The land given up to the roadway is over $\lceil, 000$ superficial feet; the amomnt to be paid by the Corporation to tho Dean and Chapter is 15,000 , hut the latter will bave to expend about $6,000 \mathrm{l}$. un the improvement, including the renewal of bince m, wecomes necessary fom their The reme mer, will ver, will be expended iu various wass on the catbedral, and brings no private advantago to the Dean and Chaptci. It shonld be stated that the Dean and Chapter invited a committee of
the Royal Institute of British Architects to consider the matter, which met and recommended the retention for the cathedral of a somewbat The Dean and Cad been intended.

The Dean and Chapter, whose only object was make a great public ioprovement, and who were quite willing to forego tho larger amount of compensation, agreed witb the recommendatou of the architects' committce, and for about year the negotiation pras delayed hy an endeavonr on the part of the Chaptor to obtain the adhesion of the corporation to this view But when it appeared plain tliat no propross was to be made, and the question only being whether the open space should be withith the Dean and Chaptor's boundary or outsito
thought undesirahle to delay a giteat pabiic im. provement on a smbordinate gucation, and plan was fimally prepared hy the surveyor of he fabric, and agreed to by the Deau and Chapter and the Corporation. This plan, whicb ponding engraving
After tbus increasing the roadway by about ,000 ft., as already stated, a spaco is laid out westward of the cathedral, of the form of a semi-ellipse, accurately worked from calculated ordinates; the major semi-diameter of tho curve hes westward, and extends to 114 ft . in front of the cathedral, and the smaller diamotor, 168 ft ., extends from the northern to the sonthern ower. The area thas inclosed is upwards of $5,000 \mathrm{ft}$, and will remain the property of the Dean and Chapter, but the pablic, i.e., pedes excepting only that on the occesiong of imes, excepting only that on the occosions of im. portant services in the cathedral it will be granite posts which mark the boundary, to doors, and the pressure of the crowd from the doors, and at night the nppor part of the stair. case and the portico will be protected by an iron fence of a suitable pattern, which is so con. ean be raisod or lowered at plensnre, two workmen, one above aud the other helow, heing sufficient for this operation. The groove through
which the rail passes is covered by a narrow bronze Hap
The reserved area before mentioned extends to about 9 ft . Westward of the railing of the Queen Anne statne, and the Corporation have moreover agreed to form round and outside of the entire boundar'y a paved foutway, 6 ft . wide, which will he elevated by the nsual curh above the roadway. The whole arca within the curb will be flat, the sills on which the posts stand being flush witl the footway just mentioned and this Hat surface (it is not absolntely level) will extend throughout up to the steps leading to the cathedral.
The sill supporting the posts is of Aberdeen granite, 2 ft .1 in . wide. The posts, which are of the dark red granito from tho Shap Quarries in Westuoreland, are polished, and are ornamented by a deeply.swnk neck moulding for the parpose of attachmeut of the temposary barriers already described. Tho posts are generally ft . 5 in . in diameter at the base, taverine in the sbaft ( 3 ft .6 in . high oxposed to view, and bout 1 ft .6 in. sunk in the solid concrete ond ranite curb), and aro 7 ft .3 in . from centre to centre, or about four diameters apart, excepting hat two larger openings, whicb are defeuded by larger posts, are formed to give carriage access to the west front for the dignitaries on the occasions of crent These may be seen by reforence great festivals. ings. The pavinct in front of the the engrayformed with paving in front of the great steps is 11 in. wide, the interscctions of granite hands, ctacrons, tha the filing in marked by access is, and the filing.in where the carriage aceess is intended is of strong granite blocks, and the remainder for the most part is formed out of the old Purbeck pitching, a large portion of heen was found to be sound and hard, and has been carefully reworked and gauged for the The st
The statne of Queen Ame, tho care of which presumedly rests with a Government departas will also the fence round it, unless, as is more likely to be done, the fence is removed entirely and as we have shown in our engraving
The plan shows a circular pathway round it, to be formed with radiating slabs of granito circumseribed by a margin of the 11 in . granite, smilar to the divisions of the panels.

The steps forming the great flights in front of the particoare formed of black Guernsoy granite, which toe surveyor has been at much pains to procuro in tho proper scantlings, havine pelsonally visited the quarries in the island for that purpose. Chese taso the placo of tho old black marble, now munch disintegrated. The materiat is very durable. They ppero worked in lengths. at the quarmes, and afterwards rubbed on riser: by the cathedral masons.
Mr. Penrose has designed the lower fligbts with returned ends, as shown on a plan by Sir C. Wreu himself, in tbe possession of the cbapter. The landing will be paved with marbles of diffe. ont kinds, consistiper of a margin of Sicilian nclosing panels of squarea, arranored lorencre vise, of black and red, the latter beine from the revived Rosso Antico quarrios.
The lamp-posts are ten in numbor, two for the pedestals, for which open iron or bronze scroll. work designs are contemplatod, and eight for the area, for which granite posts have been proosed, and a study at large for one of thein is atroduced in tho plate; but none of them havo
yot been ninally settled.
The works have all been designed by the cathodral surveyor, and carvied out under his uporintendence by Mr. Wilkinson, the cathedral lerk of works, and tbe regulal staff of work. men, with such temporary assistance as the ccasion has requirod.
The contractors for tho materials suppliod are follow, viz, - Hessrs. Dugnenin \& Harnley, of Guernsey, for the granite steps; Miessrs. Manuelle, of Scethiag-lane, London, being the agents, and who also supply the Aberdeen ranite curb; Messrs. Freeurn, of Wescminster, or the slabs of carriage way and the intersecting hands, \&c. ; Messrs. Fennivg, of Cornhill, for the Shap tranite posts; Messrs. Field, Poole, \& Sons, for the marblos of landing; and DLessrs. Cubitt \& Co., of Gray's-inn-road, for tho move. Tha ran railings.
The progress which has been mado in tbo whole makes it probable that, before tbe yea draws to a close, the outer railiog will be renoved, and a great improvement, and one which sir C. Wren wonld bave desired (for the railiner a executed, was not after his ideal), will be offered to the public eye.

A PILGRIMAGE TO WREXHAM AND ITS VICINITY, NORTH WALES:*

> AN arcbitectural pilgrimage a centary ago to towne, a pearle in Denbighshire," now recog. fforded an intellectual treat of no would bave however, when the substance cannot be obtained the shadow must suffice.
The history of a Medinval oburch is always ippertaining to Roman Catholic a peculiarity uperstitions were preferred to the holy Sorin ares; but the arehitecture of the old churches, ased upon scientific knowlodge, always affords 4 trutbful history, open to rcason, and not quiring the aid of faney.
Vrexham "bas no bistory informs tourists that Vrexham "bas no bistory, relativo or individual, ond that its origin is involved in obscurity," and was anciently famous for its buekler-makers,
nd to day it is famous for its good ale. The ood ale appears to havo been of no mental enelit to the town in former times, as the raltsters ejected a popalar Welsb onvate for
reaching against intemperance. The guide ook must not be unkindly criticised, as its riter, a solicitor, modestly undortakes "to
uncentrate ouly that which uncentrate ouly that which Hoats upon th Tbe three finest Perpendicula
Tbe three finest Perpendicular eburches in orth Wales are St. Giles's, Wrexham; All aints', Gresford; and St. Mary's, Mold. These urches contain superior work; the first is mersetshire kind, and is confessed to be the ory of North Wales. This chureb consists of tower, neve and aisles, north porch, and a llygonal apse at the east end, all being finely
oportioned. The nave is separated 3les hy octagonal colamns, with moulded pitals and bases; the arches are plain and ndows in two-lights cinquofoiled. The timber of is open, of low apan, with rafters and no corbels, with angels bearing supported by a corbels, with angels bearing shields; there a lower cange of corbels, wbich, perhaps,
ginally carried vaulting shafts. Tho spaces ginally carried vaulting shafts. Tho spaces
ween the rafters aro subdivided into squares, ween the rafters aro subdivided into squares,
th smaller squares and narrow interseeting with bosses at the intersections. The ipit stmacls on the north side of the nave, by m, laving niches filled with the firnres of our rd and the Evangelists, and enriched witb rblo shafts and much carving. It cost 2001 , e pulpit formerly stood two compartnents
stward of ita present position, arainst one of stward of ita present position, against one of tient, octagonal, with water-drain, The font is pottion; it bas been rechiselled, and placed the west end of the nave. For many years it ornamentarden at Acton House, misnsed as - and tower is lofty, and between the nerons attached clustered culuuins, wit alded capitals and bases.
b trefoil ye painting of King David, said to be by jens, bangs on the south wall, near the tower was brougbt from Romo by Elihu Yale was fomerly a painting of the royal It was organ is at the west end, under the placed on cach side, so in to expose to yiew west window. In front of the orpose to view
was the arms of Queen Elizabeth, carved in wood. organ, at one time, tho only one in the Coudon, in 1759 , and cost 3001 built by Green, ed by subsoription. At the west which was a is an elaborate Gothic mural monument, in The lectern, at the enst end of thedate, ? brass, in tbe form of an eagle, with wings inded. It has an inscription, stating that ap Gryffyd, of Plas-y-Stewart, bequeatbed 67. A carved oak reading.desk stands at be nave of the south side.
The and aisles are paved with eneaustic visles in 180 galleries which were placed in aisies in 1820 were, with all the high pews
the gronnd-floor, removed in 1867 . The ont oak seats were then put in their stead, the church was "thoronghly eleaned, and

Warmed by an apparatus running along the floor fonr laren, in recent times, it was heated b church. This event of 1867 is called the Re storation. At this time the walls wero chiselled storation. At this time the walls wero chiselled If the editor of the graidebook had referred ${ }^{\text {and }}$ the Builder, vol. found that during the process of cleaning the walla from the successive coest of cleaning the some very interesting remains of mural paiuting were brought to light, the most importaut beins portions of the representation of the Last udgment, over the chancel areb, the colours "cmaining in good preservation.
"At the Restoration," says tbe "Guido-book," the faces of the lowest range of the eorbels on the south of the nave were found to ho composed of plaster of Paris, or some other cement. They Were removed, and the present figures eut in the stone in their stead. It is to be regretted that tbese latter, wbilst tbey are not 'restorations,' have no local pertinency; and tbougb somo of them are cleverly done, they have no other origin it would bave bee artist." If this be correct sculptured them.
The inural monuments are placed on the walls the aisles, some having been removed from the cbancel. On the east wall of the nortb aisle Davies, 1736 . Vincen, - to the wife of Thomas Wgnn, 1796 . There is a marble monument to the widow of John Fryn, 1817, by Richard Westmacott, of London. In the centre of the north wall of aisle is an elaborato centre of the Mrs. Mary Myddelton, dauchter of Sir Mrs. Mary Mfddelton, daughter of Sir Richard yoddelton, of Chirk Castle, date 1717. It is he work of Roubiliac, executed iu white marble, obepresents the resurrection of the deceased, obedient to the sammons of a Cupid! A neat
brass plate recording the lad orass plate recording the lady's death would
have been more apmronriate and less of There are also appropriate and less offensive. Lloyd, date 1730 ; Edward Wettnall, Uimber merchant and carpenter, date 1766 ; Edward mith, colleotor of Ercise, 1757 ; Philip Paleston 1804; Mary Davies, 1402 ; Prances Paleston, Four mural brass plates comulete the inemeria in the north aisle,- Jolin Williarns, 1716. Chas tian Jones, 1747 ; Muria Ellis, 1756 ; and Elizabeth Mooro, date 1797.
On the south wall of the south aisle are mural brasses to Jonathan and Mary Price, 1729; John Jones, of Jlwyuoun, 1740 and 1744 ; Evans, 1751 ; Ann Wilkinsou, 1756 ; Penelope Jones, 1821 ; and Thomas Parry, of Llwynoun, 1815. There are also warble tablets to Edward James, 1815; Martha Foulkes, 1806 ; and John Foulkes, of William stone slab let into the wall to the wife this aisle is a eurious monument east end of Lloyd, of Esclusham, 1676, a judgo and friend of Charles 1. ; and a classie monument to Owen Bold, 1703. An elaborate Gothic tablet to Alexander Murray, 1835, completes the monnmeuts in the south aisle.
ond, have obtuse both aisles, excepting at each oud, hare obtuse arehes. They are in four lights, with trefoiled heads and trefoil-headed lights in arches. In the south-east angle of the north aislo is a largo bracket, moulded and carved. In the south aisle, in tho sonth wall, at. the east end, is a small cipquefoiled-headed recess. In the angle of the aisle at this end is rich canopied niche.
Bonth aisle was dengthened on the outside, the tho sonth window lengthened westward, enclosing buttresses. This of the tower and one of the apearance of the tower on this side, and form clunsy audition. There is a Bottlement between the old and new work and the corbels the external lahel of the new window have never been sculptured. It was proposed in 1867, to erect a "north ohancel aisle," to receire the organ. This would have destroyed the symmetry of the apse. At this end of the the on a framed hoard, are the arms emblare aisle, John Tievor, 1682 .
The roofs of the aisles are lean-tos, prineipals and knees moulded, the latter supported by stone corbels, spaces panelied. Tho two tattered banners in the aisles are the old eolonrs of the 42nd regiment, and bear, amongst others, the ames of Alma and lnkerman
The chancel floor is two steps above the nare The chancel is parement is raised two steps. largement of tho original church, not it modern

The present chancel arch was formerly tbo east window, which has been opened to the floor level The tracery in head is left in a broken state. On eacb side is a eanopied niche. At the east ends of the north and south aisles, were formerly chantry chapels, enclosed by sereens the entire wall surfaces on the nortb side were originally powdered with feur nortb side were devices. The former cbancol de-lis and other two bays or comper concel was limited to charch, whieb accounts of the body of the the east eads of the accounts for the windows at arches, with four arches, with fonr lights, the central mullion inner arches, The diverging, and forming two is pointed, and ine east window of the chancel is pointed, and in five cinquefoiled lights, tran. "L Life a class. A our Sariour, ${ }^{3 \prime}$ in painted and stained glass. A painting, said by Browa Willis to be was sold formerly bid the east window, and was sold for 9l. The side windows are in four ights, with cinquefoiled heads. The windows in two angles, aro in three trefoiled-headed lights, filled with painted stained plass Peter in one widow and St. Paul in the other date 1867. On the south side are threo sedilise witb canopied heads, cinquefoiled. Beneath Hugh Bellot is a recumbent stone effigy of Bangor and Chester canouical robes, Bishop of ployed by Queen Elizabeth in de was emBible, and would not have a femalo sourg the his honse. On the same side of the servant ia White marble nonument to Willinm Lloyd, Plas Power, date 1793. On the north side iso marble monament to Fitzhugh, date 1781 , Thomas Byddeltom by Romiliac, and a ment to the wife of A rehibald pe and a mone
The reredos, or altor seren compartments, cinque foiled is in five canopied doorway the chancel and altar window. The floors of tiles, and star aro pared with oncaustic Of the each side. learstory hese been, winnacles of the tower, bav culptured firn corniees are ornamented with aripured figurce and paters. The tower is a study of itself; it is mostly panelled; the pancled and tho bands or stringe are also panelied. Between the sngle buttresses on erol sice are three projecting square shafts, oom mencing from a string just abore the west window, and termiuating with crocketed win nacles above the embattlemeats. On each haft aro three eculptured statrea of saints ahout turty in number, in canopied saints, Amongst them is that of St. Giles, to whom the churell is dodicated. The guido-hooic says that two of the niches are deserted of their saints, who, one day whking from their pedestal to take the air, fell down, and were bedestal, The buttresses are in sis staces, with surmonated by pinnacles. Rising frombets augle of the tower is a trom each turret. Tho belfry windows aro canopied, in three lightg, transomed aud foiled. The win. wo lige two lower stages are canopied, in story windows and foiled. The ground lights, cinque-foiled, with labelled, in three tracery. The west doorway trefoil. headed witb square hoos doorway has a pointed door, plain. The tower forms a nohlo fis otherwise of itself, and it would be woll if reature, a stady Architects best messured do orer its sitwer medal for tho subject than poor "Temple Bar" sar superior stairense the por "Temple Bar." The stone and lea and leads to the belfry, which contaios ten bells, ap the Severn to in 1726 . They were convoyed purted by purted by hand. The total cost of founding veirge, hanging, de., was 4506. 174. 8d. Tho well oell (the parson's bell) is one of the old peal, and was cast in 1678 . Amongst the former peal was a large bell from St Asaph Cathedral inseribed Dicas Boddlewiddan.
The exterior of the chancel is more ornamental than the hody of the oluurch, there are canopies to the windows, and tho buttresses have crowns in full relief on the set-ofis. All the pinnacles, including nave and aisles, are panelled, crocketed, and placed diagonally on the battresses. There is a settlement in the east wall of the chaneel. The hasement monld ings around the church are nearly obliterated.

In front of the north porcb over the doorway，is a canopied niche coula the Virgin and Child．
In I331 the spire of the former churche was hlown down，and the cluarch itself was burnt in ahout 1457．The present edifice is in the Per． pendicular style of architecture；the nave was
built in I472，then the north aisle，the south aisle ncxt，and lastly the tower，in 1506，as indi－ cated on the iuside．The wiudows are glazed with glass from Normandy；they were reglazed in 1810 and 1811．The height of the tower is said to he 135 feet
In 16it5，Cromwell converted the charch into stahle for his horses．In ahout 1815 the a stante for was enclosed by an irou railing，at churohyard was enclosed by an irmerly a lych． the cost of sole of the iron gates next the strcet kate on the site of the iron gates next ne strcet on the north side of the cburcbyard，incorrecty called a porch in the guide－book．When
excarating for the standards of the iron gates，a stone effigy of an armed knight was discovered， witb a conclant dog or lion at his fect．The shield is charged with a lion rampant，and has
＂Hic jacet an Howell＂＂inscribed on it．This ＂Hic jacet ap Howel in the vortb porch of the church in an upright position．There are several curious and interesting memorials in the chnroh－ jard；but as tbey are not of an architectural character，the guide．book is more suitable for them．The pinnacles and cornices of the south side of the charch have bcen much dis． tigured hy tbe smoke emitted fronithe aunctown， maltsters＇chimneys on the

## INDIAN ENGINEERING．

Crider the title＂India and Iudian Engi． seering，＂three lectures delivered at the Royal Engineer Institute，Chatham，in July，I872，hy Jnlins Georgo Medley，Lieut．Colonel Royal Engincers，Assoc．Inst．C．E．，aud Principal of the Thomason Civil Engincering College，Roorkee， Sc．，have heen puhlished by Messrs．Spon，of

## Cuaring cross

In these able and interesting lectures some dea is given of the plysioal featares of India， its climate，its people，and of the peculiarities of Auglo－Indian life．The anthor then procceds to say something of the Governmezt，and the great Department of State by which public works are executed，and of tho special duties and prohahle career of the Royal Engineer ofticers who are there employed；and passes on to the nataeriala and modes of construction with which tho engi necr is called upon to deal，and those specialities
which diatinguish his work from English which d
practice．
of the state of the arts and nanufactures in India some judgruent may，as the author remark he formed hy an inspection of the heautiful specimens collected iu the Indian anvexe of the Internatioual Exhihition．
Some of the once famous Indian manufac nres，he states，have almost disappeared in nodern times，such as the Dacca muslin，of which it was said that a full－sized dress－piece could be drawn through a finger－ring．Native rchitectare，too，of the present day is tawdry nd meretricious．But Cashmero is still famons which to admire most，the heauty of the fabric， or the or the exquirs；Aura still excoutes that beau． iful in chatene which is yot only one of tiful inlaid stonework，which is yot onyy one ond the wonders of the Taj Mehar；Delbi and Beold and rich in colouring；Cuttack furnishes its exquisite silver filagree．work；Sealkote，its stee inlaid with gold in arahesque patterns；Bombay its massive and curiously－carved ebony furni． ture．But art can never attain to its lighest development in the alsence of a honlthy national life，and it is to former ages we must turn for tructures like some of the Mindoo temples，or the great mosqne at Delli，or＂the Dream in Marble＂at Agra（the Taj Mehal），and even the artistic manufactures named aro legacies from tho past，that are apt to degenerate at the pre． sent day
designs．
desisns．
Yet there is an indwelling spirit of artistic grace in the East that will not easily die，which is seen in the instinctive choice of colours in the clothes of the very poorest on a holiday festival， －in the shape of the commonest earthenwarc itensils，－－in the very salutation of the poores peasant in the fields．
The work of an engineer officer in India，as in Encland，is of a very miscellaneons description Evcry work is estimated for previously to sanc－ ion hy the execntive encincer，and the estimat after heing checked by the superintending engi－ neer，is forwarded to his cbief for sanction，who， f he approve the design and estimate，recom． mends it for sanction hy the local government， or，in case of a larce work，forwards it on to the opreme government with his own remarks．If not satisfied with it，he may return it for revision or explanation．
When a work is sanctioned and ordered to he ommenced，the money being also forthcoming for it in the Budgct，the exceutive engineer goes worl．In the larce presideucy towns，and a fer of the more important stations，he may cet the work evecuted hy contract；hat，as a general tule，be will have to he content with procuring his materials hy contract，and perhaps getting his earthwork done in this manner．for the rest，be will have to employ caily paid lahonrers and occasionally from other districts，toorgand provide them win food，water，and temporary slelter．For this he has the assistance of his curopean oversecrs， native suh－overseers，aud mistrees or head． The European overseers are nearly all non commissioned officers or privates who have volunteered from the various reginents in India for the Puhlic Works Department，and have heen trained at the Roorkee College．They are allowed to wear plain clothes，and are of course struck off all military duty．As a rule，they are bard－working，intelligent men，and many of
them are most valuable suboruifantes，but they
are generally defcicnt in prate ko are not very conversant with the language，and are hut too often given to drink．
The native sub－overseers have also bsen rained at Roorkee，and are generally good raughtsmen，surveyors，and estimators，but hey are drawn from the trading instead of the rorking classes，have no practical experience， ond leck physical stamina．
The mistrees，or native head masons ana car enters，are generally intelligent and good men， quick to learn and easily ma
The noretical knowledge．patieut，docile，and zy，never drinks，and is easily managed by any one wbo understands him．
There are many varietios of stone in different arts of India and it is employed in the varions保 in Evre Granites limestones，and sandstonce nexpely used in the localities where they en the cost of carriage over had roads ti distant plase necessarily restricts the employ istant places In Southern India meno of cxtensively used，hein！ easily world en hecoming hard by exposurt asily work， no 1 its white marhle，of which the Taj and othe its white marne，of constructed．Bombay ha famous cuivarieties of stone，notably the Poree： also many varieties Allahabad has some fin quaries of sandstone，of which the new Govern quarries oisings have been constructed，ant Colonel Medley Tecommends to notice th acconol Aedley rekinc of the Purtarpore Qua rics，in the professional papers on Indian eng？ neeri the professional practical information Slate is，as giving much practical inferior，but som five gunries iny lately heen opened out at Da hue quarries have lately heen opens in the Panjai There is a kind of soft stone called moorun found in Central and Western Iudia，whic though almost useless as a builchng material， extensively employed for road metaling．Ku： kur，too，is quite an Indian speciality，though is almost entirely confined to the nor wh．wester provinces．It is a pecuiar kind of oolitic lim tone，found in heds just below the surface，and ftwo kinds ：one adapted for building purpost which it strongly resemules artificial co rete ：the other answering admirably for rol解 recuis for the size of an egr，drenched wi water，and then rammed until perfectly smool fter which it is ailowed to dry before the traf comes ou it．
The manofacture of artificial stone by Rd ome＇s process has heen tried at Bombay on mall scale，hut not

## mical point of view．

In the creater part of Upper：India，and or auch of the rest of India as well，brick is chief building material，and there are few on weet India wha wall not have with hrick－making．The lecturers to me strongly reconmended ainted with the lat merovements in the art，at the same ti proven mind eortain Indian specialiti which will limit the use of many of th which will These are the cost of carringe， geueral ahsence of coal fnel， other frel，the ahsence of skilled subordinal and the disinolination of natives to he driven of their own customs，and to try experimenta There is plenty of good brick－earth to found，hat the cost of carriago provents same care being taken as at home clay is of tion and admixture of clays．Triken straight， the moulding．tahle；hut pug．mills are pretty common，worked hy hullock power． bricks are usually sand－monlded，and are ma of the English size，and stacked in tempor： sheds to dry．Brick－making macbines hi occasionally been tried；hut their expense， difficulty of repair，aud the cherpness of bi lahour，have always driven them out of field．Hollow bricks，too，are never seen， as the author thinks they wonld be found to mnch cooler in the walls of huildings than sis hrieks，he would recommend any one to acqu nformation of their manufacture and cost．
Coloured hricks are nowhere used in In nd their absence is much to he regretted， they would he most useful hoth for architect riey wontation and for floors and similar poses．The proper clays，on which the co posend，are fonnd in some parts of India； careful search would donbtless bring to
pothers; but here again we are met by the fact that their manufacture reqnires skill and capital which are not found on the spot, and would have to be imported. The same romark applies to terra.cotta and encaustic tiles, which would be admirably adapted for Indian use. Good ordinary bricks are generolly procnrable In India, if only proper care bo exeroised, and fair price paid for them. The bricklayers equiro close watching, and ofton systematic :nutrnction in tbe all.important subject of bond; ; or the common native brick is very small, und
aid in quantities of mortar with little care about sond; so that native walls are really masses of oncrete.
Tiles are extcnsively nsed in India for roofing mrposes, and they are often very badly made. The subject of limes and cements is a very mportant one in India. Limo is obtained from rom kneskur, from beds of manl, or torrents, careous tufa, and from limestono in situ. It is urnt with wood fuel, , sometimes in the open, enerally in conical kilns, and is nixed with and, hurnt clay, or hrick-dust, and sometimes

The best lime is that procured from pars, which when mixed in tho proportion of ne part lime to two parts of soorkee, or pounded
rick, forms an excellent mortar for hydraulic yick, forms an excellent mortar for hydranlic orks. Knnkur lime, as a rule, is simply mizod
ith sand. Wbon lime is burnt with ith sand. Whon lime is burrit with oopla, care
uust be used in sifting and separating it from ashes of the burnt fuel, otherwise, of course, a strengtb will be greatly impaired. Artificial
oments havo searcely hitherto boon mado or sed in India.
Concrete is not vory much employed, though has attracted a good deal of attention lately ; ad some of tho works on the new Sirhind Canal ere designed to be built almost entirely of it, ach as arches of 40 ft . span. Indeed, with an pundance of excollent lime, and a great
parcity of fuel, it seems curious that it has not 3en more exteasively nsed. Concrete blocks ere recommended for the great weir over the mposed of shingle, sard, and lime; and if pper apparatus be used for testing the quality the lime, there seems every reason to antioi. to oconomy au
Lime is also used in stuccoes and plasters woh as in England. Madras is noted for this ork, where the very heautiful chunam plaster hisled as marble. Coarse surar and pornd and g -sbells are mixed with those moro expensive
Of timbers there is an immense number in dia oconsiomally used; bat practically enaeors are restricted to a very fcw varieties yich are the only ones proourable in any quan. Iedrus Deodura) is the principal the doodar oyed, being nearly identical with the famous far of Lehanon. It is found in tho Himalayan ests. In Barmah and Western India, tealk is tbe incipal wood; its many excelleut qualities aro il knowa. Other common timbers are the uggoe, used only for planking or furniture, and
daily attacked by insects ; the sissoo or shee ldily attacked by insects; the sissoo or shee.
1 m, a hard, strong, but crooked wood, in neral request for many parposes, especially niture, as it takes a beantiful polish; the ekur or habool, an acacia, a very hard, tough od, much used for carts ; the famous Bomhay ck-wood, of which somo beautiful specimens carved farniture are to be seen in the Indian art of the International Exhibition; the toon,
inforior mahogany; the sandal.wood, which inforior mahogany; the sandal.wood,
a strong perfume; and many vthers.
Fimber in India is generally seasoned hy the or water process, and is occasioually k yanised Burnettised. Well.scasoned timber stands
climate well? if carefully climate well if carefully protected from ite ants, thoso pests of tho East. For this
pose, tho ends of beams fitting into walls are pose, tho ends of beams fitting into walls are rerally oharred and tarred, or the timber is
ked in a solntion of sulphate of copper; but best proservative is carefully to prevent any or mud from coming in contact with it. oden posts buried in the earth will very soon netless,
The Indian carpenters are genorally very fair, I sometimes very clever workmen, though Ido squat on the gronnd, and hold a piece of did with their toes while they work tho drill means of a bow and string with their hands. Vrges, of course, vary more or less but the
of a common labourer all over Iudia may be
fairly set down at 2 annas, or 3 d . a lay, and of an ordinary meokanic at 6 d. to $7 \frac{1}{2} d$., with which he finds himself in everything. A beldar, navry, will got $4 \frac{1}{2} d$, and a skilled carpenter or mason from 9 d . to 1 s . These wages seom very low compared with English prices; bnt the men all do far less work than an Englishman; thus, the lowest estimated rate of common earthWork is now about 58 , por 1,000 cubic feet, which each manate of 50 cubic feet only per day fo each man of tho grag employed.
per 100 cubic forick foot; timber-work, 7s, per foot, " wrong per cubic put up."

Taking into consideration the price of food, and other things, Colonel Medley reckons the difference in the value of money employed in constructing public works in India and in
Englaid as 1 to 4 , i.e., that a work costing 10, 0002 . in India would cost 40,000 l. in England Wo had been led by the accounts of som ecent works to a different opinion.

The margate drainage COMPETITION
The town council of the borough of Margate havo had a lively time of it lately in their fro. borou aiscassions upon the subject of the of the corporation, meeting after meeting, now tben of the burgcsses in common hall, has been hold, and the whole subject has been debated pro and con., with the result that might have nothing until comperled tho determination to do ago the resolution was put aud carried in the arrived and immediately afterwards another resolution to stop the progress of tho question, even after a leading engineer (Mr. Bazalgette) had been con. sulted thereon, was carried by a small majority, and nothing has been done beyond mere effortless talking, aud a fow excursious at the puhlic expense, by a "Drainage Inspoction" Committee, warded by the by a most damaging report for. warded by the medical men praotising in the poration wero goaded into action hy the appearance of Dr. Gwynne Harries, the Govcinment medical inspector, in their midst.
$\mathrm{D}_{\text {r }}$. Harries met the corporation at the townthe on the 3rd of April last, and quietly told was totally inadequate to absorb the deloterious emanations of the sulliage, and that some macbinery must be organised very promptly for the purpose of effecting the drainage of the ontire town, and the prompt abolition of the ecsspools. The corporation rated roundly the grambled at the medical insplector, and finding grambled at the medical inspicctor, and finding remoustrance and even statistics of no avail to
ward off any longer the per force interferenco of off any longer the per force interferenco very half.hearted manner, determined,- not on Wraining, -but on taking professional advice. Withiu a montli,-so hotly made they haste,they had had three or fonr meetings upon the subject, when it was at length discovered that
the contours of the $10 . \mathrm{ft}$. Ordnance plan, the contours of the 10 .ft. Ordnance plan, the newly.built districts. Here was a chance to put off the matter. If an engineer were employed to design works of drainage he would have to tako the levels of these districts himself,a work of some weeks, -and the expense plans wore called for, oach competitor would have to do this for himself, and the expense would be enormous. In vain was it elicited from the borough surveyor that he conld levels, and place 300 copies of the necessary upon the Board-room table at an expenso nnder 50l. ; and in vain did Mr. Councillor Sear, himself an architect, indorse the borough snrveyor's opinion that it migbt be done easily within the specified time, for the corporation was arently did not want to go on,-the work was distastciul-the cesspools were good-the
medical staff inspector was prejudiced-tho town did not require draining-the corporation did not like Government interference,-and, therefore, Ordnance Survey of the forther be done until the and their plans sapplied,"" brought forward by

Mr. Alderman Reeve, who had previously been thwarted in his special schemo for getting a sewage irrigation farm just near the borongh boundary, found nine ready supporters in a considering that they had effectually shelved the considering that they had effectually shelved the
qucstion for an indefinite time to come But the Ordnance Office at once sent men and ob taincd the necessary levels, and celled in photography to their aid, and, probably two years graphyy to thir aid, and, probably two years
earlier than if they had bad to wait for the work earier tban if they had bad to wait for the work
of the burin of the engraver, photographed plans were produced, and early in Jnly last a photographed plan of the town, with every level, and the most minute detail, was forwarded in twelve small sheets from tho Ordnance Survey Office be had ancd by an intimation that copies might be had at 11s. 9d. each. The corporation were taken aback, Here was the very plan placed before them which was not expected to appear nntil some conveniently remote period, and a motion drat the necessary steps for forward. with," met only withe borough be now proceeded warm and prolonged feeble opposition, Debates fessional adviser-a limited competition-an open competition-all in tarns have heen adrocated, and the discussions bave resplted in a sort of compromise-a general invitation to ubmit to a selection of ten (vide onr advertise. ment columns), and the conditions of the com petition are now before ns. A motion to invite ix of our leading engineers to forward plans and to give each of the six the sum of 50, for his labonr, fell through, and it was ova tually decided to offer tho sum of soot two premiums, among ten competitors, whom the corporation propose to select from the list of names which will be submitted by engineers, who are willing to go into this limited competi. tion, and who have had more or less previous ex. perience in sewerage and drainage works. Seein that the number of tenements in the borough stated as being under 2,500, the amount of pre mums to be awarded seems to havo beon ceived in a liberal epirit, and we believe in the sincere desire of the corporation, who are greatly agitated hy two opposing parties in their midst, edrocates, to pear most likely to lond to a satisfactory mesult. Marcoto as error in jud pous as sho is popular, and any rentar judgmamong her ralers, in hastily ventaris the expenso of a scheme that might iu the long sun prove mefficient, and necessitate the double expense of laving the work done over agaiu, wonld rnin the towns.
people most effeetually. They can well afford people most effeetually. They can well afford cannot afford to pay in this particular, hat they cannot afford to pay for experiments, and would spent 85,000 l . anlure. Brighton, we are told fect, but which failed, system supposed to be per. ditnre was incurred of $80,000 \mathrm{l}$, to amend the works. Dover and Worthing, too, and Hastings are instances of the same error. Let the corporation of Margate tako heed lest they also follow those unfortunate precedents. Meanwhile Merthyr seems to have succeeded in the direc. tion of a profitable and innocuous sewage farm (Dr. Alfred Smee's letters to the Times, notwith standing), and the Margate Sowage Inspention Committee, whose instructions direct them to visit towns which have the reputation of being effectually drained," cannot consider their labours as completed nutil they shall here risited tbis last example, and made their report apon the applicability of the system to the peculiar requirements of Margate. None can acouse tho local authorities of precipitancy in this important matter, sceing that it has been fur at least ten or fifteen years under discuasion act now they raust.

DEATH OF SIR EDWIN LANDSEER, R.A. Tens great artist diod on Wednesday of last week in London. Decoased was the youngest non orn lat. 1802. Ho escelled in the painting of animals even while a boy, and became a student of the Academy in 1816. Ho began to cxhihit when little more than fourteen years of age, and hi e:rrliest productions attracted attention, his gave great promise of fnture excellenoe, ai "Cbevy Chase", at the age excellenoo. His made himan Associate of the Academy. A mon the hest known of bis nnmeross pictures ave th following : "Diguity and Impudence"; "Jack

Of Office
Mourner" " "A The Old Shepberd's Chiel Mourner"; "A Distinguished Member ef the Humane Society"; "Saved"; "Alexander and Diogenes"; "A Highland Break fast"; "The Drover's Departure "; "The Dog and the
Shadow"; "A Fireside Party", "There's no Shadow'"; "A Fireside Party"; "There's no Placo like Home"; "The Twiz Degs"; "Tethered Rams"; "Sancho Panza and Dap. "Comical Dogs"; "Yeung Roehuck and Rongh Hounds"; "The Fagle's Nest"; "War" aun "Titania"; "Laying down the Law"; "The late Dake of Wellingten, accempanied by his Danghter.in.law, visiting the Field of Water" loo." In 1858 he exhirst ef his large drawings in chalk, which have sinoo beceme se pepular; in 1559 his pioture ef "Doubtful Crumhs," and "A Kind Star"; in 1860 bis "Floods in the Mighlands" and in ' 1861 "The Shrew Tamed"; with three large drawings in chalk; and more recently "Windsor Park," "Squirrels Oracking Nuts, and "Man Proposes, but Cod Disposos,"soene in the Aretic Regiona. The majority of his compositions have hecome popular as engravings. His graud bronze figure of the "Stag at Bay" was in the Royal Academy Exhibitio of 1866; and the four lions in bronze for the base of the Nelson Coluran, Trafalgar-square for which he received the commission from the Government in 1859, were placed on the pedestals and uucovered January 31, 180\%. At the death of Sir Charles Eastlake, 1866, Sir Edwiu was elected President of the Royal Academy. He refused, however, to acoept the honour, and an adjournment for a week took place, in order to give him time for consideration. As Sir Edwin could not be induced to alter his determination, the presidency was offered to Mr. Maclise, who Grant was elected.
Sir Edwin was knighted hy her Majesty in 1850. Latterly his health, both of hody and died unmarried.

DISPUTED OWNERSHIP OF BUILDING LAND.
The Mile End Old Town ghardians are a present engaged in a question involving an unusnally knotty point as to the ownership of certain lands within their district. It appears that many years ago a cortain property near the corner of White Horse-lane was purchased with the view to the estahlishment of a "North. East Metropolitan Asylum for Vagrants." The property was purchased by a committee composed quions in this district of the metropolis, with money borrowed for the purpose. Mr. Kelday, one of the presont churchwardens of the parish of Hackney, was appointed clerk to the committee of management; bat, uitimately, owing to some unexplained canse, the scheme for the building of the asylum collapsed. The statement bow is that Mr. Kelday claims ownership of the land under the plea of undispated possession for twenty years; and what renders the case of greater interest to those conoerned is the fact that Mr. Kelday has let portions of the land upon lease to persons who have erected extensive onidings upon il. In the meantime it appears have challenged Mr. Kelday's legal claim to the property, and have been endeavouring to it. fanence the higher authorities in faronr of its sale, and a division of the proceeds amongst the parishes interested. The Local Covernment Board, as the direct medium of communioation with the executive, are the parties to whom application bas beeu made in the mattor, and it is a commateation in reply received by the wile End Board from the first rnencioned body, which is of grave and seriously imporlant moment to those builders and others who have up to the present time taken leases and erected buildings on the property. The letter from the Local Government Board states that the solicitor for the Treasury has the matter still in band, and it also further intimates that if persons have takon leases of portions of the land in question from Mr. Kolday, without first taking steps to ascertain as to whether he has a legal title to it, they will have to abide by the result of the inquiry now pending. There is, therefore, the chance of serious consequences to those who have huilt upon the land should there eventnally
claim. On the ether hand, hewferer, he may he able to estahbish it. At present the question remains in this pesitien, that the Mile End
gnardians are still in cemmunicatien with the Treasury en tho subject.

EXHIBITION OF APPLIANCES FOR THE ECONOMICAL CONSUMPTION OF FUEL.
Tre Society for the Promotion of Scientific Indnstry, Manchester, looking to the enermous waste there is in the consumption of coal, have resolved that an exhihition shall be held in Manchester, of all appliances and apparatus that tend to the economic use and saving of and for tho purpese of inducing attentien to, matter, and of giving all consumers of coal an opportunity of comparing the various appliances, with a view to their adeption of that which will best serve their purposcs. Exhibitors will he given every opportunity of explaining the given every opportunity
speciality of their apparatus. Mr. W. G. Larkins we secretary, will give any information desired

## WHAT SHALL WE BCILD WITH?

Sin,-I think those architects who are auxions or the credit of the profession should take an opportunity of visiting Westminster Bridge, and rook at what is going on within range of vision. At three important national buildings, -Larnheth Abbey,-scaffolding is up for repairing the Abbey,-scaffolding Pa up for repairing the
stonework. At the Palace it may he ancient work that is being restored, but at the other huildings it is modern roors of ahout twonty years' standing, or less.
Would it not he well for onr architects in foture to follow tho example of their hrethren future St Persurg, Aberdeen, and other places, at suild with ererlasting granite? Of coarse and build with everlasting granite? Of course, greater simplicity on treatmen wound he an advantage rather than otherwise, considexing the smoky atmo sphere of London.
H. T.

## NATIONAL MUSEUMS.

A standing committeo has been appointed hy the Society of Arts for the purpose of hringing nnder Parliamentary responsibility the national museums and galleries, so as to extend their boneits to iocal museums, and to make them onr or puhlio education. It is desired to cause il national mnscums and galleries to he placed under the authority of a Minister of the Crown, boing a member of the Cabinet, with direct esponsihity to Parliament ; thereby aboishing all unpaid and irresponsihie trustees, except those who are trustees nonder bequests or deeds, who should continue to have the full powers of their trusts, bat shonld not be charged with the expenditure of Parliamentary votes. Also to cause the Public Lihraries and Musenms Act ( $18 \& 19$ Tict., cap. 1xr.) to be cularged, iu order o give local anthorities inoreased powers of acting.

## BELOLAN RESTORATIONS.

Sir, - I have no intention of joining the crusado against restoration which is jnst now so fashionable, but I must oall your attention to being perpetrated under the plea of restoration in the Netherlands.
The Belgians have taken the "Gothic fever" fom oursires, and, although they have caught rom oursines, the complait laver mined mportan chu un in tors as thore "ress exons" senerally consist in the these the church which not Cothio yon may easily imacine the beroc that is bein, you may
hat is being created.
No one can have a greater admiration for Cothic architecture than I have, but it is undeniahle that the Belgian churohes owe quite as mnch of their interest and pictaresqueness to their costly and magnificent Renaissance fittings as they do to their original strnctural excellence

Surely, sir, it is barbarous to destroy or emove such works as the rood-screen at Bois ie-Duc; the whote of the filtings of the grea and magnificent oandelabra of the cathedral at

Bruges; the marble screens of the cathedral at Ghent; and yet these and many other works of
destructieu are either actually accomplished or destructiou are either
are being caried eut.
I truet that you may consider this suhject worthy of the attention ef your raluable journal
H. IV. Brewtr.

THE WARMING OF SCHOOL.HOUSES. Sir,-- Four excellent notice ef the opening of Creek-road School, Deptford, does me undeserved reneur in naming me the inventor of one of the rates. These are all by Nr. Boyd, of Couduit treet, my share in the particular kind alluded o heing limited to an endeavour te adapt and mprove it for school purpeses.
With the enermous price to which coal has risen, the warming ef a school-reom has attained the dimensiens of a problem most difficult el solution. Tho epen fireplace is the faveurite method, partly from English habit and partly from its assistance to ventilation. It is attendec to most irregularly. Tnder one kind of teacter it speedily gocs out; under another, it is bep up to roasting.point. In the class-room, it cas have bat one possible positiou, viz., the corner In the school-room, it is hard to place well fos equal diffusion of heat without being in the way Yet, for small school, say up to 600 , it is th hest mothod, provided the consumption of ooas he ecouomised, and the greater part of the hea he got into the room, instead of heing, as $\mathbf{i}$ commonly the case, allowed to escape up th chimney. Several kinds of grates are being ase in Londou schools, and the coming winter wi afford some test of their relative and aotur value.
It is douhtful at what point, as to number: it hecomes more econominal in first oost an annual maintenance to adopt what is calle is, perlaps, debatable land. When the mume rise to 1,000 doubt is at an end, and the open fi has become the most troublesomo as well is tl most costly.
E. R. Robson.

THE CONTRAOTS FOR ORANTIE II HACKNEY: SERIOUS CHARCE.
A Geatix charge Fas made against the contractors:
roten granite at the meeting of the Krekney Distr Broken granite at the meeting of the Krekney Distr the Board that, hariog considered the tenders receik
at the previous meeting for the supply of 3,500 tons the previous meeting for the supply of 3,500 tons
broken gravite, they bad decided to recommend that ac broken granite, they bad decided to recommend that ac
of the tenders be accapted, and that the oummittee empowered to make arrangements for n tempors
supply. In the oourse of \& discussion which follow,
Mr. Eve, one of the memhers of the Board, stuted there was a ceneral impresion with regard, to tender
for granite that, mo mater how farr might be the of maranite that, no malter low far might be the of there was also an idea preralent amougst the public , of doors that the price of granite was kept up by nai, ominination amongst the eontractors, and that it was ip such a clique. Mr. Green, anoth +r member of Board, esid he could confirm the statement that a feel prevailed that it was ugeless for persons who did 1 hould be found to be correct, it would form the grou for a rery serious charge against the officers of the Boni ments raade reapecting corabination on the part of coutractors for the purpose of keeping up the price
pranite was founded on trath. The recommendation the committee \#as adopted, and it was also decifind endeavonar to defest

London, the following reoornmendations of the Work tee were adopted:- That the tender of Mr. J.
Warren for the erection of a school to provide accommo-
for 787 children, on the Caley accepted. That the Cayley-street, Limehouse, ection of a school to provide accommodation for be accepted, That the Belvedere-place, Borough-ington-street, N., amounting to $4,690 \mathrm{C}$, for the erec oir achool to provide accommodation for 578 childr

## HE LIVERPOOL ARCHITECTURAL AND

 ARCREOLOGICAL SOCIETY.A SOIREE, to oommemorate the tweaty-fifth niversary of the eatablishment of this ciety, has been held at the Royal Institu. m, Colquitt-strcet. There was a large asaem. oms were tors of both sexes. The musenm. oms were open from balf-past aix o'elock,
d numorous objects of architectural storical interest were exhibited. There d models, ans of mechanical printing, exhihited by 8ssrs. Spencer, Sapyer, and Bird, of mdon. Japanese and Chineso works of $t$ were diaplayed, and a atained-glass vinW, having upon it figures of Commerce, dustry, Peace, and Plenty, was exhibited hy asers. J. A. Forreat \& Co., of Lime.street. At
if-past soven o'olock the company assembled the large lecture-ball, when a short intro. ctory address was delivored by tho president, $\therefore$ T. D. Barry. He referred to the origin the Society, twenty-five years ago, when a ating of architecta was held at Clauchton ill, under the presidency of Sir Wilkiam ckan. From the date of the estahlishment the society np to the present time it had con med to increase in numbers, asefulness,
prosperity. The architects of the town had been brought together in one common bond of brotherhood, and the result had been mutual counsel and information, which had been of great bonefit to the memhers. Amongst other advantages which had resulted from the establisbment of the society were the settling of a uniform scale of fees and great benofit to student memhers.
Ir. Edmand Sharpe, F.S.A., of Lancaster, then delivered a lectnre "On the Cathedrals and Monasteries of England," illnstrating his suhject by the aid of the oxyhydrogen light. The subjects wero arranged in chrcnological order, and included his six periods of English architeonannely, the Norman, the Transitional, the Lancet, the Geometrical, the Curvilinoar, and the Recti. linear.
At the
adjonrned close of tho lecture tbe company rooms. At a subsequent period of refreshment they again assembled in the lecture-hall, when a short masical entertainment was given by some of the members and their friends.

## ST. BARTHOLOMEW'S, CIIATHAM.

Silk,-Permit me to remark tbat,-1. Lepers invariably worslippod inside their own hospital therofore their beds siderable distance from the chanel, and a couthe "square openings" in the wall are simply the "square openings" in the wail are simply
the base and jambs of the south windows of the nave, which are not earlier than tbe twelfth aave, which are not ear
oentury, and are higb np.
These facts oan be substantiated by doou. mentary evidenoe. 1n hospitals or maisons dien for the aged or sick, as at Chichester, the arrangement of a nave with aisles containing
heds and a chancol on one plane, screened off at heds and a chancol on one plane, screened off at
its upper or east end, was very different necesits upper or east end, was very different neces-
sarily from that of a lazar house. What use tho outer building at Chatham served is another question.

Machevzere. C. Walcott.
tife failure of portland cement. Sir, -1 n answor to your correspondent, "A Sufferer," allow me to say that, in an article in the Builder, about four years ago, in answer to correspondent
behaviour of to the the fault to the manufaotnrers, and not one at that time contradicted it, stating that they ground it and sifted it too coarse, and in a busy take is to bave the cement in three preckantion I using. Shoot it cement in saoks into a bin under cover, and expose it to tho air, and sift all for fining and finishiug coats through a sieve Whose mest is twenty holes to the lineal inch. Finishing all weatherings, and, where practicable, in one ooat, and if done in the hot weather, be rep in the morning and give the work a good wetting witl a watering-pot or syringe, as the rays of the snn ex
it has time to harcen.
The sand should be woll wasbed, and free from all organic matter, and the best cement 1 cwt . to the strike bnshel.
*** Several letters on this subject wer recsived too late for consideration this week.

THE BLUNDELL-STREET SCHOOLS, CALEDONIAN-ROAD.
Trie new Board schools for Finsbnry, in Bluudell-street, Caledonian-road, have boen schools on the 15th of Febroary of these 126.127). 1t may here be mention (pp. huilding is dosigned for upwards of 800 children, but the exact number which it can accommodate amounts to $830-\mathrm{viz}, 340$ infante, 245 boys, and 215 girls. The huilding contains three atories, with a basement under part of the well lighted ; it is commodions, and thoroughly building is warmed supplied by Mr. D. O. By a heating apparatus lighted in the evening with gas. Mr. Roger lighted in the evening with gas. Mr. Roger
Smith was the arohitect, and the builders were Mesars. Roherts Brothers, of Islington. About $7,000 \mathrm{l}$. was the cost of the building.

## ACCIDENTS.

Fall of a Warehouse in Bristol.-A serions accident haq occurred at the Bull Wharf, Red. cliff. street, Bristol, caused by the giving way of the flooring of an npper room, in which was an immonse quantity of property, the weight of the falling mass carrying away the second floor in its fall. The premiges in queation wero three stories high. The top room contained goveral handred bags of oilcake, and the weight proved too mach for the old timbers, which gave way, flooring enorcaons weignt broke througb the taino i all of which stell ies of oilcake and seed cotton, 100 caaka of tar stout beams, but there bad been indications that they wore yielding to the pressure bearing npon them, and this, together with the fact that the huilding is very old: led Messrs. Danks \& Sanders to have the beams ranning over the principal part of their premisos strengthened with iron girders, and in one place, where the loft passes over their oonnting-house, they had an iron pillar erected.
Mr. Datal Fall from a Seafolding at Macclesfold. Mr. Dnnstan held an inquest at the town-hall on the hody of Edward Turner, brick-setter. Mrs. Turner said that her hushand had complained of a pain in the beart, but he went to his work as with deceased on yrrell said that bo was at work at Mr. Wilbraham's brickyard, They stod on scaffolding 9 ft . bigh. About noon deceased stumbled; in falling be caught witnoss, and they both fell to the ground. Decoased did not appear to be much hurt, but witness was severely hurt on the shoulder. Decersed continned at his work, but oomplained of being ondly shaken. Noxt morning be was found dead in bed. Tho jury retarned a verdict to tho effect that death heing accelerated by the fall on the
death matal death heing
Light in Gas Escapes,-As search was boing made with a light (!) for the whereabouta of an escape of gas in a back room of the Great Northern Dispensary, Marylebone-road, an oxplosion occurred, causing a painter namod Mason to be blown off a wall on to the metals of the Metropolitan Railway,-a distance of some 30 ft . Mr. Bathe, the resident dispenser and assistant, had his bead cut open aud was aevcrely shaken. Tbey were taken.to St. Mary's Hospital, at Paddington. Two womou in the room escaped almost unhart.

SANITART MATTERS IN ISLINGTON.
A valuable report on the sanitary condition of the parish of St. Mary, Islington, during the year 1872, by Charles Moymott Tidy, M.B., the medical offiocr of henlth and food analyst for the parish, to the vestry, bas been printed. The eporter is justly severe on the private slangbterhonse system, as a carse to the poor and a promiam to dishonourahle butchers, since they afford such opportunity for the slanghtering of liseased anders abattoirs, as he remarks, would remedy this. In food investigacases in which ast, Dr. Tidy, found only fonr cases in which bread contained alnm in twenty samples. Hilk, he found, was improving ; and tea in two cases both pnre. Tbe anmher of bonsos building in Islington in 1871 was 492 ; inhabited, n,079; nuinhabited, 2 ,414. In 1861 the nnmber nulding was 551 ; inhahited, 20,074 ; unin habited, 116030 foration nd 116,033 females. Of the houses bnilding in 1871 there were 150 in West 1slington and 342 in East Ialington.

## CHURCH-BUILDING NEws.

Guildford.-The work in connexion witb the enlargement of Christ Church, Stoke, is approacbng completion. On the north side a tower, aisie, heing Messrs, Selaing buit, the contractors heing Messrs. Swayne \& Sons; the architect, Mr. Ewan Christian; and the cost $2,300 \mathrm{l}$. The enlargement takes the form of a lean.to, and ing enlargoment on the sonthe the corrospond. ing enlargoment on the soath aide, tbe building will be greatly out of proportion. It is supposed, however, that in the course of the ensaing summer the reqnisite money will be forth. coming. The old side wall will not be removed till tbe outer walls and windows are finished. When finishod there will be an additional accom.
modation for 250 persons. The tower and spire
when finished will be 120 ft . high, but at present it is only proposed to carry it up to within 6 ft . of the ridere. The remainder of the tower will probably be ereoted when tbe enlargements of the south side aro in course of completion. Tbe inner sides of the walls sh
brick, devoid of any plaster. Chesterton .--The walls of St. Luke's Church are already many feet alore the ground. Messrs, Thoday began work immediately the contract was signed. The chaucel, three bays of the nare, the south transept and aisle, are to built for 2,8002 . decided to acceppt the tender of Messrs. Tboday to add tbreo bays of the north Messrs. Tboday to add tbreo bays of the north
aisle, at a cost of 3102 . This will at once save aisle, at a cost of axpense of a temporary wall, and add conthe oxpense of a temporary wall, and wha contransept and vestry are still noeded to complete transept and vestry are still needed to complete this sice of the charch. It is hoped thas friend will allow these additions to be made before the consecration, so that tho harch of the nave and as far as it goes; two bays or thole design is complete. Estimating tho architect's fee and the clerk of the works at 10 per cont., the sam The estimate abovo the first con tract is whole church is 5,500 ? The estimate for the whol charch is Halesowen.-Somo of the features of the old
parish church were disclosed last year by the removal of plaster and whitewash from the walls, which had hidden for centuries some choice specimens of red sandstone of various shades. A groined roof under the tower showed in this process of oleaning, and has been brought into sight by the removel of the organ to more convenient place. A further stage of the work of restoration is about to be commenced under the direction of Sir Gilbert Scott, and is described in a circular which has just been issued by the committee. It is intended to remore the north gallery and the partitions which now divide the church into two senarate parts, and to restore the floor to its ancient level, furnished with open seats for 800 persons, whereas at present only twenty-four of the sittings are not subject to appropriation. T'be plans for tho present ycar will include a new roof for the nave. Tbe chanoel will also be restored, and will bo adorned with the window presented by friends as a memorial of the late Mrs. Honc. The out. lay is expected to reach 1,500 l.
Halifus.-During tho last few weeks considerable improvement has been wrought apon the interior of Holy Trinity Church in the way of mural decoration. Mr. Binns, of King. cross, has been the decorator. Instead of colouring the walls with whitowash, colours (mostly neutral tints) have been employed, and the resnlt is that some specimens of ornamental plaster-work that have never shown beforo are plaster-work thrown prominently forward for the first now thrown prominently forwe The flat ceiling, 81 ft . by 54 ft ., tbe largest in Halifax, has been traced out in panels, upon a warm grey ground, the dividing bands being relieved hy soroll-work, and the largo contral ornament relieved in gold and blue. Fifteen large circles, with background of dark blue, are charged with various sacred emblems, coloured a bright drab, and a narrow band of dark chocolate running heneath the cornice and impost-monld serve to throw them out more prominently. Tbe ceiling beneath the galleries is also brokeu into panels. The wall in the recess for the Commanon has been decorated, the prevailing colours being dark chocolate and other lighter thades, reieved by diaper.work is
gold. gold.
Holt.-The parish charcb at Holt has beon re-opened for divine scrvice. The repairs and restorations have been carried ont at a cost of
npwards of 4,000 . Mr. John Douglas, of Chester, was the architect for the restoration. The works were commenced in 1871 , the first portion nudertaken being the roof and ceiling of the nave. The latter is carried out with moulded beams, oach end boing supported on carved corbels. The spaces between the beams aro divided into panels by moulded ribs, having at the intersections spaces for patterns to be carved hereaftor. The cornice is moulded, the carring having been omitted for the present. The ociling of the chancel is elaborate. Some portions of the old ceiling were found nsed ap in the nare roof; these were collected together, and nsed again. The whole of the carring in the ceiling has been completed. The aisles have also been re-roof ed, and have plain ceilings
exeontod in oak; the old corbels serving to carry
the new brackets. The old panelled seats havo been removed, the swall portion of the floor remaining taken up, and re-laid with boards under the seats, and 4 -iu. Staffordsbiro tiles in the passagcs. The nare only is seated with oak benches, the elbors bsing of quaint designs. The aisles are for the present seated witl chairs. The colonr of whitewash has heen removed from the walls, and the church has been heatod by the Dervent Fouudry Company. The sone groining of the tower, of which ouly the spriugers were in existance, has bэen completed. The wbole of the windows have been re.paned and re-glazed with iron stanchions and tie-rods. The restoration of the chancel has cost abou 1,000l., tbe expense being defrayed by the Eecle iastical Commissionera, and has been carried out nader the direction of their architect, Mr. Ewan Christian, of London. The cost of the works carried out in the nave, aisles, and tower bas been about 3,0002 . The works were begnn by the lato Mr. J. Harrison, of Choster, but since his duatb they hare boen uudertaken by Mr. J. Lcwis, of Farndon. Nr. Lexis aiso did
Bath.-St. Andrew's Clureh, Bath, which has been built in the wealthy and popnons district known as West TValeot, at a cost of 17,000 . (of which about $2,000 \mathrm{l}$. remain to be raised) has been consecrated by the Bishop of Bath and Welis. The tower and spiro are not included in the present contracts, but tbere is libtle doubt delt on the body of the building bas been
 The style is Early Decorated. The nave ie mprarls of 90 ft low and nearly 30 ft . broad apwaras of 90 ellong, and neany so no. broad, spire, 220 ft . high. Tbe chancel is 40 ft . by 25 ft ., and tbe nave aisles, with porchos, 70 ft . by 17 ft .; the latter are separated from the nave by four arohes alternately clustered and octagonal, and, inke the chancol aiss, are lighted grouped, and shafted. The east wind.ow is one grouped, and saafted. hafed mullions, and the of three lights, wito shatted with foliage in its mouldings. The west window is of two lights, er bich is aide for the statuo of St. An. drew. The stone used is Bath, Ham-hill, blue Corsham-down, and red Bishop's Lydeard, and the different colours give a relief to the work The charch is seated thronghout with open seats, and is capable of accommouating upwards of a thousand persons. The builder was Mr. Bladwell, and the clork of the works Mr. Irvine, who fills the same position at the Abbey Cburch and at Wells Cathedral. The total expenditure up to this time has been about $17,000 \mathrm{l}$.
Blundellsands (Liverpool). - The memorial stone of a new church at Blundellsands has been laid in the presence of a larye number of spectators. The new editice will accommodate 600, and, when completed, will have cost abont 6,000l.; but at present it is not intended to carry out the plans so far as the tower is concerned. The church, which is to be Early Decorated in style, will consist of chancel 35 ft . by 25 ft . ; uave, 79 ft . by 27 ft ; north and south aisles, 79 ft . by 15 ft .; south poroh 9 ft . by 8 ft .; tower at the north.west, 18 ft . sqnare and 65 ft . high, and spire, 67 ft . high ; organ-chamber at the north-east augle, 19 ft . by 13 ft .6 in .; vestry at the sonth-east, 19 ft . by 13 ft . 6 in., with warming-chamber under. The nave will have an arcade of six arches on each side, supported by polishod granite shaits, with moulded bases and carved caps ; the responds at the east and weet ond walls, Abov ported by carved brackets in the wils. circular windows, traceriod. The windows at the north and south of the aisles will be of two highes, flled with tracery. Tbe west wince The west window of the nave will be of large size containing six liohts, witb tracery. Tbe chancel, hich is apsidel at the east end, bas seven tra eried three-light winJows. The floor is raised hreo sters aboye that of the nave. The orcan bamber will open in to the chancel and aisle by means of sto arches. The roofs will be o itch nine party open timbered with a rentiitch pine, party the of nave and chancel arm air on Has. So's pieciple The ronf of the chancel a con the plane of the nave the princinal timbers being carried by stone shaft ising from the gronnd. An ornamental cusped rib will take the place of the nsual ohancel-arch to separate the chancel from the nave. The
valls will be of brick, with a cavity to secur the building from damp in a situation so exposed Tha external facing is of Yorkshire Parpoints oursed, the dressing an of a yellow Storetert nd Grinshill stone arnally the internal stone work being of Bith stone. The gangway between tho seats will be floored with paltern files, thoso in the chancel being of a richer cha racter. The whole of the benches and fitting. will be of pitch pine rarnished. The window: will be plazed with toned cathedral glass and it is hoped that funds may be fortheoming o proride suitable stained glass for the chauob rindows at lenst. The contract has been take by Mr. Hugh Yates, of Liverpool, for the sum a 3,850l. exelasive of the tower, and the work
being carried out from tho designs and undo being carried out from Hessrs. Thomas D. Burr! the superintendence of Messrs.
\& Sons, architects, Liverpool.
Great Berlimuniteal. -Tbe foundation stone o a new charch, to be called St. John the Evan gelist, has been laid in this hamlet, wbich i situated midway between Berkhamstead ant Chesham. Miss Dorrien, of Clifton, generousl: builds and endows the church. Tbe edifioe, it is estimated, will oost 2,2002 ., and its site is on thy green. Tbe laud is given by the lord of thy manor, Lord Cheshaun. The church is intende for tho acoommodation of 235 persons, and it style is to be in Early Englisl, the architec peing Mr. G. Street, London, and the builded Mr. Cooper, of Aylesbury
Sheffield. -The chief stone of a new churoh bat been laid at Abbeydale, a suburb of Shefỉalc The charch, whioh will bo of the Early Eaglis style of architecture, will accommodate aboo 200 persons. Mr. Flockton, of Shefficld, is the architect ; and Mr. Oxmm, of Norton, the cor tractor.

## DISSENTING CHURCE-BUTLDING

 NEWS.Millbroole, Comenall. - Memorial stones of tl: Wesleyau Chapel here were laid on Sept. 3 ro Internally, tbo chapel will be $50 \mathrm{ft}$. long b apse at tbe conmmunion end of the chapel, ir tonded for the choir and harmonium. Ther will be two vestries, and separate vostibule and entrances to ground-loor, and staics to the gallery faoing the reading-desk. The accore modation provided is for 400, tho seating bein feet 8 inches from centre to centre, wit aisles, \&c. of considerablo width. Tue contrac (exclusive of the prorision of storie) has beo. snm of \$83l. Messrs. Moorsheal \& Ching al the arebitects.

## $\theta$ arebitects.

swansea.-The foundation stone of a nen
ace of worship iutended for tho use of tr Calvinistic Methodist concregations of Betban and Vincent.strect, has been laid by Mrs. I Hassey Vivian, of Parkwern. The new chap is to be sitnated at the angle formed by Argyt street and St. Helen's-road, almost opposita t ${ }^{\prime}$ lower end of Brunswick-street. It appears fro the plan that it is to be in the Italian styl, 'he entrance front, which will face St. Helon' oad, is approacbed by a broad light of step and consists of a lofty portico furmed colamns and pilasters of the Corinthian orde upporting a pedimen of the full widtb of th building, the whole front being of Bath ston There will be easy access provided to the chap by three doors, and to the gaileries by two. It chapel will have galleries on threo sides, an will provide accoumodation for about 900 si ers. At the further end behind the minister. platform a spacious organ gallery wil be erecte witb an arched ceiling. Below tbe ebapel the will be a large school-room (which can also kn ntilised for meetings), threo class-rooms, as vestry, \&c.; access will be obtained to thet from side entrances. The huilding is to means 76 ft . by $50 \mathrm{ft}$. , and will cost from 4,0001 . 3,000. complete.

## Bucknall, of Sketty.

Leicester. -The foundation stone of a ne Wesloyau Chapel bas been laid. This obape which is meant to seat from 300 to 350 persone is intended to serve the purpose of a chapel an Sunday school, to a large new Wesleyan chape proposed to be built at sume future perion, the corner of Saxe Coburg-street and Sparker hoe-street. It is to consist of a large roon 60 ft . long by 27 ft . wide, with two class-rooms each 15 ft . by 13 ft ., at one end, and at th other cond of the room is to be provided a galle for a sinall organ and choir, if thought necesear Tho roof is to be an open-timbered one. TI
-ont next Saxe Cobnrg-strcet, is to be built of
annoek Chase bricks, with Bath and red Mans. eld stone dressings, and the style adopted hroughout is that provalent in the early part $f$ the fourteenth century. The building is eing erceted by Messrs. Neale \& Son, from
esigns by Mr. Thomas Barnard, architect,

The sheffield Street Inprovements.-An journed meeting of the Sheffield town council s been beld, for the purpose of discussing the ittee's scheme of street inprovements. The ayor moved the adoption of the minutes of a making of "a now street from the end of irrey-street into Fargate, opposito Orchardeet, and from Fargate across Orchard.place the bottom of Bow•street, and the wideuing Townhead-street, Tenter.strect, aud Westbar. een to Westbar." Mr. Sharman said they were oposing to spend something like two millions money, and the surveyor's commission of 000 l . ; and if the law elerk took his commis. of of $1 \frac{1}{2}$ per cent., which would not he con. in of $1 \frac{7}{2}$ per cent., Which would not he con. aking a total of 50,000 l. The town trustecs ly proposed to give $40,000 l$. The mayor pro. eed the appointment of a committee to conler that quastion, and report to the council. le borough snrveyor (Mi; Holmes) then ex.
tined the scheme in detail, and sa'd he did $t$ think the cxpense would be great in com. rison to the improvement. After'a discassion,
a scheme was agreed to.

Liverpool Royal Infirmary School of Medicine. - The new buildings which bave recently been added to the School of Medieine, opened by Mr. Jobn Torr, DLP. The principal additions and alterations are - a pathological and anatomical museum; a chemical laboratory with a private laboratory and class-room at tached; and a physiological laboratory. The old building has, to a groat extent, been remodelled; the dissecting.room las been considerably colarged, and adjoining it a room
has heen fitted up with osteological prepa. rations, skeletons, plates, and preparations rations, skeletons, plates, and preparations
illustrative of elementary anatomy. A demonstrators ${ }^{2}$ room opens into the dissecting-room, and cvery convenienco in the way of lavatory and drcssing rooms is provided. The old
museum has been converted into a library and museum has been converted into a library and
reading-room for tho use of the students. These extensions and improvements, including tho amount of existing contracts for work not
completed, have involved an expenditure of completed, have involved an expenditure of
$5,326 l .$, a sum which, in consequence of the advance in the cost of labour, and of almost everything used by builders, is largely in excess of the amount whicb tho leccurers, at the com. mencement of their mndertaking, were led to believe would be required. The committce have entered into a contract for fitting up the parts of the moseum reqnired immediately; hut the
Sanitary Report on Northamptonshire \&c.-A sanitary report has been read hefore the central committoe of the combined delegrates, the sixteen sanitary authorities of Northamp. tonshire, Leicestershire, Rutlandshire, and Buck. inghanshire, at a meeting held in the county hall, Nortbampton, on Saturday, 27 th Septem. Ber, 1873 , Mr. J. I. Stratton, of Turweston Hall, Brackley, in the chair. The report was Health of the combined, Mredical Officer of Health of the combined sanitary authorities of
Northamptonshire and other counties. The Northamptonshire and other counties. The
subject of the report was "The Sanitnry subject of the reporl was "The Sanitnry,
Inspectors" work dating tho last six months." The number of parishes, places, sec. visited by 352, so that only sisteen parishes in this exten 352 , so that only sixteen parishes in this exten.
sive area remained unreported. In a sive area remained unreported, In a great many instances these parishes had been visited labour, Or cntalled a large amonnt of physical ealth, there wances detrimental to the probic misance to every $13 \cdot 2$ houses of the 49,609 inhabited houses within the combined area of the sanitary authorities. These nuisances consisted of 932 fou] and offensive privies overrunning with filth, and polluting water-courses, well, and the atmosphere with their sewage ooze and fonl mephitic gases. Nearly all these have heen remedied. Of cesspools 291 were complaincd
only 159 either removed or remedied.
Prizes for Cabs.- The committee of judges appointed by tho Society of Arts canie to the some of the conclusion that, although there were able merit, there were none of sufficient merit to warrunt the judges recommending any for re warrant and a notification to this effect was com. municated to all the competitors. The judges were, however, of opinion, that there were six
which were wosthy of further consideration if certain ohjections conld be eatisfactorily obviated and suggestious for further improvement carried out; and, accordingly, to these six competitors a statement to the foregoing effect was made, with an intimation that if they wore willing to sead in further improved carmigges, the judges would take them into consideration. With reference to the furtber improved cabs sent in hy the six selected competitors, they have recommended that the total amount offered,-viz., 120l.,should be divided equally hetween these four, as
follows:-Two-wheelers-C. Thorn, Norwioh 30l.; Forder \& Company, Wolvorhampton, 30 L Fonr.wheelers-Lambert, 66, Great Ouecn. street, 30l.; Quick \& Norminton, 8, Nether. wood-street, Kilburn, 307.
The Proposed Fine Art Gallery for Liverpool. - The subscriptions originated by Mr Picton, architect, with l,000l, having reached a public mecting has been held, at which it has been resoll nent art.gallery, and, for that purpose, to obtain suhscriptions to the extent of $20,000 l$. A com-
mittce has been appointed, and further subscrip. suons received: in all, 5,870l, have now been subscribed.

Working Nien's College, Great Ormond. street. The twertieth annual meeting of the members of the Working Men's College, Creat Ormond-street, has been held: In Hreat Ormond.street, has been held; Mr. crowded Am, crowcled. Among those present were the Rev. Canon Kinggley, Lord E. Fitzmaurice, M.P., and opening the proceedings, saif that they started opening the proceedings, said that they started that migbt under a new constitution, For eightcen jears they had been under the guidance of a great and good man. Since that time they had endeavoured to establish, and they had been successful in establishing, the reconstruction of the collcge. They were taking a new departure" that night. The great change made was studeney were ablo to tase a grcat number of students into the council, and they hoped that that would very much strengthen their bands, and belp them to carry on the work in the spirit in which it bad heen carried on from the beginning. Tho Rev. Canon Kingsley and otber Gentleman then addressed the meoting.
The Last of another Old City Church.St. Antholin's (or St. Anthony's), Watling.street, is about to be disposed of. The Ecclesiastical Commissioners propose to partially demolish the church, and totally abolish it as a place of worship. The henefice, says the Daily Nesus, is to he united with tbat of St. Mary, Aldermanbury cum.Saint Thomas Apostle, aud benceforward, the five accustomed worshippers in the church at the corner of Sise. lano will have to cross tho road and swell the throng of eight who, Sunday after Sunday, meet in the church of St. Mary the beantiful tower whereof peeps out from amid the cluster of modern shops and offices with which a utilitarian Board of Works bave rutblessly surrounded it. With a portion of the
money accroing from the sale of the valuable money accraing from the sale of the valuable
site, a church is to he hailt at Nunhead. The site, a church is to he hall at Nunzead. Na consideres is to be expended in repairing the former, and adapting it to the reccption of the human remains, wbich lie thickly in the church vaults.
The Erection of Back-to-Eack ENouses.An important question to owners of property in Leeds is now under consideration. The case has been brought hefore Mr. Bruce at the Leeds Town.hall. The town clerk (Mr. C. A. Curwood) applicd to him for an order ng which had heen erccted, as he alleged, con rar'y to the terms of the Act of Parliament relating to the space to be kept open in connexion witb back.to.hack houses, for the purpose of ventilation. In opening his case, Mr. Curwood said this case was intended to he a test one, and it was deemed of so much importance by the corporation that if the law was not found to bo sufficieut to enforce the ohservanee of the requiremente, fartier legislation mast bo Mr. Brace intimated that he should reserve his

Memorial of the late Bishop Wilberforce. A numerously-attended meeting was held in the Sheldonian Theatre, Oxford, to receive the report of the Diocesan Committee as to the form the proposed memorial to the deceased prelate should take. The report stated that several schemes had heon suggested in com. mittee, including the erection of a new cathe dral, the erection of a ncw chapel and addi tions to Cuddesdon College, and other minor suggestions. The meating was presided over by the Bishop of the diocese. A long discussion took place whether there should not be memorial in Oxford in the shape of a college for the training of students for missionary work; but eventually it was decided that the form of memorial should be in the erection of the proposed chapel, and a committce was appointed to arry out the work.

Africa and Life Assurance. - In some reeent remarks upon the hardship inflicted upou afficers ordered to the West Const of Africa, at the risk of death, it was suggested that even hose who possessed lifo assurance policics were compelled to forfeit them upon being detailed or this dangerons service. We are informed that this impression is erroneous with regard to "he policies issued by one old.established office, The Mntual," of King-street, Cheapside. Siuce 1868, "The Mutual" has guaranteed its policy. holders against al! risks of foreign travel, and every other contingency, without extra preminm, in every case where the policy is five years old, and the bfe is thirty.

New National Schools, Amersham, Bucks.-On the 30th nlt. the ahove block of buildings was formally opened hy Dr. Bicker. steth, the Archacacon of Bucks. The reoms comprise boys' and girls' schoolrooms, each 46 ft . by 18 ft ., with class-rooms, each 14 ft . by 15 ft ., infants ${ }^{2}$ room, 32 ft . hy 18 ft. , hat and cloak lobbies, porches, \&c. The site is 3 roods. The materials are of red brick and freestone ; the roofs are tiled, and surmounted by a lofty bell-turret. The accommodation prowill be ahout 1,650 ., including all fittings, fencing, and a small detached school for thirty infants at Woodrow, an outlying part of the same parish. The works have heen executed hy Mr. Ceorge Reavell, of Windsor, from the designs of Mr. Arthur Fernon, architect, High W ycombc.
What British Irommasters are Doing.Under this titlo a contemporarysays:-A numbor of British ironmasters have just acquired nearly twenty sqnare miles of property in the Wharekawa district, in the province of Anckland, New Zealand. The property embraces 8,700 acres of coal and iron-stose. The chief seam of coal is found in somo parts within a fery yards of the turface, as thick as 20 ft., and it is computcd to be capable of yielding an average thickness of 10 ft . throaghout the whole 8,700 acres. This represents ne less than $126,000,000$ tons of good coal. The ironstone is of the brown hematite class, and contains as high a per-centage as 62 of fine iron, and is believed to yield an average of 50 per cent.
Sanitary Progress. - An anonymons donor bas placed a large sum in the hands of the conmittee of the Birmingham and Mid. land Institute for tho foundation of a Lcc. tureship on the Laws of Hoalth, and alse for A prize fund in connexion with the class. According to Nature, $\mathrm{Dr}_{1}$. Corfeld has been offered the post for this year, has accepted the Town - ball, Birmingham, on Tinursday, the Town - ball, Birmingham, on Thinrsday, October 9th, at 8 p.m., on "Sanitary Progress." The course will begin on Tuesday, October 1 eth, at 8 p.m., and be continued on succeeding Tnesdays natil some time in April. it is intonded more especially for the working clas

Workmen emploged in Private Houses. At the Guildhall Police court, London, a workman has heen convicted of committing a robhery at the place where he was employed by a bailder in the execution of some repairs. Sir R. Carden asked whether a character was given hy the prisoner before he was engaged, and the reply being in the negative, becalise "it was not the customs," the Alderman spote strourly upon racher a state of things, and said that rospectable buch a state of things, and said that buiders ought to be more carefal of the property of gentlemen who engaged them, than to premises.

A Public Library for Worcester. conference has heen held is the Gaildhall, Wor cester, nnder the presidency of Mr. A. C. the steps to he taken in Worcester for the adoption of the Pablic Libraries Act, when it was resolved that an effort be made to secure the adoption of the Act for the city of Worcester, and that a subscription be set on foot towards defraying the cost of huildings, fittings, and derraying the cost of huildings, A committee was appoiuted and em. powered to carry these resolations into effeot.

A New Pick.-Mr. J. Roidy, of Kennington, has produced an improved pick-axo for excavating and other pnrposes. By the introduction of a socket-head on the end of the shaft of the pick, a taper hole passes through the head and bandle, thronch which a cast-steel blade or tool can be put and taken out at pleasnre, at a saving of time and expense, as a number of cast-steel blades can be taken with the pick, The blade
will resist the hardest snbstanco, and the head or body will awways remain fit for use.

The Jersey Banking Company's New Premises.-The street architecture of St. Helier's will be improved by the new bank premises in progress. The materials are grey and pink granite, with Portland stone dressings. All the capitals are curved. A cornice extends the whole length of two sides of the brilding The carving has been done by Mr. Harry Hems, of Exeter, and assistants. The builders are Mlessrs, Tostevin \& Fallaize.

Sewage Farming in Gemmany. - An enterprising Scotsman, named Aird, has lately undertaren to introduce the sewage farin system
into North Germany, and has leased for thity into North Germany, and has leased for thinty
years, at 1, 200l. a-year, 2,000 acres of sandy years, at 1,9002. a-year, 2,000 acres of sandy waste which lies between the Baltio and the port of Dantsic. On this hitherto barren spot he is now carrying on operations vigoronsly 200 acres hare heen levelled off, supplied with scwage in the liquid form, and put into root and garden crops, which are visited daily by curious crowds.

Builders' Hand-power MIachinery, - At the recent meeting of the Manchester aud Liverpool Agricaltural Society at Chester, Repnos Reynolds \& Co., of Southwark-street, for hand porer machinery. issued a cataloguo containing numerous illnstrations of their varions lahour-saving hand illnstrations of their varions lahour-saying handpower machines, and they shew their confidence in these numerous inventions oy ofering to purchase.
Dunfermline. - New Works, - Building operations aro being carried on in Dunfermline at prosent on an extensive scale. Among other haildings in courso of erection there are damask manufactory (which is to be fitted ont with 300 power-looms for Messrs. R. E. Walker \& Co., at Gardeuer's Land; a foundry at Whitomire, a hrowery at Grantshank, and an office fo the Natioual Security Savinars Bank in Viewfield the Natioual Security Savings bunk forter Grievestreet is also contemplated,

Gift to Warrington,-The local Guardian states thiat an addition is about to he made to the recent gifts to this town of 9,0002 , by Mr. George Crosfeld, and 3,000l. by Colonel Wilson Patten. Mr. Hatton, of Hatton, to whom War. rington is alceady indebted for the gift that laid the foundation of a hospital for the town, has oxpressed bis iatention of giving another 5,000 l. for the support of the hospital.

Cool-cutting Machines.-By tho patent of Messrs. J. H. Stubbs and G. H. Cottam, of Eunslet, near Leeds, the cutting-tool has a simultaneonsly reoiprocating and rotary motion imparted to it, and cuts preferabis spirally the fromework monnted on a tram, and the tool moved forward by self.acting or other means. Motion is imparted by any suitable motive power.

Durham Cathedral.-In addition to the everal stained-glass windows which have already been inserted in the nins altars and sonth transept of this cathedral, it is understood the Freemasons of the city are ahout to place a window in the nino altors, in memory of ir. Joh about to add stained windows to the sonth aislo whilst other probable gifts are mentioned.
"Self-Felp" in Japanese.-A Japanese ranslation of Mr. S. Smiles's "Self. Help" has been madc. The English work forms an octavo of moderate size. In Japanese it has expanded into a hook of 1,500 or 2,000 pages. It is not hound after the modern European fashion, bat ncatly, hut loosely, stitched with one silk thread
The Slums of Drury-lane,-We hear, with more regret than surpiso, that typhus fever is prevalent in Lincoln-court, Little Wild-street, and Great Wild-street. Readers may rccollect on description of these and smrrounding places some jears ago, and the warning given.
Reports on Vienua Exhibition, -The volume of Artizans' Reports upon the Viemna Exhibition, published by the Society for the Promotion of Scientifie Industry, Manchester, will be issued about the 20th of this month, There are thirty-six reports.
Bridgwater.-Mr. Hippisley, surveyor, of Wells, has been appointed by the town council for the purpose of surveying and preparing an estimate of the relative cost of establishing the proposed new cattle-markot at Blacklands, and in the corporation field in North-street.
Proposed New Grol, Bristol.-The Bristol town council, at their meeting last week, purohased, on the recommendation of the gaol and
hriderell commantee, the site of a now prison to hridewrell commitee, the site of a now prison to
be erected on the Horfield-gardens for the snm be erected,
of $3,575 l$, - 1 ,

VOL. XXXI.-No. 1602.

The Money Spent on Buildings.

X no means the least interesting portion of the returns of the last census is that which has reference to the places of abode of our population. By help of the facts thus ascer. tained, we have been enabled to arrive at a more accuratc knowledge of the extent and value of house property in this country than it would have been possible otherwise to obtain. It ia not every one, however, who lives in a dwelling house. As a matter of fact, very little short of half a million Englishmen appear babitually to resido elsewhere than in ordinary dwellings. They are mostly found in what may be called the publicinstitutions of tho country. A considerable number have their places of abode on board ships, or in barges and boats; others, who may be callod the houseless class, appear to pass thoir livos with no better shelter than a tent, a caravan, a shed, or barn; and some have not even this amount of protection from the inclemencies of seasons, but sleep more or less frequently "uncler the open canopy of heaven."
As a pendant or sapplement to what we said on former occasiona respecting the dwellinghonses of England and Wales, we purpose bere to summarise the leading facts with regard to the public institutions of the conntry and their inmates, and further to add what is known of that class of the community which may be called the vagrant or houseless class. At first sigbt the houseless class wonld appenr to be the worst class of enstomers which builders have; but if we consider that it is from ragrants and vagabouds that the inmates of onr prisons, reformatories, casual wards, \&c. are largely recruited, it will be seen that, outcasts as they are, they are not withont a certain amount of interest for the huilding trides.
Out of 22,712,266 persons enumerated in England and Walcs, on the 3rd of April, 1871, the namber who did not pass the preoeding night in ordinary dwelling.houses, was not less than 491,671 ; the number returned as sleeping in ordinary dwellings being $22,220,505$. Of the 491,681 persons just mentioned, 404,125 were living in the various classes of the public institutions of the country, 213,637 of the number being males and 160,588 females. The remain. ing 87,546 persons include all those who passed the night in ships, in hoats, in sheds or barns, in carts or caravans, in booths and tents, or in the open air.
The number of public institntions in this country is retnrned at 2,383, and the total num. ber of their immates, as just stated, was $401,125$. -The largest class of public institutions is that which shelters onr panper population. The worl-
houses and workhousc indnstrial schools were found to be 740 in nnmber, and the total number of their inmates was 151,967 , of whom 82,539 were males and 72,428 feraales. The officers of this class of institutions number 6,903 , leaving 148,064 as the actual namber of pauper inmates. Next to the workhouses in number come the hospitals, or charitable medical institutions of various classes. Of these there were 407 in all, and the aggregate number of their inmates was 26,566 , of whom 6,708 were officers, and 19,858 putients, $11,7 \times 9$ being males and 8,069 ferales. Another class of public establishments fewer in number than the hospitals, but with a far larger number of inmates, is that which includes the barracks, forts, and military depots. The total mumber of tbese was 25.5 , and their occupants numbered no less than 94,404 . The actual nnmber of soldiers, however, was not more than 68,518 , the residne ( 25,856 ) comprising the wives and families, and civil servants of the private soldicrs, or of the commissioned and non-commissioned officers. Less numerons than the military establishments, bnt with more inmates than the hospitala, are the lunatic and idiot asylums of the country. The total number of these was found to be 166, and their inmates, including 6,514 officers, numbered 45,731. The total number of lunatics and idiots was 39,217 , of whom 18,524 were males and 20,693 females The next class of institations to which we come consists of the prisons. Excluaing mere polico stations, the prisons of England and Wales were found to nnmber 1-19. The aggregate number of their inmates was 32,17 t. Of these, 2,988 were prison officers, learing 29,186 as the actual number of prisoners, 23,519 of wbom were males and 5,667 feinales. The reformatory and industrial schools for the reception of youthful offenders numbered 118, in which tho charitable and workhouse industrial schools, not being of a penal character, are not included. The iomatcs of these 118 institutions numbered in the aggre. gate 11,748 , of whom 1,150 were officers, and 10,598 juyenile offenders, 8,209 being boys and 2,389 girls. We have now accounted for all the public institutions except 599, which form a miscellaneons class, comprising principally orphan asylums, and asyluma or schools for the blind and for the deaf and dumb. In this miscel. laneous class of cstablishments there were 38,535 inmates in all, of whom 5,115 were offieers, and 33,420 special inmates,-that is, 14,750 males, and 18,670 females. Besides the 2,383 public institutions tbus far described, wo find that there were ninety-six ships of tho Royal Navy occupied on the census night by $13,45 \cdot \mathrm{p}$ persous, of whom 13,404 were naval officers, seamen, or marines. It appeats somewhat to strain the ordinary meaning of terms to classify her Majesty's ships, as the consus anthorities have done, as "public institutions"; but, if we accept this mode of classification, we get a grand total of $2,4 \mathrm{t}^{2} 9$ public institutions, with a grand aggregato of $4 \cdot 17,579$ inmates, most of whom are maiatained out of the local or national tasation, the remainder being snpported by private charitable subscriptious and endowments. The average number of persons in each of the public institations of the country is 168 , or about thirty-three times as many as live in an ordinary dwolling house.
Many of these public institutions are costly and palatial structures, and almost all of them are more solidly and substantially built than ordinary dwelling-houses, except tbose of the very best class. We shall hardly be thought extravagant if we estimate that it costs twice as much per head on the averago to house the inmates of our public institutions as it costs to house the population generally in ordinary dwelling-honses. The average number of persons residing in each house in England and Wales is five, and, as the average cost of a dwelling-house bas been estivated a

2502 ., wo get $50 \%$. as the average cost per head of bousing tbe populationindwelling honses. Granting that it requires donble as much per head to build for the inmates of our pablic institutions, it follows that the 40 , 125 persons of this class, we exclude the Royal Navy from tbonumber in this calculation,-have cost the country, according to the prescut value of money, mpwards of $40,000,000$ l. sterling to provido them with tho edifices they occupy. If our builders had to erect dwolling-houses for the same number of our ordinary population, the worls would be done fur half the snm , or $20,000,000 \mathrm{~L}$, -an inference which wo may leave to speak for itself.
We now pass on to the figures which have reference to that portion of our popnlation whicb passed the night before the census neither in ordinary dwelling.honses nor in publio institutions. By far the greater proportion of these persons were afloat. We have already spoken of the Royal Nary, in which 13,451 persons passod the night. Besides these there were 63,709 persons who slept on board other vessels or boats on the nirht preceding tbe census. Of this number $33,5 \cdot 17$ slept on board British seagoing vessels; 12,545 on board foreign and colonial vessols, and 6,641 on board fishing smacks and vessels engaged ohielly in river navigation. In addition to these there were 10,976 persons on board barges and boats on canals and inland waters. Oar total floating population, inoluding the Royal Nary, numbered, therefore, 77,163. So macb, then, for tho population alloat on our waters.

With regard to that portion of our population which may be called literally bonselees, it is gratifying to observe that their numbers are not only small in themselves, but they show a oon. tant and gradual diminntion as compared with previous conauses. In 1851 they numbered in the aggregate 15,764 ; in 1861 they fell to 11,444 ; and in 1871 to 10,383 . In 1851 the number sleeping in barns and sheds were 8,105 ; in 1861 thoy fell to 4,314; and in 1871, to 2,35s. In 1851 those who passed the night in oaravans or tents, or in the open air, numbercd 7,659; in 1861, they were slightly reduced, viz., to 7,130 ; out, in 1871, the numbers rose to 8,025 . As the selatter two classes iuolude not ouly the gipsies and travelling hawkers, but persons attending fairs, races, \&c., in addition to common tramps and vagrants who had not time to reach a casual. ward or common lodging-house on the night of the census, their number, with our popalation of about $29 \frac{\pi}{4}$ millions, can hardly be thought excessivo.
Our population afloat, on the ether hand, has considerahly increased of late years. In 1851 the acgregate number of persons sleeping on vessels of all kinds was only 57,857 ; in 1861 the number rose to 71,345 ; and in 1871 to 77,163 . Between 1851 and 1871 the num. ber on board fishing-smaeks aud river-vessels, so far from increasing, fell from 12,562 to 10,976 . At the same time those on barges and boats decreased from 12,562 in 1851, to 10,976 in 1871. On the other band, the numbers on board the merchant.ressels and ships of the Royal Navy rose from $38,1-16$ in 1851, to $59,5.46$ in 1871, the increase being almost entirely in vessels belonging to the merchant aervice. This increase in our douting population, concomitant with a decrease in the houseless population on land, is a fact upon which this country may congratnlate itself; and the large increaso in the floating population on sea-going veasels is ouly what might be expected from the vast development of our forcign commerce within tbe last twenty years.

The late Sir William Tite.-The Bulletin of the Société Centrale des Architectes (Nos. 5 , 6,7 , and 8 ), for 1873 , contains an appreciativo notice of our lamented countryman, from tbe pen of M. Chas. Lncas, avowt dly oondensed from the memoir given in our pages.

SOCTAL SCIENCE AND ITS DIFFICELTIES.
Surefry the Social Science Absociation is doing good? We do not helieve that even the writers who seem to feel a pleasure in throwing a stone at it think otherwise. Its effoct on
public opinion is very considerable, and always public opinion is ve
The judicial impartiality with wbich Lord Moughton spoke of so many of the most boily debated snbjects of the day, in bis inaugura address, some extracts from whicb appeared in the true philosophic tone of the listorian to the true philosophic tone of the historian to
contemporary events snch as it is rare to meet. But the very charm of the address leads to tbe But the very charms of the address leads to tbe
reflection, how vast is the field which it is reftection, how vast is In field which it is attempted to surveg. In science, although the
various provinces are as yet undefined by any various provinces are as yet undefined oy any
such oentral authority as might assign the proper extent and relative importance to each, there is yet that positive reality attending eaoh distinct pursuit that constitutes it, so to speak, as a
species. The animal and the vegetahle kingspecies. The animal and the vegetable king-
doms eacb presents an onormous field of research. Classification, on some principle or other, is a necessary step in the acquisition of knowledge by mankiud. Until facts aro arranged on some
theory, good or bad,- pigeon-holed in tho mind, theory, good or bad,-pigeon-holed in tho mind,
-they form mere looso materials for future -nowledge. The hest naturalists are the most fally aware of the immense difficulties that lie in the way of altimate philosophic classification.
The units which have to be shaken into form by a purely scientific tribunal, such as that of
thie British Association, are, like the the British Association, are, like the species of the organic kingdoms, tangible and definite. But when we come to the mere vague, if more
lofty, subject of sociology, there is a far creater uncertainty as to the elewents with which we deal. The more reasor, theu, for examination and discussion.
While jnrisprudence, in its elements and history, is a very well-defined and important branch of higher education, and as such, comes naturally within thepnrview of the Association, the kindred
question of the amendmuent of itself so vast, demendinent of our laws, is one in ledge of history, of human nature, of jurisprudeuce in general, of Englisb law in particular, of what is possible in the actual state of public opiniou, aud fually of what is practically desirable, that any sound recommendation on tho subject must bo the outeome of the bost thought and Widest experienco of a picked number of opponents of the Association, that tho course say legislative change, wbether in our own country or in the civilised world in general, can bo annually passed under revierv by a section of a committee that meets for a few days in a year, and can thus bo relegated to its proper place in a general estito the object of the Association hardly compatible witb tbat vigorous grasp of detail from whicb alone real progress is attainable. They the work of the Association (which holds that it a society established purposely for the withiu it a society established purposely for the amend the country, but goes on by means of departthe country, but goes on by means of departduring at least nine months of the year. Trnch that is admirable to the frence" bas in it so mnch that is admirable to the friends of humanity, that it is no matter of surprise that tho hounds
of the survey attempted by tho Congress should be regarded as sonsewhat undefined. Bnt we tbink the more this tendency to goneralize is checked, the more tangible are the results that
may be expected. For the Social Science may be expected. For the Social Science Association to take that position, witb relation to the
British Association, at which its snpportsrs may be considered to aim, it between the subjects of its research, and those proper to physical and chemical scienoe.
from thustration of our meaning may be taken desponding as they were, on the subject of samitary science :- No practical progress, I fear, bas been made in the vexed quostion of sanitary reform. Day after day it comes before us illustrated with fresh disaster and moral difficulty." No donbt this is, to a great extent, true. But why is this the case? It is mainly hecause twose steps which must precede any as jet been taken. It is legislative action which is contemplated in the address, and the mode in which the influence of the Association is most
neefnl will be by diffusion of such a sound dispute so much as tothe main laws of the atte knowledge of the subject as shall pat a moral but before tbis knowledge can be diffused, it has to be attained. The chemist and the engineer has yet very much to say before we are ready to call upon the Legislature for final action. Of dit coce Thinge this natre ans pabsolutely hy step. The great thing is, to seo that each step thereto be firmly planted, so tbat it need never be retraced. It is of far more importance tbat his sbould be the case than that the step taken year after year should be at the extreme limit of the stride. Bat the broad fact remains, that many of both tbe scientific and the economical questions are still ansoived. Our acconnts of what look place in the Chemical Section of the British Association show that very material points are yet in debate. As to the pollution of rivers, the demands of the trade of Bradford show how complicated is the question. Men of science have not yet agreed what, regardless of expense, are the bost means of preventing any danger of certain fotom sewage. They have arrived at others nore Men of agricultaral experience aro far commercial results of the various methods of utilising sewage. At these points we are now at work. We believe that our progress is materially hindered hy the eupineness of the legislature, and the administration, whicb has endea voured to throw on ignorant country hoards a responsibility from wbich the special adviser paid hy the nation to help thera in the matier have steadily shrunk. In such a matter as that the pressure of public opinion might be very advantageously called into play, hy such a meeting as at Norwich. But the necessity of drawnolitical he hetween the scientinc and the says,-" I have not got to the bottom of this question !" Medical science zays, "It is question of life and death to us all." What can social science say? Only this,-"Let uspeople and Government,-see that every aid is given to the men of science to get to the bottom of the question!" Tbat aid will hest be given, not by advising every one to go to work in his own way - ten or a lundred men pursuing an inquary which conld satifactorily he carried out by one man, with a knowlodge of what was done lsewbere, while perhaps twice the number are engaged in experiments whicb have been made ver and over again with definito results. Th object of the cowmittee of the British Associa ion is to register and to advance this positive Enowledge. The Local Government Board could have done, and we think ought to bave done, far nore than lies within the power of tho com nowled We think that this pursuit of positive knowledgo, and cowmunication to the country of such positive kuowledge as is irom time to time socal God, became one of the first duties of the ocal Government Board from the moment that they attempted to toucb the sanitary question the And we tbink that in this respect the artion of the Social scienco Association may b Wdrantageously, because specially, directod.
We think that theso views are in full accordhairman of tbe Congress at Norwich. In hi lance at the cradual transformation of moder ociety, and the history crime, Lord Houghto poke of the want of certainty of the philosopher, ppetites ncidents of tempens, hopes, fears, and all other dents of temperament and will., Tbat this ho case has been the confessed dificulty of But a light bas been throwne on the sabjec which does not fall on the pages of the ethics or politics of that wonderful man. Human knowedge, in his day, had not so far outgrown individual grasp that that light was absolutely necessary then. But considering the enormous buk to which the modern Cyclopedia has swelled, he only hope of positive advance, except in snbordination of the sciences. By a steady progress from the universal, absolute, aud posi-,-as logic and mathematics,-to the mastery physical, and tben of chemical science, we rouud, however laborious he the parallels by rich we approach tho fortress. It is bocanse we attempt to jump at the higher aud more complicated truth, beforo we have exhanstively mastered the more simple and general, that we
dispute so much as to the main laws of the latter, was next mentioned as the ouly novelty in was next mentioned as the ouly novelty in public administration. The only point of view
from which this great national subject rom which this great national suoject was posed absorption of the railway property by the posed absorptiou of the railway property by the
State. As to this, we exposed what appeared to ns to he the decisive elements in our numher for April 26th last. It should seem, however, that if it bo the ohject of the Social Science Association to indicate tbose points to which it is most urgent tbat the attention of either the scientific or the practical intelligence of tbe day should be directod, it is to the explanation and the prevention of that terrible series of railway calamities and offences wbich, since wo last had (seasion to refer to the important suhject (see p. 697, ante), has come upon ns like a swarm of hornets. The mechanical means of preventing these accidents we do not hold to form any portion of the sabjects into which the Association has to inquire. But the higher question of how the responsible managers and directors are to bo bonnd over to avail themselyes of the services of suience, and of bow far jadicial penalty or pubbe indignation should come into play when that over-ariving of tbo tion anel or a line to wbich so large a proporis to be traced is dotected might well form the subject of inquiry.
Under the head sessiou another of
he Licensing Act of last of those contributions which Science progress is ever offering to political to the remarks as to the medical character of drunkenness. All tbat can be imagined as to the moral and material part of the story has been said, we should conceive, over and over again, in every imaginable form. A mild fanaticism has been called into play; and under the name of temperance, and in dcspair of the thainnent of that mothor-virtue of all virtues, nthusiastic men, shocked at the terriblo evils to onfore them in the face, have endearoure by compnlsory legislation. It is a philosophical romark that "a national love for stron $\boldsymbol{c}$ drinks is characteristic of the nobler and more enorgetio populations of the world." Wo besitate to uote the remainder of the sentence : and think it well to indicate the opinion that it s not an "instinct" in these races, altbough it may spring, to a great extent, from the same source as tbeir "pablic and private enterprise." Observation of the habits of the Englisb work men in different parts of the world, not only in every province in England, but in Ireland, rrance, and Italy, leads to the conclusion that the babit, and thus the love, of strong liquor is n its origin a matter of clinate. Take au anglish navvy to a southern climate, and he either becomes sober or is carried off in a rery form of alcobolic death. We aro not speaking t random, but from a personal experience whicb vill be confirmed by any Englisb physician familiar with the subject. The Italian is not, one may well believe, a naturally more terapeate man than the enghishman or the scotch nan. In self-coutrol, as far as the passion of anger goes, he is far their inferior. But he is habitually tempcrate, because if be takes what in some parts of onr island wonld be thought a contemptible quantity of alcoholic drink he entirely loses his reason. He runs a risk of fever, - which wben treatod by an Italian doctor usually means death, -on the oue hand, and of incarceration for some frantic folly on the other. Result, - ho does not drink. Thus the sugges. tion of Lord Fonghton as to the possible advan. age of the medical study and treatment of ntosication is one to which we are disposed fom exporienco to attach much weight. It orcorer, an admirablo illastration of that hich we rentare to suggest to bo the most emunerative line of inquiry that can be adopted by the sapporters of the Social Science Associawhich the attention of men of special science can be most advantargeously directed.
From this subject the transition was easy to that of prisons and prison discipline, and to the remoto danger that it may some day become lain to the agricultaral workman, if not to the peratives in the great manufacturing towns, how greatly they would improve their diet, easy process of becoming criminals; a danger whicb Lord Houghton intimates has lieen very
sensibly felt with regard to the young. But in apeaking of the legislation of 185 I , and of the Jnvenile Offenders Act as the commencemen of legislative reform in this direction, Lord Houghton bas omitted an earlior and a morc important change. This contury was very young when the late venerated Dr. Lushington the lato Josiah Conder, William Allen, and few of the early heads of the grent anti-slayery party formed the Prison Discipline Society. In those days human lifo was weighed agains the life of a slieep, and was thought nothing of in comparison to the safe-keopiag of a horso It was the fact of the frequent cxecntion 0 children of so tender an ago that it was necessary for them to be donblo-ironed in order to allow the grallows to do its fatal work, and evon then the executioner was of ealled on to come in aid, that moved the warm hoarts of these disinterosted men, and thus lod to the advocates of red-handed justice (as judicial advocates of red-handed justice (as judicial
murdor was callod). This victory left a cum. murdor was callod). This victory left a cum-
parativoly casy task for the subseqnent roparatively casy task for the subseqnent re-
formers of juvenilo offenders and thicir treatformers of juvenilo
mont to accomplish.
From the prison, by an easy transition, tbe From the prison, by an easy transition, the
speaker approacbes the workhouse. It is a speaker approacbes the workhouse. Ind a
mattor of very groat satisfnction to find a mun matter of very groat satisfnction in the position of Lord Houghton,-an elevated position which enables him to see so much furthor than men who are too fully oecupied with the demands of daily business, and a man Who has strong reasons to speak well of "the bold Act of the Whig Government some fifty years ago," in its offort to check the spread of pauperism, - admitting tbat a "well-foundod apprehension exists in the minds of intelligent men " that "the primasy virtnes of the working classos are discouraged, and even turned into
disqualifications by our Poor Laws. Thrift, cleanliness, and "henesty," said Lord Houghton, "are not only no claims to poor-relief, but they are impediments to the receipt of it." A law that las this result is oue that relies for its support, not on the best, but on the worst tendencies of liuman natnre. The result of relying on such a basis is ultimate destruction; and the destruction of the law itself, or of the socicty which enforces that law.
As to competitive examination, we cited the sny that, while he recrarded the question o patronago, it should not bo lost sight of that thon is an opposite, and porhaps o greater, dunger, -that of c\%rm. Anstrin is called, en the Contineut, the poy/s if l'examen; and the compe-
titive system there is cembined with tho lowest degree of genotal culture fonnd anywhere in Errope, except in this country, and in tho Staces of the Cliarch. Such,
the tostimony of onr blue books
As to co-operation, and the [and laws, wo hruve alrondy quoted the addross. Wo ernnot, howevor, lay down the pen withont observing the evidence ef a deep conviction, wher impliod portion of the remarke, and which is especially worthy of notico, as showing the presontment of the speakor. It is a conviction that has long been forcing itself on the minds of thoughtiful tipetly or so appropriately brought before the tinctly or so appropriately brought betore the to the danger of the destruction of liberty by the exteusion of freedon. We do not wish to the exteusion of freedon. We do not wish to put the matter in fewer words. We can bardly busy for yoars in removing certain barriers that wore thourcht to interfere certain barrjers that wore thought to interfere with freedom of individnal action, especially among the working
classes. We cannot aveid rocognising and regretclasses. We cannot aveid rocognising and regret-
ting a coincident spread of the spirit of despotism, ting a coincident epread of the spirit of despotism, vidnal energy and talent to rnles proseribod, not vidnal enorgy and talent to rnles preseribod, not
in the interest of society, or of the bost members of society. Wo need not enter now on a snbject which must waken an nnconifortable sort of echo in the bosom of many a thoughtful man, but wo regard it as the great danger to which the develnpment of the secial life of the remainder of the present century is most obviously exposod; and as thas one worthy of tho most serious oonsideration of all students of social science.

Architectural Association.-Tbe conversazione to open the new session will be held on

A FRENCH TREATISE ON HEATLNG, VENTILATION, AND WATER-SUPPLY.* Anour four years aro we noticed tbo pnblica. tion of a French treatise on heating, ventilation, and distribution of water in privato houses The author of this work, M. Joly, has since revised and added to his stores of information elating to these subjects, and the result of his elating to these subjects, and the resurt of research is now bofore us in a second edition. A hundred and fifty diagrams econd edition. A to explain the toxt of tho first edition but this number is now increasod to 375 illustra tions. The letter-press has been augmented in the same proportion. It is not the goneral public, we learn, that has encouraced M. Joly to launch out again on this enlarged scalo, but the approbation of a fow frionds of progress. $A s$ a matter of fact, French society has neod of many pronchers and teachers of sanitary know. ledgo, but has fow ears or cyes for thom at prosent. The holiness of cleanliness is not gonerally nuderstood across the Channel, nor even familiarly acknowledged. It is quite truo that a perception of its virtue is gaining ground among les anus du progres; but it is oqually cortaiu that M. Joly has a wido uncultivatod field before him, in which his labours may bo of great value, As on this side of the 'Straits of Dover, there are builders at work who have but o comect on,-Co wit, prosk, -aim with desiro to promote the health and general well. being of their follow-croatures. The number of beams among oursolves preveats us from closoly obsorving Continental motos; but, with due sonvch, they are to be scen in every possible variety of indifference to sanitary appliances, as M. Joly assures us. But it is not only with what is, and what slrould be, that the author doals. He shows us what has been in different sanitary departments, and thus gives autiquity to a scienoe generally considered new. There is nothing new but that which has been forgotten, he urges.
Heating comes under observation first. Heat is a different thing to different people. Tbo plysician, cbemist, or physiologist and machinist tako opposite views of it. To the one, heat is the resuit and not the cause of movement, and ion and natrition. and to protuced by respira canse of action aud not tho rosult. M. Joly' canse of acdion and no ity dispute its existonce altomether. "For ws" he dispute its existonco altogether. For us, he sively to our orcmans. To malso myself reta. understood, let us supposo three vases, $A, B, C$, anderstood, let us suppose three vases, $A, B, C$, the second, $B$, water at ordinary temperature, soit $+12^{\circ}$ i 15 , water at ordinary temperature, $+40^{\circ}$. If any one placed his right hand in the vase A , aud the left hand in tho vase C , he would have a simultaneous sonsation of heat and cold; he afterwards placed both hands at the samo rotes would be reversed, the right hime would rotes would be reversed, the right hand would
experieuce a sensation of heat, and the left a experieuce a sensation of heat, and the lett a
seusation of cold. Howevor, in the second case, it is the same wator in tho sarne state which produces the tivo differeut sensatiens, following tho preparation whioh we havo made our hands underge." From this fact, he argnes, that boat does uot exist for 11s, and that all we neod do is to study its eflicts upon matorial bodios. And then he procceds to discuss rays, reflection, and transmission; the dilatation of borlies; the of bodies; tho necessity of artificial hoat; cons. bustion; combustibles; smoke; the allumante of fire ; and erory otber department of the question. Air and water next occupy his attention, with all their intricacios. "As the air, so the blood," however, is the pith of all that can be said of the first. The importance of a good sapply of water, under the various headings of baths, roservoirs, eisterns, filters, glacieres, narmites, norwegiennos, and other details, is not so onsily condensed into a few words. We pass by tho sufficiently full accounts of all thoso contrivances to look more especially into SI. Joly's chapter on the chaufage des apmatements, or, as we might pat it, on the rival modos and materials put all his strength into this soetion of his work To understand our present position the better the oarly modes of heating are reviowed, begin.
"Traité Pratique da Cbauffirge, do la Ventilation, et de

aing with the armful of faggots lighted in the centre of the floor of the huts of our remote predecessors, past the hypocausts of the Romans the open fireplaces and climneys of the Middle Ages, down to the stoves of the moderns in their perplexing variety. Those diferont con. trivances are all illussrated from actual examples. The grand mantel-pieces and admirable chimneys of some of tho old chattcaux and abbeys are extremely pictorinl. They all lead np, ingeniously, to a chemine perfectionnée, systome V. Ch. Joly, or to a perfected chimney designed by the author. This is framed upon the conditions announced by Franklin, in 1714 , be rementing a medel freplace. of an open fire with those of different kinds of stoves, to olbtain the evacuation of ritiated air, the introduction of fresh air at a moderate temperature, and eoonomy in the consumption of the chosen combustible. IC. Joly believes he has made considerable progress towards combining all these requisites with of hers, such os facility in cleanios, the utilisation of every way of heat with a rance of choico incumbnstibles, wood, coke, and coal boin eqnally sraitable for it makes his smoke pass into pipes, which diverge makes in diff firo, instend of allowing it to surronnd and lick the surfaces of the froplace Bulind the baek he surfaces of hoplace. belind the back many refletin, whare is he calls a comuille, he leaves a space all roand which he terms a chamber of heat. On the hearth be bas a vent

Tho coquille is formed so as to receive bars or g grille conveniently, aud it narrows at the top into a neck, in whioh are situated the pipes that carry away the smoke. There aro other details given, but as these would be scarcely uuderstood without the accompanying illustrations, we must refcr our readers to the work for more minnto particulars of the improvearents M. Joly dictates. The ins.allation he proposes, he dectares, is net intended for persons of short-sightel policy, who, to avoid a preliminary expense of
30 or 10 francs, weuld burn, it the course of the wintor, able sam, and which are altogother wasted uuder the form of smoke. On the priuciple we prosume, that nono but tho brave deservo the fair, only tho frionds of pregress are invited to investigate this cheminio perjectionnec. "Let us blamo, cnergetically, tho architects, and they aro still of a groat numbor who prepare thei plans without oocupying thomselves with heat iug, ventilation, or water sapply, ssys the iuventor, who thon goes on to dopone that when such ill-considerod plans are exocutod, and these necessarios are all found wauting, thon the fumiste and the plumber are called in, who pierce the tbiok walls and porch upon the chimnoys horrible funnels of hideous design, to the degradation of the buildings in question, as may be scon by any one who looks upon Paris from the livichts ef the towers of Notre Damo.
Alluding to Captsin Galtou's method of heat ing, barracks, M. Joly says the principle was Belmas, and gives sketohes of tho original drawings of it, exolaiming, " Heavon knows how often the same idea has beon copied, modified, and roristored sinco.
wing of the causes of smoko, the antho that the anciout Romans

## Sunt tris dampa domus:

That is to say, he continues, there are three domestio plagucs : damp, a poevish woman, adi smoko. "The sccond plague is incurable, but nothing is easior than to remedy the two others." When we aro dwelling upon the sufferings of onr ancestors from smoke, wo forget they used a remedy which we only know by name,-tlee paravent. Nut only have we for wotten this contrivance, but in making ou manerod to do, wo too airten faight than toey sufficient air to replace on to provid porriod nn the flnes. TNen from this bee point, JIJ ators into Jo dis startio point, J. Joly enters iato tho quostions of th proper dimensions of the openings into flues, hoed of other fues, the too close neighbour rowod causins a disagreeable san's rays causing a disagreeabies, mitres with their varions forms, traps, air-holes, and every other detail that can be issociated with the subject. He gives a list of

117 works that he has consulted，so that we are not surprised that he has looked at it from ever point of view distinguishable from another
A new featuro in this edition is the space
dovoted to the heatince of winter－gardens，or the bost mode of maintaining the equahle temperature，or heat，required by some varieties of vegetable life．Daring hy． yone centuries gardeners could only ohtain increased heat for their plants from mannre in ane indispensentation，orring to elemont in anction of green－houses，－glass．The present small oost of the prodnction of this artiole has revolu－ tionised the gardener＇s trade．It was not till the end of the seventeenth centary that forced culture was possihle，and then it was only con－ fined to the estates of tho wealthy；hut now， give himself the lnanry of an antificial climate．祭泣e himself there are difficulties of construotion in the sway，owing to the difforsnt degrees of heat required by different plants，which oan only be mot by ：diviling green－honses into oompart－ monts，Several systems of heating are ox－ plained an illustrated，heginning with that of Rolertson，published in London in 1798，and followed by that of the Chinese；that of Todd， another English authority；the Marqzis do Chahannes；nad others．Hoating by gas，as adopted in the gre
is also descrihed．
is also descrihed．
M．Joly gives several designs for conserva－ tories attached to honses．In two instances he places these glass．covered gardens on the roofs
of the hoases．To ono he gives a modified Man－ of the hosses．To ono he gives a modified Man－
sard outline；to the other a curved form， surmounted bry an ornamental ridge Both are very pleasing in appearance．He surgests that
they could ho used where the narrowness of a street，or its insufficient ventilation，would he a har to the construction of others in the more
nimnal positions．If we could dismiss the ideas of dannp，and weight，and diffioulties from Weather they convey，we shonld he disposod to
admire them as entluasiastically as ho oould 4xish．
A novelty in counexion with a work on heat．
ing is a chapter devoted to anihulances． ing is a chaptor devoted to amhulances．After
condemning some of the modes of warming hospital－tents，the author descrihes the best and most rational way．Before laying down the planks of the tent，a trench of a gentle declivity should be dug along the centre of its whole
length．At the low end of it，outside the tent length．At the low end of it，outside the tent， there should he made a square hole．In this
bole should be plaoed a stove，whoreof the chimney－pipe should proceed along the trench and pass out at a vertical chimney at the other end．When possible，this pipe shonld he cased in a doublo sheath，gaine，which，when once the little stove was lighted，wonld assist in the ventilation of tho tent by openings placed in the ground．The subterranean part of the stope． pipe should be surmounted hy a grating，or by issne of warm air into the difierent compart． menta of the tent．Tho stove shonld he pro－ tected hy a non－oonducting envelop or covering， and sheltered from tho rain．Thas all the servios is renderod outside the tent；all the utilised；the heat can he regulated；the tem－ perature of tbe ground is at least equal to that from humidity；and the ventilation perfeot．
The warning of schools，colleges，shops，and warehouses fullows that of the ambulances hoating railway－carriages．But whether this is to be surmounted by the use of the steam lost by the locom，tivo，or of a thermosiphon to keep passencers，or by a special chaudiere placed in the lugrage－van，or hy chawfierettes，as in Germany，in twhich is placed a comhustihle
speciany composed of materials to harn slowly， or by stores ns in the United States，or hy gas， is not yet satisfactorily settled．Mr．Joly hopes omployment of the telegraph，we shall haste to omployment of the telegraph，we shall haste to the passengers whom they transport to great distauces．Kitchen stoves，pots，and furnaces next appear npon the page．

The section devoted to ventilation also con－ the imparities there are in the air，as we are sometimes shomn tho impurities and organisms in the water we drink，we shonld realise the truth of the Englisl proverb，－＂＂O ar own hreath is our
greatest enemy，＂exclaims M．Joly．What with the burning of gas；the emanations from des fosses d＇aisances，some 50,000 or 60,000 in number ；the fermentations from vegetahle the parements；the hospitals with their fevers and other miseries；the barraciss scarcely less pernicious；the two hundred thousand fires lighted in the sixty－eight thousand houses in Paria；the manufactories and depôts of all kinds， it is clear that the Parisians should be alive to the importance of ventilation，if they wish to plague，the yellow ferer，the cholera，and typhus are all enemies of man induoed by had conditions of the atmosphere under the influence of heat and dimp ；and the peste bovine amono heasts must he assigned to the same cause；and the best treatment for them all is a proper ventila． tion．It is calculated that a hundred million pores or germs of differont kinds are in the pores or ghich passes iu the course of a day throuch oar lungs．＂Qu＇on juge de l＇induence d＇un air mpur sur la sante！＂cries M．Joly，with real horror．The ventilation of hospitals comes first on his list，and here he details both the Parisian and American systems．Then we inspect in his company des tentes－baraques，or stationary amhn－ ances，with their twin contrivances for summer and winter ventilation；harracks；schools；des crectes；asylums for infants；private houses， chielly English，howerer，or American；concert． halls；saloons；des salles d＇assemblée；amphi－ theatres；prisons；ships；kitchens；stables theatres，in which every difficalty associated with the subject is associated under one roof，or worling establers chambers in Forking－men＇s houses；serrants rooms；and， hally，ponder orer all the known means of making their occnpation sailubrions to their angree with Boilenu：

## La critique est aziée，ei bart est diffcile．＂

As indicativo of every phase of the suhjects
reated，we commend＇M．Joly＇s labours as exceedingly uscful．

THE BRADFORD INDUSTRIAL
PROCESSION AND THE ELGIN MARBLES We have often enough thought it not a little singnlar in these days of universal writing and reaning that no profound and elahorated hook， not evor a German one，－on＂What is civi－ I very tremendous question，indeed，if we but anse tremendous question，indeed，il we but wo．Where the uhout it for a quiet moment or cornpelled to stay his hand，thero it may seem to many hat too bold to venture．But for all his，a thonght or two about it may not come amiss．First，then，will mankind，in the fnture， －the highly．civilised future，－he lighter hearted and moro joyous than those of the past or the business，or＂amusement，＂to adopt the mildest word，be tho main thing in life？Will fine art he，－to come to details，－a primo necessity of mundane existence；or only，as it now is，a king of accident，here and there？Will art come to ho minufactured ruore perfectly than it now is， individuality of artistic expression？and，not to swell the list，which might he done with so much ease，will such things as＂Pracessions＂of any sort conve to be regarded ns beneath the dignity and seriousness of advanced and civilised human existenoe；or will they increase and maitiply，and The force more and more expressive and urtistic good deal divided as to them ：by somo，and not few，a procession of any sort，or on any occa． kind is looked on as a thing of the past，as a piece of old．fashioned foolishness；the soonev got rid of the hetter，－as a dend thinss，and waiting only for hurial！While hy others，and not a fem，a procession is regarded as a thing needful．How is all this？Somebody mnst he right．There is，indoed，more in this triting would at firgt asitht seem possible，if only artistically．
It must h解 must in some way or other express himself and his doings through material forms，more or less erpress express himself heconld and did hat copy in some
more or lcss enduring material the things and
occurrences of his daily and hourly existeuce， and in this existence，such as it was，processions and shou＂s，it may he added，formed mot a little important itoms．Art was in trath realistic，no main and the new in art Artists and artist－workmon were oontent in the old days to copy the goings． on and the doings of every－day existence，pro－ cessions included．In these times，as all know， it is ont of the imaginativo faculty to look thas at them．Art is thonght to most uatnrally and trnly and artistically spring from the imari． nation．

At Bradford，on the occasion of the opening of the new Town－hall，onr North conntrymen wonld soem to bave gone to work in right good earnest， and in the spirit of their hygone forefathers，and with true Northern energy．A great plaoe of Townall，and was buil，the we most of the occesion of the first opening of its doors，a hace procession was ormanised，－a procession of old－world thonghts，and of the very newest of materials．

It is indeed cnrions and instrnotive to contrast the part of ancient fine art with the present，and to anticipate it may he the future．Contrast，for moment，the decorative art and the illustrative art of old Greece with tbat of the modern Brad． ford．In the Parthenon，the national temple of Greece，we seo the whole of it that was open to the illngtrative sculptor given over to what in these days would he called almost pnro delu． sions．The two pediments of the east and west fronts，filled with＂illustrations＂－to use a modern and，we hope，an intelligible phrase，－of mythological dreams，$\rightarrow$ of Neptune and Minorva． The magnificent series of metopes give reprosen． tations of a qnarrel at a pnhlio feast；and the celebrated frieze on＂prooession＂from one spot to another，with no ether excuse for it than the making the most of the hrioging into the temple a vail，or hanging for a statue：indeed，so great was the importanoe attached to this pro－ cession that all Greeco seemed to flock to it，and it was commemorated in all－enduring marhle，on the walls of the greatest and most finished structnre of which the Grecian people could
hoast．Thanks to this，we may yet see what hoast．Thanks to this，we may yet see what the procession was like，what the people were who formed it，and，indeed，the whole of the beautiful show may he realised to tho modern sight－seer as plainly as the Bradfurd procession of trade－guilds，and rough and manufactured goods，and attempts at fine art．It is to he hoped that some illustrative detailed record，if only on paper，has beau preserved of this Brad－ thonght of it if preserved like that of the Greek display in enduring marble？A lesson，and no alight one，to be got out of snch old－world ways in modern times as the Bradford Industrial Show is in the fact，- n somewhat strango one， perhaps，－－of the persistency with which common human nature sticks to its old ways．Proces－ sions，in spite of so muoh that can he said against thom，still march ou，and not only are those to be found in any numhers to form them，and take part in tbem，hat spectators，as in old Grecce，in any number，and of all possinle grades，and phases of education and age，are to be tom ny kind of compulsion，hat they flock iu crowds willingly to see and to admire，and not of few of the higher sort to pay heavily for a good and secure place from whioh to gase．What an art－ esson is hero．Does it evidence an advanced civilisation or not？Is it a good sign for art in the futare or not？Important and vital ques． tions theso，and perhaps a little lard to answer． Ve cannot please all，and oannot have every－ thing．A sacrifice always seems necessary，and to get at one sovereign good，a some thing or other mnst he given up，and ahandoned，greater or ess．It is wonderful to think of what the old world did with its amusements，and＂shows，＂ and trifles，and theatricalities．It was not content to see them，and then to let them pass way．It memorialised them，and perpetrated then in almost everlasting material forms．It as not the Greok alone，either，in the world＇s history，who did all this．The Assyrian and the Persian，the Egyptian and the Hindoo，and not few others of tho old world＇s habitants，were like smitten with thie world mania for pomp， and processions，and glittering show！
The main outlines and some details of this great Bradford show of indnstrial art have een already described in onr pagres，so that will be polegs to particularise，but to
make real and good use of it. Artistically, it should be compared with the old.world displays of the like lind as tho Greek or Iggytian or Assyrian. It is true that these
were not, iu the modern sense of the word, were not, iu the moderv sense of the word,
industrial shows or processions of men with goods, raw and manufactared, passing along the streets of the antique cities for the mero pur. pose of displaying them; hut in substance they were, after all, pretty much the samo. In the
old Esyptian work, much of which may be seen here and there in the British museam, were long lines of men and things, trophies of war, all sorts of objects taken from the conquerod cities, and from the crmps of the enemy. In the glass cases in the musoum may lee seen the very objects themselves of fine art and painstaking industry-a wonderfal sight if duly refleoted
on; and tho good poople of the great and prosperous Yorkshire town might well, somo of them, come to London for a day to look at what the now so long dead men did in thoir day, and then contrast their doings witb their awu. No steam engines then, or tclegraphs, or wonderfal bystems of mechanism, which the work to set going, and which then may be left safely to do all the rest of the work by itself. The same materials, but how differently manipulated! No schools of design then, nor "art prinoiples," but how well the antigne workmar it ! What a lesson to the Bradford men Let us think but for a moment how far from the present all these old.world ways are. It has been thought wonderful, as indeed it is, to sod
into the daily life and the "life fumiture" of a St. Edmondsbury mouk " seven whole centnries ago;" bat here, in these strange things and ways, even now visiblo to us, wo actually see into the life and ways and real fincuiture of we can only look poetically, as in on antigne we can only look poetically, as in an antique
dream. Four thonsand years of progress and dream. Four thonsand years of progress and
adranced knowledge, and inventive mechanical advanced knowiedge, and inventive mechanica
ncionee have passed away, and "barbarisus" has, we are told on all hands, givon way to "cirilisation." Then, may wo not ask, how is it that we must need go bnck, as it were, and
follow the procession stretching from so far to now? Processions have, be it remembered, never ceased, in some form or other, to be.
But then there is this differeace between the antique show and the Bradfurd show of the other day: the old show was an artistic ono io measure, if not wholly, the true artistic element. Civilisation has a good deal to learn yet, may be, from the barbario past; Bradford it was a good and healthy sign wht, to our minds, other day, or tried to do. It is a true instine in human nature to thus express itself in material forms, and cven to march along by the side of them, and to look at them, and at those Who do the work. Bat the modern Bradford men have a good way to go before they over.
take the pomp and fine art of the old Assyrian, and Egyptian, aud Creek "processions."

## LANDSEER.

Tam body of Edwin Landseer, the greatest animal painter the world has yet known (not withstanding the power of Rubens within certain ranges of the art) was deposited in the south on Saturday last, a pery large number of his frionds and the public attending to show hozour to his momory. With very few exceptions, the
whole of the 1,400 or 1,500 persons present wore blaek in some shape or other. Aroand where Landseer lies aro huried Sir Christopher Wren, Sir Joshua Reynolds, Sir Thomas Law. reace, Opie, Jas. Barry, Mylne, the engineer, Fuseli, J. M. W. Tarver, and some other artists In onr volnme for $1853^{*}$ will be found a view and particulars of this part of the crypt, whioh we then termed Artist's Corner, as coutrasting
with Puet's Corner, of Westminster Abbey, and which term still seems to ns more appropriate than Painter's Coruer, made bse of in various quarters on the preseut occasion. Landseer has heen fortunate in having always lind attached friends. The late Mr. Jacob Bell for many years forwarded his iuteresta in a remarkable menner, and since the death of has devoted himself to his sorvice in an equally oonstant manner. The amount of

Fol, x., pp, 690 and 691.
money received by Landseer for his copyrights mnst have been very large. We remember an instance in proof. The pictare ropresonting the apocryphal visit of the Duke of Wellington and is daughter.in.law, the Marchioness of Douro, to the field of Warerloo, was painted in reply to Cornon, and that sum whe weliere, receire ernon, and for the painting For the right y the artist for the paintios. For the right of once told us, paid Landseor 3,0002 . Tho same once told 11s, paid Landseor 3,000 . "Peace and War." A complete collection of he engraved works of Landscer, now made for he first time, is set forth in Mr. Craves's Calleries, in Pall-mall. They aro 305 in number. We nnderstand that the value of the
property left by theartist is ostimated to amount property left

NEW XORK HARBOUR.
Writivg upon this subject, our consul at Now Tork states that the harlonr there, in point of apaciousness and shelter, $2 s$ well 28 of the beauty of the surrounding shores, is not sur. passed by any in the world. The main ontrance at the Narrows is not more than a quarter of a mile in width. At the mouth of the outer bay, near Sandy Hook, distant eighteen miles from the city, is the bar, on which the depth at low water is about 23 ft . Operations on an extensive soale are being carried on at the Hell-gate ontrance to the port for deepening the passage into it from Long Island Sound. The rook frming the bed of the stream is being undermined by a system of excarations, which will not be completed before the lapse of cightoen months, when this rock will he binsted and and winarfs of New York, and the absence of dock warehouses, are serious drawbacks to the lending and shipping of cargoes, subjecting goods o injury from exposure to the weather end hances f theft or fire But a commeneoment to remedy this state of thinces ling been medo by the construction of ays of puays to ho xyend along the whole ity ity, on tho wist as well will wecoserily very heavy, and several ycars must elapso hefore tho system is completed; but it is anticipated tat it will provide all the accommodation for shipping and commerce in this respect which conld be desired.

THE LATE MTR. JOHN CUNNINGHAM, ARCHITECT
Mr. Jonn Cunningram, whose death at his residence in Edinburgh, on the 2 nd inst., is annonnced, was a man of considerable ability, and erected several important buildings in Liverponl at a time when architects wero less plentiful in 1799 , at $\rightarrow$ now. Mr. Cunningham was born in 1799, at Leitholm, Berwickshire, and served builder there. He afterwards removed to Edin. builder there. He afterwards removed to Edin. burgh, whero he studied and practised as an 1833 he married and went to $\mathrm{N} \cdot \mathrm{w}$ York, intend. ing to settle there; but the climate did not agree with him, and he returned to liverpool in 1831 , where he got into extensive practice as an architect, and remained till last summer, when he retired and went to reside in Sootlaud, where somo merrbers of his family and a nnmber of his friends were resident. His works in Liverpool and in the neighbourhood are numerons and important. Among others, the Sailors' Home, the Commercial Bank, tho Union Bank, and the Orphans' Aaglum may be mentioned as hoing carefully studied gpeci. mens of the various styles in whioh they are designed. The building which obtained for him the most reputation is the Philharmonic Hall in that town, the music.room in whioh, 135 ft . by 100 ft ., was for somo time the largest there, and has received high praise from musicians. We are not prepared to record it as a perfect concert-roum. It is remarkably free from echo but, on the other hand, it is not a resonant room owing to the extensive use of plaster, and the areat amount of upholstery, which rather damps the sound than assists it. It was undoubfedly the best room of the time it was built, but there and Mr. Curiences since in these waters, finally ranked as the ne plus ultra in music. ooms. In one respect, in regard to accommo.
dation for the andience in the way of cloak rooms and entrance and exit, it is a remarkably well-plannedestablishment. Thearchitecthimself had agond opinion of it An acpnaintance of the writer wea 0 mplimenting him one day or the writer was complineng "Well, tho fact is that foved him by saying, "oost perfect!"

The success of this bnilding led to the appoint. ment of Mr. Cunningham as consnlting architect along with Mr. Campbell Donglas in the new Assombly Hall now being erected there.

Mr. Cunningham was also architect of many churohes, mansion.houses, and public buildings throughont Lancashire, including Ripley HosBital, near Lancaster, and Upton Church, near Birkenhead, and was engineer for several water. works.

## HUMILTTY AND USEFULNESS

Ar the Mansfield Town-hall, on Taesday last, the Duke of St. Albans, on the oecasion of presenting prizes to the succossful students of the night art-class, read a communication from Mr Ruskin, a portiou of which we print:

I fear that the tendenoy of modern thought s to reject the idea of that esseutial difference in rank between one intellect and another, of which inereasing reveronce is the wise noknow ledgment. You may, at least in early years, test accurately your power of doing anything in the least rightly, by your increasing conviction that you never will be able to do it as woll as it has been done by others. That is a lesson, I repeat, which differs much, I fear, from the one you are commonly tauglit. The vulgar and incomparably falso saying of Macaulay's, that the intellectual giants of one age bocome the intellectnal pigmies of the next, has been the text of too many sermons lutely preached to you. You think you are poing to do better thinga, - each of sou, - than Titan and Phidias write better than Virgil; think morg wisely than Solomon. My good young people, this is the foulishest, quite ore emineutly, -perhaps almost the harrafullest,-notion that could possibly be put into your empty little eggshells of heads. Chere is not one in a million of you who can ever greatest that have bein be greale perhaps to no man iu Europe in the course of two or three centuries. But because you cangot be Handel and Mozart, is it any reason why you shonld not leara to sing ' Cod Save the Oneen' properly when you have a mind to? Because a girl cannot be prima danna in the rtalian Opera is it any reason that she shonld not learn to play a jig for her brothers and sisters in rood time, jo soft little tune for her tired mother or that she should not sing to please herself among she dew on not sing to please hersol, among the humility, and usefulness, al ways go together; as insolence with misery, and theso both with destructiveness. You may learn with proud teachers how throw down the Vendome Column, and burn the Louvre, but never how to lay so much as one touch of safe colour, or one laycr of steady stone; and if, indeed, there be among yon a youth of trno genius, be assured petalance or by diadain, bat hy discerring firmly what to admire, and whom to obey. It will, hope, bo the result of the iuterest lately awakened in art thronglo our provinoes, to enable eaoh town of importzuce to obtain, in perma. nent possession, a lem,-and it is aesirable there should be no more than is few,-examples of consummate and nasterful art, an ongraving or two by Diirer, a sizgle portrait by leynolda, a afteenth contury Florentine drawing, a thir-tcenth-century Freach piede of painted glaes, and the like; and that, in every town occupied in a given manufacture, examples of unquesfonable excellence in that manufacture should be made easily accessible in its civic maseum. I must abk you, however, to observe very carefully that I use the word manufacture in its literal and proper sense. It means the making of them the hand. It does not mean the making with you for a trne humility in rivalship with the works of others, I plend with you also for just pride in what you really can houestly do yourself. You $m$ ist neither think your work the hest ever done by man, nor, on the other hand, think that the tongs and poker can do better, and that, althongh you are wiser than Solomon, all this wisdom of yours can be out. shone by a shovelful of coke. Let me take, for instance, the manufucture of lace, for which, I
helieve, your meigllbouring town of Nottingham enjoys renown. There is still some distinction between machine-roade and hand-made lace. will suppose that distinction so far done awry with, - What a pattern once invented, you can spin lace as fast as you now do thread. Fveryhody then migbt wear, not only lace collars, but lace gowns. Do you think they would he more comfortable in them than they are now in plain
staff; or that, when everyhody could wear them, staff; or tbat, when everyhody could wear them, spider may, perhaps, be rationally proud of bis spider may, pernaps,
own cobweb, even thougb all the fields in the morning are covercd with the like, for ho mado it himself; but suppose a machiue spun it for him? Supposo all the gossamer were Nottingham.made, would a sensible spider be either prouder or happier, think yon? A sousihle spider! You cannot, perhaps, imagine such a creature. Yet, snrely, a spider is clever enough for his own ends? You think hira ar insensible spidor, only because he cannot understand pours, and is apt to impede yours. Well, be assured of tbis, sense in human creatures is shown also, not by cleverness in promoting their own ends and interests, but hy quickness in understanding other people's ends and interests, and by putting onr own work and keeping our Wr. Henry Cole made with theirs.
Mrr. Heary Cole made an excellent practical address, urging Mansfield to bestir itself.

THE TURNERS' COMPANY'S PRIZES. The Lord Mayor presided in the Egyptian Hall of the Mansion House, at the fourth annual distribution of these prizes. Their origin was explained by Professor Tennant, the Master of the Company, and tho general results of the present competition for excellence of turning in irory and stone by Mr. Thomas Forshaw and Dr. William Pole, two of the judges in either department. The Lord Mayor, before presenting the chief prizes, congratulated the Company upon the suocess which had attended its efforts to promote technical education in the trade with which it was moro immediately connected, and reforred to similar ioducements held out by other City Guilds, mentioning in particular the Coachmakers' and Paperstainers' Companies. He thonght, however, more was to be accomplished in the matter of technical education by the united action of all the guilds than hy individual efforts; and hoped at the forthooming aggregate meeting on the subject to he held in that hall, the 'Turners' Company wonld bring their experience to bear npon the proposed combination.
The prizes were then distributed, the recipients heing as follor, The money prizes were given by the Baroness Burdett Coutts.
Mr. William Davis, 22, Hughes-road, Averley, first prize for isory.work. A silver medal and the frecdom of the Company and the City.
Mr. R. W. Cotton, 202, Commercial-road, Peckham, - Second prize, for turniug two flowerstands. A bronze medal and 5 .
Mr. Greenbury, Haggersgate, Whithy,-First prize for stonework. Silv
Mr. W. Atkins, Poltesco, Cornwall,-Second prize. Bronze medal and $5 l$, rize. Bronze medal asd $5 l$.
Mrone, for merit, 5 .
Mr. Jonathan Gihhoa, Whintby, for merit, $5 l$. Ar. Jonathan apprentice, named Stevens, not yet six. An apprentice, named Stevens, not yet sir. teen years of age, took a certificate for turning three howls, connected, from one piece of stone.
Rohert Lewis Packer, 5 , Park-road, CamberRohert Lewis Packer, 5, Park-road, Camber-
well, reoeived 5 l. for a "photo octant," intended well, received 5 , for a photo.octant, intended to show a picture
turn on a pivot.
At the conclusion of the distrihution Mr. John Jones moved a vote of thanks to the judges, Mr. Joseph Hall, of Derhy ; Dr. W. Pole, F.R.S., of Westruinster; Professor Tennant, Mr. John Maques, Mr. Weeks, R.A.
Mr: Mark Fothergill seconded the motion, which was carried unanimously, and acknow. ledgrd hy Mr. Windser.
Having on
Having on more than one occasion specially noticed in our journal the works of the Whithy Jet Turners, we are glad to see that they have shown their ability and taste on this occasion,
At Whithy the following gentlemen, Messrs. At Whithy the following gentlemen, Messrs. Chas. Bagnall, J.P. (Sueaton Castle), John Cormer, Chas. Noel, Armfeld (diocesansurveyor), J. M. Bottomley (architect), and Messrs. Readman, Lockey, Horne, \& Gaskin, formed them. melves into a commintee to urge the competing
for these prizes, and sncceeded in inducing two or three of the turners to send in specimens of their artistio workmanship. Professor Tennant informed them that Whithy had carried off the prize against all the turners of hard material in Eogland, and had also obtained the first honorary certificate. Tho following extract from Professor Tcnnant's letter shows the reasons which governed the judges in making their award:freedom of the Greenhury, the silver med in jet, which combines beanty of original design with excellence of workmanship and skill in the manipalation of a difficult material; also the howorary certificate to J. G. Short for an iuk. stand in jet, which is very meritorions, botb in design and workmanship.'

INAUGURATION OF THE JEWISH CEIEIERY AT WILLESDEN.
On a pleasant site at Willesden-lano, and plentifully planted with evergreens, the United Syuagogue of Metropolitan Jews have formed a cemetery, which they have inaugurated.
The whole of the ground has not been enclosed, but five acres are surrounded by a wall, in which there are suitable bat not very ornate guardian of the rround, which separates the accoss to the cemetery. At some little distance within the cates are thres buildings, a centra? we, intended for tho reception of the colfin, with the mourners, duriug the recital of the prelimi. nary prayers, heiug, in fact, what in other communions is desiguated a chapel, but which, perhaps, we mary call an oratory. It has broad windows. On the left side of this structure is a building for the Cohanim, who are not permitted to enter in close proximity to a grave. This is a singlo room. Opposite it is a third building consisting interually of two portions, a "tahara" room, or room for the performance of the rites of ahlution of the dead, and a lavatory, with necessary retiriug rooms.
The contral building is 40 ft . high and 25 ft in breadth (internal measnrement). There is a porch at each end. There are dormer and other windows. At the end fronting the ground the finial is surmonted by the ornament known as the shield of David (interlaced triangles), At the opposite end is a sort of tarret, which is
really a chimney-stack, thus hidden by the architectural ornament. The house is well lighted, and it has doors at hotheuds. The two side bnildings are roofed with green and purple
slates and red tilo orestings. The three buildings are in the Gothic stylo of the Gcornctric period. The materials are Kentish rag, with Bath stone drossiugs, and tho shafts of the porch colnmns are of Mansfield stoue. The stained the colour of oak. The windows are not yet fitted in. They are to be composed of tinted cathedral glass, set in narrow lead frames.
The works have all been carried out from the desirgns and under the superintendenco of Mr. hnilding conmittee of the Uuited Synagorue Messrs. Newman \& Mann aro tho contractors.

PRACTICAL MATTERS DISCUSSED AT THE SOCTAL SCIENCE CONGRESS.
We have already reported some of the statements and addresses delivered in Norwich The field is so large, the nurnber of papers read so considerahle, that no useful general report is possible. We confine ourselves to a few of the subjocts likely
our readers.*

## Hindrances to Sanitary Work.

Mr. Lewis Angell, C.E.s President of the Association of Municipal and Sanitary Engincers and Surveyors, read a paper, in which sanitary work, and offered a few suggestions for efficient local administration. The greatest difficulty was a want of appreciation of sanitary principres by tho pnbic at arge. Hhe said that promote greater simplicity, completeness, and certainty in the operation of sanitary laws, and to secure greater efficiency in their adminis. tration, by affording protection to local officers.

Dr. C. W. Ryails may be congratulated on the Mr. Jsmes Rohinson, ussistant secretary. deserves thank
for bis unflagging derotion to the businees of the weckec

Concurrently witb the above, we required the moral infiaence of a higher tone of intelligence in the constitution of local anthorities, and a better appreciation of sanitary principles hy the pablic, without which, as the Royal Commissioners said, no legislation in this cless conld be applied with success. There were iudica. tions that the elements of natural science would before long form part of the ourriculum of school education, and especially should the principles of aanitary science be taught from the lowest grade Board school to the College, hecause it affected alike the welfare of the prince and the peasant. It was not to the local authority or the Government tbat we must look for reform. Reform seldom arose from within; it was hy the power of publio ovinion, guided by sach information as Social Scienee Associations afforded, that we hoped for sanitary progress. The efforts of boards of bealth, medical officerg, aud sanitary engineers, however well directed, would fall short of their mark unless there were also an intelligent apprecia. tion of sanitary principles by the public at large.

Dr. Carpenter read a paper which stated that tho design of the Puhlic Health Act of 1872, Was to stamp out preventiblo disease hefore it could not be carried into effect from the inability of the bealth ofticers to get information of the appearance of certain discases immediatoly they presented themselves. Tho present machinery presented themselves. Tho present macoinery design could only he accomplished with certainty design could anly he accompished with certainty hy its heing incumbent upon medical men to give the requisite information. This entailed fficers nuder the officers nnder the Looal Government Board to a certain extent medical offeers of health by which the unit of disease, whilst remaining a anit, would be with greater certainty reached It was the opition of leading statesimea laa the beath of the country was not to be secured hy grand drainage oparations, but hy a close super.
rision of every dwelling, and that the individual hision of every dwelling, and liat the indival house was the unit of sanitary work. the best means of administering santary aw would not be reached. The nnion medical offioer, eaid Dr. Carpenter, became of necessity a bealth oflicer. But would the area superrised ay him be a convenient arca? It would be at once shown that it would not. To appoint the nion medical officer as the officer of health would entail many evils, and not produce muck good. The rich as well as the poor would require protection, and that could not be afforded y the Poor-law medical officers in populons places where epidemios wero likely to prove moss fatal; and as union medical ofticers were gencratly the youngest men in the profession, or new comers into a district, they were not gonerally the men who should guide their medical brethen in resisting the atcacks of a hidden enemy Every medical officer of health ought, however, to have practical acquaiutance with the anion medical officers work. As the district was not a convement area, the union would he more so, but even the union would not be so advantageous as the county. The writer insisted apon the necessity of the health olficer personally inspect. ing every place in which disease appeared imuaking a general inspection of his district at least twice in the year, and reporting fully after each visitation.
Mr. G. W. Hastings (who on another occasiou made an excellent presidential address) entirely agreed with Dr. Carponter that no area less in size than the county would secure the object it was the purpose of the Pablic Health Act to gerve. Mr. Angell, with whom he also concunce, spose of the necessity that pose chictration of the Public Health Act should be persons of some intellisence and of some standing and knowledge. Mr. Angell also deprecated what may be termed the smpremacy or the vestry. It was all very well to say that gentiemen of intelligence and position ought Board, hit the real answer to that suggestion fas that if they wanted them to do so they aust make the Sanitary Board such that rentlemen of position and intelligence would like to erve ppon it With small sanitary areas, there rould be small sanitary corcrning hodies, and ve cond only expect to lave men of the vestry ee could oaly exper the Board. Mr. Hastings lass appoined Government and Mr. Stansfeld in masing the

Toard of Guardians the Sanitary Authority
 connty for the area. But ater making Boards
of Grardians the Sanitary Anthority, MIT. Stans. of Gardians the Sanitary Authority, Mr. Stans.
fold appoited $a$ number of inspectors, moosily

 them to combino together for the purpose
having a joint melical officer of tealth. haring a joint medical olieer of health
Mrr. Steansidid was anxious that the Boart 3rf. Stansfid was anxious that the Boards
shonld join in this way, why dia Le not male it shonlad join in this way, why did
incum lent upon them to do so ?
Nr. Wirnham Portal toped the meeting world
 for counties should he optional. The work of the
Oresent union distrits had noi heen fornd to be
 anfruitrol of results, and that, at a reasonahle
cost. TLle objiect of sanitary measrres was to cost. The object of ganitary measnros was to
stamp out discose, whorever $t$ w was found, in the thortest possilil way; wad be oontended that Shis could hetior be done hy looal ofitiers, who wero coustantiy presiny hrough thir distriet
than hy a connty olficer wlio only recived eports. He spoke, too, of the ocost of appointing proper medicial oficicrers of health
Nr. Godwia suid that the only argument that had been nased against proper oryanis. Lion was the quesion of cypenee. $A$ county
was frightered at the idee of spending snonay on sanitary matters. That was unfor. tunately the root of the oril. Unless the connty arganisation was arranged, and the ollection of crgan wain was anranged, and the olection of
tricers of bealth and inspactors of nuisances taken from the vestries and gandrlinn, nothing

 werce "heaven--Lorrn snitiarians." From the state of Norwich, he deduced tbe necossity there was evea twerf tor the indapendenco of the medical
oficer of the local body.
Hoe bal , bith somo Iocal assistance, tateco thito opportanity of walk. ing through various parts of thio city, and found
phaces where thellh Wha perfectly imposizli

and poor, a knowtedge of sanitary laws.

## The Norncich Severerge Tints.

Dr. Eade read a paper on the bistory of the Noowich Sewerage Woirts, with a hrief notice of the health of the city, He gaid that haforer,
is6a, from which y yar tibe history of the works
 Soandess of the river, in consequunceoco of tho dis. clarge into it of the sewago of nome 3,0000 water - closetes, besides refuse from mannfac. aries and dye.wors. The acour of the river
the sewage far away, and the result was that the frist two or three iniles became practically a
foul and reeking sewer. This contanination foul and reeking sewer. This contanination
increased, and the river became a puisance to increased, and the river became a nuisance to
the boundaries of the city and to Thorpe. An injunction was obtained from the Court o Chancery hy the inluabitants of Thorpe, to stop tho discharge of the sewage. The Town Council sought the advice of Mr. Bazalgette, who drow
ap a scheme for the removal of the seware ap a scheme for the removal of the sewage,
which comprised (1) the formatiou of two ranges of sewers; (2) a reservoir to receive it (3) a pumping-station adjoining; and (4) the
hiring of 1,100 acres of laud two or thrce miles hiring of 1,100 acres of laud two or thrce miles from tho city, up to which the sewage liquid was te be forced for the purpose of irrigation. The cost was estimated at $80,000 l$. Much opposition was raised to the scbeme on account of the at $3 l .5 \mathrm{~s}$ an an Act was ohtained, hana hut as difficulties arose with the contractor the Council carried on the works themselves nader the superintendence of Mr. Morant, in whose bands, in spite of great and unforeseen difficul. ties, the scwers progressed, and hy the end of the sewage was pumped on to the land, hat it was soon fond that iustend of two-and.a. lial million gallons a day, as estimated, doublo that quantity bad to be dealt with in consequence of the leaks in the sewers. After some partial stoppage of tho lesks, Messrs. Harksley adviscd iron tuhing and wooden struts to strengthen the weak portion of the sewers.
But in spite of tbis, the leakage had continuerl, While at one time the channel threatened to become almost choked by silt aud solid material In consequence of all this delay and difficulty,
the expenditure had run np to 113,000 ? Al. though three millions of gallons of seware liquid had been for some weeks daily pumped on to tho land, yet twice $2 s$ much more still passed sewage-farming they bad no proper opportunity of testing with the varions questious of the proper quantity of land in proportion to popula tion, of the best method of applying sewage, of filtration 6 Ahout 123 acres had heen pre pared by cbannelling for surface flooding, and by the help of these the sewage-liquid had heen satisfactorily applicd with remarkahlo advanbeen observed from the crops. No ill results had grass or in any way as a result of sewace farming. As to the healtb of tho city, trking Recistrar-General sbowed that the returns of the at the rate of 26.3 per thonsand living, against an average of 24.3 for twenty large cities and towns of England, whilst for tho past five years the average death.rate had been 25.2 . As to avcrage percentage of deaths to total deathshad from this cause heen 24.9 , while from typhoid fever the average number of deaths for the past three years had been 50 , and for 1872 only the same numher, whilst Wolverhampton, In 1870 and 1871, Norwich suffered mucb from scarlet fever, and in 1871 and $18 \sigma^{2}$ from suall. pox; hut no special local or ather fentures were be responsible for their oatbreak or continuance.

## Constant Water Supply.

On this subject Mr. Baldwin Latham, O.E., who contrihuted daring the week the results of author pointed out that for the distribution of any water suppiy, if the senitary well-being of the district is to be ohserved, the following things must be insisted upon:-1st. Water to a water-closet sbonld only ho supplied through outlet pipe tion of a regulating cistera, give a good flush. 2nd. No overflow from any cistern should communicate directly with any act as a wewer, but snch overflow should only stop-cock should be of the screw wariety, and all cocks, whether ball-cocks, bih-cocks, or stop. cocks, should be fitted with loose valves, arranged so that when they were relieved from pressure of of tbe lever or screw, the internal flow of water would take place. But sbould the water from any accidental or otber cause, become intermittent, the loose valve would of foul air) into the pipes. 4th. The service.
pipes for conducting the water from the mains o the bonse should be of lead or block tin-the former, if not injuriously affected hy the quality of the water supplied to the district. In some cases thickly. enamelled wrought -iron pipes might be used, especially if laid in teria.cotto protecting casings. A series of such regulations wonld tend to remove all the difficulties attend. ing a constant supply, and greatly improve tbe sanitary status of the popnlation of many towns at present but imperfectly supplied with water. The description of pipes recommended wonl not be permoable, if passing through had soil. In the discussion which followed, Mr. Godwin urged the necessity of keeping the waste-pipe out of the drain, and spoke of the necessity for implifying the regulations, so that the constant upply might be nniversally adopted. Dr. Car ponter said that hy no possiblechance should there e the reverse action hy which foul matters or foul air could hedrawn into the pipe in the npper part of the works. Mr. Johson, of Derhy, said hat the waste of water was often the excuse or the intermittent supply; hut what bad been one in Norwich, where the supply per bead had heen reduced from forty-four to twenty allons a day showed that this waste could be revented. Irr. J. G. J. Bateman added that Torwich had a constant water supply, free from injurious exhalations, and as pure as that supplied to any town in the kingdom. A Member said that an inter mittent supply must he objectionahle, as gases were thus admitted into the pipcs. Dr. Hardwicke mentioned an instance in which gas escaping from its pipes had entered the water-pipes laid side by side with them. Drainage would also be a drawback unless there was a water sapply sufficient to flush the drains. It wonld also be desicable to have one qually on water hrought luto towns for flushing and another quality for drinking. Mr. Latham, in reply, thought a coutinual dripping of water through house-droins witb their present constructiou was useless. Some of the best sewers in Londou were badly constructed; they were of all sizes and all crlibres, and wo system of flushing can keeps them in order, and free of focal matter. Water if applied to drains, shond go witb a coraplete rush, that ping, while being a waste of water, would not effect this. Escaped gas contained in the port could only enter water-pipes when the wartl supply was intermittent. There was no town that had such an experieuce in this matter as Norwich, and he congratulated the company and Mr. Ayris upon the efficient measures they had adopted for preventing the waste of woter When the water supply was forty.fonr gallons a day per head it was intermittent; but by the Norwich Company adopting snch fittings as he proposed, the wasto was prevented, and the people had a constant supply.

## The Labour Movement

Mr.T. Brassey, M.P., in the course of his address as president of the "Economy and Trade" de partment, said, amid the many ditficulties of the present time, the English employers may per haps take comfort by looking ahroad, whore they which they have to deal are presenting them selves, and often in a still more argravated form Passing from shiphuilding to engineering, Ihave ascertained that in an establishmeut on tbo largest scale, the most liberal application of capital, the most ingenious machinery, and skilful administration had failed to compensate for the great advance in the rate of wages. In modern marine engines the cost of materials and labour is about equal. An engine which might have heen built in 1871 at $40 l$. per horse.power would have cost in $187246 l$. In the present year the price has advanced from 55l. to 607 per horse-power. It is sometimes difficult to overcome a feeling of depression as to the future of our mechanical industry. But, whon we look ground for discouragement. The there is no exports of steam-eurines in 1806 wos 1 - 60,0007 in $1872,2,995,000 l$. The ralne of 1,100, machinery of other sorts was, in 1866, 2,998,000l. in $1872,5,606,000$ l. The past has been pro sperous; the future mainly depends upon the conduct of our artizans. In Enclaud we are happily cloing away with the great ovil of employing young children in our factories. Al the chamhers of commerce in Belgiom unite in deploring the increasing moral and physical degeneracy of the working classes, which the
dron. In the Euglish factories a larger number of women are employed thnn in factories ahroad, and the association of employers, thongh differing on almost every other subject from Messrs. Bridges and Holmes, suggrest that women shonld be excluded from factories for three months after their confinement. Great evils lave been found, by experience, to ensue from the too early retarn of the motbers to factory lahour. Let ns vent will not be allowed to pass hy without ment will not be allowed to pass ay without placing on the Statnte-book a legal prohibition against a practice which is universally condemned hy those most competeut to form an opinion. Mr. Lothian Bell, oue of our highest anthorities, has recently pointed out that in ores of the finer descriptions the resonrces of the United States are unlimited, while in coal our own wealth is, in comparison, poverty. There is hut one bar to the houndless prodnction of minerals in the New World, viz., the want of bands to manufacture them. Moreover, the United States, not content with their nataral advantages, impose an almost prohibitory tariff on our exportations. There is a party in America opposed to protcction, bnt hitherto the superior organisation and greater determination of the manufacturers interested in the maintenance of tariffs has overpowered all opposition. Our artizans may helieve that the profits of former days were so large that cm ployers can afford to pay tho present rate of wages withont raising their charges to the consumers. There is but one means hy which this fallacy can be exposed. The workmen must become to a certain extent their own employers. In a co-operative estahlishment, created in part by his own hardly-earned savings, the handicraftsman will find himelf called npon to apportion eqnitahly the earnings of his hasinoss hetween labour and capital. In this double relation be will learn how great are the difficulties which beset the employment of capital in productive industry in a conntry in which competition is so keen as it is in England. English worknon aro less casily deluded hy tall talic and sophistry than the more excitable populations of the Latin race, and I would earnestly invito them to apply their practical sagacity to the difficult yet hopeful experiment of co-operative industry. The first thing to he done is, to save industry. The first thing to he done is, to Bave
something from their present high wages. Forethought is an especial duty in a period of prosthought is an especial duty in a period of pros-
perity, At no distant time the progress of our commerce may sustain at least a temporary commerce may sustain at least a temporary check. It waves hehind it multitudes of onr highly. tide leaves hehind it multitudes of onr highly.
paid workmen without any provision to meet a paid workmen without any provision to meet a time of adversity. It is unnecessary to dwell
on the evils which must ensue from a diaproporon the evils which munt ensue from a disproportionate increase in the non-productive classes of the community. Lord Bacon has truly said that a population is not to he reckoned ouly hy numbers, for a smaller number that spend more and earn less do wear ont a greater number that live lower and get more. My father's advice was often sought by parents anxions for the
future of their sons. His counsel all future of their sons. His counsel always was, that a young man wbose destiny it mnst he to make his way unaided tbrough tho world should hegin by learning a trade. It is a laudahle ambition in a parent to endearour to raise his family to a hetter station in life. He cannot bestow on his children too good an education. But the wise man will be on his guard, lest the enjoyment of such advantages should render occupations distasteful which afford the most secnre and ample livelihood to tbose wbose lot it is to lahour.

## Utilisation of Waste Lands.

Mr. Francis Fuller read a paper, entitled "The Prohlem of High Prices and Wages Solved, and the Impediments Removed, by the further Development of the Resources of the Soil." In it he spoke of the amount of waste land that
existed in the country, the deficient crops that were reaped upon the land which was cnltivated, and argued that the whole should be coltivated to the highest pitch of perfection and skill, but that in order to effect this, Government aid should be forthcoming. The principal portion the manufacture of peat coal. Tbere the manuuacture of peat coal. Tbere was, he said, an ineshanstible supply of peats in the
country. The peat heds of Norfolk, Suffolk, and Cambridgeshire were continuons, and he expected that Norfolk would be the first connty to send peat coal to London. Peat coal conld be so prezared as to be hoth eoonomical and
highly useful for mannfacturing as well as domestic parposes, and could he used as a suh. stitnte for coal. This peat conld he manufactured at 4s. 6d. per ton on the spot, and Sir E. Watkin had offered to convey it over the railways of which he was chairman at $\frac{1}{7} d$. per ton per mile.
If other railway directors wonld but follow the example, a large trade would soon spring up in the manufacture of peat coal. At Lakenheath, a company bad selected 1,000 acres of peat land, and the manufacture would soon he eommenced there. The peat in Norfolk was eminently pure, and the quantity was sufficient to supply the whole of London for 100 years. Unskilled labour was all that was required; and by this aid a valne of $800,000,000$ l. conld be produced from this source alone. Added to this immense valne, must he taken into acconnt the employment given to a vast number of workmen in a new industry. In addition to all this, it must be borne in mind that the land when divested of peat would he rendered snitable for pastore or arable land. For all these reasons, he urged that the attention of the puhlic generally sbould be directed to the qucstion.

## CAPITAL AND LABOUR.

During a discnssion at the Norwicb Congress recently, Mr. Thos. Brassey said it would, no doubt, he better that capital should be accumu. lated in many hands rather than in those of a few, but it was only hy tbe gradual accumalation of capital in this conntry that our Britisb industry, notwithstanding the comparative exhaustion of bigb rinal resonrces, and notwithstanding tbe been able of wages which prevailed, had hieaperpaid labour of foreign countries. In that serse the accumulation of capital had heen a great boon and hlessing to working men. It was almost unnecessary to urge that the accumulation of capital in this country was certainly not owing to the excessive rates of profit whicb were reaised in England. In no other conntry did only yesterday ho had before him an illnstration of the tendency which prevailed todimimish gradually the already low rate of interest. In Captain Tyler's analysis of the working of the railway system, he pointed out that the average rate of interest on debentares bad heen year by year diminisbing, and that at the present time it amounted to 4 and a fraction per cent. Now he (Mr. Brassey) knew, as an investor, that he shonld ohtain an equally good security in America at 6 per cent.; therefore it would he tions of capital wbich have taken accumth country were dne to the exeessive rates of profit which prevailed. Ho wonld rather say it was due to the fact that, as a hody, the employers of lahour in this country were superior to those in other countries by tbeir frngality, their commercial sagacity, and tbeir continued derotion to husiness. What he wisbed to esta. blish was an appreciation of these viows in the minds of the great masses of the employed. No one could watch a strike withont the yery deepest pain and regret, and if they could discover any means by which workmen could be deterred from going out on atrike, with a view of enforoing tboir own claim on the employer, it wonld be a most invaluable discovery. The only remedy he conld seo wonld bo to impart to the working men interested in the cessation of tbese dispntes a perfect knowledge of the commercial position of the business in whicb they wers engaged. If they could prove to the working man that the concession of his demand must make the hnsiness of his employer uaprofitable to that employer, the working maan, as a man of sense, wonld not go out on strike. But working men? Tbat was the great question. Of conrse, the opening of the employer's profit and loss acconnt, a tborough knowledge of the net cost of production in the trade, would be conclnsive ; but there were great difficulties in sabmitting such acconnts to the ixspection of the puhlic. If the position of the employer was at all insecure, it wonld have a serious effect npon his credit to expose the nature of his business, and show how unahle he was to suhmit to further demands on the part of bis workpeople. He held tbat, if they could make co-operative productive industry successfal, it would be a great relief to the employer, who would refer to the rate of wages paid in the would refer to the rate of wages paid in the
co-operative establishment as the gtandard or
grauge by whicb the wages of the employed should he tested. Therefore, from an ahstract
point of view, it was desirable, if it were pospoint of view, it was desirable, if it were pos-
sible, to estahlish co-operative industries. Tbey sible, to estahlish co-operative industries. Tbey
had to consider what were the practical difficulties had to consider what were the practical difficnlties in the way, and he was sorry to awnowledge In were very gerions.
In considering questions affecting capital and labour, it was impossible to ignore trade-uuions. It was ouly fair to say that many persons, fully competent to judge, said that trade-unions were rendering service, not only to the working men, hut to the masters. Trade-unions had, no donht, done harm, hy encouraging demands that were uureasonable. The leaders of trade-mnions very often possessed immense inflence over the men, and unfortnnately did not possess any proportionate degree of knowledge of the husiness in whicb they were concerned; they had sufficient influeuce to urge the men to make a demand, but not sufficient knowledge of the husiness to know if the masters were in a position to concede it. Then some of tho trade-unions had done great harm in endeavouring to equatise the ridual wages as between individual and indithat. It was the fonndation of his father's successful system of carrying out large con tracts for public works in all parts of the world, that the principle of payment by piece shomld be adopted, and it was a most desirahle thing in every in every point of view tbat men should bo system of payment by the pieco. In an eugisystem of payment by the pieco. In an eugi-
neering concern in which he wns a principal proneering concern in which he was a principal pro-
prietor, on the hanks of the Mersey, the worlsmen were not only paid hy the pioce, hat they also received a per-centage on the profits. He recommended this plan for general adoption. On the other hand, he admitted that trade-nnions had done good in one way. Tbe governing anthorities of tradc-unions were wiser nien than their clients, and in many cases workmen had
heen persuaded to accept machinery, and to adopt a system of working more readily througb the influence of the heads of trade-unions.

SAINT PANCRAS MISSION HOUSE, SANDWICH STREET, BURTON CRESCENT This mission building is erected on the western end of an oblong site of which the eastera end cerly 600 carly 600 childron, illnstrated in the Builder of last year, page 267. The entire site rung

NEW WORKS AND EXPENDITURE ON THE SCOTTISH RAILWAYS.
A rew weeks ago we gave, in the columns of urge intended expenditure in new works on me of the leading English railways, as dis. losed at the half. yearly meetings of the several ompanies. Tho statntory halr-yearly mectings ith Scottish railways, which are somewhat tier than those of tbe English companies, have aledonian, the North Britisb, and the Glasgow nd South.Western Companies, which may be egarded as the three great Scottiah raiiway rporations, wo find that, liko many of the ngish companier, they also are about to expend
ery large sums is now and extended works, and hat the Caledonian Company intend to incur an spenditnre, during the current half-year, of At the recent meeting of the Caledonian ompany, held at Glasgow, the chairman made veral interesting statements as to the operaons of the company during the past year, and
Iso in reference to prospective ontlay, the innlso in reference to prospective ontlay, the in-
ortant suhject of the great increase in wages, ortant suinject of the grice of fuel, being promiently brougbt forward. Amongst other state renta, bo observed, that the bills which they btained last session Would involve a considerahle
xpendituro of capital in extension lines and xpendituro of capital in extension lines and tations; and also, that in order to complete
neir arrangement with the North British, by onnecting with thcir line at Dalry, near Edin. urgh, it would be necessary for them to apply ext bession for Parliamentary sanction to the unction at that point. Adverting to the intended eaty traftic was being passed upon them to such a extent that, to evable them to meet its eqnirements, very large additions to rolling. $22,000 \mathrm{l}$. tho or additional plant, was a large sump ; but, in lace of grudging it, they should only bo too lad in having it to pay, affording, as it menting the revenue. Reforring to steel ails as against iron, he said that for some years hey had heon making trial of the former, in olaying the line at junctions and at otber places 10st fitted to test their quality, and so com. letely had their superiority over iron been ith steel in future to a muci greater extent. baxing the last four years ahout 4,300 tons of eel had heen laid down, and of these 945 tons ere put in last yoar. His following ohserva. ons on the enormous incrense of wages, and nt, have a significant importance. He said at, compared with 1868 , engines, carriages ud wagons were reapectively $15,4 \tau$, and 55 per
cent. dearer than they were tben, and the wages in the workshops averaged fully 13 per oent. higher, Taking in all the branches of the service, wages formed a very large item of
increase, the cxcess for the six months to July being nearly $41,000 \mathrm{l}$ He next adverted to the price of coal, stating toat the expenditnre for coal had becu fully 40,000 ? in excess of the corresponding six months, and they had paid for the half-year's consumption 4s. 2 d . per ton ahove the average of the corresponding period. these facts he remarked, "But discussion bere will not settle the wages question any more than can the coal question. Each will find its true level by and by."
At the meeting of the North British Company, beld in Edinhurgh, the expenditure of 150,0002 , in respect of a new largo station in College. strcet, Glasgow, was sanctioned ; also $50,000 \mathrm{l}$. on account of the works at the Burntisland harhonr and docks, now in progress. The sum stock. The whairman roted for newr rolling expending chairman stated that they were ment of the considerable sum in the enlarge merg ofthe slation at inlith gow; and that out tho block telegraph system along the line Referring to the stupendons Tay Bridge now in course of constraction, and also to the Forth conse of constrnction, and alse to the Forth that he had no hesitation in saring that until they got the Tay Briage and the Fortli Bridge finisbed they worked at great disadvantago and great additional cost. During tho last six
months they had paid additional toll to the months they had paid additional toll to the
Caledonian of ahout $1,000 \mathrm{l}$. for sending tratfic Caledonian of ahout 1,000 . for sending trimic round by Perth, wbich they conla not take across
at Tayport. With the hope of bridging over the at Tayport. With the hope of bridging orer the
Toy and the Forth, and tbus baving a further ino of throurb communication from north to south, the North British would he in a splendid position. Referring to the guarantee which the company have given to the promoters of the great Tay Bridge, he ohserved that until that hridgo was finisbed, and passed by the Board of Trade as ready for working, they did not incur any liahility. After the bridge was completed, and suffered the tests common to all works of this character, they shonld be propared to step in and work it. On the guestion of warges and the price of coal he re-echoed the remarks of the chairman at tho Caledonian meeting, ohserving that during the year tbe rise in materials, coals, and wages has been such that it had upset all their calculations, and thrown them hack some eighteen months. Daring the last six months there was an increase of $26,000 \mathrm{l}$ in coal for the locomotive department alone, and their expenscs had run up from 49 to 55 per ent.
At the meeting of the Glargow and South Western Company it transpired that the sum o 369,650l. Was required for new and extension works now in course of construction.

PROPOSED PUBLIC BATHS
AND WASH-HOUSES IN CLERLENWELL
A project bas been started for the erection of public baths and wash-honses in Clerkenwell, and the proposal was so favourahly received at a special meeting of the Clerkenwell vestry on the subject, held last week, that there is avery promise of the object being carried out. Mr moving, one of the memhers of the vestry, noving that publio baths and wash-houses great success in St. Pancras, where they yielded clear profit. Their hathe, he stated, cost 3,000l., bnt tbey would not require to expend so much in Clerkenwell in erecting the buildings, as the parish was not nearly so large as St. Pan. ras. Mr. Thompson, another memher of the vestry expressed an opinion to the effect that i proper haths were provided for the parish, which was in the centre of the metropolis, they would, if properly mange, give a large profl: and he noth it tho were dity more than nother, it was tho facing of this question, and securing for the poor women a proper place Whero they conla wash their clouing. Another memher warmly supported tbe proposal, believ. ing that the baths and wash-houses would prove great hoon to the poorer classes. Such an establishment, be said, shonld have been erected in the parish long since. Several other memhers of toe Board endorsed the opinions which had been already expressed in favour of the crection of the baths; and the desirability of establishing them having heen affirmed, a committee, con-
sisting of two membera of the vestry from eacb ward in the parisb was appointed to consider
the question of cost, and report to a fatpre meeting.

THE PROPERTY OF THE CITY OFFICES COMPANY,
AT a meeting of the sbareholders in the City Offices Company, beld last week, a favonrable report was suhmitted as to the annual value of the several properties in the City which the Company bave purchased and built the rentals heing stated to be higbly satisfactory, and showing a net balance for tho half-year of 5,1412 , applicable to dividend. The receipts from the Lombard rooms alone were very large, giving 4,200l. for the half-year. As showing the rapidy increasing annual rentals of the 1870 Chey, it may he stated that whereas in dor they amounted now $30,000 \mathrm{~h}$, notwithstanding that, owing to the falling in of a lease in Cornhill, the Company lost 6,500 . rental. Tho annual value of the preseut unlet property bold by the Company is estimate floors of the preperty the Company herper erected lifts, which have been found to be a great adrantage in doing aryay with the neces. sity of constantly going up and down long flights of staireases.

CONTAMINATION OF THE WATER AT THE NEW CAMBERWELL INFIRMARY.
The new infirmary at Canherwell, a large and costly huilding, which bas heen erected at an outlay of 25,0007 ., has only just heen completed, and was opened not longer than a fcw weeks since. The construction of a well to supply the estahbshment was a portion of the work in connexion with tbe building, and it bas already heen nofortunately discovered that, owing to some unknown cause, the water is unfit for consumption and contaminated hy sewage. In compliance with instrnctions from the guardians, Dr. Bernays bas aralysed the water, and as the resnlt of his analysis he condemns the quality "The water in the following strong terms:The water is about as had as water can be. It well hy the sign of sewage contamination, as quantity of frce ammonia and of alhumenoid ammonia. One gallon of water contains 0.00827 grains of ammonia and 000785 of albumenoid ammonia. It is a very bard water; hnt that, apart from the waste of soap in the washing, I per callon ohject to. The total residue drollds of orcanic matter and hy calcination. Perma nent hardncss only $4^{\circ}$, total hardness $20^{\circ} \cdot 6^{\circ}$ Nitrates very distinctly present Tho, cope filly confrms the badnoss of the It is only fit for cleansing purpores and is eve then ony forly then only fairly applicable for swilling." At the of the analyst was discused, ween the Thornhill suggested that the sewarge might find its way from a dieused cesspool, and ho proposed its way crom a disused cessponl, and ho proposed of contanination. He expressed his belief that it fonnd its way down at the back of the hrickwork; but Mr. Lyon (a bnilder) said that conld not he so, as iron cylinders were used, and not hrickwork, and it is therefore reasonahle to suppose that the water is contaminated before it reaches the well. It is feared that there will be considerable difficulty in remedying the evil, as the source of the contamination is at prescnt a mystery. It was nltimatoly decided that pumpngy should he continued for a week, and at the expiration of that period another analysis made.

## ROMAN ANTIQUITIES.

On opening the nev wing of the Maidstone Museum, Mr.C. Roach Smith delivered a lecture on Roman antiquities. The lecturer thought the study of archæology would before long become general in schools, and that it would be necessary to found a chair of archo. ology in the Universities, Coming to the suhject itself, he would take the Roman antiquities in England, Romish inscriptions were only to se found in the north of this country. When the Romans were in pobsession of the country it is supposed that tbe southern tribes were more peaceahle than those in the north, and in consequence the remains of a number of great garri-
sons may-still be seen in the latter part. There were, however, the rains of three or four mili. Reculver, \&c. These, however, are of late date, they haviurg been built in the time of the Sasons Some time after the Romans conquered the country, the northern tribes began to be very troublesome, and the conquerors, in order to keep them back, built a wall across the north of Britain. It was 70 miles in length, 30 ft . high, and 13 ft . wide, and it was garrisolued by some 15,000 men. In the soutbern part of England are fonnd residences of great extent, which were occupied by people of importance, or persons who were stationed to collect tributes, or super. intend the working of manafactories; none of hese, howere, are to be found in Kent. Eewerage of tho Romans was superior to that of modern times, and a specimen of their work may still be seen in Linooln. They were also in advance of ns in economising beat. The wall of their houses were lined with red tiles, by means of which heat was carried all over the house. In the Roman period it is believed that Kont was very densely populated. At Hartip, in that county, there is a building, supposed is houcht, was a depository for provisions, \&o or exportation. At Lockliam Wond are th ruins of a sepulchre of a distinguished family.

## KENSINGTON GARDENS

The sad condition of the trees in this invalu. able extra-urhan forest has been alluded to in worse every recurring scason; so that we are warse every recurring scason; so thask, is there no arborist or woodreevo to stop the waste and decay which are now a disgrace to the autharities in control of this royal domain? Originally planted too close, the noyal domain? foresters now interlace their branches, noble having expended their force in shooting and, having expended stalky and dead at the upwards, bave become stalky and cead at the
top. In some of the onter boundaries there are certainly many beautiful trees standing in the open sward, fully grown and expanded; and along the admirable and much. frequented flower-walk many stately forestors have attained a graceful expansion, with free brancbage; but the great cential masses of wood extibit only bare poles, with a few straggling branches and withering top-shoots, - several heing broken down and decaying from too close propinquity.
Surely many of these deformed poles onght to Surely many of these deformed poles onght to be cleared away, to leave roon for the more
healthy standards to vogetate freely, and feather healthy standards to vagetate freely, and feather not assume graceful proportions when their branches are intermixed, - standing at, say,
10 ft . apart,-some of them being only 6 ft ., 10 ft . apart,-some
5 ft ., and even 4 ft .
The cleararce of some hondreds of tbese stems would yield a considerable profit, whilst it would pon a way to tbc healthy growth and expansion of the survivors.
In this vastly extended and still growing metropolis the value of such public parks, gardens, and liberties cannot be over-estimated; and if a small share of the outlay upon rangers, keepers, and servitors were dedicated to the improvement and embellishment of these long. neglected woodlands, as also to the tasteful laying out of a skew pathway, to extend a mile from Notting-hill entrance.gate, nearly to the Ride of Hyde Park, and to the Erhibition-road gate, it would confer a great boon upon the pablic, and conduce to the healthy enjoyment of extensive woodlands, which cannot be traversed is winter, and, in their present state, are neither bealthy nor attractive.

## COTTAGE HOSPITALS.

Watlington.-A proposal to establish a cottage hospital for the district has been fully discussed at a puhlic meeting, and a resolution was unanimously passed, "That it is desirable to establish a cottage hospital in Watlington for the benefit of the sick poor in the town and neighbourbood that the house known as 'Lady Macelesfield's Training School ' be rented for the purpose;
and that a committee be appointed managing and that a committee be appointed managing committee for tbe bospital." The Earl of Mac. clesfield and most of the gentlemen present promised liberal subscriptions. It is intended that the hospital shall be used principally for accidents, and that no patient suffering from contagious disease shall be adcritted.
pital at Wisbeach has been opened by Miss Mar garot Elizabeth Trafford Sonthwell, of Honing ton Hall, Grantham, and Hyde-park, London The hospital surgeon's residence and mortuary porter's lodge, and other buildings, with the grounds in which they are situated, are the git of Xiss Southwell to the town, for the benefit of the sick and poor. The value of this gift is nearly $10,000 \mathrm{l}$, and, in addition, the foundress has given 8,000 . to the permanent endowmen und, besides an annnal subscription of 211. Mr. W. Peckover, of Wisbeach, bas given 2,000...M . Feckover, 1,0002 ., and the Dnke of Bedford looks the puhlic park
looks the pualic park.
Ross.-A statemont prepared by the assistant secretary, Mr. F. Coopler, shows the amonnt re. cived during the past nine months from patients, and in casual sums, and the amounts which had been promised and would be likely to be received if the institution were frec. It was proposed at a recent meoting by Colonel Jack son, "That the cottage hospital be made free on and after tbe 1st October." Mr. Blake moved as an amendment, "That rule 26 of the insith tion be alterod by leaving out the words, B sucb weekly contribution shall in no case be than 3s. 6 d. . The amendment was carried by a majority of five rotes. The cottage hospital
will consequently he free to those who cannot will conseque
afford to pay.

## From melbourne

The Custom-house additions and alterations bave been commenced. The new foundations arc composed of huge blocks of blue stone, hedded in cement, the wholo heing 11 ft . in depth and about 5 ft . in widtb. The alterations are not confined to any particular portions of racter as to completely of so general a chaappearance and internal arrangenents. The centre of the building will he brought forward which a flight of seven granite steps, 56 ft . in length, terminatine in a landing 8 ft . in depth, wrill lead to the level of the bascment floor: From this landing three doors will communicate with the south cutrance.hall, whence wide stair. cases will lead to tho long room on the first floor and other parts of the huiiding. From the level of the first floor four plain Ionic columns, with corresponding pilasters, will spring, reaching the base of an ontahlature, 6 ft . higb, rumning along the entire front, and surmonnted in the centre by panels 8 ft. in height. 14 ft . back from the main huilding, which will he 7 Ift . in length, the two wings will run each 5 L ft . to William and Market streets respectively, giving a total
frontace of 176 ft . The basement will be confrontage of 176 ft . The basement will be con-
stucted of sawn hlue stone, rusticated, and the st:ucted of sawn hlue stone, rusticated, and the superstructure of brick, the whole being
cemented. Kach of the wings will have a cemented. Kach of the wings will have a
depth of 100 ft., that facing William. street heing depth of 100 ft ., that facing William-street heing entirely new, but a portion of that now ahutting on Market-street will bc worked into the general design. The total extension of the present building will be in length 50 ft. , and in depth 30 ft ., adding eighteen rooms, and mereasing the dimensions for the long-room nearly one. half. In length, 88 ft ., it will not be extended, bat its depth will be increased to 54 ft , and the ceiling contractor to avail bimself of the skylights at present in existence, but concealerl by the false ceiling. The estimated cost of the alterations is close upcn 27,000 ?
a district of Melhourne, h erected into a distinct town in 1870, is to have a new town-hall, the memorial stones of which have been Laid. Mr. W. J. Ellis, of Elizabeth street, is the arclitect. The hnildings will stand at the cosner of Napier and Moor streets, and will he adjaceut to and in conjunction with the present Fitzroy court-house. The main featur of the design is the connexion of all the huild ings in one block. The new buildings will conride, and 33 ft . in heirght, which will be erecte ide, and $33 \mathrm{ft}$. in height, which will be erected on the side abatting on Moor.street; and the intervening spase between the hath and the court.house will be occupied by the present
offices of the council, together with
a council-chamber, a library, and several other apartments now in course of construction. The principal facade will face Napier.street, and wil comprise a very lengtby verandah or loggia, and
nating the east end of the ball will have si columns, each 28 ft. in height, with capitals, cornice, and entablature of the Corinthina order The total length of the Napier.strect fagade will be 175 ft ., and that to Moor-street 136 ft . The elevation of the latter will be in tho samo style as that of the former, with the exception that pilastcrs will be used in place of columns. The tower, which will he quadranglar ( 17 ft .6 in. to Napier.street and 13 ft .6 in . to Moor.stroet), will consist of four storics, terminated by a mansard roof, with inclosed ornamented iron. work and a gilt grating. The total height of the tower will be 104 ft , and the oreater portion of it will he distinctly seen from almost every portion of the municipality. The principal floor of all the new buildings will he 7 ft . above the level of Napier-street, and will be reacbed by two broad flights of cut and polished Malmsbury wo broad with winged walls of the same mate. rial. The new council.chamber will be 10 ft . one 21 ft wide and 16 ft in height with cored ong, celling and dado framing, as in the puhlio hall, but 0 for 0 ft ., and of the same beight as the last.named apartment. The erection of the works has been Messrs Messrs. James Nation \& Co., who have connsl 5 100 $8,2051.7 \mathrm{~s}$. 10d., exclusive of the cementing and
some other external items. somo other external itoms.
Sandhurst.-The foundation stone of the new Masonic hall, View.place, Sandhurst, was laid on the 2 th of June, in the presence of a concourse of about 4,000 people. The new hall will not only be the largest out of Melbourne, but in architectural pretensions it will have no supe-
rior, it is said, in the Australian colonies. The rior, it is said, in the Australian colonies. The The dimensions of the structure are 130 ft . in depth by 97 ft in breadth and 60 ft . in height and it witl be carried out in the Corinthian ordel of architecture. The foundations are of blue stono, and the bnilding will be of brick, witk face of cement.- The front has a portico, with a flight of blue. stone steps, 55 ft . in lengtl byt 20 ft . in depth, on the table of which rest sis Corinthian columns, suppiorting an entahlature the centre of which forms a triangolar pedi. ment, the base line resting on the columns while on each side is a parapet of balusters of the parapet, and on the apex of the pedis ment is an acroteria representing a human face encircled in a shell border. There are two doort as entrances by the front. One leads into hall, on one side of whioh are tbe reading. room the secretary's room, the library, merbors' room, refreshment-room; and, at the end of the hail, the lodgeroom. This is an apartinent50 ft square, but light is odmitted by slylight window, Th the tight is a ne sido are the sitting room two parlours threa esion the to the portioo is a door loading by stone staircases is by a grand staircase at the inner end of the lobby hall. At the top of the staircase are doors opsning into ladies' and gentlemen's cloak rooms. The large hall will be 92 ft . long by 45 ft wide, and 30 ft . high, the length being parallel with View.street. At one end will be a galleryr and at the otber a stage. This ball will be used on grand occasions by the brotherhood, and when not used by them will be open for use to the prhlio for concerts, balle, \&c. The interior decorations will be of a rich character ; there. will he two rows of windows, and between the windows Corinthian pilasters, crowned by ornan mental arches. The lodge-room, having walls 18 ft . high, will also bo decorated in a sinvilar style of ornamentation. The roof will be of slate. The cost of the building will bo 9,000 and it is to be finished in twelve months.

Statue of the late King of Denmark. After the opening of the Danish Rigsdag, at Copenhagen, on the 6th instant, the city fold for tbe purpose of inangurating the statue of the late King Frederick VII., erected in the great square in front of the Castle of Christiansborg: It is an eqnestrian statae, in bronze, executed by the late sculptor, Bissen, the most noted of pe pupils of Thorwaldsen. The statue we anveiled at a sigual from the King, amid cheers of the assembled thougands

OPENLNG OF OWTEN'S NEW COLLEGE, MANCIESTER.
The ceremony of opening the Owen's Newv
College, Oxford-road, Manchester, has been performed by the president of the college, the Duke of Devonshire, in presence of a full gathering of the students, and a large assenblage of poople.
The design, which we illustrated with a view and
The The design, which we illustrated with a view and plan, on pp. 86 and 87 of our volume for 1871 , was prepared by Mr. Alfred Waterhouse, archi.
tect, and the building has heen earried out substantially in accordance with the design. 1 t stands about 100 yards from the line of triford-
road, and is bounded on the uorth by Copelandstreet, on the south hy Burlington-strect, and at its east, or Oxford-road eud, it is about 150 yards its wist, or The Oxford road front is divided into tbree hlocks, joined by two receding lines of
elovation, and forms three sides of a square. The style of the huildings is Gothic, of a colle. giate aud early type. The walls are faced thronghout with York stone, and the roofs covered with flat tiling. The old houses are now andergoing demolition on the site which wil main block are the various lecture-rooms, olass main block are the varioul lecture-rooms, olass-
roons, dc. Wherever possible the class rooms are arranged witb their backs upon Oxford-road, sc as to avoid the moise arising from tho traffic without; and a wide corricor of communication
runs along the bnilding on that side, with win. runs al ong the mich
dows, some of which are of stained glass, looking into Oxford-rond. On tho basement-floor this voridor is unbroken. On the upper floor it is sut in two, in the middle, by tho library, on the irsuetioor, and by a large arts ol ass-room on the
ground floor. The division of the corridors he ground.fluor. The division of tbe corridors has acen devised, amongst other reasons, to prevent
heir being nsed too freely for general traffe. Ou special occasions, however, or whon required, he whole of onch floor can bo thrown she suite.
From the contidor on the ground-floor open nost of the rooms, which vary in size. On the western sido tho floor is ahove the level of the rround, and on the enstern side the rooms look nto areas 26 ft . wide, so that the story is prac.
ically above ground. On this floor aro placa ically above ground. On this floor aro placed the ongineering workshops and museunss, the students temporary dining-room and commonorm, the nttural plilosophy workshops, rooms The sonthern extremity of the hrilding is devotel, on the hasement and ground floors to tho chemical thentre, a room ahout 60 ft . by heatro and as tho public boll of the collego. The profussor's table iz at the westeru end, on the evel of the basemont-floor. The thor of the heatre rises eastward, until it reaches the level
if Oxford-road. Tiors of seats are arranged for oxford-road. ciors of seats are arranged for fallery for the use of ladies and visitors on oublic occasions. The room is lighted hy win. re fitted with iron shutters, go as to admit of he room heing darkened at pleasure. The oom can be lighted with a sun-burner. The valls are ornanneuted witb medallion portraits of minent chemists in terra. cotta, and at the hack If the lecturer's table is a mall laboratory, in Which experiments illastrative of lectires to the tudents can be made. Upwards of 600 persons loor is the geometrical drawing. room, which vill accommodate ahont fifty studente. This oom adjoins the engineering lecture-room. The natural philosophy lecture-room, with lass.rooms, occupies the whole of the ground-
loor of tho central projection of the building. There is accommodation fur about 200 stadents. n this room, which is fitted np so as to he ahle to oo ased both by day and evening stridents. A itrge arts elass-room, with rising floors, is also
nn this level. Seats have been provided for min this level. Seats have been provided for
whont 200 students. Several rooms for tho pro. boont 200 students. Several rooms for tho pro.
essors, for the secretary of the institation and essors, for the secretary of the institation and
tis clerks, and the board-room cornplete this part uis clerks, and the board.room corplete this part
of the luilding. Passing to the tirst floor tleere we three lirge aits class-rooms, nofessors' ooms, and various small arts class.rooms. arly all these rooms have roofs formen of
ched heans. Principal Greenwood's Greets ched heanis. Principal Greenwood's Greek a similar room adjoins for Professor Wilhts, liss students. The library occupies nearly he whole of the first floor-space of the central nit of the building. There is considerahle iccommodation in the roof, which will levoted to the natural history and geological nuseums, but this arrangement will only be
temporary. At the rear of the main block on the Burlington.street side are the ohemical laboratories, which are erected of hrick. This department is joincd to the main building by a passage. There are two laboratories Within this department, one of which is suffi. ciently large to admit of 60 stndents carrying on their experiments in it, and the other wili afford opportunity to forty other students. The forner will be deroted to qualitative and the other to quantitativo analysis. Several small laboratories adjoin the two large ones, where students may carry on private experimente. The laboratories aro 70 ft . hy 30 ft . in extent, and 22 ft . in height. Professor Roscoess private laboratories. There are in the building about 90 rooms in all, of which the chemical depart. ment takes 28; the natural philosophy depart. ment, 9 ; arts' class-roonis, 9 ; and engincering, 8. Caro bas boen hestowed on the arrange ments for warming and ventilating the buildings. In the sub.basement there aro bot-water hoilers and a steam.engine, the latter to drivo a fan for forcing fresh air (warmed in winter) into the corridors and lecture.theatre. Tho whole of the rooms are to he warmed by hot.water pipes. The vitiated air in the rooms is to he carried of by ineans of large shafts in tho roofs leading to
ventilating turrets, in which stean cones accelo. vatinaing turreta
rate the draught.
The opening cercmony took place in the prin. cipal theatre of the college, wbich was filled from floor to roof.

SCHOOLS OF SCIENCE AND ART.
Istington Schools of Science and Art.-The Queon's prizes gained by students at these schools, at the late May examination of the Science been Art Lepartment, Sonth Kensington, have been distribated by Dr. C. Meymotr Tidy, in the Essex-rood in the schoos, windsor-street tho standents and their friends. a number of by Mr. H. J. Wheatley, secretary to the schools, by Mr.
showed that the institution, which now enters ou its thirteenth session, has,-thauks greatly to on its thirteenth session, ans,
the energy of its head-master, Mr. J. Howard, heen making stoady progross in its work since tho last angual meeting, and has fully kept ap its already recognised position the one of tho frst institutions of its kind in the motropolis. The premises have recently been much inproved, und novv includo a laboratory for practical in-
struction in chemistry. Among the most recent struction in chemistry. Among the most recent
snceesses achieved hy stulents of the classes are successes achieved hy students of the chasses are
the Guld Medal, for chemistry, to Mr. Isanc Scarf; and a Roynl Exhibition of 502 per annnm, tenabio for three years, at the College of Chemistry, South Kensington, gained hy Mr.
Honry Lewis, who also takes off many minor distinctions. Dr. Tidy delivered an interesting address on educntion civered an interesting as bearing on the objects the Science aud Art Department has in view.

Proposed School of Art and Science for Brighton. A neeting (convened by circular) has been held at tho Royal Pavilion, for the purpose of con. sidering the proposal to raise a fund for building neiohbor Art and Science for the town and Mayor (Ald. James Ireland), and was attended by several gontlemen wbo take a deep interest Mr the matter. At the requost of his worship, mittee who conduct the (chairman of the comaddressed the meeting npon the importance of the school having a building erected specially for its own purposes, and attached to a school of science. Aftor pointing out that the present scbool could not accommodate all wbe applied to be admitted as pupils, and that towns of far less importance than Brichton had their own huildings, he said about 1,900l. had heen romised, but it was requisite to raise sometbing like $t, 000$ l. The estiranted cost of the building was 5,000l., but Govcrnment would grant 1,000 that was 500 f . for the school of art, and 5002 for the school of Scionce-if the lnilding was orected free from loan. He further stated that when erected, the school would be self.supporthad had no finds from which they could give, hut they had power to grant land, and an application for a sito opposite tbe New Free Library and
Museum, in Church-street, had been most Museum, in Church.street, had been most favourably entertained by the committecs before whom it had been brought. It was unammonsly resolved "That it is expedient to pro. connexion with the Science and and Sciencc in, South Kensington, for Brighton, Hove, and tho vicinity." A large committee was appointed to raise the reqnisite fands.
Guildford Science and Ant Classes, - Tho annual distribution of prizes to the successful competitors in these classes, awarded hy the Government Department of Soicnce and Art, tion placa at the Tomnhall, Gnildford. In additude the Guildford prizes, those won hy the ut onts of St. Johns, Woking, were aiso distriGuildford Working Men's Institnte. In addition the South Kensington prizes several local awards were given. The distribution was made by Mr. R. A. G. Godwin-Austen, F.G.S., who presided. There was a large attendance of visitors. aptain Campbell, honorary secretary, read the reports of the operations of the classes, from of students has contimod stendily to increase upon former years, 62 having attended the classes during the last winter session. Of those, 35 came up for examination in May, and 23 passed. The total number of successfint candi. dates in the seven suhjects tanght amounts this year to 49 , an increase of 13 from last yoar. Ethelbert Dowlen has been awarded the Queen's silver medal in hotany (boing the first medal awarded to the Guildford science classes) and besides numerous other prizes and cortificates, he won the Queen's gold medal for geology at St. John's College, Woking, and would have received these medals to-night, but for tho proapect he bas of obtaining a third medal, in
chemistry, which is still Mr. James J. Pbillips has obtained the gold medal for chemistry at Charing.cross Hospital, where ho has been a apointed ing-cross thosphay honour. The committee desire to express tbeiv sense of the valuahle services of the teachers, Mr. 12. G. H. Goffin and Mr. G. Longbottom. The lady students cive additional interest to this mecting by trking two Queen's prizes and fifteen certificates of their snccess.'

## HOBBIES AND THE ORGANISATION OF

## AMATEURS.

Sir,-Every learmed professor unfortunately volens, with his own particutar subbject. If snch notions were rigorously carried out, edncation would he an infliction on the rising generation and lead to nothing less than a demented posterity. But if the learned onthusiaste would take the more moderate and wiser course, and simply ask that the instruction of those who make these special studies hoblies should be provided for, we believe every science would be properly studicd, and its wants supplied. Nono but essenticl stadies should ho forced
upon tbo entire population. The central and upon tbo entire population. The central and
suost rigorous science is that of the mathematios, which deals with tho principles quderlying all, and shonld, therefore, be one of the important and shonld, therefore, be one of ef ene Astronomy ossentials of general education. Astronoms spechanics, chemistry, \&o., are only specialties mequiring the self- eame mental qualifioations for requining the gelf- alme mental qualione correct obtheir snccessful prosecntion, -viz, and rigorons servation, reason. It is sume specialties as his life-work these specialties as his life-work.

In the dispensation of work, however, a man is not always put to what he would have ohosen, and sometimes he finds, too late, that he is chained to work for whicb he was not the bost fitted. This leads to the pursuit of come more congenial
The elfective organisation of amatenrs, in all branches of study, is sonvething yet to he considered and worked ont. If rightly effocted, it wonld secure an extended co-operation, the perfecting of any special study, and tho material welfare of the institutions and professors dovoted to it.
W. Cate Thomas.

THE SALINE BATHS, DROITWICH. The new saline bathe at Droitwich will shortly e opened for the use of the public. The curative properties of the saline springs have long heen celebrated, and, especially during the last thirty years, the bathing estanhishment has been largely patronised by residents in the midland counties. For many years the bathing establishment has been in private hands, and although the accommodation has been of an extremely limited and iuferior description, consisting simply of three hot baths, a oonsiderable annuill revenue has been derived from them. A company bas recently been formed for the purpose of purchasing and improving the property-chairman the Right Hon. Sir John Pakington, bart., M.P The plans of the directors have been matneed and the most important part of the work, mamely, the crection of the bathe, will be com pleted in the course of the present month Arrangements will be made for providing the inmates with amnsements and suitable exercise, the grounds ocoupjing a spaco of eeveral aores At present there are hot batha, fitted op for first, gecond, and third class bathers; also douohes, plunge-bath, bot and cold brine sprays, and the Turkish bath, with spacious compart mente, ombraoing modera improvements. Ad. joining

LLANUWCHLLYN, NEAR BALA.
Tefe parish church of Llanuwchllyn has recently been roopened, after rehuilding, with additional accommodation, the south aisle b-ing lengthened ont westward. The old church was in a thoroughly dilapidatod condition, and possessed no architectural or archwological interest whatever, except the effigy of a fine old warrior, stated. It has been the endeavour of the architect, however, to koep up tho oharacte. xistics of the Welsh village church, as far as was consistent. A western gabled bell-turret has aocordingly been designed, of massive construction, and the nave and chancel are of tho samo width and heigbt, the ridges of the roofs carried straight through. Internally, a chancelarch, corbelled out, narls the division of the higher and the general treatment more deco. ratire. It had beer the architect's intention to put ormamental ridge crestings to the chancel poof, and a red-pottery cross over the chancelarch; but it has been found necessary to abandon areh; but in Formerly there was no vestor this treatment. Formeriy there was no vestry, the sonth aisle. In the materials mainly used the sonth aisle. In the materials mainly used Wrexham freestone has been adopted for the Wressings foe The roofs are covered with Portdressings, sc. The roofs are covered with Portmadoc states, nally, the roofs to the nave and aisle, also the charel a chancel a panelled arched coiling. Tbe nave is seated with open deal benches, with shaped ends. Those to the chancel are of a more decorative character. Encanstic, tiles have been nsed for the paring, in patterns arranged
by the architect. Tho pulpit is of Wresham by the architect. Tho pulpit is of Wrexham stone, with sqnare ornamental cusped panels.
Tbe glazing is of cathedral glass, of different
tints, arranged in various patterns. The altarrail and locks were made, iu wrought iron, hy Mr. Leaven, of Maidenhead, and the weatheroooks by Messrs. Hart, of London. The chnreh is heated by one of Porxitt's nudergronnd stoves. The contract was taken hy Mr. J. Morris Jones, of Carnarvon, for 1,400 l. ; but the total cost will prohably amount to $1,500 \mathrm{l}$. Sir Watkin Wyan and Lady Williams Wyan have contributed a very considerable portion towards the expenditnre, hut a large amount was raised also in the parish itself. The arohitect was Mr. Edmund B. Ferrey.

## SCHOOL BOARDS.

Northampton.-The Sohool Sites and Bailding Committee made no written report. The contracts for hoth schools have been executed. Mr. Bland, one of the architects, appointed Tuesday next for setting out the Vernon-terrace ground, and Mr. Walker, the other architect has seen Mr. Redshaw, who is now excavating for the foundations of the Spring-lane school Mr. Wright proposed "That the architects he requested to make immediate arrangernents for laying the foundation stones of their respective schools; that the chairman of the Board perform the ceremony; and that the attendance of the Corporation and other pnhlio bodies in
the borough ho invited for the oceasion." He the borough ho invited for the occosion. He great dcal of work had been done, althongh it might not be soon. The contracts had been entered into for the erection of the two schools and, as the time of the Board would expire in threo months, he thonght opportunity should be taken of investing the laying of the foundation stone with some coremony to show the publi tbat they had not been working in vain. The resolution was ultimately passed in this shap -"That the chairman should lay one of th atones, the vice chairman the other, and that the Board should dine together afterwards.

NEW SOHOOL.BOARD SCHOOLS IN SHEFFIELD.
Two new schools in Sheffield were opened on the 13th. The one at Netherthorpe is planned so as to arrange the soholars in three depart ments, hoys, girls, and infants; and so that each department is complete in itself for school wrork The hoys department comprises a school-room L shape, and 20 ft . wide, accommodating 136 scholars at desks, three chass-rooms respectively for eighty, forty-five, and thirty-four echolars cloak-room, manager's - room, and teachers retiring-room; spacious covered p${ }^{7}$;y - shed, play. ground, and conveniences. The girls' department is the same as for boys, but is entered by an entirely separate entrance. The infants department, all on the ground floor, contains school-room for 256 scholars, two class-rooms each for filty-six scholars. The entrance to in. funts' department is the same as that for girls, hecause they nse the aame play-ground, and becanse they of cen come with the giris; but there is also a lobby by which they can be dismissed througb the boys' doorway, if needful. The accommodation in the wbole bailding is for 956 scholars. The school-rooms are warmed by Water on the hig pressure system, koown as Perkin's patent, applied by Mr. R. R. Gibbs, of liverpool; and tho class-rooms have open fireadmission of fresh air, and the extraction of vitiated air, and hoth can he easily rogulated at the pleasure of the teacher, the ventilation heing carefully arranged by the architects upon their own plan, which is pronounced to be perfect in the schools already occapied. The windows give side front light and side light to all desks and to the desks, patented by Mr. Moss, the clerk to the Board, with standards designed by Messrs Innocent \& Brown. The cost of the building inclading bonndary walling, water supply as phalt ing yards sce, is 5,6a5l., heing a little under 6L per head. Messra. Thomas Sharp \& Son, M[a]. berry-strect, are the contractors. Mr. W Dickenson is the clerk of works, and Messers. Inuocent \& Brown, St. James'sorow, are the sipned October 10 th, 1872 , so that the ereation signed October 10th, 1872 , 80 that the ereation The school at Philadelphia differs from Nether thorpe in the design and arrangement being
suitable to a different kind of site and degree of accommodation. The total number of scholars in the three departments is 750 ; the cost of tbe hailding, $4,530 l$., being a little over $6 l$. per head, including water-snpply, houndary walling and palisading, asphalting of yards, \&o. The archi-
tocts are Messrs. Innocent \& Browa. The tects are Messre. In
huilder is Mr. Rawson.

THE EXETER SCHOOL.BOLRD SCHOOLS. THE chief stoues of four new schools have been laid at Exeter. The Exo Island school, the stone of which was the first one laid, will pro. vide accommodation for 200 infants, and 150 boys and girls between the ages of seven and ten. The cost of the site, which is rather a cramped one for the parpose to whicb it is pnt, is 960 l ., and the buitdings will cost about $2,000 \mathrm{l}$. The style of the structure will be Domestic. Gothic, and it will he huilt of red brick, with Bath stone window-beads, and string conrses The architect is Mr. J. Johnson, of London, and he builders are Mesars. Stephens \& Sons, of Eseter. The St. Mary Archos-street school will accommodate 200 infants and 200 girls. The nilding is from the design of Mr . J. Toner, of London. The walls will be of brick, with Portland stone sparingly introduced. The cost of tbo site is so0t., and the baildings will cost 2,7002. Mr. J. Kenshole, jun., of Hoavitree, is the builder. The St. James's-road sohool, which sintended for infants aluae, is also from the design of Mr. J. Toner. It will he almost atreet traot for the bnilding amomnts to $1,320 \mathrm{l}$. Mrr. W. R. Commings, Eieter, is the buildor. The school in Newtown, just at the entrance to the Clifton-rond, will accommodate 200 pirls and 200 infants. The site cost $445 l$, and the huild. ing will cost clo=e upon 2,600\%. The style of the huilding will' be Domestic-Gothic. The walle, from the plinth to the floor, will bo of Heavitree stoae, with a battered face, and the resis of the structure will be of red brick, the window-header being of Ham-hill stone, and bands of black hrick will give relief to the appearance. The gable will he surmounted by a belloturret. Thie gehool is from a desiga furnished by Mr. Pearsou B. Hayward, the architect to the School Board. Tbe builders are Messrs. Stephens \& Son. Yentilation and warming have boen especially atended to. The buitdivgs will be warmed winter by the Manchester grate, and wo dol peli will fit tho interiors with the E.xon dess clusive of fittings, will be $\mathbf{1 1 , 1 8 0}$ l

## SCALES.

Mrssrs. Bemrose \& Sons, of Derby, have issuod, in a neat and compact case, a dozer scales, moeting the wants equally of arohitects: engineers, and land surveyors. The space belown the scale and at the brock is utilised by a number of well-selectod calculations for ready reference As the material is caraboard, an appliaation of copal varnish, to render the scales to some extent washable, would be useful.

## TERRA COTTA.

When there is so much controversy respect ng the revival of art in our day, and the artistic decoration of our public buildings ano dwolling-houses, it appears strango that mort attention is not paid to a material adapted td such a wide expression of the architect's powet of design. I refer to the material known as "Terra Cotta." If we look to its durahility, it is equal to any stone which has been discovered, and its adaptability to architectural purposes is so superior as to he beyond all comparison with; any known material, from the fact that the most elahorate designs can bo executed at a much less expense, and also that a series of beantiful colours can bo produced so as to blend harmoniously together, thereby produo ing an effect pleasing to the eye, and engen. dering a spivit of artistio desire even in the most uncultivated. I havo been studying thi subject for many years, and am convinced i this material were developed in all its regource it would prove a mive of inexhanstible wealt to the architect and builder. Mry object is penning these fow lines is not merely to arg the adoption of terra cotta in its plaiu form
ut I should like to see it used (and I have no esitation in saying it is quite praeticable) with a evamelled surface in various colours, whieh suld be obtained at one burning, thereby adueing the expense which would otherwise be rearred. Much more could be said on this ubject, in the way of economy, eleanliness, and ereased facility of design, hoth in internal an sternal decoration.

## COMPETTTION.

At a recent competition for the Odd. Fellows all, Devizes, the drawings of Messers. Willson, illeox, \& Wilson, London and Bath, were the st selected; and those of Mr. E. Bays,
illiers-street, Strand, and Camhridge, were the illiers-street, Strand, and Camhridge, were the
cond seleeted. There were nineteen comcond 8
titors.

COMPLETION OT QDEEN VIOTORIA STREET, CITY.
AT the last meeting of the Metropolitan Board e Works Committee presented a report, stating at the committeo had directed that applica-
on he made to the First Commissioner of her sjesty's Works, \&c., for his certificate of the mapletion of Queen Victoria-street, and reeom. ending that upon the reeeipt of sueh certificate o street bo handed over to the elarge of the mmissioners of Sewers of tho city of London, required by the 11th seetion of the Act. - Nertant works carried out by of the most heu he stated that the estimated amount of recoupment to the Board of the cost was $00,000 l$., they would see that it was a work some magnitude. The street was so fax cometed that it was in a position to be handed er to tho City authorities. He mighto state at nearly the whole of the surplus land had an let, and from the Mansion House to Ben-st's-hill the most paluable portion had all let. Altogether there was only one-twelfth
the whole unlet, and that was in the st valuable portion, between Bonnett's-hill
a Blaekfriars Bridge. The motion was carried.

## ACCIDENTS.

Subsidence of a Quay at Newcastle.-The Newstle Quay from a length of from fifty to sixty rds, and a width of 12 ft , has suddenly given
$y_{1}$ and subsided to a depth of about 12 ft . $y_{1}$ and subsided to a depth of about 12 ft .
o Kiver Commissioners have been dredging , Tyne for several years pastin order to deepen and tho result, it is believed, is that the ndations of the quay are weakened, and it is red that the subsidence will be extended by 1 betion of the tides. The loss will not be lious, as the Newcastle Corporation intended ling the quay down and rebuilding it at a cost from 300,000 ? to $400,000 \mathrm{l}$.
Fall of a Wizl at Douglas.- A mason was pared, along with several otbors, in taking fn the boundary-wall between Marathon, the idence of Mr. Samnel Harris, chief magistrate Douglas, I-10 of Man, and Castle Mona unds, when the wall fell, hurying him in the ris; and the others had a very narrow escape. injuries were so severe that the man died hut two hours afterwards. Mr. Harris, prior wall from the top; instead of whieh they ameneed undermining the foundation, and, the 11 heing insecare, it fell almost immediately.

## PEYMOUTH.

He Lord Bisliop of Exeter, on the 8th inst. the fuundation stone of All Saints', the firs onr churches nbout to be erected under the piees of the Three Towns Church Exteusion iety.
Plymouth, is Early Geometrieal in style, and lymouth, is Early Geometrieal in stylo, and
building will inclnde a nave, 80 ft by 28 ft , th and south nisles, tower, with baptistery the sonth-west angle; chancel at the east , with organ-ehomber on the north side and ay on tho sonth. Betwoon the nave and aisle will be an aroade of five arches spring. from circular stone pillars, and above will a lofty clearstory. The first contract is
he sacrarium will be apsidal in form, and have five pillared and traceried windows.
roofs are to be open, and of pitch pine: the
walls of wrought dark and light limestone, with dressings of Box-ground and Portland stor

## SUSSEX ARCH $2 O L O G I C A L$ SOCIETY.

A pleasant antuma gathering of the logical Society was held at Isfield and Little Horsted, where the ancient chnrehes were inspeeted, their arohiteetural features ex. plained by gentlemen more or less conversant therewith, and visits were paid to the hospitable mansions of Major King and Mr. Francis Barchard. The weather was as fine as eonld hare been expected. Isfield Station was arrived by the midday majority of the oompany Brighton, there midday train from Lewes and distriet came hy road. At Isfield Placo, the property of Major King, conmanding the Major extonded a cordial weleome to all. freshments were served in the oak panelled dining-room; and a brief deseription of the place was given by the Major himself. Isfield Earl of Kent, and after the Conquest it appenes to have been given to the De La Warr family. In the fifteenth or beginning of the sixteenth eentury it was in possession of John Sharley, wards eofferer to Bloff King Hal The property remained with the Shurg generations. One of the fomils rho was born at Isfield in 1569 wee Iord Chief Tustiee of the pleas in Treland, and died in 1617 or the Tauchters os co piresses and ho (Mo bivo held the sure held the share which ell to the eldest darnghter. Margaret were explained by Major King and the ineumbent, the Rev. Mr. Russell. Tittle Horsted Chureh was desoribed by Mr. Francis Barchard, who provided luneheon at his residenee, where a pleasant balf-hour was spent in
inspecting the pictures.

## THE LEAD TRADES.

Tre disputes in the lead-mincs, and at the rarions lead workh in the North of England, ie spreadug south-
ward, and is litely to become a serioue question to London plumbers and buildere this busy sensou.
belonging to Mrr. Beaumont, M.P. enrdaleyed as empa.
ratore, aud at Allen. Smelt Mill aud Rookhope Mill, have ratore, aud at Allen Smelt Mill aud Rookhope Mill, have
come out on strike, in consequence of a refueal to inerease their wages, Hitherto the nucn hare received ts. 3d, for
seven hours shill. They now demand $\overline{\mathrm{s}}$, for the eapae aurs and the same work.
The cxtensive lead worist
The axtensive lead works of Messrs. Walker, Parker, Walland, are also stopped by etrikes, and in connexion With this large firm, the dispute bae aesuraed the likeli-
bood of a lung stragge. A short time ago the
wages to the average amonnt of 1 s . 9d. per weel per man The men met in the largo Elswick worh phop to hear Mr. Walker'e decision, and that gentleman spoke his mind to
them. In the course of his observations be said -Just let us consider bow yon have observations he said, -Just the stepe you have taken to enforce it. You waited pafiently for mouthe until you eaw that I had not a single valuable cargo, worth muny tens of thousnods of pounde and yon knew that a very severe pecuniary loss would he
and entailed upon mo if you were ide, pecuniary loss would he more tban that you knew that if your department remained idle the
whole of the rorks would be at a standetill. I do not
whit
helt
 a claim iu a similar sort ol' Fuy. Tho last time yon tuade the demand on the very eve or my departure for a fou monthe jorney, and you thought 1 could not help
myend that 1 could be compelled to nocede to your demand npon that occasion. There ie a point on which I do not like to epeble, but your conduct calls for it; you do not aeem to appreciate your addan-
tapeg, and I must lay a fow of them before you, I
tell yon- ind I will appeal to yonr foreman to bear me tell yon- nd I will appeal to yonr foreman to bear me
out that I have meny times bought lead to keep you at
work, when it worls, when it would have boen greatly to ray advantage
not to hare done so. I hare done thig on many ocrasiong when I have hud large stooks of market lead on may hands, and I hare done it becannee I did not like to see your pot
empty and colt, though it hroasht loss to mysele ompty and coid, though it hrought loss to myself. I dif betore yon. I do not suppose you knew sne was the cuse, and now you know it ido yot enppose you will take much interest in my loss for yonr good. It bas been a many years, and bas broken down end become infom never to turn him adift even if ino end ble of continuing
his work. We always endeevour to find a his work. We always endenvour to find a job to suit him, and l hope the practice will never be given np. You are,
I may say, unskilled men; that ib, you have not served fire or geven years spprenticesbip, liko mechanios in gencral. It is irus you must all he ablo-bodied men, but
you all know perfectly well what wrages you could ean as mochanios, and what wages yon rages you could earn a
 a week, and balf of Suturday to yourselves. The gren battie hetween capial and lubour is going to be fought
out. If I may use a military expression. the battle ha commenced, and bas to be fought out at the battle ha is now getting to close quarters, and before ranges it it next year If fuucy the hattle mill be over. Either labour
will bave conquered over capital, or capital will have eon. Wuered over labour, but whichever side wins, it will take
quenerations to repair the damage that will bave been done
get to thie country in the struggle.
The men answered their employer by an immediate
cessation of work.
hoUSES IN DEAN'S YARD

HOUSE LETTING AND PER-CRNTAGES.
Tulthe Shoreditch County Court, a cane-Mitchell it The plaintiff, Messrs. Nitchell $\&$ Tulliamy, are auc-
 Gabriel $\&$ Troke, wholesule chemists, in City-rond. The
notion was to recover $18 l$, 10 s . for services allegelu to
 To the defenduturin the City-rond. ODe of the witnoeses go about to promises to be let, and then eall npon the ownor or porson to whom reference wbs directed to he made, and eatalogue which the plaintiffe puhlished, and that ordera to riag were given to such parties as might call at the estarlishment of the auctioneers to make nqquiriee by
which meaus it was contended that substantial service bad
been been rendered, and that the commission of 5 per cent. on the rental of the first year, and $2 \frac{1}{2}$ per cent. on the
Becond year, was the usual charge made as fair and reasouable remuneration. stated poaitively that he noter gave any instructions to the plaintifis as to the letting of his premisee, giviug orders to riew, or taking any ocher
action in the matter; for that ho bad caused two large painted boards to be placed ou conspicuous parts of the ouilding, relerring applicants to himself, and that a person, who snid bis name was Sibley, called upon him,
and asked for permission to look over the premises, which and assed for permassion to look over the premises, which dimensions, the interview being throughout trested by himx as a matter of business, And when they had gone of
the brilding and were standing in the yard, tele nerson naked him to publish an advertisement in the curerso circulated by the plaintiffs, but he positively refused to do 80. Mr. Weras came aud inspected the premises, and frming a large geuteman to be a member of a respeotsble into, and ultimately a part of the premises wsis let to tha firm, and when Mr. Sibley called sfterwards bo refused to give bim any information as to the premines hating been Met or the rental agreed to be paid. The ovidence of
Mr. Gubriel was not in the least shaken on cross-exumina tion; and the Judge expressed himaself in very stron terms condemnatory of the conduet stated to ho pursued
by the plaintiffs or any other reapectal) hy the plaintiffis or any other respectable firm of
nuctioneers and house agents in sending clerls about the City and different parts ol's town seebing ont notices of premies to be lotic and then solioiting the parties to advertibe in a catalogue to be given away at eales,'
circulated in snother manner in the way of business to
indnce persons to make applicstion to them, He was of opinion case, and he gave a verdict for the defendart. Application was made by defendant for costs, which wan
opposed, but the court witiont hesitation granted costs.

WARTVICK WATER-SUPPLY
On Tuesday last, at a meeting of the Warwick town council, the following rccommendation iu town counci, the following recoma nanamously adopted, having especial referonce to the position of Mr. F. Pritchard, C.E., the borough sur vejor of
scheme.
" Iour committee receised the following propositions on the enthect, fromp Mr. Pritchard, fiz. : 1st. To be employed as engineer for tho works, and
retire fore the otice of horough suryeyor, and to receire
the nanal coromisoion of 5 . per cent. on the outlay, estithe usnal commission of $5 \ell$. per cent. on the outay, esti2nd. In addition to actiog ha encineer with the above comand to find and pay a tboroug
anproval of your committee. Xour committce consider that the works are muek more ikely to be carried out properly under the super
ribion of IIr. Pritehard, who has alread bestowed mach time and troukle on the scheme, and who is thoronghly acquainted with all its dotails, and who would be on the
epot, aud be prepared to gire his time and sttention to
the worlss, than if the management was entrusted to spot, and be prepared mansgement was entrusted to
the works, than if the man
stranger; and they therefore recommend that ho be ap stranger; and they therefore recommend that he be ap
pointed enineer for the works, and thint he bo paid tho
sum of 6 Nol. for his scrfices, in lieu of the comuission, he suming an assistant to perform the dutios of bon, gurpeyor (sach assistant to be appointed suhlect to th
appeveal of the councli). Mr. Priteliaxd to le paid b approval or the counch orime, fan the works progress, the above rerouneration 1 ,

THE FAILURE OF PORILAND CEMENT. Sid. With some surprisa and with much concern, I
read in your valuable journal, an inquiry us to the ctuse of fuilure in Portland cennent. I had been for some timo hoping that we had gone past the period of such
and beliered that the knowledge of the article and th cnuso of feilure were too well under stood to permit of cement being used without
whether or not it would fail.
From what I read in your jonman, it seems clear that such is not the case, and heyond doubt it is a master that its reuders, who look to it as their text-books, may krow whether it is or is not such a meterial as can he used from time to timae, without the suspicion and anxiety consequent upou the appareat uncertainty as to whether it will or ment and loss.
I presume tho failures alluded to are to be fonnd
amongit what louy for this purposs be termed every-dm amongst hat noty in special or extroordinary cases ; and that the cement was used by persons fairly entitled io he
considered competent, and that the articie was made by tespeeteble cercent-makers, and does not in any way I nemtion these points hecruse I do not thow of any morks of considerahle importanco, conducted under the
superintendence of first.class enfineers, and by qualified
clerks of worka, that hare exhibited for a cousiderable time any cases of failure, of my impression on this matter is correct. I ann of opinion that it toes to show protect thempersons du hnow how, zhe use of any cement
selves, and refuse to mane
prored by themselses to he abore suspicion. Unless my notion of the matter is entirely urong, this is an answer to the question as to the cause of failure, and and cannot under ordizar workman. Trenty rearg' practical aequaintance bas brought me'to
the conclusion that if good cement he supplied to the the conclusion that if good cement hot supplill that if fauly cement be supplied to the workmav, his desire to preyent its failing
is useless. Good cement requires more care and more concerned
make than tiulty censent; and my adrice to all con woildice,
material.
So far
So far es such a fact can be known to one individual, all cement-makers make three kinds or qualities, viz., grood,
bad, and indifierent, -not willingly, or by any meansinten-
tionally, hut because in some mensore it is beyond their contral. in rast cases the pood ia sold to those who will have no other; the remninder to
up that, and must leave it blakk, Coalis rery dear, and
magy hase something to do with it.
Zars.

## CHURCH-bUILDING NEWS

Fulkistone. - The new church of St. Michael pleted. The etyle of building is Flamboyant, bcing after the pattern of the fourteenth century Lomland Datch charches. The contractor is Mr. Bowley, builder, Folkestone. The interior of the church is at present simply a plain room is paved with tiles, made by Mr. Bowley, and the altar (a temporary wooden structnre) is approached by three tiers of steps, and is surmomuted by a panoply.
opened had been allowed church recently $\mathbf{r e}$ opened had much disfignred. The place had the and it was much disfignred. The place had the the north side a fow old oak seats existed, ye
these had decayed, and were propped here and chere by stones. The chancel arch hod been a larcey and inconvenient pulpit and desk A large aud inconvenient pulpit and desk bocked up the space where anciently the north pillar of the chancel arch stood; the chancel was cellcd and whitowassel; the east wiadow head entirely destroyed and walled up; tbe chancel aisle had been pulled down, and tbe arches belonging to it walled up, so that it was not evcu known that they existed; toe font wa a small stone basin ; a hage galfery blocked up
the tower arch; and a brick porch effectanally concealed thie fiue sonth door. Matters looked rather hopeless as far as restoration was oon cerned, but the parish and rector felt it was disgrace, and Mr. Parr, of Muskham, architect was called in. Mr. Clipsham, of Normell, con tracted to do the work. The gallery, the boses the ceiling, the whitewash disappeared; chance aisle arches were found; the aisle rebuit; new east window was put in; a new font,
Memoriam,' replaced the old basin; the church Memoriam," replaced the old basin; tbe church was seated with varnished pitch pine;
organ, by Cuthbert, of Hull, erected.
South Shields.-The fonndation-stono of church for tho parish of St. Mark's, at South Shields, has been laid by Sir Hedworth William son, Bart., M.P., Depaty Provincial Gran Master of Masons, with finll Masonic ceromony The total cost of the new churoh is estimated at 4,500l., of whicls 3,000 l have arready bee promised. The site, worth 5002 ., together with Rubscription of 1001 ., was given by the Eccl iastical Commissioners voted an acre of groun and 1,5007 . towards a vicarage for tho uew parish. The contract for the huilding has bee undertaken by Mr. Edmund Suddards, builder.
Mommouth. - The fonndation-stone of a new church has been laid by the Duchess of Beanfort. The church will he built in the Early English stylc, and will accommodate a largo number of persons. The architect is Mr. Luddon, Roberts, of Monmonth
Ifuch Cowarne. - The church here, after
estoration, has been reoponed for Divine ser. vice. In the restoration (at a cost of $1,025 l$.) Mr. T. Nicholson, of Hereford, has been the archite Henry Welsh. The church has undergone a Heary Welsh. fhe chards tho nargone aisle and chanccl. The whole of the low plastered ceiling has been removed, and replaced by pitchen pine roi's pitch-pine boarding, covered ou top the whol baring movided bermices of the sane materinl ruming all round the walls at the springine of the roofinside. The whole of the walls and new roof, and new gahlet windows inserted, the gables being covered with stono coping, and having foliated erosses wath the windows have al! been restored ins out and re-glazed with coloured with ornamental having new stancaion bars, The arcade and tower arches and clustered columns have been cleansed of whitewash and restored and pointed. The walls lave been replastered on the juside with a sanded surface and on the outside they have been cleaned and re-pointed. The dilapidated old catrance porch has been replaced by a timber porch, of the same material as the roof, resting upon a print of stone. The floors are all new, the space for seating heing boarded, and the alleys laid with tooled paving. The whole of the sittings (which carved circular stone pulpit has also been fixed and we understand that a carved font is in progress in the hands of the contractor. and to erect a new spire upon it, the old spir having been completely destrojed by lightning some thirty-four years ago, when two of the ol peal of bells were melted.
Furnuorth vith-Kecrslcy.-The parish church of Faraworth-with-Kearsley, to which extensive additions aud alterations have heen made, has been re-opened. The additions to tho church consist of two new porches which have been erected on either side of the western entrance, the steps oocupied by the old gallery porches being added to the ground. Hoor in order to give more sitting accommodation. The pewing has bee the gallery-front lias been altered and docorated with stencil-work devices. The walls have been dressed down with oil paints. A new and com.
modious chancel has becn added. The altar hat not yet been placed in position. By the present alterations abont 350 sittings have been added The cost of the work amounts to 4,0002 ., a which 3,000 , have already been raised. Th architect was Mr. R. K. Freeman, of Bolton. Faversham.-At the recent meeting of the committee appointed in Novenber last for re eating and re-arranging the parish church for care theotion of Sir Gilbert scott, tevder or carrying ont the work were received, ano couditionally accepted This nmount inclado couditionall acepted he reseating of the church Fith English oa eabs, loors, f necessity bave oo altered, tho estimate cost of wheh is ast. it is also proposed emove the organ from its present position in he end galery to or aisle hlich will there will be the architoot's and sundry charges estimated at
work, $2,596 l$.

## work, $2,596 l$.

Bristol. - A ncer church to be cailed St Andrew's.the-Less, situated at the Hotwells, ha been consecrated by the Bishop of Glouceste and Bristol. The edifico occupies the site what was known as Dowry Chapel, which ha to be pullod down bocause the dry rot had gos
into the structure. The new building is fron into the structure. The new brilding is fron
desigus by Mr. J. Neale, of Bristol, architectil desigus by Mr. J. Neale, of Brista, archited church is iu the style generally known as Earl Thirteenth-ceutury Decorated. It consists nave, threo bays, with side aisles, and chanct with bays opening into a quasiotransept on th on the sontb. Tho east wall hos, in the way encie soutb. Tho east wall has, in the way enrichment, a scroen the whole wide of the arcel, consisting of an arcade of caps, \& The wost wall on columms with carved for the monuments. All the colamns throughout th charch are of polished Penmant or red Mansfiel stone. The reading.desic is of pitch pino. Th seats throughout the church are of pitch piue The roof is open.timbered; and the chanecl coved, with moulded ribs. The building is we providod with windows in the aisles, and alon the clearstory of the cave, the latter bein foree.lighten, with aetached columos, wo the hilitips and jack arcues. hell canding is a porch below a campanile, poble enclosing and at the eat The material ns is local stone, with freestone dressings ; and tl cost of the work has been about 2,500 L. TK builder was Mr. R. J. Crocker, of Bedminste the stone carving was dode by Mr. Marcetso and the wood carving by Mr. Houghton.
Brandon. - The parish church has
restorcd, and re-opened for divine sorvice. N only had the timbers of the roof become rott With are, but the foundations themselves we tively unsafe. But now all has been put in tivcly unsafe. But decent state. The west gallery, up which stood a lono disused harrel-organ, h heen taken down, which has opened out a exposed fully to view the tower arch. T reded and unsafe helfry toor, waichoved, and ovel with this gallory, has been removed, and more elerated position, and ahove the top of tI ore elevated positiou, and ahove the sonth aie awe aly and Lady Chapel have also been swept aw and the walls of the cburch tlrowghout ha The windows have been filled with light at dark grey oathodral glass. A stained-gla; momorial window in the tower, immediate orer the west eatrance, hool. It consists lessrs. John and wo ights, and the subject Fistraced are a Lord Washiug the reet of His Disciples, a St. Peter baptising the Honsehold of Cornelio The east window orer the aitar cocisists of lights, and the subjects illustmated are, Crucifixion, the Baptism of onr Lord, the Adu tion of the Shephords, the Resurrcction,

Illustrated Catalogue of Chimney－pieces，Pedestals， and Tall Decorations．Issued hy the Marezzo Marhle Company， 61 ，Regent－atreot．
The manufacture of what is known as Marezzo marble has passed into the handa of a limited company，who have appointed Mr．Walter Emden their architect，and issued a book of designs， showing its use in tho shape of chimney－picces and for wall decorations．As no prices accom－ pany the designa，we are not able to compare its cost with that of Scagliola．In other respects it seems to compare favourably with that material．

## Variorum．

Dre．R．Grantham＇s Report to the Govern ment on the Floods in Somersetshire， 1872 and 1073，has heen puhlithed（Stanford），and includes Comatiens on the Report by the Inclosure Commissioners．Mr．Giantham advises that the laws of sewers，having hecome for agricnltural purposes inefficient for the ends now required， should be consolidated and replaced by an Act Drained upon the hasis of Part 11．of the Land mac＇s Chapnl，Cashel．By Mr．Arthnr Hill B．E．，containing twelpo peometrical dramings and three photographs，＂is nearly ready for puhlication．This work is a reproduction by the photo－lithographio process，of a carefully． measured set of drawinos，to which wero awarded a silver medal by the Royal lustitute of British A silver med

## 解liscellanea．

Opening of St．James＇s Hall，Lichfield．－ St．Jemes＇s Hall，which now stands on the site
of the old theatre in Bore－street，Lichfield，has been opened．It was built by a limited Iiability ocmpany，haring a nominal capital of 2，000l． Mr．Griffiths，coanty surveyor，prepared the plans．Mr．Thorneloo，of Lichfield，was selected as tho builder．The assembly－room is 80 ft ，in length by 30 ft ．wide．It is lighted by sun－lights or night．A halcony runs round the sides and the north eud of the hali，the othor end being occupied hy the proscenium，behind which is a stage and the requisite scenery for adapting the room to theatrical purposes．Tothe front of the hall is a large roow stritablo for a refroshment or small meeting room，and heneath these are two cloak－rooms，with necessary requisites． Under the stage are four dressing－rooms，and heneath the floor of the hall is a range of struing coms．There are three front entrances to the hall．The actual cost will be upwards of 2，200l．

Archæological Discovery. - The Levant Herald atates that the Imperial Museum at St. Irene has just been eariched hy the discovery at
Salonica of three finely-sculptured bas-reliefs in Salonica of three finely-sculptured bas.reliefs in
a pery fair state of preservation. Originally a very fair state of preservation. Originally
formiug part of Constantine's Portion, which faces the east entrance of the modern Bazar a.t Salonica, and stands close to the ancient Fia Ignatia, these sculptures were, it appears, detached from the mounaent which they adorned hy order of the Porte, and simply as a measnre of precaution, to provent them from being smuggled out of the convtry, as has been the case with so many other relics of Greek and Roman art. Recently several pieces of sculptare of considerahle archrological value were torn down hy night from the same portico, and conveyed, in spite of the opposition of the local police, on board of a foreign vessel, which sailed irmediately sho had shipped her precious cargo. This unqualified act of randalism, combined with the spoliation by foreigners of such ancient sites as Ephesms, Cyprue, and the Troad, have, we are told, made the Government extremely reluctant to grant firmans to European ex. reluctant to grant frmans to European esspoedily as possible, in its own museum at Stambonl, all such relics of early art as are more or less exposed to be similarly wrested out of its possession. The sculptures which have just heen added to the Turlish collection are of so large dimensions, and the interior of the so large dimensions, and the interior of the Ottoman huseum is already crowded to such an rarily set up in the courtyard of St. Irene. The rarily set up in the courtyard of stal Irene. The sent the characters in the celebrated fahle of sent the characters in the celebrated fahle of reliefs form an interesting specimen of the "eliefs form an interesting specimen of the "composite" style of sculpt

Removal of Night-soil at Leek.-The Improvement Commissioners of Leek have an active sanitary inspector, whose report has set them a-thinking how best to put their houses in order. Their medical officer had recommended to the "careful consideration of the Board the excellent report of the sanitary inspector on the question of the removal of ashes, gar.
hage, night-soil, \&c." The inspector (Mr. hage, night-soil, \&c." The inspector (Mr.
Farrow), in his report, says:- "Water-closets and well.constructed sewers and drains, with the freest possible ventilation at the head of every sewer, drain, and soil-pipe, combined with properly-conducted irrigation, is a solution of the question of sewage ritilisation; and for the removal of solid and other refuse where water carringe cannot be adopted, I recommend the 'Rochdale systom.' In Leek 325 water-closets are provided for the use of 4,500 of the popalation, and 650 privies for the use of a population of 7,000 . It has sometimes been urged that water-closets do not answer in connexion with cottage-houses. The experieuce of Leek is that they answer admirahly where a separate closet is provided for each house. Vhatever the description of the closet may be, there ought, for many reasons, to be at least one to every two cottages." The Commissioners are discussing Mr. Farrow's recommendations, and it is to be hoped this discussion will lead to some improvement of the present state of things.

Balconies of London Houses.-Dr. Lankester has held an inquest at Paddington, on the body of a plasterer, in the cmploy of Mr. Foxley, a builder, of Leinster-terrace, Lancaster-gate, Deceased was at work at 17, Cleveland-square, Tyburnia, being engaged in filling up cracks in the compo of the balcony of one of the secondfloor back rooms, when it gave way, and he was precipitated into the area, a depth of 33 ft . He was picked up insensible, and conveyed to St. Mary's Hospital, where he died of the frightful injuries he had received. It having been represented that the balconies of the mansions in Cleveland-square were merely constructed of tiles and compo, an investigation into that part of the subject took place. A verdict of aecidental death was given, with a strong expression of opinion that the attention of the district sur. vegor ought to be called to the character of the balconies in Cleveland-square, and steps be taken to make them secure.

The late Mr. Herbert Williams, Archi tect. .. We are eorry to hear of the death, on the 5 th instant, at his reaidence, Heath Bank, BlackBroad. street, surveyor to the 1 Broad-street, surveyor to
He was 60 years of age.

High Wycombe.-The foundation-stone of ew achools for the borough school hoard was laid ou Monday last, the 13 th inst., hy the Right Hon. Lord Carington. The corporation in their robes of office assemhled at the Mnnicipal Build. ings at two oclock, and proceeded in order with Lord Carington, the vicar, parish sohool board, and other invited guests, to the aite, where the atone (a large block of Portland some $2 \frac{1}{3}$ tons
weight) was formally lowered into place. The new schools will eventually acoornmodate 1,000 children, with large covered playgrounds, offices, and teacher's residence. They are of red brick, with stone dressings, with a lcfty bell-tower, the Early Gothic style. The first part of the contract, for 600 children, with residence, \&c., is for $4,250 \mathrm{l}$. The site is three roods, and is on a
steep hill. The builder is Mr. W. R. Loosler, and steep hill. The builder is Mr. W. R. Loosler, and
the architect Mr. Arthur Yernon, both of High Wy combe.
A Novelty in Naval Architecture. Messrs. Richardson, Dack, \& Co., of South Stockton, are now hailding to the order of the Tees Conservancy Commissioners a harge which is, in some respects, unlike any thing of the kind hitherto constructed. Designed hy Mr. Fowler, engineer to the C mmission, and Major Bearmont, M.P. for South Durham, the new harge is intended to enable the Diamond Rook Boring Company to blast the Eighth Buoy Scarp, a huge projecting bonder Whieh has greatly is situated a little way helow Middleshrongh. The barge has the appearance of a hnge floating platform, supported on iron pillars. It is now dmost completed, and a few weeks more will probably see it at work. The company have nudertaken to remove the
years, at a cost of $\mathrm{I} 7,000$.
Ecclesiastical Art Exhibition at Bath.Many objects of interest to tho antiquary, the churchman, and the artist, have been exhihited at the Riding School, Julian-road, in connexion with the Church Congress. There are numerous collections of church raluables, in gold and of ther, hrass, silk emhroidery, \&c. The centre architectural drawings, several photographs of ancient buildings by Fornold, of Leeds, lent by Mr. W. White finely-oxecuted photographs of Mr. W. White; finely-oxecuted photographs a sot of scalptures hy Porter, of Newark-street illustrating the stations of the Cross. There is also a collection of rubbings from monument brasses, leat by Mr. Parnell.
The Late MIr. Menry Murray.-All who have been intimately connected with the fine arts during the last thirty years, will regret to Yurray the widow of the late Mr. Henry Murray was a well known art critic, and for aeveral years tho esteemed hon. sec. of the Graphic Society. Mr. Murray's long declining health required the unremitting and devoted attentiou of his wife. This was nubly given, and everything gradually sacrificed to pressing need An attempt is now heing mate raiso a fund Osnaburgh-street, Regenu's Patk, has consented Osnaburgh-street, Regen

Oil Paints.-Mr. J. Argall, mining engineer of Adderbury, proposes to give body or opacity to the paint by using as a basis the natural mineral carhonate of baryta and zinc, or native zinc ore, to which carbonate of baryta is afterwards added. The zinc ore or the baryta and zinc mineral is suhjected to a roasting process. The required colour or shade of colour is given to the paint by the addition of calcined ores of lead, tin, zinc, copper, iron, or manganese to the compound or mixture. By the use of beryta a the said baryta also effects such rapid drying of the said baryta also effects such rapid drying of
the paint that the use of ordinary dryers is the paint that the
rendered unnecessary.

Mr. Spurgeon's New College. - Mr. Spurgeon has laid the foundation.stone of a new college, at the rear of the Tabernacle,
St. Mary's, Newington. The new buidding is to supplement the existing inefficient accommoda sion for students at the Tabernacle. The oollege will be of considerable dimensions, containing six class-rooms, the largest of which will be 20 ft . by 30 ft ., while the "common. roorn" will be of the dimensions of 44 ft . hy -9 m .4 in possible, to open in the early part of the year.

The Criterion Hotel, Piccadilly.-Messrs Spiers \& Fond applied for a licence for music and dancing for the Criterion, to the Middleser magistrates. Mr. Poland stated, that up to the present time $80,000 \mathrm{~L}$, had been expended upor the building, and only a fow decorations, to he completed in a month or six weeks, wer required. The licence was refused, on the ground that the huilding was not finished, anc application of Mr. Poland for a licence fo music alone the magistrates refused to entertain as the app
dancing.
The Seats on the Thames Embanknent The new seats on the Vietoria Embaykmen have been painted in their places, and, as : matter of course, have been exposed to shower during tho operation, and to the prematuro occupation hy passengers who left a memorandun of their presence in the shape of "Witness $m$. marit. If they had been painted under cove when dry, a hond bronght to the Emban mad When dry,
of them.
Free Public Library at Coventry.-Th late mayor of Coventry, M. John Gulson, ha presented to the City Council of Coveatry a not ree public library. The building is on the sit of the old county gaol, and its cost, horne bi memher of Parliament for the city, bas hee upwards of 4,0007 ., excluding internal fitting which have been paid for from a fund raise among tho inhabitants generally.
Inauguration of the Northern Congrega tional College. -The Congregational College a Silcoates, near Wakefield, has been Lormall, opened. The building, with the cetato, will cos $20,000 \mathrm{l}$., of which g,ook. are required. Th structure, from designs by 1 . Leeds, is Continental in style, quadranguar
form, and of red hrick. It will accommodat form, and of red hrick. It will accommodat
290 pupils. It is intonded for ministers' son 200 pupils. It is inton
and the general puhlio.
Memorial Church in Sheffield.- 1 t he been determined to honour the memory of thr late vicar. of Shoffield hy building a church, $-t$ district of the Sale Memcrial Church, -in th Dr. Sale had deeply at heart and which he wa endoavouring to promote just before his ver andden death. VOL. XXXI.-No. 1603.

The Use of Omamontal Tiles.

we bave once or twice pointed out already, when touching upon tbo sub. ject, the use of tiles as a source of ornamontal polychromatic decoration is being carriod to an indiseriminato and disproportionate oxtent, so mucb so as to be rapialy degonerating into a mere siece of commonplace. The employment of iles as a mural decoration having come into ashion in architeoture, has heen introduced also
nto furniture; and in recent extibitions of iurniture-design tho difficulty" is, often, to find anything tbat has not a tile in it. This extravasance in the omployment of any nerwly-suggested or revived form of embellishment is one of the endencies of the present day, or, at least, is moro leveloped at present than it bas ever been before, wing to the restless craving for novelty on tho part of both artists and the public,- -that portion if the public, at least, which employs archiectural art. But nearly all sources of decora. ive treatment have their proper limitations, and nevitally lose in effect by being orcrworked or aisapplied.
The most general and praetical use of encanstic iles is for flooring. Bcsides forming one of the rost indestructible of floors, in resistance to rear (when the material is really good), tiles orm almost the only means of introducing or. nament of at all an elaborate natnre and of permanent character into loor surfaces. The implor Geometric designis to bo obtained by ariously.colourcd slabs of material bave been calised in marble as often as in tiling, and with tuch better effect. But the elaboration result-㫙 from the employment of slabs with each its wa ornamental design could only be obtained in aarble by the oostly process of inlay. Tile lesigns are, in fact, an inlay worked witb the aterials in a soft state, and capable of easy aanipulation and mechanical repetition. Such resourco for producing an effect of richness pas sure to be laryely mado use of, when
he mecbauical means for its manufacture were he mecbazical means for its manufactare were onsiderable oxtent ahused.
We bave got rid now, certainly, of the notable
ropensity to blue and buff derelopments whicb ropensity to blue and buff developments whicb istingnished the tile designs of the carlier eriod of the "rovival." Combinations in wbich bese tro particular tints were supposed to rnisb all that the eye could desire would be zouted in most quarters at present as crude ad commonplaco,-at least, wheu used in any rge quantities. Combinations in which a rong chocolato red is the prevailing element
re more popular now, and the value of quiet ray tones has heen, to a certain extent, recogised. But we have still fonndation for com.
plaint in regard to the raw, crudc, and more or circles, and intersecting geometric figures, which less garish effect of a large proportion of our tiled floors. We see this most forcibly illnstrated when a church has been restored, and a large portion of the floor has been laid hy our Mintons or Maws. Tbe repose which previously characterised the old edifice is gone,-broken into hy nothing more than by the new.tiled fioor, witb its "spick-and-epan" look, and its trade-deve. loped patterns. It is to the existence of the "pattern-book" that this de-sauctifying effect is partly to be traced. Designs which have to be mechanically multiplied are made the most of, tabnlated and advertised, and pass into decorators' commonplaces. We soon learn to know the most popular ones, and recognise them, not agreeably, in places where we would gladly meet with an individual and special design, suitable to the bnilding,-perbaps designed in relation to the ornamental details of other parts. Admitting the pattern-book, how. ever, as a trade recessity, it is quite possible to get better results than aro ordinarily obtained. The averago of tilo desigus run too much in a groovo; they are arranged upon certain main types, which seem to recur again and again; and they fail as often from attempting too mnch in colour as from attempting too little in regard to originality of form. In the matter of colour, some of tbo German tile-manufacturers show better taste and a better perception of what is suitable for tile flooring than tboso of our country. Tbey bave largely adopted, for some tivie past, very quiet neatral tints in working out the majority of their floorpatterns, and thus escape much of the gew. 5aw effect which wo have to complain of in modern English tiled floors. We do not, as a rulc, want strong or bright colour for that whioh is under our fect; only a cortain well.considered design, and a snfficient varicty of tone; and the bright and strong chromatic treatment, tends to injure the effect of objects of more importance to n .s than 'the floor pattern. Above all the "shiny" tiles (glazed), in old restored buildings especially, often destroy all tone and re. pose, and vulgarise an interior in almost all cases. Sucb !tiles should only be employed in very small qnantities, whero some pecnliar richness and glitter may seem to be
called for, practically, as where ligbt is deficient, or architecturally, as perhaps in a vestibule to a lady's boudoir. The most important distinction in the method of working out tiledesigns is that between designs in which the division of the tiling into rectangular slabs is emphasized, and that in wbich it is ignored, and a continuous design formed independently of tho jointing. In regard to the latter principle, a largo design, ocenpying a whole floor, has seldom so grod an effect as a smaller diaper pattern, and it tends to dwarf the cestent of tho area in most cases. In general, designs in wbich the square form of the separate tiles is brongbt out, are the most suitable to the material, and the manner of putting it together, and have the most truly arcbitectnral effoct. An arrange. ment in which two tiles of distimct tone and pattern, or one plain and the other ornamented, are regularly alternated, almost always has a good effect when the combination is suitable in point of colour. An arrangement based on the employment of large square tiles, with smaller ones lozenge-wise at the intersecting angles, is strictly in accordance witb practical demands, getting rid as it does of the weak point in tile flooring, the joiuings of the sharp angles, wbich are always the first places to show defeets in the laying ; it therefore recommends itself to the judgnent as well as to the cye. In tho designing of more flowing and elaborated patterns, a much larger nse might be made than has yet been done of tbe conventionaliscd forms of natural leafage, which would be a relief from the constant changes roug upon quatrefoils,
havo been used, perlaps, in almost every possible combination, so far as form is concorned. But all combinations conveying to the ege the idea of inequabity or relief of surfuce should he studiously avoided; and cren the effect of an interlacing design, as of two superimposed patterns, is open to objection, or is very liablo to hecome so in some forms.
Ono of the canses of the hard, "bran new" appearance imparted to an interior by tiling arises from the absolute smoothecss and hard finisb of the tile surfacc, and the consequent want of any of that tone which a rougher texture wonld impart. In respect to this notbing makes so satisfactory and rich an cffect in the way of tile-flooring as the Roman tesselated style, formed hy the junction of numeronssmall self.coloured tessere. In this metbod the innumerable jointings over a large surface give a ronghness of texture very satisfactory to the eye, and harmonising mnch better with archilecture (and with furniture or paintings) than tbe smooth encanstic tile patterns. Even in the actual tile patterns of the Middle Ages, so far as thoy exist, we mostly find the component pieces much smaller than the avcrage tiles in use at the present day. Tho final offect, iu the modern system, is sacrificed to ease and economy in laying the tiles. Tbe merits of Rust's "artificial mosaic," in supplying a material with more texture and tone in its snrface, have been before touched npon in our columns. In diaper patterne, arranged in real or apparcht tesseræ, it is desirahle so to arrango the pattern as to mask the fact of its repetition,-in other words, not to show where it begins and ends; this has perhaps never hecn so well and ingenionsly done as in that well.known Roman pattcrn composed of segmente of circles, which has been reprodnced in the floor of the Betbual.green Musenm.
The use of wall tiles is, or might be often, as inuch a matter of sanitary advantage as of architectural emhellishment. The ease witb which such a work can be kept clean renders it most suitable for the lower portions of walls in staircases and halls, and places where people continually pass and repass. The only distinction between the principles of design for wall-tiles and flooring-tiles is that the former admit, and even seem to dcmand, a onc-sided treatment (so as to form an upright pattern), a treatment which can never satisfactoxily be applied to floortiles, wbich ought to show alike in every direotion. It is matter for snrprise, however, that this principle is so little hecded in the manufao. turer's pattern-book designs; where in most instances the patterns specified as wall-tiles might just as well be floor-tiles.
The praotice of employing tiles for the attain. ment of external pulycbromy bas been carried to a certain extent among us, but not always witb very happy effect. The same canse-meagre. ness of texture-comes into operation here, and gives a building mach decorated in this manner somewhat of a paintcd tca-caddy cffect. Tiles so introduced shonld, at all ovente, be kept in subordinate and not in main surfaces of masonry in panels under windows, occasionally perhaps in the apex of a gable. But a very little of this class of cecoration goes a long way; carrying it at all too far at once weakens the expression of a bnilding. Tiles, however, might be used ex. ternally, more often than they are, in combina. tion with cement, with which they would fall in, both practically and architecturally, mucb better than with brick or stonc. Tiles and cement work to much the same thickness, and the troo surfaces, both smooth in texture, and both par taking (in sucb positions) of the nature of a reneer, harmonise well togetber.
In regard to the application of tiles in furnitare, the most proper place for this is in a cbimney-piece and grate, in which position tiles are, on every consideration, quite in their right
place. The free introduction of tiles in wooden furniture (sideboards, s.c.) must be deprecated; the materials do not harmonise at all; the hard shining brittle tile, and the softer fibrons wood, are materials of so opposite a nature that blendof the question. An exceptrion may be made, perhaps, in regand to ehony, which in its hardperss, and the brilliant polishs it tales, approaches more to the character of the tile texture; but oak furniture, for instance, is almost invariably spoilt by tile decorations. The class of productions which bare been rather absuraly called
"art tiles," inght many of its developments to be rigorously repressed. It has becn the to be rigorously repressed. It has ben the

## ARCHITECTURAL DISCOVERIES IN

## Palestine.

Tee most extensive contribation whict has been made, at one timo, to our knowledge of the archoology and ancient architecture of Palestine, since the pablication of the Comte de
Yecoue's work on the churches of the Holy Land Vogue's work on the churches of the Holy Land,
is published in the recent quarterly report of is published in the recent quarterly report of archaology and of aucient architecture. For
we think, as we have before now bad occasion to semark, that the former word has of late received so steady an extension of application 2, to eycroach on othcr more distinct prorinces of ancient art. Archæology, according to the plain sense of the word, is the knowledge or doctriue of the Archaic, or of the beginnings of things. It deals properly with the pre-listoric; and under that term wo inclade not the history tbat is written in books alone. Nor do we even limit the term to written monnments; to the deeply incised hieroglyphics of Egypt, or to the equally durable, though humhler, legends of the Assuria terra.cottas. We refer to the risible history of architectural sequence and development. decline to term such a work as Stuart's Athens an archaoological bonk. When we can trace the fevelopment of an order or of a style from its of its final disanpearance, wo have a chapter in the history of architecture. The whole theory of that art, wheneser the timo arrives for its fit prosentation to the world, will consist of, rather will be a deduction from, a series of such chapters. Wheneser, therefore, an architectural detail, hefore unknown, is measured, drawn, published, and added to our gencral stock of professional information, we have a contribution to the general history of architecturo; the value of whici, it may be, far exceeds the estimate of the disooverer, And when by any such discovery, or group or series of anch discoveries, we can rewore an individual bailding from the position of aut archeological to that on architectural logical, or the local, development of architectural logical, or
principles.

## priaciples.

The publication to which, in the first instance, We have referred, is that of a small but accurate plan of the rock contours of the
site of Jcrusalem. These havo been site of Jctusalem. These havo been ascertaincd from more than 200 distinct excaracombined with observations of rock where it exists in bold searps, or where it otherwise comes to the surface, and with other information not pre-
viously given to the public. Before giving our
readers some brief account of a plan which must do much to remove many questions from the shadowy region of opinion and controversy to tho surer ground of illustrated history, wo made withiner, to speak of those discoreries Conder, R.E., and his little command, which are also discussed in the report, and which are of a directly architectural character.
The first of these is to be found in the remains of a large town, situated on a hill about ten or twelve miles west of Nablus, which, though in a fine and commanding position, bas hitherto been entirely unknown. it is not, of course, laid from the Arahic of the inhabitants is Day Agruhr. The ruins coser a square mile of area and appear to have bect surronnded by a wall The remains of a large building, facing the cardinal points, are found at the north west corner of the town. In the north wall is yet in situ a fine solid semicircular arch, consisting of thirteen voussoirs, with a span of 14 ft . Tho height of the courses of masonry is ir. regular, and many stones are of great length in proportion to their heignt; the former dimen gion varying from 18 in. to 63 in., and the latter from 23 in. to 41 in . All bave been worked with a well-finished marginal draft, of from 2 in to $3 \frac{1}{4} \mathrm{in}$. broad, the face of the stone being left pcrfectly plain, and the draftso shallow as in many places to have bccome indistinguishable from the cambling of the stone with age. Together with work, the flat lintels and Classie mould of the work, the hat fucels and Classic mouldings of he coors, and the bunsual proportions of the huilding, have led Lieutenant Conder to attri-
bute to it a Herodian date. The work differs materially from the coarser rustic work of the Crusaders, as it is to be identificd at Athlit and Cassarea. We shall look with interest for the publication of the plans and drawings of Dayr Asrubr, and entertain the hope that positivo information as to the structural and decorative art of a specified period in Palcstine may thus be added to our knowledge,
Wenderer our readers to the report of Lieut. Conder, in the publication we have cited, for further detaiss of this town, and of the eleven other sites, only two of which were previonsly known, of Crusading, Greek, and Jewis h churches, tombs, temples, and other buildings, which he questione in detail. But keeping to the quatel of distinct architoctural stgle, hlin the ligy evidence of date, and thas regarding history of that it sheds on the architectural as to the Palestine, we must say a few words of the pointa recently surveyed
This importaut ruin is shown on Vandevelde's map, arthough no descriptive notice of it is to be found. It stands on the summit of a precipitous hill, being protected on three sides by deep and rugged ravines; while on the east, quarries are excarated so as to form a kind of up to it from a little plain on tho west, where the lands cultivated by the monks were probably situated. This patb is commanded by a turret huilt on projecting hrackets, so as to form a kind floor some 12 ft . above the level of the main part of the monastery forms an outrork on the less protected side.
We pass orer the details of theplan,-the central hall of 80 ft . in length, the chapel on the nortb, tho dormitories on the other side, the cloisters, arrangecment, the general resomblance to the arrang in featore which is of such nozel and important interest with regard to date. This is the cornice of the ingide of the east chapel wall, which remains almost intact, elthough much worn by weather. The special peculiarity is the deflection of this cornice to follow tho semicircular arch of window or a door, a feature which is shown in the illustrations of Sir Gardner Wilkinson's "Daimatia," to exist in the peristyle of the atrium of Diocletian's palace at Spalatro, and in the "Golden Gateway" at the same spot. The aame feature occers in the Golden Gate. way in the great fortress-wall of the "Noble Sanctuary" at Jeruealem; and, in a slightly modified form (combined with a spandrel decoration) in the double "Haldah " gate of the same inclosure. From this circumstance an argument has been drawn as to the early date of the Jerusalem Golden Gateway. The details of workmanship and ornamentation in this structure are similar to those of the Dayr Kalánh in all
respecta but one, namely, the Cross appears as an ormament in every possible place in the latter. The semicircnlar arches are built with ke ystones, are all some of those at Spalatro; but which the Cross is curmounted by da Generally this symhol is placed on a tablet, but in one caso it stands on three hemispheres - the old conventional mede of reprosenting "Mount Calvary." The ashlar work of the whole building is finely proportioned, and tho joints are beautifully laid. The stone are drafted, on the exterior walls, bnt flush, on the interior. The character of the drafted work differs from any hithorto described in Palestine the sunk part heing from 2 in. to 3 in . in depth by 10 in . jn breadth. The draft, however, is not always regular, and the bose or central raised surface, is often very roughly finisbed. A surface, is often very roughly hisisbed. A typel exist on the stones in tho interior.
The architectural world will look with no amal ynterest for the detailed drawings of a work miterest for day's jonrney of Jerusalem, and bearing so close a resemblarce to the much-disputed features and ormmentation of the famous Goldeu Gate Lieut Conder compare the details to those Lieut. Conder . 1 . de Yorié as belonging to the sixth century The conventual character of the plan and arrange. ments of the monastery pointe to a not earlien date. As to this, however, we do not profess to speak ex cathedra. The discovery and delinea. tion of the monastery form an entirely new contrihution to our knowledge of a very interest. ing period: one of which the remains are rare and difficult of access, and as to which the pro. fessional interest is very great. Whatever he the theory advocated by any writer on tho suh. ject hitherto, the one great object is trnth. We witness whe witness who comes before the tribunal of Ar unexpectedly. He has to he examined ano crosseexamine 3 . Thongh dumb, he is yet elo quent. One thing is certnin as to his testimony However long a time it may take ns fully tc
understand it, it is at all events absolutely true It is given with no bias with no aurière pensfe Whether it supports the theory of those whi attrihute the Golden Gateway to the time of Constantine to don Gateway to the that of Justinantine, to that of Junan, or lo that ole distiman, is a conclusion that remains ${ }^{\text {distinctly ascertained. But of the architectural }}$ and historic valne of the discovery there can be and historic valn
The same quarterly periodical that contains the reports on the rock contours of Jernsalem and on the proviously unexplorca country between that city and the northern frontier of Palestine, iucludes also some particular: or interest as to the Dome of the Rock; the Sanctuary wbich he the midst of the fate of being the snbjcct of contention almost as fierce with rogard to its character and history, as that which has raged as to the IToly Sepulchre. The roof of the Dome of the Rock has been under repair, and Cufic writing has been fond upon the rafters. The writing refers to the repairs on the dome. The date is illegible; hut a general restoration of the mosques and masjids of the Caliphate is known to have taken place in the
year 301 of the Hejira, A.D. 913 , and it is very probeble that this was the occasion, as the con:temporary name of the Caliph El Muktader Billah occurs on the rafters. The date, heing only that of a rostoration, is not of any conclnsive value. But the discovery round the building, in the space between the ceiliner and roof of the outer corridor, on thel inner wall of the latter, just above the ceiling is simpifiont This discovery has been communicate by Dr. Chaplin, of Jerusalem; municated by Dr. Chaplin, of Jerusalem, a coumed kindness all the officers who have been enared the Ordnance Suryey of Pecn engaged on the Chaplin is also a Hebrew scholar, and well Chaplin is also a Hebrew scholar, and well
versed in the local archaology of Jerusalem: so sersed in the local archeology of Jerusalem: so respect His inference from the discorery ol the respect. His infereace fron the aiscorery orned cormice conirms ho opimen hich ho ho forme from the perusal or the Arabian historans, to turrounds the Done of the Rock is a comparan rounds the Dome of the fock s a part of the
tively late addition, and forms no original building
A further contribntion to onr defiuite know. ledge of this most interesting structnre is contained in Lieutenant Conder's report. In "The

Ioly Sepulchre and the Temple at Jcrusalem," 21, occurs the paragraph, in speaking of the rchitectural details of the Dome of the Rook, illars are mounted on stools or sub-bases, as in he octagon building at Spalatro, and as wo find hem in tho buildings of the next century at $a$ be in Justinian's time, and afterwards. The apitals are of a simple Gorinthian order of jocletion's day, which had disappeared long ofore Justinian's reign."
In the repairs now going on in the Dome, owever, it has become evident that the details a question at the base of the columns are not uilt round each column, so as to conceal itar real These have now becn removed from two f the pillars in the ootagon, and prove to have oncealed a base, apparently not originally
elonging to the shafta, as a couple of hands of elopging to the shafts, as a couple of hands of
ade giving a thickncss of $1 \frac{2}{2} \mathrm{in}$., are introduced otween, no douht with a view of equalising the
eights of columns of different sizes. To this eights of columns of different sizes. To this lay be added the remark that the twelve
olumss in the innor circle of the Kuhbet es olumas in the innor circle of the Kuhbet es
akhrah (Domo of the Rock) are crowned by upitals of no less than eleven distinct patteras, urying not only in design and elevation, in eight, and in diameter, hut, what is more im. ortant than all, in proportion. Thus in one Which the height from the top of the shaft to at of the capital is littlo more than half the ameter of the latter, measured on the squaro. 1 anotber instance, where an ornament some. uced, the height of the capital is vory nearls fual to its diameter. In a third inatance, the eck of the capital is only equal to seven-eighths ad frometer which it is separated by a projecting oulding. Thus it is more than likely that ie materials of this building have been taken om the remaias of preceding structures, obably of varying dates.
Thus much as to architecture proper. Wo e pronouncing no judgment. We are arguing tention of the architectural world to the fact at entirely new information is now being colo keencst intercst; and that any future theory " to tho naturo and origin of the heautifal filding, which tho Mosloms treat with so much verence, must comproliend and explain these oy are far from heing the last that will come to bit. The Ordnance survey of Palcatine now tends over 1,800 square milea, or three-
eventlis of the whole area of tho coantry ny or every portion of the nnexplored gronnd ay be as full of interest as that which lias now en addod to our knowledge.
The question of the rock contours is one that e. Still it is one of primary and controlling portance as to the possible topography of cient Jertsalem. When we say the possiblo
pography, we do not mean what any ono may ingino to he possible, but what is or is not ridly exclucled from being intelligently sup. ssed over to haro existod. It requires the
ind to bo fully impressed with two facts in der to sce the full difficulty of the question. The ck on which Jerusalem was built is now covered ith from 25 ft . to 120 ft . of débris. Thus tho
dntours of the present surface, which areshown ntours of the present surface, which are shown
1 the Ordnance map of the city ou the scalo of D00, which was completed by Major Wilson in 365 , give no definite information as to tho
riginal conformation of the ground. And it is cordod in history that Jerusalem was so utterly literated by the Roman governor Turnns Rufus, ho actually drove tho plough over its site, that o one could have imarined that it had ever been sored by a city. Tho first point, ascertained the first iustance by Captain Farren, enahles ${ }_{3}$ fully to believe the second assertion.
The editors of the Quarterly Statement pay igh compliment to the "energetio euthusiasm" 'Lieuteunt Gonder in sending home, as 'racation task, ", tho report on the great temple umber. We by wo macans quarrel witl them a that score. But we think it is much more oteworthy that this officer, while executing ith his too limited party liis official duty of se accuracy that are stated in the report, has me accuracy that are stated in the report, has
sund means to present the Gommittee and
the public, without the cost of a single such considerable value. Ňcarly the whole cfforts of the committee, from the commence. mont of 1867 to the close of 1870, were devotod to the mining and subterranean investipation of Jernsalem. A certain number of rock levels were thns ohtained. But very littlo tangible information on this important point has hitherto been availablo to the public. Licutenant Gonder has availed himsolf of the results of the expe. rience of Mr. Schick, the imperial German archi. tect at Jerusalem, a gentleman who has always shown a disinterested willingness to give to the puhlic the raluable information that he has colected in tho pursuit of his profession. Mr. Schick has furnished some 200 ohservations of the dopth at which rock was arrived at in digging for foundations benoath the present surface of the city. From these, comhined with the previous observations of Gaptain Warren, Lieutenant Gonder has constructed contour plan of the rock sarface of the ontire area of the city, a reduced copy of which, on the soale of 10,000 to one, accompanies his report on the subject. The comparison of this plan, with the contoured plan of the sorface of the earth and ruhhish visible to the oye, which
forms the apparent site of the city, is instrucforms the apparent site of
If this little plan he looked at as a koy to the ccount of the city given by Josephus, it will become at once apparent how nuch of theory and of contest will be now remitted to the linbo of Dante. Wo should warn our readers, howWhiston's agaiust the misleading character of保 often glided in by tho translator which entirely reverses the meaning of the historian. Glearly defined by the rock contours, wo see the two hilis on which the city stood, -the area of the southorn and larger one being divided by the present city wall, but the cated hy a rocky scarp. There is tho deep ravine between the two hills, known hy the puzzling name of the Tyropeon valley. There is tho broader and shallower depression, running in a north-westerly dircction, hetween the alled AKR and tho northern "gbbous Hil hy the Asamonean princes after the capture of tho Greek fortification on the top, and the expulsion of the foreign garrison. We cannot now find space to tell the history of this hill, which we possess iu very considerablo detail, from the time when Solomon bailt on its summit the stronghold called Mello (which a comparison of tho Septuagiut with tho original of the Books f Samuel aud of Fincs, identifies with the Akra f the Sclencide and the Maccahees), to that when Goustantine mistook possibly that of tho great high priest Hyrcanus, but more probably of ealier date than the capture of tho city by David, for that of a moro to find occasion to read the lesson that is writ in such plain text on these unveiled rocks. All we can how say is that a cloud of mystery is lifted and lifting from the site, and express our remet that any other interest ahould be allowed to interfere with that modest addition to the number of the the ollicer in commard to domhle the actual rate of progress, and to complete the survey of Palestine in the course of the year 1875.

THE PRESERVATION AND RESTORATION OF PAINTINGS IN OIL.

A recber numher of the "Procecdings of the Industrial Society of Buhouse, contains an interesting report hy Professor Dr. Göppelsrceder, on the method of restoring paintings in oil dis. covered by Professor Von Pettenkofor, of Munich, and described in a work eutitled, " Ueber Oelfarbe und Conservirung der Gemaldegaleriens durch das Regenerationswerfohren, se." a second ear The microscopic researches of Herr Rad! Lofer have shown that the deterioration of the paintings in the new Pinakothek (Picture Gallery), at Munich, and in the galleries at the chatoau of Schiessheim were not, as very gene rally supposed, the direct or incirect elfecta of Pettonkofer to detect the true causes of the evil, and to devise suitable remedies. This he has accomplished by the adoption of certaiu simple
but efficacious methods of restoring, from time to time, the normal optical condition of the var nishes and oils used in the pictures. His views, which have been carried ont with marked aucces in the art-galleries, at Munich, are atated to have been confirmed by the experience of all those who, like Dr. Göppelsroeder, hare devoted the requisite time and strdy to the art of pictnrerestoration. They are summarised as follows:It is ohvious that oil-colours, permanent as they may be, chemically speaking, can only preserve their cxact original tints, and their pristive brilliancy, so long as the drying oil, with which they are intermised, and in which their particles are, so to speak, susponded, retains its optical properties nechanged. This will always optical properties uechanged. This will always depend, more er

The most important constituent in the oils nsed by artists is linolein. Unfortunately, this used by artists is limolein. Lufortunately, this are ohliged to have recourge to linseed.oil, which contains ahout 80 per cent, of linolein, or to poppy-oil, which contains 75 per cent. only. The poppy-oil, which contains 75 per cent. only. The
linolein, when the oil is suffiently pure, solilinolein, when the oil is sufficiently pure, soli difies under the oxidising influence of the atmosphero, without loss of aulk, hat with an increment of about 10 per cent. in weight. The hard transparent snhstance thus formed, having a texture something like that of caoutchouc, encloses the particles of pigment, and the other
suhstances contained in the oil. And it is he caustances contained in the oil. And it is he sistency nnder all ordinary variations of atmoapheric tomperature that the patchcs of colour after drying, are not displaced either by mode rate pressure or hy the application of fat or ethereal oils or varnishes.
But, as molecular and atomic movements are nnceasingly occurring in the world of matter it follows that paintings are constantly sulject to certain chemical and physical changes. Theso changes are of moro frequent occurrence in the oil than in the colouring matters incorporated therewith, so that the proportion of oil to he used in the preparation of a good colour from any given pigment, is a consideration of uo small Wurtance. The experiments made by Herr gravity of a pirment affords no cluo to its powers of absorbing oil. As a rule, it may be laid down that pigmonte that take up least oil are thoso that change and crack most.
The oxidised linolein, or linoxyn, as it is called, hecomes harder and moro brittle in proportion as the fatty and non-drying constituents of tho oil are removed by the application of ether or cthereal oils. Paintings absorb moisture from the atmosphere, and part with it again hy evapo. ration. In course of time, after these alternate processes of ahsorption or caporation have been repeated sufficiently ofton, a coat of any coluur laid on hy the artist loses its original appearance, and no longer produces the same optical effects. Respecting the methods in use up to the time of Herr Von Pottonkofer's discovery, it should be rememhered that it has been customary for the artist himself to varnish the picture when fuished, so that the minute pores in its sarface which wero filled with oil whilst the paint was wet, and afterwards contained air only, might be stopped with varnish. For this purpose, resinous varnishes, i.e., solutions of resins or turpentine in fat or drying oils, were employed. The last more especially, are very hazardons to use. After a time, the varnish perishes, gets mouldy, and no longer admits of the free passage of the rays of light. It has heen customary then to add fresh varnish; and to repeat tho process from time to timo until the distinctuess of tho picture is more or less completely destroyed. To repair the latter evil, the only method has heen to remove the old varnish; to retouch more or less freely with colour- ; and theu to varnish afresh. There is no thoroaghly effectual mode of removing the old coats of varnish; and the fresh application of oil impairs the brilliancy of the picture, mparting to it a deeper and yellower tone. But, it may he asked, what are we to do ? If we wet the resinous varnish and permit the water to evaporate, the varmish cracks and dulls. We may restore the transparency temporarily by soaking the picture, , o that the pores of the canras become filled with water, The water which thins penetrates into the pores, refracts and reflects the light more powerfully than the air, and withal has a certain action on the raish. But the restorative effects only last hytil tho moisture has evaporated. Moreover wo produce a stain; and, if the experiment bo
repeated sufficiently often, these stai
white appearance resembling ohalk. At che chatean of Schleissheim, Professor von observations on the condition of the painting according as they were hnng on walls cased with wood or not so cased, or in the vicinity or otherwise of a window. The piotures resting on wood were in a good state of preservation, and the same was ohservable of the wood on which their canvas was stretched, and of the paper labels affixed to them. The Professor observed that the repeated deposition and evaporation of atmospheric moistire on the surfaees of the pictnres destroyed the cohesiveness of the varnish. Ho succeeded in restoring molecnlar cohesion in the latter by exposing it to the fume of proof-spirit intermingled with the atmospheric air, at first in small, and afterwards in larger quantities. In the course of forty-eight hours, cent. of its weight of alcoliol, which is speedily cent. of its weicht of alcolol, which is speedily
ovaporated again. The resinons matter in the evaporated again. The resinons matter in the
varnish is moistened tberoby, and becomes varnish is moistence tberoby, and becomes
absorbed into the canvas, veestablishing the cohesion between the colouring matters and itself. This softening of the varnish is muck less injnrions to the pictures than fresh varnish laid on with a brash, by which particles of eolour may sometimes be displaced.
Professor von Petteukofer's mode of operation is extremely simplo. He makes a preliminary essay on tbe picture, with the aid of a small cylindrical paper box. This is well glaed at the joints, so as to be air-tight. The bottom of the
box inside is covered with a piece of fannel box inside is covered with a piece of flanne] steeped in proof-spirit. The box is turned npside down with its mouth resting on the face of the picture, which is previously wetted. The portion thus restored hecomes a staudard for the rest of the picture. For the restoration of the wholo surface a wooden chest is used, the bottom of which is covered inside witb alcoholized fannel. The pictare is fastered to tbe inside of the lid, so as to rest borizontally, face downwards, when the box is shat.

The Professor records some extraordinary instances of colonr-renovation; notably in the caso of a green, which, by the action of the alue, as if it had been componaded of blue aud yellow and the latter liad disappeared.
Ho has not, however, stopped short at this point. He has shown ns nlso how to treat pictures quantity to fill the cracks when moistened; how to treat pictures when the resin is present in excess ; how to deal with pictnres covered with excess; how to deal with pictnres corered with nish, which are differently affected hy exposure to an admixture of atmospheric air and alcoholic vapour; lostly, how we may retard the re. vapour; lostly, how we may retard the re.
appearance of molecalar disintegration in appearance of molecr
He also describes another method of restora. tion, to be nsed alone or in conjunction with the above, viz., the treatment of the picture with the drng known as balsam of copaiba, which dries very slowly, and in composition resembles certain resinons parnishes, such as the solutions of gam. mastich, or dammara resin, in spirits of tarpentine

Balsam of copaiba fulfils very well the optical conditions of ordinary varnishes, and it may he applied to particular portions, only, of a picture withont rendering them unduly conspicuous. It fills tho pores in the coloured enrface, and the desired effect may frequently be ohtained hy merely rabbing it on at the back. In the case of either mode of treatment, it is often recessary to repeat tbe oporation more than once, and the process will sometimes render apparent cracks beretofore unperceived. In these cascs it will generally be eufficient to lay on a small quantity of copaiba, and to expose to the vapour of alcobol.
If the resinons matter bo present in cxcesa, and particularly if the pictnre be very Jellow in toue, there is anfortnnately no way of removing the surplus varnish entircly, as it is not only superposed but incorporated with the colour. The picture should first he restored as ahove described, so as to bring out the colour, and give a more homogeneous consistency to the var.
nish. Some of the excess may then be by rubhing with the Enger dipped in powdered colophane, or dissolved away with spirits of torpentine. To fill the resinous matter well into the pores, nash first with water, thes with spirits of turpentine, and lasily expose the
parts to the raponr of alcohol.

If the picture is covered with oil as well as resinons parnish, the latter only will absorb the alcohol, and so become moistened, and soak in; the oil remains on the sarface, rendering the latter harsh and furrowed. In such cases, the and subjected to a heapy pressure to facilitat absorption.
A pictnre renovated with balsam of copaiba will much longer withstand the effects of atmo. spheric humidity, than otherwise it would. Oar space will not permit as to follow out the very interesting obserrations made by Professor Von Pettinkofer in the new Pinalsothek at $\mathbb{M}$ unich, have mude its appearance in 52 per cent. of the pictures hung in rooms with a north aspect, and in 10 per cent. only of those in roons facing south.
We may, however, ohserve, in conclusion, that in every art-gallery it is inclispeusable to avoid the deposition of moisture on the surfaco of the pictures, aud that those most palued on account of age shonld bo further protected by glazing With all pictures on canvas it would be desirable to coat the backs with halsam of copaiba. With this precaution the cracks which form in conrse of time would close themselves. With the assist ance of M. Stückleherg, a distinguished artist at Bule, and M. Falkscu, curator of the maseum in the same city, Dr. Göppelsrosder tried methods, it is stated, with perfect anocess
The mode of operation adopted by these gentlemen was as follows:-A china howl, con. taining proof spirit, was placed in an iron or copper brazier. The latter was heated, so that the fnmes of the alcohol passed off rapidly. The pictures, having heen previonsly treated with copaiba, where it was deemed necessary, were suspended horizontally over the month of the howl, and as close to it as possible; every portion of their surfaces, in turn, being brought are descrit with the rising fumes. way in which the out on oil sketches that had never been var. nished and were much faded with age, is stated to have been most remarkable.

## MUSEUMS OF ART

Ar the Ianley School of Art, on Mouday erening last, Mr. Henry Cole, C.B., who presided, made an address, in which he traced the origin and progress of tho Science and Art Department, the rork of the late Prince Consort in the course of it, Mr. Cole said people were st 11 apt to look and curious as mere collections of "things rare and curious-things for learned people onty, for Consort aud his followers looked at them from a different point of view-the point of view of science and art applied to productive indostry. his profession? He looked at buildings. What did Flaxman do when he applied himself to pottery? He stadied Greek pottery. What did Herbert Ninton do to enable bis manafactory to compete snccessfally with Sepres? He col. Why was Mr. Plillips, the jeweller, trusted to set jewels with good taste? Becanse be studied the ancient and Mediæval models. What gave Pugin his repatation for Gothic metal work bnt his stady of Medimaral models? What had created a trade in majolica in this country but the Soulages collection? What had given the Craces, and Jackson \& Grahams, and Gillowe, and Hollands their reputation for furniture, hut their knowledge of ancient examples? It was simple, savage ignorance and priggish pedantry not to recognise the absoluto necessity for examples of art easily consultable by tho publio, who were consumers, by the manufacturors, who were prodncers, and hy artists and artizans, who were stadenta. Where were they to consult them if more apt at industrial art than the Enclishman: Because for a century he bad bad his free muneums in Paris and every other large town. And pnblic maseums were necessary for science as well as art. Collections of diograms, of educational apparatue, and of specimens of natural history were indispensable to the managors of schools and teachere. Where was there any collection exeept in the South Kenhaven Musenm? Why did the Admiralty meclinnical scionce models of ships? Would engineers could not consult the example of their
predecessors. The fact was, that if musenme were not educational they were of very limited value.
Mr. Cole afterwards attered an indignant proSouth Kin the threatened abandonment or the rustees of the as we have already done-the different spirit which at present actuates the management of the two institutions.
The Hanley sohool, nnder Mr. A. A. Bradbary is said to be in a flomrishing condition.

THE NEIV HAMPSHIRE ASSIZE COURTS Tre new assize conrts in Winchester, erected from the designs of Mr. T. H. Wyatt, have heer opened. The old ball is preserved. The corridor of the new building is 36 ft . long, 20 ft wide, and 20 ft . high. On either side, at ith western end, are stone staircases leading to thi basement. Both these apartments will he parer with Forest of Dean stone, interspersed with Portland stone and Dumfries stone, giving pattern with three tints. Entering the court or the right, we find the Nisi Prins chamber to be 55 ft . long, 30 ft . wide, and 31 ft . high, whils the Crown Court (on the left of the corridor) is of a similar measurement, with the exception o a greater length by 2 ft. Both chambers wil be illuminated with sanlight burners during evening sittings, and during the day four three light windows in their outer walls, and a foun litht one in their enstern walls, provide all tha will be reqnired in the matter of light. Th judicial bench, at the east end, is in the form o a canopied dais, with the Royal arms carved is woodwork overhead. The Crown Court, on it northern side, is provided with a gallery for th accommodation of the grand jury, and this i approached hy a stairease leading from their ow. room in the basement. The judges' oonsulting room is is suitable apartment occupying thi centro of the building. The Grand Jary Chambe has a mensurement of 31 ft .3 in ., by a widt. or 18 ft ., and is, with most of the other room in this story, 11 ft . high. The hot-water heatin apparatus was supplied by Mr. Haden, of Trow bridge
Outwardly, the building, which is composed o flints, witb Bath stone cressings, presents thre stories to view, relieved by Tudor windows. Thi measurement of the whole is 92 ft . from north t south, 60 ft . from cast to west, and abont 60 fl high. On the nortb side of the building then
 are located, as before, in the hasement; and thi county surveyor is relerated to the earret.
M1. Tookey is the clerk of works, and Mi Honghton the chief forcman.
The cost is estimated at about 30,000 . Th carving work, both in wood and stone, has heet execnted by Messrs. Broad, of Kennington. Thi gasfittings are hy Mr. Strode, of Loudon. Thu plastering has been done by Mr. Sealey, o Eulfood. The whole works were undertaken by Messrs. Hill \& Sons, of Loudon, contractors.

ARCHITECTURE, CONSTRUCTION, ANL SANITARY ARRANGEMENTS AT THE COMING INTERNATIONAL EXHIBITION: We bave already mentioned that one of the classes in the next Exhihition will be civil engineering and arckitecture. But the minter so immediately interests a large number of our readers that we return to it, and hope the information will not be disregarded. The class Twill be divided into the following sections:a. Civil engineering,

Sanitary apparatus and constructions. Cement and plaster work.
Exhibitors who may wish to ebow new methods of construction in actnal operation during the Exhihition, will (with the committee's approral) be allotted space in the Western Annexe, whereon to build or arrange, in view of visitors. In the same annexe will be shown specimens of divellings for the industrial classes, which her Majesty's Commissioners are desirous of obtain. ing, if possible, from all parts of the world. It is also in contemplation to obtain a collection diagrams of ancient and noodern buildings of all conntries, and the co-operation and assistance of all interested is invited. Another class of the 1874. Ehhibition will be,-" Heating by all
exion with this class the Society of Arts have ready announced offers of prizes. Intendiog nce. This olass ought to be the great feature f the year.

TESTIMONIALA TO MR. P. CUNLIFFE OWEN.
We have already mentioned and applauded he preparation of a testimonial by English xhibitors at Vienna intended for Mr. P. C. Wen, the secretary of her Majesty's Commisioners. The prosentation took place at a inner given on Tuesday eveming last, whereat
Ir. Colin Minton Camphell presided. Mr. John Iead, of the Orwell Works, Ipswioh, has acted a secretary of the fand. Tbe testimonial conists of a silver dessert service by Elkington and a purse of 1,300 guineas. The desser hilip Cunliffo Owen, Esq., this silver dossert ervice and a parse of 1,300 guineas are preonted hy 275 British Eixhibitors at the Vienne niversal Exhibition, as a small token of their steem and regard, and in remembrance of his ary of Her Majesty's Royal Commission. ctober, 1873." At tho same timo, a set of cry artistie Danish jewelry, in pearls and rrought gold work aftor Runic models, was
resented to Mrs. Owen, " hy a large number of resented to Mrs. Owen, " hy a large number of
xhihitors and friends at the Vicnna Universal xhihitors and friends at the Vicmna Universal
ixhibition of 1873 , as a small token of their steem and regard, nud in remembrance of ber aany acts of disintercosted kindness."

THE MARGATE DRAINAGE COMPETITION.
Tye applications from gentlemen who ere inxious to have their names placed on the select ist of ton competitors for tho abovomentioned oration on Tuesday last. Altogetber there vere fifty.threo applications, of which a large roportion of course came from the metropolis; at the provinces were also well represented: ord, Warwick, Doncaster, Gateshead, Wigan lifton, Eastbourne, Dorking, Sheffield, and nany other towns were among the ruplicants, and one hailed from Cork.
The list comprised many men of mark in the rofession, and its perusal elicited the ohservation hatalthough engineers of repute hesitate to trust homselves to the broken waters of an unlimited :ompetition, yet the systom of limited and elect competition secms not in disfayour among he profession generally. The reading of the rarious applications occupied the town clerk two uonrs, and upon his resnming his seat the council Ootober 24th), when the applications will bo urther considered, and the work of selection Fill commence.

## WISBEACH COTTAGE HOSPITAL

Tax North Cambridgoshire cottage hospital, he opening of which by its benevolent foundress, Miss MI. E. Trafford.Sonthwell, of Honington Lall, Grantbam, was announced by us last week, aigh, witb stone dressings and carved capitals. The gates are of pitch.pine, with gilt iron side of thisgateway. Tbe main huilding is ahout 36 ft , high, and tbere is a tower and spirelet on the north-east side, 60 ft . in height. This aro somewhat of a Gothio character; they are of white brick and stone, reliered hy ornamental red hrick hindings and fret-work. Within he hospital accommodation is provided for sixeen weds. The entrance-hall and passages are
laid with Maw's encaustio tiles. The committee coom stands on the left side of tbe hall, and is 16 ft . by 15 ft . Tho matron's room is 15 ft . by ft . Adjoining it is a store. room 10 ft . by 14 ft .9 in . There is a sick ward 16 ft . by ground floor; There is a sick ward nopon the contains six beds. Between each bed 18 ft . and able folding-soreen is placed, deoorated with a variety of pictures. Moulo's portahle earth. olosets are providod. The ward is lighted with ive windows, which have glass louvre venti.
fators, and contain two large stores. Adjoining
is a hath.room, 10 ft .3 in . by 7 ft , which is provided with hot and cold water. There is a special ward $13 \mathrm{ft}, 3 \mathrm{in}$, hy 13 ft ., which it is intended to reserve for special cases. There is a kitohen 20 ft . square, and a senllery, 14 ft . by 11 ft ., well provided with water. A dispensary, at the rear of the special ward, is fitted up with pitch-pine fittings. On the upper floor stand the nurses' rooms and a sick-ward, correspond. ing to the one on the ground-floor, two occa. sional wards (for isolated casos), tyyo speoial wards (for persons ahle to pay for their main.
tenance), a hath-room, and a day-room. The tenance), a hath-room, and a day-room, The whole of the rooms throughont the buildings are of the uniform height of 13 ft , and the stairsituated on the south side of the ground. Around the buildings the srounds are laid out with grass-plots and flower-heds. The whole of the buildings of the hospital are lighted hy gas, A good supply of rain and Marham water is carried to all parts of the building, Everything has hospital complete, though tbo sewerage arrange. ments are as yet of a temporary nature (pending the contemplated sewago works). The ventila. tion is on the same system as is adopted in St. Son, of Wisbeach and Lynn, were the architects; and Messrs, J, \& M Challan, of Grantham, the builders. The contract price for the building was $3,26 \%$.

THIE BRIGHTON SOHOOL BOARD SCIIOOLS.
These schools stand on a plot of ground 492 ft , long by 51 ft . broad; one end of which faces Sussex-street, where the boys' school stands; the otber faces Richmond-street, whioh is devoted to the girls' and infants' schools. In the centre are the playgrounds. The fall in the 9 ft or 10 ft .) that a play.shed 73 ft . hy 20 ft . has been provided nader each school, having open archways along the whole leugth of one side of the huilding. These, besides being an important addition to the play.grounds, have the advantage of being especially suitablo for
wet wcather. The boys' school is I shaped wet weather. The boys' school is $L$ shaped,
and is 93 ft . long by 20 ft . wido by 19 ft .6 in . high to the ceiling, and gives abont 13 ft . super. ficial area and 156 ft . cube of air to each cbild. Three class-rooms, each 20 ft . ly 17 ft , and 17 ft .6 in . high, open into the school-room. for forty children each, two for twenty.four children each, and one for thirty.two children. Each class.room has acconmmodation for thirty. two children, giving a total of 250 in each school. Great attention has been paid to the choice and arrangements of tho desks, botb in the school. rooms and class.rooms. The desks are those known as "Moss's Patent." They are arranged in pairs, with a gangway between each pair, so that the master can have direct commanication with any child, and any child can leave his place without distnrbing the others. The girls' school infants school is 40 ft . hy 40 ft .9 in , and 26 ft . bigh, and has a class.room and nursery opening into it, each 20 ft . square. The galleries in the school.room and nursery are adapted for infants of different ages, and the class-room will he each departm low desks. $\Lambda$ room is provideds The schools were designed for 250 hoys, 250 girls, and 250 infants; but the accommodation is slightiy in excess of these numbers. The school-rooms and class-rooms are heated by open fircplaces, with air.chamhers at the bottom and hack of cach grate, supplied with air from the outside, through airatight ducts, of sizes calculated to the cubical contents of the different rooms. The warmed fresh air is admitted into lators. lators. For tho escape of foul.air ample open. ings are provided in the ceilings commanicating by iron ventilating pipes with fonl-air shafts in arranged with regard to ventilation. They all open, and the upper sashes inwardly like hospital windows. Round shonlders, defective sight, and other evils, are attributed to tho bad arrangement and improper construction of desks and seats in schools. Tbere is no douht that a school shonld be protil elements is that warmed, and ventilated: in fact, no teachers can perform their work thoroughly nnless this he the case.

The huildings are Gothic, and are necessarily simple and plain ; an endcavour has been made, however, to givo them a character snitable to the object and requiremonta, bearing in mind the neighbourhood, site, and tho strictest economy, and relying on tbe simplest and cheapest means to obtain common. sense buildings. The outside is of stock brickwork, with a fow red bauds and patterns constructively used, The stonework used is Horsham stone. The roofs are slated. Inside the school-rooms have a cement dado 5 ft . from the floor, and the walle above the roof are painted, the only effect aimed at heing in the colouring.
The work has been carried out hy Mesarg. Bridgman, Nuthall, \& Co., of London, tbe con tract being 6,522l. Mr. Hampton, of Brigbton, has been olcrk of the works. Tho design was chosen in competition, Mr. B. Fletcher and Mr. John S. Nightingale, of Londun, being the joint architects.

SCHOOL-BOARD SCHOOLS.
Higham Ferrers.-Mr. E. Sharman, of Wellinghorough, has hoen omployed as architect to prepare plans, the one selected heing Gothic in the of a new school on an olevated site near to Mr. Jol-place. Tho building coniract was let tering to Mr. Geort, of Rushden; the oarpen and the elating to Mr Albert Laumhton; who have worked out the plans, and the sohools are now complete and opened. The exterior is red brick, with white stone dressinge, and the schoole are in the shape of the letter H, with the house for the master attached, almost like a I', so making the black plan something resembling HT, with large playgrounds in front, surrounded by a briok wall, with iron palisades on the top. The girls' playground is divided from the hoys' by a brick wall. The interior consists of infant school.room of a rectangular shape, witb class-room annexcd; while the mixed school-room is in shape like an $L$, being originally like a T , hut having a class room taken off on end of the top of the $T$, it leaves it more in the shape of an L. The sehools are large onough to accommodate 350 children. They are lighted with gas, the contract for the fitting of which was executed by Mr. J. Lewis. There are lavatories hoth for boys and girls, and the other nsual offices.
Llandworg.-Tbe Llandwrog School Board was formed in Fébruary, 1871, and has worked indefatigably in supplying the deficiency of school aocommodation that existed in the parish. Iwo schools have been huilt, one at Nantlle (which will be opened a few weeks honce), to accommodate 150 children; and the other at Penffordd Elen, situated hetween two villares This scbool, which has been formally opened has a mixed and an infant department-the one to accommodate 190 and the other 110. The plans (drawn by Mr. W. C. Williams, Plas Isaf chairman of tho Board) are in the newest style there are sufficient means of light and ventila. tion, and the whole building is warmed by hotwater apparatus.

THE TWELVE. HUNDREDTH anNiversary of the foundation of ely cathedral.
The hisexcentenary festival in memory of the foundation, by Queen Etheldreda, of Ely Cathedral has been held with great éclat by a numerous assemblage of visitors. The proceedings hegan on Friday in last week with a series of services whicb continued till, and included, Tuesday
On Monday, the proceedings hecamo sccular rather than religions; comprising chiefly a lecture in the Cathedral, a tonr of the building a luncheon in the Corn Exchange, and a recep tion at the Bishop's Palace. The lecture was to have heen delivered by Sir Gilbert Scott, nuder whose supervision the alterations which have been taking place in the Cathedral during the last quarter of a century have been carried out Sir Gifbert, however, was not well enough to fulfil his appointment, and delegated to his son the reading of the lectare he had prepared This "proved to be an elaborate résumé of the history of tho Cathedral, and a description of the varions improvemeuts which have been effected since the modern restoration was com menced. The lecture finished, Mr. Edmund Sharpe, who acted as cioerone to the members of the Arohmologioal Tnatitute of Great Britain and Ireland when tbey visited the Cathedral, led
the way in a turn ronnd the building, explaining as he wat the various peculiarities and the varied history of the principal sections of the building. The journey proved a rather excitiug one, owing to tho frequency and suddenness of the strategio movements made by the ladies and there were eleven stations, the amount of chasing round pillars, scudding down aisles, and clambering over forms and chairs was considerahle; but the result was, that the sections of the congregation had by turns a good place of hearing. The principal portions of the cathedral have A.D. 1066-A.D. 1145, illnstrated principally by A.D. 1066 -A.D. 1145 , illnstrated principally by portions of the eastern transept and the nave; the Transitional period, A.D. $1145-$ A.D. 1190 Shown in the western transept of the refectory the Lancet period, A.D. $1190-$ A.D. 1245 , to be traced in the presbytery and galilee porch; the Geometrical period, A.D. 12 15-A.D. 1315, which hias left its mark in the oastern transept, the cloisters, and the lady chapel; and the Rectilinear period, A.D. 1360-A.D. 1550, illustrated in the upper part of the western tower and
elscwhere. The distinctipe peculiarities of these elsewhere. The distinctive peculiarities of these styles, and how Ely Cathedral completely illus. trates tho bistory of chnrch architecture in England, from the Couquest to the Reformation Mr. Starpe made clear in an intercsting conversation, which lasted over an hour, and was
followed throughout by the visitors, from point to point, in tho earnest manner indicated.

THE LATE MR. STEPHEN SALTER.
We are sorry to hear of the death of Mr. Stephen Salter, who was for many years an nrchitectural and engineering modeller, well
known in both professions. He received medals known in both professions. He received medals
at the 1851 Exhibition for his model of the at the 1851 Exhibition for his model of the
cathedral at Hamburg, as designed hy Sir $G$. cathedral at Hamburg, as designed hy Sir G.
Scott; and at the Exhibition of 1862 for his Scott; and at the Exhibition of 1862 for his model (a remarkable work) of the passage of the
Tudela and Bilboa Railway, across the CantaTudela and Bilboa Railway, across the Canta
brian Pyrenees, of which Mr. Vignolles was eugincer; and in 1855 a medal at the French Exhibition for models of Lighthonses erected hy the Trinity Corporation, most of which were
designed by the late engineer, Mr. James designed
Walker.

THE SHEFFTELD TRAMWAYS.
The tramways which have recently been opened in Sheffield are laid down upon a novel pinciple. It appears that after the Act was passed, the corporation, under the provisions of a clause in the Act, gave notice that they a contract wes entered into for tho construction of lines exceeding about ten miles, the cost being nearly $40,000 \mathrm{l}$. The gango of the tramways is the ordinary railway gauge of $4 \mathrm{ft} .8 \mathrm{io}$. , and after the first six months the company have to maintain the surface of the road between the rails and 18 in . on each side, making a width of 8 ft . for each single line. The system of construction adopted is somewhat peculiar. The iron rails npon longitudinal sleepers. In the Sheffield tramways, however, there is no wood, but the rails are laid upon a system of caat.iron supports. These supports aro embedded in concrete, and the rails spiked into a wooden plug previously inserted in the support. The
company already have in Sheffield twelve company already have in shat are all of which are clegantly framway

THE MANNERS AND CUSTOMS OF THE MIDDLE AGES IN FRANCE.
Is is only at intervals that the lover of hooks is gratified with such a handsome and altogether goodly addition to the objects of his admiration entitled "Manners, Costoms, and Dreas doring the Middle Ages and during the Reanaisance Period."* It is in many respects a companion to the samo anthor's molame on "The Arts of the Middle Agres and during the Renaissance Period," Middle Ages and during the Renaissance Period," in its English form. But, if we may say so, it is addressed to a still larger circlo of thinkers and workers. The history of the arts was,

* Manncrs, Customs, and Dress during the Midde Ages,
nd during the Rensisanance Period, By Paul Lacrois.
London : Chapman \& Hall, $187 \downarrow$.
indeed, calculated to interest all artificers who prorked with artistic taste and skill in any mate rial, as well as all archaologists and antiquaries but the history of manners, customs, and dress mnst have its charm for evorybody. All trades como within its scope, all conditions of people: as do all fairs and markets, all food, all fashions, guilds, games, pastimes, punishments, tribunals, and ceremonials. This mass of information is illustrated with fifteen chromolithorraphic prints by Kellerhoven, and about 400 wood engravings. Most of the coloured illustrations are fac-similes of miniatures from fonrteent and fifteenth century manuscripts ; and many of the ongravings are reprodnctions from rare and carly Forks. M. Lacroix, we should explain, is the curator of the Imperial Library of the Arsenal, Paris, and has thns unusual facilities referenco within his reach, as well as a profes sional a chief libraries of Europe. Heuce the quality his work. He has a third volume in contempla tion, he informs us prefatorially, which is to relate to tho raxions aspecta of religions and military life in the game perioda of time. Mean कhile we will examine that which is hefore ns.
To begin with, M. Lacroix gives a sketch of the general condition of persons and lands at the heginning of the Middle Ages. Ho rominds his Coaders that the dissolution of the empire of the Csesars left the populations of Enrope not free, but in vamous stages of servitude. There were the Goths, Burgundiaus, Yandals, Germans, Franks, Sasons, and Lombards, all accustomed to rough warfare on one side, and the Romane, With those nations whom they had conquered, on the other; and a long time elapsed before the general confusion and tyranny settled down into anything like order or security. "There were on both sides," he remarks, "freemen, freedmen, colons, and slaves; different ranks and degreos being, however, observable both in freedom and seryitnde. This hierarchical principle applied itself even to the land, which wa divided into frecholds, trihntary lands, lands of the nohility, and servile lands, thus constituting the freeholds, the benefices, tho fiefs, and the tcnures." A spirit of servitude pervaded all ranks. A varlet waised at tahle on a vassal, a vassal on a noble, nobles on the sovereign, and
all looked upon this service not as a compulsory ndimity upon this service not as a compulsory M. Lacroix thinks the first political principle that was evolved from the general abasement was to bow to a superior. The greater the rank of an individual the more he was favoured by the law. Everybody belonged to somebody else. From this hasis arose fendalism. Some his. corians represent the Germans as the regenera. tors of society in these old times, hut onr author accredits Pagan antiquity and Christianity with cnstoms inal improvement. Many manners and other modified them and ongrafted upon them the spirit of human equality, which slowly thongh certainly loosened the honds of slaves, and mado all men subject to the same laws 11. Lacroix, however, allows that it was Charle. magno who first modelled a powerful and peace. ful empire out of the general anarchy. Ho estahlishod public administrations, founded towns, united small and scattered peoples, assigned a place for all, and, after his reign of forty-five years, left his dominions in fall working order. Unfortunately bis successors were not qual to their inheritance, and personal war sometimes heiween individual nobles and somc. times between the nohles and sovereign, soon reduced aflairs to their former level. Under the Carlovingian dynasty a change was made then only personal. The Merovingian kings styled themselves kings of the Franke, not kings of France, because incessant altera tions were made to the boundaries of their dominions by the incessant changes and chances of war. Bnt now the possession of land formed to become tho holder of land. Out of the desire to hold were built The laws relating to wandering tribes fell into dis laws relating to wandens race and caste disappeared. The nobles, how ever, ensconced in their fortresses, were alway indifferent subjects, preying on their neighbonts and travellers, and defying the sovereign; and when the descendants of Hugh Capet wished to consolidate their power, they were obliged to attack all their strongholds before they could induce them to acknowledge their sovereignty.
Arrayed thus against the nobles, the kings
found the corporations and citizens of grea service to them. These bodies had their towns protected by ramparis, and possessed a townhall, a seal, treasury, and a watch tower, and they could arm a certain number of men to protect themselves or assist the neighbouring lord upon whose estate in the first instance, perhaps, their predecessors were born, and who had mada couditions with them to that effect. The more the kings enlarged the privilegos of the citizens, the more independent they became of their natural lords, whose power, consequently, dwindled before that of the sovereign. Hence, it was expedient on the part of the lings to treat them with generosity. It was under Lovis le Gros that the title of bonroeois was first applied to them. This desimnation, continnes M. Lacroix, was not applied exclusively to inhabitants of cities. "It ofteu happened that the nobles, with the intention of iuproving and enriching their domains, opened a kind of esylnm under the attractive title of Free Toums asylnm under there ther to estahlish hemelpes, onds, hores, and more or less extended share of pririleges, rights, more or less extended share of privieges, riguts,
and liherties. These congregations, though agriculturists, took the name of bourgeois." In agricutarists, tonelioration in the conditions of men, slaves hocame serfs at a vory early stage, men, slaves hecame seris at a very early stage, dereloped into farmors paying, first tithes and fees, and finally regular taxes. Theso were the ancestors of "the people." Those who continned to till the soil were the ancestors of the peasantry; those who chose to devote them. selves to trade and commerce in the towns werf the ancestry of the middle classes. Many curious details are given in connexion with these changes in society, which our readers should see for themselves.
Bourgeois and peasants were at first blended together, as having one origin, but the former soon acquired a degree of prosperity and affluence that enabled them to adopt habits that left the agriculturista a long way bebind them. trouhadour, writing of the hourgeois of the thirteenth century, declared they had divers sorts of merits. "Some distinguish themselres by deeds of honour," continnes this Arnand do Marreil, "others are by nature noble, and behave accordingly. There are others tho roughly hrave, courteons, frank, and jovial, who, although poor, find means to please by graceful speech, frequenting courts, and making themgelves agreeable thete; these, well versed in courtesy and politeness, appear in noble attire, d figure conspicuonsly at the tournaments and military games, proving thenselves good judges and good company." Their taste for "noble attire," indeed, was freqnently repressed hy edicts. Their wives and daughters, especially were fined if they presumed to nse the ornaments and stuffs reserved for tho nobility; but in proportion as their husbands and fathers were honoured by their monarcha and enlarged their immense fortunes, thoy disregarded fines and penalties, and wore the costliest furs and riehest stuffs they conld procure. A nother early writer, Christine de Pisan, in the second half of the fourteenth century, relates that he went to visit the wife of a merchent, and fonnd the walls of her house hung with procious tapestry from Cyprns, on which were embroidered her initials end motto the floor spreat with a like rold, her harnished with sheets that cost gold, 30 l a quilt wor ton on tion of silk and silver lissine, and pillows orna. writer, in the fifteenth centary, a bourgeois, writer, in the fifteenth centary, a bourgeots, hold, for tho use of his young wife, gives us us many more particulars of the mauner of life of the middle classes. Among his advice, he tells his wife to consider the rank of her parents and his in the choice of her apparel. "Be respectably dressed, without devoting too much study to it, withont too much plunging into new fashions. Beforo leaving your room, see that the collar of yonr gown be well adjusted, qud is not put on crooked." He relates an anecdote illustrative of the proverbial wilfalness of woman, which reads like a companion piece ol experience to that which befell Gunhild and Gunhelda in the Norwegian story, or the owner of the gray mare and basket of eggs in this country at a later datc :-

This same fifteenth-centnry writer tells us there was in Paris a kind of registry office for scrvants, hy means of which servant-maids from the country could find situations. He cau.
tions his wife, on account of her extreme youth (girle were married at fifteen in those days), to take the opinion of Dame Agnes concerning
them. This was a nun whom he had placed with them. This was a nun whom he had placed wit her as a companion, or governess. "Before engaging them," ha continues, "know whence they have acquaintanoes in town, and if thoy are stendy.

If they come from another country, try to find out why they left it, for generally it is not withont some serious reason Superintend the work to be done and choose among your servants those qualified for each department." With the exception of onee of each task, wo might he calling from the pages of any modern model housewife's mannal so far advanced towards our own stage of proturies ago. Not so, however, with the descend
thers ants of the serfs who remained on tho soil, with only the choice of had roads, hy which they conld ever leave it for relaxation of any sort. In the "Do l'Oustillement au Vilain," furnishing us with a picture of a peasant's home and occupation, which though very removed frow tho pomp and comfort enjoyed by merchants or othe citizens, does not contrast unfavonrably with the condition of those who lahour on farms at the presont day. In France, M. Lacroix affirms, the tained in country districts, far away from the capital and large towns, at the date of the revolution of 1789. The thirteenth-centary dwelling for tho vilain, consisted of three buildings; one
for his corn, another for his hay, and the third for his corn, another for his hay, and the third for himself and family :-
"In this ruatic ahode a fire of rine branchea and faggots hanger, in tripod, a shovel, larga fireirons, a cauldron, and close proximity to thia an enormous bedstead, on which who asked for hospitality, could all be easily accornmer deted; a hneeding-trough, a table, a bench, a cheesa cuphoard, a jug. and f few baskets made up the rest of the
farniture. The vilain also possessed other utensils, such as a ladder, a mortar, a bandmill, - for every ona then was obliged to grind his own corn; a mallet, some nails, some
gimlets, fisling lines, hooks and haskets, \&c. His workag implements were a ploughl, a scythe, a spade, whoe a wagon, with harness for several horses, , o as to he ahla
to accomplish tho different toiska required of him nader feadal righta, either by his proper lord, or hy the
sovereign; for tha viain wast liabla to be culled upon to

His dress was a cloth or skin blouse, fastened round the waist hy a belt, to which he could add an overooat or mantle of thick woollen stuff. He also wore hoots or shoes, and short trousers; and in some weathers a hat made of the same
stuff as hisblouse, or of felt. He worked barestuff as his blouse, or of felt. He worked barehoaded ordinarily. From his helt depended a wallet and sheaf for his knife. He owned a watch-dog, who guarded his small kitchen gar-
den, and a few cowe, which were kent in a shed den, and a few cowe, which were kept in a shed
close hy. Rats and wild cats formed further close hy. Rats and wild eats formed farther items in his surroundings. He had his holidays in connexion with church festivals, and frequen "wakes," or evening parties, where he drank,
talked, laughed, and sang to his heart's content. It was at the wakes that fairy tales were told and where matrons, presuming on their experience, pretended they knew wonderfnl secrets, such as could cause happiness, care sickness, events. It is not, when we think of these fes. sive occasions, so much a matter of wonder, that as years passed hy, and the state of things
improved in various particulars, the old looked
back to their young days as better than their last, just as our seniors of to-day would have the present generation helieve that we are deteriorating from their superiority.
The nohility, during the reigns of Charles VIII. Louis XII., and Francis 1., continued to send their sons and da口ghters to court to attend on their sons and danghters to court to attend on their "apprenticcship of honour or virtne"; and there is no doubt it must have had its refining influences. Tbe queen of these first two monarchs, Anne of Brittany, created a great court of ladies. She nsed to inquire of the gentlemen of the court if they had any daughters,
and was always ready to receive them. She and was always ready to receive them. She
also formed a company of 100 Breton gentlemen, also formed a company of 100 Breton gentlemen, who escorted her wherever she went to mass or took a walk. Sbe maintained the strictest integrity and discipline in her court, which was renowned for its purity, refivement, and polite ness. Every noble, no matter how powerfnt, availed himself of this opportmity of securing the chiralric education and elegant intercourso for his sons and daughters that this custom nobles had a the onargeors and peasants, the teenth century, who has depicted many of their habits. This was Geoffroy de Latour-Landry, who composed for the use of his three daughters varions current social in which are set forth laughters," this wise parent advised "be cour teous and meel for pothinc is moro hentiful, nothiner so secures the favour of God and the lave of other Be then courteoue to grent and mall ; speot pently with ther have senall speat gontly wem
bow to a simple ironmonger. One of her followers seemed astonished. 'I prefer,' sho said, 'to have been too courteous towards that man, than to hav
been guilty of the least incivility to a knight.' M. Lacroix derotes, as we have indicated, chapter to food and cookery. This is exceedingly interesting. He gives the history of bread, and then runs through the Medioval materials for cookin fruits, cheese, eggs, fish, and shell-fish, beer, cider, wine, and comes to the modes of cookery em. ployed for sonps, pies, stews, roasts, grills, the manner of seasoning, and rules of serving at tahle. We are thas hrought in contact with the haker, the hatcher, tho poulterer, the fishercooks, the brower, the coppersmith, pastrycooks, grocers and druggists, and cooks, Minia. fac-similes fromeenthicenodents, manuscripts, tions of trade banners, afford illustrations of nearly all of them. Concerning bread, the staff of life in all countries, it would seem, M. Lacrois thinks it likely that the veneration in which the Gauls held the oak had for its origin the fact "rmat acorns were largely used as food hy them. "This primitive food," he says, "continued in use, at least in times of famine, up to the eighth centnry, and we find in the regnlations of St. Chrodegand that if, in consequence of a bad year, the acorn or heechnut hecame scarce, it make up for it. Eight centuries later, when René du Bellay, Bishop of Mans, oame to report to Francis I the fearfil poverty of his diocese, he informed the king that the inhahitants in many places were reduced to suhsisting on acorn bread. At first, hread was haked under tbe embers. It is trae that the Romans introduced the abe of ovens in Europe, from Egypt, hut as late as the tenth century the old plan was pursued in some places, or upon some occasions, for Thierry, near Rheims, ordered in his will that hread should bo cooked for his monks under the embers,-panes subcinericios. A flat thin cake was, perhaps, more serviceanle as a plate than any other form of bread; and as we know that they were used as such, we may thus account for the permanence of their manufacture. Froissart speaks of tailloirs. These were small orusty Dauphin of Vilcd tranchous. In 1336, the loaves, to serve as tranchoirs at table hesides white bread. Charlemagne fixed the number o bakers in each city according to the population At first the baker was also the miller but late public bakers established themselves, who haked bread brought to them ready kneaded, as well as made bread for sale. St. Louis allowed haker and millers to he exempt from the duty of wateling their towns, so that they need not negleet utility. And here, again, we would refer onr
readers to M. Lacroix's pages for mnch curions information. Concerning butcher's meat, too and the French preference for pork, leading up to ham fairs, and hatchers' privileges, yielding only to the King of France on his accession to the throne, the right to create a master hutcher, there is mnch interesting reading.
ter descrihince the luxurions hanqnets of the French Court, and a wedding dinner of a hourgeois, and showing M. Viollet le Duo's draw. ing of a ceremonial entertainment, with it peacooks, whole deer, enormous pies, silvered and gilt on the top, kids, pigs, herons, sturgeons, wild hoars, gosings, chickens covered with yolks of eggs and sprinkled with spice, jellies, creams plums stewed in rose-water, and many other tems, not inclading a final course entirely com posed of prepading a final course entirely coion pastrier prepared wines, fruits, and varioa swat is of which represented stags and that, M. Lacroix consoles us by reminding us Gaul rom the estahlishment of the Franks in the down to tho fifteenth century, inclusive dinner at ten in the morning, and supper at four in the afternoon. When, in the sixteenth century, dimner was postponed till eleven, and supper till seven, the old hours were backed in a proverb:-

## To rise at six, dine at ten, <br> Makas man live ten times ten

The chapter on gnilds and trade corporations is illustrated by fac-similes of a set of twenty desing, showing various craftsmen at work, designed and engraved by J. Amman, in the cut after a drawing hy Wohlgemuth for the "Chronique de Nuremherg" shows us a companion carpenter. A fac-simile of a miniaturo century MS. in the Burgandy Lihrary Brussels, illustrates a in the Burgundy Lihrary, Brussels, the timber framework of a small house apprentices or companions wished to hecom masters they compa suished to hecom masters, laey tri successiv duce from the stalls in Pouen , whed we repro duce carpenters ap a trial-piece. Pron Gollo (the Rouen Goldsmiths (which we give*) is inscribed in the book 15th centary, but looks not si ancient. The shield, at any rate, is more newel, good eyes may see tho date 1653 .
The Basle Lilurary has heen also looked through to furnish other examples. But we will pass on to the chapter on taxes, money, and finance, $t$ allade to a view of tho house of the celebrated merchant and financier, Jaeqnes Cceur, a Bourges, which is now converted into the Hottel de Ville, and which we are enahled to repro duce.* This merchant shares with Joan of Aro the honour of saving the freedom of the French kingdom; for he restored the finances of Charles VII., and managed to keep him supplied with the sinews of war,-money, -till he was ahle to prevail against our predecessors; but, nevertheless, Jacques fell out of the good grace of the king, and was compelled to make an amende honorable to his majesty, which cere mony is shown in the fac-simile of a miniatore of the Chroniques of Monstrelet, a manuscript of the fifteenth century, in the National Library of Paris. His house is a charming memorial of his taste, as all the architectural world knows, and tho view given of it is equally pleasing. We must pass over the chapters on law and the administration of justice, aud on seoret tribunals with the condemnations, tortures, and execu tions, though full of particulars, some of which are new ; as well as those devoted to the fearful punishments in vogue in the Middlo Ages, and he tramps, gipsies, beggars, and impostors of he streets; to one in which our readers are kely, perhaps, to be more interested,-the grand ceremonials of the days of fore. There is, however, an intervening chapter on the Jews which we must give some outline
After alluding to the day when the Romans eized upon Jerusalem, and the descendants of the old patriarchs had to wander forth over the ace of the earth in search of new homes, M. Depping is quoted to show their condition after they wero scattered over Europe. He says, feelingly:-"A Jewish community in a Euro. pean town during the Middle Ages resembled a colony on an island or on a distant coast. Isolated from the rest of the population, it
generally occupied a district or street which was
separated from the town or borough. The Jews, like a troop of lepers, were thrnst away and haddled together into the most uncomfortahle and raost unhealthy quarter of the city, as maserable as it was disgusting. There, in illpopnlation was amassed; in some cases higb walls enelosed the small and derk narrow streets of the quarter ocoupied hy this hranded race, which prepented its extension, though, at tbe same theme, it of ten proteoted, the inhabitants Rome approaobes very nearly to a realisation of this account; but the Jews' quarter in Pragne retains a more exact resemblance to it. There is the large inclosnre, dividod into small irregular is the large inclosnre, divided into small irregular
streets. Down the principal thoroughfare are streets. Down the principal thoroughfare are utensils for sale, some old and some new. The utensils for sale, some old and some new. The
synagogne is a square bnilding, dark and strong synagogne is a square bnilding, dark and strong
like a prison, covered with dirt and moss. The windows are narrow loopholes, and the door su windows are nerrow loopholes, and the door su
low those who pass through it into the dark passage within most stoop. The interior is ligbted hy a fow lamps, and fires are used moderate tbe ioy temporatnre. The roof is supported on pillairs, and along the side-walls are dark recesses in which women assist at the cele-
bration of worship. Nothing has heen repaired bration of worship. Nothing has heen repaired or changed for many centnrios, and the book of the law is as venerably old. Paris has never
had its Jowry proper. The Israelites who estahad its Jowry proper. The Israelites who esta-
hlished themselves there settled down in the neighbourhood of the markets, bnt were not otherwiso kept isolated from the general popnlation except in the matter of a burying-place. But most of the French provincial towns had their Juiverie. In the southern towns, as in Spain, Portngal, and Yenice, they enjoyed the protection of the nohles, traded with foreign ports, and hought and sold with the same facibities as were permitted to Christians; hut in the northern districts they were not so favoured. The Christian populations in the north of curope knew no sympathy wish like the people. They not only forgot Joseph, like the Abraham, and their grand old atory. They hoard and saw, on all hands, details of the Passion, and felt that resentment to the descendants of tho Jews who hronght it about was a meritorions state of mind. In Holy Week especiall, when their horror was intensified hy
all the eloquence of the pulpit, they were easily all the eloquence of the pulpit, they were easily
moved to deeds of extreme violence towards the Jowish communities. This was so well under. stood that, even where the anthoritics made no stood that, even where the anthorities made no
regulation compelling them to do so, the Jews regulation compelling them to do so, the Jews
sbnt themselves np in their own quarter till the exciting weok was orer. All sorts of accusationis were fahricatod agaiust them timo out of mind, some of which, perhaps, served as a pretext for fresh extortions from them. The case of the supposed murder of the child in Lincolnshire, in 1255, resnlting in the death of nineteen Jows and imprisonment of seventy-one more, is de-
tailed as a oase in point. There was a similar tniled as a case in point. There was a similar aconsation bronght against the Orleans Jews in in 1475 . Facsimiles of the early woodcuts hy Wohlgemüth, showing some of the mnrders, are given. An acconnt, too, is printed of tbe pablic hnmiliations, such as having to ran races for the amusement of tbe pnblic, having the ears of a ropresentative boxed in Toulonse cathedral on every Good Friday, wear badges, pay extra tolls, \&o.; and a statement is made of their cift for com. finance, their skill, in fine, of creatino canital that solaced them for all the indignities they endnred, and made them brave all their social inequalities. Oocasionally, a fow indiriduals or families were indnced to dotach themeelves from their fathers; hyt this was racely of benefit to them, for they were eyed witb suspicion and closoly watched. So late as 1611 an appeal was made against them, entitled a" Remonstrance to the King and the Parliament of Provence on Account of the great gether this is a curions chapter in the history of gether Middle Ages.
Of a very different aspect were the grand ceremonials of the clergy, nobility, and tiers. etat. For some centuries nothing in this department of things rested on any settled basis. As M. Lacrois ohserves, "The trilling rales which made etiquette a scionce and a law were introduced hy degrees, and have only vory
recently beeu firmly established. When Charles recently beeu firmly established. When Charles
VI. was about to marry Isahel of Bavaria, then VI. was about to marry Isahel of Bavaria, then
fonrteen years of age, he wisbed to arrange a
magnificent entry into Paris for her, and begged Qneen Blanche, the widow of Philip de Valois, to preside over the oeremony, and see that it was condreted according to the castom of olden was obliged to consult the Chronique de Satint Demis. In tho fifteenth oentury the first emhodiment of rules relating to snch matters appeared under tbe title of "Honneurs de la Conr." This was the work of the celehrated Aliénor de Poitiers, hut it was not generally accepted by the nohility, for in 1548 King Henry III. commissioned Jean da Tillet, the civil registrar of the Parliament of Paris, to soarch among the royal archives for docnments to throw light on disputed points and serve as the office of the office of grand master of the ceremonies of
France. Pope Julian II., in 1504, instructed his master of the ceremonies to pnblish a decree determining the rank of the various sovereigus of Europe, or tbeir representatives, hut it wa not accepted or sanctioned by those concerned. Dnaing the wbole of the Middle Ages, in fine, the question of precedence was a source of constant litigation and bloodshed. The chief ceremonial has always been the consecration and coronation of kings. This always took place ou a Sunday. Pepin le Bref was the first king who was anointed, and he approved of the ceremony so mnch as to go through it again in the following year, with his two sons, Charlemagne and Oarloman, in the Ahbey of St. Denis, at tbe hands of Pope Stephen III. Charlemagne was and then anointed, first as King of Lombardy, Déhonnaire was anointed at Rheims, whioh cathedral enjoyed the privilege of the ceremony so frequently that its clergy looked upon a consecration as their right, and finally were jnstified in doing so by a decree mado by King Louis le Bonrbons of the elder line this ancient of the saw every consecration with the exception of that of Henrily., wbo was crowned at Chartres, because the gates of Rheims were closed arrainst him. The ceremony hergan over-night, for at the onclusion of the evening monaroh went to the church, and passed part of the nigbt in prayer there. A large platform was erected between the chancel and nave, and npon it, at the appointed hour, the king, his officers of State, twelve ecclesiastical peers, six invite, and any others whom the king might harons was sent to the Abhey of St. Remi for the holy vial, containing the ampulla, that a dove brought from heaven on the occasion of the coronation of Clovis, four of whom remainod as hostages, whilst the ahbot and his monks went Ahbot of St. Denis, with similar solemnit hronght tbe crown, the sword, the polden spurs hronght tbe crown, the sword, the golden spurs, the gilt sceptre, the rod, the sandals, the
chasnhle and mantle, that were kept in the reasnry of his monastery siuce the reign of Charlemagne, and placed them by the side of the vial. In the oourso of the oeremony the king walked to the foot of the altar, bared his head, and took off part of his dress, and his nnic was furnished with openings on the chest, boulders, elbows, and in the midde of the back, which were kept temporarily closed with silver aiguelets. After tho Arcbbishop of Rheims drew the sword from its scabhard, and handed it to the king, who passed it on to an officer, ho ook a single drop of the miracnlous oil ont of the holy vial witb a gold needle, and having mixed it with some oil from his own chnrch, proceeded to anoint the king on the forehead breast, back, shoulders, and elbow joints. The monarch then rose, and witb the assistance of his officers, put on his robes, and received from the archhishop the ring, the sceptre, the rod of jnstice, and, lastly, the crown.
Jnvenal des Ursins has left an account of the entry of the Isahel of Bavaria into Paris, to to meet her, and aded. Great crowds went ou gronps representing historical scenes, or tableaus ivants, and fountains of water, milk, and wine The hridge hy which she crossed the Seine was covered with blue taffeta, embroidered with gold man was let down from one of her passing Notre Das let down from one of the towers of ky, who placed a orown npon her head, and was then drawn np again hy the same means arranged for his descent. Another smrprise awaited her at whe Grand Cbastelet, where there
was a court hung with azure tapestry, in.
tended to represent a lit-de-justice. In the oentre of it was a large white stag, artificially constructed toconveal a man within, who caused it to move its eyes, horns, month, and limhs rear it was a large bright sword, unsheathed Qneen Qneen passed, and brandished it. Juvenal de urizs adds that the king was so very anxiou o see how this entry passed off, that he per naded Savoisy to accompany him in to the crowde of spectators. The two, mounted on a strong and came up to the stag jnst as tho queen was passing. The crowd was very dense at this oint, and the sergeants entrusted with keeping ants, ants, had to apply their birch wands prettysharply ing people's shoulders, to keep them from hlook ing the way. Savoisy strnggled to got near enongh to the stag to soe what was passing, and both he and the king, who was behind him, were well beaten on the shonlders. In the evening, when the matter was disenssed before the ladies,
great fun was made of it, and the king langhed great fun was made of it, and the king langhe deartily at the price be paid for his curiosity, Dame Aliénor do Poitiers, wbo had the snbject of etiquette deeply at heart, went 80 far as to house she feared the possessions of the great to encon toe nohility were getting so large as so as to chicanery or conceamment When there was any wery tocial ceremonial to record sbe was in her element. Tbus she details every act of respect paid by the Duchess of Burgundy to Mary of Anjou at Chalons, in 1445. When the duchess alrived, with her retinne on borses and in carriages, in the conrtyard of the mansion, where the king and gneen were she alighted, and her first maid of hononr carried her train. M. de Bourbon gave her his rieht hand, aud the ccentlemen went on in front. In this manner she was conducted to the hall, which served as the ante-chamber to the queon's apartment. There sbe stopped, and sent in M. de Crequi to ask the queen if it was her pleasure duchess should enter.

When the
the train of her dress from the door she took the train of her dress from the lady who bore it, and let it knelt, and then adraced to she middle she room there moved There she made the samo obeisance, and moved the dnchess to the foot of her taroue. When homage, and the dires forl and the then pat her hand on her shoulder, omhraoed Can we uot picture the whole scene, the raise. Can we uot picture the whole scene, the painted ceiling of the chamher, the hangings of the wall, the vases, and other ornaments, and tbe group of court ladies? When a duke and
duchess were in their own court, everything npon their table was covered. The modern phrase, mettre le couvert (lay the cloth), is a resonance from this custom of covering everything in cadenas, or cases, including the basins in which the fingers were dipped. But when their sovereign was present, all these marks of respect were removed, and placed before him. One more sample, and we will concludo our notice. For mourning, the kings of France wore scarlet or violet, never black. The queens wore wbite, and kept their apartanents for a whole year. Hence the frequen chateve, hotel, or tour de la reine Blanche to be found in the huildings of the Middle Ages, the same containing the apartments in whioh a year of queenly widowhood has been passed in some old time. A dnchess, and the wife of a banneret, on going into mourning remained in their apartments, which were hung with hlack, for six weeks. The duchess remained lying down all day on a bed covered with a white sheet for the whole of the six weeks; but the wife of the knight banneret could get up at the end of nine days, and remain itting at the foot of the bed on a hlack sheet For the ceremonials of the tiers.etat, ac middle olasses, and lower orders, their fetes and fcasts, we mnst refer inquirers to the volume we have attempted to descrihe. Looking to the last ohapter, which is on costumes, and noting how exactly it covers the same ground gone over hy we thin we think of Cowper's line, "Who loves a garder loves a greenhouse too, and feel that we shal that those who enjoy M. Le Duc's work will also bat those who enjoy M . Le Dus work will also appreciate that of M. Lacroix; especially as the former of boing in the English language.

The Phonis Fire'Insurance Company's Ofices, Manchester.-Plan

WW BUILDINGS FOR THE PHCENIX FIRE INSURANCE COMPANY, MANCHESTER THE bailding shown in the accompanying he site of the course of crection. It stands on be site of the old premises of the company at he corner of Cooper and Lloyd streets, inınediately opposite to the south side of the tew town-hall. In consequence, bowever, of he corporation deciding to widon Cooper-street $t$ this point, in order to show off that part of he town-ball to botter advantage, the Phoenix milding has had to be set back abont 15 ft ., and he corner rounded, as shown on the plan. The ronts are of Darley Dale stone, with bands of ed Mansfield, Wbile tbe side elevation next thapol-street is faced with red stocks. The est of tbe walls are of common bricks. The iffices, which are in that part of the groundloor facing Lloyd-street. They consist of a arge publjc office and two private ones, with ccommodation for safe and lavatories. The emaining portion of the hailding, both on the round floor and on the other floors, is intended o be let off for offices, and for these an entrance provided in Cooper-strect. The staircase is ffices are placed so as to be entered from the be staircase abont midway in each flight. The obbies are to be laid with ornamental tiles, and he aroading in the staircase-hall has red Manshe aroading in the staircase-hall has red Mansnd Darley Dale bases; tho parapet there being 180 of Darley Dale. The whole of the work is Lancbester, with Messrs. Ellis \& Hinchliffe as 'ancbester', with Messrs. Ellis is Hinchliffe as nh-contractors for the mason's work. The ontract amounts to abont 7,0002. Mr. John owe, Manchester, is the architect.

## BAS-RELIEF AT DEPTFORD

Wien reading a paragrapb reforing to tho lesurrection Gate in your articlo on "St riles's," it occurred to me that it might interest nany of your readers to know that a very arious bas-relief of the Jndgment Day exists a the churchyard of St. Nicholas, Deptford. It a beautifully executed in lead, and is in excellent meservation; it is in a very appropriate pos
jon, being over the door of the dead-bouse.

Deptrordodia

A HEALTH POET OF THE EIGHTEENTH GENTURY: HENRY BAKER
There are no names more worthy of remem brance, or worka more fit to be rescued from obscority, than those associated with social reform. The modern history of human and public health 18, in fact, the history of onr civiliation. The growtb of unohecked diseasa,-of disease that is both preventible as well as cura-ble,-is nothing short of the growth of barbarism and criminal ignoranoe. Health and disease have formed the thomes for hoth the prophet's and poet's pen in tbe early ages of the world, but in a limited way. Man's worst passions and frail. tics have met with rehake and exposnre in inspired writings; but man's home and sur roundings, whicb have had oven more to do with the inflnencing of his character than anght else, have been scarcely deemed worthy of serious attention from a noral or social point of view. Homes, to be sure, from the earliest period, according to the position of tho owners, have been rendered luxurious more or less; but their degrce of comfort or healthiness, despite their barbaxic grandenr, must bave boen small indeed. The mind of their age probably thought them perfect as well as the mind of a generation in our memory thought theirs so; bnt the well. anthenticated plagues that have devastated this planet of ours have afforded us nnerring proofs of what nnhealthy life and living brought npon the world aud perpetuated. To apostrophise health and paint dire disease is a comnondable work, whether performed by a poet, painter, or philosopber. Scnlptors may embody, and some of and havo embodied, unutterable pain, sorrow, and madness in the attitude and features of of bealtb and and in every way tbat the lesson of bealth and its opposite, disease, can be por trayed to man for observance and avoidance, a benefit is conferred npon the living and the unborn humau race hy following it.
One Henry Baker, in the year 1725 or 1726 , published a volnme of poems, and among bis verses there is one, at least, that deserves to be rescued back to a wider popularity, not only for the sake of the author, but of the subject. The poom is entitled "An Invocation to Healtb." At the date of the publication of the volume the author could not have been more than twenty-three years of age, and his sulsequent success or celebrity conld not he anticipated.

Henry Baker, bowever, hefove the close of the eighteenth century, was well known as a natnralist and a member of the Royal Society and the Society of Antiqnaries. Beginning life as a bookseller, he relinquished trade to commence the tuition of the deal and dumb, and in the pursuit of that noble vocation he acquired a large fortnue. In devoting his onergies to instract the deaf and dumb, he became natnrally one of our social reformers, as in depicting health and disease by the aid of poetry he acted as an anziliary in a sanitary dircetion. In addition to what we have mentioned, the life of Herre Baker may be summed np thos:-He married a daugbter of Daniel Defoe, by whon he had two gons. In 1740 he obtained from the Royal Society a rold medal for his microsconical experiments on saline particles. In 1742 he puhlished his "Micro cope Made Easy", and in 1764 his "Microment for the Microscope" 1764 his "Eimploylearing 100l. to the Royal Society for an anatomical or chemical lectnre, called an Bakerian lecture. His eldost son, called the adopted by an uncle, a silk.throwster in Speer felds to wom deroted to thentrion ontertniments ; bat was arse Davja
 dered his property, finally joining some strolling layes. Very few partiontars are known of the losing years of his life, but he is supposed to have died three or four years previously to the deatly of his father. Connecled with bis life tbere is, bowever, one matter worthy of notice. As the anthor of "A Companion to the Playhouse," publisbed in 1764, he laid the basis of a work now known by the title of tbe "Biographia Dramatica.'

WARMING AND VENTILATING A HOUSE IN CANADA.
Str,-I have been not a little surprised at the asserted ignorance of even your architects on the snbject of houso ventilation, and as I seo a good deal of interest has been awakened iu the subject recently, I venture to addross you. Without stopping for demonatration, I will lay down two axioms which may be safely accepted as true.
1st. If the fresb air be introduced cold it should come in near the ceiling and through numerous very small openings to avoid dranght, and the effete air should be taken off at the top also.
2nd. If, on the other hand, warm fresh air is to be introduced, it should be bronght in along the skirting, and the effete air be taken off also near the floor, as otherwise the freshest air would be first drawn off.
The latter is the proper plan, and no hetter exhaust is needed than a commou open fire
To convince you that my tbeory is correct, I will relate my own experience.
For nearly twenty years I have warmed my house by my cooking-range, and, as I burn coal in winter and wood in summer (because the fires can be let down and started as required witl wood), my fuel costs less in midwinter than in midsummer, notwithstanding tho mercury often falls $20^{\circ}$ to $30^{\circ}$ below zero
My house is a detached one, two stories, with basements aud attics, all in use, and a wing 13 ft . square, the maiul building being 30 ft . by 40 ft . The range is in a basement kitchen, and has a fire-box 2 ft . square, and 18 in . from gratebars to top of range, which fire-hor is completely lined by a coil of 1 in . pipe, and the coal is poured in from the top. At the back of the range, and under the central hall, is a brick vanit, 6 ft . or 7 ft , square, in which are some 500 ft . of inch pipe in coils, all connected with the fire coil. I have also a smaller circulation, having one tarn at the bottom, inside the larger coil, and forming with the grate, whicb it surmonats, the bottom of the fire-chamber, and passing up, makes another twist aronnd the top of the fire-chamber, then leads off througb a knife and hoot room in the wing basement up through a wall coil in the pantry, to tbe bath room, along one side to the expansion pipe, back again, and down, and along the oeilinr of a small store-room, then into the back hall, along the stairway down to a large coil under an open jron tube opposite the dining-room door, and back to the range, all the apartments being warmed by the radiated heat from the pipes placed in them. The ontside ball doors being constantly in nse, afford amplo ventilation for these rooms, and the enemy is met at tbe door. The living-rooms, say drawing-room, dining-room, and library, on the ground floor,
and a small hondoir on the first floor, heve flues and registers, hringing a constant stream of fresh warm air from the vault, into which stream of cold air is admitted day and night, even with the thermometer, 30 helow zero. exhaust floe near the floor, always open, and the staircase being an open one, in the centre of the bouse, the only trouble is to keep the heat down
By this means I have a temperature of $65^{\circ}$ to $70^{\circ}$ in the living-rooms, and $60^{\circ}$ to $65^{\circ}$ in the hedrooms without ever having to speak or even to think of the state of the fire, for the reason that the water so completely absorbs the heat that the cook must supply the house before any heat can he got in the ovens, of which, by the way, ther are two; and a third coil, which supplies a copper boiler of hot water for the bath and othe purposes, while the smoke-pipe runs the whol length of the basement hall, keeping that entir flat warm. Both coils are bermetically eealed and the same body of water has circulated in the main coil for eleven years witbout diminu. tion. I may mention that some 4 ft . of the arge radiating pipe lies in a sballow pan of water, provided witb a ball cock, and rnns from that directly into the fire-coil. Tbis pan is on the bottom of my air vault, and the amonnt of rate at which the fire is forced, the water in very cold weatber being hot when returning to the fire-cbamber.
Half of my smaller circulation being at the bottom of toe larger one, I have a square frame of 6 in. by $\frac{1}{2}$ in. iron, which rests on the inner oil at the bottom, and carries a smaller grate, 12 in . by 12 in ., the space hetween the frame and coil being filled with cinders and ashes By this means the fire-chamber is reduced by in. in depth, aneu then the combnstion chiefly in the centre, so that only about one-hal the fire-coils are exposed to the fire. This false grate is put in about the middle of March, and eft till near Cbristmas, after which time the full force is required, and the fire docs not go at all winter.
I harn about ten tons of Welsh anthracite coal, during, say sia months and a half to seven monthe.
I have extra ventilators near the ceilings in my living-rooms, which are only used when the rooms are filled, and more gas than usual is burning. I may mention that I have openings for bot air at the ceilinge, but havo long since given up using them, being satisfied that the ther plan is best.
In addition to this, I bave a stnall oonserva. tory, 10 ft . by 20 ft ., wbich I warm from an open fire in the dining.room, which I always keep going for its cheerfulness, and also for ventila. tion. This conservatory is beated by hot.water pipes, the boiler having twenty.four tubes, 2 ft . ong, and 1 in . diameter, placed four deep and six bigh, in the cbimney immediately above and behind the fire in an ordinary low English grate, and during fonr years' use I have never lost a plant from frost,
From my experience, I am certain that there enough coal hurnt in the kitchen of English houses to thoroughly warm and ventilate the whole bouse, and that witbout the slightest ext trouble, when once the apparatus is put in.
Being only an annteur, I subscribe a nom de (he local press, but I enclose my card
Ifontreal.

acob Kallepfr.

## TMPROVEMENTS IN OXFORD.

 Nuyerous alterations and improvements have been going on in Oxford during the last twelve months, and the local Journal and Howald give their usual lengthened reports on the various works in the city and the university. The Journal states, however, tbat the only important works which have been commencod this year are the Cowley St. John National of which was laid by Prince Leopold in May last), the new chapel at Keble Collere, a new Roman Catholic Church in St. Gilcs's, and an observatory for Profesior Pritcbard in the Parks. The city improvements, according to the Herald, have been more than nsually street leading out of High-street and the widen ing of the approach from Queen-street to New. road, and the aumerous schools which have been roak, in several parts of the city Meny the colleges baving had improvements carriedout very recently, nothing hes been reqnired he done.
The work of alteration and restoration in the cathedral is still proceeding. Since our last report, says the Journat,
"A new entrance to the cathedral has been effected by cutting through the residence formerly occupied hy the

St. Edward's School is now completed, and will be shortly formally opened by the lord bisbop of the diocese. Mr. Wilkinson, of Oxford, has the architect, and Messrs. Orchard, of Banis of brick and stone, and covered with Broseley tiles, consiste, on the ground.floor, of a master's residence, forming the soutb-west wing of the building, containing vestibule entrance, hall and staircase, drawing-room, study, and hreakfast. room, with private cellars beneath the hall The main portion of the building, being the ball proper, is approached hy a boys entrance conidor oxe west aide, openiag into a long corridor extending tbe eatire length, from which are approached a refectory 60 ft . by 24 ft . library, 17 ft . hy 24 ft ; two master's sitting-
rooms, 10 ft . hy 13 ft .6 in. ; school. room, 60 ft by 24 ft . ; two class-rooms, about $\mathbf{1 7} 7 \mathrm{ft}$. by 15 ft .; lavatory, 17 ft . by $15 \mathrm{ft}$. ; cont and boot room, 16 ft . by 17 ft .6 in . ; a boot-cleaning room, 13 ft . by 17 ft .6 in., in which also is the heating vanit. Access to tbis portion of the building is also obtained by a master's entrance under an arcade apon the south side, and by a boys entrance, also under an arcade, upon the east side. separate studies for six prefects are also provided in a semi-circular annexe adjoining the master's entrance. A spacious lobhy, 24 ft . by 12 ft . adjoins the schoolroom, and the upper stories are approached by a stone staircase, 5 ft . wide, In the western wing, which is devoted to the culinary and service department, is a butler's room, 13 ft . by 14 ft . ; a servants' hall of similar dimensions; kitchen, 25 ft .6 in , by 20 ft . scullery, 16 ft . hy 20 ft ; larder, 14 ft . by 14 ft . c cellar, 20 ft . by 9 ft ., with coal store servants' closet, de., upon the north side of the courtyard. The playground, ahout 112 ft . hy 90 ft ., is enclosed with brick and stone walls, and a range of earth closets and nrinals is situated on the east side. Gas bas been laid to on the ground.floor will be beated by coils of hot-water pipes, and a hot and cold water ser. area is propided to baths, lavatories, \&c. The enclosed with post and rail fence upon the east south, and west sides, and by stone wall the north. The ground has been levelled, and a margin of yourg trees planted on the east south, and west sides of a gravel patb, which forms the boundary of the intended cricket forms
fiela.

THE CONSTANT WATER SUPPLY.
Tne Water Examiner, in his latest remarks The rancen Company have completed the supply to abnut 1 , 500 honses in thir district The New River Company have now the powe affording effective constant service in thei district. They have also commencel a new bist service covered reservair to contain $1,000,000$ gallons at Southgate, in anticipation of the requirements of the water sapply to Edmontor parish
Tlie East London Company are extending tb constant system of supply in their district.
The Southwark and Tauxhall Company arc constructing covered service reser
head, to contain $18,000,000$ gallons.
The West Middlesex Company are giving con stant supply to a number of houses on the application of the owners, who hare provided fittings according to the Board of Trade regula. tions of the 10th of $\Lambda$ agust, 1872 , and are fully prepared to extend the constant supply wher called upon. This company is also constructing extensive works and additional entine powe
at Hammersmith and at Hampton to insurt effective constant supply
Tbe Grand Junction Company lave com pleted a high service reservoir near Kilhum contain 6,000,000 gallons for constant sapply Ibe Lambetb Company are chrrying ou At exions abd improveme being proceeded with to contain $110,000,000$ t $120,00 \mathrm{v}, 000$ gallons of water, with pumpins engines to fill them to a level of 12 ft . ahow the river. Tbe company are also piping con stant snpply by means of stand-pipes in number of courts and alleys, and arrangements bave heen mode to supply upwards of 5000 honses of this close The oltemtions in fiting under the new Board of Trade rules and regula ander the board of Trade rales and regula offers, and are carried out in all new buildings.

## MORETON HALL:

Sir,-I have visited recently this interestin old edifice, four miles soath of Congleton, i Chesbire. The house is now used as a farm house, and accessible. There aretwo evgraving
of it in Lysons's "Magna Britannia,"一A.D 1810,-vol. ii., pt. 2, p. 457, namely, a south.eas view, which includes the bridge over the moat with the gateway,-and a view of the sonth sidi uf the court as seen from the south. The eas side also is seen partially in this latter view with the entrance to the hall and the window of the hall, - $\Omega$ very fine view, altogether. Ove the bow window of the hall are these inscrip tions, carved in woodwork, together with th arms and crest of Moreton,-" God is al in a thing." "This windows wbire, made hy Williar Moreton in the year of our Lord, M.DLIX Rychard Dale, Carpeder, made this window h the grace of Cod." The timber work of th honse, painted in black and white colonre alternatoly, and the glazing of the window merit special notice. The honee is surrounde Oy a moat, and occupies three sides of a conr winde north side is the hall, with its large bow window; on the east side was the old chapel, of text-hand, and orbaments. The west side i open. The entrance is on the south side, over । scone bridge across the moat. The npper of this side of the building, 68 ft . lono par occunied by a collery witb a continul ou windows on each side of it, seen in the engraving Windows on each side of it, seen in the engrasing
No. 1. On the road to this house from Congle ton, Asthury Church is seen, on the left, and it should be inspected. In the churchyard are several ancient tombs, with figures recumbent. CHis. Coose.

Roofing.-Mr. J. L. Nancarrow, of Grampound, Cornwall, has patented some improvements in roofing, and in tiles for the same. The empentoy consists in the construction and and groores in combination with locling pieces a tiles made to fit over the parts were two tile meet, made to fit over the para where two tile tiles and locing lurable and perfectly waterproof while at thi arable and perect whe whe whe the lispensed with a hil with cupshand heal and leather-washer, is described.

## SCITOOL BOARDS.

London.-The tender of Mr. R. Mann (5,943l.) hoing the lowest on the list already given hy us for the erection of a school for 807 ohildren Monte Video.plice, Marylohone, has been ac. of 614 l .9 s . 1 d . has been sanctioned for extre foundat wark

Cioydon. - The finance committeo's report recommended a list of instructions to be given to the architects who were invited to send in their plans for a group of schools to be erecte children. The report having been read, Dr childron. The report having been read, Dr Lanohester expressed his opinion on the esti were about to provide for; by saying that ho thought the Board were providing for a con siderable number more tban was really required had grone carefully iuto the matter, and had come to the conolusion that that would be about the ninmher that would require accommodation. It also recommended that the Board should erect a residence for the hend teacher, at a coat not
exceeding 400 . The report was ultimately adopted.

THE OPEN SPAOES IN HAOKNEY.
There is a possibility of the scveral open spaces in Hackney being shortly laid out for recreation purposes. Mr. Rontz stated at the meeting of the Hackney Board of Works last week, that there were still considerable difficulties to contend with in the matter, as the lord of the manor claimed 40,000 l. in consideration of his rights over Iackney Downs. He then added that it was provided by a clanse in the East London Railway Bill that the Company should give up a foot of ground contiguous to the common for in constructing their liue, and the conveyances for tho carrying out of this arrangement were all expected that something would shortly be done for the improvement of the several open apaces in the distriet, dealt with in the Act of last session, although it was prohable that before proceeding to tho pullic it might bo deemed neoessary to apply to Parliament for greater powers than the Board at present posscssed.

## SHAMS.

SIR,- Will you kindly allow me space to make a few observations on the "Defonce of Shams" in your isaue of the 27 th ult. I fail to see the application of the paragmph about the Fienne awards, and the inferiority of our art mannfac. tures to those of the Continent (excent wo ar meant to infer that theirs are all shams), and with the vague statement ahout "Jears ago," I loave
selves.
Your correspondent then states a truiam, on proceeda to try and pervert it hy hy-play about Ailam and Eve and chignons. "Art," he says, "is natures handmaid, and her mission is to deantify, which 1 thank fow would caro to
dispute; but heautify what? suroly not Nature, paint the ruee or the lity!
No, the mission of art is to beartify those things Which man bas found necessary to his altere wants siuce the time when
adorned," and which are not provided by nature viz., houses, clothing, de
To do this with any degreo of sucoess, ar mosi sit humbly at tho feet of her great mistress and study her landiworks.

Bat I should inflict a long letter upon you if extenso (especially those ahout arguments in of the fair sex) : and ns in my opinitornments not worthy of it,-I do not mear the they are bat tho arguments, - I will oonfine myself to general remarks. He speaks in tho course of his letter ahout ligh art; but I venture to opine that under the system he proposes there would he hut little left. High art is worthy to he, though it is not necessarily, executed in the noblest and most permauent materials; its glory is to be not for a day, hut for all time; it can never become popular.
Cheap jewelry, stamped all from one die, may be very pretty, hat is not to be named in the same
day as the works at which the old masters so lovingly and patiently wrought. No; let your
correspondent cover himself and all his belong. ings, if ho chooses, with cheap jewory, paint Dutch metal, and shams, as he calls them, gene ally, but let him not take credit to bimsolf that by so doing ho is forwarding the best interests of art.
In conclusion, let ns, by all means, as your correspondent desires, have "it more general distribution of God's gifts," and develop the social and domestic arts to the uttermost.
God intended Mis gifta for all; we shall be doing His will hy placing them, or in default the host representations of them that we can produce, within the reach of all, that all may praise Him, and glory in His works.
But let zs in so doing provido things honest in the sight of all men, and avoid shams, nor call was a fiar from for all lies-no "bumanizing induence" can come frow him.
T. Fred. Phoud.

AROTITECTURAL STUDENTSTIPS AT
L'EOOLE DES BEAUX ARTS, PARIS.
Puprus who have worked through a prepara. tory course under professors in the ateliers of recognised architects are, after a stringent competitive examination, in which drawing and design, mathematics, and listory are the chief subjects, admitted to a further two years' cowrse of instruction oarried on at L'Ecole hy a staff of professors under the direction of the Minister of
Fine Arta. Last autumn, the number of pupils who presented themselves for the proliminary examination was 106 . Of theso, thirty-three were declared admissible for the further exami. nation, and ultimately twenty-two were received This autumn, ninety.five presented themselves, forty-nine wero declared admissible, and thirty. five passed the final ordeals, the eleventh in Order of merit boing Mr. Alfred Frampton, of Winchester, a pupil of M. Laisné.

## ST. GEORGE'S BURIAL GROUND.

In the most valuahle position of the West End his shut.up cemetery covers over five actes of ground, bounded by St. Gcorge's.terrace on the sonth, Upper Berkeley-street on the north, Connanght-square on the east, and Albion.atreet on the west.
An old brick mortnary.house, with sepulchral vanlts beneath, and two or three living-chombers for the custodion on the ground.floor, covers a width of over 100 ft ., with frontage to Hyde defunct; and eave that there are a few trees regetating at intervals, nothing can be more luguhrious than the aspect of this large space, which is thickly planted with tomhstones, bristling in varied forms and slantendiculars throughout the whole enceinte.
A double range of wall, with a footway interpal of 4 ft ., surrounds the whole, in the form of a parallelogram. The path is reserved as a policeman's beat, giving omployment to two of the forcen, as a dead march, for the pro tection of this Campo Santo.
Nothiug can ho more rovolting to good residential houses than the somhre viep of a shut. ip cemetery; and there are hetwoen eighty and ninety valuable residences built close to and overlooking this otherwise concealed acoldama.

- there any reason wherefore this valuah pace should not he utilised, the tombs laid flat the grounds heantified (sny after the fashion of four large houses, facing Hydo Park, turned to proftablo account? The old mortuary.honse, too, should he cleared away, and the coffins in its vaults transferred to a simple mansoleum in
the centre of the grounds. the centre of the grounds.
A front entranco should be reserved on the Hs de Park side, there being already an opening next Albion-street, on the west; and there might ho one for traverse.way, out of Lower Berkeley. streot. This would conduce much to puhlic
conveuienco, and reanimate the prosent slum. conveuienco, and reanimate the prosent slum. bering waste.
Macy ancient churches in tho City have lately heen secularised, and hurial-grounds thrown open, giving spaco for the erection of utilitarian structures. In fact, as the civic population only occupy houses as offices, residing without the walls, congregations hecame so soant on the Sabbath, that the vioars might have commenced ervice after Swift's fashion, addressing "Dearly beloved Roger."

The disposal or adoption of this "terra clausa" is altogether at the discretion of the Vestry Board of St. George's, Hanover.square; and if they see that a profit can be made, more than adequate to repay outlay and managemont, whilat it would confer upon vicinal property and the public of that locality an inestimahle hoon, surely they will not hesitate to carry ont so palpahle an improvement.
It is right to observe that, so far as relates to the condition of the gronnd, under the manage. ment of one sole custodian, as mnch has heen done as one individual could effect nnaided: he has planted sevoral trees, and formed some small Hower-heds near his desolate abode.

## Qtondam.

## GAS $\triangle S$ FUEL.

TWENTY years since, when a cheaper foel than coal was really not much needed, attempts were nevertheless made to obtain something more cleanly, if not more economical, than the old and wasteful domestic arrangements; and we remem. going to see an ingenions gas-fire (described in the Builder), and invented by Mr. Bachbotfner, then of the Polytechnic, if we rightly recollect, or of the Coliseum in the Regent's Park, after be left tho Polytechnic. This fire was exhibited hy Mr. Defries, in Regent.street. It was a hrilliant Mr. Defries, in Regent. street. It was a hrilliant
imitation of a lighted domostic fire, made with gas, and studded with some incombustihle mineral gas, and studded with some incombustihle mineral Fothine, Surely surely come home such experiments, and of really ohtaining, in one way or another, an economical application of gas, on an extensive scale, to domestic uses. The sucb improvements in house firing than hereto sucb improvements in house firing than hereto. fore; and if such fires can now he used with more economy than coal, there will he tho additional advantages of cleanliuess and readiness in theiruse. Indeed, the readiness and convenicnce of lighting up, raising, lowering, and extinguishing such fres, must be taken into oonsideration in an economical view no less than as a con. may remind inventors that clay lumps acted on by gas may store the heat and give a aseful glow, and that some use night be made of lime in this way for heat as it has heen for light.

FAYLURE IN PORTLAND CEMENT
su,-In answer to your correspondent of laste week, "W. P.," I beg to differ in many points. His theory is right, but the practice is not, for the want of time being allowed, as we sometimes receive an order one day, and have to execute ib tho next. How is it possible to have cement three weeks in a bin nuder those circumstances ? quite agree with " IW. P." respecting finishing in one coat; also tho siftiug of the cement, which ought to bo dose by the manufacturer; ditto the sand; and as regards the hest cement only heing used, no had should he made.
This is my remedy,-That the manufacturer should provide places large ebough to expose the cement for a fortnight before heing sent out, similar to brewers keeping their heer a certain similar to orewers kecping their heer a certain manufacturer is reponsible to merchant and manducturer and failure. A Previous Surferer.

## ACCIDENTS.

Destruction of Ardvererikis Castle by Fire.News from Fort William states that the Castle of Ardvererikie, formerly the residence of the Marquis of Ahercorn, and in which the Queen and the Prince Consort passed the autumn of 1817, has beon almost wholly destroyed by fire. The castle is now tho property of Sir John Ramsden, M.P. Siz John and Lady Ramsden Mr. Fraser M'Tntosh, and Mr. Rhiad, architeot Edinburgh, were staying at the castle. The only portion saved is that part containing the rooms which were occupied hy her Majesty, hut all the furniture and valuable paintings, includ ing some of Landseer's, were totally destroyed, For three years past extensive additions have heen made to the huilding, and those have heen hat recently finished. The paintings hy Laud. seer which are destroyed included a number of life-size wall etchinga which were painted by the deceased artist when a guest at the castle.

They were all subjects connected witb the chase and were regrarded as of inestimable value Serious Scaffold Accident in Glasgow. - For the parpose of repairing the roof of a honse in West George.street, Glasgow, a large wooder acaffold was erected, supported by beams projocting from the roof, and five masons were working on it when the supports at one of the ends gave way, precipitating the men to the ground, 20 ft . below. Two of them were severely injured, but it is not expected any of the cases will prove fatal,
Two Men Buried Alive near West Hartlepoot. At Mr. J. Lisle's hrickyard, Cowpen Bewley near West Hartlepool, two young men were engaged in digging out clay for the manufacture of hricks, when, after they had attained a dopth of more than 12 ft ., the earth above them sud. denly gave way, and before any effectual warn. ing could be conveyed to them the two poor fellows were completely huried beneath the falling mass, which weighed some tons. An alarm was raised, and a numher of tbeir fellow. workmen set to work vigorously to dig them out, but before they were extricated lifo was extinct

THE NEW PATENT AUTOMATIC TILE MAKER
Massrs. Maw, of Broseley, bave just perfected and patented an automatic apparatus for work. ing screw-presses by steam or other mechanical power. The invention is for the purpose of making tiles from powdered clay, hy the metbod enown as the dry proces, and the cou rivance seems to combine the force, elasticity, and other advantages which manual habour alone bas bitherto heen supposed to give. The peculiar natnre of the process for whicb the machine bas been invented requires the delivery of hlows of unequal length; and for striking the hardest blow the press runs down from its bighest eleva. tion, rebounds a short distance, as though to sarvey the effect, and then, as if finding that a more gentle hlow is required to complete the work, it again descends and gives the final pres. sure to the clay. It is stated by practical authorities that the machine is appicahle to other purposes in whioh screw-prosses are employed.

THE IMPROVEMENTS AT THE LAMBETH VESTRY.HALL
The alterations and improvements at the Lamheth Vestry-hall, which have been for some montbs in progress, are now completed. They comprise the re-arrangement of several of the straction of rooms for the keoper. The Board room has also been ventilated on a new principle room has also been ventifated on a new principle, ment It is howerer, confidently believed that ment. It in, hower, conily. inereosing popu in consequence of the rapidy-increasing popu lation of the parish, which covers an unusually

THE FALL OF CHIMNEX.SIIAFT NEAR GRAVESEND.
On Monday last the coroner for the district resumed the inquiry relative to the death of the men who died from injuries received by the partial fall of a sbaft at the unfinished cement works of Messrs. J.
Mr . John Cubitt Gostling, one of the firm, said, Mr,
Blagburn, the contractor, wes s professed shafthnilder
snd was recommended to them by a irm in London, for and was recommended to them lyy a lirm in London, fo
whom he had huilt shafs. Their first zotion was build a shaft of ahont 120 ft, , but in consequence of opposition hy persons in the neighbonrbood, they were
compelled either to build the ehaft much bigher, or to ubmit to claims for compengation. They then entere at 5 fot, they inding the marerials. The shaft was to he 30 ft . square; the outside meessurement at the a top bein 11 ft . The thickness of wall st the base was 3 ft .9 in . at 28 f .3 in. the thickness tres 3 ft 4 h in. int $52 \mathrm{ft}$.6 in
 Mr. Gostling gaze statistics of several high chimneys, upon an average thot less of the one-third greater than the upon an arerage not less than one-third greater than the
chimeys named. The priucipal part of the bricks con-
sisted of Rutter's paviors, or the best pieked stocks. The best Dorking greystone lime was used Fith the best
Xhames sand; every fer courses being grouted in with
new Portinud cemeut. Mr. Blagburn exercised his dis
cretion as to the rate cretion as to the rate at which the work should proceed.
It was commenced in the early part of Jupe, aud fluished in fair wes ther in ahout sixteen weeks. Witness examined the work daily, and never discovered
contract was not put up to competition.

## Mr. Jamen Cuhitt, architect, said be made the drawing

 and superintended the building. He did not think the rate of progrcss excessive considering the fine wrather. He saw it plumhed the night before the accident, but dis-covered no defect. The materials employed were excellent. He could give no opinion as to the cause of the
laccident. He had formed a slight eonjecture, which wes that the working of the derrick at the top might have interfered with the setting of the cement in the cap. The 19 tons 3 cwt .
Weits on the
Mr. William F. Meakin, architect, said he had ex. mined the remains of the shaft. The proportions of the in the walls, and consequent strength over other shafte of the same nature. The materials were perfect, and the
workmanship of the vary best. There had been no filling orkmansip of the
Jonathan Ward, foreman to Messrs. Goatling, gave eriance as to the ercellence of the material and the work.
Mr. Blagburn, the contractor, wna present still weak, and suffering from the injories he received, he was not formally examined. He, however, answered a London. He could not account for the accident.
His son was next culled, and said he had rort shaft from its commencement, and ylumhed it abont hal an hour before the accident. He was ahout to ascend Whensible. They had Arst.rate materials to work with. Two brieklayers, brothers of the deceased man Broce
were examined at their own reqnest, and stated that the considered the hesa or cap was too heary, and th this "awagred " the shaft over.
Mr. Meakin, recalled, said Mr. Meakin, recalled, said he considered this quite of the cap beipg too heavy would be, if possible, to crush
the hrickwork beneath. the hrickwork beneath.
Mr. Cubitt aid the cap having remained all the pre
vious night, ite weakesc time, would not be likely to nious night, ite weakesc time, would not be likel $t$
collapse when the prapet was put on, for this would har the effect of atrengtheuing it.
The Coroner having summed up, the jnry ratired to con-
sider their verdict, and aiter consulting for about twenty minutea, they found that the men were accidentally
killed, the Coroner remarking that be egreed with the Ferdict, The jncy also expressed their sympathy wit A correspondent inquires if the cement used bad anything to do with the failure.

## PLUMBERS' JOINTS.

In view of the damage done by plumbers and beir fires, Messrs. Merryweather \& Sons have perfected a lead.burning machine, an apparatu that joins lead edge to edge by means of a gas jet, produced from sulphuric acid and zinc There is no fire-pot used, neither is there an solder. In addition to the security against fire they claim that a grac saving is effected, for while solder is at least Il2s. per cwt., lead is only 25s. per cwt.; and of the lattor there ot one-third used to make a joint as of solder The comparative cost, according to Messrs Merryweather, stands tbus:-

## By lead-burning procesn.

One man and one hoy will joint 90 ft . of
 $\begin{array}{ll}9 & 0 \\ 7 & 0 \\ 1 & 0\end{array}$

## By zoldering process.

Two men will joint 90 ft . of lead
roof in three day, say wages
roof in three days, say wages 13180

## Tbe cost of the machine is 362 .

LIGHTNING AND LIGHTNING.RODS.
Tee report of the paper by Mr. John M. Mott n this subject, read before the Meteorological Section of the Franklin Iustitute, bas been cou. cluded in the Journal of

## "1st. Lightning.rods, as nsunlly erected, do not affor

 nuch protection.2nd. Insulators, no use in any case; they deetroy the most valuable influ. nee of the rod, and may, under certain circumatances $3 \mathrm{rd}$. The conducting power of lightning-rods is propor ional to their solid contents, or sectional area, with oimilar metala of eqnal lengtha, and not to their sur aces. of a copper rod, ore.balf ineb square, and perfect metallic union of all its parts. A rod made exclusively from cop-
per wires, if of sumpient size, constitutes one which is per kires, if of
5th. Sharp pointa for the upper termination of rods are
neceasary. Hods are of but little value without them Pointa should be plated to prevent oxidation. They are rod.
6th. It is necessary to plsee a point at each gable,
chimney and ventilator; to connect all together; to con-
geet the rod with metallic roofs, gutters, valleys, sterm pipos, gas-pipes, Woter-pipes, speaking-tubes, nad other
permaneut metallio bodies about buildng3, mad the more numerons the connexions yith the earth the hettor mox 7th. The rod must he attnched directly to the huilding, pased through or over rings of glass, born, or other nonconducting subsasnece, nor ho placed at a distance from the bjeot to be protected.
penetrating the earth to perme two or more branches tend helow the faundation walls, or the hottom of the cellar. In some inatavees, wher' it is digicult to reach noist earth, they minat bo imbedded in chareoal. ance with the foregoing principles, will afford full prote tion in the hour of dang prinand their use is strongly urged
as a necessary means of safety.

THE BEFAVIOUR OF CONCRETE IN WALLS.
S12,- Your issae of December 2sth, 1872, oontained an advertiseraent of "information wated of concrets would furnieh information as to how such houses hare stood the test of eight or ten years, it would be well. I ma heliever iu concrote, but so much carelessaess is at some experiences in the matter.

## TERRA COTTA.

Sia, - We Were glad to see the letter of your corre-
spondent, "Alpha, on this zubject, in your last wsek's
ssue. The prsise that he accord Bssue, The prsise that he accords is well morited, and, as satements are perfectly correct as to tha varied forms and comhinations into which this material may he worked: the limits to its use are, in fisct, boundless, a ad its kmali difficultien that arige where stone is to he employed. We hope that "Alpas's" letier will enll forth other expreasions of opinion on the suhject. It is for architects, hy new designs, to assist in introducing so valuahle,
hecause economical, a material, " hoth for internal and ecause economical, a material, "othoth

Hexby Shave \& Joneb.

## BUILDER'S DISPUTE

Ix the Wavasworth County Court, an action, Hall Effer, fought The Judge ruled that in this case the set-off could not be heard, and anggested tat it should be withdrawn. Mr. Jones, for delendant, said the settle ment betweon agreed apon.
Faratal would not agree to the adoption of snch a that he was engaged by defendant to conetruct certain hrickwork at St. Joseph'e College, Clapham. He received had a verhal contract with defendant to do ccrtain work in Southcott-road, Clepham, for $3 \dot{l}$. ; there whe a balance
of $3 l$. 10 s , unpaid upoon that. Ife left some scafluding upon the worls, y bich the defendant refused to give up; he had taken proceedinga in the police-court to recover
it, but was not tuecessful; he now charged $2 t$. 103. Td. for the use of it, making the whole of the amount claimed. order to arrive at the conclusions he bad cone to ; he
admitted that his part of the worls ought to have been completed at the expiration of six or seven weeks' time. the work was delayed, but the defendant s, who had not got the ground out for him. Gall to do eertein brickwork for him; the time ellowed Wras sir or sever weeks, but it was not done in nine weeks.
It was decessary that it ahould her as ho wese allowed oolly thirtoen weeke to do the whole of
the work in: Hle complained to the plaintiff of the delay the worli in. He complained to the pleintiff of the delay
be was causing sereral times; each time he promised to put on more men, hnt be did not do so; there were only plaintiff and another at the joh. At last he bad to employ men to do the pointing. Plinintiff sent some men to take the scaffolding dowu; they did it in such a clumsy way as
to do injury to the pork, and threatened if he interfered toth johs would he left unfuished.
Mr. Hansom, the arehitect of the bailding, was called, and stated that be hed repeatedly to conplain of the manner and the dofendant ; at last be threatened to have it done hiraself. There was nlpaya a want of suflicient men to do it qnickly
After hearing erid
work done, e verdict mene mpon the measurement of the Wors done, \& verdict was given for the plaindif to.

## ANCIENT CITIES IN INDIA

Conss and other antiquities havo been fond in the ruins of Vinjrote. Goverament has ordered that tbey bo sabmitted for examination to the Royal Asiatio Society, 一the Bombay branch it is presumed. A note on the ruins at Finjrote has been made by Mr. F. Robertson, officiating executive engineer, Rehi division, Indns Valley State Railway, in which he says:

Survey Map of Scinde. They are ahout half a mile from the Reni Nallah, and two from the boundary of Baswal. poor ; the sand hils commence immediately beyond tham, hut the soil reeks with saltpetre in most places, parti-
cularly among the raizs. The general aspect of the placs cularly among the rains. The generai aspect of the placs
is a number of hillocks of various sizes strewn over kith pleces of brick, for the most purt ritriked. The boun-
daries are not Well enough defined to give any particular
size, but mounds containing
of quite oue mile sud a half:
Up to the present time the excavations have been of a
desultury character, the work being psid for ty the quantity of bricks collected. The men condined themselves to oollecting the bricks from the surface of the ground, nad
digging up oulying walls, so tbat the real itteriors of the mounds remain to be explored. It in to be hoped that has alresdy turned up is accidental, There are only tho mounds in which any siens of a building of importance
have been laxd bare. One is the largest mound in the
place. Ihe other 1s of much greater interest, and I think place. 1'he other 18 of mucb grest
was a temple of some importance,

Among the objects of interest found at Vinjrote is " a brick on which the following inscription was scratched radely
[Omitted.] The purport of which appears to be that 'Sultan Alexander and Shah Alum were great men, and that Senesi was also. Kaligur Abonra Mistry made this.' Date unintelligihle. Valley line.

VALUE OF LAND IN MANCHESTER.
An inquiry has taken place before the sheriff's assessor (Mr. J. J. Aston) and a special jury, at the Sherifl's Conrt, in tbe Assizo Conrta, Strangeways, as to tho valize of a plot of land in Great Mount-street, required for the purposes of the new railway station fronting to Windmill-street, being constructed by the Cheshire Lines Committee. Mr. John Edwards (instructed by Messrs. Lingards \& Newby) appleared on behalf of the committee, and Mr. Higgin, Q.C., instructed by Mcssrs. Makinson \& Son, on behalf of the owners Tho property in question is situated between Great Mount-strcet and Reinforth.strect, and contains ahont 320 yards of net land. Four witnesses, incluaing Jr. Thomas Acton, tbe and stated that in their opinion the property, was worth over $5,000 \mathrm{l}$, Mr. Acton putting down its valne at 5,6147 , and expressing an opinion that land in the neighbourhood of Great Minnatthat land in the neighbourhood of Great Monnt-
street was worth, for warehouse sites, $12 l$, a yard to day. On behalf of the committee three witnesses wore called, wbo stated tbat in their opinion that part of tho land fronting to Rain. forth-street was worth 6l, a yard, while that fronting to Creat Mount-street was worth 87 . a yard. The valuations of these three geutle-
men averaged 2,750 . After the connsel on men averaged 2,750 , After the consel on gentleman had summed up the case to the jury, they, after some little consideration, returbed verdict for $2,857 l$., which, after deducting 20 per cent. on account of the property being taken compulsorily, shows that, in the opision of tho
jury, the laud was worth rather more than $7 l$, a jury, the land was worth rather more thay $\uparrow l$, a square yard throughout.

THE SEAFTESBURY PARK ESTATE.
THis estate, which is the property of the Artizans', Lahonvers', and General Dwellings Company, comprises about 40 acres, and is now laid out in a sories of oblong blocks or terraces, for the erection of 1,200 houses, of which about 350 lave been built sinco the first stone was laid, last year. Tho roads or strects diverge at right
angles, and are 40 ft . wide, with pavemonts of angles, and are 40 ft . wide, with paremonts of asphalte, both roads and parements being
finished as the binilding goes on. The design of finished as the binilding goes on. The design of the houses partakes somewhat of the domestio Gothio or Tudor, thongh no particular style has been strictly followed by the architect. The houses are built in four grades, oontaining five, six, seven, and eight rooms respectivcly. The rents range from 53.6 d . to 9s. $6 d$. per wheek,
including rates and taxes; or, if the bouses are purchased by the occupiers, the prices are from 150l. to 300 l . each house. When the houses are purcbased, the purchasers usually pay down money being paid weekly or quarterly in advance. The streets tbroughont tbe estate are to be planted with trees (one street is already so planted), forming miniatnre boulevards. About three acres have been reserved in the centre of the estato for recreative parposes, and a gymnasium. Tho estate will have its own schools, lihrary, and batbs. A site bas also
been reserved for a co-operative store. When completed there will be entrance gates at the approaches from Battorsea Bridge-road at one end, and Elchoroad at the other, and also at the centre of the estate, Greyshall-road. $A$ dis.
tinctive feature is that there are to be no public
bonses on the estate, and this feature, it is said, is bigbly approved by the working men themselvcs.

## CHURCH-BUILDING NEWS

Eye-Tbe re-opening of Eye Church, after Chickete restoration, has taken place. Mir stated the Hereford, sarveyed dingerons con dition, and adrised that immediabe steps should be taken witb a view to rebuilding it. Mr. Rodney then instructed Mr. Chick to make plans restoring the church. When operations were oommenced the church was in a wretched condition. The walls and foundations were in a literally crumbling atate, cracked in all direc tions. The floor had been raised 2 ft .6 in . abore the original level to hide tho defective fond a tions. The tie beams of the roofs bud been cut apay and the lateral thrnst was pusbing the arcades and walls apart, The clearstory tin dorse he building win a sad sight. All this dilapidation has been amended. Tho execntion of the work was carried out by Mr. John" Thompson, contractor Pcterborough. The large box-pews witb which the church was filled wer floors reduced to their original levels. The bases great weigbt placed upon them. These have al been underpinncd, renewed, or repaired. The south arcade bas been rebuitt, and the old oak roofs restored. A new tower has been built, a.s nearly as possible after the original design. This made necessary the removal of the temporary western end of the churcb and gallery, and tbas the area of the tower is added to tho nave giving much extra room for seats. A new arcado has been erected between tbe chancel and mortuary ohapel, and oak parclose screens fixed thercin. The charch has heen re-seated with oak seats. The old altar-tombs in the mortaary chapel are being restored at the sole exponse of Sir George Cornewall, bart., of Moccas. The total cost of the work,
of a new east window, is about $2,750 l$
Kirkby Wiske,-The paribh cburcb has been reopencd, after a restoration under tbe super intendence of Mr. G. E. Street, R.A. Beforc drawn; the east window had been despoiled its tracery; the arch of the tower was filled with a lath.and-plaster screen and the floor corered with high pews of various shapes. Fortunately one of the seat.ends of former days was discovered smongst the framework of the pews and this has been reproduced in the mew sents The work of restoration bas lasted for sisteen Tonths The north ond south aisle walls end te north erst butresses of the chanol havo been rebuilt, the pillars of the nave underpinned, aud tbe roof raiscd to its original pitch. The chancel-arch has been raised some 6 ft . The seats of the chancel, the commnnion-table, pulpit, and side screen are of oak, the nave-seats heing of pitch pine, and the roof of red dcal. has becn done by Messrs. J. \& H. Tborp \& Sons, of Lccds. Besides tho general subscriptions, wbicb amount to npwards of $2,500 \mathrm{l}$., there have beent nany special gifts.
Bingham. - The clinreb of St. Mary and All Saints has been reopened after restoration. The present restoration follows one that took place of Sir Cive years ago under the superintendence roof, to pcarance to the extcrior, bas been the chief feature of the present restoration. Several of the windows bave been painted by Mrs. Miles, whilst the carriag of the stone corbels lining the nave and transepts is the work of Mias Miles. The architect of the present restoration is Mr. F. Miles, son of the rector. Tho roof of the nave and transepts has been raised 15 ft ., making the present height 40 ft .
Weymouth.-Tbe chief stone of Christ Cburch has becn laid. Nearly 5,000l. bavo been col. lected, brit there are still 1,800l. required. The purcbase of frecbold, and the expense of laying for the construction of the building was for 4, 100l. At present it is proposed only to erect section of the church, prophout two-thinds, carrsing ont the remainder at somo fotnre time The structure will, bowerer look complete, for The str addition is mow have to be pulled down. The new churoh faces the railway station, and abnts on two streets,

King-street and Park-street, the centre of a large and industrial class of the population. It will Christian of Christian, of London ; Mr. Thomas Dodson, of Weymouth, being the bailder. The cbarch will be built of Portland stone in random courses, with dressings of Doulting stong from the quarries of Mr. C. Trask. The interior will be lined with red bricks, baving courses of grey bands ranning round tbe walls and arobes, which will be further relieved by projecting bands of grey bricks, the wbole of which wero made in the contractor's own yards. This churcb will be materially different in one respect from the others in the town; for it is intonded to bave a tower, which will be prepared for a peal of bells,-an adornment in wbich the existing churches of Weymouth are deficient,-each possessing bnt a solitary bell. It bas been alleged as the reason for this that thesanitary nature of the soil would not allow of a peal being hung in a tower; but in the new cburch this has been provided for, as a foundation of concrete over the wholo area tbe church bas been laid 6 ft . doop, and the in length be strengthened by 3,600 poles, 8 ff . arohes will be sppported by Portland ano pillars, the sbafts being of Pernat ins in piece 7 ft in len th 2 ft in diameter, in one piece, 7 ft . in length a 2 ft . in diameter, from Bristol. Thes rincel for the Goad arch are from the quarrics of Messrs the chtonehouse, Plyraoutb. Tbe erection of now a great portion of the walls is nearly now a gre
Harleston.-Pulham Cburch is undergoing restoration. It was commenced last A pril, and, is expected, will be completed, so far as it is proposed at present to go, by tho beginning of November. At the oost of 370. ., the rector is imself restoriag the corancel, the east window of wbicb has been promised to be supplied by one of the landoyners, Mr. Cole. The bay above the chancel is also being redecorated. Besides repainting the walls, an addition is boing made by the building of an organ-chamber and vestry with flint faoings and stone dressings. A vault honoath tbe chamber is being fitted witb a bot. air beating apparatus. Tbe roots of the nave and south aisie are nndergoing repair, and new doors and windows will be pat in. The cost of this work will be 1,260l. Of this amount the sum of 1,050 . have already been contributed. When all this work is done, there will still remain the rcseating, at a cost of about 600l. Messrs. Vine \& Grimwood bave tbe contract ; the arcbitect is Mr. M. M. Phipson.

Kirk Ireton.-Tbe church of the Holy trinits at Kirk Ireton, has, during tbe last six months, been re-opened, after uadergoing a restoration internally and externally. Tbe fabrio is sup. posed to be upwards of 700 years old, the nave The chancel is of more recent date, haring been erected not more than 300 vears, and is Gothic style. The architect cnared for the restoration was Mr. Wm. Jolley, of the firm of Evans \& Jolley, arcbitects, Derby, and the buans \& Jolley, arcbitects, Derby, and tbe in the village, Messrs.Wm, and Beujamin Doxey tho contract for the floors and sittings being let to Mr. Edwin Tbompson, of Derby.

Mr. Edwin Tbompson, of Derby. Tbo parish ohurcb of this village has been re-opened for diviue service. Amongat the most prominent of the restorations are the new roofing of the nave -tbe restoration of the rude, jet highly-inte resting niches in the wall,-the entire repewing of the church,-the new reading.desk, pulpit, and seats for the choir,-all of whicb were don nnder the dircetion of Mr. Middleton, of Chel tenbam, tbe architect. The woodwork and carving were cxecuted oy Mr. R. L. Boulton, of Cheltenham. In respeot to the niches referred to, the Rer. Canon Lysons says:-
"The most singular circnmstance connected with this discovery is the thet that the larger of the two niches-size-stands upon the orapital of an inverted Roman pillar of the Corinthina or Composite order; evidematy a por
tion of a Roman temple, and very similar to those in the tion of a Roman temple, and very similar to those in the
rumal temple of Clitumnus in. Italy. The sequestered position of Woolstone, placed just under the range of the Cotswolds, and in the immediate vicinity of tbe Camps on
Dixon-hill and Nottingham-bill, would render it quite tbe Docality for a riral temple to Pan, which may bava atood on this epot. Venerable Bede tells us that " it wha a principle with Gregory the Grast that the jadol temples were
not to he destroyed, but converted into churcbes. In bi not to he dostroyod, but converted into churches.' In bie
epietle to Melitus on his mission to Brituin he says, "Idol epistlo to $M$ elitus on his miasion to Brituin he sass, Tdol are in them. If thess edifices be well built, it is desirable
that they should be converted from the worsbip of demons
their temples are not deslroyed, will more easily orercome ineir prejudices, andacknowledge and adore the Almights, St. Psuls Cathedral, in London, enys Brishop Andrews, was built on the site of the temple of Diana, to which the British name Llan Dian (Londun) refers, Westminster
Abbey, Was built on the site of the templo of Apollo; $8 t$.
Alban's on that of Apollo and Mercury; St. Mary-at.
 Mary H temple of Miverva. Yorle and Lincoln Cathedrals were ment wa,

Nun Mfonkton (near York).-The church of Fun Monkton, after having been neglected for three centuries, bas at length been restored and re-opened. The church has been restored by Messis. Weatherley \& Rymer, masons and oulders, of York, the sole contractors, under the lirection of Hr. J. W. Walton, architect, London The old flooring was taken up, and then laid down in concrete. The passage or aisle up the central part of the nave is of colotured tiles,black, hlue, red, and buff. Tho seats on each side are oper, of oak, with squarcheaded ends,
pierced below with trcfoils within a circle. The pierced below with trcfoils within a circle. The east window is of three lancet lights, that in the centre heing mach loftier than those at they sides. They are filled in with stained glass, by Messra. Morris \& Son, of London. The snbjects reated of are illustrative of the life of the Virgin Mary. On the sonth side of the chancel is a memorial window to Captain W. Crawhall. The subject is Christ walking on the Sea, with the Scriptural passage, "It is I, he not afraid." On the north side is another window of a similar character, It illustrates the Raising of Jairus's Daughter. This window is by Wailes, of Now castle. The entire amount cxpended in connexion with the restoration has been npwards of 4,000 South Malling (Leves).-The parish church of South Malling has been restored and reopencd. The plans were furnished hy Mr. Philip Currey, and Messrs. Thorpe \& Son, huilders, carried them out. The old tall-backed pews have beon removed throughout the church, and in their stead appear open beuches of stained deal. The gallery hewwcen the nave and the tower has been abolished, loringing to light the arch, and throwing the lower part of the tower into the church. Tho ceiling hiss been repaired, and ribhed with stained timher, and the navo is lighted with nery windows, with green cathedral glass. On the nortliside of the church has heen erected a now organ-chamher and restry, and also a vault for heating apparatus.

ROMAN CATLIOLIC CHURCH BUILDING NETVS
Birkenhead, -The present church dedicated to St. Lanrence, and situated in Park-street, Bir. kenhead, is about to he devoted to tho purpose accommodation in the district, and an eftort has been made to raise funds for the erection of new church to take its place in the parish considetahle sum bas already been subscribed, the foundationstune being laid by work, O'Reilly, of Liverpool, in the prese be bishop or 6,000 apectators. The site of the new ehurch is on apectators. The site of the new church is on a piece of land purchased for the purpose some years ago, adjoining the inclosure in which in the Early English style. The building will be in the Early English style. At present only the will be 101 ft .6 in . long, by 60 ft brond will be 101 ft .6 in . long, by 60 ft . broad. The archways, to lead into tho future chancel and chapele, will be built now and filled up with is intended to be down hereafter. The chancel is intended to be 45 ft . long hy 30 ft . wide. On the Gospel side will stand a roomy orgar chamber, 30 ft . by 22 ft . Tho church is to he built of Flayhrick-litl stone, with Runcorn red sandstone quins and drescings. On each side of the nave will be windowe, each containing a triplet. the western entrance will he thrce large porches and baptistery. Over the roof of the porches, \&c., will rise nine long lancet mindows, followiug the angle of the roof, the highest one in the centre being 39 ft . long. There aro to be no arches in the interior, but the whole space will be spanned by one single roof of wood and iron. A tower will be added hereafter. The ohject in view bas been to provide as mnch space as poseible at the lowest cost. Hence there is no carved work on the plans, hut everything is de. signed for massive effect. It is expected the building will not cost more than 2,000 . The architect is Mr. James O'Bryne, of Liverpool.

Oldham.-The Cburch of Our Lady and St. Patrick, Oldham, has been re-opened for divine service by Archbishop Manaing. addition to a cleaning which it has nudergone,
there has been erected a high altar and reredos, which occupy all the fine bays of the sanctuary Which occupy all the fine bays of the sanctuary Sicilian marble, eupported by four octagona colnmns of dark Deported by four octagonal which, and standing a little backward, are thre panels, scnlptured a tion, the Coronation of the Blessed Virgin Mary and tbe Adoration of the Wise Men. Above th altar-table rises the tabernacle, with a gilded door, and surmonnted by a oanopy, having, as the terminal of the apos of its front, a carved crosa, bearing the sacred monogram. From the contre of the canopy rises a carved pinnaole to tho height of 25 ft . Eacb of the four angle between the hays of the sanctuary contains a clustered shaft with a carved capital, on which stands a life-sized statue of an evangelist. The canopies above the figures terminate in cluster of pinnacles, also 25 ft . high. The fivo bays of tracery panels, angels hearing symbols, the spandrols boing filled with carved foliage. Tbe bays are surcorated by a cornice, with carved and per placed cols sedi. 1a the two outer bays ar carving. The whole of the work has been carried out by Messrs. Evan Williarns \& Billison, sculptors, Manchester, from the designs of Messrs. Goldie \& Child, axchitects, London. Pendteton. - The foundation James's Church, Church-street, Pendleton, has been laid by Dr. Vaughan. The church will be bailt in the Early English style, and will cost from 5,000 \% to $6,000 \mathrm{l}$. It is estimated to seat about 700 people, and will he 114 ft . long by 52 ft . wide, and jts height 60 ft . from the floor to the ridge of the roof. The buildings will in cludo a residence for the clergy, sacristy, choristers' restry, \&c. The architect is Mr. H E. Tijou, of Manchester, and the church is to be finished by the 1 st of October next.

## SCHOOL.BUILOING NEWS

Millwall.-LLord Enfield, M.P., recently pre sided at the opening of new denominational schools in connexion with St. Luke's, Millwall, a spot hetter known as the Isle of Dogs. The chools are ure pare with the Board schools of London in com. upon the huildings which, up to very lately, were upon the huildings which, up to very lately, were thought sufficient for achool parposes. They
stand a littlo way from the bank of the river, and possess good separate rooms for boys, girls, and possess grod separate rooms for boys, girls,
and infants, there heing space for 192 boys, 192 girls, and 184 infants. Adjosing are good play. grounds and a gymnasium. The schools are from the design of Messrs. Hooper \& Lewis The cost ia about 3,000 l., of which the Bishop of London's Fund gave 900l. ; the Committeo of Council on Education, 6931. 10s.; the National Society, 250l. ; and the Christian Knowledge Society, 1522 , 10 s . ; on the condition that the deficit was raised. Tho Earl of Strafford gave the site and 50l. About 500l. have still to be raised. It is proposed to open rooms for a reading-room for the sailors and working men in the neighhourhood and for social gatherings.
Sutton st. Nicholas (Herefora). - A new school and master's residence have beeu publicly opened at Sutton. The buildings have been crected hy Mr. Charles Evans, builder, Talgartb, for the swm of $415 l$., including the cost of school-desks, and exclusive of the contract for building gardenwall, from the designs and under the supervision site, though. Evins, architect, Herefora. manding one, consequently the buildings are secn but on a near approach. Tbe buildings com prise a school. room, 35 ft . by 18 ft ; with lavatory, porch, and necessary offices, and a master's residence. The style is Gothic, adapted to the prescnt period. The walls are built with brick,
with dressings of Box-gronnd Bath stone. The school-room, which is fitted with Colman \& Glendenning's deskg, is 15 ft . himh, ceiled to the collar-joists and rafters, leaving the framing of the principal rafters visible; being stop-cham fered and vardished.
Stowryaine. -New schoolrooms, costing abou soot have been built liere withont any Gorern for the new. By Lord Rivers a site was granted
bis lordship also contribnting to the building fund. The school-house and outbuildings are
of concrete, finished externally with Portlaud of concrete, finished externally with Portlaud
cement and shingle. The chimney-shafts are of cement and shingle. The chimney-shafts are of atone, circular, and springing from a square base The roofs are covered with dark-coloured tiles with ornamental cresting. The entrance-porch, which faces the street, has a half-timbered gable, and the other gables, excepting the class-room are fitted ahore the wiudows with ornamental tiles. The rooms are well lighted and ventilated, the principal apartnent being 44 ft .6 in . long hy 18 ft ., and the other 20 ft . by 16 ft ; boys and girls having separate lohbies and ont.build. ings. The mindows are of wood, square-beaded except that in the class-room, which is pointed. Several of them have cnsped-beaded lights. The spirelet over the centre of the main roo serves the purpose of a ventilating shaft. A bell-cote spriugs from a flying buttress at the angle of the class-room. The design is of the Early Porpendienlar typo. The interior of the rooms is fitted up with stainod-wood desks and forms, and a master's desk in the centre. The cost of the buildings is ahout $600 \%$. The school rooms and playground aro iuclosed by a coucrete wall, witb pillars at intervals of Portland cement. Tbe architect was Mr. James Baker Blandford
Queen Camel.-New schools in this parisb have been opened. They are provided for 180 chidren, and contain threo rooms, each 24 ft rated only hy an arch. The rooms have all open timher roofs, with arched priocipals springing from carved stone corbels each school being designated by a char is in the Early Enclish style, the windows and in the Larly Eaglis style, he window 8 and character. Ir the centre of the front there is a able with a hell turcet on the thero which is a large three-light on the top, helow similar hing there is windows lighting the gis3 ${ }^{3}$, Thole findows lighting the girss school. The boys居 gahle, and the infant school has two doubte-light window in the gahle end. Tbe schools are built with white lias stone, witb blue lias band courses and Lonlting stone dressiugs, from Messrs Whitcombe's quarries. Tho roof is covered with dark-coloured tiles. The solvols are get back from the road, from which they are sepa rated by a low wall and an ornamental iron fence on the top, the space between the wall and the building heing laid out with shrubs. The playgrounds are in the rear of the schools. The schools are entored from the front by two porches,-one for the girls and infants, and the other for tho boys. The walls of each room are lined about 4 ft , high with deal. The dests and benches were supplied by Messrs. Whippell, of Exeter. The rooms are warmed by Gill stoves. The work has been carried out by local tradesmen: the mason's work by Mr. Thomas, the carpenters and juiuers work by Messrs Raymond \& Son, the ironwork by Mr. Perrott and the glazing by Mr. Pitman, all of Queen Camel. The schools were designed by Mr. Henry Hall, of London, architect. The total cost (about 1,000 .) has be
Sharlston (near TWakefield).-The fomndation. stone of a Congregational echool.chapel was laid on Tuesday, the 1 thth inst. The buildings consist of schoolroom, vestry, and out-offices. The school Will be in the Gothic style, of red bricks, with rables. There dressing ${ }^{2}$ 300 persons, tho room being 57 ft . by 28 ft ., and 23 ft . high to the cciling, which will bo ovor the collar-beams. The roof-timbers aro exposed, and the atop chamfering and quatrefoils on collar-beams will be painted, the rest of the woodwork, including boarding round the school, to be varnished. No staining will be used. By fixing a movable partition the room can be divided into hoys' and pirls' schools, the principal doors beine in beds the either department oan be entered through the lobby geparately. It was originalls planmed to boby a part as this a baen frep. pel fireplaces, and ventilated by iron pipes walle in lues, on a dew principlo, to draw feld, is the archite and 1 Pu, the whole of the works, which will be under
6001. Messrs. Elison \& Broadbent, colliery 600t. Messrs. Enison \& Broadbent, colliery
proprictors, generously gave 100l, in addition
pol to the land, which cost $50 l$, ; and the director of
Messrg. Briggs, Son, \& Co.'s celebrated Whitwood Collicries gave 1002 ., on condition that the huild. ing was used as a day-school, and tbat it was adequate to the wants of the dietrict.

## FROM SCOTLAND.

Edinturgh.-The quostion of carrying out the proposed improvement of the North Bridge has been before the Lord Provost's committee and a committce of tho road trust, in connexion witb the estimates which have been roceived from work, Of these estimates the lowest was that of Mr. Waddell, of Bathgate. Bathyate-For a process of converting peat into fuel, extensive works are being conamenced on the grounds of Seafield, near Bathgate. The works are as yot scarcely in full operation, but
sone excellent fuel, says our authority, the some excellent fuel, says our authority, the

factured. The floors of the huilding are all of factured. The floors of the huilding are all of
iron, in orde: to insure safety from fre. The machinery has been manufactured by Messrs. Alesander \& Turner, Edinbulgh. When in full operation, it is expeotod that at least 200 tons of fuel will be manufactured every working day.
The fuel is composed of peat and coal chielly, with tar, aud made into bricks
Biggar, - Tho new bridge at the west eud of Biggar, over Biggar burn, is now completed, and has been opened for traffic. The roadway, which is 42 ft ., exactly double the width of the old bridge, is laid on ten cast-iron girclers, bolted together hy iron stauchions. The sides are protected by a strong iron railing ranning into
stone pillars at eacb end. The bridge is on a stone pillars at eacb end. The bridge is on a
level with the pavement in front of the adjoin. level with the pavement in front of the adjoin. ing shops, and the approach from the railway
station is much easier, tho road having been lowered abont $4 . \mathrm{ft}$., and the hollow botween the old bridge and the town has heen so raised as to make a gentle ascent, whore a quick rise forapproach to the town
Stow. - Messrs. Herbertson, of Galashiols, have commenced operations for the erectiou of
a new church for tho parish of Stow, which, when finished, it is said, will be one of the finest in the south of Scotland. The site selected by Mrs. Mitchell, and the late Mr. Mitchell, of Stow, is on a sloping bank ahove the public road village. The building is ornato in character, and the style of the architecture Early Decorated Gothio. Eight hundred and fifty commodious which masures internally above 20 ft , in width by about 126 ft . in lengtll, with apsidal end towards the south.east. On the north sido of the main body of tbe church are a transept and small gallery, also a side aisle divided from the
nave by stone columns and arclied openings. nave by stone columns and arched openings.
A tower and spire upwards of 140 ft . in beight, Ander which is the prineipal entranco, rises from under which is the prineipal entranco, rises from
the north-west end, and forms the principal reature in the design. The windows will be filled with stained glass. Tho time for executing the contracts extends over 187 t, and the cost of
the building will be about 8,0 ot. penoct. The town council h the propriety of erecting a mouument to the memory of James Watt. The special committce reported against the monumental pile of stones
from all parts of the world in the cemetery from all parts of the world in the cemetery, which would cost from $12,000 \mathrm{l}$. to $15,000 \mathrm{l}$, being
continued, but recommeuded that a brong continued, but recommeuded that a bronze
atatue bo crected in Cathcart. sonare, with these atathe be crected in Cathcart. square, with tbese atones as a pedcstal, at a cost of from 3,000t. to $41,000 \mathrm{l}$. Bailio Campboll thought an engineering school should be erected as a momorial, but
altimately the matter was deferred for a month, altimately the matter was deferred for a nonth,
that the general public niay express thoir opinion that the general pul
as to the best plan.
Dunfermline.-Mr. Andrew Carnegie, of New Fork, has intimatod his willingoess to give the 3um of $5,000 \mathrm{l}$. for the erection of publio baths in Dunfermline, of which city he is a rative. Invemess.-A great impiovement in this honses by Mr Mathe M.P. (Mr. Ross, archi ject), extending along Ness-walk from a littlo thove the Suspension Bridge to the Cathedral. These are bokior, but similar in style to those llready erected from Mr'. Ross's designs oppotite the Cathedral, and will prove an addition to he river side. The largest new works at the
present time are the station offices. These will ocoupy the opposite side of the square from the Station Hotel, and will extend from the site occupied by Mr. Pattillo's shop to the Academy gate, aud from the front of the station to the line of Academy.street. They will consist of board.room, comnuttee-10oms, offices, \&e., on upper floors, and first.class shops on the ground. floor. The buildings will be in the Italian stylo. The contractors are Mr. Hendry, mason; MLessrs. Robertson \& Golan, carpenters; Mr. M Kenzie, slater; Mr. Goodwillie, Elsiu, scalptor ; Messrs Falconer, iron workers. The cost will be abont 10,000l. The excavations aro already nearly completed. There are also various smaller jobs going on, alterations and improvements. In the country a grood deal of work is progressing. Mr. Andrew Fraser, Inverness, has contracted to wild a bank at Lochearron, with banker's house, . A sign of the prosperity brought to the Hotel has already been enlarged three several imes, and although now ono of the largest, if oot the largest hotel nortb of Aherdecn, the proprictor would willingly add other fifty bed. rooms were it not that tbe ralway company accommodation. The proprietor of the Cale Hotel has just added several bedrooms to bi already large estrablishment; whilo the Royal Hotel has been embelished with a now fron facing the station, improving that portion of
Aoademy.street between Union. street and the Aoademy.street between Union.street and the
new market. Amongst other new buildings recently erected in the town may be montioned the new house built by Chief Constable Murray further down Acadcmy-street, and that built by Dr. Fraser in the Highustreet, opposite the entrance to Lombard-street. Both of theso were crected from designs of Messrs. Natthews Lawrie.
Aberdeen.- $A$ special meeting of the heritors of Machar has been held to consider their former decision as to borrowing money to defray the expenses of "stamping out" the dry.rot in the woodwork of the cathedral. After a long to horrmonions discussion, the former 26 to 20 votes. Tho minority dissented and protested Rgainst the decision as being illecral, and those who were mombers of committee, witb one exception, resigned. The meeting hroke up in consusion, witbout coming to any decision as while, the dry-rot is making rapid progress.

## 

otes on National Eurucation in Continental Europe. By Joun F. Moss, Clerk to the
Sheffield School Board. London: Simple Marshall, \& Co. 1873.
In accordance with instrnetions from the Shef. field School Board, Mr. Moss visited a large number of pablic schools in various states on of the information gathered relating to the work in which tho Sohool Boards are so deeply interested
Although his principal ohject was to ascertain as far $\mathrm{d} s$ practicable, what points of excellence in the Continental school system could be with advantage introduced in the elementary schools estahlished and controlled under the English Elementary Education Act of 1870 , he found it aot only asetul, but absolutely essential, to see chools of all grades.
In Prussia, Saxony, Bavaria, Austria, and Switzerlaud, excellont opportunities were afforded of visiting what may he termed typical echools of every class. In Holland and Belgium the author has also seen schools of various grades His time in France was too limited to admit of the visitation of schools.
He says it would be impossible to visit, however hurriedly, the schools of central Europe, without boing impressed with the manifest thoroughness of the work done and with the evident aptitude of the teacbers engaged.

Amongst the best elementary school buildings visited was that of the Gemeinde schools in the building itself amply. Au examination of imposing appearance of the exterior, he remarks, scarcely prepared one for the announcement that this was a free school, and be knew of
expensive middle.class schools in England uot nearly so well Gtted up. Accommodation is previded for 2,000 scholars, hoys and girls, of equal numbers, ill separate departments. There are wo spacions entrance-halls, and the corridors dividing the ranges of class.rooms ran down the entre of the building. The turnhalle stands apart from the school.building, on one side of the playground, and is exceedingly well supplied with all the mostapproved gymnastic appliances, in the use of wbich the scholars displayed an aptitude which amply evidenced the smart raining they had undergone. The director's house and teachers residences are piaced at the urther end of the playground, and lodgingrooms for tho care-taker are provided in the main building. The sanitary arrangements seemed in advance of those in many of the schools he saw, for in this respect he snys, "I certainly cannot commend the German schools tus nodels."
The Gewerbeschnle of Cologne is of itself a rood example of the manner in which education is made to bear directly on the material progress and prosperity of a community. The building, designed by Herr Raschdortf, when Stadt baumeister, is well calcnlated to eonvey an impres. sion of the liberality with which the institntion is supported. Ou the facado, a very successful effort in German Revaissance, are tasteful emblematic decorations; whilst the interior is adorned in a style which well becomes a place in which the development of artistie taste and kill is songht to bo induced. It would not be difficult to point to an Euglish town of much reater size than Cologne withont a single pubbo hailding of any kind (excepting chnrchos) oqual, rom an architectural point of view, te this school building. All the rooms are carefully arranged, with the distinct object of making them thorougbly usefal for thoir respective purposes. The drawing galleries are well lighted and pro. usely supplied with all tho necessary appliances, and in the rooms for modelling in clay there is a capital collection of suitable casts. At the further side of the playgronnd is a spacions turuhalle, admirably fitted up, and replete with all the most modern gymuastic appliances. There are abont 300 scholars in attendance, though the bnilding would apparently accommodato many more.
The Real Schule in Cologne has a fine pile of uildings and an ample staff of teachers.
The secondary sohool buildings, like the primary school buildings, are divided into classrooms, hat they bave each, in oddition, a large assembly.room, which is used on speoial oceasions, as when the periedical examinations are held and certificates distributed, or on the Emperon's birthday. Most of these are beantifully decorated, some of them witb fresco paiatings. The aula, or assembly.room, of the Real Schule in Cologne is embeilished with a tablet recording the names of "boys" from the school who have fallen while fighting in the battles of their country.
pupils.
In Saxony, on several occasions, Mr. Moss asked to be shown inferior school-buildings; but in overy such caso he fonad something being done towards the provision of new premises. Some of these buildings were, indeed, such as would be made to do duty for years to como in England, though the spirit of rivalry would carcely admit of their continced existence in the fave of such imposing piles as have of late pears been erectod for school purposes in Saxony year's been el
Of the manifold methods of warming and rentilation adopted in the various schools visited few a peored to work thoroughly well. If tho warming apparatus appeared tolerably satis. actory the means of ventilation were usually either imperfeot or ill-managed. In the Victoria School, for girls, in Berlin, the sanitary arrangements seemed remarkably good, and the rentilation was very well attended to; but there are apparently few of the Prussian schools of which it could be soid, as in this case, that the ternperature is so carefully regulated that the thermometors placed in oach class.room scaroely ary more than two degrees during the whole day. The school system of Austria is, in many respects, analogous to the methods of Prussia aud Saxony. It may safely be affirmed that some of its special schools are excelled by none in the world. In Vienna, the primary and secondary schools appeared to bo exceedingly well conducted, and some of tho buildings are superior to many of those of the same class risited in Germany. The Commune has, during
tbe present year, voted $7,000,000$ florins for school-huilding parposes alone.

A Protestant Communal school in Vienna, for which the Emperor of Austria gave the land, and the building, deserved special mention, not only the building, deserved special mention, not only as presenting a fine example of the elementary
schools of the city, but also on aecount of the schools of the city, hut also on aecount of the peculiarity of arrangement. The huilding is placed in the form of a bollow square, with a covered area in the oentre. There is accommodation provided for 1,100 children, and hoth hoys and girls nse the aame playground. Each story bas a balcony or gallery extending on all sides of and overlooking the covered area, the hasement of whieh is nsed as a playground. The elass-rooms are lighted from the outer side, and the entrunces to them are from the galleries, which are protected hy a stono halustrade. All the rooms are well fitted np, and the school furniture is very tastefully designed. Drinking fountains are placed on every floor, and the ventilation seems very effective.
The Imperial Gymnasium is remarkable for the beanty of its external architectnre, as well as for the profusion of the decorations introduced in the interior. The design is Gothic very carefully treated throughout, and the corridora and staircases have groined ceilings. A gorgeously-decorated aula is used for a cbapel, as well as for the ordinary purposes of an assemhly-rom. There are between 600 and
700 stndents, hat the building seems large enongb for a much greater number. The classrooms are of various sizes. Some of them will aecommodate 100 students, whilst otbers serve only for forty. A well-arrauged room, with circular gallery. is set apart for chemistry and for other scientific lectures. There is an opon playground in the centre of the boilldings, and a well-appointed turnhalle in the basement. The florins; of this sum 25,000 Horins were expended in furnisbing. Mr, Moss evidently employed his time well.

Results of an Eqperimental Inquiry into the
Alochanical Properties of Steel. By David Kirkaidy. London: Teating and Experimenting Vorks, Southwark-atreet. 1873. The mechanical properties of steel of different degrees of haraness, and moder various con ditions, wanufactured hy Mr. Christian Aspelin, of the Westanfers and agersta Works, Swedon, snerestions and conditions for the his own saggestions and conditions, for the purpose of exhies of at Vienna, where an extensive series of them was sent; and the resnlts are
here tabulated with illustrative diagrams. These resnlts were ohtained as the most likely to interest and to be of most general use to civil, mechanical, mining, and military engineers, and to be of importance to manufacturers of ateel to be of importance to manuracturera of ateel
and iron. One series were prepared for, and sent and iron. One series were prepared for, and sent series are entirely new, and exhibited for the first time. None of those tested have been withheld.

## VARIORDM.

TrFe current number of the Quarterly includes a very interesting article on "Holland Honso, Kensington," founded on a work with that title, by Princess Marie Liechtenstein, recently issued for private circalation only.- A second edition Heath (Cassell \& Co.), just now published, inclades a fresb ohapter on the Elevation of the cindes a fresb ohapter on the Elevation of the
Peasant. Chapter III., under an anwise, because exaggerated heading, tella the instructive story of the life of George Mitchell, the marhle mason. The book can scarcely fail to excite sympathy for the down-trodden class in whose sympathy for the do
interest it is written.

Proposed New Public Offices at Green wicb.-Tho Greenwich Board of Works con. template the erection of new public offices, and at their meeting last week, it was moved that the Board take into consideration the proconsist of fonr memhers for the parish of Greenwicb, two members for the parish of St Paul, Deptford, and two members for the parish of St. Nicholas, Deptford, to search for, and recom mend, a site for the pmpose of building such offices for the Board's use. The resolution was agreed to, and a committee appointed accord ingly.

## 

Maddening Drink.-The Superintendent of Colney Hatch Lunatic Asylum confirms the years of assertion made in the Builder some principle, that the alcoholic and intoxicating the worst effects on those who nse them, bat that the toxicants, or poisons, with which they are adnlterated for the purpose of producing an effect on the brain like intoxication, hat far more dangerons, are the real sonrees of those maddening effecta which fill the lanatic asylums and the prisons. The snperintendent, Dr. Sheppard, is snrprised that at a time when milk. men are pulled no for adolterating milk with water, the preparers of gin and heer, \&c., are ail, and such the public drinka with fuse or hindrance. Has not the comparatize diff culty in analysing orgenic substances something to do with this? We do not agree, however with Dr. Sheppard when he maintains that the diseased craving of many for strong drinks is nenrahle. We have known of the cure of such craving hy the simple use daily of certai hitters, such as camomile fowers and quinine or Peruvian bark, continned for a time as onic for the stomach. But if amylic or fuse oil, as he states, produces such a oraving or hahitual

Report of Medical Officer to Holborn District Board of Works.-The sanitary report of Dr. Gibhon for 1872-73 has been issued in a printed form. He states that the district has been more healthy than it has heen since his appointment, although it never has been so densely populated as now. The Holborn death-rate, however, was 0.55 ahove the general death-rate of the metropolis, hut $1 \cdot 45$ helow that rate for 1872 was 21 " 95 per 1,000, and for 1871 it was $24 \cdot 25$, the general death-rate for the whole of London in 1872 having been 21.4 per 1,000 , against $24 \cdot 7$ in 1871 . In respeet to constant water supply, the report says :-

St. Oswald's Almshouses, Worcester, The chief stone of a Eeries of new almshonsea in connexion witb St. Ospald's Charity, to take le place of the old buildinge, has been formally the recorder, the under.sheriff, and a considerahle attendance of the general public. The building are bnt the heginning of a scheme for the eatire re-erection of the bospital, chapel, and amshouses, which is estimated to cost from 2mshouses, Which
$20,000 \mathrm{l}$, to $30,000 l$. This portion of the scheme involves the erection of 37 alm mbouses, - 19 upo one side of the entrance and 18 upon the other, -and the foundations have been dur the other f these buildias. With the portion in cor 1 of erection will be erected a new entrance-poreh of snitahle design. The almshouses will consist of a living-room, a sleeping-room, a coal-place pantry, and the necessary sanitary accommoda of arche buildings will be in the Gothic style f architecture, and will be two stories in height, The buildin, brick ith ball-stone dressings, The buildings now in the course of being erected will cost ahont 7,0007. Mr. Rowe, of Worcester is the architect, and Meskr
Tewkesbury, the buildcrs.

## Strange Accident at an Ancient "Bar

 ow."-An aptalling catastrophe has happened ear Helston West Cornwall. a harrow or ancient beap of stones, to gathe building materials, when saddenly the ground down 240 fto, into forty fathoms of water, along with many tons of sarface earth. The covering of an old mine-shaft had given way with thei Weight. Attempts were mado to reach thbodies, but nothing conld he done.

# The Builder. 

VOL. XXXI-No. 1604.

The Squares of Bloomsbury.

HE name of Blooms bury is of considerable antiquity altbough the dis. trict jtself was not built upon to any cxteut bofore tho middle of tbe seventeenth centary, It is a corraption of
Blemundsbury, the manor of the Do Blemontes, Blemunds, or Blemmots, in the reigns of Eenry III. and Edward 1., hut an absurd state. ment has found its way into books that the name was original!y Lomsberry. This mistake must have origiuated from the letter B having been dropped by the printer in the firat book in which Lomsberry is mentioned, for such a name never really existed. Blemund's Dyeho, whicb was afterwards colled Bloomsbury Great Ditch, and Sonthampton Sower, divided tbe two manors of St. Giles and Bloomsbury, and the wbole northern division of St. Giles's parisb is called in the old parish books " Bloomstury side." Tbe manor-house of the Blemunds stood on the site of the present Bedford-plueo, and is described in the St. Giles's Hospital Grant as "tbe eapital messange of William Blemund.' The manor passed through soveral hands before it came into the posesssion of Thomas Wriothesley, Lord Cbancellor to Henry VIII., who was created Earl of Soutbampton threo days bofore the coronation of Edward YI, Henry, the third earl, who was the patron of Sbakspeare, pur. chased the manor of St. Giles, whioh ho united to that of Bloomsbury, and the two manors have remained together to the present day, Tbomas, the fourth and last earl, who was Lord Treasurer to Cbarles II, and father of Lady Racbel Russell, rebuilt the manor-house and made it form the north sido of a new sqnare, wbich nudertaking is notieed in Evelyn's Diary under date 9th of Felbruary, 1665:-"Dined at my Lord Trea. snrer's, the Earle of Soutbarapton, in Blomesburg, where he was buildiug a noble square on piazza, a little towne; his owne house stands too low, some noble roomes, a pretty cedar chapell, a naked garden to the north, but good aire." Pepys also noticed what was going on, and wrote in his diary, "To my Lord Sandwich's through my Lord Southampton's now buildings in the fields behind Gray's Inn, and indeed they aro a very great and a nohle work." South-
ampton House is gouerally stated to have been the work of 1nigo Jones, but that great arebiteet died eight years hefore the Restoration, and Mr. Petor Cunningham therefore suggested that it might havo been by bis pnpil, Webb, The Earl of Southampton died in 1667 at this house, which is described by a contomporary writer as "near Holburne, in the suburbs of London.' In tbe same year his danghter, Lady Rachel Friothesley, married William Lord Russell, and the pair lived in Southampton House. It was said that whon the patriot Lord passed here on his way to execution in Lineoln's lnn Fields, he threw a sorrowful look at the place where he had spent many happy years. His widowlived herotill her death at eighty-seven, in 1723. The Countess of Souchampton, second wife of Lord Treasurer Sonthampton, and step-mother of Lady Raclel

Russell, was also living here in 1609. In 1701 tbe Duke of Bedford moved to Southampton Honse from Bedford House, Covent-garden, which was pulled down in the same year. Hatton, in 1708, deseribes the Duke as living "on the north side of Blomeshury-square, at the Lady Risssel's, alias Southampton House." the plan of St. Giles's parish given in Strype's edition of Stuw (1720), the gardens of Montague Honse (now the Brilish Museum), and those of Southamptor House, are shown to adjoin, and beyond tbom were the Soutbampton-fields and the country. Strype, when writing of Great Russell-street, witb its gardens on the north side towarls Higbgate and Hampstead, says "Tbat it is consilered by physicians as tho most healtbful [strect] of any in London." Franeis, fiftb Duke of Bedford, sold the honse in 1800, in which year it was pulled down, and new buildings planned out. It was thougbt strange at the time that the Duke should sell not only his house, bat all the furniture and pietares in A weok after the sale of the eontents of the house, the double rows of lime-trees in the garden, and the ancient stem of the light and graceful acacia, which stood in the court before the beuse, and was commended by Walpole in his "Essay on Landscape Gardening," were also sold.
Bloomsbury-sqnare was built, as we have already mentioncd, in 1665, by the Earl of Southampton, whose houso formed the wbole north side until 1800, when new houses and Bedford-place were erected on its site. It was originally called Soutbampton-square, and is so named in Strypo's "Stow" (1720), although long before tbat date it was known as Blooms-bury-sqnare. "My Laily Baltingglasse's house in the great square of Bloomsonry," is montioned in the London Gazctte for 1674. Like Lizcoln's-itm.felds, eaeh side of the square had formerly a different name : thus the South side was Vernon row or street; the east, Seymonr-row; and the west, Allington or Ar. lington row. Lord Castleton lived on the aouth side, in 1708, as did also Sir Hans Sloane. Ray directed to the latter, in 1696, "At the eorner of Southampton-street, nexi Bloomshury-square"; and another correspondent, in 1704, varied the address as follows:-"At his house at the corner of Southampton-square, Bloomshury." Tbe Earl of Chesterficld, mentioned in Grammont's Memoirs, lived on the east side in 1681, at the family mansion, whioh was inhabited by several of his descendants. Lord Paget was on the east side in 1708, and tho great Lord Mansfield's honse was at the nortb end of the samo side, on the site of three honses sinee crected. During the Gordon Riots, of 1780, the mansion was plundered and burnt to asbes, and Lord and Lady Mansfield only mado their escape by a baek-loor a fow minutes before the rioters broke in and took pcssession of the premises. In 1708 Lord Northampton and Lord Chief Justion Treror lired on the west side. Tbe latter was Sir Thomas Trevor, snccessively solicitor and attorney general and Lord Chief Justice of the Common Pleas. In 1711 he was created Lord Trovor of Bromham, in Beds; in 1726 , appointed Lord Privy Seal; and in 1730 , one month hefore his death, president of tbe Council. He was the second son of Sir Jobn Trevor, Secre. tary of State in Charles II.'s reign, and is not to be confounded witb the corrupt Sir Joln Trevor, Speaker of the House of Commons and Master of the Rolls. Other distinguished inkahitants tbat must be inentioned are the great Nonconformist, Richard Baxter, whose wife died in 1681 in wbat he calls "this most pleasant and convenient honse ;" Dr. Radeliffe, the physician; Alsenside, the poet, who was settled by his munificent patron, Jeremiah Dyson, "in a small but handsome house;" the great Lord Ellen borough before he removed to St. James's square ; and Isaac Disraeli, in a hotse (No. 6)
built by Isaac Ware. Bloomsbury-square was cnce a favourite place of residence for the great lawgers, bnt after the building of Bedford and Russell squares tbey migrated to these more agreeablo spots. In 1822, however, Lord Cbief Justice Dallas lived at No. 39. Now the houses are giren over to solicitors and arohitects for their offices, and to lodging-house keepers. There is still, however, one eminent inhahitant, viz., Sir Antorio Panizzi, the late principal librarian of the Britisb Museum, and the large building at the north-weat corner is oeeupied by tbe Pharmaceutical Society. Tho bronze statne of Cbayles James Fox, by Westmacott, which is placed in tbe enclosure opposite Bedford-place, is 9 ft . high, and stands on a pedestal of granite. It was set ny in the yoar 1816.

Maitlaud states that in 1739 the number of houses in Bloomsbury was only 951 ; but we find that from 1702, when the euterprising architect, James Burton, began to build upon the Founding Hospital estate, until 1829, 1,198 houses wero built within the parish of St. George, Bloomsbury, and no fewor than 663 of these were brilt by or for Mr. Burton within a period of only eleven years, viz., from 1792 to 1803. Southamptonfields, afterwards called Long-fields, were notorious for centuries as the resort of the depraved and robberies and murders were freqnently committed in thom. The fields at the back of Montague Iouse were famous for many years as the favourite resort of duellists; but an extract from Anbrey's Miseellanies shows tbem in a more agreeable light. "The last summer on the day of St. John Baptist (1691), 1 neeidentally was walking in the pasture behind Montague House; it was twelve o'elock, I saw there about two or thrce and twenty young women, most of them well hnbited, on their knees very busie, as if they had been weeding. I ceuld not presently learn what the matter was ; at last a young man told me they were looking for a coal under the root of a plantain to put under their beads that night, and they shonld dream who would be their husbands. It was to be found tbat day and bour." The gronnd at the baek of the west end of Great Russell-street was formerly oecrpied by Capper's Farm, which belonged to two maiden sisters of that namo. J. T. Smith deseribes them in his " Book for a Rainy Day " as wearing ridinghabits and men's hats. "One rode an old grey mare, aud it was her spiteful delight to rido with a large pair of shears after hoys who were Aying their kites, purposely to cut their strings; tbe other sister's hnsiness was to seizo the clothes of the lads who trespassed apon their premises to bathe." The nortb-enst end of Upper Montague. street is the site of tbe celebrated "Brothers' Steps," or "Field of Forty Footsteps," whicb tools this name from a legendary story that two hrothers wero in love with one lady, who would not declare a preferenee for eitber, but coolly sat дpon a banik to witness the termination of a duel that prosed fatal to both, $1 t$ is said that tho bauk upon which the lady eat, and the footmarks of the hrothers when pacing the ground, never produced grass again. For the energy and skill whieh ebauged these dangeroas places into band. some squares and spacious streets, London was indebted to Mr. Burton. Russell-square was built about the year 1801, and the bronze statno of Franeis, Duke of Bedford, by Sir Richard Westmacott, which looks down Bedford-place towards that of Fox in Bloomsbury-square, was erected in 1809. When the buildings were in progress, a great quantity of briek-clay was taken from the centre, and the gap occasioned thereby was not filled $n p$, so that the garden was formed in too great a hollow. Many years before Rassell-eqnare was built, Baltimore House stood alone upos a portion of its site. In 1767, a milliner was decoyed here by tbe abandoned accomplices of the last Lord Baltimore, and in the following year that nobleman and bis two
creatures were tried at Kingston for the abduction of this joung woman, whoso name was Woodcock. When the square was planued,
Baltimore Honse mas made to form a part of the east side, and in 1803, and for many years afterwards Wedderburve, Lord Chancellor Lough horongh, and snlsequently Earl of Rosslyn, Was its occupant. It was afterwards the resi-
dence of the Duke of Bolton, when it was called dence of the Duke of Bolton, when it was called
Bolton House, and it is now divided into two houses (Nos. 66-67). Three houses were also huilt upon the courtyard, and are now nnmered 68,69 , and 70 , and a house at the back, which is really in Guildford-street, hat is treated as in Rucsell-square, and was for some time the residence of Professor Donaldson, is called Bolton Gardens House. The few house日 on the east side of the square, hetween Guildford and Bernard streete, were originally known under the distinctive name of Southampton-terraco. Thomas Tooke lired at No. 12 in 1822, and William Tooke at the same house in 1829, and for some years after. Sir Samuel Romilly was living at No, 2 I in 1818 , when be took his own life in a fit of insanity. Lord Tenterden, Lord Chief Justice of the King's Bench, inhahited No. 28, for some jears; and Mr. Justice Holcoyd was at No. 66 during a few of the same Denman, lived at No. 50 ; and Sir Thomas Lawrence in a portion of Bolton House, from 1805 to 1830 , the last twenty-fivo years of his life. The Rev. John Mitford, writing in the Gen. tleman's Maga=ine for Janaary, I818, says: "We thair small wbite horges, with their long spears gronnded, standing centinels at the door of this great painter, whilst he was taking the portrait of their general, Platoff." The lawyers have always been fond of Russell-square. It was nce the favoured residence of the judges and distinguished counsel, hat now it is given over the iohahitants are a thars present jear, among re ionanitants are a baron, a haronet, an alderman, and a menher of Parliament, some physiciaus, and other professional men. We cannot dismjes this square withont noting the prominent Tair" as the residence of the Soray's "Vanity Fair," as the residence of the Solhys and the Osbornes, for the imagioary charaoters of fiction often throw a greater interest over a place than do beinge of real flesh and hlood.
The district nsually understood as Bloomsbury, extends heyond the mero parish houn daries; therefore we need no excuse for in cluding Bedford and Qneen squares among the squarcs of Bloomshury. Bedford-sqnare was planned out in the very latest years of the cightecnth contury. It was formerly even mor than Russell.square the favoured place of residence for the judges. Mr. Justice Littledale lived at No. 5 in 1829, and Lord Chancellor Eldon next door, at No. 6, from I804 to 18I5, in which latter year he moved to Familton-place, Piccadilly. It was in bis Bedford-square boase Eldon and the Prince Rerent took place. The prince came alone to see the Lord Chancellor, when he was laid up with the gout, in order to ovtain for Jekyll, the great wit, the vacant offico of Master in Chancery. On the Chancellor's refusigg, the prince threw himself back in his chair, and exclaimed, "How I pity Lady "what is the matter?" "Oh, nothine" the prince, "except that she will" vever see fou again, for bere I remain until yon promise to make Jekyll a Master in Chancery." The result of such pertivacity was as night he then and there. Mr. Justice Burrough lived at No. I6, in 1529, and Basil Montogn Iived the son of the Earl of Sandwich and Q.C. Reay, and editor of Bacon's worls an Miss in the same year. Lord Chiof Justice Bost occupied No. 29, and Mr. Justico Park No. 32 for several years at the heminning of the present was at $\mathrm{N}, 43$ in 1509 This legal lnminaries, hut now do jo a good list of formd in the neighhourh no judges are to be can hoast of poscering, amonge it in the square can hoast of possessing, amongst its inhahitants, a member of parliament, and a consul.general, but most of men, professors of singing, \&o., and artists. There is an Insurance Company and a Ladies' College, but no shops have yet intraded upon the privacy of the place. A part of the east in Bronswick-equare are in the the honses in Bunswick-square are in the parish of
is entirely without the parish bonndaries. The latter place is an outgrowth from the parish of
St. Andrew, Holborn. In $\mathbf{1 7 0 5}$ Sir Streynsham Master appointed trustees to others, who had been agreed with erecting a chapel Tooley to give him 3,500t. for the south-west side of Qneen.square. In the fullowing year the huildings were finished, but the commissioners for erecting the fifty new churches resolving to make this chapel one of the numher, purchased it of the proprietors. A certain district was appointed for its parish, and the church was conseorated in 1723 , when it was dedicated to St. George the Martyr, in heen governor of Fort St. Georse in tha East Indies.

Queen-square was named in houonr of Qneen Anne; and Dohie, in his history of St. Giles's says that in 1713 it was called St. George's square ; hut this must bo a mistake, for in Hatton's New View of London (I708) it is heing then desigued. This qquen-square, three sides built opon, as the north side was lef open, so that the inhabitants might enjoy the view. Now there are miles of bricks and mortar hetween the square and the fields. In Dodsley' "London and its Environs" (I761), we read, "This is an area of a peculiar kind, it being left open on one side for the sake of the heautiful landscape formed hy the hills of Highgate and Hampstead, together with the adjacent fields. A delicacy worthy, as it is an adrantage to the inhahitants, and a heanty even with regard to the square itself." Alderman Barber, the printer Who erceted the monnment to Butler in Poets ${ }^{3}$ Corner, died here in 1741, and in 1745 Jonathan Richardson the critic also died here, as did his son, Jonathan Richardson, in 1770. William Stukeley, F.R.S., called hy his friends the "Arch Drnid of his age," who held the liring of St. George the Martyr from the year 1717, died at his house in the square on March 3, 1765, in his 78th year. Dr. John Camphell, author of the "Lives of the Admirals," lived for some years at the north-west corner house, whero most mon of eminence in science and literature of his day ased to resort on Snuday eveniogg. Dr. John. son once said, "I used to go pretty often to Campbell's on a Sunday evening till I hegan to consider that tbe shoals of Scotchmen who flocked ahout bin might probably say, when anything of mine was well done, 'Ay, ay, he has learnt this of Cawmell.' " Dr. Anthony Askew, who died in $178 \%$, formed his celehrated lihrary, which sold for 5,0002., at his house in this square Now most of the houses are occnpied hy societies, cbools, colleges, homes, and hospitals. Dr Williams's library, which was formerly in Red-cross-street, Cripplegate, is now located at No. 8 , This library was formed hy the Rev. Daniel 7715-IG, for the benefit of Disseuting ministers. To rington and Wohnm squares have but littlo bistory. The fomer was completed about 1829, and according to Dohie, "it has proved a very successful speculation to its very industrious and worthy builder, Mr. Sims." No. 55 was the ast London residence of the learned antiqnary Sir Nicholas Harris Nicolas, and the Right Hon Sir John T. Coleridge lived in the square in 1829. Wohurn-square was planned a few jears 1829. Dobie states that it was in progress in 829. Dobie states that it was to be called Rothesay-square.
When Loudon, somo years ago, was divided work of the post- for purpose of facilitating the work of the post-office, Bloomshury whes included io the west central district. We thns see that the short space of little more than half a entury, London has so greatly increased in ze that the streets and squares of Bloomshury winch, at the end of the eighteenth centary hecome the very centre of the town.

Want of Houses at Ashby-de-la-Zouch. Tho population of the town itself does not exceed ,000, and is not likely to increase nader presen modation. Persons retiring from active accom the larger Persons retiring from active life in Ashbs for honses are frequently inquiring in who own the land aronnd abont, it is said, could oot do the town a greater service than hy solling

ILL PAID LABOUR: A SOCIAL DANGEP
We have taken occasion hefore now to cal the attontion of our readers to the effect of a reat law of mechanics,-or we may say a grea aw of natnre, - that known as the law of the ine of least resistance. Its effect is, that when strain is put npon any body, organisation, or system, the weakest point is the frest that yields Thos, in point of fact, no mechanism, whatevor be its nature, is stronger than its own most inef. ficient part. It is not the hest, hut the worst of a thing by which its mechanical value is to be tested. Let $n s$ go to any cost, let us apply any amonnt of skill, genius, and lahour to our work, the important fact can never he altcred, and ought never to bo neglected, that tho strength and of the whole are accurately deter rivet might sink an ironclad.
We wish onr readers to accompany ns in a little further consideration of this subject of the weakest point, and to reflect on the great truth that the stability and grandeur of the whole stately fabric of the British Eropire depends, intimately and irrevocahly, on the resisting power not of the strongest, bot of the foeble part of onr complex social organigation.

It was remarked by the writer of a pamphlet hich we noticed on its first appearance, two vears ago, that "wher distress and miser accumulate to a certain piteh, ontburst is certain to occur." If that great flood of trouhle, of which ouly the very crests of the wave cone to the notice of the general public, should harst its barriers in our time, it will not be the powerful, the nohle, and the wealthy, who will be the first sufferers. Our danger lies, not so mnch in an sssault on estahlished institutions as in the crumhling away of the lower stratu of the social pyramid. We do not fear the angry anrge of crime so much as the insidions canker of poverty. The evil that most threatens us is the gradual expansion of the quagmire of absolute pauperism,-the involving in its mischief of individnals, and families, and trades, that now maintain a brave band-to-hand struggle with hunger, want, and disease. A Spanish proverk says,-"If jou gee your enemy in the water up to his knees, gire him a hand and help him out If' you see that he is up to his waist, give him your hand and help him out. If you see him no to his shoulders, jump on him, and keep bis head ander. We fear those among us may he numhered hy more than hundreds of thousands who are in the water much higher than the waist The enemy who waits yet a little hefore jnmping on and holaing their heads under, is pauperism.
People who live in perfect ease are of ten little poor man struggle which the respectant of the pauper. In Saxony, for example, the people are far poorer than they are in England. But the case of a person dying from staryation was never known to occur in Saxony. Hardly a week passes, in the severer season of tho year, without instances of death from actual want and starpation finding their way into the Tondon papers. And for one that this filters to the sur. face,-how many are there unreported? Amin, how small a proportion do the deaths that posi trely ocerr from the want of the daily bread on be day of decease ber to thoo which are matored by are the vital power by a course of insafficient food, warmth, and comfort?
The part of our soc
the part of our social system, then, which, as cars of the trues, chiefly demands tho anxious who are house : these just alo juse poorclothe or half clothe, or half clothe, themseryes, - house hemselves, or do withont housing. It is highly important that the state and condition of these classes of the community should he fully and distinctly hronght hefore the puhlic. There is an enormous amount of charity hestowed in England. Some of it is given from the parest motives. We think that it is a melancholy reflection that so much money, given from a sense of religious duty, should be spent with the object of indoctrinating negrobs or other people with special theological views. Upwards of 50,0007. per anoum are raised and spent in order to prove to the ancient people of Israel how matuch snperior is the wisdom of our modern institutions, hased on what we call an nlighteneareligious knowledge, 一 to that ancient aw which so tenderly provided for the poor, and which bade those who were themselves in comfor relinqnish up to one-fifth of their income when there was need among their poorer hrethren

It is not, bowerer, in this way alone, but in many, that wo bave to ingrire as to the distri. bntion of our charity. Thore are, first, the true
almsivers, - the good parson, the good squire, the good lady of squire or parson, where these are not improved away by modern progress, 一those
who know the poor and sick of their parish,--who Who know the poor and sick of their parish,--who
make tho relief that they personally bestow of twofold value by kind words, good advice,
and cheering sympathy. The most perfect system of alms.giving ever organised in the world is that of the Jews. Alms, according to the precepts of their law, are at once a deht due
to man, and a plea for tho favour of Meaven. to man, and a plea for tho favour of Meavon.
The virtue and merit of alms-giving has eight distinct grades, the principles being that reither be who gives because ho cannot help doing so, nor he who gives openly and ostentatiously, has
any hut the very smallest sbare of merit. any hut the very smallest sbare of merit.
Highest in the scale stands he who so gives Highest in the scale stands he who so gives
that the left band shall not know what the rigbt hand doeth. But yet, higber is the praise of that man who prevents alms, hy so aiding the tottering as to enable bim to avoid a fall. He He who, not by ostentatious gift, but by timely loan (so that it be a loan of free heart and free
band, not to be exacted till a fitting time) does band, not to be exacted till a fitting time) does fice sot down to his account in that great symholical book in wbi
Tbere are, then, the wisest and most useful givers of alms. Thore aro the honest, religions, but prejudiced or misguided givers, who waste wbo bare their reward by the publication o tbeir name in the newspapers ; and to wbose money, somebow or other, the want of a fructi. fying benediction often aeems to cling. And so
we come to the lowest, and smallest, and most we come to the lowest, and mallest, and most
insignificant,-but at the same time the most munificent givers, - to the poor wbo give alms to tbe poor; and we have no besitation in snying tbat the actual total of these widow s' mites is snch as to exceed that of the silver crowns and golden sovereigns of all the other classes put
together: In true merit, -tbat is to say, in ready self-sacrifice,--it is only the alms of the
first class of givers, the personal visitors of first class of givers, the personal visitors of the
poor, that can oompare with those of tho poor man himself. The fartbing of the latter is worth the crown of the theological subscriher, and outweighs the guinea of the Pharisee. But actual amount of money help which the poor give to tho poor is greater than that which the rich give to the poor. It is larger, and it is far It mimhinistered.
and the ensue, from this consideration alone, fact - that the timply proof to be collected from than the larger but deferred donation. It may be a very great question whether our eleemo. a falso principle. The matter has to he a false principle. The from two entirely distinct points o view,-namely, the esonomical and the moral.
The new principle has been ad ipted of late vears that supplementary aid to the poor should be discouraged. The poor.house was intended to be the last resource. It was to stand between the poor man and starvation, when he touche
starration point ; in he may go if he likes. Bu starration point ; in he may go fie likes. But
the help which should prevent him from going in is not contemplated by the wisdom of Parlia. ment. On the oontrary, it is discouraged as
much as possible. It may even yet be matte of question whether this wisdom is ahsolute or the reverse; and that not only the reverse of being absolutely certain, but the reverse of wisdom. In a moral point of view there is very the whole influence of society should he directei rathor to keeping people from heing paupers tban to snpporting them when they have become paupers. In a financial point of view we think this latter opinion is capable of proof, which, of to morality.
Here comes to hand a little book, lately puh lished, without name of author, whicb fell under directing attention to which, all godfatherless as it is, we do a service to the canse of the poo is ill chosen, as in no way indicating the contents. It is, in fact, a temperate, instructed cautious appeal to the rate-payers thronghout noms which are now paid in rates are not, to a great extent, squandered. The writer is admir-
ably froe from any exaggeration, bombast, or sentimental appeas. He gives chapter and verse for his opinions. He compares the effect of definite suma of money applied to the support and healing of tbe poor under the Poor Law, and in tbe great hospitals and iustitntions whicb are munificently snpported by tbo endowments left hy the piety of onr ancestors, or of the sub. cribers, whether pions or ostentatious, of onr lay, on the one hand, with less pretentious chavity on the other; and he certainly shows how much farther the widow's mito goes than the shekel of the Pharisec. Thas he draws attention to this most important question,--is not injustice done to the poorer rate. payer by
the extravagant distribution of the money raised the extravagant distribution of the money raised for the support of the poor? The question is one tbat cannot be blinked. The sooner it is fully grasped by the public inlelligence the hetter for the future bopes of England.
Let $n s$ look, for a moment, at that stratum of society wbere, as we before said, onr weak point as a people is to be fonnd, in a little detail. The traveller who is hurrying from the unattractive streets of Londun (perhaps intend. ing to study in his journey the new "Digest of the Statutes of the Rural Sanitary Authorities, will look in rain for the and "s Eex of which and is beset, at tbe door of the station, by two shrill voices,-one of them aaking him to buy a half. penny newspaper, the other a half penny hox of matches,-little thinks what bas to be paid for out of those half pence. We will say nothing of
 second half fenny rer kind the cutcalist. The combined labour of those who are not even small capitalists. They are,-to apply an old word in new sense,--perfectly acephalous. What goes to make up the balfpenny of the acephalous mannfacturer and salesman
Children generally are employed in making the lucifer-match hoxes. They are paid at the rate of 4 d . a gross. Do our readers happen to remember how many go to a gross? Unless the "Vanous purchase hy Moscs, in the immortal spectacles" shall ha, of to green spectacles," shall have led them to inquire, wo venture to douht thair accuracy of knowledgo. little manoufacturer's labour is a did for is, tho rate of a penuy for three der paider o say, at the rate of the ninth pait of a farthing per hos. It is not an extrayagant rate; that is to say, if viewed from the siuc of the consumer, our side. Yor is it too cucouraghy if regarded rom that of the producer, the smal acephalous manufacturer. Yet hy hard work a clever child an earn at this wou hom lo. to ls. 6 . a week. Next has to he considered the more important capitalist who supplies the materials for the bor. Then the matches whicb fill it have to bo made. Here, again, come in labour and material; and hero also comes in Ekill of a higuer order,that of the chemist. Some of the la'est discoveries of science deal with the heteromorphio orms of the pbosphorus that caps the matches. Last comes the distribution to the public. We cannot give all the details. It would be instrucpre to thulate them. We know that out of the ist of a hook that costs 1s., 5d. goes to the hardyucors. The halfpenny match-box can hulfyenny capitalist, of whum, parchaser from the manufactnrer, he is the agent. So it has happened that on the threat of a strike among these makers of boxes, which has resnlted in an ncrease of their pay np to almost a quarter of a farthing per box, the increased expendituro, which would not in any way be thrown on the purchaser, hy reason of the failure of our dealing system to take any cognisance child who could sell boxes enough to give him a profit of 1 s . a week, must now sell an extra numher. Wo give our readers the data on Whicb to calculate how many more, in order to income.

Another minor indnstry is told of by the same ignominious chronicler. It is that of the maker of skewers for dogs' meat. Who that pays dog. tas,-stamp and sign of eminent respectahility lover of expenditnre is,-01 who, not heing. lover of dogs, has privately rejoiced at the drui nution in the number of that species that mas he traced to a fiscal canse, thought of the skewer matter? Tbe price of dogs meat itsolf is not
bigh,-wo cannot speak from personal experi-
ence of the present ruling market rate,-but ont of every pennyworth of the aliment, the aliquot part that represonts the cost of the skewer must require for its denomination a knowledge of decimal arithmetic hardly to be expected among the small merchants of whom we speak. We are wrong: we can give the data. The manufacturer of dogs' meat skewers must be also a capitalist. $\Pi_{e}{ }^{\circ}$ or sle, has to "find the wood." Finding wood, and finding labour, the gross return ohtained by the small manufacturce is the $125 t h$ part of a penny. We have contrived to write it without the aso of decimals. Taken in another way, - in the whole sale terms,--it is at the rate of eightpence per
thousand, wood and all. At this rate, what is thousand, wood and all. At this rate, what is called life has been snstained hy the dog's-meat akewer-maker, so tbat the disorganisation of tho business hy the falling off in the number of cus tomers raised the question of the nuion or the grave, or at least the hope of a possible grave, from a charity not met with by the poor frail body, so long as, hy the lingering within it of the chained immortal 'spirit, it was denied the advantage of becoming a palpsbly dangerous soarce of mischief.
Another female bandicraft of sirailar magnitade has been improved away hy the modern Tho women whing hooks and eyes by the weight called a livelihood by sewing hooks and cyes on cards for sale, aro thus demeritées. Then there are tbe women who do the reedlework for dozen la.makers,-they roceive tenpenco for it is only the labour that they find, not the alpaca or gingham,-so they ohtain the whole five sixths of a penny, withont deduction, for making one ambrella. Let any lady who thinks this a remnneration in any way iuadequate set, to work to mend a seam of an incb or two long in an nmbrella, and minuta on her gold watch how an nmbrella, and minut on her gold anondreds of women who are employed by the penny toy-makers. Tho division of lahonr here has heen earre to a dotal which we dare not attempt to follow. The women whork in the pence per das in fino wether But as ponco per day in fine weather. Bat as they wet days must reduce their incoune to something wet days mast reduce their incoune to something like 2s. 6d. per week, - with the additional feature of total nucertainty when they will have a day's
work and when a day's loss of income, entailing work and when a day's loss
In those and similar small industries are oceupied that numerons class of the houest poor who prefer semi-starvation io panperism. The sub-
ject is not one thas briefy to be disnissed. But what a pienre do these fow dry details givo of the ninobserved oxercise of one of the nohlest virtues of the citizen, if not of the man? There is something that the ancient philosophers call by very lofy names in the patieat resolation that will rather earn a crust than accept a loaf.
We do not now speak of what are ordinarily called "the dangerous classes," of the Bedonins of our city life; those whose hand is lifted against any man who has an unguarded pocket We have recently seen, in tho walks sacred to the capitalist, how mnch skilh, incontion, observation, knowledge of the world, and cool courage has been steadily employed to commit robbery on a large scale. No less is the "making" of many a good worknan thrown away on the too bard, even on him. If it be a virtue to dieslowly, or at once, rather than to heg-there is at least a word to he said on hehalf of the child ho finds it eastor to steal than to beg. We are not cond
To this rast class which, by honest or dis. honest means, strive to leep out of the poorhonse, the ancient law wuuld have hold out just that degree of aid that would have enabled thom te right themselves, aud to become useful instead of harmful, merabers of society. And it is not the fact that the puhlio burden would he increased hy preventive aid ; on the contrary it weuld he very largely diminished. The maiutenance of twe adult paupers in Kensington workhouse amonnts to 12 s . $2 \frac{1}{2} \mathrm{~d}$. per week. The cost of four pauper children, in the Hauwel Schools, for maintenance and establist ment charges, is $17.8 s$. 6 d . per week. The dock yard lahoarer, whose loss of work has thrown his family on the parish, earned 18s. per week on which ho kept tbem. But the oost to the nation, which forces them inta the poor-house hy refusing any preventive aid, is $2 l .03 .8$. 8 d. per
weok ; and the 183. was a fructifying outlay some one or other was at least 36is, the hetter for it; the national wealth was increased to that cxtent. The outlay of the 40 s. is not only in unproductive, but acmorase family is swamped in tho urorass of panporism, Are not these questions worthy of perion potient, able investigation, even on tho principl that the bighest morality means the largest profit?

## WINTER EXHIBITION AT THE

 DUDLEY GALLERYNo searcity seems to threaten that the suppls of pictures will fall short of satisfying any reasonable call for them at this season, judging by what inay b $\rightarrow$ seen at present at the Freunh Gallery and tho Dudley Gallery, The nearly 400 "cabinet pictnres in oil" that are to form part of the Eigyptian Hall's attraotions for a time are of similar character to former oollections exhibited there, with the difference that the absence of some of its best supporters would he sure to occasion, added to no very great bolp from others who linve formerly assisted so vory much to establish the institution. There can be little fear of dearth, however genoral it might become otherwiso, lessening so apparently illimitable a provision as that of such pioturos as are wont to corer exhibition walls at all times of the year, sinco it has become the rarest of rare things to havo to chronicle any great effort, leave lone oommensnrate saccess, on the part of British painters ontside the Royal Aoadomy (and not very often inside either!).
On tho otber hand, the opportunity of ob. erving how clever and industrious they are, as arule, obtains from Spring to Ohristmas. Such ovidence as supply can put forth of demand woald seem to justify a helief that pictares are included amongst our daily wants, and come under the category of common neoessaries. It is quite to bo wished that this should be the casc, evon by those who know it never can be ; for taste is more often dominated by appetite than vice verst, after all; and on dark days the beanty of the cream.jug is less an object of interest thau the share of lacteal treasure it thought of when all things are dear alike.
Thero is nothing more reraarkable to record of this score of scores of performances to which public attention is invited at the Dudley Gallery just now than the faot of there being so little that is remarkable. Although Mr. J. A. McNoill Whistler's admirers will be oharmed again hy bis "Variations in Pink and Grey" (193), to the sarue degree, no doubt, as they have been by "Nocturns in Blue and Silver," and other variations, opinions of their real value will remain as wide apart as Cheyne-walk from Japau, with as little doubt.
Mr. A. Legros mnst be said to follow natnre vory conscientionsly and earnestly. His study or sketch on "The Grand Canal, Venice" (185) is just the antithesis of what is but vague and vaporous indication of anything that anybody may choose it shall mean. The level of water and its colour, with the mist veiling the damp basement of buildinga, that seem to shoot up ike berbage from a marsh, to bloom into colour so soon as they may meet sunbeams, are mor than snggested here.
It is a pity the law of eridence does not moro frequently apply, or is not oftener made to apply, to nature's witnesses. If there were need it would be next to iupossible to swear that a same number of girls, so plain, so homely, so ug-. Ugh! Well; thenks to Dorsetshire
butter, or any other of tho grod and kind provisions, if Mr. Legros liad depicted a formful of British girls, they wonld not,-could not, have atforded such a show of ungainliness as his "Ecole des Filles" (379) ; and yet, bow tho. ronghly well each girl keep ${ }^{\text {ger place with no }}$ sonmble to show distance! This and Mr. Hay. wood Hardy's "Stricken Lioness" are the loudest pictures in the room,- if one is to listen. "The Stricken Lioness" (66) is too ohviously dead to leave room for question. Her head and parse aro almirably painted; and Mr . Eardy vill fight his way up to very ligh position Mr. G. F. Watts, K.A., has been nsually botte represented than by his study of "Eve" (75) one of a series of designs for large pictures, as, apart from the exquisite modelling of the torso it can scarcoly be accepted for a good epecimen Mr. G. D. Leslie, A.R.A., has reproduced the princ:pal figure of his pleasant classio composi.
tion that gained him more laurels than he showed, in the background of "The Fountain" (156). The figure is still very pretty, bat soems to miss her sarronndings, and, like Mr. D. W. Wynfield's damsel culling dablias, "The Morn. ing Task" (178), to want freshness and vivacity Mr. E. Stacy Marke, A.R.A., besides sending some admirable wayside studies of landscape, contributes one of the best figure pictures-a monk, "The Convent Dradge" (221), polishing the chapel plate, with a patient submission equang the care he is taking over the job. Mr. , E. Hodgson, A.R.A., never excelled the com. pleteness of execution and apposite character that distinguish his Alyerian group of A Coral Merchant" (248) noisily expatiating on the smperlative quality of liss string of beans to a would. be purcuaser, io daes cot beta sold if he can help it, and contrasts by his iraperturbable decision, the demonstrative eager ness of the vendor. A young girl leaning within the doortway makes up the numbor actors in this ordinary scene, whioh is estraor-
dinarily well painted. We shall try to visit the dinarily well painted. We shall try to visit the Dudley Gallery again.

A SACRTEICE AND A WARNING.
Crace Calvert, the well-known chemist, dead, and was buried on the 29 h ult. He died of typhus fever, caught in Vienna, making another victim to tho insanitary state of the capital city of Austria.
Mr. Crace Cavert of late improved the manu facture of carbolic acid in all its forms, to be used for purposes of disinfecting and preventing disease which might be caused or aggravated by dirt; and yet he dies by what has aptly boen termed "the dirt fever."

Mr. Calvert had gono over to Vjenna to ju ite and spread the sale of his carbotic acid its varions furms-as a soap, as a fluid, as a firmly in its power to prevent disease; as, also, that, to a great extent, the fluid preparation might be taken as a cure for disease. Alas it did not prevent nor cure in his case. The lesson to be learned from this great loss and sad case is, Do not put too mnch trust in disiufect. ants, as putrid cesspools, and stagnant, corrupted atmospleres, will kill in spite of disinfectants. A city with corrupting rcfuse
In 1863 we made some co
onal absorrations in Yiennments, from per resh air in the houses and other unhealthf conditions, and wroto thus :
"There must bo other deadly agencies in operation in Vienna if the aunual death-rate offcially reported ho correct. In London, on an average of ten years, twenty.four porsons out of every thonsand die oach year, and this is greatly in excess of some of the healthiest parts of England, where, as at Eastbourne formerly, for example, only ffteen persons out every thonsand, die cach year. Even in dis. tricts of London, sisteen or eighteen in the Vienna an average of forty-nine persons out of every thonsand die each year; so that if the population be taken at 580,000 , -which is pro bably correct, 11,500 persons dis evary yead Londan. Much of this frightful waste of life, and its accompanying misery to survivors might surely he prevented. Here is a noble work that wants doing. We recommend it to the atten. tion of the Emperor. A commission of inquiry should at onoe bo issued (not to-morrow, hut to-day) to a certain number of enlightened, dis. interested, and instructed men, including, if it could be arranged, two or three Englishmen Who have given special attention to tho subject. Cunses heing made evident, remedies conld be pointed out, and weakness, misery, panporism, crime, and death woald be lessened, just as oertainly as that good food, if taken, will nouriah and prussic acid, if taken, will kill. Would it not be well, 0 Emperor, that history should say: 'In the reign of Francis Josoph Charles, life was lengthened, and sorrow abridged in the city of Vionna
If these words had reached the ears, and convinced the anderstanding, of those who bad power, and so led to works of anelioration, thousands of lives and millions of mouey might have been gaved. The amonnt lost during this Exhibition year alone, through the unhealthy state of the city, which has kept away visitors,
and made the Exhibition a farlare finanoially, is far greater than would hare been expende.
rendering the city fit for healthful existence.

EETENSION OF THE METROPOLITAN AND ST. JOHN'S WOOD RATLWAY.

The Metropol way company aro immediately about to com-
 down a double line of rails, aud also to extend their line by constructing new branches from the Swiss Cottage to the Finchloy.road Station of the Midland Company; also to the Hampstead Junction of the London and North-Western lino, near the Edgeware-road; and likewise a new branch line to Kingsbnry, where extensive workshops and engine-sheds aro about to be erocted by the Metropolitan Company. The porvers to construct these new works were obtained in the last session of Parliament, the Parlinmentary committees also giving the Metro. politan and St. John's Wood Company power to run goods traius on their liue, whioh, under the 88th section of a formor Act, they wero pre rented from doing. The company's proposals were strongly opposed, more especially that to run roods trains on the lino on the gromnd that valnable property in the neighhourhood, consisting of high-cless bonses, would be seriously injured hy shaking and vibration. On this point there was a remarkahle conflict of evidence before the Parliamentary committees, and the question whether on the one hand builders are not eagerly anxious to build over and imme diately on tho margiu of railways, or, on the other hand, are absolutely deterred from doing so through fear of vibration, was brought pro minently forward. The following extracts from the eridence given by the several witnesses examined for and against the proposal will be interesting to all persons counected with build ing operations, as woll as railway construction generally. Vibration and injury to buildings in the immediate neighbourhool of railways was the main point under consideration during the wholo of the inquiry.

Amongst the witnesses examined ou bebalf of promoters of the Bill was Mn'. J. S. Forbes, the managing director of the London, Chatham, and Dover Company, and also chairman of the Metropolitan District Railway. In answer to the question whether any injury arises to pro perty or any serious incouvenience to the inta bitants by the vibration caused hy railways, " Veplied in the negraive, and then remal. It is a very convenient thing to raiso before com mittees, and a very convenient lever for compensation hut the practical view of it is this, that whero you have railways in taunel or in cutting, you alwars find people willing to busild honses oror the tannel or hy the side of the cutting. Within a very few yaris of this building [Honso of Comme St Stors Lhonso Comaly buit orer the District Railway. We have different parts of the suburbs of London, which has actually been built upon over the railway; and a great donl more whero they hnild close up and a great don more whero they hnild close up
to the railway. Those who are familiar with Camden.town know that people have built there up to the very banks. There is nothing in it except in these rooms. The surveyors, when the Bill is passed, very soon gettle the vibration value. Judging by erperience, I have not found that there is any deterioration in the valuo of property by the proximity of the railway, buti quite the contrary. The rents of the houses on the railway with which I ann connceted have been enormonsly incroased since I have been connceted winh hem. As I have itad, the St. Stephon's Club are building over the rail may. We sold them the land. Hey were not satisfied with huying the fand up to the enge of the tunnel, bit they woula insist upon having the land over the tunnel. * In answer to the question as to whether any special modo was adopted for counteraoting vibrations, he said there was not, but added, - "We had some questions as to the foundations of Weatminster abbay, in tho Metropolitan District Railway, and there were additional precautions taken
with reference to that building. I think thero

* They are buildng over the railway, and have actually iovered over what mas an open part of tho railway with
iron girders, which are to carry the supcrse ructure of their irongl
clui.
were more solid retaining-walls and inverts. were more solid retaining-walls and inverts.
Wben you are doaling witb a building liko Westmineter Ahhoy, you cannot allow a shade of a shadow of a doubt, and you take preoau.
tions which in an ordiuary building would be tionsalled for." In oontinuation of his evidence, he said he had found in his own experience of the London, Chatham, and Dover Railway the increase of tho value of property that took place hy the vioinity of a railway, "We know that,"
he observed, "perfeotly well hy the rating returias, and by the enormons increase of new houses. All the way from tho soutb bank of tho Thames, whetber you go from the Elephant and Castle side or from Victoria, you will find houses growing ap in onormous quantities, as
far as Sovenoals." On being asked if ho had far as Sovenoaks." On being asked if ho had
found any deterioration in the value of property along the Metropolitan Retilway aud the Metro. politan District Railsay in consoqnence of the rail way, bo replied, "I give my own experienco. I havo lived in Pbilinore.gardens, Kensingtou, for ten years, and I wanted to got out of London, and I sold my bouse. I gave 3,0001 , for it ten Years aro, and whon the Metropolitan District $6,000 l$., and I think some neighbours of mine have done botter stjll. I have had as much exponience as
because I have heon connected with most of the railways about London. These outcries as to vibration are stock complaints,-they are good levers for compensation. On the very edge of the cutting's at Paddington and Euston.squaro the railway was made. Mr. Myles Fenton
Mr. Ifles Fentow, general manager of the Motropolitan Railway, said it was the fact that houses were constantly heing built over their
railway. Tho oompany had considerahle plot railway. Tho oompany had considerahle plots
of land odjoining the railway, and parties of land odjoining the railway, and parties
eagerly songht them, and actually built, not only over tho railway itsolf, but also on the walls only over tho railway itsolf, but also on the walls
of the railway. He would not gay tlat there might not besome vibration; hut, as he told the committee, they had persons living over tho
railway, and persons huilding houses on the railway, and persons huilding louses on the
walls of the railway. He did not think they would be likely to huild if they fcared vibration. They had large bouses in Cambidgesquare where people were living on the top of the rail. way, -houses worth from 400 . to 4502 . a year.
One of these houses was bnilt absolutely over One of thes
tho railway.
Sir Edward Watkin, chairman of the Metro politan Railway, gave similar evidence, stating that he did not find tbe vibration on the Metro. politan Rrilway was at all a source of annoyanoe
to people. He had found that, notwithstanding all the objeotious raised upon the question of vibration, people were not unwilling to come and take houses along the line of the Motropolitan a now demand for property at higher prices. The Metropolitan Company proposed to take ahont 40 acres of land at Kingsbury, on which to buik ongine and oarriago shops, and also
residences for the workmen. Ho did not say it would improve the neighbourhood for nice lonses, but ho should still bo dolighted to buy the whole of tho land within a mile of the place He wonld give $150 l$, an acre for it.
Mr. Edivard Wilson, C.E., who had had the superiatendence of the East London, Great Tustern, and Metropolitan Railwayg, said that in his experienco of building, people did not so como to you as a rnle," loo said, "and when yon got a railiway opened, tho builders come to it. Tho District Railway runs right in front of Somersot House, and I have never yet heard a clock-tower of this House, and we have to the clock-tower of this louse, and we have never
heard of the clock losing a second of time or showing any effects from tho vibration." In opposition to the proposed works several architects, surveyors, and builders, as well as
ownors of property alonr the line were called Their evidence was to the effect that tho honses in the neighbourhood of the railway had alleady in the neighbourlood of the railway had already
severely suffored from the vihration caused by severely sufored from the vihration oalused by traius boing allowed to run, the property would Mr. Puillip bured
that the walls of ailder, in his evidence stated that the walls of a houso which he bad erected the vioration causod by the railway, and that he he shakingore his workmen in consequence of the shaking caused hy the trains.

Mr. N. F. Dawe, architect, said that ther were cracks in several of his honses, caused by tenants had left rimay, serneral of hi benants had lek. They complained that the Vibration shook down the olmaments. He had intended laying out $30,000 \mathrm{l}$. in building highclass honses on land wbich he had purchased from Lord Portman, but if goods trains wer
to be allowed to ron on the line he should no do bo

Mr. James Blythe, buildor, gave similar ovi dence. As a residant in the neighbourhood for seventcen years, he spoke to the injuries which the houses noar tho line had receised from the worse if cods wished to erect sever were allowed to caich bour hood, but should not do so until the decision on the Bill was given.
Mt. Aloxander Peebles, district surveyor, also deposed to the injuries which the houses in the neighhourlood of the railsay had sustainod by vibration, illustrating the case of bis own honse, here, on the occasion of a friond diming wit train almost shook the fork ont of his friend's hand. Henry Logg, architect, who had erected Trinity Church, in the Finchley-road, which was situated over tho railway, said in his evidence that the tower had not yet been built, and that the inereased vibration cansed by heary goods trains passing along tho
unsafe to build the tower.
Mr. William Todd, architect and snrveyor, stated that he had heen professionally engaged upou several bouses and a churcb which had The ohorch had sustained considemble structay damage hy two of the columas of the nave arobde baving split
After a prolonged inquiry, cxtending over upwards of a fortnight, the Bill authorising tho construction of the proposed works aud the
ranning of goods trains was sanctioned, with the ranning of goods trains was sanctioned, with the
proviso that no such trains shall be run between proviso that no such trains shall be run between eleven o'clock at night and six o'clock in the morning.
We understand tbat tho new works are in. tended to be carried forward with all possible speed, with the view of the janction with the london and North. Western and the Midland stated that the Metropolitan Company will take over the line, and uadertake the conatruction of the new works.

## ANTIQUARIAN RESEARCHES

The greatest possiblo service is heing ren. deret to our national archroology by the publi. cation of the Roman inscriptions and sctiptares discovered along the line of the great Roman drawn by the $\quad$ repeated attention has been liftlle aware of this event (for such it may be correctly termed), that auy notice of the under. taking will, it is hoped, be welcome to all who are anxions to know something moro of Roman sonrces of information eqrent under tho name of general history. The work is being prodaced under the auspices of the Society of Antiqnaries of Newoastle-npon-Tyne, by tho man bost qualitied for the important task, the Ruv. Dr from . Dr. Bruce's "Roman Wan soon grok edition has been published; but the matorial specially applicablo to bistorical purposes were so extensive and so continually increasing tbat sometbing was yet wanted; and thus the "Lapidarium Septeutrionale"'* is being printed to coinpletoand make aocessible these records soncees. sary for fully iuvestigating tho Roman poriod of the history of our countiry. Au andertaking such as this, demanding not only montal and physica] qualifications, but also serious pecunary means could not be entered upon withont care and prndence; hut where earnestness is combined that sympty conscien iousuess, it is seldom late Dulse of Northomberlane withheld; and the and tho Society of Antiquaries of Newcastle cordially and effectively supported Dr. Brace, who, under their assistance, is now bringing the noble volume towards a close.

Horsley and Hodgson had done mach to prepare the way; but the "Britannia Romana"
and the "History of Northumberland" are and the "History of Northumberland" are latter is without engravings of the iuscriptions, the formor entirely fails to represeat their trae charncter; and the sketches of the sculptures are almost hurlesqnely unlike tbe origiuals. Such monuments demnad the most careful and accurate treatment. Scrupuloas fidelity is imperativo; for very often tbe correct reading of an insoription may depend npon a letter or a igature; and the artist, if not trained for the purpose, should always he assisted by a pracartistio effect be may uever sace matilated or imperfect inscriptions, add a stroke from conjeoture. It is for the antiquary to restore, accorling to tho hest of his judgmont, whicb is inseriptions from the lone line of the Wall itself and of the atations to the north and sontl of it, Dr. Butuce has added the military diplomas of Trajan and Hadrian, the earliest documents yet discovered in respect to the Roman forces in Britain in tbe time of those emperors: these bave been preparedia facsimile under thosuperin. tendence of $\mathrm{Mr}^{2}$. Franks. The enamelled bronze cup, witb rames of some of the stations on the shire, is introduced in a well-engraved plate, and the guperb silver lans, richly adorned witb mythological subjects, whicb was discovered at Corbidye, has never before been so well repre sonted and discussed.
The general arrangement of the "Lapidarinm "is as follows:-Altars and slabs dedicated to dcities; tablets erected to omperors; stones inscribed with the names of legions, alw, cohorts, aud centuries. Then follow scalptured stones without inscriptions, with other objects, of whatever material they may bo made; all arranged under the loonlities where they were discovered. It would be utterly beyond the hounds of a notice such as this is to describe any of these valuable monmments so as w rencler adequate justice to their merits; but to convey some notion of the scheme of the work very abridged description of Procolitia, the extracted, - not according to the Aotitia, may be but because Mr. Clayton, to wbom the district fortunately belongs, is at the present moment making excapations there wich liave yielded several new inscriptions, to which reference will robably he soon mado in the Builder.
The site of this station, now called Carrawbirgh, is open and exposed to the weather and winds from every quarter. $I_{i}$ is a little to the sonth of the great Wall, and contains an area of about three acres and a walc. Fere tho Notitia Cohortis Prime Batatomam Procolitia. Two inseriptions discorored upon the spot eonfim the Yutitio One is pron an altar to conctione the M. Flaccinius Marcellus, Prefect of the First Cohort of the Batavi, the other erection of some building by the same cohort in the time of the Emperor Maximinus, when Perpetaus and Cornelianus wrere consuls. The Batayi are mentioned by Tacitus as being in Britain under the comniand of their own chiefs; ad the same historian describes them, together with the Tringri, as materially contributing to ecure to Agricola the viotory at the Grampian Hils. They are also recorda upon Hudrian's diploma as heing then in Britain. Here we find hem in the time of Maximinus; and the Notitia, as befere observed, shows whore the first cobort was quartered whon it rias compiled at a later period. Another inscription proves that the first chort of the Aquitani was, at some period, tationed hore, prohah!y in the time of Hadrian, hea, from one of his diplomas, we know it was in Britain, and uader Aulus Platorins Nepos, hose uame is associated with that at Carrawonrgh. This station, like otherg, is fertilo in wat are called conturial stones, recording as cone io companies under centurions, as the century of Caecilius Proculus, of the fifth cohort; the century of Gellius Philippus, \&c. Sometimes the meastrement of the work is given, as "the century of Florinus, twenty-two paces." On some occasion, a further iuscription informs 48, the sixth legion, or a portion of it, was present, having beeu moved fiwm its permanent quarters at York. An altar, orected by Tran. quilla Severa for herself and famils, has the dedication headed by the letters D. M. D. Dr. McCaul proposes to expaud them to Deabus

Deer Matri Doum, observing that it is not usual to iadicate the names of obscure local deities by single letters. On another inscription (of a class common to the region of the wall), which has boen lost, Dr. Brnce remarks that "the dedica, tion may be deo veterr, "to the ancient god," a dedication not less common than deo virish. The sculptures from this station represent Mincrya and a portion of another figure with her; and Neptune, or a river god; on which Dr. Bruce's remarks will he read with interest. A work so important as the Lapidarin Septentrionale" should he in every puhic too highly; and, no doubt, from the limited namher printed, it will soon become unattainable at its present price. C. Roscr Syiry.

## STATISTICS OF CAMBERWELL.

Tefe opening of the new vestry-hall at Camberwell, last week, was the means of hringing before the public a number of highly interesting before the public a number of highly interesing
statistics respecting the enormons expansion of that parish, and which show the immense that parish, and which show the immense
amonnt of building which must have been con. amonnt of buinding which rust have been con-
tinuously going forward in the district for more tinuously going forward in the district for more than half a century past. Tbe area of the parish
of Camberwell is unusually large, occupying of Camberwell is unnsually large, occupping
$4,3 \% 2$ acres, and extending from the Crystal 4,342 acres, and extcuding from the 1 Man-gate, in the Old Kent-road, and thence to Man.gate, in the old Kent-road, and thence to
New-cross. Its great increase within the last century is proved by the fact that whilst in the year $\mathbf{1 7 7 3}$ the population was nnder 3,000 , it is now, in 1873 , upwards of 120,000 . The number of assessments in 1773 was 517 , and the rateable value of the parish, 13,2332 .; whilst, in 1873 , the nomber of assessments was $21,110,-$ an incroase of 20,593 , -and the rateable value, 575,5992 , or an increase of 502,3662 . Dnring the half. contury between 1821 and 1871 , when the last consus was taken, the increase was marked and continuonsly rapid, the population in 1821 being 17,867, whilst in 1871 it was 111,306, or an increase of 522.96 per cent. The statistics also show that the relative increase of population in the neighbouring parishes has not been half so great within the same period as that of Camberwell, for we find that the increase in Lamheth is from 57,638 to 208,312 (no douht a very large expansion), or an increase of $261 \cdot 46$ per cent.;
Nowington, from 33,047 to 88,722 , or $168 \cdot 47$ per Nowington, from 33,047 to 88,722 , or $168 \cdot 47$ per cent. S St. Ceorge the Martyr, from 36,36S to 56,077, or $54 \cdot 19$ per cent.; and Bermondsey, from 25,235 to 80,429 , or 218 ; 72 per cent.; thus showing an enormous per cent. in favour of
Camberwell. The increase also in the popula. Camberwell. The increase also in the population during the last two years hetween 1871 and
1873 , heinc now 120,000 as against 111,000 in the former year, showing an increase in the population at the rate of 4,500 (or nearly 5 per cent.) in each year. The statistics again show that in the two last decades, between 1851 and 1871, the population more than donhled itself, the number of inhabitants in the first-named year heing 51,667 , whilst in 1871 , as we have already stated, they numbered 111,000 . Within 8313 the period the number of ho 912 as agains 17,755 in 1871 , or an increase of $88 \frac{1}{2}$ per cent At the present time thero aro 4 miles of main drainage within the parish, 50 miles of sewers, and 45 miles of publio roadway, in addition to a large numher of streets made by private owners, which have heen taken over by the parish. In the several streets and thoronghfares there are 2,300 lamps, which are constantly heing added to. Buildiog is still going forward at a rapid rate in the parish, several large estates having heen laid ont in streets and now being huilt upon. These include the Denmark-hill estate,
formerly the well-known Denmark-hill gramamarformerly the well-known Denmark-hill grammar-
school; also a large area of land in Peckbam, several years past as a cricket-field. These two several years past as a cricket-field. These two
estates alone are laid ont for the erection of estates alone are laid ont for the erection of 800 to 1,000 honses, and a considerable numher has already heen built, whilst others are at present in progress. Notwithstanding this remarkable expansion of the popnlation it was stated incidentally last week, during the pro-
ceedings in connexion with the opening of the ceedings in connexion with the opening of the hall," that Camberwell was not nearly hilt of land to he had at reasonable prices, and plenty of room for houses to be huilt.

A viex and plan of the Hall will be found in our
umo for 1372 , ph. 238, 257. Mr, Power is the architect; volume for 1372 , pp. 28,
Mr. King, the builder.

THE CITY ARCHITECT AND EXTRA PROFESSIONAL SERVICES.
Ar the meeting of the corporation last week the Officers' and Clerks' Committee brought up a report recommending that Mr. Horace Jones the architect and survefor, be paid the sum of 5,000l. for extra services in connexion with certain completed works, which wero not contemplated hy the terms of his appointment. The report stated that had the outsido profession beon employed, the professional fees would have been:-For the Meat Market, $14,000 \mathrm{l}$; restoration of Guildhall, 2,300t.; Foreign Cattle Market, 5,6007 . ; new library and museum 2,5002 .,-showing that a saving of $21,000 l$. had been effected after deducting the expense of the necessary addivional dranghtzmen. The report further stated that in the judgment of the comwittee it was bo:h just and right to recognis the special services of the architect, as they believed the works he had oarried out did honour to the corporation, and were highly oreditahle to
his professional talent. After some discussion, his professional talent. After some discussion,
it was resolved that the report of the committee it was resolved that the report of the committee
he printed and oircolated, and ita consideration he printed

SIR EDWIN LANDSEER AND ANIMAL LIFE.
Amidst the perplexities and disappointments of life, it is sometimes not a little consoling to discover, by accident or otherwise, that you have been, after all, to some extent right. A crude theory, not a little doubtful perhaps to not a few, tnrns out true, and its truth comes to be vorified by something which no one can dispnte.
We have, time after time, urged that the hand We have, time after time, urged that the hand of the artist is a prime necessity to enable him to interpret the inner thought that is in him This, when plainly stated, seems almost a truism needing no sort of proof, yot, as we know, the praotice of the time in which we live is not a little adverse to it in very many sorts of ways. Art manufacture, or the production of art hy a number of more or less able hands, working on the art object in succession, and taking it up one after another, is the method of art production now almost everywhere in vogue. It is in painting that the principal exception lies. A painting in the rooms of the Royal Academy may fairly be instanced as an example of a work of fine art,-hy the hand as well as the mind,-of the artist exhibiting it. We conld say not a fittle on this generalising theme. Our thoughts have again heon drawn powerfully to it hy a engramination of the series of etchings and engravings and lithographs of the admirable Edwin the late great animal-painter, sir now in the rooms of the Messrs. Craves, the priatsellcrs, of Pall-mall, and in these works may he secn the sort of mastcry which the oxecntive artist and artist workman in Sir E. Landseer had over the forms of animal life Whimal life was the phase of nature which Landseer delighted in. Dogs and horses he never seemed to be tired of looking at and making notes of, and drawing and painting. It their rendering, and on the special work of their copyists and engravers, that we would ventur word or $t$ to
In the first place, we would almost recommend the student who would really wish to profit hy the study of these works of Landsecr's to pay a he Zoological Cardens, and to look well at the nimal forms and morements therein to he seen There ans a fruwhots, it is true but
 11. 1t was the actunlities of znimal existence nd 16 noved ing way or ans in that the panter loved to note and portray; so that he more the stndent looks at and knows yill manmals tho bola it appreciale the me painter and drarmitsm of course to he painter and dragglsman. of course to hose who can soe into the lite, if but a litie, of the creatares the wil be needless to ay to him that to find th real uature and wonder of the animal existenc and ways of life we mnst needs go to the animals and to their haunts. They will not come to us, except on compulsion, and by dint of more o less of tuming and consequent loss of nataral expression. To those who cannot do this, then, a zoological collection or an animal "show" is an enormous help, and can hardly ho too much
prized, or too often visited. It is well to panse
and dwell for a moment on the importance of the distinction between the will and the tame or domesticated animal. Landseer, he it observed and the thonght is somemhat new, stndied animal life nnder both aspects; but, perhups,
unfortanately the most popular by far of his unfortunately the most popular. by far of his
works, both paintings and their engraved copies, works, both paintings and their engraved copies,
were those suhjects in which the animal formas were those suhjects in which the animal forms
and gronpings were of domestic and petted animals, and the groupings and composition invented and artifecial. Tbis is well worth note and we should he disposed broadly to divide his works into two main divisions or classes ;-those in which the animals represented are in their wild and native state, and those in which they are domesticated, and, so to phrase it, postured and groomed. This broad distinction, which to many may seem a slight one, but in reality is not, is well and significantly represcnted and typified in many of these engravings and etohings. One, and probably to many farailiar illnstration of this distinction between animals and their ways in a wild, as contrasted with a tame state, will be found in the "Otier and Salmon," engraved by J. R. Jackson. It mus have heen a very clever and slippery salmon which could have escaped from the savage jaw of this supple hrute. No tamed and ohedient otter conld look like this one, and the painte manst have studied well, and looked often and long at "otters," to have canght the wild expression as here to be seen even through an engraving on steel, not the best of mediums, by the way, through which to see into otter existence. Quito study for a stone carver. No conventionality eeded, aud certainly no effort of invention coula see anything more than Landseer conld hat see the animal itself in its fish-capturing ways!
Other aud remarkable examples of wild animal existenco will be found in a series of small round otchings of deer and dogs in the Highlands, These little sketches seem to us to be thoroughly characteristic, and to have come from the heart f the painter. One of them, called "The Watch-tower on the Hill-side," takes fairly to the place itself. The deer on the look out for angrer from the side of a desolate hill. Anothe, sabject, Doomed, another named, "of. They could na but catch he wind." Such things must needs be seen under difficulties, too, as Turner looked at snown torms at sea: they cannot, with all man powers, be invented. The "Dead Deer," the "Eagle," and "Missed " are other subjects worth all the study tbat can bo hestowed on them; for if there are those who cannot go and see the realities themselves, then they may, throngh the keen eye and ready hand of this great animal-painter, sce them almost as well, and certainly more safely and comfortably, in these masterly drawings. The three dogs in full chase, in the lower left-hand corner of the frame, could not be surpassed. And while in these small drawings, so much fuller of life,-animal life,-to our minds than the larger engravings, and the more showy and popular snbjects,-you see less of the means and more of the snblyect,ve would point also to a series of small photo graphs taken from the walls of some Highland castle, whereon Sir E. Landseer drow roughly some deer and other suhjects with singular force and life-like trath. The watchifn animal in the centre pancl is wonderful, in truth of form, as are the indications of the surrounding conntry. We name these small suhjects hecause they are little likely to he missed, being eclipsed hy the more showy and larger bograved works around them; hat they were evidently executed for the mere love of the work, and at moments when the painter was in the true humour for it. All thanks to him for thus leaving his hand-writing for us to read, each as we may and can. It is ruly unfortunate that, as us, these small photographs are northern costle, for it has suffered since by fire, and these clever paintings were destroyed. A something truly nohappy; for these light and ketchy works of love, and power of rapid band, are always hetter in many ways, and more powerfal than the more painstaking and finished worte of the studio. There are no "models" of ony lind to po by, the subjects exist in the mind, and find outward expression at the fingers mind, and little work may here he points. Another little work may here host speciaily narmed, -a small pet epaniel, most
clererly etched by the painter himself at Buckingham Palace. It must have heen greatly buckiagh or it is ertainly a true and life-like admired, for it is certainlerfully exented with bot a fem stroles of the needle.

We could thus go on, and particularise not a wron of these productions of Landseer's, nd to do full justice to them would require a olnmo; hut we can but indicate the way to
ook at them, and offer a hint here and therc, ook at them, and offer a hint here and therc,
vith a tributo of admiration. It scems a pity hat they are not arranged in the order of thein late, or suhject, or in some way which would
ndicate the special faculty of the artist at the ndicate the special fe
ime he did the work.
ime he did the work.
We have spoken of the Zoological Gardens, nd would fain believe that Landseer must have tudied well the familiarly-known white bears here, and their singular ways. They never seem - have forgotten their life, short as it was in the rozen North, and the painter must have marked hem night well. At all events, he has, as may iod disposes," taken full advautare of the nowledge thus got at. It may not ho quite so trange as the life of the Polar hear on lis own
ce-flow, but it is very striking and admirably uggestive in its way. The engraving is hy homas Landseer. May we not here asle, is not he lify of the painter generally ratlier too mnoh $f$ a homc-spun existence? Polar hears oan carccly be made to go through the antics whicl andseer's dogs 80 good-naturediy did, -to neetings, -aud yet, too, all the time retain thoir avare and solitary isolation, and indifference to he genteel conventionalities of modern human xistence. We really know of nothing more ley first make their appearance at the Zoological luey first make their appearance at the Zoological
lociety's Gardens, and to note, which we have ften and often done, the ways and strange look f the creatures in their new and nnaccustomed arrow cages, so totally different from the place
bey came from. After a while this disappears; hey get used to the place, and to the good-natured mportunities of visitors; they get tame, and, to ud isolated nature is subdued. Is this a gain a loss f What did Landseer think
We cannot wind We cannot wind up these few thoughts with and of Landseer, the two "Black Dogs." These apitally-drawn animals werc produced hy tb ainter witl) tho point of a charred stick, in a arv seconds. It wonld he difficult to find any.
where, or hy auy master, a finer drawing. It hows what can be done when you know well zow to do it,-with a clear head, a grood eye, and an ohedient and fexible liand. It is not in Le catalogue of his engraved works. It leads ack to our first thoughts on the power of hand fthe artist-workman, and to the way in which nis great painter of animals rendered them, xpression, if but for a moment he abaudons to thers this gigantic executive instrument. By to sorto of possibility could any one, howerer
hle, have helped the painter with this drawing. $t$ is all his own work, and nothing else. It hows how he saw the dog-nature, and how he ould communicato to others what he himself law so vivid y, and loved so well. It is satisfac. ory to know that the Royal Academy, of whicb
Landseer was so distingulishod a member, is to avo an exhihition of lis paintings. We trust 2avo an exhihition of his paintings. We trust
bey will be classified, and, more than all, that bey will be classified, and, more than all, that
he exhihition will iuclude, if possible somo of he exhihition will iuclude, if possible somo of is in the lighter and more rapid work of such
then master as Landseer that the true power lies. lhe working artist then is visible, and the rapid and fleeting moments of the wild life of these vonderful

## ARCHITECTS' DIFFICULTIES,

AT tho last general meeting of this Society, the president, Mr. J. Murgatroyd, delivered tho ollowing address:-
The poculiar position in which an architect is olaced, by his relations to his client and the unilder,-the desire to achieve or maintain a eeputation,-and the fact that his works are not or the cahinets of the fers, hat are exposed to
he view and the criticism of the public, - pre. sent many diffeulties, the surmounting ohviating of which forms often no mean task. Among those which at tho present time force themselves most prominently on our notico aro,
frstly, the difficulty of getting our works cxe. cuted in a reasonable gemont of time; and scooudly, that of securing what we consider the
proper quality of materials and workmanship.
The former is douhtless, to a very considerahle extent, caused hy the fact that the high wages earned, aud the consequently short time worked hy the operatives, have told upon production more rapidy than the laws of supply and demand have had time to halance hy bringing a suffient extra numher of hands into the market. There are but few hranches of the building trado into which any appreciahle number of new hands can be imported from other aud less highly remune. rated callings, and I am of opinion that it is mainly to the rising generation that we must look for any alleviation of our wants in this respect. The increasing use of stone, as a material for facing our buildings, has thus received a severe check, much to be regretted no douht; for magnificence in huilding and the nse of costly material go hand in band.
Apart from the great cost of working stone hy hand lahour (and no other method can prodice ther than mechanical-looking results), we must have frequently regretted the delay caused by the non-appearance of frequently-promised and long-expected hlocks of stone, the scouring of quarries for them, and the admission ultimately of a matcrial of a different texture or of colonr varying from its neighbour,-no small drawhack in this smoky atmosphere of ours, the canse hcre being, I presume, that gnarrymen find they can ohtain hetter remuneration by working at piecework in hlasting limestone for nse at iron-smelting works, or in mining, or other occupations of a kindred nature to quarfills their pockets better than the care and judgment required for our purposes.
Our only or ahnost only otler suhstitute for tone, superior hrick, finds us in almost the same difficulty. Instead of hrick-makers,-or, in their
place, companies possessed of capital, place, compazies possessed of capital, -- taking hivery and thes of hrickmaing, and hy mamproved the nse of Ilofmann's or other ion of hilas, securing the effectual prosecuround, independently of the weather and of brickmakers' onions, while ohtaining at the same time a fair return on their capital, the manufac. ture is still mainly carried on in a primitive nanner. Thus we have to use a material which one year may he had and another good, according evere weather has been unfavourahle or the vour to and at all times ode in which the endea expensive fuel, coal, results in the production of hrichs of so soft a nature and so irregular a slape that we are compelled to use more ponought to he the case
As regards iron, the reports we hear from the irou and coal districts show that so long as the mount of labours can he procured by a smal dearth of that metal and delay in procuring it, and that we nay have again to revert to tbe use of those materials of which it was so satis. factorily and increasingly taking the place.
actorily and increasingly taking the place.
In devising new modes of construction
architects are at a disadvantare under which, I think, no other profession suffers, in introducing a novelty into its practice. We lave not only to deal with security to life and limb, but with that ery sensihlo harometer-the pockets of our clients, 一and while every advantage is theirs, the everse falls on us most unmercifully. I do not, therefore, see any immediate channel of escape flluded, so far as first-class buildings and those to sustain heav weichts ass buildings and those others, such as cottages, villas, and other light buildings, where a return on the outlay is of primary consiceration, there is one which hitherto has met with but little favoar in this locality allade to the use of ceneent, more particularly to cement-concrete. We have all the materials cheap and at band. Broken stone, ruhhish from stone quarries, \&e., could he procured in any quantity, and, with lime, clay, and coal within easy reach, there is no reason why in this district the manufacture of cement on a large scale houldings, I pay pursued. For suitahie kinds of filly be used forment-concrete might snocess. advantage of securinar greater rapidity of build. ing, sufficient durability, the use of less expe. rienced labour, greater certainty of quality, and goon resistance to the weather.
There is, no douht, a great prejudice in the profession against the use of cement, except in las genernily hat this, I think, is becanse it las generally heen used as a sham; hut the
sooner we recognise its valne as a building material, and learn how to treat it as suoh, the better. It is not hy ignoring the use of a new material, or the novel application of an old one, that enginecring has separated herself from architecture by such giant strides. Where comznon sense, guided hy the results of scientific investi. gations, points to the proper use of that which we have hitherto disregarded, we onght not to he slow to folloty her indications, bearing in mind that what we do he done well and sufticiently.
Torning now to the other hranch of this sub. ject-that of the quality of materials and woikof procirine all know and regret the diminulty procaring these of the proper standard, and I am not inceresting to discover the reason why fault. The modern builders are altogether keen competition have, no contracting and with it. The huilder, in the proper interpreta. tion of the term, hardly exists: be has hecome a contractor, not one who understands construc tion, and whose opinion may be sought on points of actual experience and the knowledge of ma. terial, such as were the huilders of a quarter of a century agro, hut ove who undertakes the exe cation of work by others, not chosen for their ahility to do it, hut by reason of the price they will do it for
 tention to drawing, to the exclnsion of acquiring a sound knowledge of construction and mate rials? I am also ohliged to come the con clusion that the habit of desicning too ambi tionsly for the funds at their disposal has done much to foster the difficulty I have alluded to It is, ro doubt, hy no means easy for an archi. tect to resist the moral pressure often put on him by his olient or committees, who urge the small cost of other buildings, or the athility of otber architects, under circumstances which may not be fairly analogous to the case in hand; and in competitions we well know how apt a committee is to he misled hy the specious promises of competitors. How often the fear of losing commission, or the hope of caining one, leads an architect to a too favourable view of his posi tion,-all ending in his showing on paper that which he may find it impossible to carryout well and thorouglily. Then comes the reduction of every element of strenoth and solidity to a point verging on iustahility and the searching out of those who will undertale the worle at the least possihle cost-men, it may be, inexperienced, or of little capital, who catch at straws like the drowning man-those who undertale work ruinons prices in the hope of clearing themsclves by a good hill of extras. Thus are the men of some reputation in their calling, who have an honest intention of doinc properly what they uudertake to do but who cannot do so without that wbich ought not to be hegrudged themfair profit-elboved ont of the way
Thanks to the existence of this society, many of the fears that I have attempted to depict 1:0 louger exist for the architect, or at least tiey are, to a very considerahle extcnt, reduced loy tho hetter feeling that has sprong up amongs us since the society came into existence; and I think it will be very much to our henefic, and to the real benetit of those who honour us with their contadence, if we set our faces resolntely ngainst this letting of our work at any price Bat to do this, some time must be devoted to acquiring that whioh is too often ignored-a knowledge of the valuo of materials and latour. Nor must we he anmindful that it will he also to our alvantage that the builders of the futne do not degederate into mere entremenews witbout a knowledge of huilding at all as a soienco. I cannot, therefore, look upon the efforts which some of your body have been for some time making towards the technical edreation of the workmon, hy means of the Building Trades' Institute, otherwise than with stroyg hopes of success.
But why should we stop here? Can we nat look a little nearer horae, and do sometbing for have often desired toced us as architects? 1 architects dupils and place withia the reach o advantages which lie within the reach of thes brethren in London. some mer of their lnowlede of then profession which to to to lained in profestime of offee bol to laraed in tbe bysy time of onice hours, and hat in a more ystematio mander haa mere individual, mndi It is well known to all of us, that the office is
$r_{\text {ather }}$ tbe place for the stadent to obtain a knowledge of the method of carrying ou the business of an architect than for studying architecture ; indeed, the former alone wonld occapy
all, and more than all, of the time usally devoted all, and more than all, of the time usaally devoted
to an apprenticeship. Are we not constantly to an apprenticeship. Are we not constantly
grieved at seeing the productions, and the illus. grieved at seeing the productions, and the illus.
trations of productions, of some who imagiuo trations of productions, of some who imagiuo office, they have earned the right to assume the title of architect? Mow their efforts show a
total ignorance of architeoture as evidenced by total ignorance of architeoture as evidenced by
its history and the knowledge of styles? A its history and the knowledge of styles? A
total inappreciation of proper harmony of pro. portion and balance of parts? An incapacity to perceive that features aclopted ad captanduin from one and another period of architecture are totally unfit and incopgraous wheu brought together? Most disastrous, in my opinion, is the striving after prettiness, and the constant and laboured variety and exuherance of meauingless excresceaces, to the total destruction of ly its very material, shows that it is intended to remain where it is placed for at least a generation.
Can we not, I ask, do something more than we have done to counteract this tendency? We have, it is trne, puhlished a list of hooks which it is desirahlo the student should make himself akquainted with, and pointed out where many
are to he found for his free uge. We have also cre to he found for his free use. We have also in Mauchester offices; but knowing that study, to be of value, must be pursued systematically and out of ofrce hours, would it be impracticable to establish for our pupils some institute, snch as the workmen have dote for tbemselves, drawing, the deassing of ornament, some know ledre of building construction and huilding ledge of building construction and huilding
mathematics, some hints of an wsthetio ten mathematics, some hints of nn asthetio ten
dency, could be imparted? Onr School of Ar does not offer the special education I would wish to have taught, and the difficulty of procnring capable instructors is, I am aware, very great hut I think not insuperable. I have often heard a valued friend of mine relate his experience, in time gone by, in such a school in London whero sound maxims were gradually inonlcated; and $I$ for one, shonld not only rejoice in seeing somcthing of the same hiad established here, but would willingly devote some time to that end if adequately assisted by those among us who have the samo object at heart.
A few more words and I think I shall have trespassed sufficiently,-perhapa more than enough,-upon your indnlgence.
It must be admitted that tbe street improvements that are, and have been, for some time in progress in Manchester, will not only be beneficial in affording more scope for traffic, and in introdncing light and air into many hitherto insalubrions neighbournoods, but will also afford the means of adding much to the magnificence over, that in some instance, such as in what practically a new street-Deansgate, -the corporation have not insisted on enforcing some of the powers which even their, at present, curious medley of building regulations confer upon them An essential feature in strect architecture is the proper accentuation of the angles of the thoronghfaree, evoiding, however, the monotony likely to arise from an everlasting rounding of the corners; yet here we see fine angles spoiled hy the erection of low, or comparatively low, huildings faced with stone, above which, no doubt, will tower the return brick walls of other huildings. It wonld he difficalt to imagine anything more destructive to architectural effect, or less likely to redonnd to the credit or ultimate pecuniary advantago of tho proprietor, than such a treatment. I do hope that if the rebuilding of any of these angle blocks fall into the hands of any member of our body, he will do his hest to impress on his client the deairableaess of accentuatiog the angle
Tbe competition question has in Manchester had another phase recently added to its already ansatisfactory character. The resnle of the Vic. toria Market competition, so far as known, is not likely to give confidence to arehitects in any ver, to the crnel disappointment censed by the reveral of the award of the preminms that I would draw your attention, but rather to the conditions of tbe competition itself. I am well aware that suggestions on the management of a elves though they
to have a little knowledge of tho subject, gcue. rally share tho fate said to attach to advice given nosougìt; and yet I think I rasy challenge any one to produce a scheme fairer for all parties tban the "Suggestions ou the Mauagement of Competitions," published some time ago by this society. While, however, I had the plensure of acting as your honorery secretary, I generally found myself too late to introduce it to the notice of a commiltee seeking designs, iu com petition, since the first intimation of their inten hiow was usually coaveyed to me by their advertisement. In the townhall competition our views were set before the city counoil, and some of our suggestions were adopted; but it was no snggestion of onrs that tbe council should be at liberty to adopt any featares they chose from any of the designs. This clause has, as you are aware, been used as a precedent for the same condition in the markets competition; hat I believe the cases are not amalogous, for in the latter a general competition was invited, while in the former the clanse was introduced, if I remomber correctly, into the second competicon, when cight architects competad, each re Then to reqnire each competitor to design ex tensive frontages to the remaindler of the plot not occupied by the market itself seems to me useless, inless it be intended to oompel each person building thereon to ad here to such design. Sbonld the successful competitor, then, whose premium is swamped in bis commission on the utlay on the market only, be unremunerated for designing these other frontages, and submit 0 his ideas being appropriated by others
The makiug a charge of one guinea to architects for the information that should decide them whether the competition be witbin thei
acope, was in this inatance made, I am given to acope, was in this instance made, I am give to the adjudication, gome misapprehenson. A competition, when we only in this consideratio the number of years of stady-and close study too, - that mast he devoted to the art and sciege of architectare before any one can properl read" a set of designs, wo must come to the conclusion that no ordinary observers can properly cope with the task, and that a report by a competent memher of the profession shonld in all cases be laid before the ultimate jndges And here, again, a difficulty stares ns in th face. What if a design equal to one of the most charming of Sir C. Barry's Italian eleva tions, and distinguisbed by his most paiustaking care in symmetry and elegance of plan, were laid before an adviser of "aorobatic Gothio" ten dencies? What cbance wonld tbere be for the designer? There can bo only two modes of avoiding this position. Either the committee mnst audertake at first that which they have to do at some period-decide on the style to be whomed-or docide on the professional adviser nouncing the partienlars of the competition Those who will heatow labour and skill on their Those who will hestow labour and skill on their
drawings, without some snch guarautees as I have indicated that they will at least recoive some considcration, sbonld aurely not cavil at the resalts.

ST. STEPHEN'S, VIENNA.
Tres Cathedral Chnrch of St. Stephen, Vienna s one of those huildings which have been looke upon as representatives of the architecture of it is preeminently the church of the Austrian dominions, just as Cologne is pre.eminently the church of Rhenish Germany, and althongh St. Stephen's cannot he compared it point of design or dimensions witb its Rhenish rival, yet St. Stephen's, Vienna, has one point about it which makes it more interestiag in an archzoological view than the cathedral at Cologne, and that point is the fact that St. Stephen's is complete embodiment of German architecture -a huilding so intensely national, so excessively German, that it could never have heen built in any other conntry in Europe; and even more than thie, its minutest details partake so strongly of all the heanties, and we may add all the defects of German Gothic, that not the slightest foreign influence is perceptible in any siugle featare of the building. In fact, St. Stephen's, Vionna, is to German arohitecture wbat Salis bary Cathedral is to English arohitecture. Do not let it he supposed that we wish it to be understood that St. Stephen's, Vienna, is the inest example of German architecture, or that Salishury Cathedral is tbe finest example of

Euglish Gothic: far from it, as both th cbarches in a most remarkable way illnstr the defects of the styles of whicb tbey examples; but as esamples of their styles, th cannot be surpassed, and are therefore mensely valuable to those students who wish princily of Gothie architecture to arrive at principles which actuated the ancient bnilder The Cathedral of St. Stephen at Vienna is largest example of woat is called by the Germa a "hall church," and the great nim of its are tect appeara to have been the croction of a chur which shonld be composed of as fesw parts possible. Tbo very opposite in this respect Salisbucy Cathedral, where the aim of the are tect appears to have been to give a great eff of size by anb-division of the parts of the bai ing, and it is moat interesting to compare two bnildings as examples of two diametrica pposite schemes for arriving at the same resu Now, it need not be supposed that this is result of the architects of these two chnreb having been bronght up in two different schoo for in all probability if a German had been call on to design a church for sucb a site as th occupied by Salishury Cathedral he would ha erected a building sub.dipided into waid ha parts; and if, on the other hand, an English chiteet had had to erect a church in Vienua would have designed a plan nearly as simple that of St. Stephen'e. The fact is, the archit of St. Stephen's, Vienna, knew tbat his chnr would be enrrounded by lofty houses, and so planned a church wbich shonld look like hngo monster of a building, one simple who which by tho very fact of its oneness and compactness shonld preserve its scale, althou surrounded by bnildings which would simp awamp an ordinary eburch; and to pro the success of the arcbitect's design we m mention a faot to which all who know th church can testify, and that is, that althoue St. Stephen's Cathedral is surrounded by hons seven aud even eight stories higb, and prop tionately immense, yet the church not only $p$ eerves its scale, but looks much larger tban really is!
Although the general plan and arrangeme of St. Stephen's is, $2 s$ we pointed out, inple, yet in the detail the principle of be seen in Medional to an extent rarely is composed of $\&$ most intricato mronp of small pinnaoles, and every gable is divided by m lions, then subdivided hy other mallions, then subdivided, and then the spaces are filled in wi most clelicate tracery work, which is of two, even in some cases of three, orders, cnsped a recusped. Thigs bdivision of the parts is ried to its extreme in the buttresses and p nacles of the tower and spire bot kopt so acvient to the cren spire, bat kopt so kilfully that it hat the as and withou, cait he scaio of the baildi which which is grion of a design.
Perhaps no Mediocval chnrch in existen offers a more valuable field of stndy to a Lond architcet than St. Stephen's, Vienna, for studying this church he cannot fail to noti that every feature of the design had referen not only to the hailding itself hnt to its 8 roundings; that the great object which th architects of this bnilding always placed hefo themselves was to make the church keep $i$ place, and in this they have been eminent successful; and it appears to us that this is point on wbich modorn architects very general ail. Some of our architects who profess atndy "English Gothio" exclusively, and void all foreign elements, and inflaences, mig? asefally notice bow poor is the effect of a lo village church placed in juxtaposition to a ro of West.end mansions or Hast-end warehouses and we submit that a study of the large (hy th ord we do not mean large as to positive dimer ions, but largely treated) churcbes of German and the Netherlands, would be of more practice ase to a Loudon architect than devoting $h$ ime to the pretty little villago churches orthamptonshire, thongh nndoubtedly the latte present a very fascinating study.*

* In our ralume for 1863, ander the heading "Goin Along" (notes or a tour by the conductor of this jonrms some particulars of St. Stephen's will be found, nneludin gide of the roof (vol. xxi,, p. 782) ; also illustrations the modern architectire of Viennas, the Yotive Chnre (p. 741 ), private residenees (pp. $72+25$ ), de. $A$ view the Builder, vol. xvi., p. T27

## HOMES IN HOMERTON.

Witein the last few days we have looked at some scores of streets, lanes, courts, homes and their back yards, in the district known as Homer-
ton, which forms a portion of the extreme east ton, which forms a portion of the extreme east
of the parish of Hackney. The Homerton of to-day is very unlike the hamlet it was fifty years since, or even twenty-five yeara ago. The
whilom hamlet contained a numher of well.built red brick mansions, with large gardens, and these were occupied by waalthy merchants of the
City. Several of these old residences still remain, bot aro sadly altered, and others have conpletely disappeared, and their site and that of their gardens aro huilt apon. Numerons streets of honses havo cropped up, and many more at this moment are growing, centrally and
at either end of the ancient hamlet whicb has now swelled into a very popnlous neighhourbood. Tho great majority of dwelling now in courso of erection, are of the cheap and speculative kind. They are huilt hy a class of small employcrs, to suit tho wants of meohanics, clerks,
or those with smail annuities, and their owners or those with smail annuities, and their owners
do not care to let them on any other condition than do not care to let them on any other condition than
that of receiving the rent in weekly or monthly payments. These new dwellings are nearly all two stories in height, and contain on an average six rooms, front parlour, kitchen, and washhouse, and three rooms upstairs, one of these
being a small bed-room above the projecting being a smanl bed-room above the projecting
wash-honse at the rear. The construetion of wash-house at the rear. The construction of
these honses shows that they cannot afford more these honsess shows that they cannot aftord more
than proper room for ono family, yet two than proper room for ono family, yet two
families are to be found in somo of them. Tho inconvenjence that must exist in case of two occupiers will be illustrated when we state that
the stairs of a numler of these houses start from the stairs of a numher of these honses start from the back roorn, so that the members of one family
would he obliged to pass and repass throurch would he obliged to pass and repass through
the apartment of the other. The intention of the the apartment of the other. The intention of the
builders of these houses, as they aver themselves, builders of these houses, as they aver themselves, is to let them to ouly one tenant; hnt it must be rememhered the builders are for the time being
only the temporary owners, and their ohject is to only the temporary owners, and their ohject is to
sell them as fast as they are finished. It is im. material to them what condition these houses may be rednced to in a short time. Externally these cheap.class bouses are, to a certain extent, what may he culled "nent,"-that is, to the inexperienced eye, -and even their intcriors present certain amonnt of agreeahle accommodation. Capboards, or lockers, are provided in the recesses, and, as an inducemont to a new
tenant, Vonetian blinds will he put ap regard, however, to the workmanship and materials, tho less, perhaps, that is said the hetter, Yet we cannot resist mentioning tho fact that the doors and sashes aro made ont of $1 \frac{1}{4}$ in. stuft, first coat of paint, tho smoothening process has reduced them to $1^{\frac{1}{f}}$ in., and even less. Doors and sashes framed of such scantlings ate hound to warp. The stairs are little better than steep tition and the wall, the partition being continued from the lower floor to the ceiling of the npper loom, aud of course forming one of the sides of to sell these houses singly, from prioes rangiug the
from 150l. to $170 l$. and make a profit. The weekly rcut of a great number of those honses a little better finished, or perhaps a little moro roonly, 9 s. are asked. The charactor of these new dwelings may be summed up-they are
built to sell, and being built in rows, they are built to sell, and being built in rows, they are
designed to matually assist each othor in stand. designed to matually assist each othor in stand,
ing or falling. Seven years wear aud tear of occupation, assisted by the elements, will render the majority of them a sorrow and a nisance to
the pooket and the healtb of their then owners or occupiers.
Having said thns much about some of the new and cheap speoulativo dyellings in and around Homerton, we will turn our attention to a fow of the moroaged, many of which in construction and sto commodation conld not he mucb worse. These
$d w$ cllings are sitnated in the narrow streets, dwolings are sitnated in the narrow streets,
courts, and lancs on either side of High-street. courts, and lancs on eitber side of High-street.
Amougst the places we visited are John-street, Hayward's-bnildings, Plongh-lane, Cross-street, Church-terrace, Albort-terrace, Coliege-lane,
Farm - lane, Piokles -hnildings, Crozier - street, Brooke-strcet, and its contiunation Victoriastreet, Bergier-street, and its vicinity, the offshoots of Sheppard's. lane, James-place, and
some other smaller courts and passages that some other smaller courts, aud passages that
hore no name, or, at least, exhibited none. Many of the houscs and the back premises
in the abovo - named places aro in be and dirty state, and the drainage must found merfect, or the smell and dirt we narrow and back streets and lanes there was little evidenco of the scavenge-oart or the dustman. From Brooksby's-walk, extending throngh Brooke-street to College-lane, a large number of the houses on either side aro in a very dilapi dated oondition in their interiors, and the back premises of some were in a really frightful state, when we made our visit. The places of nocom modation were hrimfil of filth, and the seats flooring, and fittings scething with rottenness looring, and fittings scething with rottenness
and corraption. About here will be found women and children in raga and in wretched. women and children in rags and in wretched.
ness, foul walls, fonl floors, fonl bedding, fonlness ness, foul walls, fonl floors, fonl bedding, fonlness
without, within, and around. We were happy in meeting some instances of cleanly persons and cleanly homes, hemmed in by otlers whose frightful examplo was sufficient to demoralise the whole neighbourhood. "My poveity," said one poor, thinly-clad woman to as, " never pre-
vented me from keeping roy children, or mpelf, vented me from keeping roy children, or myself,
or home olean." About Brooke-stre Homerton Church and Homerton Hospital the dwellings of the working classes Hosp in had con ditiou, hat thoy must he examined within and at their backs, or else no conception can he formed of their unbealthy state. Many of theso houses we are now descrihing are not very old, neither are they of recent erection; but they are thoroughly ill-constructed, and are ont of repair. erparently, many of them were, when first houses, Wenstructed of the materials of older better class of dwell occupants provided with a to the health of tho neighbourloood if they were demolished. Abont this quarter of Homerton no small number of the vendor and coster class seem to have settled down, interspersed with the labouring class from factories and huilders' yards, and other classes of working men.
In a lane off the upper end of High-street called James-place, the houses have no rear, ahove, ascended to hy ams, ono helow and ono courtway in front, and at the stair. There is a are two places of accomniodation for there houses. One of these closets is for the six indeed, the condition of both in the matter of drainago calls for instant attentiou, as does the who complained bitterly some during our visit the School Board. Mothers fessed to us that theiv chiland fathers conwork far too soou, but that they were obliged to do so, as the earuings of their children, small as thoy might he, wore a help. Unfortunately, in Homerton, as in ether places, there are numhers to keep their girls and boys from school. Where we found dirt, and filth, and rags, We mostl found the demoratisation of drunkenness. The beer-shops and gin-shops aro plentiful every Where, and a nisil on a Saturday night and Snnday convinced ns that our deductions from day visit were well founded.
he homes of the poor must be improved hefore the work of the School Boards will produce good results; and pari passu with elemontary dncation must proceed the inculeation of the aws of health.
Of very old houses of the half-timbered kind here are a few in this district. Opposite Bridge. treet, in the Higb. street, there are three or four with projecting windows, plastered fronts, and their roof line hroken by gables. One used as a lot, as s shop is the most pictaresque of the ootway aged elm-tree springs up from the It is an old landmark ene projecting shop. front visit tho aged tree was being cleared of some of its extending branches, and the house was under. going some repairs.
A few words more by way of finis for the prerou about Homerton. All the available waste gro is being fastly covered over. Four years tuatere was a largo space of unenticing ground his detween Church-road and Sidney-road ber space is noarly all builtu upon with a tumWhich we have desoribed in the opcning of this Sid
siduey House, a building which once belouged to a wealthy merchant, and which for a numher having fled the district, is now enclosed owner and its garden built npon, A sisterhood of and a chavel, Romish Chnrch occupy this honse and a chspel, rnn up hurriedly, hailt of
brick, has jnst been opened a few yards distant, Chere is plenty of work in this rough district for Christian ministers of all kinds; for sanitary officers, relieving officers, school hoards, and for velnutary and philanthropic efforts. We fear that the dearuess of coal, if it should continne, will work mischief in this aud similar districts daring the The poorly clad and the ill-housed he scvere. The poorly elad and the ill-housed and ill.fed, particularly the children, are certain to suffer
from a number of complaints, aggravated throngh cold warmith. Typhns and bronchitis want of proper in winter as well as in other seasons, and cold and nnhealthy homes, acting on ill.fed of disease and dersons, are the best anziliaries
on

## THE BALDACCHINO A ROMISH

 ADJUNCT.Tusapplication for leave to erect a baldaochino in the Church of St. Barnabas, Pimlico, has heen 0 C . An Stephens Q.C., speaking on the part of the opposition, said duty to course of his address, -It would bo hi duty to contend that the real ohject of that application was to introduce, under tho anthority of the Chancellor's Court, a structure which was to adjunet to a Roman Catholio altar, in order crated elemouts, corporal presence of Christ enthroned in the so. called altar,-in fact, to creet a monument of Popish superstition which was legally condemned and destroyed as such in legally conEdward VI. and Elizabeth, It had been stated in the course of the present application that the erection of the proposed baldacehino was unsmimonsly agreed to at a vestry meeting on tho 15th of April, but he contended that as no men tion of the special purpose of the meeting was made in the notice convening it, it was illegal. In support of this view he cited a pasgage from tho second volume of Sir Rohert clined, Ecciesiastical Law," hut he dein such a case to take any technioal objection in such a case, preferring to treat the matter apon its merits. The terme "haldacolino" was 80 little known to English churohmen that it
might be desirahle to might be desirahle to give a short definition of ipley, in his " Glossary of Ecolesiastical Shipley, in his "Glossary of Ecolesiastical Terms," "cloth of gold made at Baldec or Babylon." In old Engrlish inventories the word "bandekyn" appeared n. a material nsed for church vestments, and the late Canon Rock, in Fathers," gave a copy of an entry of thing honght for a homan Catholio church in 1486 , oontaining, among other itemse, "A canopy for "baldacchine" handekyn." In time the term canopies came to be transferred to the " Bituale made of that material. In the boldachinum was to he carried over the Host when conveyed by the priest to a sick person, and in the Feast of Corpns Christi, instituted in 1264 hy Pope Urban IV., for the special adoration of the consecrated wafer, a baldacchino was ordered to be prepared to he carried over the Sacrament. Its nse was also enjoined in the Rubric of the Roman Missal for the Mass on rood Friday. In Italian charches the canopy of state over the altar was not unfrequently an architectural stracture of marble or stone in the orm of a dome, supported by four pillars; and stmuctures. The first defuition of it by Mr Shipley was "a structional covering on fom olumns of marble or stone, or a canopy hangin in the roof over the altar in churches," and Wohster's Dictionary wero imila To all these erection " oxplauations "canopp" were also twas thns that appled iudiferently, and wurches an that the baldacchino in Italian impler structuro of eame purpose as the hurch stracturo of the canopy in the English prop . Mr. Sureet, R.A., the architect of the prope 1 baldacchino at St. Baruabas, in a letter ano cator of the Guardian in August last, pore tho shot of the baldacohino as a canopy and "haldar, and used the words" canopy ta in terms. In Churche號 ratilcatioa this learned friond Mr. Phillimore cancpies wero substantially idontical both in
principle and object. He now proposed to show that such ornaments were adjuncts to a Rowan Catholic altar, and totally incompatible with the
rites and ceremonies of the Church of England. rites and ceremonies of the Church of England.
In 1215 the doctrine of Transubstantiation was In 1215 the doctrine of Transubatantiation was
first decreed by tbe Council of Lateran, under first decreed by tbe Council of Lateran, under
Pope Innocent III., in these terms:-"The body and blood of Jesus Christ are truly contained under the form of bread and wine, the bread being transnbstantiated into His body, and the wine into His hlood by the power of God." was ased or enjoined in the Churcb of England and no mention of them was made in ecclesiastical documents; but in 1279 Archbishop Peckbam of Canterhury issued the following order to the Charch in this country:-"We charge you for the future that the most worthy tabermacle he made in every charch with a decent enclosnre, according to the reatness of the cure and the value of the church on which the Lord's Bodymay he laid." Canon Fock explained the necessity for that ritual ohservance by stating tbat "Cbrist is always coming down from above to dwell upon our altars," and added that the first wooden or stone tabernacle resting on the altar seen in this land was put op in Queen Mary's reign The object of Archbisbop Pecibam's constitu. The object of Archbisbop Pecihan's constitu-
tion was obvious. The doctrine of Transnbstantiation having been decreed, it was reqnisite that it shculd he impressed by osery possible means on the minds of the people. That end was best attained hy placing a canopy over the
Host, maling that the rnost prominep Host, making that tbe nost prominent ohject in
every church, and thos promoting increased veneration for the consecrated wafer. This was in full accordance with the ordinary practice of tbe Roman Clurch, which invariably inculcated new doctrines through the means of the bodily senses. Canon Rock bore out his assertion in victim offered there that stimulated the piety of the faithful to spread the richest carpets round tbe altar, to hang gorgeous veils on either side, to canopy it with domes of porplyyry or silver, to pile chalices of gold or precious stones nipon He addec , it in fine, as glorious ats possinle. be honoured with a baldacchino, unless a similar or more sumptuons camopy was suspended ahove the altar, for the bonour of the consecrated ceding the Reformation, every church in England had a canopy more or less elahorate over the Host, indicating therehy the (supposed) presence wns thus one of the adjuncts of the canopy altar, and heing the most prominent ohject hefore the eyes of the congregation, it was most hefore the eyes of the congregation, it was most
immediately connected in the minds of the people with the superstitious doctrines of the Mass. It was, in fact, the point to which the tion of the wafer. In the reign of Edward VI. the canopies which were found in all the English churches were removed and sold as monumeut of superstition. The era on which the reformed Chorcb of England was suhstantially based was the reign of Elizabeth. Her Act of Uniformity, Articles, coustituted the Magna Charta of the Protestant Reformed Church. That Act aholished the Nass, witb all its adjuncts, and consequently the canopies over the sacrament were rexnoved, like the rest, as monuments of saperstition. In 1559 , and again in 1560 , the queen sent out commissioners to seize and destroy all the adjuncts of the Mass and other monuments of superstition then so plentiful in tho churches, and amoug these, in the ancient chronicles, the canopy was tion and destruction of canopies clearly esta blished the fact that such erections were incompatible with the reformed dectrine of the Chureh of England in regard to the sucrament of the minds of people the doctrine to instal into the sence of the very body and hlood of Christ in the consecrated olements. The doctrine of the Churcb of England was that the very body and and that Cbrist was to be adored and knore, sitting on the right band of God in Hearen. He submitted that it had heen clearly estahlished that, when the Roman Catholic religion prevailed in this country, canopies over the altar were in use; but when the Acts of Uniformity of Edward and Elizabeth came into force these canopies were condemned
inonuments of superstition.

## SCIENCE AND ART CULTURE.

On Tbursday evening, the 23rd ult., Mr. T. C. Buckmaster delivered an address before a largeandappreciative andience, at the Mornington Institnte, Eampstead-road, on "Science and
Art for the People." Mr. Buckmaster said that Art for the People." Mr. Buckmaster said that his business that evening was to bring under the meeting's consideration some of the arrangements which had been made by tbo Government for the purpose of promoting and encouraging throngbout the country a more general knowledge of science and art. This department of Government came into existence in this wise. atten thought by some, who the Science and Art Department and the South Kensington Inseum wera entirely new organisations of the State, and that they had heen called into existence without any definite purpose. But the intentions for which tboy were designed were by no means nev to the Govermment; and long before the building of schools for the promotion of education, very large grants of public money were anually made for the purpose of the cultivation of science and art. So early as 1815 the attenfon of the Government was directed to this suhject by a parnplilet, which recommended that the Govermannt should vote a sum of money for the purpose of appointing competent ecturers upon tho various branches of science and art which were thought likely to be useful. A few years after a general movement took pace for the purpose of establishing institutions he chief feature of whicb was the delivery of systomatic courso of lectares upon the various hanches of science, art, and literature. It was the object of these institutions to teach, cbiefiy y means of lectures, somethiug of these laws. An apprenticesbip to a trade, he tbought, disciplined mens natures to the performance of the kind of work with whinh they were engaged, and the doing of this day by day required skill; sut scientific education addressed itself to the man's mind, enabling him to reason and think on wbat he was to do; and it was this idea that, some forty or fifty years ago, called into exist. ence mechanics' institutes and such-like institutions.
Speaking of the amusements of the people, such amusements provided was to be always considerad a safo index of tbe refinement and culture of the people; the more educated a man was, the greater became his enjoyment of life, In 1840 , attention a moyement, and Mr. Foley Thompson, then Pre ident of the Poor T 1 word, cotohlished inet or tho Por se lmost time schools of des.en. These schools were imost entirely subsidised hy the state; hut they ailed to exercise any important influence on th arts and manufactures of this conntry; they, in was wanted was a qeneral elevation and improve ment in the art and tastes of the whole people Ion wanted to cultivate a love of the beautiful nature and art. If any improvement was to take place in the art incustry of the country, must come from the people boing hetter educated in art, and tbis must have the commencement in eaching people to draw treehaud drawing. But he doubted whether it was possible for people to arive at a true appreciation of art unless they ad been led to love and admire everything that as beautiful in nature. We had cone all tha ugly $n$. giy as possible. The majority of men passed refinga inflacnces of perfectly insensible to the then, a love of nature-if it were only a little plant, if it were only a tiny flower; love in and it could not but have a vast intuence of art was not easy. If you could only manage In ohtain one good work of art, however simpl it mighit be, if you studied that little work it would do you more good than a mere superficia careless gazing. The inflnence of a work of art must not he measured by the surface which it overed. A man who prodnced one lasting work f art exercised a far more powerfal influence ou humanity tban a man who had painted tbou sands of pictares. A pictare, to be of any use to
you, must be studied; it must be looked at for some considerable time, and not in the mere casual way that we sometimes observed it. What was wanting was to cultivate carefully and accurately the powers of seeing things in their right ligbt. This art-knowledge had
always exercised a rery important influence in
the civilization of the people. Witbont progress in art there was no progress in civilisation. Th teaching of science, however, was a more difficolt thing. Most of us could understand a work of art ; bnt the results of science could not he made so evident to the aenses. The gradnal progress of development was far more important prohahly, as a means for increasing wealth, than the mere conventional application of art. About ifteen years ago the Government passed a and compreheusive scheme for enconraging ciencomoting a more general knowledge of for knowledge. 11 of these sciences were to be divided into a nnmber of parts. Amongst these was geometry, the science of form teaching men sumething of form and shape, $n$ knowledge of which was very desirable, that the material ahould be tur to the hes possihle advantage. Then we had mechantos mathematics, thenretical mechauics, animal physiolory navimation, botany, soc so, animat physiology, navication, botany, sc., \&c. But he most of these He helieved in one or two subjects well done; and one subject thoroughly mastered was better than a superficial acquaint ance with many. Tbese sciences were valuahle as part of your education; they were valuahle also in their relation to work. The language of science was to most working men the languag of a foreigner, and you could make no progrese in any of these sciences unless you had mastered the definitions and axioms upon which thest sciences are hased, and with more exact lan guage among working men there wonld grow np better langnage among the men themselves Was there, he asked, anything in a life of labour which necessatated that boarse, rough way in speaking to eachother unfortunately toocommon among working men? It had been said that to givo working men a knowledge of the sciences it would make them discontented, hat reason and he saidy rebelled against this. In conclusion, he said, educate men and they would feel mor new plans would work; and new methods anm who bad first been educated in those principles in which the success of his work depended.

PROPOSED BATHS AND WASHHOUSES IN SOUTHWARK.
The erection of baths and washliouses in the different crowded parishes of the metropolis appears at present to bo occnpying the attention ve now find that the vestry of St. George the Sartyr contemplate the establishment of an nstitntion of this nature. At a meeting of the restry held last week, it was decided to apply to the Local Government Board for the sum of 12,0002 ., belomring to the vestry, held by that Board, and invested in Consols, for the purchasu of a site and the erection of baths and wash houses tbereon. The Local Government Boari hold the amonnt named under the following circnmstances. Fonr years ago the Board ordered the parish of St George the Bartyr into union with St. Saviour's Union and Newington, the result heing that land and workhouse schools at Mitcham helonging to St. Goorge the Martyr were sold, and after paying their share of the cost of St. Saviour's Workhouse tbere was a balance of $12,000 \mathrm{l}$, invested as already named by the Government Board, the parish taking the interest in mitigation of rates. At the meeting of the vestry last week it was stated that the president of the Local Government Board was willing to hand over the money to the vestry if they brought forward a proposition to use it for any pormanont henefit to the parish, and it was urged tbat the erection of baths and washhouses would not only be a permaneut benefit, hnt were highly necessary in that crowded district. It was agreed that, in the event of the Local Government Board complying with be takeu for the erection of the building.

Proposed New Dispensary at Wandsworth. Tho Wandsworth aud Clapham Guar dians contemplate the erection of a new dispensary in the neighbourhood of tbe Wandsworthroad, and at their meeting last week a committee was appointed to look out for a suitable piece of ground, and also to ascertain the cost, in view of
the erection of the huilding.

MARGATE DRAINAGE COMPETITION. Tee corporation hold threo meetings to consider the applications for admission to this com. petition, and on Tuesday last the selection wa completed, and with the following result, viz,, Messrs, Lewis Angell, J. Bailey Denton, J, E.
Eachus, Gotto \& Beesley, Russ \& Minns, and Eachus, Gotto \& Boesley, Russ \& Minns, and
Whittaker \& Perrot, of London; Mr. Edward Whittaker \& Perrot, of London; Mr. Edward
Appleton, of Torquay; Meesrs. Brierley and Holt, of Blackbura; Mr. Goodison, of Liverpool and Mr. Wilson (Native Sewage Guano Com-
pany's cngineer), wero selected. To these ten pany's cngineer), wero selected, To these ten
gentlemen will be offered the two premiams of 200 guincas and 100 guineas respectively for tbe best and second best plans, to he sent in to the
council before the 30th of January ncxt, the corporation stipulating that the selected plans must be approved hy the Local Government Board before being promiated. There were in all fifty-four candidates. An episode occurred in the course of the pro-
ceedings, Mr. Coghlan, the borough survejor ceedings, M\% Coghlan, the borough surveyor,
having been put up as a candidate, and elected having heen put up as a candidate, and elected
as one of the competiug ten; hut on a very strong remonstrance, led by Mr. Councillor Sear; bimself a member of the profession, pointing out
tbo manifest unfairness of the corporation putfing tbo manifest uufairness of the corporation putting suocess would be open to a stroncr imputation of collusion; and that his local knowledge, wbich ought to be arailablo to all the competitors who obose to apply to him for information, would give him a most unfair adrantage ovcr othors, Mr. Coghlan honourably withdrew, and Mr. Lewis
Angell (who tied with Mr. Jacobs, of Barrow-inAngell (who tied with Mr. Jacobs, of Barrow-in
Furness) evcntually was selccted in his stead.

THE FALL OF A CHIMNEY AT NORTHFLEET
Sir,-"The jury found that tho men were accidentally killed, and expressed their sympatby with Messre. Gostling and with the rela. tives of the deceased; the coroner remarking
tbat he agreed with the verdict." Suroly this tbat he agreed with the verdict." Suroly this is not the kind of conclusion proper to so sad an accident as that ly which six persous lost their lives, and others were severely injured, by the
rccent fall of a chinmey at Northfleet. If one recent fall of a chinuney at Northtleet. If one
of these lives bad been lost by a collision on the of these lives bad been lost by a collision on the been an exhaustive inquiry, not merely with viow of placing the responsibility for the dis. aster upon the right shoulders, but for the prevention of futuro accidents of the like kind. I the interest of all those who may be concerned in the building of chimney-shafte, the matter calls for some investigation beyond that which the coroner and jury bave been able to give to it.
Nothing could be more satisfactory than the account of the work given in evidence at the
ingnest, if we did not know that the chimney ingnest, if we did not know that the chimney foll. This was no hrp-hazard job of the scandping contract kind. The design was made under professional advice, and carefully studied, with a view to the provision of unusual strength. All
the materials were of the hest, and were provided by the proprietors. The builder was experienced in this special class of work, and his workmanship was perfectly satisfactory to the proprietors, the architect, and to the experienced surveyor who was called in after the accident.
Nevertheless the cbimney fell, and the one Ihing which we have learnt from the oatastrophe is, that if rebuilt in all respeote as hefore it must certainly full again, Let us see if, hy examining the evidence anow, something cannot be learned from it of more practical atility than this. Now, the huilding of a chimaney 220 f height, though no great nndertaking in the manufacturing districts, is not so common in from everything of an experimental character. Both bricks and mortar differ very materially from those in use in the north; and this sbould influence the designs of the structure, the execution of the hrickwork, and the rate of progres. It is, therefore, not with a view of suggesting blame in any quarter where all seem to have taken great care and pains; but rather as suggesting modification in future practice that the following remarks are made:-

1. It is shown by the evidence that the thicl zess of the brickwork of the shaft was, on the arerage, not less than one-third more than in certain chimneys named, and, in partionlar, that in the lower part it was nearly double St. Rollox. But as the accident seems to ber
originated at the top, there is no need eithe to question or to prove tbe sufficiency of the lower part, and it seems clear that there was the upper part of the shaft. The practice indeed, is to make the wall at the top of a shaft, $1 \frac{1}{2}$ brick in thickness, where the internal diameter exceeds about 4 ft .6 in., and to ontinue this thickness downwards for abou in., or nearly double diameter was 8 and the work in $1 \frac{1}{2}$ brick exteuded downwards for as much as 36 ft .3 in ., a consideration Which, if it does not suggest the necessity for roater thickness of work, clearly suggests ured.
2. What was the nature of the bond ? The cientific evidence shows simply that there we "no filling in with hate or rubhle," but it would be easy to make very unsound work out of whola hricks, and especially in tbe case of $1_{2}$-hrick circular work of this radius. Indeed it is casy to see that without extreme care ther might be no effectnal bond for th
3, "The principal too wall
Rutter's paviours and the best pricks were of Ructer's paviours and the best picked stocks." the whole comhined in the upper part of the shaft? If there was a facing of one kind and a hacking of another there would almost certainly be some difference in thickness of the bricks aud consequently in the mortar.joints thore decree, or at least in the a difference in the degree, or at least in the rate, of absorption of tbe two bricks, and from one or both of these causes it is possible tbat the weight of the cap would, while the work was green, be carried by a very tbin facing of wall.
3. Was anything done to aid in tbe bonding of "every few courses " with nent Porthond "every few courses" with nent Portland beyond that produced by the overlapping of the bricks it should be so strong as to ahsolutely resist every force that can he brought against it. A weak bond may resist the process of settlomont to a certain extent, and then hy snapping suddenly may be worse than no hond at all. Does the term "grouting" indicate, as it usnally would, tbat the internal joints were left with little or no mortar, and were thon filled up with liquid cement, is which case tbe desirahle homogeueity of the work would be destroyed or was it simply poured over the course after flushing up? In the latter cose, thongh much advantage could hardly be expocted, the possihle mischief would be less.
4. The shaft, wbich was 220 ft . high, occupied sixteen weeks in building; not too short a time, perhaps, under certain conditions, but it is abont the time ordinarily occupied in carrying up height. We are not told how much of this time was occupied in building tho lower portiou, and cannot therefore judge of tbe rate at which the upper part, where the accident originated, was have beet quite orcen and in that contition gradual settlement and consolidation which is most dangerous under beavy or irregular londing.
5. What were the design and construction of the cap? 1ts weight of 19 tons 3 cwt. would be no material consequence,-assuming the brickwork under it to be perfectly soond,-hut on the said, it was green, and if its bearing disasters may not be diffienlt to account for No doubt the suggestion of the two bricklapers, that the cap had "swagged" the sbaft over, was rude and inexact; hut it seems only in accordance with common sense that this weight placed on the shaft only on tho day preceding the accident must have had some influence in causing it. It may be that, as the arcbitect said, the weakest time in respect of the cap ouly was on the previous night, when it was just where the fracture took place time" for tbe part ahly the time at whieh it fell.
6. What was the precise outline of the fracture visible immediately after the acoident? A drawing of a huilding which has fallen down is ofton mnoh more instructive than one of building which stands.

Any one of the causea here indicated, or two of them in comhination, wonld bave gone far none of them may have existed; bat if so, the
diffioulty of acconnting for the accident is but increased; for, wbatever it may bare heen, it cannot have been trivial in its action, for no rivial cause would bring down a structure suchconcerned It is to bo hoped that all parties tion as may cion the mystery which now exists, and render such works, - wbich are now increasingly necessary,-less hazardous in timo to come.

## SHAFT BUTLDING.

Sir,-In the Builder of last week an accident in building a chimney shaft at Northleet is mentioned, which I think would not hare happened if the following precaution had boen
The
The employment of bard-burat bricks, or paviours, of a unifom thickness ; before being grouted overy course, and levelled and plamhed every 3 ft . Portland cement, instead of Dorking lime, tested as to its hardening quality in the proportion of one cement to two of clean slarp rit, well washed.
I think the top part of the shaft (being only 14 in. in mortar) was not sufficiently dry whon the heary cap was placed on it, which cansed it to collapse or bulge.

Whitehead.

## PORTLAND CEMENT AND

THE NORTHFLEET CHIMNEY SHAFT
Sir,-Portland coment having been the sub. jet of some remarks in your joursal lately, and baving had much experience of its use, I beg to Somble you with a notes
Some years since I was building a large factory; the walls were of stock bricks, the arohes of the windows were described to be grauged and set in Portland coment. Of conrse a gauged arch mast be cut in soft hricks; mine Were so, and in order that tbe joint might be fine, my foreman set the arches in Portland cement mado up very soft, the bricks well soaked, and the result was, that the cement expanded, and broke every hrick in every arcb. As they were semi or cambered arches, with a onsiderahle rise, no harm resulted.
The above facts were brought to my memory on reading an account of the evidence given before the coroner as to the chimney at North. fleet, hy gentlemen whom I know to be compe ont to express an opinion. I am inclined to think tbat the design was good, the materials wero described as of the ver'y hest, hut the worl is described as flushed in with Portland cement, and if it was done with cement without a large admixture of eand, it is possible that the expanion of the cement rent the chimney from to o bottom.

Brickbat.

## PASSENGER REGISTER FOR

## OMNIBUSES AND TRAMWAY CARS.

Ammost innumerable nosnccessful attempts bave heen made, in the interests of the procheck the reccipts of and cran Pors, to considerable proportion of the men wrobably a upon the occupation of conductor who enter failures in otber pursuits, and athor have been doubtless many honest men on the foothoard, it may be feared that some of them bave a secret sympathy with the frank avowal of a certain sympathy with the frank avowal of a certain
shop assistant who, in asking for an engagement, was required to state what wage he expected, His reply was "I do not reckon so mnch on tho wage dome" It is perfectly notorions that the bas and trame omni the disbonesty of companies suffer greatly from moro in their pockets, prohably, by whom put moro in their pookets, prohably, by peculation, One of theceive in wages.
One of the most recent devices employed for keeping conductors bonest, is by a system of tickets, delivered to passengers when they enter the vehicle, whicb they are oxpected to destroy When they leave it. These tickets they are requested to see torn out of a book, which contains a connterfoil, showing a fare corresponding to what they have paid. If every passenger were to require a ticket, were to see it actnally taken from the book, and were to make certain that it conld not be used again hy a second passenger, the cheok poonld be tolerably effective; but this is not done. Some passengers, from sentimental, ill-fonnded, or improper considerations, object,
by using these tickets, to acting as a species of
detectives; others carelessly, or in innorance o the intention of the tickets, do not ask to h furnished with them; while others, again, leave them on the seats or floor of the carriage, and grive the conductor an opportunity, if he be so
minded, of issuing them again without an addiminded, of issuing them arain without an additional counterfoil debit against himself for the additional fare, thus defeating the essential object of the tickets. In any case, a solfecating
register of passengers and their fares scems a register of passengers and their fares scems a thing much to be desired, alike in the inte
.of prnprietors, passengers, and conductors. of prnprietors, passengers, and conductors. has been perfected by Mr. Marshall Arthur Wier, of Great Winchester-strect, in his Pneu matic Passenger Register, which was exhibitod in operation in one of the London Trammay Company's cars hetween Blackfriars Bridge and Brixton and back on Friday in last week. This register, it my be stated, has been brought to its present efficient state, after a long series of trials and experiments upon the London Tramway Company's line, such trials having resalted from time to time in the modifioations and charges that seemed desirahle. The difficulties that beset the inventor have a enrious illustration in one of the "steps" of his progress. Among other plans he contrived $\Omega$ "Stop recording the number of persons who trod upon the step, if not the entrance and exit of the actual passengers; hut this system bad radical defects, that he has now corrected effectually. Among the defects referred to were the readiness of persons to jump on to the step of the phacers others car, conductor is heyond arm's length; the driver has to get off to attend to harness and other matters; the conductor has to get off to bear a hand in assisting old women of both sexes, who, in their trepidation, may make a species of treadmill of the step, and press it several times bofore they can get fairly either in or
out. All these steppings would be recorded against the conductor, which is, of course, entirely incorrect.
The apparatus is now in operation on the London Tramway Company's line, and, as shown on Friday, consists of a neat hrass gate across the door that moves in or out with ease hy the person entering or leaving. This gate is comnected, nuder the platform of the car, with the lower end of another,--a slide gate,-which passes belind, and follows the passenger in or out, as the case may be, and thus prevents two persons entering or leaving and registering at the same time. The gates are evenly balanced, and more easily and rapidly, so that no impediment is offered to the passenger, and entering and leaving the vehicle are quickly done. brass box, locked, contains the register, and is insido the box, of the kind used in electrio tele graphy pass round two brass reels, and are moved hy the apparatus. The passengers are noted by prickers passing through the paper at regular distances as the passengers enter and leave, the upper line indicating those who enter, and the lower Iine those who leave; the division of fares at each station is noted by blank spaces on the paper hetween the holes made by the prickers. This may he effected by either of four methods, two of which were shown on tho car in operation separately. The frst is by "crowning" the road at the stations from which the fares are charged. The road is gradually raised about an inch above the ordinary level, the nise heing atmost imperceptinle A wheel, of ahont 6 in, diameter, is placed ander the car. That is authached lo levers connecting with a box containing an air-tight chamber, registering hox. The mother chamber in the over the crowning moveraent the wheel the air.ohamher and cortion of the road, presses tho chamber in the registering box to pass into on the paper, the registering box. The space on the paper, slowing the station, is thus made apparent. The other mode is effected in a knoh; the movement by the force of the air is produced in the same way. If he omits to press the knoh at the proper station, the larger fare wonld he reoorded against him. By the latter method the crowning of the road is not necos. aary. A very ingenions invention for noting the number of times the conductor enters the car is contained in a small hox inside the car. This, also, is worked hy means of the atmo. sphere.

Mr. Wier, the younger, inventor of this ingenious apparatus, which is worked partly by mechanical means and partly by compressed atmospheric air, is the originator of other
pneumatic patents, and has, we understand, received a ligh testimonial from Capt. Halpen, Commander of the Great Eastorn stoamsbip, for he elficient system of pnommatic signals, in rented by Mr. Wier, and used in the Great Eastern and other ships in laying subraarino cables. For lis Passenger Register the invontor may, we think, fairly claiw that it will record every fare that should be paid to the conductors of the omnihuses or tramway-cars that are fitted with it; that it will note not only the numher of end, hat their cospective emonnts; tha it fi detecte use of tickets and the employment entrance of the conductor into the car, for the collection of fares, or othor purpose, and distinguishes passengers who have mistaken their car, provided they leave it within a reasonable distance after entering; that the apparatus does not leave control of the register in the power of be conductor, or admit of its alteration hy col. union hetween the conductor and the inspector or elerk in charge of the registering hox ; that the parts of the apparatus are strong and simple, and not likely to be easily damaged by rough usago; that the apparatus may he readily adapted and fitted to the present class of street vehicles for the conveyanoe of passengers; and, in fine, that its adoption would largely increase the receipts of tramway and omnibns com. panies, improve the moral, and it may he reason. ably expected, by the increased wages that wonld be afforded the material and social con dition of conductors, and tend directly to the benefit of all parties concerned.
The enormons number of passengers carried by tramway-cars and omnihuses alone throughout the world, may be illustrated hy giving the nuruber of passengers carried in London and the suharhs. There are three tramway companies carrying ahout $40,000,000$ passengers annually; the General Omnibus Company carry upwards of $40,000,000$, and it is estimated that other omnibus companies in London oarry about $20,000,000$; thas giving $100,000,000$ passengers carried annually, whose fares at only 2d. each amonit to $16,666,6661$. Every penny for this vast traffic throughout the world passes throngb the hands of an army of men who have only the semhlanoe of
amonnt receive $\qquad$
ARCHITECTURAL ASSOCTATION OF IRELAND.
Tee opening meeting and conversaziono was held at the Rooms of the Association, 212, Great Brunswick-street, on Thnreday evening, Octoher 23, the president, Mr. J. J. O Callagham, in tho chair.
Amongst those present were:-Jonathan Pim, d.e.; P. J. Smyth, M.I.; Very Rev. Canon R. Cuall Wrooks, Marcus Koane, J.F. inn. ; T. Goodwillie, A. W. Robinson, R. O. Longfield, T. Holhrook, J. Kirk, James Farrall, D. J. Freeman (treasurer), S. Catterson Smith, John Holmes, Dr. Barker, T. I. Long Eield (hon. Robinson, P. S. Swan, Dr. T. Purcell, C. Geoghegan, Peter Roe, A.E. Murray, J. Mulligan, E. L. Clarke, J. L. Rohinson (bon. sec.), - Monsell, Dr. Frazer, Dr. Grimshaw, T. Dockrell T.C.; Wr. Mrazer, Mitchell, V.P. ; Rev, J. F. Shear. man, - Mitchell, R. S. Swan, Sandham Symes, Maguire, J. P. Griffith Rev. J. Carolan, James II. Owen, P.R.I.A.; J. W. Hanghton, H. Keogh, H. Wilmot, Charles H. Brien, II. Donglas, J. Cahill, E. Oldham, \&c.
Mr. Longfield (hon. sec.) read the annmal The

## address.

 f. Jonatian Pim, M.P., proposed the thanks plat a great improvement had taken Twenty city huildings in the last twenvy years. Duhlin years ago there was not a huilding in han of any architectural pretensions, exceps could boast of as ast century, whist now we ings, hanks, insurance and mercantile offices, as any other city in Enrope. Such an improve. ment had heen brought ahont by societies like the Association, which he hoped would go on and
prosper.

The Very Rer. Canon Popo seconded the rosolution in an eloquent speech. God had not anyening on this man either to create or dostroy anything on this earth, but the nearest approacb to creative power is when the architect is enabled to raise a heautiful building that has originated from his brain and inventive genius. He said that he also had to bear testimony to the great improvement in architecture of late years, especially of buildings that were dearost to him,-the ecclesiastical edifices of Ireland, which were set as gems in the boautiful scenery for which the island is famed.
Mr. Rawson Carroll, in moving "that the Association is deserving of the snpport of the profession," said that as a Fellow of the Royal Institute of the Architects of Ireland, he promised the hearty co-operation of the elder body with the Assosiation in all its under takings.
On the motion of Mr. Maurice Brooks (Lord Mayor elect), it was resolved "that it is most desirable to enlist the sympathios of the kindred professions of painting, sconlpture, and engineer. MrManus, R.H.A., on the part of painting; Mr. M. A. Hayes on the part of sculptare ; and Mr Griffith, C.E., on the part of engineering.

## A CRY FROM LEOMINSTER.

You have recently protested against the destrnction of ancient buildings abroad; allow me to call the attention of your readers to the condition of the magnificent cathedral- like churoh of Leominster. It presents examples of Bome of the finest and most perfect Norman, arrly English, and Decorated work in the king. my attention was first attracted to the smashed windows, one opening being at least a foot square in and out of these openings the birds were gaily flping. On groinr inside, the roof of the south ingle. On going insia, roor or walls wero saturated. from one part of the roof number of funci wero prowins and then cround oth simath ars the the pleneas full hirls and an ata he place the or we a During wet wer in sor ouring wet weatherlle rain concsin in stream pounds will 1 on bla pounds will soon require luudreds for its renova. irremediable destruction.

## THE IRON RIBAND PILLAR.

Tris patent (of Messrs. Lee \& Rogers's invention) has now been iutroduced for a sufficiently long period of time to test its value thoroughly; deed, in the hands of the Riband Telegraph
 to develop and work it, it may he said to have passed beyond the introductory and experian essentiol tion. The tille of the company is, we are dis posed to think, calcolated to mislead, inasmuch as it would be an error to conclude that the application and use of the riband principle was limited solely to telegraph-posts, for thero really no case in which arerical standend support is needed, wherein its employment would not be adentan, in subtitution the ordinary cast ire coumos, which for hitherto ary material stren th in point distile of mere naterial strength. In point or disthution and conory of material, he hionn Fillar or post, possesses peculiar merits. cius apphed in a
post, 10 ft . or 12 ft . in height, and 8 in . in diameter, the iron measuring only 1 in . in width hy $\frac{1}{4}$ in. in thickness, a weight of 3 to 4 tons oan he supported by as little as 2 owt. of iron, which is the weigbt of the riband post, inclusive of cap and base ; and, moroover, at a cost as low as from 5 s. to 6s. per lineal foot. At the Com.
pany's Works, at New Islington, Manchester, pany's Works, at New Islington, Manchester, many speoial forms and applioations of this pillar, as also of a complete line of telegraph posts, of considerable length, doing duty with the telegraph wires in the imme. dhate vicinity of the latter, may be seen. One of the Governnuent telegraph engineers, Mr. Culley, in the discussion at the Society of Telegraph Encineers, on a paper upon the sth. ject of the Riband Telegraph Post, remarked that if every one knew them, all the old wood poles wonld require to he removed from half the towns and districts in England.
In connexion with railways alone, there are
other pnrposes for whicb these pillars are coming into general demand and use, - such, for in
stance, as for signal-posts, pillars for supporting stance, as for signal-posts, pillars for supporting
the roofs of railway-stations, gate-posts, \&o., and, we learn in particular, tbat the company are exoonting largo orders for India.
Among the general applications may be onumerated lamp-pillars, sign-posts, gate-posts, pillars of verandabs, conservatories, and greenhouses.
The company have just supplied two coalsheds, fitted witb the riband post, to the Famjong Paggar Dock Company at Singapore.

## ROYAL INSTITUTE OF BRETISH

## ARCHITECTS.

The library is open during the session, every Monday, Tbnrsday, and Friday evening, from six to nine, as well as daily. The Council consider that this nex arrangement is more likely than the formor hours of seven to ten, to meet the requirements of stadents and others, who will be able, without loss of time, to use the library on leaving their offices. Several douations the opening meeting of the session, - Novemher 3rd, The president, Sir Gilbert Soott, R.A., is not expected to attend the opening meeting, having
becn recommouded to romain in Italy until the close of the ycar, in order to recruit his hoolth. He has, bowever, forwarded to the Institute an inangural address, which will be road. It is proposed that the Aslipitel Prize, founded hy the first time this year, shall bo presented on the same eveniag to the oandidate who gainco examination of 1873 .

## CIVIL AND MECHANICAL ENGINEERS'

 SOCLETY.
## On Saturday last the members of this Society

 pisited, by permission of the Lords of the Adinizalty, the extonsion works at Chatham aays, tho civil ongineer in charge, and were hy bim shown over the whole of tho works. NLr. Bernays gave a lucid description as well of thedrawings and models as of the method of con. drawings and models as of the method of con. struction, and raterials used in the works, descrihing the unmerous dilliculties encounte Two docks are completod, and ready to tak in the largest iroucfad in the world, and the others aro in rapid progress.
Mr. Bornays pointed out the great extent to which he hul made uso of ooncrete in the con. atruction of the docks, and stated that the proportion of cement over tho great halk of the reatest caro was excrcised to ousnre getting a first-class cement.

## LABOURERS' COTTAGES WITH TIIREE

 BEDROOMS.Str,-In your issuo for the 11 th of Octobor, you 'Iave an abstract of a paper by Sir TV. Jones, on 'Labourers' Cottages,'" in whicb the writer und two living.rooms; and that the hest mode f giviug this accommodation is to place tho bird hodroom on the ground floor. May I ive the result of some experience, tending to
how that this method of arrancing the roons vill not always lead to succoss?
Some years ago Sir Joseph Whitworth desired a huild somo good moodel cottages, and emloycd the to sce what had been dono olserrivod at the result whis cottages for bing. Y. Jones's recommendations, namoly, that the ottages should have their third hedroom on the round floor, and they wore so huilt. They
vere compact, and considered satis?actory, and always fondly imagined that I had contributed omething towards the solution of an important rohlom, till, baving to go through the cottages bagrined to find that in no single instance had yy ground-floor bedroom a bed in it! Thase ottagers who wero able to master ap a little oreang on the walls, had mado a best parlour it; few who were not so well off harlour sed it at all, excopt to store fruit or lumher.
have no douht that in many other parts of

England the result will be tho same. The repronance to occupying a ground-floor bodroom, wbich is, as we all know, common among English people of bigher station, will effectually hoing the intention of cottage builders fron mendod by Sir W. Jones; and if this he so an injustice may have been, I am sure, baintentionally done to the competitors referred to in the paper whose designs for cottages did not adopt this arrangement of rooms.
The true solution is the one which is con"huilding inforior hy the writer of the paper,walls to the top of the cottare oarrying anp the series of artizans' cottarces, in Fissex, which I series of artizans cottages, in misex, which I the well. known difficulty of keeping a lodger distinct from the bousehold, provided for hy giving this back bedroom an independent ap. proach up a stop.ladder, and through a trapdoor ont of the sbod, as well as its door off the staircase. It strikes one, however, that a respectahle cottager would often prefer to exercise letting bim in hy the lodger which is implied in letting bim in hy the regular door of the house, might he of , ike many other ingenions devices, might he often foiled hy the persistenoe of the
inmates in adhering to their old arrangements.
T. Roger Simitr.

IN゙AUGURATION OF THE VIENNA WATERWORKS.
The Vienna Waterworks baving hoen com pleted, after a labour of about three years and Schwarzenberg Platz in was crected on the the palace of Prince Sohwarzenherg, close to the the palace of Prince so hwarzenherg, close to the mony of innugnrating the supply of pure Alpino water to the city of hienna and all its depend. encies has taken place. An aqueduct condacts sprincer for many miles from the far mountain springs of the Kaisersbrunnen and the Stixenstein. Hese waierworks bave been exconted Gahrielli. The wnem bydraulic contractor, MIr. Gahrielli. The mayor, Dr. Felder, received a tho Emper occasion from ho Emperor Francis Joseph, who conferred upon class, wbich entitles then Crown of the second to tbo rank of a Bes the recipient to be raised to tbe rank of a Buron of the Empire.
At tbo great city fote inaugurating the completion of the works, the Emperor, Archdukes, and all the official personages of Vienna were present. The burgomaster delivered an address, which was replied to by the Emperor, and hoth orations were groeted with great applause. Tbe city in the evening was brilliantly illuminated. Connt Hoyus Sprinzenstein, the donor of the the dignity of privy oouncillor heen raised to the dignity of privy oouncillor, and also decosecond class. Professor tho Iron Crown of the second class. Professor Suess bas long striven to demonstrate the advantages of this under. taking, and was congratulated by the Emporor. The centre column of water at the opening, it is said, rose to a height of above 180 ft .

## JERSEY NEW HARBOUR.

> concrete buthivg.

The necessity for increased harbonr room and shelter led the States of Jersey to invite designs rom four of our leading harbour engineers, tho towards tbe expenseg aitending the grentlemar of the designs. The altending the preparation ot reatrictis. The competition, however, was nvited to take part in it were thas specially tho reault he resul hoing that forty-three desimns were Harhour Commitee four speoial plans. The Harbor Committee collected evidence, investigated the designs, and, after maturo doliberation, awrided premiums. The selected to wbich they warded preminma. The selected designs were Gespectively hy Mr. (now Sir) John Coode, Mr. Giffard, and Mr. Kinniple, whoso names are placed in their order of merit, Sir Jobn Coode, ne of the invited competitors, taking the first preminw. Shortly after the awards had heen
made, Mr. Giffard, \& young envineer of ahility nade, Mr. Giftard, a young enyineer of ahility isdand. Dltimately Sir Jobn Coode's design was
islate wat eleoted for adoption, the necessary surveys were made, the preliminary arrangements completed, and the foundation-stone was publicly laid in August, last year, by the Bailift of Jersey
supported by the autborities of the island.

The works on the western sido of the existing harhour consist, in the first place, of a protecting break water, whicb commences at Fort Elizabeth and is carried over the Crow Rock, wbicb bas to be partly removed for that purpose. From the Hermitage the breakwater will be continued in south eastorly direction to a rock known as the latte, wbere it will terminnte with an elbow, 170 ft . long, at the bead of whiob a lighthouse will be placed. This breakwater, whioh will lave a total length of $2,700 \mathrm{ft}$., and will be 60 ft . high, and 38 ft . wide at the top, is to he contrusted in deptbs of water ranging from 12 ft . to 20 ft at low-water of ordinary spring tides. foundation halow low stracture will have its foundation helow low-water, the depths in some places being 20 ft . The eastward arm of the reakwater commences by a roadway, which Pier, and skirts the foot the present Victoria Pier, and skirts the foot of Sonth-bill, as far as the Point de Pas, just bolow the Engineer Barracks
A special feature of this work is the method fits construction, whioh is of conorete masonry, with steps, landings, and copings of granite. Sir John Coode has had oonsiderable oxperience Thenorete construction in otber similar works. The landing.pier will have a roadway 48 ft . wide, flanked hy a range of haildings, consisting of open shelters and waiting-rooms for passengers by the steam packets, refreshmont-rooms, lavatories, lock.up sheds, and otber convenient offices. The top of this rango of buildings will form a promenade 18 ft . wide, haviug a parapet wall on the seaward side, and a light iron railing on tbat next the roadway. The main walls of the struc. ture are being formed of compound hlocks of oonorote, oonnected by cross-walls of the same material, the spaces this formed being filled
wita rubhle stone.
Tho estimated cost of tho breakwater and landing-pier is 253,0002 ., and it is anticipated toat tiey will be oompleted in ahout nine years Tbo Times of October 25th gives a fuller ccomat of the works.
The authorities of Jersey are also erecting a ligiathonso of considerablo proportions, under the same engineer. This also is of coucrete, structure a the spot, and so as to make the rapid progross is one of the results of the Very of this material. It is expected that the use will be exhihited early next Junuary the light will be exhihited early next dunuary

ASSOCIATION OF MUNICIPAL AND SANITARY ENGINEERS AND SURVEYORS. A meeting of the Midland Connties' Branch of the ahove Association was held at the Royal Pump.rooms, Leamington, on Saturday, Oc toher 18th. Mr. Lewis Augell, president; Mr. Lomes, of Ealing, Lenpton, vice-president; Mr. Jones, of Ealing, general secretary; Mr. Pritchard, of Warwick, local secretary, and ahout also Dr. Bely, medical also Dr. Bely, medical officer of Leamington; and Dr. Wilson, medioal officer of the Warwick The President as visitors.
The President, in opening the procoodings, said it afforded him very great pleasare to bave tho privilege of presiding at a meeting of such an important section of tho Association as that of tho Midland Countios. He regarded the Midland section as a most important one, hecause very many of the members represented largo
popnlations, large industries, and places with large scattered that requirements. They were so very often, but wey mecessarily could not meet represented a community did so each member meetings like the one recently hold in Manchester must not only he of adrantage to thens individually as memhers ef the Association, but to the commnnities also which they repre. ented.
Tho members visited the Leamiugton Sowaro Pumping.station and the Warwick Pumpingstation; also Lord Warwick's sewage-farm at Hoathoote, and the Warwick Corporation sewage. arm ; after wbich they returned to Leamington, when papers were read hy Messrs. Bettridge, Monson, and Allen upon sanitary matters.
The President, in closing the proceedings, said where a town, in adopting irrigation, bad to contend with great difficulties,-was bampered in obtrining land, had to construct extensive pumping works, and to convey the sewage to a great distance, it was impossible to realise any profit
taken into consideration. On the other hand, some towns might convey their sewago to the land hy gravitation, and land might be obtained cheap, and, of course, such places would be able to adopt irrigation at a comparatively small cost The qnestions of ontlay and profit and ioss There were many places where it was ntterly impossible to apply irrigation. He had recently had an opportunity of hearing and reading all that conld be said for and against irrigation, and he was bound to confess that, nsing his knowledge and experienco as an engineer and his common sense as a citizen, there was nouning Which had hitherto proved so efficient and per were favoarahle, he was also of opinion that there were no hetter means of utilising sewage than irrigation. The qucstion of profit and loss, at ordinate to local circamstances. There was one thing wbich they, as sanitary engiveers, ought to gnard against, and that was heing possessed to guard against, and luat was heing possesse follow that becuse ivigation might be right and proper nnder certain circumstances, it was the proper under certain circumstances, it was thorld not he pat upon land. There should always be something to take out the solid matters, wbich caked the land.
The members afterwards dined togetber at tbe Crown Hotel, Leamington.

## ACCIDENTS.

Fatal Fall of a "Stecple Jack." - An iuquest on the body of John Prince, of Manchester, aged 25, has hoon held. Deceased was a fixe of lightning conductors and repairer of cbimueys, and was also employed at the Broughton Copper men accented an encoprement to point a boiler men accepted an engagement to point a boile Brown-street, Salford. Deceased was standing on a ladder, the foot of which was resting on the slated roof of the pattern-room, when tbe ladder slipped and throw him to the ground, It was not known what cansed in lhas but sustained a severo injury to his head, of wbich he died. Verdict, "Accidental death."
Singutar Accident and "Cure."-At the Ironworks, Seend, near Melksham, according to the Bristol Times, a large iron tuhe, ahout 30 ft . in circumference, through which hot air is blown from the engine, sometimes gets obstructed hy ashes, and then a man has to creep into it for the purpose of removing them. A man named Drewe got into the tuhe for this purpose, and not making his reappearance a man was sent into the tube, and found him jammed in a narrow part and insensible. He was pulled out, still insensihle, with severe scars and burns on his body. "The Staffordshire mode of bringing him to life" was then adopted. "A hole was dug in the gronnd large enough to roceive Drewe's head, and into this bole his bead was put, face downwards, and carefully covered up in the 'mother earth,' with the exception of Wonderful to relate, there were soon sigas of returning life, and Drewe so far recovered as to 'unearth' himself. Brandy was administered to him, and he was soon himself again," which no douht he wonld have been,--all the same,minns the earth process altogether.

HOSPITAL ARCHITECTURE.
Dr. J. H. Worteington, of the Asylum for the Relief of Persons deprived of the Use of their Renson, situated near Pbiladelphia, descrihes the improvements in the asylum:-

CLAIM FOR WAGES UNDER RECENT ARRANGEMENTS.
The first legal case arising out of the agree mont entered into between the Master Builders Association and the Metropolitan Society of Operative Plasterers, with respect to the incrensed rate of wage up to 9 d . per hour, came efore Mr. Serjeant Wheeler, the judge of the Brompton County Conrt,
The plaintiff, a plasterer, named Slade, claimed the small amount of 29 . $7 \frac{1}{2} \mathrm{~d}$. of Mr. Smith, a huilder; and Mr. Newman, who appeared for the plaintiff nominally, but virtually for the Trade ocieties, in opening the case, said, the sam sued for was of no importance as against the ques. tion involved in the dispute, as the decision would probably settle a difference between a would probably settle a difereace between a number of workmen and the claim was for an extra $\frac{1}{2} \mathrm{~d}$, per bour case the claim was for an extra $\frac{1}{2} d$. p
between the 2nd and 9th of August last.
Mr. Slade stated that in July he entered Mr. Smith's omploy as a skilled plasterer, and he then received the
 plasterers should he paid ga. per hour, the same as masons, bric
Mr. Bernard, counsel for the defendant, contended that vidence of this nature was not admissible, as there was nothing to show that thr defendant had come to any guch
ngreement between himself and his workmen, and he objected to its recsption.
In answer to the judge, the plaintiff said the majority of employers paid, and still did so, the extra td. per
hour to their workmen. If he were paid at the increased haur to their workmen. If he were paide sum nors sued rate for
for would be due to him. Ho had gess other plasterers
paid in the defendant's employ the 9 d . per hour on ths paid in the def
th of Angust.
In croess-examination by Mr. Barnard, the plaintiff said no was a member of the Society of Operative Plasterers, pay all the expenges of the etrial. He wrs arare that the The Judge here interposed by observing that in his opinion if tho dofandant s men Lad gone to bira on the 2nd of August, and acquainted Mr. Smith that they would
not continue to worls for him unle ag the agreement said not continue to work for him uniess the agreement
to he entercd into by tha Buildera Association as to the rise of one halfpenny, was paid by him, then they wonld
bo entitled torecover; but as far as the plaintiff's evidence had gone be did not see any case against the defendant. Ar. Newman urged that if somo of the men ware psid was entitled to recover his claim.
The Judge said he certuinty did not hold that view of money. The plaintiff was bound to eithar prove an agreement to which the defeadant was a party, or hoom hat bis master, Mr. Smith, promised to give tha increased
halfpenny per hour. This the plaintift had failed as yet ${ }^{0}$ do. Newraan here inqnired of the plaintiff if he wers ayar whether Mr. Smith was a member of the Master
Builders Asocistion. The plaintiff replied that he whs. He and others deputed goms of their fellow-workmen to wait on ths make full inquiries respecting the rise of wares, und
foreman then said be would see Mr. Smith abont it. foreman then said be would see Mr. Smith abont it. not hing furtibs was said abo
a number of their hands,
The learned Judge said
case for the defendant to suswer. ary to the Metropolitan Society of Opsrative Plasterera and this witnssa deposed to his knowladgs of an agree. ment bsing made, to which Mr. Sinthitiog.
The plaintiffent solicitor said the witness wsa alluding Co a letter, signed hy Mr. Bird, the Secretary of the Master Builders' Association. If admissible, he would The Judge said the plaintiff and his society raust first the Master Buildera' Association reforred to, and they must also subparha the person from whom the latter was
sent to the Metropolitau Syciety of Oparative Plasterers to give evidence as to the procesdinins of the sogiety hy mhich tha plaiutiff conterdsd Mr. Smith was bound.
The el xintiffs solicitor admittad ho was not in a pos The plizintiffs solicitor admittad he was not is a posi-
tion to prove all tisis, and acceptod a non suit.

The counsel for dafsndant suld his client would not ast | for costs. |
| :---: |
| Mr. Ser |

Mr. Serjeant Wheelar observed that it was very hand-
some tratmant of Mr. 8 mith, or he certainly should some treatmant of Mr. 8mith, or he certainly should
have given thera, becanse the sction was not brought hy single man, but by a body of men.
Nonsuit, without costs, accordingly.

## KENSINGTON GARDENS.

Srr,--I am glad to see that yon bave brought the nbject of the trees in Kensington Gardens to the notice
of the public. It is indeed fall time that eomething was done, as the garlens at the present time are in a most disgraceful atate, and sad!y require the superintendence of some intelligant person. The decay of so many fine trees
may, I thing, be put down to three canses, -a bad soi may, 1 think, be put down to three causes, - a bad soil
overdrained, too thick planting, and the babit of raising the ground ronad the roots of the trses, causing the rotting of the hark at the erown of the roots. The firgt
crase can in part he removed, where the trees stand by canse can in part he removed, where the traes stand hy
themselves, by removing the soil aronnd the roots, and chemselves, it with hetter, or if the trees were watered
replacing it
occasionaly in the sumer.time with liquid manure (sewage), the same end raight be perbaps gained. In the recond ease the trees, as you suggest, should be thianed
snd, lastly, if the ground were Eept away from the hase
of the trees, the thind cause of mischief would be arrided
In thess lisst cases the cause of mischief seems so ohvious In thess list cases the cause of mischief seems so ohvious
that it is extraordiary that the persons who have the management of the gardens should not see
present time two flie trges at the entrance of th
near Rotten-row, may be seen, both of which hava been near Roten-row, may be seana, both
an Inhamitart of Kexisingion.

## ASSOCLATED HOMES."

Sir,-I have long urged the social nccessuty of these adopted Homes io a rast numher of persons in
the midals and lorer classeg, corabining (as ther
might be made to do) all the priracy nnd independ might be made to do) al the pritacy and independ selectuess of say, a West-end club; the order, dumestio
arrangements, and committee of managemeut of onr great London and Continental hotels, and, like them, erected ty companies; lastly, economy, anormously less,
affording that social and intellectua! interconrse of alording that social and intellectual interconrse of
society not otherwise attainathls diminishing (that
refuge for bo many) evening amussments, drinking, abuse of tohaceo, the social eril, ideness, and dissipation; and

RUST'S MOSAICS.
$8_{18,}$ - Referring to yonr remarks on "The Tse of Ornamental TLes," in your last issue, as I notice you term the
mosaics manufuctured by me "artitcial," I am anxious to correct the impression which this description would he
Tikels to conver, and to call attention to tha fact that this material, as laid in the north court of the Sonth Ken singtion aruseam, \&c., sud the glass mosaics used by the to particular more artificial than that or the other and io of ancient mosaics, viz., marble and clay.
The general prejudice, especially among the architec-
tural profession, to any material coming under this head, is my reason for troubling fou in the mater.

## LEGACY TO WIGAN.

We understand that the late Mr. Joseph Taylor Winnard, surgeon, of Wigan, who was interred in the cemetery there last week, has left a hand. some legacy to the town, in which he has long resided. The execitors (one of whom is a local architect) ander the will of the deceased have informed the mayor, through their solicitors Messrs. Leigh \& Ellis, that tho residuo of Mr Winnard's property is hequeathed to the mayo of Wigan for the time being, for the purpose of purcbasing hooks for the proposed free libracy. The amount has not get been stated, and many figures hetween 10,000 ? and 30,0007 . have heen mentioned as the sam which is hequeathed to the town. Mr. Thomas Taylor, who has offered to give a huilding for a library, may now hegin its erection at once, knowing that as soon as orected its contents will be ready, and further that it may he stocked in a manner which stould make tbe institution one of the first of its kind in the county or the kingdom.

## THE ECONOMIC CONSUMPTION OF

 SMOKE.The operation, at Glasgow, of Messrs. T. \& T. Vicars's pateat self-stoking smokeless furnace, which is pernaps a litulo better snown a.g the than in Scotland, is thus spoken of in the thoroughly than any invention of a similar kind that bas hitherto come under notice, and is simple in constraction as it is efficient in operation. The coal is placed in a hopper, over the small quantities througb a couple of apertures. It is not neoessary to open the front door of the furnace, except to see how the fire ls getting on, for by a simple mechanical readjustment the man in charge of the furnace may regulate the quantity almost to an ounce. As it is added toll from abore the coal sinks down and slides slowly inward antil it reaches the bars forming slowly inward until feaches the bars forming acted upon hy plungers, which carry them foracted upon hy plungers, which carry them tortop, and then, an eccentric being applied, every: top, and then, an eccentrich applied, every froh supply In this systomatic and confresh supply. In this systemith and touous way the furace is fed with coal, whioh passes right through in slow and oasy stages, the same quantity of fuel hemg abio thesore exantly the same state. Combastion pertect, the smoke is burnt up, and the waste fuel is discharged, in the form of clinker or slag, into the ash-pit. The works of which we have been speaking are thoso of Heshis or these Thornliebank, where npwards of thirty of these furnaces are in operation, and others are heing
erected with all diligence. A small donkeyengine, with four-horse power, is sufficient to

Work sixteen furmaces, the manual labonc in connexion with them being reduced to a minimum. It has been found that when "triping" o round coal is used, the saring is from 20 to 25 per cent., while in the case of dross it is about 15 per cent. So far as the working of the furnaces is concerned, it seems to be all that could be desired. We may add that one of the furnaces at the Thornliebank Works was taken down after being in operation for nearly twelve months, and the fnrnace-bars were found to be quite perfect. The amount of wear and tear on these is reduced to a minimary by an arrange. ment of water-troughs, wherein the edges 0 the bars are constantly immersed, which effec tually keeps them cool and insures their pre ciple is $150 \%$.

PUBLIC BUILDINGS JN READING SINCE 18.18.
A 'orrespondent lias sent us tho following list of new public buildings, restorations, and exten sions in Reading during the last twenty.five
Jears :- Churches.-Christ Church, Grey Friars, St. Stephen's, St. Johy's, All Saints'. Churches Restored and Enlarged.-St. Mary's St. Giles's, and St. Lawrence's.
New Chapels. - Trinity, Wesleyan, Carey, Augustine, Brethren, Providence, Zoar, Cumber land road, Spring-gardens.
Chapels Enlarged.-King's-road, Ftiends', Wesleyan Reformers', Primitive Methodists'.
New Church Schools.-St. Mary's, St. Giles's, St. La wrenco's, Trinity, St. John's, Groy Friars', St. Stephen's, Christ Church, St. Nary's Chape (enlarged).
New Chapel Schools.-Castle-street, King'sleyan.
Halls.-Town Hall (enlarged and decorated) Albert Hall, Fest.street Hall, Abbey ILall. Public Institutions.-Berks Hospital (sever enlargements), dispensary, Connty Courts with sounty police stations, borongh police station, Forbury.gardens, restoration Abbey. gateway, narkets, abattoirs, savings-bank, bathing eataplishment, twenty-eight almshouses, water com. any (extension), gasworks (extension), new narket, Church of England Young Men's Instiate, Servauta' Training Institution, sewerage umping works, Freemasons' Hall, and union oures.
General Schools. - New Grammar school yoys', girls', and infant schools upon British ystem; Shue - coat school, Coley and Silver.
treet Board schools, Mr. Sutton's school (New own)
Railucays.-N゙cm stations of Great Western nd South-Eastern railways.
Buildings in Progress. -The sewerage works, ew master's house of Grammar school, new
hapel of Grammar school, Newtown and hapel of Grammar school, Newtown and rlesg and
ublic offices.
Of the above buildings, the niajority of which ore erected for the direct spiritual, intellectual, nd pbysical benefits of the inhahitants, forty. $x$ were raised by yoluntary contributions, The following is a carefur
The following is a carefully. calculated ammary of the cost of the churches, cbapels, hools, and charitable institutions crected in eading by voluntary contributions (from which 1 debts have been deducted) during the same riod:-
Churches and Church Schoola
£74,325 Chapels and Chapel Schools 2,350 32,350
28,200 £134,875
destruction by lightning and by fire.
Ripponden.-The church spire has beeu strnch - lightuing. Tbere was a lightning cone electricity entered the clock chamber, doing e electricity entered the clock chamber, doing
nsiderable damage to the genring nsiderable damage to the genring connected the chiming apparatus. Thence it doscended nded, severing it and breaking in two one of nded, severing it and breaking in two one of

Within the tower must have been destroyed,
together with the works of the clock.... In the together with the works of the clock.-.. In the eame district a mill has been strnck by light. room, igniting some cotton on its way out.
Glasgow.-A disastrous fire has occarred in an industrial school at Mosbank, near Glasgrow During a short lightning storm the roof of the building was struck, and tho woodwork having ignited, the flames spread withalarming rapidity Before the City fire brigade could reach the spot, the centre portion of the institution was onveloped in flames, and, in consequence of the scarcity of the supply of water, the firemen were unable to check the progress of the con. flagration, which soon extended to the eastern and weatern wings of the establishment. The fre has almost completely destroyed the larg being saved. The danage is roughly estimated at $12,000 \mathrm{l}$., but thia sum is covered by insurance. The boys connected with the institution, num bering over 400, were at play in the gronnds They wero taken to the Barmhill poorhouse until other accommodation is provided. The buildings, which were of brick, were opened only about three jears ago.
Halifax. - Two churches in the parish of Ealifax have had a narrow escape from destruc tion by fire. Tho little church at Lydgate, Tod morden, was in great danger in tbis respect, and
but for the timely arrival of a fire.engine would bave been totally destroyed.

## THE RJCHMOND DRAINAGE AND SEWAGE WORKS.

A special meoting of the Richmond Select Yestiy (as the urban sanitary anthority) several schemes for dispoaing of the sewage of the parish, so as to comply with the require. ments of the Thames Navigation Act, 1866, and the Thames Conservancy Act, 1867. Admiral Stopford, J.P., ocenpied the chair, and twenty. five members were present. Thirteen schemes were submitted from the several engineers, and were described as follows:-No. I, "Immer. sabilis" (irrigation); No. 2, "Mr. G. Erder Eachus" (irrigation); No. 3, "Mressrs. Mill \& Wilcooks " (irrigation with filtration) ; No. 4 "Experience" (irrigation combined with inter mittent downward filtration) ; No. 5, "Practice" (intermittent downward filtration with inviga tion, or for irrigation only) ; No. 6, "The Solu. "Dran (intermittent downward filtration) ; No. 7 Drainage and Sewage Engineer" (downwara docet" (intermittentfiltration) ; No.9, "X. Y.Z." docet" (intermittentfiltration) ; No.9, "X. Y. Z."
(chemical and intermittent filtration): No. 10 , "Mr. George Smith" (filtration by charcoal) o, 1I, "Ex Luco Lacellum" (irrigation h A B C process) ; No. 12, "P. F." (filtration) and No. 13, "Spes" (filtration). The scveral shemes wero considered seriatim, and on a show of hands two only-viz., No.4, "Expe. rience," and No. 5, "Practice"-were reserve for further consideration, the others being out. voted. Subsequently these two were examined and contrasted, when "Practice" came to grie on the motion of Mr. Steel, seconded by $\mathrm{Mr}_{\text {r }}$ Jones. It was nltimately resolved-"That the scheme of 'Experionce' be further considered at a special meeting on Tuesday next, with a view of adopting the same if approved." Scveral of the members were anxions to adopt it at this meeting, hut it was ruled by the chairman, on the wording of the Vestry rotice, "That no scheme could be adopted that day nnder any circumstances.'

## VARIORDM.

"Crildren of the Older Time," by the author of "A Trap to Catch a Sunbeam," is a re markably pretty book for the yonng people of ment, and very amusing it merely for amnse-
is fill find in it ment, and very amusing it is, will find in it information they will be glad to recall when
they haveceased to be children. It was a capital idea, going back to the Sarons, the Normana, the Plantagenets, and so forth, and would justify even a bigger book on another occasion; but as it is we can strongly recommend it, and skall be surprised if it does not come to be regarced as classic in juvenile literature. The book is copiously illustrated from old sonrces, Chaturg an engraving of the children of Cliarles 1., after Vandyck. Mr. Mackarness's
little book bas a preface by her father, Mr.
J. R. Planché, which seaves to afford assurance looked for in auch a work; and the publishers, Messrg. Griffith \& Farran, have given it an Murray appearance the aloquent and suges ive sermon, delivered in St. Panl's Cathedral by Dr. Heseey on the occesion of Sir Edwin Landseer's funeral the idea inculcated being "The Artist a Great, Moral Teacher" With, outburst on "the dnty of delirht" With bis sympathise, and amee with him that we fully us rejoice, and who have the power to enable onr brethren to rejoice, imocently.

## 

## The Sanitary Survey of the Ainwick

 Union. - The valuable reporte of the sanitary inspector of the Alnwick district continne to Not only to the rural sanitary authority. carefully examined and seported premises are others, the more extensive and on. Among premises of Havick Hall are overhauled Tbe isspector states that within the last fow years Mr. Rawlinson converted all the privies in and about the house into water.closets There are now," says the reporter, "eight water-closets in the house, and four others in adjoining buildings. Tbese twelve water closets are drained into tho hurn at a poin properly remote from the premiscs. Formerly the outlct of the main drain was immediately in front of the hall, bnt it was unbearable and dangerons there, and a lower point has been substituted. Until the great question of the day as the Earl admitted to me that be considered the factorily determined, this disposal most be accepted as sufficient. The water aupply is not quite so contenting. . . . . . The best mode of improving the water supply to this great house would he to prevent the discharge of any drains into Howick burn by the ntilisation of all the gewago along its course, as elsewhero ; but as this cosmopolitan question is not ret sifted to its bearings, pure water might meanwhile bo obtained fiom the hill ranges bordering bis lordship'sestates."
The Sewage Question at Maidstone.-The report of Mr. George Livingstone, C.E., Borongh Surveyor, on the collection, removal, and utilisa. tion of the sewage of Maidstone, has boen re. ceived. He is of opinion that there aro many Masons why irrigation should not be adoptod in Haidstone, and the Maidstone Joumal thinks the $A B C$ system shonld be also discarded, as it has ang a very fair trial, and has been found wantand The Borough Sarreyor proposes to collect ather remove the whole of the focal matter and a dry manure ; and in the aecond place, to conrey the whole of the remaining sewage by a low-level intercepting outfall.sewer, to a point below Allington Liok, on the line of whicbshould be constructed asnitable tank through which the sewage shonld be filtered, the effuent water being allowed to flow into the river in a comparatively pure and harmless condition. The remoral of the contents of dust-bins, night.soil, and other efuse, Mr. Livingatone recommends, shonld be carried out by the local anthorities, or a plan which is an adaptation of the Pail or Tub system in use at Nottingham and other tomns, and profit is calculated upon from the undertaking.
Cheltenham and Gloncestershire Victuallers Asylum. - The fonndationstono of this asylum has been laid by the Duke of Bean. fort. The building will be in the Domestic Gothic sty.e of architecture, according to plans by Mr. Darby, of Cheltenham, architect, and will cost about 1,2002 . The accommodation to be provided for the inmates will be complete but at present only the central portion of the building will be proceeded with. two wing the which provision has been made, will be added in due course. In all, twelve families will bo accommodated.
Parliament-street.-Many will be glad to hear that Mressrs. Glasier \& Sons have received instructions to proceed with the sale of the materials of the honses in Parliament-street, in front of the rew Home and Colonial Offices.
Woolstone.-The works at the church here, mentioned in our last, were execated by Mr. A. Hawkins, of Cheltenharn.

Eucalyptus v. Fever. -The Frenctu Academy of Sciences has received an interesting com. munication from M. Gimbert, who has heen long engaged in collecting evidence ooncerming the Australian tree, Eucalyptus ylobulus, the growth of which is sarprisingly rapid, attaining besides gigantic dimensions. This tree, it now appears, possesses an extraordinary power of destroying miasmatic influence in fever stricken districts It has the singular property of absorbing ten times its weight of water from the soil, and of emitting antrseptio camphorous effluvia. When sown in marshy ground, it will dry it up in a very sbort time. The Eoglish wele the first to try it at the Cape, and within two or three years they completely changed the elimatic condition of the unhealthy parts of the oolony. A few years later its plantation was andertaken on a large scale in various parts of Algeria, and complete immanity from looal fever has beeu maiu. tained by it. In the island of Cuba, paludean diseases are fast disappearing from all the anhealthy districts where this tree has been introduced.

Prizes for Designs of Philadelphia Ezhi. bition Building, 1876. - The Uuited States Centennial Commission, at a meeting held in Philadelphia, on Augnst 8th, aocording to the Polytechnic Bubletin, awarded the premiums of 1,000 dollars to each of the authors of the best ten of the competing designs for the Exhibition building 1876, viz,-To Samuel Sloane, of Phila. delphia, for No. 9 ; to Jobn MoArthur, jun., \& Jos. M. Wilson, of Philadelphia, for No. 11; to Calvert Vasex, of New York, for No. 21; to Collios \& Autenrick, of Philadelphia, for Ňo. 23 to C. C. Clark \& II. A. aud J. F. Sims, of Phila delphia, for No. 32; T. O. Sidnep, of Phila. delphia, for No. 15; J. S. Fairfax, of Wheeling W. Va., for No. 20: Thomas M. Plorman \& Co Washington, D. C., for No. 22: Francis R Gatchel \& Stephen Rush, of Philadelphia, for Gatchel \& Stephen Rush, of Philadephia, for No. 24; and J. II. Veydage, of Terre Haute, The., for No. 25 . From these ten the design for the building will be selected, it being understood their desigus before competing for the main prize.
Finsbary Park.-A right of way over Fins. bury Park is preserved by law to Messrs. Wing \& Ducane, who, as the owaers of the pasture land adjacent, are empowered to drire and nightoss the park at all hours of the day cannot be properly fenced in and preserved An offer was made by the Park Committee of the Mretropolitan Board of Works to make a special road through the park, but it was not special road through the park, but it was not accepted, and tration. Mr. Baron Pollock, it has of the arbitrator, Mr. Barou Pollock it has been thought de promotion of a Bill in Parliament to remedy the promotion

Soluble Glass in the Arts.- The employ. meut of this substance in the arts is rapidly extending, and it has beoome indispensable in many industrial branches. It; seems to he sements : when intimatels mired with fine chalk it is found that a hard cement will be formed in from six to eight hours. With powdercl sulphide of antimony a black mass is produced, which is susceptible of taking a hich polish and possesses then a superb metallio cives a grap metallo iustre. Nue iron-dust Zinc.dust grayeblack mass of great barduess. and and haring a metalic lustro. Ziuc castiags can be readily repaire
Franlilin Institute.

The New Townhall at Wavertree.-The townhall which has heen erected by the Local Board of Wavertree has been formally opened. vear by Mr. J. A. Picton, chairman of the boast jear by Mr. J. A. Picton, chairman of the Board. The architect is Mr. John E. Reeve, of WaverO'Fills \& Morrison, and the builders are Mossrs. was celebrated by, of Wavertree. The opening was celebrated by a dinner in the now building, Mr. Picton presided ; and the guests included the mayor of Liverpool, and other officiais.
Scindhia's New Palace at Gwalior.-We earn from the Bombay Gazette of September 20th, that the new palace which Maharajah Scindhia is erecting at Gwalior, is an exact copy of the Government House in Caloutta. There are at present 9,000 men at work on it.

Antiquities in the Caucasus.-La Caucase tates that the archwologieal excavations made uring the past summer in the distriets of Alexandropol and Etchmiasdin, in the proviuce f Erivan, have produced important results. Utensils of iron, silver, gold, and bronze have beea found, which helong to an age anterior to the introduction of Christianity into the country. the introduction of Christianity into the comatry The excavations in tho andropol have brought to light a Pagan temp: of gigantic dimensions, na now from cuneiform inscription, of which a photograph has becn taken.
Hospital Barracks.-One of the twenty rold medals given by the Empress Augusta for the purpose of rewarding those persons who bare this year extibited tbe best artioles for the care of the sick and wounded ia war, bas been awarded to the Crown Princess of the German Empire, for the model of an improved bospital barrack, cxecuted by Mr. Jacobi, an arcbitect at Homburg, from drawings and descriptions of her Roynal Higbness. Ou being informed by the Royal Higbness, Ou being informed by the
committee of the award, the Crown Princess at committee of the award, the Crown Princess at once decided that the medal should he sent to Ir. Jaoobi, who has shown great skill in the coustruction of the model.
Improvements at the Midand Station Derby.-Extensive alterations have been going n. Additioual offices have been erected for the derks and station-master; and these aud other alterations and extensions have cost several housand pounds. Important improvements have also been made in the refreshment depart ment of the station, with new bufet, refreshment rooms, and diaing.room. The new dining-room is 30 ft . by 36 ft ., aud oconpies the site of the statiou-master's offices and tbe second-class refreshment-room.
The Assyrian Expedition.-The proprietors f the Daily Telegraph bave received a compli. mentary letter from Mr. Winter Jones, on the part of the trustees of the British Museam, thankiug them warmly for the valuahle collectiou of antiquities which were bronght together by Mr. Smith in bis recent expedition to Assyria. The antiquities,-upwards of 500 in number, -are now all in the British Museum, except the stone monument of the reign of Ierodach-Baladou I., king of Bahylon, whicb is on its way to England.
Remains from Mileto.-The Mcssrs. de Rothsebild have just made to the (Paris) Administration of Fine Arts a valuable present, consisting of columns, statnes, and bas-reliefs coming from the ruins of a temple dedicated to apollo.Didymus, ciscovered iu the neighbourhood of Mileto (Anatolia), in the course of excarations mado for some years past at tbe cost of these gentlemen. According to Galignami, these relics of antiquity will be placed in the Musée des Antiques at the Louvre.
All Souls, Oxford.-A reredos, discovered some time ago in the chapel of All Sonls, Osford, is being restored to its original beanty by Mr. Geflowski, of London. All tbe niches and canopies are completed, and a number of statuettes and other figures have been fixed. Earl Bathurst, a Fellow of the College, has undertaken this work, at a cost of between 3,0007 . and $4,000 \%$.
A Wilberforce Memorial. - The memorial tone of a chancel to the Charch of St. Michael and All Angele, at Silvanmore, Isle of Wight, which is being erected to the memory of the late Bisbop Wilberforce, has been laid on the feast of Saiuts Simon and Jude, hy Miss Raine. The chancel alono will cost 1,7007., and towards this sum Miss Raine has given 1,000 .
The Old Opera Fouse, Paris.-At half.past even on Tuesday night a fire broke ont in the old Opera Honse, in the Rue Lepelletier, Paris. The flames soon spread, and in threo bours the destraction of the building was complete, althongh a large number of engines were at work en. deavouring to save it.

## VOL. XXXI.-No. 1605.

On the Value of Symmetry and Design.

find the word in the HE Greek verb बข $\mu$ - $\mu$ ктрін h ав for its literal meaning "t thing by another," thingby another,' measuro toge. ther"; and the corresponding adjective, бін. $\mu$ erpog, siguitios " of like mcasure or size with," It is only when we como to tho sub. stantivo derived from this, $\sigma v \mu^{2}$ $\mu$ erpia, that we treicl we attach to it in a as signifying gencrally pleasing proportion of parts and outline of form. But the moro literal and restricted sense, as indicating that in which one part is measured from, and is a ropetitiou of another, is andoubtedly tho origizal sense of the compound word; and as we have no single word in English to express this likeuess between parts, it is convenient to nso the word "symmetry" sometimes in its narrower meaning, as indi cating repetition of parts on eacls side of the centro line, in any artistic composition or orna ment

In spcaking of the "value" of symmetry considercd in this sense, wo are not assuming that a symmetrical treatment is in all cases desiralile, but proposing to consider how far it is an essential element in architectural and orna. mental dosign, and whether or not it is a characteristic of the highest class of design; both sides of the proposition having becn respectively asserted is a pretty positive manner by critics of different schools. By one writer absolute symmetry is regarded as the necessary ooncomitant of any complete and artistic ornament; by anothor it is decricd as a mere mechanical and soulless method of treatment, substituting "vain repotitions" for thoughtful claboration of work
This latter vies is generally backed by an appeal to Nature,-to the endless variety in natural regetation, \&c.; and if we comparo the productions of architecture and its tributary arts with the works of inanimate nature, the con. trast in regard to this matter of symmetry is certainly remarkable. Tho objects we are accustomed to regard as beautiful in the latter are in aimost every case characterised by utter absence of symmetry; the constituout elements in a landscapo are utterly irregular, whethor in detail or in combination; no plant, and scarcely evcu a leaf or a flower, is absolutely symmetrical, though they both approach, in some cases, very closely to this condition. But, on the other hand, the almost universal consent of mankind so far (with one or two exceptions to he noted hereaftcr) tias been for more or less symmetrical treatment in ornament; in most cases absolute symmetry, in nearly all cases a symmetry more formal and preciso than anything fonnd in antural growths. There appears to he little connexion, either, between these symmotrical
tendencies and a high state of civilisation or intellectnal culture. If we compare the carving on the canoe or paddle of a New Zealander with the design 011 a Greek vase, we find, though the former is far less refinod in line and exeoution, almost the same importance is attached in both to the symmetrical treatment of each half of an object, and of the ornament worked on it ; and thronghout tho intermediate links between bar. barism and civilisation there is appasent, in tho characteristic ornament of each nation, the same principle (or habit) of reduplication and balance.

It is the consideration of this constant recur. rence of the symmetrical principle in almost all schools of design which has doultless led, in great measure, to the exaggerated estimate of the value of this elcment in ornament taken by some critical writers. It has been asserted that reduplication is tho very essence and fonndation of ornament; and a favourito example is the resnlt produced hy marsing any form on a piece of paper and folding it over while the ink is wet, so as to produce a correspanding opposite impression. Mere, it has been asserted, is the rough genesis of ornament; a form which was without meaning or beanty when first sketched, becomes "ornamental," and nequires a sonse and purposo the momont it is shown as a sym. metrical repetition. This is an extreme statemeut of the case, whicb, however, wo met with not long sinco in a hook put forth by an official instructor in art. It would not require much research, certainly, to find oramples to set agains so general a statement; specimens of heautiful but ansymmetric crnament of the Medioval school could be at once adduced; and it is quite possiblo to produce excecdingly ngly would-be ornament in tho strictest duplicato symmetry Tho part which symmetry really plays in orna mont consists in supplying the evidence of law and of design. Tho evidence of law, the rela tion of parts to a fixed purcrose, in nature, de pends upon minutio far moro numerons, various, and delicate than auything which man's handi. work can attain to or imitate; nor would such imitation, if attained, bo sufficieutly subordinato or quies cent in expression to serve as appropriate ornament to anything so artificinal as a bnilding But the priveiple of symmetrical opposition suggested hy nature in the growth of vegetation from a contral stem, ond carried out further and more completely in the higher forms of lifc, fir. nishes the readiost and most recognisable means of imprinting on man's artificial work the ex pression of law, and of a fixed intent governing his productions. Mero imitation of nature in her thousand irregularities, wants this expression of law, secanse we can after all only produce an imperfect imitation of certain details, which fail to exhibit any but a very small suggestion of the great physical laws of the world; we have there. fore to make to ourselves a smaller and more easily defined law, which we can illustrate in the compass of a panel, or a cciling, or a frieze; and it is only the ornament composed according to such an obvious readily comprehended law which has been regarded by mankind as of permanent valuo in its own class, and as matter for study and admiration. Mere knots, festoons, Grinling Gibbons carvings, and such matters, are of inte. rest historically, but not artistically, except as to mere power of handiwork.
This cxpression of law and design through symmetry may be ohtained, however, either by the omployment of forms and details absolutely symmetrical in themselres, as in the Greek honeysnckle ornament, of which each section consists of two similar halves; or hy the uso of a form not symmetrical in itself, but giving the effect of symmetry by repetition. This is exemplified in much of the best Gothic ornament, esjecially in illuminated border designs. And we may take, again, a well-known example from
which is striectly symmetisical, but which runs in a symmetrical sequeuce. The radical distinction between these two forms of symmetry and their expression, is, that the last.named (the repotition form) always indicates movement,-a tendency in ono direction, while the other indicates repose Each portion here is complete in itself, and conld in a suitable position be used alone. No section of the other form can be nsed aloue, for it abso. lutely depends for its motive on the parts pre. coding and following it. The greatest stateliness and sumptrousness of ornament belongs to the repetition of forms complete in themselves; the greatest life and piquancy to forms which are interpendent and only symmetrical in their juxtaposition. This is an important and wide principle, which in the main decides which type of crnament is suited to any given budding, room or situation. Where the mass of the building is severely symmetrical, the ornament must be in keeping with it, and must not assume, by the introduction of toe many unsym metrical forms, a liveliness and piquancy out of keeping with the structure which it adorns. Where the main bnilding is uuspumerical, romantic, "picturesque," in type, the ornament may display the tendency to morement and life which the uso of nnsymmetrical forms in connexion furnishcs. Palatial state and luxury is best adorned and embroiderod hy symmetrical ornament; the drawing.roon and bondoir, on the other hand, are better illustrated by the less rigid types of running ornament, approaching more to the life and vivacity of nature ; and this is the more trne, inasm uch as the strictly syinmetrical type of ornan eat, in order to tell and produce its full effect, requires both careful and exact execution and cousiderable richness and elaboration; the repoating style of ormament, less stately and more piquant, is satisfactory in simpler forme, and with less perfect execntion; avy iruperfections in the latter point being far less marked than iu the case of decorativo features which profess to be precisely and mathematically similar on cach side of their centre. Wo have hero heen supposing the case of buildings in the samo style, but intended for different uses. It might bo said that tho buildings for the most solemn asesin the Gothic stylo oontain a good deal of totally unaymme. rical ornament ; but if we compare styles with one another, we shall find that in most of the suc. cessful styles of the woild, the relation between the symmetry of the building and of its deco ration is kept up. In the pure and rigidly defned Greek building wo have tho grentest proportion of strictly ay mmetrical ornament; in the Gothic, which is much less restricted in general composition, there is a similar departare from uniformity in ormament; but in the earlier stages of the Gothic, when the logical clevelopment of the plan and construction of the build. ing was more strictly observed, tho ornament also (in French Gothic ospecially) is largely goverued by symmetrical disposition; it is only in the florid decadence of the style that the free. dom and irregularity of nature are affected in the ornamental details.
In addition to the two types just mentioned, and which are illustrated chiefly in ornament arranged in longitudinal or vertical lines, there is a moro sulbtle and ingenious combination of syumetrical effect with variety, which is possible in ornament designed to fill spaces and angles, In such positions the remarls as to the supcrior stateliness and sumptuonsuess of perfectly symmetrical ormament still holds good in tho main, and tho practico of mankind in general has ratifed it. But a more intoresting and moro piquant trentment is that in whicha symmetrical arrangement of the leading points and outline is adhered to, but tho connexion between them,the manner of passing from one point to another,-is varied. This is what gives much another,-is varied. This is what gives much
of its charm to the beautiful school of Moorish
and Arabic ornament, where we sce a centre or a spandrel filled with what at a first glanco appears to be an elaborate symmetrical design, hut which on closer inspection is discovered to be studiously varied in the details of its con-
struction, while preserving a perfoct balance of struction, while prescrving a perfoct balance of
the maiu portions and forms. A renarkable the maiu portions and forms. A renarkable design, this symmetry prodncod nnsymmetrically, is shown iu the small centre-piece of mosnic inlay given by Sir Digly Wyatt among his principle and genesis of this style of ornament. The intellectual interest of this style of treatmont, wheu well carried ont, is considerable, and its accomplishment, on at all an elahorate scale, demands more trouble and thought than most other methods of dccorative design ; its drawhack is that it is apt to degenerate, and with its luventors did at times degenerate, into mere designer becoming fixed rather on the cleverness than on the heauty, meaning, or suitahility of his work.
In considering the decorative treatment of a whole huilding en masse, we can perceive that here, again, there are degreos in symmetrica! treatmeut. In decorating large features, divisions, or bays of a building, which in their main parts are symmetrically repeated, we may either reat tieso with absolutely similar decoration, and depend for effect on the hreadth and largepreserving a general correspondence of appearance, of size, aud of motive in the decoration, when viewed as a whole, givo a moro immediate interest to each portion by a separate and
varying design in the details. The former prin. ciple, we need not remark, is that of the classic school, and, much as it has heen deeried and condemned in some quarters, there is almost every tbing in its favour, where great dignity and a monamental character are sought for. How for variation of featares, similar in the main, can safely ho carried, will dopend, again, on the Any variation of the capitals in the Doric temple (except, of conrse, botween columins and antox, which are really dififorent features) would have been an undoubted error, the capital bcing so severely and rigidly designed to give exaotly the expression that was wanted, and nothing more. In the moro Horid aud less rigidly constructive Corinthian capital, on the other hand, a variation of the design, so as yet to preserve the of all tho capitals symmetrical, might hardly have been out of place even in Groek architecdelicately and slightly accentuatod in snch a style. In a less rigid style, hut with a form of capital as symmotrical as the Corinthan, the early French Gothic architects in many cases it may be sece in a somewhat 1 uder manner, but very delicately carried ont in principle, in the early Transitional capisals of our own archi-
teoture, when the Norman scolloped capital was played withand varied by the architects previously to tinal disma. foliated capital. The variation in the mouldings of the main arcades in some of our cathedrals might be cited as another ivstauce of this principlo of treatment, so far as effect goes; hut this was
in many cases the result of work heing carried on at slightly different periods, hy difforent hands, rather than of a deliberate intontion. Iu Norman work, as at Peterhorough, it appears, howerer,
to have heen done with design. But in general it may be ohserved that this method of varying the treatment of symmecrical parts may bo
more fully aud safely applied to portions which are not a part of the constructive design, -mor to spaudrels and panels than to piers and arches and this is the more so, of course, the more rigid and bymmetrical tho general style of the
building. Any iraportant variation in the archivolt mouldangs of an "Italian" areade would he likely to he felt as an impertinence. On the other hand, the unsymmetrical treatment of symmetrical parts is a principle especially appli-
cablo to small works of tho nature of furaiture rases, and other such classes of articles. of this we see admirablo osamples in the design of the orvament on a good many of the enamelled the manket of "taste" lately, - tho largely into the body of the rase is divided into circles or serments of circles, symmetrically arranged but filled in with ornament differiur both in colour and design in each compartment.

Proceeding from parts to the whole, and con idering the application of symmetry to entiro hnildings, or to architectnre in the largest sense wo find the ohservations which we made in regard to its value in ornament holding true to very much the same oxtent and in the same manner in recgard to oomplete structures. What over may havo heen urged to the contrary, man kind have considered, and will continue to consider, symmetry of general design as au im portant element, ono of the ruost important elements, in the expression of architectural grandeur and dignity. This may he carried into pedantry, no doubt, as in the oase of a critic of St. Paul's reforred to in a recent article, who thought it must be ovident to every rightthinking person that the huilding was defectire in not having the dome in the contre and the two ends identical in design. This good man mistake arose from his not considering that hat to he entered (on great occasions) at one end, and that the progressive development of the design was from the westward towards the domo as the main internal feature. But if we take the west front of tho same huilding, overy one can readily imagine how mach the dignity and stateliness of this, the main frontexternally, would be impaired by a variation in the western owers, so as to destroy the symmetry of the design. If the cathedral had hoon intended to be approached hy a main avenue from the side also, and the flank bad thus hccome as importan as the front, there can he littlo douht that Wren would have constrncted it symmetrically, an have placed the dowe centraly with the sada avenue, if not with tho hoilding. It is not to the parpose to quote such an instance as the spires of Chartros in opposition; hccause, in the first place, Gothic is a less quiescent style and aims less at repose than Greek or Roman, and therefore what would assist the expression of the one might militate against tho expression of the other ; and, secondly, because the variation of tho Chartres spircs is a matter of accident rather than design, and its interest is at least as much historic as artistic; and there can be no douht that any ono who made a design now with that degree of variation in towers so placed (symmetrical on plan) would be held to have uildiuge of as a gonoral rnle, bace, not gearl so much examples of a contempt for symmetry as has been protended; the nohlest of our cathe. drals were designed as symmetrical huildinga in their main mass, with a procise repetition of features on each sido; the adjuncts of chapterhouses, cloisters, \&c., which go to mako a oncsided plan, and give the idea of irregalarity ought strictly speaking to he regarded as separato structures from the main design. The stent to which tho cathedrals have been pulled about and added to at differcnt periods has created in the mind of the pablic and of archiectural amateurs an idea about their want of ymmetry and regularity which is contrary to fact and to the intentions of their hailders. On the other hand, it may ho said with baildings which hare to be be proportion of buildings which hare to be erected in the present day, absolute symmetry is unneantruthful; for it is contrary entirely to the genius of architecture to mask an irrogular and unsymmetrical plan hohind a symmetrical exterior. What has heen ohserved in regard to onnament-that symmetry means repose and stateliness, and that irregularity or partial sym. metry means movemont and vivacity,-holds truo to the same extent in regard to hnildings. Where we require tho highest form of stateliness and dignity, either in the palace, the town-hall, or the mansion, wo require symmetry of design, the moro so becanse in almost every such case aymmetry of plan is a necessary element also. Where wo wish for the expression of comfort convenience, elegance, and what is called the picturesque element, we may discard symmetry; ho measuro of our progress from the palatial to tho domestic, and from the architectural to the picturesque.
These considerations are not without signifoance in relation to the great attention which has lately been hestowed upon almost the only and value which has in a considerahle proportion of its productions isnored symmetry altorether -the Japanese. These remarkahle decorators hare understood, as we ohserved, how to employ symmetrical arrangement in their designs with-
out symmetrical details. But in a large class of their works symmetry is entirely ignored, and the only object soems to ho to put on as much as possible of heantiful workmanship, without any seference of one part to anotbor, or ople had esign to tie ohject to which ard which o admire this and focdo and to imitate cellis haphazard overlaying of artes fith miscellaneous ornamental detall. Now: nuless the astes and perceptions of all the rest of mankind, including the most highiy-cultivated races that have ever existed, were totally wrong and mis-
taken, it is evident that a distinct low in the taken, it is ovident that a distinct law in the arrangement of ornament, and a distinct referform a great part of the art of design. No throw upon an article, he it what it may,-a vase, a flower-jar, a cahinet,--to throw upon it irregularly ornamental detail, of however elahorate and beantiful design and workmanship in tself, without order or symmetry, is simply for the designer to ignore one half of his work. The admirers of the Japanese cahinets for which such prices are given speak of what they are pleased to term the uninteresting and unintellectual repetition of parts in ornament of the Renaissance school. The fact is that the careful exeoution of a symmetrical ornament is one more evidence of the skill and care of the workman. The porception of this is really at the bottom of the rather affected objection to stencilling colonred ornament held hy some nodern Gothio architects,-it is a mechanical performance of what should he dono by the care and skill of the art-workman. The sense of a dificulty carefully overcome always adds to our leasure in the contemplation of a design ; and hus, if we do not adrocate the execution hy hand of all painted ornament of the symmetrical type (the gain soarcely compensating for the oss of time in such a case), we contemplate with loving admiration the exact execution in narble of the Greek symmetrical ormaments he two sides identical to a hair's hreadth, as a beautiful example of delicate, and careful, aud conscientions workmanship compared with which the Japancse and Chineso irrerular and unsymmetrical elahorations of ornament appear comparatively coarse and unintelligent efforts, in which that combiuation of intellectual interest and mechanical perfection which is necessary to produce the highest forms of artistic ornament is absent.

## BLACKERIARS GOODS WAREIOUSE.

ron por strlctulal use
THe new goods warehouse that is being hailt hy the London, Chatham, and Dover Railway Company, and which has heen in progress for nore than two years, and is now very near complotion, is an extraordinary structuro in various respects, hut most notahly perhaps for the enormous quantity of wrought and cast iron that has been used, and with much skill and success in he erection.
Tbe huilding is remarkable also for the quan tity of property that had to he demolished in clearing the site. Jpwards of thirty honses had to he taken down, and although the property was of an inferior character, the company had of courso to pay fall value for it, or rather more In the case of a dilapidated tavern in Holland. street, with ten years of the loase to run, for which the occupier, it was stated, considered 5,000 l. an insufficient solotium, we are not
prepared to say this was wrong. Holland-street prepared to say this was wrong. Folland-street was for the greater part ahsorhed hy the goods warehouse, and closed as a carriage-way, hut a
suhway in its stead was provided for footsuhway in its stead was provided for foot. passengers. One side of the warehouse faces Blackfriars-road, from which, howover, it is hnt little seen, hccause of the nnmerous lines of railway that intervene. The other side elevahon fronts Green-walk, now a spacious thorough. fare of ahout 22 yards wide, which now takes the traffic into Southwark-street and Blackfriars road. One end of the warehouse faces what remains of Holland-street, from which are the priucipal entrances: the other end is towards Southwark-stroet, at which also there are entrances.
The site covered is an ircegular parallelogram, being ahout 276 ft . long hy 126 ft . at its greatest, and 120 ft . at its narrowest, widths. Having Give floors, including a basement, it would appear that the huilding has an aggregate of about 18,090 square yards, or nearly 4 acres of floorbays, with two windows in each, or nearly 300
mindows in all, including the end elevations The windows are all of iron. The only com. munication for goods hetween the hasemont and the floors abere it is by hatohways and hoists. The basoment, which will be appropriated to the storago of ale chiefly, is 9 ft .8 in . high, and is pared with Staffordshire bricks. The roof of the hasement is supported upon 101 longitudinal wroaght-iron girders, having a total length of $10,100 \mathrm{ft}$., and 550 cross girders. Between the cross girders jack-arcbes, witb two rings of hriok, are thrown, which are covered with concreto, lovelled up, and 44 in. thick at tbe crown. The principal floor, immediatoly over the base. ment, is supported by the girdors already referred to, that are borne hy 161 cast-iron
columns, inoluding 27 principals, 9 ft . 4 in. bigh and 2 ft . diameter, eaoh woighing 2 t tons. Tbese are the main supports for the whole of the into. rior. They have under eaeb column an iron bod-plate, 4 ft. squaro, and woighing $1 \frac{1}{5}$ ton, the hed-plates being laid upon granito bases, and these again upon beds of concrete, 8 ft . 9 in . in the basoment are from 9 in . to 7 in . diameter The total weight of cast and wronght iron at and uuder the ground.floor is $471 \frac{1}{1}$ tons.
On the gronnd-floor, to which earts and wa have access, the forest of columns in the baso. ment, and in the upper floors, would be quite inadmissible, and only the twenty-seren principal collumns appear, which are carried right up roof. These columns are 22 ft . high, 2 ft . dia. meter at the base, and $1 \mathrm{ft}, 9 \mathrm{in}$, at the capital; they woigh five tons each. Intermediato oolumns are introduced in the upper floors, which neces. sitates the provision of enormons strongtb in the gitates the provision of enormons strongtb in the
girder have to carry them and the superstructure. The min girders, 106 in number, that support the first-floor, aro probably the most remarkable oollection of wrought-iron riveted girders to ho met with in the world. Sixty-one
of theso girders weigh an average of 11 tons each, and forty.five others aul average of 4 tons cacls; in all about 800 tons. Upon theso main gilders 300 cross girders rest, that are the same in conseruction $2 s$ those on the ground. foor level, These are placod at distances of 6 ft .6 in . bet foot, These are placed at distances of 6 ft .6 in . botween
contres. Tho total weirgt of iron work in this contres.
floor is about 910 tons of wronghtsiron girders, and 135 tons of cast-iron colnuns. The largest of these girdors, which are fish bollied, have the large dimensions of 3 ft . $11 \frac{3}{8} \mathrm{in}$. deej in the centre, and 3 ft .3 iv . deep at the ends. The
ground.floor is paved with granite oubes for the waron ways, and with wood paving in other parts. This floor has two strong phanked loading stages oach 235 ft . long, 10 ft . wido, and 3 ft . high.
The first and second floors are almost entirely atike in construction, as regards the iron work,
They have 361 wrought-iron girders, and 3.10 columns, including the continuations from the basoment of the 27 principala. The first floor ig $10 \mathrm{ft}, 6 \mathrm{in}$. from floor to ceiling, and is laid with $2 \frac{1}{\mathrm{in}}$. tongned planks; the seoond and third floors are 10 ft and 9 ft .6 in . high, respec.
tively, and are laid with 2 in . tongued planks. The joists are 12 in . hy 3 in ., and 11 in . by $2 \frac{1}{2} \mathrm{in}$. Tho upper floor has 32 cast-iron colnmns, that hear tho lattice girders npou which the principals of the transverse roofs rest. The roof principals are placed 27 ft , apart. Thotie-heams are 11 in. by 4 in.; the king.posts, struts, and other bind.
ing parta 8 in. by 4 in., purlins 8 in. by 3 in., and ing parts 8 in . by $4 \mathrm{in} .$, purlins 8 in . by 3 in ., and forged straps are employed at all tbe junctions of the principals. Diagonal boarding, 1 in. thick, and Countoss slates covor in the whole. There are sir roof gutters across the building, each 2 ft . wide, nnd laid with 6 lb . lead. The gutters are 58 ft . above the ground line. Fourteen of the main columns are made available for conver. ing part of the roof water to drains at the base of the building, from which it is convejed to a street sewer. There are also cast.iron rones in each bay on the Green Walk side for the same purposo.

The ground.floor is laid witb a line of rails long each side of the two stages, and a single line across each end of the warehouse, and is the ends of each of the stages. The rails on the ground.floor are 28 ft .9 in, below the level of the rails by which the Midknd and Great Northern Companies will communicate with the and raised by powerful hydraulic lifts. There will he twelve cranes on the ground-floor, capable of lifting from 25 owt. to 2 tons each,

Tho communication hetween the gronnd and upper floors will he hy nine cranes, inside and ontside. Thero is commnnication between the toors hy hatchways, -fonr to the basement, 12 ft . by 6 ft . $\operatorname{six}$ from tho ground to the first loors; and two each in the second and third loors. The walls, of Staffordsbire blue and white Burham bricks, are 3 ft . thick, witb fonndation footing 7 ft . 6 in . broad. They are built in oement to tbe rail level; there are also six bands in cement, a foot deop, nll ronnd the buildiug, at graduated beights.
The quantity of iron used in the building exceeds considerably 2,000 tons, including more than 78 tons of best prought.iron rivets. The quantity of timber used in it amounts to about

## 31,000 cubio feat.

The whole work has been designed by, and execated under the direction of, Mr. WVm. Mills C. F., engineer-in.chief to the Lendon, Chatham aud Dover Railway Company; rosident engineors tors, Mosers. . Hewitt and R. Barkor ; contrac tors for the iron work, Mosars Mat ; contrac Co., of London and Stocikton-on.Tces, whose engineer, Mr. C. M. Chittiok, arranged the working drawings, and suporvised the manufac. working drawings, and supervised the mannfacnotwithstauding the irregular ghape of the bnilding, one side of it being a curve, and its width at any ono point being diferent from what it is at every other, the girders are so nnmerons, so varied in form and dimonsions, and many of them so enormons in size, it was thought practicahle to pat them together at a distance, which was done with complete success the whole of the girclers laving been made at upon the of Hessrs. Shaw \& Co., and brought upon the ground ready for their places, into
which they fitted readily, not only without Which they fitted readily, not only without
alteration, but with absolate precision, a result alteration, but with absolate precision, a result
of which the firm may reasonably be proud.

OVERCROWDING IN SOUTL WALES.
It appears from the prooeedings of the local authoritios, that the expansion of the mineral trade of South Wales, and the consequent increase of the popalation in the various contres for the constantly andended with a searcity of louses for the constantly-increasing number of inhabiHonlth lost week, a case was Cwman Board of where elopen persons, ineludind three married couples, were occnpsing apastment! and iostances wore given where sis, eight, and even ten persons, consisting of different families, were living, cooking, and sleeping in the samc room. In the oourse of a discussion which took place on the subject, it was proposed that immediate atcps be taken to put a stop to such overorumdiug as bighly injurious to health, and that the officers of the Board be instructed the members present opposed the proposal of tho ground that "the inspector had no legal right to interfere with private honses," and the matter was allowed to drop withont any action whatever heing taken. We shonld bo disposed to say it is will rather than power that is wanting.

## THE NEW BLOCRS AT PEABODY

 SQUARE, BLACKFRIARS.The two new blocks of huildings which bave for some time been in eonrse of erection in addi. Peabody-squere, in the Blackfriars.road, are now noarly completed, and will be ready for occupa. tion in a ferp weoks. These additional blocks, which bave heon erected hy tbo Peabody trustees in consequence of the numorous applications for dwellings in Peabody-square, aro situated on the formerly or the present building, on the site extend to Webber.street, Blackfriars, whioh forms their uortbern boundary. Thers have eaoh a frontage of about 60 ft , but the principal elera tion of ouly one hlock faces Blackftiars.road the block immediately adjoining the present frontare thenng eastion this main frontare of the extreme north new block being a continuation of the Black friars frontage of the oripinal buildings. Althourh the atage tectural elevation of the new hnildings is mainly uniform with those already oconpied, it is not baite of the same character, the new hlocks
enly four stories. On the ground floor of each block there are two dwellings containing three rooms, and two containiag two rooms ; whilst on here aro five , and tbird floors respectively, three rooms, two two rooms, and tho other a single room. The foncth story contains three dwellings with three rooms each. The blocks thas contain twenty.two dwellings each, or fork dwellings in all. The wasi2 houso and on the fourth fluated at tho top of bied with wash tabs, wrinring.machines, and other repuisites in addition to two large drying.rooms, There is also a dust.shaft on the same floor, carried down to tho bottom of the huildiom, to which there is access at the severat stories. An im. provement has been made iu some portions of the fittings, the cupboards, amongst other things, being larjer and more convenient ther hose the adjoining blocks At the rear of the block the adoining blocks. At the rear of the blocks limitod in space Wo underar ather limitod in space. Wo understand that the exogeds their fomber, andings already let. lready let.
The architect is M. H. A. Darbishirc, wbe designed tho original hlock, and Miessrs,
Cubitt \& Sons are tbe huilders.*

## IMPROVED STREET CONVEYANCES.

Wita tho introdaction of "Hansom's Patent fatety calbs, or as they aro called for the sako took place in the means of conveyance in the streets. Erery other cab plsing in the street of London is now . Finssom, and the large pro vincial torns hare adopte the large pro When the underground railway was opened, peoplo propliesied that a marked decrease vehicles in apparent in tho nomher of public vhown that the number ; hut experience bas ghown that or threa years ago, tramways, on improved principles, were revived annong us, it was said that the nso of omnibuses, at any rate, would become less common; but, still they seem to increase iu number, and, instend of decreasing, cabs and ombibnses are becoming more and more mmerons. With all this demand, bardly any improvement has taken place in the com fort of the public vehieles: "four-wheelers," or as they are irreverently called, "growlers," than the first " backney carriage" of an age gone by

The Society of Arts bas at last come to the rescne of the grambling, hut patiently suffering British pablic, by offering prizos for the best cabs that have actually plied for hire in the streets of London for six months before tho differen the compotition. $\Lambda$ bout eight or ten different vehicles, -. four. Wheelers and two. wheelers,-accopted the challonge; and after complying with the necessary conditions, were subjected to examination and comparison, and exhibited among the other carriages in the International Exhibition, which closed on the 31st ult. Theso cabs have thus nudergone unt only oximination by the Society of Arts Committee, but by the public in general; and the verdic is in most cases the same. Those who have not been enabled to see the "patteru" reformed oahs at South Konsington will have an opportanity of doing so at the $\mathrm{C}_{1} \mathrm{y}$ stal
Palace, whither they aro, we helieve, to be trans Palace,
ferred.
The prize cab, that which by public consent is declared the best, and which has received the medal of the soctety of Arts, is a11 i:nproved Hansow, - a two-wheeler. Its chief fenture is idoomicess: carried on wheels of the same num as the ordinary Hansom, its inside mea average cal. Two doors in front, opening simul. taneonsly from the centre, and reaching to the roof, take the place of the awkward fold. ing windows and doors of the ordinary Hons som. The npper part of the doors is fitten with windows, which can he opened or shat at pleasure ; these doors can also be shat or opeved by the driver on the seat behind, by connectiag. rods at the top of the cab; at each side of the cah are sliding windows. The shafts are hang on a spring, giving greater easiness in riding and the cab is decidedly most comfortahle in overy

respect. It weighs 8 cwt, costa 751 . to 901 , and is built hy C. Thiorn, of Norwicb.
Nest to this comes a four-wheeler, by Lam. bert, of Great Nueen-street, wbict has received a prizo of 302. It is a most roomy cab, more like a privato Brougham than a cab bin anpearance. The back part of the roof can be folded hack hy any affording an onen carriage for the summor. Beneatb the lining at the hack of the front meat is a roomy "boot,", and at tho back of the cab a courenient box for "nose-bag," \&o. The
price is $85 \%$. price is 8 \%.
Quick $s$ Norminton, of Kiilluyry) presents some novel featurrs; but it appears too complicated, and lacks solidity cuough for street trafio. The front part of the cab is fitted
witb wiudows, and, by raising tbe box-seat, can witb windows, and, by raising tbe box-seat, can
be doubled back so as to form a carringe open in be doubled back so as to form a carringe open in
front, witb a hood behind, for summer use. front, witb a hood bohind, for summer use.
Beneauth the bos-seat is an opeu space available for pareols, \&ece. Bebind is a rentilator, and it is proposod to add a clock to provent dispntes as to hiro hy time. Tno windows are provided vith sunall disos of india.-rabber, -a very slight, but very noticeablo, feat rre in the comfort of the
velicele. A company has boen formed for the vehicle. A company has ben formed for the
purpose of supplying these cabs to drivers at the rate of 16 s . per wook. The prico is 902 , and the carriage weighs abont 9 owt.
A novel fature in soreral cabs, both forr. Whoelors and two wheelers, is the position of the doors, which are placed neither at tho side, as in a Brougham, nor exnotly in frout, as is a
Hansom, but at the fore cornuer, dingonaly Inansom (two wheoler), by Marston, of Birming. lams, has a semiciroular front, with a door on eacb side, hung on a door-post in the centre of the foot-board, and opening towards the lorse. Another, by the same firm, has the doors openiug outwards; and a four-wbeler to carry thiree Mansfield \& Crosse, of Exector, exhibit a fourWheoler, to onrry two, with doors similiarly lunug. once. There is no nuvkward entrance througt Whiou one has to take one's seat in the cab back Whad one has to take one's seat in the cab backcrush ono's hat, na the doors reanch from the floor to the roof, and aro fitted with frop-win. rlows. Messys. Marston alan contribute a
Zansom which dispenses with doars but has Hansom which dispensos with doors, but has instead a a argo stirf apron, whioh litts upwards
against the aplashb-board, and when closed forms against the aplaah-board, and when closed forms
a completo covering to the logs: it has the a completo covering to the logs
disadvanture, bowever, of the disadvantage, bowever, of tho old fanlioned

divides a similar apron into two parts, nactesi divides a similar apron into two parts, necessitating two movements to open it ; provides a
smail door roacling half way up to the roof, smail door roncling half-way up to the roof,
which opens outwarli, diagonally, falling open which opens outwarid, dingonally, falling open
of its own accord if not actually fastened; and retains tho old windows donbling back against the roof. Suah a complioation of movements would deter any one from entering the velicle. Messrs. Turston, of Leods, exlibit a curions ndaptation of the Hansom, with two doors reach. ing to the roof, one on each side, opening four in unnuber, two in the ordinary position and one on each side of the osb, the body of which is necessarily mnch longer than that of the existing oabs in general uso.
Such are some of the more noticeable features in cab bailding which the prize of the Society of two or three of the types will be brought into actual use iu our streets. A man with a cal like that of Messrs. Thorn, of Norwich, Messrs. Marston, Messrs. Quick \& Norminton, or Messrs Lambert, would hardly evar be without a "fare." In fact, when these cabs were serving their term of probation, it is said that they were continually evgaged.

The Proposed Building Act. - At the meeting of the Metropolitan Board of Works to be held this, Friday, Norember 7 th, a cousidered:-
"S Submitting, for the approval of the Bonrd, the draft of the Metropglitan Buildings and Mungement Bull; and
recommending thut the Buard do consider the same, and
decide as to its introduction into Parliament in the next decide as
Bession.
And the following notice of motion by Mr, Rocle:-
"That the Bontd approve of the prineipies of the Bill,
Purposes Commattee to report whet her ank of the clauses
require alteration or amendment."

## RECENT EXCAVATIONS IN ROME.

Of this subject Mr. J. H. Parker delivered a cotnre last week in the Ashmolean Musenm, Osford. Mr Parker said much credit is due to in Italian Government for the vigorous manner in which tbey are carrying on excavations Hill, and in the Thermm, ard or tla, as well as at Ostia aud at Tiroli ; in fact, all those anti quities whicb are acknowledged to helong to the Government. The Italian Parliament votes 1,200l. a year for this purpose, which is nnderstood to be chiefly for the excavations of the Palatine Fill, with the slopes round it, including tbe Forum Romanum Thes beren the excratora me in the of III., and oach fresb apeleon cleady the substantial trnth of proves more legendary history of Rome nltimatel the midy to make into a second Pompeii in the midille of Rome, including the most in. butesting archroological ground in the world, nirable project mast elapse hefore this ad. mirable project can he fully carried out. In the meautime, since Rome has bsen made the capital of Italy, a new city is being built within the old walls, but practically on wbat is now a new site, in the city of the empire, which hills on the eastern side of Rome, modern Rome of the popes of the six ; the centnry having been built on the level sixteenth between the bills and built on the level ground flood decided tbe builders not to build on that site, and to begin the new city on the bigh gronnd. This new city is mnking extraordinary and rapild progress; upwards of 2,000 bouses streets, new quarters of the city are being built new drains being mado on the most marnificent scale, and at an enormous depth, vieire with those of tlio old Romans. But in doing all this the remaius of tbe ancient city of the time of the empire are being brought to light week after week, and ofter buried agrin the noxt, The municipality of Rome does its atmost, by appointing an Arcboolo does its utmost, by appery ng an Arcbano very active secretary (Signor Lanciani), to preshape of notes, plans, drawings, and photoshape of notes, plans, drawings, and photologioal jonrnal to record what is found and whe ogical journal to record what is found, and whatever works of art are found, if portable, rescned Further than this they cannot on the Capitol. is to be preserved in its place it If anything clased by some one, and presented to them purhased some one, and presented to them, when frould not be refused; they would gladly take charge of it, and guaranteo its preservation by done in France offials. This has freqnently been done in France by the French Archæological ociety, Who purchased antiquities, and had them officially regristered as public property. In Rome it has happened uufortumately that from employed by the Goverument a anmher of vers employed by the Goverument a number of very destroped historical monuments mnst now be reserved withoul just as well have been Governmed without loss to any one if only the ho finct had possessed propor information. herman of Distake was in giving a part of the water that sapplied those thermm, as a site for the railway station, and therefore cutting throngh the great agger of Servius Tullius obliquely in order to arrive at it. The station might just as vell have beon placed outside of the agger in the space, half a mile wide, botween that and the outer wall. The consequence of this has been that the railpay station being naturally inado the centre of the new city, all the rest of the agger is rapidly being destroyed. The Government engineer fixed upon the nortbern end of it as the site for the new Government offices (the Somerset Honse of modern Italy), conseqnently he was obliged to make a temporary railroad for the parpose of carrying away th thonsands of loads of earth which had been piled up more than 2,000 jears ago, and which might onormous wasto of prblic money, which worla have been disor of pabile money, which woul been wilful ; bat it arose all concerned had it been wifu; bat it arose from mere ignorance, nd nothing else. Tho most recent discovery is the foundation of the roun fill, and jesta, at south of the Fomm Romanum, in front of the soath of the Fomm Romanam, in front of the Church of St. Maria Liberatrice, in tbe garden of which inscriptions hare heen found of restal
rirgins buried there. It had previonsly been
ascertained that tbe celebrated three columns near this point bolonged to tbo tomple of Castor and Pollnx, which also served as a vestibule to the palace of Calignle, which was therefore on The remains of the tomple of Julins Cocer fso bun for Antoninus and Fanstino with foumtain at antar huk end or the Forum, the whole length of wbich tbe platform of the great Bagilica Jalia, called nlso tbe platform of the great Basilica Jaha, called also number of brick bases.

## CHEAP SUBSTITUTE FOR DOUBLE

 WINDOWS.Dr, Oidthans, of Linuich, in a pamphilet on Sanitary Measures, suggests that "doublogrooved window.glazing should bo used, in stead of double wiudows, hy which, as he says, great expense mar be saved. This is done in the following manner:-Two grooves are cbannellod in the framo for receiving the panes, an onte and an inner one, and in botb of them panes are then put in and puttied. A space of ahout 3-16 tha to $3.8 t h s$ inch is thus formed, contain. ing a dry atmosphere, cut off from the air hoth in the room and in the open air. As it cannot perceptibly contract or expand, the outer pases repel the cold of the outer air the pares warmth of the room. For such a double groored window-clazing good hard glass (poor in potash) must he sect aspects tho may of the sum lo not decompose and render all the facing and render anl the racing aides of the panes, which natu liny canao bo eloanca. In putting the panes in, therefor, care mast bo taken, no only that the facing sides are sorupulonsly cleaned or all dust and dirt, but also that the air between the panes bo dry. The glazing of tbe window shonld therefore take place only in dry weather. It is self-evident that icc-llowers never appear on sach wiadows. Their inoreased cost will be covered the first year by saving in fael. Tho new metbod acta also as a protector in summer against the troublesome heat of the direct rays of the sun. A room provided with double-glazed windows, at a temperature of about $26^{\circ} \mathrm{R}$., will be $4^{\circ} \mathrm{R}$, cooler than ono witb ordinary windows. The method may also bo applied to hotbeds, for which it bas proved efficient, and for large areas of glass and green houses donble glazing might be likewise very advantageonsly used.

THE ARCHBISHOP OF YORK ON ART.
Tre annual meeting in connexion with the elby School of Art was held on TVednesday in ast week, when the Government and local prizes wre preseuted to the snccessfui stndents by the Arobbishop of Iork. On the walls harig the drawings and paintings of the papils during the year, as well as upwards of 100 works of art ent by the director of tbe South Kensingtor Museum. Amongst tbose snpporting his grace on the platform wero Colonel Grabam (one of her Majesty's inspectors of scienco and art schools), Rev. Canon Harper, Rev. G. Wyndham Kennion (diocesan inspector of acliools), Rev. J. B. Mitchell, Mr. J. T. Atkinson (sec.), aud others.
The scoretary read tbe report, and the Archbisbop in the course of his address said:-Art is all things the most democratic. It cannot be onduced without a certain gift, which seems tho middle, and to the loweat class; and here overy one may meet upon a common cronnd, and loe who has to deplore, -if it be a thine to be deplored - that he is one of the humbiesticlass, may yet see his name stand high with those of the foremost artiats in the world, for they, too, have sprong from hnt humble origin, and, using well the talents God has riven them, rose to he the admired of mankind, and the henefactors of their race. That applies to every art-to architecture, to music, to painting, to sculptare,-to everything that is colled art. It is a fair field, and the conrse is open to all, and those who thart, under some disadvantage of odncation find for poins and tronblo to for pains and tronble to compensato those diferemces, and place them in the front rank, althongh they started in the last. Inet na ask urselves what art is. And that is rather a diffi. enlt question. A Frenchman said that art was
that which taught you to do easily something
well whicb by nature yon conld do naturally but very ill. I think you will find that remark, althongh it is not a definition, goes a long way towards the trath. Art is the production of things in beautifal form of every kind. There every doy in the newspaper, -tbat easy style of writing which is now attained by so many, and which once was the privilege of only a few,-is, in fact, attained by groat practice and great painstaking, and that nico taste and fecling which preverts crror in all development of thonght. Art, then, is the power of doing gomothing which naturally we conld do, but Wbicb we cannot do properly or easily without tbe belp of rale and of practioe, and of a cortain innate gift

## THE PHOTOGRAPHIC EXHIBITION

## THE present exhibition, made by the Photo

 eraphio Socioty, in the Rooms of the WaterColour Sooiety, Pall-mall East, has a special feature of its own, and shonld bo visited by all Fho are interosted in the art. Mr. Crawshay, himself a diatinguisbed photographer, offered prizes for life-size portraits, open to the whole yyorld. The followine gentlemon were the and-judicators: Mr. J. Glaisher, F.R.S.; Mr. G. D. Leslio, A.R.A. ; Dr. Dirmond, F.S.A. ; Mr. WV. Mayland; M1. II. Buden Pritchard, F.C.S.; and Mr. G. Wharton Simpson, B.A.; and tbe result First prize Robinson \& Cherrill Stuart Wortley Filst prizo for small hoade (25l), Mr. Yolen dine Blanclard. Seoond prize for small heads (12l.), Messrs. Robinson \& Cherrill.
Prizo for Enlargements (252.), Mr. B. J Elwards.
The exhibition inclades tho portraits sabmitted in competition, somo of which ara remarkablo works, and must bo recrarded as exhibitiug the greatest advance in the art of photography made for some time past. Several forcign prac. ditioners of

THE FALL OF CEIMNEY AT NORTHFLEET.
Srr,-The important questions asked by gour orrespondents of last weck deserve the completest answers that can be given to thom, and put in as concise a form as possible. I will take the various points in the order in which they stand, beginning with those in the letter signed "B."

1. The first qnestion raised is, wbether, considenig the dinmeter of the ohimney at top ( 8 ft .9 in . inside), the 14 rin. Work ( 36 ft .3 in . deep) did not extend too far down. 1 do not understand your correspondent to snggest that
there was tho least approach to anything like a crushing weight on the lower part of this work, and a simple calculation (taking the common entimate of 15 tons to the rod) will
show tbat while the pressnre on the base of the show tbat while the pressne on the base of the
$3 \mathrm{ft}$.9 in. work (whicb has never shown the 3 ft .9 in . work (whicb has never shown the
slightest orack or flaw) was $\mathbf{~}_{\frac{3}{3}}$ tons to the foot slightest orack or flaw) was ${ }^{\frac{5}{4}}$ tons the the 14 -in. work was barely $2 \frac{1}{?}$ tons to the foot super. In other words, the thin part of tbe shaft was three times as strong as the thick part, in proportion to the weight it had to orary. The inquiry seems, howeror, to be directed to the power which this 14 -in. work might have of resisting an oblique pressure (such as might for instance, be caused by sligbtly nneren bedding) tending to make it bulge or crumple ontwards ; and the snggostion is whether 36 ft is not a rather extreme height for a 14 -in. circular wall of as minch as 9 ft . internal diameter. 1 have now before me the working drawings of a chimney at Wokington, bolonging to the Wost Cumberland 1 ron and Steel Company. This chimney is 200 ft . high above the ground, 12 ft .10 in . internal diameter at the top, and is only 1 i in. thick for 67 ft . down. 1 am informed by a builder at
Manchester, who bas erected a great number of lofty sharts, that they are generally finished with 9 -in. work, and that this thiokness is continued for 30 ft ., 40 ft , and even 50 ft . down. More remarkable than these, however, because
wider than most of them, is the sbaft at Messes. Pontifex's cbemical works, in the lsle of Dogs.

It is 228 ft . high above ground, 8 ft . in internal diameter at top, and only 7 in. thick in tbe brick work for a depth of more than 40 ft . Otlien examples could be given, but theso will perlaps be enough to show that we must look beyond this item for tbe causes of the falure.
2. The bond was that known as "half-brick bond," which is specially intended to prevent vertical fracture across the wall. Chimney builders say that this sort of fracture is the one that almost always bappens in the failure of a shaft, and that a split of the opposite kind, down the middle of the wall in the diroction of its length, is bardly ever heard of. To prevent tranavcrse fracture, the more stretchers can be used the better; and in a straight wall, the "balforick bond" contains at least twice as many as would occur in old English bond. circular work, no stretcbers appear on the out side, but tbe priaciple is carried out in the re. mainder of the thickness. Toe brickwork at Northteet was bonded thronghont on this syatem, the work could not bave been mnch improved unleas by the curve of the chimney.
3. The whole of the upper part of the chimney was built of the best pariors, and evon these were picken, every imperfect brick being re. jected. The lower part of the walls was partly composed of the hardest atocks that could bo got, and partly of payiors; but within 50 ft . of the ground there was a small proportionperhnps 5 per cent.-of rather over burnt and somewhat vitrified bricks, approaching in claa. racter to "rough stocks." There was no differ. ence between the facing and backing; the same quality of bricks was carried right througb the wall.
4. There was no artificial boud besidos that described at the inquests. At intervals of about 3 ft , tiro conrses of brickwork successively grouted with neat Portland ccment. The cement whoutch with neat portland ccment. The cement after falling 200 ft , these bricks were still found joived in donole courses, and they had as often brokon through their own snbstance as through the cemeut. Tbere was not the least sign of expension ; bat the best proof that there was none, is the fact that a large mill floor on the lot of cemont, and that to this way there same lot of cemout, and that to this day there is not a flaw or a blister in it. your correspondent speaks of the "desirable homogencity of the
work being destroyed" by boud courses grouted with cement; but, provided that the cement sets perfectly, and without expansion, as it certainly did in this case, it is dificult to oonceive how
they can be anything but a source of strengtb to they caulibe
5. The thick and thin parts of the shaft both went up at about tho same number of feet per week, excepting, porbaps, the lowest section of the walling, whicb was done a little more slowly. Of course, more bricklayers conld work where the dinneter of the shaft was wider, and more materials could be drawn np by the srindlass in a day when tbere was not so far to draw them. 6. The cap was formed entiroly of brick in cement, and the cement liore, as elsemhere, was tho rery best of the Barham Cement Company's make. The original iatention was to mix it with an equal measure of sand; hut, by the advice of persons experienoed in this class of building, it mas actnally used with a small though the ultimate strength of the cement and sand migbt be as creat, jet the cement and mortar wonld adhere to the bricks better at the begiuniug. Whatever may have been the cause, it appoaroil after tbe accident that a considerable part of this cement-mortar had not set with anjthing like the firmness of the neat cement grouting; and thongly it is bard ta see how, on a quite oalm day, this imperfect setting could have cuneed tbe fall, it is ovident that it may bave helped to make it possible. A tentative opinion was expressed at the inquest that the vibration from the derrick might have bad something to do with this imperfect setting; bat this theory did not seem to be confirmed in the course of the inquiry. It is only certain that while the cement which was used as grouting set like iron, the same cement used as mortar set iu many places but very indifferently. Tbere are two considerations which natarally suggest them selves bere: one is, that if bricks are not snfnvincible repugnance to wetting them suf ficiontly) the more liquid the cement the botter ;
the other is, that comest gront, once set, cannot be workad up again and used, whereas cementmortar can be, and I fear too of ten is. I make personal bins without intonding tho smantes who slowed himself an excellent and very carefnl workman; but a great part of his time w is noccssarily pussed at the foot of the shaft in superintending the mixing of the mortar and the aelection of materials
Proceeding to the shape of the cap, I may say frit was formed of eqwal overgailing courses of brick, cach conrse projecting about tbreo elchtos of an inch beyond that below. The expome projection attained by the body of tbe it started. bin. beyond the point from whic to do tbis, and as the shaft diminished apwards at the rate of 6 in . in 10 ft the projection tho top of the cop from the recedingection of shaft was 181 in Thon the bods in the there were oight fiat projections or piers, eaoh 1 ft .11 in . wide, carried up in piers, eaoh conrses, ranging precisely with oversailing body. The projeotion of these piers, from top to hottom, was $4 \frac{1}{2} \mathrm{in}$. beyond the main part of the hotton, wind ported on a series of conraes overaailing still more gradually than the npper ones. Above tbe more gradually than the apper ones. Above tbe app, to so height of 4 ft .6 in ; and the result of the whole was, that at the time of the accident tee 4.3 in. super. while the sectiong cap was 7 ft part super., while the sectional area of that part of the shaft whicb connterbalanced it was section that this section had the immense aduitional security of being workod on a circular plan, it seems very ovident that the cap had no tendency to fal outwards by its own weight; and, on the other hand, its pressure on the 1t-in. wall below it was considerably less than half a ton to the foot super. It ought to be known that tho two bricklayers who camo forward at the inquest to express an opinion that the cap had "swagged" or the drawings of it, Your en either the cap observe from the or correspondent will was not "placed on the shaft only the das before tho accident," but was merely finisbed on that day, having been built up like the rest of the brickwork

As to the ontline of the fracture, the highest part was on the sonth-west side, and it sloped down irregalarly for perlıaps 30 ft . in the opposite direction. For abont 100 f . at the bottom tbe sbaft was upright and sonnd, exeept where small cracks occnrred, in the upper part of this leugth, from a cause to be preseutly descrihed. The top of the ruin overhang considerably towards the arorth-east, and there were vertical fissures extynding for a short distance down. The smaller fissures, and very likely some of the lawrer one日, were produced as follows:-The cross timbors on whicb, oue aftor another, the internal scaflolds had rested, were loft in till the completion: at the moment of the accident, great masses of brickwork foll on these timbers, and thas violently jarred the walls at tbe points where they were inserted, and the result was that many of theso points were snbsequently traceable on the outside by bulges and radiating cracks.
We do not know, and probably never sball know, what cansed the instantancous collapse. It may bave been started by some slipping of tha derrick on which the men at the windlass below were hauling; it may have been begun by the falling insards of a part of the ohimney wall above the cap. The first warning of the interior was the descent of bricks and the gencral full. The only witness who has deposed that be savy the aotual collapse from the outside states that it began, so far as he siow by tho bulging of a point on the nortb-east side of the shaft, some 10 ft . below the cap. 1 f we snppose a mass of brickwork from the top chimnes wall, ouilt that'rery morning, to bave been pushed batten any cause, and to have struck tho way of accountine, we have a not impossible

Jayes Cubitt,
Architect to Messrs. J. C. G sstling \& Co.

The Institution of Surveyors.-The Piecont and Conncil have issued invitations for a instant.

A Memorial reredos of the late BISHOP OF WINCHESTER.
The late Bishop of Winchester laid the fonndation-stone of the Church of St. John the Divine, in Vassall - road, Kennington, which is intended to be one of the largest churches in the metropolis. The ehancel, externally, was completed about two months ago, and it was originally intendec not the edifice, along with a temporary nave, until the estimated cost for the permarent church was subscribed; but in consequence of an anonymous donation of 10,000 l. towards the building fund baving been received, the erection of the unve and the other portions of the porma. of the buive and has iust been commenced, ond the foundations are now heing got in. It has, bowfoundations are now hoing got in. pletion of the whole building hefore the opening pletion place. A portion of the nave will, in the first instance, he comploted, and, as at present first instance, he comploted, and, as heen fixed arranged, the opening ceremony has heen fixed for the month of llay next. In the menntime, the completion of the interior of the chancel, the lady chnpel, the sacristry, organ-chamber,
and other portions of the eilifice already buit, and other portions of the elficice already britt, will be proceeded with simnitaneously with the ersction of the nave, and the internal decora-
tions include a reredos, which has been designed tions include a reredos, which has been designed by Mr. Street, the architect of the church, as a memorial of the late Bishop of Winchester. The beneath will ber figure represcnting Dr. Wilber. force knecling in prayer! Tho estimated cost of the reredos is 5001 .

## DIAGRAMS OF BUILDINGS

FOR INTERNATIONAL EXILBITION.
The following rules have heen issned hy her Majesty's Commissioners for the preparation of countries in Division II., Class 9 (civil encineer ing), srchitcetoral and building contrivances, of ing), architcctaral and bulding contrivances, of the ef a bold scenic character. 2. Tbey should he be of a hold scenic character. 2. Tbey should he executed on canvas, and may bo in oil eolour or distemper. 3. They may be exeeuted in colours or in monoohrome. 4. They should be per-
spertive views. 5. Each diagram should be at spertive views. 5. Each diagram should be at
least 5 ft . hy 10 ft ., bnt aingle diagrams ought not to occupy more than 10 ft . in height and 20 ft . in lengtb. 6. Ench diagram shonld he 20 ft . in lengtb. 6. Ench diagram shonld he attached to a roller, and sent rolled. 17. The
scale should he clearly marked mpon each scale should he clearly marked npon each
diagram. 8. Her Majesty's Commissioners would be glad to hase the right of prochasing the diagrams, if for salo, at the prices attached to them. We are not quite sure that competent persong will find sufficient inducement for th
proparation of snoh diagrams as are desired.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.
The firat ordinary general meating of the session of the Royal Institate of Britieh Archi. tects was held last Monday evening, at the House in Conduit.street; Mr. Horace Jones in the chair. The following gentlomen were duly elected as Fellows:-Mr. Henry P. Legg, 32 Bedford-row, and Mr. Joln Lome, of Manchester Several donations of books, pamphlets, draw. ings, paintings, \&c., were announced to bave been presented to the Institute, as well as a hnst
of Inigo Jones, modclled in Italy, the of Inigo Jones, modclled in Italy, the gift of Mr: James Noble. Among the many donors to the library fuud arc, Mr. John Gibson, vice prosident, $25 l_{\text {. }}$, and Mr. G. T. Redmayne, assooiate, 3 guineas. Thanks having been voted to the donors,
The chairman proceeded to award the Ashpitel Prize of 1873 , wan by Mr. H. Stannus, for having distinguished himself the most in the architec. tural examination; and, in presenting it, stated that this wns the first time sueb a prize had been awarded,-the gift of their lamented friend, Mr. Ashpitel.
owing to ill.health of Sir Gilbert Scott, in Italy then read the presidenecretary, Mr. Eastlake, print in extenso.
The chairman aaid that they probahly felt that, in the absence of the worthy president there were fewer opportunities for discussion than if he had been present; atill, they would be glad to liear friendly criticism,
The Marqnis of Westmister, who was warmly
received, said that it would be highly prosnmp
trous of him, an amateur, to take objection to quything the President had said hearing npon arobitecture, uponwhich he (the Marquis) had no claim whatever; but there were one or tivo points in Sir Giljert Scott's address which par. tiealarly struck him. One of these was the ascellent, powerful, and very round aluse which he had given to the dreadful spccimens and the towns of Encland. It seomed to him that nutil the public had some knowledge of architooture, and their tastes were somewhat cultivated, such discreditable specimens of architecturo would very long disgrace the country; and especially so in the case of those who in after.life would probably have the means of erecting buildings. It was very unfortunate, he thought, that in higb-class society very little knowledge of archi. tectare existed. He did not know whether the Institute would bave any power, but they would certainly have infuence, in rocommending some cortrge of study, to sugrest whether some small or hettor knowledgo of the principles of architecture conld not form a part of oducation in publio schools. With regard to these public sohools, he did not know whether it was a prac. tical suggestiou; hut it geemed to him that it might be of some use to this powerful nssocia tion if it ased ita infuence in that direction. He was talking, he went on to say, a short time back to a triend of his, who had now arrived at the age of seventy-four, regarding an ahbey at St. Alhan's, and in roply to a question of his hin was Roman, greater part of mast have heen Norman, for it had a rood deal of "dog.tooth" ornament about it, If such ignoranco prevailed in old age, the time had come for giving oppor. tunities in early life in public schools to attain to nome knowledge of the art of architecture. Ho had but ono other point to mention, and that was to tako the opportunity, which he said he ought to have done long ago, of thanking the Institute for having done him
Mr. B. Ferrey, in proposing a vote of thanks to the president for his address (which was seconded by the Marquis, and carried unanimonsly), aaid he felt that the matter Sir Gilhert Scott liad brought before the meeting was of so large and vast a character that it would ill become him to enter into any detai? regarding it. We all dceply regret his ah. sence, and are greatly indehted to him for his address, considering the state of his health, and co great calls upou him iu his professional so mnch timo to the many points emhodied in bis address, and we must also thank the nohle Marquis for the able way in which he has expressed himself on the points he brought forward.
Mr. Eman Christian said that with regard to the suhject of the Benevolent Fund, mentioned at the annual dinner, and in which the Presi. dent, he was glad to say, took such an interest, ho would mention a case in illustration that
had lately come under his notice. An architect of real capacity,-a man who would no doubt, bad he hut lived, have achieved a reputation in his profession, died, leaving a wife and family without any means of snpport; he had not lived long enough to make his practice prontable, or to reap the fruits of his early labours, and con. sequeutly his family was left to the chnrity of architects the was a reproach, be thought, to only in this casc allow out of its funds the amall sum of 60 l . The Artists' Benevolent Society were taking care of three of the children ; and for the Architects' society to allow this was a great reproach upon ns as arcbitects. Our ociety onght to be better supported, anen than those miserablo subscriptions and few donations hich it now received.
Mr, Jemnings was of opinion that the Artists ${ }^{2}$ Benevolent Society and Architects' Benevolent Society ought to he one hody, as many people hought they were, and said that it was a great more thoronghly connected
The meting then arnar papers to he read during the session are the following :-
"On the Ceatral Iron Dome of the Tienna Exbibition Building," Mr. J. Scott Russell; "On the Sanitary
Aspets of Hoose Construetion," Captain Douklas Aspects of House Construetion, Captain Doukss
Galton ; "On the Old Hall and Assize Court at Win-
chester," Mr. Thomas Heary Wyatt; aud "On Chinese

ARCHITECTS AND ARCHITECTURE,
tye adoress of tre presidest at the nstiture of arceitecets.
Ir is with unfeigned regrot that I have to ask your kind forbearanco with me, in my failure to appear in my place, as your president, at the opening of the frst session after you have done mo the great honour of elacting me to that office. I had proviousily to that eveut had some idea of spending a part of this autumen and winter at Rome; and had mentioned it to my predecessor when be announced to me the kind. wishes of the council. I had, however, wholly relingnished this idea, aud was preparing to return from a Continental tour, when I was so urgently pressed by frieuds, whoso opinion I had every reason to respect, to prolong my absence with a view to coufirming the good effecta upon my health, of the rest and relaxation in which I was indulgitg, that $I$ felt I should be doing wrong to resist their romonstrances ; and I bave now to throw myself upon your kind indulgence, and to heg you to allow my inangural address to he read for me, instead of being delivered, as it ought to be, by myself.
Ify regret at this is increased, and my apologies rendered the more needful, by the fact of my abseuce rendering it impossible for me to deal with some subjects I am hound to allude to witb that care and fulness of information whioh I should have aimed at had I heen present. These subjects, anfortunately, are amongst the most important topios for the year; as, for instance, the transactions of the Institute during the past session ; the papers read at its mootings the puhlic occurrences relating to our profession; the moro important works undertaken or com pieted; the Great Intcrnational Eshibition at and the molancholy daty of chronicling the anuual obituary of momhers of our Institute, and of giving a skotch of the carear of the deceased. On all these points my notices must he more or less defective.
On the last.named point I will renture on asking the aid of members of the Institute best acquainted with those whom wo have lost, as there would be an appearance of partiality and inequality were I to attempt to rocord the merite of those I happen to have hest known, to the neglect of those I chanced to bo less acquainted with. Nor would it he proper to attempt a notice of the professional lives of those whose position was so prominent as clearly to demand a special memor, as is clearly the case with oni lamonted Past President Sir Filliam Tite, whose merits have already been frequently brought before the notice of onr meetings, with that respectful warmth of feeling which delights to celebrate even facts tho hest known and acknowledged; and they will, I feel convinoed, be shortly laid before us in a more forma. manuer and one more proportioned to their publio importance. I leave, then, this melancholy though crateful task, to anch bands as may he selected as best fitted to its importance.
Our obituary for the year is, unhappily, a yery long one. It is as follows:-Sir Wilbam Tite, M.P., Past President, Mr. R. R. Banks, Mr. R. P. Browne, Mr. W. Slater, Mr. A. S. Newman, Mr. J. H. Stevens, Mr. S. S. Teulon, Mr. C. Buckeridge, Mr. II. Williams, Mr. G. T. Randall, Mr. E. A. Spurr, Mr. W. Corbett, JIr, J. D. Simon. To these I mustadd our respected honomary member, Mr. G. L. Taylor ; and our honorary correspond ing memhers, M. De Caumart, Professor Hes. semer, and II Cav. Nicolo Matas
Those best inown to me in the sad catalogue were Mr. Teulon, Mr. Slater, and Mr. Buckeridge; the first so well known as a zealous and success. ful followor of the Gothic revival, and the huilder of numerous chnrehes, \&c.; the second as the successor of tho lamented Mr. Carpenter. He having been ent off in the midst of hie days, left his extensive practice, and the professional training of his young son to the care of his faithful pupil and assistant, Mr. Slater, who right loyally porformed tho task thus hequeathed him; keeping up the practice, largely as I believe, for the benefit of his friend's family, and caurying on the professional education of the son, till be was of an age to unite with him in partnership; and only living long cnough to see him fairly and ouccessfully launched as the successor-throagh this faithful and efficient medium-of his talented and lamented father. Mr. Buckerige was a pupil of my own, and was anrrying on his practice with great devotion, taleut, and snccess, when cut off at an early age hy a sudden illness.

I bopo that further notices of these and other members of our Institute will be laid before yon by taose who havo facts better within reach than myself.
The International Exhibition at Fienna, in its bearings npon architectnral art, is another sub. ject on which I must beg the kind aid of suoh as have given the most attention to it ; circumitances having wboliy deprived me of the oppor tumity of making myself acquainted with it, as 1 Of publio transactions.
fession I may say much the samg upon our pro I much more regret that I had hoped, on the present occesion to abote, as I works of architoctare now about notice tbe menced, or those recently finished. I had promised myself mach pleasure in the per necessitated abseuce during the summer has
natis necessitated abseuce during the summer has it to a future occasion, should such offer. It would to me be a most grateful task, both to visit the many admirable buildings wbich have recently been completed, or are in the course of erection, in a moro careful and systomatic
manner than one would perhaps venture unon under other circumstancos, and to record the jnst praises of their architects ; and it would on the present occasion have been the more gratifying, because, in the remarks I shall have to oficr, I shall feel it my duty to call attention, not indeed to the demerits of any specific works,
for that would be an offensive for that would be an offensive and a presump-
tuons act (indeed, I rarely inguine the architect of any work I should be dieposed to censure), but to the general fact of the im . mense gulf which intervenes in our day between different works one passes, and to rsk your
speoial attention to special attention to this as one of the most serious questions of the day. Having, then, a painfal duty to perform of this nature, it would have boen a relief to have enumerated, and works of our period,-works whe nost admirable lone credit to any age in either of the great branches of onr art, and works which tend to establish one most encouraging fact heyond the -ach of question, that if we hive at a day when nuch is done which tends to discourage, we ulso have the happiness to live at a day when -works of noblest aim, of the deepest and most oving study and care, and of the highest utistic character. I must, however, of yece
ostpone this delightful task.
Of public buildings about to be undertaken I vith congratulating the I will content myzelf vork congratulating the Inatitnte that the great
vork their talented member Mr. Street is fter so long delay, about to be commenced. I egret to observe the statement in the public to be struck off trat a considerable amount 3 to be struck of from its embellishments. een laid before the problic; but from them I hould have judged that the arobitect had Iready exorcised great reserve in this respect; nd I fear that a further pruning down, such ecessity lhave a very serious effect, will of esign; and I earnestly, though respectfully, rge upon the attention of the Goverument the nportance of reconsidering tbis instruction; lasmuch as an anount which sonuds like a sman! orcentage upou the entire cost of a building, its meare embellishments, and may the cost to reduce them to thents, and may go so far This is a huilding of which too much bas heen did, whioh has heen far too prominently beforo 10 pablic, not only of this country but of tho hole civilised world, to permit of its perfection ntage. Such a result would be a disgrace perir ago and country, which have a richt to mand from those in power that the architect trusted with such an edifice shall not bave his nds thus cruelly hound, but shall be allowed embark upon this great national,--this great aropean,-work with a fair and reasonable igin and destination; while it worthy of its whioh it has been subjected would call forth, ea fom their originators, if actuated hy a e architect should not pe play, the demand that it shonld have every reasonable restrained, d facility allowed him for the production of a
truly noble work, worthy at ouce of bis own fame and of the age and country which the lyuilding will represent.
I will now procced to the affairs of our Institute.
The anuual report, which bas been for some months in your hands, together with the briof conspectus of the proceedings at the ordinary and at other general meetings, will give a correct idea of what bas been done during the last gession, as well as of the general prosperity of
the Institute the Institute.
From the former documeut it will be seen that our pecuniary status is woll kept ap; that onr list of members shows a coustant increaso tbat tho Institute has been actively engaged on a number of important questions, bearing both upon our professional dignity and upon the interests of onr art; that in the consideration of these questions we have been well met and aided by the Conference of Architects from all parts of the kingdom, from which conference very useful results are likely to arise; that the ur diptural examination of stndents seeking creasing encouragement; that our offers of prizes, modals, students' prizes, \&c., have heen responded to not omly ly satisfactory numbers the candidates, but by a degree of excollency in character, while the sketch-boozs encouraging lists have shown a most ch-books of the medal. that the standing committe for result. Also of ancient activity. In short, that the Institute has been actively and snccessfully performing its arduous daties. In the latter document will be daon a list of the excellent Sessional Papers read at our many subjects which bave particulars as to consideration of the Institute,
The medale, prizes, de., awarded have been as sum ot 50 ., under the usual conditions of Condesign for a pabic will Wiam Frame, for a for a design for ball; and a medal of merit Eastwood; and the Instime subject, to Mr. J. H. guineas, to Mr. Aloxander E Kersey fon draw ings illustrating St. Mary's Abbey, Old Malton. and medals or merit in the same competition to Hr. Thomas Garratt for drawings illustrating Arthnr Hill, Assoeia at Lilleshall; and to Mr. St. Cormac's Chapel for drawings illustrating standard of Chapel, Cashel. Of the high of drawings I merit evinced by these several sets strongest terms. A medal of to speak in the been awarded to Mr. Alfred Jowers, Associate for an essay on "Modern Arohitectural Criti. cism."
It was also unanimously resolved bumbly to recommend to ber Majesty that the Royal Gold Hedal shonld be awarded to our late excellent president, Mr. Thomas Henry Wyatt, which graciously accepted.
Though the pecnuiary condition of the Inst tate cannot be viewed as other than prosperous, ounts that an oxamination of our annnal ac hat tour will be sufficient to aftord conviction meet the actual demands of tho Institucient to I caunot, therefore, wholly sympasthitute itself. yearaing so often expresged, for anion the our single banner of ant the a anion unde upon our art or profession Hadies bearing suffioed, or could it be tons to our income objects, I should to be made to suffice for all that our Institute should to gee all nnited, and but, when I see should have the credit of all; object in promoting the for a most important agreed to promoting the study of onr art only application an express understauding that the oblized to should not be repeated, and am nnoracio it sary I cannot happear, to bave been necesour common hut rejoice that the efforts for that no arten object take numerous channels, sun isation the nondue central. of comme Lenem bo bound together by a bond their mon sympathy, bnt let their tinances and it, no singlo list of several; for, depend upon sufficiont to list of suhscriptions will ever be which to cover the multifarious objects Which bear npou an art of such neiversal appliAt
Art-education, however, is an object of such paramount importance that, in spite of all discocragement, I recommend it to the special aught, I feel convinoed, to be in its finances, it
self-supporting, but it ought to be nevertheless in a greater or less degree, under the direction our Institute and of the sister Association. The Royal Academy has of late given greate attention to the snbject than formerly, and it has occurred to me that a nseful result might arise from a conference between our Institute and that body, though I bave not sufficiently matared my thonghts on this subject to enable me to offer any specific suggestions. I will say straight-laced I feel very averse to so rigid and adopted in France system or training as that to repel by lits e, which seems to mo calculated varm affections of its satber than to win the
It occurg to of its students.
done, both by increasiver, that mucb may be addiag in by increasing our library and by adaking in every way possible to the facilities for from our annual income, I wonld strongly cous mend that direction as the most profitable for its expenditure.
I will take the liberty of mentioning that two pessional dinner last June. The first was this, hat the chairman to the Noe frst was this, Vorks, when alluding to Hetropolitan Boaraolition of Northumberland House seemed to state that the Bioard bad been encouraged in pressing hat project by tbe opinion of our Institnte a, rin our course with reference to it but trongly holdiag, that in all public improve ments, it sbould be made a principle to preseryo hotb existing publio monuments and private buildings which from their importance privat pubic cbaracter, I trust that I misapprohended wat I heard; for thourch it way ocesoionalls become unavadable to deviate from this ciple, I should be distressed to think that sncl1 deviations should ovor he able to claim the authority, or even the oonnivance, of an Insti tute which slould be, and is, the protectress of all public monuments.
The other point I allude to is this:-In the anmual report of the Institate, I find that in anmouncing the intention of having a professional dinnor, it is stated, that "it will alford an occaston for enlisting subscribers to the charity (tho Architects Benevolent Society), hy the game means which are adopted in the case of other benevolont institntions." Now, at that diuner no such means whatever were adopted, and bad it not heen for excellent and almost remonstrant the esses from Mr. I'Anson and Mr. Christiau, the subject announced as the special object of I wake the liberty of alluding to forgotten. sake of recalling of alluding to this, for the especially to the remarks of Tr. Ansjont, and Mr. Christian : as, with all our profossional prospority, it would ill hecome us as a representafortunstitution to forget the claims of our less ortunate brethren.
of our Institute whole subject of the position heartily heartily congvalate you on its constantly in. Few is usfulucss, iniuence, and prosperity. parallel to parallel to this, and I earnestly trust that our grow at an ever. only be permanent, but may While congratulatinging ratio.
while congratulating ourselves, which we bave sperity of our Institute, on the material procomman ground of hers of our profession reunion, in whioh the mern-arms:-ur profession meet on equal and friendly mongst them one of prodacing genial feelings ing asperitios, of towards another, of soften ementing friend rubbing off prejudices and teree on all questips;-as a standard and re and etiquette, and as the professional practice sional honour ;-and further, as a society which by its prizes and medals, enconrages and inconts o exertion, and at whose meetings instructive nd interesting papers are read and digcussed alculated to disseminate the knowledge nattors hearing upon our common ant, ad th mportant practical matters which while congratulating ourselves, I repeat, with just pride on our success in all these, and many other ways, which it wonld be too lengthy to ennmerate;-let ns never, for one moment, for. get that suoh societies as 0 res, and which allusion bas been mede whers ments to aid in the promotion of the cund end and object for which we should all be earnestly labouring ;-the raising of the great art of architecture, and the arts subsidiary to it to that high level which the cirilization and
prosperity of our age, and its advancement in
scionce, in literature, aud in mechanical art, scionce, in literature
This, Gentlemen, I need not say is the real,the ultimate ohjects of such instjcutions as ours; and towards this should all our efforts tead as the oue great ceutral ohject of our earnest aim, aud oar heartfelt aspirations.
At all great periods of art, so fur as we can gather from historicol records, or from the internal evidences so abundantly supplied us hy the actual works which have been spared the effurts, the enthusiastic strivings, and the whole heart and soul of each artist, from the humblest to the most exalted, wero ever dirceted, as their single object, to the advancement and perfection of the art on which they were engoged.
Howerer different, and even contrary, may be Howerer diferent, and even contrary, may be of the great Pharaonic period, of the age of Pcricles and Phidias, of the Angustan age at Pcricles and Phidias, of the Angustan age at
Rome, of the age of Justinian at Constautinople, Rome, of the age of Justinian at Constautinople,
of the twelftb and thirteenth centuries in NortbWestern Europe, of Arnolfo and Giotto with Western Europe, of Arnolfo and Giotto with finally of that army of painters, scnlptors, and architects who accompanied what is knowu as the period of the Renaissance, works which have defied all their followers to rival; -whatever, I say, may be the difference, and even the contrariety, of the artistic sentiments which inspired these almost superhuman productions of art, ono fact is common to them all, one golden thread unites them as it were into one; -the fact, I mean, that they are all the works of men who were devoted heartand soul, ahsolutely and unre. servedly, to their art; and with whom personal advancement, social position, or any other con sideration was as dust in the halance when weighed against tho perfection of the arts to which they had sworn allegiance.
Until we can resuscitate among ourselves a like glorions enthnsiasm, it is vaiu to hope for another great period in architccture.
True it is, that knowledge and skill are elements necessary to porfection, but neither one nor the other can be acquired without that burning zoal which pervaded the old schools of art, while its presenco impels its possessor to their acquirement, and even goes far at tim
towards compensating for their imperfection. towards compensating for their imperfection.
Now, though I do not helieve that such chronic enthusiasm can he brought ahout directly by intention, or by any exterval means, hut rather that it arises from a spontaneous excitement of the human mind, apart from deliherate intention, Io nevertheless hisk that, if once ex cited, it may be promoted and cherighed, or generons evcouraging sympathy upon the one hand, or hy cold-hearted absoneo of sympatby on the other.
Let us for a moment inquire whether, in our own day, we have had any promise of such a spontaneous rise of earnest onthusiasm as would suggest the possihility of the advent of a great period in onr art.
har indichal and enthsiastic zeal we had monch, of which the contemplation is entrancing. Our fonnder and former president, Professor Donaldson, gave us in his inaugural address a charming sketch of the oareer of his lamented predecessor, Professor Cockerell, from which, - and we have ample evidence besides, -we can see that that admirahle man possessed all the burning zeal and generous euthusiasm, united with that high artistic sentiment and power, which have characterised the artists of the greatest periods. Oar friend's awn participation in those nohle feclings, were not other proofs so ahundant, is sufficiently evinced hy the earnestncss with which he re. cords them; and that they were shared hy many others wo have only to luok to the artistic lives of Barry, and many others of our architects, who have rendered their memory imperishahly great, and having arisen during a period of comparatire deadness in the art, have lahoured
earnestly and successfully in instilling iato it a new life.
Besides these great men, however, wa have in our day been wituesscs to a movement in our art, which, however different may he our estimates of its valno, can at least lay claim to the merits of having heen at ouce spontaneous and enthusiastic, of having united in a single aim a greater anmher of persons, whether professional or otherwise, than any other movement of modern times, and of having, to a greater extent than avy other been collective rather than indivilual
in its charncter, sinking, in a great degree, personal and iadividual feeling in one great flood
of collective ardour. collective artour.
I need hardly say that I refer to the revived feeling for the study and resuscitation of Mediæval Many
Many of those among us who, not having personally participated in this movement, vien naturally from the ontside, fail to see in it anything but a deliherato effort to overthrow the previously existing state of things, and to erect In its plaoo the creation of o new fashion. For myself, without laying claim to any primary share in this great movement, but heing never. theless a contemporary of its earliest activity and liaving devoted to it an early allegiance, 1 arn able to speak of it, not from the outside, hit from the inside, not as a Laputian critic who, soaring a little above the level of human occurrences, could rccord them as they passed under bis notice without the lenst porsonal sympathy oue withis the pale, who has from the first been cognisant of most thut has passed, and car peak of it frow his own personal conscions ness ; and iu such capacity I am ablo to assert that the movement has been ahsolutely pontaneous, and the result of mere love for sudy on which it was founded, apart from any ostile feeling towards the status duo, and ammos ree at first from even the thought of disturbing If I may speak of my own experience with hat incurring the charge of cgotism, I wonld say began before the thought of my future calling ccurred to me; that the choice of my proession arose wholly from that derotion, and that when I subsequeutly found that my tastes had notbing whatever to do with my practical employments, I still fullowed them as my aimost cohtary amusement, with scarcely a thought of their over becoming the suhject of my professional work, which I was for the time passively content shuuld be of Lecessity in another, and the dominant style.
How this great change came about seems to me as a dream; nor can I clearly recail the manner in which it took place. It seemed to arise spontaneously and uncouscionsly, tbe effect of a hurning love for the architecture of our forefathers; which, wichout external cause, withoat premoditation or concort, had taken possession of the minds of a large number of persons unknown to each otber, and only waited its timo for practical doveloptaent.
Nothing parallel to either the cause or the effect has occurred since the great Italian Renaissance! It bas not been our doing; we have heen the mere hamhlo instruments of a truly its ffects are oraryollong in our eyes 1 have, thus, alluded to two great exhibitions of earnest architectural zeal, which have been manifested in our day:- the one tending to the reviping of Classic art from a state of comparative torpor; the other having hrought ahout the actual resascitation of the architecture which was indigenous among our own family of nations, and which it has re-estahlished, side hy side, and on equal terms, witb the lor
I am not going over tbis alroady well-trod ground, with any ohject of partisanship, but simply in search of an answer to my previous inquiry:-whether in our own day we have had any promise of such a spontaneous rise of earmest entlusiasm, as would suggest the possibility of the advent of a great period in our art; for, as 1
said hefore, natil we can resuscitate among ourselves a like glorious enthusiasm, with that movemen in tormer times given 1iso to the great another great period in architecture.
Gentlemen and brother architccts,-I put the question to you, to which ever of the two great phases in our art you may have rowed yonr such noble onthusiasm? Have we lived in days when everything bas gone on in its wonted whon everything bas gone on in its wonted undistinguishable from any other period of equal length in the smooth current of undisturhed art history? The vory reverge, I boldly assert, has heen the case, and the proofs of it are no matters of past and recordod history, but are within the range of our memorieg, are comeident with the existence of this Iustitato, a
causes of our own daily acts.
Tes:--it has been our own privilege to live during the days of great mental strivings,-of during the days of great mental strivings, -of
deep and earnest enthusiasm in our art: and
though, milike tho great periods of old, our art amp has heen dirided, aud we must be content o work in two parallel oourses and in two diverse tyles, we have a right,-nay, we are in duty ound, to ask onrselves, whether we are doing ach our duty by the great period of mental ip-stirrivg, in which it has beon our lot to be ment may be promoted and cherished, or that it may he damped, and even extingnished, by our wn eonduct towards it
The first question which suggests itself is, do all, - does each in his chosen camp, and each accorl. ng to bis abilities and opportunities,-strive to the utmost to do his work well, and to fit himself for doing it in a manner characteristic of a period of earnest onward striving ?
Now, one of the most marked characteristics of the productions of the great periods of architecture is this, that, though the works of any one of them difier in artistic mexit,-some displaying the highest genius, of hers only comparatively unassuming correctness and prooriety, - yet no really bad architecture is ever to ho found among them. From the most majestic and glorious huilding downward, to tho least pretending, the same matared knowledge, and the same careful, thoughtfu! wolking, is found ever to prevail. Who ever heard of th work of the Greeks at tho great period of their art whioh they would presume to call bad arcbitecture? Even in Byzentine ant thourh it lohoured under reat disndvantores, great disadvantase, we have proors in the ruined oitics discovered in Syria, that these otildings of the more veranacular classes were as carefully studied as the mighty works by which居 works of the twelfth and thirtecnth centuries in onr own and neighbouring lands, as well as in Italy, the same masterly skill, and the same studious handling, are found in tho simple village church as in the noblest cathedral,-nay one is often disposed to uncover oneself in humbled reverence hefore the work of some unheard-of mason or carpenter in on obscur village, of which we had never before so mucl as heard the name; nor did these oid workmen, so unamhitious of fame, -ever produco work $t$ the like of which the best or the most self satisfied among ourselves need be ashamed $t$ attach his name.
Now, -is such the caso among ourselves? I is worso than idle to attempt to hlind our eye fy hand felicitations or to seek the bliss of foors paradise;-lot us rather look facts bold
in the face; and if they prove mupalatable, le us make it our husiness to correct them.
The true answer to the question is, that $n$ contrast oould he more marked than the differ ence in this respect, between the present stat prevailed at the great cras alladed to.
Instead of all works (each in its own style displaying the samo instinctive sentiment, th same understanding of its style of art,-th same carefal, wise, and thoughtful handling, the very reverse of all this is aotually the case From each of our art-camps, produotions ar put forth of the bighest, and of the most con temptible, character, as well as of every inter vening stage of merit and of demerit. Our ag and country will hand down some works of whio no age or country need be ashamed, and other which any age or country, however degrade its art, ought to hlush; while I fear a larg nnmher of the hnildings whioh will represen our period will be of that negative kind which heing neither hot nor cold, but only lnkewarm will not tend to excite any but a sickly emotion
Among the works of the classic school, an more aspecially among those of a civic and men cautile closs, one is, in passing along our streets ften quite startled and taken aback at th excellence of individual works, while, perhaps bext door to them, one soes others displaying a degrees of want of skill and knowledge, or 11 -instructed and worse-effected attempts a riginality; while in our provincial towns on ften sees, perhaps, a hnilding rivalling in meri Chose of the hest ages, and others, the mecha nics' institntes, corn exchanges, and such lik buildings, the execrablo results of those com petitions which seem to he inangarated rathe for the amucement of ignorant committees an own ancils than in any pish or aim at addin hononr to their towns hy a work of good arch tecture, howerer unpretending.
In the Medireval school the same nopleasin act stares $u s$ in the face. On the one hand w oay folicitate ourselves that there exists a han true architects, who produce works of a high
and some of them of tho highest, degreo of "restoration;" and the work of destruction and excellence, such as one would fain believe would be acknowledged hy the architects of the best age; while, on the other hand, we are disgusted hy the works of a host of mere pretenders, who of skill, disfigure our towns and onr oomntry with bnildings either so ntterly contemptible as to be beneath the lowest grade of criticism, or so sickening in their mediocrity that one wishes they wore either cold or hot, as some more pro. nownced degreo of demerit woald

I exclude from my censure apon our two great schools those works, most of which we know, and all of which we

We have recently seen marvellons statemonts as to the numher of dwelling-houses which have within
laud. land
iunocent of these, I would put it to our two innocent of these, I would put it to our two tion of these are not a disgrace to our age aud a
blot upon our towns and our country! Tho blot upon our towns and our country! The
exceptions are, happily, numerous, and in many exceptions are, happily, numerous, and in many
cases actnally brilliant; but they bear no pro portion to the immense comprehensivcness of the rule. If the erection of this mnltitude of houses centary, had been extended orer five centuries counting back from the middle of the last, few indeed wond have been the numher of those
with which any serjous fault could be found with which any serious fault could be found and, if we wore to concentrate our period a littie
more, one may almost say that on nearly all one might have looked with some degree of satisfac. tion. It has been reserved to our own age,-the age of mechanical and scientific progress,-to
deluge our land with an inundation of brick and mortar and compo, more degrading in its forms than any previous period has prodnced. This
plague of nearly unmitigated barbarism is so inveterate that ono sees no means by which it can be remedied, except by so absolutely elevating the art prodnced by members of our own profession, however urpretending their position, as to reflect of necessity its merit upon those of the non-professional bailders beneath sphere of tolerable art that it may become im. possible for sach atrocities to continue to he perpetrated.
however, a yet sadder form of inequality to be recordod, -sadder becanse irre. million of ngly honses, or the evil majority 0 them, may go to decay or ho rebult; but a single ancient edifice destroyed or ruined hy ignorant "restoration" can never be recovered. It is unquestionaloly that the ancient strnctures, from the study of whioh a knowledge of
our Mediraval styles has been resuscitated, had suffered for the most part so severely from negloct, ill-usage, and decay, as to demand the they have, happily, in very many instances, received. The knowledre and skill of our nouMedireval architects has often been devoted with admirahle suceess to this grateful work, anc from among the restorations of ancient buildings may he instanced many of the most happy
results of the Gothic revival. But here, again, the unhappy diversity I have alluded to, as existing in our now works is found to exist in its
most aggravated form. Our old huildings, too most aggravated form. Our old haildings, too
often,-- bay, in a majority, I fear, of cases, - fall oiten, - bay, in a majority, I fear, of cases, -fall
into the hands of men who have neither know. into the hands of men who have neither know.
ledge nor respect for them; while, even amongst those who possess the requisite knowledge, there disposition to sit in a lack of veneration,- - a disposition to sit iu judgment on the works of
their teachers,- a rage for alteration to snit some their teachers,-a rage or alteration to snit some
system to which they had pledged themselves in their own works; and even the preposterons idca that the ancient examples they were called
upon to repair were a fitting field for the display upon to repair were a fitti
of their own originality!

Nor have the official guardians of our ancient hnildings exercised mucly restraint upon these vararies; or the contrary they have too often heen most culpably careless as to the hands to which they have committed their trust, and are usually the inciters to ignorant tampering, the
ueedless remoral of valnahle features, and evon weedless remoral of valnahle features, and evon to the condemmation and destruotion of the
huildings under their claarge. The result has been truly disastrons - so much so that our country has actwaliy heen robbed of a large proportion of its antiquities uuder the name of
puhlic festivities goes on merrily, while at the brated, we find ecclesiastical dignitaries, clergy squires, and architects congratulating one another on the success of the latest effort of Vandalism. Our Institute has done itself in. finto honour by appointing a Standing Committee to investigato and protest, and ly publishing a code of excellent suggestions as to the mode of dealing with ancient remains; hnt still the work gocs on, and the equivocal motto of the Ecclesiologist-"Donec Templa refeceris" seems likely to prove well-nigh the death.knell of one ccclesiastical antiquities.
I fear I shall he tbought to have painted the darker side of our architectural status with greater perspicuity than its brighter side. I do
not intend this, as I have a very hopeful appre not intend this, as I have a very hopeful appre-
ciation of the happier circumstances of our position; but it is of little use to congratulate each tion; but it is of little use to congratulate each other on our successes if we fuil in courage to trust, therofore, yon will have patience witlu me if spend a few moments in patience with mo he possible causes of tho inconsistencies we deplore, leaving to your own conaideration the means of remotivg or abating them.
Ono would have imagized that there would he oo sucb thing as a really ignorant and thohe spinskilful or cold-hearted architect; that endered the ex, nature of our art would have ible; and I periods I have so much dwelt upon none such did exist; hat during a dull period, snch os bas preceded our own, architecture came to ho vowed by the public as a profession rather than as an art -as one of the quarters io which a yont conld ho provided for, 1ather then as a clorions celd for the exercise of mind, imagination, and zeal. Just as the Church was viewed by former generation as an institution providing rehitecs 1ather than for saving souls, so has ather then heen dealt with as a means of hom of life; and in choosing it as a profession the question has too often heen decided by tho prospect of a good connexion rather than by prospect of a good connexion
It has happily been the case that at all times, owever dead, a goodly number of ingcuuons youths have allied themselves to our art from the highest motiver, and this has of late jears so rapidly incrased that I am convinced that it is yot I cannot but fear that the old leaven of professionalism versns art hios heen one canse of the extraordinary contradiction I have been at. tempting to chronicle. This evil does no necessitate ignorance, it is true, bnt it induces it for thongh a man, in spite of a non-inclina and interest, this is hardly expected to go far and a yontly so circumstanced, however con tion to the far more likely to devote his atten parts he far moxe hosiness. like and praction parts of his profession, from which bo can most learly perceive the advantarges to he derived, foels, perhaps, too little appreciation to bo con scioas of his defects, rot to mention ;that many young men are naturally so little given to application of any kind that, if they lack the internal fire, they will never hring themselves to that
zenlous study which is ossential to escel cenlous study which is ossential to excel lence.
A second canse, and perhaps the most damaging of all,-is, that the puhlic, as a hody, good architey perceive the diference between young gentlemen I have alluded to, if he has toler able introductions and grood address, and fair bnsiness hahits, is really as likely to get on as if he possessed the higher qualifications: nay, I could name many young men of the highest promise who aro at this moment actually languishing for employment, while others almost innocent of art are making their way prosperously.
This bears directly upon the tbird canse I wond rention-competitions as now conducted; for what can we bope from them if the jndges whether a desion is crood or had? Compctitions have thus becoroo a mere lottery, into which the most ignorant and nnskilfnl may theo his design; and, provided he' gives a low estimate and makes his drawings look smart, he knows that "the race will not bo to the swift nor the battle to the strong," bot time and chance may
amatenr jndges be appoiuted, it may at the best be decided hy the fancies of an individual or a
clique, clique.
Another-I will not say cause, hat-promoter of this state of thinge, is the prevailing style of fession is held up to puhlic soorn one our proa word said up to puric soom, one rarely sees which. said again tho mero ofal of our art, which is the great disgrace of our age ; nearly all which appears is agajust those who havo really their hearts engaged in their work, and are enthusiastically aiming a high atandard of art. These aro singled out for depreciation, I know not by whom nor with what motives; nor would I care to inquire. Of such critics I would rather say, "O my soul, come not thou into their secrets." Yet, however this may he, it obviously has the effect of encouraging those who employ inefficient architects, and of making the prblic the more satiafied with their own want of perception.
The next canse, or promoter, of the ovil in concion to wbich I will allude, is the want of im an matual sympathy, and of a common themselves.
I am not alluding to the diversity between the standards of the two great camps into which we have become clivided; I doubt whotber much harm would come of this, were those who ocenpy each camp of one heart aroong themselves. Neither in one, however, vor the other, can this so prevalent or so paramonnt as to beclearly the style of the day; in both eclecticism prevails flmost to the extent of dissipatiou. One man has $0^{\text {" }}$ fad" for one shade of style, another for moment to be settlin opinion Been for this is but sinting down into a single channel, that promised bond of mion hecomes years hat promised bond of anion hecomes a mere he scoffed at and rejected. Meanwhile our camps are visited by that rreat enemy of union and syinpathy-self.conceit. I do not refer to hat noble self.reliance which gives a man courare for his work, howerer difficult; but that lower sontiment, which too often makes him cornful of his fellow.labourer, however true hearted; and by means of nutual scorn and depreciation, tends to encourage those whose nnocence of art Leeps them heyond its range ad warns the careless publio against the em ployment of chose who thus bear witness one
I will close my list, hy suggesting one of the difficnlties of our day to be the ahsence of any ecognisod means or iustruction in, or facilities for, to atudy of the higher branches of architectural ome hy the zealous, but it afford a practical xcuse for zealous; but it affords a practical fession as an ant hy those who lack onthuainsm It is "the lion in the way," which is sufficien to deter the apathetic from exertion.
I am conscious that I ntterly lack the sagacity to suggest a remedy for all these inherent evils Which seem to drag us hack from the goal at Which so many are; sincerely aiming. I wonld, however, comrmend the question to the unitod wisdom of the Institute, as one of the most impertant considerations on which it can cagage itself.
With every apology for the length to which my address has extended, and for its plajnness of speech, which has been so far from being personal, that in my allusions to the defects in some f the architecture of our day, I have in no one sstance had a specifie architect in view, and fee hat I may have myself challenged a tu quoque opeated cong my remarks to a conclu thanks, and appeals to your lind forhearance.

Geo. Gilibrirt Scott.

## enlargement of the rotherhithe

 INFIRMARY.Thz infirmary at Rotherhithe has for sorae tome been fonnd inadeqnate in size, the number of wards being unequal to the number of patients he St Olave's Board of Ginardians on thaces commendation of the Local Gorems, on the recommendation of the Local Government Board, have decided to make extensive atlditions to the huilding, which will shortly he commenced. The estimated cost of the additions is 12,0001 ,
and at their meeting last week the guardinns resolved to horrow this sum, the amonnt to resolved to horrow this sum, the am
ropaid in thirty annual instalments.

hope end, Near malvern. position between Malvern and Ledbary, in place was built about seventy years ago at the bottom of the valley. The new house is being built of of the valey. The new hruse is bandstone, with dressings of Bath stone, rocal red sanastofe, with dar's red tiles.

The reception-rooms are all placed on the entrance-hall by the turret staircase, as well as south front, which commands the most extensive from the upper floors of the honse.
(he men-servants rooms on the second floor The Fitchen and offiees have a north.east are approach
In the basement are placed wine and beer The corridors and staircases are all to be finecellars, lorder, de., also the apparatus for heating proof.
and ventilation. The chapel, and the smoking-room in the npper of Plumstead, from the designs of Messrs. part of the tower, are approached direct from the Habershon, Pite, \& Fawckner, of London.

## PUBLIC WORKS REFORM IN INDIA.*

It bas been too common an idea in England, notwithstanding our knowledge of the anciont temple and palace architecture of Ivdia, that the lindus are withont an engineering history, that there aro no works extant of their cngio neering skill, and that they owe to us all that they possess in that department. Col. Tyrrel shows that sucb is not the case, India has an engineering history, marked by works wbose usefulness may vie with works of any otbe nation,-works on which her life depends.

Some parts of Indila, partieularly the south, are covercd by a network of tanks; they are
fonnd, bowever, all over India, and the ruins of somo bear witness to their immenso size. Their number and extent, and presence all over India,
prove the general jdea that was felf of tbeir prove the general idea that was felt of tbeir
necessity. In order that we may have some notion of their size, be gives the dimensions of fonr large tanks now in existence, and there are even larger ones:-

| District. | Name of Tank. |
| :---: | :---: |
| Mellore ........... | Connigherry Tank. |
| North Areot ..... | Canvenpavknm Tauk |
| Chungleput ...... | Chumhrampauknm Tank |
| South Arcot ...... | Veeraunum Tank ....... |

To the east of Iryderabad in the Deccan, and
of Nagpoor, and cyen as far east as tho Boad Country in Orissa, the remains of tanks are numerous,-showing that at one time, even iu those wild tracts (where at present there is little besides jungle) there was a thriving people.
The ancient engineering works of India in the south are, with the exception of tanks, neither very numerous nor well executed. The ancient of curious works than works of engincoring skill; they are, in many instances, extromely solid and strong, but the arob is seldom mot with. Huge stones eover their tomples, as in Humpee or Bejanuggur, founded hy Viriza hudra. some of thcse measure 24 ft. long by 4 ft wide, by $1 \frac{1}{2}$ ft. thick. The chief attraotion of the ancient Hindoo temple is, howevel', generally the elaborate carvings of figuros, \&c. The old bridges mot with in India are not built on very bigh in the centrc, with a gradient often of 1 in 6 to 1 in 10 ; there is generally a great want of waterway, and the approaches are often covered with water during floods, The old annicnts on the Coleroon and Toongabudra and other rivers are not neat constructions; they, however, gave us nocessful ind are the for most snceessful irrigation works. The chief works of wbich there were thousands; many silted up many in ruins, many dry by destruction of the supply ohannels.

In Central India, and towards Bombay, we havo many curious works, bnt not very instruotive in an ongincering point of viow; sucb are the tombs of the Ghond Kinge at Chauda, the forts of Gawilghar and Narnulla on the Satpoora range of hills, ahout $3,000 \mathrm{ft}$. ahove the sea, huilt extromely massively of black hasalt, quar. ried on the spot; the lime must have heen all hrought up from the plains witl. great labonr on
the backs of bullocks. These forts were taken the backs of bullocks. These forts were taken
hy Lord Wellesley in 1803 . We have then the hy Lord Wellesley in 1803. We have then the
caves of Adjunta and Ellora, near Roza, and caves of Adjunta and Ellora, near Roza, and
the caves of Elephanta in the harhour of Bom the cavcs of Elephanta, in the harhour of Bomhay; the former wore doubtless used hy the
Brahmins for religions purposes, and at an Brahmins for religious purposes, and at an
earkier period hy the Buddhists. Col. Tyrrell is of opiuion, however, that they wore oriminally Egyptian in idea. The capitals of the most anciont columns have a strong resemblance to tho Egyptian formz, and the paintings which formerly covered the caves of Adjunta were painted on a material and witb pigments exactly corresponding with those found iu Egypt; and, comparing the figures themselvcs, there is ofteu could wcll imasine the Eggptian idea depicted hy an Indian hand. These temples were catont of the amygdaloidal trap by a pick; the marks
 Publio Worlis Department. London: Bumpus, Hoborn
hars, 1873 ,
of the tools are still visihle. The work was donhtless lahorions, but required hut little skill and no science.
The ancient Mahommedan rulers left us noble examples of architccture,-clegance of design massiveness, and science in construction. The Taj at Agra, and its very inferior copy at Aurungahad, are good examples of masonry. There are also some fine examples of stonewor and scientific construction in the Mohammedan remains bnilt by Yoosuf Khan in 1849, around tbe very ancient Hindoo ciby of Vijzapùra. They wore also aware of the importance anals, and commenced our prescnt system i the north. Thus the bistory of native engineer ing in India as regards the Trindoo is not hril. lant, bnt it was nseful. Xet we, with all our boasted science, havo failed to do what the Tindoo did in a most efficient manner in many parts of the conntry (see a map of the Tondeman's conntry soutb of Tanjore : it is a networ of tanks) ; that ia, store water all over it We have taken water by anniout in the large deltas,

Eugland, could pass the required examination in Ergland,
and then go through the second practical course (nuw to
 the prescribed examination at the Indian practicen scolool

cedre demanded of them. And demanded of them. And here I would point out that Indiw is the proper
feld for the student oit the Indiun Public Work. There
are peculiarities in many things thut do not srrike the are peculiarities
After pointing ont some of these peculiarities, he contilues:-
following the example set us by the natives hut in storing watcr against an insufficient monthe we have done scarcely anything; yet this hose dire famines when the dad may reckoned hy tens of thousands. The matter is, however, it is acknowledged, one of dificuity he ancient Hindoo was fully alive to the neceseing of stonng water, more so than we are, has not is ret penetrated the Government: th Hindoo had a power we do not possess; $h$ turned out the whole of the inhabitants of a district, and made them make their own tanks hy compulsory lahonr. We do not behave in his way; hnt the raising funds by local taxation and manicipal offiocrs would appear to bo our remedy
Ninco Captain-now Sir A-Cotton wrote in 837, we have done much for India. We bave truggled on; we bave changed much; wo have made many miles of railway, and have consider bly increased the engineoring establishment he wave not, by any means, grasped the nagminde of the work to be done, nor the vast號 Considering the vastness of tho country, the mmense snms required, and the large nnm ber of qualified men that the works wonld cmava, it may have beon, perhaps, impossihle urely the following conditions of the Publi Works Dcpartment in India, pointed ont by Col. Ty yrell, must be now patent to all, viz, :-
"That, not withstanding the check e and conuter-cheeks,
work is unsatisfactory in the highest degrea; that true respousibility is wiil; that the resources of the country native talent is altogether igaored, and, finaly, that the
time has arrived for a thorou gh reformation of the depart. ment commensurate with the just demsuls of the comatry nd our duty towards it.,"
After brielly describjug the present system, Col. Tyrrell thus proceeds:-
"To commence a review of the system that I propose, $\chi_{\text {will }}$ state first, the training that the yoang encinee houdd undergo, and then follow him up, until I build u, Fould preflece it hy repeating and laying down cortain wroud prineiples that I contider our rulers are bound to
bserve in lealing with Indin. First oserve in dealing with India. First, I would obscryo
that the stallisbuent of any engine ering department hould rave for r tis ofject not merely the development of
the resourceos of Indi, but it shonld elso equally and rimarily aim at tbe development aud adranoement of the ach them not only to worl, but to design Secondy conomical mind simp ent establisbment muast be the moat ill 14 view of finding high pay for a number of Europen
 quickest, least expensive, and most elficient manner. To obtain this object the following arrangements woid be
deeessary. There should he Gorernment collegee or chools at sereral largo tonzs, -say Poonah, Colloutta hoorhee, Madras, and Hyderahad, or a less number und European would bare to pass a certain standard in would have to pass in one of the native languafes. The instruction would bo in English. In several of the towns
nentioned mentioned ahore, there is an embryo of anch institutions
Men, bowerer, who had gone throurg the same course in

 two Superintending Fugineers of saze grand division,
nd two civi offcers or compissiuners of the distriat,
 Railwayy ic. Lrrigation List of ofticers of the Public Worls Department for each grand division:-One Chie Enrineer and Secretary Rnginer and Becretary to tovernment roads and civil nildings; one Chief Engineer and Secrotary to Govern.
nent railway; one Cbief Engineer und Secretary Gorernment' Irrigation; Superinterding Enginears for each grand division, as may be required; Executive Engineers, four classes, as now, for eiek grind divivion,

Col. Tyrrell tben proceeds to describe the duties of tbe different grand divisions, then of the several officers, \&c.; and afterwards gives general sketch of the accounts that would be required from each,
ken is the course he recommonds and slightly kecches. He does not put it forward as an ressised scheme; hat what ho wishics to im press on Indian officials auc the Indian pablic is there must be, in any remodelled scheme of pnolc works, a clearly defined responsifility and smple system of accounts; that men shall Do nosen for their practical knowledge of work aknowledre and ing 11ative intcllect and native resources as menc s protent the pockets of the taxpayer. We aro not justified in making the inhabitants of India pay exorbitant prices for iron, for example, wher ties in inexhaustible quantities at their very doors ; nor are we justified in dragging her sons to England to learn a profession that must of all thers affect most seriously and heneficially tho physical and moral condition of India, when that profossion can he hettcr learnt in India
The ycar 1871-72, 168.019 tons of material osting 707, 6̄̈l, besides 223,617 l. for freimht were sent to India. In 1872-73 the price moald
be doubled, and the price will increase year by year. This is doubtless good for English iron trade, good for English shipowners. But is it right? Are we never to rise above our old
appellation, a nation of shopkeepers? The appellation, a nation of shopkeepers ? The price of iron is now so high, and the price of perforce commence earncstly to develop the immense resources of India in this respect. Then let is manfully do our duty, however tardily commenced. Our difficulties are removed; with a little patience and perseverance India may not only supply her own material, but work may not only supply
Finally, concludes Col. Tyrrell, there is nothing that promises so well for the rapid advancement of India as the thorough development of her iron and coal trade, and the education of her iron and coal trade, and the education of her sons to work out that development. No reform
of her public works will succeed withont the of her public works wall succeed withont the honest cultivation of native talent and the promotion of her matema lex est.

## PORTLAND CEMENT.

Sir,-Regarding the strictures in yonr paper upon the alleged "Failure of Portland Cement" as most important to architects, builders, and others, I have often desired to communicate my thoughts, but for several reasons I have previously refrained.
If the concrete roof of an mnderground build. ing can be so finished as to allow loaded lurries to pass over, thus exposing it to weight, wear, and weather, it goes to prove that Portland cement will not fail if properly treated. If factories can be fire-proofed in 10 ft . and 12 ft . spans of arches, the hays being from 30 ft , to 40 ft . long, -and the top of the arch doing servico as a floor, carrying all machincry, \&c., without any other support than the ordinary iron beams, I think any other kind of work may be done with the same material, and I can point to soveral works snch as indicated.

I venture to give the following as truisms :done, care and good wood work cannot be done, care
standing.
2. With good cement had work may be done, oy (a) improper hallast, (b) improper mixing, (c) injudicions working.
. With good cement, clean sharp rnbble of proper size, properly mixed in right proportions, and handled by a good workman ac
cernent work, failure is impossible.
cernent work, failure is impossible.
4. It wonld he just as wise to allow the use of soft, insufficiently burnt bricks, set with inferior mortar by unskitled workmen, and then cry ont against brickwork, as to say that because som
concrete is not good "Portland cement fails." concrete is not good "Portland cement fails."
I hazard nothing in saying that best Portland cement, if properly treated, cannot fail. I have
blocks of cement concrete, now (and have heen for years) lying about my yard, and are hard just in proportion to their age. Good concrete hardens by time and exposure, -bad concrete perishes rapidly.
I have been engraged extensively in the cement concreto business for some years past, - of ten nsing many tons per day,-and I can assert confidently that every "failure" can be traced to ascertainable and perfectly natural causes, such as I have indicated. The fact is, that bricks from bad ones, good stone, \&c., from had, not one in five hundred can detect bad from good cement, till all the damage is done. Not all the materials about a bailding require half does.
In the majority of cases, as cement-makers can testify, inferior cement is preferred by jnd ce crood cement by the few can, -miller.like,jzdge grood cement by the mere handling of it Yet this may be done after years of study and close attention; and if cement-work is to oconpy its proper position in the bnilding trade, it can only he rade to do so by persons who will make a speciality of it.
I have not by any means found that the high. priced cements are the best, bnt often to the contrary.

All cement-makers turn ont some cement worse than their best; but some makers cannot make good cement, often for want of the proper materials. Much of the cost of cement depends npon the quantity of coal used. Good Portland mnst have considerable bnrning. The high price of coal reduces the chances of obtaining good
coment. Manufacturers may learn some day
that the best way to destroy their trade is to teach the puhlic that the quality of cement can not be depended npon.

## Macolar Macleod.

Sowe Portland cementmanufacturers, in reply to the assertion of one of our correspondents, that cement-makers produce three linds "or qualities, viz., good, bad, and indifferent," assert that they make but one article, and are careful that all buyers shall he well served. "There are many other respectable houses in the trade who, we believe, act upon the same rule. Therefore, ' Zeta's' statement, applied in a general way would manifestly convey a falso impression Which we shall feel ohliged if you will correct.' We insort the statement, bnt that a great deal of cement lately used has failed is undeniable, and, indeed has not been denied. It is in the interest of all that we seek to learn the canse and provent a recurrence of the evil.

## DEFENCE OF SHAMS.

Sir, - My letter in defence of sharns was not written in the "interest of art," for which, from in the service of humanity, for which I care a great deal. That art which has no reference to the civilisation of the nineteenth century has, I am bold am bold enough to say, no hold upon my sym. pathies, and posterity will, to my way of do well the much.needed work of their own time and generation. That "art which sits humhly at the feet of her great mistress" is not the art We most need; and Nature horself, ontside of Mayfair, is not always the mistress at whose soil-stained and travel-torn feet an average lover would care long to sit. The office of handmaid to Dame Natare is not a sinecuro, and the "rose and lily" of poetry owe much to the "paint" of modern floriculture.
What more oan I, the practical worker, say to Mr. Prond, the dreamer ? Does he need to be told that the "works at which the old masters so lovingly and patiently wrought" can never be known to the thousands condemned to toil ignorghe of something more than thon sands dwell where the first is only the shy above and the tradition, perhaps, of fields that once wore thercahouts, but are no more; where art sanitary of the lahouring bricklayer and tho monts panct the weather, and the common priry, which is the central structure of the conribyard, has at last a decent roof. There is water, too, for the pumping, though the fastidious may still object to its proximity to the cesspool. Bnt thero are no "shams" hore. Those wicked and "devil" born abominations have not yet displaced or covered up "things honest in the sight of all men. So "indin, of any pretensions to taste of any kind has ever been suspected of even visiting them. And as the dwellings, so are the dwellers; for hnmanity chameleon.like, takes colour from its sur-

## roundings.

Will Mr. Proud think of these things, and let ns know how the art of his imaginings will here carry out its lofty mission? And will he permit me to suggest that his reasoming may be quite as forcible if the language used be misconrteous?

> C. Heney Whitaker.

## IMPROVEMENTS AND BUILDINGS IN

 ILKLEYThe rapid transformation which has taken place of late years in this charmingly situated little town furnishes a striking illustration of Yorkshire enterprise. The thatched vil-
lage has been supplanted by the well-built, lage has been supplanted by the well-built,
thriving town. The chance, however, extend only to the style of architecture, the opening out of new roads and drives, and the greatly increased number of houses and semi-public buildings. The nataral features of the landscape are, if anything, improved by the new phase town is built every year receiving fresh orna. mentation by the erection of pretty villas, with appropriate plantings of trees and shrabs. dmongst the most recent schemes is the erection f a large family hotel, which is to he commenced forthwith. The opening of the short line of
railway from Braiford and district, and the prohahle oreation of a military camp in the noighoourhood, have influenced a few gentlemen o take this step, in the helief that such an contribute to the prosiperity of Ilkley. The new erection is to be called the Victoria Hotel, and is heing promoted hy the Ilkley Hotel Company, Limited. The external dimensions of the huild. ing will be 167 ft . by 62 ft . wide and 62 ft . in hcight. It will be carricd out in the Italian style of architectare, the more prominent features being equally distributed on t wo front ages. The intervening land between the botel and the river is inteaded to be laid out in terraces, with gardens and croquet-grounds, \&c. The architect is Mr. George Smith, of Bradford. rom whose designs many of the private resilences at Ilkley have been erected.
Active steps are heing taken towards commencing the erection of the Home for Con. valescents which Mr. Charles Semon, of Broughton Hall, is abrat to huild at Inkley. Plans have been prepared hy Mr. George Smith, and tenders are now sought for the necessary works, which will be commencod forthwith. The bnilding will occupy an elevated site, overlooking the valley of the Wharfe. Tho Home will have a rood approach by Queen's. road and West Wood Drive, and will stand in its own gronnds of six acres. The building is intended to be substantial rather than ornamental: its style of architecture, however, a domestio Gothic, will be in harmony with the site and with the style generally adopted in tho vicinity. Tho building will be T-shaped, the cross representing the principal front; bat this will only have an extra width of 13 ft . beyond the main body. The length from front to hack will be 141 ft ., the frontage width being 51 ft ,, and the remainder 38 ft . The principal entrance will he in the front of the building, on one side of which will be the matron's rooms, with bay. vindow (which is carried to the floor ahove) window (Which is carried to the floor ahove), by 17 ft . The hed-rooms for male patients will lso he on the ground.floor, approached from a corridor. On the first floor are placed the bedrooms for females, with a corridor as on the ground.floor. Their sitting-room will also be on his floor, and will occupy the front wing over the matron's rooms. On the opposite wing will be the general dining.room, 30 ft . square. In the attic-story rooms are obtained, which are lighted by dormer.windows, with a corridor riving access to them. All the bed-rooms are valled to the ceiling, each patient baving a cparate room, except in a few cases, where cuble-bedded rooms have heen provided. All he rooms are fitted with fixed wash-basins, with water-pipes, \&c. Accommodation will he alforded or sixty patients, besides the servauts. Special attention has been paid to the heating and ventilation. The latter will be on the system adopted by Drs. Hayward and Drysdale, of Liverpool. It is self-acting. The yitiated air is carried from the ceiling of each room or cor. ridor into a central flee, whence it is drawn off by the heat of the kitcheu fires, and it then passes up the chimney-shaft. When in working order, the institution will not be a "charity," in the usual sense of the term. A fixed charge will be made for each patient, which, however, will be more than returned in attention and generous diet, and, it is hoped, in that restoration of health which is the chief desire of the generous of healt
donor.

## A NEW THERMOMETER.

M. Palmieri, the director of the observatory on Vesnvins, has at present exbibiting at the Royal Academy of Sciences at Naples a new metal thermometer provided with alarm bells. The latter are sonnded as soon as sudden changes of temperature take place. The apparatus is so sensitive that its hand is constantly in a state of oscillation, When the change of temperature has attained a certain height, the alarm signal sounds, thereby enahling the observer to notice the rise and fall of temperature. By means of a pecnliar arrangement the higbest and lowest grades of temperature prevailing at a certain time will be registered; and this is independent of the proper parpose of the instrament, viz., to indicate when certain limits are exceeded. The Professor had been commissioned by the Empress of Russia to construct such a thermo meter; it will he hnng up in the Imperia. travelling carriage, and hy its help the tempera ture may be regulated by hoating or ventilation

THE $\triangle$ ROHITEOLURAL ASBOCIATLON. The new session has commenced under the conversazione has passod off successfully. Paint iugs, drawings, metal work, emhroidery, carved woodwork, painted tiles, terra.cottas, and other objects of interest wero lent for the occasion by various mannfacturers, momhers, and thei frionds.
As usual, some of the prizes offerod by and through the Association were formally presented
by the president, the successful students coiving hearty applause as they came up to the chair. The following is a list of the awards :For the two best serios of designs in the Class

Johnsoa; \&c.
A short addross from the prosidont formed alluded to work of the ovening. In this he study afforded hy the Association, and to the friendships which should naturally be formed hy young men constautly moeting and tabiug active interest in special pursuits. He thought in the main the hest service afforded to memhers was in this motual help and emulation; and that less stross should he laid on the profescional interest of the momhers who will prohably deal years. Still the presence of older men is wel come and called for,-who can and will give assistance in studies and otherwise. As a past such a position, Mr. T. Rogor Smith was called on, and made a few remarks on tho architectural activity iu the large commorcial towns of tho North of England, - for instance, Liverpool, Manchoster, Preston, Halifax, Leeds, and others, There is to ho found in tho puhlio and privato bnildings of these places,-which ho had recently examinod persoually with much caro, - a thoroughness in design, and exacution too, rarely met with in London, Is the activity of
thought and deed less in what was once the thought and deed less in what was once tho
intellectual as woll as political capital of Englaud? Or aro greater strides heing taken olaowhore than here? As to architecture, the
ond future answer to that question will no doubt bo studies and of the students in tho olusses of the Architectural Association.

The first ordinary meeting of the session was held on the $31_{\text {at }}$ alt., the presidont in tho chair. The fullowing gentlemen wore elected mom. Lors:-Messrs. C. J. Bentley, W. J. Wood, S. J Lethbridge, J. G. Stevensou, R. W. Collier, J. Rowkmood, jnn., W. J. Kemp, J. E. Sears, J. Gandy, R. R. St. Leilger Morrison, G. II. Jeffroy, F. Unsworth, C. J. Graham, W, S. Guildford, The Secretary, Mr. Paioe, read the report, Thich mentioned tho increasing number of tudents joining, in order to take advautage of he many and still fresh opportunities for, and
aelp towards, self.education. Careful arrauge. eelp towards, self.education. Careful arrauge. nents have been made with respeot to the wor
of the several hranches of the Association. I s to he hoped that, with the fewest possihle xceptions, each memher will ho ahlo to interest nimself thoronghly in tho success of one, if not noro, of these hranches, giving in this and
ther waya, as may he in his powor, hearty issistanco towards the realisation of the objects or which the $\Lambda$ ssociation was originally formed, iz., the promotion of friendly intercourso among ossion, and of efficient atudy in fellowship of natters affecting their common pursuits. Con. ributions laring heen from timo to time offered sy memhers and others, a prize fund was o whioh the following geutlemen suhscribed :rofessor T. Hayter Lewis, Mr. J. Donglass Iathews (ex-president), nod Messrs. E. J. . A. Paice, and S. E. Barnes. It was decided at three prizes, value five guineas each, shonld heir sketching tonrs. After a competition in

Which work done previonsly was suhmitted, the
prizes were given to E. J. May, R. C. Page, and I. C. Yates.

The Treasurer (Mr. J. Douglasa Mathews) then read the balance-sheet for tho past session which showed that the total income wa 4392. 10s. 3d., and the total expenditure wa 435 l . 1s. 8 d ., thus leaving a halance of $4 l, 8 \mathrm{~s}, 7 \mathrm{~d}$. in hand.
The secretaries of the varions olasses aftorwards he cited their reports. It was shown that in was not so Deaign, although the attendance some good designs were produced. The Class of Constraction and Practice, in its reconstituted form, under experienced visitors, was very successful, hoth as to the numhers attending its meetings, and as to the work done. Tho archi. three candidates, all members of the whe tion, passed in tho Closs of Proficiency. two othors, in ono section only; and twelve (includ ing several members) in tho preliminary examination. The fact that those who passed were more numerons than in any previous year should afford encouragement to intonding candidates A contrihution was made for tho first time towards tho funds of tho Architects ${ }^{3}$ Benerolen Society, consisting of small subseriptions of memhers, and a sum roted from the funds of le Association.
M. Walter Spiers, in andswer to inquiry, said The value of the library was about 350 l.
said that if they , in the course of his remarks, sand that if they consued themsolvos withits the did of standard works in the profession, and practitioners thet to act within theso walls as the proper hiect would devote their powers to he proper ohject. Among the momhers were of the of the day. The Association then numbered ahont 600. Of these eighty-eight joined las session; hut he regretted to state that sixty ave of these new memhers had not contributed thus any way to tho comraon stock of knowledge, thus showin a want of appreciation of the objects of the Association. Tho Sketch Book numbered no fewor than 158 subscribera; ont of thus leaving a tremendons amount of workes, these contribntors and lous amonnt of work to these contribntors: and he urged upon the new ing men naturally leading copies of their work. It was the hame of tho profession that there were so many imitators, so let them think for themselves.
On tho motiou of Mr. Ridge, seconded hy Mr. Quilter, thanks wero voted to the Presidont, and the moeting then terminated.

LABOURERS' COTTAGES WITH THREE BEDROOMS.
Sir, -The difficulty of providing three hed. rooms is met, on the plan of Sir W. Jones, hy placing the third hedroom in a lean-to on the Roger Smith, hy "building an external shed, and carrying up the walls to the top of the cottage." Both expedientaseem to me, nat onl ohjectionable, but quite unnecessary ; indeed, I lave not found it needful to depart from the traditional arrangement of an ordinary English house, in which the liviug-rooms aud offices occupy the whole of the ground floor, and the hedrooms occupy the whelo of the floor ahove
Thus, acoording to the received anthorities, the minimum sizes for tho three hedroome are $100+80+70=250 \mathrm{ft}$., which, with a few feet for passage-way, will mako say 265 ft . in all. The $150+70=220 \mathrm{ft}$., which leares 45 ft rooms are excess in area of the bedroom floor orer the ground floor. This is littlo enough for the pantry, which is a necessary adjunct, and the ontrance lohby, which is most desirahle architect will work out the details in his own way: in practice the bedrooms are tenernll made somewhat larrer than these minimm dimensions. I am now desimning some cottores in which ahout 10 ft . are added to the bedrabe and this is easily divided amongst the living oome, pantry, and lohhy.
$\Lambda$ cutage hailt in perfect accordance with Fnglish fashion. Whon wally ecoupied after the room used as an apple store, we should consid how few pantrios are wo sher enough for the winter stock of garden produce
and wo need not rush to the conclusion that there is indecent crowding in tho other two rooms. If one of the gronud floor rooms is made into a parlour, is it not tho special amahition of overy honsewife to have oue room untrodden by working-day feet? A proprietor who, out of puro good nature, has made his cottages theoretically perfect, and fiuds that his labonrers, aftor living in two rooms for many gonerations, do uot all at onco occupy five rooms just as he threo wish, should have pacience: in two or dining-room, and more the parlour will hecome a he drawing, and a lean-to will he needed for the drawing-room or houdoir.

Thos, Blashill.

DEAR COALS AND DOMESTLC SAVINGS.
I rave waited a long time to soe in the Bulder some practical suggestions for a gencral improveent in house (or room) warming for the million the various plans pnt forth (as far as I recollect) being only adapted to houses of tho higher class, and expensive; aud I must express my ignor auce at present as to what is leing done at the Society of Arts in rogard to the prizes offered. Lighting the fire in tho common storo at the top, and putting a plate at the bottom, has nots ecome popular, and never will. Gentlemon who pay 10l, for a now stove, \&c., on that plan do not get a "cheerful fire," aud grow tired of looking at it. $\Delta$ new grate at a cost of 15 s . to 20s., to give more heat, is the desideratum, and conld he managed by tho manufacturera, in the North, if they wonld give their attention to it The long-standing wasteful defect is bedwing the ordinary stowes in brickwork, and consequent los of hoat in the wall. The fireplace should be plastered clean all round, arched orer, and tho stove stand clear ; the feet hoine set on hrick and cement, ahout 6 in. deep, but a short con exion of iron or hrick into the ront of the stove heing perforated or trellis pattera, to lct out the heat: and for the moderi "hreakfast.parlone"s or por fooms helow, great improvement would be the insertion of pipes from underneath tho floor to the side of impingo against the chees, stroam of fresh air to of fingo againat the cheeks, and theso should bs on re-brick, fitted on an improved plan. This ventilawion would, of course, gave much rotting of floor, and increase the draught whon doors c., are closed up.

For small rooms, lodgers, \&c., especially where the chimneys smoko the wrong way, a little grate might he made (as some are now) only at each of the are, hut with a hot hob or shelf These should stand flush with tho chimney. piece, and having a neok sliglitly sloping hack into the fluc, when they would no douht dram well. no douht drap
Corrtaenda.

THREATENED COLLAPSE OF TITE NEWINGTON-BUTTS IMPROVEMENTS A.v Act of Parliament was obtained last ycar the secropolitan Board of Works for making hutts hyportant improvement at NewingtonThe project involves the taking down of the present parish charch (which projects in an ansightly manner into the lighway), and building a new parish church on another site the phas already heon seonrod; but althrogh the plans of the new charoh hase for some time been in readiness, the building of the structure has heen delayed, owing to a certain amount of money not being forthcoming; and, from the meeting of the Thich took place at a protracted now appears that the entire scheme weck, it unlikely to end in failure, and the abandonment of the improvement, which is one of great importance, and mach to he desiced.*
The question of this improvement has already boen referrod to in the Builder, in connexion with the proposed new parish chnrch, and also a second new mission church, now in couras of rection in Newington Churchyard. Tho disous. sion of tho suhject at the meeting of tho Newington Vestry last week was the reault of a resolution of the Church Building Society for warded to the vestry, stating that the comnitte raised pithin thity of the requisite sum being

But, beyond this, the threatened fuilure of the schem
 in the oocality, sasisereral blocks of houses bate cthanged

Parliament, and the discussion of the meeting tarned upon whether the vestry ought not to farned upon whether the vestry ought not to
find the money, seeing that the romoval of the find the money, seeing that the romoval of the ebnreb was to bonefit the parish by widening the thorongbfarc. The rector of the parish, who presided, appeared to be of opinion that the money onght to be found hy the ratepayers; Whilst, on the other hand, it was contended tbat this would be an injustice, if not illegal, one of the speakers obeerving that the ratepayers, throngh the Metropolitan Board, had already agreed to contribute 4,500 . for the old chnrch and the site. Eitimately it was resolved, "r That the vestry memorialise the Board of Torks to petition Parliament to repoal so mneb of tbe Metropolitan Streets Improvement Bill as related to tbe deposit of the snm of 5,0002 . in the hands of the Ecclesiastical Commissioners, and for porver to constitnto the new church now in course of erection the parisb chnrch for the time being." The rector observed that be could only say that if they went to Parliament, he should oppose them there; and as to the mission-church, he hoped to ehow them it wae needed.
It is thus not improbable, from the resolution adopted by the vestry, that there will ho another Parliamentary fight in connexion with this longtalked.of improvement, and that, in the mean. time, the improvement itself is jeopardised.

## A LAABOUR QUESTION.

Is it true tbat there was a strike in the stonequarries at any time during 1573 ? A contractor has stated that between the months of January and July, 1873, there was a strike amonc stonequarrymen, which has had the effect of raising the price of stone. Is this statement correct?
A.B.

## LDDGATE-HILL.

Chaos just now reigns snpreme in Ludgatehill. This thoroughfare, at the best of times, is not very easy to pass throngh, boing eo erowdod; but now that the pavement is taken ap, and block up the space intended for foot-passengers, the state of affairs is really becoming serious. The street is heing paved with the wood paveThe street is heing pared with the wood pave-
ment nnder the anspices of the Improved Wood Paring Co., and the smell of tar is just now Paring Co., and the smell of tar is just now
very powerful in Lndgate-hill. Pasoere-by appear to be mnch interested in the process of laying the wood parement, and as this leads them to congrecate, the attendant policemen
have no little difficulty in leeping the road clear. At the lower end of Ladgate-hill, towards the station, huilding operations are going on, and have been going on,-well, if not quite since the memory of man, certainly for a con-
siderable period. When theee buildings will be completed, and the tborough fare in its ordinary state again, of conrse we cannot say, hat the improved wood parement, ae well as the other improvements, onght certainly to prove very
benefioial in order to rccompense the publio for present discomfort in Ludgate-hill.

DRAINAGE AND SETTAGE WOREJ.
Twickenham.-Tho plans for the drainace of thie parish, prepared by Mr. H. Malcolm Ramsay, the town sarveyor, having been finally
approved and adopted, bave been snbmitted to approved and adopted, have been snhmitted to
tho Local Government Board for their sanction the Local Government Board for their sanction
to borrow the nocessary fands ( 20,0002 .) to carry to borrow the necessary fayds (20,0002.) to carry Ramsay for disposal of the eewage, is that of intermittent downward fltration, as also advised
by him in his scheme eubmitted to the Richmond by him in his scheme eubmitted to the Richmond veetry. Mr. Ramsay is of opinion, as ex.
plained in his report, that nltimately a market plained in his report, that nltimately a market snrronnding agrionltaral districte, and that, therefore, it would he unwise for the local anthority to adopt irrigation, and theroby incur the costly alternative involved in the pnrchase of a large tract of land.
Richmond.-A special general meeting of the Richmond Select Vestry rescinded a. resolation passed at a former meeting, for the adjonrm. ment of the drainage question for throe months, and to consider farther the scheme sent in by "Experience" (Meesrs. Rues \&
Minne's), and if approved, to adopt it. The meeting was a very full one, there heing twenty-six membere present. The chair was occupied by Admiral Stopford, J.P. After a somewhat
stormy discussion the resolution was carried by fourteen against twelve. It was snbsequently resolvod, by thirteen against eleven, "That the scheme of 'Experience' he now considered," and ultimately, hy a majority of eleven to six, "That after the long and careful consideration of that scheme, and after the final satisfactory answers that have heen made hy the engineers, the vestry do fully approve the said tunnel sobeme." This was the signal for some tumait, during Which Mr. Sims gave notice to convene a meeting to resoind the resolution then carried. This meet. ing has since boen beld, and bas affirmed, by 13 to 12, the resolntion provionely passed to adopt the tannel scheme; and rosolved that the soheme be referred to Mr. Abernethy, C.E., with a re quest that be will advise the vestry as to its suitability and effeetiveness, and the estimatos and engineering detaile, and generally on the anbject of the disposal of the sewage of the parish. - We omitted to mention in our acconnt of the different schemes that the author of the schcme "Practice," left in H. Nalcolm Ramsay, surveyor to the Twickeubam Local Board.

## CTILISATION OF SLAG.

 society of enginerrs.At a meeting of thie Society, held on Monday last, a paper was read " On the Economic Use of Blast-farnace Slag, by Mr. Perry F. Nursey brongh, and of Hessrs. Bodmer, of Hammersmith, was deecrihed by the anthor, with the aid of diagrams. Mr. Wood'e machines, he said, were of two kinds, one a borizontal revolving table, and the other a vertical revolving drum. By the firet machine the slag wae cooled as it left the furnace under a stream of water, and hecoming disintegrated, was broken up and pushed off the table at a certain point, by scrapere, into trucks placed beneath. In this state the materinl is in a fit condition for making concrete for haildings. The eecond machine is for reducing tho slag to a finer condition. It is run from the furnace into the drum, throngh which a stream of water hows. The drnm has screens placed within it, and as it revolves the slag hecomee rednced to a ine sand, and it is delivered in that condition Into trueks. This sand is atilised in making bricks, cement, mortar, and for other similar purposes. Messrs. Bodmer's plan consists in the use of a pair of rolle, through which the slag ie run from the furnace into a travelling band, which delivers it where required. The oheet of slag thus produced is readily hroken up for nse in making concrete, or grouud into powder for Tessrs. Bodmer mortar. For some purposee for bricks and cement they produce it dry. They have aleo a epecial syetero of machinery for the mannfactrre of slag bricke, which is worked by hydraulic power.

## SCHOOLS OF SCIENCE AND ART.

Wolverton Science and Art Institute. The anniversary of the opening of the ecience and art classes in conncxion with this Institute has been celebrated by a soirée. The proceedincs commenced with tea, of which upwards of 600 persons partook. The room was decorated for the occasion. After tea the large company adjourned to the Institnte, where the prizes were announced to be distributed to the successful students during the paet year. Mr. Thomas the London and North-Western Railway, presiled and presented the prizes. The room, Ithough large, was densely packed with people. Mr. R. King (secretary to the Iustitnte) gave some information respecting the present position of the Institute. There had been an enconraging increase in the numher and euccese of those who had availed themselves of the advantages of the institation. At its opening in 1864 the number of members was 24 , and of science suhjects only three or four were taught, aud only abont 20 students attended. Since then the namber of members had boen raieed to 4.50 , and the nnmber of stndents in science and art subjecta had increased to 152 . For the most part the science teachers conducting the classee had been men employed in the works, who, having worked themselves ap in certain eubjects, had hy competifrom the S 'ience and Art Department, South

Kensington. The committee bas thas been enabled to arrange for instruotion in many subjeote withont incurring graat expense in teachers' salaries. The teachers were Jessrs. Coker, A. Goyer, G. Green, and T. Moore (art teacher). After giving the number of stadents who had passed in the different subjects, the secretary sated that the following honours had also been gained by Wolverton students:-
"In 1872 E. G. Field obtained a Whitworth scholarship of Iond. per annom for three years, and W. H. Warren fared one of the bronze medals given by the Department Non of 501 . With free education foroue year at the Royal abtained a Whitworth Scholarship, and also a certificate with prize of $10 l$. given to
the society of Arts Tech
hanuacture of steel, colnyled with an offer of a stade ship of $50 l$. by Her Majesty's Cormissioners of the
Exhibition of 1ssi. Both young mea aro now studying af Owen's College, Mazch yourt,"

RE-OPENING OF THE BURY ATHENAㅈUM. Tre large hall of the Bury Atheuroum, after being closed for many months, has again been opened to the public. The building was erected 1851, under the snperiatendence of the late Sir Robort Smirke, R.A. During the past few years the directors have had on eeveral occasions to repair the timbers of tho roof. In the autumn of last year appearances were so threatening that they gave instractions to Messre. Maxwell \& Tuke to make a thorough inreetigation of the etate of the roof, and to report apon it. These gentlemen, in their report, stated that the timhers were far too slight for their work, and were in many placee absolutely crushed by the load they had to carry, and insisted npon the necessity of new and macb more substantial framing. This report being adopted, the architects were anthorised to prepare plans and get tho works executed. These have now been corppleted, with the exception of a little painting and decoration still remaining unfinished. The replacement of a new and suhstantial roof for the old shaky construction necessitated an entirely new ceiling for the large room, and a curved and panelled ornamental coiling now replaces the old aud comparatively plain one Three large eunlights have been placed in the ceiling. The platform has been raieed 1 ft ., and a performers' room couveriently placed rander neath with neath, whe plown and bave been made The plastering and pointing have been mave. The plasterng and painting have been osecuted hy Messrs. Jacou Lomax the stonework, by Mr. James Hill; and the plamhing and gasfitting are by Mr. R. Caton.

OPENING OF A NEW RESEIVOIR AT OSWESTRY.
THe ceremony of turning on the water into the new reserpoir has been performed hy the Mayor of Oswestry. There was a large number of ratepayers and others present on the occasion
The new reservoir bas been exconted by Mr John Whittington, nuder tho gratuitons inspection of Mr. Georgo Owen, C.E., and Mr. W. H. spanll, and has cost the ratepayers nearly 1,000l., including the cost of the land. There three dry shortness of water eapply in the were completed.
The present reservoir was "tricrod" ont by the surveyor, Mr. E. B. Smith, and his aseistants, on the 5th of Jannary, 1870. The work was completed in about fifteen months, and the formal opening took place on the 11th of May, 1871. The cost of the reservoir to that time was about 2,000t. The site of the reservoir had heen for a century past used as hrickyarde,
and to convey the water wbere it was reqnired and to convey the water wbere it was reqnired
for brickmaking had cansed the surronnding land to be "boneycombed" with drains. These were not discovered at first to the extent they existed, and consequently in a ebort time after. wards the sonth-western and north-western hanks gave way, and gradually fell down into the middle of the reeorvoir. It was allowed to remain in that etate until the spring of 1873 , when DIr. Ward nndertook to trace the drains to their eource, pat down a deep priddle wall, remake the banke, and line the sides of it with a large wall of etone, filled in with hydraulic lime, and concrete the bottom, for 1,3501 . A considerahle snm of money additional has been expended to make walks around it, trim the
opes occasioned by the deposit of the excava
fons, and othor matters, all of which has hee complished.
The depth of the reservoir from the water 10 downwards is 21 ft ., and $3 \mathrm{ft}_{\mathrm{t}}$ from the ater-line 'to tho garface, making a total depth 21 ft . T'he qnantity of clay excarated, at at, was 43,000 cuhe gards. Such was the denty of the clay, that it weighed I40 lh. to the
whe foot, and great quantities of it had to be blasted " with ganpowder.
The present consumption of water by the Wn is about 150,000 gallons per day; and the dllons; so that, whon onco filled, they will ntain sisty days' supply. The main pipes, upever, are in a corroded stato, and the council re it

## REREDOS, PLYMOUTH

The chancol of the Catholic Apostolic Charch a recently heen enriched hy the erection of a redos, or altar-screon, execntad in carved oak, lir. J. .. Legassick, from a design by Mr. H. liott, architect, of Plymouth. It extends across Whopied arches and niohes of light open pork, nopied arches and niohes of light open pork,
namontod with tracery, pinacles, crockets, namonted with tracery, pinnacles, crockets,
d other onrichments, the wall at the back ing lined with oak panolling, except certain aces which will altimately be filled in with ooration in colour. It is intended to refit the les of the chancol with carved ook stalls and nelling to harmoniso i
Therk above named.
Theof and uppef portions of the walls of o chancel have alrcady been finished in colour dgitding.

## CADTION TO BUILDERS.

## Ther committec of works of the vestry of St.

 orge, Hanover-square, have instructed Mi:, mkins, surveyor to the hoard, to snmmon all ilders who stack bricks and othor materials tsido hoardiring done.
Mr. A. Scott, builder, of 48, South Molton. eet, Grosvonor-square, is the first to feel the ect of this order hy heing fined, by the magis. te at Marlborongh police.court, the sum of s. and costs, for piling up a stack of hricks tside tho hoarding of a job Mr. Scott has on ad in Albemnrle. street
As zo notice is given either hy the police or y vestry proparatory to a summons, builders ving work in St. George's had better take a te of this paragraph.

## WVLLLINGS OF THE METROPOLITAN POOR.

Che report of the Special Committee of the uity Orgauisation Society on the Dwellings of tho connoil, on Monday. It was aigned Lord Napier and Ettrick, and is a careful ement, with notos and appendices. The cluding and principal rocommendation is
tensire and effectual powera of purchase, demo.

THE INTERNATIONAL METRE. Accordiva to Les Mondes, the first Intornathe commission now was cost, in the presence of laboratory of M . Sainte. Claire at Paris, in tho been able, with the assistaire Deville, who has been able, with the assistance of M. Dehray, to alloy platinnm and iridium in their pure chemical guidance in the production of all future original metres. Tho operation was considered of such importance that the President of the French Ropublic and aoveral high dignitaries of Stato were present during the proceedings. Nine ilogrammes of platinum and one kilogramme of iridium were melted by means of the oxyhydrogen gas blow-pipe. This process took then let off into a mould made, like the crucible from a block of limestone, whose inner surface was hurnt to lime in conseqnence of the enor mous heat. In applying this snhstance, there is consequontly no danger of a fracture in the mould. The metal did not lose its lustre in cooling. Tho easting, which was considered a perfect success by all present, will havo to he converting it to its eveutual use.

## CHURCH-BUILDING NEWS

Bathwich.-The foundation-stone of the longtalked of chancel of St. Mary's, Bathwick, has been laid hy the Rev. Prebendary Scarth, rector of rington, who originated tho idea of making ars desirable addition to the church, including as it does, a vestry and organ.chamher, during work will he of the parish. The cost of the 3,0002.; of which, we helieve, ahout two than has heen paid or promised.
Bradford. Tho new chureb which has been erected in Little Horton-lane, Bradford, and
which is dedicated to St. John, has heen conse. Consisting of nave, with by the Bishop of Ripon, and chancel, the edifice will afford saccom aisles tion for 700 , the edifice will atiord accommodais Early Decorated is Early Decorated Gothic of English character. A tower 23 ft squaro at its hase rises from the arches on the chancel, and is carried on a helfry constructed for it is surmonnted by The total lieight of the top of the vane is I15 ft The architeots are Messrs. T. H. \& F. Healoy, and the contractors for mason and joiner work Messrs. J. \& W. Beanland. The cast of the building, including the site and extras, has heen about 11,000\%, and of this amonnt hetween 9,0002 . and $10,000 l$. havo heen raised, leaving a balance of ahout 1,5007 , still to he made cood. Manningham (Bradford).-The chief stone of St. Mark's Church, Manningham, has beone of by Mr. F. S. Powell, M.P. in the has been laid large assemblage. The building, which is well advanced, is situate in Grosvenor-road, Manning. ham $;$ is in the Early Decorated Gothic style, 150 ft . long hy 72 ft . wide; and consists of nave, side aisles, baptistery, and narthex, and will have a tower and spirelet, rising to a beight of 150 ft . The internal height is 65 ft. Aocommodation will be found for 1,000 persons. The nave and aisles only are to he erected at present. Inclusive f land, the portion proposod to be erected will to complete the huilding. The amonnt received and promised is $5,300 l$.
Toseland,-The ohurch has heen re-opened and onsecrated. The architect, Mr. T. Streatfeld, as possible to to restoro the church as nearly have heon worked ont hy have hat worked ont hy hr: Osborn, St. Neot's and Mr. Wade, Eaton Ford.
Frankley. - The littlo church of this parish has been re-opened, after a reatoration, which has been carried out from the designs of Mr Cirllis, Prefy, of London, hy Messrs. Colling \& this am, Tcwkeshury, at a cost of 1,100 \%. Of whis amonnt $950 l_{\text {s }}$ have alroady heen raised, to whner of the Lyttelton, who is the principal owner of the soil, contribnted 5002. The restoration comprises the putting in of new foundations to all the walls, the rebuilding of the south chancol.rwall, the ereotion of a new south porch, the replacing and fitting of the roof, and the insertion of several new windows in the church. Inside the walls have been re lieved of the plaster, and a new chancel-arch erected. The roof timhers havo heen thrown open, and the church seated with now open henches. A new arch has been opened at the west end, and the font has been placed nnder the tower.
Dorking. - At a recent meeting of the parish church hailding committee, it pyas resolved to proceed with the orection of the Wilberforce Memorial Tower a further height of about 20 ft, making nearly 60 ft . in all, and carrying it to the apex of the nave roof. It was also resolved to instruct the architect (Mr. Woodyear') to make provision for the church-clock in the portion of the tower now about to he nndcrtaken. The late fine wenther bas enabled the contractors to make considerahle progress with the works generally. It is hoped that in ahont a month or five weeks the nave roof may be on and partly completed.
Shipston-on-Stoutr:-A new church kns boen conscorated at Darlingscott, in the parish of meddington. The edifice, which is but a small Phillips, erceted on a site presented by $\operatorname{Sir}^{r} \mathrm{G}$. R . huilding fund to was also a sungcrber to the of the church is English Gothic, huilt of style Armscot lias, with Bath stone facings. The interior has no protence to decoration. It is capable of accommodating ahout 200 persons. The south transept is so constructed is to bo appropriated on week-days to the purposes of a national school, being partitioned off from the nave of the charch by a movahle sereen. The Frant of a church and sohool has long heen experienced in the village, as the mother church and national schools are situated in the parish of Treddington, some two miles distant
Paruvich.-The new parish charch of St. Peter, Erans, of Allestroe Hall patron of Mr. T. W has been opened hy the Bigh of the living The new opened hy the Bisiop of Lichfield. hy Mr. F. J. Rohinson, of from designs The style adopted is late of Derhy, architect being rather later, and hordering npon Earl being rather later, and hordering npon Early
Euglish. In plan the charch consists of a

* Have nreviously received Tellord incdils.
chancel 16 ft . by 22 ft .6 in . in the clear; the nave and north and south aisles are 17 ft . by 41 ft , in the clear. There is a western tower and spire, wbich rises to the altitude of about 100 ft .;
and there is an organ. chamber and vestry, $18 \mathrm{ft}$. and there is an organ. chamber and vestry,
hy 12 ft . at the east end. The pulpit, which is hy 12 ft . at the east end. The puipit, wh of the northern arcade, and the old Norman fout has hecn replaoed at the south.west end of the nave near to the tower. Thero is a now reredos, of Ancaster stone; this is carved, and has upon it, immediately over the altar.table, two seraphim with veiled faces. These stand upon pedestals. The panels on either side of the central cross are carved with foliago suggestive of the Sacrament. The cxtreme length of the building, from ont to ont, is 96 ft ., and the extreme width, 51 ft . The nave is separated from each aisle hy arcading of four hays, each column being surmounted by carved capitals. Two of the responds are old examples, and the types of these, as well as of other lucal Norman work, bave heen retained by the carvers. The aisles single-light windows, and by douhte-lighted once on their western ends. The clearstory is liphted an each side by nine cinqucfoil circalar windows recessed in a running arcade. The walls all recessed in a running arcade. The walls all throngh the interior of the charch are of ashiar stone, and the roofs of the nave and chancel and tbe lean-to roofs of the aislcs aro of timber. The seating is open, and of pine; the stalls in the ohancol are of pitch pine. The anciont scrved, and made to form the tower arch. ohurch is entered by a western towor door, and a priest's door. Over the former is the Early Norman arch that originally belonged to the south door, and within it is a tympanum, sculp. tnred in Norman type. The roofs are slated hat the spire, which is low and squat, like nearly all the local spires, is entirely of stone. The carving thronghout the building has been cxcented hy Mr. Harry Hems, of Exeter sculptor. The builders are Mesers. H. \& J Slater, of Derhy; and tho Coxbench stone, produced from a quarry belonging to thoso con tractors, has heen nsed for all the work.
Portmatloc.-The foundation-stone of a charch dedicated to St. John the Evangelist, has been laid here. The church will consist of 6 f ft . by 25 ft .6 in., north and sonth aisles each with. 6 in . by 10 ft ; chancel, 31 ft . by 21 ft . side, heating-room below, and an entrance porch funds, the chancel and chancel aisle will for the present be omitted, as woll as a tower contem plated for a subsequent dato to oomplete the dato 400 persons, and the present contract anounts to about a rool, towards which abont 2,050l, bavo been already sabscribed.

## DISSENTING CIIURCH-BUILDING NEIVS.

Afanchester. The corner stone of a new Pres. byterian church, situate in Singleton-road, Higher Bronghton, has hoen laid by the Hon, George H. Stnart, of Philadelphia. The site of the cburch is on the gouth sido of Singletonroad, abont half-way between Bronghton Bar and Park-lane. Mr. John Stuart, brother of the Hon. George H. Stuart, has expressed bis willingness to defray the ontire cost of the crection. The churoh and schools, the foundation for which is already completed, will consist of nave, 74 ft .4 in . long by 29 ft .4 in , wide, with aisles on either side, 8 ft . wide, and transepts $20 \mathrm{ft}$.4 in . Wide (the lattor containing
gallories for school children), at the south ond gallories for school children), at the south ond
of the cburch, right and left of tbo pnlpit plat. form. The style of the architecture is Early Froncb Gothic. The exterior of the edifice will he executed in Pierrepont stone, with out atone dressings. A lafty tower and spiro (the latter ornamentod by angle pinnacles and lncarnes), will rise from the west or right-band side of the front elevation; and on the opposite side of the same front there will be a lowor tower, surmonnted by a pyramid of slate roof terminating in a metal finial. Each of these side towers will serve as an entrance porch, and will be grined by arched and moulded doormaye. An arcaded corridor stretching across the whole front of the nave will join the two entrance porches, and from this corridor accoss will be obtained into the two main aisles or passage.
walls of the chnreh will be divided into fonr
bays, in addition to the transept gables. Those to the aisles will cont ransopt gables. Those with large traceried cirolo in the bead of each with large traceried cirolo in the bead of etch, the whole heing contained within a pointed arch The clearstory will have couplod ciroles, with soxfoil tracery. The front gahle over the areaded eorriched hy a larro wheol. window under enriched hy a largo wheol. Window under a
spacious pointed arch. The transept gables will spacious pointed arch. The transept gables will
have circular rose windows, with four small have circular rose windows, with four sman
lancet lights below. The seats and timbers throughout are to be of pitch pine. On each side of the steps leading to the pulpit will he an arohed and traoeried door oponing from th ohurch into the long oorridor of the sohool huildings. On the gronnd-foor of these hack build. ings will he placed the sessions.room, the minis ter's and the deacons' vestries, and the oare. taker's residenoe. From this hack corridor will rise two stairoases, of ornamental design, in pitoh pine, to the large lecture-hall, 56 ft .3 in . by 25 ft ., which will extend the whole length of the
rear huilding, and whioh will have an open timbered roof. An opening will be left in the wall between the organ reoess in tho church and the loctnre-hall, and will be provided with movabie shntters, in order that the organ may be availMole for tho looture-hall as woll as the ohare London, are the arohitects ; and Messrs. Neill \& Son, the contractors. The total cost of the bnilding will be about 7,000 l. The church is to aocommodate over 700 adults, and the leoture. hall about 300 .

Chester. -The new Wesleyan Methodist Chapel, n the City-road, which is to snpersede the Home Mission Chapel in Black Diamond-street, has been opened for divine worsbip. The stylo lis Gothio, and tbe materials used in the erection aro Runcorn and Handbridge red sandstone Tho front elovation is to the City-rond, and pre sonts a gable, with tipo entrances, -a smalle gable on the one side, and a tower, with broach pire, on the other, hoing used for access to the body of the chapol and galleries, as well as fo desconding to the gchool-room below. According to the designs of the architect (Mr. Botteril, of Hull), the apire was to be 118 ft . high from tho City-road level, but tho cost was considerable, and it was at one time decided not to erect a spire, and to finish it of just above wbere the buttresses now terminate. But the building lund was augmonted beyond expectation, and the result was that the spire has been added, hough somewhat rednced in height. In tho oentre of the prinoipal gahle is a group of three wwo-light windows, which, witb respect to the interior is in tho west gallery; and to avoid hiding this, the organ was divided,-one portion being plaoed on the one side of a recesscd arch, the pedals communicating with tho ather portion on the opposite side. Below this large window is a three-light window, or group of threo lights, and on each sido of the huilding are rows of two-light windows, with alternate quatrefoil and sexafoil traceried heads. All the windows are glazed with an obscured glass, with ruby-tinted border. The chapel, which will accommodate nearly 800 persons, is 68 ft . long by 17 ft . wide, and the beight from the floor to the ceiling, at the collar-beam, is 46 ft . There are galleries on three sides, with a communication by means of a narrow balcony across the chapel, at the east end. The whole of the interior fittings, with open roof-timbers, are of red fir, stained sohool and class-rooms, which are entered from Leadworks.lnne. The principal scbool-room is 50 ft . hy 46 ft , and $13 \frac{1}{3} \mathrm{ft}$. in height, and there are two class-rooms 16 ft . by 13 ft . each, and one are two class-rooms 16 ft , by 13 ft each, and one and other convenient and reqnisite appurtenances. Mr. Stringer, of Sandbach, contracted to baild the chapel for $4,445 l$., but that did not include the spire, which together with the site, gives tal cost of 6,500 ?.

The New County Police Station, Ship-ston-on-Stonr.-Th station now in conrse of erection will bo built with brick and Bath-stone facings, and will consist of entrance-hall, court room ( $34 \mathrm{ft} 6 in.$. by $16 \mathrm{ft}$.6 in .), superintendent's parlour, and magistrates' retiring-room; there will also he a kitchen, sonllery, pantry, laundry, and offices, and fonr bedrooms; prisoners' yard, four cells, stahling, and coach-house. The arehitects are $M$ essrs. Medilam \& Son, Gloucester and tbe contraotor Mr. John King, builder, of Shipston. The amount of the contract is 1,610 l.

ROMAN CATHOLIC CHURCH BUILDING NEWS.
Chester.-The first atone of a nerv Romar Catholic Church in the city of Chester has boes aid. The site of the new building is very closi o the park. Tho now church is to be dodicate 0 St. Werburgh. The designs of tho architect Ir. Edmund Kirby, of Liverpool, show a huildin of an Early Eaglish character. All superfinou ornamentation will be dispensed with, as th intention of the foanders is to make the buildin as spacious as possible, regard being had at th same time to dignity of style. It will he com posed of a chancel, where the bigh altar wi stand, and will terminate with an apse of sever sides, to which will he attached side chapels sacristies, and cloisters; a nave of six hays 0 sets of arohes, with north and south aisles, an a tower, which, when completed, will reach hoircht of 200 ft ., and will thus rival the hiche towers and spires in the cicy. The oxirencie of the sita haro altored the enstomary pasition of the chancol and tower. Tho former will b at the west ond instend of the cast, and th latter will in the plo that slould be appro riated to former. Tho boo the beight priated to the form. Tho roor, the beight Thich win bo 2 ., whe chroughont tho Fill bo about 30 cl , and the entire length $1 \cdot 40$ divided thus:-Chancel, 30 fl ; nave, 80 ft and base of the tower, so f. Siomeartono the material to he used in eonsuruction the church by the contractor, Mr. Thos. Irugho of Aldford. At prosent only the chancel, si chapels, and oloisters, with four bays of th nave, will be built, the oost being ostimated apwards of 6,0002 . The remaining portion the desigu, which includes a presbytory
priests houso, will he buit afterwards. priests ${ }^{3}$ house, will he built afterwards.
Workington, -The new Church of Our Lad and St. Michael, at Workington, is to be crnciform structure, from a design by 113 Edward Welby Pugin, architest, and is th marly English atyle. The ontrance will ho th ground Beneath tho turmet there is to be carving in atone representing the crucifixio and utiderneath thistwo pointed windows. TT building, which will consist of tio aislos, nave, a chancol, north and south transepts, corrijor, a sacristy, two confossionals, chapels, and an altar, is to be 159 ft , in leagt transepts heing 63 ft . Thero will be an orca gallery arched over, and the pillars which su port the nave roof are to be of polisho granite with marble basos, the lower and app portions beine of red sandstone. The clape which is to be arohed, will contain niches fo frares There is to bo lare poipted windo firares. There is to large pointed wiado at the east ond of pitch pine, and open. Th churoh is be huilt of Inzonby stone, and f church is ber hit ashar or tracery work atone from the si. Be and Aspatria quarries is to be ased. Th structure, when complatud, will accommoda persors, of is Migh Yates, of Liverpool, is the contracte for the whole of the work, an under te
saperistendence of his manager, Meaga considerable progress has already been ma with it.

SCHOOL-BUILDING NETVS
Hill Top.-Tho four memorial-stones of a ne soboolroom in connexion with the Fesleya Schools, Hill Top, havo beon laid. The builc ing, which will accommolate about 200 person is estimatod to cost about 1,000l. Purses per laid apon the stones, whioh, togethor wib various donations, realisod as considerable sun Pickering. -The foundation-stone of a mer school has been laid at Cropton. The school to bo ready for use by Christmas.

Worthing. -The new schools at Broadwat have been opened. The " mixed school" nearly 50 ft . by 18 ft ., and a teacher's residenc will, it is hoped, soon be added. Tho arehitech were Mr. E. E. Scott, and Mr. Hyde, of Broac were
water
ins.

Burrough.on-the-Hill. - The new parochi school, which has heen recently erected on a sil given by the rector at the oast end of th village, was opened a fow days ago, on th occasion of the harvest thankagiving. building is of brick, with white stone dressing and has a bell-tnrret in stong in the east gabl The walls, internally, are lined with press
oricks, and the roof is open-timhered, stained and varnished. A porch at tho west end answors he purposo of a cloak-room. Tho works have ocon executed by Mr. Hayes, of Melton Mowbray
puilder, fiom the designs of Mr. R. W. Johnsor of Melton Mowbray, architect. Ockley.-Mr, W. J. Evelyn, of Wotton, granted sito for the new schools at Wallis Wood, near Dakwood, and contribnted 5002. towards the puilding expenses. Hessrs, Colls \& Sons,
puilders aud decorators, of Dorkiug and London, puilders aud decorators, of Dorking and Loncon,
urnished plaus and specifications for tho school uildings, to accommodate 120 children, and for an adjacent residence for the master. The work was undertaken by Messrs. Colls, and the total sost has been ahout 1,4007 . The formal opening of the schools has taken placo. Wilbexfoss.-The new village school has heen pened. The Rev. Nicholas Walton, with the rincipal landowner (Lord Leconfield), and the onant farmers and tradesmen, formed a comnittee, and all subscribed liberally towards so lesirable an object. Tbe scbool has a master's -esidence attached to it. It has been erected rom designs prepared hy Mr. Whitaker, of
Hanchester (formerly of Wilberfoss) ; and the Hanchestor (formerly of Wilberfoss) ; and the uilder, Bishopthorpe. It is proposed to crect ence walls round the school grounds, which with other minor matters
he cost up to nearly $1,000 l$.

## STAINED GLASS

Thdia.-Messrs. Heaton, Butler, \& Bayne hav produced some xich heraldic windows for the ndian Goverument. They aro intended
he New University Senate Hall, Bombay. Cholesbury Cliurck, Buchs.-Tho east windown $f$ this church has recently been filled with be Euston-roadi. It is of three lights, and illusrates the Aativity, Crucifixion, and Ascensior f our Lord.
Beckenham Church, Kent.-One of the windows a the south side of the old parish church has een filled with stained glass hy Alderman tyle, and consists of two openincs, contnining espectively subjects representing the Resurespectively subjects representing the Resur-
ection and Ascension of our Lord, placed rupon ection and Ascension of our Lord, piaced ripon igures in the foreground. These are surrnamental pedestals, and surrounded by suitrnamental pedestals, and surrounded by suit-
hle borders in the style of the period. The hle borders in the style of the period, Th
lass is in memory of "Jeremiah Wilson." The hole is designed and executed by Mr. Charles A libbs, of Marylebone. In the same church is
laod a two-light window ou the north side he clearstory, the suhject heing the Return of he Prodigal Sou. The figures are placed under anopies, with borders and pedestals of the
serpendionlar style. The treatment of the erpendicnlar style. The treatment of the
ubjocts is in kooping with tho style. This findow was presented by Mr. Charlos Leevilson, of Beckenham, son of Alderman Wilson,
nd was designed and executed also by Mr. harles A. Giblis
Todnooden Churoh.-Three clearstory staincd indows have beon recently placed by Dessrs ox \& Sons, of Southamptow-street, Strand, a this church, the windows consisting of two ights and a sexfoil, opening in tracery respecvoly. Six of the eight bcatitudes enunciated a the sormon on the Mount (Matt. ซ.) have heen re the poor in spirit," \&c., hy the Angel of the ord appearing to tho shepherds at Bethlehem Blossed are the meck," \&c., by Joseph maniasting himself to his brethren; "Blessed are me merciful," "\&e., by the parable of the good c., by Simeou in the presentation of our Lord c.y Somple; "Blessed are the peacemakers," c., by Lot's separation from Abram; "Blessed te they which are persecnted for righteousness," c., by Joseph in prison. Tho fisures fill up nament.
St. Clement's Church, Sheepsear, - The wrest W. Tay lor, of Newas, by the kindness of Mr. ith a stained window and encaustic tiling. The indow is by Mr. Wailos, of Newcastlo, who ly Cathedral. It oonsists of five lights, and is avoted to Old Tostamont subjects, as the east to forrteen of the last sceves in the life of our ord. The suhjects are "Tho Sacrifice of

Noah," "Abram and the three Angels," "The offering up of Isaac," "The giving of the Lavy,"
and "The Ascension of Flijah." The tracery is filled with the emhlems of the twelve tribes and the ark in the centre, while in the two large quatrefoils are Moses and Aaron. Bencath the window was a large mass of walling, hat this has now heon covered with some encaustic tiling. The wholo is a momorial to a daughter
of Mr, Taylor. A design has been prepared fur of Mr, Taylor. A design has been prepared fur the east end to give
exercise of liherality
Doncaster Parish Church.-In St. George's Cherch, Doncaster, a new stained-glass window has been erectod hy Sir Isaan Morley, of Beechfield, to the memory of his wife. The artists were Messrs. Ward \& Hughes, of London. The window is the great ono situated at the west end of the church. It consists of seven lights, each The desigu comprises an iliuminated chart of the genealogy of Christ. In the main stem are figures of the fourteen generations of kings and patriarchs, from Jesse to the time of our Lord. indindow is designed on the prinoiple of tbe hinaf in Merevale Ahbey. The first of the David, Solomon, and Rehohoam. In the second are figures of Abia, Asa, Jehosophat, and Joram The four suhjects in the third are Ozias, Joatham Achaz, and Tzekias. The representations in the fourth are Manasses, Amon, Josias, and Jechonias. In the fifth are figures of Salathie are personified Azor, Sadoc, Achim, and Eluid and iu the sevonth Eleazar, Matthan, Jacob, and Josoph. Springing from the upper part of these lights, and forming tho top row across the win. dow, is a foliage, embracing the suhjects of the Annunciation, the Nativity, the Transfiguration the Rcsurrection, and the Ascension, the repre sontation of the latter being supported on either side hy au angel.
Kippers Church (Scotland).-The decoration of the side windows of this church with stained glass, in harmony with the two pnlpit windows been commenced. The centre window in the orth side has been filled in. The window is in two lights, and, in couformity with a complete plan proposed for the illustrations throughou of the windows of the church, represonts two giving sight to the bliud man," and tho other, "The raising of Jairns's daughter." The window Was desigued and executed hy the firm of Jame Ballantine is Son, Edinhurgh.
Church of Fornham St. Martin. -Tho latest whinh this renovated ehurch is now adorned, conists of the insertion of stained glass in one of the windows ou the north side of the fiave, next the Mr. John T. Ord, of Fornham Honse. The sindow consists of two lights, cach of whic miracles, in the one case, the hoaling of the miracles, -in the one case, the hoaling of the
woman who expressed ber faith in the words, "If I may but tonch His garment I shall be Whole"; in the other, the restoration of sight to the blind heggar Bartimons. The tracery in the heading of the Findow is filled with angel bearing ecrolls, on which are inseriber the words Jesus said, come unto me, all ye that labour and are heavy ladon, and I will givo you rest.'" Messrs. Wailes \& Son, of Nowcastle, executed the windows.

## 愢iscellamea.

The Silber Light.- In reply to the question what is the Silber light, we may state that it consists in the inventions of a Mr. Silber, in the Co., of a company called the Silber Light argand, hatswing, \&c., so as to socure, as fors possihle, the perfect combustion of the material in mineral and vegetable oil lamps, as well as in gas-jets. Air currents are admitted both into the centre and ronad the circumference of the flame, in various forms of lamp and hurner manufactured hy tho company; and it is said that thus an argand hurner, for example, is got nsuol consumption of 5 ft . of gas per honr, or the while vieldincs a light candles. These improvements are secured, not by complicated arrangements, hut simply by constructing the hurners so that the material is as complotely humed as possible.

The Australian Jarrah Wood. - The "Swan River mahogany" is a species of Eucalyptns (E. marginata of Smith) which is restricted to Western Australia. It is thus descrihed in the Journal of the Society'0f Arts for the 24 nit., wbich, however, does not stato whether
this species of Australian Eucalyptus is known to possess tho singular canitary properties of the Eucalyptus globnlus, of which some acconnt was given in the Builder of the Ist inst., or whether
it he the same species. Djaryl or Jarrah is the ahoriginal name It is a pulicable for furniture and every purpose for which ornamental wood can be required some of it being of the very finest grain, and showing much figuro, mottled curls, feathers, and excrescences, a feature pecnliar to colonial wood, and highly effective immense size attains The tree grows to an plentiful size, attains a great height, and is very possess timher of similar character, or endowed with equally valuable proporties. The advantages of this timher are its great streagth, hardness, and closeness of grain, cowhined with durahility nnder exposure to eithor salt or fresh water. It is never attacked by white ants or hy the teredo navalis. It somewhat resermhles the rod gum in appearance. It is in raluable to the Western Australians, who uso it for ship. as for the iner, and railway consun for furniture It defies decay; time, weather, watcr, the white ant, and the sea-worm have no effect mpon it. The chief objection raised against it is that it is liable to "shakes," the trees being very commonly unsonnd at the heart. It will doubtless shortly come into more general nso, as two companies have heen formed for supplying the aarket on a large sogle, one Indian and the

The Periodical Floods in Towcester.-An attempt to get rid of the floods which the river
Tove produces in the town of Towcester aftor Tove produces in the town of Towcestcr aftor heavy rains is about to be made by the parochial sanitary committce, who have adopted a plan suggested hy a Mr. Savago and recommended hy their medical officer of health, Mr. Haviland. This plan essentially consists in converting tho winding course of the stream which causes the floods into a straighter channel. At present tho water-way meanders in four S.like loops tbrough the town, and the result in heavy rains is that own ad unwholesome damps pervade the eoaders and diminish its healthfulness. Our dexion tay recollcat or Mr. Haviland graphioal distrihation of disense "Floods," he remarks in bis report on the Toweester question, "are the canse of many diseases,-rheumatism, phthisis, and many pulmonary complaints from dampnoss,-and I was the first to point out that hat dreadful disease, canocr, especially in womon kills more persons in the districts suhject to loods than in any of the other parts of Englaud."
Amalgamation of the Leeds Schools of Art.-Arrangements have been completed for the amalramation of the Leeds Sobool of Art and Science, South Parade, with the Leeds School of Art in connexion with the Mocbanics' Institute. The desirability of this step has for some time heen patent to those cornisant with the matter. Messrs. Nussey, representing the Sonth Parade School, have agreed with the ommittee of the Lecds Mechanics' Institnte School of Art, represented by Mr. John Holmes (chairman), Messrs. Hick, Kempe, Sales, Ward man, and Woodoock, to transfer the pupils in the former school, and the latter agrocd to recommend their gencral committee to appoint Ir. A. Stevenson to be head master of the malgamated schools.-At a special meating of the general committee of the Leeds Mechanics nstitute, the report of the School of Art Com. mittee was prosented, and agreed upon without dissentient vote. By this union it is anticipated that there will he a great advance made In the position of the School of Art.
Explosion of Gas.-An explosion has taken place at the Kew Gardons Station of the London and South-Western Railway, doing damage to the extent of about 200\%. It appears that the head porter had, about ten minutes previously lighted the gas in the waiting-rooms on the up side, and while another porter was standing on a truck lighting the gas outside an explosion followed, hilowing out gas outside an explosioz both waiting 100 s, and destroying the tion of gas in the explingion was an accumnla tion of gas in the ceilings.

Education of Children in the City. - A pnblic meeting, called by the Lord Mayor, has for the education of children in the City of London, propared by a committee, conof London, propared by a committee, conSennett, Rev, H. I. Cunmins, Rev. W. H. Milman, Mr. S. Morloy, M.P., and the Rev. William Rogers, and which involved the amalga. mation of tho ward, endowed, and national scbools, with exceptions, and the erection of three large schools, capablo of accommodatiog ,000 children in each, it the neighbourhood of Farringdon, Fenchurcb, and Moorgate, and under one general Board, with the Lord Mayor at its bead. Into the minatio of the scheme, however, we need not enter, as an asnendment, "That, While thanking the committee for their services, this meeting declines to adopt the schemo sug. gested," was carried in the face of the scheme by a majority of at least 20 to 1 .
The Proposed Eyker Eridge, Newcastle-upon-Tyne,-Some months ago, designs of a scheme to bridge the valley of the Ouseburn wore prepared by Mr. Thomat Parker, architect, sbowing on the ground-plan threo different lines. A roadway of 30 ft . width is shown in connexion with each, or eqnal to that, at the IIigh nexion with each, or equal to that, at the Ifigh
Level Bridge; tho shorter line shows a bridge of Level Bridge; tho shorter line shows a bridge of
sisteen arches, making a total lengtb, with apsixteen arches, making a total lengtb, with ap-
proaches, of about $1,500 \mathrm{ft}$; whilst the other proaches, of about $1,500 \mathrm{ft}$; whilst the other
lice requires eighteen arches, of 60 ft . span hee requires eighteen arches, of 60 ft . span
each, and is, with the necessary approaches, each, and is, with the necessary approaches,
about $2,000 \mathrm{ft}$. iu length. The cost of the scheme, calculated on the hasis of the shorter line, and for a brick structure, is estimated at about 40,000 l. Tho eost of the longer line, it is considered, would bo higher in about the pro. portion of its greater length of appronches. The provisional committeo have referred tho matter to Mr. Robert Hodgson, C.F. It is hoped
tbat arrangements may be made to enable the promoters to ohtain tho necessary pomors during next session of Parliament.

Opening the Cottage Hospital at Seven-oaks.-Tbe new hospital which has been erected near the Bat and Ball Station has been formally handed over to the general body of snbscrihers. The total amount promised or paid has been $1,166 l$., and the expenditure up to the present time, 1,0467 ., which ineludes furnishing, gas. fittings, \&c. They had, howevor, to lay out tho gronads, and pay for feaciag, which would re. quire about Sol. more, but they opened freo of
debt. At present the annual suluscriptions pro. debt. At present the annual subscriptions pro. mised amount to 692. 10s.3d, but the promoters estimate that they will require abont 200 l . a year. A vote of thants has been given to Mr. Hooker for his gratnitous servicos as architect. The hospital has been fitted with eight beds, and a small weekly payment, according to the means of the patients will be charged.
The Ryde Water Supply.-A report upon the water supply of Ryde, by Mr. Georgo H. Staton, C.E., the borough surveyor, has been printed by the borougb authorities. The report relates to the present and futuro supply, the
constant system supply, extension and renewal constant system supply, extension and renewal
of mains, fire arrangements, street-watering appliances, and the costs thereof. Tho surveyor is of opinion that tbere will not be any
diffeulty in ohtaining any quantity of water for difficulty in ohtaining any quantity of water for
an increased supply, the only question beine the an increased supply, the only question being the
ono of expense. The cost of the works he pro. poses, including a new rising main and additional. service reservoir, will, he estimates, be ahout $6,800 \mathrm{l}$, involving, if borrowed at $3 \frac{1}{2}$ per cent. interest, repayable in fifty years, nn anaual pary:
ment of 2892 . odd, or a rato of about $1 \frac{1}{2}$, in the ment of 2892 . odd, or a rato of about $1 \frac{1}{4} \mathrm{~d}$. in the pound per annum.
Fall of Railway Works at Halifax. -1 portion, 30 to 40 yards long, of an immense retaining-wall on the Halifax and Ovenden Branch Railway, now in course of construction, has fallen down at the hottom of Lower Wadestreet, Halifax. The wall was hailt in the hed of the Hebble Brook, and behind it was an im. mense quantity of earth and other díbris. The wall had been noticed to have given way, but still the pernanent way had been laid hehiad it. By its fall many hundreds of tons of debris were let down into the hrook, tho waters of which
were dammed np behind the mill of Messrs Cockoroft, silk-spinners, which it was feared they would flood. However, the waters were diverted; bnt it will he weeks before the damage to the wall and earthworks can he made good, and more may gire way.

Casket for Sir A. D. Sassoon, -The gold casket presented hy the Corporation, with the freedom of tbe City of London, to Sir Albert executed hy Jlessrs. Howell, James, \& Co., of Regent-street. It is designed in the Renaissance style of Art, and executed in 18-carat gold. The body of the casket is sapported by four ornamental columas, relieved by panels in repousse and carved gold, each end inclosing a medallion and carved gold, each end inclosing a medallion pid is dome-shaped, and suxmounted hy the arms of the City in gold and enamel.
Charge against Surveyors of Wands worth District Board of Works.-Charges against these surveyors of having received cer. Board are being inquired into. A oommittee of tho wholo Board to go into the matter has been formed. The Clapham local committee reported the resignation of Mr. Trussler, road foreman of the parish. The Board refused to accept the resignation, as he fas one of tbe persons impli. cated in the pending inquiry.

## Eartlıquake in Sicily.-An oarthquake has

 taken place in Sicily, ofter twenty-one days continuoas rain. The sulphur mine of Fra Paolo has been completely destroyed. Its value was 300,000 . The shafte, galleries, and aque. ducts, in operation for fifteen years, all collapsed. The mines of the Giona Sulphor Company have tion, suffered greatly. Mount Etar is in erapPautbeon is nnder overtowed Yesnvins is sbowine signs of eraption.
## Enlargement of the Camberwell Ceme

 tery.-In conseqnence of the increasing number of interments in the Camherwell Cemetery, near Lordship- lane, Dulsich, it is about to he enlarged, and for this pirpose the vestry have agreed to parchase a plot of land adjoining the upper part of the cemetory. This is in addition to another portion of land which has already tery, with a view of carrying out the enlarge ment.A. Case against Workmen dismissed.A complaint made by Messrs. Cbubh \& Son, tho fock manufacturers, against two of their men, at Lambeth in faronr of the defendants. It appeared that theso men had been in the habit appeared that theso men had been in the habit mitted that they afterwards returned to their duty, and also that deductions from their wages were made for all absences, the magistrate said that the summons mast be dismissed.
Outbreak of Typhoid in Wellington. Tsploid fever is reported to have broken out in the ncighbourhood of Wellington, Herefordshire. No fower than thirty cases bare heen traced to impregnation of well-water, and it is said the devoid of artificial, means of drainage. Dr Sandford, who has reported on the outbreak describes the contamination by sewage as sescribes the contamination by
something fearful to contemplatc."
The National Safe Company's Premises. The first stone of this building, of which we have already given some particulars, has been laid. at tho north. western excavations for these offees, siderahle number of antiquitics were discovered and presorred, and are described in a quarto book issued by the Company, some account of Thich we will give on another occasion.
Patents for Inventions for the Year 1872.-The number of applications for letters patent recorded within the year 1872 was 3,970 ; the number of patents passed thereon was 2,771; the number of specifications filed in pursuance thereof was $2,73!$. The aggregate surplus iucome from patent fees on balance of accounts from the 1st of October, 1852 , to the end of the year 1872, amounts to the sum of $1,012,9286$.
The Artizans', Labourers', and General Dwellings Company.-This Company's ney houses, Lecture-hall, and Working Men's Institute, on the Shaftesbury Park Estate, Lavender Hill, Waudsworth.road, were opened on Monday last, November 3rd. Lord Shaftesbury delivered an opening addrese, and some other gentlemen took part in the proccedings. We will make an opportanity to louk over the place quietly.
St. Pancras.- Mr. E. W. Hudson has reSt, Pancras Board of Works.

New Park for Sheffeld. - The Town Trustees of Sheffield decided to purchase twents acres of land in the ontskirts of the town for the prpose of a park and recreation-ground. The cost is 14,0001 . A few months since the corpora ion of Shoffeld pnrchased a park at a cost 18,0002 , and the land to be parchased by the town trustees is in close proximity to it.
London Tramways.-Speaking in our last of the namber of persons using public convey, ances in London, the writer, hy an inadvertence. 2d. 833,333 h. In working out tho sum, shillings were called pounds.

Want of a Mortuary for Eattersea, - A he last meeting of the Wandsworth Board of Works, atteution was called by Dr. Kempster to tbe want of a mortuery for Battersea. The need of sucb a building is admitted, and it has een decided to refer the subject to the Battor. ea Local Committee for inquiry and report.

## Close of the International Exhibition.

 Whe third of the series of annnal International a close, without form of any sind. Tho Eshibi ion has not been without some useful resnlts.Close of the Vienna Erhibition.-Tbi Exhibition was closed hy two of the archdukes without coremony. On the southern terrace three largo military hands ployed the National Anthem. This was followed by cheers from the thousands of persons present.
Railway Station, Existol.-The tender of r. Jonathan Marshall, contractor, of Plymonth has been accopted hy the Joint Railwny direotor for tho second and main portion of the nev general station at Bristol, the first of which ho bus now in course of completion.
Transit of Animals.-The Royal Society or the Prevention of Cruelty to Auimals offer premiums amounting to 400 l . for improred cattle.trucks. Tho conditions will be found in
our advertisiug columas, and ought to prodace. competitors.

The Belyravian Squares.

LTBOUGE the fashion. ahle neighbourlhood of Belgravia is a growth of yesterday, and arose suddenly out of a damp, waste, and unintcresting district; yet to day many of its streets have been rebnilt by their proprietor. As the bonndaries of London are eninrged, the surrounding pasturolland is gradually swallowed up; hut in this case only fields "where the robbers lie in wait" were destroyed; for there were no fields of wholesome grass:-

Thus writes Mre. Gascoigne, who has sung the glories of London's mcst distingue quarter, and describes its former state as follows :-

Dreary ind od it it tegegravia, grate of

Prowling with stenlithy, treacherous step around
Or crouching on the damp, unwholesome ground
Whaist soung on the damp, unwholesome ground, Fell on my ear, and offen scared my sleep." The name Belgravia was at first convenient term to espress the fashionable squares and streets around Belgrave-square We remember a lelter so addressed hy John Britton, writing to the creator of the distriet, Mr. Thomas Cabitt, whioh had been forwarded by the post-office to Huugary, and came baek to Britton after many days. But the title gradually hecame recognised, and bas now almost pressod out of existence the proper name of the district. Pimlico is one of thoso place. names for which no thoroughly satiofactory etymology has ever been proposod. The wori
frequently frequently occurs in the writings of the old
dramatists of the sixteent dramatists of the sixteenth aud sorenteentb conturics, where it seems sometimes inteuded to designat a man, sometimes a drink, and at
other timese a place. 1n "News from Hogsdon" other times a place. 1n "News from Hogsdon",
(1598), we find,-" "Have at thee then, my merrie boys, and hie for old Ben Pimlico's nut-brown." Hero is the man. In Robert Greene's comedy, "Tu Quoque," the place is reforred to. Si Lionel Rich says,-" "I sent my duughter as far as Pimlico for a draught of Derby ale, that it may bring colonr into her clieeks?" Tearly eigbty years after this last passage was written, the liquor "Pimlico" is mientioned in the "Counter Rat" (16T0):-
"Let Ho gadon's scrapera on their buse,

A Counter. Tenor is that pote. But Teno

But got with wotting woll your biront
Or stout Marreh beer, or Wiandarth alt clarot,

Or $P$ imblico, whose too great sald
Belgravia : a Poem, Seconit edition, London, 1851

The explanation of this seeming contradiction usually given is that Ben Pimlico kept a house of cntertsinment at Hoxton, which was a popular place of resort for pleasure-seckers in the days of Good Queen Bess, and that the liquor be sold and tbe place where ho sold it gradually eame to be knowa by his name. Pimlico thus being nnderstood to mean a place of public entertainment, the name wonld be likcly to be given to a Louse of the same charaeter in another qnarter and a passage in Ben Jonson's "Alchemist scoms to corrohorate this view:-
and of all sorts, tag rag, been sen
And of all sorts, tagrag, been seen to lock here In threares, theso ton weoks, as to a second Hogsden

The first mention of the Pimlico near Cbelsea is in the parish books of St. Martin's-in-theFields for 1626, and one little point that makes it probable that this Pimlico took its name from the one al Hoxtou, is that at both places thero was a Willow-walk. It is curious, however, that as there are places in Wales, Lancashire, and the Chiltern Hills, named Piccadilly, so there are Pimlicos in Yorkshire, at Cudham in Kent, and near Clitheroe in Lancashire, and also one at Batkside.
To return to our Pimhico. It lies between St. James's Park, the River Thames, the village of Chelsea, Hyde Park-corner, and the hamlet of Knightsbridge, and appears to have been first inhahited about the year 1680. In 1687 four persons are deseribed in the rate-books of St. Martin's as living in it, viz., the Duke of Grafton, Lady Stafford, Thomas Wilkins, and Dr. Criapin. The Duke of Grafton lived at Arlington Eonse, afterwards Buckingham House, and now Buckingham Palace; and Lady Stafford at Tart Hall, in James-street, Westminster. Pimlico, or Bel. gravia, is in the manor of Ebnry, which belonged to John de Bcnstede, in the reign of Edward I., and that king granted to the said John, in 1307, a licence to fortify his manor-hoase. By skip. ping over a little more than two centnries, we arrive at the time when the manors of Eyhnry, Negte, and Hyde were exehanged by the Abbey of Westminster with Henry VIII. for the dissolved Priory of Hurley, in Borkshire. In the Act of Parliament (28 Henry V1II., c. 49) by which the exchange was confirmed, the manor of Ebury is stated as lately in the occupation of Richard Whashe, and a person of that name onted the more considerahle part of it Enown as Ebury Farm (whieh contained 430 acres) in 1592, direct from Queen Elizaheth. The manor afterwards became the property of the Davis family, who owned it for a long period of time, until 1665, on the 2nd of July, in which year Alesander Davis, the last male of the family, died. His only daughter and heiress, Mary, married Sir Thomas Grosvenor on October 10, 1676, and on her dcath, in January, 1730-31, the manor devoived npon her hushand, in whose fomily it has remained to the present time the Marquis of Westminster being the Lord of he Manor of Ebury. The increase of Pimlic wes its origin to the existence within its limits of the residence of the king and quecn. George 11I. foresaw that many persons would be rawn towards the place where he himself lived, and therefore whon he was adding a portion of the Green Park to the gardens of Buckingham Honse, he desired that some fields, which were to be sold for $20,000 \mathrm{l}$., should be honght for him; hut George Grenville, the Prime Minister, refused to sanction any such expenditure. In consequence, tho building of Grosvenor-place Was commenced in 1767, and the king's grounds wero overlooked by the dwellers in the new houses, much to his annoyance. Streets running out of the main line were also built, but all
these were terminated by high mud.banks, whichs formed a boundary that few felt any wish to cross. Beyond were the Five Fields, which remained a desolate wasto until 1825, when

Mr. Thomas Cubitt and Mr. Seth S:aith took leases from the Earl of Grosrenor, and built Bolgravia.

Shall fair Belgravia" sona transmit to fa
Who ruised a town where ouce a marsh had been, Ahine be tho praise, O Culutt ! thine the tiand
 That caused Belgravia from the dust to rise A tiser wreath than Wren' a should crown thy brow:

Of course we are not bound to endorse this lust assertion, notwithstanding the regard in which we hold the memory of Thomas Cuhitt, The Fivo Fields ohtained that name from being divided into five parts by the paths that intersected them. The only road across was a trackway for the use of the farmors and gardeners, and this was formed into a public road in the roign of Charles 11., wben it was found to be a near way from Whitehall to Hampton Court. This road was very insecure, and for many years soldicrs patrolled the ground, fifty.two privates and sis non-commissioned officers being told off for the service. Half of this number were on duty cvery alternate night, but fwhen there were gala nights at Ranelagh still moro were required. It was always thought advisable for those who wished to cross the fitlds to wait nutil a sufficient number (to insure proper protection against the gangs of rohbere who frequented the place) were collected together, and then all sallied forth under the guidanee of two men who carried lanterns on long poles. This was the King's-road, which is now built npon, and runs from Buckingham Palace wall, through Enton-square, to Sloane square. As a strong instance of the dangers of the King's-road, it is sufficient to mention that Grosvonor Bridge was formerly named Bloody Bridge, * and before it was built in a regular nuanner in the reign of Charles II. was only a foot-bridge, consisting merely of a plank or hoard. In the Chelsea registers for 1590 there is tbe following entrg, "John Dukes was this yoar enjoined to make a causie at Bloody Gate," and in Read's Journal for May 21, 1753, we find that " on Saturday evening last, Februaly 24th, a gervant belonging to Mrs. Tomple was robbed and barbarously wounded near Bloody Bridge, in the King's-road, leading from Chelsea. Her Royal Highness the Princess Amelia coming from Eampton Conrt, hearing a man groaning, ordered her servant te stop; and it proving to be the man above-mentioned, he was taken hekind the coach and brought to town; and her High. ness ordered all possible eare to be taken of him." Still later, in the last century, the stagecoach that ran from town to Cholsea was frequently stopped by highwaymen. Tbe Five Fields are mentioned both in the Tatler and the Spectator. In the former we read (No. 3!), "I fancied I eonld give your an immediate descrip. tion of this village [Chelsea] from the Five Fields, where the robbers lie in wait, to the coffeehouse where the literati sit in council." The notorious Jerry A bershaw lived at a housc near the Willow-walk, whieh was afterwards the head. quarters of those who delightod in dnek-hanting and bull and bear baiting. The Five Fields were much frequented by the men and women who took their pleasure in hrutal sports, and every Good Friday large numbers resorted to the place to witness the cock-fighting that was always practised on that day. Most of these persons belonged to the lower classes, but a higher order of persons were often to be found here, and these were the duellists. $I n$ the reign of Charles I. a duel took place between Lord Mohun and a foreign nobleman. The Englisb ord was killed, and there was some suspicion of foul play. The darkest pioture has usually a bright spot of some kind in it, and there is some thing cheerful to be said eren of the Five Fields.
"Fanlkner, in his "History of Chelsea," aess that this
called Blandel Bridge in olu records.

The old herbalists frequented thom，and gathered the＂wild clary＂and the bitter cresses that grew along the river＇s bank，Swift，when
writing in 1711 of his walk into Loudon from writing in 1711 of his walk into Loudon from wall through the flowery meads；＂but，he adds， ＂the haymaking nympbs are perfect drabs．＂ There is still an bistorical incident to meation which illustrates the retired character of these fietda in the reign of Charles 1．Hamplen， ＂King＂Pym，and other of the Parliamentary leaders of those disturhed times，found it a cong． venient place for private consultations，and seew
frequently to have used it for that purpose Lequently to have used at hor that purpose． at Pym＇s lodgings in company with Hampden， Marten，and Fiennes，when the latter proposed a ride in the Celds，Here the conversation
turned upon the Episcopacy Bill，which was then agitating the pahlic mind，and Fiennes then agitating the pahio mind，and Fiennes chureh，nud espressed the opinion that blood world be shed before certain proposed changes Fere submitted to．This，Clarendon adds，wa the first positive declaration he had heard from
any particular man of the party．
We must now pass on from the past history
fe must now pass on from the past history of Pimpico to the present state of Belgravia． raise a ucw torn upon the site of the miserahle Five Fields＂that the formation of the St Katharine＇s Docks was projected，and the Ear of Grosvenor，tnking advantage of this oppor－ property the soil which was excavated there．
Belgrave．square（called by Fanlkner in his
＂Mistory of Chelsea，＂＂Lord Grosvenor＇s new magnificent square＂）is 684 ft ．long，and 637 ft ． broad，and is one of the finest open spaces in London．It was designed by George Basevi and commenced in the ycar 1825．The detached villas，lowever，were designed hy Mr．II．E． Kendall and other architects．Tho square takes its name from the village of Belgrare，in Leices tershire，where the Marquis of Westminster has considerable property．The architect＇s name is prominently recorded on one of the porches on tory is very recent，it can boast of several dis tinguished inhahitants，and Mrs．Gascoigne writes of it，rightly or wrongly，一
＂Nought that ia rude nor menn，may venture there．＂ The detached mansion in the south－west corner was built for Mr．Kenpp，of Kemp．town，Brighton and in 1837 became the residence of the cele brated Lord Fill，who was commander－in－chief for many years．General Sir George Murray
died at No． 5 ，in 1816 ，and Napoleon 11 ， s woll． known nombassador to the Court of St ．James＇ M．Drouyn de l＇Huys，lived for a time at No 10 The late Duchess of Kent lived at No． 36 （sometimes called 1ngestre House）in 1840 and at No． 16 most of the oelobrities of the day have met beneath the hospitable roof of the late Sir Roderick Murchison．Other former inhabitants of this squaro to be mentioned ar Mr．James Goding，the picture－collector；Field Marshal Lord Combermere；Lord Herbert of Lea；the last of the Dukes of Gordon；and the last male representative of the Scrope family who published＂Days of Deer－stalking，＂ 1.843 ；and died at his house here on July 1852 ，in the $81 . s t$ year of his agc．
Eaton．square was set out by Messrs．Cuhitt and commenced in 1827，but was not wholly completed until 1853 ．Its name is taken fron Eaton Hall，Cheshire，the chief conntry－seat of the Grosrenor family．We are accustomed to sqnares that are not squares，hat Eaton－square is one of the most extreme instances of an oblong square in London．It is $1,637 \mathrm{ft}$ long and 371 ft ．hroad：thus its length is more than four times its breadth．The public road runs through it from end to end；a road Which long remained in a highly nnsatisfactory state，but the return of which to oleanliness i celebrated by the poet we have groted：－

## The square of Eatonttheme of discord dire ！－ Has cleansed，at last，its fearfinl road from mire

At the cast end of the square is St．Peters Chnrch，designed by Henry Hakewill，and built in 1826，but burnt in 1835 ，and lately added to under the direction of Mr．Arthur Blomfeld．
This square is a favourite one，and bas its full share of memhers of past and present ministries among its inhabitants．The late Ralph Bernal treasures at No 75，and died in that bousti 1853．In the same year Lord Chancellor Truro
died at No．83．No． 71 was for some years th official residence of the Speaker of the House of Commons before the Palace at Westminster wa complcted，and here Viscount Eversley（the Mr．Shaw Lefevre），held his levees．Othe noted inhabitants to be mentioned，are Lor Alvanley，whose jokes figure so largely in ＂Raikes＇s Diary＂；Admiral Sir Edward Cod rington，the horo of the battle of Navarino General Codrington，one of the commanders－in clief in the Crimean war，and the well．know acoh Omnium（M．J．Higgins），whose tal gnre was at one time frequently depicted in ＂Punch＇s＂cartoons，and was often to be seer Hyde Park
There is little to bo said of the other Belgra ian squares．Chester－square was built about the year 1810，and takes its name from the city where much of the Marquis of Westminster＇s property is situated．Its appearanoe is great： designed by $\mathbf{M r}$ ．Cands．
Victoria－square，a poor little out－of．the．way place，without any enclosure，was huilt abont the year 1836．There is an interest attached to No． 8 ，as it was the last London residence of the poet Campbell，A statue of the Queen，on globe，which once stood in the centre of the square，was taken away a few years ago
Ebury－square is on the site of the old Ebury arm，and Eccleston－square takes its name from Eccleston in Cheshire，where the Marquis of Festminster has a large property
We shall close our present account of the Bolgrarian squares with a notico of Lowndos quare，which more properly belongs to Knights oridge．In Thomas Faulkner＂s＂Chelsea， publishod in 1829 ，the site is described as meadow，which was let to Mr．Cubitt，by Mr．J Lowndes，of Chesham．Closo by this meado formerly stood a famous old place of entertain ment，known as＂The Worid＇s End，＂which was isited by that indefutigable sight－seer Pepy and is mentioned iu Congreve＇s＂Love fo Love．＂The first houses in the square were built about 1836，but the whole place was not completed until 1819．Mrs．Gascoigne，whil painting in brilliaut colonrs the whole of Bel gquare where her own home is

Sir William Molesworth，Sir William Tite，Mr Brassey，the contractor，und Mr．Loader，once 11．P．for Westminster，were inhabitants of the square．M．J．Higgins（Jacob Omnium） ready mentionod，

## A man whom rage and clamour ne＇er withstood，

ived at No． 1 before be removed to Eaton quare．Tho value of the houses here ha reatly increased．For one of them，on the west side of the gqnare，when first built，the um of $4,000 \ell$ ．with 1,0002 ，afterwards for the mproved ground．rent was paid．About a year ago the lcase of a similar honse on the same side，at the original ground rent， 10 l ，and with about fort
Colozel
Colouel Gurwood，the editor of the Duke of Wellington＇s Despatches，lived at No．33；and Irs．（here the street．In 1837，Mrs．Gore was living in Paris ＂Recollections＂ Hecollections gives a curious account of he mode of literary work．He asked her one da how she managed to write the multifarion works that issued from her pen，and she replied ${ }^{\text {＇}} 1$ receive，as you know，a few friends at five o＇clock nearly every evening．They leave mo at ten or eleven，when 1 retire to my own room and write till seven or eight in the morniog I then go to bod till noon，when I hreakfast after which 1 drive out，shop，pay visits，and return at four to dress for dinner，and as soor as my friends have departed，go to worl again as hefore．
At No．11，William－street，Lowndes－square lived for many years Lady Morgan，of whom Irs．Gascoigne mrites：－

Endow＇d with manly powers，a woman＇s quill
Aneedotes of this lady were at one time very numerons，hat the following，related by M1r Planohé，is characteristio．Sho had invited
was dressing to receive her guests，when a note was brought to her，a remiuder from a lady of rank that she was expected to dine with her ava saning，an engagewont she bad atterly forgotten．The hour she had named for her own dinner was six，that of the one she ras invitod to，seven．Her mind was made up in an instant，She finished her toilet，received her company，sat down with them to dinner， and a fow miuntes before seven informed them of her dilemma，begged them to excuse her for on hour or two，and fiuish their dinner quietly， she would rejoin them as speedily as possible． Off she drove to her friend＇s，dined there，and returnad before nine，bringing with her the poet Moore，and sevcral other desirable additions o her own party
The squares have lately been quite colipsed in plendonr by the new houses that have been erected in other parts of Belgravia．A few years ago the late Marquis of Westminster planned the rebuilding of a large portion of his property，and the result has beeu the erection of the Belgravia Mansions and the immense houses in Grosvenor．gardens，forming a very remark． able neighbourhood．

## OLD FASHIONS

Teere are poople who can give a grace to any price，and make slaves of the indements o the rest of the world．Happdy or unhappily however，they are few in number，and generally so well conscious of their own occentricities，that they are able on the least provocation to becom more piquant than evcr by their grave，scriols soberness．We have little to do here with the head practitioners of these delightfin arts，to whom setting the fashion must be an enjoyablo misture of self－confidence and masterly skill， and more or less malicious pleasure in the dis－ comfiture of others．But something of the same sort finds its way into most of the occupations that dopend on ready wit and good training．Did not Scott，after reading an historical romanoo in his own manner，say of his imitators，with a proud hnmility，in the language of Sir Andrew A rue cheek，＂Ay；they do well enough，if they be disposed，and so do I，too；they fool it with better grace，but I do it more natural＂？An might not more than one modern architeot pro vido himself with this useful phrase for his ocea sional consolation，when he thinks he see日 but little honour coming to some special mauner of hit ohoice？

Perhaps，when people measure acts by a good high standard，there is not much to he said for anything but the following of the dictates of the best and most cultivated judgment，looking at things in hright white light，－without condescen sion to what is felt to be second－rate，or even lower，alheit pleasant onough and enjoyable in is wey When the formation and exhibition of buman choracter is in crestion this is always tacity ack ard ave inte all vesa They They reader it posila ormenth in por mor the breath in a purer mor
In spoken truth too，in the forms of high endeavour，this is at once accepted．A great epic or any work conceived on a grand plan， and carried through with all the force of a rare nature，and its resulting rank among the precious things of the earth；一the mastery of the sculptor rendering instinct with spirit the dull matter，the vehicle of his craft，and that for no trivial purpose，but as the result of a thought strong enough to touch all his fellows：－these are but the commonplace examples adduced by all our teachers to illustrate the different scales of human work．There is no condemnation of iesser things，or want of perfect appreciation of them shown or implied in such teaching：the decisions may fairly be come to without that being even guggested．Addressing children the case is stated very simply ：－The horse is noble than the fly；there is involved in his powers，his aptitudes，his whole nature，his graceful strength or magnificent energy，－sometbing that appeals by the observation of the transparent winged insect notrithstandiog that this last may be found to contain delicate beauties peculiarly its wn＂The questions as to such natural and com－ pren and as to the distinction between these and the
bobbies, crotcbets, whims, oddities, and all tbat kind of thing whioh crop up in buildings from kime to time, cansing controversy, and at time to time,-calsing controversy, and a
times it is to be foared making those who are anxious to be deerned judicious demonstrate their grief,-would be settled witbout difi-culty;-if only well-constructed arcbitecture was a little loss enduring ;-if freak in solid stone or granite did not seom to acquire a seriousness
from such ombodiment that it could bardly claim from such embodiment that it could bardly claim exclusion of trifles from our lives and works,those graceful trifles, those bits of by-play that those graceful trilles, those bits of by-play that
are the "business" of art. But there is a show are the "business" of art. But tbere is a show
of sound judgment in the wish to confine the of sound judgment in the wish to confiue the eccentricities to comparative trifles, and not
tbrust tbem forward as tbe staple work of the tbrust tbem forward as the staple work of the
best powers of onr time. A leaning towards this kind of serious estimate of any strenuous work may account for some of the strong
feeling expressed at times, by those who deserve to be listened to, as to "tho degradation of architectare," "the aoceptance of motifs of well-acknowledged inferiority," "the use of groat skill only to revivify for a time or
in a case or two the dehasca Jacobean, -or the inane architcoture of the lator Stuarts." No one is surprised at the pleasure felt by artists in some characteristics of this kind of work. If one promiment quality more than another marks a good deal of the reccat bailding of mediocre quality of both tbe modified Gothic and Classio Renaissances, - it is want of breadth. Fritter,-frcquently absolutely false in scale,-a love for surface decoration carried beyond mere difference of colour into a desire to teaze the wall areas into broken effects; these and even stronger specimens of the art of raaking a building busy were practised till it became pretty certain that the time for change would soon be at hand. When it came, as usual the leaders of the revolt were ready and stood out sufficiently in front of everybody elso, prepared to carry the old qualities temporarily undervalned into tbe snpreme place, - to make the contrast as forcible as possible. Like all revolutionists, they found tbat the surest way to mako their new position clear was to go to the othcr extreme, -or at any rate as far as thoy could with show of reason, of this sort was reeded, and that features and qualitios may thus be brought into voguo too long forgotten hy those architeots who are con. tent always to be followers of others,-possibly with bonefit to the futnre of the art at large. There may bo imbihod, and permanent ohange effeoted by means of, tbe love of the quality of repose :-the attainment at any prico of tbat perfect balence and proportion of parts baving whioh a building can dispense with decoration, and still retain distinction of cbaracter. Further benefit will probably result from the suggestion of an increased range for wood constrnction and plaster decoration,-more, one would hope, in the copyism of tho general forms and details.
Before attempting, however, a little longer to peer into tbe future, a word may he said as to the interest in things " old fashioned,"-that has also a good deal to do with this ourions leaning ing of the eyobrows. It is necessary to leap back inf of the eyobrows. It is necessary to leap back
to the Stnarts before we reacb an architecture with anything of a rnst about it, and at the same time suffoiontly notable, for its inherent qualities, time suffioiently notable, for its mhereat quaities,

- for fineness and vividncss of sentiment, to make it interesting. The work that is in this way it interesting. The work that is in this way babits require, which also pliable bnt habitloving buman nature has accustomed itself to loving bnman nature has accustomed itself to
regard without a sense of dreary strangeness,regard without a sense of dreary strangeness,-
must of necessity possess attractions that, must of necessity possess attractions that,except under strong excitement of persoual or other similar influenoe, as of eloquent imaginaexperience in one or two highly sensitive mindsexperience in one or two highly sensitiveming to a more remote antiquity. It ig not for Romnn art it would seen en this year of grace 1873 that is conceived the feeling of personal nearness, of homelincss and thorough oomprehonsion which is called up by the Stuart work; perhaps far inferior in quality, but when once looked to with an open mind rery charming
throngh tbis sense of ancestmal convexion. The throngh tbis sense of ancestm conuexion. The over-looking, the fixing tho eyes on other times
and aims,-whicb has been hinted at above as and aims,-whicb has been hinted at above as
no noworthy pursuit of pure and perfected models in the arts, -will account for the faot that for many a yoar these mnaltered and well. looked-at prodnctions have never been seen
with the sort of preparation tbat would allow-or rather witlout the sort of antidote that would deny, tbis peculiar power of association its ful] legitimate influence. The observant Hans Breitmann, writing of Leyden and its air of sixty years ago, scarched in his noble heart and fonud the sentiment :-
"They may dalk of azeiendt hisludory
De ding romentisch acel
De ding that mofes most teeply, is
Old-vashioned, - not antique.,
All tho above bas been said on the assumption that for no long time,- for no longer, in fact, than till now,-will the merely imitative phase last, and impress its peouliarities on modern worn. The stage at which the ready-witted are learning as quickly as they can to practiso a newly-sanctioncd game is never a very interestImitation of the Past, as well as all the concord of sentiment about it, proves really of little avail against tho constant action of the forces the are so certainly making mere eclecticism in tbe futnre a course easy to the consciences of the easy - going. Perhaps, in truth, this process, by exhansting the various opportunities for imitation, is thus clearing the ground for a more uniform and consistent effort to drop tho archoological manner, and to design simply at frst hand,-disregarding no form that was used in other days for special purposes, but asing it for any purpose tbat may seem fit;disregarding no teaching as to the right end and means tbat may be learnt in careful training by precept and example.

Tho present tendencies of the Gothic Renais-sance,-seemingly fast winning its way, even if it had not already won it in the view of mnny an observer even a few years agone,-might well cause to any one who bad not seen the conrse of The pure interval a slight shock of datcs was then, by an only manner at all suitable for English domestic sworn foes of thge. Not by the as the result of persuasion from withont,-but apparently as the result of steadily advancing progress witbin, has noteworthy change shown itself in a section of one body of the fighters of the Battle of the Styles,-and made itself patent to all. Tbere are Abdiels, it is true, and perhaps more than just now one is inclined to give oredit and ana not feel disposed to leave their hag cling to tho canse tbat bas won them persoual hononr, and that, at one time at least, made them garnest in proportion to the excitement of all their combative feelings. The manifestation of a most accommodating willingness to bo on botb sides sbown and persisted in by a strong partisan in the case of the Home and Colonial Ofices and the other buildings of that bulky pile must have had no small moral effect,torvards weakening the spirit of antagonism and of self-assertion that got from most of the believers in themselves,- even if our eyes were not wilfully kept half closed, so tbat tbe other side might be kept out of view
Pcrhaps, aiter all, however, tho futmo had best be left to work itself fully into form, hefore prophets can perform their proper function, and explain its meaning by the lights of insight and the past. In such,-in archiand with sucb easily changerble materials thero would be more honest confidence required than pradent men would like to confess to, for venturing to outlino even the immediate future of arcbitectnral development. It will be for, however, areat addion the oomance viewed to have below the surface of the thoughts confidence in the new possibilities lodged in the womb of change. Tbo tiansiconsidered as a whrle - the wor considered as a whole, -the want of definite aim (or, at any rate, of the same aims at the adme time), among the practitioners, might is a counsatisfaction, did we not feol that thero is a connteracting influence in the possession of an honest prido in the subtle minds and trained powers of the considerable number of workers to whom excellence of high kind, even if not the
bighest, is possible under such strange calls for their versatility,
A real belief that good work is a tbing confound to no special period of art-history, -but prevent any oue from indulging a mon-oatbolic
spirit. The recognition of the special charms, and even the special possible benefits to the art, of certain nev-revived-old features and manners, will prevent a taint of bitterness mingling witb the cheerfal recognition of the inevitable, as far as to-day is concerned when in this connexiou we use the words, "The thing that bath been, it is that whicb sball be ; and that Which is done is that wbicb shall be done and tbere is no new tbing nnder the sun." Practical optimism is, after all, the possession of differ impression them to 1 them bo, and that for bring things nearer to our wishes. The perfect racter racter through the decay of the infuence of the form past, and he un forms that have been triumphantly perfccted in differcnt ages and climes, handled with a new spirit.

Not, bowever, that one would, even when in so oontented a spirit, pass withont notice cvery thing that is inharmonious with sucb prevalent couleur de rose. Some constraint must, if neoes aary, he pnt on amiability, if only to indicate one of the little blomishes in this apparently best possible state. Rererting to tho beginning of these notes, it will be found that the imitato is introduced, as the somewhat ridiculous pupil aping with imperfect capacities the manners and performances of a thoroughly capahle leader or master. Tbere is another way of locking at the matter, which doos not present the injured follower in qnite so innocent an aspect. Instead of being penetrated with tbe fine qualities of his pattern, he, sad to say, actuated by a les worthy motive than tbe seuse of reverenco sometimes aims only at a clumsy mecharical copy of what he fonad brought into visible form through the real talents, the learning, and hard work, - the genius, it may be,-of anotlier. I sbould be considered out of the way, instead of being quoted as an average proceeding, fur an arcbitect to convey his design into his capable assistant's pencil hy the uso of the magieal formula, "Make some sketches in the style." X Y is not an algebraical quantity though, of course, an unknown one as far as information is derivable through these lines He ia, however, really a well-known and popular architect, with some "debased" sympathies and a large part of his suocess witb apparently untractable materials is due to bis pereonal power, which is so marked that no one would sour him as a mero imitator even when th drawn sugrestions. Less skilfnl and less trained hards coll Higns with no thonght of the proliminow acquisition of a right to "convey," will vulgarise acquisition afo convey, will vilgariso dolight in them. Cannot each mun's special loight in them. Cannot each man's special hunting - gromend be left mianly to himself, especially when he has won his way to it by some thing far more his own than even Apuient Pistol' phrase"? Cannot it be binted a fico for the phrase" Cannot it be hinted also to tho les accomplished, as we are talking of corantos danced on horseback, that they slonnld make themselves anare of the smal and ant of digity to the lat of those not truly to the manner

THE "PRINCIPLES" OF ARCHITECTURE Is the course of a discussion which followed the roading of the Presidential addreas at thle opening mecting of tbe Institute of Architeots nst week, the Marquis of Weotminster took occasion to lament the obstacles to the progress and advancement of architecture occasioned by the ignorance and indifference of the genera publio on the szbject, and arged among possible romedies for this state of things that "somo rould form of the education of public should form part of the education of our public schools." We have too often called for gome tecture amons the subjects coniprised of hirhil tecture among the subjects comprised in higher posed to be at all lnkewarm in remard to be sulu posed to be at all lnkewarm in rermard to such a subject. Bat the suggestion of instraction in the prineples of architectrre" induces the reflection, Twat are those principles, and itl what tangiblo form and under the sanction of what use of schools," as the title-pages of the Latia ad Greok exercise-books have it.
The question really isnot quite so easily answred
as might at first be supposed. Toteach abstract prinoiples of a practieal art to those wbo ar not iutending to practise it is a somewhat vague and indeterminato undertaking in most cases and would certainly not prove least so in regard to architectaro. Ono micht, no doubt, teach somo very definite prinoiples, if we conld make up our minds which to seloct. We migbt give toxt-hooks of the venerable and rovered "fire orders," with their proportions in modales and iutercolumnibtions; and it did happen to ua to discoper not long since, on tho counter of a repository of arte," a small new hook of can very objoct, and which affected us mneb as the aspect of a re-animated mummy mimht ho supposed to do. Or we might back the "Seven Periods of Gothic Architocture," stifling a kind of discomforting conriction that these respect. able divisions of the study were destiued to the architectaral pedioree. Or elhould wo rather strive to inculcate, in comprehensihle words, hat habitude of desixn whieh is now ragnely callerd "Gothic feeling " and wich appear with called hothic lee.ing, and mirch appears, with those whe nos in the main the reduction of everything, from the town-liall to the lodge, to as nearly as possible the likeness of a baru? Or, if none of these are catholic enough, by what end are wo to get secmre hold of our principles, so as to
apply them successfilly to the entightenment of he Britisb school hoy?
The fact is that "principles" is a vagac cxpression, and if we attempt to define what is really neant by it in this case, or to find a definite meaniag for "principles of architectnre," it will appear that for educatioual purposes this can soarcoly he done in any eoncrete form. What we really think of as principles of architecture are those geucral views of the relation between design and utility, and betwoen dosign tudy of the best styles of architecture, eom bined witb the practical working out of ner structures. It is really impossible to tabulate tbese for a scholar, and to put a theoretical student of architeotare on the same footing, in egard to th.e comprehension of the art, with a practical one. Nor is the fact that this is so any disparagament to architecture, as inferring it to ie a study with no real definitions or houndaries. Fe do not start with the idea of prinoiples teacb a boy the principles of The do not but we teaeh him to read Horaee. We do not intradnce the study of drawiog or masic in not chools by taachincr their "principles" shools by teaching their "principles." im, and enoonrarine him to study and before sither from natare or from other drasinas copy, ather from nature or from other drawings. And rost painters wod they wero assed to define the principles of their art. Such principles as these are, applieable to painting io general, are apprehended throngh bined with the prictical studs of painting com. bined with the pructical study of the method of delineation. In short, what is wanted in a gencral educationnl syster is a study not of snch vaguc generalities as principles must reault in, but of the history of the art, combined with some knowledre of its practical prohlems ; and interded to ask for. The theory of architecture nufolds itself on a study of tbo history of its principal phases, and the manner in which on was developed out of another (a study wbich nay be very moch facilitated, no douht, by an able concurvent cribicism), and on a knowledge combined with the historic stady, of the principal mechanical prohlems involved in construc-
tion with varions materiala. The relation of design to material becomes alınost self-evident when the history and the mechanics of arcbitecture are studiod in reference to one another. Elio "history of arohitecture" then, it is rather than the "principles of architecture" whelpshonld form a part in the cnrrienlum of ciplos hacome evident for those will the prin fanolty of comprehending such things; and for fazalty of comprehending such things; and for less in matters of this natire. But the is nseless matlers of onmprehension in regard to the forms of art erpmssion study of their oud a better secarity for a wide eclecticiom true de-ineratnen for the amateur) is secured this means than hy amateur) is secured by inculeating "principles." There is but too much danger of teachers miataking their own
medilections, or those of a sect to wbicb they have given their adherence, for immutahle and incontrovertible principles. Iistorical stndy precludes, or at least offers the hest antidote to, this kind of bias; for if the historical facts given are mainly true, and their bearing be rightly apprehended, the "principles" may he trusted o take care of thomsolves. Nevertheless, we are equally ohliged to the Jarquis of Westminster for the tendency of his remarks.

THE "CRITERTON," PICCADILLY,
In our volame for 18 the puhlished the selectod design for this huilding, and plans of the principal storiss.* Previorsly in the same volume (p. 220) we had given some particulars of the competition in which the desion (by Mre Thomas Verity) had hoen ckosen. In July of that year the tender of Messrs. Iill, Keddcll, \& Waldram, for the hasement and works to party Walls ( $7,995 \mathrm{~L}$ ), was accepted, and on Satnrda last, the huilding, to all intents and purpose finished, was inspected hy a large nnmber of porsons invited hy the proprietors. No one who was soen it and knows anything of snch matters amonnt of work his deny that a very larg especinlly when the undergronnd difficulties an the legal obstnnctions, tonching light, air, an party-walts, are rememhered. Messrs. Gearge smith \& Co. are the contractors, Mr. Chaney heing their foreman of works. M1. Bare was nally named for the cost, cxclusive of decora tions and fittings, was $20,000 \mathrm{~L}$, afterwards raised to 25,0007 . The sum spent, it has been stated by the proprietors, is over 80,0002 .
We repent some of the descriptive particulars. The Piccadilly façade is of Portland stone, in the style of the French Renaissance, and is feation into centre and wings; the prinoipal featuro, and a fine one, being the deeply-reccessed arched doorway, which riges through two floors and is 16 ft . wide. This archwry is filled in with glazed framing supported by two pairs of hronze columns (modelled by Mr. Kremer, and cast by Messrs. Masofield \& Co.). The side entrances lead respectively to the lunchoon buffet on the rated on front and revels with of an of an appropriate charactcr in high relie, Pace in height height, represeating the seasons. The range of Findows on tho upper floor, which light the tho spandrels. The whole of this sealptare in tho spandrels. The whole of this sculpture has heen exceedingly well oxecuted by Mn, Ed. W Tyon.
Ahove the raain erruice is an attic, which marks the positiou of the dome in the great hall and surmounting the whole is a Mansard roof,
The Jermyn-street front is exeouted in hrick, with Portland stone dressings, with the excepion of the ground floor, where tho external wal for part of its leartis is supported by detached grauite piers, while another wall, faced with rea-oath, is built ahout 5 ft . back, to form as The or the parpose of lighting the bascmenc an arched doorway flanked by grazite piers, leadiug to a small vestibule which commanicates with a staircasc, and gives access to all parts of the building.
The kitchens and serving-rooms are over each ther, and situated in the centre of the bailding, immediately under the dining-rnoms, for cconomy fervice. The retiring-rooms, again, form a istinct block, with the exception of the ladies oom, whore their convenience and privacy bave heen the first consideration, and where every Thito has boan provided for their confort
to doratiol gho pand other painted decorntions have heon exeonted hy Messrs. Simpson. The figure-subjects were py Meases. Simpson. The

THE NATIONAL ARMOURY.
Romert, Baron Zoache, who died at Parham Park, Pulhorongh, Sassex, on the 2nd of Augast, ives permission to his son in his will, just now proved, to sell his collection of ancient arms and f London first offer to be made to the Tower London. The collection incindes emember rightly, some interesting spooimens. Who is there at the Tower with knowledge and authority to act rightly and risely in snch a case? Wo have strong reason for helieving the uswer must he,-No ono; and that the national collection, which onght to he carefully tended and perfected on all available oeeasions, is still discreditably neglected. If this ocenrs under a Prime Minister like Mr. Gladstone, who is known to have a feeling for history, antiquarian associa lons, add ant propren, in what quarter can wo look with a hope for hetter things? The price less memorials in the lower are still treated simply as scorcs, and are exposed to snch dangers from fire, water, and ignorance as the most ordinary stores wonld searcely be suh ected to by wise manarers ; and all this, too, while it brings money onongh of itsolf to set everything right.

## THE ARCHITECTURAL MUSEUM

Iv the report which has just been publishod, the conncil say the subscribers to the institntion may rest assured that their support is acoorded io aid of a great and thoroughly useful work Which bas culminated in the succossf 11 estahlish ment of classes for modelling and drawing. To and Hese, Brindley and Redforn voln teered their aid, and Mr. Francis Child has kindl given his services as honorary secretary of the classcs.

From a report presentod by him to the conncil in May last, it appeared that as many as sixty art-workmen had paid the entrance-fee of 2s. 60. and had attended the classes as freqnently as the constant removals incident to a
their working localitios would permit.
"It may safely be asserted that nover until now
has so large a numher of bont.fide art-workmen been hrought together nnder the heneficial in. flence of so fine a colleotion of ohjects of study for the purpose of receiving instruction of the bighest order in the very detail of their eraft, and for so insignificant a payment as 6d. per week.
These remarks bring the conncil to another important and equally practical suhject, $-i, e_{\text {, }}$ the provision of an annual income sufficient for the engagement of a paid instructor, now that the classes, hy the self-sacrifice for a period of six months on the part of the gentlemen above. named, have bees successfully inaugurated.'
A fair nomber of students have, wo helieve, presented themselves for the present session.

## "HOMES IN HOMERTON."

Oun remariss under this heading have heen received by the local press in a proper spirit. The Haclncy Express, on repriuting the article, writes, -
"An articlo in another column presents in forcible
terms some phases of the sanitry nud social condition of terms some phases of the sanitryy nud secial condition of
Homerton. In reproaucing it in our coluynas, we wish

 distriet extreme; but there can he no doubt that the bear a good deal of attention. We shall
disol proinbly have more to say upon the zanater."
It is to bo hoped the matter will not end with talking : endeavours shonld at once be made to remove some of the evils complained of, and alleviate the present condition of things.

## SANITARY ADMINISTRATION.

AT the Sonth. Western Poor-law Conference, held at Exeter, on the 21 st ult., Dr. Ackland, of Oxford, rend a paper on this suhject, in course
of which he said,-If we were to listen to the eriticisms which aro made in various quarters, we might imagine that the arrangements for
puhlic health in England are the worst, the laws puhlic health in England aro the worst, the laws the most mischievous, and the administration the most henighted. Prohahly the faet is that pohlic health administration is more advanced
in England than in any other country, and that the sanitary laws are more intelligently progres. sivo now than at any previous period of history Nevertheless, it must he owned that under the most favourahle aspect there remains muoh to bo done ; thero are hlots to he removed, anoma. lics to he rectified, irregularitios to he rectod, additional powers to be obtained. Tho Sanitary Acts of 1871 and 1872 appear to me to have taken the conrse hest calcalated for a speedy solntion of most of the questions. 1. They have adopted the principlo of having ono coutral sanitary authority, under one Cabinet Minister, therehy terminating the confliet of independent departments in London, 2. They have placed every spot in the conntry nader one
anthority, and only one. 3. They have require the appointment of an inspector of naisunces and a medical officer of health for every distric in the country. 4. They have given power to the contral authority to nppoint, as they are tequired, with the sanction of the Treasary Thatever nutuber of experts in auy subject. But the Acts have not done certain things. They have not reqnired that old administrative areas shall be compnisorily hroken np, withont a permanence. Nor that existing count for unions should he forced to appoint sanitary offcert with specinl qualifications to disclarge duties whose very nature is nncertain. No existing and transitional circnmstances should the permanently maintained after experience ehall have shown that some other are hetter suited of the kingdom. The farts which organisation throughont the oountry have heen making in throughont the oountry have heen making in
the least year will throw light on the real wants of the country, will have eduoated themsolves to of the country, will have eduoated themsolves to
an understanding of those wants, and will, I make no douht, result in a most iutelligent puhlic opinion, as to what, apart from all theory
and fancy, will conduce to the physioal well. heing of the people. I am not prepared to say as yet the task is accomplished.
The Sanitary Commission having made care. ful inqniries into the arrangements of the various puhlio departments, and having talion into oonsideration the great number of inspootor already employed hy the Central Government determined to nse, as far as was consistent with efliciency, the extensive medical orgadisation of the Poor Law Board. The President of the Local Govornment Board starts, therefore, with the whole Medienl Staff of the Privy Conncil tho Inspectorate of the Poor Law, the legal 4,000 of more than 600 unions, and abou Army," The fitness described as "a hig Health Axmy." The fitness pleteness or inoompleteness of their organisation will he more fally appreciated if it is horne in mind what dopartments are comprised neces. sarily in the office of the Health Minister. There are at least six-Legal, Medical, Statis. tieal, are angineering, Relieving Destitution, Parlia. mentary. Under each of theso six distinct departments there are subjects to he considerad too numerous for even rocital on this occasion.

## SINITARY REPORT ON SOUTHWARE.

Tre anmual report of Dr. H. Bateson, the medical officer of health for the parish of St George the Martyr, Southwark, for 1873, has The officer of healted form.
ithe officer of bealth congratulates the antho. rities that they have got rid of one pest, the small-pox, which has heen epidenic for two or threo years, and have not, as yet at least, had any other inficted on them. The Poblio Health
Bill, he considers, hears traces of the results of Bill, he considers, hears traces of the results of
much labonr and thonght, and shows that the Government is no longer beedless of the health Government is no longer heedless of the health and comfort of the people. Still there is mnch in the passing of it, ho thinks, to abate one's ardour in its favonr. The Adulteration Act is nest alluded to, as a groat desideratum, adn]. teration having reached a most shameful extent, injuring anke the heasth of the purchaser and the morals of the seller.
On the suhject of fever in the abstract as a possiblo epidemic, Dr. Bateson says :-
"In like manner as I hronght hefore yon the destractive powers of small-pox when uninter. you fever hy vaocination, so 1 will place hefore mensure as it rages in localities whero banitary the year 1871 neglected. In the heginning of Ayres, the effects of which were similar Bachos of the plagne in London, only that the mortality was actually higher. It commenced in the low and thiekly peopled districts. It spread rapidly tho hot ever increasing viralcnce. Through death list grew longer and more sad, till early in April the olimax was reacher, for in ute day there were 700 deaths out of from 200,000 ) of 70,000 . By the middle of April, not more than 30,000 were left in the city : of this nnmber it was calculated that 7,000 wero ifl of the fever, and there were still 300 deaths occurring daily. . . . . This city of 200,000 souls was without a drain. Cesspools were dug in the conrtrard of every house, of which averaged ahont 26 ft . This fillod another was dug close hy, and so the process went on. The water was drawn from wells into which the cesspools drainel (A.D. Carlisle, B.A ) Means more fitted to bring about these terrible results could not have heen adopted. The mere money loss from this opidemic would have a city of marhle, and with snol sanitar appliance
to see."

New Masonic Hall, Derby.-This bnilding haturday lapt the tered in Gower.street. On tahlet in tho banqueting-room placed a momorial was performed hy Bro. J. Smith, P.PGemny the Mnyor of Derby, Chairman of the Tungtoes, The stone was engraved and the initials painter. in, stane it is a permangent record of the orininator nd trustees of then record of the origunators hospitahly eutertained the trustees, arce itect, and builder, at dioner. The mayor has heen a arge dinor to this new institution in Derby, and
contrihuted 400 l . towards the hulding fand.

SANITARY IMPROVENENTS AT STRATFORD.ON.AYON.
At the Leamington mooting of the Municipal Sarveyors' Association, alreafy mentioned,-
Mr. T.T. Allou, borouch anrveyor Dir. T. T. Alloa, borough surveyor, Stratford-onAvon, read a paper on eanitary improvements in that town. Premising that the town was well known throughont the civilised world a the hirthplace, the grave, and the home of Shakspeare, he remarked that it was a vory ancient town, and had been traced to a period of 300 ycars heforo tho Norman conquest; and it derived its name from heinc on the aneat north road from London to Birniugham, which passed straight through a wide part of the river Avon close to the town. Sonn after the passing of the Puhlic Health Act of 1815 , and mainly through the exertions (and in the face of much opposition) of the lato Dr. Thomson, a name well known in Leamington, who was sident at Stratford-on.Avon, after stating the varions improvements which had sung tho ho mentioned that Mr. Knott, the district oudi tor, at the last audit of the Local Boand accoud said that he did not kow any tord accounts, many improvements (considering tho size of the town) had heen carried out no so mize of the ontlay as at Stratford.on-Avon, A system of sewerage and main drainage had heen carried and and the whole of the private property thronghont the town connected with the sewers. The outfall sewer at present conveys the sewage into the river Avon, at a considerahle distance small, this did not causo much pollution of the strenm. This now causo much pollution of the tinned, This, however, wonld not long he conobtain, who anxious to tho sema the best information as to the disposal of and least and least offensive method of dealing with the matter, on which there are so many conflicting and opposite opinions at the present time. The to the of the Board had recently heen directed sidered sidered might well he classed as sanitary improvements. Within the past five years tho Board had newly paved nearly every street in the town, and had expended ahout 5,5002 . on the
work. The main streets had the footmaths laid work. The main streets had the fnotpaths laid
withs York stone, and the others witli the hest of with York stone, and the others with the hest of
the old pering stone and hlue bricks. The result had been that the and hlue oricks. The rehad heon greatly improved, and from heing ono of the untidiest it was now ono of the cleanest in the Lingdom. $\qquad$
ST. MARY'S CHURCE, NUN-MONKTON, YORKSUIRE.
This interesting chnrch, nfter heing closed for with great cercmony, by the Bishop of Rider, accompanied by the Deau of York, and about thirty of the clorgy of the diocese.
It was huilt in the twelfth century as a church endowed hy William de Arches in the and was Stephon, a descendant of Osbern, to whom tho Conqueror granted the estate. The names of some of the prioresses are recorded down to Johanna, the last, who surrendered the priory to Henry VIII.; from which time to the present this ancient and renerahle ohurch has suffered In ace lis of negloot and injury.
In 1869 Mr . Cranhall, the patron of the living down occupant of the aljoining mansion, pulled site of the rehuit tho oftices which occupied the after the clancel, at a cost of 1,300., and soo fortnnately, the wall that formed the eastern end of the refornied charck har haried, and thus preserved tho rich fragment of what was ovidently the beginning of tre choir, showing great variation in detail from the rest of tho gallery. This has been carefully followed. Two windows were continned on the north side, and one on the sonth, and the gallery carried all Found the building. Beloys, on the north ald an organ-cbamber is ohtained, opening into tl e chntch hy an arcade of three arches, with tila iered shafts of polishod granite, With chs organ.chamher is connected the vestry, nuder Which is the warming-chamher. Thess addilions are contrived so as not to hlocs an window, or otherwise impair the continaty the triforium gallery, 0 the nor $h$ sid ala tho credence-tahle; on the south of the deeply-reossed Normen doer ragmen carefully followed, and the door now er ace to the chanoel. Within the sacrarium are placed
the sedilia, in thres compartments, and th piserua.
The east wall, and part of the others, have, owing to the existence of cellars, been carried down to a depth of 11 ft . below the anve floor. The east wall is 4 ft . 6 in , thick, the others $\$ \mathrm{ft}$. above the plinth. The three.light window corresponds, with somewhat richer details, with the exquisite window of the west front, oxternally
Internally the enst wall exhibits an open arcade of five open lancet arches, rising with the gable, the three centre ones being opposite the east window, The opeaings of tbe arcade have massive and deeply-recessed jambs, with shafts tho dor.tootb errichment that characterises the wost windows very freely introdnced.
The reredos, which is lofty and prominent, is of Caen stone, in five comprirtments. The cinquefoil-beaded arcb. The side compartments hare a trefoil headod arch. They are dirided by clnstered shafts of polished serpentine marble.
The chancel, wbioh is 33 ft . deep and 27 ft . wide, has two rows of seats on each reading. desks for the clergy and choir
The nave, which is 50 ft .7 in long, is separated from tbo choir by a low stone screen or septum, pierced with cinquefoil openings, with gates of ornamental ironwork. There aro two rows of seats, of oak, wbich are all free and open. The centre passage, 7 ft . wido, is laid with Godwin's tiles, of a plainer pattern, nith square panels of stone let is at intervals, to indicate the position of former monuments. The brasses and other monuments of no great interest have been preserved and refixed, and two monumental slabs fonnd below the floor, with folinted crosses incised, have been placed on end at the west of the charch.

The whole of the inside of the church has a layer of concrete, 1 ft . thick, spread over it While sinking for this another base moulding was diacovered to the piers, showing the floor to be about 5 in, helow the existing one. This ancient level has been preserved, though entailed a step down at the west door. This doorway has been inclosed with oak framing and inner folding doors provided, and over it is an open oals singing.gallery corbelled out to obtain space, which is somewhat contracted for the singers.
The restoration generally has boen carried out by Messis. Weatherley \& Rymer, builders, of Fork, and their foreman Mr. Plows, noder the superintendence of Mr. Jolin W. Walton, of Loodon, architect. The reredos and pulpit were executed by Mr. Beall, of Newoastle-upon.Tyne, who also completed the whole of the carving to the churcb.
The enlarged bnilding is intended to provido accommodation for 217 persons, being an incost, including the painted windows, has been about 5,0007.

MEMORIAL SCHOOLS FOR BRIGHTON. The foundation stone of Scbools to he erectend by the congregation of St. Margaret's Churcb to the memory of the late Rev. Edmund Clay has been laid. The design for the schools (which are situated in Queensberry-street, facing west, towards Regency-square), was chosen from twenty in a competition confined to Brighton and Hore architects; the selection being made by the Memorial Fund Committee, assisted by Mr. G. G. Scott. It is by Mr. George Tuppen, of Brighton, and consists of two schools, - one the basement, 31 ft . by 28 ft . The frout elera tion is in the Gothio style of architectnre, and each floor is lighted by three bay mullion and transom windows, with monlded arches; centre one having three lights, and the window on each sille two lights. The windows on each respond in every particular, with the exception of the centre window on the upper floor being higher", and having tracery in the head. The division hetween the two floors is marked by a monlded brick cornice and stone fascia ( 3 ft .6 in . deep), in whioh is cut the insoription, "Edrand Clay Memorial Schools"; the comice and fuscia being continned over the entrance portion of th and covered with a flat, finished by a paraper, and covered with a flat, finighed by a parapet. schools (bat also facing west), bas two doors
divided by a lancet-shaped window; and it is beveath
In the gable is a three.centre ventilator, surmounted by a bellbuilding will be red kiln bricks, witb Portland stone mullion and dressings, and a continnons label moulding running over the arches of the windows on the socond floor. The first floor is intended for the infants scliool, 37 ft .6 in. by 34 ft ., to accommodate 150 children; and a class-room in connexion with it, 34 ft , by 12 ft ., will be for fifty little boys; the second floor being set apart for the girls' school, 51 ft . by 31 ft ., cupable of accommodating 200 .
Tho contractor is Mr. Brnton, of Brighton The Industrial Girls' Scbool (adjoining tho Me morial Schools on tbe north) will be used as scbool for boys, tbis concentrating the whole of the educational institutions in connexion with St. Margaret's Church.

SCHOOL.BOARD SCHOOLS FOR LONDON The new schools in Essex-street, Globe-road, Milcend, were opened on Monday in last woek They provide acoommodation for 1, 137 children Tho infants' scbool and class-rooms are detached for them. The jung bas been partially and senior boys and firls scbools, with the accompanying class.rooms, are on the first and second floors of tho new blook; the ground floor portion forming a covered play hround hoor por provided for the mesters and mistresses, and one for the managers. There is also a room specially designed to be ased for arawing-classes
The whole of the building is heated by hot water.

Messrs. Cooke \& Green, of Napier Works Blackfriars, are the builders, and the hot-water apparatus has been fitted up by Mr. H. Watts, of St. John.street, Smithfield.
Mr. A. G. Hennell is the architect
A Board school has been formally opened in Harmond-square, Hoxton. The school stands in the centre of a very populous and poor neigh. bourhood, and is constructed to accommodate 375 boys, 388 girls, and 376 infants, making a total of 1,139 children. The rooms are spacions and well ventilated, and one novel feature is a covered playground for the girls, on the roof, and of a heigbt of 41 ft , from the ground. This arrangement onables the cbildren to breathe comparatively fresh air. The building was designed and carricd out under the superin the Board. The total cost of the building was about $6,14.17$.
At the last meeting of the Board, Mr. C. Reed, M.P., called attention to the satis. factory pararraph in the finance committee $s$ report relative to the statement of the architect of the Government that the Board's estimates were very moderate, being at the rate of 10 . per head, or considerably less than in most other towns. The Rev. J. Rodgers asked whether that sum included the site. The Chairman said not the site, but the fittings. Mr. Freeman said, learing out the fittings, tho building and site would be about ten guineas. Mr. Reed said the aim of the works committee had been to prodnce the simple building at a cost of $7 l .10 \mathrm{~s}$.

## SCHOOL BOARD SCHOOLS

Diss,-The chairman, at a recent meeting of the Local Board, stated that Mr. Menry Angold was requested to produce some pencil sketches of new huildings requived, and four plans were placed before the Board. These plans were No. 4 was decided on. It was also considered that tho present stores were very cxpensive, and that it was desirable before erecting tho new buildings to know the most eoonomical and yet most effective way of warming the schools, and it was suggested the Rer. Mr. Monle's system be ascertained, and probablo cost of same. It was agreed that Mr. Augold should proceed with No. 4 plan, accordiug to the re. prirements, and to get some information as to the mode of warming the buildings.
Mildlesb soughs.-Mr. Isauc Wilson, J.P., of Nun thorpe Hall, has opened tho first schools (in Fleet. man street), erected by the Middlesbrough School Board. Mr. Wilson said he considered this event a new and important era in the applica. event a new andimportant era Mincation dot in Middlesbrough.

These schools were capable of accommodating 800 children, and altogether the Board was at prosent providing for 2,800 scholars. Altbough this was the first school they had erected, they had not beon idle, for they had now 900 or 1,000 cbildren attending their schools. The 1,000 cbildra attencing their schools. 1 . Govorament ordered hem to provide accommo lation for 3,000 ohildren, but they must not orget that the tow was iucreasing, and by he time their schools wore ready they wonld have an extra 3,000 to $p$
declared tho schools open.
Deronnort. Thools open.
Devonport.-The Devonport School Board, on 6 th inst., formally opened the first of four new sclools being buit loy tbem in the borough in compliance with the orders of the Education Department, viz., the Ford Schools. The schools are in the Gothio style, and consist of three departments-boys, girls, and infants. Th boys' and girls' departments face Cambridgeroad, the former on the gronnd floor, the girls with a similar arrangement above them. Each consists of a large room, 45 ft . by 20 ft ., and four class.rooms, each 18 ft . by 15 ft . Surmounting the boys' porch is a bell-turret with spiro 10 ft . high, and giving also accommodation for a clock. The infants ${ }^{3}$ departmont, facing Melville road, comprises a large room, 75 ft . by 20 ft ., and two class.rooms. The rooms are heated by open fire-places, and are well lighted and ventilated. Ample laratories and offices are attached to each department. The schools are erected from designs of Mr. John Chudleigh, jun., of Newton Abbot, by Mr. N. R. Yerren, of Plymoutb. The Education Department on the 30tb of January, 1872, communicated their opinion to tbis Board that accommodation was required for 2,750 ohildren. The Board have accordingly taken steps to meet the requirement of the Departsteps the the following gchools which will pritlo accommodation for 2.529 children, viz. :$\begin{array}{llllll}\Delta \text { rchitect, } & \mathrm{Mr} \text {. Chuthigh i con. } & 192 & 192 & 235 & 609\end{array}$ tractor, Mr, Versen
 Hodge \& Murtin.................. $210210210 \quad$ Cherry Garden-street. trachect $_{1}$ Mr. C. Clifton:

Architects, Messars. Moorshes a \&

giving a general average of cost per head of treet Schools will bo town and Cherry.garden. street Schools will bo completed in February next. The Public Works Loan Commissioners have agreed to advance in lonn $13,37+4$ l, repayable with interest at $3 \frac{1}{2}$ per cent. at the end of able with interest at $3 \frac{1}{2}$ per cent. at the end of
fifty years. The annal charge on tho school fifty years. The annnal charge on tho school fund in the repayment of the prinoipal and interest of this advance when compleced will bo
$568 l .7 \mathrm{~s} .7 \mathrm{~d}$. per annum, or $1 \frac{5}{1 d}$. in the pound on 568 l .7 s . 7 d . per annum, or 1 gid.
the rateable valne of the parish.

Liverpool.-The School Board of Liverpool is working actively in tho erection of new schools for that town. At the mecting of the local body on Monday last, tho proceedings of tho Sites and Building Committee in cluded a recommendation (which was adopted) that tho tender of Messrs. Holme \& Nicol rmounting to $8,700 \mathrm{l}$, for the erection of schools in Beaufort-street, should bo accepted. Upon this Mr. Pooley asked how many schools remained to be erected to mect the requirements of the Elucation Department. In reply, Mr. Roberte stated that they would bave yet to bry land and build schools to accommodate as many as 16,000 children.

An Architect-Mayor.-Mr. Alfred Norman rchitect, has been elected Mayor of Devouport. the new Guildhall, Plsmouth.

THE CONSTRUOTION OF PUBLIC abattotrs in london. A Good deal of evidence was given with reference to this suhject before a select commitice of the House of Commons, which recently held an inquiry as to certain provisions of the Metro-
politan Building Act of 181.1 . The evidence of politan Builang Act of lifle The evitence of Mr. Thomas Rudin is of interest. With regard of the metropolitan district, he suggested that there should be about ten in number. There vould be one at the Copenhagen Catcle Market;
one at Deptford, which would have to be enlarged one at Deptiord, which would have to be enlarged
and improved ; the third one would be near the Great Eastern Goods Station, this néighhourlood heing a very poor one, and the houses small; the fourth would be near the Hackney
Station; the fifth, near Bow Common; while Station; the fifth, near Bow Common; while
others would heat the Bricklayers' Arms Station, on the Surrey side of the river; at the Battersearoad, near the London Gas Works; on some open land near the Westminster Workhouse; in the rear of the Great Western Station at Paddington;
aud the tenth, near the Camdon-town Goods and the tenth, near
Station. He had visited the wholo of these aites, and found amply sufficient open space slaughter-houses, without, in his judrment, detriment to the surrounding neighbourhood. His idea was that these sites should be purchased by rates collected from the metropolitan inhabitants, and that public abattoirs should be constructed thereon. They should be under the control of the Metropolitan Board of Works, if of London might possibly he asked to do so. With regard to the expense of the construction of these abattoirs, he had no hesitation in saying that they would very well pay for the outlay. He cstimated the cost of construction for the that it sbould he constructed by puhlic authority, and he their property; that the teoants should pay rent to the public authority, and that it should include an ample water-supply, hoth hot and cold, and every expense, except gas. As to the area the abattoirs would cover, he calculated it an acre or an acre and a half. There was no necessity for there
distance between them and the neighihouring honses, as there need not he much nuisance. He thought that the sites he had mention coulc be easily purchased for the purpose of huilding Dr. Lethahr
Dr. Lethehy was examined upon the same sabject, and expressed the opinion that it was
desirahle to establish fixed and properly-regnlated desirahle to establigh fixed and properly-regnlated abat those should be well looked aiter in a sanitary point of viow. The present system of slaughter honses he described as a great nuisance,--snch a muisance as ought not to he
tolerated in this metropolis, and, he believed tolerated in this metropolis, and, he believed, wonld not be tolerated in any other large city in Europe.
Lient.-Col. Hogg, chairman of the Board of Works, said that if Parliament shonld decide that public abattoirs were best for the public, the Board would bo very lappy to undertake any duties inmposed upon them.
Abattoirs in Paris. - In tho course of the evideneo taken, some interesting informatiou is
given as to the public abattoirs of Paris, and a given as to the public abattoirs of Paris, and a
brief resume of this information will not be un brief résumé of this information will not be un-
interesting to the readers of this journal. The first witness examined was Mr. J. W. Crouch, solicitor to the Butchers' Trade, who said that in Paris there was nothing similar to our private slaughter.houses. In that city there is at the present time one large market, with ahattoirs
adjoining, called "La Villette": it occupies an area of about 100 acres. Ahout one-half of this spaco is occupied by the market, and the other half hy the abattoirs. In addition thero are two other abattoirs in Paris,-the Ville Juif and La dition, and look as though they were about to be ahandoned. With regard to rats heing a great pest there, they were kept out by there
being no entrances from the sewers into the elaughter-houses, and the doors were shod wit iron. These ahattoirs are described as working very well, and are not shut on Sunday. Hea is sold in Paris habitually on the Sunday in fact, there is a fresh supply every day Crouch said) between Paris and London to the means which exist for having a private slaughter-house. The water is not laid on
sider slaughter-house. The water is not laid or
although the supply is better now than it ever has been. In a large number of honses in Paris being continually supplied with water. When the abattoirs were instituted Paris was prac tically without water-supply, eo far as slaughtering was concerned. The construction of Paris is such that there is no space for private slaughter houses. The next witness examined upon this suhject was Mr. J. W. Keates, chemist that the Metropolitan Board of Works, who said that he helieved the ahattoir of La Viliette was intended to absorb the two other Parisian abattoirs. He had visited La Villette, hut it did not strike him as being particularly offensive. He considered that there would be a very
great increase of expenditure in having a large great increase of expenditure in having a large central abattoir built, either in Loudon or the neighbonrhood. Mr. T. Rudkiu, in his evidence, gave some information as to Parisian ahattoirs. In the year 1866, lie mentioned that there were seven ahattoirs in Paris, including the Ville Juif, Grenelle, 'Montmartre, Poppincourt, Les Batignolles, and Bellard; bat, with the exception of three, he believed these had been closed, With regard to the large abattoir at La Villette, he said, -"The most curious thing I have ever seen in my life connected with the meat trade is this abattoir, for cleanliness, order, and perfection.'

## ANTIQUARIAN RESEARCHES

A recent visit to Leicester and Sljeffield has enabled me to actuire information, which 1 submit to the Builder and its extensive influ. ences. Ahove all, as the most important and pressing, I draw attention to the imminent danger of destruction to whioh the old town-hall at Leicester seems doomed, unless some extra. ordinary and prompt exertion be made by the people of the town to save it. Modern Leicester has so increased in extent, and is growing at the present moment so widely on all sides; old streets have been so ronovatod and altered, and the ancient boundaries so offaced, that it is only by the aid of plans and maps and the main roads, that the limits of Roman Ratee can he at with medioval Leicester. But one interesting monument of the latter yet remains, environed hy recent buildings which convey a conviction that the town-hall will shortly be doomed to complete uniformity, and nake more room for the demands of trade. Of course such a result may be avoided. It is not necessary: Leicester but public anthy will certainly lead to the destruction of the hall, if it he not met hy active remonstrance and persuasion.

The architectural features of the edifice are nothing remarkahle, except that they afford a good example of what such buildings were, four conturies and more ago, in all of onr towns; and it derives interest in the highest degree from its associations with Shalsspeare and his colleagues, who, as "the Queen's Players," were accusomed to perform, through a serics of years, in into a playhouse. Of Hall-place, at Stratford. ppon-Avon, where Shakspeare lived towards the close of his life, and where ho died, scarcely one stone remains upon another; the theatres in London in which he acted are no more; but not wholly, in the very state and condition in Which, in the prime of life, though not yet in the fulness of honour, he took parts in his own plays, which have contrihnted more humanising and moral influence than all the dramatio writings of aucient and modern times. "It is surely something," says Mr. Kelly, "even yet, to he ahle to gaze on tbe very pulley whioh has hokse to draw aside the curtain and discloso ormpeare on the stage !--the living, breathing was not for the greatest of dramatio poels, who writes for an age, hut for all time. popular teeth and serenteenth centrries; and in the ame spirit let ns hope hiq fellow townsmen at the present moment will think and act.
In the western side of what was Roman Vichoster, to the west of the Church of St pile of and in leman masonry, in height ahout 0 re from 6 ft . to 14 ft . This mass is pierced, hut
not through, with four arches or recesses, and in the centre is a small arch of about half the monicated the others. In a valuable paper com. tion,* hy Mr Jam tion," hy Mr. James Thompson, the historian, Wall, as it is it is suggested that this Jewry Wall, as it is called, formed part of a temple, dedicated to Janus, and that it stood near to or adjoining the western entrance to the town. Excavations have since been made which confirm Ir. Thompsor's opinion, so far, at least, as to prove that what we now see is only part of an extensive and grand brilding, and certajnly not a gateway, as has bcen conjectured. The church. yard, unfortunately, covers what may yet he preserved of the foundations of this building and the Charch of St, Aicholas itsel? probably stands npon part of the site, Reparations of the church now being made, show that it was constucted chiety with materials from Roman huildings, many of the lower squared stones heing of large dimensions. Inscriptious throw no light on this and the other important edifices of the Roman town. I cannot find that eveu : solitary sepulchral epitaph has ever been dis covered; yet the portions of columns and capitals and other arehitectaral remains, exclu sire of the Jewry Wall, prove the presence of puhlic huildings; while tesselated parement of which a few fine examples are preserved attest the importance of the place. Oue of these pavemente, now in tho Town Muscum, has a group of three figures, consisting of a nnd towards the fema and Cnpid bending his bow supposed to be intended su-sect has bocm of Actaon and Diana. This it cannot be myth it is not 80 enay to say satisfatorily we; but artist meant to the
 the town and picinitr, and ley are bein the town and vicinity, and they are being augment other ohjects inst disorered ame among tessera of hlue lizs, inscribed, in two line PAL GRACILIS; and a fragment strous yellow marbled pottery, stamped OF IAPOMI,--the onls instance I know of this peculiar and rare Roman ware bearing a potter' name. Mr, Harrison has also lately acquired the iron framework and chain of a bucket fron Roman well, 25 ft . deen, situated just outsid he south gate of Leicester; and three leade1 collins, irom Newarke-street. One of thes had an opportunity of examining. I cannot ascribe to it a Roman paternity; for, although it may not be many centuries posterior to tho homan periou, it does, not conform in characte to any one of the many leaden coffins of nndouhted Roman manufacture with which I an familiar. I will not gay these coffins may not
he as late or later than the eleventh or twelftl. entur
Although the museum contains no lapidary inscriptions relating to Roman Leicester, it hathe good fortane to possess a fine columna milestone npon which appears the name of the town, lrate. It was discovered some yeni since, on the military road, at the distance o wo miles from the town, which is marked upo the stone at the end of the name and titles of the emperor Hadrian,-A RATIS II. It is possible that the root of this name may h dentical with that of Ratsby, where, hy the indness of my host, Mr. Alfred Paget, I wial hown a British earthwork
Of Sheffiold I have hut little to say that can helong to the domain of archacology. From time mmemorial the place has heen celebrated for th hardware; and now for its catlery, its iro nd steel manufactorias, it holds the for Shes position in the world. When we look at she ts contrihutions to onr domestio necessities nal comforts we can but feel admiration and grat tude for the minds which have conceived the hands which have wrought so muoh in improving the commercial and social condition of society. These feelings will bo intensifed hr mixing with the population of the town, aric seeing at what a saerrifice to liberty and to health the blessings we onjoy are purchased. As yet Sheffield has no museum; hut there is Literary and Philosophical Society and an Architectural and Archeoological Society, which include men of intellect, zeal, and benevolence who are resolved on showine that eminence in mechanical and industrial arts is not incom patible with science and literature.

| Mr. William Bragge is preparing a collection | scarcely completed before it was declared to he |
| ---: | :--- | :--- |
| of ancient and medizoval works in iron and | too small. Fow moch yet remained to he done to | steel which he intends to present to the town It is a happy and appropriate idea; aud, emanating from such a apan, it will surely nevor die in conception. In this department there is soope for the introduction of much that has hitherto heen overlooked in our museums, as, implements, domestic utensils, \&e.

To Mr Bragere
noder favourable circu indebted for an inspection, at Bradfeld ahout seven miles from earthwork at Bradfold, ahout seven miles from Sheffield. It is called Bailey Hill, and is situated on the north-west of Bradfield Church, at a short distance. It is a very lofty hillock, which at a
remote period has been converted into an exremote period has been converted into an exwide extent of country; and is hy nature and art almost impregnable. Tho Rev. Joseph Hunter considered it a Saxon fortress on the frontier of Northumbria; and the late Mr. S. Mitchell was of the same opinion. The Rev. J. Stacye, in the second edition of Hunter's Hallamshire," by the Rev. A. Gatty, while he does not dispute the possibility or prohability of its serving as a Saxon castle, gives it a far earlier origin; aud with good reason considers it to havo been one of the strougholds of tho Brigantos. I cannot do hetter tban dircet attention, for the sake of comparison, to Conig's Castle, and Cranborne Castle, in Dorsetshire, so well described and illastrated in Mr. C. Warne's "Ancient Dorsct." Some of his remarks on these hill fortresses will well apply to the Bailey Hill, at Bradield. C. Roace Sintre.

## SANTTARY SCIENCE.

Ar a meeting of the memhers of the National fealth Society, held on Thursday eveming, the Association, at the Rooms of the Social Science Ross, Medical Officer of Health, Bloomshury read a paper on "Helps to Householders in Sunitary Matters."
in introducino was taken hy Canon Kingsley, who, in introducing Dr. Ross, said that he had always the health of the intert in anything that concerned trusted would he of a more practical character since certain changes had brought hims here London, in the centre of civilisation, ond alas in some repects, of modern barharism. The movement on the part of the National Health Society, to teach practically the science of health, was growing and growing ; and in tbis direction a considerablo progress had been made in Birmingham, owing to the munificent sam of 2,500l., which the authorities had received for the purpose of spreading in Birming. physiology and health. Dr. Corfield's laws of thero had been so well attended, that we micht presume that Birmingham would becomo the great health centre, and this movement was progressing slowly and steadily. One of the most important publishers was telling him only two or three days ago that this health movement was stirring men's minds wherever he turned; and that there was an increasing de. mand for lectures and pamphlets conuceted with the simple science of health, and those rules by eusure the health of their childrenilies could there would be for any works on heath that would he of that cheapnes make thom attainahie by and compactness to the middle classes, quite, and interesting to, wbich wonld increase, quite an unlimited sale, weometrical procresse, not in arithmetical but in left into an exceeding wide curve out right and ment gathered strength wide curve as the movement gathered strength and popnlarity, proving its own efficiency and life-giving power, which he (the chairman) had no doubt but that the novement would a
In the course of Dr. Ross's paper, he said that whilst everyhody admitted theoretically the vasue of health, most people practically disregrarded it. Hence saritary science could scarcely he called popnlar. Yet sanitary science, when its principles should he well estahlished and fally carried out, would supersede, to a very large degree, all that was now known as the practice of medicine; for even now, in its state of infancy and imperfection, it had revolutionised th healing art. Much had heen done, too, in re gulatiug and improving the physical conditions of our sooial life. Our mighty city had carried
promote sanitary principles! Look at the enor. mons masses of human heings who are herded together in our larger cities iu miserahle honses so dirty, so dark, so ill-ventilated and comprehensively loathsomo, that no gentleman would keep his cattlo in them with the least regard to his own iuterest. Yet the owners were not always to bo hlamed; it was often their mis fortune rather than their faylt that their property had fallen into the ruinous and disgraceful condlition in which we ofien found it. Householders generally found a difficulty in keeping fortunately, the saupitory armatary condition.
honsestely, the sautary arrangemetats of on houses were so universally had, ab initio, that all that could he dono in most instances was merel paliative of iucurahle evils. For example, our sewers ran uncerneath the strects in front of our houses, as also did gas and water pipes necessitating frequent disturhance of the roadway for repairs, and set ting free offensive gases either from the sowers or the gas-pipes. To abate this, it had been proposed to make a tunnel or enhway in which all pipes should be placed. The plan, which was a good one, had beed adopted iu the construction of the Holborm Fiaduct, But it would be a long time, he thought, hefore Mr. Hayward, the City Engineer, would be able to carry it out in the narrow streets of universally ingide herm, too, were almos of them, avert anisance and daner, rhe, at all imes, through the houses underneath the passage in the hasement, and the risk of leakage was conthe hasemen, and the risk of leakage was contant, even thongh toere should he pipe drain. a good sanitary system. There should he a road at the hack of every row of houses for the especial parpose of providing for domestic accommodations. The main sewer and tbe water and gas-pipes should run down naderneath the oac. Water-closets should be huilt outside houses in the rear, and cut off by proper arrangements. so as to prevent contamination of the air of the ouse. Many people thought that if the trapped a drain they were then afterwards safe, hut this was a mistake. A had stench would man througa a drain with the hest mechanical he The efficiency of a trap depended upon ne ater it contained; and unless a trap be frequently flushed, either the water would evapo. contaminated with the or the water would be itself a source of noxious exhalations. Ther were numberless forms of traps recommended; hut whatever trap might he employed, we slould always remomber that as a trap wonld not work of itself, so 2.8 to he clear under all circumstances, it should be woll flushed after each usace. The commonest sources of annoy. ance with which he had to contend were old hrick drains, soaked soil, rotten fonndations, and camp, fcotid walls; should this be the case in any of the houses witl which the meeting had to contend, he would recommend then to call in a surveyor, or an experienced builder, to repor 11pon and have the matter seen to. There was sanitary maxim that a water-pipe should never enter a drain; but a fow years apo it equally a maxim that all water-pipes should be this hod into drains; and they were so carried to thas hour by order of some public Boards. Both indims would be found wrong in practice, i indiscriminately applied. All water-pipes and and pipes shousd he trapped, both at the top and bottom. With regard to cisterns, it should te an inviolahle principle tbat the squply of water for drinking and cooking should be distinct rom the supply to the diains. Every possible risk of the contamination of drinking-water hy The impurities should he strictly avoided. doue cistern for drinking , water should be the water should enter by a ball-cock, the vacant space between the two cisterus; and more charcon finld ascend through one or of tho inner tank. Thus all dirt suspended in tho water would be deposited at the hottom of the water cistern, and the charcoal filters would offectually purify the water of all pollations. The overflow-pipe should be always trapped and cmpty itself into space. The tank arrangements for drinking-water were radically had. There was an absolute neoessity for ohtaining an case at supply of water. This was not the case at present, for the supply was likely to
companies were admitted. Our population was of providing for its sanitary not see any way of providing for its sanitary noeds except by he system of water-carriage already in nse. heir inability wore even uow complaining of expense they to meet the demand, and of the ments imposed upon them by the Lecrislatare. A constant supply was the thing wanted, and the companies would not afford it except pon such estrictions as would make it practically inopera ive as a sanitary agent,-the very end in view But local authorities should have a power of commanding an ampler supply for ushong and cleansing purposes than they possessed. More water must he had even if it came from the Welsh or Westmoreland lakes. was quite likely that, if the demands the companies continued to rise it wonld heaper to hring watar from mountain dishict as tbo people of Yierua the Alps), from Wales to London fhem ourselves to the present sources of shan leave vas a larce question and ces of supply. This out the question, and had many aspects; ut the time was not far distant when the urgent wants of this vast and rapidly maltiplying ity wonld enforce that the matter should receive ue consideration.
An interesting discussiou followed the reading the paper.

## THE LATE DR. CRACE CALVERT.

We have received letters from friends of Calvert asserting that, a tbouch he toot tophoid in Vienna, the disease from which ho really diad was pulmonary consumption. Mr. Richards, the writer of one of them, says - "You are ther fectly correct in assumine the fou are per vert had implicit foith in the porer of cal acid as a preventive of typhoid fever; but unfortupately could not carry it ahout with him to disinfect every place he stayed at in his travels. I may, however, mention that it was successfully used in the treatment of his case, and that althongh his wife and nurses were in constant attend isited whilst he was snffering of his friends
 not one of them took the disease, thas slowing that, by proper care, infection may he pre Wedi. had no desire to depreciate carholio acid in its proper place. What we meant to sbow was, that it must not be supposed to ender unnecescary, or to compensate for the want of, proper sanitary arrangements.

## WHAT TO BUILD WITH.

Sin,--If your correspondent, " H . T.," will furn to the Builder for 1.872 , he will find some articles germane to his reflections occasioned hy the view from Westminster Bridge of three publio bnildings under repair from decay. The atles of two of these articles are, I tbink, "The and "Concreto Building and Encaustic Tiling," and there are prohahly others. They deal with be huestio prohanly others. They deal with tbe question of the employment of polished for lare, ablo or large public huildings, as capahle of a most smptruous effect, as necessitating a broader and mpler treanmeat than is now too little resorted , and as meeting tho question of so macle concern in city architecture, the preservation of the material employed from the dirt-producing and corrosive properties of the atmosphere of cities and large towns, which more than anything else is destructive of effect, if not by actual decay at anl early date, yet by blurring and defiling the building to such an extent by dirt and weather stains, as to make it vory gnickly an eyesore. It is surprising that so little is attompted with different tinted and polished granite.
The snggestion as to concrete was that it conld be employed in the fabric of the huilding, and that then, whether for exterior or interior decoration, we had in encanstic tiling a material capahie of endless variety of colour and design, according to tbe character of the huilding and the genias of the designer, and thas would be comhined all the advantages of durability, light, cleanliness, and a novelty and freshness of strle which woyld he a great rebef upon existing modes.
For a clear country atmosphere the materials most ready to hand in the district should always be used, there being no need for such resorts as the ahove.

New reredos, herne church, Kent--Messrs, Goldie \& Child, Architects

NLW REREDOS, ST. MARTIN'S CEURCH, HERNE, KENT.
This, in addition to a restored chancel and other screens in carved oak, has been erected by Mr. Earp, soulptor, from the designs of Messrs. Goldie \& Child.
The reredos now represented is composed of alabasters, marbles, and Caen stone, of delicate detail, and is richly carved.
The centre suhject is the Crucifision, and those on either side the Sacrifice of the Lamb, and Ahram receiving from Melchizedek the Bread and Wine; the aroade flanking these containing half-figares in relief, the Evangelists, \&c.
The rich gables forming the upper part of the reredos are pierced to admit of an effect of colour given by the new stained-glass window.

On the apex of each of the projecting canopies, which are brought forward over the adoling angel. Flanking the canopies, partly in more open spaces, for it must be remembered carving is by Mr. Ckremer,

[^9]
## SHAMS.

Sur,- -Now that this ever-interesting snbject
has cropped up in the has cropped up in the Builder, it would be a thousand pities that we should in the result find
it more confused than over, instead of the re. it more confused than over, instead of the re-
verse. Will you, therofore, allow me to ask a verse, Will you, therofore, allow me to ask a
quostion or two, and thus indicato the sort of quostion or two, and thus indicate the sort of
dificnulties that controvorsialists wonld with advantago sot themselves to solvo

1. Strange as it might appear, Mr. Whitaker would seom to have ( p .890 , s.c.), , used a word
which ordinarily conveys condemation, altbong whioh ordinarily conveys condemnation, altbongh
he was spcaking in reference to something onhich he was spcaking in reference to something which
he wished to fayour. Was this done in order to pique curiosity, or in an honest endeavour t change this bad meaning of ths word "sham,
into a meaning convering uo हentiment eithe into a meaning conveging uo centiment eithe
of praise or blame? Ho is speaking of the no. costly luxuries that may, now or in the futuro, bo mado to render somewhat loss bare and poor the lives of the least fortunate of the struggling in modern western civilisation. Such produotions may have their own good qualitios in good rich nor rare ; and though the qualities that would bo possihle with ricb and rave materials had better not he aimed at. For instance, woodcuts may well be hung on a cottage wall, and they noed not profess to be steel engravings; plaster easts may as well remain plaster, except perhaps where thcy represent an original in
bronze ; steel ornaments need not delicaoy and softncess possible in silver, but will hest retain the geomotrical character of design to which they readily lend themselves; and so increased production, would thus result, as he pats it, in a service to hnmanity; but as yet we sce no necessity for what we cormmonly know as a sham, -i.c., a connterfeit or cheat.
2. Wo seem, question to deal however, to have a different of more or less luxary in dress and porsonal adornment. Whon we taik only of Groek coins reproduced by electrotype, or other such multithey may be the daily delight of the numy they may be the daily delight of the many
instead of the few,-we show all ronnd the most admirable concord. But rings, and brooches, admirable concord. But rings, and brooches, and watch-chains of mosaic gold and imitation
silver !-here we approach tho tug of war. Is :ho dosire for personal dccoration so amiable aud sirit-stirring a quality as to render worthy any
port of gratifieation that may be afforded it? Is it liko the care for children and other sucb rolpless ones that with most moralists would ender landable the, if need be, foreible demand or food for thera?-or is it even more strongly,
f possible, a leaniog wholly to virtne's side i possible, a leaniog wholly to virtue's side ?-
or is there rcally nothing more than conven. ional halfopinion to toll agninst these pre ensions to a wealth desired but not possessed ? -
in the snobbishness of the woll-to do pising and endcavouring to render conternp. ible the little strivings of those poorer than
hemselves ? If we could hemselves? If we could settlo this point Imorals we should be able to apply it very f the question as to personal trappings, such as heap substitutes in buildiug, temporary and uakeshift contrivauces,-many of which are how perhaps a little unduly passed by. But we weed not hint thus at what is behind in order to nstify the discussion. There would be somerhat a sham is, and who could all agree as to hight then approach Mr. Proud's questions, . 851 , snch as, - Are any deviations from the ppraise produetions in the fine arts to be brought bont? Are intrinsic qualitics to become of less, ervice to the which things may oe put (their oportance? Or are we still to see preat difnt nees between tho perfect worts of a great rtist executed in perfect materials, and the
nmbler though not utterly commonplace aat must for ares yet, it is to be fored, work 10 mo

King's College Chapel.-The chapel of ing's College, London, after an interval of bout three months, during which it has been losed for the completion of the decorations,
nder the superintendence of nder the superintendence of Sir G. G. Scott,
as been re-opened. The style as been re-opened. The style of ornamenta-
on adopted is the Byzonting on adopted is the Byzantine, and the cost of te whole work is about 2,5001 .

THE NEW PUBLIC OFFICES AT
LEWISHAM AND THE ARCHITEOTS.
Some littlo orcitement is being caused amoners the inllabitants of Lowishan and the district by tho conrso whieb the Lswisham Board of Works pnhlio offices when in connexion with the now that township. It appears that a few month ago advertisements were issued inviting archi tects to competo for tho new bnilding, and fifty seven gentlemen sent in their names and tost commit, when tho subject was referred to mending not that aghtap report recom gentlemen who had forswarded their name should be invited to send in desions, but thot former nomber of tho Board (Mr. Elkington) who bad sent in his resignation some month previously, should be selected. This recom mendation was adopted, but sulsequently one of the members of the Board moved that sir architects be selected to compete, and that the former resolution bo rescinded; but the motion was lost, and Mr. Elkington remains the arehitect for the bnilding. This decision of tho Board dissatisfaction excited a certain amount of lissatistaction amongst the inhabitants, who, not fifty-sevon architects who sent in their names have not been treated fairly, and a pnblio meeting is talked of
At their meeting last weok a somewhat odd and arnusing discussion took place on architec. nral style generally. The new offices committeo nd that the that the style should be Gothic, the that the architoct's commission should be at willingness to accept the compensation laid dis wy the rules of tho Institate of Architectown case the bnilding should fail to be erected. Upon this recommendation heing submitted to the Board, Mr. Lemon, one of the members, moved as an amendmont that the huilding be erectod in the Italian stylo, and not in the Gothic. In the disonssion which followed the relative merits of the two styles were freely canvassed by the that the huilding. Evontually it was decided and desigus accordingly

EXPANSION AND CONTRACTION IN BRIDGE BUILDING.
THE ST. LoUis bridae, missouri, e. s. A. AN American paper 'affords the material for the following concerning the progress of this The difficu
The difficulties to be encountered in priting in the connecting tubes to complete the san orally understood, nence the bridge are not generally understood, hence there is a little snraccount of tho darge portion of tho public on present the At supported by the cables, and wherst that is the case, the expansion and contraction the the by beat and cold are of noction of the thbes when it comes to putting in the last ; bub oxpansion and contraction play an important part. When the connesion is once made, and sustaining, a new eloment is introduced selfintion antroduced,-the VIVhen a due to pressure.
When the cables are slackened, the arch at the centre will, from this cause, settie about 3 in, ength in the tahes, all for this by inercased based on calculations being that temperatuperature of sixty degrees. inch what would be the intervening space betweeu the approaching tubes, and the last points have beon diminished accordingly.
Only once sinco the workmen have been ready oputin theso last tubes has the temperature conditiourable. On one morning recently, tbe inexplicable tardiness ${ }^{2}$, but owing to some men, the tardiness on the part of the workpnt in and filted to a nicety. In the meantime the san shone ou the bridge, and when it was attempted to place the other tubo, it wonld not go entirely to its place, being about a thirtieth of an inch too long, on account of the expansion of the tabes in place. An attempt was made rive it into place with sledres, bot withont ffeot. In consequence of not being able thont the second tubo in place, the first one bed to taken out again, and a more favonrable opportunity waited for.

The prospeet hoing that a delay of several days would occur before the exact temperatnre to try a little stratecy ined, it was determined the temperature artificially the case by reducing forty-five tons of ice were Accordingly, about and bound on by many yards of to the tabs forming on by many yards of gunny lagging, forming perhaps tho most extensive ice poultice the expansion had been roduced about 2 ine, and our informant concludes it was expertod that in a fow hours more the contraction would ho sufficient to admit of the tnbes being put in place. We hope to hoar of the snccessful exeonit in a fature number of the Builder.

## PUBLIC WORKS IN BRITISH INDIA

An ofioial statement has just heen pablished, showing the amount of inperial fands expended publio works in British India daring recent cars. A short sesumé of this statement will ince is uninteresting. Each presidenoy or prothe sum expended separatcly, and we find that homb expended on ordinary puhlic works in , including Scind) was, in 1872, 493,8697 hile the amount expended similarly in Madras was $22,250 t$., and in the Punjab, $346,070 \%$. The 48 expenditure in British India in 1873 was ,489,72قl., the amount heing in $1863,4,400,632$. Te statement also shows the amount expended y Government for irrigation and other extra ordinary public works in British India. From this we find that the largest expendituro under ams head, in 1872, was in the Punjai, the expended $331,28 \mathrm{I} l$; while the gral there was expendituro for these wote grand total of 1,628,4742. This shows a slight 1872, wa former years, with the exoeption of 1870, when the amount wos 1870 , when sterling. Of the sum thus expended millions India during the sum thus expended in British India during the past year, it appears that amount. The cost of absorled tad largest the following heods: - Constrion is divided into the following heads:-Construction, $703,611 \mathrm{l}$ establishment, 216,4957 .; tools and plant, former ; and increase to stock, $33,201 \ell$. In former years, it appears that the cost of irrige tion works in India has not been so great as during the past year ; and it is noticeable, indeed, that 10151568 the sum expended was only 19,000t. During recent jears we find, too, that the amount expended heing thus Fund works," Construction, expended heing thus classified:Construction, 50,871 , ; ©stablishment, 2I,03I . guaranteed railways, $54,481 l$. For State railWays the amonut put down, in 1872 , is $497,767 \%$. Wrom a statemeut railways of India, we find, from a statemeut upon the subject, that the 5,057 miles, as ayainst 2,234 miles in 1863 1872, the total nu, as against 2,234 miles in 1863 ; that 1872. T9 220 ber of passengers conveyed was, is (in addition 2,0129251 ; that from the goods traffic) being 1872 wore 3,406 that the working expenses in railway $3,406,617$. The greatest length of being 250 open is in Bengal, the distance next in pro miles. Mactras and Bombay are graph in British Ind The number of miles or tele. quently to this date no statistics are given unoa the subject. $\qquad$
THE PROPOSED NEW BUILDINGS ACT metropolitan doard of works,
AT the meeting last week, the Parliamentary Committee submitted for the approval of the and Mane dranght of the Hetropen An consolidate the Buildins Acts to rela formation of stroets and to amend ond the he provisions of the Metropolis arn exten Acts respecting the line of boilding Memen ment of streets ; to mate spogsand manage against fire, and to provide betor prots he Board's sewers The protection for clauses, and is 1 prosed to culties mhich have been foned in the diffiActs which have been found in the existing Acts.
rraurht bill in moring the adoption of the day he should say that at that late hour of the nce was that tho Bill he had to propose, which committe submitted to of the or the whole Board, when the whole the elanses conld be oonsidered. The firs part of the Bill embraced a consolidation of al the existing Building Acts, which oighteer
vears' experience of their working had shown to be necessary; the nest was to regulate the form of streets and lines of buildings, and to make special provisions against fire.
main principles of the Bill, and they had for five or six years been brought hy the Parliamentary or six years been brought hy the the Board. They Committee under the notice of the Board. They had also communicated with the bulaing trace,
saw-mill owners, and pianoforte manufacturers, saw-mill owners, and pianoforte mannfacturers time, and all their ohjections had heen fully considered. The first principle of the Bill to
which he wished to draw attention was as to the which he wished to draw attention was as thisting law no building could he erected where the cubical contents were more than $216,000 \mathrm{ft}$., but hy the new Bill the cubical contents were calarged to $220,000 \mathrm{ft}$. The second ohject referred to the line of buildings, and under the new Bill power was given to the Board to define the line of huildings instead of the architect, who was responsible to no one. There were also separate provisions against fire, which were of great im portance to the metropolis. By the present law there was no power to prevent a large accumu lation of timber in timber-yards, and if any attempt were made to interfere with it that would be attended witb a great cost in the form yards. A provision contained in the present Bill wonld prevent any such erectious in future and thero would he no accumalation of timber in yards beyond those in existence at the present time. Another matter was in referenco to steamengines in timber-yards, and as regarded them the committee had adopted the aame principle and no new places of this description wonld bo sllowed to exist. The great provision of the Act was to prevent the extension of fres, so far us the structural arrangements wcre concerlued. At present the district surreyors had a power quite independent of the Board. Blany persons did not owject to tho power being exercised by the Board, bnt they did strongly object to such largo powers being conferred upon district sur veyors. Undor the new Bill all orders would come from tho Board, and the district surveyors would oniy be their servants, instead of, as at present, being vested with a quasi judicial anthority. Ho moved that the Bill he referred to a committee of the whole Board, to consider the clauses in detail.
Mr. Fowler seconded the motion, which was put and agreed to

TIIE NEW MASONIC TEMPLE, PHILADELPHIA
Tue new Masonic Temple recently erected at the corner of Broad-street and Filhert-street, Philadelphia, and already hriefly referred to in our pages, was opened on the 26 th ult. by the aficers of the Penusylvanian Grand Lodge, and a grand procession of all the lodges in the city rok place on the occasion. The huilding, which asserahly-rooms in the world, and is a curious pecimen of architectural art. The strncture has heen nearly five ycars in huilding, and cost haserds of $1,300,000$ dollars. The outside is 1pwart prith of pranite, with hacking built entire 1 walls, and arches, which are very thick suhstantial. The chief frontage is of finely, dressed Quincy granite; the Filuert-street front, running to Juniper-street, is of Richmond dressed fronts are of granite also. The huilding has a fronts are of granite also. The huilding has a
hasement and three lofty stories. The main hasement and three lofty stories. entrance in Broad-street is modened from the exception of the figures, these being symbols of the order. The style of architecture on the first and second floors is Norman and Gothic, and throurghout the rest of the edifico Corin. thian. The meeting-room of the Grand Lodgo is the largest apartment in tbe temple. From an octagonal vestihule at the western end the visitor enters througb massive walnut doors, with cedar sinkings and raised panels of mottled French walnut. The work is highly polished. The furnitnre of the hall is of walnut and cedar covered with hlue plush. On every side Masonic emblems meet the eye, carred in wood or stone or shining from stained-glass windows and on glohes. The Grand Chapter Hall is the next largest roons; then come the Egyptian hall, the Ionic, the Normal, the Oriental, and unmerous other halls.

The library is situated on the secoud floor, and if the plans of the Grand Lodge can he carried
complete Masonic library. It is intended that very publication relating to Freemasonry shal o all Masonic bodies in the Lnited States. During 1872 about 365 dolars were expended for rasonic works of rarity.
extensive building operations at BARROW-IN-FURNESS
We have on more than one occasion, in thes columns, noticed the extraordinary expansion of Barrow in-Furness, which, from a hamlet conaining less than 100 inhahitants not twent years has now hecome atown of reat com mercial nation of uwards of 50,000 , In addition to the crimeroustablis ments for manufacturing $p$. numers and and pres, ill ho hare hen erecte whher and wha works or this claracter, on ection itudo are now lo corso a of tho town alone, and the inadequacy of bous accommodation in this particular district to workmen constantly coraing whe in town, has led Messrs. Yenuall \& Hitchen, exten sive contractors, to make arrangements for the huilding of hetween 700 and 800 cottages 100,000 yards of land, which has just heen prit chased from the Dake of Devonshire for the purpose. The work of building these cottage has already heen let, and their erection is to h proceeded witb immediately. It is compute hat, within the last two years from 1,200 to 1,500 houses havo been erected, and that inde. pendently of the 800 cottages ahove referred to 300 new houses at least nre at present in course of erection. New iron works for the smelting of he larce deposits of valuablo iron ore in the district, are constantly springing up, as wefl as additional steel manufactories, which is now oue of the great staple industries of the town. Tbe eigantic wet dock of 200 acres, for tho accomgit a nde iven and 1,000 aso now g a plo na 3 ,000 and 4,000 ton burthen each, are also bciug hailt in the port.

## VENTILATION OF THE BRIGHTOS

 SEWERS.Soyre douht having arisen as to Sir John Hawkshaw's views on the question of ventila tion, the engineer writes:-"There is no choice between providing efficient ventilation and running the risk of sewer yas in its worst and most concontrated form finding its way int dwellings. Tentilution, bowever, to be of use must he thorongh. A few long and circuitous connexions hetwcen sewers and rainwater pipes, for instance, and contrivances of that natare are of little nse. Ventilators also in which charcoal is introduced, are unsuitahle, as the cbarcoal hinders the pure outside air from enter ing the sewers and the diluted gases fron escaping through the ventilators. If the venti lators are properly made and sufficiently numerous, you will find them nnobjectionahle The least distanco apart at which ventilator should be placed will vary according to circum stances. In the intercepting sewer I hav placed them 200 yards apart, between Hove and Kemp Town: east of Brighton they are rather more tban 300 yards apart. These distances are snfficient for the interceptin ewer with its large sectional area and fa curves, but in the case of trihutory sewers o mall sectional area and having sbarp carves, the entilators may have to he more frequent ndeed, the more n刀merous they are within reasonahle limits, the better. As regards the ther part of your resolation, viz, as to whethe districts entirely without ventilation will, if none he provided, he in greater danger of sewer gas ntering the houses than at present, the cbayg of circumstances that will occur when the inter cepting sewer is in operation wis into the intersowers and drains nischargng hoto $b$ and cepting sewer will, through that sewor, $B$ th to communicate with cad I $\quad$ Bat intercepting sewer. will, as 1 have aiready intimated, he provided with elfccive ventila tion, and I do not consiler that atter is is in operation, there will be more danger of sewer gas entering the houscs than at present. Hitherto you must hare been running great risk in this reapect."
westminster Bridge and its surrocndings.
Sir,- In reply to a question in the House of Commons last session, Mr. Ayrton stated that he would takecare the building for St. Stephen's Cluh shonld not exceed in altitude the Palace of Westminster. Of course he did not mean the clock tower; but I ohserve that advantage has heen taken of the recess to carry up the now building considerahly higher than the ridge line of the palace. What is Mr. Ayrton's successor abont, to allow this?
Having my pen in hand, I heg to express my surprise that from rerlec, or some other canse, Westminster Bridge is not yet finished: in the piers immediately under the lamps at the north west and south-east ends, and on the four central piers hondsome cast-iron plates were in serted. There are ten other piers, and in each seraces were oridentle lef for the insertion of spacise plates are in similar plates . prob if y destrey on of the plates could be readily destroyed, one or be plates con 1 be somehody's duty to see the hridge finished. Aprin, at the top of the landing-steps, from the Speaker's lawn, there are placed two hand some stone piers for lamps. Years since an old lamp of the usual hideous street pattern, was placed, evidently tomporarily, on one of thes piers, and there it remains : gross neglect this on the part of some offial in care of thovern ment buildings. At the east end of the hridg on tho Southern Embankment, a gateway was constructed, and filled up with deal hoards. I was doubtless intended by the architect that gate should take the place of the boards. a fuestion as to whetber the gate bo supplied by the Metropolitan Board of Works hy tbe authorities of St. Thomas's Hospital These are matters of small moment; but ppears th

## THE PUBLIC HEALTI

Tee last quarterly return made by authority of the Registrar-General is satisfactory. snows that in the third or summer quarter of this year $114,3 \pm 3$ deaths were registered. The amual death.rate was so low as $19^{\circ} 4$ per 1,000 and 2 per 1,000 lower than the average rate in the corresponding quarters of the ton yeara 1863- 22 . The death-rate last quarter was lower than in the corresponding period of any year since the remarkahly cold and wet summer of 862, then the deaths were equal to but 18 pe 000 annually of the population. Had the death-rate last quarter heen equal to the avcrage ate in the ten last summers, rearly 12,000 more persons would have died than those whose eaths wore actually recorded. A very large roportion of this decrease in the number of eaths was due to the continuance of a marked lecline in the fatality of the principal zymotic diseases.
ate elen registration divisions of England and Wales, the annnal death-rate last quarter ranged from 15.0 and 15.3 per 1,000 in the agriultural counties of tbe south-westerm and south-eastern divisions, to $23 \cdot 1$ and 235 in the principal manufactaring and mining counties Durbam and Northumberland were the ouly ountios in which the deaths registered quarter exceeded the average nnmbers returned in tbe tbree preceding corresponding quarters. The popnlation of the registration districts and sub-districts containing all the chief towns of England and Wales is now estimated at about thirteon millions and a half of persons; the annual death-rate among this large urban population pras equal to 22 per 1,000 during last quarter, and was 21 below the average rato in the ten previons corresponding quarters.

Exploration of the Libyan Desert.-The German expedition for the exploration of the Lihyan Desert is expected to start from Eoppt ahout the end of November, and from expedition is Dr. Gerhard Rohlfs. The funds for the expedition are furnished by tbe Khédive. They are are prepared for for with them 500 iren ceses, capable of holding 1 cwt . of water each.

THE MAYCHESTER SOCIETY OF ARCHITECTS.
$S_{\text {ir, }}-$ - In the President's address, priated in your prper of the 1 st iust., amongst other
remarks he says he is pery desirons to see remarks ho says he is very desirons to see
more availablo system of instruction for stndents more availablo system of instruction for stnatents
ostablished, "and some of those advantages established, "and some of those advatages
which lio within the reach of their bretbren in London," \&c. Does it not seem rather inconsistent that from this same Society, promoted
mainly (if I mistake not) by tho prcsideut, who mainly (if I mistake not) by tho presidcut, who was previously the honorary secretary, all
students are excludet? And it is limited to students are excludel? And it is limited Oue wonld havo thought such burning zeal as is hore expressed might have, at least, given
the youngsters a chanco of benefiting by the the youngsters a chanco of bonefiting by the
wisdom and experienco of their elders, as in wither architectural societies. It is a fact that a man may he an Associato of the R.I.B.A., momber of tho Architectural Association, and respectifully venture to express the opinion that it is unwise to sot up a close corporation of this reason to know that soine of its members are also of the same way of thinking. evonts, it would be better, whilst this system is ing facilitios for improvement to the younge members of the profession.

STATISTICS OF OHMNEY SHAFTS.
Sir,-The importance of thoronghly gifting the cause of the Northfleet ontinstrophe is so fully recognised, that every ray of light which can bo thrown upon the subject I believe will be roceivec pared seventeen or eightoen years hack of some of pared seventeen or ei-shtoen years sack of some of
the tallest chimney-slafts in this neigh hourhood (Woolwieh), I furward the following statistics for the information of your numerous readers, for the information orthour aume
if you thiuk then worth iusertion.
if you think then worth insertion.

The highest chimney is that of the shell | foundry in Woolwich Arsenal, and was huilt in |
| :--- | toundry in woolwich Arseal, and was 185 . It stands $223 \mathrm{ft}$.9 in a hove the

the year 185 . the year 1856. It stands $223 \mathrm{ft}$. in. ahove ine
ground-line, and the brickwork is continued ground-ine, and
down to a depth of 16 ft., making the total
height 239 ft .9 in , above tho concrete. It was height 239 ft .9 in. above tho concrete. It was
built from the inside. It has a base nbove the built from the inside. Tte has a wase above the
ground-line 20 ft . square, and with plinth and
 cornice 27 ft . high, above which the octagonal
shaft commonces, being extervally 16 ft .9 in . in diameter at the bottom, and 6 ft. 6 in. at the top. The walls aro 2 ft . $7 \frac{1}{2}$ in. thick at starting, and rednced $4 \frac{1}{2}$ in. at every 31 ft 6 in ; the
upper 26 ft . heing ouly 9 in. thick, all built in mortar, exceptiug the top 9 fto, which is bell. shaped, and huitt in cement, and is surmounted
by a Portand stone eqp aad blocking, weighivg by a Portland stone cry, and blo
by measurement about 17 tons.
by measurement about 17 tons. From the day of laying tho first briek to tho timo when eight or nine of us connected with the work mounted to the top and sat on the
parapet at the ceremony of laying the last stone parapet at the ceremony of hying the last stone
was only nineteen weeks (see the Builder for 1856, p. 638). An attempt was made to tnke a photograph of the buildings below, but with a slight viud the oscillation was too mach to admit of such being done, and was quite perceptihie, notwithstanding which it has stood many a gale, and is likely to hear many naoro.
Thero is another chimney in the gun-factory department, with a base 18 ft .9 in , square, and 30 ft . high, above which rises an oetagon shaft, 140 ft . high, having an external diameter of 13 ft .1 in . at the springing, and 5 ft .6 iu. at the top, the greatest thickness of brickwork being
$1 \mathrm{ft} .10 \frac{1}{2} \mathrm{in}$. for the first 50 ft , and above that redncod $4 . \frac{\mathrm{t}}{} \mathrm{in}$. in thickness at every 30 ft ; the top 9 in. thick, and finished with a bold stone cap and blocking. There are several others varying from 120 ft . to 150 ft . hirh, and in no
case were they huilt more than 9 in. thick at case were they huilt more than 9 in. thick at
the top, and gradually increased downwards somo are octagonal and some square, and no failure has occurred in any of them.

Compring these facts with the chimney a Northlect, it will ho found the lattor has an enormous advantage in point of streagth, being of larger dimensions and thicker walls, the weight of the cap is only equal to half a ton per foot on the brickiork, while thitt of the chimney before referred to is one ton and a quarter per root ; and if an brickwork in the fonudations of the
rof shell.foundry chimney the rate of progress in
the erection of both is about the same. It
appears to me, therofore, it would be erroneous as is known from its relics, was established in to attribute the failure cither to want of skill in Eboracum.
the design, the too great weight of cap, or the rate of progress; but I should look with great suspicion on the few words given by the huilder in his evidence as tho sole oanse of the evil,every ferr courses being grouted in with new experience of several failures from tho uso of cement, which was supposed to be too new, but which fact was not discovered autil the work was done: in one case, a recently-built parapet was sevored the one from the other, both horizontally and vertically, in nonsequence of the expansion of the cement, and had to be rebailt; and in other cases the work was entirely destroycd. the same thing took place in the unforturaco laid dry, and I doubt then if it would not have been the stronger of the two.

TV. R.

## CIIMNEY SHAFT NEAR GRAVESEND COMBLNATION OF MATERIALS.

Sir,-The evidence of Mr. Gostling on inqnest, p. $8 \overline{2} 2$, may he read this,-" Tho best Dorking p. mime was used with the best Thames sand, forming compressible mortar, which shrinks in setting, the interior being grouted in new Portland cement, which swells in setting."
Thus tho shaft might he safe whilo the lining carried the facing work, which faning worl failed when the proportions varied, as at the feight of 160 ft. there was an equal thiclinces of height
Thus it might he compared to a tube of iron inserted in one of lead to support a large weight

Joseple Caretien.

## A ROMAN CEMETERY AT YORR.

Ourside the sonth-western walls of York, on the right bauk of the Onse, and just opposite the gardens of the Philosophical Society and the
ruins of St. Mary's Abbey, tho fround bas for ruins of st. Harys Absey, tho ground bas for the North-Eastern Railway, which, with its attendant buildinga, will cover a very largo area it is found that the whole had been a Romau ometery, and so assed for a great length of poorer class than that ly the burial-placo of a poorer chass than thal which raised its monunents by the side of the greal road; hut it is "regious," and that certain classes separate regions, and that certain classes had their Roman interments are found in the uppermost bed of soil; and in some parts of the ground it Wonk seem that Roman carters had been in the haht of shooting rubhigh from the neigh buriug city. There are thick strata of Roman hiiks, mortar, and pottery, mingled with frag. ments of wall plaster, on winch coloured patterns f the istinct. Aujoining this rougher portion putei," " have byo or threo deep pits, on usual, the bodies of slaves had been thrown carelessly and pell-mell. No such "putei," it is said, have been fonad elsewhere in Britain. There are blocks of Knareshorough stone, ahout 20 in . by 10 it. , roughly tooled and without in. scription, which can have served no other purpose than that of a modera headstone. There a a small hollow on the top of some of the blocks now fonnd, possibly for
for some sacrifial vessel
The cometery coffins had clearly been hought cheaply from somo stonecutter's shop; and one at least was imperfect when so hought, $-1,600$ rears ago. A single coffin hearing an inscrip"Decurio" of the "Colonia" of Thoracorm a the first proof that the Roman city hail a municipality
Tottery, including some fine Samian fragmonts, bronzo ornaments, coins in great num. bers, shattered statuettes, and, in one case, child's ball, with a clay centre, have been found Two remarkable relics are specially mentioned. One is the skull of a yourg woman, containing a false palate of very thin gold; the other is small tablet of bone on which are the words, "Domine victor vincas felix," - a mysterious line which is much exercising the antiqnaries o York. It may bo Christian; but is thought nore probably to have a reference to the "Victor" sun of the Mithratic worship, which

The gravel below the cemetery bed has been xcavated in some places to considerable epur. It is full of glacial blocke, some of them boulders from Shapfell, and others masses of rechistone from some unhenown source. The arraggoment of theso should be catefully examined, as they may have formed a sacred inelosure of an ancient British or Druidical order. ne of the stone circies of Stonehence if we ro mot mistaken, is of greenstone from a distanco.

HOW SCOTTISH LAW KEEPS HOUSES TENANTABLE.
A case lias just been decided in the Edin. burgh Law Courts that would ho of servico if pplied to Ergland.
Jamcs Thompson, a shopkeeper, sued his landlord, Daniel Gunn, for Sl., iu nanue of damages sustained in consequence of the defendant not keeping his tenant's shop, house, room, and cellar in snch a state of repair as to render them fit for occupation, tho same being atterly unin. habitable. The amonnt claimel was made np of havtable. The amonat claimed was made ap of varous iters, then as reat of anolher honse, lill fors nendance and medicin
Ar. Damiel Gann would not admit that the state of the honse was so bad as set forth by Mr. Thompson, and netterly repudiated the notion of a landlords liability for a tenant's sickness and lodgiuge. The tenant, however, produced evidence to show that about a week after taking possession of the house it was discovered the family conld not tako up their permanent aboce therein, as it was not only ruiuous and dark, but was filled with very bad smells. The family slept on the premises occasionally Two police officors callod place gave it a very bad character, and considered it a habitation totally unfit for human beings.
The landlord's advocate exoused the charge mado by tho police, on the ground that the Edinburgh, and the landlord was desirons of reserving its antiquity, although ho had done everything in his power to put it in a preper condition.
The Sheriff, in giving judgment, "said there was no douht of the lhouse being in need of a graat number of repairs. It was well known at tenants in the social position of James yail themselves not able on all occasions to hem by the law, and they woro at the mercy of bad landlords who cared for nothing but rent, and, moreover, poor tenants did not care to institute proceedings of this nature on a chance of success. His judgment would bo for the enant, to whom he should award 5l damages, with fall Court coste, and 10 s , for the police

NEW TOWN IILLL FOR ST. HELEN'S.
Trix memorial-stone of the new Towa-hall for . Helen's has been laid.
In 1871 the old town-hall, in the 3arket-place, was partly burnt down, and was subsequently temporarily repaired; but some months ago it was again hurnt. It was then determined to erect a building suitable to the increasing $r$. quirements of the borongh, and plans, by Mr amners, of Liverpool, architect, were adopted. The site of the new huilding is on the north sido of Cotham-street, and is hounded on the north by Parade.street, on the east by Hardnd ards, covers an area of 6,000 supericial square street, and will have a frontacro of 200 ft . The style of architecture adopted is a simplo adapta tion of Gothic, suitable to the materials to bo nsed in the construction, viz., piuked frey briclas nd Stourton stone, for porch, bay windows, and other finishings, The maiu entrance-porch pitl form a prominent feataro in the desim. It is approached by a spacions flight of steps anil wide londinga, enclosed by stone balusirades anil piers for lamps, and has a buttressed base, upon which rest clustered red granite shafts, with carved caps and moulded bases, from which springs a deeply-recessed and monlded archway, with gable over. On the left of this, attached to the ceatre hirgh portion of the buiding, and separatiug the same from the police bnildings, is separatiug the same from the poice bmilaings, is
of 85 ft ., and to the top of the vane, on the upper slatel roof, 130 ft . On the right of tho porch is a wing, of two stories in height, termi. nated at the junction of Cotham-street and Hardshaw-street by a gabled projeotion, having a large ovorbanging bay-window, belonging to the mayor's parlour. On the loft of the olock. tower will be the police.oflioes and contt-room entrances, and lo the libraryand reading-room, In the plan the building is designed to afford accommodation for numerons municipal offioes, inoluding council-chamber, 42 ft . long by 32 ft . Wide; asserahly y-room, 96 ft . long hy 45 ft . wido, and 40 ft . high to the ceiling, and capable of accom. modating about $\mathbf{1 , 0 0 0}$ persons ; also police modating about forming part of the general desigu and frontage to Cotham.street, and enter
from, with court-room, 50 ft . by 29 ft .
rom, with court-room, 50 ft . by 29 ft . cot cost of the new strnotare is estimated at 25,000 . Mr. George Lome, of Liverpool, is the contractor, and the sah-contractors are,-for brickwork and excavating, Messrs. James Leslie, Bootle; plnrahing, Mr. Merricks Liverpool; aud plastering and slating, Messrs. Tanner \& Son, Liverpool.

LEWES SEH TOWN-HALL. A NEW Town-hall for Lewres, built by prblio snhscrip toon, on some land bolonging to the Lewes Provision Harket, hnving jnst heon completed, the following vote of thanks, emhlazoned, tramed, Arms glazed, and Saturday last presonted to the clerk. It bears the following:
"Leeres Town and Record-room.-At a moeting of the
Commissioners of the Lexres Provision Market, held at the above room, on Thesday in

 man, Senior High Constable of the Borough of Lewes."

TME ROMANISING OF OUR CHURCHES. Sir,-You have insorted bomo very useful but the placing of a table "Altarwise " and uso of the term "Altar" are equally Romish and follow it up with the following letter of Arch. bishop Williams, of York, 1636, as nohody geems to know how entirely wide of the real Anglioan $\begin{array}{ll}\text { have now strayed? } & \text { E. L, Garbetr. }\end{array}$

LIABILITY OF VESTRIES UNDER LOCAL MANAGEMENT ACT. nad drims.
Tru Solicitor-G eneral, at the instance of the St. Pancras Testry, has reviven tho veexed question, in reagrard to the the
inkility of paribhes to make good damages nrising froun nad drainage. as well ae to owners of bouses in London, and may be briefty diaposed of by atating that at the hast ierm a jury
hefore the late Lord Chief Jurice Bovilh, gave a verdiet, with 50 diamages, to a Mr. Hamuoud, of the Elephant and Castie Hotel, St. Pancras, aguinst the Vestry of St. his cellar of wine
The restry stitl disputing their liakility, the Solicitor Was douhted whether the drain was dedicated Ao the the parish, but the restry now admitted that the Local
Manngemeut Aet had made them its apoosors, as it drained more than one house. The 72 nd spection of that
 semprs were properly constrneted, cleared, cleansed, ana
emptied.". coutd not trial the jarry foond that the Testry did not and the drain, though they might have known, hy the exercisn of care end inquiry.
They yliso fonnd that the de fandents did not troow, and They nlso fonod that the def fadents did not know, and
could not have known, of the ohstruction kefore the mischaff occurred.
It was suhmitted to the Court, sitting in Bazeo, that there was no duty upon the Vegtry to cleange drains of
which they did not know the existence and it woutd a rery serious thing if they were sudided with raino

 an omis son to to perform a duty oa the part of the Vestry, and therefors showed no good cimso of action.
The Judges, Brett, Grove, and Feating, enarted the rule
to sho cause; end where aud when the lifigation will end is a query.

## BRADWELL, OXON.

The Chnrch of SS. Peter and Paul, Bradwell, having heen closed for some months while undergoing a thorongh restoration, was opened on the 30 Lh ult. hy the Bishop of Oxford. The church consists of nave chancel, western tower,
with spire, north and soath transepts, and a nortb chantry chapel. The walls of the chanoel are early twelfth.century work, though they have heen pierced, and windows of the early part of the fourteenth century inserted. The chancel aroh and the arch to the chantry chapel are thirteenth.century work, and the walls of the chapel were probably built at the end of the same century, and the
remains, is of that period.
Tho sonth transent is early fonteenth century work, with arch and window of the same character, and contnine a very gnon piscius, with a pointed outer arch and trefoiled ioner ono; the surface of the wall round the outer
*From " $A$ Canto from tho $A l$ lar, or an Answer to

wroh enriohed with foliarge, and a corbel for an mare olose to it.
The north transept is fiftoenth-century work, With a etair turret at the north east angle. The sentury work, with good foliated capitals; one sentury work, with good foliated capitals; one :estored.
Tho font is very good twelfth.centary work; $t$ has a large hasin of the quatrefoil form, with leads in the hollows, and is snpported on four arge shafta, with ecalloped capitals, and emall hafts introduoed between the larmo ones. Amonget other works, tho old ringing-lloor
tas been replaced with a now one at \& higher las be日s replaced with a now one at \& higher

sontary single-light windows in the base of the sontury single-light windows in the base of the
ower; and the font has been reetored and slaced hero, and a vory convenient baptietery is he result.
The arohitect is Mr. E. G. Braton, of Onford ; nd the buildor is Mr. Alfred Groves, of Milton

3UILDERS' BENEVOLENT INSTITUTION. The twenty-eixth anniversary feetival in aid if the funde of this Institution was held at Villis'e Rooms, King-atreet, St. James's, on
'Tharsday evening, the 6 th inst., the Prosidont f the Institation (Mr. Thomas Robinson, of the irm of Cubitt \& Co.) in the chair.
The usual loyal and patriotic toaste having een duly honoured (Captain Stanloy Bird eeponding for the Voluateers),
The Chairman eaid: Gentlemen, I have now 0 claim your serious and earnest attention to
he toaet of the evening, "Prosperity to the Suildere' Benovolent Institution." I need not caupy your time with any detailed account of he origin or tho history of tbe Buildere' Beneolent Institution, for they are known to many cyou hetter than they are to myself. I may, tbo Institution has beon establiehed ther s been invested in the Government funds the side for a epecinl huilding fund ehould ee sotercaine to build, but which remaing for fut otion, leaving upwards of $13,200 \mathrm{l}$. invested, and vailable for the objects of the Inetitation, and te interest of which is constantly added for no maintenance of the expensos of tbe $b$ the nmount inveeted, there has been dis. ibuted in pensions the,--I think I may say urge, -sum of 17,1507 . This large amonnt has oen distributed with great care amongst the oserible to calculate or to over. pod tbat tbo distribution of such a comparavely large sum must liave effected amongst jocts 80 deserving. There have been altother 124 individuals who bave been recipients ow deceased, leaving 4.f etill depeadent apon te funds of the Institution, and receiving its enefits; and there is to be an eleotion of trwe ore pensioners during the present month, hich will make ap the number to 46 pensioners mw receiving tho benefits of tho Iostitution.
ich, then, gontlemen, ie the etate of our fands id progross. But while we cannot but admit at so mnob good has been done, I think that ost of us will admit that there ie etill more to done; and I ask you to bear in mind that, os the past it is necegood which has been done the past, it is necessary to continually agitate F subscriptione. The committee wonld he glad, we will give them the funds, to place a fow more insioners on the liet, so tbat as few as possible de oommittee would also be glad, if they had e means, to give eomothing more to pensioner an the 21l. or $20 \%$. which thoy now receive, zich, althongh of great use to its poor recipients, ee not seem to mo quite what it should be, conlering tbe intorests connected with this oharity. ding the building trade generally, I think ore than nsually hazardous nature. The great ks they have to contend with, the fierce oomitition they have to figbt against, the many pleasant circumstances and complicating ases over which they have no control,-all ase things, I eay, tend to make the trade of huildor a peonliarly bazardons one; and laring that in mind, it is not to be wondered that eome few may snccumb to tbese adverse
into comparative povorty, and even, in many casee, to positive distress. In oonclusion, the chairman strongly urged the neoessity of the amounts of the annual subscriptions being increascd.
Mr. Macey, in appropriate terms, proposed the next toast, "The Chairman and President," which was duly rosponded to.
At this etage of the proceedings, liets of subscriptions in aid of the charity were announced. The total amount promised was 3247 , and this announcemeut was roceived with great cheering, altbough the chairman etatod that the amount was not so satisfactory as on some former oceasions.
The Chairman next proposed "The Patrons, Vice-preeidents, and Trustees," coupled with the aame of Mr. Rogers, who brielly responded.
Mr. Goorge Dines proposed the next tonst, "The Treasurer" (Mr. George Plucknett), wbo, in responding, oarnestly advocated the neceesity for increasing the funds at the disposal of the Institution.
"The Architects and Surveyors" was proposed by the chairman in gracefal terms, and respouded to by Mr. Sandell.
tewn nes toast was, The Directors and Sewards, coupled with tbo name of Mr. Simp The last whond
Harris," ciative terms: and $M$ by tbe chairman in appre said he had now heen twenty, firo yon in the service of the Inetitution, and had evor made it his business to promote, to tho utmost of his ability, the proeperity of the Institution.

## THE ARTIZAN REPORTERS AT TITE

 VIENNA EXHIBTILON.A rovg the pleasing incidents wbicb marked the visit of the English artizan reporters sent and the Sirmingham Chamber of Commerce Industry, Manchester : Promotion of Soientifio Industry, Manchester; at the hanquot given
to them by his Excellency Baron Sobwarz Senborn, the Baron requeated eab Sobwarz Senborn, the Baron requeated exeb artizan reportor piesent to forward to him on their his name adand a photograpbio portrait, with wis name, address, san tbe manufacture upon sent ie roported. The "cartes have been sent inclosed in an album eaid to be of considerable heauty. The addrees which precedes the portraits was drawn op by Mr. Charles Ilibbs (the roporter on gans), and inititle of the addrees and various words and Mr. letters are illuminated by the pen of Mr. Frank G. Jackson. The portraits were arranged in sets of four to cacb page, and the whole was bonad together in dark brown rnsset. inted morocoo, ornamented in gold, with wbite entin linings in the interior of ibe bonrds. On Baron Senborn, surmounted witb a bamon' coronet, in eatr-pierced metal, enamollod and gilded. Well done, men of Birmiagbam.

## TEOHNOLOGICAL EXAMINATIONS.

Tue Programme of Sociaty of Arts' Examina tions in the Technology of the Arts and Manu Lactures of tbo Conntry for 1874, is now ready for issue. These examinations are beld aunually, in conjanction with the examinations of the Science and Art Department.
The eubjects for the year 187.4 will be Cotton, Paper, Silk, Steel, Carriage.bnilding, Pottery and Cloth-manufacture. Candidatoss-making, and ohtain certificates in any of these subjects, must pass the examinatione of tho Soience and Art Department in certain ecienoos, which are specified in the programme as hearing upon the particular art or manufacture. In addition to tbese, special papers will be set in the technology of each manufacture, hy examiners appointed by the Society of Arts.
The prizes offered hy the Society in each of the nine snbjoots are given in the programme. In orcer that these examinations may really in tbis country, it is desirable that enconven ment ebould be civen to candidates by corrageof prizes and soholarehips. Witb the offor the conncil appeal to the trade filds object city of London, to merchents guilds of the tnrers, and to the members of the Society prize fund.

## 

A Rsoorl of nyy Artistict Lije. By J. B. Wartive Suce a titile as "A Reoord of My Artistio Life" requiros a strong name after it to obtain the atlention of the prblie, and we are dieposed to chance of. Wed wonla have had a bette "Art Jottings and Home Strnyles") "\$ Art Jottings and Home Strngyles"; "An Hard Work in Eaclani,", "Rrubles Abroad and title less personal than the one bo has adoptod We hope tor his sake that onr impression may prove inoorrect. Mr. Wrering hampression may prove inoortet. a monget other thinge rery cle erer ded, and man ; and the ar thinge, a very clever draughts. man; and the book betore us mainly consiets of the notes and jottinge made abroad, with here and there an inustration hy bis facile pencil, and not obtained for him hat his endeavoure have Sote obtained for him tho return ho deeerved. Some of his earlior lucubratione are repriited from our own pages, whero they friret appeared. We quote a few paragraphs from his later Obsorvations, headed "On Limeal Exppession
and Architeotaral Design," as a samplo of the and Architeotural Desisn," as a samplo of the
style style of the book,
Architectare, I think, ehows the stuhbornness and inoongruity of etrongly-marked qnalitios more clearly than the other arts, there being paint confuse the ideas than in sonlpture or painting, and it exhibits better tho gradual, almost imperceptible differences by which alone tbey aro made to harmonise and thoir antagonism rendered less palpable. It must bo premised tbat ae art, like oivilisation, admite of no chronologically continnons development, but Ohowe varioue pbases in varione and unconnected perinde, in filling up and explaining the neces. eary gradatione of a particular class or etyle of building, we must be prepared to put chronologieal ordor ont of our minds. As one, for bistanes, would be foroed to commonco the moly of architectnre with the comparatively modern remaine of Druidical times.
Let us commonce, then, with retaining what Egypuline tbe Italian, what is grand of the bow doe , what is picturesque of the Gotbic, and them aee lbe idea of the moet ekilful fusion of piotureequ the miad? Even unite the graoeful the rough picturesqueness of a Gothic momnment, and could any imarination conceire an agreeable comhination? In either of the can would a snperior or eqnal etyle he edneed or rather would there not be a bybrid conglomeraand deetroying the cbarm of eacb? Sicilian hlend panieh Saracenic have both boen ekilfully Yot the with Norman and Gothic respectively. aovel effect may che procuce, lower than its primary and pure conetituente, and is universally allowod to be theatrical, in a lowering eenee of the word; it is here the same deteriore, the different qualities of each aro an Elizabet in combination. Let us now tako that is allowedly coaree and grotesque; bere migbt the breader of etyles say' 'is a nnity for a oross with the gracefil or the bportiful'; let him then put gup Conome beaudiche, or replace that protespue a Greoian type, and is be not on tbe richt what ruin the whole buildin? It is not prejuctice whicb would affright the admirer of this style were you to bring the ordere of ancient Greece for his use.
Tbe building has one distinct quality or character, and bie eense of propriety or tate at oneo tells him that these, though good in tbem-
selves, aro not good for his purd carried out througb the whole purpoee, but if cetriining the outline thenld whole huilding, oven
 clayracter in the eame as regards two phases of ponding pho sano style. There it a corro Venice Venice, as seen in many parts of the Dogo's hecanse the ration venico more especially hecause the Cinque Cento of that city hears Elizabth seatur rosemhance to our clizabothan than tbe Cinquo Conto of Italy enerally, having amongst them tbose many curved gables so common with us. Now, were yor to apply any ordinary string-oourse, nicbe, moulding or foliated ornament of the one to the he charey would he mutually out of place; for ness in the with the trane will not amalgamate eatisfactorily with the grace, the delicacy, often the weakness,
There is no more difference as regards the
expreszion of form between Grecian，Roman， and Italian architecture，or between Doric， Ionic，and Corinthian，than there is between the expression of form in the Hercules，the Ghadia－ tor，and the Apollo．Yet wbo would expect to
form more perfect fourth from the most form a more perfect fourth from the most skilful and artistio combination of the thrce． Blend them as you will，and the mauy atcmpts of tbis natnre hy various celory in themselves， architects，however satisfactory in themselves，
all point out the futility of hoping to excel or all point out the futility or hoping they are known equal the excellence of each as they are it would to as in their separate cbaraoters．The excel．
seem，then，essentially wrong to graft tbe lencies of one stylo to the excellencies of another，in form or ornament；and yet we have many bnildings whose size alone would render them grand，and arranged in the grand simplicity of Grecian art，detailed out with the spirit of Ancicnt Rome，of Palladio，and Vignola，nay， often with the weal delicacy of Cinque Cento and the richness of Gothic．It is but too usual to see tbe celebrated works of the past the models for our modern buildings，and while the essontial original forms are retained，the whole
character is deteriorated，if not destroyed，by that studied refinement and variation of detail which our books，our travels，our studies render so easy of obtaining，and wbicb are so rainous in their effect．＂
Touching the antbor＇s complaints，be is mach too sensible not to see that the conrse he took， conseqnent on his exprossed dislibe of neither his health nor his temper，＂－was not calculated to insure success as an architect；so that it inust bave heen in another direction that he looked for the reward whicb bo considers he has failed to obtain．

Tbe hook contains many useful ohservations and suggestions；and wo cordially wish the autbor a good fat
industrious past．
How to Make Momey by Patents．By Cbarlis Barlow．Third edition．London
borough \＆Co．，Warmick－lane．
Iv the preface to this edition of a volume already noticed in our colnmnes，the author says：－
＂Mever has there heen so prosprcous at time for the
ownery of patent priviteges as furiog the lhat few year

 and then form a limited liability company to parchase it，
The number of such companiee formed sithin tho llisi
three jears for purchasisp and working patents almost
 much is certain，that whenerer a patentect can show sure－
censfut，or at any rate dazting，experiment，or primd
facio demonetrate the feasibility of his invention facie demonstrate the fe asibilitito of his invention，he masy
readily procurc eapital for working it throngh tho instru－ readily procnre capital
mentality of a company，＂
Mr．Barlow writes in the intcrest of inventors and patentees ；and we must refer those of them who wish to know＂bow to make money by patents＂to bis successful publication．

By the way，we may here note that the report of the Commissioners of Patents for inrentions for last year has been issued．The number of applications for letters recorded within the year 1872 was 3,$970 ;$ the number of patents passed thereon was 2，771；the nuntocr of specifications fled in pursuance thereof was 2，73＋；tho number of applications lapsed or forfeited，the applicants having neglected to prooeed for their pateats within the six
months of protection，was 1,199 ；the num－ ber of patents vrid，the patentees having neglected to fle specifications in pursuance thereof，was 37 ．It appears that 27,683 patents hear date between the 1st of October， 1852 ，and the 31st of December，1865．The additional progressive duty of 50l，was paid at the end of the third year on 7,798 ，and 19,885 became void． The additional duty of 100 ．was paid at the end of the seventh yoar on 2,664 of the 7,798 re－ maining in force at the end of the third year， and 5,231 hecame void；so that ahoat 72 per end of the third rear，nud 91 per cent，at the end of the seventh year

The Journal of the Royal Historical and ginally founded as the Kilkenmy Archacologicul Society．Vol．II．Fourth Series．Jaly Thrs issue of the Irish Arcbeeological Jourbal contains an interesting memoir of Gabriel Beranger and bis labours in the canse of Irish

Causes of Railway Accidents．－At a meo ing of the King＇s－cross branch of the Amalg mated Society of Railway Servants，Ir． Bowles，昭年etary to the North London distric said if the society could carry out one of i great ohjects，viz．，the shortening of the howrs labour，there would be fewer railway accident Nine out of ten railway accidents were preven able．The conpanies had been frequent recommended by the Board of Trade and b corouers＇juries to adopt the absolute bla ystcm and interlocking signals，but all the． would be of little use if the honrs of labour ailway servants were not reduced，or if eugin drivers had to work from fourteen to tw hours at a stretch without getting sleep． hope juries will persist in keeping such d graceful facts as Mr ．Bowles brought forwa in view in amercing railway companies lampes for accidents nntil the compelled to wake up themselvos and ewp waking officials，instead of waking ap ert own and other sleepers with the intiful nuisance of alal of whioh implies that the norne．
Marylehone Church．－This church has be opened aftor being closed for a perion of $t$ months．The internal portion has undergo renovation，painting，and artistic decoring， Baker－street，under the direction of the borous surveyor and a committee of inspection．

Lead Water-Pipes. - The outcry against lead-pipes bas ineen as loud and as indisoriminate n. Paris as in London. The action of pure or ago by Professor Christison at Edinhurgh, and ago by Professor Christison at Edinhurgh, and
was first brought nader public notico by the was first brought nuder public notice by the
Builder. Since that time a variety of asserBuilder. Since that time a variety of asser-
tions have been mado and opinions expressed ou the subject of the action of lead on water, or of by words without understanding"; but it seems oy words without understanding ; but noticed in to ho an ascertained fact, long aince noticed in onr columns, that water containing carhonate of
lime, which very genorally prevails in potable ime, which very gencrally prevails in potable
water, so acts on lead as in most cases to pro. duce a coating which protects the water from the lead and tho lead from the water. This of tin-lined pipes appoars to havo created a stir of tin-lincd pipes appears to have created a stix
against the uso of lead water-pipes at all, although such pipcs are known to have withstood the action of Paris water for many yoars, and
the council run the risk of being callod upon to tho council run the risk of being called upon to The subject, we hear, is to be referred to the Acadomy of Sciences, wbich, it is to bo hoped, will settle the question once for all.
The Assyrian Discoveries. - We are glad to learn that the trustees of the British Museum have directed Mr. Geo. Smith to proceed to the scene of his recent labours in Mesopolamia, for the purpose of parsuing his researches there to nudertake the expense of the new researches, it was hardly possihle for them to shrink from of the Daily Telegraph. Mr. Smith has read two interesting papers hefore the members of the Biblical Archaological Society. The first related to fragments of an inscription giving part lated to ragments of an inscription giving part the Canon of Berosus was copied; while the second roferred to a new fragment of the Assy. rian Canon helonging to the reigns of Tiglath. Pileser and Shalmaneser, and Mr. Smith states that these fragments materialy confrm the expressed bis opinion that the inference drawn by Mr. Smith was too wide for his premises, but by Mr. Smith was too wide for his premises, but
ho acknowledred that the subject was full of he acknowledred that the subject was furch of student.
Inauguration of Working Men's Extension of Queen's Mospital, Birmingham. The new out-patient department, or working men's axteusion of the Queen's Hospital, Birmingham, has been oponed by the Mayor in the prosence of a large company of spectators. In
the new building now erected there is a large the new building now erected there is a large for the officers of the institution; and, besides that accommodation, thero is now at the back a mortuary and a laundry, where all the washing ean bo done without being sent off the premises. To provide all this, the committee had to expend a large sum of money; but the additional accommodation will relieve the old hospital to such an extent as will allow them to provide from
eighteen to twenty new heds, so that the whole of the cost is not to be charged to the out-patient department. The cominittee bas spent upwards
of $20,000 \mathrm{l}$., which will includo alterations in the of 20,0002 ., which will includo alterations in the old building, and of
the sum of 7,0002 .
The Doek at Fleetwood.-A dock is now in course of construction here. Two wells, each abont 40 ft . deep, have been sunk at the north. east and south-west corners of the site of the intended dock, and in the lattor a stenm-pumping apparatus has heen put down. These wells will will be kept clear by pumping. There is now will be kept clear by pumping. There is now on the ground a large quantity of stone, in imnear Preston, and several limekilns are being wide, and this part of the undertaking is 17 ft . progress. The fonndation will be npon concrete 2yif. wide, and will rest upon a bed of fine stiff clay; and the stone wall will be 31 ft . high. The dimensions of the dock will be $1,000 \mathrm{ft}$ long by
400 ft . wide. The entrance-gates will be 50 ft . across; and the dopth of water at spring tides will be 21 ft .
A New Town-hall for Hastings.-The new council of Hastings have decided to erect a new town-hall, at a cost of $10,000 \%$, and sums
of 100 l . 502 ., and $25 t$, are to be offered for the best designs. A proper town-hall has been long needed for Hastings.

The Cottage Home System for Pauper Children. -The benefit derived from this system is heing widely recogniscd. Not only are the children kept in better condition, hut the cost, instead of being nearly 10s. a week for each child, is is a movement, of lady risitor's and ladies' committees of inspection. In those places where the greatest succass has attended the boarding ont, it is almost invariably fonnd in conuexion with the Birminghar 1 Findermere, Swindon, Dorking \& At Swindon Union the guardians have appointed A ladies' committee to co-operate with them in the oversight of boarded-out girls. The Government, haye collaterally set a good example, by the appointment of a lady, Mrs. Nassau W. Senior (sister of Mr. Thomas Hughes, M.P.), as one of the Local Government Board inspectors of union schools, \&c.
A Fever-stricken City.-The yellow fever has been raging in Memphis for six weeks, and] the mortality has heen dreadful. The deaths have already been 1,000, out of a population of 40,000 , but large numhers of the people fled from the oity. There were five Roman Catholic priests in Memphis, and all remained faithful to the sick and dying, and all fell victims to the disease. Their placos were filled, as fast as they died, by ber of sisters of charity were indefatigable, and some havo died at their posts. The fever was brought to the city by a sailor. A kind.hearted Irishman received him into his honse, and cared for him, but he died the next day. Good nature does a deal of harm in the rorld. Tho Irishlence spread in all directions. This year Memphis has had small-pox sevorely, then eholera, and now this last and dreadful disease. The city Inbles London during tho great Pag
Interesting Archæological Discoveries. Mist, has examined three tomuli in the "Garto. Slack," Wetwane, near Driffield In Garton tumuli were trelve interments hy inhumation, and four after cromation. The relics which and four after cromation. The relics which accompanied these interments consist of a and two other bone articles of unknown use, a dagger-shaped instrument or weapon, 103 in dongger-shaped made from the left-side human femur. There were also found a finely-polished flint axe, three flint knives, and many flakes. The articles of earthenware brought to light eomprise a tens food vase, and a sman eup-
shaped vessel ; also four elegantly-formed and shaped vessel ; also four elegantly-formed and
ornamented drinking-cups, one of which was aninjured.
The Metropolitan Tramways. - The Tondon Tramways Company, which, amongst its other routes on the south side of the Thames, rreen, in octween auxhall and Camber Camberwell, Pookhon wid Greene opened an extensiou ronto over Faushall Bridge to the Victoria Railway Station, so that the line originally contomplated botweon Pimlico, Peck. han, and Greenwich, is now practically effeoted. there are now three companies in active opera. Norih Metropolit Tramways Company, London Street Tramways Company; and there are thus at the present time nearly sixty miles of tramway open for traffic in the metropolis, with additional lines in course of construction.
Fire in a Church during Divine Service. Mrinity Chnrel, Nottingham, has just undergone Niterations, and wbile the Bishop Suffragan of person entered the edifice, and said the upper person entered the edicice, and said the upper the preacher, who, withont emotion, closed the service. The congregation, though not knowing tho cause of the sudden dismissal, quietly walked away. After an investigation it was fornd that the roof had canght fire, owing to the heat of
the new pipos. The superintendent of the firebrigado was fortunately amongst the congregation, and the fire was extinguished before any great damago bed been done.
The Institution of Civil Engineers.-At $1873-4$, which was held on Tuesday, the 11 th 1873-4, which was held on Tuesday, the 11th
inst., Mr. Hawksley, the President, heing in the chair, the paper was read on "The Design and Construction of Modern Locomotive Engines," by Mr, John Robinson, C.E., of Man. chester.

Wykham Park, near Bambury, Oxford-shire.-Extensive alterations have been completed bere, the seat of Mr. Vm. Mewbam, in removal of the old staircase, and reconstruction of a new one, with oak atairs. Tho entire mansion has undergone renovation and decoration. The large dining-hall, drawing-room, musicroom, library, ordinary dining-room, stairoase, and bedrooms, having all been treated in various styles of art, inchading a Pompeiian bondoir. The builder's work was executcd by Mr. Albert Kimberly, of Banbury; the heating hy Messrs. Boulting, the gas arrangements by Mr. Roth well, and the decorations hy Messre. Phillips, all of London. Messrs. Jolin Tarring \& Sod, were the architects.
Vandalism at $\mathbf{S t}$. Sophia $-A$ paragraph in the Levant Herald mentions the wanton destruction of an inscription found near the sonth-west eorner of St. Sophia, where a newy corner of the entrance to tbe courtyard, and was valuable-was, for the only part which can make the rest intelligh has been knocked of The anthorities would perhaps look on the matter in a serious light, if they knew the fact that what bas been destroyed is a name that they reverenco. Antiquaries complain that improyoments are going on so far and wide over the city
that within a short time there will be nothing that within a sh

Eltham, Kent.-The foundation-stone of a now ehurch at Eltham was laid on Friday last by Sir C. H. Mills, bart., M.P. for West Kent, in the preseace of the Lord Bishop of rochester and a large assembly. The church is to be church, which, upon the completion of the new one, is to be taken down. The execntion of the works has heen entrasted to Brr. James Naylar, of Rochoster, from the designs of Mr. A. W. Blourfield, M.A. The quantities wero prepared by Messrs. Gardiner, Son, \& Theohald. This is the third cburch, hesides church schools, which Mr. Naylar has erected at Eltham within the last six jcars.

Thornhill Obelisk, Stalbridge. - Mr the sight of the inliabitauts of the neighbonrthe sight of the inlabitauts of the neighbonr bood the form of an objoct well known to thei fathors,-the ohelisk which they called "Thornhill Spire,"-a memorial of a Dorset worthy, Sir Jamos Thornbill, who huilt it to the
memory of George II. and Queen Caroline. memory of George II. and Queen Carolne,
Noarly the whole of it eome years ago fell down Nearly the whole of it some years ago fell down,
as we believe, from the force of a storm. Mr. as we believe, from the force of a storm. Br.
Boucher has now entirely rebnilt it of Box stone, the whole being solid throughout, instead of, as formorly, filled up with rubbish.
Opening of a Jewish School at Bucharest. On the 26 th ult, a Jewish school was opeued in Bucharest, according to the Jervish Chromicle. The school was founded hy private initiative, who bequeathed 22700 froncs for its foundation About 4,000 francs were received from ather sources the schol contains sir classes, in sources. Se school contains six classes, in which nearly 900 pupils have to be taught. This will he giving no less than about 100 pupils to by Conol mell miniator of public instract by General Tell, minister of public instraction and worship
Paper as a Building Material.-The use of paper as a suhstitute for wood in tbe con.
struction of railway carriages has long been knowion of railway carriages has long been be put seems now to bo without limit. The Joumal of the Society of Arts gays there is a papor ohuroh actually existing near Bergen, which is capable of containing about 1,000 people. It is circnlar within, and octagonal without. The relievos ontside, and the statnes inside, the roof, the eeiling, are all of popier
mache, rendered waterproof by saturation in vitriol, lime-water, whey, and white of egg.
Buried Alive in a Sewer. While a number of men were engaged cutting a sewer at Barrow on Saturday, a fall of earth took place, and two 8 ft . of sand and cloy 8 ft . of sand and clay. Tho sewer had been ent to a depth of $10 \mathrm{ft} .$, and considerahle time elapsed before the labonrors who witnessed the accident could get at their nnfortunato comrades.

The Royal Literary Fund.-The King of a donation of 100 l to this admirablo institution. This mnnificent and thonghtful act on the part of His Majesty will be widely appreciated.

Proposed Pier for Sandown.-Some public apirited gentlemen have started the idea of ob taining a pier for this rising watering-place, and, with this idea, intexd applying for a Provisional Order during the ensuing month to confer on the promoters the necessary powers. It is proposed that the pier shall start from the Batteryroad slipway, and will extend across the foreshore into the sea a distance of 700 ft ., which will give a fine promenade for visitors, and make a secure landing.place for steamers and boats.
A. Caution to Euilders.-The Leeds stipondiary magistrata has given judgment in the pondiary magistrata has given judgment in the against an owner of honse property in the against an owner of honse property in the
borough for building a larger number of back toback houses in one block, and therehy leaving back houses in one block, and therehy leaving less space vacant, than the Local Improvement Act of 1872 allowed. Mr. Bruce decided that the haildings were contrary to the law, and ordered them to be demolished, but granted a
case for appeal. Costs were allowed in the case.

Statue of Sir John Burgoyne.-It has now been fully decided that the memorial by the corps of Royal Engineers of tbeir late distinguished officer, Field-Marabal Sir Johu Burgoyne, shall take the form of a statue, which will be placed near Whitehall. M1. Foley, the sculptor, has been entrusted with the work. Abont 1,000l. have been contributed towards the fund by the officers and men of the late Field-Marshal's comp.

A Lutheran Church in Jerusalem.-The excavations having been completed on the plot of land in Jerusalem assigned by tho Sultan as a present to the German Crown Prince on the occasion of the opening of the Suez Canal, the buildings in connexion with the proposed Intheran Church, for which the land is intended as a site, will shortly be begrn. The block of buildings is to include a Lutheran Chnrch, a自chool, and a parsonage. The designs have been prepared by Professor Adler.

Roots in Drain-pipes.-Mr. Meohi says,"An agricnitural friend assured me (when discnssing the filling up of drain-pipes by the roots of trees or plants) that where the drain-pipes have been well coated with gas-tar, there is no risk of choking with roots; for the roots turn away from the tar, evidently sensible of their danger. I hope this hint may prove nseful; for I know that no spring drain is safe near trees, fences, or even strong. rooted weeds."
Sewer Accident in Fereford.-In the excavation for the new flood culvert in Friarsstreet, Hereford, which is being made by Mr. James Bowers, the contractor, a labonrer has been killed by a fall of carth, which buried and crushed him to death. There had been a and deal of rain, which was believed to have loosene the sides of the excavation The city lourveyor and the coroner's jury exonerated the contreyor and the jury gave a verdict of aocidental death.

The Statue of Prince Albert on the Holborn Viaduct.-In answer to a question in the Court of Common Council, it was stated that it is iotended to unveil the statue of Prince Alhert on the Holborn Viadnct on Monday, the 24th inst.

VOL XXXI, -No. 1607.

The National Memorial to his Royel Ifighoness the Prince Consort." *

ITH this title we have a large, costly, and beautiful hook, which gives a history of the National Memorial ereoted in Hyde Park, descrihas the corl struction, and illus. trates every portion of it, botll as to colour and form, in a complete and very admirable manner. It
is not too much to say that ovory Englishnan is interested in tho circulation of this volume, which will serve to convince all who study it, and who may rot be able to visit the monument itself, that the fincest modern work of its kind bas hoen produced in this country, and that we have amongst us artists (as well as constructors) of high ability.
It is a distinguishing feature of the book before us that the name of evcry artist is given in connexiou with his work, which should, and we hope will, have the offect of bringing to some of them increased fame and fortune. We would point for cxample to the remarkahle histories writton with the chisel on the marblo podium, half hy Mr. J. Birnie Philip and half by Mr. II. H. Armstead,--tho first setting forth the architects and sculptors ; the second the painters, pocte, und musicians; producing a whole honourablo alike to the country and the artists, hoth as recgarde conception and execution.

We agree with Mr. Scott that this, taker as a whole, is perhaps one of the most laborious works of scalpture ever nudertaken, consisting, as it does, of a continuous range of figure-sculpture of the most elaborate description in tho highest alto. relievo of life-size, more than 200 ft . in length, containing nbout 170 Ggures, and executed in the hardest marble which could be procured ; each figure, not cut, as is usual, out of a dctached block, so that crery portion can bo easily reaohed, and the wasto stono readily struck off, hut, on the contrary, hewn ont of the solid mass of tho monument, just nas if the forms were out eut of a solid rock of marblo; so that every opening between figures, or hetween parts of them, became a work of unnsual cost and lahour. We can bear testimony to the zeal with which both the sculptors, Mr. Axmstead and Mr. Philip, persistently oarried on their several proportions of the work, though they found a difficulty in respect of the great harduess of the marhlc, not calculated on when they made their original estimates as to cost. The producers of this successful work deserve some public recognition, and should havo it. The namo of every figure is appended, and we would note that the lettering should be filled in with some

[^10]|permanent dark material, some of the names being alroady illegible.
The history of the Memorial will bo found scattered through the last dozen volumes of our joarnal, and we need but slightly refer to it Mr. Scott, now very properly Sir Gilbert, submitted a precise estimate for the work in April, 1861, and the executive committee accepted in that year the offer of Mr. John Kelk, the term18 of which, embodied in an agreemont, wo print, as honourable to that gentleman :-
"London, April18th, 1864. I hereby agree to ereet and condplete the bropoged
Nationsl Memorint to tho late Prince Consort (exclusire Nationgl Myemorni! to tho late Prince Consort (exclusire
of the eight groups offigrres and the statue of the Prince)

 to be examined by buditiors appointed by her Mujesty, hand if it should appaar that the prime cost of the work to

me is less than $85.503 \%$. then the sum to be paid to me to me is $\begin{aligned} & \text { to beduced to the amount of sach cost, but in no casse } \\ & \text { is the amount to be paid to mo to exceed the sum o }\end{aligned}$ $85,518 l$ The commette are to pay for the worls as in pro ceeds, by instalments of $5,000 l$, each, on the certiticate of
Wr. Scoti. I also agree to bind myself, and in case of my death my
representutives, in a bond of $10,000 t$ for the dine per
 Cormance of this agreement. I am also wiling that thine bodied io a formal legal docyument."
Sir Gilbert Scott tostifies to the value of the assistanoe rendered te the worls by Mr. Kolls. Honomable mention also is rightly made of Mr. W. Cross, who acted as director of the works for Mr. Kelk.
The last timher of the scrffolding was taken down on the 31st of March, 1871.
When this was done, tho irou tio-rods between each arch became visible, and an impression prevailed that these rode had only just been introduced as a procaution against thrust.* They had, howerer, been fised in 1866, whilet the arches were heing turned, and it was thought to be more satisfactory to allow them to romain for a time after the centreing had been romoved, in ense any tendency to subsidenee or thrust might appear, though from the peculine arrange. ment by which tho spire is oarried, such a contingency was not considered to be at al proballo. Each of these rods consisted of two pieces of iron joined together in tho contro by a largo screw-nut; they were tostod from time to time, but no tension was ever observed. They appearcd to be affected only by change in the atmospherio temperature. After remaining in position for nearly fivo years, they were removed in April, 1871.
The central portion of the monument is based upon a mass of concrete, 60 ft . square and 17 ft . in thickness; indeed, in some parts it is of mueh greater thickness, owing to the inequalities in tho solidity of the ground. Upon this aro laid two continuous coursces of thick stoue Indings, bedded in Portlnud coment, and on this plulform is ereoted the superstructure of massive brickwork, upon which tho monument is based. Tho substrustare which supports the steps and landings surrounding the monu ment, though planned simply with a view to their practical uses, form a curiously intricato and picturesque series of catacomhs, which may bo entered by a trap-door provided heneath the surrounding platform.

The materials of which theso steps are formed is mainly the grey granite from Castlewellan, in the county of Down, the samo granito boing used for the large pedestals at the angles of the stops; a portion, however, of the steps cnime from Dalheattie quarries, in tho county of Kirkculbright
Owing to the slope of tho ground towards the south, an additional range of steps wras required on that sido leading down to the drive in frout. Thise steps,-no less thau 200 ft . in length,are of the granite from Pearga, in Cornwall, while tho blocks which terminate them are of

[^11]the same granite capped with the piul granite from the Isle of Mrult. The landings of the stcps are paved with stone of varied colonrs, consisting of tho whito mountain limestoue of Hopton Wood, iu Derhyshire; the red magnesian sazdstone from Mansfield, in Nottingbamshire; and the dark slate stone from Charnwood Forest, in Leicestershire.

The granite up to the levels as yet alluded to is unpolished, but wrought hy the axe with extrene delicacy and precision. Ahove this level, however, all the granite which is exposed to view is finely polished, and has bocu studiously selected in puint of colour and textare, with a view to the harmony of its artistic cffoct.
The podinm, or stylohnto, which forms the base of the great canopy, and to the carving on which we have already alluded, is of two kinds of granite, and of marble. Its baso.moulds, 3 ft . in height, aro of a single course of the richest red granite from the Ross of Mull, and the eoraice, 2 ft . in height, is of a lighter-coloured variety from the same locabity; hoth wrought and polished with the groatest caro and precision. The intormediato portion, which is of marble, and is occupied entirely by sculpturo, is $\sigma_{\frac{1}{4}} \mathrm{ft}$ in height in a single course.
The construction of the four main clusters of shafts which carry tho canopy was of conrse all-important. These do not trust alone for their bond of union to the metallio band which binds each cluster. Each of the four greater shafts (which are about 2 ft . in diameter) is attached by a dovetailed groove to the central core, and the groove is ran in solidly with Portland cement. Besides this, there is another very important method of attachment; for,
 band at abont one-third of thoir height from the base, the core is jointed at about the same distance from the capital, thas, as the workmen say, "breaking joint;" the longer length of one crossing and strengthening the joint of the othor, while the joint in each is attached to the side of the ether by strong coppor cramps, and caoh block is also plnggod with four copper dowels to that below and ahove it; so that tho entire group is, as it were, in one pieco.*
The spire, which surmounts the stonework, is wholly of motal, and is supported hy two enor mous "box" girders of wrought-iron, Each girder lies diagonally from corner to corner of tho structure. They may, parbaps, be more truly desoribed as one girlor in the form of a cross, for at their point of intersection they are so united by the interlacing of their component parts as to become in reality a singlo girder. The girders are in section, 3 ft . $4 \frac{1}{2}$ in. in depth by 3 ft .6 in . in width; thoir longth each way is 31 ft . 6 in., and their clear bearing $23 \mathrm{ft}, 6 \mathrm{in}$. Their weight is 23 tons, and it is calculated that they aro capable of sustaining a load equal to 360 tons. The ends of the girders rest upon vast blocks of granite, whioh being laid across the angles of the structure, tond to bind its walle togethor, and to carry down its weight directly and vertically upon the columns. How the amount of iron used in the construction may behave in the courso of time is a problem not yet to be solved.
The architectural oarving was carricd out by Mr. Brindley, Sir Gilbert snys, -"The capitals of tle great piers [of which we are enabled to roproduco the illustration givon $\dagger$ ] arc, as I think very effective work. They are founded on such as we find in anoient buildiugs in France and Germany, and such as we see in this conntry in the eastern parts of Canterbury Cathedral, a form of capital originating in tho Corinthian, but entirely rothought ont by the great Mediozral artists. The arches are, in somo of their divi-
sions or orders, beautifully oarved with pierced
*The weight borne by each group of columos is 21 tons prer foot super

+ See $p$. 926.
foliage in high reliof, thas obtaining effect by ontrast.
The architect was personally ropresented on the works by his assistant and former papil, Mr. Coad, who had heen engaged in the preparation of the working drawings in coujunction with the architect's second son, Mr. J. O. Scott; the drawings which were submitted in the first instance to the committee having been made under the architect's own inspection by his
eldest son, Mr. G. G. Scott, who devoted to eldest son, Mr. G. G. Scott,
A very important part of the
A very important part of the monument is the artistic metal-worls, the whole of which was carried out hy Mr. Skidmore. "It is here [says large scale the ideal of tho old shriues comes large scale the ideal of the old shriues comes literally into practical eperation; for here the classes of art and ornamentation displayed in
those exquisite works on a minnte seale, suggestthose exquisite works on a minnte scale, suggestdirectly reproduced in cognate materials, and to a scale of reality instead of mere miniature models. The materials in which the works of the Dfediaval gold and silver smiths are thus translated, as it were, into life-size, are copper and lead, and in these humbler metals are ro. produced in nohlo workmanship, and to a nohle soale, the repoussé work, tho chased and beaten foliage, the filagree, the gem-settings, and the matrices for enamels, such as aro found in the shrines of tho Three Kings, or of St. Elizabeth. No nobler work in metal for architectural pur. poses has, so far as I know, been produced in our own, or, probahly-considering its scale and ortent-in any other age." And the architect then pays a high compliment to Mr. Skidmore. Wo bave onfy to add in this direction that the mosaics in the tympana and spandrels, afso the
vanit of the canopy, were executed by Signor Salviati, after cartoons by Messrs. Clayton \& Bell.
Now, as to the sculptural works not already allnded to, the general scheme may bo thus stated:-The great statue of the Prince Consort himself, by Mr. J. H. Foloy, forming the central feature, round which all other works of art
group themselves, we have at the angles four group themselves, we have at the angles four
ranges, eacls containing four illustrations of ranges, each containing four illustrations of
suhjects to which the Prince had devoted bis suhjects to which the
study and patronage.
1st. On the pedestals at the outer angles of the steps wo have groups of figures in marble, representing allegorically the quarters of the globe, with reference to the Great International Exhibitions which have done so much for practical art and mannfactures and tho productions of varied industry, and which claim the Prince Consort as their originator. These were executed hy Mr. J. H. Foley, Mr. Macdowell, Mr. W. Theed, and Mr. John Bell ; and are noble works.
2nd. Wo have on the upper pedestals, which form the angles of tho podium, groaps, also in marble, illnstrating Commerce, Agriculture, Manufactures, and Engineering, all furthered and promoted by International Exhihitions: these are by Mr. Thornycroft, Mr. Calder Marshall, Mr. Henry Weekes, and Mr. John Lawlor 3rd. The great pillars of the Memorial bear on their outer faces-on pedestals of polished senting Astronomy, Geology, Chemistry, repreGeometry; while . Geology, Chemistry, and Geometry; while
nitals of these pilles immediately over the capitals of these pillars is a second range of bronze statues, representing Rhetoric, Pbilo-
sophy, Medicine, and Physiology. The whole of sophy, Medicine, and Physiology. The whole of
these were executed by Mr. J. B. Pbilip and these were exe
These groups and statnes, which occupy the four angles at successive heights, thus illustrate the whole range of science, and of practical art and industry
Some of the bronze gilt statucs in the spire, designed by Mr. James Redfern, are very beantiful.
Wo are glad to find that Mr. Murray has supplied an omission in his first published smaller account of the Memorial by printing the names of tho Mansion House Committee, by whom important work was done.* It was the privilege of the conductor of this jonrnal to co-operate with some half-dozon other gentle.
men deputed to act for the general committee men deputed to act for the general committee
(as it also had been his privilege in raising the

Memorial of the Great Exhibition of 1851, at penth kensington), so that we speak from and loyalty with which the original committee ong and sedulously worked.
The Memorial bears the following dedicatory inscription, execated in mosaic work, and whicl and our notice. It mins round the structure, and is so divided that each side shows a complete sentiment:-

## quEEN VICTORIA AND HER PEOPLE

to the memory of albert prince consort as a trisute of their gratitude FOR A LIFE DEVOTED TO THE PUBLIC GOOD.

THE HASTINGS AQUARICM AND BATHS COMPETITION
Durivg the past few days there have boen on iew in the Market-hall, Hastings, sixteen set of designs, sent in competition for a premium of 100 guineas, for the hest scheme to enable the town conncil to inclose a recessed portion of the shore so as to widen the parade and roadway and to apply the under space to the purposes of aquarium, baths, or "such other parpose as may snggest itself to the desiguer." Tho spot in of the new pier, where the Eversfield Parade terminates in a bastion, 10 ft . farther seaward than the beach to be inclosed. In reality, taking a base lino from the pier to the Queen's Hotel, the shore nearly forms a trianglo, $1,300 \mathrm{ft}$. long, and 120 ft . from base to apes. The portion to he dealt with is tho western half of the weather with terrible force. The eastern part forming Carlisle parade, belongs to the Crown A prime coudition of any plan adopted must be that it does not throw the sea into the adjoining shore, so as to cause damage to the Cromn estate. Originally the oouncil contemplated the orection of a sea-wall only. Tho estimate for the work, propared by Mr. Andrews, borongh having arisen, Ar. Alderman he 4,000t. A delay principal huilders, suggestod the atilisation of the site by forming an aquarium, baths, \&c., within the wall. Hence the resolve to offer the premium. No conditions were laid down, each competitor being left to inclose what space he would, and deal with it how he would. Probahly this was a mistake. It was nnderstood in the council that a company was to be formed to carry out the work, with the probahle effect of releasing the town from the oost of the wall. In 40,0002 . wonld be the utmost amonnt of capita which could be raised; consequently no more expensive scheme has the slightest chanco of being adopted.
No doubt, the best plan wonld be to enclose several adrentages are also involve the parchase of private rights, and hargaining with the Commissioners of Woods and Forests.
In sketching the features of each set of plans, we mainly confine ourselves to name the spesets are evidently the work of tyros, or of those conceited persons who think no training neces. sary in order to produce an architectural design. On the other band, there is shown, in several instances, more than ordinary ahility in Alanning and arranging the space at disposal or beyond, the lino of Eversfield Parade; and they ond with more projection at the east end than exists at the present bastion; an objec be injurious to Carlisle Parade. A shaft would bave to ho provided, for the steam-engine and ooilers; and all the designers propose a tuune under the roadway and houses, to the chiff in the rear, after the plan adopted at Brighton. Three of the competitors propose to enclose the whole triangular spaco; and the most elaborate and most expensive dosign of all is arranged in Lat riew. The others only suggest the advisability of doing so. The majority bave selected the east end as the hetter place for the baths, and have placed entrances in tho centre of the parade. This seems to he the hetter plan, as there wonld be less diversion of the line of traffic than there would he by any other arrangement plans is reason to helieve that nearly half the names of authors in two instances are so the known, that an impartial jndgment can hardly
be pronounced. As matters stood, the award the premium rests with tho council, amongst whom are two of the principal resident hailding ontractorg, an architect and surveyor conoxperienced in building matters
Therienced in buiking matter
lassified form Amoncst the presented in a lassified form. Amongst the schemes which "Alpha" goes to the farthest extent. In the gos in the face of a granite wall, remiuding one of the Thames Embaukment, he has upwards of a dozen windows. chese are to be glazed hexaconally; but it may be douhted whether any glass oould possihly he "go strong as to resist the most violent seas" Which the wall will have to withstand. The ladies' haths will he at the extreme east, with soparate entrance. Hot baths, Turkish baths for sixty or seventy per. ons, and a gentlemen's plunge-bath, follow in succession, the latter 100 ft . by 35 ft . The aquarinm is in a crypt, 40 ft . Tvide, divided into wo by granite columns. The tanks are on eaoh side, 一those on the south, under the windows in the sea-wall. The north would be lighted from the parade-surface, the skylights being hidden by covered seat-houses, for puhlic use. The author is enabled to give larger dimensions than ther competitors, by nsing the space under the present parade. His sea-wall wonld continue in strairht line for 850 ft ., and would take in a wide strip of the shore. The entrance to the qquarium would be separate from the baths. It would lead to a vestihule, a library and readingroom, 96 ft . by 17 ft . ; a mnseum, same dimensons; and a lectnre.room, 40 ft . by 27 ft . No stimate is riren. but compared with other plans, it could not cost less than $50,000 l$.
rsia "derives light principally from twenty circular openings near the top of tho sen wall. He proposes to inclose enly a narrow strip of the hore; but by going 200 ft . farther westward than either of the other plans he gets 825 ft . otal length by a width of 40 ft ., ample space for quarium at the west cod, 320 ft . by 30 ft ., with tanks on the north side only. Between cach vindow opening in the sea wall is a massive uttress. Tho recess is filled with ferns, \&c. he hall is suh divided into a series of courts. The roofs to form promenade will be of iron plates, supported by cross girders, and covered ith concrete and asphalte. There is but one entrance, in the centre, with toll-houses on the landing of a double tight of stairs. A hall, 30 ft . square, leads to the aquarinm on one side and baths on the other. The author indnlges argely in fanciful arrangements of rock-work, erneries, and caverns, with out-look to the sen, throngh the windows. His interior decorations re as gorgeons as a stylo combining the rilliant jewel-colouring of India with massive Babylonian solidity" can make them. In the aths "Persia" introduces a feature in which he tauds alone. Two baths, 90 ft . wide, and each 50 ft . long, are separated hy folding doors. A callery is fitted over tho bath-rooms, and thus, on gala occasions, swimming matches, \&o, a large number of persons could be accommodated is spectators. In two other details, the anthor of the Persian plan is original: be takes his tarting-point for the sea-wall farther west, and ceeps inside the present wall at the corner, and e provides chambers 90 ft lone at cither end e provides chambint ould be nsed for an extension of the aquarinm oul 17 5001 and 0,9627 additional for engine, furniture, \&c.
"Au bon Droit" produces a "cheap" plan, thongh not altogother defective. He puts the aths at the west end, and shows one spacions entrance for the wholo. The stairs lead to an open conrt, with arched corridor. The refresh-ment-room and readisg-hall are at the east side of the corridor. There are twenty-eight tanks in the aquarinm, which is lighted hoth from openings in the sea-wall, and from flush lights in the parade. A marine pond with rock fernery is placed at the end of the strmeture. The bathe are lighted by windows on the parade. The arger plunge-bath, 107 ft . by 45 ft ., is for genlemen; and the second class bath, "to be used occasionally by ladies," is 77 ft . by 45 ft . The ot hatbs are well arranged. A Byzantine style of architecture is adopted. Like "Persin," the author prefers to narrow the eastern end, so that it does not project far boyond the present wall. He is more in favour of baths than an aquarium sone of the needs of Fastings. His estimate makes it the cheapest scheme in the room.

Nunc aut Nunquam" illustrates his plan by the hest drawings in the hall; and (thongh
locally anknown, apparently belonging to Lon. don), has eroked fapourable professional opinionlocally. Both exteriorily and internally he produces good effects. A Classic style is adopted.
Seven turret-like projections in the sea-watil Seven turret-like projections in the sca-wall hreak the monotony, and afford room for seats.
The wall would he of concrete, faced with granite. The projection into the sea, at the east end, wonld be very great-110 ft. This
wouid help to carry a fature extension on to the wouid help to carry a fature extension on to the
Oneen's Hotel, in a direct line. It is the only plan which disoards stairs, and uses a sloped way for entrance. The author says he proposes to make the building cellular in construction as far as may
vaulted, the hrickwork huilt upon walls and girders. Light "is introduced in a way to make the corridors cheerful and agreeable." acquarium is at the wost end, baths at the east. A large entranco-hatl divides the two portions. The aguarium is in two corridors, with intervening conservatory, 58 ft . hy 52 ft ., to serve for
cimcerts. There aro eight tanks (somo very large), in the east corridor, and fourteen tank in west corridor. The author has availed himself of the advice and experience of the natu ralist and the engineers of the Crystal Palace
Aquarium. He strives for a good effect by Aquarinm. He strives for a good effect by
placing all the principal apartments in one direct arial line, and in discarding any impedinent $t$ a cloar. view from end to end. The estimate i 50,0002 . to 60,0002 ,
Nearly the most amhitious design of the
whole is marked "Utile Dhelci". This plan must Whole is marked "Utile Dulci." This plan mnst be distinguished from a second anthor of the samo name, by its proposed dome and spire. Its
featnres are novel, though there is a question as featnres are novel, though there is a qnestion as
to its practicability, both as to cost and dan to its practicability, both as to cost and danger
from the extont of projection seaward. Besides from the extont of projection seaward. Besides
carrying his sea-wall considerably heyond the lino of the pier entrance, tbrce bastions are shown with still greater projections. These are protected by a lower parade, which would form a private promenade. The forco of the sea at
the east end is proposod to be modified hy adopting a double curvo. The sea.wall would be 10 ft . thick, formed of concrete, faced with stone. "Utile Dulci" thinks a paving helow force of wator from helow. To obtain suxficient height, be would raise the parade snrface by $a$ gradual slope towards the entrance,--in the centro, -as much as 4 ft . to 6 ft , and thus
secure 18 ft . height abovo the highest spring tide. This plan shows the aquarium at the east cnd. The huildings connected with it are in tho Early Pointed style. The entrance-hall and reading-room, 70 ft . hy 60 ft ., gives access to onrator's room, $\&$ c. There are forty-sevon tanks some very large, arranged at the sides of corridors, 200 ft . long, intersected hy an open room. Beyond the corxidors is the circular concert-
room, over which the dome and spire are raised. room, over which the dome and spire are raised.
Cloisters around the room are used to form the floor of a gallery, which is to he reached hy winding stairs in a grotto on the south. A winter garden is also planned. The corridors o the baths are roofed with a harrel vanlt. There are ehown 25 hot baths ; 8 wimming. baths, 60 ft .
hy 25 ft ., and 70 ft by 50 ft ., with semicircular hy 25 ft ,, and 70 ft . by 50 ft , with semicircular
hoad, for gentlemen. The ladies' baths are approached by a different passage to thoso of tbe gentlemen, from an entranco-hall, 42 ft . hy 35 ft . Besides a swimming. bath, 48 ft . by 30 ft . there are 18 hot-haths and Turkisb baths. reservoirs aro provided, on the gronnd that they
wonld be an nunecassary expense wonld be an nunec cassary expense. Tho space
insido the bastions is nsed as part of the desin insido the bastions is nsed as part of the design. The ladies' hath, and some other portions, would be lighted hy patent prismatic pavement lights;
the remainder hy skylights. The objeotionable features are too numerous to give this design "Neminm." Estimate, 87,000l.
of all. Even though it should be costly design best, the estimate would should be thought the carry it out. The wond prevent any attempt to forbiden. The plan shows the haths on the forbinden ground, whinin the eastern part of the
triangle. The anthar can consequently afford more convenience than those who take up less land; and his arrangements wonld ho likely to give general satisfaction. The ladies' haths show a plunge-hath, $68 \mathrm{ft}$. by 50 ft .; and the gentlemen's ditto is 101 ft . by 75 ft . There are sisteen private haths, and a Turkish bath of
larce size. The ladies have a separato entrance, large size. The ladies have a separate entrance,

divided hy a large contral hall, 66 ft . by 46 ft . containing two very largo tanks. Altogethe there are three corridors,- one 200 ft . long,witb tanks; also a concert-room, and tanks for Bris and reptiles. There can bo no doubt that righton bas provided a model in this instance. An alternative plan, confined to the smaller pace, gives the same arrangement of haths, \&c oxcept that the Turkish bath is rejected. The larger $p$
90,000 .

Mumus Maritimus." The design under this namo, illustrated hy eight or nine plans and drawings, has, from local causes, with another set adjacent, shared tho hnlk of popular favour Jnnecessary oraamentation is aroided; but a good scheme has heen arranged. Tbe drawings show a lighter kind of structure than tbo others, in consequence of the free nso of iron girders and lofty ceilinge. The principal tank-room has a large contral passage, and two aislcs close to he tanks-an arrangement which would be The two entrances and threo sets of skylights are placod in the centre of tho parade, the latte being hidden by tbe hacks of public seats built around the openings. A good space for pro-
menade is left on either side. Tro entrance to menade is left on either side. The entrance to courtyard. Besides the large room for tanks courtyard. Besides the large room for tanks, nd two corrided, tsero is an octagon room placed on orrars for small tanks, which aro considerahle dimensions. From a minseum of entrance, which also serves as an exit from th cquarium, males and females have separate corridors to tho batbs. The boilor and engincroom are under the stairs. Tho ladies plangebath is 56 ft . hy 21 ft ., and the men's, 100 ft . by 10 ft . The anthors of the design explain hat they have arranged the sea-wall (of concrete) in such a manner that it may stand aloue and that they have kept in viow the possibility of any change whioh might take plaoe in the pinion of visitors to require otber attractions he plan shows a projection beyond the line of the existing wider parade; and the propriety of advocated. Estimated cost, 32,000 l.

Cancer" is also favourable to a straigbt line of protection, from the pier to the Queen's Hotel, and he carries his sea.wall out to enclose depth of 120 ft . at the east end. He ounits ween in order to have a large aqnarium. Betanks he proposes a terrace, 5 ft , bigh and 30 ft wide. The lanthorn of an octaganal parilion, at the east end, is mado less objectionable by surrounding it with covered seats; and some other useful arrangement is contemplated in connexion with the raised entrance at the west end. An Italian style of architecture is adopted entre, gether, twonty-fonr large aud sixteen small, aro well arranged : many of them are recossed so that a crowd of persons could watch the fishes without the pressure of a moving crowd, on holiday ocoasions. The author farther provides a suhmarine gallery, with tank, 68 ft . hy 28 ft . a room for large tanks, cutting off the continua tho corridors; a court, 54 ft . square, with pond for diving-bell; a restaurant, \&c. A snb reservoir, would fill at sea-level. The cost is reservoir, wo
"Victor" may he oonpled with "Cazcer" designing an aquarinm only

His sea wall
of heacb, exwould inclose ahont 70 ft . width ept at the east end, where a somicircular bastion wonld project an additional 10 ft ., the pnrpose being to make an incline for Bath-chairs. The entrance would he at the east end, with a oourt. reading.room, 62 ft . hy, 53 ft . $A$ large refres $b$ ment-room and a dining-room are shown near the steps. The tanks are placed down the vestihule 50 ft . by 39 ft . Boyond is the grand corridor, 170 ft . hy 31 ft .6 in., with large tanks at each side. At the end is the conservatory, or 62 ft ., with ferneary waterfall, 1,000 pers, 82 ft . 6 in. by The bith fernory, waterrall, aud ponds beyond the offices, dc., is at the extreme west ; whilst would he formed earance end. A kith material would he largely hrichwork, stone, and terra cotta. The author avoids all signs of huilding ont promenado space. He places the tall-houses on a landing, 9 st. below the surface;
and proposes to get light from numerons glazed
iron frames, fixed, as an ordinary vault grating wonld be, in the surface of the parade. Ventopenings near the top of tho sea-wall and in the courtyard. The estimate is $40,000 \mathrm{l}$, to 50,0001 .; but "Victor" says "the question of cost is most elastic."
"Stability", is the design which competes with1 "M. M." in local favour. Besides plans and fair perspection of the desimens makes exterior. This plan would occupy a considerable portion of the promenade space for lights, \&c. portion of the promenade space for lights, \&c. so that persons oould alight from carriages at our the door. In the undergromd arrangement one shaped divisions introduced. From the val haped chill ontrance-hall ord son al pond, caverns, and rockeries. The men's bath is oval in shape.- The Turkish bath and the private haths aro satisfactorly placed. Three towerlike projections from the surface of the wall,
whilst they add considerably to the interior whilst they add considerably to the interior space, are likely to offer a great obstacle to the
heary wares in a storm. The estimated cost is heary w.
$30,000 \mathrm{l}$.
"Utile Dulci" (No. 2) is, on the whole, pattid to praise. He follows the majority in pating the aquarinm at the west end; hut his ffied.portico entrances, with waiting.rooms, \%es, de., above the parade, will he an objecnonad the design. He also curtails tho pro. emain-spaco too mnch, by surrounding the rnaming portion of the building site" with an walk, from tualcade, within which At the bathsentrance, the ways to the ladies' and gentlemen's departments are separated, on the landing. Each department bas a hot as well as a cold sea-water bath, rooms for eight bathors, and ten privato rooms for either hot or cold baths. The engine and boler are put botween the two sets of baths. The staircase to the aquariam is only 10 ft . wide, which is not sufficient aquarium (having thirty-two tauks of nuiform width) is 160 ft . long, 26 ft . wide, and 13 ft .6 in in average height. Light is admitted through saloon, 50 ft . square, is at tho west end. sea-wall is shown strongly arched at the hack, to resist pressnre from the waves. Ferns are shown in the recesses, The sea-wall, of hrick, is to bo faced with glazed bricks "for the better oxclusion of damp." Cos $5,40,0002$,, supposing the spot, and that no extraordinary difficulties would arise in carrying out the work. "Aquarins" offers another "cheap" plan (ine of F ), hag he starts for the existing sen-wall, the east end Hf The two huildings above the par ond finns for the restaurant, the other as a reading-room, with residence for the porson having chargo of the huilding. This author stands alone in placiug tho aquarimm in the centre, and assimning the extreme ends for the baths. By patting a plat. form over the conrts of the baths, ho wontd he parm cors 20 t, wide. Sne of these mould he part of the entrance; the other would give The tanks are on either side. A large hall is provided across the oentre of thecorridor. Baths provided across the oentre of thecorridor. Baths them. The hydraulic arrangements are mada so as to avoid the expense of pumping. A considerable portion of the centre of the parade is caken up hy the boildings and skylights; but a hroad space is allowed on either side, connected hy cross-passages. The sea-wall (concrete) is put at $3,9502$. ; central hall and aquariunn, 1,6751 .; haths, 7,4862.; surface buildinge, 2,000l.
The conception of "Finis coronat Opus" is commouplace. By groing back farther west-
ward, and using a part of tho prescnt byod parade, he gets a length of 698 fte . A circula staircase, on the east, divides the ladies' and gentlemen's haths. These aro p'unge only,--the irger, 80 ft . hy 40 ft .; the smaller, 50 ft . by 10 ft . Next to the ladies' hath is the engineroom, which separates the east portion fron the aquarinm. The stairs to aquarium are cluse to from which al wall, 63 by 52 t., opening eight tanks to hold 17,000 gallons each, and thirty. one to contain 9,000 gallons each. A senihy is an exit. Eatimated anst, 46, $\mathbf{6}$, Designs are also sent in by "C. E," $44,752 l$,
"Dreadnouglit," 32,0001. ; "Student," 25,000l.; and "Non quo, sell quomodo" (no estimate). These are so indifferent in dosign or exocution or so monagre in part
A large nuander of townspeople bave looked
And at the designs, as displayed in the Market Hall; and considerable commendation has been bestowed upon the autho $s$ of those best coloured and most ably drawn.
It is to be hoped that the Conncil will call in tbe aid of soine disinterested professional ansor

THE FIREPLACE, AROMITECTURALLY
CONSTDERED.
Fkoys the "noble savage" cowering over a owner of a modern mansion sitting beforo the scalptured or tile-bedecked erection which forms the setting to his patent grate, is perhaps a
transition as stroncly marked as any which can transition as strongly marked as any which can
bo showa, from the conditions of barbarism to those of civilisation. That which in tho former case is the mere menus of obtaining the warinth necessary for lifo and for the preparation of food, in the latter caso has becons the central point gatheringrplace of fumily and friends; and the very word " fireside" has becomo in nopthern countries, suggestive of, nlmost synonymous with,
the most beartfelt associations of domestic hap. the most beartfelt associations of domestic happiness and regard. It is no wondor, then, if, as soon as domestic architecture became developed in countries where climate necessitated frequent fires, the fireplaco sloould have received special attontion not only in recard to its utilitarian purposes and allaptation, bit as an opportunity for combining comfort or luxary nit
tural, or at least ornmental, effect.
Viewed iu this light, the fireplace may be regarded as an emmatiou of Medieral life especially; the centro of ita domestic life, as
the fountain is the centre of home life of classicalisu. It had its rise, and came into of Medixral architecture ; and its earlier speci mens are impressed with that massiveness and the whole strictly logical, relation of furmo and the whole stricty logical, relation of furme and nearly eversthing b :louging to that great ago of erer, that in these earlier specimens of the fireplace the arrhitectural idea is completoly in the mantel or surrounding masonry, the hearth, and the grate itself, - the first only corld be sail to occupy the atteution of tho Medixaral workman, from the treatment of the modera "chimney. picce; for while the latter is in most cases a separato erection capahle of being purvejed for
in a showroom and fised up after the house is Cinished, the Medieval fircplace, according to spirit of its coustructors, is an integral part of the edifiee, huilt up and bonded with the other masonry, and forming an opportunity for the display of ingenions unasonic construction and arcbitectural character and dignity of expres. siou. The hearth in these old examples was not, so far as decoration is concerved ; tho tacle of iron hars, innoeent of the glitter of polished steel; hut on the other hand, the chimney, now a disgraised necessity, so far as the moldly shown, the lower part of concornedled was f.ar from the wall, and sbowing like a vast tuanel opening upsard from the room. The and concentrate the fire, was probably the original cause for hringing out the chimney in these larye pliportions; for the erratic suoke only be fully caught and collected by such annple provision. M. Fiultet-le-Due, who gises in his meles of thesa older fireplaces (under the amples :s Chemine") of ireprves thes (under the head of "Chemince"), observes that,Le cheminse primittre se compose d'une niche priquque côté par druc piets-droits, et surmontso rl'un manteau et d'une hott,", sous laquelle
s'engouffe la fumé. Les plus anciennes chemi. s'engougre tant souvent tracécs sur plan circulaire, le nets sont sontent tracers sur plan circulaire, le

This plan of the fireplace, witb the circle thus worked into the back of the fireplace proper, and carried ont as a conver semicirele in the projoctiou of the chimaog, is highly charac.
teristic, iu its unity and siaplicity, of the spirit Early Gothic architecture or of the spirit of Early Gothic architecture, or perhaps we masy rather say, of the spirit of true architectural dosign everywhere. In theso old fireplaces, however, tho chimney. Shaft, or tunnel, as it may to seo cuttince and brouking the ceiling line so atrkwardiy, as it frequently did, at the top; nnd it could only be in daya when luxury and finisb in tbo farnishing of apartments were anknown that such a huge excrescence could be tolerated. Its deliberate imitation in some moderr Gotbic mansions or castles" is scarcely to be justified, now tbat we have every means for manipulating the fire so 2 s vill most readily he drapn up the chimney without milding out the latter to oatch the smoke. What about the draught of these old smoke tunnels, though ? We do not remember whether there is any old monastic or baronial chronicle which would give information on this head; any chapter de chimnibus smolientibus, which would record how far our ancestors snffered from downdraugbts, before "tall boys," and "cowls," and all the other contrivances'which make our streetoofs hideous, were thonght of.
But, bowever the mind of the arobitect may approve, ia tue abstract, of such a parely archi. Modimel creatment of the ohimaey as tho Modiwal exampies show, this treatment, in its integrity, is $\begin{aligned} & \text { scareely to ho rendered suitable to } \\ & \text { a modern hahitation. In the transition period }\end{aligned}$ in between the old and tho modern fireplace when tho bulky stoke-tunnel had been found inconvenient, and prohohly dranghty, but hefore the inste for largeness and depth in firoplaoes was extinguished, the compromise was effectod by hnving a great fireplace opening, with a deep recess, at the back of which was the actual grate and fireplace, opening into a chimney of be dignity of the fireplaino was prosorrcd, in ragard to the size of the opering, and the sides of the rccess formed places for a fiveside seat. reduced the fireplace, even in the highest class of residences, to a mere hole-in-the-wall affair, and effect and ricbness aro sought for in applied decoration and accessories. But, cren granting may ho quastioned whether we shontd pot to better to foliow tho older plans somewhat more han we do, or at least to apply thens in a carcy the acturl man of our bonse into the drawing.room fireplace. Modern manners and tastes will not admit of this; but we may, in arranging and designing fireplaces on any large scale, cndearour to connect and hond the work Cacn stone, or whatever else, into marble, construction so far as to make it are mural portion of the architecture, and a permanent portion of the architecture, and not a mere
applied "fixture"; aud we may design it iu reference to the room and to its immediate adjuncts, which is not rory often done. The value of the large recess for the fireplace depends a grod deal ou wh it is wanted from the fire, and whether the main part of lie room is other. wise warmed or not. There can be no doubt taat the aspect of the large rccess is far the best and most dignified, and that there is a comfort. able and home-like appearance in the "ingle nook," with its seats, which no other arrange mont gives to the same extent ; but it is equally much to warm the centre and further corners of the main apartment; and the ouly way to satisfy botb demands would be to have the fire fur effect, and hot air or water ciroulation for aotual hating. The fireside recess, however, is architects and their clients at eresent, and bas bsen eshibited in recent designs of this kiad sone happily combining the old "homely" louk (in the best sonse of the word) with modern good tasto and rofluement in style of decoration, some showing the mere uaked reproduc. tion of Medineval baretess and clumsy proportion, without Hedioval picturesqueness.

In rerard to the modern chimueypiece, iu its ordinary forms, we must con fess here, indced, to finding a sad downfall from the older style of Greplacb design. There is somothing in the
nsual style of slab chimneypiece, in "bardiglo" usual style of sln chimneypiece, in "dardiglo"
or "black and gold," which is indescribably.
offensive and flinsy in manner and effect. The Whole thing is sucb a mere piece of veneer,
planted ont to look solid; the thin slab at the top is so mean a termination withont weight or massiveness, that the a, specially calculated to repel and annoy all oxx arcbitectaral susceptihilities. Of the current forms of design, if it can be called so, for theso things, and the kind of look that they have all in a row, in their repetitions of nothinguess, in the deaier's show.room, we are not wortby to speak adequately. Only, it seems very absurd, seeing what the freplace is, and that it is the place to whioh every one naturally tarus in a sittiog. room, and opposite to wbioh the master or mistress of the honse naturally sits to read or to rest, that it should be so almost universal, in the average type of "well-to-do" dwellings, to take for this part of the furnishing of the room some hackneyed dealer's model, instond of having the thing done according to some definite motive, and in harmony with the owners It we mast have marble and cannot aford it in solis blocke it is muah bettor to use it single brond band m hrehitrave use it as geni and to 13 la ho and aria pilaste and archlraro whio forms the unal receipt. chimerpico the shale this is objectionto chimanegpicoc, tbe sbol, this la ohectionablo only beoause it is usually so daly treated: it is too tain, and it is constanty had so as to appear, aud to be in reality, very iusecure. The shel? shona be much thicker than it is usually made and moulded on the edge, and shonld always be supported cither by large and ample brackets, giving an obvious suppoit, or by shafts rising from the base of the design ; a feature wbich might he much oftoncr used than it is, and would afford boope for cousiderablo novelty in design especially in tho combination of the shaft and bracket. Whero economy is an object, and some compratively inexpensive stono is nsed for the chimnoypicoe, turned slato shafts may be nsed with pery good effect, and at very little oxpense. The tendency imong thoso who profess to have specially architectural tastes au present is to igroore altogether the mantelshelf, and to finish the chimnespiece hy a rakino set.off dying into the wall-surface. But the shelf, if properly de. signed and constructed, is really a suitable and well-placed feakare, for tho position is a retr good one for arrancings small ornamental ohjects, of arlistic interest, wbere they can be well scon and contribute to the general appearance of tho room, and if it is reppied that the set-off is the architecturally correct trentment, remresenting extornall tho "s whe in" of the fue it may he found the it is ato mousible to coub, ine both, and to hracket out the shalf from the face of the set.off. But the absence of the sholf will bo gonerally folt to be a loss, excopt among those who go merely by fashion.
Where either economy or taste is against largo and massive arehitectural erections as chimney. pleoes, the employment of oak or other bard ood woula often be mucb wher sulable fle desing of this tind is the notul in flat designs of this kin, is the natural treat. ment of wood, whil it is not really suitable to martle; and wool used that slabs can he fixed and tenoned in a more pormanent way thau is possible with the marble voneers which form so inany of our chimneypiceo designs, and which are constantly getting loose, and showing gaping joints. Inlay of darker wonds would be most suitable as ornament in such a case; or even silhouette designs in a dark tiut, where inlay is 00 expeusive. We very much want attempts to mako the cbimneypiece more artistic and attractive, in its comparatively inexpensive corms, than it is to he found at present. The cheaper forms of marblo cbimney-piece, as usualy designed, are enoughi in tbomselves an otherwise tastefaly furnished apartment. The very lowest form of all, the " mantle sham," 33 it is called in furnishing ironmontrers ${ }^{3}$ langunge, which is cousidered grood enongh for cottaces, lodses, and upper bedroms, is cer. tainly one of tho very meanest-lookiny articles aver invented. A border of plain stone slab is far superior to the paltry mock marhle chimney. piece of cast-iron.
In cases where a design of size and importance to be carried out in connexion with the fire. place, this should, if possible, embrace the whole neight of the room, and not appear merely as an repta should thus appear as the basis and central point
of a Intge composition, which above may take the form of a niche, or series of niches, for statuary; of a stand for the display of articles
of pottery, ornamental tiles, or other objects of of pottery, ornamental tiles, or other objects of
bealuty and interest. The chimnor.brenst. class beauty and interest. The chimnoy.breast.glass, se long considered the ne plus ultra of decorative treatment for this position, is in doubtful taste, more particularly as it is in a position where
any one standing by the fre must be troubled with bis or hor own reflcotion, which is not always desired even by the rainest or tho most beantifnl, atill leas by those who want one or both of theso characteristios. Dosigns of con
siderablo originality and intorost bevo oca sionally appeared recently for this extendod troatment of the fireplace design ; one or tw have been cnerraved in onr pages. In gonoral the complaint to be made against modern design of this clase is, that in seeking refinement and eleganco they rather fall short of dignity and architectural character: an infusion of the large manner of the Middle Age fireplaces, withou imitation in evory respect, seems dosirable, to raise tho freplace to sometling lise its ancien large halls may be mentioned the combination of two fireplace openings, sido by side, in one dosign, a method greatly extending the accommodation for tho freside cirolo, and which cer tainly would be susceptible of very brilliaut and effectivo treatment in point of design; but, considering tho prosent prico of cosle, we cannot, it justice to ol
Of the grate as nsually designed there is little indoed to be said on architcctural gronnds; the majority of grates, large aud smanh, costly and plain, are for the most part markod by entire absenee of true tasto in thoir design, and in the treatment of the material. Mouldings, which are eschewed very often in the marble pilasters and shelf forming the chimney pieoe, where they wonla be quito in keoping with the material, and improve the effect, are, on the contrary, sedu. lonsly intronnced in the iron grato, to which suitable; and cast-iron wreaths and foliage are liberally bestowed, in vulgar profusion. These in fact, often serve to hide more serions fanlts of structure and manufacture; and those who pur. chase grates aro often surprised to find that the perfoctly plain ono is more expensive than the one with the pretty festoons, \&ce, which latter are, in fact, screens for bad workmanship. Ther is one point in regard to which the grate wavo facturers hit upon the right thing, iu the introduction of polished stcel into the grate. No source of effect in itself oun be botter or more suitable for the situation, as it not only reflects and magnifics the glow and glitter of the fire, but refects heat ols 9 . Still, this source of effect mary bo overdone, and some of the forms of "patent" grate, nearly all an expanse of polished steol, aro gewgavelooking when empity, and almost oppressively. lieated looking when the firo is buraing, at least for a room of moderate size ; and the difliculty of keeping them bright is greator than tho effect is wortli. What we require genarally in the treatment of grates is a less pretentious, less pronouncedly drawingroom appentance, and more attention to tho nature of the material, which requires treatment in straiget lines and in flat surfaces and sunk or slightly relieved ormament, rather than in thoso super.elegrant flowing curves and cist.iron vege. "illustrated catalogue."
We have referred to the hearth as a spnoe for ornamental treatment, but, in fact, coloured tiles are elmost the solo form of decoration suitable to such a position; and the chief desideratum hero is that the colouring should not bo too bright character looks out of place in a surface, which if oxposed to view, and not cosered by somo o the patent grate arrangements, is in reality recoptacle for drupped cinders, Tiles of brighter and more pronounoed desion may very fitiy be introduced in the jambs or sp'ay of the rrate, where they cohance tho cheerful effect of the Where thoy cnhance tho cheerful effect of the some motive appropriate to the situation.
Architectural unity and consistency of treatment in all its parts, and in relation to the vanous materiale employed, is above all things roundings of the fireplaee from the category of mere trades style and oharacter which it has at formor epoch presented.

## SYMMETRICAL EDUCATION.*

THe readers of the Builder already Enow Ittle about "the Golden Mean," to which $\mathrm{Mr}^{2}$ Cave Thomas has devotod much attention; an We nead acareely say that the present volume is based upon this principte. We oannot ventare except in bis own words, to give them any ide fle way in which be hore redaces that prin ither in practical rnles, resnles, and opinan or against more ordinary principles and ideas we shall therefore transfer one or two leading passares to our pages, in order that the antho may speak for himsele.
The whole tendency of the technical system according to Mr . Thomas, is to specialise and reduce men to mere machinef; and to specialise is to narrow the sphere of vital action for there are but two possible tendoncies in nature, viz., either to excentration or to ymmetry, either to the unbalanoed or the balanced: the eccentric, the unhalanced, tho disproportionate, aro but different expression or snecial developmont. The two opposite endencies may be thus formulated:-
. Beings in whieh tha greatest number of racnlies are coucentrated in their mean or mbderate degre 2. Beings in whieb auy speciul faculty, or group of aptitude, lut are deficient in varied mobility, in generind chou or disproportion
characteristic increase 3 .

Now, if the full import of these two positions be thoronghly grasped, the title "Proportionate or Symmetrical System" will at once be undel. stood, indicating, as it does, a system essentially opposed to that which has so long been in vogue, iz., that based upon tho misconceptions that biat in the buman cbaracter shonld be culti. vated, and that quintity and variety of know ledge are preferable to antity in education, to the regulated, symmotrical cultivation of tho holo mantood.
If the popular zotions on the subject of cducar. found examinca, continues our autbor, ound that they are, in the main, founced on phrenology; and ubder the supposition that this misd, when it is nothing but a mere shaky hypothesis : bencotendencies in character resulting from accident and bohit are attributed to the ing from accident and babit are attributed to the
promptinga of certain cerebrol organe. These promptinga of certain cerebral organe. Tbese that it can scarcoly be wondered if tenchers oud parenta, whose notious are derived from phrenology, sliould be anxious to "crim" youth with all kinds of intormation, lest it should appear naturaly defcient, minus ayy cerebral protuberances. Henee one of the principal motives of cramming, and the origin of the absurd notion of tho grent variety of study necossary to develope the intellect. This is indeed, ono of the most absurd and fatal mistakes of modorn times, and is as imjurious stomach as apstion as crammirs the the mind, as of the body, ie impossible under snch treatment.
The proportionate or symmetical system of education we are now adrocating, the author minnere remarks, is based on that, great and ion which science of delimite proportional rel. leading positions of this doctrine, applicable to the subject in hand, are thus stated:

1. That, all wrongt imperfection, disproportion, ar aberrations from mean, of averuye conditions. The mocam, things, of the proportioned, the symametrical, of the good,
the perfect, the beuatifinl the parfect, the sutilal
necessarily in rolves a expecitil defict: tbis results from a 3. That as the ritality of power in any aystens of being is a fixed quantity, any excessive expenditure of vitality, geted liy inaction in orbers; or by tha gust be compeaby a period of alsolute rest; otherwise orgacisation will
 la m of compensation, hy which irreanhar activity in boidy
ar mind may be corrected and health restored. That any special excess or any system of heing necessarily involres a special defect, at once indicares the weakness of the educational system Which would promote or devolopo bias. For it will at onoe bo seen by (2) that any special at the of mind or body can only bs developery Tho general offeciency of the humanity is im.

- Symmetrical Edncation i or, the Importance of just
Proportion in Miud and Body. By W. Cave Thomas.
Londou: Smith, Elder, \& Co. is73.
prired by such a course. The trath of this position is, in fact, frequently attested ly the way, hat a fool in yes? he is very clever in that way, hat a fool in respect to everything else. That we have a public superficially informed, crotohety, eccentric, incapnble of observing or reasoning correctly, thinking deeply or seeing
far nhead, is dae to tho ahsurd system of far nhead, is
developing bias
developing bias.
The cultivation of bias, of special intellectal or physical idiosyucrasies, inevitably tenda to foster and increase what is evidently by (2) a predominance or disproportion in the man, and, luerefore, to destroy that proportion or symmetry in which well-being consists, or that regal manbood which is neitber in excess nor defeat of anything essentidly buman.
An ill-uatured critic, wo may bere remark, might curtly describe Mr. Tbomas's system as ad endeavonr to introduce and estahish a mean level of mediocrity suppressive of all taleut, all genias, all superiority, eitber mental or corporal, and devoid of those stimulants to emnla. tion and exaellence in all and every dircction which would oring mankind, in tho agreegate, to a bich level, instead of to a low ono such as Br. Thomas's system would. Nevertheless, we think there is much truth in his principles ; bnt why he should scont phrenology 0.8 he does, one cannot well see. Even though not ourself sabisfied, by any means, with phrenology as an in accordance with Mr. Thomas's principles as the contrary; for where smallness of cerebral devclopment and weakness of capacity are coin. cident, it does not fullow that this leads to or specinlly countenances, the farther derelopment of the nore prominent faculties, and the ncolect of the wenker. Quite the contrary and should thint as many phrenologists beep we ne way in viem as fo other. But we the leare phrenologists themselves with Mr. Thomas, and phrenoldgists themselves with Mr. Thomas, and ideal man," or "the regal manhood," to which the anthor allades; for this is his grand "pot. tern" of porfectod manhood, right or wrong, which rules and regulates all his conclusions as to what is ripht or wrone, and true or false, in oducntion, and overything elso within the sphere of humanity.

Let ns suppose that in adjusting the balance of political power on the glove, we were to cx-
clude the Amerioas. However equitablo and symmetrical sich a balance might be made in itself, would it be a false bolance or a true one? Eperything depends on tho expansion and com. pleteness of the view we take. If we regard as a sphero what is only a bemisplere, we calculate without our host, and our idea is worthless. If we regard as "the whole man" what is only half the man as a true and iutegral whole, enr conolusions are certrin to bo wroug. And from what Mr. Thomas liere and elsowhere says, we rathor fear lie does so.

## ROYAL INSTITUEE OE BRITLSH

 AROIITECTS.MEDIEVAL BRICKWORK OF PuMERANIA
Tres secoud ordinary genaral mecting of the aession was held last Mondry eveniug, at the Rooms, Conduit-stweet, when a paper was read by Mr. J. Trwenor Perry, Associate, "On the Mediæval Brickwork of Pomerania: "Mr. Jobn Gibson, vico-president, in the chair.
Mr. W. S. Barher, of Haljfax, and Mr. James Lemon, of Suuthampton, were elected as Fellows.
Tho Secretary (Mr. Eastlake) annonnced amongst otber donatione, the presentation, from Lady Tite, of a large water-colour drawing, Whien was on view, representing the varions buildings erocted by Iuiro Jones, fur which a special vote of thanks was passed.
After the ronding of the 'paper, the Chairman, imviting diectrssion, called upon
Mr. Street, R.A, who, in tho cmrse of his which Mr. Perry had ably treated, exterded all over Germany, from the Biltic to the Nortb Sea, and if he were to say ansthing at all, it woutd not be upon the buildinos exactly in Pomerania, but ont of it, aithongh they were of the same desoription. Every one visiting Germany Was immediately struck with the beanty of this brickwork; but wherever it was used, it geemed the fashisn to make the most of it. He trusted that next yenr we should know more about the subject, though the younser members
of the profession, he thought, did not seem in clined to visit Germany, there seoming to be a Want of interest in foreign art and architecture internal like himself to know more aboat the Pomerani knew to the oontrary, the most interesting featnre, consisting of old altars, vestments, \&o everything, in fact, heing left in the most perfect state to show what a Mediæval church was like before it had been ruined. The gatevays, too, were anlong the most important thing Which immediately struck visitors. These hrick
buildings were really of a most pieturesquo character ; and one could not help admiring character; and one could not help admiring their extreme beauty, the gable at Prenzlau being of great excellence, and the tracery of so
simple a character. In conclusion, he moved a simple a character. In conclusion, ho moved
vote of thanks to Mr, Perry for his paper, re gretting, at the same time, the paucity of attendance.
Mr. Charles Fowler, in seconding the motion, said that he was not very familiar with the exact places in Pomerania to which Mr. Perry had referred, but there were other towns, he thought, to whicb his remarks would apply. Stargard,
however, he, with Mr. Perry, had scen; and when he visited it twenty-five years ago, it wa a quaint old town, the picturesque buildings of which seemed to him to be of the fourteenth cen
tury. The old brick walls were remaining almost intact; and his theory was thereminilg archi tecture was imported from adjncent countries, there being but few earlier buildings than those of the fourteenth century in Pomerania; but possibly this might be explained by the inference
that during this contury, when the country was in a high state of prosperity, the early boildings were pulled down in order to make room for the magnificent churches which were then erected Mr. Perry had not directed the attention of the members to domestic buildings, of which there were some fino apecimens, though not of a large Yariety, being of a gabled character, the gables
heing the fenture of the building, but there were a great number of them they were cetremely pictaresque. The quality and cha racter of the bricks employed, Mr. Perry had greatly to the effect of the buildings, he thought, if they hai been made of a finer colour, and if they had been smaller in size, large.sized bricks they had been smanler in
heing dificult to handle.
Mr. Phené Spiers was of opinion that there were other towns in the same country, such as Lubeck and Danzig, the style and character of Which were precisely the same as those which
had been mentioned. He confessed that, from a personal canamination of the buildings, be had a personal cyamination of the buildings, be had into the country, and also imported into a place Where previonsly stone was the chief material employed. With regard to the town of Neu-
brandenburg, he thonght it was of tbe fourteenth brandenburg, he thonght it was of the fourteenth
contary. If the style was imported, it soon contary. If the style was imported, it soon
became a natural one in the country. With regard to the peculiarity of carving bricks, in England we very seldom thought of carving bricks; hut it was very certain that in several parts of Pomerania brick was carved. In $a$ height of 70 ft . heyond that of the iron doors, which was certainly surprising. The tracery too, was of an elaborate character; and, in conclusion, he regretted that so very little wos known of this interesting brickwork.
Mr. Fowler said, with regard to carved hricks, his experience was, that npon a carefnl examina. tion he had come to the conclusion that no bricks were carred which had becn burnt.
Mr. W. H. Brewer stated that the paper had been of great interest to him, for it had pointed laboured during the Middle which architects the material employed; they not only had to use a certain material, bnt had to find out how to use it. They knew, howerer, that if they had to build a church, living in the thirteenth centnry, they were to build it only in that particnlar style, thas overcoming the greatest diff. culty an architect had to contend with at the present day. The use of brick to these Gothic arclitects in the Early Ages was really one of
great difficulty; but when they came to employ great diffculty; but when they came to employ
stone, it was interesting to note what use they made of it, and how the style developed itself, He ventured to assert that the stylo developed He ventured to assert that the stylo developed hy the nse of brick was not of so fine a chathat which developed itself in the employment of stone. Gothic architecture was really more
applicahio to stone than hrick, and it might be looked npon more as a stone style than a brick rid. 10 finest specimens of hrickwork of the houses in England.
Mr. Street said
racery, these brick wat with regard to the of tracery, and in the mables all only imitations ings there were to be seen nothing but traccries, the architects having the material at hand which so easily lent itself to the making of tracery Brick traceries were also to he found in the north of Spain, and arain in the south of France.
Mr. Thomas Morris thought that history was really the basis of any kind of architectural really the basis of any kind of architectural
study; and it was very essertial that the suh. ject of which the lectnrer had heen treating ject of which the lectnrer had heen treating brickwork we shonld not speak of terra cotta, in brickwork we shonld not speak of terra cotta, in
which the Italians excelled. It appeared to him which the italians excelled. It appeared to him the score or the thonsand from one part of the Continent to another, it was quite possible that some of the decorative portious might have heen carried to Luheck, and there been disseminated in to the northern parts of Europe. He thought hat this was a point concerning which history might be able to show in what direction such a style travelled.* $\qquad$
THE PROFESSION IN IRELAND.
architectural assoctation of ireland.
The president of this Association, in his opening address, said, -What are the prospects of the profession? You have certainly complainings, and justly. Yon have also strong proofs of prosperity on every side. The number of architects is increasing every day. Fou should take courage from the fact, as it is pretty certain that architectural practice is becoming more and more general, -in fact, becoming a necessity of the age. I need scarcely dwell on the fuct patent to you all, that the influence of the profession is heing felt day by day; and though you occasionally hear statements made relative to the profession, you find nexamination that these observations are made oftentimes without sufficient ground on the part of the individual; ofteucr still, without any knowledge of the subject. I think it only reasonable to expect that beforo men criticise they should learn even a small portion of the nowledge which an architect should possess Men of real influence seldom or never indulge in snch criticism, but place themsolves nnreser Iedly in the hands of their professional ndvisers. 1 would also mention that the influence of the desired in salpe that sion. I hope it will contige dignity of the profes never sparing us wheu eur huildings depart from their praing us wheu eur huildings depart from mair proper nses and truthfnl principles. ence of the satchitect founded increased influ attainments proves that founded on his improve tecture is ectire is carly prosperous, and that no one dility need fear to succeed in it. I shall no dwell on the fact of how we are to get practice or how act in our intercourse with our clients designs. Then, having formed some idea of how to represent the work to your client, yo shonld perhaps consider our relations with them and all others in our paths (professionally). The latter, Professor Cockerell, gave it. as a rule than which I think none could he better, To be an artist amongst gentlemen, and gentleman amongst artiste."
As to geting practice, almost every man expericnce in this way is different from his neigh yonng architects a means of distinguishiny rising selves in early life, althonch there is a risk; jet I think the principle is a noble one, if only properly carried out.
When you have got clients, you mnst do all in your power to realise their wants, fall in with feel that the resplt against them when you in the case of prominent be satisfactory; and will be better to retire fonlangs, it prohably than that your name foult bo work anogether that which is opposed to the nsocid with It was very deliposed to the true spirit of art clients who clearly stated meet with intelligen

dered all the assistance in their power; and was still more delightful to fulfil successively the conditions required by such clients. The work of the architect should not he confined merely to the designing and superintending the buildin itself, but the whole work of decoration and fur nishing should be loft in his hands for it is wery sad and very discoraling to the arehitect find that when ber ing to completion bo 1 the ftime ing to completion, a found tha the fitings and rest shorld te thim for bot stako hing, ine ark ase studied tie general pubight shit stady can give the greates aelight. By it you learn to see beanty wher before all was blank. This study produces a spirit of gcatleness and refinement, and without
it pou can hardly realise to the fuil the beauties it you can hardly realise to the full the beantio of creation. The earlier in life yon get this power the moro readily you learn to understand those heauties. You then can sympathise wit the efforts of the artist, and a more charitable feeling will arise when you witness defects, you will be hetter prepared to understand the dificulties of his position. You should als. study art, and support professors in every pos sible way; for this reason, -that they live for their country's cood, and it is tho only thin that suall remain to tive a justidea or our stato when all else shall have passed away. Lose, then, no opportunity for the cultivatiou of this art, add a training to appreciate works of art Architecture is the history of civilistion. it wa the first necessity,-it is the real and only foundation of fine arts, and should be the guiding spirit to the others, which were created for her decoration.

The late Cardinal Wiseman, speaking of architecture, says:-"It may seem super fluons to observe in writing of architecture that it obviously divides itself into two branches, -the purely artistic, and the constructive If, on the one side, it seems to descend towards the class of mechanical pursuits ; on the other, it rises so high as to command its other two sisters, and to be almost necessary for their perfect existeuce I hay sufficiently intimated that one great difference between ancient and modern art, includin Mediaval art, under the first division consist in this,-that ancient art was public, and modern is privato. Galleries of scolpture were anciently unknown. Its most matchess pieces were in temples or in prblic halls, such as those hathe or in open gardens, perhaps, adorning fountains but generally accessinle to the most pleheian cye; but this very circumstance shows how architecture is in the highest sense a fine art and must always necessarily grow as such comnensurately with the advancement of the other two branches of art of design."
It is sad to think that in our minersities the fine arts receive none of that consideration which is their due, and which they should receive, if the education afforded is to supply the intellectual wants of the age. In England, France, and most other countries of Europe, those arts have always received due attention; but in fee the we are very far behind. I am happy to being paid to fine of the nniversities and I hops the day is not far distant when orr "silent sister" will remove the reproach that practically the fine arts are expunged from her programine.
The Government of the country do very little or art education. It is absolutely necessary that museums should be established, a a doblic lectures instituted, if we would hope for a reat knowledge of art in our midst.
However, notwithstanding all the drawbacks, I am happy to congratulate pou on the exertions you have made in the past, and the success attendiug those efforts. It must have been a surce of great pleasure to you to find your effort so well assisted by many of the sentior members of the profession; and the friendly aid given in several ways by the Royal Institute of the Architects of Ireland must also bo cncouraging; and, though last, not least, the riendly interest displayed by your frieuds who have honoured you here this evening, must be to you a proof that if you work earnestly for the advancement of the fine arts. you nced not fear that your efforts will go unvewarded.

The John Stuart Mill Memorial.-The execntion of the statue of Mr. Mill has been entrusted to Mir. J. H. Foley, R.A

H. Principal Staircase

K, Principal's Residence.
THE LAWRENCE ASYLUM, OOTAKAMUND.--Plan of Ground Floor.

THE_LAWRENCE ASYLUM, OOTAKAMUND,*
Tuis building has been recently erected by Governmpnt in commemoration of the late Sir Henry Lawrence, at a cost of 50,0002 . It is
intended to provide a home and education for Dimensions of dining-room, 107 ft . hy 40 ft . the children of the European soldiery, and affords ample accommodation for 400 boys. The cole of room is as follows :-
School-room space, 9.7 superficial feet per hoy.
Dining-roum ditto, 11
Dormitory ditto, 57

School-room, 96 ft . by 36 ft . The erection of this huilding required much labour and ekill, being built at a height of $8,000 \mathrm{ft}$, above the sea level.
The architect was Mr. R, F. Chisholm, of Madras,

## ART ORITICISM.

Is a recent work on the science of language, Professor Max Müller, in illnstration of the manner in which a primitive root may be traoed in its wanderings through the various later tongaes, takes as an oxample the root $A R$ (to plough). After finding it represented in the Sanscrit by a word meaning lahour in general, and under various modifications of sound in all the Indo-European languages, bearing the same or cognate meanings, it is discovered in the
Anglo-Saxon word Ar (heace oar), to propel a ship through the waves, to plough the deep; in the old English prerd ear, in the words eamaings, earth, \&c., and from the same root, come our modern words $A, t$, Architecture.
Art cannot exist withont labour ; labour, how.
ever, which in itself ministers to no bodily want, ever, which in itself ministers to ne bodily want, serves no physical necessity, but labour which is performed because man has more than a mere animal life, something distinct and superior which craves food and exercise, and affords him the highest enjoyment, because be has a spiritual being which can partake of and assimilate the good, the true, and the beantiful.
Fithics, science, and art are the three provinces of mental onlture, which, each having a mingle, and partake of each other, and interoxists botween them a strong analogy and natural harmony. The first care of man has ever been and must ever bo to satisfy his animal wants, the necessary support of his bodily existence, but the mere eking out of material existence has satisfied only the very lowest types of the species. Wherever the true dignity of onr birthright can be tmaced men have craved for somo sort of intellectnal pleasure, and all intellectual pleasure is more or less identified with the perception of the beautiful. As man has advanced on the path of civilisation he has endeavoured the more oarnestly to give grace and comelness to the works of his hands, to surround himself with things of beanty, to polish the mirror of his soul so that it may receive and reflect impressions of the beautiful in its.highest development, and in thas cultivating the
æsthetical faculty within him he is the more asthetical faculty within him he is the more from which his inspirations spring
It is the perception of the beantifnl, either through the senses or memory, that gives charm to art; and it is the moulding and fashioning of his material through its inspiration that exercises the genius of the artist, whether it he in filling the eye with graceful form, skilful composition, or harmonious colour, or filling the ear with " the inarticulate mystic speech of music," or stixring the soul through the measured rythm of poetry. Nay, somothing of a kindred pleasure and emotion to that which the perception of the soane minds take may bo traced in the delight apprehension of the beautiful in the abstrat the idea of unity, design, variety, and harmony in those sciences which treat of order in the When or created things,
exquisitely her the influence of that which is exquisitely beantiful we are drawn out of our-
selves towards it, it takes possesion of sonls : and this emotion excited with of our the 'power of the beantion excited within us hy the power of the beantiful in insensate nature only in quality and degree) as thre (differing kindled quality aud degree) as that which is kindled within us by the power of the good, the noble, and the fine in living action. Tho godlike in the soal is the heautiful in morals; and its contemplation evokes a higher emotion than nobler than matter. And yet there exists a nobler than matter. And yet there exists a
certain relntionship hetween our percentions of the oxternal and sensuous beautiful and the inner and moral heautiful, hetwixt material greatness: they are emanations and manifesta. thons of God, the source of all that is good and skill this moral setting forth with power and skill this moral beautifnl that has exercised tho genius of the great workers among men. "Was martyrs, and poets, in all times bages, and and suffered, bearing testimony through life and through death to the godlike that is in man ? and in the godlike only has he strength and freedom." Outer natnre is only the clothing and manifestation of spirit, of an inner life; and the inner life, with its hopes and fears, its moral powers and spiritual aspirations is the trne field of action of the poet, bat only in a relative degree of the painter and sculptor. Representa-
tive art in its first degree is content with the mere ovolving of outward beauty, and the charm Which such is calculated to produce on the per coption of the beholder is its chief motive; but
in its higher aspects it aims at a moral beanty, the expression of emotion and passion, the touch of natnre which makes all men kin.
Yet while this eloment of sontiment forms a component part in the highest efforts of representative art, it receives its full and proper developmont in poetry. In this matter art and poetry to a certain degree overlap each other, for while the raising of emotion hy sentiment is sometimes a purpose of the artist, and the realisation of a scene or action the effort of the pect, yet in the main the creation of a beautifngl
work of art is the true vocation of the one; the ovoling of sentiment and emotion is the trne vocation of the ether. Both, indeed, deal with the enter and inner life of man, but it is the assurance of the "relativity of our perceptions," in regard to the material and sensnous beautiful Which give confidence in his work to the artist whilst poetry appeals more to our inner life, the communion frem soul to soul byet which find pathy, and it is the assurance of the relativit of our moral perceptions that gives to the poet his existence. A true sense of the material beatiful is essential to constitute an artist, a certain sympathetic and emotional temperament is essential to constitute the poet harmon deals with succession of thoughts and harmonies, the other with thought ceystallized The material form
The sympathy and aptitude to emotion must exist in the soul ere art steps in to intensify or exalt it; hat where the responsive cord is
wanting, the appeal is in vain. The poet may not be a good art critic, nor the artist a jndge of "Evetry.
"Every man is the measure of all things to himself." No criticism on a work of art oan be true and just unless the critic can place bimself
at the point of view of the artist, unless he can at the point of view of the artist, unless he can sympathise with the feelings, cmotions, and objects of the worker. Education will not pro. duce this sympathy; the germ must exist in the
soul before it can spring up end be cultivated.

## THE GOLD AND SILVER MINES OF SCOTLAND.

WITHIN the shadow of "dark Lochnagar" the Marquis of Fnntly has commenced prospecting for silver. He has employed labonrers, under mine which of an expert, to reopen a silver. about the middle of last century. The nuders taking of the noble proprietor is anxiously watched by the inhabitants of Dee-side, who should it prove successful, look forward to a new field for labour being opened in their midst. The most successful prospector for silver in Scotland, in later times, was Sir John Erskine of Alva, who discovered a valuable mine of silver in a ravine of the Ochil Hills, which formed part of his estate. The silver in this mine made its irst appearance in small strings of ore, which being followed, led to a mass of that metal. A part of this had the appearance of malleahle silver, and was fonnd, on trial, to he so rich as to produce 12 oz . of silver from 14 oz . of ore. Not more than 50 l . bad been expended when this valnable discovery was made. For the
space of four months, it is credibly affirmed that space of four months, it is credibly affirmed that
the proprictor obtainod ore from this mine the value of $4,000 l$. per woek. When this mass was exhausted, the silver ore began to appear in smaller quantities, symptoms of lead and ether metals prosented themselves, and the search was for a while abandoned. Sir John, however, arove another shaft in the vicinity of the first and the result of the undertaking is made plain by the following anecdote. Walling over his reat hole, and riend, sir Johu pointed out took $50,000 l^{\prime \prime}$ Then wall-ing on, he come another excavation, and concluded the sentence "I put it all into that hole." In 1767, Sir John's nephow presented a pair of silver communion cups to the church of Alva, with au inscription which may yet be read, stating that they wer fashioned from silver found in the parish.
The earliest mention of gold and silve
in Sootland occurs in the reign silver mine James IV. In the royal accounts for king $1511,1512,1513$, in connexion with the gold and silver mines in Lanarkshire, there aro paymonts aud "the melter of the mine"," "the finer,"
a lease of the lead-mines of Glengoner and Wanlockhead (Lead Hills), was granted by Queen Mary to John Acheson, "master cunyer," and John Aslowan, burgess of Edinburgh, they were bound by agreoment to deliver forty-five ounces of hine silver for every thousand stone weight ef ead ore. In six months the leaseholdors delivered at the Hint " nine hundred onnces of atter fine silver." In 1563, the queen granted Jo John Stewart, of Tarlair, Banflshire, and William his son, licence to "win" all kinds of metallic ore between the river Tay and the Orkney Islands, and in the event of their find. ing any gold and silver where none were ever found before, the product was to be brought to her majesty's Mint; "the anco of gold for ter pund, and the unce of utter fine silver for twenty-four shillings" (Scotch). Of this grant nothing further is recorded, but it may he taken for granted that the Tarlairs failed in their nndertaking, as also did Eustacho Roche, Fleming, who entered into a contract with King James VI., whereby he was empowered to break ground anywhere in search of the precions metals. It was not till 1593 , when precions metals. It was not till 1593, when Thomas those days to King Edinburgh, who was in Erose days to kirg James what the Bank of England has often been in modern times to the sitish Government-a ready resource when money was urgently required for State purposes, wat the search in Scotland for silver and gold was industrionsly conducted. The king, in consideration of loans-and very heavy ones they were,-granted to Thomas Fonlis, a lease of the gold, silver, and lead mines of Crawford Mair and Glengower, for twenty-one jears. During his lease, he worked them well, and in time they passed through his granddaughter into the possession of her lusband, James Hope, of Hope. tonn, the founder of the noble house of Hopetonn. The estate has long been one of the best in Scotlana.
While Foulis was mining and prospecting, an Englishman named Bulmer, with the licence and favour of Queen Elizaboth, and a patent from the King of Scots, set serionsly to search for silver and gold threnghout the border country of Scotlaud. The enterprise was ruined by his personal extravagence, according to a reoord of the period. "Opon Glengower Water he builded a very fair country-house to dwell in, and he brought home a watercourse for the cleansing of gold and silver; by the help thereof he got mach strageling rold and silver on the skirts of the hills and in the valleys, but none in solid places, which maintoined himele thou in preat poces, and thereby ho kept onen house for all comers and coers : as is reported, he feasted all sorts of people that thither notice of silvelter came. Scre ends a brief gone by. Tho mines were in many instances vorked with many instances forgotten, the men who worked upon these forgoten, the men who worked upon these Reference has been made to the silver-mine at Alvaree han Alexander Sroper 4 , Sir John ith arr was bestowed as a gift on Sir John with a view to his being employed on the silver-mine, and his proprietor was enjoined following insoription:- s 1 man, bearing the following insoription : - "Alexander Steuart found guilty of death for theft at Perth, the 5th of December, 1701 , and gifted by the justiciars as a perpetual servant to John Erskine of Alra."
This collar was dredged up in the Firth of Forth many years apo, and is now in the musenm of the Scottish and is now in the Even until the personal freedom of miners and salters-the villainage of the Middle Ages-were in full force ntil extinguished by as statnte of George III. Three hundred years ago gold and silver were found, but not in abnndance, on the mountain sides where the Marguis of Huntly is at present prospecting. There is no doubt of the existence feins and nugrets of these precious metals in ho mountainons and moorland districts of scotland, but will the value of the "finds" be able to everbalance the amount expended on the labour employed? That is the question.

## SCHOOLS IN THE COUNTRY.

Vorthing.-The new schools in connexion with . George's, Worthing, have jnst been opened. The accommodation is for 208 children, without residences. The total cost, inclnding fittings, architect's fees, \&c., but exclusive of ground, has been about $1,069 l$., or $5 t$. per head. Mr. George Traefitt was the architect; Mr. Smith, of Traefitt was the arcl
Worthing, the bnidder.

THE PRINCE CONSORT NATIONAL MEMORLAL, HYDE PARK.

Capital of Great Pier.

Plan and Section of Pier

POSITION OF THE NATIONAL ARMOUR
Sir,-Allow me in the name of all lovers of art and adrocates of education, to thank you for your observations respecting the collection of tho
late Lord Zonch, and the present state of the National Armonry in the Tower. I can testify to the truth of every word you have said in con. demnation of the red tape system whioh compels the authorities to remard our priceless antiqnities as "stores" in a "fortress," instead of instructive treasures in a maseum, and in exposure of
the constant peril they are in of deatruction the constant peril they are in of destruction
cither by fire or water. cither by fire or water.
I am weary of representations to the War
office, having found them ineffectual from the office, having found them ineffectual from the
days of Lord Panmure to thoso of Mr Cardwell days of Lord Panmure to thoso of Mr. Cardwell, from nearly every administration of the justice of my remonstrances, and the desire of the authorities to remedy the evils complained of,

It is unnecessary for me to occupy your space by repetitions of the facts and arguments which have already appeared in yonr columans, and heen ro-pnblished in my "Recollections."
For your constant and strennons support I am deeply gratefnl, and if the public press generally wonld take up the subject, some hope, I have private reasons for believing, might hc enterwined of the reformation of the present "penny wise and pound foolish "s syatem ; but nothing, i sure from without"" dono except through "pres. The Government
Meyrick Collection to be dispersed matchless chasing a single article. That it will avail itself under the presentcircumstances of the patriotic offer of Lord Zouch is osceedingly problematical, An averago incomo of nearly $3,000 \mathrm{l}$. per annum is derived from the exhibition of the armour in the Tower alone, and of this sum not one shilling is set apart for the increase and improvement of tho collection. Contrast this Parliament, ordered some year or two aco hy Pariameat, ordered some year or two ago hy
the House of Commons, of the expenses of the Sonth Kensington Museum. "The amount exponded in purchases of works of art and science books, \&c.," is therein stated to have bee $224,873 l$.! independently of the cost of ar. Tho
Tho only self-supporting exhibition in the metropolis College of Arms.
J. R. Pianceé.
"South Kiensington AI useum.-From a Parliamentary return ordered by the House of Com.
mons on the I4th ult., the entire cost of mons on the lith ult., the entire cost of
buildinga, inoluding repairs of buildings for schools, appears to amount to $306,372 l$. ; the
cost of arrangement, which includes cost of arrangement, which includes manage.
ment and expenses for the circulation of art aroongst 107 local soholols, $630,555 l$. ; and the amount oxpended in purohases of works of art and scienoe, hooks, \&c., 224,8732 . Gifts to
the museum are estimnted at 160,0002 , in add the museum are eatimnted at $160,000 l$, in addi
tion to the 100,000 . given by Sir Joseph Whit worth for soholarships. Objects on loan are estimated to be of the annual valne of $300,000 \mathrm{l}$, and since tho fonndation of the mnseum it has
been visited by $9,056,818$ persons." been visited by $9,056,818$ persons.'

## SOMETHING ABOUT IRON.

Mr. Morris, manager of Dallam Forge, has read a paper before the Warrington Literary and Philosophical Society, entitled "Notes on Iron: its sources, Praccesses of Manufactnre,
nnd a Few of its Characteristics." We print the earlier portion of it. Me said: What is this mater portion called irou; this most useful of all
metals, - the intrinsic walue of which exceeds all metals, -the intrinsic value of which exceeds all
others, and which, in proportion to its use should he the cause of propgrtion to itt use, in the world wherever it is manufactured; and nation, hoth in times gone by and at the by any day, indicates very truly the degree of its attainment in the arts and sciences? If we ask the geologist, he tells us that it impregnated the
waters of tbe old red sandstone period, tinged with rnsty red the whole of that system; that it now appears in the segregated form of are found more or less in all parts of the world, are found more or less in all parts of the world, , in the sedimentary rocks, or in the massive deposits in the olden rocks, that tho United Kingdom derives its prinoipal supply
from the earthy carhonates of the coal measures, from the earthy carhonates of the coal measures,
from the carboniferons formations where some
particnlar coal-fields possess large deposits the sun and tho ore. Mesper a thost us portant part during the carboniferous era, anil that now we are consnming the millions of years past hottled up sunlight in the raking of iron Atrain, iron in the shape of falling meteors has heen fonnd, and from one of these bodies Persian emperor had made two sahres, oze knife, aud one dagger. This iron of lightning or thunderbolt conld not bo worked rp hy itself common iron hefore the Tubol did his master's hidding. It would be a wrinkle worth knowing how he obtained the suixture Coming to onr nearer friend, the metallurgist be lets us know the numerous combinations and analyses of tho particular metal yon wigh $t$ are involved to complete che separation and evolve the motal to that condition of puritp desirod by the manufacturer; what flux will hest suit to form a glass with the multifarious ores during their fusion in that hage laboratory, the smelting-fnrnace; and that withont flux to
separate the earthy matior from the ores would be formed, instead of the carburet of iron would be formed, instead of the carburet of iron nime.tenths of the ores is limestown flnx for nime.tenths of the ores is limestone, whicls is
incapahle of holding iron in solntion at hich temparatrures; that theren raust be blown at high pressure, from six to ten raust be blown, niter pressure, from sir to ten tons of atmospheric air in the farnace to produce the reqnired oxygen tor the reduction of one ton of pir iron
from the ore. The pig iron tho finished iron manufactarers take in hand, and by two distinct Wrocesses convert it into bars, plates, wire, \&c. Whe have arrived now at the puddling process, which is replete with intercst, consisting, as it ion. The present cast metal into malleable carried on alinost nniversanty, with fow mading fications (which shall he named), was in. vented hy an ironmaster of the name of Cort, ahout the year 1780, the hed of whose furnace buret made of sand, consequently the carespeciaw refined, many of its impurities eausialy the carhon which is the metalloid when Hudity, was driven from it; bence, When the pig iron was melted it assumed the he piry metal. If the carkhon had heen left in the pig metal tho bed of the furnace could not what iood ; besides, silica is fatal to iron, cansing brittleness and and silica had on the iron when wored contact with it was seen sone years afterwards by Mr. Samuel Baldwin Rogers, who introduced the present system of iron bottoms to furnaces, which eventaally did away with the finery process. Both of these gentlemen died in porerty, desideratum, ins in their day wore as much evolutions in the iron trade cause of greate the Bessemer process or Dank's rotary puddler in onr time. Many imagine tbat the gentlemar oonfess that for four or hive months in the year it is one of the most distressing processes to thie physical system of ail manual labour, yet phd. at the do not all stagger from the furnace fainting paper commissity, as a certain special news These joint iuventions were the means of this kingdom taking the lead of all other nations in the iron trade, for up to this time wo were de pendent for our supplies npon Norway, Russia, and Sweden. From the latter place even now a large amount of their prodnce tinds its way into England. In describing this puddling process it should be explained that the furnace is divided into two compartmenth, separated by a hridge
about 12 in. thick, and 14 in. high. Over this the flame passes it from the grate, and comes in conthere there passea round the hoilers, generating the quired for fory for driving the machinery re. quired for forging and roling the iron. The with er or compartment the pig rae tal is cbarged sides, which are lined plates formiug the bottom and sides, which are lined with refractory slags rich in oxides of iron. Inchanging the hont, slagsand scales from the hanmmers and yoliers are thrown on the hearth or bottom, and on this the charge of pigmetal, consisting of 510 lb . to 540 lb . Fuel is then thrown into the grate, and in ahout twentyfre or forty minutes this canburet of iron becomes liquid, and assnumes the form of a molten plate of iron some $1 \frac{1}{2}$ in. to 2 in . thick. Being eavier than the slage, the latter pass throngh , and rise to the top. In passing, the oxygen
contained in the silicates combines with the nnless of the iron, and decarbonises it; hut malle the iron is agitated it will not become malieable. Hence the paddler, with a har called a rabnle, agitates the metal, and hrings in con-
tact the oxygen of the silicate with and other impurities of the iron. and other impurities of the iron. As the carhon is leaving the metal, its atoms expand and become of less specific gravity, aud it throws off corhoniu oxide gas, the hlue flame of which is plainly seen hy any one who watches the pro-
cess. The puddler at this stacge must he inces ant in his cone is coming malleable. The boiling of the mass is leopt up by the fresh energy of the puddler antil, as the arbon ciminishes, the atoms of the iron berin tonit or agglutinate together in a soft spongy once moncy, the cinder taking the place of the once molten iron. The iron is now as sensitive to oxygen as a tropical plant would bo if placed in a temperature at zero, and as the human lives would he if inhaing puro oxyeco? it that were, too fast. It is at this point that smoke.preventers are puzzled; but a
deoxydising flame is kept on the iron while it is heing kneaded and divided into balla, pre and, when dong brought out of the furnace hammer and heaten into the reqnired shape for rolling it into the puddled har of comperce. This operation is called shingling. From what has been said yon will readily nnderstand that the puddling operation consists of chemical combinations and mechanical application; and the inventions hrought forward to assist the puddler in his part of the business are legion. The may be connted hy scorcs. have sprung up with physic to throw in the moiten iron during the process, to drive off the deleterions substances, the one idea being that dos iron would have a greater affinity for their phosphoras, and silicon the metalloids, carbon phogphoras, and silicon, and so leave the iron
pure. None of these recipe, pure. None of these recipes, however, have and general use. Mr. Bessemer. some twenty five or thirty years ago accomplished the grand idea of foreing air through a molten mass anticipating that the oxygen of the nir would iron, but he failed, for when give him malleable np its last equivalent of carbon to the had given commenced to burn it up. Besides, it lacked the neading, or mechanical part of the operation. The chemical part he got over so far as to proresist metal thoroughly tenacious; and it drrable and eoonomical materina to the most ther purposes. awakened metallurgist invention of Begsemer' inventions for steel-rakking, hat np to the present ime there is only one invention of any practical mportance, and that is the Siemens.Martin pro cess. Abont the same time as Bessemer we ompleting his inventions, two gentlemen, Mr. Tooth, of London, and Mr. Walken, Wolverhnmpton,-brought out patents for orail lating and rotating puddbing furnaces proved a step in the right direction. Somehow hey got across, and their scheme was dying when Mr. Menelaus, of Dowlais, bought up thsir rights, built a forge, and toade some good iron.

## heating hothouses without cosx.

 TE have long looked towards the utilisation of the erormous amount of heat (as also power) now rasted, and have pointed out directions in which such a result seemed possible. A writer in the Garden has described a notable instance in Which this is being offectod. We will condenso his account. He says from Dromore, in Ireland, asstem of lime-kilu heating hoth Filns are being were recently heated under difficulties at Manchester. Since that great show other kilns have been set to work in various parts of England Edinburgh that heats a series of hore rent levels with the pinest aideontire satisfaction and unost ease, and to the cerned. Many distima met at Hatfield Honse to sce a kilo heat $7,000 \mathrm{ft}$. of 4 -iu. pipes, extendiug through a series of directions ont of houses, and running in various and 6 ft ont of doors. The kiln was 8 ft . deep it 3,000 more feet of 4 in . pipes to warm. Therecould be no question as to the power and suf. ficiency of the heat provided hy the kiln. Mr Cowan also purposes adding still moro to th potency of his boiler by sinking it lower into the glowing heat of the lime-kiln. The sides of the kiln are so intensely hot that if a series of hoiler rings can be introduced into the kilu itself without interfering with the barning of the lime, thero can he no question as to the heat pene. trating through the iron, nor of its power to warm the water. And all this will be additional, for it may be assumed that the hoiler in the kin will in no degree check the energy of the heat sent up vertically to heat that portion that will in any case be placed right over it. If it he found practicable to sink any or a large portion of this boiler into the kiln, then less vertical depth will he reqnired for the effective workin of this new and cheap method of heating. found a geweral impression among those assembled at Hatfeld, that the plan was only applicable to largo establishments. Nor was this to be wondered at; the example before then was large and powerful; 7, ,ow capahle, poseibly, of heating 3,000 more; and a cart-way down to the month of the kiln, an arrangement made to Facilitate the making or removal of lime on a large seale. The kiln itself had probably an excess of power. This was also the first experiments with chalk, and it was important in such a not fail for lack of area; and, after all, I have not fail for lack of area; and, anter an, costly, doing a mere tithe of the work. But it wonld he illogical to reason that because of the magnitude of the works at Hatfield the system is not dapted for small places. Why should not the mall one? The expense of the kiln need not be much more than the expense of a well-huilt farnace, and all beyond the kiln costs neither less nor more, on Mr. Cowan's system than any otber. chester. At the latter the rate was two of limestone to one of coal; at Hatield it was seven of chalk to three of coal. The expcriment may be pronounced a splendid success. The system seems equally well adapted for the heating of manufactories and public buildings, as for horticnltural purposes, and is likely to he extensively adopted wherever sulficient deptb 18 available, and limestone or chalk within easy distance. do not anticipate much difticulty in commanding a market for the lime made. The next experiment needed is to test the cost of conveying limestone or chalk to the kiln, and this is about being worked out in Glasgow, where a kiln is Ireland.

## THE FALL OF A CHIMNEY AT

 NORTHFLEETSir, -The particnlars obligingly furnished in your last number materially add to, and in some respects correct, tbose previously reported. If we cannol wo we draw from it some practioal tbe disaster, we may raw fond be these :bints, and I think they sbonld be these :-

1. The building of a climney-sliaft of great height, of circular plan, and battering profile, is a work so special in all compared with ordinary cannot for a moment be cont phafts mancb more
walling. We know that sher slight than this one was have stood securely; we do not know how narrow way heen their escape in their early and unconsolidated state. No doubt the rule whicb would fix tho upper stage of 14 in . work at about 25 ft . in height is rough and unscientific, hut as it happens, curiously, that the first bulge seen in the shatt was at ahout 10 ft. below the cap, the point to which the above rule would bave led one to carry aip the is in. work,-it seems advisable to follow it, at any rate, until science shall bave provided a better
2. The bond secms to have been as good as was possihle under the conditions, although, as compared with that we can obtain in ordinary walling, it was very indifforent. On this account alone it would prohably be better to build such shafts on an octagonal plan, which would admit of nearly perfect honding, and in that case the base would be made a little broader tban in the case of the circular form.
3. The excellence of the bricks, lise that of the materials generally, seems to be borue ont. the Many persons being of opinion that cement nsed as in this case is of advantage, which opinion I hold to bo erroneous, we may put the
matter to a simple test. At intervals of abont 3 ft . in height, two courses of brickwork successively were built witb the vertical jounts, dry, and then grouted with neat Portland cement. It is not necessary to dispute with pour various correspondents as to whother this cement work would expand or not; if it did, it would fracture the rest of the work; whether it did or did not the rest of the work would fracture it. For this cement work would constitute sixth or a geventh of the whole shaft, and any ppreciable expansion would have force enough a pull out the areen brickwork to the extent of its own expansion. If it did not expanil, but set swe sas "tike a rock," the best way to judge of it will bo to consider how a piece of rock similar hardness would hehare under the like conditions Let us suppose a flat rinco of stone ditions. Let us suppose a ternal diameter, and abont 1 . 1 the ring moreover being almost only 5 in. thik, he in ar but (1) horizontal hea of tre can be hedded perfectly npon a mass of green brickwork, and thon carry up wore brickwork ing would break like glass whereser the least inequality of pressure took place (whicb would be inevitable), and what would happen to one such ring wonld happen to any number of others in detail, and just as the separate pieces of broken glass might bo perfectly sound and very strong, so might he tho stoue or the hrick in coment. This would be quite consistent with its inutility as a bond or tie, which inutility may be inferred from the result in the present case It seems a wise caution never to use cemon brickwork in intimate combination with mortar brickwork, and also to use, by preference, mixture of perfectly clean sharp sund equal to, or hrick and mortar on a good fonndation, we know pretty well what we may roly upon. I other bond is required the introduction, at tervals of a fevy feet, of thres conrses of iron hoop bond, while it can do no harm, will effectually resist any ordinary disturbance during settijent and when the work is thorourhly settlewent, and when the work is tho octagonal form of shaft would much facilitate the use of such bond.
4. Sncb a rate of progress as 6 ft . per working day, or 35 ft . per week, seems to requiro very favourable conditions, to be free from all chance of failure.
5. Why must every chimney have a ponderous cap, and thus add to other sources of danger this fnal one? Brickwork corbelled out to the extent of $15 \frac{1}{2}$ in. heyond the face of the wall, with an additional 41 in. in the piers, would, to a great extent, be dependent npon the cementing material, and witbout it mighit rall away bodily. The introduction of mortar into the cement, in such a position, can never he entirely trusted, and cortainly not unless actnally mado and used under perfect supervision.
The most diflicult question in the whole case ises out of the fall of "great masses of hrickwork" down the chimney before the general catastrophe; but it seems a question of scaffolding rather than of constructiou. There does not appear to have been a rigid framework of timber whioh would interfere with the settlement of the brickwork, nor anything beyond the needrul caffuld constructed upon the last stage of crossSome fraturh were carried by the boisting machinery may have acted upon the crosstimbers, and so tilted the parapet over. Tbis, herefore must be rectoced amongst the dangere wbich render the bonding and tying in of structures of tbis kind a matter of special imtures of

## ANTIQUITIES IN READING.

AT the opening meeting of the Readine Architectural and Archæological Society, hehl the 5th inst., the Rey L. G. Maine, Vicar of t. Jawrence, said the need of a society to dis. nes remable illustration by the ppence of a letter in the Builder in which ppearance of a the the building in St ssertion was mawo the original Gram Lar Sehol founded by Meary VIL, in which mar School foud in the ohiect Archhishop Laud was edncated. In the ohject of that letler wo to the in fact, an appeal th $b$ oso 1 bil $f 11$ to not to suffer an old historical building to far decay without an eftort this is not the old school. I propose to however, this is not the old school. I propose to discuss the site of the old school, and then to say a few words about the character of the old building, now existing on the north sido of St. Lawreuce's Churchyard. If wo would seek for the origiual school of Honry VII., to which he gave 10l., we must seek it in the basement of the resent town-hall. And now if wo may not irlentify the old building in St. Lawrence's Chnrehyard with the old schoolroom used in Henry VIL.'s time, what may wo think about it? Has it no history of its own? Itbink wo are much indebted to the writer in the Buider for drawing our attention to such an interesting rolic of olden times. I think we may identily it witb the old barn or granary of tho monastery. The present building has two stories plainly corresponding to the tivo floors to be found in many old barns. The granary has plainly undergone many alterations which may be accounted for. Considering its history, I would express my It i It 18 a veritable as having been the residence Sir William Armorcr, a man of rougb aspect, of Sir William Armorcr, a man Worcester, and who escaped atlo to King Charles II. He was became equerry, probably the kiog mitred ahbot lise toat of Reid by his retinue of orth in state was acco wis a handred horse. He rode with a baw ou his fist, on a mule with a gilt bride, witb oratioary monk was enjoined by statute never to appear without the cowl and regular habit of the order The vicar of St. Lawrence, wbo commends this paper to your notice, may lay some claim to discuss the subject of the stables, becanse in former days in these stables a horse was kept for the nse of his predecessors whenever tbey were called npon to attend the invitation of tbe bishop.
At the conclusion of the paper, a discnssion ensned, in which the president, Mr. Morris, Capt. Kennedy, Mr. Rolfe, and other gentlemen took part; and it was nuamimonsly held that the destruction of such an interesting relic as the old Ahbey Granary would be a great misforture to the archæology of Reading; and that, so far as possible, it would be most desirahie to retain an erection of such antiquarian value,

## Supposed Discovery of a British Strong-

 hoId at Gxassington.- $\frac{A}{\text { gentleman, who is }}$ round Grassiagton, near Skipton (where it is roposed to establish a hydropathic establish nent), in the conrse of his explorations in the neiphbonrhood has recently discovered som ruins of British fortress. The main buildin ond has been defended by an onter wall nes, Within the circle of the wall there has beert nother huitding and hundreds of tons of ruhbishi lie upon the ground. The remains are upon thic highest hill in the picturesque wood, and core about half an acre of its surface.

## CONGREGATIONAL CHURCH BULLDING

 the architectural association.Ar the ordinary general meeting of the session, held last Friday evening, tho 1 1th inst. (Jr. J. S. Quilter, vice president, in the chair), the following geutlemen were olected members
Mr . E. E. Deane and Mr. A Mr. E. E. Deane and Mr. A. G. Northover. The ohairman announced that Sir William
Tite's prizes had been awarded to ; -1 . Mr. H. Cheston; 2. Mr. H. G. McLachlan; Messrs. Langford, Homming, Wood, and Taylor being honourably mentioued.

Mr. E. C. Robins then read a paper on "Consgregational Church Building,s" and in the course of it said that hy the term "Congregational Church Building" he did not mean only to refer to a denominational system, but rather to the desirability of building churches for the special convenience of the congregations who should use
them. It may not generally he considered that seeing and heariag were so important where ritual obsorvances wero paramonnt, or where pulpit ministrations were the predominating
element is tho servicos ; but where larre num. bers cougregatod to hear an ablo proacher, it bers cougregated to hear an ablo preacher, it pleasure of seeing and hearing distinctly should he assisted by the building within whiah they were for that parpose assembled. Thero would ever be those who

## Lovo the high embowed roof, <br> And antic pilliar"s massy proof, And storiod wirdows richly dipht, Casting a dim religious light."

If churches wore to correspond with the wants of oongregations, then it would not be wise to iguore this powerful sentimental craving, or to
measure every want by geometrical progression. measure every want by geometrical progression.
The old basilican form of ohurch, which im. The old basilican form of ohurch, which im-
pressed itself so decply upon the Medireval mind, and lef us the rich inheritance of numberless parish churches and all our glorious cathedrals, had still a deep-rooted hold of the sympathies of a vast company of religiouists
whose feelings had a right to he considered whose feelings had a right to be considcred, and
for whose worahip it was the fittest form of expressiun, the most eloquent shrine of their deepest sentiment. Enulating, then, the liber. ality of our National Church, he did not share in the general condemnation of the usual form of Gothic churches, which was so suitable to the requirements of a very large section of the
church; and that it should bcome a conventional church; and that it should become a conventional
form was not only to be regretted, but overcome But some of the leading raeu had, nevertheless, set grood examples of sturdy iudependence. Arr Spurgeon had his own ideal, and executed it;
Samel Martin had a higher, and better roulised it; Newman Hall had the best conception and intention, hut it yct remained to be seen how it would be developed. These and other men had, at all events, in our own day given examples,
the great cont of which proved that lare means were yet forthcoming at the biddiug of earnest non, and expense of realisation need not deter risiug architects from attempting noble designs, even iu this so-called utilitrrian age. What we
had chiefly to avoid was wasting the noney at our dieposal in little prottiness, at the expense of the main outlines and general plan of the structure, -elahorate tracery, hooded huttresses foliated pinuacles, aud a forest of carriug. The ecclesiastical buildings, in the Classic istyle prevalent in the earlier part of this cenfilence, ulthough they were not in fashion now. There was a large number of parish churches in and around London, erected during the revival of Grecian architecture, which were eminently for which Protestant congregational uses, and wide span and without iuternal columus, except some small ones for the support of the gallery. fome small ones for the support of the gallery. parade an integral part of the design that it was rare thing to find them absent, they iudicated
what was felt to be all-sufficient for the simple services of that day. But they were usually bold in the extreme, cold, and caveronus; they ion, bat were not of that charicter that comnouded themselpes to the luver of our national , tyle of architecture. The grandest specimed was that of st. Pancras Chureh, which had been
lecorated with colour to overcome its internal lecorated with coloar to overcome its intermal
lrearincss. Pratt-street Church, Camden.tow, vas another which had aleo heen trated wit, , lecorativo oolouring, as well as the church in
Naterlou-road, opposite the railway.station; and Mathew's, Briston. Hanover Chapel,

Regent-street, was a widcly different adapta tion of Grecian art, and was an attempt to bend its forms to tho wants of a large congregation on so restricted a site that a double tier of now und was required, and this building was tendence. In tho exccution of this work he had introduced (the first time, ho thought, in London) the use of the steam jet for cleaning down the stonework, which obviated the neoes sity of any tooling of the surface of the stone, The time had come, he thought, for upsetting the old English practice concerning the orientation of churches, in defence of which he had heard no sufficient reason given, which had long since exploded abroad, and in consequence of which this particular church had been spoilt.

Prior to In wood's revival of the Grecian st Roman was prevalent,-the style of ali Wren's churches, and those of his contemporaries and immediate followers, great nobility of conception being observable in them all. He thought that it was quite time that tho rizes and recnlations of the Incorporated Society for Building Churches were revised and corrected. It might have been, and indeed was, very useful iu the earlier careful adhesion to precedents ; hut surely some latitude might now he given, and some ceperi ence must have heen acquired by the examiners of plens, sufficient at least to enable them to issue a less pedantic and restrictive set of rules. In the discussion that followed, Mr. Sulman said that with regard to acoustio properties of church buildings, he thought it absolutely neces-
sary that every one present should hear, the subject every one present should hear; but He adrocated the beset with many dificulties. to meet this question, which would convoy the poice to any part of the building. He wuuld like to he better informed with regard to the use of the steam jct for cleaning down stone. thanks to Mr. Robins for his paper, which of carried.
Mr. Paine was of opinion that with regard to building a church where people were to worship, it should be done with as little money as possible; and with the planning of the building the who emplould suit the requirements of those mon Tabarnalon. He hoag apital buildin for hearing and soeing, being a convenient shape, With regard to the development of church architecture in other countries, it was interesting to know in what position England stood. He was of opinion that we stood alone in this espect as compared to other countries. Ho "Middle Aged" architecture? modern churches in France the aisles were never used for seats, and he thought that this was an advantage, the aislo being only a place to walk in. In Germany the churches that were built were carried out with a rigid syminetry anknown in England; in this country churches aeing huilt with a great paucity and bareuess about them.
doption of adrocated, with Mr. Robins, the ags, which should the pillars for church build. ags, which should he erected on the ciroular Mr. Spurgeon without being struck with its Mr. Spurgeon without being struck
Mr. Flint Clorkson anid that it wape.
ary in churehesson said that it was very neces. hear and churches that the congregation should wear and see well. He helieved that the reason ro in for prodigions outloly an anxiety not to go in for prodigions outlay in church buildings mainly proceeded from the idea that the prohlem rally the thing was more of an experiment and that any one who holdly tried experiment, and hat any one who holdly tried snch experiment kind of problem to join monumental architecture ith a congregational church. With regard to he adoption of the elliptic or modification of the a method would give the building sufficicnt dich mity. But the give the building sufficiont digcity. But the gallery was reallg the great diffiing gallenies from a very powerfal roof had been successful, hut still this was involved in some difficulty.
Mr. Ridge regarded a church as purely a place of workhip, and for this purposo it was unso arranged that the persons therein shonld hear well. He took exception to the adoption of long transepts, and advocated the adoption of the
trusted that the liherality allowed in future ohurch buildings would give a larger spaca upon Mr. Hugh Stannns thought that the idea of a church was more for teaching than worship, and church was more for teaching than worship, and
therefore it was necessary that people should therefore it was necessary that people should
hoth seo and hear well. For this purpose a hoth seo and hear well. For this purpose a
building should be comparatively small, and the buidding should be comparatively small, and the
roof must be kept down as muoh as possible. roof must be kept down as muoh as possible.
A theatre-shaped bnilding was, after all, really A theatre-shaped bnilding was, after all, really the hest. Ho wonld ask whether it wonld not Ge advisable to huild churches in the form of the Greek amphitheatre.
Mr. Robertson was of opinion that the funcwhat of the architect was not to prescribe in what manner congregations shonld worship, hut to satisfy the requircments of those who ena. ployed him.
The chairman said that the great object which appeared to bim to cause the church of the present day to differ from other churches was the entire absence of symbolism; and this essential element of the early church was gradually losing its force in this atilitarian age. In this respect we were to a certain extent following the Americans. With regard to the pulpit, why shonld it not be abolished altorethe Many attempts bad been made to do this, bnt without success.
Nr. Robins, in reply, said that the discrssion had been of a very intereating character. He had great respect for the form of worship, He represented by tbe High Church party, there being an immense amount of bennty and poetry in it. With regard to foreign churches, they were almost invariahly large ones, and wey vaulted, and were not desioned or intended to bo used only for teaching purposes. The thentro plan, or the adoption of purposes. The theatre with regard to the building of amphitheatre huildings, was a subject hos of congregational vantages, one of the difficultics being to make it church like.

## ST. MICHAEL'S HALT AND SCHOOLS, HACKNEY.

A NETY building, combining the douhle purpose of schools hy day and a public hail at night, has heen opened in Lamb-lane, South by the Rev. J. B. Podmore, rector of St. Hichael's, and is intended to be condncted on voluntary principlos. Means for erecting the hall have been provided by private subscription among residents in the district, aided hy other contrihntions. This is one of the largest institutious of the kind that has heen opened sinco the passing of the new Act, and is regarded as being, to some extent, in opposition to the Board school, which is situated on the opposite side of adjacent to the chaels Hall is built on a site fields, the the church of that name in Londomthe Gieat gronnd having been purchased frombranch line branch liue to Enfield rans close by. The interior is spacious and lofty. The area is
oapable of containing an assemhlage of 1,000 persons; but for the purposes of the schools it has heen deemed advisable to divide the room by means of huge folding-doors, surmounted by indcpendent pari itions reaching to the roof, and effecting a complete separation of what are intended to be the girls and boys departmenta. One room is intended to accommodate 250 girls, the other 500 hoye. Mechanical arrangements have been introduced for the purpose of changing he sohools into the hall. The cost of the building, including 900 l. for the site, is $3,500 \mathrm{l}$. of this sum 2,23sl. have heen received, and a grant of 530l. from the Privy Council will be made when the remainder of the money has been raised. $\qquad$
A TELEGRAPHIC CABLE AT THE TAX BRIDGE WORKS.

THE Works at the great bridge now in course of construction over the Tay are heing vigorously pushed forward, aud, with the view of still further accelerating the progress of the undertaking, a telegraphic cable was laid last week hetween the contractor's offices at the north and south ends of the bridge. The cable was paid out from the steamer Excelsior. The whole peration was accomplished in about forts minutes, and immediately afterwards the instro ments were connected and signals exchanged Another connexion is at once to bexndo he station on hoard the store ship in the midd of the river, and it is expected that this meaus
of communication will give great facilities in the Work, as much time is often lost for want of means to comamand a tug at the right moment, and transmitting other orders. The contractors have also made arrangements to incrcase the plant considerably, especially the part which is used to pamp the sand out of the piers, as this has proved to be a point which conld not go on with sufficient speed, compared with the other operations. It is fully expected that the

THE WORKS ON THE SEVERN BRTDGE RATUWA AND THE SEVERN TUNNEL PROJECT.
The works in connexion with the Severn Bridge Railway, poreers for which were ohtained during last session of Parliament, are abont to bo commenced, it having becn deciced wat once but some timo is expected to be taken up in the purchase of land over which tho railway on the forest side of the Severn will pass. The line commences in a township named Syduey, near the parish church there, and the river wil he spanned at the point known as the Company have decided to contribute 50,000 l of the capita decided necessary for the constrnction of the bridgo and railway, the company being undor the impres. sion that the new lino will increase their revenue and affording acoess to new markets.
The borings for tho Severn Tunnel are also in progress, and the process is watched with great interest by geologists and persons in search of coal.

THE ALBERT HALL
Tee Royal Albert Hall Choral Society sang Bach's sublime Passion music (St. ILatthew) on Thursday, luth inst., heing the second concert of the season. The choir, nuder Mr. Barnby's direction, gave the choruses in such a manuer as to maintain fally the reputation it so deservedly graned last season. Tho points were all taken up with most praiseworthy preoision, and the only fault we conld find, were we iuclined to be hypercritical, would be a slight tendency on the part of the soprani to flatten on the sustained note at the end of ono or two of the choralcs, Which otherwise wero beautifially good.
Foremost among the soloists was Madame Patey, whose rendering of the contralto musio was simply perfect, more particularly in the air, with riolin obbligato, "Fave mercy upon me." Mr. Cummings is now so familiar with the tenor music (the part of the Evangelist), that his rendering of it leaves nothing to he desired. Hr., Thurley Beale, who hasrecouly surides in lis profession, $6 a n g$ whe 1 Miss Emily Spiller (sopiano), who possesses a swoet voice wonld be heard to greater advantage in a smaller wonl.
Handel's "IsraeI in Egypt" is to be given tho next concert, with Miss Elith Wyane Cadame Patey, and Mr. Sims Reeves.

## STREET IMPROVEDENTS

AND TRAJTWAYS 1N SWANSEA.
Tre Corporation of Swansea have just ontered into an arrangement with a public company for carrying out important street improvements in that town, under circumstances of an entirely novel character. A company of London capi. talists, calling themselves "The Swansea Tram ways and Improvement Company (Limited)," have mado a proposal to the corporation of Swansea to construct a numher of tramways in Srransea, and also to undertake the making of soveral new streets in tho town, and the widen. ing and improvement of others. Tho proposal inclades the purchase in fee, by the company, of all the sites necessary for the undertaking, and also the payment of compensation to parties injuriously affeoted. The estimated cost of the works,-including the tramways, 36,0007 ,,-is 136,000 l., towards which the company propose that the corporation shonld contribute 25,0002 , the company nudertaking to keep the streets and roads permanently in repair, to the extent of 8 ftu, which it is calculated will effect a saving 8 ftu, which it is calculated will effect a saving 1,000l. per annum. The improvementa also
inclndo the construction of a new bridge at the outskirts of the town, leading to one of the main thoronghfares, which will materially re uce the present gradient of the road, riz., from in 151 in 35 . As a guaranteo that the come pany will carry out the works, they are prepare 100,0002 . for the improyonent
T000. for the improvements.
The proposal was disonssed at a special meeting of the town coanoil, which has just
been held on the subiect, when the feeling been held on the subject, when the feeling in its favour was warm and unanimous. It was stated by the Mayor that during the whole annals of the corporation, a more important matter ha not been brought before it. Ho added that the proposed improvements would be the making of Swansea, and that the suggested street attera. tions would he most advantageous to the town. The figures to be submitted to the council would show that the alterations, which had become neccssary through the great tratic in the streets, would be execnted without the corporation ultimately incurring any expenso.
The resolution was unanimously adapted, the Mayor remarking that it had heen arranged that orly when the improvements were carricd out was the corporation to pay the sum agroed to. the sifreyor had dividod the 20,000 . heeween carried out wonld the instatments bo prid. The worizs contemplated are to be completed within three years from the time of the passing of the Bill.

THE NEW FORK BUITDING TRADE.
Tue huilding trade of New Fork has of late heen very dull; in fact, the present season is oxceptional in this respect. According to the statements of the largest builders in New York this state of ivactivity has been brought about by a varicty of cruses, not tho least of which were the threatened strikes last spring, and the actaal eifht-honr contests previonsly. The vastly increased value of real estate, the great expenso of labour, and the scarcity of money havo rendered men unwilling to spoculate iv what has always been regarded as one of the
safest possible investments of capital. The nn. safest possible investments of capital. The an. certainty that the men would stick to their work after it was commenced, and not strike for higher mages or fewer hours' work, was a great abjection to the builder to continuing upon the constrnction of houses, the site and material for which cost suol high prices. The occur rence of the late financial panic was only required to bring ahout the utter stagnation o this branch of trade. In the subarbs, however where the influences so potent amongst the operatives of New York are not felt, and wher living es well as real estato is cheaper, capitalists have been spendiag their money more liherally and associations for building up and improvin localities have been actively employed, thougl to nothing liko the exteut of 1872 . With regard to the gencral sitnation of the building trade of New York, ono of the prominent builders of that oity states, - "The fact of tho matter is, the brilding trade is wholly dependent upon the baineral trade of tho country When the latter is bad hnilding will he had, and vice vers $\hat{a}$. The prest stringene of money affects us as much present stringency of money affects us as much, time of the $y$ ent, when men ravely enter upon time the winter new bnilding specilations, beca of and heing so near, the prospects of builders and their employés dur
very dark indecd.

THE AMERICAN CENTEXARY BUILDING COMPETITION.
Sre,--Being a subscriber to your journal, and now on a tonr through America, I havo thonght that it may bo intoresting to your readers to have an example of tho way in which competitions seem to bo managed in this country; and if the instavce I shall mention he the rule, I think we may cease complaining of our system.
America intends, or intonded, having a grand Centenary of its Independence in 1876, in the shape of an International Exhibition. Two winters ago a commission was appointed from all the States to mako preparations, when great pains were thken to assure Americans that they would he expected to come from all parts of the country.
country.
This
This commission, by the beginning of the
present year, had so far advanced in its work as to have decided on Philadelphia as the place most suited for its object and America's glory. On this decision, it wonid seem, the commission and committees were reorganised, and out of seren as the number of the committee for tho selection of designs, four were Philadelphians, or at least Pennsylvanians. Prizes of 1,000 dollars each wero offered for the best ten designs for the necossary buildings, and all architects were invited to compete for them. Forty.four accepted the invitation, and spent some weeks of hard labonr in preparing their drawings. In course of time the best ten were selected, and requested to revise their plans for a second cornpetition, from which the hest four were to be selected, and to receive respectively $4,000,3,000,2,000$ and 1,000 dollars each. The decision on this last competition has just been made knowt with this result
It seems that ont of the forty.four sets sent in on the first competition, six were from Phila delphia architects. These sir were nmong the first ten selected nid now for of them are selected to receive the second promiums offered, and all outsiders have worked to no purpose. It would also appear that it is not the intention of this committee to follow any of the phas to whicl these premiuras have becn awarded, as the ex pense of carrying them into execation would be too great, and would also require a much longer period of time to get completed than they have at their disposal.
I do not remember of any enso in which such conspicuous partiality was shown. Instead of its being a national atiar, it would seom it is to be solely for Philadelphia, unless capital bo equired when they will look to ontsiders to supply them.
*** The account certainly reads oddly, but ** from Philatelphia deservod the position given to them.

## Parhitamentary fotices

AS TO RATLTVAY AND OTHER WORTS.
Among the notices already given by advertise. ment of intention to apply to Parliament in the coming Session for Bills, ico., are the following : Testminster Boulerarl, --Construction of new treet from the New Palace-Fard, near the Clock Tower of the Honses of Parliament, to Eatonsquare, ucar St. Peter's Church, and streets therefrom to or near to Victoria street, widening of other streets, juactions with and stopping up andappropriationor various strcess and horayn. fares, works in connexion therowith, custuction of markct. place, market powers, connpulsory pur. chaso and appropriation of lands, de., modol lodging-houses, provisions in relation to parochial and local rates, incorporation of company, powers of constrnction, \&c., to such company or company incorporated nuder Companics Acts 1862 and 1867.

Tho guvernors of Heriot's Hospital have resolved to erect two now schools at Ahhey Hill, at $\Omega$ cost of 2,0001 . and 1,000 l. respectively. An exhihition of water-colour drawings is now open at Hill's Gnalleries, St. Andrew's-square. It contains examples of woll-known artists, both English and Scottish, but none of them are worthy of special notice.

## SПAMS.

Sin,-1f there was any personal discourtes $y$ to your corvespondent in my letter I am truly sorry for it. I am not aware of any, nor was dwellintrss, about which he improvement of the can only snggest a little limewasin opinion, I "accom snggest " lithe limewasi and more whether slams or otherwise made the tenants and their hone he has made the temants and their houses clean, and drught them to keep them so, "chromolithographs that rival paintings " may ho added as rood to at atout pir of hooto them more good got a stout pair of hoots, and take an oconsional walk in one of the many parks. They may by that means learn to love Nature, and not trouhle themselves about "Mayfair."
But your correspondent has caused me to wander from the point at issue, viz., the in. fuenco of shams on mankind. What is sham? A doception, an imposture, -in other words, a substantive io. Wo all hate a verbal or an acted lie. Where has the snbstantive lio or sham the adrantage? -that it should he oncourajed and set up as "the humanising influence of the ninetecnth century."

Has a thought heen hestowed hy this defendor of shams on the producers of these same lios? See how they toil all day in close atmosphore at the most monotonous work for the lowest pos sible wages (or how else enn the shams be cheap ?). What satisfaction can they have in their work, the ohject of which at best is ta omulate "Maytair" and foster that pride which is as surely the forernnner of degradation as that humility which your correspondent depreciates is tho only road to social edvancement and true liappiness. I do not think it will ho neces sary to trouhlo you with further letters on this suhject, as I have confidence that Tratb will prevail when Falsehood is ouce unmasked.
In conclusion, I would earnestly exhort your eaders, if they will forgive my presumption in doing so, to strive after Trutb in all things, and to avoid anything that savours of deception.

## INSTITUTION OF SURVEYORS.

A conversiziove to celebrats the opening of Nu. 12, Great George-street, Westminstor an Wedoesday, November the 12th. At the, tation of the president and council 1 nu number of members and associanci, a larg in the eomelions assembled just been completed at a large outlay. The society had so far' ontgrown the premise which it previously ocoupied, that further accom. modation for its present needs had hecome ahsolutoly necessary, as well as provision for its future expansion. In addition to this, it was considered by the counoil to he necessary to ereot a room suitable not only for the fortnightly meetings of the society, hnt which shonld alse he especially fitted for the numerous arhitrations held at the Institution by its members, and for whioh the old rooras were found to be to sorae extent ill adapted. As many of those members of the Institution who reside in tbe country have no red in ontess, special rooms haro heen provided in the bew huilding, in which they can meet their professioual friends, hold consmltations, write letlers, and so on
On the occasion in question, the rooms of the society were well decorated. The lihraries were filled with Mr. J. A. Rose's magnificent cel. lection of historical portraits lent by that gentle. man for the occasion, as well as with many valuahio and beautiful water-colour drawings hy Mr. R. H. Mason. The walls of the council-room were covered with oil-paintings leat by memhers and friends. In the large lecture-hall (a kandsome and lofty room) was exhihited a portion of the remarkahle collection of prints illustrative of the topography of ancient Loadon and Westcmnster, lent, with his usnal liberality, by Mr. J. E. Gardner. Other contrihutors of objects of
value and interest were the Watcomhe Terra Cotta Compans, who sent a collection of pottery executed in that material; Mr. J. E. Price, who exhibited some Roman pottery, and his well. known collection of Pilgrim signs; and Mr. Lamhert, of Coventry.street, who decorated the refreshment-tables and some of the reccsses with rare examples of the ancient Goldsmith's art. Brr. J. P. Heseltine, Mr. H. Vig. nolles, and othcrs, were also contributors. A special feature of the occasion was the excellent mnsical performance nnder the conductorship of Mr . J. B. Zerhini. The conversazione was perfectly snccessful, and gave happy

## mprovements in Parliament STREET

the publit offices
Several of the houses on tho west side of Parliament-street, near the Whitehall or north end of the street, have heen sold, and are in course of removal, and the improvement which has been so long projected in the widening of Parliament-street to the same width as Whitehall is at last in a fair way towards actual achievement. The doomed haildings comprise rather more than half the hlock which at present obstructs the viow of the new Government Offices in Dorving-street, and their remoral will hring into the light of day the west ond of
the pile. It will also make moro obvious certain the pile. It will also make moro obvious certain
departnres from "the square," which will doubt. departnres from "the square," which will doutt-
less excite comment. We hope the other portion of the block will speedily follow, and in a ferw pars we may look for the completion of the work in the demolition of the houses hetween Upper Charles-strect and Great George-street. The approach to the Honses of Parliament from Charing-cross wonld then he one of the widest avenues in Earope,-too wido, indeed, for the convenience of pedestrians.
Mr. F. Sang has rearranged his designs, suggestive of improrements in Westminster, and the concentration of Government Offioes, of which we gave an account in a previons rolume. Metropolitan Board of Works.
The proposal is to enlarge Trafalgar.squaro on the north, in a rectangular shape, and on tho south in a semicircle or crescent, and to an avenue in a straight line from the centre of the of the Parliament Honses. Beyond the crescent of the Parliament Honses. Beyond the crescent of the square an opening of 150 ft . leats into second square, swrronnded hy puhlic offices of seven spacious arches on each side, one leading seven spacious arches on each side, one leading
to the new Thames Emhankment, the other into to the new Thames Emhankment, the other into
St. James's Park. A largo circus at the WestSt. James's Park. A largo circus at the West.
minster Bridge end completes this Grand Avenue. He further proposes to prolong the Avenue. He further proposes to prolong the Mall in St. James's Park, and form a commodions drive and thorongharc into the southern part of the enlarged

## SCHOOL BOARD SCHOOLS

London.-On the recommendation of the works committee, it was resolved "That the Kentish.town, N.F., amounting to $9,2 f 92$ l., for the erection of a school to accommodate 1,070 children on tho Haverstook-hill, Mary lebone site, bo accented. That the tender of Mesers T. Niblett \& Son, of 37 , Birkbeck-road, Hornsey, rise, N., amounting to $7,180 l$., for the erection of a school to accommodate 755 children, on the site in Hawley-crescent, Camden-town, he accepted."
(hengh.-The opeaing of the principal hoard.school at Scarborongh was celebrated by an appropriate demonstration on the 25 th ult tion of the toem meant to serve the central por. the of the town, and form the chief work which the first school hoard elected by the borough have executed. The central schools are situated in Trafalgar-street West. The huilding has two frostages, -the infants' department facinct Tra.
falgar-street, the girls' and hoys' department falgar-street, the girls' and hoys' department facing the new road now in course of construc.
tion by town council, the board-room and care. taker's residence heing placed at the extrem corner. The architectare of the schools par. takes of the Gothic, and the building is of red hrick, with stone dressing. The ro ma are

100 infants, 200 hoys, and 200 girls. The infants' department consists of one large room, 65 ft . hy 31 ft ., for the assemhlage of all the infants at one time; one class-room, 32 ft . by 18 ft ; two class-rooms, 20 ft . by $18 \mathrm{ft}$. each git $1 s^{\prime}$ devartment consists of one large room 80 ft hs 20 ft for the assemhlace of all the givls t one time it class-rooms, 20 ft , hy 14 ft . at ove 1 , to ache 1300 square yarde comme phaygron 1,3 are yarde, commea the ghilden in shods for the acour ${ }^{\prime}$, wet weather. The boys department is simila to tiat of the girls, having one large room, two class-roons, \&c., with large playground, cuec tually cut off from the girls and infants' department. The Board department consists of the Board-room, $20 \mathrm{ft}$. by 18 ft ; clerk's oflioo, 16 ft .
hy 12 ft ; and lavatory; attached to this is a hy 12 ft ; and lavatory; attached to this is a
living.room, and over the whole are threo hed. living.room, and over the whole are threo hed-
rooms. Tho arehitects were Messrs. Stewart \& Bury
Orighbington.-After a long discussion the local Board has resolved:--"That the principle of 'wido schools' had been adopted in the plaus after due consideration of the relativo advan tages of wide and narrow schools, and also has heen, in some measure, detcrmined upor on the nature of the site. At the same time tho Board would adopt the suggestion of the Depart ment so far as to make the width of the schools 32 ft . within, and that the architets he requested porsonally to attend heforo the Departmencasa heing given to the plans already prepared and suhmitted to the Department, suhjeet to the sume named modifications.
Hull.-The competition for plans of proposed schools and teacher's residence at Keyincham has been decided in favour of those suhmitted hy Mr. Rohert Clamp, of Hull.

HOMES IN HOMERTON" AND THE HACKNEY BOARD OF WORES.

SINCE our last issue, at a meeting of the attention of Dr. Tripe, the medical olficer of health, to the article in the Builder, and aske him what he had to say in the matter. Dr. Tripe is reported to have said that " he had seen the article in qnestion, which was very much esaggerated, althongl some of the statements 28 to nuisarces, and the state of certain buildings Homerton, were substantially correct. Immediately on reading this article, he instructco inspectors to visit the district at once, and he was happy to state that many of those nnisance been removed, whilst the other matter proper attention."

## roper attention.

解 he medical officer had boldly acknowledged that not some, hut all our statements were substantially correct. Instead of exaggerating we nnder ar the evils wo found in Homeron and an adjoiniog district, which will prohably come in for a separate notice. We have arai fisited Homerton; aud althongh we found, in regard to one or two spots, a something had been done by the orrners since our former visit, the radical evils yet remain. The hack premises of fow honses in Brooze-street and street have heen cleansed, and the places rocommodation have undergone bome patching In their fittings; but houses in Homerton, in anmer and varicty, are bad, and removal in several iustances, we fear, will be the only certain remedy. As to the inspectors, do they possess such practical knowlodge in respect to the constrnction and drainage of dwellings as to properly qualify them for the task they are expected to perform? Moreover, unfortunately, the hands of inspectors are tied in the majority of instances, and they shirk their duty, because the performance of it might entail upon them the disagreable necessity of reporting on the acts of some who are to be fuund sitting as their masters. Homerton, we repeat, is quite as bad as we have described it, and there is no lack of independent corroharative evidence, not only to bear ns out in our statements, hut to supplement them, if necessary.

Dingwall-The hospital recently hailt a Dingwall, in memory of the late Dr. William Ross, has heen formally opened.

## GHURCH.BUILDING NEWS.

New Chesterton (Cambs).-St. Lake's Chnrch is in progress, as recently noticed. Early in une a contract was made with Mr. Thoday, of Cambridge, to huild the chancel, three hays of hie rave and south aisle, and the sonth transept, for 2,888 l. The designs were furnished by Mr. Smith, of London. In August, three hays of tho north aisle were added at a cost of $340 l$. To complete this portion eastwards, there remain the north transept, which will cost 300 t ; and the vestry and warming-chamher, aboat 80 . A gentleman has offered $30 l$. towards the north transept, if nine others will give the same: six have already promised. The committco wish to have arm to 500 and save he espere and periness of temporay walls. The experb, when compter will onst a proious na ( 30 n , wide) of live bays in length, cast erd ond roth and south transents. At the ast end, and north and ashle west coracr of the soun aill 150 s spir will he placed, rising to a height or 150 f., and vestry will ho provided on the north side of the charioel. The style adopted is Early Fourteenth Centary. The materials used are Camhridge hricks, with Bath stone for the dressings, and the open timber roofs will he covered with Staffordshire tilea. The total accommodation provided when the church is corapleted will ho or 700. The pressing need of a church in this district has compelled the committee to commence hailding, though they are not in a position o undertake the whole of the work.

Thruscross.-In the valley of the Washburn, a hittle distance from the Fewston Reservoir of the Leeds Waterworks Scheme, the Bishop of Ripon as consecrated the Church of Holy Minity at Thruscross, or West End, a rural district in the sufficiently distant from any other ohurch to render their spiritual wants an object of solicilie Rer. J. E. Briqge, formerly of Leeds, actuated by true missionary spirit, has tokeu the work in band, and has not only heen instrumental in finding fouds for the erection of the chorch, but has undertaken its ministry, and the ministry of has undercake withe fee poward without ative whe phurch can hardly be termed new secing it occupies tho site of one and acludes a 1660 ; the will of noludes a portion of the xisted in 168, and on the porch or the new hurch is a slah bearing the following inscrip-ion:-"Chorch of Holy Trinity, Thruseross. A chapel existed here A.D. 1660. Eularged 1811. Nave rebuit with chancel, and conserated A.D. 1873. The cla do a plain Gothic huilding, with porch, nave, chancel, and vestry Tho seats are all open, of pitch-pine rarnished The chancel has a circular end, with fonr lights. The centre window is presented by Mr. J. D. Hannam, of Knaresborough, and others hy the Rev. G. Hales, E. M. and A. Kirtley, and other friends, and Mrs. M. S. Dury, Birstwith. The floor of the communion and chancel is laid with encaustic tiles, and the huilding is warmed by heated air. The architect is Mr. H. Cookhain of Middleton, Manchester. Assistance has heen rendered hy the neighbouring farmers in loading stone, \&c., free of charge. Attached to the church is a barial-gromnd, given by Mr. W. Roundell, of Gledstone.

Upton snodsbury. - Tho coremony of re-opening the church here has taken placo. It had become so unfit for use that it was found to require large and expensive repair and restoration. At last, owing to the decay of the timbers of the roof, it hecame unsafe to nse it any longor for public worship and the rector determined to pubmere its restoration, with the inadequat sum he had in hand trusting to the liberality of wurchmen to comple the rcstoration as funds would permit a prest portion of the walls have roull pilf g hare he wall hav been rehunl, $A$ row nave, chancel, and aisle; new encaustic tile the from time to a. by churchivardens has been repaired; the gallery removed, the lolly lower arch throw opes, and the westera window of the tow exposed to view. All the old features of the church have been retained, except a rood.screen, the remain of which are placed under the tower, only wait. ing for the necessary funds, to be restoren. The chancel contains windows of nnisual character. Mr. Wm. Jeffrey Hopkins was tho architect, and Mr. George Warner, of Malvern, the builder. Che portions of the work that remain unfibished for lack of funds are the restoration of the ancient
rood-acreen, the proposed new porch, the resto ration of the tower, and other details.

Tundridge Wells. - A new cemetery bas heen consecrated hy the Bishop of Chichester, for the Chnreb of England portion of the community The cemetery is situated on a slope commanding Woodand scencry, and consists of ahout twenty
acres, the land baving been purchased by the acres, the land baving been purchased by the town, of the Earl of Abergavenny. There are two entrance-lodges, and of course the nsual Cemetoly huildings for the members of the Church of England and the Nonconformists
These were erected from designs hy Mr These were erected from designs hy Mr
Stephens, of Maidstone, by Mr. Constable, of Stephens,
Penshurst.

Thirsh. The ohnreb of St. Mary Magdalen has for many years gradually become more dilapidated. The tower, together with the tracery of the wbole of the windows, is shortly to unhas been appointed. Mr. Street is the architect and he estimates the probable cost of the restoration at 4,600t, that sum being made up as follows :- New floors aud seats of oak, 1,000l.; repair of internal and external stonework, 1,3007 .; repairs of roof, $700 \ell$; chancel, $550 l$. ; warming, $250 l$., so. By a re-arrangement it is expected fifty additional sittings дearly 1,300 . bave been promised.

Boston Spa. -The parish chnrch, partially re built and generally renozated, has been reopened. II. Parkinson, of Leeds, and in accordance with them the partial reconstruction has been carried ont, as will doubtless he the rebuilding hereafter hegun in July, 1872 , by pulling down the east end, consisting of a low chancel arch and very short clancel. A new chancel.arch, chancel, with organ-chapel at the north side and two ward of the existing nave, and a transept and part of aisle southward, open to the nave by an part of aisle southward, open to the nave by an
arcade of four arches. The stylo of architecture is Early English, the stone used being the local is Early English, the stone used being the local Door quarries. The chancel wal's are faced with dressed wall-stones botb externally and inter-
nally. The chapels, transept, and aisle nally. The chapels, transept, and aisle are
plastered internally up to the ashlar-work of the plastered internally up to the ashlar. Work of the
windows and arehes. The chancel is 26 ft .6 in. windows and arehes. The chancel is 26 ft .6 in
long (greater length could not he ohtained, as it is now huilt up to the eastward houndary of the churchyard), 22 ft . wide, and 45 ft . in height from floor to ridge. The roof is an open-timber
one, of red pine, varnished. Tho east window is one, of red pine, varnished. Tho east window is
a triplet with cusped lancet-heads, moulded a triplet with cusped lancet-heads, moulded
internally, the arch.moulds bcing carried on internaly, the arch.moulds bcing carried on
foliated shafts. The centre light is 18 ft . high in the clear. North and sonth of the sacrariam are doublo-light lancet windows with cusped heads. The organ, inclosed in a pitch-pine case, with coloured pipes, has been built by Messrs. Forster \& Andrews, Hull. The chancel-arch, which is double-rimmed, is 18 ft . 4 in. wide and
30 ft .6 in . in height from the foor of the nave to the apex. The south transept is 18 ft . long by 19 ft .6 in . Wide, and is 40 ft . high from floor to ridge. That part of the south aisle now completed is 42 ft . long and 11 ft . wide, and is divided into three hays, with two small single lancet windows in each bay. Nave, transept, and aisle are now fitted with open pitch-pine sittings. The work which still remains to he dono is the taking down of the nave, north aisle, and tower; completing the nave, arcade, and soutb aisle with anotber bay; building a similar arcade, transept, and aisle on tbe north side; erecting the clearstory above the arcades, and a new nave and tower at the west end. The roof struction so far earried reuewed. The recon ture, has cost abont 2,300l. The eherot wil accommodate about 500 persons.
Dudley.- St. John's Church, Kate's-hill, has heon re-opened, afcer undergoing extensive altewith organ chapel and a vestry. The contral portion of the roof has boen raised, and additional light given hy the iutroduction of quatrefoil windows immediately boneath the raised portion. Anew portion of the roof is supported
porter by an arcade of seven hays, having columns of red stone (from Lord Dudley's "Straits" quarries), with hands and carved capitals in Batly stone. Old ohstructions in the stape of inside porches to the galleries have heen swept away, gives considerably more room in the church. The floors have heen laid with encaustio tiles.

Tho pulpit, of Caen stone, carved and inlaid with marble, is the gift of Mr. E. Terry, one of the wardens, and his family. One of the stained windows has been sabscribed for hy the teackers and scholars. The reredos, of Caen stone, ate Mr Tobr the gitt of the family of the total cost of the alteration of the churoh is 2,600 .
Tedstone Wafer and Edvin Loach (Hereford-shire).-The parishes of Tedstone Wafer and Edvin Loach are consolidated, and the consecration of the churches, although erected some years ago, - the formerafter designs hy Sir Gilbert Scott, and the latter from plans furnished by Mr. Haycock, of Shrewsbury, - has been delayed. The necessities of the parisb have, however, in the case of the new edifice at Edvin Loach, been met by, licensing it for publio worship. Additional space has also been thrown into the churchyard, rendered necessary by the circum. stance that it is the only ground available for interment for botb parishes. The churches were erected by the late Mr. Edmnnd Higgin. on, of Saltmarah Castlo The Edmma tiggin Loach is sitnated Castle. The building at Eavin wich sitaine the spire, and stands upon pillars. Upon entering, the space anderneath pillars. Upon entering ance of anderneath the spire bas the alpearthe of anance-chapel, which is divided from bin opposite end of winh there is a short chancel ard apse, con aining three coloured wiudows. The roof is of polished timber, plastered within the interstices of choir stalls are of pine, and the body f the church is furnished with open stalls. The whole of the sittings, of which thero are about eeventy, are free. The accomnodation, however, can he inereased when
necessary by the introduction of chairs. The church at Tedstone Wafer was built by church at Tedstone Wafer was built by
Bowers \& Co., of Hereford, and is provided with acoommodation for about seventy persons, the seats, of polished oak, heing open and free. The principal feature of this churob, which consists of nave and ohancel, is a Bath stone screen in front of the harmonium. The east window con. admitting of a larger one with four. There are several other small windows in character. Tho roof is of polished timber and plaster. Both churches are huilt of grey stone, roofed in with coloured tiles. Tbe consecration of both has now taken place.
Hartford.- The ceremony of laying the fonn-dation-stone of St. John's Church, Hartford whieb is being rehuilt, has been performed by Lieuteaant-Colonel Marshall, the patron of the living. Tbe new church will be built partly on the old site, and partly on land recently pur. chased, adjoining the Chester and Northwioh. road. From the designs, which have heen pre. wo learn Mr. J. Douglas, of Chester, architect Gothic, of an early type, and will consist of nave, north and south aisles, with tower, 22 ft square at the west end, terminating with a children on spire; chancel, with transept for vestry being on the south side of it. The nave is separated from the north and south aisles by an arcade of piers and arches. The chnrch will be entered throngb porches on the north and soatb sides. The walling of the exterior and interior will ho Macclesfield stone, the dressings heing of Runcorn and Eddisbury all covered with Broseley tiles. The ceiling of tho chancel is proposed to be arched in stone, bo fitted with ribs and cornico. The churcb will dating 520 persons. The capable of accommo3,700l., is let to Mr. R. Beckett, of Hartford, hut this does not include the tower and spire. The this does not include the tower and spire. The
masonry contract has been suhtet to Mr. John Holland, of Northwich. Mr. Walter Edwards is appointed clerk of the works.

Testimonial to Mr. H. Brady, C.E.-A Wedne was given at the Pier Hotel, Ryde, on Wednesday evening in last week, on the occasion Brady presention or a testimonial to Mr. Henry Brady, C.E., late district engineer of the London and South. Western Railway Company, when a nnmber of gentlemen connected with the railway ni steam-packet companies running to the Isle of Wight sat down. The testimonial consists of siderable value, made hy Mr. Thnrlow, gold.
smith, of Ryde.

## STAINED GLASS.

All Saints, Broadchalke.-The completion of the memorial west window, to the late vicar of Broadchalke, bas been celehrated. The design ine, of Ed up and executed hy Hessrs. Ballan traceried window, of Perpendicular style. In the centre light is onr Lord, holding the orb in one hand, and the other hand nplifted; while underneath is insorihed the text, "I come to bear witness nnto the truth." In the two lights preachinght side are figures of Elijah, the prophet; while on the lights of the window the lights upon the left side St. Jobn. Canopy work rises into the cusped arches of each light, and divides this nnder.tier of figures from those inserted above in the tracery windows, Four of theso tracery com. partments aro illustrations of the life of Dr. Rowland Williams, who is represented therein respectively as atudent, teacher, preacher, and pied with the allegory of Truth overcoming the pied w
Church of St. Lawrence Jetury, Gresham.strest, London,-A second stained-glass window, from
the establishment of Meserg. Cox $\&$ Sons, has the establishment of Mesars. Cox \& Sons, has
lately heen erected in this cburch to tho memory lately heen erected in this cburch to the memory headed windyaston. it is one of the circular. divides St. Lawrence Church from that of St. Catherine, and consequently it recoives a borrowed light: hence great judgment and discrimination required to ho used in the general arrangement and colcuring. The main feature of tho design is an zrchitectural composition, Renaissance in style, enriched by festoons of flowers, leaves, and fruit, relieved by scroll-work dividing the whole space at the springing of arch into two grand portions; in the lower and larger of which, within a niche, stands a full-longtb and fult-size figure of St. John the Evangelist in the act of writing, with tho head elightly npturned, ccompanied by the eagle; in the other, at the head of the window, is depicted a representation of Christ rising from the Tomh, in a large circular medalion, the latter sapported by a hroad ric border running round the arch, hroken up by smaller medaliions with chernhs' heads.
Slandish Church.-Tbe Misses Sheringham, daughters of the late vicar, the Rev. Canon Sheringham, for some three years or more fave lahoured quietly to fill the east window , church with stained glass. This The five licent done by Messre. Clayton of Bell the history of Sapier, from , Crucifion, the Resiation, and the Azcension,-and are respectively me. morials,

Berkeley Church.-There has just heen put np in the chancel of this church a memorial window to Dr. Jenner, the discoverer of the raccination aystem. Tho movement which has now heen brought to a successful resnlt was started some years since, when the Rev. J. C. Norman was in charge of the parish, but for a long time little progress was made. A fresh start was, however given to the proposal through the instrurnentality of Mr. Kingscote, who got a committee formed in London ; and tho necessary funds (500l.) having been procured, the provision of the window was undertaken ly Messrs. Hardman, of Birming harn, and the work bas been completed. The window is of large size. The cornpartments depe Gospel vans miracles of healing recorded in the Gospel of St. Luke; the centre one represeuts the Saviour as the Heavenly Physician, anderneath is Lake the physician ; and ou either sido are representations of our Lord as the Good Shepherd and the Good Samaritan. Another
 new rerodos. A portion of tho old one remains ; but it is in such a decayed state that at present it is covered with a curtain. The cost of a new reredos is estimated at 1,000 .
St. Hark's Church, Tollington Park.-Three painted windows have lately been placed in this church in memory of tbo lato Rev. John Lees. The entire work is from the studios of Messrs. Globs \& Moore, Southampton-row, London.
Barnard Castle Church.-A mernorial window has just been placed in this church, by Messre. Brownless and the Missos Brownless, of New Broomielaw, to the memory of their parents. Baguley wow, -a three-light ono,-is by $\mathrm{Mr}^{2}$ partment is filled hy a representation of Mary anointing onr Lord's head. Our Lord is seatod

VOL. XXXI.-No. 1608 .

## Lincoln's Ian.

tho legal profession jokes are numerous, and gone rally appreciated, but in spite of these jokes, every Euglishman must bo proud of the Bar and Bench as one of the nohlest of the institutions of bis country and he cannot, therefore, fail to feel interest in the history of the nurserios in whiob the lawyers and judges have heen reared The Inns of Court are pre eminent among the antiquitics of London, and within their gates we breathe an atmosphere of the past. The term In formerly denoted the residenco of a nobleman, and these legal collcges were mostly founded where such residenoes had bcen. They were called Iung of Court, because they were places of study preparatory to practice in the courts of lew which were anciently held in the Aula Regis, or court of the king's palaoc. The first students were sons of the aristocracy, and in the reign of James I. an order was made, whicb was signed .hy Coke, Bacon, and othcrs, that "none be thencoforth admitted into the Society of any House of Court that is not a gentloman by descont; " but in spite of this exclusiveness, it has always been a rule that no diguity or title confers any rank at the Bar, 60 that the highest nobleman takes his place in accordance with legal precedence alone. Considerable changes, however, have taken place at different times in tbis precedence. The degroe of Serjeant.at-law is tho most ancieut, and formerly was the highest in the law, but now Queen's Counsel rank hefore Serjeauts hoth in court and else.
where, Lincoln's.inn is the most ancient of Inns of Court, and takes its name from the iun or town houso of Henry do Lacy, Earl of Lincoln (who died in 1312), which oceupied a consider ablo portion of the site of the present Inn. The oald built his mansion upon ground granted to bind whicb had previously belonged to the ancient monastery of Black Friars, by Holborn. The other portion of tho present Liucoln's.inn was occupied by the palace of the Bishops of Chichester, which was built by the great prelate Ralph do Neville, Lord Chancellor of England and Ireland in the reign of Menry III.
The huildings of Lincoln's-inn consist of an odd mixture of stylos, from the ugliest speci mens of house-architecture to the bandsome new Mall. Of the new Chambers now in course of completion, contiguous to the Hall, and similar to it in style, we give a view and plan in our present number. Tho old huildings were erected at various periods betwcen the reigns of Henry VII. and James I., and bave thoir ohief frontage to Chancory-lane, formerly called Newstreet, and afterwards Chancellor's.lane. The gate-honse is an object of considerable interest; but it is expected tbat it will havo to bo taken down to moke way for some new suites of obambers. Sir Thomas Lovell, K.G., treasurer
of the household to King Henry FII, contributed of the housebold to King Henry TII., contributed
liberally towards the erection of this gate, as
did to the funds of the Nunncry of Holywell, is the parisb of St. Leonard, Shoreditcl, wher the windows are inscribed with theso lines:-

## All the nunnes of Holywe Pray for the eoul of Sir $T$

The oak doors of the gate are the original ones which were put up in the sixth year of Eliza beth's roign (1564). Chancery-lane existed in the reign of Henry III., but continued for many years in a very miserable condition, and was not paved till 1542. New-square, or Scrle.court, as it was formerly called after Heury Sorle, a momber of the inn, was erected about 1683. In 1800 Sir Samuel Romilly lived at No. 2 and Sir William Grant at No. 3. A Corinthian column used to stand in the contre of the square, on which was raised a vertical sundial, and at the base of the shaft, four jets.d'eau arose from iofant tritons bolding shclls. In 1815 the open space was inclosed by railings, and planted in compartments with tices and shrubs. Stone. Buildinge worc bnilt in 1780 from tho desigus of Sir Robert Taylor, and wero only part of a scheme for rebuilding the whole inn. Tbe arcbitccture is vcry plain, hut the effect of tho Portland stono is pleasing. It is said that the drawings were executed hy a pupil of Taylor's, named Leach, who afterwards bccame Mraster of the Rolls as Sir John Leach. In 18 ts tho buildinge, which had been left in an unfinished stato for sixty years, were completed by Mr. Hardwick.
Tho chapel was built by Inigo Jones, "aftor tho Gothick manner, in imitation of that of St. Stephen's, Westninster," in the reign of James I. when the ruinons condition of the old cbapcl had rendered a new one necossary. The crypt boneath the chapel, with its open arches, was used as an ambulatory or plaoe for lawyers and students "to wall in, to talk and confer their learning"; and Pepys describes himsolf as having gone "to walk under the chapel loy agreement." It is now railod in, and nsed as a place of interment for the benolers. Tho first stone of tho chapel was laid by Dr John Donne, and tho completed bnilding wa consecrated on Ascension Day, 1623, hy Dr George Mountaine, Bishop of London, the sermon on the occasion being preached by Dr. Donno. The building is moro curious than admirable; but the stained.glass windows, by the Flomisb artists, Ahraham and Bernard Van Linge, are worthy of somo attention. Mr.
Winston says of them, "in point of colour they Winston says of them, "in point of colour they ever seen." Alezander Brome, the Cavalier song-writer ; John Thurloe, Secretary of State to Oliver Cromwell; tho indefatigahlo Willinm Prynne; Sir John Anstruther, one of the managers in the impeachment of Warren Hastings ; and Francis Шargrave, the anthor of "Notes on Coke npon Littlcton," were all buried under the chnpel. Some of the most distinguished and eloquent diviucs of the Charch of England have filled the offce of preacher to the Society, and amougst these the names of Dr. Donne, Archbishops Usher and Tillotson, Bishops Warhurton, Hurd, and Heher, are perhaps the most conspicuous. Dr. Lang horne, the translator of Plutarch, was assistant preacher for several ycars. The Warhurtonian Lcctures, founded by Bishop Warburton, in 1768 , are delivered in this chapel. The old hall was erected in 1506, in placo of a still oldor hall, which had become so ruinous that it bad to be pulfed down. Alterations were made in this goodly hall in 1625, 1652, and 1706, and in 1800 the exterior was repaired and stuccoed by Bernasconi. In 1819 the room was lengthened hy about 10 ft ; hut some few years ago it was divided near the centro by a temporary partition, in order to form two courts, for the sittings of the Lord Chancellor and the Lords Justices. In 750 Hogarth was engaged, on the recommen.
the chapel, and he painted his well.known "Paul before Felix," which was so unceclesias. tical in its treatment that tho benchers thought it wiser to place the picture in the ball than in the chapel.
The Inns of Court were of old great places for masques and revels, and Lincolu's-inn was not behind its sister societies in these amusemeuts. The seniors loved to see the juniors onjoy themselves, and in the seventh year of James I. an ordor was made "tbat the under barristers be by decimation put out of commons for example's sake bocanse tho whole bar were offeuded by their not dancing on the Candlemas. day preceding, according to the ancient order of tbe Society, when the judges were present," and a threat was added that if the like fault were repeated, they would be fined or disharred. Charles II. attendod the Christmas revels in 1661, atd ten years afterwards he made a second visit, in company with the Duke of York, Prince Rupert, the Duke of Monmouth, and others of the nobility. The king and his suite eurolled themselves as members of the Society, and after pledging tbe welfare of Lincoln's.inn the king conferred tho honour of knigbthood on two of tho henchers, one of the barristers and one of the students.

In the beginning of tbe year I813 the bonchers of Lincoln's.inn detcrmined upon the erection of a ball and library tbat should be worthy of their Society, and they adopted the designs of Mr. Philip Hardwick, R.A., which were carried out in a manner that satisfied all concerned. The foundation stono of the new building was laid on the 20th of April, 1813, by Vice-Chancellor Knight Bruce, who was then treasnrer of the Society. Two years and a half afterwards a building had arisen which added one to the small number of elegant cdificos that adorn London. It is constructed of brick, with stone dressings, and all the stone used in the exterior decoration was quarried at Anston, in Yorkshire. Part of this afterwards failed very considerahly. The hall is nuch larger in its dimensions than any of the halls of the other Inns of Court. It has a timber framed roof, and on the northern wall a fine fresco was exeented hy Mr. G.F. Watts in 1859, which represents an imaginary assem. blage of the early law.givers of varions nations, from Moses down to Edward I., and has heen entitled "The School of Legislation." When the new buildings were completed the Queen honoured the Sociefy with ber presence, and on the 30th of October, 18 15, the ceremony of inauguration took place. The Prince Consort was admitted to nuembership, and the ceremonial was conclnded by a banquet in the hall, of which the Queon partook. The library is in the same huilding as tbe hall, and forms a suitable repo sitory for the valuahle collection of books which is placed therein. It is prohably the handsomest library in London, and now that it has been enlarged in this present year, it is 130 ft , in length from east to mest, cxclusive of the two oriels, which are ench ahout 6 ft . The original foundation of the library is of considerahle antiquity. In the thirteenth year of the reign of Heary VII., A.D. 1.197, "John Netbersale, late one of this Society, bequeathed forty marks, partly towards tbo huilding of a library here for the benefit of the students of the laws of England, and partly that every pricst of this bouse, in the celebration of divine service every Friday, should sing a mase of requiem for the sonl of the said John." Little progress, however, was mado in the accumu. lation of hooks; and in 1608, "becanse the library was not well furnished with books, it was ordered that for the more speedy doing thereof, every one that shonld thencefortb be called to the bench in this Society, shonld give twenty shillings towards the bnying of hooks for the same library, and every one thence.
foarpence." The collection of books is now a pecnliarly ricb one, for not only are here to be found all the treasures of English law from Glanville, Bracton, Britton, and Fleta, to the latest digests, but foreign Jaw, theology, English and foreign history, classics, dictionarios, and topography, are all adequately represented. The Society have been fortunate in the dona. tions that they bave received from varions benefactors. Serjeant Ranulph Cholmeley, three times reader at Lincoln's.inn, in the reigns of Edward VI., Philip and Mary, and Elizabeth, gave many raluable books to the library. Sir Matthew Hale hequeathed a large collection of mannscripts, and the celebrated William Prynne presented three volumes of his invaluable "Records," which are now of the greatest rarity, on acconst of a large portion of the original stock having been burnt during the Great Fire of London. In 181.9 the Society, acquired at the sale of the Stowe library for 33 a 7 , the volume containing tho author"sintroduction to those "Records." Tho library was formerly iu Old-square, whence it was moved to a suite of roxms in Stone buildings, in 1\%87. Here it remained till the new library was ready for its roception. There can be no donbt about the improvement that the new buildiugs havo made in the character of Lincoln's.inn, but there was one evil connected wrat their erection, which was that the cele brated gardens were destroyed, and tho elms under which Ben Jonson loved to walk, were
felled. In the first and second years of Philip and Mary's reign, the walk under the trees in the Coneygarth or Cottrell Garden was made, and in 1653 tho garden was enlarged, a terrace walk made on the west side, and tho wall raised higher towards Lincoln's.inn-fields. It was this wall that gare point to the distich on the characteristics of the four Inns of Court:

## 

The enlargement of the gardens of Lincoln's. inn grew out of an arrangement with James Cowper, Robert पenley, and Francis Finch, esqrs., and other owners of Lincoln's.inn.fields, who were exemptod from forfeits or penalties in regard to any new bailding they might erect on three sices of these fields preriousty to the certain sums for the public service, and conveycd the residue of the fields to the Society of Lincoln's-inu, for laying them into walks for common use and business. Pepys mentions the inn, to see the new garden which they are inn, to see tice new garden which "hey are making, which will he very pretty ; and beBickerstaft expressed in the Tutler his liking for Bickerstail expressed in the Tatter his liking for sate cown, according to the allowed familiarity of tbese places, on a bench." Coneygarth, to which we have referred above, obtained its name rom the number of rabhits that were found in the place; and by various ordinances of the Society in the reign of Edward IV., Heary VII., and Henry VIII, penalties were imposed on the stadents hunting them with bows and arrows, or
The eminent mien who have been connected With colleges and societies are always a source
of pride to the members of such institutions, and Lincoln's-inn can boast of a long list of dis. tinguished students, out of which we may select the names of Sir John Fortescuo, Lord Chief Justice of the King's Benoh, and Lord Chancellor uuder Henry VI., who was one of the most learned men of his age, and author of the celebrated work, "De Leudibus Lerum Anclio" Sir Thomas More, Lord Keeper Eeerton, Dr. Donne, Attorney.General Noy, Sir Uenty Spel. man, Willinm Prynne, Sir Matthew Hale, Sir John Denham, George Wither, Jobn Rushmorth tbe historian, Lord Shafteshury, Lord Mansfeld, Lord Erskine, Spencer Percival, George Canning, Lords Lyndburst, Brougbam, Cottenham, and Campbell.
Mr. Spilsbury, the librarian of Lincoln's.inn, has publisbed in this present year a sccond

Society, which first appeared nearly five-and twenty years. ago.* And in bis preface be remarks that two.thirds of the henchers of 1850 bave now, in 1873, passed away from this life Amongst those who bave gono aro the Prince Consort, Lord Brougham, Vioe-Chancellor Sir Lancelot Shadwell, Lord Cottenham, Lord Leigh, Sir James Knight Bruce, Matthow Daven. port Hill, Sir James Wigram, Charles Purton Cooper, and Lord Macaulay. Among those that remain,--the third,-there are the venerable Lord St. Leonards, Sir Richard Kindersley, Sir William Hayter, Bart.; Sir John Stuart, Lord Eversley, Sir Edward Ryan, Lord Hatherley, Sir Jomes Bacon, Mr. Spencer Walpole, and the Lord Chancellor. Although the list is so cbanged, the dead are replaced by such worthy successors as Lord Justice Sir
William James, Lord Cairns, the Master of the Rolls, and many other distinguisbed men.
Mr. Spilshury's book, with the handiness of a guidebook, combines the loarning of an elaborate reatise. It is written by one who knows and oves his subject, and is able to make bis readers now aud love it too. We have been much indebted to this book for the information con ained in our prescnt article.
Here we migbt close, but we cannot leave Lincoln's-inn-fields and all its historica! asso. ciations unnoticed although it does not belong o the Honourable Society of Lincoln's.inn. anecuted in patriot William Lord Russell was before (1586), Ballard, Babington, and their nccomplices, lost their heads even in the place where they used to meet, and conferre of their traitorous practices." This sqnare was anciontly called Fikatesfeld or Ficket's Field, and as early as the year 1376 "was a com. mon wall sing and sporting placo for the clerks of the Chancery, apprentices, students of the
law, and citizens of London." It appears that law, and citizens of London." It appears that one Roger Leget set some traps in a certain trench, "wbere the said clerks, apprentices, and otbor men of the said city had wont to have their common passage, in which place be knew that they daily exercised their common galevolent intent that all who came npon the said trench should he maimed, or elso most grievously hnrt." The clerks, apprenticos, and others broupht Mr. Leget before the king's council, and complained of his conduct. In conseqnence he was sent to the Fleet prison, "there to expect the king's grace." Ficket's Field remainod as a promenade, or place of recreation, for the students of Linooln's-iun and tbe public, until the latter ond of the reign upon, in on when it sirst vegan to be huil into very nerlected condition hen fell 1618 James I. appointed a cominission, consisting of Lord Chancellor Bacon, the Earls of Pombroke, Worcester, Arundell, and others, assisted by the king's architect, Inigo Jones, o plan it out as a bandsome square. The in. structions given to the commissioners were to reduce those fields, called Cup Field and Purse Field, both for sweetness, uniformitie, and comelincss, into snch walkes, partitions, or othor plottes, and in such sorte, manner, and forme, botb for publique health and pleasure, as by the said Inigo Jones is, or accordingly shall be, done by way of map." The great architect planned dimensions should be exactly the same as those of the Great Pyramid, hut this, it has been shown in our pages, is incorrect. Although he proposed a magnificent scbeme, the west side only was completed by him, and although some years
afterwards a few buildings were erected, which inhabited for the most part by Popish recusants," the north and south sides of the
square were not completed until after 1657 . The condition of the cuclosure in the ceutre was for a long time wretcbed in the extreme, and in the petition of the inhahitants of the parishes near Lincoln's.inn-fields (1656), its neglected state was complained of. Many thousand loads of dung and dirt had been laid in the fields, wherehy the petitioners were mucb hindered and almost quite deprived of their commor aberty of walking, training, drying of clothes, and recreating themselves. Ah this time Lin called "Purse Field, Ficket's Field, and Cup Field." Many years after, even when the centre

* Lineoln's Ton: its Ancient and Modern Bulldings. With sn Acount of the Library, By Hilliam Holdon
Spilibury, London: Reepes \& Turner. 1373.
was railed in, Gray, in bis "Trivia," gives but a poor account of its condition (1716) :-
Where Lincoln'g-inu, wide space, is rail'd around, Cross not with venturous step; there oft is found
The larkiag thief, who white the daylight shone Made the walls echo with his begging tone: That crutch, which late compassion moved, shat Thound
In 1698, Mr. Cavendish Weedon (the first in. habitant of New-square or Serle's court) pro. posed the laying out of the fieldsina magrificent style, to he adorned "with figures of the twelro apostles, and waterworks at ewch corner, to be supplied from Hampstead water, and a model of St. Mary's Chapel, to be erected in the centre, from a design of Sir Christopher Wren's." * This proposal was never carried out, but in 1735 an Act was passed for inolosing and new ordering the area of tho square; and in the Daily Journal for July 9th of that year we read that "the plan for beautifying Lincoln's.inn.fields is now before his grace the Duke of Nowcastle. There are to be four iron gates, one at each corner, and dwarf wall, with iron palisades: this plan has been agreed to by the inhahitants." At the beginning of the present century the square was again laid out and arranged, as it remains at present. Formerly each side of Linooln's-inn. fields had a separate name; and in Matton's New View of Loudon (1708), the north is colled Holhorn.row, the south Portugal.row, the east Lincoln's.inn-walks, "i.e., the strong wall that wuppats a fine terrace walk" " the weat the Arch-row. In Strype's Stow (1720), the same aames are given, with the exception that the north side is called Newman's-row. The west side was the first built upon, and the houses erected there are still the finest in the square. The handsome bnilding at tbe north.west corner, now in the possession of the Society for the Promotion of Christian Knowledge, was originally called Powis House, and was built iu 1686, by Captain William Winde, for William Herbert, Viscount Montgomery and Marqnis of Powis, who forfeited it to the Crown, hy his steady adherence to James II. after his abdication. It was inhabited hy the great Lord Somers; and iu February, 1696-7, it was ordered that it should remain in the possession of the Lord Chancellor. Sir Nathan Wright, Lord Keeper, nest lived in it, and the Governmeut contem. plated the settlement of it officially upon the Great Soal, but tbis was not done, and the house was sold to John Holles, Duke of Newcastle, who died iu 1711. In 1708, Lord Coxper, the Lord Cbancellor wbo succeeded Sir Natban Wrimbt, was livinc in a house at the south end of the Arch.row. At the death of the Duke of Noweastle, Newcastle एouse, as it was then called, came into the possession of its late owner's nophew Thomas Pellam Holles, Duke of Vew noplle a fevy doors to the south of this house was Lindsey House which was built hy Inigo Jones for Poy Bo ligo Jones, for Rohert Bertie Larl of Lindsey, who fell at the hattle of Edge.hill. The fourth Earl of Lindsey was created Duke of Ancaster, aud Lindsey House thea took tho anme or ancaster House. The duke sold it to the proud Duke of Somerset,
dauchter.

## daughter.

Portngal-row, or the south side of tbe square was bnilt in 1657. Here Wilmot, Earl of Rochester, lived, next to the Duke's Playhouse, the situation of which is described in Sir Wil. liam Duvenant's epilogue to "The Playbouse to Let'"
"Therefore be pieased to think that fon are all
Behind the Row which men call Portugal."
The site of the Lincoln's.inn Theatre is now occupied by a part of the mnseum of the Royal College of Surgeons. Hatton describes Lord Cardigan's house in 1708 as a "beautiful new one, ahout the middle of Portugal-row." Sir Richard and Lady Fanshawe lived on the nortb side of the square, in a house previously helong. ing to the Conntess of Middlesex. The dis. tinguishod inhabitants gradually migrated, but in 1805 Lords Kenyon and Erskino and Spencer Perceval were living here, and in 1812 Sir John Sorue built the house on the north side of the square, where he stowed away his valuable col. lections in the most ingenious manner. The honse is still kept up as the celebrated architect left it, and erhes continues to be an cxinition of the sights of London.

- Of this proposed chapel there is a model in wood, finely oarred,

With the exception of the Soane Mnsenm and tho Royal College of Surgeons, Lincoln's-inn. fiolds is now almost entirely given up to busi.
ness offices, and its history is concluded. Our ness offices, and its history is concluded. Our
notice, therefore, comes naturally to an end, and we will close this article with the pleasing lines that Mr. Spilsbury has given us:-

Rises the late-rear'd pile, majjostic and serence.
Nor has it been leas pleasing, sooth to say,
Within their oalcen shrines, in goodly rows,
Those raried storex of learting to survey,
Whence voices secm to burg from they, repose,
fo tell how laws, how creeds, how faith arose While visiond forme of sages meet our eyes, Who to the toiling studcrat bear discloso
Such words of wisdism as his hear Such words or wisdom as his heart magy prize,
To chasten, train, and guide the hopes that in him
rise."

BCILDING AFLOAT.
Atcherecture and huilding, as the words are applied in their ordinary sense to those stable edifices, public and private, in which most o us spend the greater portion of our lives, afford that wo can but rarely afford a glance at that special department of architecture for whioh the solid earth does not afford the basis. In a word, the building of ships, or naval arehitec ure, is so much of a specialty as rarely to come under the rotice of the civil architect. From it is advantageous to turn our attention to tbose which pero once the wooden, but must now be called the iron, walls of Old EDgland.

How intimate is the connexion that exists tho erafts of the sailor and of tho shis tho erafts of the sailor and of tho ship-
builder beoomes evident when we consider how buider beoomes evident when we consider how
much of the material necessary for structural purposes is imported into our island. Canadn and Norway supply our various descriptions of pires and deals; and it is with ospecial reference to timher ships that very mnch of the excitement wbich has called for the recent Par.
liamentary inquiry has arisen. The relation liamentary inquiry has arisen. The relation
hetween the nominal and the real capacity of vessels,-the important question of how they carry their load, whother closed undor batches or on deck, -and, above all, the douht whether
the lives of passencrers or of navigators are the lives of passangers or of navigators are wan. tonly imperilled for the sake of gain, are matters
that have been debated with a vivacity, if not with a judicial impartiality, fitted to their im. portance. And there has already resulted, from the lahours of the Commission appointed to inquire into the question of anseaworthy ships, the detection of certain customs, and cortain faulty methods of procedure, the removal of which will,
no douht, do much to diminish the total of our annual losses at sca.

When wo rememher that the annual average of wrecks and casualties at sea, reported in throng List, is such as to give nearly ten daily social question, affecting the safety of a large and important class of property, aud the proteo. and adventare, we can ill afferd tances of peril and adventare, we can ill afford to negleot the no other department of human industry is man so much at the neercy of the great powers of nature- the winds and the waves. We have a moans of distinguishing between avoidable and unavoidahle calamity at sea (that is indecd
rough, hut that may he taken as approximate), afforded by noting the difference in the average number of wrecks that occur in the calm and in tbe stormy months of the year. Tha casualties Jnne; tho number of wrecks in the former mone; tho number of wrecks in the former those in the latter, 152 . If we assumc, -not as a positive fact, but for the sake of comparison, that nothing but neglect can cause disaster in fue weather ; and if we further assume that as mach diligence is disployed hy our sailors in fair time as in foul, we shall still hare to attri. bute what the old charter-parties call "the act of God," twice the number of disasters that spring from the neglect of man.
Power has bees given to the Board of Trade, by an Act of Parliament passed in the present year, to survey and to condenn unseavorthy
ships. The chief point now unsettled on the
subject is, the method hy wbich the function of the Board are to be put in operation in any particular case. All parties, with a few inte rature of a strict and authoritatire desirable any doubtful case; and of powers boing given to the inspecting anthority to detain unseaworthy vessels in port ; to order definite repairs; or to condemn the craft to be hroken up. But a wide difference of opinion exists as to the mode in which that inspection should be carried out Some persons propose universal Governmeni survey; otbers are of opinion that this is im. practicable. As a general result of experience, anything of so wide and comprehensive a nature as universal inspection, which, to be worth any. thing, must be repeated as required, would bardly have the practical results intended. To make nnob an inspection absolutely reliable, would Minio a very large ontlay,-one that no Parliamen would fee! justified in proposing to Parliament, without the most stringent proofs of
its necessity. To have any inspecticn that pro. its necessity. To have any inspecticn that pro-
fessed to be gencral, and tbat was in fact only fessed to be gencral, and tbat was in fact only partial, would he to do much more harm than
good. The whole burden of responsibility wonld good. The whole burden of responsibility wonld lance wonld he Inlled to sleep, and the wrecl register would show the resnit.
The chief causes of considerable danger that may be attributable to the shipowner or ship. bad construction reduced to two groups. First, questions of converting an open, or parily open, deck into a portion of the body of the ship, of which we have heard so much; and, secondly, overyaluing the life of a vessel, or continuing to keep it afloat when it is too old, or too mach worn, to be seaworthy
This simple division of the suhject, bowever, has the effect of very mucb diminishing tbe appa. rently vague and enormous area of inspection, as applied to the mercantile navy. It would be very ur sbodemand that every ship launched from ter should be accessible in rend ; with copies, requisite, in Liverpool, Glasgow, or any other place of primary commercial importance) ; and hat any vessel which has been afloat a certain number of years should, ipso facto, call for an dficial inspection. The proper period of life it ping to indicate; hut that a ship wbich had reached that marine old ago should be forhidden to sail withont inspection, which the owner should be both empowered and obliged to demand, seems no very outrageous guarantee to require, when the ohject sought is the preserva. tion of buman life.
A provision of this nature would simplify the general question, by the mere lapse of time. A1 ships that are now ill huilt, whether by means rials, or from ohanges in the construction of the upper deak, such as those to which we bave refersed, would, in the courso of a few years, com in for inspeotion; and, if proper, for condemna the statistios which of such an ordeal, and of the statistios whicb a vory few years would place at the service of the public from the re-
gister of insjection, would have a wholesome inflience on our ship.building firms, from the very date of the passing of an Act of Parliament enforcing sucb an inspection. The register of the condition of agod ships wonld, in a very few lence of their builders. Purchascrs, freighters, insurers, and all those intorested in shipping, would thus soon ho put in possession of the
surest of all testimonials to the character of the different shipbuilders. In any case of this kind two things occur: first, the inferior producer (Who will be the one most vigorously to resist
the innovation) will be known, and may be avoided. Secondly, the attainment of certitude as to the character of vessels will diminish the rate of insurance; and all those charges in which a margin bas to be allowed in consequer of a want of exact and reliable information.
suhject that has many sides ; but wo sura on a as matter for serious consideration, the advantages tbat would result from the eatablishment should period at which a ship, like a horse, should beconie "aged"; and after which it keel without some assurance that the vessel was seaworthy. The matter would be simple, thrown on of demanding a pass certificate was witb propriety fix a date for a renewal of the
cbaracter given to the sbip. A brief form, such the ship Johing, Bull ; owners, suffice. "Certificate the ship John Bull; owners, Messrs. Sailwell built at Birkenbead, by Messrs. Trenail, in the year 1863 , is certified as being seaworthy, and 1876 ." Brief notices of this nature would Janary, 876. Brief notices of thig nature would afford and would, in course of time, prove the most and would, in course of time, prove the most work.
Under the head of inspection rank all those questions as to sonndness of material, and excellence of workmanship, as to which the report of the Commission is enough to show the some searching investigation is requisite Theong is tbis more tae case than in jron The introduction of iron into shiphuilding has made the fact of the production of cheap, had ron, a Berions evil. There is as much difference in the iron manufactured in different places as there is in the coal of different mines. Aseverything that is black is set down as coal, in the reports of the Commission as to the durabibity of our supplies, so do we find material not very much superior to good millhoard, offered, occasionally, for the sheathing of ships, under the arme of iron. The clever arrangement of a punch, so ordered as to out a clean sharp hole through a sbeet of iron, which will tear if attacked by an ordinary workman, is mentioned in the evidence, and is only one sample of the oxpur in which any but the most thorough and the unscrupulous mor may be hoodwinked by many instances of similar feata. It is not to the credit of this country that such should be the case. But wo do not think that in a highly. complicated state of civilisation, such as that in which we live, when consequonces so fatal and serious may and do so often arise from the unconscientious scamping of work, which is left to be regulated by the principle of competition alone, socicty is justified in relying on what used to be a sufficient guarantec,-mercantile much.needed so we bave spection of milk offered for sale,-introduced with the best results. We feel convinced that $t$ is in the romue; and, haring detected him, to make an example of him. The "rat" which is te fonder an over.insured ship may exist only in the imagination of the novelist. But justice and pradenco alike demand that, in a nation so dependent as ourselves on maritime activity, ar vessels should be as free from any possiblo With regard very wife of Cossar.
With regard to those causes of danger which o not result from original bad construction, but fom attempts to make vessels carry more than an be done with safety, having regard to thei shape and displacement, considerable difficulty egists. It seems that the port and harbour egulations of the whole maritime world are based on a principle that is discordant with the resent state of maritime knowledge and habit. We refer to the quastion of registered tonnage. t appears to be the case, that dock and port nes are charged, not according to the longth of ime for woich a definite area of dook accommoation is occupied hy a vessel, but acoording to he tonuage of too vessel alono. In old times, great degree of rough justice underiay thi ule. A maritime city,-take Havre de Grace, for example,-might thus fairly regard the matter. In the interest of commerce we in end to provide dock accommodation for ertain amount of tonnage. We must remuae rate ourselves, in the only way open; that is, by tonnage-dues on the vesscls which make nse o our port. We oan only do tbis by a charge upon hem of so much per ton. But, if tbey seek our hospitality, it is open to them. If they havo suffered damace at sea, and have to wait for epairs ; if from a failure of advices they have 10 wait for orders ; if for any reason they inco demurrage ; we shall not argiavate their loss by charging tho vessel more for the loncer time thich it is thas compelled to remain in our harhour. Charce wo must in telf protection, but our object is not profit, but self smpporting haspitality. Vo vessel will linger an bour that can be helped; and wo shall not cumulate mis ortune upon misfortuno by charging duties on delay.
Such we conceive to have heen the broad sound, thorouglily mercantile riew, which was aken by those large-bearted merchants to whom re owe the origin of commercial ports, barbours
and regnlatiens. But the state of affairs has now changed; not only so, it is atill in course of a very rapud transition. Time has an entirely different valne now, in matitime affairs, from that which it had when the good old maxim, "Timo and tide wait for no man,"-was adopted. The converge of that saw was then true. Erery man was bonnd to wait for time and tide. That waiting might be for six hours, or it might be for three months. The travcller went down,say from loondon to Dover,-in a period of time that might bo reasonably fixed ber mas a matiter hour or two, but his stay at the disposal of Providenee. When the weather would allow the sailing of the packet, and how soon the packet, if sbe sailed, would be ahle to land her passengers in France, were matters regulated by the winds and the demand for accommodation that would be made on any particular harhour could be very closely forcseen. A month or two sooner or later would make little difference in the work done by a make hain ecremely ulikely to excced, in any rear the remere average numher of trips between port and port; and even if they did so exceed then, no trouble
would occur. If the ship came twice to a port, would occur. If the ship came twice to a port, she took up no more water accommodation than if she stopped there for six months, Business was limited; shipping was limited; and there
was no reason for that scramble for thac, space, and accommodation that now exista
The change wrought in this respect by the introdaction of steam, and by the commaud of immediate commonication which is given to the merchant by the electric telegraph, has entirely altered this comfortable and easy.going state of things. The arca of a dock is now a space of
rentahle land (corered with water), which bas its time value as well as its acreage value. It is in the juterest of all parties that the payment for accornmodation shonld be made according to those two elements. The change is one that seems very difficult to make, and the more so bocause it cannot he effected hy any legislative power, hat only hy the common consent of the maritime intercst at large throughout the world. Nevertheless is it one that is so consistent with common sense and common advantage that we cannot douht that its adoption is a mere question Connected with this change in the relation between the harbour dues and the maritime requirements of the husy commerce of the day, is the question of register tomnage. It munt ho net mean either its capacity or its displacement. It means the prodnct in cubic feet, divided by 40 , of cortain preseribed measurements taken from its hull. From this artificial tonnage are deducted certain allowances of space allotted te the crew; and, in stcaners, of space allowed for the steam machinery and requisites. The re. mainder is the registered tomage. On this it is that barhour dues are generally charged, irrespective, as we lave said, of time; and also to a great extent irrespectire of the actual area

For it is the case that, with the riew of e comraging steam navigation, the deductious that are possible for a steamer to claius from the logal, er gross, tonnage, before arriving at the register tonnage, are so considerable, that it may eccur that a rery large and capacions steam. ressel has less dues to pay than a rery small craft that has nothing but its sails to propel it over the sea. Ihis is an instance of the hardship and injustice which may arise from the imposition of differcntial duties ; even where, as in the present case, they take the form of a fashionable deduction tbat all such regulations are in themselves bud. Quite the reverse. But We think it does follow that all fiseal regulations which are made for other than fiscal purposes, may become injurions, and that they roquire careful observation from time to time to pre. rent such an evil
In the present caso the tables have been com. pletely turned. If we had to give a premium at the present moment, to encourage naviga. tion, it would not be to the steamer, hut to the
sailing vessel that it onght to be offered Economy and quick returog are fayour of the steam. ressel, whether for long in for short vorages, that the whether for long or whether the sailing vessel may uot be abont to whether the sailing vessel may unt be abont to our navy during the wars of Napoleon, a thing of the past.

The London coal trade, carried on by cousting colliers, was regarded at the commencement of he prosent oentury with especial favour ; no only as needful for the supply of the metropolis and southern districts, with an article of which we then consumed pounds where we now consume
hundredweights, but as the special nursery and hundredweights, but as the special nursery and
school of the first favorrite of England, the Jach Tar. Internal fater. corriage by navigation schemes and canals was remarded with jealousy as likoly to interfere with the coastwige colliery business; which, however, continued to flourish in spite of Telford and lis comrades. We have now, in addition, the internal competition of the railways, altbough the opening of new internal fields of coal 28 enough to prevent them from absorbing the seaborne traffic.

Alloat, however, we have the steam eollier, as whip as the steam packet, and the steam war stops. We have the stcam barge to ascend ou ivers, as well as the steam.crane to unload ber freight. Under these circumstances it is andercoing chonce More and more the sistible power of steam is displacing the typical British sailor by the zocehanic who can keep his legs on board a vessel. It is mot, in its present phase, a change that we think a good one. But its gradual spread is undeniahle; and, we fear is the effect that it moy have on the character of our naval officers, as well as on that of their crews. The numeroas accidents to our men-of war, which made the Admiralty look very blue a fow months since, appear to have been due, in uine cases out of ten, to the absence of the old scamauship of the captains aud sailing officers. So handy and manageable have our great war ships become-the Agamemnom in the Crimea was called, if we remember aright, Lord Lyon' brougham, - that the anxious previdence of the on saft.water captain has been loss and les the patively cemanded. From the acquisition of choico of of neat handing, and making an exact teristics of the sailor are less called into play. The unfortunate result is, that they are les readily forthcoming en demand.
The inveatigation of the Commission on nu. seaw orthy ships is a matter of vital interest to We hope good will comers of the conmunity fail to do so, if the public at large take that in. telligent interest in the matter for which we there is ample justification.

## BOW STREET."

Our readers have heard that Parliamentary notice has been given, on behalf of the Gopern ment Commissiouers of Works and Public Build. ings, to remove tho Bow.street Police Court What will Seven Dials say? wbat the human warrens of Beclfordbury f what, above and beyond all, the dearly.cherished slnms of "Old Drury"? Whole generations from these well known regions have passed and repassed, from sire to son, and from grandam downwards, through the portals of "Bow. stroet," unde arying conditions.
The proposed site is on the east side of Castle-street, Leicester-square, opposite th end of Green-street, facing a well.know ariosity-shep. It includes part of Whit Eart-court, in Castle-strect, aud St. Peter's cort, st. Martius-lave, in addition to ming's-row. Tbo Society of Frieuds have meeting.house in St. Peter's.court, but not at present intended to meddle with this. It may be mentioned here that the whole of that neighbourhood will shortly change its appear large haer varions Acts of Parkament. Tentuyson's Schor and St. Martin's Workhouse Tennel of the National Gallore will aborily be cloned ary for the Gellery The St George's Barracks are included in the scheme Georges barracks are the new street and under round line of the Central London Railway, from Camden.town, along the west back of Totten am.court.road, by Leiçester-square, to Charing-Castle-street and "tastle-street and Jemming s-row will not be the tatterdemalions" of streets that they are now, "n fack, there will be no Memming's-row, it will have clisappeared in the honse-hreaker s cart,
haring made room for a large open tboronghare.

Green-street, with its picture.restorers, its majolica and china shops, and its cobwebhed, bric.a-brac sanctum at the Castle.street corver, nto which Cabinet and ex.Cahiuet Ministers may be seen furtively sliding during the "oft" afternoons of the session, are all to be swept away. The Central London Railway Act of 1871, in conjunction with the Metropolitan Board of Works, and a roadway 80 ft . wide, have fixed their doom.
The name of "Bow-street" is known wherer there is a law to be broken. It is unlike any other police.court. All Government proso. cutions that are to ge before magistrates are sent to Bow.strect as the first stage. Its seat is the highest place in metropolitan magisterial promotion, honour, and emolument. Aay barrister of geven years' standing ' may well begin his 'prentice.hand dewn among the unsophisicated aborigines of Whi but, for "Bow-street" nothing bat full.fledred, hard.beaked emitbologicals will answer. Bow. street Police-court is to the magisterial neophyto what Drury-lare Theatre was formerly to the aramatic oue. After the actor had, in bygone days, drudied for several years on the sereral circuits," and won Bath the doors of Drury cireals, to him After the metropolitan police weren ". "circuit" " owards Bow sone but not till then Bow own treet rejow in for all a co nly ; the principal of the three is expressly anmed ia more lhan one Act of Pariament as eing invested wid epecial privileges. The 3rd W that officers and patrols of Borst, that offers and patrols of Bow-street Office are empowered to act as constables in the onnties of Middesex, Surrey, Lssex, and Kent ; and, also, within the Royal palaces, and ten miles thereof, Of course, ghould the court bo remored, the Act autherising the removal will have to provide for the retention of the powers mentioned above, as a change of the locality night void and determine them,
Bow-street has been the principal police. court of the metropolis for more than a century. Henry Fielding, the novelist, was a "Bow-atreet ustice" ; whilst his hrother, Sir John, sat on its bench for many years. Later down, there has been Sir Richard Birnic, who, we believe, was the last utrained lawyer who presided. In early times, the magistrates were paid by fecs, and it is recorded that, during a day of bad busiress," both justice and clerk would adjourn pipcs and drink their ale wogether, toasting for "bipester luck next time." When fair fish were rery searce, the grand hanl of the justice was to gend tho day and night coustables out te seour
 he an "his worship's" people they conld find. Then his worship's uctor bat to to bil bond price bs custody hat mor moner bo. Ther had either to send to money about ibem, they had eilher to send to heir friends or enter iato a second hond to go and fetch it themselres. Sut this camo to an and on account of Bow. street being severely handled once or twice, both in the law courts and in Parlimment, for having been too inciscriminate in its angling,-catching the wrong
fish. Things lad been going on in the same fish. Things lad heen going on in the same way at Bow. street for many ycars, wben the first Metropolitan Police Act was passed, in 1792. In addition to the old office, toe following new ones were estahlished:-Queen's-square, Vestminster; Great Marl borongh.street, Hattongarden, Worship.atreet, Lambeth, Shadwell; and Union-street, in the Borough
The magistrates of the olden time at Bowstreet, went hy the names of "Basket Justices," and "Trading Justices." The first.named had "presents" brought to them in haskets hy tho varions suitors ; and had, furthermore, their own baskets to receive whatever was quietly slipped into them, fruit, poultry, and game being the most accentahle. The "Trading Justices" were mostly well to do ahopeepers, and were settled with at their places of business before going with at their places of
Most people have heard of the once famons Bow-street Ranners," the "Robin Redbreasts," and many middle-ared gentlemen have sect them. They wore douhle.breasted red waist. coata, and carried a small painted truncheor, with a gilt crown at the head of it. They were considered to be all eyes and ears, all and all feet; and it was thought to be difficult to
sneeze in any part of London, or the saburbs, without the time and place coming to the ears
of a redbreast. The most celebrated of theso of a redbreast. The most celebrated of theso was their chiof, Townscud, a man of strong common sense, and Fery humane; a man with
whom a lord chancellor and judges frequently whom a lord chancellor and judges frequenthy
conversed upon criminal policy. Towasend was examinod hefore the Select Committoo upon the motropolitan police which sat in 1816. He was then passing into years, but had a memory well stored with his peculiar information. He was most strongly opposed to the old system of "blood money," and told the committee that the police officers wero temptation." He stated that at trials for life and death, where the halance of evidence hung evenly, the officer had turned tho scale against the trembling wretch in the dock, for the sake of the conviction reward, and that the victim had beon hanged through that extra testimony! In 178I, when he was in his zenith at Bowstreet, he told tho samo committee that ho had rarely seen executions without the gibbet receiving as many as ten, twelve, thirtcen, sixteen, or twenty; "and forty I once saw at twice, the names of every one of them I have got at home." He said that the horse and foot patrol established by Sir Richard Ford completely annibilated footpads and highway robbery.
Such wero the "good old times" at Bow-street at a period within the memory of many men now living, as well as during the last years of the last century.
In 1867
conrt was determinedal of Bow-street Policeconrt was determined upon, but it was not to leave its famous locality, -it was to be rebuilt alongside the police-station. To those who know houses bounded by mention there is a block of houses bounded by tho station-house in front, Martlett's-court adjoining, and Crown.court,
Russell-street, where Dr. Cumming's Scotch Chnreh-strcet, where Di. Cumming s Scotch Chnrch and Schools are. Botween the schools and the old Harp Tavern is the Harp-gateway, loading rp to a livery-yard and stables. It was pull down a few honses in Bow-street, on the puli dowi a few honses in Bow-street, on the The police entrance would heve been in Russoll tre police entrance would heve been in Russollatreot, up the gateway named. It was also pro. posed to cot away the half of tho first floor of
the Harp, so as to allow the police van to drive the Harp, so as to allow the police van to drive underneath, to take the bnilder's premises adjoining, and place tho public entrance between the Albion Hotel and the Harp Tavern. That For upwards owever, was abandoned.
For upwards of a handred years, as we have
said, Bow-strect has been the criminal Gaid, Bow-strect has been the criminal centre of is infamons. It is oncompassed with an ugly balo of orimo.
But its character is to be redeemed hy the momories of those who resided thoro hefore either police-court or station was established. In the days of Dryden, Bow-street was a fashionahle lounge. In one of his epilogues, spoken by Mrs. Ann Bracegirdle, ho writes i-
"r ro had to day a dozen billet-doux, In commenting upon these lines, Sir Walter Scott remarks that a billet-dous from Bow street in modern days would be vather more alarming than flattoring. In the bygone times, however, Bow-street wos the abiding-place and the favourite haunt of famous men. Here was
the shop of Jacoh Tonson, the boolseller, in the the shop of Jacoh Tonson, the bookseller, in the
doorway of which he received a certain epistle from Dryden, Tonson owed money to the poet, and was dilatory in his payment, so Dryden, failing by fair means to obtsin the cash he so a mes needed, sent him a pen-and-ink sketch o a mean, shabloy, hooksoller :-

With leering looks, ball-faced and freokled fair, $\Delta$ nd frowey pores that taint the ambient ofr."
"Tell the dog when yon deliver it," said the poet to the messengcr, "the man who wrote reply satisfied Dryden; he received his moner in full.

Here abode Wycherley, the handsome fop and the witty dramatist. To his lodging in this street came Charles II. With 5007 . in gold, which
he presented to the playwright, then in illhe presented to the playwright, then in illto the south of Earope. Wycherley went, and on his return, passing through Tunbridge Wells, entered a hookseller's shop at the monent that
a lady, young and beautiful, was inquiring for a copy of the "Plain Dealer," of which Wycherley
was the anthor. "Madame," said a gentleman Tho stood by, pointing to Wycherley, "there he is for you." This introduction was the beginning of a courtship that ended in marriagre. The lady was the Countess of Drogheda. She was loving but jealous, and when Wycherley wont across tho street to the Cock Tavern he was obliged to request the waiter to open the windows, while tho Countess did the same at home, that she -might convince herself thero was no woman in the company.
Hereabode Sir Godfrey Kneller. The jencontre between him and Dr. Radeliffe las often been told, but is worth retelling. Knoller was fond of flowera, and liad a fine collection. As there physician, he intimacy between him and the door into his parden; but Radeliffe's servants gathering and destroying the flowers, Kueller sent him ford he minst sliut op the door, to Which tho physician replied, "Tell him he may do anything with it but paint it." Kacller physic." To Knoller's studio from him bat his Gay; and in it, at Kneller's came Pope and "flattored him a littlo." The flattery verged on profanity, but it was toothsome to Sir Godfrey. Hore for forty-three years abodo Grinling Gibbons, the fanous carver, whose house, on a stormy Thursday of Janwary, 170I, came rattling down sobout his ears; hut, providentially, none of the occupants were injured. And here, after Ufency Fielding was established in I74.9, abode Kenry Fielding and his half-brother, Sir John Fielding, of whom wo have already spoken. Dr. Johnson, too, lived in this street for a brief period.

The houses of entertainment in this street were the Cock Tavern (already mentioned) and
Will's Coffee-house, The momories attached Will's Coffee-house The memories attached to the tavern are not pleasant. It was the their drunken revels set morality and religion at defiance.
The Coffee-house was frequented hy wits and critics. In its ohief parlour sat Dryden tapping his snulf-hox and discussing poetry and politics. Hither came Pope, when twelvo jears of age, to look upon the poet that ho venerated so mnch, man, with a down look, and not very conversible." The house was hest known as "The Wits' Coffee-house," a name which it retainod for ten years a'ter Dryden's death, in I70I. The site is now occupied by a ham-and-beef shop.
April, I663, It Theatre was opened on the 8th of Davenant's Theatre, in Lincoln's Iun-fields, without a rival until December 7th, 1732, when Covent Garden Theatre was opened by Rich, tho famons harlequin, under the patent of Daveuant. After varions alterations, in the course of years, rohuilt in 1787, to be totally destroyed by fire on the 20 th of Septemher, 1808 , since which at addition of the Floral Hall
leaned from Whycherley's carly days can he Plain Dealer" Thonerly comedy of "The removed, Bow-street will long remain the suggester of sensation

CONCRETE BREAKWATER, WORKINGTON HARBOUR.
UTILISATION OF UNSKIL, Led Labour.
AN interesting huilding operation has just heen completed in the harbour of Workington, Whiteliven, in Cumherland. Some few years ago the control of tho west harbour was trausferred, nnder the provisions of a local Act, from the Workington Harhour Trastees, to the late Earl of Lonsdale. His lordship, howovor, previously to this, had undertaken certain preIn 1871 the harbour
In 1871 a new and comprehengive schemo was brought forward by Lord Lonsdale. It was intended to effect a radical and final improve-
ment on the entrance of the harbour. This ment on the entrance of the harbour. This went entircly from its south-westerly outfall, into a new channcl running dne west, as well as to bnild a breakwater extending in a north Westerly direction from the end of the John
Pier, to protect the channel. Mr. A. M. Rendel, C. E., was commissioned to draw up the plans.

This craction has now been completed, and the rosult is a perfect transformation of the aspect of the harbour.
The structure, which presents an imposin appearance, is 400 ft . in length, $2 \% \mathrm{ft}_{\mathrm{i}}$ in beigh hore the foundation level, or 6 ft . ahove ordi nary highwater; 28 ft , hroad at the hase, and 21 ft . broad at the top. As will be seen, it composition, aud the mode of crectince it, ar peculiar. It is composed entirely of Portland cement concrete, partly laid in situ, and partl constracted in blocks on the shore, and hardened weigh some hefore being laid clown, These block they are 7 ft or 5 tons each; at the foundation The outer casing is 3 ft . thick, and 3 ft . wide in outer casing is huilt up of these blocks, se in coment mortar, and the interior is filed up with cement concrete, made between the tides, and deposited when opportunity served. The For many years there has been 35 ft in diameter For many years there has been a harbour light on the head of the John Pier; this has heen reWhile the breakwater.
While the breakwater is extremely solid, it has been constructed with siogular eoonomy There is not a blook of stone in it; the only stone rather being the shingle cobbles of which two concrete was made. No mason has heen employed, or any skilled workman beyond a been or two to set the blocks. All has been done by unskilled labour. The materials were fond in abundaneo on the beach Lahourcrs mized it up with cement, and huilt he breaswater, in fact.
The harbour works have now cost upwards of defrayed by the they were all, including this, defrayed by the late Lord Lonsdalc.

TIIE NEW SURREY SESSIONS HOUSE During the last six months new sessions-honse buildings have been in course of erection in Nowington-causcway, which include the construction of an entirely new court, much larger and more convenient than one of those which have hitberto been nscd for the business of the couly ; also considerahle alterations and rearrangements of the present courts. The new huildings will also contain offices for the clerk of the peace, and also a record.room, erected on a portion of the site of the old courts. In addiroom, barristers, include a rew magistrates judges, grand jury-room and grand jury waitingroom, treasurer's office, refreshment-har, and building also apartments. The basement of the with t:e courts ans prisoners cells, connected And this portion of the building pontainges ventilating apparatus, which cons of boile and encine for working a ventilating fan toret with a chamher for rerulating the hothether air to any degree of temperature apon Haydn's principle, and the machinery for the purpose is now being fitted up under the superin. tendence of a representative of the petentee Besides the ventilating apparatus just named, the courts will he ventilated by tiro shafts
The building is now approaching completion oxternally, and in the courso of the ensuing wiatels in fands immeliatejy in front of Horsemonger-lane, with Fhich it is directly connected. The priucipal routage, which faces tho area on the east side 45 f ington-causeway, is 150 ft . in length and $25 \mathrm{ft}$. in height, Which curmounts the contral portion of the
elevation. This part of the building is tho most prominent feature in the structure, and is hrought forward considerably beyond the two wings on each side of it. The building is erected of white Suffor brick, with Portland stone dressinge. The principal entrance is in the central portion of the elevation, and consists of a handsome portico, 15 ft . in width, with pilasters and columns of Portland stone, and surmounted by a balustrade. Under the portico the entrance leads into a vestibule, and thence into an entrance-hall, 50 ft . by 30 ft ., through which tho courts and other portions of the interior of the bulding are approached. The building has a Mansard roof, and effect is imparted to the elevation hy wo paviion-towers at either anglo of the central portion of the huilding. In addi. tion to the man entrance there is also another entrance at the south end of the building, for the magistrates, buristors, clerk of the peaoe, and other officials.
The interior of the huilding contsins, on tho
refroshment-bar, the one on the north and tle other on the south side of the vestihnlo. The courts themsolves, as well as the witnesses rooms and the several other apartmonts in the The housekcepers's and sorvants' rooms are at the sonth. weat corner of the ground-floor. The magistrates' private room is a conveuient apart-
 mert, 20 ft . by 22 ft . The new court is 40 ft , and the enlarged old court is 40 ft . by 40 ft ., and the enlarged old court is 40 ft .
square. They will both be fitted up in carved square. They will he lighted by windows on threc sides of the huilding, and at vight by sualights in the ceiling. The clerk of the peace's office and the record-room ore erected on the site of one of the old courts, the other court, as bas
already heen stated, having been reconstructed already hoen stated, having been reconstructed and considerably enlarged. The record-room contral hall will hare a panelled ceiling. stone staircase, from tho floor of the central hall, leads to a circular iron staircase and balcony, a portion of which, in additiou to the recordroom, will be set apart for the deposit of documents. There are also two other stone staircases from the central hall, leading to the grand room and the grand jury waiting-room on the first floor. The staircases also lead to a gallery for the use of the puhlic in each court. The architcot for the building is Mr. Howell, of Lancaster-place, and tho contractors are Messrs. Pcrry Brothers, the estimated cost exclusive of fittings, being 17,5002. It is expected that the courts will bo completed and ready for opening in the carly part of the ensuing year. $\qquad$
IRISE WHISKY DISTILLERY PREMISES GREENMOUNT, DUBLIN.
TVe were happy to perceive, on a visit recenty paid to the capital of Ireland, that commercial enterprise,-cspecially that fostered by joint. stock companice, -is decidedly on the advance We were strengthened in this opinion by an inspection of the distillery recently acquired by this company. Originally designed and erccted
for the purposes of a brewery, it has, by the for the purposes of a brewery, it has, by the agency of a limited liability company,
verted into a most promising distillery

Some twelve montbs ago a few influential gentlenien in Dublin, assisted by sono friends iu England, conceived the idea of purchasing from Messrs. Perry \& Co. their fine buildings known as the Greenmount Browery, situated at Chin-bressie-street Bridge, Harold's Cross, and for that parpose formed a company uuder the in the brewery had all been erected within the last five or six years, in a substantial manner and under the advice and supervision of a com. petent architect. They comprise an ontrance. clerks, manager, and reueral staff, fitted for and completed with every requisite for carrying on a large business. The main building which is five stories high, and 100 ft . long by an average depth of 243 ft ., was principally nsed for brewing, and huilt of limestone heing supported by wrought-iron hox girders. Adjoining the main building two stores were erected of similar materials, each over 100 ft long by an average width of 35 ft ; the boilers, engine-house, tanks, do., were placed at the reas of those buildings. One of these two stores has been fitted up with the wash-backs, mashtubs, \&c., required for the purposes of distillation; the other has heen set apart for the bonded store, for which purpose it is admirahly adapted. The main building has been altered to answer the requirements of the distillery by putting in new floors for the grain lofts, erecting it kiln on the third story, and fitting up the second story with the requisite number of mill-stones, which are worked, as well as the pumps, by an engine on the floor beueath. The copper stills have been erected at the rear of the main building and a chimney-sliaft specially huilt for thow Immediately adjoining the still-house will be found the worm, top-wash chargers, receivors, \&c., raised on a powerfnlly-constructed platform, whereby they are enabled to command the stills. The boiler-honge, which formed a part of the original browery, immediately adjoins the still. house, and the products of comhustion are carried off by a chimney rising about 140 ft . being. Tho situation of this distilery is excellent grand canal, by means of which the whisky can grand canal, by means of the quay and shipped
be sent down by water to the
for any part of the world, or scat by railway to facilities for getting malt and fuel from the different districts through which it runs, thereby saving ontlay in cartage, as well as obtaining the malt and fucl at low rates. It is contemplated that in a few wees' bime the distillery will be in full working order, and the dircetors expect to manufacture at least 270,000 gallons per annum.

Another feature should not be overlooked, mamely, that tho same water is uscd for the purposes of distillation, as that employed by the ld-estahlished distillers, - a point which may he considered of little moment by those who are nacquainted with this particular busiuess, but to the enlightened few who are admitted behiud he sceues, is known to be of the utmost conseThe
The works have been erecuted from the designs and under the superintendence of Mr. E. H. Carson, architect, of Duhlin; the machinery being supplied by Mr. Edward Toomey, of the Phoevir Ironworks, in that city; the building operations being entrusted to Mr. S. H. Bolton, also of Dublin. The wash-backs and chargers were supplied by Messrs. Osley \& Co., of Frome, Somersctshire.

PROPOSED NEW VESTRY-HALL AT KENSINGTON.
Ture snhject of the erection of a now vestry. hall at Kensington has for some time been before the local anthorities, bnt hitherto nothing definite has boen decided upon. The preliminary steps towards the erection of the building were, howover, taken hy the vestry at their meeting last week, when a resolution was unanimonsly carried o the effect that it be referred to the specinl purposes committee and the law and Parlia-
mentary committee jointly to consider and report mentary committee jointly to consider and report
as to the most desirable steps to be taken for as to the most desirable steps to be taken for viding the accommodation nccessary for carrying ou the business of the vestry.

THE CITY ARCHITECT'S
EXTBA PROFESSIONAL SERTICES AND THE CORPORATION

AT the meeting of the City councll last week, the recommendation of the Officers' and Clerks Com mittee, that the City architect, Mr. Horace Jones, he paid 5,000 . for his extra services in onexion with the recontly completed works which have been executed by the corporation, course of which a diversity of opinion we elicited, some members warmly supporting tbe rccommendation, whilst others opposed it on different grounds. Mr. Ridley was opposed to it as a right, but thought some amount might be given to the architect as a gratnity, and ho moved as an amendment that $2,500 \mathrm{l}$. he so granted. Mr. Knight did not think the archiect was cntitled to any extra romuneration. He admitted that the work was done in a masterly manuer, but denied that the architect had any claim to extra pay for the works. Mr. Boutems was of the same opiniou as the previous speaker, stating that he conld not see that there was the least shadow of a pretence for saying that the architect had a claim on the corporation for extra services, and ho added that if the 5,0002 wero voted him it would bo a great mistake, and very discreditable to the court. Mr. Collis, on the other hand, was at a loss to see how it for $20,000 l$, wortb of work. The recommenda tion of the committee seemed to be an exceedingly moderate and just one, and he hoped the court would adopt it. Mr. Wordley observed that the architeet was a gentleman for whom he had the greatest csteem, hut he could not seo that the claim of Mr. Jones was a substantial onc. Mr. Depnty H. Lowman Taylor warmly stating the rccommendation of the committeo architect should he paid 5 noo? for his extra sorvices, and in his houest opinion 5,000l. were not sufficient. We ohserved that the real cause of the opposition to the recommendation was the non-success of the Foreign Cattlo Market, at Deptford, and ho had no doubt that, had that market been a success, those now opposing the met mmendation of the committee would have ffered double the amount Mr. Rudlin wes opposed to tho recommendation, bat in favour of
a good increaso of salary, dating back from is , which he thought would be the best mode opiniong with the case. N.r. Bedral claim on the corporation, and would support the recom mendation. Ultimately the $5,000 \mathrm{l}$, were sranted to the architect ss a gratuity in recognition of the manner ill which ho had corried out work during the last ten years.

4 STEAM FERRY AT MIDDLESBROUGE, AND PROPOSED TUNNEL UNDER TUE TEES.
The Corporation of Middlesbrough some time ago obtained Parliamentaxy powers to estahlish a steam ferry across the Tces to connect the town with the opposite side of the river, and withiu the last week or two they have commenced the wrork of constrncting the approaches on the bank of the Tees. It is said that the approaches to the ferry will cost about $10,000 l$., and that the outlay ou the steamboats will be about the same amount. The North. Eastern Railway Conpany have in contemplation the constraction of a tunnel under the Tees at Midalesbrough, and shonld this scheme be carried out, a greatly required improved commnnioation hetween South Durham and North Yorkshire, at the rapidly-growing ceutre of the iron trade, will be fully met. This tannel is intended to commence on the south side of the Tees, immediately below Middlesbrough, the existing railway at Middlesbrough being connected with it by a junction at that point. The tunnel will mp in an obligne direction under the river, terminating on the north side in Stockton, where it will he connceted with the ralway there by a junction. The tumuel and jumetions with the a of the Tecs will have the effect of connecting the coalfilds of Duram with the iron distriet the coalfields of Durham with the iron district towns of Stockton and Middlesbrongh more closely of coll hy a hridge over the Tees was opposed by cho hy a hridge over the corporations of both stockton and Darington, give the tunnel project their warm support give the tunnel project their warm support.
The Stockton corporation are also taking steps for making new dock accommodation there and inproving the river, and with this objoct they intend to apply for Parliamentary powers, the Bill including anthority to construct a large new dock, by utilising the channel of the river opposite stockton for that pnrpose, and to ent a new channel in the river. It is stated that tho North-Eastern Company will assist the corpora tion in carrying out the works.

DECORATIONS OF ALL SAINTS' CHURCE, MARGARET.STREET, CAVENDISH SQUARE.
A comamter, comprising the most influential members of the congregation of All Saints Church, Margaret-street, Cavendish-square, has been formed for tho parpose of raising a menorial of their late vicar, the Her. William Upton Richards, who died early in the present year. The list of the committee includes the names of the Earl of Limerick, Earl Beanchamp, Lord Eliot, Lord Clinton, Sir Edward Hulse, bart., Sir Henry W. Baker, bart., Archdeacon Deniron, \&c. ; and, we understand, it is proposed in the first instance to complete the decorations of the wall of the uorthern aisle of the church, six compariments of which are at present left vacant and unfaished. This work, which the late vicar had much at heart, will be carried out under the direction of Mr. William Batterfield, the architect of the church itself. The probable cost of completing the decoration of these compartments in fresco is estimated at 1,0002. If Mr. Butterfield's ideas are carried out, a group of saints, apostles, martyrs, prophets, patriarchs, \&c., will bo placed in each of the vacant panels. Some members of the congregation, however, baving expressed a wish to appro. priate their gifts to the completion of the All Saints' Convalescent Hospital at Eastbourne, Sussex, the secretaries to the "Richards Memorial Fund," who are tho churchwardens of the parish, have opened an account at the bank of Sir Samuel Scott \& Co., Careudishsquare, and they invite the donors to state to which of the two objeots they desire their contributions to be devoted.

THE MEDIAVAL BRICKWORK OH POMERANLA.*
When I was asked some time since to pre. pare a paper on the Mediraval Brickwork of tho subject was one whicb had received so little attention from English architects. Still less was I prepared to find, as I did when I hegan to look out for the necossary authorities and matehas so long formed a province, searcely any work of importance had been published to illustrate of importance had been published to illustrato with which it teems.

German works on this topic are naturehly more numerous, and $\Lambda$ dler's fine treatise on the valuable assistance to any one reading up the valuable assistance to any oue reading up the
subject. But only small portions of tho coantry are therein dwolt on, the great examples of Pomorania and Mookleuburg heing, I boliere,
unnoticed, so that, even in its own country, unnoticed, so that, oven in its own country,
German brickworls has yet to bo properly doscribed.
The meagreness of the information one is able to get relative to the foundation and early listory of the Pomeranian towns is to a great extent to be accouuted for by the peculiar
character of Pomeranian history. The province charactor of Pomeranian history. The province
was for long periods after the extinetion of its native dynasty the object of contention among noighhouring and more powerful States, and by its frequent change of masters it gradually lost all patriotio pride and distinctive character, without the compensation of becoming at the
same time a part of any one powerful country. same time a part of any one powerful country, Fussians, Poles, Sivedes, and Dines have at one time or another held parts of it in possession, and it is scarcely more than half a century since it came absolutely into the hands of the kingdom
Origiually it was peopled by a Wondish tribe, and its natives to this day have a marked diffor. ence of appearance to the Germans of the sur. rounding proviuces; whist in the names borno by many of the towns, and tho peculiarities of che low German spoken by the people, there are atill many marks which distinctly point to the Veadish origin. At the end of the twelfth recogrnised as princes of the German empire; and with the exception of that eastern portion which was wrestod from them hy the Teutonic Jnights, and eventinally added to the Polish crown, the province was governed by its native fifteenth contury.
Through nearly the whole of this period it sppears to heve enjoyed considerable prosperity; but with the tronbles cansed by the Protestant changes in Germany, and the extinction of the
native line, this prosperity came to an end. One after another the brothers of the Ducal house died childless; fand the last of the race house died childless; and the last of the race thirty years' war brought on his unhappy country. The tragic circumstances which led Wilhelm von Meinhold in the account he published of Sidonia von Bork, a lady of high rank lished of Sidonia von Bork, a lady of high rank
and for some time tbe intended wife of one of and for some time the intended wife of one of
the dukes, who, in revenge for heing disapthe dukes, who, in revenge for heing disap-
pointed in this, was supposed to have oinsed pointed in this, was supposed to have ounsed
the extinction of the whole ducal line hy abomin. able witchcraft
The physical foatures of the country, which perhaps more than anything else have modified and inflnenced the charactor of its architecture, are peculiar. Through its whole extent it is flat and uninteresting, broken only here and there with low rounded sand-hills, interspersed with large lakes. The coasts are deeply indented with large gulfs of havens, which form natural harbours; and the oountry is intersected by broad sluggish rivers, on which in the Middle Ages floated great stores of woalth and mer-
chandise. The land consists of large sandy traoks, with clay helow, and through its whole oxtent no building-stone of any sort is to he found. But gramite houlders, sometimes of freat size, are to be found everywhere deposited hy the glaciers and floods, which at one time swept southwards over Europe; and in the country aronnd Stargard they lie to this day thickly spread over the surface, in spite of the enormous quantity which has at one tirne or another heen used for building purposes. The

From a papor by Mr. J. Tavenor Perry, read at the
greater part of the grom was originally
covered witb great pine-foresta, and althongh these have great pice-forests, and althongh cleared, and grain grown in their place, large tracts of country are still kept for their cultiva. tion. Such heing its physical pecnliarities, it is evident that circumstances were generally nnfavourable for building operatione. In spite of them, bowever, towns of great importance, filled Fith chnrches and buildings of a size and cha 7orks of chane ge comparison with the fines and although the materials nsed were of the simplest, and not manfrequently of the coarsest, implest, and not unfrequently of tbe coarsest description, you will see that the re

The granite was employed for the hases of th buildings, for the town walls, and in some rave instances for the superstroctures; hnt the mapurnoses was invariahly used for general building purposes was hrick. Otten of the simplest descriplon rad rudest work, sometimes modelled with a delicacy tbat might rival the finest terra-cottas of Italy, or carved witb tbe sharpness and bold. ness of freestone, this brickwork had always an pose that leaves little room to regret the absence of the nobler material. When stone was used which was hnt rarely the case, it had to be shipped from $S$ weden, an operation early found ton expensive to be often resorted to. The skill with which ornamental foatures were moulded in clay caused less desire for carved stone than might otherwise have heen felt; and in later examples such features as capitals and bases, hion in the earlier huildings were workod in in hrich. abounded whe wood with which the country of the huildings, and instead of the fine opentimher roofs of our own country, we find the whilenes are almost invariably vaulted in hrick while the love for blank tracery and gables, with the proficiency gradually acquired hy their archithem in the nse of their peculiar material, causer half-timber over-langing stories that were the common in other well-timbered parts of Europe. with roofs of the churches are generally covered forms aper, which, turned to a soft green with age tints of the walls.
I shall confine myself to the butilings I have myself visited in the towns of Stralsund, Stettin, Pasewalk, which, with the exception of the last two, are contained in Pomerania itsolf. Of these, Stral. sund is architectarally the most important. It contains six churches of oonsiderahle size, a town-hall of a remarkable character, soine remains of its ancient gates and fortifications, and several

In attemp
tyle in whiching to give any acconnt of the style in which the buildings are erected, there are some facts which have to be borne in mind. to the country but the style was not indigenous the the comessity, bat was imported complete when the necessity for buildings was suddenly felt
At a time when important works were going on in other parts of Germany, the Wends Pomerania were scarcely converted to Christi anity, and sunk in harbarism. But the civilised Statos of Brandenbnrg and Mecklenhorg leaning on their horders, and the intuence and warning caused ay progress of the Tentonic kuighits, although we aro not able to trace it stepy; and we find snddenly in the middle of the thirteenth century eridences of prosperity and taste in the anmerons buildings which hegan to spring up ported from the survounding States, or whether native workmen giuned their knowledge by travelling, they seem all at once to commence the erection of edifices, perfect in style, and complete in all the appliances of ormanent and construction. The huildings, prior to this time, were so poor and unimportant, that they themselves conld not have afforded the experience required for the erection of such works, as, for Axample, the Nicholai Kirche at Stralsnnd. startine foticeable point is that, as a rulo buildings appear to bo tho most enriched, and after this was maintained for a century or so, they fell off from the florid cbaracter they first assumed to a haldness that oven their enormous With proportions can scarcely atone for With the material the hnilders had in use, $t$
modes of deooration were open to them, of which they arailed themselves, sometimes apart, and lricks, and enamelled bricks for colon or carved rations. Tho latter bricks for coloured docoadopted in tbe Old and New Mark, and about adopted in tbe Old and New Mark, and about Pomemnia as scarcely to modify ia any degree the style of the buildings. The cast or moulded the style of the buildings. The cast or moulded
work was, however, the characteristic charm, and to a great extent the altimate canse of tlie destruction of the style.
The workmen were not long in discovering the ease with which a great variety of design could be produced hy different combinations of a few simple patterns, and we accordingly find the orrliest and most general decorations employed o have been small cusped bars and circles, which singly or together were bnilt on the face of the walls in the panels. In bigh-class frork, such as some we have noticed at St. Mary's, Stargard, the workmanship was of a much bettor and more artistic class, and the variations in the different portions show that oach was separately and carefully modelled and built in as an ingredient part of the structure. Generally, however, tbe work was of the more oasily made sort, and, in consequence, the moulded shapce, although they often produce exoeedingly satisfactory and ornamental finishing, were of suoh an unsuhstantial and structnrally useless oharacter that they soon decayed and fell out, leaving only ugly sockets and gaps to the detriment of the building they were intended to adorn. The facility with which it was found hey could be added to the work after its com pletion, seems frequently to have suggested the oaving of them out until some later period Which, in too many cases, never arrived; while, in tho later work, it seemed to be rather the rule omit the more ornamental work of the earlier ime, and the unshapely panels and hlank arches which former builders had prepared only for a means for holding decoration, were imitated for heir own sake, and bare walls and untiaceried window-heads are unfortunately too often the charaoteristic marks of the later plases of the style. The most commun form in use was a har orming one side of a trefoil or quarterfoil, three fonr of which formed a complete pattern, and these were produced indefinitely in long panels, as round the towers and under the arcades, and sometimes over large wall spaces, gables, icc. Sometimes these hars were of great size and laborate character, and must have been made Fith great care to fit together, as in the south door of St. Mary s, Neuhrandenburg, where thre usped brieks or pieces of terra cotta, each ft. ithin a plain brick circle. The ordinary plain mouldings employed in these huildings have distinctive character of their own. They are with few exceptions, worked in the same sized hricks as the rest of the huilding, and necessarily show a smallness of detail as compared with stone resulting from the size of the materia employed. It is in its plain mouldings that this class of work shows to great advantage, for the nature of the mannfacture requiring the repeti tion of the same design, a rich and ploasin effect is sained hy the nse of one or two good sections. These mouldings appear almost in variably to have heen mouldod bricks, but some at St. Nicholas's, Stralsnnd, which church has a very fine series, appear to have heen cut after they were in position. Not a little of the orna mental work in some of the earlier huildinge appears to have heen carved, like stone, after i was in position, as, for example, the heads in the buttress decoration of St. Peter's, Stettin, and the corbels at St. Mary's, Stargard. Another very effective but simple mode of decoration found in thirteenth-century works was the hreakincr of the loner rolls at the ancles of the hnttresses, with a koldly projeoting hricle carbel often emphasized hy a hollow on either side, and carved into a grotesque head. This will be seen in the dotails of St. James's, Stettin, and St. Mary's, Stargard.

The traceries of the windows were in thirteen th and fourteenth century work of a most elahorate description; they appear to have heen bnilt ap entirely of moulded bricks without any support of iron hars, other thau those used in the glazing, although at times the mullions aro of aring, although at times the mullions aro of phases of the baldness and want of design which characterise the rest of the work; for anything more ugly the rest of the work; for anything more ugly
than the monstrons windows of St. Mary's, than the monstrons windows of St. Mary's,
Stralsund, divided into six or eight lights hy
mullions passing straight up into the heads, could not easily be imagined.
Some of the best examples of decoration by enamelling the bricks are to be found iu Stargard, a great part of the decorative terra-cotta being black-glazed clay. Where, as in this case, if they are used with red or dark bricks, the effect, no doubt, was always satisfactory; but when a number of hright colours, washed clean and brilliant by every shower of rain, are bnilt together in a wass, it required the lapse of centuries, and the decay inheront thereto, to mellow and barmonise the whole. The great west door of St. Jarmes's, Stralsund, has the jamb-mould-
ings built ap iu large blocks of ings built op iu large blocks of glazed terra-
cotta; but in this case the colours were all deep cotta; but in this case the colours were als deep
browns and blacks, and could nover have lad browns and blacks, and could nover have had
the staring look of the little red and blue turret the staring look of the 3 li
I deecribed at Prenzlan.
1 described at Prenzlan.
The bricks of which all these bnildings are formed are chiefly remarkable for their size. At Passewalk I measured some 11 in . by 5 in . by $3 \frac{1}{2}$ in., with a full ${ }_{3}^{3}$-in. mortar-joint; at St .
James's, Stottin, they were the same size ; whilst James's, Stotlin, they were the same size; whilst
at Lübeck some which were bcing removod at Lübeck some which were bcing remored from an old wall during the restoration of the
cathedral. I fonnd measured as muoh as 1112 in . by $5 \frac{3}{3}$ in. hy 4 in. The colour is a brownish red, and the mortar joints white, so that althongh we say that all the buildings are red hrick, they never have the staring red colour we have too often to associate witl the new red-brick house iu England.
Before conoluding, there are one or two points which have been incidentally mentioned in the planning and arraugement of the churches to first thin would partioularly recur. One of the ment of a large open porch or narthex across mont of a large open porch or nartes across aro one or two towers in the front, the iaternal aro one or two towers in the front, the internal arrangement is generally ythe same, and wherc
there is a single tower, as at $S$. Mary's, Stralsund, transepts aro thrown ont beyond the tower to transepts aro thrown. Ont beyond the tower to towers common in the disitrict,--one the gabled square tower with the spire over; so common iu Germany, of which wo see, porhaps, the hest examplo at Limburg.on-the-Lahn; and the octagounl lantern with angle pinuacles, examples of which, indecd, are scattered througrout
Europe, hut which seems here to liave been a type carried to considerahte perfection. Where, as is often the case, the aisles wero built of equal height, the roof over the whole church was in a sing:e span, and the architeots gained a space in the eastern gable for lavishing all their favourite display of panols and ouspings. Thus these gahlos come to form a most prominent featare $i \Delta$ the principal buildings.

## JOHN STUATT MILL AND THE POWER

 of Fine art.Ir is impossible to note the course of the carrent of the eyen popular literature of the day
without lighting every now and then, as if by without lighting every now and then, as if by acoident, on some thougbt or other in the way
of fine art, which shows how impossible it is for the haman mind to rest coatent without it in some one or more of its forms. No merely
practical education, whether of a business kind or otherwiso, can altogether annihilate the feel. ing for it. Sometimes it is found to influeuce, and powerfully influence, those who havo been hronght up, and even educated, with a dead wall in front of them-tho dead wall of pure and the world's history, and amoner peoples of the tho world diverse mistory, and among peoples of the most diverse meutal type and physioal organisa-
tion, it will bo fonnd that art of some kind or tion, it will be fonnd that art of some kind or practised, and indeed went hand in hand with practised, and indeed went hand in hand with Whatever objects of pure necessity and mitity
the most savage and rudest nations were possessed of. It seems, iudeed, this desire for "ornament." -an ineradicateahle instinct of the tuman mind, not to be got rid of even by igno-
rance ittelf, or by an advanced education of the rance itself, or by an adranced education of the most learned ntilitarian rigidity. It comes simply to this, that tho haman mind is complex, and has in it not only the faculty of the usefut, hat the faculty of the ornamental, or tho beautiful, or the "pretty," too; and education, to be of any real service, must recognise both of them. To neglect either, or to try in any way
to stamp one of them out, must needs cad in failure, however perfect and complete the cul. ture of the one left may have been.
That this is true, and the fact is not a little
interesting and instructive to the artistic community, is amply proved by tho example, the Mill if ev. His odncation,--and that was edacation, he could see was such a thing,-began as ind after the model of the strictest and most severe "utili-tarianism,"-tbe "utility " of Jeremy Bentham. In all things Mill, the philosopleer, would have nothing to say to any doctriue whatever, excep him, as his stern preceptors thought, which oom pelled him to look in any other direction, and away from this mere utility. Toetry was the beguiling and weatening influence which servel to rend asunder, and almost at times to threaten to overtbrow, this stracture of pure utilism, which be bad, at so ruch labour aud cost, huilt up in bis miud. It is to this one special artistie or poetic influence that we would call attention. It is oue which must make the "antoand even consoling, to architects. The youthful pbilosopher, lookiug up from his many, many books, could not but ho struc with, struck with, a " view," with a liking for natural scenery, and a lovo for pure nature. After bis aborious book-reading, what a revelation! But this was not all. So intont had ho been on lie books, that bo noticed not the very apartment in which he sat, and in which he daily lived and moved, aud had his being. Fort unately for him, Bentham, his great teacher, lived duriog the balf of each year at Furd Abber, Somersctsluire, and in the spacions and lofty rooms of that Abbey it was that tho principle of ntility, which hive so ruled his mind hitherto, was made to and qniet dignity. In the magnificent apart. quict beanty he found, he tells us, a new sense and idea. These architectural roonns wero to me, he says, "the sentiment of a freer and larger existence, and beoame to me a sort of poetio cultiration." A wouderful confession, truly, from oue who was brought up iu the principles of the most rigid utility, aud was taught to oonsider all things from the standpoint of a solitary utilism. Looking at the room in which moment from lis pile of tomes, lee saw from his window the "grounds" in which the Abbey, to which both he and we now owe so much, stood. They were, he tells us, "at once riant and secluded, umbrageous, and full of the sound of falliug wators." It was, then, suoh as thesc and untiring studend of tho yontbful plilosopher and untiring student of books. The sound of falling wreat trees from the open window of a lofty and nohle room. Utility, bare and hald ntility, was shattcred and fairly riven asunder in his nund by the impression of serene beanty which first glanced before him in this Somersetshire Abbey. Norch before, prohably, did architecture make so great a conqnest, or achieve so transcendent a victory.
it must have boen, surely, says an acuto writer some ancestral type in Mill's concrete heing when he could thus find his mind, ill full of sheer atility, thus affected. We do not so much for any eane human mind to us almost inpopsible impression nade on it by a noble room. Indecd, tbo very contrast botween the poverty, thinness, aud sraallness of the ordinary middle-class habitations, and the rooms in thern, and tbose more enlarged and right uoble manpoint cannot hut strike every man. They existenco, when we may suppose it will bo conscious of this, and will find a way to provide for the nobler want. The great singularity here ig, that one so brought up and isolated, and educated in tho principles of sheer ntility should have been thus so powerfully affeoted by for wh says whole volumes for architecture, and the future do-a distant future, it may be,

And thus may we see liow pantry
largest sense, and architecture with it, may como to influence a man almost in spite of him. fuences in the shape of a defined and rigidly striot educational coarse-all tending the other way. The all. powerful influences of such men as Bentham, Ricardo, James Mill, and others, "ith the grimmest of tho hard facts of the "dismal science," constantly at bim, could not destroy or eveu nnllify the faculty for the man, for the ennobling and purifying influences
of it, from the fret and always, tbough perhaps nnconsciously, influenced his mind. It is a
right noble aud impressive lesson, and should go far to prone to despond at the present look of things in the world of art. Humau nature is too powerfully and strongly constituted to give way oren to the mighty iulluence of a steru necessity, in the form of the absolutely useful. It will have "something more than use." It needs, and will have, the pretty aud tbe pleasing; a something to find a joy, and a simple delight in. It is for these that the artistic faculties, doubt. less, bave been conferred, and made to dorm component part of the very heing of man

4 nd, again, mey we usefully noto what And, again, may we usetully note what wonld
by many be thought a strange attraction for 60
utilitarian a 10 an, and tutored as he was, and it is interesting as still further showing and it asily his min as stil further showing how and pis man and picturesque idess, though constantly warring with his bald utilitarianism. Wo reter to his delight in the romanocs of Sir Walter scott. te had read nothing of the poetic decamings of the present century, and could soe, it would seem, but little merit in it; but that with the metrical romances of Sir W. Scott, lie was "in. consely delighted," as he always was witb nimated narrative. This fact is not a little remarkable and significant of the power of art and arohitcoture, even as word-painting, over a proctically educated mind. All know how frll these romances of Scott's are of descriptive power ; of art, and arcbitecture, aud pic. turesque scenery, and a simple love of nature. These works of tho great novelist hare capti. rated all hearts, and tbey took even John Stuart Mill's heart fairly by storm, or rather, after his dry and hard ntilitarion training, they opened upon him like visions of fairy land.
We cite these facts in the life of Mill because Ley go to show how much more there is in matters architectural than the mere facts, important as they are, of its birth, and briuging the nid the ror destinio, whe hilory of nd tho romance that graduy, as goes solid stones and huge tiuhers, material poetry. Scott's feudal castles seom hardly realities, yet they were so!
We think we may thus learn from the oxample of this philosopber an artistic lesson of the highest kind. In a twofold way we see the power of art and benuty over the humau mind. First, in its prower of teaching all neen, whether philosophers or not, aud thon in its powor of triumphing over adrerse influeuoes and circum. stances, and making havoc where tho defences against it would seem to have been invuluerable. We may soo also in this remarkable instance of the power of art that it takes no previous art. education for a man to becone suhjective to its power., Not only was John Stuart Mill "ignorant of art," as the plarase is, but he was expressly educated to resist its blandishnents. A wall was hnilt up beforo him, to keep ont the sight art, and almost nature, too ; bat his warm and gontle mature, aud intuitive love of the ture, mastered it and bo becamo nn artist in a day. Ho found in fine art that which his mind needed, and whioh he could not but miss in the merely useful. Feeling, or sontiment, he was taught to remard as a deadly sin. To give way taught to regara as a deady sin. 10 give way
to those was to foll into error, or, at all events, to lose time ; blis this old , bling hel against ho cold teaching, - his clear eyesight conld not be blinded. When nature, out in the open air and in tho green fields, canghit his eye, his himerent love of the conntry quite mastered him, and be conld not but feel as a painter and an artist,-his rigid rales of life gave way, and,
like a clild, he found simple pleasure in the ar. like a clilid, he found simple pleasure in the arrangement and collecting of humhle wild llowers. There are few events in this generation, looked at from an artistic point of view, which bave told so strange and instructive a tale as this fact of the mind of a strictly brought up and educated "utilitarian" heing so powerfully swayed by art and simple nature. What a lesson it is, and ought to be, to our hosts of educationalists and pedagognes, and to those who nowalays in such numbers are seekiug in such somotimes artificial ways to elevate the masses of humanity. In higher quartors, even, efforts are to be made to move the Royal Academy to rouse itself, and to further highly educate the architects of the future generation, But fow, very few, oan hope to follow the wonderful example of Mr. Mill, or
can over attain to his vast accumulations of
knowledge, both old and new, from the dead past and from the living present. Still less can they hope to use it all withont confusion, as he did, and to apply it to a good and nseful purpose. But one thing that he did all can do, instinctively and throngh clear and intutored eyesight. They can look at the things about them and, it may be, see in not a few of thom, however common they may seem, that beauty and barmony which exist in the whole of Nature's works,-in natural scenery, in "views," even in "gronnds" sometimes, and in things simplest wild flowers. In the very humblest of Nature's works J. S. Mill took simple delight, seeing in them all tho evidences of that transcendent contrivanco which is more strikingly obvious in her mightior efforts.

THE WATER-SUPPLY OF THE METROPOLIS.
Is pursuance of the powers given in the Metropolis Water Act of 1871, the water companies of the metropolis are taking steps to provide a oonstant supply of water to consumers; and with that ohject they have issued
notices calling upon owners and occupiers to provide the necessary appliances to secnre against waste. As a consequence considerable opposition has heen aroused in varjous quarters
of London, and it is alleged that in enforcing the of London, and it is alleged that in enforcing the
regulations as authorised by the Board of Trade regulations as authorised by the Board of Trade great severity has been exercised, so that in many localities whole streets have bcen deprived of water. Dr. Meynott Tidy, the medical officer
of liealth for the district of Islington, has just presented to the local authorities an elahorate report on the present position of affairs as between the publio and the water companies, in the course of which he observes that the water companies having at length yielded to the popnlar clamonr and granted the constant ser vice, it is unnecessary to urge its desirability; and there can he no question that it will bo an enormous gain in the case of the courts and crowded homes of the poor. But to the well(Sundays not excepted) a sumply little short s constant, it is far from certain that the constant sorvice is so great a boon or so desirable as some seem to regard it. However, this is not a matter for discussion now, because the popular cry has been yielded to. But now a complaint of \& diferent character is made, - that the con. ditions required by the companies in granting the constant supply are unfair. Dr. Tidy, however, affirms that their most manifest fanlt is their indefinite character. It certainly could havo been wisbed that the comparies-who have decided ou some special form of apparatus have decided ou some special form of apparatus rather than leave them to choose and shift for themselves, floundering about amongst the numerous patents of almost daily creation, which are in many cases absolutely worthless. Thus a new expense is incurred for further changes of fittings that might just as well have been advised in the first instance.
haracter than this now The vancod is of a deeper character than this. The public no doubt imagined when, in the first instance, they loudly asked for a constant supply,-that "constant
supply" meant unlimited waste. To one with even a mere chance knowledge of the important question of the water supply to London, a work, bo it remembered, of pigantic magnitude, and what is more, a work of daily-increasing magni-
tude, it will be seen that this never could he tude, it will be seen that this never could be
permitted. And hence the water companies permitted. And hence the water companies
have drawn up a scries of regulations in accord. have drawn up a scries of regulations in accord
ance with the provisions of the Metropolis Water ance with the provisions of the Metropolis Water
Acts of 1852 and 1871 , which regulations have, Afts of 1852 and 1871 , which regulations have, sanction of the Board of Trade. These regulations provide for the prevention of im proper waste and contamination of the water, and also, as far as possible, an equal delivery to bouscs on different levels; having been in force
now since the 10th of August lest year, and a now since the 10th of August last year, and a
snm of $5 l$. being the penalty for their violation, snm of $5 t$. being the penalty for their violation, it is advisable that the public should cicary nuderstand their nature. The regulations provide rionsly to the water supply to new dwelling. houses being fixed; that no house may have more thau one pipe of communication, but that every house must have its own pipe, except in
the case of blocks of bouser, the water-rate of only shall be employed; that ; that screw-taps if it can possibly be prevented, he laid through a drain, hut, if impossible to avoid, that certain precautions shall be adopted to prevent contamination; that to prevent the action of frost the pipe shall be of a certain depth; that no pipe in connexion with the company shall be connected with a rain-water receptacle; that no waste-pipe shall hereafter be allowed, and that all waste pipes, -that is, pipes the ends of whicb are not visible, and the outlet of which may be into drains,-shall be converted into warning pipes, the ends of which are visible, and so ditions, no nnderground cistern or wooden butt withont a proper metallic lining shall be allowed; withont a proper metalle lining shall be allowed;
that where a stand-pipe is erected for the supply of a group of honses, or for otber purposes, " water waste-preventer" must be employed; that in the caso of water-closets a service-box, so constructed as not to deliver more than two gallons at each flush to the pan, shalt be erected, this servico-box being refilled from a store cistern ; that under, no circomstances shall any pipe communicating with the water-closet be in direct communication with the companies" pipes; that bath apparatus shall he constructed so as to prevent undne waste. It is provided, however, "that all existing fittings, if sound and efficient, which are not roquired to be removed or altered under these regulations, sinall be deemed to be preseribed fittings under the Metropolis Water act of 1871 .
But the public mnst be prepared for further changes in rendering the constant supply more universal. Fittings for the present supply will not nnswer for the constant service. The companies may give notice to the puolic requiriag and if the order is fittings within two months panies can do the work themselyes at the expenso of the owner or consumer.
Sach is a summary of the new regulations; and no words are uowedays spared in their condemna. tion. On this matter, further, the pablic have a right to be heard. Tho water-supply is a great panics question, and directors of water com todians of what is inteuded for the are of all and whioh the public have eatrusted to their care to deal with in tbe best possiblo way, and with the greatest possible consideration for the whole commonity. Immediately directors cease to remember they are acconntable to a higher tribunal than a company of sharelolders, they what society uatizrally deuands of them. The whater companies are the creation of the people, permitted by the people, and, in all they do, accountable to the people. For the benefit of the one and all; for the greatest possible good terms of the companics' trust-deed - are the between companponics lrust-deed,-contract if theo company and people. And of course, if thie comprany are thminaful of the trust, the not only must the company remember the terms of the contract, the people must remember them too. And if the water companies allowed a whole district to ran short becanse they were not sufficiently careful to prevent waste by a
few, or the supply of a whole parish to be confew, or the supply of a whole parish to be con-
taminated by the carelessness of an individual, then the public would be jnstified in complaining that the provisions of the trust liad been violated. It could not be expected that a constant service, which the public and press have demanded so rigoronsly, conld be granted except under certain conditions. These conditions should be so drawn as not to be nunceessarily hurdensome or troublesome to the publio, while snfficient to grard the water both as to quality and quantity. That to the nuinitiated and uneducated there are difficulties in the regulations tbere cannot be a donbt; but then Londoners required education in the use of the constant supply, and that this educa. whion is no hopeless or difficult task the success places has attended the constant service in other will arree to this, thaties. All, at any rate adopted to prevent the waste wbich would otherwiso be inevitable, and from which, sooner or later, tbo public would be sad snfferers, and also the possibility of the contamination of the water, with all tbe horrors of disease in its train. The question in dispate is, are the regulations proposed unnccessarily stringent for the purpose of avoiding the dangers that may arise from these causes? In answering this question, both com-
panies and people must remember that a very false view will be obtained if they regard it point being tbeir own likes and dislikes.

## NEW ARMY PREPARED.FOOD FACTORY,

 MAYENCEAn nndertaking, novel in its features, says the Cologne Gazette, is being rapidly pashed towards completion at Mayence, and which is destined to effect a great change in the existing modo of furnishing subsistence to large armies in the field, facilitating at tho same time rapid move. ments, and producing an entirs change in the present manner of warfare. Our readers are aware that, during the Franco-German war, a portion of the German army was supplied with rations of what was called Erbsuurst ("peasesausare") -a very carefully preparcd and ontritive article of food, on which a greater part of tbe troops almost wholly sabsisted. The prin. ciple of supplying an army in this manner is to be largely extended, and every article of food for mau and beast is, in futnre, to bo gerved ready for immediate use or cooking. A factory for preparing this food, capable of snpplying for preparing this rood, capable of sinpplying rations to an army of 50,000 men is in course o the undertaling was taken by General (now Field Marshal) was taken by General (now Field Marshal) von Manteuffel, and a lively with regard to its practicability If milary circlos with regard to its practicability. If the results are satisfactory, an establishment of this kind i The works are so far advanced
The works are so far advanced that the erection of the iron roof, with its covering of corrogated irou, as well as that of two stories, which are entirely of iron, of balf of the principal building, has been nearly completed. Tho façade (over I,000 ft. long) of the main building is broken hy three pavilion-like jetties, which, jutting ont at the back as centre and side-wings are to serve as loading halls for the sets of rail to be laid along the length of the building, a well as through the balls, by which means the manufactory will be brought into direct communication with the Ludwig Railway. In front of the façade of the main bnitding the so-called Water-tower is in course of crection, a highpressure reservoir for supplying water to the whole of the factory, to contain about 90,000 gallons For obtaining tbis supply, as well as the water for three steam-engines, of 200,150 , and 100 sunk-power respectively, two wells have been bed. The level of the bottom of the Raine fro. The boiler-house and chimney are detached orde the main building. The engines have been stenm from England. Ibe works will contain and washingite, bakehoune plant. The stenm flour-mills will turn out $7,000 \mathrm{cwt}$. of flonr daily and thers is sufficient accommodation in the bakehonso, with its kneading-machines and con tinuous orous, for monfacturing this quantity of flour into bread. The slanghter-house large enonoh to slaughter and deliver read for manufacture into food 170 oven daily or at $1,000 \mathrm{per}$ week to the prepared food depart ment, which, independently of this, will mann facture also prepared vegetables. In addition to providing daily rations for an army of 50,000 men, the works will supply prepared forage men, the works will supply prepared forage
rations for the horses of such an army. Sixteen honge for the offisur
sikmen bare 600 workmen bare been hegun. The opening of
the works is fixed for about the beginning of the ${ }^{\text {K }}$
1875.

NEW CHAMBERS, LINCOLN'S INN, We have already referred to the uew chambers now in course of eroction near the Hall (p. 937 ante). The accompanying view and plan illus trate these, which aro being built by Messer Jackson \& Shaw, from the designs of Sir G. G Scott, R.A. They are of red brick from East Malling, witb Ancaster stoue dressings, and will
cost about 8,000 . Mr. Kabelly is the clerk of works.

The Government and Railway Acci dents.-An important circular has been sent by the Railway Department of the Board of Trade to the chairmen of the various rallway companies, warning them of the necessity of makink better arraggements for the diminution of rail Way accidents, and threatening procednre ${ }^{\text {Parliament for legislative powers should this be }}$ found renuisita.

[^12]"LANGUISHING FOR EMPLOYMENT." Sre,- When the "rising junior,"-slightly, or porhaps more than slightly, bald, and with a powdering of grey among his whiskers,-is in-
troduced in a legal or social sketch, everybody troduced in a legal or social sketch, everybody
confesses that the character has been ontlined of tell cnongh to render him a recognised type in the world of fiction. There is, in the
method of bringing him on the scene, the kind method of bringing him on the scene, the kind
of mixture of $a$, jise and a sentiment, - of something a little pathetic with something a littlo funny, - that is sure to hit the mark,
and in good time to find safficient applanse and in good time to find sufficient applanse

## DEFENCE OF SHAMS.

Sin,--Under this head, in the Builder for September 27 th, I intended to show that the production of shams might not only be conheir a logimate work of the artist, but tha duciv general recognitiou would be highly con eal to the advaucement of the cause whioh iromote. I and notood by the elect, is said to roughe. I did not expect that the views there ori urnarly, would pass unchnlienged; but I am ailerised to find that on several points I have do that explicituess which I supposed to happened merit of my letter. Thus it has "application of the paracruph ohort mako awards," or of the reference to the the vican unr art schools, in "the vacue state leaching in years ago' "i" aud he has sumpoed me abou acprecating the value of hish art-culture to be was, in fact, odvocaling the art-calture when I believed the sphere of its usefuns by which I extended, established, or made universal.
not uso tho word "s whanld explain that I did curiosity," but from a reproach, consure, and ridicula which at present
attach to the wearer, user, or possessor of al articles,- Whether they be of personal attire hmilding materials, or domestic furnitare and decorations,-which can bo brought under the hanc of that designation. The truth is, that shams aro but the product resulting from th friendly alliance of the arts and seiences, and when the invidious distinction betweeu "real" and "imitation" shall have hecome a matter of earious listory, then the bighest art of which we are capable will he equally at the command or all; for then manufacturers will not find it neces sary, in deference to hirro.class patronare, to mark by a debased art the costly from the cheap: nor will the patron of the "sham"" the to securo himself from ridicule by mean subter fuge, Tren, indeed, tho "initation" will have hecome "real,", and the real will in dne coure take its plaee wisb hona made printings, needle-work tapestry, and kindred suhjects, within the glass cases of our musenms. And this hrings mo to the of our masenms what should ho the highest aims of the decora. tive artist, and will enable me to decora bearings of this suhject of shams upon the teachings of our art institutions. Tho question is, whether skould the designer he the slave that awful poteutate "high art," or prime minister to that halting and many mindod monster "pnblic taste"? Whether should bo speak a language intelligible to the million subjudes the former? At the scattered units of he canict at one the same time both he cannot do; and it is to the persistent repudiawho of this simple, self-evident fact, by thos who have from the conduct or ourtional art schools, that I have repeatedly attributed much of the failure the country. To enter npone art industries of tion country. To enter npun a surgical opera. constithe pevious ioquiry as to the smbjeots all patients without reference to individual physique, is tho work of tho reckless chaylatan. and the first duty of an art instructor, whose sphere of operation was to embrace the majority of tho nation, should have been to inform hiraself of the mental, moral, and social condition of those comraitted to his charge.
Colour is not for the hlind, nor is musio for the deaf; yet it were not less wise to paint for the one and sing for the other, thau to expect just appreciation of conventional ornament whon is a is no knowledgo of the nature whence it is derived, or acquaintance with tho artist's discourso who speak an unknown end do they they ever so learned and eloquent, to the vulgar listener it is only incomprehensible jargon, and a little plain.speaking in the mother-tougue wonld be of more avail. If, then, yon would read a lesson in art to tho cottager from the walls of his dwelling, from the covering of his deoc, or from his domestic furniture, you mast decorate then with objects likely to arrest his attention, stimulate his fancy, or excite in his mind somo emotion of pleasure. This has not been done, and should never have heen at rempted, by diapering them with ssverely conchrome farms treated in shadowless mono chrome. thow hir anraho, artistic, and suggestive these utterly foil to impres in of any faing in the hervens one with a sense beneath or in tho wators und the the eart ore for purpose of an lor tharth, and lutely worthless. It was perhaps natnral that men living in opulence should mistake the wants of the indirent masses. Suated in a sumptrously.furnished drawing.room, which open apon a conservatory ablaze in tho, brillint hpen acost plants, it is engy to diconer Horal decoration is an excess in the carper. and gazing in pride upon the costly examules of the paintors art which hag un thes of not less easy to discover that the work of the onperhanger is supererogant. Here, indeed, the loor and the walns are, as has so often bee urged, only a background to superimposed and nrronndig ohjects, whica will gatu in effect hy its neatral suhordination. But in the pool' man home, if the needed colour and ornament are not in the wal.-paper and upon the carpet, they Fill nowhore be found ; for gilt mirrors, hright hanginge, and rich ppholstery do not usually hitemashed ave denied him in his floor coversing wind in his wall-paper have not sprung spontaneously in tho
backyard．The deal table，which you have stripped of its brightly－painted oileloth，be it ever so well scrubbed，is but a poor snbstituts for the rich inlay of your own；and the air of comfort and cheerfulness whieh these things gave to his room have sinee been wanting Ruined castles and birds of Paradise；cathedral spires，moonstruek and benighted lovers；steeple chases and impossible landseapes，may a for highly repreheusible as mural deeorations from
four standpoint，bnt they were all in all of art Four standpoint，bnt they were all in all of art
and of nature to the tens of thousands amongst and of nature to the tens of thousands amongst
whom they obtained；and I ，who have seen whom they obtained；and I，who have seen
something of theso things and noted their effect upon the uninformed miud，do not hesitate to say that the demand which bronght them into existence was infinitely more human than the iutelligence which swept them away．
It was not less of life and nature and colonr that were needed，but representations of a higher type，expanding the horizon of too contractod views，and indieating the existenee of a higher social，moral，and intellectnal society within． The flowers whieh could nowhere elso be known were well and wisely seattered upon the floor． covering，although their presence there did de－ stroy the proper sense of evenness，and their foot；for it is were crnshed under the theng our path，and under our feet，that Nature has most profusely strewn them；and the plants whieh living trail and climb in tangled profusion in obedience to the law of their growth，or the gniding hand of man，were not inaptly pictured uponts，crude representations as they mostls were，of quadrupedal nature had a vey in the cultivation of the infant mind and budding affections，whieh I dare to say may he wanting in the abortive samples of Classic art which have displaced them．I am no longer a child to he pleased with toys，hut I remember enough of
my childhood to understand their necessity，and I Enow that the wall．papers and the carpets and the mantel ornaments were of old the picture books and the playground and the pets，where now are ouly blank walls and filthy gutters to amuse and to instruet．I do not know that tho rising generations have shown a more presoeious reverence for Nature＇s works since the promulga－ tion of the edict against pictorial wall－papers and Horal carpets；a more gentle and considerate treatment of the brute creation，since their earthen effigies have boen banished from the domestic hearth．I do not know that in more advanced years they have shown a higher appre－ ciation of the beauties of art，or a greater pride in their homes；and I havo yet to discover that the higher attributes of soeial and moral life have been generally quickened into more healthy aotion by the purifying ordeal through which the domestic art has been put
My own observations，I regret to say，incline me to believe otherwise．Nor am I surprised； for there is even in the minds of the most igno． rant a sense of the＂everlasting fitness of tbings，＇and it is not unreasonable to helieve that carelessness as to personal attire，leadiag duties，－may have been induced by the di－ duties，may have been induced by the di－ ＂A Speetator＂s＂second＂diticulty＂is in the way of being solved，and the relation of dress to art demonstrated．

That＂dress does not make the man＂is only partly true，beeause the wearer of good clothes does reecive，and is mostly entitled to reeeive， marks of eonsideration，which encourage self－ respeet，and stimulate love of approbation，
qualities of mind which ean only be fod by qualities of mind which ean only be fed by active well－doing．The sloven，on the other hand，be he worthy or disreputable in himself， is in his contaet with the better clothed snbjeet to saspieion not always unjust，and liable to insnlt which he dare not resent；and in his desire to escape hamiliation，the ehances are that he will descend to debasing associates，and in the end avenge himself upon society for imaginary wrongs by swelling that stream of raftianism which is a carse in onr conntry．This is，howerer，rather the moral than the asthetic aspect of the question；and my letter has already so far exceeded roasonahlo limits，that I must defer for the present the further dis． cassion of the subjeet．C．Henry Whitaker．

ArchitecturaI Union Company．－The six最别 annual general meeting of this company will be held on Deeember 3rd，at the House in Conduit－street．

## MOTTOES ON MASONRY

Sir，－II havo made inquiries coneerniog the house in West Eud－lane，Hampstead，bearing the inseription，＂Furth fortune and fill the fetters，＂and learn that it is in the oecupation of
Sir Charles Murray．Xour correspondent is Sir Charles Murray，Your corre
therefore correet in his conjectare．

## therefore correet in his conjectare．

In turning over the pages of Crabb Robinson＇s Diary I pereeive incidental mention of three Continental inscriptions．In vol．i．，p．101，he writes：－
＂On my way hack to Pirna（from Prague），I was amasea
wall．
hone is is honse is in the hand of God．In the year 1793 was the wall rased；and if God will turn rat heart to it，and my
father．in law will adrance the needful，I will cover it with tiles．＂
And again，at p．118，he writes of the Fichtelcge birge，or Fir Monntains，the birthplace of Jean Panl Richter：－Here are some very curious roeks， well known and celebrated by travellers in search of the picturesque．Houses of entertain． ment have been orectod，and are adorned vith ment have been orectod，and are adorned wins On a lofty rock，under whieh there is a rich spring，there are two hexameters，which I thus translated：－
Here，from thr rook＇s deep
fount nours her trensure
Leara， 0 man，so to give
Leara，o man，so to give，and so to conceal，too，the
The third is sloorter．It relates to the great anthor of＂The Sorrows of Werther＂
＂Goethe lived in a large and handsome house－that i
for Weimar．Before the door of his study was masked i mosaic，saLVE．＂
The Rer．Robert Collyer，writing from Ameriea，of Yorkshire，mentions a motto which cenrs on a boam in an old honse by Bolton Bridge，close to Rapert Field，wrich was onee a bridge chapel：

## Thou that wendest on this way， One Aye Muria thou shalt bay：

I trust these additional examples will interes four readers． $\qquad$
BREAD BAKLNG AND HOUSE heating The following novel idea has just been pro posed in Edinburgh，viz．：－An arrangement o jacketed orens，constructed of boiler plate－iron so that the surronnding water would retain and distribate the surplus heat from the bread ovens by such heated water，circulating in pipes laid on as required to warm puvic or private build． ings from the jaeketed iron ovens．＂Be ye varmed and filled，＂is iudeed a counforting Scripture text，that may yet he praeticaly mount of the bakers is utilised，instead of being dis－ sipated in drying the street pavements：no doubt a very good thing in wet weather as far as it goes ；but why should not this waste heat be tarned to better aeconnt when fuel is 80 dear？A plan of atilising sueh heat in the asement of larger buildings may be seen ut indeed it is dificult to satisfy two dogs wit one bone．

SIMPLE AND ECONOMICAL MODE OF PROJECTING FIRE．GRATES INTO ROOMS
Siseng that the cost and trouble attending the removal and replaeing a chamber．grate is considerable，I have this winter adopted a very simple mode of projecting a grale fire．basket nto the room，so as to obtain the desired warmth from one－third the quantity of fuel formerly consumed in the ordinary Kennard grate．What good dranght into the vent，I find that by thus projccting the open basket．grate so as to reqnire a smaller fire，the
Nine－tenths of these Kennard grates having a good dranght，carry away with the smoke mneh heat that must be replaced in the room hy cold ir rushing in．
My simple modifieation of the existing grate in many apartments might be adopted at little cost，even less than 5 s ．With a good yoing vent an ordinary fire basket，with hooks riveted behind， so that it will hang like a trivet on the front bars of a grate，gives a rude jdea of what may he done．With an ash－pan below the fire－basket， it forms at once a very cheap and suitable pro． jeeting grate for parlour or hedrooms，safe and eleanly．I do not see why we should continue with good．going vents，wasting the warmth and glowing eharms of dear coal by hurying it while
burning in our chamber walis，seeing that a bright blazing firo，even in a fice－basket，is the grandest decoration that a room can have at this season．My economical projeet may be made the most of by plaoing a sheet of brigh fre－baskot，so as to reflect the cheerful glow of fre－basket，so as to reflect the cheerful glow of
the projecting fire，still more into the room， while the gaping cavity in the disused grate is decently filled up by sueh a sheet of tin us can be burnished up every morning．

Jabes Kerr．

## ＂MADDENING DRINK．＂

Our last paragraph on this snbjeot（on 25th ult．）has called forth the strong remonstranee of a correspondent，under the pseudonym of ＂Beer．＂He states that he has＂had much ox－ perience as a brewer，being one of the largest in adnalteration＂＂deelares that＂thero is nothe of adnalteration，＂deelares that＂there is nothing to justify the gross aceusations made against the trade；＂and thinks＂it is a scandalons thing for any one to make them withont having first taken sufficient measures to ascertain their truth or otherwise．＂
One would think＂a brewer＂ought to be glad to know that drink，in which he deals，and which is declared，by many judges－if not in－ deed by magistrates in general，一to be＂the cause of nine．tenths of all the crimes that fill their prisons：＂and is declared by the expe－ fienced superintendent of Colney Hatch，－the distingnished chief asylam of the demented and the mad，－to be the main cause which fills such houses as his ；is not so on account of the legitimate alcoholic and intoxicant principle which it contains，hut of toxieant or poisonons principles，which simulate the intoxicating effects of pure or unadnlterated drink upon the brain，and produce those deleterious effects npon it which orerturn and destroy its legitimato functions altorether，and conrert men into devils，and drinling houses into hells Whether the（or listler）be to blams． Whether the brewer（or uistiler）be to blame， or the publehose（ores， dous focther by con in the tremen－ dous fact that m． fils the prisons and madhouses are due to drink． Let the hrower consolo 1 that it is not the drink as it passes through his hauds that is blameable（if sueb be the case）；－ and we blamed＂preparers＂of the drink；dia－
tinetly and purposely avoiding the attribation tinetly and purposely avoiding the attribntion
of any special blame to brewers，or distillers of any special blame to brewers，or distillers
either，although there are different opinions on either，although
these points too．
We lave not spaee to enter farther into a sub－ ject sueh as this in the Builder，but we cannot close theso few remarks without callints＂Beer＇s＂ at teation to the following condensed extraet from a recent issue of the Fremans Jorrnal，in ordet to show，not so much the probability that drink is adulterated as that at last the adulterants are beginning to be used＂neat，＂without even the drink to moderate their toxicant eflect！－
＂For some time past the Duhlin police hare been marh
nuzzied to account for the number of persons affectel puith temporary lunacy whom they hare had of late to arrest in the streets，or for the numerous acts of ahsolute madness comraitted by persons who were asid to he onty
uikder the infuence of driuk．Almost every night in the police．stations raging maniacs were to be found．Many

 it has bean aseertained that in several places in the city a
terrible cheraieal combination is sold at a low price．This fiquid compound has the effect of produeing the moat farfud and rapid brain excitement，and we understand that it has beer introduced here from America．It has the effect of not only making those who drint it demented，
hnt also of producing temporary paralysis of the limbs and frequently utter ancousciousness．It is high time for the anthorities to look after this now and terrible traffic，
already so disastrously attended with the mositemen already so disast
consequences．＂

We may add that lunacy is on the increase in London no less than in Dublin；and that notwith－ standing what＂Beer＂says about the Excise rendering adulteration impossible，a retired brewer and Poor－law gaardian at Liverpool while speaking of the filling of the Poor－law lunatic asylnms of Laneashire with mad drunkards，expressed his deeided conviction that drink was adultcrated in certain cases by brewers；and Messrs．Brett \＆Co．，dis－ tillers，admit the existonee of those besot－ ting essontial oils of which the saperia． tendent of Colney Hatch speake，in much drink as it is distilled，and hefore it reaches the notorious pnblic．honse adnlterators or＂drink doctors＂at all．

## SANITARY MATTERS.

The Sewage Question at Leeds.-For the past two years tho corporation of Leeds has heon experimenting on the sewago of the town on a
rather large scale, Works have heen erected at rather large scale. Works have heen erected at
Knostrop, on the left bank of tbe River Aire, Knostrop, on the left bank of tbe River Aire,
about a mile and a half below Leeds Bridge, at abont a mile and a half below Lceds Bridge, at
which tho " A B C" Company have bean cerry. which tho "A B C" Company have beon carry. ing on operations. The corporation are erecting muoh largor works on the samo principle a little nearor the town. In the meantime, the existing experimental works, calculated to doal on the A B C system with ahout one.sixth of the entire sowage of the town, have been placed at tbe
dispoaal of other oxperimenters on the ureatment of sowage. During the last month Gencral Soott has heon conduoting a series of experiraenta, and the Sanitary Committee of the Town Council have been visiting the works for tbe purpose of witnessing some experimenta made patented. The sewage is mized with lime, sulphate of soda, and several other ingredients not specified, and thorougbly churned up by an "agitator." The action of the chemicals on the sewage is said to he to produce rapid and comple to precipitation of all solid, colouring, and noxions matters, so that by the time the water flows out none but a practised eye could detect any discolouration. Nor is thicre any perecptible amell or taste left beyond a faint suspicion of brackMr. Fulda only commenced operations on the previous day, produced a favourable impression previous day, protuced a tavourable impression
on those who witnessed tho experiments. The great advantages of this process are stated to be its cbeapness and tho facilities whioh it affords for adoption on a small scale as well as the largest, the appliances requirod heing of tho
simplest description. Tbe inventor afirms that simplest description. tree inventor alsirms that heean nndertase to treat the town sewage of Leeds at 17.s., and the sewage as treated con-

Guiseley, and Idte, and at Bramley Uuion Workhouse.
Evesham : Disgracejul Sanitary Conditions.-At a recent meeting of the Rural Sanitary Anthority of the Tnion, the medical officer of health, Mr. G. H. Fosbroke, handed in reports rolative to tho sanitary condition of two of the villages in the rural sanitary district. The reporta revealed a doplorahlo state of things at Broadway and Childswiokham. At the latter place there was no regular aystem of drainage, and what few drains there were, including one from the churchyard, emptied thomselves into a hrook ruuning through the village. The privies were, with one or two exceptions, in a disgracefni state. The water-supply was shown to be very had. In some casee it was derived from wells, but frequently from the stream running through the village, and often takon from it only a few yards below the point where various kinds of seswage enter, in addition to that brought down from the villages above. Typhoid fever and diarzhea were very frequently in the village, and at tho date of the medical officer's visit (November 12th, 1873), the report stated that one patient was just convalescent, and one just dead, from the former disease, Boh cases highly contaminated with sewage, and near the door of the cottage was a filthy midden, which was being clonnsed. Nost of the hahitations were labourers' cottages, and were in a mos propped up by poles, and altogether unfit for propped up by poles, and altogether unfit for should bo at onco taken, with a view to the immediato adoption of remedial measures. The salaties of the temporaxy inspectors of nuisances (lessrs. Wadams and Smith), were raised, the The salary of the clerk (Mr. J. Wadams), for The salary of the clerk (Mr. J. Wadams), for
oxtra work in rellatiou to the sanitary business of the Union, was raised $35 l$. per annum.
Outbreaki of Fever at Thombury.-The inba bitauts of the little village of Thornbury, abou five miles north of Bromyard, with a popalation of only about 2.45 , have beeu thrown into painful excitament in consequence of the outhroak of an epidemic of searlet fever. Already soven lives
have been sacrificed, and many porsons are at have been sacrificed, and many porsons are at
present lying ill with it. The Sanitary Authority for Bromyard (the distict to which tho village
is attached) is endeavouring to stay the progress of the fever. Dr. Sandford, the medical office of hoalth, was summoned to tbo village to make a sanitary report, and, if possible, to ascertain
the cause of the outbreak. From a rigid inquiry he had ascortained that tbo infection had heer imported into a public school by one of the cbilaren coming from a distance, whoso relation had been suffering from the fever. Dr. Sazdfor minutely inspected the premises and water of the achool, together with tho drainage. The well is only 12 ft. from the sowage tank, which was found to be full, and the well being situated below the lesel of the tank, if leakage took phace gravitation wonld inevitably contaminate and found Dr. Sandford examined tbe water tainted with it bad recently become alig in any way athribute the outhreak of fever to this canse. The school has been ordered to be closed until further orders. Wherever there has heen a large accumulation of dirty linen, orders bave been given for it to be burnt, the Sanitary Antbority freely acquicscing in this precaution, aud compe
sustained.

SCHOOL BOARD SCHOOLS
Kondon.-Mr. O. Reed, M.P., brought up the following report from the Works Committce which was reccived, vi
" 10 th Norember, 1873.
(a) Optatige of Pithunent Echool.

1and 2. The committoe have to report that the bors' and girlst departments of tha Nonnow.r.rad, Bermondsey,
Sollool will bo ready for oponing on the 2atl instaut. 3. Theormmittee have tin
of a shool to accommodate 571 bhildren on the site Fanz hall-street, Lambeth, tho amounts of which are a

Brixt on, S.W. amounting to $5.185 l$.
4. On the
4. On the 29 th Oetober thast. the Board agreed to tho
 drea from the present schiool in Clupel-road, Lower Norwood, the lease of which will orpire st Christras next,
could be trasaferred. As it will he impossill to complets
 children heing dispersed, some temporary nooviserent the be made for this ir acoom, omodutioup in the preantime. They nceormorodate 320 chilid tren be hoorected on on a portion of the bito the school to ho in threo departmonts, which can bo
detached if neeessary, or crected sido detached if necessary, or crected sido by sido in order to
form a singlo blook. Tenders hnvo been ohtained from
 ereotion of
Boys', School and Clas3-room to acconmodato 120

The committee recommend that these tendere be ace
At the final meeting of the Board, on the recommendation of tbe works committee, it was rosolyed tbat the tender of Mr. J. D. Hobson, of 7, Dnke-street, Adelphi, W.C., amounting to accommodation for 1,75 chir sohool to provide Sbarp-street, Kincrland-roxd, be accopted; that the tender of Mr. G. Stephenson, of Beaufort treet Chelsea, S.W., amounting to 63011 , for the orection of a school to provide accommodation for 775 children, on tho site in Albany-row,
 S. J. Jerrard, of Homesdale, Lewisbam, S.E., amountiug to $6,317 \mathrm{l}$, for the erection of 2 school to provide accommodation for S14 children, on the site in Burrage-road, Plumstead, be accepted; that the tender of Mr. J. D. Hobson, of 7, Dakestreet, Adelphi, W.C., amounting to 5,5892., for the erection of a school to provide acoommodaDeplfor Deptford, he accepted; toat the amended tender of Mr. J. High, amounting to $8,775 \mathrm{l}$., for the rect:on of a school to provide accommodation St. Giles's, be accepted.

Nouthampton. - The foundation.stones of the Vernon.terrace and Spring-lare Schools have been laid. It was found that the central parts
of the town were amply provided for, and that the schools to be built by the Board were re quired in tho extremities of the town, par-
ticularly in the east and west. To meet the ticularly in the east and west. To meet the deficiency, four schools will have to he built, but the Board determiued to erect two first, the Lducational Department approving that course of action, and aso the two astes for thoir erec-lion,-Vernon-terrace and Spring-lane. The plans selected for the sctiools were those of Iessrs. Bland \& Cossins, Birmingham, for the Fernon-terrace Schools, and those of Mr. Walker, London, for the Spring-ane Schools; the conractors being Mr. John Watkiu, 3,417l., for the ormer, and $\operatorname{Ir}$. Redgrave, $4,2 s s c$., for tbe latter. The style of both schools is Gotbic in treatmont. bo Vernon-street Schools, according to the design, are built in red hrick, with Bath stone ressings. The elevation towards lernon-stree a a gable, filled in with a five-light transomed indow. Tbo infant-school is 52 ft . by $21 . \mathrm{ft}$., 14 ft class-room, $2 \pm \mathrm{ft}$. by 19 ft ; and lavatory 4 ft . by 14 ft . The girls' sohool is $48 \mathrm{ft}$. . by 20 ft ., with two class-rooms, one 20 ft . hy 17 ft . and the other 20 ft . by 14 ft ., and lavatory 20 ft . by 12 ft ; the boys' scbool is 48 ft . hy $20 \mathrm{ft}^{2}$. avatory 20 ft . by 12 ft . Tho girls' entrance is on the right, and the infants' entrance on the eft, of the front in Vernonstreet, and the hoys ${ }^{3}$ entrance at tbe side in Elizaheth-street. Eao school has a separate playground. In the in terior thoy are partizlly open to tho roof, which s covered with match hoarding, stained and varnisbed. The whole of the walls are boarded ft. high, tbe boarding being finished with an ornamental railing. There is a donhle-ligh ransomed window on each side of the room be exterior roofs are of red Broseley tiles, and turrets. The site for tho Spring-lane Schools is considerably larger than that for the Vernon treet Schools, toe achools being also aomewba larger. They are built with red pressed bricks, with back brick stringa, and Bath stone dress ings. The infant-school is 60 ft . by 30 ft ., with large class.room, cloak.room, lavatories, 8 cc .
the hoys' school is 60 ft . by 29 ft., with two large class.rooms ; and tho girls' scbool is of the same size and also ba buple of larre class-rooms Tho infant-scbool forms the centre of the block and the boys' and girls' schools tbe side winge The building is so arranged tbat the whole of tbo school-are entered under covered porches. In tbe rear of the infants school is a playground 100 ft . square. The hoys' and girls' playground is to the front of the building, and is about 130 ft . by 60 ft . Tbe front boundary wall comes np to Spring-lane, and is a dwarf enclosure wall, surmounted with ornamental iron rainggs. The whole of the site is enclosed hy houndary walls, tho total area heing about 250 ft. by 150 ft , The playgrounds are asp balted. The schooks in hoarded, stained, and varnished, and the side next tbo slates covered with felting. Ample provision is made for ventilation. Should it he required there is space for the erection of master's honse
The Board Schools, Powell's.place, Newport L form. The larme school room is planned in by 21 ft ., and 20 ft . high, with a large and small gallery. A smaller achool-room is 26 ft . by 16 ft ., and 18 ft . hirgh, for the amaller children tbis room has one large gallery, An inclined which there are tro, the one an open pravelled playground, baving an area of ahout 150 squaro yards, tbe other a covered and paved play. ground of about 140 square yards, beneath the large school, toom. Architecturally the buildings are of Domestic Gothic character, in red brickyork, with Bath stone dressings, blue brick plintbs, and with slated roof. The interior walls of the schools aro lined with Bodmer's patent hrioks, and the ceilings are Bodmer's patea hrins, and the ceilings are opent timbere, stained and varnished, framed With light iron tie-rods and shoes, and the
floors are of ploughed and tongued red deal boarding of very gubstantial congtraction. The warming and ventilation have been spocially considered, the former being effected with radiating open fireplaces, wued with tiles, aud further provided with hollow chambers, and ventilators through wbich a continuous sapply of warm fresh air passes into the school-room.
Provision is uade for ventilation by means of air-flues carried up alonggide each smoke-fluo, and by a line of perforated zinc ventilators through the whole length of the ceilings into
the roof space, and thence into the open air hy lourre openings at the roof apex. Care has been taken that as far as possible the Whole of the galleries should be side lighted. The aocommodation is for 216 children, thus distributed :-in the principal school-room, large gallery, 84 children ; small ditto, 19 ; desks, \&e., $24 ;$ small school-room, 60. The cost of the
bnildings has been about 1,500i. The architects bnildings has been about 1,500l. The architects
are Messrs. Lawrenco \& Goodman, The builder, Mr, David Miles.

## ART CRITICISM

Sir, -Supplementing your able article of last week, will you allow me to say a word or two? There can be no doubt that the tone of a person's criticism is much affected by outward circumstances, such as state of health and nerves, manner and time of inspection, motive for ob. truding it, \&o. Merely to take delight in saying sharp and smart things at the earliest opportwaity, is a sure evidence of weakness; to pronounce judgment, or to rush into print for the sake of $j t$, or with naripe and biased views is to inflict injury, and we have for too many volun. teers for this responsible office to pass them over quietly. We cannot igncre the fact that there is certain power in illoatured ignorance, the only antidotes to which aro vigorons denunciation, and an appeal to more mature minds who have he power to ronder it harmless. It does not do at all times to treat it with silent contempt, and to refrain from a just iudignation from would remind some recent critics in other pages that the first and best sign of true power is a largo and hon - hearted magnapower is a large and hon - hearted magnathings beyond thom. That the duties of a critic are not to be entered the dufses of a che hasty summons of auy one, and that critihe hasty summons of ally one, and that critiwritten and flippantly worded. It is just that one product of the man that cannot be bought at so inach a line or column ; and yet the public are almost foroed to swallow these doses,-accompanied as they are by bettor things. No sonred or disappointed man scems too far gone to make a critic. Though all the good, genial sap should be out of him, he will yet do to bear the strain of this high duty. Surely there is something wrong here that demands our attention. The public,-good, easy folks,-are not always able to detect the counterfeit and recognise the trne coin : hence arises the mischief done by "cheap and nasty" criticism,-and the reason for my troubling you with these reunarks, the summary of which is to beware of false and foolish orities who enter apon the almost sacred duty with a jaunty superficiality that has some show and glitter of cleverness, hut is really worthless, and beneath the notice of all sensible meu. Such productions are in reality noisome weeds that threaten to choke the true grain, and should be rooted up periodioally; for, if unchecked, they will surely do immeasurable injury. Veritas Vincir,

## CHUROH BUILDING IN EXGLAND.

At the laying of the memorial stono of a tower for the church of St. Botolph, Knottingley, by Lord Houghton, Mr. Childers, M.P, spoke of the difficulty of ascertaining statistically the namber of churches built and rostored every year in England; bat said that he had succeeded so far, and that he thought he had found in the rongh how mnok had heen done by the Church of England in chnroh-building and in church. improving during the last few years, and be would give a rough estimate of the amount spent in these great works. During the present century he found that no less than 4,100 new churches had been hnilt, and it was with pleasure he ohserved how very steady, and sometimes how wonderfully rapid, church huilding had been increasing. They would perhaps be sur prised to hear that, at the beginning of the century, although the population was rapidy increasing, and the wearth of the was rapidly creasing in a similar ratio, the number of churches anonally hailt and rehuilt in this country-not only new chnrches, hut churches built in lieu of old ones which had falleu down or were no longer nseful,-was ouly about throe a year. Thirty years afterwards it was forty in a year, Nhirty years afterwards it was forty a
year, Now it was about I20 a year. It struck year, Now it was about 120 a year. It struck able rate of progress. When he came to inquire
what had been spent upon those charches, he could not get any information as to years lon goue by ; but he found that, at the prosent ime, on an average a new church cost, all over the country, in all dioceses and in all parts something under 5,0002. So that the people of Englaud, he did not say Church peoplo only, for that meeting was a good illustration of the fact that those who did not profess to he Church people joined heartily in such work-the people of England had subsoribed something like 600,000 l. a year for the building of new churohes and as far as be could estimate it from tho information of societies, and from comparing their accounts, they spent $700,000 \%$ or $800,000 \mathrm{l}$. a year more on enlarging oxistivg churches. If they added to those amounts the large sums spent in of existing churches, they might take it in round numbers that there was something like two mil lions of money expended. That was a mer atisfactory result. If it conld was a very during the result. If is conla be said that millions arerling tad fabrics sting haw beon spent on churol abrics, he thought the Charch of England had good right to say that she had, with grea We pus, porth excrions in that direction. building and restoration throughout England which are the most complete to be yet got, will show that more than 120 new ohurches a yea are now built, $\qquad$
THE WEST HAM AND STRATFORD PARE THe inhabitarts of West Ham, Stratford, and the neighbourhood, having procured subserip. tions for more than half the amount necessary for the purchase of Ham Park, have snoceeded in inducing the corporation to subscribe a substantial sum in aid of the purchese, which is to bo contributed out of the Motage on Grain Fund the corporatiou to have a share in the manage ment of the park when fully completed for recreation purposes. The desirability of securing this park for the free uso of the public is proved by the fact that it was shown hefore a committe of the House of Commons last year, that th East-end of London was peouliarly destitute of open spaces when compared with other parts of the metropolis, and it is felt that as building increase it will become more difficult to obtain these opon spaces for the now population. I appears that the district in which this park is of the English counties, 17,000 children in the neighbourhood.

## THE GOVERNMENT AND ART

AT the opening of the City and Spitalfelds School of Art, in the new schoolroom, Princess. treet, Bishonsgate
Mr. Henry Cole was led, by his strong convictions as to the fate of the Kensington Luseam, if handed over to the management o the trustees of the British Mnseum, into a little warm abuse of the late Chancellor of the Exche quer, Mr. Lowe
Mr. Goschen, after dofending his colleague, said, -He himself did not helong to the elect in matters of art; he was not an art critic, hut h had, in common with all in that room, the conscionsness that art and scicuee have ennobling influences, which even those who do not profess to understand art are able to recognise and ex. perience in themsel ves. The cause of art conld not be confined to the ferv; it was the cause of the public at large, All must remember the time when we as a nation were accused of being lamentably deficient in that taste in that art Which was the characteristio of somo of our foreign neighbonrs. We were famous for our manufactures and for the solidity and fuish of our works, and be trnsted it was not true that We were falling off in these respects. No doubt there was much to be learned by this country as regarded heanty of design, as regarded taste and it was infinitely to the credit of those who ycars in this directioen working for twenty gress had been made in the such marked promost nearly home to the country at large There wore people who asked what was the nse of this; as if they wished for nothing moro than ponnds, shillings, and pence. There were resnalts in pounds, shillings, and pence, there were higher results than these,-resulta Which were fitting the people for a higher social
life, Man had to lire socially as well as mate
rinlly, and it was important that the inner life shonld be heautified, ennobled, and improved, as well as that food simply should be supplied; inner life to those ennobling influences on the hat art edut they mnst look for the success of anxious on behalf of education acnerally rejoiced to see in operation at the present day.

PROPOSED NEF APPROACE TO THE pictoria eybankment,
The works committee of the Metropolitan Board of Works at their last meeting reported that they were proceeding on the resolntion of the Board on the IIth of July last, referring it them to consider as to the steps to be taken for carrying ont the Charing-cross and Victoria Embankment Approach Act. In conncxion with no rcierence the committee had had under consideration the question of the formation of he approach from Craven-stroet to the Embank. ment. The commitcoo received from the engineer and superintending architect a report upon his subject, which they submitted for the infor. aation of the Board, together with a plan. The eport contained three proposals for tho forma tou of the proposed approach, viz :-1. To Wer the street so as to form one gradient from Craven-court to the junction of the proposed oad through Northumherland Honse, at a cost of $4,500 l$, in addition to the cost of the exten. ion to the Embankment rondway, 750l. 2. To ower the surface to mamiain a level for nearly the entire length of the street as far as No. 26, at a cost of 250l. in addition to the 750l. above ruentioned; and 3. To preserve the present level of the street ap to No. 26 , the estimated cost of his proposal being 70. in addition to the 750 . iready alluded to. The committee found that if the schome No. 3 be adopted, a gradient of I in 25 can ho obtained to the junction with the sew street, and that no vaults would he de. troyed. The total cost of the work, inclading he extension to the Embankment roadway, is stimated at 820l., and the amount of compensation included in tho Parliamentary estimate. Tho committee, after duly considering the three
 the report was agreed to.

## CONSTANTINOPLE.

The handsome kiosk which is heing con. structed ncar Maslak as a snburhan villa for the Sultan's nepbew, Prince Abdul Hamid Effendi, younger brother of Prince Murad, is now nearly completed. The designs are by the Spanish architect Ceiestino de Ortega, and the rotal cost will be about £T. 45,000. The Levant ferate says a large brewery recentiy built on the Chiehli road, at the further end of the suburb of Pancaldi, has been totally destroyed by fire, a portion of the outer walls only now remaining. The brewery, wo are informed, thongh conducted by Gcrmans, belonged to an Armenian, and had not heen insured.
It is a matter of notoriety that a number of English skilled artificers and engineers have recently heen dismissed with very scant cere. mony from the Imperial Arseual, where they have contributed largely for many years past the improvement of Tarkish armaments Eaglish superintendonts also, picked men from Wool wich of the highest training whose services Fere indispensable, havo, on the expiration of their contracts, been treated in a similarly incon. siderate and uuceremonious manncr, and, so to speak, dismissed at a moment's notice,

## THE FALL OF A CHIMLNEY AT NORTHFLERT.

Sir, - I write to correct two mistakes of fact in the letter on this subject in last week's Builder. Your correspondent "B." spoaks of the rate of progress of the chimney as being $\$ \mathrm{ft}$, per working day, or 35 ft . per week. It vas, in reality, nuder Is ft, per week, or about 2 ft .6 in. por working day. Mr. Parker mis. quotes my evidence as to the supposed "swag. ging " of the cap. It contained no reference to he reshness of the work, but related purely to question of weight and connter-weight. Your report of the inquest, pnbliabed October 25th, atates both these matters correctly.
I can hardly agree with tho opinion that hrickwork, corbelled out with an overaail of less than $\frac{1}{2}$ in. to a course, so as at last to orerhang,
n the averagc, about $18 \mathrm{in.}$, " is , to a great xtent, deprendent on the cementing material, nd, without it, might fall away bodily. orbelling, we all know, is constantly nsed to arry very great weights, - for exnmple, the que faces of octagonal lantorna, brought s sufliciently gradual, it is a rare thing to hear 8 sufliciently gradu
any failure in it.
The advantage or disadvantage of cement ond-courses in brickwork is a subject which nust interest every one conmected with building.
ts application extends far heyond the region of ahimuey construction, and I hope it may be aken up and thoroughly discussed

Jabes Cubitt.

PROPOSED NEW INFIRMAIRY IN LAMBETSI,
A. proposat is before the Lambotl2 guardians o erect a new infirmary. Somio of the nembers are in favour of convorting infer ory,
workhonse in Prince's-load into an infirmary, fork that the inmates have been transferred to bo largo new workhouse in Kemington-lane, which has cost upwards of 80,0002 .; but Mr. Caylor, amongst othors, is of opiviou that it is
nore desirahle to sell tho old workhouse, the ralue of which is estimatod at 25,0001 ., and puild an entirely new julirmary with the proseeds. Witi a view of carryiug out this object,
Ir. Taylor has had plans prepared of the oroposed new buildiug; and at the mceting of the guardiaus last week he brought forward his proposal, stating that if the old workhonse were altered for an infirmary, the cost would be away altogether with the old workhonse, and to let the site at an annual ground-rental of about 700l. or b00l. a yoar, which it was worth, or to 301l it absolutely. In oithor case, ample funds whle to the roguirements of the parish. He estimated the cost of the proposed new building, zocording to lis plans, at $18,000 \mathrm{l}$, and the
fixtures at 2,0007 . IIs explained the ponoral axtures at a, out. which, ho proposed, slould be in blocks, so that each soparate block might be appropriated to special diseases. His proposil was twat the next to the present workhouse. His calculation was that the average cost for the new iufirmary would ho ahout 30l. a bod, wheroas tho cost of tho present workbouse was about 90l. a bed. Mr. Taylor, baviug given aut oatline of his should he adjournod, in order to enalle members to consider the subject ; and it was accordingly decided to tako it into further considcration at the uext meoting.

## THE LOST TOIVER OF SIXHLLS.

The controversy about the Sixhills bells and tower, which has long disturbed the diocese of Lincoin, is, happry, on the point of being termi-
nated. So says the English Ohurchman. Mr. Wilkinson achierod his purposo in demanding tho reparation of the tower and tho replacing of the bells. The terms of the arrangement effected are sinply these :-A friend of Mr. Heneage, stat tion of the tower, and the replacement of the three bells in the restored belfry. Mr. Wikinson ceascs to he ricar of Sixhills, and returns to the suhscribers to tho Restoration Fund the amornt of their individual donation.

THE ARCHITECT IN FUTURE,
On the occasion of opening Ditchingbams works, a luncheon was provided by the rector. The alchiteet, Mr. A. Frere, on being called upon, made some remaths upon Church Restoratiou, and reviewed tbo adyanees which have bcon progressing in this dircetion during tbo
last thirty years, pointing out that, howerer conseientious thoso cfforts have been, they will be far outstripped in future gencrationg. Giving all crodit for the energetio work of those who have done so much to revive public taste in this matwor, he nrged that the works done bas becn archxological, ratber than architectural; that
something more was demanded of the architect of to-day than merely modelling aud copying of to-day than merely modeling aud copying
now sook to produce living arobitecture, barmonising with all adjacent works, but in roality growing out of the special requirements of each caso presented to his notice; not striving after novolty for mere novelty's sale, but specially bearing in mind utility and fitness, he must crolvo crolvo charme out of new combinations of well-
known beautiful forms. He maintained that whilst tbose to whom is due the credit of having whilst those to whom is due che credit or having make caroful copios of old work; yet that, owing make cardiul copios of old work; yet that, owing
to the diflerence in the spirit of the workmon, to the dilerence an the spirit of the woikmon, of machinery and new matorials, it was and is really impossible to produce a true fac-simile of such work; that at the best we can only execute models of architecture, and can never, as wo ought, in accoraance with the sprit of tbe art
in its best times, produce living architecture by these means. Pointing out that progress iu any art to he good must bo slow, and acknowledging the immense valne of all the archoological re-
search made during the last thirty years, he search made during the last thirty years, he
said it becauze evident that, unless the architects of some future generation were to rush rapidly forward, discarding all previons eflorts in liy forward, discarding all previous eilorts own time, they must be content again to mare new models of must be content again to wake pared for tbem; but that as this doduction preunlikely to ; but that as this doduction was portant step true, wo may believe that an imthe time has arrived when architocts may hope to make the next step in advance.

## A NEW GYainasium at dulivich

 college.Tue Governors of Dulwich College have rocently decided to erect a new gsmnasium and fives-court in connexion with tbe college, at an outlay of $3,500 \mathrm{l}$, and we anderstand that the plans have beon preparod in antioipation of the immediate commoneomont of tho building. This determination on the part of the governors has given rise to an opposition to the proposal on the part of the St. Luke's Vestry, who held a special meoting on the suhject last week, when the proposal was condemued as illegal and unjust, on the ground that as the governors of the college offered the parisles on the nortb side of the Thames 10,000l. only, for their interest in the olarity, tbey ought not to spend 3,500l. in the eroction of a gymuasium for tho benefit of Sonth London. A resolution was passcd protesting against the proposod expenditure for the erection of a gymnasium at the college out of the joint north of the Thames had been provided with equal educational adrantages to those possossod by the southern parishes. The clork advised the vestry that if the resolution was disregarded, and the building be proceeded with, they should communicate with tbo Charity Commissionors and the Endowed School Commissioners.

## THE TRADES MOVEMENT.

Sheffiedd.-A strike has occurred on the part of the masons employod by Desers. Chamhers \& Son, the contractors for tho Gas Company's new offices at Sheffield. The dispute arose in consequence of the employers desiring the men to work a longer time each day than the rulos of the society permit. MLe whole of Messrs. employor meeting oy two otber firms came out. A however, was beld, at Builders Associativa, that the masons should work from a quarter-past seven to fivo o'elock during the winter months; and the men consented to return to their placos. Birkenhead.-While the masons of Sheffeld bave been striking because they were required o work longcr than a winter-day, a joiner at Birkenbead bas been taking his cmployer to the hims to a wister-day's work, The magistrate said he had not made out his claim, and disuissed the case. He wantod to be paid for loitering about while it was too darls to work, Barrow. - Upwards of 100 carpenters em ployed at the Barrow shipbnilding works emstruck work. Tbe alleged cause of their grievance is that a numher of non-society men omployed at the same works bare accopted piecework at a loss price than has hitherto boon paia
Grangemouth. - Tho carponters and joiners in

Grangemonth, have struck for an advance of wages from 6id. to 7d. per hour, and a reduction of hours from 54 to 51 per week, with an in crease in the rate of overtime.
London.-At the Marylebone County Conrt, a houso-painter named Watts, summonod bis employer, Mr. Weir, for lls., being money alleged to be due as travelling expenses, \&c He had heen sent to do a job at Aborgavenny, in South Wales. The defendant having doelined to bring his foroman to give evidonce as to tbe agreement with plaintiff, because he only re sistod the demand "upon principle," tbo judge gave a verdict for the plaintiff,

## ACCIDENTS.

Five at the Liverpool Exchange Buildings. Mach alarm has beon created in Liverpool for the safety of the pile of buildings which form the Liverpool Exchange. A fire was discovered in the sample store-room of Messrs. Newgass, Rosenbeim, \& Cor, cotton brokers, which is or the top floor of the ceutral tower of the quadrangle, and faces towards Oldhall-street. The fire was very soon subdued, but it was not totally extinguished until tbe cotton had hoen brougbt On the flags and thoroughly drenched with water. The fire was confined to the room in which it originated, hat bcing the top room of the build. ing, the roof was to some oxtent burnt throngh, aud the flames were spreading along one of the heans into the adjoining room, when their progress was arrosted by the exertions of the firemen.
Fall of a Scafollat Consett.-At Consett Iron Works the damper of a chimney connectod with one of the puddling furnaces having become darmaged, a scaffold was orected, and two men, a blacksmith and a bricklayer, proceedod up tho chimney. They had not heon long at tbe top, however, before one of the iron bars on which the scaffolding rested gavo way, and both men were precipitated to the ground, a distance of 30 ft . Two lahourers were working at the base of the chimney at the time, and one of them was struck on the head by one of the falling was struck on lio head by one of the falling
men. The blacksmith was taken to bis own men. She to Coll to Consett Infirmary, where their injuries were attendod to.

MEMORIAL OF BISHOP WILBERFORCE. A Comurtee meeting has been held in the Gospel, in London decided that the momorial of the lato inally should consist of the maintenance of a bedy of clerey and the provision of a building for home missionary work in South builuigg for bome Winchester. Among south London, diocese of Winchester. Among the many influential persons Winchestar and Chinestar the Archdishops of Buokingham and Surrcy Cone Archdeacons of Buokingham and surrcy, Canons Gregory and Winter, and Lord henry soott. Tbe daty of institution would and lay men connocted with the institution would be to oarry on bome missionary work in Sonth London, whiob the Bishop of
Winohester, witb the consent of the incumbents. of the districts, might appoint.

THE DEFECTIVE SEWERS AT PENGE.
Considerasle damage was done to property in Penge in the course of last summor by floods cansod hy the dofective construction of tbe sewors, and it appears that tbe injuries to tboir housos which several of the inhabitants allege they bave sustained by the floods are likely to involve the ratopayers in considerable exponse by way of compensation.
At the meeting of the Penge Local Board last wroek, two clains were made hy Mr. Webb and Mr. Clifiord for compensation in respect of tbe damare wbich they had received from the floods, und some diseussion took place npon the subject ${ }_{3}$ in the course of whicb it was morod that the claim made by Mr. Wobh be paid; whorompon this was objected to on the ground that other claims wonld doubtless be roceived, and that if the claim in question was paid it would estaliligh ultimately referred to the finnee committee.
An acconnt, amounting to 3007., was also recoived from Mr. Williams, surveyor, who had beon employcd to rectify the faults in the sewers, and in tbe courso of a conversation which ensued on the subjeot the clerk stated it was the opinion of Mr . Williams that the sewer was quite inadequate to carry off the storm-water of Penge.

WINDOW IN SAXMUNDHAM CHORCH. A fatnored mindow has been put np in Sax mundham Church by Mrs. Long, of Hurts Hall Saxmundham, in memory of her two sons, the design for which was giren by the Marchioness of Waterford, and is highly studied. The sub. ject is "The Ascension," and it extevds throngh the three lights. The window is Perpendicular in style, and the traceries are flled with angels, and the emblems of the Passion. The work is executed by Messrs. O'Connor \& Taylor, of Berners-street

CONVENT OF SISTERS OF PROVIDENCE. artrams, south haypste.id
The first portion of the proposed new build. iags, viz., an orphanage to accommodate 200 elevations are of handsome design, and are faced with Malm bricks and Ancester stone fands the traceritd windows, copings, and other dress. iogs are also of Ancaster stone.
The building, internally, is fire-proof, the floors being formed of Dennett's arches on wrought. irong girders, and it has been warmed by Messrs. J. L. Bacon \& Co., of Oxford-street. The chapel has an open-timber roof. The arohitect is has an open-timber roof. The arohitect Clapton, have been the general contractors. Tbe oarring of the panels under the enst window the giff of the architeet, has been exccuted by Messrs, Allen \& Burge, of Holloway.

## ARCHITECTS v. BUILDERS

 Srr, - May we rsk an opinion in the following ease:-Wo tendered for some worit, and were lowest. Almost as soon as our tender was accepted a strike oceurred in tne ldeality in which the work was to be done, and also a
sudden rise in the prico of bricks took place. Under these circumastances we declined the contrnct, and. the architeot
refused to return the $5 \ell$. which we had paid for tbe quanrefused to return the $5 t$. Which we had paid for tbe quas.
titics, because ha said ours was not a lona fide teader. It seems to us an important point in the usares of th
trade, and think it should he decided, course pursued hy the architect. We have uo aympathy
with builders who make tenderg and course pursued by the architect. We hare no sympathy

## RE "HOMERTON HOMES."

 8in,- If a full report of my reply to the Board of Worlesfor this district had hee o given, I think you would not bare had any reason for asserting that I bare wold not candid in this matter, I said that 1 ts houses in Brook. street, Tictorin-street, and Alhert-street, are under notico
hy the ground-landlord, and must erither be substantially
ropaired by Christmas, or fill into his other bonscs are under, notice; that eight owners of property had been summoned to Worships street for of pro. tsken out against others; aud tbat all tbese proceedings
had beed taken lefore the appearauce of your article. Also that many of the houses hafe lutely changed hands, The only paragraph to which I took exeeption was the following:-" The places of accommodation were hrimfill rottenness and corruption." 1 and said that so far from whe places described being brimful of flth, that only 5 out of only was the stoppage ceused by struecural defect, but
arose from the fllthy habits of the people. Tbe words es that if the words "screral of" bad been introduced, I shent not have oballenged the facts, alchougt roduced, I that the words "secthing in corcuption" are somewhat Gigniative
As regards Brook-street, Victoria-street, and Albert.
street, I inspeceed many of the houses, and csme to the conct, I inspen that it manid he better to allow and csme to the the the ground landlord to run out, than to interfere, except
by remoring the worst uuisnoces, as it seemed best for tho
houses to fill into tbe ground-landlord's hands, and be pulled down or thoroughly rephired, than to remain the are not begun at Christmas, wo shall talio stringent action againt the parties who shall then collect the rents. I I m aware that the course I have taken is open to discussion,
but the present condition of the property must not be loid or tho inspectors or on the Board,
I will conclude by stating that no difference whatever made between members of the Board and others as to the inspected during the prescnt year; that the inzpections of and that they were made later ther not long been finished of the death of the chief inspector and the dismissal o year, by wbich the sauitary work has beeu mudeh delaved.
Joux W. Tripe, M.D., Medical Ollicer of Health.

NEW OR OLD BDTLDINGS APPEAL TO THE sUDGES in band Tur Lord Cbief Justice Coleridge, and Justrees Common Pleas, have had before them an appeal, "Hobbs v. Dance," from a decision of tbe Tunbridge Wells surveyors ${ }^{\text {a }}$ lawyers
Mreet, Tance, the respondent, is a tradesman of Highmall stable. Which was a wooden structure carried up rom the garden-wall, He pulled down the wood, atad
with some old materials and new ha rehuilt the stable, The was diffcrent in size, and mainly upon a news site. Local Board, and he summoned the respondent for baving made under it," for haring erected a new buildang mithout having giren notice to the Local Board.
Mr. Dance contended tbat it was uot a ners building, and the Justices coinciding, dismisged the complaint. The knotty question, subnatted to the Judges was
Whether the mafistrates' view of old and vew baldings Was a enrrect one. Justice said it would bo playing with ome's understanding to say that they conld doubt that
this was a ners building ; and the Court reversed the decision of the magistratis, with conts against the respondent, Dance, and who will again
before the justices on the oll summons.

## LEADEN OISTERNS.

Wult any of your readers kindly inform me whether
is more wholesome for a leaden cistern (supplying
house with water) to bo painted inside or left untouched

CAUTION TO NEGLIGENT WORKMEN. Iv the Erompton County Court, on Monday, before Gcorge Pickering, in the employ of Messrs. Hooper, of
the Britannia Iron Worlis, was actioned for the sum of
 work. It being a nex mode to make workwen answer.
able for carelegsness and bad worlinanship, great interest
Mr. Gcorge Williama, foreman angineer, in the gervice
of the Britannia Iron Works, said the defendunt raeuced to worlk as boilerman, in August last, and it wa make all joints secure, and see that the boilers, and to
was properly finstencd. was properly fistened. On the sth of Oetober laste about of thic platoo, the stearn and water hurst out, snd the
fres had to be drawn, in order to prevent the hoilera
from hursting. The eause of this miochion from harsting. The cause of this mischief was fastening
the plate on the wroug side, He saw the defondant on the following morning, and asked bim how be mnaged
to blow the plates olf, and he said he did not consider it washis duty to fis the plates. The duties of a boilerman were explained to the defendant when he entered the
erploy of the Britannia Works, but not by mitness, or in his presence.
In answer had in assistant the Judge, the foreman aaid the defendant helf, but ho ought to base seen they wera properly
fustened fustened.
Mif. Fol Mir. Folkard, counsel for the plaintiffs, contended that
employers were not expceted to acrunint employers were not expccted to aequant working men
nith their duties it was their daty to understand their
several trades, hut here the defendant wes told what he several trades, hut here the defendant was told what he
would have to do. His elieuts desircd to make an example of a man tbrough whose negligenca a great loss of hife
right hare occurred, as well as ruin to the works. Itwas not the loss ineurred by stopping tbe steam his clients 80 much cared for, as the wish to show their workmen that they could be made to pay in purse tbrough a couly
court, and wera liable for aul durage incurred hy nectl gence or bed workmanship.
haring fixed the plate in to question case, candidly admitted explained that it was entirely oring to a mistake on his doors were marked with crosses, but there wera no mark on the door in question to guide any one in putting it together. Previonsly to tbe night in question, the hammer-
man whose duty it plate of the boiler that blew off, and ho (the defendant) put the door on to the best of hig linowledge.
He called John Shaw, azother boilerman
He called John Shaw, another boilerman at the Britannia
Ironworks, who confirmed the defendant's version of the

## The

mount of, if any, negligenee displayed by the defendant in fixing the plates, gnd he should give judgment in hi to the defendast and other, workmen to be very carfeful
with such dangerous with such dingerous engines as boilers, and it was a mercy a loss of life had not occurred. If at any fature time
negligence on the part of worlimen came before him negligence on the part of work wen came before him well as for compensation.

## CHURCII.BUILDJNG NEFS.

Lomgney. - The ancient church of Longney g to the Gloucester Chromicte, has heon yeglect, the festoration. Owiog to years of to be dangerous, while many of its most in. teresting foatures bad heen buriod inder stucco and whitewash, arches had heen wallod up a gallery had been erectod against the west wandow of the nave, and the seats were of corman deal, Mr. F. S. Waller, the cathedral to the best its furtber decay. The estimated outlay wa bout 1, 1001 ; the contract was tolen for about 1, 0 h; The sum hy Mos, What The chancels have been stone whicb corere the roors has been removed and tiles substiot, whitewash has disappeared from the interior, staco and plaster from the exterior; open benches of pine have been substituted for deel hoxes; the oak timbers of the roof have been reopened, and in the chancel cleared and varnished, and the interstices plas. tered; the chancel-arch has heen rebnilt, the timbers of the nave have been relieved of lath and plaster, and in a week or two the woodwork will be vamished and the spaces between cleansed. The chnrchyard, we may say, con. tains a few quaint epitaphs. Among the latter is the epitaph of the villago blacksmith, in. scribed less than forty years ago, and which is thus readered, -

> My Sledge and Fammer lies declined, My Forge's extinet; My Fire's decayed,
And in the Dust my Tiee is luid, And in tho Dust my lice is luid,

Lines to this effect, but with variations, are to be found in many of our chmochyards. On a tombstono in Chipping Sodbury is this ad. dition,-

His body's here, elutched in the dust.
'Tis hoped bis soul is witb the just."
And at Houghton churchyard the last two lines of the inscription read, -

## My fire-dried corpse here lies at rest; My soul, smoke-lilie, soars to be bleat,

In the course of the restoration two enrious dis coveries were made. Emhedded in the walls was a senlptured stone, with two hands olasping an pen book; and undor the cbancel-foor, at the south east angle, was found a small leaden bos, with an ivory top of interesting workmanslip, and containing about 150 ,coins, with one excep tion (a golden nohle) all of silver, and of the reigns of the first, second, aud third Edward, and of Riclard II.
Mcerurook.-St. Matthew's Church, Mecrbrook, rebuilt, has heen opened. The chancel was erected about five years ago at the sole expense of Miss Concliffe. The chareh will accommo. date ahout 250. The new wave is in harmony with the Condliffe memorial chancel and tower The style of the church altogether is of Early Fourteenth Centary period, with tracery win. dows. Tbe walls are thick, and have been built with local materials. The roof of the new nave shows all the timbers, and is covered with Staffordshire red tiles. T'here is a sonth porch, with remains to be done. Mr. Paul Bailer, Wetley emains to wo done. Mr. Paul Bailey, Wotley Rocks, has executed the masonry, Messrs. Nixon rlazing. Mr. Edward Ash, of Meerbrook, has glazing. Mr. Edward Ash, of Meerbrook, has
supplied a pulpit and a font. Mr. R. Norman Shaw, of London, designed the edifice. The cost of the nare has been abont 1,1007 .
Winkleigh (Deron). -The church of All Saints, Winkleigh, has heen reopened for divine service. The works of restoration have been very considerwall and embraced the rebuilding of the south part porch, and vestry, the whole of the upper considerable ports of the Loosedon aisie, a repairs of all stone-masonry, new tracery-work to several wiudows, Dew copings and gable crosses. All portions of ancient work have been preserved where possihle, and it has not been f a neted to mako them assume the appearance cayed has heen repaired with new stone corre. spouding to that of the original work. Instead of slates, the roofs hare been corered with warm.colonred tiles from Staffordshire, and crestings of Itamhill stone surmonnt the ridges gutters, water-pipes, spouts, \&hole of the lead
organ-chamber has been erocted on tho north
side of the Lady Chapel, and provision made to keep out damp. The works to the tower have been extonsive, embracing the rebuilding of the upper part, new buttresses, parapets, pinnacles, parapet copings, extensive repairs to the old entire. new floors, beams, and lead covering, The pinnacles are of Hamhill stono, crocketed hy Mr. Moses Luxton, of Winkleigh. A light. ning conductor, by Mr. Tetheron, of Cheltenham,
has also heen fixed. The new western doorway has moulded jambs and arch, with carved patere in the mouldings, and label of Middecot
stone. There are two new decorated windows on tho sonth side, one of wbich has been filled with stained glass hy Mr. W. H. Dixon, of London, depicting tbe Raising of Lazarus. The other windows are filted with leaded glazing, supplied by Mr. Pepper, of London. A new stained.glass window has been erected to the
memory of the late vicar, the Rev. J. Fisher memory of the late vicar, the Rev. J. Fisher
Turner, by members of his family. Tho glass Turner, by members of his family. Tho glass with SS. Mary and John on either hand. The lower part of the window has angels in square
panels. A son of the lato vienr has promised a panels. A son of the lato vicar has promised alahaster, it heing understood that the granito reredos, erected somo years since, should then be placed in some other part of the clurch. A
new altar, of oak and inlaid ebony, has heen new altar, of oats and inlaid ebony, has heen
given lyy the Rev. W. T. A. Radford, of Down St. Mary. Mr. Pinckhard, who is paymaster of tbe costs, has been represented on tho works by
his friend, the Rev. W. T. A. Radford, whom the architect, Mr. John F. Gould, of Barnstaple, has been associated in the earrying ont of the work. The whole of the carpentors and joiners' work, iucluding the organ-case,
wero contracted for by Jr. Joln Dendle, wero contracted for by M1r. John Dendle,
of Barnstaple. All masons ${ }^{3}$ and general work of Barnstaple. All masons' and general works
have been carried out by men employed by Mr. Gave been carried out by men employed by Mip
George Vickery, the clerk of the works. The contractors for other works were:-Mr. W. Letheren (Obeltenham), Mr. Young, and Mr. Harper (both of Barnstaple), iron and metal work; Mr. J. Thorne (Crediton), the paiuting and decorations; Mr. John Davey (Barnstaple), plastering; Mr. John Bryant, the marble and alahaster work. The whole of the carving and carried out hy Mr. Hems, of Eseter, who, at the arehitect's request, visited all the churchcs in the northern part of the county, where aneient romains were to be found, and took impressions display as much as possible the peculiar feeling nud effoct whiob perraded the old local ex. amples. Irrespeotive of special gifts, viz, amounting to between $6,000 \mathrm{l}$. and 7,0002 ., has with the exception of about 150 l . raised in the parish, hoen defrayod hy Mr. George Heary Pinckard, of Combe Court, Godalming, Surrey.

DISSENTING CHURCE-BUILDING NEWS.
Reading.-The now Wesleyan obapel jus divine forship. The chapol has been huilt at a cost of $7,500 \%$. The body of the building is 80 ft . in length by 50 ft . in width, and is divided into nave, 26 ft . wido, and lean-to aisles, with arcades and cloarstory. There is a chancel, 21 ft . long
and 26 ft . wide, with organ-chamber adjoining; the seats for tho choir are arranged upon either side of the chancel. At the back of the com. munionstahle is a reredos composed of stone and terra-cotta, inlaid with Maw's majolica tiles, and the panels are filled with illuminations, con-
sisting of the Croed, the Lord's Prayer, and the sisting of the Croed, tho Lord's Praycr, and the
Ten Commandments. The centre panel over the table is ornamented, and shows an emblematical device, consisting of tho intersecting triangles iuclosed in a circle. Beneath this is inscribed
the appropriato text " For as often as jo eat this bread and drink this oup ye do show the Lord's death till He come." Galleries extend slong each side and at the end of the ohapel, and these, with the benches, have been crecutod in pitch pine. The chancel and entrances have tesselated pavements manufactured hy Mr. Godwin, of Lugivardine. Adjoining the chapel is a school. room, 57 ft . long by 33 ft . wide, with five class. rooms attached. Tbe minister's vestry adjoins the chancel. The chapel and school'oom aro
heated by Haden's hot-air apparatus, and pro.

Vision is made for ventilation. At the corner of
the chapel is a tower, from which rises a spire, the chapel is a tower, from which rises a spire, eather-cock buins 130 ft . The style is Deco rated. The buildings were designed by an amatcur, the Rev. J. P. Johnson, of Wood-green, London, and have beon carried out undor the direction of Mr. Joseph Morris, architect, Reading. The contract for the whole of the Fork was undertaken by Mr. W. H. Woodroffe, of Roading. Mr. Barnicoat undertook the mason's work, and the font, which is wrought in Caen stono, is his gift to the building. The illaminations upon the reredos have heen painted by the Rev. J. P. Johnson as his gift, and the rost of tho painting and decoration has beeu done by Messrs. Froemnn \& Son. The gas attings aro by Jessers. Hart.
Brearley. The foundation-stone of a new Baptist chapel has been laid by Mr. John Sunderland House, Tho nev Wardle has been designed hy Measrs. Horsfall the Romanesque styla of architectire free reater will provid titing ton ona more in a vestibule gallery over the entrance There are to be three schools, one for hoys and one for girls, besides a large schoolroom. There will also be a chapel-keeper's dwelling in the ame hlock. The estimated cost is 3,000 , towards which ahout a little
Tunstall.-The foundation stones of a new Wesleyan ebapel and school have bcen laid here The site of the new huilding is King. strect, at the upper part of the town, whero there is a prise extent of new haildings, The edifice comprises a clapel to seat about 750 persons, a
schoolroom for about 400 children, and live classrooms. The site upon which it is being erected has a frontage on its north side to King-street, and extends southwards to Cooper-street. The choolroom will be under the chapel, and will be aproached on the level from Cooper-street whilst the chapel entrance will he from King treet, slightly elevated above it-an arrange. ment necessitated by the nature of the site. The design is of Italian charaoter, and the mnterials o be nsed are red brick, with moulded brick and bricks of other colours for relief, and stone ressings. The Kiug-street front presents a able as a central feature, projecting somewhat before the rest of tbe front, and contains the two oorways in the lower part, with small windows on either side of the same to light the vestibules: hore the doorways, and occupying almost the whole of the npper part of the gable, is a recess spanned hy a semicircular arch with carved keystone, and this recess is filled in with two two light windows $n \mathrm{p}$ to its springing line and the tympanum, with a circular window and spandrels of ornemental brickwork. The central gablo is flanked hy the two gallery staircases, which are height than the gable by ciroular roofs. The side eleyations and elevation to Cooper-street are plain, but are relievod hy bands and arches of blue brick. The internal arrangoments of the chapel on the ground-floor consist of the front vestihule, 6 ft .6 in . wido, approached througb two doorways fitted with sliding doors, and from whicb, right and left, 'through glazed swing-doors, the gallery staircases (which also form innor restibules leading to the ground-floor) are entered, and through other doors to the hody of the chapel, which is to be entirely pewed, side pews set apart as free. The rostrum is to be placed at the opposite end to tho entrance, correspond. The arrangement of the upper plan is for galleries to extend four sides of the build. ing ; tho front gallery will be eight pews deep, and the side galleries three. Tbe organ will he placed in the end gallery behind the rostram, and on either side of it will be the children's seats, which will be approached from the school com by means of a back staircase, and this staircase will provide additional means of ingress and egrass for the congregation on epecial occa. sions. The form of ceiling will be one with ooves finished by mouldings, and the cove will spring from foliated corbels and panelled pilasters. The interior woodwork will be slightly stained and varnished; that of the most prominent parts, such as gallery front, rostrmm, \&c., will be of pitch pine, and tbe remainder red deal. The
front of the site to King-street will be inclosed
by palisades and gates, and the approach from the same to the chapel will have flag pavernent and retainiug walls coniplete. The architect is Mr. George B. Ford, of Burslem, whoso designs were selected from public competition; and tho builder is Mr. Wm. Cooke, of Burslem. Tbe
contract for the bailding and fencing is $3,197 \%$.

Treatise on Practical Solid or Descriptive Geo nebry, by $W$. Imbrell Pierce, Architect London: Longrans, Green, original Drawing THE author of this treatise is of opinion that a rood text.book on the suhject of Practical Solid Geometry is much wanted for English studeuts but, remembering the many works on Gcometry puhlished during the last fery years, we should carcely have thought so. The present trea. ise embraces orthographio projection and perspective, or radial projection; and Mr Pierce proposes, in a future work, to sbow the application of the snbject to the soveral arts of construction. Having hean lectarer on geometrical drawing at King's College, Loudon, autbor to deal with his subject is cortain.

A Mechanical Text-Book; or, Introduction to the Study of Mechanics and Engineering. By Wigliay John Macquori Rankine, C.E. C.E. WVith numierous Enoravince Bandon Griffin \& Co., Stationcrs' Mall-court.
THIS volnme was in progress whon Profossor Rankine died. Mr. Bomber was assisting him with it and with it, andit whe at Rankime own reques that his assistant's name was given on the title page. Nevertheless, the hook is to be regarded as essentially one of Mr. Rankine's numerous and valuable productions. It is designed as an introduction to more abstruse works on engineering and mechanics, and iu particular to those of the late Professor Tiankine. Its study demands only a previous acquaintance witb the ordinary rules of arithmetio, and witb the elementary algebraical notation.

## VARIORUM.

The Buried Talley of the Mersey. By T Mollard Reade, C.E., F.G.S., \&c." This is a paper extracted from the proccedings of the Mr. Reade's ideas as to the it is based on struction of the Mersey Valley, of which con have before had occasion to speak. The promoters of the railway tunnel which is in. tended to cross the Mersey, and the sbafts tended to cross the Mersey, and the sbafts
for which have already heen sunk, have always beliered that they would have only a continuons mass of solid saudstone rock to penetrate Mr. Reade, in this paper, contends that in al probability a deep gorge, filled up with clay or ancient river or torrent formed in or before tho times wher Fingland was covered with ice, and When its valleys were filled Titb enormous glaciers. The railway works in progress will, dountices soon put tbis interesting question to the test.- A large sheet of letter press and illustrated engravings showing certain inventions and improvements in steam-builers, \&c., patented by Mr. George Rydill, of London, mostly for the saving of fuel, has been pablished by Palmer,
335 , Strand.

## Hiscellanea.

Memorial Mall to the late George Stephenson.-The hall proposed to be erected to the memory of the lato eminent engineer,
George Stephenson, at Cbesterfeld, will now, it George Stephenson, at Cbesterfeld, will now, it
is believed, he carried out. Tbe hall, to be erected within view of the churchyard where the remains of Gcorge Stephenson rest, will bo opposite to his residence, Trpton House, and close to the Midland Railway, whioh he perfec ed and completed, as well as to tho Locksford Colliery, wbich was snnk and worked hy him, A joint committee, consisting of members of the Corporation of Chesterfield, of the Chesterfield and Derbyshire Mining and Mechanical Engineers Associations, of the Mechanics' 1nstitnte and of the Technical Education Societr has been formed for arranging tbe preliminaries The Corporation have offered as a site about 2,600 square yards of land in the town, now used as a bowling-green, provided that the legal estate in the land and bnildings to be erected by the various societies be vested in the Corporation upon trust for a Board of managenent, contbe societies. Tho cost of the huilding, which is to consist of a large hall, library, and reading and class rooms, has hoon estimated at from $12,000 \mathrm{l}$. to $14,000 \mathrm{l}$.

The late Mr. John Cough Nichols, E.S.A. - We bear with much regret of the death an old friend and well-esteemed antiquary and genealogist, Mr. Juhn Gongh Nichols, the grandson of the author of " Literary Anecdotes." He died at Holmwood, near Dorking, in his sixty-seventh year. Besides editing the Gentlemon's Magazine for many years, he cdited tbe Collectanea Topographica, and the Topographer Herald and Genentogis in 1862 commenced the of publication. In addition to nдmerous paners in the varions antiquarian journals, he was the in the varions antiquarian journals, he was the
anthor of many separate works. He was one of the founders of the Camden Society; and several of the volumes illustrative of our national history issned by that society were edited by him. Mr. Nichols was the eldest member of the Literary Fund Committee, with one excep. tion, baring been elected to it in 1836.

Manchester Cathedral Restoration.-The new churchwardens, co-operating with the dean and chapter, have reoommenced the restorations of Manchester Cathedral. The portion known as Brown's Chapel (to the rigbt of the south entrance), which bas been long in a dilapi dated condition, is hoing taken down to the to harmon the facework, and will he rebuil Tliese work Graham \& Sers bers the arebitect, Yr Willio Doro There ery very mnch to be done to tho cathedral in the way of cleaning and restoring. The costly f place in its dirty surronndings. In tbe nortb wall of the Derhy Chapel a new stained.glass window is about to be inserted, by Mrs. Bowers, to tho memory of the late dean; and near the west ond of the nave another new stained-glass window is to be placed.
Painting on Pottery.-We hope the offer of two preminms by tho conncil of the ArtUuion of London, one of $35 \tau_{1}$, and one of $15 \%$., to he competed for hy past or present students in Schools of Art in which painting on pottery is augbt, will not bo disregarded. The snbject proposed is a desion for the decoration of circular tazza, of specified form and dimensions. Tho desigus are to he on papcr, in water colours or tempera, and are to be sent to the Society's house, on any day from the 1 st to the 7 th May next. Care must bo taken that the designs are in sucb colours only as can be secured by the use of pigments, which are able to andergo tho process of firing. The council have recently etermined that the competiag designs for the above, may be for execution either under the laze or ouer it ; but jt should he stated in each case for which mode the design is intended.
Manchester Free Library. - The repor for the twent $y$-first year shows, tbat during the for jor closed, 609,462 volumes were issued y 13 - reading, 149,092 volumes were used , 13,128 readers in the Branch Leading oms, 92,802 volumes, and 91,702 specifications patents were issued in the Principal of Reference Library, to 51,172 and 984 readers espectivcly, being in the aggregate 943,708 issues to 703,300 readers, as compared to 306,311 issues to 641,327 readers reported last year. No record is attempted of the use of periodicals in tho reading-rooms, but during the year probably $1,711,960$ persons bave so ased nem. This added to the number of borrowers nd readers makes an aggregate of $2,501,56$ brsons who have availed themselves of the fre braries during the year just closed, heing a crease of 236,896 on the preceding year

House Decoration.-No. 5, Lower Berkeley位, has been decorated by Messrs. Phillips放 gold blue, with crnamentation in the fit ilac; the walls are panelled in a silver grey witb cinnamon marging; and two pilasters on each side of the room in opaque white ground, are being paiuted by hand; the woodwork is amber vellum, inlaid with black and gold. The dining. room ceiling is in pale vellnm, with geometric reatment in gold; the oornice in strong primeras and gold; the walls, with a deep frieze nnder cornice in Indian red, inlaid with a floral ornamentation in gold, outlined on beck; wall pace bereath in a pale applo green, and wood ilver grey

Crystal Palace.-A conversazione will be held in the tropical department of the Crystal Palace; the now buildings of the School of Art Palace Aquarium, on Friday ard in the Crystal th. At half-past eight Mr. Thomas Hughes M.P., will orplain the principles and ahiecte bo School ff Scionce, and Titeratnre in belibrary reading on Pr Pron Hon. Dr. Lyon Payrair, Mr. Norman Lockyer, arathers. Ander the lecture-room, and in the stadio of the School of lecture-room, and in the stad

New Mint Building Site.-A Bill unde his title will he among tbose to be brought forward in Pariament, session 18 it, for the " Ac erection of a new Royal Mint, and to sell, lease, or otherwise dispose of the buildings now asec as the Royal Mint.

Decoration of Belgrave Chapel, Leeds. This chapel, whicb has heen closed for several months, was reopened on Sunduy last, after undergoing considerablo improvement. Tho ated in colours in interior have been doco ated in colours in the henaissance style, and replaced with stained sash-windows remosed and eplaced with stained-glass windows; tho desigu being principally worked on various tints of white. The colouring of the roof and walls is of a neutral and subdued character. Tbe deco. rations, together with the stained.glass window have been designed and executed by Powell, Brothers, of Leeds.
United Methodist Eree Churches.-A new lace of worship was opened last montb in the auxball Bridge-road, Westminster, for the use of the charch and congregation formerly wor shipping in Lewisham-street. The building, wbich is a plain structure, will accommodate 450 persons. Thers is also a large schoolroom, vestry, and other conveniences, with approaohes from Yauxhall Bridge-road and from Willow gtreet. The cost of the building will be about 1,8007. Mr. Ranger is the architect, and Messrs Richardson are the contractors.

The Chester Workhouse Plans.-Thes plans, prepared by Messrs. Perkins, of Leeds, have been altered by the Local Gorernment Board architects in London, mostly in conse quence of new regulations, some of them reducing previous dimensions. The alterations are said to be, on the whole, improvements, and are still within the amount advertised for,-namely 30,000 . The building committeo recommended their adoption, and tbe board of guardians have unanmously agreed to the committee's recom. mendation.
Tenders to MIr. Diswaeli.-Tenders have heen received for a monument in St. Michael's Churohyard, Mnghenden, for tbe Rigbt Hon. B, Disraeli, M.P. (including railings, valuo 80l.), Mr. Arthur Vernon, architect. They ran as
follows:-follows:-

VOL. XXXI.-No. 1609.

A Flight on Stairs.

YING archmologists amateur or professed, considering the mansions and the castles which are the remains of bygone days, generally find no little interest, whether in regard to appearance or association, in tho dights of stairs which have served for generations for transit from one love! to another of the edifice. It may be a yrorn-out stone tnrret-stairease, each "tread" scooped hollow by countless footsteps, and which, in the case of a ruined building, emphasizes the centrast betweon past and present, reminding us of the occupants who have so often ascended and descended it in sterner and more turhulent days; or one of tho wide, spacious oak ataireases of a later date, - such as that down which the Roger Wildrakes of the Stuart period swaggered, whistling eavalier dittios, to which the long rapier scabbard bitting against every step in the descont extomporised an appropriate accompanimont.* Whether from association or architoc. tural effect, howevor, there is a general interest in an old stairease, as we might conclude from tbe frectuency with which we see snch subjects selected for artists' drawings or for illustratod
publications, as "Staircase in - Hall," and the manner in which the garden-steps at Haddon are continually reproduced hy photography or in water-colour.
Tho intcrest of the staircase, however, is not morely archnoological or picturesque (in the ordinary sense of the term), for it is, if rightly used, the opporinnity for varied treatment and effect, internally and externally, in domestic as well as in puhlio architecture ; it is the archi. tect's opportanity for escape from the straigbt line and horizontal floor, and for introducing an element of variety and interest in the dispo. sition of his building ; and in Medizoval times
this was fully perceived and acted upon in many examplos whicb still exist, and probably in very many moro of which no trace remains. What elements of tho romantic and picturosquo in building could be thus extranted from, or rather
roalised in, a staircase, is indicated roolised in, a staircase, is indicatod in snch works as the splendid German example, of Which, hy the aid of Mr. Bremer's admirahle pencil, wo were enabsed to give a view in a
rocent number.t Here the crossing and recrossing of the soveral flights and landings, the elaborate and rich decoration of the oak newels and balustrades, and the deep shadows between, give almost the interest which belongs to some romantic nook of natural scenery. This is an exceptional instance; but in buildings of this late we frequently come across bits of staircase squally happy and suggestive in foeling and reatinent, thongh on a smaller or less compliated scale. Nor is the picturesque in sueh
$\dagger$ Sec p. 747 , ante,
structures confined to the interior of the bnild. ing. Tho ataircaso among the Mediwval arohi. tects was fully as often an external as an internal feature; if not an actual external flight of steps, open to tho air (as not infrequently), it would bo bronght out in a turret or an oriel, and made to contribnte, in a legitimato and purposelike manner, to the external outline and composition of the building. The stair turret, of course, is a feature in our towers and ecclesiastical buildings familiar to every one; but the same kind of treatment is cound carried out mach more boldly (in Continental examples particularly) in the case of domestic buildinga, whore it is just as apphicable, where space has to be economised in the dwelling-rooms, as it is in the church or oathedral tower; though the domestic stair, being necossarily wider and more commodious, requires a different treatment from the tower stair,-rather that of an oriel or bay than a turret. This kind of piquancy of treatnent goes naturally with the typical Medieral house plan, in which the stair is nearly always kept somewhat apart, placed unsymmetrically on the plan, and occupying a nook or angle where it will be out of the way, and not encroach too mnch on the rooms. This retired position for the staircaso rouders it, ono may olserve, more casy to produce effect with it by any characteristic and unlooked-for treatment or design, which thus comes on the eye unexpectodly. The Italian theory in treating the staircase is, as even amatenr readers neod hardly be rominded, widely different from the Gothio method. Hero the staircaso is, in houses of any pretension to architectural effect or state, a central object,-one of the principal things one sees on entering, and is generally approached hy, or surrounds, a centre court or cortile as sprocous and imposing as circumstances will admit of. That this is the most stately arrange. ment of the staircase scarcely admits of a doubt: it demands, however, much greater sacrifice of space than the Gothic method, and in most cases is entirely without effect on, or relation to, the external design.
It is unfortunately, however, to the Italian mothod of atair-planning that the English building mind has mostly adhered and applied itsolf during the period since the denadence of Modiwyal art: nnfortunately, because the Italian plan is only snitable to tho comparatively small
number of large and spacious houses, aud where a somewhat rich and costly material can be om-ployed,-where there is soope for marble, or the finer kinds of bnilding stone, in stairs, and columns, and balustrades. Its adaptation to ordinary dwelling-housos has led to frequent waste of room, in search of an effeot of spacionsness which cannet be realised, and to a common. place monotonous square arrangement of the domestic staircase, in eases whero it would have been possible with tho samo or less expen. diture, on the Gothic plan, to havo produced a staircaso picturesque and pleasing in arrangement and mode of access, without taking np nearly so mncb room. It is to this oheap imitation of the palatial Italian plan that we mnst set down muoli of that air of utter conmon. place and valgarity which characterises the stair arrangement of so many modern dwellings, where no attempt is made at any picturesque effect, and the stair is meroly a thing to take one np to bed. Fur all dwelling-houses on a comparatively small scale (the average scale of respectahle middle-class life), the Gothic plan, with the staircase seclnded in a corner or a recess, is the one to follow; the atairs can then be brought to the outer wall; can be made a source of external expression by fenestration or in other Fays; and internally can be treated with effect in their approach, in their lighting, and in their onstruction and decoration.
The qualities which gare to the staircase formerly so mooh of the interest which its
older examplos still have for ns, are not to be fonnd very largely exemplified in nodern work, a common and very serious defect is want of width; most modern staireases, in largo and small houses alike, having the appearance of boing mado just wide onongh aud no more, even if they do not fall short of tho "just enongh." A oomparatively spacions stair (and, of conrse, this must always be regarded in proportion to the size and scalo of tbe house) gives at once an improssion of dignity and spaciousness to the internal plan. The question of rake, the proportion of troad to rise, has an important efloct in the same hiud of manner; a steep stair always looks mean, besides being nncomfortable, and in this respect the advantage on the whole is rather on the side of the modern stairoase, which in honses of a fair class is seliom found over steep. One of rise to two of tread is the best working proportion for a good stair; a less inclination ratber increases tban dininishes fatigne in asoending ly maltiplying the steps; the well-known circular staircase in St. Paul's is a notahle instance. The comparative fimsiness and slightness of the balustrade is another common deficiency in tho modern stairoase The ordinary moulded handrail, with thin stieks to support it, is mean of course to a degree in appearance ; but even where something decisively decorative is attempted, there is almost always error on the side of want of massiveness, and it is rarely indeed that we meet witb anything like those thick tumed balusters and broad heary toprail which are to be found in old staircases of the Jacobean and Queen Anne period, and whiok are so eminently satisfactory and permanent.
Of the various substitutes for wood balasters which occasionally appear, wrought iron only claims partial commendation. If plain balusters, they unight as well be wood or cast iron; if worked into flowing scrolls, in the fashion to which wronght iron is so well adapted, they are apt to catch dresses in going npand down stairs, A good effect may bo obtained by the employment of perforated wood, in panels, in place of halusters; but (so long as the stair is a wooder onc) no elfect will be so grod, and no kind of work so enduring in the aituation, as massive and well-designed turned balusters, with plenty of thickness in the contre of their length. As to the method of footing the balusters, there can be no donbt that a thick and massivo moulded "string board," with the balusters set on and tenoned into it, is tho strongest and most workmanlike method. When tise line of the steps is brought brough to the outside, and the balusters foot directly on the ateps, they have not nearly so strong and solid an attachmont as in the othor case, though, as a matter of appearance, showing the outline of tho steps may have a less heary effect. The temptation in the case of tho raking string-board is to make it too thin, from motivos of eeonomy, to afford a seat for anything but a verg thin and starved-looking baluster; wbereas, baluaters, when footed on the step, may bo almost any thickness. The question as to the termination of the handrail and balusters at landings and angles ean scarcely be a dorbtful one. Unless in eircurastances where the plan of the stair must noeds be winding or circular, the tuewel is the only serviceable and rational way of forming a termination. The old superstition of "wrcaths," "scrolls," and "ramps," gave rise to some wonderfally clever handiwork, and formed at one time almost a monopoly for a few able workmen who had specially mastered "the trick of it "; but all the trouble and science were hestowod in treating mood in an unsuitable and weak manner, and elahorately torturing it into shapes which were, when finished, unsatisfactory in appearance, constructively weak, and ofering no compensating practical advantage. The nervel systom proserves the straight line of the wood, and givos a point d'arpuli at each turn of the
stair, strcagthening and steafying it. The
finish of the nerrel above and bclow sbould always be worked out of the solid piece; tho
almost ineradicabie tendency of the modern almost ineradicabie teudency of the modern
Britisb joiuer is to put on beada ("caps," be Britisb tjoiuer is to puts on beads ; a diveraion which, unless watched, he will persist in, even When the object bas been carefully sketcled for "joinery" procceding totally unncoessary. An "joinery" procceding totally unncoessary. An case is a wainscot on the wall side (when against a wall), and this should be capped with a
finish which will serve as a handrail, or somefinish which will serve as a handrail, or someto the hand. Falls on a staircase sometimes occur, from accideut, throngh there being
nothing on the wall. side for the hand to catcb bold of.
Stone stairs are less suitable to private dwellings than to public buildings ; in the former they bave ratber a cold comfortless aspect, though undorbtedly conveying an offect of dignity, as When fixed in the ordinary notohed fashion, with sloping soffit, they cannot be suitably pro. tected by auytbing but a light ornamental iron railing; ansthing heavier looking would be unsuitablo for a structure so entirely self.sapporting. Stairs constrncted in this fasbion, however, seldom look very well; nor are they safe in the cvent of an nnusual crowd, or of a fire. Enougb is not made, in private residences of the better class, of the opportuanty for architecturaly
designing and constructing a stone staircase, designing and constructing a stone staircase, solid basis. Stone stairs, however, lend them. selves very well to a curved or circular plan, and may have a good effect on such a plan in this case the serpentine windings of and in this case the serpentine windings of the brass, or in gilded bronze or iron, may be more brass, or in gilded bronze or iron, may be more
in keeping, and bave a better cffect, with their in keeping, and bave a better cffect, with their
light flowing lives, than any other form of stair railing. Sucb a stair, spacious, and of well-kept brigbt white stone (or marble), lends itself vcry well as the ground-work, or passage-way, for
elegantly costumed figures, as was exemplificd, if we remember rightly, in Mr. Val Prinsep's very agreeable picture, under the title, "Devonshire House," " in the last Academy Exhibition, representing two ladies ascending a staircase of this description.
In staircases in public bnildings, the remark as to the great importance of spaciousness, within certain limits, for the sake of safety iu the event of crowding, applies even more strongly than in the case of private
bouses: a public building with an insufficient, bouses: a public building with an insufficiont, mean, or narrow staircase, is a discredit to its architect. A grood instance of ample proportion in a stairccase is Drury-lane Theatre, the prin. cipal staircase here, if properly treated and
decorated, instead of presenting the cold bare appearance which it has at present, would be a remartably good specimen of an entrance. ings of this class, theatres and concert-rooms especially, are unfortunately constantly deficient in stair.room, a deficiency giving rise to occa. sional danger as well as continual porcrty of (ffect. A considcrable number of landings, pro. for squeezes in coming out of a building, is an for sqneezes in coming ont of a building, is an
element in the effect of a staircase, assisting the element in the effect of a staircase, assisting the
idea of spaciousness and liberality of accommoda. idea of spacioundess and liberality of accommoda.
tion. An external fight of steps is a great source of architectural effect, and bas always been felt to be so; but it is often ill managed, and is so treated, by being returned and again retarned
on itself, as to appear like a mountainous mass of stone placed with little purpose against a buildivg. An attempt at a grand effect by a large tlight of steps up to a main entrance will
defeat itself sometimes, if not trcated witb defeat itself sometimes, if not trated with
judgment. It is not well to leave it nnbroken for any great length, as the eye in such a case bas a tendency to orerlook the step form and to
resolve the whole, when on a large scale, into an inclined plane. It sbould bave its larger breaks to give scale and outline to tho whole Bight. The treatment of the onter edgo of the steps, in the care of stone stairs, is a matter for consideration: the old-fashioned "nosing" looks well, and defines the edge of the step, besides extending, practically, the width of the tread,
but it cuts a great deal of stoue "to spoil." On the other hand, the mere sharp edge, besides being less commodious, gives a bard, thin line, or, rather, scarcely marks the line of step at all.
Where there is no lack of space for a wide tread,
a glight chamfor taken off the edge of each step
will be an effective finish, and comes well enourg under the foot in desceudiug.
The stone stair windiug round a centre newel is coming mucb into the predilections of some architects now, and it gives scope for good effects and for clever tours de force of stonework; but a better form of circular stair, perbaps, is that Whico is carried round the work of a circular compartment, leaving a space in the centre; there is more scope at least for architectural effect in this. But in the main the circular stair, symmetrical as
diappointiug plan in its effect, and always involves danger in the ereat of crowl basty descending. Tho staircase on a rectangular plan, with freqnent and ample landings, is the
form for realising arcbitectural effect. The form for realising arcbitectural effect. The
ataircaso thus laid out offers great opportunities to the architect in a large building; each landing baving its own "point" cither in statue niche, or a stained window effectively placed, or in a sudden vista opportunely gainod, on the way up, into some other portion of tho howng. Whether on a largo or smank scho, however, the staircase is a legitimate field for capable of far more in this way, even in its more restricted forms, that is commonly obtained or aimed at.

## THE ARCHITECTLRE OF CHINA.*

Is tbat strange college in the island of Lapnta which Gulliver risited in his travels, be relates among the seemingly impossible problems whioh its inmates were speuding their lives trying to sclve, that one was an effort to build a house by
beginning at the roof. Tbis, curiously enough, is the chine roof. Tbis, curiousty enous, framework of the mode of construction. .rand on the exact the roof is first made on the gromnd then it is raised up, and the pillars are placed below to snpport $i t$; and the walls are afterwards formed. Putting up a roof in this manner on wooden pillars reminds one of pitching a tent: and it is said that the pecnliar curves of Chinese roof are an imitation of a tent form, and that this is the real origin of Chinese arcbitecture. Such may have been the case, bat nov woo architecture of that country is essentially wooden, and these wooden forms may ben and marble. Many important buildings are wholly of wood, -such as the structure on the north altar of the Temple of Heaven, and the great hall of the Ming Tombs,-and this last I believe to be one of the finest buildings in Cbina Stone is largely used for hrides, sateways for p is largely used for hidson onal ays, and in pardens for balnstrades surronnding tombs and import ant hildinge ne ceneralls of marble Brict mint be said to the prinei building Brick might be said to be the principal building made and put in its place, the space bemade and put in its place, the space be-
tween the pillars is usnally filled np witb twecn the pillars is usnaly inicd ap wailt of this material, the brick being about 12 in . of this material, the brick being about
long. For some temples and fine building work a very small grey brick is used. These are ground perfectly square, and all to one size. S exactly is this done that when built one conla not insert the point of a knife between them, and the work produced will rival the finest world. Tile is afmost nniversally used for roofs In palaces and temples they are often coloured and glazed. All palaces, temples, tombs, and buildings erected for the use of the emperor, or by bis order, hare yellow tiles, that being tbe imperial colour; and it is a capital of ence for any one else to adopt it. There are a number of very handsome pailows about Peking, in which glazed tiles or bricks are nsed, prodncing a very colours. Byron's liue, where be speaks of "small-eyed China's crockery.ware metropolis," does not, I think, convey au accurate idea of the appearancc of Peking. Here and tbere a pailow may be found witb tbese Majolica incrustations, ne or two temples bave coloured tiles, all the buildings of the palace have rich yellow.coloure instances are so few and far between that they do not become a prominent feature of the city. Peking is only an extended village of dirty
streets and crumbling walls, where everything streets and crumbing walls, where everyting

- From a paper by Mr. William simpson, F.R.G.S., read
to say, is in a condition of roin already. In this wilderness of decay, anything that could be called "crockery-ware" in the architecture is an exception. Were such baildings common in eking as the temple on the Wan-sheu. Sban, have been applicable with the exception of a marble hee, it is wholly constrncted of benuti all 11 . il should suppose luat is one of the cinest pee his or eristence, and is bighly satisfory to estruction or the sur hildine was ordered, the great beauly of the bunding sad fron he fate of everything around. Lord Elgin made a request that this work of art should not e tonched. Close beside it is a very tine temple, all formed of bronze: as it would not burn, and could not be knocked to pieces, it has also escaped. It is very small, but it was curious to see in it almost every form of Chinese architec. ture repeated so perfectly in metal.
The place occupied by our Legation belongs the Duke Leeang, one of tbe offsboots of the imperial family, from whom it is rented by our Government. It was called the Foo or Palace of tbe Duke Lecang, so it is a fair specimen of Chinese architecture.
All bnildings of this kind are placed upon a raised stone platform, with steps for ascent. Some of the stoues forming the floor of this are cut with circular dises as bases for the woodeu pillars. The pillars are not inserted, they only rest like the pole of a tent. I exhibit a small ketch of one of the large teak pilars orke noticed one of these base-stones with a socket of abont an inch in deptly; but that, so far as my observation went, was an exception to the In more common houses, where no plat. form has bcen made, circular ntones are placed below the columns, so as to preserve the wood from the damp of the ground.
may here remark that all houses are made to face the soutb. I tbink there is no exception to this in palaces and better-olass houses; although in the dwellings of the poorer classes it is not lways attended to. The usual reason assigned or this is owing to a pocular. She there words and water known as tbe Fung. Shurie, these words simply mcaning wind and water; but they bave mucb to do with overything in Cbina. They control the architect as woll as the sexton, for it takes a long propitiation, and expenditure of means as well, to discover the proper site for a grave; and it will no doubt interest gentlemen who are connected, or at least interested, in public works, to know that this Fung-Shuie may be called the unresponsible beart of that department in China. No one in that country would dream of constructing a bridge, a canal, an embankment, or quay, without first propitiating this great power with sacrifice and inconse, so
shat its supreme will micht be known. The public supremo really splendid monuments of the industry and power of the country; but that is of a past date. They are all now in ruins, and works of a more modorn European kind are wanted. Railways, celegraphs, and every improvement but tben the Mandarin class are most bigotedly opposed to them. Supposing a railway or a telegraph was to be made in spite of tbe Mandarins, its probable fate might be this. If any accident were to tate place -it might be some hundred miles away from tbe railway or telegrapb, -the Mandarins would only have to say that the iron rails, or the telegraph poles, bad interfered with tho or the fouie and that while they existed similar events would occur. Tho result would be certain: the belief in this strange deffcation of wind and water is so deeply rooted that the populatiou would rise in mass, and tbe disturbing infuence would be swept out of existence. Ido not see that there is mocuch into the celestial
improvements being introduce kingdom while the Fung.Shuie has the cbief control in such matters. Of course $I$ have no doubt but steam, which may be looked upon as a newer Avatar of wind and water, will be the strongest in the end, and it is only a question of time when it will conquer.
To returu to my subject. The relations of this Fung-Shuie with architecture are numerous. In the construction of a house it may have been a sanitary object whicb first gave rise to the
connexion. In a cold climate a suathern aspect is looked for hy those who wish for a comfortable, wbicb, in a sense, means a bealthy bouse. If
the architecturo of China came from the north, and in that part of the country there is a cold winter, with biting winds blowing from the frozen regions of Mongolia, hence a solid wall,
or any other protection on that side, would be djetatod hy common sense. This simple ohject no donht, got worked into the religions ideas of
the people, and is now only part of a ridicolous superstition.
A palaco like the Duke Leeang's comprises a series of huildings, each hehind the other to. wards the north. As you pass throngh, they there is no essential differenco of constructive character. The more private rooms of a palace are those towards the north, and in the flowery land rery flowery names are given to overy thing, rule. You pass throngh the halls of "Heavenly Bliss," "Stoadfast Purity," and "Serene Feli. city" is at last gained in the extreme recesses of the placo. There is only one floor in Chinese houses, and their distinctiro feature is, that extent of accommodation is derived from the repetition of these halls, and not from storjes
ahove or cxtensions on tho side. Irouses in India, such as I havo seen in Delhi or Benares, are quadrangles with rooms all round looking
into a garden in the middle. A Pompeian house is only a variety of this. The Chineso plan is is only a variety of this. The Chineso plan is sents the first of theso halls on the south, and only a comparatively small space at each end is
walled in, indicating that it has only gob accom. walled in, indicating that it has only gob accom.
modation for some outer attendants. Passing modation for some outer attendants. Passing most northern are walled entircly round. The gronnd hetween each is more or less in the form
of \& garden, with shruhs, flowers, and plants, Two lion.like griffins, in stone or marhle, or in palaces they aro of hronze, watch the southern approwh. There is still an outer wall, and yon mny be passing to a very fine palace in Peking,
and see nothing hut dirt and decay on the and see
One very distinctive featare of this arehitoc ture is what I may call the "frieze," hat I confess that tho term is doubtful when applied to this part of Chinese constraction. It reminds ono of tho braoket capital of Hindoo arohitec. ture, and no douht it had a similar origin. now a complicated triple succession of smal hrackets, which project forward, giving in. creased breadth on the top for the snpport of
the roof, Although evidently constructive in its origin and purpose, it is the most ornamental portion, and its complexity makes it perhaps the most striking feature of Chinese architeoture. All buildings with anything like architectural frioze; and if you note it in my detailed sketches, yon will then reoognise it in all the skotches and photographs which I exhilit. Its origin is evi dently wooden; but I have seen it repeated it Many of theso forms are exhihited in the sketches. There are some varieties in the tiles of China; hut those of Peking, particularly when they were of tho Imperial yellow tint, suggested that hamhoos had first been nsed for roofs, and had given origin to the round form of the
upper tiles. In these cases the terminals are round, with an ornament within. Oae from Peking from one of the imperial palaces there; will give an idoa of the colonr of the roofs. It has the fine clawed dragon as an ornament, another of the Imperial cmhlems which it is treason dragon, reprosented as being pinned down with dragon, reprosented as being pinned down with
a sword. It is called Show.tor, and is done to secure that fahulons animal as the protecting secure that fahulons animal as the protecting
head of the houso. In some of the grander temples and palaces, this top ornament is a verg the ridges leading to cach corner of the roof are the ridges leading to cach corner of the roof are
a numher of emaller animals, which are also a number of emaller animal, which
supposed to he guardians of the house.
While in Peking I managed to visit the Great Wall of China, and we planned our route so as to see the Ming tombs. I heliove that thoy have never heen properly descrihed hefore, and I am
sorry that time only permitted of a sorry that time only permitted of a visit to one
of them; hut as that was the oldest and most of them; hut as that was the oldest and most important, a description of it must do duty for the others. We have all heard of the ancestral worship of the Chinese, hut it would ho difficult leads to such a profonnd veneration for graves, that a Chinaman never disturbs one. He will plongh round it from generation to generation,
but he would never be guilty of the sacrilege of
aestroying it. Tho resuit is, that the whole of China is ono vast cemetery. Tho usual form of the gravo is a monnd; and there are places mounds can he seen, almost justifying the trut of Shelley's lines:-

## There's not one atom of you earth

The Chinese have, no douht, buried in this way from the most remote antiquity, and a minute cocount of it would be of great value, as bearine on the harrows and ancient grave-mounds which ro being explored in this country. I have to deal with them architeoturally, and yet I feel hat the little I have got to say is not without its mportance as hearing on many points of archæo ogical interest.
The chief desire of a Chinaman is, that descondant shall always "stand at his grave, meaning hy that phraso the performance of religions rites. The present Emperor performs these coremonies to all the deceased monarchs of his own dynasty. As the Ming dynasty onded in 1628, their tombs have had no ono since that period to perform the necessary ser ices. The locality is abont forty miles north of Peking, and a fine road, with splendid hridges,-now all gone to rains,-communicated with the capital, and hy which the emperors of that time went in state to perform the due ites of ancestral worship. As we neared the tomhe, on our visit, the first feature we came to was a pailow, of five gateways, in fine white marble. No one who is familiar with the gate vays of the Sanehi Tope, in central Irdia, could have failed to notice the marked resomblance, he wooden origin of its construction was pal pahle at the first glance. Ahout half a mile further we passed a second gateway; hut this was not a pailow; it was huilt in the form of a house. We passed another of the same kind and thon hegan one of the noted featnres of the Ming tomhs, that is, a long dromos, with colossal tone figures on each side. This strange ap proach is nearly a mile in length. There are hirty-two figures in all, twenty of them being arimals, and twelve are buman. They are in pairs, opposite each other, and facing the road. way. First are two grimins couchant, then two standing; two camels recumbent, and two standing ; then elephants, asses, and horses, in the same way. Tho human fignres seem to re all of sto warriors and priests. and in what we understand hy rude art, yet they aro not of a high class of work. I felt in looking at them how snperior tho oonventional forms of Egyption art were for sach purposes. I afterwards found that a row of animals were no ancommon at important tombs.
On reaching the ond of this soulptured arenne the Ming torohs become visihle. They re called the Shi-san-ling, or the Thirtecu Tombs, for that is the numher of emperors huried at this place, They are about two or tbree miles away from the end of tho avenue for it is the approach to the whole group, and the tombs extend for some miles along the hase of the hill, which forms an amphithentre all round, My first impression on sceing the tomhs,-from roofs and walls heing visiblo through the troes which anrround them,-was that they were country villas. I was admiring he heauly of the site, and thinking what a pleasant placo it would be to live in, when I hnuses of the dead and not of the living. Ther have all a southern exposnre, and are protectod by the bills on the north. This arrangement is due to the Fung. Shuie's controlling powers.
Our party made for the tomh of Yung-lo, wh was the first of the Mings buried here. He changed the seat of government from Nankinge to reking. His death took piace in lias, which will indicato the for it tombs in this part of China it is an oarth mound but of imperial proportions, I had no means of mensnring it; hut it is said to he ahout sald mile in circumference, and my own impression buth. There is a retaining wall arent and ahout 20 ft a retaining wall, crenellated, the surrounding ground I should say that this mound is wholly artificial. There is nothing to indicate where the interment has heen. I have little douht hat there is a very large coffin, and that it is placed somewhere under the centre of the mound. There is no entrance. I should suppose that it would not he difficult for any one
in Peking to get all the information as to how
the intorments are made, as to the coffin, and funereal ceremonies : it woll as regards the valuahle as giving light on this most primitive mode of sepulchre. To the student of Indian architecture this grave heap will ho of arcat interost as giving us almost the oxact model of snch monuments as the Sanchi and Manikiola Topes; which we know were developmeate from the tumulns and tho cairn.

As all graves in China are places where offer. ings are made, they hecome, as it wore, altars or temples. At an emperor's tomb a temple is constructed for these ceremonies, and in the case of Tung.lo it hecomes an important addition to the original tumulns. A rectangular space sonth of the tomb is enclosed hy a walls it is ahont $1,000 \mathrm{ft}$. long, hy 500 ft . wide,-I am sorry that I cannot give you accurate measurements, hut our visit was 80 short,-within this are a numher of huildings, one heing the finest specimen of Chinese architectnre which came under my ohservation, The plan is exactly that of a Yamun or a palace; in this I helievo we have a very ancient idea which may he traced yet, that the tomh, the temple, and the dwelling were symbolically repetitions of cach other. The House of God, the House of the Living, and the House of the Dead, are words which illustrate the old idea, and many evidences might he given, and the reasons which underlie it might also he explained, if that were the subject of the even. ing. China in her religions, philosophical, and political systems, hrings down to us much that is primitive, and these large grave mounds are ar evidence of this. In China tho differences be. ween domestio and ecclesiastical arohitecture does not exist. The temple there is still only a hetter house. If it is a grand temple then it re. sembles a palace, and this is the case at the tomb of Yung.lo. Inday romark while on this point of the subject, that tae connexion bet ween a tomple and a house is still more intimate in China, Every house in that country has its altars, thus making it a temple, 1 pe porest house I have heen into had something in which to harn incense hefore the ancestral tablet. Even those who pass all their lives in hoats, who are horn and die on the waters, -where the hoat is the honse, -they havo a small portion of it get apart for the worship which it has heen their custom to praotise.*

## SOOIETY OF PAINTERS IN WATER

 COLOURS.The twelfth winter exhibition of sketches and stndies by the members of the Society of Painters in Water-Colours might give somo opportunity for something new to he said of it, if it were any less interesting than the gene. rality of thoso preceding it. What recommenda. tion to puhlic notice and admiration can it need heyond that to he fornd in the catalogue?
It is helow platitude a degree or two, now, to affirm merits that have long ago heen univer. sally recornised and acknowledred,-to insist on pronouncing things excellent that no one said, zays, or means to say, if it can he avoided, are not. Once, and since, twioe a year, a visit to the Society that has helped so much to disof Nature, to whom the members stand as high priests, was and is exception to dispnte the theorem of "no pleasure realisinc its anticipa. tion" ; for, who was or is ever disappointed with winter or snmmer show of what the cleverest landscape-painters represent so well in this gallery :
No sooner has the swing. door closed out the noisy streets, than the smell of fresh grass and of wood-fres; the rustle of leaves and of waving corn; or such as the sca will causo on the shingle when it plays at touch with and within its houndary of earth, on sunny mornings (plea. santer to hear than the roar of it when tho mighty monster grows angry, and writhes and wrestles, assaults and batters for more room and a wider share of the world; or its moan in retreat, aftor the hattie; for there os a King who says, "So far shalt thou come and go, O Sea, hut no farther !'"); and the songs of hirds; the distant tinkle of sheep-bells; the murmur of brooks; and the drowsy ham of gnats (that wonld he sure to he present in such a scene, for instance, as Mr. J. W. North's " Cront-stream and Flowers" (237), that vies with his delightful drawings of oas-trees and hedge weeds and rustic firures, "Acorn Gatherers" (198), in exquisite
qualities of colour) ; and the thousand and one other delights of out-of-town and town-house existence that association conjures up, s.em $t$ great one.

Wo do not mean to say another word about the landscapes on this pecqsion. Wo looked for the Right Hon. Mr. Gladstore's drawing (hon member), but could not find it ; his designs will he exhibited aud reported in another gallery, no doubt. Mr. Ruskin contrihutes two exquisit wonld help to indicate that tho "Stones of Venice" must he reans of fairy story. As ex anmples of what infuence a poetic apprebensio of fact has on fact, these drawings are choice and beantifu? indeed, but it must need a more and bemmon eyesich than common eyesight to perceive horal loveliness of scarce this more than common eyesight is ! A thousand English libraries,-millions books,-offer all the knowledge they hold solace, direction or edrice, leasure hold; give descrihe overy phaseand picture, - in words, oren human feelizer; teach all who read, everything that can be taught-save experience (wrinkles and gray hair accompany small grow th of this, often). The world as it was, is, and will he, is taught ns hy means of two dozen letters. Yes! just those thatlittlocurly-pated Polly sorapes for her frst whilig-lesson so soon as sho can hold pencil in one chubby fist and a slate in the other. There is not one more in tbe Bible than the twenty-four heginning witb $a, h, c$, ending witb zed: the bones of the body of all book-learning. A painter's means are double these, at least, and with these besides.
The keyboard of the grandest piano gives shorter opportunity for tho musician than the gamnt offered for painter's play, and yet tunes vary,-must vary, - to be thought worth anything; whilst pictures, like freworks, do not vary much. And so we do not mean to bay anything more about the figure compositions on this occasion, either.

THE LONDON AND VTENNA EXHIBITIONS RETROSPEOTIVE.
Almost at the same moment there have closed the London Exhibition of ' 73 and the Great Exhibition of Vienna, inaugurated as it was so Imperial help and patronage. All seems to havo gone off comfortably, and without mnch of mishap Of any kind, excepting great money loss in withont disturbing infuence, and ask ourselves, What is theresult of it all? Aud what do such displays point to and indicato in the fature of art and art production? All important questions bese, aud well worth a little cogitation.
In the first placo, it may be useful to bear in mind that the Great Exhihition of 1851, the parent of so many, included four main divisions got from the earth itself, or which grow upon its surfaco ; machinery, moro or less complicated for the purpose of moulding these raw unformed materials into shape and practical usefulness the useful resutts of this machine work in tho form of mannfactured goods of all kinde, from $n$ sheet of note-paper to a complicated coloured lithograph ; and then, lastly, the fourth division, tbe Fine Art, as it is termed, which is applied more or leas to these manufactures, and which membered, did not form a part of the frst Exhi bition of '51. In the later Exhibitions pictures were included, so that these last great shows comprebonded everything. Sculpture, a mord frome not a little indefinite in meaming, was to be seen in botb Exhibitions, as was architecture, moro or less. A few words on eacb one of these severel sections, and on what they indicated, and on their special worth may ho uscful, and may, perbaps, foreshadow a something in the future of art.
Raw matevials, then, are the foundation of these displays of the world's productious. Things as tbey aue broncht up from the depths of the fully and mysterionsly on its surfaco; things rongh and nnformed, thongh at the eame time it may be notioed full of beauty, and sometimes way imitated, by art, after all, or even in any ekill hestowd on them. It is doublabour aud good and interesting proceeding to collect as large a quantity of such rough and natural materials together, from different quarters of the
earth, into one hnilding, and to place them side by side, and then to comparo them oue with the other, and to note what they are best fit for is interesting and profitahle to find out what other countries and climates yield, and what more can he done when quite a new and unknown material turns up. Trade, too, here hrightens up at the sight of it. Science pries cruiously into it, and analyses it, and puts it to its best purpose. But still with all those advantages and prospeots, there is one consideration worth ooking into, and it is, -looking at such natters rtistically,-that the special materials to be cound in each conntry, and pecaliar to it, would seem almost, in some mysterious way or other ond hest fitted for it, and for its special need It is, whon we come noth nsefully and artistically his wo wo come to look closely into it the frst time, a little douhtful how far any one country is able to work well with the material poonliar to another and a distant one; or, if it pan do this, whether tbe energy and skill expended on them would not he better applied in worsing on the materials proper to itself. It is thought, when we see what, - to cito hat one instance, 一the native Hindoo can accomplish with somo special product of his own oonutry And then to go a few paces and see what another rationality, 10,000 miles off, is found to do witb the self. same material. This has been, in almost overy Exbibition wbich we have seen, exemplified not a little remarkahly in vood-carving, wherein not only tho cliaracter of the orna. mentation, and the art-style, have beon peculiar to the conntry of its birtl? ; hut the very material itself is found to he speoially adapted to it, and to he suitable for the speoial worl. The colonr and texture, and graiu of the wool, are in all or noarly all, cases, found to be, and ft for, the special obaracter of the carring. It is a ques tion for the futnre, may be when art a ques turn, how best to make use, without loss of power, of a new material. The trae seoret of a real success, and a real "progress" in art wuld seem to lie, not so mucb in new, and stil hows in foreign materials, is in tho fruding out in them It may be wo thint safely that if the may bo, wo think, safely afficued, aat ore Brish wood-carver, for example cood ho good wonk with own British oak Indian teak, or irdy he likely to do hetter wit Indian ceak, or iron wood, Or Australian wood ostrange to the touch and eye. These con thirke, so much having heen mado of the " open ing up" of new materials, almost as the "openhad none of our own, or they had been foun out to be worthless. A thoroughly good, an exhaustive display of pure native British woods is yet a desideratum; not, bs it ohserved, put aray in glass cases, but open to the touch and inches, and dainty walking.sticks, hut in piece of practically useful size. We hare cited but one material ont of a long list. Much more might be said hero, but we monst forhear. Thero exemplify, one thing that strikes us, and wil the end, from almost any old Gothic roof, will show to any one the nature of the timber, the ing it, and the 1 , the beet method of would not sucb roof timber be a rood tbing to go by It is indicative of a useful "wood" show.
Nachinery, wonderful machinery! which bids nan's do any justice to it. To the artistic eye the triumphs of machinery in these exlabitions wer almost appalling. The mechanism all hut lived, there was nothing it did not seem to be capahle of doing almost at any speed, and to produce vain to and justice to the mapio any kind of even poetica systeras of mechanism power of the complicated work, and whicb brought forth their produce before the rery eyes of the wondering specmysterious ane raw materials pass by some mysterious agency into useful things, all ready for use and wear; while the fisitors glanced a troughs, and delivery-troughs. A tiue magic show, all driven primarily hy the hurning fire in he dim distance.
But the thonghtful spectator all this while coald not but look, not only at what this
mechanism did, but mnsthave thourht, -at least, we often did, -at what it could not, and did not, dol Here it stopped. Here it conld go no
further; a limit was set to its action and power of production. In this is the bey to the future of art and artistic aotion. The magic engine could roll and press and cut and magic engine metal, and even connt the coins stamp the raw it could not design the device on the coin, nor cot without the hand and hrain of the coin, nor cat which the han and hraiu of man the which impressed the penoy-piece! It could do everything in the production of a common envelope, but it could not design and engrave the littlo flower on it which forms the seal. It could make the paper, and print it, and cat it up and count the sheets afterwards, but it could not thinliont the priated matter. A most wonder. ful distinction not so much thought of as it will one day be.
We wonld pass now from the raw materials and producing machinery as seen in these im. portant Exhibitions to what was produced, to the useful products, out of the raw materials, through the costly machinery, and as, in so many cases, "ornamented" by art. Art was the last element whioh entered into the idea of these Exhibitions of the world's indnatry. But fow of the ohjeots exhibited, and which could in any wise be "ornamented," were to be met with which had not had somo artistic thourbt hestowed on them, All the "textile" fabrics had in them either in pattern or in colonring some art element. It was a curious and not a little instructive sigbt. Some amalytical power was needed sometimes to deaide on the relntive merits of the almost rival arts at work on the falrics. Sometimes it was the pattern or design that carried all before it. The mind bad design that carried all before it. The mind had to travel all the way to old Assyra sometimes wo find the original of the strange device, afterwards to fgure, might be, on a table-cloth or a muslin window curtain! Sometimos China drew the pattern on a hearth.rug, while the carpet on which it restel so comfortably got its novel and attractive pattern from a quaint Gothio source, invented perhaps by ark old monk of the twelfth century. It was, indeed, wcnderful to note where the patterns came from, and the mind had to travel fairly round the world, and throngh centuries of times, while contemplating the limitod amount of textile fabrics necessary in the fumishing of an ordinary bedroom or comfortahle little hondoir.
All the world literally came togrether to contribute to the novel display, and something surely ought to come out of it all permanently, and beyond the mere iden of a passing show.

It has sometimes occurred to us, when looking at what was done at so much cost in these Eshibitions, to ask, bow is it that they have not in some way or other done a something towards the creation of a now and untried style in art? All and everything seen in them was more or less copied, or, if not copied, the idea artistically of the object was foreign and distant,foreign to tlie country altogether sometimes, and distant, -sometimes centuries distant from the age in which we live. How is this? It is, says a great authority in such matters, "mere atfoctation and priggishness" to reject help rom the past of art. In simple despair tre must needs go back in time and borrow from th things philosophically, and looking at the great part of art, we cannot but ho struck with the contrast it presents to the present in principle of production. It is truly marvellons to ontemplate. The closer wo look, the greater the mystery and wonder of it. The old artists had, as it would seen, nothing to go by but tbat which had immediately preceded them. Not a thought else. The old Goth built his tower, not of Babel, and as he hailt it it changed in expressional power, as the style ho worked in pro-
ressed, as the old passed into disuse, and the ew arew into life and freshness. The old oetic the piled on stone, but it changed also. A wonderful progression from foundation to spire-top. We car now in mowise equal this feat of are; but could not the future of these Exhihitions do somewhat to enlighten us as to the future of art and architecture, and to point the new way that once upona timo was old?

Crystal Falace Secretaryship. We undertaud that 230 applications have heen sent in. A particuiarly modest man, hearing ns mention this, jersed out, "Then I should say there are 230 persons who bavo a very cood opinion of tbemselves." The position certainly demands peculiar qualifications.

## PROJECTED RALLWAY, DOCK, HARBOUR,

 AND PUBLIC WORKS,Tra notices and plans which have heen given and deposited with respect to applications to Parliament as to powers for new railway and other puhlic works show that the Privato Bill
legislation during tho next session is likely legislation during tho next session is likely
to bo somewhat heavy. The total number of Bills for which notices had been given* is upwards of 300 , of which 150 are in
respeet of railways, and sixty of these are for respect of railways, and sixty of these are for
projected new lincs by companies to be incorpoprojected new lincs by companies to be incorpo-
rated for tho purpose, whilsi upwards of fifty are applications by existing companies for exten sion lines and otber works in connexion with thoir several systoms. The tramway notices are comparatively few, tbeir nnmber being not more than eighteen, and several of these are for provisional Board of Trade orders. Thero are sixty applications in rospect of now gas and wator projects, and several of those are for works of a or projects of a miscellaneons eharacter are upwards of cighty in number, and anongst these
thero are soveral for proposed harhour, dock, and thero are soveral for proposed harhour, dock, and pier works of considerable magnitude, whilst locral anthorities in many large towns, for the erection of publio buildings, the construction of parks, and
large scale.
Of the aggregate nomhor, no less than forty of the Bills direotly affeot the metropolis. Of this number, twenty-two are railway projects, the Thames, whilst the Bills for undortakings of a miscellaveons charactor aro eleven in number
The railway Bills includo the Midland, Higbgate, and Alexandra Park; the Wandsworth (extension of time), and the Aldgate and Cannon. stroet (inner circle) lines, notices of which appeared in tho Duilder of the 22 nd ult.; hat it project, that it embraces an extensive line of railway from the inner circle, under tbo Whitochapel, Mile.end, and Bow roads, to a jnnction forms a junction with the East-London line, now in course of construction. One great merit thus claimed for it is, that it will open ont a now means of communication to tho large East-end
population. Witb respoct to the new streets to he made and affected by the proposed lino, it is ho made and affected by the proposed lino, it i
stated that the exporience of the last few yeare in the construction of railways under public thoroughfaros will ennble the engineers to construet the proposed works without unduly inter.
fering with the traffo in the several streets affected. There are three projects for connecting tho Alexandra Palace with different portions of tbe motropolis, The Great Eastern Company are seeking for powers to construct a lino com. zencing by a junction with their line in Tot tenham, near the point whoro the line crosses the Scren Sisters'-road, and terminating by a junction with the Lintield brancb of the Grea Hortbern line; anotber project is for the incor poration of a new oompany to constrnct a rail way, commencing in Tottenham hy a jnnetion with tbe Enfield branch of the Great Eastorn line near Lordship.lano, and terminating in tbe grounds of the Palace, on the north side of the refreshment parilion; whilst the third project Aloxandra Park jine, from tbe Tottenham and Hampsterd hine of tbe Midlaud Company to the Fidgoware and Highgate branch of tho Great Northern Company. Tbe Great Eastern and South Eastern Jnnction is a proposod new line commencing by a junction with the Great Eastern line near the Fenchurch-street station and forming a jnnetion with tbe Soutb Eastern line near the Cannon-street station, The Great Northern Company seek powers to construct line at Islington with the North London. There aro four projects for additional lines to the new line eallod the Crystal Palace and South London, - a new line to form a juricto comm the Brighton line from London Bridge London janction, and terminate on the south side of the Queen's-road station; alsoa line from the London, Chatham, and Dover, and London and Brightou (West-end) lines at Dulwich; a * Up to Saturday Iast, the Iust day ullowed under the
standing orders of Partiaraent.
station of the Crystal Palace line, and torminating near Brockley-lano on the South-Eastern Railway. Also, another line called the Crystal Palaoe Hirh Level line, commencing at the
present high-level station at the Palace, and terminating at Selkurst aud Croydon, on the Croydon and Balham line. The Ealing, Acton, and City Railway is a proposed new line between Hammersmith and City, and the Great Western aud Brentford lincs; the Acton and Hammersmith Railway is a proposal to nnite the North and South-west Junction with the Hanmersmith Extension line, with a now station at Aoton ; whilst tho Kingsbury and Harrow project is for the construction of a new line between Kingsbury and Harrow, commencing in the parish of Willesden by a juoctiou witb the Metropolitan and St. John's. wood Railway, passing through Willesden, Neasdon, Kingsbury, Wembley, and Preston, and terminating in the parish of Harrow ond the Hill, on tbe road leading from London to Pinner. The North London Company seels powers for making an embankment with a sea wbarf in Poplar, commencing on the north sido of the Blackwall entrance to the West India Docks, and terminating olose to Messrs Money, Wigram, \& Co.'s ship-building yard Tbe company furthor seek power to remove Blackwoll stairs dation. and also to trent an is siso stop up so mucb of sun treet wall of the lreat ing that street; and the western boundary of the railway viaduct over such street. The London and Blackwall Company seek powers or the oulargement and alterations of the Feneburch - street, Lemon - streot, Sbadwell, Stepnoy, Limehouse, West India Dock, and Millwalt statious, by extending the platforms on hoth sides; and also for building au entirely new station at Bow. The London and South Western Company have a bill seeking powers or the widening and otberwise enlarging and south-east sides; and also for widening and south-east sides; and also for widening Company have a Bill to enahle ther to oon Company have a Bill to enahle them to oonribute fands, or hold sharcs in any compauy or chambors over or adjacont to any any hotel tations. Ther or adjacont to any of thoi he block of buildings in Kensing to aoqnire as Methwold's Almigs in Kensington, known ral Company have a Bill for empowering the London and North-Western, Great Western, Midland, South-Eastern, Great"Northern; Great Castern, London and South-Western, London, Brighton, and Sonth Coast; London, Cbatham, and Dover ; and Metropolitan, and Metropolitan District Companies, to suhsoribe and apply unds towards tho construction of the line, for which Parliamontary powers have already been obtained. The East London Company have a hill for an extension of time for tho completion of works, and also for powers to purchase ortain lands and buildings in St. George's ain the. East.
The Motropolitan Tramway Bills inclndo one promoted by the North Metropolitan Company or powers to use roiseless steam-power; a Bill ow lines in St. Pancras, Kention Company for Brecknock-road; also for new lines in Eideware oed and Maida-volo, also a Bill by tho Wes London and Kew and Richmond Company for now lines and powers to nso steam-porver. also Bill for powers to construct tramways from the Vest India Dook Station to the Poplar Station of the Blackwall Railway.
Amongst the Bills of a miscellaneous character connceted with the metropolis is one by tho East and Fest Indja Dock Company for the contruction of slips, dry docks, and graving docks also Bills for the construction of subways under the Thames, between North and South Wool wich, and between the Isle of Dogs and Grecn Poljce-station for the removal of Bow strce for a boulcevard in Westminstar and other a Bil (already noticed in the (a)ready noticed in the Buitder) ; powers to Coke Company's huildings on Victoria Emenan ment, for site for new Mint buildings ; a Bill sceking powers to purchase land and huildings i Seymour-street and Bedford-street, Euston, foenlargement of the Railway Cleaing-house; a Bill for powers to purchase land and buildings in King William-street for enlarging the Lom-bard-street Post-office; a Bill hy the Metro
politan Board of Worlss for the constrnction o
now roads near Finshury Park; a Bill for the construction of new roads and improvements in Eaton-terrace and Eaton-place to Ovington square, Brompton, and the widening of Cadoganplacc, near Sloaneastreet, Chelsea; powers for aiteration of tolls at Covent-garden Market powers to Corporation as to City of London Police onperanvuation; and also a Bill giving powers to City Corporation and Metropolitan Board of Works for the compulsory purcbase and management of the Metropolitan gas companies.
Amongst tho projects connected with the provinees there are several of an important cbaracter. Indopendently of a larse nnmber of ontirely now railway undertakings and extension lines promoted by many of the great companies, there are several Bills, as we have already stated, in connexion with town improvements, pier wad water worka, and harbon1; dock, and promoted hy tho Nottingham Cornomtion af wide and eomprebensive charetor In this Bill the corporation col powerg for the conatruction of two large nevy corored marlets, together with a cattle-market, and public slaughter-honses. The Bill also enables the corporation to parcbase land for the erection of a new town-ball, moni-cipal-offices, court-houso, gaols, station-honses, and other offioes and buildings for public purposes; also to provido pablic parks and plaoes of recreation, and to erect build for the enjoyment of the puhlic; to alter and ertend, for manicipal purposes, the limits of the Nottingham Castle, and to enable the Duke of Newcastle's trastees to graut a lease of the Newcastle's trustees to graut a lease of the that tho oornoration may convert it into pahlic ibraries, nusoums, and art-exhibitions. Tbe Bill further seeks for powers to onable the corporation to purchase land ou the banks of the Trent for the purpose of conatrncting pnblic baths; to enahle tbem to hnild and maintain artizans awelings; authorises tbe corporation o encloso and lay out ornamentally any disused onrial.grounds within the borough; and, finally, nables tho municipal body to orect buildings for inland honding-warchouses, and to let and regalate tho use of them, The Bill also contains several stringent clanses for promoting and mproviag tho sanitary condition of the borough neluding the remoral on ruinous and dangerous buildings, and ohstractions, projections, and encroaghmonts in the streets; provides for the more effectual drainago of houses, buildings, and other property in the borough; the laying ont and completion of new streets, and the erection and alteration of houses and buildings; and it also contains clauses preventing or regulatine tbe etting of cellars or underground rooms as residences, and for preventipg the diefigurement of the front of buildings by sign-boards and adver isements. Tbe Corporation of Edinburgb have also a Bill for the constraction of fish, vegetable, and corn markets. A Wigan Improvement Bil also sceks for powers to huild a new market and widon the streets in that town. A Leiceste mprovement Bill provides for extensive drain age powers, and also for the construction of works to prevent floods in the river Soar. There are also Improvement Bills promoted hy the ride autborities respectivoly of Leeds, cam hrough, Dover, Swansea, and other plaoes. The Bills in connesion witb gas and water nadertakinge includo one promoted hy the Wake. field and District Waterworks Company (to he ncorporated) for the construction of new works o supply Wakofield and the neighbourhood noluding, amongst otber works, three large resorpoirg, The existing Wakefield Water Com pany are olso applying for powers to construct now works, inclading large reserpoirs. The Cdibburch and District Water Company have a Bill for new works on a scale of great magnitnde nelading the construction of five large reservoir o contain water supplied from the Rirer Esk The proposed works inclede sereral mileg of conduit-pipes. The Hartlepool and Wrexham Water Companies have also Bills for new reser roirs, whilst the water companies of Nottiogham, Padiham, Chester, Leeds, Maidstone, Broad stairs, Maidenhead, Belfast, and Mid-Lothian are also applying for powors to construct ex
 new works, and other existing companies for new works, and other exist
The dock, harbour, and pier projects include a
yowers to make three new piers er hreakwaters, $550 \mathrm{ft} ., 1,900 \mathrm{ft}$., and $1,200 \mathrm{ft}$. in length respectively, together with a pier and jetty $1,200 \mathrm{ft}$. long. The trastess of the Marquis of Bute apply fer powers te extend the dock accommodation at Cardiff hy the construetion of two new docks and a tidal harbour. The largest dock will be a continuation of the gouth basin now approaching completion. Its water area will be greater than that of the existing Bute East Dock, and it will have a quay space of upwards of $8,700 \mathrm{ft}$. in length. The other dock, and the tidal harhour on tho weest side of the town will involve the diversion of a portion of the river Taff. The water area of the dock will be seventeen acres and a half, with a quay space of $4,350 \mathrm{ft}$. in length. The Swansea Harbour Board apply for powers to improve the harbour, make now docks, extend the piers, and construct a new embankment and pier. The Satton (Devon) Harhour trmstees seek powers for the conversion into a dock of part of Sutton Pool, and also to construct dock walls and embankments. A Bill for the improvement of Neath river harbour includes powers for making a new navigahle cu and embankments. Another Bill provides for the incorporation of a company to construct a new dock at Whitby; and there is also a Bill seeking powers for the incorporation of a comdoeks at constrnct a wet dock and two gravin trustees are appling for liadig Harbon rubank arnts, works The Londonderry Port works. The Londonderry Port and Harbour the bed of the river Tople there is also atil the bed of the river Toyle. There is also a Bill for powers to construct a pier $\mathbf{1 , 2 0 0} \mathrm{ft}$. long at Melcombe Regis, Weymouth, together with a
heading and landing places at all times of tide, and also to erect on the pier-head music, bath, and refreshment rooms. The Tees Conservancy Board have a Bill for the construction of a graving dock, and thero are also Bills for the
constraction of piers at Sandown, Islo of Wight constraction of piers at Sandown, Isle of Wight Cattle Water, Sidmouth, and Yarmouth.
" No small amount of both "capital" "Iabour" would he needed in carrying out this programme. All are interested in forwarding such wrorks when wisely conceived and honestly intended.

## HIBERNATION IN PUBLIC PLACES

Everybony is no doubt aware that on public fountains-thongh they are not without some varieties, -have been stated to belong for the most part to the same class of art as the conventional lamp-post. It was supposed, time agone, hy some observers, and the supposition articulated distinctly with the aid of their all-too-flippant tongues, 一 that the area-railings, the posts at the street cormers, and the lamp-posts of ordinary hife, were in some niystcrions way members of a common family. They were all, it is true, so unpretentions, - not to say dowdy; and had so little marked feature of any kind about them, favouring ono another mainly as being all mado up of dull negations, that t attribute near rolationsbip in the absence special knowledgo seemed to require a stretch of cemerity heyond the safe proceedings of pruden you cannot say with justice and confidence that they have a lot of characteristics in common. It is just possible, however, that some of the confidence from an cxomination have got their Such works bear at times inscriptions that gires information as the artist's studio from which they emerge. . . . . When the street fountains appeared also in handsome cast.iron, - in imitation of Roman altars and tea-urns, in the midst, and in the other forms dictated by in the midst, and in the other forms dictated by a severe but enlightened fancy, it was, we have said, concladed at once that the long-established
lamp-post family, being possessed of eleration lamp-post family, being possessed of elevation and position, was conrted by a new set of German cousins. Like many poor relations, the new comers felt, to all seeming, their inforiority, their want of fresh graces and charms, that
conld enable them to stand by themselves, and conld enable them to stand by themselves, and do without the countenanco of their congeners, -
equally unlovels, it is true, bat possessed of that equally unlovely, it is true, bnt possessed of that
best of attractions the "established thirt best of attractions the "established thirty years," Which, in well-regulated communities, very pronecessity of other claims to consideration Under these cincumstances, the modest new race of dowdies shrank into the shade. Perhaps no
one has much regretted this consequence of their estimate of themselves, and it weuld be an invidious and painful task to call public attentien summer aspect. Harsh peeple havo said, indeed, summer aspect. Harsh peeple have said, indeed, sistent with the performance of their useful functions, theirs (the harsh people's) would not he the voices to bid such fountaing to retain even their present prominence. Reduced to etherial condition from their too solid form, their change would be viewed without emotion, without bitter regrets or sad memories. They might hido thomselves in hoarded pamp-cases; and no eye would suffer for tbeir shyness.
But there are in London a fow,-it is to be feared a very few, examples of fountains that are works of art and not unpleasant objects for the sight to dwoll upon, even when oompared with the grey smoked brick dwellings that in all their rich laxuriance of fancy line our better-class thoroughfares. We will not vonture to point them out after the remarke above; it might be supposed that we wished to set the guardian Nymphs by the ears. which wonld be all too cruel sport. It may be seriously affect the appointment of these guardians. While it no doubt happens that those in qnest of employment regard the care of the gentlo stream from a quarter-inch pipe as not quite so dignified a post as that involving a residence in the neighbourbood of thundering torrents. It is to be hoped for the sake of nymph-nature that this is forgotten when the ormal installation has taken place, and that every one feels a becoming willinguess to do
anything dreadful that may be necessary in honour of her office, i.e., her own social rank But this by the way. There is one such foun. to nemory by the mention of these attendant goddesses. It is pleasant to see, when it is allowed to be visible. No sooner, however, do fogs and Lord Mayor's Day gladdon the world, than a sor of exaggerated hip.bath is inverted over the kneeling fignre and her vase; and this truncated extinguisher is submitted for pablic admiration, till soft spring renders it possible for thirsty people to be gatisfied to quench their thirst with water. Why is this? It is difficalt to suppose than at gure runs more risk of damago in winter not the dreaded danger, or it Fould not be covered jnst now, but might (thongh we doubt white world be suddenly boxed in when the the snow-fall. The basin might he closed up if fear is felt as to the suction of stale rainwater by onthusiasts heedless of the absence of the legi. canopy was pressed hy an ingenions tradesman on the donor of the fountain as an appropriate pieceof completeness, required by etiquette, with out which his gift wonld be deemed by every one a specimen of stingy liberality that pulled up stupidly over the ha' porth o' tar. Can it he that such a tradesman lies in wait? Will this account for this somewhat inexplicahle custom? Does he also keep on the watch, lest it should all into desuetude, - lest wo should not be called on to gladden ourselves with gazing, at
appropriate seasons, on this magnified thimhle?

DEATHS FROM ESCAPE OF GAS.
A singular series of fatalities, arising, in some of the cases, from gas, has just occurrod in diferent parts of England and Scotland, as
recorded iu last wcek's nepspapers. The coinci. recorded au last wcek
dences are curious.
At Bilston, in Staffordshire, a man and his wife were found lying dead in bed, and the corpse of the woman in particular was dread. fully discoloured. It is supposed that they perighed through an escape of carbonic acid gas rom the earth
At Edinburgh, in No. 56, Blackfriars-street, tho man quis wife were found lying in bed, tho man quite dead, and his wife appagas, and on examination it turned out that the gas-pipo by some means must have hurst.
At Leven, also in Scotland, a soung man and his wife, recently married, were found lying on he noor of the bedroom of a friend's house and his wife only semi-conscious. The house was a new one only recently occupied, and,
amengst other conjectures, cmanations from the new building have been suspected.
At Dundeo, a country girl was feund suffocated in her bedroom, having neglected to tarn eff the gas: she had perhaps blown out the light, as a ountry girl might readily do
In a nunnery at Bristol a young woman was found in a oell nearly dead, and shortly after she did die, from gas, which filled the room from burner left half on.
These aro all taken from one week's papers. In tbree of the cases Thursday night is named as the time of the occurrence, but whether in one and the same week is not clear. In threes of the instances, too, the door or window of the room had to be burst open.

## the message of art.

## the architectural association.

At the ordinary fortnightly meeting of the ession, held Friday evening, the 28th inst., Mr. E. J. Tarver, president, in the chair (when the dlowing gentlemen were elected members:Cessrs. H. W. Lockwood, J. Edsall, J. Payne, A. N. Bromley, M. Hulbert, R. J. Dickens, jun., . Gibbons, F. H. Farrow, Alfred H. Tiltman, F. T. Baggallay, C. W, Davies, and W. Wilson), Mr. Wyke Bayliss, F.S.A., read a paper entitled "The Message of Art, or the Legend of Bearty." In the course of his remarks he said that art was a great living influence. Everywhere there was abroad that which was ugly and ill-conceived. It was the province of art to discover the realism of the beautiful, and this was their true aim. Beauty came to them in many diferent forms here was poetry in every phase of life. There were many to whom art was a living language, which language was really a beautiful one. Art was one of the highest means of culture they possessed, refining and ennobling them, and filling their hearts with gladness. Beauty was that which pleased the eye, and, synthetically, that which gave pleasure to the mind. Art told them of everything that could be told of strength, life, and beanty. As Beauty, in the legend of "Beauty and the Beast," came to the king's son, awakening him from his debased condition of the rich inheritance of his birtbright, so the sacred influences of poetry and art came to them, ennobling them, refinine them, liftine them, ennobling them, refining them, lifting hem from baser pleasures, teaching them that bey were indeed the king's children, and that Bealuty was his messenger. For not the divia alone nor the philosopher was charged with a message ; but the poet and the painter also, heir message was about the heautiful. There were lilies hy every river side; there was poetry every here; and wat tho liles and tho olher lowers were to the margin of lhe stream, such should poetry and art be to their lives.

## Linger to kiss thy feet;

lower of song! bloom on and make for ever
The message of art was always and everywhere for their good. He that was not better for looking apon the splendour of the creation, would not he better for looking upon the face of the Creator; be would only shrink blasted from His presence by the excess of light. Then the message of art was always and everywhere a protest against evil. Against the raging fire of sensualism and tho dead ashes of materjalism alike, Greek art gave its protest in the passionless splendour of ideas heauty. Against the hrutish law of force, every gentle legend of the north was like the soft hand uplifted, weak, it might be, physically as the gentle hand of a woman, but with another kind of strength, migbtier than the hammer of Thor. Was there an evil in the cruel and stern dogmatism of the Medixval Church? Then every sweet picture of the Foly Cbild or the Virgin Mother was a message to stay the fire and sword and rack of the Inquisition. Yet, once more : was there an evil still existing in the world, in the hard, grinding, pitiless, compctition of their own times? Then poetry and art gave their perpctual protest against it in every dolicate rendering of nature by the painter, in every refined thought or nohle aspiration of the poot. But the message of art must always be about tho beautiful. The only hope of the modern school was that it had found a new life, not in the traditions, but in the stndy of nature out of doors, - in the fields and under the blue skg. The mesenge of art, the pursuit of the heautiful, as in poetry and painting, was still the "holy
grail,""一 the one quest; and by seeking it, it
meant the fruition of thoir manhood, the blossom meant the frnition of thoir manhood, the blossom part of our faith, and this message was everywhere and always good. He kuew that in taling man for a theme lie must take lim with all his passions of life, both good aud evil; but the grod and evil must not stand as ce-ordinates if act was to be the king's messenger; it must show the mastery of evil, the nltimate triumph show rioht ; it mast rise, 一

## In ever highering eagle cirole up

To the great sun of glory, and shenec swoop
Dowa v.pors all things bage, and dash them deat
In the discussion which followed, Mr. Riddett, in proposing a vote of thanks, said he remembered, some six years ago, Professor Kerr stating in those rooms that there was growing top a very rapid worship of the ugly; buthad the Professor been present that night, ho would have found an ardent admirer of a contrary quality
Mr. J. Douglass Mathews briefly the vote of thanks.
Mre. S. Flint Clarkson said that as architects were generally looked upon as prosaic people, he would say a few words in their justificatiou. It was a national characteristic to suppress our everswhere o lepreciation of art-crition This, no douht, had an evil effect on the national character. There had been, too, for some time past, in the public press and in private circles, were alluded to giviug occasion for smart sayings; but stopping Giving occasion for smart sayings; but stopping
there, it seemed to him, was a deplorably had habit, and was had art-criticism, which seomed likely to bring out an evil foeling which they ought all to deprecate.
Mr. Boyes thought that the pursmit of the Coantiful and the love of the beautiful were the reve aim of all art, and being artists they should keop that before them; this was a sort of roligion in them, which they helieved in profonndly, though there were many obstacles in the pursuit of this helief. The prevailing wor-
ship of style and precedent was a great obstacle ship of style and precedent was a great obstacle in the pursuit of the beartiful; hut it was time that they got rid of followit
After some further remarks from Mr. Elkington and the chairman, Mr. Bayliss replied, aud the proceedings then terminated

## WOODWORK AND JOINERY IN THE

VIENNA EXHIBITION.*
Iv presenting my report upon Woodwork and Jomery, I feel desirous of making a few preLiminary remarks
Fiest, with regard to tho Eshihition itself. Gince my return I have often been asked what I chought of the great show at Vienna, and have beors compelled to say that I scarcely saw it. 'Looking at the arrangement of the exhibits from \& reportor's and workman's point of view, it has seeecoed to me that too much importance has been attachod to the geographical position of the country supplying the article exhibited, and too $\$ i t t l e$ to the fact that, if a proper comparison is to be made, the productions compared should We,-as far as possible, -in juxtaposition. If the
whole of the articles had been arranged accord. whole of the articles had been arranged accord-
ing to material or class, the work of three days ing to material or class, the work of three days
could easily have heen accomplished in one, and could easily have heen accomplished in one, and comparisons could hove been made with much
oreater easo and certainty. I am quite aware greater easo and certainty. I am quite aware not have had the best effect; but it is a matter for serious consideration whether it is not of ninfinitely more importance to institute perfect comparisons than merely to please the eye of the acdinary spectator. After working hard for crearly a week, I came away fearing that my work was imperfeotly done, and that I had missed many things which I ought to have seen, and fesling that the time had been too short for justice to be done to the various subjects.
Next, with reference to the classification any notes. For reasons which I shall state hercafter, I bave placed first, and dwolt someIhut at longth upon, wood.converting machinery. carpentor and joiner; third, buildings and house joinery ; fourth, cabinet-work and furniture generally; fifth, machines nade to any oon siderable extent of timher; and sixth, timber

By Frederick Smith, Manager, Union Land and
.ruilding fociety, Manchester.
trelf. In the latter portion of my report I make some remarks npon the work I noticed in belieping that it is in the streets and we passed, thet the truest exhihition of the aye workshops man's skill is to he found of the average workman's skill is to be found, at auy rate 80 far as intention to makeany special reference to dot my except where I feel compelled to do so to design, except where I feel compelled to do so in order to illustrate my opinions, as I have no desiro to be
canght poaching on the domains of my fellowcanght po
With r
With respect to the workmanship displayed in the construction of the varions machines, desire to express no opinion, leaving that to the reporters on machinery. I shall chiefly con-
fine myself to the discussion of their adaptability ine myself to the diacussion of their adaptability
to the various purposes for which they were made. various purposes for which they wer
Holding strongly to the belief that in this ag Holding strongly to the belief that in this age perfect runs the least risk of being left behind in the race for commercial pre-eminence, and helieving, also, that the measure of a nation's machinery is, or ought to be, the measure of both I natorally turned with some andive classes, English agreeably cion in the Machinery Hall, and wase a thousand niles of land carriage, our manufacturers stood foremost in the quantity of thei exhibits.
When, after looking round, I discovered that large as was the assortment of machines, they represented only a portion of those actually in use in this country, and supplied by the various so fors who are exhibitors at Vienna, I felt that so far at least as variety was concerned, wo had nothing to foar from Continental nations, and consins. only rivals were our Transatlantio gratificatiou I felt at the kindness and candour of the English-speaking portion of the exhibitors. Erery machine was put in metion, and every speciality was pointed ont to me, without the least besitation; an example which was not followed by some of the Continental exhibitors one of whom even objected to my measuring the bed of a planing machine.

But some of the difficulties which $I$ and others of my fellow.reporters met with were, I helieve, simply owing to our inability to mako ourselves
undergtood. At the same time understood. At the same time, I would suggest bitors in flowre, it be made as condition that exhibitors allow measuring or sleetching within exhibitions mean anything, they mean an interexhionions mean
change of ideas.

## Wood-converting Machinemy

Worssam it Co., London, exhibit, among other things, an arrangement for giving the druuken" motion required in a circular saw when used for grooving parposes, hy means of one washer and a set screw, thus dispensing with They also show a set of mash commonly used. parqnetry flooriug, including a diso for turoing ap the squares when olued with vertical spindle, enabling two men to work at one pair of cutters; tho timber is held firm the table hy an eccentric roller.
Messrs. Allen, Rausomo, \& Co., London, among their machines exbibit a hand mortising-machine; and endless as is the variety of these machines, there have been improvements made in them of late. For instance, this firm lowers the table instead of tho chisel, and if the scrow and sup. ports are only made strong enengh, the advantage is great, inasmuoh as it not only maintains the stroke at one unjform height, but the spindle carrying the chisel sliding in perfectly rigid this, they seen additional advantage. Besides carded the sprin with other masers, to have distus, and now this step is taken, the wonder seems to he that a spring should ever have been fized for that purposo, Personally, I should have preferred a longer stroke, and I find that the indiaseen that in ars are still in use, although I havo a pulp. There are also some important improvements in planing machines, exhibited hy this firm with some other makers. They have dispensed with the flange from the pnlleys of the bund-saw, thereby greatly reducing the risk of breakage, and havo applied to their palleys 'a hinge bearing.
Charles Powis \& Co. show a cheap and simpl of which is that all the the principal advantages
from one shaft. They also show a plavingmachine, the spindle of which carries a flange for supporting the edge of the cutter, therehy mparting greater steadiness.
The pneumatic apparatus of Messrs. Allen,
Ransome, \& Co. ought not to be forgotten. By Ransome, \& Co. ought not to be forgotten. By are carried arrangement all dust and shavings conemy, and lesseniag the risk of fire
Messrs. Robinson \& Co., of Rochdale, have number of machines, amongst them a dove-tailing-machine of a first-class character a lorframe calculated to run 300 revolutions per minate, and a cross-cutting machine, having a chisel-sharpened tooth. When we consider that this firm stands in the front rank in England as makers of weod-working machinery, and that the machines they exhibit in no sense represcut the extent of their manufacture, but may he said to be only a small selection from their stock, and that the same remark will apply to most of the other exhibitors, it will be understood that this Exlihition must not bo taken as a test of England's strength in this direction
The English makers seem generally to strive to obtain such a form of machine as will enable them to cast the frame in a single piece, and to secure solidity, accurate fitting, and-ugliness. The utilitarian character of the people is shown in their machines. The exhihits are precisely the same articles which will he sent from their workshops in the ordinary way of trade. The same everlasting lead colour, the same stiffness of ontline, and also the same acouracy and strength.

## American Section

In this section, considering the great distance the exhibitors havo had to travel, the show i There are some very the variety is considerable. There are some very compact moulding machines by Rogers \& Co., Norwich, Connec ticut, some of the small ones at a vory reasonable price
A new machine to supersede dovetailing, hy cuapp, of Northampton, Massachnsotts, executes some very grod though novel work, and its small sizo and neat appearance will commend to the public.
J. A. Tay \& Co., Cincinnati, show a tenoning. machine with narrow frame, enabling the attendant to feed quite through the cutters witbout leaning over the table. Those who have worked a tenoning-machine will appreciate this arrangement. There is also a beautiful machine for making inckets.
The general design and decoration of the American machines is superior to the Euglish, though, for practical utility they are no better and in point of strength and solidity are scarcely

## French Section

In the French section, F. Arbey, of Paris exhibits a considerahle number of machines, inclading a trying-machine with spiral cutters by mearpening of the cutters beino accomplished when in of an emery disc traveling over then advantare in this arrangement; for to see any consider that the primary object of such we machine shonld he accurate worls such at simply clean work, and when we also hear in mind that a cntter for a 2 -inch mechine min be 28 in . to 30 in lones the difficulty of must an even. to 30 in . long, the dieculty of securing tho impossibility of applyine a spiral snrface, makes me think that spiral will sever be makes me think that spiral catters machines. Several other machines trying-up by this maker, includiner machines are shown for manual power, very chenperal saw-benches apparently well adapted for light work of them apparently well adapted for light work
rious comntries, senttered an and kinds from various comntries, senttered up and down, but none of them, so far as I sew, calling for special remark.

## Joiners Tools.

Heissinger, of Nurnberg, shows a case of joiners' tools in hoxwood, and a cabizetmaker's hench. The case is a credit to him, both in dosign and execntion. The tools, also, are well finished, hat peculiar in shape ; the handle at the front end of the planes would be puzzling to an English joiner. There are no hand-saws, and the sqnare hlades are very narrow, which must make it easy to force them ont of square. Next is a case of tools from Leipsic. Here We see the marked difference hetween the
Enghish and the German tools. The bench
planes are very uarrow, the mouiding planes are all worked npright instead of being sprang as ours are. The olumsy looking frame-saw, and the variety of tools for doing the work which the English joiner would do with his plough alone, did not tend to impress mo with a belief in the superiority of the German tools. The exhibi. tors of this case have had a medal from some exhi. hition ; hut most of the tools I saw-an English hition ; hut most of the tools I saw-an English workman would consider rude and ohsolete. Phere are other cases of tools from Rhenish Prassia, many of them well finished, hat the hand.saws are conspicuous hy their absence.
Of the English makers, Spear \& Jackson, Ward \& Payne, Kenyon \& Co., and others, show joiners' tools, principally steel tools. The grinding of these tools is saperior to anything of Continental manufacture. I could havo wished that the show of planes and othor wood tools bad been larger.

## Buildings.

The huildings of the Exhibition itself and the annexes, arc, generally speaking, of good design, and the work is sufficiently well executed. The main haildings differ from those of previous Exhibitions, in that they are lighted from the side, and have a boarded roof; the inside was therefore cooler than it would have heen had the roof heen of glass. An additional advantage is, that there are no galleries, thas much labour is saved to the visitor. The roofs of the French annese are formed of rihs of oak, bolted tomether in segments, and strengthened hy laminated rihs ahove and helors, the whole retained in shape by forked tio rods and king bolts. The span is ahout 60 ft .
Some of the other annexes have what may he called hammer. beam roofs; hut in consequence of the struts passing across the middle of the hammer. heam, and straight up to the purlin, one fails to see what purpose the hammer.heam serves, except to produce an optical illusion-an illusion the worst which could he prodaced in roof, namely, an appearance of deflection.
In the grounds is a Russian honse and out hnildings, hy G. Winterhalter, St. Petersburg constructed of $\operatorname{logs}$, ahout 9 in . diameter, very neatly put together. Every possihle portion is of timher, eren to the cornices of the living. rooms. The work is well done, but the orua ments are remarkable for heing all angular.
Thore is a village composed of honses built in the styles adopted hy the people of the various portions of the Austrian empire, and a church with a groined root supporting a hell turret, al of timber. The work is most of it ill execated aud contrasts unfavourahly with the Rnssian specimen hefore mentioned, and with a Swedish dairy, the work of which, is well as the selec tion of tho timber, is exceedingly good.

## House Joinery.

In this olass of work, England and America show nothing, for the joinery of the workmen' sottages and the offices of the Commission can scarcely bo called exhibits. In theso, corrngated iron was the speciality, though, to my think ing, the visitors might inspect the sanitary arrangements, and be henefited therehy, for they are the only decent closets and lavatorie I saw on the Continent

Stroman and Larsomm, of Gothenhurg, show some very good mouldings, and various kinds of joinery, well execnted; but the panels are all jointed, and the wood hadiy matched in grain and colour. Other Gothenburg makers show a quantity of joiners' work, including splayed circnlar soffits for windows, not sufficiently well executed for England. There is also a spiral staircase from Stuttgart, with oak treads and risers; tbe design and proportion are very good, hut the rail, instcad of heing moulded from the solid, is in two thicknesses, screwred together from the is inder side; the joints are very bad, and the under side; the joints are very bad, and the
lower length is in threo thicknesses, the top pieco heing about 3 in . long, and $\frac{3}{-3} \mathrm{in}$. thick, and of a different colour to the rest of the rail. wonder bow a workman, able to make the rail a all, failed to see the defects I have mentioned.
The pulpit hy Goyers Brothers, of Lonvain praise, and, aften to need either description or praise, and, after the specimens of had work which I saw in Antwerp, I was ready to fancy that so much skill had heen lavished on that pulpit that there was none to spare for the rest of Belgium.
I also found a spiral staircase, with risers, halusters, and rail in bent oak, an exceileut illustration of the elasticity of the material, and of the skill of the workmen in hendiug timher;
also a model of a spiral stairease from Brazil, with scarf-jointed rail, and I wondered why no English workman or firm had sent, at least, a model,
made.
In Venetian hlinds, cironlar-heeded windows have genorally been a difficulty. In one caso this is obviated hy an arrangement like two fans, which olose up the aroh, and have a very neat appearance. In England, when the blind is drawn up, part of the light is hlocked out, and the window practically shortened. In Vienna, they of ten ohviate this by forming a box above the sash head, and drawing the hlind into it, $-\Omega$ great improvement upon our plan.
In parqnetry flooring, England is a long way behind. Porlaps it is that our damp, cold climato causes ns to prefer oarpets; but, he the canse what it may, althongh there are many specimens of this class of work, I saw none hut what were from Continental countries, some of them very elaborate and heautiful in design, and superior in execntion; in fact, there was nos
olass of exhihits which struck me as beiug soi uniformly good. I am informed that noss of the machinery which is mado in England for this work is seut to the Continent. Some of the principal exhihitors are,-CCarl Sterkel, of Ravenshurg; Baner and Rehorsh, of Breslau and Berlin ; Blumer, Strashurg; and Tlasson, of Brussels. The Brassels flooring was specially excellent, and in these exhihits Belginm partly retrieves her character.
As in most Continental exhihits, the judicious choice of colonr strikes tho cye of the English visitor, as something to which he is not accustomed.

## Cabinet Work.

Nothing struck me more, in examining the German specimens of cabinet work, than the wide differenco in the quality of the workman ship. The designs were generally excellent hat, taking two pianos placed almost side by side, in one the joints wero painfully apparent while in the other, hy F. Neumaun, of Hamhurg the framing and cross-handing wers perfect seoimens of clean work manship
Another, in ehony, by a Berlin firm, was excoedingly chasto ; the ornament was finished clean from the tool, and the rest of the work was all that could be desired. The same remark applies to the specimens of many other German exhibitors; hut I noticed two wardrobes that were very inferior, and onght never
found their way to the Exhihition,
An ehony cahinet, by a Dantzic firm, is very beantiful in design, the colour dead black, and the onrved mouldings and general finish reflecting great credit upon the workman.
Among English exhihitors, Messrs. Jackson \& Graham, Holland \& Sons, Walker \& Sons, and others, show specimens of the skill of the English workman. The two cahinets hy the first named perfect marvels of esigns by Owen Jones, are and ont. The one in ebony and ivory is a masterpiece of cahinet work; the most rigid scrutiny on my part failed to expose a single farr. The second firm show a splendid marquetry tahle, aud the others have arti
Tho Italians show from Miland
Tho Italians show, from Itilan and Florence, quantity of furniture. From the former city design hut wretched in y antion; also an ab and ivory cabinet with lapis lazuli an jaony ornaments, yery haty lapis, land it jaspor placed beside that of Jackson and if could be placed beside that of Juason \& Grahem, the contrast would be plain to tho most snperficial from Carlshad fuere is also a marqnetry cabinet from Carlshad, full of work, hut of a very inferior
quality. uality.
There seems to he very little ecclesiastioal work in the Exhihition; tho Belgrian pulpit is he principal article in that hranch of joinery. Anstria, and particularly Vienna, has a fine show in olock.cases; onk and walnut are the principal materials; walnut seems to he an especial favourite with the Viennese workmen. The design and workmanship are generally excellent; in fact, the workman of the Austrian capital appears to be in advance of his Con. tinental hrethren.

## Machime Joinemy.

In these days of iron thero is little scope for the joiner in the frames of machines, except in hrashing-machines ; and here Rohey \& Co and Marghall \& Co. vie with each other ; the one
exhibiting a framo in oak and pitch pine, and the other a similar frame in pitch pine and iron, hoth well made and deserving praise. Somo my attention; they were exceedingly well put my attention ; they were exceedingly well put
together, as American machines almost always toget

And this leads me to ask how it is that the workmen of the United States are 80 far in advanco of those of Sweden, Norway, Germauy, nd other conntries ? It cannot all be owing to fact of their haning ahundance of timher, for ine countries 1 have named timber is plentiful. It not partly owing to the fact that very many of the hest of the Continental workmen find a omie in the states, coupled will the fact that When they reach America they are fottered hy o such absurd restrictions as provail in their native laud, and are freed from the curse of enforced military service, and so hand down to their children the glorions heritgge of unfettered intellect and unrestricted enorgies.

## Tinber:

There are some very fine specimens of timber hown iu the Exhihition grounds, among which a piece of straight ash, 93 ft . long, 2 ft .8 in . ft. attom, Ift. 4 in. at top; a heech, 80 ft . long, it. at hottom, 2 ft .4 in . at top; and a splendid pine about 150 ft . long, 3 ft . at bottom, 11 in . at op. The timber most used in Vienna is oak and a species of spruce-fir of two kinds-one resembling American spruce, and the other not nolike Norwegian red deal-neither of them very easy to work, and that makes mo wonder that machinery is not more generally used. Mruch of the timber used in Vienna is rafted up the Danuhe, and the price of oak at the quay, when purchased in considerablo quantities, was given me by Herr Paulick at abont one gulden sixty sreutzers por cubic foot, or something like three shillings sterling. The timber used in Dresden rafted down the Elbe in the same manner.
I visited the workshops of Herr Friedrich Paulick, and was received by that gentloman with the greatest kindness and cordiality. spent some time with him ith his office and work. shops, and was struck with the good fooling which seomed to exist hetween bimself and his worknien. He had some English machinery at work, hut complained of tho difficulty of getting his men to attend properly to it. Ho mentioned that it was his custom to give to his oldest workwen-I mean hy that those who had heen longest in his employ-a periodical honns over and abovo their wages, according to the amount of his profits. I saw there,--what I am sorry to say I nover saw in England,-trees and flowers growing among the piles of timber, and looking in at the office and workshop windows, zo that the workman could look out, not at a hrick wall, hat on a flower-bed.

In the construction of casements the Germans are in advance of us; hat tho great ohstacle in the way of adopting their windows arises from our wet climato and the difficulty of keeping casements weather.tight. Douhle casements are almost universal, and in Vienna the outer pair aro hrought flush with the face of the wall; the result is that there is scarcely any shadow on the front of the huilding, and the architectural effect is serionsly marred. At Aix.la.Chapelle I noticed many revolving shutters made to pull up with a strap; very well made, and apparently capable of pretty general application. At Antwerp the shop fronts strike one as very pecnliar. Here, also, I noticed the custom, which I havio alluded to as prevalent in Vienna and elscwhere, of hringing the doors and windows out to the frout line of building, and consequently giving a flimsy and gingerhread appearance to the fronts of the houses and shops by destroying the shadows. This is the more remarkahle in people who understand so well the shading of Aat ornaments, and is almost unpardonahle in the citizens of Antwerp, who have their beautiful cathedral constantly hefore their eyes; hat when we seo that they, along with the inhabitants of Aix-la. Chapelle and Prague, have striven to hide or disfigure the edilices which whioh it should he their delight and pride to show to strangera, hy surrounding them with cohhlers' shops aud cafés, one ceases to wonder at huge sheets of glass being hronght out to the face of a wall, and I felt inclined to say, "We manage theso things hetter in England.,
The joinery of Antwerp is very indifferent. Nothing hut the stump, tenon, and pin seems to find ravour with the joiners of that city, - a mode this country. I eary some not he allowed in
being fixed in a largo shop in one of the main streets; the design was elaborate, hut tho work manship was simply abominable, and no respeet able English builder would bave allowed himsel to be disgraced hy sending it out of his workshop, the conce that whilo onr workmen,-and, indeed, many of our architects,-are very far behind in art.knowledge, and have very much to learn in design, especially where colour is made a predominating feature, we are as arration greatly In adrance in the quality of our workmanship Exhihition, I do not hesitate to say that superior work can be foand any day in the workshops of nlmost any building firm in England professing to do good work.

Again, the great differenco in the quality of the exhibits, to which I bave already referred, the work of isolated individuals, and are not to be taken an criterions of the average skill of the districts from which they come. They are more carefol of lum life in they new buildings; at least, such was my impression on eomparing their scaffolding with the flimsy erections wo see in this country. It seems almost impossible to fall off a Continental scaf. fold, unless it is done on pmrpose ; the scaffolds being formed of squarc timbers bolked together, with wide floors, strong and close balnstrade,
and are reached, not by ladders, but by flights and are reached, not by
of steps or inclined planes.

I conld not help remarking on the journey, that the amount of waste land to be scen is infinitesimally gmall as compared with England. 'ibrough Belgium, Prussia, and Austria tboy scem to know how to mako the most of the land. Where they cancot grow coln they grow trees, and we find few immense commons in the very richest of their land, as. with us. Near the stations and crossings, rows of fruit-trees aro planted aloug the sides of the roilway, and in many places the turnpike-roads are marked out for miles by liues of fruit-trees,-an example which might be followed with advantage in this conntry.
One great drawhack to the development and progress of tho Continental nations seems to he the military spirit which is fostered hy the Governmente, and the waste and demoralisation consequent thereon. Vieuna swarms with idlo dradgery of the city. The waste of wealth caused by the withdrawal of millions of tho poople from productive industry must be felt severely by the rest of the population, and the burden must be especially beavy on the poorest clusses. Feeling this, I was not in a frame of mind to appreciate the exhibition of Krupp's and felt saddened to thinls that, after the doctrine of peace on earth and goodwill to men had been preached for nearly nineteen oenturies, the workmos of the most Christiau countries in the wurld should excel in the production of machiues or murdering each other.
We are often startled by the alarmist cry of only consider that every extra cau of corn would either in our own conntry or elsewhere, increases the gencral stock of food, that every extra articlo which is useful to man increases the stock available for liuman comfort, and that tho mission of every new machine (if in proper hands) is to iustead of fearing the rrowing skill of thir Continental bretluren, they would leave off thei Grankennces, become posessors of their arankincs, train their minds and the minds their children to a love of the beautiful minds of in art and in mature, and bid God apeed to at Toternational Exhibitions, and to every means which good and thonghtful men every means to bring men face to face in friendship. shall then not only cease to see women Rhall then not only cease to see women in
Belgium harnessed with dogs, and drawing carts; women in Prussia corrying hay out of the fields on their bocks; women in Austria elimbing scaffolds and working as plate-layers, barefooted; hut we sball cease to see in onr own country little boys and girls, who should he at school or at play, wearing out their young lives in our factories and workshops, nearly every oorner in onr cities occupied by a flaring liquorshop, one prisons and workhouses crowded, immenso wealth aad abject poverty elhowing ach other, and every largo town garrisoned by hundreds of mon living in enforced idlenoss on labour of their fellow citizens.

After visiting the lospital-trains exlubited hy

Baron Minnday, a man who deserves for more deeply impressed with those lines of Lowg fellow,-

## Were half the power thet fils thre world with terror, Given to redeem the buman mind frome error There were no need of arsenals nor forts."

In concluding my report, I desire to say that f any special machine or work has been omitted, it has been, not from any desire to leave it out out from shoer inability to examine the whole of the articles in that immense Exhibition in th ime at my disposal.

## OPOSED CENTENNIAL EXPOSITION

 BUILDING, PIIILADELPHIA.To obtain the best building, or set of build rgs, for the Exposition proposed to be held in Philadelpbia in 1576, a compctition was invited and forty.threo designs wore sent in. From these ten were selected, the designers of each being permitted to reviso and alter the details, and having for this purpose access to all the hers. Thore was then a second compotition flan revised desigus, from which the sucfessful plau was chosen. This design is by our country. man, Mr. Galvert Vanx, and Mr. G. K. Radford somewhat modifed, we welicve, by details takan from a design furnished hy Messrs. Sims \&
Brother, of Philadelohia, Brother, of Philadelphia,
We lave engraved a view of the interior of the building and the plan, as originally sent, and which it will be seen is novel in constrac tion. We will let the designers speak for themselves.

Although several largo structures are to be erceted in connexion with the proposerl sclseme for the Intemational Exhihition in 1876, it was evident that the problem to he first polved was tho plan for the main temporary hailding, and to that they mainly confined themselves.
The schedale of instructions elearly recognised the advantages to be gained by providing for the various groups of exhibits in concentric zones, as in the last Paris huilding.
The present study in its floor plan is based on a zone armagement, witb square instead of rounded ends, it being contended that this cor. plan, wis the facts better than the circular require the angles give to the nations that exhibition space in the departments, illastrating the results of bigh civilisation. It has, on the other hand, the main element of the Vienna plan in its twelve interior open courts, which have been designed with tho iden of making them as small as practicable, but are 60 ft . in the light and air of tho huilding, and the dis. cbarge of water from its roof.

The delivery and distrihution of groods was difficult and tedious in the Paris building, as its mode of conatruction did uot allow of acoess by railroad cars to all parts of the interior. This is proposed to he remedied in the present in stance, -direct oonmunications being provided doublo-track railroad. In the Paris railroad
was attempted, and no general interior effcet was attempted, and no special emphasis was possiblo anywhere, so that the impressions of tho fused, and the interininable circular line prevented vista effects of any preater length than ahout one-tbird of the short diameter
In the Vicnna building the rave and transept arrangement, whicb includes all the proposed any sufficiently, was not depended on to prodace any sulficiently satisfactory general effect, and a of permanent materials, tolgivo an adeqnately grand impression. In the present study the aim has been to make the tomporary building itself ire desirn elements or a spacious and impres. sire design, that shall be equal in dosirability for exhibition parposes in every part.
333 f ., the present desion dome with a span of 333 ft., the present design is made up of twenty one domed or vaulted pavilions, each 240 ft , in arches of 150 ft . opening, and fountain-courts 60 ft . in diameter. The various parts of the building are thus included in one grand wbole, and the result becomes a spacious hall, adequate to the emergencies of the occasion, with long vistas, contral and intermediate points of em. phasis, direct lines of transit throughout its
ation where really needed, and an entire relie from any appoaranee of contraction anywbere or the visitor is always in on apartment ove 200 ft . wide, that opens without any interme diate corridor into other apartments, also ove 200 fl . wide. Tbis resnlt is obtained by employ. ing semioircular roof trusses, springing from the round level.
The difficulty ordinarily experienced in thi method of construction, is that a long stretoh of roof is liable to be ilown over while in progress erection, cven where moderate spans are nsed, ecause the design does not include provision for lateral support or stay. In the present plan russes diffedty is avoided; for tho principal russes ased in the construetion of each parilion arc so arranged that each pair intersects anothe pair at right angles, the two groups being put in place at the same time, from the same centre rame or scaffold, so tbat when the centre frame, fter serving its immediate purpose, is moved on frite of the next pavilion, the structare rom which it is removed is left standing squarely on four broad feet, and is entirel securo from any incidental disaster arisiug from sudden wind-storm.
The trusses and framiug of the roof and fooring are to be of timber, with iron shoes and connexions as required, the roo covering to be shingles, and the gables and skyligbt to be glazed with rough or fluted glass, and the interior $t$ bo lined with painted eanvas or other suitable material. The work wonld probably he started with a oentre frame at the end of eacb main longitudinal passage.way, the hnilding advanoing by three paviions at a time, from one end to tbe other.
The circular of instructions jssued by the Commissioners calle for a floor-space of 25 aeres, of which not care tor a cluded in a permanent memorial building.
In the design illustrated tbe main temporary building provides 23
The principle of classification that has been dopted hy the Commissioners requires that five dopartments and a portion of the sixth sbonld unquestionably be exhibited in the main brilding The motive machinery and fine arts are intended by the schems to be provided for in separate buildiags, and it is suggested tbat other depart. ments may with propriety also be accommodated in a separate structure, containing about 3 acres and wbich may be located in a part of the park which will be more suitable for the permanent art building tban eny portion of the site to be occupiod hy tbe temporary huilding.

Offices for the various exhihiting nations buffets, retiring-rooms for ladios and gentlemen in other necessary conveniences, are provided in the gables, as shown on plan, and sites for ermed restaurants are indioated, Galleries are formed over the offices, in which light refresb ments may be served, and visitors enabled to rest and quietly survey the scene below: giving access to and eommonicating building, entrances and eommunicating with all the approaches to the building is a matter of detail requiring elose examination and full discussion hereafter.
In the design as anbmitted it was proposed tbat a hranch from the existing railroad, arranged for passenger trafic, should pass at a level of about 20 ft . above the side. walk, inside the boundary.line of the Exhihition.ground, and parallel to Elm-avenne, with high and low level entrances to the huilding. Tbis would bring all visitore who may an"ive by railroad, to the main cntrance, withont interering with pedestrians those who come in carringes or streetecars.
The cost of the design, an modifed and maneh enlarged, has been stated at ahout $4,000,000$ dollars,* The committee of the Exhibition have now recommended the erection of the following bnildiugs, viza:-1. The art.gallery, cotering one acre and a half. 2. The grand pavilion, or main industrial hall, covering thirty.six acres. 3. The macbinery.hall, covering ten acres. 4. The agricnltural hall, oovering five acres. 5. The conservatory, 6. Also, from time to time, smaller buildingh for specific purposes, as annexes to the above
For the art-gallery, to remain as a permanent Memorial Hall, the design of Messrs. Collins \& Antenreitb, architects, of Philadelphia, bas, we believe, been selected.
*ewings by mention that Mr. Yaux was assigted in the old country, Mr. Alfred deawings by a fellow pupil in the old country, Mr. Alfred
8mith,
to the of Inited Sonden, and now payivg a temporary visit

## HOMES IN HACKNEY WICK.

Situated something over a mile heyond South Haokney Church, and adjoining to the oast of Homerton hy a narrew street of built-upon land Lies the derelict corner of the parish of Hackney called the Wick. It bears about the same proportion in size to Hackney proper as the head and nock of a portly female do to the rest of her hody, her extravagent chignon perhaps included. Our comparison relates only to the built-upon, or the heing-buitt-upon, soil. The Wick is a
salvage of the original marsh land, which bas salvage of the original marsh land, which has
been lifted from the marsh within the last fow years, the process being accomplished hy using the Wiok as a monster " shoot," Its first settlers turingspeculators sectling down here outof harm's way, having as little desire of consuming their own smoke as they had of bottling the smells which their noisome products produced. A great portion of this marsh tract was exca-
vated for the purposes of brickmaking, and the vated for the purposes of brickmaking, and the
walls of tho first factories and houses crected walls of tho first factories and houses crected
ware built of the brick burned here. In the meantime Hackney and adjoining parishes, sent out their rubbish to be shot here.
Factories having sprung up with their tall shafts ; the management of machinery and plant necessitated the concentration of workmen in the
vicinity; the "Jerry brilders" of the metro. vicinity; the "Jerry bmilders" of the metro.
polis became alive to the waut of the neighbour. polis became alive to the want of the neighbour-
hood; and, after a_short interval, the first squat. ters in the marshes were housed in bran new brick dwellings as guiltless of drainage as they were and are of comfort or proper nocommoda. tion. Thus emerged the Wick from the low or swampy marshes stretching towards the Lea. Want haring created want, more sottlers oame, and more houses were pitchforked togethor, at different angles of the Wick. The hailders who shrewd to excavate the ground for underkitchens; for, much as they might desire to obtain, the sand below, it was scarcely worth their risk, as a donkey-engine would have hecome neceasary to koep ont the water while the foundations were paternal consideration of the District Board of Works, it will bo seen that it would have been akin to madness on the part of the hnilding speculators to devote a inoment's thought to houses, therofore, of the marsh diange. The their footings a few inches below the surface in some places, and in others, and the greater portion, they aro laid upon a stratum varying from 6 ft . to 9 ft . of an artificial compost, which we shall serupulously descrihe, - viz., a coanbination of, dusthin, ashpit, road.gutter, broken delft or crockery, tin pots, cans, and other cooking utensils, with a large addition of cahbage-stalks,
rotten matting, and the aisjecta membra of rotten matting, and the disjecta membra of
countless boots and shoes, and other decayed vegetable, animal, and mineral rubbish. Here may he found at times the City casual and the London tramp, with their divining sticks, poking the odorous rublish for shoes that do not pinoh, and the rag. pickers and marine stores' agent
striking bargains with the custodians or lessees of the "shoots." If old tin wereas precions as old iron, and old leather could bo worked into a pulp for india-ruhber, a thriving hranch of indnstrial employment might spring up. Over suoh doposits as we have described the habitations of the poor are fastly running up. Many houses have
no proper systev of drainage, becanse thoir base no proper system of drainage, becanse thoir base-
ments are below the hed of the foul open sewer ments are below the hed of the foul open sewer
that rans through the district. Some are barely that rans through the district. Some are barely
level with the marsh ditch, and only very few are a fow inches a hove it. The houses aro in fact positively water-logged, and the new houses that inost flimsy character. We examined the mate rials and workmanship of many. The timber is grcen, and far under the proper seantling ; the front walls are one brick thick; the doors and sashes are $I_{8}^{\frac{1}{8}}$ in. thick; the stairs are hoxed step. ladders, steep and narrow, with treads about 9 in . wide; the door-frames are merely casings of $\frac{s}{2}$ in. thick, with grounds or hlocking behind
to stiffen them, and on their cdses are planted a strip of ogee moulding, which answers for the ormamental architrave; tho window-sills are hrick coated with rubhishy cement; and the only inducernent to a tenant is that some of them include tolerahle patches of haokyards, which may he converted into gardens. This, however, tho occupiers helong to a class who keep piga o fowls, and other fancy animals. The mortar
used in the brickwork and on the walls fo plaster is mere rubhish, the latter laving a thin skimming of lime putty. In severa of th fonnd the backyards full to repletion with ashes and other ash-pit rubbish, and pools of muddy and other ash-pit rubbish, and pools of muddy gobbling and dabbling together. We would not ike to see the poor debarred from keeping poultry, nor would we have an objcction to make pouitry, nor would we have an objcction to make against the poor pig or the hard-working though
despised donkey, if they were housed at a dis tance from tho dwelling. Onr chief complaint are in respect to the situation and compositio of the dwellings dwelt in, and heing now ereoted for the poor. They are emphatically fever-nest buit upon hotbeds of disease, and they are to dear at any price, no matter how low their rent or how many their rooms. Will any medical officer of health challonge our statements? Will any samitary inspector, with a practical knowWill any independent report the fact to his masters : Will any independent witness, with compassion for the poor, go and see for himself, and if ho is convinced spoak the truth, and assist in promulgating it, that the health and lives of the
living and the unborn moy be saved? wrie once represented to be sown in a certain island like dragou's teeth, where they subse. quently sprang up as armed men. In the low and putrid sonl of Hacknoy Wick the seeds of fell disease are sown broadcast and decp, and it is impossible to doubt that some day they will sprintr to life, not as urmed men, but as pestilent iends.
Had Taylor, the water poet, been alive, ho would prohahly have colebrated tho fame of water-logged Hackney Wick in rhyme, after tho following fashion:-

## Of timber green, road mud, and rotten brick,

Rubbish shot there for good, one fathom thick,
Do rare fonudations make, in Hackney Wich.
Doctors prosper well, and undertakers quick
Do follow in their wake, in Hackney Wick.
Saus pavement, flags, or drains, lo! span and spich:
The Hackney 1 Board rules over Hackey Wiek.
The streats of the Wick, with the exception $f$ about half a dozon, aro, when rain falls for a few hours, in a state of sludge. As many streets are yet but half-formed, or huilt only apon one side, they have not as yet passed into the care of by these presents, that by these presents, that though the Board have pat up another hoard to cantion outsiders from sliooting ruhbish on the open spaces heing hailt upon, their own ears and the contractor's are carting daily continuous loads of poisonous rabbish. Speaking in the most mild term, the stnff that is shot there is quito unfit to raise houses upon, and if huilt on at all some ycars There is aned to elapse previously
There is a group of factories or works of various kinds, some in the Wick, and others on the bonndary line of an adjoining parish, with wharis on "Hackney Cat" Canal, which afford Tar, ink, colomp coyment to the inbabitants. other works, in chomical, iron, starch, jam, and dozen. Some aro small, others extensive.
The jam factory gives employment to a namber of girls, and all the factories combined absorb some hundreds of hands of both sexes, the majority of whom are housed in the houses of the surrounding district. A rubber factory is heing commenocd, and the fomadations are aid in water. Tho drainage heneath will be very superficial indeed if it has ouly to dopond pon the extent of the works we witnessed. The lower-level sewper can he here availed of, which was construeted a few years since by the Metro pontan Board. After passing tbrough tho marsh lands, and recciviug a portion of the drainage of he shoots," the foul open sewer passes along menting its nuisance on the way by the supple 2 colour factory, and finally disnppering an arched sewer, where after sompearing into drops to the low level. The Board District Board, shonld see at once to the covering arar of this open sewer, and prevent any rainage from the houses emptying into it in its presbnt state. We would particularly direot connexion with some of the huildings now being connexion with some of the h
The cheap speculative buildings that are heing hurriedly run ap on all sides will hom in the years ago was a grassy and swampy marsh, as years ago was a grassy and swampy marsh, as
fras also the site of the surrounding dwollings,
nd it was known by tho amphibious name o Frog.town, from the prodigious number of the
different geuus of the creatur different genus of the oreatare that were
to be found there, A littlo farther to be found there. A littlo farther asth ward another portion of Marshy Wick was dubbed Tarrytown, from the fact of tar-works and ether shed there. Frogtown, Tarrytown, ocal habitats euphonious names that fud rowth of the Wick, and ing absorbed by the be rememhered by a few of the oldest inhabitants. The Wick affords no food for the archeo logist or antiquary. There are no "finds" to be had except what the depths of the "shoots" au give forth. Stretching towards the rive Lea the botanist and the geologist would doubt less turn up some trifles, hut in the heart of th Wick there is nothing to be seen or found bot rick above and refuse and wator helow. The rapid growth of the place es a livince locelit requires that it shonld be propely mopped once, so that the old fading names, wen thon ocal, he canotht up, and its earlier thong xed. Tf on up, and its earier landmark nother when the Wick is all bnilt nower, and study some years hence would be both interest ing and important in a parish history and progress point of view. London oast is stretching rapidly, and though pieces of commons may be preservad for open spaces, it is not improbable that the great marsh tract extendine from the Wick to Temple Mills, and thence to the the Bridge-road, will be encroached apon hy derreos until eaten up by the Moloch hriok, and his usual prearsor in low lands, "the shoot."
We were mar in lawds, tize shoot. sant walks through the Wick, in reading the flne names the builders have found for their two story building of streets and terraces. Right royal English and Scottish mames aro pressed into service. Such as Windsor, Wallace, Percy Montague, Prince Eaward, Elgin, and Viotoria streets. Somo of these regal streets are full of hills and hollows, and have 6 in . deep of sludge Tho first day of our risit we with great difficnlty picked our steps over odd bricks and stones em bedded in 6 in . or 8 in . of aludge. In these and some more streets, cxcept for portions of the way, there were no footpaths, and pools of water were lying against the thresholds of the hall doors. Hliness, not very long since, was rifo in tho district, and at present the health of the inlahhitarts is anything but robust. The sraells axising at times from the "shoots," and from out the foul marsh sewer, reeking with slime and nuisance, are staggering. The occurmade monster forcing.bed for propargating an epidemic that might touch the very heart of London Those who never spent an hour in tracine sach ills as we describe may poo-pooh this statement; but we challenge denial and nwait the proof. but one those who in view, -the general good. Let

## THE SISTER ARTS.

edingurgh architectural associatios.
At the first ordinary meeting of this Associa tion for the present session, Mr. John Bryce president, in the chair, Mr. M. Thornton Shiells Architecture, though it was in the ordinary parlance of the fine arts, -viz, painting, sculp ure, and axchitecturc,-placed last, is by means the least: it is the highest, the grandest the noblest, and, I may add, the most subtle of the fine arts. Painting is the most popular, a it represents nature in her varying forms, and thus appeals to the feelinga. We heve, how, and no remuins from tho great nations of forme imea, -such as the Greeks, and only the deoora tive part of the art hy the Egyptians. In the present day it is more used as aninterual adorn ment. Thus all classes of society cannot gain pleasure from it. In this respect architecture as the advantage. Sculpture heing an idealisa ion of life, appeals forcibly to the mind. It has beeu attermpted in all ages, and never more successfally thau in the timo of Phidias, when it formed either a decorativo part of arobiteotur or had architectural surroundings. Howeve beautiful statuary may be when isolated, its beauty is mnch enhanced when accompanied nith architectare,-the impression on the mind being in some circumstances grandeur, in others and Arohitectare requires the assistance and combination of the sister arts merely as a
subsidiary or help. It can stand alone without them, but is adorned and beantified with thera, It may seem strange that, though architecture It may seem strange that, though archicecture is over betore the oye of the public, there
is no art it has less knowledge of, owing to architectare being not only idealistic and scientific, but the practical embodiment on
both into utility and beauty. This combina both into utility and benuty. This combina-
tion is seldom met with successfully applied tion is seldom met with successfully applied,
owing to the mind being naturally drawn owing to the mind being naturally drawn
or syayed by natural impnise or education to or sivayed by natural impnlse or education to
ward either the one or the other. The zeces ward either the one or the other. The reces
sities of the present day are the first desideratum. They have their influence over form and con trivance, as structures without such would no coincide with the spirit of the age. It is within the province of architeoture to be subservient to the requirements of religion, of cormerce, and the habitations of men in all climes; and more so in the present day than in any former period. as comfort, health, cousenience, and sanitary appliances are all crowding forward into a pro minent position by the impulse of the press and the education of the public. Science in architecture embraces the knowledge of materials, as regards their strengtb, properties, and durability, so that they may be adapted with becorning fitness to the several parts they may have to occupy in the embodiment of design. Architecture is range is boundless, from the finest marble to the meanest clay. Tbe triumpli of mind over matter fias advanced witb great rapidity. Scarcely any material is so mean but what may be made more or less artistic. It is only by science that arcbibe any defect in construction, or the insufficient knowledge of materials from the foundation to the highest point, ruin is suro to follow. Th study of ancient buildings forcibly brings before us this trath; the massive columus of the Classic and the graceful pillars of the Gotbic proving it and proportion according to the position it has to occupy in relation to the whole stricture, and and strength of the zuaterial employed, so that stability may be obtained without unduc effort or waste of labour and material. In all true architecture this principle has been with the put, combined with utility, in accordance intie the purpose for which the buildiuge were intended to be used, and the countries it which they were situated, This has been successfully exempinied in the religions structures of former times, where the materials have been judiciousl used, and the construction embodied into forms of beauty. Their ntility is evident, as tbey are still used for large assemblages at the present time, and though worshippers may be in hourly and ventilation are ample. In our moderi structures, ecclesiastical and civil, those point inaterial and form, and more especially in renard to air and ventilatiob, as often a stilling, anwholesome atmosphere pervades in a large within the building in propertion to the number of people assembled. In recrard to the present question of styles, trne art is independent of it, thongb it is absolntely necessary to have knowledge of its history and biterature. Any attempt to commingle styles diametrically opposite to each otber in thonght, such as Doric with sive to the eye horizontal lines, fud of the the it is Arctitecture as a fine art has always had a latent spark or glow, in all ages, aud in all countries. At times it has risen to the brightest effulgence, or bcen suhdued to a very low flame. The expression of beanty is not felt by all alike, or otherwise there would be a uniformity of design and thought, and no battle of the styles, no orers. The art of the day demands a utopian emhrace, thongh each country should acquire an expression of its own, owing to the natural prodncts, materials, and scenery. All exotics in architecture are misplaced when transplanted from their natnral zone, bnt may advantageonsly be engrafted into a milder or severer clime. Tbe street architecture of Paris would look flat under our cold sky and hilly position, and mnch more so wonld castellated Scotcb look heary and crade in their clear atmosphere. But to come nearer home, when atteropts have been made to introduce into stone districts in the stormy north the brick or timber architecture of the sunny south it has always
been a failure in comfort and effect, and quite incongruous with the surroundings; and mach more 80 when attempts have been ruade to castellate in brick in the scotch style. Al beanty, and made a handmaid of the fino art, if it be used according to its true province, and not falsified to represent what it is not. The various materials now within command can leavo the naterials now withim comand can leavo the architect no excoso for falsity. whatever naterial is obsen ally decossary, either for com fort, healch, or atilicy, should be scientifcally applied. In the latter part of tho paper, Mr Shiclls gave a detailed account of various materials in nse at the present time, showing tho nccessity of each being carefully designed so as to produce true architecture, which wonld endure to after ages, shedding an influence or the minds of all who behold it, honouring the age in which it was erected, and handing to posterity thought in tangible form, while the architects who produced it have prssed away from the busy scene.

NEW YORKSHIRE WATERWORKS.
For several years one of the most important questionswhich can affect any community, viz, an abundantsupply of pure water, has been practically worked out hy many populous towns in Yorkshire. As a rule, the most desirable and advantageous service has been dccided upon, namely, the supply of liguid wealth which is to be found on he vast uncultivated tracks of moorland which are still to be met with. Many valuablc works have within the past three or four years been constructed, and several are now in the course of completion, whilst others will doubtless ere ong bo nudertaken.
The Barnsley corporation, at a large ontlay, have constructed works at Ingbirchworth, about seven miles from tibat town, from the reservoir at which place they are entitled to take $1,200,000$ gallons per day. The Leeds corporation has expended a grod deal of money in its water supply. Halifax, since 1871, has been engaged in improving a powerfal source of supply, by constracting additional reservoirs, so as to provide against any contingency which may arise. The total gathering grounds for the Halifax anpply is $1 \mathrm{~S}, 300$ acres, or rather larger than that of the Manchester corporation. The Dewsbury aud Heckmondwike Water Boards have also laid out a considerablo sum of money near to Dunford Bridepe, on the Yorkshire moors; wbilst the Batley corporation liave taken their stand for Ramsden Valley in the Holrufirth district

In addition to the works already completed or in progress, several notices have been issued, informine those whom it may concern that applications are about to be made to Parliament lnriug the coming session for powers to take certain lands as water-sheds, and construct reservoirs at various places, so as to keep up a constant supply of good and pure water. Two notices have buen given by Wakefield companies, which are giving rise to a cood deal of interest. The present water company, which takes its supply from the river Calder, has given notico of its intention to apply to Parllament for Langsett, on the borders of the Yorkshire woors, above Penistone, for supplying water to Wakefield and neighbouring districts. The notice states that the company seeks to take the whole of the water of the Littie Don river, and tho streams which now flow into the said river, at or above the site of the embankment of the Langsett reservoir. The notice given empowers the company to constract 2 tank or reservoir at Thurgoland, a tank or service. reservoir at Beacon-hill, a cank or reservo the parish of Wakefield, and other places The powers asked for would enable the company to supply over forty hamlets and parishes in the line of their pipes, and in and around Wakefield. In the latter district, amongst the places named, are East and West Ardsley, Wetbley, Wbitrood, Altofts, Normanton, Feather tone, Sbarlstone, Walton, and other mining dis ricts, where the water for the most part will

* The President called the attention of the memhers to
the phbilication of the drawings of Fortrose Catabedral \#hich had gained the frot prize last year in the eompeti-

 prize nest year; also that Mr. John Hutchison, R. had agred to grve apremmul for torbe to be competed for
doubtless bave been taken by the working of the coal measures.
A A new company, to be known as the Wake also issul District New Waterworks Company, has to Yorkshy for powers to take a supply from the nejrer Manclester than the odd comeny cearer Mauchester than the old company pro poses to take. They propose to construct neservoir, to be called the "llordron Reservoir, in the township of Langsett, togetlier with a catch-water drain or conduit near Muckleden aud sinular works necessary for the prope torage and supply of water to the inhabitants, t only of Wakefield, but also of Penistone, Thurlston, Normanton, and many other places The Horbury Local Board of Health, who rule over a thickly - populated district near Wakefeld, have also given notice with respect to their water supply, to enable them to obtain and supply water to their district.

ADDITIONAL REMARKS ON A NEW MODE of hospital construction:*
Mr. Henry Greenway, M.R.C.S., Plymouth, further remarks on his proposed mode of con struction The cases specially requising this plan of hospital are,-wounds, whether caused by operation, accicent, or diseaso; infections diseases, and obstetrio cases. Thus cared for it is believed that hospital erysipolas, pyæmia, and gangrene (the pests in the surgical wards o onr existing bospitals) would seldom or neve: occur, and would not spread throngh the build ing, as the wound of one patient would not be exposed to air tainted by the wound of a neigh boaring patient, and the compartments themselves wonld not be a source of evil. It is believed that all wounds (some more than others) injuriously affect the air of a room either immediately or uttimately, if the walls be porons, and that they (the wounds) are very prone to absorb the organic particles tbus suspended.
In a general medical ward some patients suffer, and even die, by being exposed to the same rentilatiou and temperature which may be considered necessary for other patients. This would not occur in my play of building, where the rentilation and temperature of the different comparments may be varied as circumstances may require.
Iy plan of hospital construction bas, by some surgeons, heen considered unsuitable for counesion with a medical school, on account of tbe inconvenience which students would suffer wbet following the surgeon from one compartment to another. My reply is, that the primary object of a hospital should be the patients' welfare, and whatever interferes witb the attainment of that must yield. Once let the public imayine that any hospital, or portion of one, deemed perfect for cases (especially wounds) requiring isolation and therefore tending to save life, is objected to by a surgical staff on the score of its bcing inconvenient for students, we may he quite certain a cry will be raised demanding the utmost tbat art or ingenuity can provide for saving life, and we migbt hear of the establish ment of hospitals apart from medical schools.
Construction.-At present, the inlet ventito meet in the opposite sides are not desighly it wonld be centre of the buliding. Probill to pass transversely througb the building, and perhaps project a foot or two on one side, the projecting portion to be perforated. In the event of birh side winds, their force would then pass completely through the tubes, from one side of the building to the other, withont unpleasantly affecting the compartments : and the proiecting ends would act like "wind-sails" by catching fore and-aft breeze thus increasing the circila tion of ar in the thbe. I wonla ate surcest a second inlet ventilating tabe for each compert me to part ment, to pass across the celling of the corrido way I thin a downward current of cool way. 1 link a thar current of coor air
 door. Wher of the could be shut of if ncces. hotwater stem pipes, placed in the air whe underneat steam pipes, placed or the air-ubea just placed abo the loor. fron guards would be placed around the interior of the compartments

Thustrated in the Buidder from drawings by Mr. Hine, architect. The estimate per bed, in 187, was
would now, most probably, be somewhal higher.
a substitute for glass, certain portions of the compartment walls might he mado of sheet-iron coated with white evamel. A receptacle would he placed in each compartment, as no infectec patient should bo allowed to visit the water closet. Cotton-wool screens, and vessels con taining a solntion of permanganato of potash, 0 such like material, may he placed in the inle ventilating flues. The air would thus be filtered and ozonised. Charcoal filters nay also be placed the outgoing air, the oharcoal to he occasionally rehurnt.

## HARBOUR AT ALDERNEX.

tite institution of civil engaxeers
On November 25th, the paper read was an "Acconnt of the Construction and Maintenance of the Uarhour at Braye Bay, Alderney,"
Mr. Leveson Francis Vernon Harcourt, C.E. Mr. Leveson Francis Vexnon Harcourt, C.E.
The harbour at Alderney, designed by the late
Mr. James Walker, Past-President Inst. C.E., Mr. James Walker, Past-President Inst. C.E. as commenced in 1847. The Admiralty in. small harbonr, but subsequently gave directions for the enlargement of the scheme. In 1858 the design, then in course of construction, consisted of $a$, harbour of 150 acres, with a depth o water of 3 fathoms and upwards, sheltered to the west and east by two breakwaters. The western hreakwater, ahout $4,700 \mathrm{ft}$. in length,
had heen constructed, hut the castern hreak. had heen constructed, hut the castern hreakwater was ahandoned, and the harhour was con. sequently oxposed to winds hlowing from any quartor between N.N.E. and E.S.E. Westerly winds, howevor, from which the harbour was woll sheltered, were the most frequent and was exposed to the whole force of the Atlantic and the cffect of the fury of the storms was increased at Alderney by the rapidity of the tides near the island, occasioned by a peculiar confluonce of currents in the bay of St. Malo. The breakwater was constructed on the pierre, deposited in the line of the proposed work from hopper-harges, towed out by steam.tugs. A soon as the mound was sufficiently consolidated
it was surmounted by the superstructure. The stone was ohtained from quarries at Mannez, on the north.east side of the island, distant about two miles, and was conveyed to the works hy a railway. The superstructure consisted of a sea respectively, founded at first at the level of low respectively, founded at first at the level of low
water, and built, without mortar, entirely with this stone, the intermediate space heing filled with rubble; the hatter of the sea-wali being 9 in , and of the harbour-wall 4 in. to 1 ft . To
protect the lower or quay level, whioh was 6 ft . protect the lower or quay level, whioh was 6 ft .
above high water, a promenade wall was huilt on the sea side, about 14 ft . bigh, consisting of two masonry walls set in mortar, and filling hetween. The outer wall rested on the sea-wall,
and the inner wall on the rubble filling between the sca and harbonr walls, the whole forming the base of the upper or promenade level. A this structnre proved liable to damage hy storms
the dosion was modified, in 1819 , at 410 ft from the dosign was modified, in 1819 , at $410 \mathrm{ft}$. from the shore. The foundations of the sea-wall were
then commenced at 12 ft . below low water with then commonced at 12 ft . below low water, with coursos, each 3 ft. thick, being composed of Portland cement concrete blocks, faced with granite headers, each courso having a set-off of wall was huilt of Mauez stone set in Medina cement, with a batter of 6 in . to 1 ft ., and the width of the wall was increased 9 ft . at low. water level. The harhour-wall was founded 9 ft . helow low water, and was 14 . ft. wide at the
bottom. The first four courses were composed bottom. The first four courses were composed
of Portland cement concrete hlocks; the restit of of Portland cement concrete hlocks; the rest of the wall was huilt of Mannez stone set in 4 in. in 1 later thace throughout being up vertically, the space of 21 ft . hetween them heing filled with concreted hearting. The pro. menade wall was huilt of solid masonry in mortar, and hoth the upper and the lower loadways were paved with granito pitching and copings, and a line of rails was laid down on water, and 25 ft . wide, and thas upper level $\mathbf{1}+\mathrm{ft}$ higher and 14 ft . wide.
In 1860, when tho superstrncture had been carried out $2,700 \mathrm{ft}$. from the shore, the desigy narrowed by reducing the width of the quay to 20 ft ., the batter on the sea-face was altered to

4 in . in 1 ft ., solid masonry was suhstituted for the concreted hearting, and the foundations of the harbour.wall were commenced at the same cvel as the sea-wall. The head was built in 1864. The foundations were laid 24 ft . below ow-water level, across the whole width of the breakwater. The first nine courses, each 3 ft . hick, consisted of concrete blocks faced with granite headers; the npper portion was built o masonry in cement. The most exposed face stones were joggled and dowelled together, and several of the corner quains were further secnred
hy iron hars and diagonal straps. Two red hy iron hars and diagonal straps. o the harhour at night.
The cost of the works of constrnction and of maintenance, to 1873 , had amounted to $1,274,200 \mathrm{l}$., of which 57,2001 . had heen expended in repairs. The harhonr was transferred from the Admiralty to the Board of Trade in 1866. The ongineers who successively bad charge of the worbs were,-as engineers-in-chief, Messrs. Walker, Burges, \& Cooper, Messrs. McClean \& Stileman, and Sir John Hawkshaw; and as resident engiveers, Mr. Parkes, Mr. Rhodes, Mr May, and the author. The contractors for the whole of the works were Messrs. Jackson Bean.

PETERBOROUGH CATHEDRAL.
A New pulpit has just becn crectod in Peter. horough Cathedral, and was first usod on Sunda last, when the bishop of the diocese preached to a large congregation. The pnlpit is from the designs of Mr. E. M. Barry, R.A., and has been presented to tho Dean and Chapter hy the sons of the late Dr. James, as a memorial of their father, who was a canon of the cathedral for forty years. Dr. James died in $[1868$, and "is nd othor devotional works
The materials used are a rich rod stone from Dumfries, red Mansfield stone, and Devonshir and Trish marbles. The lower part of the design consists of a large central shaft and furr ugle detached columns, "all of marble. The upper portion is square on plan, with the corners out off, and at the four corners are attached marble columns, flanking figures of the fonr vangelists, carved in red Mansfeld stone. The pulpit is placed close to the choir-sereen, on the north side, and facing westward, so as to com nand both nave and transepts. It is approache hy a sido staircase of stone steps, forming a straight flight, with small marhle colamns, sup porting a handrail of similar materinl. The rms of the see of Peterborough and of the Dean and Clapter are carved on two shiclds, in he lower part of the staircase, and in the string half-way up the pulpit, is a short Latin insorip on, cescrining the purpose of the monument here is a brass desk and light-standard, mad y Messrs. Hardman; and the rest of the wor Co., of Westminster. The pulpit is inter for the nestrinster. or the nave services, which, at Peterhorough, a regular place in our cathedral system.

## INSTITUTION OF SURVEYORS.

## agiculitural geojog.

This first ordinary general meeting of the Institution of Surreyors was held on Monday Hhi November, at the new Rooms, Grea George street, the president (Mr. E. Norto lifton), in the chair, when a paper was read by Tr. E. P. Squarey, on "Agricultural Geology." It was announced that the president had given wo dehenture bonds of $25 \%$. oach towards the building deht, for which a special vote of thank was passed.
After the paper had been read,
Mr. H. Lloyd, Q.C., said that the paper was an extremely suggestive and practical cha. rcat interest to any one concerned in agricul ure.
Mr. Woolley said, that with regard to magnesium limestone, after putting on an average ental with the oolitic series, it was very simiVith agricultural value as well as onatach found, contractors were willing to give from 1002. to 150l. per acre, such land considerably iding its surface value. Geological Societr of London, was of opinio that the suhject of agricultural geology was ono
of immense importance, and should be more particularly studied. After some experience in the matter, he lad deternined to use the term surface geology, restricting himself to what he found on the surface; and was therefore able to reject anything heneath the sulface which was not applicable to agricultare: He would not attempt to deal with the vast mass of facts which Mr. Squarey had eetablished in his papor, the pahlication of which he would look forward confin some degree of interest, hut he would confine his remarks to one or two things bearing upon general principles. On the south-eastern part of England, where we had alluvial rocks, there were to he found to a very greal extent alluvial deposits. On that part of Englana which was the corn-growing portion these rocks bad an immenso importance wherever the chalk was cultivated, simply hecause the chalk was covered hy these alluvial deposits. In the north of England it was a well-known fact that the chalk was almost entirely deposited. The Goo. logical Survey had been tnrning their attention to agricultural geology, to show the extent of the surface deposits, and we should, he hoped, shortly know something more of tho important subject of agricultural geology.
Mr. John Clatton regretted that Mr. Squarey did not touch upon the effect of climate and the diference of elevation, for the value of the soil depended to some extent upon its elevation. With ordinary fair managemeni, the Wealden ciay would let at from $2 \ell$, 10 s . to 32 . per acre. Where a mixture of soils could be ohtained, that land was the most fertile.
The discussion was adjourned till Monday, the 8th of Dccember

## ST. SEPDLCHRE'S CHURCH, LONDON.*

 A miscovery bas heen made during the progress of the restoration of the tower and porch of this charch which will interest you and some of your readers. Tpon taking down the octagonal furrets and pinnacles erected in 1630 and 1632, it was fouud that the ahove were cased with Portland stone, averaging 8 in . in thickness, and cramped with wrought-iron cramps 10 in . long, 2 in . wide, by $\frac{\mathrm{n}}{4} \mathrm{in}$. thick, set in ahout 4 in . from the external air. The core of the turrets and the pinnacles was filted with rubble, and some of the crockets, emhattlements, aud gargoy leB, with lions' and other heads, belonging to the Perpendicular church of 1450 , all being of Ketton stone. This discovery is so far satistactory, as it confirms the employment of crockets in the pinnacles, and embattled parapetson the turrets, of the presont restoratiou. These remains will of course be preserved.W. P. Gkifeite.

A CALL FOR EVENHANDEDNESS.
SIR,-I happen to have two husiness offices,one in London and another in a country town. This fact has for some years been the subject of careful record on the part of indcfatigable com. pilers of directories. It is, as you must know, one among the manifold duties of memhers of our profession to receive,-in somewhat irregnlar hut still tolerahly coustant streams, -what are known as Trade and General Circulars. These range, of course, over wide fields; and most of them are useful in one way or another. It is cheering to reffect that the Directors of the Spitzhergen Coal Company contemplate large dividends from the working of the well-known and most productive regions aequired on such favourahle terms from Mr, Jones, who will remain the managing director of the company,or to he made aware of the mixture of philan. thropic impulse and pleasant expectations of gain that should urge to the exportation of some thousunds of tons in unfavourable seasons to that inhospitahle region. (A tendency noted of late to print on two sides, and on poor flimsy paper, cannot be too severely reprobated. The old liberal, large, and heavy foolscap, with the perforated demand slip, that it was a pleasnre to write upon (at the back), will soon, it is to be eared be an extinct institution in these par simonious days.)
It is not uncomplimentary to be asked to ubscrihe to every charitable institntion in the ingdom; and there is a little salve to one's self-love, even in the gentle demand for a hilling towards the church that is to exhibit the name of a professional hrother on the fonnda-tion-plate, and to show throughout his power of
producing sittings for naxt to nothing, and the agony of his soul at his suocess. There is something touching in such confidence in one's possessing character and circumstances so much in unison;-liberality of spirit in all its happiest senses, and that still more valuable quality, $\rightarrow$ purse that fortme has filled till it finds itself forced to overflow. In the secret recesses of one's soul,-not to be revealed to the vulgar gaze,-there may, it is true, he the remembrance of stirring appeals which some one must have made to have rendered possible in time the harvest and gleanings that gladdened the heart hongering for appreciation and the completion right away of a spire in honest ashlar,--as an sgreeahle substituto for the dismal sense of the world's negleet that co-existed with docking and that molancholy temporary slated rool
Bnt I must not go throagh the list and point ont all the benefits to the moral sentiments of this profuse bestowal of paper and typography,consider some of these gifts not it overp respoct ap tomy standard of perfection.
In point of fact, Mr. Editor, my solo purpose in writing to you is to complain;-and it thorefore will appear not a little generous for me to act the Balaans at tho heginning. I shonld hope my condour will not tell to my prejudice. want to know why my sense of delicacy-in ono or both the capacities of which I have informed you above, -is at intervals most grievously uffonded. A recent flogrant instance has wrang this remonstrance from me. In this instance, as you will at once soe, I am placed in a dilemma:-Whichever way I take it is tho worse for me. At my office in the conntry were received by bookpost descriptive accounts of the "Patent Monstrosity for rendering Chimneys hideous" (this may not be its full title, as I quate only from the memory). In the middle of testimonials from eminent noblemen, their agents, admirals, chimneysweeps, $\& 0 .,-$ amongall these recommendations frou porsons of tasto was laid a slip of paper, $5 \frac{3}{4} \mathrm{in}$. by $1 \frac{1}{4} \mathrm{in}$. (to be perfcetly exact), adorned in good large legible printing, with the legend, "Architects' Dis count, 10 per cent." This was not affixed in any way to the other papers. Careful fore-thonght,-anziously prevising the needs of prac fitioners,-had provided thus for its heing removed, carefully endorsed, and pasted in a systematio manner in the rolume appropriated o such rccords. But I have a further tale to tell, and please to mark the difference. Similar papers came to me in London, and with what, to the casual observer,-might this was lightly interesting enclosure; but connt 15 per cent.", in bold Egyptian lettering, of vermilion huo. Can I, who an subjected to such treatment, be expected to indulge in heartfelt panegyric? I fear,-tiny as may seem the disturhing cause,-I am little disposed to do so. I must confess that, being unfortnnately possossed of these contrasting views, derived from different monnts of vision, I am imperfectly gratified by either. Is this another instance of the folly of soeing too much behind the scenes? Does it merit a qnotation from Mr. Gray's "Eton College"? Or ought it rather to stir up a desire for reform and suchlike hetter things? When the (exaot) value of my recommendation is so highly esteomed in each case (and so carefinlly appraised), I think I am jnstified in feeling offended with this difference of per cent. between London and elsewhere. Why, on the other hend, is the additional expenditure on gum made for the distribntions a the metropolis? Can it bo suspected that ausiness is carried on in a loss thorough way there than in other places? Is it supposed that the bribery-paper mirht be severed from its company in the chronic harry snpposed to be characteristio of a London office? I am puzzled, and ask the assistance and sympathy of your readers. Perhans some explanation micht set these matters straight. In the meantime, the sir of mystory is not satisfactory to, jours obediently,

An Arcittect and Surveror.

The Cattle Show.-Tho privato view of the Smithfield Club's Show of fat cattle, sheep, pigs, and appla Mond he Agrienltural Fill, will exhibition will remain open to the public Thent exhibition will remain open
Eriday, the I 2 th , inclusive.

## ROXAL INSTITUTE OF BRITISH ARCHITECTS.

## chinese architecture

AN ordinary general meeting of the session was held last Monday evening at the Konse in Conduit-street (Mr. Vulliamy, vice-president, in the chair, when the following gentlomen were elected:-Mressrs. F. Beeston, D. Gostling, J. Lanyon (Fellows) ; Mossrs. C. Buker, E.
Roberts, and Hugh H. Stannus (Associates). Roborts, and Inugh H. Stannus (Associates). It was stated that MIr. R. H. Shout had kindly prosented to the Institute a hust of Palladio, oast in pewter (exbibited), for which a special rote of thanks was passed. The chairman notified that Mr. John Wolfo had signified his intention of presenting a replica of the bust of the late Sir Charles Barry, which would probably he done at the next mocting.
Mr. Simpson then read a paper on the Architectnre of China, part of which we have printed. In the discussion which fo? lowed, Major Crossman, R.T., said that Mr. Sinupson, in his interesting paper, had given a good description of the general features of the spoken of the tombs of Tanc Chow, which were sinated on the side of the hills, from which they were dug out, being in the shape of horse hoes. There were too numerons projections the thero the hills of intaresting athe otbr In the city Noling walls of which were thirtyeight miles r, walls of which wore thity.eignt miles round deer within the walls; but nearls the whole deer within the walls; but nearly the whole few temples. There wero to he noticed in this ity emples. city the marble foundations of old inclosnres around fish-ponds, and gardens, and such like; and also a large hrick tower, the structuro of which was marked with great gran dear. There was really nothing in Chinese architectare except the old wall, the temples, the pagodas, and tho tombs. As regarded the origin ef the style of architecture, he agreed with Mr. Fergusson that it was not exactly of tent character, but there was to be found the high-pitched roof, with the tiles so construoted as to allow for the beavy rains which visited the country at certain poriods of the year; the carved work of the houses, too, was really very hoautiful. The whole of the Chinese architecture was similar in character to that of the Japanese, being very simple and clearly defined. The mechanics were nice people to deal witb, the greatest difficulty, however, with them being that of their trade-unions: and if a man was dismissed they all struck work. With regard to Chinese engineering work, some of tho bridges were very fine, the arches being well made. The caual, too, must have heen a very great undertaking; but nothing had been done to it for many years. The ronds were also treated in a similar manner, being allowed to fall into neglect, although their Commissioner of Public Works had received for years various sums of money for the purpose of repairing the highways. A road he was familiar with had not been gravelled over for more than twenty-sever years, nor any attontion paid to it whatever :
consequently it was full of unpleasant ruts. The gates of Pekin were of a remarkahle character, gates full of intercst to the architect. The architecture of China had been at a standstill for many years past, and he trusted that in thi respect, as well as in everything else, $\mathbf{i}$ wonld gradually adrance; but this advance ment required time, the Chinese being a people who cannot be forced
Sir Dighy Wyatt, in proposing a vote of thanks to the reader of the paper, said that $M$ r. Simpson was an illustration of the entire fallacy of a rolling stone gathering no moss, he having had heard of most and from China and Japan, and week after week he had delighted them by sending sketches of his travels to the Mustrated London News, so It was very pere particeps criminis in all his work like Mr. Simpson oould travel so far about the world and interest himself, as he did, in archi tectural work; for he had interested himself not only in picturesqne, but in constrnctive and archæological matters; and they owed, Sir Digby thought, a deep deht of gratitude to Mr. Simpson for the interest he had taken in Chinese archi tecture. He would have liked Mr. Simpson, in his paper, to have touched npon the ordinary they were far more beautiful and far more illus-
trative than the suhjects which had been treated which suhjects were rather of an archzologica charactor than Mlastrations of beauty. Th Chineso excelled very much in garden-archi tectare, which so delighted Sir Wm. Chamhers, Who had interested himself very considerably in tho architecture of that country; their fret work, too, was of a gay, cheerfinl, and nseful character. In conclusion, he trusted that at some futuro day a paper would bo read con cerning the domestio architecture of the Chinese Mr. TAnson, in seconding the vote of thanke hoped that the paper just read would be the precursor of ohners. He wished very much that in future observations they might learn of the permanence,-or the want of permanenceof the prevailing style of Chinese architectare. From what he could gather, the same style was carried throngh in all pmhlio buildings, even up to the Temple. This style, he understood, had been at a standstill for several hundred vears, Previously to that time, was it, he asked, the same style precedent to that, or were there variations in the style? The Chinese hildings, they wcre told, were decorated with elahorat fretwork and wherever there was detail there was difficulty of omamentation, but the Chines deration thoult, with Grat Did Chince, hour woll Grol art, wore ther paction of tho same tspo of tecture opere they fored the sions of the the different periods of prosperity or commercial different periods of prosperity or commercial
import which would put them in communication import which would $p$
Mr. Jennings stated that there was a groat difference in the kinds of materials employed by Mre Chinese people
Mr. Audsley, in answer to a call from the chair, expressod the gratification the reading of the paper had afforded him, and said that he could not offer any remarks upon it, as his exporience of such architecture was confined to tho Japazese.

The discussion then closod.
Bofore the meeting separated, the secretary called the attention of the meeting to some specimens of iron cut with a saw by steam machinery, which wero exhivited, being the production of Messrs. Dolong, of Paris.

UULDERS' BENEYOLENT INSTITUTION THE fortieth election of pensioners on the funds of this Institution, was held last weok, at Willis's Rooms, St. James's, the president, Mr. hos. Robinson (Cuhitt \& Co.), in the chair fucluding those then elected, there are the Institer persons receiving twenty-six fomalos, the former receiving 24 , and the latter 202 per annum. There were seven candidates for election on this occasion, two men and five women, hut the funde of the Institution only nllowed of the election of two-one man and one woman. The suocessful candidates were--John Thomas, 1,587 votes ; and Elizahoth Trevethan, 3,320 votes. Messrs. T. Stirling and Matthow Hall acted as scrutineers, votes of thanks to whom and to the chairman closed the pro. ceodings.

## OXFORD ARCHTECTURAL AND

 HISTORICAL SOCIETYTre mombers of this Society had their second waik this term to Pombroke College and Bishop King's House. They assembled at half-past two colock, in the library at Pemhroke College, Whero the mastor (Rev. E. Buas) Eave thon a cordial reception, and briefy explained the hisory of the building. He said that there was scarcely a trace of tho old huilding left. The college was fonnded in the year 1621 , and stood npor the sito once ocoupied by nnmerous academical buildings. He exhibited to the company arious views of the college, and sevoral memo. he wrote his famoons dictionary
A vote of thanks was finally given to the Master of Pembroke, for the conrtesy be had shown the risitors in condncting them over the college
Bishop King's House, in St. Aldate-street, was next visited. Mr. James Parker gave an inteesting account of the bnilding, which, he said, was certainly not the brilding inkabited by Bishop King who was appointed as first Bishop of Oxford so far back as 154.2 , in the reign of

Herry VIII. It was very probable that he lived in a honse on the site of the present building, House." The present house was built in 1628 , in House. The present house was buit in 1628, in
the reign of Charles 1 ., and is a good example of the reign of Charles L., and is a good exar A vote of thanks was given to Mr. Parker, and tho company separated.
The annual meeting of the Society took place
at the Taylor Building, Professor Stubbs ocoupy at the Taylor Building, Professor Stubbs occupy. ing the chair. The offcers for the ensning year were olented:-President-The Rev. the President of Trinity College. Hon. Secretaries-The
Rev. J. S. Treacher, Merton College; and Mr. Rev. J. S. Treacher, Merton Col
J. P. Earwaker, Morton Coliege.
Mr. W. H. Turner, of the Bodleian Lihrary, road a paper, entitled "Curious Extracis from tho Ecclesiastical Court Books of the Diocese of Oxford."

A short disenssion followed.
In the last walk this term Queen's College and the Charch of St. Peter-in-the-East were visited.

## COMPETITION.

AT a moeting of the mombers of the Throston School Board on Weduesday, the 26th ult., the threo premiums for the designs of the proposed now schools were awarded as follows :-1st, to
Dr. R. Watt, Hartlepool ; 2nd, to Messrs. Parsons \& Ellwood, Newoaatle-on.Tyne; and the 3rd, to Messi's. Moses \& Weatherill, Stockton-onTees.

WEST DERBY LOCAL BOARD.
A special moeting of this Board was held at the publio offoes, Green-lane, for the purpose of appointing a surveyor to the Board, and also an Dr, Fitapatrick presided. On the motion of Mr. Cook, seconded by Mr. Johnson, and supported hy Dr. Glazebrook and other members of the Board, Mr. William Kolly, C.E., who has acted as surveyor since the death of Mr. Orridge, and who, for npwards of eight years, acted as assistant surveyor, was appointod surveyor, at a salary of 250l. por annum. Mr. John Holme, an old sorvant of the Board, was unammously appointed inspector of roads annum.

ENCAUSTIC TILES IN ARCHITECTURE, Sir, - You receutly gave a detailed exposition of your views as to the use and abuse of en. caustic and other orummental tiles in archi. tectural decoration, and no exception can be taken to the judioious manner in which yon deprecated beyond the linits prescribed by you. form beyond the linits prescribed by you.
But there is another side to the question, which, with your usual candour, you will, I am sure, allow to be stated in your columns; and it is whether,-admittiag all you say as to their partial employmont as adjunots for effect,- the capahilitios and advautages of the material being so great as to durablity, cleqnianess, \&o.,
and lence its suitability to the dirty and destructive atmosphere of large towns, it could not bo employed upon a thorough system for the
external facing of buildings? There is abundant exterual facing of buildings? There is abundant and it is Mr. Forgusson, I think, who says that few buildings ever impressed him more, or pro. duced upon him such a refreshiug sense of beauty as those similarly decorated. Of course, the mere clapping on of variegatod tiles such as we now see would produce all the "tea-caddy" offect you refer to; hat this is not what is meant, but the designing of a structure, built say in concrete, entirely for such a mode of decoration, and the careful study and planing of the encaustic work as a whole, with special reference to harmony of tint and fitting arohitectural character in the pattern. Repose need not bo sacrificed, as one tint,-say a rich cream, -might orm the ground of the larger snrfaces of tho onilding, be relieved where decoration was appropriate, hy well-clesigned patterns in diferent and well.harmonised tints. The endless litained, combined frith its superior advantages is a material over others affected by dirt and leony, point it ont as worthy a thoroughroing xperiment. Its piecemeal employment as at ut, but its capahiiity in the way now indicated $s$ another and interesting question, well worthy
of the attention of architcets, as pecaliarly snited to all the conditions of onr climate and the atmosphere of large towns. Not only would perpetaal cleanliness and freshness be attainable, and colour, now so much wanted in our
streets, bnt painting, ro-painting, and all the streets, byt painting, ro-painting, and all the other modes now resorted to to revive appearances, would he got rid of.

## LONDON SCHOOL BOARD.

Ar the final meeting of this Board, to which we have already alluded, Mr. Reed, M.P., brought up a report of the Works Comamittee, which was received, and in which wore the following passages :-
1-3. The committeo have invited tonders for the erecthe respective amounts.
Bhap:street, Kingsland-road-Accommodation for 1,075

Albany-row, Lambeth-Accommodation for 775 chil-

2. Burrage-road, Plumstesd-Accommodation for 814
 Cosilding per head, 71.15 s .1 ad
The The committee re
tender in each caso.
the acceptance of tha lowest 4. Tender have also been invited for the erection of a
school to provide accommodation for 793 children on the site in Dulke street, Deptford,
The amounts sce as follows:-
 $\begin{array}{ll}8,100 & 0 \\ 6,1199 & 0 \\ 5,981 & 0 \\ 5,980 & 0 \\ 5,870 & 0 \\ 5,589 & 0 \\ 5,380 & 0\end{array}$
 into a contract fors the erection of the sechool, the ecomMr. J. D. Hobson, of 7 , Duke street, Adelphi, W.C. amounting to $5,5892$. , be aecepted.
Cost of site, 8006 . Cast of building per hend, 7 . 5. Tenders have also been invited for the erection of a
Bchool in Towerstreet, St. Gilea's, to provide accommoda-
tion for 778 chitdren hon for 778 children.
The respective amounts have already been given in our list of tendors.
The committee recommend tho acceptance of the lowest tender, that of Mr. J. High, of Clarence-raad, Lower Clapton, E., arnounting to

## COST OF NEW CHAMBERS, LINCOLN'S INN.

Sir,-The sum of 8,0002 ., which was given yon as the cost, was for the portion now standing, but not the estimate for the total, which is Ap
Apologising for the mistake, I am, \&c.,
E. J.

## PRESERVATION OF YORK GATE.

At the last week's meeting of the Metropolitan Board of Works, a report was brought up by the Works and General Purposes Coramittee, which stated that they had considered the letter from Mr. Samnol John Bennett, Board for his willingness to negociate mith the known as York Gate, on the Victoria Embank. ment, but tho committee did not think that it woald be adpisable that the Board should parchaso this structure, and they recommended that Mr. Bennett should be so informed.
Aftor some discussion, in the course of which the Lammin moved an amendment in favonr of spoke in favour of the architectural merits of the structure, tho amendment was negatived by majority of twelve to six, and the report of the committee was adopted by a majority of twelve

THE LATE MR. E. T. PARRIS.
The ohituary of the Times will have prepared our readers for some notice of a veteran in art, who passed away suddenly on Thursday, tho 27th nlt. Mr. E. I. Parris was in his eighty-seoond year, and died, as the saying is, "in harness," for he had just done breakfast, and was about to begin his day's work, when he fell from his chair and expired. Many of his survirors who romember him in days gone by will call to mind the novel works which his mechanical in. genuity and versatile talents prompted him, not only to mudertako, hat to carry through with extraordinary zeal and success. Gifted with unuaual energy a true feeling for the fine arta and a happy temperament, which helped him throngla many difficulties, he has left behind him a well-carned reputation, besides many personal friends who deeply lamont his loss. He has, fortunately too, loft a very copious journal, from which we may be ahle to procare some extracts for publication. At any rate, his life merits a more lengthened notice than we can give at the present moment, and we hope to supply somo details of his carcer hercafter,

SANITARY APPLIANCES FOR THE INTERNATIONAL EXHIBITION.
Tere sub-committee for obtaining a proper representation of sanitary appliances and construction at the approaching International Triesday last, Preld their first meeting on Tuesday last. Present:-Dr. Hardwicke, in the chair ; Mr. Gatliff, Capt. Clode, Dr. Ross, and Mr. Godwin; Capt. Clayton acting as secretary. Arrangements were settled for making known the wants of the commissioners. Applications by intending exnibitors monst is made by anuary 1st, and tho arlicles themselves minst be sent in by the 1st of March. We hope suoh of our readers as are interested will take note of this.

## SCHOOLS OF ART.

Swindons.-The annual distribution of prizes and certificates to students in the classes at the Mechanics' Institute, Swindon, took place in the hall of the Institute, which was orowded with spectators. Sir Daniel Gooch, M.P., took the chair, supported by Sir James Anderson, and other men of influence. The sucoessful candidates were called to the platform, and the chairman handed certificates and prizes to some of them, Lady Gooch presented prizos to females. One of these prizes was a sewing. machino. Sir James Anderson (ohairman of the Great Eastern Stoamship Company) ad. dressed the meeting at some longth, in the course of which he alluded to the works he had seen that day at New Swindon. They struck him as marvellous, and worthy not only of a district, but of a nation.

## THE TRADES MOVEMENT.

Tee Bishop of Manchester addressed a gathering of workpeople at the Atlas Works, in Manchestor, on Saturday night, and his remarks wero of a practical character. His lordship contended that prices had risen to such a pitch that it was impossible for society to stand the strain mnch longer, and he asked the working classes to prove themselves worthy of the position to which they had sucoeeded in raising themselves, not to be extravagant in their demands, and not to push their employers into a corner. They might, he said, for a time command their onn terms in tho market; bat the laws of political economy always revenged themselves, and no body of men, either cmployers or eraployed, oould alter those inexorable laws.
At a meeting of the master masons of Sonth Shields it has been decided to agree to the terma of tho men, namely, that their wages be not reduocd during the wiuter qnarter, but remain at 33 s . per woek. The masons have resumed work, and operations in connexion with the erection of tho new Union Bank, in King-street, are boing proceeded with.

Cape Town Competition. - Some of our readers may be glad to have their attention directed to an advertisement in our presont issne, inviting designs for Houses of Parliament
in Cape Town.

GHURCH-BUILDING NEWS.
Langport (Somerset). -The parish church of Huish Episcopi, near Langport, bas lately undergono extensive reparation under the suporintendence of Mr. Ferrey, F.S.A., architect; tho contractor being Mr. Maurice Davis, of Langport, who has ably carried ont the works to the entiro chnrch, -the chancel heing rehuilt by the Ecclesiastical Commis.
gioners. An ontirely new roof and panelled seiling (of the ancient wagon-headed type) ceiling (of the ancient wagon-headed type)
have heen put to the nave; but many of tbe old have heen put to the nave; but many of the old
ribs hare been reased, and the original colouring ribs have been rensed, and the originat colouring
reproduced. The old roofs were in a thoroughly reproduced. The old roofs were in a thoroughly
decayod condition, past preservation. The north decayod condition, past preservation. The north1
transept and south transept roofs have heen ex. transept and south transept roofs have heen ex. tensively repaired and restored to their aucient
design. The whole of the incongrupus higb design. The whole of the incongrupus high
pering has been removed, and the body of the pewing has been removed, and the body of the haring solid shaped ends. The depressed chancel arch, of debased form, has been altered and brought into a more pleasing curve, the old voussoirs heing reused. A vestry has heen added on the north side of the nave, it being impossible to contrive one on the north or south side of the chancel, on account of vaultsheing in the way. Tho interesting south porch has been Though clearly not the original design, it is yet
of some antignity. The elaborate and beautiful Norman doorway has been made good where necossary. The stone of wich this doorway was constructed has evidently suffered from fire, as may he seen by its colour. Tbe church has total cost of the worlss to the hody of tbe charch will probably a mount to 1,500 ?
Clapham.-St. Saviour's Church, Cedar.road, Clapham Common, has been consecrated hy the new Bishop of Winchester, Dr. Harold Browne. new Bishop of Winchester, Dr. Harold Browne.
The church was completed, and bas heen open for service, so far back as three or four years, for service, so far back as three or four years,
but it remained unconsecrated. The explana. but it remained unconsecrated. The explana.
tion of this is, that the late vicar caused a tion of this is, that the late vicar cansed a
monument to his wife to ho erected in the monument to his wife to ho erected in the
central portion of the front of the chancel. The monument in question consisted of a sculptnred figure of the lady in a recumbent position,
resting on a pedestal, with the feet towards the altar. The late bishop ohjected to tbe situation in which this monument was placed, and refuscd to consecrate the churoh until it was removed to some other position. This has only just been
effected, the monument in question being now effected, the monument in question being now placed under the west window of the north
transept. A lectorn has been placed on the former site of the monument, and the pulpit which formerly stood under the tower, and Which is open to $a$ considerable height, has also been brought forward to the angle of the nave and chancol.
St. Leonard's.on. Sea. - The foundation-stone of a neww church at St. Leonard's has heen laid ${ }^{2}$ large congregation. The ceremony was pre. ceded by services in the present church. It is intended to ercet a costly and handsome building. The offertories amounted to over $\$ 002$.

- Decpear--A meeting has been held in the Rmional school.room, Deepcar, to consider tbe Lord Wharncliffe occopied tho chair parish. resolved that a church shonld be built at Deep. car, and a committee was formed to carry out the
ohject of the meeting. ohject of the meeting. A suhscription-list was tbat Lord Wharncliffe had given 500t., and that Mr. WV. Taylor had given a site for the new charch. charch.
Laton.-Christ Church, Eaton, which has been erected upon a site given hy Mr. H. Bolingbroke, and situate between Newmarket-road and UnThe church is of the Early Gothic style of arcbi. tecture, and has been hailt from the joint plans of Messrs. J. H. Brown and J. B. Pearce, architects, hy Messrs. W. Wright and J. W. Lacey. It is of a cruciform plan, and at present con. sists of chancel, nave, and transepts, with organ. cbamber and restry on the south side, provision heing made for the addition of aisles when re. quired. The nave is 75 ft . 10 ng , and 25 ft . wide ;
the trausepts are 18 ft by 16 ft, and the chancel the trausepts are 18 ft . by 16 ft , and the chancel
20 ft . by 18 ft . The huilding is of fiot, witb $20 \mathrm{ft}$. by 18 ft . The huilding is of flint, with Bath stone dressings, relieved with hands and
arcbes of coloured hricks, supported by hattresses; and the chancel is the gift of the vicar (the Rer. F. Weston). The roof is of open
timber, ligbt in design; the internal walls are of
stncco; the windows are glazed with cathedra grass of various tints. The east window of the glazed with ordinary glass, is to he filled with stained glass, to the memory of the late Mrs. Hewitt. In the nave and transepts the floor is of hlack and red Staffordshire tiles, that in the chancel being of encaustio tiles. A light stone spire, or bell turret, is in course of erection Altogether the church will cost between 2,0002 and 3,000 .
Haywood.-The foundation.stone of a new church bas heen laid at Haywood, about a mile soutl of the Moss Railway Station, and where Owe parishes of Bloss, Fenwick, Burghwallis, and Owston unite. The site on which the church
will be hnilt is in a field, having the North Fill be hnilt is in a field, having the North. Eastern Railway line on the east, and the roa leading from Mr. Stones's farm to the west.
Owston. - The chancel of the parish churcb of Owston bas been restored and reopened. Coat mpon coat of whitewash, plaster, and lime had
disfigured the inside walls, and that on the disfigured the inside walls, and that on the
northern side had so minch receded from the northern side had so mnch receded from the perpendicnlar as to necessitate heing driven upright before the ontside portions were fixed in and rebuilt. The roof was that of a harn, and cbiselled stones to the departed. The walls have been cleansed of their coverings, a door and arohway of the time of Edward III. have been brough to view ; the huilding covered with a light roof, and the flooring laid in encaustio pavement. Si Gibert Scott superintended the work, and his designs. The large east window has been considerahly enriched. Besides the fiveseparate figures of our Lord and the four evangelists, each occupsing a light to itself, the upper portion is now filled with coloured glass, har monising with the old and lower portion of the decorations. The roof of the chancel has heen made higher, and is carried up to the ancient height; it is formed of oak. The exterior of the chancel has been mostly rebuilt with plain worked stone. On each of the bosses figure.heade suppres ar figure.heads. At the end of the roof over
eastern and chief window is a carved cross.

## SCHOOL-BUILDING NEWS.

Hammerwood (East Grinstead). - The new school chapel, which has heen lately erected h Mr. Oswald Smith, for the education of the children of his tenants and workmen, and also for the performance of divino sersice, has beeu opened. It is a red hrick orection, with Bath stone dressings, and has a spire attached, with hell, the schoolmaster's house being immediately adjoining: Tho interior is fitted with seats, serving the double purpose of form and desk for scholastic parposes, and also seats with backs or the congregation on Sundays.
Newtonn (Derom). -The foundation.stone of All new schools, which are called All Saints', are in course of erection on a site on the Marsh, pre. sented hy the Farl of Devon, and are intended to accommodate about 260 pupils, the const completion heing estimated at about 520l., will also contain a chancel, as it is intended to ase the building for religious service on Sundays The plans, which were prepnred by Mr. Rowell the architect, are being carried out hy Mr. Mills, the contractor.
London. - A ncw wing to accommodnte 90 children, and offices, have been added to St . Agnes's Poor-law School, Leyton House, which is a mansion of the Queen Anne period. Mr. Blease, of Stratford, was the contractor; and the architect was Mr. C. G. Wray, of Regent's Park, who is also the architect for the new Roman Catholio Reformatory at East Ham, and of the St. Fizabetb's Scbools at Richmond;
Messrs. Perry \& Co., of Tredegar Works, Bow, heing the contractors for both works.
Dover-A new school (St. Paul's) for ninety children bas been erected adjoining the church, the front of wbicb is of Kentish rag stone, witb Bath stone dressings, and has been designed to accord with the church. The school bas an open-timber root, and is well lighted and renti lated. Mr. C. G. Wray was the architect, and Messrs. Tunhridge \& Denne, of Dover, were the contractors for the works.
Miscellaneous.-A new school.room bas been
orected in connexion with the North Hydo (R.C.)

Industrial Schools; and a new refectory, play. room, and enlargement of the chapel in connexion with the Blythe House (Hammersmith) Indus. rial Schools. Mr. C. G. Wray was the architect employed; and Messrs. Robbins \& Co., of contractors respectively.

## FROM SCOTLAND.

Edinburgh, Mr. Waddel, contrador, Bath. gate, who has undertaken the work of widening the North Bridge, has just made a commencement with the preliminary scaffolding operations. t is proposed to erect a strong scaffolding of Baltic pine on botb sides of the bridge, part of whiob will he raised from tbe base of cach of the piers: for dealing with tbe spaces between the piers a staging will be swung with chains from the parapets of the bridge. The uprigbts for the scaffolding at each of the piers will consist of fonr logs placed on end, and these will he connected diagonally with battens in tho usnal manner. In these preliminary operations a travelling hogey.crane will be used; and as this will be run along the footpatbs, the passengers on this already over.crowded thoroughfaro will have to suhmit to considerable inconvenience for some time to oome. The elst side of the bridge is to be first dealt with. It is thought that the wbole work will be completed by the end of June. - The new huilding of the School Arts in Chambers-strect is now rapidly pproaching completion. There are, in addition the large hall, which in accommodation and convenience for scientific lectures, acoording to kind in Edinhorman, equals anything of tho fitted up on a less elahorato scale besides fittea or 1 abor for besides chemise notural phlosophy feolor and chem and botany. There and at sectar At an aggregato meeting of the joiners of carried:-
"That this meeting of the joiners of Edinbargh agree to go in for an advance of Wages to the extent of $\frac{1}{3}$ d. per hour, to come in force on the ist of March, 1874; and, to
incresse our couldence in one another, we immediantely neresse our couldence inone another, weimmediately
siga the paper circulated amoag the trade for that siga the
gurpose,
It may be stated that the present rate of wages is 7d. per bour, and that three months' notice will he given to the masters of the intended rise. The paper referred to in the resolution is talked of hy the trade as "the plebiscite," its ohject heing to elicit the opinions of both unionists and non-unionists as to tho desirability of the step that is proposed to he taken. This bas been in circulation for some time past in the various sbops, and, it is said, has heen largely signed. Leith. -The Tolbooth Wyad of Leith was in formor times ouo of the most picturesque tboroughfares in the ancient burgh, hat since the destruction of tbe quaint Tolbooth and interesting old watch-tower, it has sunk into a com parntive architectural destitution. At the corner of Tolhooth Wynd and Water-lane, and facing towards Charlotte-street and Kirkgate, a tenement has just been put up from designs Edinhurgh. The frontage, which is upwards of 200 ft , in length, consists of three stories, the street-floor being fitced up as shops, while the upper tlat is arranged for warerooms, saloons, drc. In point of architecturo the building illus trates the applicetion of the Italian strle to the trate the a for requiremeion shop sions or piers be thers and the shops are of chamented wit murmon and surmoanto filled in with carred ornament. An ornamented glled in with carved cornice runs along the wbole frontage over the sbop lintels. The upper story is wholly of freestone. The building is surmounted by a
moulded cornice, baving a parapet and moulded cope.
Greenock,-The Greenock anthorities have made an official inspection of the new Greenock Gasworks, erected on Inchgreen Island, hetween that town and Port.Glasgow. The old gasworks iu Glebe baving latterly hecome deficient for tbo supply, and an eyesore to town residents, it was resolved by the Police Board in 1871 to coustruct the large and improved works just completed about two miles east of Greenock. The estimate tben amounted to about $50,000 \mathrm{l}$., but ex
tras and the price of the land have increased e total cost to 70,000l. The whole work was carricd out under the guidnnce of Mr. S. Stewart,
the engineer. They are constructod to supply two million fect of gas per twenty.four hours, three times the present demand.
Dunded. -The Albort Institnte, erected in the centre of Dundce to porpetuate the memory of the Prince Consort, has been formally opened by the Earl of Dalhousie, lord-lieutenant of For. farshiro. Tho building is in the Gothic style of architecture, and has been erected from designs by Sir Cilbert Scott, at a cost of $33,000 \mathrm{l}$. It is
intended for a free library and musenm, and the intended for a free library and musenm, and the epening was celebrated by an exhibition of products of art and industry. Many nohlemen and gentlemen in the neighbourhood have lent pictures, and a loan of art treasures of the value of
$\mathbf{1 0 0 , 0 0 0 7}$. has been obtained from Soutb Ken. 100,000l. has been obtained from Soutb Ken. sington. The exhibition is to remain open two months. The ceremony of laying the founda tion.stone of a new chnrch for the Rev. Mr. Knight, has been performed by Provost Cox The building, which is far advanced towards completion, has cost between 8,000 , and the first The new church is
Peat Fucl.- The South of Scotland Peat Fuel Company (Limited) has held its first general meeting, Mr. Maxwell, M.P., presiding. It was reported that arrangements had been entered into with Mrs. Withom, of Kirkconnel, for lease of the peat upon her moors for thing with Sir A. Gricrson for the peat on Rockhall.

## Boohs 解ceriber.

Artizans' Reports upon the Fienna Exhibition Manchester: Tbe Society for the Promotion of Scientific Industry, 11, Manchester-chambers; London: Simpkin \& Marshall. The Society for the Promotion of Scientific In. dustry, Manchester, acted wisely when they determined that a number of selected artizans engaged in the principal industries of the
country should be sent out to visit and report country should be sent out to visit and report upon the International Exhihition in Vienna; every reporter being bond

In selecting the artizans to represent the various industries associated with Birmingham, Mr. W.C. Aitken, as usual on all such occasions, rendered most efficient service.
amore into the matter; and has, further, super. intended the editing of the reports of the Birmingham men, giving, himself, an introductory chapter.
Among other instructions issued by the Council to tbe reporters, were the following: :"The object in sending out selected and skilled rork
men to report npon the Exhibition at Vienna is, that the men to report npon the Exbibition at bienna is, that the international displays are caleculated to teach, sand that
throuph them their raspective trades may be stimulate to improvement.
It is not intended in any way to fetter the reporters ench ono will confine himelff to hits paricular industry Their best discretion must be used, and attention may $b$
profitably directed to the following polnts:I. A comparison of the quality and oha
work exhibited by the diferent countries.
II. The new features in old manufactnres, machines, and procosses, and the principal points in new onca,
III. Relative cost of materials, wages, conditions Inbour, so,

Mr. W. G. Larkins, the secretary of the society, in his introduction, speaks strongly of the intelligence displayed by the reporters, and by the earnest desire they showed when in Vienna to do their work as well and as thoroughly as possible, at a time, too, when from twenty to thirty deaths were occurring daily from cholera.
With the exception of the slight illness of one With the exception of the slight illness of one or two of the party, a
to England in health.

Tho volume now published contains nineteen reports from the Manchester men, and fifteen from Birmingham; and when it is remern-
bercd that these were written ly hard-working artizans, their own teachers, they must be regarded as most creditable and encouraging. We would point to the paper (amongst others) "On
Design as applied to Jewellery," by J. W. Tonks (Birmingham) ; and to the report "On Ceramic Ware," by Fdward Locke (Manchester), an elaborate and discriminating paper.

As a specimen of the work done, and because in another part of this number the report "On
Woodwork and Joinery."

## discellamea.

New Summer-house in Eaton Fiall Gardens, Cheshire. - Some euriosily has
been excited in connexion with the extensive been excited in connexion with the extensive
works now proceeding at Eaton Hall, hy the works now proceeding at Enton Hall, hy the room for the Ladies Grospenor, in a secluded part of tho shrubbery near the mansion. Ex ternally, $u p$ to the plinth, the building, as described by the Chester Chronicle, is constructed of cbiselled stonework, and above this of English oak framing, the panels betweer being plastered. The upright framing, instead of being a flat snrface, is formed into elaborately carved and monlded columns, which support earved brockets carrying the eaves. To tho front of the building, which is an open covered space, hetween each column is a balustrade, formed of richly tumed and twisted smaller columns. The roof is covered with tiles of a red eolour, finisbed with an elaborate crest. ing. A portion of the area to the front and the summ the bnilding is left open, and forms this portion of the work is the earved oak wood. work of the columns by which it is surrounded and the roof. The tea-room is a handsome apartment. The sides are panelled with fine picked English eak, the panels being filled in with by Mr. Mar tiles. These thes were desigoed Minton \& Co., and duplicates of them were exhi. bited at the Vienna Exhibition. The subjects are principally flowers and birds, the former being painted on a white, and the latter on a light chocolate-coloured ground. The panels around the centre of the room are filled in with figure. subjects representing the Seven Ages of Man. Over the fireplace, in larger panels, are repre. sented the signs of the Zodiac, comically treated. The whole of the work has becn carried out by Mr. Hughes, of Aldford, from the designs of Mr John Douglas, of Cbester, who also designed the new park.keeper's louso and kennels in Eaton Park.
Big Things.-This is an age of "big things." There is, in Western language, nothing "one. to lire about the age in which we are permitted to livo. Chang, the Chinese giant, the bigges has developed papier mûché, is found strong enough to resist both wind and weather. Florida is to bo made into an island by the construction of a canal. A similar fate awaits the Morea, whicb is to be severed from the mainland by a canal 27 ft . dcep and 39 ft , wide, converting the Peloponesus into ono of the "isles of Greece." The ocean dides are to be atilised in France. At St. Malo, Were the tide rises 80 ft ., the motive power to the from the moon is to be benl, if ponsibe, be beaten. Gigantic waterways and colossal irxigation schemes are to the fore. More than by the use of artificial bcat. Congelation can it seems, be arrested by a neat arrangemont of bot.water pipes slightly helow the surface of the body of water it is desired to propitiate. Tinnels "used up" by centrifugal pumps and the Euca lyptus gilobulus. Blast.furnace slag is to be adapted to all the purposes of construction; and teak is tolked abont as a new matorial for rails St. Petersburg and Samarcand are to he united by a line of railway. The vicious hogs of Ireland, which burst with mud when their sides re tickled by the spado, are to be converted into practical peat and peat cbarcoal; and the Meanwhile we hear nothing of the Isthmuse Darien canal, are wasted en', uoprofitahle discussions concerning the North-west passage. - Iron.

The Alexandra Palace,-Messrb, Kelk \& Lucas bave a large force of men at work remoring the debris of the old bnilding, levelling the ground and preparing the foundations for the ew palace. It has been found necessary to pul eft standing. At either end of the main haild ing a large conservatory is to be erected, and midway between them is the transept or centra hall, 386 ft . by 184 ft . The wrought-iron roofs for these, as well as the girdors in other parts of the huilding (hetween 500 and 600 tons in all) are hein
London.

Railroad Bridge at Buffalo.-Tbis great work, of which we lavo hefore spozen, is finished, and connecting tro between the United States and Canada without break of bulk or chance of Canada without break of bulk or change of cars. The inconveniont and almost dangerous steamboat which formerly transported goods and passengers from shore to shore, has lost its ocross the Niegara river, te congect the a cross the Niagara river, te connect the iwo 1870 that the regnisite capital and charter for s.0 that the requisie capital and charter fo his work wore ohtained, The bridge extend ver the Niagara river from Buftalo, United States, to Fort Erie, in Canada. The hridge is three divisions,-first, from Canada shore Square Island, $1,167 \mathrm{ft}$ ft. ; second, aoross Square Island, $1,167 \mathrm{ft}$; ; third, thence to American shore, 517 ft ., making a total lengtb of $3,651 \mathrm{ft}$. The contract was let to Messrs. C. . Gzowski \& D. L. Macpherson for $1,000,000$ dollars. The two eentral piers are respectively 4.7 ft . and 48 ft . doep. Near the eastern shore of the Niagara, a swing bridge, the largest of the kind in the world, turns upon a pivot pier, leaving two open spaces, eacb 180 ft . wide, for the passage of masted vessels. This swing. bridge is worked by steam-eugines, and can be opened or closed in one minute. The river at this point has an average current of six miles per hour.

Whitley Partuers.-A company is being ormed for the purpose of acquiring and devo. oping the well-known business of Mossrs Whitley Partuers, mechanical engineers and ez. port merchants, of Hunslet-road, Leeds, which has been carried on for upwards of twenty-nine ears. The conversion of this firm into a public company has arisen, as we learm, chiefly from the desire of the senior partner (who founded he business in 1844) to retire from active on ragements requiring his personal care; as also from the fact that tho leading branches of the trade have become so developed as to need a larger capital tban that hitherto employed. The busincss, whicb is very large, consists of three distinct branches, each materially aiding the otber, viz., the brass fonndry and finishing department; the mechanical engineering branch of the business, which enjoys the exclusive monopoly of several patented inventions of great atility, including the Allen Governor, for stationary, marine, and portable engines, and Peet's Valve, for steam, water, and gas pipes, and large mains; and, thirdly, as exporters of machinery and general hard ware merchants.
A Cemmunity of Women.-The Chicago Tribune says:- "The establishmont of a women's community within the limits of the town of Tohurn, about twolve milea from Buston, was begun a few days ago, by the formal raising of the frame of the first building. In this community all the land is to be owued by women. The occupation of the residents in Aurora village will be varied, and industrial schools [for chil. ren ?] are provided to fit persons for the differont kinds of work to be done, including a domestio school for instruction in home duties. Each homestead is to be accompanied with a garden, and gardening and frait raising will be a avourite occupation. Co.operative schemes are also planned. About 1,000 persons are com. mitted to the enterprise, though they are not all women, and not to be residents. The site of the illage is a wildcrness. The community is oalled 'The Women's Economical Gardon Home. stead League,' and is established by Aet of the State Legislature." It is to be hoped the statement is untrno.
The Chislehurst Sarcophagus. - The granite sarcophagus presented by the Queen to the Empress of the French, for the remains of hie late Emperor, has arrived from Aberdeen, and been placed in the mortuary chapel. The building has been orected from designs by Mr. H. Clutton; and the builders are Messurs. Brass \& Co. It is entirely of masonry-exter. nally of Bath stone, lined with stone brought rom France. The carving is claborate, especially the capitals of the pillars; and the roof is groined, the design of the whole edifice being Gothic. The littlo chapel has a carved altar and canopy, and at the opposite end is a private rose.window, and there are three other lights on the south side. The sarcophagus will stand on a tesselated pavement in the centre of the new building, and will be approacbed from the interior of the church by twe steps, through a double bay divided by columns of jasper.

Invention " of "Gold," and Discovery of Perpetual Movement. - One of the most eminent scientists, says the London correspondent of the Suffolh Cluronicle, has lately been informed by a lady that she has discovered a method of inventing gold out of a mixture of other metals. She has asked the gentleman in question to assist her in bringing out her discovery. Yonr readers may think him rery ungallant for refusing, but after all science is science, and one can hardly expect an eminent metallargist to go back 500 years and turn alchemist. I fancy another iuvention which I have heard of during the last few days must be placed in the same category of psendo dis. coveries. A gentleman professes to have found ont that by a certain arrangement of metal xods placed undergronnd he can produce so mnch galvanic force as to drive machinery. In other words, he alleges that he has discovered a motive power which is practically permanent and comparatively costless.
The Criterion. - At the last meeting of the Metropolitan Board of Works, Mr. Wakefield, clerk, read a letter from Messrs. Pain \& Clark on behalf of Messrs. Spiers \& Pond, stating that application having been made for a licenco for Lhord Chamberlain Criterion is Piccadilly, the Lord Chamberlain has stated that he will bo prepared to grant the licence, providod ho is satisfied, by a certificate of the district surveyor or the Metropolitan Board of Works, that the building can be regarded as a pablic building eparate from the tavern adjowing, and asking Board, in order that they may receive the certificate. It was referred to the Buildine Act Committee to visit and inspect the proposed theatre.
Proposed New Pier for Yarmonth, Isle of Wight. - The Corporation of Yarmouth have decided to apply to Parliament for the necessary permission and power to erect a pier, and to levy tolls, \&c. The subject of a new pier bas at em howes during the last len or twelve years been brought before this corporation in connexion whi various railway schemes, but they have now given notice of heir intention to erect the pier themselves. The original intention was to erect it from the Quay, but as it would be very difficult to do so and at the same time keep intact the slipway for cattle and the prosent goods' accommodation, th has been decided to erect it from the Bank. The engineer whom the corpora. tion have employed is Mr. Cilcs, jun., Southampton.
Utilisation of the Tides.-Mr. C. R. Huxley, writing to the Glabe with reference to utilisation of the tides as a motive power for machinery, - which we have often urged,says a plan is about to be submitted to the Government which illustrates the awailbility of wator as a motive power for all standing machinery, whether for dockyards, within reaoh. It is calculated that this inven ithin reaoh. It is casculated that this inven tion will save the Government 200,0007 . in fuel none, and throw into tho market, for domestic nse, coal in suoh quantity as to reduce the price of this costly luxary to one half its present fgure, and cheapen considerably most articles of anafactur
The Birmingham Midland Institute. The first meeting of the members of the archao logical section for the present season was beld in the Lecture Theatre, on the evening of Thurs day, the 20 th ulto., when Mr. John Cotton architect, read a paper on "The Rise and Development of the Military Architecture of the Hastles Ages," with special allusion to "some Durham," and exhibited, in illustration of paper, a large namber of his sketches and drame ings of examples of ancient military architecture

Etching.-Mr. Hayllar has discovered that it is possible to substitnte glass for copper, and thus obtain an etching at mach less cost than tas been possible hitherto. Copper, too, bein opaque, the engraver could not ascertain how his work was progressing, except by taking proofs. But now he is able to see at once what progress he raakes, and to repair any defects as he goes on. Mr. Hayllar has recently left Sarmundham to reside permanently in London.
Royal Archæological Institute of Great Britain and Ireland.-We understand tha Mr. B. Montgomerie Ranking has been appointed seeretary of this Society.

Memorial of Charles Knight.-A lych gate, in memory of the lato Charles Knight, is ding erected at the Bacheiors Acre entrance
 tect is Mr. Tarver, of London. The piers are of red briok, with carved stone capitals, with oak woodsork, the roof being of red tiles, and surnounted with a cross. The gates are of iron, and will bear the Windsor arms. The lych gate is being erected hy the family of the deceased. What has become of the memorial committee that was formed in London?
Liverpool Architectural Society. - The hird meeting of the session of this sooiety was held on Wednesday evening, last week, at the Royal Institution, Colqnitt-street, Dr. Hayward presiding. The paper for the evening was by Mr. H. H. Fale, the subjeot being "Art Notes Abroad." In this Mr. Vale gave an acconnt of at recent tonr mado by him througb Belgium, Holland, and the Rhine, and sketched and criticised the architectural featnres of the buildings he had visited in those places,
New Use for the Sand-Blast.-The mos recent application of the sand-blast is to clean the fronts of buildings. Soot, dust, and othe substances are removed therefrom by sucl means. The impact of the sand on the surface dislodges the soot or dust from all the crevice and indentations, without perceptibly interfering with the sharpness of the architcctural ornamentation.
Institution for the Blind and Deaf and Dumb in Leeds.-A ineeting has been held in Che Philosophical Hall, Leede, for the purposc of considering a proposal to provide larger and more convonient premises as workshops for the blind. The meeting, acting upon a suggestion made by the Rev. E. Jackson, determincd to aclude in the enlarged promises provision for the accommodation of the deaf and dumb also Upwards of 2,000l. were subscribed before the meeting separated.
Bursting of a Canal Embankment. A serious landslip bas occurred in connexion with the Somerset Coal Canal at Monkton Combe, near Bath. The canal was drained for distance of three miles, and a gap was made in the embankment nearly 30 ft . deep and 50 ft wide. The field below the canal is extensively covered with debris, and a great many fis which bad been landed high and dry by the lloo have been captured by the inhabitants.
Derly Town Council. - At a recent mecting of the Derhy Town Counoil, Mr. John Mume C.E., of Derby, was appointed surreyor to the sanitary anthority.
Police Stations. - On the 29th ult. a station, rected for the Metropolitan Police was opened at North Woolwich. It is bnilt by Mr J. Terrell, of Victoria Docks.

VOL XXXI-No 1010.

"Principles of Decorca tive Design."
(IE work published under the above titlo is a reprint of the sub. stanco of a serics of essays written by Dr. Dresser for the Tech nical Elucator, and specially intended for tho enconragement and assistance of working men in acquiring a knowlege of the hest principles of decorative design, with hints and suggestions for their practical application The plan of the hook in its present form is to give an introductory general definition of the requisites and characteristics of decorative design, the remaining portion showing, in chapters dedicated to different branchos of matorial and manufacture, tho manner in which these may be illustruted in practico. In the opening page of the introduction, the anthor observes that a man horn and bronght up as a son of toil," but feeling tho ability and ambi tion to risc ahove his fellows by fairly hecoming their smperior, can find no means of accomplishing
this so readily as "by acquainting himsolf with the laws of heauty, and studying till he learns to perceive the difference hetwecn the beautiful and the ugly, the refined and the coarse." That this kind of perception is with nearly all Englishman an acquired one, is, as here hinted an unfortunate fact, which it is as woll to state plainly Not less dipropos is the warning to the student, not to take for granted the judgment of those persons, women espeoially (ungalian decorator!), "who suppose themselves to be pos. scssed of good taste. It is common to assume that momen hare better taste than men, and some women seem to consider thomselves the possessors of even authoritative taste, from which there is no appeal." This amiablo illasion, however, is certainly not so generally prevalont now as it once was.
$\mathrm{D}_{1}$. Dresser's introduction inculcates that viow of the dcgree of meaning and expression possilile in pure ornament which he has enonciated at greater length, and illnstrated hy some ahle and rather imaginative designs, in his former larger work on "The Art of Deoorative Desigu"; view in which there is a great deal that is true and suggestive, though it is to be regretted that the anthor allows himself to be botrased occasionally into exaggerated and rather foolish rhapsody ahout his own particular branch of art. The general principles laid down, ander the heads truth, beauty, and utility, are what are not nnfamilinr to most of our readers, and are here well and concisely expressed and exemplified. Neither of what may be termed the two opposing prejndices in regard to ornament is adhered to. Disliking the Renaissance orna. ment (so mach and so inconsiderately put forward as tho only model by our Government art-instrnctors), Dr. Dresser has on the other hand no sympathy with the love of irregnlarity for its own sake whioh has arisen (logically or

* By Cassell, Petter, \& Gaipin.
not) out of the Japanese mania. Among bis axioms is tho one that "a principle of order must prevail in every ornamental composition," and that "the orderly repetition of parts froquently aids in the production of ornamental effects." Tho capability of the expression of "humonr" in ornament is enlarged npon, and exemplified by some illustrations which border a little too much on that taste for what may he called "Medisval childishness," of whioh in some quarters there has been a great developmentlately.

Some of the points adverted to in the chapters on special suljects we may touch upon. The chapter on colour gives the usnal facts as to the relations of colour in harmonic comhinations, together with hints on the carrying out of experi ments in chromatic cffects; the effect produced by combinations of intense colonr in amall quantities is recommended, rather than that of masses of more subducd tones, as furnishing greater purity of effeot: "if pigments are mixed they are roduced in intensity; but if placed sido hy side, when viewed from a distance the eyo will mix them, hut they will suffer no diminution of brilhanoy :" a point which oan hardly be too strongly arged among people so addicted to either mandy tints, or raw masses of colour, ns are tho average English decorators.
In the chapter on "Furniture" we see with ploasnro an attack npon curves-the absurd and still largely prevalent fashion of working the backs and legs of chairs, \&o., into the very weakest forms, hoth in appearanoe and reality, which can be devised; an error which reache its climax in some of tho furnutare sent from Germany to our Exhibitions The diffeulty in regard to chairs, as we have hefore pointed out, is to combino solidity and dnrability with con. venient lightness. Two or three designs for chairs given here, of rathor a sumptnons charac. ter, are excellent in regard to outline and what may be called "expression" (for there cortainly is expression in furniture), but which certainly would not he very handy for much lifting about. One or two others that are given show more of a combination of strength and lightness. Certain remarks (p. 62), as to the carving of struetural portions of furniture (illustrated by a calinet from a design of Pugin's 's) we mnst dissont from; the ornament is certainly wrongty placed here. The author takcs opportunity further on of show. ing up as it deserves the absurd fashion of making cabinets in mimicry of Gothio structure, with buttresses, sloping roof, and dormers; the example given being hy an architect of note, who really onght to know better; and records also his righteons indignation at a classic cabinet seen in an exhibition which appeared to be unimpeachable in solidity and trathfulncse of struc tural design, until, the doors heing opened, away swung with them the pilasters which had ap. peared to support the top. The popular looking. glass is hranded as it deserves; but the picture. frame given as an example of good work (p. 71), we certainly cannot praise; it is commonplaco and coarse, and shows the cross-cornered frame which is so inconvenient, from the amount of space it dernands begond the line of the frame.
The remarks on the deooration of ceilings may bo read with profit, both in regard to their positivo and their negative axioms. The principles laid down for the decorative treat. ment of walls are botter than tho examples given. In regard to wall-papers (p. 87), Dr. Dresser wishes the straight-joint system of hauging to be abundoned, and the paper cut as much as possible to follow the pettern. "If you uso paper for the walls, use it artistically, and not as so nuch paper. Let a dado be formod of one paper, the apper part of tho wall heing covered with paper of a simple and jnst design" (what is a just design? ?), "and of such colour as shall harmonise with the dado." But if papers are used, snch as we (as well as Dr Dresser)
should recommend, of small geometrical or powdered patterns, it would be almost absurd to think of outting them to follow the pattern The joining.lines do not show in well.hung paper, unless one looks for them. This is refining too mnch about trifles.
In tho chapter on oarpeta, the principi: (selfevident, yet constantly overlooked) shonld be noted, that while wall.papers or decorations may have designs with on upward tendency and a " bilateral symmetry," oarpets should always consist of designs with a "radiating symmetry," so as to appear the same in every direction. Among the romarks in regard to designs for stuffe generally, table.oloths, so., we may call attention to that in regard to articles that hare to hang in folds, like the edges of tablo. cloths, viz., that componnd ourves, on at all a large scale, are had in such a position, as they are broken np hy the folds into mere wavering lines; whereas straight lines and sogments of circles in such a situation natzrally meet the eye as correct componnd ourves; and, as a general rule, that which looks well on a flat anrface will look bad on a ourved one, and vice verst̂. Carpets are recommendud to be kopt "neutral in general tone," either by the employ. mont of tortiary hnes, or by small quantities of primary colour in juxtaposition.
In regard to pottery, and the working of hollow vessels 'generally, we very mnch ooncur with Dr. Dresser's observations. He is alundantly right in his remark as to the ampount of finish which is often put into articles of this kind, without any art at all. Clay is susceptible of "a bold sketchy treatment," as well as of high luigh, "As a rule, however, we over•estinate the valuo of fimish, and undervalno bold art cffects, . . . I have hefore me some apecimens of Japanese eartheaware, which are formed of a coarse dark-brown clay, and are to a great ortent without that finish which most Europeans appcar so mnoh to valne, yet these are artistio and heantiful. In the case of cheap goods, we spend time in getting smoothness of surfaco, whilo the Japanese devoto it to the production of anart effect. Wegret finish without art; they prefer art withont finish." Which deficiency is tbe most serions there can be little donbt. Ona author thinks we should get much more artistio and beautiful shapes if we adhered more to tho old "potter's wheel" method of working clay, by which heautiful ourves almost design thom. selvos; and a somewhat similar remark will apply to tbe practice of glass-blowing, and the natural shapes resulcing from the prooess, as compared with many of the more artificial ont. glass sbapes and outlines. The accessories of the tahle are gone intoat some length, and some of the shapes given for decanters, jugs, and other adjnncts, are suggestive and suitable. In touching on the ornameutal use of silver, we notioe the remark, unfortunately too true, that modorn European silvorsmitha have fallen into the error, now almost nniversally prevalent, of making their works of a pictorial, rathor than of an ornamental character, The extraordinary creations which we see put forth almost daily as centre-picees, prize cups, and so on, would warrant much stronger critioism than that indulged in by Dr. Dresser. Wo have hefore now condemned them.
It is refreshing to find the prevalent absurdities of stained.glass design (architectural cano. pies, \&o.) so strongly denounced as at p. ${ }^{120} 6$ Of two specimens given hy way of example, of a pnrcly ornamental treatment of stained.glass design, hoth aro suggestive, and one has con. siderable bonuty, the other not.

In the main, we can recommend this hook to art.workmen, as well and clearly written snggestive, and based almost entirely on sound and true principles, in regard to the treatment and application of ormament. It is not freo from the nsual pessiasist tendenoy of
morks of this kind; every ove who writes on orrament at present decming it incumbent on
him to show how fearfilly wroncy bad and him to show how fearfully wrong, bad, and
degraded in taste is ercry article we are in the degraded in taste is ercry yrticle we are in the
habit of using. Perhaps this is tho best policy habit of using. Perkaps this is the best policy,
hat it is apt to be overdone. All ornamental critics, howerer, do not offer their thoughats in so aiberal and geeerons a spirit ns Dr. Dresser, who concludes his book hy assuring the reader that, "If I personally can aid him in any way, I shall be glad to do Bo. If any who really geek tnowledge of decorative design, and aro hard workers, choose to send me designs for criticism or comment, or desire any other aid that I can give them, I shall he happy to do what little I can for them. My address will be fonnd at the end of the Preface." After this, we can only adopt the langnage of Sir Hugh Evang, "So Got judge me, that is a virtuous mind.'

## TLE OLDEST BUILDERS' SPECIFICATION

The nndying interest which, from the date of the carliest edition of the English translation of the Bible, has been kept up, generation after generation, as to the architecture of that ancient house of prayer, the Tabernacle erected in the wilderness, may bo thought to have fornished such a stimulus to inquiry as to have led to the exhanstion of the subject. The name of Dom Catmet will not readily be forgotten. The same stndent bestowed on the genealogies of the Imperial Family, and of certain ot her ancient astios of his day, when directed to the investi teuch produced teuch, produced graphic illustrations of wellconsidered detail. Dom Calmet, indeed, drew
npon his imagination to supply what he thonght npon his imagination to supply what he thonght
mnst hare been indispensable. Thns, in his plans and sections of Noah's Ark, he not only planided the allegorical dimensions given in the Book of Genesis into decks and cabins, but went so far as to sbow the trunks down which the fodder (from his point of view) was daily thrown by the patriarchs for their charge. The Tabernacle, as well as tbe Temple, were represented by the learned Benedictine with equal precision. Nor can these early plans he regardcd as more purcly imaginary than some of the latest which indeed greater confidenca world, with equal or of mnch less patient examinathough as the result It mary be patient examination of the case. gewly-discoverely admitted that, unless eithe trate the subject acts can be brought to illus. can be shown to or a new method of inquiry hetter now be left to possible, the matter had cyclopædia ard the architectural dictionary; and that the columns of a practical jonrnal have more important claims on their space, than to allow the discussion of such ancient and shadow structures.
It is the case, however, that the last few years have witnessed the discovery of facts that have a very close relation to this ancient structural problem. And when we observe that some of bese fncts have been for several years pnblished different works, but that no one has taken the pains so to collate the infurmation as to derive from it any positive teaching, it will an often-told tale. Further the over again collected, and in course of collection mation rendered of increased value by the adoption of a method of ingniry somerbe adoption of and severe than that which any writer, who has a theory of his own on the snbject, appears to be able to prevail on himself to adopt.
In a recent number of the Builler (May 10, 1873), we investigated, with some detail, cerPalestine 2,400 years which were in use in from what we yere justified in then deduced, from what we were justified in terming a very ancient specification, illnstrated by certain actual measurements taken by tho Royal Engine plan of the surerb positive information as to the plan of the superb Temple ercoted by King Solomon. In that paper we confined our semarks almost exclusively to plan, withont reference to elevation; excepting in so far as the determined by positive survey. Even that wab ject we did not exhanst, feeling that it was wiser to keep somewhat within the limits of our actual knowledge, than to hazard anything in the sbape of a guess. In what we have now to bring for-ward,--although the primary question is the
true rendering of the accomnt which, in minuto
detail, is thrice repeated in the book of Exodus, - of the stractare of the Tahernacle, it will he Eeen, by thoso who are at all familiar with the subject, that we shall obtain very much that i suggestive as to the elevation of the Holy Honse, or celld of the Temple, which was huilt on the normal plan of the Tabernacle.
One point ought to he premised as to any attempt to read, with the eye of an anchitect an account that was written in Hebrow 3,400 years ago. It is this. It is hoperg 8,400 one, whose scholarship is confined to modern tongues, to attempt to explain that account of the technical passages of the Old Testement, cannot be said to have even a direct translation in our languagc. A careful comparison of the original with the Greek, Latin, and English persions, shows that the third of the the Hebrew. The same tatin, and not from invariably made; and the additional obscarity, which is the natural result of a double transla. tion, settles down upon the nutborised version. We confine onr remarks to these technical pas. sages, because it is only with them we have nowto dcal.
Two further difficulties attend on such a collation as can alone deserve the name of critical research. Oue of these is, that the Greek translators, writing, to some extent, under the influence of the Alexandrine Court, and biased hy the tone of thought of tbe lcarned men whom the Ptolemies collected in Egypt, have frequently lett strong impressions of individual opinioz on their work. Remarkable differences between a close translation of the Hebrew (as it now exists) and the Greek of the LXX, are faniliar to the student. And that these diferences result from the individual opinion of the translator, appears from the fact, that the same Hebrew words are translated by Bible hat he is in, no one is justined in concludizg passage of the Old Testament, withont collating it with the two codices of the LXX , which sometimes differ materially both from eacb other and from the Hebrew, and nowhere morc so than in the present iustance.
The other difficulty arises frcm the fact, that in consulting a Hebrew lexicon, the stndent is, winked, to St. Jerome only seut back, hoodpressly from experience of oue of the olding exnost scholarly of the Hebrery the oldest and Bustorfi. As far tranglation of Tehreva the is coucerncd, this valued bool is littlererw disaection of the Tulmoter Thas who, whatever he Tulgale. Thus when Jerome iven a ragne or incorrect an architect, ha Mebrew arohitectural word translation this dilcmma He will fid the student is in the Tulgate translated ind the word used in When ho turne the G lie authorised version find a mere transliteration, be is very likely to
 back to the original, unless be Aud when he goes back to the original, unless be can bring Arabic likely to find his Helyew bis aid, be will be ikely to find his Hebrew lexicon repeat the In the under of St. Jerome.
emarkable occurs a research. The word which St. Jerome has ranslated tabulce, and the English writer boards, occnrs in tbe Book of Ezecbiel (xxvii. 6), where Jerome has translated it
transtra, "thwarts," aud the English "benchcs." Accordingly the English version, benchos." Accordingly the Hebrew lexicon acquaintane and transtra as the meanings. Any building woll th either natural history or ship. the benches athwart a ebip as made of ivory The word in the Greek is "temples." The etymology of the original rather indicates plates, ice. Dine sense of a shiny surface, like that of ico. Bat nine studencs out of ten would be Thy contented with " transtra."
The only safe method, then, we take to be that whe we previously indicated; namely, to treat he doubtful words like algebraical expressions excluded, in each are included, and what are and thus, finally, to attach the true value. This will almost always admit of an etymological verification.
We find it necessary to make these remarks with sonne degree of distinctness, in order to Hebrew type. Our readers now made Greek and nethod adopted, will for the most part thank us
for presenting tho results, and not asking them o accompany our investigation, step by step. The first thing that will rerify the true construing of the accounts of the Tabernacle of Moses (if the passages in which they occur be uncorrupted) will be this. We must find a nataral explanation for every term, in its proper place; and we must have neither omissions nor epetitions. When people wrote painfully, letter hy letter, not even hreaking the line into words, they wrote carefully. Each word was wanted; and each word had its proper meaning. We unst therefore think it probable that the pecaricate given in the Book of Exodus is adcquate ; and tbat it omits no essential part of he structure. If a workman now took that acient description, and worked it ont, he ought o be able to set up just such a tabernacle ; without introducing a single structnral feature or which he could not show the anthorising clanse in the specification.
It is clear that this critical canon will at once exclude a great many suggestive explanations the form of the structure in quostion.
For the sake of hevity, wo will adopt the unit of the cubit in onr reading of the specification. There is no authority for snpposing that he cubit bero used was any other than the ordinary Jewish cubit, of 16 in ., or 48 English barleycorns; as the larger onbit is not in any way bere alluded to. As to the dimensions of he ordmary cubit, we have positive information the Talmud.
The woodwork of the Tabernacle was as follows: - Thero were forty similar plates or hoards, each 10 cubits long, $1 \frac{2}{2}$ cubit wide, and 4 digits, or nearly 3 in., thick, which were covered with thin plates of gold. A comparison of tho weight of gold employed for all the work,位h the saperficial area of the woodwork of the Tabcruacle, shows that this plating could not have heen thicker than the tenth part of the thickness of an English sovereign, or, in round numbers 6 oz . Troy per square foot, if the weights of gold given are stated in terms of the ordinary mese shere a strong presumption however, in favour of the opinion that the gold thind of in that or the silver shekel, is enployed; and made i tho a weight the estimale one goid used. Tho weight of tho silver shekel, daring the existence the rist this we The definitely from Maimonides.
These boards, all exaotly alike, were jointed (whether by a bird's-mouth groore, a tongne, or enons and mortises, cannot be distinctly ascer. tained), but so as to fit together in two nuhroken walls of gold. Each board rested ou two feet, or bases, of silver, which must bave heen not very dissimilar to onr present railway-chairs, of which they were about the weight, and which were huried in the earth to give fixity to the structure. These two long silez, 30 cubits in longth, ran east and west, when the Tabernacle was fixed.
For the west end of the Tabernacle, which was 10 cubits long, six similar boards were made; which, according to our view, were in three pairs, with an angnlar slope at top, so as to form a sloped or pedimented end to the build. ing. Two corner-pieces, of only half a cubit in riath, were specially formed to connect the ends with the sides of the building. All these picces of wood were jointed io a simiar manner. and stood on similar bases. The only point which is to be cousidered as netwly indicated here, is the shape of the end of the structuro.
This is arrived at as follows. At each end of the building were five upright pieces, pillars or pilasters, those at the west end standing against the Golden Fall (whether within or without is not clear), and those at the east end snstaining veil, in lieu of doors. The odd number shows that one pillar was in the midst; and this is an almost certain mark of a double pitohod roof.
Eight upright pieces, or pilasters, are thon ammed, the explanation of which, as direct structural elements, is now, wo believe, for the first time suggested. Five bars aro mentioned as fixed on either side of the building, and one long bar, 30 cubits in one piece, "in the midst between." In this enumeration we read five pairs of rafters and a continuous ridge piece. We thus have an explanation of the eight uprights. Thrce pairs of them corresponded with the three pairs of intermediate rafters, and were for taking tho weight of the roof off the thinner boards of the sides. One pair was at the west end, forming with the outer of tbe five end columns, some-
thing like a pair of coupled pillars, at each angle.

For the west ond a pair of additional aprights was not nccessary, hecanse thero were already two pillars at each western angle; one boing other being the outer of the five bars attributed to the west end of the hailding.,
On this view the structure is porfectly simple and intelligible. Erery word is explained; and the great point is attained, that nothing further is reqnired; no tent-poles, or ridgo-lines, or separate fittings for supporting the embroidered linen veil, its outer cover of black woven grat's hair, and the row of red and blue rams skins on the top; for this we tako he translated "hadger. skins," to the confusion of the natnralist, who has been nnahle to suggest what animal was intended. We read it that these were rams' skins, dyed of difforent colours, which would give a special peculiarity to the aspect of the give a spe
It is quite certain that any ordinary carpenter conld construct a perfect model of this build. ing, in wood, linen, and canvas, and could erect ing, in wood, linen, and canvas, and could erect be easily fixed and removed; and it would always be erected in exactly the same form.
alw The ouly question thas left open, as to form, is The only question thas left open, as to form, is
that of tho angle of the roof. Hero it is that a comparison of certain distinet data hecomes a comp

Do Saulcy published, in 1851 , in his "Re. cherches sur la Numismatique Judaique," drawings of tbrco Jewish coins, which have becn reproduced in Sir F. Madden's "History of Jewish Coinage." Each of these coins shows on the ohverse a tetrastyle temple, with a lofty,
arched, contral door. We do not adont the viows arched, contral door. We do not adopt the viows
of either of the learned editors in question, as of either of the learned editors in question, as
to the exact date and legend of these coins; and that for reasons, taken from Jowish literatare which they have not consulted, to which wo have no doubt that they would have been the
first to adhore. There is no reference, for instance, in Sir F. Madden's learned work, to the positive determination of the silver shekel hy Maimonides,-a knowledge of which would bave saved a vast amonnt of confessedly nnsatisfactory discussion, and moreover would have given accurate results, instead of erroneous approxi-
mation. But that they are Jewish coins, issned mation. But that they are Jewish coins, issned during the independence of the nation; bearing, in each instance, on the reverse, representations of ohjects employed in the services of the
Temple; and the name, either of Jerusolem or of Israel, in the peculiar letters found on the coins before the adoption of the Greek letters by the Idumean, and even by some of the Asamonean, kings ; there is no manner of douht whatever. We do not, thereforo, see how there can he muel reasonable doubt that we have here representa. tions, as faithful as the art of the coiner allowed him to givo, of the elevation of the second Tomple; and thns an illustration of the permanence of the type "showed in the Mount" to Moses, down to the days of Horod, and probably down to the destruction of the Tomple by Titus. It is impossible to believe that any other haild. sacred emblems and legends
A less positive, hnt still veryluminons, illustra. tion is found in the proportions of the two small THELTHATHA, which aro figared in "The Recovery of Jerusalem" (a work published in and ruind which are types of numerots relics little fanes all agree vory olosely in form with that which we bavo suggested as normal in the Tabernacle. They differ in the one par. ticular of forming double, instead of triple, cuhes, hut in that almost alone. They open
towards the East, with two columns interspace hetween two squaro anglo pilasters; which we tako to be the form introduced by Solomon, when the ceatral snpports for the ridge heam were rendered unnecessary, by the substitntion
of sobd masonry for framed woodwork. Even * It would exceed our limits to enter into detailed com.
 rafter,
 or vectes, from each side entered. The ordipary notion
that these gided bara were merely bolts to keep the fitted
side-pieccs of the building together, is inconsistent with these expressions. In egch description the phalan> is
spoken of as one, and in the middle. To convert this into
two long bolts, one on each side, is contrary to the two long bolts, one on each side, is contrary to th
langugene used, as well as to any intelligent ideas o
structure
in the Tabernacle, the same form was adopted in be internal division, where four pillars supported of these Syrian temples secms to have heen the ordinary one, of a rise of one-filth of the width, griving a slope of $2 \frac{1}{2}$ to 1 for the roof. The porch being in one instance one.third, and in tho other one-fourn, of the entire lencth of the building. In the Tabernacle the external eurtain was so folded and hung as to form a porch. In feature comple of Somon the porch was a distinct temples are the remains of vaults, showing that tho altar stood, in each case, on a raised plat form, forming what we should term a choir or sauctoary. The different arrangement here holds cosely to the 'special difference between the losely to the special diNenc botw the jeople. Where no imat of the contemporary peaplment, by a reil of the mystic Ark from calment, which the oracle was uttered, from hecessity. But for the careful provision of the law in that respect, the Ark, with its forms of life beaten in gold, wonld, in course of timo, have hecome the visiblo symbol or idolon of the Jewish temple.
The care that was taken to prerent the of this vatureach to any idolatrous declension of this vature was extreme. The oral las pre.
scrihod overy action of the High Priest on the only occasion on which he was allowed to enter the Sanctivm Sanctorum. Two veils hung, a cubit apart, between this portion of the temple and the outer part of the hody of the huilding; at least, in the sooond temple. (In the first, there was only one veil.) The outer, or western veil, was so hang as to have its opening on the
south; the inner veil, on the north. The High south; the inner veil, on the north. The High piece of live charcoal, taken from the hoarth of the altar and placed in a goldon censer. With this burning, be ontered the Temple, passed within the outcr veil, passed between the two veils to the second opening, turned his face gain to the south, and, with his eyes cast down wards, waved the censer till tho cella was fille with the smoke. He then retired backwards rom the Templo. The contrast between this reveront modo of symbolic worship, and the magnificent display of such an ohject of adora. tion as the great chryselcphantine statues of the Greek temples, is absolut

## , a structural expression.

Thus not only the rare, but undoubtedly nthentic, Jewish coins to which we have efcred, hut the actual forms of tomples ye inteligizle reading whioh wo have ventured to offer of the long.disputed acconnt of the early abernacle. Mr. Fergasson has been strongly impressed with the unreasonable character of ho ordinary opinion, which makes that venc. rgument is resemble a fiat-topptases of tha shape for the discharge of rain or snow. should be rememhered, however, that not only most of the roofs to be scen in Syria are fat occasionally varied, as in other Mediterranean countries, by the introduction of little domes, bat that tho ectual black cootgkin tents of the A mab of the day are menerally fat.topped; being for th most part formed of only a single sheet, bent to form a lat roof and one side. Still,' the question of rainfall is one of much importanee. So long as the idea of a ridged roof required the intro. duotion of any structural clementa which are not mentioned in the account, we felt bound to oppose it as unauthorised. In the drawing of the Tabernacle which is riven in'the work oalled "The Holy Sepnlchre and the Temple at Jerusalem," reprodnced from the Bible Dic ionary, ocenr elements which are not only not aentioned in the Book of Exodns, but whicl re incompatible with that acconnt; such as the central standard between the nave and the sanctuary. The entire form of the building is atered. Side.posts, lines, and verandahs are added, and the imagination of the artist has heen allowed such play as to render the origina acconnt, fhom the new point of View, of no valu But onr present scheme, which is fonnded simpl on the principle of investigating enoh detail, no ccording to the name given to it by St. Jerome but from a workman's point of view, remore his objection; and we thus have at once a literal only an arohitectural possibility, bnt a carefully djusted and beautiful structnro.
The measure of half the slope of the roof, on
the proportion which we have indicated, is a would than $6 \frac{2}{2}$ cubits. The embroidered vei gilded walls to within $2 \frac{1}{3}$ cubits, or 40 in ., of tbe gronnd. The outer curtain of black goat's hair would fall 16 in. lower, or to within goat's hair ground. We thns attain a correct structural equilihrium hetween the thrnst of the roof and the additional weipht imnosed on the wall. If the curtains were so arranced that the joinings coiucided, the eontrol sutre lying on the cen tral rafters of the buldine they wonld hare luner down only to within 7 arbite of the gromd on the down 3 cubits at tho over, being folded back when not reqnired for protection from rain.
Whether the scarlet and parple sheop.skins covered the whole of the sloping roof, or the covered the whole of the sloping roof, or the ridge alone, is not clear. In the latter case, throngh the embroidered poil In the fitted throngh the embroidered veil. In the former lishted by the rays that entered from the only ighted by the rays that entered from the east, and by the lustre of the golden candelabrum, wlipht. The awe and silence of the continually alight. The awe and silence of the place ; the it contained con all wh of pare gold; the shimmer of the walls; and ont orer the of emhroidered roof, stretched ont over the shining golden rafters; must have impressed the ministering priests with a deep sense of the mysteriona solemnity of their worship. Thus regarded, the Tahernaclo was not a makeshift, hut a well.planned ecolesiastieal strncture,-portable, indeed, but complete and entire, - the outline of whioh is preservod to the present day by its repetition on Hehrew coins, and in Syrian temples.

## THE LATE MR. E. T. PARRIS.

Descended from a family in Norfolk, the sub ject of this notice, Edmund Tbomas Parris, was hori in London, in the parish of Marylehone, on the sid of June, 1793. He early gave evidonce of a taste for drawing and for mechanical pur. suits, which he continued to cultivate through his long and energetic life. In his journal, minutely kept, he has recorded of himself that at the tender age of seven years old he made many copies from engravings from the Passions of Le Bran, from Macklin's Bible, West, and others which fell in his way. Ine early bias of the mind of the child, enconraged or disrerarded, may often acconnt for the success or falpro in the life of the man. The father of young Parris, probably withont any exact or lofty notions of art, had, however, carefnlly noted the predilec tion of his son, and sensibly detormined to place the boy to some kind of husiness in which his poncil could bensefally applied; and, acoordingly, Ray usaal age, he was apprenticed to Messr's. enamel-painting, and gold figure-obasing. Here he wronght through the day, and in his leisnre honrs at night cultivated that mingled love of science and art which never left him, and which, a few years later, developed itself in the invention of his scaffold for getting at the dome Pt. Panl's, and in bis great picture of the Panorama of London at the Coliseum in the Regent's Park.
In 1816 Parris bid farewell to the goldsmitb's hop, hat occasionally made designs for his late masters, one of his latest heing the sword pre. sented to Lord Exmontb, the gold ornaments of which he not only chased, hut he painted all the enamelled subjects with which it was enriched commomorative of the naval battle at the taking of Algiers. With prowing experience and higler aims, bo now sought to qualify himself for the life of a painter, and entered himself a student of the Royal Acndomy, and at the same period studied anatomy for thres years nuder Dr Cerpue, meanwhile making designs for anything that came in his way. In a competition for a set of drawings for the painted glass windows at Brancopeth Castle, he carried off the prize, not withstanding the accomplished Stothard bad entered the lists. Ambitious of still greater
things, in 182.4 Mr . Parris oxhibited his frst things, in 182.4 Mr . Parris oxhibited his first large picture, "Christ Blessing little Children, displaying his ripening powers and academic tho church of St. George at Sheffield. He also tho church of St. George at Sheffield. He also invented about this period his remarkable apparatns for getting up into the dome of St. Pawl,
paintings of Sir James Thornhill, which had allen into decay, and submitted his model to the Deair and Chapter, Professor Cuckerell, Brunel, and many other architects and scientifio persons, Who bighly approved lis plans; but, for the
want of funde, the rcstoration was, delayed. want of funds, the rcstoration was delayed.
Amongst others, Mr. Thos. Horner, the proAmongst others, Mr. Thos. Horner, the pro-
jeetor of the great works at tho Colisenm, was so struck with the eimplicity of his invention, that he immediately entered into an engagement
with Mr. Parris to assist him generally in his with Mr. Parris to assist him generally in his hinge undertaking. Accordiogly, on the 12 th of
Deceraher, 1825 , Parris connenced that stnpendDecomber, 1825 , Parris conmmenced that stnpend-
ous work, the Great Panorama of London, coverons work, the Great Panorama of London, cover-
ing over 40,000 square feet of canvas, or nearly ing over 40,000 square feet of canvas, or nearly an acre in extent, and which, for the following
four years, taxed all his mental and physical powers to their greatest stretch. The original sketches for this work were begnn hy Horner in 1821, during the tinie a new ball and cross were heing set up over the dome of St. Paul's. They
were drawn in outline by means of an optical wore drawn in outline by means of an optical apparatus on numerous picces of paper, and a number of young men had been employed to sketch the details of the prinoipal huildings ahout London withont plan or system. These, when hrought together, presented the ntmost confnsion and endless mistakes, and were like an ill-derised puzzle, the parts of which no dexterity could fit. "The difficalties [wrote Mr. vast dimensions, and so fall of linear and suchial pergpeotive, combined with architecture, will be understood when it is stated that every line helow the horizon had to be dipped downwards, in order to appear straight on account of the curvature of the canvas; the great size of some of the objects, and the most careful finishing of in the visitors' gallery), -also to make the foreground objects appear nearer the eye, though, in reality, more remote from the speotator, the distortions of drawing on a curved surface requiring every managoment of the artist to humour in
order to appocr true. The canvas, ton, was order to appoar true. the canvas, ton, was
always in motion, which tho wind or leaning against any part wonld occasion all over. These with tho danger and awkwarduess of painting every day suspended in a box 50 ft . or 60 ft . from the ground, and a multitude of others
nuforeseen by the projector, and beyond his noforeseen hy the projector, and beyond his
control, wero every day retarding the progress of the painting, and I began to dospair of ever seeing it brought to completion." "Mr. Horner
at length became deepcrate, and, convinced of at length became deepcrate, and, convinced of
bis own inability to conduct the work, implored me to take tho whole management into my own hands, as the only way of saring him and the picture from ruin." An ari ist with less energy,
skill, and constructive ability would have sank skill, and constrnctive ability would have sonk
ander the ceaseless lohour and perplexity he ander the ceaseless lahour and perplexity he
weut through, in setting everything in order went through, in setting everything in order where nothing but disorder prevailed. His
power of worl was amazing, as tho following power of work was amazing, as tho following
from his Journal well illastrates:-" When Mr. Horner made his eletches from the top of St. Paul's, the ground on which the Post-office now stands mas a blank spaoe, enolosed with wooden palings. Consulting together, we kuilding sonld he more interesting when the the scatorolding standing than if represented of finally complete. I therafore went to St. Paul's, and made the requisite sketches from the Golden Gallery, and finished it on the canvas, without assistance, in seventeen cays. It is full of very 423 ft . superfcial."
By undlinching determination and industry Mr. Parris had oompleted ahout two-thirds of his ment arose. Rowland Stephenson of embarrassment arose. Rowland Stephenson, the hanker, through whon Horner obtained means to carry
on his undertaking, fled the conntry, to ho ful. on his undertaking, fled the conatry, to ho fuil.
lowed shortly by Horner himself, who abseorded to America, leaving creditors to the amount of 60,0002. The Panorama, however, being so far advanced, the trnstees for the creditors ordered its completion; and on November 29th, 1829, Mr. Parris put the last touch to his gigantic pictare of London.
At the termination of his lahours, Mr. Parris, hy oommard of Queen Adelaide, attended at the Coliseum to receive Her Majesty, and at the same time rras honoured hy a comanission for a cahinet picture, At this period of his life, it appeared as thongh no amount of toil could subdue his aotive temperament; for soarcely
had he conolnded his arduous task at the Colj seum, and the town was still ringing with admira. tion at his great and well- nerited success, when
he joined in another large undertaking with Mr. Daniels, R.A., to paint a panorama of Madras wholly dosigned and constructed which Mr. Parris wholly dosigned and constructed.
He had now cstahlishod an uncommon reputation as an accomplished artist, and man of ready mechanical expedients, with quickness
and acuteness in combining ideas, on an enorand acuteness in combining ideas, on an enor-
mous scale: it was now ( 1832 ) that he displayed mous scale: it was now (1832) that be diaplayed an equal oapaoity for small, and birhly finished
work in "The Bridemaid," exhihited at the British Institntion, perhaps the most felicitous of a number of pictures of this class which he produced in a snccession of years, as it was undoubtedly the most popular. Parchased by the great minister, Sir Rohert Peel, praisod by the oritics, comphimented hy verses from the pen of Diss Agnes Strickland, and of Haynes Bailey, mezzotinted by Bromley, it long retained the admiration of the public, and estahlished the artist's reputation as a painter of female hearuty. The domand on his time was now excessive, for persons portraits of noble and distinguished and ; designs for churcl windows; for ornamental silver, for carpets, for paperings, for lustrated books, screens, and all kinds of decorative work. It is perhaps to he regretted things, as navy of them conld only serve the fashion of the hour, and draw him from more elevated ocenpations. For the coronation of William IV., Mr. Parris painted the architectural screen set up hefore the organ-loft, and other ornamental works, in the Abbey, for Mr. S. Smirke ; and soon afterwards finished the pictnre oommissioned hy Queon Adelaide, enitled the "Warrion's Wife," with whioh her Majesty was so well pleased, that unsolicited "Historioal Painter to the appointment of entered largely into decorative paiuting for whioh his rendy pencil and previous practice eminently fitted lim. Ire executed the ara-
besques at Northnmberland House ; the Wattean besques at Northnmberland House; the Wattean panels for the saloon of the Great Western
steam-ship, the first that stcamed across the Atlentio ; and gubsequantly thed across the dences of the Dubsequently the palatial resihoe, Lord Downshire, Earl dan's, Lord Prudof Lansdowne, Sir place, and many others: at this last the Prince Consort honoured the painter by calling to see his work
In 1838, Mr. Parris undertook to paint for Mr. Moon, the print publisher, a large picture for engraving of the Coronation of Queen Victoria, and remained all one night in the Abhey making preparatory eketches. Soventy members of the nohility eat to him, and Her Majesty honoured the painter with a sitting for her portrait to complete the work.
In 18:13, he carried off one of the first prizes the Cartoon Competition for the Houses of Parliament, and also exlihited a largo Fresco of reoommendation of Lord Prudhoe was invited to paint tho Pulace of Mehemet Ali at Alexandria, in fresco. ITe was also invited by Prince Kochebee to paint his Palace at St. Potersharg; but both these offers were deelined. The quee tion of the restoration of Thornhill's pictnres in the interior of tho Dome of St. Paul's twas again evived in 1852-3, on this occasion to be brought to a conclusion. In March, 1853, MIr. Parris
commenced his platform -" the first pole of which was raised to the great cornice and fised in its place," and in abont three weeks the whole of his ingenions plan of getting at the interior of the dome was constructed, and
the restoration of the pictures commenced in July. "Tho wholo surface painted contained abont 1,800 square feet. The figures are nearly 16 ft . high, the vases 10 ft .
The cornice where the painting begins is 160 ft . from the pavemont; the eyo of gallery at to of dome, 220 ft . Suspended at this terrific height throngh winter and summer he continned his arduous employment for a little over three years and a half, and finished it in July, 1856 , without a single accident having occurred daring the whole period, though no less than five hundred visitors had at different times asconded to the artist's platform, in addition to the necessary lahourers employed,--a practieal proof which all his plans were executed. Of thisstructare some accounts appeared in the Builder for Juno, 1853. In 186.4, he constructed a fullsized model of Shakspeare's House for the Crystal Palace Compary at Sydenham; and
in 1860 his facile pencil was engaged to prepare a; model for a piece of tapestry, 40 ft long, for the Paris Exhibition: the snhject, Christ and the Apostles, after the statues of Thorwaldsen; and so he continucd to the end, ever working: nothing came arniss to him, great or small,-he pursued it with uutiring eal. It was, iudeed, impossible, with a mind so active and a hand so ready, ever to be idle. Self-reliant, he carried his inventions into pracfice withont fear; and in painting essayed almost every form and hranch of the art. With versatility so pronounced, he conld hardly he expected to aohieve success in all, yet he was successful in many, and will be remembered by hose who knew him, not only as a man of great general ability, but also for his kindly and happy heazing.
It is castomary to express regret at the loss of those who hare distiaguished thembelres in this world. Rolatives and friends naturally mourn the departare of those to whom they have heen long attached, but it may aftord hope and consolation to many to know that the late Mr. Parris passod his long life in the happ Mr. Parkh parbul enjoyment aratellecal by troops af friend the world, and respeeted by troops of friends; common lot of humanity, without snffering, at the adranced age of eighty-two years.

## ON ARTS AND ARTISTS.

AT the annual meoting of the Gloucester School of Art, fully noticed in the local Chronicle, Mr . Cambier Parry made, as on some previons occasions, a long and interesting address. On this occasion, ho eaid, he thought it most appropriate to take a general view of their standing
in fine arta, both nationally and as regarded their own school. If he went back to the Middle Ages, it would be only for a few minutes, he. canse he wished them to know or to learn what arts prevailed in the $M$ riddlo Ages in England, and particularly at Gloucester. In a country so small as our own island, and when it was smaller still for all available purposes hy being, even as late as the reign of Edward IL., about two-thirds covered with wild foresi or desolate moor, and when Scotland and Ireland were bnt halfcivilised neighbours,-a hindrance by thoir barbarism and a trouble hy their wars,--they mist not expect to find works of art of the sizeand imposing grandear of those to he found in great Continental nations, or of a small one like Italy, with the gigantio wealth of Rome, and a clinate and a soil exceptional in this world; hut it was notorious that some forms of in their quality. Such, for instance, was the develonment of the purest forms of Gothic archi. tecture at tho end of the thirteenth and hegin. ning of tho fourteenth centuries, and the singular exoellenoo of its dutails. Enclish architecture
 mention more tharpassedstores, he would refer thera to the little clapter-roorn in York Minster, on the walls of which there was this heautiful motto :-
"Et rova flor formas, sic domus inta donorum."
s is the rose the lower of flowers, so of louses this is
of ours.,
This was the hrightest idea over wrought round a building. The other was the Lady Chapel at Ely, which, although it had been knocked to
pieoes by the Puritans, its scalpture whs still pieoes by the Puritans, its scalpture wha sein
ausurpassed. The mechanical genius of Einglishmen had nsually mechanical genicnt than any ofty artistio our archistio mepiration. Hence that we had exhihited to the world men of highest genins, from the daye of Alan de Walsingharn and William do Wyckham to those of Sir Christopher Wren. Some of the most striking anecdotes had heen told of the men of those times, such as that relating to old Prior Goldstone, of Canterbury, in the fonrteenth century, who had every crap of oarved stono hronght into his study, where ho kept a little anvil and hammer, and broke np every piece that was not up to his tandard of excellenco. Then, again, at Glon. eester, there was the excellent old Abbot Wig. more, who did much the anme and had every iece of stome and corving usod for building Cloncenter C undra hrogrt to
 did wor nid, was not good en Abbot Wigmore was a very remarkable man.
cestor, and worked in it himself in every grade. Ho was a great artist, a designer, a skilful broiderer; and in an old MS. of the biography of the abbots of Gloucester, preserved in ope of Wiocoleges at Oxford, it was recorded that own hands silver doves ou a green satin copo for the office of the Pentecost. Wigmore was not only a man for small thinge, but he was a great oollector of works of art, and the first account we had of any portrait-gallery of Englishmon more, who had in his rooms portraits of all the kings of England wefore his own time, and his timo was that of Edward II. The embroidery in which Wigmore was so great a proficient was a most famous art in England, so numol so that tho work was valued at an immonse price all over Enrope. There was no doubt that printing and illumination were arts in which Englishmen used to excel exocedingly. If they went to the cloisters at Gloucoster, and turned sharp to the left, when they wont down tho steps they would
seo a numher of litt'e rccesses wherein wore seats on which a monk could sit, with the light seats on Which a monk could sit, with the light
on his left hand, and with his desk before him ; and his notion was that those were the places and his notion was that those were the places
in which the monks used to write their in which the monks used to write thoir perhaps old Wigmore cmbroidered his doves. times, 一the days of IIenry VII., which formed the era of tho greatest amonnt of building in this country since tho thirteenth
contary, and which wero only equalled hy the contury, and which wero only equalled hy the
building activity of our own times. But the building activity of our own times. But the
best of English art seomed to have died out as arohitecturo degenersted, and we heard ouly of foreigners. They all knew the everlasting pie-
tures of Henry VIII.; but no Eoclishmen ever tures of Henry VIIL.; but no Englishmong ever
painted him. Indeed, if it wero not too much painted him. Indeed, if it wero not too much
of a joke, they might suppose that Henry VIII's tremendous fatness was eaused by his alway sitting for his portrait; be must have taken a great doal of what an Irishmau called sedentary exercise. From his time things weot on just as bad as ever, for in another MS., quoted by an made by the writer as to the condition of English art in the time of Henry VIII. In his time inere were two mon of Yory remarkable talent
indeed,- - Bossom and Hilliwrd, -illuminators and miniatnre portrait-painters. Tbe document to whicll he had referrod said :- "Alas! if a man he so induced by nature, and live in time of trouble,
and under a Government wherein and under a Goverument wherein arts be not esteemed, and himself but of small means, woe
be to him! as nnto an untimely bith, for of $m$ y own knowledge art hath mado poor men poorer, and such wero John Bossom and Miohnel Hilliard who wero only unfortavate in art because they wero English born. They heard of Holhein and many Fiemish and Itaian artists, hat at that date few names of Englishmen were Enown, except inferior workers of decorstion in records in anonymons MS. at the end of Henry VIIL.'s reign in reference to the treatment of poor Englishartists. They must wander -on ever many years before finding any English names of eminence; Flemish and Italians were Antonio More, through the days of Pubens, Hilliard, and Vandyck, to those of Kneller and Lely, they haard of no ono but such as Betts, of Elizabeth, aud a distin nuished ame time Edward Courtnay, Earl of Devon, of the same period, and Dr, Garrord, whose name sonnded and designed for engraving, glass-painting, and other arts. He was born in Brages, hat died in
England in 1635 , in 1619, was ono of the earliestiard, who died in 1619, was ono of the earliest-known English artists Who really acquired fame for his great
merits. He painted a great many portraits Queen Elizaboth, which werenowmneh valued. He was a gonius, and, at the age of thirteen, painted his own portrait; hesides which he designed and worked in gold, jewelry, sculpture, and illami-
nation. Indeed, the poor fellow's powers were nation. Indeed, the poor fellow's powers were
so great that it would be hardly an exaggeration to call him our Early English edition of Leonardo da Vinci, for he seemed to bave known and done evorything; but James I., who would have heen vory, glad to he considered our
Lorenzo do Mediei, allowed poor Hilliard to live in poverty and to die in trouhle. Next after him came Isaac Oliver, whose works were in.
valuahle, because from bis miuiatures conld he
soen tho faeer of Mary Queen of Scots, Queen Elizaheth, Ben Jonson, Sir Philip Sydney, and
James I. His works were describa Tronderful execution, minute and powerful in expression, and perfect in nature. Sacred sub. jects he failed in, bat the "Entomhment," and copies in miniature of great pictures in the col eriginal Charles 1., and also a few portraits, originals and copies in oil, were known to have at this time were hardly worth mentioning, bnt there were cngravers such as Cute, and painter such as Pyne and Cole, buch as yne and Cole, whose works might now be draggring the weary folds of their canvas in parsong hames in far-ol rarnhouses or remote parsonages, where their traditions were in-
valuable, and where the ignorance of the public was to blame in neglecting the remnants of Euglish art. One of the most remarkable name in English history was that of Bacon. Not onl Was there the great Sir Francis Broon, Lord Chancellor and Keeper of the Seals to Queen Elizabeth, hut there was a Sir Roger Bacon in the thirtoonth century, who was so great a man
as to have invented or nearly completed the telescope and the tor nearly conapletod if had lised now he would mostara, so that if ho been an artist. But he invented another thin and that was gunpowder, which he (Mr. Parry) was afraid was very little in keeping with the arts. Ho was a most wonderful man, and wa che snggester of the first great Charch Refor mation whicb took place in the thirteenth cen(Lord Vexulam), they came to Sir Francis Bacon (Lord Verulam), the great philosopher, and then poilor Nathanicl Bacon, half-brother of the of his the was one of the greatedt artist 100 yearg of the he was an amatenr. Within Bacon, who was agreat desimer of china, at Wor costerand Barslem. In the time of Elizaheth ther wore some very distinguished architects. Thie principal ones were John Thorpe and Skillington, and amongst the houses huilt hy Thorpe were Barleigh, Holland House, Castle Ashby, and Charlton, in Wiltshire. From that time English art began in earnest, and the leading names of istorical were those of Peter Oliver, the grea clder, a glass-painter; and John, the younger, master mason and a great earver. It was remarkable how genius and art ran in families. Nest they came to William Dobson, whom King Charles used to call tho English Tintoretto. He was a fine painter of portraits in oils, and succeeded Vandyek as pninter to the king. Among his pictures which were valuable, as giving rince Rupert and painted, were a portrait o f "Religio Medici"" Still, in spite of the fact hat there were such men in this contry fac persons supported and patrovised wore none others hnt Dutch, French, Flemish, and Italian artists. Amongst them was Coker, who painted Colonel Massey, a name known to every GlonCheshire, and whose picture was uow in was Samel Butler, the author of "Hadiknow He was one of the greatest amnteurs of the period in painting and music ; hat his work appeared to have shared a sad fate; for it wa aid of some of them that on a tax heing levied n windows, several of Sir Samuel Butler's pic arces were used to stop up the windows and
"History of Warcest was recorded in Nash" History of Worcestershire. Among the firs painters of their das were Anthony, Harrizon, \&c., ye saw how Eaclish art was patronised. Even foreignors spoke of English artists, and wer urprised that they should have been so mnel neglected. Inico Jones who was horn in 1572 nd died in 1652, rose to the highest estimation England and on the Continent. He mentioned that as an cncouragement to the young men in Honcester. His fother was en emed in a husi ness in which Gloncestershire especially excela. He was a oloth-weaver, and Inigo himself was apprentieed to a earpenter; hut the young fellow, in his quiet moments, amused himself in artstudy, little knowing how mmeh he was going to
do. Iis heart, instead of bein in the er's sho wander in the folds, of doors, and he would sape-painting. He toly painting, but came baek an architect, and was the designer of Whitehall Chapel, tho Banqueting. mation of King James, who set him to find on a query, viz., what Stonehenge was,-a wonderful
mystery in thoso days; and Inigo, after considering tho mattor a long time, came to the conclusion that Stonehenge nust be the remains of a Roman temple! His attempts at St. Paul's were vot very grand, though he did a great many grod works; but, alas: for poor Inigo, he was
ruived hy the fall of Charles ruived hy the fall of Charles T., his goods were
sequestrated, and, more sad still, his monve sequestrated, and, more sad still, his monument
was destroyed in the Fire of London wrote three lincs worthy of being his epitaph:-

## Firm Doric pillarg found your solkd baso;

The fair Coriuthinn erowns the higher spiee.
Thus all below is strengtio and all abore is grace,
A most perfect epitaph for poor Inigo's tomb Still, foreign painters were the favourites in Englaba, tho Mytens avd other Flemish pictures being all the rage. In Cromwell's time, a man named Robert falker was a famous portraitpainter, and was largely patronised by Cromwell, Whose portrait he frequently painted, and if ever thoy sary a fine portrait of Cromwell they might Wo sure it was either painted hy or copied from Walker. Two other famons painters at about Chis time wore Francis Carter, chief clerk to Inigo Jones, and one Heywood, who painted portraits of Fairfar. Coming on to the period of the Restoration, they found a celebrated miniatare - painter, Samuel Cooper, whe was born in 1609 and died in May, 1672. He was the first to give the force of oil to water-painting, and ho also exeonted portraits of Cromwell. He must also mention a famous lady named Mary beal, a pupil of Lely, who died in 1697 ; and then they came to a man whom they all knew a sculptor and carve famous Grinling Ginbons, August 3rd, 1721. His work was unsnrpassable and was greatly admired. And now they came face to face with Sir Christopher 1 Vren, -a arent man indeed, and the first artist who seemed to have engaged the concentrated attention of Englishmen. They did value him, hut even he died in sadness, and almost of a hroken hoart. He was a mathematician, an astronomer, and an but do not let them sappose that all the finges, churches in London said to be Wren's were huilt by him. He built a great many churches, but thero were other great men at ahout his time who huilt churches, and amongst them he mentioned Gibhs, who bullt St. Martin's with its fine colonnade, and no one could go past Charing Cross and down towards the Strand without being struck by the execeding beanty of st. DIartin's colonnade He also built St. Nary's in the Strand. They nest came to a Sumber of architects, and amongst them was and Bleuheim died in 1 Tos
 remarkole $n$. Eurury, and it was a yory emarkabe one, Euglith landscape gardening; way the scenery way, there was wanting feature in it. William年ulptor, ana arolitent ana was a painter, sculptor, and ancect, and was also the father of landscape gardening in England. The great Prino Rupert, son of hio Priocess Lizabeth of England and Qucen of Bohemia, after all his trouhles and all his wars, settled in Paris, and occupied himself with the fine arts, and invented mezzotinto engraving. Coming still nearer to our own times, they met with Sir William Chamhers, arcbitect of Somerset House; and hen came the Adamses, John and Robert, architects, who buiit that part of London known as the Adelphi, which, in Greek, meant hrothers, and for whieb reason it was called the Adelphi. And now they came to a time when English art hroke forth in real earnest, and hegan to he aporeeiated. He could not bay that the man he as about to speak of was a great artist, hnt ho o little encoursgement was offered to prehitent He referred to Sir James bronglicd in sir James Hornhin, who was imsolf Ho went to parsonage, and tanght f the Italian sehool of the and came baek full rood ono-aud was of the time-bot a very interior of the enpola of Great Hall at Greenwich; hut while the Italian ainters wero receiving their thousands of ponnds, and Frenchmen their 500l. and 600l. for painting ono room, Thomhill, who was really a reat painer, wha depreciated and treated in most shabby manner. When he sent in bis moderste bill for the great work to which he (Mr. Parry) had alluded, it was retorned, and when the question of payment was submitted to Parliament, they said "Oh, you had bettor pay him hy the yard!" and he actnally received
for his gigantic work the sums of 10 s. per yard.
Thornhill was born in 1676 , and died on the 4th May, 1734. The poor English artst could come to the front simply because he was English. However, at this peried things hegan to leek brighter, and Sir Joshua Reynolds, prpil of another great man, Thomas Hudson, the portrait-painter, came upon the sccne. He was
born in 1723 , and, after working a great deal hy himself, he went to the Yatican to cepy and study the greatest masters there, particularly Raffaelle and Michelangele. With bim arose Gainsborongh, wbo was horn in $172 \%$ and was entirely notaught. It was said of him that Natore was his teacher, and that the woods of Nature was his teacher, and that the woods of description of him which was perfectly true. These two men were the great men of their day, These then it was that art and the merits of English artists began to be rightIy appreciated. But he must now leave the portrait and landscape painters, and refcr to another most remarkabe and beautifnl art, 一the art of porcelain. He did not know if they were aware of how many establishments there were in England for the artistio mannfacture of porcelain: they were too artistic mannfacture of porcelain: they were too over the country. The principal mannfactories were at Worcester, Liverpool, Chelsca, and Battersea, besides which there was the great Battersea, besides which thore was the grcat
Wedgwood at Burslom. Those estahlishments showed how much at that timo art was being approciated; but if Reynolds, Gainsborough, and Hudson had not commanded the English taste, he douhted if the porcelain works would bave succecded as they had done. As long ago as 175 I the remarkable invention of printing in copper-plate on china was discorered,- a most simple and ingenions discovery, but one which revolutionised the art of ornamental pottery, bringing the brightest things into the humhlest cottage, and enabling tho poorest man to have ornaments which should be to him a joy for over. Having described the mode in which this ornamental work was done, any one would ask what are these fine arts whence did they come, and why do they exist, I can only reply, firmly, that their motive power is in that spark of life divino which is our soul, and which, conscious of its own power, conscious of its own eternity, and conscious, too, of its temporary imprisonment within the narrow limits of the human hreast, is ever seeking the means of its orn expression to communicate and to attract the sympathy of others. And hatred for all that is earthly, its love for all that is lovely, good, beautiful, and true, and to tell that tale to others? If the words of common languago will not suffice, it creates for its own prrpose that finer and more subtle language which we call art. For this it takes the forms, the featares, the sonnds, and the characters of express its idea. These, indeed, embody and to express its idea. These, indeed, may be poor materials for so high a purpose; but it is all is the source and centre of our individual life and character. Some men are conscions of it ; some men are not; and hence the varying tastes and hahits of those around us. Some men have choked that spark of life, and closed up its arennes to the light hy beaping around themselves the things of earthly and sensuons vanity. Others, more free and open to the light, are sensible of an energy within them which impels them to-actiou and expression. They seek to clothe their thonghts in the beanty of words, or sounds, or of material things. The whole world is open to them, and whether it be in the beauty of literature or an't, in the bcauty of reason or science, in the beauty of moral life or material expression, they attain what they most long for, viz., the expression of their own fulness and the sympathy of others. Such purpose, such impalse, has been the motive of the poets, the sculptors, the artists of the world, -men whose names outlive their works, beoause their works have been the joy of the world, and joy will always outlive sorrow, and truth will always ontlive falsity. The arts have had a long history. They live among us now not, indeed, in their old vironr, hat at Ieast with an evidence of reviviug force. If ever the old vigour is to be revived, if ever the great and good of fine art is to be reproduced in its future, it can only be by the same means, learnt by equal devotion, and perfected hy an equal freedom from self-consciousness and conceit; and if it is ever again (as it was in former
days) to he the glory of those who produce and the joy of these who receive it, it can only be hy its purity and its beauty and its truthfulness the secret of that 'touch of nature which makes the whele world kin."

HASTINGS AQUARIUM COMPETITION.
The first promium has been awarded to Mr. E. A. Heffior, fer the design marked Nurc aut Numpuan, 'fareurahly neticed in eur review
of the competitien. Mr. Heffer is best known by the Church of St. Bridget, Warertree, Liver pool, fully illustrated some time ago in the Builder.
Mr. Card, to whom six of the designs sent in were referred, said in his report,-
Victor,' 'Neptune B;' and 'Alpha, not laving complies with the requirements proposed, or having failed to carry ont the purposes suggested, or whose desigas are
not desirable to be considered. Those not
desigas bear 'the mottos of 'Stability, 'Murus Mari- Mari-
timus,' and 'Nunc aut Nunquam,' appear such as merit timas,' and 'Nunc aut Nunquam,' appear such as maerit the greatest commendation, and, in forming my opinion various objections to each, and toling into consideration the main features of your requirements, together with
the greatest benefits and adrantages which would be the greatest benefits and adrantages which would be secrred by "Ne adoption of any design, I consider that the with the purpose intended, although, at the same time, it would be unfise that this or eilber design submitted
should be carried out in its entirety without certain should be carried out in its entirety without certanin
modifieations affecting the parade, and also tho widenin modineations.
In conclusion, it appears to rae not orly to be a matter of regrot that the conneil did not offer a second, or eren mord, premilun; but that they did not also lay down a proced upon, and that too much has been therefore loft
to their ideas: thus rendering it a matter of considerable difficulty to arrive at the conclusion I have done,

After some discussion, the Town Counoil voted the sum of $50 l$. each to the authors of the designs marked "Murus Maritimus, and "Stahility" the authors of which are, respectively, Messrs. Wm. T. \& Alfred Cross \& Artbur Wells, of 53, Charing-cross, London, and Bohcmia-road, Hastings ; and Messrs. Jeffery \& Skiller, Havelock.road, Hastings. The awarded designs are to become the property of tbe council.

THE PROPOSED BATHS AN゙D WASH HOUSES IN SOU'lHWARK AND THE LOCAL GOVERNMENT BOARD.
A FEW weeke ago we drew attention to an parish of St. George the made on the part of the of baths and washhouses in Sout har erection with the view of carrein had applied to the Local Government Board for the sum of 19,700 l belonging to the Barish for invested in Consols, being the proceeds of oertain parochial property at Mitcham, which was sold as heing no longer necessary when St. Geor 'surionr' mised that they would consent to the application of the above-named amount for the establishment of any institution or works of a permanent character for the benefit of the inhahitants And the St. George's anthorities, thinking that the erection of public baths and washhouses would confer a benefit on the inbahitants, ap. plied for the amonnt accordingly. The reply of
the Local Government Board, however, which the Local Government Board, however, which
has just been received, is unfavourable; and it wonld been received, is unfavourable; and it wonld appear from it that the large amount now invested in Consols is likely to be invested
in the building of extended workhouse accom. modation in the St. Saviour's Union. The Board in their reply state that the St. Saviour's guardians have just agreed to purchase the freehold of the site of St. Saviour's Workhonse; and that they propose to erect new bnildings upon a portion of it, in addition to whicb the contem. plated alterations involve also an enlargement of the Newington Workhouse. The Board therefore state that, in expeotation of the prohable demands upon the parisb of St. George the Martyr is reference to the new Forks, it is not advisable that the investment should be disturhed in respect of any other contemplated building. This communication has given rise to much dissatisfaction in St, George's parish, the iulabitants of wbich are warmly in favour of the erection of baths and washhouses, in order to promote the health and sanitary condition of the district. They urge houses, in addition to which a spacious infirmary has just been built at a large cost, and that the workhouses are ample and Jarge enough for the
requirements of the Union. The inbabitants of St. George's appear desirons that the large sam belonging to them shall be expended in the grection of haths and washhouses rather than in understand that a public meeting is about to be held on the suhject.

BUILDING CONTRIVANCES AND MATERIALS AT NEYT INTERNATIONAL EXHIBITION.
We wish specially to direct our readers' attention to an advertisement from her Majesty's Commissioners as to the department of archiecture, building contrivances, and matcrials, noluding cements, concretes, and plaster, in order that tbey may be indnced to assist in forming an adeqnate representation of the section. A meeting of the sub-committce to whom it is intrusted, was held on Wednesday, he 10th inst., at Gore Lodge, Col. Gallyey, R.E., in the chair, when Colonel Wray, Major Du Cane, Mr. Grissell, Mr. George Dines, Mr. T. Roger Smith, Mr. Grant, Mr. Kirkaldy, Mr. Godwin, and others, also attended. It was deermined, amongst other things, that facilities honld be afforded exhibitors for testing new materials and processes. It was much desired hat forcign materials and modes of constraction should be well represented, and it was hoped that the foreign commissioners, through whom overything from abroad mnst necessarily come, rould take steps to make this desire known.. From France much that is valuable might be sent. If M. César Daly, M. Adolphe Lance, or M. Charles Lucas, for example, would move in it, most intcresting means of comparing the building appliances and modes used in the two conntries would doubtless be obtained.
Intending exlubitors at home should send notice at once. $\qquad$
NEW PUBLTC HALLS FOR GLASGOW.
HE inadequate accommodation, inconvenient situation, and defective acoustical properties of the Glasgow City Hall have been rendered painfuly apparent of late oming to the occur. rence of the musical festival and the visit of Ir. Disraeli. There have long been loud complaints as to the want of new and commodious public halls to meet the wants of a large city like this, and it is satisfactory to learn that hose wants are likely to be soon supplied. It is proposed to erect new public halls on a plot fround having a frontage of ahout 200 ft . to Granvilte-street and 160 ft . to Berkeley-street and Kent-road, thus occupying over 3,500 square ards of building-ground. The main entrance foor. The great hall which will be principal and 140 ft . long, will be reached the wide costibule, and then through an octasonal hall 36 ft . in diameter. To be added to the above imensions of the creat hall is the recess for the rgan and the north rallery, whicb will for the otal lencth of 185 ft . The galleries mill make a modato 650 . The galleries whecommade in for of bo made in front of the organ for a large orchestra nd chorns, which is of great importance in a laco intended for large meetings. There will he $x$ exits from the great hall. All thoso minor duch a
The prace complete will he considered.
The great hall of the new bailding will contain $5,565 \mathrm{ft}$. of floorage, and will seat 2,920 persons, and, when packed, will hold many more. The actual capital required to complete the new andertaking will he $80,000 \mathrm{t}$, mearly $60,000 \mathrm{l}$. of which have heen already sabscrihed. Sir. Michael Costa, who has examined the plans, has expressed tis satisfaction with them from a musician's point of view. Tbe late Mr. Cunningham, of Liverpool, architect, in coujunction with Mr. Campbell Douglas, of Glasgow, plannod the new bnitdings.

THE LAT COURTS.
Messis. Butl \& Soxs will commence the erection of the new Law Courts on the 5th of Jannary next, being the first Monday in the new year.

Society of Arts.- On Wednesday eveniug last a paper on Mechanical Processes for producing Decorative Designs on Wood, hy Mr. Thomas Whitburn, was read. We will return
to it in our next.

THE PLUAIBERS' FIRE-SAFEGUARD.

THE PLUMBERS' FIRE.SAFEGUARD. The calamitous fires hy which a considerable part of Canterbury Cathedral avd, still later, the Alexandra Palace, with all, or nearly all, its valuable contents, wero destroyed, having been traced out to the fire-basket of the plambers engaged in repairing tho roof, from
which, it is supposed, some livo coals or molten metal had escaped and ignited the mearest inflammahle materials, attention has mearest inflammahle materiale, attention has
been drawa to the means of preventing such been drawa to the
disasters in future.

Mr. F. C. Pearose
Cathedral, Pearose, the architect to St. Paul's Cathedral, having given the matter lis consideration, with some valuable aid from Mr.
Shand, of the firm of Shand Shand, of the firm of Shand \& Mason, of Southwark, ongineers, has just perfected a nseful plumbers' oresset or for tho protection of the plumbers oresset or fire-basket, and which is
now in actual use by the plumbers engaged in the repairs of the roof of the cathedral, and is found to answer very satisfactorily. We hawe
given in the present page a wood.cut of it, given in the present page a wood.cut of it,
made from sketches on the spot, aud wbioh, with the following desoription, will bo readily anderstood.
It oonsists of a cylinder of galvanised wrought iron, made of hoiler plate $\frac{1}{x 0}$ io. thick and 3 ft , high hy $2 \mathrm{ft} .8_{4}^{\prime}$ in. diameter ; being fixed to the centre, is movable,-i.e, may
be raised or lowered at pleasure, for the purpose 'strect, Blackfriars road, encrineers, made it, and of getting at the melting-pot. The head is are prepared to supply them to the trade for square or oblong on plan, and semicircular in 10 l each
each other the answers to the full satisfaction of the frmmework ; they are each strengthened with a plumbers now engaged with it, and, moreover rords, formed of bars, of thin gauge,-in other it effects a saving of at least ono-third of the secured to the sides of the cylinder with nuts fuel as used under the old upprotected plan. nd screws the sides of the cylinder with yuts for the prpe cow is thus made removable he cresprose of insertigg and withdrawing When the fire cyliuder.
been previonsly poured into water having epth of about one-third of its height, the the ghted, the metal.pot pat on, the bulbs or irons nserted hetween the bars, a small door beins rovided for getting access more readily to the re, and which is afterwards carefully shat When the cowl is closed, a long aperture is left of ahout $1^{\frac{1}{2}} \mathrm{in}$. in widtli for the escape of
the plan shows the sides of a segmental form, ft for tho atmosphere, which are parposely for the snpply of air to the fire.
en, who thing is made portable for two ides for whose use haudles are provided at the weig. The enclosure, apart from the fire. basket weighs ahout 12 cwt , to 2 cwt ., but may be made onsiderahly lighter, if requisite, hy redncing limension, hight and diameter about 3 in. each Mesion,-hut no more.
Messrs. Shand \& Mason, of Dpper Gtomnd.

PROFESSOR MAX XÜLLER AND "RELIGION" IN ARCHITECTURE, Ir is most curious to note how the past, every now and then, starts ap and makes itself visible to the phresent. If the world of to-day had nought but itself and its own thoughts to go by, it would by recollections and hy borrowinge figure. It is of haman experiences that the from the past of haman experiences that the poetry of tlie present is made up, aud perhaps its mental happiness assured. This is an old thought, but it may strike some, it may he, for the first time; for do not press themselves on common beginninps do not press themselves on common notice. 'I'o cite an example,-architectrure, what would it be without "precedent" to go hy? If the past of would the present of it be bloted out, what question enouch of it be like? A curions question euough. Church architecture, again, as "Fistablis practised, whether in or out of the "Establishuent," is but little more at any time
than a careful copying or a following of the
past of church and chapel building, both i past of clurch and chapel building, both in
arrangement and in details. So mucb are we arrangement and in details. So mucb are we If these or some such thoughts have not struck many before now, they can hardly fail to do so after the remarkable, and certainly exceptional,
"evening lecture" of Professor Max Miiller, in "evening lecture" of Professor Max Miuller, in the nave of Westminster Abbey. It was a thout
the past and the origin of the primitive religions the past and the origin of the primitive refigions
of the world, -of thoso religions, and feelings, of the world, -of those religions, and feelings,
and intellectnal systems which gave birth to the and intellectnal systems which gave birth to the
great architectures of tbe past, to wbich we great architectures of tbo past, to which we
moderns nowadays rcfer so industriously, and moderns nowadays rcfer so industriou
make such efforts to imitate and rival. make such efforts to imitate and rival.
In this right glorious and tight little island are so accustomed to a steady and eren routive, that it hecomes not a little difficnlt to realise to ourselves anything very different from it. It is to us the whele world in miniature. But if we go back in time, and cease to think of the present, and look at things as they once existed, and had form and movement and meaning, we must soon sce bow very wide a world it is we live in, and how very many are the thoughts and ways of it; and how diverse the thoughts of this world have heen, for the very poles of the world are net wider apart than bave been the religions expressions of it, and the architoctural thoughts which bave grown out of, and enshrined them. Take old Egypt, for instance, - of which, by the bye, the learned Professor said nothing,-what a strange faith and architecture. In the "science," cult to say whereabonts the faith of Egypt would rauge itself. To the common people it must have presented a gorgeous show, as the magnificent scalptures prove; and to the "learned of the Egyptians" it must luave embodiel some truly grand ideas, clse could the architecture never have risen to the height it did. Building was a reality, aud the buildcr meant all ho did. If the building was large and colossal then wo may be sure that the feelings and notives of those who bnilt it up, stone by stone, were large
and colossal also. To this hour there does net and colossal also. To this hour there does net
exist on the earth's surface so grand a structure exist on the earth's surface so grand a structure
as Karnac, with its multitude of courts and its columned hall,-writicn on within and without. Tt is not a little strange, too, that the earthly habitations of theso people should all of them have ntterly perislicd, and passed away, while their "Temples," deroted to "dreamings," and their "sepulchres" to hold their dead bodies, should have lasted to this hour. Nowhcre do we possess so complete a record of an antique faith, and of that which enshrined it, as we do in tho rained temples of Egypt; and from the sculptures, accurately realistic as they are, to say nothing of the bicroglyphic writing: it may be in the future that a complete idea of the rcligion of this ancient people may be got at, and the foundational ideas on which it based, and out of which the architecture grew. Architecture and sculpture, fine art that is, were prime necessities, the ontward forms could not int exist. A noteworthy fact for the thoughtiu very opposite of this, and specially referred to by Professor Max Miniller in his interesting a ture the Juan wable in tho world's history, as altogether rejecting a multiplicity of temples, but demanding, as a prime necessity, temples, but demanding, as a prime necessity,
one temple, and one only; ronnd which the whole one temple, and one only; ronnd which the whole
nation was to cluster, and wbich, indeed, was to nation was to cluster, and wbich, indeed, was to hold the whole people togetber. We are speak-
ing, of conrse, of a time before the idea of "synagogue" became a necessity. There has heen, perhaps strangely, no Jowish architecture, no style of art, which can be said to have heen pecnliarly the invention of tbe Jew, and usefal to him, and to him only. It would have been
not a little curions to have seen this "order" not a little curions to have seen this "order"
of architectnre. Tho word poetry of the Jow being what it is, the poctry in stone must surely in some strange way or other, have corresponded to it, and been worthy toensbrino it. A wonder-
fnl idea if only in thought. The magnificent fnl idea if only in thought. The magnificent "prophecies" of Israel were not ittered within honses made with hands.
We cannot, of corrse, follow Professor Müller inte all the eight "historical languages" or ntterances of the faith of mankind, from tbe beginning of the world to the present day, and under which headings he has catalogued the world's religions, and nnder which he might have almost added the world's corresponding architecture; but we may yet say a word more on ene or two of them. We bave named two opposite ideas,-the one needing temples everywhere, the other nceding bat one. The Exyptian, there can be brt amall doubt, invented
everything for himself, or, rather, wbat he needed grew out of limself, unborrowed. The Bible shows how the Jewish faith camo into hoing ; but the architecture was aways, as it chosen people" happened to abide at the time. It may bo interesting hore to note that, faith, and before the Eopptian could have symbolised his strange ideas, there existed a form of worship which necessitated no temple or bailding. The faith of the Parsee or the ancient ire wor in time. So far does this primeval idea so hack or to say when it began. It may he that it is the very earliest form of religious faith on the faco of the globe, the result of a natural and spontaneons feeling and perception in the human nind. The surn worshipper saw the sun, and could not but feel and perceive that to it he owed everything, - light and heat, and tho very fruits of the earth. What more natural than to adore indeed, while the primitive idea held, was a bnilding possible. It is not $\approx$ little strange to contemplate such a necessity before Abraham was, and to find, as may be seen in Mr. Pal. grave's book on Central Arabia, that this primitive form of worship yet lives as it ever did in the earliest ages of the world. In travelling across the Desert, his attendants, more than balf savage and primitive in look and manner, hailed the rising sun on the instant of bis new day appearance. No more conld have been done by the primitive Arab. Wo cite this carious cir cumstance here as showing a phase of the scienco of religion, as the no building ; tbus differing essentially from those others where a building or temple of some kind Tho other was in all cases absolutely necessary the wandering Israelite, and tho fixed stone temple of Egypt, were absolute necessities, and temple of Egypt, were absolute necessities, and
conld not be done without, and arclitecture conld not bnt spring out of them in some form, reater or less.
But passing from this, which needs to be noted, and mnch morc, we may come to Christi. anity itself, whicb, growin out of older thoughts mado a new "utterance" in the world. Much might, indeed, here be said, -and it is monewhat strange that so little has ueen said about it,-- 1 det
this lecture in the nave of Westminster sounded at a little startling; and the architecture of the place, and its sang ; and the architccture arrange place, and in front of the dim shadows in tho dis. tance, woke up strange echoes. The very vastness of the subject, nud its vide signiificance, the "Semitic" races and tho "Arian" races, and the "faiths" that have grown up, no manknowing how or when, seomed in the mere talk about them to well-nigh afright the old Abbey out of its propriety and watchful conselvatism. But if in this very vastuess and breadth of spread Clutouratention forms and the architecture which it has fostered, if no given birth to, we shall find mattcr eneugh for thought and wonder. It is not one style of art do not has calleak of the almost infinite diversity of Christian Chnrch and Chapel architectnre at the present hour, drawn as it is from all places and all times, but of that which was done in the old days, before "books" made all arcbitecture We all know how the Gothic, or Pointed, has We all know how the Gothic, or Pointed, has heen claimed cxclnsircly as a christian style of have grown np under any otber rcligions system. Those who say this forget the great doings of the Mahometan architects of India, the Holy Land, Egypt, and oven Spain. But, passing by all this, nothing most surely can he more wonderful than the way in which the "missionary" syirit, as
Professor Max Müller terms it, of the faith of Christ, has adapted itself to all forms and modes of expression, artistio ard ollerwise. Gothic and Renaissance, both, have becn its willing servants, and it would perhaps be hard to say in which style of art it has accomplished its and St. Panl's, Compressive work. St. Peter's seem equally in their several ways to attest its dwell for a long time on these results of the building powers of the faith of Christendom, as it is to be seen in tbo length and breadth of phases of Christian building, or Christian ex
pression, in material forms, that bavo always seomed to us specially interesting. First, when In its infancy, having to buildings of its own, and trensth clambers; ", "bd then, gathering "prophets, champions, and martyrs." And then, secondly, when it commenced to build for itself, in the days of the great and solemn Romanesque. In no succeeding architecture did the Christiau expression of religion assume a more impressive artistic aspect. It had then taken firm hold of tbe Westo world and all Europe we hold ork wad built every natienality in its own way -all differing yot all alike, its reat Rom, all arng, yol alhe, its greal noman cast to west. The Southern Remanesque, as tbat of Venice, was cspecially characteristic : notbing nos was spared to make it great. It wona be a arious thing to rease ancy, the Christian wice of the lauesquo ays. There needs must have been a barmony midst the several arts which all went to maze p the art lifo of tbe city. We may yet see a omething of this in the "ivories" to be found in antiquarian stores, and in them, tbough perbaps but faintly, wo see how architectore, and culptare, and costame, and the common thlings f daily life all went together to make up a conistent and harmenious whole.
Architecture and fice art will be fonnd to hrow no snall light on the great snbjects on
which Frofesser Max Muller discoursed so lcarmedly, and so well, and so holdy

NEW POLTCE BUILDINGS IN KENALNGTON.ROAD.
Duming the last few months, new and convenient police-station buildings have been in course of erection on a plot of ground in Ken-nington-lane, immediately adjoiniug the extensive new premises called the TVellington Mills, recently built for Messrs. Oakey \& Co., and which were described in the Builder some time ago. The land on which the buildings have beeu erected, including the parade-ground, is 126 ft . in length and 72 ft . in depth, covering an rea of upwards of 1,000 square yards. The rontage consist or each, with entrance, carriage, and foot gates in the centre, of similar dimensions. The build. ings are 40 ft . in height from the street level, daucion to a basement. They consist or rials used in tho elevation up to the first-floor: windows aro of Denling stone, rusticated, and the upper portion of red Fareham brick, with triucoursegs, hie pliathe, the eleration heing Portland stone. The first.fleor windows have old arched stone headings, and the eleration is old reh of of the prupe entrance rates in the centre there aro stone piers surmounted by lamps. One of the blocks, which is called the "station," contains, on the grennd-floor, the charge-room, with cells in the rear. The first-floer of this block contains the inspector's apartments, includiner sitting-coom, two hedrooms, and ether omestic offices; the second-floor containing a imilar set of apartments for the sergeant. The basement contains washhouse and stores, for the no of the inspector and sergeant. The other block, which is called the section-house, is for the use of private members of the force who aro single men. The basement of this block conains a drying.room, messroom, cooking-kitchen, bath-room, and washing-room. On the gronadfloor is the officers' day-room, library, lockerooth, clothes-room, and brush-room. The first na second foors, wbich contain haree rooms ach, flo furnished with twentering accommodation for fifty men. The parade.ground at the ear of the buildings is 80 ft . in length by 34 ft . in depth.
The buildings bave been designed by Mr. . H. Caiger, the police architect and surveyor ; Messrs. Merritt \& Ashby, of London-wall, being he contractors; and Mr. J. H. Taperner, clerk of works.

The Temple at Jerusalem.-Mr. James Fergusson, F.R.S., read a paper, on Tuesday ovening, the 2nd inst., at sion Colloge, Londouwall, "On the Temple of Jerusalem." The chair was taken by Mr. Driffeld, the president.

CHURCHYARD GATE, ST. JEAN-DU-DOIGT, BRITTANY.

CHURCHYARD GATE, ST. JEAN-DU.DOIGT, BRITTANY.
Not the least interesting of the many picturesque and beautiful features of ecclesiastical architecture in Brittany are the charchyard gates, or, as they are called, "triumphal arohes." These singular strnctures are, as a excessively rich in ornment. The example we give from the churchyard of St. Jean-du-Doigt is one of the earliest wo have seen, and dates from the end of the fiftoenth century: it is not so rich or extensive as many others in the same neighbourhood, bnt its desigu is very pleasing and more appropriate than the more pretentions and wild bnildings erected for the same purpose a century later. It is constructed entirely of Granite, and is in a good state of presercation. When the name of "triumphal arches" first
became applied to these stractures in Brittany became applied to these structures in Brittany
it is not easy to ascertain, hut there is a kind of it is not easy to ascertain, hut there is a kind of grim poetical notion about the idea mixed with a deep religions sentiment, which accords well with the general charaoter of the Bretons.
The Church of St. Jean-du-Doigt is at interesting bailding of the fifteenth centary, with a nave and aisles under one roof, a good tower orowned hy a lead spire, a large porch, and many other objects of interest. The east window is a rich rose, with the star rather skilfnlly introdnced into the tracery internally. The double font and one or two original altars are worthy of notice. The cemetery surrounding this chnrch, in addition to the "triumphal" arch, contains a fine Renaissance fonntain in cast lead, a simple Calvary churchyard chapel, and a small ossuary or bon

In the village are many interesting old Gothic houses, two of which are seen in our view.

BURLINGTON HOUSE, PICCADILLY.
The Royal Society has taken possession of its new quarters in Burlington Honse (the eastern side of the qnadrangle), the interesting collection of portraits have heen hang, and its 30,000 Whines expeditiously transferred hy Mr. Wm. hite, the Assistant Secretary, to the handsome and commodious library prepared for them. This is on the one-pair, and has a lofty crallery The fittings of the apartments are of oak, as are those in the rest of the hlock of buildings, the ornamental work in plaster is sufficient for the nrpose and slight decorative colonrings the nerpose, and slight decorative colourings are by Mr. Haden is, when quite in order, to warra he various apartments, and will donbtless do so. The meeting. room, which is on the ground floor, eparated from the entrance-hall hy an anteroom, might have been made a little higher with dvantage, but this was douhtless regalated by ther requirements.
On a previous occasion we gave a viow of the Piccadilly front of the new Burlington House, a plan showing the acoommodation provided for all the societies housed in it, and some desoriptive particulars of the whole.* To theso wo refer our readers, to avoid recapitulation. At that time $(1 \mathrm{~S} \% 1)$ the works, under the direction
of Messrs. Banks \& Barry, were in abeyance, in consequence of the failure of the original contractors. They were soon afterwards placed in the hands of Messrs. Perry \& Co, of the arried ont to completion, the lamented death of Mr. Banks, in the meanwhile, leaving the sole direction to Mr. Charles Barry, as architect. Mr. Daniel Rnddle, who had his training nnder

Vol. зxix., pp. 217, 226, 227

Sir Charles Barry, at the Honecs of Parliament has acted as clerk of the works from the com mencement.

Our present view shows the sonth-west angle the building from within the quadrangle, and ncludes parts of tho portions occupied respecavely hy the Linnean Society (next the rreat archway) and the Astronomical Society. Tho apartments next those of the latter, northwards are for the Society of Antiguaries, these are fast approaching completion, and will donhtless be occupied hy that distinguished hody hy April next. The iron gates to the archway in Piccadilly, now in course of erection, are the work of tho Midaland Iron Company

THE CORPORATION WORKMEN'S DWELLING-HOUSES.
The new workmen's dwellings in the neigh bourhood of the Holborn Viaduct, the erection of which has for some time heen under the consideration of the Corporation, have now heen inally decided apon, and will shortly he commenced. At the meeting of the Holhorn Board Works, held last week, Mr. Isaacs, the surveyor to the Board, stated that he nad seen the plans of the intended new huildings about to be erceted by the Corporation for the artizan classes, on the site of Union-court, one entrance heing from bieeding Hart-yard, and another in Field-lane, at the foot of the steps recently erected hy the Corporation as an approach from Field-lane to Charterhouse-street. The plans embrace four blocks, each to contain accommo dation for ten families, thas making forty in all Mr. Isaass observed that the quantitios were heing taken off to enable the Corporation to receive tenders. The Board expressed thei satisfaction at the prospect of the long-promised buildings being at length erected.

Burlington house, piccadilly: view within the quadrangle.-Mr. Charles Barry, Architbct.

## ART FOR THE MILLION:

Sid,-Mr. C. H. Whitaker, in his last commaication (p. 949), bas illustrated at more levgth and thus made additionally clcar, his viows on the production of slams. I feel personally
ohliged to hims,-as, no doubt, do others of your ohliged to him, -as, no doubt, do others of your
regular readers. I may say also that there uglit perhaps to have been no misunderstanding ahout tho drift of his formor letters (pp. 770 and 890) : this is qnite evident when they are re-read, -after his last. It does away, to a grent extont, with one of the radical failings of written opinion, when it can he supplemented the exigencies of readers seem to requ:re. cannot help froling, Phodrus, that writing is unfortunately like painting; for the creations of the painter have the attitude of lifc, and yet if you ask them a question, they proserve a solemn silence." But, then, the Platonic Socratesspeaking over 2,000 yoars ago,-and providing thus what might be used as an implicd apology, in somo cases, for ns poor modercs, -had no disposed jonrnals. .... The Vienna awardsn so far as they may indicate iuferior taste and skill in our mapufacturers, -ought decidedly to be brouglit into the fullest possiblo prominence rith a view to future iuprovement. The fact (if it is a fact) that much of this failure has rosulted from tho crrors of purists in the deco. rativo arts, -their defective theory, and conse quently crroneous teaching, -would deserve to he onunciated and reiterated till it was universally acknowlodged, and a new course entered feel so suhhlimely yirtuous as to reject good thinking, even if it should happen to be prefaced hy a simple dpropos de bottes, and after these other to take up the questioning where it was left.
The matter seems, then, to divido itself now into (1), culture (by means of the arts) of un. educated persons and children, and the hest method of effecting it; and (2),
imitations hy the reat of the world.

1. Here we have a very wido and long. debated question. It would seem quico possible to for notice in auy consideration of the aims and methods of education as far from 2 dramback, J'erhaps each niay do good service in its turu. So long as the practical work of teaching is stendily pursued,-according to the best systen plain. It is the proper work of theorists to hrce into notice any special defect or excess to compel the nicer adaptation of means to the attainment of ends; and hring ahout larger attainment of ends; and hring ahout larger
modifications still when it has heen agreed that modifications still when it has heen agreed that
there has heen some mistake as to the ends themselves. Are we to conclude that there has been a misapprehension of the things to he nimed at ?-or only of the means? In this case of the little luxaries, the possihle decorations of
the cottages of the pool: If the former, we scem to let ourselves in for still expanding issues. If the latter, tho question is still very wide, -quite wide enough for me to touch on it only just now. Hay something whici has been put forward as to pure eavages be
considered to have a hearing on-culture hy considered to have a hearing on-culture hy
means of things thoronghly within the reach of means of th
the tanght?
I have formed no opinion, I should say, on the correctiness, or humanity, or any other quality of the theory, but simply state it as it has reached me. Observers have, it seems, noted painful failares in tho work of quickly.eivilising savage races. By meaus of exertiona, that could not he
too highly lauded, made by deroted men, sararge too highly lauded, made by devoted men, savage manities to affect the manners of the nations of Europe, to aim after the realisation of the highest personal and social virtues of cirilised man. Great success would seem to have steadily persevered in. Schools and churchos have heen built; religions services attended as a custom; habits of patient lahour sometimes acquired, - ail the most ohrious details of life at the old home of the teacbers copied with an carnestness, a thoroughness, that is not without its pathetio interest. The hest models known to these teachers have been followed, and the
unbounded suhtrission of the weaker.willed and less self.mastering people under their sway has becn secured. But the imperfectly.conqnered savagencss will, it is said, on occasion,-and the
occasions' are mneh too frequent,-show itself quite untamed. The old wild love of uarestraint breaks the linen bands that have beld it in ; and the moral that is pointed to as a conseqnence is, that no power, except the continual action of formod hahits persisted in for generations, can forge the iron fetters which are worn without pain, and still effectnally restrain from excesses of any kind, -the majority of a well-trained poople It is of conrse added that this slowly-acquired self-oommand is the security for the permanenc of the achievements of the past,-menaced in tho worst of cases only hy a small section mado temporarily delirions hy special causes, and not restrained and cured, as they should be, by the exercise of gemuine wisdom and nucroifu tricugth. In view, then, of this tendency to relapse, in the case of saparres, it has been arguod that tho tenohing which has most per natares anduesce on them, -which monlas the from the uetual example of those who are nearest in culture to themselves, - woch as the sweepings of our cities,--the driftwood, so to speak, of civilised humanity,-and the somewhat better class of imperfectly-educated Enropeans who man the ships that trade hetween old coun trics and those now frat heginning to have a history. From such persons the natives are aid to imhibe in an effective and permanent wor hio germs that hereafter develop into the sent mont which makes the hinding ohligation of aty the commencement of habits that go pards some self.respect and self.restraint, \&c. prohably need not pursue this further. The argument scems, as far as I can judge, not far
from analocrous to Mr. Whitaker's, that decors ive anogous to Mr. Whitaker's, that decora otelligiblo to theak the laaguage most readily cultur our own country, whose mental, moral, and social condition is not remored so far from that of savagos as micht heve heen hoped from the ength of time during which the work of civilisa ton las been going on, and the high culture clee whero evident;-that in fact we must hegin Loroughly at the heginning, and treat hosts of
rowu-up men and women of our orn eountry -as a matter of policy, - to the sort of teaching, which, in the case of children, has excited times and ayain indirnant protest nast wholy unlarnt when, if th itelligence is sufficiently developed). I shoul ook for answers to the kind of dificulties her Thitaler in the further commanication Mr. no or two promised. 11 w will (we mention region for which "the sterile, hope, show the ractive one occupied hy the disciples of the doctrine of the purista in decorative arts " ought ohe abandoued. Also whether he intends ahsoately, or only as an caception, to recommend a recurrence to, - what we have for the most part agreed to consider,--errors in decoration; such, for instance, as fully. shadowed suhjects for the tit surfaces of floors, walls, sc. The use of iple. Tho present interest in Chinese and apanese art owes its strencth very largely to a reaction that has heen gaining force for some time,-tending towards the more general appli. cation of varied and delicate colour and unex pented harmonies.
The conclusions that may be come to as to these matters should affect so materially what one mirht have to say ou what I have culled the second division of this subject, viz., the use of mitatious by others than the rery poor and gnorant. Therefore, and hecause I am afraid pace than yon would he libely to occnpy mor continuation of the foregoing, I had better hold back tho further perplexities of

A spectator.

## BONDING COURSES.

Sir, - Want of information with reference to the results of experiments ought perhaps to deter mo from addressing you on this suhject,or perhaps it may be accepted as a suficient are, I doubt not, a ware of facts that they hers come across, in the course of practioc that would solve other people's difficulties as well as mine. I must confess to a fairly diligent look-out for such facts, in actual work, and among forehailding :- hut I have found very little in th way of exact ohservation on some of the points, and absolutely nothing in the way of special
experiment. From this it results that I ans the advantages of bonding courses being sup. posed to he :-

1. That they spread weight,-doing service in their way similar to that porformed by wall-plates, templates, landings in fonnda parationd piers, dc. This is done hy a commaterial is use ${ }^{\text {I }}$, on stone and nuusnal case, the ereater 1 tiont of hed uuder such stone mintion or the be hollow, and then-with thicheppen to 6 in . and a lenth of 4 ft distance short only by a reiv fow brug. own length Tractur wiat iacles of its expected with an considemh reasonanly bo hut in practice this would probably happen not once in a hundred instarces. The whole bearing of the stone heing coyered with soft cement mortar, this yielding material will be forced by of stone's weight,-certainly with the additio of a very little superincumbent matter,-imto all rithingularice of salaco. On the occurrence widence the area the flag of anequal sub measurathe measuranle in iuches, and finds-it may be hefore long - a unifurm hed once agail The temporary conditions have been clangod in the imperfectly solidified work, which but also setting only hardening within itself, but also settiag up, as hest it can, per manently satisfactory relations hetween it evoral parts. If thrnugh failure of fonndations shond come about that the hine of separation, hetween two scetions of any wall, ent throug uch a honding.landing, it wonld also fracture ,-hreak it in two probably like a biscuit,hat the oparation had become so consicerablo elves ruiu wonld ber. Bat this is a case in whic cantions we inevitahle, - -no matter what pro ct tore taken to make the superstracture honding.cer. If this viow of the case is correct have b-courses of hrick in cement may no all theated by "B." in the buider (p. 9so ondino consideration they deserve. Such a he hrocourse,-composed, say of two course ato ark in thiokness, all thoroughly bound ono mass by quick-setting cemeat,-might 2 ft . or 1 f 6 in. thick," ${ }^{3}$ if only this point of difference was first noted, -that the hrick and cement rinc has the great advantage, as far as its resistance to racture is concerned, of heing, within some slight limits, able to re-adjugt its furm. However quick the cement may he in settiag, the ring connot bo "a rock" for days or even weels. if the stone ring is not supposed to be continuous - (in one piece for its whole size) -the liahility "to braak like glass wherever the least inequality of pressure took place "3 wonld appent less certain and this sugycests to one what is likely to he the case with the brick and cement. It is sufficieutly pliant to act as a succession of short stones would,-i.e., each part of the length takes up its own position without heing affected hy what the others are doing. The inequalities are very minute: this is supposed from the very first. But while the honding-course is showing this want of complete rigidity, it is well enough compacted to act together over syfficient aroas and thus serve the purpose for which it was introduced, and effectually prevent severance of Walls or piers as the result of the slight differences that probably exist in every square foot of brickwork actually executed,-such differences heing caused hy difference of size of bricks, and the fact that somis are well wetted and others but little, helped, of course, hy fitted or nufitted cross-joints, uneven lasers of cementing naterinl, \&c.
Bunding. conrses,-in which boop-iron is also nsed,-may he regarded as still more effective. Not only is there added the weiglt-hearing strength of the laths themselves, hut the irom strength of which the materinl stood in tensile makis a por makigg a powertul Brunel beam of the whole resistanco to supposed to he presso may mose cases he and cod to amplo; hut the hrick in cement siderable hintels wich bridge anch .considerable spaca at wes cannot wo without the insertion of the irons, which supplement thoir powers where weakest, and thus increase ther rces many time
2. As to this, mucb less need be said. Still it is not necessary to pass over the fact that
with the hoop.iron they act also as grivdes. In
strnctures covering small areas, and tall in pro portion to their height, such as towers, chimneys \&c., it is absolutely necessary for safety to compel the whole to staud together, and main. tain its origiual form unaltered. When the area of the bailding is considerable, and the continnity of the bonding-courses is hroken hy open. ings, and there are few cross walls to hrace tho boop-irons hack, it would seem likely that their action will he simply local. They will pull together certain sections of wall; also prevent, to the extent of their own resistance to lateral Gexure,-any teudency to hulge. The intimate contact get up with every portion of the materjal round it hy the iron is equal to a pinning.down at numhers of points. Hoop.iron, tarred and sanded with coarse sand, must be perfectly in. capahle of sliding on the brickwork nnder it, when only a ferw conrses have been built above. In ordiuary buildings they may even do more than in larger ones,
3. This is especially seen to be so when we consider the inain use of almost all artificial bond to be temporary. It supplies something to ounteract against the heary demands made in to stand them. There are all the lemporery inequalities before alluded to : and in addition, nequallies bere - scaffolds, with workmen, hoisting moratus heus of matcrials so derisu apparatus, heaps of matcrials, \&c., derive all what a very little while ago formed part of similar beaps.
Of the many queries as to details that might be put, beyond those suggested ahove, I will limit myself to :-
A. Is it not desirable to build iron into al brickwork-in cement only? not in mortar ? I have heard it commonly asserted that lime wortar perishes by the action of iron. Is, however, the tarriug a suflicient preparation
for its ingertion of tie iron, without risk, in a or its ineer
B. Will any such resalt bappen from the use of a mixture of lime mortar and cement? Bricklayers havo told me that tho mixture made of cement and saud is so "short," that the adition of mortor makes a compound more readily ased, and more evenly distrihuted hy must frorkmen. It is, if I remember rightly, some. times used, one third of mortar to the requisite hulk of cement and sand, uixed in the proportion found to suit the cement; and as pnt hy workmen, the result is simply a substitution ot one cementing material for another throughout the hulk of the compound,-not a further reakening of the cement. I bave hada sus to attribute defects to others and to nuatcrials a little wildly at times; and that hy some strauge coincidence their masters, and therefore the orn interests, aro almost always served by the remedies tbey dovise. But there is perhaps somethiug in it.
C. What is the use of carrying the hoop-iron bond through openings? Instances must occur when the bonding-courses can only be put where they will he interrupted. It is dithoult imagine when they are seen in wide openings, sagging so mnoh with their own weight, that they can act as effective girdles within the narrew limits of possihle lateral movements in buildings that are going to stand any fair chance of scahility. Should the bond be tightened artificially? Or is it worth while to let the iron be wasted and to involve the trouble of cutting later on, in order that it may he clear on inspection that fors tfulness has not resulted in a gaving of expense to the contractor?

## SCHOOL.BOARD SCHOOLS FOR

 LIVERPOOL.Tre fonndation.stone of new schools to be erected in Butler-street was laid by Mr. Bushell, the chairman of the late local School Board, in presence of Mr. Foster, M.P., Vice. Presidcnt of the Comacil on Education, who was maiuly re-
Fponsihlo for the passing of the Elementary Education Act. Alterwards Mr. Foster went to Queen's.road, where new schools, built hy the
School Board, are approaching completion. Hero School Board, are approaching completion. Here
he placed in the front of the huilding a stoue he placed in the front of the huilding a stone
to connuemorate the erection of tho schools. to commemorate the erection of tho schools. of the Edncation Act, criticised its opponents, and defended the Act iu a speech of an honr and a half's length.
The schools of which the memorial stone was raised are erected on a piece of irregularly
shaped land, having a long frontage on the west
side of Queen's-road, and are the first of the series now being erected by the Board, hoth as regards the date of their commencement and superiarity of position. The general outliue of tho building is that of an inverted T, presentin façade of 185 ft . in length to Queen's-rond and running back wards to a total depth of 103 ft On the ground floor are placed two infants schools, one 55 ft . hy 22 ft ., the other 39 ft . by 22 ft , , - cach provided with junior and senior infants' class.ruoms; and the senior boys' sohool 39 ft . by 22 ft ., with two class-rooms, each 18 ft . by $1+\mathrm{ft}$. On the upper floor are schoolrooms or junior hoys and pirls, each 55 ft . hy 22 ft with donble class-roome, 18 ft . by 1 ft ft .; also a senior girls' school, 39 ft . hy 22 ft ., and two class. rooms attached, each 18 ft . by 13 ft .6 in . The various class-rooms are plarued to permit of two heing thrown into one hy means of Stone's sliding London School Board sound.proof partitions, and the larger schools have similar provision for sub. division whem required. Each room is prorided with through light and ventilation, and will be armed by hot-water pipes in ad is ft hirb pen ireplaces. The ground floor is 14 ft . high istresses room, board ond head master's room, istresses room, board wad hear alaser's room, portion of the girls' and infants' playground will be roofed over, and access to the various departments and to the latrines is ohtained under cover. The total accommodation pro 900 is for 1,00 chlaren, $\mathrm{E}, \mathrm{s}$, soo boys, and sorts. Each school de partment is suppited with separate entrances wholo have hees carried ont from the designs and under the supervision of Messrs 1. Cooke and John E. Reeve, of Liverpool, ar bitects, whose plans were selected in compoti tion, and have received the sanetion of Mr E. R. Robson, architect to the London School Board (and consulting architcet to the Liverpoo School Board). Mr. J. Henshaw, of Liverpool is the sole contractor, and the masonry has been cxecited hy Mr. W. Thornton, joiners' work b Mr. Sammel Wehster, ironwork bs Mesars. Tessi mond \& Kissack, slating and plastoring hy Mr. T. Jones, plamhing, \&c., hy Mr. W. Merrick, all of Liverpool. Mr. William Laidlaw has been clerk of the works. The amount of contract is Tho front to Queen's.road is built of Yorkshire par.points, with red Runcorn stone tects is domestic Gothic
At the laying of the foundation-stone of the Butier.strect schools, fronting Penton.streat, Mr proliminary was nov remarks, he said the school whic Was now ahout to be commenced was one of si. Board's work These siz schols would provide boar 600 hildren ase shond provide for 6,20 ar fiting of something tike 68 sites and aln needful fittings, of something like 68,0002 Thad $p^{\text {ro }}$ posed, and the education epartment had sane.
tioned, a further provision for something like 5,000 children, making provision for some 11,000 altogether, at an entire cost of 123,0001 . That money had in part heen borrowed, and the re mainder might he horrowed from the Puhli Works Commissioners at an interest of $3 \frac{1}{2}$ pe cent., which, with an additional $\frac{3}{\frac{3}{4}}$ per cent. for redemption fund for fifty years, would involve a sim upon the rateable value of the horough o the pound.

THE VACANT BUILDING.LAND IN CANNON.ROW.
The Metropolitan Board of Works have de. cided to let the vacant land at Cannon-row, adoiving the Thrmes Emhankment, near the new St. Stephen's Club, for huilding purposes. he meeting of the Board last week the Works Committee reported that they had had under consideration tho utilisation of the land in ques ion, and that the Board having finally decided ot to form an approach to the Thames Embank hent hy a continuation of Derhy-street, the ommittee had instructed the architect to prepar plan of the ground, and adrise as to the cours to be taken. It appeared from this plan that the land helonging to the Board, following the old line of frontage, has a frontage to the Vic toria Emhankment of 210 ft . by a depth of 189 ft ., witb a frontage to a portion of it in
Cannon.row of 102 ft . The committee thought
that the time bad arrived for letting the land for building purposes, and they recommended that advertisements he at once issued inviting tenders. The recommendation of the committee for bnild ing on the land was agreed to.

MANNINGHAM MILLS, BRADFORD, TORKSHIRE.

## Tre erection of premiscs in place of thos

 destroyed hy fire, abont two years and a half ago, together with additions and extensions that will entitle Messrs. Lister \& Co.'s works to bu regarded as equal to any in the country, ar drawing towards completion. The great chimney has been recently finighed. The new worls ar of more than usmal interest, as velvet.rvesvin. by power.loom machinery is introduced, a pro cess which, it is anticinated, will work a decider evolation in the velvet trade. The ase of power.loom machinery in velvet-weaving has hithcrto been vainly sought after; but Mr Lister, after spending many thousands of pounds in experiments, has, after many years study, heen fortanate enough to solve the prohlem. The extension of the works is effectel by the erection of ghed continuations of the premises built some time ago, and also by the building of a large mill and warehouse. The entre of the huildings, fronting to Heaton-road, occupied as offices; and this centre hlock rises slightly ahove the shed.walls on either side, nd is a little more ornamented than the rest, with high-pitched roofs at the endsThe works have a frontage to Heaton-road of 350 yards, and they extend westward 150 yardr, where they are bounded hy Patent-strcet. They thns cover an area of abont 52,500 square quare yards, being nearly eleven scres, and reckoning the several stories of the mill ard Warehouse, give a total extent of floorace of hont sixteen acres. The uew mill, to the west, the ther of tomber high, not including the collor of good exteres gpesran in orl ppeara with lorse and a bokd rental ond panelled poripet. The staicaso is in the cent pof the front and stands clear out rom the main. It is more ramentel rom the main walls. than tho rest of tho bniling, and, with its turret-lormed root, sumounted with a large flag. tan, makes a feature in the great leagth or rontage. The four corners of the mill are also marked hy raised parapets. Each room contains n area of 2,000 square yards, the tier of windows on each side numbering forty-one, so that, t a rough calculation, the whole mill will give an area of ahout 12,000 yards. The uew ware. louse, further to the rear, parallel with the mill, but separated from it hy the reeervoir, is six coreys high, and will furnigh, reckoning each loor, room to the exteut of aboat 11,000 square yards. The top rooms of hoth warehouso und will bave shed-roofs, and may he used for lommweaving.
Lach room in the mill, warehouse, and sheds is Lofty and well ventilated, aud provided with vater closets, lavatories, drinking-tiplp, and other arragements conducive to the comfort of the workpeople. All the huildings are fireproof, ven to the winduw-frames, which are made of iron. Each floor is of Dennett's concrete arching. resting on iron heams, supported by pillars of the same material. The supporting. pillars are futed and ornamented. The inner walls, instead of being corered with a uniform whitewnsh oue ainted; and the stairesses, to the heiclt of 50 or so, are lined with polished brick.
There is an immense chimney at the rear of the centrail shed, and at the end of the new ware. house. It is 83 yards high, square in form, and house It is 83 yards high, square in form, and top. Nearly 7,000 tons weight of material have been used in its construction. The inside width is 10 ft , gradually increasine towards the top to 11 ft . The object of this arrangement is to proride hetter vent for the smoke as it ascends and expands, heing the revorse of the old prac. ice of huilding shafts, which "throttled" the smoke at the place where most space was required. The chimney is of an ornamental desirn, having panelled sides with circnlar heads. At the height of 200 ft . is a hold cornice, surmonnted by a circular panelled and ornamented parapet 50 ft . in height; this is again covered with a cornice. It is intended that this chimney shall serve for the whole of the works.
A large viliage has been built on the sontli. west side of the works. It is intersected by six new hroad streets. Beamsley road bounds it on
tbe nortb and Lilycroft-lane on the south. One of the new Board schools is erected in the latter there will be room in it for 600 boys and girls. A co-operative store on the most approved village, and is occupied as a branch of the Bradford Industrial Society.
Messrs. Lister \& Co. manafacturo silk yarn, sliver, scwing silk, silk cords, Japanese silks, velvet, plnsh, \&c. They also dye tbeir own yarn and velvets.
The land opposite the front of the works in Rows of villas and cottag out as building sites. and in a short time there will be bat little, if any, greon fields soparating Heaton from Man. aingham.
The architects for the works are Messrs. Andrews \& Pepper, Bradford; and Mr. A. Rhodes, carried out under the supervision of Captain carried out under the super
Lepper, agent to Lister \& Co.

## THE ARCITITECTURE OF CHINA.

## the temple of hbayen,"

I consider that it was fortunate for mo tbat I chanced to visit Nauking while in China; for there I saw another Ming tomb. When this dynasty began, Nanking was the capital, and
Hung-uru was the first Emperor of His tomb is still an object of attraction amenest the ruins of that vast city. The residence of the court having beon removed, the tomb at Nanking has not heen so well looked after as those at Peking; and it must have suffered during tine Taeping war. I found the trenches by which Nanking was taken by the Imperialist troops all abont the tomb. It scomed te mo as if the buildings bad been hurned, for the stone bases had all the appearance of haring beon Although in ruins, the plan of the tomb conld be easily mado out. With some slight differences of detail, the arrangement is the same as that of the tomb of Yung-lo. I should say that if any. tomb is also at the very base of a ridge of hills, which cover it from tho nortb wind, indicating again the influence of the Fung. Shuie. This tomb has also an approach, hordered with sculptured stono figures, like thoso near Peking. but unfortunately he could not speak a word of Euglish; however, when he saw me sketcbing, be [used the word "loong," and pointed to the road with its men and animals, This word, knew, means dragont, and as it is supposed to be became anxious to know what my guide meant, and I questioued him repeatedly to see if I was right in understauding that he applied this word tine dragon to test ; I even sketched a scrpen. approval of it. From this man's mauner I am certain that the twisted form of the way receives from the Chinese the name of the Dragon; but whether they havo the idea in this case, which has been suggested as the theory upon wbich the
stones of Carnac in Brittang, and the avenues at Abury, are supposed to he laid down, I could not say. I made inquiries on this subject while in China, hnt could find no one who had studied My sese architcctare from this point of view. have shart, or I would here so that matter clcared; and I mention it dracontine temples and serpent worship, in dake the subject up and make furtber inquiries I should be rather and make furtber inquiries. I should be rather inclined to believe that the
doong, or dragon, has something to do with it.

I was able ono morning while in Peking to visit the Temple of Hearen; aud, so far as I know, this curious shrine has not yet heen fully
described in our language. I have seen Du

Halde's acconnt, but not the faintest notion of the place conld bo formed from it; and his grapbers who bovo penetrated to the place have always given the north altar as the Temple of Heaven, whereas it is only a portion of it, and not the most important. The few travellers who have described the place hare heen attracted by the building on the north altar, and havo not even mentioned the south one, whicb I now believe to he the most important part of the descriptions of the building wbich wore made out at its constraction, and which explain the purpcse and phrpcse and meaning of it all. The Rev. Mr. from this source, and written a chapter upon the subject, wbich will be found in the appendix of subject, wbich will be fonnd in the appendix of sionary, I mention this as the sonrce of mach valuable information, but I could wish that everything connected with this very important temple were translated from the Chineso autbo rities, and accessible to us Westerns.
There are in Peking a number of Imperial temples, such as this Tempio of Heaven; the Temple of the Earth; the Temple of Agricul. ture; the Altars of the Sun and Moon; and
others. The cercmonies at all these temples others. The cercmonies at all these temples
bave no relation with any of the threo relimions followed by the people of Cbina; these being followed by the people of Cbina; these being The Emporor only is the aorshipper in thes lmperial Temples at Peking. He is not only the Worshipper, ho is at the same time the Priest. It is another examplo of that eld idea of priest and king-of the spiritual and temporal power comEnned in toe head of the state. As the present Emperor has been a minor for the last ten years, heen performed, or they have only been done not deputy. On the 21st of December last-thy being the winter solstice according to Chinat reckouing-the young Emperor officiated for the first time at the Temple of Heaven. At the vernal equinox the Emperor repains to the Temple of Agriculture, and plonghs a portion of land, is done he sows \&ye varieties of grain. This The ceremonies at the Temple of Earih tate. place at the summer solstice, when a hullook is sacrificed and huriod.
the Temple of Heaven eccupies about a square mile or greund: that is, tho outer wall is about four miles round, inclosing a large space, which has a park-lice appeavance, with avenues of trees Here the animals kept for tho sacrifice find razing. I was struck by noticing that this emple has three inclosures: whether tbis accident or not I could not say. I know tbat the three-fold division is common to temples all over the East. We have the Tabernacle of Toses and the Temple of Solomon; and the Eastern churches to this day follow this threeold division. The Umbrella is an old symbol dominion and power, and the Cbatta Buddha is triple, implying, no doubt, sovereignty ver "the three worlds," which are so often re ferred to in the aucient classice of India. They are as eld as the Ramayana. One of the most important of the insiguia of the Emperor of hat the circiple umbrella; and it will be see the Temple of Heaven has a triple roof. The north and soath altars bave a triple terrace From this we may almost presume that the threefold inclosure of this great templo is not accidental. The plan of Peking itself has this same arrangement: there is the Tartar city; within that is the Imperial city; and within that agrain,年e a sanctum sanctorum, is the palace of the things in rirtur of that the Coinese do these uotation from Gutzlaff. He says that China " is heaven upon earth-the Celestial Empire. They havo endeavoured to model their government after Nature, and the laws of the visible heavens. Evon their military standards and royal palaces are supposed to have resemblance to celestial objects." It would have beon valuable if we had had this author's explamation as to how his left in the dark, bat we will see as we proceed that the Temple of Heaven has a signification in almost overy stone of which it is composed. The central portion of the Temple of Heaven contains two altars, which are distinguished as the north and south. I will first describe the south alcar, as I believe it is the most important part convey more clearly the original idea upon whicb
the wbole was constructed. At the first glanee it would strike the observer that it was merely a platform for a band to play upon. There are three circular terraces built on each other, each about 6 ft . high, which are ascended hy four flights of steps, one towards each of the cardinal points. On the top of this which are to be fonly the five ressels, in marble, which are to be found on all Chinese altars: a canopy is erected upon eccasions of celebration. Athougb we apply the term "temple" to this, Still we mese, as will he seen, only call it an altar. Still we might apply the old Greek term, and givo it tho name of a hyprethral temple, for it is truly that, having no roof hut the dome of hearen ahore. The visible ohjecte, to whicb worsbip is directed at this shrine, is the tablet of Shang-ti, the God of Heaven, and to the tablets of the deceasod Emperors of the present dyuasty. Few temples in the world are so free from idolatrous forms as this. The Emperor prays, and cffers inconse, as an oblation of fire. He drinks, and eats the "Flesb of Happiness,"almost repeating the sacramental ceremony of the Christian Church. Mr. Edkins says, "to Heaven alowe is offored a piece of blae jade,
cylindrical in shape and a foot long, formerly used as a symhol of autbority, Thero is a furnace of greon porcelain below, and eight smaller furnaces of iron; and while the ceremony is going on ahove, a ballock-it must he two years old and without blemish-is being hurned with sbeep, pigs, rabbits, and deer; pieces of silk aro also burnt as offerings, Dancing and music are also part of the performances. The Emperor comes to the temple the night before, and fasts. The hall wbere he is lodged is called the Chai-Kung, or the "Hall of Peniteutial Fasting," and the ceremony takes place at the dawn of next day. This is only a very rongb outline of the coremony; and I will now give some details of the symbolism of the construction of this altar or temple
The four ascents, witb approaches and gates to e four cardinal points, bave no doubt an astro f Praphical significatiou, Tbe 1 mperial temples Feking have been construoted with reference the relations of numbers, and this is more the middle These are multiples of $3 \times 3=9,3 \times 5=15$, and $3 \times 7=21$. The number nine fignres largely in The ascent to each terrace has nine steps, the whole ascent heing $3 \times 9=27$; the pavement on the top is formed of nine circles of marhle slabs; the first circle has nine slabs, the second ircled of 18, tho third of 27, and so on, each irclo being a multiple of a fil at too onte in Chineso philosophy. There is a centrol stone and there, - sarrounded by theso symbolical ircles, with terraces and enclosing walls, and the circle of the borizon as the extreme of the isible world,-a deified Emperor seems to him elf, and to his conit around to be the veritabl centre of the unizerge. With his face to the borth, and assuming the attitnde of a subject he acknowledges in praper, and hy his position that he is inferior to Henren, and to Henre alone. One of the statements I beard while in Peking was regarding the number of second, third, and fourth class wives whioh would form the complete bareern of the Em peror, and, strange to say, they were mnltiples of 9 , being 9,27 , aud 81 . It is rather startling to our Western ideas that a hareem and a templo should be arranged on the same symbolism "The balustrades have $9 \times 8=72$ pillars, and rails on the uppor terrace; on the middle terrace there are 108, and on the lower 180 these amount in all to 360 ,-the number of degrees in a circle. The pavement of the middle terrace has in its innermost circle 90 stones, and in its oatermost 162 stoncs, thus reaching the double of 81 , tho outermost oircle of the upper terrace. So, again, in the lower teriace, the circles increase from 151 stones, the innermost, to $2 \cdot 13$, or three times the square on the authority of Mr. Edkins, and I will still further quote from lim in relation to this temple. Ho says:-"It has been an aim to use odd nomHo says:- le has been an aim to use odd nnmis round, heaven is odd, earth is over; heaven mateund, eartb is square; or, to use the ultimate expression of Chinese metaphysical thought, Heaven is Yang, Eartb is Yin. The numbers 1, 3, 5, 7, 9, belong to Yang, Meaven; tho nnmbers 2, 4, 6, 8, 10 , belong to Yin, Earth. In tho official published accounts of the Temple
principle.
principle." I quote still further from the same anthority respocting the Temple of Earth, as it by comparison assists us in understanding the snbject- 60 ft square, and both 6 ft , in height. The paving. square, and both 6 ft , in height. The paving.
bricks are in multiples of 6 and $8 ; 36$ and 64 are the favourite nnmbers, for we have now areme into contact with Yin, the principle of darkcome into contact with Yin, the principle of dark-
ness, which affects a square form and even ness, Which affects as square form and even
nnmbers, just as in the Temple of Heaven the Yang principle was represented by ronndness of form and odd numbers. The principal sacrifice is offered at this altar on the day of the summer solstice. There is, near the altar, a pit for bary ing a bullock. At the altar of heaven, when the hnllook is burnt, the Yang principle in the sacri fioo is supposed to go upward in smoke and flame. At that of earth, on the contrary, when the victim is buried, the Yin principlo descends in connexion with death and corraption. xayy bero explain that the Yin- Fang are the Chinese symbolio forms of the dual powers of nature which underlie nearly all primitive worship. And it is important to find it here as the declared fundamoutal principle on which these temples are oonstructed. There is a cir cular dwarf wall round the altar, with thre doors at each of the cardinal points, and leading to the steps of ascent. Another low wall is beyond this agaia, with the same number of doors corresponding to the others. It is between these two walls that the altars for burning the sacrifices are placed, in the south-east corner At the south-west corner are three very long poles, whioh I was told were for lanterns, as the ceremony begins early in the morning, before it circular building, where the tablets are served. From this a great built.up way leads to the north altar. On each side of this way and all round both altars, is a thick grove of cypress trees.
The north altar is a triple torrace, nor differ much from the south altar. The ono most striking featnre is, that a large circular honse is erected upon the top of it. It is this which gives it such apparent importanoe, and has caused it to Heaven. Undonhtedly it is a part of tho temple bnt as the great ceremony of the winter solstice is performod at the other, I gire it the prece. dence. It is cailed eni-Kier-iren, or "Tomple the name of Tien-hung, or "Heaven's Palace." The Emperor prays here once a year, offering sacrifices similar to those at the sonth altar Ou cooasions of famme, or national calamity it is at this altar that he prays to heaven.
The south altar has four ascents, with gates and ways leading off to the cardinal points, as if globe. The north altar, on the contrary, has only one approach-fron, the south; but it has eight \#ights of steps. This is fonnded on the Pah-Kwah, or the "eight diagrams," a symbol equally profound with that of the Yin- Yang, and which figures largely in the aucient Chinese classical books as the basis of their religions as well as their philosophical system.
This circnlar temple, or palace, is a very beautiful specimen of the wooden architecture of China. It is 99 ft . high; four round pillars support the central and highest roof, which is rearly all gilt on the inside; twelve smaller columus sustain the second roof, which reaches visible from the four inside pillars, thus leaving highest roof. Twelve still amaller wooden columns form the onter circle and support the lowest roof, which, like the second, only roofs the space between the pillars, which sustain it and the circle of pillars next to them. All this woodwork is elaborately painted and of a deep ultramarine blue; at first anly the npper roof was of this colour, the midale was yellow, and the lower green; hut the Emperor Kien-loong, who ascended the throne in 1736 , cbanged them all to one tint. In the inside, tho altar to Shangti, or the Supreme Lord of Heaven, is on the north; and the altars to the deceased emperors of tho present dynasty are on tbe east and west. On the occesion of my visit it was all very dirty, and the pavements of the outside were covered with grass and weeds. This was owing to the fact that the place had been noused on account of the Einperor being a minor for so many years; but workmen were busy putting it all in order for the cerenony to
take place at the last winter solstice.

In my travels, temples have always been a study to me; and I feel a certain degree of satisfaction in having seen, and in beiog able to deseribe this unique plaoe of worship at Peking. It is so now to 48 , and so exceptional in its form, that ono feels doubtfal abont rentaring upon any explanation of ita origin. In sailing up the Pei-ho, I was struck with the seemingly eudless number of grave mounds. This is peculiar to number of grave mounds. This is peculiar to vary from a yard in diameter to that of the vary from a yard in diameter to that of of Yang-lo, which is abont half mile in cirenmference. The simple grave-mound mile in cirenmierence. The simple grave-mound whs the most primitive form of sepulchre. We now it in the present day as the "tnmnlus and tho "barrow." It became the "cairn," or heap of stones, and this nltimately developed itself into the "ppramid," or tomb, among the
Egyptians. The "dagopa" is only another form Egyptians. The "dagopa" is only another torm of this developmont, and is only a round pyramid, for it is also a tomb, or a relic-holder; for burning the body and proserving the ashes is the characteristic of the Buddlist system. I have no hesitation in saying that all tomples are fonnded on tomb worship. I am aware that this is a question npon which many varieties of opinion have been expressed; but after much travelling and stndy of temples, I have no donbt in my own mind on the matter. Dnring the Crimean war I wont with the expedition to amen; and as we sailed np the strank of that gigantic molehills all round. They were sepnlchral tumuli; and Dr. Clarko, whose works are now old, although not yot forgotten, desoribes thom, and thns epeculates:-In view of lahour o prodigions, as well as of expenditure so onor mons, for the purpose of inhuming a single body customs and superstitions are manifested which serve to illnstrate the origin of the pyramide of Egypt, of the caverns of Elephauta, and of the first temples of the anciont world. In memory of the 'mighty dead,' long before there were snch edifices as templee, the simple sepnlchral heap was raised, and this became the altar upon which sacrifices were offered." The writer s here mistaken in his reference to Elephanta; is a Brahminical temple, and the temples of that religion are in a senge an exception to the rule here laid down, and yet, I think, not altogether so when properly understood. In India we hare to do with the Aryan ; in China it is the
Toranian raco, and among them the tomb-temple theory seems to have no cxceptions. Readers of Ir. Forgussons wrinings will be familiar with their tomb-bnilding propensities.
The theory I would suggest is, that the Temple of Hearen in Pekin is mado in imitation of a sepulchral mound. It would be important to
kuow if any one wes bnried there, or if there is any tradition as to relics of a hnman body having heen deposited,-a point on which I have no information. Still, withont this, if its origin has a symbolical tomb; the architoctural features upon it heing a growth, and repoating in another way the dovelopment already describod in the pyramid and the dagopa. The south altar is the Chiness mords which sipnify temple are applied to it. It is oalled Tien-Ion, or "Heaven's Altar"; but in tho oldest times it was called Nan-Tan, or "South Mound"; and Fuen-Kieus r "Round Hillock." These names in them. elves seem to indicato the original charaoter of Clarke's words, that "the simple sepulehral heap was raised, and thus bocamo the altau npon which sacrifices were offered." Shih-Inufze, or
"Altar of Seorificos," is another of its names.
I think that a confrmation of this theory may be derived from the plan of the sonth altar The ordinary grave mounds in the north of Chima, where they are in their complete which the mound is heaped. Now almost which the mound is heaped. Now almost every Chinaman has read the olassic hooks square form symbolises the Earth or the Fin and that tho mound elso symbolises Heaven or the Tang. We have the statement from the Chinese anthorities who constructed the Temple of Heaven, that it represents the Fang, and we can see from the plan that it stands in a square enclosure, giving us the riv form ; and thas realising the whole principle upor which Cbineso grave is arranged. The essential parts of the temples of China is the tablet with the cated, and heforo this is a table with five vessels. The centre one is for incense, what we call
"joss-sticks," are barned, bnt the Chinaman in his dlowery style, calls them the "Fragrance of an hour." The vessels on each side of this are for candles, and the other two aro for flowers A clerical friend has informed me that this is exactly what the Chureh of England permits upon an altar. Incense may be nsed, hut it must he in a stationary vessel; two candles may be upon the altar, and flowers are not objected to. It is ourious that East and West shonld be so close in their ritnalistio rules; for it can only be by an accident that it is so. I may also mention that the theatre is still a part of the templa all over Clina. Every temple has not got a theatre, but the conjunction of the two is rery common; and giving as an illustration of the retention of ancient forme, a tendency which is perhaps more marked in China than in any ther conntry in the East.
The official residenco of a mandarin, or a court of jnstice, is called a Yowun. Now mun, the second syllablo of this word, means "gate." I tried when in China to discover why this was so, and what wero the ideas of the Chincse thom selves; but could get no information. I natnrally thonght that it might bo some remnant of the old idoa of the king or judge sitting in tho gate, and judging the people. I have described to you sepulchral monuments anch as they are when ordered by the Emporor. I have now to describe another kind of monument, which are so com mon in China, that yon can scarce more without seeing one, or the fragmonts of them which timo has loft. They are called "Pailows" and are in the form of a triple gate. They are generally put up as a roward of virtue, or good deeds: most nsmally they ere erocted in honom of virgins or of they eroctod in honorn married a second time. The word "pailow" has two syllables. the firat means boerd or hane ala the second mears ipper story an that lha, and the socond appor story; 日o that uror a upon a slab botweon upper liptals of the gatoway. Although now generaly coustracted with large slabs of granito, the original wooden model is so exactly repeated, that we need have no doubt as to what it was; and the porfect identity of construction hetween these pailows and the gateways of the Sanchi Tope, which i oue of the oldest architectural erections in India, would seem to indicate a closer intimacy of connexion among the races iu that part of the world than we have yet realised. I exhibit a pictnresque old pailow from Nanking, wbich will oxplain this woodon construction. You will seo that the stones have been mortised into eaoh other as if they had been logs of wood. In tbe photograph of the south altar of the Tomple of Heaven three of the gateways can he seen, and the wooden constraction will bo evident. I ex nibit a small sketch from the native town of Shaughai : it is the base of one of the supports of an old pailow, it is all that remains of it, but shows one of the feqtures of the wooden origi of Chinese architecture. Its right name would be a truss, but I think "base-hracket" wonld better express its real character. It is one of he marked members of nearly all Chinese arohitecture.

It may intorest architects in this country to now how money is raised in China for building nrposes. In the streets of Peking I one day and a man in a sort of wooden sentry-hos arge nails had been driven into it, so that thei points projected throngh : this prevented the man from leaning against the sides, and the only rest ho had was from sitting on a board within. Ho was a monk, and never seemed to sleop, for he had a string with which ho night and day onnded a large sonorons bell overy few minntes, a a sort of advertisoment of his purpose. This ras, that the benvolent should come forward ith money: each nail represonted a sum when any one paid that snm his name was stnct p on a bit of paper, and the nail was pnlled out, makinc it more comfortable for the hermit within. All the nails represented the necessary amount for the repair of a temple which was
close bchind. This is a common proceeding for aising the wind for such pumposes. I was told that this monk had been two years shut up, and bat he would likely be another year before be got ont of his cocoon of mails.

Rospital for Consumption, Ventuor.he Bishop of inchester has appointed this Saturday, the 13th inst., for the opening of the clapel of the hospital at Fentnor; 1,000l. are still required towards the cost of it.

## PROPOSED improvenent at hyde Park corner.

Tue Wouks Committee of the Metropolitan Board of Works, at their last meeting, reported that they bad proceeded upon the resolution of the Board of the 20th of June last referring it to them to consider and report upou the subject of the formation of a new thoroughfare from Hamilton-place to Constitution-hill. It woald be remembered that the question of this improvement had beeu much discussed, and suggestions for relieving the block of traflic at Hyde Park-corner had heen suhmitted to the Board by the Earl of Longford and the Marquis of Westminster. The committee at once admitted tbe principle of the desirahility of the improvement, and it appeared to them that it would be best effected in a way suggested by the cbairman of the Board, after conferenoe with tbe engineer. By this plau it was proposed tbat Piccadilly should be widened; that a Hamilton-placo, running into Constitution-hill nearly at right angles; that tho portion of Constitation-hill to the west of this new road should he extended into Grosvenor-place, and that a new road in contingation of the present over the above-mentioned extenion bo carried tbe mardens of Buckincham Palace for the private use of her Majesty alo 1 , for the tbe execution of this, or, indeed, any design, must affect the Green Park, it was necessary that the question should be snbmitted to her Majesty's Government, in order that the Board migbt nscertain whether to expect any and What co-operation in the formation of the proposed new rood. Tbe committee, therefore, as authorised by the reference to them, had an sioner of her Maiesty's TVorks sioner of her Maiesty's Works, \&c., on the -28th of July latt, when they suhmitted a plan to him. Owing to the late period of the soason tho snhject was not brought hefore the Cabinet until the resumption of their sittings in tbe prosent month, and the committee had now had before them a letter from the Oflioe of Works, stating that the Government are not prepared to bring in a Bill to give effect to the Board's proposal, and that sioner to proceed furtber in tbe matter. Under
sion sioner to proceed furtber in tbe matter. Under
these circumstances, it did not appear to the these circumstance日, it did not appear to the
committee that the Board could, with any adran tage, take further action in tho matter, and they trge, take further action in tho matter, and hey In connexion with this suhject, the committee had also a letter from Messrs. Boodle \& Partington, on behalf of the Marquis of Westminster, submitting that tho widening of the npper part of Grosvenor-place, at its junotion witly Piccadilly, woald form a complete soheme in cou-
nexion with tbat under the consideration of the nexion with tbat under the consideration of the Board, transmitting a plan showing the proposed
widening, and stating that the Marguis wonld he widening, and stating that the Marquis wonld he prepart of $2,000 \mathrm{z}$, that part of the soleme representing tbe widening of Grosvenor-place, provided a place for the deposit of the excarations were given free of cost in the Green Park, witbin a reasonablo distance. The Marquis, accompanied by his survesor, attended the committee of his proposal. His lordship was of opinion that tho widening of tho upper part of Grosvenor. place would very greatly relieve the pressuro at Hyde Park-corner and tho neighhourhood, and that the architectural offect of a broad descent from the level of Piccadilly to the Grosvenorplace honses would be very striking. Lord Board bad it in contemplerstanding that the Board had it in contemplation to form a c:ntinuation of Hamilton-place to Constitution-hill, instrneted his estate surveyor to prepare a plan, combining, to a certain extent, the widening of Grosvenor-place with the extension of Hamiltonlordsbin's opinion, a complete forming, in his henefit of the prulic. By Lord Westminster' plan, the upper part of Constitution-hill would be cnt away altogether; and a new roadmo formed into Grosvenor-place on the rast way of tho Wellington statue, which wonld then occupy a central position at the head of Gros venor-place. A road would also be cut diagonally througb the north-west corner of the Green Park to Constitution-hill, meeting it at the point of junction with the new road proposed hy the Board. It would ho oheerved that this plan, equally with that of tho Board, would interfere equally with that of tho Board, would interfere
with the park, and would, therefure, presumably
bo open to the same objections on the part of ber Majesty's Government; moreover, it did not appear to tbe committee that in itself the plnn concorned the trafic at IIyde Park Corner ; indeed, did bis lordship seem to lave contem. plated it otherwise tban in connesion with the Board's scleme. It was only necessary, therefore, the committee thought, that Lord Westminster should be informed of the decision of the Government, and they recommended this nicotion aopo 1 the reply to his letter presentel to tho Lond in 13th to and further, that the governors of St. Georgo's Hospital, wbo had drawn attention to tbe great nnmber of accidents which had occurred in Grosvenor-place, be also informed of the position

## Ge

General Sir William Codrington said he under stood that the sobemo of tbe Marquis of West mivster was different from tbe plan of the Ear of Longford, Lord Westminster's proposal Iood on its own merite.
Mr. Newton said this qnestion bad been hefore the Board for somo timo. The committee had considered the plans of the Marquis of West-
minster and tbe Earl of Longford. They waited minster and tbe Earl of Longford. They waited on Mr. Ayrton, the then Commissioner of Works, Who promised to support a plan for a rood throngh the Green Park at Grosvenor-plaoe. Before anything was done Mr. Ayrton went out of office. Tho Gorornment intimated that they oould not approve of any scheme which would
interfere with the Green Park, and under the interfere with the Green Park, and under the
cireumstances, the commaittee recommended that circumstances, the committee recommended that
no further action be taken in the matter. The motion was carried in the matter
The motion was carried.

## ENORMOUS PUMPING MACEINERY.

Messhs. Johis \& Henry Grywne, of the Hammersmitb Ironworks, Hammersmith, are constructing a romarkahlo act of centrifngal punping machinery, intended for employ. ment on the reclamation of the Ferrara reclaimed extends over an area of nearly 200 equare miles, and tbe work to be done by the pumps consists in raising a little over 2,000 tons of water per minute. The first pair of these pumps, with their engiues, have just been completed. It is difficult to realise what is meant in saying tbat nertain pumps bave to raise 2,000 tons of water per minute. 2,000 tons, or 456,000 gallons, per minnte, equal $656,640,000$ gallons per day of twonty-four bours. According to tbe latest return, the total quantity of water supplied by the whole of the London waterworke is a ittle under $110,000,000$ gallons per diem, so that it will be seen that the quantity of water to he dealt with by the Ferrara pumping ma. chinery amounts to six times the whole motropolitan water supply. Again, 456,000 gallons, or 72,960 onbic fieet per minato, would supply a streann over 103 ft . wide and 46 ft . deop running at 2 speed of troo miles per hour, or 176 ft . per minute; whilo the delivery for a singlo day would snfice to fill a reservoir a mile square to a depth of about 3 ft .9 in .

THE LONDON CENTRAL TELEGRAPH OFFICE.
The "New Post-Office," of wbich we gave a view and plan on the 1st of Fehruary last connected with the Pent.ofice St Maph Oinio Grand. The \#orlimen are still Musy its interior fittings, but the great telegraph room is being rapidly set in order; a poroccupy the new building, and thus leare to General Post builuing, and thas learo the nd newspapers) has entirely free for letters road and ipers) has adready moved anross the nents from Telegraph ents from Telegraph-street will take possession of the npper Hoor. As the great central tcle-raph-othice of the kingdom, it will afford not sufficient ample accommodation for actual needs, but develone room should the telegrapo servioe All ape even to twioe its present dimensions. Al along one side of the great telegraph-room fitting of the curred leaden tubes and brass looking of tbe pneumatic delivery apparatus, looking somewhat like a row of gigantio heer-engines. Eighteen miles' length of tbis
pneumatic tabing is laid to $t$ wenty-five tele-
graph-stations in the City and Westminster, whicb can thus deliver tbeir telegrams at tbo central office in parcel form faster than the messages could be sent by wire. The messages despatch tabse wbich ire shat a time, in hausted pipes, wich are sbot along the exhausted pipe to the counter of the central office. tahle, wbenco they messen whenco they are distribnted, partly by messengers and partly by traveling-tapes, to being the aty instivments. The post-office being tbo only collectors and distributors of privates, telegrams for the cahles and linos of private companies come to this central office anies by the oom. panies by pnenmatic despatch. The 440 wires working directy from toe telegrapb-room are in Thmumicalior with upwaras or 1,000 stations. The ballery-room on the hasement will have 25,000 ballery.cells, and here, again, tbe wires are collected Logether at a test-box studded with innumerable brase hatals. liese test.boxes, wbich look sometbing like railway tioket-offices, enahle a defect in a wire to he at once traced out and set right. The gutta.percha-covered copper wire, of which there are 300 miles' length Within the building, is manafactured with bear. iful accuracy.
Learing the spacions instrument.room (the telegraphic workshop and execntivo are lodged tbo bame lloor), we notice tarough the windows uilt great chimney rising from tho boiler-houso stan the floor of the sontb court. Descending he drcase nndor a bandsome Ekgligbt, we pass urnipartmental offices of the lower floors, and descend along corridors, always well lighted, north co the engine-house, on the floor of the engines of 50 -horse power each for the pumping work of the pneumatic tuhes, and two of 10 -borge power to draw water from the well of 400 ft. deep wbich is heing sunk on the premises.
The new offices will have cost altogether, when complete, about 450,0001 ., of wbich $300,000 \mathrm{l}$ have heen swallowed np by tbe site.
The mails and telographs of the kingdom will now have only a stroet hetween them, the chief Aldey-order Office will remain in its huilding in arsgate-street, and tbo Surings-bank will be oved from St. Paul's Chrechyard to tho vacated promises in Telegraph-street.

THE PROPOSED INCREASE IN THE PRICE OF GAS.
AT the last meeting of tho Metropolitan Board of Works, tbe Works Committee brought up a report recommending that tbe Gasligbt and Coke Company be informed, in reply to tbeir letter, inquirivg whether the Board is disposed to agree with the company for an increase in the prioe of gas in order to meet the extraordinary expenses of the year 1874, that the Board cannot agree to their suggestion, hut will be compelled to oppose any application whick the company may make for an increase in the price of gas. Mr. Newton, in moving the adoption of the report, said that the recommendation of the committee in this matter had arisen in conseqnence of an application wbich had been made hy the Gaslirht and Coke Company. Under that the Bord ohe hot to allow a fer lelt increas Boar ough now allow a further a most determined opposition to the claims of that company. Ho believed also that the Board ougbt noty. Ho bolived also that the Board present price agree to a continnation of the be a considerable reduction in it. He did not believe in the reasons put forward by the com panies for the increase of the price. Trne, coal had risen; but, on the other hand, the price of the gas prodncts and of coke had cone up in a corresponding manner. Therefore, he was sure he Board would be justified in offering th trongest opposition to the proposal of the Mr. Watking in the price.
Mr, Watkins, in seconding the motion, said a few years ago he hought colso from the Imperial Gas Company at 8 s. per chaldron, bnt the prico Was now 30s. and 32 s .
Mr. Leslie buped the Board would go before the judges of tbe land and protest against the imposition of the gas company. The average prioe of the coal used by the company for the present year was Il. 3s. 6d. per ton, and that of the gas products IOs. 9 d., tbns reducing tbe price to
Mr. Freeman hoped the time would come wben tbe gas and water companies would bo
managed hy some central board, for the bencit of tho consumers. He would like to see some strong corporation which could take up the matter, with this end in view.
Tho motion was then put and carried nem, dis. Mrr. Lessiie afterwards moved a long motion the effect of which was:
"That this Board resolvo to prepare for immedisto

 mont of tho Metropopliton Board ming determine as mo offectually to insure a better and cheaper supply of gas to
their constituent ratepaycers, and a riddance oi the grasp-
ing effects of amalgamation and mismanagement."

Mr. E. D. Rogers seconded the motion, which was negatived, on a dirision, by six to four Fotes.

## NORTHFLEET.

Sire-The villago of Northfleet, near Gravesend, is in great need of houses suitable for working men, more especially now the large ship-bailding yard there is satisfactorily let, and two new cement works will be in full work very
shortly. Many of the men at prescnt employed in the various cement works are compelled to live in Gravesond and in different villages, on acconnt of the overcrowding. A huilder would do well to take a trip down there, and judge fo
himself.
An Inhabitanc.

## OXFORD ARCHITECTURAL AND HISTORICAL SOCIETY.

Tre members of this Society had their last walk for this term on Saturday before last. There was a large gathering.
The party first visited Queen's College, where they wero recoived in the hall by the Provost Sayce gave a history of the college, remarking that it stood upon tho site of remple Hal Gater Hall, and other similar institutions, tho names of which had long been lost. The rev the large collection of valuable deeds and documents in the possession of the college, whioh ments in the possession
The Rev, J, R. Magra
numere numerons picces of plate which had been spread out on the hall tables,
which adorn tho walis.
which adorn tho walis.
The party next visit
The party next risited the lihraries, chapel, and other portions of the college, where they
fonnd mach to interest them. fonnd much to interest them.
After votes of thanks, on leaving Queen's
Collego, the party visited and inspected the Collego, the party visited and inspected the Church of St. Peter-in-the-East, where they were received hy the Rev. J. R. King, the vicar. The general design of the crypt, with its four entrances, two originally cummunicating with the nave, and two with tho chancel of the church, having been explained by the vicar, the party proceeded to the church, where the alterations and improvements, which we have recently described, wrere also pointed out hy Mr. King.
Mr. Jas. Parker then commnnicated some pa ticulars respecting the crypt and its history Dismiasing the mythical account of tbe hailding of the church by Grimhald, in the ninth century, and showing the inconsistency of the details in the chronicle which records it, he said that he was disposcd to assign to the crypt an carlier to he prohable; and that, judging partly from the notices of the that, judging partly from Survey, partly from the strong resemblance of the architecture to that of St. George's Chapel, formerly in the Castle of Oxford, inolined to think that the crypt and the lower part of the wall of the church were of earlier date than the of earlier great probability be recture, and might with Robert D'Oiley the hilered to work of recorded to have been a "huilder of charches." This would place the bnilding at about 1070 to 1080 , or nearly a century earlier abont 1070 to hnilding of the chancol, wbich might with great cortainty, from the many points of similarity, be pronounced as of contemporary workmanship with Iftey Chnrch. Howerer this might be, the plan of the crypt he declared to be a relic of a still earliex age, the only instance in England of any similar arrangement heing at Ripon and Hexham, and only a very few cxamples of its later continnance being found in France. It was, however, the conmon type of the crypt of
the fourth century downwards, and in Italy
the examples were still very numerous. Ho thought that tho original church probably con. isted of a low chancel, wh a very short nave. In confirmation of Mr. Parker's view, as to the dato of the chancel
Tho Rer. J. R. King pointed out that the sonth wall of tho nare, to a point west of tho porch, was obviously built at the same time as the chancel, and that the Norman doorway under the porch bore a striking resemhlance to one of haso at Iffley.
Fotes of thanks having been given to the Rev. J. R. King and Mr. Parker, the company dispersed.

THE SETTINGG OUT OF SLOPES. SOCIETY OE ENGINEERS.
At a meeting of the Sooiety of Engineers, held on Monday, lst inst., Mr. Jabez Chnrch, president, in the chair, a paper was read by Setting out the Slopes of Earthwork." The author divided the conditions nuder which this pperation has to he performed into three classes. When the crosg section is practically level . When the cross section is practically level, . When the inclination of surface in cross 3. When tho cross seotion is irregular and rough. The proposed new metbod dealt with the second and largest class. The author then briefly described the ordinary process by successive approximations, and said that for this he proposed o substitnte dircet and exact measurement on the surface of the ground, based upon data casily ohtained, and deduced from tables of a simple form. He then showed that the general formala
for the side-width, measured from the centre peg along the surface of the gronud is,-

## $A \frac{\mathrm{~F}+\mathrm{SH}}{\mathrm{M}+\mathrm{SD}}$

Where $F$ is the half formation width, $H$ the sectional height on centre line, s the slope, the difference of levol on cross section at a distance A from the contre peg, preferably 100 ft ., and $\mathrm{M}=\sqrt{\lambda^{2} \mathrm{D}^{2}}$.
Of the two signs in the denominator the + sign applies to the lower side in cuttings and the ppper in emhankments, and the - sign to the upper side in cattings and the lower in embankments.

## ARCHITECTS' CHARGES.

Kovernaymaian Treherne, an architect, sued Mr. Hart, proprietor of the Alexandra Music-hall, uion-street, Borouch, for 11/. Ss.,
Wolng 8 , halsace of account due to hum for furrishing plans for the re-erection of the Alexandra Music-hall,
which had been burnt down, and $3 l$. 3s. for waiting upon the district surreyor on several oceasions. The case was Then tho plaiatift was noe-suited,
ot aupply hint case was chiefly that the plaintiff did that he had to employ proper plans for the rool, and was
In oross-examination, defendant also admitted that his house was foing to be pulled down by the Metropolitan
Board of Works for a new street, and he hnd promised the jobo of raluing the premises to Mr. Waltera, Messrs the jos of raluing the premises to Mr. Waltera, Micssrs,
Fox E Bousfield, and half a dozou Others who bothered him to get rid of them.
The District Surver.
The bnilding of the new music-ball Fere not deposited a the proper time, and before the roof was put on they required to see the plans. Plaintiff showed him some
drawings at the office one day, but they were not com plete, He afterwards showed witness a complete drawing, coutaining a plan of the roof, but it was objected to
$H_{e}$ nerer saw shy other drawing of the plaintiff's. There was a dilleulty in getting a drawing of the roof, tut he
afterwards saw one, zaid to be Mr. Dunning's, and it Was approved, and from that the roof was built.
The Judge gaid he was of opinion that the plaintiff had not performed his contrect. It was true that a design for been objected to, and the plan for a wooder one was supman, in order to get the building erected in time. This was a second trial, nad, the plnintiff having failed to make
out his case, be should givo judgment fur defeadant, with out his
costs.

IMPORTANT TO ARTIZANS JOINING CO-OPERATIVE WORKS.
As action brought last week in the Neweastle Count Court deserves the especial attention of mechanics beMr. Jannes Waters, is a mechavical eugineer, and the defendants are the Directors of the Ouseburn Co-opera-
tive Enginc Wors, of which concern the plaintift was formerly a member and workman. The sum sned for was 8. bs., the amount of wages deposited by Mr. Waters in
the concern. As the the concern. As the case occupied part ot t
resamé muat suffice to explain the particulars.
Kpoa a workman joining the Ounebnrn Engine Works,
the sy stem adopted 13, in order to become a member, for
him to agree that certain sums of money shall be deducted Fom ins wages week by week, which amount is entered in to a share in the venture. The plaintiff ras in that posi tionsare on the 3onti of June n certifieate was given himi for two shares, being the ralue of 101 , and to that limited linbility, he was a shareholder in the busiluess so far. The
plaintiff s deposits afterwarda were increased to $8 l$. 63 , but plaintift s deposits atterwards were increased to 8. 63, ; but certihicnte of a share, and subsequently he gave the necessary notice to leave the establishment, and ho afterwards directors refused to aceede to. Mrr. Joel, the plaintiff's so
Rutherford, the managing director, of the Co-oporative Engine Works, demanding the retura of the doposit, or in Iailure an appeal to a law court.
The managing director, in reply
directors were exceedingly anxinus that thre question in dispute should be fairly, liherally, and amionhly set titid,
and that a provision was made for such a settlement in the and that a proxision was made for such a settlement in the
artioles of partuerstip through 3 conrt of arhitration, and not through a court of law; and Mr. Rutherford begged of Mr. Waters to refer the dispute to the court of arbitration, but if in cesse of refusal, the directors would be
compelled to fall back on the rule which recited, "Any compelled to fal bacls on the rule which recited, ""Any
member of the company who refused to submit any ques member of the company who refused to submit any ques.
tion in dispute between him and another member, or other members of the company, or between himand the company, to the court of arhitration, or if he does not
subanit to the decision of the conrt, Ehall forfeit all money in his deposit account." The Judge, with respect to the ahove role and the
plaintiff s rcfusai to proceed to arbitration, ruled, notplaintiffs rcfusal to proceed to arbitration, ruled, notof forfeiture of all moneys deposited by recurant members, that a man had a right and a perfect option, if he hought fit, to have recurrence to the laws of his country in order that the matter might bo settled in a court of This decision being tantamount to a verdict for the ispute having the deposit, Mr. Blackwell, for the Co, perative Company, nrged that if this rnling were "law, where a rule for arbitration of disputes existed, and such ruling was very important for the prospority of the Co oparative Engine Works, and he hoped the Judge would grant a ense
minster Hall.
Mr. Joel, for the plaintifl, quite agreed with the other side as to the importance of the case to working men
belonging to co-operative works, as this was a representative case.
To dratr
Pleas, the evidence of the plaintifi' was of Common he part not herre abore noticed stated that before the plaintiff was employed by the company he applied f.r
two shares. That was in the year 1871, and he re. ceired a note stating that troo shares were allotted cime That Fas his first connexion with the Ouseburn
Co-operative Engine Work Company. Ho paid the sum
Co
 sum of $2 l$, upon them. There had not boen any further
calls made upon these shares. Ho did not join the comcalls made upon these shares. Ho did not join the com-
pany as a workman nntil Jannary, 1873 , and at that time pany as a workman nntil Jannary, 1873, and at that time
he received a deposit-hook. Before ho received this hook he wrs required to sign as a member for a $5 l$. share. Ho got the book at his tirst "pay." After that from time to time he handed in this book from week by week, aud the wreekenty. He sigued for two 5 l. Ehares under pressure, and For the second $5 l$, share as a workman. He gave notice in writing to leare on the 17th of September, 1873 . Upon applying for the moaey deducted from his wages as
deposit-money, Mr. Kutherford, the manager, would not pey it.
The le

The learned Judge wished to sce the rules constitnting to dray up the fucts as above noticed for the opinion of one of the superior courts, which will, upon a motion made by counsel to the judgea sitting in banco, give their decision as to the legality of the County Court judge's
ruling. If the judges are of opinion that the oourt below raling. If the judges are of opinion that the ourt below
has decided legally, then courts of arbitration for workmen's societies are a mere gigment. On the coutrary, the plaintiff will be ousted in his County Court aution, and have to refer his application for a return of the deposit to
the arbitrators of the Ouseburn Co-operative Engine the sarbitrators
Works Compeny.

## THE FUEL QUESTION.

The Midland Institute of Mining Engineers have held a meeting in Barmsley, at which the question of coal-cutting machinery was dis. cassed. It was resolved that the council of the Institute and a committee of twelve members should be appointed to inquire into and report pon the merits of various coal ho sum of 50 l. was xpenses, ant it was intimated that in the event of any deficiency of funds the district coal. wners would doubtless make it good.
The Belgian Echo du Parlement has the follow. ing interesting lotter from Hasselt, bearing on the question of a substitute for coal :-
"Ten days ago a poor peasant of our neighbanrhood
rent the round of all the coffee-houses with a sack consent the rownd of all the corlee-houses with a sack con-
taining earth. He said he had found the means of heat. og rooms with that aubstace impregrated with a solution ing rooms with thataubstauce impregrated with a solution
of soda [and added to small coal]. He made the experinent before a crowd of people, and succecded. Next day the whole town was in great excitement. Everybody had
tried the vew discovery, aud I did the same. Following the man's instractions, I filled a scuttle three-quarters with small cosi, and the remaining tonrth with vegetable monld; I then sent for a halfpeuny worth of common carhonate of aoda, which I dissolved in hali" a litre of water,
and then mixed up the solution with the rest. This guanand has been sufiticient to warm ny room from two o clock
tit the afternoon 10 seren in the evening, at which tirne I in the afternoon 10
am peaning this."
New Fuclawaiting Use.-Among the anomalies $f$ tho faol question, the most striking con-
sists in the fact that the supply of petroleum from the Pennsylyania wells is now at a rate wbich has reduced its value to Id. per gallon, and that yet no metbods have been hronght into goneral use to ntilise this product, either for manufacturing or domestic pnrposes, so as to influence the price of coal. The present yield of tho region is estimated at 30,000 barrels a day. Some wells give as much as 1,300 daily and new discoveries are constantly being mado.

SUNDERLAND TOWN HALL, COMPETITION.
8rk, The hardibood of the Sunderland Corporation in
requesting architects to furnish denigns for a town-hall in threc weeks is something mizprising exen thall in three weeks is something azpriaing, even
well nacquainted with the nerve of public bodies.
Let me warn the profession a Let me warn the profession against placing too mnch
faith in the instruction ismied. I bnppen to know that at
the council meeting to-mnero faith in the instruction issurd. I happen to know that at
the council maeting to-mnorrow a motion will be zmade to
apset the whole scheme apset the whole seheme. It appears that the corporation
hare no power to build in the park, it being public properiy, nad arohiteecs will do well to reflect before they Outsiders are of opinion that it would have been the council had ascortained whether they really conld in advertisements and instructions,
A Residesw in the Locality.
the trades Movement.
Bamsley.-The old Oaks Colliery, near Barns. ley, bas heen idle, owing to the lads who drive the horses rofnsing to work. Nearly 500 persons have heen idle for two days in consequence.
Bristol.-The shipbuilders of Bristol and tho Bristol Channol ports have roturned to work, having accepted tho masters' terms, viz., that the rules of the society which restrict tho amount of work to he done hy the memhers shall he suspended until a gencral meeting of the trade can be called, when thoy shall either be rescinded or modified.
Limehouse.-On Saturday afternoon a מume. ronsly.attended meating of engineers, primeipally employed in the steamship building-yards Fas beld at the Eastern Hall, Limehouse, for the parpose of takiug the opinion of the men as to whether they would stand firm for a rise of wages on the lst of Jantuary next. It was resolved:-"That this meeting is of opinion that the time bas arrived for us to apk our employers for a riso of wages, owing to the unprecedented rise in the price of provisions; and we would suggest that that rise shonld he one of $2_{s}$. upon the present wages"; and that asked for, namely, as. per week upon our prosent rate, we are determinced to ccase work on the 1st day of January, I87.E."

## ACCIDENTS.

London.-There bas heen a fatal accident at the National Gallery. A house-painter fell from a geaffold, while at work, and was killed. At the inquest, the father of the doceased said he was at work with his son. Deceased went to the far end of the soaftolding for something, when witness
heard n shout "A man is over!" He rushed and heard $几$ shout "A man is over!" He rushed and
saw it was his son. The deceasod was perfectly soher at the time. A smith said ho was at work with the deceased; the plark he was on was not more than 10 in . in width, he was trying with
his foot to bring another plank forward, when his foot to bring another plank forward, when
his foot slipped, and he fell heavily on the next scaffolding, and then on to the ground, fracturing the skull, and swashing the hody. Verdiot, acoidental death.
Halifaci-L Last week a serious fire broke out at the silk-mill situate in Wade-street, Halifax. The cause was au explosion of gas in the ground
floor of what is termed the "Little Sill" floor of what is termed the "Little Mill." So instantaneous was the firo that in the course of a
few minutes threo floors were in flames. On the arrival of the fire hrigade, with engines, hose and reel, they could ouly protect the adjoining property, as the "Litlle Mill," Was soou one
mass of flames. About the fate of ooor girls who were at work thore seems to her been some uncertainty at the time the news was lespatched, hnt five bodies have heen got.
Stockport.-A large circns has heen blown he wind at had heen before roughly treated hy aving to he accles6eld, the crown of the ten The establishmeat was at Hazel Grove, naar tockport, and during the gale which prevailed the evening the large tent was carried hodily com one field to another, and literally tora to
pieces. The structure had jnst b
Tbe damage is estimated at $100 l$.
Sheffield.-A tailor's shop in For
tho busiest thoronghfares in the town, bas falleu in, burying the contenta of tho shop and the furniture beneath many tons of ruhhish. Though all escaped persons wero passing at the time, had warning tbat the huildiag was coming down and rushed out in timo to preserve themselves from injury. An adjoining huilding is in a critical condition, and has hoen propped to pre critical condition, and has hoen propped to pre-
vent its falling. The shop on the other side is also much injored, a portion of the falling build. also much injured, a portion of the falling build. side, smashing in all the windows, and forcing in a part of the wall. Tbe canse of the accident is supposed to be the weakening of the foundais sapposed to be the weakening of the founda-
tions by some extensive excavations at the rear. In order to carry these out hlasting has heen resorted to.
Hartlepool. - A fatal oarthslip bas occnrred at he and dock, Aow in course of construction hy the North-Eastern Railway Company at Middlo. tou, het ween the Hartlepools. It appears that a anmber of navvies in the employ of the con. tractor, Mr. W. Scott, were excavating earth, when, to facilitate operations, they determined to undermine a portion, heside a perpendicalar
cutting ahont 8 ft . or 9 ft. deen, and whilst they were thus entrared tho deep, and whilst they were thus engaged, tho soil above gave way, completely hnrying heneath it one man, and parworkmon ran to the rescne numher of fellow cated them, hut hoth were serionsly injured, and one died hefore reaching the hospital.

## ASPHALTE PAYING.

At the Freemasons' Tavern thero bas heen a crowded meetiug, chiefly of omnihus and cab proprietors, to protest against the use of asphalte paving for horse-roads. Sir James Lawrence, addressed hy Colonel Beresford, M.P arge horse-owners London Genoral Omnibus Company said the whed 8,000 horses. Their annual loss on the old roads was 114; but siace the introductio of asphalte it bad risen to 202. How this can ho from deaths by falling on asphalie, consider. ing the comparatively vory small proportion of asphalte road throughout London, he dill not explain; nor did he speak of the relative numher of horses, although the Omnihus Company now supply tramways with horses, in addition to their own omuihuses. Tbat the asphalte, howovor, when greasy, or hetween wet and dry plays serions havoc with borses we know well from personal exporience. At the meeting demning asphalte, praying Parliament to orde ta removal, and urging the Board of Trade not to lay any more.
Something must bo done to get rid of the serious defect in aspbalte if the use of it is to be continued. In other respects, - that is, at other times than hotween dry and wet, or in fog,-its advantages are admitted.
Wood-paving is turning up again, notwith stand its repeated failures hoth here and in New York; hat it is to he hoped some very different kiads than those heretofore tried will first he tested. Slippiag of horses, we well rememher, was just one of tho chief objections arged to ; and also their want of lasting nature
A correspoudent of the 1 Iorning Post speaks of a inyeation of Mr. Norton (of Tuhe well notoriety), and renders paviche both to wood and granite, wator-tight and impervious to wot. Mr. Nerfectly process he understands to he as follows :-Blocks or wood or granite are placed in a mould of any required dimensions upoz a hacking of planking hedded in asphalte, in cooling leaves a vacuam at the top of the interstices of the blocks, afterwards to be filled up with coarse gravel. The wood hacking is iso entirely coated with a bituminous cement and thus tho whole slah is taken from the mould tway to its mass ready for heing carted these slabs bequred destination. The fact of rapidity with which they and under cover, the facility of raising them can be laac, and the water pipes, are, in for repairs of gas and features in Mr. No occasioned by wet weathor, and tio says skilled labour is unnecessary.

All tbis, however, does not manch alter the nature or wood paving. As for asphalte, it is find onoped the asphate companies will speedily find ont some method of ohviating the tendoncy 0 greasiness at certain times. Some simple mixturo or modo of working tbe composition in laying it down may do so. It is notahle how itlie may he reqnired to effect this. By way of innstration, we may instance the common little experiment called the "Magician's sand," wbich nay he pat iuto water withont hecoming wet, hy simply sprinkling it while hot with oil, wbich ppears to evaporate entirely from it. We not speak of this as a snggestion of ase in bis case, hat even this wo may at least say hat if sucb sand were well mised with nsphalte $t$ is hard to say but wat the cure of the defect of greasiness might be thus completed.

## Water supply for villages.

IIr. Rose, of Rayners, through the Times, gives practical adrice for securing a supply of water in villages where there is diffeulty in ohtaining it. On the high gronnd of the Chilterns, ho says, where spring-water is not to he found at a less depth than 300 ft ., a comparatively inexpensive mode of constructing cottage tanks has long been successfully practised. The plan we find to answer is to dispense with all hrickwork for steyning tho sides, and merely to plaster the cement on the earth itself. A circular pit of the required dimensions is dug ont and as soon as solid ground is obtained, a dome is huilt over it with hricks or even with old bats, a manhole heing left in the centre, and a pipe inserted at the side for the inlet of the rain. water. The pit is then dug to the proper deptb, Lee earth heing drawa up thronoh the manhole, and the sides are then plastored manhole, coats of Portland cemeat and sand mixod dry, the first coat in the propertion of mixod dry, cement to three or four of clean rongh part or shinglo ; the second coat, of two parts cement to three of clean sharp, facing, half cement and balf sand The bottor is first laid with hroken tiles, and then hor in the same way. The thickness of the the coats of cement is not torether more inch. Built in this wey ther ail, and are lass linho to thery seldo hrick work and then cem which nsnal and more expensive plan, as the hrick rork, in the proces of setling the hrick cement lining and thus coupo bon oras can he secured in any dentio. Succes lay ven in sand or ul and the matorials an bis care eep and 6 ft . or two cottares. Trperience has poned theced ank of this if if rarely empty. An outside estimaected, is pery of such a tap is leading, 18s, ; ton as follows:-Digging and 2s. 7d 115 s . dome and layer and lahourer , hat and 1 2l. per, value can he tole priceless cost of wo sappled. It is fullo more than the is sometines herlt and its dillings. The dome號 soiss full depti. lauks or much largor dimen. sions can he coustructed, and are equally suc. It 12,00 gallons. iortly hade lwenty-ave years ago, in soil partly clay and partly chalk, with a narrow vein sand on one side. It holds like a china hasin, and the lining 18 as sound and impervious as when first huilt

## CHUROT-BUILDING NEWS.

Reading. - The new Church of St. John the Evangelist, Reading, has heon oonsecrated. It stands on the old site, and is hailt in the Freuch Gothic style of arebitecturo of the thirteenth entury. It consists of nave, 85 ft . long hy 0 ft . wide, and 54 ft . high to ridge, flanked on ither side by clearstory traceriod windows, with internal arches, supported on Mansfield stone hafts and carved caps and bases. The roof i pen-timbered, hoarded, and felted, and covered externally with Staffordshire tiles. The chancel as close-boarded roof, with mouided rihs height to contre, 36 ft ; width, 26 ft 5 in length, 30 ft . The transepts are douhle-gabled d intersected with aisle.roofs. The tota,
width from aisle to aisle is 61 ft ., and length from east to west 111 ft . The organ-chanher is on the north side of the cbancel, and is shut off from the transept by a carved and traceried screen. The vestry is 17 ft . by north porch, and there is a thin outlet by the south transept. The accommodation in seats on ground. floor is The accommodation in seats on on being made 900 by aisle.seats; and the gallery, whieh is over the west end, is capable of seating 60 children. This gallery is approached by external winding stone stairs, and forms a featrre of some importance in the west front. The tower and spire (a portion of which is included in the erection (a portion of which is included in the present contract), but only as far as will cover
in the west entranee. The building is of Kentish rag, with Bath stone dressingg. The window and door beads have Mansfield azd Bath stone arch.stones, set alternately; the whole of the columns are worked in red Mansield stones. It is intended that the tower and spire, when complete, shall be 150 ft . from base to summit, the spire bcing of Bath stone excussively. The woodwork is stained and varnishod, and tho aisles and chancel are tiled with encanstic tiles. The lighting is by a serics of small jets surrounding each capital in the nave and transepts, issuing from a specially designed triplot bnrner, giving the building when lighted a pleasing appearance. The pnlpit is of Caen stone. The reading. desk is of oak. The cost of the building wiil be ahout 6,000L., exclusive of tower and spire, which will cost nearly 2,5007 . more. The boundiaries ; and the infant sebools, which are in the same inclosure, in every way correspond with the general character of the church. The architect is Mr. W. A. Dixon, of Londou, and the bnilders for tho whole of the works are Messers. Niblett \& Son, of Hornsey-risc. The earving has been executed for Messrs. Nihlett \& Son by Sansom, of Kennington, and the gasfitting by Woodcock's system of hot air. The duties of clerk of the works have been pcrformed hy Mr E . Green.
Margate. -The new Church of St. Paul, Cliftonville, on the east side of Margate, has been consecrated by the Archhishop of Canterbury It accommodates 800
Penzance (Cornwail).-The re-opening, after restoration, of the Chureh of Paul, near Penzance, has taken plaoe. Paul Church is spacious, with a high granite tower. The tower is Perpendicular; but to a good deal of tho fabrio it wonld not be very easy to assign a date. It consists of a continuous nave and chaneel, with north
and south aisles to hoth, also continuous. The and south aisles to hoth, also continuous. The
nave and ehancel are separated from the aisles by aroades of nine hays, which may be desoribed as of an Early type. The shafts of the colnmns are of granite, and mostly monoliths, One crrions feature is presented by the north arcade ; the third bay from the chancel end is yory much smaller than either of the others, the arch being of moro elegant outline, and its shafts-clearly not the original,-instead of granite, are of a dark stone, and of Perpendicular character. The areh is partially blocked by a low wall. Ahont fifty years ago the church was restored in the worst fashion of the period. Some few jears ago true restoration was commenced by the throwing open of the towerarch and allied work. What has been done now is the entire re-llooring and re.seating of the edifice, which has heen cost of about 5007. When the old floor was removed, the ground beneatb was found to bave been honeycombed with vaults and graves. These were filled up and secured, and then the new seating was erected, and the aisles laid Wided, the chancel improved, and tho orran
vided renovated,-this last by Mr. White, of Penzance Nottingham.-Holy Trinity Charch, Notting. ham, has been reopened after nndergoing resto. ham, has. The chief featnres in the ration. The che featnres in the. restoration are the hirh of the high hox-shaped pens, and the removal of the organ and choir from the west-end gallery to the obazce. was buik in the yan find from the designs of the late Mr. Stevens, of Derhy, architcct. The
chancel has heen lengthened 16ft. to leave room chancel has heen lengthened $16 \mathrm{ft}$. to leave room
for the choir, the east window has been opened, and, by the kindness of a friend, filled wilh stained.glass, by Heaton, Butler, \& Bayne, of
London. The window is reometrical in London. The window is geometrical in pattern,
with the symbols of the fonr Erangelists with the symbols of the fonr Evangelists,
fowers, and conventional oraments in panels.

The ehancel is filled with piteh. pine stalls. The Hoor of the sacrarium is laid with Minton's en. eanstic tiles. In the nave the scata, whieh were high boses, bave heen cut down, the aisles have heen unade straight, the paint has heen taken off the pews and they have been stained and var. nished. The ceiling of the nave has been doco. rated principally in the centre part hy bands of colonrs, with panels between the rentilators. The work has beeu carried out at a cost of 1,650l. under the personal direction and superintendence of Mr. W. Arthur Heazell, architect. Messrs. Hudson \& Facon were contractors for the huilders' work, assisted by Mesers. Bradley \& Barker in the carpenter and joiner work of the chancel. The decoratiou work has been done by Mesgrs. Best \& Lea, of Manchester. The painters' work by Mr. A. Gascoyne. The wood. work in the nave by Mr. H. Daubney. The decoration of the chancol is to be completed in fery monthe' time, when the new work is dry
Kirkby Finoule.-The ehrrch here has been reopened after undergoing a restoration. The church, previous to the restoration, would seat only 150. Besides the dilapidated state of the difice before the commencement of the prosent estoration, the place was exceedingly damp and consequently unhealthy The nave and cbancel wero of the same width, heing extremely limited, and extending only 13 ft .5 in , aeross; the entiro length of the fabric being 71 ft .3 in . The roof was flat and low, and heing ceiled with plaster, presented an unsightly appearanee; whilst the ittings were inconveniently fitted up and arranged, and the llooring moist and nneven. All this is now improved. The plan of the present chnrch, built as it is upon the site of the old, is entirely new. It is much wider, but not qnite so long as the former structure. The nave is 35 ft . in length by 21 ft . in breadth; and the church is 32 ft . long hy 18 ft , wide. The height of the nave from the floor to the apex of the roof is 28 ft , and the height of the chancol is somewhat less, being 26 ft . The matcrial of which the churoh is built is mountain freestone, obtained in the immediato noichbourhood. The walling of the edifice is hammer-dressed, and the windows and hattresses are of aehlar work. The tower is at the sonth-west corner of the nave. It is square, and tho hell. chamher has on eaeh of its four sides two windows. The parapet connd the summit of the tower is hatlemented, nnd it is about 60 ft . in height. The porch is at tho restry is entcred and the tritl side of the estry is bituated. on the horth side of the immediately adjoining it is an organ-chamher or immediately adjoining it is an organ-chamher or
reoess, there being introduced into it the old chancel arch of limited dimensions, whieh has been retained in this position. The flooring of the old church was taken up, and the present floor of the nave is of stone paving laid down in con. crete. The chancel-floor is laid with colonred tifes from the establishment of Messrs. Maw \& Co., of the Benthall Lile lyorks, sliropshire; and tiles of rich pattern furnished by the same firm The church is Early English. The roofs of the nave and chancel are similar in character,-high pitched, open.timherod, and boarded. Welsh slates have been nsed in covering in the roofs, and tho gables teraninate with stone crosses The nare windows are triplets, the stoneworl above the side lights being pierced with quatre foils, which, as well as the three lights, are filled in with plain glass, with the exception of the margins, whieh aro coloured. The chancel windows are lancet lights of plain glass. The east window is of three lights, and lat wit plain glass with coloured margins. The sents are open and of deal, with profile ends of pitch pine, and provided with hookboards. The chance is fitted up with stalls. The internal fittings throuthont, as well as the boordince and timber of the roofs, have been stained. The chnreh is dry and is warmed by means of a hotein appa dry, an warmed of the chore apparus. and hy has or . Aenge row Jones, or York, an hy 1000 tray as been fom 1 , 1,300 . The lraterme
 low :- Masonry, Mr. Paliser, Nortancion; car penter and jomers work, Hessrs. 1. Bellerhy Son, York; plastering, Ir. Councilor Rawling, Xork; plamber, glazier, and stainer, Mr. Coun cillor Varvill, York; slaters, Messrs. T. Wood Co., York ; and warming apparatns, the Sheriff o Xork (Mr. Alderman Dove). Mr. Harrison was
the clerk of the works.

Leicester.-Christ Charch, whicb has undergone considerable repairs and alterations, was reopened on Thursday, Nov. 19th. The restoration of the exterior was entrnsted to Messrs. Thrall \& Vann, masons. The interior bas been reseated with open stalls by Mr. J. Plant, a new gallery by Mr. J. Norman, and a vestry by Mr. I. Duxbury. The heating apparatus has been carriod out by Mr. W. Riehards, ironfounder. A carved oak pulpit and reading-desk have been executed by Mr. W. H. Noble, medizval cabinetmaker. The old organ has been replaced by a now one, huilt by 1

Hessrs. Partridge's Good Little Books.
The Children's Friend; the Famity Friend; the Band of Hope Review; tho Infant's Magadue Friendly fistor; all well deserve this title. They are all of the game class (a httle over.good, some people may think), and are
 the right direction.
The yearly part of the British Trorkman, which also comes to us from Messrs. Partridge, can take only half the title we have giren at the head of this notice: it is a good book, but not a little one. Of the illlnstrations in this valuahle serial we have often spoken. They are capital specimens of the bolder kind of wood-engraving,-drawing and engraving alike good, and moreover they are well printed. The best block in the world may be nullified in the printing. The British TForkman cannot be too widely circulated.

An Introduclion to the Study of Gothie Architecture. By John Hemry Pabker, C.B. Now Edition.
Tere fourth edition of the "Introduction to the Study of Gothic Architecture," just now published, includes considerable additions, especially in the foreign part. The Pisan style, for example, is elucidated; and in the English part special attention is called to the constrnction of walls, as affording a test for age. It is alnnost too late to say that it is a most raluable little work, and may be studied with pleasure and advantage by general readers as well as by those who are studying arolitecture as a profession. It forms a compauion volume to Mrr. Parker's "Concise Glossary of Terms used in Architecture," and the two together may he fairly considered the Grammar and Dictionary of Gothic Archi tecture.

## VARIORUM.

The Telegraphic Journal and Electrical Review (Gillman, Boy-court), bound as a volume, forms an interesting record of the progress of the cience of telegraphy during the year. The ditor of Hardwicke's Science.Gossip (Mr. J. E. Taylor), in the last number for 1873 , con. ratalates himself and his readers on the success of the work, which "nover had a larger lientele" We have so atrongly urged the ecessity for making a place for Natural Science eaching in any soheme of education worthy the ame the we nearcely say wo hear prith pleasure of the success of this serial. An interest in the atady has greatly spread since Science. Gossip was estahlished. - The People's Magazine, of which twelve volumes have now heen publisbed by the Society for Promoting Christian Knowledge, comes to an end with this December number. This is to be regretted. It nceded a more special character than was griven to it. -Old and Now London," by Walter Thornhury, goes pleasantly "Biwelve parts having now heen" (part xi.), and the " Illustrated History of England" (part xcriii.), come to us from the same publishers as the last (Messrs. Cassell \& Co.).--TheDecember number of the Contemporary Revieu inclndes some interesting letters from tho late Mrs. Browning to the author of "Orion" on literary and general topice, hitherto nnpublished. Others are promised. - Messrs. Henry King \& Co. announce the puhlication of a manual of the law of contracts as affecting architects, under "hy Ede or A Legal and John Baymond, barristersEdward Jevkins and John Raymond,
at-law. -The current number of the Art.

VOL. XXXI.-No. 1611.

Northumberkend House.

NE of tbe last romaining of the old-fashioned London mansions of the nobility, - a house, witb its court. yard and gardens, which combined within itsolf the quietucss of a country. house with the central. ness and convenience of a London one,-is ahont to bo destroyed. Here in the very beart of Western Loudon gates shnt out the turmoil and bustie around, and all is quietness witbin. Suoh boures as these are relics. of former times, wbon ${ }^{-g r e a t ~ n o b l e s ~ w e r e ~}$ princes with hosts of retainers.
If well carried out, a noblo street leading to the Thames Embankment should be a great improvement to Charing-cross,-a place with perhaps greater capauilities than any other in London; but our love of the past makes ns feel some regret tbat so well-known an objcct as the Iront of Northumberland House should pass away to make room for it. It is not fine archi-
tooture, aud it bas been so much altered and robnilt at varions times, that it has not very high claims to our notice on account of its antiquity ; yet fer places are moro familiar to the Londoner and bis conntry cousing; feen fronts
give more character to their neighbourhod is a landmark that we alhall miss, and it is not mere pun to say that the animal whose striking figuro brcaks the akyline, and wbo may bo supposed to ganerd the portal beneath, is one of tho " lions of London." He has been a little thrown in tbe shade since Landsecr's lions have sup. ported Noison's Column ; but who does not know and cherish the story of tho man who gathered a crowd around him in order to see this lion wag
bis leaden tail? bis leaden tail?
The site of Northumberland Honso was occupiod by a building of some pretension as early as the thirteenth century. This building was cloared away in the sixteenth oontury, and after a sbort space of time, during which tho ground was nnoccapied, the original of the present louse was ereoted; but it was not until somo years aftor its first building that it received the
name of Northumberiand House, and previously there had been two or more Northumberland Houses in the City. The first of these was sitrated in a street since called Bull and MonthEarl of Northumberland of the Percy line, and his son, tho celebrated Harry Hotspur. Whon tho Percys were defeated in their straggle against Henry IV., that king gave their town
house to his wife, when it was called the Queen's Wardrobe. It was subsequently con. verted into a printing-office, then into a tavern, and at last disappeared altogether. The next Northumberland House was in Fenchurch-street, and was inhabited by the Earls of Northnmberland from the reign of Henry VI.; hut in Stow's time the gardens were tarned into bowling alleys,
and the mansion into a gaming-house, much frequented by the roysterers of that day. Henry Percy, 9th Earl of Northumherland, the father of tho first Earl to live at Charing. oross, occupied a house in the Blaokfriars. The plurality of mansions with the same name is a oonstant source of confusion, and it is easy to mistake one for another by supposing a deseription to refer to Northnmberland House in the Strand, when it was realify intonded for one now buried among the warebouses of tho City.
In the reign of Heury III., William Marebal, Earl of Pemhroke, founded and endowed a hospital and convent called St. Mary Ronnoivall, on the strand of the Thames, at the village of Charing, near the place where the cross was afterwards erected. This hospital was a cell or appanage to the Priory of Roncesvallos in Nevarre; and when certain alien priories were suppressed by Henry F., St. Mary Rouncivall was among the number. In 1476 , however, it was refounded by Edward IV. for a fraternity or brotherhood, and continuod to be so appropriated nntil the sappression of the religions houses by Honry VIII. The chapel and its appnrtenances were granted in the year 1549 to Sir Thomas Cawarden, hy Edward VI., to he held in soceage of the Honour of Westminster; but soon after coming into the possession of Henry Howard, Earl of Northampton, yoanger son of the poet Earl of Sorrey, ho razed the wholo building to the groand. In Ant. van den Wyngrerde's plan of London in the Satherland collection (Bodleian Library, Oxford, 1543), St. Mary's Hospital is shown as a fine building at the water's edge, a little to the south-east of Charing-cross; but in Aggas's view, published about twenty years later, the site is marked as unocoupied. On the vacant ground Northampton built bimself a brick man. sion, Peter Canningham says ahout 1605, hut it was probably earlier. It is a matter of dispute as to what architects are to be looked upon as the original designers of the house. Some say that Northampton himself made his own design, and left it to he carried out hy Bernard Jansen, and there appeare to be no doubt that Jansen was engaged in the building of the house. The front, howover, does not seem to have been by him, and bas been attributed hy some to Milos Glover, and hy others to Gerard Cbxismas Horace Walpole makes the following remarks as ot tho claime of the latter architect,-" Before the portal of that palace was altered hy the late Duke of Northumberland, there were in a frieze aear the top, in large capitale, C. 正., an enigms long inexplicable to antiquaries. Vertue found that at the period when the house was built lived Chrismas, an arohitect and carver of reputation, who gave the design of Aldersgato, and ont the Gus-retief on it of James I. on borseback, and thence concluded that those letters signified Chrismas æedificavit." Surmounting the facade, there was a bonder of oapital letters in place of a railing or parapet, and we learn from Carmden's "Annals of the Reign of James I.," that at the funeral of Qacen Anne of Deamark, a joung man among the spectators was killed by the fall of tho letter S from the top of Northampton House. Cumningham found a corroboration of this siatement in tho harial register of the Churoh of St. Martin.in.the.Fields, wbere, under date 1.6 May, 1619, the burial is recorded of "William Appleyard, slayne by a stono falling from My Lord Treasarer's honse." According to a MS. note by lnigo Jones, in bis copy of Palladio in Worcester College, Oaford, the front was 162 ft . in length, and the conrt 81 ft. equare. The Mansion was first known as Northampton House ; hut the Earl of Northampton left it hy will to his nephew, Thomas Howard, Earl of Suffolk, who took possession of it at his uncle's death in 1611 , from which date it received tho name of Suffolk House, - a name by which it continued to be known for many years after. wards. Neither of these two men has added mnch
astre to the history of the bouse, for Lord Northampton was implicated in the crimes of his great-niece, the notorious Countess of Essex 2 and bas been described as foolish when young and infamous when old; and Lord Saffolk, who was Lord Treasurer, was fiued bearily for his fraude upou tbe king.
In 1642 Suffolk Hase came into the posses. sion of the Percys, by the marriage of Elizaheth danghter of Theophilus, second Earl of Saffolk with Algornon Perog, tenth Earl of Northumberland, and Lord High Admiral of England. We do not know when the house first took the name of Northumberland, but it was probably not antil some years aftor this narriage, becanse Evelyn still writes of it as Suffolk Honse in 1658. The son of this Earl and Countess (Josceline, Earl of Northumherland) dying in 1670 without malo issue, Northumberland House hecame the property of his ouly daughter, Elizabeth Percy, the beiress of the Percy estates, and for eigbty years thero was no Earl of Northum. berland. This yonng lady was looked npon as a great matrimonial prize, and was twice a virgin widow and throe times a wife hefore sbe was seventecn. Her first husband was Henry Cavendish, Earl of Ogle; her second, Thomas Thynuo, of Longleat, known as "Tom of Ten Thousand," who was murdered in the Hay market by the accomplices of Count Konigsmark, who wishod to obtain possession of the widow, himself; and her third was Charles Seymour, the proud Duke of Somerset, who survired ber. The Duke and Duchess Lived in groat state and magnifioence at Northumberland Honse, wbich continued to be so called on account of the existence already of a Somerset House in the Strand. Authony Henley, wishing to annoy the Duke addressed a letter to him "over against the trunk-sbop at Charing-cross." The nest oconpant of the house was Algernon, seventh Duke of Somerset, who was oreated Earl of Nortbnmberland in 1799 , with remainder, failing issue male, to Sir Hugh Smithson, hart., the hoshand of his only daughter, Elizabeth. He died Fohruary 7, 1749-50, and in 1766 Smitbson, who had taken tho surname of Percy, was oreated Dake of Northumbarland, but the title was not o descend to any ohild by another wife than Elizahoth, the true represectative of the Percy line, and from these two the present Duke is descended.
Wo bave as yet only mentioned the first bnilding; but since 1605 great alterations have been made in it, so that, in fact, with the exoop. tion of the front, little of the old hoase now remains. Lord Norlhampton's mansion consisted of a front with two wings to the soath, and the principal apartments were situated in the Strand front, but bis sucoessor preferred to be more seoluded, aud huilt a fourth side, which ho made the chief portion of the house. It is frequently stated that this alteration was made by the Earl of Northamberland, hat there is reason to bolieve that it was before his time, and it is not improbable that Inigo Jones was the architect engaged for the purpose. In the discussion of such a question as tho present old views aro of the greatest value, and we shall therefore make a few rernarks upon some of those of Nortbumberland Houso. There is an undated view of Suffolk House in Wilkinson's Londino, Illustrata, copied from a drawing by Hollar, in the Pepysian Collection at Cambridge, which is sapposed to have been executed in the early part of the reign of Charles I. It represents a large massive square building witb towers at the four corners, not unlike in general appearance to part of the Tower of London. The domestic offices were detached from the main bailding and reached to the waterside, forming a wall, with steps leading down to the river. In Wilkiuson's book there is also a view of old Somernet House, takon from a painting in Dulwich College, whioh
represents that place as it appeared previously
to the alterations made to the alterations made by Inigo Jones to fit it for tre une of Henrietta Maria, and in the distance Suffolk House with its four towers is shown as it appears in the view just referred Peter Canniugham doubts whether Inigo Yones lad anything to do with the south side, because Evelyn speaks of it as now ine altera.
nuost probably Evely $n$ refors to some ald tions made at that date. He writes, "The new front towards the garden is tolerable were it not drowned by a too massy
and clumsy pair of stairs, without any ncat invention." At all events, we know that a carden-front was in existence some time before 1655. The engraving, talken from Canaletti's painting of tbe street-front, was published in 1753, and represents it as it appeared after having been completely renorated.
snrmoutted with lamps, are marked as placed surmounted with lamps, are marked as pased
by the curbstones along the front. There is a by the curbstones along the front. There is
view of the garden.front, by G . Wale, in. Dods ley's "Lendon and its Environs" " (1761). Cods Iterations were made at Northnmberiand House in tho years $1748-1752$, which wero begin by Algernon Duko of Somerset, and completed hy his son-in-law and dayghtc
Countees of Northumberland.
We printed, on the 15 th of Apri!, 1871, an article by 31r. Wyatt Papworth, in which he communicated two interesting letters from the Ducliess of Somerset to Lady Luxborough, describing the works in progross, and expressing herself as frightened at the sum hor busband was spending upon them. The duke put aside 10,0001, , but in June, 1749 , he had already spent 14,0002 , and his wife thonglit that, with the purchase of certain honses, de., he would spend as mnch more. The completed improvements are described as follows in Dodkley's "London": -"The street was im. nodiatel' m made wider, and the front next to it compleated. .T. The fonr sides of tho court wore now faced with of architecture, so as to form, as it were, four stately fronts. Trionew lengeth, and extending frem the garden.front lemards the Thames. By meuns of these additions Northumberland House is more than twice ns large as it was when first bailt by Lord as large as it was when firse bailt hy Lord
Northanpton. The entrance into it is on the side of the court oppesite to the great gatoway; the vestibule is about 88 ft. Iong, and more than 12 ft . broad, being properly
ornamented with columns of the Doric order. ornamented with columns of the Doric order.
Ench end of it communicates with $a$ stairEach end of it communicates with a stair-
case, leading to the principal apartments, case, leading to the principal apartments,
which face the garden and the Thames. They consist of soverul spacious roonss, fitted up in the most elegant manner. Tho ceilings are embelistoonents copies of autique paintings or fine ornaments or stucco, richly gil. Papworth supposes that the street frout was rebilit at this time, hut this was not so, for
there can be no duabt that the stone portion ot there can be no duubt that the stone portion of the façule above the gateway with the bow window are the remains of the original building. The parapet was new in place of the old letters, and if the towers were rebuill they wcre copies of the old ones. The Duchecss of Somerset writcs, "My lurd will do a good deal to the front in order to make it appear less like a prison;" and an Architect, writivg in the Gentleman's 3fugazine (vol. 1sxxii., part i .), describses the "general repair of the frout" as consisting "in new pointing aund facing the hrickwork, recutting the stone ornamente, sc.," and adds
that the Adanzs were believed to be the archi. tects emploged, but accorling to an euyraving of tho front published in 1752 it would appear that Daniel Garrett was the architect. The same writer affrms that his friond J. Carter informed him "that in 1752 his father made the model from which the Lion in the centre of the opinious change to find that Ralph, who was one of the chief arbiters of architectural casto in the last century, specially condemns the portnl the writes, "Northumberland House is very much in the Gothic taste, and of courrse cannot be snp. posed very elegant and beantiful, and yet thoro is a grandeur and majesty in it that strikes every spectator with a veneration for it: this
owing entirely to the simplicity of its parts, the greatness of its extent, and the rornantic air of the towers at the angles. The middle of the
front next the Strand is certainly nuch more front next the Strand is certainly nuch more antient tban any other part of the builiding, and, thoongh finished in a very expensive manner, is a,
rery mean and triling piece of work. It may,
indeed, preserve the idea of the origininl pile, nd acquaint the moderns with the antiquity of heir forefathers; but then it breass the uni formity of the whole, and might .
Nore propriety than continued.
Northumberland House has more than once suffered sererely from fire. The following is an acconnt of one that occarred on Saturday March 18, $1780:$ "- It broke ont abont five in tbe morning, and raged till eight, in which time it burnt from the east end, where it began, the west. Among the apartments consumed, are those of Dr. Percy, Dean of Carlislc. We are rappy to inform our readers that the greatest part of the doctor's invalnable library is for tunately preserved." -- Gentleman's Magazine, ol. 50 .
Althongh wo know that the old hospital of St. Mary extended to the water's edgo, as did also old Suffolk Honse, we cannot find when the piece of gronnd between the garden-wall and the Thames was cut off, and the present road made. In 1750, the Duchess of Somorset refers to the duke's hope of obtaining "the remainder of the Duke of Chandes's grant for Scotland-yard, which he is in treaty for, in order to carry down his carden, and opon a view order to camse to the Thames." In Pennant's "London" (1791), this is referred to as Lollows:-
(1791), this is referred to as the Crown of all the intersening ground as far s the river; and within these very fow yoars $n$ absolute exchange for certain lands in Nor. humberland, to erect batteries on against oreign invasion, at the period when the projeot universal fortification prevailed. A little ame may see every buisance removed, and Somersat House," Somerset House." Again, in 1817, we find (in the Gentleman's Magazine) this matter men. tioned, but still nothigg apparently was done thumberland, it is said, has concluded a treaty with the Commissioners of the Crown Lands, for exchanging tho site of tho Tynemouth Barracks which are built on his grace's property, for tbe ground adjoining the garden of Northurnberland House, wbich extends to the hank of the Thames, where a noble terrace is to be formed. The present carriage-way leading into Northuraber-hand-street from Scotland-yard is to be arched "London," as forming "a pleasing piece of scenery bofore the principal apartments, for consists of a fine lawn, surrounded with a neat gravel walk, and bounded next the walls by a border of curious flowers, slurubs, and evergreens."
Intimately mixed up with our interest in an old building is tbo life lived by those who bave inhabited it, but a history of the Howards thu mberland Houso would be out of place here Nerertlo associations that occur mpon the surface. It was in one of the apartments of this honse that the Earl of Northumberland held a coufercnce with General Monk and several leading men, when the restoration of Charles II. was for the first timo proposed in direct terms "as a mea snre absolutely necessary to the peace of the kivgdom.'
As we have mentioned before, Bishop Percy connd a home in Northumherland House. He dedicated his "Ieliques" to Elizabeth, Conntes of Northinmberland, and she and her husband were always kind friends to him. Percy was the son and grandson of a grocer, but ho drew up for himself a pedigree in which his aim was to identify his family with that of the descendauts of Ralph, yonnger hrother to the third Earl of Northunherland. Had this descent been capable of proof, the bishop would have been himself Earl of Northumberland, but it is doubtful whether he believed in the claim, and it is certain that his patroms did not recognise in him a pretevder to their honours. Goldsmith has left us an amusing account of his first introduction to the Duke of Northumberland, who, after reading "The Traveller," liad expressed a wish to see the poet. "I dressed myself in the beat manner could, and after studying some compliments I hought necessary on such au occasion, proceeded to Northumberland Honse, and acquainted the servants that I lad particular business with the Duke. They showed me into an antechamber uher sey shoting very elegantly dressed, made his appearance,

* We remember noticing at an old building in Reading
oma years ago, a pair of gates nearly identical with those
soma years ago, a pair of gates nearly id
in the façade of which pre are speaking.

Taking him for the Duke, I delivered all the fine things tbat I had composed in order to compli. mont him on the honour be haddone me; when, to my great astonishment, he told me I had mistaken hirm for his master, who would see mo immediately. At that instant the Duke carme into the apartment, and I was so confounded on the occasion, that I wanted words barely sufficient to express the sense I entertained of the Duke's politeness, and went away exceedingly charrined at the blunder I had cemmitted.?
The stories in wbich Hugh, Duke of Northumberland, and his Ducbess figure are numerons in the pagos of Walpole, and that ill-matured lettor writer was never happier than wben he was ablo to set them in a ridiculous light. Sion Houso was too near to Strawberry-hill to please him and the doings of the "Duke and Duchess o Charing.cross," or "their majesties of Middlesex, as he called them, always seem to have excited his bile. The Duke, when Sir Eugh Smithson, bart., of Stanwick St. John, near Richmond, in Yorkshire, was considered to be the handsomest man of his time, and a story was carrent that the great heiress, hearing that he had been crossed in leve, expressed to a friend her astouishment that any one could refuse such a man as Sir Hugh. On this encouragement he spoke and was accepted. The noble family of Northum berland have always been famed for their bos. pitality and anmer Tho name of Smithon has obtained fame and an adjectival form in the United States, where the manificence of an Englishman (who claimed some kind of connexion with the neble family of Northamberland) has given that country the opportunity o raising a noble institution for the advancement nd poplarisation of science. Previously to 1851 thes an of these ven who obaice ald mansion did so part conts of the fifity ith consider or rown maltudes visited Cont bain hen, Londen ad Grons hrown open Gr vailed themselves of the the handsomo across the oourtyard and up the handsomo marble staircase, of which and picture - gallery, hore they saw, among other fine things, the Cornaro family by Titian, for which Algornon, Earl of Northumberland, gave Fandyck 1,000 gineas, and a wonderful vase, which now has a story of its own. We may add that the staircaso we have illustrated was desiga the elder Mr. Cundy. The railing is of brass, gilt; the steps and columns are of marble; the capitals of brovze.
Soon tbe rooms will be empty, and a site hich has been occapied by buildings for more han six centuries will be cleared to make way or a street which is intendod to open up from Charing-cross a view of our fine embankment.

FROM LEICESTER-SQUARE-TO ROSS.
FEw of us would in all likelihood wish to how onrselves purblind enongh-to indulge in irtuous indignation at, or even friendly remontrance with, Mr. Talk and his coproprietors of the right recently awarded to them judicially, of not advertising on hoardings in Leicestersquare. According to their varions characters, however, we might hear, if we listened, from various people varions exprossions of opinion as to the proceedings of these bistoric persons;not (to put the case mildiy) reaching the acme of praise. We have happily, the most of us middlc-classes,-been born and bred to so handsome a respect for legal decisions, -and to, if possible, a still more decided reverenco for the possessors of tangible property, that we hold oustomarily our individual judgments in suspense, and bate our breaths before the winners of the substitutes of civilisation for Choctaw scalps, in a way that should entitle us to the admiring reverence of less happy nations. But at times we come on exceptional cases,--instances of the variety that is plansibly said to be, at least, better than monotony, -and then in place of the normal silence or awo, we are stirred by a sense of novelty to articulate expression,- to confessions of onr inmost thoughts as startling it may be in themselves as the shonts of pæan with which S. T. C.s laconio, very mono-syllabic friend, - welcomed the advent of a hatch of apple-dumplings after his own heart.
for tho most part indicate in the lenst, - that

need to cultivate the intimate friendship of need to cultivate the intimate friendship of
people possessing the sancst and most evenly. poople possessing the sancst and most evenly. balanced and traincd minds, in order to keep firm within themselves their confidence in their own sanity; to correct hy these moral surroundings in which they are placed hy their every-day business. Somesach corrective would he necessary to most of us soher-minded moderns, if we had piled upon us, too often, or too much in a heap, the reoords of the strange private henefactions of heathens in the early centuries, hefore Christianity had leavened ihe world. Herod is but one instance among many He, hy the hye, woll merits the naturalisation of his name among ne, by the docking of its ter-mination-a process which ono De Quincey has made out clearly to bo a sign of appreciation on this side of awe, instancing the Tacitus, whose character wonld forbid such trifling, and the Horace (Horatins) who would seem to invite it. Not to talk of Herod's youthfnl frolic, when nishing of the free cities of Asia, himselfond , omitting this his small heginning, his works at Athens, the Stadium and Odeum in memory of his wife Regilla, give one the impression of good. will. "Nor," adds Gihbon, "was tho liberality of that illustrious citizen confined to the walis of Athens. The most splendid ornaments he stowed an tho Temple of Neptuno in the Tsth. mus, a theatre at Corinth, a stadium at Delphi, a hath at Thermopyleo, and an aqueduot at Canusium in Italy, were insufficient to exbaust his treasures. The people of Epirus, Thessaly, Eubcoa, Bootia, and Peloponnesus, ex perienced his favours; and many inscriptions of the cities of Greece and Asia gratefully factor." Here is the translation of one now remaining, -"To the High Priest of the Casars,-Tiberius Clandius Herodes,-on his country." Heir to immense treanares his country." Heir to immense treasures,
married well, beld puhlio offices,-could he avoid spending the wealth that came to him? somehow ?-sumetimes well, sonetimes badly?
and if a little greedy of the unsolid pudding called praise, could he satisfy his appetite more fully than hy puhiic works? These are the suggestive comments of all who pride themselves on their knowledge of mankind,-a phrase which of course nsually means a ready discernment of all the real and imaginary resemhlances hetween their endowments and those of pigs. Quickly, therefore, forsaking for the nonce the typical example of the ancient world,--in order to seek a true kinsman, heir to his hest ways,trho shall at the same time not be ohnoxions on account of similar avil qualities,-what wonder if memory lights on the Man of lioss ?
Of debs, and taxes, wife and children clear,
This man possess d dive hundred pounds s -
No large fortnne and no Regilla bere, it will be ohserved!
But planting, water snpplies, public seats, huild. ings, almshouse, marriage-portions, prentice fees, personal service to the sick, aud reconcilement of friends,-in such works, though on so different a scale and scene, does the same spirit show itself? Havo we here the 1 in . to a foot Herod drawn to $\frac{1}{8}$. in. 8cale, but with spirit quite equal to the larger and older production Trchitectural simile wakens one from dreaming. What can be the necessity for pointing out again the old acknowledged facts of life in the world ? Who douhts that we are all in one hoat, and will do well to belp onr shipmates ?-and that many of us have it in our power at times to do many ervices, whether wo be rich or poor ?-that gifts to the public, adding to the common possessions of loealities of the nation, are particularly graceful things, pleasant to all time ? -that gifts may range from the ready surreuder at a moderate rate of legal rights of no nse to any one but the owner," ap to the munificence of a Mr Peahody? Who is not pleased to acknowledge hat such gifts and the disposition that prompts rould are not absent nowadnys, and that they would, strange it might appear, he all the nto sight? And, if it is to be considered one of the proper features of a sentimental ramhlo of this kind, to speak all the truth all ronnd rho doubts that architects, surveyors, engineers, and builders have the best of reasons for looking with satisfaction on all new manifestations and growths of this kind of virtac?

MESSRS. COCKS \& BIDDULPES NEW BANK BUILDINGS
THE new banking premises in Charing-cross which bave for some time heen in course of erection for Messrs. Cocks, Biddulph, \& Co., hav jast been completed and opened for husibess.
The huilding, which has heen erected from designs furnished by Mr. Coad, of Duke-street, Adelphi, is lofty as compared with the rest of the huild ings in the neighbonrhood. In additio o a deep and sulistantially-huilt basement, speoially designed for bank purposes, tho build ing contains a lofty ground-floor, with two uppe stories, pitohod roof. Tto height of the hnilding rom tho street level to the top of a protructure being earried 10 ft . higher by thre large dormers. The ground-fioor portion of the huilding is of red Mausfield stone, with pilaster between each of the semicircular-headed win dows, and quoins at each anglo. There ar wo entrances to the premises, nuiform in design with the windows, the principal ontrance o the banking-room heing at the east angle The upper portion of the elevation is executed in red Suffolk bricks, with ganged brick drese ings and rusticated pilasters, the window-heads nd sills, as well as the cornice and the nental podimonts togethor with the chimnoy caps, heing in Blashfeld terra-cotta, from the mann heing in Stamford. Tho roof is covered with Broseloy tiles.
Tho hasement is provided with four isolated strong-rooms, covered over with Dennett's fireproof arches, which are also introduced into other portions of the building. The hanking rom occupies the whole of the front portion of the ground-floor. Its dimensions are 40 ft. hy 30 ft ., and it is 18 ft . in height, the walls from the floor to the ceiling heing entirely faced with ncanstic tiles. A dado, in chocolate-ooloured files, is carried round the apartment; whilst she upper portions of the walls are in panels coloured boder. Thed hin,
into concave panclling, formed of fireproof arches, carried on girders extending across the entire width of the apartment. The floor of the hanking.room, as also the floors in tho other portions of the building, are all of oak, as well the whole of the fittings are in ehonised polished mabogany. The bank-parlours are immediately to the rear of the banking.room, and are uniform in their mnral finish with the hauking. surronndiog dado. It may here be gtated, as an interesting fact in connexion with the old banking establishment, that when the bnilding was demolished, to make way for the new structure, it was determined to retain the old bank. parloar, out of rospect to the elder Mi: Cockerell (father of the late Professor Cockerell), from whose designs it was erected. This determination has been rigidly carried out in the construc. tion of the new building, the fabric of the old hank-parlour having been preserved, and the walls refaced with tiles, and otherwise decorated, so as to harmoniso with the adjoining banking. room and new bank parlour. We have omitted basement of the huilding, there is another strong basement of the huilding, there is another strongroom, on the ground-floor, at the rear of the bank.
ing-room. The walls of the staircases and passage ing-room. The walls of the staircases and passage nniform with the ground.foor portion alrcady described, being faced with paried.coloured ornamental tiles, with a chocolate dado. Dennett's arched fireproof floors are carried $\mathrm{pp}^{2}$ to the
second floor of the building, and the first story second-flowr of the building, and the first story has an oak floor, and is fitted in mahogany and teak. The upper portion of the bailding will be occupied as resi

WINTER EYHIBITION: INSTITUTE OF PAINTERS IN WATER COLOURS.
There is more difference, this year, than custom, and fog, and the darkness that more than fitfully veilg the checrfullest winter-time for this metropolis, can wholly account for, in this present show of drawings and sketches that Water Colonrs offer for their winter exhibition : more than the odds hetwist sunlight and sunhurner this time: and those who would like to know what an exhibition at this gallery would be like without the marvels of Mr, E. H. Corbould's stippling and the deep gummy richness of his pnrples, and strong browns; of Mr. Edward Weechen glades; or the golden corn-fields, and beechen glades; or the pink and lemon atmo. spheres that prevail when Mr. C. Vacher paints the cast ; and Br. J. D. Liuton's exquisito finish that makes pictures ont of nearly nothing, have a chanco now : for absemce of these well-known
attrihutes is amongst the strongeat reason fur attrihutes is amongst the strongest reason fur any perceptihle distinotiveness that m
Dccember from April at 53 , Pall-mall.
Dccember from April at 53, Pall-mall,
The charm of charms is modesty, and the ntter want of anything that sbows protentious. ness leaves quite a quiet glow of giory to shed meek effalgence on small and pretty things which abound. But Mr. Louis Haghe's draw. ings, however small, aro more than pretty things,-always. He is one of the first half. dozen who proved that watercolour conld fulfil almost any requirement as a painter's manual. Of his contributions,-some eight or nine, - none lave greater interest than tho sketch of "Vargas taking the Oath hefore the Duke of Alva, previous to his becoming Pre. sident of the 'Conseil des Troubles'" (170); for, apart from its being a brilliant and ad. mirable little drawing, it recalls the picture made years ago, when leadiug painters of to. dny hnrgher soldiery, in huff jerkin, morion, and breastplate (205), and "The Return " (255), are quite in the vein of Mr . Harhe's style, thongh, these conspicuons works hare evidently ben made with the intention of distinguishing the class of performance that the minor considera. tion for winter.show should set forth as promise of something better for summer. Goodness knows how good these clever works might have been if black had not been so positively paioted black! It takes honest men all their life-
time, -not an honr longer, - to learn that it is not always necessary or wise to speak ingly
truths, nuless asked for them. Mr. John Absolon ramaing a neck-and-neck raco with colour. printing: who can but hope that he will be the winner, even whilst block paint is taking the long strides that a halt at some shop. wiudows will any day recount? What dash and foree here are in the score of instances that clever Mr. Absolon gives of what a "diggings" an eighteen-cake colour-box is to him. "Peeling Putatoes" (16); "Charity" (34) ; "Going to Market" (56) ; or any one of such subjects as ho may meet with at a "Sketching Club" (153) aro sure to be turned to good account by this indefatigahle sketcher, who sketches everything remark that could in no way be applied to Mr. C. Green, for he sketches nothing, and, what ever the naturo of the work may be, the work manship never differs Errome be, the work. ility of herer din tility of taste are the allin all of suoh represen ld furniture for fabsorna bere ( 330 ) and hare do nearly all that here (330), and have done nearly all that has been done to make up a pretty little old-fashioned "The Post-bag", from the messenger, who has ast arrived with it (351), for incident. Two tudies of lrish character (337), very oommo ype of the conventional kind, are legs grateful for the pains that have been taken to make tho most of thom
Mr. G. C. Kilhurie's idea of oompleteness axceods Mr. Green's even. "Blue Bells" (332), giving a title to a family agroupmont in a wood of higher social grade than the busier peasant people who are "Coming Home" (340) to a specimen of "the sweetly protty" hat the method of its presentation is far rearer affinity to what photography makes cheaper, and
the practised hand of the artist dearer
Mr.A.C. Gow's melodramatic villain, "Secnring the Title Deeds" (G6), and making a had Crew" ( 80 ), and Mr. Y. W. Bromley's weal warrior, or respectable armourer (teetotal), apostrophising a cracked belmet (284), are noticeable as much for finish as for the small end gained by it.

Most of Mr. F. J. Skill's drawings aro agree. ably free from affectation, and that of a "Misty Morning on the Dart" (3) leaves the impres. sion of its being really a study of nature.
"The Young Shrimpers," by Mr. Hngh Carter (50), and an admirahly luminons portrait of an old "Dutch Fishwife - Scheveningen" (262), hy Sorrow," of we as Mr. Jozef Israel's "Eveuing Sorrow, ', of one younger, but a widow (216), might be offered for a comparison, and as to what should be the worth of half that is called example of water-coloar art, judgment should he arrived at hy weight of eridence of effect rather than th
get an effect.
Though Mr. Guido Bach has acquired extra. ordinary frcetom and power in his use of th medium (life-sized heads such as that of the Peasant from the Abruzai" (269), studied
from the real, no doubt, or the smaller but still large fignres of the "Pifferari" (232), are striking proof of this), ho no more shows its strength than its weakness.
We must leave some room to speak of the landscapes. How often has "Arundel Castie" heen the subject of the sketcher's exercise? favourable day, has sketched it once and on cepitally.
the visitor as he strolls round the room wil stop at "A Tranquil Day-Coast of Cornwall" (28), by Mr. J. G. Philp; "Study on Hay ward" (70), and "The Agglestone, Dorset" (215), by Mr. H. G. Hine; "Barmouth Sands" (85), by Mr: J. Mogford; "Tho Warlock Knowe,-Scene on the River Ayr " (93), by Mr. W. L. Leitch at Mr. Carl Werner' as it is convincing of fact Vestry Carl Werner's drang, Interior of th Vestry, Catboaral of Toledo, in spain" (47); drawings, especially "The Drover" (90). Undertake to undevstand "glamour," and fairies should be either treated comically or classically. Mr. "Dicky" Doyle or Sir John Noel Paton must always now head the list of
those who would tread enchanted ground. If thuse who would tread enchanted ground. If Titania and Queen Mab had not long ago retired from all mandane interference, they would have
pinched Mr. H. Herkmer to death for painting pinched Mr. H. Herknmer to death for painting their lieges bilious, yellow things. What does he ehow himself to know of such perfame, poetry,
and music as the gross world hold,- even fur

Martin Luther ? A man who can paint "Paërie" is worth gold in lumps.
"Durham Cathedxal" (104.), hy Mr. J. Orrock; Sketch from Nature at Lewes" (111), by Mr E. H. Fahey; "Old Mill, Sussex" (116), by Mr. J. Sole; and Misi vide "The Daisy Chain" (36) ; and "In Class," (334), all these are points dotted in our cata. logue, in order that we might write or not a longer article,-and we did not, so here is an longer art

## THE LATE SIR CHARLES BARRY.

noysl institure of beitish arceitects.
Ay ordinary general meeting was held las dent, in the chaing,
Tho secretary (Mr. Oharles L. Eastlake), having announced the donations of various books elected associates :-Messrs. T. II. Myres, R. B. Ogle, and W. II. Powell.
A letter was then read from Mr. J. L. Wolfe, in which he stated that he had much pleasuro in presentiag to the Institate a marble bust of the late Sir Charles Barry, executed by Mr. J. H, Foley, R.A., of which we have already made mention. The bust baving been nncovered, $\rightarrow$

Professor Kerr said that, owing to the absence of Professor Donaldson, through illness, he had been called upon to make a few remarks regarding the presentation. It was just thirty rears ago, ho went on to say, since he first came to London from a remote part of the country, to pash his fortune, when he was particularly struck with a croup of four distiuguished men who bad heen leaders of their profession, the idols, so to speak of his life,-Cockerell, Douald son, Tite, and Barry. In Cockerell, they had a man of infinite delicacy and refinemeat, and an artist who did hononr to every touch of his poncil, deriving honour and glory foom his works. In Tite, they had, strangely contrasted witb him, and singularly sometimes, a grand massive, masculine intellect, not devoid of artistic aspira. tions or learning. Of Donaldson they had not to speak. Ho was fortunately still amongst them, a man possessed of that strong personal character which enahled him to consolidate the profession in tho manner in which it now existed. Lastly, in Barry, they had a successful worker, a man of few words, but a constant worker, who was manifestly designed to he the leading practitioner of the day. He was the most confess that he was quite unable to speak upon thom, words failing to express what he then felt; and this ho would say when their profession had become vastly extended, and when art criticism might be said, in a great measure to be laid on the shelf, and when the doctrines an principles of but been to grent extent flimsy fallacies, Therewas no text with which he ponld rather deal in preaching a sermon than the life and career of Sir Charles Barry. He was a mar, as he (the speaker) had said, of few words in resnect to the operation of the profession at large; in fact, be might say that he was a man of no words at all. He had no time for the disoussion which anfortunately in the present day occapied so much of thoir attention. Sir Charles Barry had his percil always in hand, the gracefulness of which was particularly characteristic, foating in a perpetual stream. He was always a hard worker, and so much did he find to do, that he supplemented the short hours of the day with tho long hours of the night, us if he had not done onough within the reasorable limits of daylight, sitting down in silence and solitude, and working laborionsly uring the long homrs of darkness, so as to rest in the broad daylight of morning. They all remembered the day when the flag of England

Victoria tower ; it was then half. mast high, for its architect had died in the night. If it was half-mast high, it was wholly significant of his triumph, for he had oomplotod his work, nud had conquered to the uttermost within the province of his glory. IFe thought that there wes some. tbing particularly appropriate in what was called audder death as the ond of a man like Sir Charles Barry. It was far more appropriate, ho thought, than to linger through old ago. When that great architeot died so suddeuly, they could soarcely holp reflecting on the words of the poet, that
". "Those whom the gads love die young ; "

## hut they could add, -

Those whom the gods admired died in their harnese ;' for Sir Charles died, as he lived, in his barness After some further remarks, tho speaker concladed by quoting these words:-
"Life! we're been loog together
'Tis hard to part when friends eloudy westher
Porhaps 't will cost a sigh-a sear;
Choose thing own time
Say not 'Good night,' but in some brighter olime,
Bid me 'Good morning.'
The Chairman intimated that a letter of thanks, properly signed, and couched in such langnag would best convey the obligations the In stitute was nuder for the bust, would be pro onted to Mr. Wolfe.
Mr. Thomas Morris said, when tbe late Sir Charles Barry was at the zenith of his fame, Mr. Wolfe was his steadfast, silent, nupreteoding fiend, and he thought that this fact should not he lost upon the framers of tbe address,
Canon Barry, in reaponse to the oxpreas invi tation of the chairman, said he was there on that night merely as a spectator; but be oould not let the ocoasion go by withont referring to the remarks of the previons speaker. Wbat he Canon Barry's) father and MIr. Wolfe was per ectly truo. Their livos were ono of nubroken friendship, and bis father received from him great assistance throughout his career. He (the speaker) had tho task of preparing for the press his father's hiography, and there was no page of it that gave him so mnch ploasure in dealing with it as that which commemorated the kind appreciation and generous feeling which his father had happily recoived from the Inatitute of Britigh Architects.
Mr. Phené Spiers thon read a paper on the Chateau of Pierrefonds, and its restoration hy M. Viollet-le.Duc.

Mr. Bucknell, in opening the discussion, said that with regard to tho restoration of the Chateau of Pierrefonds, it was really of great and inconuity of the arrangement of its restora tion, the science of constrnction, and the grandeur of its architecture. This rostoration hy M. Viollet.de-Duo was deeply interesting. But draugbtsman, was not distinguished as an archi. teot, though this restoration showed that his outlines were vigorous, there being harmony and unity in tho designs; still they looked in vain for those things which constituted an archi teet in this great work.
Mr. Barges confessed that the works of M. Violiet-le.Dac had bitterly disappointed him; he agreed with others that, as an artist, be excelled,
hat he (Mr. Burges) partod company witb him hat he (Mr. Burges) partod company witb him at architeoture. They all owed him, he was of opinion, a great deal for his namerous works his letters and writings being well received; hut he could not allow him to be considered a great architect.

Profossor Kerr, in moring a rote of thanks to tho reader of the paper, conld not quito agree with the remarks of Mr. Burges, and he was sure that Mr. Burges would not wish it to go forth that the Insititute of British Architents tacitly agreed that M. Viollet.le. Duc was no arohitect; and he ohjected to the system of
what tho president in his address had called what tho president in his address had called wish to speak flippantly of the work of Freuch arcbitects

Mr. Burges explained that he intended to point out that a knowledge of antiquarianism and archoology did not make an architect. He admired M. Viollet.le. Dno's profound knowledge of these, hut his exccuted works did not come up to what was previously anticipated of him.
Mr. White, in seconding the vote of thanks, said that whether or not if. Viollet-le. Dao was a good architcet, they still owed to him a great
deal for his anmerous works. He had not seen worl Chateau of Pierrefonds, but as far as the work had been brougat beforo them that night, he considored that it was a very successful restora. tion, for it was vory difficult to find where the old work in it left off and the new work began The new work, be anderstood, was dictated chiefly by the old work, excepting, perhaps, the struc. tare of the fabric of the roofs. He bad certainly diverged from all that had been acoepted in the restoration of the old work
Mrr. Backnell drew attention to the hooks used for slating, which he considered of an excellent character, he having tried them.
Mr. Helyward thought that the word "restora. tion" was one of those things desirable of explanation in connexion with the building. Restoration he definod as the carrying ont of the old work as far as it could be carriod out, not adding a large quantity to the original design. Speak. ing of the question of restoration in England, he hoped that tho Government wonld see their way clear to prevent tbe going into decay of a rariety of ancieat buildings in this conntry; but be wonld deprecate strongly the restoring of old castles aud buildings in the manner in which the Chatteau of Pierrefonds had been restored, and if they wero to follow out the same principle as tho Goverament of France as regarded restora tion, they woald, he thought, be doing more barm than good.
The chairman said they were all agroed as to tho difficulties as between restoration and re take licence of their own somehow permitted to to the position of M. Viollet.de.Duc, he thought that they coald only admire him as an archero logist, net as an architect

CHUBB \& SON'S FIRE RESISTING STRONG-ROOM
TuA completion of a fire resisting strong-room, Nacional" of Buenos the "Credito Publico Nacional" of Buenos Ayres, has led a number inspent Messers. Cinbb's wor in such matters to old Kent lessra. Cunbb's works, in Glengall-rosd, no of the lar The strong.room referred to is no of the lar est constructions of the kind 11 ft .5 g , we believe, boing $14 \mathrm{ft}, 3 \mathrm{in}$. wide 11 ft .5 in , high, and 4 ft .6 in . deep from front ${ }_{3}$ in. thick, rehated torether, and fastened by ery strong angle-iron screws and rivets. The oor, sidee, front, and ceiling are alike in oon struction, and, with the small air-chamber, and cases charged with fire-resisting material, mako ap a total thiokness of 5 in . The doors are 1- in. thick of combined steel and iron. In tho $\frac{1}{4} \mathrm{in}$, thick of combined steel and iron. In tho oors there are two chamhers,-ono contains the works of the looks, and the other is a fire-resistiug chamber, obarged with the vaporising matorial employed by Messra. Chnbb. The naturo of the action, in the event of fre, is to produce vapour action, in the event of fre, is to produce vapour of the two doors is fitted with enclosed. Chab patent gunpowder-propfock throwing fourteen bolts all round, each look differing from the otbers, and requiring its own key. The room contains a series of compartments, twelre in the length, and four tiers high. It weighs about I5 tons, and is made portable, the separate pieces being about 400 in number, It has taken ten men ahout three months to make, and has required the drilling of about 7,000 holes in the iron plates, and the use of 1,000 rivets and $I, 400$ Government bonds and for the security of the Ayres by one of Messrs. Chubb's workmen.
Anotber smaller room bas heen completed for the safo custody of cash. It is 5 ft . wide, 5 ft 6 in . high, and 6 ft . from front to back. It has folding.doors that throw twenty-eight bolts instead of two separate doors; it weighs about six tons, and is for the nse of the Buenos Ayres Govornment National Bank. It is fitted up with extra strong safes for bullion.
The works of this firm, which cover a space of about $1_{\frac{1}{2}}$ acre, wore built in the year $\mathbf{I} 866$, from the desigus of Mr. Hoole, of Russell-square Abont 130 men are constantly employed in them, and their production is about 1,000 safee, strong. rooms, and iron doors. on an average, each year; theso varying in price from 102 . to 1,1001 . each. The steam power is at present farnished by a horizontal engine of $2 \breve{2}$.horse power, but and a Corliss encino, of 50 . horse power, is und
order. There are twenty-six machine tools o the best description in the factory, including planing, punching, slotting, shaping, and drilling and has a very active 500 cwt . steam. hammer in constant use. It is used for punching os well as forging, and delivers with about 200 strokes per minate. A Wrecision pnoumatio steam per has been Waton' will be equal The hlast of tho minnte by a fan, from which irons fires is supplied by a fan, from which iron pipes are carried all
round the shop. Water tayeres are about to be supplied in tho smitha' abop.
It was curious to notice a mortising-machino and a band.saw emplosed mortising-machino taking out mortises 21 ed npon iron, the one taking out mortises $2 \frac{1}{2} \mathrm{in}$. long by 1 in. wide, equal to performaneo negs. The merits of apon iron doablo the thok. their locks, Cheir locks, employed successfully by Messrs. Consists since 1858, was onnlarly exhibited. This consists of the introdaction of steel pins in the region of the keyholes, whiob renders the lock invulnerable to burglars, the drill being ntterly destroyed when it comes into contact with the stoel pins. This was shown by a test supplied by a Hulse macline, of which, of course, burglars cannot have the advantage in operating upon a bank strong-room. Amongst other work in progrees in the factory at the time of the visin wore safes for Scott's Bank, Cavendishsquaro; for the National and Provincial, the London and County, the London aud Westminster, and other banks. It shoald be mentioned that the works wo have been deseribing are only part of those occupied by the firm, their locks being chiefly produced at vorks in Wolverhampton

## THE STOWMARKET INSTITUTE

 COMPETITION.AT a meeting of tbe general committee convened on the 9 th inst. for the purpose of receiving tho report of the committee appointed 0 award the premiums in the competition for the plans for the new building, it was announced that the first had been given to "Utilitas" (Mr H. Lovegrove, architect, 20, Xork.buildings, Adelphi, London), andle gecoud "tility" (Mr. II. Goodherr, Kentish Tuwn, London).

## NOTES ON PUBLIC WORKS ABROAD,

Ir is interesting to loarn bow pablic wo gress abroad, -how neoessary improvements ar effected in varions foreign cities; and some in formation upon this subject which we have colleoted will not bo anacceptable to ou readers. Let us begin with Russia. From Berdiansk we laarn that many improvement aro heing oarred out in that port. In the first place, two good sohools have been erected,--one or boys, and one for girls. The constrnction of higher scliool for woys has also been com menced, the funds for which have been pro vided hy the landed proprietors of the district The local mnnicipal authorities are anxions to carry out the necessary improvement of pavino the streets of the town, hat, as funds are want ing , they propose to raise the moans easential to tho object by special taxation. This, howerer is resisted in some qnarters. With regard to anothor Russian town (Kertob), we note that publio works are being carried on with creat activity thronghout tho town and its vicinity. A new church has heen erected on the Quaran tine-road; a convenient hridce has been con tructed over a marsh to ficilitate the approach o tho town from an adjoining village; a rell nacadamized road has been mado for a dis ance of three miles, leading to the Crown and ther gardens; wbile the ereotion of a new ynogrogno is in progress A project is also under consideration for the erection of a new theatre of an improved charaoter, in Kertch and rocently two large hotels haro been opened there, in addition to those previously carried on Of late, indeed, the local antlorities have been very active, and many improvements have been offected, wbile still others are in contempla tion. Throughout the town building operations are actively goiog on; many fine new houses hare heen oompleted, or are in oourse of ereo tion, not only in tho leading thorougbfares, but in the most retired quarters, the architectural appearance of the place heing thus mnch im proved. Kertch possesses a town bonlevard,
described as of a handsome character. It ha:
been raised some 6 ft . above the level of the been raised some 66 ft . above the level of the quay, and planted with rows of trees in
straight lines, with seats placed at intervals, straight lines, with seats placed at interrals, a
Kiosk in the contre, and a commodious huild. ing in one corner. It has also heen discovere that the town prison is inadeqnate and unsuit able for its purpose, and a new one, more com. modious and better arranged, has conseqnently been erected. Althongh not large, it is proportionate to the size of tho town. The prison is dry, warm, and well ventilated; and every prisoner has a plank and straw pillow for his country where men of nearly all classes sleep in their clothes, where sheets are almost unknown, and where the temperature of the prison, even in winter, is by no means severo. From Odessa the assistance of English capital, to provide the town with water from the Duiester, have neces sitated the importation of several cargoes of iron pipes from England. By the ternis of iron pipes from England. By the ternls of
the contract these works were to be completed by the end of the present year, and they by the end of the present year, and they
have been so completcd. Improvements arealso being effected in the paring and drainage of the being effected in the paring and drainage of the
town, and the works at the pier and port are town, and the works at the pier ard port are
slowly advancing, though it is said that they slowly advancing, though it is said that they
will still extend over several years. The introduction of tramways is contemplated in Odessa, but they appear to be intended rather for the carriage of merchandise than passengers.
Pablic works in Portugal appear to be progressing. With regard to the Azorcs, we find
that a lighthonse at the north end of the island has boen in course of construction for some time The work, however, has been very perfunctorily carried on, but its speedy completion is con.
gidered imperativo. Another work calling sidered imperativo. Another work calling
nrgently for completion is the district laol, nrgently for completion is the district gaol,
which has, it is significant to notice, been actnally twenty years (.) in conrse of erection and is hy no means finished yet. This system would hardly snit English bnilders in these go-abead days. Other works, commenced about twenty years ago, are new baths in the valley of tbe Furnas, and tbese are very backeard. The mineral waters of the Faruas being always in a improved manner the following plan in an recommended:-first, to olose hermetically the reservoirs of cold water by arehing them over; secondly, to aid the cooling of the watcrs by resorvoirs, tbrough which a stream of cold aid or of cold uir should be driven by soitable wate ances; and thirdly, to substitute the applipresent in use hy openings made in the bottom of tho baths, which is a more perfect system of introducing aroided with the importance in the Azores is tbe erection of new Custom-bouse, the existing one heing far A company has also been formed public business. A company has also been formed to construct a fleating dock, and the sbares subscrived have the purchase of material for its construction. Of late years great progress has been made in Portugal generally. In 1851 there was not Gingle kilomètre of carriageablo road in the country, with the exception of that from Lisbon to Cintra; not a single railway ; the ports were
silted np; the rivers were withont bridges except a few brilt years ago. At the presen time, as a contrast to this state of things, Portugal possesses 3,500 kilos. of good roads, while new roads are still in course of construc tion throughout the conntry; 715 kilos. of rail way in operation, 131 kilos. more almost complete; more tban 200 good bridges over the rivers and smaller streams; more than 3,00 kilos. of telegraphic lines; improved harbonrs and many recently erected and beautiful edifice for the service of the State. Tbo economical progress of the csuntry bas not been less noticestep ; bot with regard to the latter conntry thide is not much to notice of special interest relative to public works. From the Canary Islands we effected at several of improvement are bein struction of new roads is a much-ngh the conit cannot he thoronghly carried quence of an inedeqnacy of funds. siderable portion of the mole at the port of Santa Craz, Teneriffe, has heen carried away recently by a strong wind with beavy sea from the eastward. From Porto Rico we learn that
railways, irrigation, drainage works, \&c., are
much wanted there, hut still remain in embryo. With regard to the port of Mayaguez, it is stated
that some street-rnils which were laid down there have proved a failure, the system bcincon Which have proved a faiture, the system being one heso has never been adopted anywhere. Ender been tapressing circumstances, the rails have States
Brief consideration may next be given to the puhlic works of Turkey. With regard to Adranople, it may he mentioned that that city contains ahout 160,000 honses, 50 mosques, 15 pita's, \&c. The hogues, a military college, 2 bos. dried hricks; the streets are narrow, tortnons dark, and very badly paved, being lighted at night by a few petroleum lamps, placed at long distances from each other. Altogether, the town is dcscrihed as heing of a most dilapidated and neglected appearanco, and all the streets are extremely fithy. The roads in the province are neclected as long as possible, and only repaired when ordered by the Central Govern. ment, on the representations of some foreign anthority. It is alleged that the local anthorities are entirely dependent for the construction of roads, \&c., upon compulsory labour. Although yet in their infancy, railways have been intronced, there being at present only three lines, one from Adrianople to the Agian Sea, another to Propori, and a The publio works carried on in the island of Creto of late have not been extensive. The
most useful las been the dredging of the harbour of Retimo, the smallest of the three commercial ports of Crete. It had become so silted up with sand the anchor outside while, since the dredging, ships of 400 tons can moor inside. Road-making, it is said, in this island appears to be nndertaken as a sort of concession to modern sentiment on tho subject. may, therefore, bo inferred that the roads are not very good. From Cyprns we also learn that ofthing has been done there of late in the way is manifeste bridge naking; and equal negloct dilapidated water.conrses, and the organisation f some judicions systom by whicb irrigation might be promoted and extended. The railway from Galatz to Bucharest on the one side and from Galatz to Roman on the other, has ben opened, bat the traffic eitber way has not been ery great. The increasing number of steamers Galatz baving caused the want of quay municipality has nudertake and more felt, the solid stone wharfs of some extent, and the work has been commenced. The town is also heing lighted with gas, and supplied with parified and filtered water hy a regular system of water. works. This is considered a great improvement apon the old sys'em. In the Lown of Erzeroom (Koordistan) many improvements bave been recently effected, the greatest part baving been promoted by the late Vali, Samib Pasha. By alled uniring zeal hilthy open sewers, tormerly calied streets, have been converted into broad, morivg all occasion for the usual summer movivg all occasion for the usual summer
miasua whicb preyed npon the inhahitants of the overerowded dwellings linincr both sides of the now reclaimed ground still moch is left to be done cre the tion of dirt and filth that poison the otherwise pure air. To a stranger the place has been hitherto intolerable. The Erzeroom-Trobizond. road is said to be in a wretchedly ruinous condition, and much needs reparation. A new road to Batoom has been pusbod on actively, and When finisbed will be of great commercial and to the public works there ported; the roads are what tbey were a hundred years ago, and the greatest astonisbment is expressed as to how even the natives, in winter can manage to get over them. We suppose, however, that use is everything.
Our readers must uext turn their attention to Hungary. Much bas been done of late in this conntry in the way of railway and canal construction, and much remains to be done. The schemes for Public Works is occupied with iccable the railways tbero bave not been so useful as they slould have been. They have been constructed with too exclusive attention to the local wants and witbout sufficient regard to through trafio and connexion witb the railway system of othe conntries. It now becomes necessary to snpple ment the existing lines by connecting links in
order to make a real railway network through ont the conntry. The Government have, in addition, a project under consideration for the construction of a direct line from Pesth to Semlin and Belgrade, whicb, when tho Servian railways are completed, will, it is hoped, hecome a portion of the direct interuational line to Constantinople. As to canals, one of the most important, viz., the Franz Canal, originally con structed hy the Government to connect the rivers Danube and Thaiss by Zombor and Ners satz, is heing improved, chielly by Englisb capital and enterprise The present coudition of Pesth is described as admirable, the canital possessing numerons lofty and bandsome build ings, and nevv wide streets, paved in many case with aspbalte. As regards rate of increase and aepor it is that capital has surpessed that of any other European contry; and large sume of mone are erper pollity expeaz, necessich tecesiated by ubo the tined with hares of thanube are being lined a has extesiv docks, entrepôts, and a railway hridge acros the river on the sonth of tbe town have beed planned by the Department of Publio Works, and will soon hecome faits accomplis. And bridge above the town is in process of construc tion, and will comnect the manufacturing quarter with the slipbuilding district, \&c. Mucb of the poorest and most squalid portion of the capital is being opened out by new streets and boule vards, of an improved character, handsomely paved with granite and aspbalte, and intersectec hy tramways. In the neighhourhood of the Museum and Houses of Parliament an aristo cratic quether is springing ap, in whicb are hotels and other buildings of considerable architeotural magnificenco.
Ar important work is being carried out at Carthagena (Colombia). Mr. Terry, an Eumlis civil ongmeer, arrived there at the end of the last year to make various surveys for the Colnmhian Government of the local barhour and of the canal wbich leads from the Bay of Carthagena to Calamar, 116 miles on the Magdalena river Air. Terry was engaged seven montbs making these surveys; bnt, nnfortunatoly, nothing is likely to result from his lahours. The opening of the Digue, or cannl, so as to onable steamers of moderate tonnage to strike the river Magdolena at Calamar, is known to be the onty mens by which Carthacena con be rescued from its present isolated position. The local barhonr covering an area of 40,000 neres, is second $t$ none in South America in point of convenience for londing and nnloading, and complote security in all weathers. Mr. Terry, in the survey he gave to the Government for opening the Digue proposed, by cutting through one or two angles and reducing the bends of the old route, $t$ sborten the present distance of 116 miles from Carthayena to Calamar to eigbty-one miles, in order to allow of steamers to do the distance in twenty hours. He estimates the cost of the work at 18,000 l. The local merchants, however show great apathy in the matter, and are con tent to sit still and see their fine harhour void of shipping, and their once fine city fall every year into greater decoy. With regard to other public works in Colombia, there is nothing of any interest repair of tho catbedral at Panama, which will cost the Government abont 40,000 dollars. From Guayaquil (Ecuador) we glean that a proposed carriage-road from Quito to tbat port has been abandoned, the Government having come to the conclusion that it will be casier and chenpe to construct a narrow-pance railroad. It will have to traverse a hilly oountry, the stecpest gradicnt being estimated at 4 per cent., and the radius of the sharpest carve at tbirty-one yards. The Gorernment sent sme time since yards. gineer to America and Eugland in order to decide upon the most snitable kind of railroad and have, at the same time, instructed their representative at Washington to make a contract for its construction. A new penitentiary in Quito has just heen constrncted, and is a fine building, alchough it is significant to note that it is always subject to be destroyed by a gevere shock of earthiquake-a pleasant prospect for the enterprising builder.
Puhlic works in France deserve passing no. tice. The excavation of the new docks at Duukirk procecds slowly; but much has been done towards demolishing the old ramparts and the erection of strong forts nearer the sea.
When finisbed a large amount of land wilj
become available for building purposes. By the extension of the fortifications the terminns of the Furness Railway has been enclosed within the ramparts. It is intended to anite this line with the Compagnie du Nord. A new railway is proposed between Nice and Corni in North Italy, and is considered a very desirable line, as it would connect Nice by rail with Turin and
Central Europe. Another line is projectod to Central Europe. Another line is projectod to Lyons, whioh would materially abridge the would necessitate a long tunnol tbrough the pass of the Tenda-a work whioh would last some time.
In Greece, several projects are in view which may be brietly alluded to. The whole of Western Greece is lamontably in need of good roads, bridges, \&c, but the attempts to supply these condition of the port of Missolunghi, for instanee could not be worse. From the Pireus we learn the long-pending question of a railway via Tbebos, Livadia, \&c., to the northern frontiers of Greece, with a view to its ultimate connexion with either the Turkish or Austrian lines to Vienna, has at length received a satisfactory solution, and that a conveation has been signed oetween the Government and a combination o material importance to the country. In order to carry out the work effieiently, the now com. pany have retained the services of M. Piat, a pany have retained the services of M. Piat, a jectors of the line. The concession is for ninety. nino years, after which the railpay reverts to the State. It is to be finished within a period of throe years, and the Government engage to pay the company a subsidy of $15,000,000 \mathrm{fr}$., in three instalments of $5,000,000 \mathrm{fr}$. each; the first to be paid as soon as the line is open to Thobes; the second, when it reaches Livadia the Turkish frontiers. An Exchange huilding the Turkish frontiers. An Exchange huilding expense of the municipality, and a magnificent expense of the municipality, and a magnificent the Academy in Athens by the opulent Greek banker, Baron Sina, of Vienna, - a building in the style of a Crecian temple, worthy, it is said, the style of a Crecian temple, worthy, it is said,
of any capital, aud "for beanty of materials, of any capital, and "for beauty of materials,
probahly hardly equalled in Elarope." The probahly hardly equalled in also rendered an important service to the local publio by substituting iron pipes for the supply of water to the vionsly used for that parpose, which were pres. petually breaking. The purity of the water ha From improved by this scheme
From the classic regions of Greece we must ransport our readers to the more commercial land of the Netherlands, whence we get some interosting information. The consul at Rotter dam states that the Moerdyk Railway Bridge is completed, and is the longest bridge in Europe, forming a link in tho Sonthern Railway con. wecting Hulland with Belgium. The increasing commerce of Rotterdam has rendered necessary greater storage facilities, and more cspecially
river frontare; and in order to meet these reqnirements, the town authorities have enter tained proposals from a private company, on titled the Rotterdam Trpding Company, who under certain conditions as regards quays canals, and roads, to be constructed on account of the town, propose building docks and warehouses on the opposite shore, thus making Fyouoord-the name of the district referred to the Birkenhead of Rotterdam. Other Owing to the system of sewerage, which pre sents engineering difficulties in a city which, for the great part, lies below the level of high.water mark, the water-supply of Rotterdam has no hitherto been the most pure; and to improve it reservoirs aro being built in the town, which are to be supplied with purified or filtered river water. The iran tubing, which has been imported rom England, has been laid down.
It is officially stated that the town of Suez is in a most neglected and filthy state, no means whatever being provided for cleansing the strects, and the aanitary arrangements being most imperfect. The open spaces are selected as the camping.grounds of numerous hordes of pilgrims, who are not particularly clean; and the Health Department (so called) take no step. ties, in fact, do net and forer to consider them selves responsible for the cleanliness of the my brothers's keeper

ON MECHANICAL PROCESSES FOR PRODUCING DECORATIVE DESIGAS ON WOOD SURFACES,*

To define the distinction between decorative and imitative art, it may be said that the former is art which is essentially subservient to archi. tecture, but subservient not in the sense of tame insipidity, but of sympathetic helpfulness. In all cases dccoration should heighten the effect of structare, not apparently- weaken or conceal increase ad to it variety, and consequently itself, the the but not attract attention to nobler qualitios more imporan grandeur. For the office of decoration, at least in onr day, is pre-eminently to amuse. The cultivated eye delights in a composed intricacy of line, in a symmetrical variety of figure, in subtle balance of apparently conflicting forms The artistically.wrought principle of repotition is as pleasant to the sense of sight as that of re. curring poetical rbythm is to the ear. In a word, a decorative design, if not possessing the power of a full orchestral harmony, sbould at east resemble a simple, dclightful, and refreshpictoringy. Decorative art and imitative or hat of the forn, have two distinot functions structural features is to heighten the effect of adapted to the locality to which it is applied whilst that of the latter is to attract apdied centrate the spectator's attention on itself, and to make him entirely ohlivious of everything and shade, and in decorative art, form, ligh fanciful or symbolical ideas intelligihle to mak or beautiful; in pictorial art they demand tbe utmost subtlety of execution that the hand of the artist can cxpress.
Nevertheless it is
truct a definition thatemely diffioult to con struct a defmion that will inolude all the For instance, might it not he asked - suseptible sone pictures if so, phy ane they and To this it may be answered that not others? itrinsically on atructure $\begin{gathered}\text { an adjnnct to architecture and }\end{gathered}$ structurb. Decorative design may consist of of masses of thether of pattern or figures, or versit; or it may consist of masses of harmo. niously contrasted colours. Bearing this in mind, we must recollect, also, that pictures ar fection one quality, such as form; some another such as light and shade; others, some another, tinot from these, and illustrate colonr Now, le as consider what the qualities are which let ornamental art tho qualities are which true ined form is ind possess. Acourately de light and dark is another. Harmoniously con. ight and dark is another. Harmoniously con or almost imperoeptihle gradations of light and ralmost imperoeptihle gradations of light and pade which conf use form, and detrect from the purity or richness of colour, are, in decorative tures, in which this quality is engravings or pic tures, in which this quality is expressed, may be botar they are not decorative. Pictnres beautiful, ont they are not decorative. Pictnres, then, of decorative kind, are such as have figures
 which the effect depends on broad, powerful masses of colour. For instance, piotures hy than those by Correggio. Compare tbe "Famils of Darius," in the National Gallory, with the Venus, Mercury, and Cupid," and the distine titian" "Be at onco apparent. So, pgain Titian's "Bacchus and Ariacine," with its masses of powerful bat harmonions orange, blne, green, purple, and white, is more decorative than Rembrandt's homely, but poetically couceived, Adoration of the Shepherds," in which the colourn are fused, as it were, into very low-toued light, and richest depths of "grateful gloom." The quality that is essentially non-decorative is mitative gradation of shade. All Oriental nations, snpreme in certain phases of ornamental feect, without exception ignore it. And it is least, the too much to say that, for a time a into decoration, coufused form, vitiated colour and did decorative art in Europe an injury from which it is only just beginning to recover gain, in what catagory, it may be asked, should such a work as Michelangelo's Sistine ceiling he placed? I reply, in a very swall class - by itself. Its merit is so exceptional as to be far
From a paper by $\mathrm{Mr}_{0}$ Thomas Whitburn, read at the
beyond classification, cavil, or criticism: We can but wonder and admire. But wben we come to work of anotber kind, beautifal rather than sublime,-Correggio's Cupola at Parma, domay feel domo shonld be built in order that a painter, by a prodicions tour de force, should make it seom that Cercot. There 18 this to be said, however, and tbat even if ane not so common as domes; turall urally spoiled by the transformation of it into decidedly decidedly a gainer thereby. To come nearer Paul's dome is Pauls and unfortu nately, he was not by any means a Correggio. Now in the Greck vases, as in all other true artistic wort, we and that decoration is in. variahly groverned by fitness. It meets with distarbs ar architectural treatment. It never distarbs or destroys the offect of constructive in fill. Tt is always appropriate to the position it fils. Thas, on the vorder of the vase is depicted some incident of beroic times, or story of the gods, whilst the border is composed of fret or olinge, of desiga wbicb modern artistic in genuity has not been able to surpass. This decoration, be it observed, is always, in vases of the best period, perfectly flat. There is n attempt to deceive the eye hy semblance of relief. The natnral baked clay colour of the vase, a pale hrowo, stands for the figures, whilst distinctness is given them by means of rausparent black ground, on which they tell as arasses of light. Upon the importance of this quality of distinctness in dccoration, of which form is the cbaractoristic, too much stress cannot possinly be laid; and some remariss by Mr Raskin on one of the Mediæval uses of thi quality are so pertinent, that perhaps you will bear with me if I quote his words concemiog :- "And this love of symmetry" he says, "was still further onhanced by the peculiar aties required of art at the tinze; for, in order to fit a flower or leaf for inlaying in armonr, showing clearly in glass, it was absolutely necessary to take away its complexity, and reduce it to the condition of a disciplined and orderly pattern; and this the more cause, for all military purposes, the device whatever it was, had to bo distinctly intolligibl at oxtrome distance. That it shonld be obl mitation of natnre when seen near be a goo moment, but it was of the highest momen tha when first the rnicht's barner fasked in the an at the turn of the mountain road or the orn and bloody, throngh the drift of the battl lust, it should still be discernible what tbe bearing was. . . . Hence, to the one im perative end of intelligibility, every minor resemblance to nature was sacrificed, and above all, the curved, which are chiefly the confusing, lines; so that the straight, eloncrated back, doubly elongated tail, projected and eparate claws, and other rectilinear nnnatnral asses of form became the means wherehy the lopard was, in the midst of the mist and storm battle, distinguished from the dog, or the lion rom tho wolf; the most admirahle fiercenes ad vitality being, in spite of these necessary anges, obtained by tbe old
The process for the mechanical production of esigns on wood, for which I have ohtained a patent, has not a pictorial, but a distinctly on flat surfaces of wood either flat effects of on surfaces of wects of ght figures on a dark ground, or dark figures on a light ground, or figures light and dark apde n adaptation of are produced on the wood hy rinting ion the processes of engraving and rining Into the varions enpaper, after the profornd producing designs on aper, articles [r. De suject, by a most compet ont anthority his Davenpo it ine worthy Financial Officer of his sociory, for me to enter, pecially as those who wish to study examples ris progress in解 opre the print room of the british asenm, now nuder the able keepership of Mr. George W. Roid, .S.A., whose courtesy on very many occasions am happy to take this opportunity of acknowedging. I wall confine myself, therefore, to the xperiments which I have made for producing certain specimens which are submitted to jour judgment. These specimens are printed execrited on wood-blocks by Mr. Edmand Evans
and Mr. Horace Harrall, and also from electrotypes from such wood-blocks. The kinds of wood which are hest adapted for recciving such impressions are those which are light in colour and soft in grain, such as pine and lime trees,
which I have here employed. The conditious under which the impressions are taken are precisely those essential to the production of prints on paper, namely, that the surfaces of the en-
graved block and of the substance taking the graved block and of the substance taking the impression must be throughout in perfect contact. The specimens shown were produced in an "Albion" hand-printing press, with ordinary printer's ink, and were taken by Mr. Guildford the employ of Mr. Hooke, printer, Guildford. Such impressions, being polished or varnished, are necessarily as durable as the rood itself. As regards the colouring materia that the process is by no means limited to printers' ink. The object, then, of this process is to multiply designs of a decorative kind, at a he applied to sull purposes and sitations in which flat smfaces of wood are or may be used and especially for friezes, dados, panels, and borders, either for walls, architectnral adjuncts, process to the decoration of furniture, a cabinet process to the decoration crurns, and manufne tured by Mr. F. Coote, of Tottenhanl-coart-road, well knowu for the excellence and beanty of his deal suites.
By some connoisseurs mcchanical processes for multiplying copies of works of art bave been gravely objected to. But I think it mnst be conccded that even mechauical processes are
not without a certain utility. Making plaster casts is, for example, a mechanically reproduc. tive process, and some years hack the Arnndel Society pablished exquisite redactions, likewise by a mechanical process, of those two famous statnes which a clever American sculptor and Writer now proves, to his own satisfaction, in
the current number of Blackacond, aro not by Phidias,-the Thesens and Hlyssus. Would any lover of art object to possess those casts because they are the result of mechanical process? Again, we may not all be fortunate enough to possess a picture by Landseer; hut there are to possess, who are nuable to obtain, or objcet and shade, of the delineations of those animal instincts, passions, and emotions, which he has so marvellonsly interpreted for us, and which may be said to have enlarged our sympathies with one class of created heings. The question
really is not whether a process is mechanical, but whether the result is mechanical. Does the material or the method over-ride artistic qualities of imagination or exccution Do we get careless, finish? or, on the other hand, have we coarse or clumsy, in place of delicate and refined work? If the result be good, what matter work ? If the result be good, what matter ndvantage though it be shunned?' Now engraving is a recognised mode of multiplying copics been ohiefly an imitative one. It has beou used weon chiefly an imitative intention by great masters of thought, such as Albert Durer; or of outline and action, such as Mark Antonio ; or of brilliant light and nysterious shade, as Rembrandt; but tbe use to which my adaptation purposes to put it is, that of multiplying for dccorative purposes deco. rative ideas. The comparative cheapness of the process to some may be objectionable ; but do we disapprovo of those marvels of piotorial journalism the Graphic and the Illustrater London News, becanse they are cheap? Do we
turn np onr noses at Punch because his price is only threepence? Surely the love of decoration is a good thing. Would nature teem with deco. rative effects merely that we might shat our eyes to their influence? This society was founded to encourage not only mannfactures and commerce bnt art. Its efforts, from its origin until now, dations of the false and ahsurd Puritanical theory that beanty is a snare in the path of the righteous, and decoration a device of the devil. That these wise efforts have been crowned with success is, fortunately beyond a dorbt. The factnring districts largely contributed to spread factaring for drawing among operatives and now the maseum and schools at South Kensinoton for the prosperity of which the country is so largely indehted to Messrs. Henry Cole and Red largely indehted to Messrs. Henry Cole and Red-
grave, has dealt, let us bope, a deathblow to
insipid formality for evermore. This decorative speriment of mine, then, is not intended to compete with, or expected to supersede, the heantiful. of hand-painting and inlaying, the skijl displayed in which has made the cabinet work of our great firms renowned throughout Europe; hut, as printing on paper has brought imitative ar within reach of cyen the poorest, so I conceire that printing on wood may eventually enable all who possess decorative taste to indulge it, an ornament will he a more importaut and at the samo time common feature than it has hitherto been possible, for ordinary purposes to employ. In the course of the discussion which followed, Wr. Pitman thought, if the two surfaces were not exactly even, it would be impossible for very oxactly as when transferred to a yielding ma terial, snch as paper. The only speciality ap peared to be printing on wood instead of paper, and it occurred to him that if printing-ink were nsed with an unyielding surface, such as a piece of wood, it would either canse it to come up in lumps, which would have to be finished afterill delioncy of ontline
Mr. Trollope also thought it would be necessary, in order to ensure perfect printing, to make the two surfaoes which had to come in contact so perfectly true, that it would ho alm
Dr. Dresser said, it struct hoses
Dr. Dresser said, it struck him there was a is the present was introdnced of attemptimple do too present was incroxiced, antempting to do too much in decorating wooden structures A fault which he constantly found when an that too great elaboration was given to it, and the general effect suffered. Thosewho had visited the late Exhibition at Fienna could not fail to have noticed that some of the most costly pieces
of furniture, upon which labour must have of furniture, upon which labour must bave
been lavishly bestowed, and which manicsted a great amount of art-workmanship were altogethcr ineffective; and were they
placed in a room, he did not hesitate to say that ono hundred people might enter the room and yet not he struck with the beanty of the furniture. If furniture were decorated, it hehoved them to have a, true, just, and legitimate stracture. He liked to see a perfect revelation of truth in all things. After haring chosen a structure, it was necessary to determine on chooso such decoration as was necessary; hut although an ornamentist himself, he was strongly opposed to too much ornameutation of furniture. It must be horne in mind that the gene ral effcet of a room bad to he considered, and that they should have suhjects that they could dine, it was not to be supposed that he would ret np and minately examine the chairs and very other piece of furniture in the room and the same thing would apply to a drawing. room-the furniture mnst be nseful. Any mechanical process which would enable them o beantify cheap furniture, at a low cast, was too much in that way, and should be very careful in the application of ornament. At the present time their houses were for the mos lany houses were called Gothic, with scarcel Gotbic feature in them, and the same migh e said of the othcr styles. If the room was joly a square box with a few holes, it was just as legitimate to decorate it in one style as another. If they considered what was wanted when produoing any articles, and tried to use he material of which it was going to be forme in the most fitting manner, and then sought to add to it such forms as would give beauty, no altogether considering that they were pure re aissame, or Greek, or Gothie, it would be hetter if they were beantiful, better if they were original and vigorons exprossions of that which was new and peouliarly adapted to thei present wants.
The chairman (Mr. R. Ramlinson) said he, like Dr. Dresser, thought art should decorate and not smother the object, and he also thought that considerable amount of decoration was pracson said of a piece of musio which he was told was very difficult, "Difieult! I wish it was (Wpossihle," with Difrealt: I wish it was thought, in trying to imitato this an enormous amonnt of injury had been dane. Architects
lad attempted, in this country, to reproduce hat which was done in Grcece, with the materials they had in hand; had tried to copy their forms and mouldings, and to repro, nuee them in coarse sandstone; and the result had been ntter failure. He had been told by Germam professor that the Greeks used marhle solely or principally because it was good to paint npon; but there were others who denied that entirely, and who maintained that the Greeks never painted the lovely temples he remains of which could now be seen. He hought the time was gone by when they would do minch in attempting to copy the temples of Greece. The Gothic style, he thought, was exceedingly heantiful when kept to its own purpose, hat its time had gone by. In modern art, f they had decoration, they eertainly wishod to have comfort, and if the arobitect failed in giving comfort and the means of henlth, he failed in his hnilding. With regard to the special art they were tben considering, a means of decorating wood by block painting, it appeared that tho wood must he carefully prepared, and the design such that the hlock should not be fractured by he pressure put upon it to give the impression in the wood to which it was to impart its pattern. In calico printing that was not neces. sary, the lines being of the most delicate character: - In printing our pottery, the pattern was put on to a piece of fine paper, thiuner than bauk-note paper, of a very strong kind, and it was simply laid on the ar-ticle to be printed, the colour being left on the article, and the paper emoved hy moisture. This art, no dorht, might e employed for cheap forms of decoration and might supersede iu some degree the old style of raining and varnishing, hot he could not see any evidence in the patterns exbihited of the same durability as wood, becanse he thought the ornamentation would rub off.

## TATFIELD HOUSE, WANDSWORTH

Hatrieid Horse," Portinsoale-road, Wandsworth, the residence of Mr. W. H. Withall, of which we give illustrations, has heen designed so as to combine modern improvements iu construction, to a somewhat greater extcnt than is usaal in baildings of this class.
The house externally is faced with Beart's patent white hrioks, with red brick bands, and Bath stone copings, window-dressings, and cornices. The roofs are covered with Taylor's patent tiles. The oolumns of the windows aro f east-iron, and those of the porch are of red Peterhead granite.
All the floors are constrnctod with Deanett's patent concrete arching and rolled-iron joists, and tho floors consequently are entirely free from vibration. The honse is also warmer than f ordinary wooden joist-floors had boen used; and it is stated that no sonnd can be heard from no room to another through the floors. The building is also rendered practically fire-proof, and the architects have been enahled to provide ventilation over the gas, without endangering the building by fire. It is a matter of interest, with regard to the applioability of this method of construction, that although the supporting. walls are only 18 in. and 14 in. thick, tbero is no sign of their haring been forced out of the perendicular by the thrust of the arches. The staircase is constructed of pitch pine, varnished, with carved malogany balusters, the ceilings of the morning and drawing rooms are panelled. The joiners' work of the principal floor also has heen execnted in pitch pine.
The vestibnle is laid with tiles. The stoves used in the principal rooms are of Edwards's patent, and the fireplaces are recessed, with windows over them; the windows can be concealed at night by shutters of looking-glass which slide out from recesses in the walls.
The interior of the house has been decorated ander the superintendence of the architects by Mr. Earle, of Howland-strcet. Sax's elcetric bells and thief-alarms have been nsed.
There are a stahlo and conservatory in comaunication with the house.
The coping and vases of the terrace to the farden front of the honse are of terra cotta, by Mr. Blashfield.
Messrs. Lee Bros. \& Pain, of Whitchall-place, vere the architects ; Mr. Joseph Thompson, of The cost of the house, includinc contractor. walls and steps, amounted to 3,6312 , the decorations, $614 l$; the stahle-huilding, $800 t$.; and the conservatory, 270 .

HATFIELD HOU'SE, PORTINSCALE ROAD, WANDSWORTH,' SURREY.

## OLD ST, PAOL'S CATHEDRAL.

## the architectural association.

Ar the ordinary fortnightly meoting of the ses. sion, held Friday evening, the 12 th inst, Mr. E. J.
Tarver, president, in the chair, the following gentlemen were elected members:--Messrs. H. W. Stock E. F. Bisshopp, J. E. Iosford, $H$ thill, W. Stokes, F. W. Hamilton, E. E. Dyer and C. H. Lühr; and a paper was read hy Mr. Fdmund B. Fcrrey, on "Old St. Paul's Cathedral.'

The Secretary announced that the visits to the metropolis would hegin ahont the around next January; and he wonld be glad, he said, to hear from any of the memhers, as to places of interest which they thought worth visiting.
In the course of Mr. Ferrey's paper, be said that Dugdale's "Monograph" was undonbtedly the best authority for tho history of St. Panl' Cathedral, and to Dogdale's pagees he was in. debted for much historical information. Except whero further information respecting the church could be feund. With regard to Hollar's platos, no wilful carelessness conld he attrihated to him merely bocause his plates were often crude and Ohtiously inaecurate. The discrepancies in
Hollar's plates were namerous and puzzling Hollar's plates were namerous and pazzling,
though not more so than in tho other contem. though not more so than in tho other contem.
porary representations. The late Dean Milman statod that some of the earlior anthorities gave the appelintion of monastery to St. Paul's, hat he also added that this was erroneous, though monastic estahlishments,-the Black Friars monastic estahlishments,-the Black Friars
White Friars, or Carmolites, Tcmplars, Groy Friars, or Franeiscans, and other orders ;" hut the dean went on to say, "St. Paul's hai
lation with any of their institations." lation with any of their institations."
The first chmrch dedicated to Tondon was chalt in the time of to St. Paul in London was built in the timo of Bishop Mellitus,
A.D. 603, by Ethelbort, king of Kent, ou the A.D, 603 , by Ethelbort, king of Kent, ou the
former site probably of a lieathen temple, former gite probably of a heathen temple,
redicated to Diana. During the reign of dedicated to Diana. During the reign of
William the Conqueror, this building was entirely destroyed by fire, though it had been doubted that this church thus annihilated was the original
Saxon strneture, Measures, however, were taken Saxon strncture. Measures, however, were taken
to crect a new cathedral on the ashes of the to crect a new cathedral on the 2shes of the
ancient one, and Bishop Maurice, in 1083, began, Dugdale told them, the foundatious of a most magnificent pile, namely, all the body of the chnroh with the north and south cross aisles. So
stately and heantiful was it that it was worthily stately and heantiful was it that it was worthily numhered among tho most famons huildings, tho
vanlts or nudercrofts being of such extent, and the upper stricturo so large that it was sufficient to contain a vast numher of people. The succeeding prelate to Bishop Maurice, Richard
de Belmeis, zenlously continued the work to suoh an extent that he hestowed the wholo revenue of the bishopric upon it, supporting
liunself and family hy other means, though he himsself and family hy other means, though he
effected little towards the bnilding exceptiog finishing the walls After this they got no information as to the history of this "eminent structare" oxeept that it had grot hnrt by a dreadful fire in 1135. Richard, who was made Bishop of London in 1189, however, did a good deal to the cathedral. There was little further known ahout the progress of tho works till 1221, when a steeple was added to the huilding, the choir heing completed in 1240. The stalls were prohahly commenced soon after 1236. Ahout or suhstantially repaired, it being then in a minons condition. In 1256 the cathedral was eulargod hy heing lengthened; and in 1283 the maiu hrunt of the work was over, which year the worshipper beheld the sacred pictures in their tabernacles, the images, and the exquisite shrines, adorned with gold, silver, and precious stones.
Lvery nook and cornor of the cathedral posexperienced iu wide unfurnished naves was conspicuonsly ahsent. In 1332 the chapter-house was huilt, the old chapter-houso then being "rained and deformed." Tho first mention of the hell-tower, which stood at tho east-ond of the chnrchyaru, was in Henry I.'s roign; hut it though no date was given. It was crowned by a large spire of timher, covered witho lead, and possessed four immense bells. These detached towers must have contributed mnch to the picturesque effect of the churchyard, independent of the great advantage that if the bells were
hadly hang or ill-used, the fabrio of the cathedral adjoining remained quite uninjured. The celohrated Paul's-cross stood on tho uorth sido of the choir, towards the east end, and it was there that sermons were delivered. Old St.
Paul's was anciently snrroundod by a wall which had six gate houses. In 14.41 the spire, of timber covered with lead, was struck by lightning, and reign of Edward VI. the images were pnlled down, according to an edict of the council, and in the spoliation of the immense treasures of St. Panl's they found that some of the altar-cloths found their way to Spain, whore the spoils of the ancient oathedral. [u 1 ab 61 , through the negligonce of a plumber, the spire was totally destroyed ly fire, as well as the timber-roofs of the cathedral; but in 1566 the lattor were perfectly restored and covered with Italian portico, this being intended as the first instalment of an entirely new church. In 1612 instament of an entirely new church. In 1612 the cathedral was allowed to fall into neglect and sacrilege, and gross irreverence toolk place and it remained in this rainous condition until and it remained in this rainous condition until
the restoration. In 1663 tho repairs were commeneed in good earnest, and appeared to have continued till the Great Fire, which most effectually put a stop to any further progress in the undertaking
With regard to the characteristio features o the cathedral-it was of immense length, had a neve of twelve bays, a eloir of twelve hays
(uniquo as regarded English cathedrals), also a singularly statoly transept of great projection and flanked by castern and western aisles. The plan, too, was pecnliarly symmetrical and nnsions, Another eloisters were of modcrate dimen. sions. Another great characteristic was that of
tho light, bold, flying buttresses at the hase of tho light, bold, flying buttresses at the hase of the tower, contributing mnch to the effect, though clearly put there for constructional purposes, Although the last ond was sqnare, the immense rose-windows, with the seven dights immediately under, wero rathor a French than an Engligh feature, and there was some. what the same feeling in the long narrowed tower windows. The windows of the nave aisles, for Norman examples, appeared unneually large. The sacristy did not appear to have formed an external structural feature in the huilding, and in vain they looked for a trace appeared to he no absolute evidence as to it nso ; it might have served as a safe place of deposit for documents, registries, \&C.; ; hat, according to Mr. Walcott, it prohahly served as a vestihule. The romains of the Norman transept seemed to have lasted till Hollar's time, and to have heen re-nsed in the work of the early Euglish period; and again in tho westernmost anciont remains of the old Norman architectare with its massive piers, The vaalting in Hollar's plates was ohviously of wood, and it was the opimion of some, he believed, that this was the original Medireval intention; hut if so, why ho would ask, were the flying buttresses hnilt? The original design of the nortb transent wes so completely transformed and masked by Italian oasing that nothing of the ancient design appoared when Hollar lived. Thero was yo evidence that the original altar-screen was particularly lofty or elahorate, except that it was mentioned in 1309. How Dean Milman could have heon so utterly prejudiced against old St. Panl's, as to spoak of it as "a gloomy ponderous pile," and that, "escept its vast size, it had pothing to distinguish it," he could not com. prehend. By a glance at Hollar's plates they oould see how fine the cathodral must have been, notwithstanding its matilated condition. He thonght that the reason it looked so grand He thonght that the reason it looked so grand
and majestic wras on account of the somewhat unusual prominence and projection of the tranunusual prominence and projection of for tran-
septs. There was every preparation for something large, the interest concentrated at the crossing; the transepts, iustead of having only eastern aisles, as were common, had western nes also.
In conclnsion, he said, let them hid a sorrowfrn farewell to the image of that glorious edifice, coming Panis, and look choerny forward to a Old England Old England might reprodnce charchos thoronghly adapted to their present reqnirements, While still preserving hallowed traditions of the
Mr. Birch, in proposing a rote of thanky, said,
with regard to the rose-windows, they were one of the marvels of the age, and Chaucer, in "The Minler's Tale," refors to them. Ho (Mr. Birch) differed from Hollar with regard to the dimen sions, Tfollar heing, he thought, decidedly in correct. Speaking of the existenoe of the western towers, he was of opimion that they
must havo existed, one of the towers boing must havo existed, one of the towers boing used as a prison, the Lollards having heen known to be
confined in one of them contined in one of them.
HIr. S. Fint Clarkson, in seconding the vote of thanks, did not agree with Mr. Ferrey as to the dength of the catiodral, and thought the subject dehateable one. With regard to the flying hattresses, Mr. Longman, in his hook, assnmod fat tbey must have existed; and in the engraving Antige Cabhedral belonging to the Soeiety of Antiquaries, flying huttressos were there shown.

EASTLAKE'S LOST PICTURE
Last week Monsignor Capel leatured in St George's Hall, Liverpool, taking for subject "The Painter's Mind on Canvas." Before a painte could be worthy of the name, he said, he must from two elements-man's. Conception sprang nowlolge the nowlodge. The whole power of the mind and he comparison of mind with mind depended on secondly ing of the power of saoh mind, and secondly, upon the extent of the knowledge itself. From that he advanced to the further point-that any painter rendering the thought mad eoncol must necessarily pat upon tbo carvas part of his own mind. He plaeed there that which witnessed to the sense that he had, to his delioacy of percention, to his power of arranging. It was he that had the most mind, and the greatest dolieacy in that mind, and the greatest knowledge of dotail with regard to things past, and of science, that mnst neoessarily he the greater painter. This might scem very olementary, and yet on it tnrned the whole theory of art. In illustration of this idea he adduced some works of Marillo (who, heing hred amid scenes of poverty, could never paint a picture without introducing patehed clothos and dogs, and se on) and others, and in referring to the "Last Supper," by Leonardo da Vinci, he attrihuted the contradictions and errors there ex. hibited, in respect of tho customs and habits of the Easterns, to the painter'signorance. Leonardo dir inci's experience at that timo was limited to his own surroundings, and wheu ho had to render that thought, "There is one among you who will hetray me," he simply portrayed his own thought. The conceptiou onco formod in the mind of the painter, the second thing was, What was to ho tbe motive to guido and direct clearly this might altor in every way toe for of the whole painting. One mioht paint for money, another from a pare love of the art another to represent some particular leading thought. In judging of a picture thoy might be certain that, nntil thoy had realised the pasnter's thonght or motire, it was impossible for them to enjoy the real pleasnre of such motive for his painting, the painter next came to the power of invention-the invention of that which was to express his conoeption and realise his motive. Invention necessitated not only a knowledge of the fact to he emhodied and the details of that fact, hat it displayed a special power to induce something which would at once give expression to the painter's miad. The fourth necessary element was unity While iu nature there was marvellous variety, yot who conld fail to he struck with the harmony that united all together? Turning for a moment to modern productions the lecturer said there were two great pictures now Liverpool, and he might ask them was in Liverpool, and he might ask hid they kiddon any great work of any great master hown ? Thay mind hole or cormer of their it was so. Lady Eastlake, in the memoirs of Sir Charles, stated that one of his greatest productions, "Brutus harangning the People on the Death of Lacretia," was either Jost or destroyed. Now it so happeued that Liverpool was the possessor of it, and that its destruction Mr. Eberle, Royal It was in the possession of Mr. Eberle, Royal Hotel, and after the last lecture he (Monsiguor Capel) gave in that hall work work. In that painting oue great thing that
struck him was that, though heing an early
prodnction, and while it manifested a little men who had won for themselves a name, and throughout, it breathed that power of conception, that anity and harmony in its varions parts, which spoke of it at once as one of the parts, which spoke of it at once as one of the greatest productions that England had yet seen
from one of its own sons. He expressed a trom one of its own sons. He expressed a
strong hope that this picture wonld not be allowed to leave Liverpool.

## ENGLISH ACADEMICIANS AND SCOTCH

In the address of Sir George Harvey, pre sident of the Royal Scottish Academy, to the pupils, associates, and members, last week, the speaker said, it had heen remarked that nothing was denied to well-directed industry; yet, in addition to the indispensable reqnirement of personal exertion, it was of first importance to the student to discover in what direction the bent of his mind was likely to find surest exer. cise, so that his inclination might go hand in hand with his work. It was sometimes painful to contemplate the result of incompetent and ncongenial cffort apon suhjects chosen from deal poetry, or the romance of history, and to contrast with this the same amount of skill hestowed on an operation of common nature or still life. In the former case raight not un. reqnently be seen the result of a too ambitions choice, indncing only a smile on the countenance of the intelligent spectator, while in the less ambitions but more suitahly chosen suhject, there might be a display of very great art, yield. ing simple but real pleasure. It was surely a truer exprcssion of what was sought to be accomplished, thus to give grace, and dignity, and beauty, to what might be considered in itself comparatively hnmble, than hy incompe. itself comparatively hnmble, than hy incompewas poetically high or historically grand. In was poetically hogh or historically grand. In distinction dne to works of the higher class of mental conception. Such works could not be too highly valned; but seeing that it was given $o$ few to excel in this department, surely if on crial it were fonnd that the wings furnished by ature were not fitted to hear the student pward to those higher regions, prudence sug. gested the wisdom of contenting himself with \& flight more snited to the powers of his pinions.
When in London, at the opening of the Royal Academy last May, more than one of the leading Academicians expressed to him (the president of the R.S.A.) the great pleasure they had in viewing the pictures produced by Scotch painters, from the general excellence of the work which they showed. One of these gentle ictures with this pecaliar qualification, and his reply was, - hy simply teaching students in the first place to draw well, then to very from the life, and after that allowing ment and clothing of his ideas. And thus he elt sure that some experience was the best, if not the only, way by which a yonth might show of what he was capahle hy the direction of the mbodiment of original thought - a snggestion times from thuse who, by their acknowled ged re-eminence, were entitled to spesk with pre-eminenc, were ontilled to speak whan ould desire while proceeding with his wort ould desme whis proceedio with his work, By this means a great variety of resnlts might e expected fro which would not be the case were stadents, nstead of looking at nature each from his own point of view, to set ahout copying pictures in search of a style. Any success obtained hy such means mnst prove to he only secondary in its alue, and tended to delude with the belief that progress was being made in the power of producing, whilst all the time the student was only a copyist, aud entitled to no more credit than a person of literary pursnits would he in getting Shakspeare or Hilton by heart, and imagining he was acquiring the art of a poet. However much delight one might have in contemplating the outcome of great minds, still, as a rule, a man's chance of occupying a place among the efficient would be found not in being elevated on the shoulders of other men, however tall, but in pressing to the front hy every legitimate means, go as to contemplate nature each for himself, and so fill the mind with the ever-varying aspects of beanty and grandeux, which she bonntifully spread ont for the enjoyment of all who took pleasare therein. In support of these remarks, it was only necessary that he should point to the
characterised by the distinction that in the reatment of all they prodiced they had songh o make whatever they touched altogether their own.

DRYING CHAMBERS : A QUESTION ANSWERED.
Sir,-A correspondent in your impression of the 29th of Novemher inqnires what size and height of chimney will prodnce a draught of air equal to two fans which he desoribes. His question has not been answered, probably for wo reasons; first, the intrinsic difficulty of the question; and, secondly, becanse the writer has mitted some most important points necessary 0 be known hefore a correct answer can be given. I will, however, endeavour to reply to the question so far as the data given will permit.
The inqnirer has omitted to state,-first, the area of the discharge.pipe of the fans; secondly, the temperature of the air after passing through the heated cylinders; and, tbirdly, the thickness and density of the two layers of wool throngh which the air is driven by the fans; -all which are most important to the solution of the quastion.
I understand that there are two cylinders, ach with a separate fan. If the fans are of a good constraction,-which, however, appears o be very doubtfol from what is afterwards tated ahont them, - the vanes heing 4 ft .11 in . in diameter, and making 800 rovolutions por minute, the air oncht to be projected or driven the rate of 150 ft per second. This calcula. tion is based on the assnmmtion that the relocity of the discharge is equal to three.fourths of the actual velocity of the tips of the vanes. If, then, the area of the discharge-pipe is $2 \frac{1}{4}$ square feet, or 18 in . by 18 in . (your correspondent only says it is 18 in . wide), the actual quantity of air discharged hy each fan will be 337 cuhic feet per second, or 674 cubic feet for the two fans. This quantity is irrespective of temperaure, which for this calcalation is of but little consequence ; but in what follows the tempera. are is an all-important point
Hathematicians have differed most materially in their calculations of the velocity of chimney draughts. The method of Montgolfior, however, is an once the most simple and most accurate. The hest information on this snbject and on the use of fans, may be found in Dr. Ure's paper, Philosophical Transactions of the Royal Society for 1836 ; Péclet, "Traité de la Chaleur," third edition; and Hood's "Practical Treatise on Farming Bnildings and on Ventilation," fourth cdition, London, 1869.
Yonr correspondent omits to siy whether he proposes his chimney to be merely a flue heated yy the hot air, after passing through the drying. chamber; or whether be proposes it to be a real chimney with a large furnace-fire at the hottom, in the sarne way as was nsed some years ago for rentilating the Houses of Parliament. 1.will endeavour to show him that neither plan will answer his parpose.
If the temperature of the air, after passing through the heated cylinders he $100^{\circ}$ or $50^{\circ}$ ahove the average external temperature, then as ar expands 00208 of its balk for each degree of Fahrenheit, in a chimney 100 ft . high, we shall have this calculation,-
$.00208 \times 50 \times 100 \mathrm{ft},=10.4 \mathrm{ft}$.
as the expansion of air at $100^{\circ}$ Fahrenheit; or other words, 1104 ft . of heated air will velocite velocity of discharge will then be equal to that which a falling body acquires by falling through height of 10.4 ft . This will be eqnal to "eight times the sqnare root of the difference in height of the two colnmas of air"; and in this case, as here assumed, for a flue or chimney 100 ft . high, and a temperature of $100^{\circ}$ Fahranheit, the velocity of discharge will he 26 ft . per second, and it will require a chimney or flue 100 ft . high, and rather more than 5 ft . square at the top, to
discharge the same quantity of air as the fans. discharge the same quantity of air as the fans. If the height of the chimnoy be equal to the great chimney of St. Rollox near Glasgow, which is 422 ft . high, the velocity of ascharge will be 53 ft . per second, and the opening at tho top of the chimney wonld require to be rather more than $3 \frac{1}{2} \mathrm{ft}$. square at the top to discharge the same quantity of air as the fans,
But suppose the chimney is heated by a large will be about $600^{\circ}$ Fahrenheit at bottom, and
abont $300^{\circ}$ at the top, or an average of $450^{\circ}$ roughout. In this case the velocity of dis harge will be 77 ft . per second, and it will $\mathbf{r e}$ uire a chimney 100 ft . high, with an apertnre a the top of 3 ft , nearly to discharge the 674 cubic feet of air at present discharged throngh the fans.
It is not the least likely these methods can be nsed. The discharge of large quantities of air by chimney-draught is all hut impracticable Dr. Ure has estimated the relative cost of dis charging air by fan and by chimney.dranght as 1 to 38 . But it is rery questionahle whether the weak dranght from a chimney could be made to draw the air through two thicknesses of wool, in the way your correspondent reqnires. Nothing but experiment can determine this; and if the layers of wool are at all considerable, it is pro hable no effect whatever would be produced by the chimney.draught.
The pressure by means of the fan can be carried to almost any extent, if the fan be pro perly constructed. The eight hlades, or vanes, described by your correspondent are greatly too many, in a fan of 5 f . diameter. The vanes, also, ought to be eccentric, and not concentric with the case. When fans with concentric vanes and too many in number, are used at high velocities, the result is that the air is simply carried round and round in the case, and little of it is discharged through the apertare, and the cost of revolving the fan is also very greatly increased. A fan with three or at most five vanes and an eccentrio case will dischare douhle or treble the volume of air than one with douhle or treble the volume of air than one with eight vanes and a concentric case can possibly number of vanes to ar at number of merely causing great loss of power and greatly.dimi. nished results. $\qquad$ F. R. S.

## CHESHIRE HOUSES.

Sir,-In Britton's "Beauties of England arm? Walcs," vol. ii., p. 256, it is stated that "Brere ton Hall was the seat of the respectable family of Brereton, one of whom, Sir William Brereton, Kt, built a magnificent hrick edifice here ahout the middle of the sixteenth century." It is en. gravcd in this volume, p. 256, and in Ormerod's "History of Cheshire," vol. iii. (1819). The views are taken from the south, and include the towe of the adjacent church. The building has been in some measnre modernised, but the doorway on the sonth side, flanked by a high tower on each side,-four-sided and ancient,-and severa of the rooms, are of the olden time. Two miles sonth of Stockport is Bramhall, the ancient scat of the Bramhales, and suhsequently of the Davenports. Geoffry de Bramhale, the last member of that ancient family, lived in the reign of Edward 1II. In Nash's "Mansious of the Olden Time," are two engravings of this old mansion, one of which shows it as seen from the porth. The other view shows one of the large windows seen from the south. In vol, iii. of Ormerod's work are two views of this mansion, one of which shows it as it was seen before the removal of the north side of the qnadrangle. The other fiew is taken from the conrtard looking southard and includem th conrtyard, it from It is built on hill, and is painta black and Thite colours. white colo. Th, ropetion af Brereton, pormits a closer insection of the exterior of hese houses. At Broreton an an ancient oadside $;$ ncient houses, incluans the sway Kn , which hould be inspected by architects. Ormerod's work, vol. iii., contains engravings, also, of old Moreton Hall, and of Astbury Church (see the Builder, No. 1603), taken respectively from the south and west. The former view shows the moat, the bridge, and long gallery, at the top of the south wing of the house. $\qquad$ Chr. Cooke.

## OLD WORK AT WHITEHALL.

 Sis,-In this "t age of progress," which I presume isa term intended to include what, to my mind, is one of
its most important features, namely, the destruction of its most important
our old baildivge in
we can,
we can,
London.
mondoa. In the recent sale of buildin rems at Whitehall
much that is raluable will no doubt be destroyed
led te led to understsud that the carred ceiling work of Inigo appreciate its value) in Mr. Lord, the decorator. It is to be hoped a marked catalogue will be sent to the British Museum, so that lovers of Old Loudon may in future
years know where to lonk for these remains, - CH $2 \mathrm{UV} \Delta \mathrm{ZD}$.

DUBLIN WATER SUPPLY.
The state of things as described below is not snch as should exist in any first-class waterworls like those of Dublin.
Average volume of water sent into the city
daily, $13,714,198$ gallons legitimately used, daily, $13,714,198$ gallons ; legitimately used, about $6,954,256$ gallons; volume wasted, about 6,755,942 gallons.
This waste of nearly cent per cent. is, of course, caused by leaking main-pipes and sluicovalves, dctective service-pipes and service.taps, and honse-taps; or stand-pipes left open, broken, or wilfully or carclessly tampered with.
Waterworks engineers do not always pay
ufficient attention to inspection and super sufficient attention to inspection and super-vision,--in these, however, consist the true ceonomy of water snpply. Inspection and repairs should be ample and nnceasing. Some persons toolishly think that a laking tap wates
the drains, and many persons prop open water. closet valves for a similar purpose; these are mischievous ideas, -the dribble of a leaking tap only wets the drain, but does not in any degree flush it.

Dublin is not alone in wasting water. London, Glasgow, and Liverpool waste nearly in a similar proportion, and many smaller torvns follow suit Wo bare no hesitation in saying that the fault is not so much in the consumers of water as it is in the management of the local authorities, and the power for aupervision of the local enginecrs. be in perfect order; and not, hy drants should of the London West End supply, be permitted to leak for months continuously. In Dublin it is merely wasting water as the supply flows in; but in London it is wasting steam.engine power, and this means wasting coals.
As in London, so in Dublin,-water is wasted whilst the poor suffer a watcr-famine. Should this be?

THE NEW MUSTC-HALL FOR SHEFEIELD. Tre opening of this new Music.hall is to take place ou the 15 th instant. The architecture of the building is Italian in character, almost entire absence of external decoration an but the otherwise dreary monotony of the brick; but the otherwise dreary monotony of the brickpillars and by carved stone headings to the win. pilars and by carved stone headings to tho win. It is intended to cover the whole in Barker-pool. in front and on either side of of the paveraent with a roof of either side of these entrances with a roof of glase. There is a waiting-room on eacb side of the hall, and there are two From tho entrancel be used for refreshments. lead up to the principal, hroad flights of steps lead up to the principal part of the building,the great hall. At the top of the stairease leading to the floor of the hall there are two apacious corridors, one extending along the
wholo front of the bnilding and the other wholo front of the building and the other
ranning down the western side. In these there ranning down the western side. In these there
are four or five doors, so that there are plenty of are four or five doors, so that there are plenty of
means of ingress and egress. The balcony-stalls means of ingress and egress. The balcony-stalls
are approached by a separate staircase, and are approached by a separate staircase, and
corridor, and the balcony or gallery at the back corridor, and the balcony or gallery at the bac Like the exterior of the of its ows.
Like the exterior of the huilding, the interior
of the large hall is Italian in character. of the large hall is Italinn in character. In con-
sequence of tho immenso size of the sequence of tho immense size of the organ, and
the depth of the gallery at the other end, the the depth of the gallery at the other end, the
length of the hall is deceptive. The length i length of the hall is deceptive. The length is
125 ft ., the width 60 ft ., and the beigbt from 125 ft , the width 60 ft ., and the beigbt from
floor to ceiling 50 ft . The hall will very comAloor to ceiling 50 ft . The hall will very com.

if the seats iu the body of the hall were removed. Tho ceiling was originally iutended to he o cooved" wood in the form of a segment, but tion of M. Cavaille-Coll, the huilder of the tion of M. Cavaille-Coll, the huilder of the
organ, probably because he thought such a would somewhat militato against the effects of his instrument. Tho main portion of the roof from end to end is now flat, with a division into four panels. The sides of the roof are sloping. The walls are hroken up by a numher of pilasters, and by recesses at tho back of the balcony-stalls. The pilasters havo an coriched
string at the base, and capitols at the string at the base, and capitols at the top. These support an entahlature, which runs round the entire ball. The panels in the ceiling are decorated. There are seren windows on either side each becing 13 ft. high, hy 6 ft . wide. At night, the hall is lighlited by four sunlights in the ceilnot sunlights of the character onmmon in some
churches, chapels, and puhlio bnildings, but ar covered with a kind of double net-work of glass The hall is heated by hot water, the principle adopted being what is known as Perkins' high pressure system. The architects have placed a number of wood pipes above the ceiling, into Which the vitiated air is couveycd by means of ormamental gratings. It then passes on to a by a coil of heated pipes, and will thus it is hoped, into tho open air. The sito and the building
of 20,0001 . 1 itg have entailed a cost -and tho oran 50001 more. But by that sum everything is completed, it will very likely be everything is completed, it will very likely be
found that the total expenditare is not far short tound that the total expenditure is not far short
of 26,000 . or 27,0007 . The architects are Messrs. Flockton \& Abbott; and the contractors Messrs. Longdon \& Son, masons and brick layers; Messrs. Badger \& Holmes, carpenters and joincrs; Messis. Harrison \& Chadwick, and Mr. Staniforth, plasterers; and Mr. Bassett, plumber and painter.

THE PROPOSED NEW STREET FROM KING WILLIAM STREET TO FEN. CEURCH STREET: EASTERN EXTEN SION RALLWAY.
Fros the proceedings of the Metropolitan Board of Worlis at their meeting last week, it may bo taken for granted that they will support King William fir constructing a new street from King willam-street to encharch-street, Mansion Honse Station Circle Rrilway from the Hansion House Station to Aldgate and Moorgate-
street, and also the proposed brancb line frore Bureet, and also the proposed brancb line frore
Whitechapel to Bow, and that they are also pre.
pared to contribute towards the cost of the new pared to contribute towards the cost of the new
street. The Works Committoe brought ap a street. The Works Committee brought up a
report to the effect that having considered the report to the effect that having considered the
two railway schemes-the one for completing two inner circle, and the other for also extending the line to Bow, they had come to the conolusion the line to Bow, they bad come to the conclusion
that the Inner Circle Completion and Eastorn Extension scheme was the best, because, in addition to completing the inuer circle, it also con nected the extreme East of London with the West, and formed junctions with the East Lon. don, Great Eastern, and North. London Railways, Which the altornative plan did not. The com-
mittee recommended that it be referred back to them to consider what amount of contribution them to consider what amount of contribution
should be made hy the Board towards the con. should bo made hy the Board towards the con. struction of the proposed now strect in con-
nexion with the railway. The recommendation was unanimonsly adopted, and it may therefore be assumed that the Metropolitan Board will snpport ion sehe Circle Complecion and mastern Extennext session, and that the scheme for the com pletion of the inner circle only will be abandoned.

## ENLARGEMENT OF THE LAMBETE

 CEMETERY.The Lambeth hurial board and the vestry have jointly agreed to purchase a considerable area of ground adjoining the cemetery at Tooting, for the purpose of enlarging the cemetery there belonging to Lambeth. A discassion whioh took place upon the su bject last week, when the question of purchasing the land was nnder consideration, revealed the fact that, in conse. in the neigh constant expansion of building land value, the purohase which bas just been determined upon showing that, within the last fifteen years, it has arisen from 300l. to 500 l . per acre, or an increase within that period of npwards of 65 per purchase for the purpose of extending the ceme ery is 11 acres, 1 rood, and 33 perches, immo. diately adjoining the cemetery in Garratt-lane, looting, which Mr. Joseph Martin, the owner, has offered to sell for 5,725L, heing at the rate covered by the present cemetery was purchased fifteen ycars since for 9,0002 , or $30 \cup \mathrm{l}$. per acre The hurial board, in recommending the purchase, 10 see that the population of Lhmbeth exceed pied for hurials in the consecrated portion of the cemetery wifi only provide for intorments portion for ten years. They add that the metro polis is estending so rapidly that the land in the suburbs is annually becoming available for
building purposes, and when developed, not only enhances the value of the uncovered ground, hut will certainly shnt out the possibility of obtaining any addition to the cemetery, unless the present offer is accepted, hy which provision will b made for the burial of the dead for at least th next twenty years. After the purchase, the xpenditure in the preparation of the groun or interments by the ereotion of walls, fences raining, and road-making, is estimated a ,272l, making the total cost of the enlarge cemetery, $9,000 \mathrm{l}$. Mr. Taylor, senior, in advising harial hoard, said that siuce the sunject bion of the harial hoard, said that siuce the suhject bad been for the land which been several parties bidding for the land which they (the vestry) then had that if any delay acquiring, and he was afraid hat if any delay took place they would lose the chance of getting the ground, and that the parish wonld have to find accomonodation elsewhere at a fabnlous price. He added that, whilst they Culd obtain the land for 5002. per acre, the parish of Camberwell had just given 700L. per acre for a similar purpose. The purchase of tbe land for the enlargement of the cemetery, sub. ject to the approval of the Lords of the Treasury,
was unanimously agreed upon after considerable discassion.

## THE CLEVELAND SLAG-WORKING

 COMPANYAs mentioned by us some time ago, a " limited," corapany has been formed at Middlesbroagh-onTees, for the parpose of utilising blast-furnace slag, by processes which have lately heen sub mitted to the test of practical experiment. The chief objects of the company are, the manufac ture of bricks, mortar, sand, cement, and concrete, to which pnrposes slag, reduced to sand as it runs from the furnace, and after warde specially prepared, has been successfully applied at Did dlesbrough and elsewhere. Nunierous samples of the various products,-bricks, mortar, sand, concrete,--have been snbmitted for approval to practical men; and from tho abundance of material and the small amount of labonr re. quired, it is calculated that the oompany will he able to supply building materials at a chcap rate, and yet realiso a substantial profit. Land has been purchased for the erection of an extensive factory, acar the new dock-entrance convenient alike for shipping, railway, and carting, and the patents of Mr. Charles Wood, of Midalesbrouch, and Captain Bodmer, of London, have been secured.

PURCHASE OF FURTHER NETV BOARD SOHOOL SITES.
Some short time hofore the late London Sobook Board retired from office, they decided, under the powers of the Education Act, to parehnse different the ercetion of fifty-four new schools in the schools, about ninety in number, which have already been completed and now in course of erection. The necessary notices for the compulsory acquirement of the land necessary for lars as to its have been given, and a fcw particinbe interesting. The agoregate quantity of land included in the proposed purchase is 669919 . square feet, being no less in the whole than $15 \frac{1}{2}$ acres. The intended additional now schools are spread over the several metropolitay divisions as follow:--In the Chelsea division, four new
 land required for which is 75,786 squaro feet. In the Einsbary division, it is proposed to huild no less than ten new schools, in addition to those now in course of erection. Of this number, one is in St. Giles-in-the-Fields ; two in St. Audrew' Holborn; three in Clerkenwelt; three in Isling ton; and one in St. Luke's, the land for which covers an area of 112,980 square feet. In the Hackuey division, the additional number to be built is eight, for which 97,175 square feet of and will he requited, and of theso three are in Hackney parish, two in Bethnal-green, and three a Shoreditch. The number to be erected in the Marylebone division is fire, viz., three in St Pancras, and wwo in St. Marylehone, the sites covering 38,502 square feet. The 'lower Hamlets avision is to have foar additional schools, two Bronis in Bromley, requiring 57,497 日quare feet. West-
minster is to bave two new schools, one in St.

Anne's, Soho, and one in St. John's, Westmin ster, the land necessery heing 10,742 square feet Thns the number of additional new schools which it is proposed to erect within the Middlesex portion of the London School Board area is thirty-three, for which 392,682 square feet, or upwards of 9 aores, of land will bo required. On the Surrey side, eighteen new sohools are to be erected, of which eleven are in the Lamheth division, fise being in Lamheth parish, three in Camberwell, and one each in Newington, Batter sea, and Wandsworth, and the requisite land for these schools is 170,199 square feet. The Sonththese schools is 170,199 square feet. The sonthof which are in Bermondsey, two in St. Seviour's, of which are in Bermondsey, two in St. Saniour's, Rotherhithe, and the land required is 74,440 square feet. The land to he purchased for the square feet. The land to he purchased for the sehools on the Surrey side of the river is 241,639 square feet, or nearly 6 acres. The Greenwich division, in Kent, is to have three new schools, two in Deptford, and one in
Greenwioh, for which 30,598 square feet, or Greenwioh, for which 30,598 square feet, or
upwards of three-quarters of an acre of land, will have to be purohased.

## HIGH DEATH.RATE IN NEWCASTLE.

 NORTHERN ARCHITECTURAL ASSOCLATION.The ordinary moeting in oonnexion with the Northern Arohitectural Association was held in the Old Castle, Newcastle, on the 9 th inst. Mr. Mathew Thompson, President of the Associa. tion, occupied the chair. The elaction of officers for the ensuing ycar was as follows:- Mr Thompson was reelected president; Mr. F. Charlton, vice.president; Mr. W. H. Damm, treasnrer; Mr. Oliver, secretary; and Mr. Hodge, honorary solicitor. A paper on "The Excessive Death. Rate in Nowcastle," was read hy Mr. Oliver. In tho conrse of it he said:One of the most remarkahle statements, indeed, is-and it is, perhaps, hy ench a statement that to be hardy, healthy recnperative What ongh men, when admitted into the infirmary owing accidents, are incapahle of bearing the shock and consequont reaction of an operation, not withstanding the alleriativo and scientific modes resorted to. There is something almost appal. ling in such a statement. It seems to strike at the root and foundation of healthy marhood. Have we hegun to decay ? Aro we retrogressing? Is it possible that the tide of England's great. ness in her sons has hegnn to ehh hefore her own most ample resonnces are half expended P I think it is a fair and logical inference to draw from what has heer stated that at least one cause lies within ourselves. I do not say to What extent, nor do I say to what, specifically, this may be attrihutable; whether to cansos over which we have control, or whether to causes over which we have no control. But we have traced out one fact, and that is, that the general standard of health has been reduced, and as night follows day, so it follows that in the reduc. tion of our normal life-force we lose at the same time the power to resist the influences and en. croachments of disease. Doubtless, our ignorance of some of the higher, and our negligence in regard to some of what we may think the lower laws of nature, as demonstrated hy scienoe, may have something to do with the matter. We must not forget that nature is inexorahle, and that she invariably avenges herself. She supposes ns to know a great deal more than we at present do know, and ever and anon she reads us a lesson such as the present, for the world's future henefit. The reader said he did not care to enter into minnte details, or at present to ascertain merely local canses. His object was rather to show that their chimney.shafts ought to be carried show tbat their chimney. Shafts ought to be carried so high as to be heyond the reaoh of harm; that theur smoke onght to he much more effectually consumed; that their foul gases ought to be done; that their lanes and narrow chares ought to be deeply drained, filled np with dry materials, and solidly laid with Val de Travers, or a similar non-absorhent asphalte ; and, ahove and hefond all that, they should at once have a great com. prehensive system of sewerage, such as other towns possess, with an intercepting trunk sewer, irrespectire of mere first cost. These, togethex with a hetter water supply, and the carrying out of a proper sanitary system in the older portions of the town, would, he firmly helieved, if immediately and systematically and continnously carried out, despite the natural disadvantages, make Newcastle a comparatively healthy town.

WATER IN LEADEN PIPES.
In a paper addressed to the Academy of Sciencer, Dr. Fordos showed that hottles rinsed With shot retained leaden particles in their innex surface. In a second paper just sent in, according further experiments of his. Distilled water never failed being more active than other waters taken from the Seine and Ourcq. The solations obtained by mechanical means were analysed, and those derived from the river waters were fonnd to contain two carhonates, one of lead and the other of lime. As for any lead in a metallic state, nowe whatever was discovered in the water after this analysis. The quastion now hecame restricted to tho effeot produced ou water in leaden pipes. Dr. Furdos fonnd some old ones in the lumber-rooms of the Hospital de la Charité, and, npon examination, discovered them to he inwerdly coated with a deposit of carbonate of lime, strongly impregnated with sulphate of lead. Hence there remains no donbt as to the fact that river water attacks leaden pipes, but it also deposits what it takes, so that the coating above alludod to plays the part of a preservative varnish. When all the leadensurface is covered with it, the water will not only be unable to tako ap any more metal, but will deposit all its calcerous particles, so that it must arrive at its destination in a perfectly pare state. It would therefore appear that old pipes are safer than now. In the Comptes Rendus for November 17, is a note hy M. Cherroul on the "Action of Pare Water upon Various Metals," which indicates several points demandiag carefal consideration in sanitary arrangemeuts.

A TRADE UNION OF CAPITALISTS. A fonmedable national federation of associa. tions of employers of lahonr has been established at a meeting held in London, and its influence is very likely to be felt, sooner or later, in a very marked manner, upon the disputes between capital and labour. In general terms, this ociety majy be described as a combination of of trade unious. It is, in fact, an amalgamation of enaployers' associations, mited for the com. mon object of defending capital against the unjust demands of lahonr, whether they are mado through the channel of legislation in Par. liament, or whether they are made through the medium of strikes. The promoters profess that their organisation shall be purely defensive and hence they decline to "emulate the collect and dissemiate throughout the country information bearing upon industrial questions, for which purpose it is in contemplation to ostablish a weekly or fortnightly newspaper. The federation will also watch over every legislative proposal affecting employors and employed,
with a view to influenoing the same; it will en. courage the indenerdence of non.unionists, and endeavour "to give to edacation, intelligence, and capital their fair share of influence in the constituencies." It would, therefore, seem from the rules and printed documents of the federation that tho employers have determined to accept the gauntlet of the working.men unionists, and to fight them-if that muhappy necessity have been almost their own weapons. It wonld better names than appear upon the list of the conneil. The majority belong to Lancashire and Yorkshire; hut it must not he forgotten that it is in those two connties that we find the largest employers in the kingdom. The president of the association is Mr. J. Robinson, of the firm of Messrs. Sharp, Stewart, \& Co., Manchester. Among the other members of the oouncil we ohserve such names as Mr. B. Hannen, of the firm of Holland \& Hannen, London; Mr. J. Crossley of Halifax; Mr. J. Laird, of Birkenhead; Si Titus Salt, of Saltaire; Mr. E. Akroyd, M.P. Mr. Field, of the firm of Maudsl ay, Son, \& Field London; Mr. Trollope, Westminster ; Mr. Stanley G. Bird, of London, Among the a.ssociations which have heoome affiliated to the federation
are the Master Cotton Spinners' and Manufac are the Master Cotton Spinners' and Manufac turers' Association of Proston, of Blackburn, and of Burnley; the Engineers' Association of Bel fast; the Master Cotton Spinners' Associations of Manchester and Salford, and of Bolton; the Master Builders' Associations of London, of Birmingham, of Manchester, and of West Forkshire; the Iron Trades Employers' Association of Barrow-in-Faraess, Barnsley, Bradford Bristol, Halifis, Haddersfield, Keighley, Leeds,

Leicester, Lincoln, Liverpool and Birkenhead, London, Manchester, Nottingham, and Wake field. These names will indicate to our readers in some degree, the success which has attended the earlier stages of this movement, and the enormous influenoo that surronnds its debut The workmen employed by the masters belon ing to the association are estimated to numbe rearly $2,000,000$.

The Federation have inaumurated their advent by sending to the Home Secretary, Mr. Lowe M.P., a depntation, who placed before him and the Government their viows upon the statement made, on November 5th, by a deputation of trade-nnionists, and also npon tho questions involved in the proposed repeal of the Criminal Law Amendment Aot, the amendment of tho Lesw of Master and Servant, and tho amendment of the Lav of Conspiracy

Mr. Lowe, in reply, said that the sabject had engaged his attention for a lone time. He would only then remark that he wished whatever was done shonld be in strict justice to all parties He had offered no opinion as to the justice of the claims made by the working men's depnta tions, when he received them on Novemher 5th nor wonld he offer any opinion on the case now suhmitted to him. He thanked them for the information given, and for the clearncss with which it had heen imparted; and he promised to give to the statements and the memorial his best attention.

ARCHITECTURAL SOCIETY OF THE AROEDEACONRY OF NORTHAMPTON.
The annual meeting of this Socioty was hold at the Society's room, Gold-street, Northampton, on the 8th inst.; Mr. E. Thornton in the chair. The report was road by the hon. sec., and unanimously adopted. The opening of the report was as follows :

The Committeo of the Architectural Society this Archdoaconry have had fewer plans for church building and church restoration bronght before them during the pas year than durin any similar period within the last decade. This arises in part from the circumstance notod last year, that every fresh restoration leaves less to restore; and now, that happily a neglected churoh is the rare exception, instead of, as in tho remembrance of most men, a nearly universal rule, the reports whioh your committee have to give of this portion of their labours mnst be often meagro. When, however, it is statod that, in the Nere Valley alone, three such ohurches as Earl's Barton, Raunds, and Rushden, second to none from their many points of archæological interest, or of arohitectiral beauty, churches in one or more of which for many a year decay has been permitted to creep on unchecked, are all now in the course of extension and well-advised restoration, on which the advice of your com. mittee has heen asked, they think that they have not been idle. But in many other places, have not been idle. But in many other places,
similar works have been in progress, and others of the same kind are still projected. In some of the same kind are still projected. In some of these your committee have been called on to lend a helping hand; in others, when their advice
has not hoen asked, the true principles of rosto. has not hoen asked, the true principles of rosto ration have not been iguored, and the infuence of architectural associations has been indirectly felt ; in others they are sorry to report that socalled restoration is effected by setting aside an ancient example of nudoubted beanty, and auh. stituting an inferior design in a worse material

## SANITARY MATTERS.

The Outbreak of Enteric Fever at Whitton.An onthreak of enterio fever in the village of Whitton, which ocenpied the attention of the Board of Gaardians has also been the subject of a coroner's inquiry. The disease is confined to court, consisting of ten cottages on the town ide of the Maypole Inn, the property of Mr. Fm. Lovely. In one family of the name of Lambert, consisting of nine, and living in a cottage consisting of three rooms, the disease
has been most rife. The head of the family, and has been most rife. The head of the family, and two boys, one aged seventeen and the other seven, have fallon victims to the disease, whilst others are either ill or convalesoent. The cases have been in all thirty-seven in number, and hesides the three of the Lamherts there havo heen two other deaths. The well from which these people obtain their drinking-water is within ahont ten yards of a cesspool; its top is now hoarded up, and water is bronght from Ipswich in a cart daily.

The ooroner's jury, at the inquest on one o the hodies, was-
"That the deceased, George Lambert, died from enteric
fever, brought on by in combination of causee, -riz, tha and the want of proper drainage, tand we deeply regre
ret
 rities are sot able to more with more despatch in such
manteres."

They also appended a presentment calling the attention of the sanitary authonty to the dis graceful state of the sanitary arran
enumerating the facts of the case.

Typhoid Fever in Canbrilge.-Cambridge is suffering from an alarming outhreak of typhoid fever. This fever has heen prevalent to some extent for the last six months, but within quite rocently several cases have occurred. In one college a case bas terminated futally, and two other persons are seriously ill. Isolated cases have occurred at other colleges, whilst amongst the townpeople it is very prevalent. Two causes have heen assigned,-viz., a bad system of drainage and a supply of impure water. When the threatening character of the disease in one of the colleges was ascertained, the anthorities hastily gave "excats" to stadents in residence, and as quiokly as possible cleared the college, and remaved tho stadents from proxinity to the sown in sorae instancee; so that to the cases which have occurred in Camhridge must be added, it is feared, more than one case which has appeared among the students after reaching their homes.

Wolverhumpton. - WYe learn that Dr. Ballard, the sanitary inspector of the Local Govornment Board, recently arrived in Wolverhampton. After making an inspeotion of the town, he will mako a tonr through the surrounding district, in. cluding Wedresfield, Willenhall, Sei:den, and of his visits to the Local Governnaent Board.

## THE MAUSOLEUM AT FROGMORE.

In the current part of the Sunday at Home a Niow is given of the interior of the Royal Mausolerm, Frogmore, which is copied without acknowledgment from the engraving we pub. lished in July, 1870.* A woll-known print. publisher in Bond.street made a similar uso of it some time ago. As the view we were enahled to issue, by the gracious command of her Majesty the Queen, is the only one that has heen made, we feel bound to comment on the improper course pursued. An external view of the Mausoleum, also made hy Command, will he found in our volume for 1863.

## Parliament chambers.

The architectural features of King.stroet, Westminster, have just heen improved by the ercetion of a handsome hlock of huildings, near Chambers. The new structure, whioh has an elevation of 63 ft . iu height, and 42 ft . in width, is Gothic in its architeotural charnoter, and consists of ground-floor and three upper and consigts of ground-fioor and three upper
stories surmounted hy dormers. The materials in whioh the huilding is executed give it a striking appearance. The main body of the strikation appearance. The main body of the
elevation is red Suffolk hrick, freely inter. elevation is in red Sufiolk hrick, freely inter.

Each angle of the turret has stone columns and oapitals, from there is a border of red and blook hrick. chimney shafts are in red and black hriot The ornamental terminations and black hrick with tion of the building is intended for hasiness purposes, and the entrance to this part of the premises, as woll as to the upper portions, which are intended for offices and chamhers, will he through the central gateway. The interior of the building is finished in a strong and substantial manner. The staircases are all of stone supports. Spacious corridors, 6 ft. in width, lead o the different suites of chambers on the several floors. The architect is Mr. John Norton, and the contractor, Mr. John Garrad, of Spital

THE TANDSWORTH SURVEYORS AND THE ROAD CONTRACTORS.
Ax inquiry, of a very grave and serious nature has occupied the attention of the Wandsworth Board of Works during the past month, which Battersea last week in the dismissal of the Battersea surveyor and all his assistarts, toge-
ther with the road.foreman ; and the Board glao ther with the road-foreman; and the Board also
decided that in future no tenders should be decided that in future no tenders should be accepted from certain road contractors whose
names were mixed up in a collnsion names were mixed up in a collnsion proved to have oxisted between them and tho surveyor and his staff. A committee of the Board also recommended that the sarveyors for Wands. worth, Clapham, and Putney should be called upon to resign; and, after a long dizcussion, the number iu farour of the recommendation was 24, and against it, 17. This heing on a show of hands, a division was called for, when the result Was 23 for the rocommendation, and 22 against it, the chairman ruling that as the majority was not the majority of the members prosent the motion was lost. The three surveyors in question, therefore, rotain their respective offices for the present, although the actual majority of votes was adverse to them. The charge made agaiust the several surveyors was no less than one of haring accepted hribes from certain contractors, the result of which was that the work on the ronds had been improperly performed, and that the ratepayers had consequently heen derrauded. On this charge heing made, the W. I appointed an independent survesor (Mr. and report to them The suhstance of this gen tleman's report was that, on an examination of the roads in qnestion, he found that the contracts had been improperly carried out, both as regarded the roadway and the kerbing, and a committee of the whole Board, having gone through the report step by step, arrived at the conclusion that the surveyors had heen guilty of neglect of duty, and their dismissal, 8.3 ahove recorded, was therefore recommended,

## THE BOARD OF WORKS

and northumberland house.
The Works and General Parposes Committee of the Metropolitan Board of Works presented a report at the last meeting on the proposed ar rangement for the transfer of Northumberland lonso at Lady.day next, instead of Midsummer, as provided in the Charing.cross and Victoris Euhankment Approach Act.
Mr. Newton moved the adoption of the report He said that this question had arisen in conse quence of some difficulty which had occurred in arrying out the Act of Parlinment until the Board had got possession of property belonging to Northumberland House
Mr. H. L. Taylor seconded the motion, and said the sconer they got possession of Northum. herland House the better, and he wished at the same tirae to throw out a snggestion in reference to it. There was, no douht, a desire on tho part of the members of the Board to view Northumber land House before it was dismantled, and there was also a desire on the part of the puhlio to have an opportunity of iuspecting it bofore it was puled cown. He hoped that the Duke of Northumherland would not object to giving the racmhers of the Board an opportunity of viewing it, of course nuder proper regulatious, before the ouse was dismantle
Mr. Fowler said it was most desirable that this improvement shonld he carried out as speedily as possihlc. The question which had heen raised
hy Mr . Taylor was a very important one, and ho thought that there were many persons who had not seen the interior of Northumberland House, and the more that was seen of it the better, as it contained many works of art which were of imnense importance, and ought to he seen hefore on the rino on the ceilings, and, as thero was a possibility of their being injured in the re moval, he thought did nould be viewed as they were now, and he id not anticipate that there would he any diffionlty in obtaining the opportanity for doing so.
Major.General Sir William Codrington said be anderstood that the cost of $3,500 \mathrm{l}$. for the altera. ion of the time from the 25th of June to the 5th of March wonld be fully recouped to the Board by the early possession whioh would he Mr.
Mr. Rocho remarked that the possession of Northumberiand House itself would not advanco the Board a single step, unless they acquired ther properties facing Charing.cross, and satished bue interests of existing tenants, as some of these tenanoies would not expire for six, nine, or welve months. He therefore said that they ghould give notice to those tenants at once of heir intention to take possession of their pre mises, and settle their claims under the Compensation Clanse.
Mr. Lamzin moved, as an amendment:-
Charing Cross and Vietoria Embenk pront Act, ay the bo reicrered baek to the committne, with authority to anko ateps for the serrice of sucl notioces upon the temants
as may ba nocessary before the
23 th as may ba necessery before the 23 th of of December instant,
and alao to serva the necessary notices upon all

He considered the expendituro of 5,000 . for an earlier possession of the land unnecessary.
3ir. Furness seconded the amendment.
After a protracted discussion, the amendment was put and carried hy a majority of 19 to 15 .

## ARCHITECTS' ACTIONS.

This was an action in the Court of Excheqner Westminster, before Baron Cleashy and common jury, to recover 892.4 s . for arohitect's charges. The defendant paid 40 l . into court in antiefaction of plaintiff's claim, and pleaded set.off aroounting to 10 ?

Mr. H. T. Colo, Q.C., and Mr. Aithur Cohen appeared for tho plaintiff ; Mr. Huddlestone Q.C., and Mr. E. Clarke, for the defendant

 yeara. At the jatter end of the year 1871 the defendmat
instrncted the plaintiff to prepare designs for additions to his preraises, 94, Regent. street. Owing to diffculties the
Works were not commenced until Angust, 1872 . From
December, 1971, to August 1872 rarious December, 1971, to August, 1872 , various extraneous had to be ahandoned ayd fresh, ones prepared, The
plaintiff divided his claim into two heads. 18t. For proplaintiff divided his claim into two heads. 1st. For pro
fessionsl remunerstion for work sad labour done in pre tessionsi remunerstion for work and abour done in pre-
liminary work as set forth, a nominal oum of 285 , 2 nd.
For professional remuneration for work and labour done in preparing sketches, plans, and specifoations, saper-
 plaintifi bssed his clsimn upor the schedule of professional plaintifi based his cisina apon the chedule of professionsi
practice and charges of architects published pader the
sanction of the Institute. Me relied on clause 2 as
fittings; on clages 5,8, , and particularly on clauso 11 as to the legulty of \& special charge boing made for professional services rendered in the alterations of premises
as involving special difficuities and troublcs, nud to cover as involving special diflicu,tieb anc troubics, nud to cove
this he stated that he inraribbly charged $7 \frac{1}{2}$ per cent, on
all works under love expenditure all works under 1 ,000t, expenditure.
T'be plaintiff's case was supported by Mr. Chas. Cooke, F.R.I.B.A.; Mr. Tahberer, A.R.I.B.A, and district sur-
veyor, and Mr. E. Power, A.R I.B.A, and district sur-
veynr. Cooke atated that ho always charged upon the achedule prices, and that had he done so with regard to
plaintiff's account it pould hare exceeded the amoun plaintiff
Messrs. Taßberer and Power both stated $7 \frac{1}{3}$ per cent, to be their nsual scale of charges for "alteration" Torks. The defendant contended that 5 per cent. Was the
usual charge for all architect'a work, and included all extraneous services, nud that without a special agreemen to the contrary, an architect could not legally eharge o recover more.
Mr. Henry
Mr. Heary Yarvis, district surveyor; Mr. Cassar Long Mr. Wm. Berriman, and two or thrce surfeyors aupported the Institute and the Institute'g seale of charges. Al
the defendant's ritnesses stated that they never charge the defendant's witnesses stated that they never charge
more than 5 per cent. whether the worlis were dulicult or not, or whether they involved additionslal trouble and skill or not; and, in answer to plaintifft's counsel,
asserted that they and other architects would undertake the works of "a stable or elaborate houdoir," or the
designing stnined-glass windows, for 5 per cont. commission on the outlay.
The Judge, in summing up, directed fhe jary that the rules of the Institute were a 8 fe guide both for himsel.
and them, ruore particularly when they were corroborated by a member of the coutucil of that body. He con
sidered that an additional charge for works connecte with alterstions was contemplated by the "schedule, hut he left it to them to say whether 71 per cent, was
fir charge on the amount expended. He did not con
sider that
 arctiteat and client, althongh, no doubt, it could be made,
and he left the question of pay ment for extraneous scrvices to the jury to decide 1sat. If the plaintiff wa
entitled to them at all. 2nd. If he were, was 20. a fai and reasonable charge.
The jury, silcer tifo minutes deliberation, returned
verdict for the añt, and rerdict for the $2 \overline{2} t$, and th per cent,
being the amount claimed by the plaintif.

## PIPES AND PRESSURE.

Sir, -Will any of your roaders kinaly sigy what shonla the pressure of 150 ft . head of water, or how it may he
ascertained ?

## BIG TIMBER AND SHIPOWNERS.

In the Court of Queen's Bench, last week, to case of Cabriel \& Co. v. Neane \& Co, testifud to huilding purposes that bas existed in the me tropolis.
From the statement of Mr. Watkin Williams, Q.C wo appeared for Aldeman Sir T. Cabriel, au which way borne out by the evidence adduced it appeared that a contract was entered into with the defendants, who aro Baltio shipowners to ship from Norway to the Port of London 100 loads of balk timber. The defeudants, in pmr . suance of that contract, despatched a ressel to Norway that had not sufficient capacity to ship the 400 loads in one oargo, and only brought 23 loads of the timber to its destination.
The timber merchants alleged that they had sustained a pecuniary loss, as big timber was in great demand by London builders and contrac. tors, by the non fulkiment of the contract, and they now songht compensation in damages.
they now solnght compensation in damages. favour of the plaintiffs, the special jury found for them. Tbe judge allowed costa.

OLD BURLINGTON HOUSE.
Sir,-The Builder of last week contains "a View within the quadrangle" of Burlington House, and in 1871 you published, in vol. $x$ xir., descriptions and plans of the whole building, rogetber with the elevation towards Piccadilly, which is now completed. Would it be assing a view of the front of old Burlington House as altered and improved? When this change on an old friend's face was projected, there were some who feared that the addition of an attic to Lord Burlington's design might injure the proportions of the front hy dwarfing and redacing the importance of the principal order
Our architects tbought ocherwise, and, conse quently, not an attic, but a whole order was superposed, which bas certainly had, to somo eyes, the effect apprebended. But, as if it was thought that this formerly beantiful front could bear further alteration with advantage, withiz the last few months a rusticated arcade has been prefixed to the building, which not only masks, at least, the base of the three-quarter column of the principal order, but in the centre, where
the cntablature further projects over the
entrance, cuts off from view a considerable portion of their shafts.
To an admirer of Palladian symmetry, the effect is positively absurd; but perbaps yon, sir, as the best autbority of the day, may be mie to explain the "rationale of this re arkable performanoe, which jars so disag Travellers' Club.

Trayeller.

## CLEAN AIR.

Sir,-As a rnle, most of us prefer cleanair; but bow are we to get it at this time of the year? Fe close up direct openings in walls or windows : the dranght from them to the fire is unbearable. supply, therefore, clean air warmed by the side ret of the fire, either above or at the side of the fireplace: the room is then provided with a onstant nnfelt, becanse warm, supply of clean ir. No draught is felt, beoause the clean air warmed, and tbe flue removes the dirty air. It seems to me tbat we want simple and cheap means of ventilation, and the above I know by Eperienco affords this.
For summer ventilation I know nothing better than a 2 -in. tuhe of perforated zinc, close to the ceiling, open at both ends to the outer air
J. A. L. C.

## ACCIDENTS.

London2. - On Tuesday afternoon a man was at work upon the leads of a City warebouso when, owing to the fog, he walked off the building, and fell headlong to the ground and froctured his skull. He was taken at once to Goy's hospital, but died shortly after admission.
Liverpool.-A disastrous fire has occurred at the premises of Messrs. Milner, safe manu. facturers. The fire originated in the soutliern wing of the bailding, which has some time since been added to the manufactory, and contained oils and paints in the second storg, and it raged or several hours, duriog which the gable cnd of the worls fell upon some bouses, forming a oul de sae, demolishing two and rendering a third aninbahitable. By this accident a man and a boy were killed, while tbe mother of the boy was seriously injured. Damage was done to raluable and extensive collection of kafes, form. ing part of a large contract wish the fro are getting out or ha 16000 The canse of the fire is shrouded in mystery. Northampton. - At the Petty Sessions, Mr. Pidcock, surveyor to the Improrement Commissioners, made an application for the appointment of two surveyors to inspect the state of honses in Court-yard, the scene of an accident. He prodnced a complaint made by four bouseholders to the effect that the houses were in a dilapidated and dangerous condition. The surveyor said that the Commissioners bad barticaded the Fhole yard to the beight of 7 ft ., but it was soon pulled dowa. Iwo or three bouses were still standing. The place was stewn with hricke, de. The Commissioners had already exceeded their duty by puling down the houses, but wey were obliged to do it. The owner was somewhere in South America, but be bad an agent iu the town. The ruagistrates granted the application. Chester.-Whi'e several men, in tho employ of Messrs. Hugbes, builders, of Aldford, were en. gaged in undermining the walls of a cellar beneath the old club-room, Queen's Head, Seller. street, symptoms of the building giviug way were perceived. The men at once rushed from the spot, and immediately afterwards the baild. ing (two stories bigh) fell to the rround fortunately without injuring any one The amomt of Jo ion are Soller, bere Hessra. the hostelry, which fronts Forerate-strett, and extends some distance up Seller-street, iuto vanlts of an extensive character, and no blame vants of an extributed to Messra. Hugbes, who are can he attributed to Messra. Hugbes, who are the contractors for the work. Cwo or three hours afterwards, a labourer fell of a bace, and injured both bis legs. the same place, and injured hoth bis legs
Oluham.-A fire broke out in the Scotsfeld Mill, Scot-street, off Ashton-road, Oldbam, which resnited in the almost tctal destruction of the largest of the two wings which composed the principal portion of the premises. The whole was owned by Mr. Emanuel Whittaker, mayor of Oldham, hat attempts to transfer it to a joint-stock company were being made. The total value of machinery and premises was held to be not mach less than 30,000 l. The fire
broke out in tho first instance in a mule rolier in the top room, and in a very few minutes the whole top of the building was in flames.

## CHURCH-BUILUING NEWS

Dawlish.-At an adjourned meeting of the committee it has been resolved unanimously hat the eastern end of the restoration of the church should be proceeded with at once. It is ost 3,0007 , and the committce have already works in hand tendered for at $2,350 \mathrm{l}$., makin altogecher about 5,500l.

Henstridge. -The Church of St. Nicholas, at Henstridge, a parish in the sonth-east corner of Somerset, about two miles from Templecombe Juuction, bas been reopened, after having been entirely $\mathbf{r}$ huilt, with the exception of the towe buildings, which had been erected at very considerable expense, were opened. The churcb restoration involved an outlay of over $3,000 l$. It addition of a side-aisle aud organ-chapel. The old arcade of the noth aisle, as well as the arcade of the north ohancel, or Toomer chapel has been replaced. No attempt has been made to restore the monument of the Carent family taken to put it in its former position, without detriment to its antigne colouring , Whou provennents havo been carried out, under Mr. J. M. Allen, architect Crowkerne, by Mr. C. J. M. Allen, arcbitect Crowkerne, by Ir. C. are in the Early and Decorated style, though in are in the Eld building the nave and north aisle were in the Perpendicalar, and the chancel in the Decorated. The olurch is built of native forest marble, dressed with Doulting stone; the roof is covercd with old stone tiles, and the win-
dows, both in pattern and quality of glass, are dows, both in pattern and quality of giass, are
copied from those in Bristol Catbedral. In the copled from those in Bristol Catbedral. In the
tower is a small painted window by Ashwins, tower is a small painted window by Aghwins,
of London; and in tbe south aisie a tbree-light one bas been placed by MIr. Jonathan Gray, of Backwell-hill, near Bristol, in memory of some members of his family who are huried in the
ohurch. The latter window was executed hy Cannon Brotbers, of Smethwick, Birmingham, to represent tbe miracles of raising the dead. The chancel windows at present are of plain glass, but they are soon to he replaced by stained oues, a good portion of the sum necessary for the purpose being already promised. The choir
stalls are of carved oak, but the open benches stalls are of carved oak, but the open benches
are of pitch pine. The chancel is laid with Maw \& Co.'s encaustic tiles; those within the communion-rails presented by private friends of the vicar. A baptistery is formed under the tower, and it has been paved with tiles, and lighted by the above-mentioned window, and in
it is placed the old font. The charch has no organ, hut a fund is being raised to purchase one, at a cost of 200 l .
Uamaston (Pembrokeshire). - Tho Bishop of St. David's, attended with a large number of clergymen, has celebrated the reopening of
Uzmaston Churoh, after haring been closed for Uzmaston Churoh, after baving beon closed for nearly two years, during which period it has
been almost rebuilt. The ouly portions of the been almost rebuilt. The ouly portions of the original building remaining are the tower, a small portion of the east walls of aisle and hagioscope between tower and cbancel, three fifteenth-century windows, two corbels, and a Norman fout and stoup. There were hagioscopes on both sides of the chancel-arch, whioh have been reproduced in the new walls. The internal dimensions of the present structure, which considerably exceed those of the old one, are as follow :-Nave, 45 ft .8 in . by $16 . \mathrm{ft} .9$ iu.; north aisle, 31 ft .8 in . by 16 ft .5 in ; chancel, 19 ft 1 in . by $10 \mathrm{ft} .2 \mathrm{in}$. ; vestry, $9 \mathrm{ft} .6 \mathrm{in}$. by 6 in . by 4 ft .10 in ; and porch, 8 ft , by 8 ft . The width aoross the nave and aisle is 35 ft .2 in ., and the length from east to west, 67 ft .3 in . Local stone, witb dressings of Forest of Dean out. side and Batb stone inside, has been used for the walls, whicb are plastered internally. The roofs generally are open-timbercd, covered with Bangor slates aud plastered between the rafters, the height of that in the nave beiug 27 ft . from Hoor to moderside of ridge. The glazing generally is catbedral glass, in lead diamond quarries, hut the west natre window has been filled with stained glass hy Messis. Wailes, of Newcastle. on. Tyne, in memory of a furmer rector of the parish, the Rev. 8 . O. Meares. Pitch piue and red deal mized have been used for all the wood
fittings. Some of tho internal woodwork has been stained, and tho whole of it varnished. The stone carring has beer executed by a young country mason. The contractore, Messrs. P. James, of Milford, and Mr. W. Morgan, of Haverfordwest, have carried out the works generally, mider the superintendence of Mr. E. H. Lingen Barker, of London, Hereford, and Haver. fordwest, who was selected by tho committee in the place of Mr. F. Welmert, of Milford, who died shortly before the commencament of the works.
Battersea Rise.-The chief stone of St. Mark Church, Battersea Rise, has been laid by the being erected to afford additional new chmodation which the iron church it supersedes was unable to supply. Mr. W. Wbite, of London, is the resupply. Mr. W. Wetor bing Mr. Tnoma Gregory, of Clapham. The foundations are already in, and when the church is completed it will consist of chancel, with transeptal aisles, nave with aisles, south porch, and western vestibule. The natnre of the site, falling rapidly towards the east, affords opportunity for a picturesque and commanding elevation. Tbe chancel is arcaded all around. It terminates in a polygonal apse; and passages outside the polygonal apse; and passages outside the which serves for vestries, choral practice, and other useful purposes. This ambnlatory is in the form of a lean.to aisle surrounding the chancel, with a clearstory above. The transept chancel, with a clearstory above. The transept roofs are very simple, bipped roofs. The nave ratber lofty clearstory. The vestibule at the rest end is specially intended to scrve for unerals. It is made irreg口lar in form, follow. gig the line of the sito. The charch is to be bricks for jambs and arch monldings, with red pricks for jambs and arch mouldings, witb a few patterns interspersed in the plain walling. The only stone employed will be for the caps of the pillars, and a portion of the beads of come of parement nnder the seate, with tiles for passages There will be abundant room for offerings of stained glass and mnral painting from any who may be disposed to give them. The crypt is to be vaulted in briok, with moulded brick ribs and pillars. The accommodation is for 600 persons, neluding 85 children. The contract is for $5,045 l$., including lighting and warmiug. At the west end of the south aisle is a wooden bell-turret, capable of taking a stnall peal of six bclls. It is covered with wooden shingles. The seats will be open benches. In the erening about sixty of the builder's workmen dined at the Freemasons Hotel, and after spending a pleasant evening,
the party broke up at an carly hour.

Atchings on the Mosel. With Descriptive Letter press. By Ernest George, Architect. London: John Murray. 1873.
Mr. Ernest George is a facile sketcher, as wo have seen before now, and has a good eje or a point of riew. Some of his former ketches were reproduced for publication by the anastatic process, but not to his satisfaction ins. Rnskin advising him to etch, he se imse to work, and now him We diftoultios of Wo haro hero twenty he der fiem Thill Ther Cochem Coblenz, and other places, on tbe pictnresque Moselle, or Mosel, to use its German name with Mr. George, brightly and cbarmingly rendered, rith a variety of colour, and precision of touch to wbicb older bands at the needle work do not lways attain. The views of Metz; the market lace in Trier; the old houses at Cochem; tbo iews of Schloss Elz, and the remains of the Elector's Palace at Coblenz, are capital plates. it is specially a book for the drawing-room talole

At Workmanship : a Monthly Magazine of Design, to illustrate the Master-works of Eiget plates are to be given monthly, with short descriptions, and it is intended to illustrate ancient and modern art, including arohitecture, goldsmith's work, iron-work, furniture, bookbinding, and so on. The first number is devoted works wholly of the sixtoenth century. The value of the publication, which apparently has a oreign souroe, will, of course, depend on tbe kill and taste shown in the selection of subjects.

Where there's a Will there's a Way! or, Science
in the Cottage: an Account of Naturalists in Himble Life. By James Casir. London Hardwicko. 1573.
The ohject of this work is briefly to record the labours and hear some testimony to the character of a class of men, for tho most part in the humblest walks of life, who hare rendere no mean service to science. The stories such men cannot be too or ten repeated. Ther intercst in them for all, whether of heir own station or of a hightr rank in life and there can be no fitter present at Christmas for yousg people of various sooial stations than one which will show what patience and perseverance will do, even with moderate ahilities and however hard and laborions a life may be in leisuro moments, "where there's a will there's

ALMANACS AND DIAIIES
The British Alnanac and Companion keeps its top place for 1874, and will be found of neverending use on the library table. Comets and metcors; utilisation of waste ; the International Exhibition; wors and wages abroad; the coinage the worl, with many illustrations; coal; and "Companion," of more than average value The department of Architecture and Pablic Improvements is still in the hands of Mr. James Thorno, wbo gives an interesting oon densed acconnt of what has been done under Union heads during the past year. - The Art usual, and condon Atmanac has been issued as it own. This little book is looked for by thonsands wherever tbe English lavgnage is spoken. It has space for daily engagements, is not too large for the waistcoat pocket, and, better still, costs nothing.-Elegance is the prevaling characteristic of the pocket-books of all aizes issued by Dela Rue \& Co. They are all scientific. De lo Ruo's Desti Diary bas a number
of plain pages for memoranda.-From Letts, Son, \& Co., come all sorts and sizes of diaries and pocket-books. They who cannot suit themEelves here must be hard to please. No. 31, The
Rough Diary, or Scribbling Journal fooleca size, Diary, or Scribbling Journal, size, gives a page to threo days. The quarto
diary, No. 6, is also a capital volume, and includes much bnsiness information. Letts's the month, \&c.), for suspension, may be recommended, -The City Diary (Collingridge) in cludes special information as to London, proper foolscap - "The Labour News Almanac for 18\% f . Price 1d. Labour News Office, 1, Long-acre, London." This is a sort of momorial of a pleasant outing o the metropolitan clubs connected with the Work ing Men's Clab and Institute Union, at Brocket Hall, the seat of Lord Lawrence, formerly Governor Goneral of India, and late chairman of the London School Board. The almanac is other engravings; aud contains a list of clubs other engravings; and contains a list
and institutes throughout the country.

Lectures at the Royal Polytechnic Institution.-The lectures arranged, and now in course of delivery, in the scientific depart-
ment, at the Royal Polytechnic, by Professor ment, at the Royal Polytechnic, by Professor series deecriptive of "Inventions and Appliances Useful or Necessary to Every-day Life"; the snbjects being, "Sugar; from the Cane to the Teacup;" and "The Silber' Light and Light-ing,"-both more or less important to all. Mr. Silber proposes to make use of petroleum lamp as sources of heat, for cooling and other pnr poses. Ho has at present completed two cookung contrivances. One of them is a substantial glass ehimney can be removed, and replaced by a coffee-pot, which is, in fact, a metal chimney surronnded by an onter cylinder, the coffee being made in the space between the tro. On sancepan, in which water can be boiled in a few minntes, and which is intended to cook eghs, potatoes, dc. The sancepan can be replaced by potatoes, dc. The sancepan can be replaced by a pan, in which a chop or rasher can be fried. coffee, hot milk, eggs, and a chop, can be cooked coffee, hot milk, eggs, and a chop, can be cooked
more than thirty times at a cost for petroleum more than thirty times at a cost for petroleum
of only one penny. The other contrivance is a field-oven and boiler, with a hot-plate for two sancepans. Tho boiler holds about 24 gallons of water, the oven contains about 18 cubic feet of space, and will bako bread or joints, by the heat which is furnishod by four lamps.
Hydraulic Automotor: Pumps Super-seded.-The wonders of the hydraulic press have prepared one for other extraordinary tion, and we now observe, from an elaborate article in the Mining Journal, with drawings of mechanism in illustration, that a "hydraulio antomotor" has been invented (though not antomotor" has been invented (though not yet in practical use) which, it is expected, raising water, whether from mines or for any other purpose. This important idea in connexion with practical hydraulics is claimed by Dr Bonron des Clayes, of Paris. It is evident that, if whilst retaining, or nearly so, the propor-
tional relations between the power and the tional relations between the power and the
resistance of the hydranlic press, we could resistance of the hydranlic press, we could
sncceed in angmonting in a notable proportion sncceed in angmonting in a notable proportion
its conditions of specd, wo shonld its conditions of specd, wo shonld have a motor at once the most powerful, the most economic, and the loast dangerous in use which conld be placed at the disposal of mankind. It is precisely of this problem that the hydraulic antomotor is claimed to be the solution, and of which a theore
offered.

Tunnel from Denmark to Sweden.-Tho Correspondance Scandinave says that two Danes MMF. S. Edwards and O. r. V. Petersen, have applied to the King of Sweden for a conceesion In support of theire a tunnel noder the Sonnd. In support of their request they have forwarded a letter from the Danish Minister of the Interior agreeing to give them a similar concession as
regards Denmark if they can show by the 1 st of Septembor, 187, that they can command the needful capital.

Liverpool Architectural and Archæological Society.-A meeting of this Society was held on the 10th inst., at the Royal Institution, Colquitt-street. Mr. T. D. Barry presided, and in some remarks mentioned the fact that one of
their members (Mr. Heffer) had obtained the prize essay in the competition for the best design for the Hastings aquariam. Mr. W. Parslow, the secretary, observed that it had been suggested to him that a public aquarium wonld be a great acquisition to Liverpool. No doubt many material contributions would be made by captains visiting the port if one were established. He thought the contributions promised by several gentlemen for the erection of an art gallery, before the mayor undertook that work, might very well be appropriated to the erection of an aquarium. Dr. Haywood con. erection of an aquarium. Dr. Haywood con-
curred with the suggestion. Ho thonght, how. ever, thore was sufficient moxey and public spirit ever, thore was sufficient money and public spirit
in the town to accomplish the object without robbing the art-gallery. Nr. J. Smith afterwards described what is called as his invention of an inverted ventilating syphon. It would seem to be similar to the late Dr. Cbowne's arrangement.
The New Cattle Market, Newbrury:This market, built from the designs, and carried out nnder the personal snperintendence of $\mathrm{Mr}_{\mathrm{r}}$. J. H. Broney, architect, Speenhamland, was to rontare to the new street of about 450 ft ., and has, besides a recossed main entrance, two side entrances, one at either end. The site in lengt is 470 ft ., with an average width of 68 ft . The interior space of about 3,600 square yards, is divided into three sections, that nearest Cheapstreet being set apart for pigs, the central portion for sheep, and westward for cattle. The settling room occnpies a central position. Adjoining there is a good store-room, with other necessary conveniences. The enclosed space on the right of the western entrance to the market is in tended for the sale of horses or yonng stock, having a covered shed 56 ft . long by 12 ft . dcop. There is a supply of puro water for the use of the market. The market is approached by roadway, 30 ft . wide, from two of tho principal thoroughfares, and having the railway statio and corn market within five minutes' wall.
The New City Fall, Carlisle.-The Pnblio Hall for the City of Carlisle is rapidly progressing, and the chief stone was to be formally laid on Tharsday, December 18th, by the Mayor of Carlisle, assisted by the Corporation. The anilaing, soys the local Joumal, will be on it is required. The site is a good ore bein within two or three minntes' gall one, bein street and the station, with a frand man in front for any number of carriages spaco in come and go, withont ancer ar tonfusion, and tbe accommodation insido will be all that is desirable. There is the large hall itself, seating desirabie. There is the large hall itself, seating
2,000 people in comfort. Then the smaller hall for 500 , which will be in frequent demand for sales and small mootings; then four shops, with good cellarage, \&co., in addition to the halls, will form a nseful basis of permanent income. There will bo ample space for ingress and egress, and plenty of escape room in case of fire. The rcfreshment and withdrawing rooms are ample,
while ventilation and warnth, as well as freedom while rentilation and warnth, as well as freedom
from draught, have all been thoughtfully considered.
The State of Ieicester Square.-At the last week's meeting of the Metropolitan Board of Works, Mr. Bidgood, who Lad a notice on the papor that he would call the attention of the Board to the decision of the Master of the Rolls in the case of "Webb $v$. Tullh;" as to the garden he attention of the solicitor since his notice he attention of the solicitor of the Board had been directed to the snbject. The judgment of he Master of the Rolls should be printed and referred to the Works and General Purposes Committee for consideration and report, and he moved accordingly. Mr. Smith, the solicitor to the Board, said that he had consulted the Parliamentary agent, and he bad informed him that if the Board were desirous of carrying out any plan for the improvement of Leicester-square, the standing orders might be snspended, to euable them to do so in the coming Session of Parliament; but he must, at the same time, ask the Board to anthorise him to take the recessary steps for the parpose. It was agreed that the solicitor should be empowered to take all necessary steps, and report them
General Purposes Committee.

Mechanics' Institute for Calverley.-The roundation-stone of a new ilechanics Institute has been laid at Calverley by Mr. Joshaa Fielden, M.P. The sito of the building, which is in the centro of the village, covere an area altogether of 580 scuare yards. The building itself, which will he in the Gothio strlo of anchi tecture, will be 60 ft by 36 ft . of two stories, tho lower floor comprising a read, ing-room 22 ft . by 15 ft ., library, smoking-room class-rooms, lavatorios, \&c. On the upper story will be a large lecture hall, capable of accommodating 500 persons, and ante-rooms. The prin cipal ontrance to the Institute will be by a porch access to which will be by a flight of steps. The building will be bnttressed all round, and will be surronnded by ornamental palisading. Including the site, the estimated cost is $2,000 \mathrm{~L}$. The building will be erected from the designs of Mr. John P. Kay, architect, Idle and Leeds ; Messrs. IV. \& C. Murgatroyd, Idle, are the cont Mactors for the mason work; and Messrg. J. \& E. Barker, Cal. verley, the contractors for the joiners' work.
"Catnach" of St. Giles's.-The editor of Press News favours us with the following:-
"We Lind that the Stotioner has been inadrerten thy led
into doing us an injustice br printing an aneadate into doing us an injustice by printing an anecdote from
the Builder coucerning Old Jemray Catnach, which is Ford for word the mame as thant given in Prese News a short time back, boing allusiong to that eccentric old
eharacter in his habit of washing his dirty halfpeneo character in his habit of washing his dirty halfpeneo
in zolution of hot vinegro, and also spasking of his
making making a doal of money by publishing a catchpenny sheet gain ! These items we had from an old friend of Catmachis, and te consider it very mean and palkry of the
We go a little out of our way to assure our critic that he is not gnite correct. We never aw theso aneodotes in his paper. We have heard them mentioned as known facts in more han one quarter, and they are printed in a book published by Reeves \& Turner,-"The Catnach ress: a Collection of tho Books and Woodents f James Catnach, lato of Seven Dials, Printer," prefixed to which is "The Fill, True, and Jemmy Catnach."
Homerton and Hackney.-The local press are doing their duty: one and all receiving with good feeling the observations we have been led to make, and urging the necessity of attention. The Hackney Eirpress says:-"We have again much pleasure in colling attention to an article in the Buitder on matters vitally affecting this district. We have ever given prominence to the discussion of sanitary and social subjects, and have constantly adrocated reforms in many diroctions. We therefore welcome the present arder the on contemporary, asd in order that its unimpassioned but trenchant articles may have the fullest possible effect, we have reproduced them in these columns, and intend, in onr next issue, still further to follow up the subject treatcd. We trust, bowever, that the Builder will not leave the work incomplete. Having done with Hackney, the sister parishes of Betbnal-green and Shoreditch offer a promising field for similar investigations, whioh will abuadantly repay the attention of our excellent contemporary.
Proposed New Council Chamber at the London Grildhall - Mr. McGeorge, chairman of the City Lands Committee of the Court of Common Conncil, at the last meeting, moved the adoption of a report from that committeo, so far as it retated to the bnilding of a new council chamber, at an expense not exceeding $50,000 \mathrm{l}$. and that the committee prepare and bring up plans and cetimates, together with a model of the proposed new chamber, aleo plans for the reconstruction of the offices of the Guildhall, showing how fre the new chamber will be in harmony and form part of the whole plan in the reconstruction. The motion having boon seconded, Mr. Rudkin proposed, as an amendment,
aderation, and that the committee do prepare and bring ap plans and estimntes, together with a model of the proposed new chamber, and, if necesasry, the reconstruction Mr. Knight seconded the amenduent, which was carried.

Stove Competition,-The testing of the stoves sent in for competition for the Society of Arts' prizes will shortly commence, half of the testing-rooms beiug nearly completsd. These rooms are boing buit by Mr. Nicoll, on his patent method of concrete-building. A large number of stoves hare been received, the number of competitors being 107.

## VOL. XXXI.-No. 1612

The Masters' Federation and the General Welfare.

IIE pen was just dipped to writo a word or two of Christmas counsel and greeting, whon the expression "the national federation of employers" fell npon onr ear.
Wo cannot conceal the fact that this phraso has cost us no small amount of inquietude. We are not for a moment ahout to assume that the respectable and eminent men, whose names are citod as forming the conncil and supporters of the federation, are actuated hy any motives but that of "supporting that which is for the common good, and steadily opposing that which is adverse to industrious interosts." Such names as those of Salt and of Croseley, of Akroyd, Ashworth, and Marshall, of Hannen and Trollope, are sufficient to provo that suoh is the real ohject of the organisa. tion. Nor are we ahont to he gailty of the impertinonce of advising tho council how to do their own work, or suggesting that they may at all he likely to drift from their proposed course. Nor, lastly, can we at all say that there has not heen, even within the twelvemonth now near its conclusion, ample warning to tho employers of labour that they should look anxiously and kecnly to their position.
But thinking and writing, as we trnst we always do, not for a class, but for a brotherhood of classes, we cannot but point out to our respected friends who now taleo the title of a "federation," what appears to ns to ho an element of no small danger in the scheme. It is a qnestion of Flag. We have lately seen how such a question may he, in point of fact, decisive of tho destiny of a nation. Not that a Flay is, in itself, more than what Bonaparte said "the throne" was, "three hits of wood and a hit of velvet." But it is the expression of a policy, and of more than a poliey,- -the expression of a conviction. And when a Flag is oneo raised, it soon hecomes more than a symbol. It hecomes a power. It rallies round it all classes of sup. porters. Anon it hecomes necessary to lay down certain lines, to abandon certain positions, to enforce others, -in a word, to define snch a line of policy as shall enlist the greatest number of supporters; and to carry out the common object of the mass of those snpporters hy imposing a stern discipline on the whole party. The compensations and 'graceful concessions to opposite opinions, that form the very oil of the social machine, are excluded hy this process. Thas a committee, a conncil, or a federation, hecomes a
machine which may, no douht, he very powerful, hnt which works with a high degree of frietion.
The danger in tho present case we take to be rather in reaction than in action. It is not so muoh to the programme of the Federation that we refer, as to the effect that the programme maly have on the other members of the great industrial partnership, -the owners or makers gave wings to our words, has heen to promote
the union of masters and men, to show the solidarity of living and of stored-ap work, to in. crease the harmony of the capitalist and the lahonrer. With this view we have ever pro. tested against association on the part of the workmen heing cast into such a form as should be likely to lead to war ; still more against any association expressly organised for the purpose of war. With the same ohject in view, we have to arge on the employers of lahour the propricty, and the true wisdom, of carefully aroiding anything that may look like an organisation of class against class, or the repulse of a danger by a menace.
We have, it is very likely, in these colnmns referred more than onoe to certain facts con. nocted with the industrial history of Europe that have profoundly strack us, in the course of professional visits to varions parta of Enrope. They are facts that cannot the too widcly known, or too attentively contemplated. We refer to the certain evidence, which is afforded hy the citics of different parts of the Continent, of the former existence of a great industria? prosperity, followed by a great ruin and collapse. This evidence is afforded by long strects, or wide quarters, of closed, tenantless, decaying bouses. In some of the great cities of Belgium, the speo. taole first hung upon us like a nightmare, It is now some years ago, and matters may have altered for the hetter. But Bruges, if memory does not fail, offered one of the most conspicuous examples of monuments of a past and half. forgotten energy. In Bordeanx, oneo one of the main seats of commerce, we have counted whole streets of tenantless houses. In Brindisi, once the Livorpool of the Roman Empire, the de. crepit, desolate, unocenpied houses appeared to form the majority of the haildinge. And what, in these cases, is matter of local decay, in Porngal may be ohserved as evidence of national decay. Nowhere, not even in Italy itself, can he seen such marks of stately power, and of nnhounded wealth, as in Portugal. That ancient kingdom was our precarsor and pattern in opening the world to the merchant. Her ships first donbled the Cape. Her sons were the first, or among the first, to circumnavigate the world; and in due reward for the untiring energy of her sailor prince, and her enlightened monarcbes, the exhaustless East"
"Pour'd in her lap all wealth in teeming showers." The monasterics, chnrches, and palaces Portngal show a lavish and well directed outlay of wealth, to which it is hard elsewhere to find a parallel.
What is Portngal now? We need only ask the inquiser to walk throngh Lishon in order to reply. There the rains cansed by the carthquake of 1755 yet stare ns in the face. Since the time of the great Minister Parabal, the desolation of a proud, helpless, ntterly ignorant idloness seems to haro enwrapped his country like a mist. Have these things no lesson for ns? Is our. prosperity necessarily more eternal than that of the great centres of anoient indnstries in the Low Countries ? Is our commerce more inde structible than that cradled and nursod by the are of the groat Prince Heory of Portugal ?
The effect on the mind of snch scenes as we have mentioned we take to he this. They show os, more plainly than mere languago can do, the leeting, transitory, perishahle nature of mannfacturing and commeroial prosperity. They point, hy reoent and familiar examples, the same moral that is tanght by the nameless desolations of the mighty cities of the East, hy the shapeless heaps that mark the sites of queenly Bahylon, -that great centre of com. merce, of which the power and inflience were so widely spread, that we yet weigh our gold and silver in Bahylonian grains, and measare, there is some reason to helieve, our Ordnance triangnlation, not only by Bahylonian angles, but in Bahylonian feet.

It is only a fcehle and unpractical mind that can experience such a shock as a visit to one of the scencs we have cited is calculated to give, withont sceking for some cause, at once explana. tory of what has passed, and fraught with counsel for the future; and wherever we can trace it, the cause of tho loss of power and wealth oan generally he traoed to the relasation of the ties that should hind society together, as in one golden hoop. Even whero foreign conquest has applied tho torch which has wrapped city and shrines in common destruction, that conqnest hes for the most part heen invited by civil dis. cord. Tho history of Europe is full of the lessons how, hy that very municipal spirit which, to a ccrtain extent, was the very spring of modern civilisation, were developed party inte. rests, olass interests, personal interests, which tore to pieces the garments, nay the very limbs, of the mother country. And it is an action of this nature which wo so mnch droad for Great Britain,

We hold that to be a very false view, either of religion or of history, which regards lahonr as a cnrse. On the contrary, it is not ouly the © mmon lot of man, lut also the school of all that is great in man ; and the splendid triamphs of physical and mechanical science which dis. tinguish the present age have for ns this nohle function, that they tend to remove from labour all that lowers or hrutalises the lahourer, at tho same time that they inerease tho lahouring power to an natold degree.
With this new instrument given to mankind,with the ever-new and evcr-surpassing services of that "drudging gohlin," the steam.engine,new views as to the staus of the lahourer are hecoming more and more clearly understood. It has heen very fully pointed out hy a writer in the Edinburgh Review, in a notice of Mr. Thomas Brassey's valualle hook, "Work and Wages," that we have to reconsidor many of our oldfashioned assumptions as to worl and the work. man. Looking at the thing from the lowest stand. point, it does not pay to over-drive the lahourer. Cood food, good clotbing, good lodging, or, in another word, good wages, are found to he indispensahle to produce good work. Of conrso, the thing may he overdone; hat the main ides is, that there is a certain rate of pay, and a certain amount of time which the lahourer emplogs in work in the conrse of the year, which will produce the largest economic ressilt. As an abstract statement, this cannot for a moment he denied. Then comes the practical question, where doos this limit lie? aud experience goes to prove that it lies considerably higher tban we have been in the hahit of taking for granted. Il is more remunerative to the employer (provided the lahouror conscientiously does his hest) to pay somewhat higher, and to demand a somewhat shorter time of work in retnrn, than wo have, until very reoently, con. sidered to be the case.
The reign of merecapital, if we are not much mistaken, has reached, if not passed, its apogee. The school of Adam Smith has done good service, in its time, in calling attention to the power of capital, and to the advantage which the lahonr of to-day may derive from the wise application of the fruits of the lahour of the past. But there are signs ahroad that the most thoughtfinl men of the day are taking a great stride in advance of this time-honoured position. The power, rather than the rights of lahour, is that to which the attention of the producers of ahour is now directed hy their wisest friends, and with the hest promise of good results. Not the power of idteness, or the power of ohstruction, but the frnitful, creative power of the human arm, hand, and hrain. Further, it is be. coming daily more and more evident that the principle of association, if fully acted on by the working classes, is one that mnst greatly modify the power, and prohahly the existence, of oapi-
talists as a distinct class. If this nem set of the tide is taken intellisently and houcstly into nocount, il will be well for the honest and indusif this he really the set of the tide, it will be as id'e to attempt to withstand it, as for Mrs. Partington to try to mop up the Channel.
No individual in history, ancient or modern, has done so mnch to imperil the reign of great capitalists as the late Emperor of the French. His Government has done this in two ways,- direct and indirect. Directly, he sot the example of appealing, in the first place, to the mass of the people, for
the loans called fuaded deht. Lonis Napoleon had the oppertnuity (it is not every ruler who had, or who could prefit by it if he had it), has, or who could prefit by it if he had it),
of knowing how very littlo great capitalists actually do for any sound financial operation, with the exception of drawing a large profit from it. Having the credit of France to draw upou, he thonglit it hardly neoessary to give Kotbschild or Perière 10 per cent. for merely
endorsing his hills. The enormous anccess of tho endorsing his hills. The enormous anceess of tho popular appeal for Rente, inangurated in the later years of the Empire, is well koom, The
importance, and also the facility, of the associaimportance, and also the facility, of the associa-
tios of small sarings, for a public object, was thus proved. We are not asserting that it is a good thing for a Goverument to havo great facility for raising money. Our opinien is to the contrary. But, when a puhlic lean is required, we have been thus shewn that the direct appeal to those flom whose peckets it must ultimately
come, is hoth the surest and the cheapest method.
The indirect blows given by the latter year of the cmpire to the power of capital bare been no less severe than this pointed attack. The great scandals connected with great finaucial names; the collapse of great credit establishments; the fatal Mexicon war, originating in a "financing" speculation, and culminating in the fall of the these have been amongst the blows to which we refer:
Now, althongh it is an old bit of wisdom which remarks that by-standers see more of the game than do the players, we are not to snppose that
great signs of tho times such as those we hare called attention are those to which prudent aud foresecing men, both among the capitalists and among the working classes. And those thonghtful persons will be disposed to agree with us in the opinion that we are now at, onward path divides into two and wich the take it either to the richt hand or to the left Either we shall Eitit which closed the welsh Jeginning of the present year, to a gradually leginning of the present year, to a gradually
increasing difference and antagonism between employers and employed; or we shall take a turn employers and employed; or we shall take a turn
in the other direction towards a trae harmony in the other direction towards a trae harmony
and move intimate solidarity between the two. The former conrse, if unhappily persevered in, will tend to much ill blood, much suffering, and much advantage to the foreigner at the expense of the English workman. It will check our industrious development, paralyse onr commerce, and finaliy swcep away the capitalists, as a class, from this
country, withont any resulting adrantage to the country,
On the contrary, if we take warning by what others have suffered, and by what we have
hardly ourselves escaped, we shall drawt together hardy ourselves escaped, we shall draw together master and man begin to look at their mutual relations in the light of a wise partnership, rather than in that of a sharp bargain.
We think that, by due considcration, the federation of employers of labour may play a not inlittle doubt thart in the good work. We have of itself, beoome an influenco in the opposite direction : a cause of strife, rather than a sourco of harmony.
Not to be rague, and thns of little practical aid, in the advice we ventnre to offer, we will indicate plainly what we mean. We think it essential toproduce the reanits at which all good men should aim, that the Federation should give pledges of the truly catholic and national olject programme, and the other by their composition As to the promramme, there is composition. which they may inscrihe on their banner withont Which they may inscrihe on their banner withont fesigning and the bad. Let that principle the designing and the bad. Let that principle be,-the independence of labour and the sanctity of
contract and of law. Let the compact between
master and man he freely entered on,-freely by octed by all the rivour of the law. Those who terrify or seduce the workman, who dispose of his cuergies at their command, and prevent him from selling them to the hest market, are the real enemies of society. Wo do not care whother they wear fustian jacketa, but hold out hands unhardoned by the honest stamp ot labour, or whether they dwell in mansions and recline in luxury. Wo do not care whether ther are stump-orators or "hooks in breeches,"-thinking-machines. Thoso who step hetween master and man, save to draw them together in strong Christian hrothorhood, are the enemies of both, the enemies of labour, the enemies of wealth, the enemies of England.

Then, in carrying ont this national and indus. trial programme, the Federation would nt once trial programme, the Federation would at once take o great stride in public acceptance by associating with them some genuine representa.
tives of lahonr. Not any of those who have tives of lahonr. Not any of those who have
come hefore the world, soft-landed, as we before come hefore the worl.d, soft-handed, as we before
binted, as the "labourers' friends," hut, as reprebinted, as the "labourers friends," hut, as repre-
senting the class from which they spring - men senting the class from which they spring, -men
who, from humble origin, have attained great who, from humhle origin, have attained great wealth. It is not onr province to point out
individuals; but we will indicate the direction in which we are looking. In Novemher last we out ont from a paper, sent with the report of a certain railway meeting, an account of the operation of a co-operative industrial coal and iron company, in the North of England. It was the third annual report; and after paying 5 per eent. on all the capital employed, the directora divided, for the half.gear, a bonus of $2 \frac{1}{2}$ per cent, and included the farther entry "to the of the compana retarn of the capital embarked in the several departments." Of this thoronghly respectahle enterprise we know no nember or associate. We observe that a City financial paper calls attention and not earning of 10 por cent., not on paper, the leaders and organisers of gound.working schemes like these,-enterprises for which the capital is fonnd in the pockets of the workmen themselves, redeemed from the tithe of the pnb. rican and from the "salary" of the paid acitator,that we think the members of the Federation will do well to look for that popular element which shall prevent them from coming before the world in the guise of an exclusive class organisation.
Sserved in renarks were on paper, we have observed, in the columns of the most widely circulated of tho daily papers, observations Which, though not antilpating our own, coincide very fully with them. Tho Tines appeare to bo the dan awaro, as we ourselves have been, of the danger of a "Federation" proving a sonree rather of discord than of nnity. It has directed its remarks chiefly to the subject of some of those legal measires (such as the penalties against conspiracy, picketing, and the like) in which opposite viows are advocated hy some of the employers of lahour, and hy the great
masees of the labourers themselves. In all such masses of the labourers themselves. In all such
questions, however, it must be obvions that ony steps which tend to clotho the Federation with something of the natnre of a court of arkitra. tion,-which enable them to speak, not in industry, fed and supperted by but in those of convert, fed and supperted by capital, -would engine of party warfare into that of a promising organisation for general aeeord, and for the promotion of the national welfare.

## BRICK ARCHITECTURE.

The order given by the Egyptian taskmasters to the Israelites, is in snbstance echoed just now by some notive professional practitioners, - "they there scems to be a decided loaning in corta quarters towards the employment of brick, not as an ocononical snbstitute for but in procen, not to, stone. Whether this is the conserncmere the canse of some of the studies that hase been hirected to tho eh the blat of that been brick is necessarily the staple huilding materiat brick is Decessarily the staple huilding material, to think it is rather the whould bo inclinca tudied and is rather the former. We have studied and more or loss imitated, or adapted, most varientes of European worls of the great architectural epoch, sotar as style is concerued; and a material hitherto comparatively littlo nsed,
hin ia some contries has been so aln insively employed as to give its own decided stamp and character to the architecture emhodied nggests new comhinations of old things. The iscussion which has taken place therenpon is indicative, along with other things, of the wish of ind some degree of novelty of architectural expression in the revival or transplantation of some of the foeling of an essentially brick archis Bone of
tecture.
From one point of view, certainly, it might be urged that we can have no need to ge to other countries to study this class of architecture, when Wo have a brick architceture, pure and simple, so peculiaxly our own, omitting notice of earlier worls in this material, filling so many leagues of our streets with its unadorned neatness, and rising to something of monumental graudeur and dignity in the masses of warehouse and factory, to be found in different parts of the kingdom; heaps of bricks, as Fielding somewhere obsorves, piled up as a lind of token or monument, that leaps of money had been piled first. It is all very woll to sneer at the "hole-in-the-wall syyle, but it has at least been a great fact; it the exprossion of the sole and comprebensive dea of thonsands, we might say millions of people, as to the possibility of arobitectural expression in the exterior of city, and even of many country, homes: it represeats, in one point of view, the readiest, simplest, and most economical way of using a material which cau be Cormed into anlimited aumhers of cuhes of cxactly the same size and proportion; and its nerita in its palmy days Lave autracted the comnendation, the sympathelic admiration of a very minent medern philosopher.* It has the quality, pecially charactoristio of the grandest produc tion of the art, nnity and breadtb of style; like the Doric temple, it achiever effect by a repe tition of similar features; and any section of it, talen soparately, is, as a composition, complete in itself. The researches of modern architectural ritice, however, are tending to throw contempt on this chaste and aevere style of brick architecure, and drawing our attention more and more o the effects produced in other countrics by monlded brioks, and tracery, and other tours de orce of this lind, in burnt clay from which we may draw wholesome lessons and precedents for ransplantation to onr own streets and squares. If wo beyon the pure English style of riols do molur disting He ere he ill onsiderable hisuano tyle bith the first ule, aly in lo merely the snbstitation of brick for stone in the nor the chielly of economy; thongh it may "tre accompanied by a cerrain amount flines or crosses of darker bricko therthor fines or crosses ther then red brick ground. Though this is an imitation - brick and atone of a masonio style, rather han a distinct style, it has, nevertheless, a character of its own, and in old houses espe. cially, where the conflicting brick and stone elements have been toned down by time, it is capable of very pleasing effect. But in moro recent times this method of combining the two wateriais has been the mediun for all kinds of architectural commonplaces and vulgarities. It affords a means of getting what is supposed to oe an architectural effect at a reduced cost from that of stone, and is eminently nseful in the production of the kind of dwellings or shops called "handsome" or "respectable," as the egree of stone embroidery is mote or less prouse. It is especially disagreeable when carried ont with those staring, cold-looking yellowish bricks, which are the bane of so much modern own architecture; and at the hest, the system of combining brick and stone in this way pro. ceneons character takes away entirely gives it a kind of put-together cabinet appearance, with what we have heard called the "architectural features" added and framed into the rest. It ould be possibe tonse brick and stone tomether rul moph architectural woy then this, making a basement of the one and saperstruc. ure of the other; for instance, instead of putting the stone in after a carpenter and joiner's

Sce Carlyle's appreciative remarles as to the quality and eppearaice of the bricks in the olde
and elsewhere, in "Bhootiug Ningara."
fashion, to make jambs and architraves to windows avd doors. The colonred brick architecture is, as far as this country is concerned, of modern origin, or rather importation. As carried ou here, it is distinguished by great flatness of treatment, and a freqnently violent opposition of strongly.coloured patent brick; though lately there have been attempts to realise more delicate harmonies by the combination of stone of suit able tints. The style is, in fact, the importation arising not unnaturally in a southern climate where there is plenty of light to bring ont distinctions of tint, and where material of rich and delicate tints (marble) could be procnred, either to be nsed alone, or to combine with and harmonise the more raw hues of brick and tile work. We have not the same faoilities here, We have becn smitten with "the brick and marble architecture" of Italy, and have trans planted it, minus the marble, into an atmosphere Where we have only two things to choose beeither to make it very unpleasautly stray at first, or to see the effect obliterated by weather in a very short perion. The coloured brick style, when the huildings are new, gives certainly a varioty to our town architecture, and does not there clash with the sense of association; but it quiekly loses its effect. In the country, on the other liand, the style is an anomaly, not har. monising with tho colour or with the sentiment introduction of this style is for interiors, where it can be treated more delicately without danger of losing its effect so soon; though even here it needs to be handled with a delicacy and refine. ment, in regard to ohoice and arrangement of ment, in regard to oho
The genuine brick style, wbat we before called the moulded brick style, is that which has the moulded brick style, is that which has naturally and of necessity been doveloped in trinst to tbis as the only material avaitable in any large quantities for realising their designs. any large quantities for realising their designs. of Pomerania and some other regions of northern Earope is the genuine ont rewowth of the neces. sities of the case. It is the attompt to do in brick work what in other countries other Mediaval workmen accomplished in the grander and work plastio material, stone. And ferv things in the history of architecture are more interest. ing and more characteristic than the monumentis left by builders contonding with restricted materials, bnt determin to produce with these this efrect they. Xike all styles formed in this natural and nnaffected manner, the brick architecture of northora Europe is marked by a charaoter at the same time distinct and homo. gencous, and direotly the result of the pecn-
liarities of the material. Imitated in store, the featnres of such a building as the Marien Kirche at Stralsund would appear for the most part wall would be bare and cold itsed spaces of foatures thin ware and cold, its oruamental foatures thin, wiry, and starped looking. Recog. hise, howerer, the character and limitahions of the material, and all this is changed, and the design comes out as a suitable efficet and picturesque achievement.* Nothing could more
forcibly illustrate the relative nature of archiiorcibly illustrate the relative nature of architectural design, and the extent to which the intelloctual capacity, the reason, is appealed to
by it, as well as the eye. It is noticeable, too by it, as well as the eye. It is noticeable, too,
that the satisfoctory effect fails where the that the satisfactory effect fails where the
matorial is strained to do what it cannot satis. matorial is strained to do what it cannot satis. long lines of mulliou in such a material as moulded brick. Conversely, the long pilasters, the square turrets and pinnacles in the Pomeranian brick style, which in that style appear as a satisfactory and characteristic treat. rnent, would, if carried out in stone, appear simply bald, the material being capable of so much more rich and free treatment.
Regarding this last as the true brick archifoctural style, in which the material is made nse of to produce purely architectural effects of composition, surface ornament, and light and
shade, through the means of moulding and shade, through the means of moulding and areading, but with its own pecrliar manner suited to the exigencies of tho material; the ques.
tion then hecomes, how far is it desirable, in a hecomes, how far is is desirable, in
 Ward thrust at the external anitles of the apse, in a style
where buttresses would be ont of keeping.
country where there is no lack of good average building stone, to carry ont and enlarge upon astyle Which in roality expresses the absence of stone absence? If anything like an imitation of the North German style were attempted, it would almost oertainly be a failure; for it would he d deliberate putting of himself into fetters by the architect, who should be content to use an inferior and cumbrous material when ho had ieldine diy to his hand. Among our stone on brick is an anomaly. On the other hand, what we do learn from this brick architecture mong other things, is the palue of homogeneous materjal and treatment, rather than patchwor of a better and a worse material. Brick archi teoture shonld be purely brick, architecturally speaking, and aim at brick effects and treatment, and not be dependent on extraneous stone features to make it pass for architecture. And Where circumstances are such that it really wil feeling us realise an architectural efect and bourhoods where the stone of the district is poor or in small quantities, there will really be a valid reason for emploging the artificial material ; for tbero cun be no doubt tben as a mere material, in regard to tone and coloar, and even finish and durability in mouldings and orna. ments, good brick is botter than a soft and inferior stone. Such cases, howevor, are exceptional in this conntry; etherwise, a develop. mont of pure hrick architecture here nuust be the result of a wish to obtain a new source of effeot, something wbich our more usual orna. mental building materials cannot realise. That this is possible with brick there is no doubt but not economically; any brick building, to realise architectural effect of a high order, is likely to cost as mucb, or more, in time aud workmanship, if not in material, as stono. Whether it is worth while to try experiments of this kind will depend entirely npon the way in which architecture is regarded. If we pre. serve the utilitarian theory, and regard a bailding as a necessary erection, to be set up of the most suitable and procusable materials, and with them made to look as picturesqne as possible, brickwork can only retain its place in the vory plain olass of buildings it has hithorto will bo best hnilt of stone. If we heyond that tecture more as an stone. It we regard archi. lecture more as ornamonil art, in which we can take any matcrial we like, and fashion it to be an tastes, that is another lhor, ana may which interesting experimen; but the cases in public architccture is for the most part indis public architecture is for that part inars solnbly bonnd up with public econony, and experiments therein cannot he honestiy or
snocessfally made, to any but a very limited extent

Where brickwork is to be used in architec. tural design, however, it must be observed that at present we are, in a second sense, in the position of "Israel in Egypt"; for "there is no highest class of brickwork is not fortheoming; highest class of brickwork is not forthcoming; than ordinary, for special pnrposes, requires something littlo short of an act of Parliament to produce the article. Perliaps a little experimentalising in brick design might at all events have the good effect of forcing our brick manufac. turers a little ont of their usual groove, and welping to demonstrate that there are mor

SHALL ALL THE NATIONS BE ALIKE? Ir must often have been a subject of wonder ss to how it has come to pass that no scien. and written a book person has as yet got the work aspirations or dominant ideas of the leading nations of the world at each partionlar epoob. or instance, what fras it that filled the thoughts patrinchas a predominating idea in the old barharism, and barbaric pomp and glitter? What in the Dark Ages? Might not a philosophic history of the world's mind be got out of snch a method of search and treatment and inquiry as this? There might be a good deal of difficulty night puzzle sometimos the rery keenest of filled men's era. But nowadays in these centres of civilisa.
tion there could be but little trouble in the finding out of the master-thought of the time, or that which the most intelligent and influential majority are best agreed about and most eagerly desire to do. We are concerned here with the broadest possiblo and most general thonghts, and are led to a thought about them by the present goings on in modern civilised Europe. It is not only within the special province of fine art and architecture, but is rcally and in. deed at tho very foandation of them. It is a wide subject, and asks for a little gathering together of all one's knowledge, acquired someimes with no small diffionlty, but is woll worth little tronble to come at oron dimly as events go on in the wide world.
If it he diffoult, and we will allow this, to got at the main motive of the older cominant deas in each age, it certaiuly is not so to seo rbat in the main constitutes the one of to day. If we might venture to give it a name which should generally characteriso it, it might be and of men, and of arts. If there be any ono aspiration more ortain then otherg of come mandiar oniversal assent from "societies," the press, the pulpit, and the reneral instinct of the public mind of civilised Europe, it is that of rope and a long time, all the nations of Europe, and indeed of the world, will come together and be as one, and follow the lead of the most powerful and dominant nation. All thinges about us help this omin Rilo the hea. Rai praps pople po together. Telegraphs enable people to talk to sens 4 wide lan. A ledge is gradually spreading everywhero, and kind model educal. perfo tho wich must in timo include everybody rom the Ba and 1 the street arabs and gamins of its capital cities the his is in progrose, bo it obsor, and is not the mere hope and fancy of a fature. There is also, and it is, as all know, one of the great hopes of the future, a general dissemination ef what are called geueral or "universal principles "" of fine art tending to hring all art-styles together, and to elicit out of them, if possible, a sort of universal art-language. Free trade and mnrestricted commerce help this not a little, for the shop is a nuiversal necessity of civilised life and what is good for one place must needs do for another, if but the people in it and about it oan be indnced to adopt it and make proper use of it. Nothing, indeed, can well be more delight. ful and cheering than this thought of a univerea coming together of countries, artg, and peoples the savage "eivilisod," the harbarian civilised, or, what is a better word, "Westernised," and the oivilised man more and ever more educated.
But-we say but, for it is quite a necessary word in all this bright prospect,-it is to be noted in the first place that this thougbt, though and the tele modern, and so full ef the rainway now a one a say, it was one, if not the chief, of the wonderful. activities of Alexander the Groat to not only subdue the whole carth hy force of arms and force of will, but to "Grecianise" it as well. He, like the modern man, wanted to bring the wholo earth together and to mako all one, and to dominato all with a Greek sceptre. If there ever were in the world, and lie might bo well excused for thinking it, a people perfect enongh to form a model for the whole of the rest of humanity, it certainly was the all but perfect Greek. WOrm, presence, face, manners, grace, fine arts, architecture, language, all went together to make up as perfect a whole as can we! be conceived; and Alexander, with tha maguificent Persian at his fcet, might well be excused for hoping to accomplish tho task of maling all the rest of tbe world like it,-to make the whole world "Greek." But he did not and could not do it. Let us grant that the ancient Greek, as wo may yet see Lim, was a well-nigh perfect tecturo and his surroundings, as his archiof himself; who is there we may ast, that wonld wish to see all the world Greek, or eren all Emrope at the present day Grcek? Nothing but Greek architecture, Greek scnlptare, Greek impress everywhere, and nothing spoken but the Greek tongue? A glorious unity it must be confessed, but who would ask for such perfec. tion of samencss? And if this be so, what aro we to think of a dominant ascendancy of any
he it oliserved, going to the root of everything,
and compelling all thio
to to he alike ? and compelling all thiogs to he alike?
Be lo observed thay we are not supposing merely things as they might he, hat are speak-
ing of things as they are now voing on, and ing of things, as they are now going on, and
"progressing," and perfecting themselves. To cite but one proof of it, not only is the fine-art and architecture of all civilised Europe growing alike hy slow degrees, hut the several individual details of it are aotually manufactured in the sarae phaces, and even cast from the same
moulds. It is really not a little dificicnlt to con. moulds. It is really not a little difticnit to con-
ceive how any one can,-in an artistic sense, come to think there can be "art progress", in such as this. Commercial progress there may he, but not art progress; for this system can but serve to make all buildings precisely alike. Invention, style, individuality of treatment, ationality, and all else that can constitute diversity and artistic interest, must needs disappear nader such a systom of production. There are donbtless advantages in it, bnt are the advantages at all commensurate with the disadrantages, and tho hindrances to a real and a true art advancement and to artistic interest? It cannot surely be so. All this may he, as we may donhtless he told, inevitable, and in the aature of things ; but can it he said that it is favonrable to the iudividuality and nationality f fine art and architecture? Aud art and archiectnre, and all that hangs on it, are, after all the great material proofs of what is eall, progress, and advanced civilisation, and bigh progress,
We are led to these thoughts hy more than one or two things that are at the present moment going on in the world, and under the highest auspices and inspirations.

The great and dominaut nations of the world are driving all before them, whether they quests, such as those of Alexander, were as quests, such as those of Alexander, were as as compared with modern
Alezander advanced into the very heart of tho great continent of Asia, and then turned back, declaring that there were no more porlds to subdue; hut when tarned back he left all as he fonnd it; he bore away the spoils, may be, of the great and wonderful cities he overcame hut he left them as he found them. The con quered inhabitants must have remembered him, as men rememher vaguely a distempered dream bat they could have horrowed nothing from him and he could have taught them nought. Their special individualities remained. Art, language manners, modes of life remained as they wer hefore the visitation, neither hetter nor worse But how different a modern oonqnest, or "ocoupation," to use a favourite and conscience quieting phrase, such as that, for example, of the Russian advance into Central Asia, or the British occupation of India, The more satis. factory and the more complete it is, the more perfectly and entirely is the nationality of the place occupied put aside, and a some thing else put in its place, better in some ways, it may be, bat still individuality is displaced, and so far destroyed. There was surely nothing so strange and almost mysteof its attactive in the old world as the isotatio tinctness. Arts, mand theirs, separation and dis their races of men, buildin, oustoms, languages, was different, Nas different; almost as in different worlds. hand at inventing and working, to he trying her distinctive individua worbing out different and Jew, the Endividualities. The Greek and the Jew, the Egyptian and the Aseyrian, the Gaul and the savage Briton were all unlike eachother as their several architectnres as we now see and wonder at them in museums and in rains. The men of each conntry difered, as did thoir several quaint, or heautiful, and gracefnl costumes, and in passing from one to another, as, doubtless, many an old pilgrim and trader did, it mnst have seemed to sccil like the passage from one each other sphere of existence. Borrow from each other they sometimes, doubtless, did, hut there really was no need of it. Every nation seemed to he equal to its own special work, But now-a-days all is changing; the whole drift aut spirit of the tinle is well epitomised by the rail. way; the more even and level it is the hetter, and the great effort is to reduce all to a level. The Ressian in Forthern Asia, and the Briton in Southern Asia, imply not simply conquest bot occupation, -the uegration of things Asian The great "Asian mystery," "phich attracts JIr. Disraeli so much, and so often, and has confounded others, is after all but a simple affair is
the future; for the Asian must disappear, if not in actual person, at least in speciality and indi viduality in exact proportion to the "progrcss" is compelled to mak
formitive ard of primitive art and individuality, and at their might rather term it, we cannot but ho struck with owe special though slight indication of with one special though slight indication of national feeling on the part of some fow of those, to us, strange men who now represent the great individualities of the past. We hear now and then, in faint enough tones, may be the very voice of Asia, not only present in this age, hut really as coming from the ages that are gone. A dim consciousness of their own valie, and the powor there mast he in their own individuality seems to come over them, even after "educa tion" has done its work, and almost transformed them into new heiags. Is it, indeed, the great Asian mystery that fills the miods of such men almost unconsciously, or is it only after all the natural affeotion which all distinct and indivi dualised races of men must sometimes feel for their own past history? Arts and architecture, and language, and, may we add, costume and manners, are surely worth tho preserving and surely hg; for other things may be developed we hope so, even ia Central Asia, other shops, and shop-fronts, different from those yon may bay realy made in London, waiting only the fixiog, conapounded of all styles, and helonging to none. Surely there must be more in the in dividuality of nations and distinet races of men than such implies, and certain it must he, that to ehicit the strength and "art power" of a dis finct race of men, it is, and must be, necessary, own hauds, and out of their own minds, aiced by their own past history, and "art precedent."

THE ORYSTAL PALACE SCHOOL OF PRACTICAL ENGINEERING

The first year, and the third term, were brought to a close on Saturday, hy the presenta. tion in the lectare-room of the school, of the certificates awarded to students; Mr. J. W Bazalgette, C.B., C.E., presided, and presented the certificates. Beforo this was done the numerous visitors bad an opportunity of inspecting the work of the stadents in the drawing the fitting pattorn- 8 hop, in tho foundry, and in embraces one term in the drawing-office, one iv the pattern.shop and foundry, and one io the smiths' fitting and erecting shop. The students that have attended each of the three terms have now accordingly taken the complete course. It s mnch to their oredit that, as a substantive result of the year's instrnction and training, they should among other things be able to show at work, and working suooth!y and well, a 3-horse power steam eugine that has been produced entirely in the school workshops, excepting only capahilities of their little forndry The however, were received in the rough condition, and were finished and fitted by the students, who produced also all the drawings, and made tho whole of the patterns. A number of draw ings, the work of the students, each accom pamied hy specification, staternent of quantities, The subjects were shown in the drawing-office. The subjects incladed elevation, details, and estimates for a wrought-iron roof of 40 ft . span.
Mr . Bazalgette, hefore presenting the certiMr. Bazalgette, hefore presenting the certi-
ficates, spoke in terms of praise of the school as well entitled to tho name it took of bein practical, and estimated highly the value of the theoretical instruction comhined with practical raining of which the students had the advan-
Mr. Shenton read the report of the examiners, Messrs. W. Pole, F.R.S., C.E., and J. Imray, M.A., C.E.

Certificates were awarded for merit in the students' papers, "On materials and their manu. factare," and for merit in the drawing office, the pattern-shop, or the fitting and erecting shop. For merit in their papers, the stndeats were allowed marks, the highest number they could reach being 232. Of twenty-nine stndents in the school, eighteen presented themselves for examination on their papers, and twelve of these received douhle certificates, one for the merit of their papers, and woother for the excellence of heir work in the drawing-office, the pattern. shop, or the fitting shop.

Mr. P. W. Britton, with 225 marks for his papers, was second in the pattern-shop; Mr. J. 11. Frogley, 223 marks, first in fittiog-shop; Mr. ffice: Mo
 pattern-shop. The other stndents that received oublo certificates were Messrs, H, C. Dent Harrichels, S. H. Hampton, E. Smith, G Harris, W. H. B. Green, A. Wortham, and E. Green. Single certificates were awarded for drawing, to J. T. Brickford, C. S. Swith, and R. de Javrequi. For work in the pattern-shop I. F. E. Tompson, and E. IV. W. Waite And, for work in the fitting-shop to A. Saubergue, F. J. Jones, E. W. Rees, F. Maurice, J. Day, and H. S. Fitzgerald. The examiners conclude their report hy expressing their great satisfachon with the progress of the students, and with the sound practical system of instruction and raining adopted by the Principal, Mr, J. W. Wilson, C.E.
In acknowleding the vote of thanks accorded o him, Ir. Wilson stated that the students had nswered four questions npon each of eiohtyaree lectnres that had been delivered to them, or 332 questions in all.
Professor Pole, one of the examiners, on being called upon by the chairman, hore high testimony the valne of the sohool, and the efficiency,with which it was conducted hy Mr. Wilson. He considered it an admirable preparation for entrance to an engineer's office.
Votes of thanks to the chairman, the exa miners, Mr. Wilson, and Mr. Shenton, closed the proceedings.

## A NEW DANGER TO ARCEITECTS.

Sin,-The position of the architect in the present day is not an onviable ono. Althongh as regards material prosperity it cannot be denied that, individually, architeots have participated to a great extent in the prosperity thathiss attended the trade of the country during tha century, it is at the same time indisputable that their inflaence as a hody has decreased, and that their status with the pnblic has deolined rather than advanced of late jears. For this anomalous position of the profession, and the want of recognition of architecturo as a liheral art, it would he perhaps unfair to blame the public, the fault lying rather with the architects themselves, who are for the most part disinolined to evforce a compulsory system of education, as has heen adoptsd hy other professions, or to set op a standard by which the qualified proctitioner might he distinguished from the charlatan. This is a question of too wide a rango to he disoussed in a fow words, and I have no intention at previrtually decided by the ropresentative body of Britiah Architects, in a sense intended to promoto the interest of its memhers. I meroly allude to this point from a desire to aroid including in my enumeration of the disabilities ander which architects lohour any burdens they have imposed upon themselves, or which they have not ondenvoured to remore from their shouldicre It ondeavoura to m architeet nerer was an time a recognied n architeot profession, in a legal sense, in this country. No certificate or diploma was ever issucd to tho position to enable tin to practise, and yet him position (in England, at least) Was, until the com mencement of this century, as alar and his position as recogmised, as that of a member of any other of tho liheral professions. I do not forget that, occasionally, the archi tect suffered rehuffs, as when Wren was displaced by Denham, or when Kent, originally a painter, monopolised the patronage of the nobility in all matters connected with art. These, however, were accideats, due in the one case to intrigue and political jealonsy, and in the other to tho. protection of a nobleman who had acquired a repatation which onabled him to dictate to the fashionable world upon questions of taste. The so-callod Gothio revival, although it certainly did much to advance the study of architecture, as certainly contribnted to degrade the architect in tho pablic estimation. The writings of those ominent men hy whom this important revolution was mainly effected invited us to regard the architect 08 merely a master mason, or clerk of the works; while the emphasis that was laid mpon the necessity (or it micht almost be said the supiency) of the study and admeasurement of Jodional hildinge le people to believe that the comprehensive view of the education neces sary to the architect which had been insisted
on from Vitruvius downwards was a mere supererogation, and that it was in the power of any one of moderate abilities who had mastered the simple elements of true or Christian architeotuxo, and had some tasto for drawing, to hccomo an architect. The tiresome study of the proportions of classical art, tho nocessity for the acquisition of foreign languages, the pursuit of what was called Belles Lettres, and of undertaking foreign travels, were all done away with: Trude in Art was proclaimed. There can he no douht that many men who were hefore deterred from entering upon the study of architecture from the dificulties whioh it seemed to present, which followed in the course of education upon the puhlication of Pugin's "Contrasts", and his "Principles of Christion Architccture," and embraced a system which seemed to afford greater dispensed with much that is distasteful to the young raind. It would be idle to deny the many valuable resalts that hare flowed from the study of English antiquities, or to shut one's eyes to the noble works which have been executed by disciples of this school; but it is certain that the commenoement of the puhlic distrust of the architeot was coincident with the revival of a taste for Gothio architecture, and it is not difficult to nnderstand how this change was brought ahont. The publio had before heen accustomed to regard an architect as a superior being, by reason of his eduoation and position; but fuding that architocts themselves ridicaled classical attainments as pedautic, and that the ranks of the profession were being recruited hy raen who were ignorant of everything hut theis zaen who were ignorant of everything hat their
business, they took their authors at their word, and came to regard an architect as merely a and came to regard an architect as merely a superior artizan, who might he entrasted with
the oarvying out of work, but who was of such a the oarrying out of work, but who was of such a
naturo that he required to be held with hit and nataro that he required to

It is this fceling that has led to the ignominous conditions that have becn imposed upon con. and public appointments. What, for example, can be more degrading to a nana of any delicacy of feering thau to have tho daties of his ofice rigorously defined hy a oode of regulations, as
is now done with most now appointments? Not is now done with most now appointments? only, however, are the architect's duties pre. scribed, but his omoluments are also usnally restricted, with a view to provent his claiming
any additional oompensation in case he is called any additional oompensation in case he is callec
apon to perform any additional worls incidental to his office. Everything is, in fact, done in order to prevent the possibility of the architect taking advantage of his client, and the honour
of the architect himself is not cousidercd as of of the archit
any value.
any value.
A large proportion of profitahle husiness which formerly fell to the slare of the archltect has of late years been monopelised by ongineers and surveyors. Forty jears ago the husiness of the burreyor was scarcely recognised apart from that of the arobitect. Now, the survoyor has
eatahlished for himself an entirely distinct estahlished for himself an entirely distinct
branch, and has sncceeded in alienating from branch, and has sncceeded in alienating from
the architect some of the best paid portions of the architect some business, leaving him with some of the most embarrassing and least remunerative parts. Again, hy the action of the Goverument, a considerahle nnmber of large puhlic buildings, such as churches, harracks, hospitals, sanitariums,
\&o., hoth at home and abroad, have heen taken \&o., hoth at home and abroad, have heen taken ont of the hands of architects and given to royal ongineor officers; or if an arohiteot has hicen employed, the whole oredit of the design is usually given to the officer in oharge. The PostOffice has thus dispensed with architeots, and wo bave lately seen that a large huilding has been ercoted in London hy this department, at a cost
oxceeding $200,000 \mathrm{l}$, hy a gubordinate officer in the employ of the Government.
These are some few of the grievauces of which arohitects complain, and I night readily enlarge the list, but I do not desire to do so further, but prefer to call attention to a new danger with whioh architects are threatened
rather than dwell npon evils whioh are known and admitted.
The dangor to which $I$ advert is the insidious encroachments of the landscape-gardener upon the domain of the architect. It is true this is no now thing, hut the encroachments have of late architects to putthemselvesupon their guard. The profession of the engineer has grown up chiefly
hy the railway system in this country, and however mnch architects may lamont the fact, there can be no dispute that the ongineer has fairly won the position ho has acqnired, and that he supplies a want which tho architect was not fitted, cither by taste or education, to supply. But this is not the case with the landscape gardener: his functions are essentially different from those of the arohitect, to which they are usually and properly subordinated, and there need not he any jealousy or any question as to jurisdiction hetween the two. Some landscape-gnardeners
have, however, assumed the title of landscape architects, a palpahle misnomer, which oan only have heen assumed to mislead, and have taken opon themselves to desifa and carry out buildings in addition to their other dutics, The puhlic, little accustomed to discriminate, aro "arobit hy the assnmption of the name of unfrequently contrusted with commissions for works of importance, to the manifost injury of the architect proper. It may, porbaps, seem ide to complain of the preferenco of the puhfio for these irregular practitioners, secing that, standard of architcctural education, and that anyhody is entitled to call himself an architect, and to carry out any work that ho may he ahle to obtain ; hut that is not the point to which I desire to dircct attention. It is, of conrse, impossible to coorce the public taste, and to lay it down as a rule that none hut properly qualified men should be employed npon architeotural works; that is clearly impracticable in the face of the attitude of the prosent Government, whose action with regard to architeots is not jorly countenanced, hut applauded, hy the majomy of pcople in this country. We must ho contcnt to take things as they are, and for thes
most part we have hecome nconstomed to the present position of affairs; but the new danger consists in this, that while hitherto architects and lamdscape-grardencrs have heon in the hahit of working side by sido apon the same work it in now rimp upon the landscape-gardener for his assistance, or to acquiesco in his appointment, without iutro. ducingat the same time a rival who may take away the most proftable portions of his work, interfere with his most cherished designs, or perhaps supplant him altogether. This could not have happen now, and the sooner architects becomo alive to the danger they incur in thus acting the hetter it will he for all parties.
It comes abont in this wise. An architect has prepared designs for a mansion, let us say ; the site is bare and nnadorned, and tho client determines to employ a landscape-garcener
to lay out the grounds. The landscape-gardener to lay out the grounds. The landscape-garcener
prepares a pinn, showing not only the arrange. prepares a pinx, showing not only the arrange.
ment of the grounds, but terraccs, couservatory, garden-walls, lodge, entrance-gates, stables,--in fact, everything necessary for the completion of tbe mansion and its surroundings. This is submitted to the client, Who is in an prohnsility ignorant of the distinction hetween the daties of
the architect and landsoape-architect, the design is approved hy him, and the landzcape-arohiteot is entrusted with the execution of the work. The architect is not perhaps consulted at all, or if he is consulted and ohjects, tho landscape-architect makes the plausihle sugrestion that as he will have the control of the roads and paths, walls, \&c. it will he desiro the the buildings which adjoin should also he placed in his hands : perhaps he suggests that the main huilding itself has not heen proparly treated, or that the expenditure has heen excessive, or that he has carried ont similar works for the Marquis of Blank, or Sir Hamphrey Chose, and the client, as we have before eaid, ignorant for the most part of the achicvements of the landscapo-architect, acquiesces, although perhaps reluctantly. It is not the mere loss of hasiness to the architcoct which is to he looked to in this proceeding, althoagh that is not to be diaregarded; bnt it is to be borne in mind that it is in the power of the landscape-gardeuer to interfere greatly with, or, perhaps, entirely destroy, the effect of the arclitect's design. The mansion may bo Gothic, and the lodge Classic, or, vice. versat, the stahles may dwart the house; and it is also elways in the power of an hascrnpnlous man to put his rival's work in the shade, or hy means of colour, outline, or juxta-position, to enhance the effect of his own compositions at the expense of his coadjutor's.

This is not an illueory pictare, and the danger is real aud threatening. The remedy is in the hands of architects thomselves: let them take care not to associate themselves with landscapearchitects, hut choose a landscape-gardener of the old type; let their respective duties he clearly explaincd to the client, azd if necessary defined in writing; and, ahove all, let the architect asseri his authority, and insist that all drawings, for whatever works, shall he suh. mitted for his approral hefors being pnt in hand. This is the architect's proper position, and if he abdicates his right to heing oonsulted upon overything relating to the house and its surroundings, he will inevitably lose the confidenco of his olient, and will find himself immersed in numerous annecessary difficulties.

## LONDON AND ITS FOGS.

Loxpos and for are as closely allied as Scotland and mist ; but between the Scotch mist that is reputed to be able to wet an Englishman to the skin," and the hlack dry tog of the metropolis, there is a widc difference. The reports which with difficulty can be gleaned from old newspapers and journals concorning previous London fogs are very meagre, which may ho wonderod at considering that cach for was, like that of the week bcfore last, the cause of many fatalaccidente. On January 1, 1720, London was so darkened by fog that several chairmen, with their hurdens, persons fell into the Flect-ditcb, and many into the Thames. On December 2, 1761, "the fog was so vary thick in and about London that even carriages ran arainst carriages, by which much mischief was donc, and many lives lost." On the 19th of Novemher, 1767, many deaths were caused hy a dense fog, Fleet-ditch and the Thames being, as usual, the recipients of many fog in London of 1813.14 , it may he interesting to notice some fogs which have appeared in other places. A gentleman writiug from Konsington, Connecticut, U.S., under the date of the
 ahout sunriso at this place, was a fog of so ahout sunriso at this place, was a fog of so filled us all with great amazenent. It came in creat hodies, like thick clouds, down to the earth, and iu its why striking a aginst the houses, would bropls and fall down the sides in great bodies, rollingerer and oror One of onr neigh bodies, roling over and over. One of onr neighhours was then at Sutton, 100 milcs distant, and December 15, 1774, Amsterdam was wrappod up in a fog of so dense a character that people ran against each othor, oven though provided with torches; 230 persons wero drowned by falling into thic canals; theirories wero heard, hu no one could all over Holland." The city of Dublin wascovered with ruary 1 "0s "ntenso 0 , member to have seen." Although the country round was in a great measure freo from its influence, yet in the streets it was at one time se thick, that persons in conversation conld hardly distipguish one another's faces. The carriage of Mir. Taylor Rowley was driven into the Liffey, near Carlisle hridge. Nr. Rowley and his coachman had the good fortune to escape, but two no horses mhich drew the carringe were drowned. At night it was scarcely possible, cven with the gid of lighted flamheaux, for passengers to explore their way along the streets without danger or accident. The Chronicle omits sumilar to that of Mr. Rowley's horses. The great fog in London, which hap. horsce. The greal log in London, which happener of Decomher 31st, in that year. "The density of the atmosphere during the day, and the heary fog at night, which prevailed for the whole of the last week in London, and many milcs round, has heen very remarkahlo, Monday uight tho mails and other coaches were delayed nuusually long. The Glasgow coach, Whioh should reach Stamford hy eight, did not arrive on Tuesday till tro in the afternoon, and the York and Edinhurgh not natil four '. Many of the coaches wore overturned the York mail twice, near Ware, notwithstand ing the guard and passengers whlked to keep
it in the road. The Maidenhead ooach, on its return to town the same evening missed the seturn to town the same evening, missed the
road, and was operturned. The Birmingham
mail was nearly seren hours in going from the Post.office to Usbridge, a distance of legs than twenty miles; and the short stages in the unnin fog of last the horses heads. As duro drowned in the Thames and the canals. Tbe following paragraph from the fashionable intelligence of the Moming Post, December 29, 1813, reads somewhat strangely in 1873:- "We stated yesterday the Prince Regent's departure, a few minates after seven o'ciock, for Belvoir Castle, the seat of the Duke of Rutland. His royal highness had not got further than abont a mile from Tottenham-cotrt.road, when one a the out.riders whs thrown off inte a ditch. lamps in the carriage were of no vase, and even flambeanx were insufficient." Returring weyal Highness resolved to give up the idca of proceeding to Hatfield, and getting ont of his carriage whilst it was turned, remained knee. decp in mud for some minntes. By taking off the leaders, the cartiage was at length tarned, and proceeding slowly with flambeanx turned, and proceeding slowly with fambeanx
before the horses, almost to Carton House, bis Royal Highness got safe there at abont his Royal Highness got safe there at abont
half-pnst nine, haring been two hours and a half in proceeding ahout one mile beyond a half in proceeding ahout one mile beyond
Tottenbam-court-road." Certainly travelling in Thtenbam-court-road." Certainly travelling in those days throngh Kentish Town in foggy wea-
ther, on a road untouched by Macadam, must ther, on a road untouched b
have been far from agreeable.
What is tho cause of these dense fogs ? Those who bave studied the qnestion, reply, - A fog is formed by the mingling together of masses of air of different temperatures, and may properly
be termed an earth -cloud, because it is formed at be termed an earth.cloud, because it is formed at the surface of tho earth, and seldom riscs many extend mnch beyond the height of the houses. During its prevalence one may, by ascending St. Paul's Cathedral, obtain a clear atmosphere while underneath the dark vapoor is rolling like a sea, through which the spires and steeples rise like the masts of stranded wrecks. London fog is not equal in density in all places; a long depressed line marks the course of the Thames, and the deepest darkness hangs over the most crowded neighbonrhoods. Before the Act Parliament was passed requiring the London factories to consmme their smoke, the fors was particularly dense in the localities of the was breweries. The height of the for is treatly termined hy the nature of the subsoil. If it is clayey, it stands high, and low if it be of sand or gravel. Defrance states in his treatise on Vapour, that fog is occasioned by a descending rolls it over the which beats down the smoke and time a current of airmer be the earth. At this through the ohimneys which have no fire, producing a strong odour of soot, thns proving the existence of descending currents in the atmo. sphere. Therefore, if the smoke of tens of thonsands of chimneys be discharged into the air, and there mingled with watery vapour, and then again forced to descend, a dense fog must necessarily ensnc. It is generally considered cause tho eyes to smart, orye peculiar taste, and propert eyes smand, owe their disagreeable properties to gases and vaponss produced by the combustion of fuel, and from this source the atmosphere is charged with carbon, sulphnrons, nitrous, and pyroigneozs acids. A modcrate wind will nsually break up a fog, bnt an increase of temperalure withont wind tends to increase its density. It has often been observed that dining the middle of the night until early in the
morning, London is free from fog morning, London is free from fog, which, bowever, sets in as soon as the fires are lighted; sometimes it clears away for a short time at proaches and the gas is lighted. London fog bas also a peculiar tidal motion, which tends down the river towards the marshes, and an extra. ordinary amonnt of electricity freqnently accompanies thick driving fogs. Fogs and epidemics often accompany each otber; they have, it may be, a common origin, or, perbaps the one is the canso of the other. Dr. Prout, in his Bridgwater Treatise, specially refers to a certain poisonons gas, seleniuretted hydrogen, which exists in the atmosphere drring a fog, the smallest atom or bnbble of which when inhaled by the nostrils excites pain: this is followed hy catarrh and pains in the chest. During the recent fog, as perished, probably throngh the inhalation of this poison.

Strange it is that though London has so long fog requently suifored from tho visitations o forward to propy man of science has ever come entirely abolishod and stamped out.

## THE RESTORATION OF THE CHATEAU

 of PIERREFONDS.*Tefe restoration of the exterior walls and towers of the château, comparatively easy as far as the repetition'of existiag forms was concerned, must have called for very great practical know. ledge in the design and erection of scaffolds, and I regret very much that I was nnablo to risit the chateau in the earlier years of its restora.
tion, especially as on these poiuts M . Viollet-le. tion, especially as on these poiuts M. Viollet-leDuc is facile princeps in France, having almost, I may say, created a
In consequence of their immense thickness, and of the escellent quality of their masonry, the and, had all retained their vertical positions, internal walls of slight importance, underpinning was required in the restoration. The breaches and gaps were filled in, and the masonry in the upper part of the walls was execnted in the ordinary way,-that is to say, for the exterior walls, rails were laid round the Whole of the chateau, on which the materials raised by means of an immense steam crane; the thickness of the walls otherwise allowium the materials for cross walls to be rolled along on their summits. For the interior walls the scaffolding was continuons, the stones boing placed in position by travellers.
The stone details for the windows, cornices, and other decorative features, were bnilt in block, and carved or moulded in their respective positions: this applies only to those parts which were built with the soft limestone of France; Whenever a barder stone

each bay bas on the ground.floor a segmental arcb, with hnge keystone ; and on the first, or mezzanine floor, a trefoil-headed arch, carried on corbels. The great windows of the assombly. room have solid mullions and light transoms above the balustrade to every alternato bay Continuing round on the north side is the belfry, Continumg round on the nord side is the belfry, the great window lighting the vestibule to the the great wind lighting the vestibute to the
apartments of the garrison officers. Tha jambs aparments of the garrison ofticers. The jambs
of this window descend to the ground floor in the form of battresses, which are corbelled out and carried on massive columns, with carred capitals, a lofty arch being thrown across between. This marks the chief entrance to the guard-rooms of the back entrance to the chateau. Beyond this enture is the great light of steps leading to tho entrance of the officers' rooms; the stairs rising to the first floor being strongly accentuated in the external arohitecture.
On tho west side of the courtyard is the cbapel, which is perbaps one of the happiest features. The lower portion is an origina itreatment of the Flamboyant porch. The rose-window above is perhaps somewhat decadent in style, but was, I believe, based on the original featnre. The gable and corner buttresses are well proportioned and fine features. The staircase leading to the prin. cipal apartments in the keep forms one of the more remarkaible features in the court. It is preceded by a grand porch with three archways, and external flight of steps beyond them; in ternally the staircase is circular, externally octa gonal, the windows lighting it rising with the steps.
The decoration of the interior is not yet completed in all the rooms : with the exception of the great assembly.room, and a vaulted chamber in the Casar tower, its principle is the same in all the rooms; a dado in oak, carved and panelled 5 ft . high, runs round the principal apartments ; above this the wall is stencilled with various devices, and a deep frieze is carried ronnd the upper part of the walls, with figure or orna mental decorations. The chimney-pieces are all in stone, carved and richly painted and gilt. The oak girders are carried on stone corbels carved and painted. The woodworl on the ceil ing is painted of a dark ground colonr, relieved by light colour ornament; the ceiling between the joists has dark ornaments on light ground The decoration varies in every room, and has all been designed expressly by M. Viollet-le-Duc the colouring is quiet and extremely harmonion in tone, and is, perhaps, the best evidence of the wide range of bis talents. The room in the Arthur tower has an octagonal yaulting, the chimney-piece being decorated with a representation of King Arthur and the Knights of the Round Table. Tbo great assembly-room has been turncd to acconnt as a museum of arms; these were, I anl sorry to say, removed to Paris during the late war, and have not yet been restored to thoir places; the hall is surrounded with cases to hold the collection, which is, I heliove, of great value. The roof consists of a pointed band vault in wood, painted with various devices, the boarding being fixed to tho iron trusses of the roof. The chimney-piece in this ball is the finest in the chateau; it is double, as it has two grates in it, with tiles at the back; and above are placed in miches and on pedestals the nine heroines of antiquity, with tbeir coats of arms above, and a crenelated cornioe, with miniature turrets and battlements. In conclussion, I have only to add that, although the restoration was necessarily stopped during the late war, I have every reason to believe that it will be continued and completed now; at present there are hnt a few artists at work, which may be acconnted for from the cessation of the Emperor's donations. The whole work reflects the greatest credit on M. Viollet-le-Duc, who has consecratcd to it an immense portion of histime ; and it places on record for future generations one of the most interesting features of the feudal period of the Middle Ages.

The Inns of Court Hotel. - Wo are glad to bear that the pile of buildings in Lincoln's-InnFields, long left unfinished, is now in course of completion. The Inns of Conrt Hotel Company has purchased the ontire property, and having restored the Holborn hlock, are now finishing the remaining portion, which will form part of the hotel according to the original intention. Sessrs. Lockwood \& Mawson, the original architects, have the matter in hand.

## THE KEEP OF CLITHEROE.

The costle of Clitheroe, the chief seat of an ancient and extensive honour, tbongh one of the smallest, is perhaps the strongest, the oldest, and from its position one of the most remarkable of the fortresses of Lancashire. It is placed upon the left or eastern bank of the Ribule, here the boundary between Yorkshire and Lan. cashire, three quarters of a mile from the struam, and about 130 ft . above it. It occupies the summit and upper part of a limestone crtig, which, precipitous in parts, and very steep on its northern flank, falls, according to the dip of the rock, less steeply towards the south or south. west. Hence the nortbern point was selected for the keep and upper ward, and for the lower ward and approackes, the shoulder and slopes apon the soath. the Roman way from Man. chester, by Skipton to Xork, ascends the dale shout half a mile east of the rock, which could scarcely have been neglected as a military post by any people who held the district in other tban very peaceful times. The town of Clitheroe has sprung up at the foot of the rock upon the north.east.
The keep stands within, hut close to, the east side of a small rounded area of abont 80 ft . by 90 ft ., contained within a curtain wall, which skirts the edge of the rock. This cartain is 6 ft . thick, 12 ft . high inside, and from 14 ft . to 20 ft . outsido. The circuit, which has no doubt been complete, is broken for sbout 70 ft . on the soutbern side. This is the breadth of the neck by whicb the upper wand was united to the lower, and the curtain at each end of the gap is extended sontbwards and south-eastwards down the stecp to include the latter. Thus, what is wantiug is none of the exterior curtaiu, only the interior and cross wall hetween the two wards. The open spoce is in steep of rugged broken rock. Probably there wa a cross wall and door way above, and a narrow flight of stops leading to it from below.

The keep is of rougb rubble masonry, with ashlar quoins and dressiugs. It has neither plinth, set.off, nor string, and preserves its exterior dimensions to the summit. Eacb angle 11 in. projection. They unite at the angles, wbioh are solid. The two southern angles are Bupported by extravagantly large low buttresses, of modern addition, but it is said they were preceded by buttresses somewhat similar, though preceded by buttresses some

The keep is 33 ft . square, and abont 43 ft . high. The walls are 8 ft . thick at the base, and consequently enclose a chamber 17 ft . aquare. level. It is 9 ft level. It is 9 fl . ligh , and the floor, which covered it abovo, and is now gone, reated upon The north, anth, ard west wall are eely strong. The north, soatb, ard west wall are each pierced by a loop, set in a round-headed recess, 5 ft . broase tond bare to the springing. Two of these loops bave heen converted into open breaches, and the thirc, to the north, has been Walled up, and the recess covered with a flat lintel. This floor must have been entered from tbe room above hy a trap and ladder. It was, as usual, a store, the value of these strong small towers depending npon their being well provisioned.

The first floor rested upon a set-off of a foot, and is therefore 19 ft . square, witb walls 7 ft . thiok. It is 23 ft . ligh. It has in the north and sonth walls small square-beaded loops, placed in round.headed recesses of 4 ft .6 in. opening. In its west side, close to the north end, is a doorway $2 \mathrm{ft}, 10 \mathrm{in}$. broad, and 8 ft . high, round. headed. In the north wall, on each side the loop, is a door. One of these, flat.topped, of 2 ft .6 in . opening, and 6 ft . high, leads tbrough a small mural lobby, $4 \mathrm{ft}$.8 in . by 3 ft .2 in , into a well.stair, 7 ft . diameter, whicli occupies the nortb.east angle, and commencing at this level, ascends to the battlements by dify-four steps. The other door, of 2 ft .11 in , opening, 8 ft . high, and round-headed, leads by a passage bent at a right angle with a barrel vault, iuto a plain mural chamber, 7 ft , hy 5 ft ., also barrel. vaulted, and which, no doubt, had a loop in its seest wall. This wall, however, is now broken away, so that tbe chamber has mucb the aspect of an entrance-door, which it certainly was not.
The second, cr uppermost, floor rests upon a set-off of 2 ft , and is therefore 23 ft . square, with walls 5 ft . thick, and at present 11 ft . high. Siagularly enough, it shows no trace of any wall. opening whatever, as though it had been added
in modern times for effect only, which, however, to give space for the stair. The walls may have does not appear to be the case. Tbe staircase, been a foot or so high, but scarcely more. The however, bas certainly heen repaired, and no parapet is gone, and was probably another 5 ft . doubt originally opened into this floor. The The north-east angle seems to have ended in a wall at the interior angle is thiokened somewhat small square turret.
$\qquad$

D

The principal entrance was evidontly on the first floor, in the east wall, reached by an external stair built against the wall, and ascending from the south end. This is clear from the position and dimensions of the doorway, and from the abscuce of a loop on this side of tho basement, where it would have been covered by the staircase.
The small door of the west wall of the same Hoor seems to have led apon the rampart of the adjacent curtain, here only 11 ft. from tho keep. There is snch a door at Arques and Roohester, contains no fireplace nor gardrobe, nor ormament contains and.
The lower ward has been so altered for domestic purposes, and is so built over, as to be very obscure. It was at least eight or ten times the area of the npper ward, and descended 280 ft . the area of the apper ward, and descended 280 ft .
down the slope, with an extreme hreadth of 150 ft . Thomodern dwelling-house is huilt upon the sonth-east ourtain, and no doubt represents, and probably contains, part of the old domestic buildings. Buck gives a view of the southern front of this ward, and sbows a largo round tower upon ono of the angles not now seen. A convemient ascent skirts the foot of the west curtain, or rather of the cliff upon wbich it stands, and enters at the upper end of the lower ward, just helow the keep. This, however, is prohably modern. The old way seems to be represented by the road from the town, which rises on the other or eastern side. Abont a furlong to the south of and much below the castle is a steep straight bank of earth
with an exterior ditch, probally an outwork with an exterior ditch, pro
covering the foot of the bill.
The castle is the property of the Duse of Buccleuch, whoso steward for the bonour of Clitheroe resides here, and allows visitors to enter the keep nuchallenged. The chief rents and royalties of the honour are vested in the kept, aud is in as substantial repair as becomes a ruin ; but his Grace's most commendable zeal does certainly a little obscure the fabric it was intended to preserve, and it is to be regretted that the new work was not made more elearly distinguisbahle from the old.
The name of Clitheroe, thongh evidently old, aud said in part to be British, does not oceur in Domesday. Whittaker is of opinion that the place is incluced in Bernulfeswic, now Burnoldswick, a parish aboot six miles north-east of the castle, and Pietavensis or of Poictou. It is stated that "in Bernulfeswic Garnel held 12 carncates, paying geld to Berenger do Todeui. The manor is in Roger is identified with the Castle of Lancaster Roger is identified with the Castle of Lancaster, bat at hat lime Lazaster Castie was not onit, Roger was a large tenant in chiff in the Roger: of Chester, Derky, Notts, and in the shires Yorkshire and Lancashire and Lincoln. In little. The mesne lord, de Todcni, wis one of the family who had Belvoir; Dugdale says, the son of Robert de Todeni, who built it. He does notagrain appear in connexion with this part of England.
Roger is tbought to have granted the fee to Roger de Buishl, from whom, or from Albert Greslet, it came to the De Lacys of Pontefract, lords of Blackburnshire, of whom Robert de Lacy is said to have held it ander Do Bnieli. This De Lacy, whose bistory belonge to Ponte fract, is the reputed founder of Clitheroe keep in tho reigu of Henry I., and certainly the building is not of later date. From that time Clitheroe shared with Pontefruct the honomr of heing the seat of the De Lacy power, and so remained until their estates merged in the earldom and duchy of Laneaster, and this acain in the Crown. The founder prohably also endowed the Chapel of St. Michael within the castle prohably in the lower ward, and which is nontioned in the reign of Henry I. A claim, however, to represent this chapel is set up for the parish charch, thongh this building could never have been within the castle.
Clitheroe, like other strong places in Lancashire, was held for the king in the Parliamentary struggles, and in 1649 the castle was ordered to be dismantled.
Charles II. granted the castle and hooour to General 11 onk, whose son, Christopher Duke of Albemarle, left it to his wife, Lady Elizabetb Cavendish, who again left it to her second hus. band, Ralph Duke of Montarn, from whom it has descead.
1873.

If "overy man is the measure of all things to himself," the corollary to that saying is the other that "the trme measure of all things is God," and so the depth and measure of a man's moral nature are the measnre of his partaking of God, "in whom we lire and move and hare our being," and thns there is no exaggeration in spe
the inspiration of the poet or the artist.
It is in this spiritual world where is to be found that mystic force called sympathy,-the action of moral intelligence on moral intelligence,- an clectric cord which girdles the world or wind in effects which influenco more than any other thing the wholo aspect of social life.
There is a power pervading the living influence of the truly noble that draws congenial elements from the crowd, inspiring its votaries with a courage to carry victory to a higher issue tban mere mortal combat, to carry by assault the citadel of the passions and cenet ont the demon within, inspiring men with that truest of heroism to look beyond self and mere material good, inspiring them with enthusiasm and devotion to the rood, the true, the beautiful; aud of this moral ideal, material beauty is but the sign and symbol.
It is
It is the sentiment which underlies the work of the artist which renders it noble or ignoble, the subtle clement which stirs tho heart, which appeals to the mind, which carries the beholder out of hiraself, and places him en ranport with
"Tul of the designer.
The statue is born in the clay, it dies in the plaster, and lives again in the marblo." The clay model is not a mere piece of handivork; he is, ahovo all, the work of the artist's brain; peration is procuced hy a merely mechanical of the worker: Labour there must be, and the hand must ho trained to answer every wave of thought; if not, to the extent it faila so to do will the realised worl fall short of the ideal. What that ideal was no one but the artist himself can fully know; but, having sounded the key-note his thoughts, a responsive echo may be awakened in the mind of another, which, with tho mind of the recipient many that note, and harmonies to it never dreamt of by the originator. Mechanical excellonce ia doubtloss an admirablo thing, bnt it must not bo confounded with arlistic excollence, it is but the servant of art, without wbose service slo is helpless. Theory and practice must go band in hand ; scicnce and sentiment lend their aid to the artistic consentimen

A language withont grammatical construction is deficient in vitality : it may exist-like some of those in Central Africa-for a generatiou only; but when the disjointed fragments are constructed into a system, the langnage grows and expands so widely that it is with difficulty the original roots can be traced. Caltirated with care, the weed becomes the flower; the arrid, unpalatable herry the rich and luscious fruit. The language, or certain words in the language, may lave had their origin on the banlis of the Indas or of the Euphrates, or in the 1stes of Greece, or in the City of the Seven Hills; it matters not whence derived, they aro but the means of giving expression to thought. Worthy thoughts, although radely expressed, deserve admiration; bnt if, in addition, they are beauyed and arranged iuto harmony, or brightened by the light of eloqnence, they receive the deroion due to genius. Style is but the language in Which the artist expresses himself, and it is in the work, and the heanty and eloquence with which it is expressed, that he should be judered. Thousands of eager listeners crowd to the words of wisdom uttered by a spalker, and ens of thousands con these words nest day ot ase by the freside. When read over with eliberation, their truth and value can he better cstimated than when heard from the living roice. Why, then, not print them off at once? Why, but that the living influence of the nian the printed pace with fert. Another may read than the author, hut the effect is not the same A work of art may he copied so skilfully as to me mistaken for the original, hat the copy will never he valued as such. Harmony cannot be
elicited from the cord of sympathy unless it is tonched by a master-hand. Man, created in the
image of God, has the gift of originality bestowed upon him; he is touched by a ray from the holy of holies; he is inspired to produce what has not hefore existed; he becomes a creator. The creations of genius aro the most precions of gits,-too precious to be lavish!y dealt out: let those prize them who possess them ; but, above all, let us pay due respect to the great ones who created them.
Bat tho soul of man is chained while on eartlu to a mortal frame,--material wants mnst bo sappled; he ransacks the store of Nature nud subjects to his uses what he finds there. Not content with merely saljecting the material so round to useful purposes, he adorns his handiwors with suitable detail; he strives after har nony of proportion; he studies effeets of light and sbade; he constracts with skill; he com Special requiremellence with æsthotio beanty different mairements call for special trcatmont
 and the real meet, and they oannot bo sorered; dres ispor 1 arug is put ap a the pheri influenco ment be pore if this restraining warko $f$ be be fully fuly consurea, but apon must be super addod tbe grace of form and the charm of the f. The true artist must be possessed of the faculty of design, of tho facnlty of invention, of the power to express an original thonght in the material he has at command. His aim should be to elevate and refine tho tiste of his age, to give now sensations to those aronnd him, to add to the amenities of life, to enhance the pleasures of daily existence. He may not be appreciated. "We have no absolute criterion of greatness amongst us; we can but be measnred by our relation to each other." He may fall short of his aim, but he will have his reward if he has raised his own taste, and so increased his capacity for enjoyment.
To discover the sentiment anderlying the work of the artist, to understand the technical excellence thercof, and-where suoh is a neces. sity-the saitability of the design to the parpose for which it is made, are absolute requisitcs to the formation of an art-critic.

SOUTHSEA LAENORY COMPANT
Portsmouth st in the Highlend roed, Southsen. The buildiners are for a company which has been formed for the purpose of providing an eatablishment where the washing, wringing, drying, mangling, and roning of articles of all kinds, can be performed by macbinery.
The huilding will be a plain but substantial structure, the walls of Portland cement concrete, built with Drake's patent apparatus. The gravel and sand will be obtained by digging on tho site. Attention has boen paid by the architect to the internal arrangement, so that the business may be carried on with ease and economy. On the ground floor will be a receiving and sorting room, large washhouse, dryingroom, private washhouse, disinfecting - room, engine-room, store, and office. The dryingroom is to be heated by a steam-coil, assisted by the waste heat Irom the boiler, which is placed for this purpose below the floor; the washing blueing, wringing, and drying being completed on the gronnd-floor. The articles will then be raised by a lift to the floor above, consisting of starching, folding, mangling, and ironing rooms. Here the process will he completed, and the thinge will descend by another lift into the packing-room, where they will be sorted, and placed in racks sot apart for the various customers, ready to he returnod.
Stabling, coal-stores, \&c., detachod from the main huilding, are also provided for.
Mr. Archibald H. Ford, of Portsea, is the architect ; Mr. J. C.Cooper, of that town, is the contractor. All the machinery is to he supplied by Mrr. Thomas Bradford, of London. The buildings and machinery togetber, will cost about 3,5007 ., and the company will be able to wash from thirty to forty thonsand pieces weekly.

 portions or elegance of outline. Thorough yynmetry
of all the part, which is an essential element in the
grandeur of arehitectural effeots, is also pained by the grandcur of arehitectural effeots, is also gained by the
adontion of this style, ss well at the pratical use of all
ornamentation

The plan submitted, is that of a building having an open court in the eentre, the inner rooms being lighted from the courtyard, and the outer ones from the several streets. The en. trances are sitnated on all four streets, in the centre of eack front-access being immediately to the hasement floor. In addition to theso, flights of steps on Wasbington and Randolph strcets will afford immediate access to the principal floor from the streets.
The several floors will be connected hy four donhle flights of stairs, constructed of iron ; commencing immediately in front of the en. of the stracture. These stairways will be very bandsomely lighted and ventilated from the roof, as well as by windows at each landing. Elevators are also provided for, one heing on the city, and one on the rounty, sido of the building. Access to the various rooms, on cach floor, will be had from the corridors, which lead entirely round the building, and also connect the La Salle and Clark.street fronts, throagh the rotunda in the centre. Tbese corridors will be well lighted fiom the stairways, and will be pe well with marble.
paved with marble.
of is intended to orerlay the entire foundation of the hailding with a layer of concrote, 4 ft . thiek. This method of construction was fonnd to be absolntely necessary, aftor thorough and exhanstive investigation on the new Gor
building now heing erected in this city.
The footings of the main walls will be of Ilinois limestone, as tbat material has been fonnd to sustain a pressure of $17,000 \mathrm{lh}$. to the inch, which is superior to most granites. The
foundation walls are intended to be of the same foundation walls are intended to be of the same atcrial.
The constrnction of the ent-stone masoury is such that all tho modern appliances of machinery can be made arailable in getting it out, and no gigantic dimensions of scantlings are needed to
furuish the huilding, and to produce all the furuish the huilding, and to pro
effects shown by the general view.
effects shown by the general fiew
At the risk of repntation (obscrve the arehitects), it nayy again be said that claborate ornamentation bas been avoided, witb the
belief that the stahility, endurance, beanty, and economy of the building have been consulted thereby
The interior walls of the building are all pro. posed to be of brick, or, in the case of the lighter
partitions, bollow tile or iron lath and standard partitions.
All the floors are fireproof, the aroling hetween the beams heing intended for hollow tile or corrngated iron, as may be selected.
.The mansard roof bas not been adopted, as there is no need for the space wbicb it would snpply as an upper story, and a varied sky. line has been secured by means of the corner and flank. ing portico towers. The roofs are entirely of on fireproof arching.
The matter of ventilation has been carefully cousidered, and it is proposed to lead the fou air downwards, and thence to the ventilating shafts, through whicb are carried the furnace Anes, and to those in the great tower.
It was determinod to place the tower in the contre of the building and of the interior court. dome (which in its construction would be mach more expensive, and would be out of harmony with the design sabmitted). It was also con. sidered that the dome treatment had vecome so common to all public buildings, that sometbin different was demanded.
The adoption of such a tower was considered absolutely necessary in the ooustruction of the entire building, containing, as it is intended, the
priucipal foul-air shafts, the tank- for tbe reception of tbe water of the artesian well, from which tank it is proposed to furnish foumtains (to be located in positions afterward to be considered), and to a bell, and a fire lookout.
Tbe county portion of the basement containg accommodation for the recorder, the sheriff, heating apparatus, and the reoeiving vanlts; and also the vaults of the circuit and prohate clerks, which could not be provided, for want of space, on the first-floor.
On tho city side, arrangements have heen made, as called for, for the police and fire de. partments, the meter department, pay.roow, harbour-master, gas inspector, and heating appa. ratus and necessary storage.
On the first.floor, on the county side, are located the treasury and collecting departnients, connty clerk, county commissioners, superintendent of public charities, and clerks of superior, circuit, and probate courts.

On the city side are the mayor's suite of apartments, the comptroller, treasurer, collector, hoard of public works department, water department, and city clerk. Accoramodations are also provided on this floor for tho tax commis. | ioner |

THE DECORATIVE ARTS AND PALNTING.
Ix recent numbers of the Builder, I bave nore, I the "Defence of Shams ; nay, important place in any system of art-education intended for the benefit of the middle and lower classes of society; and I have expressed my belief that their honourable recognition in con. nexion with dress and personal ornaments would at once make tbem powerful anxiliaries of taste.
My remarks brought upon me, in the columns of your journal and elsewbere, some censure and some ridicule, and raised the question,- "Is the spirit.stirring a cmality as to render worthy any ort of mratification that may be afforded it" In reply, I promised to point ont more definitely the closeness of the relationship I had assumed o exist between the oteomed prespions of the painter and decorator and the tailor's and dress maker's unhononred tredes. But the maject dress, in all its benings npon individual public morals, as sngrgested for my consideration
by "A Spectator," is too conplex and too im. with for anything like adequate discussion must heg conventional limits of a letter; and this con my reacers to hetieve tbat 1 do not in than slim over the surface of the subject in the most superficial manner
The first obvious fact which suggosts itself is, that tbe oarliest arts of which we have any record were developed in connexion with per. sonal autire ; the second is, that these clothiug arts were in ancient times held in high respeot, and that the good housewife is commeuded in the Scriptures for the labour and time she bestows upon the manufacture and ornamenta. tion of her domestic draperies.
Foremost amongst ancient nations stande Egypt, and chief amongst her decorative arts hroideries, and persoual textile fabrics, ompraises the beauty of her carpets and of ber linens and contmines and the fineness imporiod the rich embroideries of 1 se sti counted them amonst lier most ajpt, and counsed Thinger most valuabe pos. seulptrol et the mainly soulptural, yet the parahlelism of the arts of be traced The Chinese and Jan also be traced. remarkablo for the richness of their costumes, had arready made considerahlo advances in the art of painting; whilst the Yndians and the Persias, hog whom migat almost be salid dress was hon-existcnt, were still ignorant of any bigher art than the rudely-scalptured hieroglyphics of their rook.cut temples.
The study of dress and
impulse stady of dress and embroidery gave the impulse to art ins Greese; and the shawl of Alcisthenes, made 400 years B.C., upon which and worsed a galaxy of gods aud goldesses, was a chersit of the innstious owner himself, samples cuvre of deoorative art. The finest bave been preserved to us, or of which whe which any record in bistory, during the provasory, were indeed proten for personal adornment. The evidence of this is found, not only in the elegance of the provailing fashions of dress, and the variety and beauty of its associated emhroideries, but equally so in the tastefully varied and elahoratc decorations of the hair and head, and the magnificence of the jewelry miversally worn; whilst the greatest mainter of the acre was praised by Lucian over ail others for the surprisiug trutb, elegance, and Alowiug lightness of his draperies.
Amongst the Romans, the arts rapidly degenerated; but whether that degeneration precoded or followed tbat whioh certainly took place in all matters of personal ndornment, both civil aud military, I will not here attempt to discuss. The fact sulfcient for my purpose is, however, beyond dispute; that the marvellons comhinas unity, of ornames and simplicity, of variety and in Greece, wero very early and utterly lost in Rome. The Greeks clothed the body without concealing it; and each addition to, and encich. ment of, the dress, was so skilfully arranged tbat it seemed but the more to rereal the beauty of the form beneath. This surprising facnlty of adjusting and elahorating the manifold draperies with which they robed themselves, adapting each dress to the condition and wants of the wearer, and infusing the spirit of art into all, did not desoend to the Rumans; and all beauty and variety of costume were nltimately sacrificed by that nation in fapour of the miversal toga,--a garment which has proved, in the bands of later artists, as fatal in its effects upon modern, as it ever was upon ancient, art

Thenceforward, to the end of the twelfth centary, we are as little ooncorned with art as art was with dress. Humanity of these dark ages had indeed, lapsing into barharism, cared little for one, and nothing for the other, and liad well.nigh forgotten the use of both. It was not nntil the beginning of the thirteenth contary that art actain showed any conspicuous signs of vitany.
Then, again, marching slowly forward hand in hand, again, marching slowly forward hand in the sizteenth century with the works of Leonardo da Vinci, Micbelangelo, Raffaelle, Titian, and Correggio, we find that in no otber period of Enropean history had all classes of society affected greater magnificence in personal attire, or exhibited more taste, skill, art, and ingenaity
in the manifestations of their exuberant love of display.
But the lamps which burnt tbus brigbtly during three centnries over Italy, Germany, and France, flickered but faintly and fitfully in
the uncongenial atmosphere of Eingland. The earliest signs of art revival were hers met in 13 fit by the sumptuary laws and penal ordinnaces of Edward III.; and in snccessive reigns, to the middle of the fifteenth centnry, every fresh manifestation of vitality was the signal for further legislation and more stringent statutes. Yet the strong arm of the law would prohahly have been still too weak to arrest or hold in snh. jection a sentiment so universal and dominant of the human faculties, had it not enlisted into its canse an army of voluntcers, whose fanatical ravings made the centaries dolorous. But civil, religious, and social persecntions proved too much for human endnrance, and under their combined influences England remained withont national art and withoat native artists until the seventeenth century
The fitful and feverish history of the arts and costumes from this period is closely interworen with the political records of the country, and infinitely too involved for treatment in this sketch; hat if any one still believes that I have unduly estimated the influence of dross apon art and national taste, -if he still douhts that "love of finery" is the potential germ which, ander intelligent culture, grows and fructities pursne the suhject for himself from the date at which I have left it, and I do not fear hat his ultimate judgment will wholly vindicate my own, for he will find that corelation of growth is as certainly a mental as a physical law in hiology that the buman faculties have a hilateral tendency, and that if their growth is persistently to develop in the other; and finding that the penalties of the law, the anathemas of the clergy, the satire of the "reformer," and the
still worse cruelties of domestic tyranny hare still worse cruelties of domestic tyranny have
united to stamp out every cffort of the hnman mind to worthily clothe the human hody, as though the contemplation of filthy rags were an ennohling study, and the physical degradation of man, created in the image of his Maker, an acceptable sight in the eyes of the omnipotent God, he will no longer think it remarkable that we have grown up as a nation in besotted ignorance of art and in callous indifference to it heneficent influences.
Fet love or dress is not, in my estimation, a miversal good; neither do I helieve that all the firtues follow in the train of art. The mountain stream will hring down some refuse, and man's nohlest aspirations, still testifying to original sim, will ever be degraded by contact wita the sordid facts of material life, through which alone they can find expression. But wilh this aspect of the question, as I have already aid, I am not at present much concerned. My rative Arts and Painting," and if I have proved their corelation of frowth in the past, I do not ess confidently affirm it of the present. We are confessedly the most inartistically dressed nation confessedly the most inartisticaly dressed nation department of the fine arts we can claim preeminence.
C. Henry Whitaker.

METROPOLITAN IMPROVEMENTS AND POPULATION STATISTICS
In the course of a lengthened and exhaustive financial statement which was made recently hy Mr. Dresser Rogers, chairman of the Finance Committee of the Ifetropolitan Board of Works, some highly interesting facts were disclosed as to the improvements which have been made in the inetropolis during the last ten or fifteen fears, and also some equally interesting statistics regrarding the population and sanitary condition fie metropolis generally
Referring to improvements, Mr. Rogers stated that the great improvements now being carried out in the metropolis were gigantic in their cha. racter, which was almost revolntionising the appearance of London, and they conld not fail to be of the highest importance as far as sanitary measures were concerned. Adverting to the question of dangerous structures in the metropolis, he said that during the past year the Finance Committee had had them very fre. quently under their consideration, and scarcely a meeting passed without having reports from the accountant with regard to the dangerous. structure fee account. Objections had been taken to the working of the Act of Parliament throughout the metropolis, hut this he attributed to the fact that from year to year the Legisla. ture of the comutry Tas casting duties on the

Board entailing considerahle responsihilities with regard to pnhlic matters of great import ance to the inhahitants of the metropolis, an hese duties were thrust npon the Board hy th House of Commons without giving the Board fair opportunity of recoaping the ratepayers fo expenditure incurred
Referring to the population and the sahject of sewers and drainage, be said that the population of the area over which the Board had charge re mained much the same as last year, namely, abou 3,2 fif, 987 , and the number of houses 419,612 Fhilst the acreage was 75,490 acres, and the are of texation 117 square miles. The tatal length of main drainage sewers was now eighty-two miles, exclusive of old sewers, which amounted to 165 miles in length. The total length of local sewers constructed hy vestries and distric hoards since the year 1856 was, at the present moment, 722 miles in length. The rateahl andual value of the metropolis last year wa $20,307,2952$., but during this year it had in creasod to $20,644,0002$. The finances of th Board comprised an income and an expenditure of more than $550,000 l$. per annum. The statement went into lengthened details upon a variety of other financial topics, including loans arious public hodies and vestries. The sale of ground-rents during the past year also formed a prominent feature in the statement, from whic appeared that they included Sonthwark and Westminster communication, 29,1281. 8s. (eqna to twenty-six years' purchase); Victoria Par pproach, $6,275 \%$, or twenty-one years' purchase outhwark Park, 5007. Whitechapel improve ment, fi581. 19s. 10d. ; Kensington improvemen $6,992 l$. , or twenty-five years' purchase ; Mansio House-street, 11,249 ; Stingo-lane improvement 3,575l. ; Park-lane improvement, $99,389 l$; and Wapping and other improvements, 2011.17 s . making a total recoupment of $138,000 t$. I farther appeared from the statement that durin the year $3,500 \mathrm{l}$. had heen received from an ahortive scheme known as tho Waterloo an Whitehall Railway Company in satisfaction of the Board's clamm on them for money expende in carrying onf worke, which they were em powered to have done under their Act of Parlia meut, by the Board on the Thames Emhankment. The valuo of surplus land was $1,232,812$. this year, as against $1,795,291$ l. in the estimates for last year, and Mr. Rogers explained that the reason for the reduction was, in addition to the sales, that the architect had heen eabied, had occurred, to give a truer estimate of the value of the surplus lands than formerly
This statement gave rise to a remark from Mr. Newton that he thoaght it unfortuate tbe statement shonld go forth that their snrolus lands were worth less than last year; and he added, spealing from his experience in the wort committee, that he cid not think the vacant land had let helow the architect's estimate, in proo of which he said that a few days ago a plot had been sold for twenty-six years' parchase, and in many cases even a higher price might he ohtained.

## THE INSTITUTION OF CIVIL

 ENGINEERS.On the 9 th inst., the paper read was "On the Geological Conditions affecting the Constrnction of a Tunnel hetween England and France," hy Ir. Joseph Prestwich, F.R.S
The anthor, in this paper, reviewed the peological conditions of all the strata hetween Carmich and Hastings on one side of the Chamnel, and Letween Ostend and St. Valery on he other side, win a view to servo as data for any future projects of tunnelling, and to show in wat directions inqniries shonld he made. The Loadon clay, at the month of the Thames, was from 200 ft . to 400 ft . thick, while ander Calais it was only 10 ft ., at Dunkirk it exceeded 264 ft ., and at Ostend it was 418 ft . thick. He considored that a trough of London clay from 300 ft . to 400 ft , or more, in thickness extended from the coast of Essex to the coast of France and, judging from the experience gained in the Dower Suhway, and the known impermeahility and homogeneity of this formation, he sew no difficnlty, from a merely geological point of view, in the construotion of a tunnel, hnt for the extreme distance,-the nearest suitable points heing eighty miles apart. The anthor, when considering the Palæozoic series, to which his attention was more particularly directed while making investigations, as a member of the Royal Coal Commission, on the prohable rance
of the coal measures ander the south east of England, showed that these rocks, which consisted of hard Silurian slates, Devonian and carhoniferons limestone, and coal messures, together $12,000 \mathrm{ft}$. to $15,000 \mathrm{ft}$. thick, passed nader the chalk in the north of France, out. cropped in the Boulonnais, were again lost ander newer formations near to the coast, and did not reappear uutil the neighhoarhood of Frome and Wells was reached. Supposing the strike of the coal measnres and the other palmazoic rocks to ho prolonged from their exposed area in the Boulonnais across the Cbannel, they would pass under the cretacenus strata somewhere in the neighbourhood of Folke. stone, at $\AA$ depth estimated by the author at ahout 300 ft ., and nenr Dover at ahont fino ft . The anthor considered that it would he perfectly practicahle, so far as safety from the influx of the sea water was concerned, to drive a tunnel through the palæozoic rocks nnder the Channel hetween Blanc Nez and Dover, and be stated that galleries hnd actually been carried in coal, under less favourable circumstances, for two miles under the sea, near Whitehaven. But chile in the case of the London clay the istance seemed almost on insarmountahle bir here again the depth offered a formidable diti ry rounds rounds alone, it was in one case perfectly possibly 0 , a poside besides thase of a geological nature, and whether was questionable.

SCHOOL BOARD SCIIOOLS FOR

## BATTERSEA.

The London School Board Schools in Boling. roke-road, Battersea, were opened on the list nstant, without any ceremony. They occupy an open position, rather more than threequarters of an acre in extent. The huildiags are set hack ahont 50 ft , and are surrounded by separate playgrounds for girls, boys, and infants, the area of which, allowing 25 square feet for each child, would be sufficient for nearly 1,300 children.
The schools consist of a central mass, two stories in height for the hoys and girls, with ther haildings, one story high for class rooms and infants' school. The general plan is the H form, the centre room for hoys heing 42 ft . 3 in. hy 21 ft., with two class-rooms on each ide, each 24 ft . hy 16 ft .6 iv . These are con. wected with each other by double sliding doors, and with the general room hy glass doors.
The boys' entrance - lobby, lavatories, and cap. room, are in the centre of the group; the irls' entrance and staircase, also with lavatories and honnet-room over that of the hoys, with V.C. ; and over these is the mistress's room overlooking the girls' playground. The girls are provided with a general room, $1: 2 \mathrm{ft}$. 9 in . hy 21 ft ., and one class-room. Another room, 24 ft . hy 16 ft .6 in , with a north lioht, is intended to he used hy hoth as a drawing-class oom, with separate access.
The infants' school contains a general room, 38 ft . hy 21 ft. , with a gallery calculated to accommodate 73 children; a babies' room, 20 ft . hy 18 f f., with callery for 56 childreu; and olass. Fom, 16 ft .6 iv . hy 13 ft ., with desks for 30 infants.
The manargers' rooms, 18 ft , hy 14 ft ., with avatory and W.C., adjoins the infants' school entrance, with the infants' lavatory, cap.room and W.Cs. behind, connected with the covered playground.

At the baok of the main huilding a wing contains the master's room, commanding the boys' playground, over which, in two stories, are the carotakers' dwellings.
All the school and class rooms are warmed by grates intended to consume the smoke, ant supply warm fresh air to the rooms from a chamher at the hack, fed from the ontside ; and connected with flues to carry the warm air to the rooms on the first floor. All the rooms are rentilated by gratings connected with a cavity adjoining the flues. In addition to these, fresh air is conveyed hy a shaft to the upper n?rt of each room, with extractiyg llues for the vitiated .
The hoys' and girls' schools are provided with and 120 accommodation, in pairs, for 3.10 hog, more. Allowing 9 square feét for each child the rooms would admit of 276 hows , and $1+1$
 they would acoommodate 172 .
The haildings aro in tho. Gothic. sityle, of
 sional bands of Bath stome, with red brick arches to the mindo ws and toors.
The amount of the contrnet was $\overline{5}, 370 \%$, and tho selools have heen built by Mr. John spink, of Baterean, nnder the ouperintendence of the
architeot, IT. John W. Waiton, of 12, Bucking. ham. tircel, W. .C.

THE REPLY OF THE RAILWAYS.
THe circular reecntly addressed by the Presi. dent of the Board of Trade to the several railway companies, in which the companies are,
hy implication at lcast, charged with neglecting hy implication at lcast, charged with neglecting the means for securing the safoty of the travel.
ling pablio, by not having provided works and station accommodation commensurate with their coustantly increasing traffic, has been followed hy replies from the cbairmen of nearly all the
great companies, in which the latter warmly great companios, in which the latter warmly
defend themeolves against the charges made by defend themselves against the charges made by
the Board of Trade authorities. A notable feature in these several replies is that which discloses the enormous outlay which bas recently
heen inourred in cxtension lines, and new and heen inourred in cxtension lines, and new and
cnlarged station buildings by many of the cnlarged station buildings by many of the companies concerned.
Thestatement of the chairman of the London and North-Western Company reveals the fact that during the last five years this company has expended more than $4,000,000 \mathrm{l}$. in doubling lines and onlarging stations, in addition to a
further expenditure of $2,000,000 \%$. on new lines, further expenditure of $2,000,000 \mathrm{l}$. on new lines of which the greater part was laid out to relieve
the traffic of exiating linos, amounting altogether to about one-ninth of the whole capital of the company. Beyond that sum they havo cxpended during the last two years out of the annual revenue $100,000 \mathrm{l}$. per annum almost entirely refuge sidings and interlocling points. chairman shows that many of the large stations have beon rebuilt and materially enlarged to
meet the increased traffic, amongst them heing the Enston Station, the area of which has heen doubled. Limostreet Station at Liverpool, the chairman states, has been huilt three times, and the company are now doubling its area at a cost of upwards of $500,000 \mathrm{l}$. Stafford and Crewe stations bave also hoth been constructed three
times, and greatly enlarged on each occasion times, and greatly enlarged on each occasion, enlargement of Crewestation, at a cost of about 100,000l. Mancbester, Birmingham, Farrington, and many other stations bave also been recon.
structed and enlarged at enormous cost ; whilst Carlisle, Preston, and Bolton stations are now in course of being rebuilt and enlarged. Similar
works have for some years been going on, and are now being carried out, on almost all parts of the line, as rapidly as the state of the lahour market and other circumstances will permit, and others are in contemplation. The chairman, the stations were laid out originally on what was then considered an extravagant scale, but in the great majority of cases they have now proved
insufficient, and as works of different kinds naturally gatbered round the stations the task of enlarging them has become not only exces. sively oxpcnsive, but very difficult, owing to tho vested interest concerned, which frequently cannot be dealt with without Parliamentary ing new lines and branches, and additional douhlo lines, the chairman states that a third line was several years ago completed from shortly be opened, and also, in order to continue these lincs into Euston.square, powers were obtained in last session to construct a duplicate tunnel for two lines of rails under Primrose.hill. Plans are also now preparing for further extend. ing these two additional lines to near Northamp. betweon Rugby and Auneaton on the up side, for the goods trains, in order to facilitate the passage of the night tuails. Two additional tween Stafford and Course of constrnction beprooeeding with arrangements for filling up the prooeeding with arrangements for filing up the intermediate portions so as to complete four
lines of rails over the whole distance botween London and Crewe. Altermative railways have
as the Whitcburch and Tattenball, for the pur pose of conveying the traftio of South Wales with Birkenhead and Chester, withont passing through the busy station at Crewe, the Runcorn Bridge and its necessary approaches liaving cost more than 500,000 . The Lancashire Union lines, the donbling of the line hetween Liverpool and to Wigan, make duplicate communications be. tween Manchester, Liverpool, and Figan and the north. Several branches and tunnels, especially a tnnnel three miles and a quarter long in Yorkshire, originally made for single ines of rails, have also been doubled to meet the public requirements. The expenditure on the hlock and interlocking system is also noticed, the chairmanstating that in this department the
ontlay for some years past has amounted, on an ontlay for some years past has amounted, on an will be exceeded during the present year. To will be exceeded during the present year. To
show the magnitude of theso works the chairshow the magnitude of theso works the chair. man states that they have involved the exection
of 13,000 new signals, with the corresponding pparatus.
The chairman of tho Midland Company has also replied to the President of tho Board of Trade's circular, and his statomont likewise ghows the heary expenditnre which that com. pany has incurred, and is now incurring in now
works and station accommodation for their in. works and station accommodation for their in-
creasing traffic. He states that the amount creasing traffic. He states that the amount expended during the last six years upon the
enlargement of stations, sidings, buildivgs, and enlargement of stations, sidings, buildings, and estahlishing the block and interlocking system, ame period The amonnt expended during the $1,233,635 \lambda_{\text {. }}$; whilst in duplicating the line between two common points, the sum of 2,390,8662. has been expended within tho same period. The amount expended in increasing the number of engines, carriages, and wagons, was $2,558,265 l_{\text {., making a gross outlay for the ahove }}$ named purposes, during the six years, of $7,948,8252$. The chairman adds, that this expenditure is altogether irrespective of the construction of new lines in progress, and is still going on. He also makes the important statement that the sidings npon the Mdland system at che present the block system, he remarks, that at present it 8 in operation over nearly 500 miles of the most important portions of the railway, and the further extension of it is being proceeded witly as fast as materials can he obtained and the work executed. Similarly, steps have heen taken points. As regards the sufficiency of the jstaf for the proper conduct of the traffio, he states that while the gross receipts from all sources of rom 2,801, 4361 to $5,026,1021$ per annum bein at the rate of 79 per cent., the number or servants has increased from 15,882 to 30,006, on 90 per cent., and the salaries and wages paid from $871,728 l$, to $1,852,136 l$, or 112 per cent
Sir Daniel Gooch, the chairman of the Great Western Company, in his reply to the Govern. ment circular, states that during the last year hroad company substituted tho narrow for the from Swindon to Milford Haven, representing about 500 miles of single liue, and that they con. tomplate a similar operation in tho cnsuing year on other important and oxtensive parts of their system. In effecting these changes, as woll as on other parts of their line, the enlargement and rearrangement of stations and sidings, and the laying down where needed of additional linos, have been and will be proceeded with. But the chairman adde, that the question of "station and siding accommodation," referred to in the Government circular, is a complex aud difficult one. The fluctuating nature and extent of the requirements of the traffio involved considera. tions perpetually varying with the variations of traffic in different localities. What amounts to sufficient provision for tbe safe working of in. creased traffic by the enlargement and rearrange. ment of stations and sidings, is a question dependent upon the special circumstances of dependent upon the special circumstances of thereto. On this particular point the ohairman observes that the directors nover hesitate to inenr any expenditure which is called for by the demands of an expanding traffic, the reason. sonable accommodation of the public, whether as passengers or as traders, being inseparably bound up with the permanent iuterests of the company. have been dochaiman 'regrets that it should Government to address to this compony a letter
which contains-hy unaroidable inference and implication-charges as to the coudnct and management of company's allairs of so so far the Gratacter, and he denies, orned as the Grat Western Corupany is con. cerned, the charge made by the Government manent way, the rolling.stock, and the station manent way, the roling. stock, and the station requirements of tbe traffic.
Mr. Castleman, the chairman of the South. western, replies on behalf of the directors of that company, and in doing so, states that the board ening apd every known weans for stresgth. ening and improving the permanent way; that a very arge expenditure has been incurred in and ging the station andeiling accommouation; and that the work is still proceeding without cessation. Within the past seven years, in ad. the the permanentway, 250,000t. hare becn expended upon its strengthening and renewal, and the directors have thus heen enahled to keep the permanent way and the siding and station ac. increasing traffic; and that as regards the rolling-stock the same course has steadily and successfully been pnrsued. The chairman further states that, some time ago, a very considerable expenditure was incurred at the waterloostation in crecting a large over-bridge signal.box, with all modern rpphances for interlocking signals and points, and an extensive trafic had, foz many years, been worked in the Waterloo station. A further large expenditnre has been, and is still being, ixcurred in erecting additional signals and making other improvements on that station. Referting to the ahsolute block systcm, he tates that ont of G6t miles of railway, 419 miles are already worked npon that aystem ; eigoty. nd milcs additional will soon be hroug block its operation, and next year the absolnto hat system will be further extended. He adds hat the interlocking of points with signals has largo extent, and is in course of further ory tension.

RAVAGES AMONG BUILDINGS BY A STORM OF WIND.
On Monday night and Tuesdiy morning of last week, England and Scotland were visited by an extraordinary storm of wind, resulting in lifo.
The gale orer Sheffield and district, for inensivy and disastrous results, has never been equalled in the history of the town. Numerons all ctimneys have heen cast down, and other premises demolished. High chimneys, too, in an ominous manner. Aoen to rock to and fro which has long been referred to as heing pro bable in the event of an unusually rough wind his was the fall of a square. built chimney, orer 150 ft . in beight, situated in Trippet-lane. The front part of the premises were used as a sewingmachiue mauufactory; the next set of workshops, twelve in numher, by cutlers. This part demolished by the massive chimner, and the occupants, numbering between twenty and thirty, of both sexes, were buried in the heap of ruins. After some hours' labour, the police recovered five bodios, mangled and cushed beyond recognition, and it was helioved that many moro wera buried. A fettlings shop at the newly.erected fonndry of Mr. Hadfield, in Now hall y-erected hall.road, Atterchiffe, was blown down, hurying 40 yards in height, fell at the Norfolk Works, 40 yards in height, fell at the Norfolk Works, Aestroying part of the forge and hammer mill wrick in its fall. Part of Messrs. Hornby's pitriol whe Alterclife, were blown down the work morks, heing at breakfat, escaper The work Son's Wa at buest a Son's, Watery.lane, the high chimney fell, cutChristopher Johnson \& Co, in two. At Hesars. Christopher Johnson \& Co.'s, Portobello-street, the chimney fell, breaking through workskops
and warehouse. The infirmary and hospitals and warehouse. The infirmary and hospitals are full of injured people, and the list of casmalties cannot possibly ho exbausted herein. The following enumerates some few more of them:Six shops partly destroyed in Highfields; the police-btation, Hightiolds, considerably damaged; sixteel houses unroofed; Thonipson \& Co.'s fit ting.shops hlown down; in Washford-road the
churches are more or less damaged; and the

Pavilion and Botanical Gardens partly destroyed. In every strect some houses are nirroofod and chimneys blown down. The telegraph wires between Sheffield and Barnsley were completel wrecked.
The new Board schools at Walkley stand in a position where they encountered the full force of the gale, and they have sustained very serious damage. The schools are ereeted in the shape of the letter H , and they were so far completed as that the main principals of the contre roof had been got up. A tremendous gust of wind swept across tho hill, and hiteraly lifted the massive framework of the centre roof from off the inge and aroppo it ovor the front of he huilding, a great doal of it heing emashed to pieces
in the fall. The contre walls being thus loft in the fall. The oentre walls being thus loft without support, were blowu down to the floor
line. The roofs of the outer portions are not line. The roofs of the outer portions are not
much injured. Ono of the gable chimneys was much injured. Ono of the gable chimneys was
blown down, and did some damage. One of the blown down, and did some damage. One of the buildings to suffer was the Mothodist Now Connexion Chapel, which stands at the junction of Walkley-road and Walkley Bank-road.
Instances are not wanting where every
chimney in a whole row of houses has been chimney in a whole row of houses has been blown down. Such is the case at what is known as the Brick-row, at Hillsbro'.
In Leeds, churohes and chapels were terribly knocked ahout. 20,000 . will not cover the damage done. One large building, situate in Lady-laze, injored three men in its fall. Many buildings in the course of erection have been injured to a greater or less extent. At Gildorsome, near Leeds, a biacksmith's shop was blown down. At Chwechwell, a new oo-operative store was much damaged, and great injury to rosidenoes was also done. At Halton and Whitkirk, a chimney, fifty yards high, in Moadow-lane, was forced down to the ground, and iu its fall cat through the mill and a portion of a dwellinghonse.
The Weeton Railway Station, near Harrogate, Fas blown down, as well as several houses. The same thing occurred at Knaresborough. The North-Eastern Railway eugine-shed at West of chimneys bave been unable to stand the violence of the harricane
At Hahfax, b new brick chimney, just com. pletcd for tho saw-mill in conrse of erection in Jorton-street, for Messrs, Bedforth \& Son, builders, was blown down, and fell on a shed immediately under it, killing a youth, and seriously injuring three sawy ers. The chinney was had not diried. Three of the pinuacles at the had not diried. Three of the pinuacles at the
foot of the spire of Sqnare Congregational foot of the spire of Sqnare Congregational pinnacles are in douhle sets at each corner of pinnaclos are in douhle sets at each corner of
the tower, the set at the sonth.west corner fall. ing into tho yard, and snashing gravestones. ing into tho yard, and sniashing gravestones. At the northowest oorner, one of the pimnacles
fell througl the roof, its companion having a ioll through the roof, its companion having a
great rift in it, and it was momentarily expected great rift in it,
At Dewsbury Moor, a newly-erected building (not oocupied) was demolished, and a house at Earlsheaton was rendered uninhabitable, the roof heing completely lifted off the walls. Considerable damage was done to St. Johu's Church, Dewsbury Moor. The large new chimney of the Dewsbury and Batley Brewery Company was blown down, and other danage was done to the
works. The new Board Schools, in course of erection hy the Soothill School Board, were totally nnroofed, and the buildings were otherwise seriously damaged. Many buildinge, including the Dewsbury Chronicle office, were partially unroofed. A foundry was partly de. molished at Meckmondwike, where a great dcal of damago was done. At Batley, one of the four pinnacles of the tower of the parish church was blown through the roof, 6 square yards of whioh it carried awtay into the church, causing damage to pews.
At Aberdeen, and elsewhere in Scotland, much damage to buildings also occurred.

The Projected Railway to Eounthay Park, Leeds.-At a meeting of the subscribers to the proposed Leeds, Ronndhay Park, and Osmondthorpe Jnnction Railway, it has been unanimonsly resolved :-
"That haring regard to the very limited amount of
support giren to the project, and to the formal expression support givento the project, and to the formal amount of espon
of dissent received from the Corporation of the borough

## CONSTANTINOPLE.

A special section has been established in the Council of state for the consideration of all matters oonnected with public works. Of this section his Excellency Fdhem Pasha, ex-minister of publio works, has been named president, with Rani Pasha, Nustapha Assym Pasha, and Pavlaki ilussaras Bey asoleader Acourding
to the Levant Herald, M. Guerrard, engineer, as the the Levant Herald, sr. Guerara, engineer, as
the representative of it. Pascal, has roeently sub. mitted to the Porte that gentleman's plans for the harbour and other works at Dédé-Agatch, Varna, Salonioa, and the Stamboul terminus at Sirkedji-Iskelessi.
The Torkich
The Tarkish papers pnblish an official communication annonncing the arrangements made by he Government for oarryingout the new oadastra] snrvey and valuation of reat estate in Constantinople and its suburbs as the basis of the assossexisting plans and registers are no longer correct, and are often a canse of contention and onfusion.
Tho capital and its suburbs will be divided for the purpose into a certain number of cadastral districts, and the Government surpeyors, in conjunction with professional valuatore and tho imanis (priests) and mouhtars (head-men) of the list of will for cach district prepare within its boundaries, the houses and shops unoccupied and occupied, whether hy tenants or oryners. When the snrvey is commencod all owners mnst exhibit their title-deeds; but if the owners be in the provinces, or the title-deeds themsel res be elsowhero than in Constantinople, a delay of five months from the beginning of the sarvey Nill be allowed for the presentation of these docrments; but should that lapse of time be of 10 piastres per 1,000 upon the estimated value of their properties.

THE PROPOSED MEMORIAL OF THE LATE SIR WILLIAM TITE.
IT may ho remembered that, after the decease of Sir William Tite, M.P., who represented the parish of Chelsea at the Metropolitan Board of Works, the vestry of that parish made a stir with regard to erecting a monument to Sir William on the Chelsea Embankment, and Sir Charles Dilke, M.P. for the borough, forwarded a cheque for 100 l . Several of the vestry proposed, also, that the parish, which owed so much
to their late member of the Board of Works to their late member of the Board of Works, should bear part of the expense, and some of the
restrymen talked of their owa desire to restrymen talked of their owa desire to suh. scribe.
To carry ont the design a "Memorial" Committee was formed, and, at the last meeting of the restry, tho committee submitted a report recommending that the project he abandoned, and this courso the vestry agreed upon.
The friends of the late Sir William Tite will no doubt be much snrprised, if not something else, at this issue; for the step taken by the vestry unquestionably hindered others ready to orect Tite ; and it may ho now a difficnlt task to get friends together for the desired object.

## THE ENGRAVING FOR THE ART.tNION

 OF LONDON.dutcit tramlens latding fise at egnont.
It appears from the last report of the Counoil of the Art-Union, that the plate of "Tilbury Fort," after Stanfield, is still so much in request, and the eight plates of "Coast Scenery," given two years ago, wcre co popular, that it was and accordingly Mr. E. W. Cooke, R.A. commissioned to paint, for the Sooicty, one of his charming pictures representing seafaring life on tho coast of Holland. We have here a couple of the full-bowed Dutoh boats, much such as those in Mrr. Cooke's pictore in the sucademy this year-lying on the shore near Sohovening-the tide being so low that the men and women can wade through the shallow water to carry the baskets of fish to land. We scem to catch the smell of the sea, and to hoar the waves breaking against the kulls of the vessels, and driving the shells aud pebbles before them as they subsido into ripples on the beach.
The hoats are painted with the artist's firm
solid touch, and the sails-one in shade, the
other lighted by a watery gleam of sunshine, which is relioved against a blaok threatening loud behind it-form a striking, hut not violent contrast. The subject has beon capitality en. graved in pure line by Mr. Arthur Willmore, almost the only landscape-engraver in this style now left; unfortunately, the more rapid and economical methods of mezzotint, or chalk engraving, being alone patronised by the print. publishers, though nothing can attain the bright. ness and power of the pure line manner.
We learn that the prizes at the ensuing distrihution will comprise, amongst other works, and the right to select pictures from the public galleries, a number of statuettes in bronze of the painter Cimabuë, from a model by Mrs. Fonnessy, for which, as a pnpil in the Bloomsbury School of Art, she received the Queen's Goid Mcdal last year, and the warm commendation of mavy crikics. $\qquad$
WHiTBY JET AND ITS MANUFACTURE.* Weat is jet? This is a question often put, but never satisfactorily answerod. Nearly all the jet workers have au opinion on ite origin, and most of them, in common with the greater part of the inhabitants of Whitby and its neighourhood, believe it to be of ligneous origin. Some, however, believe it to be of mineral simin, and others think it combines the two. Taking the opinion of Mr. Martin Sirnpson, the arator of the Whitloy Musenm, who has studied the geology of this district exceedingly well, and with whom I have talked on this suhject, he put his theory as follows:-"Jet is geverally con. idered to have beer wood, and in many cases it has undouhtodly been so; for the woody structure often remains, and it is not unlikely that comminuted vegetable matter may have been ohanged into jot. But it is evident that vegetahle matter is not an essential part of jet, for we frequently find that bone and tho scales of fishes have also been changed into jet. In the Whitby Musenm there is a large mass of bone, which has the exterior oonverted into jet for about $\frac{1}{3} \mathrm{in}$. in thickness. The jetty matter appears to have cutered first into the pores of the bono, aud then to have hardened, and during the mineralising process, the whole bony matter has been gradually displaced and its place occapied by jet, so as to preserve its original occapied
To this latter opinion I am inclined to arree, for it has the appearance of a substance that has mpreguated veretable, and in some othcr cases animal substances, while in others it has simply filced up a fissore in the rock, and solidified. In some specimens I have seen the grain, apparently of wood, distinctly; in others, scales and bones of fishes; and in one of the best specimens that; have been found here, the mass in forin and strnctnre was that of a tree, with bark, knota, and roots, and in the curled portions of the root
Whaterer may be the actual formation of jet, that known as the lard jet is most worked, it not being thought worth while working the soft spccies, since tho importation of the Spanish articlo. The hard jet has a specific gravity of about $1 \cdot 238$, has a oonchoidal fraoture, $a$ resinous astre, it gives off a bitnminous cous burnt, is an electric, and a bad in the of beat. It was formerly obtained in the largost quantity by working in the oliffs, by a process called "dressing" (very dangerous work), -that is, by clearing away and hewing down the clif. sides till jet onds protruded; the searms were then followed till exhansted. Some seams have realised as much as 1,0002 , and have been discovered in a short time. At other times, however, men have been employed for weeks, cceasionally months, and have found nothing ; in fact, have been on the point of giving up, when they have nnexpectedly come npon a seam that has fully repaid all their labour.
There are somewhat more than twenty mines at work at prescnt; about 200 miners, whose weekly wages vary from 24s, to 26 s . Owing to these low wages, many men, who might otherwise be at jet-mining, go to the ironworks in the district where they get paid much better. A
short time since there were more than 400 miners, but they have gradually lessened to the number before mentioned. Again, jet-mining seems to be a sort of hazardons undertaking, as far as profits are concerned, for often largo areas have been tunnelled, and nothing found; and
*From a paper by Mr. John A. Bower read at the last
meeting of the Society of Arts.
ethers hevo sometimes taken up minos that former workers have given np in diggust, and reaped a fine harvest. Both the jet oliffs and mines are rented by the workers. By far the Turgest jetminers are W. Thompson and
hoth of Whithy. The former has carried Turner, hoth of Whithy. The formcr has carricd 1860 . Rongh hard jet varies in value from 4 s to 2ls. per pound, according to its closeness of texture, direction of grain, freedom from flaws, and breadth for working. The soft jet varies from 5s. 6d. to 30a. per stone; the price of the Spanish is nhont the same as that of the English soft jet. The Whitby hard jet is the best in the world, not only for working, hut it will take a fine polish, which it retains for years, and it can bo worked np into finer designs on acconnt of a greater tenacity and elastioity that it has orer ther qualities.
The skin has first to he removed, which is done hy the workmen chipping the surfaee with a large iron chisel; the stripped portions are then taken to the sawing hench, where the jot is sawn ap, with the kconest oye to economy, into the various shapes and thicknesses, according to the articles for which they are required. The pieces are then given out to the carvers turncrs, as the case may be. In the case of the former, if he requires to make it into a brooch, locket, or cha n-link, he takes it to a grindsione, whioh he works hy a treadle, and brings the edge, which be keeps turning round, on to the
faoe of the stoue; it soon then hecomes oval round, square, or any geometrical shape required The snrfaces are next both ground smooth ; it is theu fit for oarving. Fery often-I mights say rarely is it otherwise-the artist in jet who undertakes this is no draughtsman whatever yet he can ont the most beautiful and trathful faces in high relief, the most delightful floral designs, - the latter often without any pattern at all; the most tasteful monograms, and other designs equally good, without heing ablo to sketch the simplest object on paper, and often not being ahle to write his Own name. It was only last week a striking instance of this kind came under my own notice. I saw a workman, able to cut the most elahorate monograms, the most acourate portraits, the most elaboratc fonage, hut quite unable to sign his name. Is instances, that we in Whitby should havo not only elementary classes, but also a School of Act? I remarked on the economy with which he jet was cut up. I am informed that som masters, hy oure, get one fifth more work out observing this.
The most complate worlshops we have in the town are those of Mr. Bryan, who has lately gone to considerahle expense in rearing not only a large struoture, hut has added cyery possihle conveuience
I have heard Mr. C. Bryan, whom I named just now, say that he was willing to take fifty little London street Arahs as apprentices, and should turn out first.rate jet workers; and from frequently visiting these workshons I have every reason to believe this is no exaggeration.
According to the classen of work so do the wages of the workmen vary; some idle and care less hands getting from 16 s. to 1 l . Is. per week; thers earning from 30 s . to 50 s . weekly; and the average wages for hoys, fro
teen years, being 8 s . to 10 s .
In conversations with provement in the patterns, masterg on an im. provemont in the patterns, or the introduction of
something new, I am told that if customers im something new, 1 am told that if customers im price of a and fere were any acmand fo to oring bne whe hy hringing ont a good and new design, it fre quently was on their hands for a long time, er so that muoh improvement in this class of goods di yends on the puhlic tasto
The designs would be greatly improved if we had a good art school in Whithy; this is very much required, and many of the artizans hare expressed a stroug desire that efforts shonld be made to get them one The only school we auspices of the Mechanics' Institute, ander the it is doing the Mehancs Institute, but although many fford more wold avail tbemselver of it did it selection of good copies, designs, and models is greatly felt.

A cood museum of works of art, occasionally loenlised in the town, would do very much to help the men and improve the art, and repetitio of suoh inducements as have lately been give bring ont the taste and skill of the workman.

## ARCMITECTS' CHARGES

Sin,-It is more interesting than instructive to observo the exceptional difference of opinion among architocts and snrveyors touching their professional charges, as evidenced in the onse of Collins v. Ullman, reported in yonr last issue. On the one hand, we have a grave and weighty Insti. tute,-chartered hy King William IV., royelised hy Queen Victoria, and supported (with idiosyn. cratic exceptions, such as the elder Pugin, proving the rule) hy the genninely eminent members of the profession, sneh as Cockerell, Barry, Smirke, Donaldsen, Tite, Scott, \&o.,-Betting forth a system of remuneration; and, on the other hand, we have "Mr. Henry Jarvis, district surveyor," who "repudiates altogether the and is thas the Institute's scale of charges, official scale. The reason of this somewhat rude rebellion reems to be that it is the cnstom of the dissentients to charge the same, or "never more then 5 percent., whether the works were diffionlt and not, or whather they iuvolved additional trouhle men could act. Bat, of course, no sensibl binding or otherwise than 0.5 penerally wrong and so the jnry said by their verdiot. For, in homparison of free trade, cheapness is matter of have, many of ne, considered our "bargains" at our leisure, and counted tho cost of one man underselling his neighhonr. Tha direction of Baron Cleashy, that "the rules of the Institute were a safe guide both for himself and the jury" is of immense importance, while any advocates chesp arehitecture have still no canse of

## TEE CONSTRUCTION OF THE NATIONAL

 ALBERT MEMORIAL.Sin, -My mind has been much exercised of late on the constructional aspect of the National Albert Memorial; hut as I am not in possession full information, the question 1 propose isking must ho taken with a qnalifioation. It sound constrnctional principle?" Io not refer to the strict principles of "Pursinism" " hut tor those which could sucgest themselves to any non-professional individual. Were snch a one expressing limeself ho would prohnhly take this position Here is a shrine with a roof of mense weight, sustained by pillarg, which by some occult reason, appear effiently to dischar a duty I should not have supposed them petent for. The architect must hove madosome compact with statical law, and so insared the safety of his design.
Well, the reply will be, you may rest satisfied the secret lies in certain iron cross.girders, of immense atrength, which relieve the sulstructue non-professional might accept snch an explana tion; hut this, if I am not mistaken, prill not satisfy the thonghtful professional; and I open up this question, not out of any disposition to cavil, but with a deaire to elicit a right theory f construction. Let us reason ont the matter.
When an architect brings unresting forces into play by arch.construction, ho provides means of resistance which bring these forces into a state of equipoise. When he constructs, for instance, a tower or spiro at a church crossing arch-pierced, - ho las abatments in the nave, and chancel, and transepts. Tano away hese abutments, and the points of support must be altered accordingly. But I presume it will not be considered a piece of hyper-Pnginism to say that this alteration cannot recognise beams or ties of any kind, as legitimate, or, at least, This case is, It
This case is, I take it, precisely analogons to the Albert Memorial, in which there is a heary superstructure depending for its support on means which do not make themselves apparent, and althongh I do not assert that means of con. struction should be evident in all their unadomed snrageness, they should bo visible enough to
satisfy the spectator that his object of admiration is stable; and this, I renture to gay, is what
cannot ho said of the Alhert Memorial. It is stable; but its stability requires explanation, and whenever that explanation is not forth for it fo nat end of support do not unaided fulfil the purpose of support. charch-roof with visihle tie or resisting hateresser a charch-roof with visihle tie or resisting buttresses, or under an arch with proper ahutments; but, for anght be can learn from ohservation, his position under the Albert Memorial might not
heso. G. S. A.

## " HOMES IN WACKNEY WICK."

Reports of the proceedings of the Hackney Fick District Board of Works, in the local papers, show that attention has not been directed a moment too soon to the sanitary condicion or Wick. We are glad to observe, that a motion was carried to institnte on inquiry, and that a sanitary committee are to specially briog ap a report upon the matter. We will not anticipate the report, hat we shall he prepared to supple ment it should it fall short of what we expect it to he. We know the exact state that the dis trict was in when we first visited it, as also its condition within the last reek it, as also its the streets and ronds, and of the forl march sewers, allnded to attention and it is to he honcd that the drainage and foundations of tho delling of Tomege and Hackey Wio will also attention in the report promised The local Express follows up its observations, in last issue, with the following words:-
"The necessity of seeing ourselves' 'as others see nis'
is being forced upon ws in a remartable manner. Our contemporary, tho Builder, has sought out manner. Our contemporary, tho buitder, has sought out in our midst,
and held up to our gaze a grim array of terrible facts.
As a district, wo fear we must stand convicted of the olfences wisich are charged against us. It wonld be an exhibition of the most contemptible species of false pride
Fere we to nttempt to put a gloss one the hideous truths
that hare been laid bare with that hare been laid bare within the last few weeks by our enterprising and painstsking contemporary. The de-
servedly high reputation of the Builder would be a sulticient gataratite for the reality and truthfulness of
the picture which it has given us of anme of the the picture which it has given us of anme of the 'homes'
which exist in the borough of Hackney, were it not that Which exist in the borough of Hackney, were it not that the calm and unimpassioned tone of its remaris indi-
cates that the circumstances whioh are described are

adduced by by the Budider in reference to the 'Homes' in Momerton; and our readers are already familiar with the cerning that district Now which have been made con, and to consider the fresh results which baye heen arrived at through the efforts of our contemporary, and trict which araits the pacternal Consideration of tho
District Board of Works. Those of our readers who hispe porused the extract
from the article given by us in our last week's imprestion from the article given by us in our last week's impression markabie, facts concerning the nature of the soin poon doubt, learn these frets tor the first time. To those who
dave not read the article wo commend its careful study, have not rend the article we commend its careful study, $\rightarrow$ We feel that we cannot dieraiss this vitolly important subject with the present article. A deep sense of publio the thanka of the whole district are ague to the editor of

## Water in the north.

Ar a recent meeting of the new Local Board of Health at Bishop Auckland (a, town under the wings of the Bishop of Durham, and of considerahle popnlation and trade), the clerke road the following offor to sapply the town with water, from a member of the Board:-
Geutlemen,- - Iu accordauce with yonr reqnest, I bereby
give you a written offer of the terms and conditions on give you a written offer of the terms and conditions on ing the water to the town. 1. I propose to aupply water the Board of Mealth district who require it for domestic purposes only, nud also the water required for watering
the streets. 2. All persons nsing the water for commercial or manufucturing parposes, to psy on the same scalo
of charges on the ratealte value of their premises as at of charges on the ratealue value of their premises as at
present, or by meter, in cases where I consider it neces-
sary, at the rate of 9 d . per 100 gallons. 3 . I will heep in repair all existing works and maing, but if the Board
should at any time from the extension of the town, or other causes require additional storage, reserfoirs, or
new maing, such new works to be paid for by the Board
\$. The Board to delegate to me, - arse to he agreed upon, the existing plant, and fall powers for obtaining and fitcring the water, and for
manhing the necessary erections, excavations, and other worlis, for the ercction of a turbine wheel, and supplying other public places \#hen necessary for repairs or maling conmexions. S. Tho ingpector of nuisances appointed by
the Board to continue as part of his duties to inspect all wrter.taps, and report any waste of water to me. I am
prepared to give ample security for carrying out of the ontract-Josiry Dirr.
Several members considered it a very fair effer hut said, if accepted, Mr. Duff wonld have.
vacate bis seat at the Board. Mr. Duff said it would be quite a rolief for him to resign. His only motive was to hevefit the town through his of 10,000 l., according to the present water-rate for domestic purposes, but wished to know if the Board could give the donor a lease for twentyBuard could not grant the lease. A member pntting on his hat whilst leaving tbe room, said warmly, "Well, there it is again : cross my name out of tbe Board of Iealth. I am disgusted."
out of tbe Board of Neath. I ammangusted." carried out ; and unless the London Board spurs tbe Bisbop Auckland Board to instant action, years will elapse before a good water supply will years will elapse bef
flow into the town.

NATIONAL TRAINING SCHOOL FOR dusic.
Thes first stone of the proposed new building connexion with this undertaking, was laid by his Rogal Highness the Duke of Edinbargh, on Thursday, the 18th inst
The site of tbe school is on the west side of tbe Royal Albert Hall, and about 50 ft . distant from the western portico. Her Majesty's Com. missioners for the Exhibition of 1851 bave granted a lease of the ground necessary for the Rchool for a period of ninety-nine years. The
Royal Albert Hall supplies unrivalled accommodation for any large andiences in connexion with the training schoo. Tt will also provide a small theatre and some large rooms for library. It is there fore contemplated to connect the new building with the A.hert iall, by means of a bricge, giving a passage under corer to the school. The new briilding, deroted to twenty class-rooms, professors rooms, and offices, has been designed y ticut. II. H. Cole, R.E. The style is described may he seen at Longleat and Wollerton, with panels decorated with sgrafto work, designed by Mr. F. W. Moody. Mr. C. J. Freake will liherally cause the bnilding to be erected at his own risk, use of the building to the school for five jears.

When the school is bnilt it will be under a committee of management, consisting of two for the Evhibition hy the Royal Commissiovers pointed by the Council of the Royal Albert Hall, and three members appointed by the Council of the Society of Arts.
The Conncil propose to establisb the scbool for a period of fre years, and to obtain the the society for that perioc. At its expiration empire will so recogniso the utility of the institution that it may be engrafted upon the system of national education, and be made part and parcel of science and art instruction, directed by a ministor of puhlic education.

HEAVY COVERNMENT FEES FROM oandidates for the india public WORKS.
Mucr dissatisfuction was expressed on Friday amonast the hands of the lurge mechanical engineers' lirms in tho dates for direct appoint mients as assistant engineers for tho Public Vorks Depurtment in India would be required
to pay the enormous lee of $40 l$ for admission to the com-petition-balf to be returued to the successful candidates, and all forfcited to the uufortunate losers ol' appoint. ments. At this competitive examination any man under tweuty-four years of age, and who has beep employed for
not less than eight months as pupil or assistant to a civil or meebanical engineer, will be eligible to compete. The subjects of exuminstion will consist of mathematics, natural and experimental seicuces, engineering, fo. They
will siso be required to undergo an exsmination likely to wil alsa be required to undergo an exsmination likely t aud practical surreying, drawing, designing, and estiThe eramination will not be held until after next Eastertide, and in the meaambile poor and worling-mea candidates will have time to arge apon Government how serious is the "'lorty.ponsd gate to enter" where the
number of prizes are not likely to exceed twenty, and the number of prizes are not likely to exceed twenty, and the blanks, perhaps, be hundreds. It rill be soen, too, that
the fortunate candidates will be further rewarded by baring hale their foe returned.

THE NEW GOODS WAREHOUSES AND STATION FOR THE MIDLAND COM. PANY AT WHITECROSS STREET
For some time past the Midland Railway Company have been actively carrying out a policy in different parts of the Metropolis, having for its object the estahlishment of large goods and coal depots in connesion with theis system. The largest and most costly of tbese is the very extensivo goods station and ware houses which are now in the course of construe tion on the site of Whitecross-street prison, which the Company purchased from the City authorities for upwards of 50,0002. ahout fou years ago. This land, which is ahout tbroe tion since the early part of tho year, down to the bince the early part of ho year, down to view of convertine is a station hine, ofer which the Midland Company bave full running powers.
The area covered by the site exticnds from Whitecross-street, with a frontage of about 260 ft in length, to a depth of 300 ft ., where it is bounded hy Redcross-street, the janction of tbe intended depot with the Metropolitan line being on the south side between the Moorgate-street and Aldersgate-street stations. The heavy cha racter of the preliminary work of excavatiou may be imagined when it is stated tbat the depth from the street-level to the bottom, apon which a bed of concrete is intended to rest, is 30 ft ; and the estimated quantity of earthwork to he removed is upwards of 80,000 cubic feet. The warebouses are to be erected on the east side of the site, with a frontare to Whitecross-street extending the entire length of the land, and they will he carried in the direc thus coveriness-street to a ceptt o. ahout 2,000 square yards, or about one-fifth of the entire area of the depot. The rest of the site, hetween the rear of the warehouses and the Redcross-street boundary, will bo covered with metals for the goods-wagons, communicating hy sidings with the Metropolitan line. Tbe rails howerer, will extend over the wbole of the cross street, under the warehouses to the White-cross-street frontage, the geveral floors of the warehouses being carcied up on strong iron columns and wrought-iron girders, with hydrau.
lie lifts from the ground-floor under the warelie lifts from the ground-Hoor under the ware-
bouses to tho several floors ahose. With the view of preparing the foundations for the view of preparing the foundations for the
warebonses, the work of excaration, siuce the
commencement of the undertaking, has been directed in the first instance to the Whitecrossstrcet side, and this portion has now been almost completed. The whole of the site, after heing excavated to a depth of 4 ft . below the level of the Metropolitan Railway, is to have a foundation of concrete of that depth, so as to bring it np to the level of the Motropolitan line, and a considerable portion of the basement over which the warehouses will be erected has already so been laid with concrete, and is ready to receive the superstructure, which will be proceeded witb in a fow wecks.
As regards the warehonses themselves, it may be stated that they will be an unusually lofty block, heing 80 ft . in height, and consisting of six stories above the railway level of the station. They will be huilt of red brick, with dressing in Portland stone, and will in evory respect be of the most substantial character. Iron columns, resting upon the basement columns already named ( 3 ft . in diamoter), will carry oacb floo o the top of the building, and all tho floors win be strictly fireproof. There will be entrances to he warehouses in Wbitecross-street, as well as from the rear of the building on the railway ow-level. Messrs. Mansbridge, of Camdentown, are the contractors for these cxtensiv works, wbich, it is aaid, will take about two years from the present time to complete, and ve nnderstand that tho contract amounts to lupwards of $130,000 \mathrm{l}$
The above are not the only works of a liko haracter in which this enterprising company are engaged in tbe metropolis. Ahout two years ago they expended upwards of $40,000 \mathrm{l}$. in the worth, adioning extensive coal chatham, and Dover Railway, upwards of four acres in extent, and they are now about to extend it to the boundary of \#anover-street, near the Elepbrat and Castle, to the extent of an additional two acres. The preliminary stcps for this extersion wero taken last wrek hy an application to the Nowington vestry; and the land being alroady in their possession, the works are immedintely to bo commenced. In addition to this, the company have recently opened a coal depôt, four acres in extent, at Wandaworth; and are abont to erect goods warehouses and other buildinge adjoining mon a portion of an additional gix acres of land which tbey have already secured.

## GLAZES.

Sur, - Will one of your correspondents informe me what
hind of ingredienta I bould use to glaze yellow tiles hind of ingredients I should use to glaze yellow tiles
with? Tho nearest I can find gre equal quartities of
red lead, antimony, and borax.

## COMPENSATION CASE: THAMES

 EMBANKMENT.In the Sheriffs' Court, Red Lion.squere, before Mr Under-Bherifl Burchell and a speeial jury, the case of
Sir H. P. Gordon, bart., r. The Metropolitan Board of
Worli has Workis, has been tried.
 Embankenent. The claim as mode was $3,000 \mathrm{O}$. Evidence wes giveu on both sides, and the surveyors
disagreed. The rental wes put tot 500. a y yar on one sids
and at 270l. on the other, The emlsankment would in. jure the residence, it was said by one party; and the propery.
The jury, after a long investigation, gave a verdict for
trial. A much larger sum had been ollered before the

MOULDED AND MORTISED BRICES.
Messrs. L. de Fontainemorfau \& Co., Patent Agents, have forwarded ns drawings of some improved bricks and tiles, patented by BI. ing the bricks or hlocks with mortises and ing the or dovetails, and of we required and tenons or dovetails, and of the required sbape, so that they shall fit into and be joined to one to prodnce the required design of a house or to procnce the requined desigu of house or other huilding to he constructed. The bricks are furtleer connected together hy iron work of
suitable construction, by whicb but little wood suitable construction, by whicb but hittle wood is required in such structures, and a great materials.
The patentee proposes to form cornices and entahlatures of bricks or blocks witb mortises and tenons, and with the required monlding on the outer face, and with channels on their upper faces, so that when put together and united by
in the blocks for that purpose), a gutter will be formed with a proper fall, thus dispensing with wood and lead as usually employed.
Window and door frames, with the required boxes for weights, rabbits, and grooves, with monldings and architraves round, may also be made. Mantelpieces can also be hult np by
employing these improved materials, and can be employing these improved mater

## SCHOOL BOARES

Goole New Board Schools.-The design by Mr. William Watson, architect, of Doncaster, and of Wakefield, has been chosen by the Board out of ten designg submitted in competition by nine competitors. The buildings will be Gothic in style, and consist of schools for 600 obildren, and teachers' residence, and the cost is estimated at about 3,500 l.
Driffelu,-The subject of the proceedings of the contractors of tho rew schools was again brought before the Board. Mr. Paul, the archi. tect, had been over, and had given notioe to the contractors that unless they proceeded with their work more satisfactorily, he should advise tho Board to take the works into their own bands, for there was no prospect of their being completed hy the time required by tho Board. In stead of being ready by Christmas, it was more ikely to be next Lady Day before the works were finished. A long uscussion ensued ro specting the contractors having used Scotch fir blocks in laying the foors, instead of larch blocks, as required hy the specification. The Board expressed a determination that there sbonld be no departure in this rospect from the requirements of the contract, which, as representing the ratepayers, they were bound to see carried out. $\triangle$ etter was read from the architect to the clerk of the works in refercnce to the failure of the con ractors in carrying out the contract, -that the clerk of the works was to exerciso his own judgment, and act accordingly. This the Board thought was a very extraordinary letter to have been sent by an architect to a clerk of works on his representing a doparture by the contractors from the specification. The meeting was adjourned to allow time for a report from the arcbitect on the necessity of laking measures for the completion of the works, and deciding what course should be adopted in doaling with the contractors.

## SOHOOL BOARD SCHOOLS, EUDDERS.

## FIELD.

The foundation stone of Stile Common Board School, HudderGeld, has heen laid. This build. ing, when oomploted, will be a plain Gothio one, built of pitched-faced wall-stones, 20 in., and lined inside with brickwork 5 id , thick. The windows and doors will be of saudstone dressings, and the sebool will be roofed with plain red Staffordshire tiles.
It will have a frontage of 213 ft . $4 . \mathrm{in}$.; a deptb from bock to front of 116 ft .8 in ., and will stand in an enclosed area of $7,26 \mathrm{l}$ square yards. The boys' school will be 70 ft . long hy 22 ft . wide, and will have three class-rooms, 22 ft . by 18 ft .9 in.; a lavatory of $21 \mathrm{ft} . \mathrm{hy} 13 \mathrm{ft}$; and a school will bo preciscly similar to the boys'. The infants' school will he 50 ft . by 25 ft , and will contain one class-room, 22 ft . by 20 ft . ; two class-rooms, $20 \mathrm{ft} . \mathrm{hy} 19 \mathrm{ft} . ; \mathrm{a}$ kind of lavatory, $20 \mathrm{ft}$. by 12 ft .7 in . ; and a toacbers' room, 11 ft . 7 in. hy 9 ft . One of these tbree distinct departments will accommodate 250 boys, anotber 250 cirls, and one for 300 infonts, making a total acoommodation for 800 cbildren. Each of theso departments will beve a separate playgronud The estimated cost of the building when completed, will be 72601 , distributed as follows :Tenderg, 6,200 , forss 400 l as fows :commission, and other grpenses, 3602 . contin gencies, 3007 The school and the playground will cover an acre and a half
The Hudderafill School
Tite have eithor built, or have in contemplation, thirteen ncw achools, street or Fizwillian
 modate 8.55 children; the third at Berry Brow, for 300 ; the fourth at Birchinclife, for 150 ; Deichton, for 150 ; the seventh; two sixtb at Dorghton, for 150 ; the seventh at Molagreen, 1,062; the nintb at Oakes, for 800 ; the tentb at Outoote Bank, for 230 ; the eleventh at

Salendine Nook, for 100 ; the twelfth at Spring street, for 67 ; and the thirtcenth, the foundation stone of which was now laid, for 800 , These collectively gire a total accommodation or 6,166 children. Tho estimated cost of these achools will be 69,578l, involving an anuual repayment of $3,027 l$. 3s. 9 d ., or $4 l$. 7 e. per cent., for a period of fifty years. Besides these schools, they have one in Spring-strect, at present accommodating 150 children, and a second at Out. cote-bank, for 460 ohildren, which has been handed oper to the Scbool Board. They bave a third school at Crosland Moor for 314 children and a fourth at Hillhouse for 297 children, the two latter of which tboy regard as more of a permanent character than those at lock wood. These four scbools give accommodation completed there will be accommodation for completed the

THE LEICESTER SQUARE IMPROVEMENT.
From the decision just given by tbe Mastor of tbe Rolls, it resnilts that the vacant space in Leiceater square is not to be bnilt over, bat will be retained as open ground for the purposes of ornament and recrotion. His Lordship stated that there had been more litigation over tbis square than any otler square in Europe. A plan of the proposed improvements which the Metro politan Board of Works hopes to effect by the powers of the Act of Parliamont to be asked for in the ensuing session has boen deposited in the usual manner with the Clerk of the Pence for the county of Middlesox, togetber with a book of reference to the plan, \&c. The notice accom panying the plan states that the Board asks for powers to provide for the transferring and vesting in it of the garcen of the sqnare, to extinguish all existing righte, and, if necessary, to acquire all estates, rights, and intorests in it compul. sorily; to enahle the Boar to regulate and use the garden, and to lay it out, drain, plant, and ornament it ; to make bye-laws and regulations for its government, managemont, and improvement, for proserving good conduct and good order, and preventing nuisances and annoyances in it ; and to vary and extiugnish all rights and privileges wbich would interfere with any of these objects. At the last meeting of the Board the Parliamentary Committee reported that they had prepared the Bill for the acquisition o Leicester-square, and proposed to apply to Par. liament to set aside the standing orders iu order that it might he introduced during next session. The Board, after purchasing the square, will be able to deal with the railmay company which has power to pass under it in the same way as the prosent owner.

SCHOOLS OF ART AND OF SCIENCE.
St. Martin's School of Art, London.-The annal distribution of the prizes pained by the students of this school took place in the school. building, Castle-street, Long-aere, in the prosenco of a large assemblage of visitors. Mr. R. Rodgrave, R.A., presided, and gave an introductory addross, oxpressing bis satisfaction with the offorts of the students, at tho favourable position of the school as comparod with otbers connected witb the Science and Art Department The prizes, which included several presented by by Clasterers Company, were then distributed by the chairman, the most distinguished of tho prize-winners hcing Miss Cornalisen, Mr. Sey mour Lucas, and Mr. George Japp, to eacb of whom was awarded the bronze medal. Mr. H. S Harks, A.R.A., then addressed the students on the subject of art, giving them many valuablo hints and a good deal of somnd practical adrice. Lord Francis Hervey subsequently made a fow observations upon tho same topic; and during the remainder of the evening a selection of
music was porformed by tbe students and musio friend.
Bristol Schoot of Science and. Art.-The prizes and certificates awarded hy the Scieace and Art Department, at tbe last examination, to the students of this school were distributed, at the Fine Arts Academy, Queen's-road. Tho Mayor (Mr. T. Barmes) presided over a large attendance. From the annaal report it appeared that the debt of $655 \%$. on the institution had been reduced to 25l. The committee, bowever, lamented tho smallness of the subscription-list, whichamounted to only ahout 30l. a year. Tbe report went on, 一

The results of 1873, as compared with thoso for 1869, the first year of Mr. J, Nieol Smath's head-ms sterslip of
this schooi, are highly sotiefactory. Resulta for 1803 :-

#### Abstract

The requisite spacs and proper lighting cannot be
obtained in the present building, and I trust that one obtained in the present building, and I trust that one Mr. Pell attributed the deficiency in the taste for art in snoh towns as Leicester to the unequal increase in the population, and to the fact that thero was less art in making a stocking than in designing of patterns for Nottingham lace, Birmingham toys or jewelry, or Coventry ribbons. or wat was tormed "oriofinality," especialls those of a mechanical turn of mizd, When travelling in Staffordshire recently, he endeavoured to ascertain why wo had in England such a numher of ngly jugg that it required something good inside them to make them tolorably pleasant. The explanation he received was that the new patterns were brought out by the new desigusters, and that they hrought out a and must end in nnentiofactory results.
York School of Art.-Tho annual meeting of held at the Institntion, Ninat was a numerous attendance, Major York ocen. pied the chair, and distribated the prizes Amongst others, Mr. Dominy, the master of the school, addrossed the subscribers and the students present. Having thanked the formor for their generous support of the sehool, and condition, be spole of its improved financial conclasses during the the work done in the various classes during the past year. On the whole, this was highly encouraging. Many Etudents had passed their examination very creditably, and had done well. Speaking of tho various ways in which a thorongh and practical knowledge of ence was made to ornament in manufactnres which as a branch of etudy he should like to see carried out more in that institution. He was perfectly aware that there were, comparatively
and hence not that encouragement and incentive to this special branch as in larger towns; but he was glad to say that a stadt was made during would be continned, and produce better results noxt year. At some longth Mr. Dominy alluded to the preferenoe on the part of many of the stadents for what ho might term showy mork, rather than the more artistic kinds, and those which were of more intrinsio and permanent beneft. He spoke of the growing interest in art, its elevating influence, the neceesity of patient and thorongh application, and the importance of seientifie and correct art instraction.

> the studenta he gave much valuable advice. Walsall School of Science aiud Art.-Th

Walsall School of Science aiul Art.-Th Institute took place at the Tantarm-street Board School, the president, Mr. C. Forster, M.P. for the borough, and who distri huted the prizes, in the hair. There was a good attendance of students and friends. The report, after acknowledging he efforts of Mr. Forster to bring about an malgamation of the differont institutions of the own, -efforts which nltimately proved successfor on to state that the committee com ailway station, in in the rooms above the ailway station, in October, 18,2 , with five ary and the more adrenced. absolutely elemen tary and the more advanced; and six classes i science, viz., physical geography, animal phy.
siology, electricity and magnetism, acoastics, ight and heat, geology, and chemistry. Owing 0 the amalgamation having taken place late in the seasion, many students were prevented joining; hut, nevertheless, there were passed by the Government examinere forty-six students in art, and fifty-one in science, winning twenty-six Queon's prizes, and two hononrahle certificates, -a success of which all concorned might he justly proud, excelling, as it did, most other institutcs of like proportious. At the present time there were sixty-three students in the art classes, being an increase of seventeen, who Mulliganght by ant experienced teacher, Mr. A (aligan, and his assistant, Mr. A. Mills. I dents, heing anses, there were ninety-four stn tanght by Mrr. Turner and his assistants. It wa intonded to take for use the rooms ahove the station, at present occupied by the Working Men's Club, and use them in addition to those now occupied by the institute; and it was also apparatus for the study of electricity and magnetism. The financial condition of the institute was not nnsatisfactory, hat its extended opera and those funds, the committoo felt surs, town would be willing to supply.
Derby Central serool of Art. - The annue distrihution of prizen and certificates to the successal students of this school, took place in being made by the Rioht Mon. Lord Vernon the aresident of the scho who the The attendance of the who oceupied the chair nood, both the hody of general pnhlio was very good, both the hody of the hall and the gallery being well filled. Tho head master (Mr Simmonds) read a statement, in which he said: It is very satisfaotory to be ahlo to
state that there has been a continnal increase state that there has been a continnal increase
in the numher of atudents from the time the school was first opened intil March last, when, I regret to state, it was necessary to close the registers and refuse admission to all other applicants, in consequence of the space in the rooms heing totally inadequate to tho demand This course wrs not adopted till the rooms were oo crowded that the studies were much inter work all chance of success entirely prevented After the registere were closed a large number of applicants were received. If it he reported id the promises are unsuitable the Government raw. be liable to be partially or entirely with messm. Therefore it is evident, that nuless speed accommodation the school will be unable to maintain its position even should it not cease to exist. Finally, would urge the gentlemen of this committee to ort to aphold a school that has an mphished in the time more than any school of

## CHURCH-BUILDIVG NEWS.

Torquay (Devon).-The formal celebration of the completion of the rehuilding of the parish church and tower of St. Marychurch, Torquay, has taken place, The undertaking has cost 14,250l.
Nibley.-The parish church of St. Martin, North Nibloy, has been re-opened. Three windows have been restored in the south aisle, and filled with cathedral glass; and one in the east end is a completely new one, the upper tracery is filled in with stained glass, with the words, "Holy, Holy, Holy, Lord God of Hosts." These were executed by Mr. Blandford, builder, and Mr. Garn, glazier, both of Dursley. Tho eas stained window has also been filled with stained glass, wronght by Messrs. Bell \& Son tho window, of Gothic design and in three life, viz. :-"I am sent to my Father," "And to hife, viz, :-" "am sent to my Father," "And to "Feed My Sheep," "And He took Bread" (this "Feed My Sheep," "And He took Bread" (this forming the centre snbject), "Abide with Me,"
"Tonch Me not," "Bo not Faithless," "They ran hoth of them together.

Pulham. - The Charch of Pulham St. Mary Magdalene, Norfolk, consists of a nare and aisles, tower, and north porch, of the time of Henry VII., whilst the chancel is of the earlier or Decorated period, or abont the time of Edward II. The roofs, all of which are figured in Brandon's "Open Timher Roofs," have now been restored, every portion of the old timhers, as far as they were sound, having heen left as they were, and all necessary new pieces have been roinstated in oak, moulded like the old, hut left in their now wood, without stain or varnish so as to show exactly what is original and what is not. The nave and chancel roofs have becr overed with green slates, and the aisles with lead, as before. The eastern bay of the nave roof had been highly decorated in distomper, but time had to a oreat extent obliterated it. It formerly consisted of ancels and cheruhs and monograms of the name of our Saviour and St. Mary, and ornaments in rod, green, gold, white, and other tints. There whs sufficient left to enahle the artist to exactly recopy tho old, which has been done by Mr. King, of Norwich. The east window was a very debased post-Reformation work. A new three-light Early Geometrical window has been put in its placo, and filled with stained glass, by Featon, Butler, \& Bayne, representing, in the centro light, the Crncifision, with Mary kneeling at the foot of the cross; on the lefthand, Mary Magdalene washing the Saviour's feet; and on the right, Mary telling tho Apostles he hed scen the Lord after His death. The side rindows in the chancel are aiso filled with tained glass by the same firm, and omblerns of our Saviour, St. Mary Magdalene,
St. Mary the Virgin, and other devices. The hancel is benched with oak carved benches, of the Early Decorated oharacter, the floor being laid with Minton's encaustio tiles, that within the altar-rails containing emblems of onr Savionr, the four Evangelists, the cup, \&c.; and outside, he letter M, for St. Mary Magdalene, and other devices. A new vestry and organ-chamber have been huilt on the north side, opening into the ohancel and north aisle, with stone arches, filled in with oak screens. The clearstory and south. aisle windows are glazed with cathedral glass, the walls having been re.stuccoed, and the loor laid (where the seating shonld be) with rood, and the passages of the nave and aisles with the old monuments and paving. The whole of the doors, both north, south, and west end, and vestry, are of monlded oak, the hinges and fastenings being of wronght iron, made from special desigus hy the architoct, Mr. R. M. Phipson. The ohuroh is warmed by apparatus supplied by Hader \& Sons, of Trowbridge. The eneral contractors for the works are Mr. Vine, of Eye, and Mr. Grimwood, of Weybread. The organ has been repaired by Mr. Rayson, of pswioh. It now occupies a chamber at the east end of the north aisle, and its outward appearnee has been brought into harmony with the restored interior of the ohureh.

Cheltenhamr, -The committee appointed some ime ago to consider the best means of inereasing the chnrch accommodation of the parish have ssua a Camon bel. It is a the committee ask the star's Chwo the restoration or old Bt. Mary's Church. To properly restore the builing 4,000 . will be required. Secondly, funds are asked to ereet a
now church, capable of holding the presens
largo congregation of the temporary cbarcb To do this 14,0002 . or 15,0002 , are needed. Liverpool.-St. Margaret's Church, Anficld has been consecrated. It occupies, says the local Journal, a prominent site at the corner of Belmont-road and West Derhy-road, within the township of Aufield. It has heen orected from desigus by Messrs. W. it G. Audsloy, of Liverpool, and is of the early Freach style of architecture, freely rendered, so as to harmonise with the treatment demanded hy the materials employed in the structure. It is constructed of looal grey bricks, relieved with the sparing introduction of red and black bricks in the arches, bands, and cornices, the finishings heing of Storeton stone, Yorkshire stone, and polishod red granite. Externally the design is of great simplicity, littlo ornament being applied except in the west fapede and sonth porch. The general features of the design aro a long nave with aarthex and lateral aisles, an apsidal chancel, north and south transepts, and a centre tower gabled east and west, and roofed in tbe saddle baok form. The west portal is largo and deeply reeessed, with jambs set with nook shafts, and alternating arches of red brick and carved
 ways, divided by gronped shafts of polished rea carved tympenum, enciehed with menlptares onr Lord in plory, and adoring angols. Tb south qnasi.transept, or limb of the narthox, i ased as the principal entranoe-porch, having a doahle doorway, with scenes from the life and martyrdom of St. Margaret sculptured in the tympanum, and a full-lengtb fignre of the saint ass depioted in Christian art, in a centre niche abovo. The treatment of tho remainder of the extcrior is simple. The interior of the chnrch consists of a western narthox, a nave with lateral aisles, a choir space at tho crossing cliancel. The nave is 100 ft . long, with its aisles 61 ft . wide, and 60 ft . high to the ridge rib of the wagon ceiling. The western end i crossed with the narthex, composod of guasitransepts, which open into the nave by arches 36 ft . high, and into the aisles by losser arches Tbe southern limh of the narthex is used as the entrance vestibule, and the northern as the rated with devices containing the monogram of the patron saint, and the latter is illuminated in gold and colours, the designs having allusion to baptisen. The font, which is placed in the centre of the baptistery, is of large sizo and elahorate Workmanship; it is of square shapo, and consist inlays of colonred inlays of colonred marbles, supported on fou sqearo and sixteon circular columas of red and The whole stends ceiling of the anve is of three steps. The painted thronghont in gold and colours. The celings or the side aisles are tho decorated in gold and colonrs. Over the weatern doors i a painting of the Adoration of the Magi, work of Messrs. Heaton, Butler, \& Bayne. The mave is seated with low open bencbes of pitch pine, and warmed, along with the rest of the chnrch, with hot.water pipes. The ohoir is placed under the tower at the crossing of the transepts, and opens into tho nave, chancel and transepts by four arches 50 ft . high. The pulpit, whieh is of Oaen stone and marhle, is placed on the left of the screen and against the north-west pier of the tower. In the north transepst is erected the organ, a work of Besses. W. Hill \& Son, with its principal front across tho tower arch and its secondary front in the transept arch towards the nave. The oeilings of both transepts aro decorated in colours. The Width of the obarch woross the transopts is 70 ft . The chancel is of an apsidal form, 25 ft . Wide
and 30 ft . long. The reredos is of marble and Caen stone, and of the Agony, the Crucifixion, and the Ascension divided by columns and surmounted hy pedimented arcbes. At each end, and hetween the archee, are four angels hearing inscribed scrolls. The whole terminates at the height of ahout 16 ft . with a cross and dove. The altar is of black oak relieved with gold and colorrs.
Talsall. -The foumdetionstone of the new district Church of St. George, Walsall, has been laid by Lady Hatherton. The design is in the Early Deoorated style, the onter walling
boing of limestone, with Penkridge stone dressings, and consiats of n2ve, 90 ft .9 in. hy 29 ft $6 \mathrm{in}$. ; chancel, 40 ft .6 in . by 20 ft ; Festry and
choir-vestry, and organ-chamber. There will bo a porch on the north and south sides of the church, and ahove the former will rise the steople, whioh will be 168 ft . high, or 3 ft . gill her tban that of the parish charch. piteh pine. Oring to the formation of the ronnd, the floor will incline from west to eas to the height of 3 ft . The floor will be laid with enoaustio tiles, and the cluarch will he heated with hot water. The cost of the whole buildine to is estimated, will be about 10,0002 ; hat present the nave and aisles only will be erected, t a cost of between 50001 and $6,000 \mathrm{l}$ bat will include the forndations for the whole strue ture. The orection of the steeple will not ontered upon mptil the other portions of the building are finished. The architect is Mr, Grifitis, connty surveror, Stafford, builder, M Tames Adkins, Walsall; and clerk of the works, Mr. J. Adkins, jun.

## DISSENTING CHURCH-BUILDING

 NETS.Bridlington, -The fonndation-stone of a Bap tist chapel, to he erected on the west side of the Quay road, has been laid. The style is Gothic and the building will be of white brick, with ornamental stone, with a tower on the sonth ide and at the east end of the chapel. It is intended to accommodate 500 people, having a gallery over tho entrance at the oast end, and an orchestra behind the pulpit at the weat ond also a schoolroom and vestry on the west of the chapel. The huilding will cost over 3,000 . owards whicb the building committee have ecoived, in donations and promises, 1,000 L ir. Mnscrave, jun., of Mull, is tho architect and Mr: John Rennard, of Bridlington Quay, tho contractor.
Frodsham.-A now Weslcyan chapel has been pened for divino worship at Frodsham. The Prospect-villa, Ranoorn, Thomas Hazleharst, of rospect-vila, hanoorn, and has been presented uternal fixtures, and frese, complete with the 7,0006. The land, which cost 6002., was the gift ' Mr, Charles Hallo hich is alose the whe cas close to tho chapel, has been erected by The style of areht he stylo archicecture is Gownic, freely troated ios of the was or the Harquis of Chomondeley, hy whom 120 ft , in ith can height, and of the broach desoription rour canopied windows on the four sides, and sur mounted by the nsual vane. The upper part of ho tower, inmoutely below tbe spire, is finished with a rocessed mindow and an arcade below, Fith polishod granite shafts. Asmaller arcade, or then sid olise a ohed faces Main. reet, and tbus ocenpies a prominent position ns grounds wim the gatoway aro haid ous and oultivaten. The architeot is Mr. C. O. Elli son, of Liverpool. Tho building is constractod accommodate 600 persons. The seats are pen, and of pitoh-pine, tho entrance to the body or tho chapel heing by two doors from tho main catrance, and two on either side or the oommanion rails, at the other end. Tbere is a spacious gallery on three sides. The effect of the commanmion enclosnre is maintained hy an arch, moulder, and with polished granito clus. tered colnmns, the lower portion heing filled in with a pitch-pine screen, with polished brass shafts and carved capitals and ornamental glass panels. The pulpit is of pitch.pine, with ebony shafts, traceriel panels and side panels, inlaid with black. The font is the gift of the archilect, and is in hammerod brass and oopper jewelled; it stands immrediately over the centre of the handrail, and hears this insoription:Presented to Trinity Cbapel, Frodsham, hy its architect, C. O. Ellison, Liverpool, Nov. 6th, 1873." The galery-front, the wall-hoording, and the framing of the aisles, are finished with long narrow panels along the tops, filled in with ornamental perforations, witb orimson cloth at the baok. The pillars which support the gallery are moulded, and from them lighter columns ascend to support tho roof-timbers, which ride from the oaps of the mpper colmmis in every direction. The ceiling is filled in with diagonal pitch-pine hoarding, with ornamental perfora. tious in the centre, communicating with ventilating chamhers between the ceiling and the roof. The windows of the chapel are the work
of mesars. Holloway, glass contractors, Liver pool. They are tracerisd in stonework, the heads being filled in with painted glass of varied design and colonr. The ornamental effeot is The pillars the windows hy borders and panes. the organ front The deen gold colour, to maton oarried out by Messrs. Chandley, of Warrington. The gas-fittings are by Messrs. Brawn \& Down. ing, of Birmingbam, and aro constructed of hammered brass and iron, in colours. A ton. light corona is suspended between oach column, and five-light brackets from the walls undor the gallery. The heating properties of the chapel are afforded hy apparatns supplied by Messrs. Trusswell \& Oo., of Sheffield. The organ was huilt by Mr. Wadsworth, of Manchester, at a cost of 4002 . The front of the instrament is wood, and reed, and is enclosed in a pitch-pine case, with ehony shafts and ebony mouldings in case, with ehony shafts and ebony mouldigs in
gold and hlack. The centre pipes are gilded on colonr, and the sido pipes coloured on gold. The colonr, and the aido pipes coloured on gold. The behind the pulpit, in a gallery orected for the behind the pulpit, in a gallery orected for the
purposo. A Sunday-school has been erected at purposo. A Sunday-school has been erected at for week-nigbt services. A fault, however, in for week-bigbt services. A fault, however, in its deficienoy of light, which is afforded hy low vindows of stained and glazed slass. There are three vestries conneated with tho chapel. The house of the minister is of plain construction, without ang fentures of attraction, and built of red stone. The hailders were Messrs. White \& Son, of Runcor
land, of Chester
Biggleswade.-The chief stone of a now Primitive Methodist chapel has been laid. Tho plans and specifications were prepared by Mr. Tbos. the Bedfordshire town, architect, according to new chapel will he in the Gothio style, will ccommodate ahout 300 persons, and he so con. straoted that a gallery (if aeeded) may be added. The estimated cost is about $560 l$.
Belgrave (Leicester). -The memorial-stone of new Nonconformist Cburch has been laid at Belgravo. Tbe buildiug is intended to seat 500 persons, 100 on the ground-floor aud 100 in an ond gallery. It is roofed in one span, and has a ght projection on each side, and also a recess hehind the Communion platform, which is occu. pied hy the baptistery. Behind the chapel, and on the sara lever with it, are two vestries and ladies' retiring-room. A staircase adjoining hese rooms leads to the lower story, which is arrauged to contain a sohoolroom for 300 ohi ren, wo senior class-rooms, an infant-schoolrom, a kitchen for tea-meetings, heating-cham bers, and other convoujencos. The lovela of the round are such as to admit of the basement being well lighted, and also of the sobool heing approached from Vann-street, with only a mall namber of steps, while the chapel-floor hove it is not an inconvenient height above the Loicester-road, towarda which the main entrance fronts. Tho style of architeoture is Early English Gothio, tho matorial for the walling boing red pressed-brick and Bath stono. Tbe rchitect is Mr. Tait, of Leicester, whose design was chosen in competition; and the contract for the huilding has been taken by Mr. Billington, of Belgrave.

STAINED GLASS.
Miscellaneous.-Two double-light meznorial indows have been lately placed in tho chance of the (a. C.) Chnrch of Our Lady and St Patrick, Oldham; the following snbjects from the Now Lestament are arranged tberein in medallions, three in each respective light, viz. Annunciation, Visitation, 刑ight into Egypt Holy Family at Nazareth, Marriage Feast a Cana, Good Shepherd, Charge to St. Peter, Crucifixion, Resurrection, Asoension, and De. scent of the Koly Ghost. The spaces between each medallion aro filled np with patterns in grisaillo inclosed by Early English borders. Those windows are the gift of Mrs. Sophis Ainsworth, relict of Mr. John Leee Ainsworth, late of Bankside, Oldham. The esecution on plass was by Mr. Willian Gardner, of the St. Helen's Stainod Glass Works, after the car toons of Mr. Casolani, of the samo town. Tbo same artists have likewise recently completed the following:-A douhle-light baptistery win. Our in large figures, the gift of Mr. G. Kigbley; one
of the openings of a four－light window of Lady Chapel in the（R．C．）Conventual Church of St．Francis，West Gorton，with a representation in full－length figures of＂the Immaculate Con－ defining that dogma；the remaining three lights to he subsequently filled in with other suitable subjects．A small lancet window in St．Wilfred＇s Church，Bedford－street，Hulme，with a figure of St．Margaret of Scotland under a canopy，erected St．Margaret of scotland under a canopy，erected

Science Simplified．By Professor Pepper，late of the Polytechnic．Frederick Warme \＆Co．， Bedford－street，Covent－garden．
Under this general heading，we have six in－ teresting and useful little books by the popular lecturer on Science，Professor Pepper，respec－
tively devoted to Heat，Light，Electricity，Pucu－ tively devoted to Ieat，Light，Electricity，Pucu－ matics and Aconstics，Chemistry，and Magnet－ ism．They all have numerous illastrations，aro full of useful infermation pleasantly conveyed， and each can be separately obtained．

## 解iscellanea．

The Ventilation of Law Conrts and other Public Buildings．－Mr．Justico Denman has refused to sit in tho room provided by the Cor－ poration of the City of London for the sittings of the Second Court at Guildhall．He found that the chamber was small，low in ceiling，hot with large fires，and poisoned with gas－smoke．
In Leeds，Eays the Yorkhire Post，judges and jurors for a long time experienced all the ill jurors for a long time experienced all the ill
effects of a similar state of things in the Assize Courts，and various plans bave been tried，at mach cost，with the object of briaging about an improvement．This has，with the approval of the corporation，been introduced by Mr．Martin Tobin ：－

Gas Explosion：prepare for Erost．－The millinery estahlishment of Mr．Garland，West． well－street，Plymonth，was being opened by a
porter，but on going into a room behind the porter，but on going into a room behind the shop，he perceived a strong smell of gas，and， calling for a pair of steps and a light，he monnted the steps，striking a mateb close to tbe gas pendant in the room．Immediately there was a terrific explosion，the window of the room being blown out，and the plate－glass front of the shop and the shntters blown across the street．All the articles in the room were burnt．The porter
and three women were eeverely scorched，as also was another person．The canse of the gas escaping was，that on the previons evening the pendant was pulled down too far，and a large amount of gas was collected in the room during the night．－This is tho time argain to speak of the advisability of snbstitnting Colza oil for water in hydraulio pendants to prevent accidents in frost．The pendant to which we havo for several winters referred passed another winter in safety，and witbout any attention or addition whaterer，since last winter，although it is very easy to replenish it with the oil，which gives no bad smell，and does not burst the pipe soldering， and so canse accidents in any degree of frost，as water is apt to do．
Housebreakers＇Differences．－The follow－ ing tenders have heen delivered for the demoli－ tion of two cottages，Albion－hill，Ramsgate，for the Local Board：

$\qquad$

The Metropolitan Gas Question．－A nomerous depatation from the vestry and inha． hitants of Paddington attended at the last and prescnted a memorial npon the subject of the proposal made by the Imperial Gas Company to raise the price ef gas supplied by them．The memorialists stated that the Gas Company possessed a moropoly for the sopply of gas，and notwithstanding that they charged the maximum price allowed by Parlia． ment for 14 －candle gas，at 3 s .9 d ．per $1,000 \mathrm{ft}$ ．， the memorialists had heard，with astonish ment， that the company had given notice of its inten． tion te apply to the Board of Trade to raise the price after the lst of January next．The reason assigned－the high price of coal－was fallacious， inasmuch as the price of the residual products had very mucb increased．The deputation hoped the Board would use all the means at its command to oppose the application of the company．Mr．
Roche said this was only the first of many Roche said this was only the first of many
memorials which would come in to the Board from all parts of the metropolis protesting against the proposed increase of price．The memorial was referrec to the Works Committee for report and consideration．
The Clapham and Brixton Baths．－ It is satisfactory to hear that the scbeme for supplying with water，from an artesian well，the swimming－bath now nearly erected by this com－
pany in the Ferndale－road，Shepherd＇s－lane， pany in the Ferndaleroad，Shepherd＇s－lane， Brixton，under the superintendence of Messre． Fowler \＆Hill，architects，is in a fair way of being caxried out．The managing director，Mr． A．T．Timewell writes to us as follows：－On the 2 th of July last，the then Lord Mayor，Sir Sidney II．Waterlow，bart．，laid the foundation．stone of the above－named huilding，and at the ceremony expressed his opinion that tbo company itself was formed for a praiseworthy object，and that the considered the financial succebs turned upon supply．I here wow wotion in nouncing that a well bas been dug，and bored to a．depth of 418 ft .6 in ．，and that wo have entered a snbstratum of water，which rises to within 83 ft ．of the surface of the gronnd；and by all our trials，both by hand and steam．driving the last three weeks，we have been nuable to lower the water in the least，although the pump has the water in the cast，althongh the pump has
thrown at times upwards of 200,000 gallons without stopping．

Northallerton New Town－hall and Market Buildings．－This hall was to bo opened on Monday with a grand concert．The new market－house is a huilding of brick and stone，erected from the designs of Messrs．Ross \＆Lamb，architectb，Darlington．The basement is entirely occupied with cellarage．On the ground－floer are a covered market，with accom． modation for the market－people，and seven shops．The first－floor contains the public hall， capable of seating ahout 600 people，and with will occasionally bo used as a concert and ball room，and for theatrical performances Tbe ceiling，which is wagon－hcaded in form，is deco rated in colours．At the back of the stage or platform is a semicircular recess，which，together with the form of qualities of the room．The lighting and venti． lation have also received attention．

Improvements in Brussels．－The new ooulevard now in progress will，wben completed， bear comparison with any of the Paris boule－ vords．The honses already crected are built in an expensive style，far surpassing any of the existing buildings in Brussels．The site of the River Semne，which has been covered in great expense，and after several years＇labour， hy Bessrs．Waring Brothers，of Loudon．$\Delta$ com－ mittee bas been formed in Brnssels for the pur－ pose of giving a hanquet，on the IOth of January， to M．Anspach，the burgomaster，in recognition of his services in connexion with the various recent improvements

A．New Church for Caxdiff．－A meeting has been held in the Tredegarville Schoolroom， Cardiff，for the parpose of considering what steps shonld be taken for therec ville is the district of St．John＇s．Tredegar－ Foath．The necessity of a new town，adjoining rery stroncly felt in the neighbourbood．It was very surongly felt in the neighbourbood．It was parpose of taking the necessary steps for the prection of a churcb．

The Mill Memorial．－At the last meeting of the Metropolitan Board of Works，a report was presented from the Works and General Pur． poses Committee，stating that the committee ave considered the letter from Mr．W．T．Thorn ton and Mr．Artbur Arnold，Honorary Secretaries of the Eixecutive Committee of the John Stuart Mill Memorial Fund，requesting permission to erect a statue of tho late Mr．Mill at the western end of the gardens of the Victoria Embankment， near the Houses of Parliament，and requesting the assignment of a site for that purpose，and recommending tbat a site，te be hereafter de termined upon，be granted，the design of the statue and pedestal to he subject to the approval of the Board．Mr．Newton moved the adoption of the report．He considered the Vietoria．Em bankment a most appropriate place for the re ception of statues of distinguished men．The motion was carried．
The New Pier at Blackfriars Bridge．－ The stage which is to form the future place for embarkation and landing on ond from the river steamboats at Blackfriars Bridge，has boen placed in position，as well as the hridge which connects it with the platform leading to Bridge street，Blackfriars．The landing．stage is of the improved pattern，such as those at Westminster and the Temple，consisting of a number of air tight iron drams．Wooden houses for tho accom－ modation of passengers and the officials of the Iron，Citizen，and Woolwich Steamboat Com－ panies respectively are erected upon tbe stage A light iron bridge，rising and falling with the tide，connects a stage with a fixed iron hridge， which leads up to the entrance of the pier， within a couple of yards of Blackfriars Distriet （Undergronnd）Railway Station．The pier has been opened for steamboat traffic．

## Presentation to Mr．E．Dresser－Rogers

 The vestry of the parish of Camberwell have presented an ongrossed memorial to Mr．E． Dresser－Rocers，in recognition of his inde fatigable services in opposing the South London Gas Bill，which，if it bad passed，would have cost the ratepayers several thonsands of pounds annually，and allowed the price of gas to be raised．Mr．Dresser－Rogers，in thanking the vestry for the compliment paid him，said ho could safely stato，as a member of the Mctro politan Board of Works，that the parish of Camberwell，at the present time，was parti cularly privileged with regard to the gas question，and that it might consider itself quite safe against any increase at present．He hoped therefore that the vestry would give their moral snpport to the other parts of tbe metropohs in their endeavours to oppose any encroachment by the gas companies in raising the price of gas．A Well－earned Gratuity．－The governor f Devonport horough gaol having，in addition to his ordinary duties during the past two yearg， designed and caused the prisoners to build a new wing for the prison without employing any ree labour or extraneous assistance，the Devon port council have awarded him 100l，with maller amounts to other officers．Tho prison， crediting it to the ordinary value of the labon bestowed on the new wing，has not cost the borough one penny during three years，and so thoroughly are the prisoners kept to industrial pursuits，that for several yoars they have tarned their own maintenance，and partly paid the salaries of the staff．The per－centage of recom mittals to Devonport Gaol is unusually low．
A．Diamond Saw．－Tbe American Manu－ acturer and Builder spealss of a diamond saw in operation at the Exhibition of the American institute．It is an ordinary reciprocating saw machine：but diamonds form the entting tools， in combination with the steel blado as a gnide The diamonds are set in＂cntter hlocks＂at intervals upon tbe blade，and work horizontally as a trie saw in the stone set bencath．But While an ordinary saw cuts on an average I ft 3 in ．of brown stone in a day，the diamond．saw will do as much ir balf an bous

The New Street through the Charter－ house．－－Dr．Middleton has applied to the Cban． cellor of the Diocese of London（Dr．Tristram）， at the Consistorial Court，for a faculty or licence to take a portion of the charchyard of the Charterhouse，and to remove the bodies to another part．In order to make the new street from Bloomsbury to Shoreditch，it would bo necessary to take part of the churchyard of the Charter． house，and a faculty was reqnired to appropriate a cousecrated spot．The court granted the a consecrated spot．Th
prayer of the applicants．
