résume, on rohes, to leave space for a brief indi. cation of tho contents of the part that is issucd of the fifth volnme.
We should not look with antiqnarian interest only upon the arins and defencos in use in the Midale Ages, arges M. Le Duo, because they are the result of the contrivances always incourse of consicaration to meet the reqniroments of war,
hy people who were not sitting safely in com. hy people who were not sitting safely in com.
fortable offices, discussing the question; but were actually always in the field, or in the lists, or in strongholds they were bound to defend. We saw in the Scbastopol days how the troops altered their equipments to snit their altered circumstances with a swift ingennity, and we
should remember that this process of should remember that this process of adaptation was formerly always going on. After a few
further prefatory remarke, redolent of Poitiors, and Agincourt, the alphahetical arrangement commonces with the ciguillette, which is shown as worn in different modes on three knights. These are tho leathorn laces thpped with metal required to fasten one part of a war. rior's costame to another, or to the place it was to protect. The ailette was a picce of armonr worn on the shouldor generally in France, but very rarely in England. Many a blow or cot aimed at a was a contrivance tied on with aiguilettes to meet that slip of the lanco or axe. It was sometimes painted with the arms of the wearcr. There are
seven illustrations of this piece of from MSS. entitled "Tristan," "li Roumans d'Alixandre," "Godefroy de Bouillon," "Lancelot du Lac," "Histore du Roi Artus," "Law in the French national library, whereof six are of a
isquare form, and one circular : and isquare form, and one circular; and we are re-
forred to other examples on statucs forred to other examples on statucs in Bale
Cathedral, the Church of St. Denis de CoulomCathedral, the Church of St. Denis de Coulom-
miers, and Lyons Cathedral. Crossbows are next minutely doscribed and delineated. Bows, with snatches of the Roman du Rou, telling of the
battle of Hastings ; battle of Hastings; and figures from the Bayeux tapestry, to illustrate them, follow.
Armets, which is a terma corrupted Armets, which is a term corrupted from
"hiaumet," or "helmet," are described very fully, as is the subject of armour generally from the days of Charlemagne down to the sixte nth century. Such is the power of tradition, M. Le
Duc observes, that, despite the change Duc observes, that, despite the change produced
Jy the use of artillery, it whs long before gentlr. y the use of artillery, it was long before gentlr-
accontrement; and to this day, he aske, have not most of the European armies retained their cuirassiers, notwithstanding that their cuirasses are not proof against conical balls? Sixty-two full-length fignres illostrate tho word armure. Returning to details, arriere-bras and avant-bras, arm-guards, present thcmsclves as next in succession purtistoric hinds have beor noticed arm. guards pierced with four holes to admit of them. guards pierced with four holes to admit of them
being fastened on. being fastened on. Wa are not taken back so
far as this by M. Le Duo who mentions the far as this by M. Le Dus. who mentions the date of this invention theenth orntury as the date of this invention. In the firsu rlace the warriors of that date thought of the ailette th guard their shoulders; then les cubitières
coniques for their elbows; then a back-guard coniques for their elbows; then a back-guard
for the arm ; and lastly a fore-arm guard. The brassard, or articulated piece held together by ivets, was a further development of the samo idea. Only foot soldiers wore the separate pieces, whereas the brassard was adopted by any armed men regularly equipped. With the bacinet this first instalment of the fifth volnme closes; and the companionship of the French knights, who were so much to our Plantagenets, memorable addition to French litcrature.

THE NEW "WELLLNGTON MILLS," IN LAMBETH.
A.v extonsive block of huildings, to which the ahove namo has been given, is in course of erection in Vestminster-road, Lamheth, and within the last few days the structure has been externally completed. Tho new building, which bas been ercoted as a factory for Messrs. Oakey \& Sons, emery and blacklead manufacturerg, is a striking object amongst the surrounding buildings. It is situated at the angle of Westminster and Kennington roads, immediately adjoining the site npor which the new Surrey Chapel, for the Rev. Newman Hall, is abont to be built. The principal elevation is in the Westminster-road, but the block may he said to have four frontages, namely, the main eleva. tion in Westminster-road, another at the angle of the last-named road and the Kennington-road, and a thiud frontage to Keanington-road, whilst the rear of the building faces Mead's-row, and extends the entire length of that thoroughfar from Kennington-road to Westminster. road.
The position of the site has necessitated th bnilding being somewhat irregularly shaped; but notwithstanding the difficulties with which the architects have had to contend in this respect, the different clevations aro more or less is about 320 ft . by 160 ft . in width, the entire promiscs covering an aroa of upwards of an acre n extent. The main frontage in Westminsterthe building, is 90 ft . lone warchouse portion o is very lofty, being 70 ft in $50 \mathrm{ft}$. in depth, and street-level. In addition to $a$ deep and spacious sasement, it contains the ground-floor and three stories above. The elevation of this part of the huilding, to the top of the ground-loor windows, centre as the principal entrance. Tho facing of the uppor portions of the yellow patent brick, with Portland stone dressings, and carved trasses, hetwecn which are festoons, surmonnted by a massive cornice in tains a residence for the superintendent of the premises.
The frontages at the angle of Kennington and Westminster roads, as well as tbose in Kenhat alrcody described 8-row, are not 80 lofly as structure will in part bo devoted to the manu. facturiog purposes of the establishment, the ground-Hoor heing used as packing-rooms, and also for stores. These last-named elevations anl a distinctive and novel appearance, not nater point of construction, but as regards the materials used. They consist mainly of spacious ho building the ground-level to the cornice of and sills of the windows; the entire the several frontages is faced with hexagonal tubes, formed of a combination of concrete and ranite, on the system of Messrs. Parr \& Strong, of College-hill, in the City, the architects of the fuilding: and which we have hefore now illus.
The se
The several elevations and sides of the build.
ing thus described, inclose a spacions area within them. In the centre of this area, witb a roadway entirely round it for the receipt and delivery of goods, a separate and distinct huilding, one story in height, has also been erected, for the machinery and steam-power required in the manufacturing business of the estahlishment. In connexion with this part of the building is a lofly chimney-shaft, which is a striking feature in the structure. The chimney, which is octa gonal in form, is 12 ft . in diameter at the hase, and is carried to a height of 100 ft . It is chielly of yellow brick, umiform with the rest of the building, ornamented with red, white, and blue brick bands, and diamond work of the same hraso fial, with a cast-iron cap and ornamental in dept foliage at the top, between 7 ft . and 8 ft . in deptLu The watcr required for tho works will be obtianed from an artesian well, which has heen sunk out the premises.

The whole of the wrks have heen carried out by Mescrs. Oakey \& Sons themselves, undor the Strediate supcrintendenco of Messrs. Parr \& Strong, the architeots, Mr. Easinan acting as works. Independently of the value estimate the building will involve an ontlay

THE NEW EXTENSION WORKS AT THE BLACKFRIARS GOODS STATION.
Tre heavy works which have for some tinne becn in progress at the Blackfriars station of the London, Chatham, and Dover Railway Company, in connexion with the enlargement of their goods area, are now considerably adrancod towards completion. The new warehonses which the Cbatham and Dover Company are erecting, but which will be rented and cbiefly nsed by tho Midland and Great Northern Conpanies, have been carried up to their iutended height, and wan be covered in withiu the next month. These wain several lloors froin 3 ft . in thickness, and the most stories are carried on iron pillars. Mesers. Hiil, Keddell, \& Waldram are the contractors for this portion of the works, and the amonnt of the contract for the warchouses alone is upwards of 40,000 .
In addition to the warelouses, which are being erected in Southwark-street, some distance to the eastward of the present station, the inter vening space hetween the last-named and the
warehonses is being added to the existing rail. warehonses is being added to the exisling rail. of the warehouses. Tho area of this portion merchandise space and sidings, irrespectivo of that furnished by the warchouses, is between 600 and two acres. This increased area is about $600 \mathrm{ft}$. in length, from its commencement, by a junction with the main line near Sonthwarktreet to the margin of the river, and npwards of 50 ft , in width. Immediately to the east ward of the presont boundary-wall of the station, the widoned line is heing carriod forward partly on arches, and partly by a girder bridge over Holland-street, and the space, again east ward, between these arches and the warehouses, is being connccted with the latter by thirty-four massive iron girders, thrown aoross, one end resting on the newly-formed arches already rcfrrred to, and the other end embedded in the wall of the warohouses, 25 ft . above their ground level. On the extendcd space thus oh tained, four additional sots of rails and sidings for mer: chandise purposes will be laid, and the railway wagons will be raised and lowered to and from the railway level into tho ground floor, and the several other floors of the warehonses by hydraulic power. The contractors for these works are Messrs. Ball \& Gammon.
Simultaneously with the oxtension works at the station for increased accommodation for the goods traffic, the company are also about to effect an important improvement in reference to passenger traffio. At present, althongl there are four lines of rails hetween Lndgat Station and Blackfriars over the company viaduct, there are only three lincs from the entrance into the Blackfriars station, to a poin near the Borough-road station, the result hein that both the incoming and outgoing trains are constantly impeded and delayed between the two stations. A fourth line is about to he laid down through the Blackiriars station to tho poin named, near the Boroughoroad, wtich will oom plete two distinct sets of rails, and obviate the constant stoppages of the trains which are now

COLOURED DECORATION.*
In askiug yon to discuss the question of "Coloured Decoration," I must request you to pardon me if I appear to detain you
unnecessarily with a recital of those natural unnecessarily with a recital of those natural
laws on whi:h its successfal practice mnst ever laws on whith its successfal practice mnst ever
be founded. We have to deal with a subject which is not dependent on iudividual taste alones, whicb is not dependent on iudivicu of professional but which, like every other irancibe proles. It is practice, is goverised by iullexible rules. It is
true that these lawe may be unconsciously recog. true that these lawe may be unconscionsly recog.
nised, and their teachings followed,- as in the nised, and their teachings followed,-as in thension of tbe matter; still, I submit that much
will be gained if we start with a common ground. will be gained if we
We must all desire to see the arcbitruc the real director of his works. We are - ory day urging that not only the huildins teself, hut ite decoration and furmishing, sbald be confided to his care. We are constsatly protesting ayainst a work which has wen carcfully plannod and rendered externs"1y pleasing, being spoiled internally when iss completion is condedanse, even although tbe decoration may he intrinsically although tbe decoration may he intrinsically
food. Tbe sculptor and carver willingly come food. Tbe sculptor and carver when wiscly content to direct and dofine, generally leaving minor details to their taste and skill. The painter, beset as he has been by chemical aud precbanical difficulties,--offers bis best services. Why should not the decorator and upbolsterer also act moro frequontly with1 the architect in giving anity to his work; and this not only in great andertakings, whore the necessity for unity is acknow-
ledged, but in smaaller and apparently nnimpor. tant commissions? A cliont, too, will be more willing to listen to the suggestions of bis archi toct, when he finds that tbey are based on the and tbat successful decoration and furnishing do not necessarily mean a large additional expenditure.
I have said tbat successful decoration in colour must be based on the right apprcbension Let us see how these laws are ordinarily defined, and then prooeed to apply them to the subject in hand:-A heam of light falling on a glass prism in a darkened roon is found to he aplit mp into seven coloured rays (or rather bundles of rays), whicb arrange thomselves in the following order,--red, orange, yellom, green, blue, indigo,
violet. This is further oonfirmed by the same violet. This is further oonfirmed by the same prism held before the electric lamp, and (more
faintly) by the colours in the rainbow. We also faintly) by the colonrs in che raindow. Weals also being redaced to three,-red, yellow, hlne,which we designate primary colours, as we bave failed to reduce them further. I am aware that much disonssion has lately been cansed hy an effort to class green as one of the primaries; bat I prsfer, for many reasons, to follow the accepted arrangement.
I need scarcely remind yon tbat red and yellow produce orauge; blue and yellow, green; and red and hlue, violet (or purple). Theso, then, are termed secondary or composite colours; and, with the primaries and the addition of the colour indigo forming the solar spectrum, you perceive they arrange themsolves betweon the all further derived colours (tertiary) may he regarded as coloured greys, as more or less broken colours in which a primary or secondary predominates. Still further we aro taught that, as yellow and blue produce the colour greent, of red; the red and the two forming green com. pleting the primnry trio, and so with bine and orance and with yellow and violet. These colours, as I have just quoted them, also form our first harmonies, as complete harmony depends on the presence of the three primaries in a composition. Ou the furegoing simple statement the whole seience of colour rests. I have placed on the wall a few diagrams which will make this still clearer, and which are also meant to illustrate the deductions which I now propose to draw.
If we place red and green side by side, we perceive that tbey mutually parify oaob other: tbis is the result of tbe $\ln w$ of contrast, It is.so complementaries, when so placed. If we look upon a brigbtred wafer for some time we per. ceive that the white paper on whioh it lies

seems to be faintly tinted, wbere it toucbes the wafer with the complementary green, If, after graing on it, we remove the wafor, we find the space it occupied appears to be also tinted with i fo complementary green. Similar effects will colour of the other primaries. We accept it hew as an winm that than nimprifis have a ten doncy to produce in their supsifaklave a ten complementary to themselve
Again, it is found (as was to be expooted) that colours mutually eact on each otber. Tasing, even, my frot example red and green, should Joe xoll have a decided orange tinge, the green will look bluer ; shonld the green be bluish, tbe red will appear orange-tinted ; orange, the complementary of blue, will appear to have heen added to it. Take a different example: if I havo several pieces of scarlet clotb, and look at thom in succession, altbougb they be of exactly the same colour, cut from the same piece, they will seem aftor a time to have lost brilliancy; tbe fatigued eye has developed the complemontary green, and the scarlet has been tarnisbed, all mixtares of tbe primaries being broken, dulled, or tarnished colours, -we look for some on a green colour, and find tho scarlet bas beon restored. It is an intuitive appreciation of these laws which causes tbo blonde to select blue and green to enhance bair or complesion, and the hranette to prefer red or orange tints. You will bronze tbe negro, or an orange enhance the natural blue-black of some races. These con siderations will also suggest to yon how all colours will gain in purity and distinctness by being separated by black or wbite, as thereby we neatralise this tendency to tarnish. The colours of the spectrum may be doepened or
dulled by black, or lightened by the addition of dulled by black, or lightened by the addition on white, or tbey may be altered by admixture with oacb other in varying proportions; thus we get tones and hues-terms often confounded. Tbe russet, and citrine :-

Olive... $\left\{\begin{array}{l}\text { Blue }+ \text { Yellow }=\text { Green } \\ \text { Blue }\end{array}\right\} \begin{aligned} & \text { Red } \\ & =\text { Purpe pre- }\end{aligned}$ $\left\{\begin{array}{l}\text { Blue }+ \text { Red }=\text { Purplo } \ldots \\ \text { Blue }+ \text { Rod }=\text { Purplo } \ldots\end{array}\left\{\begin{array}{c}\text { ponderates } \\ \text { Red pre }\end{array}\right.\right.$ Russet Red and Yellow = Orange ; pondcrates. Red + Yellow $=$ Orange $\}$ Yellow pre. Citrine $\{$ Blue + Yellow $=$ Grecin

As the pigments which we nse are never pure each primary colour being more or less tinged by its fellow primary, and so with the rest, no assence of colour, as in the case of the colours of the spectrum obtained from the solar heam, or by the electrio lamp. In theory, the colours red, yellow, hlue, should produco white, if combined in the proportion-yollow, 3 ; red, 5 blue, 8 ; hat painted on a disc and caused to revolve rapidly, tbe crey prodnced ia tinted most frequently by tbe red and blue, and the resultant colour is generally a violet grey. Indeed, as I have said, all comhinations of tho primaries prodnced by pigments are dulled and broken, as you must have of ten perceived when red has accidentalls been present in the mixins of green, nd the tedency is towards black rather than white The tertiary colonre, then, as they con whito the prime consist of greys pro duced by this admisture, colonred by the ace primar combined so as to be diatinctly dominated artber conb 1 is owing to this difficulty of admixinre, and to save time in proparation, that tho palette of the artist is being constantl added to hy new pigments ready to his hand. I would ask your attention to another peculiarity of the primarics and their combinations Tbo yellow is the most brilliant and obtruding colour; tho red warm, and occupies a middl place; tbe blue cold and receding: hence the yellow is suited for projecting suraces, the rea for the mass. In the figures I have quoted, you perceive the hlue has an area equal to the two others combined. You see the effect of this brilliancy of yellow in tbe secondary orange, and its tinge in scarlet; the warm of red in purple, and its tinge towards blue in crimson, the colduess or blue in some greens; and brillinncy of yellow in the new aniline coloun, where wo have toe luminoas leaning lowara yellow, In preparing colours it is, therefore, desirable that pugments to he combined should lean towards each other;-in orange, for inand tbe yellow shonld be free from a greenish
int; in green, tbat tbe blne sbould be greenish ather than purple; and so on; the tendency to broken or impnre colour being favoured by races of the absent primary in the pigment as already stated.
I said that colours were purified by being separated from each other by whito or black Let us seo the effect of a ground of white or white will be to exalt colours by contrast of one: of black, to lower them, for the same eason: and yet tbero are changes respecting dividual colours worth noticing. Yellow, for stance, will appear much ligbtor with black greenish tince; lirbt blue will contrast greenish tinge; ligbt blue will contrast most ill beorably with white, as will light green; red ill be subdned by black by contrast of tone while violet, for the samo reason, will wid
mproved. Contrasts of this kind aru well seen in some. of the in some of the nationai fragee the rea, gold, and black of United Germany; tho white and green of nited Germany; wo wato aises best with he majority of colours, and, if slightly tinted with the complementary of the colour, bas a ost pleasing effect: indeed, hy the law of imultaneons oontrast, this will occur in many cases without the actual addition of tbe tint. It is furtber to be noticed tbat tho substitution of gold for yellow in decoration produces a nlarked ebange. Gold with black is lowered, whitened by contrast of tono; whilo withent ened, enriched by the development or tbe com plementary orange. I sbali have occasiocora. pursue

Let me now say sometling on the subject of modes of decoration generally as applied to rchitectural works, and on the appication of heso laws which 1 have bastily sketched,-first, as to public buildings, and tben as to private,
dwellings. We have to travel over a large field, and within the limits of a single paper our eview must be a cursory one. The grandest modes of coloured decoration are-mosaics rescoes, stained glass, paintings proper, marble mays; in private awelings, curur prea in painting, bangings, carpets, upholstered furnihure. Tho huildings most susceptible of decora tion, of the costly class, are-churches, picturegallories and mnsoums, theatres and public
palaces and tbe resideuces of the weaithy
There can he no question that mosab docoraIon is the most durabie and suitahio for works on the lareo scale, comhined with coloured marble in great masses: as at venice and home, it louves nothing to bo desired. St. Mark's, at Fenice, which may be regarded as a museum of this class of decoration, is admittedly uurivallod, In recent times, through tbe efforts of Dr Salviati and others, the anciont schools of mosaicists have been revived; and it is even ossible to transport the finished work, and place t on the wall in the most distant places. Wo have a specimen of Dr. Salvisti's work in this room, and at the Houses of Parliament, tbe Wolscy Cbapel at Windsor, at St. Paul's, and tbe Prince Consort Memorial in Hyde Park, as well as in the artist portraits at south Kepsington Iuseum, wo have admirahie iustances of its erival. In the case of the portraite in the niches of South Kensington you have also an opportunity of comparing the mosaic picture with the original drawing. The great merits of his mode of decoration are: tho enamels em. ployed are praotically indestrnctible as regards material and colour, tbe ouly possible weak point being the attachment of the component tesscra> to their places in the composition. They are capable of the finest or coarsest mode of produc. tion, are snited for all points of view, and, by the addition of gold and silver, at-what may he regarded as nominal cost, they oan be of a richness with which no other decoration can com. pete. Rocently the number of colours capable of being nsed bas heen largely increased. It bas been objeoted that thoy are not capahle of as flexiblo treatment as the varions forms of fresco; tbat their peculiar glitter is unfavourable to distinct view; and that they are costly, and reqnire to be surrounded by accessories as rich as themselves.
Now it mast be romemhered (taking the last objection first) that all docoration, carvod or colonred, is open to this. I admit, when we decorate at all, it is hard to keep the balancoand panellere to stop. of the Perpendicular period: this nurest in art-work which has mads the Sainte Chapelle a blaze of colonr, and will
icare no blank spaces externally or internally in Westminster or (internally) in the restored crypt of St . Stephen. A difficult problem is abont to be solved in the proposed completion of St. Panl's. But the principle of decoration in mosaic does not necessitate gorgeousness. The band surrounding the Albert Hall is in principle a mosaic. Its most effective works can bo done by inferior hands; whereas, in fresco, the preparer of the original drawing must also do the completed painting, if great excellence is to be roached. Its durability-as I have more than once said, its natural accordanee witb marble and stone, as all long for its extension, and hail every effort to allang for its extension, and hare within our reacb. I do not think its glitter is a disadvantage, as it is pecnliarly its glitter is a disadvantage, as it is pecnliarly
suited to dimly-lighted positions; on carved suited to diml-highted positions;
surfaces this gives the colour a peculiar cbarm; surfaces this gives the colour a peculiar cobrm; equally necessary in stained glass and frescoes. Except in the cases of practically unlimited expenditare I bave named, this objection need not have place. Generally, it may be stated the Sigure-subjects in mosaio are best placed aboro
the line of vision; that the subjects sbonld be the line of vision; that the subjects sbonld be
simply treated, tho scale large. I think the ohjection that Dr. Salviati's mosaic of the " Last Supper" at Westminster is to too small a scale, has considerable force. There is much in common between mosaics and painted glass in these respects.

FEMALE ARTT.
"Society of Lady Artists." -The ladies have brought together, in the Condnit-street Gallery, 469 works of art,-drawings, paintivgs, and copies, -which form an intcresting collection two or three years. Mrs. Marrable, Miss Marian Croft, Mrs. Backhouse, Miss Thornycroft, Miss Partidge, Miss S. S. Warren, Miss Eva MI. Ward, Miss Lane, Mrs. Rayner, Miss M. Rayner, Mrs. W. J. Brown, Mrs. Brownlow King, Miss Elizaboth Thompson, Madamo Bischop, and Miss Georgiana Swift, have most distinguished themselves.
The Duke and Duchess of Teck visited the collcction before it was opencd, and a number of the piotures bave heen pnrchased.

Female School of Art.-Her Royal Highness the Princess of Wales has consented to preside
at the distribution of medals gained by the at the distribation of medals gained by the square, Bloomsbury, on Wednesday, the 26th inst., in the tbeatre of the University of London, Burlington-gardens.
A Statuette. - We are glad to bear that the Council of the Art Union of London determined at their last meeting (Lord Hoaghton in the -chair) to produce in hronze a revised version of the statuotte of Cimahnoe, for whioh the National Medal was awrarded last year to Miss Emily Seloas (now Mrs. Fennessy), in connexion with the Female Scbool of Art.

## THE BUILDING TRADE IN LONDON.

 We are threatened with arother disastrons strike and all its evils and losses. The masons have given notioe to the masters that they require 9 d . an hour instead of $8 \frac{1}{2} \mathrm{~d}$. as at present, on the ground that the purchasing power of money is less tban it was; and the masters, after mncb consideration, baxe declined to concede it, hut bave informed the applicants that they are perfectly willing the men should make longer time at the present prices, during the summer months, and so earn more money. The masters consider, as we undergtand, that the limit has been reached, and that furtber increase in prices wonld have the effect of checking work. It remains to he seen what is to be the end of the constant move onward in the rate of wages and the oonsequent rise of prices, we are unable to divine. "With pig-iron at 9l. 10s. a ton," a well-known builder said in our hearing yesterday, "and timber twenty-five per cent. higher than I have ever known it, erenwith the duty on, how am I to make my bills witb the duty on, how am I to make my bills
satisfactory to employers?" How far may the satisfactory to employers?" How far may the
patience of the public be trusted? If there patience of the public be trusted? If there were no other conntry than England the general
riso in prices would be of less consengenco riso in prices would be of less consequenco, excepting to annuitants and other tboosands
with fixed incomes heretofore equal to their maintenance; hat this is not the caso, and it may be feared tbat many brancbes of manufac
turo will leavo the country. One fact is wortb dozen suppositions. The inventor of what is known as the Cuiversal Tooth and Nail Brush hack, a nscful little article for the wasb-stand, wood at 3s. 6d. a dozen, and the makers supplied him and were well satisfied. The nnion men interfered, and said tbe racks must not be made for less tban 4s. 6d. a dozon. The inventor found this would stop the sale, sent to Nuremhnrg, and now receives all be wants from that city at 2s. 6 d . a dozen. We mention this little story, tho truth of whicb is youched for to us, as serving to show what is going on in much larger ways all oror
the country. This is surely matter for scrious the country. This is surely matter for scrious
reflection, and should "give us pause." What seems best for us individually at the moment is not always so in the long run.

## TRADES MOVEMENT.

Manchester. - A general meeting of the mombers of the Operative Society of House Painters in connexion with the Mancbester Alhance, bas been held to consider the desiraBility of requesting an adranco on the present
rate of wages received from local master rate of wages received from local master
painters. After some discussion a resolution painters. After some discussion a resolution
was unanimously passed to the effect that notice should he forwarded to the employers rospectfully requesting an advance of id. per
hour on all olasses of work. It was stated at the meeting that several of the employers in the town had already conceded the advance.
Glasjow.-The bouse joiners have laid before their employers a request for a riso of wages from 7d. to $7 \frac{1}{2} d$. per hour. The employers have declined to accede to the request, and the men are to consider whetber or not they shall resort onforcing the desired rise.
Edimburgh.-At a mecting of the joinors on strike, it has been resolved, after a somewhat stormy discussion, to accept the terms offered hy the masters, viz., 7 d . per hour, heing an advance of $\frac{1}{2} d$. on former wages. A number of the men who had struck work, of whom thore were ahout 300 in all, accordingly applied for as we have learned, abont the balf of them only as we have learned, abont the balf of thom only
bave boen successful in their applications. Some bave boen successinl in their applications. Some
of the men left town in order to seek work elseof the men left town in order to seek work else filled up during the 24 hours' strike. The strike comed up during the 24 hours' strike. The strilke committee, however, have denied the correctness
of this statement. In Leith a similar result is of this statement. In Leith a similar result is
thought not improhable, as the number of men thought not improhable, as the numher of men on strike does not now, We are told, exceed 30 , ont of aboat 160

Greenock. The master joiners having acceded to the demand of the men for an increase of wages, the new arrangement has come into force. Tbe increase was $\frac{1}{2} \mathrm{~d}$. per hour, the wages heing now 7 d . per bour.

THE PROPOSED BUILDING ON THE THAMES EMBANKMENT.
Tee St. James's vestry, Westminster, have had under tbeir consideration the proposals of The Governmeut to build upon that part of the Thames Emhankment near Charing Cross, which
is to he retained by the Govcrnment under tho arrangemont into which they bave just ontered with the Metropolitan Board of Works for the land west of Charing Cross, which has been so
long in dispute. long in dispute.
At the nieeting of the vestry, Mr. Bradshaw brought forward a motion to the effect that it was undesirahle to appropriate any portion of the spaco reolaimed from the river to building pur-
poses, on the ground that the huildiugs would poses, on the ground that the huildiugs would destroy the beanty and convenience of the great arenue which the ombankment roadway affords
through London, and, by covering a space through London, and, by oovering a space hitherto nuenclosed, would impair the healthithat the spaco on the foreshore to he retained by the Crown should he devoted to the same purposes as the rest of the space,-puhlic recreation and amnsement ; and he hoped that the Metropolitan Board of Works wonld not consent to any Government proposals which would have the effect of advancing tho line of huildings beyond the line of houses in Whitehall-gardens.
The discussion which followed showed that tbere was a considerable diference of opinion on
the subject amongst the members of the vestry present, several of whom appeared to think that the proposal of the Government to build on the spot in question would "be an advantage ratber than otherwise; Mr. Bidgood, one of the members, remarking tbat the proposed new buildings whuld shat out from sight tbe hideous railway hed of the Soath-Eastern Railway Company. Tbe result of the discussion was tbat the vestry refused to take action in support of
Mr. Bradsbaw's suggestions, thexeby practically expressing their approval of the proposal of the Goverament to huild upon this portion of the land.

THE ASYLUM FOR IMBECILES, AT CATERHAM,
Extensive additions are now being made to the Metropolitan Asylum for Imbeciles at Caterham. Tbe committee accepted the tender of Messrs. Henshaw for the new recreation-hall and additional block, and the works are being rapidly proceeded with.
The recreation-hall is abont 120 ft . by 45 ft (including stage), and abont 22 ft . high, divided on plan into nave and aisles by iron columns supperting hrick arehes. Above the nave is a dormitory for malo patients, with all necessary lavatories, \&e
Tbe necessity for this ball was strongly urged by the Commissioners in Lunacy at their last visit, and at Leavesden Asylum a ward bas been set apart for the purpose of recreation, but no hall has yot been erccted in the position originally fixed by tho architccts, and shown on the plan illustrated in the Builder some years ago.
Inadditiou to the hall mentioncd, the Catcrbam committce are erecting an additional block for 160 female patients, which will when completed hring up their entire accommodation to nearly 2,000 patients.
The architects of thcse additions are Messrs. John Giles \& Gough, who were also the architects of the original structures.

## STATE OF VICTORTA PARK

 CEMETERY.Oy more than one occasion we bave described the nnsanitary state of Victoria Park Cemetery,
and ohjected to the course pursued thore. A and ohjected to the course pursued thore. A writer in the Evening Standard, after quoting some passages from our columns, adds:-"Is there any neccssity for carrying tbe indictment farthor. If there be, I can confirm and supplement the above by othor facts. The last coffins plaoed in graves ought to be 7 ft ., or at least 5 ft ., helow the surface of the soil. I have beon witness of iutcrments in reopened (old), graves where the coffins were scarcely an arm's length from the surface of tho soil. The staff of gravediggers in this cemetery is harely snfficient to open and close the newly-made graves'; so order and neatness, or even deconcy, are not dreamt of. The owners or directory of this cemetery feel the exigencios of their position so much that they have begun actually to manufacture space An offset of the graveyard, which existed for rears as a sand-pit, is now being filled in, to be utilised for interments as soon as the smanl patcb immediately within the gates is used up. Sidorally the graves nre adranced nearly to the gates, and the contral carriagc.way, which only oxtends for a short distance, will be eaten up if an ukase does not go forth from the Seoretery of tate. I think I have now made out a case for aquiry, hut if instituted it must be an exhaustive ve, into the past bistory, management, and surroundings of the Victoria Park Cemetcry."

## SCHOOL BOARDS.

London.-Mr. Reed, M.P., hrought up a roport from the works committes, stating that the fol. owing tenders had been received for the crection of a school in Lower Wandsworth-rond, for 1.078 hildren, viz: :-J. W. Falkner, 8,2ธ01. ; Marsland \& Sons, 8,150l.: James Cooper, 8,1172 . Gammon \& Sons, 7,596l. ; B. E. Nightingale, 7,5951.; Nixou \& Son, 7,5892.; Nowman \& Mann, 7,578l.; J. Cook, 7,565l. ; and W. Higgs, 7,549l. The tender of Mr. W. Higgs, of Crown Works, South Lambeth-road, S.E., was accepted. The area of the site is 23,000 square feet. The cost was 2,500 . The schools have heen designed by the Board's architect, and will cost 'Tl. per
bead. The Board has also resolved "That the
amendod tendor of Messrs. L. E. \& R. Roberts, of 34, Rbeidol-terrace, Islington, N., amounting to 6,8617 ., for the erection of the schools to b built apoa tbe site in Harper-street, New Kentroad, in accordance with the revised plans, wig that the tender of Mr. Wig. accepted; and that the tender of Mr. W. Wig. more, of Bradkel erect on of a school to provide to 4,825 l., for the erect on of a school to provid accommodation for 818 children, on to court, St. John'siane, Clerkenwell, he Eagle-court
Leicester:-A letter was read from the Educaion Department, approving of the plans of the Oxford-street schools, and also recommending he Pablic Works Loan Commissioners to lend the requisite amount.
Halifac. - The clerk read the report of the sites and buildings committee, which stated that having examined tbe several set of plans and designs (numbering eight), for a scbool at Booth Town, received in competition, they gave tbe preferonce to that under the motto, "We live to learn," considering its arrangement of groundplan to be the best, and they recommended th Board to accept it on condition tbat the archi leot would produce a revised elevation more in accordance with the views of the committoe, and make sncb other alterations as may be suggested Tbe chairman observed that some of the other plans had vaxious degrees of merit, still the com mittee did not find one wbich so periectly cam ap to the idea of tbe Board, and therefore the could confidently submit it to the approbation tbe Board. The ground-plan was the best of any in its arrangements; hut the elevation was not quite approved, The report was mani. mously carried, after which, the successful plan having been opened, the chairman stated that, with one exception, the committee were entirely ignorant of the quarter from which any of the plans came. The successfnl design was then stated to be by Messrs. Leeming \& Looming, architects, George-strect, Westminster
Northampton.-The Board have consulted Mr 2. Roger Smith upon tbe desigas submitted to them in competition for two schools which tbey are about to erect.

## metropolitan convalescent

 INSTITUTION.The committee haring purcbased a sito upon Kingston-hill, determined to erect a building for the reception of the children convalescents now at Mitcham and Hovited fonr architects to send plans in competition for the proposed building, but upon reconsideration, as we are informed, they witbdrew consideration, as we are informed Mr. H. Saxon Snell to prepare a design. The working drawings and estimates are being prepared, and tonders will be invited so soon as tho legal transfer of the ground has been completed. The building will accommodate 200 children, and the estimated cost is abont 17,0002 .

ART AND SOIENCE.
A "Fine Arts Financial Association" (rather an odd iden, it strikes ns), is amounced, with a capital of 150,0002 , in 30,000 shares of $5 l$. each, the principal object being to advance monoy to artists and others on works of art. and to effect the sale of such works on conditions matually advantageous to the borrower and the company. The prospectus states that artists wishing to obtain advances upon tbeir works do so a considcrable disadvantage, as they only get a nominal amount of the value at a large rate of interest, whilst the works are stored away, thas preventing their exhibition for sale. It is therefore befieved tbat this company will supply an existing want of making advances to artists at 10 per cent. per annum, or such terms as may be agreed upon, the company finding a proper place
for tbe exhibition of the works for sale, on for the exhibition of the works for sale, on which, when effected, a moderate commission
will be charred, and the halance between the will be chargec, and the halance between the amounts obtained and tho advance handed to the owner. Depositors may clear their deposits at any time, on paying the adrance and interest, without any cbarge for extibition. Works of art on whic deposits are made, wa which are not intended for sale, will not be exhibited, noless desirad. Depositors may, npon special terws, oxhihition in the kingdom, and poriodical sales oxhinition in the kingdom, and porionical saies
will take place of uncleared deposits. The
company will also buy and sell works of art, on its own acoount or on commission. The project is stated to have been favourably recejved by artists and others, and negotiations are already in progress for a of high-class pictures.
theres on Geek Aot.-The Darlington Church of Englend Institute have bad Mr. T. H. Thomas, of London, engaged at the Central Hall, deliver ing a series of lectares on Greek Art. The attendances were not so large as the interest of the subject deserved. The lecturcs were illustrated.
Gloucester County Muserm and Schools Science and Art.-The formal inauguration of the building in Brunswick-road, Gloucester, recontly erected for the accommodation of these combined institutions, will take place on Easter Tucsday, the 15 th of April, according to the ocal Chronicle. Earl Dacie, lord-lieutenant of the connty, has undertaken to preside at the ceremonial to be obserred on the oceasion.

## ARCHITECTURAL ASSOCLATION

O. Saturday aternoon, March 1ol, was paid by about sixity of tbe members to "The Criterion," the building now being erected in Piccadilly for Hessrs. Spiers \& Pond. The roofs are nearly completed, and some portion of the interior finishings is in position. At the last ordinary meeting of the Association on the 7th inst,, thanks were voted to Mr. Verity, tbe architect, for personally accompanying the mem. bers over this building. The thanks of the general body of tho Association were aiso voted "Pr. T. Roger Suuith for the course of lectures a close.
A paper was read by Mr. E. C. Robins, on "Middle-class Schools for Girls," calling atteution to the general question of secondary education for girle, and the provision for it in different countrics; noting also the vievvs of the adrocates for large schools, and such stops as have for boarding and day schools, each to contain considerable nnmber of children, consider that tbeir propositions will now and hereafter be largely acted upon. Their requirements are now sufficiently defnite for the work of the architect, in the provision of suitable buildings for the children of the middle classes,-not widely differing from thoso provided for the poorer classes, e.f, the best schools for primary of comfort ond of Boards, - but with increase wider rauge of study. We shall return to the subject.

ARCHITECTURAL ART IN ENGLAND.
On the 6th inst., Professor Kerr lectured, at the rooms of the Society for the Encouragement of the Fino Arts, Conduit-street, on "Arebitec tural Art
In the course of his remarks, the lecturer said that the fine art of architecture was at the present moment the subjeat of extreniely bitter controversy; and it was certainly remaracisism, withont which no art could Hoarish, should he, as regarded architecture, a dead letter. The main reason of this was owing to what was called the " battle of the styles,"Gothic versus Classic,-the two causes being continually pleaded together. Arcbitects have continually pleaded logether. Arsbitects have been thald to ignore this controversy, and to tari The two styles of Gotbic and Classic represented two different scbools of thought; and all other styles were cither subsidiary to these or were out of the category by reason of their being out arbarous. We had been asked to invent a new style; bot that was uiterly impossible. for a style of architecture was thing that could not be invented suddenly, or on demand : it could not be introduced into any country except by not be introduced into any country except by rueans orement of buman history temples were condmens wold the arent and al ways wonld be, the great standard works Egyptians this was so: and in the present day Egyptians this was Bo, and the present day our charches fuly tasched to this. Pbore were Frencb Clasio and the Farlish Gathice, the Frencb Classic and the Eaghsh Gothic; the Europe whilst the latter represented the reaction in favour of the Miadte Ares With regard ta the revizal of Romanticism, amongst
that school there was displayed at this moment an unoxampled amount of energy and eathusiasin. Thoir ideas were very high as regarded art, but yet their platform was very narrow. Gothic architectore was extremely attractive to young minds; the youngest architects were Gothic architects, and Classio architecture with tbem was entirely out of fasbion. In Franco, design, too, had almost disappeared in England Our monumental art and our ordinary art were entirely aifferent The Gothic architectore of the present day was extremely ambitious, and the prosc ecertio and bizare The leaning of the lorc eccontric and the lead thiuf enory arcbitecture and the French Gothic, but a new school bas now sprung up. Wo are driven back upon the adoption of a crude, rougb, and rude mode of design in order to escape the imputation of weakuess. The public of late years bave become boll alarmed and astonished at our position, sion berong distrnst, But the every en. in co af geral ant. But toe fashion ta aill ind would. In conclusion, he tbought that the reaction would be towards the edoption of the French Classic style, becanse that was the modern Earopean manner, from which we had gone away and to which we must ultimately come.

Mr. Browning agreed entirely with the sub. stance of the lecture, and believed that the fashion in architecture would change, and that there would be a fine future before the young arcbitects of the present day
The Cbairman, in proposing a vote of thanks to the lecturer, said that different styles of architecture were governed by tradition, and that in the presence of criticism not founded
upon real canons of taste, it was impossihlo for upon real canons of taste, it was impossihlo for
any art to flourish and occupy that positios. any art to flourish and
which it onght to occupy.

## THE DUBLIN PORT AN゙D DOCK IMPROVEMENTS.

Fross a report just issued of the Dublin Poxt and Dock Board, detailing a variety of statistical and useful information, we learn nnder the head of Improvements that the eastern extension. of sir John Rogerson's Quay is finished, and the deepening of Great Britain Quny is making a bantistactory progress. About 250 ft . of the wall are complete, and during last year the sum of 26,001 . was paid on account of these works, making a total payment already of $65,3792.1 \mathrm{~s} .9 \mathrm{~d}$. of the north-wall extension of the quay-wall, 300 ft , are complete, and blocks laid to the curther length of 120 ft . Abont 600 ft . of quay-wal have been built on the works for deepening the steam berths. New steam-dredges have been the has been paid lis balance of 3,577 l. 19s. The wharf adjoining the Bristol and Glasgow Company's berth will be extended 90 ft . to give accommodation to sailing vessels. Further, a range of vaults for storing whisky, extending from the Dablin and Drogheda Railway terminus to the main cntrance to the docks in Amiens.street will be constructed at a cost of 4,9852. A piece of ground has beeu sold by the board to the railway company to enable tbem to construct an inclined roadway adjoining the terminus. The amount due on mortgage bonds towards the oxpenditure incurred in the improvement of the port was $94,000 \mathrm{l}$.
In Dablin, also, in connexion with the Holyhead traffic and the Irisb inland traffic, the Mid. land and Great Western Railway Company bave been for several months prosecnting some important engineering works for the better de velopment of their goodsitrafic via the Liffey branch of their line. Theso improvements will give that line great facilities by placing it directly in that line great facilities by pir the Royal Canal) communication (alongside of the Royal canal) several years ago hy the Midland Railway Company.

New British Institution Gallery, Bond-street.-An interesting collection of cabinet pictures will be found here just now on sale. It polour da number of oispictares and worked with Fortuny at Rome, and tbere establighed a rising school for colour and character.

## ON THE PRESERVATION OF WOOD BY MEANS OF TAR.*

In a previous number, aays the Noniteur Scientifique, we published a memoir on the pre servation of timaher for parposes of construction All the methods of preserving wood bithert in uso were therein noticed; but whilst some were treated at considerable length, others wer
touehed upon very slightly. Tn the touehed upon very slightly. In the latter cate-
gory was the preservation of wood by means of tar. We believe it may be of service to our readers to treat the subject more fully, and we
have, accordincly availed ourselves of the writ have, accor incly availed onrsclves of the writ-
ings of M. Melsenns, nember of the Acadénuie inge of M. Melsenns, member of the Acadénie
Royale de Relgique, of the Philomathic Society Royale de Be
of France, de.

In August, 18.18 , M. Melsenns directed atten tion to certain facts connected with the conserva tion of wood with the aid of substances insoluble in water and unalterable under the ordinary rype of these substanees chiosen moisture. The ype of these substanees chosen by M. Melsenns was resill, pitch, and tarry products generally sion of conturies in Eganged after a 10
In a subsequent number of the Bulletin of the Belgrian Academy of Sciences, the same learne institated by him and of the results thence obtained. These we propose to review briefly. In the winter of $1810-41, \mathrm{M}$. Melseans pre $(1.49 \mathrm{in}$.) long, and 25 centimetres ( 9.2 in .) in chickness, which were thoroughly inpregnated thickness, which were thoronghly inpregnated
with gas-tar, by a repeated frocess of heating and cooling. These prepared blocks were then buried in the eorner of a garden, whero the soil
was saturnted with the lrainege was saturated with the drainage from a urinal;
there they remained for a couple of years. When taken up and split open, they were found to be perfectly sound.
In the cross-sections white bands or streaks were observed showing the places into which tho tar had not penetratod; it was observed that the fituer had The split-blocks wereseparated in woody -one set of halves was retained, and the other buried for some time in ordinary soil. The first set of halves was kept from exposmre for into a steam. batb at a temperature of $100^{\circ} \mathrm{Cent}$. ( $212^{\circ}$ Fahr.) ; suddenly cooled hy planging them were then laid ont for some time uncosered the damp surface of a lawn, then placed on the parapet of an isolated building; lastly, they under a butt holding rainwater. It wonld be difficult to suggest or imagine a concatenation of cireumstances more favourable to deeay, thar which they were tbus continnously humidity to according to the reports of all who inspected tbem, they were perfeetly sound and uninjured after twenty years' triel
M. Melsenns also gave portions of the same bloeks to M. Rottier, who placed them in his rotting-vats. He reported to M. Melsenns as follows:-"Small portions of your blocks were destroyed in my vats at the expiration of 240
days or thereabouts; hut it should be ohserved days or thereabouts; hut it should he ohserved
that blocks of a preeisely similar description, and not so prepared, lasted 120 days at furthest. These facts deserve the attention of railway directors, who still not unfrequently neglect this department of their service. With M. Melsenns, on lines of railway is not alired in this matter The Belgian Government, for example thied hozen different methods of preserving wood; hut special Commission appointed to investigata he swhect was directed to devote its attention the following matters : -1 . The durahility of oregnated with creosotic oils by Bothell's im. cess. 2. Ditto, of blocks of beech and red deal orepared in a like manner. M. Melsenns also observes that it is to be regretted that the rea. ons which led to the abandon ment of the "Borhe year 1859 have not been given in the reports of year railway administration, as such refsons would bavo afforded reliable data for futurc experimentalists to go upon.
Useful information might be oltained in wother way. We know that the rencwal of the naterial is most frequent with certain woods ud upon certain lines of railway, and we are

- Monitear Scientifque, Junuary, 1873.
disposed to agree with the observation made by M. Melsenns in 1848, that "an exhaustive study the the circumstanees that contribute to rende infallibly unservieeable under such cases woul question; at any rate, careful researches into the more immediate causes con1d not fail to be of infinite value.'
In a pecuning point of view the subject is of 1861, 1862 and 1863 , over 110,000 three years put hors de service on Belmian lines, in 1800 the number was 150 De0, exngereration in su, the there is n exaggeration in assuming that the fature expen5 francs a piece, represents a sum of 750,000 franes ( 31,2501 .). It must be understood, that np on 188 not more than one.third of the sleepers on the Belgian lines were prepared in any way. reduced as the proportion of the miven mest be sleepers beeomes proportion of the prepared be total number reater. However this may be 1862 was $1,819,781$. Of these, $1,081,000$, 5 francs each $=5,405,000$ franes; 761,000 at $3 \frac{2}{2}$ francs each $=2,885,000$ francs; makinc intal value of $8,290,000$ frances ( 331,6001 ). But the question is by no means as simple as it appears here; neither would it be all unalloged gain if the sleepers lasted for an indefinite period.
M. H. Mans pmblished an intoresting paper apon the subjeet in the Armates des publigues, vol. iv., 1816. Without going minntely o M. Mans, the annual eost of a sleper is man up of two separate elements, -1 , interest on the prime cost; 2, an annual resorve, which at interest should reproduce the sam required to purchase a new sleeper when the time comes On this point the reader may consnlt M. Mans's paper, and the aceompanying table, based upon a formula prepared by M. Emery. The formula, however, needs eompletion. As it now stands,
no account is taken of tho money-value of the discarded sleepers. The sound portions of oake leepers, for example, may often be turned to ceonnt for other purposes along the line,-fences, barriers, posts, and such like, and for fuel. Sometimes a disearded sleeper purchased in a rood year will fetch as mnch as the price of a ew one; but, as a rule, they are not worth mueh. As fuel, a sleoper prepared with gas-tar will be valuable in proportion to the tar con. ained in it. Hence, the data in M. Mans's able are not altogether exact, and must be take as representing the maxima of resnlt. In every case, howarer, the cost will be less in propor tion as the durability of the sleepers individually is greater.
A correct formnla eould only be prepared with the aid of long experienee in the working of lines of railway, due regard heing paid to all the con. laying and replacing the the cost of labour in prime cost and the , the choiee of the wood, the nature of tiee soil in each caty each sort, the of preparation should hech case, dc. The cost preparation shond he as much less in propordurable. The in lis natral state io mors darable. The hesitation of the railway autho anties ana explana 1864 sufficient of how it came to pass that in Belgian lines of railway were prepared on any way.
A section of a pieco of timber impregnated with tar presents some curious and distinctive characteristics, according to the duration of the process of injection and the amount of tar injected. In every case the injected tar follows the lines and sinuosities of the longitudinal fihres. When injeeted in sufficient quantity it fills the pores altogether ; when, on the contrary, the process has been ineom pletely periormed, which, however, is generall suffieient, the tar aceumulates in the transvere Eections, and plugs the channels that give access o deleterious agents.
In the large hlocks of heech and other soft woods, bands were ohservahle marking where the tar had not penetrated. Still, despite the severe test to which they were exposed, these blocks kept sound at a very slight depth below the surface of the ground.
It should he remarked that it is always bes that the wood should he put in shape, and in chairs, and the holes for the receiving the chass atter are fixed, shonld be made before
the late injection.
The experiments made, by M. Melsenns on
oaken blocks, exposed to the fumes of liquis ammonia, show that the conservating fluids follow the precise course that wonld be taken by decay. To our great regret, want of space for bids as to follow the author into the details of the experiments executed by him, or to reroduce the figures given in the original memoir. Sinfice it to say, that in wood thus treated, the ar acts on the very parts first exposed to in. ury, and on the course that would be taken by eeay, which is thus rendered impossible. We may add, that a working engineer, with whose assistance M. Melsenns attempted to split the bloeks thus prepared, considered the resistance qual to, if not greater than, that of ordinary oak. Several small nails, in the substance of the wood were found entire, and not at all rusted-a peculiarly favourable circumstance that deserves to he specially noted.
Whatever the nature of the wood, rot, wet or dry, spreads rapidly in the direetion of the length; its transverse progress, in the direetion of the mednllary rays, is less rapid. Sleepers are thus often thoroughly rotten, althongh the outside shell may appear sound and uninjured We frequently find them decayed in the lines of prolongation of the dowel-holes, and yet sonnd everywhere else. When sleepers are not dressed, the proeess of deeay is observed to be delayed in all ordinary woods. In oak, where tho filber run in the direction of the dowel-holes, the por tions of the wood helow the latter are often stained black with a sort of ink formed by the rust of the iron dowels acting on the tannin i the substance of the wood. Theso blackened lines do not run straight, but in each case follow the line of the first series of longitudinal vessels reached.
Saw and hatchet cuts, and all other injuries caussing a solution of continuity in these longi tudinal vessels, tend to expedite decay. In 1813-4, when the wooden prvement in the Rue Croix des Petits Champs, in Paris, was taken up, all the blocks left exposed on the ground were deoayed at top and bottom : an injeetion of tar, however incomplete, would have pre vented this injury to the wood.
In his "Memoir on the Conservation of Wood" (Bulletima de l"Académie Royale de Belgique) M. Rottier bas endeavoured to determine by whieh of the numerous substances contained in coal.tar, this special action is exerted; but, whichever it may be, the experiments of $M$ stilsenns sufficiently testify to its practical ntility. Neither need we lay too great stress on the substance with which the wood is to be impregnated, so long as it will not volatilise except at a high temperature.

1863) has directed attention to Rendus, June 1863) has directed attention to the employment of buildine conservation of every description of building material. He shows that tar, or better still, pitch, stearic acid, and the like, might be snbstitated for water in mixing plaster, and that the admixture, although mechanical, is so intimate that the benzine, and other suhstances in the piteh, are often found imperfectly orystallised in the plaster. The process of im. pregnation with gas.tar ahove described, must have a somewhat analogons effect, as if. Rottier found that chipe thus treated would not bleach ander the action of ether. They remained of a deep brown colour, and under the microscope, the woody fihre of the cells was found to be stained witb the tar.
However this may be, M. Kohlmann ascribes the practicability of employing these substances in plaster, in place of water, to the property they The of intermixing intimately therewith. neither merents of M. Helsenns soww that perty. In the specimens of injected woods exhihited in 1818 were pieces impregnated with mercury, with sulphur, and with "Darcet's metal." It would be interesting to ascertain to what extent timber thus prepared might be employed in shipbuilding and in mines. regards woods impreignated with fnsible alloys, heir eeonomic value is very small, being limited marqueterie-work aud the like
Everything tends to show that the conservation of wood deserves a place in the foremost rank of questions affecting public economy, and that up to the present time the subject is very far from having received a satisfactory solution. A sleeper shoula last as long 0.5 a mummy.
The methods of injection suggested by M. Melsenns in 1845 did not answer equally well locks in terg wood. After tryiag wooden the rough, green and dry, sound and decayed,
M. Melsenns found that alder, birob, hornbearn, heech, and willow were easily and completely impregnated; deal sometimes resisted the process, the innermost layers remnining white,
noplar and oak offered a very great resistance, poplar and oak offered a very great resistance,
indeed, with poplar it was found necessary to repeat the process.
In oak it ofter happens that the sap-wood, or its outermost layers, are impregnated, whilst the tar has penetrated a fow millimetres only into the rest of the wood. A very large block of oak, very imperfectly injected, in spite of a twenty-four hours sojourn in a boiler, at a temperature of $120^{\circ}$ to $140^{\circ}$ Cent. ( $218^{\circ}$ to $282^{\circ}$ Fahr.), was left out through the winter. the workmated that he had never seen harder or drier oak. It had then heen eight months in the lowing the severe winter of 1817 .
It often happens that considerable portions of the wood will resist the passage of the tairy matters, but the interstices bergh certain parts of their length are thus rendered inaccessible to deca
According to the nature of the wood and the manner in which the injecting process has becn performed, the wood will absorb from 30 to 50 por cent. by weight of tar, when perfectiy. ( $281^{\circ}$ Fahr.). This would no donbt involve considerable expense ; but in most cases, as with sleepers, a thorough iujection is not with sieepers, a thorougite, and the process may be repeated when signs of decay begin to show themselves. The Bclginn railway regulations require that sleeper impregnated with tar should retain 9 a sleeper impregnated with tar shoule retain dozen kilog. of tar, deprived of all its volatile dozen kilog. of tar, deprived of all its volatile $\left(300^{\circ}\right.$ Fabr.) should not do as well as ordinary (302 Fahr.), shoul not do as well as ordinary sleepers, it was found that 30 to 40 k kloge of sleepers, it was found that,
The experiments 011 which M. Melsenns has Tased his assumption of the sufficiency of a superficial injection of hot tar, were executed with ity pieces or bor riekness. The period of broad hy 0.05 m . in thiekness. The period of immersion in the hou tar atricd froloten to twenty minutes. The mattcrs employed were ordinary gas-tar, and gas-tar deprived of its volatile ingredients; sometimes resin was added. On coming out of the hot tar, the boards were plunged in cold liqnid tar; afterwards they were and poplar were used.
Wood in its natural state, from the Veterinary School, where it was more damp than in an ordinary store, was prepared, dricd, weighed, plesed in boiling water for twelve bours; then left exposed; and weighed from time to time. The results were as below :

First Series of Experiments.
Average weight of the prepared wood (mean of 20
Ditto, ateriments) immersion in boiling water
Ditto, anter fintecu days' exposure..
Ditto, after two month' expouure

Second Series of Experiments.
Average weight of the prepared wood (mean of 2 2 Ditto, esperimentso a monition in suoudy soil, always damp, Ditto, sffer turo moonths exposine at noon-day in

Tho weights of similar blocks, not prepared and treated in like manner (a mean of five experiments), were,- $100,127,89 \cdot 5$, and 91 .
These data show that wood hastily prepared and very imperfectly impregnated lost and gained less moisture than ordmary wood in its datura state, in like times, and nuder like conditious.
As regards the sort of wood, it was found tha oak absorbs and loses least; fir ranks second; beach and other soft woods come third; and hornbeam fourth.
Further experiments in regard of this point would be nisefu!
Superficial injections with hot tar appear to differ cssentially in their effects from ordinary tarring with the brush. Under the microscope, the ditference is very atrongly marked.
1n conclusion, we give M. Melsenns' deduc-
"We may inject the whole or any part o parts of the wood, green or dry, dressed or in he rough, hy preparing it either by chemical agents, or the natural process of seasoming mploying the pressare of steam, or of the aolvent or liquefier of the proserving substance. solvent or liquefier of the preserving substance ould be followed spontaneously by decay. The superficial carbonisation of the wood is The sugericial carbonisarion produced with the id of tarry matters than hy the simple action of heat (charring), which decomposes a portion of the wood.
When the injection is superficial
sonld always be put into shape first.
A railway sleeper thus prepared shonld have long, if not indeed an indefinite existence, if exposed to the inroads of decay alone; but, ir practice, we have to take account of mechanical causes of injury as well.

DRINEING FOUNTATN FOR ALNWICK.
Iv 1871, the Ainwick Local Board of Mealth desiring to remove an unsightly octagonal stone erection, 10 ft . in diameter, of the date of 1780 , called "Pottergate Pant," which stood on a conspicuous spot iu the town, at the junction of Narrowgate-street, the main street leading to Alnwick Castle, with a picturesque and Eteep street called Pottergate, that hody obtained a desigu for a new "pant." It was then discovered that, at the establishment of the Board of Health, twenty-five years or so ago, this and all the "pants" in the town were given up by the Corporation of the town to the Board for "use and maintenance" ouly, and the Corporation now claimed to have a voice in the selection of the design for the new erection, although they were not to pay for it. The Board objecting, the dcsign was withdrawn, and nothing was then done. The question cropped up agrain last year, when, on the proposition of the Corporation, the Buard reluctantly cousented to a design submitted by the former, and the unsightly erection was renoved. The design of the Corporation, however, being of no artistic merit, and merely for a cast-iron erection apparently taken from a trade-book, considerable issatisfaction was expressed at the opportunity that should be a credit to the town. A project was then mooted to erect by subscriptiou a handsome granite fountain, which met with decided suceess, when at this stage Mr. Wm. Dickson, F.S.A., the clerk of the peace for the connty and the chairman of the Local Board, volunteered to provide a granite fountain at his sole cost. In order to batisfy both the Corporadesign for his forntain, Mr. Dickson issued advertisements, offering a premiam of 57 . for the best design based upon a printed specification of particulars which were to be obtained from him. These particulars were, in the main, that the accepted design was to become his property, and the author was to bo employed to carry it out thisture, and 11 ft . hich to the hase of a catoptric lamp, which he would provide for the suto aquare at wase, with troums and drinling square at tho the Edwrardion character, thet the cost wes not to exe 1002, and that the desiom was to be to exceod 100 , ; and that the tesign mas to the Board of Health and the Corporation.
In response, fourteen designs, illustrated by twenty-five handsome drawings, by eleven competitors, hailing frons London, Glasgow, Inverpess, Newcastle, and Alnwick, were receired at the appointed time. Mr. Dickson, having obliterated a! sirnatures and evergthing that would give a clue to the authors of any of the designs, handed them over to the joint committee, com posed of five members of the Local Board, on of whom was Hr. F. R. Hison, architect, aud who was not a compctitor, and five menbers of the Corporation, giving to them absolute power or select a design and to carry out the work.
The joint committee, after appointing Mr. G-
Cockburn chairman, and Mr. James Heatley Cockburn caairman, and cors. James heatey care at three several incetinge, have, afte climinating from the competition al those designs that were not in accordance with the specification, finally adopted a design of considerable artistic merit, whose author is Mr. D. Macmillan,
a lonal sculptor, and which came under the
motlo, "We live to lcarn." It is about 4 It square, two-thirds up, with lancet-headed cusped panels in the centre, whence are suspended the rinking-cups. The upper part rises out or the quare into an octagon, with a quatrefor in ront face, and a plain uctacronal pyramidal roof erminated with a finial, which carries the lamp pillar. The lower parts of this design, incladin ho tiough for "gkeels," and niches for dogs and attie to drink from, are to be red polished ranite, and the upppr part of axcd granite. the imal termination is to be of car This, the elected dosim, is one in the competition which trictly couforms to the specification, and has hus fairly won the premjum and the honour of carrying out the design.

One matter yet remains to besettled by the joint ommittee, viz., the inscription. It was the wish of the donor that it shonld stand simply thus "The gift of William Dicleson to the town of "nwiok 18ヶ." The cornoration would like the Alnwick, "s.a. "he in "f "the " midalo "ourse, in mace of tho old pant 1873", Dickson, csq-, with his monogram on a station (St. Michael) on a shield in the rear, would perhaps answer the parpose.

## COUNTRY HOUSES : MILNER FIELD

 YORKSHIRE.Teis house, the residence of Mr. Titus Salt, is ituated in the parish of Bingley, and near to the villacre of Gilstead. It occupies a prominent position, overlooking the valley of the Aire, and commands cxtensive views of the surrounding country. The house stands in a newly-formed park, and is approached by a new road, commu. nicating with Saltaire on one side, and with Cilstead and Bingley on the other. A small Domestic building, of ahout the severteenth centary, which had been altered and modernised from time to time, and possessed bat little interest, stood near the site. This has beon pulled do
retained. The bew building is placed almost due north The new building is placed almost due north through a massive gateway into an enclosed courtyard. The principal rooms face the south, and open on to a wide terrace, with flights of steps leading down to the park. The house is huilt of local stone, with brick linings, forming hollow walls. The roofs are covered with IVhitland Abbey treen slating. Some of the rooms have moulded open ceilings of oak, and the woodworkof the principal rooms is either wainscot oak or chestnat. Burt \& Potis's casements are fitted to the opening windows. The entrance-hall and corridor are faced with stone in party colour The Old English type of plan adapted to the prosent requirements has heen adopted, and the whole treatment of the work has been kept in harmony with this, all the fittings and mnch of the furniture having been made from special designs. The internal decorations are now in progress.
Near to the house, and adjoining the Gilstead Lodge, extensive stabling has beeu erected, and at the lower end of the park are model farm buildings. The kitchen-grarden, witlt an extensive range of bouseg (to which we referred recently), is placed at the upper end of the ground, opposite the principal entrance, with the carriage-road between. Messrs. Shaftoe \& Barry of York, were the general contractors. The wrought metal-work was manufactured by Mesbrs. Richardson, Slade, \& Co., of London. Messrs. Burke \& Co., of London, supplied the chimney-pieces and marblework. Mr. T. Nicholls, of Hercules.buildings, London, executed the carying; Messrs. Marsh, Jones, \& Cribb, of Leeds, manufactnred the furniture. Mr. T. Harris, of Gray's-inn-chambers, London, Was the architect; and Mr. A. Thorne a.cted as his clerk of works.

Machine Labour in Mines.-There is in he Bulletin de la Sociétś de V'Industrie Mìnérale, a memoir, "On Compressed Air Borers for inking Shafts." by M. Chanselle, cspecially as pplied to the mines at Sarrebrick. All the results are carefully compared with those ob. aiued by manual labour, and they deserve especial attention at this time, when the substiation of machine labour in mines is exciting much attention.

MILNER FIELD, YORKSHIRE.

PARK FRONT.

## THE CASTLE OF PONTEFRACT.*

The position and dimensions of the castle wore wortby of tho great harons by whom it was con. structed, and far too noble for the events with which its name is associated. North.east of, and one-third of a mile from, tho market.cross of
Pontefiact, there is secn a rery remarkahle table Pontefiact, there is seen a rery remarkahle table part a steep slope and in part a cliff of from 30 ft . to 40 ft . high, rising ont of a talns, which, on the north, south, and eastern faces, descends into two deep natural valleys, which unito on tho north.eastern front. At the soutb.west end is
also a natural depression dividing the rock from the town, and which has been deepened somewhat by art, as has tho clifif been scarped and, where necessary, revetted, so that the general result was the prorluction of aln almost impreguable strong. gards the east frout, some little modification. gards the east frout, some little modification.
Here, immediately beyond the wall, is a ditch nearly all artificial, and beyond it a nearly level area, beyond which, again, is the natural valley. As it was necessary to cover the ground, it was walled and converted into what was called the
barbican, but was really a doublo ward ontside barbican, but was really a double ward ontside the castle, covering its main entrance. The
castle was thus conmosed of the main ward, occupying the tahle-rock, and the outer and inner barbicans covering its south.cast front and entrance.

The main ward ocenpies the whole summit of the rock. It is in plan an irrcgular oval, 150
yards north-cast and south. Wrest, and 103 yards in its cross diameter. Of this area a segment at the south. west end, 37 yards deep, or on the "sacitta," is occupied by a raised platform containing the seep and remains of various build. eud is occupied by the bases of other haildings, including the cbapel. If the arrangement be likened to the deck of a ship, the keep end will and the large intermediate space the waist.

Tho present appcarance of the nortb-eastern platform is a bank of earth, irregular, and about semilunar, and is evidently composed of the basements and ruins of buildings, the soft red sandstone of which readily becomes converted into soil. The face towartls the ward, standing
from 2 ft . to 6 ft . bigh, shows the base mouldings from 2 ft . to 6 ft . bigh, shows the base mouldings
and plinth of a range of baildings that rose from and plinth of a range of baildings that rose from tbe main ward level, and seem to have included a polygonal tower or turret. All that is visiblo
is of excellent ashlar, with stones of large size is of excellent ashlar, with stones of large size,
and the workmanship is mainly in the Per. and the workmanship is mainly in the Per.
pendicular style. In tbe rear, along the edge of a cliff, is the curtain-wall, part of which is a revetment filting up the irregularities of the
rock. This platform is returned a few yards along the east front against the curtain, and there is seen the besemont of St. Clement's Chapel, more than once rebuils since its first Norman foundation.
The curtain along the crest, where the cliff is high, seems to have been a mere parupet. On the north.east point, where tbero is only a slope, ness; much is hroken away, bat what remaing shows it to have been 15 ft . thick at its hase and 11 ft . at 24 ft . high. The main gate was in this curtain near the south end. It secms, from tho drawings, to have been covered by a small
square tower, the exterior and interior portals square tower, the
not being opposite.
The main
The main merest of the castle attaches to its south-western platform. This is ahout 20 ft . above the main ward, and at its southern angle there
is raised upon it a conical mound, flat-topped, is raised mpon it a conical mo
and rising about as bigh again.
Towards the main ward tbis platform is supported hy a revetment wall fiom 12 ft , to 14 ft . lagh, of good rough ashlar, of large stones, laving a hase oif 4 ft., and above this a phinth of about 4 ft , more, the two offsets being plain chamfers. This, no douht, carried a enrtain.
wall. In the wall, near its centre, is a broad. wall. In the wall, near its centre, is a broad.
arched recess, called "the King's Seat," pro. arched recess, called "the King's Seat," pro.
bably from a tradition that Richard II. sat theve, which is prohahle enough. At the north end the platform is returned about 25 yards along the west curtain. Various indications show that this platform was covered with huildings, most of which, like the retaining wall, were of Norman date, and of which the hasements remain, though much oovered up. Of the enceinte or curtain-

Wall that supports the outer faco of this platform only the lower 30 ft ., or revetment, remains. This commences some way down the slope, and
is prodigiously strong, and buitt against the is prodigiously strong, and built against the
rock. At the south-west angle was the Trea. surer's or Pix Tower, tho ruins of which still
encumber the slope. Passing sonthward wall rises and becomes more sorfect. It it exterior hase, ahout 30 ft . below the rampart, is a Norman postern, very perfect, and which pro bably is in the base of the old Red Tower. Then hohind, and on the level with the top of the wall, the end of a round.headed vault of about 16 ft span, of rude rubble, but springiug from good ashlar मalls, and having a later-inserted window. This is called "King Richard's Prison." Near this is a rectangular shaft, 8 ft . hy 4 ft ., but which, a few feet down is increased to 8 ft , square, a ronnd-headed arch supporting the upper half. It is now about 40 ft . deep, and the shaft of a garderohe.

Beyond this rises the mound, the top of which is circalar, and about 20 yards across, and 40 ft . bove tho esterior base ward, and much more which it forms a part. Thofe who formed tbe mound no douht gave it a natural slope all round, and placed their structare on its top, and, making it a part of their line of defence, carried the general palisade to its snmmit from
either side. The Normans, on taling pessession, procece. The Normans, ou taking possession, soft rock forming the core of the mound, on the outcr sides, into the figure of a three quarter round mural tower, and then faced it with a very solid wall, so that though really a solid bastion, it had all the appearance of a magnificient round tower, 70 ft . diameter. When this segmental bastion bad been carried to a height of 50 ft . or 60 ft ., that is to the level of the top and the cylinder the wall was continued round, was cronned by a regular, so that tho mond diameter, aud probably 25 ft . high, which was really, what its substructure only scemed to be, a tower of masonry. As the rock was of irregular smaller botion prohably a as composed of three large and three small roundets. However, only two now renain. the castlo, standing as they do high above the the castlo, standing as they do high above the upon the crost of a steep slope. They are faced with largo blocks of sandstone, of excelleut open jointed asblar work, with a bold set-off at the of the rock to staircases, some of which are still open. In the large hastion, at its exterior hase, near a cover. ing angle, a shonlder-headed doorway, a postern, opens into a round-headed passage, partly cut in the rork, and partly vaulted. From this one way leads into a moral cbamber; another up a steep flight of steps, cut in the rock, but having serjes of shoulder.headed hanging arches to support the roof. At a hoight of 30 ft . this stair leads to an open gallery above, com. manding the posters, and from this again Boothroyd rives three other of the kecp proper. which contained the well mentioned by one of Besides theso the remaining fragments of the keop proper contained the baso of a well.stair, probably ascending to the battlements, and a phaft, probably from a garderohe ahout that level.
The main entrance to tho castle was a few yards east of the keep in the south curtain. From the gate a narrow stair ray up the cartain into the keep, and is still seen. Another, on the other side, still descends from the keep towards King Richard's prison.
From the keep a spur wall descends the slope, and was intended to cover the approach, as at Hawarden and Coningshorough. It evidently crossed the ditch, and formed part of the harbican. Thus the keep conld be reached rapidly and directly by three ways, all narrow and well defended, one from the outside hy a postern, another from tho main gate, and a third from the west ramparts. In substance the masony and arrangement of this keep is clearly Norman, refaced in the Perpendicular period
Mention must be made of a very curions and early excavation in the main ward. On the
surface, a few feet from the king's sent, a flight
of rock.cut steps descends nearly north.west, and at 70 ft . distance is the mouth of a square shaft, lighting a passage below. Duscending, tbirty-three steps lead steeply down a passage, iff. hroad, witb a hanging roof. A little way down, on the right, are traces of a cylindrical staircase, no douht the original way in, hat now, with the tower, in the base of which it no doubt as, destroyed. At the foot of the stairs is a plain round.bcaded door.case, apparently of Late mence, Beyond this the stairs recomand the passage forks, a short hranch running nd the passage forks, a short hranch runaing the fork, part of the passage is vanlted in finethe fork, part of the passage is vanlted in line-
jointed ashlar, with two plaiu round-headed ribs. In thie wall, on the right, is a round.beaded In tlie wall, on the right, is a round.beaded
recess for a lamp, and the commencement of recess for a lamp, and the commencement of mere recess. Above tho fork opens the shaft, here scen to ho a truncated pyramid, about 6 ft . by 12 ft ., and 30 ft . deep. At the fork the salient is occupied hy two small oblong colls, with pointed roofs. They communicate with each other and the passages by narrow lancet doorways. The excavation is now called the magazine, and no doubt was so used at the siege; out it is of Norman and Early English date, and robably woas intended for a cellar. The arrance. ments of the cells are scarcely suitablo for prison. The present entrance is clearly an ad. dition.

There remain some exterior points to be noticed. Leaving the keep by its postern, and roing north-west along the foot of the west face, the wall is seen evidently to he Norman, and near the centre of this front is tho original Norman postern. There are upon the faco of the wall 6 in. projection headed reliering arch, and below it a segmental headed reliering arch, and below it a segmental cullis, but with a rebate for a door, and hout porttwo stout bars. This opens into and holes for vaulted passare, This opens into a straight vaulted passage, ahout 5 ft . broad, lofty, also round.headed, of excellent ashlar, and cloarly Norman. It runs about 15 ft , and is then choked up. It no doubt ends in a well-stair, which might roadily be excarated. Iu later, prohably Perpendicular times, this postern has been disused, and the door converted into a loop, and blocked with the usual window.steps within Following the base of tbe cliff along the north front, it is seen to have been carefully made good with masonry; and at the north-west ancle under what was Queen's Tower, a larre rift in the rock has been lined with ashlar, and spanned by a round.headed arch is trood masonry. It looks like a large cavalry yostern, hut is merely a recess. At the foot of the talus on the west front, and about 180 yards outside the wall, are tbo remains of Swillington Tower, an outwork huilt by Tbomas Earl of Lancroter, and in which lie is said to have been imprisoned dout hal of the hasement remains The tower wes 40 scuare with walls 10 ft .6 in . tended to coman the end was of ing defence. Doubtless a donble wall connected ing defence. Doubtless a donble wall connected it with
It would seem that at Pontefract, as at many inland castles, a dam was thrown across a valley below the place, and thas provision made for defence and for the working of a mill. This seems to have been the case here bolow the northern front. The valley was converted into a lake, employed to feed two mills, of one of which traces remained in 1806, and the otber; the lower mill, was removed in 1766, when the dam was levelled, and the pool converted into a mpadow. Bubwith Bridge, no donbt, crossed this pool, at what is still called "the Wasb."
Nearly all traces of the Barbican are gone, but its memory and site are preserved in Barbicau House, Row, and Garden, and there remains a fragment, prohably of the lower gate, between Ass Hill and the Castle chain. There were two approaches, one from the town ond one from the oreat church, wioh mot in the outer ward of the Barbican. In frot of the north entrance there still. remains a for be late Tudor House into the front of whioh but been inserted a, ina the bearing the three lions of Eugland and a label of three points, carved in hold relief, a relio pro. hably of the ropal occupation of the cestle. The style of the shield is Early, and the castle. points to the eldest son of a king of England hefore Edward III. introduced the lilies of

Bootbroyd's hird's.eye view gives a general notion of the castle before it was destroyed. There were eight mural towers,--the Keep, the Red Tower, the Treasurer's or Pix Tower, Swillington Tower in advance of the wall, the Queen's Tower, the King's Tower, Constable's Tower, and the Gate house. All, save the keep, were rectangular, perhaps Norman. Of these only the keep and the ruins of Pix Tower are trace. able: the rest, with the great hall, kitchens, and lodgings, were carefully removed by the Parliamentary contractor, though prohahly a few pounds spent in excavation would still sho
basements, and establish a general plan.
Looking of this castle, it is clear that it was as strong placo in pre.Norman times; those who fortified it placing the mound at what was naturally its weakest point.
The greater part of the remaining masonry is Norman, and not improbably early. The enceinte wall, the huildings conncoted with it on the wost platform, the rear wall of the platform, the old postern, the interior of the keep, and the magazine, all seem to he in substance Norman Of the Early English and Decorated periods very slight traces are lefe visihle; hut it is clear that under the House of Lancaster, in the Perpen dicnlar period, much was added. Prohahly, the bnildings on the north-east platform were con. Svillington Tower added, the keep refaced, and much done in repairing the chambers and stair cases within.
Roothroyd, whose bistory, with all its imper fections, should he mentioned with respect, rives a copy of the account rendered for the destruction of the works, a plan of the siege onerations, and a hird's-eye view of the castle.
Ruincd as is the place, and reduced to he mero garden of liguorice, enough remains to mero garden of very deeply those who are conversant intercst very deeply our ancient military structures, and espe cially such of them as are of Saxon or English foundation, and havo hecn recast to suit the Norman fashions of defence. G. T. C.

PROYERBS FOR GENERAL CIRCULATION. Thene are always plenty of persons ready assist those who are not in need.
If giving away what you do not want he cbarity there is plenty of it.

A timid rogue will get behind an impndent ne, and push him more to the front.
If everybody had his own in England, there would be a great reversal of positions.

## POWERS OF BOARDS OF HEALTH

Milward v. Redditel Board of Health.-In thin case, condensed in Law Joumal, the plaintiff was a needle manufacturer. The Local Board, in exercise of their statutory powers, atered the oad in front of his house, raising the footpath this was injurious to him, and offered to make the vecessary alterations to remove the inconyenience; but the Board insisted that, as the alteration was generally an improvement, he conld not complain.
The plaintiff filed his bill, complaining gene ally of injury, and prayins to restrain the Board of Health from keepincr the road in a state less convenient to the plaintiff than before; and givins evidence of the specific injury, that the raised footpath dammed up tho water a few inches deon in front of the house, and made the basement damp and liahle to injure his needles. It was proved that a fey pipes, at a small expense and withont injuring the footpath would prevent the water being dammed up.
JIr. Southote and Jr. W P. Beale for
plaintiff.
Sir Baggallay and Mr. Methold for the (ac
cndant
The Master of the Rolls held that the Board wero bound to exercise their statutory powers so as not to canse more inconvenienco to private individuals than necessary, and granted a mandatory injunction to restrain them from permitting tho water flowing from the plaintiff's premises to he dammed back by the footpath.

## PREVENTION OF FIRES.

Sin,-since I first bad the honour of corte. sponding in your journal, in the autumn of 1860 , then with respect to the great fire in Tooley. street, and since upon that and other matters, I have always taken the greatest interest in any means for either preveuting or stopping the which is seldom now considered, our system of insurance alleviating its more painful effects. Yet the loss of such at immense amount of property going on at all times in some part of the country can he no other than a misfortnne; fre. cmently indeed, hrieging distress npon tbose thas suddenly thrown out of work.
Some ten or thirteen years ago I proposed an someten in hildinc warehouses, \&c, by arrang a shet of water could at ony time he which shed to
 occasion of a fire helon by ohject is now to give a practical suraesto, by which that can be attained when reçuired in any manufac tory or warchonse in a minute or two hy self. action, an ar ary suppose an ordinary good wooden hoor. At edging of wood or ron should be fixed round such foor and across the entrance leadicg to the stairs, \&c., of 1 in . or 2 in . high; a water-valve, held up hy-werds of hemp or wonld he cornied af enp under the ceiling, and ona he carried along unar the ceilis, and so he cord natany park colted the wighted he cord heing untht or melted, the weghted ninutes he floo ar where the fire water of ave would be covered by sheet of floors of in. or more in cepth, supposing the foors to he fairly sound, this onts of all com proper towards above or below, and witb higher on each flon than the height named rery hipher ou each flon than the height named rery
little damage would be done by the water, whilat
any extenaive progress of the fire on the one loor wonld hring the water throngh from ahove pon itself, jnst
In its application to hotels and dwellinge, or warehouses and works where watchmen are ept, of course the self.action arrangement would not be adonted, but simply a pipe to flush ach floor, the valve being situate ontside the nilding or in any convenient place, as I hrve hefore proposed in yonr journal. For hotels, \&c, having atairs of wood, each step should have trip fastened on ahove the unsing, say bnt $\frac{1}{2}$ in in this wot interfere with walking, hat would allow, upon the ocenrrence of af the staine ond landince heing fllelhed from the top Jownards and the each step remt corered with a thin sheet of water hesides be floor where fire would he commencine or the or wher a the case of whor would prevent its rapid progress. ould prevent
It is well know, therever good fire pronf foors are, the spreat or less pre. en. Wow the time bender floors and stairs fireproof for the tim

PUBLIC HEALTH INSPECTORS' DDTIES. the madeley union.
THE inspector lately appointed to make a sanitary survey of this union has presented tho following statement to the Board of Guarcians. The union consiste of twelve parishes, and conof 30 ancea of 27,951 acres, and a popilatinn county of Salop:-
Gentle sanitary Authority of the Eadelev Tnion. Gentlemen, -have to report to you that I have come orer the ground generally, to begin with. to enable me to mare a preliminary report to you to day 315t. ult.
Socing how the ground lies, I propose to divide the
union, for the purposo of a union. for the purpose of a sanitary surrec, into districta, and I suhmit the following districts for your approval,
viz, 1, Much Werlock: 2, Barrow, Willey, sad Linley 3. Brobeley, including Benthall: ${ }^{\text {, Madile }}$, including
 was. These scem to me to he divisions of the union dic-
tated by the manner in which the ground lies. I propose to inspeet and report to you upon each of these districts in turn, zud I shall ask to be allowed to complete the inspection of each distriat before reporting upon any part
of it, unless there skould occur some urgent reason for a more partial report, which I do not forence.
In begianing a work of this lind. nnder a new Act of Parliament, it may possibly he satisfactory to you if I
make a short statement of the prisciples which will guide $m e ~ i n ~ c a r r y i n g ~ o u t ~ m y ~ d u t i e s ~ a s ~ s a n i t u r y ~ i n s p e c t o r . ~$
I take it that the intention of the Public Health Act is possible for all persons to live healthily whilst They do live, of whatever class they may he.
The sanitary question secms to mo to he summed up in this formulary, question seems to mo thatever people consume or vse shan in be wholesome, and that the refuse pronincts shall he dealt with in such a manner as not to be a nassance or injur
to health.
To this end I interpret my duties to he as follow:To see for myself and to report to yon the source from of water. water.
To take sampea of meh water su may he necessary, and
to submit them to your analyst for examination as to their fitness for humna consumption.
To see in what manner the refuce whter and sewape To see what necessary accommodation is provided on the pemises of the re ppective honses.
To see that housee are not orercrowded, or, if 80 , in
suggeat to the owners such structural remedies as may sem to be justifiable.
I shall wish to inquire as little as possiblo into the cirImstances of any household, hut, seeing that it is tho and disease, I shall hope to he willingly informed, when I
make my survey, and from time to timf, whether there hake my survey, nud Prom time to time, whether there have been recent enses of sichness in the houqe.
Generally, to prevent the commissia

IMPORTANT DECISION UPON BUILDING DANGEROUS HOUSES.
Mr. Justice Pollock last week, on the Northern Circuit, had hefore him a case that gingularly oponed up the most important points of the liabilities of huilders in regard to the construction of baildings, and the leading counsel on the Northern Circuit further enlightened tbe
hnilding profession by their arguments and hailding profession by their
opinions on the laws of building.
Tbe action that introduced the subject was not brought against any members of the huilding profession, althougb it may yet reach some one of tbom ; bat it was hrought againt a livery. staale keeper of sunderland, ono Laverick $k_{1}$ to
rocover compensation for the destruction of two carriages by tho fall of a coach-house during a gale of wind, and which building was alleged to gave been unsafely huilt.

## NORTHUMBERLAND HOUSE

Sir,-Sarely it is not impossible to elicit an oxpression of pablic feeling in favour of retain. ing Northumberland House. in London to lose so unique an example of its times.
If the following alternative sobome wore carried out, it would greatly improve the neighbourhood, and effect the objects in riow.
When all the property at tbe east ond of St. James's Park is acquired for toe purpose of extending tbe Government Offices, let that part ate the end of the Mall be thrown open to Cbaring. cross, and remore the Marble Arch from its presont somewhat nndignified position at Tybarn, presont somath it at the end of the Mall; it would then become the principal ontranoe to the palaco it was intended hy its Royal author to adorn, bo in close proximity to his eqnestrian statue, and to the terrace which bears the name of his bonse ; and our dear Queen conld then drive direct from her palace to Chère Reine Cross, to ber people to toe City, Emhankment, \&o. Let the entrance to the Embankment he made jnst oppoente, and it will lead by the sonth-west side of the Elouse, instead of over its site. If necessary, zanother entranoe might he made from the Strand on the other sido of the house : it wonld tbus spare an bistorical monnment, and save the finest site in Enrope from desirnction. A triumphal arcade of three arches could fitly adorn the entrance to the Emhankmens what more appropriate name cond
reon than that of "Victoria.
A proposal has heen made to form a tborough. fare along the inner side of the garden on Embankment, oommencing at its east end, termiStrand much if esoh, street leading to one wer Strand mnch if eaoh, street leading to one were openod to the other. Another grand improvement might one day he made which it would assist; viz, a grand street in a straight line; in
through Seren Dials (wbere an improved street rould join it for Trafalgar-square) to toe Em bankment, whioh it would reach somewhere about Cecil-street; so there would then be a noble street, leading direct from the river to th extreme north, namely, to Hampstead.

## Agnus.

THE FALI OF BUKLDINGS IN HOLME, MANCHESTER.
Av inquest has been held by tbe City coroner in tbis case. The alleged circumstances of the accident bave already appeared in the Builder of the 1st inst., uuder the hoad of Mr. Best. Tbo bouses wore being erected for Mr. Best. Margaret Best, wife of Samuel Best, of 69 , Fine-grove, was one of the winnesses called. Sbe deposed to having noticed that the bailaing was in an unsafe condition tivo hours before tho accident. She cantioned deceased and tbe other and begged them to come down. Tbey, however, refused.
J. Taylor, foreman to the contractor, said it was about tbroe weeks from laying the first brick to the time of the fall of the building. The mortar was in every respect as good as that used for cottage property.
I. G. L.ynde, oity surveyor, said be weat round the ruins of the building the morning romnter the accident. Inspecting some of the mortar, he found it to be well tempered, but apparently crumbly, as if tbe frost bad acted apparent. The thickness of the walls was in accordance with the bye-laws. Some of the accordance wed were old ones, and they appeared to bave been badly cleanod. Tbree weeks were too sbort a time to "run mp" tbe wall in suoh weatber: and, as a practical bricklayer, Powis (the builder) onght to have known tbis. Witness (tbe builde) an the building to the walls beving aving boen whe the nse of old brieks in ane of the walls.
Tbe jury returned a verdiot of "Accidental death.'

## CHURCH-BUTLDING NEWS.

Rotherficld.-Considerable alterations and improvements have recently been made in tbe cbancel of the cburch. Tbe wbolo of the ancient stone pavement has been romove, altern which paving snbstitued, pelican of the wilderncss reseding ter young witb her own blood. A reredos, feeding ber young witb her own blood. A reredos, carved, in alabaster and marbles, has been orected. This work bas heen cxecuted by Messrs. Field, Poole, \& Sons, Tbe paving and tbe remainder of tbo works bave been execated by Mr. Aaron Moon, of tbis town, builder. Tbe whole of the works bave been exconted from the desighs and undor the superintendence of Mr. Raph Nevile, architect, Godalming. The walls of tbe cbaucel have also been greatly improved in appearance, and brass altar-rails have been added. Tbe expense bas been defrayed, we bear, by tbe rector, tbe Rev. Alfred Cbild. Colonred glass in the chancel is much wanted.

Thrapston.-A restoration of the fahric and interior of the Church of St. Poter's, Raunds, will shortly bo commenced. Sir Gilbert Sootit has undertaken the supervision of the work, which, in conseqnence of the nnsafo state of tho whole erection, now hecomes an imperative necessity. The estimated cost of the restoration is hetween 5,0002. and 6,0001. ; and of this, from various sources, ahout 1,700 . bave already been promised hy the rector and parishioners, and public suhascription-bist bas also heen opened.
Eaton Hastings. - The chnrch of the village of Eaton Hastings, near Faringdon, has been reopened. The reotor, the Rev. F. J. Walker, ahout a year and a half ago, set an example by restoring and heautifying the chancel at a cost of nearly 2002. Since then the people of the parish have taken the mattor up with much interest, and tbe restoration of the whole ohuroh has heen completed, under the supervision of Mr. Cham pion, of London, who is tbe architect employed Ir. Wbeeler, of Faringdou, heing the oontractor During the progress of the works an Early English areade was fonnd hlocked up with plaster on the south side; this has heen opened out, and the windows reinserted in the wall The late foarteenth-century doorway on the south side of the nave has been restored, andia new oak door supplises the place of the old one The works carried out in the restoration acbeme
consist in opening ont the old roof, reseating the are, the centre passago of whicb is laid with Godwin's plain tiles ; and now glazing, with ark green borders to the windows. The Jaco bian pulpit has been lowered, and farnisbed with new steps and hand-rail. A beating apparatus has been placed in.the churcb. Tbe chief works on the exterior are a new bell-cot of stone,
able cross, and copingg with stone ridge. Mid.
Middleton.-Tbe Oburch of St. Andrew, Mid. Midateton.-Wolds, which bas nndergone a deton-on-the-Wolas, which service. The tower, west front, north wall of nave, and the sonth porch han and chancel aroh has heen wide and, by the insertion of wiotss in tho eash and west ends, the church presechan opea appear. ance. Beginning with the eco. the south silie has bee reso, an this rated window close to the cbacel arch on this side bas been suporseded by two lancet windows, to correspond with the others by which the chancel is lighted. Tbere aro four lancet windows on oach side, filed .ill cathedral glass, while in the east end a stained glass window bas been inserted, as the gift of Mrs. Blanchard, the mother of the rector, in memory of the Rev. Jobn Blancbard, ber husband, and tho Rer. John Blanchard, her son. Tbe window, wbioh is of three compartments, contains a grew number of subjects, representative of Seriptural types and antitgpes, all of which have been executed hy Messrs. Tavers, Barcaud, \& Westlake, of Blooms. bnry, at a cost of about 160l. Tbe subjects represent types of our Lord and his bistory, and heir fulfilment in the New Testament. In tbe lower centre is the Lord's Supper, on the north side of which stand Abel and Noall, and on tbe soutb sido Abrabam and inelchizodek. Abovo these, in a narrow compartment, is a representa tion of Isaac bearing tbe wood, surmounted by a figuro of our Lord bearing the Cross; tbe Sorpent lifted up in the wilderuess, surmounted by the Crucifixion ; Daniel in the Lions Den; and our Lord being taken down from the Cross. In another narrew compartment aro the reproseda tions of Joseph being taken up out of tbe pit surmounted by our Lords resnrrection; Elijah translated to bcaven, and the Ascension of Jesns; Moses near the flaming busb; and the Descent of the Holy Gbost at Pentecost. In the upper compartments is represonted our Abord in glory surroundod witb stained glass. Tbo floor of tho chancel, whicb was formerly paved with brick, is now Rid with Minton's enoanstio tiles, and tbere aro two steps, with a footpace, ascending from the nave to the altar. On the south side, within the altar-rails, is a sedilia, divided by a triple arcade, and beside it is a credence of early date; while in tbe opposite wall is an old aumbry, wbere the vessels of the charch were formerly kept. It is noticed that tbo eastern division of the sedilia is wider than tbe other two, and is probably the seat formerly appropriated by tbe chiof minister of tbe church. Tbe walls of the edifice are built of Piokering stone, with Ancaster stone dressincs, and have been faced on the inside with chalk. The old pews, with bigh backs, bave heen superseded by open benohes of stained deal, and tbe floors of the nave, tower, porch, and passages have been paved with Yorkshire flags, in which are inserted iron gratings, in con. nexion with Haden's patent heating-apparatus. tbe choir-stalls in the chancel are open in Tho frout, with moulded uprights and cornice. Tho mave is divided from the aisles by from circnlar pillars, except one near the south entranoe, which is ootagonal. The aisles are lighted by forr donle windows on each side, and these also filled with cethedral glass. The roofs of the re filed which were formerly andordrawn on pred now of woodwork drawn or plastered, are now of open woad, stained nd are constrncted of The trusses of the maiu ightly where oxposed. moulded ribs, resting on . tone cornels, herk, is in
 the kit 76 ft . higb so about of the wrourht-iron vane. It is huilt the top of with turret stairs in the southin three stages, wh the ringing-loft. Givine proceed to suceessful campetitor.
ing, the heads of which are filled with enricheu tracery. The south porch has been entirely rebuilt, and has stone seats on either side, the gable apex being surmounted by an ornamental stone cross. Outside, the roofs are covered with Welsh Countess slates, and have been raised to what may be considered the original pitch. Thero are ornamental crosses at the gable ends of both are ore and chancel, and the exterior of the tower has been designed after the English villacenpied Tho work of restoration, which carried ont about sixceen monthers.r.J. M. Teale, of Don. under the directin Mr. Slater, of York, was the caster firactor, and Mr. Swallowell was the foreman of the work. The total cost of reno. vating the building was about 2,6007 .
Faton Hastings.-The church of this little rillage has been reopened. It is situated on the banks of the Thames, and is of Early Norman foundation, containing examples of oach style up to the fourteenth century. The restoration of the whole church has been completed under the supervision of Mr. Champion, of London, as the architect, Mr. Wheeler, of Farringdon, heing the contractor. Dnring the prorress of the works an Early English arcade was found blocked up with plaster on the south side; this has been opened out, and the windows re-inserted in the wall. The Late Fourteenth.centnry doorway, on tho sonth side of the nave, has been restored, and a new oak door supplies the place of the old one. The works carried ont in the restoration. scheme consist in opening out the old roof; re. seating the nave, the centre passage of which is laid with Godwin's plain tiles; and new glazing, with dark green borders to the windows. The Jacobian palpit has boen lowered, and furnished with new steps and handrail, and also with a Hew brass sermon-desk and lights, the gift of a lady. A heating apparatus has been placed in tho chnrch. The chief works on the exterior are a new bell-cot of sione, new gable cross, and
copings with stone ridro. The work was started copings with stone ridgo. The work was started with a donation of $100 l$. by the Messrs. Kinch and relatives, and the sum of nearly 150l. has boen obtained by donations from varions sonrces by the energy of those ladies, who undertook to get together a certain sum.

## SCHOOL. BUILDING NEWS.

Godalning.-The low.pitched nnsightly brick structure, which oomposod the old British Schools, has been radically altered and largely added to.
The old bnitding has had two stone wings attached to it, and the brick of tho eld centre has been
hidden by a long stone lobby. In the centre of hidden by a long stone lobby. In the centre of the lobby is the porch, which is carried up in the shape of a round tower, which is ornamented with some decorations in carved frecstone. In
the tower a bell will be hung. The grey gtone of the building is relieved by light-coloured free. stone, which is again Faried lyy the windowframes being painted a dark red. The old haild. ing, although not actnally rebuilt, has been raised. While one wing was being ereoted, school was held in the old building, and when work was proceeded with on this part, the wing Mr. S. Welman, a local architect, and Mr. Bonrer wes the cottractor. The tower is not yet com. pleted.

Forest of Dean,-Tbe new national school bndding committee have decided to huild a school for 170 ohildron,-boys, girls, and iufants. Grants and promises, amounting to 860l., have been mado. Among the subscribers are,-Mr.
Crawshay, $100 l$. ; Mrs. Crawshay, $50 l$. ; Mrs. Wait, 100l. ; Woods and Foreste, 125t.; Charity Trns. tees, $100 l$.

Sheffeld.-The seoond school erected by the Sheffield School Board has boen opened. It is sitnated in Beeoh Hill-road, Bromhill, and althongh the smallest school, the Board at present con. templates erecting it as an elementary ednca. tional establishment, complete. The building is of Danford-bill stone, with Grenoside ashlar dressings, and the roofs are covered with blue Welsh alates, capped with red ridge Berkshire tiles, with finials on the angles, according to the
special designs of tho architects, Messrs. Inno special designs of tho architects, Messrs. Inno.
cent \& Brown. It is erected in the geometric style of Gothic architectare. In front are two lofty gables with triplet windows, with trefoil
heads, and sepment.headed windows on the ground floor. Over the angle of the building, Which is mado circular, is a small bell.turret. The school is divided into three departments for boys, girls, and infants. The school for the
int.tor, which is on the ground.floor, is $L$ shaped, and is ou xLo lang by 20 ft . Wide. In this room school, and extending uryer the infants behind, are the boys and girls' schun. pheds of which is 36 ft . by 20 fa. Each has a class. room 20 ft . Hach sohool is approached by a lavatori-. Each sohool is approached by a cotic of stone stairs; the entrance to the boys school being from Beech Hill-road, and the entrance to the girls' and infants' school heing on the other side of the building, and approached from the playground. The schools are fitted
up with patent desks, and will be warmed by up with patent desks, and will be warmed by hot water on the high-pressure system, by
Messrs. Bacon, of London. They will be lighted with gas. Attention has been paid to the venti lation; plans that have proved suocessful else where having been adopted. The rooms will accommodate about 300 children. The contract for the building was abont 2,300l. ; but with the fittings and so forth, the cost will probably be 2,500l. The contractors wero Messrs. Sharp \& Son. The mason's work has been done nuder them hy Mr. Butler; the slating and plastering by Harrison \& Chadwick; the plumbing by Mr. Thickett; and the painting by Mr. Hunter.
Britgrater:-The newly-erected Board school in the eastern portion of the town of Bridg water, consisting of three departmenta-one for boys, another for girls, and a third for infants, capable of accommodating 600 children, have been formally opened. The cost of the schools, which are built in the vicinity of the railway station, together with their furnishing, amounts to something like 2,800 ., which amount has been advanced as a loan by the Publio Works Commissioners, the repayment oxtending over
fifty years. The architect was Mr. John Mount. fifty years. The architect was Mr. John Mount.
ford Hay; and the bailders were Messrs. Haryey ford Hay; and the ba
\& Sons, of Torquay.

Ringley.-New Cburch of England anhools at Ringley have been opened. The style of th new building is Gothio. Tbe materials of the construction are bricks, with stock brick facings and stone dressings. Tho walls of the rooms ornaments. The timbers of the large room are of pitch pine, varnished, as is all the joiners' work throughout. Tbe site ocenpied for the and has heen given by Lord Derby. The masonry and brickwork have been done by Messrs. J. \& S. Hall, of Bury; the joiners' work Mr. F. Murphy, of Bury; and the plambing, gasfitting, plastering, \&c., were executed by Mesars. Leach \& Son, of Bary. The architects are Messms. Maxwell \& Tuke, of Bury.

## VARIORUM.

The " Agricultural Returns of Great Britain, with abstract Returns for the United Kingdom, British Possessions, and Foreign Countries, extent of land returned in 1872 as being nuder all kinds of crops, bare fallow, and grass was 31,004,173 acres in Great Britain, 15,746,547 acres in Ireland, 88,573 acres in the Isle of Man 18,026 acres in the island of Jersey, and 12,007 making the islands of Guernsey, Alderney, \&c. making a total for the United Kingrom of $46,869,326$ acres. Althongh exact figures cannot at present be given, the results exhibited in the meturms indioate that an addition is annually made to the land onder cultivation in Great Britain. The reolamation of waste land is men. tioned by the collecting officers in many parts of of the acreage returned in their districts of the acreage returned in their districts.
"How many of the population were directly employed in agricultnre in 1871 is net as yet known, but, when ascertained, the number will probably not differ materially from that shown by the census of 1861. At that time (iucluding farmers, graziers, farm bailifs, indoor farm servants, sbepherds, and agricultural labonrers) abont 1,590,000 persons of both sexes were employed in agriculture in Great Britain, or 6 per cent. of the total population in 1871. This number, in proportion to $31,000,000$ acres, the total quantity of land retnrned as nnder cultivation in 1872, wonld show that a little more than fire persons, on an average, were employed upon every 100 acres of land. It would, therefore, reqnire a large quantity of additional land to afford employment, at this Yearly added to the raside portion of the nnmber

Britain." We should prefer to see a different deduction from this. How many more persons might profitably be employed on an acre. A writer in Iron gives these particulars as to
the measurement of the velocity of light:- "The valncity of tho transmission or propagation of light. as now generally acceptod ( 192,000 miles per seconuf, "w onical observation, based determined by astronamely, $8.58^{\prime \prime}$, augmented by tho whtam narallax, lation to $8.75^{\prime \prime}$ or $8 \cdot 92^{\prime \prime}$. M. Fizean has recently introduced a mechanical method of exact deter. mination by direct observation of the dnration of a double journey indicated by reflection; the principle boing that of a toothed wheel, cansed to rotate with great velocity ( 700 or 800 revolutions per second), and effecting records elecrically by means of a cam and suitable mechanism A brake for regulating the speed and reversing gear are also accessories of the apparatus. Acad Cornu, in a commnnication to the French sand ony, gives the results of more than a thou vere observations, of which two-thirds at leas conditions. The distance between the stations of observation was oarefully and accnrately measured and determined by triangulation, and found to be 10,310 mètres, with a possiblo error of 10 metres, or the one-thousandth part. The resulting mean grave 298,500 kilomètres $(185,483$ miles) per seoond, as the velocity of light in vacuo: olosely, according with the values as signed by MM. Foucault and Le Verrier, and corresponding to the solar parallax, $8 \cdot 86^{\prime \prime}$. an Corresponding to the solar parallax, $8.86^{\prime \prime}$. M. and considers that with stations 20 to 30 kilo mètres apart ( 12 to 20 miles), an approximation metres apart ( 12 to 20 miles), an approximation
to within less than the thousandth part may be obtained; for the realisation whereof me be obtained; for the realisation whereof he urges the antive co-operation of the Academy, so that Paris Observatory, simplified and continued by Freach savants," may bo perfected with precision by France."

## Hiscellamea.

Oxford Architectural and Historical Society.-The members of this society held their first meeting for the Lent Term in the hall of Oriel College, where they were received hy the Rev. the Provost. The Provost first drew attention to the pictures, and referred to the peculiar construction of the hall, which had, rom the height of the screens, the appearance of having been a small room under a large one. The name of the college he said came from an oriel window over a doorway which was in the building prrchased by Dr. Broome, and that they knew from documents in the possession of the college actually referring to it. The first meeting of the society during the present term was held in the lower room of the Taylor Buildiug. Several gentlemen were elected mem. bers of the society, and the names of others were submitted to be balloted for at the next meeting. Mr. Trevor Fielder, of St. John's, read a long paper on Lanthony, in the vale of Ewyas, Mong paper on Lanthony, in the vale of Ewyas, monmouthshire. A chronicler living in the twelfth centnry, who described himself as a monk
of Lanthony, when writing of the ohapel which St. David erected on the spot which was after wards ocenpied hy the Abbey, described it as "a poor bnilding surrounded with moss and ivy" a poor bnilding surrounded with moss and ivy, for beast." The lectnrer gavo some arohitec. ural descriptions of the ruins, and after tracing the possession of the property from 1809, he tated that about four miles north of the Abbey "Food the building a short time back erocted by Father Ignatias," who destined it, when the innds were sufficient, to become a large monas. ery in exact imitation of those which flourished nnder the rulo of St. Benedict, in the tenth and eleventh centuries, but at present the establish. ment was very small. Mr. W. Seott Champion, of London, architect, then read a paper on North Stoke Cbnrch, Oxfordshire, and illustrated it by momerous drawings and plans. On Thursday, March 20th, a communication will be made on the Utrecht Psalter, with ospecial reference to the recent controversy, by Professor West rood; and a report will be read on Archeso logical Discoveries, \&o., in the neighbourhood of Oxford during the past year.
Protection of Passengers.-A builder has been fined 3l. and coats at the Westminster Police-court for negleoting and refnsing to pat np a fan to his hoarding at the corner of two
streets in South Belgravia.

Opening of a New Saw.Mill in Here-ford.-A new saw-mill has been erected within tbe precincts of the city of Hereford, according to the local Journal. The bailding is at the Canal Wbarf, and bas been erected by the
execntor of the late Mr. E. George (Mr. W. A. execator of the late Mr. E. George (Mr. Wr. A.
Hill). The erection, which is 50 ft. in lenot by
40 ft , in width was A 40 ft . in width, was and C.F., of Murmingon, of Hereford, huilder. The engine, which was made by Messrs. Davey \& Paxman, of Colchester, is of 10 -horse power (nominal). It is of the type known as vertical, with boiler combined, the boiler being on the makers' new principle of bent taper tubes throngh the fire. principle with mnshroom dellectors, by means of which rapid circnlation of water and generation of steam are produced at a very small cost for foel. The engine was exlhibited at the International Exhibitiou last year, and used for driving a portion of the machinory in motion. The sawing machinery was supplied by Messrs. Robinson \& Son, of Rochdale, and consists of a deal frame for sawing by vertical action; one laree circular saw-bench, witb self.acting motion for bringing the timber forward; and a smaller bench for cross - cutting grooving, tongueing, bench tor cross - cutting, grooving, tongueing, rebating, boring, sc. Mr. Hink arranged and machinery. A supper was held to celebrate the accomplishment of the work: Mr. W. A. Hin took the cbair, and Mr. E. George officiated as (clerk), the sawyers and labourers cmployed by the firm, Mr. Wham (representative of Messrs. Dave and his wort.

The New Library at Guildhall. - The new library and maseutn at cuildhall, erceted by the Corporation of London, have been opened for the free use of the public, and
during the firat day between 400 and 500 people visited them. The lihrary itself coutains accommodation for hetiveen fifty and sisty readers at a time, and one of the twelve bays into which it is divided is set apart for ladics. There are hetween 30,000 and 40,000 volumes on the shelves, and the library abounds especially With works referring to the history and the traditions of the City. There is also a puhlic reading-room, where dictionaries, directories, guide-books, maps, atlases, and commercial and bnilding will be open daity from ten until five throughont the year, except on holidays. Each reader is reqnired to give his or her name and address on entering the room, and the way in which books are ohtainod and recurum. Children under fonrteen years of age, and intoxicated and disorderly persons, are inadmissible. A new catalogue has not yet heen compiled, but Mr. Overall, the librarian, has for the present
re-arranged and re-numbered the old one. This is the first oxperiment of a free library ever made in the City. The committee are consider. ing whether to open the bnilding daring the ing whetier also to form a circulating hranch of the library. We hope both oljects will be the library.

Fatal Sewer Accident near Brighton.An inquest bas heen held on the body of John Pincb, aged eighteen, whose death had resulted from his falling down a shaft ( 96 ft . deep) at Ballard's Bottom, in the parish of Telscomhe, where deceased and others were engagcd in carrying out works eonnected with the Brighton intercepting sewer. Deceased, it appears, was oiling some portion of the machinery, when, in turning round, his foot slipped on some planks that cavered a portion of the shaft, and he foll down an opening hetween them. He caught at the skip for supplying the engiae with water, but this gave way, or he might possibly have saved himself. He went down feet first, striking against somo woodwork twice in his descent. When drawn np and taken to the hospital he was conscious, but died in a few hours. Deceased was perfectly sohor; and it was shown that the opening through which he fell could not be pro. tected, the space heing left for the skip to pass through. The jnry retarned a verdict of "Accidental death.'
Burlington House.-The temporary entrance in Piccadilly to the housc of the Royal Academy bas heen removed, and carriages will now drive learned societies, and set down at the steps of Burlington Honse.

Proposed Graving Dock and Jettioe -a the Tees.-The Commissionam or the Tees Conservancy are abnyt to construct a new graving-dow are abn the works of Jones, Dun. ni-o the first and only dock of its kind on the River Toes. The statutory notices Lwe been given for the occupation of the land, aru hilding next summer The estimated cost of the new dock is about $30,000 t$. It is also intended to constrnct two new jetties on tho river below Cargo Fleet. One projected by Mr. Vaugban will be the largest on the river. Its lengt will be abont 700 yards, and it will have frontage to the Tees of 360 ft . One result of their erection will be to diminish the value of the trade of the docks at Middlesbrough and Lackenby. At the presont time the Nortb. Eastern Railway Company charge a duty of 1 s . per ton for conveying iron to the docks from eitber tbe Estoa or the Cargo Fleet works; and there are dock-dues to be provided for ovor and above this sum. By the use of their own jetties irommasters avoid these payments altogether Another effect of the now jetties will be the partial discontinuance of the Normanby Jetty, belonging to the North-Eastern Railway Com. pany, from which the owners of the proposed new jetties bave hitherto bcen accustomed to new works are being promoted below Eiston.
New Buildings at Elland.-On the nortb side of the Elland and Brighouse-road, near to "Woodlands," the rcsidence of Mr. Dewbirst, is about to be erected one of the largest mills in the district, to be worked as a worsted manafac tory. The building will bo 75 yards long by 20 yards wide, and four stories high, and at each roof at a cand will bo sparate huildine to roold. At one end win to separate hury hald four boilers, and 0 , machuery will he turned hy a powerful bo-horse compound engine, Wheing made at the worss Mossrs. Yollt Wisyell, of Sowerby Bridge. The whole bnilding will be made hre-proof. The huilding will he erected for drawn hy Mr. T. W. Helliwell, of Brighouse relitect. The teaders have been let, and operaarclitect. The teaders have bcen iet, and operaheing let to Mr. Geo. Hanson, 'of Elland; the heing let to Mr. Geo. Hanson, of Eland case joiners' work to Messrs. Hirst \&
iron work and shafting to Mossrs. Berry \& © Son, of Halifar: and the slaters' work to Mr. J. Ban roft, of Halifax. The chimuey will be square and ornamental, and 45 yards high. The two largest malt-kilns in the district are also being hailt from plaus hy Mr. Helliwell.
The Site of Troy.-At a meeting of the ociety of Antiquaries, under the presidency of heen read hy Sir John Lnhhock, M.P. He stated that he had spent his holiday last year in paying visit to Constantinoplc, and from Constantinople he had sailed to the plains of Troy, landiug close to the tmmulas of Ajax. The halance o opinion as to the trae site of the city of Troy pe thought, was clearly divided between Bunar bashi and Hissarlik. The rival claims rested principally in the distance of these places from the sea ind the coorses of the rivers, hut all theories aurested on these points were open to reave ohjections. No site could be said to accord horoughly with the account given by Homor, and he examination of the tumuli threw little light upon the matter. Admiral Spratt said he had made the visit to the Troad tbirty years ago, with Homer in his hand. With regard to the distance from the sea, Pliny and Strabo had both placed Troy at the distance of 12 stadu (abou n English mile). Though it was now aine miles,號 end hen hore betw the city and the sca.
Increase of Salary to the Town Surveyo of Great Yarmouth.-Mr. H. H. Baker, th Yarmouth town surreyor, having applied for ac increase of salary, the committee appointed to consiary sher the suhject recommedul. to 310l, per salary shoold be advanced trom 200. to 310 . per annum; namely, as sarveyor to the sanitar spector of gas-meters, 10l. ; the surveyor to keep a pony and gig at his own expense. Objection was taken to the necessity of the surveyor kocping a pony aud gig; but it was finally resolved that the salary should bo 3102., and that it should be obligatory on the surveyor to keep a pony and gig.

Medical Officers of Health and the Poblic Health Bill.-At the annual meeting of the Poor-law Medical Officers' Association, Dr. mogers presiding, Dr. Lush, M.P., was unani. for the easuing were passed - - That the following resolutions is adrerse to the amain districts, and considers thet to pro sanitary istricts, and considers that the Pablic Healtb mediconuld be best carried ont by appointing possible, as bëalu for their own districts, tion entertains a strongrep ". "That this associa. ment of public dispensaries, , ftbat the estabish. the recommendation of the Sanitary Cance with and the Poor-law inspectors' special report, is necessary and desirable, and earnestly hopes tbat the Government, notwithstanding their avowed intention of introducing no measure in the present session of Parliamont affecting the sanitary requirements of the country, may be adrised, in view of the groat distress among all classes of the poor, in a time of exceptioual seperity, to pass some measure having for its object the prompt and eflicacious relief of sicljness.'
Carlisle Rublic Hall.-The local journal says that of the parious plans sent in for tbe
 "May Carlisle Flaw. D. Birkett, Carlisle), and Broci anisle Flourish (Messss. Hakersbon a Brock, London), are those approved of most by mitted to the inspection of Mr. Cory, the county mitled he bas reported in favour of Mr surveyor, who bas the same time he has informed the committee that, in the present informed the committee that, in the present ates of aterials, ho does nat think either of ates of materials, holans could be exocuted for he two competing plans conditure contemplated liss han 10,0 ex the hulding is 45007 nd we beliere that both set will bo reforred na ber ber astima for form beimates, and future acion mush opond upon he desinn; will hero bo phandora the he de for cope of hil sital apporates large hal
Newcastle Society of Antiquaries.-The sual monthly meeting of tho Nowcastle societ of Antiquaries was held in the old Castlc, Mr. R. Carr-Ellison in the chair. The chairman presented to the socicty a very old axe-head, which he had received in a pecnliar manner. He remarked that Mr. Crisp, of Pendwick, in the parish of Alnham, observed ono day recontly his blacksmith holding the axe-head in the fire. Ho 2 w that there were some cross figures upon it, and requested the hlaoksmith to take it out ugain. It then appeared that it had heen bought nongst a quantity of scrap from a travelling dealer. There was tho figure of a crown on the axe, which was worn, but left the impression hat it had once been a headsman's axe used ander the anthority of the Crown. The secretary, Mr. Longstaffe), had a copy of Sir Jobn Luh. hock's Bill for the preservation of antiquities, and on the motion of Dr. Brace, seconded hy the Rev. Mr. Adamson, it was agreed to petition in its favour.
The Late Mr. A. S. Newman. - We have to nnounce the death of Mr. A. S. Newman, surveyor the board Thormatar District, Southwars. of the Commissioners of Paving for Divion of Sonthwark wero superseded by the Sivision of Sonthwark were superso the Metro. St. Olave's Board, on the passing or the Manegement Act, 1855. The late Mr. A. S. Newman had assisted his father, who Mr. A. S. Newman had assisted his father, who Was the surveyor to the Commissiouers. Mr. A S. Newman their surveyor, and superannoated the father. Mr. Newman held the appointment until his death. We may ata that the members of the St. Olave Board always had the greatest confidence in their
and much rogret his early death.
The New Infirmary for Chelsea.-In con. sequence of an interview with Mr. Langley, of the Local Government Board, the guardians of the parish of Chelser have decided to increase hee accommodation Plans have heon sul) 300 pitted by their arehitects, Messrs. John Giles \& Gough, of Craven-street. These additional patients can be provided for at a cost of about $22 l$. per patient, so far as the buildings are concerned.

New Method of Forecasting Storms.- A letter by Mis. G. Weuley, of Chelmsford, on a Now Method of Forecasting Storma," has been reprinted from the Chelmsford Chronicle explain the drift of this letter, which must itsel be read hy those interested in tho subject, but we may give a brief quotation :-
"The plan I have adopted for learning the form of aëria Fave which is passing over any given place is to take a
sheot of paper ruled rith perpendicular lines (a shoet of
ordinary foolscap ruled with horizontol lincs only, and ordinary foolscap ruled with horizontol lincs only, and
turned on its edge so that the lines are upright, answer
 The arerage or mean line of the barometer, and fifteen
jner lines abore and below at intervals of about one.sixth inclu riae or fall) ; then, haring represent one.tenth of an to correspond with the days of the month, begin by
noticing how many tenths of an ineh the mercury may noticing how many tenths of an inch the mercury may
stand (say at eight am.). abore or below the average, or
ait in 293 in.; make a dot in the line corresponding to the dat
at the required height, do the same thing the next day a samo honr, drawing a pen across from dot to dot; con
tiouing this daily winl give the wave.form. In practice
find it far better to mark it twice a day, - viz p.m., halfway betmeen the daily lines : a sailor might
reark it every watch."
"The acrial ware," adds the writer, "follows the same law as the watery one: that if a great height be suddenly reached, it will be as sud. denly left; if slowly reached, as slowly quitted. It will also be seen that our most dangorons gales are in many cases preceded by periods of exceptionally fine weather, but too apt to throw yet warned him, so far as I know and believe."

Extension of Dundee Harbour. - In ac cordance with the request of the Dundee pared a report and plan of a large scheme of harbonr extension, in order to mako the accom. modation ample, and to prevent the large annual expense of dredging to keep the accesses to the present docks clear. With this viow, Mr. Harri. son proposes to construct a wall from the outer bend of the esplanade to the Beacon Rocks, and from thence to the Stannergate. This wall, he proposes should be huilt of concrete, and founded at a great deptb, and, when finished, it would be ahont two miles in length. Within this wall 250 ฉcres of spaoe would be enolosed, which
wonld be allocated to new hasins, dooks, timher ponds, quays, sites for warehouses, \&c. The ponds, quays, sites for warehouses, \&c. The
structnral cost of tlie new works is catimated at 450,000 l., exclusive of filling up ground by the dredger for the next ninety years.
Method of Cleaning Glassware, hy Dr. I. Whemical slassware that have containod other fats, and similar organic matters, by means of potassium hichromate and concentrated sulphuric acid, is often inconvenient on account of the shape of the vessels, or becanse sometimes requiring the application of considerable heat,
and thus causing breakage. Tho following method has given me uniformly satisfactory method has given me uniformly satisfactory
results :- The vessel to he cleaned is filled, or, if large, rinsed with a moderately dilute solution of potassium permanganate, the contact of the liquid being prolonged till a film of hydrated is then poured away, and the glass vessel rinsed with some strong hydrochloric acid. Chlorine is wich some strong hydrochloric acid. Chlorine is
then formed, hat not enongl to cause incon. then formed, hat not enongh to cause incon.
venience; and acting in the nascent state on the organic matter, it speedily converts them into
substitution products, that are soluble in the substitution products, that ar
slight excess of acid or water.

## A New Household Fuel Economiser.

 simple and effoctive improverat, has invented a ordinary open kitchen. range may be convertedind into an approximation to an American cooking stove. His arrangement consists of a cast-iron plate corering in the top of the freplace, another
plate closing up the month of tho chimney, and a connecting-pipo passing through hoth plates for a chimney. The plate over the fire is pro vided with holes for cooking utensils after the
manner of the American stoves, and the chin manner of the American stoves, and the chin ney.pipe has a valve in it to act as a damper.
The inventor claims for his stove all the advan. tages of the Amcrican stove, together with cheapness and adaptability to ordinary ranges.
Mr. and Mrs. German Reed's EntertainF. C. Burnand, with music by Written by Mir is in preparation, and will be produced at an early date, we presume in the place of "Happy Arcadia," which bas now reached its 140 th representation.

Search for Coal in the North of Europe cams of coal, according to a Copenhagen cor of Sweden, and several companies the soutt or are heing, formed to work them. One of the companies commenced operations on the 21 st of January, under the direction of an English engineer. A circular has been issued by Stockholm capitalists for the formation of a company to work the mines, which are near Engelholm, to the south. Fest of Scania. The capital is fised at nine millions of Swedish crowns, mostly suh. scrihed. An Auglo-Swedish society has heen formed in London, to purchase, for 190,0001 ., 7,000 acres of coal country in Scania. Borings for coal have been also made in Denmark, hn has been found, but the quality Bernholm it has been found, but the quality is inferior. There are coal-beds in Jutland, and the search for new mines is being prosecuted in the Island of Forse.
The Iron and Coal Trades.-Circulars from makers of the best sheet.iron have been issued 22. a B charcoal 28i. Cookley bars are advanced to 15t. 10s. These makers have to give unprece. dented prices for their raw material. Charcoal has advanced 100 per cent. Those japanners who advanced their prices after the recent owing to are now advancing them again, Glasgow Herald learns that the fuel. The adopted by one or two mills in the city this week, owing to the high price of coal. Our con. temporary further states that from nearly all the mannfactnring districts that from nearly all the the Tweed come reports of north and sonth of ment of production and as a gradual curtall large portions of machinery being thrown idle.

Society of Bihlical Archzology.-At the last meeting a paper On the Synchronons History of Assyria and Bahylonia, translated A. H. Sayco, historical document, which unfortnmately exists in a very fragmentary condition, is a chrono. logical history of the two kingdoms of Assyria centuri that of Shalmanare the time of Karaindas to Bahylonia the record ends, and whose famous black marble ohelisk is now in the British Huseum. Ar. Sayce accompanied his transla comments, and promised to trauslato some further historical tablets on another oceasion A discussion ensued, in which M. Lenonnant Dr. Birch, Professor Donaldson, and Mr. R. Cull, F'S.A., took part.
Proposed County College at Cambridge. ishment of a Connty College, at Cambridge, has lishment of a County College, at Cambridge, has been held at the Guildhall. In the unavoidable chair. A memorandum of association was read and approved. One of the articles of the memorandum states the object of the association to he:-
ade in the pariond assist certain efforts that are being raise the Btandard of middle.class Encland to extend and purpose to purehase and bold and occupy requisite buildorgs at Cambridge or elserhere, and to erect thereon one
The company will he registered nnder th Limited Liability Acts, and its capital is to he 30,000 , A number of shares were at once taken up.
Overcrowding in Lambeth.- A report prepared by a special committee of the vestry of Lambeth, in relation to "proposed regula. tions for houses suli.lot in lodgings, or occupied hy memhers of more than one family," was Frought up to the vestry on the 13th of February, 1872. It was then ordered to be month. The twelvemonth having expired, the eport was considered at the meeting tho vestry on Thursday. There are a series of fifteen proposed regalations, as to cubic space, whitewashing walls, cleansing, water, f the suhject was deferred. The consideration ifference of opivion in the vestry on the subject Architects' Benevolent Society. - The annal meeting of the society was held o Wednesday, the 12 th instant, the president, Mr. S. Smirke, R.A., in the chair. Wo will give
particulars in onr nest.

The Durham Architectural and Archrological Society of Northumberland and Durham.-The annual meeting of this society was held in Bishon Cosin's Library, Durham the Rev. W. Greenwell presiding. The financial statement was read by Mr. R. J. Johnson, and showed a balance in hand of $56 l$. 10a. 3d. The chairman then gare a resume of the proceedings of the society during the past fear. It was then agreed that the places to be visited by the society 1. Norton, Redmarshal, and Bishopton; 2. Ryton and Newcastle - 3. Dinsdale, Sockburn, and Eryholme; 4. Rothbnry, Eglingham, and Cas. erton Castle. A fifth visit of two days was projected to Selby, Howden, and Beverley, in

Clerkenwell Workhouse.-The Cuardians of the Holborn Union requested their architect, Mr. H. Saxon Snell, to prepare a dosign for re. building this workhouse, in consequence of the present bnilding being in so decayed a state that large quantity of timber shoring is necessary 500 insupport. Plans for the accommodation of 00 inmates were accordingly suhmitted for the approval of the Local Government Board, at an the Guardians to refrain from building bere until the St. Lake's Workhouse, also belonging to tho Union, has been rebuilt
Vapour Stove.-A new artiole from America s heing sold in Liverpool, for use either in booking or in heating apartments. It seems better suited for snmmer use in cooking, howover, on a small scalo, than for warming is
cold weather, unless it be for hed-rooms. It is called a prasestore, but the gas is produced in the tove itself, and seems to be modification of mineral oil into vapour: lhence the name of "Yapour-stove." It is the subject of a patent. The cost of the fuel is said to be not more than ono halfperny an hour, and the stove is quite portahle even while burning.
Consulting Engineer at Yarmonth.-In consequence of the death of Mr. J. Cubitt, C.E., the office of consulting engineer to the Great rarmouth Port and Harbour Commissioners became vacant, and Sir John Coode has been appointed consulting engineer to the Commission. The clerk has heen instructed to forward the resolution of the Board to Sir John Coode, and to reqnest him, in the ovent of his acceptance of the appointment, to attend at Yarmouth, and nspect the injnry done to the harbour works to the north and south of the pier.
Baptist Church and Schools, Prince'send, Tipton. -This church and schools hav just heen completed and opened. The buildings are of red hrick, with Holnngton stone dressing nd traceried windows, and have heen carried out by Mr. Gcorgo Eaffiner, builder, of Tipton from the designs and undor the superintendence hampton. The church will seat 700 ; and the

New Townhall for Paisley.-The late Mr G. A. Clark, a pariner of the firm of Messrs. J. \& J. Clark \& Co., thread mannfactnrers, Paisley, who died at Newark, Now Jersey, United States, on the 13 th of February, has left 20,0002 . for the erection of a new townhall in Paisley. The hall is to have combinod with it a roading-room for working men, whero they can sit in comfort and enjoy smoking, and is to be open from five dolock in the morning till twelve at night
Frome Market Competitions. - At a meet ing of the committee of the Frome District Agricultiral Society last week, Mr. H. P. Jones presiding, it was decided to a ward the first pre minm of $20 l$., for the best set of plans for the new market at Frome, to Mr. W. J. Stent, archi tect, of Warminster; and the second, of $5 l .$, to Messrs. Wilson, Willeox, \& Wilson, architects, of Bath. The proposed cost of tho works is 4,000l.
Artists' Benevolent Fund.-The annua, general meeting of this fund will be held at the Freemasons' Tavern on the $20 t h$ instant, at two o'clock. The Dean of Westminster will take the chair at the anniversary dinner of this fund on or ahont the 2.th of May.
Royal Architectural Museum. - The Council announce that Mr. Thomas Peard has promised Two Addresses in the Museum, on the Art of Producing Artistic Ironwork," on tha folloming Saturdays, at $3 \cdot 15$ p.m.:-March 15 and March 22. Admission free (without ticket), Museum,

# (1) The guilder. 

FOL, XXXI.-No. 1572.

Sir G. G. Scolt's Lectures at the Royal Academy.* on the done.
T has been my lot to de. liver my lectares from this chair in gronps so very detached from one another as to render it impossible for my hearers to follow them as a continuons series. In spite however, of this disadvantage, I purposo to make my present lecture form a natural seqnence to the last which I had the pleasnre of delivering, though this was read three years ago.
My last course was on "Arched Oonstrnction," and my last lectures were on " Vaniting." My pre. seut one will canry on the same subject inte its cule minating development, "The Dome."
Strougly as my tendencies towards our own Mediæval architecture draw me towards tho modes of raulting which prevail in our own ancient buildings, and which
formed the sulject of my later lectures, I am bonnd to admit that the noblest of all ferms by which a space can be cevered is the dome; and, much more than this, that of all archi. tectural forms it is the most sublime and the most peetio, and is susceptible of and demands the highost artistic trcatment. I deplore, therefore, its non-existence in our old English archj. tectnre.
This regret, however, is diminished by tho abundent evidence wc pessess that the dome, though alsent from English buildings, was by no means held to be alien from the contemporary arclitecture of neigbbouring countrics, inasmach as we possess it in highly-developed forms over a large part of France, in Germany, and in Italy, erected at the same periods with many of our great Medioval edifices,
If, then, I am departing from the line I had been taking in tracing out the history of old English architectare, I am not only snpplying a liatus in chat history, but I trust that I may be
able to offer suggestions for a more practical able to offer suggestions for a more practical
object,- the supplying of that hiatus in onr revived and redevelopod neo. Mediwal style. In a former lectnre, after defining a vault as the oovering of a rectilinear space produced hy tho motion of an arch paraliel to itself, I defined a dome as the covering of a circular space, produced by the revolution of an arch round its central vertical axis. It follows that if the arch so revolring is semicircular, the result. ing domo is a hemisphere.
The revolving arch may, however, be of any form which an arch can assume. It may be elliptical, parabolic, hyperbolic, cycloidal; or it may be a pointed, a horseshoe, or an ogee arch. Any one of these, or other ferms, of arch revolving on its centre will generate a dome of its own sectional form. The plan, too, in spite of
*We have displaced some articles in order that Te may

full. All the previous lectures delivered by the Professor will be found in our columures.
my definition, need not he a circle. It may be an ellipse, or of other forms.
I will not at this stage admit of square.planned, polygonal, or other straight.sided domes, becanse it may be doubted whether they are genuine domes at all, or whether they are not figures resulting from the intersection of a certain number of ordinary vaults. Anyhow, these are not gene. rated by the revolntion of an arch ; so that if they are domes, my definition is at fault.
Simple, however, as is the hemispherical dome, it does not appear to have heen his. torically the primæval type; for, strange to say, the earliest known domes assume in section tho form of a lofty pointed arch. I refer especially to that of the supposed tomb of Agamemnon at Mycenæ, and also to some portrayed on the Assyrian sculptares.
These would hardly come within the range of this lecture, were it not so curieus a fact that the earliest form of the dome foreshadows the very use to which I would now especially desire to accommodate it.
It is easy to perceive why the pointed arch was adopted in those primeval domes. They were not built with radiating joints, hut in over. hanging courses; and it will readily bo seen, on comparing their sections, that, for this mode of construction, the pointed arch is much more favourable than the circular, while, as soon as ever the radiating system was adoptod, the semi. circle at once became the simplest and most obvious section.
It is, however, strange to observe how little has como down to us of the histery of demes. From the tomb of Agamemnon,-some cleven centuries hefore the Clristian wra,-we have scarcely any cortain evidenoes of their history till wo arrive at the Pantheon, erected in the reigu of Augustus,-or, as Mr. Fergusson thinks, considerably later. Yet, as that dome is still the widost built of solid materials which exists, and as, both in its construction and its architec. ture, it is in a high dogree artificial, and evinces a period of advanced development, it follows that it must he the representative of a long series of antecedent domes, progressing from the crude idea onwards to this, the very highest developed form of the simple dome, for we shall presently seo that there are other forms scarcely foreshadowed by even this magnificent structureI may hcre remark that the dome, like the arch and the vanlt, having great outward pres. sure, requires either a vast amount of sustaining wall carried ap considerably above the springing level, or, in the absence of this, a tie of metal at, or somerwhat above, its springing, or perhaps several of suoh ties at difforent heights. Unike, however, the arch and the vault, it is independent of a keystone, each circulax course of its struc. ture forming a horizontal arch and keying itself. It may consequently be erected without the aid of contering, and may he discontinued at any level, leaving a central opening or eye.
The Pantheon is the great type of Roman domes. It is a simple rotunda of 142 ft . intermal diameter ; the wall being some 20 ft . thick. The wall is about 72 ft . high to the springing of the dome, and continues above that level about 28 ft . more
The dome is a $e$ emicircle, but has an open eye at its apex of nearly 30 ft . in diameter. The dome, as viewed externally, is buricd by the wall, which rises above its springing to fully a third of its height, and above this rises a sort of attic, crowned by six gradini, burying nearly an equal hoight; so that the dome, as an extornal feature, is far from conspicuous, appearing as a more flattened disk. Internally, however, it forms a covering of the noblest character. Its internal sarface is deeply coffered by panels of four orders in depth, dividing the circumference into twenty-eight parts, and its height up to about two.thirds of the distance from the spring. ing to the crown into five parts, the apper por.
tion being plain. These vast panels or coffers, the larger range of which exceed I 2 ft . in diameter, are curieusly arranged as to their sectional recessing, so as to appear perfectly symmetrical to the cye of a spectator standing beneath the centre of the dome.

The wall up to the springing of the dome is heantifolly dccorated with rich architecture in marbling of varied colowr ; and it cannot be doubted that the cupola,-the very sond of the design,-was embellished in a manner fully pro; portioned to the heanty of its sustaining wall. indeed, it is thought to have been coated with gilded brouze. When thus perfect, it must have formed an interior of surprising beauty; lighted as it was solely through the central eye, and the light tempered by the linen veil stretched across its rioh bronze cornioc, which still remains round the opening, and retains vestiges of gilding.
The Pautheon can scarcely be called a daring effort of construction, hecause its vast solidity seems to defy all doubts as to its duration. It would be, howevcr, ahsurd to suppose it to have been an early effort, for it is, as I have already said, so artificial in its construction, as clearly to prove it te be the result of long.continned practice.
The walle which I have described as being 20 ft . thick, aro so only in theory; for, prac. tically, they are hollowcd into innnmerable cells, some of them forming beantiful architectural recesses, and others merely constructional hollows.
The dome itself is constracted in a manner evincing long continued practics; for it differs toto calo from the yormal modo of construction. It is shown differently by different authors; in fact, it has probably never heen sufficiently ex. posed to obtain complete information as to its curionely complicated construction. As far, however, as I can ascertain, it seems to be in two thicknesses. The inner thickness consists of the framework of the coffers, which is of brick, and the filling in of the coffers, which is of ralble or concrete. This would form the centre. ing on which the outer sheil was huilt, which is a curious tissuo of arches, each rising from the crowns of those below it, and so disposed as to concentrate the pressure upon points in the wall which intervene between the cells. The spaces hetween these archcs are filled in (so far as I can gather) with rubble or concrete. The whole was probably covered extornally with plates of bronze, or of marble.
The next antiqne Roman dome which I shall notice is that of the so-called Temple of Minerva Medica, so named from the discovery of a statue of that deity among its ruins, but now supposed by some to have beon the grcat hall of puhlio baths.
This building greatly resembles the Pantheon in its general idea, bnt differs in this essential particnlar,-that its surrounding wall is not circular, bnt dceagenal.
At a later date, as we shall presently see, this peculiarity would bave been seized npon as the suggestien of another type of dome of which I shall have smhsequently to treat. As a matter of fact, the transition from the pelygonal prism helow to the nearly hemispherical dome above, is get orer by "rnle of thumb," rather than on any trne system. The vertical sides of the wall do intersect the dome in arched forms; but neither are these forms the trae sections of a plane with a sphere, nor have they been used as architectural features, as in later times; hut have been afterwards, so far as I can judge, obliterated by the incrustation of the dome with plaster, so as to slur over a union of forms whioh the architect had fallen into accidentally withont appreciating its trae results. The dome is sur. rounded by gradini, much as in the Pantheon. It is not lighted by an eye, hut by ten windows, surrounding what we should call the clearstory. Beneath these are ten arches piercing the sur-
rounding wall; indeed, reducing it to small angle piors. One of these is devoted to tho entrance, the other nine to semicircular recesses, of which five seem to have contained hasins for
water, and four to have opened by menns of water, and four to have opened by means of colonnades into exedra, or surrounding build ings. It may he mentioned tbat this form was, in after-times, extonsively imitated. Tbe span of this dome is ahout $80 \mathrm{ft}$. Its date is not
known. Not unlike this is the Templo of Venus known. Not unlike this is the Templo of Venus
near Baim, though here the dome is eut into near Baiw, though here the dome is cut into
cells like a conch,-a still near approach in cells like a conch,-a still
effect to the pendentive dome.
There are other domes not differing materially frou those already descrihed, but which it wonld extend my lecture nnduly to dwell npon. Oae called the Torre dei Schiavi, in the Via Prames. thotigh lighted by round clearstory windows, thotugl lighted by roun
instead of a central eye.
Thic Tre a central eye.
Tirot Temples of Vesta, hoth at Rome and at Tivoli, consist of circular walls surrounded externally by a peristyle. The cell of each is
supposed to linve been covered by dome though supposed to have been covered by a domo, though roofed oror. A parallel cnse, thongh in a more complex form, exists in what is called the Temple of Jupitor in Dioclesian's Palace at Spalatro. In this ense, the exterior of the cell with its peristyle is octagonal, but tho interior, with the dorae, round. Tbe latter hats a complicated con struction of fan-shaped arches throughont, scancely any part being constructed of hori zontal courses.
Nest, perhaps, in date, "yet at once displaying similarity of idea with a significant chauge in the carrying out, is the tomb of St. Constantia the danghter of Constantitice.

Christian clurch, in its early form, has been familiatly described as the Pagan Temple turned insido out. To convert the ideal temple iuto the ideal church the wall and the colonnade must change places. So completely is this the case that some of the earlier commentators on Vitruyius were completely puzzled betwoon the wall of the temple and the peristyle. They
assuned that the latter must he within the wall, assumed that the latter muse he within the wall, as in their own chure
The comparison betwecn these almost contemporary works,--the Temple of Dioclesian a Spalatro and the Tomb of St. Constantia at Rome,-exactly illustrates this change. In the onc, the solid wall forms the circle and carries the dome, and the colonnade is external; in the other, the colonnade forms the inner circle and carrics the dome, whilo the wall becomes external, -an aisle taking the place of the peristyle. The colonnade is doublell to sapport the massive clearstory whence tho dome springs and tho whole assumes the typo of one form of Christian churob, whith hencoforth bocame of frequent occurrence. The dome in this instance censes to be an external feature, being covere orer by a conical roof. I may add that the peri style is repoated in the old manner as an additional feature heyond the wall of the aisle.
The Baptistery at Nocera is similar in distribu. tion to the tomb of St. Constantia, and may be of similar date. It is wider, however, and loses and the admission of light through tho haunches of the dome.
Among the innumerable remains of domes of the older tgpe, I will only mention one more subject, to which it in second branch of this That to which I allude is thio Boptistery Ravenna, erectod, as it is supposed, about th yenr 1.00.
This is a very charming building, octacomal in form, Fet covered over by a hemispherical dome. Though having no surrounding aisle, the design of its sides seems derived from the aisle and clearstory; indeed, it has a clearstory, though the arcade below is rather rudimentary than real The dome, like that last alluded to, is covered
externally by a sloping roof.
The special feature, however, in this dome is that it rests upon an octagonal wall or rather
upon eight arches.
No shall presently see how this was effectcd in subsequeut times, and I will not anticipate tbat suhject, hnt will content myself with mentioning that this seems to anticipatc the Byzautine domes of the succeeding century, as bad heen the case in two instauces to which I shall hare to rofer, and as had beon nearly tho casc in the
Temple of Minerta Modica.
The domes which we have hitherto considered are exclusively and of nccessity carried by
circular or other continnous walls. They are
consequently snpported uniformly throughout heir entirc circumference, and their use is Guasi.circular or tolyonal buildiings. Ind no further developmont been attained, it would ever have been felt to bo a sad deficiency in the scope of architcctural facilities, that the noblest form of covering shorld bo limited to the least nsual and, for most purposes, the least convenient form of apartmeut. Wo are happily as far as possible from being left in this dilemma. A very simple application of geometrical thought opened a way by whiols almost any reasonable form of huilding may bo covered by a dome or by a series or may be covered
I will domes.
I will endeavour, as simply as I am able, t It is a this important development.
It is a property of the sphere that every possible plane section of it is a circle. It follows
that every vertical section of a hemispherical that every vertical section of a hemispherica or segmental dome assumes the form of a semicircalar or segmental arch. If, therefore, quare be inscribed in the base of a dome, and walls be huitt on that squrare and continuod up all they meet the dome, they will intersect with hild build arches on the sides of that square, these arches will coincide with the curve of the dome whero they meet it; and, if strong enough, will carry the portion of the dome remaining hetween them. If, again, insteal of arches, you suppose the dome intersected on the lines of the inseribed squaro by rankts at right angles to tbose It the result will te the same.
In the first case we have a dome, or a portion one, covering a square apartment; in the second we have the same covering standing on arches open towards the extcrior; in the third we have a dome covering the intersection of two barrel vaults just as is more usually done by roining. The process, however, is not limited o a squatre: it is equally applicable to the ctagron or any other polygon,-indeed, to any figure which can be inscribed in a circlo. Nor is it necessary that the inscribed firure should be complote; for remnants of the circle may qually woll be left hetween the arcbess or walls. Thas, a ciroular sproe may be interseoted by square, leaving portions of the circular wall emaining between them.
The dome, again, may as well be segmental in section as semicircular; in which case the arches supporting it will also he segmental.
Again, the figure inscrihod need not be eylb lateral; so that oblong compartments, sucb as domically vanlted.
In all the cases which I have enumerated, bave supposed tho result to bo literally a portion of the original dome. As it happens, however, in adheot few ancient examplos in moder works they aro more froquent. The parest specimen I know of (if I judge rightly from drawings) is the dome of the little Church of th. Nasario and Celso, at Ravenua,-the mauso. lonm of Galla Placidia and of her two hasbands,就 emperors Honorins and Valentinian 1 . This between four walls which intersect it in the form of arches.
The next step heyond this was a very im. portant one, as to beanty of effect. I refer to moulding on the surface of the dome,--touching the crowns of the arches: this is not only orna mentel, hut it has the effect of emmhesirine the first completed course of stones, and perhaps further effect of defining the gpherical triangles hetween the arches, which, when thus gifted with a separate existence, recoive the name of "pondentives". Whance this extire class dones are called "pendentive domes,"
The earliest specimen of this is probably the which tho Church of Si Nronal of cealso date than the pand aro pripiplo toll fevelopment just pendentivo principle to double gate and the Golden Gate of the T'emple area at Jerusalem, most probably erected under Justinian. All these domes are segmental in ection.
The pure form, however of a pendentive pome,pendentives and the upper portion are really dome in the plan or base of which the rectilinear dome in the plan or base of which the rectinnear
figure is inscribed,-was not long ndhered to

It was soon felt that the disk enclosed by the circnlar moulding looked fat and ineffective; and the idea early suggested itself of converting the circular moulding into a massive cornice ; raising upon it a new dome of such proportions as should approve themselves to the eye; and allowing noucht but the pendentives to remain f the original dome.
No bolder idea was ever introduced in con tructive arcbitecture ; for now the dome, instead of being, as at the Pantheou, supported firmly by a solid wall thronchout every portion of its cir umference, finds its conditions absolutely re. ersed ; for in no portion of its circnmference has it now a solid support, bnt all floats upon racnity, surgesting the poetical similitade to Procopins, that the dome of St. Sophia appeared, as if suspended, by a chain from heaven
Pendentive domes, in neither of their typical forms seem to bave boen frequently or cus. omarily made use of in the more genulno cassi ges, thongh in modern times they have bot, een very wisely adopted into the revis tyles. They were in fact, the spocial chara. eristic and the great glory of the Byzantinestyle. Mr. offspring of the arok io the vanlt; of the vautt, the cupola; and this majestic omament is the very 119 and son or Byane architecture, lo wherery ollor foalis subordinale. Ils se bad miln hecu mandy consal to in buildings. To mako it the central point of a Christian templo was a grand and hold idea, and one which involved a complete revolution in the oxisting principles of architecture. . . . . And not only did the grand cupola crown the whole pile; but the smaller portions are often covered with smaller domes and semi-domes. ye habituated to the long naves. own groat churches, is totally bewildered with so hugo a pile, with apses and somidomes sprouting out, to use the expression of Mr. Hope, in ovory direction, and all circling round the vast central cupola, like tribatary rulers encircling an mporial throne."
It is thought by some that the Byzantines Lorrowed the pendentive dome from Persia; but his seems insusceptihle of proof; indeed, it exists of earlier age in Italy. It is more certain that, having onco discovered its wonderful ntility
it was communicated by thom to every region to hich their influence extended; and tbat, having heen learned from them by the Mrhomedans, ure, which extended continuously from the Bay of Bengal to the Atlantic.
The nest devolopment I will mention is the raising of the dome proper upon a drum or circular wall, elevated upon the pendentives or corbels, so as to convert it into a species of tower. This seems to have been the first step hy which, spicuous external featuro, though rather at tho sacrifice of internal beauty.
It is, in fact, the weakest point in the dome, restlietically considered, that the same dome can. nut be made artistically perfect both within and withont. If its height be limited to what looks thoroughly well from within, it is so low in its external aspect as to haro little artistic valuo; while, if raisod so higb as to be an important oxternal featnre, it is only seen by a painfal ofort from witbin. This is manifest even in tho wall, as in tbe Panthoon and the Temple of Minerva Medica; but it becomes muoh more so a a pendentive dome, whero the angles are externally incumbered with large masses of masonry. In tho earlier Byzantine buildings, we accordingly find the dome to have heell viewed almost solely as an intornal foatnre, and its exterior very much neglected, and in the case of St. Sophia itself, noone wonld be prepared by its low heavy external aspect for the unvivalled glories of its interior. Many of the ofd archi. tects in fact are np the extornal form altorether covering over the dome, as at Parma, do., hy an ordinary sloping roof.
The change I havo last chroniclod, the interpasition of a circular wall between the pen. dentive and tho dome, thongl hy no means in all cases leading to tho result I am refercing to, was anquestionahly the origin of the treatment of the domo as an important external feature. It ras, in fact, tho elovation of the rotunda npon the top of the pendentives. Unhappily, bow. ever, it had at once the effect dome ahove the level favourable to its internal effect ; while, if erected on four arches on $y$, the ta use to domes of very moderate size.

A large number of domes thus raised bigb above thcir pendentives or corbellings, are really of a class whose claims to the name of
dome are somewhat ambignous. I refer to dome are somewhat ambiguous. I refer to
tbose whose horizoutal soction is not oireular, those whose horizoutal soction is not oireular,
but polygonal. Striotly speaking, this is a variety of groined-vault: it is generated by tho interseotion of several barrel-vaults, springing from the horizontal tops from the surrounding walls. Now, my definition of a dome was a
vault gonerated hy the revolution of an arch on rault gonerated hy the revolution of an arch on
its vertioal axis. If this were an exhaustive its vertioal axis. If this were an exhaustive
defnition, it would follow that tbe vaults under consideration are no domes at all; yet they look so mnoh like thent, and as the namber of tho sides of the polygon increases, actually approach so closely to the genuine dome, that it would be affectation to deny them tbe name. They may approaching to regularity of form, as the triangle, tbe square, the canted square, polygons either recular or elongated, oblongs or parallelograms of any kind; hut the usual form is the octagon or other polygon; and for our gencral purpose it may ho hest to imit them to figures 0 belng inscrihed a a occurring in tbose which ave raised hibhe as their pendentives or corbels. They occur, however, in numerous positions. The greatest I know of is that of the cathedral at Florenco, of wbicb I shall have to speak more in detail in my next lecture.
But to return to the pendentive dome. The pendentive dome, tbongh occasionally used at an earlicr period, established itself as the leading feature of a style about tho time of the Emperor Justiuian, and its central seat was Constanti nople. The earliest, or about the earliest, charch now remaining in that city seems to bo that of S. Sergius and Baccbus. Its dome is sup-
ported by an octagon. It appears itself to he concoidal in its horizontal seetion, and to be supportcd on sixteen small pendentives. It hear considerahle resemblance to the Temple o
Minerva Medica, but is really less develope Minerva Medica, but is really less developed
than the Baptistery at Ravenna, which dates fully than the Baptistery at Ravenna, which dates fully
half a century earlier. half a century earlier
Contemporary witb tbis was the Churcb of the Apostles, also erected hy Justinian, but now destroyed. It showed, however, according to the description of it by Procopius, an immense advance upon that last named; for, while in one the dome was carried hy an octagonal wall, thus sbowing no practical advance upon the antique form of domo, in the latter, a vast cruciforn building was covered by five domes, which is just the advantage which the pendontive system affords; for, when the base of a dome is cut into a square hy four arches, thomes heyond, and thns any space may be covered over hy a series or a group of domes. Tlus last chureh, then, was the true ty pe of advanced domical structure domical structure of this class (for it bas never again been equalled) is tho Church of St. Sophia or of Sacred Wisdom, erected by the same Emperor as the Metropolitan

The plan of this chnreh differs in ideal, and yet more in fact, from the contemporary church lost referred to.
The ideal of each is a cross with a central dome. Tbe difference is that in the Church of the Apostles the limhs of the cross were eacb
covered hy a complete dome, of equal dimen. covered hy a complete dome, -of equal dimen.
sions with the central one; those of St. Sophia sions with the central one; those of St. Sophia
are covered eacb hy a seri i-dome only, -of equal are covered eacb hy a senti-dome only,--of equal
diameter with the arches carrying the central diameter with the arches carrying the central
dome; so that if we consider the latter to spring dome; so that if we consider the latter to spring
from the top of its pendeutives, which it in effect from the top of its pendeutives, whicb it in effect
does, its springing is on a level with the crown does, its springing is on a leve
of its surrounding semi-domes.
In reality, however, this ideal is not carried ont to completion, $2 s$ only tive of the semi domes have heen erected. This incompleteness, however, is greatly more than compensated; first, by tbe vastness of the scale,-the central dome, if measured on the diagonal, heing 150 ft . in diameter,--and, secondly, hy other semi. domical projections branching ont from the Walls which support the great somi-domes, three from each, oxoppting that on the western side one is devoted to the ontrance, and is not domed Even these secondary projoctions are mostly areaded, so as to allow the eye to pass onwart the primary ideal, tbe actual effect is one of great iutricacy and of continuons gradation of parts, from the aroades last alluded to up to
the stupendous dome wbich hangs with little apparent support, like a vast buhble, over the centre; or, as Procopius, who witnessed ite erection, described it,-as if snspended by
chain from heaven.
The dome is lighted by forty small windows which pierce it immediately ahove the cornice which crowns its pondentives, and which, hy sub. lividingits lower part into narrow piers, increases the feeling of its being supported by its own buoyancy.
The interior thas generated,-covered almost wholly by domcs 0." portions of them, each rising in succession higher and higuer towards this floating hemisphere in the ceutrc,-and so rranged that ene shall open out the view owards the others, and that nearly the entire ystem of vaulting may be viewed at a single flanco, appears to me to be, in some respects, the noblest which bas ever heen designed, as it was cortainly the most daring which, up to that time at least, if not absolutely, bad ever heen con structed.
Its beauties are of a contrary kind to those of that noblest interior of antiquity, the Great Hall of Karnack, or to those of later ages, the Gothic catbedrals. Botb of those gain beanty of effect and an increase of apparent extent throngb tho ondless intricacies of their perspective, and the changes of aspect at every step, arising from the multitude of their columns, and from no possible view showing the whole interior at once. This, on tbe contrary, trusts to the very roverso of all this,-the absonce of all interraptions, and the studious distrihation of parts, so that no one conceals another, but that the entire huildIng shall be grasped at once by the eye.
I bave not seen St. Sophis's, though I long to so different from wiow a form of artistic treatment so different from what I delight in in our owu cathedrals. The internal effect does not, bowThe contrary theory was too well known from. The contrary theory was too well known from the Christian hasilica to be lost sight of in this the greatest of Christian toinples. It was, in point of fact, allded to the other by means of aroados, both in the sides of the nave and in its apsidal projections, oponing ont mysterious perspoctives into the inner recesses of the temple. This union of the more palpahle with the more niystorious; of the vast unbroken expanso with ppuncately hroken perspective, must, as it pears to me, and as 1 judge from representithan that of almospression more astounding when we consider the wbole as clothed with the ichest beauties of surface; the piers oncrusted with inlaid marhles of every hue; its arcades of marhle gorgeously carved; its domes and vaultings respleadent with gold mosaic, interspersed with solemn figures; and its wide-spreading floors aich with marhle tesselation, over wbich the huoyant dome floats self-supported, and seems to sail over you as yon move, I cannot conceive of anything more astonishing, more solemn, or more megnificent. Well might its Imporial fonnder exolaim, when, with pardonable oxultation, be viewed the resnit of his costly aspirations, - "Clory be to God, who hath thought me worthy to accomplish so great a I have dwelt longer on my description of th wonderful building because it is facile princeps among structures as the pendentive domical principle, jnst as the Pantheon had been among those with the simple dome; and as, in after ages, was St. Peter's among tbose wbose domes soared upwards as lofty towere.
I must here olose my lecture, leaving the continuation of my descriptive sketch of the history of the cupola, and such remarks as I may have to offer on its uses, its practical application, and its future dovelopment, to he followed up in my nest.

THE WORKS AT THE ALEXANDRA PARK AND PALACE.
APTEr the unsuccessful efforts rade to obtain possession of the Alexandra Palace and the extensive park and grounds connected with it, sequently by mpt larm Mayor and the gentlemen known as the Mansion House Committee, it now appears that it has at length been determined to open the building and grounds upor the same principle as that which has for several years past characterised the Sydenham atahlishment; and for the parpose of carrying ont several months past been employed in extensive
alterations in the interior of the building, and also in the grounds.

Palace is announced to be opened in May noxt, a notice of the works now in progress will perhaps he interesting. Anongst the con structive works going forward in the interior of tbo structure, a number of plant and flower heds aro in course of formation along each side of th main central avenue or nave, from onc extremity of the building to the otber. These beds, which are ohlong in form, are inclosed in walls of Portland cement, whilst at the ends of each bed running the entire length of the avenue, are pedestals of the same material, on which statuary will be placed, the beds themsolves being orna mented with ohoice trees, plants, and flowers. Fountains, also inclosed in Portland cement, ar likewise in conrse of construction at differen points along the avenue. The large pedestals a the several angles of the central transept and dome, and other portions of the interior, sup. porting colossal statuary, have becn artistically also boc, while the statues heniselvca hif organ in the north side of the centre transont has also heen elaborately decorated, the capa cions and towering pipes on ench side having been illnminated and gilt on a mauve ground wbilst the pipes in the centre hove a full ground with enrichments in varied colonrs The grouds spacis archestra in front of the Th already spacions rin or the orga has heen ch y oxtend the entire width of the transept, its eapacily
bcing sufficiently large to accommodate upwards of 1,000 performers.
Tbe space underneath the gallerics on cacl side of the eentre avenne is intended to be filled with figures, clothed in the costumcs of various countries. These several figures will he placed on an elevation ahout 3 ft , above the pround level, and staging for their reception is now in The of erection.
Tbe north-east and north.rest transepts respectivcly are both heing converted to dif ferent parposes from those for which thoy were intended when the building was first erected and the works going fortward in these portions of the interior are perhaps tho beaviest of the whole. The north-east transept is being entircly oonverted into an immense theatrical stage, with spacious dressing-rooms, wardrobes, and other apartnents, for dramatic and operatic per formances. This portion of the reconstructed interior has been desigued by Messrs. Grieve Son, and is lueing erected under their immediate personal superinteudence. The large dimension of the stage and the apartments in connexio with it will he seen when it is stated that thr. ocenpy the entire area of the transept. The proscenium opening of the stage is 36 ft . in widh by 37 ft . in height, whilst its extreme widtb is 85 ft ., and 60 ft . in depth from the front of the proscenium. There is a depth of 22 ft . boneath the stage for the working of the requisite machinery, and in connexion with the machinery it may be noticed that for its safe working ani in order to provent accidents by persons falling through the stage when the traps are opeuiog what is called a "lock-iron," tbe invention of Mr. Grieve, has for the first time been intio dnced. The height from the stage-level to the gridiron floor abovo is 77 ft ., and the extrem height to roof, 100 fl . The dressing-rooms wardrohes, retiring-rooms, offices, lavatories, and other conveniences ore at the rear of the stage from which they are divided hy a partition-12all and corridors extending across the entire width. They consist of the ground-floor and atory :hove approached by spacious staircases, the numbe and size of the apartments on each floor bcings nniform. The front of the stage on each side of the proscenium will he handsomely decorater? Ornamental pilasters and mouldings iu Portlind coment, with carved eapitals, will he carried ui to a considerahlo height abuve the proscenitum, and archway springing from the eapitals. The space in front, betiveen the proscenium and the arcbway over it, will we flled in by a largo fresco. executed by Mr. J. Ahsilon, of the Society o Painters in Water Culours. The auditorime space in connexion with the theatre will be llat portion of the main avenue immediately iu frunt with the south_east transept opposite, togethe with the galleries immediately adjoining, and un theatrical performances taking placo that por: tion of the interior of the palace set apart fer tho audience will be screened off from the rest of the building.
The concert-room, in course of construction in
the north-west transept, will be entirely cut inf
west transept, by a main wall or partition carried up to the top of the huilding, which is now being erected, and which will enclose the area within the north-west transept. The orchestra will be at the south side of the transept, resting npon main walls and colurmens, now being built, and at main walls and columns, now being buin, and at placed slightly above it, an organ will he cr'cetod. Retiring-rooms aud other apartments connected with the orchestra are also being constructed on each side. The rest of the space in front of the each side. The rest of the space in front of the
orchestra northsvartls, on the ground-tloor, as well as the gallery round the transept, will form well as the gallery round the transept, will form
the auditorinm. Tho circular roof of the tranthe anditorinm. Tho circular roof of the transept will be shat out from the concort-r
a new and handsomely-decorated coiling.
a new and landsomely-decorated ceiling.
The large and prominent building near the summait of the hill, to tho castsrard of the palace, whioh was originally erected for the purposes of a gymnasium, is not to he so utiked. Extensive alterations have heon made in the interior,
with the intention of converting it into dining With the intention of converting it into dining
and refleshment rooms for visitors to the palace, and refreshment rooms for visitors th the palace, and it is now well adapted for this purpose. There is a large dining-room, which, it is stated
will seat apwards of 1,000 persons, besides namerous smaller rooms for pr
general refreshment purposes.
general refreshment purposes.
Not the lcast important in the arrangoments for opening the palace is the new branch railway from the Great Northern line diroct to tho building, which is now almost fnished, and which will be entirely completed in the conrse of a few weeks, before the time appointed for the actual opening of the palace. The routo to the palace from King's Cross will bo by the Edgware and Highgate brauch of the Great Northern, which leares the main live a short distarce boyond Finshury Park. The palace hranch, whick is about two miles in length, joins the Edgware and Eighgate branch not far from the last-named place, and proceeding ronnd to the northwards
of Muswell-hill through the valley, by a gradual of Muswell-hill through the valley, by a gradual bat continuous gradient, terminates in the park
immediately on the north side of the palace, the immediately on the north side of the palace, the station. The line passes partly through excavations and partly over embankment, and is carried across the valley skirting Muswell-hill hy a bandsome viaduct consisting of thirteen arches, the entire length of the riaduct boing about 500 ft . The viadact is buitt of white brick with stono
piers, with a hlue brick coping. In addition to piers, with a hlue brick coping. In addition to the riaduct there are also five other bridges.
There is an intermediate station hotween the junction with the Edgware and ITighate lino and the palace, a short distance to the wost of Muswell-hill. It is a neat and commodious building, containing ladies' and gentlemen's wait-ing-roouss in addition to the booking-offioes. The now bramch to the palace has heen oonstructed jointly by the Great Northerm Company and the Alcsandra Park and Palace proprietors. Access to the palace and park is obtained from the Wood Green station of the Great Northern Company's meing completed ; but hy the Wood Green route a considerable ascent has to be made throngh the park before the palace is reached.
The coutractors for the works at the palace are Messrs. Kelk \& Lucas, Mr. Clemence being the railway are Messrs. Lucas, Brotbers.

ON THE ART OF "SGRAFFITO" DECORATION.
ROYAL INSTITUTE OF BRTfISK ARCHITECTS.
A paper "On the Art of 'Sgraffito' Decoration," hy Mr. Allen S. Cole, was read at the ordinary general muceting, held on Monday,
the 17 th, Mr. Thomas I. Wyatt, president, in the chair. We print the pith of it :-
Whilst London contains some of the finest buildings in the world, its miles of shahhy brick bouses give it a dull air. Ooal smoke and fog do In tbese times of individuality, cheapness has an uninterrepted sray of its own. The Londoner is froe to brild the cheapest of houses with bad is froe to build the chapest of houses with bad

Houses of a
Houses of a rental of 3007. a year and upwards
liave nsually a stucco face, and affect some archi-
tectural mouldings in coment. At best it is very mean and tasteless. But whilst cheapmess must and will prevail as an influential consideration in the erection of bouses, I venture to think that are processes hy which even tbe cheapest brick architecture may bo elevated by a little decora. tion produced at a low price; and I am going to prove tbis on the present occasion. As an illustration of my precise meaning, I live had a diagram propared, showing a house front of Mr. Moody has prepared a second diarram showing the same house front as it mirht appear by applying to it a facing of ornamental plaster work, at a cost of say fifty guineas. is needless for me to say that this method of deooration leaves the style considered to bo preferable entirely at the option of the buildor, the decorator, or the purchaser, thougb one dogma should be perbaps laid down in respect to this, namely, that the surface under treatment should he panelled, and the arabesques or ornament sarity follow the prominent const of the faceade, and so will not woaken the appoar. ance of them
It will no donbt be said that tbis plnster deco ration will beoome as dirby as the common plaster work which covers modern bouses, and that it will reqnire to bo protected hy paint. This may at first starting the cround of the serafito tat at first starting the cround of the sgraffito is of a dark tone, while the upper layor of plaster is white, or hight in colour. Therefore the two will remain for a long time in contrast. When they are entirely obliterated the incised ornamentation will always be apparent, and be of
service as a decoration in spite of the toning of soot and fogs. It has occurred to me that some modification of the artificial stone manufacture might be usefully adopted in strengthening the plaster, and in perhaps giving it an invisible Vitreons coating after tho work las beenexecuted, so that from time to time the dirt which would I have no anthority for spealsing ahout such an application, beyond that of my surmises, which go for nothing, since I am no chemist.
At South Kensington various methods of using cement for decorative parposes havo heen tried hy Mr. Moody and the students in training. The practice ground has beon the extensive wall surwhose former side ur he new Science Sosite the site of the proposed Natural Mistory Museum.
Sgraffito is the scratching of an ornament npon an intonaco layer applied to a blaok ground, leaving tho white of the intonaco to represent the white forms of the design and the black to ropresent the hlack. To fix this preparation of plasters to a wall it is nocessary that Coninni should bo well wetted; in fact, as mnch." An ordinary "floatino" coat of plaster $\frac{3}{4}$ in. thick is first laid; when this is sufficiently dry,-say in three or four days, -a layer of black piaster not more than $\frac{1}{4} \mathrm{~m}$, thick is then damp the finishing coat of light-coloured plaster $\frac{1}{8}$ in, or less is then laid, according to the delicacy of the work to be execrted or the distance placed from the eve. This last-named is the "intonaco" or "upper layer" spoken of by Bossi, who, in his "Diotionary of Art Terms and Work," \&c., describes "sgraffito" under "sgraffio."
The surface is now propared for being worked pon, and before the plastor hardens the sgraffito it will be ohserved that this method resembles fresco painting, since no more of the surface honld be prepared than the artist is able to finish in one day.
Quoting verbatim from Tr. Moody's menort this art the following is his experience to tho transfor of a design and its subseqnent xecution on the plaster:-
Having made a full-sized drasring of the proposed ornament, it can he transferred to the le wet and yielding plaster, or if the drarying is executed in chercoal, it maybe printed on the wall by trurning its face towards the plaster and rulubing it firmly at the hack; then with an ordi nary dosk nary desk penknife, which was found to be the best tool, the artist firmly incises tho outline, cut-
ting through the apper layer iuto bat not through
tbe black layer below; be then sorapes away the apper layer and exposos the hlack wherever black is wanted, learing the upper layor design in two tints wanted, and and effect. Where large spaces of black occur it is as well to use a broad tool with a square end, which not only removes the npper layer easily and quickly, but gives a tolerably even surface to the layer below. Although designs are very generally executed in black and white, any colonrs which are permanent when mised with plaster can of conrse be used.
Shading by lines oan easily he done provided they are not too near together, otherwise the projecting white might he apt to chip off."
As regards the experiment at Sontb Kensington, Mr. Moody says:-
"For the top part of the building (and tbis also refers to the work down to the first-floor), the irst, or toating coat, was composed of 1 part and a little plaster of Paris ; this of rough sand, quarters of an inch thick.
The next, or hlack layer was composed of 1 part lime, 1t black oxide of rangranese, 2 of Barra shale or clay, and in the upper parts of tbo building this was three-eighths of an inch thick,-a thickness wbich was found necessary, at a suhsequeut stage, to reduce to less than a quarter of a a inch.
The third, or fimishing coat, was composed of silver sand, lime, and whitening, in equal proportions. This coat was hardly more than The of an inch thick
The upper friezo was composed of purple, hrown, and a little manganese; the colouring matter being somewhat less in proportion than the hlack.
In the second floor, the space ahoro tho win. dows has been divided into panels by a serios of styles. These were made in ordinary Portland factory, they were afterwards painted maroon with common oil colours

As the work proceeded, it was discovered tbat the adherence to the wall in the previous worts was in some parts defective, for, on cutting iato the plaster in these places, it was seen that tho failure was in the first layer. It was first supposed that this arose from the wall not having sufficiently out of the joints, to give a good key to the plaster; and it is not improbable that in the long interval that elapsed between the erec. tion of the carcass and the completion of the
building, the walls may have become so di'y that building, the walls may have become so di'y that
they required much more wotting than would they required much more wotting than
have been the case with walls just built.
Mave been the case with walls just builc.
Mowever, be that as it may, an experiment with the second, or black layer, proved its expansive powers when setting to be so great, that it," may possinly have bowed out with suffieient force to have dragged up the first coat with it. Accordingly, in fature work it was determined to reduce its thickness to a minimum. Soap
lime was also substituted for selenitio lime in lime was also substituted for sele.
A change was also made in the first or floating layer, which in fnture consisted of 1 part solenitic, 2 parts Barra clay, 5 parts coarse sand, but withoui complete success, as testing the
work witb a hammer will betray parts that are work witb a hamm

The adherence between the throe coats was nvariably found to be complete, it was impossible to separate them; indeed, the strength and solidity of the wbole slahs or panels were so obvious, that it was thought quito nnnecessary to cot tbem away, although their adherence to tbe wall was in some places imperfect.
The small panels in the upper part of the are paina above the windows or the delicate shadows of the ornament were also painted with little mangranese and water on the coat of plaster, and in some parts, more especially in one of the spaces between the arches on the round-floor, a whole bay was entirely painted nstead of cut. In the centre plaques of the decoration, between the windows, are figures in rekief. There are five of these, beginning on the left. The first is modellod entirely in selenitic, sand and whitening in equal proportions. The ground was mixed with yellow achre; but as this was found to he too soft, the grounds of the ther figures were painted with raw sienna in fresoo; the second and third figares were mo-

The selenitic mortar was made by hand, which i
delled in the samo material as the first; the fourth was roughed out with Beasley's cement, and coated with $\frac{1}{\text { t.inch selonitic; tho fifth, the }}$ modelled by Mr. Gihhons; their esecution did not occupy more than two hours each. The pilasters, with rot
Tho great mass of the ornament on the ground floor was throughout executed in the way I have already described. There was, howerer, a slight modification in the figure-suhjects which fll the principal panels.
of these panels (if we count the lalf-panels at each end) there are sereu. The two half panels and the centre panel are modelled; that to the left is cotirely in Portland cement. The panels next to the centre are oxoouted in sgraffito, with shadows in lines, similar to the rest of the work ;
but in the two panels next to the end ones, three ingtead of two layers have heen laid,--namely first the ordinary hlack layer, then a gray layer, and last the ordinary finishing coat. To ohtain the and last the ordinary finishing coat. ©oat only; hat shadow wo cat through the apper coat only, hat
whon we want to come to the backoround, we eat througlh both that and the shadow coat. In this way wo have prodnced the appearance of a drawing with tinted shadows, and in this why no doubt still great raricty and refinement could, without manch difficulty, be produced in sgraffito, for this work, however, it is neceesary to devote very considerahle care to the preparation of the
design, the exact form of the shador must be design, the exact form of the shadow must be clearly defined, and for this reason the preparation of such designs is a most usefnl and instructive study, but nocessarily adds
of the work.
This latter piece of work closely resemhles in the sixteenth century in I taly, for decoration of fagades, \&c.
In concluding this description of the South Konsington oxperiment, I must mention particularly a successful modification of sgraffito which Mr. Moody has tried.
"Having preparcd a maroon ground instead of a finishing coat, scarcely more than 1.16 th of an an inch thick, and having traced the drawing the outline of the figure was cut straight down to the ground; aud, clearing away the waste, a pro. jecting slah of the exact figure wishod remained The face was then carvod aftor the manner of cameo-cutting; and in this way a relief, in some
respects hetter perhaps than if it had heen modelled; for the degreo of relief is moro uniform and sculpturesque, while the figures oome more satisfactorily off the ground than they more satistactorily off
would if it were painted."
would if it were painted." Moody has more or less availed bimself of prece. dents which exist for the various uses of stucco supplied by Italian artists of the sixteenth and - serenteeuth centuries, and by the Tuscan archi. tects and docorators especiaily.
Of the origin of sgraffite I believe it is difficult to speak with anything like accuracy. Italian artists employed stucco considerahly in tho decoration of the Vatican, hoth for modelling
and for painting upon. Hence, from this latter and for painting upon. Hence, from this latter nese of plaster vero revived the varions methods,
more or less similar, which went hy the names of more or less similar, which went hy the names of "painting in fresco," "intonaco," "terrata,
\&.., which, as the earliest examples of wall. decoration indicate-the wall paintings of Pompeii, for instance-were known to artists prac. tising thousauds of years ago. It is not unlikely that sgratito is an offspring of cameo-cutting. They hoth swe arts having limits analogous one to the other. The artist who designed and exocated a cameo limited himself in materials and colonrs. He depcnded solely upon the varia. tions of layer which a stone possessed. In the same way the sgrafitito worker, relievod certainly of the trouble of finding a suitahle combination of layera, since each comhtination is nudor his obthin from the two layers of oppositely colonred plasters. But Vreari and Bossi, wbo hoth describe the working of sgrafito, throw no light upon its antecedents.
In the South Kensington Musenm thero are specimens of stucco ernamental panels which lante from 200 B.C. These panels came from Porzuoli, near Naples, a village known in cen nuries past for its ahundant examples of stucco
work. Some of these panols are unmistakable bits of syraffito, the marks of the hatcler being quite apparent.
art applied to other materials, is well known in

India. Metal sgraffito is, I believe, of anciont origin, I have not, however, pursned my inquirics as to the archaoology of this particular Moradabad is interestius to note that from orvamentation upon a ground of copper, whic are esecuted precisely after the manner of sgraffito in stacco. Then, again, from Kachmir come silver-gilt works, in which the gilding is scratched away to reveal the hackground of pure silver, while the gilt ornameut remains on pure silver, whine the git ornameut remains on
its surface. In like manner, a gromnd of lac applied to pottery is scratched into ornamental applied to pottery is scratehed into ornamenalis
forms, of which the pottery in phuris naturalis is the ground. At South Kensington Museum there is a case entirely occupied hy specimens of sgraffito pot tery, Italian in origin and of the fifteenth century. From this ware the Italian artist of the fiftoenth and sixteenth centaries possihly obtained the suggestion for the rovival of sgraffito as a micans of decorating façades of iouses.
In the conrse of my researches, which I regret are so slight and hardly worthy of your attention, I have heen reminded of tho plaster-work
to he found in Northern Germnny. The exam. to he found in Northern Germany. The examples I particularly allude to are thoso at
Hildesleim and Halberstadt, aud date from the elcyenth and they are low-relicf stucco heir are low-relief stucco figures. 1 menhion porrers tence here as an evidcnce of the lasting nd also the material when fairly protected, and also as a species of connecting-link between by the Italians in the fifteenth and sixteenth centuries.
During this period great quantitics of deooration were executed in plaster. Perino del Vaga, Domenioo Beccafumi, and Giovanai da Udine produced works of this kind. But none of these appear to have executed sgralifto decorations. he wortes who turned his attention, and, from really instigated as revival of sgraffito, is Morto da Feltri. The especial bent of his art was the invention of arahesques and "grotesche." Ho strong conservative prinoiples. He devoted himself to discovering examples of the style of art he affected, and his devotion caused him to spend a sood deal of bis time in the suhteraneous passages at Rome, in which he gratified his fancy hy the study of the arahesques and such like, which were painted on the walls. In closely following the footsteps Italinn masters, Mr. Moorly has allowed himself to ho tenpted into painting the arahesques upon the plaster, instead of batching them. The result of this is in cffect as good at first sight as
the real work. But in a short time the accumuthe real work. But in a short time the accumu-
lation of blacks, soot soaked into the flat surface lation of blacks, soot soaked into the tlat surface
hy rain, reveals the disadvantages arising from hy rain, reveals the disadvantages arising from think, competo with the real work. I humbly Eubmit that sgraffito should be sgraffito, and an imitation of it not be encouraged. I may add that the paintod work at South Konsington will shortly give place to the real art.

## SPECIAL DWELLINGS COMMITTEE.

This committes appointed hy the Charity Organization Soeiety held its third meeting on Wednesday, the 12th inst., at the Central Office, the Right. Hon. W. F. Corrper-Temple, M.P., in the chair.
The sub-committce hrought np a report, con. taining a summary of the suggestions which they hare had before them :-
"1. Chart indieating the drelliggs more or less unift
 $\xrightarrow{\text { and. }}$ Info
. Informantion : (a) $A$ s to the natare of the dwellings
 to be engayed in imperoving the dvellings of tho poor in
London. (c) As to the operations of privato builiders. qiestions of pbinctiple.
3. The extent (if any) to which priuciples other than amellings for the poorer classes. 4. The induenece of unremanerative rents on the move-

And varions questions of detail.
The committee then proceeded to consider lanse 3.
Mr. A. II. Hill was of opinion that it was impossihle to henefit the people at large by charitahle interposition; that indeed any suck
interposition, if not ahsolntely necessary, tended only to demoralise. He proposed a resolution, hut withdrew it in favonr of the following reso. Then suggested hy tho Rer. R. J. Simpson, That in providing improved dwellings for the poorer classes in the metropolis, while hy no means discouraging the comhination of a judithis philanthropy with husiness ontorprise on the outlay must be obtained in all such cfforta in orler to insure extensive improrement and permanent success.
The Chairman thought that charity and the commercial principle should be made to co. operate, hy investors contenting themselves with a recular but moderate dividend
Mr. Liddle urged tho importance of koeping in view tho simantic scale of what was required Ho considered that at least two millions of capi. tal wonld be wanted. But no scheme could sueceed unless compulary powcrs of purchaso were obtained from Government
Dr. Ross said the question was too complicatcd and rast to be settled effhand : they conld only work away. In his own district of St. Giles's, about one-third of the deaths took place under did these people live? In dwellingz ninfit for did these people live? In dwellings nnfit for
any human heing. Cliarity could not deal with so rat a work. There were at present 0,000 tramps and people of bad repute in St. Giles's with whom nothing conld he done until their dwellings were reformed.
Mr. Gilhert said that there were some properties Whicls it would be no charity hat a nuere act of justice to sell npon easy terms for this purpose. He referred to the property of the corporation, the Ecclesiastical Commissioners, and the Metrolitan Board of Works. Few people had any idoa of the injustice done to the poor of late years by wholcsale ejectments.
Mr. Gatliff thought it was desirable that companies like the Industrial Dwellings Company, which could do so, should declare a large dividend of 6,7 , or 8 per cent., hoth to stir ordinary huilders and to encorrage others.
Mr. Bosanqnet thought it was desirable to como to a resolution, to clear the way for fature discussions on detzils. It seemed to him that the were threo ways of improring London, prise of building companies, and Improvement Commissionors with compulsory powers. It was an important question how far encouragement giren to the two last would chook the aotion of the first.
Dr, Greenhill referred to the statement that two millions of capital would be reqnired. He had made a rongh calcnlation many ycars ago, milliod come to the conclusion that soine tryelve millions would he required to improve the dwell. ings of the poor throughout London. He would not despair of getting this on a good schemo likely to pay from to to $5 \frac{1}{2}$ per cent.
Adjourned to Wednesday, 26th inst.

## VIENNA EXHIBITION.

Rapto progress is being made with the works, and the marvels of the huilding arc becoming more and more apparent. Tho ohief difienlty that looms in the way of visitors is the possible want of sufficient apartments. Te lessen this, and prevent imposition, the Austrian Minister has decided that official register bureany are to bo established in each district, appointed hy tho mumicipal authorities, to keep a list of disposable lodgings, and refer arriving etrangers to such as are vacant.
Bnokidinding.-Here, there, and everymhere landsome things have heen prepared for the Exhabilan. Wo have inspected whi mach binding which are ahout to he sent off by Mr. Joseph Zachnsdorf, of Gatherine-street, Strand These include a cony of the Dorés Bihle, in two These include a copy of the Dore Bihle, in two
volumes, bonnd at a cost of more than 3002 The patterns are prodnoed hy inlays of different The patterns are produoed hy inlays of difterent coloured leather, in one case separated throughchany a gola colours produced hy the gold line (well understood by those who have studied the subject) is very interesting: it is difficult to aslieve that the colours are the same. The design of the oxterior is a little over florid: wo prefer that of the insido, as being more fully. In hotb, however, the forms are beantiPfonder has assise execition is excellent. Mr. smaller hooks show beantifal speoimens of tool-
ing, and the wholc makes a most creditable exhibit on tho part of Mr. Zaehnsdorf. The demand for high-class bookbinding is much less than it used to be : chacapress is the objcct chicfty aimed at now ; and the result, unfortunately, is that the number of workmen capable executing first-rate work in this line is small. Tiles and Slabs.-Mr. R. Minton Taylor, Fenton, will show a fino collection of plain, cncaustic, and majolioa tiles, majolica slabs, and other similar objects. At each end of the wall. space will be showa a complete piece of wall. tiling, including dado, wall-space, and cornice. Both compositions are Classic: that on the left hand is characterised by simplicity of design, while that on the right, oomposed mainly of majolica tiles in relief, is rich and ornate. majolica tiles in relief, is the two are shown tho principal memhers of a tile reredos, with large memhers of a tile reredos, "Arrial representations of the "A pictorial representations of the Pelican in her piety." Several sceand "The Pelican in her piety. elaborate foor which Mr. Taplor is laying nt elaborate floor which Mr. Tay.or is laying at there is also a specimen of a reproduction of a there is also a specimen of a reproduction of a tiled floor of the thirteenth century. The superintendence of Mr. G. Figre.

DESIGNS FOR THE HOTEL DE YILLE, PARIS.
From the 66 designs submitted, the jury selected 20 , the estimates of which raaged from $7,088,761$ franos to $19,500,000$ francs. The anthors of theso will all he rewarded. The author of tho design standing first will have the direction of the works in carrying it out; the authors of the $2 \mathrm{ad}, 3 \mathrm{rd}, 4 \mathrm{th}, 5 \mathrm{th}$, and 6 th will receive respectively 600 l ., 4802 , 4002 ., 320 L , 200l. The remaining 15 will receive 100 t. each, all the premiated designs becoming the property of the Administration.
Ultimately the design of Mcsers. Ballu \& Doperthes, architects, was selected for execution. The estimated cost of this is put at $13,881,539$ francs.

THE NEF TRINITY COLLEGE OHURCH, EDINBURGK.
Thas church is the first edifice erected in one of the new strects opened up hy the City Improvement Trust, to be called Jeffrey-street. It is the substitute for an ancient charch founded by Mary of Guelders, the consort of James II.
of Scotland, in 1.462 , which was removed several of Scotland, in 1.462 , which was removed several
years ago by the operations of the North British Railway Company. This building was, next to Holyrood Chapel, the hest example of Medireval architecturo in the city, and consisted of choir, transepts, and aisles. Before taking it down, corrcet drawings were made, and the stones numbered and carefully removed to a vacant space of ground, with the riew of their being reconstructed in the original form.

A lawsuit ensued between the occlesiastical and municipal authorities as to tho disposal of the compensation received from the railway company, which caused many years' delay, and the idea of re-erecting the original church in its entirety was ultimately abandoned, the funds set apart for a new church being insufficient for that parpose. It was resolved, however, to preserve a portion of the original work, and this has been dono by making out of tho old stones a hall at the rear of a modern church, designed by Mr. Lessels.
The principal elevation is to the north, and consists of a gable, baving a tower and spire to the west rising to a height of 115 ft ., and to the east a turret roofed in with stone. In the side elevations all attempt at architecturo scems to have been abandoned. They consist of a double row of shallow lancet windows, without mouldings or detail. Yon are supposed not to look round the corner, and yet it is only by so doing that you can see the restored portion, which is deoidodly the best worth looking at; and, so far as it goes, the restoration has bcen carried out in a conservative manner, no attempt having been made to hlend old and new masoury. The contrast between the massive bolduess of the fifteenth-centnry work and the dimsy, shallow chareoterless work of the nineteenth century is very observable. Why the fine old work should Had it been placed in front, and made as a nare to the preaching-hall, the effect would heve been
more satiefactory. In the front elevation an attompt has been made to follow out the style of tue original, but tho attempt has not been a which has a certain surdy character about it such as is found in several ancient Scottish examples.
The interior is fitted up with galleries on three sides, supported on iron columns, whichare carried up to support a lath-and-plaster arched ceiling, as to which the less said the better. The pulpit occapies the centro of the south side, and on either side of it appears an arch of the anciont aisles, throuch which a yiew of the restored part, with its groined ceiling and traceried windows, is obtaincd. Fere grain the contrast between the new and the restored old part is very remarkable. One cannot help feeling that if work would stand hale and sure when that of the niucteenth has crumbled into dust.

THE PAINTEIS' COMPANY AND TECHNICAL EDUCATION.
The Painters Company was one of the first of the City guilds to move in the direction of technical education, as carlier volumes of the Builder would serve to prove. Our advertising columns last week contaiued fresh offers of premiums from the company for the best specimens of decorative painting, freehand drawing, and so company is aware of its dntics, and is trying to perform them. We invite such, of onr readers as these offers concern to obtain the conditions from Painters' Hall, and to compete for tho premiums offered. We shall hope to find some premums offered. we stal

The company is also arranging for the delivery of lectures, likely to bo of advantage in the education of the trade. Mr. John Gregory Crace, now Renter Wardon of the company, and who has always shown himself ready to commnnicate his knowledgo and the results of his large experience, will commence the serics, on the 15th of May, with a lecture " On Colour, addressed to Operative Painters, Any one who desires to learn can go: there is nothing to pay: them. But thoy must remember it is of no use merely looking about: they must go to work resolutely and continuously. The efforts of other in their behalf will be of
make efforts for themselves.

THE HOUSES ON THE WALWORTH COMMON ESTATE AND TEE BUILDERS The Newirgton governors and gunrdians, who have the marragement of the Walwortl Coumon Estate, are inaking serious complaints against oertain builders of houses on the estate, for violating the terms of their agreements as to the matcrials used in tho buildinga, and the conduct of the builders has been the subject of severe animadrersion at the last two or three meetings of tho Board. The builders are charged, amongst other things, with building on surface-soil fonndations, contrary to the agrecments into which they have entered. At the maeting of
the Board last week, Mr. Malthouse, one of the he Board last week, Mr. Malthouse, one of the nembers, stated that the manner in which some ustead of concrete beinir used as a foundelul. they of concrete beinr used as a fonndation, ome were built on soft clay, and in the case of ble to those which he had examined, he was betwo pass his stick throngh it to the extent of hat an applantion on from Ir. Jarvis, the surveyor to the estate, Mr. Jarvis said that, as their survoyor, he had purposely attended the mecting to confor with the Board on tho subject. He then made a statement which refected much disoredit on the builders. Ho observed that he was in a great difficulty in the matter. He had done all be possibly could to prevent the use of inferior materials in the construction of the huildings. He had written no less than 800 letters, the whole of which contained complaints as to using bad materials, What Mr. Malthouse had stated was perfectly rue. But as matters stood at prosent he was hireatcucd to withhold the certificates of the builders, and in one or two instances he had actually done so. When he had secn bad mortar n the ground he had ordered it to be removed
becn brought back again. There was also a difference of opinion between himself and the estate committee. What he had condemned as bad material they had considered to be fair.
After some discussion, it was resolvod to take practical action againat the offonding builders, and a resolution was passed to the effect trat when the survejor considered there was suff. cient reason for withholding the certificate he should do so.

Another resolution was also passed affecting persons who have taken plots of land, but who have not built upon them. This resolution was to the effect that instruction be given to the clerks to serve notices upon those takers of land who as yet had failed to commence building, requiring them immediately to commence opera. tions, upon paiu of incurring the forfeiture of the money deposited by them at the time of letting, and their interest in tho plots of land taken by them $\qquad$
PROCEEDINGS UNDER THE NEW SANITARY ACT.
Rotherlam.-The jojut committee, consisting of representatives from the urban sanitary authority and kural sanitary authority of the union, purpose of appointing a medical officer of health purposc of appointing a medical officer of health for the mhole union (excepting Watb), at a salary
of 600 ? a year. The voting was conducted on tho ballot principle. There were six name tho ballot principle. There were six namen
before the committee (Mr. A. W. Babbington before the committee (Mr. A. W. Babbington, Chapeltown; Mr. J. N. Fox, London; Mr. DV Chapeltown; Mr.J. N. Fox, London ; Mr. W. M. Pearce, Rotherham; and Dr. Edmond Syson, Salford), and out of these Dr. Syson was sclected. Guardians - A meen meetho Guardians and of Health has hern held to elect medical officer at 300 l . a year for three years. There were five candidates, but the roting was between two local applicants, and resnlted as Jllows:-Dr. Young, 14 votes; Dr. Jones, 13. For the officc of nuisazce inspector there were ight applicants,
 Marshall, 16 , Mr. J. Marshan, 12 . The officers re to enter on their duties (whoh are not neces March. March.
Howden.- A meeting of tho grardians of the Howden Union bas been held for the election of an inspector of nuisances. There were upwards of trventy applicants for the office, but ouly three candidates wore proposed :-Mr. Alfred Hind, of Rowland Hall, Howden; Mr. Thomas Shaw, of Towport; and Mr. Millan, of Bradford. Mr. Alfred Hind was elected. The salary is to be 1562. per annum; the inspector will ho expected o dovote the whole of his time to the duties of the office, and the appointment was made for one year only. A communication wns read from the Goole guardians suggesting the desirableness of a Medical Officer of Health being appointed for a district to consist of the Howden, Goole, Thorne, and Selby unions; but the opinion of the guardians seemed to be decidedly gainst any such amalgamation. A depatation was appointed to attend a meeting to be hold at Beverley, to consider the best means of appointing medical officers for the various unions in the East Riding.
Southport. - For some time past the question. of electing a Medical Officer of Health for the borough of Southport has been provocative of much discussion and considerable excitcment. The town was divided into two proties, one going or a medical officer of health, part of whose alary (3001. a year) should be prid by Govern. ment, and the other insisting that the remunera. tion should not exceed 100l. a year, that sum to he paid by the council, ignoring Government assistance altogether. The question oulminated at the last monthly meeting of the borough counci. Tho town clerk read the recommenaanon the committee that the sarary of the medical officer skould be 1002. a ycar. An animated discussion ensued, iu which the later ecision of the general purposes committee was everely criticised. It was erentually resolved 1007 a medical officer should be appointed at t. a year salary. Had the sool. been heted, testing against the action of the councit.

Institution of Surveyors.-The next meeting will be held on Monday evening, March 24th, when a paper will be read by Mr. W. Brown,
entitled "Beech W oods and Larih Plantations?

ARCHITECTURAL SKETCHING.*
Having arranged your materials for, say a day's sketching (a sketch-hook, Winsor \& and a plumnet will be sufficient), star't on yonr and a plummet will be sufficient), start on yonr
journey with a determination to learn as much as you possihly can. Yon should carefully observe every hiniding you pass, endeavour to pick out every hnilding you pass, endeavour to pick out
its defects if it bave any, and endeavonr to avoid them in your own designs.
If, in walking along a country road, it is lined on the sides witb yarious kinds of trees, secure a specimen of each leaf, with its name, and sketch it in your note-hook at your leisure,-with Howers do the same, -and, in fact, lose no op-
portnnity of adding to your stock of knowledge. portnity of adding to your stock of knowledge.
Nothing will ever come amies to you as an architect. If you pass a farmstead, ask permission to look over it. If the byre or stahle seem snitahle and convenient, mensure them. Look into tho piggeries. If a carriage or cart be lying about, get width, length, and heigbt of ceiling necessary in a shed wben the shafts aro up; tho width and height of a cart of hay; the size of the mill in the harn, and other matters which will suggest themselves on the spot, -all these hits purpose. Wherever you are keep this in prac. tice, and in a year or two, by constant attention to it, you will find that you have amassed an amount of .information whicb will be almost invaluable to you in your daily professional duties. Sir Walter Soott is said to have from the humblest and most ignorant this in mind; and even if you pass a hedgetrimmer, you may learn from him wbat kind of a hedgo ho is trimming, tho best ago and the hest way to plant it, and how long it takes to grow a certain beight. This information will enablo yon to write a conciso specification of it in yonr note-book for future guidance if you property.
An ancient philosopher was asked how he had gathered such immense stores of knowledge as lie possessed, and his answer architectural
stadents should constantly keep before them. "I stadents should constant y keep before them. "I
was not ashamed," he said, "to ask questions was not ashamed," he said, to ask questions
wherever I was ignorant." But through all this miscellaneous observatiou you must never forget tho principal object of your journoy, namely, to sketel Mediæval architecture. When you have
arrivod at your destination,-let us suppose it to arrivod at your destination,- let us suppose it to
be a parish cbureb,-look carefully at every part of it, botb inside and outside. Endeavour, according to your ahility, if it contain both early and late work, to fix the various dates in your
own mind, whioh you can compare with some own mind, whioh you can compare with some reliablo authority at your leisure (not scxtons, who are sure to talk about this ohurch having
been huilt in the ninth or tenth century although been huilt in the ninth or tenth century, although
it may have been the fiteenth really, hut some it may have been the fifteenth really, hut, some
architectural authority if possible). Having architectural aathority if possible). Having
done this, proceed at once to measnro and sketch all the early work you can find. Suppose yon sommence at a doorway : remomber all details last. Tako a section of the jamh, witb all tbe measnrements and joints, where they occur, of it thy marked; get, in fact, the construction caps aud bases of pillars, an elevation with all general dimensions, the jointing of arch, of tbe the door occurs; then sketch the caps and orna ment to a large scale, and endeavonr to make a regular study of the ornament. Through all this do not hurry. It is not rapidity in sketching
and measuring you ought to wish possess, but accuracy, thorough command of and possess, but accuracy, thorongh command of and the ornaments, and all detair generally connccted with early work.
After yon have measured as mucb detail as time will permit, proceed to write concise notes of the church, which, by-the-by, is almost as anything else, ard conclude your study of i with a general sketch, with your notes, dates, and modern features, if any, marked on. Never omit to do tbis, as it is as particular a part of
the day's proceedings as any details you may measure.
If you have a will, your progress will bo rapid and sure. It is not to be expected that at frat you will be able to hit the exact character of THrom a paper read by Mr. Thomas P. Marwick before
the Edinburgh Architectural A ssociation.
the mouldings, that your measurements will he neatly taken, or yonr perspective sketch precisely accurate, but if you persevere and con.
stantly practise, you will soon troin stanty practise, you will soon train your eye to
precision, and rapidly become an expert in sketching and measuring old work.
If you go on a regular sketching tour, neve ing :- add to your stock of materials the follow-ing:-A camp-stool; a drawing-hoard, about 12 in. by 9 in., would suit very woll; a suitable T square; a bottle of ink; and an etching pen. Then set your measurements up on the spot; in inct, always do this where time permits: it insures accuracy, and prevents the odious system of "cooking" your sketches afterwards.
Take your perspective sketcbes with ink, and, above all, do not hurry. When you draw a line, not by dr do draw it correctly at once; for it is ine by dashing in a line and pasting it over with slope or curve by accident upon lie correct anything like good or antis What to oketch is almost ary skelches.
o sketch. If yon has as ingortant as how church architecture elvetcb litte if ancy lowards chareb architecture. if to dom anything but ture, sketch littlo if if domestic architec. arehitecture, the if ayything but domestic endeayouring to master a number of difforent styles, that it generally results in learning nono.

We cannot attain eminence in every style, and the only way to make ourselves eminont at all is hy concentrating our whole energics on one particular style, and, I hold, one particnlar branch of that style. If Mr. Street had studied a variety of styles, or even the miscellaneous
application of one style, I do not think he would application of one style, I do not tbink he would have occupied at the present day the bigh position he holds as a designer of ecclesiastical work. We do not hear of men attaining eminence in a variety of accomplishments, hut generally one in particular upon which they have bestowed all tbeir attention, and lavished all their resourees.
I would therefore encourage architectural studenta to centre all their attention on one stylc and one particular application of it, although in a pocunary point of view (iu somo cases) it may ork large class of as in late; hat bigotry prevents . These had points practice acknowledging y will enahle them to discern and avoid.
The benefits of architectural sketching numerous and important. It trains the eye to thorough knowledge of perspective; in fact, it is the only proper method of studying per. spective; it educates it almost insensibly to an mproved idea of form and proportion, and to tbat suhtlety of henuty in old work so difficult to successfully originate; it gives the hand a facility in representing original ideas on paper nd often of an artistic manner of handlin hem, often tedions otherwise to learn. By mea surngy them, it acquaints you with tbe size and appearance of mozanges of particnlar dimen-
sions, and both this and the material in which it is executed has an important bearing on it cbaracter and manner of introduction ong int dern work which mere sketches withont modeur work which mere sketches withont me surements would be totally insuficient for.
By sketching and measuring old By sketching and measuring old work you proserve for your own future reforence, or perof buildings whicb will soon he in characteristics condition whicb will soon he in so dilapidated be undistingnishable,--buildiners mhenldings to vords of the leaves in antumn."
Students will some day bccome architects Architects qualifications aro onerous and almost withont limit. A recently published letter puts this forward well. It says "that of course it is to he expected that an architect shall he vay, shall combine beanty with, in a general construction, hut such a general description oes not agree with the views of the presen he and we find him required so to understan de various uses to whicb hoildings are pat that omay bo ablo to arrange a plan which shall completely answer its purpose, whether it bo for he mast be a complete master of the varion styles of architectnre; able to desing in an of them, and adapt his huilding to every peculiarity stand the varticular style; he must also so under he can give ninute directions for execnting the
several works, whother in brick, stone, wood, iron, glass, or any other material, to their smallest details; he must have the law of con. tracts at his fingers' ends; understand all about valuations, dilapidations; be ablo to take out quantities; havo a thorough knowledge of tbe prices of materials and labour in all parts of the kingdom, and to say at a glance how mucb a building will cost,-to be, in fact, a complete surveyor and lawyer; to say nothing of understanding statics, dynamics, resolution of forces, and all the usual requirements of a civil engi

As if this were not enongh to try one man's brain, we are now contirually told that an arcbitect should design the furniture; be able to give models for the carving, designs for stained tass, paperhangins, decorations, carpets, portions, is kitclun-fittin more mechanical portions, ns kitclion-fittings, heating apparatu, water and gas supplies, bellhanging, \&c. But oven tois is not sufficient! He is encouraged to spend a good portion of his time in stndy of bigh art, figuredrawing, water-colour painting, do. Then he is to have Natrue herself so completely undor his control that he shall he ahlo to mould ber forms, and as a landscape gardener hring out the varied heanties of the country aronnd his building to their greatest advantage.
duties, it is essential that from this long list of their pir essential that all young men daring worls thin the futare. sketcuing is an admirable in m, but it naust (like everything else) he dono too seration; there are some who cultivate it in endennously,- every spare moment is eppent particeavouring to forward themselves in this strongly hranch. This is a proceeding I there requiring tborough knowledge, skill, jud orment and integrity; and if they do not, as assiduously as in sketching, bestow a proportionate amount of their spare time on the studp of the oth hranches of their profession, according to their importance, bow is it to be expected that, when called upon, they will be able to discbarge tbe responsihilities iucumbenton them satisfactorily? These, as some think, suhsidiary stndies, I consider very important; and although progres in them is slower and less evident, still it will be found in the end that the earnest study of them will more materially contribute than sketching to real intellectual enjogment and social position.

DESIGNERS FOR MANCHESTER.
The report of the bead master of the Manchester School of Art, Mr. Muckley, has been printed. We give the concluding portion of
"It has been thougbt by a few tbat the chief business of this school is to supply designs for catico printing, and that it ought to educate youths for the immediate purpose of this department of manufacture. Last year, in my report, I just tonched on this question, as to what I considered our main function bere, and I wish now to go a step furtber in my views on this head than I did at that time, by stating to yon that with my conviction that we bave nothing to do speci techmical teaching of any kind, nor the whate preparation of stuadents for any cally mate tho puhlic duty, pre-eminenty, do its simplest and hest form, independent of its bearing on any particular manufacture, toling whatever material may he placed in our hands no matter whether it be that of the artizan class, or that of the wealthier classes of this neigh. bourhood,--and dealing with it from the broadest possihle basis as to the distinguishing characteristics of art-knowledge.

You well know the peculiar domands of diffe. rent markets at the present moment, and how bear theroportion of the designs supplied would and from a husiness point of ornamentist scious that this must nect rils bo we are con sure you will also sen in 1 am position if in tbis school we attempted to meddle witb their rople school we atcempted to meddle sometimes be found administering to the caprice of the lowest taste, and I should not he sprprised if the Busbman bimeself were to make demands at our bands.
Now with respect to designing for textile fabrics generally, I am very anxious that this institution should do its utmost to help it forward, and I will state to you my views as to that course migbt be taken to this end in the future.

Economíal Fireplaces,

Repeatedly have I tried to aronse attention to feel, that if their services are to be secured, a the matter, being sure the day was near at hand higher rate of payment shonld be held out to when a demand on our natire talent would he them, as an inducement to begin their term When a dor 1 bave twice bofore stated in my former poports, that which I now desire again to bring hefore yon.
1 am of opinion, then, that manufacturers should make arrangements with their apprentices, at the commencement of their engargement to attend the achool, in order that they might obtain an art-training up to a certain point which shonld he as follows:-To therwise, fter tairly, whether fro from wards to draw and and foliage. This would torme most important department of their study; and then a close intercourse with ornamental works, medium of books and photographs, independen of any particular relation to textile fabric, or other material, with as much drawl
Thman igure from the cas ase about four years to ass throngh if a student attended the scbool four niehts a week, and after an edncation of this kind, be wonld prohably be ready to commence his future occupation as a desiguer, but not hefore.
When this has been accomplishod,-I do not say that some arrangement might not he made for the pupil to receive special instruction suited to the technical requirements of his profession, from some one having superior acquaintance with ornamental design, and with the peculia requirements of the different markets; bnt, ce ainly this school is not the place for that
One vital point, however, I have not yet pat before you; indecu, it is the motive popyer of the whole affair,-it is the question of emolument
In Manohester there are ready occupations for outhe about fourteen years of age, nearly all of which yield higher wages than those obtained hy young designers; conserquently, the hest designing as a profession, and I therefore atrongly

The thoughtful young men of this money getting city must be made to see clearly that they are likely to do hetter, or at least as well, at the profession of a designer as they will in all probability do by attachiog themselves to any other calling; and, until thoy liave this assurance, their life's work, and the demand for good designers from onr own people will be made in vain.

ECONOMICAL FIREPLACES
THe drawings appended show two forms of freplace that have been proved to he excellent for the three essentials of heat-giving, nonmoking, and thorough combustion. No. 1 was introduced in Leeds, hy whom I do not know ahout twenty years ago, and proved an almost certain cure for smoky chimneys. In combination with a half.register grate (i,e, the front portion only of a register grate), the opening of which must be círcular in form, is used a hack of fire-clay in two pieces,-a half-drum and a balt-dome,-the former backed up solid with ordinary brickwork, and the latter resting loose apon the top of it, to ellow of the opening for smoke being adjusted and the draught regulated hy moving the dome heckwards or forwards, and o allow of the chimney being swept, for which purpose the dome is tilted back. The beat thrown out is intense; and until I had made trial of No, I considered it to be tho best form of grate for ohtaining the full effect of the coal, and for secaring freedom from smoke. In the latter respect there is, probolbly, oo better
No. 2 form has been loug used, I heheve, in the Midland district; hut my first krowledge of it was derived from Mr. Ewan Christian, who had seen it in York, noticed the good qualities and adopted it in his practice with great sntis-
faction. First trying it in my own offices, I have
since used it frequently, and always with more satisfaction. The draught is good, without satisfaction. The draught is good, without heing too quick; the consumption of coal is perfect; and the bent hat of a furnace
in full glow is like that of a furnace
To secure the best results, however, there are some points to he attended to:-the angre mins he exactly $45^{\circ}$, Bo that the two sites form right angle when they meet; the front hars of the grate should were inwards tho - inia is especially necessary with the bottom bar and the top bar; the hottom grid mast be helow the level of the bottom har from $\frac{1}{4} \mathrm{in}$, to $\frac{-1}{3} \mathrm{in}$, In any grate this is most important, to prevent the fuel falling out whenever it is disturbed, and it is a point regarding which makers of grates are very careless, if not ignomant.
The sides may be bailt with firehrick, or firelumps entirely; but I have nsed glazed whíte brick, and glazed tiles, sometimes for the front portion of the jambs, and occasionally for the whole depth, according to the importance of the room.
If a fire be made up in a grate of thís description, -small coal freely jused on the top, and left untouched, - it will barn for four hours, the firebrick hecoming red-hot, and the coal slowly consnming, leaving nothing but small ash, After hurnint some time, the glow will diminish; and f it he desired to renew it, with tho poker clenr away the ash from the hottom grid, and tho current of air thereby allowed will effect this without distarbing the upper portion of the ere. I heve sairl four hours, hut the firo heside mo just now was mado up fivo homrs aco, and it would last another hour

THE DURABILITY OF IRON ROOFS.
Str,-Last Saturday ( 3 p.m.) I was at Cannonstreet Railway Station waiting for a train, street Railway Starion waitiog for a train There were no trains in motion in the station at tho time, wher some part 11 , on, pror to ho pioee of paint and rust half tion, proved to a a pore prod in thickan inch long, and as mould broad, and in thickness the paint, I should say, was about two coats, and the oun forin If rust is might have leen thek a for is forming in snch flakes on the snpports of that roof, so it must he elsewhere; and what will he the ultimate resul of such ano sRmple of rust that that pinint had been used, but growing is had litved it inp and throw it ons spot is now bare, and oxidation going on; and it is a natural conjecturo if we say that the process of decay is actively at work. I do not wish the railway authorities to suppose that I am finding any fault with them, but, hovertheless, they ought to know it, and if tho bunder will kiady tell them what I say, they may by prompt action conserve their property and save money other Wise.
While Iam "on the line," allow me to suggest that some precautions against loss of life be taken at the Spa-road Statiou, where the platform and its approaches are not commodions enourg. The platform is only a few paces wide, and trains come up at each side of it. Some of them pass it at full speed; and it is terrible to stand and look on, and even more so to he in the rain itself, and feel like another Jugrernant,

Gdgar Redmond
CASES UNDER METROPOIATAN BUILDING ACT,
Wooden Projections.-Mr, Preedy, huilder, was ummoned hy the district surveyor of Sonth Islington, under the 26 th section of the Building Act, for having put up an outside flight of wooden teps leading to an upper workshop, at premises Kingsland-green, such steps, with landing (at first of wood, hat altered to stone), projecting Ct. from the face of the wall of the workshop. The defendant contended that it was wot he projection, that object to portable steps, and that these were portable.
The surveyor answered that these could not he carried by one man, if by two; and were such a substantial projection of wood as he had no nower to permit.
The magistrate, Mr, Barker, ruled that it was wooden projoction, and onght to he removed. Ordered to be amended within fourteen days, and defendant to pay 23s. costs,

Defendant asked for a case for the Qneen's Bench, hit took the advice of the maristrate not to press his request, and agreed to amend.

FINANCES OF THE INSTITUTE OF BRITISH ARCHITECTS
Ar the general meeting, already referred to, a financial statement, giving an estimate of the annual receipts and disbursements of the Institute, as approved by the Council, and enume. rating the investments made and the exceptional experses incrrred within the last four years, having been laid before the meeting, the following proposition of the Council was submitted for approval:-"Tbatin order to meet the xcesse of disbursements over receipts in 1872.3 , occa. eioned hy excoptional expenses during the last four years, the snm of 300l. sterling, being acenmulated surplus income invested in 1869 , be sold ont of Consols, and applied as the Council may direct."
After some dikcussion, during which it was pointed out that the sum of 3001 ., would probably he insufficient to cloar off all liabilities within the present year, the following amendment, having been duly proposed and seconded, was put to the vote and carried:-"That in order to meet the acoumulated liahilities at the low 1072 (shown in the prencil he ow before the meeting) the Comal he em
wered to sell out stock then put as and carried. $\qquad$
CORPORATE POLITICS versus PUBLIC HEALTH.
Ir is a fundamental rule in that most excellent and successful system of Poor-law relief, now known as "the Elberfeld system," that all selections and appointments are to bo made without
reference to politics or religion, or to any con. reference to politics or religion, or to any con.
sideration save fitness for the offico.
The admirablo results the offico.
The admirable results of the working of this of the judgment of Daniel Von der Heydt the of the judgment of Daniel Von der Heydt, the eminent and able founder of the system pursued
at Elberfeld. Great would be that gentleman's at Elberfeld. Great would be that gentleman's
surprise if ho had before him a full report of the surprise if ho had before him a full report of the proceedings of the Dublin Corporation, on a recent of disoussing matters which pertained to itself pecoliarly as the sanitary authority of Dublin, but for the consideration of the Govemment University Bill.
We liare hefore us a report of the proccedings in question, and we must not omit to state that there could be no excuse for tho proceedings, on the score of inexperience or want of knowledge of the proper functions of a corporation; for the chairman of the Public Health Committce endea. voured to bring the members present to apprecattention of tho civic mind should occupy the people of Dublin wore expecting prompt measures for the amelioration of great and pressing evils.
The Dublin Corporation consists of somo sixty the oncasion in question; and were present on in alderman asked for the consideration of the Government scheme of University Education Health Conmittee immediately promosed of the lution, to the effect, that it is most objectiourhie und foreign to the purposes for which the cor poration was established to introduce political or or private. This was, hy of its meetings, public or private. This was, however, over-ruled, and the discursion of the now celchrated University all present, as well as the other late measures of Churesent, as well as the other late measures of

We do not wonder that Mr. Maclean (the chaipman of tho Public Health Committee) left political proceedingr that ensued into the long surprised that the citizens of eminence in Duhlin, as a rule, refnse to enter the corporation.
deaths repristered in Duhlin curine the fat the deaths registered in Duhlin during the first ten by no loss than 299, in a population of 314,000 .

## MDDLE.CLASS SCHOOLS FOR GLRLS. <br> Mr. A. C. Robins, in his paper, read recentl

 before the Architectural Association,* quoted, a- Mr. Mobins gave some particulars as to the provision this matter), in Sweden, Germauy, Switzerland, \&o. A practical and ecouomical arrangement in Danish schools, observed in ar recent visit made by Miss Buss, was given
from her pryate notes. In I school building for 1,000
children, 1,000 sro taught atidrend, 1,00 are taught from eight (moraing) to one
atime-table, under one to six. Both sehools worl to one time-table, under one superintendent, who teaches three
hours it day, and has assistants, who teach sis houss th day
follows, from Miss Wolutenholme ("Fssay o Education of Girls"): "Tho experiment of larg schools for girls has heen successfully tried, and of the system (so far as concerns day-schools) from whatever point of view we regard it. Thei the gain economy is ohvious. Morally, we helieve siderahle town in England a bigh.school for conwhich erann in England a bigh. school for girls, which should offer the best possible education on moderate terms, one which should serve as a model to all those private establisbments for Which, in future, as at present, there will no this it would be rery. to such a school a of appliances and y easy to attach all mano cia. classes, whioh might be attended hy pupil from private families, or smaller schools."
As an illustration of the kind of huilding that wonld he required, Mr. Robins showed a design for a now building, prepared expressly for this lecture. The North London Collegiate School, Caraden-town, conducted by Miss Buss, the pre sent principal for the last iwenty years, has been recently handed over to trustees. Dr Storrar and the Rev. Prebendary Thorold, two of these trastees, were members of the Seoondary Schools Inquiry Commission. In these school and the Camden Schools (included in the same from 1l giris receive tho hest eclucation, for pupils are waiting for admission. Considerahle onlargement, or a reconstruction of the present buildings, is contemplated, to provide, in the North London Collegiate Schools, a day-school for 400 pupils, -the sort of high-sohool with fnll appliances to which Miss Wolstenholme refors in the extract given above. The following is Mr. Rohins's description of his design, shown in The two apper floors to be similar in ant plans. ment to the ground-foor, thourch variously em. ment to the ground-floor, tbough variously em-
ployed. The attic to contain servants
dor. mitories, \&c
The gronnd-floor provides entrance-hall and general waiting-room, on one side of which are the head mistress's room, and the office.
A general hall and stairease (chiefly lightod rom above through the open well-hole) are in the centre opposite the entrauce. From the mid. landings of this staircase, lavatories and conventoncos are ontered through a cross ventilated corridor.
On the right-hand side are class-rooms (for thirty-five and thirty), with small withdrawing class-rooms to each. The upper part of the wall dividing these rooms to be fitted with casements ling on pivots, so that hetween school hours, or at any time desired, cross ventilation may he ohtained hy the opposite windows.
On the left-hand side are similar class-rooms for thirty pupils each. Between these and the taircase are two rooms, - to be music-rooms on upper floors, and teachor's room and library on this story.
The seats and benches in the class-rooms are all designed for a lcft light. On the first-floor over the hexagon entranoe-hall, is another class. room, for twenty-five. Above this, on the two. pair floor, would be two more class-rooms, one or mnsic classes and one for drawing. The $\{35+30+(30 \times 2)\}$ would thus be
$\{35+30+(30 \times 2)\} \times 3+25=400$.
Over the head-mistress's room and office, Over the head-mistress's room and office,and class-rooms would he placed.
A lectire-hall, for 600 on the ground-floor ard 200 in an end gallory, is provided. An enclosed gymoasium wonld he underneath this in the hase ent, level with the Botanical Garden hehind.
The girls could enter the hall from the schoo building through the class-rooms for lectures, prize-givings, and representations, \&c.
In the hasoment: underneath the paved court, in front of the lecture-hall, are the kitchen, scnllery, larder, \&c. The space under the classrooms, \&c., on the left side of the central stairirls. A a general dining-room for ahout 160 min. A housekeoper's room is provided. From loak-roouce in front the girls pass through the ahove. These honnet and cloak rooms-rooms the rest of the basomeut. Eaoh class would have its own cloak-room, locked np hy its nistress. Warm-water pipes for drying the
each; the rest of the time is ocenpied by the visitirn
teachers of the district. By permanent tenchers and th
visitina teachers, four. nuildings) by thre for schools could be taught (in two schools bave their daity work, as well as this attendance
clothes to be carried round ander each side of tho partitions. The huilding throughont to he heated hy warm-water pipes.

## DESIGN FOR ST. MARY'S CATHEDRAL,

 EDINBURGH.LHE accompanying engraving represedts an aterior view, looking east, of Mr. Willism Barges's design for St. Mary's Cathedral, Edinhurgh, concerning which we have more than once spoken. As in the case of the selected design, already illustrated in our pages, we append the remarks of the referee, Mr. Ewan Christian, on Mr. Burges's work :-

Non Ignotes Oivitatis Municeps.-The whole of the drawings are worked out with remarkable skill and conscientious carefuiness.

With regard to compliance with Instructions :
The area of the whole church, including the eboir and its aisles, is sufficient to provide accommodation for more than 1,500 persons hat the number in tbe transept westward of the choir, in the nave and aisles, would not oxceed 1,300. For small congrecations the architoct makes no special provision hat soys, that 'space might be enclosed hy temporary woodon barriers, as in Continental churebos.
2. It is proposed to place a large organ divided into two parts, in the western callory over the central entrance; and ' $a$ gmaller over the central entrance; and 'a smaller the stalls. As regards suitahility for preaohiag, there is no special provision beyond what is usual in similar large provision beyond what is siderable proportion of the 1,500 persons for siderable proportion of the 1,500 persons for whom space is required mast of necessity h put in the choir aisles, and elsewhere hehind the preacher, it is hardly prohahle that all would 3. Ample sprily.
3. Ample space is provided for clock aud bells in the western towers, and the architect, in this case, shows a bold skeleton dial in frout of one of the apper staces of the north-west tower
4. The dimensions of the Chapter-house, and of the staircase of approach, are hoth too limited for the accommodation required; and in every respect this is the least satisfactory feature of the whole design.
5. As regards Contes House, the author says that he 'would strongly recommend the reten. tion of Coates Honse, not only on acconnt of its interest as a specimen of old Scottish architec. ture, hat as affording the means of grouping the cathedral with the other buildings round and about.' He adds that 'the architects of our ancient cathedrals were most careful to snrronnd mise works with other edifices, and no greater quenc can he committed than that so buildings.
Neither heating nor lighting is particularly described. In respect of cost, the architect says but little: hat it may he implied from his general ohservations that he has proposed to himself to work within the limits gropon by the trustecs; and it must he here remarked, that not only is the cuhical area much less, but, by careful comparison of the two, it wonld appear that the relative cost, as compared with the design of 'Fidelitas,' is also proportionately mnch lower.
huilding is considerably Arrangement:- The huilding is considerably shorter than the length sequently tho western front to north-east, con. sequenty the western front might be advantage. ously viewed from Palmerston-place. The plan the the later lerminated hy two western towers, une space within and hetween which forms an unenclosed vestibule to the church; north and south transepts surmounted at the cross hy a feecho; choir terminating in an apse; and choir aisles following round; and canons and ohoir vestries, with chapter-room over, approached hy a circular staircase, of somewhat limited dimensions. The entrances are ample in numher and area, there being, in addition to the western doorwayb, one to each of the transents. None of them are protected, though there is every facility, especially at the western end, for properly effecting this. The font, thouch near an entrance, is not rightly placed, as it would he hidden by a pier fron tbe congregation.
The construction of the church is solid and good throughout. All the aisles are intended to e vauted in stone, but tbe architect has not aspe, transepts, or choir, cost, to vault either the poses to snrmount hy timher roofs, with hoarded

NORTH LONDON COLLEGIATE SGHOOL: SANDALL ROAD.-- Proposed New Buiaidings.

#### Abstract

and arched ceilings within, which he states would character there is considerable similarity be the litnit of cost, the author was probably wise 'preclude any difficulty as to the preacher's tween this design and that of Fidelitas'; Jut in not attempting a central tower. The interion voice being distinctly heard,' in the working out of details they differ more of the catheural would be bold and simple, and In respect of general Design:-The architect widely. There is less of broad contrast, but yet rich in effect, but it would undoubtedly lose in this case states, that 'the sum of money to be equal, if not greater, boldness, in the character both in dignity and solidity by the use of timber spent utterly precludes any central tower, and of this work The treatment of the windows is roofing, instead of vaulting, for the nave and the author has consequently elected to put two markedly different; while 'Fidelitas' trusts choir. Taking, however, into account the necestowers at the west end, where they not only almost entirely to his clearstory windows, the sities of the estimate, this design should not help the western facade, but perform the usefu] author of this desion has much larmer windows suffer by comparisou with others on this account, office of masking the western ends of the aisles.' in the aisles, but his clensstory windows, thongh There is, however, one defect which must not be The spires will be of wood, covered with lead, smaller in area, are very numerous. The church passed over, namely, the method proposed of and the feche at the intersection of the nare by either system woald be thoroughiy lighted, roofing the aisle of the apse it is not, as usual, and transepts will also be of the same moterials. The nortli eastern end, next Melville-street, a leanito, but a span roof, with a gutter inside, He makes no remark as to the style of art in excepting tho Chapter house, which nudoubtedly next the wall of the main bmilding, The trap which he has worked; but the design is founded reguires to be enlarged and improved, would be, for snow that would thus be formed is very upon a French type, and from materials of which rich in effect; and although the flebe would objectionable; nad as regards external effeat he evidently possesses a masterly knowledge the seem to require areater elevation in the base, also this roof is the least happy part of the author has composed a very beautiful design it wonld not bo an unsatisfactory feature in whole design, and should, and might easily, be In the general scheme and architectural groupiog with the western towers, Considering aifferently treated to avoid this difficulty"

A DESIGN SURMITTED FOR SAINT MARY'S CATHEDRAL, EDINBURGH: INTERIOR VIEW

PROVERBS FOR GENERAL CIRCULATION The snccessful will tell you that "success is the anfailing reward of merit." Tbe world too readily believes the platitude. (What of the nehle army of martyrs?
The guilty are over on the alcrt to take up and cart tho first stone.

| E | $\varepsilon$ |
| 650 | 4,550 |
| 989 | 6,783 |
| 934 | 6,538 |

The cost must, howaver, necessarily vary in bluastevery
street, snd it will he safer to take the cost per mile of fitting up streets with lydrants at 7ool., and the cost washing annually at 1,000 . per mile psr amnam."

## THE CURE OF ECHO

Sis,-I think I have sean it stated in your paper that ona of your correspondento say what sized wire and kind

EMIGRATION FIELDS COMPARED.
Sir,--Your shert review of the progross of the colony of New South Wales cannot but prove welcome to the emigrating section of the community. It is very painfal to seo suoh splendid emigzation felds neglected in favour of the United States, and solely hecause the colonies do not trampet their charms as the States do.
The statistics yon give speak volumes in favour of New South Wales, as I will attempt to shew. I have hefore me the agricnltural statistics of the United States fer 1872, and I find the average yield per acre there was:-
$\begin{aligned} & \text { Whent, } 11 \frac{1}{3} \\
& \text { Maize, } 25\end{aligned}$

| t 58. 5d. ............ 143 |
| :--- |
| $, 2 \mathrm{~S}, ~ 8 \mathrm{~S}_{1}$ |

In New South Wales the same year it stunds thas:-

## Wheat, 12 buahels nt Maize, 30 <br> $\qquad$ 23120 410

## The mean value of an acre in oach is thorefere:-

## The United States. New South Wrles

$\qquad$
Balance in favour of the latter............ 156
The cost of a passage to each is:-Nebraska, 10L.; New Seuth Wales, 14\%. The extra value of a ten-acere orop will cover the extra cost of passarc in one year
But let us look at the attractions of Queens land, to which colony a passage costs bot 42 ., the Governmeut paying the balance of 12 .
This colony, if we exclude York Peninsula, extends 6 degrees cach side of the Tropic of extends 6 degrees each side of the Tropic of climate , and there more dits northe from eat ous than there is from but byon the low it is nowhere disargreeahle but upon the low coast-lands. Wheat is not buchels per atica, but the yiela averages 30 banhels per aore, and maize 45 bnshels. Sogar The yield in cultivated, and by white labour in the yield in the south was $1 \frac{1}{2}$ ton per acre, and in the north $1_{\frac{1}{2}}$ ton, bat in the middle diatrict i.e., on the Tropio of Capricorn, it wis 1 ton only. Taking the whole colony, thero were last year (1872) ohtained 3,762 tons from about 3,000 acres, heing at the rato of $1 \frac{1}{4}$ ton per acre. The labour to produce a ton of sugar will cost about 107., and as the sugar is worth at least $27 l$., this is the most profitablo investment there can possibly be. Of conrse it requires nnited labour, as one man by himself cannot produce it, but ten can produce 150 tons per anoum with the aid of 500l. worth of machinery and four horses.
Now, sir, if we compare the income of ten mon in Queensland with ten in the United States we lave the following results :-

120 acres of land producing 1,350 hushals of
wheat, st 5s. 5d............................. \&351

## In other words:-

120 scres of land in Queensland will yield $£ 1,050$
1,200 screa of land in tha United States
290 ncres of land in tha United States
will yield ........................................ ft,050
Thus wo sce that to obtain the same results in enoh of the rival emigration fields, 120 acres must be cleared in Queensland, and 1,290 acres in Nebracka. The summer of the latter is much hotter than that of the former, but the winter is not warm enongh for the oultivation of the sugar-cane, and that fact makes the formor superior.
It is worthy of attention to note also the
differcnce iu the death-rate. Tbis is in Qacens. land, 15.2 per 1,000 per aunnm: United States 30 per 1,000 per anmura.
As regards the rate of wages there is no difference, but the cost of living is 25 per cent.
less in Oueensland than in any of the Wester less in Queensland than in any of the Western
States.

TUMBLE-DOWN BULLDLNGS, MANCHESTER.
Str, - The townslip of Hnimo has proved itself lo bo not one whit behind that of Lowor Bronghton is the character of ita buildings ; on the contrary, by the rocent fall of bonses in Embdea-street, Hulme has Rilled its man, whereas Lower Broughton only lamed a fow. If that man had heen a bishop (vide railways) instead of being only a hricklaycr, the whole city would have heen sot hy the ears, and dennaciations load and deep of the "jerry" work which cansed his death would have been
heard on all sides. But, as it is, the local papers simply notice bis death, and give a short report of the inquest, with the verdict of "Accidental death," and pass on to cousider other matters. Now, a bricklayer's life (aged 37) may not be worth much I forget what they used So fetch United States); but, mucb or little, it is worth something to the community, apart from its Falue to his family, and it does appear to me that proper precautions ought to be taken to preserve it, which, as far as I can gather, were decline to call this event an accident. In this case a certain number of houses such as working people are here condemned to live in, for want of better, wore contracted for, labour only, by a certain bricklayer, the bricks and mortar being sapplied by the customer, whose wife, according to her own statement, gave a general supervision to the building, in the course of which it appears that she observed a very ominons bnige in the $4 . \frac{1}{3} \mathrm{in}$. party-wall, which was built of old bricks entirely, and to a height of some 28 ft . ; that she then called out to the men above to como down and shore it up, which thoy theu dia, one of and shore it up, which thoy theu did, one of bnlge, for the foreman had seen it before, and he was of opinion that the wall would stand for ever. They afterwards returned to their work on the top, and very shortly aftersfards the wall gave way, and down came tho whole bag of tricks, meu and all, one of whor has since died in the infirmary, of the injuries he tben received. Nothing at all is reported about the other victims, who must get over their injuries as best they can.
Of course, as is always the case, the coroner and jury were assured by those interested, that everything previous to the fall was quite as it should be: good bricks, good mortar, and good workmanship; and, that zothing might be wanting, they were told by the city surveyor, Mr. Lynde, that he observed nothing wrong with the brickwork, althongh the bricks, being old, were not so absorbent as new ones would be, and that, as far as he could see, the mortar appeared to be
well tempered with time. The latter observation is so unique and ambiguons, that I should like to ask Mr. Lynde if he is correctly reported; and if 50 , what does he mean? Mortar is usually composed of three things, in variable quartities: sand, lime, and water; in the absence of any one of which mortar carnot be made. Speculative builders are not in the habit of "tempering" their mottar with too much lime, because, as they say, sand and water can lee got on the spot, and lime has to be fetched from a great distance, which makes it valuable; and, to make matters worse, they run their lime in pits here, in the same way as plasterers do, which takes out its virtne, as the phrase has it, and causes it to be slow setting; so that when used with old bricks, which have no "suction," the wall will be wet for a long time. But bricklayers would be very mach offended if they were charged with not knowing this; and yet, as we see in the present instance, they work on to tbeir death. They know, as every one else knows, that a $4 \frac{1}{2}$-in. party-wall between two houses, 28 ft . high, built of old bricks in ordinary mortar, is very unsafe at the best times. We had a very littlo rain or frost bere for several weeks previously to this catastrophe, and although the wituesses told the jnry that they attributed it to the frost, yet, as other brickwork near, which has been carried up during the same period, is uninjured, the pubbic will have graye doubts about its accuracy. The real cause of the "accident" was the thinness of the walls. As at Lower Bronghton, so now at Hulme, I ask, when are builders to be compelled to build honses which shall at once be safe to their makers, and warm and comfortable to their occupants
E. G.

BERKELEY CEAPEL, JOHN STREET, MAYFAIR, W.
Since its erection, this church has not undergone much alteration in the arrangement of the interior until recently, when, npon the appoint ment of the Rev. I. Teignmoath Shore to the incumbency, some improvements have beeu made, including tho removal of the cumbrous high-backed pews, which have been replaced by more fitting accommodation.
The old reading-desk has been bauished; the floor of the sanctuary has been raised and removed from the east gallery to the north side,
the choir-stalls having been arranged decani and
Among the decorative improvements may be mentioned the re-colouring of the chancel in snch manner as to show up the pilasters, panels, and mouldings; the pendentives of the ceiling are tinted in two shades of grey, with hrown n encanstic, warm orey and reddish brown with slightly floriated diapers. In the centre panel over the table is the figure of our Lord ascending to Heaven; the side subjects are respectively SS. Peter and John. The capital and bases of the pilaaters are brown and rold the shafts in Etruscan red, with broad bands of ivory colour at the top and bottom, ornamented with bronze-green, maroon, and gold.
It is the intention of the incumbent to take lown the east-end gallery, and to place a rosewindow in the wall behind it, to alter the side windows for the purpose of obtaining a better light, and to complcte the decoration of the ciling and pillars; and, in fact, the whole of the interior of the church, as soon as the neces ary funds, about 5007 ., have been raised.
The altar cloth was supplied by Messrs. Jones Willis. Tho works described were cxecuted nder the direction of Mr. Pitman, of the firm Pitman \& Cuthbertson

## NEC SINE LABORE.

If ev'ry cave with gold were fill'd, And er'ry shell contain'd a pear Who would then strong treasuries huild, Or wear the gem now decks the earl ?
The costly gold so finely wronght, From stubborn rock must first be torn The pearl deep down in ocean sought, By divers bold, before 'tis worn. What lightly comes may lightly go; Before they reap they early rise,

## They weary plough, and broad-cast sow

By stadious day and restless night,
Ey ceaseless thought, work never done,
They pluck the treasures Truth and Right,
The brightest jewels 'neath the smin.
They gain the guerdon dne to fame, The crowns and laurels heroes wear Because so few the labour dare

Oft studious day and restless night But win some grain of truth at last; Gainst so much toil the gold seems light, Wben in the balance conntercast.
But who cau tell what wealth may rise From that pure grain in days to come,
Shall strike the lode and trace
Work on, work on, and ne'er repine Though treasure found may not be great; To earnest workers gods incline,
Who moto by will, and not by weight.
W. Cave Trowas.

## ROOF COVERINGS FOR FARM

 BUILDINGS.In the construction of some kinds of farm buildings, a cheap form of reof-covering is a dosideratum; this more especially in tho case of temporary buildings, as sheds and the like. Zinc plates, or galvanised iron, plain or corrugated, are of teu recommended in snch cases; bnt these are rather expensive, and require workmen
more or less skilled to fit them up. A writer in the Field says, - Where rough boards can be had, a very good, and indeed a lasting, though cheap, roof covering may be obtained by usiug them. Slabs will answer if of uniform breadth. This is necessary that their jancture lines when placed on the roof should run in as straight lines as possible, so that the half-round rolls or slats which cover the joints ess io a made of the uper side adds mnch to the appearance of the roof. To present the covering slats or rolls from being split by the "giring and taking" of the boards of the roof, the joints of which the slats or rolls cover, these must be nailed to the boards on one side only. A roof boarded and rolled may be made to last well for years without slates, tiles, zinc, or asphalted felt,
by simply covering its sucface with a composition of ordinary coal-tar, in two or three coats. The cement known as "Portland" is now being nsed iu a variety of ways in construction, and with marked and most economical advantages ; perhaps its most recent application is to the formation of cheap and durable roofing in conjunction with coal-tar and strong brown paper, such as is used for laying under carpets, The paper is laid upon the boarding of the roof he sheets overlapping not less than 3 in ., but better if $4 \mathrm{in}$. ; the sheets are then tacked down, and the surface covered with the composition, which is made as follows:-Take 180 lb . of Portland cement (this should weigh, to be good, 100 lb . to 110 lb . to the bushel), and mix it wel a cauldron heated by a furnace. Care must be taken to heat the tar gently at first, so as to
prevent it boiling over : and the cement must be prevent it boiling over : and the cement must be mixed gradually in small quartities, so as to
insnre its thorongh mixture with the tar. The mixture, when completed, is to be spread over mixture, when completed, is to be spread over
the surface of the paper with a brush, and in as hot a condition as possible. The surface is then to be rolled over with a light roller, to make it as even as possible, and when partially dried is then to be covered with another layer of brown layer to "break joint" with the frst-laid layer In some cases a layer of sand is laid all over the surface of the boards before the first layer of paper is laid down.
Of a similar process we have already given some particulars.

THE SANITARY STATE OF ROTHERHAM.
The report of Dr. Ballard "upon enteric fever in Rotherham, and generally upon the sanitary condition of the borough," has been laid before the local council. This gentleman was sent down by the Local Government Board some time ago to inquire into the sanitary conclition of the borongh. The report states that he had visited the town ou November 21st and following days, and fonnd that the statement as to the prevalence and fatality of enteric fever in the townships of Rotherham and Kimberworth, including Masborough, and outlying places-all of which were within the jurisdiction of the corporation of Rotherham-was correct. The report dwella upou the utter and complete sanitary neglect throughout the town. He condemns the system of ashpit privies. The corporation, he thought, neither systematically cleansed them itself nor did it systematically require the occupiers of premises to cleanse them.

The corporation [continues the report], Las neglected its Thty as the suthorised guardians of the puhic health
within the borough. The disguring condition of the poorer neighhourhoods, of the courts and of the privies and ash-pits, aud the auwbolesome condition of most of
the cottages, could not have ben made the subject of the unfoyourable eommmetts I have been compelled to mathe,
had the local authority exercised, even in the rustter of the most ohvious and lagrant nuisances, the powers whi of has pogsessed ever since the year 1855. Since 1866 it nnisances, the salject of complaint, are remored or abated, but, under the 20 ch bection of the 8anitary Act, to make systimatio ingpections, with a view to discover
nuisances dangerous to health and to obtain their re.
woral. This duty bas not been performat mosances danigerous to hesith and to obtain their re-
moval. This duty bas not been performed: it has not
even been attempted to be performed. Again, since 18668 eren been attempted to be performed. Agsin, since 18698
it has been its especial duty to see that drains, privies, and ashpits within itsjurigdictiondo not hecome nuisances,
and it has nemtected its duties in this matter to sueb an exteut that they bave become the redia of gpresding
enteric ferer throughout the district uuder its control.'
The report coucludes by suggestions as to the measures which the corporation may at once take for the arrest of the spread of the fever, and as to the future general administration of the borough.
A letter was forwarded with this report from the Local Government Board, requesting that they would inforn board as to what steps they proposed to take in the matter.

Waste Pipes and Sewer Gas. - The same thing has to be said agrain and acain. The medical officer of health for St. George's,
Hanover-square (Dr. Corfield), has called tho Hanover-square (Dr. Corfield), has called tho hat, in a house where he found a case of typhoid fever, the waste-pipe of the drinking water cistern weut into the drain. He had traced several cases of typhoid fever and one or two denths to this cause. He asked if he should give notice in such a case to make the waste-pipe rain elsewhere, and, in case of non-compliance,
ummon the offencer. Dr. Corfield was directed to serve a uotice in the case.

THR TRADES MOVEMENT
Sheffield.-The wood. tarners of Sheffeld have struck for au advance of $12 \frac{1}{2}$ per cont. They will receive 3s. or 4s, a week more than the
regular strike allowance, their union being very stroug

Huddersfield.-The master paintors have refused to give an adrance of wages to the men, but havo offered to reduce the length of the day's work by allowing the men to commence work in the morning half an hour later than hitherto
Birmingham.-The carpenters, joincrs, and bricklayers have agrced to settle their demand for an advance of warges and alterations in the time rulcs by arbitration.

Exeter:-The carpenters and joiners have given their employers notico that unless the ninc-hours movement is concoded to them, and their wages increased, they will striko nox to the demands of the men. Negotiations have been in progress twolve months.

Wolverhamplon. - At a mecting of the Wol verhampton Brickmakers' Association, it was una per 1,000 on the present rate which is 5 of 18 per 1,000 on the prescnt rate, which is 5 s . The pence, as a start, for one year, and the makers pence, as a start, for one year, and the makers
assented. It is the determination of the men to striko unless the demand be conceded. meeting of masters and mon representing the Iron Trade Conciliation Board lias met a Wolverharapton, and the masters have resolved
that it is impracticable now to adopt a pcrma that it is impracticable now to adopt a porma.
nent scale for regulating wares, and that the nent scale for regulating wayes, and that the
condition of the trade does not warrant any condition of the trade does not warrant any
advanco upon oxisting rates. The delegates in. adranco upon oxisting rates. The delegates in.
timated that these terms would not be accepted timated that

## by the mon.

Edinburgrgh.-At a meeting of the joiners of Edinburgh held in St. Mary's Mail, it has been agreed to accept of the oftor of the
employers, viz., 7 d . per hour, beiner an odvance employers, viz., 7d. per hour, being an adrance of one halfpenny per hour.
Essays on the Labour Question. - Mr. Arthur
Steaing has offered prizes of 50. and 30 for Steains has offered prizes of $50 l$., and 30l. for the best essays on the Labour Question. Me proposes the lst of September next as the latest time for sending in the essays, aud to leave it to as to whether any and which of the essays come np to the required standard. He does uot confine the composition of the cesays to any elass of writers, and tho chief ohjects he seeks to obtain from them are :
classes of not permitting the intellicent athe workin
 hard, to adrance beyour the lerel of the nnsteady, irdo-
lent, and simple-minded men, the main objeet in the life of most of whom appears to be to consmone their aranings
in strong drink and other debasiug habitg. 2. The true principle npon which canital and lablour can be har moniiged. 3. The best meane for elevating the stille
labour of tho country iuto a better social position than it
 adrantage to the morking classeg. 6 . The application of mainenio for this country the pre eminent position it lias
hitherto held in this desperment $n$ hitherto held in this department.
Mir. Roebuck on Strikes and Demagogues.-Mr. . A. Roebuck was present at a banquet given a toast, sail,-

In the Eugligh workmen therc are great virtnes, but
 World ought to look th to-that ho is the one whe pre-
serats mankin man inesanco af great magrificence and
and

 he is abows to do oror hirim, nde so ho worke upon higs sim-

 England will fill. Now the demagoguo who omeme sown
and preaches to the worlman that eupital is his euomy,
and
 eapital who knows whint he has to do will coneiliate the
working man, and will make him his friend. Ihz hefefore
 fonow what are the terrible resulte. That strike ia pot
for the parpase the working man $j$ that t trike is for hho
purpose of the demagognes who impose upon his simpplicity.
National Association for the Prevention of
Strikes.-A meeting of the supporters of this
association met recontly at Chippenham, for th purpose of hearing an exposition from Mr. Jame hillips, the secretary, of the objects of th bad been called into existence at the instance of bad been called into existence at the instance of some of the leading farmers and tradesmen of the county, who felt the neccssity of raising powerful organisation, having for its object th prevention and repression of strikes, and the advancement of arbitration in trade disputes The association was one entitled to tho suppor of the nation, and to the nation they woul appeal. It was unsectarian in claracter, and represented in its constitution all shades of political opinion other than those who favourc revolutiouary, republican, and dangerous changes and its objects were to counteract the deplowhle effects cansed by strikes, and the danger wit which all classcs of the community were threat ened as the result of the tactics of the repub lican aritators, now prowling about the conntry setting class against class. The project, as ex plained by Mr. Phillips, was received with favour and at the closo of his address the following resolution was unanimously carried:-
"That this meeting having heard Mr. Phillipas explation for the prevention and repression of strikes, and the

 throughout the country by establishing tranches io ever Kiagdom
Mr. Phillips said public meetings would b announced to take placo in London and the chie? centres of commercial intcrest.

## WIRING THE WORK.

Sir,-The pretended invention of Mr. H. Turner, of which somo account appeared your journal, constitutes an essential feature of ny monolithic patent, which has not only been develoned the estounding powers of fing siuce doveloped the astoung powers of fibrous an bination with other fions materials in combination wh cementions snbstances for al hinds of huildinga, futhgs, and fixturcs in build ngs. Instcad of the awkwara and tentative operations descrihed in the paragraph in ques not, under my patent an entire structure i cements, bot actnally the aid of any available sements, but actually without the use of the smanlest fragments of wood, lead, or other sub.
stance capable of injury hy fire. Thns the sur face of all parts of overy wall, ceiling, floor, door shelf, closet, \&c. is enabled to be finished in one operation, and ornamented in any manncr de sired.
I have only to add, as tho advertisement in relation to this subject announces, that any
person using wire in the mannor described without my licence will be amcnable to the law

Philff Brannon.

## SCHOOL BOARDS.

Noithampton- - Afr. T. Roger Smith, architect, London, was, at the instance of the chairman, axed upon to make a selection from the varions plans sent to the Board for the erection of sites. Mr. Smitl reported that there-Lere in all 51 designs, of which 29 were for the Spring. lane site, and 25 for the Vernon-terrace site He reduced them nutil he was able to recom. mend for the site in Spring-lane the design named below, as being, in his opinion, the thre first in order of merit:- The first, "Experientia," "Col.; the sceond, "Spes," 4,000t.; the third Cor trenience, Economy, and Stability," 2,940t, recommended: - The built in Vernon.terrace, he second "Education" 2,5857 and 2,0951 ., third, "Convenience, Economy, and Stability," 2,350 . The report went on to make some observations with respect to the designs selected, and a long conversation ensued respecting the conditions under which the plans were sent in. Mr. Phipps said it was a question for the Board whether it would take the two sites together bnt while he should take the opinion of Mr "Experientia", Spring-lane site, and accept "Expericatia," because thero was comparatively little difference between that and the lowest; with regard to the other he should panse, and prefer to take Convenience, Economy, and Stahility," becanse there was a difference of 650l. on 3,000l. outlay. He moved that the plan with the motto "Experientia" be selected for
the site in Sprinc.lanc. Mr. Rush moved that the site bearing the motto "Convenience, Eco nomy, and Stability" bo accepted. Mr. Mason proposed that "May success be equal to labour," which did not appear in the list selected, be adopted as tho plan for the Spring-lane site Neither the motion of Mr. Rush nor Mr. Mason was seconded, and Mr. Phipps's proposition was voted for by all the members except the chairman, who preferred to remain neutral. Mr Adkins proposed that the Board select the one which stood first on the list for the Vernonterrace site, because the architect had thought it descrved the first place, considering economy with the general requirements. Mr. Rush again proposed "Convenience, Economy, and Sta vility, but failed in getting a seconder; and the original motion was carried, all voting in its farour except Mr. Rush and the chairman. The authors of the plans chosen are:-"Experi entia," Mr: Robert Walker, 10, King's Arms yard, Moorgatc.street, London, now engaged in building Rochdate Schools at under $4 l$. per child; "Spes," Mr. J. G. Bland, architect, Unity buildings, Temple-street, Birmingham.

## ACCIDENTS.

Fire in a Timber-yard at Liverpool.-An alarming fire recently broke ont in the timberand bnilusing to Mr. John Westmoreland, joiner , cular saws. In the upper rooms there were Working abont twenty men and four boys, who, immediately they saw tho fire, made an effort to Eave their tools, hut they only partially succeoded in doing 80. Notwithstanding every effort on the part of the firemen, the building in which it originated was completely gntted. The stoch and property are insured in the Queen's to the cxtent of 2,600 ., but the daccage is estimaked at 3,5002 .
Fall of a Scuffold with Five Men at Southwort While three workmen, in the employ of Mr. John Luke Highton, bricklayer, were at work on a new house which is being erected in Upper King. street, Southport, one end of the scaffold on Fhich they were standing save way, precipitating to the ground two of the bricklayers and three labourers, who wero on the gangway underneath and strewing the basement with the díbris of a wall 16 ft . high. The workmon are all more or less injured by the fall.

## THE SEWAGE QUESTION

Failure of the Great Crassness Sounge Enperiprising to claborate iuvestigation the Metropoliton Bord of Works have decided that the results of the trial of the "A B C" process on the London sowage are unsatisfactory and unprofitable According to Mr. Bazalgette, the chief engineer to the Board, the manure obtained costs 6.. 6s. 4d. per ton, without reckoning rent ccording to Mr. Keates the eciation of plant the chemicol raine of the consulting chemist the chermical raiue of the manure is 20s. per only a fesw shillings hares of the company ales Thi is go hor received for peatedly showed, process in which, as we re The IVindoor Drainage Question.-The Local Board a forl meyt question-The local Board, at a fun meeting, hase discussed the fuestion whether a system of irrigation or that deodorisation and precipitation should be dopten, and a majority of eighteen agrainst two hen in fiter system. It was arious lor Guano plans, laching those of the Native Guano Company and General Sewage Company nd rccommended oue for adoption by the board. The Board aterwards discussed, rivate, the defonce which should be made to he summons taken ont by the Thames Conervators against tien
the Utitisation of Sewage in Leeds.-A deputa the Leeds Town Conncilerage Committee of the chairman the ewly-appointed borough engineer and surveyor hare visited Bulton to inquire respecting the sewage uthisation wolks, and a report has been iven in to the general committee. It seem hat in Leeds the residuam of the process doe tot prove to be so valunble as was hoped, and e question of mixing night. soil with it under discussion. This plan has been partially
adopted at Bolton. There the soil is mainly pur cbased from the mills, but in Leeds it is sng gested that it shonld be purchased from the night-soil department. To tbis department th soil is valuable, and by its sale to farmers and others the expensea of the collection of soil and ashes are materially reduced. Were the soil taken away, the ashes could not, it is thought, be so readily disposed of as at present, and this, together with the price to be paid for the soil required to mix with the sewage residuum, seems to be a difficulty in the way of the suggestion boing fully carried out.

LOWESTOFT: BELLE VUE PARK COMPETITION.
Iv reply to their advertisement, the Commisaioners received twenty-seven sets of designs for laying ont the proposed new park. The Commissioners, having inspected the drawings, manimously agreed that the design bearing tbe motto "Merlin" was entitled to the first premium, and the one called " Floreat Lowestoft" to the second. The names of the successfu] arohitects are as follow :- "Merlin," Jir. W. Clement Williams, Cavendish-terrace, Halifax; "Floreat Lowestoft," Mr. Geo. W. Usil", Assoc. Insi. C.E., and Mr. J. Wattall Pegrs, Assoc. Inst. C.E., Great Queen.street, Westminster.
Owing to the peculiar outline of the site, no Jittle difficulty would have to be overcomo to produce satisfactory results.

## CHESTER CNHON COMPETTTION.

 Str, - - When beaten in a competition, as a rule I think itbest to say nothing; but one does like to be fuisly heat en and the injustice in the present case is so glaring that I ahall he glad if you will insert the following, remprlis." On the whole, Iagree with the letter from "Yerita," in
1ast week's Builder, but I would also ask - Fow is it that
the Guardians (who have now called in the aid of an the Guardians (who have now called in the aid of an
architect, to be appointed by the Local Goreroment
Board, to assist them in selecting the best design) folt Board, to assist them in selecting the bcst design) folt ont of the original thirty designs? Also, how can these gentlemen know that the desimens
they hare selected can he executed for the sum named in the conditions, riz, 30,0000 .? Are they awaro that cant is the essence of the present cornpetition (the snm
being ised
unquestionahly
losp that the qnestion in justice ought to be, not only "whieh is the hest design, " but "" which is the best design that, it
may rearonably be nupposed, can be executed for the stiphmay reatona
lated surn"
On this question the Gnardians are as git to judge as so
many children, -even without taking the " loonl friends" many children, -eren without taking the " looal friends"
into consideration. (Note.-I should like to learn into consideration. (Note. - I should like to leara 1 he
real cost when finished, for their requirements are enormous !) will only add that my drawings wore returned withont even thanks for the trouble and expense, though, 23 aent in, they Fere worth little nader $100 h_{\text {! }}$,
The thirty architeets engaged would have done well had they each put in bul., and then had a raflle for the prize id
really, they would have apared themaelves mueh hard really, they would have saped themselves much hard
work and annoyanee, and the lucky man would have had the commission without having even earried out the work,
Well, erchitects hare only themselves to thank for a stane of things that can reuder such a competition as thi
possible.

METROPOLITAN゙ CONVALESCENT INSTITUTION CONPETITION.
Sir,-It shonld be known that three out of the fonr architects invited hy the Board declined to competo under the circumstances for the New Children's Asylnm, at Kingstou-hill.

One of the Architects.
PATNTERS' THREATENED STRIKE. Sirr,-In Liverpool the paiuters are again agitating for
a further advance in wages as the season for paiuting a further advance in wages as the season for paiutin
comea on. They may or may not in this instance be ello
to ohtain all they want from the employer, but what i the consequetion ? The master painter hos to charge exorbitantly to the putblic; the lattor will snbmit only to
a certain point. The eriil works its own care. At the
present time there are ecres of painting hoing done in present time there are acres of painting hoing done in painters. Large owners of Tarehonses, houses, ollices, selves, employing old sailors, (and many of them are
aplendid hands with the hrush), others get the work done hy their warehonsemen, or byordinary lahonrers, at 3 s to 33. GA. per day (a day, too, of elerento to twelvo honrs), and
I will tell youn the result in one instance. A friend of mine wanted the ontside ironwork of a large hlocko f buildings, scraping and painting, and got an estimate in for doing
it, whion was 2 ge He bonght his own paint, employed ordinary working mon, nat the huilding was as well painted as any practical painter could do it, at a cost painting the outsided of of offee blocks, warehouses, ironWork, and snck like ? It does not require an artist to do thiedesoription of painting. When a roorking painter would
come and do a fir day's worle for a fair day's pay (hefore he was the slave of a paid agitator), he was always sent he was the slave of a paid agitator), he was always aent
for, The pullie are always willing to five a fair and
reasonable advaneed price for wort when the working
man has to pay more for the necessaries of life, hnt kicle
ngainst imposition and now owners of property are fast nainst imposition; and now owners of property are fant
folloving the examples set by one or tro, nand never send or the working painter but when shilled labont is a nece Witv such as for graining, platting, \&o.
Why shoutd not London follow the pool in this respeet? An Estate Agryt.

## PARTNERSHIP DANGERS.

 diegoive a partnerghip and appoint a recelver in the West-
minster County Coutt.
Mr. Harding stated that having noticed an advertisement requiring a partuer for a flonrishing manufncturivg hasiuess he replied to a firm of solicitors, who referred
him to Mr. Banks, the defendant, who gave a glowing him to Mr. Banks, the defendant, who gave a growing, per week, which might be increascd, and the profits wero
101. a week. The profession was that of lithographers and 10f. a week. The profession was that of lithographers and
dranghtsmen, and was carried on in Drury-lane. Bedranghtsmen, and was carried on in Drury-lane. Be-
lieving all this, he agreed to become a partner, and a prorisional deed of partnership was drawn up betweea himself and tha defendant. He had paid altoget her li3l, into the conceru, and the deed arranged that at the expiration
 It was not very long before he fonnd that architects, engineors, and other customers, did not patronise their firm
to an extent of profit, aud his partocr further executed a
hill of sale without his consent, signing it in the oame of the firm conjointly. He now, although the three month had expired, prayed the Court to grant his application, as it would entitle him to a lien ou the goods.
The Judge (Mr. F. Bayley) anid smpposin
large estate involved tha proceedings now taken wonld be adviable; ; but from what had been stated he should say it would be policy for the plaintiff to take what he could get
witlout fncther litigation or expense. Ho should euggest
B eompromise.
The oounsel
i and solicitors, with their clients, tools the hint, and it was agreed that the defoalting partner should
give all the goods and stock-in. trade to the plaintiff; the partnership to he dissolved; each party to pay his own costs, aud all litigation to cease.

THE FALL OF A BUILDING AT WALKLEY.
Av action,-Burton o. Powell,-has been tried at th
Shiffield Coanty Court, to recoser Bl. 1 l . Bd., damap done to the property of the plaintiff, under the folloming circumatances:- On the 26 th of January the gable end
of a house in course of erection, in Indistry etrect of a house in course of erection, in Indnstry. strect,
Walliky, fell in, and bulged in the gable end of tho honse
situated a few fect distaut, and occupied by the plaintift. Alarge apertnre was made iu the wall, and about half
ton of brick and timber fell into the bedroom ton of bricks and timber fell into the bedroom and
deatroyed fraitnre to the a bove amount. It Frg alleged
tlat the newlyercted proper supporterected property had been the mortar used in conatt mithoctiun
was little better than mad. Tho plaintifl, who lad was little better than mand. The plaintiff, who had enter-
tained fears as to the insecurity of the house, had removed his wife and children the day before the oecurrence. For the defendant, it was shown that the defendant was
not the contractor for the property, and the plaintiff was not the contractor for the property, and th
non-suited.

## TחE ARCHITECTS' BENEFOLENT

 SOCIETY.THe annnal general meeting of the memhers fook place on Wednesday, the 12 th inst., at the looms of the Royal Iustitute of British Archi Smirke, B.A., occupying the chair
The report showed that favourable progress had hecu made by the Society during tho past twelve months.
"The gross receipts during the past Year havib amonnted
428. fosen year 1871, pnd there remaina now a balance in band of eriod last year, end again a somewhat larger sum was distributed during the year 1872 than in 1871 ,
The council regret to state that the dcaths of memher during the year hase nearly equalled the number of new subscribers; hut it is earnestly hoped that great efforts
will be made hy all who are interested in the welfare
of the society to enlist a greater number of members,
The report then alluded to the fact that thougb much work was heing carried out hy the profes. sion at large, "old age and sickness. have still their nnmerous victims ; and, above all, the cries of the
Tbe report concluded with a recornition reo Royal Institute allowed the Society for holdiag their meetings, and of the prominent notice into whicb their president, Mr, T. H, Wyatt, bad brongbt the Society

Tbe meeting then considered the auditors' balance sheet, which showed the receipts during the past year, from all sources, to have been 281. 12s., and the expendituro 296l. 1s. Id., of which 190 t. had heen in gifts to applicants, and Il. 18 s . had been invested.
A discussion ensned, headed hy Mr. D. Mo. catta, upon tho plans to be adopted to extend still oonsiderably curtailed through lack of funds; nnd upon the snbject spoke Messes, Boulnois, Cockerell, Kerr, and Nash
In addition to those alroady cited as present,
vere Messrs. W. Moseley, Geo. J, J. Mair, T. M.

Rickman, G. Wales, Jobn Tarner, the hon. sec., and J. Goldicutt Tarner. Messrs. Hornce Jones, C. C. Nelson, J. Iت. Hakewill, and John S. Phené all wrote regretting the probebility of their being unable to attend the meeting.

At the close of the proceedings, the president tated that since the conncil meeting of the 27 th ult., the following donations had been 27 th ult., th
received :-

## Horace Jone

D. Mocatia

John Turuer, hon. .....
Arthur Blomfie
Wm, Moseley
And that Mrs. Edward Hake will continued her lato hus. hand's subscription; also that Messrs. John Noyes and C. Dowling had pro
each of one guinea,

ST. SEPULCHRE'S CHURCH, LONDON.
TIIE restoration of the fid front, and porch of this church has been placed in the heads of Mr. W. P. Griffith, F.S.A., whose drawings, having been approved hy the subcommittee and the Estates Committee, were unanimonsly confirmed by the Vestry at their last meeting, and Mr. Griffith was appointed to carry out the samo.
The perspective view exhibits the perfect Intter are not contemplated at present.
The new octagonal angle-turrets are to be octagonal pinnacles with and surmou crockets The parapets are to be embattled and panelled, and the buttresses are to be restored with gablets. Tho helfry and tomer windows are to bave mullions transoms, and foiled tracery, with canopied heads, finials, and crockets. The clock is placed in a canopy, with buttresses supported by winged figures.

The west mindow will be in three cinque-foiled lights, with transom and tracery, and, with the aisle windows, to have lead lights, quarricd. The vest doorway and porch are to he restored aactly as formerly. The canopied niche con. aining tho statue of Chancollor Popham is to oompy its original position over the doorway of the porch, and the parrise turret is to be carried p to its proper height and embattled as formerly. All the restorations and details are to be of the fiteentb centary, the church baving been built in the year 1.450 .

EDINBURGE AROHITEOTERAL ASSOCIATION.
Las week a meeting of this Association was eld in the Rooms, 37 , George.street. In the
bsencc of the president, Mr. Alex. Ballantine was liminary business, Mr. R. T. Shiells called attention to the very commonplace character of the buildings in progress on the south side of the Castle Rock; and after exhibiting the plans f them, the following resolution was passed :'That the Fdinburgh Architectural Association highly approre of the steps taken hy the town council regarding the Government new bacrack building on the Castle Rock, as they are of opinion that if executed according to the drawings, the huilding will be quite out of harmony witb the site and surcoundings." A paper was Causes affecting the Development of Architectnro in Scotland," in which the relations hetween the history of the Soottish people and certain features of the national architecture were traced and illustrated. The points principally referred 0 were the influence of the mixture of race of which the Scottish nation consists-the isolated situation of the conratry, and the ehsence of situation of the the intercourse with [reland in the early acres, and with Encland and France, at a later period, wos whown to lof morked traces on Scottisb art; while the influence of the national religion, both embodied in the primitive Church of the Ouldees and in that of the Reformation, favonred simplicity of ritual not conducire to mag. nificenco in the ecclesiastical buildings of the country as a whole, though there were many Marwick afterwards read a paper on "Architec. tural Sketching," part of which we print else. wbere.

## ARCEITECTURAL PUBLICATION SOCIETY,

Iv consequence of letters complaining of tbe stoppage of the "Dictionary", wo bave made some inquiries as to the position of the work. Mr. Artbnr Cates says, "the deaths, one after engagements of Mr. Wyatt Papwortb, wbo bolds engngements of ur. thyatt Papwortb, wbo bolds the management of the text, seerned to seriously
affect our progress. I have hoped for somo affect our progress. I have hoped for somo
opportunity to arise of which advantage might bo taken to go on, and meanwhile, considering that wo are trnstees for those wbo paid under the new arrangement, until the way is more clearly to be seen I demur to incurring any more expenditnre tban is necessary, and have a
large sum in the hands of the tresurer, Mr. large sum in the hands of the tresurer, Mr.
Sydney Smirke, available diroctly we can go on. Sydney Smirkf, available diroctly we can go on. funds are well taken care of in the hands of Mr. Smirke. Perhaps the better course will bo to hold a general meeting, to wbich the facts of the position may be fairly statod. Tbe only causes for not baving done so long ago have been the bopo and reasonable expectation that I might be able to lay before it a proposal for completing the 'Dictionary' out of hand.'

THE CITARTNG.CROSS APPROACH TO THE THAMES EMBANKMENT.
Ar the last meeting of the Metropolitan Board of Works, Mr. Bazalgette, tbe engineer of the Board, made a report as to the gradients and
goneral featnres of tbe proposed approach to goneral featnres of tbe proposed approach to
tho Victoria Embankment from Cbaring.cross, tho Victoria Embankment from Cbaring.eross,
as compared with the carved line suggested by as compared with the carved line suggested by
tbo late Sir James Pennethorno. The report disonssed at considerable lengtb the relative advantages of the Northumberland House scheme
and a curved approach. Tbe merits of the two and acnived approach. Tbe merits of the two
projects, according to the reporter's view, were projects, according to the reporter's view, were
thns briefly compared:-"1. Nortbumberland thns briefly compared:-"1. Nortbumberland
Honse approach is the most direct and sbortest toute witb the best inclivations. 2. It would he a handsome improvement, whereas one sido of
the curved line must be very unsightly. 3. The the curved line must be very unaightly. 3. The
Northumberland House plan would probably cost Northumberland House plan would probably cost
abont one tbird of the curvilinear project." Tho report was adopted.
Tbo chairman announced tbat the wholo of the new loan of $1,800,000$ l. was now fully sub. scrihed, at an average price of 95 l . 11s. 10d. per to $1,883,033 \mathrm{l}$. 14 s . Ad .
Mr. Dresser Rogers stated that a large amount had been subscribed in snms of 100l. hy the prbiio generally, while 400 ,
ap by one subscriber alone.

THE RECENT HIGII TIDES AND THE ROTHERHITHE WHARF,

## procebdings agannst tife ofners,

ThE recent disastrous high tides which flooded soveral houses in Rotherhitbe and the neigbbour. bood, and did much damage, have led to steps
being taken to compel the owners of the what being taken to compel the owners of the wharf wall to reconstruct it, as in consequence of the defective condition of the wall in question, the
owners of the wharf are beld nccountablo for owners of the wharf are beld nccountablo for
the injury to property which the high tides caused.

A memorial has just been presented by tbe Rotherbitbe Vestry, from the residents of Adam. street, complaining of tho loss and incon. venience which they have sullered owing to tbe flooding of their honses to a height of upwards of 3 ft . It appeared from the memoriul tbat in some of these honses the occupants slept on the ground.floor, and that several of them were wasbed out, and lost their beds and other articles of funiture. Some discussion followed upon the presentation of the memorial, from which it appeared that the responsible parties were the
owners of the wharf to whicb tbo mischief could owners of the wharf to whicb tbo mischief could be traced; and it was stated by the surveyor
that some three months aro he called the atten. that some three montbs ago he called the atten.
tion of the owners to the defective condition of the; wharf wall, informing them tbat the wall was an insufficient protection against tbe action of higb tides, and that in case of any such disaster as had now occurrod, they would be beld accountablo for tho damage. It was agreed to forward the memorial to the owners of the wharf, with an intimation that they wore bound to come bad sustained; and it was also resolved to inti-
mate to tbe owners that the vestry considered them respensible, owing to their having failed to carry out the recommondations of the sur. ceedings would be taken to oompel them to rebuild it.

## NATIONAL MONUMENTS.

IT is to be hoped that political changes will not interfere witb the passing of an Act for the preservation of our ancient national monuments contains various scbedulos before the House which we give scbecuse of buila ilgs one of ancient monuments intended to be protected :england and wales.

Any monuments of a like kind to the above not being situated in any park, garden, or pleanor includes the ruins of neitber forms part of abbey, religions honse, or ecoleciastical fortress, vill cory religious house, or ecolesiastical edifice,' the comemissioners the operation of tbe Bill, and the commissioners to be appointed under it may prohivit its injury or destruction, and talse stop
to acquire it in whole or in part for the nation.

The Last of a Foreman.-On Saturday last at West Bromnton Cemetery, tbe faneral of the late Mr. A. Rae took place. He was for several years a foreman in the employ of Messrs. Geo. Troliope \& Sons, of Belgrave Works, Pimlico. The various foremen of the firm, together the last mate of the employes, attended to pay uniform kindness and straighto to who, by bis highly esteemed by all who knew him.

NORTHUMBERLAND HOUSE: AN IDEA. Sig,--The trangfer of this well-known Charing.oross
tandard from the noble owner to the Metropolitan Bosd of Works, for improvements in connesion witith the $T$ hate Embankment, has called forth in the press a variety of comments, reports, and bistorien. matter. It has occurred, up a mutually contributed memorial of considersble e in. terest both to present es well es future metropolitan generations. There ean bo no two opinions that the "finest
site in Europe site in Europe." (as Trafalgar.-square has been called)
will have ita beauty wonderfully enbanced by the templated new erente from Charing.oroses to the embennkment, which will eerthinly form an architectural vista
wholly uneqnalled. But wo shal lon kaoly wueqnalled. But we shall lose our old favourito the Perey lion, now enciosing NorthumberIsnd Hous Irom viev. THE ABATTOIR QUESTION IN BRADFORD.
AT the present moment, when the question of publio or private slaghter.honses is engaging blention in the metropolis, slanghtorcement of the A private bory the bouses, it may bo interesting to notico important mafin bock in the morkent manufactaring town of Bradford in Some
Some time since tbe Bradford Corporation determined to huild a commodions abattoir at Leeds-road, at a great expense, witb the sole
 ogarh butchers took utabrage at the site, built a rival laugbter. bouse at Bolton Bridge, just out of the hits of the berougb, and there carried on the corporation that this proceedinc of the for the was an infringement of the manorial rights, for
which the corporation has to pay a large ycarly sum. A heary loss noorned to the corporation from the butchers removing to their own abattoir, and litigation has been going on until last week. Some members of the corporation were determined to test the rights acquired by the leaso of the manorial privileges, while others thought that the timo had arrived when litigation ought to cease, and the question be settled by the corporation buying np the butclers' nbattoir. The bntchers wanted $10,000 \mathrm{~L}$ for their plant and preunises, and 2,000. for law expenses. This, however, was thonght to bo a high price, and the council have just now agreed to purchase the premises of the Abattoir Company for 10,5002 . The litigation is thus extinguishod. It has, however, been a wasteful affair.

## HYDE PARK CORNER.

The Earl of Longford writes to us (as also to the Times),-

The opening of Hamilton-place suggests a farther improvement in the same direction, namoly, the construction of a short length of road in continuation of Hamilton.place across the corner of the Green Park to Constitution hill, and a carriage.thoronghfare by that route to Buckingham Gate. This wonld give a tolerably direct hie from the Marble Arch to Wostminster Bridge; it would still present some gracerul Gate to serious angles, and would relieve by Gate, no serious angles, and would relieve, oy avoiding, the blockade (to say nothing

Some jears ago many of us yiewed with alarm the proposal to open a ronte across a portion of St. James's Park, Experience has shown the convenience and the innocence of that arrangement. With this experience to guide us, it is believed that the adoption of the snggestion here respectfully put forward wonld, without its ander prown or any one of tage."

That great puhlic convenience would he afforded hy such an arrangement as that proposed is certain, and though one or two obvious objections come at
deserves discussion.
A scheme hy Mr. E. M. Barry, for improving the means of access at llyde Park-corner, wa illostrated in our pagos some few ycars ago

## "TO ARCHITECTS.

We have received several copies of a printed paper sent ont hy "the purchaser of the architects to submit designs, with specifications and estimates, for the erection of a buildine on the site to comprise shops on the ground-floor with suites of rooms or chamhers over, after the manner of the Belgrave Mansions, Grosvenorgardens, and offering a premium of 501. Cor the most approved dcsign, and one of 10l. for the preminms are, with the plans, \&c., to become the property of the Advertiser, who docs not bind himself to employ any competitor to aporintend or carry out the work." The least mount of consideration will, we shonld think mount of consiceration will, we shonla think, the profession from responding to such an offer

## STAINED GLASS.

All Saints' Church, Acton.-The fourth of the windors in the east hay of this church has heen fillod with stained and painted glass, the It is from the stadio of Powell, Brothers, of Leeds.
Handsworth Church.-A stained-glass memorial window, in memory of the late Rev. John Hand and his wife, has recently been fixed in designed and executed hy Messrs. James Ballan. tine \& Son, of Edinburgh. The window is divided into three tall lighte, in the Early Pointed style of church architecture, and has heen filled styte of church architecture, and has heen filled light illustrates "The Last Supper." The suh. light illustrates "The Last Supper." The suh. ject underneath is a space containing the text, ci1p, ye do show the Lord's death till He come" The side lights are illustrative of our Lord in The side lights are illustrative of our Lord in the Garden of Gethsemane.
soul is exceeding sorrowful, even unto death," $i_{k}$
lepicted in the one subject; and in the other is " 0 my Father, if this cup may not pass away except I drink it, Thy will be done." The diapering throughout tho window is formed or the Cross, outlined upon a light ground. The descent of the Holy Spirit is introduced in the top arching of the centre light
Hall of peteriouso agh.
Hat on in thine cantiage.-The large way-window in this hall has recently been filled with stained glass by Messrs. Morris, Marshall, \& Co. Mr. F. Madox Brown was the designer of everal of the tigures of worthes. The window comprises three tiers, of seven lights each. The Whole represents a tree, on the branches of which hang shields of arms: these occupy the lowest tier of lights. The second tier oomprise日
seven figures, one in each light, beino rcpresenta. seven figures, one in each light, being rcpreseuta-
tions of sis worthies, and the founder of the coltions of sis worthies, and the founder of the col-
lege, in lis monk's dress. All thcse figures are lege, in his monk's dress. All thcse figures are
by Mr. Brown. They represent, from our left by Mr. Brown. They represent, from our left,
Homer, Aristolle, Cicero, the founder, Friar Bacon, Lord Bacon, and Newton. Four othe windows, for the same hall, have been under taken by the firm in question. They comprise three lights each :-I. With figures of Edward I. St. Peter, and Queen Eleanor. The frst and third of these are hy Mr. Brown. This window is in its place. 2. Figures of Dr. Warkworth Cardinal Beaufort, and Chancellor Holbroke These fguros, designed by the artist we have amed, are finighed, but not yet set up. 3. Ca endisl, the chemist; Grofton; and Gray, th poet. 4. Crashaw, Bishop Cosins, and Whitgift.
The last tlree are placed, and are by Mr. Brown

## 

Happy Homes for Working Men, and how to get them. By the Rev. Jares Begc, D.D. Sccond edition, revised. Edinburgh: $F$ Lyon London: Cassell, Petter, \& Galpin. 1873. acute writer on social economy, has published a new edition of the above work, which has lready becn noticed in our columns. His theory is that, nnder certain forms of coopera tion, every workine man may eventually bcoome proprictor of his own house; and we are told proprictor "upards of 900 houses have thres been built in Edinburgh, at prices varying from 1301 . to 21ōl., the feu-duty [or ground-rent] being from 11s. to 20s. They are nearly all sold, and are chiefly the property of working men; whilst the shareholders of the association have jeccived annually from $7^{\frac{1}{2}}$ to 15 per cent. mpon their capital." We agree with the doctor (although we have differencce on certain points) in holding that this would be an advantageous applicatio of the present higll wages of the worki. and einful objects to which these are at present so often deroted."

## VARIORUM.

The Lithograpleer, monthly journal, No. 33, vol. iii. March 15th, 1873. London : Wyman $\&$ Sons, Great Queen-strcet. This journal conlains matter nseful both to tho trade and to the puhlic. We hope to sce it take higher ground as it progresses under its new arrange. ments. - - "Salvage Corps. By Henry J. Barber Brighouse: Bayes. 1873." The origin and use of firo salvage corps, with reasous for their general establishment, are shown hy the anthor of this pamphlet, who is vice-president and trustee of the West Yorkshire Fire Brigado Friendly Society and chief officer of the Royal Insurance Volunteer Fire Brigade at Brighouse.

The Amalgamation of the Mayor's Court, London, and the City of London Conrt ; with Remarks on the proposed Trihunal of Conumerce. By G. Manleg Wetherfield, Solicitor. London : Longmans is Co. 1873." The amalgamation of Court for Civil Causes, as here explained would the author holieves, remove unnecessary compli. oations and remedy all defects in these courts. - "The London Necropolis, or Woking Ceme. tery. Chief Office, Laucaster-place, Strand." In this prmphlet on account is fiven of the picturesque and well.conducted cemetery at Woking, with remarks on extramural scpulture the reguirements of which this cemetery helpe well to fulfil, as well as those of furneral reform (-The Ga, atte des A chitectes ot du Bitionent (Febrnary 28 th ) has roproduced from onr pares the plans and particulars of Mr Ches Barry' design for school in Winchester-street, Finsbury.

## 

Messrs. Moreland's Iron F'actory.Yessrs. Moxeland, well known for many yeare considerable old-street, St. Lnke's. Tho Metropolitan says, The frontage in the main street is extended 35 ft . and the new huilding, 48 ft hioh from ooting to ridee is lichted mainly by sikylichto outhe roof and is desiened for an There is no diaplay on the ground level-.. a plain rick rick the rollers, from which it is suspended, and passins vien in front of the hall On the floo hen open, in floge ft, wile of cast iron built ap sections It. whe, 1 cast-house is apeigh bridge ore entering the wrehouso is a weigh-oriage, ove hich vis and oing or ot pass and registe wh ny quantity of iron cannot be taken accurately was manufactured hy Messrs. Hart, of Leman. treet, Whiteclapel. The whole store is com nanded by an overhead travellor 32 ft . in the lear, powerful enouch to move and lift 10 tons This was fitted up by Messrs. Applehy Brothers, f Emerson-street, Southwark. The site is sap posed to bo exactly upon one of the localities in which pits were surk for the intcrment of the ead en masse at the time of the Grcat Plague of London, and a public-house at the angle of the Head," goes hy the name of the Head, -a local name undouhted.y derived in the irst instance frow the chow we have alluded, although now, as may be magined, he signboard that acsignates the of that name. The works have been carried out by their relatives, Messrs. Joseph Moreland \& Sons, of Old-street

Public Hall for Chesterfeld. - As the esnit of many committee meetings and much. deliberation, a joint meeting of the memhers or
he council of the Chesterfeld and Derhyshire Institnte of Mining, Civil, and Meohanical Engind ; of the committees of the Chest Woik ing Mer's Club, the Technical Classes, and the Chesterfield Young MLen's Christian Association; of the subscribers to the fund for plans, estio. mates, and preliminary expenses for the proposed public hall aud buildings ; and of other gentlemen interested, has been held in the Municioal Hall, Chesterfield, Mr. C. Binns in the chair. It then it appeared that the only vailable site in the town was at the top of the news street to the railwas station, nowy in course of formation, where it was proposed to purchase from the mayor a plot of ground containing 1,500 yards, at 12 s . d por yard, and to erect thereon commodious structure adapted to the increasing necessities of the town and neighbourhood. It sas surested by the committee that there hould be in common for the use of the rarious societies, a large hall capable of seating 800 persons, a soall 200 and a rood library, Somelhinglike 10,000 , would beneedod. The offer of the mayor was accepted hy the weeting, and it was resolved to make an appeal to owners of property, the great works in the neighbourhood, and the public generalty.
Widening the Metropolitan Thorough-ares.-The Westminster District Board of Woris have received from their Works and General Purposes Committee, a report stating that having consicered the systematic widening of the streets in the district, and the importance of widening Cannon-row, they have agreed npon the following recommendations, viz.:That it is rery important steps shonld be taken for widening Cannon.row at the present time, and that it is adrisahle a communi cation should be addressed to the Metropolitan Board of Works, calling npon that Board Thame the improvement That as to the more general question of widening all narrow thoronghfares upon a properly y-arranged system, from time to timo, as opportauities offer, either from land being vacant or from houses and buildings being demolished, the committee arc of opinion the subject is of great importance, nnd deserving of most selious consideration, not alone with reference to the Westminster district but in regard to the whole of the metropolis.? The report is to be considered at a specia vestry.

Axt and Morality. - There are few questions non which more dissimilarity of opinion prevails han that which relates to the mission of artists. Tbe Saturday Feview calle attention to a fal. lacions doctrine which bas recently been put forward, to the effect tbat the artist is unfettered by political, social, and religions considerations n the exercise of his art. Without entering merous ramifications, it shows the hest manner of ascertaining the true relations heeach their hiphest development hy practising the rules of morality, and the bighest art is llustrative of the most fully-wrought facnlties, $t$ may be tasen for a general rulo that a Iucive to the performance of great works. Tb oest art and the loftiest morality spring from ourity and truth. With recard to thoso who are ourity and truth. With regard to those who are hat their strength lay in the nobler sentimonts of their nature, not in the collateral evils which vere unfortunately mixed up with them.
Heating Apparatue. - Mcssrs. Truswell, Brothers, \& Holden, of Sbeffeld, have brought uat an apparatue, specially designed for this end, which is adapted to warm the air in public buildings, private bouses, warehouses, sale shops, \&c. u different cburches, chapels, schools, and saleshops in Sheffiold and suburbs, besides various other parts of England. The apparatus con-
sists of a number of cast-iron pipes (round or sists of a number of cast-iron pipes (round or nother, witb space sufficient betwecn each to allow of the heat to pass. Those pipes are fitted into socket plates with expansion joints, so that injury from expansion or contraction, the arrangement being such as to insure the fire passing ander ot over the wholo of tbe pipes. Tho appainto the pipes by means of fiues or apertures in the brickwork, and then goes into the hot-air Hue, from whioh it travels into the huilding to be heated. The beat is regulated by a peculiar ventilator. Tbe patent has lately been further for ono or more of the prizes offered by the ciety of Arts.
The American Iron Trade.-Tbe tronble is English coal and iron trades has been a golden opportumity for American iron interests. The production of American railroad iron in 1872 tons, an increase of 200,000 tons in one year. As compared with 1861 , the production of 1872 shows an increase of 191 per cent., the amount In 1871 the proportion of Englisb railroad to tho entire consumption was more than 13 per cent., but is reduced for 1872 to 35 per actually diminished during the ycar, while the aggregate consumption has increased by more than 150,000 tons. "A year or two more of the
same experience," says the Boston ( $D . S$. Adver. "and we shall be independent of tho English iron market, and may even begin to com. ete with it for the foreign trade."
Co-operative Aseociatione.-The accounts rendered to the Registrar of Friondly Societies by 746 industrial and provident (co-operative) societies in Liggland show that in 1871 they received for grocery, drapery, aud other goods sold $8,687,562 l$. Their expenses amounted to 382,3612 ., and they realised disposable net profits to the amount of 720,1211 . The societies established in Lancashire received in the year more than three millions cash for goods sold; those in Yorkshire more than two millions; tbose in retwrn is from the Civil Servico Supply Association, Monkwell-street, which numbors 3,422 momhers, has a sbare capital of less than 2,000l., sold, had expenses amounting to 40,7581 ., and made 18,626 . disposablo net profit. Above 200 ocieties neglected to mako a return.

## The Surveyorehip to the Highway Board

 Middleton Cheney.-Mr. Samuel Sharp, of Thenford, parish surreyor nnder the old Act,and a memher of the Board for a numher of years, has heen elected hy a majority of 21 to 10 of the Brackley Highway Board, as their snrveyor. The salary bas heen raised to 2007 . a-year.

The Air-Gae at the Cryetal Palace. The directors of the new Air-Gaslight Company resolved, with permission of tbe Crystal Palace Company, to light up tho westorn side of the north nave of the Palace with something like 550 burners. The row of burners on the eastorn side of the samo nave was supplied with ordinary coal gas. Dinring the illumination (about an hour and a half), the air gas is said to haro emitted a light that was quite brilliant and steady, at a height of 50 ft ., and a distance of several hundred yards, wbile it was heing made ment witb of burning in toe rropicu lipht was quito white, and at times of intense brilliancy, though it did not transpire with what velocity it was sent through the pipes. Its illuminating power, as sbown in the nave, was equal to tbat of tbe coal gas.
Royal IIBernian Academy of Arte.-The forty-fourth exhihition of paintinge, \&c., in con nexion with this deademy, was opened in tbei Gallery, Lower Abhey-street. The gallery presents an appearance superior to that of any former occasion, iu consequence of the alteration in the lighting from the roof, recently carried out under tho superintendence of Mr. J. H. Open, architect of tho Board of Works. The angular formation of tbe roof, hy which light to a great extent was obstructed, has been removed. The ight now of a semicircular form, and tbo sky ban has full play on tha sides and ends in a the pillars have beete to be desired. Even nothing whatever now to obstruct the view from any part of the gallery, or to throw a sbadow

## picture.

Monumental. - A monument has just bren erected in Burton Parish Church to tbe momory of the late Mr . William Worthington, of Newton Park. It is chiefly worked in Caen atono, oxcept the slab on which the inscription is placod, and that is of Carrara marble, surmounted hy three carred nichos of the Decorated period, in wbich are three figures emhlematical of justice, mercy,
and humility. A memorial window has just heen humity. A memorial window has just Nepyter on the soulh side of the chancel of ington, second Chnrch, to Mr. Calvert Wortl man. The window consists of tbree mair lights, witb traceried openings above, and is of the Decorated period. The suhject is a choir of angels, chosen becanse of the great interest the deccased took in forming the choir of the charch Messrs. Hardman \& Co., of Birmingham, were the artists.
Alleged Substitnte for Coal-Mr. William Wrigbt, of sheffield, plumber, has patented an invention whicb proposes, in short, to use air for
fuel. Fre do not quite understand it; but it is fuel. We do not quite understand it ; but it is thus described:-"Atmospheric air is passed tbrough a battery charged in sucb a manner that it carbonises the air which issues at the other hrighter than that of coal-gas, and when mixed with atmospberic air having a beating power capable of inelting copper wire. Mr. Wright oalculates that the gas may be made on this plan at the cost of 6 d . per $1,000 \mathrm{ft}$., but the con-
sumption will be one.half faster than that of coal-gas, so tbat the price will he practically 9 d. per 1,000 against the present rate.
The Propoeed New Railway Station at Middleshrough.-After the last meeting of the Town Council, Mr. Peachey, architect, Darling-
ton, wes in attendance at the Corporation Hall, and exhibited and explained the plans of tho proposed now railway station. On tho site of Cher present station the North-Eastorn Railway Company intend erecting a station, 300 ft . long, an np-platform and a down-platform, with two sets of offices, at a total cost of ahout 90,0001 . Mr. Peachey is preparing to let contracts for the work. This large outlay includes cost of sabways maderneath the new station to relieve tbe tratic over the level crossing
whicb is a husy thoroughfare.

Hoepitals to he built for Burning.-Dr. Woodworth proposos that all huildings intended for the treatment of the sick should in future be constrncted of wood instead of stone, brick, on iron, and that after having been in use ten or fifteen years, these wooden structures sbould he pital huildings advises this course because hospoisonous exhalations, wbich, respired by a certain class of patients, conduce to proyoke erysipelas and cognate disease.

Water-Supply by Steam Eixe Engine at Warwick.-In consequence of repairs heing required to the waterworks engines at Portobello, handhills were issued informing householders tbat for two days the supply of town water would ho stopped. Mr. Pritchard, C.E., borongb surveyor, however, detarmined to atterapt to connect the rising main with the fire steamer, and so supply water as risual. Accordingly, Shand \& Mason's small engine wae olaced in situ, and pumping was commenced. The experiment was snccessful. The low-lyin paris of the town were continuously supplied, and it was only in the higher levels that an intermittent flow was necessitated, from the low strength of the "steamer" as compared with tbe stationary engines.
Contamination of the Mancheeter WaterSupply with Lead.- A letter from Sir Joseph Heron as to a lecture by Mr. Ciace Calvert at tbe Royal Institution of Manchester having heen published in the local Courier, Mr. Calvert has written to the same paper showing that the Manchester water, whicb is very soft aud pure, does act upon lcad (as such water is apt to do); and ho republishes cortain statements and recommendations as to the fact contained in a report published in 1861 by a suh-committee of the local sanitary association. This is a matter of serious importance, and ought never to have been lost sight of. The lining of lead pipes with tin, Professor Calyert states, can only afford temporary protection, and is of no practical value. He has himself tried to suhstitute iron piping.

The Annivereary of Thanksgiving Day. The Prince of Wales has accepted a testimonial in commemoration of 1hanksgiving Day. It bas been presented hy the Ludgate.ail Decoration Committee, and consists of a poem profusely and elaborately illmminated by Miss K. Ashley, and inclosed in a caskot carved in rich pollard oak by Mr. G. A. Rogers, of Maddoz-street. Sir Wm. Knollys, in a letter to Mr. Herbage, the secre. tary of the committee, conveyed
"The thanhs and admiration which both the Prinecand Prisessa exprassed on Beciag one of the most beautifully ithunanated cud bound rolumes, nud one of the most
elaborately carred bozes which art in this or sny other country cas produce.

The late R. W. Thomeon, C.E.-Tbe in ar of the road steamer witb india-ruhher tires on the driving-wheels has died, at his house his ability. Blasting by electricity was one of hig earlier ocenpations, and Sir William Cubitt was so mucb struck witb it tbat he at once set bim over 500 mcn and engagod him in the gignti hlasting operations tben in progress near Dover From Cubitt's he passed into the omplopment of the Stepbensons, and at twenty-two heran husiness on his own account as a railway engineer He afterwards patented the india-rubber tire for road locomotives.

The New Royal Hotel at Blackfriars, Tho contract for the ercction or the now Royal Hotel, at the corner of the Hames Embank ment and Blackfriars, which is about to be erected for Mr. De Keyser, and for whicb Mr Graning is the arclitect, has just heen taken hy Messrs. Lncas Brothers, the amonnt of the contract heing 49,7902 . Tbis is independent of the foundations up to the level of the Embank mont, and 30 ft . above the ground-level at the rear of the hotel, for which Messrs. George Trollope \& Sons are the contractors. Messrs. Trollope's contract has heen completed, and the work is now ready to receive thosuperstructure

Thames Embankment at Eattersea.-The Wandsworth District Board of Works propose constructing an embankment similar to the Albort Embankment on the Thames, in front of St. John's Training College, Battersea. The scbeme has received the approval of the Thames Conservators; provided the work is carried ont to the satisfaction of their engineer. Tbe Board has no Act of Parliament, and arxangoments must he mado with Ear] Spencer, who owns tbe property, and who requires the land and premisea to be valued by his surveyor.

Plymouth New Guildhall.-There is some falk of completing the new guildiall in Ply mouth in time for the visit of the Batb and West of England Agricultural Society to the town in Jnce next. The architects are a present engaged with the plans for the gasfittings for the soutbern range of baildings.

A Veteran.-Mr. G. L. Taylor, the surviving author of Taylor \& Cresy's "Architectural Antiquities of Rome" (who is now in his eighty. sixth year), has expressed a wish to read a Architectus as artate of Architects, buildings of Rome. But as papers have been promised for all the ordinary general meeting nights of the present session, the council have arranged that Mr. Taylor's paper shall be read at the rooms of the Institute on Monday, the 7 th of April, when the chair will be taken at 8 p.m.
A Hotel. keepers" Association.-A meeting of hotol proprietors and managers has been held in tbe "City Terminus" Hotel, Cannon.street, E.C., for the purpose of forming an Association of Hotel-keepers for Mutual Protection and Co; operation. Mr. John Hall ("Great Western" Hotel, Birmingham) was in the chair. An association was formed, to he called "The Hotelseepers' Association" and other appropriate resolutions passed. Tho offices of the Associa. tion are to be for the present at the "Great Western" Hotel, Birmingham.
Sewage Irrigation at Doncaster.-Tbe extensive sewago works whicb the Corporation of Doncaster have been carrying out daring the hast two years, and which have involved an ont ay of ahout $25,000 \mathrm{l}$., have just been completed and the sewfage of the town is now being pumped ntilised in the irrigation of the land. The farm consists of 265 iges and is the Consists of 1 acres, and is the property of the foartoen years, at 800 l . per annam.
Addition to Stockton Workhouse.-At a meeting of the Stockton Board of Guardinns tenders for a new vagrant ward, estimated to cost 1,000 l., were opened, and sulject to the approval of the architect. The teuders of Mr. Bland (huilder), Mr. Smurke (joiner), and Mrs. Atkinson (plumher), to do the work for 4887. 9s. 6d., were accepted.

Lath and Veneer Cutting.--A prospectus has been issned of the Lath and Veneer Cutting Company (Limited), with a capital of $50,0001$. ., in shares of 42., to parchase Ellis's patents for outting wood. The payment is to be $1-1,0001$. cash, and 10,000 . in deferred share
Free Library and Mruseum for Hereford. The chief stone of a Free Library and Musenm for Hereford has been laid. Tho new establish. ment is being provided at the cost of Mr . Rankin, of Bryngwyn Park, Mr. Bowers is the con. tractor.

VOL. XXXI.-No. 1573.

The Real, the Conventional, and the Ideal.*

the present state of the fine arts in this country the most important,-or, at all cvents, the most self-snpporting, - branoh of design, is, prohably, portraituro. In this parsuit, while family affection, social respect, historic pride, physiognomic study, conenr in demanding the portrayal of in. dividnal likenesses, it is unforiunately too often the case that the mainspring of the call on the painter is personal ranity. Under this disastrous influence it is impossiblo that the nohlest featnres of art should be developed. The vigorous grasp of physioguomical characteristics, good or had, which is the chief merit of portraiture, is not cnl. tivated by the painter whose main object is to please his sitter or his friends. Noither the dress nor the ordinary type of 一 at least the men-of our time and country is often pioturesque. Thus the pursuit of portrait-painting for the sake of incomo tends to falsify or to convontionalise art, and to cramp, rather than to develop, the powers of the artist. Refage is songht in the courtly blandishment of some fashionable painter againat the unflattering testimony of the camera. Few thinge are more distasteful to a man of culture than to he expected to look through some richly-bound volume, full of tho cartes do visite of the family and friends of the owner. The sacrifice of the most pictorial light, or of the most oharacteristic expression, in the least ordinary of the subjects; the intolerable self-satisfaction betrayed hy othors; the positive hideousness,-thanks to strong and ill. cast shadow,-of many, lead one to wish evil to
Fox Talbot. But the walls of many of our exhibitions are crowded with produotions which share the general want of interest of cartes de visite without claiming even their questionahle virtue of a sort of grim fidolity,
At times, indeed, the painter will clotho his sitters with the mantle of his genins. Ho will seo the man, and reproduce him on the canvas. Thus wrought Titian, Vandycke, Gainsborough. Or an artist may see his subjoct through the coloured light of his own piotorial imagination, and present it to the admiration of posterity aglow with that borrowod lnstre. Thus did Sir Thomas Lawrence. An air of nolle, if some What histrionic, dignity was communicated hy his orush, while likeness was get preserved. In comparing portraits of the samo famous heauty by two swoh ornaments of their profession as Sir Joshna Reynolda and Gainshorongh, no one could mistake who was the painter of either. The strong paternity of the painter's genius is as distinctly apparent as the material evidonce of bis art.

We are not without ample gnidance for the formation of a pure taste in portraiture. All the tionents of what may be called realistic, conven. tional, and idealistic treatment are illustrated
by the relics of ancient art. As to painting, those only who have had the rare good fortane to witness the first unveiling of some long-huried Roman fresco at Pompeii can speak with fnl appreciation; bnt in sculptnre we have instances of an excellence that is heroic. A few, very few, Greek gems and ooins, a more numerons collection of portrait husts of imperial Rome, and a selection from the Papal medals, especially those alout the date or ascribed to the hand of Cellini, carry portraiture to its apogee. As we look on them with wonder, no less than with admiration, we may reflect how the vehement pathognomical action of the human oonntenance among theso impulsive races, and in a climate where the blood runs ao hotly, ever present to the observation of the artist, instructed him in the subtle truths of physiognomy. Unchecked and violent play of feature, no less than of form, was constantly educating the ancient artist who looked at hnman beings as subjects for portrayal. With this constant exhibition of the clothing of sentiment and passion in expres sion was hlended the influence of the tradition of art, the constant reference to those methods of delineating certain ideas, or certain characters, that had becomo conventional and determined.
The influence on Grecian art of speoial means of observing the play of human cmotion may he deteoted, in its most delicate phase, in the difference that exists between tho degree of individuality given hy Greek artists to the representations of the two sexes. Certain ideal cmhodiments in the conrse of that progress of art of which the history fails ne, had heen arrived at by the period of highest excellence. Certain gonii, or gods, or mythological personages, had assumed not only oonventional attributes, but permaneut conventional types. Japiter, Hercules, Apollo, Mercury, Neptune, are to be recognised oven in fragments. With the conventional idea strongly impressed on his mind, the artist con. stantly roverted to the formation of nature when ho sought to reproduce tho type. Tho Wearied Morcary, that mastorpiece of Italo.Greek sculpture, was not an academic study from a model. It was not patched up, like the design of a Wedgwood vase, from a gallery of statues. It was not drawn hy the artist from his own con rentional erndition and anatomical knowledge. It is impossible to study that all but breathing bronze withont tracing the evidenoe of the different elements mastered by the sculptor in perfecting his maryellous creation. First is the tradition of art-the conventioual idoa of Mercury. No one would think the statne inended for that of a youthfnl Hercules, or of an Apollo, or of a Cupid. Then there is the inspiration of the pose,-the languid, momentary, voluptuous, repose;-the stereotyping, for all time, of an actual incident in the life of a real Grocian youth, that caught the sculptor's eye by hazard, and never faded from his memory. With this we have the fruit of patient, truthful study of the actual model; of the aid derived hy the sculptor, in the emhodiment of his well-pondered design, from tho constant comparison of his work with the living form. In the ahsence of either of these elements of art, snob a production as the Wearied Mercury would have heen superhuman.
We may contrast such a work as this with the productions of Flaxman. In him we behold an artist of rare and delicate taste, formed on the purest models of the art of the past. He loved Greek art with a passionate lore. He stored his memory and his sketch-book with its forms; he hecarme almost as fully possessed with the conventional ideas of classic sculpture as Phidias himself. Nor was imagination wanting, nor labour. But occasion faited him, In the hahitual life and movement of decoronsly-dressed English men and women, or in the commanded and artificial attitudes of models, classic art could find 'no food to digest. It became starved to
death. One ramble, in a hot summer evening on the wave-beaten shore of Sorrento would have given Flaxman that without which it was vain to seek to evolse the shado of Hector or of Helen. A glimpse at Southern life,-at tho heroio,-the nude,-the natural,-mand then a faithful study of the typical living model,--for even the proportions of the Northern races differ from those of their Southern cousins, and Flaxman would have grasped that trisuph which his taste, thongh not his method, deserved. But Flaxman's Italian sketches are not taken from life, but from sculpture. Thas, Italy failed to impart the true lesson to his mind.
While so distinct an individuality marks the heroic senlpture of the male sex, female forms, or rather female faces, are far less readily distinguishahle. Flora, Juno, Heho, Minerva, Diana, Yenus,-who can tell which is represented in the absence of her attributes? It may he thought that the comparatively neglected state of femule edncation in Greece may in great measure acconnt for this want of ideal individuality. To some extent, this may be the case. But in an age which prodnced such women as Aspasia or Sappho, and in which freedom of female action was vindioated hy such a tongue as that of Xantippe, there conld have heen no want of characteristic female portraits, had the artist heen as free to ohserve the gentler, as the xuder, sox. And among the Roman portrait busts we find most marked instances of indivilnality. Sahina, and Plotina, and Cleopatra, have come down to us throngh the shadows of time with as distinct individual vitality as Tiberius or Scipio; or the immortal Caius Jalius himself, whose long-throated effigy is such a glory to the British Museum.
In dopicting goddesses and heroines conven tion was at a loss; for so was observation. With queens, and empresses, and famous heauties, tho sculptor was as much at home as with their lords. But the most graceful inhahitants of Olympus never came altogethor out of the golden haze with which the Sonthern sense of decoram thinks it needful to reil female chastity And when at last a long-lost art darod to pre-sent,-in spite of some lingering sense of im. piety, - tho female form entirely unveiled, neither physiognomical nor pathoguomical knowledge of the sex was on a level with the anatomical excellence which even in the work of Praxiteles tells more of the lahour of the modeller than of the inspiration of the poot.
There can he littlo doubt that the conventional element of Greek art was an inhoritance from Egypt. In Egyptian sculpture conventionalism may he said to havo attained its highest power. Certain features, such as the eye, are ropresented, during certain periods of Egyptian art, ahso lntely ont of drawing. Other details, whether accurate in their resemhlance to natnre or sym bolical (anch, for instance, as the short, square beard), can only he regarded as conventional indications of actual forms, whether the artifioe were that of the sculptor or of the subject. The attitndes are stiff; the proportions, at times, preposterous. The constant repetition of reci procally-indistinguishahle forms, of Colossns or of Sphinx, however it may have excited the sense of sublimity, is hardly fitted to awaken that of heauty. But amid all that is so foreign to a taste which has heon formed on Greek models, the sense of power, of repose, and of serenity that hroods over the mighty images of the huried Pharaohs denotes a very lofty phase of art. The sculptor in the time of the eighteenth Egyptian dynasty may be said, like the ancient monarch himself, to have sought to see the gods. In the age of Pericles, the artist regarded human passion and human beauty. Under the ferce blows of Michelangelo, marhle seemed to become plastic, and the ohserver gazes with wonder, not unmingled with awe, at the mastery evinced hy the artist alike over his material and
over his suhject. In the works of Roubiliac mar. ble is made to connterfeit a textile structure, in the drapery, and life-or death-in the firures themselves. In many of the works of Bacon we see an elegance equal to that of the Gnscon seulptor, shorn of his audacious boldaess; and
we trace a graceful mannerism as characteristic we trace a graceful mannerism as characteristio as that of Lawrence himself. And so wo doscend to the street scilpture of the day, - to the
Wellington on the Marhle arch,-or to the Pcel, which, in Palace Yard, proved intolerable eve to Loadon.
Regarded in another light, we may say that sculpture, in the time of the kings of the name of Thothmes and of Amenophis, had not yet fally separated itself from architecture. In the
Greek period it had passed into its own special Grease of epic art, -of poetry in marble. Im. perial sculpture waited upon empire, and sank sculptare became the handmaid of relimion, of superstition, and, finally, of ostentation. And so went on the decadence, till the sculptor sank into the companion of the sexton, or, still more lamentahle, into the designer of lampstands, and the decorator of the salon. The terrors of refined taste, if ho thought his memory destinod to he associated with the oppressive ugliness of such a stahle-door as now disfigures the aisle o St. Paul's, under the name of a monument to
Lord Palmerston end his brother, a ponderous, gloomy, unmeaniog gateway, flanked hy two very questionahle angcls, trampling on their own wings, like a
door clanticleers.
Unquestionably the most perfect and harmonious comhination of the ideal, the conventional, and the realistic is to be found in the architecture of Greece. The noble proportions of thoso Classic forms, which, after a lapse of more than 2,000 years, still challenge any attempt at rival2,000 years, still challenge any attempt at rival-
ship, are derived from the very simplest origin. ship, are derived from the very simplest origin.
A row of posts, trees, -with a hlook or slab placed underneath (as we guard our mining framework of to-day), to give a broader hasis for the npright; horizontal heams, laid from post to post, and others laid at right angles athwart; a pointed lean-to almost every human race, that have grown into almost every human race, that have grown ithto
the lofty columns, the graceful bases and capitals, the lofty columns, the gracelar bases and pediment.
the entahlature, the triglyph, aud the pedin Realistic, in the hnmblest sense, in their origin, the varions architectural elements hear the impress of a conventional mode of treatment that has maintained the general form of wooden structure when the material was entirely changed. The most brilliant and costly marhles of Attica were not employed in structures of an essentially masonic character. The very term of traheate
architecture tells of wood, and of wood alone. architecture tells of wood, and of wood alone.
A true masonic style may he said to have origiAated in Italy, especially in those districts where, as on the Adriatic coast, a fine soft stone, that hardens on cxposire to tho air, tempts the sculptor to lavish his work. We there find in the
windows, the door-posts, and the masks, gurwindows, the door-posts, and the masks, grar.
goyles, consoles, and other unnamod ornaments goyles, consoles, and other unnamod ornaments
that luxuriate over the costly palaces, a richnoss that so far overpowers the original idea of Classic ontline and regularity as to form almost an in. dependent style. But as in Egypt and India wo find either the earth mound or the cave to be the original type followed by the architect, so
do we trace the impulse of a wood-bnilding do we trace the impulse of a wood-bnilding people even in tho nohlest triumphs of Greek
architecture. Yet where does the ideal soar to such a pitch? Whence was learned the numeric barmony that defines evcry proportion? What grasp of optical law was possessed by the mind
that substituted the delicate curve of the outline that substituted the delicate curve of the outline of the column for the rigidity of an nndeviating
straight line? How has the humble,--we may straiglit line? How has the humble,-we may
almost say the ignoble,-element of the pitched roof (the expedient of countries whero snow has to he provided against) become the very
Olympus of sculptare, in the glorions Athenian Olympus of sculptnre, in the glorions Athenian tomples; and thus come to be considered as snch a necessity in huildings of a oertain cost.
kness as to haro descended to ns in the por. liness as to hare descended to ns in the por-
ticoes of the British Museum and the Royal ticoes of the British Museum and the Royal
Exchange? So perfect hecame the workman. ship, that the designer's art paused, and finally resigned itself to the mere effort of reproduction, with no variations hut that of scale. In the capitals was provided, even hy the soverest law, an ontlet for individual fancy, a space for an extempore ntterance in the litargy of art. But even of that it is comparatively
seldom that the architect has availed himself.

The symbol of the Deity to whom a temple was dedicated is to be sought in the onpitals of the columns. It is mostly confined to an insignificant boss. In the costly pillars which have heen crowded by the great Saracenic builders into the Dome that protects the sacred Altar
Rock at Jernsalem, at least a dozen different torms of capital may bo distinguished. Th nost exquisite play of fancy (when we once depart from the pure Corinthian type), with
which wo are acquainted, to he found in this which wo are acquainted, to he found in this department of architectural design, occurs in the case of Pompey's Pillar at Brindisi, where the heads of sea-gods are entwined hy the folia ons of the capital.
We are not among those who hold that the delicate harmonies of strnctural proportion have heen exbausted, and that, with the close of he Classic period, architecture uttered her last Gothic art protest acgainst such an idea-of art that was indigenous to non-Latin soil, and that sprang up with a vigour, and flourished into an exquisite beauty; that was fed by Teutonic fancy, Teutonic earnestness, and Teutonic faith. We will not now linger to trace the outcome ot the three elements of which we are speaking, cither in the severe and noble forms of Early Eaglish work, or in the hurst of lusuriant heanty in which tho art expired. But let any by some modern painters. Let him dissolve the harmony of his art. Let him be real, with the sordid realism which was enconraged by the window.tax; with the realism of that pirstye style of architecture which produced the hideous forms of the old Dissentin chapels, now gene rally swept away. Let him argue for the heauty of the conventional forms of strcet architecture, of suburban lath and plastor,-for the ideality of $n$ elevation of his own, unlike any for which a precedont can he found elsewhere. We know to por cost what is the result of atternpts such as taste, hut to positive professional ignorance From this judgment there is no appeal. And it is only hecause the painter adducsses a more limited and a more timid pnblic; hecanse, 1itti of his mayt, know of the great and enduring law spectators know less ; that the imposition of ssamine to fonnd a new school on neglect of main principles of art can for an hour escape detection. Architootare may supply more ready illustration of this important truth than can either sculpture or painting; but the law in the three sister arts is the same.
The expression, then, of a realistic, an ideal istic, or a conventional school is tantamount $t$ t the phrase of confessedly imperfect art. In any raly pictorial or sculptural design the thre deas must he combined. To attach maduo im portance to either is to ignore the proper influence of the others. Nor is this all. Not only is a
derotion to, for example, what may be called a realistic treatment, accompanied with a hlindness realistic treatment, accompanied whin an the nohlest qualitios which the artist onght to cultivato with the utmost care, but it defeats its owu limited ohject. As attempt to reflect in an imperfect mirror,-to copy, not to reproduce,--vill, after all, have as little actnal ality as Chivese pergpective.
It is not the case that an appreciation of the rue elements of excellicnce in art (such as lcads famo hy a pursuit of ouly one of the many studies nessary to completo mastery of design as being only imperfectly educated) would tend to the production of sameuess or unpictaresque uniformity. In the ahsence of original genus, high art cannot exist; and such genius will Ways speak in its own natipe, unmistakahle he resour us press into the service of art Let us chasten chemistry and of mechanics. Let us chasten the imagination by acenrate natomical knowledge, fire it hy the contemplation of all that is most beautiful in nature, and guide its wing by the study of all that is most pxcollent in ancient art. The result will be like that of giving tools to a workman or corces to a seneral. The true artist will create, under suoh a training, productions to which ho could never have attained by uncultured effort; hut he will no more lose his individuality or simulate the work of a hrother artist than Wellington can be confounded with Hannibal.
It is therefore every way to be desired that writers aud thinkers on art should cease to speak of the real, the natural, the ideal, the conven(ional, or the like, as distinct and competitive principles, pursued by schools of rival excollence.

The true artist must grasp the whole. He must he natural,--for he must see nature as she is, oot in her outer clothing alone, hut as the leacher, the mistress, and the friend; and he must bear her message to the world. He must he real,--for such a message is truth. He nust be conventional, - for he must know the result of the study, and the insight, and the practice, of those who have groo bofore him in his path. He must reap the fruit of their labours, and profit hy their errors. He must learn to speak in a language that is understood hy mankind, and to appeal to a sentiment prepared to respond to his ntterance. He must he ideal, for if he unite atl the former excelleuces, and yet look only on he lowest, the meanest, the most paltry aspects of life, he will be hut a hewer of wood and drawer of water for the temple of art. He must leara to seize the nohlest motives, to portray he most heantiful furms, to clothe his work with the most elevated associations. Thus only can he hope, in his life or in his works, to attain to the fellowship of the immortals.

## COLOURED DECORATION.

Os this snbject Mr. G. Aitchison read the following paper at the last meeting of the Architectural Association:-
From very early periods it is probahle that something was used for the express purpose of decorating the abode of man. The skins and leaves earliest used to exclude wind and rain, or to insure privacy, must have suggested ornament whon their place was usurped hy woven stuffs; and in fact the greater part of all the patterns used for modern decoration point to their woven rigin. To those who dwelt in caves, in hoseslp. ture most naturally surgested itself, and douhtless some rude kind of painting was almost coeval with it. As wealth and civilisation inleasant the varions suhstances that are useful, the splendonr and comfort of man's ahode. The perfection to which decoration axrived at many epochs in the world's history we probably owe to rolicious onthusiasm. Man when confined to purely selfish ohjects is hut a poor creature, and is only whea generations of men are fired with patriotic, religious, or benevolent enthucapacities individual man exhihits the ligglest perfect specimens of decoration in the church, the temple or the mosque, rather than in the honse, the palace, or the council chamher.
The arrangement of decoration in one way is simple, as in the bulk of cases it is internal, and can hat he applied to the floor, to the walls, and to the celing. The floor has to he walked on, rind the lower part of the wall to be protected from injury, dirt, and stains, and, if possihle,
made agrecable to the toach. Theroforo, properly speaking, the upper part of the walls and perly speaking, the upper part of the walls and
the ceiling are the oaly parts in which the decoration is pnrely for instruction and delight. And " + lo you will find that the main body of the deeorayou will hand that the muin bay the decoradepiction of pan except in, the caso of those religios religions where tho portraiture of the human
form is forhidden. But this is the art of the form is forniaden. But this is the art of the do I vish to interfere confining myself to the a humbler part that fals to our lot. Let me say loveliness of colour is not an enrapturing delight; for such a one, if he once departs from mono. chrome, will he a curse. If his greatest pleasure is not to hathe in the liquid-coloured light of fine stained glass,-to watch the colonrs fade out as the sun goes down, imperceptibly fading the deeys and wo never to formet the floming star that the sua makes of the first autumn leaf, in the deep gloom of the woors; ;-if he has not been thrilled with the harmony of some hit of chequered light falling on a mountain stream from between crees,or with the mysterious colons and heautiful colouring of some Oriental dish, dress, or carpet,-let hays rect Always remember that you are knglishmol hing in the mineteenth century, and in all prohahility doing work for Englishmen of the nineteenth confury, and that yon owe to yourself, to them, and to ,our country that you give something heautiful and new. Do not he a copyist, a reproducer, a
paraplraser, or imitator, but do what is lovely to
you, and make those you do it for love it. You are an artist, an inventor, a maker, a poet if you will, and you are to impress your own creations on your own ago. If yon have no new lovely and want to do, -leave decoration and do something else. Decoration is an art, and tbere. fore little can be written or said about it, -it is not a science for which rules can be given. At the most you ean only give recipes, and tbose thing to study, and it is not the Greek or any other example that sbonld be studied by day and by night, - but the book of natare. You have tbe sky and the clonds, snnset and sunrise, the pond, the lake, the river, tbe sea, and the ocean, the pond, the lake, tho river, tbe sea, and the ocean, the
woods and fields, the rocks and mountains, the colcurs of birds and fowers, of butterllies and colcurs of birds and towers, of butterties and
beetles, of beasts and fishes, and from these you beetles, of beasts and fishes, and from these you
cannot but learn. And you will learn muoh cannot but learn. And you will learn muoh more even than form and colour, you will
loarn what may he oalled tbe inexhaustible patience by which effects are obtained. You will patience by which effects areobtained. You will gonorally on close exaraination find that in a brilliant flower tbe hriniance is partly obtono, and partly hy its haring some small pot, speck, or at complementary colou placed where it gives the greatest effect. its sculptured form. You will find that the surits sculptured form, You will find that the sur-
face is ribbed or embossed, the texture is dull face is ribbed or embossed,- the texture is dull like silk, or shiny like satin, or piled like velvet,
or shagey like plush,-and that its general effect or shaggy like plush,-and that its general effect
of colour is set off by tbe tertiaries of its leaves of colour is set off by tbe tertiaries of its leaves
and stalks. After successive and unavailing and stalks. After successive and unavailing
attempts you may throw down your brush in attempts you may throw down your brush in
despair on finding that your sketch has just despair on finding that your sketch has jnet missed the grace of the Hower, and the peculiar
loveliness of the colour. In such wolk, however loveliness of the colour. In such work, however,
you will, if you persevere, learn much. You will improve your taste, and your admiration will be raised for the inexhaustihle fcrtility of invention, and the exquisite subtlety of the methods that nature employs to bring to perfection ono little
perishing flower. Yon will also learn the rela. perishing flower. You will also learn tho rela.
tive value of form and colonr. Throughout tive value of form and colonr. Throughout
nature you will find that some things are to our ejes only harely agreeahle; others are ugly while some are of an exquisiteness of form or of
colour that you could never have appreciated colour that you could never have appreciated without diligent study. These are what the French call distingue. As an instance, the heauty of the flower of the pumpkin may be notod, not rich in full colonr, hut perfect in form. Tbe leaves of the lemon have eharmed many a painter by their peculiar gracefuluess, his trained eye discerning in these varied furms of delicate loveliness a rare quality, not revealed except to the initiated. Natural ohjects are by no means equal in beauty. It is as ridiculous to suppose that all things are equally beautiful as to contend that the croak of the crow or the scream of the peacock is as masical as the song of tho nightingale. The union of perfect form witb perfect colour is all too rare in the work of now smpposing colour to be the only matter requiring to he studied, when yon can apply it to and among pure and finished forms its own valuo will bo enhanced. Beanty of colour may do mucb to correat or to cloak imperfect archi. tecture; but tbe finest work of man is the wedding of wealth of colour to what is in itself noble, graceful, or otherwise excellent,-as music to immortal verse.
In designing the decoration of a honse, you have to consider the various nses for which the parts of the house are intended, and this must us say, your house consists of a hall, staircase, us say, your house consists of a hall, staircase,
library, dining-room, drawing-room, houdoir, and bedrooms.
The hall is a passage only for the inmates and their visitors, and a waiting-room for servants and messengers. It shonld convey, to a certain extont, a notion of comfort and of the quality of the houso. It must not be too dark, or else it makes the reading of addresses, \&c. too difficnlt; and as it is generally a receptacle for hats, coats, rugs, sticks, and nmbrollas, it wil require a plainer and broader treatment than
other parts. As visitors cannot conveniently linger there, no very elaborate decoration is required. Such decoration migbt also spoil the effect of any more elaborate adornment of the staircase or the rooms, by raising the expecta. tion too high, or it may pive a smack of ostentation to the house. This applies, of course, only to the halls of ordinary town and suhurban
bouses. A fuller and rioher treatment of very
spocial kind may be nsed in balls of large monumental country honses or town palaces. Tbe hall of the Roman house in which the patron received bis clients required, so to speak, muct decoration, as something of a compliment to those who visited it ; and a parallel demand for statoliness or appropriato elogance is made
used of ten for receptions of any kind.
The stairease must be light; or, if the lighting is insufficient, the tone must be ligbt, 80 as not to increase this insuffioiency. A staircase may be treatod in almost any way, either simply or elaborately; but, of course, this must greatly depend on its architectural obaracter and on the decoration of the rooms. If the staircase is very small or narrow, elaborate decoration is thrown away. If the rooms are brilliantly and gorgeously decorated, the staircase must he simple, or yon injure their effect. If the rooms are treated with severe simplioity, you may con centrate the splendour of your decoration on the staircase, unless it is to be the field forexhibiting sculpture or painting. In this case the pictures must be your first oonsideration,--the grounds for them kept quiet, and gold and silvor used sparely if at all,-or the high lights will be destroyed hy the brilliancy of the reflections from tho metals.
For the dining-room, yon want to convey tbe idea of warmth and comfort; and as it is fre quently the picture-gallery of the honse, it must be treated in entire subseryiency to the pictares, -as a setting for the gems

The library is for study, and its decoration mus also be broad; not so light as to fatigue the eye
nor so dark as to render reading difficult. There nor so dark as to render reading difficult. There must be notbing in its decoration to distract or The greatly to attract tho eye.
The drawing-room is, perhaps, tho most diff cult room to treat, for it has to fulfil so many different and even opposite requirements. It must he light and cheerful by day, as well as hrilliant at night. It must be suitahle to the complexion and dresses of ladies, and this while its walls have to serve as hackground for pic. tures, china, and objects of virtu. Satin damask supplies much gnod decorative material for draw.
ing. 0 oms. A room that is to be used largely ing-rooms. A room that is to be used largely for music has other difficulties as well. Here no even flock poper is considered objectionablo by musicians and musical oritica. Wood, too, wil be preferred to plaster. At all hazards and a the cost of any amount of difficulty let eacb room be first of special purpose.
The boudoir is casier. It is the temple of the lady of the house, and must be treated the way most advantageons to her complexion. An air of lnxurious repose must also he given, with some tinge of its fitness for ber especial pursnit he that art, music, or literature
The bedrooms should he light rather than dark, and may be oither plain and simple, or gorgeous and elaborate, but to my thinking thero should be nothing in their decoration which the $\begin{gathered}\text { snggest difficnlty in the frequent use of }\end{gathered}$ quently a large hedroom is used also as a private sitting or reading room. Hard painted walls, ceilings painted or whitened, give the agrecable impression that results from the sugrestion of perfect neatness and eleanliness, Decorative papered ceilings are inferior in this view to washahle surfaces.
Let common sense guide you in your main arrangements, art and skill in the disposition and genius, or at least study, in your inspira each room the sense of special fitness to that part, also the appearance of adaptation to all th circumstane apperianco of adaptan to all the for the intellect. Floors should be rather dark than light; the lines, spots, or patterns not too trenchant. Though you do see carpets of
 Italy, I think unshaded pattorns are the best for Hoore, pavements, and carpets.
In orr, pavements, and carpets.
eight of the dado is fixed by most rooms the cight of the dado is fixed by the height of the chairs, unless perhaps in a dining-100m with
very large pictures or tapestry. Then the dado ery large pictures or tapestry. Then the dado nay reach on occasion as bigh as the head, and Dados may be hrackets or a shelf for china Dados may be wood, either or the natural colon r ooloured, stained, or painted and varnished with but very slight polish. I think if the carpet or floor is not the lowest.toned portion of the
a hole decoration, the hottom of the wall or the ado should always he darker than the uppe part. Force may, bowever, begiven to a dado by
architectaral form, - by vigorous mouldings, for instance, - sufficient on occasion to give it
emphasis enougb to take proper placc in relation emphasis enougb to take proper placc in relation gronnd proper may be of velvet, of dull stuff of lock, distemper, or even flatting. If not for piotares, it may be bung with tapestry or figured paper, or it may be painted in a pattern sufficiently interesting to engage the eye and attention, but not too obtrusive. Good low-toned tapestry is always agreeable in a dining-room, if pictures are not to be bung on it; but you cannot put one picture over anotber, Bad pictures are as inad. missible as bad wine, being costly luxuries. Everything mast be subordinated to good pic tures. Warm neutral greys, greens, or dull reds are most serviceable as backgrounds, for reasons apparent to all wbo know Cbevreuil's law of complementary contrasts. The main body of the ceiling should be white, or but sligbtly toned, -even a gold grouud is rather beavy Deep coffers and much gold give an effict of weigbt too heavy to be carried. Much gold has also a reddisb, unpleasant beat, that should be carcfully avoided or dealt with specially. In tbe backgronnd of Byzantine decoration the heat of the gold grounds is partly neutralised by the greenisb tinge which intervenes between the picture and the roond The Chamber of Com picture and whe groma. the Chamber of Comceiling hlack, an arrangement of colour only tolorable in a tall room, and then of wery tolerable in a tall
doubtful expediency

The arranging reds and blues so as to bar honise seems to have been specially sought after by the Old Masters. This is attempted frequently by Titian with mucb suecess, - with reds nd blnes inclining towards purple. In the inferior Masters, the juxtaposition rets the teeth on edge. In the macaw and other gorgeonsly coloured hirds, Nature brings about this har mony. Here, in one of the most difficult problems in your decoration, yon will find light and leading at once form critical observation of the ranks of the great ancient and modern colourists, and of nature. And this instance is hut one among many. At tho Zoological Gardens, or British Mnsoum, you will often find the simplest and most perfect solution of a colour problem inviting a difficult harmony,-some spots or streaks interspersed of white or some inter. mediate colour, or a gradual bringing together of tints themselves. In precions stones, the abseuce of determinate colonr has for many a great attraction. The turquoise most prizod by jewellers is the deep blue; colour oritics prefer the stones bordoring on green. Much of the vulgarity of British dyed stinfis came from the raw unmixed colours used in them. This is happily much oorrected, and the teaching from oriental stuifs, that seem always pleasing, place of the pure old colours. No doubt much of his preference rests on the deligbt of the buman eye in variety.
In each room seek for some principal ohject as the key, and work up and down to that. If some prominent piece of furniture, as a splendid abimet, is in a room, you must wors your you want a room to be a success, you mnst choose carpet, ourtains, and furniture: one blot of inharmonions colour may spoil all.
Every colour may be made to harmonise with every other, but only hy varying its tint and one. In nature there is no flat or uniform colomr nywhere,-not in the gradual melting of a blue sky, nor iu the smallest leaf or speck of dust. Large, flat, uniform tints are alvays unpleasant, and are only to be allowed where the surface is hroken up by many objects. Those single colours please us most that approach other colonrs, or waver, as it were, between two. Emulate, if yon will, the gorgeous colouring of India, the brilliant colouring of Clina, or the soft harmonies of Japan, but do not copy slavisbly the works in which yon find them.

Mr. Elim H. D'Avigdor, C.E.-As to proiding improved dwelling-houses in Fienna and be vicinity, which has engrged popular attenton for some time past, several pumphlets have been published, and of these productions, says the Jewish Hord, the German press is mani. mons in commending one in partionlar, which is rom the pou of an Euglish geutleman, Mr. Elim H. D'Avigdor, C.E., a scion of the Coldsmid family. The parmpblet also contains designe for reasdying the nauscous odour arising from the overflowing of tbe river Danube.

THE CITY CHARITIES AND DWELLINGS FOR THE POOR.
On Wednesday last, the special committee of the Charity Organisation Society, at their meet. ing in the Offces in Buckingham-street, in the Strand, were engaged in a discussion extending
over nearly three hours, on the "Bearing of City over nearly three hours, on the "Bearing of City
and other Charities on Metropolitan Direllings and other Charities on Metropolitan Divelings
for the Poorer Classes." Amongat the members for the Poorer Classes." Amongat the members
of the committee present, were,-Lord Napier of the committee present, were,-Lord Napier
and Ettrick, the Earl of Aherdeen, the Hon. T . and Ettrick, the Earl of Aherdeen, the Hon. T.
Pelham, Mr. Andrew Johnston, I1.P., Sir Charles Pelham, Mr. Andrew Johnston, M1.P. Sir Charles
Trevelyan, Mr. W. Gilbert, Mr. J. Liddle, Capt. Gardner, R.N., General Cavaunah, Mr. J. S. Storr, Mr. W. II. Hall, Mr. J. R. Rolland, the Rov. R. J. Simpson, Miss Octavia Hill, \&c.
Mr. Gilbert, after endeavouring at consider able length to show that the varions charities in the City had at their disposal snfficient funds to erect dwellings for the poor within the City and Metropolitan aroa, moved a resolution to the
effect, "That a depntation from this committee effect, "That a depatation from this committee
wait upon the Corporation of the City of Lon. wait upon the Corporation of the City of Lon.
don, the Ecclesiastical Commissioners, and the don, the Ecclesiastical Commissioners, and the
Metropolitan Board of Works, to submit to them the justice of letting, on moderate terms, portions of land for building dwellings for tbe working classes, so as to allow them toprofit in this way by the valuahle endowments and charities origivally intended for their henefit."
The motion gave rise to a lengfhened dis. cussion, in the conrse of which objection was takeu to the latter part of the resolntion, on the ground that eleemosynary aid to the poor was no part of the hnsiness of the committee, tho improved dwelliags for the poor boing what they were alone appointed to consider.
In the conrse of the discussion, Dr. Ross pro posed the following rider to the resolation:"And that this conmittee is of opinion that the charitios possessed by the companies, vestrios, and other public bodies in the metropolis, in al cust in there the original trusts cune appropriated to facilitating industrial classes upon terms that would not permit such buildings to be regarded as chari. $\mathrm{t}_{\mathrm{i}}$ ble institutions."
After some further discussion, both the resolu. tion and the rider were withdrawn, it being nnderstood that Dr. Ross would bring forward and after some remarks from Mr. Andrew Johuston, M.P., Sir Charles Trevelyan, and others, in the course of which the maladministration of the several City charities was freely canvassed, Napier and Ettrick, and seconded by General Cavannah, were adopted:-"That the snh.com. mittee be rcquested to consider and report upon to the committee the amount and position of houso property held in trust by the City and other authorities, or any pnblic bodies connected with for the improved hahitations of the lahouring classes of the metropolis;" and "That the sub. conmittee be requested to report upon the above, or to report upon the best means of carrying ont the above resolutions."
In the absence of the chairman of the com. mittee, the meeting wns presided over hy the Ref, R. J. Simpson, rector of St. Clement Danes.

## INDIAN ARCHTTECTURE.

Os. Friday evening, the 21st inst., Captain Lyon lectured at the Royal Institution, Albemarle. street, on the "Temples and Idols of India." a large attendance.
a large attendance.
In the conrse of his remarks, Captain Lyon said that India possessed 1.40 millions of inhahitsaid that India possessed 140 millions of inhahitants, and ahont her temples and idols very hittle
was known, tho information on such point being was known, tho information on suct point being
very soanty. It had been computed that there very scanty. It had been computed that there
wero 300 million deities morshipped in India; wero there milion deities rorshipped in hndia; beings. The tounplos were very celebratod, and beings. The tomplos were very celebrated, and
were embellished with some of the most wonder. ful carving in granite that anywhere could he foumd. At Madnra, the Rome of the Hindus, there was the scen a beautifal mundapum, which cost one million sterling, carved oet of granite, the galleries of which were formed of carred pillars, each pillar being a solid block of granite 15 ft. high, This exquisite piece of workmansbip was represented with marvellous
delicacy of ontline, conveying a very clone ide delicacy of ontline, conveying a very cloar idea
that must have been bestowed on its erection. There was also to he seen, too, at Madura, the golden lotus tank which the Bralmins assert was fod by the waters of the Ganges, passing 1,000 miles under the sea for that purpose; the tank, was one of tho most celebrated throughont India. In oontinuing the journey south, We come to Streevellipattur, and there hebold the great Jugrornaut car, the finest to be seen in the south. and carved out of the finest bevony The yearl peregrination it undergoes is well known, and the sight, once seen, never to be forgotten, beggared all description when it made its journey. Further south there was a little bijorn, which being hidden behind a rock, was lost to sight to nine out of every ten travellors; but it was well finest in the whale of $\mathbf{I n d i a}$. Its elaborate carving was truly marvellous. Acoording to the acoonnt hy a Brahmin high priest, it was exoavated and carved in the short space of twelve honrs hy a on who had hecome indignant at the slow proon the other side of the rock. Ramisseram was known as the most sacred temple of India; some porsons assert even more so than Benares. Concerning its sanctity, a poem had been written called the Ramaynan, which filled an enormons volume. Connected with this temple are mar. vellous corridors, $4,000 \mathrm{ft}$. in length.
Turning northwards, and following the coast, we come across Avadea Corill, which, though one of the smallest, is one of the most wonderfully heing that tho stone forming the pillars was so hard that no chisel could he found to cut it in these degenerate days. Passiug on to Tanjore, with its magnificent tower 300 ft . high, there was bero to be soen the celebrated hull of Shiva weigbing eighty tous, dating from the eleventh entury. The temple at Tanjore, though a very sacred one, and justly renowned for its beauty as literally deserted.
Still further north, and olose to Madras, there was Mahayellipore, or, as it was commonly called, the Seven Pagodas. Nothing excited so mnch astonisbment as this place, and it was doubtfu] whether the world could produce anything more remarkahle than the monoliths here to be found. The more we examine them, and indeed the whole place, the greater was our astomishment, while at the same time we were lost in conjectnre as to the motive or purpose for which such an amount of lahour and time had been spent in forming these marvellons struotures; for no record existed as to when or hy whom they were execnted. Not one among the many works here hegun had heen finished, and all seemed to have been undertaken by some enthusiastic rajah, or by people under some strong religions impulse, nd all stopped simultaneously either by the rajain's death, or some other catastrophe; and no one could really form any concep
the elaborate carving here displayed.
Illustrations from photographs were exhibited hy means of the magic lantern.

## FEMALE SCEOOL OF ART

Wedntsday last was a proud day for Miss Louiza Gann and the Committee of the Female School of Art. The theatre of the University of tondon was crowded with students and their friends ; the mietress stood first on the list of premiums offered by the Corumittee of Council
on Education to the head masters end mistresses of these institutions ; the prizes to he distributed
of were numerons and well deserved; and thei Royal Highnesses tbe Princo and Princess of Wales were on the platiorm, - the latcer to hand these prizes to the pleased recipients, and the
Prince to speak to them afterwards witb that eriality and heartiness which distinguish all he goes. Prebendary Thorold read the report, which gave cheering evidence of the progress of the school. Professor Donaldson, who has long worked for the school, read the names for pre. sentation to the Princess, ending with the
heroines of the day, Miss Alice Blanche Ellis, heroines of the day, Miss Alice Blanche Ellis,
Miss Julia Posock, Miss Emily Selous (now Mrs. Fennessy), and Miss Emily Austin.
The Rer. Sir Emilins Bayley, one of the trustees, in a very felicitons speech, referred to
the great assistanco to the school which had been the great assistanco to theschool which had been
afforded by the Royal Family, and conveyed the afforded by the Royal Family, and conveyed the
thanks of the meeting to the Prince and hanks
His Royal Highness said it had given them
gratnlated the yonng ladies who were before and around him npon their recent achievements, and hoped and believod there were evidences that whatever profession or position in life they might hereafter he oalled upon to fill, they wonld con. tinne to bo an honour to themsolves and to tho school to which they now belonged. It was equally his duty to tonder his acknowledgments to the president of the school for the great interest he had always taken in its welfare, and also to Miss Gann and her efficient staff of the frnits of which they bad had an opportunity of seeing that day
Mr. Sir John Lubbhock, Mr. Francis Bennoch, who have worked in aid smith, and ous present.

## some fine furniture.

We have examined with great interest and pleasure some remarkahle pieces of artistic crniture which have been prepared for the rrternational Exhihition at Vienna, by Messra, Jackson \& Graham. They show in so good a England that our readers will not complain if re describe them somewhat fully.
6 The first wo come upon is an ebony cabinet, 6 ft. 6 in. long and 9 ft .6 in. in hoight, in the lapis lazuli and jasper. The cabinet is in two divisions, each in three compartments, the lower division being enclosed with three panelled doors, richly inlaid with ivory, and the frieze supported hy futed pilasters with very finely carved capitals, the plinth and frieze being also panelled and mlaid. The npper division is also ouclosed by three doors, the contre door having plateglass, for the parpose of showing objects of art and virtu, the doors on each side baving panels of ehony, inlaid with ivory, of rich arahesquo design, fluted columns inlaid with irory and richly carsed capitals to support the frieze and cornice of the npper division, and in the entre of the pediment are the armorial henringe and monogram of the fortunate owner of this beantiful work of art. (the Earl of Bective). All the inlaid ormament is engraved in the most perfect manner, and the beauty of the design (by Mr. Lormier) has been heightened hy the art of the engraver. We have no hesitation in calling the cahinet work perfection.
Near this is a small cabinet, also in the Italian style, in wbich various woods (the choicest specimens of their rospective kinds) are used, including amboyna, box, thuya, purple, satin, palm, bony, and rory; and tho way in which these figures placed in harmonious contrast, has been nost carefully and successfully studiod, EO 23 to produco a charming effect of colour. The lower part of the cahinet is open; the plinth, panelled back, and supports all fiuely inlaid with the various woods mentioned, in elabo. rate designs of great heauty; the npper part is inclosed by doors, and the frieze and cornice supported by fluted and inlaid pilasters; the panels of the doors are ornamented with most delionte and exqnisite arabesque designs, inlaid in ivory and rarious fine woods; the whole heing engraved with the oreatest oare in tbe highest stylo. This enhinet is the property of Mr. H.A. Brassey, M.P., who kindly permits it to be sont to the Eshibition, Like the last, it was designed by Mr Lormier, and the dimensions are 3 ft .6 in . long, and 6 ft . 2 in. high.
and 6 ft .2 in . high.
la a large carimet, of architectural design, by effect is Jones, a novel and very beautiful effect is proces, whou tho ar engraving, by the ornamentatio or the plasters, columns, panels, and friezes wioh il ament of various woods. ft her. Alfo moris. The wis and th. cor, and in wo suages. 4 f 6 in with two side anels 7 att, 6 high two high, separated by pilasters, 6 in. Wide. The
whole of the panels and pilasters are elaborately inlaid with hanly, and wroad, orance wood, and inlaid with hoily, grey wood, orange wood, and
purple wood, on an ebony gronnd. Below the panels is a monlded hase and skirting ; ahove runs panels is a monlded hase and skirting ; ahove runs heing in different-coloured woods. The npper tage of the cabinet is equally in three divisions, pilasters. Separating the divisions aro detached pilasters. Separating the divisons dached colnmns, crirying a frieze and dontited cornioe. The corvice is arched over the centre division
and encloses an olaborately-inlaid spandrel.

The general character of the composition may be called Itatian; hut in the ornamentation an attemnt has been mado to combine the purity of Greck forms with Italian playfulness, nd with
a tinge of Orientalism in the colouring of the a tinge of Orientalism in the colouring of the
several portions. As a piece of cabinet work, several portions. As a piece of cabinet work,
it is perfect. There are thousands of small it is perfect. There are thousands of sman truly marvellous. The inlaying of the colnmne bas been a vrai tour do force.
There are three other cahinets dosigned hy Mr . Prignot, two of them heing of ebony, inlaid with ivory and box-wood in very elegant designs, and one with various woods, the chief being olive wood, and the inlaid dosigns in the Greek style, the different colours of the woods being harmoniously introduced. A large sideboard and a suito of chamber fumiture also deserve notice, hnt we havo said onough to show the remarkahle
character of the works prepared by Mossrs. character of the
Jackson \& Graham.

## CONCRETE HOUSES IN GERMANY.

 Dr. Riese lately delivered a lectnre before the Berlin Polytechnical Society, on the use of con. orete, for the walls of houses. The concrete nsed by him consists of one part of best Portland cement and nine parts of coal ashes, scoria, sharp sand, gravel, brick-dust, or similar cheap huilt tho first house of this kind at Friedricksberr, near Berlin. It is 40 ft . high. The front walls are, for cellar and ground-floor, 12 in . thick; first and second floors, 9 in. The supporting cross wan is 12 in . and the partition. sbown itself sufficiently strong, notwithstanding the comparative thinness of the walls. In the saiddie or October of the same year the foundalecturer moved within ten weeks from its comlecturer moved within ton weeks from its comdamp. The durability of the material and of the buildings has heen induhitably proved hy these exporiments; and in consequence of these exporiments; andfavourable resplts, twenty-eight cottages of farourable resnlts, twenty-eight cottages of
concreto, mostly intended for clerks and working concreto, mostly intended for clerks and working
men, were erected at the end of the summer of men, were erected at the end of the summer of
last year. Most of them aro inhabited already; the rest will be ready by April. In the twelve cottages last erected, the timber-work has been resorted to

## AN ORDER OF MERIT.

AT the last General Meeting of the Corporation of the Literary Fand, the president, Earl Stan. hope, in the course of his address, roferred to the
rocent dehate in the Houso of Lords touching the rocent dehate in the Houso of Lords touching tbe wearing of foreign deoorations hy Englishmen.
We were told on that We were told on that occasion, said Lord Stan. bope, that these orders wero to be lightly ro-
garded, and that, as Motterrich said, it was a garded, and that, as Metterrich said, it was a distinction to have no orders at all. And by whom? By Earl Granville, -a Kigight of the
Garter. Was it for that noble earl to tell other gentlemen that orders were insignificant, and that it was better to be without them? It would be as becoming for one of our merchant princes -a Rothschild or a Baring-to tell people that
money was of no account. It was not for a statesman whose services had won for him the highest order in this country to blame those who had attained eminence in arts, science, or literature
for being desirous of an honourahlo decoration. He (Earl Stanhope) thoughourahl the amhition of the hlue or red rihhon was allowable or praiseworthy in statesmon, military men, or naval demned in the artist, the man of science or of letters; and the very firmess with which they ought to resist foreign decorations being worn by for dosiring that an arder of merit should he in stituted at home. If he met with sufficient approbation and encouragement he should be greatly inclined to move in the House of Lords an address to the Crown, praying that her Majesty wonld take the question of tho creation of some such order of merit into her consideration. He thought such a motion would not he resisted, and refuso to givo it their attention. Seeing many literary and scientific men around him, he thonght it not unhecoming to make a sugges tion which might perhaps ripen into a practical result.

We hope it may do so. It is not the first timo hat we have urged the want of such an institu tion as should enahle the sovereign to bestow mark of honoar on men who in arts, soienoe,
philanthropy, or literature, bave deserved well of their country.

THE COST OF THE NEW LAMBETH WORKHOUSE, AND THE RISE IN BCILDING MATERIALS.
Trie Lamheth new Workhouse, near Kenning* ton-lano, which bas heen for somo time in course of ercetion, and is now nearly completed, is likely to cost very considerably more than the oriminally cstimated 1.3 , which was uader $20,0000$. , but Which bas already been exceeded hy ahout $5,000 \mathrm{l}$., found that a farther sum of 5,000 , is required The board recently dosired Mr. Parris, the archiThe board recently dosired Mr. Parris, the archi required to complete the huilding, and at their required to complete a comununication was read meeting last week a communication was read
from tho architect in reply, to tbe effect that he was not in a position to state tbe amount whic would yet be necossary to finisb the building He, however, recommended that application he made to the Local Government Boadd for permission to borrow a further sum of $5,000 \mathrm{l}$. He oxplaincd that this sum was required to mee tho expenses of articles contracted for since the last loan, and was also caused partly by the un precedented rise in the price of all huilding materials. The board at once agreed to comply with the arcbitect's recommendation.

STR G. G. SCOTT'S LECTURES AT THE ROYAL ACADEMY.*

## on the dome.

Is my last lecture, aftor hringing down on consideration of domical construction to the period of the perfecting by the Byzantine architects of the systom of what are known as "Pen. dentive Domes," I was proceeding to descrihe a
few of its most marked productions, but was few of its most marked productions, but was stopped short when I had given a rapid sketch Church of St. Sophia at Constantinople.
I will now prooeed with my subject. After the Church of tho Holy Wisdom, all suhsequent domed churches of the Byzantine olass seemed to sbrink from a hopeless oompetition, and to content themselves with very moderate dimen. sions.
Among those remaining at Constantinople, that of St. Irene perhaps comes next in date Its central dome, like that of St. Sophia, is extend to the yaulting, hut simply carry malleries These winga, therefore, as well as the enstward extension, are covered hy harrel vaults, the har being terminated by a semidomical apso - . Wit vest in plan, excepting that, heing less in dimension east and wcst, its base is an ellipso instead of a circle. The actual domes, however, differ nuch more widely; for, while the western on dentives the contruing the snrface of its pen on a high drnm pierced like a clearstory with many windows.
The Chnroh of the Holy Theotokos, or of the Mother of God, is of a much later date. The chnreh proper has bnt a single dome, though there are several othors over the narthex. This lome covers the intersection of two barrel vaults, supported simply on four columns, and rises In above its pendentives on a drum piercod hy ndows. Tho architecture of this church i ery elegant, differing in date, it is prohahle, but ittle from that of St. Mark's at Venice. Othera

* Seap. 217, ante.
do not differ sufficiently from these types to make it worth while here to descrihe them. It may, however, he mentioned bere that in the hiter Greek charches the domes, or some of them, rose often so high as to become rather elegant towers, arcaded externally. This is the oase witb several of the churches at Athens.
Among the churches of that city we find one type of great elegance, the Church of St Nicodemus, in which the dome oconpies the width of what we should call the nave and its aisles; eacb side of the square orer which it stands heing divided into three unequal arches, over which it rises on a lofty drum, and is carried on eight pendentives. This forms a most elegant interior, susceptible of many varieties; and, from the spacious central spaee which it affords, seems the most valuahle type on which to found domed design for a modern church.
It would, however, he endless to enumerate the varied forms of domed churches in the East, tbough, with all their varieties, they may usually be reduced to a fow elementary types. If you desire to study them, I would recommend to you Salzenherg's "Old Christian Architecture at Constautinople," Couchaud's "Byznatine "Byarches in Greece," a
Byzantine Architecture"
It is not, howerer in th
Byzantine dome to earliest days, - those of found, even in its established itself oqually at Ravenna; indeed, as wo have seen in the Baptistery there, as welT as in the tomh of Gaila Placidia, it, in an early form, preceded those at Constantinople itself. Its great effort, however, there was the Church of San Vitale, erected by Justinian and Theodora. This church was evidently imitated more or less from the Temple of Minerra Medica, or lhongh whether direotly or through that of St. Sergius at Constantinople can hardly be judged. It is a grand octagon, with a spaoious snrrounding aisle of double height. Sevon of its sides have the same circular niches projecting from them that we find in the temple (as well as in the Church of St. Sergius), only they are arcaded nd canied out with purely Byzantine details. The aislos are of two stories, united hehind a lofty arcade. This is surmounted by a clearstory encroaching, to a certain degree, upon the
dome. This, however, is not pendentive. It is covered externally by a roof. It has undergone much modernisation, hat retains its general form and a good deal of its ancient decorations, Which show it to have been treated much as t. Sophia, with which it was contemporary. The charoh is the more interesting from having heen the type followed three centuries later by Charlemagne in his famous church at Aix-laChapelle.
nee manner in which the dome was intronced and adopted iu Italy daring these ages cause it to be in its causes and its resnlts as to any clear consecutive order. There were, in fact, two distinct influences, both occasionally leading to its adoption.
At Rome, and in places under Roman infnence, such examples as the Pantheon could not fail to have their effeot on the snhsequent architecture, and we accordingly find there numerous scions of this primeval family; while, as we have just seen, the purely Byzantine form was siraul. taneously introdnced hy way of Ravenna, and later on was planted at Venice
Through this twofold influence the dome became very frequent thronghont Italy. It was carried, as we have seen, by Charles the Great, from Ravenna to Aix-la-Chapolle, and, later on, was carried forward from Lomhardy, nnder the first tbree Othios, across the Alps, down the valley of the Rhine, and far into the interior of Germany. Only a fow years later it was con. veyed from Venico into the interior of the south. west of France, whence it apread throughont an extensive district stretching eastward into Auvergme, and even as far as Lyons, and north ward to the banks of the Loire, where, to this day, the effigies of our early Plantagenet kings lie, heneath a series of pendentive domes, almost as perfect as if at Constantinople
1 will not dwell at mach length on the domes Thich were derived from purely Roman traditions, because they, for the most part, suggest no The most delopat.
The most magnificent, probably, is that of the Baptistery at Horence, a nohle work of early, though unknown, date. It is olearly founded in a great degree upon the Pantheon, though of octagonal plan, and with a dome of the same
form, Its sides are in two stories,-the fret
with deeply-recessed colonnades on each side,tbe дpper stage, a clearstory. One face, however, is occupied by the arch of the sanctuary. The dome had formerly an eye like tho Pantheon, but has now a lantern turret. It is encrusted with beautiful ename mosaic work, wanctnary having a colossal figure of Our Lord sanctuary having a colossal figure of Our Lord in Majesty in a vesica. The is tesselated work. marble, and the pavement is tesselated work. The whole internal offe
A parallel work is the Baptistery of Parma, a Ahe the the of is polysonal work of the plan, and greatly inferior to that at Forence Bejamo, is simply like an ordinary Templars Bejamo, is simply like an ordinary Templars church, wh a turret rising from its apex learstephano at Bologna is in some dogree on tho same type.
The greater part of the Itahan domes of these periods, and of this class, simply cover the rossing or the隹 The most orginal, perhaps, is tbe dome of the Cathedral at Siemna, which stands apon six piers, forming a hexagon, each side of which is qual in widu to tho next stage, tho angles are corbelled out 80 as to form in the upper story a do
The merit of this plan is that it unites itself, The merit of this plan is that it unites itself, with little obstructiveness, with the church on of donblo the width of the nave. It is also pleasing and elegant in its effect. But it is time that we returned to the Byzantine type, which yon will remember that
We now adjourn from Ravenna to Wenice
The mercantile and perhaps political co nexions of the old Venetians were mainly Oriental. This probably accounts for their architecture, up to the twelfth century, being Byantine.
The Charch of St. Mark, or the Chapel of the Doge's Palace, was foundod in the ninth century, in honour and for tho reception of the body of St. Mark, which had been procured from Alexandria, when the chnrch in which it had been long deposited was destroyed by the
Moslems. This church, howerer, perished in a Moslems. This chureh, however, perished in a popular tamnlt, lato in the tenth century, whereupon the Fenetiaus set about its reconstruction with a determination to render it one of the finest and most sumptuous in existence. All the East, so far as accessible to their ships, was laid under contribution for columns and other architectural embellishments. The design is ofton spoken of as founded on that of St. Sophia. This was not the case. The Church of the Apostles at Constantinople would rather seem to have furnished its model. It consists of a group of tive aquare spaces, covered each by its pendentive dorne. Its peculiarity lies in the breadth of the wagon-vaults which support and separate these domes, wbich is so great that the vast piers which sustain tbent are pierced in two stories, and divide each other into four piers, with a vaulted space hetween them. Each dome is consequently the centre of a cruciform space, the wings of which have wagon-vanits. The only exception is the east end, where an apse is substituted for this space, and out of this apse spring three minor ones, as at St. Sophia. Each dome is about hemispherical above its penden.
tives, and is picred with windows, as at Sc . Sophia.

The domes are now, and have been for many ages, covered over by lofty domical towers, of timber, each surmounted by a sort of turret on its apex. The wings which fanked each domed space, bounded as they wero by the perforated piers, were so suggestive of side aisles churches, added arcades from pier to pier, both in the nave and transepts. These, however, are merely decorative, snpporting no galleries, as is frequent in the East, and only serving as narrow communications, equivalent to triforinm pas sages, between the upper chambers in the grea piers.
The entire chnrch is internally encrusted with richly-coloured marbles and gold mosaic with figures, just as at St. Sophia's; and the floor is of marble and porphyry tosselation, varying in scale from the most vast slabs to the inest mosaio work.
The interior was no donht a joint imitation of
the former in its sumptuous decoration, and mitating the latter in its plan.
To those who have not visited the East, this interior gives a very faithful idea of the splen dour of a Byzantine church, and I must aay that I have myself seen nothing more impressive.
I will only further (hofore proceeding to ano fier branch of my subject) notice one othe church, -the little church of Santa Fosca, on the island of Torcello, close to Venice. This church is not domed, or has only a wooden dome, but was clearly planned for a proper domical covering. Its plan is like that of St. Nicodemus, at Athens, already alluded to, and is perhaps one of the most beautiful in existence, and one best adapted of all domical arrangements to modern nso. Before I proceod further I must call your attention to a fresh step in advance.
The next step in the developmont of domes is the adoption of pointed arches for their support, ofton accompanied by an increase in the height of their own section beyond that of a semicircle
The fact that the pendentive dome is, as it were, suspended in mid-air, so that a perpen. dicular line dropped from any part of its cirdumference posses throuch empty space, renders it imperatiro that the arches which sustain it in this airy position should be extremely strong, and should have as little outward thrust as possible; and it is eqnally desirahle that the courses of stone forming the pendentives should not form very acute ancles with the haunches of these arches. These considerations seem to have led the W ahomed an architects soon to substitute pointad arches for round as the supports of their lomes; a step in which they were followed at a later ; Earopen architects who adopted the pendentire dome There can be no doubt that this wes dome. There can be no doubt thr. Fergasson a very advantageous change. Ar. Fergasson says, $A$. the retion of a pendentive difficult it is to adapt the curves of a pendentive dome to a circular arch, and how woak the arrangement is when done, ..... With a pointed arch, however, even when the pendentives follow its lines, there is some thickness in every part, and no curve need
a greater angle than 45 degrees.
a greater ancle than 45 degrees."
On the other hand, the change was attended with the loss of geomotrical accuracy. Hitherto सe have dealt with none but perfectly correct geometrical figures; hat, the moment the pointed arch is introduced, the pendentives lose is valgarly called "rule of thumb"" to conditions not prarly called rule their forms not precisely suited to their forms. A pendentive hetween pointed arches has, it is true, a geometrical form of its own, but this is 80 atwkward in its sections, hat it has only to he seen to be rejected; for, instead or its central section being a reguar arched curve, suited to a its lower part, and ower part concave (as seen from withiu), and its upper part convex-la shor, an ogee This being inadmissible, the curve has to be accommodated the hest way we can, so as to in fact, to determine, according to the best of in fact, to determine, according to the best of of the weadontive, and adopt such horizontal curves for the courses of masonry as will make it reach the extrados of the sapporting arches in the easiest maner really done so successfully by the French archi. ects, whose works I shall shortly have to describe, that, for myself, I must say I mever found out the difficnlty from seeing them, and was naware of it till I worked out the profies geometrically.
After all, however, it is only parallol to what re have to do in filling in the spaces between the ribs of Gothic vaulting.
The pointed arch, though beantifal and prac ically excellent, is no reguar geometrical figure but the union of portions of two; its nse, consequently, indnces irregularities which would he at once avoided by the snbstitution of an ellipse. Bat, then, our geometrical accuracy would be purchased by the sacrifice of beauty.
All the sections of a sphere heing circles, the supporting arches of a true pendentive hemi. spherical dome are semicircalar arches, and in the same roanner those of an elliptical spheroidal dome would be semi-elipses; bat there is 110 regular solid figure, more than one of whos sections are pointed arches, so it is natiral that when they are used, some part shonld haro to he accommodated to fit them.
It may, however, he as well at this point to mention that pendentives, after all, had bccome
original intant. Ever since the dome ceased to. have the same curvaiure with its pendentives, and to be a continuation of their surface, the latter bad become a mere form of corbet, for which any other varjety might at conveuience be snbstituted. This fact was amply acknowledged in every region where the dome was made use of ; so that from the Pilhars of Hercules to the Bay of Bengal, and among those who occasionally adopted and developed upoд Byzantine deas in Western Earope, we find all forms of corbelling nsed in addition to the typical pen. dontive. I shall presently have to show you some of these varieties, and will only now remark that, though they aro perfectly legitimate means of support, the perdantive has still the advantage of them in its simplicity and in its snperior adaptation to coloured decoration.
About the beginning of the eleventh oenthry, the Byzantine style, in all its integrity (excepting only in its richer decorations), was con. voyed into Aquitaine, as it is supposed, by Venetian merchauts, who at that time had extensive commercial establishments in that part of France.
The earliest work carried out under this semi. Byzantine influence was, so far as we know, the Charch of St. Front, at Perigueux, -a building obviously copied from St. Marks, at Yenice. The two churchos are, in fact, mearly identical in their plans and sections, the oue being an almost unalorned copy of the other, showing ns what St. Mark's would be if stripped of its marble encrustations and its mosaics.
There is, however, one important difference, and one which bears directly upon the foregoing observations:-The domes at St. Front, as well as the great arches which support them, are pointed instead of round, though all the minor arches retain the older form. inker lectures, that the pointed arch was introduced, not so much as a matter of taste as of construction. Thus, in the buildings in which it first appears, we nsually find it in the arches carrying towers, in the wider vanlting, and iu other positions where great weight had to he sustained. before it made its appearance in minor features.

Here, at St. Front, we have it appearing at a date a century and a half earlier than in our own country, and nsed solely in the parts where urgent.

The style once transplanted into this region,widely separated though it was from all its pre. jous sents, -seems to have seized powerfully pon the public mind, and to bave hecome ithin a centary, the nncleas of a new form of rhitecture, of very great beauty and intorost niting the domical construction oh the wish he Romanesque, and
The entire distriet
 doptcd the dome as its acknowledged form of pinted arch, and always supporting it hy the pointed arch, and nisually
At Souillac we find a nave, apparently nearly as early as St. Front, covered by a series of pointed domes supported by massive transverse pointed ares by a semi amical apse fl carried out with scarcely an ttempt at architectural detail
At the Church of St. Stephen, at Perigueux, ommonly called La Cité, we havo an imperfect arly nave of simple character, with one reaining of its domes, but to the cast of it tands a later compartment, in which the same onstraction is carried out with very fine archiecture, agreeing in character with our own ransitional style.
This brings us to the new devolopment; for he style now ceases to be Byzantine. It is rery noble Gothic, united with domical con truction.
The eularged copies from my sketches of his and St. Front serve to show the greatness. of the chance, -the one a rude transcript of St. Mavk's, without its decorations,--the other nohle interior of the transitional style, hat with a pendentive dome; and it will be seen hat this addition in no degree the style into which it is adopted.
At Angroulême wo find this development carricd ont to full perfection. We have there complete cruciform chnreh, precisely in the style of the work lnst-named; the bays of the aave almost exactly like it, but the crossing rising to a far greater height, with a sort of drnm forming a elearstory over the arches,
and imperfect pendentives, and bearing tho
dome aloft. I also give an enlarged copy of my sketch of this nohle interior.
I may mention that this dome is not circular ${ }^{+}$ in plan, hut that the middle of each side is flattened.
A very parallel arrangement exists in a church far more to the north, on the banks of the Loire, and one in which we, as Englishmen, are specially interested, as heing the huridul-place of our earlier Plantagenets. I refer to the Ahbey Church of Eontevrault.
This church has four domical hays to the nave slmost identical with those at Angoulêmc. The church is now a prison, and in some obscurc portion lie the beautiful effigies of King Henry II. of England and of Eleanor of Guienne his queen, of Richard Coour de Lion, and of Isahel of
Angrouleme the queen of King. John, and mother Angouleme the queen of King John, and mother of the rebuilder of Westminster Abbey.
There are in this district of France fully forty those I have allnded to; my main object heing to show how perfectly compatible is the capola with Gothic arehitecture.
The influence, however, of the dome oxtended, in France, far hoyond the district in question for we find it spreading eastward into Auvergne and beyond that again to Lyons.
In Auvergne, it usually covers the intersection of cross churches, beneath the tower ; at Le Puy it is uscd in a very unusual form to cover, not only this contral space, but the hays of the
vaulting.
The nave is divided into ohlong hays by
transverse arches, and the intervals are reduce transverse arches, and the intervals are reduced to elongited octacons hy corbels, doing duty for pendentives, and these octagons are domed over
on the angular system. The same form of on the angular system. The same
covering exists at Ainay, near Lyons.

I may mention that the pendentives in many of theso French charches give place to corhels of varied desicn, as ot Monthron, near Angoulême,
Notre Dame da Pont at Clermont, Notre Dame des Dons at Avignon, and very many others. The last-named dome rises into a heautiful tower, and I may mention that small lantern
turrets are common upon the Aguitainian domes. turrets are common upon the Acquitainian domes.
I will not dwell upon the German domes hecause they do not illustrate any special development. They seem to have heen the
offspring of those Italian domes which followed offspring of those Italian domes which followed
Roman traditions. They mostly cover intersections of cross churchos beneath central towore. Thoseat Aix-la-Chapelleand Nimweguen are of the ordinary type of domes covering octagonal buildings. That at Worms covers a
square, but is hy corbels brought out to an square, but is hy corbels brought o
-octagon, and then domed in that form.
In our own conntry, I know of no nearer Mediæval approach to the cupola, than the semi-dome covering the apse of the chapel in the Tower of London.
The last form of dome which I will allude to is what may be called the modern type. It docs not differ in essentials from what may he found
annong those of earlier periods, hut is distin. guished from them by several of the elements which it possesses in common with some of becoming more pronounced and more essentially characteristic.
This type of dome is:-1. Raised high in the manner of a tower; 2. The dome hocomes an important external feature; 3. It is crowned hy nsually assumes internally the form of a lantern, with a range of windows heneath the dome; 5 . In some instances the external and internal domes are independent structures, the former - acting as a roof to the latter, with, perhaps, an intermediate structure to carry the culminating
tower on its apex. Now, every one of these features is to he found in earlier domes.

The raising of a dome upon a drum or tower is common hoth in the East and West. In many instances, and especially in Mahometan huild. ings, the dome hecomes an important external feature. The crowning of tbe dome hy a small tower or lantern on its apex is frequent among the early domes of Northern I taly, and is seen in a different form, on its prototype at Venice. The internal range of windows beneath the dome is found both in the true Byzantine districts, in Italy, in France, and in Germany; and, finally,
the independence of the external and the the independence of the external aud the
internal domes, -the former hecoming the roof internal domes, -the former hecoming the roof
to the latter, with even the intermediate structure to support the culminating turret or Mark's at Venice, where its early date is proved
by its boing represented in the most ancient of the external mosaics.
Why, then, if all its esgential characteristics are to he found in ancient examples, do we call this form of dome "modern"? I wonld reply that, though its elementary ideas were old, their systematic combination, and the vast scale on which thoy were worked out, is due to the opinion, their greatest achierement is, in my anion of the Classicest achievement, being the Medioval ideal, and the working of them into feature which no previous style had produced in so complete a manner or on so nohle a scale. In this, as the true Byzantine dome; on the contror think it a less reasonable and an eonen beautifnl covering, hecause it is raised to so vast an elevation as not to he visible at any nataral angle of vision, nor to hecome a part of the general internal view of the huilding. It must, however, he confessed that, when seen, it is of wonderfal and almost magic aspect; while axtermally it produces a nohler form of tower I do not be found in any previons development. I do not think it in any dogree belongs essen. tially to the Renaissance, though it chanced to trary, the first complote infuenco. On the oon. dome, the first complote type of this form of dome (though happening not to be pendentive) was designed as the completion of a Gothic structurs, and its only serious fault is that it whs not carried out witb more perfectly Gothic Cathedral at Florence.
That structure had heen carried out during the fourteenth century,-all but its cupola,-from the design of Arnolpho and his successors.
dome equa! in space to that now existing wa prepared for, hat varions causes delayed for a century its actual erection; so that, when it was at length nndertaken, the prevailing style had changed. It is prohahlo that Arnolpho intended to have sprang his dome at a far lower level, and to have made it like that of the adjoining hapistery; perhaps not oxhihiting externally its domical form. Branelleschi raised the drum to a considerahle height,-exlibited his domo as a vast external feature, -and crowned it with culminating lantern, thus giving us at one⿱ the leading features,-and that on scale ance the exceeded, of what I havecallod the moderm type of dome. Had he made its details more type rately to harmonise with those of Arnolpho, struoture, his work wonld have heen perno Not only is his dome erected on heen perfect and arches, hut its section is a pointed arch hat in all but its decorative features arch, so these in some degree,-it is essentially a Gothic dome. It is not, however, pendentive, nor is it circular in plan,-and though opening hy arches into the arms of the cross, it is after all merely he covering of an octagonal chamber, so that is claims rest more on its size, its height, and its external heauty, than any novelty of developOf
be uselegs fuccessors the name is legion. It wonld the moseless for me to attempt to ezuruerate even the most successful of them. I will, therefore, content myself with a hrief description of the wo most typical-those of St. Peter's_at Rome, and of our own St. Panl's.
I 2 m not aware of any dome of great scale erected in the interval hetween Brunelleschi's dome at Florence, and that of Michelangelo at Rome. The latter, however, was the crowning result of the efforts of successive architeots, especially of Bramante and Sangallo. In one sense it does, and the other it does not, show evidence of this lengthened period of develop ment. Its nnity of design would hespeak it as the work of one master-mind, while its perfection may mark it as the result of oft-repeated trials. Thongh founded in idea on the dome at Florence, that of St. Peter's differs from it in many most important and essential particnlars. In the first place, while that at Florence is supported from the very floor upon an octagonal wall merely pierced hy comparatively narrow arches, that at St. Peter's is essontially a penlentive dome, rising fromfour colossal piers which give it a square hase, and united with the four of vast the church hy arches, or rather vaults, wide as to These arches, it is true, are not so from hetween them to triangular forms, hut are set so far apart as to leave a portion of the ideal circle hetween them, and to give the pendentive horizontal hase. This wis necesery strength to the piers for the support of so gigantic
a structure, but in no degree interferes with the pendentive character of the dome.
Again, at Florence the octagonal wall rises to the very hase of the dome, while at Rome the dram, from the pendentives upwards, is circular At Florence it is pierced only hy rather ungainly circular windows, while at Rome it is colonnaded within and without, and beautifnlly decorsted within. At Florence the dome is of that donht inl kind which has straight sides, carrying up Rome octagonal form to the very top, while at Rome the dome is circular and perfect. Both are in some degree alike in construction, being double, St. Paul's, hut one dome not two domes, as at our St. Paul's, hut one dome formed of two shells partially connected; a mode of construction well Baited to the snpport of the crowning lantern. Both domes are founded in their section on the pointed arch. Their internal span is nearly the same ; hut their proportions differ greatly; for, while that at Florence is internally only two of its diameters in height, that at Rome is two and half: and while the former is exterually one and three quarters of its diameter in leight, the latter is two diameters, - each irrespective of the lantern. Strangely enougli, however, the great external defect of the dome of St. Peter's is its want of height. It is so encumbered hy the surrounding huilding, that its height, from near points of view, is greatly lost. Like the mountain, 一which seems to he its prototype,-though towering nohly in the distant view, it hecomes as yon approach it entangled among tho nearer thongh smaller heights. This is ohviated at Florence, -at least from the eastern points of view, -hy the more favonrahle distrihution of the snhordinate huildings.
The hoast attrihuted to Michelangelo - that he would raise the Pantheon upon the top of the Temple of Peace,-has more meaning than at first appears. The Temple of Peace (so called), now known to bave heen tho Basilica of Maxen. tins, consists of a vast nave with aisles. The nave is divided into three square hays of hegroined. Had the in width, and these hays are known, each hay pendontive dome been then such a dome as that which spans the central hay of St. Sophia, and in such a case the dome of the Pantheon might, in loose language, have heen said to he placed upon fonr piers and four arches of the Temple of Peace. But Michelangelo aimed at mach more than this. It was not the dome only, hat the whole structure of the Pantheon, which (in a figure of speech) he thus intended to raise upon a square substrncture open on all sides to view from other parts of the interior. Thas he raised upon his pendentives What he compared to the circular wall of the Pantheon, and on that he raised its dome. This was not, however, the whole of his task, for over the eye of the dome (as of the Pantheon) he orected again another structure-a domed roand throneh which the eye reaches from helow, into the dome. And mows the light penetrates f allowing half buried within the walls of the huilding, he made it rise holdly from their upper sarface, and gave it suoh a proportion as to render it an august and beautiful object from every point from which it is visihle.
The task was indeed one of which the greatest genins might fairly hoast?
Nearly every subsequent dome of any magni. tade scems to heve heen founded, more or less, upon St. Peter's; and, so far as I can judge, our own St. Paul's is the nohlest of them all.
The domo of St. Paul's is clearly founded on that of St. Peter's, thongh suhject to extensive changes. The ohjects of these changes seems to have heen throefold: 1st., to render it more conspicnous externally, especially from near points of view; 2ndly, to a void disproportionate internal hoight, which was the more desirahle from the smaller size of the openings through which the interior is viewed; and 3rdly, a desire to suhsti. tute eight arches and pendentives for the four at st. Peter's. The two former motives acting to retber led to the greatest peculiarity which this dome possesses, viz., it heing, in fact, two domes, one to he seen internally, and the other exter nally, with the consequent necessity for provid. ing some independent means for the support of portions of the intern. In this case, the proeach haviag two of its awn exterior are alike, each having two of its own diameters from the hase to the top of the dome. The external that of St. Peter's that of St. Peter's, while its internal height is
half a diameter less.

We bave seen at Florence and St. Peter's that the dones consist of a donble shell, conneeted at intervals by ribs,--a very excellent method of supporting a lantern when necessity domands so difficult a piece of construction as its direct support by the dome itself. Tho space, however, external and internal domes rendered this conatructional effort needless. He accordingly provided for the load on the apex by a mere cone of brick intervening between his domes, giving it a threcfold structure, a domo proper within formbrick above this carrying the lantern, and a dome of timber over that, to give comeliness to tbe exterior, and to serve as its roof.
This expedient, certainly rather complicated, has boen very differently dealt with by critics, some extoiling it as an original effort of genins, false. Neither party liave, as I think, full justice on thoir side. In the first place, it is not oritinal, the same principle baring been, centuries before, acted on at St. Mark's, Venice. It is true that, in that case, not the external dome alone, but the lantern, with its supports, are all of timber. This does not, bowever, alter the principle in the least ; for we have the threefold structure, -thle dome proper, the supports of the lantern, and the exterual dome, just as at St. Poul's, as a glance at the sections of the two Paul's, as a glance at the sections of the two
will at once prove, In more recent structnres iron supports in the lantera bavo been substi. iron supports in the lantern havo been substi. nearly to tho type given by \$t. Mark's. In tbe second place, I hardly think, with this Mediaval precedent hefore us, we need be so squeamish precedent hefore us, we need be so squeamish
abont the expedient being artificial. We con. stantly find double corerings to our ancient stantly find double coverings to our ancient roof without, and if we desire to place a fleche riding upon the roof, we support it hy construc riding upon the roof, we support it hy construc-
tions concealed between the two. This is procisely what Wron has done. Tho only difference cisely what Wron has done. Tho only diference against him is, that his roof is domical, and sue same which he sees within, -a mere pecca. dillo, after all,-and amply atoned by the fact dillo, after all,--and amply atoned by the fact tbat you gain hy it the power of giving due height both within and fwithout, and avoid the difficuity and dangor of snpporting a massive structure of stone, as large as some church
Bteeples, upon the apex of a dome. Anyhow, public opinion has decided in favour of the expedient, for a majority of suhsequent domes
are constructed on the same principle; while I almost defy an architect now derigning a dome and experiencing these two difficulties-1. The artistic difficulty of making the same dome look
well from within and without; and 2. The conwell from within and without; and 2. The constructive difficulty of balancing a steeple on the
top of his dome, -to resist the temptation pre top of his dome,- to resist the temptation pre-
sented hy this simple expedient; and the more sented hy this simple expedient; and the more
so when conscious of having for it a Medioval so when
The dome of St. Paul's is exteraally perhaps more successfal than any other. Internally, it is good from the supporting arches upwards, excepting that it is damaged hy the unreason.
able system on wbich its painted decorations able system on wbic
have heen designed.
The arches hclow are, however, an exception to its claims or our praise.
The scheme on which the plau of the dome and its accompaniments is set out in St. Panl's is totally different from that in St. Peter's. In the latter, the space heneath the dome is penetrated hy the nave and transept alone, irrespective of their disles, which stop dead against the piers of tbe dome. In the former, the same space is penetrated both hy the nave and tran. sept, and their aisles. To take another view. In St. Peter's, the square occupied by the dome, and its piers, is surronnded on all sidos hy an aisle low in the angles and lofty in the centres of the sides; or, in other words, the aisles failing to penetrato the dome branch round its angles, while those of Sir Christopher Wren pierce direotly through it
St. Panl's has estervally tho advantage of the great corner piers rising from tbe gronnd, unen. cumbered by surronnding baildings; hut inter. nally grandenr is sadly lost through the smaller span of the large supporting arches; the want of bold simplicity in the piers, hy the meanness and irregalarity of the smallor arches, and the confusion caused hy the mode in which the portion abore them is arranged.
Externally, however, the outline of this dome is perhaps uneqnalled; and, even internally, if
to defects in detail, the impression produced is grand in the extreme.
I bave used np all the time at my disposal without having even reacbed one of the greatest classes of domical structures, - those of the
different Mahommedan nations, from Moroceo different Mahommedan nations, from Morocco
and Southern Spain, by Egypt and Turkey, to and Southern Spa
Persia and India

## ersia and India.

I the less regrot tbis because I leave it wholly untonched for some one better acquainted with it than myself to take up: I will only offer two remarks upon it. The first is, that it is wholly an offshoot of the Byzantine style wbich was first adopted, and then developed upon hy the infidel conquerors. The seoond is, that it is throughout, or nearly so, carried out witb the pointed arcb, and most usually witb corhela instead of pendentives, giving in these two directions an extension to the developments whicb took place in Western Enrope. I may also mention that, in splendour of decoration, it is impossible to conceive anything to go heyond it; though it is a style which seems afien to ou Western and Christian prepossessions.
Wo bave seen that the cupola,--the noblest of all architectural features,- has helonged hy righ to Roman architecture; was continued in the same style when it became Christian; was wonerfall developed in the Eastern and Misdall Aran Empire; was conlinued into German and France ; that it was taken np during the early days of the Renaissance from the unfinished Gothic Cathedral at Florence and, through that semi-Medizral, semi-Renaissance graft, was styles that it sloould be equally welcomed into our but sncb a welcoming of all that is good and noble to render it complete, and no featnre posscsses these qualities in a higher degree than the cupola. Let 11s, thercfore, make it owr oum. I have myself made some fow attempts at his, which I venture to submit to you.
The dome, however, without its appropriate decorations, is but the hody without the soul. If is the sister art of painting which breathes painting must, however, be athess form. This painting must, however, be adapted to its posi-
tion with skill, knowledgo, and study. I have not time left to dilato on this subject, but com. mend it to the students of tbat art, only hegrging them to remember that, while exercising thei an essential form on which its very stability real or apparent, depends, they must keop it in such subordination as not to disturb that assential, but rather to hinc out and emphasise it; otherwise what I am urging will not prove a loving union, hat a hostile collision, of tho two sister arts.

OUR ANCIENT NATIONAL MONUMENTS.
Sir,-The time is now close at band for the revival of the long-delayed discussion of the question on the best mode to effect the preserva. tion of our ancient national monuments, and we may, with some confidence, I think, look forward to the Bill Sir Jobn Lubhock has promised draft of it; but I truat ithas been well circulated draft of it; but I trust it thas been well circulated kingdom, to call their attention to the suhject, and to induce snpport to the Bill within and without Parliament. For many years this roeasure, professed hy all to ho desirable, has slept; for it is impossible to regard the com. munications made to Mr. Ayrton on the part of the society of Antiquaries as indicative of wbat is generally understood here and in Franco by ancient national monuments"; and 1 am not aware that any decided and effective steps have been taken by pnhlic bodies either in snpport of Sir John Lufbhook's scheme or independently of this patriotic antiquary : as in other matters, so in this, what is ever'yhody's business is nobody's.
The nearest approach towards a Govermment recognition of the necessity for some compre. hensive scheme for saving what yet remains of our anciont national monuments was when the co-operation of suoh men as Sir Rohert Inglis and Mr. Hume was secured to endeavour to obtain a Commission to investigate the suhject thoroughly and comprehensively. A dissolution of Parliament suddenly checked our efforts and damaged our hopes. Then was formed the Britigh Archwological Association, chiefly to of presorving the remains of ancient national
art for the pnblic, and to aid in advancing and illustrating historical education. Not only were cathedrals and churches, with their comprehended in the notions and plans tho founders of this popalar and prolitic institution, hat the various primeval remains strewed equally with the sacred works of art somosed equally with the sacred works of art sapposed
to be already under the safe.keeping of the clergy. The rast extent of pre.bistoric earth works, megaliths, sepulchral structures, British oppida, fic., formed a. prominent feature in our plan for preservation; and especially so as many of them are daily exposed to dostruction from heing but little known, and consequently at the mercy of the ignorant and selfisb who claim ownersbip over them. There was no notion of restricting conservation
"regal and other tombs and monuments in "regal and other tombs and monuments in catbedrals, churcbes, sc.," sucli as seem to have "xclusively engaged the sympatby, of the Societry ion Mir. Ayrton refused to recognise. Bat since be establishment of the popular archroological societies the destruction of our ancient national monuments, the Celtic oppida, the Roman castra and villas, churcbes aud their sacred appendagee, bas gone on as nsual, slowly and surely; and more has been saced by private energy and good eeling than by any comined remonstrances or collective demonstrations; and when a societp has been propelled to plead for some important monument, such as, for example, the Roman Thoatre at Old Verulam, Governments bave ever turned a deaf ear to the petition.
It is not my wish, sir, to intrade apon your time and well-occupied columns a subject wbicb to be fnilly considered, wonld probahly demand more than you could conveniently afford; but wo may, I feel assured, reckon on your goodwil? to assist in bringing Sir John Lubbock's pro posed Bill into greater prominence, in order that the public may nuderstand its provisions and objects; and that societies of archroological and iterary character may be stimulated to petition Parliament on hehalf of the Bill, and at the same time bring it nuder the consideration of nembers of Parlisinent to prepare tbem for the introduction of the Bill. C. Roach Smitr.

ST. PAUL'S CATHEDRAL FROM WREN'S POINT OF VIEW.
Anndst all the nncertainties of art in these days of progress and perpetual change, there re some few things luckily that always remain the same, and are certain. The almost perfection the heod of them. In scupture, in prehitectume ne heaumina in painting they were pre-eminent; but in oothing were they more singularly happy and hoursitfore they more singularly happy and temples and public huildings. This is a charac. teristic of Greek work which has as yet hardly heen touched upon, and to do any sort of justice o glance at it we need but notice the ad in position, as a mere matter of planning, of the Pantbeon, and its gateway of approach on the Athenian Acropolis. By referring to a plan of the Acropolis, it will be seen how admirably con. rived the whole group of buildings was, and bow, on approaching tho famous tomple, as the
central ohject, you did so at an angle, and so saw at one view, and from the hest possible point of view, the front and side of the matcbess builaing. It was the very perfoction of artistic and architectural jndgment, and fine and noble taste. Not only was the building all but perfect, but the way to it, and the sight of it, were the hest possihle. Nor was this all. On great occasions, as on tbat of the Panathenaic Pro.
cossion, those who composed it not only canght cession, those who composed it not only canght first sight of the temple at its best, i.e., angularly, but tbey passed completely ronnd it before eaching tbe coorway of tho entrance, and its portico, with its fight of steps, its eight columns, its recessed columns, and its magnificent illus. trative and instruetive sonlptnres, - a written record in enduring marble, which but to see was to read. A side yiew was to the old Greek the
hest of views, and the most artistic. How hest of views, and the most artistic. How different from our ways of doing things in these improved times. With us a "street front" eleration is the one thing needful, and the way to look at a huilding is to stand richlt in front of it on the opposite side of the road, and in the
middle of it, -the angle taking in the buildiug
when bisected by a line from the oye to it, -is always a right angle with tho line of the front of tho building. This is the invariable orthodox way of looking at street bulding, and any an angle of forty.five degrees from the front of it, and refusing to go further, and right in front of it, would most certainly be thought insane, or nearly so. But this was the old Greek's way, and he almost compelled you to keep away from the direct view of the front of his building till you were nearly under the portico of it. Thus you were nearly under the porsico of it. Thus
was it with the Parthenon, - its architect wampelled you to look at it aright and at its hest.
We have heen urged to these thougbts on the artistic methods of the antique Greeks, so far
off from things that now are, and in all ways so off from things that now are, and in all ways so
different, by an accidental view, for some hours different, by an accidental view, for some hours
on successive days, of St. Paul's Cathedral from on successive days, of St. Paul's Cathedral from
Sir Christopher Wren's own point of view, Sir Christopher Wren's own point of view, -
indeed, from the windows of the honse in St. Paul's-churchyard which Wren must havo many times looked out of and at his work as it went on day by day. Indeed, the house we refer to is
but a door away from the very house he himself but a door away from the very house he himself
lived in. What, then, did the great architect of lived in. What, then, did the great architect of
St. Paul's see as ite front and side elevations, the St. Paul's see as its front and side elevations, the
west and sonth, rose into completion under his west and sonth, rose into completion under his
very eye, and day by day? We can scarcely imagine it. So much nowadays is done by steam machinery, and by cut-and-dried and hackneyed processes, that all such work is alike overywhere. Tho same "pluat" is used, and
the scaffolding employed is reduced to its very the scaffolding employed is reduced to its very simplest expression,-uprights, cross-pines, and a "traveller." But in Wren's days, ospecially
under the eye of so ingenious a mechanic, the very scaffolding ronnd St. Paul's and its great dome must have heen a most complicated and ingenions mass of timber and hand machinery, almostasinteresting, - mechanically, at least, - to look at as the cathedral itself. But our business at present is not so mucb with the mode of con. struction of St. Paul's, a subject yet awaiting a little cogitation by the way, but with Wren's
special riew of St. Pau's from his own window spi point of sight. From an upper window of this house may perhaps be seen the very best possible, and most artistic and "architecturesque," view of the cathedral: a truly Greek view of it : The eye takcs in the front and side angularly, and the dome risce from the mass of the structure with a picturesqueuess that cannot be surpassed. Here wo may notice one element in the designing or planning of St. Paul's which is notewortly, and shows how Wren thought out his plan, with the "elevations" in his mind's eye at the same time. We refer to the angular blocks of masonry in which are the dean's Mayor's vestry and school, and the staircase to Mayor \& vestry and school, and the staircase to the whispering gallery, forming gigantio butA happy thougbt; and Wren, from his window, A happy thougbt; and Wren, from his window, point of sight with the dome, and tho structure on which it rests, both real and apparent, at their very best. In the many critical examinations of St. Paul's, we hardly think that the
sculpture in it has been done full justice to, sculpture in it has been done full justice to, or,
indeed, that tho sculpture of Wren's time has heen sufficiently examined and prized. It is, we think, worth all the study the student can bestow on it, and may well serve as an example to those whose fortune it is to fill our modern London with statues and sculptare. From his window Wren could get a good view of the Gigure-
sculpture of St. Paul's, and must, of course, have sculpture of St. Paul's, and must, of course, Lave seen each tiguro before it was hoisted into its
place. Some of these are erceedingly fine, being higb np, and well out of the way, they have not suffered by painting over, as have the sculptures (St. Paul preaching at Bercea) behind the columns of the west portico, which were coated over many times with oil-colour. They are, too, unrestored, and so have great value, as
showing the actual stone-cutting of the time in which they were executed. To give a list of hem would ocoupy too much space; but one or wo of them, as seen from Wren's point of quiet bbservation, may be of interest. The figures at St. John the south-western tower are those of western corner of it, just opposito our window of observation, is singularly fine. It represents the Evangelist St. Jobn, seated, with the eagle at his feet.
The attitnde and the whole expression of this igure are worthy of the place they occupy, and how bow much Wren must havo left the
scalptor to himself, he probably regarding the responsibility of his own, and assistant, with independent credit to gain or to personal and is no evidence to show that Wren "designed" as it is called, much less executod, "designed," as simply provided fitting
he sata these figures: figures might bo afterward places in which fart of the work was erwards placed, when his part of the work was executed. Indeed, just in the same way as the arcbitect Setinus left Phidias, the sculptor, to bis proper work, each getting tho credit for kis own, but only his own work. You may see this from the street, but more clearly from our window. You are nearer the work, and can see the individuality Theso oxecutive sculptor hetter and olearer. our modern and creryday mode of work, and show what is possible. The figure in the opposite corner of the church, at the north-western angle of it, is, perhaps, a yet grander one, almost In the manner of Michelangelo, with magnificent drapery; but tbis cannot be seen from our window of observation. We may here ohscrve as we are so very close to it, that the clock cannot well be missed, being so largo, and occupying so conspicuous a place as it does; but it does not mar or in any way get in the way of the architecture. A clock in a cathedral somewhere or other wonld seem to be a sort of necessity, both architecturally, and socially and morally, as marking to that vast majority who are without portable clocks Time's inexorable passage, waiting for no man

It is impossible to catch sight of St. Panl' from Sir Christopher Wren's window, and to look at it as he must have so often done, without a thought of the railings round it, 80 irregular in outline, and placed there with such small consideration of their effect on the build ing which they surround. They are remarkable specimens of iron castings considering the time carefully and boldly desionted. They are very carefully and boldly designed, and contrast not a little favourably with the thin and meagre work which "railings" commonly now-a-days show. They form, with the stone plinth on which they atend, an indication of a "platform" on which the building should stand. The Parthenon stood on a rock platform, as on a solid basement. It adds not a little to the dignity of an isolated and regular structure But in order that this cffect should be as perfect as may be, the supporting platform should harmonise in outline more or less with the main lines of the structure wbich stands on it, and which it supports. Jadging from Oreel precedent and examplo, very great dignity indeed must acerne from the wbole surface of the platfcrm on wbicb St. Paul's stands heing retained, and its houndaries cleanly defined by the stone plinth and railing. It may, as is obvions, be so altered in plan as for its lines to range with the main lines of the walls of the building. We could see all this from Wren's window with some clearness. Wo could not help thinking, the crowds aifferently, and how picturesquely Wren's day. Pictnresqueness and quaintmess of costume add not a little to the artistic effect of Venice. Our thoughts, too, travelled to old and coloured costnmes, and half-Orionta wds, wouen, and children, and ways of life. Pictures in plenty,-no invention needed, - the painter might go to work on the spot, with bat little in his mind's eye but the magic scene before bim!

LONDON SCHOOL BOARD SCHOOLS WILMOT-STREET, BETHNAL-GREEN.

IfTs huilding, now in conrse of erection, is one of those for which designs were invited in limited competition. The successful design was that submitted by Hessrs. John Giles \& Gough, any deviation from the plans by them withou huilding is one of the largest yet contracted for hy the Board, the plans being prepared on inatructions to accommodate 1,520 children. There is, bowever, actual accommodation for nearly 1,600. Mr. F. Crickmay is clerk of workg
The entrance for the infants is in the centre of the huilding fronting Wilmot-street, and on the right of tho buildings, and in Wilmot-street also is the entrance for girls, their play-grounds (which The entrance for boys tho rear of the schools. entirely renoved from the others and theirplay-
ground is distinct, and cut off by the care-taker's adjoining the boys ${ }^{\prime}$ been thought best to place adjoining the boys' entrance. A basement is provided under the care-takers rooms and boys ntrance and stairs, for coal storage.
The ground-foor of the entire block of buildings right and left of their central entrance is evoted to infants.
The first floor on tbe rigbt is devoted to 220 girls; on the left to 240 boys. Between these w is placed the manager's, or board room, conenent for access to either school, and reached T small private staircase
the second floor, on the right, is devoted to girls (as on tho first floor), 220 in number; on號, to boys, 240 im number. These are divided, as bolow, by a room to be used jointly for drawing-closses, having upper and north infants on the cround floor the total of 600 first and second fround floor ; 480 boys on tbe second floore also; each doport an tinct sebools. The more detailed arrangomonts of the plan are follow,

## INPANTS' SCHOOLS,

Rigbt and left of the central entrance, and im mediately adjoining a mistress's room, are the cloak-rooms and lavatories. The space provided on each side is alike, and is in school and clas room in each case for 300 infants, allowing 9 ft . superficial for each infant.
The large school-room has a gallery capable of accommodating at least two-thirds of the infants with side and high back light, together with a
smaller gallery and a large clear space for smarler gal
The class-rooms enter in cvery case only from the school-room.
A class-room is provided for babies, and another for the most advanced infants, capsble of being thrown together as directed in Rule of the Board's "Rules" as regards infants" schools; and as this is a school of the maximun size, a third and larger class-room is in each case provided.
Each school and class room has in erery case direct through-ventilation, and window space is also given.
The Graded Schoole, as before mentioned, buildings, the left of the centre of the block of being devoted to boys, the richt to girls, and the arrangements of both floors in each case alike.

## the roys' schools.

The plan on tbe first-floor provides for 240 boys, in six grades of forty cach, in one principal school-room and four class-rooms; on the second floor for a similar number, arranged in a similar way
Each class-room is entered orly from the school. They are arranged to be thrown toge tber in pairs, and all here side.light mand through-
The prinoipal school-room has light at the hacks of the boys, and windows opposite,
at a considerable height, giving through-venat a con
tilation.

A stone staircase, witbont winders or open well-bole, gives access to these sohools, and on the half spaco are the lavatories, and hat and cloak rooms, and between the two schools masters' rooms.

THE Girls schools.
The arrangements for these are similar to those for the boys, except that the fiftb and sixth standards are taught in class-rooms, having ouly thirty instead of forty, thus giving the required number of 440 girls. The cloak-rooms required number of 440 girls . The
are also somewhat reduced in size.
The school and class rooms, together for each child, 10 ft . superficial space has been provided and in the school-room alone a little over 4 ft, superficial for the entiro number of 240 or 220 superficial for the entiro $n$
respectively on each floor. The warming will be
whe warming will be by open fireplaces, in which will be fitted patent ventilating stoves. The materials will be stock brick, with red brick facing throughout, and monlded brick strings, Bath and Portland stone for heads and sills, \&c.; roofs covered with Penmoyle green slates. The mullions and transoms aro of fir with casements lumg to transoms to open down inwardly.
The cubic space of the entire building is $442,800 \mathrm{ft}$.; and the contract, including boundary-walls, play-gronnds, \&c., bas been taken by Mr. A. Sheffield, of East-India Dockroad, for the sum of 10,389 ?

## NEW BUSINESS TREMISES IN BURY:

 A NEW pile of buildings has heen erected a the top of Boltou-street by Messrs. Driffield, place of some miserable old huildings which were totally unsuited to the centre of a town like Bury, however valuable as specimens of the architeoture in vogre in old times. The site of the new premises is in the vory centre, andholding a commanding position at the junotion holding a commanding posit

THE PRINCIPLES AND PURPOSE OF ART Lord Napier and Extrick, K.T., took the chair on Thursday evening, the 20th inst,, at meeting of the members of the Society for th Encouragement of the Fme Arts, held at thei rooms, Condnit-street, when Mr. George F. 1 enis wood, F.S.A., read a paper on "The Principles and Purpose of Art.
In the course of his remarks the lecturer said, that nnder the term fine arts" were com prised poetry, painting, sculpture, and mnsic but that it was his purpose that eveniug to draw attention to paintang, or the piotorial art. This art emhodied tho forms and the imagery of oxtemal nature; and there was a great distinc ion, as Mr. Ruskin had pointed out, hetween the terms " manufactnred art" and the "fine arts" Art was not limited to the painting of a picture merely; it had its distinctive character, hein an expression of thought hy form, and its pur pose was to emhody the expression or emotio of the mind. Art, therefore, was not only in reat measure the offspring of the imarination hut was addressed to it; and there could be art where this faculty was wanting The artist was the interpreter of natnre and of hnmanitr, and was the vehicle of thought and sentiment modified hy his feelings and by his intellect Art represented idess, and realised truth macination : and if a work of art aronsed dorment quickenince of that sinit which impels all moring thinking thine put it ono sel Art was the power of oiving the chan side trnth in whatever parh it presented iteolf. the prodnction of gicture the means ampion the prose of alome and of theompsion, ho and shade was ooloar. Of these elements of imitation form define the mos important, the artist having to define the shapo of objeots hy line. There wa no quality so distinotly the mark of a genins as
Fnvitation from the pnrchaser of site in Bond-street
original inventive power, and composition disposed and arranged the matter supplied by in vention. Light and shade were of the bichest value to the artist, and the power of darkness vas the agent of the suhlime
Shadow appeals to the sensitive imagination, and is full of mystery, and many great painters have heen strong in the representation of light and shade. Let us, then, not complain of exaggeration in deep-toned pictnres. In colour the artist exercised original power and imagination, In conclusion, he said that the love of art may be enjoyed hy all. It recognised no priesthood, and its temple was one wherein all could worship. It was a passion increasing, andjan enjoyment within the privilege of all; for the universality of its practice and the antiquity of its existence were well known.
The chairman, in proposing a vote of thanks, after alluding in high terms to the eloquent lecture, said that the piotorial art reconciled us to the humblest ohjects of life, which, without this art, we should be almost unfamiliar with. The painter was the interpreter of the charms of nature, and his worl increased our interest in the subjeots. This was especially tho case with regaru to Dutich larusceapes. The same might be ohserved in the manner in which painters of scenes taken from domestic life represented and idealised the emotions, sorvows, and joys of the poor, thns a makening onr interest in such The power of painting, too, went still further; and awakened in our mind such an appreciation of subjects which we did not derive from the ohjects themselves, hut which, when transferred to the canvas, a more delicate and refined enjoy. ment was to be derived from contemplating them, this being noteworthy with reference to flowers and leaves.
Major Britten, the president of tbe society, thonght that there was one purpose of art which he regretted the lecturer did not touch upon, and that was the practical purpose of art. Our art workmen and artizans were far behind other countries in technical edncation, and this was a great pily, in such a sreat oommercial country as onrs. He hoped that the Government would be fully alive to this, so that something might he done towards extending art education among our artizans, for this was a purpose of art that wel! deserved attention,

INFLUENCE OF ARCH ROLOGY ON ARCHITECTURE
Mr. J. H. Chabberlais, F.R.I.B.A., gave a lecture recently to the memhers of the Archaoological Section of the Midland Institute, at Birmingham, on "The Influence of the Archaoa$\operatorname{logist}$ npon Revivals of Architecture." The which had heen bronght to pass within the last 500 years, and he proposed to sketch some part of the work that the archnologist had done in promoting them to the best of his ahility and in spoiling them to the hest of his ahility, the latter having been manared hy him far more successfully than the former. The Itwo great revivals of past art were those of Italy and England, -that of Italy heing known no partionar noe, and lat of England having It partioular name excopt revival of Gothic. yenrs, years, during which time it had done, for good or for evil, a very great deal of work. It had covered tho Whole of Europe from one end to ine other with various huildings, and it had influenced the art of painting and sculptnye. In Ttaly art-revival was essentially a literary
revival, and was owing to the discovery of revival, and was owing to the discovery of anolent manuscripts and to iterature rat her than Italy. In Fingland it could not he said that the author, the poet, and the "1iterary man" (to use an ugly phrase) had very much to do with art.revival here. Neither in the case of Italy het of England was there a complete break England there had been no time in which Gothic architecture had ceased to he practised, althougl towards the middle of the Lourteenth centur the Classic change began, and was at last forced into an original style called Elizahethan. Italian revival had a marvellous influence on the art of the world, which was encumbered with huildings erected according to the rules and laws laid down in Italy 500 years ago, and erroneously supposed the the laws hy which the anoient bulder were governed in putting up their temples and
haildings. In Italy the chief cruse of the revival
of Classic art in the first instance was the man of letters, and the laws, after being discovered, were then moulded and fashioned hy the archroologist. In England wo might dismiss the man of letters altogether, and the archreologist might lay what claim he pleased to haviog heen the principal canse of the foundation of art-revival power of admiration, and that had led him to try and adapt what he saw in old work to what he wanted to produce in the present day. In tho way of doing this, however, lay the whole difference hetween the good and the evil effect pave numerous illustrations in which the archeo. logist had influenced the architecture and style of public buildings in accordance with his taste and especially referred to the dome of St, Paul's

## ST. GILES'S CATHEDRAL, EDINBURCH.

The restoration of the choir of this church which has been in progress for the last ten months, has heen referred to in former numhers of the Builder. On Sunday last, tho 9th instant, it was opened for public worship, upon which occaston the representatives of vations public bodies, attired iu their oficial robes, attended the services. Sermons were preached by the Rev. Principal Tulloch, of St. Andrews, and by Dr. Lindsay Alexander, a distinguished Nonconformist divine, -an instance of that approachment hetween difforent sects of ChrisBoth which is one ored the subiect thmes an aid to religion. "Onr taste and our sense of art," said the learned principal, "should be consulted as well as our spiritual intelligence. We are bound to beautify our worship soll se to make it intelligible and earnest. When we allow our worship to be nnseemly in any respect; our prayers to be informal, confused, and dogmatic ; instead of to be a harsh, discordant noise, communion service to he, what it too often is, a series of preachinge $r$, than alon is, a series of preachiogs, templation, with solemu hauksgiving and a loud amen, let us remember that the apostle is not for ns, but against us. If a Christian church be is it a lecture.room nor a hall for discussion." is it a lecture-room nor a hall for discussion.'
Such would have heen considered bold words t he uttered hy a clergyman of the Church Scotland not so very long ago, end even ye there are some who listen to them with fear and trembling. At a meeting of the restoration committee, one gentleman stated that ho was horrified to find that there is a reredos; that the pulpit is placed against a pillar, and not in the entro of all,-an open space is left, and occapied hy
a table, which some day may be utilised as an altar.
The restoration is in most respects a very satisfactory one, and bears a greater verisimili ade to cathedral arrangement than the restora tion of St. Mango's, at Clasgow. The stalls in this instance run east and west, and are really stalls, and not open pews, as at Glasgow. They are of sold oak, substantial, and richly carved
with heraldic devices, dc. The royal stall is with heraldic derices, tc. The royal stall is
situated at the west end of the choir, and is situated at the west end of the choir, and is
sereened from the entrance by oak panelling. The central cunopy has the Royal arms, after the Scotish manner, and unicorns holding the Royal banner.
The reredos is of Caen stone, haring panels in which are to be placed bas-reliefs in marble, represonting scenes irom the life of our Lord, above which are canopied miches, supported on shafts of green marhle, which are to contain figures of prophets and apostles. The space in front of the reredos is raised two steps ahove the general level, and paved with encaustic tiles apon this platform is placed an ohlong oak tahle and carved oak chairs for the use of the clergy The pnlpit is octagonal in form, resting on four pillars of green serpentine, with foliated caps At each angle is an angel bearing a scroll, and tbe panels are richly carved and casped.
All the passages are laid with encaustic tiles, and appropriate brass standards are introduced for lighting.
Any one inclined to he hypercritical might object to the reredos and pulpit as heing too and bald character of the interior; bat, upon the whole, the restoration is satisfactory as far as it goes. If the whole bailding were opened up and treated in a similar manner, the result could
not fail to he aatisfactory ; hut as it is we have a bit of patchwork whioh renders the necessity ohvious than hefore

## PROGRESS AT LISKEARD.

New Masomic Hall.-This huilding, situated Banl Parade, next to the Devon and Cornwall eleration is ownearly completed. desioned by Mr. Paul, of Liskeard, architect, and is hnilt entirely of stone, several varieties and colours being introduced, contrasting with the sombre granite Bank next door. The style has been called French Classic. The plinth is of prey granite, and above, the walling is of local stone, raised in the adjacent parish of St. Clair. Tbe dressings are of Ham.hill. The arch-stones of the windows are relieved hy alternate bands of Polyphant, and ahope and below the moulded and carved cornice, that runs the full length of story above, are bands of Polyphant also. The columns to all the windows es well as those the entrance, are of red Mansfield stone and from them spuing carred foliated capitals, by which the window-arches are carried. The front room of the lower story will be used as offices The first Boor is reached by a wide staircase The newels are of oak, carved wheat.ears bein largely introduced. The hand-rail is of polished mahogany. The lodge-room is 17 ft .6 in . by 30 ft . The walls are relieved by a high skirting Portland stone and The mantelpieces are of in circular panels, are carved various emhlems of the craft. Under Brother Paul's personal superintendence the work has been executed Brother Lang, of the same town, heing the hailder. The carved stone and wood.work, and the sculptare, have been carried out by Mr. Harry Hems, of Exeter, sculptor.
Neiv Drinking Fountain. - Upon the centre o the Parade, and hard by the granite.obelisk gas. hamp, Mr. M. Loam, twice mayor of Liskeard has just erected, at a cost of abont 2002., drinking-fonntain. The hase is 8 ft . 6 in. square upon plan, and is of tooled and moulded Cheese wring granite, standing upon two steps of the same material. The hasins are of polished re Dartmoor granite. The recesses on three sides are of Portand stone, and the water will issue from the open hower of a water-hly, carped the same material. The upper part of these recesses are groined, the groining springing three a sculptured shell. Above these niches on re sides, and over the door npon the fonrth, The pediments supported by carved hrackets. aiselone principaly used is a local material hised near st. Clair, a neighbonting parish, and and Poze is interspersed with bands of Portland ronnd yphant. At a height of 11 ft from the Ahove is a carval the structure rapidly taper off, to the total height of 13 ft . The architect is Mr. H. Rice, of Liskeard, and Mr. Harry Hemb has executed the wbole of the sculptured work The structure itself has been built in part by Mr. Sargeant, and in part hy Mr. Doney, bot builders at Liskeard.

## FROM SCOTLAND.

Edinburgh.-Tbe officers of the 93rd Highlanders resolved to devote a small fund to the erection of a fonntain on the site of St. Margaret's Well, West Princessstreet Gardens. The ruins of the so.called Wellhouse Tower, says the Scotsman, stand immediately under that part of the castle which is known as the Holyrood Rocks, and the building they represent has played a not unimportant part in the fortunes of the castle. Tbe old well in the interior of the tower, which was used by the castle garrison, and was accordincly sometimes prisoned hy their hesiegers, still furnishes a considerable supply of water. It is to this that the hand o the restorer has been directed, the object being to replace the wooden pamp hitherto in use by something more suitable. A large tablet of sandstone has been let into the northern wall of the tower, while immediately is front a fountain has been erected communicating with the ancient well. The fonntain, which was designed by Mr James Drummond, is of polished grey granite with a pedestal of sandstone, and, including small ornamental jet, is ahout 5 ft . in height. The design is somewhat in the form of an urn,
surmounted by a Scotch thistle in cast metal, with nozzles for two jets
Glasgow.-The Commissioners appointed by Government to inquire into the pollution of rivers in Scotland have recommended that steps be taken for the purification of the Kelvin, with all its tributaries; and the Commissioners are about to issue circulars to the different sanitary inspectors whose jurisdiction embraces any part of the river, to carry this into effect. The order of the Commissioners will embrace the inter. dicting of all paper, print, dye, and bleach works, including all the public works between North Woodside, Clasgow, and Campsie, from polluting the river. It will also hecome illegal for any portion of the town sewarge being discharged into the Kelvin. Action is to he taken imme diately for the carrying out of the Commis. sioners' recommendation.

## DISINFECTANTS AND DEODORTZERS

A Paper "On Disinfectants and Deodorizers their Uses and Modes of Application," was recently read before the Portsea Island Society for the Cultare of Science and Literature, by Mr. G. H. Stayton, C.E., who is connected with the sanitary authority of the island. Having referred to irrigation (which, he considered, was foremost among the more successfn] modes of treating sewage), Mr. Stayton mentioned the application of carbon to sewage purification as recently brought hefore the public by a member of that society, Colonel Synge, and Mr. Stanford, of Glasgow. He believed their mode of treat. ment was by "intermittent charcoal filtration;" and they claimed for it that the valuable ingre. dients in sewage were arrested hy carbon, were distilled, and more or less of the constituents separately secured, increasing the value of the deodorant, Also, that it perfectly purified sewage water, and reclaimed all tho value possible. He had always understood that charcoal was a most poweriul deodorant, as long as it was kept ary. From experience, he conld say that it ceased to be a puritier of sewer.gases, and was totally useless for that purpose, after it had been thoroughly wetted; and one could only conclude that its use as a sewage deodorant would not give satisfaction, as it coald not he relied on to do more than mitigate the evil, jnasmuch as a filter of charcoal must very soon get blocked np if largely used, as must be the case, if used for clearing seware. The charcoal wonld then be aseless, unless reburned or replaced with fresh which could not he done without labour and expense heing increased. Mr. Stanford stated hat seware purification by charcoal was mado independent of existing limited and expensive sources of supply of charcoat, as it was furnished from an original stock, improved in value hy means of the refuse dealt with; but if it were refuse, it would involve a dry deodorant carrier, which would do away with the necessity for sewerage works. Of conrse, that tonched on a subject which had caused much disagreement among professional men, as to the "wet" or dry carrier for the removal of town refuse, which, he feared, was too wido for his subject to admit of discussion. Various other processes were hriefly referred to, and Mr. Stayton entered into details referred to, and wr. Stayton entered into details acid, chloride of lime Conds'a fluid, sulphurate of iron, sulphurous acid, chlorine gas, dc.

## THE COAL QUESTION

At a recent meeting of the Manchester Sciendifc and Mechanical Society, a paper was read on Fuel, with special reference to peat and ing of fuel," hy Mr. A. Hildebrandt. Speakresult of the author said the famine was the reckless selfishness of the colliery proprietor and the collier [and be might have classed the coalmerchant alons with them]. The prices were not altogether dependent upon demand and supply, bnt were mach more the result of com. biuntion among the holders of coal. Nor was there much likelihood of the prices cominy down to anything like their original level, because the ideness of the collier suited the coal proprietor, who could now make larger profits upon less es tensive transactions. It was rumoured that in some cases the proprietors had refused to bring to hank any surplus of conl which had heen got above the ordinary quantity The Parbamentary inquiry, with Mr. Munde the
its head, would no doubt produce boneficia results in exposing dishonest practices. great deal might he done to economise fuel ; conld not be done all at once. The first substi. conld not be done all at once. The first substi mind was peat. Its extent was almost, if not quito, as extensive as that of coal, the area occa. pied by it in the United Kingdom heing esti. pied by it in the United Kingdom heing esti. the area of Ireland alons being peat bogs. Tha deposits ranged in thickness from 6 in . to 4.0 ft . The arerage heating power was somewhat greater The average heating power was somewhat greater there were peate, - the bottom layers of peat
mosses,-which were equal in value to coal. The mosses, - which were equal in value to coal. The
great obstacle to its general adoption had heen great obstacle to ita general adoption had heen
its cost, and there was no doubt that with coal at the price it was two yonra ago peat as a fuel forgeneral purposes could not compete; but with prices more than double what they were then, there could be no question that peat as a substi-
tute for coal for general purposes must be a tuto for coal for general purposes must be a
commercial success. Manchester had the adrantage of extensive peat bogs in its vicinity. They wero contignous to tbe London and North.
Western Railway, near Patricroft and Leigh,Western Railway, near Patricroft and Leigh, -
the Chat Moss, Irlam Moss, Bedford Moss, the Chat Moss, Irlam Moss, Bedford Moss,
Astley Moss, Worsley Moss, Barton Moss, and Astley Moss, Worsley Moss, Barton Moss, and
many othors. He strongly adrocated a trial of hringing peat into the market, and said he wonld be glad to render any assistince which be might
be enabled to give from his praction experience be enabled to give from his practioal experienc
in the treatment of that material.

## A NEW MORTUARY IN ISLINGTON.

 At the meeting of the Islington Vestry heldon Tuesday the sanitary committee recom. mended that mortuary and post morter build. ings and waiting.rooms be erected at the chapel. of. erse grounds, in accordance with certain plans which were submitted.
Mr . West, in moving tho confirmation of the
recommendation, said that the committee had inspeoted the present mortuary and post mortem rooms, and had come to the decision to entirely reconstruch and rearrange the present buildingSome opposition was raised to the recom.
mendation on the ground that the present build. ing only required to be slightly alterod; where. was little better than a collcetion of old sheds and was in a diegracefully broken.down condi. tion, and that es iu the new building there would ho an inquest-room it would put a stop to inquests being beld in puhlic-houses.
The proposal of the committee for the erection of the new huildings was confirmed. The plans, which have been prepared by Mr. Higgins, the survejor to the Board, provile
for the reception of the hodies of persons dying for the reception of the hodies of persons dying
from infectious diseases, likewiso a room for from infectious diseases, likewise a room for
bodies awaiting coroners' inquests, and a post bodies awaiting coroners' inquests, and a post inqnests can be held, and there will likewise he a room for mourners attending funerals.

## SCHOOL BOARDS WORE

London,-The public clementary school in course of erection for the London School Bonrd situate in Beazley.crescent, Old Ford, Bow, is planned in two distinct blocks ; "A " being for the
elder boys aud girls, "B "for infants. Tho " $B$ " block is now ready for the roof. Eacb block has separate entrances and playgrounds. The girls and infants have a play.shed fronting the Ole
Ford-rond; the selected design for the Ford-rond; the selected design for the wholo being
one suhmitted by Mr. Keith D. Young, which is being carried out under his snperintendence, by Messrs. Hill \& Sons, of Tslington, the amount of contract being $7,518 \%$. The schools are designed
to accommodate abont 1,000 childwen; the largest to accommodate aboat 1,000 children; the largest
school.room being 48 ft . long by 21 ft . wide school.room being 48 ft . long by 21 ft . wide,
which, with the usual class.teachers' and care, takers' rooms, will he warmed hy hot air, sup. plied by tho Manchester school-grato, each room having also the advantage of an open fire. The
material used for facing is hrick. The arches material used for facing is hrick. The arches
to windows and doors are Gothic, in red bricks. with Bath-stone lintel, the tympana being flled in with Cooper's red ridge.tiles. The conveni.
ences are McFarlane's, aud the lavatories are Messrs. Beard \& Dent's iron enamelled basins, let into slate tops, with the necessary fittings.
The huildings are two stories hirh, and the basements are huilt in cement concrote. Th clerk of the works is Mr. George Mamlin.

The report of the works committee at the last meeting of the Board, stated tbat on Noveraber 13 th the Board accepted the tender of $6,996 l$. for the erection of achors amounting on the site in Harper.street, Now K be built These schools were desireet, Now Kout-road. these schools were designed with the front if this arrangement be carried out, consideraht, loss of huilding space will occur, as the district surveyor insists upon the building being placed back from the more advanced line of frontage, which, on this side of the site, is very irregular. The committce have deemed it advisale to obtain fresb plans of the school, with the front owards Harper-street, and an amended estimate recten obtained from the builders for the erection of the schools accordiug to the revised plans. The committee now recommended, and Messrs. Roberts, amounting to $6,861 l$. (being 135l. less than the tender for the erection of the chools as originally designed), be accepted. The committee also stated that they had provide accommodation for 818 children on the site in Eagle-court, St. Jolm's-hne, Clerkenwell. The following are the respective amounts:F. \& F. J. Wood, 6,667l.; E. Conder, 6,050l.; Fill \& Sons, 6,000l.; Dore, Brothers, 5,955l.; Scrivener \& White, 5,900 l. ; J. H. Tarrant, 6,762l.; J. Hirh, 5,495l. ; W. Wigmore, 4,825l The committee recommended, and the Board rosolved upon, the acceptance of the lowest tender, that of Mr. W. Wigmore, of Bradfield Honse, Fulham, amounting to 4,825 l.
Leeds.-Mr. Richard L. Adams, who has heen appointed architect of the Leeds School Board requiring only of 4002 , a year, -the has resided eleven years at Leeds, says the Forkshire Post, where he has practised exter. sively, especially is a church architect, in part. nership with Mr. Kelly. The firm of Adams \& following:-Christ Church Schools, Upper Armley; Christ Cliurch, Upper Armley; Carist Luke's Churog Schools, Beeston (in hand); St. C ures Churct sestl, C Hlege Schools at isconvod. Chow Leeds; Schools at Leeds. St Jo 'harles.street St. Mary's Cirls' Sobool, Loods. St Mary' Boys' Schools, Leeds (in hand) ; St. John the Baptist's Church, Newtown; St. John the Bap. tist's Vicarage; Holy Trinity Church, Armley Hall; Holy Trinity Cburch Schools (in hand) ; Leeds Church Institute; Leeds Industrial Dwell. ings; St. Mary's Charch, Butley; Christ Church, Cateshead; St. Matthew's Chureh, Hall; St. Andrew's 'Church, Hull (in hand) ; All Saints' Charch Schools, Acton, London; schools at Adel (in land) ; schools at Shadwell (in hand); church at Eecup (in hand); restoration of St. Mark's Cburch, Woodhouse, Leeds.
Bredford.-Mr. Neill moved that the resolution of the 10 th of July, 1872 , accepting tho tender of Messrs. Beanland, or the Whetley. lano School, should be rescinded, and that the tender of Messrs. Wilson \& Sons, for 8,3002., shonld be accepted. He said that Messra. Beanland had taken this contract, and sent in a tender which the Board proposed accepting. They could not legally and properly acoept the tender, and it was postponed
for some months. They then sent in for some months. They then sent in a second tender, asking for 1007 . more, in conscquence of the adrance in material and wages, and the mittee thender amounted to 8,300. The comto take to thought it was nol a proper tender without again appealing to the public. They advertised again, and the result was, they had Mrreed to twke Messes. Wilson's tender for $8,300 \mathrm{l}$. Messrs. Beanland sent in a third tender, whieh amounted to 8,5007 . Tho conmittee thought that they had got the hest tender, and he believed that the work would be well done. Mr. Duggan, in seconding the motion, remarked that Messrs. beir the were notified of the acceptance of econd tender long before they had sent in thei Exeter. - At. The motion was then carried. chairman stated that in answer to tbeadvertiseinent for plans for schools to he erected on tbe three sites of the Exe Island, Mary Arches, and st. James's.road; for the first.named, thirty froms were submitted, with estimates rangings from 930l. to 2,440l. ; St. Mary Arches, nineteen plans, with estimates ranging from 1,940l. to
with estimates ranging from 5907 . to 1,877 l. The designs were furnished on the 15th of February, in conformity witb the instructions to the archi. tects, one of which was that the "Board are anxious to secure good design, and convenient arrangement, and also to avoid unnecessary expense in ornamentation." The plans were exnibited at the Judges Room on Northernhay and after careful and repeated consideration the which, with selected from each group three plans, which, with due regard to economy, and the con ditions of competition (for in several cases the estimated cost appeared to be altogether insufficient) seomed most likely to furnish the best schools, special attention, in all cases, having becn directed to the internal arrangements. They next instructed their survoyor professionally to examine and report on those selected; and finally, after farther examination of the plans, in connexion with the careful and exhaustive report of the surveyor, agreed to recom. mend to the Board for adoption the following plans:-Exe-Island, first, Mr. John Johnson, 25 Moorgate.street, London, -motto, "Well Con. sidered; "second, Messrs. Fletcher \& Nightingale, 32, Ponltry, Londou, -motto, "RRR;"St. Mary Arches, first, Mr. J. 'Toner, Gray's.inn.square, motto, "1873;" second, Mr. J. Johnson,... motto, "Well Considered;" St. James's.road, first, Mr. John Toner,-motto, "1873 ; "second, Mr. Roher't Falker, King's Arms.yard, Moorgate street, London,-"Experientia," This selection though arrived at independently and on their own judgment, the committee were glad to find to have been in accordanco with the opinion of their survejor, snhseguently mado pnow to them. The committee recommended that the selected plans (witb certain rery slicht modific tions, whicb have been complied with) be for warded to tbe Dopartment for their approval Mr. Andrew moved tbat the plans selected should be forwarded to the Department as recommended and that the bost thanks of tbe Board should he tendered to those pentemen wo plans, but who had been unsuccessful. They bad received plans from no less than thirty.three gentlcmen, most of them well designed. Not a single member knew to whom the plans belonged until after they were judged. Mr. Gidley seconded the motion, and added that their resolution would form an excellent answer to the very impudent post.card that bad been received hy the chair. man with refurence to the competition. The card ran as follotvs:-

## card ran as follow

of the Exeter School Board had fixed on the architeet to be appointed and to receive the prizes for proposed sohuols before the prizes were eent in. If this is correct,
is it justice to those who bave competed? I would re comanend that a disinterested architect be appointed to a. judicate on the merits of each. Surely a School Board
who look to the Bible as their guide, and have clergymen in their midst, would not be gulty of dishonesty."
It was referred to the Board in committee to arrange for ohtaining plans fur the achool to be erected in Newtown
Eccleshall. - The following tenders for the erection of the school at Endercliffe, to accom. modate 300 children, were accepted:-Masons' work, Mr. W. C. Murgatroyd; joiners' work, Mr. D. Myers ; plumhing, Mr. J. D. Cartb; plaster. ing, Mr. J. Firth; slating, Mr. Thomas Nelson painting, Mr. J. D. Carth; ironmongery, Mr. J rernant. In every case the lowest tenders were accepted, amounting in all to $2,3252.11 \mathrm{~s}$. The foes, legal expenses, \&cc, will of site, architect's fees, legal expenses, de., will amount to $3,244 \mathrm{~d}$ estimates to the Fumention to suhmit the estimates to the Edncation Department for total amount to cover the cost of erection.

## THE SPONTANEOUS IGNITION OF OILED COTTON OR SLLK FASTE

Major Majexdie has commumicated to the loyal Artillery Institution the resnlts of cer tain experiments, instituted to pscertain the relative degree of risk accompanying tho presence of oiled cotton waste and oiled silk: waste in huildings and stores. Mr. Galletly made the investigation. He found that cotton waste soaked in boiled linseed oil and wrung out, if exposed to a temperature of 770 deg , set up oxidation so rapidly as to couse actnal com anstion in 105 minutes in the caso where the action was slowest. A common lucifer matchhox full ignited in an hour in a chamber at 166 deg. Fahr. Raw linseed oil ignited less readily. Mr. Galletly considers that the heary wils from coal and ehale tend remarkably to pre-
tiesue from contact with the air. It appears that the so.called spontaneous action of oiled cotton waste proceods from the substance being exposed in a finely-divided condition to the oxidising action of the air. It appears to have been hoped that silk waste might havo offered greater seonrity, bnt this proves not to be the casc. It is to be regretted that nothing more enconraging can be drawn from tho experimento than the caution not to leave oiled waste about, even in the smallest quantities, especially in warm placee. We have before now shown the danger so, incurred. $\qquad$
THE TEGETTHOFF MONUMENT COMPETITION.
Tre eecretary to the Austro-Hungarian Em. bassy presents bis compliments to the editor of the Butlder, and, in referring to his letter of May, 1872 , begs to request him kindly to insert in the Builder the following paragraph relating
to the award of prizcs for dosigns for the Tegetthoff Monument at Vienua:-
"Tegetthof Monument, Tienna.-The committee formod at Vienna for the erection of a monument the prizes for the designs presented to them by different artists. The first prize has been awarded to Mr. F. Schloth, in Rome ; the eecond to Mr. L. Ran, in Rerlin; and the third to Mr Martin P. Otto, in Berlin. Tbe other artists who have sent in designs are reqnested to apply to having their plans returned to them.

Imperial and Royal Austro-Hungarian
Embassy, Belgrave-square, Ifurch 21, 1873.

## NATIONAL MONUMENTS.

Sir,-Tbe recent wanton destruction of the Constantine Tolmen in Cornwall and tho at. tempted deetruction of the Logan stone,- in that wbich I hope Sir John Lubbock will carse to be enacted before the ceparation of this Par liament. Cornwall hao oven now eome notable stone rolics which I have seen recently, viz, soveral circles in the neighbourhood of Penzance, and etone pillars in their vicinity, described by Mr. J.T. Blight in hie "Week at tbe Land's Find, and otherwise. Cromlechs at Chùn, Molfre Zennor, Pendarres, Trevethy (near Liskeard), and one near Lost withiel; also a kistvaen, near, Wadebridge, engraved in Warner "Cornwall, of a circle in this vicinity; the Trippet Stone Circle, near Bodmin ; the large Lanyon CromCircle, near Borlmin ; the large Lanyon Crom lech. That at Coit, near st. Columb, hae been deetroyed recently. The circlee, pillar, and zomaine of threc ciroles, tbe Huriers, and Cheese tine fod eoveral smaller stone relice, doscribed iny local antiquaries, merit preservation.

Cør. Сооке.

THE DRAINAGE OF WINDSOR CASTLE. Tre works for tbe drainage of Windsor Castle, Frogmore House, and the Crown buildings situated in the Home Park, have heen completed, and, according to a correspondent, are now in fall operation. The eowage collected from tbe difforent systems into one large pipe paeses through the Home Park and Manor Farm to the pumping station at Old Windsor, next tbe atavigation cut of the Thames, and close to the new iron and red brick bridge receutly thrown over the stream by the Thamee Conservancy Board. The pumping.station is a plain bervancy brilding, within an enclosure; the receiving tank and other chambers being on the sonth the engine.bouse. Owing to the immense qnan tity of water nsed at Windsor Castle, and which is snpulied to the palace by the weterworks near tbe Windsor Look, pposito Fiton College, the gewage, although separated from the minfall, is in an extremely lignid state $P$ ossing throngh an iron grating or strainer, it falle into throngh whence it is easily pnmped throug the well, weence it is easily pnmped tbrougb the pipe is easily effected by a form- on the Ham. This is easily effected by a four-horse steam-engine, keep nnder tbe smply of sewage. There to keep nuder tbe snpply of bewage. There is can be worked by tbe eight.horse boiler, or com. can be worked by tbe gight.horse boiler, or com. Wressed air, snpplied by a pipe from the old Cumberland Lodge and the Indian Engineering

College at Cooper's.hill, Finglefield.green. The eewage, on leaving the pumping-station, passes over the bridge into pipes concealed within raisod tanks, ranning round and crossing the farm. At the distance of every 22 yards ( a chain) tbere are taps and earthenware pipes sloping from the covered conduits to the levol of the field, whence by means of sballow iron troughs, made on morable lengths, tbe sewage ie distribnted.wherover it io desirablo. Tho irrigation works have been in operation for a month or two, and the ground (rather a hoavy soil) repeatedly flooded by the Thamee, hae now been well saturated with tbo liqnid sewage. About ten acres have been thue prepared, and the plough has been at work turning up the ground. When this is done it will be again drenched with sewage, after which a crop of Italian rye grass will be sown. The procese of ixigation is said to be simply and effecioconsly performed, and little, if any, smell is perceptible, although the snn was occasionall warm. The works bave been carried out by Mr Menzies, of Windsor Great Park, to dispose of th Castle sewago without passing it into the river and without creating a nuisance in tho district.

THE PROPOSED LAW COURTS.
The following tendere for building the New Law Conrts were opened on Taesday last, at twelve o'clock, at the office of hcr Majesty'e Commissioners of Works. The eums represen totals on the tenders from the

that old inventions aro patented as new discoveries, which,

## INSTRUCTED PAINTERS

Str,-1 notice in the Builder of this week March \&2nd, that the Worshipful Company of The exhere to offer prizes for decoration, \&c. The exhibitors, or oandidates, are not eware of it becomes known in painters' shaps in ineste, if and among tbe feromen thereof $0 f$ London, and among tbe foremen thereof. Of conrse it is presumed that all the exhibitors aro honse. paintere, accustomed to distemper ceilings, paint case may be. As I bave eaid. if it beco the case may be. As will not get a job at house-painting

Thie may seem extraordinary, but it is neverthelees true, which I can prove in my own case, nadn that ood workman in all hat reath the mino epartments of bouse-painting, let alone decoraibited bibited eome patterns in tbe Painters' Hall some years ille. Ho is very whall o a ekilled workman, and they will not employ im, ho is willing to do th fact, anything that comes. I win not say mucl my own case ; only, because I am suppoeed to o a little skiled aiso, it has kopl mo out of ork the party I have mentioned, else it would be all o worse for me
Where will be the benefit of Mr. Crace*e lec ares on drawing and decorations? As you will see by what I have said, wben a mar spends some years in tbe study and practice of decotion, and asks for work, he is told there is nothing fine enough for him, though at the same time he only wante to work as an ordinary buuse.painter. There is so little done in deeo rations, that men wonld starve if they wero to wait till euch work had to be done

A Panter.
ELECTIONS UNDER THE SANITARY ACT. louth, hincolnseibe.
The joint committee, cousisting of twelve suardians and twelve members of the town council, representing the Urban and Rural Sanitary Authorities of Loutb, met on Monday, the 17 th inst., to elect a modical officer of health for the whole nnion, which comprises 90 pariskee, with an area of $\mathrm{T} 47,292$ acres; the population is 34,760 , and the namber of houses 8,129 . There were thirty.seven oandidates, bat the voting woro thirty.seven oandiates, wat Mr. T. W. Boge, Louth; and Dr. Domenichetti, Pengo. Bogg, Louth; and Dr. Domenicheth, Yengo. The latter genleman, who kad very high teetinonials, was elected by fourteen out of the 375t. being paid by the Rural, and 125l. by tho Urban Sanitary Autbority.
Orban Sanitary Autbority. The rppointment (for five years) of
Domenichetti was confirmed by the town counDomenichettio was connirmed the Doctor being aloo appointed the public analyot. The council also proceeded to the election of an inspector of nuisances. There wero ton candidatee to select Irom, but Mr. H. Marsden, eurveyor, and Mr. 1 , W. Wallis, eurveyor, both residents of Loutb, were the only namee voted for. Mr. Wallis was appointod, receiving eleven rotes, and Mr. Marsden nine votes. The salary is $100 \%$. per annnm, but the officer appointed (for two years) is not required to give his whole time to tbo performance of his dutiee. The area of Lonth is 2,560 acres, the popnlation is 10,500 , and the number of honses 2,713 .
On Wednesday the committeo of Board of Guardians met to appoint an inspector of naieances for the whole union (excepting Louth). There were thirty.three candidates for tbis office; tbe salary, 250 L . per annum, to includo travelling expenses, and the officer must devote his whole time to his duty. The long list was reduced to five names, the final selection being postponed to the Wednesday following. This appointment will be for two years.
It is much to be regretted that political feeling shonld be allowed to prevail in elections such ao these, but this is unfortunately the oace.

## THE TRADES MOVEMENT.

Liverpool.-A largely-attended meeting of master painters bas been held at the rooms of the Builders' Association, Mr. Gardner in the cbair. Tho meeting was called to farther consider the demand of the operative painters to reduce their bours of labour from 56 to $5 t$ per W :ek, and to increase tbeir wages from $6_{2} \mathrm{~d}$. to 71 $\frac{1}{4} \mathrm{~d}$, per hour. The committee appointed to meet a depntation from the men roported baving offered them a reduction in bours of labour to 55 per week (as worked ay tbe otner branches per hour ing radi, they declined acres per hour in wages, whicb tbey declined, agreeing to forego the time question, but to adhere to their demand for 1d. per hour to their wages. After fally disconsing "the queskion, it was nnanimonsly reeulved,- That the oller of the advance of $\frac{1}{2} \mathrm{~d}$. per hour, be confirmed and adhered to."
Leeds,-At a meeting of the engineering trade,
umeroasly attended, a resolution was passed, usking that "time and quarter" should be paid time and half" for each additional hour; louble time for Christmas-day and Sundays, wach day to stand hy jtsolf in the computation f either day-time or overtime. The workmen resent pledged themselves to work no more vertime after tho date (March 15th), except under the conditions ahove specilied. Some fifty the large mechanical employers in Leeds Lave resolved that the demand cannot be coneded, and have passed a resolution that they fill not pay for overtime at an extra rate unti full week of 54 hours has been worked. Aherdeen.-The painters are moving for an
dvance of wages,-The overative joiners have dvance of wages.-The operative joiners have emanded an advance on thoir wages of 2s. 6d. er.week, to tako effect at lst April next. The aasters have offered $2 s$., to commence on $20 t h$
mene next. This the men have dechnod, and hore is every probahility of a strike.
Alloa.-The operative joiners have addressed circular to the masters, soliciting an advance Id. per hour on their wages, to take effect in .
Aneroath.-At a large meoting of oporative or an advance of to request the employers ate of wages.
Burntisland.-The joiners employed in the comotive workshops on the North British Rail. ay at Burntisland have applied to their overseer or an advance of wages. The avervge wage mounts to 23 s . per week of 51 hours. Clippens.-The fitters, joiners, and black. niths employed hy the Clippens Sbale Oil Com any, who struck work in consequence of having eeivod notice of an increase of their weekly orking hours from 54 to 57 , have accepted eir employers' terms, and are now working the coreased hours.
Ayr.- The dispute between the operative iners who struck work, and their employers, ems to be no nearer a close. Tbe operativen mand an advance of $\frac{1}{2} d$. per hour, and a
iduction of the hoars from 51 to 51 por weok. duction of the hours from 54 to 51 por weok.
$t$ a meeting of the masters, held on Friday a meeting of the masters, held on Friday
ook, it was agreed to withdraw their offer of lok, it was agreed to withdraw their offer of

1. and and offer only $\frac{1}{3} d$. , withont any duction of the hours.

## FLOWERS FOR TIE POOR:

 sin,-One of the kindliest efforts towards the nelioration of the surronndings of a number of the dirty and densely-popnlated noighhour. od of Greengate, Salford. The movement has on begun hy a numher of benovolent gentle. en, and led by Mr. Lee Grindon and Mr. John en, ands. Mr. Grindon is very well known as eminent hotanist, whose writings descriptive the flora and their habitat found in the inityimanas to botanical study, and added largely the intorest felt in our country rambles. the intorest felt in our couutry rambles.
Abont tbe close of the past year these go Abont tbe close of the past year these gontlo-
on invited the poor people, by handbill, to me aud receive gratis a potted hyacinth balb, nich they had to promiso to tend, and with the derstanding that when the flowers were in nom there would be an exhibition. Many the plants are now at tbeir hest, a show was Id on Saturday afternoon last, in the Riohmond ctare Hall, when not less than 250 plants 0 individuals, for their respective owners, $t$, -and the plants were very creditahle indeed their growers. Most of them had evidently on well cared for. The pulbio wore admitted view on paymont of 2 d . each, and prizes of 11.established hydrangeas, vallotas, dic., were adly given as rewards for the best flowers by - R. S. Yates, and every exhibitor received a
all parcel of flower.seeds suitable for the acinth-pot, when that fower should have done soming, with instructions how to sow it, \&c. iny of the reoipients, donbtless, never had pthing like these in their hands hefore, nnless $3 y$ would be porfectly high-dried herring, and them. As fresh mould would be required the pot at planting, and such a thing is nn.' own in Greengate, a gontleman residing in wor Broughton has kindly offered to supply that is needed from his own garden. By.and.
by thore will be an eahibition of these dowers, and so the movement will grow.
I takeit, sir, that this is one of the kindliest of the many kind efforts of the present day, most hnmanising in its effect, and redounding to the honour of its promoters, whom, as an out. sider, 1 heg leave to thank most heartily, and to commend the
other places.

## SCHOOLS OF ART.

Lambeth.-A largely.attended gathering of students and ex.students of this sohool and their friends took place at the school, Miller-lane, Upper Kennington_lane, for the purpose of pre. sonting Mr. Edwin Bale, who has held the post of assistant.master for the last ten years, with ostimonial. The testimonial, as described by the South London Chronicle, consisted of a hand some riohly.engrared silver claret-ing and salver, and also of two claret-jugs in sgraffito ware designed by Miss Barlow and her brother, sindents in the school.
Cambridge. - The annnal exhibition of this school has been held at the lnstitution. The place in the meeting in connexion with it took hair heing occupied by the per Prafe to Lichtfoot, ocousied by che Rev. Professor hy Mr. A. J. B. Beresford Hope, M.P., Mr. Sidney Colvin, A.J. B. Beresford Hopc, N.P., Mr. Sidney mayor, and others. There was a large attend. mayor, and others. There was
The hon. secretary read the report, in which it was said:-
"The school has now oompleted its fourteenth year, and the committee oan spenk with satisfaction of the
attendance of the students, the numbers haring been fully kept up.
The comraittee, however, think it their duty to state that the Government inspector ils his report has called
attention to the want of minute care and earnestness of purpose in the delineation of objects, and to the lack of
deaire to imitate olosely general outline. apply prinoipally to the groups of still life. The students have not this year succeeded in obtaining any of the highor
or national Government prize日 as was done last year but this distinction isnan speoial that the failure is no cause for
discouracen "iscouragement."
The Government had awarded varions ordinary prizes for work done during the year.
Tbe Chairman said, an unespected, hat a pleasing duty now fcll to his lot, in presenting to their master, Mr. Wood, a testimonial of the affection and the esteem which the students elt for that gentleman. Judging by his own sentiments, he did not think there were any highor tokens of appreciation than these. He was quito sure the appreciation of his pupils would go further to his heart than the treatment be an incornment offcials. It would, no doubt Mr. Wood, who was warmelions. was extremely ohliged to them. The a, said he the Government Inspectors were not to be chal lenged, but he, nevertheless, did ohallenge them He wanted the students to look nore to Nature, and to infnse a little more life into their lahours. It was true they were painstaking; hnt he wished thom to stand higher (not with the Sonth Ken sington Department, but) with the public.
pils of this prizes and vertificates won by puphexion with the the annual examination in Sonth Kensint at the ronsing on, in April, 1872, were presented at the rooms of the school, hy the Rev. J. S. H. Horner, president. Owing, doubtless, to the nu. of pupils and vate of the weather, the attendance of pupils and visitors was small. The president the scbool's history arrived at the eighth year of the scbool's history. During the year 1872, there were 297 works sont to London executed hy their pnpils. That wos not quite so many as in the previous year, but it did not follow tbat the school was not do g good a work, or that the pupils were less earnest tnd energetic. Such a schoo tudes and ups and downs. Of the 297 works 286 were for elementary drawing, and 11 in the advanced section. In a town like Frome it was peculiarly their work to advance elementary

The Sub-Wealden Exploration, - Qnite nexpectedly, at a depth of 131 ft . a stmate unexpectedly, at a depth of 131 ft ., a stratified alahaster) has been reached. No sach aconmnlation of gypsum was ever met with in Sussex hefore Gypsum being a material which is serionsly considering the question of working it.

## CHURCH-BUILDING NEWS.

Longtor.-Dresden Chnrch, built from plans by $\operatorname{Sir}$ G. G. Scott, in 1853, and enlarged acoord. ung to a provision in the origiual plans, in 1863 has again heen onlarged, to meet the needs of this large and increasing suharb of Longton The accommodation was originally 272 , it was increased to 452 in 1863, and it has now been further increased to 670. This last increase has been made by lengthening the entire fabric westwards. $A$ porch has been added, and unany internal improvements made. The floor of the ontire huilding has been hoarded, and the centre aisle paved with Minton's oncaustic tiles. The geats have been cleaned and revarnished, and new kneelers provided. The organ has been improved, and a new bourdon stop added, by Messrs. Bellamy \& Stringer, of Hanley. The total cost of enlargement and improvement will amount to ahout 1,000l. The architect employed was Mr. Lynam, of Stoke, and the builders, Messrs. Inskip, of Longton.
Murston. The tender of Messre. Adcock \& Recs, of Dover, for rehuilding the church on a W. Burges, according to plans prepared by Mr. W. Burges, has heen accepted by the committee The amount reqnired is nearly 3,0002 , of which ahout twothiras have been snhscribed or pro mised. The new chnrch is intended to be built in a more central position, so that the inhohitants of the eastern parts of Sittingbourne will be benefited as much as those of the actual parish of Mifurston.
Saffron Walden.-A mecting has been held in the Town-hall to consider the report of the
architect, Mr. C. Butterield, who had been consnlted as to the state of St. Mary's Church, and the prohable cost of its restoration. It was also an ohjeot of the meeting to open a subscription. list. The Rev. T. C. Beasley, vicar, presided. He said he had written to Mr. Butterfeld as to 6,000 w, wald he had replied that the sum of ion of the fire cost of the restorathe architect fable the chnrch. The report of deplorable state of special attention to the roofs, and proposed that these shonld be restored at ouve. It was proposed to extend the work over three years. The vicar further announced that Lord Braybrooke had authorised him to thate that he would give 600?. to restoration fund, in addition to restoring the entire chancel at his own cost. He estimated that the cost of the latter would amonnt to abont 8001. A subscription.list was then opened, with a total of $1,084 l$.
Broadclyst.-The chief stones of a chapel and shool have heen laid at Westwood. The build. inga themselves will cost ahont 1,5002., but that oes not include site or sarroundiags. The rohitect is Mr. Edward Ashworth of Exeter and the bnilders are Mesars. Diggins \& Smith, supplied by Messra 7 bitchell is son of the Bank Works, Mr. Harry Hems tbe carviug is being done by Mr. Harry Hems, of Exeter. The hnilding is Early Decorated Gothic. The walls are being dressings. This Killerton stone is dark-colonred, honey-combed, of volcanic origin, rather soft honey-combed, of voloanic origin, rather soft hardens to great power of endarance when ex. posed. The nave is $39 \frac{3}{2} \mathrm{ft}$. in length, by $21 \frac{1}{2} \mathrm{ft}$. posed. The nave is $39 \frac{1}{2} \mathrm{ft}$. in length, by $21 \frac{1}{2} \mathrm{ft}$. The chancel is $21 \frac{1}{4} \mathrm{ft}$ in length, 9 ft . by $7 \frac{1}{\mathrm{~s}} \mathrm{ft}$. readth. The seats will he open, according to foe fashion of the times, and calculated to ccommodato 110 persons. A Corsham stone pulpit will be the rostrnm for the preacher, and here will be a font of the same material. The chapel is to be lighted by six windows in the ave, filled with cathedral diamond glass, Three windows will give light to the chancol There will be an entrance.porch, 8 ft . hy 7 ft . The roof, as a matter of conrse, will he open, with carved braces, and moulded wall.plates The chancel roof will have trussed raftors and collars, with carved hall.flowers in the hollows, lined with $V$-jointed boarding. The chancel. arch will spring from carved corbels, the work of Mr. Hems. The floor of the ohancel will be laid with hlack and red Minton tiles, the sacrium and footpace with encaustic tiles to a design, The nave and porch with Largport stone paving. The roof will be covered with countr slating to vary in colours. The bell.turret is to have a Warner's bell of 2 cwt., with wronght have a and monlded base npon the apex. The crose premises are a few yards further on the fied The schoolroom is 27 ft . by 18 ft ., with a mis-
trese's dwelling and all necessary offices. It is to be a "dame school." It is in a style con. gonant with that of the chapel, the materials of construction the same. The walls are to he lined with brick, in lien of plastering. The school is to accommodate ahout sixty children.
The walls, at points, are now sevoral feet ahove The walls, at

Remarts on the Land Transfer Question, with a Sketch of a Plan for a General Register. By F. H. Coltr, of the inner Tomp
law. London: Sweet. 1873.

Tie cost, the uncertainty, and the deley atten. dant on the purchase and transfer of land, often form serious ohstacles to those who would possess t, especially in small quantity

Mr. Colt has hrought before the public (under the sanction of a permitted dedication to the Lord Chancellor), a proposal which scems to us to he at once simple and effective. He allows Time to come to the aid of legislation in a manner that evory transfer of land, after the passing of the suggested Act, should be compulsorily registered, such register giving to the transferee a perfect title as against the transferror. In case of demise or of bankruptcy, the transfer hy will, hy legal heirship, or by operation of law, i to be thus registered, as well as in the case of sale and convcyance, no charge upon land, except a first mortgage, to be put on the register. The operation of this plan would, within the lifetime of a couple of generations, estahlist a per. fect legal title to all the landed estates of the
country that would he at once indefeasilic, easy of access, and readily availahle to purchasers It wonld do this at a minimum cost, and with a minimum degreo of interference with existing interests. The remarks to which we refer are reprinted, with additions from the columns of the Law Jnwrnal, of
one of the editors.

The Fear.Book of Facts in Science and Art. By Joun Trass, London: Lockwood \& Co. 1873. Once more Mr. Timhs ombalms for the popular eye the most recondite fraits of the years progress in science and art amongst the adepts, heard of for years, if at all, by the puhlic. And yet Mr. Timbs is not seldom taken to task yy hypercritios hecause he is not the author, but only the editor, as a rule, of somo of his but only the editor, as a rule, of some of his most useful wooks. Buth this volume, fonld such a hook pared with this volume, won were it written hy the hypercritic him. solf? It is the ipsissima verba of men of self? It is the ipsissima weroa of men of
The present volume has a portrait of Dr. W. B. Carpenter, the president of the British Associa. tion in 1872, and a vignette of the central rotunda of the Vienna Exhihition, with a reference to p. 27, on which is our own acconnt of the rotanda, duly acknowledged. The interest of the volume is as varied and great as it has heen any year during the last quarter of a centary, any year during the last quarter of a centary,
or at lenst since the origin of tbis standard work.

## VARTORUM.

"The Illustrated Guide and Directory of Manufactures," edited by R. S. Barker (75, Fleet-street), has reached a third edition, and has heen enlarged. The ohject of the work is "to show the huyer at a glanoe the names and addresses of the leading manufacturers engaged in any particular trade in all parts of the sing. names might yet he added, still the hook goes long way towards doing what it professes to do. - "The Export Merchant Shippers of Loudon, 1873 (Dean \& Son), is another directory that will be found useful hy many of our readers The shippers are armaged alphahetically, and there is an index to places of shipment also."Yacher's Parliamentary Companion" las heen published for March, and contains its usual large amount of necessary information...-TThe second edition of "How to Mako a House Healthy and Comfortahle," hy H. J. Lnachester (Simpkin, Marshall, \& Co.), contains some additional matter, and will gerve to make popular advice often giren hefore, but which cannot be too often repeated. --"Steam in the Engine: its Heat and its Work. By P. Kauffer, Managing Engi-
neer, Leeds. London : Blackie \& Son." In this volume the author has compared his own prac. tical experience with the data from Joule's and Regnault's exporiments ; and gives the conclusions to which repeated trials and observations have led him. - "Cracroft's Investment Tracts: American Railways as Investments. By Rohert Giffen. London: Stanford." Informa. tion is here given as to the average proftes of American railways, the conditions and dis. tribution of profit, the land grants, the legal position of American railways, \&c. On page 28 the author gives some incredinle. looking figures as to the wealth and popula tion of the United States, by decades from 1790 to 1860. According to the table in ques. tion, the value of real and personal property in the States has mounted up from $750,000,000$ dollars in 1790 to $30,069,000,000$ dollars in 1870 , which, even making the largest possible allow. ance for depreciation of dollars hetween 1860 and 1870 , is a tremendons leap, even ove $16,159,000,000$ dollars in 1860 . Yet, as the author remarks, if wealth increases in England twice as fast as the population, the rate of increaso in the States between 1840 and 1850 ( $3,764,000,000$ dollars to $7,135,000,000$ dollars) should at least he credihle, as it is in little more than the same ratio; and many reasons, he adds, could he urged for helieving in the bigher rate hetween 1850 and 1860 . The average property to each person is stated to have been 187 dol lars in 1790 and 776 in 1870 .-"s Second An. nual Report of the Board of Commissioners of the Department of Public Parks for the year ending May 1, 1872. New York : Bryant \& Co." The detailed nature of this report may he seen from the fact that it consists of about 250 page of imperial octavo size. On the suhject of con crete pavements, tho Report says :--
"This department has laid, chile Uy in the year 1871, a large extent of conercte pavement. Farious patent com.
positions and processes have been employed for this purpose, all of which were expected to be improvernente upo used. On inspection, grathel tolose of the last winter, the condition of hit a very small part of all chese pavements
was found to bo satisfictory. The surface of the walks whieh had been laid more than one year was disintegrated in whole or in frequent patches, and it was evident that an extensive reco
diately necegary.
A pumber of gentlemen connected with the public
oorks of Philadelghia, Washingtou, and Brooklyn wer invited by the Department to make an examination an study of the subject, aud a report of cerfain conclusion
eached by thera bos been made public. It was ascertaine
 specifieations of most of which profide for an admixture o
substances, the only effect of which would be det rimenta to the parpose in view. The reason of the failurc of other ased contains different and unknown proportions of acc dental impurities, some positively harmful, sud some skill is in some parts exereised by the workmen engaged
in the manipulatiou of the combination than in othera Tbe practicatility of obthining hinate Aconcrete parement years past so satisfactory in Paris is not doulbted, but yet no method by which an cqually valuable result can
aecomplished, execpt at a cost which would forbid
general application, has beca completely eatablished."

## gliscellanea

Steam-Boiler Inspection.-The Twenty scond half.yearly report of the Midand Stean Boiler Inspection and Assurance Company, Stourhridge, has heen issued in a printed form It atates that there were 3,285 hoilers under the care of the Company, and this numher has since increased. There have heen two slight and one serions explosion among the assured hoiler during the prst half.year, but without injury to any one. There was no explosion among the boilers under the Company in the first half of the year 1872. During the past year there were made 13,626 examinations of hoilers, of which 1.697 have heen seen inside, and 1,808 in the flues. Of the 3,285 hoilers under the Company 1,155 were used at collicries or mines, 1,502 at ironworks, and 628 at mills of various kinds. Tho hoilers may ho descrihed in general terms as 2,514 fired externally, and 771 fired internally The detection of internal or external corrosion have heen, as heretofore, ahout equally divided hetween faults of construction, want of proper inspection, and inattention of attendants; but there has heen an unnsnal numher of casualties to steam pipes and fittings. In a recent care of explosion, we may remark, careless attendants had first lighted the fir, and then filled the hoiler!

Utilisation of Slag.-Mr. Woodward, of Darlington, has patented a plan for manufacturing hricks from scoriz, and the system is now Vat work at the Eston Works of Mr. Thomas raughan. The slag is taken as it comes from the blast-1 an an a revolving moulds, placed af heing removed from the monlds the bricks are throm into a kiln or furnace the bricks are thrown into a kinn or furnace afterwards they are ped in any ordinary struc. ture for which clay hricts are spitahle. The frace for which clay hriols are suitahle, the fracture is of are capahle forll withstand a as atrength is concerned, they will withstand a crushing force of 3 to \& tons per cuhio inch, or four or fre time more than that of common bricks. Tho sconce brick rerrains unaffected by does not accord with what has been said of slag oes not accord with what has been said of slag sed for roads whe is said to contain sulphonld elisper if possible, of the hricks. Thero he disproved, if possihle, of the hricks. There is considerahle loss by hreakace, hut once solad ed they are as hard as granit. It is oalcnlated hey can he made for 8s. per 1,000, or even less per 1,000 . A new company has been formed, on the limited liability principle, to worls Mr. Woodhe limited liability principle, to work Mr. Wood ward's patent, and they bave acquired the Tees, including those both above and below Middles brough.
A New (?) Patent Gxate.-A patent bas heen taken ont hy Messrs. Carrington \& Platt for a fire.grate of simple constraction, desigued o prevent the formation of smoke, and to cause more perfect and regular comhustion of coal. It consists of an ordinary fire.grate, with bars in front, and a haek and sides of fire.olay, the whole of which is pivoted in a suitahle frame on wo supports. By a small handle this grate can he rotated on these points. Small grids are placed at the top and hottom. The firo ighted in the ordinery manner, and when it has urnt clear, the upper grate is cemoved, and resh fuel placed on, as in ordinary grates; the movable grid is then replaced, and the grate is nrned round, with the f Thus the fuel burns gradually downwards, and the production of smoke is almost, if not entirely prevented. The advantages of the invention are said to be great economy of fuel, provention moke, and perfect combustion, as well as steady, continuous fire, requiring littlo nse of a The rotating grate is an old invention, as past The rotating grate is an old invention, as pas pages of the Bruider will show; hut it may none the worse for that, only it d

Technological Examinations.-The pro gramme for 1873 of the Society of Arts has oppeared in print. It states that at die confer cnce held at the house of the Socievy on council's, 1872 , Princednical examinations, a proposed by Captain Donnelly, R.E., a member of their hody, having heen cordially approved of, the council have decided to hold anmually, in conjunction with the examinations of the Science and Art Department, examinations in the teehno. $\log y$ of some of the arts and manufactures of the country. Due notice will he given of the se held. Tho examination will he hy a special examing. tion-paper, to be worked in conjunction with these examinations. The practical skill will be judged by the returns of the candidates' employment, for some years past, in the partionlar art or manufacture. The programmo of ex. aminations for each industry is given. The suljects for the year 1873 are Cotton, Paper, Silk, Steel, and Carriage. Building. Amnouncements will he made from time to time of any additional
snbject.

## The Amalgamated Society of Engineexs.

 At the Newcastle.on. Tyse County Court on Wednesday a memher of the Amalgamated so. ciety of Engineers made a claim on the funds the weekly allowanoe under the rules. For that dence it was stated, according to reports, the rules of the society were not registero claim this plea was beld to he fatal to tho clanat If not, it is time the some error in this ace as to their position. The socie'y is stated to number 40,000 memhers, with funds to the amount 250,000 l."Removal" of Northumberland Honse. is proposed to remove the house bodily, in the merican style, on a halk timber framework, userted transverscly and longitudinally below ne hascment of the house, and hy the applica ion of a series of powerful screw-jacks liftin he superincumhent mass, moving it along 0 square with the approach from Pall-mall ! Proposed Widening of Charing-cross.it the last meeting of the Metropolitan Board f Works, the Parliamentary Committee reported hat they bad further considered the Adniralty nat War Office Re-building Bill, by which it is nd War Office Re-building Bill, by which it is ide of Charing-cross from Drnmmond's Bank o the Horse Guards, extending westward to the epth of nearly 500 ft ., and on that site to e.buid publio offices. It had occurred to the pportunity for widening the thoroughfare at haring-cross, and they recommended that they e authorised to confer witb the First Commis.
ioner of Jfer Majesty's Works, \&c., as to hether an arrangement can he made for widen. gg the thoroughfare at Charing-cross, in com-
exion with the Admiralty and Wax Offico exion with the Admiralty and War Offico
Re-huilding Bill. The Bill has since been rithdrawn.
Who Orders must Pay:-At tbe Sussex uent Assizes, hefore Mr. Justice Brott, tbe
ase of Mncfarlane \& Co. v. Dr. J. F. Money ase of Macfarlane \& Co. v. Dr. J. F. Money pailder, Mr. Kemp, under an architect, Mr. Hill, milder, Mr. Kemp, under an architect, Mr. Hill, fith the builder. Messrs. Macfarlane \& Co., of ondon and Glasgow, supplied iron-work; and the queation at issue will appear from the adge's summing up. His lordship said the uestion was not whether plaintiffs had given redit to defendant, but whether there ever was contract between the parties by which de-
ondant agreed to pay plaintiffs for the goods ondant agreed to pay plaintiffs for the goods upplied for huilding tho bouses. The invoices
vere not sent in till some time after the goods pere not sent in till some time after the goods
ad been delivered, nor ontil Mitchell had ascer. ained that Kemp was in difficulties. It was for he jury to say whether the fact of the invoices eing sent in to Dr. Monoy after Kemp had ailed did not show that plaintiffs were looking ut for some one to pay thom for their goods. he jury in
ofendant.
Weather Reports and Charts.-A specimen eport and chart of the weather in the Britisb sles and thoir vicinity, prepared hy Mr. G. A Rowell, has heen lithographed by Whiteman \&
3ass, of 236 , Holhorn, London. As Mr. Rowell 3ass, of 236 , Holhorn, London. As Mr. Rowell
emarks, "The value of maps, showing hy signs he simultaneous meteorological conditions ore vast extent is now fully proved hy the tri-
aily issue of weather charts hy the aily issue of weather charts hy the American
fovernment, giving at a glance (on a map 22 in . lovernment, giving at a glance (on a map 22 in . $f$ eight hours, over the whole of the United tates. These charts must be extremely valuhle to the agriculturist, in giving a warning of eather ; and so also to thoso engaged in mary eather ; and so also to thoso engaged in marinowledge of important facts as regards the ourse and cause of storms. The play of the nnexed map is auggested as a ready means for iving the information to whicb it relates; it is fimilar to one I submitted to the Ashmolear society in 1848.
Accidents.-About 100 ft . of the Drogheda Quay-wall has follen into the River Boyne, carry. ng with it a corresponding length of adjoining aused hy tidal aotion undermining the wall - A gas explosion in the Hirh-street, Lincoln, as hlown out the now front of a shop put in a reek hefore, and strewed the High street oppo. ther wares. Gas baving escaped through the ight, the too usnal course of seeking for the vurce of tbe escape with a naked light and not
fith the nose was adopted, and with the usual esult.
Clerk of Works to Padadington Vestry. a recent meeting of the vestry, the Highways ates, viz., Mr. John Conway, Mr. George candind Mr. John I. Oram, as most eligiblo for the ffioe of clerk of works. On a hallot being taken [r. John Conway was elected, at a salary of I40l er annam.

Costly Water Fittings.-The vestries and district Boards of the metropolis are protesting almost witb one accord against the preposterous regnlations which the water companies have in pursuance of the Act passed last session for ensuring a constant water snpply, and the Metropolitan Board has expressed its determina tion to resist as far as possible the enforcement of the remblations. It is declared that the cost involved in in involved is equal in many cases to the rent of the bonse for lino years, and involves a cost over tbe honse-owners of London of 11 millions terling. The Hetropolitan Board havo ascerdained that the expense of providing the fittings eqnired wilk ann to for a fhe the lage, and to 60. and upwards for each they large bouses in the West-en London, and they are in hopes of iuducing the Government interests every bouseholder in the metropolis.
Extension of the London Hospital.-A puhlic meeting bas been held in the Egyptian Hall of the Blansion Honse, for the purpose of Hall of the Mansion Honse, for the purpose of Whitecbanel-road, in raising a sum of Hospital, whitec is required for the pup anm of 100,000 ., which is required for the purpose of providing additional accommodation, and meeting in other. respects the growing demands npon the hospital. The Lord Mayor presided, and among those on the platform were the Duke of Camhridge, president of the hospital, and other influential gentlemen. The present oxpenditaro of the hospital is said to be 20,0002 , a year in excess of its fixed ncome. The secretary, at the close of the meeting, read a list of the sums already suhacribed to the fund, amounting to 37,0002 . It was stated, that of the 100,000 . now asked for, about 25,0002 . would he expended in erecting the additional accommodation that was required and the remainder would be devoted to the main. enance of the bospital.
Crane-testing.-In a case decided at the Devon Lent Assizes, - Kerslake v. The Exeter Corporation, -the plaintiff had anpplied a crane for defendants, and tho chief point turned on the testing of the crane. The judge said there was not a tittle of evidence of adoption by the corporation. The crane was not tested to their sntisfaction, and in ordering it to bo removed they only did what they were bound to do. crane was a vory dangerous thing, and if life was loat by tbe poor workmen who were bound to work under it, it would he a case of cruel manslanghter on the part of those who compelled the men to work with it. The corporation were quite right in acting in the spirit they did. The and bis lordship had to furtber explain it to tbem. They then found tbeir verdiot for the defendants.
Steel from the Ore with little Coal.-An important lecture has heen delivered to a crowded audience of tbe fellows of the Chemical Socioty, at Burlington House, hy Dr. C. William Siemens, F.R.S., "On the Marufactare of Ore by now Metbod." By thect from Iron last-furnaces, as well as the this process the operations, are suppressed, the ore beine simpl dooxidised, and tbe iron precipitated, in a new furnace, from which it is withdrawn in the state of hlooma, and at once ahinglod or melted into steel. In place of some 4 tons of hest coal to obtain a ton of wrought iron, only 28 owt. of coal of an inferior quality prodnce the same weight. An interesting discussion F.R. S the lecture, iu which Dr. Frankt -esulted in the confirmation of tho views pro pounded by Dr. Siemens.
Land in London.- At tbe London Auction Lart, on Wednesday week, Messrs. Edwin Fox \& Bousfield sold the Glohe Tavern, at the cornex of Fore-street and Finsbury-pavement, for 17,000l., the two houses adjoining in Fore-
street for $8,100 l$, and the Moorgate Tavern, in Finsbury-pavement, for $8,150 l$. The area of the several lots amounted to $3,418 \mathrm{ft}$., so that the price realised was at the rate of IOl. per superficial foot.
Mr. Wagner, C.E.-In our last we printed lotter headed "Northnmherland House: an Idea," sent to ns, clearly written hy the writer, Mr. J. Wagner, a civil engineer. On the day it was puhlished (Friday, the 2Ist), the writer died at his residenoe in the Vauxball-road, aged
sorenty-one years.

Compulsory Taking of a Manor Farm for Drainage Purposes. - At a special meeting of the Roading Town Council, the common seal of the corporation was affized to a notice to Mr Local Board of Health, pursuant to the Reading Local Board Waterporks, Sewerace Drainare and Improvement Act, 1870, and the Acts incorporated therewitb to issuo their warmant to the sheriff of Berks for summoning a apecial jury for the purpose of determining the pro and compense and compensation payable to the said Ricbard Attenborough, and stating the amount which the The offer was 5s for the give for compensation The ofer was 5s. for the Manor Farm, \&c.; but the special jury, of course, will make the eward
and the the Board will pay it. Mr. Hawkine and the the Board will pay it. Mr. Hawking, Q.C., and another coun
for Mr. Attenhorongh.

Local Improvements at Westerham.-A short time since an improvement in the foot paths of the Kigh-street of this town was mado ay several owners of property, and now a long front of the property of tho aquire, wbo has cansed sundry walls and fences helonging to him to be pulled down and set further hack so as to enahle his workmen to continue the foot path alonc one side of the road, where previonsly none oxisted. Colomel Warde bas also setiled upon giving, as a site for the group of alms. upon giving, as a site for the group of alms. Merey which a certain charitahle Sister of Mercy is about to erect here and endow, at tbe will possess a $10,000 \mathrm{l}$., a piece of ground whio will possess a frontage to the London-road. Tbe plans and elevations have been prepared by Wrirssell's contract of Charts Edge, and Mr Worssell's contract for erecting tbem has, we understand, been accepted.

The City Walls of Gloncester. - Mr Bellows, one of the members of the Cotteswold Naturalists' Fiold Cluh, has laid bare portions of that part of the wall lying north of the East Gate of Gloucester, at his new premises in Eastratesays tho local chronicl for a length of 42 ft . on the top, increased by three successive sets. of to a widtb of ahout 7 ft . towards the base Nothing os yet has heen found so as to indicato specially a Homan oririo. On the innor side however amongst hoico pottery and side, however, amongst hroken pottery and other rubbish of undoubted Romau character, were potter's mark upon them, and a fow other potter's mark
ancient relics.

Slaughterhouses in the Metropolis.-At隹 moeting of tho Metropolitan Board of Wad by considered the anheect of the Bill introduced of Dr. Brewer, M.P., to repeal the 7 th section of the Buiding $A$ ct of $18: 4$, probibiting tbe existence of slaughterhonses in the metropolis arter 1874. It appeared to tbe committee that recommended solicitor, the consideration of the report was deferred in order that he might fully consider the Act, and report to the Board thereon. and tho Act, and report to the Board thereon; and Mr. Poland, opinion of Mr. Manisty, Q.O., and Dr. Breprer explained the provisions of his Bill Wo Begret that we cannot support him.

Iondon International Exhibition, 1873. At the rourth meding or the committee on scien tifio Inventions and new Discoveries at the Royal Commission Offices, Gore Lodge, Mr. Cbas. B Vignoles, F.R.S., in the chair, the oommittee examined the objects already delivered, and re jected those wbicb, in their opinion, were nn worthy of admission in the class, which consists of objects the excellence and novelty of which are so great as to render it undesirahle that their introduction to the public sbould be do layed until the proper year for the exhihition of their class of manufacture in the Industrial Division. The arrangement of ohjects is proeeding rapidly.
Parquet Floors.-We willingly mention that Mesars. A. J. Arrowsmith \& Co. obtained a medal and certificate at the Dubin Exhihition for their parquet floors. The same firm are providing handsome parquet dados for tbe prin. cipal apartments of Bolton Townhall.
"The Vapour Stove."-We are asked to state that the "vapour stove" recently mentioned in our pages is sold in London, not Liverpool. The manufaoturers must take the usual modes of making their address known.

Tracing-paper:-A method for rendering ordinary drawing. paper transparent for the pnr. ordinary drawing.paper transparent for the pyr. poss of making tracings, and of remoring its ance when the drawing is completed, has heen invented hy C. Puscher. It consists in dissolving a given quantity of castor.oil, in one, two, or a given quantity of castor.oil, in one, two, or
three volumes of ahsolute alcohol, according to the thickness of the paper, and applying it by means of a sponge. The alcohol evaporates in few minutes, and the tracing paper is dry and ready for immediate nse. The drawing or tracing cas he made either with lead-pencil or India.nnk, and the oil removed from the paper by immorsing it in ahsolute alcohol, thus restor.
ing its original opacity. The alcohol employed ing its original opacity. The alcohol employed diluting the oil used in preparing the next sheet.
Driving Machinery by Waste Heat of Steel Works. - Arrangements hwe heen patented hy Mr. Joseph Knott, of the TighLeld steel Works, Sheffeld, for applying the Waste heat of steel melting furnaces to the simple. Mr. Knott has six furnaces along the end of one meltivg.room, discharging their sur. plus heat and flamo into a porpendicular ohimner stack of the usual kind. A hoiler.room adioins, and the hoiler is laid alone the sido of the chim ney stack To the perpendicular flues dampers are fitted, hr the insertion of which the heat and flame are diverted into a wide horizontal flue under tho hoiler.

Proposed Memorial to the late Samuel Bamford.-A meetinc of the srhserihers to the fund for the erection of a memorial at Middleton in honour of the late Samuel Bamford, has heen held in that town. Yarious designs were suh. mitted, including one of a statue, and it was decided that the roost suitable form would he an ohelisk of rough granite, with on appropriate inscription,
Society of Biblical Archæology.-A pro. position has heen made hy the few surviving memhers of the Syro.Egyptian Society, the Anglo-Biblical Institute, the Chronological Insti. tute, and the Palestine Archaological Associa. tion, to incorporate, with all their books and effects, as life members of the society of Billical Archæology, and this will he reconmended for consideration hy the council.
A GreatMake.-Messrs.Thomson \& Browning, the London agents of the Darlington Iron Com. pany, write,-" It may be interesting to some of your readers to know that during the last fort. night 3,988 tons of rails were made at these works. We do not think so large a quantity of rails has ever heen made in England, under one roof, within the same space of time."
Engineer to the Great Yarmouth Port Commission.- Sir John Coodo, C.E., has accepted the office of consulting engineer to the Great Yarmouth Port and Haven Commission, and will in a short time inspeet the harhour works.

VOL. XXXI.-No. 1571.

Welsh Annals, Antiquities, and
Familics.*

BOUT four years ago, the Camden Society photolithographed, for the benefit of its members, acurious work in the possession of Sir Thomas E. Winnington, entitled "Marhle in History," by T. D. We gave our readers an account of the mastorly manner in which Mr. Gögh Nichols, who edited it traced this T. D. through the me. dium of his own sketches, to his native haunts, and identified him as Thomas Dingley, of Dilwyn; and we also gave an out line of the singr. lar survey, which was oonfined, chielly, to the cider connties and those adjoining them. The same Thomas Dingley acompanied the Duko of Beaufort into Walos, and made sketches of the seats and arms and monuments of the Welsh gentry, which survey, known as the "Beaufort Progress," has beon puhlished by the Dulse of Beaufort, for private circnlatior only. Just such a task as either of these has now been executed by Dr. Nicholas, with the advantage of all the extra appliances that the march of two centuries has afforded. Instead of the stiff pen-and.ink sketches of the old antiquary of Staart times, we havo views from photographs, and instead of bis pale velluxo binding we have cloth of crimson and gold. Moreover, in the two handsome volumes befor us, which are entitled "Amnals and Antiquitie of the Conntios and Connty Families of Wales," there are more geological, geographical, and historical particnlars than Mr. Dingley furnished. Bat much of the same gronnd is gone over as that ricwed by the Duke of Beaufort and his suite, and sereral of Dingloy's sketches are reproduced to illustrate it.
Now, the Welsh have a aaying by way of a laugl at the supposed national yearning for the identification of a remote ancestry, that the surname of Adam was Williams, and that the patronymio of Noah was Jones. In Andrew Borde's "Boke of Knowledge" there is a Welsh. man who expresses the same longing for an ancient lineage. He says, "I ara a gentleman, and come of Brutus blood; my name is Ap Pryce, Ap Dary, Ap Tlood." There is, doubt. less, as indicated in these and many other instances, an intense interest in consanguinity in Wales, and there is also a vory good and anciont reason for it. In very old times a man who was avenging an injury did not desist from pursuing had arrived ap the family of his enemy till he
*Aunnls and Antiquitien of the Connties and Conty
Families of Wales. By Thomas Nicholas, Families of Wales. By Thomas Nicholas, M.A., Ph.D.
Lonition: Longmann, Green, Reader, \& Co, 1872,
from the actual offender. Under these ciroum. stances, and in those days, it was imperative for a man to trace his relations, both up and down the stream of life, to a very remote degree of kinship. We know that old customs and habits of thought, like echoes, linger longer among the hills than elsewherc, and we shall probably not be wrong in assiguing a Welshman's considoration for a pedigree to this, or a similar old-world influence. A Cymro, or Welshman, past the ninth descent, was the head of a new family, which he represented in the national coancils, which was another arrangement calculated to Kcep lineage before the eyes of the people in a remarkable degree. And as, in addition, he held rank and claimed property by kin and descent, and enjoyed the possession of land in virtue of descont from free men, a pedigree oould not fail to be of the greatest importance. Not content with preserving and copying genealogical trees in grcat numbers, the Welshman sometimes inscribed his lineage with his coat of arms npon his buildings. The mansion built by Sir John Games, knight, in 1582, at Newton, near Brecon,* has his shield of arms soulptured in stone on the fireplace in the great hall, with this inscription -"John Gamocs, mab ar etyfedd bena Edward Games ap John ap Morgan ap Edward ap Morgan ap Dafydd Gam, 1582. Ar Dduw y gyd. Games," which, translated, rans:- "John Games, the son and eldest heir of Edward Games, the son of John, the son of Morgan, \&c. 1582. On God depends everything. Games." The ancient mansion of Ahermarlais, in Car. marthenshire, hore an insoription of like character, to this eĽect :-
"Urien Rheged, King of Rheged, in Ireland, and King
of Gwyr, in South Walee, Lord of Is. Kennen K, nd Kydwelly. He was in, King Arthur's tyme, and marrie is sibier by the mother' s side, by whom he had Owen and Pasgon, with others. Urien was the fourth in descent
of Coel, Emperor of Great Britain,")

To have oome over with the Conqueror is no merit in the eyce of a Welshman, whose hills, vales, moors, and river-banks all speak to him of a more remote and nobler ancestry than the adventurous knights who accompanied William the Norman across the Channel. Uther Ten. dragon, Arthur, Urien Rhegid, Cynetha TVeledig; Cocl Godhebog, grandfather of Constantine the Great, Boadicea, Bran, Caractacne, Bronwen the Fair, Cadwaladr, Merlin, Taliesin, Howel the Good, are illustrions, reliable realities to him, by the side of whom the Normans are newcomers. Jnst as in the days of the Plantagenets in the Honey Island, as the old Cymry used to call Eugland, all intellect and taste expeuded itself in the practice of architecture, so, in older times, in Wales, all possessors of talents wore bards. One of tho Wolsh historical trinds says, -"The three beneficial artizans of the Isle of Britain : Corvinwr, the bard of Ceri of the long whito lake, who first mado a ship, with a sail and radder, for the Camhrians; Morddal, the man of the white torrent, the artist of Coranit, son of Greidiawl, who first taught the Cam. orians to work with stone and lime (at the time the Emperor Alexander was subdning the world) and Cocl, son of Cyllin, grandson of Caradog and great-grandson of Bran, who first made mill of round and wheel for tho Cam. brians; and these three wero bards." Again, "He that has skill in emblazoning arms, portraying heroic nctions and wonderful events, so that they may be understood as soon as the emhlazoning is seen, is called the sign-showing bard." It is not too much to affirm that no one could treat properly of Wales and the Welsh who was not, in feeling and temperament, a hard; and accordingly we have plensnre in per. oiving that Dr. Nicholas may bo fairly classed among the sign-showing or heraldic bards of old; for not only has bo portrayed many heroic actions and wonderful events, and detailed the
descent of many heroes, but he has performed his task in a manner that may be understood as soon as the omblazoning, 80 to speak, is soen. He has done more than this for the old conntry; for he has saatched a county from England, and shown clearly that it is Welsh. This is Mon. mouthshiro, which by modern geographers is placed with the English comntios, but which from time immemorial, before the reign of Henry VIII., formed part of Wales, and even long after that time was allowed to be one of its thirteen counties. In all thinge, too, he is grave and certain, and armed with anthority. He has aimed at producing a new visitation of Wales, which, thongh not under the anspices of the College of Arms, may be considered as complete and faithful as if compiled by a professional herald. Each county is treated as a distinct dietrict. Its physical features are noticed; its annals, structural antiquities of all ages, noted its extinct families enumerated; great men cele hrated; and present county familics described, with their lineage, dignities, alliances, and public services, safficiently fully to exahle a clear and well-defined presentment of its anoient and modern characteristics to arise in the mind of the reader.
A similar task, as far as the histories of the families of the Principality are concerned, was nndertaken in the reign of Elizaheth, by Jewys Dwna, Deputy Horald of the College of Arme. And in the reign of Queen Anne there was another antiquary, Henry Rowlands, pursaing the same study, thongh limiting it to the island of Anglesea, pacing the sites of the ancient groves, counting the monoliths, carnedds, and cromlechs, making up lists of the highs sherifis of the county; lists, too, of the members of Parliament, and of the clergy of the various beneficcs in the connty, with the same interest, aim, and faith. Since this worthy viear of Llanidar laid down his pen, more than a hundred high sheriffs bave taken offee, with due pomp and circumstanco. His successor, therefore, has many new names to add to his lists, and many cvents to record that never foreshadowed thera. selves in his most tronbled dreams. It is, of course, easy to travel in Wales, and see but littlo that these heraldic bards saw. Lady Morgan, for instance, after staying with Lady Stanley, at Peurhôs, thought only of its swoet walkg, quiet crags, black rocks, its perfumes, drawing rooms, gardens, and strawberry-plants, we may road in her correspondence. But it is cortain, those who would get a full enjoyment out of Welsh travel should avail themselves of the pioneering of these painstaking scholars.
Perhaps the most interesting of the Welsh counties is Merionethshire. Heury Rowlands would, doubtless, have awarded the palm to Anglesea, i,e., the Englishman's isle, the sulhject of his work, and the scene of his labours; the chief seat of the Druids, the site of the old home of the Tudors, the refuge of the pursued in all ages. Thomas Dingley would, probably, have preferred Montgomeryshire, in whioh division of the 'principality his long journey came to an end, and his patron was met by fonr coaches, with six horses to each, containing the Dachess of Beanfort, and his grace's daughters and their attendants, and where a serics of noble entertainments was enjoyed by all the suite. Lewys Dwnn would, as certainly have voted Pembroke. shire to the first place, on account of his own descent from the Dwnos of Picton Castle, who traced to Meurig, ling of Dyfed. But we are iuclined to give Meirionydd the preference to sither on accoant of its intactness, its old heroio character, its freedom from levelling influences, and the picturesqueness of its scenery. It is allowed to be the most Welsh part of Wales. It consists of a triangular area of 666 square miles, one side of which, 37 miles long, borders Cardigan Bay. Dr. Nicholas remarks, appreciatingly "How much of this surface is arable land it

## THE BUILDER.

would be perilons to say : a much larger propor tion would be desolate moorland, or bare and craggy rock; but in narrow intervals hetween the hills, where the cataracts leap, and the small rivers pursne their lively and noisy courses,
there are found scenes of smiling fertility, there are found scenes of smiling fertility,
ahysmal steeps and tangled forest, the charms ahysmal steeps and tangled forest, the charms imagination to surpass. No part of Britain more bewitchingly invites the artist, or more sweetly regales tho intelligent tourist." Here and there, along the hanks of the Rhine, in the neighhourhood of the Lurleyburg, for instance, there may be spots appronching rivalry with the scenory, though as a wholo that famons stream is quite eclipsed by the Mawddach. "Switzor. land itsolf," avers Dr. Nicholas in continuation, "though, doubtless, ahounding in scenes of different type, and of more colossal grandeur, possesses nothing of similar scale and character to surpass this exquisite distriet.
There are three systems of monntains in the county. The most famous elevation is Cader Idris, $2,914 \mathrm{ft}$. ahove the level of the sea; hut this is not the highest. Aran Mowddwy raises its mass some 40 ft . higher still. From these Deo, tho Wnion, the Cain, the Eden, the Lliw, the Trywerin, and Cwn Prysor, - some wending
towards Bala Lako (that great hopo of the towards Bala Lako (that great hopo of the motropolitan anxions for a snfficient watersupply), and others towards tho estuary of Barmonth. "Around is a rogion of mist, hogs, and lakes,"-wo quote Dr. Nicholson again, rather than trust to memory, " of wild fowl and diminutivo sheep, of humhle cottages, turf fires, simple and shy mauners, and withal nearly unmixed Celtic hlood. No coach-road has yet traversed it, and no railvay ever will invado it, unless, indeed, some treasares of gold, copper, or slat $\theta$, as yet undiscovered, should tempt the enterprise of the ages coming to form ono." county, that the tourist has not yet discovered, homld incquire for the moors, heaths, and craigs of Craig $y$ Dinas, Llech Idris, Bedd Porus, and
Myndd yr Wden. One of the hattles of the White and Rod Roses was fought near the village of Pennal, and won by the valiant Welshman Thomas ap Gruffyd ap Nicholas (of Dinefawr). Owen Glendwr filled this district with his presence and name, especially in he. Anjon took refuge in this fortress, too, and looked out upon the Bay of Cardigan and the estuary of Traethhach and up to the Harlech mountains for aid and succour, doubtless, till her eyes were tired with lookjng; and when dward IV. was King of England, this grand old Welsh stronghoid was still holding out for tho Lancastrian party. It was when Edward sent the Earl of Pembroke to reduce it that its defender, Dafydd ap Jevan, made the answer so often qnoted and always admired, -"I held a tower in France till all the old women in Wales shall hear how I defend this castlo." In the Vale of Dyffrin, too, close hy, aro numeroms pre-historic relies. This wns a field where, to hattle was tried in times hoth of British ciril trife and of contest with English and Norman nvaders, the ravines and crags of the Artro and its tributaries gave refuge and conceal. ment to many a baud of retreating patriots, and the celebrated Pass of Drws Ardydwy was repeatedly a real Thermopylae." Apart from nondscape this district and charms of interest of possessine many the additional Prince Llewellyn had a residence here seats f this there ono troces heyond a but rtifis mound no races horge artificial mound. The mansion of Peniarth, a finest lihraries in Europe. A new mansion has lately replaced the ancient residonco of the Myttons, which is of great extent, and in a picturesque situation, surcounded hy mountains with cascades dashing over rocks, yot toned down with ornamental gronnds and plantations. Corsygedol is an Elizahethan structure, once th Meat of tho Fanghans, hut now the property of lection of pointines of erves in the finest col the Principality. The onate and new masters in the Pincipaing. "Ye gate house of this mansion was designed hy "Yuyr Shôn," Inigo Jones, in the neighhonrhood. Netected in other seat in the neightourhood. No part of Wales contains a larger nomber of camps and caers. The largest caer is that on the Craig of Ddinas,
fyich is in the centre of a small valley. Round
the crest of this great crag is a rampart formed
of walls of great thickness, and within the of walls of great thickness, and within the
onelosme is a carnedd, with a rock close by on onelosme is a carnedd, with a rock close by on Which are to be made ont indications of seats. There are also geometric incisions mentioned which, upon examination, will he found, pro bably, to correspond with tho now familiar cnp and circle marks. This caer is supposed to be that allnded to by Taliesin, as heing the "cave of silence" in which Elfin was confined. Ther is a caer at Penralit, on the cstate of Mr. J
Humphrey Jones Humphrey Jones. Another on the farm of Llwyn Griftri, Talybout, which has been ex-
amined and measured by Dr. Griffith. There is amined and measured by Dr. Griffith. There is another overlooking the vale of Isgcthin, above Llanddwywe ; fifth on a hill abovo Llanfihange 5 Pennant; and several others north of Cormen. And tumuli abound. There are the remains of Cymmer Abbey, near Dolgelley; and Egryn Abbey near Barmouth; and of a religions houso or oratory, Cae Ahatty, nenr Plâs Dinas, Mowddwy, the now seat of Sir Edmund Buckley, ahove mentioned. But ahove all, in point of popularity, there is the grave of Gelert, the cele. brated hound of Prince Llewelyn ap Iorwerth, which was presented to him hy Eing John of England, who was his father-in-law, and which he slew in haste and error, under tho impression that he had killed his infant son, whom he bed, in reality, defended and preserved from the attack of a wolf. Of late years there has been an inclination to douht this tale, hecause counterparts of it have heen found in other lands, and we are glad to see Dr. Nicholas active on the defensivo side of the legend.
It is not a littlo curious that most Welsh antiquaries dwell with pleasuro upon the fact that the Royal family of England owe their seat upon the throne, and thoir Scottish kingdom, to their Welsh descent. In Queen Anne's day this circumstance afforded them immense satisfac. tion. The Rev. Henry Rowlands, whom we have quoted hefore, remarked:-"Wo have hy strange compensation of Providenco, the of glorious memory, as well as some of her oyal ancestors hefore her, enjoyed the ancient kingdom of Scotland, the Kingdom of England, and the principality of Wales, by right of inleritance, from persons whose descent and origin wero from the Isle of Anglesey. For she had the name of her family, and tho crown of scotland, as desconded from Walter Steward, England, in right of the Lady Margaret Tudor paternally desoended from Owen Tudor, of Penmynydd, in Anglesey; and she inherited the principality of Wales from Gwladus Ddu, the ap Iorworth, Pangiter and heir of Llewely Anglesey, who was married to Sir Ralph Mor timer, by which marriage the inheritance of the Principality, in right of hlood, came to the house whero it now happily rests." Mr. Rowlund went still further, for he added that if a rimht to a new territory heloncod to the state or kinodom whose suljjects discovered it, then King Georgo was entitled to all America, hy virtne of jts firs discovery hy Madoc ap Owen Gwynedd, three hundred years hefore Christopher Columhus was born. Dr. Nicholas follows suite so far as to preface his hook of illustrious lineages with that of her present most gracions Majesty, whos pedigree he traces to Rhodri the Great, King o Wales, who died A.D. 876. This is done in a take up the line at Henry VII., sake we wirst Tudors. He was the son of Princess Elizaheth daughter of King Edrard IV eldess Elizaheth Richard of ke eldest son Camhridge Camhridge, hy Anne Mortimer, daughter and of his family, who was great.grandson Gwladys, wife of the Lord Marcher, Ralph Mortimer, and daughter of Princo Llewelyn ap Torwerth of North Wales, son of Gruffydd ap Cynan, sixth in descent from Anarawd, Prince of North Wales, eldost son of Rhodri the Great Although Dr. Nicholas gives vicws of most of dace he has duce, he has been curiously oxclnsive in the matter of the churches. The ecclesiastical antiquities are, indeed, scarcely glauced at, and, consequently, yet present a very inviting shject for a futnre work. Several of the castles are illustrated with two or three views. Caerphilly Castle, for instance, is shown in three aspects. This the author fixes upon as the England. It covered, with its projecting earth-
works and redoubts, thirty acres of ground ; and to this day its massivo walls, its towers, -one
leaning as though ahout to fall at any moment, leaning as though ahout to fall at any moment, since the days of Queen in the same position since the days of Queen Isahelia,-1ts Fast halle and gateways occupy a very large site abrong this fert hers mention this fortress especially, howover, hecause we have a snggestion to make concerning its name Dr. Nicholas says of it :
St. Cenydd, who is said in the Brut to bare founded a macuastery on the spot, is both familiar and intellimible;
but the modern Cuerphilly, or more corretly if the components are Velsh, Caery jecture, therefore, has its reason, no man can tell. Conand strained derivations have been proposed. It were
beneath the dignity of scholars not to search for a key beneath the dignity of scholars not to search for a key
among the arclives of Greek and Latin, avd we have been accordingly olfered Cara.flia, on the assumption
that sorue one's "beloved daughter' had held some

Ahout 1093 Glamorganshire was partitioned by Rohert Fitzhamon among the knights who accompanied him into wales, and then saiwghenydd fell to the share of Eimion ap Cadifor ap Collywn, who had assisted him in his adpance. So late as 1221 the castle is montioned as Sang Henyd; hot in 1270 the Brut records, in that yoar Llowelyn ap Gruffydd took tho castlo of Cuer-filu." Now we think the reason of the change of name in the Brut, from Senghenyd to Caer-filn, may he traced to the high consideration in which the Normans held the castles they huilt or strengthened. When Richard Coeur de Lion looked upon his newly-huilt castle, Le Châtoan Guaillard, in Normandy, bo said to it, in his price and pleasure, "How beautifnl thou art, my daughter of a year!" Here we have, at all ovents, one application of the term "daughter riew ande. And Cara-filia, from this point of holding or living in Caerpbilly, may he the real solution of the mystery of the change of name. The enphonions resemblance between the Aorman chere, dear, and caer, the common Welsh word for stronghold, may have led to the permanence of the application of the enthusiastic term
The inevitable alteration in the form of names, hoth of consequence of importation into a foreign conntry and the lapse of time, is shown knights, to whom the lordship of Llanwerydd was apportioned in tho distribution of the county to which we have just alluded. This was William lo Esterling. Some of the old docr. ments mention him as Desterling. But hy tho fourth geucration his family were known as Stradlings. The Stradling pedigree states "Sir Rohert Strading married Hawivio daughter of Sir Eugh Brin, knight, whose mother was the lawful Welsh heiress, on failure of malo jssue, to the castle and manor of St. Donat's (Llan. werydd)," and so, by marriage, as in the case of many other conquerors in all times, ohtained a rightful title hy just heirship to the estate Fitzhnmon, who took Cardiff for himself, died after twelvo years' possession, and left no son. His daughter married a natural som of Henry $I$. hy a Welsh princess. This samo Henry I., by the hye, kept his brother, Rohert Curthose, Duke of Normandy, shut np in Cardiff Castle for another of the Norman ad encrs mariod the TVelsh heiress of the district assigned to him with Coity Costl (Coed ty, somo of him readers, thinting of Kit's Cotts horse fout may he glad to woodlands.) The seat of the Earl of Dsnraren stands on the site of tastlo, thous her Carach Carack , Willize with hamon's knichts, who afterwards huilt for him self Cydweli Castle, in Carmarthenshire. Bat with tho solitary erception of one female descondant of Turbervil, all these Norman families, Granvilles, Humfrovills, Sywards, St。 Qnintins, Berkrolles, Le Flemings, aud the rest, are extinct. The Stradlings were the longest to linger, and the last of these was Sir Thomas Stradling, who died in 1738, aged twenty- eirht Their castle of St. Donat Dr. Nicholas describes is unquestionahly one of tho most perfect of the ancient haronial halls of Wales, but he gives no illustrations of it. Omissions such as this mar the effect of tho survey con siderably. A second edition, with moro nnme rous views, is however not impossibl, when hope, among other itoms, all tho other ancient mansions, though they ho now hut farmhouses,
rocks in connexion with prehistoric works, will not he forgotten.
Althongh, thinking of the parple hills, the winding wators, the steep wastes which, as has beon truly said, when the gorse is in bloom, appear to be covered with the mantlos of a thousand kings; the old inviting manor-house the mystic forsaken caers of the ancient Britons Who lorded it there before the articial settlemas thought of ; the grey cottages of their peace. was thought of; the grey cottages of their peace.
ful descendants; the sea; the craft coming and going, with their dove-coloured loads of slates and the high, lone slate quarries up on the hills, which do not spoil the beantiful face of the country like the coal and iron industries, we have placed Merionethshire before the manu. factnring districts, we would not pass lightly over the many grand features of other counties Dr. Nicholas treats each district with equal care and fulness as far as his description and particulars are concerned, The pauoity of illustra. procuring photographs, and the fact that the procuring photographs, and the fact that the doctor is not an artist. The ancient home of trihution to the illustrations, but no photographer has yet pitched his apparatus on that royal soil, althongli Ponmynydd, the Tudor's birthplaco, is scarcely an hour's walk from the Menai Suspension Bridge, which is figured in every guide pocket -book, almanac, and hotel hill in the district. Aftor mentioning that the conntry through which it is approached is common, bare and lonely, our author cxplains,
"And yet veritably you are on sacred ground. Earnest were lords of those acres, looked out on those gre knowlis, and weat oft to fight by the eide of the Blact
Prinee in France ; and you are close to the dwelling Where lived that Tudor ap Grour who was made a kninght
by the Black Princés royal father. You have on the right a little ehurch perched on a rising grouve on wher
the fumily of Tudor worshipped and are buried, and whic contains to the memory of Owen one of the noblest tombs
in the lund; and going down a stecp, short hill, you soc to the right a quiet furm-house, whose whole expression
forkids the thonght that from that homestead sprang anything great or historio. A fey trecs, far from
siately, shelter the diveling. The entrance is by a lane deep and nerrow, which speaks of the waris
rains of gene anations, but of little hesides. Fon sco no
grey or ivied ruin of wall groy or ivied ruin of wall or tower, no gabled roof or
mullioned win low, pillar or pediment. All that is visible is downight commonplace Anglesey farmhouse, which
seems to be sutisfifed with its humble lot, and to lonow of nothing higher.

If the reader had got out of the train at the ncarest station to the Menai Suspension Bridge, and had walked the hour's walk throngh the rain-washed lane, be would not be able to see the rain-washed lane, be woald not be able to see the
house in which OwenTudor was horn much plainer house in which Owendudor was horn much plainer
than this aocount shows it to him. To marry a gneen was a perilons performance, we must own, gneen was a perilous petformance, we must own,
for a Welah gentleman. Down came the jealous with their reproaches, as we know, but note here questionable sound. Ricbard good nume into a clamation calling his grandson "Oon Menry Tidder, son of Edmand Tidder, son of Owen Tidder," and denouncing him as being deacended of hastard blood, "hoth of the fader side and moder side," whioh denouncement tho old Welah plan of preserving pedigrees enahled him to One portion of
One portion of Glamorganshire offers a decided contrast to the grey sumny serenity of this old farmhbuse, and the distant quietude of the old of Swansea. The first oopper-smelting works were erected upon tho river of Swansea in 17 I 7 , beyoud the boundary of the corporation, at Glandowr, soon corrupted into Landore. In 1720 another estahlishment was opened, withiu Aberaven or Taibach Works, the followed the Works Punclawdd Works, Loughor Works, the great

of the sulphurons smoke which once rolled away into space, but is nuw condensed into an acir used in making phosphate manures, is estimated at $200,000 \mathrm{l}$. yearly. This being the valuo of what wes once wasted, we can easily conceive that tho profits of the coal, iron, and copper industries in the aggregato must be enormous But the grandest fact connected with the subject or, if we may not aay fact, we will suhstisute prohability, is the extent of the reserve of coa beneath the vale of Glamorgan, from Cardiff to St. Dunat's, aud thence to Bridgend. The
exteut of the entiro west coalfeld is estimated to measure above 1,000 equare miles; and when all the known storesare exbansted there will be still
the vale of Glamorgan to begin upon. Dr Nicholson is not on the side of the alarmists, it is clear. Tho popnlation of Glamorganshire, in pears, or in 1875, After a lapse of seventy as mang. The popnlation of tiddeser in shand many. popnlato of diddeser, in clading London, only trebled itself in the increaso is, of course, due to the coal, iron, increaso is, of course, due to the coal, irou,
and copper centres. Merthyr Tydfil makes large contribution to this retnrm. We aro glad to assist in epreading the following testimony
"Tho great ironworks of Cyfarth-fa, Dowlais, Penyearnings amount to fubulous sumg and and we Whoso annual curse of intemperaneo aud ite associated vices, this region with all its drawbacks, might be the home of a humas happiness, maribed hy alical Sodom elements of prosperited with is moral and social paradise. And worthy effiorts are made to counteract the ovil by the good. Places of worship are hnilt by
tho score. Leading families talee nctive part in the social amotioration. Schools of a superior kind are actively encouraged by tho great proprictors, as at Dowleis and money contributions. The battle to draw ont and refine money contributions. The battle to draw ont and refine
the good in humanity and to overcome the stubborn obstructions of evil, is ainoost as carnest as the battle waged the orel of iron and lead and the jet of coal. But it is

Dwelling npon this soction of the work as we prepare to close it, and reminded of the more chivalrous portions of it hy the arms of Wales emblazoned on the cover, we feel that if the present generations can do better than the grand old Welshmen, well and good; brt if we cannot, their example shonld animate us not to do lees. Tho diaties that are ours to perform aro not so inspiriting as theirs; are not so likely, in a word, to he heard of by all tho old women in Franco, and all the old women in Wales, snccessively, like those of Dafydd ap Jevan; but they are as oncrous. We have not to defend castles as fair as daughters, like Caerphilly, from brave knights and stout men-at-arms. But whilst, in our gnorance, disregard of sanitary laws, sensnal intemperance, and other wrongs to right, we must own we have moro gigantic foes that will ake our gravest considerations, our strongest quish. If Dr. Nicholas's work should do no more than press this conviction home, it will have its great nse. But after our indication of its valuable

NORTHUMBERLAND HOUSE AND LONDON IMPROVEMENTS.
Tee meetiug held at Willia's Rooms last aturday, under the presidency of Lord Lyttelton, first Lord the propriety of memorialising the first Lord of the Treasnry to delay the contemplated demolition of Northumberland Houso, and other proposed metropolitan improvements, made as to the expodieney and propriety of the made as to the expodiency and propriety of the proposed changes, wonld have been more largely attended than it was if those who arranged in the matter of their inown to take interest growing feeling abroad on the subject which would have led to a large attendance. Never theless, pood Prime Minister was adopted, setting forth the lamentable state of our whole arrangements with regard to public worky, arrangements which unite vacillation, tancertainty, costhuess, extravarance, meanness, and other conticting vices ; and thus procceds:-
"The Charing-eross, Rc., Approach Bill proposes to
deal with ono side of Trafalgar-square, the fillest and most important site in the metropolis, and takes powers old architectural manepion, with a riem to the making of a new street, leadine in a direct lige from the Nelson Column
to the Emtankment or or near the Hungerford Bridge o the Embankment at or mar the Mangerford Bridge
station of the Metropolitan Railway. Under the present system of Parliumentary procedure, the Bill that is to
 proposod buildings, nor any view of the gencral offect The new street, and of the changed aspect of Trufulgarmitted to the Committee on tho Bill. No opportunity question of the Thumes Embankment Approsch in con
quexion with any rival plans, nexion with auy rival plans; and thus thas new line of
street in the heart of the tmetropolis, involvine street in the heart of the metropolis, involving th
destruction of Northumherland House, will be dealt wit precisely as if it were an equivalent portion of a new
pullic rond or railwny in some rcinote and purely rural district of the country. We Fespectfully suhmit that, whe we honst of our cirilisation, we are thas acting in
isy in which it can hardly bo supposed that the minst
barbirous people would deal with the collection of hats
capital. So far, then, as relates to the Bill in qnostion,
we wonld arge that further and fuller consideration shonld be given to it than under our present forms of Parliamentary procedure it is lilicly to obtain before the
powera songlut by the Metropolitan Board are granted."

Tho memorial further calls for some system of efficient supervision which may afford a guarantee to tho public that no important works will he exocnted without having heen maturely con sidered hy Parliament and by competent persons appointed for the purpose, in all their aspocts, rogard being had not only to pablic atility, but also to appearance and general effect.

The chairman spoise strongly against the proposed destraction of Northumberland House, a did Lord Elcho, who followed with an address of considerable interest. speaking on the renera question of supervision, Lord Elcho said, in the committee of 1869 many suggestions were mado for amending our system with regard to public works. Mr. Cole, whose approaching retirement they all regretted, suggested that tho First Commissioner should he counselled hy a perma nent body of professional men,-for instance the architects of the City and the Metropolitan Board, the president of the Inatitute of Archi tocts, a representatitc of the Royal Academ and of the Civil Engineers. Whether that body of five thoronghly competent persous would he enongh he could not say. At all events, our capital deserved a better fate than that which threatenod it. We had an unrivalled park and a noble river. We had the new Embankment Whitohall Chapel, St. Paul's, Westminster Abbey and, ho would add, Westminster Palaco. The nation which had produced Inigo Jones, Wren Barry, Tnmer, ought to escape the stigma of continuing to have it work dono in the present helpless chaotic way. [No one can donbt this and every effort should bo made to bring it abont.]
ity of Lestio properly enforced the neces sity of comhination in hutilding the proposed Mr. Cowper. Temple suid, What he atreet
Mr. Cowper-Temple suid, What he most desired was an efficient approach to the Embankment and if the now sect were the hest he conld endure the loss of Northumberiand House. But letais and ight to dccide without examining details, and ho was, therefore, in farour of creating proper tribnnal for that purposc. He though well of the proposed council. Mr. Beresfor Hope said the burden of proof lay with the destroycrs, and they had shown no case. We Want more than the proposed council. The Offico of Works must ho reconstructed, it is too monch a department of the Treasury. We must
have a Minister of Works. Professor Kor said have a Minister of Works. Professor Kor said archonce tho Metropolitan Board had three compells; now it had none, for Mr. Vulliamy was making valuations. In cone to the the line of tho proposed street was not an architect's line it was-ho spoko with all respoct--a vestryman's line. Othor speakors fullowed to the same effect and the memorial was egreed to
go to sign it
We fally agree with its two prayers : the special calling for further consideration as to Northam berland House; the goneral, demanding proper provision, with the aid of compotent persons, as to pnblic works. As we havo said before, i any great adrantage can bo gained for the puhic by the destruction of Northumherland equally good road can be obtained by entering on tho west side of it, the destruction should not he permitted. Jookind at carefully, and with a view to relieving the Strand of traffic the most efficiently, we have becn long conthe most efficiently, we have been long con-
vinced that neither the road to the west of Northumberland House (thut which has heen called Sir James Pennethorne's plan), nor the road proposed by the Motropolitan Board, is the best. For that purpose the entrance Hotel foll Hotel, front of the ask for, however, is Duncamum-street. All we ask for, however, is a cartul consideration of
the whole question by a competent tribunal.*

Institution of Civil Eagineers.- According the daily papers the rucmbers of the InstitnVillis's Rooms, axcheqner, Mr. Lowe, made an interestine speech.

considierable personal cost of time and nuoney, considerable personal cost of time and nioney,
for yoars striven to inspire a more tender caro of every remmant of the ovideneo of bygone races in this conntry. It is a pleasure to know that our oxertions and outlay have not heen in
vain; a greator, and still growing, love of an. vain ${ }^{2}$ greator, and still growing, love of an.
tiquities, not merely for their own sake, but for tiquities, not merely yor their own sake, out har
the tales they toll of carlier civilisation, has been the result; and it has tended to the pre. servation of antionuities wherever we have been
able either to hold ono of our annual meetings, or to impress on authorities about to allow de. struction the importauce of preventing suoh proceedings.
Bat it is one thing to instil snch a love into the minds of the world, and quite another to persuade a Government to make an expenditure on the matter; and, much as I and others thiuk it desirable, it may be diffieult at present to obtain the power's whiob Sir John Lubhock seeks. Should the Bill bappily pass, it cannot but bo a step tomards a larger measure. It has often been my lot to expross my rejoicings over a Medicoval ruin; for amidst tho wholesale restorations little of our still-used buildings of those ages will remain for our successors. It will he as necessary to have care for structural remains of periods later than the Roman and Saxon if we dosire to afford means of study to future genera. tions. The Bill, however, is a step in tbe right dircction, and althongh it has raised an outery in one quarter, where the owner asserts that he is perfectly preserving the work named, it is ohvious that great national monuments should be as much under jublic care as tho treasures in the British Museum.
It would he untrue, as well as nagenerous, if I allowed the idea to be formod that I ignore other great archwological societies; for although they are mostly, if not wholly, emanations from trust (speaking in the name of onr council) they will endeavour, as we are doing, to strengthen Sir John Luhbock's hands in any way he may consiler most available.
As jear by year we see in previously unof many ralualile works, we come to no other conclusion than that the national monument shouli be preserved for, and hy, the nation

and Mr. E. Mo. Gihbs, were prominent com. petitors.

THE "ROTTEN ROW" WORKS AND NE
PLANTATIONS in Battersea PaRK.
The saddle ride or Rotten-row which has for some time past been in oourse of construction round Battersea Park is now completed, with the exception of about half a mile in length, the works from the York.road entrance on the soutb side westward having hoen finished within the last few wceks, and there will shortly be a con. tinuous equestrian ride entirely round the park mearly two miles in length. Simultaneously with the formation of the ride on the sonth side, the land immediately adjacent on the extreme southern houndary of the park bas been taste. fully and ornamentally laid out in mounds of an nudulating charactor, and artistically planted with trees whicb have heen removed from other parts of the park. The greatest portion of tbese trees, which are the growth of several years past, have been carefully raised, with the soil around the roots, by a process of machinery, soil around the roots, by a process of machinery, injury, and now present an appearance indicating that they had been there for a considerable length of time.

SIR G. G. SCOTT'S LAST LECTURE AT THE ACADEMY.
I A3l now ahout to close the very fitful and non-continuous series of lectares which I havo from time to time, during the last fourtoen year's,
I have to express my regret that it has never beeu in my power, owing to the press of other engagements, to give the fnll complement of sia lectures in each soason; and that in some jears I have heen prevented hy circumstances,wbolly beyond my own control,- -from leotaring at all. I may further mentiou that my earlier coupled with a parallel course, on Classic Archi. tecture, hy Mr. Smirke, who suhsequently, on being appointed professor, took for five years the whole duty upon himself; so that, as I said before, my own lectures have been hut fitful and non.continnous.
I have further to confess that these disjected lectures have been for tho nost part linsited to the particular phase of our art in which I am mysolf most deeply interested; for I do not see appear asitity in artisially whici is not tha which I view as my special mission.
I trust, however, that on my own special sub ject I may bave been useful; anyhow, I helieve and I am sure that I hare at least taken an infinity of pains, and that by the kind aid of those aronnd me I have illustrated my lectnres hy dramings profuse in numher, and ofton excelent in execution.
Hy lectures have heen non-continuous, no only $2 s$ to their periods of delivery, hat as to found, should they bo hereafter puhlished, to contain a fairly clear account of the rise and perfeotion of our Medizval architecture, with some useful digressions extending somewhat hoyond tbis range.

Inave not continued this history of Medineal architecture hcyond the period of its perfeot late phases, their history does not maintain the same interest with that of the noble enthusiasm which urged on its earlier growth.
Ou now closing my lectures, I think I may hecome, for once, rather more discursive, and may venture a little to the right and left, and in other directions, in search of matters hearing generally upon architeatnral art as viewed in future, and (which concerns yourselves more noarly) in referenee to yowr own individual nearly)
studies.

Onr a
Onr art, as has so often been remarked, differs rom tho sister arts of painting and sculpture in this,-that whereas they ariso drectly from the practical necessities and utility, ours arises first from these necessities, and then from the desire to clothe their results with beauty. It may be said that the yearning after abstract heauty unlinkod with utility is the bicher and more spiritual sentiment; but, on the other hand, if
we look around us tbronghout the creations of nature, we are prompted to reply that, in linking beauty with utility, wa are more directly imi tating Him who made man in Kis own image,
and in whose works this anion of the useful and the heartiful is one of the most universal ohn racteristics.

Architectrare, tben, as distinguished from more huilding, is the decoration of construction. If I wore lecturing on architeetnre, in the brondest form of the expression, I must treat throngbout of construction, and of its decoration, pari passe, 2 as the latter has hat little meaning if severed from the former, which is its groundwork. And, even in lectures from this chair, where architectre is viewed specially in its character as Fine Art, it is still impossihle,-as indeed it would be undesirahle,-wholly to sever that bigher characteristic from the more practical phase to which it owes its origin.
Now, the history of this concurrence of art with construction is the History of Architecture; and, to an architectural historian who is cappahle of taking at once an artistic, a philosophical, a political, and a religious view of the facts which he chronicles, nothing can he more interesting than to follow out from the earliest ages to which we can carry back onr researches,firstly, the practical changes in huilding, arising from the exigencies of climate, the stage of civilisation, the traditions of race, and the varie influences of political and religions circumstances; and to connect with these the changes, the progress, and perhaps the docline and degradation of the art made use of in the decoration of their huildings; and to trace out the canses which led to those changes.
Let ns not, however, suppose that a know ledge, however intimate or accurate, of archi tectural history, is of necessity a part of the study of architecture itself. On the contrary at no period when a genninc, unhorrowed style of architectnre has provailed, has any know ledge wbatever existed of the history of art nor at any period previous to our own has the history of architecture, -heyond a very limited knowledge of that of Greece and Rome,-been Fiewed as an ohject of study.
From the dewn of civilisation to what is known as "the revival of letters," the leading nations of the world possessed each a gennine architecture of their own; all growing, hy a natural growth, from an original stem,-un borrowed and nnimitated,-and practised hy artists highly skilled in their art, bnt ignorant o its history
The "revival of letters" was followed hy a revival also of the architecture of tbose races whose literature was resuscitated; and with this revival came a certain, though scanty, knowledge of its history; hat the investigation of the entire istory of architectural art, and the constituting it into a branch of our hitcrature, has heen re served for a period which possesses no architec tural style of its Own, excepting as the result of revival or imitation.
Is, then, this study to he viewed as a thing to he avoided? Certainly not. Our predecessors worked honestly and with perfecs sncoess, in ae. cordance with the conditions of their times; those of our times are wholly different, though, fear, the reverse of fovourahle; hut, nevertheess, they are the conditions to which we have succceded in the due course of events which we could bat little control. It may he that this his torical and arohmologioal tendency of our time is the saring clanse in onr position; which, in its ahsence, might have heen an utter hlank, Let us not, then, throw away that which, for aught we know, may he our solitary birthright, in the vain hope of recovering conditions long since passed out of our reach. It is ours rather to use well and wisely what we possess, regwating controlling, and guiding it, striving earnestly after hetter things by whatever means; hut cumstances of our period
Nevertheless, let it ever be remembered that art history is not art, nor architectural history architecture. They may, like the Syxen's song perhaps, if rightly used, be made to guide or aid us in a right path.
The stady, however, of architectural history bas many and wholly differing phases. It may, or example, be followed purely from an historical and archæological point of view, or it may be prrsued mainly with an artistic sentiment, Both re interesting, but I need hardly say, the latter the spirit in whic
It may, arowin, eren.
It may, again, eren if artistic in its purpose, courge of the gistory of the through the whole not neglcoting the main linc of history, be con
centrated and intensified apon thoso styles, or that style, which we desiro to he the guide and foundation of our own artistic productions, need not say that here, again, the
couree most profitablo to ourselves.

The great danger of the study is the dissipation and unfocussing of our own artistic thoughts; just as tho great strength of the days when this study was unknown was the ahsolute concontration of all architectural thought upon the matter actually in hand-an advantago which in our day is absolutely and, I fear, irrecoverably lost, Be this, however, as it may, it has hecome a part of the necessary education of a gentleman to know something of the past history of our architcct, if only as a matter of literary culture. We must, however, take caro that our thoughts We must, however, take caro that our thoughts
and tastes aro not led away hy it into a state of objectless dissipation, having no concentration on any one griding form of art, but viewing all forms of beauty with equal pleasuro, and froe forms of beauty with equal pleasuro,
from any strong and healthy preference. rrom any strong and healthy preference,
The most natural course for the stadent arohitectural history is to limit himself mainly and firstly (though not eventually, perhaps), to thoso styles from which our own architecture, Whether native or borrowed, whother living or
revived, is lineally descended-"to look to the revived, is lineally descended- "to look to the
rock whence we were hewn." And truly it is a rock whence we were hewn." And truly it is
right glorious genealogy which we can hoast!

The history of architecture is the bistory of civilisation, for architeoture unites and emhraces
the sister arte, and art is the visible exponent of the sister
oivilisation.

Our more Western civilisation ie distinet from that of tho far East; and, without disparage. mont to the latter, its study may ho viewed as soparate from it.
Our own branch of civilisation and art may he said to have arisen on the hanks of the Euphrates, of the Tigris, and of the Nile, and to have moved westward with a quiet course along the gevial ehores of tho Meditertanean; while the eastern hrauch took a contrary direction hy India and China, reaching Japan and perhaps the opposite continent of America. Let us, h
Though the hanks of the Euphrates and the Tigris were the nureery of our race, and though recent discovery has mado us in some degree familiar with their architectaral monnments, we, shich will compare with the antiquity of the remains on the hauks of the Nile. In etudying the one, wo long for relics oarrying ne hack to a date oven approaching that of the known history of the inhabitante, while in the othorwe are per. stretching hack into such unknown for works the past.
Egypt must, we may fear, ever remain a land of mystery. Its chrouology seems inserntahle its paiating, its sculptrre, and its architecture alike wonderful and mysterions. One flash of historical light shines upon its early days-like the lightning npon the midnight landscape-in the scriptural history of those three centaries anding which the peoplo of Israol sojonrned there,
and helped in their slavory to prepare materials and helped in their slavory to prepare materials
for its strnetures. After this it seems again in. For its stmetures. After this it seems again in-
volved in indistinctuess till the period of ite decline. Its monaments seem continnous throngh all these ages, and even onwards to the days of the Roman Empire; hut how early they com. menced no antiquary has yet heen ahle to show while, strangely enough, the earliest and lateet monuments-those preceding Greek architecturo by, perhaps, fifteen hundred yeare, and thoso ereoted when that art was in decay-as clearly and later of our own Mediæoval haildings.

Their character may he said to he threefold The imitation almost of monntains in the pyra mids, the rock.ont tomhs, and the architecture proper-which ie columnar in its most etupendous form ; and whose greatest remaining monu-
ment is the micflty Hall of Karnac, with its hun ment is the mighty Hall of Karnac, with its hun-
dred and thirty columns- perhaps the most impressive of all the works of antiquity. All these were accompanied hy painting and sculpture of a bighly myt
teristic kind.

An art like this, existing in full perfection in its ancient monuments, and also as a still living art, side hy side with tho rise of Grecian architecture, could not fail to exeroise some influence npon it; yet the evidences of that influence are
far from heing clear. The genius of the two peoples was uhsolately distinct, and Firypt was already a couquered nation while Greece was
making its early strides towards fame. They were, too, of wholly different races, so that, strivings which led to its furing thoss hacee of men in its culture, was familiar with Egypt, and must have looked with wonder at its almost appalling structuros, it is, after all, hut little that we can trace of actual imitation; and that atrangely enough, not of the productions of it livingart, hut of a phase which had heen extinet fully a thousand years. The inner and earliest sancturies at Krmac ond on ohserme rock tomb at Boni Hassan, contain pillars to which we trace some resemhlance in tho Grecian Doric; but whether that resemblanco was intontional ccidental to one car any Cariously, the toma at Beni Tesenn ovinces prof of the imition ber matro it on alliance with tho Dorio; hit now ort found on wood construction boin imitated from on art of mitated fom art of a blousand years back As reasonahle would it he for timher constructors As roasonahle would it he for timher constructors in our own colonies to make pigrimnges to AngloSaxou churches which happen to suggest a
timber prototype, in search of types for their More rince
More reasonable, however, it may be to suppoee that the latest type of Greek art, the Corinthian capital, may have hoen suggrested hy the foliated
d bell-shapod capitals of Eigyptian columns.
Paesing, for a moment, from tho Nile to the ligris, we find huried under the Assyrian mounds an architectine as different as possiblo from the Greek, yet containing a few almost acoidental foreshadowings of some of its dotails. This architecture, seems, however, to havo inflaenced firstly that of Bahylon (now almost wholly lost), and suhsequently that of the Persian monarchy, which brings us again in contact with the Greeks.

Here we find, at last, a direct similarity in , for, direrent as are their capitals, no one Chebil at drawinge of the columns of the Xerses at Persepolis, - without temple huilt by that there was a near relationohip in their style to that of Greece. Strangely enough, however, thie resomblance is not to the earliest phase of Greek, - the Doric, - which was its contemporary, hut to ite second phase, - the Ionie, -which, putting aside tho ohronologrical difficulty, need not be wondered at, ae the Ionic citiee had long prove that the influence of Persian architectare was unconnected with the origin of that of Greece, and only affected its more advanoed stage.
I view Greok architecture then, in the main, is an art of spontaneons growth. Ite first form, the Doric, as strictly and ahsolutely Greek, The second, the Ionic, as Greek in the main, hut with few suggestions from the land of tho Great Kirg; and the third, the Corinthian, as equally from harpt. creation of that most wouderful, in intellectnal power, of all the races of man,-that race inepired, as it wonld almost seom, of God to he our nstructore in literature and art, and our initin. tors in science, just as was another people to he the teachers of Hie holy religion.
The actual origin of Greek arohitecture is baried in impenetrahle ohscurity. If the huilding called the Treasnry of Atreus, or the Tomh of Agamemnon, was really of that period, it would distinetly prove that what we now know as Grecian architecure was unknown to the beroes iu the "Iliad," inasmuch as overits entrance remainealittle picce of highly-decorative columnar work, hearing no resemhlance to the suhsequent architecture of Greece, and going far to prove that theee early inhahitanta of Greece had a etyle of hnilding which did not evince a timher bnt a stone original. Of theoe early etructures, including the Cyclopean walls of the Pelasgian cities, Mr. Freeman eloqnently remarlss,-"These awful remains of the world's yonth stand hefore us as the relics of murecorded days, of the din times of poetic legend, enveloped, as they were, in religious mystery for ages hefore a line of what we deem ancient history was penned. The historians and philosophers of the days of Pericles knew $n 0$ more of the authors of these gigantic fragments than onrselves; all that eurrived, even to them, were the shadows of fallen reatness, the feehle echoes of a voice long since hished in death. Our ancients had to explore the remains of these far earlier days hy the s ourgint glimmerings of legend and tradition
youth is spent among the immortal lays, whose iving substanco is called up by eveu the picmonuments, as we would fain helieve, of the days of Achilles and the Atridio, and tho old time before them, -to us every rugred stome sooms rocal with eome old heroic lesend Fiom way may havo ole home leg. Lach gate rayed to man the thousand ships of Argos nd to wait npon their ens had conei hel cus han conerged her twofold throne and ceptre.
The dificulty is to explain how, in a country where a dietinctly stone architecture (stone no only in fact, but in idea) had for ages exieted, it ould he suddevly changed for an arohitectrar vidently hased upon a timher ideal. Were it aly the Cyclopian walls of the old citics whioh remained, the perploxity would he loes. Such Vitruviss that the Firia; yot we gather from Vitruvius that the Etruscan tomples had a construction founded upon timber. It is that little scrap of aetual columar architecture at yycene which defies explanation, hat which is hought to pornt to an Assyrian origival.
The Dorians, however, were a difforent (how different is not known) and an invading race. It ray he that ther former seat had heen in a specially timher country, and their former architecture actually of wood; and that, on migratiog into a stone country, they translated heir architecturo into its prevaining material
The intrinsic marvel, however, is their powe to invest in art, eo homely in its origin and so simple in its character, with such ouhlimity of aepect and ench refined heauty of detail. But why should we wonder at this? Look for moment at their figure-sculpture, even in it first archaic simplicity, and we need not wonder at what such mer' could do. But, ob ! look at again, after the desolating Pereian had hoon driven from thoir shores, when the ahotered institutions of Greece had been re estahliohed and her ruined temples restored, when nationa glory, self-gratulation, and thatifues ba given a new and generous impulse to ha feeling of the great mind and eopl of every and 800 then what art they produced (you know it right well in the Eigin-room at (you know maseum), and then you need not wouder at any other miracles of art that they performed
I am not going to drar you through all the changes in ancient architecture: you will see for yourselves how the majesty of the Doric Tomplo wae eucceeded hy the greater refinement and olegance of the Tonic, and the richness of the Corinthian, though their developments were not exclusive of one another, like those of Medierval art, hat onmnlative and practised side hy side.
confese that, so far as capitals are concerned I agree with Mr. Ruskin in thinking the first and The last each more reasonahle than the second The moulded capital and the foliated capital are things of all time. Tho voluted capital was an accidental introduction from the East, and has o permancut meaning, wonderfnl though it he The special features, however, for artistic stady in Grecian architecture, of whatever order are the exquisitenese of its proportions, the purity of its linee, the refinement of ite mould. ings and enrichments, and the euperhmman instinct it ovincee for delicacy and almost spirituality in the refinement and perfection of every line; hut ahovo all these is the manner in which it welcomes, indeed presses, into its ser-vice,-or, rather, devotes itsolf to the service of,-the all-glorious scnlpture of which it was at once the dutiful handmaid and the loving mis. ress. Nor need we douht that it treated the painter's art one whit leas lovingly.
As a etyle, the sentiment of Greek architec. ture may he said to he a quiet, calm solidity and repose, free from all queation as to its stahility hecause it admits of no pressare hat what ie vertical. Thie quality, however, it shares with the Egyptian ; hut the Greek unitee with it the most studied symmetry of proportion the grcatest purity of line, the most refined detail, and the nohlest allied art
Whon the Greek orders were adopted hy tho comans,-a most natural alliance, seeing that ho Greeks huilt within a comparatively short distance from Rome on the south, and that the Etruscans in the north horrowed Greek decorative art, we find that they mited with it an element in itsolf discordant with the simple static principle which gave such calm dignity to he Greek. It is, as I have heard, a saying among the Moslom huilders in India, that the arong the Moslom" hailders in India, that the
pushing outward. Thus, purely trabeated architecture sleeps in safety, while arcuated architeo. ture never ceases to exert force. Tho one is a static, the other a dynamio style,-only becom. ing static when its abutments are of nndoubted sufficiency. Thus, repose belonga of a right to one, but bas to he purposely secured in the other
We know next to nothing of the carly archi. tecture of the Romans. Recent cxcavations show the walls of the time of the kings to have heen pretty much like those of Etrnscan cities; and it is prohahlo that, like tho Etruscans, thcy of construction. When they superadded to their own architecture (whatever it was) that of Greece, the latter hecame in many cascs an artistic veli, concealing more or hess tistion ; and even where the artistic effect was purely trabeated, we find arches used behind it to aid the apparent construction. The two systems were thus used together, and side In purely engineering works, the arch became hoidly predominant. In purely architeotaral works, it was often wholly concealed; while, in works of an intermediate kind, the two were nsed together, naturally and with perfect free. dom. Nor were these, or the purely arcuatcd structures, open to the objoction of presinting was such as to defy all suspicion of want of streegth.
It is true that the Romans, from a want of that delicacy of taste and eye which characterised the Greeks, failed to treat their details with the same refinement, though this was not always the case; but, in spite of this delect, the coman hilities of Classic architecture, rendering hilities of Classic architecture, rendering and demand, whether of matcrial or of construc and demand, whether of material or of construc
tion, and piving it a cosmopolitan cbaractor suited to a people which had conquercd the world, and which, if itself a race of iron, united worder ite world wide sway the brass the silver, and the gold of the older ralers of mankind.
Of Egyptian architecture we have little but o vast tombs and colossal temples ; of Assyrian and Persian structures much the samo may ho soid. Of Greek we have little but the tomples, and a few public works of a monnmental cha. racter, whe have works of overy possible description, meeting every don must have existed during older periods, but were prohably on an inferior scale and of ephemeral construction; hat those of nome wero marked and permanen been land ted say that the who'e rauge on perfectly known to us; and, so far as wo are can be called complete. As timo wont on, we find the arch, the vault,
and the dome asserting, ever more and and the dome asserting, ever more and Christian church followed this on in the most marked manner; and, when the seat of empire was removed to a new, an Eastern and Cluristian metropolis, where or Pagan art existed, this change woald app.
to havo goas on with yet increased rapidity. o havo goue on with yet increased rapidity. We have of late years hecome hetter acquainted covery of the ancient cities of northern Syria and their illustration by the Count de Voguié, which show us what the late Roman and early Byzantine buildings of every class were, on a scale suited to prorincial towns, though influonced by tho local tendency to megalithic construction which pervades the old architectures of Syria. I have not time to dwell upon these most instruchive remains, which, beginning in Pagan and going on into Christian times, culninate in the vast and splendia dome ereoted over the pillar of St. Simon Stylites. I, however, commend De Vogué's work to your attention.
In my lecture on the Dome, I have said almost as much on Byzantine architecture as is perhaps veedful for the purpose of this rapid sketch. I may add, however, that it was a purely or almost purely arcated style, though yet more pre-eminently a domed style, and most of all a purely Christian style; that it rejoiced in onrfree decoration, in painting and mosaic, and in marhle incrustation and inlay, though, from
religious scruples, it disconraged sculpture. It delighted in every form of Oriental splevdour, and the representation which its mosaics afford
us of its secular hnildings, when in full perfec. tion, shows us that, thongh splendid solemnity characterised its churches, gaiety was a marked element in its more ordinary architecture. It is
true that the gradual decay of the Empire caused rue that the gradual decay of the Empire caused a decliue in the artistic quality of its huildings yet we mnst admit its architecture to he one of
the holdest and most original of developments; the holdest and most original of developments; and we owe to Byzantium a heary deht of gratitude for having kept alight the lamp of art during tho long and dreary ages when Western Europe was trampled down hy barbarian hordos,
its arts destroyed, and its civilisation well-nigh forgotten.
It was from this still glimmering lamp that Charlemagne nobly attenipted, though almost in vain, to rekindle that of the Western Empire. It was from the same that the three first Othos made a second and more succossful effort; it was from thence that the revived art was further aided at the time of the Crusades; and to this source we, in a large degree, owe our modcrn the nufon. Ahe Easteru Empire, which, having performed its work, has now so long been rodden under foot of the Gentiles!
As architectural art recovered itself, after the ages of darknoss, the later works of old Chris fum, and the half-living architecture of the day in Rome itself, formed together the groundwork of the rerival. This architecture was all mainly arcuated; and the increased difficulty of ob. aining and transporting large blocks of stone the reviving style. Wo know the style which thens rose in Italy. I do not helieve myself that muck of this is so old as the time of the Lomhard kingg, but that it was in a much greater degree Italy work of the Othos,-emperors atending tho same style from the south of the Alps, acros into Germany, and onwards almost to the Baltic cannot, in this short lecture, follow up the beg fou to do so for yourselves, and at the same time to make fonrselves acgaainted with the contemporary architectnre of Franco, in which subiect to many variations, the same feeling will be found to prevail.
I hase, in my last lecture, mentioned the ntroduction of parely Byzantine architecture at ence, as especially illustrated in St. Mark secular huildings). I mentioned also its trans ference, a pparently by the Venetians, into th south-west of France, whero and whenoe it exercised a very decided influcnce on the sul sequent architectnre, and I have, in one of my early lectures shown the extension of tha influence at in date,-in the form of arohi tecturel senlptare, -into the north of France end thence into our own country. I will her add that peral thouch not exactly similar, radar of Byantine inflence pervade the Romanosque Bycrmany, whose rolers were Montant constant commance will the eastern ka. pire,-an the grath por woren fabric metal.work, jewelry, and illuminations from the East into the West
From such united influences, added to and aiding the earnest strivings after refined and improved art, arose the Romanesque architecture of the eleventh and twelfth centuries, hecoming at length a perfectly original, consistent, and artistic develop ment of arcuated architectnre.
I have, in my previous lectures, gone much niso detail in recording and explaining the history of the development of this Romanesque into the subsequent pointed.arch style. It in, perhaps, mockery to refer you back to lecture which pernaps no not allow me to do more, and should they he puhlished, you may perhaps think it vorth your while to refer to them.
As the Byzantine was tho Christian architec. ture of the East, so was the Pointed style the culminating Christian architecture of our own group of nations in the Wost; and, while the
former had the disadrantage of heing developed during ages of gradually.declining civilisation, the young and vigorons shoot which grew from it in the West had the immense advantage of developing itself during the vigorous upstriving or a new and hetler civissation
To onrselves it is incomparahly more interest. ing, inasmnch as it woome the architecture par excellence of our own and immediately neigh. bouring countries. It grew op in this country
with our institutions; it is of the same age with
our constitution and our system of laws, and in our constitution and our system on lesiastical polity. It
many respects with our eccle adapted itself to our climate, our materials, and our scenery. In this style aro the monuments of onr kings and of our forefathers; and, above all, in its original and identical temples do we Well Well, then, may wo say,-in common with eack nation of Western Europe, - that thi
And well may we glory in this assertion, fon And well may we glory in this assertion, for look at the monuments of that atyle! Thave not heen stinting or cold-hearted in my eulogy of the architecture of ancient Groece an rome so I may call you to witness that I am no narrow or one.sided if I give way to a generous nthnsiasm now I come to speak of that whic e may proudly call our own.
The a rchitccture which produced our glorious cathedrals and abbeys; our churches of every scale, from those down to that of the humblest hamlet ; which prodnced the colleges of out niversities, with their noble chapels and halls; which produced the stately nunicipal buildings of tho great manufacturing cities of Medinoval Europe; with every form of structure needed, for whatever purpose; and nnited truo and appropriate art with every form of building, from the lumblest to the most stately. An architecture, too, which decorated its edifices with such a form of art as our ancient painted glass ; and which carried on ils infuenoes oves metal.work, jewelry, paiated dccorations, and very collateral art in the samc spirit of exquisite and original taste, may well claim to stand side hy side with the most glorious production 3 of antiquity ; but to ourselves, as the inhahitants of the countries where it prevailed, and the descendants of the artists who produced it, it has proe-eminent claims to our most loving and enthusiastic admiration; while the more closely, constantly, and carefully we stucy its remains, the more ontirely shall we be convinced that our love and admiration cannot cxceed what is due to its intrinsio excellencies.
This architecture, though a lineal descendant of those of the old world, was, whon in the fulness of its development, so absolutely diverse from them that they can in no way be compared. hy likeness, hat only hy coutrariety. It was an ahsolutely new phase of art, hearing no kind of resemhlance to its early progenitors. Where their characteristics were horizontahity of line, directly downward pressure, a we may almost say an eternal sleep, those of this now creation wear on upward goaring, an apparent inversion of gravitation into a striving Lowards heaven, and a vivacions wakefulness in every feature. Constructively, instead of tho mere support of dcad weight, its principle is the systematic halancing of an infinity of diagoaal pressnres; yet this, though a constructive fact, is not an artistic characteristic, for in its more annihilated, and converted into upward striving, so that the archivolt, the Alying buttress, and the ribs of the vaulted roofs, seem rather the medium of upward than of downward pressure. In elogance and expressiveness of detail, no provious style had surpassed it; in endless variety of imagination or in spirituality of sentiment none had ever approacheral ar he greatest marvel thate architecturam aric qualities with a gravity and aolemnity in the temple, a stern solidity in the castle, an asceticism in the monastery, a quiet, retiring sentiment in the seat of toning a, serfulncss in its civic and domestic structrres, and a deeply touching oxpresion in its sopal mal monuments which no style cond possihly go beyond, and none have yet equalled.
It presented, too, during its course a beautiful series of variations. Its earliest phase stern and precise, with details rivalling the Greek in the studiousness of their contour; in its seoond, lighter and less severe; in its third, branching ofi into an infinity of charming lines, suggestive almost of vegetahle growth; and in its last, while returbing rather to carlier rigidity, indulging in new dovelopments scarcely foreshadowed hy its earlier forms. Thus, at Glastonhnry, at Salishary, in the choir of Westminster, 1 King's Colloge and of Henry VII. we have a series of works, all helonging to the same genaral type of architeoture, dicersities th
Nor was it alone in ite successive periods that
varied phases were produced. Each conntry in
which it flourished had its own series of national and provincial types. Thus, in France, in England, in Germany, in Spain, and in Italy, and even in far.off Scandinavia, we find it adopting ever.changeful forms, though all belonging to the same great stem. longing to the same great stem
Mr. Fergusson, though an Mr. Fergusson, though an opponent of its "Not even the great Pharaonic era in Egypt, the age of Pricles in Greece, nor the great period age of Pricles in Greece, nor the great period
of tho Roman empire, will hear comparison with the thirteenth centnry in Europe, whether we look to the extent of the huildings executed,
their wonderful variety and constructive ele. their wonderful variety and constructive ele. them, or the power of poetry and lofty religions
feeling that is expressed in every feature and in feeling that is express
And again, while speaking of its sculpture, which is not usually considered as its strongest point, he remarks:-"The great cathedrals of Chartres and Pheims even now retain some 5,000 figures scattered about or gronped together in various parts, beginning with the history of the creation of the world and all the wondrous
iacidents of the first chapter of Genesis, and incidents of the first chapter of Genesis, and then continuing the history through the whole
of the Old Testament. In these sonlptures the story of the redemption of mankind is told, as get forth in the New, with a distinctness and at the same time with an earnestness almost im. possihle to surpass. On the other hand, ranges
of statnes of kings of France and other popnlar potentates, carry on the thread of profane history to the period of the erection of the cathedral
itself. Besides theso, we have, interspersed with them, the whole system of moral philosophy, represented with an appropriate symbol, and the reward or punishment its invariahle accompani. ment. In other parts are shown all the arts of peace, every process of hushandry in its appro. peace, every process of hushandry in its appro.
priate season, and each manufacture or handi. craft in all its principal forms. Over all these are seen the heavenly hosts, with saints, angels, and archangels. All this is so harmoniously contrived, and so heautifully expressed, that it
hecomes ia question even now whether the hecomes a question even now whether the
sculpture of these cathedrals does not excel the architecture."
Noble and exquisite, however, as it* was, it at length ran its course; and, by sorne nncon.
trollable movement of the hman mind, it gave trollable movement of the hnman mind, it gave
way to what the world had, till then, never witnessed-a resuscitated style. I will not attempt to philosophise on this new phenomenon in art. It seems to have originated in a douhle cause; firstly, the very natural pride felt hy the Italians in the antique monuments secondly, in the appreciation of these antique monuments which was engendered and fostered by the revived love of classical literatnre. It is not difficult to nnderstand how this tended to the revival in Italy of old Roman art; and, once revived there, the centre of ecclesias.
tical and, in a great degree, of literary influence. tical and, in a great degree, of literary influence; the centre, too, of the revival of painting in its highest form, it need not be wondered that it spread itself as a fashion into more northern taken root. However this may be, the fact is undoubted, that from this time forward original took its place.

My predecessor, Mr. Smirke, in one of his lectures, gave a highly interesting description of the noble enthusiasm which inspired the early architects of the Renaissance in Italy; and the Medioval styles were less deeply rooted where classical traditions had never been extinct and where the reminiscences of ancient Rome were a suhject of national exultation. The revival of the nohle literature of their mighty to prompt a wish to revire their arts ; and I a to prompt a wish to revire their arts; and I an taneons and irresistible movement, wholly un connected with any premeditated plan

Anyhow, whether for good or for ill, the re vival was a great and potent fact; and its pesults have now lasted an long as the whole and have extended their sway to all parts of the Slobe where European infuence is felt; nor can its opponents deny that, on its native soil espe cinlly, its productions were often of the most masterly description and exquisite heauty enriched as they are by decorative painting

Which has never been excelled; by sculptnre of which antiqne artists would not have been ashamed; and by other arts of proportionate merit. In other lands, it has produced works of which no one would venture to dispute the merit; and, though a borrowed style, it has developed anew many marked chronological and national varieties, and has produced, as we havo seen in my last lecture, works and types scarcely even foreshadowed hy its antiqne originals.

Nevertheless, in the opinion at least of many it had, hy the close of the last century or early in the present, so far run its course, at least in this country, as to have lost its old artistic pewer. Art had become enfeebled, while art and the decay of there prominently into view and the decay of the one was promoted hy the distraction of thonght occasioned by the other.
The revived knowledge of the architecture of Greece rndely disturbed the vernacular style derived from Rome, so that by abont the year 1830 the old state of things seemed almost hope. lessly damaged; and every architect, instead of working on the traditions handed down to him hy his predecessors, seemed to do just what was right in his own eyes, though with a special rage for not very practicahle reproductions of Greek coupled with a conviction that Roman and its derivatives were little short of harharons.
All the traditions of the past appeared to be broken up. Onr every.day arohitecture, as ex and conted ordinary houses, had hecome mean things have since greatly mended, it has heen from a purely eclectic and not in the least degree from a traditional point of view; while the untutored honse.builder, left to himself, even now disports himself in reminiscences of these first decades of our century-the halcyon days of Gower.street and Tavistock.place.
It was jnst at this strange junctnre that, by some occult influence, the public mind was then with admiration and love-the long.neg. lected architecture of onr own country and our own race (a group of kindred races). At first this was with no intention or thought of revival it was only interest, admiration, and love Writers on this subject, whether friendly o hostil, affect to systematise the movement; hut it was wholly nosystematic. It arose from the inmost feelings of the heart, and in no degree Irom premeditation or plan.
It is now the fashion to speak contemptuonsly of revivals; and truly they do seem strange and inconsistent after following the more natural his. tory of art from the dawn of civilisation to the
Renaissance. Yet I cannot bnt arree with Mr Renaissance. Yet I cannot bnt agree with Mr
Smirke that the Classic revival was, in the land at least, of its rise, a natural, spontaneous, and nnpremeditated movement of the human mind, That the Gothio Renaissance was so too, I know, for it was my own happy lot to he a humble agent in it, and I am old enough to have watched it, I may say practically, if not literally, from its commencement.
People talk of Horace Walpole, of Sir Walter Scott, or of any one else they like, as the early do not know howit bat, for myself, I know that my love for Gothio rchitecture was absolutely spontaneous, and that I had no kind of incentive for following up its study other than the delight I took in it, before I knew a word about other architecture, or was acqnainted even with the pnblished works on our own, and that without a thought of its stady over becoming practically useful to me. 1 am ings, followed as it was subsequently hy a desire to imitate their architecture, was as spontaneous and as irresistible a movement of the haman mind as those which had originated either Classic or Mediasval art, or that which, two thonsand cars after its first rise, had led to the revival of yet been so all-pervading as those of the Cise not Renaissance, yet they have been very the Classic and away the most marked feature in modern and away the most marked feature in modera architectural history, inasmuch as it, almost alone, has resulted from ardent and genuine
enthusiasm, and from the inmost recesses of the enthusi

As one of the survivors from among the more active of the earlier agents in this great move. ment, I may claim a right to dilate a little on my reminiscences of it.
In writing respecting it, nearly ninteen years ago, when my memories were more fresh, I made he following remarks :-
I described the movement as "heing the de-
elopment of a new and vigorous style upon the fonndation of the glorious architecture of our own country and of our own forefathers, in the place of one at once alien to our race and our religion."
"This," I went on to say, "I need hardly tell ou is a mighty and most anduous undertakingso mighty indeed, and so arduous, that I douht whether, if it had been in the first instance fully ppreciated, any body of men conld have been found with sufficient daring to set about it. The atrength, however, of the movement lies in the fact that it was not deliherate nor preconcerted, hut was the involnntary working out of a deeplyseated mental revolution. It was not that a body of men deliberately banded themselves together to carry out and propagate particnlar astes or opinions; such would have been but a feeble, or at best an ephemeral and merely local movement; it was rather that a number of per. sons, in different neighhourhoods and oountries, and withont any concert, had been led hy their own unbiassed and unguided instincts to an ap. preciation of the long-neglected beauties of our wa indigenous architeoture." This (with other feelings), I proceeded to say, "had led them first to study, then to imitate, and ultimately to at. tempt the revival of the style which had thns involuntarily approved itself to their natural perceptions of what is right and beautiful.
There is here no conspiraoy, no organised movement, no preconccrted effort. Not one of those engraged in it ever thought of its being a movement at all; few of them know in the first instance that others were affected by the same feelings with themselves, nor perhaps were con. scious of any external causes which had given cise to such sentiments in themselves. Yet all, from some internal impulse, scem severally to have heen impelled in one and the same direc. tion; and, having at a later period discovered the concurrence of their feelings, thoir efforts ave since assumed the form of a united move. ment, though originating from tho individual and unbiassed feeling of persons wholly un. known to each other.
In the same paper I spoke in the following terms of the greatest of the early promoters, and in fact the great hero and Coryphans of our revival, and of the societies which were formed throughout the country for the furthering of the study of our ancient architeoture. "Ahout the time I am referring to, an immense impulse was given to the reformation of architecture by the earlier publications of Pugin. His 'Contrasts,' published in 1836," - an architectural jeu d'esprit, placing side hy bide in somewhat' bur. lesqued contrast, selections from Medimval and modern works, " while it enraged the majority of our architects, exoited others most strongly to press forward toward better things. His tecture, step in adranoe. It grappled at once with all the fallacies whioh had corrupted modern archi. tecture, and estahlished a code of rules, founded upon common sense, utility, and truth; while his 'Apology', whioh came out a little later, showed the necessity of falling hack upon our national style, and its ready applicability to bvery requirement of our day. In the mean. was truly astonishing. Not only were the advances he made in the reviral of Pointed architecture most rapid, showing genius in every architecture most rapid, showing genius in every achievements,-he actaally revived by his own achievements,-he actaally revived by his own
personal exertions nearly every one of its suh. personal exertions nearly every one of its suh. ture, stained glass, decorative painting, metal. work, stained glass, decorative painting, metal. and silver work, enamelling, emhroidery, woven textures, paperhangings, encaustic tiles, the manufacture of furnitnre, and even of ordinaty household crockery-ware, all felt the impress of his hand and of his genins.
Shortly after Pugin hecame publicly known, the same course began to he vigorously taken up
in our own Chnrch. The societies formed in connexion with both Universities were followed up by others in all parts of the conntry. That vigorous periodical, the Ecclesiologist
did immense service in exposing the desecration and degradation to which our old chnrches were suhjected, and in promnlgating correct principles of ecclesiastical architecture and arrange. ment.
A noble feeling for the snbject rapidly spread itself among all classes. The zeal for chnrch huilding and restoration greatly ontran the in-
maltiplied on all hands, and an entirely new state of things carle about."
Two more decades have nearly passed over our revival since I thns chronicled its progress; and, if it has had (as has heen my own painful experience) reverses to deplore, it has had a continued series of snccesses to rejoice over; and if its early ardour has at all sohered down, this has served, for the most part, to give steadiness and maturity to its efforts; and ayyhow, it now possesses architects and other artists of distin. guished talent to carry on the work, and, while it has long held ahsolute possession of the ecclesiastical architecturo of tho day, it now
adds to this many of the most important of our adds to this many
secular huildings
ins access has been indeed enormous; yet its fallures and drawbacks have heen in proportion who have followed jt up with an earnest and generous enthnsiasm, for it has unhappily been practically followed up hy a mixed multitude who view it as a fashion of the day, hy which pro. fessional practice is to he ohtained; hat are de. void of all ardour and love for what they are ongaged upon. The conseqnence is that, while and other huidin propion of new chwom comparison with those of the Middle Ames; we have a swarm of others-mere cold-hlooded, heartless, trayesties-a disgraco to our age, and a disfigurement to our towns; but, worse still, while a minority (as I fear) of our ancient churches have heen repaired or restored hy men Who treat them with a loving care, and with portion are left to the tender mercies of the mere pretenders,-often not architects at all,-mwo pretenders,-often not architects at all,-who treasures committed to thoir unworthy hands; and who have done and are doing their hest to rohour country of one of its richest inheritances -its genaine and indigenous architecture.
Nor is this the only drawhack to the Gothic vival
It suffors also from a degree of capriciousness eren among its abler and more art-loving fol lowers, who, jealous, perhaps, or contemptous of others, refnse to co-operate in any steady purpose, and who, morbidly keen in their percep. tions of beauty, are apt to follow momentary
fancios - now farouring ono type, and now fancies - now farouring ono type, and now another-and, perhaps, reviviag styles little allied to their parpose, as if the ohject of the age were to revive just for revival's sake, rather hau to gath er in these oxtraneous beauties to enrich the resonrces and to widen the capahilities of one received style. This tendency seems to threaten the nonle movemon with premature decay, though I do trust that there remain earnestness and steadiness of heart enongh to avert this danger, and to gride these artistic trivings into a healthy channel, and canse them o add new life to the general movement.
It is, in trath, as yet unsettled whether we
should concentrate our revival on one phase of the old style, or whether, as the ancients did with their orders, we should use them ad libitum. The one seems somewhat artificial, the other somewhat too eclectic; hut solvitur ambulando, and perhaps this discnrsivencss I have been regretting may promote that solution.
I have found, as I went on, that the schemo of my lecture was much too extensive for the timo at my command. I had intended to say something of the application of the sister arts to architecture, as well as on the subordinate and allied arts. I mast omit this; nor do I much regret it, as I trust I shall be suoceeded hy mon better qualified to deal with the subject.
I will close my lecture,-itself the last of my long hat disjected series,-with a few words of advice to architectural students.
First of all, I wonld repeat what I once heard from that accomplished artist who formerly graced this chair,-Professor Cockerell,-that the first rule for success in art is the same which the wise man laid down with reference to morals, Keep thy heart with all diligence, for out of it the student is purely and earnestly devoted, with generous ardour and enthusiasm, to his work, you may unke pretty sure of his success; but, if he follows it up in a cold, perfunctory spirit. from a sense of duty or self-interest rather than of earnest love; whatever may be his success in a merely professional point of view, he will never do any good in a higher and an artistic sense. The first thing, then, to encourage is a loving zeal for he art you have chosen.
The next airn is self-culture, and that of atwo-
fold kind : the cultivation at once of an intimate knowledge of the form of art which you select as your groundwork, and of a personal artistic power to work in it.
In these days of miscellaneoas distraction, it is difficult to give advice as to the choice of groundwork of study. Having no actnal style helonging to our age, you ranst choose between the two Renaissances, -the Classic and the Gothic,-as best you may
It was my own lot, arising from the period at which I commenced, to have heon trained in one (at its deadest period), and to have, from the love of it, trained myself in the other; but I will suppose, for simplicity's sake, a single and simple choice. Nor is it for me to dictate, were it in What I have to sar is that, yonr choice being made, youl must study with all diligence, and with the most assiduons attention, the hest and purest oxamples of the style you have chosen making yourself thoroughly acquainted with it from its very root to its minutest details, and using every endeavour to catch the true arkistio spirit of the stylo in its hest phases
If Classic architecture (whether antique or as revived) he your aim, you are at some diendvantage from not haring within yonr reach its most authentic examples. Books and the works of our own hest architeots must supply the need till youd.

If Gothic architecturo is that on which your lovivg choice has fallen, you are more happily ported art, hut that of your own country; you have not to tra7el widely from home to ; you jts nohlest productions, for they are at your very doors; you liare not to go throngh a long couxse of book-study, treating of examples of art which you have no means of seeing and studying with yonr own eyes; but, though not rejecting books, yon may go from them to the originals and jndge of them for yourselves. Even if kept pretty closely in London or its vicinity, you do not want opportunity for the
study from its noblest productions of study from its noblest productions of the art of your choice. The glorious fane of st. Peter at Westminster snpplies an inexhanstinle fand for study, while the histy med he Chapel in the Tower, the Temple Church, St. Chapel in the Tower, the cemple Church, st. Saviour's, Wostminster Hall, Crosby and Eltham Halls, aud other minor examples ; while an honr's run will take you to the stupendous ohurch of Fingland's pretomartyr, which equals its sister abhey as a fund of artistic study and information. The advice, then, I givo to the student of Medioval art is, lose no opportunity of studying and carefully sketching from old examples, wherever they may he found; nor, I
would add, should you neglect the aid afforded would add, should you neglect the aid afforden
hy collections of ohjects of stady such as our hy collections of ohjects of stady such as our
museams contain; but study not only the mere fart, but the spirit and sentiment of the style you are learning.
This, however, alone is hut the skeleton. You must clothe it with mnscles, and breathe into it the breath of life, by the direct onltare of your own individual artistic powers. Make yourselves artists,--not so much artists in the lower sense of being able to make your ideas look well on paper, as in the incomparahly more important sense of making yonr works roally nohle works of art in reality and in execution. It is of very little importance to any hut yourselves whether your drawibgs look well; but it is of infinite importance that your works, when carried out, sloonld be really worthy of admiration, and should produce the impression on the mind which they ought to produce.
Make yourselves, then, artists, not alone in also of of mere architecturo itself, but in respec also of its allied arts; in respect of architectural respect of figure sculpture and of figure-painting forms suited to architecture ; of painted glass mosaic work, metal work, and all the subordinat ise. I do not say that $y 0 n$ shonld really prac selves in them yourselves, but by fraini to direct guide, and check those whom you employ, or who are made gour art colleagues.
Fow, indeed, of us have as yet come np to the standard,-very few have even approached it. I address yon as the rising generation of archipredecessors having the means of doing. Let your new generation go far heyomd its predecessor. It i generation go far hey he content predh stand
of our own degenerate age. To "mcasure onr selves by ourselves, and to compare ourselves with ourselves," is never the part of wisdom. Set, rather, hefore yourselvos a standard of glorious days of old; and, remembering always the right noble Catcenca Patrum, whose successors you will he, make it your first ondeavour to raise yourselves to a level worthy of your parentage, and then to press ardently onwards,
if Providence shall perinit, to evcr new and if Providence shall

## COAGREGATIONAK CHURCH CAMBRIDGE.

This building, which was hegun in the antumn of 1872 , will have something of novelty in certain points of its arrangement. Two chief ohjects were aimed at in the design,--first, to put the whole of the congregation within sight and hearing of the service; and secondly, to do this withont having recourse to thin columns and slight construction. It was desired, on the one hand, to avoid cast-iron and lath-and-plaster, and, on the other hand, to a void the inconvenience which generally results from a series of massive nave piers. Many forms of plan on which hoth these objects are attainahle are sugrested by Post-Roman and Medixal works; bat from the confined nature of the site, some of the most promising of them proved to be inapplicahle. To ohtain the reqnisite numher of sittings, it was necessary to cover the whole of the ground, with the exception of two pas sages lleft for access to the schools, -and the general form of the nave thus presented itself as a plain ohlong, ahout 60 ft . by 51 ft . internally. This space has been divided into a central and two side aisles, by one large clustered pier on each side, which supports two wide arches and these again carry a lofty clearstory. The nave opens at one end by an arch of 20 ft . span
into the tower gallery, and at the other into the tower gallery, and at the other end into
a polygonal apse, occupied by the choir. The nave pier on the sido next the pulpit is so placed as to produce no obstruction whatever, the with the ontends ; the opposite one interfere with the view from abont half a dozen sittings, or less than 1 per cent, of the whole
7 ft .6 in . wide, and about 130 ft . high. The interior of the tower is occnpied below hy a large entrance-porch, and ahove hy the end gallery before named, which is lighted by a wheel-window some 40 ft . from the ground. The windows throughont are highly placed, and the greater part of the light will come from above. The gallery stairoase, with its enclosing turret, carried np in the angle hetween the tower and the end of the south aisle, will he noticoahle extervally. It has an octagozal roof of stone, like that of the tower, the latter having the peculiarity,-which was less common when it was designed than it has recently become,-of an octagonal beliry-stage, with a pier above each angle of the square from which it springs. In the treatment of these piers, however, and in some other particulars, the type kept in view was rather that of Coutances and St. Lo, thanthat of St. Alhin, Angers, which has lately appeared in snch numerous adaptations. The total length of the intorior, including apse and gallery, is abont 100 ft ., and 700 sittinger of con. venient size will be provided. The inside of the church is lined with ashlar, with occasional bands of red Wolverhampton stone. The roof and ceiling are of Baltic timber. The apse ceiling is of pitch-pine, with panels intended to receive coloured decoration. The ceiling of the navo, as will appear from tho view, is pointed, but of a low pitch. This form was adopted, partly for its acoustic merits, and partly to secure an equable temperature, hy getting a thick stratum of air between the roof and the ceiling. It also makes it possihle to dispense with a visible cross-tie in the trusses. The nave arches are kept square on the soffits, and are panelled.a mode of treatment which, if nncommon, is not unprecedented, even in the hest Mediæval work. In the present case, it seemed likely to assist in giving scale to an interior which, from the fewness of its main dirisions, was in danger f being doficient in that verf important element of effect, -the danger, in fact, of most interiors which ventnre either on wide naves or wide haps. Externally the walls are of Yorksire par pint, with dressiggs of Ancaster stone. The joiners' work is of pitch-pine. The work being executed hy Mr. Horsman, of Wolver hampton, nuder a contract for 8,0002 . The architect is Mr. James Cubitt, of London.

congregational church, trumpington street, cambridge.-Mar. James Cumitr, Architect

## OUR PUBLIC MONUMENTS.

Tre few public monuments which London can hoast of are rendered appareutly fewer in conee quarsely scattered, and it is difficult to are so sparsely scattered, and it is difficult to get a
comprehereive glanoe at them. A city devoted almost exclusively to husinees, and not, like Parie, to westhetic coneideratione, it offers hut rare opportunities for the display of purely rare opportunities for the display of purely
artistic decoratione. It hoasts many magnificent artistic decoratione. builings, whero art has lent its aid to gild the utilitarian requirements of the place; and edifices such as Westminster Abbey, St. Paul'e Cathedral, the Houses of Parliament, Somereet House, and the Royal Palacee, not to epeak of the hotele and private commercial buildings, are an ornament to auy city. But in their
case the primary ohject of their erection case the primary ohject of their erection
wae their uso, and art las heen called in, was their uso, and art has heen called in,
only ae a eccondary consideration, to beautify and embellish. They are to be met with all parts of tho metropolis, hat monumente etruetures, withont pany prinativo or memorial are few and far any primary useful object, bo overlooked among such giante. And to are from their nature, and from the diffi cultics attendant on tbeir design, naturally low to increase. It ie my intention to try give a short sketch of the most pro. minent or most important of theoe witnessee to a nation'e glory, a nation's tasto, and a aation'e pride in her moot worthy sons. rials "indoors," such ae those in the memoof Parliament and Weetminster Hall, Husee in Westmineter Ahbey and St. Paul's Cathedral confining myeelf to a few of the purely "puhlic" monuments ont of doore.
One of the most life-like and spirited etatuee in London is "Marochetti's coloeeal " Richar Cœur de Lion," erected in Palace-yard, hetween
the Houee of Lords and Westminster Ahhey The Houer of Lords and Westminster Ahhey. The natural pooe of the finely-modelled horee, admirahly execated, and the effect is very are It seems a pity that so good a epecimen of art ehould not have heen placed in a more populoue thoroughfare.
Equestrian statnee are equally difficult of oxecution and effective in appearance. They admit of moro varied treatment than simple their rendering of the different attitndea of horse and ite rider

The "Iron Duke" seeme to have heen very hadly treated by the sculptors and monument. makers. Have they any special grudge againe him that they determined to make him a laughing-stock when they placed the "little man with the big cooked-hat" on the top of the triumphal arch on Conetitution-hill? Placed in such a prominent position, - the taste of which is in itself very questionable,--he ehould at any respectful ohservation. Placed where worthy of has to he "looked up to," he is really "looked down upon" as an example of etatuary. Viewed from except a horse surmounted by a field-marshal': hat and an ontstretched arm and hand holding roll of plans.
A second representation of the Dake of Wellington, which gracee the open epace in
front of the Royal Exchange, is less ambition and though somewhat tamely modelled is it les, and though somewhat tamely modelled, is less
objectionahle, and is a very fair specimen of objectionahle, and ie a very fair specimen of
mediocre art. In the actual decign and mediocre art. In the actual deeign and workmanship of the Hyde Park-corner statue, tbere may he very little to counplain of, hut in euch works the general effect must he studied according to the pooition they are to occupy. A will instance tho Crimean memorial in Whaterlo I Nill instance tho Crimean memorial in Waterloo. nounted by a figure of Britannia, or Victory, or ome equally indefinite female, holding out rreaths of laurel; on the front of the lower one Wo or three admirahly-exeouted figuree of the tuards, in their winter nuiform, standing in an ttitude of mourning; at the back, a trophy of fune and colours. The female figure, perched p aloft, has her hair banging down her back in wo pigtails; ber arms are outstretched in oppoite directione, each hand holding two rings. Ire they hoops in which ehe invitee all the righhouring birade to come and reet, or are they uoite? Happy thought! they are intended for iurel-wreathe! At a very short distance he ack, with a stiff heary mantle hanging straight
down, looks perfectly flat, and reminds me of a Weymouth, where the once saw and admired at is skill or cash or artist, having expended decorating the fron, or hoth, in developing and decorating the front part of his Majeety's body, as actually rounded the back off without an Thet at modelling it at all!

## " Unweppt, unhonour'd, and unsuag."

For years it was a fertile eonroe of speculation on the part of antiquaries to discover its author I heliere pereon whom it was meant to ropresent. equestrian simlar uncertainty exists as to the equestrian etatue of a jamnty gentleman in wig looke down whitehall fror thickset horse, which looke down Whitehall from Charing-cross. Is he Stuart or a Guelph
And who is the military man who, hat in hand salutee the paesers-by from Pall-mall to Cock opur-street? He deservee to have a name; for though the flowing tail of his horse depends from a very thiu root, his tout ensemble ie worthy a retura ealute.
But it is impoeeible to specify a tenth of the smaller etatues sprinkled over London. Each equare boasts of one or more, but their escel. lence is never very remarkahle, and they are f thorongh fares
"The Monument" ie a tribute of homage to no man's memory; hnt as marking a great epoch notice here hisy of London, it deserves a short colve here. 202 ft . in height, it is an imposing distance. Thie ie one of the a considerahle styles of memorial structure and primitive most simple, it is still one of tho most oft the In this case the fluted column is mosl efective. The effect is spoiled hy the cag really very fine. be erected at the top of it, to pe that has bad to evicides from throwing the to prevent would-he long. The spherical mamselvee down beadis meant to represent $a$ hall of fire. To my eyes it always presents the appearance of a brazen plum-pudpra he thapeasauce of a brazen Nelson's Column Monument, io $176 \frac{1}{3} \mathrm{ft}$. high, height to the Corinthian pillar, surmounted by - an elegant hero in who bour it whe a statue of the he Monument and the "Duke of Ynike" Column," it hae no interior etaircase, and so ie not spoiled by the hideous cage with whioh these hier two are disfigured. It has been eugrested that a cage ehould be placed there too, to enclose Neleon himself, who, some critics aseert, should not be piaced at suoh an elevation, ae they say it is a cruel idea to pnt a man on the top of a column with no means of descent. With the good effect produced hy the column ae a whole, partionlarly since Landeeer's grand colossal hous avo taken their place at the hase, the ohjection thatite, and surely the taste is not so bad as in a wbioh placed an elderly civilian gentleman a chair with his head nncovered, without even all all the changes of this changeable climate of ours, as is done in tho case of the Peabody statme at the back of the Royal Exchangc. The the cruel to plaoe the great benefactigy, hut it is unsheltered position. In rain or sunshine, I feel equally inclined to "coper his defenceless head" witl an umhrella.
The Duke of York is eatisfied to survey London from a height of 124 ft : : though, the column really so mucb hier grouna, its sum mit is not Another patent sicide that of honument. the appearance of the-preventer renders hideous which particular the comian. I do not know ents : whether it is he of york the figure repreWhether it is he of whom it is said,"The Duke of York march"d up the hill with 20,000 men; down again." The authoritie
erratic flash of lightning ehonld throw down the image which they have eet up on high, and have caken the precaution to provide a lightning the head of H.R.H. 1 single
Nelson'e columns teaches Duke of York's and Nelson'e columns teaches the practical lesson such a beight that their feat never be placed at The Dulo of You' firlut lost to niew by time and Yorks figure is bronzo, blackened bented and smoke, and rain; and being represeated in a large, lowing cloak, the outline of hie limbs cannot be perceived, and the effect is an unbroken mase of black cloak, surmounted by a hall for a head. Neleon, on the contrary, is or stone, which is cleaned inotead of blackened hy and linate from folds of drapery, his features Whinhe are all easily dietinguiehahle.
lhile we are in the neighhourhood of Waterloo. place, we will go and eee two nnobtrusive little ne Sir Colin memory of two great men. ife-size helow eits Britang on a neat grainet the Britit lion, and holding out a epray of laurel. Query: if the laurels are intended for Sil. Colio, ho to get them without an undiguified descent from hie elevated position?
The other is in memory of tho great Arctic explorer, Franklin, and his brave companions. hronze bas-relief on the pedestal represents asenal of the disco paseage in the midst of the montaine of ice force a passage had vainly endeavoured to excellent statuc, a littlo larger than life-eize, of Franklin.

One of the most ambitions, most utilitrian most novel, and moot unsightly of memorial Grections in London is the drinking-fountain in mory of the-street, Weatminster, huilt in me is tvill the great work in which such men as lahoured oo zealously,--the emancipation of the aree. This production has been profanely anted the "gigantic extinguieher." It certainly thenil useful househol decor, considerably enlarged, and gorgeously decorated, eupported on six emall pillars, he tween which there is just room for the thirs travelier to pase, and under which he may be forerea from the outer rain or sun while h annee the inner mati.
A word on drinking-fountaine. Why ehonld they he closed for the "winter monthg," as is generally the case? People become thirsty houyh to a leeser degree in the wintor as well as in the summer, and if, during that seaeon, the way-worn hydropath approaches one of the tructures, boping to quench his thiret ho is confronted by a board which telle him that tbe quickening streame are cloeed till the let of Karch
The granite column erected in Brond Sancuary, Westminster, to the memory of the Westminster scholars who fell in the Crimean war is a pretty little etructure, and from its position honour that awaits them in the propers of the ance of the duties of manhoot in peper performI cannot help roferring to the striking vien that is to he obtcined near here from the end of The Itreet, looking eaet.
t. Margaret'e oh th argatin Henry VII.'s chapel, with Scholars' colug hnidnge, and the Westminster ery effective " The National corner of architecture.'
and a lonr one too lom eption of S , eption of sur Gilhert scott's fertule hrain, it is ears hefore the memory of him who, twenty pot, here its inauguration, had, near the same pasien rod andes oh induetrial and artistic produce. Its ornate Gothic style contrasts finely contimestern ponderousness of the Albert Hall, contiguous.
A large sum wae expended in the work, hit he return is worth the inveetment. If we had rinng else we have here a proof that the most rnate examples of the Italian echool can be re producea, or so modine ae to exist withont incongruity, aven nyder this inclement eiky of ours Rome e Colisenm needed no protecting ron scenes enacted in its arena were open to skyabove. The visitora to London's inita of the great model require a shelter from pitious Jupiter Pluvius and the rude hlasts of
ducing a Coliseum, with a roof which would not spoil its outward appearance. Still bolder was the determination to defy the raing, smoky atmosphere with a highly-decoratcd structure, such as the Albert Memorial, with its marble sculptnre, its gilded pinnacles, its tesselated pavement, its inlaid work, its precious stones, and a thousand valuable minute adornmeuts and enricliments, which, as a whole, produce an effect of elegance, and jet solidity,-in a word, of complete success,-which it would be difficult to rival anywhere.
With such a triumph of art, it is surely too soon to say that English teste is dcad, that English art is a thing of the past, - a name. With all the fanlts of the many mediocre pro. ductions of monumental skill, we have some examples deserving of praise. It is good to feel would have been most keenly felt, is one of the most snccessful of which the country can boast.
$\qquad$ C. E. Fryer.

## heating by gas

Is a paper by Dr. John Barber on the Heating of Public Buildings, read lately at the Royal Institute of British Architects, the writer said, We live in an age of improvementa, and none of us will deny the fact that much happeus now as a matter of course which was deemed impossible years ago. Economy, or at any rate convenience more convenient to swallow a teamspoonful of medicine than to drink the bucketful of wash from which it is ooncentrated. Why should we not apply the samo principle in warming ou preferonce to burning a ton of coal? and why taking all things into consideration, should such a corrse be nneconomical ?
During a late professional visit to Denmark, became intimately acquainted with a Dane who had gone much further than any eulightened Englishman I have jet met with iu the treatment and use of gas for other purposes beyond lighting. I visited bis house several timcs be fore being aware it was heated by gas; and having bad my attention drawn to the subject of stoves (hcated with gas) by Mr. Scddon, only short time before, my mind was naturally ripe and ready to take in any ideas which might im.
prove my knowledge on those points. I looked prove my knowledge on those points. I looked round his room on one ocobing one, althongh the the stove line, and not finding one, althongh the day was very coll and friend took a panel ont how it was heated. Hy hien took a panel ou of his window bottra, and burners, witb perfectly blue flame, playing on a firebrick lump, with no pipe to take the products of gas combustion away. The heat from combustion and the heat absorbed and imparted by the firebrick was all allowed to enter the room, and although I was in the room for hours $I$ did not feel any choky or atuffy sensation. Here was a realisation of the very idea which bad pre. seated itself to Mr. Seddon and myself, and which I was proposing to hring to a successful issue. Now I must tell yon that the gas there was the hest I have ever seen, though no dearer than London gas ( 6 s . per thonsand, if used for lighting purposes, or 4s. 3d. per thousand, if used for cooking and heating). I ought also to tell you that my friend oooked entirely hy gas, his roasting fire simply consisting of a 16 -inch drainpipe, with a cross har at top, inside which the meat was hung, the hottom of pot resting on a tripod, which also carried a circle of gas jets; a sort of ventilated dish-cover crowned the whole. The consequence was that carpets and furniture were not spoiled by dust and cinders from fire; chips were saved, as also space for holding them, and labour in not having coals to carry to and cinders from the fire; and the first cost of the stoves, if we may call hem so, was much loss than the elaborate iron ones generally used in the Scandinavian kingdoms.
Now I feel I may he speaking to sceptics, bnt I fully believe it is possible so to burn gas, even tondon cas, that the heat arising from oombustion shall he neither unpleasant nor injurious; and if so, I contend that we may most reasonably expect to find economy in ite adoption for warm. ing houses in lien of the use of coal; for this reason-that in coal all the products of combustion itself go up the chimney, whereas in gas,
treated as $\frac{1}{1}$ propose, they would serve to heat the room; and in cousidering the economy of gas as a hoating apparatus for houses, we must credit it with the saving in wear and tear of car pets, chips, coal-cellar aud chip-house, chimney
breasts and chimney tops, hearth-rugs, fenders, fire-irons, and register grates, the marble chimney piece and its uecessary accompaniments, chimney ornaments, mirrors, \&c. In fact, it thoroughly re-models a room, and renders much expensive furniture unnecessary; and it is my firm opinion that if due nad proper consideration be paid to all those points, the cconomy will be in favour of the essence of coal-that is, gas, -and not coal itself. I am not a chemist or a gas engineer myself, and must leave the actual treatment as to admisture of air to ensure the Bunsen flame and other matters to them to work out; bat think I have just held out to them sufficien promise of success. With the foregoing remark fresh in your memory, yon will most readily conceive how easy and convenient it would be to apply a gas-stove nuder the window-cills of church or public building, as previously suggested when treating of hot-water apparatus; how easy to regulate the temporature of the building, giving more heat or less, as required, by turning a tap; in fact, the more I thiuk of it, the more advantages turn up in its favour over and above any other eystem of heating apparatus, What is wanted is a fair and impartial trial, and this may be accomplished withont yery much trouble or expense. Try one room in a house first, and have a meter specially for the gas. stove; carefnlly register on a thermometer the temperature inside and outside the room for week; then repeat the operation, use coal in the firegrate, maintain the same temperature inside for the same length of time, weighing the coal, and this will show the actual cost in consump tion,-the other items of economy, as enumerate above, require no test. After arriving by experiment at the proper form of gas-jets to adopt, in order completely to destroy any pernicious effect rising from the combustion of cas, it becomes no easy matter to arrange the form of stove to nhich the burning gas jots are to transmit their heat. I would recommend the following plan eax. carthenware oylinder placed horizontally, the ontside of which is ridged to as great an extent as possible (similar to the gills of a gitl.stove), to as possibe (bimaricial area of the heated surncrease the where circulating air is in contare Upon the top of this cylinder or terra-cotta gill Upoa the top or . filled with water and place the whole apparatu flled with water, and place the whe appansl in a recess under the willowing out these sug. recommeade obtain,- first of all, the great advan tage of the form of gill-stove for transmitting heat to circulating air; secoudly, we obtria the gdyantage of softening the heated atmosphere by evaporation of water; thirdly, we have com. pulsory induction of air by placing the atove in a recess sligbtly larger than itself; then the advantage of introduciag the warm air into the building in a couvenient, unconspicuons position where its effect is more likely to he general Again, we have no dirt, ashes, coals, or othe lumber to provide for or to remore; *ad, lastly we succeed in obtsining a heating power which can be increased or diminished at will, to 8 ant the requirements of the day or the tastes of the puhlic within the bailding. There is yet the crowning advantage of all to ennmerate, whioh is the securing of the whole products of comhustion and radiation, as well as the heat caused hy simple circulation. This last advantage, mnst confess, is not yet certainly secured; hut why should it not be? Nothing need now be pnt down as impossihle to ohtain, for every day hrings us fresh evidence to prove that what were impossibilities once are now admitted as simple facts.

NEW CHAPEL, UPPER HOLLOWAY
Tre new chapel which has heen erected at the corner of Archway-road and St. John's-road, Upper Holloway, occupies a commanding posiRomanesque. The gronnd was of a somewbat peculiar form, and made the planning of a commodious structure difficult. The building committe thefore invited several architects to mittee designs, and those suhmitted hy $\mathrm{Mr}^{2}$ Joha Johnson, of Moorgate-street, were chosen os most slititahle
The west frout has a fight of steps leading to a landing the whole width of the huilding. There are three circular-headed entrance-doors, with

- That frequent marrer of architectural effect in
Churches, the heating apparatus chimney, is
remored
colnmns, with carved capitals, and euriched arch soffits; above is a large light window, with rose. window in head, the spandrels being carved with Romanesque foliage. To this front there are two tmrrets, containing gallery stairs, with pointed omical roofs of blue Bath stoue, with iron finials, two height from ground to top of finials bein 85 ft . The chapel is in plan a Latin cross the total length east aud west being 110 ft ., and the total width across at transepts $9 \mathrm{a}^{5} \mathrm{ft}$. The width of the nave is 44 ft . The ceilings are in blue and white, with blue and red lines and ornaments. The timbers of the roof are light brown the walls and dado being Pompeian buff and brown, with panels of bloe with red and bluc enrichments the plaster cornices and monlding being left white. The commnnion is rathe ichly treated by arcading and diapers. The rchitect prepared the designs, and bimbelf exe uted a portion of the decrative work. The basement has a large school-room for 200 boys, 200 girls, and 150 infants; also four class rooms, ach 18 ft . by 16 ft . The walls are of brick rith light yellow facing, with bands of dark Malm paviore, and dressings of Bath stoue, \&c. The rvarming is by hot air and hot water, exe cuted by Mr. Waller, of Fish-street.hill. The as-fittings are by Mr. Glasse, High-street, Islington. The foreman of the works was $\mathbf{M r}$ Taylor, and the geveral contractors were Messr Dove Brothers, bnilding is about $5,600 \mathrm{l}$., but the total cost, in cluding land and all charges, is about $7,200 t$.

PROVERBS FOR GENERAL CIRCULATION A colossal social superstructure on bad foundations will inevitably be sapped by the tide of progress.
England forgots that she owes her wealth and ower to abont half $\Omega$ dozen great intellects.
A nation in cont dangre which whom its success is due, for it will reglect those intellects which could alone maintain its position.
Englishmeu batten upou the profits derived from ideas, and are for ever ridiculing the peoples who fight for one
Let your great intellects be either robbed o dishonoured, and ere long your nation will be despoiled and dishonoured.
A nation's art will be its monument : by that the future will determine its aspirations or abasement.
People would soon be astonished at results if they would all work together for the common good.
What is the use of having senses if meu are not trained to nse them properly?
Yield and feign timidity if you wish to find ont whether a coward means to attack you.
No one need stand in fear of brave men, but the wrong-doer; it is only cowards who stab in the back.
Flippancy in art, literature, and social life is a had habit; the longer encouraged the more difficult to eradicate.
Do not let a natiou's hardiness decay, but do not make it too hardy lest it prove fool-hardy.
Establish a temperate zoue of thought and policy round the globe, and the social world will he safe.
One of the first resnlts of educational equality is, that all men hecome amhitious ; the final one, that they all desire to he happy.

## the amoant of the work

A REVIEW OF WORKS ILLUSXRATED IN THE "BUILDER."

## liverrool architectural association.

At a recent meeting of this Society, Mr. W. H. Picton read the followiug paper :

Pressed by our secretary for a paper, I venture to offer a fow thoughts which have passed through my miad on a review of tho architecture of the past year, as illustrated in tbe Builder. Valuable and interesting as the architecture of past ages must ever he to the student, that of the present day possesses a yot leener interest to the architect engaged in the active practice of his art, and striving earnestly and often with difficulty to fit it to the oxacting requirements of the ago
and to hreathe a spirit of heauty over new forms and to hreathe a spirit of heauts over new forms view, the works of our hrother practitioners aro
of inestimable value, affording suggestions to that cad which are in vain looked for among older cxamplos. I shall endeavour in tho present paper, to the hest of my ahility, to point out in a
spirit of friendly criticism the merits and defects of tbe buildings I have selected, and to note
anything of value which we can extract from anythi
them.
My first oxample is the Roman Catholic Chwreh
Mary of the Angels, Dublin, of which Mr. J. J. M'Carthy is the arehitect. It was buitt for
the religious order of the Capnchius, and is a the religious order of the Capuchins, and is a
single-span church. The plan consists of a nave th lateral chapels and apsidal chancel with ge sacristies. Its widtb, clear of the main als, is 45 ft ., and including the chapels 65 ft . total length is 160 ft , and interior hoight
ft . The view given shows the west and sonth fronts. The wholo design exhibits a uuity of purposo which gives it much porver of effect.
Both fronts have the samo leading features, although worked out in a different way. The archcs from buttress to buttress, and the pro.
iecting features hetween the latter, are the same both, but the projections in one case form the entrance porches, and in tho other the side
The side chapels are, I consider admirably managed, with a gahle occurring in ery otloer bay, the alternate hays having straight caves, and being covered with stone buttresses may appear down to the ground line, care is taken that they are not covered up by the projecting chapels, but sufficient left of them to
satisfy tho eye that they are still there. The main openings into the church, elovated above the chapels, becomo large clearstory windows, and the effect of their elegant triplet ligbts in the interior must be exceedingly fine. The largo
pinnacles at the angles of the west front are pinnacies at the angles of the west front are
worthy of note, whero the corner, formed by the wortliy of note, whero the corner, formed by the
wo hittresses, is made into a nicbo with a hafted pedestal and statue. The spiro has quite hongh rich in the general effect appears a little prercrowded. The building as a wholo displayn, [ think, a considerable amount of originality, and me arrangemont of the ckapels is one which n the shape of narrow aisles, simply to gain rehos rehes
Chapel of St. Parli's College, Stony Stratford. The plan of this building consists of an atrium, vesteru gable of the ohapel, a choir proper for he members of the collego, and a dcep sacra-
inm terminating apsidally. The total length is 114 ft . by 35 ft . across the cboir. In the interior, orickwork is ased for architectural features, Window-tracery, cornices, wall.sbafts, piers, \&c.
are all carried out in hrick. Stone is employed n the shape of sculptured corbels and capitals, and the introduction of some shafts of grey
granite adds to the effect. The ceiling is arched ind ribbed, with tie-beams and shafted king. posts. Thero are no windows in tho apso, hut it pas a liggh roof-light, from a spirelet, which rises affords light for the froscoes intended to adorn he walls, showing scenes from the lifo of St. Panl, the patron saint of the oollege. The floor oing preserved for the sacrarium. Tho choir is itted up with panelled and carved seats, in oak anopy over the npper seats, and canprojecting or the warden and chaplains. The building is ho work of Messrs. Goldie \& Child, and the $n$ the estimation of tbe architect during the last enty years as hriok. From being so muc 1
despised, that it was everywhere, if possible, it bas come to line the interiors of public huild. ings and cburches, preferred in many cases to stone, and huilt in along with polished marble and granite. The great attention now bestowed on the manufacture of hricks and terrawcotta will explain this fact to some extent ; hut the chief reason lies, I think, in the development of a taste for colour, which has heen growing ever a taste for colour, which has acen growing ever this development there was undouhtedly a dis. position to overdo the thing, and to paint over the surfaces to too great an extent ; but now : more refined method provaile, and the colour is not laid on as bomething oxtraneous, but comes as it were, from within, heing in the coloured stone and bricks employed in the construction of the building. This method of colouring pre vails in this church. The general effect of the interior is exceedingly striking, but, to my mind, is marred by the tie-heams. With the nohle open roofs left to us as examples by our ancestors, it is, I think, a retrograde step to return to the horizontal tic-beam, which has ahsolutely nothing to recommend it. In this instance the ties look liko shores placed acrose the church, to keep the acruss the arohes of tho roof are harsll and ucly in the cxtreme. The high roof light over the chancel is a noteworthy feature of the design. pletelyy churches the costly decoration is comwhich pours insequeuce of the hlinding light dows, and to attempt to see tho paintings on tho walls is as impossible as to seo the landscape around yon with the bun iu your eyes. An opening in the roof, on tho contrary, affords a steady light throughont the day, and is out of the reach of the eye.
One of the grandest now chnrches illustrated this year is the Roman Cathalic Church of Our of Mesars, Joseph A. Finsom \& Sor The church has been erected by the Duke of Norfolk church Builder states that the first work of throwing in concrete for the foundation was began took placo in 1809, but a berions interruption tions down to the solid chalk rook, which in some instances was as much os 50 ft below the surface of the ground. Tbo churoh is cruciform in plan, having nave and aisles to the west of the transept, and choir and chapels to the in the place of porch, and at the soutb-west angle is an octagonal haptistery projecting from the line of sonth wall. Besides the entranco under the lower thero 18 a great western portal, and in each transept a smaller door of admission to the chnrch. At the south-west anglo'aro the sacris.
ties lying between, and communicating with hoth the church ween, and communicating with hoth churoh at the west end is the large organ-loft raised bigh on stone-groined vaulting, and with carved stone parapet front. The whole of the church, the choir, the three chapels, tho hap. stone ribs and realk filling. The dimensions of the church are as follow:-Ex. ternal length, from east to west, 200 ft . ; interior, arrobs the transopt, 96 ft ; width of nave and choir, 33 ft . ; width of nave aisles, 12 ft . ; lencth of choir, 52 ft . ; height to ridge of nave groining 72 ft. Tbo flêche or sanctus-hell turret rises to a height of 1.10 ft . The spire is 270 ft . to the apex. From the above description, it will be seen tbat tbe chnrch is of first-rate dimenaions and equal to many of our smaller cathedrals. It is a matter for congratulation that in this imporant work the architect has adhered to the native style of the country. Tho charch is a specimen shown in the viow before ne for which a pre cedent could not be found in ancient examples in England. The different parts of the structure hlend well together, and form a nohle group, cul. minating in the towor which rises holdly np at one eud, and lifts far aloft its beaven.pointing mnsterly. At the foot, solidity is given to the angles by filling up to a considerablo height the corners which would otherwise be formed hy the promend, the tower is kor two stages ahove the pierced only by bold arched popenincs and smal windows. Above these is a bend of and smali with crocketed canopies, which is on arcading in accord with thopies, which is on a lerel, and indows wh, the clearstory, with los row of windows and halustrading. Above come the
belfry windows with rich tracery beads and
crocketed canopies, forming a central feature to arrest the eye as it travels upward to tbe spire. The springing of the spire is gracefully pathored with pinnaeles and crocketed cano-
pieh, while breaking up the rigid spire ines, all assist in directing the eye upwards to the apex. The introduction of the projecting cbapel in the angle, between the north transept and choir, has a very happy effect in varying the formal lines of the building and giving freedom o the design. Two flying buttresses extend across this chapel, aud answer to thoso in the nave. The east side of the north transept exhibits another variety of treatment, having only a row of small windows, light being scarcely equired, as it is amply prosided for in the large arth window. Another oridence of careful hought is shown in the thickening out of the wall of the choir, hy which great stability is given o the structure, and the unpleasantly weak effect avoided which is of ton noticed in foreign cathedrals, where the buttresses stand out from apparently thin walls, like so many scaffold. poles. Sculptured atatuary is freely introduced over the wholo exterior, and no less than thirtythreo statucs of the saints may be counted on ous llustration of tbe church, all in niches with hadowy recesse to whole composition the finibing gace to this fine architectural work. I now pass on to an example of modern honse-huilding.
Wukehurst Susser -This house
ormed is the wor It stands the work of Mr. E. M. Barry, R.A. vands in a commanding position, among aried scenery. The style of the architectnre Loire The bonse is huilt of stome Loire. The bouse is huilt of stone, and the roofs re tile aud ly . The hall and ence are aced internally with stone. From the hall a cipal staircase, which is of onk, with steps 7 ft . cipal staircase, which is of oak, witb steps 7 ft .
in width. From the nature of the site, a basement story was considered advisahlo, and on this floor are placed the servants' officos. The loor over these offices is of fireproof constrnction, ing composed or concrete with mrought iron jists. Ne kitchen and scullery are placed outide the main house, and Davo nothing over them. hey are situated near to the back or lnggage entrance and stairs. There is a lift for lnggage and coals in the back staircase. All the external the two walls. Tho floors are douhle-framed the two walls. Tho floors are douhle-framed with main beams of wrought iron. The firat fonr contains the hest bedrooms, with private sitting-rooms and drawing-rooms arranged in suites, having separate bath-rooms and privato closets. There are other family bedrooms, and also servants ${ }^{2}$ rooms, on the second floor, the partitions and framing of the roof being mado douhle with special precautions against cold and noise. All the best hedrooms and sitting-rooms have baloonies commanding a fine viow, and each window towards the south and west is fitted with wooden "jalousies," or shutter blinds, which Then not in use fold hack into the thickness of the walls, thas avoiding disfignrement to tbe rchitecture. Tho turret staircase near the entrance is for tho use of the servants, who can thus attend to the front door without passing trough the bonse. The cost of the hoдso was hout 35,000l. Tbo ground plan of this nohle mansion is spacious and well arranged, each epartment being kept distinct, and compact together. Beginning from the left of the plan as it stande, first comes the family portion, with morning-room, sobool-room, and bibrary, alk entering from a common corridor; next the grind hall, 40 ft . long, and drawing-room, whiote nay be called the state apartmonts. In the cutre of the hall is the entrance-lobby, and at he angles are circular turrets, which project boldly out, and form a prominent feature in the design, ono of them containing stairs from the asement for tbe servants, as before mentioned The drawing-room has a projecting loggia, with a flight of steps leading on to a terrace. The aits are on a scale rarely met with in a modern ouse. On the first landing is an octacenal hay, ith lofty window the full height of the build

Leading from the staircaso is the dining oom, with large semicircular bay at one side ok on to the terrace, and sidehoard recoss ith effice adjoched is serving-room, and with office adjoining. Beyond is the hilliard. rom, lighted by a large bow window at tho side nd windows at one end. Behind it is the smoke from. The oxternal elcration of the entrance front is exceedingly striking and effective. Jike
the greatest amonnt of ornament on tbe centro of his composition, here the handsome pro jecting portal, the angle turrets, the balustrades and dormers, givo hecoming dignity to the mosh the work is more domestic in character, with reater amonnt of wall space, and quieter in greater amount of wather alther ee woll marbed put by the lofty octnoronal apse s woll marked out by the front and fow which projects out from the front, and forms distinct feature of the design, The part of the bouse over the luggage entrance is carried up iree stories as pailo tower. is broken ap throughout, and witbout any strain ing after irregularity, a delightful pioturesquo ness and rarie ty of a ine contrasts are tween the rich central portion and the plain and massive turrets at the angles; again, betwee broad surfaces of the parilion tower. Ohserve broad suriaces or the pariion tower. Ohserve also tbe difference in treatment shown in the lank levation botwee the sido of thorning room and the side of the library, On the upper stage of this front also an excelleat effect is obtained hy splaying off the corners ahove the morning-room, ohtained, adding thereby greatly to the pleasing character of the design. The dormer windows, with their varied shapes and sizes breaking up the large masses of the roofs, lond an additional charm to the whole. Mr. E. M. Barry has, I consider, dono good service in adoptang this very picturesque style, which has all the charm of our English Elizahothan, with much more refinement of foeling. In these cays of Dltra-Gothicism, it is ine cashion among some to undervalue tbese hyhrid styles which lio between the Gothio and Classic. The stadent, in endeavouring as hest he may to hring forth some now creation for his art, is more likely to produce it ont of the chaos which enstes npon the breaking op of an old and effete phase of art than from the "faultily fanltless, icily regular" order of a style at its hest. There is froshnoss of feeling, and a daring originality in these styles both in England and the Continent, which afford mach food for thonght and room for development. In the conrse of the transition from Norman to Early English, and in that from the last phose of the expiring Gothic to the Renaissance, mony hold experiments have heen attempted and now ideas thrown out, which have never to this day heen followed up. I bolieve thore is a wide field still open here for the earnest architectural student, and in this feld the old French chatcanx exhibit many featur
and details well worthy of attentive study.*

THE NEW JUNIOR ARMY AND NAVY CLUB BUILDINGS.
Tere huildings at the corner of Pall Mall and Waterloo-place, formerly the offices of the European 'Assurance Company, having been purchased hy the Junior Army and Navy Clah, are af the cluh. With the excention of taking down of the cluh. With the exception of taking down the main externa whall rebnilt, and then the premises are heing wholly rebnilt, and when the finished, the hnilding externally will present an finished, the hniding externally will present an entirely altered appearance. In the Pall Mall frontage a new porch has boen erected, nearly
11 ft . in width to the ontside of the pilasters and piers, the doorway being 7 ft , wide. The porch has a hold and massive cornice, above which is a halustrade surmounted hy vases. The huilding has heen raised hy tbe addition of another story to both the Pail wall ava Waterloo frontages. The now buiding will have a flat lead roof. large hay windows, 14 ft. in width to the outside of he piers, have of the Waterloo-place frontage. gronnd-loor of the Waterloo-place frontage. recoustructed, nearly tho whole of the interior walls having been removed, and the former offioes in the hailding on the soveral floors have been thrown into large and spacions apartments, supported rom the hasement chiefly hy iron colnmns and girders. The hasement contains the kitchens, servants hall, housekeeper's room, steward's room, sculeries, and the whole of the cooking apparatus, together with extensive cellarage for wines. On the ground-loor is au entrance ball, together with a morning-room, reading room, and smoking-room for the members of the cluh. The front portion of the first floor of both the Waterloo-place and Pall Mall frontages has
heen converted into a spacious dining-room, its dimensions heing 93 ft . in length by 23 ft . in width, whilst at the rear of this foor are a members of the clab. The secoud foor contains two hilliard-rooms, card-room, committee-room lavatories, \&c., and the billiard-rooms are rentilated with Benham's patent rentilator. The third floor containg tbo secretary's office and the cluh bed rooms, and the fourth floor the servants' dormitories; tbelast-named story heing reached by a separate stairease, carried up from the hasement to the top of the building. The several apartments in the interior, more especially the dininc-rooms and billiard-rooms, will be elaborately decorated in colours and cold on a ground work consisting of Parian cement, the ceilings (whicb are in panels) and cornices being en. iched.
The architect is Mr. Rowland Plumhe, and the builders are Messrs. Baker \& Son. Mr. Richards is foreman of the works in charge. The estimated cost of the new building is upwards of 10,0007 .

IHE NEW CORN EXOBANGE BUILDINGS, SHEFFIELD

Try working plans for this strncture have heen provisionaly approved by the Duke of Corfolk. Messrs. M. E. Hadficld \& Son are tbe architects. The following is a short desoription.

Tho new Exchange will be erceted apon the present hay and straw market, having its principal fagado to the now street ( 60 ft . wide), which is ahout to be laid out in the line of Sheaf-street and Exchange-street, forming a direct communication from the Manchester, Sheffeld, and Lincolnshire, to the Midland Rail way stations.
In the centre of tho principal front (to the street lirst mentioned, which is 227 ft . long) will he the principal entrance to the Exchange, through a portal within a tower, which will rise with the féche or spire to a height of upwards of 200 ft . A continuons arcade extends on each side and along the return wings, each comparthasement occupied as a sale-shop, baring a throngh the tower, a hroad flight of steps gives accoss to the vestihule, which is 37 ft .6 in . long, of stone. 6 in . wide, with a vauled g onites of offices occapying tbe chamher or upper floors of the front building, and adjoining are settling rooms for the corn factors.
The Corn Exchange Hall will be 110 ft . long, 55 ft . wide ( 10 ft . longer, and 5 ft . wider than new Catlers' Hall), and 60 ft . high to the arched ceiling. It will he lighted by windows on the northeeast and west sides, and hy ¿ glass cownter round the room, in which there will he space for 100 desks or stands. The floor will he of oak, Adjoining the room at the north-east corner will he an entrance-porch, giving access to lavatories, court, and also communicating with the implement glazed roof, and being specially adapted for the sale of agricaltural produce in bulk, implemeuts, \&c. The space under the entire huilding will he cellared, eacb cellar being lighted, and having spacious avenues of access.
At the north. west angle of the huilding, ac commodation is proposed to be made for a restaurant or refreshment.rooms.

The design is Gothic, of the fifteentb century and English detail. The materials will he brick and stone. The tenders for the work are to he procnred forthwit
When the new Exchange is completed, the prosent bnilding will he cleared away, and the site appropriated for enlarging the wholesale fruit and vegotahle market. The hay and straw markets will be removed to the present cattlemarket, and the latter will he provided with ac market, and the latter will he provided with acchester, Sheffield, and Lincolnshire Railway.

## THE ARCHITECT

To truly build, it needs an arohitect,
With thinking powers ahove the average man, To make his art througll handicraft reflect The ends foreshadow'd in design and plan. The parpose sought, the work should realise; Proportion show, and use in every part Vot only streagth and beauty to the eyes But time-preserving energy and art.

BUILDINGS FOR THE DUBLTN WHISKY DISTILLERY COMPANY,
A NEW distillery bas beeu founded in Duhlia hy a few gentlemon forming a linited company, The site selected for the building is in the pic. turesque district of North Richmond, npon the triangular tract of land to the west of Bally. hongh Bridge, bounded by the river Tolka on tbe south, and Richmond-road, Fairriew, on the north. Here the company have secured several acres, and havo bosides facilitios for aoquiring still more, when the increasing demand for theil product shall call npon them to extend their works and stores. Possession of the site was only obtained on the lst of July; the building operations were commenced towards the end of that month ; and now the immense edifice, with all its complicated machinery, is almost complete, and tbe directors confidently expeot to commence huilding were furnished by Mr. Chas. Geoghegan architect, under whose direction the works have heen carried on by Messrs. T. Wardrop \& Son. He has embodied in them every rao. dern improvement, and provided so effectnally for every requirement of the manufacture, that the distillery will certainly bo unsurpassed, if equalled, by any other in the kingdom, The principal entrance is on Richmond-road, towards which the huilding presents a continuous front. age of ahout 370 It., with a square projecting wing at the extreme west, crowned hy a higb Mansard roof. A massive gateway admits to the interior under an arcbway penetrating the mair building, and leading to a large courtyard in the rear. To the right of this passage is seen the boiler-honse, where three immense hoilers ar fixed on heds of solid masonry; two of these wil he used for tbe supply of hot water, and the third for the generation of steam. In the centr of the courtyard rises the great smoke-stack which will be a conspionous feature of the land scape, heing visihle for many miles. It is 130 ft high, of octaronal form, ahont 12 ft . Equare a the base, and gradually diminishing to the top In the engine-house, 2 lofty apartment, measur ince 30 ft he 14 ft , is placed a horizontal steam engine, sapplied hy Messrs. Coates, of Belfast It is of 25 nominal horse-power, and possesse a governing apparatus on a new principle o extreme delicacy. Two mash.kieves, of 26 ft diameter each, will receive the malt for tb preparatory process of the distillation. Th preparatory process of tha conse contains eirht large oools capah? of containing 1,400 harrols each; and in anotbe department long ranges of immense store-vats sapported on iron pillars and framowork, stan ready to receive the finished product. At th extreme west end are the malt mills and stores seven stories high, provided with the newest an most improved apparatus for screening the malt elevators for raising it to the different floors, an endless screws hy which it will be carried to thw discharging loft above the mash-kieves. It still-house contains four large copper stills, wit
all their appartenances. On the top of th all their appartenances.

On the top of th building are two immenso tanks, from whic water, derived from a well 60 ft . deep, will snpplicd to all the departments. The floors a]
through the edifice are supported by iron girder through the
and pillars.

## INIGO JONES'S WATER.GATE

Ar the last meeting of the British Archeolo gical Association, on March 26 th, Mr. George $\mathbf{R}$ Wright read a short paper, illastrated hy a print after a drawing hy Mollar, on the sadly-neglocte and ruinous condition of the "York Stairs, once the water-gate of the famous York House the residence, amongst other illustrions people of Lord Bacon, and afterwards of the two pro fligate Dukes of Buckingham; the latter o whom, regaining his father's river-sido propert; throngh marriage with the daughter and heires of Lord Fairfax, to whom the Parliament had presented it, enlarged and embelished the man sion, under the direction and designs of Inig Jones, who huilt the water -gate in question, ant which is the only portion of tho once princel dwelling now remaining, to mark the site of it former grandeur. The object of the paper wa to urge apon the Association the necessity o calling upon the Metropolitan Board of Work to rescue the gate from its present melancholy and forlorn condition, and to utilise it io thi place where it now stands, half-huried in th accumulated mud and rubhish of somo 200 years bs making it a footway entrance to the ner
strect, and thus givo the puhlio another and most interesting approaeh to the Embankment itsolf, A ruanimous vote of the meeting in. dorsed the recommendations of Mr. Wright, and it was agreed to solicit the council at their next sitting to bring the matter at onco before the Metropolitan Board of Works, and so ondeavoux morials from further degradation and decay.

## THE COAL QUESTION.

The Cool Committee havo been at work. At one of the last sittings of the committee, Mr . Bakcr, inspector of the Staffordshire and Worcestershire district, gave evidence showing the amount of cool raised in tho mines, and stated that tho men worked about four days and a balf per woek. Their wages had heen raised 10 per cent., and the price of coal 100 per cent. He did not think that prices wore likely to inerease, and one reason for this helief was that the groat demand would canso coal to be worked in many places which had hitherto been unproductive. Mr. Wardell, inspector of mines for Yorkshive, also gave eridenee. The coal. owners met at certain times and fixed prices, but in his opinion the original cause of the high prieo of coal in his district was the prosperity of tho iron trade.
trike in Sonth Wales has been tho great strike in Sonth Wales has been definitively closed, the workmen employed by the Rlymmey Iron Company having returned to work at the roduced rate. The question whether the prof. fered terms should be aceepted was deeided by ballot, and nearly three.fourths of the men voted in the affirmative. All the ironvorks of the distriet are onco more getting into full aetivity.
Where do the Coal. Profits go to?-At a meet. ing held in Manchester, for the purpose of forming a coal-supply association on the matual system, Mr. Tattersall, who was tho chief speaker, entered into calculations to show that, oven at the present high prices of coal, he could ance for the redemption of the purchaso-money for the first two years, at the rate, namely, of 3 s .9 d . per ton on tho increased ontpnt which he expeeted, paying wages at 3s. 6d. per ton, which was 6 d . more than tho eurrent rate, 1s. per ton 3d. for contingeneies, he said he believed he sonld raise eoal to the surface for 88. 6d. per ton. Fhis was said at a meeting of practical miners. Singular Demand by South Stafordishire Col. iers.-At a large mass meeting of the Sonth Staffordshire colliers, held in Dudley, it was odueo coal 5 s . per ton, the men would rest con ont with the present wares, and return to work. The total numher of eolliers affected by the novement is about 12,000 .
Beating Rothschild hollow.-A correspondent of the Manchester Examiner is responsihle for he following:-"The Earl of Dadley has forty ints, each yielding 400 tons of coal daily, thns howing a day's output to he 16,000 tons, whieh, t the lowest pries, 8s., shows a daily profit of $191,400 \mathrm{l}$. But the pit priee for cogine coal only 191,400 . But the pit priee for cngine coal only
als heen 20 s . per ton, and all is not engine coal, 10 he shows a grand total profit of $4,992,000 \%$, uer annum, and a margin left for what is called or annum, and a

## ACCIDENTS.

Fatal Scaffold Accident in Holloway. - Infor. ration has heen forwarded to $\mathrm{Dr}^{2}$. Lankester of he death of a bricklayer from a fractured thigh. th would appear that the deceased was working n a scaffold near 'Tufnell Park, when in turning ound he slipped and foll of the scaffold, a istance of $\mathbf{1 . f t}$.
Scafold Accident at Sheffeld.-An alarming ccident oecurred lately at the offices of the hettield Gas Company, which are boing erccted a that town hy Messrs. Chamhers \& Son, of iishops Monckton. The building on one side as already attained great altitnde, and ou this art a high soaffold gave way, earrying with it a ricklayer and fire labourers to the ground, a
istanee of 60 ft below, The briclistanee of 60 ft . below. The bricklayer had a it a dangerons state. The a labor men were now it a dangerons state. The other men were also Falt of a Store at Greenock.-A three.storied
ato store at the cotton-mills in Greenock now
being eonverted into a sngar.refinery, suddenly fell, through the joists of the upper flat and roof giving way. I wo lahonrers who were at work in the store were severoly injurod hy boing pre. carter was also severely injured by the falling heams. Three other labourers were injnred, though not severely; and the managing partner of the new refinery was cut on the head. The six workmen were, after much diffieulty, extri. cated, and were removed to the infirmary.

## "THE DURABILITY OF IRON ROOFS."

 Sir, -Mr. Redmond's letter on the abovo sub. ject, is one that is worthy of most serious atten tion, not only on account of human life that is endangered, but also on account of railway share holders' poekets that are made to suffer.If flakes of iron, the thickness of a florin, fall from any roof, time after time, it is only a matter of calculation how long that roof will stand. The paint that is nsed is of conrse in. tended to preserve the metal from oxidation, and to outward appearanee it apparently does so; hut what is going on underneath? It is well known that tho oxides and carbonatos of load, from whieh most paints are made, aet ehemically upon iron,-a kind of galvanic action is set $n p$ hetween the two metals and the lead is eating into the very vitals of the iron, on some descriptions hut slowly, on others rapidly What canses this differenoe, I do no not know A paint having no chemical action non metal, should always be used,-one whose base is per fently inmocuons, and the most pure.
J. G. H.
*** It is said that if paint be coated ove satisfied with the iron it has already oxidised, hut will leave it for tho new metal below, so that the iron once rasted and painted will ho gradually eaten throngh or disintegrated hy the oxygen of the rust.

## SCHOOL BOARDS

Leicester.-Tho following is a list of tenders submitted to the Building Committee, for the erection of the new Board Schools, for the site in Slater. street:-Flude, 7,2761.; Firn, 6,380l. Barnett, 6,369l. ; Sharp, 6,345l.; Eagle, 6,320l. Hewett \& Son, 6,277l.; Major, 6,269l. 15s. ; Rat cliffe, 6,220l.; Lewett, 6,130l. ; Winkles, 6,091 l. Saekree, 6,000l.; T. Bland, 5,805l. ; Herbert 5,71.97.; Osborne Brothars, 5,610l.
Carlisle.-Mr. Birkett, architect, heing pre. sent, the plans for the new schools again came on for discussion. It was reported at last meet ing that the Department had reekoned the plans for two of the sehools as calcnlated to accommo. date only 213 eaeh, instead of 250 . Mr. Birkett said he thonght the Department allowed for class. rooms, and could only account for their reekoning by assuming that they bad omitted the oxtra width of 5 ft . over the ordinary, which the DeHe ment might have considered unnecessary visit to however, altered his views dnring so largo as those without haying tyo so schools called double class rooms He had acourdingl altered the plans so as to rooms to the schools, hut the amomer of ass modation world remain the same. The clag rooms might he divided by a permanent wall. After a long discussion, the a principlo of the Atter a long discussion, adopted, hut some alterations were made in the dotails, after which fresh plans were adoptod. Longton. Whe tender plans were adoptod. Longton, for making the requisite alterations in St. John's school for $512 l$. was aecepted Pembur
o the hoard, prepared and suhmitto plitec the proposed After being approved the board the plan was duly approved hy the Educational Depart. ment, and tenders for the erection of the huild. ings were advertised for and ohtained. The at 1,5912. 13s. 7 d . was accepted. A contract and bond having been entered into, the works are now in progress
Bristol. - The Sehool Designs Committee submitted fifteen tenders for the erection of new sehools in Freestone-road, St. Pbilip's, and they fommended that the tender of Messrs. Bevan, f Bedminster, be accepted, at 3,0802 ., if the
foundations were of Hanham stone; and 3,170l. if of hrick. This, and other matters tending to reduce the cost somewhat, the committee sug. gested should be left to the architect, Mr. Coleman. The report was adopted, and also recom. mendations for asphalting the yard, the ohtaining of designs for school fittings, and the borrowing of 4,000l. from the Loan Coramissioners to cover the cost of the land and the erection of the building.

## VETERAN FRIENDS.

Sir,-Mr. Geo. Taylor is not the only veteran attached to the R. I. B. A. who deserves a few kind words. There is one who not only from his age, from his worth, and kindness of heart, rom tho interest he has ever takon in tho Institute, and those around him, from his in. anstry, from his knowledge, from his travels, and from his desire to impart the benefit ho has derived in his intereourse with the world, merits many a kind word in his hehalf. Of late
we have seldom heard his name Te have seldom heard his name mentioned at the Institnte, but let us hopo he will ever
receive a kind word from one and all.

## SOME COMPLAINTS AGAINST CHELSEA.

Sir,-Will you kindly allow me space to relate the following? The Board of Guardians for the parish of St. Lako, Chelsea, gave an invitation parish of St. Lake, Chelsea, gave an invitation to teader for the ereetion of relief offices for their parish, reserving to themselves the right to their parish, reserving to themselves tho right to The tenders, when opened on the 19th of March, The tenders, whe
were as follow:

Mr. Elkington's tender was aecepted condi. tionally that his sureties were correct. On the lst ult. I received a letter from the clerk to the Board, which I inelose, stating that the con. tiactor who was accepted not being prepared with sureties, would I he willing to abide by my londer and provide snreties? I reply that I am prepared to do both. Withont my hearing anything more from them, they at their next meet. ing , on the 26 th ult., hand the job over to Mr. Thorne. I may perhaps be allowed to say that I have carriod ont several contracts exeeeding this in amount. My snreties were first-class ; and I was not unknown to the Board, having exeeuted contract for them more than six years ago. Then, why do they give 220l. more to Mr. Thorne than to me?

Robert Lace.
$\mathrm{Srb},-\mathrm{I}$ am tha owner of a house in Edith-grove, and
have just received a notice from the vestry tave just received a notice from the vestry calling apon me to pay them a portion of the sum of 8588.183 . 11 d , the
estimated expense of paving that street. Included in that sum, 1801. 6seare charged for forming and raetalling the oad. Colonel Gunter and his lessees are the owners of his street.
A friend of mine is the owner of a house in Blantgre18 s . 9 d, , the cost of pavigg that street, Ineluded in this
$\mathrm{mm}, 3 i_{\text {. }} 12 \mathrm{~s}$. were charged for the road sam, $3 i .12 \mathrm{~s}$. were charged for the road. Mre Mr. Cox, a vestryman, and his lessees are the owners of this. ©treet, a
Now, si, , , pon these fact, the obvious inference to be drawn is that the owners of ilantyre-street had done their Work so much better than the owners of Edith - grove, that the vestry's surveyor's requirements, beforo taling to the
street, would be met relatively in the two cases by the whore, disproportionate expenditure. This inference, however, must be fillacions, because
I see by the locat papers thet the vestry are bow called neen by the local papers that the vestry aro now called upoken spend 123l. 4s. of the ratepsyers money in laying May I surmise that there are some adrantages in being a
vestryman that do not meet the public gaze ? Inqutara.

Flower-vase and Hyacinth-glass Holders Mr. C. Bachliofner, of 4.1, Hatton.garden, has registeredauseful invention of his wherehy flowervases and hyaeinth. glasses can he readily held and fired or nufixed in the ornamentation of windows or other parts of rooms, or in exhibitions, halls, se., much in the same simple way that we have seen wax candles affixed, with brass fittings, to pianos. They were exhibited at the late Horticultural Show, and excited attention there from the simplicity and convenience of the arrangement for the floral decoration of rooms either in summer or in winter.

BUILDERS' CLERKS' BENEVOLENT institution.
Tre Sixtb Annnal General Meeting of the friends of this valuable institution was held a the Office, 27, Farringdon-street, on Tuesday the 25th ult., under the cbairmanship of Mr Thomas Robinson, one of the partners in the well-known firm of Messrs. Cubitt \& Co. There was a numerous attendance.
The report stated tho Institution to be prospering, and the balanoe-sheet showed:-Income, 315l. 9s. ; cxpenditure, 92 l . 18. 6d. Amount 1000t.; and balance, 190l. 6s. 1d. There are eight pensioners, all of them widows, one of pension, withont election

Dcepite your advic
Despite your adivic, and the strong protest of many of the London vestries anginst the extravagant scheme of
the Board of Works, the suggastiou was rejected by that body.
Now, when it is too late, their crror in made palpable,
and hence the proposal of Earl Lonford to remedy the eril nt a atill further outhy.
As no compensation had to be paid, it ie quite clear thast the proposal Jou recommended would hare been executed
for less than the est inated cost of 11 ,ooot. Whe eetimate Cor less than the estinated costo an Ho Familton-place was 100, 000 L . I have resqon to beliero that it has cost conside crably more than this sum, Would it not be iuteresting
to your readers to know how mong more?

## MR. HENRY LESLIE'S CHOIR.

TaE second snbsoription concert of the seasor took place at St. James's Hall, on Thursday ovening, 27 th wit. The programmo which con. mote entirely of sacred music, included a new motett, "O Deus! Ego amo Te," hy Mr. J. G. Leslie's mart-song, "The Pilcrims". Palestrina's "Exaltabo To"; Schubert's 23rd Psalm, for fomale voices; the ever-popular "Judge me, 0 God," for an eight-part choir, by Mendelssohn, \&o. The execution of tho most diffeult part. music by this ad mirable choir is 80 widely knowu that it is needless to say more than tbat its repntained in precision and delicacy was fally main. pieces. Mr. Callcott's motctt, which the com poser himself conducted, is a work of considerable merit, and wonld have bad a better chance of heing appreciated hy the andienoo had it been given later in the evening. It was evidently sung by tho oboir con amore, but being the first picce in the programme, those who wished to rive it the attontion it desersed were provented by late arrivals. The next timo it is performed, lot us hope it will receive better treatment ${ }^{2}$, Sims Reeres was announced to sing but an pology was made for him and Mr. Henry Guy ang in his place "Deeper and deeper still" This rentleman possesges a sweet tonor voice nd gers like atrue artist espccially in pian passares, bnt lack 0 for dectomatory pian Mr. Valentino Smith who mado his dsbut, is a tenore robusto, with a full rich voice but has ye much to learn as a singer Mr Santley con ributcd "Tanor and Ams" on ofertorium by tribated "Cof ann an "Nazareth," tho final chorus being sing by the "Nazareth," tho final chorus boing sung by the
choir, in nnison, with grand effect. As usnal, this was unanimously re-demanded. The third concert is fixed for Thursday, 2 tth inst., when the choir will sing a selection of madrigals, glees, and part songs, and Madame Patey, Mr. Sims Reeves, and Mr. Santley are anuounced as the

THE AMALGAMATED SOCIETY OF ENGINEERS.
In reply to Mr. Headlam, in the Commons, the Attorney-General said he had no materials for forming a correct judgment witb respect to the case said to have been decided by the Connty Court judge at Newcastle, where a working engineer hrought an action against the Amalgamated Society of Eugiveers, alleging that, after subscribing to its funds for twenty-ono years, he was denied the privileges of his subscription, and had been non-suited becanse the society was not registered. Associations like that of the engineers could be registered under three separatc Acts; and if they were recistered, those who contributed to their funds would have the protection of the statutes. If, however, snch societies, to suit thedr own pnrposes, chose
not to register, and if individuals knowing that chose to join them, they must take the conse quence. It was not his intention to propose any alteration in the law of partnership in cousequenco of this case.
Wre have since received a circular note from Mr. Allan, the general secretary of the society, stating that the plea of non-registration was put in as agrinst the judge and not as against the plantiff's claim. Thas, however, does not at al affect the real matter, -the actual position of
the members. If the plea is good in the one case it would be in the other.

Improvements in Lurgan.-Messrs. Harve M'Laughlin, of Belfast, have commenced the erection of the new Conrt-house in Williamstreat. On Monday before last was commence

## CHURCH-BUILDING NEWS

 built when laworh - A new oharoh bas been St. Peter,-taken down to make way for the pre sent erection: The pulling down of the former dilapidated building commenced in May, 1871 It was then intended to leave the old tower standing; but after the remoral of the rest 0 it had corch, this was found to be so unsafe tbat new building, like the old, is Early Decorated and by the architect's dircctions, and nnder the superintendence of the clerk of works, the wbole of the available portions of the early chnrob bave been preserved and reingerted in the new building. The nave arcading on the north side is almost all old So also are the Tarly lancet windows npon the north side of the chacel Also the west windows of the north and sonth aisles, togother with some other remains. Under stone coffin lide, with foliated arosen gor them, beloning to a atill orrlior cburch, herc hen, presered in the wallo Fur somo hundrad for ther here doty
 as jambe preserved in belfry The church, on plan preserve in lan consists north and south aisles, and arcading of fire bays, and from the chancel by : arcading of dve bays, and for the cha mould window. The roofs are a grent Measuro oll stuff, much of the oak heing in a grod state o. preservalion. Ho tho upon theso timbers. The ghaziay througho the building is of caftocdral tind pass. Al the chancel hatings aro or being carred. The aisles and cbancel aro haic
with encanstio tiles, those within the sanctuary with encanstio plazed. They are from Messrs. Minton heing glazed. They are from
Hollins, \& Co.'s manufactory, Stoke-upon-Trent Holins, \& Co.s manufactory, sloke-upou- have been laid by the tilers of that firm The seating throughout the church, outside th chancel, is of deal, the ends being moulded. good qnantity of carved stonework is concentrater about the western doorway, inside and out. The arcbitects, Messrs. Slater \& Carpenter, of Lon don, bave been represented during the whole conrso of tbe works by their clerk of worlse
Mr. W. Thompson. Messrs. Law \& Son, o? Lutterworth are the contractors. The carvia throughout has heen executed hy Mr. Harry Hems, of Exeter. Mr. Burlow was the foremai of masons. The total cost of the work will be about 5,000l, of which the Duke of Bucclencl
has contributed $2,500 \mathrm{l}$. has contributed 2,500 .
Gloucester:- An offer has recently been mad
by the Misses Hedley by the Misses Hedley, sisters of the late Rev Mr. Medley, the first incumbent of St. James's to give 2,500 . towards the erection of a ner
district church for Barton, conditionally that the chancel of the huilding shall be dedicated their brother's memory, and that a further sum of 2,5002 . be raised from other sources. Thi present incumbent has heen working witb
committee to earry out this ohject. The com mittel ho to carry out this onject. Toi con to the amo received promises of subscripipat obtaining s00t in 6atr, and liney anticictios This leaves a deficiency of 1,000 ., and thes intend to a help, anc especiell appeal to the public for hel B, artor district is emproyers of classes. It is proposed to place the odifice in part of the district where the want of a convo nient place of worship has been most felt. Thi committee are engaged in considering as to the best of three eligible sites near the top of Vic toria-street, in Lower Barton-street.
Derby.-Tho chancel of St. Worburgh's ancien parish chnrch has for some time been uuder going considerable alterations. Two months ag a new organ was orected in the chancel, by Mesers. J. W. Walker \& Son, of London. Thi tesselated pavement and choir-stalls hive be uncovered. The pavement within the rail, thi choir-stalls, and the altar.cloth are the gift o Mrs. Heygate. The pavement jnst alluded to $i$ a design in squares, containing numerous de scriptions of marble, surrounded by encaustil tiles. The step round the altar is of blacl marble, the riser being of a variegated descrip tion. The whole of the tileworls has been lais by Messrs. Simpson dis Son, of Loudon. Th of Norwich. They are in four blocks, with pas sages between each to the vestries. The gas standards are by Mr. T. Crump.

Winchcomb.-The parish church of Winchcomb has been reopened, after having undergone an oxtensive restoration, for the carrying out of which it has now been closed for some months. Winchcomb was at one time the capital of Mereia, and more than a thousand years ago
King Offa commenced the building of the abbey, whieh his successor, King Konclph, completed. The abbey has passed away, and the church which succeeded it has also crumbled into dust ; fort the present church has stood mearly four centuries, and the renovation and restoration it has undergone are calenlated materially to
extend its history. The chureh is 158 ft . in length and 68 ft . wide, has a spacions chancel, an ancient screcn, oak roof, and chancel fittings, and a massive tower. Its features of interest and a massive tower. in the restoration. The work done has cost nearly 3,0001 ., all but a small oroportion of which has been raised in the neighpourhood.
Kidderminster: Opening nfa Mission Church.The Rev. H. J. Fortescue, one of the curates of St. Hary's, has provided a mission church in Stow bridge-street, at a cost of about 1,5002 . It 8 a brick huilding, of Gothic style, and has heen
arected by Mr. R. Thompson, from the designs rected by Dr. R. Thompson, flom tho designs
of Mr. John Davis, of Birmingham, and opened or divine service.

## STAINED GLASS

Sidford Church, Sidoury.-A stained.glass pindow has been placed in the new church at idford, by Mr. and Mrs. Bayley, of Cotford conse, in memoly of two sons. Tho glass is
rom the firm of Messrs. Clayton \& Bell. The rom the firm of Messrs. Clayton \&
Thorme Porish Clurch.- A new stained-glass
Thect is tho of indow has been placed in this chureh, by the indow has been placed in this chureh, by the f a nephew. Mr. O'Connor, of London, was the ctist. The window has six compartments, in ach of which are represented prominent subucts, taken from the liff of our Saviour: inetrayal," "The Seourging," "Crucifixion,"
Ascension," and "The Descent of the Holy host." Wistow Church, Hants.-An east window of aived glass, from Messra. Clayton \& Bell's, as been recently plaoed in tho chancel of this uurch, as a memorial of the late Professor ryme and Jone Townley, his wife, hy his aughter and grandchildren. The window may 3 described as of four lights, with tracery of e fifteenth-century type. The whole has been ond with the date and eharacter of the correork. The tracery contains angels, and in the wer lights the subjects introduced are :Bearing the Cross," the "Crueifision," the resions of ancient glass which were formerly serted in the east window-discoloured hy ne, and without order or arrangement, -have en restored by the same artists, and placed der eanopies execated in a manner to aecord sole. Tro subjects represented in the main hits are the "Annunciation" and the "Resurction." This small window has heen fixed in e south aisle
Paistey Abbey Church. - An application has en made to the heritors of the Ahher parish of
isley, in Scotland, on belalf of the Glasger Anley, in Scotland, on behalf of the Glasgow Andrew's Society, for liberty to fill in with
ained glass a window in the Abbey Church to tined glass a window in the Abbey Church to
e memory of Sir William Wallace, of E!derslie. e memory of Sir William Wallace, of E!derslie. ne subject selected is Samson assailing the
emies of his country sincle-handed, and the emies of his country single-handed, and the tist is to be Mr. James Ballantyne, of Edin-
rgh. A committee has boen appointed to rgh. A committee has been appointed to
rry out the ohject, the suhseriptions being nited to a guinea each.
Burgate Church. - The chancel of this chureh ring been partially restored, tho family of the e Rev. C. R. Ashfield, who was reetor of the rish for thirty-six years, have just put up a
ined-glass window to his memory. It is in eo compartments, and is treated in accordance th the style of arelitecture prevalent in the eenth century. The subjects, which are ce miracles of raising the dead; namely, the ising of Jairns's Daughter, of the Widow of in's Son, and of Lazarus. Under each subject on it descriptive of the incident. In the tracery, apper portion of the window, an emblem of
the Holy Trinity and the Alpha and Omega are introduced. The design has been executed under the superintendence of Mr. Phipson, the archi storation of been architect to the general re Barraud, \& Westlake, London.

## 

The Purchase of Railways by the State. At a recent meeting of the Statistical Society, Dr. Farr, Registmr-General, in the chair, a discussion on Mr. R. B. Martin's paper on this'subject was resumed by Captain Tyler, of the Board of Trade, who, having alluded to the importance of the question, said that he was there in a privato capncity, and not to advocate purehase of the railways of the State. The question was, what would happen if the State did not purchase the railways? Porhaps, not in a few years, hnt in a reasonablo term, the result would be a railway monopoly. The tendency towards combination Fas shown by the amalgamation of the London and North-Western Railway and the Lancashire and Yorkshire Railway with the Caledonian fourth of the railway capital of the United Kingdom. Captain Tyler said there were thee kingdom. Captain Iyler said there were thee
points to bo considered in regard to the taking points of railways by the State. First, there was the financial consideration. The purchase at first sight seemed a gigantic operation, The nominal valne of the railpays was 550 millions. In one sense it rould lee a purchase, but in another it would not. The same individuals would continue to hold the stock, only it wonld be State instead of railway stock. The second consideration was the difficulty with regard to the administration. The State, in taking the whole railway system under its management, task, but to be undertaking an overwhelming cere existing shonld be rememulered that thore rosponsibilities were even departments whose administrations wero far more extended than the railway system. The last diffienlty, with regard te rates, demands for personal injury, and loss Captains, and the construction of new lines, his con Tylor disposed of briefly, expressing reduction of that there worid be a genera and tho manufacturers of the kingdom would he placed on an equality with those of other

Working Men's Club and Institute Union.- A meeting of this institution has heen held at the Cannon-street Hotel, Sir H. John stone, M.P. (in the absence of the Lord Mayor) in the chair. There were present:-Lord Lyttelton, Mr. Hughes, M.P., Mr. Hodgson Pratt, do. The Chairman said that applications were being made overy day from various parts of the country for advice, and also for funds, -in some cases merely to start clubs, -and it was precisely to afford such encouragement that the iastitution had heen founded; not in the way of patronising, hut hy way of co-operation. way following resolutions were passed:-That, re. garding the present position of the working classes of the country, the formation of Working Mon's Clubs is a matter of the gravest importanee, alike in relation to their employers, themselves, and the community; that in consequence the working public-honses for large numhers of imperatively required to afford them requisite stimulus, information, and guidance for the establishment of such institutions; and that the meeting, satisfied that the Working Mon's Club and Institute Union supplied the requisite organisation, and liad heen carrying forward an important work, hereby pledges itself to give it

Mr. Smith's Explorations in Assyria. The Daily Telegrem has received a telerram dated Bogdad, from Mr. George Smith, who is now at Mossoul, prosecuting his search for Assyrian records. The telegram states that the Turkish Government has been good enough to forward telegraphio orders to the Governor. General of Bagdad, directing that he might be permitted to commence operations at once, whithout waiting for the arrival of the firman, coveries have already been made, and some long letters had been despatched by Mr. Smith.

The Drainage of Windsor.-The mayor, the aldermen, and burgesses of the borongh of New Windsor, aeting as the local sanitary authority, have appeared at a special petty session in the townhall, before the borough magistrates, to answer the snmmonsissued at the instance of the Thames Conservators, charging them with having neglected to comply with the notices served upon them in pursuance of the Thames Conserrancy Aot, to divert the sewage Thames Consercancy Aot, to divert the sewage
of the town from the river Thames. After some proceedings in the matter, Mr. Michael, on behalf of the ganitary authority, said they were now engaged in negotiations for the acquisition of land, and it was hoped that the works might be very soon completed. He asked that the ease might be adjourned for two months, at the expiration of which time he hoped the Board Wonld have taken such steps as would satisfy the maristrates and the Conservators that the nuisance would he very soon stopped. Mr. English did not ohject to the adjournment, bnt hoped some practical steps would be taken The case was then adjourned until the first Monday in June.

## Dwellings for the Working Classes,-A

 doputation, appointed hy the Model Honses President of the Wresident of the Local Government Board, at Whitehall, to urge upon the Board the nocessity scope of the Artizans' and Itan to enlarge the scope of the Artizans' and Labourers' Dwellings Act, 1868 , and to render the work of the same moro effectual. The objects of the deputation were also, in addition to requiring an extension of the ahove-named Act, to obtain powers to borrow money for the adaptation of dwellings, as there existed a great difficulty in procuring sites for huilding afresh. Mr. Stansfeld, in reply, said he did not think he had ever received a deputation whose statements he had fennd it so difficult to answer, and for the reason that he entirely sympathised with the objects the deputation had at heart. It pras not possihle to oxaggerate their importance, but ho was uncertain what means would suffice to effect a real and efficient cure for the evils complained of. The right hon, gentleman then went through the suggestions of the deputation at somo length, and said when the time came, which he did not think was at present, for tho amendment of those matters, he should be happy to recoive suggestions, and to act upon them.The Warwick Water-Supply.-A com nittee of the town council, including the mayor, appointod to consider the question of the water. supply, has reported to the council in favonr of a seheme for the appropriation of the Haseley
brook, as proposed by Mr. E. Pritehard, O.E., brook, as proposed by Mr. E. Pritehard, O.E.,
their surveyor, and engineer of the new sehemo, whereby a supply of pure water could be got by gravitation to replace the river Aron water, which is hecoming more and more unft for water-supply. Plans and a report hy Mr.
Pritchard accompanied the committee's report. Pritchard accompanied the committee's report. the engineer's report, and a supplement as to the water supply of various towns, which shows inter alid that in many cases storage is said to Waprove the water, have heen printed hy Lacy, of Ir. Simon of proceedings are just in time, for modical devartment) has jovernment Board wiek Council, calling their attention to six eases of fever said to have occurred in the Warwick egristration distriet, and requesting information on the subject, and as to what has been done for he sanitary improvement of the borongh simee 1870, in aecordance with recommendations then made by Dr. Buchanan in a report on Warwick.
Building Trade Co-operative Labour Society.-A correspondent states that a number opresenting the various branches in the building epresenting the various branches in the building for the purpose of taking at a fair price, the labour only of any branch in the trade, from labour only of any branch in the trade, from
respectable builders. The men are unconnected respectable builders. The men are unconnected with any of the trade-unions, and are being organised under a well-known general foreman, who will take the entire charge, and submit prices from the drawings and specifications, if desired, hefore tenders are sent in.
St. George's Union.- It has been deter. mined to convert the workhouse at Kensington belonging to this Union into an Infirmary, and plans have been prepared for raising the build ing another story, and adding other additional structures, besides entirely re-modelling tho Ad-
minigtratire Offices.

St. Marylebone Workliouse.-The recon. struction of this building, which is in a very dilapidated condition, has been dolayed for some time, owing to a difficulty in arranging the Terms having at last been settled, the grardians have reqnested their architect, Mr. H. Saxon Sncll, to prepare plans for laying ont the build ing upon an entirely nerw plan; but as it would be impossible to erect the who anco and find accommodation for the inmates elsewbere, it may be some few years before the entire work is completed. Working drawings and estimates are being prepared for tbe first portion, which will conkist of a block of buildings extending the whole length of the Nortbumberland - street frontage. This building will contain accommodation for 608 chronic and infim inmates, and probntionary wards for twenty pazupers, besides a porter's lodge, mastcr's residence, stores, board and committee rooms, clerks' offices, and rooms for the distriet registrar. The estimated cost is 26,000 l.
The Proposed Eastern Cornties Aquarium, at Yarmouth.-An abridged prospectus of the Eastern Counties Aquarinm Company (Limited) has been published. The company has been formed for the purpose of erecting a large fresh and sca water nquarium on the beach at Yarmonth, to be followcd by the construction of a great central hall, capable of
 ba!ls, concerts, banquets, and public mectings; billiand for the formation a hbrary and Thinard of 22 . eacb; but the equarimm and its immediate of $2 l$. eacb; but the aquarium and its immediate
surroundinge, whicb it is intended to get into surroundinge, whicb it is intended to get into
operation first, will only cost $25,000 l$. The operation first, will only cost 25,0001 . The
mayor and corporation of Yarmouth have granted for 999 years an elicible site of about granted for 999 years an eligible sit
seven acres, near the Britannia Pier.

Turner's "Liber Studiorum."-The sale of the first portion of the valuable engravinge from the works of J. M. W. Turnor, R.A., was con. cluded recently at the rooms of Messrs. Christie, Manson, \& Woods. The following were the more important lots included in the last day's sale :The whole of the remaining impressions of the "Liber Stndiorum," in 68 lots, produced nearly $1,5001 . ; 17$ complete sets of the work, impres. sions on thick paper, each set comprising 3 SOl ; the copper.plates of 12 unpublished numbers of the "Liber Studioram" fetched 7507. ; and other plates, including Calais Pier Fishing-boats preparing for Sea, the Euclish Packet coming in, - engraved in mezzotint from the picture in the National Gallery, by T. O. Xenptor -450 guineas. The whole five days sale realised upwards of $20,000 \%$.

The Lancashire Statue Memorial of the late Earl of Derby.-A meeting has just been beld at Preston in connexion with the movement for the erection of a statue memorial of the late Earl of Derby, for the county of Lancaster. The snbscriptions wero limited to 1 d . each, and up to the period of his death it was estimated that after the demiso of county gentry was held at Preston, where it was decided to raise funds for erecting a statue to his memory within the old Parliaruentary division of North Lancashire. The statue, which is to be erected in Miller Park, Preston, will be formed of Carrara marble, and is estimated to cost abont $2,600 \mathrm{l}$. It is expected that the cere. mony of unveiling will take place in June.
The Public Health Act at Altrincham.Altrincham was one of tho mnions in Cheshire whicb appointed a nuisance inspeotor, temporarily, to the 35 th March, to make a pre. liminary report on the sanitary state of the district. From that report it would appear that in every township in the union the privy accommodation was defective. The water.supply in most instances was of a qnestionable cbaracter, from proximity of wells and pnmps to drains, and thronghout the union generally the cottage accommodation was bad. The report alto. gether contains a formidable list of nuisances to be seen to.
Our own Thunder.-The article beaded "Workmen's Tools in the Middle Ages," in a paper callcd the Furniture Gazette, sent to ns by an obliging correspondent as "degerving of quotation," is taken, without the slightest ac-
knowledgment, from our own pages.

The Union of Senefices Bill-Attention ought to be called to the threatened removal of certain City churches, contermplated in the union Bonences Bill, recently referred to a Committee of the fouse or Com Ins. tcets' Committee for the Conservation of Ancient Monuments, and a memorial has been addressed to the chairman of the Parliamentary Committee which it is hoped may help to sara some of the more notable of the thentenea curches rom mose notablo Prefor Donaldson has friven cridence on tbe subject before tho Parliamentary Committee. Mr. Beresford Hopo is doing his best.
The Railway Benevolent Institation.The presence of the Prince of Wales, as president, at the annual dinner of the Railway Benevolen Institution, at Willis's Rooms, attracted a large number of noblemen and gentlemen. There were nearly 400 guests. The Prince pressingly urged the claims of the charity on those present, and himself contributed a second donation of 110 . The list of snbscriptions amounted to no less tban 5,000l., and altogether the hanqnet was the most successful of all the series, at least since that at which Charles Dickens was the president.
Bedfordshire Archrological Society.-A the montbly mceting, tho Rer. H. Wood exhi"ited Romano. British relics lately discovered in "South Field," in the parish of Biddenham. Among them were three large cinerary uras, of various and elegant forms, and one large pocuium or cup of brownish yellow earth. Neas the urns were found vertebro and other bones, some human, and also a number of fint flakes and a part of a well-worked arrow-head and two scrapors of flint. Flint flakes have been found at or near the same spot on a previous occasion.
Enamelling Paint.-An article with this name, is being sold by Mr. T. Griffiths, of Liver. pool. It is provided of a light stone colonr and a chocolate, aud is said to be good a gainst damp in walls, and rendering buildings of brick, stone corrosion of metals, and form a hard enamelled surface. It appears to be composed of some sub. stance like appears to bitumen in spirit solv. tion, and is extremely light in weigbt, althoogh a single coating is said to equal in body that of any ordinary paint.
Escape of Gas: a Tamily Suffocated.-At Dundee, a foundry labourer, his wife, son, and danghter, were lately found lying dead in hed in their house, in Lowndes-alley. Gas had once been in the house, but the supply had been cut had for some time, and it is supposed that gas suffocated the inmates. There was a stron smell of gas, and no appearance of fonl play Provisions and money were fonnd in the house and they are said to have been respectable people.
Iron Chapel burnt at Knowle. - Last Wed. nesday the Congregational Iron Chapel was destroyed by fire. The flames having got a thorough hold of the flooring, soon communicated with the roof, which in a short time fell in with a heary crash. The side "walls" soon after. wards fell in, leaving nothing uprigbt but the entrance-porch, which had already beon half destroyed. The great majority of iron chnrches are the merest shams in the world, and ought to be called wooder chnrohes.
Testimonial to Mr. George Smith, of Coalville.-On Saturday, a number of gentlemen and ladies, with Lord Shaftesbury in tho chair, met in the Social Association's Rooms, Adam. street, Adelphi, for tho purpose of presenting a testimonial to Mr. Georgo Smith, of Coalville Leicestershire, for the exertions wbich he made on behalf of the brickfeld children of England. The testimonial consisted of a Bible, a purse containing 100 grineas, an illuminated address, and a silver teapot to Mirs. Smith.
Corn Exchange for Dunmow.-It has bee resolved to form a limited liability oompany, to be called the Dunmow Corn Exohange Company, to provide a building for a corn exchange and other purposes. Ncgotiations are on foot for a site in the High-street, and a committee has been appointed to form the company, treat for purchase of site, obtain plans, solicit the pnblio to take shares, \&c.
Royal Society.-The Royal Society conver sazione will be held at Burlington Honse o Saturday, April 26th.
"Wiring the Work."-Wo have received long letter from Mr. Tall, in reply to Mr denying the validity of that gentleman's patent. we cannot, however, open onr pages to the discussion.
Erench Publications. - The Encyclopedi $d^{\prime}$ Architecture, for March (Paris, Morel \& Co.), contains engraved illnstrations of the Swansea
School, erected from the designs of Mr. B. School, er
Bucknall.

VOL, XXXI.-No. 1575.

Works in. Iron.*
R. MATHESON, a member of the firm of Andrew Handyside \& Co., of Derby, says in the book he has puhlished, with the above title, dated Jamary, 1873, that it is almost certain that there will be a reaction downwards from the high prioes of iron which have rulod through the year 1872, but that it is hardly prohable that tho low prices of 1869, even if reached at all, will ever long prevail. The constantly - diminishing purchasing value of gold is apparent in the iron trade, as olse. where; and as notonly tho price of fuel and tbe rate of wages have riscn, hut the hours of labour have heen reduced, there are many elements at work to keep up prices; although against theso thero must be placed the economies tbat may be obtained by improvements in machinery, new methods of working, the competition of an increased number of ironworks, and by fluctuations in the home and foreign demand.
When the hot-blast was introduced in Scotland, forty years ago, the quality of the iron made by that metbod was greatly reduced; so much so, that it has since been customary to require iron to he made by the cold hlast wherover a good quality of iron has been required; but now the iron-makers claim to hare so improved the system of working and applying the hot hlast, that tho difference in quality between
iron so made and cold-blast iron is, they say, greatly lessened, and is practically of no effect for most purposes. Several qualities of iron may be produced by either system from the same smelting-furnace, and with the same materials, aceording to the proportion of fuel used in the operation of smelting; thus, when the fuel nsed is in large proportion to the hurthen, soft tough, grey iron is produced; but when the quantity of fuel is diminished to its lowest point, hard, brittle, whito iron is the result.
To judgo of the quality of cast-iron from an inspection of a fracture requires considerable experience and skill, and enn hardly he tanght except by experience. The following doscription of the various kinds of oast-iron may, however, form a useful gaide. No. 1 is the production of the furnace when charged with a large quantity of fuel in proportion to the quantity of ironstone. This iron is the most slowly made of all the descriptions of pig-iron, and contains a larger proportion of carbon in chemical combination or mechanical mixture than any other quality. It is the most fusible pig-iron, and most fluid when melted, and is nsed for small and delicate costge. The fracture of this quality of pig shows a darlk grey colour, with a high metallio lustre the crystals are large, many of them shining like freshly-cut lead. However thin this metal may *pon, "Woris. in Iron," By Ewing Matheson. E. \& F. N
be cast, it retains its dark grey colour, if of good but beyond a moderato thickness cast iron quality. No. 2 is intermediate in quality and becomes spongy or open. A hollow column, appearance between No. 1 and No. 3 . No. 31 in , thick, for instance, will not be doubled in contains much loss carbon than No. 1. The strength if made 2 in. thick. erystals shown in a fracture of tbis iron are smoller and closer than in No. 1, but are larger and brigbter in the centre than near the edges of the fracture. This iron is capahle of being made sufficiently fluid for large eastings. A mixture of a proportion of No. 2 with this im. proves it. The colour is a lighter grey than No. 1, with loss lustre. No. 4, or bright iron, bas a light grey fracture, and but little lastre, with very minute crystals of even size over the whole fracture. It is the "leazest," or contains less carhon, of any of the grey irons. It is not fusible enough for foundry purposes, hat is used in the mannfacture of wroughteiron. It is the cheapest of the grey irons. When inferior in quality there is usually a thin coat or "list" of white iron round the edges of the fracture.
Mottled iron is intermediate between No. 4 and White, tho fracture heing dall dirty-white, with palo greyish specks, and with a white list at the edges. White iron is the worst and most crude, being hard and brittle; the frootnre is metallic white, with but little lustre, and not granulated, hut having a radiating crystalline appearance. This iron, says the author, is largely used in the mannfacture of inferior bar iron.
Where specially severe service is reqqired of cast-iron, special tests are required, as in the case of railway chairs, where the test of a weight falling on the casting resemhles in some measure the heavy and sudden shooks of passing trains but for ordinary prrposes the tost is the trans. verse strength and elasticity of a beam. A convenient size for the bar to be tested is $3_{\frac{1}{2}} \mathrm{ft}$. long, 2 in . deep, and 1 in . hroad, placod on bearngs 3 ft . apart, aud loaded on the middle until broken; but as considerable power of cohesion may he attaiued in allianoe with extreme hard. ness and brittleness, it is necessary also to monsuro the deflection which occurs, and thas to ascertaiu the elasticity and ductility of tho iron. If a bar made of twice.melted iron-i.e., iron first made into pigs from tho ore, and thon re. melted-bo suhjected to this test, it will be fonnd that the weighte necessary to break bars of this size made from the same kind or No. of iron will vary from $2,300 \mathrm{lb}$. to $3,500 \mathrm{lh}$., according to the locality from whicb the ore is ob. tained; and if mnde from mixed irons, from $2,700 \mathrm{lb}$. to $4,300 \mathrm{lb}$; and that the ultimate deflections before fracture will wary from twotenths to five-tenths of an inch. These wide differences in tho quality of the same kind of iron from different localitios onuse corresponding differences in prioes. Some of the Derhyshire and Yorkshire irons aro generally sold at higher rates than the averace, while some of the Middlesbrough iron is of a very inforior kind, although by judicious mixture of the local ore with other and better sorts a good standard may be roached.
The hematite iron found in different parts of Cumberland and Lancashire, and elsewhere, is of a peculiarly tough nature, whioh renders it very valuahlo for mising witb other kinds. Almost all kinds of pig iron are improved in quality hy mixing with other sorts, but in thoso cases whero the cost per ton is tho only con. sideration the lowest price for castings will of necessity bo ohtained from thoso founders who nse the ohoapestiron, and who do not incur the expense of huying and corrying to their premises more expensive kinds for nixing with it. The cheapest castings are, in some cases, not made from pig iron at all, but directly from the ore-smelting furnaces. A large proportion of the iron castings supplied for building purposes in this convtry are made witbout any reference whatever to the quality of the iron. It is often tho onse that an incroase in the dimensions is supposed to compensate for inferiority of quality,

The price of different sorts of iron varies considerably, but the cost of lahorr and of transport are the same for all, and pig iron of a lesser cost and proportionately lower price will, when made into a casting, show an inferiority more than proportionate to its low price; thus a saving of 25 per cent. in the cost of the raw material will be rednced to 10 per cent., or even less, in the finished casting, whicb still preserves its inferionity in quality of 25 per cent. It would be an advantage, therefore, if specifications of ironwork were given with greater distinctness and more often enforced. A strength capable of enduring 25 owt. on the test-bar withont fracture shonld he the minimum quality allowed, even for sbort and heary columns; but for otber purposes, a load of from 28 cmt . to 30 cwt ., and a deflection of five-sisteenths of an inch, should be demanded. The deflection will vary from three-tenths to five-tenths of an inch There is no difficulty, says the author, in getting such iron, and higher qualities can be given if necessary, breaking strains of 30 cwt . to 35 cwt ., being obtainable with jndicious mixtures of tho best kinds of iron; and in testing such iron it will generally he found that some of the bars will endure as much as 38 ewt. In the minds of those who are not aware of tho great differences of quality that have been referced to, the numerons accidents and risks that often attend the use of cheap metal, have created a prejudico against the use of cast-iron altogether; and many poople, considering it to he without elastioity, avoid it wherever wrought. iron can by any means be used instead. This is tho more to be regretted hecause cast-iron allows infinite varicty of shapes, more nearly approaching the exact forms and sizes required by design or strength than is possible with wrought-iron; and for many sitnations cast. iron is even stronger and more endaring.

Wronght-iron, like enst-iron, when put into large dimensions, is not so strong per square inch as smaller sections, when well made, hecanse of the greater amount of working the smaller sizes undergo, but sometimes the method of rolling iron into peculiar sections canses lami. nation on somo of the parts, which revders the iron not everywhere oqually stroug or elastic. From this it arises that from certain sections, where the iron is afterwards heated in the fire or worked on the anvil, it is difficult to produce the shapes that may be required witbout burning or cracking the iron.
Great uncertainty in the quality of iron has usually been cansed hy the manner in which the specifications have been given, as "Best," Best Best," "Best Staffordshiro," and so far as these words distinetly implied a oertain quality they were sufficient; but as the B. of one district was equal, perhaps, to the B. B. of another, and tho terms thus conveyed a conven. tional and rather nncertain meaning, at last it hecame necessary to indicate the really best quality as "Best Best Best." It is now thonght expedient to "avoid such phrases, and to state distinctly the strains and tests to which the iron shall be cqual.
If notoriously cheap and inferior sorts be mitted, wrought iron may be obtained in the open market to sustain the following strains, and rcspectable manufacturers of hridges, roofs, and other iron structures may ho expected to use such iron without express stipulation. Square, round, flat, and L bars will enduro a tensile strain of from 20 to 24 tons per sqnare inch before breaking, and 20 tons should he con. siderod the minimum. T bars have abont the same strength, but, owing to the manner in whioh they are rolled, it is in some other respocts. inferior to $L$ and simple bars.

Plates, as a rule, are not capable of sustaining such a ligh degrec of tension as bars mado from the same quality of pig-iron; and from 18 to As the breaking-strain of a number of bars pur. chased together will vary, a specified minimum breaking-strain implies an average strength of a higher figure, and, for iron of fair quality, this averame may be taken as ahout 22 tons for bars aud 20 tons for plates.
Tbe limit of elasticity, rather tban the ulti. mate or breaking strength possessed hy a piece of iron, determines its value for structural purposes. With a strain of 10 or 11 tons per squaro poses. inch of section an elongation of a hundredth part of its length takes place, and the quality of phart of iron sbould bo such that when this force is the iron sbould bo such that when this force is
withdrawn the bar will retnrn to its original length. If the iron is stretched heyond this point, the rate of clongation increases, and a point, the rate of clongation increases, and a
permanent set takes placo, $-i, e$, the bar will not permanent set takes placo,-i,e., the bar will not withdramn. For determining the quality of "rovght iron, apart from its mere breaking strength, the fact that it can be bent cold to a certain angle withont damage will show its toughness. A plate $\frac{1}{2}$ in. thick, bont to an angle of 30 without damage will, if it possesses sufficient breaking-strength, afford, for ordinary
purposes, a satisfactory proof of its clasticity. purposes, a satisfactory proof of its clasticity. greater angle than $35^{\circ}$. Lowmeor iron will bend greater angle than $35^{\circ}$. Lowmoor iron will bend
nearly doublo without breaking. Tbe iron from nearly doublo without breaking. Tbe iron from
whicb rivets are made should be of a better whicb rivets are mado should be of a better quality than ordinary bars, and its ductility
should be such that it will hend demble when cold witbeut cracking

Althongh the prico of iron fluctuates, the relative prices of the different shapes at any one time are about the same, Assuming that the price for plates is I2l. per ton, ordinary flat and round hars may be purchased at $10 l$. to 10 l .10 s . $L$ irons at 10l. 10s. to 112 . ; and $T$ irons at 11 l . to 121. per ton. But for $L$ and $T$ irons of a section whose total dimensions exceed 8 in.
(that is, exceeding 4 in. by 4 in , or 5 in . hy 3 in .), and for bars orer 6 in . wide, extra prices are cbarged.
Joist iron $I$, and channel iron $U$, of small sections, in to abont 7 in . in depth, may be obtained at ahout the same prioe as $T$ iron, hut with larger aud wider scetions tho price rapidly adrances, so that with a depth of 12 in. or 14 in. a price of $15 l$. is reached.
Bars of all kinda may be ohtained in lengths of 20 ft ., 30 ft ., and cron 40 ft ., according to tbeir scetion; hut when a weigbt of it cwt. is exceeded, extra pricos are cbarged. Plates can bo obtained of any size up to 21 . scquare fect arca, if not excceding is cwt., without extra price, hut the increase in price is not very great up to 8 cwt, Thin plates of large area cannot be rolled.
As cast-iron resists a compressive strain with six times the force with whicb it is capahle of resisting a tensilo strain, it has been usual to follow Hodgkinson's rule of making the sea tional aro of the bottom flange of a girder six times as much as that of tbe top flange, hut it may be considered that the strength of a heam ought not to be determined hy its resistance to fracture, but rather by its resistance before the limit of elasticity is reached, and the proportionate resistance of cast-iron to compression and tension in this case is only tbree to one Assuming three to one as the proportion to he adopted, the section of the girder should be so arranged that its centre of gravity is at a point three-fourtbs of its depth from the top; that is to say, if tbe total depth of the girder be
divided jnto fonr ports, the ouantity of metal in the lower fourth part should be eqnal to that of the upper tbree parts.

Irregularity of thichness of motal in castings tends mucb to reduce tbeir strength, for the thick part takes longer to cool, ard drawa cowards it the thinner part wbich has already strained; and if such eastings are afterward subjected to percussion, they may broak. The shrinkage in dimensions from the molten to the cold state is about an eighth of an inch per foot - For wroaght-iron eirders, the plate-girder is the most simple, and, up to a certain gize, is most economical. It is ripid and dorable and is the most appropriate for small spans. Wher great rigidity and strength are needcd. Wher plates are sometimes eraployed, thns enclosing a space, and making what is callod a box, or tubular girder. Tbis enables wider flanges to be used, and makes a much stronger beam. It
is, bowever, necessary that the insido of the girder shall be spacious enougb to give access consequent detcrush, as it is liable to rust, and the exigencies of a design render small box. girders necessary, special precautions should be adopted to prevent deterioration by rust. The be should be allowed to rust, and sbous then paint. Rolled benms are sometimes used with adrantage instead of plate. rirders of amall depth They are especially suitable as joists for fireproof floors, as rafters in iron roofs, \&c. They are mado from 4 in. to 14 in. in depth for gencral use, but for specinl occasions tbey have been made as much as 3 ft . in depth; nevertheless, it may be said that, for a greater depth tban 10 in or 12 in., a plate-girder is preferable to a rolled beam.

Deterioration of iron-work is rapid when the proper painting is neglected; the dlakes or scales of rust which fall from wrought iron of conrse weaken its structuro in proportion to the entire siderable in the iron, and this proportion is con siderable in the case of plates $\frac{1}{4} \mathrm{in}$. to 1 in . tbick With wronght iron girders and joists sustaining as they often do in warehouses, immense loads, is considerable.
Whensiderable
When iron-work is completely imbedded it is preserved from rust, and it is said that in cathedrals and ether ancient huildings, iron-work has been found which has kept in good condition for 600 years. This, however, and the effect upon it of lime or cement, requires further investigation.
In
In the process of casting iron, the molten netal fuses the sand npon the aurface of the mould, and prodnces on the casting a skin which has the appearance of a silicate, and wbich is
mnch harder tban the purer iron within. Tbis skin is of value in giving a bard, smooth continnity of surfaco to the iron; and as it would, if allowed to rust, soon be destroyed, it is desirahlo to protect it by paint. A casting, therefore, slonld bare a coat of oil or paint as soon as possible after it lcaves the foundry, and before any oxidation has commenced. A second coat of paint should soon afterwards be added, and then tbe original surface of the iron may he permanently preserved hy occasionally paiuting from time to time, as required. Whetber one year or five years elapse before fresh paint is wanted depends npon the weatber and climate, and the kiud and quality of the paint. If rust does appear on a casting, it should ho carefully scraped off before the paint is applied. Cpou the surface of wronght iron a $s \mathrm{kin}$ is formed Cluring the passage of the heated bars er plates through tbo rolling-mill. This skin, unlike that upon cast iron, is not inseparable from tho solid metal, but forms a scale which can be dotached. It is a chernical comhination of iron with oxygen, the proportion of the latter incrensing as tbe peroxide, or rust. But the elements of rust are on the iron from the commencement. The scales must fall off sooner or later, and in a manner cutirely unliko the granular rast of cast iron. The thin skin or scale which forms on new wrought iron is of no value, and it must fal off or be removed before the real iron is reached. Wben tbe iron is galvaniscd, it is necessary to remove the scale before the zinc will achere to the iron, and this is effected hy a process of "pickling," tho iron boing first clipped in dilate acid to remove the scale, and then washed in pure water.

Tbis is occasionally exacted in very strict spo. painted ohtained by allowing the iron to rust, and then scraping off the scale preparatory to painting. If some rustrenains on the iron tho paine sboud hrush should be mixed with the rust. When jron structures are sold for delivery only, one coat of paint is inclnded in the price, and if the ironit is fixed is also included. When more than tbis is required it should bo stipulated in the contract. For bridges, roofs, and similar strue tures, three or four coats should he given in all As a general and approximate rale 2d to $4 d$ per square jard or 3 s to 5 s . per tom on tbe weight of ironmolk may be taken as the expens of each coat of paint after the first

Which we bave referred, and altogether the book will be very useful to arcbitects and engineers; and the vocabulary of French and Germau appended will bonder the book particularly valuable to tbose going abroad.

## FLOOD, FEVER, AND LOCAL

 GOVERNMENT.The British rainfall of the winter of 1872.73 , rhich has excecded by one-half the average deptb, has read a lesson to some parts of tbe country which they mill be slow to forget. It is one of the most odions characteristios of hnmanity to reioice in the occurrence of evil hecause its prediction has been verified. We trast that we need not disclaim such a dispesition. It is not for our own gratification, hat for the public service, that we take the oceasion of the long-continued floods in Somersetehire to insist anew on the importanco or a contral and scientifioally directed investigation of the great national question of wa
and water-consorvation
In Decemher and January last (and the subsequent rainfall has been such that we may almost now use the present tense), 150 square miles of the low-1ging lands in somer setshire were permanently inundated. Some acconnts give a much lay ane to mischief. In Langport, the cellars, streets, and living-rooms were flooded, and many villages were permanently isolated. Mr. Neville Gren ville, acting on bobalf of the Selgemoor Commissioners of Sewers, hrought tbese facts hefore Mr. Secretary Brace, and used the expression,
" the present plague of waters cannot be "the present

The question of neglected hydraulic engineering has in tbis instance assumed an economic importance to which possibly some small degree of attention may be afforded by the Government Indecd, weare told that tbe Government promised to send to the spot, at the expense of the inhabitants, under a personal guarantee, a gentleman who was one of M : Brunel's resident engineers en the Cheltonham and Great Western Ruilway. As to the sanitary part of tho matter, the trancated legislation of last year has produced its natural result; that is to say, nil. "Ague is prevalent," writes an inhahitant of Sedgemoor My danghter and niece are suffering from it now ; when the waters subside, fever will doubt less follow. It is idle to appoint medical in spectors, if such a vast fever bed as Sedgemoor is to remain untouched.
It is discovored that tho Land Drainage Act 1861 coes not give power to any one to do anything efficient in this case. Sedgemoor, however, is but one instance out of many. The valleys of the Partet, the Brue, the Ile, the Fico, the Tone, and the Axe, are all in a state of confluent flood. There are large inundations in othor places whero Commissioners of Sewors have jurisdiction; but everywhere tbey are nearly powerless to initiate any nccessary works, oven in cases of extreme urgency.
It is proposed to hold a puhlic meeting at Bridgwater, so soon as Mr. Grantham bas completed his report. A remarkable feature of the case is, that no attempt seems to be mado by from of the sufferers to derive any advantage tion of sanitary districts was the one expedient whicb survived out of the original Bill. And yet we find the old Sewage Commissioners ap. pealed to, the inefficiency of old legislation deplored, and the sufferers opplying,-not to the Local Government Board, but to the Home Office! A more crael satire on the administra tion of the sanitary measures cannot he imagined. Here are thousands of people flooded out, hundreds of square miles under water;-and no one seems to have any idea that it is in the charre of auy Mirister hut the Home Secretary, who offers tbe lusury of a report-at their own expense! There can be no doubt that a great national question is here paltered with in an incxcusable manner. It is not creditahle that our Govern ment shows such supineness where both the health and the wealth of preat districts of the country are involrcd. There is not even the
cols paltry excuse of economy. The equation show. ing how many human lives ought to be sacrificed, in how mat of of 1001 in tho Budpet in order to ecet saving or loo. in tho budget fairly worked out. Probably the Cbancellor of the wormer and tho of the Torn ment heve abrat the
glad if one of our friends will put the question in Parliament. We hesitate to venture any gness as to the unit of value that may be adopted.
How many lives go to a pond ? In somo dis. How many lives go to a pound? In somo dis. tricts, perhaps, a negative value is attached to
the former quantity. In that case it will be a mrand stroke of political economy at once to diminish the population, and to reduce the nominal expenditure of the nation. If that rule be established, we do not see where its applica. tion will meet a limit. It will be of nse all round. The policy of "do nothing" will rcceive its most complete support and appropriate dovolopment. First thero will he the usual result of saving trouble and Parliamentary responsibility to the Minister. Parliamentary responsibility,-for what has public bife to do with such figments as conscience? It is not a question whether a fow hundred people shall caust not say I did it." Our legal institutions are not such as to admit of any trouhle being tiven to any one on such a mere theoretic quos bility is this. The honourable member for Sorewemtight will give notice that on such a day mont, regarding the waste of public money latcly involved in making an altogether uncalled for inquiry into the haalth of a certain district. Such a matter, the mover would prove, had
none but a sentimental interest. It was on tiroly confined to a fow hundred inhahitants of the district in question. The great law of supply and demand has, on the presont occasion, supplied the deficient quantity of water for waich thero was such a vociferous demand a
summer or two ago. If such a supply was summer or two ago. If such a supply was
attended by ague and fevor, these were mere natural phenomena, with whioh enlightened legislation had nothing to do. 'The inhahitants porfectiy free, as far as logisiation is suoh phenomena. If they did not leave, it proved that they prefcrrcd remaining. No one had a right to interfere with their choice. They wore in all prohabily, many of them, members of the "surplus popnlation." If otherwise, and if fever carried off so many as to raise the price
of labour in the district (the only practical of labour in the district (the only practical
evil), surplus labour would soon flow in from ather districts, and restore the natural level. II fact, fever and ague are among the beneficial agoncics of nature, as reducing surplus popa. lation.

Against argrments such as these we know that it is of hut littlo avail to raiso our voice. We do, indeed, venture to think that of all the prodnce of Great Britain that which is at tho same time the most costly to rear, and the most valuable when support that view hy facts and figures, though ws shall only be snecred at by certain persons. But apart from that,-apart from the "senti. mental "s view, that the effect of a single out. burst of fover, thoroughly prevontiblo and on human life; apart from that great responsi bility as to which,-bcing only moral, and pot Parliamentary, - the Minister is content to shat his oyes; we have a word to say which should, oven now, claim attention. We speak in an authoritative tone. We will wso the magic phrase hefore which, in tho country of Cer.
vantes, all doors fly open, "de la part du Roi," -wo invoke the namo of Fing L. S. D. What a terrible wasto of something so much more waluable in some estimates than mere hnman health and life is involved by giving op these
fertile valleys to the occasional ravages of floods, and to the pcrmanent invasion too often of reeds and rushes and bog-growing vegretation !
Tho great check to the fertility of this country is to be found in the uncertainty of the seasons. Or, we may say with greator precision, in the unqualifiable ueglect of onr agricultnrists to take such measures as are demanded. to make
the hest of that uncertainty. No attempt has been rade, on anything like a systematic plan to avcrage our amplo and aluundant rainfall. We do not store the heaven-sent treasure, as people in more thirsty lands have long been taught to do. We not only give no bced to facilitate the discharge of the waters when they reach the lower lovels of the natural drainage districts,
but we throw obstacles of all kinds iu tho but we throw obstacles of all kinds in tho way of the ontlet which the physical character of the weirs, water.rights of all kinds are allowod to erert a prescriptive energy in drowning our most fortile river valleys.

The question of irrigating the high-lying and waterless distrjcts is one involving cost, time,
and mnch intelligent investigation. But the questiou of freeing the natnral outlets from artificial obstruccions, is far more simple; and, o return to our present argument, it is self. spporting. Fivo tons of rich meadow hay per acre may he obtained from well.watered, but unflooded, land in any part of England. We are not putting this as a theoretioal possibility, but as an outcome of actual cxperience; and, in the cases cited, it is not said how mnch area of land is actually wasted by the barbarous system of water-carriers generally adopted. In thoso water meadows which raise heavy crops in a season elsewhere grassless, how goneral is the presence of flags and rushos, the evidonce of wasted aroa and diminished swathe.
We might go further if wo point to tho industry of Lincolnshire, of Norfolk, and of Holland; and to the laughing crops raised below the level of high water. Bat wo are confining our attention at present to that simple amonnt of security which is to bo attained by the simplest procedures of the ongineer, and which will immediately recoup the outlay. And we throw in the health and vigour of the inhabi tants of the districts that cry out for this atten tion gratis, hecause we are as yet waiting, as before intimated, for the solution of tho equation 1. Con human lives, to find the value of

Confining our attention for tho moment to England and Wales alone, we bave to point ten grand natural watershed districts. Physi. cally, of according to the character of the rivers, they may best bo dividod into eight ; is the size of two of the areas thus marke
is so great as to render more feasible is so great as to render moro feasible
division into ten. Each of these districts i enough to occupy the full attention of a civi engizeer of the first cminence in his profession The general course of the waterflow in the dis trict, from the high lands where the rainfall is parted, to the altimate escape into the sea, should ho carefully studied, attention being paid at the same time to the physical and to the geological structure of the country. No largo amoun either of oost or of time would bo required, in order to enable these engineers to arrivo at such a perfect knowledge of the details of their respective districts as to bo able at once to give tions of sound advice as to the leading condi magnitude puric work or private wors of in so far as it affected or was affected by the course of rainfall and of drainage.
The amount of public time that would be saved, and of pnblic convenienco that would bo into engineer districts division of the country a residcnt enginecr appointed to each, would bo incredible. As it is, when any reat work is proposed, not only must a special study be made by, or on behalf of, the proposer, hit an inde. pendent stindy has to be mado by every opponent or hy every one whose interest is, or may be, so, but by the proposed operations. Not only If this is made a mero party question; if the sanction or the rejection of a Bill is to be a mere matter of personal influence, irrespective of the if erits of the caso, we have nothing to add. But thonght right that the action either of the Legislature or of the administration of the country should be directed by intelligence; if we can conceive it possible that the real ralue of any engineering proposal had to be weighed by a committee which inquired into the real merits of the case, - then the function of the district engineer would become one of evident importance. A few hours given to the exposition, hy such an officer, not of his own opinion of and of the mute the actual facts of his district, was accommodated to those physical facts, would savo weeks and weeks of dreary hattling in committee; where the acumen of the examining counsel, or the adroit cleverness of a"witness, is the element that detcrmines the verdict, at least, when that is not mere matter of foregone conclusion and counting noses.
It is tolerahly evident that the time has not yet arrived in which sanitary and economical pon a sympathising hurcen of the Gorern ment. But we are suro that the lasting gratitude of the people of England will follow the name of that Minister, -whatever be his political hoe, who shall first deal with the great sanitary and
economical question of the water circulation o the country on none other than sanitary and been lost, hut it is seldom too late to mend.

ON THE LAYING OUT OF CITIES.*
ROYAL NSETITUTE OF BRITISH ARCHITECTS.
When we turn our thonghts to the antique past, stimulated by the fact that, from the earliest ages, various large cities have existed, Wo mnst expect to he disappointed in olataining
any complete idea of their formation and arrangement, becanso their remans are so small and contemporary notices of them so vague; indoed, it is almost a waste of time to seek hey were information concerning them. That public buildings ranged principally aroand a large open space, a campus, agora, or forum, is about all that we can with certaiuty assert. Pompeii, which bore somewhat the same relation to Rome and Naples that Brighton does to London at present, remains in a partly perfect tate, and affords ns some idea of what a populous and fashionable scasice lown was most the earier homan emporors, and in the the impression is noty of cary farable one. It is a vcry suggestive fact, and one that we hould bear well in mind, that not a single city $f$ emains at the present day to give us the model ago. Will the same remark hold good some two thonsand years hence? We have every reason to think so: and the cities of the fature will be as different to the cities of the present as the cities of the present day are to those of the past Is that difference rreat? We can anse nce and with certaints it is can answer at almost incrediblo! One meat conse of th ifferen midalo class only masters and slares bmes no the anciast, Amongst vere hold fit onlo to pros professions rerer her fit only to be practised by slaves. uxury a mon aristocratic luxury, - a mean, squalid, general poverty. With also anvance of the later Roman empire came also an adrance in conveniences or lifo; hut rt itself declined, and with the fall of the mpire, the art of building cities fell also; hen the dark ages settled over Europe. Through. out this period, or from about the fifth to the elcventh century, many now cities and towns rose throughout Earope, of which the royal residence, the church, or the castle formed the aucleus, surronnded by walls, within which all was narmowness and filth: nor is this to be wondered at, when wo rememher that the reatest people of Europe during this period ased thoir fingers to eat with, and thought it ne mean accomplishment to bo able to writo their wn names. Luxury, sanitary provisions, and ven comfort wero unknown, excent amongat the great nobles and the higher clergy. Bot why did the dark age people huild such close, pent.np towns? Lind was not dear, as it is ree.pland they might havo had spacious st is, that they hed no jden that system and art ought to enter into the arrangement of a town They probably did not think about it at all; they did what their fathers had done hefore them. hey followed preoedent, and the principal pre edents of the West were derived from the Eest The Mahomedans of the eighth and succeeding enturies were to the world what the Christians became at a later period, the first in arts and arms. Europe was their pupil, and followed losely their example. Life with Orientals was then an incessant warfare against two cnemies, the sun and their fellow.creatures; so that when aen congregated together, thoy sought to keep out both in the best way they could, raising strong walls acgainst the one, and forming narrow treets against the other: thus they eajoyod the comfort of coolness, or at least of shade and the comfort of a sense of security; beyond that they appear to have had no particular ideas. The plan of many such towns is preserved even our own day, of which Albenga, on the Riviera, is an interesting oxample; a sort of arge prison, intersected hy narrow and tortuous passagcs, tending to keep out sunshine and fresh dark and confinod a space. So things went on

* From a papor by Mr. J. B. Waring. Fellown, read at
he ordiuary generai meeting, held on 1 onday, the 31 of of
in the same fashion, over and over again, into the semi. opeque or Middle Ages; and Mr.
Hudson Tarner, in his most valuable work on Hudson Tarner, in his most valuable work on the "Domestic Architecture of England," speak-
ing of London in the thirteenth contury, when ing of London in the thirteenth contury, when "as to tho appearance of the City, we shall not perhans be far wrong in assuming that it pre. sented the aspect of a mass of low whitewashed tenements ; the plasterers' hrush appears to have been unsparingly omployed, to give a cleanly exterior to the dwellings of the Lon. doners"; but if the outsides were clean to the eye, the interiors of the cities must have beeu
often filtby. "In the principal thoroughfares," often filtby. "In the principal thoroughfares," says Mr. Turner, "it is evident there was some kind of foot paroment, though the roadway chance; and the streets leading down to the river, which offered the means of a natural
drainne from the upper and more level parts of the city, had usually onen drains flowing throug? them, the effect of which was to maintain them in a continnal state of mud." Eren in the great hall itself at Westminster, the refuse and dirty water flowed in an open kennel through it, until the foul odours arising therefrom" led Henry II. ordered the construction of a "sub. terranean conduit" to convey the "offensive matters into the Thames"; and this, Mr. Tarner thinks, is perhaps the earliest instance of nnder. ground drainago in this oountry. But to returu to the more immediate subject in hand, we come at last to a glimpse of a better state of things in the reign of Edward I., who, from one causo or another, founded completely new towns, which were often oalled in France villenewves (new towns) or villefranches (froe towns). Mr. Turner freo men, exempt from the power and juris. diction of the neighbouring barons or bishops; their tennre was dircet from the Crown, and they were granted the important priviloge of free trade." Here, for the first time, so far as we know, in the history of cities, "we come to a clear and definite system of arrangement;
and it appears probable that this system is dur to Englishmen, since Mr. Turner gives an extract from an original document in French, wherein Edward I., anno 1298, wrote from Bordeans (then the capital of the English provinces in France) to London, "desiring the authorities tbere to send him ont four persons competent to lay out the plans of towns, who best know how the divide, order, and arrange a new town, and for the merchants." Alfonso, of Poitiers, coming to the Duchy of Cuienne, about the same period, finding tho nobles and higher clergy quito independent of him, also founded free towns, such as Rovergne and Agen, the last of which is still in a pratty perfect state. Edward founded Sauveterre, Mronsegur, La Linde, Saint Foix, Libourne, and Montpazier, in France; and Kingston-on. Enall and Winohelsea in England, all formed on a general plan, of Which Montpazier win serve as a good example, and fully described by Mr. Turner, from which We give the following extracts:-"These towns modern towns, and are built on an excellent and modern towns, and are built on an excellent and
scieutific plan. . . . There are always two scieutinc plau.
- There are always parallel streets and connected by short streets at frequent interfals; between these principal streets, and in parallel lines, are narrow streets or lancs, corresponding to the moderu mews, and em. ployed for the same parpose. By this means each plot of ground for building on is of a uniform sizo and shape, a parallelogram, with one end facing a principal street, and another a lane wide, tho lanes 16 ft ., and the passages only 6 ft . Near the oentre of the town was Iarge market-place, at one coruer of which was usually the charch; and it should he observed that the prinoipal streets do not cross each other in the centre of the market.place, hot run in a line with its four sides . . . so that the traffic did not interfere with the central space." Our
own opinion is, that this plan of rectangular own opinion is, that this plan of rectangular United States of America, is not a good one, for reasons which we shall presently state; never. theless, it is a great improvement on old customs, and has no doubt some special advan. tages.
*This remark applics to Medieral cities in Europe. Marco Polo, writing in tho thirteenth century, describes Pekin as formed in a regular plan of sqnares, like a chess.
board, a plan of ancient adoption in China,

The foundation of now tomns seems to have oersed shortly after the thirtecnth century, and the principal cities of Enrope appear to have heen built $n p$ from time to time in a haphazard manner, whilst their internal condition was of the worst description, of which an idea may be formed by reading the article "Paving of Streets," in Beckman's "History of Inventions," volume 1. In the seventeenth centary, however the Great Fire of London (1666) prodnced two plans for the systematic arrangement of new streets, \&c., which present some new and notice able features. They were designed by Sir $C$ Wren and John Erelyn, and both are engraved in Strype.
The fire destroyed buildings estimated at ahout 13,200 houses, covering an area of 436 acres, and, hoth in form and extent very closel corresponded with the great fire of Chicago, in 1871 ; besides dwelling-houses, St. Panl's Cathe. dral, eighty-seven parish churches, the Exchange, and other public huildings were hurnt, and an opportunity was afforded of designing, as it wero \& new city. Sir C. Wren's is shown on the wall. Lcaving out details, he proposed to form three kinds of strects, 90 ft ., 60 ft ., and 30 ft . wide respectirely; to form a canal of Fleet Ditch, to be 120 ft . wide; a quay along the river-side 40 ft . wido; the principal puhlic huildings to be massed together round the Royal Exchange, on a large arca of octagonal form, from which radiated the main streets, and in which, at stated intervals, were to he placed the *arious churches, whilst all churchyards and " ronnccessary vacnities, and all trades that nse grat fires or yield noisome smells" were to he outside the town. This plan of Wren's is a system, and on the ald system, or rather no. scarcely be indeed, in some respects, could say, howerer, that neither his nor Evelyn's plan was adopted, much to our loss at this day.
When the great fro took place at Chicago, it occarred to mo that an opportunity presonted itself of laying out the new city on an entirely new plan. I had not at that time seen Wren's plan for rebnilding Loudon; but it required only some consideration to be convinced that the rectangular plan common in the States was open to many objections, and that an entirely different principle should be adopted. That principle I found in the spider's web, especially in the web of the "geometrical spider," in which the siven point is clearly obtained; and time is, we know, money, which all men now seok after so earmestly. My further ideas on the subject will perhaps he best understood hy the papers I sent to the Mayor and municipality of Chicago on the suhject, and from which I give the following

The main plan is to bo on concentric circles
rather semi-circles, divided into sections by radiating streets, and sub.divided into wards, to be provided with means against fire, and sanitary arrangements complete in ench section respec. tively, corresponding to our old system of wards or guards. In rebuilding the city, advantage might be taken of a combination of squares, arescents, torraces, boulevards, and streets, so houses might have colonnades on the lower story, as at Bologna, forming comfortahle walks in summer or winter, whilst arcudes, like those of Milan and Paris, should connect the principal points of interest. All buildings should ho con. structed as nearly fireproof as possiblo, and per structed as nearly freproof as possiblo, and per.
manent sites for firo escapes be established at stated distances throaghout the city. To avoid stated distances throaghout the city. To avoid
the monotony which characterises the new por. tions of Paris, Lyons, and other French cities, in which large blocks of new buildings have been lately erected, and one street so closely resembles another that somctimes you can hardly say in what street yon are, I propose that various
styles should be assigned to varions styles should be assigned to various hlocks of buildings, so that all styles of architecture may bard, represented-Crees, Italian, Gothic, Lom. bard, \&c.-as may be found consistent with good taste. Moreover, we should thas avoid the unsightliness commonly seen in Fingland, of huildings widely different in style, ont of all harmony, and sometimes painfully incongruous, placed in juxtaposition and mutnally destructive of each other's effect. I wonld snggest that all buildings wherein large masses of persons con gregate, such as theatres, chnrehes, assembly. halls, \&c., should be provided with numerous ways of speedy egress, not only for safety's sake in case of sudden panio, but for the ordi-
nary convenience of the crowd; whilst the way
of ingress may still be few in number, Public haths and laundries, and pnblic kitchens and hakcries for the poor, should be established in the poorer quarters of the town, as well as a regular system of puhlio drinking-fountains for men and cattle. There should be a large pnhlic park, gymnasium and haths, and a puhlic garden With terraces and fonntains, laid out or the model of the old Italian gardens, such as, for instance, that of the Pitti Palace at Florence; these should he connected with the houlevards, which might consist of a contral paved pro-
menado lincd with trees, having a road and menade lined with trees, having a road and
tramway on each side, furvished with a hand. trammay on each side, furvished with a handsome pared way next to the honses for foot passengers. An example of this kind, which produced an excellent effect, I have seen at Toulon, and would carry out on a larger scale.
A few rood canals, crossed by ornamental swing bridges, as in Holland, might serve to counect the traffio of Lake Michigan with the principal railway stations and the Ilinois caval. Spacious markets should be orected in centrai positions; those for fish heing fornished with troughs to cach stall, bllod with water, in which fish can be kept alive, as in the "Halles" at Paris. Abhatoirs, cattle markets, and all offensive or dangerous manufactures, should be kept outside the city precincts, and finally, not only should a system of sewerage be carefully pre parcd, for the purification of the oity, but the sewage matter should be utilised as manurc, cleared prairie land of the State; and in all cases, it praire land of in mind, that as Chicano has grown so rapidly in the past, thero is every reason to beliere that it will increase still further in tho fature; therefore, whatever is done,$_{2}$ an eye should be kep
It may appear fancifnl, and yet in many re spects a large city appears to me to resemble a human being. It has arterios and veins, or largo and small thoroughfares, through which the blood corpuscules, in the shape of men and its cen, continually circulate. It has a heare busincse of life is mainly carried on. Lungs, or parks, and open spaces in which tho air is purified; it requires water reservoirs and apparatuses for receiving and discharging solid and liquid secretions, by means of drainage and sewace, ontside the body corporate: moreover to complete the resmblance, the surface of the city, its akin, so to speak, requires oonstant cleansing by water and friction, to insure that clearliness which is essential to health, whilst the mnnicipality may he regarded as the brain, the mnnicipality may he regarded as to brings oxperience and science to hear on the regulation of tho entire body, having an equal regard to the convenience, health, and exteraal appearance of the whole city

As regards the figures adaptable for the block plan of a city, with its thoronghfares, it will be seen that the choice lies almost entirely between a square, a parallelogram, or a circle; and our OWL opinion is ell in favour of the last named both for hearty and convenience

Space, air, and trees should enter into all plans for new towns or new quarters, and wonld propose that instead of tho old system of gardens at the back of two houses, the garden should he in front of the house, then the paycment and road for ordinary traffic, with a donblo tramway in the centre for the corriage of trains and cattle, not by steam but by horse-power; for thero seems mo no valid reason why rail way trains should not be carried right through a
city without changing. This of course would city without changing. necessitate a much wider roadway than is common at present. All streets, tarraces, de.,
should bo provided with back roadways for house service, coals, dust, and the carting away of refuse or sewago matter ; and in a wellarranged city a back road to each street will be
as necessary as a back staircaso in a wellas necessary

Society of British Artists.-The fiftiets exhibition made by this Society, and now open in the Suffolk-street Galleries, consists of 924 paintings and drawings, and four small pieces
of sculpture. The president of the Academy of sculpture. The president of the Academy sends a portrait, and Mr. Leighton, R.A., some small contributions. The collection cannot be said to bo strong in figure. pieces, hut has some good and many pleasing landscapos. We will take an opportunity to speak of it more at length.

## SCHOOL BOARDS.

London.-The Works Committee recommended the acceptance of the lowest tender, that of Messrs. Perry \& Co., of Tredegar Works, Bow, amounting to 7,1781 ., for the erection of schools designed by Mr. E. R. Robinson, to provide for 1,100 childrea, on the site in Globe-terrace, Hackuey, purchased for the Board for 3,000l. 19s. 6 d . The list of these tenders has alroady appeared in our columns. Northampton. The following letter was read by the clerk with respect to the sites selecte by the architect chosen by the Board:-
"I here the honour to acknowledge the receipt of your
ro letters of the 24th ult. The official architect report as follows upon the plans for tho Spring.lane site:-
-These plans are satisfactorily arranged. There accominn
infants:
built on -The arrangement for the boys sitace was girls follows:should be revised in aecordance with rule t. The preasent
arrangement causes considerable logs of desli and bench space. If properly arranged there would beacommoda-
ilon for 540 viz., 160 boys, 160 girle, end 220 infants, My Lords acquiesce in the Board's proposal to purchase the amall additional piece of ground adjoining the Vernon-
terrace site, -I am, \&., F. Cumint." Bristol-The Coh De
Bristol. - The School Design Committee brought forward fifteen tenders for the erection of new
schools in Freestone-road, St. Philip's. They recommended that the tender of Messrs. Bevar of Bedminster, be aooepted at 3,080l., if the foundations were of Hanham stone, and 3,170l. if of brick. This and matters tending to reduce the cost somewhat, the committee suggested, should be left to the architect, Mr. Coleman. The report was agreed to, and also recommendit tions for nsphalting the yard, and obtaining desigus for school fittings, and borrowing 4,000l. from the Public Loan Commissioners to cover
the cost of the land and erection of the the cost
building.

Halifar. -The Sites and Building Commitiee reported that the Education Department had finally approved of the plans for the Queen's woad Schools, and wonld recommend the Puhlic Works Loan Commissioners to grant a loan of $10,220 \mathrm{l} .17 \mathrm{~s}$. 6d. on their account. The committoe suggested that the plans and specifications of Bootli Town School be sent to the Education Dopartment, and that on their approval
tenders shond be invited for tho works. The seport was adopted.

## STONE FLOORS.

Sik,- I have a lloor of rery soft stone. The goods are
spoiled by the fine, dust from the said floor. I should
the glad to know of any morlole be glad to know of any matorial to put upon the surface say in, or $\frac{1}{4}$ in., from which there would be no dust.
Anything liko the foreign asphaltes would do, but for the oont. Perbaps ordingry apphalte would do, if it could be
made rery poont, The metbod of combining tar and
Portland cemannt, and the purpose for which it is wanted,
$\qquad$ a Contractos.

## ON MODERN ART-ARCHITECTURAL CRITICISM.*

IT is not our intention to attempt an elaborate essay on the subject of criticism generally, or to
vontare even to glance at the large area of its vonture even to glance at the large area of its
soblivisions lying open for dissertation; nor does it imnediately conoern us at the present moment to inq口ire whether to Aristotle we owe
the art or science of criticism, or whether in their day, Aristarchus, Varro, and Longinus
the ant were distinguished "practitioners," or Hesychius, Dionysius Alexandrinus, Eusebius, Si. Jerome, dC., masters," of the art.
With the limited

Wiffice us to limited space at our disposal it must suffice us to know that from the eleventh to the oighteenth centuries this art, or science, has pos-
sibly, sondowhat interruptedly, been made "study," and in the sixtcenth, seventeenth, and eighteenth centuries raised to a "polito art",
by all nations of the globe who boasted of by all nations of the globe who boasted of any smount of oultivation or refinement.
Up to this latest date even was critisim
invested with good sense, logic, and an inflexible rulo of fair dealing, placing the critical works and essays of the time amonget the best of our .standards now, it was left to our more enlightened (or moro degenerate, as our readors may prefer) of judging in such matters, to forget that "criti sism" involves seeing beauties as well as faults, to be ohlivions of the fact of its requiring disorimination, exactitude, and the impartial hand Which shoald hold the scales whilst the tre
balanoe wavers betwixt praise and blame.

* By Alfred Jowers, Prize Essay, Royal Iustitatc
of Britieh Architecte.

We have changed all this; for the better? No, With a practice apparently far more consonant to modern times and taste, we, as a rule, indulge in undiscriminating and uncoupromising couselves in this nineteenth century asking, "What is criticism? In what-does it consist, in analysis, or in mere expletive verbiage
To a greater extent, possibly, than over previously occurrcd, the press is now mainly the reflection of pullic opinion and fceling on most matters of social importance; and yet, judging from the contribations of some, at least, of our contemporarics, and the editorials of a portion apart fress, here is no such thing as cricism but of the man, and that troo criticiem shonld consist, not in the scientific use of the dissecting. knife, but in a perpetaal wielding of the tomahawk and sealping.knife ; in constant endeavours to maim and mutilate the entire structure, good and evil, rather than to delicately probe and scientifically diagnosticate, with a view of preserving the sound and severing the obnoxious portions.
Undouhtedly the philosophical, political, and, in spite of a prejndico to the contrary, even the wheological, helds of literature are well supplied who, more frequently than not, soem imbued who, more frequently than not, soem imbued
with a true spirit of criticisun, "judging," or at least to the hest of their ability atberopting to 'judge, in the hest sense of the word, the various doctrines, hypotheses, and party views which come to their notice
It is only when wo reach the confines of art, or most certainly of art-architectural criticism,that we observe at onee the tracos of an inter-
nccine strife rather than the symbols of dignity nccine strife rather than the symbols of dignity Whethor it is a judgment. seat.
Whethor it is that from the very refinement of art its devotees become abnormally sensitive and irritahle, we aro naahle to say, hut it is undoubtedly a fact that as a body wo seem ingularly deficient both in justice of discernment and fortitude of ondurance when jousting in the arena of criticism.
Nor even in this arena is it by any means strugglo of honest, above-board, hard blows, and marder returns. Our anonymous attacks partake the of guerifia wartare than of the lance and openly cer-stalf, and in the few to be as to who can throw most mud, in the praiseworthy lope of some sticking, rather than an endeavour to discoss the merits of tho suhject moro immediately under rovicw.
surely when we hecome art-workers we need under ase to he generous! Or is it that we are abuso, and that it would be a deplorahle weakncss to indulge in gentle and generous recognition of merit in any work of a "brother-inart"? If it he true that "out of the ahundance of the heart the mouth speaketh," it is to he loped, in the name of all that is haman, that there is a vital distinction hetween that of an ordinary social being and the same individual when trausmogrified into an art-architectural
critic.
Moreover, is not the course we pursue,-t take a more practical, if somewhat. lower, view, Is not the
Is not the mind of the puhlic already sufficiently callous to the merits of our art (prone to look upon us, even at the best, as evils necessary, hut a nuisance) as scarcely to need the constant iteration of intestinal squahhling
as to our weakness and our folly ?
If, thoreforc, this pufortunate Eluency and requency of eritical commonplace, seasoned with a strong spice of what may he termed literary acrohatism, is known to repel not only the mere surface-skimmer, hut the earnest thinker and well-wisher, to mase arohitecture a an art less ontrancing and its practiscrs less influential, shall we of ourselves both propagate the offence and weep over the result?
Not only in this general tendency to a cynical appreciation of others, in this disruption in our very midst, is danger to our reputation for strength of mind and common sense to be ohserved and feared, hut even in the very dovotees of those earnest and pure-minde apt to deteriorate unconsciously into partisan. ship.
Aot that we arc hy any means preaching a and no criticism," too conscious that in these days that inust be a myth, a text, a peg on
which to hang nuch fine writing, not a tangible fact on which to practise; hat rather are we condemning "criticism for oriticism's sake,"
seeking to eradicate that odium architecturun which to eradicate that ourum architechum its rirnlence shame he it said, has long sinoe hat roverb of tirown far into the shade that
Let us consider for one moment, and take random, in our own mind, any recent review or reviews on suhjects architectaral : what do we find?
practitioner is incscusably successful over his compeers! Inmediate suggestions are covertly mado as to local or other interests, or on tion of part, delicately veiled nnder the descip. may have committed the indiscrction, at some early period in his career, of writing a book, and may have bince become as well man, on accomplished owchitect. neretheless without the least eramination of the tural work supposed to be under review he immedialy twittel with hi former lite is efforts and assured that in those selon "保 ho "! church orchitecture, and o seonlar ramous in into consoin ands: nevar mina that ho is an ahle, will hear on oll sines that "it sarours of coll siasticism, it is 'monastio'". " for the Dark Ages, no douht, but atterly sunfate for modern rogirments". that herry united better " keep to the path in which he had dis tinguisled himself"; and so on: hut not a word of real criticism of the work, thourh much on the man, not a word of argument or proof to support the mere assertions of the critic. Should he have given his attention carly to, and havo gained a reputation in, the more decidedly decorative portions of the profession, we hear glibly repeated that he is not a "practical man," or that he can decorate a bouse, but cannot haid one," regardess of the actual frot that the criticised has probably built more than all his critics together! And so on through all phases and all branches of professional practice it seems the constant endeavour of the critic to import into his criticism as much of tho man as possible, aud to carcfully avoid any impartial consideration of his work.
Failing these more personal notices, we obtain cither a vague, dreamy, nerveless, "damning pinion, an unserupulons wiclding of intellectual force, goading the victim to aningenions weaving of literary pitfalls, into which possihly bo falls, to the intense delight of the anonyrnous fowler. Suraly this is scarcely fitting work for literary athletes; worse than useless in either forming or gaiding pahlic opinion; a safe and sure means of promoting jealousies and mutual mistrust amongat those who frequently have no possibility of professional intercourse with, or knowledge of, ono another except through press notioes of their respective works of no more value in raising the standard of professional tone than attempting to stecr a vessel hy ignoring the compess and abandoniug the helm ; is shor ighted in policy as refusing a crop of sterling grain and revelling in the winnowed chaff
and yet such appear to be modern notions of architectural criticism! Such the erapty crambs so grecdily accepted and devoured as art-manna by a public eager for flitting pleasures, and anxious for seasoned dishes, even though they be made of devilled reputations!
Nor do we hear frome our professional ranks one word of remonstrance ; on the contrary, of all critics thus sinning we ont of our own midst are undoubtedly the greatest simners. Not from outsiders, bnt out or the tnouths of colleagues," of "brothers in art," or, as some will have it, of ellow "trade-unionists," have from time to time proceeded critical witticismas on contemporar's works, which, however amusing at the tme, are, we fear, not calculated to raise either the status of the critics or that of the profession they represent.
Quite recently we had the edifying spectacle of a member of the profession, writing of another still more distinguished member's crowning work, that "it would have been a lesser cvil to have had a war or a pestilence than that such a building should he erected."
Ts it necessary to quote further examples, Which must occur to all who interest themselves in ourrent professional topics, to account for the easy' descent from such premises to the would. be scathing of a contemporary reviewer? Can we be surprised that the public fights shy
of birds who so wilfully foul their own nest Or that, on many occasions, public especially we, as a profession, get unnuercifnlly snubbe we, as a protession,
To what a painfully low ebb all sense of professional cohesion (other than that induced by a be judged of ty the sole public reply ronchsafe be judged of ly the solo public reply vonchsafed but very recently to the proposal ar a most Whor in and respected memver or our prolession, round of our body by a code of honour, as round of our body by a code of honour, as a
means of ensuring somo measure of esprit de comss and uniformity in practice. And the comss and uniformity in practice. And the
reply ? Not an eager acceptance of, bat a duly reply ? Not an eager acceptance of, bat a duly priuted and pnblished protest against, the pro. posal as an forsooth! as thougb codes of honour and esprit de corps wero terms synonymons for and espuil de corps wero lerms synonymors the constitutional symbols of trade-unions!

## Part II.

Hence the unsatisfactory position of the profession, and tho low estimation in which it is hold by the public. For unsatisfactory the
position is, however much wo may attempt to position is, howerce much we may attempt to
iguore the fact, or to bolster up our own egotistic igyure the fact,
self.sufficiency. self.sufficiency.
Of course, it
Of course, it is equally trine that the profession boasts a few duces, who, by reason of sheer force of character, intellectual attributes of an exceptionally high order, powerful friends, or even by luck of that "opportunity" which is said to occur to erery man once in a lifetime, hare won for themselves a position in which they are to a great extent paramount to the public ; no less certain, howerer, is it that by that same
public is the great majority of the profession public is the great majority of the profession

## Part III.

Hitherto we havo dwelt chiefly on those phases of adverse criticism which have had their origit more or less in professional or allied sources. It may he wrell, perhaps, that we should now turn to views expressed by those whom we may define more correctly as ontsiders, and whose judgment might therefore be regarded as more impartial, or at least more mobiassed, than that of those practice.

We may, moreover, state that neitber in the observations we have already made, nor in the further remarks we may offer, have we the least intention of suggesting a "masterly inaction" or "rest-and-be.thankful policy." on the con. trary, we are desirous of moving with the times, not deprecating but ansions for criticism, and simply stipulating that it should be criticism, and not simply condemnation.
It would entail by far too long an essay to many indicments a cainst pse and reply to the to "bark back" to the early days of Government cormpetitions, or even to the somewhat later "arcbitects and market-gardeners" period of our exaltation! Moreover, there is now and then of a strong position and forcible type, may be looked npon as proceeding rather from a "semi. foedom of an irritated or indiguant public. And
to what, wben it is analysed, does this mitrail. euse discbarge of random literary blows amonnt? To a great many hard mords, disagreeablo suggestions, and impossible assertions, witb a cheap and temporary notoricty for the author.
Nor is this by any means a diffleult rolo to play; and this desire for notoriety is the only possible interpretation of the singular dogmas to which, nnder the influence of criticism, iutellecthal writers capable of brilliant composition caa give birth.
Is it for a moment possible to conceive tbat any one man, wrapped as he might be in egotism, soured as be may have heen by a dire train of untoward circnmstances, could sit down and honestly think himself capahle, in the course of some forty pages of letterpress, of attempting to detract from the reputations of somo dozen men whose professional ability and social probity have, after years of earnest toil, met with ackowledgment from their brethren and approval and reward from the public? Conld any sane person solemnly propose that, in these days of fierce compctition and hand-to-mouth strucgle for life, we should, crab-like, proceed backwards to thoso halcyon days which, Minerva-like, we fear, have but sprung ready-armed from the too fertile brain of the writer, but in which we are gravely assnred that the architect, builder, elerk of works, and artizan were all comprised in one marvellous indipidual, the bite-noix of modern times, the irrepressihle "working man"! Yet snch is the adrice, combined with the flattering unction "that nothior would he more mratifying to our social progress than sueb an clevation of the men whose works continually affect our daily life. sion, and a place as bonta artists, business men, stu. dents of dents of symbolism and arclicoology, and, in fact, pupils and illustrators of those very workmen ws to face of universal strikes "continually affecting our daily lives." we think there can be but one affirmativo opinion; but as to the "social progress" which wonld result from any sudden up. hearing, or, we should more correctly say, any confess to sception as extreme as that wich confess to a scepticism as ext as thich forbids as for ono momeut to entertain an idea so preposterous as that the picturesque charms of Canterbury, the grandenr of Durhan, or the chaste completeness of Salishnry were ever in
eitber or all instances the sole conception and erecution of one inspired head and haud; on the contrary, we are firmly convinced, and assert emphatically that, whether with or without drawings, there always did exist, ond ever will exist, tho same marked divergence of nental and physical labour, tho sumo sub-divisions of master and subordinates, tho artizan and labourer, as we now find. Undouhtedly, in tbe absence of mischievous agitation, there was one great dif. ference; authority was kindly exerted, labour willingly conceded, and possibly from this alone arises the oneness, the immeasurable beanty and completeness of Medireval works.
But, in fact, noither from these pscudo-profes. sionals nor from the genuine and unnitigated "one of the public," is it possible to grather a tangible basis on wbich the ill-defined under current of half-contemptuons, slighting, half-on smfferanco endurance of onr profession at present rests. In many instances might we most appro. priately borrow a simile of one of our would-be bitterest critics, and sny that theso aimless attacks are "a propos of nothing save of desperato imbecility.

Equally impossiblo is it to nnderstand on what qualifioations tbey ventmre to assume the judg. praise or blame to be awarded their victims on praise or blame to be
And yet is it so difficult to comprebend? Does it not all proceed, to borrow again from our friend the critic, from that balf.knowledge that "puffeth up"?
"Knowledge" generally, and of ordinary subjects,-is no " technical knowledge of special be attaned by any "royal road," but is the re sult of careful study, of sheer hard work, of untiring energy, perseverance, and ability rightly applied, in conjnnetion with eyes educated to seo and a mind trained to receive tho best impros sions from the choicest sonrces.

Of, "Si monumentum quaris circumspice," noble paraphrase

ON THE ECONOMY OF FUEL FOR DOMESTIC PURPOSES.
On this important snhject, Captain Douglas Galton, C.B., read a paper at the Socioty of Art on the 2nd inst. We condense portions of it. The total quantity of coal now annually con sumed in the United Kingdom is stated hy Sir W. Armstrong to be ahout IIO millions of tons. The Coal Commission estimato that the con mmption of coal may he roughly divided into incee parts, one.third being used in manufactur. ing processes, one-third in steam-engines, and one-third for domestic purposes. On this asat nearly $37,000,000$ latter may be assumed at nearly $37,000,000$ tons in the year. This means a consumption of ahout one ton and a fifth per head of the popnlation. I am, however, inclined to think that the amount is over.stated, and that probably even one ton per head of the population of the United Kingdom would be somewhat in excess of the average. The in. crease in the price of coal, of from 2 oैe. to 30s. a ton, which we have recently experienced, is thus equivalent, on this assumption, to a tax of from Il. 5 s. to 1 l. 10 s . a head.
I think I may say, withont hesitation, that the quantity of fnel now absolutely wasted in our houses amounts to at least five. sixthe of the coal consumed. That is to say, if the greatest care and the hest method of applying the heat were in all cases adopted, wo conld effect in heating and cooking all that we now effect, with one-sixth of the coal we now use; and if, in the construction of our fireplaces and cooking appar ratus, simple principles were recognised and ordinary care were used, we might withont diffi. culty save from two-thirds to half of the coal $32,000,000$ Therefore, instead of consuming , poses, we should not consume, if coal were fully conomised, above $5,000,000$ tons, and, if even I2,000,000 to $16,000,000$ tons only need he Thus, this economy in the household consumption of coal would enrich the nation to the extent from $20,000,000 l$. to $30,000,0002$. annually.
One pound of coal is capahle, if all the heat of a room, 20 ft , or rasing the temperature 10 degrees, air. If the room were not abotnre of the onter air. If the room were not ventilated at all, and terials, the consumposiod of fuel to manatain this temperatare would be very gmall, but, in pro. portion as the air of the room was renewed, so would the consumption of fuel necessary to maintain that temperature increase. If the volume of air contained in the room were
changed every hour, one pound of coal additional would he required per hour to heat the inflowing air, 80 that to maintain the temperature at 10 degrees ahove that of the outer air during 12 hours would require 12 lb . of coal.
One ponnd of coal may he assumed to require or its perfect comhustion, 150 cuhic feet of atmospheric air; 8 lh . wonld require $\mathrm{I}, 200 \mathrm{cuhic}$ feet; but, at a very low computation of the velocity of the gases in an ordinary chimney. fue, the air would pass up the chimney at a rate of from 4 ft . to 6 ft . per socond, or from 14,000 to 20,000 cubic feet per hour, with the chimneys in ordinary use, and I have often found velocity of from 10 ft . to 12 ft , per second giving an outflow of air of from 35,000 to 40,000 cuhic feot per hour. This air comes into the room cold, and when it is heginning to he warmed it is drawn away up the chimney, and its place filled by fresh cold air. A room 20 ft . square and 12 ft . high contains 4,800 cuhic feet of space. In suoh a room, with a good fire, the air would he removed four or five times an hour with a moderate dranght in the chimney, and six or ight times with a hlazing fire; the air so removed would be replaced by cold air. The dowa rapidly hy the continued influr of cooled to supply the place of the warmer air drawn up the chimney. The very means adopted to heat the room produces dranghts, because the stronger the direot radiation, or rather the hrighter the flamo in open fireplaces, the stronger must he the dranght of the fire and the abstraction of heat. The only way to prevent draughts is to supply the place of that removed. warmed air to Warming hy means of removed.
various parts of the hnilding conveyed hy \#ues to various parts of the huilding, will answer, as a rule, in ordinary existing houses, hest in connexion with open fireplaces, which draw in the
warmed air to the various rooms, because there
must be some means of forcing or drawing the warmed air into the honse, and it would not be house to pump in the warmed engin an ordinary freplaces would then warmed air. These open spare heat when, however, be wasting the spare heat which each fireplace sends np its own chimney; hat, on the other hand, very mucl smaller fires would he needed to keep the rooms warm, than when the rooms are not supplied with fresh warmed air. Theoretically, however, it can be shown that if we are prepared to give up open fireplaces, and acrange our houses on the plan of having flues which weuld draw off the air from noar the floora of our rooms, and which would also warm fresh air, heated from a central fire, to he constantly admitted near the ceilings, and if the climate were such as to make us desire to have the system in continuous opera tion, such a system wonld prahably he hy far more economical of fuel than open fireplaces, because the fuel used could then he made to do its full dnty. The variations of our climate, and the low price of fnel which have hitherto pre vailed, have prevented snch systematic arrangements from being adopted in this country. The plan of carrying the heat from the fire to the air to he warmed by means of hot-water pipes, affords, also, a very economical method of warming air, because the best construoted hotwater apparatus will onable the full heating value to be got out of the fuel. Fuel may he consumed to far greater advantage in a close furnace than in any open grate, because the admission of air for the comhustion of the fuel can he regulated to any required extent. The heating surface of the hoiler may also he so arranged as to ahsorb a very large proportion of the heat generated by the fire.
Bater in deciding on the amonnt of heat in hotwater pipes which is most favourahle to ecoleast the following considerations occur:-At necessary the quantity of air which is strictly necessary by theory passes through the fire in the best constructed furnaces. In an ordinary grate this consumption is enormously increased. Each part of oxygen supplied hy the air and necessary for combustion is accompanied hy four parts of mitrogen, which is of no value for comhustion. Conseguently, if twice as much oxygen passes through the fire as is strictly necessary, we have one part which combines with carbon and produces combustion, and nine parts which, the temperature of the the first place, to lowe ${ }^{\text {. }}$ the temperature of the fire; and, secondly, to carry a larger amount of unutilised heat up the chimney, Moreover, when water is heated sufficiently to generate steam, each particle of water converted into steam absorhs or makes latent $960^{\circ}$ Fah. of temperature. In experiments on gases passing off in the chimney was ascertained to vary from $430^{\circ}$ to $530^{\circ}$, diminishing to $415^{\circ}$ at the top of a flue 35 ft . high, with dampers open; and about $380^{\circ}$ at the bottom of the flue with the darapera closed. With a hoiler of which the temperature of the water is maintained at $200^{\circ}$ without eveporation, the temperatur of the flue need not exceed from $230^{\circ}$ to $240^{\circ}$.
It is clear from these oonsiderations that, in order to ensure the maximum offect from the fuel, the heating surface of the pipes shonld he sufficiently large to warm all the air required without its heing necessary to raise the tempe. rature of the water in the hoiler to any great extent, and the proportion hetween the boiler surface and the pipe surface, that is to say, hatween the surface which ahsorhs heat, and the surface which gives out heat, should be such forced ronder it unnecessary for the fire to be which the gases from ther the teraperatnre at whimner, the gres from the fire pass of up the In order to show the the economy. reing the hiter into the the hoilex, i.e., from passing the gases tempera Demperature, I will give an instance of one ex. perjment. The proportion of heating sarface in the poiler to the heating surface of the pipes, is assumed sy some 100 , or, whent ment made on $4,000 \mathrm{ft}$. of pipe, heating cortain 40 greenhouses with a wagon-shaped hoiler with 40 square feet of heating surface, showed that a certain lemperatnre was kept up for 8 hours wilh 8 bnshels of coal; hut when, hy the addition of another boiler, the heating surface of the hoiler was increased to 80 square feet, the emperatare conld he maintained for the same period with 4 hushels of coal. The outer temperature was the same on the two days.
On these grounds it is not so economical, so
far as the consumption of fael is concerned, to uso steam instead of water, either water beated to a high temperature under pressure, or to heat air for warming purposes, hecanse the gases from the fire employed to produce the higher degree of heat will pass off at a high tempera-
ture, and the heat they contain be wasted. On the other hand, the capital outlay required where highly-heated pipes are used, is smaller than with bot.water pipes, because a smaller heating surface, and therefore smaller pipes, will suffice When the temperature is high; and, moreover,
very small pipe will convey steam to any required place; whereas, with hot water, at a relatively low temperature, much larger pipes are required. It follows that where the price of fnel makes it necessary to reluce the perma. nent annual expenditure, the original capital outlay must be increased. There is a further consideration in regard to economy with hotwater pipes, steam-heating, and all appbances for warning buildings from a central fire, viz,s, distances before its uscful application comes into force, very mnch heat is lost, and consequently force, very mnch heat is lost, and consequent one saving which would result fromi a more immediate application of the hent to the place to be warmed, there is to be weighed the diminished expense of attendance consequent upon the use of one fire instead of several fires, each with its attendance and supply of fuel. There romains grates nsed for heating water, which has not grates nsed ador heat. 1 mean the application of some of the heat which is passing into the chimney to warm the air which frods the fre. Theoretical considorstions show that an advantage of from six to nine per cent. might bo obtained from this source, and the exp
whiok I have made bear out this result.
Whiol I have made bear oit this resul.
But, after we have desigiod the most effective But, atter we have designising the fnel which
arrangements for economising the warms our dwellings, if that object is to be fully secured, wo must arrange to retain the heat in our houses. The architect sbould dovote to these considerations the same eare which ho
now is frequently satisfied with bestowing upon now is frequently satisfied with bestowing upon
the beauty of the design for a building. The arrangements of the plan should be adapted to the retention of beat. All portions of honses ex. posed to the air should be formed of materials Which are found to be the slowest conductors of
heat. Whatcrer may have heen the laches of heat. Whatcrer may have bran or kitchen. ranges, the nation has latterly very much disregarded the means of retaining heat in the honse. The nniform model-house of the specu. lating builder is constructed with thin walls,
thin glass windows, ill.fitting casements, and a thin glass windows, ill. fitting casements, and a
roof of slates, with nothing ander them. The roof of slates, with nothing under them. The old half.timbered house was warm, because it had an air space between the inner and outer skin; the brick.built, stone-faced house is warm heoause it has, so to say, a double wall. In
modern honses it has long been shown that, modern honses it has long been shown that, without mnch increased expense, the nse of walls
huilt hollow will keep the rooms effectnally hailt hollow will keep the rooms effectnally
warm and dry, and yet this mode of bnilding is Warm and dry, and yet this mode of bnilding is
the exception rather than the rule, possibly the exception rather than the rule, possibly
because it gives the architect or the builder a little additional trouble. A slated roof, if ill. constructed, is a material agent in allowing of the esoape of heat, becanse there is necesearily an inlet for air where the slates overlap. The old thatched roof, althougb most dangerous in cases of fire, was a great preserver of heat. In well-bnilt modern honses the slates are laid on felt, which is laid on close boarding, and this arrangement keeps the house warm in winter and cool in summer. As regards the windows, glass ranks high as a non-conduotor of heat, and the effect of using thick glass, instead of the vory thin glass so often seen, is very largely to oconomise the heat. Evidenoe of the cooling effect on the air of a room of a window of thin glass is afforded byl the cold dranght which anyoue perceives when sitting on a cold day near a elosed wirdow of thin glass. Proposals bave been often made to glaze a window with double panes ; and no doubt such a plan is a good means of retaining heat in the room, hnt the inside of the glass between the panes will in time hecome dirty, and then it can only be cleansed hy re. moving one of the panes. A more convenient, hut more expensive, plan is to adopt the system, which prevails aniversally in the northern parts of Europe, of a donble casoment.
It is not, however, ny object here to give a treatise on bailding. The conclusion which 1
that if wo desire to economise to the utmost the daily expenditure of fuel, we mnst increase our ontlay of capital. So long as coal was cheap, it may have been better wortb the while of the in. dividual consumer to employ coal wastefnlly rather than spend money upon the arrangement for economising heat. On the other band, when coal is dear, the daily expense from the waste of fuel will induce a capital outlay to secure eoo nomy of heat.
The question of saving fnel for cooking pur poses is even more important than economy in warming; becanso cooking is an operation re quired every day, and the wasto of fuel in cooking is even more considerablo than in warming
An ordinary cooking-range in bouses which, for convenicuce, may be designated middle-class houses, is derived from the time when the same fire was nesed for cooking and for warming. It is interesting to consider Connt Rumford's remarks on this question. He largcly developed the use of stoam for cooking in large establishments, but in considering private kitchens he showed that 9.10ths of the heat produced in cooking operations was wasted, and only 1-10th utiliscd in cooking, by the use of open fircplaces He laid down the following principles on fre place constrnction.

1. Each boiler, kettle, and stewpan should havo its separate fireplace.
2. Each fireplace should have its grate, on which the fuel must be placed, and its scparate ash. pit, which must be closed by a door well for rerulating the quantity of air with a register the fireplace through the grate. It sbould also have its separate canal for carrying off the sumake into the chimney, which canal should be of this with a damper or register. By means rapidity of cer, and of the ash-ption of heat is regulaterl, and on the proper use of the two registcrs the economy of fuel will much depend. 3. In fireplaces for all boilers which are too heary to be easily lifted with the hand, an opening just above the level of the grate should be mado for introducing fuel to the fire, which opening must be closed by a close-fitting stopper stewpans this fireplaces constructed dor smanh fuel bo introduced tbrough the opening into which the stewpan is fitted, by remoring the stewpan occasionally for the purpose.
3. All portable stewpans should be circular, and suspended in their fireplace from the circular rim. The best form for large fixed boilers is an oblong sqnare, broad and shallow rather than narrow, and deep, and it should be of thin metal 5. All boilers and stewpans shonld be fitted with oovers to reuder them well adapted for con. fining the beat. The best arrangement is to ming the heat. and double; that is, with an air.space between and double; that is, with
the outer and iuner cover.
We have, during the last twenty years, intro. duced, as a rule close ranges. They are cer tainly cleaner and cose ranvenient for cooking tainly if cleaner care be exercised in the nse of the and, than open fres Bnt, as a rmle, they are based than open fires. Bnt, as a rmle, they are based on the primciple of makis one fre periorm a variety of operstions. Independently of the question of a combined fire, as compared with a consideration of the form of modern kitchena consideration of the form of the principles laid
ranges will show that most of ranges wil show that most of the principles lai
down by him hare been entirely neglected. The doors of the firephace and ashpit seldom fit close ; the boilers are rather deep and narrow than broad and shallow; the use of the hot-plate prevents the stewpans from being suspended from the rims for the fire to play round them; the use of double covers for sazcepans and boile
rather a rarity tban a usual arrangement. rather a rarity tban a usual arrangement.
I have already mentioned sereral points of dotail where fuel can be saved in our kitchon ranges, viz., by great attention to the close fitting of the ashpit and fire.grate doors, the ase of donble covers to saucepans and boilers, the ase of sand on the hot-plate to prevent the escape of so much heat from that part; and beyond these an important point in securing economy is the separation of those oalinary processes which reqnire different gradations of heat. The three main parts of the ordinary cooking apparatns are the oven, for baking and roasting, the boiler, and the hotplate. If the boiler is to be of the form most effectnal in saving fuel, the flame and gases from the fire should play under and ronnd every part of it; the water
should be kopt at something nnder $212^{\circ}$, so that
the gases, after leaving the boiler, may not enter the gases, aftcr caving the boiler, may not enter,
the fue much above that temperature, and, the fue much above that temperature, and,
inasmuch as that is a higher temperature than inasmuch as that is a higher temperature than
is necessary for the purpose of prodncing a sufficient draught in nn ordinery chimney, the heat cient draught in nn ordinery chimnoy, the heat
in these gases should be still further utilised. In the first place, they should be used to warm the water which will be required to replace what is drawn off from the boiler; and, in the second place, an economy can he obtained by employing place, an economy can he obtaived by employing
tho geses, which pass off into the chimney at a tho gases, which pass of into the chimney at amperature above what is reqnired an cricient draught, to warm the air suplied to an efficient draught, ments which I have made on the supply of ments which I have made on the supply warmod air to feed the fire, have, unfortunately not been worked out sufticiently to enable me to give them in a clear form with exact results,
but an economy of from f to 9 per cent. might be obtained from this source.

PROPOSED CATHEDRAL FOR GOULBURN, NEW SOUTH WALES.
The Cathedral about to be erected in the ising Australian town of Goulburn, and of which ve give an illustration, will also be the parish charch, the present church being notoriously inadcquate to the rcquirements of the popula tion. The Bishop of Goulburn, ou his arriva seven years ago, found himself surrounded by perhaps unprecedented dificulties, and by claim which at that time appeared to be of a more prcssing nature. He therefore resolved to post-
pone it. The diocese, containing an area of 120,000 squarc miles, was to a very great extent destitute of clergymen and churches; and the want was universally'felt. The bishop, therefore in the first placo devoted himself to the tasl of aiding tbe parishes to provide clergymon, churches, and parsonages. By the divine blessing the result has becn the introduction
of twenty-four additional cleggymon, and the erection of twenty-five churches and ten par sonages of a substantial oharacter, at very grea cost. Besides, a sum of about 4,000 l. has been collected towards the endowment of the bishopric When present arrangements are completed it is expected that the diocese will possess forty-six churches, ninetecn parsonage-houses, and twentynine clergymen.
During this interval the colony bas passe through great vicissitudos and a very severe financial crisis; and it has been only by great effort and much self.denial on the part of the bishop, the clergy, and the members of the Cburch generally, that these results have been attained. Much, rery mnch remains to bo done, independently of the duty of completing the fund for erecting Bishopthorpe.
Meanwhile Goulburn, the centre of operations for the diocese, while unsolfishly assisting the interior from year to year, has itself been some-what negleoted. And now the feeling is well nigh nniversal that the time has come to provide more adequate and more suitable accommodation for the city. Goulbarn has a population of a bout 4,000 ; but the present building will scarcely accommodate 400 persons. The new building will same time a parochial churcb for Gonlburn.
The proposed cathedral will be in the Dec rated style; the walls to be built of the bln rnbble stono of the neighbourhood, the facings, dressings, sc., of white sandstone from Wingels, and the nave pillars of blue stone from Mel. nourue. The nave and choir are to measure 146 ft . long inside, and 95 ft , inside across the inside will be 54 ft ., and the height of the clear. story wall, 36 ft . The tower and spire at the sonth-eastern angle will measure to the top of the finial 185 ft . At the west end tbere will be a narthex and two porches, and above the narthex a recessed gallery for the organ, opcning by a large arch into the nave. The nave, transept, and aisle will be fitted with 1,000 fixed seats, and the choir will have the usual fittings for the bighop, clergy, and choristers. The architect is architect - Blacket, Sor Wales. The estimated cost is $16,000 \mathrm{l}$ but it is proposed to herin with nave 16,000l., but it is proposed to begin witb nards and transept, costing about 12,01., to 3,500 . whid is earnestly desired from the mother Aid is earnes. enther of the banking firms of Barclay, Beran, \& Co Lombard-stroet; Hoare Barclay, Bevan, $A$, Pall-mall, will receive subscriptions.

proposed cathedral for goulburn, new south wales.--Mr. E. J. Blacket, Architect.

THE CATHEDRAL OF LIMBURG.
TaE cathedral church of Limburg on the Lahn, in the now mediatised dukedom of Nassan, was originally a collegiate church Nassan, was originally a collegiate church dathedral of Treves. It had a dean and canons Cathedral of Treves. it had a dean and canons those of the mother church. After the treaty of 1815 , the collegiate church of St. George was of 1815 , the collegiate church of erected into a hishop's see, ankic diocese, com cathodral of a Roman Cathohic diocese, comprising, and co-extensive with, the dukedom of
Nassan. assau.
Perhaps no charch in Europe possesses so解 upon a rock more than 100 ft hich, which is radiating ohapels. There are, however, two view. The costame or absidal chapels projetin thom the eastern ment is very remarkable. Tho Duke Conrad precipitons to the north and east, it looks down side of the transept. The great featore of the is represented as dressed in a large kind of precipitons the apo of this great aides,列 picturesquenes,
steep streets connects itself with the church. The figures attached to the columns support
steep streets connects itself with the church. What similar to the wester ones,
A charch more suited for such a site could smaller; and one over the crossing, consisting scarcoly be imagined, it is a solid and massive of an octagonal lantern, crowned by a very lofty late Romanesque building, and seems to be part slate spire of the rock apon which it stands; but as it rises Internally, the principal feature is the tri- cult tosay.

THE CATHEDRAL OF LIMBURG, NASSAU : THE FOUNDER'S MONUMENT.

## A REVIETV OF WORKS ILLUSTRATED IN THE "BU1LDER.".

Liverfool arctitectulal association.
Anosc the many remarkable works which bave heen in progress during the year, the huildings erceted by Herr Gnldenpfennig aro particularly worthy of note. One of them is a range of farmbuildings erected at a place called Werver, near Paderborn, in Westphalia, for the Baron von
Breukin. These buildings consist of a gatehouse, wo large stables, a large coach-house, harness rooms, a cow-house, poultry-house, porters'-room, outdoor servants and coachmen's room. All these are in the lower or ground floor, which is
constructed of stono worked roughly, and partially covered with rough mortar. In the upper story, which is framed in oak and filled in with patterns worked in red brick, are two large lofte
uscd as granarics, divided from one another by the upper portion of the gatoway, which forms a large apartment with two projecting bay win. tbe ncighbourbood, the bips and ridges heing ornamented witb finials and crestings of lead and
orng iron. The ontire cost was ahout 9007 . This,
ind however, does not include tbe timber, which was
supplied from the extensive woods belonging supplied from the extensive woods belonging
to the proprietor. Tbe architect of this very pleasing and picturesque building has entered pleasing and picturesque building has entered
most thoroughly into the spirit of tho Medireval builders. In a distriot where timeter is ahundant there is an appropriateness in the erection of
balf-timbered structures, and it should ever be our study to enibody our art in the native materials of the country. in the Builder of Ootober 12th. They consist o a doorway and bow window, and a pair of folding doors to drawing-room of Boeddekon Manorhouse, Westpbalia, These oxhibit the same
quaint feeling as before. Tbe bow window is quaint feeling as before. the bow window is designed timber hrackots: above these the win.

the angle of the eaves is an iron garcoyle the angle of the eaves is an iron gargoyle, or gutter, which projects far enongh to throw the water olear of the building. The entrance-door, witb its two-light fanlight and the two smal flanking windows are thoroughly in accord with attractive bit in the design of tbe Manor-bouse. The drawing-room folding-doors are highly elahorate, and are treated with much originahity. Unlike onr English ones, they are seldom kept open, receptions are given. Tho whole opening is 5 ft . wide, and on ordinary ocoasions only 2 ft .6 in. need be open at one titue. Great fondness for German and Latin inscriptions is sbown in various parts of the building, and over these folding doors, in German, is a legond, of which I give
tbe translation:-"If the devil rules on earth the translation :- "If the devil rules on earth
to-day, God will be master to-morrow. A.D. to.day, God will be master to-morrow. A.
1871." The space above the doors is formed into two triangular crockoted canopies, fillec with trefoil panels, and enriched with carve lowers, the hackground divided into narrow
panels with shields. The doors themselves have panels with shields. The doors themselves have
two rows of chamfered and stopped linen panels, two rows of chamfered and stopped hinen panels,
and two of small square carved panels splayed and two of small square carved panels splayed
so as to form a oircle. The doors are hung with no as to form a oircle. The doors are hung with
large ornamental binges. There is the same antiqne cbarm about these that seems to be possessed by all the works of this eminent architect. They are not mere copies and adaptations of medizval work, bnt ratbor original designs by a
thoughtfnl mind thoroughly imbned with tbe thoughtfnl mind
spirit of the past. spirit of the past.
I wish now to call your attention to som I wish now to call your attention to some
school huildings erected by the Commissioners of the Royal Patriotio Fund at Wandswortb, Surrey. The cost was about $25,000 \mathrm{~L}$. The building is capable of accommodating 230 hoys. The exterior is of red hrick with Portland stone dress. ings. The plan is well considered, and may be divided into two parts; the rigbt half being the portion appertaining to the boys, the left to the superintendent and the management generally. The entrance-porch condnots yon into a comthe compotrance-ball, 15 ft . aqnare, with which Beyond are the unain staircases to the dormitories, the superintendent's private apartments and the chapel. ing to his apartments above. Only a portion of ing to his apartments above. Only a portion of the huildings on tbe ground.floor is carried up Lwo stories, and is occupied as dormitories. I want more particularly to draw your attention to tbe extcrior elevation of the principal front, as given in our illustration. Tbereis great breadth of character abont this, which gives it much dignity. At the same time, great variety is imparted hy tho different treatment of the windows on eaoh of the three stories. On the groundstory they are arranged in groops of two.lights and three-lights alternatoly, divided by detached sbafts ; on the first-floor stage, in a regular sucession of arched openings; wbile on tho second foor thero are large hold dormers, which break p pleasingly tho rigid line of the eaves. Much mportance is given to the entrance-door, which ppons into a bold and well-designed porcb, and rom the centre of tho front rises the tower This is kept quite plain to tbe height of the ridge ine of the roof, with the exception of three small openings, and is then crowned with a belfry story, having deeply-recessed arched opening and angle buttresses. The tower is roofed with slated spire in two stages, with crocketed nighes. On each face of the lower stage of the spire is a small dormer. The ends of the façade are treated differently from the rest. Here are clagonal bow-windows carried up two stories, ni ano-light window with a circle over on the hird stage. I think you will agree with me tbat considering tbe simple and plain character which ho architect had necessarily to give to a school building, he has suoceeded in imparting as much variety to it as was possible nader the circumtanccs. The tendency at tho present time is ather, I think, to do too much, and suitability to the purposo for which a building is orected is sadly too often forgotton by the architect, and the restless effort to produce somcthing striking ives to many modern designs a disagreeable lutter and pulgar pretence. Tbere is one other great element in the effect of this building wbich wish to point ont in the depth of the window revens. Tweso give a mass of sladow whic adds considerably to the broad effect of the whole.
The Hull Dock Company's New Offices.-This building stands on a triangular piece of gronnd racing two stroets and tbe Dock quay. Its plan consequently presented much difficulty, espeuixed upon a comparatively fimited area. Th ntire building is faced with Ancaster stone xoepting the principal sculptures, which are o Portland, and tbe basement, which is of Bramley fall stone. Entering by the principal door, and passing throngh the vestibule, leading from which re a waiting-room and porter's room, the prio corridor leads to the dock-master's office right, nected with whiob are clerk's office and lavatory, cc. From the other side of tbe ball, another road corridor gives access to the offices of tbe essdent engineer, drawing-offioe, clerk's office, na resident engineer's clerk's office, conthe range. The portion of the buildin end of he ruay is tharfay is occupied hy the oflce for general office at epar Th, with snperintendent fice at one end. The dimensions of this large fice am f. long by 30 ft. maximnm widtb its amply lighted at tbe hack hy windows look ng into interual courts. Dbere is a separate curved facade topartment in the cenire of the ide of theade to the quay. On the opposite ith lue room is a passage commanicating th large strong-room for deeds. The arrange on the the foor above is very similar to tba ane gronnd-Aloor; the spave over tbe wharf age department becoming here the proprietors curb, with directora committee and retiring roms at one end and ante-room at the other The remaining portion of this floor is occapied with offices for the secretary and solicitor. The design of the exterior displays mach skill and judgment. The Venetian style employed was thonght to he appropriate to the situation of the bnilding near the water's edge. Both the gronnd and one-pair stage are broken np with conpled pilasters between the windows, those on the ground-stage of the Ionic order, and ahove
of the Corinthian. Tbesc give a great number of upright lines, which on the curved front are most valuable, tying togetber the irregular sweep of the curved horizontal lines, and giving materially ty the building, which is belped亚 Each ond rooms at each angle of the building. than the centre fronts is treated more massively and projecting pirere the pilasters are omitted, carried the whole height of the building. These sids projections give much stability and breadth to the desion, besides which they breadth pleasingly with tbe columnar treatmont of the rest. The small circnlar windows in the frieze relieve what would otherwise be mat a bery feature, notwithstanding the elaborate carving with whicb it is covered. The entrance has much importance given to it by being boldy projected out from the front. Altogether, I tbink tbe arcbitect, Mr. Wray, may be congratu. lated on having achieved a most meritorious The

The Horton Infirmary, Banbury.-This building, an oxample of thoughtfnl planning, and of much quiet taste in the external design, was The Holt Middene, 1869, hy Miss Horton, of London, and was ion Cheney, and of Highbury, Lownon, and was intended by her as a gift to the down of Banbury. She did not live to see the completion, which was effected hy her granduephew, Mr. J. IL. Horton. Mr. Charles H. Driver, of London, was the architect. Tbe plan vith of a main builaing nearly 200 ft . long, The a projecting central block and two wings. The main portion contains the administrative department, and the wings, wards for men and women. A portion of the centre blook of the maiu building only is carried ahove the groundfloor, afforaing accommodation for surgeon and matron. The whole of the remainder of the building is on the ground-floor, except the itchen, which is obtained under the women's ward, with soullery, pantries, wine, heor, and coal collars, with a lift to the ground-floor. The nain entrance leads you to the matron's room on the right, and room for surgeon on the left with staircases to hedrooms above. The ontrance hall leads into a broad corridor extending the whole lengtb of the building, and commuricating with the various departments of the bospital. Opening from the corridor is the operating. rom, 20 ft . hy 16 ft ., with an open-timber root, which is lighted hy foar large windows and lantern-light. A gallery is provided at one end for students' use, under which are lava tories and sinks with hot and cold water laid on, as also to the sinks for the use of operating room. There are waiting-rooms for men and women, and dispensing and consulting rooms, room for convalescents, 16 ft .6 in . by 14 ft ., and room for hospital stores and comforts. The wing containing the wards for male and female patient egpectively are each 48 ft . long by 24 ft . wide ad 16 ft . hich, with fireplace ighted on both sides and at end. At one end of he wards, and having a direct ventilation from he external air, are lavatories, sinks, and bath roms; at the other end are ante.rooms scu eries, and nurses' rooms. Tbe wards and room ppertaining to them are plastered througbou dors paisbed rarian oement, the dressings to the be the wimows are execnted in cement, and be Hoors are wainscot, waxed over. The erec ion of the infirmary cost 6,2000. The exterio , Itink, very successfur composition, althoug hardy giving you tbe idea of an infirmary. At cobol bnildiugs would he taken for a group of instance of angs. his fanit apart, it is a good building by archilectnrsi charaoter given to a aced with rery simple means. The walls are roand with its stane dressings. The central block, resents armos a great number of sloping lines, which pward to well togetber, and carry the eye ffective sky hignest point, and give a most a ling inish to the wheo The arrangement of tb windows of this portion of the front is worthy of note,-two on the ground stage and one above, those above baving dormer beads, which effectively vary the rivid line of the eaves. The rards, with their hich-pitched roofs at each ond balanoe the composition, and they are very sue cessfully treated. Tboir hroad, simplo masse contrast rather stronely with the hroken haracter of the centro bnt not mon han they shon'd do as they apartment, while tbe centre gives, very properly.
the idea of a number of small offices, of which it is composed. The chimneys are brought up boldly to a considerable height above the roof, and break very advantageously the lines of the building. The gable-ends of the wards have large two-light windows, in a pointed arched
bricked recess, with occosional stone voussoirs, bricked recess, with occasional stone voussoirs, which are ornamented with incised ornament and bands of hlack brick. A stone label is
carried ronnd this arch. The window-lights are carried ronnd this arch. The window-lights are
divided by a stone shaft, with foliage cap, and divided by a stone shaft, with foliage cap, and the tympanum of the arch above is filled in with a carved shield and foliage. On each side of these windows are small square-beadcd lights. One of the chief merits of the design is that it tratbfully expresses externally its internal arrangement. In the central block, the five breaks in the front show the five rooms of whicb it consists; the corridors, with their unbroken series of windows, exhibit plainly what they are, and the wards are equally well defined. This clement of trnthfulness is sadly too often over. looked in modern architecture particularly in buildings of a classical character. The effort of the architect in these too often is to obtain sym. metry and a perfect balance of parta, for which we will even sacrifice the arrangement of his plan or build np uselesa features, in order to make the ends of his façade agree. But this is not orse, is cart before the horse, "delight before commodity and"fitneas"; and in the other it is a hypocritical sham. I am sure that if we wonld only express honestly and truthfully the character and features of the buildings we are called upon to erect, hending to the style, but making the atyle bend o ne, our art would develop and flourish in a eg of which we bave little experience as et. I do not for one moment wish to decry consisteacy of style, but consistency to tbe aractor purpose of onr bnilding is a fa higher and more important element, to whic where possible, but make the latter the first where possible
I have now brought nuder your notice nine different examples of bnildings which have been carried on during the year 1872 . No one who looks into any architectural journal, and compares the works of the past year with those of an earlier period, can help being struck with the auperiority of the former, and the marked im provement which has taken place in the produc ions of our art since these journals were firs published. There is, I believe a growing dispo pition among architecta to break the chains of and to go to the fundamental prineiples of truth and fitnees, on which ant architacture worthy of he name and the pitis. tyle, of which there are many evicon of a new gradual fasion of the Gothic and Classic elements, which is seen increasingly year by year. Truth of construction, truth or materia, truthful expression of the purpose of tbe building, trnthful ormamentation,-these are now hecome the watchwords of the day, and
they are words bopefully elognent in promise they are word
"Notbing," says Mrr. Rnskin, " can atone for the want of trath, -not the most brilliant imagination, the most playful fancy, the most pare feeling (supposing that feeling conld he pure and false at the same time), not the most exalted conception, nor the most comprehensive grasp of intellect, can make amends for the want of truth ; and that for two reasons,-first, becanse falsehood is in itself revolting and degrading; and, secondly, because nature is so immeasnrably superior to all that the human mind can conceive, that every departure from her is a fall heneath her, so that there can be no such thing as an ornamental falsehood. All falsehood must be a blot as well as a sin, an injnry as well as a deception. We shall, in conseqnence, find that no artist can be graceful, imaginative, or original, unless he be trathful; and that the pursnit of beanty, instead of leading us away from trath, increases the deaire for it and the necessity of it tenfold.'

New Travelling Crane.-Mr. T. Grosse, a German engineer, resident in Manoheater, has desigued a new travelling crane, on an improved principle, the chief object of which is to prevent the danger from overturning, one of the most important defects in this class of machinery.

## THE ROTUNDA FOR THE VIENNA

 EXHIBITIONWe have already given some particulars and an illugtration of the building erected for the Vienna Exhibition. Let ns add a few statements made by the correspondent of the Journal of th Franklin Institute:-
Accurately stated. the exterior diameter of he Rotunda is 107.83 metres, and its height 811 metres. A rounded roof, supported upon thirty-one iron columns, 24.35 metres high ises, with an angle of $31^{\circ}$, to a height o $48 \cdot 2$ motres, and is terminated by a centra ring of 30.9 metres diameter. The ex terior of the roof is covered smoothly with heet metal, and, viewed from below, has th appearance of a smooth truncated cone. Upon his conical froof is placed a so-called observa tory, composed, like the rest of the structure, entirely of iron, the outer diameter of which i 32.4 metres, and the height 10 metres. Upon his, finally, there is placed another building, metres in diameter, and 18.5 metres high Which terminates in a crown, whose highest poin is $84 \cdot 1$ metres above tbe flooring below.
At a height of 23 metres in the interior of he Rotnnda there is placed a gallery, directly gainst the pillars, having a breadth of 14 netrcs. This may be reached by two stairway on opposite sides of the Rotunda, or by two elevators, introduced for the purpose
The entire space covered by the Rotunda measures 338.8 metres in circumference, an the surface covered by the roof measures 9,405 square metres, the interior circumference in 319.6 'mctres, and the space available for the purposes of the Exhibition and accommodation of the visitors is 8,129 square metres.
To give an idea of the forces operating npon the varions portions of this structure, a few data are attached.
The vertical preasure npon one of the iron倍 the lower portions of the radial rafters $=21$ Tangential atrain on the lower roof ring $=86$ tons Pressure on the nuper ring upon which the observatory rests $=217$ tons. The total weight of the strncture of the Rotunda may be stated in round uumbers at 80,000 hundred weight (Zoll centuer), or about 4,000 tons. The pillars rest upon beton foundations, which were prepared for this parpose as early as Octobe 30th, 1871.

THE DISPOSAL OF THE AYLESBURY SEWAGE.
Tre report of Mr. Hawksley, C.E., for the disposal of the sewage of Aylesbury, has been diacussed at the Local Board. Mr. Hawksley at once discards irrigation as unsnited to the physical and eoonomical conditions which present themselves in the neighbourhood of the town. He also rejects the process of Mr. Bailey Denton, intermittent downward filtration, tried with so mnch snccess at Merthyr Tydvil; the soil, he cousiders, being insufficiently open and porons for this mode of treatment. With regard to the various proposals for a sewage-farm, he hinks that the suggested sites are all nuposes as the near the town. The romedy he proof the sewage is precipitation by quick-lime, of the sewage is precipitation by quick-lime, which he states has been adopted with entic success at Birmingham. He proposes the esta hlishing at Heydon Mill of clarifying and precipitating works, sufficient for the immediat daily, and half a milion gallons of sewag daily, and capable of easy enlargement i necessary. He estimates the probable cost at
6,0002 , inclnsive of land and compensation ; and 6,000., inclnsive of land and compensation; and the annual working expenses at between 250 . and 300 . The precipitated matter, he considered, would possess a market value as a manure, and would be readily bonght by farmers, but tbe price it commanded would not be suffi. cient to cover the expense. Several members of the Board stated that the proposed site wonld be difficult to get to; that a road would have to be constructed; and tbat, in addition to the cost incurred thereby, there was also the sewerage of tbe town, which had not been incladed in the estimate, and they calenlated the wholo cost at not less than 12,000t.
It was decided to obtain from Mr. Hawksley an approximate estimate of the total ontlay, and then to submit the scheme to the ratepayers at
a town's meeting.

## MATTER OUT OF PLACE IN IRELAND.

Contemporaneously with the agricultural de. mands for the matter that has been sadly out of place for months past amid the purlieus as well 2 in some of the more favoured parts of Dublin, some action appears to have been taken by the Dublin authorities towards compelling persons guilty of polluting the atmosphere of that city oir noxioug accam what we have before observed repeatedly,namely, a show of action at a time wben tbose roceeded argainst would, in any case, has ound it their interest to clear out their filth to meet the demands of the farmer for spring illage. But this is not all: fall time is bein iven for those traders oul matter wbo bave been proceeded against to remove the same with due leisure to socure theiwo gains. Nevertheless, in the next official tock-taking, so to speak, all such spring leansings will be duly noted down, and credi aken for, as the results of official action
It is scarcely necessary to say that the very nsatisfactory state of the public health in Dubbin demands a mach more decided and thorough mode of dealing than such makebelieve proceedings, which but create a false impression among those who do not inquire into what deeply concerns themselvee, but take official reports as evidence of work done. We bave before shown the amount of mortality and the comparatively amall hirth-rate of Dublin, which together account for the fact that the popalation of the Irish metropolis has actually diminished of late years. The poor, and espe cially the very young and the aged, are the chie sifferers; but many heads of families, many read-winners, also snccumb, adding seriously to tbe apount of taxation of a local nature, which now amounts to almost 10 s . in tbe pound of the valuation.
Within a few days past, two medical men ongaged in the active practice of their useful profession, perished,- - one by fever, "caught, doubtess," * in the discharge of his perilous anhing, at the early age of thirty.one ; and the snffered from the effects of a fatigning and riskful profession, and who, but a few days hefore his death, was heard adrocating improved sanitary measnres for the poorer parts of Dublin died almost suddenly, in tbe midst of his profes. sional work.
A third medical man lost his life in the following manner:-returning home late at night from a pationt's residence to the town in which he lived, he was thrown from bis vehicle, which was npset by a large heap of way for the more ensy removal to bis land next way. When the mischief was done the condaybnlary assisted the doctor home - only, how taber for him to die the jujurio he recored ever, for him to die of the injuries he recoived
within a few hours, nuconsciousness having almost immediately set in.
Aericultare is an impor
Agriculnire is an important industry, hnt it shonld not he supposed that those who practise it are to do so to the damaye either of themcollecting and storing manure, rearing pios and colleching and storing manare, rearing pigs, and tall-eeding dairy catlo in Dublio ane other large lrish towns, or the means adopted in some
conntry towns and on the Queen's highway for conntry towns and on the Queen's
facilitating the labour of the farmer.
Where such matters are
anger and matters are so plainly franght with danger, and even with fatal results to the public, it becomes the dnty of the State to intervene; nor sball we he sirprised if measures be taken by the sirviving famy for die deceased medical gentleman (he has left a widow and nine yonng children unprovided for) to recover commeninrate damages.
In like manner, we cannot but think that it is time a coroner's inquest should be held in all cases fatal from fever arising in apparent rola. tion to canses in Dublin, ench as we bave re. ferred to as so common in that city. In the words of the Freeman's Joumal (of 25 th ultimo), "For a score of years, the month of May has been aignalized hy littlo less tban universal quake ; for as the thermometer rises, disease and death stalk holdly out from tbe noisome dens in which they have lain hidden. The summer-time has been shorn of half its glories by the gloomy reapings of the King of Terrors, to wbom fever, cholera, and small-pox bring a woeful harvest."

- Ag recorded in a morning contemporary published in

DILAPIDATIONS DISCUSSED.
Arter the reading of a paper "On Dilapida.

Mr. L. W. Ridge, in speaking on the subject of ecclesiastical dilapidations, said that their nature could be more readily explained by reference to their contrasts with other dilapidations. The hoder of a benefice is to aject to cortain limitations. He is not to allow property to suffer cither from injury or neglect in any way affect. ing the fabric. He is bound if a house or other building falls down to bnild it ap again as before. building falls down to made for wear and tear: he No allowanoe con be made for wear and tear: he
must make good any want of repair during his holding, or must pay at the end of it. If a floor, holding, or must pay at the end on scriously worn he must put a new floor; it will not be enongh to rencw broken and damaged portions as in lay
dilapidations. Painting must he renewed when dilapidations. Painting must he renowod when
it is necessary for the durahility of buildings, as on perishahle woodwork, de. It is thus donbtful
whother, in any caso, paintine or colouriny on whother, in any caso, painting or colouring on
external cement work can bo demanied. But while the liahilities of an incumbent are thus greater with respeot to matters of structure, -
than aro those of tenants undor ordiuary leases than aro those of tenants undor ordinary leases
with repairing covenants, -the incumhent is with repairing covenants, - the incumhent is standard of tenantable repair. Decorations and finishings do not oome iuto notice at all. Io is not called upon to do internal paint. Th, paporing, whitewashing, or colouring. The recent Act has iu no way altered the
gencral principles provionsly established. It has been framed for the purpose of essing off things that, in practice, worliod hard on some mission to alter and amend buildings, m凤king them suitahle for modern requirements, or the average wants of the incumhent of the living. Charges may be made with less troublo on the
revenues of tho bonefice for desirable and approved works. Perhaps, however, the most important provision is that which enables an incumbent to amend his buildings to the satis. faction of the surveyor for the diocese,reeeiving, whon the works aro completed, a certificate which rolieves him from liability, for five years from its date, cxcept for a wilful five years from its date, cxcept for a wiru
(voluntary) waste. Insuranco against fro arranged for also by the Act. The value of the relief that may thus be oltained by incumbents can be judged when it is called to mind, that aforetime everything on the lands of the henefice was to be kopt up that was proved to have
existed within reasonalle memory; a matter depending on testimony involving vague, some. times considerahle, liabilities. The surveyor in lay dilapidations represents an individual owner having reversionary interests it in surveyor
under the Ecclesiastical Dilapidations Act practically represents (Mr. Ridge said, in answer to a qucstion from a member) the ultimate owner of church property.
Professor Korr called attention to the pro. Fisions iu Lord Selborne's Bill, now before Par. liament, for tho appointment of permanent
assessors attached to the Courts of Judicature, assessors attached to the Courts of Judicature,
to whom is to je cntrustod tho decision of ques. tions of fact, instead of to a jury, as at prosent. This will, if made law, probably sceure intelligent decisions on complicated questions of a technical kind,-among which will be the too often very imperfectly comprehended questions involved in trials as to dilapidations. On the matter of covenants in leasos, on which somecudorsed all that conld he put forward as to the inefficiency and frequently the gross injustice of the repairing clausos,-copied regularly into now lenscs, and accepted by lawyers completcly ignorant of their meaning. The real intention of the bargain between a good landlord and a food tenant is that tho property shall be used
fairly and kept up fairly, and no more. The only reason why people accept the unreasonable terms of leases without question again and again is, that they are rarely insisted on,never by landlords who wish to act as they ought:: if they wero, there wonld be brought about a complete change, and lessees would have leases that cmbodied precisely tho intentions of their bargains. The covenant to paint inter. feiture, Professor Kerr considered most inl. adrised. Much internal grained work, and plain painh g, even, if carefully used, requires no such renewal. It would be mere waste and
annoyance. In cases whero this and other similar covenants are taken advantare of by grasping or unprincipled landlords pressing for forfeiture or costs, the hardship suffered and wrong dono to their untortanate tenants provokes indignation in right-thinking people.
The presidont, Mr. J. D. Mathews, spoke of the necessity of some arrangement by means of which the provision of so many months' notice could be adjusted to suit the case of $a$ lessee and his under-lessees. A sub-lessee usually holds under the samo covenants as are in the oripinal lease from a frecholder ;-why should the lease be forfeited if repairs are not completed by the time apecified in the notioo to the original lessee ? He also spoke of the obvious injustice of a lessee being responsiblo for the acts of his assignee, contending that a cortain lapse of time shonld freo him from liability, especially where tho assignee has been practically, even if not formally, recognised.
Mr. Fletcher, in reply to the thanks that had been roted to him, alluded to tho various points that had been raised. Particularly with reference to the question of forfeitures, ho stated that all that could be wished for as a measure
of practico would be attained if compliance with of practico would be attained if compliance with
tho covenants and parment of the expenses in. tho covenants and payment of the expenses in. cnrred in an action always put an end to any claim for forfeiture. The insuranco clauses in leases aro thus affected by an Act passed a few years ago ; there is no good reason, ho said, why the repairing clanses shonld not be similarly doalt with. He also insisted on the jnstice of always scheduling a description of buildings, thoir age, their noticeable defects of structure de. This could oasily bo done if once made the custom, and tho effect of to lessees taking obvious or improperly apeakers who had adrocated such a course.

IMPROVED DWELLINGS FOR THE POOR, AND UNREMUNERATIVE RENTS. AT the meeting of the Special Dwellings Committee of the Charity Organisation Society Iuaghe Hughes, M.P., in the chair, an interesting discus.
sion took placc, "On the Intuence of Unremune. rative Rents on the Movement for Improving Dwellings."
Mr.C. Gatliff, representative of the Metropolitan Association Dwollings Company, enlarged upon the importance of the Peabody trustces and others who built for the poor, taking care that only thoso were admitted into their houses who could no help themselves. A clear line ought to be drawn between associations working on commercial principles and associations working on charitable principles. So long as this was not done, the charitablo associations drew away tenants from other improved dwellings. He moved the follow. ing resolution:-"That the intuence of unre. munerative rents on the movement for improving dwollings, unless confined to tho less fortunate, or classes not earning more than 20 s , a week, will seriously affect, by competition, efforts based on commercial prinoiples, which are and permanent success of the movement Mr. Easterwiek, M.P., inquired of Mr, Gatlif tho principles upon which his society acted. Mr. Gatliff, in reply, stated that the Metro politan Association was restricted ly its charter to a dividend of 5 per cent. They had power to set aside 15,000 . 10 c adrancing the objects of tho assooiation.
Sir Charles Trevelyan observed that mos great enterprises in England had an element of publio spirit in them. It had been so in the cstablishment of steam communication with India, and of telegraphic communioation with Amerioa. Ho salv no occasion for charity to any greater cxtent than this. The neeessary footinc. footwe. There was danger of perpetual conflict and those working on commercial principles. All associations should let at the mariot rates, with the full conviction that they were doing the best for the masses. They would then make it known that the undertaking was a highly profit those shoula we inst phe nature of chings tha the best of their provided for who had made the best of their opportunities. Room would thus be made for those below them. He moved, as an amendment to Mr. Gatliff's motion, "That
commercial and charitable principles cannot be
on con he sordid parts of London without mutaal con. lict and obstrnction.
Mr. Eastwick, M.P., hopod that the commercial principle did not mean lettivg houses in a filthy condition to the largest number who coula crowd into them. The masses, who could not or oud not help themselves, must be educated nd helped. Still, the work could not be dono a eloemosynary princinles.
Dr. Greenhill understood the commeroial prin. ciple to mean getting a fair return for money, and not an exorbitant return. The insufficient returns obtained by somo societies had discouraged people. Each instance of comparativo failure had done harm. He was not prepared to ay whether the working classes who earned the lowest wagcs conld pay onough to get proper accommodation.
Miss Octavia Hill thoaght there was a deeper reason against nnremanerative rents than had pet heen given. The ultimate result would he lopendent ages, and to keep a larga clasa dependent on charity. Improvements mnst ho mado gradually, and the poor must be educated up to them. She believed that they might bo
The Rev. G. M. Murphy had no doubt that the Peahody trnstees did their best to make correo
inquiries. It was very diffioult to select the ight class.
Dr. Ross remarked that the commercial principlo would prevent poople building bottor houses than there was a demand for. He did not see how the very poor wore to pay for sufficient accommodation.
Mr. Storr thought that the object of the committee should he to stimulate the anthorities. The metropolis was in an anarehical condition. The work of charitable associations was a drop in the ocean; but until there was effectual government in London, and the power to remove bo effectually dealt with.
Mr. Bosanquet suggested that power might be given to the Peabody trustees, to take houses not fit for habitation at a valuation. They had no private intercst to serve. He failed to see how the distinction which Mr. Gatliff wished to establish between the charitable and commercial associations was to ba carried out.
The Chairman was of opinion that the commer. cial principle was tho only one that could be ing shonld be in certain limitations, that build good of its kind. Thore should he just enough inspection to cleck overcrowding, and secure repairs. Some rise in rents conld not be prevented. If wages did not riso it was the fault of those who gave charitable doles. They should not play into the hands of those who were griud. ne the poor down. Subject to these conditions the only solution of tho question was to build ood houses, and let them to thoso who would pay the fall market valuo for them. It was the bighest charity to make people independent. Mr. Gatifif's motion was then rejected, and the amendment of Sir Charles Trevelyan carried by a majority of 12 to 4 . The committeo adjourned until the 23rd instant

## IMPROVING HOUSES.

In our last volume we described the miscrable ondition of threo dwelling.places in Great Si. ndrew's.street, Soven Dials, which had been aken on lease by tho society for Improving the Condition of the Labouring Classes, with the ntention of repairing and rendcring them fit for hcalthful habitation. On Thursday in last week meeting of friends of the Society was held on the premises, Lord Shafteabury presiding.
Mr. Payno, the excellent secretary of tho company, read a report which gare a clear and suohow it acount of the whole transaction, showing everal indiridu brought about by the gina the bouses sound and comfortable had been from 1,000l. to 1,100l; and that the rentals would five a return of ahout 6 per eent. on the outlas. The ground floors were fitted up as shops; the apper floors were let to families at a lower rent han used to be paid in the old building.
Lord Elliot mored a resolation to the effect that the report be adopted, that the subscribers be thanked, and expressing a hope that the work of the society in making this renovation would be followed in other parts of London. He said here were not only many houses in London unfit in themselves for human habitations, bat
many more unfit by reason of their surroundings and the localities in which they were placed reminding him of Thackeray's "Codlingsby," who had a mansion of Oriental magnificencs in Holywell-strest. It was with some a cheap and easy way of accounting for the wretchedness of some wretched dwsllings by abusing the owners of the property; but it should not be forgotten that the law did not onabls ell landlords to
scll. It was impossible to greatly improve ths part of London in which they were mst as the property now stood. He thought, in efforts of this kind, decent honses should bo built of various sizes, as some of the very poor could only pay 2 s . or 2 s .6 d , a week; but he feared, that to effect much good there must not only be privats orgamisation, bnt a legislative enactnent for the oompulsory purcbase of land in cortain cases.
Mr. Godwin, being oalled on to second the resolntion, spoke of the overcrowding in many parts of London, and ths evils resulting from it. A map had recently bsen published wbich showed that in London proper twenty acres bad been recently cleared of houss for railways and other public works, and that twenty acres more were scheduled in new Bills for removal. There wers enormons funds at command for the improvement of the condition of the working urged on statesmen of all denominations that it was the grsat question of the day, and demanded the most serious consideration from all. No nation could be prosperons witb a decaying people. There tyas surely nothing more valuable than immortal sonl,- and this question concerned both.

After the adoption of the report,
Tbs Rev. Canon Nesbit, rector of St. Giles's, moved a vote of thanks to Lord Shaftesbury for presiding, and contended that drivk was tbe great cause of crime, and that drinking was itself largely whioh drovs a poor man ont. Whers wes therg for him to ro to but the ont. Whers was there would drink one glass for the good of where hs and perhaps many to the good of the house and perhaps many to the harm of himself? They did not wish to tura the poor out of St Giles's, neither did they wisb to do away with their independence by wholly eles mosynary aid; a groat fuancial success. He thonght thsy might do soms philanthropy in a business spirit, and do soms philanthropy in a business spirit, and, by taking up ths case of such housss as then a reasonable return for their money.
The Hon. William Vornon cordially scoonded the motion, not only in his iudividual capacity, but as secretary of the Charity Organisation Society. This movement, he fearod, could only palliate the evil complained of; unlsss legislation assisted them more, its remoral was hope less. In that room, for instance, supposing it to be occnpied by a family, and ths father sickened and died of an infectious dissase, what would become of the children? On this point-the disposal of the body hetween death and burialhs had to inform thsm that a scheme was now afoot for a public mortuary for the poor of Drary-lans and part of St. Gilss's, and that the Vestry of St. Martin's had granted a site available in Drury-lane.
The vote of thanks was then carried unari.
The Earl of Shaftesbury, in acknowledgment, congratulatsd the Socisty on what they had accomplished; and said no one could form any dea of the filth, the stencb, and the vermin in these houses a year ago, without actually witnessing it. He cquite agreed with Lord Elliot that such renovations as this were only a part of they left the honses was very much better than their former state; they had, at any rate, mads it possible for families to bvs tbere in decency and in the practice of Christian duties. They must hring commercial principles to their aid. The renovation of London would cost ten mil. lions sterling, and could never be effected by the philanthropic principle alone. Tho displaoement of the poor going on in Itondon, as Mr. Godwin had shown, was enormous. From railway Bills, persons pinoe 1852 the averaced, it was colculated that poor in England and Fales had been 50,000 a year. During a large displacement in West. minster many crossed the river, and soms who wretched lodgings. Referring to the renovation of Tyndal's.buildings by the Society, the chair-
man dsscribed the condition of the court as so the that tbs workmen struck work on account of the vermin, and as sending twenty-two fever cases to ths hospital in a year. Since the alteration no fsver cass had occurred; and the con. duct as well as condition of the peopls had very mnch improved, according to tho statements of the police. Cbanged domiciles would soon make changed population. He trusted that th example of this society would be imitated in many other parts of London; as certainly many wonld thereby bs extricated from misery, and a condition of things altered which was now a degradation and a disgrace to the metropolis.
The condition of the houses when Mr. Eyton tbe Society's architect, began thg work, was found to be even worse than we had described; coms of ths walls were hanging up by ths eye brows, and might have collapsed at any moment

THE NEWINGTON VESTRY'S DEPOTT AND MORTUARY AT WALWORTH.
For some time past ths Newington Festry hare been engaged in the construction of ex ensive premises, at Whalworth, which are in tended to serve ths several purposes of a road crapings and dust depót, a stone-yard, cart heds, store-rooms, offices, and stabling, toge These premish mortuary, for ths use of the parisb large outlay, are now fast approacbing com letion, and will bs fully opened and utilised for general parish purposes in about a fortnight rom the present time.
The premises, whic
The premises, which are situated between Manor-place and Penrose-street, on ths west sected by the sected by the London, Cbatham, and Dover rail way (the two sections being connectsd by the arches under tbe railway), occupy altorether an Tho land upon either side three acres in extent which the depot has been formed, was purchased which the depot has been formed, was purchased from toorailway company by tho vestry, who have also leased from the company seventeen of the dust and street sweepings into ths country by railway, a timber siding for a stand of twentyeight trucks has bsen crsctsd alongside the railway, at an elevation of 20 ft . abore the yard level of the depot. The dust and street sweepings will be raissd from the depot to the rail. way trucks by means of a steam orane on the railway level, drawing up skips containing the
dust and refuse. The railway level of the siding dust and refuse. The railway level of the siding contains a fantail for romoving the trucks from staging or jetty for the sterm crane under which sunk helow ths paved surface of the depoti, tbsre are eight pits and hoppers, built at an equal distance from ths centre, and formed in a circle round the jetty, so that the skips fit into them. Two of these skips are for the reception of dust, and the otber six for shooting road-scrapings, and a complete set of tramways is laid thronghout, and facilitate the removal of the varions materials from point to point, until they are finally discharged by the steam crane into the railway trucks. This portion of the work has heen exsonted by Mr. Ritson, the contractor; the plans for tbe rallway timher siding, steam crane, and other"works in immsdiate connexion therewith having bsen prepared by wir. Mills, engineer to tbs Chatham and Dover Company.
-Ths arches under the railway have been fitted up, three of them as stables for fifty horses, and oftis as cart.shecs, store "warehouses, and being Mr. Cook, of Walworth-road, huilde.
Tbs entire area of the depôt has been drained and pared on a bed of concrete, and in laying out the levsls ? of the deport, a sohems of slop drainago and slop filter-beds has heen adopted, in which provision is made for the drainage of 1,000 loads of slop, or the depositing of 5,000 to 6,000 loads of snow. This portion of the works has been carried out by tho workmen of Gledhill, tho surding to plans prepared by Mr. This method of slop drainage is an exporiment, and it is expected that nnder its practical opera. tion a saving of upwards of 500 l. a year will bs effected in the cost of conveyancs and loading. One portion of the depôt will be set apart as a store-yard for drain-pipss, briolis, bme, stons, and paving materials; another portion for the road-sweepings or slop jast referred to, and the road-sweepings or slop just referred to, and the
remaining portion for dust. A boundary-wall,

8 ft . high, encloses tos entirg area, which has just besn planted all round with trees.
Ths mortuary, whicb forms a portion of the nabsbment, is not the least important feature $f$ oo works. It is sitnated at tos extrems end reme depot, separated from tbs rest of the rether distinct from the rest of the establish. ment. The dimensions of the mortnary are ecting tbe necessary slate slabs and tables, sinks, and drainage, and has a concrete floor, with Portland coment surface. One of the railway archee which immediately adjoins it, has been converted nto a disinfecting-rooun, the dimonsions of which are 50 ft . by 25 ft . It has been fitted up vith a completo disinfecting apporatus, containpg all the latest improvsments in connexion herewith The arrencemonts of the mortarery and disinfeetine-room are such that the hearses ontaining bodies or carts containing moteriols onniring disinfection can draw at owce ont the premises without causing any nuisenco to he neichbours. The warks conned with the nortuaryand dissecting loom hare been erecuted ccording to pling prepared by Mr, Hardy the surveyor of sswers to the vestry; and havo been carried ont under his superintendence.

The estimated cost of the depót and mortuary s intended to be very upwards of 7,0001 ., exclusive of the land.

ENGLISH BUILDINGS FOR LEGHORN.
A cornespondent informs tus that the muni. ipality of Lsghorn, with a desire to improve and add to the inducencents to strangers on the Continent to visit and stay at Lsghorn, are bont to grant to a party of English gentlemen os concession ef a large tract of land in tb best portion of the town, just ontside the city walls, which will bs so extended as to inclose it. This piece of land, on part of which formerly tood the barracks, has a sea frontage on thre f its sides, ths fourth side facing the Corso Toe object of the mnnicipality in making this concession, is to enable thess gentlemen to create anwinter season in Leghorn, by erecting a superior class of house, bnilt, as is nsual abroad, in flats, but containing those comforts and re aremsuts which are necessities to the Eurlish American, and other visitors. An esplanade will be built all round ths sidss facing the sea; and on that looking toward the Island of Gorgona is to be erected a largs botel, with snitss of rooms, replete with overy English convenience, such fireplace, gond ventilation, and good bathcoms, On one of the remaining sidss, facine the sea, will he erected a cluh-house, which vill be conveniently situated for prentlemen oruising in their gachts in the Mediteranean On the other side thers will be a krersal. On the rest of ths estats it is proposed to erect villas, as before mentioned, so far embodying the foreign principls that they will hs constructed to he let in flats, hut each flat will bs furnished in such a manner as to combins all the reqnirements and comforts of an English homs, with the hearties of an Italian climate.

Ths prics of land in this portion of the town increasing very much in value, and in the case of that opposite the estate in question, the value has gone up ovsr 50 per cent. within the last twalve months. An architect has already been to Legborn to make a report and survey, as well as to aid in carrying out the necessary negotiations. Tbe misfortune is that Italian authorities are hard to deal with : an English company would bave to keep all its eyes open.

CONSTANT WATER SUPPLT.
IT is gratifying to know that a serions grievance, whioh the inhahitants of London have long had occasion to complain of, is in course of the intermittent and often greatly defective supply of the prime necessar'y of life-water. supply of the primo necessary of life-water. Watsr Examiner for London, it appears that progrsss is being mads by several companies in progrsss is being mads by several companies in past year the Lambeth Company have given past year the Lambeth Company have given constant supply, by means of stand-pipes, in a and have made arrangements to give a like sup. and have made arrangements to give a hike sup.
ply to abont 5,000 houses of a similar class. The ply to abont 5,000 houses of a similar class. The
alterations in fittings under tbenew rules and re.
alations of the Board of Trade are being gradually fectod as occasion permits, and they are being arriod ont in all new buildings. The Grand nnotion Company are constructing near Kilhurn high.service rescrvoir, the work being well orward, that will contain $6,000,000$ gallons. The Vest Midalesex Company have rccently given onstant supply to 100 houses on the application f the owners, who have provided fittings in conormity with the regulations of 1872 . The eomany is fully prepared to oxtend the oonstant upply when called upon to do so. To afford providing additional engine -power at Hammermith and at Hampton. The Southwark and auxhall Company are constrnoting, at Nunhead, roservoir to contain $18,000,000$ gallons, to apply. The works are being prosecuted vigorusly. The East London Company have given otice that, from the 25th Maroh, they will give onstant supply to the part of their district ounded on the north by tho Hackney-road, on ouncuth by Church-strcet, Bethnal Green, on the ast by Cambridge-road, and on the west by Shore. itch. The districtindicatod emhraces 205 strouts, 328 houses, and about 40,000 inhabitants, errules have boon used hitherto to restrict the upply, but their nse will be disoontinued, as Oth August, 1872. Tho New River Company ave provided additional steam power, mains, and igh-service reservoirs, as required for the high-
ressure constant supply of tho Mretropolis ressure constant supply of tho Metropolis
Vater Aot, 1852. After the passing of the Act Vater Aot, 1852. After the passing of the Act f 1871, the company undertook the construction f a new sorvioe reservoir at Highgate, 336 feet hove Trinity high-water mark, as further addion to their power of affording offective constant ervice. This company also has afforded con-
tant supply in a number of cases hy means of tand-pipes, and they have rocently agreed with committee of the Corporation of tho City of ondon to furuish constant snpply at once to a urge number of the houses of the poor within ce City bounds, and are now only waiting the xrangements of the officers of tho Corporation carry this design into effect. The Kent Water ompany are also stirring in this matter, and avo given notice that from the lat of June next ouses in Rotherhithe, Deptford, and at New ross. It is necessary to say that other itics.

## tic

The Last London Company has now atorage aseryon capacity at Wallhamstow for $360,000,000$ allous, the regervoirs having an area of 220 ros. The cngines that are beiug provided by
no West Middesex Company at Hampton and ammersmith are the one of 120 , the other 5 horse power, each having a 68 -inch cylinder. xtensive pewer, works have heen ordered by the helsea Company that are not likely to prove noxious, as wero their proposed worlis at ampton Court.

TATUES FOR THE SCOTT MONUMENT. About two years ago a movement was set or ot hy Mr. James Ballantine, for the completion the Seott Monument, by the fittiug up of its terior as a musenm, and the providing o atnes to fill the niches whioh diversify its ex-
unal sarface. Tho former object has ben tained, and the latter is now in course of alisation. Of tho statncs requived to fill the umerons niches, says tho Teckly Scotsmian, the mmittee charged with the undertaking found mmitee chargred with the undertaking found a first instalment, and these, in the hands of Io rarious sculptors intrnsted with them, are for to most part bither finished or mapidly approach g complotion. To Mr. Wm. Brodie, R.S.A. mir smbjects wero assigned, the samo number hile two each were given to Mrs. D. O. Hill r. Clark Stanton, A.R.S.A., Mr. D. W. Stevenon, and Mr. Lawson, London. It was provided tat the figures should bo of a uniform heightmothing just under life size -and that all culd be hown out of Binnie freestone in a style me 15 ft adapted to the elevated positions iey are intended to oocupy. Mr. Brodie' atues illustrate the "Heart of Mid-Lothian," Id "Kenilworth." From the former novel ere is Jeanio Deans, in homely attire, and aall bundlo in hand, as she took the road on her ission of meroy. Jeanie's eccentric admirer,

Drmbiedykes, forms a companion snhject, hands crossed in front, and head to one side, with a wistfnl look as he ejacnlated "Jeanie, Woman!" Kenilworth" furniehes the Earl of Leicester and Amy Robsart. Mr. Hutchison gives illustrations of "Waverley" and the "Fair Maid of Perth." Mrs. D. O. Hill's subjects, taken from "The Pirate," are Magnus and Minna 'Troil, the former a vencrable figure in flowing clonk, with hands en a staff. Mr. Clark Stanton, to whose ot "Ivanhos" has fallen, gives us a stately Rebecca, with waves of rich hair rolling down pon her shoulders, and a countenance full of dignified composure. In dealing with Friar Tack, Mr. Stanton has departed from the ordinary pot-bellied ideal, and has modelled a stal. wart figure with frank jovial expression, holding in his hand an antique drinking-horn. Mr. D. W. Stevenson illustrates "The Abbot" with a statue of Mary Queen of Scots, and one of Halhert tlendinning. Mr. Lawson had assigned him Diana Vernon, the heroine of "Rob Roy" together with Bailio Nicol Jarvie, The Boilio tands with one hand in the poolet of his leep wistent hand in the pocket of his his long oravat, as while exelniming " My onscience!" In addition exelaiming "My there are being prepared by Mr. Hutchison a series of heads in altorelievo, intended to bo cast in hronze, for the decoration of the interior of tbe monument.

## THE TRADES MOVEMENT.

Liverpool,-The differences between the maste ${ }^{T}$ painters of Liverpool and the operatives have boen adjusted. The men claimed 73 d, per hour for 51 hours' work per week, which was rejected hy the masters, who offered 7d. per hour for a week of 55 hours, boing an advanco of a $\frac{2}{2} d$. per hour upon the exiscing wages. The mon declined cope terms, and after several meatings of joint ropresentatives, it was decided to refer the matter boronch coroner, and Mr. Clarko Aspinall, the Aspinall's award has been received by Mr. Hugh Shimmin, the Secretary to the Master Builders Association, It is in favour of $7 \frac{1}{2} \mathrm{~d}$. per hour for o week of 55 hours. This, it is expected, will finally settle the matter.-The building trades of Liverpool have recently been in an unsottled
state in consequence of the disputes with the state in consequence of the disputes with the house carpenters and joiners of Liverpool and Birkenhead. The men claiman increase of wages, and a reduction in the hours of labour, which practically involvo an increase of pay amounting o 2s. 4 d . per week, with five hours' less work. o positive change, however, cau take place net the 1st of May, as both parties on the lst Novemher last bound themselves to give sis already noice of any chango. the men bave increase the wages by $\frac{2}{2}$ d. per hour without re dacing the hours.-At a large and influential meeting of master joiners, held at the rooms of the Mraster Builders' Association, Mr. Rome in the chair, called to take into consideration the advisability, or otherwiso, of loaving to arbitra. tion the dispute between tho masters and the operatives on tho wages question, a resolntion was passed "unanimously and emphatically deolining to go to arbitration upon the present deolining to go to arbitration upon the present consequence of it being considered that the offer made by the employers in February last was mide by the employers in February last was a general strike in the building trade will probably take place on the 1 st of May, unless tbe me forego their claims for further concessions.
Leeds.-The plasterers' labourers, numbering abont 100, have struck work, their masters not haring conceded their demand of 6 d . por hour Hithorto they bave been paid 5 d. per hour. moeting of the employers hass been held for the purpose of considaring the matter, and the resul of their deliheration was a unauimons determina tion not to increaso the rate of wages.
Leamington.-The operatives in every branch of the building trade at Leamington have struch. Through the local trades' council, they some time ago served notice on the masters for shorter hours and increased pay. They stipalated 54 hours instead of $56 \frac{1}{2}$ hours should be a week' work, aud demanded an increase of wages, ranging from a farthing per hour for labourers to seven-eighths of a penny for carpenters. The masters formed an association, embracing the whole trade, and served counter notices on the men, to come into operation, adhering to the old wages, but making alterations in hours for bo-
ginning work. The men proposed arbitration but the masters intimated that thoy shonld unak no concessions. It is calculated that ahont 800 men have struck
Wednesbury. - At a special meeting of the members of the Operative Bricklayors ${ }^{\text {' }}$ Society the following resolution has been unanimously adopted:-"That an increase of $\frac{1}{2} \mathrm{~d}$. per hour in summer ( $7 \frac{1}{2} d$ ), and $1 d$, per hour for twelve weeks in winter (8d.), for red brickwork; also 1d. upon furnace work, at $1_{8 .}$ 6d. per hour, and 1d. upon ditto at 1s. per honr, allowance to remain as previous, -be reqnested. It was also decided, "That the notice of 1872 be rescinded, and that all futare notices be givon on tho 18 st of April, to take cffect on the 1st of May in earh
$\qquad$ Woodhouse-The master builders of Woodonse and Handsworth have coneeded the fowing, being a part of what was asked fo 'so o begin at half-past six instead of six in the morning, and an adpance of 2s. per week on thei wages.
Glasgow. - At a meeting of Glasgow joiners it was reported that eighty*six employers had consented to accede to the demands of the men for an advance of $\frac{1}{2} d$. per hour ; twenty promised to pay tho advance if the trade generally did so nine had refused, and four had not yet given any decided answer. As the nine masters who decline to give the advance employ very fem hands, the tbreatened strike will be averted.
Arbitration is working successfully in the pro Finces. It has jnst averted two great strikes in the building trade, one at Liverpool, the other at Birmingham, Mr. Clarke Aspinall, as we have seon, has decided the Liverpool case in favour of the men as regards wages, and of the masters as regards hours. Only the first part of the Birmingham award has been given,-that settling the hours; the decision as to pay was expected shortly.
Mr. Rupert Kettle, te whom was referred the question of wages in the North of England iron trade, has declared that puddlers shall receive an advance of 9d, per ton, and that all other ironworkers shall be paid an advance of $7 \frac{1}{3}$ per cent. on present prices. This decision was communicated at a meeting of the Board of Arbitration at Saltburn.

## NATIONAL MONUMENTS.

Sirt,-Having read Mr. C. Cooke's remarles in your paper of the 29 th ult., under the heading of "National Monnments," I am at a loss to understand the harsh expressions used from time to time by gentlemen who profess mnch veneration for notable stone relics. I have before, in the Times, mentioned cortain particulars respecting the Tolmen Rock, in Con. stautine, Cornwall, and I would suggest that when a relic is offered to the country at large for a mere nominal sam (as was the case with the Tolmen Rock), there should be an effort put forth to purcbase the rights to such monuments before any person or persons give expression to censure.
The Tolmen was the key to large masses of beantiful gravite rocks; and althongh it was hrown down after working-hours, naknown to me, yet I maintain, had I ordored its destrac. ton, it is not becoming in any ono to question he aetion of a proprietor with respect to a monument or relic, when he has had the opporunity of purchasing all rights to tho same

In the Geutleman's Magazine, May, 1844, pp. 483, 488, roference was made to various destroyed stone monuments in Cornwal, near Penzauce; and it was stated that the late Sir Charles Lemon, of Carclew, offered a reasonable price for the Constantine Tolmen, and the land on whieh it was placed. Tbe then owner demanded 5001 . as purchase-money, which Sir Cbarles declined to pay. Dr. Borlase deemed it to be a rock idol, and engraved it in his work upon the Antiquities of Cornwall, 2nd edit., p. 14.7. This relic, when I inspected it in May, 1861, was ominously near at stone-pit, as the Cheesowring is now. The Rev. R. Polwhele, when vicar of Manaccan, distinctly saw the eddystone light from the Tolmen, some fifty miles distant as the crow flies! The fine cross, which stood ahout half-way botween Helston and Penryn, near the road-side, has been destroyed recently. A protective fence round old relics, as at Capel Garnon, in Carnarronshire,
and at Bryn Celli, in Anglesey, is useful, and has been exhibited in the Gas-Meter Testing sasy to constract. Sir J. Luhhock's Bill ahould include post-historic monuments; althorgh, as illars from heine mastroyed throwoh imorance copidity, and folly, or mischief.

Chr. Cooke.

## A MUSEUM FOR CHESTER.

Av cffort is now to be made to provide the "rare old city of Chester" with a museum capahle of displaying her archmological treasures. The Marquis of Westminster latoly presided at a meeting of the principal professional men and tradesmen of Chester, the ohject being to consider a scbeme for uniting nnder one roof the city library and reading-room, the society of arta, the architectural and archroological society, the natural science society, and also for esta. blishing a local museum, the nuclens of which is already secured to the eity by a very fine geological collection presented hy Lord West. minster. Plans were suhmitted of the louse and a portion of the premises lately occupied hy named for the same. The soint committees tho societies received porver to treat for a rental of the premises, witb the option of purchaso.

## GAS.

Air-Gas.-While noting particulars of the experiments lately made in London with an apparatns in which common air was charged and then stored in a suggested that the simplest and best way would be to fill the gasometer with mere air by lifting pass through the hydro.carhon spirit the air to pass through the hydro-carhon spirit on its way spirit must tend to doposit the spirit in the gasometer before it is used. Now it turns ont that the plan adopted at Sbeffield by a Mr. W Wright, and not very clearly announced in ours pat into practice. The Sheflield Independent onrs put into practic
thus deacrihes it :--
" The new gas can to used either for lighting, henting,
or soldering purposes, to each of which uses it was yester

 minuteg after it was ignited, so great was the heat
the plate at the top hecmere red hot. Unmistalahhle the plate at the top hecame red bot. T nmmistakahliee erit
 it flled equith nit. the gas. When the cirometer was taine it flled with air; and on $\frac{a}{}$ wieigh being placed on it, the

 he amme bollows met the gas at the end of the then from hus a steady blast was crented. The secret of tho mile it is applied in tho cyivioders. By means of the manulacture gas at the rato of 5 , Woift, per hour He it lightiwy or its heatin? power, hat hoth what is eithe be considerably above those of, the ordimary gas. HIL is
of opinion that the outside cost mill not be alove od, per
Silber's Lights.-One of Silber's patent lights is avout to be ereoted hy the St. George's Vestry at Ebary bridge. It is stated tbese lamps give a better light tban gas, and are less expensive If so, no time should be lost in adopting them all over London.
Price of Cias.- In the House of Commons sir C. Dike asked tho President of the Board o rade whetber, looking to the excitement which at present prevails in the metropolis on the subject of the price of gas, there was any objection to printing the accounts of the Metropolitan Ga Companies for the year 1872 at once, instead at the end of the session of Parliament reply, Mr. C. Fortesoue said, "I am not ahle at once to have the accounts of the Metropolitan Gas Companies printed, becuuse they have not yet heen received; hut I hehieve thes will soon oe presented, and that I shall he ahle to lay the ceturn heforo Parliament at an carlier perio than usual."
Instantaneous Gas-lighting Apparatus.-Professor Klinkorfono's apparatus for the instan taneous lighting and extinguisbing of gas-lamps

Ofice, Glasgow. The system consists in having and the apparatus nsed is a combined hydrostatic tap and galvanic battery. By increasing the gas-pressure from the street mains galvanic action is produced, the supply opened, and tho jet ignited. By reducing the pressure the tap mmediately closes, and the flame is extingished

## SANITARY AUTHORITIES.

Gloucestershire.-A meeting of delegates from varions sanitary authorities of tho county, for the purpose of appointing a medical officer of healt, has heeu held at the Gloncester Work houso. The Rev. H. W. Maddy, cbairman of the Gloucester Board of Guardians, presided, and ahout thirty delegates were present. The salary of the proposed officer had been fixed at 600 l There were sixty-seven candidates, of whom eight were requested to attend the meeting After the delegates had examined the testimoniala, and had had interviews with each of the candidatea, Dr. Francis Thomas Bond, of the Harbley Institution, southampton, was elected, wioh election heing subject co confirmation by the Local Government Board.
Public Health Act (1872). -In roply to Dr. Lugh, in the Houso of Commons, Mr. Stansfeld aid tbat the instrnctions given to the poor-law inspectors ander this Act, and the nroan and sanitary authomies, were not identical, as the conditions of eacb locality were different. In cases where medical officers of health were ppomted over largo areas, it would be neces hem, aw medical officers for sanitary purposes, but he was not prepared to say what the remuneraion for extra services, to which the latter wer undoubtedly entitled, would be.

CASES UNDER THE BUILDING ACT.
At the Clerkenwell Police Court, Mr. Robert Turnbull, of Sylvan Cottage, Hornsey-rise, appeared in answer to a sum forveyor for ailag site the or erectig ar bime rise lonation Building Act.
Complainaut stated that he sammoned tho defendant to this court about a fortuight ago for neglectiag to givo
him, as the distriet surveyor, two days hefore the building in question was commenced, notice in writing, stating tho Which aftence defendast was lined j0s, The present summons was for consuructing the sarme hailding, contrary to work, with tinalyer framing, Fith an asphalte roof, and oncloged on throe sides.
Mr. Wraseling. for the defendant, said the huiding in保 to put the drayz of the brewery under. It was on wheels, aud could be mored about any where, and it was ereet a permanent buiding on snother portion of the
premises; that hy section stiot the Merropolitan Building premises; that hy section 5 bolt the Merropolitan Building $^{\text {Act, it was enacted. "When any huilder is desirous of }}$ erectivg any iron buillug, or any other buildiag to whith the rules of this Act are inapplicable, he shall malie an such desire, aud setting out a plan of the proposed huildlag , with such particulars as to the conatruction thercof
as may be required by the said Board; and the latter, if satisfed rith such plans nud particulnrs, shali signifs their approral, and theruupon such building may he con.
structed aecording to such plans and particulars." His structed aecording to such plans and particulars." His
client had made applicution to the Loard under the abore section for the ercetion to be allowed to remain for six montlas is had also deposited tracings of the buildipg,
and paid log. for fees upon same, and his application vocld he laid before the Bard at their next meeting ; therefore, under thege circumatances, he (Mr. Waleling $)$
asked that this summong should stand adjourned, to know the result of his clicut"s application to thic Board.
The magistrate adjourned the summons for fourteen days.

## WORCESTER DIOCESAN RRCHITECTURAL SOCIETY

The annual meeting of this society has been held in the Council Room of the Natural History Society at Worcester. Mr. G. J. A. Walker presided, and there were also present-Sir E. A. E . Lechunere, hart. ; the Revs. N. Cathey, W. Norne, Gree. Mreen, E. Rohinson, Hi. . Eumon, G. C. Salt; Messrs. Walker Remnick, E. Lees, Hyla Holden,
G. A. Bird, J. Cotton, and J. Severı Walker (hon. sec.)
The Hon. Secretary read the annnal report, which was adopted.
Sir Edmund Lechmere, in moving the adoption of the report, said he thought it night he worth while to consider whether another object, in ac. dition to the original object of the society, might not bo recognised; that it shozld not merely ho an arohitectural society, but also, as was the

## mociety. Mo believed such an object would be

 productive of a great increase of members, withatility of tho society. Sir Edmund then ex. prossed the hope, as one of the Cathedral Resto ration Committee, that the Architectural Society would not come down upon them with a sweeping oriticism as soon as the works now in progress are completed, but that even now, if they saw any points that wonld promote the interests of architecture or tho beauty of that nohle edifice, hey would gire the committee the benefit of heir advice.he sugcestion walker said that, with regard to he suggestion thrown out by Sir E. Lechmere, he society was practically, althongh not in $t$ more expansive, and enlist greater sympathy rom the public generally hy altering its title, ond adding to it an bistorical section, it might be dvantageous to do so.
The president, vice-presidents, honorary se. retaries, treasurer, and auditors were re-elected,

## ZE-OPENING OF TIE PRIORY CEURCH

 DUNSTABLE.AFTER a partial restoration at a cost of about ,700t, this church, according to the EDedford mes, has hoen formally reopened for divine Three
Three years ago, the sum of 5,0001 . wa :xpended, and now 1,700l. more have been levoted to the work of restoration. Tho north isle, however, remains to be restored, and owards this the Duke of Bedford has proaised to supplement his former donation by second sum of 5001 . 300l, more aro also eeds restoration. As for tho interior, the worl f restoratiou hecame a matter of necessity, for was not until the roof threatened to fall in, ie.beams were rotten, rafters were dropping nd an ornamental corbel had fallen,-that a ecided step was taken towards the restoration the edifice.
tho entrance an oak screen has beer ected. The clergy of the rural deanery hard cescnted the church with a pulpit of marhle, or wos beriegated brown, from orguay, and the upper portion of polished exhyshire marble, with a oaryed eagle sup. on the book-rost apon its wings. The steps ortions of Kettering stone. The floor is laid ith Minton's encaustic tiles. Haden's patent t.air heating-apparatus is provided. A new "ding-desk of carved oak has been purchased. he old style of pew is dono away with, and open ows supplied instead. The chancel, as far as it 308, is all new, but a good deal is required to zen provided, and a new vestry ereoted. The d gallery is clearcd out, and the organ.loft has sappeared
$\mathrm{Mr} . \mathrm{S} . \mathrm{Cl}_{2}$
Mr. S. Clarke was the architect under whom are a view of the church some time ago.

## IFT BY THE CROWN TO THE TOWN OF DUMFRIES.

Thil estate of Hannahfield, which, in defanl heirs, fell to the Crown, has been gifted to 10 magistrates of Dumfries, and the sheriff and verifis substitute of Dnmfries and Galloway, tras
Part of it is to be converted into a public nk, and the revenne derivahlo from the reainder to be appliod to the improvement of Iucation in Dumfries and Galloway.
The greater part of this estate originally lled the Kingholm ; but about fifty years ago was sold in order to extingaish debts incurred the burgh. Tho purchaser was a Mr. John annah, a native of the burgh, who had accu. nlatod a considerable fortune in Jamaica. ais gentleman added to the landed estate, and ang unmarried, intended to leave the proIncational institution, - the Bargenance of an tually prepared a will for that purpose, hut died before the deed was completed. His ly relative was a nophew, who succoeded by W to the having ; died, in 1868, intestate and
d she again left it to his widow,
vithout issue, it foll to the Crown, as ultims iveres.
In granting this gift, the Crown has reserved park itself the ight of drilling troops npon the Wark. Dumfries was a military station, and the War Office was freqnently put to considerable expense in hrigading the contingent quartered there, there bcing no sufficient space of ground in the neighbourhood at command.
It is expected that the personalty will be ufficient to defray all preliminary claims, so The the land will be free of barden.
The good news was received by the Dumriesians with demonstrations of joy, ringing of hells, babquets, \&c.
In this instance the Crown is only following he examplo set by several wealthy private individuals, and is besides practically carrying into effect the intentions of tho person by whose oxertions the estate was acquired.

DIGGING FOUNDATIONS TO THE INJURY OF ADJOINING HOUSES.
Berdon F. Gradon.-This action, bronghtin the Durham County Court, ie ono of some interest to architects and
builders, in regard to foundations, and also to owners of The property.
claimed 500 . damages of the defendant,
 superintended the Bhying of the foundation. The ground Wes peaty, but the floors were laid with 2 f . of coucrete.
The house on the noth side, aud a tinber-yard, belonged to Mr. Grador, the delendant, and considerable aiterations engine erccted close to the witnes's house. The detendant has cut away one house, and removed threc walle that
formerly supported witnesses housa, and the garden party-
wall fell down wall fell down iu consequence of the excarakions made by The floor of the back kitohen sank 5 in. on Mr. Gradon's
side, and the froplace was injured. In the font the floor was sprung up, and the ireplace let down. The irames considerably ened in seperal places; back window. on Mr. Gradon's side sank 5 in., nnd parted from the ad. joining property, and the front windows are dropping in,
nad the daruage was done within three months of the com mencemeant ol" the excaratione, and he estimnted the
damage at upwards of $50 l$. Upon speaking to the defevd. damage at upwards of 502 . Upon spenking to the defend.
ant, he oidd he would sond a man down to make it good, but all bo did was a little worls to the epouting. Hecould
not now jet the bouse, and had to live in it himeell: $H$ H further expericnced a great nuieance from the vibration
of the detcndant'e eteamecngine which did his building Fork. The engine wae worked with metal cog.wheels, and
whet caused a great noise.
In cross-examination by Mr. Edge, counsel for the he honse twenty years ago did not remove because mit the rof, but there was only one slate onf. Domplained of
to Mr. Gradon elout the damage until 1871 , as he wished ascertain its full extent, and he had spent lot, in repairng it since he went to lire in it. Will not swear that the
defendsat did not offer to put the floore ripht, rather tha Mr. Robson
reinstatomeat. builder, proved the darasge, and cost o
In answer to the case, Mr. Edge said, the action had
ween brought in order to make hie client bnild the plaintit anew houso. No excarations had been made as stated by the plaintifi: His client had offered as a neiglibonr to
repair the floore, but the plaintiff would not let him, and repair the loore, but the plaintife would not ket him, and
now nount to recoover vindective damages. In faet, Mr.
Gradon hed Gradon hidd done nothinghe was not entitled todo in carry:
ing, on his business, and the present conditiou of the ing. on his businoss, and the present condition of the
plaintili'e property was owing to his neglect in repairing the house. With rcgard to the clnim for compensation
on secount of the alleged nuisance of the defendants en gine, every care had been takien in working the machinery,
and no unnecessary noise had been caused. Mr. Crozier said ho was the county arechitect, and pre pared the plans for the alterntions on thr. Gradons pre
misee. The work was done according to these plans, an no excaration had heen rude in currying out the alf era
tions either under Mr. Gradon'e house, or within 6 or tions either under Mr. Grador'e house, or within 6 ft . or
7 ff . of the wall of the plaintin's house. Tho front hitehen of the houee pulled down bad beense. filed up to the the
extent of 6 it , or 7 ft ., and an archway made through the houee iteelf, so that conveyances sould be talien into the defendant's premises. The present floor of the back
kitchen also stands on the old floor, and is 2 ft hicher than the old floor : 2 ftion of concrevtor, nas laid on this toor
in order to make a good bed for Mr. Gradon's machinery. in order to make a good bed for Mr. Gradon's machinery. quence of the vibration of the encine. Ho did not con-
sider that anything Mr. Gradon bad done to his premisea
had in the loast injured the plaintifn's hove. The only place where may excaration was made was in the garden
 noticed the dilepidated otate of the plaintiff o bouse. The judge, Mr. Meynell, ssid if rachinery adjoining
dwelling-house made such a noice as to causc inconvenience or injury, or a nuisance to any one, an actio would lie, but if it were only a slight noise it would no be actionable. If a person bad a piano in his houee, mad
his neighbour, owing to the thinness of the walls, wa annoyed by the i
ground for an action. In this case all the cvidence ma given by Mr. Hardon, who stated that he experienced iacon renience when the eugine was atarted in the morn-
ing. Ho alleged that the engine shook bie bed, and pre ing. He alieged that the engine shook bie bed, and pre-
rented him from sleeping, and if that were so why there
mas a nnisance. in cases like this only to give a emall amount in the fire instance because other actions could be brought after. considered it rigbt, thes could give substantial domages for the alleged nuisance.

## THE ANNUAL REFORT OF

the metropolitan board of works. The report of the Metropolitan Board of Works for 1872 , which has just been issued, contains some intoresting particulars as to the work which has heen effected by the Eoard during the past year, together with otlier works contracted for and immediately to he com menced.
Amongst other items contained in tho report it is stated that dnring the year sixty-five plots of the surplus land in Queen Victoria-street hare been let at a rental of $26,592 l$, and some haro been sold, includiper 15,531 square feet to the Metropolitan District Railway Company for $73,373 l$. The report adds that all the remaining ground will very probably bo let or sold during the present year. The works at tho Chelsce Emhankment were rapidly procooding. On the question of parks, the report atates that the Board have resolved not to let for building pur poses any portion of the land pnrehased for Finsbury Park, and that a greenhouse is to he crected there in which to propagate plants for the gardens of the Thames Embankment. Southwark Park has been similarly dealt with and all the ground purchased, with the exception of a small outlying portion, is to be included in the park. The Board have also purchased of the Crown $23 \frac{x}{s}$ acres for $20,450 l$., for the pur. pose of adding it to Victoria Park, for the recreation and cujoyment of the puhlic.

A review of the drainage and sewerage works effected hy the Board during the year forms a prominent feature in the report. With the ex. ception of 8,000 feet between the Cholsen Sus pension Bridgo and the pamping station at Cremorio, the main drainage porks wero com plete, and the dolay in completing this portion was occasioned by the Chelsea emhankment For the intended new western pumping station near the Grosvenor Canal, Pimlico, contracts have been signed to the amount of 126,950l. for huildinge, and 56,789l. for machinery malsing a total of 183,7392 . ; and in the course of two years the works will be complete. The report adds that when that is dove, the sewage from the westernmost portion of the sewer will no longer he pumped into the river, but raised into the eastern portion, aud conveyed into the Abbey Mills pnmping station. Contracts have been entered into for sewer connexions in the city and five contracts have also been entered into for sewer works at Hammergmith Creek, Stam. ord Brook, Hackney Wick, the Flect sewer and High.street, Shoreditch. In addition to the sewer and drainage works executed during the year by the Board itself, the Board has also giveu its sanction to plans for twenty.four miles of sewers executed by the several District Boards, these sewers varying from a 9-in. pipe to a brick sewer, 4 ft .3 in. in dimension; whilst duringt the year 356 branch sewers have been connected in the main sewers.
At the conclasion of the report it is stated that the net debt of the Board at the close of the ycar was 6,389,530L., and that it had lent to various District Bosrds during the year, sums mounting in the aggregate to 215,273l. for public works ; also a further sum of 62,4007 . to pertain of the Boards for paving and other purposes; and had contrihuted $\uparrow 3,600\}$. towards public works, costing 149,052l.

## FROM SCOTLAND.

Edinturgh. - In reply to the memorial forwarded to the Secretary of War, calling attention to tho baldness of design and generally unsatisfactory character of the huildings now in course of erection on the south slope of Castle hill, as quarters for married soldiers, a commnnication has been received to the effect that the matter shall receive due consideration in the proper quarter. Meanwhile, the Week $l y$ Scotsras states that the city snperintendent of works, Mr. R. Morham, jun., has prepared a plan hy which, withont any material alteration of what has already been done, the internal保 the hnildings would be greatly improved. The introdnction of pantries and of sanitary ap pliances on a more satisfactory scale than was contemplated in the original desigu affords the
opportunity of adding certain features in the eleration and sky. ine of the block. This plan is, we hehove, to be forwarded to the War Ofice,
as affording a feasihlo sugrestion for the im. as affording a feasihle suggestion for the im. provement of the buildings.

## CHURCH-BUILDING NEWS.

Blaydon.-A new cemetery has been set apart at Blaydon, and the consecrated portion dedi. cated hy the Bishop of Durham, in the presence of a large company. The groand set apart for tbe cemetery was parchased two years ago from Colonel Towneley, and two cbapels and mortuaries have since heen erected, together with a
superintendent's house and offices. The bnild. superintendent's house and offices. The bnild.
ings and laying ont of the cemetery have been ings and laying ont of the cemetery have been carried out hy Messrs. Marcb \& Smith, under
the superintondence of Mr. Matthew Fhompson, the superintondence of Mr. Matthew Ihompson, nearly filled up, the ceraotery supplies a de. sideratam in the parish.
Alton.-The steeple of tbe parisb church has been for some time nnder repair, the work being placed in the hands of Messrs. Puzey \& Filewood, of this town, huilders. The steeple bas been entirely stripped of its former covering of lead,
weighing many tons, and will be replaced hy oak shingles.
Chard.-A Mission Church, in connexion witb the Free Church movement, has been built here. It occupics an olerated site in a meadow adjoin. ing the station-road, and has been erceted principally at the cost of the Rev. C. S. Grueber, B.A., of Humbridge, near Langport. The church, as it stands at present, is a very modest and untime to come. The east and west walls are the only portions of the fabric which it is intended to leave in the same state as they are now. These are built of local stone, with Ham.hill aressings. There is an oriel window at the west side windows ; the intention being to leare space side windows; the intention being to leave space
for a large altar-piece. The building is 105 ft . for a large altar-piece. The building is 105 ft , a small vestry, and a robing-room. The side walls are built of flint and brick, and are to be walls are built of jlint and brick, and are to be
removed, if more room should be requircd, as removed, if more room should be requircd, as
soon as the funds can be obtained for hailding son as the funds can be obtained for hailding and ceiled between. The chancel is elcvated (in and ceiled between. The chancel is elcvated (in the altar is to have gilt crosses, candelahra of rarious sizes, drapery, \&c. The seating oonsists various sizes, drapery, cic. The seating oonsists of very plain chairs. The brilding is lighted
with eleven large windows and oras. Some arrangements have heen made for heating the arruagements have heen made for heating the church, hat at present the heating. chamber (heneatb the altar) is withont an apparatus. port, and the cost is estimated at 1,500l. The port, and the cost is estimated at $1,500 \mathrm{l}$. The
formal opening of the church has not been fixed. Horsham St. Faith's (Norfolli).-The restoration of this well-known chnreh has long been desired by those who were acquainted with its history, its condition, and the wants of the parish. Distant four miles from Norwich, on the aylsbam-road, its tower arrests the attontion of the traveller, whilst its connexion with the once famons Albbey of St. Faith's, commends it to the antiquary. An effort is being made to accomplish the restoration of the chareb. It is proposed to underpin and otberwise strengthen the outer walls, aud thoroughly rectore the mindows, tower, belfry, porch, roofs, pulpit, screen, and re-seat the whole of the interior. If a sufficient sum of money can be raised, the hrick arches of the nave (now leaning outwards), tbe chancel arch, and clearstory will be rebuilt in stone. The cost of these works will be ahout 2,100 l. or 2,7002 . if the arcading is rehuilt. The plans and specifications have been prepared by Mr. R. M. Phipson, and approved by the vestry, and by the bishop, and tenders have heen sent in. It is proposed to commence at once, if an appeal issued meets with a ready response. lady, connected with the parish, has offered $1,000 \mathrm{l}$, and it is boped that this donation will be followed by other gifts from owners of property in the county.
Thirsk.-A vestry meeting has been held in the crypt of Thirsk Church to receive the report of a committee appointed last Eisster for the by the conmmittee was based scbeme adopte plaus prepared by Mr. G. E. Street, architect. The committee proposed that the following should be the order in which the different parts of the work of restoration be undertaken,
according to the funds at their disposal :-1. The roof, exclusive of pinnacles and other external adornments. 2, The scraping of walls and pilars. 3. Re- Hooring and re-seating. 4. Re.
warming and re-bghting. 5. Vestry, groand warming and re-bghting. 5 . Vestry, ground porch, pinuacles, \&c. The scheme of the com. mittee was approved and adopted unanimously by the vestry. It may be added that Mr. Street's estimate for the whole work is $4,600 \mathrm{l}$. Bridgnorth.--The new tower of St. Leomard's has been completed and opened. It bas heen already described in our colnmus. Tbe stone cmployed in its stracture was brought from the Town's Mills Quarry. The dressings are in red Alveley stone, and the panelling in the belfry windows is of wbite stone from the same district. The height is the same as that of the old tower, viz., 89 ft . to the top of the cornice, 95 ft . to the top of the battlements, 106 ft . to the top of the pinnacles, and 125 ft , to the top of the summit of the spire. The embattled cornice at the top is surmounted by eight other pinnacle crocketed. On the north-west angle of the tower is a tnrret, terminated hy a starting from croct other pinnacles, and further enriched with crockets running $\mathbf{n p}$ each of its sides. The glass hy Mes the types of Baptism, the Sarionr heing the central figure. On either side are figures of Moses, Noab, John the Baptist, and Nicodemns. Messrs. Slater \& Carpenter, of London, were the architects ; Mr. Escourt, of Gloucester, the contractor ; and Mr. Hart
Monmouth, - St. Thomas's Charch is beim restored. The vicar discorered that the roof ot the ohancel was in a bad stato, and that the foundations appeared to be giving way in places. He communicated with the Duke of Beaufort, to Whom the ohurch holongs, and the result was Llandos. Pritcbard, architect of the ciocese of entire cost of the Duke. It was further dis. corered that the stonework in tbe north and sonth windows bad perished. The cast window, of throo lights, was foand to he an innovation, the lights being merely placed in the wall with cement. The work of restoration is now rapidly progressing; the whole of the fonudation has been renewed with native stone from Longstone Wood; the walls have heen underpinned, and the old leating apparatus taken up. The latter was found to be so useless as to necessitate laying down another. On the coping from the north door heing removed, it was found to bo a casing placed over the original coping. This door has mas found that its entire restoration The tracings aro so far discornihle. In stripping the old walls, which had at some time or oth heen stuccoed over, a window was discovered between the north door and the wall of the nave which divided the chancel, which will be restored to its proper use. In stripping the plaster from the south wall it was discovered that a Norman window had heen taken out in its entirety, and the place filled in with stones and hricks. In al cases where a mindow has heen built up there will be replacements, of the same design, and everything possible will be done to render the restoration of this interesting church a perfect one. The outside of the walls will be painted, not covered with plaster, as before; there will be a new open roof of pitch pine, with a boarded ceiling, and the covering will be of sea-green slates from Penmole. There will he new altar rails and steps, and encaustic tiles will take the place of the present wooden flooring.
Iley.-For some time past the parish church neley was much too small for tho increasing to ther who attend it. Application was made the lord of the manor for a site for a new church, and he consented to grant a site in wh short distance below Wells House, on condition that 1,000t. were raised towards the ohject. This sum bas been ohtained, and it is believed that the transfer will immediatcly be made and building opcrations commenced fortbwith.

Moving a Lighthouse.-The Ness Point Lighthouse, near Lowestoft, is beine moved in land about 100 yards. The hottom iron framing has been nuscrewed from the lower piles, and the hnilding lifted hy menns of serew-jacks Iron flanged wheels have been screwed to the hottom frame, a temporary railway has beer laid down, and the huilding has hy these mean been moved some 40 ft .

Illustrated Guide to the Fish, Amphibian, Reptilian, and supposed Mammalian Remains of the Northumberland Carboniferous Strata. By Thomas Pailister bareas, f.G.S. Londom: Hntchings, Bouverie-street, Fleet. street. 1873. Atlas of Carboniferous Fossils from the Northe
umberland Carboniferous Strata. By T. P. umberland Carboniferous Strata. By
Barkas, F.G.S. London: Hutehings. Barkas, F.G.S. London: Hutchings.
Tue anthor of these wrorks has long been engaged in the investigation of the palcontology of the coal measures, witb the indispensable aid of practical and intelligent coal-miners in North. umberland, and the interesting results are the Mannal and Atlas nnder notice.
Amongst tbe discoveries made by Mr. Barkas i which has for some years exoited a good deal heated controversy among palæontologists and eologists. This was a mandible, illustrated in the Atlas and described in the Manual, as probahly hat of an insectivorons mammal. how it has ditherto heen considered to he orthodox to mit or suppose the existence of any mammal nasio the carboniferous era, the foregone con lasion, or hypothesis, amongst the orthax alia bat tho tine come. This hypothesis has een hased not then fact that beretofore such remains have not been fonnd,-a cnrions reason for objecting to the finding of them now, but simply an indication that it is disacreeahle to have a fine theory oyertorned by facts. Mr Barsas calls the mandible in question a sun posed mammaian relic, hut ho seems to hare po doubt of it, and probebly it is 50 , bot is to be wondered at that remains of land onimal should be fer and far between in ocean demosit Where fishes are so abundant ? A new light on the antiquity of the mammalia, and even of man, appcars to be striggling throngh the darkness and the errors of past geological and palioness and the errors of past geological ant palefid that, while little clse hut fishes were being find that, While little clse hut fishes were being malia, and even mankind, existed in ahundant numhers elsewhere on the face of the earth. ven already recent facts seem to show that man did exist before the glacial era, during the rift of wbicb era such complete evidence of his existence had shortly before been found, and Mr. Barkas is one of those pioneers of the ew licht whose fact-respecting animus onght he favourahly regarded, even were he proved have heen mistaken in the present instance which, so far as we know, he has not yet been.

Street's Indian and Colonial Mercantile Directory for 1873. G. Street, 30, Cornhill.
ansiderable improvemonts havo heen made in his Directory. The various steam routes to the places treated of, with rates of faros and times eooh of the banks are nemed, so that the merchant is enahled to see to whom to apply; " nlso particulars as to the principol products and the articles in which the trado of each place chielly consists. Information, too, regarding the prin. cipal Government offices in cach town, and of he varions railways in operation or construction is added. It is quite cvident that Messre Street have bestowed a large amount of time and lahour, both locally and at home, on the pro retion of the work which we can in conse quence, recommend.

## VOL. XXXI.-No. 1576,

Opening of
the International Exhibition.

N MONDAY last the third of ths serics of ton annual exhibitions planned by Her Majesty's Commia. sioners for the Exhibition of I85I, was opeued nnder favour. able auspices as re. gards. weathcr and other influences. The threo days preooding Easter Monday wcre characterised hy dull loaden skies and piorcing winds, hut on Sunday night the E clouds lifted, and Monday morning dawned with an azure dome, flocked only hy fleecy clouds that ere highly omamental, and the revorse of ureatening. It might have been aupposed that e arusual hrightneas, pleasantness, and hope. al promise of the morring would divert many fitors from tho in.door attractions of the xhihition who might have resorted to it nuder ss summery circumstances, hat this does not eom to have heen the case. Probably the fac that the fine day turned out a grand maximum
pleasure-seekers. The lovors of al fresco tertainments and enjoyments had abundant portuuities for the gratification of their tastes; ut, however this may ho, the Commissioners, eneral Scott, and his staff may be congratuted upon the successful opening of an in. reating, and, we may suppose, attractive ollection, tho numher of visitors being, in so ar we conld learn, considerahly in excess of
hat thoy have been on the opening day of ther of the two preceding Exbihitions. There as no ceremonial to attract a crowd, fashionahle otherwise ; the doors wero thrown open simply, ad the puhlic admitted to judge of the Exhi ation on its merits: they came by thousands, pronounced a favourahle verdiot that will be dorsod daily hetween now and the end o It is quite well known that all has not been ain aailing in these Exhihitions as between the ommissioners and the exhihitors, and the annual ollections have been attacked by gome detractors. hey have hoeu pronounced failures as regarda cecialties, but this mnst be held to be at least open question. It may be admitted that last ear, when cotton manufacturing processes were ispecialty, and this yoar, when silk mauufactnre is its turn, the oxhibits in the machinery.in.
cotion department, as illustrating theso at hranches of onr national lequate, if the magnitude of these interests are ken into consideration. This also, however, hast he admitted, that even the limited display i machinery of last year in cotton mannfactures, ad of silk manufacturing machines this year, as and is sufficient to show fairly, and with
assable completeness, the rationale of the two rocesses. This muoh is indisputable, that last ear the display of products of the cotton manu.
dacturo, and this year of the silis fabrics and pro dnctions, ancient and modern, may ho regarded as completely successful expositions.
But the specialties of this year's Exbibition include, in addition to silk and silk manufactures, food, drinks, and their preparation, also cookery and coaches.
Visitors on the opening.day followed, of course, their own tastes, hut reached the objects that interested thom under difficulties, from having to master the oontents of an offioial catalogno of nearly 200 pages, first acoessihle on their entering the Exhibition.
The exhihits of distinct classcs are not,-for good reasons, douhtloss,-placed very compactly, and this remark applies cspecially to the carriages, which, occupying much space, are dis trihuted in varions localities, at a considerahle distance from each other; as, for instanco, in the east and west arcades, the French supple. mentary court, and other rooms. There can be no question that the display of spring carriages, ancient and modern, in State coaches of tho Sovereign, of the Lord Mayor, of the Speaker of tho House of Commons, and of nimerous other offoial personages, and of modern vehicles, is very full and rich. These last inclucde drags, landaus, hrougharus, phaëtons, Victorias, and other carriages of the park character; with a profusion of shooting-carts, dog-carts, gigs, Nor wich and Alexandra cars, cosy carts, and an cndless varicty of other vehicles. In addition those more imposing exhihits, thero is a pro fuse display of spring.oarts, wagons, hrewers drays, town vans, and oven of trolloys, wheel. harrows, perambulators, and velocipedes, two, taree, and fors wheeled. The models of old nail-coaches, and the actual mail-coaches that were run off the road hy the dailways, are pecn. liarly interesting ohjects. One of the most important departments of this display, and destined, probably, to produce important reanlta as affecting the comforts of street locomotion, is the exhihition of improved Hansom-cabs, in the oast arcade. The exhibitors include,-Mycsars Edwards \& Sons, of Cardiff; James Eqans, of Liverpool; Forder \& Co., of Wolverhampton J. C. King, of Camden.town ; G. Huhand, of Rogent's Park; J. Lambert, of Great Quoen. street ; T. II. Lowis, of Regent's Park; J. Mar. ston \& Co., of Birmingham; Standfield \& Crosse, of Exeter; Wm. Stoneham, of Seymour.street, Euston-square; Turton \& Rogers, of Leeds; and B. Ward, of Lamh's Conduit-strect. The prices of the improved cabs have as wide a range as from 30 to 100 guineas. Without attempted enumoration of particular cxamples, it may be said truthfully of the ahundant dis. play of modern spring-carriages, -the finest over brought together, - that they afford con. clusive and satisfactory evidenco of the high degree of excellence and proficiency that has been attained in hody-making, amith work, wheel.making, trimming, painting, and all hranches of the ooachmaker's trado: so far as the art goes, there is something yet to he donc. Next to coaches, cookery and cooking appliances enlisted popular attention. The major portion of the kitchen ranges shown aro in the South Gallery, Room XXIII., hut there are aleo some interesting objects far removad from these in the iron annexs adjoining Room XII., at the entrance to the School of Practical Cookery. There are fifty exhibitors in this class, some of them showing a large variety of objects, the whole embracing coal and gas cooking-stoves and ranges, fixed and portahle; stoves for roasting, haking, hoiling, hroiling, grilling, and toasting; hospital, workhouse, and harrack cooking apparatus; cottagers' and emigrants' stoves and fittings; cooking apparatus for petroleum oil fuel; Naphtha cooking-stoves; Field kitcheners; married soldiers' ranges, and ship's cooking apparatus; hot-air ovens and chambers; fire.trough field cooking apparatus
tor campaign service; self-acting roasting ma ohines ; portahle suh.fire ovens; hot platos; and a great variety of other ohjects, almost all interesting at any time, but that would have heen eapecially so a month since, before the demand for coal abated, and its price fell
In the theatre of practical cookery that has been fitted $n p$ in the cast maohinery anneze, where the Walter printing.machine used for the Tirnes was exhibited last year, Mr. Buchmaster delivered, on Monday, hetween twelve and one o'clock, an illustrated lecture on cookery. There was a good attendancc, although the hour was early. There is hopoful evidence given already that in the conrse of the next six months the school of cookery will he instrumental in doing something to ahate the national stigma that the English people, many of whom are notoriously adorfed, are really the most extravagant foeders in the world, and chargoahle, as regards their use, or ahuse rather, of materials for sustenance at their disposal, with producing a "plethora of waste." It is to be hoped that Mr. Buckmaster may at least be instrumental in producing oxtenivcly accurate impressions as to the economio value and the virtucs of the too long neglected pot au fou, In this connexion a valuahle practical proposal hy Mr. John Macgregor, of the London School Board, "Rob Roy" of canoeing cele-hrity,-should not eacape notice. Mr. Maogregot proposes to pay for the attendance at the lectires on cookery of 1,000 girls selected from the Liondon Board schools. It need scarcely he said that, even discounting the nomher freely, on the grounds of parental prejudices, or of inaptitudo on the part of the scholars, thero shonld he left out of tho 1,000 a goodly number of apt scholars, future wives and mothers, who may prove radiating centres of beneficent influence, and powerful agents in a domestic and sooial revolu. tion of tho most salutary character.

The machinery.inemotion department in tho western ground.floor rooms excited much atten tion. Many of the machines were in operation but all were not ready, and notice of this departmeat and others may be properly defcrred.

Concerning the Creawick and Phillip col lection, wo shall take our own time to speak of it in our own way. The architectural drawing placed in the gallery of the Albort Hall are not very important.
On Monday the visitors had tho privilege of listening from the west quadrant to a concert by the Life Gnards' band stationed in one of the band kiosks, in the Royal Hortioultural Society's Gardens. Mr. Barnhy's orchestra gave also two concerts in the Royal Alhert Hall.

## COLODR.

Litait and shadow, as appreciated hy the human inind, aro intimately related to the delineation of form. Buth light and shadow have, indoed, a special power of their own, which depende more on mass, or on intensity, than on figure. These casce, however, are com paratively rare and exceptional. A burst of golden sunlight, or the fiorce blood.red flare which is thrown upon its hlack canopy of np cast ashes by the secthing lava of a yolcano reads its own message to the mind, withont waiting to be clothed in definite shape. But even in these signal cases, what may be called tho absolute effect is fleeting. In a short space of time the eze bering to apply itself to the per ception of the contour and undulations of the landscape, lighted by the sun, or of the majestic and threatening aspect of the fire.lighted columns of scorie. And if we take the only phenomenon of light which may rank with either the sunheam or the lava glare, the hieroglyphics scrawled hy the lightning on the veil of night, the bizarre form and the rapid and atartling motion, impress the imagination as distinctly as does the actual imagination

But colonr affects the mind in a mode distinct from the foregoing. It appeals to a different faculty, or order of faculties, from those which deal with form. Colour may ho said to bear the
amme relation to light and shadow that music
bears to speech. The amalogy is not poetical alone, it is true. Without entering here into the philosoplical investigation of the opposite of the nature of pulsation or vilhration, of motion refertible to time, is involved in its action. rethmical changes in these pulsations are asso ciated with colonrs. Wo know that the ordinary terms in which colours are spoken of as qualities inherent in bodies, are merely conven. tional. They are soientically incorrect. Colonr is prornced to say in the sonsorium, by the incidence of pight at a particular angle, or at a particular light at a particular angle, or at a particular
velocity. We know by the charming spectroscopic experiments of Mr. Haggins, that if the velocity with which a given pencil of issuing mays strikes the eye be increased or diminished, by the movement of the object on which they flow of light remaining, onder all circumstances, the same. All such terms as primary and the same. All such terms as primary and import in the face of this magnificent demonimport in the face of this magnificent demon-
stration of a trutb, of which tbe existence is stration of a tratb, of which tbe existe
indeed hinted by the hues of the rainhow.

Thus guarding onrselves from any accusation of assuming a physical theory of colour which is inconsistent with the little, the very little, that
we know of its intimate nature, wo may recal the close analogy that has long since been detected betrecer the tints of the rainbow and the notes of the musical scale. And we do this, not only for the purpose of illustration, but with tho object of pointing out how the effect of colour on the sensorium is different, not only in
degree but in kind, from the effect of form. degree but in kind, from the effect of form.
Form appeals more directly to the intelligenco. Form appeals more directly to the intelligence
Those of us who have not the misfortune to be bora blind cannot conceive of material existence except muder the catcgory of form. And thus it is thai shape has smch a message to onr minds.
Form has a dcfinite meaning in the gencral order Form has a dcfinite meaning in the gencral order of our ideas, whether we grasp that meaning in each individual case or not. So language has a definste meaning, nohle and instructivo, tender and wiming, irritating or alarming; wo know what the speaker, in our own tongue, interds to conrey to tho intelligence. But the tone in which the words are spoken is something allied themselves. Fe can understand the tone, even if tho language is foreign. The reason is that the spoken words appeal to the intelligence, while the tone directly awakens the sympathetic emotions. So ic is with music. We cannot tell what idea is present in the mind of the nightingale, but his song awakens within us something of the enotion which be is endeavouring to excite in bis wate, or which be is pouring forth from the full happiness of his own aebrial hife. So arain an ear devaid of musical education, or of that delicate perception of time which is a gift very much apart from other mental endowments, cannot listen to tho choral thanders of the organ of St. Panl's, or to such a splendid burst of mnsic as the rendering of the "Song of tho Seraphim" hy tho voice of Christine Nilssen, accompanied by the silver trumpet of Harper, Fithout a sensation heing aroused in the hosow of which
Thus, if we rightly noderstand, form in the abstract, and form as defined by light and Colour appeals directly to the emotional part of tho mind. Form is speech,-colour is music.
In any dissection of the elerments of art, it is as well, in tho first instance, to seek for direction from nature. It is in the forms of the clouds, shaped by no laws that we can formnlate, not bent into planes and angles by any force of any pitality of organic prowth, that we may traco the countless vagaries of varied, yet even harmonious contour. On a grey, dull day, when the prone blue of the Enclish sky can scarcely be detected when masses of sapour, all of dull monoch, watic tints wreathe, and bow, and monochrom transform, and mighty shadowy genii, the eye will linger with delight on the ever.changing celestial panorama. But when, as the sun goes down, or still more powerfully wher he first rises in the east, purple and gold, and olear azure, and the brigbt silver lines of the columus of the dawn are thrown apon the vault of heavon, our attention is not attracted by the forms of the clouds. It is the glory, the harmony, or the magaifeent contrasts of the colouring that fills the mind. We wish to
draw the quaint fleeting forms of the grey
clouds, - we are content to feel the magio of the iving colouring.
Again, if wo take the most heantiful ohject iu this world, a noble human face, let $u s$ think of one in which sculpture can find no foult, in which physiognomy will love to find a mirror. Throw over this face the hluc.black hae produced by certain diseases, or the unhealthy tint of the janndice, we turn from it instinctively, although not a lincoment of its positive formal beanty has been altered. Toke a rude, unin. formed, even a vulgar face, and light it up with the brilliant red and whito of perfect youthfu health, and the charm of beauty is at once added to its humhle individuality. The nose may he small," the month large and clumsy, the eyes small and nnlighted by intelligence; and yet by force of mere glory of colouring, the peasant girl gives a pleasure to the heholder which tho delicate, oultured, sickly, woalthy beauty can never unconsciously arvaken.
Colour has the peculiarity of charming by itself alone; by the brilliancy, the depth, and the purity of its tint, apart from any question of balance, harmony, or distribution. The pure bue, cloudless sky of Italy, when the has hecome all but invisible, while neither cloud, apeck, nor shotin ray disturhs the still, rast, pecknoise vault may he reaarded as the nost triking emple of pure and perfectly enchant ing colour. The glorious red of our comanon poppy (in the rapid extermination of which by more careful cultivation of our wheat-lands tho farmer is so regardless of the pietnresque), wben spread over a happily neglected field, is perbaps the finest instance of colouring to be scen in England. Wo may compare with it the golden blaze with which the furze.blossom covers miles and miles of tho Pemhrokeshire cliffs and owne,-a blaze which, bat for the partial relief fforded by the green of the foliage, would soon hlossoms. which, at first most delightful to the smell, after a timo produces a sharp pain hy it intensity. Perhaps the most lovely of all the colours produced by plants growing socially in leep hlue of which almost pales the azare of the sky. Flowers which have tho rare peculiarits of varying hetween hlue and red in the saine, or at least in indistingnishahle, species, are those which revel in the fullest and purest tones of colour. Thus the brilliancy of the scarlet flax may he taken as an example of one of mos glorions of all colours. The pimpernel, shepherd's weather . glass, in tho South
Europe (where, as in this comntry, it is mostl of a somervat dull scarlet), in certain years is replaced by blue seodlings, indistinguishahle rom their red parents except by the possessio of a lovely tint approaching the Bleu de Roy o Sevres, and purer thau the gentian itsel
All vegetable colours are beautifal, Every lower, if we except some of those ominous trihes that give warning of their venomons or rare chemical qualities by their pallid or lurid hues, appears always to be adorned in the very tint that suits it hest. Even in the quatnt lattooing of the gardoners, whero squares, and stars, and crescents, are cut in the living turf, and crammed witb variegated.leaf plants, and awarf, hot-hed-reared gerauiums, the blaze of horticulurist redeems the clumsy toil or the azaleas beve heen tortured,-pyramids or glohes as stiff as if they had been moulded in clay, and witb every leaf improved away out of sight, are yet beautiful, in spite of their dotormity, hy the charming hues of the blossoms. Nature cannot he forced to go wrong in colonr. The wealth and distribution
In birds, wo see how nature, when left to herself, disposes of this magical gift. Thesc creatures, which in their power of flight, their natural melody, their instinctive skill, and their tender care of their young, from the moment when a second egg gives to the mother a hope that she takes good means of realising, em. attributes to the angels,-present the most numerous and splendid examples of colouring In some instances, indeed, the exquigite delicacy of the feathers augments tenfold the lustre of their bues, by metallic reflexions, or by she. dowy gradations of hue, 8 in the trocons and homming.hirds. Tho triumph of taxidermy which is displayed, in some of these species, in the British Museum, ought to be known to all our readers. A perfect cascade of delicate
oream-colonred spray falling over the darker tints of the lustrous body feathers, in one of the rarer Birds of Paradise, is an ohject that will be
familiar to all the ohservant visitors of the familiar to all the

> oological galleries.

As tho tropical countries are those in which he ardent power of the sun calls forth the most hrilliant colours both in the vegetahle and in the unimal world; and as the anomnt of land near the Eqnator is proportionately so much larger in the old thar in the new hemisphere; so it is chiefly to the former that we are accustomed to ook for examples of brilliancy of colour. In Brazil and the West Indies, and no doubt in many a deathly swamp untrodden by the white man's foot, humming.birds aud butterflies may ie with the sunbeam in lustre. But the animals of the OId World, for the most part, occupy a higher place than tbose of the New. Among frican birds, the simple combination of red and black, as in the case of tho Bateleur Eagle and the Barbary pigeon, forms one of the moss perfect lessons in co

## reat book of nature

The sun has not only clothen his farourite children, the natives of the equatorial regions with special glory of colouring, hat has imparted to tho human races that can bear his hesms, as if recompense for the bronzing or blackenus. elonr. a special instinct in the applioali with which infant, at birth, is of a dull cherry-red, and this colonr, darkened to the extreme, is that which be bears through life. In the north of Africa exists a splendid race, with aquiline noses and true hair, the yonthful nembers of which resemble Greek statues in bronze. copper hue But we are not referring to the colour of the skin, set off as it is by lustrous hair, and by eycs that rescmble stars, to be met with in Eastern travel. We are referinc to the rare subtlety with which the textures
 colonr. Quaint forms of pine, or shell, or pyramid, so conventionalised, ages ngo, as to convey no meaning in themselvea, are made the vehicle for such harmonies and contrasts of colour, now full and hright, now subdued into magical semi.tones, as to leare the Curopean colourist absolutely nowhere. It is the same in the porcelain of Persian or Moorish origin. It the porcelain of Persian or storions stained windows through which the daylicht bas to struggle hefore it can kiss the most sacred spot in the word, -the mastic Sakhrab Rock, under the shadowing dome of the noosqne of Omar. Wherever Oriental taste deals with colour, the Wherever Oriental taste deals with colour, the
result is like that of Nature herself. One exception, alas! we noticed in the Indian display at the Kensington Exhibition of 1872 . The cheap aniline dyes have reached the Indian market. There is a quasi metallic lustre in their colours that is, after a little timp, extremely wearging to the eye. Tho vulgarisation of the Oriental work that result from their introduction into Indian tissues is indescrihahle.
The beauty and vitality with which the painter clothes his work, when he is a master of colour, can be only very faintly eohood by the engracer, although he makes a technical nse of the word, and translates the hues of tho canvas, to some extent, by his wonderful monochrome. is very striking to obser7e the utter failuro of photography to produce anything like a good cngraving, when the camera is applied directly to a polychromatic object, such as a highly. coloured picture. This difficulty is not to he overcome by skill, - it is an inherent chemical condition. The only rays that chemically affect tho negatire are those of
the blue end of the spectrum. Red light and the blue end of tbe spectrum. Red light and yellow ligbt, are invisihle in photography, except in so far as they may contain a sthall portion of blne light. If a richly-coloured paiating, in Which these tbree colours are boldy introduced, is exposed to the camera, the dariz hlues will look white in the image, and the yellow will be tarue to hack. Thus, wbile photography may he a -never the is left behind. Tho magnificont picture by Gustave Dors, representing Christ leaving the Pretorium, which attracts so large and so hushed, almost awed, an attendanco to the Gallery in Bond-street, is thus heing reproduced for the engraver. The picture has been photographed, and the photograph enlarged, to the size of the intendedengraving. Ou this photograph, printed of course but lightly, an artist is engaged to colour
fiter the original. From this tbe engraver wilf work, employing the aid of pbotography to give losolute aceuracy to his forms, and then using
the instinct of bis art to translato the colone the instinct of bis art to translato the colone.
This is the true method. A mecbanical proces This is the true method. A mecbanical proces
may he called in to aid the living artist, but i can never.rival, nor supersede, his genius-wben indeed, gonius is present.
But the point where tbe command over colour is lost by the painter is wbat we call its play. In all tho magnificence of nature, in all cases where colour, eitber of a splendid or of a gloon1g One, produces the most powerful impression The most glorious sunrise would lose tho greater bart of its charm if the evauescenco of its hues pould be arrested. Nothing can malso up, to the Juman imagination, for the absence of life. When colour is avowedly absent, as in pure
sculptare, an order of emotion is excited whicb s not altogether sensuous. The imagination yives life to the statue, if it be one on whicb the (Hotentiality of life has been impressed by the cnlptor. The seated fagure on the Medici tomb s not regarced by any caltured obsorver as a niece of marble. The grand Inea of Michelind it needs but littlo eftort on the part of the Wwe-strieken spectator to attribate a ghostly life lifferent. We are not speaking now of hamen xxprossion, or even of the expression of animal ifo given by such magic pencils as those of
lisndseer and Rosa Bonheur. We are speaking unndseer and Rosa Bonheur. We are speaking
iff the harmony of colour. With refereuce to fil the harmony of colour. With refereuce to
bis, nothing ean make up for the want of that bis, nothing ean make up for the want of that

deance of that attained iu any previous period drance of that attained iu any previous period
f the history of civilisation. Music is the only rt in which the mea of our days are not warfed in comparison with the giants of the 123t. We speak, of course, of pare, not of
allustrial, art; and we must remember that to hostrial, art; and we must remember that to ures musio owes very much of her prosent. ower. The instinctive genius of Straduarius
detected forms and conditions for the violin whicb the subtle anatony of tho highest matbe. matics can only explain and confirm, not im. prove. The violin attained perfection in his ipproaehed instrument, - a perfection not sinee of the day, with eloctric tonch and steam feci lungs, we lave a grand example of mechanics ministering to art. It is not impossible, if somewbat of the same enthusiastio study Were given to the subject of colour by those whose eyes are as alive to its beauty as are harmony, that we oar of music to melody and sulte. As it is, the lover of colour mest seek its charms not in art, but in nature, in the clouds, in the flowers, in the rainbor, rarest nad noblest of all, in tho changef ul, rosy and transparent complexion of a boantiful English woman.

SOCIETY OF BRITISH ARTISTS.
Ye.rss ago, and from time to time, the Society of British Artists numbered amongst its member somo of the ablest and best to be remembered landscape-painters. Landseape was the specialty the surfik. street show of pictures once, and the possibility of its resuning to a eertain extent nd lonouring, and becoming the chief honoured and lonouring home for the professors of its de. piction, oceurs when sueh al mirable specimens Tanar" T. Dawson's "Misty Morning on the Manar" (181) ; Mr. G. Cole's "Fern Cutting (10) , cearing off-Harting, Coombe, Susse. (10) ; Mr. W. Gosling's "Harvest.time at Hen. nerton" (149), although tho heavy howed wheat to the 41 si . loaf magnicent sauple-ten ears Argyleshiro" (133); Mr. I. Moore's "Gather ing Ferns" (138); and Mr. Jas. Peol's Welsh scene, "Cannl and Aqueduct on the Usk" (169) are present to suggest it. An increase of such productions, and some better assistanee from the general society of British artists than has hitherto been offered, would establish the title of this in stitution to be as fairly representative, instead of, as it is now, hut nominal. Sir Franeis Grant is countenanes Poyal Academician who lends a "Portrait of to this occasional assistance; the bandsome aud winning one; for Mr. G. Richmond gives similar help, only varying in relative inte. rest, "Portrait of Willianm Blake Richmond" (3i) ; supplemented by a vigorous chalk draw (S66i). Mr. Leighton, too, indicates in 51.4 ) how small studies of heads ( 3 ro and "A loman" and "Vittoria "" as well as paint. performances, but they tell of sound training and with Mr. Palmer's landscapes ( 369,371 ), wenr a look of affinity to "old mastera"
Very little variety from proceding collections from mound to separato the one for this season or Italian tamhourine. gir], "Camer's Neapolitan or Italian tambourine. giry), "Camilla" (1.32), is
tho most attractive of sonie three or fonr of bis fascinating beivilderments who or fonr of bis play for a critic's conjeoture 300 years heave as plat for a critic's conjeoture 300 years hence as
to their paternity; any further than "Sunrise, with the story of "Leander" (160), or rather the finis of it (for the long-hreathed swimmer bas done his last, aud is stretched on a cold rook by his too-powerful, and now slowly re. treating adversary - the sea), could be mistaken for any other's version of it than Mr. A.
J. Woolmer's: both these painters appear to he inimitable in their totally dissimilar manner, nimitable in their totally dissimilar manner, native dide between them nearly all the imagi. native leaven that, shared by a dozen, would The most dificult achievement for the artist is to combine faot with fancy no donbt,-or, at least, it seems to be. Proof enough exists now or a widespread capability to paint cleverly, and represent very satisfactorily natural apthe dearth of piotures may be imitated, yet authorship as distinguished from and compared with caligraphy,-becomes the more remarkable is tho supply of paintings and drawings is multiplied.
Mr. J. Gow has applied considerahle power and good taste for colour on the figure of the eighteenth century belle, with a lover at her feet abont to replace the shoe the has adorned with one of his latest presents, "Diamond Buckles for my Ladye's Shoon " (4), and agrin in a represen. tation of "Goldsmitb amusing young Collins,"
by juggling with a sixpenco (264). Mr. E. C Barnes has often turned to better aocount sibailar advantages than he has in (19) "Butterflies," the name givon to an ordinary agroup"The elder sister and younger brower when youths and maidens took holiday and the streets were garlonded with spring flowers very picturesquely and neatly deseribed by Mr D. Pasmore. Mr. W. Hemsley's country boy stolidly intent upon aceomplishing tbe trick of oup.and.ball, "A Day aiter the Fair" ( 41 ), or (285) , he he 1 (28), he hammers a big aail into the doll's Hemsley's models, looks free of all consoiousness that he is being painted. $\Lambda$ perfect naturalness that never verges on vulgarity, is the real socret more refined in lis treatment of matter.of-fact instances, but then ho gues a step or two up tho social ladder to fetch nis aetors or actresses,to he most precise in allusion. "Lizzio Farren (afterwards Conntess of Derby) bringing her (29t), assisted by of bot Milk to the Prison erved her dif hy in polite hoy, who had obfrosted pavement it tho pretiest and moat agreeable notion of the incident possible, but a very improbable one: the heroine is costumed more like a little countess already than the danghter of a poor strolinag piayer, though by no means warmly, and she does not look cold.
And strangely unlike "Littlo Enn'ly" to be at all like Davin Coppertield's admiration is the demure and micely.painted anybody who sits for her here ( 90 ); pieasant enough to look at,
 Wilkie Collins
"Solving the Problem" (80), by Mr. G. E. writ mony be hearil, mead alowil ensure how holy or how the blind may really lead the blind; for ne of those who have all their learning at their ingers' ends is iustructing from the embosped oxt a orowd of wondering elildren.
Mr. A. B. Donaldaon's two pictures should cer tainly lave been hung in better positions. With 60 manel tite rubbish sickening the eye at its worthy work much an insult to the spectator that worthy work sloonld be denied fair view as it is by Mr. Haynes King (62); "The Ballad," by Mr. J. J. Hil (108); "The Jesuit," by Miss M. S. Toveg (101) ; "Portrait" by Mr. P. Priolo (165) ; "A Beggar Boy," by Mr. J. H. Walker 184) ; "News from Abrond," really admirable by Mr. R. J. Gordon (360); by whom another seated fgure, "Anxiously Whitioug" (1.59), serves to provide evidence that the quality of the former was obtained by $n 1$ "fluke," are some of the hest painted hends in the collection. Tbe
dogs, one of which is "The Keeper's Favorrite" dogs, one of which is "The Keeper's Favourite" (49); and tho game, by Mr. J. S. Noble, are not easily to be surpassed; and "The Cattle on the Coast "" (113), by Mr. T. F. Wainewright, would take high rank in their class anywhere lut at a Smithtiell show.
Mr. J. T. Peele's "Highland Supper " (5-1) fails by very little of being, a very much finer
produotion " Meal Tliae", (69), a Medixval domestio adaptation much in Marks; "A French Girl" (110), by Mr. W. H Weatherbead; "Left in Charge" (14.3), hy Mr
Edwin Roborts: "Marine Munsters" by Edwin Roborts; "Marine Munsters," by Mr. W.
M. Wyllie (156)
"Wood Gtiherers," 175 ) M. Wyllie (156) ; "Wood Gtherers" (175) and
"The Seaside" (321), two of Mr. E. J. Cobhett' most telling works; "The Mountain Spring (197), a very favourabla exanple hy Mr. Henzell ; "Toa.time, Duddy," a homely, natural representation with its worth of being directly drawn from nature, by Mr. J. C. Waite (218) and "The Heir.at-Law," by Mr. E. Porteus (412), are indioative of what consticntes the hulk of 500 oil paintings or more.
Mr. Wyke Bayliss, F.S. A., cuntrihutes a fine architectural interior of " $Y_{\text {prew }}$ Cathedral: Relice in the Chapel of the Black Virgin" (189), and nearly as elaborate a waterewtour drawing of "Interior of Dixmnde Curhidral-a Village Festival" (736). Mr. W. H.an'y copies the at of the late David Ruberts, R A so closely the he can never hope to pailtergatwly well. "Interior of the Jesuits' Church, Venice" (491), is very noticeable, if it he miy tal remind followers that they must always he b-huml.

visiting the "Warren." fetch a priest, to ensure their lives, if they wanted a notorious character, or even to quell a faction fight; hut at last no "father" would act
as a "special protector," and the order came out as a "special protector," and the order came out fight it out amongst thomselves. So long as the "hoys" did not fight in "Tavern-yard," the
following spots,-New-court, Coperers-gardens, Palace-place, and Jennings's buildings,-were fields the men could bleed on and where the women oould make mats of their torn-ont hair
namolested. namolested.
At the renr of the Tavern, was a long danoing-shed; and when Tom Hardy was alive, and kept this fortross, his good lady also dispensed eatahles, and, perhaps, not one of the colony but were indehted to these tradesmen for ale and groceries. It was also a smugglingshop, and when the dance was on, norefined whisky was brought in, and the boys would take off their boots and the wenches thoir petticoats to pawn with a money-lender prosent to keep up the merriment. The writer of this was in the shed one grand night for the benefit of a " jantilman" who wanted a "mouthpiece" to get him out of a little tronble he was suffering throngh, for merely trying to drown a policeman by knocking hira off the towing-path into the Thames. Whon it became time to hear the cock crow, and go home with the milk in the morning, the ball hroke up, and the dancers then proceeded to the "Sqnare," and arranged themselves into opposite parties. Stones, hrickbats, choppers, poleers, frying-pans, saucepans, crockery, and every
handable means of murder were freely distributed. The cries at last reached the ears of the police, throngh the peaceable inhabitants outside the "Warren" jnmping out of bod and opening their bedroom windows, joining in the chorus where, and no police to hand!
The police inspeotor called apon the landlord
the tavern to aid and assist in the name of the Queen, and in a few minates, the belligerents, hleeding and howling, rotired into their boles, at the simple order of the landlord and his wife. These practices, only altered for the worse, have been going on evor since, and nearly opposite to the palace her Majesty was horn in; and as the palace her ateres were constantly docimating the "Warren," and spreading throughout the metropolis and country, the parochial anthorities holpless, a gentleman of name of Grant has purchased the estate, the enumerated popupurchased the estule, the et the last census, 876 , in eighty-three tenements ; but Dr. Dadfield, the medical officer of health, who rejoioes at the advent of Mr. Grant, sets down the nnmber at 1,200 souls or more.
To get rid of this "plague and lawless colony"
was no easy matter for the new landlord ; and the after-experiences have led Mr. Grant to appre-after-experienoes have led Mr. Grant to appre-
ciate the motives of the subscribers to the ciate the motives of the subscribers to the
Nottiag-hill Volanteer Firo Brigado in shutting Notting-hill Volantere fire sighare in shuthing their doors in the face of the yearly collector, as tho report stated the brigade had pat out
fire in Jennings's-buildings, and which, but for
their timely arrival, wonld have burnt the place down. The original collector of rents would not, ind conld not, dispossess the inhabitants of the "Warren." Tho County-court officers at Brompton had plainly told the judge that they had wives and families, and no ponsious for thom if killed. The magistrates of the Hammersmith Police Court were told by the warrant-oficers, that if eject. ments were issued it would se an impossibility to carry them out; for uf the tenantir weoms ejeoted one hour, they wo
as soon as the police left.
as soon as the police left,
In this fix, the new owner of this delightful state, with a "Palace-place," called a parley of the "TFarren," and actnally had to agree to give the ocoapiers of each room $2 l$. compensation, as well as the right to remove the firewood in their rooms. The new owner did not, perhaps, take into thought the meaning of "firewoon in the Trishe vocahulary ; bnt he knows now. His houses are complete wreck, -floors, staircases, doors, window-frames, joists, roof-timhers, stoves, water-tanks, pipes, stonos, slahs, the pavement, tiles, and slates have all disappeared, and rot ne brick wonld have been left, but for a strong force of police, and these had to protect a hody of bricklayers, who have now hlocked np the entrance of this horrible "Warren.
The colonists have dispersed, some to Nottinghill, some to Fulham, and ollers to Betomea The nest is destroyed: who will look after the hirds?
From first to last this plague-spot, it is computed, has cost the parish of Kensington at least half a million of money. What this "Alsatia has cost the country it is impossihle even to guess.

NeW Barracks on the castle hill, EDINBURGE.
Ir seems to be generally nuderstood that a barrack should he Beootian in stylo: why it is so is one of those things "whioh no fellow can of Edinhurch is disfigured by a hlock of huilding of this nature and now it is proposed to dis. figure the southern slope of the Castla Hill in a similar maner. The building in question is intend for the accommodation of married intendod the tiats of a long narrow strip soldiers, and consish having narrow 144 turee floors in height, having rooms of 14 f square withouf is to be nsed by a single aver, each ohey are pproached hy open iron ramily. They are approached hy open ron theries on the arial ther wise show isty yards in front is an erection about fitty or disy providing a depor asped one, which the War ppears to be a srereotyped one, whichitnele for ny ny site, and whin coild be formed, but in this hore the slope is so steep that necess to the astane tho dop is bured by the formation f a flight of steps or a zig-zag pathway. These of a flight of steps or a zig-zag pathway. barracks then woun enient.
The attention of the Town Conncil and the Architectural Association having heen called to Whis matter, a memorial was forwarded to the War Office, pointing out the nnsatisfactory cha raoter of the building, accompanied by a plam prepared by Mr. Robert Morham, City Snporintendent of Works, showing how the oxterual appearance of the building, as well as the accom. modation, could be improved without materiany aitering the original plan. Mr. Morham proposes to secure this end by advancing wiog at each end and the centre slighltly, and adding gables and towors, which latter features are nou merely rnamental appendages, but contain cupboards and other useful additions to the compor the inmates, a olass who do not nsually possess much farniture to give comfort to their temporary residences.
The alditional expenditure involved wonld be nder 2,000l., but the War: Office adheres to its original plans, founding, upon the fact that they have passed the Dean of Guild Court,-a very ame plea indeed, seeing that the jurisdiction of that Court does not extend to the westhetic cha. racter of the plans requiring its sanction. When it is kept in view that private individuals have, with praisewort hy consideration, given the buildings recently erected in this neighbourhood a character in keeping with the surroundings, it does seem strange that the rulers of the vealthiest country is the world shonld act in so narrow a spirit..
Mach money has been spent upon museums
and art-galleries, and yet when art is to be applied to practical nse it is ignored : this is Wurely being "penny wise and pound fooish. the opportunity would he emhraced of producing a stracture wbich would add to, and not detract, from the beauty of a city like Edinhurgh. The matter is not to he allowed to rest, however ; it has heon talen up by the city members, and we earnestly hope they will he successfol in preearnesty the completion of a huilding which vening the complation one of the most picturesque sites in the kingdom.

THE BUILDERS ON THE WALWORTH COMMON ESTATE.
In the Builder of the 22nd of last month, we stated that the Newington governors and guardians, as the manafers of the Wal worth Common Estate, were making grave complaints against certain builders on the estate for violating the terms of their agreoments with respect to materials used in the buildings, and also in regard to the takers of land who had failed to commence building mader the terms of their contract, and that the surveyor had been instructed to take proceedings in all cases where there had been such violation of contract.
At the meeting of the governors and guardians hold last week, it was stated that the solicitors, acting upon the reports made to them by Messra. Jarvis, the surveyors, had taken steps for re.en tering and taking possession of plots Nos. 1, 2, 3,4 , and $34,35,36$, and 49, in Alvey-streot, in consequence of the takers of such plots having failed to proceed with the huildings thereon and that there had heen a similar re-entering and taking possession of certain plota in Mannstreet, arising out of the same cause. The resul of this proccoding is that, under the terms of heir contract, the takers of the plots in ques. ion forfoit the money deposited hy them at tho ime of letting, torether with their interest in the plots of land taken.
raffaclie's house in urbino.
OUr readers may rememher that an endeavour was heing made to raise money for the purchase and preservation of the house in which Raffacile was horn. The snm asked of the municip ality was 20,000 lire. versary of the great artist's birth and death, there was a large gathering of visitors, and list meeting was hold in the Ducal Palace. The list of subscriptions was read, and on its appearing that 5,000 lire were required to complete the purchase, our countryman, Mr. Morris Moore,
statod his willingness to give that sum, in statod his willinguess to give that sum, add'tion to his former subsoription. At four p.m. the deed of purchase was signod. An address was presented to Mr. Moore, and at a banquet in the Salon di Ariosto
Crbino was conferred upon him.
The Ducal Palace in trbino was considerably injured by an earthqnake on the 12 th of
bnit the principal rooms escaped damage.

THE NETV BULLDINGS IN ST. BRIDE
STREET AND LUDGATE CIRCUS.
Tre newly-formed St. Bride-street, from Lud-rate-circns to the junction with Shoe-lane, will very shortly present a prominent architectural appearance. The west side, more partionlarly, s being rapidly covered with large and sub. tantial buildings of a palatial oharacter. Messrs. Cook's Continental exenrsionist block of buildnge, which has already been described in the Builder, has, during the present week, been adrantageonsly exposed to view by the removal of the scaffolding ; and we nnderstand that those portions of the spacious huilding intended as Messrs. Cook's offices, and the sections now hoing fitted up for the Midland Railway Company's depôt and recoiving olfioes, will be

## THE NORFOLK COUNTY SCHOOL.

Ar North Elmham, a pleasant villago, which was once a city, and from the year 603 to 1075 wras the seat of the Bishops of Norwich, the foundation stone of the new Norfolk Connty School has been laid.
The movement which is taking place in
Norfolk, like that which took place in Devon Nortolk, like that which took place in Devonshire some years ago, must be attrihated to the efforts of the Rep. J. L. Brereton, Prehendary of Exeter Cathedral, and is part of the system
which has called into existenco county schools which has called into existenco county schools
in Bedfordshire, Suffolk, and other counties; has led to the Oxford and Cambridge Local Wxaminations ; and promises to oulminate in the estahlishment of a connty college in connexion with tho University of Camhridge.
North Elmham is almost in the centre of the county of Norfolk, and oonveniently situated for railway acoommodation. The site selected is contignous to the ransion of Lord Sondes, and skirtod by the River Wonsum. The estate, which has been purchased by the Earl of Leicester, comprises thirty-seven acres, and has a frontage next the ford ample accom a mile. for boating and swimming, whilst the are suffioiently eapacious for all the purposes required for a puhlic school. The movement has throughout had the sanotion and movemert of the Prince of Wales, whose estate is situate twelve or fifteen miles distant. The bnilding is leing erected on the summit of the hill, overlooking Lord Sondes's park. The style adopted is the old English Domestio, the exterior being of flint, with red brick dressinge, large dormers and weather tiling at intervals. The roof will he covered with red and hlack handed tiles- All the timber work, externally and large hall on the ground-foor is intended to be a large hall on the ground-floor is intended to be a
general plaoe of meeting, the reception-room general plaoe of meeting; the reception-room form. The school-room will also be so arrangod form. The school-room will also be so arranged
as to increase the epace, where necessary, to
afford accommodation for ahout 500 persons. The galleries round this hall aro fitted with prosses for clothes and linen. No laratories will be provided on the dormitory floor. It is intended to have ordinary washstands in the dormitories, and to give as home-like an appearance as possible to them. Large barrack-like
dormitories will he avoided; the largest of the dormitories will be aroided; the largest of the rooms contains only thirteen heds, and many only siz or seren. Kitchen oflices aud dininghall are on the top floor. The master's house oommunicates with the building, but is practi aally detached from it. A correspondin building on the opposite wing will form, if over required, an infirmary, sufficiently detached from the main building to prevent anything like spread of infection. It will be complete in itself, and can be at any time cut off from the main building by ventilated lohbies, having closed doors.
The heating at present contemplated is by open fire-places only; hut provision is made for hot-water pipes in the large hall, school, \&o. The ventilation will be hy the same moans, with ventilators
The architects are Messrs. John Gilos \& Gough, of London. In the present huilding the average cost of connty schools is by no means reached, and the problem of the promoter, Mr Brercton, is solved. This gentleman has con tended that 302 . per boy should in a school of 300 hoys farmish the huilding proper. The architects have on their present plan obtained The builder is Mr. Rohert Skipper, of East Dereham.

OPENTNG OF THE FEOVIL WATER. WORKS.
THF new waterworks for Yeovil have heen completed, opened, and formally handed over to the town authorities by the ongineer, the clerk of the works, and the contractor for the re servoir. The contract for supplying the pipes (about 14 or 15 milos) was taken by a Glasgow firm, Messra. Stewart \& Co., at about five guineas per ton. Immediately aftorwards the price heen delayod, the total cost of the pipes would have heen increased from abont 7,000 l. to nearl $14,000 \mathrm{l}$.
The contract for laying pipes was let to Mr. Joseph Walker, of Crewe, represented through. out by Mr. Worthington.
The water is obtained from the lower green shot, in the parish of Melhury Bubb, near Jirer in a The main supply is derived from aprings to Holywell Tunnel, and a second contrions close is ohtained from the tamel itself. The water from the plantation passes through a small circnlar filtering tank, which was oonstructed at a cost of ahout 100l. The tunnel stream joins the main a little lower down. Tho length of the Newton-hill, is abont eirht miles reservoir on from the reservoir to eight miles. The main diameter, and the town mains vary from 3 in , to 11 in . Tho laying of the pipes cost over $2,000 \mathrm{in}$. The reservoir was oonstructed by Mr. Ridal of Wadsley, Sheffield. It is ahont 100 ft . in length and 50 ft . in breadth, and will contain a depth of about 10 ft . of water. Its capacity is somewhat ever 250,000 gallons, which is more then the daily consumption of Yeovil is likely to reach for some years. The reservoir which is hned and floored with briok, is covered with arches resting on brick pillars. The whole is covered with earth, and the earth is sown with grass, so that a fow months hence it will present the appearance simply of a green mound surrounded with an zron railing. The total oost of The reservoir work was a little over 2,000t. The reservor is more than 200 ft . above the lower parts of the town, and the sources are 100 ft . higher still. The water, therefore, flows very reely through tho eight miles of main, and the pressure on tbe town mains is equal to that of the steam in a locomotive hoiler
The works were designed by Messrs. Thomas Charles Hawksley, of Westminster, and were carried ont under their superintendence, represented by the clerk of the works, Mr. C. E. of payments for land, compensation, and incidentals, has heen abont $13,000 \mathrm{l}$., or abont 400 l or 5002. more than Messrs. Hawksley's original about 20,000 .
suggestions as to the arrange MENT AND ARCHITECTURAL treat. MENT OF PICTURE GALLERTES.*
Bumprias for the exhibition of paintings may bo considered under three principal heads : in regard to lighting, which is a purely practioal point; in regard to the arrangement and classification of the pictnres and other works of art, which is, or sloould he, based on wsthatic con. siderations, but which practically affeots the planning of the rooms; and in regard to the architectural and decorative treatment of the building, which, though in one sense a purely artistic matter, is govermed to some extont by practical considerations bearing on the dqe effect and the character of the works of art exhibited. Picture-galleries in general, again, mnst be to a certain extent regarded as divided into two classes-thoso intended for periodiasl exhibitions of new works, and those intended as permanent receptacles for collections of a less prasient terest; for the conditions in these tronsient in. not by any means the sarne. In regard to light. ing, however, both permanent and periodioal art. galleries are on pretty much the same footing; and no other question connected with them can bo of so much importance, obviously, as this nor is there any point in connesion with the subject on which there have been so many theories, and, I believe, so many failures. In re gard to paintings, a great portion of the difficulty orghting ariges from the fact that the vehioles flew almost universally used hy oil-painters re. fleat light more or less, and the necessity for into the wame cateurs under glass brings them into the same category. It was this difficulty which led, in a great measure, to the employ. ment of fresco for the paintings in the Houses of Parliament, as some of onr leading artists pronounced that it would be impossible for oil-paintings to be satisfactorily soen under such a light as they woald be subject to there, rom low windows placed at various angles to the surface of the picture. Tho popular faith on this point, at present, may prohably be summed up in these two articles,-that $y 00$ cannot have too mnch light in a picturo-gallery, and that you must have it from the top. Both these artioles of faith must be taken with a certain reservation, however. It is quite possible to have too much light in a picture-gallery, and to defeat your own ends in introdncing it. In regard to the top light, however, its smperiority may be wecepted as generally incontestahle in the case of the great majority of pictares in most collections ; the circumstances in which it may not be the best will be referred to afterwards. It may be said, however, that definite reasons have heen assigned in contradiction of the top-light theory ; and the Berlin gallery was built with side.lights, on the ground that painters almost invariably work with a high side-light, and that the spectator should see the picture under tho same light as it was painted. In reference to which it was pointed out by Sir Charles Nastlake, that if a picture was painted with a sido.light from the left, and had to be so hung as to get a side-light from the right, the conditions of the painter's light would just he re ersed. To which it may be addcd that the spectator does not want to see the picture as the artist saw it, whon working npon it, minutely and in detail, but to take in the whole effect rom a little distance. But the real philosophy of tho top light seems to be simply his, - that it is only by placing the light urface olitter can insure escape from the ight is the simplest pictare, and a sky. way of procuringlest and most manageahle properly canco a high light; besides that, if properly constracted, it operates equally in regard to all the walls of an apartment. The avoid the reflech the high light enahles ns to avoid the refection may he seen if wo make section of tho proposed room with its skylight a reverse section, taking the plane of the picture as the dividing line light, in the rawn the extremities of the light, in the reversed section, to the oye of the spectator, will show, where they out the plan of the picture, on what portions of the wall rellection from the picture will be inevitable. Thus it will be seen that, with a light at a con siderable height above the npper line of pictures the larger pictures, which require to be viewed at a greater distance, and which on that account alone shonld he hung highest, are helow the line of reflection when viewed from a proper dis

From a paper by Mr. H. F. Statham, architeot, read
meoting of the Liverpool Architectural Society,
tanee ; and When the speetator approaches nearer to examino the smaller works nearer the eye, though the larger pictures are thereby brought lown are otill clor of it The higher a pioture down are still clear or it. subject is it, in the majority of cases, to surfaee reflection; and it i to obriato this that in badly.ligbted galleries we often find the upper now of piotures inclined often find tbe upper row of plotures inclined forward, so as to throw the reflection below the spectator's sight-line; a method of banging which has a singularly unsightly effect on the
general aspect of the room, and does not tend general aspect of the room, and does not tend to improve the effect of the plenre. Such an expedient is merely shirkiug a difficulty, and always means either that the picture has been plaeed too high or the light too low. The principle laid down by Sir C. Eastlake was, that the picture and the souree of light slould not be within the ringe of rision at the same time; the $60^{\circ}$, the ligbt should be so far ahove the picture tbat, at the point at which the spectator would stand, the picture and the light should subtend an angle greater than $60^{\circ}$ with the eye. though a somowhat different way of putting it comes to very nearly the same result practieally.
The next question to that of the position is the construction of the light. The commonest form is that of a simple raking skyliglet, with the glass on the level of the outer roof, and following its linc. This has been adopted in the rooms a Burlington Houso, and there is little to fin fault with in the light tbere. Another arrange ment,-possessing, is that of a double skylioht, the advantages, is that of a double sliylight, the upper one o the roof consisting of clear glass, the lower one on the ceiling level being a horizontal glazing, with obsoured and, if possible, rongbened, glass This brings the apparent light lower in the room whicb, bowerer, would only be of consequence in a room of somewhat limited height, and any disadrantage it may hare even in this way is connterbalanced by the mild and diffused oha. racter of tho light which is gained in this of diffused ligbt, and not "rays of light," is what is wanted in a picture.gallery, and this treatment would go far to weaken the bad effect of reflections, even where the pictures were so placed as to be liable to reccive them; besides which, by the use of the lower layer of obsonred glass, the bad effect of snnlight passing through his method offers possibilities for very good internal treatment of the ceiling. In such a case, easy access between the lights, for dusting and oleaning, would of course be inperative. It is necessary in arranging the building for to light, if any of the rooms are lower than tho others, to take care that the bigher ones are nob placed so as to rob any of the lower skylights of their hest light, and for the same reason a site should be selected not overlooked, or likely to ho overlooked, by loftier buildings, - a very obvions consideration perbaps, but one of those little things wbicb are sometimes in danger of heing forgotten, just becanse they seem so mush a matter of conrse. Another porth attending to in the plan of top-lighted galleries, is to cut off the cornors on plan, so as not to place the pictures in the corners too far from the ligbt. The of the rooms appear to be considered by for the smaller pictures, so far as attracting spectators goes ; it is certain that many of the finest of the smaller works at tho Academy are placed at the angles of the rooms, and jou generally find a group redged round them, the there is nearly always a certain deficiency of light in the corners, and if they wero canted off at an angle of $45^{\circ}$, the pictures hung there would rat all the moral adrantaces (as we may call them) of the position, with moro light and more converience to the spectators. In regard to the equal distribution of lighting over the pictnres equal distribution of lighting over the pictnres Post Office-place, where the Liverpool Academy Fostibitions nsed to be hold hes pery successful in this way, and it may be surrrested whether a room in this form is not one of the best ad apted for the exhibition of a large npmber of miscellaneous the exnibion of arge namber of miscellaneous and jamming of the spectators at the ancles are and jamming of the spectators at the angles are rery nearly equidistant from the light. They very nearly equidistant from the light. They would, of course, be still more so in a circular Rubens built for the exhibition of bis own work
is in this form. Bat for a permanent gallery, where pictures ought not to be crowded, but to bo so placed as to be studicd separately, a long room would probably be found the most effeetive torm, for the combination of architectural and pictorial effect. In long rooms lighted by a sky. ight, a practical difficulty occurs in the necossity for roof trussing at intervals, which must tend oobscure the light at certain points ; and here described, would assist ns in meeting the case, as the light would be so far diffused by the thick lower glass that no definite bar of shadow woutd be seen across the lighting surface, unless he cie.beam were very close to the glass. on this rery account, a form of roof construction witb an iron curved truss carried high above the lower skylicht, which, in fact, was to be hupe from the truss, giving a light to the pictures tbrough the sides and centre, and with an opaque hanging ceiling over the spectator, so tbat he migbt have no light except where he wanted it. A disadvan. tage of this arrancement would be tbat the paque ceiling might obscure the light in opaque cenling might obscure the lisht in would have to be viewed further off. Bat in regard to a collection of one class of piotures, espeoially landscapes of not very largo size, and which must bo riowed not far abore the level of the eye, a low hanging ceiling over the centre of he eye, a minh heo merested for the landseane-raller in 14 . 4 B in Mr. National Galcty), letug the spectator loo upon an illalf in hanaseape bore him wbie he is timself in shaw. a go how it could bave in regar to the phenes; for how il could bave tructel canld ho mado to look well from rehitect conl boun it arehitectural point of vew, one point, which has a bearing on sce. One other point, which ias a bearg oter the position of columns, pilasters, and our architectural fatures in enguity to the pic reflect liglit or bright. coloured objeets near them, to some extent; hut they will do this the less in proportion as they have an adequate supply of direct light: the better a pieture is above, the less will it be disturbed in effeot by the reflections from objects in tbe room, or rom the dresses of tho speetators.
Artiticial lighting would, of course, be goverued by tho same considerations as the admission of daylight, in regard to the position of the light. But in order to obtain that diffused quality of light which has been said to be desirable for pictures, the artificial light should, I tbink, be communicated tbrough obscured glass, and this is another adrantage which, I thunk, might he found in the double-skylight system, that the gaslight (whicb at present is the only light whic can bo used for artificial ingiting) could be placed above the glass of the lower skylight, and tous the separate points of light from the gas.jets would he hrokea up intoa mass of ligbt. It doo not appear to mo that auy position of gas-lights within a room, and communicating ligbt directly to it, could be otherwise than disadvantageousto the effect of the pictures, in producing gittering rellections. Another advantage of such an all heet ant as 1 have mentioned would be, the gas could bo proant out of the apartment altogether; and this is decidedly desirablo in a permanent gallory, where the same pictures are to bang for years, or perhaps for generations. In the beommission was appointeation of pictures oonsisting of Messrs. Faraday, Hoff man, Tyndall Redgrave, and Fowke, and the following quota. tion from their report shows that they attacbed some importance to keeping the piotures from the aotion of gas :-
"Coni-gas may be free from sulphuretted hydrogen
ompounds and in Londou is
so
at the present time ; hen has little or no effect upon pretures. But it has no
ret been cleansed from sulphide of carbon thbes

 product of combustion to come in contact with pieture painted in either oil or water colours , and the commis
aion are emphatically of opinion that in every systemo permanent gas-lightivg, for picture or sculpture galleries,
prorision should be made for the effectuut exalasion or prorision shoula be made Hor the
withdramal of the prodncts of .c
chamhers containing worke of ort."
Another point, which is neturally connected with artificial lighting, is artificial warmth; and it mnst be remembered tbat an equable and moderate temperature is an essential elemont in the preservation of pictares. In a permanent
gallery fires, for every reason, must, of course, be considerod inadmissible; and probably the best possible way of warming such a gallery wonld be by hat-water pipes; the furnace fcr onorating heat being placed in a fireproof vault, and, if possible, out of the building, as, for nstanee, in a quadrangular arrangement of build ing, the heating apparatus might be in a vant ander the central court. An advantage of the hot-water system is the readiness with which the egree of heat can be regulated by sbutting of the water from a portion of the pipes. The ind of beat commnnicated by hot.water pipes is also less dry and parehing than that from mosi ther contrivances for artificial heating. In order, however, to provide argainst too mucb dryness in the atmosphere of the room, the ystem has been adopted in the Berlin Gallery of placing a argo vesse of water in each apartment, vhich is evaporated gradually by tho warmth of the room, and imparts a certain degreo of moisture to the air. Dr. Waagen gives it as bis opinion, tbat this is "equ
In regard to the question of the arrangement and classifioation of works of art, the distinc. ion between permanent and periodical exhibi. tions is, of course, very great. The object of the latter is to give room for the exbibition of as many as possible of new works whitob come up on certain standard ; and as the style, character, and size of the works sent for exbibition can only be generally surmised beforehand, it is inspossible to suit the arrangenjent or che room 3 . sidered sufficient if a separate apartment is prorided for water.colour drawings, and another for sculptare. That the water-eolour drawings, with a scale of tone and a range of effects so totally distinct from those of oil painting, require to bo exhibited separately, is obvous of annual exhibitions, a further classification of works might be carried out than is generally attompted and that the possibility of doing this depends in a eonsiderable degree upon the arrangement of the rooms. The Royal Academy Eshihition, even under its present improved conditions, is little more than a hnge jumble of picures, large works and small works, portrats, nadscape and genre pietures, crowded togetber difficult for either the or the mind to do difficul to wom justice to any wron more delicand it The oly approseh to classifi. cation in the Aeaderay consists in placinc in one oation in the room (the north.east row) wiw wol light,
 fresco-like painters,-Awert Noore, Armstrong, Barclay, and others. These pictures, with their fairly killed by being placed siugly in the midst of more heavily.toned pictares; but the same thing is the case, in a lessor degree, with worke not differing so much in style : paintings on a large scale for iustance, and paintings on a small scale, are a mutual injustice to each other and cannot adrantareously bo studied when jumbled up together
void this wramb, Ihink, be quite possible to解 ning calleries on hanging comances, by planrooms for the exhibition of cabinet pictures, or (as small rooms are bad for circnlating a crowd of spectators througb) by so arranging the large rooms that screens can be placed for hanging tbe smaller works apart, while tbo large ones are luug or the main wals. There has been an excellent opportunity afforded of seeing how
well such a system of banging works, since tbe well such a system of banging works, since tbo enrly part of last ycar, when its Riohara
Wallace, as Punch expresses it, "invented Wallace, as punch expresses its invented tion to the new museum there, and making that comparatively humble suburb centre of attrac ion to all lovers of art. I have never seen pictures so well arranged in any place whero hey were necessarily placed as close as they would go on the walls. The huilding, as yon know, is part of the old Kensington edifico, the "Brompton boilers," re.erected in a new posi-
tion. The upper floor consists of a wide gallery tion. The uppex floor consists of a wide gallery rom remember rightly, hy long skyligbts running longitudinally; the large paintings are all placed against the main wall, ronnd the back of the gallery,-tbe smaller pictures, the Ostades, Terburgs, Meissoniers, and others of that class
are hung on each side of small separat soreens placed close to the front of the gallery, leaving just sufficient room for spectators between the screen and the gallery railang the splendid specimens of the works of Meissonier and Decamps, to forget the larger pictures altogether, and to suit the eye to the scale and finish of the smaller oncs; and I am sure tha just idea of the genius of Meissonier, and of the splendid finish of his work, than I could possibly have gained if his exquisite little productions had hecn wedgod in hetween larger pictures, and overshadowed hy their projecting frames, as the Academy for exhihition. On the other hand, the provision of a separate apartment for sculp ture (I am speaking now of "poriodical rule, sculpture requires a decided light in one direction, and not a top light, though a high light is of course hest. It is partly for this reason that it is generally supposed necessary to provide a separate apartment for sculpture, 2 s is done in Burlington House, where the sculptare sent for exhibition at the Academy is placed in the room opposite the entrance, which is the only one lighted by a side light. But there is a seriou drawback to this, and one which I believe sculptors feel very keenly, that the room thus selected hecomes, according to tho general usage in regard to the treatment of sculptare galleries, the only colourless room in the place; and the
effect on coming out of the picture-galleries into effect on coming out of the picture-galleries into the sculpture-roorn is as if a sudden chill came over everything. If this is felt even by those who are enthusiastic lovers of eculptural art, rulo understand and care much less for sculpture
ren than for pictures. The consequence always is that the sculptare is nearly deserted in
exhilhitions; and I am told, on good anthority, that the sculptors hate the Academy sculptare room, and regard it as a sort of den. Moreover works of scnlpture will not bear to he crowde another, and with the right appreciation of it for no work of art so much requires undivided attertion as a work of senlpture, if it is worth anything, does, owing to the highly conventional and abstract character of the art. For these reasons I, think that in periodical exhihitions for the works exhibited is impossible, it is a great deal hetter to leave room for the principal sculptural works to be placed in isolated positions in the picture-galleries. They have far more work serves as a kind of centre for the eye to dwell upon, while the pure white of the marhle rather tends to heighten the effect of the pictures than otherwise, care being taken that the sculp.
tures are not placed so as to throw any injurious reflections on any of the pictures. In the Inter. national Exhibition galleries a good many of the sculptured works are placed down the centre of with vases and other on pedestals alternating an arraugement which adds very much indeed to the general effect, and hy which the statnes is too narrow, fairly seen, althongh the room above them to be considered entirely satisfactory A hetter arrangement, when wall space can he spared for it, is to place the statues agrainst the side of the room at intervals, as the important desideratum of a principal light in one direction and on one side is thus secured for them; this was done with some of the principal statues it effect of Longh's spleudid figure of "Comus", thus placed, half-way up the English gallery crowded to its fallest capacity with wainting but on the whole I think that sculptare would he muoh hetter served in periodical exhihitions by and that the sculptors would he willing to com pound with some disadyantages of lighting order to secure a position where their works would form central and important objects instead of heing penned together hkea collection
of curiosities in one room, where they suffer far more from crowding and close juxta-position than pictures do. So much as to the possibility of classification in periodical exhibition galleries When we come to consider the question in regara srrangement and classification of the works and the provision for this in the building,
become more distinctly obvious; and no such gallery car be considered a good or a satis. ractory one which does not provide for every class of work, and every individual work, hoing seen to the hest advantage, optically and resthetically. And the first and broadest distinction which can be drawn is as between large and small works. Large pictures containing broad masses of light and coloner, and requiring to he contemplated from a distance as a great whole, onght certainly not to be placed in the samo room and under the to light with small cahinet works, depending for their effect upon delicacy of detail and elahora. tion. This has heen recognised in some of the best and most celebrated art. galleries,-in the Pinacothek at Mnnich, for instance. Here the arger works are hung in the grand saloons, hioh aro 42 ft wide 52 ft hirh to the to ight, and $3 I \mathrm{ft}$. to the cornice (I do not kuow if the pictures are hung np to the level of the cornice, -if so, I think it is too high to hnag any but colossal pictures); and the smaller works chiefly of the Flemish school, are arranged in series of small rooms at the sido, with a sidc ight to the north. Our preseut National Gallery is a most unhappy example of utter unsuitability in this respect; and I havo no doubt that the effect of the splendid collection of Flemish pictures lately bought from Sir Robert Peel very much marred by their heing arranged in mass aronnd a large room, instead of hein placed in smaller apartments more suitably designed and lighted for such pictures. And here, roverting for a moment to the subject of highting, we may notice the principal exception the general rule as to top.lighting for pictures Sir Charles Eastlake has laid it down that while large pictures require to be distont from the eye and from the light, small pictures shoma he near the eye and near the light; and there ore in many cases, at lenst, their conditions of lighting wonld be hest met hy a small room and a side-kght. It would he important, however, to consider at what angle the light should fall on the picture, and what should he its relative position in regard to the picturo and the spectator, so as to afford the hest result. A square room, as shown in the Mnnich Gallery, is not a very scientific form, for the light could not possibly be good for the pictures on the opposite wall nnless it were a very high one, in which case, as a side.light, it would he bad for the works on the side-walls near the window, Reflections of light from the pictures, when conections of light from the pictures, when considered horizontally, are found to be confined to tremities of the linded by lines connceting the ex. tremities of the light with the extremities of the picture, and to a space enclosed hy lines forming an angle of $30^{\circ}$ with those bounding lincs at the edge of the picture. Applying this to a square room with side-light, it will be found that scarcely any portion of the wall opposite the window would heavailable for satisfactory inspection of pictures, particularly if under glass. The plan proposed y Sir Charles Eastlake for ntilising side-light, was to have a gallery lighted at both sides by windows at intervals, going nearly to the top of the room, and then to suhdivide this by screens or partitions placed at an angle of about $62^{\circ}$ with the wall, in alternate directions. The effect of this ohviously is to reduce the wall opposite each window, which is a had position, and in. crease the area of the side walls. This is very architectural hough less satisfactory to the room; and hesides the advantage over tho square apartment, the inner and narrower side f the room could he utilised as a place for a statne, which, with the opposite window kept high, as suggested, would he as good a situation for scnlpture in combination with painting as in all prohability, could possihly be obtained The sides of the roorn, it is true, are for the most part at a less advantageous anglo for pictures than in a square room, so far as reflections are might he better, but the plan comhines severalad rantages in rosard toeconomy of spoce and tive arrangement $O n$ a he worled into. On ligh symmetrical form, and with a hanming hailding I I in proportion to the area of the huilding. I do not, however, mean to infer that top light wonld not he the best for cahinet pictures also, could the light be brought low cnongh to be near them; hut in a large huilding, he other apartments of which would be much loftier, it might he difficalt in many cases to secnre a low top.light for the smaller pictures,
alluded to, of so placing the lower skylights as not to have their light rohbed hy the higher portions of the building.
The question of classification in a gallery of art, however, includes much more than the mere division into large and small works,-comprising, in fact, the whole system or principle on which the collection should be arranged; for a col lection without a definite principle of arrange ment loses half its value either as an opportunity of study or of enjoyment. A very long gallery filled from end to end with pictures of various classes and nationalities, oven if woll classed as to the size of the paintings, is a somewhat weari some way of arranging, or rather a neglect of arrangoment; hoth the eye and the mind are dis satisfied with such a maze of works, and require its it whre, a division into chapters, each with its own heading, to form a kind of resting-place Assuming, then, on this if on no other ground, that works of art should ho arranged rather in a succession of smallor rooms than in one or two yory large ones, npon what principlo are they to he grouped ? There are two main principles, more comprehensive than any others, which may he followed, viz, a classification as to class of snbject, or as to schools of painting. adoption of either of these in its entirety mus have a very distinct effect on the planning and arrangement of the rooms.
If the division hy class of suhject he adopted this armangement will naturally, or ought naturally, to lead' 'to a considerahle diversity in the size, proportions, and lighting in the rooms respectively devoted to large historic snhjects, to lardscape, and to genre. If the division into different schools bs adopted, the rooms will he more nniform in dimensions and arrangement boing adapted for a generally advantageons display of works varying in subject the only marked difference which would be forced upon the architect would he in the case of schools of painting, which, like tho old Datch and Flemish, deal almost entirely in corm paratively small works of high finish, and require amaller, and difforently require nich or these angements woula answer the ond of such an institurion best most depend very mnch $0 x$ hat wo consider that ena to he. If is for elacidating and giving opportunities for the study of the history of painting, there can he little doubt that the classification according to schools is the most neefnl, the more so if arranged chronologically. One drawback to this 18 , that to complete the chronological sequence works of itttle artistic heanty or power must often he introduced, illnstrating the childish heginnings or the feeble decline of a national art. If, on the other hand, the ohject is the study of painting as one of the imitative arts as the art of transferring various aspects and incidents of nature to canvas, and giving them more or leas of vraisemblance, then the division into classes of subject wonld be more to the purpose: the spectator would then see hefore him the varions ways of looking at nature to which different countries and their artists had hahituated themselves, the various points of view from which the same ohjects may he regarded, and the varions kinds of interest which the painter can extract from them or infnse into them. I am inclined to think this would he the more instructive as well as the more pleasurable arrangement. The chronological history of art the dry skned from hooks, and is after all but pictures thomselves are the living reality. In other word it is of the living reality. In people shonld learn to understand and feel the real interest and beanty of a fine painting, and its relation to natural beauty (which is a very subtle subject), than that they should learn that it is of such a school, and that such an artist was the head of the school, and such others were his pupils and followers. But, perhaps, a were his pupils and followers. Bat, perhaps, a
middle course hetween the two might he followed
by a division, not into "schools" by a division, not into "schools" (which are into mationalities, - French, English, Italian, Russian, \&c. (for the Russians are going to be a very remarkahle people in the way of art), each nation having a large room for its largex pictures, grouped according to oentaries, and a small room for its smaller works. I think this would be perhaps the most interesting way of comhining enjoyment with instruction in a large gallery of art ; for national difference in fecliag and style in art is a very great and deep.seated distinction, showing itself not only in the various methods of execution employed, but in the way
of looking at nature, in the preference for this or that class of subject, \&c.; and plitosopbical as well as

## ART IN IRELAND.

AT tho last meeting of tbe Arcbitectural Asso. ciation of Ireland, Mr. Henry MacManus, R.H.A., read a paper on the "Geography of Architec. About the year 1750-the brigbtest period of our modern bistory, which dawned like a sndden morning. ligbt after a dark tempestuous nigbtmorning. igbt after struck with astovishment at the energy employed to cultivate the fine arts in Ireland. A news and the resident gentry, relying on tbe realms, and the resident gentry, relying on theo
Act of Sctlement, vied witb each other in their efforts to servo their country by promoting its efforts to servo their country by promoting its
material welfare. Among the nobility, the names matcrial welfare. Among the nobinty, the names of Lhe Duke of Leinster, Lord Newtoun, and Lord Ranelagh stand foremost. The clergy were tbe most active in the resuscitation of Treland; the names of toe Rev. Dr. Samuel Madden, Lint the Charles Jones, Rev. Dr. Henry, Dean Maturin, tbe
Bishop of Ossory, and Rev. Dr. Barrington, are recorded by their deeds; and private gentlemen, such as William Maple, Jobn Putland, David La Toucbe, Arthur Pomeroy, Holt Waring, Jones
Ford, Dr. Prior, Dr. Weld, and Mr. Caldwell, have also distinguished themselves by thoir patriotic cndeavours.
As early as 1738 , Dr. Madden, the originator of that art movement in Ireland, in an en lightened address to the nobility and gentry, among other good and cogent reasons for establisbing an art institution, gives tbe following :"The fine axts bave always been considered by all cultivated nations as the greatest ornaments and elegancies of every country, so tbat the utter neglect of them that prevails in Ireland will ever he a proof against us of barbarism and Gotbic ignorancotill we sball abake it off." And of nature are sufficiently provided for, the art of delight and amusement will constantly come in, and if we do not bring them tous we will be apt to go abrood to them; since wo must have bas the most of pleasure and the least vice
in 1757 my Lord Duncaunon writes from the Continent to the Dublin Society:-"Tho art of designing is of the greatest use, not only in the polite arts, but tbrough every manufacture, and ment of their Acaderny by supplying nearly the Whole world with Parliament thonght propcr to approprithot and ahsentee pension-tax to this very worthy and completely, and much to onr bonour." Four completely, an mer years laty purposes. From that time we find the sundry purposes. From that time we find the so.caled clastic styl ofary the names of the appearance in thas country. The names of the noblement who introduce good architecture amongst us are:-Charlemont, Portarington,
Powerscourt, Cunningham, and Beresford. Powerscourt, Cunningham, and Throngh their exertions sprang up, if by enchantment, those beavtiful structures, the pride of our capital and the admiration of all visitors of taste or ordinary intelligence: they are the work of one generation of noble Hrish. men. Cassels, Wilkins, Vallancy, and Gandon were strangcts that were principally engaged in these works, thongh by that time we bad native architects capable of whatever was required of them, and in all directions throughout the
country the gentry were building, as if in whole. country the gentry wore building, as in manion
sorae rivalry, abbeys and castellated mansions witb banqneting.halls, turreted towers, barbican gates, court-yards, and terraces. These found artists in the Morrisona, Papworth, Baker; Joonston, Murray, and Capability Brown,-
picturesque dwellings that mark tbe splen. picturesque dwellings that mark tbe splen.
dour of a resident nobility, and inspire admi. dour

## Up till that time there was nothing in the

 way of architecture that had any recognised existence: there were only the old ruined castles of the Pale, and a few scattered, bald, heavy. roofed, rueful-looking manor-houses with seg. ment.top windows in the lowest Dutch taste lime.trees. It was here that the descendants of the settlers of Cromwell or William aroused the echoes at early morn,-a lusty, hard.drinking,hard-headed race, fond of hunting and good
cheer, but, alas! eutirely indiffercnt to tbe civilising influence of the arts. Meantime sculpture was represented in Neand
foreigners,--Rysbaech and Van Nost. The re. cumbent statue of Dean Drillincourt is of the best class of the day, and that of Priort, by Van Nost, is very regpectable. Yan Nost was patronised by the Royal Dublin Society, and taugbt most of the rising sculptors of his day, His works, by the way, have the contorted and fluttering air of Roubiliac and Bernini made intterly grotesqne by the minuct attitude of Incas and otber figures of tbe same kind in onr monumental sculpture.
Let us now glance at tbe three societies which arose in tbese realms in imitation of tbe school in Paris. The one in London indirectly helped the life-scbool of St. Martin's-lane, which pro. duced those men who, ander tbe Royal protec. tection, becamo tbe Royal Academy of Arts. It was subject to the vicissitudes common to infant institutions, and was removed from Spring Gardens to Somerset Hoase; thence to the National Gallery, Trafalgar-square; and lastly Piccadilly
In advocating the existence of academies their first president says:-"The principal ading able an academy is, that hesides farnisbrepository for the great examples of art. Tbe student merceives and receires at one glance the principles that many artists spend tbeir lives in ascertaining.'
Edinburgb h
Himb street her dxawing. scbool in a gal Higb. street, at a rent of 5 . per annum
From the ract tbat the Royal Academy in London was open to North British artists no 1826 , just two years after the Royal Hibernian Academy was founded hy charter in 1821 . The delay arose from the same cause in hoth cases wo rival societies of artists in Treland existed fifty years hefore one of them was incorporated $y$ royal charter in 1824.
Holding sacred tbe opinion of Sir Joshua Reynolds, it is needless to say that the object of these three academics of art is identical. The
drawing.schools of tbe Dublin Society were at drawing-schools of the Dublin socicly were at Grst in Mr. West's Academy, in George'lane, and
continued there until Mrs. Mr'Mullen's rooms, in continued there until Mrs. Mandlens roonns, in Sbaw's.court (now Commercial-buildings), were rented by tbe society at 302 . per annnm. we find the institation honsed in Gratton-stree then in Hawkins-strcet (now a theatre), nntil, in 1815, the Society purchased Leinster House This time-honoured institution deserves more than a passing word, though, indeed, it generally speahs pretty loudly for itself; hut this is per-
mitted only on holidny occasions, and we rejoice mitted only on holiday occasions, and we rejoice with it. The Dublin Society had heen founded eventy years, and supported by an Irish State grant fifty years, hefore the union of our Paxlia ment with that of Great Britain, an event the possibility of whicb was never contemplated hy pirite founders, who had estabushod in which he gentry and nobility of the country were to unite in developing its mental and physical resonrces. It is needless to say, that ever since that event in our history, which occurred at tbe beginning of the present century, the arts and the functions of the parent society have under tone a certain abaction, if I may be allowed the expression, as injurious to them as it fatal to all peaceful development of nationa feeling.
The following remarks will show, by inference what the Society miglit have done had it heen left to the fostering care of a resident gentry and local Parliament. Some distinguisbed frists who were taught in this Society, with a his of their Englisb compeers, must go acity for art, hough wo must deplore the interrnption of ite hough te must deplorien on ather accounts prot this holl of time hononved names must first cknow the fact that it pivces nono to corre acknowge the forre pond with those of Logarth, Reysolas, homney fifty years before Ireland had an academy, but lheir names are in their way unapproachable Francis Danby ranks with Tarner in landscape Mulready with Wilkie, Behnes witb Chantrey Foley with Flaxman, Barry witb Haydon Haclise with Etty, Comerford will Ross, an rish Hamilton, Hone, Chinnery, Shee, Cum ming, and Cregan need not yield to Owen,
Hopner, Beecly, Briggs, Jackson, Lawrence Hopner, Beecliy, Briggs, Jackson, Lawrence, or Opie, as first-class in portraiture; while Irish
Peters, Tresham, Heaphy, and Rothwell may
rank with the painters Hiltov, Howard, Bird Drummond, and others who worked for bistory or illustrated tbe beaution incidents of life. Most of these men belong either to the end of the last or to the heginning of tbe present century, and are identified with the old order of tbings.

The names of artists get so mixed up togetber by writers and speakers on hoth sides of the Channel that we sball presertly be done out of onr fair claim to tbe merits of our distinguisbed conntrymen. The inter-communication of Irish with Enclish artists bas not tended to tbe production of a national style of art in eithe country therefore our efforts in apite of 118 come onder the general bead of British art.
The works of Irish artists exhibit at no time distinct nationality, eitber in subject or treatment. Britisb art, as it stands, exhibits a simple unity of purpose,-namely, to sell, the pnblic If being the standard aimed at.
If we wish to bring forward Yrish art, we must retrace our steps eight centuries; then indeed we may claim for Ireland the bighest reputation for ornamental art, acknowledged hy all who have the capacity to judge of it, com pared with tbe productions of other nations, Indian, Persian, Greek, Roman, or Arabio. It is still here to maintain its nndisputcd claim to be the finest conventional ornamentation in existence.
There is no saying how far the fine arts might bave advauced in this conntry but for the dis. tarbance caused by its altered position seveng years ago. The accounts of this period present Bahel of conflicting interests and opmions, and bow tbe evils of a community demoralised in rated exreme,-a hopeful nationality dapily the corrupt materials conseqnent upon such a state. Political and social disorder oppressed the country like a nightmare, and weighed it down for years, -"It became treason to love; it was death to defend." But lovely woman interceded or the vanquished -our patriotio women whose rritings prepared the way for a better under randing with our neighhour who lent a not unwilling ear to their sweet influence.
On the occasion of the royal visit in 1821 the Society was made a royal institution. The Royal Hibernian Academy was incorporated, and the miles of royalty shicd a gleam of hope tbrough out the land. Ono of the frst acts of the sooiety n entering its new residence in Kildare-stree was to move for a Wellington testimonial in the park. So much space was ibrary, mnseum, chemistry, and natural pbilo opby departments that the drawing-schools wous nearl golen, ana wer at this time housed in bo hy hade, theso schools uffered much, not only from wank of accommoantion, hut also from insumciency of instraction. For a whole century it was the boast of the Society that the gere-school was und ar 1 . West, who was tho pupil of Vanloo. In 1730 Mr. Fest died and was sncoeeded hy bis son Francis, who had been his father's pnpil. This Francis West also died, and was in luke manner succeeded by his son, who had also been taught by his father. So that for a period of 110 years the figure was taught by this trio in succession, each lcss capable tban the other,-the elder West being simply lgare-draughtsman and no artist whatever. It is well for the Itish atudent of tbis time that the last West died an old bachelor. To make this state of things more onfortnnate still, the society, ahont forty years ago, snftered both in dignity and finance through he impolitic and overbearing condnct of Chief Secretary Grant. Whe schools, however, snch as they were, found a friend and snpporter in Isaac Weld. William Carey lectured on the fine arts; Mr. Pomeroy and General Vallancy did what they could as chairmen. Captain Davis encouraged lithography on its first appearance; bnt notwithstanding these efforts the Society became nearly worm out; its art schools were a endroach, the objects in the ald and incompetent office it seemed on the verge of ruin. But a new epoch was approaohing The state of local politics made it imperative for the Government to take her by the hand (hold out her band), and to assist this fine old but mnch-ahused institntion. Since that time a new generation has sprung up to witness the Society in a higher state of efficiency than ever it had attained hefore.
Ireland since the Union can boast only of one first.class portrait.painter, and, before photo. graphy, bnt of one miniature.painter, bnt of no
figure or landscape painter of eminence. Tbough we cannot of late support artista of any stand. ing, we indulge in the absurd propensity of taling credit to ourselves for the reputation our countrymen ohtain in othor parts of the world whither they go to earn their bread. cannot he cured must be endured," bnt we have no right to boast of having distinguished men who owe us nothing but their birth, and possibly a considerable deal of sufforing before they left heard of lim, and now wo fortnne hefore we heard of him, and now we thrust bonours upon
him he conld well dispense with, Hogan was permitted to live amongst us in povorty, and When he died every one crowded at his funeral quite nnabashed at their neglect of him wbile he
lived. Behnes, whose bead lived. Behnes, whose bead of Clarkson equals the best of Chautrey's buste, died in Middlesex
Hospital! Now if we could, Hospital! Now if we conld point out a spot on Macliso, Mulready, Danby, or Behnes, it would ge some way to excuse the tasto we have for appropriating to ourselves the credit due t others. We need not point to one particular
class who are indifferent to art; we may say class who are indifferent to art;
tbat all are alike in this reepect.
Yot, after all this, we still labour undor the delusion that we are a nation. Wo were so once and had trades and manyfactures of our own; but they have gone, and we have become simply salcsinen for the manufactures of other countries. The trades have gone with the old guilds. Where are our gold and silver bmiths gone? With Saint Loy to Birminghain, Sheffield, and London. From the time wo open our eyes in the morning till we close them again at night we see notling of Trish manufacture or workmanship, bog-oak orvaments, which are purchased by visitors to this country, and called, as if in idea of Trish trade is still associated is making at bome the and contented workmen bnt the idea has chanced its sion around us, now really means trading in significance, and view of it is to he found in the code of moral seutiments among chapmen sinco the time that Jacob higgled with Labau
In the year 1849 the Goverument established schools of design in this conntry. They had already an existence in England and Scotland. Their object was to train designers to assist the
manufacturer who desined to compete witb manufacture who desired to compete witb
Nrance in tho marliket. But so littlo did the Government of that day minderstand of the relations of manufacture to art, that Lord Clarendou, anxious to advance the manufactures
of this country, imacined this would be best of this country, imagined this would be best
done by gettinc uy schools of design, It bas done by getting up schools of design. It bas must first exist, and then a cultivated taste in the customer will demand bcauty in pattern. For this purpose the present Schools of Art were organised, where the olements of practical art are taught to all ranke, from the palace to the hovel, under the care of an enlightened administration. The success attending these schools is well knowri, and has called forth many a nohle panegyric.
1 proposed to draw your attention to the cir cumstances which have influenced the fine arts ability within the time allotted mest of my shown yon that the fine arts were introduced into this country by a resident gentry, and at whose departure from the country they lan. guished. I have shown you how attempts were made to create manufactures amongst ns in lieu
of tho trade we lost by the union with England, of tho trade we lost by the union with England,
and they rosnlted in failure. I have in. and that they rosnlted in failure. I have in.
timated that we are only a nation of agents for foreign houses. I have endeavonred to show you that we have a capacity for everything except governing; that our sagacity cannot suspect tho insidious approaches of what nust ulimately ruin our national honour; and that we are at this moment blind to the fact that wo are
impercoptibly but surely controlled hy tho impercoptibly but surely controlled hy those Who only understand our weak side, our vanity, and that, provided we get a pretty shadow, we do uot mind who takes the bone. This is called progress, and so it is, but it is a cirous progress, with a, whip in the middle and a body of clowns and mountebanks making smaller gyrations within it.
These facts put together may convey this
lesson,- namely, those who camot lesson, namely, those who cannot govern them. whother for good or evil, will depend unon tho part wo ourselves take in it.

GREENWICH ROYAL NAVAL COLLEGE AND SCHOOL: NEW WORKS.
In the Builder of February 1st, we gave some particulars in concerning the internal structural coanges in Greenwich Mospital, and additional nexion with the sido of the highway, in conrand blocks, Royal Naval Scbool. The four grung blocks, each having a spacions inner dation of retired appropriated to the accommocommar retired admirals, commodores, captains, commanders, pursers, and all grades of officers, petty and pettier, as well as to a host of old salts, men before the mast, who had their herths somo in one great room, labelled, it may he, on Princess Caroline," Howe, 13 men"; or, "The which we remember as the show-ward, where the fanciful old tars had their sleoping-herths, they could not be called hammocks, curiously adorned. All these have been swept away, with compensation to the former inmates propor. tioned to tbeir rank and influence. A number of the officers retired upon full pay, with allow. ance for their "emoluments," -an unknown quantity to any one but themselves, until thoy were requircd to "declire." One,-perhaps of his of the officers made a claim for the vane and another, it is stated, in the hospital chapol; Admiralty for his funeral actually scheduled the was inade with the old salts, who, simple-minded men, did as they were ordered, and, old and done np , took what they could get. The hospital was emptied of the tenants for whom it was intended, and the question arose,-" What Shall we do with it ?" To make it a Royal Naral College is prohably the best use to whect that, appliedj to this purpose, Greenwich Hospital will again lift up its head, and hecome great national institution, During the first hree months about gixty students have cn. Cored as cadets at the Groeuwich Royal Naval College.
Tho adaptations of the buildinge to their new believed that after that hefore Octoher. It is believed that after that time the college will In the meantime, as we intiaction and braniog that have already entered are well accommodated and cared for. They are under proper discipline and control as regards training and teaching, and for recreation are provided with hilliard. rooms, reading-rooms, haths, \&o., and have rooms spacious enough and so 6tly furnished as 0 satisfy any one hat the veriest sybarite.
In addition to tho gymanasium, to which wo formerly referred, a new lanndry and bakery at east end of the Royal School area are in progress. The new buildings will have one haps, elevation to Park-row, better known, perwest. The premises will have an entrance near the Park gates. The landry and hakery are lesigned to serve for the 800 hoys and the resient officers in the Royal Naval School, and lso, if need require, for the 200 students, and professors and officers who may be in the The new college.
The new lanndry will he 8 ft. 6 in . in length by 35 ft . inside, with IS-inch walls. The bakery house for working the sas attached to it a brewhouse for working the yeast required. It has
two large ovens, each 10 ft . by 6 ft . in the clear, wo large ovens, each 10 ft . by 6 ft . in the clear, The working-room of the bakery is 25 ft . hy. 1 ft .6 in. It has two troughs for mixing the sponge, eacb 25 ft . long by 4 ft . wide at the top.
The wash-house is 32 ft . by 30 ft ., and will be fornished with two large washing.machines, two rainers and riusers. It has adjoining it a large be washed, and in another place a larre mendingroom for the clean clothes. The wash-house is
besides fitted up with bins for the besides fitted up with bins for the reception of heated by steam, It has a drying-closet, and high sliding, supplied with fourteen long and the matron's office adjoin tho wash-house In addition to tho other machines alceady named it has two lyydro-extractors, and it may here be stated tbat in driving the washing-machines, drainers, and rinsers, in working the hydroextractors, and wherever it can be applied steam-power will bo employed. In the mangling.room, 34. ft. by 18 ft ., there will he two 38 ft . by 18 ft The ironing-room, whicb is and near it two radiating elothes-racks. It js
furnished witb four long ironing-tables, eacb 3 ft . wide.
Ahore the lanndry there are rooms for tho man in cbarge, and otbers for miscellaneous pur. poses. In the basement there are boiler-rooms and a disinfecting-room. The foumdations are rav concrate that is laid upon the natural ravel. The whole of the work is done in bricks rom Chatham, made by the convicts, the facings heing of picked Chatham bricks and the dressggs of red hrick.
The buildings are to be covered hy bound roofs with a raised lantern along the ridge, with openThe power will he suppl
oighe power will he supplied hy a 6 -borse power bigh-pressure horizontal engine, combining the most recent improvements. The engine will be with one flue 10 -horse power Cornjsh boilers with one flue each. The hoilers to he of the beste Staffordshiro plates, and with Low Moor plates over tbo flues. The boilers to be tested to 120 ll . pressure to the square inch. The engine, bolers, tanks, shafting, washing, mangling, baking, and otber maohinery, are estimated to cost I,545l., including setting, fitting, and all appurtenances.
The works are designed by Colonel Sir Andrew Mr. Lo, R.E., C.B., director of Admiralty works; Mr. Longhhorough elerk of the works. The exection of the constructive portion is in the very competent liands of Messrs. George Smitl? Westminster $\qquad$

THE SHEFFIELD NEW STEEL AND IRON FORES BUILDINGS.
A VERY extensive hlock of bnildings for the inteud steel and Iron Works Company, who comp carry on business on an unusually Thesebensive scale, has just been completed. will he works, in which the Bessemer process perhaps on a scale featnre of manufacture, ar any similar establishment in the country The huildings already erected, and premises the nexion, cover an area of 15 acres, and with the view of still further oplargement the wh have purchased an addition I5 a immediately adjoining the already erected works, which are conveniently situnted a short distanco from the centre of the town, and close to both the railway aud canal.
The buildings include the rail-mill, 400 ft . in lengtb, 50 ft . high, and 60 ft . in deptb. This portion of the establishment is supplied with powerful mills and machinery, and its great capacivy may be conceived when it is stated of stat is equal to the production of 4,000 tone of stecl rails per month. It contains seven hoilers and fourteen firmaces, together with soveral rolling-mills for the manufacturo of steel-boiler plates, and also special mills for tbe company's particular make of steel.
The Bessemer House, which adjoins tho rail mill, is one of the most prominent buildinge in the block, and replete with apparatus and maohinery for carrying out the Bessemer process of steel manufactnre. Tithin this huilding there are no less tban six "converters" of iron into steel, each "converter" having a capaoity of six tons. There are also twelve cupolas, from which the iron is passed into the "converters" six hydraulic cranes, and a pair of hydraulic pumps to work the accmmulator and cranes. The hlow-ing-cngines used in the Bessemer process at these works have steam cylinders 40 in , in diameter, and the blowing-cylinders 60 in . in diametor This machinery admits of the prodnction of 2,000 tons of steel per week
The tyro-mill is another portion of the hnild. ngs. It is 170 ft . in length, by 130 ft . in depth, and the machinery is eqnal to the manufacture and fimish of 1,000 tyres per week
The spring shop is a large and important poroof covers on area of 386 ft . 13 leight , and the building several departments are 150 It . In this cluding rolling, forging, fiting, \&e. It contains fifteen furnaces, sixteen water-tanks, and ninetysix fitting-places, and amongst verions other articles manufactured here it may be stater that all kinds of railway-springs are made

## ithinit.

In addition to the several buildings already nentioned, there are also departments specially evoted to smiths, founders, buffer-makers, aslomakers, carpenters, and engineers, besides eparate bnidings for the dranghtsmen's offices, and the general offices of tbe establishment.

ACTON LOCAL BOARD OFFICES.
ThE erection of distinct buildings for parish purposes is a distinguisbing feature of the present time. The accompanying engravings illus-
trate the ofices which have been recently comtrate the offices which have been recently completed for the Local Board of Acton, Midadlesex. The building stands by the side of the main road from London to Uxbridge, at the entrance to the Steyne, and was erected from the designs and under the superintendence of Mr. Eaward Monson, at the cost of $2,000 \mathrm{l}$., including the fence-walls.
The materials used are stock bricks, relieved with cement dressings. At the end nearest to Ealing parish are two bay-windows. The south front of the main building is brougbt forward so as to present a grood face to the main thorough. fare, and to admit of the main entrance. The front doors are of oak, whicb shat back into recesses so as to form the sides of the lobby; while the inner doors are of mahogany. The colamns to the front door are of Mansfield stone, with Portland cement caps. All the windows on the ground. foor have cast caps, and the Boardroom windows have enriched heads, drip monldings, and ornamented blocks, supported by Mansfield stone columns. Level with the ground at the back are the engine-honse and the fire-cscape-house, -the latter having an entrance aufficiently higb to admit the escape without heing lowered, and sufficiontly commodious to admit of drill for the men in wet weather,torether in one yard, quite unconnected with the offices. The tool-house for the workmen, as well as the cart-shed, are also entered without interfering with the housekeeper's part of the huilding. The housekeeper has a living-room, a scullery, and coal-house in the basement, with a bedroom approacbed by a separate staircase, quite isolated from the main entrance. Under the hall, which has a fireproof floor, and is paved with Minton's encaustic tiles, is the strong-room, and adjoining this is tbe collector's room, which can be entered cither from the Steyne or by the main entrance on the ground.floor. On the rigbt, as the visitor nters, is the surveyor's office, through which the plan avatory, with modern fittings, hy Jennings The walls of the latter are paytly lined witb bite 0 on the left of the surseror's office is a commodions room, with two bey windows, The main staircase, leading to the first-floor is of Portland stone, and is lighted from the top by a lantern. The Board-room is 27 ft . long by 18 ft .6 in . wide, and 14 ft . high, and opposite to it is the committee-room. The whole of the external walls are 14 in. tbick, covered inside with Keene's cement, on a Portland cement round, and painted. The doors to tbe principal rooms are of mahogany. The Board-roomisighted with one of Strode's sun-burners, and the others have bronze pendants. there are cement skirtings to each room, and provision for ventiation. The varions rooms are fitted witb marble chimney. pieces, that in the Board-room being of Sienna and statuary marble. The contractors were Mossrs. A. \& J. Blick; the stonework was executed by Mr. Mence; the plumbing, hy Mr. Sutcliffe; the gasfitting, by Mr. Mason; and the plastering, by Mr. Nichols, all of Acton.
The building will be found useful for other purposes besides those strictly official.

## SANTTARY CONDITION OF SHIPS

Wren, years ago, we first drew attention to the condition of onr ships in a sanitary point of view, snoers, not to say laughter, were the response. Tbe existence of the evils complained of, and the necessity for remedy were hut slowly dmitted. At the present moment, it seems that the crews of her Majesty's ships Doris and Narcissus are suffering severely from enteric fever, indnced, it is stated, by bad water, dirty ilges, and deficient ventilation. It is reported, indeed, that there were no less than thirtyeight cases of fever on board the Doris. the fancet, commenting on this says :-" Dnpleasant lacts of this gort intensify the importance of laping a medical oficer conversant witb hygiene attached to the construotor's department of the bavy, whose special duty shall be to confer with the official naval arohitects on all points relating to ventilation, whether in the cabins, 'tween decks, or hold of the ship."
Would not a sanitary ongineer seem rather to be the man required ? However, whether it bo is competent doctor with engineering lnowledge or an enginear with hygienic knowledge, we will not complain, provided the proper knowedge be there, and be rightly applied.

## DILAPIDATIONS DISCUSSED.

In the course of the paper on "Dilapidations," by Mr. Fletcher, referred to in our last, the I wish to anstom, on oertain estatos whero the froebolders are peors of the realm (I do not wish to allude more particularly to the freelolders), on the nean the occupying tenant, and when these are fully arranged, and the agreement embodying them signed, to require payment in caslo for the dilapidations under the old lease. Can anything be advanced in favour of snch a claim? I venture
to say all will arree with me in saying No. There to say all will agree with me in saying No. There
is not a scintilla of justice in the claim. What is not a scintilla of justice in the claim. What
right has the freeholder to that money? Not one iota. The position is this : the lessor says, will repair and surrender to yon, in accordanc with the covenants of the lease undor which hold; but if we can arrango terms of renewal, will suit me better" (bocause oither his bnsiness will suffer from removal, or, if a private house he wishes to avoid the exponse counected with fully, in many cases extended by the freeholder's agent; so that no time is left in which to do the new agreemont signed, the tenant feels happy he thinks, - poor innocent fellow! -that he has notbing to do but make the alterations and out. lay agreed to in such new ngreement, within are bis feelings, and what would be free. What hearers, if such a case happened to them, when hearers, if such a case happened to them, when
the freeholder's surveyor comes in, a few days beforo the expiry of the lease, to take a schedule of the dilapidations? To tho indignant reply of the tenant, "There can be none; I havo tho new
lease, and have agreed to improve the property, and fully repair," comes thecalmireply of thisgreat frceholder's agent! "The new agreement in no
way affects your liability under the old way affects your liability under the old lease, and as to-morrow that old lease expires, there
will be no time to do the repairs, and I shall therefore require the amount or valne thereo paid in cash." Such an instance of injustice has happened only too often in my experience. On what ground can the freeholder justify the receipt of money? What loss has he sustained The now lease is valued by his snrveyor as if it taken by the lessee. Surely yon cannot admire snch practice, and thereforo it hehoves ns all, as tion, which, our power, to prevent such extor obtain in a fow estates in London, seens only to freeholders are peers and mon of high rank. While doaling with this portion of my subje cannot refrain from comparing the position of glish leaseholders with that of Irish tenants. Recent legislation has certainly created an anomaly. Now the Irishman can lay out almost any sum be chooses in improvements and hailding, and, if required to go, gets fully compen. sated for his ontlay. His landlord may consider orevent the ontlay, although he is bonnd to repay it. He must at some time or other find the money to recoup the tenant a great portion the English loaseholdor. He may bnild and of the English loaseboldor. He may baild and im. prove as much as ho likes, hut not one penny can he require his landlord to repay him; worse still, he is hable for dilapidations on the very inprovoments he makes. Pardon this digression. I have made it to show forcibly the exact position of the English lcaseholder.

To further oxemplify it I need only mention that if modern sanitary science, through its official medical officers, considers the premises nnfit for habita tion, and that they cannot be strncturally altered to render them fit, the lessee has the pleasnre of pulling them down, or, if not, the authorities will do it for hinn, the result boing be is deprived of his incorme while the freeholder searcely suffors. More frequently be does not suffer at all, for this reason,- whe acquires at a much earlier date the reversion, and the value of the time thus gained compensates him for science considers that premises which every one oonsidered fit for occupation years ago, are now unfit, some portion of the loss should fall on the frecholder, and he should find some portion of the money to render the premises fit and proper to meet the reqniremonts of advanced scientific knowledge. Let us try to look at this point, and B. enter into a contract; both believe that
the premises at worst are fit for habita. tion. Improved science says, somo time afterwards, "We find these premises are unfit for habitation." Now, what iu the name of common sense ought men to do? The granter of the lease should say, "I am sorry the article I gavo you for a number of years for a certain snm has hecome valueless from causes over which we have no control, and about which we could have no idea; therefore, pro rata, will meet you in making the property what is requircd by advanced scionce." Such a oourse would appear right, only I regret I cannot mention an instance whero it has becn done. Bear in miud that in Ireland the outlay made by the tenant wonld have to be repaid him when be quitted the promises; dwell on this point, because I feel it is the key-note of dilapi dations. Unquestionably ddapidations are more favourably constrned as regards the tenant than they were formerly. The most recent deoisions show that in repairing to avoid a money pay ment, it is not necessary to nse now matorial Id stuff may be used, provided of conrse tha that the lcssee quas only bound to C. J., stated house as an old house bound to keep up the freeholder the benefit of new work. Moro recent decisions appear to incline even more farourably to the lessee. In repairing it mast be ro nombered, that if the tread of stairs be worn so hat they reqnire repairs, only nosings can h claimed; that if a door be roquired, the only laim that can be sustained is piecing. I think the foregoing will explain how at the pro sent timo we must take our schedule. Next, as the time of doing the works to prepent a money farmed for dilapidations: the the continuanco of the be pe

## ARTIZAN SOLDIERS.

The normal operative eloment which bas hitherto heen confined to the Royal Enginee Corps and the Pioneer forco is about to undergo largo development, by a systematic organisa of the employment of soldiors at The question of the employment of soldiors at trades is no novel in itself, but as by the new formation man issues are raised, and particnlarly as regards the futuro of the budding operative, it may wel laim a little serious attention.
Pioneers from the earliest hare been con nected with armics, and we need only instance the case of the Roman legions, their nission, and their work in Western Europe, and more espe cially in connexion with this island. It is now proposed, that in each regiment of the British army an efficient pioneer body shall be formed, comprising men who to their ordinary duties as pioneers will be available for imparting instrue tion to soldiers desirous of learning a trade, and practising the same for military and governmental purposes.
According to the "Queen's Regulations and Orders for the Army," the distribution of thi operative force will be as follows:-One ser geant, a carpenter hy trade, if possible; three carpenters, two bricklayers, one plasterer and slater, or a man each able to slate or plaster one amith, capable of shoeing horses; one mason, painter and glazier, two plumbers and gasfitters ; painter and glazier, two plumbers and gasfitters; pioneers. Power will be invested in command. pioneers. Power will be invested in command the Pioneer Corps, without asking permission of a higher authority. Transfers from other regi ments will be allowable when any regiment is unable to fnrnish the specified quota, or hy enlistments of new men of the required trades. qualifications taken on at stations where their may still be cannot do propery tested, they opportunity thpointed as pioneers, the is to b availed of. Although pioneers are, as a rulo, intended to be stationed at the head-quarters of every regiment, yet, at the discretion of the commauding officer, they may be otherwise dis posed. A small proportion of carpenters, smiths and plnmbers whom the Royal Engineer Department may have classified as ordinary pioneers Each no received at Woolwich for instrmetion or selected for taking charge of a body of pioneers, mast himself he an artizan of some respond and keep acconnts appertaining to corormpetent men selected for the duty of pioneer sergeants will, on the application being mado to
the Adjutant-General, be seat for entry to tho School of Military Enginecring, and, after a state of prokation, may kave thoir appointment fo the new daties confirmed after six months tial. It is regnlated that, after appointment, poneer sergeant can hold a second sitnation
In the Eqnipment Regralations," the tool needed for the nse of pioneers are stated, and the materals for barrack damares and repairs wil be furnished through the Royal Engineer De partment. Next comes an interesting featore the pioncers may bo either employed on work for the Royal Engineers, or the Contract Depart ment,-1st, by contract or agreement made with the pioneer sergeant; 2nd, by piecework; 3rd, by day-work or the hour. Men belonging to the building branches, such as carpenters, joiners masons, bricklayers, blacksmiths, gasfitters plumbers, glaziers, painters, and others, ar peculiar to the Royal Engineers, and these will be classified and tested by the Royal Enginee Department; but the Contract Department wil sce to the qualification of the armourers, smiths, wheclers, carriage-smiths, saddlers, coopers shoeing-smiths, saddle-tree makers, collarmakers, \&c. In the employment of these soldieoperatives, priority is to de given to all pressing work needed for pablic service, and for the per formance of this work a preference will he giveu to skilled and competent men. Tho work of the regiment may be performed as circnmatances permit, and the officers are allowed to employ the men on private jobs for themselves, and others may so employ them, if approved of by the commanding-officers,

A danger seems to lie here, for the word "others" may be made to include work within or without the barracks, and officers' private jobs may be extended to their lodginga, for number of them reside ontside the harracks with thei families. A fund is to be raised to defray the cost of repairing or replacing tools, and this fund is to be created by a contribution not exceeding 5 per oent. to ho deducted from payments made for work executed. It is intendod to make the system self-supporting without meddling with the ordinary regimental pay of the soldicr-crafts men and pioneers. It may be asked what will be the effect on the mechanical world outside the army by these new regulations in the Britisl army. We helieve the system contains the germs danger, and will be all the better for a little disdanger,
cussion.

EWELME AND DORCHESTER.
Sik,-The tourist season is now coming on, and to your young architectural readers a hrie may prove as interesting and instructive as it myself
Being at Wallingford, and having read of the Ewelme Rectory scandal case in the Honse of Commons, in my own mind I judged that the living, being a pretty good one, would probably contain a chnrch worth seeing. Half a mile from Wallingford, I took the fields by the west side of Cromarsh Giffard Church, a small ancient Norman one; a heacon elm-treo guides tho atranger for three milos without a house near the way. A few yards from the tree is a stcep descent, at the bottom of which stands tho village; and the first sensation at the view of it that of having walkod into another age rather han one at the latter part of the nincteenth entury, the several clusters of farmsteads, with heir outbaildings forming a scene of rural beauty seldom met with. Among the blocks of huildngs can be seen an Elizabethan one, near the church, for which I made. I found it to be the National School. It is built of red brick with angriar huttresses and wholesome-looking himney-shafts, that fairly pat to shame our miserable sham bits of chimneys in this much annted cirilised age. The doors contain the old oak tracery in tho head. Ascendin the round, I came npon the schoolmaster's bouse suhstantial-looking block, with a battlemented ntrance at each side of the yard enclosine Next I came upon a good red brick gateway, with a pointed arch, enclosing a huge ornamental cusp, out in brick. Near this stands the quad. rangular block of the almshouses, and, entering by the north side, I found the houses surn ounded by a conrtfard, with a covered way to oach side the plan of the block showing tho greatest concern for the comfort of the old inmates. The windows and doors, by opening apon the court ard, effectnally screen them from the summer' heat and winter's cold. In the centre of each
passage-way is an opening, enriched with an prssed three and richly traceried barge-board, the openings and richly traceried barge-board, the openings being to facintate crossing from one side to the besides various pifts and what they can earn by besides various gifts and what they can earn by working, sbowing that we are decidedy hehindhand with our deserving and infirm poor. We bunde them into costly workhonses, and make heir latter days a comparative misery to what was the case four centuries ago. Ascending a fight of steps, a covered way to the west end of the church is arrived at, the doorway being rich. The church is of late Perpendicnlar date. Internally it is handsome, and plain externally, with a vestry or the north side of the chancel. The whole hlock, consisting of the charch, alms. honses, and schools, were evidently planned and built at the end of the fifteenth century, and, considering the state of preservation they are in, there are few places that can boast of such an interesting hlock to the architect or casual visitor.
Shonld the visitor decide to go on towards Dorchester, at Berwick Salome is a poor old church, with a low timhered tower, tarred over. was snrprised to learn it contained a peal of six helis. On going np to them, I fonnd them to be in a space of 10 ft . by 10 ft . The font is a good and small Norman one, with interlaced arcles in two series round it, with leares between, a peculiarity observable in the circles heing that a connecting band is only round that half of the font facing the east, the west half being without it. At Warhorough is a lead font, of early Perpendicnlar date. The tower bas outside the figures 1666 upon it, in flint stones, and, considering the date, it is a creditable specimen, having huttresses and pinnacles, looking well at a distance. Next comes Dorchester Church, which is too well known to need any comment from me. The font is of lead, of early Decorated date, and enriched with sculpture. In a glazed case at the west end is collected a number of stones, exquisitely carved and highly eariched with tracery: they evidently formed tbe groining to an altar-piece or monnment, some of them retaining their original colours and gilding. They were taken ont of a hlocked. up doorway in the north wall of the nave, which is now blocked up again. The hailding is nnder. going restoration at the east end of the south aisle. I trust I have not intraded too much upon your valuable space, hat that it may prove an incentive to onr young architectural friends in their leisure time to roam about and see the treasures of their native land, which are in such
profusion as no other country can produce.
J. B. Watis.

Institution of Surveyors.-At the next meeting, April 21st, a paper will be read by Mr. W. Menzies, entitled "Arterial Drainage Works, Water-Supply, and Sewage-Drainage Works, expented at Windsor, between the years 1867 and 1573.

## THE TAY BRIDGE

A VERY fully illnstrated account of the Tay Bridge, North British Railway, the method of hailding the piers and sinking them, the caissons and 80 on, will be found in the Engineer of April 4th.
The total length of the bridge from shore to shore is $10,320 \mathrm{ft}$. Commencing from the south, or Hife side, there will he three spans of 60 ft . two of 80 ft ., twenty two of 120 ft ., fourteen of 200 ft ., sixteen of 120 ft ., twenty-five of 66 ft ., one of 160 ft ., and six of 27 ft . The first three spans ( 60 ft .), south side, are on a descending gradient of 1 in 100 , the two 80 ft . spans are level; the bridge then rises with a gradient of 1 in 353 to the centre of the 200 ft . spans. It the descends with a gradient of 1 in 73 18 north shore, passing at a height of ahout 18 ft . over Magdalen
now being constructed.

The hridge thus comprises eighty-nino spans, and at the commencement on the south side the rails are 78 ft . ahove high vater, running over the tops of the girders as far as 200 ft . spans which cross the navigable channel of the river. Over these fourteen spans the rails run on the bottom of the girders, giving a clear headway of 88 ft . above high water. On reaching the 120 ft . spans on the north side, the rails are again on the top of the girders, which is continned, with the exception of the 160 ft . bowstring span, to the nortb shore. From the south side the first five spans are on a cure of twenty chains radius. Gve spans are on a cure of twenty chains radius.
The bridge then runs straight across the river as The bridge then runs straight across the river as
far as the end of the sixteen 120 ft . spans on the north side; thence the whole of the 66 ft . spans, north side ; thence the whole of the 66 ft . spans,
160 ft bowstring, and the 27 ft . spans are on a curve also of 20 chains radins, forming nearly a quadrant of a circle, the length heing about $2,000 \mathrm{ft}$. This long ourve is necessary to bring the hridge,-which rnns nearly due north,-at right angles across the river into the town, along. side the Caledonian Railway
The greater part of the piers are hnilt of hrick, varying in diameter from 6 ft . to 15 ft . Fig. 1 shows the elevation and section of a pier 9 ft .6 in . diameter at the water-line, supporting the 120 ft spans. Fig. 2 shows the elevation and section of a pier 13 ft .6 in . dinmeter at the water-line, carrying the 200 ft . spans.
The method of huilding the piers and sinking them to the foundation is carried out in a novel manner, and specially adapted to rivers having strong enrrents, and with little soil overlying the rocky hed,-which here in one case aid not exceed 4 ft., -prohihiting the use of timber shaying, as heretotore nsed for such structures. 15 he piers are first built up to the height of 15 I . on the foreshore on a temporary hasis of flostete, the girders carried hy the falling tide are pontoon hanging to the pier and moored in the harbour. The pier is then built $n$ p to such a height that when resting on the hottom in its permanent position the top will be above low water. The girders, on which are resting the hydraulic rams for lowering the pier, are then connected by the wrought-iron lowering links with the base of the pier. The pontoons are floated underneath the girders, and the whole pier floated from its temporary resting-place at high water and towed out to its permenent position. The heaviest piers floated out weighed 145 tons, and wore lowered hy six lydranlic rams. The brickwork is built of Portland coment, in the proportion of one of cenient to one of sand; and such is the strength of the hrickwork, that after a few months those cylinders which capsized, after heing floated on to the foreshore, capsized, after heing foated on to the

Up to the present time, on the south side wenty piers are in position, fonrteen of which have heen sunk to their permanent place. The first seven spans of superstructure are np to their proper level, and Nos. 9, 10, 11, and 12 pans are within a fow feet of it. On the north spans are completely finisbed and planked, and the bowstring span of 160 ft ., with its piers, is nearly finished.
The bridge is heing carried out from the designs of Mr. Thomas Bouch, M.L.C.E., of Edinhargh. The whole of the work was undertaken by Messrs. C. de Bergue \& Co., of
London, Manchester, and Cardiff, for the sum of 217,000l. ; and the construction is being carried out under the superintendence of Mr. William Paterson, C. Th. the contractors' engineers being Messrs. Grothe \& Austin.

The contracts for the collecting line between The contracts for the collecting line betwen
Louchars Junction and the south side of the bridge, together with railway running into Dundee and atation, have been undertaken by Mr. Waddell, of Bathgate.

RECONSTRJOTION OF THE NORTH BRIDGE, EDINBURGII.
The North Bridge at Edinburgh, which con nects the new town with the old, resembles, so far ns the trafic over it is concerned, London
Bridgc, which connects the City with the Surrey Bridgc, which connects the City with the Surrey
side of the Thames. There is an enormous trafic over both, and the carriage and foot ways across each have long been too narrow. The rebuilding or widening of the Edinbargh bridge has for some time been contemplated, and it now appears that the latter plan is to be adoptcd. Messrs. D. \& T. Stevenson, engineers, acting on instructions received from the manicipal anthorities, have just furnished plans, accompanied by a report, in which they recommend the widening of the bridge in preference to its boing entircly re-bailt. According to these plans, it is proposed to malse the carriage-way
$32 \mathrm{ft}$.6 in . wide, and the footways 11 ft ., the $32 \mathrm{ft}$.6 in. wide, and the footways 11 ft ., the cotire width heing thus $5!\mathrm{ft}$. But beyond this
an additional width is proposed by the construction of projections on either side of the bridge supported by transverse iron beams. The total estimated cost of the proposed extensions, cxclusive of the paring, js 13,500l. Messrs. Steven-
son calculate that it will take somethiug like sonelve months to cxecute the proposed works, in consequence of there being a legal obligation in forco preventing the bridge from heing altogether closed, which it is alleged would have the elfect of ruining the tradesmen who have places of business at each end of the bridge. They, therefore, propose to complete one side of the hridge hefore procoeding with the works on the other side.
Messrs. Stevenson report against the construction of an entirely new bridge, not only on
account of the large outlay of 50,0002 , wlich account be necessary, but also on the ground that the works would take a considerable length of ime to exceute, and that there would necessarily e a serious stoppage of traftio between the old rown and the new t
way traftic under it
way tratic ander it.
It appears that the proposed works will cost It appears that the proposed works will cost
oetween 2,000 . and 3,0002 . more than they would oetwcen $2,000 \mathrm{l}$. and 3,0002 . more thinn they would
aave done a year ago, in consequence of the tave done a year $\begin{aligned} & \text { ngo, in } \\ & \text { unance in the price of iron. }\end{aligned}$

## WESTMINSTER ABBEY.

The reredos (of which we gave a view some time ago) is now completed. The reredos was, ime ngo is now completed. The rered os was,
in its main features, set up in 1867. Three n its main features, set up in 1867. Three
fears later the vacant niches wore filled, under fears later the vacant niches wor dean, by Mr. Armstead, to whom the sculptures in the frieze ure also due, hy four stathes, representing Moses, Peter, Paul, and David, the tyo Apostles heing those to whom the Abhey is dedicated, and
Moses represeuting the law-givers and statesmen, towards whose transopt he looks, as David repre. sonts the poets, on the side of Poets' Coraer.
Since that time the decoration Since that time the decoration has been com-
pleted by the addition of framework nud canopies of wainscot, gilt and in laid with enamelled plaques of motal and plaques of filagree and jewel work. The general troatment of the space below the large picture is copied from the ancient retabulum discovered some twenty years ago, and now preserved in the south aisle of the Abhey. The Times says,-This retabulum was of the
earlier part of the reign of Edward 1 ., as is earlier part of the reign of Edward 1., as is
shown by the arms of Elcanor of Castille, and was probahly painted hy an Italian artist. It is recorded in Dugdale's "IFistory of St. Paul,"
that there was there a like retahulnm, made hy that there was thcre a like retahulnm, made hy one Richard Pickering, a citizen, in 1309, which is descrihed as "a beautiful tablet, mado and fitted to set upon the high aitar, variously
adorned with many precious stones and enamel work, as also with divers images of metal, which tablet stood hetwixt two columns, with a frame of wood to cover it, richly set out with curious
pictures," Its cost was 200 marls, which would pictures." Its cost was 200 marks, which would, when translated into modern money, excced the
oost of the new screco in the Abhey. The racant space underneath the picture has heen filled with seven heads, representing the holy women of the Bible, whioh were designed hy Messrs.

Inmbeth, to execute them in mosaic, and who also undertook the ornamental glass-work and the gilding. The whole of the woodwork has the enamelled and jewelled plaques hy Mr. Skidmore, of Coventry. The three large porphyry more, of Coventry. The three large porphyry
slabs in front of the Communion-tablo were given hy the present Lord Elgin.

## THE WHITECHAPEL BATHS AND

 WASH-HOUSES.We regret to learn that the Whitechapel haths and wash-houses, the foundation-stone of which was laid by the late Prince Consort, and which for thirty ycars past have been of great service in one of the poorest and most crowded parts of London, are in danger of being sold to satisfy a claim upon them.
It appears from an appeal on their behalf which is now heing nuade by the Rev. Canon Kingeley, that they have been closed since March, 1871, and are now in a dilapidated con. dition, and are likely to be sold this year in order to pay off a mortgage of $4,000 \mathrm{~L}$. Canon Kingsley, in making an appeal for subsoription to raise the amonnt, and also to re-open the baths, points to
the statoment of Dr. Liddle, medical officer of the statement of Dr. Liddle, medical officer of health for the Whitechapel district, who says that since the closing of the haths thonsands of poor women in the neighbourhood bave been forced to wash and dry the house-clothes in one room, in which all the family both eat and slecp together, drinking in the seeds of disease from an atmosphere reeking with foul steam. Poor men's homes will never he fit for civilised heings to live in until such public baths as those ot Whitechapel are within every poor man's reach. It appears that the committee which has been formed to raise the required sum, and so save the baths, consists of Mr. Cowper.Temple, the Rev. Canon Eingsley, and the Rev. W. Rogers (rector of Bishopsgate).

## BULLDERS AND BILLS OF QUANTITIES

 AN architect, who had advertised for tonders, with this intimation, "One guinea will he charged for the quantities, which will he re"Mrned on receipt of a boná fide tender," says, "Mr.- (who applied to me for quantities, which were sent to him on the 6th of March last) returned them to me on the 14 th of the same month, with a note, stating that he declined to tendor, on account of his not being able to come to Manchester to see the plans, and requesting the guinea hy return of post. Is he entitled to the one gninea, uuder the terms of the advertise. ment? If he is not, I should wish yon to giveit to some charity, or dispose of it in such a way it to some charity, or dispose of it in such a way
you may think best. you may think best.
What would my position have been had the other builders acted in the same way, by return. ing the quantities, more especially as there was a meating of the Board convened to receive the teaders on the 18th, according to advertise ment?
We have returned the guinea to the writer, hut have no hesitation in saying that we think the builder is not entitled to it.

THE NEN ReSERVOIR AT GORLESTON, GREAT FARMOUTH.
A NEW reserroir has just heen constructed by the Yarmonth Waterworks Company. The desirability of constructing a reservoir at Gorleston has long heen felt, and to mect the general demand the Waterworks Company have built a oovered reservoir, from designs by Mr. Hawksley, of London, C.E., and the work has heen carried to completion under the superintendence of assisted hy M. W. the manager of the company, The new reservoir is sitnated on an ominence on the Lowestoft road. The ground taken by the company was ahout five or six acres in extent Entering the enclosure by a brick gateway, facing the east, a roadway, the sides of which will eventually be planted with trees and shrubs, leads to the reservoir, which, in its exterior Ormest, differs but little from the rescrvoirs a is approached hy ster. The roof of leading to an opening in the shape of a half-circle, and another staircase of tiventy-five steps into the interior of the reservoir. The reservoir is constrocted apon the principle of corridors, six in number, each
corridor being of the span of 12 ft .; and to secure strength, the outer walls are made to form a series of bays, the roof of each bay terminating in a half come; while there is a tank at each corner of the reservoir, with circular onter walls and domed roof, which form a tie to bind the walls of the building together. A thick bed of concreto has been laid under the entire floor, projecting heyond the foundations of the outer ralls and puddle-hank, and upon the concrete is bed of clay, covered with white bricks, forming the floor of the rescrvoir. A thick puddle clay bauk is carried up outside the extornal walls rom the concrete fonndation to ahove the waterline of the rescrvoir. The latter is 115 ft . square inside, and the hoight from the floor to the roof is 16 ft . The reservoir is calcmlated to hold 800,000 gallons of water, and when full the depth will be $I 4 \mathrm{ft}$. 6 in . The reservoirs at Norwich are constructed upon an almost precisely similar principle, and hold about a millioz and a balf gallons each. A well, 65 ft . deep, has been sunk, from which a portion of the water will be snpplied, by means of a steam-engine, to the escrvoir, and another pipe, connected with the Ormesby main will be laid across the river at Gorleston. The material used in the construcion was as follows:-800 yards of concrete, 1,400 tons of clay, 80,000 hricks, 300 tons of lias imo from Leicester, 1,000 hays of cement, 10,000 cubic yards of material dug from the land adjoiuing to form the banks and to corer the roof, and 150 men were employed, with a large number of horses and carts. The total cost is cstimated at from 70002 to 80001 The total cost of the other works of the company at Ormesby, Caister, sc., amounted to upwards of 80,000 l.

ROYAL ITALIAN OPERA.
Mr. Fuedk. Gye does well in giving a certain nuanber of singers noknown to London a chance of founding a reputation here, provided, of course, that he or his agents are first well satisfied as to their capahilitics and probabilities ; the suhscription is too large to allow of experiments lat are certain to be failures. With two of his ady adventurers, at any rate, on the present Madame Paoli and Madile. D'Angeri. The former lady especially, in the "Farorits," showed more lady especially, in the "Farorits," showed more than promise, and was generously received :
the other charaoters were sustained admirahly by Signor Nicolini, who is fast rising in ostima. by gignor M. Flini, who is fast risily in ostima-
tion, and M. Faure, who can scarcel $/$ rise higher. Both these artists distingaished themselves in representation of Gounod's "Frast," which has been given. The scone and grouping of the Kermess are the most artistic things of their hy Teniers. Sirnor Cotogni ( (ralestine) should hy Teniers. Signor Cotogni (Talentine) should not he omitted when praises are hoing hestowed. On Tuesday evening, Mdlle. Albani, who made an admirable debut last season, re-appeared with sigual success in "Lucia di Lammermoor." It was a fine performance, and has placed her high in the Town's estimation. The sub. scribcrs, who are numerous this year, we are glad to hear, can well afford to wait the coming of the great gun of the establishment, Madame Patti, whose appearance always scryes to fill Covent Garden to overllowing.

BRITISII ARCHEOLOGICAL ASSOCLATION.
AT the meeting on April 9th, Mr. H. SyerCuming, V.P., in the chair, Mr. E. Roberts, hon. seo., referred to a communication he had received from Sir John Lnbback on the suhject of his Bill for the Preservation of National Honuments, and mentioned that the council had hat day agreed to petition Parliament in favour of the Bill, considering it a step in the right direction, although not groing far enough in its scope, being limited to British, Roman, and Saxon remains only
Mr. Thomas Morgan exhibited a handsomo pair of steel scissors, of Sparish manufacture, the handles being inlaid with silver ornaments and tortoiseshell. On the bladcs was the follow. ing inscription:-

## Jun romezo ane fectr by la <br> di USSO DN'H R'COM: GEN.

Mr. Isaacson Tucker, Rouge Croix, explained to the meeting that he had lately paid a visit to the "York Stairs," on which Mr. George R. Wright had read a paper at the last meeting, and found
that the arms on the gateway were those of Villiere, Duke of Buckingham. He quite con. curred in the view taken by the Association, that this interesting memorial should be imme. diately raised from its present degraded con. dition, and made an entrance into the garden of the Embankment from Buckingham-street. A of Inioo arose as to whether the above from its original position at the time of the destruction of York Honse, although the opinion of the meeting was in favour of keeping it in its meesent was in favour of keeping it in its Mr. Wright donbted its having been removed, and referced to the drawing by Hollar, in the and referred to the arawing by Hollar, in the his view.
Tbe Obairman exbibited a curious cast-iron chair of Sussex workmanehip, and observed in reference to the antiquity of casting iron in Britain, which had heen notioed hy Mr. J. W. Grovor, C.E., on a previous occaeion, that it was undoubtedly practised in this country ae early as the fifteenth century, and quoted several writers in snpport of that opinion. After other exhibitione,
and Use of Hairman read a paper on the "Origin and Use of Hour Glasses," and the meeting 2ndjourned to the 23rd inst., St. George's.day.

## warming by gas.

Sir, -Mr. Barber's saggestions upon gas warming for domestic purposes open np a queetion deserving some attention. Makers of gas.warming apparatus will tell yon that their gas, and that therefore no true or cbimney ie required to carry off the prodncte of comhnstion, or, as eome have put it in other words, "there aro no producte of combustion to carry off," an off the products of combustion in their neces. sarily heated state, the apparatns does not show so economical a resnit.
I am not a chemist addressing chemiets, ont we probably know eufficient of the matter not annibilate it, but ratber decomposes it and allowe the elementary gases of which it is formed to enter into new combinations with the gases of the atmosphere. Ordinary coal gas is (barring impuritiee) carburetted hydrogen, a combination of carbon and hydrogen; the act of combnstion is tho combination of the carbon with the oxygen of the air. Thns, one of the products must he carhonio acid, or carbonic 1: Carbonic oxide is extremety poisonous, even tuorse than corbonic acid, is colourless, and possesses very little odour"."

No method of warming hy gas can be other than poisonone, nnless provision is made for sing the heat py means of radiation and athe sing the heat by means of radiation only; then we obtain for breatbing heated atmospheric air instead of heated carbonic oxide, or heated car ing, we not only rob our breathing gas. warming, we not only rob our breathing air of ite vital oxygen, but hy mixing that oxygen with carbon, prepare a deadly poison.

Tbe difference hetween the resnlto of the ordinary gas jet for lighting purposes, and that
of the Bunsen burner, in which air is mined with of the Bas before comhustion, ie $T$ believe the with the gas before comhustion, ie, I believe, that in the former caee carbonic acid is evolved, and in the latter caso carhonic oxide, the latter componnd differing in its composition from the former in containing a larger quantity of the result of more poisonons composition bein the result of the more perfect combustion
A. $\boldsymbol{\mu}$.

## HOT-AIR DOCTORS.

So long as the wholo of the air admitted into a room has to he roasted on its way thither, so Iong may we he certain the atmoephere, from a health-invigorating point of view, will never he What it onght to be; but if the stove is merely
looked apon as a source of caloric, to be cooled looked apon as a source of caloric, to be cooled
and aerated hefore it passes into the apartment and aerated hefore it passes into the apartment, ther something may bo made of it. Dried and
scorched air, which has necessarily lost all its ozone in its paseage throngh or over the source of heat, cannot be healthy; hat if it ie gene. rated at, oay $200^{\circ}$, and ie cooled by admixture with fresh air hefore it passes into the apart ment to he heated, then it bocomes another and
very different thing. This is the rock npon

Which the day.dreams and waking schemes of a large majority of our hot-air doctors have been so for wrecked, and until they hark back to a be warmed, system, and otue by which air can medicated, they will never heat our dwellings or public buildings in a really satisfactory manner. All the recent improvements have been directed almost exclacively to the economy of fuel, very necessary point certainly, but there something of more importance than the sarin of penoe, and that is, a warm and thoroughly healthy atmosphere.
Let those who are rushing in for patents for mere mechanical oontrivances ask themeolves a few questions as to the chemical and hygrometric nature of the atmosphero they aro likely to generate, and they may poosibly discover thei

Hortulajus.

## THE TRADES MOVEMENT

Brighton.-A vory large meeting of operative carpenters and joiners employod in Brighton has beeu held, -Mr. George Duddoll in the chair,had been presented to the bnilders of Brichton in August last. The 'following was the formal requeet of the memorial:- "Tbat work shall commence at eix o'clock a.m., and termiuate at making a total of fifty-eix hours and a half por week; allowing within the above-named hours half an hour for breakfast and one hour for inner, the same to apply all the yoar round, and the wages to be 7d. per hour, making a total of 9. an bour." por week, and overtime to he paid into operation on the 1st of April thie year, and circulars had been eent to the innsters, remind. ing them of thie fact; but no reply had been received from tho mastere to either the memorial or the circular. After diaenssing the matter, the meeting nnanimously passed a resolution to tbe elfect that, having heard the manner in which the memorial had been treated, the exe. to the employers, askiner them to send a circular tation of tbe men; that such to meet a depu. f not less than three nor moro than eopen, that the meeting take place not later than April 18tb; that the employere give notice nob later than April 12th of the nnmber they propose npon the deputation, so that the men may appoint a liko the decision of such conference pledges itself to the decision of shch conference. Two other follows:--1. "That, in the eronimy adoptod, as loyers not meting the employers not meeting the depatation, the comfirms, as they may decide; and this meeting pledges itself to support them." 2. "That this meeting pledges itsclf to allow full pay to any delegate who may be discharged in consequenc of thie movement." It was announced that promisee of support bad been received from London, Manchester, Birmingbam, and other
Weston.-The society men of the carpentere an joinere are now out ou strike, demanding their pre ent rate of wage, 2ss., to be increased to 28s. 3d, per week. They state that an application to their masters tosettle the matter amicably has beenmet with contempt, and the give as their reasons for making the demand that the prices of provisions are much kigher than heretofore, and that the wages given in neighbouring towns are far in advance of those paid in Weston.
Inverness.--The operative slatere are at presont ont on strike. They have been paid at the rate of 5 d , an hour, and they now ask for 6 d . which the masters deeline to grant.
Stonehaven.-The jonrneymen slaters have come out on strike. They have received for whole time $4 \frac{1}{4} d$, per hour, and they wish to have he town for Aberdeen
Mr. Rupert Kettle's Award in the Iron TradeThie award has been pnblished in full in the columns of the Staffordshire Advertiser. After disposing of the question of the sliding scale in the negative for the present, the award thns settlee the question of wages:- "I feel myself at fnll liberty, with the coneent of hoth parties, to fix the rate of wages for six months-i.e., until the end of the ordinary Michaelmas quarter. And after the fullest attention I can give to the onh. ect, and in the fervent hope that it may he hene ficial to both parties, I fix, sabject to its including
all the claims I hefore mentioned, the rate of wages for puddlers shall be increased 9 d . per ton from the 31st of March until the 4th of October ; tbat all other ironworkers shall be advanced upon the present prices."

## SCHOOL BOARDS

London.-The works committee invited tenders for the orection of a sohool to provide accommo. level, Sonthwark. The following wamaica respective amounts :-

Towman \&s Ma
he committee recommended the acceptance of the lowest tender, that of Mr. J. H. Tarrant, of 33논, Weymouth.etreet, New Kent-road, S.E., amounting to $7,297 l$. The cost of the site was 2,500l. An application has been made to the School Board by Mr. Cbarles Reed, the vice hairman, for their sanction to contracte heing entered into by committee during the vacation, foundation osed new Board officee on the Thames Embank teut, on the nnderstanding that the actions of sideration of the Board on the 30 th inst. The application was granted. As appeare from our application was granted. As appeare from our
list of tenders on the 12 th inst., tendere for con list of tenders on the 12 th inst., tendere for con. called for and eent in.
alled for and eent in.
Levcester. - Tbe clerk read a letter from the Rev, Canon Burfield stating that the contract for the new schoole of St. Mark'e had been taken by Meesrs. Osborne, Brothere; that there would be ccommodation for 485 boys and girls in equal proportions ; and that they would be finished by the end of the present year. Tbe clerk also read the following report from the architects' com mittee: -. Tho architecte' committee have to eport that fourteen tenders were eent in for the rection of the echools in Slater.street, a list Whereof they submit with their report, and the ominittee recommend that the lowest tender,hat of Messrs. Osborne, Brothers,-be accepted by the Board, embject to the Education Depart. ment. The committee also present an elevation which base been prepared hy Mr. Tait for the chool in Elbow-lane, which they recommend to the Board for adoption, Tondere for the school a Slater-street:-

The first part of the report waeadopted; and the latter part was held over, as Mr. Tait'e plans were not then beforo the Board. The scheme anctiogeston hospital schools has rece it the trastees of the hospital are to pap over to the governore of the schools $15,000 \%$., $6,000 \%$. of whicb are to be applied to building boys' and 4,000l. for huilding girls' echools. The boys' chool is to accommodato 300 , and the girls chool about 200 , with a capacity for extension in each case. Adjoining eacb school ie to be a ence for the head-master and mistres The echeme viewed with great diesatisfaction

## HOUSES FOR THE WAGE CLASS.

Srz,-Although a earpenter, I do not say tbero is
nothing like leather. Wood mayy be beat in Norway sweden, Canads, and where a sarplus of slabs from deals, forest thinnings, \&ce, exist; but in this part of Englsand $I$ aling labour, insurance, and repairs into coasiderstion. Like cottages, and other buildings che returns frozo which and be produce
In this reighbourhood (Fulham) and other subarhan districts old brick rubhisb, gronted with Portisnd oement, round brioks, sud hy dranlic lime, wsuld he hetter and
heaper. In other locsitites ironstone, sandstone, gravel
 toar. Eitber of thase materinhs would he incombustihle,
and is not liahlo to rapid decay. They might a Iso he
made ornamental if required; even ivy or other climbor
might met them off.

Honece for the wage ciassee are also worthy of consi
doration. You note some buildings in Germany bn doration. You note some buildings in Germany nno this and other aubnrban districts to build a few hurdre
somi-detached houses, having gardens and room to erec Workshop or plant. houne, that the occupier may amuse
himeelf aftor learing bis daily work instead of spending his time in a tap-room, and teach his childreu to labour or cnltivate a few ho wers ? I think that class of house
would tend to raise the moral standard, and koep it up ia plan now followed by building eight or ten roomed house plan now followed by building eight or ten roomed house
to belet in tenements of one, two, or three rooms each, howercr large the family may bo who ocenpy them
Would it not be preferable for the wage-receiver to pay Wrifle more gronnd-rent, saving by the privacy affordod?
Bolecting this locatity for the cxperiment, the follovin We are close to the District, Metropolitan, Westorn Extension, and North-Westorn lines, giving access to
most parts of the metropolis, Snirey, and other westera Kensington, tho cheap musical experiments at the Royal
Albert Hall, and to Hyde and Batfereea Parks. I think,
 to adhere to the old times, 5.15 and 5.30 e.m.,
be allowed to defer the traiu uatil 6.15 , thereby cansing a loss of some 4s. per week to many working men
The companies recive the proflt arising from friends the artixans travelling, and onght to hear the loss, if thers bility of helping the educational movement.
Wero a co-operative company formed for Wero a co-operative company formed for tho erection

THE
WAY TO THE VIENNA EXHIBITION ?

Srr, -Tho coming Exhibition at Vienma will most pro-
babiy be an straction sufficiently etrong to induce grea numbers of the art-workmen of this country to pay a
visit to the Austrian cepital. I have no doubt eome on of your nnmorous readers, who, from experience, may be
able to afford inforrantion, will kindly tell us the best way to tato the trip, eo that the jouraey may be performed in
the lenst posible time, and aford an opportnnity of manding architectural interest, Personally, being tolerably well acquaintsd with Italy
and Franco, $\frac{1}{\text { should }}$ jike to travel via Germany, in which case I should be glad to know where to make my stopping
places, I am sure that many hundreds of my fellow art laces, and amore that many hundreds of my fellow ar cipation, the kind correspondent who may enighten u
upon this subject,
H, HEMS, Carrer,

## A SMOKY CIIMNET.

Srir, - Can any of yonr correspondents sngesest a remed for an old country fireplaco which smokes continually
with the violent south-west winds i metal hood has boen put on the top of the fue, and closed at nee end,
towards the south-west, but it still smokes. The flueopering is largo at the lower part, and occasions a stron grating orectod over the fireplace into the flue, would
effect a remedy by a current of air passing into the flue
$\qquad$
STORING RAIN-WATER,
Srr, - - should feel greatly obliged if one of yonr correspondents would give me hitchen boiler, baths, and house gonerally with pure, soft
water. As I am about to increase the size of my house, water. AB am sood opportunity for carrying ont some
it would be a goom
arrangement of the hind; but those whom I have consulted on tho subject have not any very satisfactory views for doing so, and my own experimenta with two water-
butts charged with ehiugla and charcoal have all faliled to
Keep the water pure keep the water pure. There must be some way o
eeonomising and storing rain-water for houshold pur
poses, taken from the roof, nad I should bo glad of any informatio $\xlongequal{\quad} \quad \underline{G}$. M.

TRADE SOCIETIES AND THE LAW, Srit, - The late case at Neweastle, in which the Engi-
neere neere Bociety refused to pay a member the boneft for
Fhivh he had for upwards of twenty years subscribed,
will, it is to be hoped, turn the attention of the members of all trade eocieties to the position in which they aro
placed by the law imposed on them by their leadere precoived its main features from the Bill brought in by Mr . Frederick Harrison, and agroed to by a conferenee of
trade delegatos as a deeirable Act. No opposition among the unionists appears to have been given to this proposed
Aot, until it was piaced before a publio meeting at Exeter
Hall, nider the presid the noving of the following Mr. Samuel Morley. From meeting, it appeared that Mr. Harrison's Bill took away
all legai elsim of the members. on these aocieties, resolution proposed in referenoe thereto was,-trade-unions, to be just, should makn any legishation nnione legall
responaible for any assurances made to its members." The meeting lietened very impatisatly to the mover
this, as may be seen from the Zimes report of the pro cois, as may be seen from the Fimeg report of the pro
cence $\begin{aligned} & \text { Howerer, with all their effors, this Bill did } \\ & \text { become law, and the injustice propared to be legalise }\end{aligned}$ Was postponed until 1871 , whea Mropsaed to be legalised Goversment measure, waich eontsind the sume provision
After what is now the "Criminal Lat Amendment Aot
had been soparated from this Bill, the anionists gave
their general aupport to it. But at the trades canference,
called to held at the Sussex Hotel into consideration, which was held at the susser Hotel, Bonveriestreet, E.O., March 1 , attention to the injuatice likely to bo perperated on the
members by the proposed measure, and he proposed the mambers by the proposed measure, and he proposed the anylegislation on trade-unions, to be just, should make such unions legally responsible for any assurance mado
to their members; therofore this meeting must withhold to their mombers; therefore this meating must withhold
ite oupport to tho present Bill, nntil ench timo as that Le oupport to the present Bull, nntil ench timo as tha
portion of clause 5 is erased which would reliove the societies of their legal responasibility in this matter. This met with no support at all. Not anothor single
delegate could be found anpporting the interests of the
members. They were all desirous for protection as far as tho frandulont acts of their treesnrers were concerned; but that the indiridual member ahould be protected隹e manner, was not thought desirable. This was indeed injure the weale.
the Bill, and memorialisod the Howne Secretary on the matter. From their memorial I take the following olenr the position of trade-uaionists under the law. The "To the Home Secre
ensons that could have induced the Goverament the sttempt to place members of such societies outside pale of the law, more especielly when they would in the ame measure provide for the societies being rocognised, ider it nothing but justice that such associations should be protected against the fraudulent; but, surely, it will be the reversso of jugtice if a lile protection is daniod the membera as ngainst the society, and shonld the 5th olanse to mombera in case sny sooiety rcfused to pay any benefft o Which a member may be justly ontitled.
declares the agree with thet portion of the clanse which any agreement for the payment by any person of any subany agreament for the payment by any person of any sub-
soriptiou or ponalty to a trade-union, inasmuch as the
society is fully able to and do society is fully able to, and does, protect itself in this
matter, hy (in onr own sooiety) compeling the members
to to eubseribe twelve months before becoming eligible to pay his sumbecription within a given time, he forfeists every
claim on the society, with all moneys, he may have pre. claim on the
rionsly paid:
"We wonld furthor arge that it is not for the pnblic good that any ansosiation shonld be incorp

This had no effect on the Government. Sir Charles Parliament, wero akked to support the prayer of the ake the matter up; the leadere of the working men must be seen." The Bill became law, and, I believe, the only by Earl Russell. One elause of this petition said,Yonr petitioncrs believe it is not desirable the protec-
tion given to members of societies registered under the
Friendly Sooieties Act Friendly Sooieties Act should be withdrawn, experience
having shown such protection to have been needfui, and hasing shown such protection to have been needful, and
your petitioners are therefore uaable to nee why the
mombers of trade-anions ahonld be denied the same
protection."
Surely the members of these societies will now see to
what a pass their leaders hare brought them. Each memher is eatirely at the mercy of the exeentive of his particular society. His only appeal is to the members, and he must, indeed, have a strong cesse if he is able saeBut have not the publie an interest the members? That there is good in thece sasociations none will hardiy deny, but that good never can be injured hy coming within the lar, or, if so, it is the law that
should be altered. Trade-unions are not infallible. Rat tening is not altogether a thing of the past. Remem-
bering this, ie it wiee snch a power shruld be placed in the hands of these societies that they may have a legal right o withhold a benefit jnatly due to a member, for the and traitor to the freedom of his fellow.man ? Is it wise to refuse protection to those membere (and I believe they
aro the majority) who wish all their actions to be fair and he present Act we learn of the groas injostice at Newcaatle hy the most reapected of the large trade societies. tiee under it he the last; lot it not be a fact that the lisw money under frotects the funds of societences, for such is the casse when promises of benefits are held out to men in return for certain snbecriptions, and when such subberriptions have its engagements.
The members in self.defence should derand an amaondment of the law, and the public should not tolerate a law
under which the Amalgamated Society of Eugieers has refueed its superannuation benefit to a member of twenty. one jears' standing. A momber, let it be remembered, ff, and ie not even given a reason when he seeks redress in an English cour
Worcenter Park, $\qquad$ M. H. J.,

## STEAM TO PUT OUT FIRE,

Sm,-I believe steam wonld be the quickest, easiest, safest, and most effectual agent to extin. guish fires in huildings,-steam from fire-engines other steam boilers near.
Break or disconneot the iron gas-pipe next to the stop-cock (outside all buildings); than clap on the steam. The force wonld instantly bnrst the thin leadon pipes in the interior and fill the house. No fire will stand steam; furthermore bnildings and goods would not he flooded. This could he applied to ships' holds to qnench spon. cool-house, boilers, or otherwise, R. T.

## SHIPS' BOATS.

 Srb, - Wonld it be posoible to lounch bosts more expe-ditionely from ships by having a tauncher on botrd, sneh
as a long narrow plate of iron, with a groove in the is a long arrow plate of iron, with a groove in the with a etrong grapple at one end to be affixed to the part
 board; and this small boat-railroad inclosed with iron hoops, that the boats mipht slide straight down (lite the
skeleton of a half-barrel) ? maygrasp my meaning, and lnow whether the suggestion
ie qnite impracticable.

## POROUS TILE ROOFS

Bir,-Would you or some of your correspondeuts kindy inform me what is the best remedy for tile roofs
that are porous? I find the upper part oo my honse is damp, and have traced the source of it to the tiles being
porous. The lower part is perfcetly dry, as the fonde.

## SANITARY MATTERS

Appointment of Sanitary Oficers.-Dr. Griffiths, Sheffield, has been appointed medical officer of health for the borough of Sheffield, at a salary of 600l. per annum. Ho is required to devote his whole time to the dnties of his office. Mr. H. Allan has been appointed public analyst,
Charles Adderley to amend introduced by Sirpublio Aderloy to amend the law relating to public nealth, proposes to extend the provisions of the Nuisances Remosal Act to unwholesome milk; to add to the definition of the word nuisance" houses withont an adeqnate snpply of wholesome water, any ditch, gatter, cesspool dam, so., in such a condition as to he a nuisance or injurions to health, and any animal kept in such a situation as to ho similarly injurious, The Bill also proposes, among other things, to extend the right of complaint under the abovementioned Act; to oxtend the power given to magistrates to close a house nnfit for habitation to any part of a house or building; to extend tho provisions of the sanitary Act as to honses let in lodginge; to give power to rural sanitary anthorities to mako building by-laws, and to give power to the Local Government Board to make by-laws on the defanlt of the sanitary authority. Ono of the clausos in the Bill pro poses that every sanitary anthority shall from time to time canse tho wator supplied for domestic or drinking purposes to be analysed,

CHORCE-BUILDING NEWS.
Grosmont (Monmouthshire),-The Charch of Et. Nioholas, Grosmont, on the banks of the Monnow, was restored in 1870, but again danger threatens it if means be not at once takon to restore the tower and spire; piers which snp port the tower, bells, and spires are crumbling away from the weight imposed nnon thom About 6002 . have already been subscribed to the fund, and the remainder of the 2,0007 . reqnired for the work will, it is hoped, oasily be ohtained This chnrch possesses one of those altar-stone marked with crosses in the centre and at the angles. The chancel is in perfect repair, bnt th rest of the bnilding is in a lamentahle state, and expense has already been incorred by shoring up the centre portion, 2,000t., according to an estimate mado by Mr. Seddon, the architeot would defray the cost of restoring the tower and spire with the transepts, reseating them, and erecting new frames for the bells, de.; bn should it be reqnired to restore the nave and aisles, mother 2,000. will bo wanted. A meeting on the sabject was recently beld hy the rate payers and tenant farmers, over which Axch deacon Cramley presided, and a resolution was unanimonsly passed to contribute a voluntary rate of not less than 5 per cent. upon the assessed value of the parish; but the parish is an agricultural one.
been held - m meeting of parishioners has purpose of the Kirkey Sohoolroom, for the larging and rebuilding Kirkley Church. The rector presided, and it was nnanimonsly resolved that as the parish of Girkley, with a popula tion of nearly 2,000 sonls, has accommodation for only 220 persons within the walls of the parish church, the enlargement of the chnreh is ahsolutely necessary." The plans were ex plained by Mr. Steward. It was proposed to do only a portion of the enlarcement at one time so as not to provent the services being beld When the entire plan is carrin ont the will be rebnilt and geat 850 pergone Tho expense of the first portion of the or Th was estimated at 500l. The sum in hand and
the promises amontted to 250l. A committet was appointed to carry into effect the wishes of the meeting to enlargo and restore the church.
TVest Clandon.-The parish church has long been in a dilapidated condition, and it is now proposed to restore it. A portion is considered
unsafe, and this part it is intonded to rebuild unsafe, and this part it is intonded to rebuild, and the oxterior of the hnilding will he putinto substantial repair and made to exhibit an appearance more in accordance with its roligions cha.
racter. The interior also requires considerahle racter. The interior also requires considerahle
renovation. It is estimated thot $1,500 \mathrm{l}$. will be renovation. It is estimated that $1,500 l$. will be required to restore tho chnrch entirely, and towards this sum Lady Augusta Leigh has promised 300L, the Viscountess Crabley 200l., Mrs. Onslow (East Clandon Park) 100l., and the Rer.
J. C. Harkness (the rector) 100l. Mrs. Onslow J. C. Harkness (the rector) 100l. Mr
has also promised a memorial window.

Woodley.-Tbe Church of St. John the Evan. gelist, Woodley, has been consecrated. The cdifice has been erected as a chapel of ense to Sonning, and it has heen built and endowed by the late Mr. R. Palmer, of Holme Park, at a cost of $G, 000 \mathrm{l}$. The church is built in the late Early English style, and consists of a chancel, north aisle, organ - chamber, porch, vestry, and parvis. The exterior is waced with tiled, and the turret is furnished with three hells. The front of the churchyard is enclosed with a flint and hriok wall, the remaining sides being guarded with iron fencing. Tho chanoel is separated from the nave with a triplo arch, stone capitals, bands, and hases. The screen wall separating the chancel from the nave is filled in at the base with gilded ironwork and gilded gates. The chancel is paved with Minton tiles, and also the nave and aisle. The orennchamber is separated from the chancel hy an oak park close. The reredos consists of carved panels, the two outer pauels boing filled with green marhle, decorated with gold. The centre panel contains a carved representation of the Crucifixion; the left panel a representation of right panel, a carved representation of Joseph and Nicodemus proceeding to the Cross. The reredos is composed of Caen stone, with English alahaster arceding, supported ou polished red
granite collums, carved Italian alabaster capitals and bases. The super-altar is of Deronshire marble. The east window abovo tho reredos consists of three lights of stained ylass, supplied hy Mr. Hardman, of Birmingham. In the centre light is a representation of the Ascension ; in the left, the Lord's Supper; and in the right, St. John the Evangelist in a trance, beholding the Holy City conning down from God out of heaven (as recorded in the Book of Revelation). In the clancel are the sedilia and tbe credencetable. Tho tracery is filled in with the descend ing Doves, tho Lamh, and the Angels. The
seats in the nave and aisle are of deal, staiued and varnished, and the choir-stalls in the chancel are of oak. The font is composed of Caen stone, are of oak. The font is composed of Caen stone, supported on Forest of Dean columns and base.
The colurnns are filled in with emblems of the Tho columns are filled in with emblems of the
Passion. The cover is made of Riga oak, and is Passion. The cover is made of Riga oak, and is
the work of a young man resident in Sonning. The pulpit is approached by stone steps and an ron handrail. It is composed of Bath stone and Euglish alahaster. The bookhoard is of stone, supported on a column, at the base of which is a carved head of St. John the Erangelist. The roof of the church is open, the prin-
cipal rihs and wind braces heing of oak. In the cipal rihs and wind.braces heing of oak. In the tnrret is machinery for ringing the bells. By means of a wheel, ono person can ring the three hells. This was invented hy Mr. Belcher, of
Sonning. The charch was designed by Mr. II. Sonning. The church was designed by Mr. II. Woodyer, of Graftham, near Guildford. Tbe clerk of the works was Mr. W. Cooper, of
Croydon. Messrs. Wheeler, Brothers, of Reading, were tho contractors for tho masonry; Mr Creen, of Sonning, for the brickwork and plastering; Mr. Brown, of Sonning, the staining and decorating; Mr. Cox, of Sonniug, the carpeatering work. The heating-apparatus has heen supplied by Meesrs. Remmington \& Son, of Shipton, Yorkshire ; and the ironwork hy Messrs. Filmer \& Mason, Guildford.
Bruntingthorpe.-The memorial-stone has been laid of a new charch now in course of erection hy Mr. H. F. Allen, hnilder, Leicester, from drawings, and under the superintendence, of Mr. W. Smith, architect, London. The old charch, having heen for years in a very dilapidater condition, has been pulled down, and the new church will have an additional aisle and chaucel
aisle, which will afford greater accommodation than the old one.
Hatifax.-The erection of a much-needed Church, to be named St. Augustine's, is to he commenced forthwith. A few weeks ago ten-
ders were invited for the erection of the entire building, when it was found that they ranged from 11,0002. to 9,0002 . Under these circum. stances, therefore, it was decided to proceed with the erection of a portion ouly of the building. The church committee have resolved to begin the erection of the nave, aisles, and transepts, leaving the tower and spire and the chancel to a future date. The cost of this portion of tho building will he over 5,000 ., and about 4,0002 , are already promised.
Worting, near Basiagstalce.-During the past twelve rnonths considerahle improvements have been carried out at the Church of St. Thomas of Canterbury, in this parish. It became necessary to take some steps for effec. tually warming both chancel and vestry. Tho insufficien in the north aisio of the charohnefer decided that Mlessrs. Haden's procoss should he employed to remedy the want. Before winter set in, the two stoves had been replaced by an apparatus which, hy means of small hot-air grating in the vestry and chancel, and a larger one in the nave, keeps the whole church at one uniform temperature, which can be raised or lowered at pleasure. The constrnction of the necessary flues and the chamber for the reception of the furnace, involving the under-pinning of three walls, was carried ont by Mr. Whistler, of Sherborne. The organ filled a recess on the north side of the chancel. Its position was mnfortunate, and the construction of the now warming apparatus suggested a more convenient arrangement. Accordingly, tho pit in which the organist used formerly to sit has been hoarded over level with the cbancel floor, and is occupied by tho hellows, so that the choir can now ne disposed north and sonth; and the orran has the adrantare of being raised into a position far more favourable to its sound, and also helter for the choir which it acoompanics. availahle portion of the original organ has bsen worked into the new instrument, and some considerable additions hare becn made. huilders of the organ are Messrg. Wordsworth \& Maskell, of Leeds. The design was hy the Rov. F. H. Sutton, vicar of Theddingworth, who wrote a work upon "Gothic Organs."

## SCHOOL-BUILDING NEWS.

Leighton Buzard.-Tenders for the huilding of the Now British Girls' School, in accordance with the plans and apecifications of the archi. lows Mr. W. C. Reed, bave been sent in as fol. lows - viz., Messrs. Eyre \& Son, Hockliffe, 1,037 l. 12 s.
Guodchild, Croydon, Messrs. Wright, Bros., $953 l$. 5 s. ; Mossrs. H. Ed. Goodchild, Croydon, 953l. 5s.; Mossrs. H. Edwards and C. Gibbous, Eggington and Lcighton Buzzard, 9351. ; Mr. Charles Noom, Eaton Bray,
9062 ; Mr. David Cook, Leighton Buzzard, $852 l$. $906 l . ;$ Mr. David Cook, Leighton Buzzard, $852 l$;
Mr. John Shelton, Newport Pagnell, 7311 . 13 s . Mr. John Shelton, Newport Pagnell, 731l. 13s.
Mr. Shelton's teuder, being tho lowest, was Mr. Shelton's teuder, being tho lowest, was accepted, and a coutract has heen signed, and Angust. Tho contract includes the needful approaches, offices, and drainage, and all joiners' work of pitch pine; hut does not include tho Fas-fittings, desks, and forms, or finniture.
Walsall.-The foundation.stone of new schools in connexion with Centenary Wesleyan Chapel,
Stafford $\cdot$ atreet, has heen laid. The schools have heen built near to the chapel, schools form an addition to tho schools alrendy existing which have been found too small for the requirements of the district. The huilding will be 65 ft . by 30 ft., and will comprise two class-rooms 16 ft . hy 14 ft ., a small room, 10 ft . by 12 ft ., aud also a gallery. The hyilding is 25 ft . high. There will be accommodation for 300 children. Messrs. Loxton Bros. are the architects, and Mr. James Adkins is the huilder. The total cast will he 795 l , includiry the cost of the fittings. Bircle.-The corner-stone of a new day and Snnday school for the parish of Bircle has been laid by the incumbent of the parish church. The huilding will he in the Gothic style. Mr. S. H. Brocklehrist, of Manchester, is the architect, Mr. James Hill, of Bury, is the contractor for the masons' work; and Mr. S. Horrocks, joiner and huilder, has the contract for the woodwork. The schoolroom will he 80 ft . hy 21 ft ., and there addition to the school there will be a teacher's
house, containing three rooms on the ground floor, and five bedrooms. The sito for the new building is situated a short distance from the charch, and has heen presented by the Earl of Derhy. The school and teachcr's house are estimated to cost $1,000 \mathrm{l}$., the money being raised y publio subscriptions, the amount already promised being about 500 l . It is expected that the school will he ready for use about Whitsun. ide next, and will afford accommodation, ac. cordiug to the Government standard, for about 330 scholars.
Dififiell.-The foundation stone of the Sohool Board new schools has beeu laid by tho chairman of the Board in the presenco of a large com. pany. The site is immediately at the outskirts he town. The school will accommodate 2 ' cesid, 200 girls, aud 200 infants, with master's style, with the buildings are in the Lombarcio bands in red stook bricks, withed slated roofe, and
bith the floors are composed of upiight blocks of larch set endwise. Mr. H. J. Paul, of Man. chester, is the architect, and Messrs. Hewson Brothers, Drifficld, the contractors for the worl at the sum of 4,5662 . 6 s . Gd.
Everton (Liverpool). -The foundation.stone of a new mission-room and sclools for the district site of the new building is in Gordonermet Netherfield-road, ahout a distant from the church. The pew building will stand between Gordon-street and Conway-street, one side of it being in Leech Hall-street. It will consist of three stories. The hascment will comprise an infant school, 65 ft . by 28 ft ., with a class.room 30 ft . by 25 ft , and playing-sheds adjoiving. The ground-floor will contain the girls' schoolroom and a large room for "mothers" meetings," and ahove this and extending the whole length of the building will be the boys' school and mission room, the dimensions of which will he alout 81 ft . by 42 ft . In the mission-room accommodation will be provided for aboat 700 adults. The cntrunce to the girls' and infauts' schools will be from Gordon-street, and that to the boys' schools from Lench Hall. street, Accommodation will be provided for about 300 boys, 200 girle, nnd 200 infants. The style of arenitecture wiin be Gothic, of anl
unpretentions character, and the prineipal gahle unpretentions character, and the principal gahlo
will he surmounted by a bell-cote. The cost of whil he surmounted by a bell-cote. The cost of addition to 1,1001 . paid for the land. The architects are Messrs. T. D. Barry \& Sons, and the builder is Mr. Hugh Dyer.
Lutton.-The fonndation.stone of new national schools for the parish of Christ Church has heen laid. The site of the new buildings is in the Buxton-road, an open and healthy situation, and the schools, which are to accommodate 70 boys, frontag of 1 Cb , will, whor orplea, hill a Gotlis of 10 lt . Tho architecture will be Gothic, and the total cost is cstimated at some. thing like 2,8600 . The work will bo carried out
by local tradesmen, the architeots being Messrs. by local tradesmen, the architeots being Messrs.
J. R. \& W. Brown, and tho huilders Messrs Smart, Brothers.

## 

Notes on Church Organs: their Position, and the Mlaterials used
C. K. K. Bisbop.
Tars is a well-written little book, by a writer whose family have for threo generations been honourahly known in connexion with the art of organ. bnilding; and gives, in a concise and readable furm, information and advice as to the plaoing of organs in churches, the hest naterials for pipes, \&.c., which should be usef nl both to architects and to "organ committees." Nearly all that is said bere on the suhject of the posiwill of organs, and some other hints hesides, of the Build in an articte in a former memher the Evilder (Octoher 23, 1869), wader nearly judge, will probahly have to bo repented a good many times before the majority of the architects. concerned in such matters can be persuaded to attend to it. In regard to one question, as to the placing of the organ in cathedrals, we quite agree with the author in thinking that the old central position on ihe choir-screen was a far aro willing to admit. "The partisans of the 'vistn' theory have arrayed themeelves strongly against this position ; hat what lover of architectural effect, who has seen the grandly.ceased
argans at Lübeck and Bruges so placed, has failod to notice bow the effect of distance is improved by the line of vision being thus partially broken?" That this position is hy far the best for the musical effect of the instrument in a cathecral is incontestable; it may be questioned whether it is not also in reality the best for arehitectural effect. Mr. Bisbop is scarcoly as strong aguinst the "organ-chamber" in churches as we could wish; he seems rather bent ou making the best of it, and showing how it way be most satisfactorily constructed; but nothing can make such a position for an organ satisfactory, and the organ-builders ought to
combine against $i t$. We may mention a case which came under our knowledge a few weeks since, when a very eminent German builder wa invited to build an organ for a church in Lanca. shiro, the work of a leading English architect and containing tho usual absurd closet for the organ. The huilder, with equal good sense and spirit, declined the commission altogether ratho than put his instrument in snch a situation and eventnally he carried his point, and was beard with proper offect. We join Mr. Bishop in calling attention to tho advantages which would result if archiceta organ-builder before instead of after commencing For want of forethought, nine-tenths of modern For want of forethought, nine-tenths of modern church-organs are placed where they can neithor
be properly heard nor efficiently looked after. be properly heard nor efficiently looked after.
The hook is illustrated by lithographs various designs and forms of organ-cases, drawn, aud in most cases designed, by Mr. J. Tarror they are sufficiont for tho purpose of illustra tion, but are unfortunately in that hasty scratchy style which is so much in vogue at
present, aud whicl has only the merit of axving present, aud which has only the merit of aaving
a great dcal of trouhle to the draughtsman. The designs are mostly appropriate and in good taste, without displaying any particular novelty or
eftect. Sir G. G. Scott's caso for the organ a effect. Sir G. G. Scott's caso for the organ at
St. Mary's, Nottingham (Plate II.), is very picturesquely grouped, but is done great injustice to in tho drawing

The author would have shown better tasto in omitting the reprint of laudatory articles from the papers on Messrs. Bishop \& Stan's organs, which is tagged on at the end as a kind of advertisement. In other respects the book will on organs.

## VARIORUM.

Tur Gardeners' Chronicle sounds a note of warning to flower buyers, thas:-"Purohasers of cloves, carnations, picotees, or what is offered to
thenr 28 such hy hawkers, should look twice thens 28 such hy hawkers, should look twice dities, as the following incident will show. $A$ conple of smaxt-looking young fellows, carrying large rush baskets, and having no lack of money in their pockets, came to a grower of market things, annually raises a few thousands of eingle cloves from seed. A wide-awake gardencr selects for his seed-stock each year some of tho reproduce others of a like character in consider able proportions, such plants being most eagerly desired hy the hawkers, and are in slang plrase called 'broad-leaved Jacks.' Our brace of amart yonng men purchase from 100 to 200 of having ready some soft hay, bast, and deal labels, they proceed to carefully tie them up into pairs, fury hove on they have an abundance at the ends of their
tongues, not $a$ few having those aristocratic tongues, not a few having those aristocratic
bandles so dear to the dwellers in suburban villas; then, stowing their plants carefully in Fillas; then, stowing their plants carefuly in
their baskets, and throwing tbem orer their shoulders, off they set on their journey, to sell both their camations and those who buy them.' concerning English ironworkers in America:"A fow years ago, the 'president' (or, as we should say, 'chairman') of one of the largest
iron-working companies in the iron-working companies in the United States
came to England. The object of his mission was to get skilled workmen, especially for Bessemer works. This simple fact struck me
as rather remarkahle. In Encland it is common as rather remarkahle. In England it is common enongh for workmen to go on tramp in search of
employment, but it is quite out of the ordiemployment, bat it is quite out of the ordi-
nary course of our expericnce for a rery wealthy and prosperous oompany to send their chairman on a vory expensivo jonruey balf-way round
the world, in order to find workmen. Tbe terms on which he engaged these men were also
remarkable. He engaged them at once, at remarkable. He engaged them at once, at
something like double their English waces, took something like double their English wages, took them across the Atlantic with him at great expense, paying their high wages whilo they were waiting to start and during all their journey. They were ongaged for a period of years. These remarkable facts awakened my curiosity, and led me to make further inquiries respecting tho condition and career of other men in the iron trade who had left South Staffordsbire, Shropshire, \&c., for America, and under similar engagements. These inqniries brought out some very interesting and instrrnctive facts. In all the cases that I conld follow up I loarned that the men,-pnddlers, mill forgemen, \&o.,-fulifilea their ongagoments faithfully, worked through the three or five years term as arranged, bit only a minority of them, in spito of very high were by no means the most intolligont and provident. The majority of the best men and provident. The majority of the best men saved and bent to move farther west, buy some land and become farmers, and thus the costly opera men bad to he repeated." -Readers of the City Press will be glad to hear, with reference to the antiquarian column in this well-conducted paper for so many years contribnted by "Aleph" the late Mr. William Harvey), that arrangement have been made for a succession of "City Scraps," by various writers of known ability. Mr. John Timbs fnrnishes well the first of these.

Ventilation.-To this all-important subject the matter of hospitals Dr. Demarquay bas levoted an interesting chapter in his latest work, Les Amhalances de la Presse." He fixes the nantity of air to be changed at 80 cubie mètro per loonr and per bed. Behind tho latter, and on a level with the floor, the mouth of the evacua tion-slaft should he placed, at the rate of one
for every two beds. The question as to whether for every two beds. The question as to whether
these shafts shonld be ascending or descending is decided in favour of the laiter, beeause in that case they are made in the thickness of the lower walls, which, being stronger, are better
able to bear a diminution of substance than the able to bear a diminution of substance than tbe npper ones, which are thinnor. All these evacuating conduits open into galleries, and chese into a larger one, communicating with the main shaft, where a fire producing the draught is kept up. The average velocity of the latter should not be less than 180 centimètres per socond, and 2 metres at the upper orifice. The main shaft ahould be pro. enable the mar intrusted with the caro of the fire to feed it without having to expose bimsclf to the pestilential eflluvia of the galleries
The Charity Organisation Society Tho fourth annual report of the council of thi society has heon issued in a printed form, at the Contral Office of tho Society, in Bucking. ham. street, Adelphi. "It has long boen evilent," says the report, "that it is not want of money, nor want of relief, which produces so
much distress and pauperism in London; and the nuch distress and pauperism in London; and the Charity Organisation Society was formed not to raise a fresh relief fund, but to attack the cause of want and panperism in a systematic manner To establish inquiry offices, which shall at the same time be hases of charitahle operations, in each of the poor-law divisions of London, t give tbem necessary support and guidanec, and to carry on those rarious functions which it is
found expedient for the council to discharge as found expedient for the council to discharge as the representative of the Society, has required considerable ontlay of labour and money. considerable part of their income has again been derived from the guarantee fund which a small number of noblemen and gentlemen contributed in 1870 to assist them during the three following years. This fund is now nearly exhansed, and public for sufficient means to carry on their work.'

The Castellani Art Collections. - The question must now he decided whether the nation with an additional collection, some of them of higher rank. Pending the decision, the bulk of tbe whole is for the moment placed together in the Britisb Mnseum. Among the bighest examples is the bronze head of, probably, Aphrodite, and nnderstood to have heen found in Thessaly, which has only just been brought to England. This is of heroic size, with the back and crown of the head partly battered in and wrenched away, and with tho eye-sockets empty; but for the rest, presenting a front view quite unimpaired, with nose and mouth perfect and uninjnred. Betweon the two sides of the face there as curious deviation from symmetry of which, have been doe impossible to say whether it will the statue, or to one of those enbtle audacitics of artistic calculation by which the Greek iu. stinct was wont to adjust the proportions of a work for a true effect from its particular point of vios. There are other hronzes in the collection, which have lain longer than this beneath the we of experte and stadent Tewncath the cye oxpormo Horé Thi coloel hed we foud Cirgo. Hore. Nise colsal head of Poman imperion a series of Ronan imperil important ure a youg Augustus, in singular preservation (perbaps the best extant), and a
Tiberias in old ago; besides a Romin sarcophagus, which is not yet in this country. Another sarcophagus, belongiug to the class of terra-cottas, is one of the clief items in the whole collection, and belongs to its newer portion. Its possession would go far to make up for the loss of the Cesnola discoveries. Among the minor terra-cottas are a great many figures of the ordinary ornamental kind found in tomhs, a few lamp-monlds and miscellaneons curiosities, and one unique set of figures of Roman actors, glntton, parasite, and the rest. The vases are numerous, and especially strong in the class of rhytons, or cups moulded in the shape of animals or heads of animals. There remain a variety of carved ivories, aud of carved ambers from Sicily.
Reproduction of Monmments.-The hist of works purchased by the trustees of the National Portrait Gallery include a cast in plaster from Ahbey nart of the monument in Westminster 11. 11. 6d. The above-nanied effigies of the earlier sovereigns, as they aro placed in West. minster Abbes being all in a recumbent posi tion and considerably elovated beyond the reach of the spectator, are almost useless for spccial pnrposes of portraiture. The trastees, thercfore, by permission of tho dean, availod themsclres of a favonrable opportunity, when the statues had been carefully cleaned and freed, for the first time, after the lapse of centurics, from corrosion and the accumnlation of dust, to bave plaster casts taken from them, with grcat care, by D. Brucciani. It is contemplated hy the trustees that the plaster reproductions specifed in the oregoing list shall be oonverted into bronze by Messrs. Aikington's electrotyping process, already applied with complete success to the monumental ef Mary Queen of Scots, described in the pre of Mary Queen of Scots, described in the pre-
vious report of the trustees, under the head of vions report of the
Donations No. 85.
Co-operative Congress at Newcastle. The fifth annual congress of the Co-operative Societies of the United Kingdom was opened at Neweastle-npon.Tyne on Satırday, under the presidency of Mr. Joseph Cowen, jun., who deivered an adiress of some length to a largo audience of delegates and others. A large pubtic meeting was held in the evening inder the presidency of Mr. Joscph Cowen. Mr. T. Fughes, 1.P., moved, and Mr. I.loyd Jones seconded a resolution "That this meeting recognises in co. operation the most effectual meana of permanently raising the coudition of the people"; and Holyoake seconded the motion, "That it is the sseace of co-operatiou to recocmise the richt of labour to a substantial share in the profits which it creates." The resolutions were unanimously

Middlesbrough Exchange. We bear that lower is about to be added to the Middleshrongh Excbange, to make the design of the building complete. Other arrangements, to make it more convenient, are also likely to be carried out.

The Opening of the Spencer Docks in Dublin.-On Mouday the Spencer Docks were opened in Dublin hy the Lord. Lieutenant. These docks have heen carried ont hy and for the Great Midland Railway Company, for the accommo. dation of thcir ontward and inland traffic in connexion with England and lreland, and are capable of accommodating nearly 100 vessels of large tonnage. The npper dock has a spacions quay.wall on its western side, huilt with cut limestone, with a strong concrete backing, running the entire length, ofer $1,700 \mathrm{ft}$., 100 ft . wide on top, with a double line of rails. This wharf is for the convenience of the general public. On the opposite, or eastern side, the quay. wall was constructed by driving long piles, 6 ft. 6 in, helow the hed of the dock, and reaching to the top of the wharf. This quay. wall is also provided with a douhlo line of rails, similar to the other side, and is intonded solely for the traffic of the Midland Great Western Railway Company. A swivel bridge connects tbe two docks.
Curious Relic.-A Findon correspondent of the Sussen Brpress,-Col. Margesson,-sends a sketch of a small cavity formed hy hrick work, fond hy workmen when excarating under the stone floor of the old kitchen at Findon.place, In section it is spade or shovel shaped, point downwards, the upper part helow the level of but in the same plane as tho floor. The lid was broken hy the pickaxe of the workmen; in its centre it has an iron ring attached, very rusty from age. Charcoal and somo ashes filled up the cavity, which also contained two small flat bottles, one larger than the other, botb empty, and without corks. The carity lies in solid chalk, aud cannot have been disturhed for a long period of time. It appeared to have been filled hefore closure full of live coals. No drain of any kind is in the reighhourhood of it.
London Cabmen's Mission-hall. - The fonndation.stono of a new hall at King's.eross, Mr. Arthur Allom, architect, has been laid, ad. joining to the Metropolitan Railway Station, hy Mr. Samuel Morley, M.P., who contrihated 50 L. on the occasion. Many cabmen and their wives also contrihnted, and 100 l . in all were collected. Tbe new hall is to be devoted to preaching, Bihle classes, prayer andtcmperancemeetings, lectures, and a Sunday school. It is estimated that the hall will cost about 1,6002 , and as the work of support, an urgent appeal is made to the henevo. lent for belp. The trcasurer is Mr. W. Percy, of 35 , Euston-road.
London Anthropological Society.-On the 9th inst. the first ordinary general meeting of he London Anthropological Society, whicb was inaugurated last January, was held at the rooms of the Social Science Asbociation, Adam-strect, Adelphi. The president (Dr. R. S. Charnock F.S.A.), in his opening address, spoke at great ength on the objects of this newly.formed society, and what gave rise to its formation, louching on the disputes between the anthropo. logists and the ethnologists. Thanks having been accorded to the president for his address, Inman read a paper "On certain Ancient

The Avonmouth Docks.--It is stated that definite undertaling has been entered into hy a numher of capitalists to provide the money becessary to finisb the Avonmouth Docks. proposition was made to the Nidland and Great Western Companies to contrihute each 25,0007 . towards the work. The companies have, how. ever, receired an intimation that no suhscription rom them will now he neccssary. It is not unlikely, therefore, that the docks for occan steamers on either side of the river may he finished and opened contemporaneously
Manchester Conservative Club.-Mr. Ro. hert Walker has been appointed architect to the Manchester Conservative Cluh. In consequence of notice having been given by the corporation to take part of the site for the purpose of of the building will the bailaing will have to be thoronghly

Sicker Safe" for Exhibition Commi sioners.-lli. J. F. Klwell, of Birmingham, is constructing one of his newly-invented "Sicker" (or sure) saifes, of great strength and size, for he Intcrnational Exhihition Commissioner The safe will be prominently shown in the Exhihition, hut it will not be sent there as "an
exhibit."
"The Bridestones," Pickering. - The singularly placed glacial bouldcre, near Picker. ing, invested with a Draidical reputation, have changed bands. The ostate npon which they stand has just heen sold at Pickering. It con. sisted of 59 acres of cultivated land, and 219 acres of moor, on which stand the Bridestones fringing two of the most romantic valleys of North Yorkshire. The last hid, by Mr. Fro.

## Co-operation in the Building Trade.

 The operatives on strike in the building trade Leamington have ninited to carry out co peration in building, and have issued the prospectus of the Leamington United Trades Building Company, and invite puhlic patronage and support. They state that they are prepared to nudertake every description of building, and to execute work in every branch of the trade, and assert that they have the choice of the most killed artisans in every brancb.Exhibitions.-The private view of the So ciety of Painters in Water Colours, and that of the Institnte of Painters in Water Colours, will private view of the Royal Academy inst. The will he piven on Friday May 2nd the exhi hition heines onened to the pulic on the follow ing Mondary as usual. The Royal Manchester lnstitution Eshisition of TVatcr Culour Drawter will be opened to the public on Monday, April 21.

## Proposed new College at Cambriage.-

 The dcsigns for a new county collego which it is proposed to erect in Cammage, at a cost of 25,000l. or $30,000 \mathrm{l}$, represent an imposing pile of buildings. It is understood that a very eligible property called the Leys, on Trump. ington.road, nearly opposite tbe Botanical Gar. den, recently purchased with a viow of estab. lishing a Wesleyan College, has been secured for the erection of the county college.Testimonial to an Engineer.-Mr. H. W. Davis, C.E., in retiring from the position of ongineer.in.chief to the Great Eastern Railway, to which company ho has been professionally attached for twenty-five years, has been pre. sented with a service of plate by his brother ficers, and apwar 1,00 workmen on the line. Mr. Davis has commenced husiness in the City on his own account as a civil engineer.
The New Organ for Gloucester Cathearal will be placed on the screen. The Dean and Chapter have entrusted the work to Mcssrs. Bryceson \& C .., of London, and the instrament will be specially arranged so as to conduct either choir or дave service.

VOL. XXXI.-No. 1577.

Purchase of Railways by the State.

ECH as has been recently said and written as to the State administration of rail. ways, we question whether the sabject has yet been firmly grasped by tbe small of the back. At all events, there are certain considerations bearing on the oase to which full prominence has been by no means given. And, althougb roflection comes late in tbe day, it may not be without practical value.

No competent person will question the truth of the abstract proposition, that the communications of a country ought to bo under the direct control of the Government. Tbe king's highway is one of the first acquisitions of $a$ nation emerging from barbarism. But this geueration bas witnessed a revolution, more signal than the world has horetofore displayed, in the physical command exarted by man ore nature. It was not accordant with our politioal nstincts to oall upon tbo Government of tbe sountry to experiment on the motive power whioh, more than forty years ago, was so un. expectedly shown to be applicable to locomotion, oy land and by sea. Private onterprise, as in tbe case of tho preceding great invention of tho machinery for textile fahries, seized on the now birth, as the source of private wealth. We are neither lamonting nor admiring the fact,-we only recal it. But when from the condition of experiment the locomotive advanced to that of experience; when it heoame evident to the fore-
seeing that the traffio of tho fnture mast be seeing that the traffio of tho fnture mast be entirely now nature dovolved upon the Govern. ments of the day. It was, unfortunately, ontirely ignored by English, although it was recognised, by foreign, statesmen. After the Liverpool and Manchester Railway had proved what the roads of the future would resemhle, it was blindness the most inoxcusahle to throw the control of those new roads to he the sport of privatel. speculation. It was not needful, in order that tbe nation migbt ultimately derive the fall benofit from the new invention, for tho Government to make the iron highways. Tbe formal asseut of the Legislature was required in each instance. The promoters of a railway were powerless without thoy obtained swecping and summary powers,-powers enabling them to eject any Englislman from his traditional and bereditary castle, if it stood in tho way of tbeir line. For this exceptional legislation something should bave beeu demandod in return
beyond the general tacit engagement, so to lay out a large sum of mouey as (in the expectation of the subscribers) to secure the best return. Such a something was demanded by foreign Governments, but neglected by onr own. Abroad, it took the form of terminable concessions. All the money raised before 1845 for our English railways would have been as freely forthcoming cession in porpetuity, improvidently sanctioned by Parliament.

It may be said that it is of no use to cry orer spilt milk. Had wo been provident, with even the most ordinary foresight, we should by this time have heen half. way advanced towards a natural solution of the railway question. Our grandchildren, at all events, would have seen the Government of the country placed in full control of its internal communiations, and that without being weighted by any increase of the National Debt. It would then have been possible at the same time to incroase the efficiency of tbe service, to diminisb fares and charges, and to ease, both directly and iudirectly, tbe incidence of taxation.
The shoe drawn on by improvident legislation, -by a liberality which seemed eheap, but proves texribly costly,-is now pinching. It pinches in more places than one. But the prescnt notion is, that the original error can bo retrieved hy tbe purchaso of railways by the State.
Let ns see, for a moment, what such a proposal demauds. The railway capital of the country is stated at $553,000,000 \mathrm{t}$. sterling ; the return for which expenditure is a gross aunaal revenue, whicb, for 1871, was bard upon 49 millions of money. It has been attempted to diminish the serions magnitude of these figures by dividing the stook into debenture, preferenco, and ordinary. In face, however, of any transfer to tbe State, such a differonce would vanish. The debentnre-holder who is now content with his mortgage on the line he has seleoted, would only part with that special security on the general security of the publio faith. All the great financial operations of recent times bave recognised the primary importance of simplicity. The various loans obtained by the State aro most manageable, for all parties," when consolidated Tbus we can only regard the State as the pos. sible purchaser of the railways by moans of an inerease of the consolidated deht to the amonit of the displaced oapital.
The present average distribution of interest and dividend on our railways is at the rate of a little moro than 4.6 per cent, on the capital Tbe tendency of пny improvement in the traffic is to increaso the dividend of the original share. holders; the debentnre-holders and preferenco shareholdcrs being fully satisfied (on the ave. rage) already. To capitalise, at 3 per oent., the stock of the railway companies, so as to arrive at a $p a r$ value of 4.6 per cent. would require 846 millions of Cousols, or, in round figures, tho donbling of the National Deht. But the sharebolders would bare their voice in tho matter. They would not assent to a oalculation on so low a basis. The increase would be matter of debate and of coutest; for which our figure of 816 millions would be the starting.point, and the minimum.
To cover the interest on this new deht, the Government would look to the annual intake of 49 millions. But what wonld be the position of the new dopartmont? To say nothing of the enormons and demoralising patronage that would thus be created; to say notbing of the great diffoully of balancing the rival interests of different distriots; of the immense rosponsi bility of deciding on conllicting claims for aecommodation and for extension, of the rise in price that would follow when one great neces. sitous purehaser took the place of numerous competing purchasors in local distriets, let us see what is expected from tho now arrangement. 4. Everything would be expeeted, and that at once. Better scrvice, cheaper service, dearer service; economy and liberality; retrenchment and increased remuneration. All would he demanded together. It would be like the bousehold of serrants counselled by Swift. The public would demand moro numerous trains, better carriages, greater speed, fewer stops, more stopping.places, and lower fares. The railway staff would demaud better pay, certitude of en. gagement, and peusions when past work. The

Post-office would demand mail trains, for whiez it is now too economical to pay. Supposing no disjointment wbatover to ensue,--supposing tho excollence of the management whicb charac. terises the one successful admiuistration con. dncted hy the Government,-the simple routine of the Post.office,-to attach to the rule of the First Commissioner of Railways (and that without any soandal as to accountability),-ats whose cost would all these incompatible reforms bo effected? "We should either lave to listen to one incessant and ever.swelling chorus of discontent, one constaut query, "What are we the better for tbo change?" or people must he satiffied at the expense of the net revenue,that is to say, at tbe cost of the tnepayer.
For these reasons, not to mention others, we decline to admit that the purchase of railmays by the State can rank among the burning questions of the day. Let ns rather direct our atten. tion to such reforms as are possible, to snch im. provements as are only too loudly demanded. We are not yet in a position to donble the National Debt by a stroke of the pen, and to place a patronage to the extent of twenty-five millions a year at the disposal of Her Majesty's ministers; with the sure alternativo of either puhlic dis. content, or incresse of taxation.
We have referred to the question of patronage It is one that is sufficiently grave. In extent it is enormous. The expenditure of our railway companies at the present time amounts to near! y half a million sterling per week. It is steadily on the increase ; and it must contiune to increase as branches and extensions aro carried out, so long as the internal trafio of the country pos. sesses a healthy vitality. This ontlay mainly consists of two items, namely, the payment of
waces and salarics, and the purchase of stores We uither affeot auy extravagant purism, on the snhject of Government patronare, nor assume that all men are rogues, and that all legislation onght to ho framed with a special relation to that ethical view. But, ou the other hand, it is wise to avoid temptation. We are not unaware of tbo peculiar relations which are tbought to exist between the constituencies of the greattowns that depend for their prosperity on the presence of the national arsenals and dockyards, and their Parliamentary representstives. To place the entire railway oxpenditure of the country in the hands of the Administration would be a long step towards making a Government borough of every important railway centre. The number of tho dircct employfs of the State wonld he enormously increased. The advantages to be derived from Government contracts would be extended to every class of supply, and to every class of tradesmen. Wheu we see what an unprecedented amount of pnblic corruption is fostered hy the hyper-free institutions of America, we shall do well to watoh with the utmost jealonsy against anything that may tend to throw a large increase of patronage into the hands of any department of the Administration.
Nor are the questions which continunily press for solution as to the rival interests of different localities, amoug tho least thorny of the consequences that wonld attend on the unification of railway administrative powor. In this respect, at loast, wo now possess many of the advantages of free competition. When two or more companios engage in some ohstinate struggle for traffie, indced, the public, whicb at first seems to be the gainer, proves ultimately to be not only the paymaster, but a heary loser. These con. tests, however, are becoming more and moro things of the past; and the public now, as a rule, aro more likely to suffer by the comhination of different lines tban by their undue competition. But tbe healthy influeuce of competition remains. It is chiefly with regard to the opening up of mining, coal, and metalliferous districts that we now speak. The mine and the railway are integral parts of the same systers.

They are functions of one another. The opening of a new mine, if geology point out that it is likely to be productive, will in many cases be advantageous or otherwise, in proportion to the railway facility given for the sending the produce to market. Nro brauch, no mine. In our present condition, each great railway system is directly interested in encouraging a new inanstry within its district. A new colliery means while to lof down so nuany miles of railway to earn this. The dircetors of lines in Yorkshire will not hesitate to take such a atep, in order to open a new coal district, hecanse a now enter. prise in Wales promises to supply the Loudon market on somewhat more advantageons terms. central control, the principle of extensions would be altogether altered. Local advanta. would always he postpoued to general, or central, advantage. If a particular traffic were found to he the most remunerative, it would bo the inclination, and we may oven say the duty, of the new executive, to enconrage that traffic to the uttermost, and to discourage any competo see how this would tell. For we must assume that the new railway revervment monld assume to do its duty to the compry wond attempt economical and lucrative mauagement of its own special service. On any other supposition, men being what they are in the present year of grace, being what they are in the present year of grace,
confnsion would hecome absolutely rampant. If we fancy the controller of our internal communications attempting to decide, not what was best for railway purposes, but what was hest for fol railway purposes, but what was hest for
general purposes, we should arrive at an industrial Utopia such as has nerer yet been even trial Utopia such as has never yet been even ironically sketched. Just as we see tbat
doctrinneire piews is to educating tho country farmers and other local dignitaries up to the level of discharging tho duties of sanitary authorities has ontirely chocked the progress of sanitary reform, so should we, at any moment, be exposed to the wildest innovations on on system of tratic, for political or quasi-political
purposes. Wo should bo cnlled on to make lines, purposes. Wo should bo cnlled on to make lines, not hecause there was much traffic, but becanse there was none; not becanse there was an industry that needed outlet, but hecause there was an absence of industry, and it was thought that the creation of an outlet would tend to produce an industry. Let no one tell us that this is an imaginary case. It would be impossible for so great a power and patronage as that which would devolve on a Central Railway authority to be disconnected, in the prosent condition of Parliamentary govermment of England, from political and party objects. We know that there are men who entertaiu the most nopractical and Fisionary riews as to tho control of labour and the development of national wealth. It would he a hope more sanguino than any experience warrants us in entertaining to tbink that no suoh rash hand would ever grasp the reins of adminis. tration. The fact that railways would, hy central power, be used for other than railway purposes, is a danger soimminent that it may almost be spoken of as certain. It would not be more inexcusable than the actual fact that anitary measures are nofy regulated on other thau sanitary priaciples.
Then would arise the cquestion,- What is the proper principle on whicb the trafic of the country should be conducted? It must be confessed that this qucstion has, for the last forty years, been altogether unanswered. Strietly speaking, we bave been engaged, during that our experiments laboratory or of the lectureroom. They the been eminently proctical. They have heeu controlled and directed by the growing requirements of tbe country. Commencing with tho least possible deviation from the old habits of the stage-coach and the common carriers' traffic, tbe modifcations demanded by the increasing circulation of passengets and of goods have to of 4 ft . $8 \frac{1}{4}$ in was determined by the gaug expedient of masuring the width hetween the Whecls of a mail coach. When the first aection of the London and Birmingham Railway was opened the passengers were actually hooked as by the old stages,-their names insorihed in a great folio volnme, and the counterfoils torn out and handed to them. Almast the only consciously introduced novelty, in those early days, was, that at the Manchester Station early days, were started by the sigual of a trumpet. That stirring note was soon silenced by the whistle.
now, as long as we go on on the same plan introducing, here and there, improvements which take root and spread only when they prove to be really serviceable, we may get along with some comfort. But the idea of transfering tbe whole control to the State, of centralising tbe administration, is hardly cousistent with this empirical experience. If wo only goon as wo have hitherto done, cui bono the change? The uced of some reform is implied by the very proposal. In what direction is it to he sought? Are we to look upon the national railways as a great source of national revenue, and as a means of lightening taxation? That they might have thus served had we possessed the smallest amount of legisla. tive forethought, we have already shown. But with a large revenue to be provided, how is this to be done? If experiment be made in the way of developing traffic hy lowering fares, we shall entor on a transition period which no prudent minister would dare to face, whatever might be his opinion as to the ultimate result. If we seek to economise, -to restrict the number of trains, and the destructive speed of many of them, anivergnl outcry will ensme. All those experiprovements which are blunders, and general im. bit hy bit, wonld either constant progress, dan hy bit, wonld either be exaggerated to impracticable, by central governmental ad. mpracticalion
It will be
those wer observed that the opinion of all those persons who are most familiar witb the actual conduct of the railway system concurs, more or less fally, with the views which wo have ahove expressed. Nor let it be said that these men are blinded or biassed by self-interest. The contrary is the case. A man who posgesses the ability and experience displayed by some of the chief officers of our great railway systems would be rather the gainer than the loaer by the
transfer of the line to the State. A heapy weight of responsibility, -the responsihility of earning a dividend for clamorous shareholders, would be taken off his shoulders. His social status would be raised lay the acknowledgment of his position as a public offieer. If his actual salary was not increased,-and as to this, the principle of yearly increass would almost certainly be applied,--he would, at least, he sure of a retiring pension. When a man wbo knows what railway management means, and who wonld personally gain hy a change of masters, tells us that a scheme is bad, he is entitled to respectful attention.
Let our readers, then, decline to attribute to the discussion of tho question of tho State pur. chase of railways, as a whole, auy practical value. As to the railways of Ireland wa now express no opinion. Exceptional circumstances part or may not exist, reudering action proper in now retries improper as a whole, the canuot perpetual rights to railway companies, by the prcsent folly of doubling the National Deht, in order to convert private into public property. puhlic Board, and to the arena of politicat obbery, the coutrol of nnmerons and highly organi-ed servicos, that spend among them hal a million sterling per wreek. We canaot chec the wholesome enulation of our different minins and manufacturing districts, by committing th decision of the ereat question of local extension o the sole arbitrament of a tribunal which most sither decide such matters on tho sole gmound of he relative magnitude of the net revenue to be earned, or be guided by theoretio views which may lead to the wildest pranks. That we may do much to improve our railway administration Parliament donbt. That in every fresh Act of State should be borne urge. But it is orly throwing duat in the eyc
 tbe "loggus" question of the purehase of the bines by the State.

Art-Union of Iondon. - The general meeting the memhers will be held in the Royal Adelph Theatre, on Tuesday, April 29th, at half-past eleven, for the purpose of receiving the Council's report, and for the distribution of the amount We shall for the purchase of works of art We shall give a full account of the proceedings, We have done for many years. In fact, a omplete series of the reports annually pre sented to the suhscribers can be foand together
only in our volumes.

MORE OF THE AUTOBIOGRAPHY OF OCTOGENARIAN AROHITEOT.
We have pleasure in noticiug the appearanc of the second rolume of Mr. Taylor's auto hiography. In this section of bis reminisceuce be treats of many of the same Contiventa buildings described in the first volume, which b re-visited in the company of bis third wife, in 185́6. Towards the close of his Jabours b lingers in the wnglisb cathearals, giving par ticulars of eighteen of tbem, most of which hi re-inspected, between 1865 and 1868 , in thi company of bis fonrth wife. A considerabl number of the valuahle illustrations are plater taken from his own hooks, first published mor than hali a century ago. Tho plans, views maps, and details, with whicb he illustrated hi. remarks on Rome and her ancient buildings to the memhers of the Roynl Institute of Britis? Architects, at the commencement of the month are here likewise reproduced. Altogether tho work partakes of the character of a portfolit full of sketcbes, which are occasionally minutely explained, but moro frequently only briefly alluded to in letters which careful friends have preserved for him. The drawings are none the radable because they are more chatty than more laboured pro ductions would be

Only think," he wrote from Pisa to his frient Cresy, who was his partuer in the production $\alpha$ "Medireval Buildings of Pisa," aud "Reviré Arcbitecture of Ttaly," "only think of my aitting down to write you from this dear olo place again! We arrived here yesterday after noon about throe, en route for Leghorn, were we bave taken herths on hoard the Amsterdam for Civita Vecchia. To.morrow, Wednesday, ai for Civita vecchia. To.morrow, Wedneskay, al
fonr, wo so on board. We started at once to the cathedral, to see it before darl after entering were accosted, as usual, by the guardians, to know if we wanted to have the Belle Cose explained. How long have yoz been eustode here?' said I. 'Ahove thirty five years,' said he. 'What is your name?' said I. He saw in a moment,-'Edoardo; the same that it was when I assisted your excelloney in taking the plans, which we prize so much, and of which I have copies at home ;' and calling a youth, de. aired him to go home and fetch the Signor Taylor's works. When they came I found they were copies of our plans, sections, \&e., of nearly all the huildings, engraved bere, with our names and Enclish dimensions attached." Aud, consider. ing that nearly forty years had clapsed hetween he two visits, we cannot blame the octogenarian for recording the recognition
Only in a letter, too, aro we likely to find such amusing gossip as the remarks upon the husts Campana:-"A the collection of the Marquis Campana :-"Among the statues are Seneca, to
the life ; Demosthenes, seated,-the likeness to the standing one at the Vatican stamps it trne; Augnstus Cassar, kpeaking; Sylla, a noble statuo; Vespasian, living; Titus, dumpy, bnt Donaldse; an excellent liseness of our friend Donaldson, Nero, a bust, - seems not so bad as he was ; the Mrses, nine beautiful statues, about 6 ft . high, each most expressively given, and all in excellent preservation; -or as the descriptions of some of the sights, or as some of the soufldential admissions of tricks apon travellers, in the way of extortionate charges.
But to give some idea of the gronnd traversed in this volnme, we must mention that Mr. Taylor jourueyed, in 1850 , first to Genoa, whenec, after a stay of three months, be passed on vid, Veuice, Verona, Vieonza, Mrantua, Modena, and Bologna, to Florence, where be stayed three months. Pisa next attracted kin. Then he made a long stay in Rome. Perugia furnished suffieient attractions to detain him for four months, and then be returned to Rome by Arezzo, Monte Pulciano, Chiusi, Siena, Orvieto, Monte Fiascone, Viterho, and Sutri. After this he saw Siena, Volterra, then Pisa, and Florence gain. In this wide field, of course, he viewed many objects of geumne interest, and of varions departments of art. He gives prominence now to minute details of the Etruscan tombs of the Tarquins and Toluuni, now to tbe architectnral antiquities of Perugia, now to the wedding-ring of the Virgin, or to the painting by St. Lake, or to the pictares of Perugino, and, successively, to other thinge as diverse. In Rome, as woll as

old ground revisited, the newest discoveries are discussed, and tho name of one temple altered to suit the newest lights on the anbject. This Taylor allows must now ho considered to be the Temple of the Dioscuri. As we cannot trace all his movements, wo will follow him first to the tombs of the Tarquins and Volunni, and then glance at the wedding-ring of the Virgin; and at one, at least, of the paintings of Perugino. Cerevetri, the modern representative of the ancient Core, stands on the site of the citadel or keep. "It is," explains Mr. Taylor, " a heterogoneous mass of stuff, heaped on tho soid rock, the houses and walls built up to the edge, with tuffo, which served originally for the walls, now mized in with irregular construction of modern houses, all standing up as a sor Acropolis." In the ancient city is a street of tombs, a mile rock. In this place Mr. Taylor went to work, rock. In this place Mr. Taylor went to work,
taking plans and sections. The tomh of the Takquins is a chamber, ebont 35 ft . squaro, with Twaqnins is a chamber, twont ins in the centre. In the walls are rocesses for the dead. There are numerous inscriptions painted in red and black, among which the name of Tarquin may be counted in thirty. four places. The tomb of the Volunni lies about two miles from Rome. Although one woodeut serves for a delineation of the last restingplace of the Tarquins, there are three plates filled with particulars of this chamber and its contents. These are taken from tho works of Count Giancarlo Concstabile. We aro shown a cell with nine others opening out of it. In one of the smaller cells are several recumbent figures, and in the centre of the ceiling is an enormous gorgon's head. In the central chamber there are other scnlptures, which are also illustrated very carefully. "It must be borne in mind," points out this ardont admirer of Etruscan remains, " that this beautiful sepulchre is wholly cut out of a solid mass of tufo, the sides being elaborately carved, and ceilings recessed in panels, deeply sunk with scuIptured heads of fine workmanship. It is altogether wonderful ! Since this tomh was discovered, in 1810, several others have
The ring shown as tho wedding-ring of the Firgin, in the Cathedral, Perugia, is formed of onyx. And with his mind full of Etruscan pronownced it to be of Etruscan workmanship. The littlo casket in which it is kept is in the form of a small silver and gold temple, in three stories. The ring hangs in the upper story, the sides of The ring hangs in the upper story, the sides of

anthor, with the old experience it fields, the peculiar fact that the labours of his youth were ikely to be "clean forgotten," as the very title new one on Rome was chosen to designate a industry, are not without their claim. Nothing daunted, after fifty years, he is about to hring out a new edition of his work on Rome. The cost of the scaffolding and excavations for the views and measnrements, and of the engravings, entitle it, ho thinks, to further consideration, and he is not without hope of its finding an extended sphere of usefulness. He wishes to contribute to the welfare of his fellows, and to disseminate the information he has acquired will, he helieves be one way of doing so. We heartily wish him success in his undertaking.

FRENCH GALLERY, PALL.MALL.
Taf twentieth annual exhibition of pietures by artists of the Continontal scbools quito satis factorily continues the course of acquaintance that the stay-at-home Londoner has had tho means of acquiring season after season; and, so far as opportunity can assist such knowledge, foreiga art production is nearly as well known, or better, than half a century ago conld be said to be the case in reference to what then constitnted the representation of contemporary English art.

Now all things are changed; and if an illustration of the rapidity and certainty with which supply attends demand were asked for, it might readily bo found in the growth of pictnre-painting as a husiness, and the progress of the desiro to possess specimens of it. A salutary check upon mediocrity and inferiority passing for something of higher wortb is helped very much by the of what the world can provide will have a chance of being recognised everywhere prescntly, and honestly-obtained precedence he amongst the tories of peace.
It mas be taken for granted in the meantime however, that when a lrench pictare is selected to be honoured with even a second medal in the Salon, the right to the distinction would imply unquestionable excelleuco; and M. E. Castres proves this right in the admirable naturalness "TH mpressive scene from the late war"s drama. The Red Closs Ambalance" (11) is an unexag to alleviate the misery of battle's victims, and it will remain one of the mementoes to tell of the trying year for France, 1870; for France will he likely to forget it soon. The cortsge consisting of surgeons and others who ministered the aid of the red cross to the maimed, the sick, and the wounded; 'the very horses as they slowly plod throngh the deep snow, seem conscious alike of their duty and its responsibility; sky aspect, and the monotonous white droariness of llat
country, all help to emphasize the pathos of this very cleverly-described episode. Eren now the peasant's cart that followed the ambulance wagon with a supplemental load of the suffering and the dying, may be carrying roots or seeds that have grown and ripened on the trodden ground; and corn will have waved again over hidden graves, and fresh turf covered some of those who helped to send strong inen to early rest.
Founde Ankers "Swiss Peasants attending (172) have Soldiers of Bourbaki's Division ${ }^{3}$ red cross to he considered earnest in their compassionate care for the wretched fugitives who, ill, desperate, or half dead already from famine, die in but to have asked leave to lie down and will in peace ; hut the kind-bearted country folk that: they hring them warm soup or coffee dress their wounds, and help them to such warmth and comfort as their means will allow, and watch their guests with the quiet inquisitiveness a wish to do the yery best for then they can would engender. Subjects like these require the finest and simplest apprehension of them to avoid, what is 60 wrongly termed, theatrical effectiveness this wrongly termed, most effive wh most effective when actors seem not to be acting
at all. Mr. Irving would not he so likely to be remembered and spoken of time hence as one of the most finished and powerful of actors, did he not make us forget that he is so now.
Souvenirs of was could take no hetter form than such as hrings into the foreground its saddening results; glory and profit enough
accrae to the victor to ealve over to some degree
such sorrow as the price of victory often makes only an unequal share of disaster; and no hetter delineators to point the moral and adorn the tale of such results need be desired than MM. Castres and Anker, who have contributed two of the most remarkable pictuces here, where all are more or less remarkable.
M. R. Wylie's Brittany witch - wife "La Sorcière Bretonne" (18), charming to health a fever-stricken child, is the principal figure in a cleverly-arranged and hrilhantly-lighted composition. Picturesque dresses pleasantly varied by colour and apt character-painting, make this notable work. More sombre and more truth ful-looking, M. Jules Breton's peasants-a young girl knitting, and a life-sized, half-length stady of a man bearing a lighted taper, are conspicuous, as well from the mastery over brush (31, 123). M. W. Bougnereau's "Passing Thoughts (128) illumines one of the sweetest and most interesting of faces; and an exquisitely rendered edition of the volumes of mother's love for her child, "The Sleep of Infancy" (14), shows the extreme care for thorough finish with whioh he idealizes even refined nature. Completeness, and a method of enunciating meaning nongh with what would be shallow sources of it or lesb scientific draught, is the dominant characteristic of a numerous class in the Continental schools; but only the better members of it are best known at the French Gallery.
Judging from the wide field for selection opeu those whose husiness or pleasure it may be to collect pictures for public exhibition or for private enjoyment, it would appear to bo a far sasier matter to succeed in satisfying themselyes or others whom they would satisfy than really is the case, and thouch it would be as ameutable to contemplate that the general excellence pervading the Continental pictnres ow gracing the walls here entailed thrice their number of rejected ones, it would be as silly to class them with average specimens of foreign productions, leaving it to be thought that we had but the sample of a Targe provision English appreciation of what is really admirable nart as in anything else, has its own winning Fay of showing it and securing reciprocity; and whilst good taste is so carefnilly and justly administered to, fow can differ from the wish hat there should not remain one good artist oreign in Britain; and that tbe Continental shools should teach somo of their best learning o our own learners.
It is only now and then that a more directly ttractive French and Belgian exhibition has been offered hy the managers, when some two or hree renowned masterpieces have been inoluded to focus interest ; seldom, if ever, a more arree ble and convincing display of exquisite work manshin-thouch often bestowed in elaborately settirg forth the simplest fact with no object putting aside the opportunity it gives of showing the means that opportanity it gives of sho bhow the means, - than this anniversary of it presents.
M. J. Tissot affords very delightful ovidence proof of how little heyond consammat executive skill and the refinement with which he treats modern custom and costume, is necessary to him for making a picture. Iu "Safe to Fin" (1) a handsome hrunette is improving he aim with the pistol. M. L. Goupil's lady seated at "The Dojenner" (28), with frnit and flowers introduced by MI. Do Noter; "La Blonde en Blen" (84) and "La Gantière" (93), by M. J. E. Saintin; "The Mirror" (189), by M. P. C. Comte ; and "The Pearl Suite" (232), hy M. F. Willems, also owo everything that rocom mends them to the pitch of finish they reach and the absence of common-place valgarity that this particular dependence on mero tation,-only too common with those who are cleverest with it eren- is apt to he attended by when followed aud imitated hy less practised hands, rrided by nono of such innate taste saves it from becoming intolerably amoying or insipid.
M. Meissonier confers as much honour as he takes when he is compared with any of the other beat masters whom he may resemhle in style, and his sketches would intimate that his wonderfully manipulated picture cost him less patient labour and time than mould naturally ho supposed from their thorough perfection. Some half-dozen studies of cavaliers and soldiors buildings and landscape, hotoken this, as cer tainly as in such an example as he contributes rith them to this year's exbibition, "The Traveller" (63). Tho freshness and vitality so
often confined to the first and speediest expres. sion of an artist's conception may be maintained through any amount of that deliherate application to positire truth, and of the technical power to imitate it, common to the performances of nnlike any one else, and always so like himself. If there be fitness in all things, the calm astute. ness of this long-headed, strong-handed tra. veller, who must he moving, even whilst at easy rest, for he tips his chair hack aud sways on his toes, for the sake of short chango from stirmp fatigue,-would make him choice company in a smoking-room ; would he but remove his brown pipe, and, after wetting his lips with the coffee pipe, and, after wetting his lips with the coffee only a tithe of what he knows, He is an omissary of Fonché, perhaps? or a Pollaky of the period? or if only bont on a nission of his own, he is extremely provoking, net to say any more than extremely provoking, not to say any more than that one of tho hest attributes of a pic
entice thought aud invite speculation. * M. Gérôme's

## ON THE CHORCAES OF BRITTANY

 NORTH COAST.ROYAL INSTTTUTE OF BRITISH ARCETTECTS. At the ordinary general meetiug, held on Monday last, a paper on the ahove subject, by
Mr. II. W. Brewer, was read. Mr. Brewer said he Mr. H. W. Brewer, was read, Mr. Brever said he had heen assisted in his task by Mr. Goldie, who had placed at his service his sketches and notes upon the Eame suhjeot. He said he should confine his remarks to a single district, and that was the part of Finisterre round and ahout the ancient episcopal city of St. Pol de Leon : the buildings in that district possessing the peculiarities of Breton architecture more strongly marked than those in any other part of tbe province.
Having first described the ancient charches of Morlaix, he spoke of the domestic architecture of that town, which has fortunately suffered far in the on the ecclesiastical; some of the streets ancicat cabled the Rae dcs Nobles and the Grand Rue. Many of the houses in these streots date from the fifteenth centary, and are wonderfully fine examples of "timber-framed" hnildings of tbat date. The imposts, the corbels supporting are projecting stories, and the harge-boards statuettes of saints and angels, animals, foliage \&c. The hagpipe is a very common device, and is fiequently represented as being plared by animals. The interiors of some of these houses are even more remarkahle than the exteriors. This is ospecially the case with two which be examined. The first is sitnated in tbe "Butchers" Markot," and is used as a haker's sbop. There are a fine large chimney-picce on the ground-floor, and a well-moulded ceiling; nearly all the doors are old, and tbere is a beautifully carved stair. case; the newel is terminated with a statue of St. Michael. Unfortunately the whole is yellow. stands, and the hal in wh fivis starcas and canvas, so that it is imposible to seo the vhole whole $h$ onse is in
 erer, contoins a still mon ho how hall original condition, and have been most carefully preserved. The carving here is really saperh Theserved. The carving here is really snperh timher, about 60 ft . hish, and the piecs covered wout 60 hr . high, and the whole is marked by largo statnes of saints standing under ich canopies. The saints represented aro St. Mrargaret, St. Catherine, St. Barbara, and t. Dominic at the top. The galleries, which re carried along one side of the hall, have their parapets adorned with linen panels, separated symall pinnacled buttresses elaborately carved, and the junctions of the galleries with the stair. case are still further accentuated hy the introaction of small statuettes seated under canopies. The lower portion of this fine work consists of a large cupboard or closet, ormamented with most elahorate tracery panels, and containing within
it a stone lavatory or sink, with a finely-moulded it a stone lavatory or sink, with a finely-moulded ogee canopy over it. A portion of the hall is
screened off with ancient panelling, and serves
the parpose of a kitchen. Tho mantel-piece is the parpose of a kitchen. Tho mantel-piece is
old and ricbly monded. The old benches and a kind of crane for hanging up meat and game kind of crane for hanging up meat and game whole of this hall, and it has a roof supported hy Whole of this hall, and it has a roof supported hy
two arched principals, resting on carred corbels. This This was the most elaborate piece of Gothic domestio work he had ever seen, and it probahly dates from the end of tho fifteenth century.
dean a beautiful dell ahont a mile from the sea. Its church, which attracts a large pilgrimage, takes its name from a finger of St. John the Baptist, preserved over the altar, The brilding is one of great interest and not a little beauty. It consists of a nave and aisles under one external roof, a transept on the south side, a fine tower surmounted by a lead spire, and four pinnacles of the same material, and a very fine Flamboyant porch. Internally, the effect is very fine, from the great height of the nave, which is separated from the aisles hy two arcades of well-moulded arches, resting upon lofty piers, which are alternatcly octagonal quatrefoil in plan. Some of the capitals are moulded, and others carved with good simple sculpture. Ahove the archcs the wall is pcrfectly hlank, and has rather a hald
effect. The roof, however, is remarkahly good it is a Gothic barrel vanlt of wood, supported npon a lichly-carved cornice, with a carved ridge rih, and well-monlded vertical ribs. The tie beams are inserted into the heads of dragons, which project just above the cornice or wall. plate. The whole is docorated in krown, blue, and white. The east window is of six lights, and the upperpart is filled in with a large circle containing tracery forming a star. A heary transome cuts tbe lights just below the springing of the arched heads of the tracery. This is a common feature in Brittany, and to my mind, continzed the writer, a very ugly one, especially when it is used as it is in some of tbe side windows of this cburch, where the tracery above it is arranged so as to accommodate itself to a four-light window; bnt the mallions below the transome only divide the window into three lights: a mors cecentric and hideous notion could not be well conceived When I first saw it, I directly put it down as some buncling piece of restoration of the sercr. teenth or eighteenth oentury; but I found afterwards that it was far from being an nncommon treatment. There is no chancel-arch, but the chancel is marked off from the nare by a rood beam, supporting an ancient rood and attendant figures, and a modem screen abont 8 ft , himh, of very good design, the upper part of which is pierced rith traory on partments, the stalls are also modern but are well carved. The roredos is a work of the latter part of the seventeenth century, and though in the stylo of that period it gires a very ricb appearance to the interior, and is pot without considerable merit in its way. Attached to the second pillar from the west end on either side are larse and very riclly moulded responds which were eridently intended to carry an but it is equally evident that the arch was never constrncted, as these responds stop abruptly at the beight of the capitals, and there are no marks upon the walls to indicate that there has ever been anything above them. At the foot of one of these responds is an ancient stone altar, with three great nooharged shields on the reredos, and the piscina cot into the side of the reredos,-a rery common plan in Britany. It
is a question in my mind whether originally the is a question in my mind to be much larger than at present, and whether this was not intended toserve as a chancel arch. It is trno the cboir, in that case, would have heen very large, fivo bays in depth, and the idea is only tenable upon the sapposition that the church Was commenced upon a large scale, and the original plan ahandoned. The details of these reaponds are remarkably like English Porpendioular work. The lower-
story of the tower is vaulted, and forms a bapstory of the tower is vaulted, and forms a bapcistery, containing a fine double font of rather pecaliar design. There are many old statnes attached to the columas and walls, and the pracice which is so common in maritime parts or France of hanging up little models of ships as votive ollerings, adds greatly to the picturesque effect of this interior. The organ occupies the second arch of the nave on the north side, and has in front of the loft a curious old triptich. The porch is well vaulted, and the inner doorway is subdivided into two ogee.headed opening, with a miche ahove them, whioh containe an ancient wooden statue, and is fnrnished with panelled doors after tbe mauner of a triptich.

The tower is a fue example of Flamboyant work, and is ornamonted with open gallcries marking its various stages; the belfry windows are long and graceful, and the upper story is pierced parapet ; the spire, although of lead, is piecceted all the way up, which is 2 vory crocketed all treatment: An inscription on the porch states that the foundation-stone of this church was laid in the year 1440, and that the charch
was completed and consecrated in 1513 . The was chaty in whioh this interosting church is cometery in whioh this interosting church is situated is one ot the most Stage Jear dn Doigt is composed almost entirely of ancient honses, prohably coeval with the church, and they are most interesting examples of the cottage archi. toctnre of the Middle Ages, and show that, while
noble cathedrals and lordly castles were heing noble cathedrals and lordly castles were heing his suhstantial comfortable cottage; nor are these cottages peculiar to St. Jean du Doigt; they are to be seen in all the villages in this part of Brittany. They are huilt of granite, and generally have small ogee-headed doorways, and square two-light windows, with the heade counded at tho angles, and sometimes pinched rp into a kind of ogee form in the centre; the roofs are high pitched, and composed of solid beams of chesnat: They geem to me to be very euperior to the
Tho Cburch of Laumulr contains a very $\sin$. gular Romanesque crypt, with rude representa. tions of trees or monsters on the columns. The Church of St . Thegonec, a few miles to the east of this, is perhaps the finest example of Breton Renaissance work to be found, aud it stands in a ings. The trinmphal arch hy whioh the cemetery is approached is a most elahorate structure; yis flanked by hige huttrosses, carried np to a great height and termanating in open turrets, covered with domes, which are again sur. domes, the whole terminating in larce stone orbs domes, the whole terminating in large stone orbs and crosses. Between these buttresses is a these are capped with three singular pediments, these are capped with three singular pediments, obelisk surmounted hy a cross. This triumphal arch has on either side of it a large stone stile, arch has on either side of a a large stone stile,
ahout 10 ft . wide, and these are again flanked with ahout 10 ft , wide, and these are again fankod with buttresses similar to those already described.
Close to the buttress on the left hand rises the remarkable gabled apse of the mortuary ohapol, crowned with open pinnacles and a large
domical turret in the centre. It is singular that domical turret in the centre. It is singuar that
although this chapel is a mixture of Gothio and Renaissance work, the tracery of the windows is perfoctly pure Third Pointed work. Behind these rise up the magnificent squaro towor of tbe church, crowned with five domes and a lofty open lantern, and further on still the piorced thirteenth-centrry spire, attached to the west gable of the church. Looking between the great buttress of the triumphal arch and the stiles, one sees the great Calvary in the chnroh. yard, with its three lofty crosses and crowd of attendant figures, the elaborate entrance-poroh, and the remarkahle gahled aisles of the nave. A more extraordinary picture of architectural richness and a more perfect confusion of pioturesque forms it is difficult to imagine than that presented to one's view wheu first coming in sight of this most remarkable ohurch and cemetery. The church itself consists of a nave and aisles, transepts, and an apsidal chancel (the latter is rather an nncommon feature in this
part of Brittany). There is a large and very grand square tower of Renaissance work, with \& porch beneath it, attached to the south aisle, and an old thirteenth or early fonrteonth century tower and spire at the north-west angle of the nave. Intervally tho church contains a finelycarved Renaissance pulpit and three rather etriking roredosos of the same date. In the sacristy is a grand processional cross of the sacristy is a grand processional cross of the
asme style. The following are the dates which I saw upon some portions of the buildings. Tower, 1605 ; Triumphal Arch, 1587; Ossuary, 1677; Calvary, 1610. In a kind of crypt under the chapel in the churchyard, is a finely-carved group of the harial of our Lord, carvod in wood; group of the harial of our Lord, carvod in wood; Both the churoh and the surrounding buildings Both the church and the surrounding buildings
are of granite. Ahout three miles from St. Thegonec is another equally singular church, Thegonec is another equally aingular church,
that of Guimillieu; it is not so large a huilding that of Guimillieu; it is not so large a huiding
as St. Thegonec, but possesses a still more wouas St , Thegonec, but possesses a still more wou-
derful cal wary and essuary. The church itself
has a pretty little early spire of a very common Breton type; it is a singular compromise between a hell gahle and a spire, and is a kind of comhiation of the two. Within the church there is a magnificent Renaissance canopy over the font, and a superh organ of the same date. The calvary dates from the years 1581 and 1588 ; the ossuary hears the date 1648; the porch, which is a very fine one, 1605. The priest at Guimillieu, who is an agreeahlo man, and takes the greatest interest in the archæology of the neighhourhood, told us that some years ago the chnrches in this neighhourhood were fnll of the most beautiful Renaissance furniture and wood carving, and that just before he was appointed to his cure at Guimilliew, the stalls had been remored out of the church, and sold by a kind of local ommission, who are called the "vuardians of the fabrick '" and are appointed by the loverment to tate care of the chnrches. This good curó was only appointed jnst in time to save the font-cover and organ-case sharing the same fate, for they had beon sold to an English gentleman, and it was only by going to Paris and making man, and it was only by going to Paris and making personal ropresentation of thister matter to harity of Pullo W, barity was put a stop to. In a loft in the village this energetic priest discovered a quantity of heantifully-carred panelling, and this he has had placed round the chancel of the church in the place where the stalls originally stood. Several other small works of restoration, or rather conservation, were heing carried out under his direction. I am indebted to the Curé of Gui. milhen for a very valuahle piece of information respocting the numerous fine churches, calvaries, ece., erected in Brittany during the latter part of the sisteenth century, and the first few years of the seventeenth century. It is remarkable to and ecclesiastical buildings of this date, as it was anything but a church-huilding age. Accordng to his information, and also to local tradition, hese buildings were all erected hy a confrater. nity called the "Builders of the House of God," composed of architects, sculptors, and masons, bound by vows of poverty, who went ahout from place to place and erected churches and religious monuments wherever they were required, upon the condition that the inhahitants of the places where they went should supply them with food and clothing, and, certainly, without some aid of this kind, it would have been impossible for the Bretous, who were a very poor people, to have orected such works as the church and trinmphal arch and mortuary chapel at St. Theronec, the church, calyary, and ossuary at Guimilhen, the church, calvary, and ower of Ploucastol-Dowlas the fine spire of the chnrchas at Landivisien, and the porch and spire of the charch at Lam. pant, the church and calvary of Pleyben, and many other monuments of the same date seat. tered all over the country.*

## THE FATAL ACCIDENT SEASON TO

 ARTIZANS.The metropolitan coroners and hospitals are as usual at this season of the year, getting wel emplojed in attending to the cases of fatal accidents to the building olass of operatives; and
last week two occurred to painters of a fearful last wee
Dr. Diplock, the coroner for West Middleses, held one inquest ou the hody of Michael Tombs, house-painter ; and Mat Burney, his mate, thas descrihed the accident to the jury. He said be was at a joh with Tombs at a house, 17, Carlislesquare, cleaning off the old colouring near the drawing-room window, on the first-front floor. His mate was on the halcony, near the bottom of the drawing.room window; the halcony was of compo, ahout 18 in . wide at the top. All at once ho heard a cry of "Oh!" and then hcard a hrush drop. On turning ronnd, to his horror he saw poor Burney hanging inside of the area assistance, and throat, impaled. He ran but his poor mate was then no more. (Witness was here much affected.) He was quite dead. No one sew him fall.

Mr. Fairman said he employed the deceased, and visited him two hours hefore the accident. He was quite sober. He found the ladder down the area. Verdict - stereotyped - Accideutal death.

On the same day, Mr. Humphreys, coroner for the eastern division, held an inquest upon another painter, named Charles Howard, who
lost his life through the falling of a stage in Lillwall Dry Dock.
Frederick Domaine said, ander his supervision a stage was erceted outside a ship that was lying in the dry dock, for the purpose of painting . The rope on which the stage hung was of the nsual size, and what made it break he conla not say, as it was in good condition. He had orected several stages before, and never had an accidont.
John Bradley, painter, said he, with three ther painters, were at work with the deceased when the stage suddenly gave way, and they wore all thrown to the ground, and were all severely injured, He could give no account or the rope hroaking.
Wilham Smith, painter, said he fell at the ame time, and was taken to the hospital. He did not hlame any one for the accident, and could not account for the rope breaking.
Henry Puttick said he was scraping the side of the ship when the stage suddenly gave way. The only reason he could give for the rope breaking was on account of its chafing against the ship's side. Witness was much hurt.
Mr. Garrett, honse surgeon, Londoz Hospital, said the deceased died on the 12th, from fracture of the $\log$ and inflammation cansed by the mjnries

The jury took considerable pains in this investigation, and were a long time before they would give a verdict: they said they conld not helieve that such a piece of rope could break unless there was some defect in it; and at longth bronght in, "That the deceased died from the njuries received, cansed by the falling of a stage by a rope hréaking, but under what cir cumstances the rope broko there was no evidence to prove."

STATE OF FLINT CASTLE.
Texe disgraoeful condition of the fine old min of Flint Castle has been discussed at the local quarter sessions, and there seems a gloam of hope that something will at last bo done to reuder it in a decent condition, and fit for the visits of anticuaries and others who have an interest in reviewing relics of the past. It is proposed to raise a sum of 258l. by public sub. scription to carry ont this object, and we havo no douht that will soon be accomplished. But it monst be horne in mind that the town of Flint will benefit most by the improvements, and we see no reason why its inhahitants should not contribute to the restoration fund. There are plenty of wealthy employers of labour in the neighhonrhood, and they will confer a lasting viding, as is already similarly done in Denbigh viding, as is already similarly done in Denbigh, a suitable recreation-ground within the ruins
Its historical associations, and pleasant situation Its historical associations, and pleasant situation on the hanks of the De0, admiranly adapt the castle for such a purpose. Should the matter be ahle to realise the benefits of the improvements before the summer of 1873 is passed.

## THE RESTORATION OF WORCESTER

 CATHEDRAL.Lord Dundex haring offered to defray the cost of laying the floor of the nave with marble, and to fill the great west window of the nave with stained glass, besides colouring the roof of the choir aisles, the lady-chapol, and chancel transepts, considerahle progress has heeu made with tbe work. According to local authorities, about one half of the flooring of the nave has already been laid with Sicilian white and Kilkenny blnok marble, in squares ranged in panels, and joined by Parian cement. The painted west frindow is in the hands of Messrs. Hardman, of Birmingham; and the same artists are employed in decorating the roof of the ady-chapel, the transepts, and chour aisles. The lady-chapel roof had heen but meanly coloured, only the tops and bottoms of the spandrels having been coloured, leaving the centre parts plain. That work is heing replaced by richer colouring of a similar character to the colouring of the choir and chancel. The bare stone roof of the lady-chapel transept has been covered with plaster, and is being coloured to harmonise with the colouring of tho choir and chancel roof. The roof of the aisles of the choir and that of St. John's Chapel on the soutb side aro also plastered reaty for similar decorations. The descent from the north aisle of the choir to the ladj-chapel has been put back westwards
about 3 ft ; a new flight of stone steps has heen built, and new light iron gates have heen erected there. The same alteration will be made in the southern entrance to the lady-chapel, hat that part of the work is for the present postponed. The choir aisles are being laid with alternate squares of slate and Hopton-wood stone. Con. siderable progress has heen made in the carved oak case of the organ, which occapies two bays on the north side of the choir. The carrings are by Messrs. Farmer \& Brindley, of Lambeth, the design is by Sir Gilbert Scott, and the in. strument itself is by Hill, of London, who are now putting it in place.
In the choir itself little remains to be done the restoration of the tomb of King John and Prince Arthur's Chapel has been completod by workmen sent down by the Government for that purpose. The chapel of Princo Arthur, beyond untouched. The oak entrance-door of the chapel untouched. The oak entrauce-door of the chapel which formerly obscored the car vings.
Which formerly obscared the car vings.
discovery was made stone pulpit in the choir a discovery was made. In the pulpit as it lately appeared, there were emblems on three of the panels of three of the Evangelists-Matthew, ing. In toline, but that of sl. John was missing. In taking down the structure, the fourth, luat of St. John, was found partly hidden by remodelled pulpit now being erented remodelled pulpit now being erected. cloisters, which appeared very plain before they were taken in hand by tho restorer, have been much altered. The stone carrings in the roof (which had heen plastered over) have all been restored, the walls scraped, and the worn stone of sedilia and lavatory replaced. It was stated to be complcted by Whitsuntide, hut changes since decided upon have rendered this im. possible.

## LAYING OUT OK CITIES

Sir,-We obscrve in your number for the 12th of April, a report of a paper read hy Mr. J. B. Waring, at a recent meeting of the Institute, "On the laying out of Cities," and which contains a statement that we are ohliged to notice. Mr. Waring is quoted as saying that after considering on what was the best principle of planning oities, "that principle I found in the epider's weh, especially in the web of the geometrical spider, in which the quickest way of reaching the centre from any given point is Clearly obtained.
To this principle we can have no objection; in fact, it meets with our cordial approval, and we cau inform Mr. Waring where he "found" it, namely, in the pages of the Builder of the 15 th of Septcmber, 1860 . If he will kindly refer to that publication, he will there recogniso full statement of the nature and advantages of the apider's wob system, the sole drawhack being that the article setting them forth hears the imitials of so obscure a name as our own. Can any good come out of Galilee? Our article
was reproduced in the Estates Gazette, short was reproduced in the Estates Cazette, shorlly after the date last quoted, and was also referred to in the Family Herald. We will do Mr.
Waring the justice to say he may not recollect Waring the justice to say ho may not recollect
these points, but such are the facts notwith these points, but such are the facts notwith-
standing; and we rely on the impartiality of the Builder for allowing ns to mention them.
The only circumstance in which we differ from Mr. Waring is, as to the detail, where he speaks of his main plan, consisting of concentric our artiole that the circumscribing lin out in not circles that the circumscribing lines wis

The circle is polygons strictly speaking.
was shedl is beautifal in buildings, bnt as columps, it is highly inconvenient for interiour scarce a room in the house heing squared where the street is in a crescent, circos, quadrant, \&ce Any one looking carefuly at a perfect spider's Web, will see that there is no circle in it ; the lines are all straight, though many of them arranged in a form approaching the circular.

> H, \& R. Powell,

St. Giles's Church, Reading.-The spire of this church is beine raised 100 ft and the work is progressing. In the original plan it was contemplated to make it 150 ft pian it it will now exceed 200 ft . When finished it will

## SIR WILLIAM TITE, M.P., C.B.,

 F.R.S.We restrict ourselves at this moment to mentioning, with sincere expressions of deep regret, the death of Sir William Tite, which took place at Torquay on Sunday evening last. The remains of our lamented colleague will be interred at Norwood Cometery on this, Saturday, April 26th.

INAUGURATION OF THE SCHOOLS OF SCIENCE AND ART, GLOUCESTER.
The new County Museum and Schools of Scienco and Art at Gloucester, a view and plan of which were given in the Builder of 1871 , pp. 466-67, have been inauguratcd hy Earl conmeittee entertained the Lord-Lieutenant the dinner, at the Bell Hotel. With the ceremony an exhibition ${ }^{\text {a }}$ we of opening loan collection of pictures woter color dable ings, curiosities, china, antiquities, \&c. (contributed by the South Kensington Museum and local possessors), students' works, scientifio apparatus, \&c., was commenced at the building. In the evening a grand conversazione at the Shire-hall followed.
The cost of the building has been $5,000 \mathrm{l}$, and tion of which the proceed, towards the liquida. tion of which the proceeds of the conversazione The style of the devoted.
Thirteenth centary on edifice is Gothic of the are are provided for the curator, hat and cloak and collo and cellars. The ground-tloor consists of a general entrance, with carred work, an enclosed porch, a hall, and staircase. Entered from the nall, on the let-hand side is the museum and himrary, a room 60 ft . long by 20 ft . wide, and 16 ft . high. Immediately facing the main cntrance is the door leading to the lecture theatre, a room 28 ft . by $26 \mathrm{ft}$. , and 17 ft .
high. This is to be used in common science and art studente; it is fitted with benches, and has separate entrances for each department. The remainder of the accommodation on this Hoor is devoted exclusively the uses of the Scienco School, and comprises a class-room, 19 ft. 8 in. by 21 ft., a mastor's and preparation room, and a lahoratory, 21. ft. by 21 ft , with an open-timbered roof. There is also a separate entrance porch, with cloak-room, lavatories, \&c., appropriated exclusively to the nse of the science students. The laboratory is a low huilding on the north side of the main block. It is placed as near as may he to the other rooms connectod with the Science School.
By means of tho stairease from the hall the rooms on the first floor are approached. The whole of these are devoted to the use of the school of Art. They consist of an elementary room, 34 ft .3 in . by 20 ft ., and a modelling.room 18 ft . hy 12 ft ., each 20 ft . high to the collar heams of the roof; a large painting and ad. vanced class room, 60 ft . by 20 ft . and 22 ft .6 in . high to the apex of the open roof; and a master's room, 20 ft . hy 12 ft . There aro also cloak-rooms, lavatories, \&c., for the ise of tho lady students. The roof of the large painting-room twas suggested by the architects in order to ohtain a perfectily on interrupted light, free from impediments which cast shadows, to the great discomfort of the tudents. The building has been fitted with the varming and ventilating apparatus of Messrs Haden, of Trowbridge. The huilding is erected ftone of the district, lined with brick with Bath stone dressings. The roofs are corered with Broseley tiles, and the timhers on the inside where visible, are stained and varnished. At window of the staircese is a Munich glass executed by Chevalier Max Ainmiller was intendent of the Royal Glass under the direction of Mr. Nihlett armich Eerbert Eaines thus describes it in "is "Guiz to the Cathedral Cluych of Gloncester"" Guide 1. Arms of D. J. Niblett (Drake on an escut. cheon of pretence). 2 and 3. Arms of R, and Stock and Handford. 5 . Arm. Niblett, imp. (Whitcombe on an escutcheon of J. Nibleti

## ARCHITECTURAL ART CLASSES.

Berore the meeting of the Architectural Association, held at 9, Conduit-street on the 16 th inst., award was made as follows of the prizes offered to students in the classes held last year, at the Arelitectural Museum:-
For studies in life class, offered by the Royal Institute of British Architects, to Mr. J. Wager, Mr. W. Name honourably mentioned.
For studies from the antique, offered by the Architectural Association, to M1. W. R. Mallett. For studies in the ornament class, offered by the Architectural Association,-prize to Mr.
W. J. Cudworth. Honourable mention made of Mr. C. R. Pink.
All the successful students are members of the Association, and wero applauded as they came forward to receive their prizes.
We regret to say, that all efforts to maintain for the future these classes, from which great things were at one time cxpected, may now bo considered abaudoned.

## THE DUC PRIZE FOR ARCHITECTURE,

 PARIS.The hiennial prize,-1602,-founded hy M Due, to encourage les hautes études d'architec ture, this year attracted but two competitore, M. Train, the city architect, and M. Lauwrence Chapron. M. Train suhmitted all his drawing and details of Chaptal College, and to him the prize has been awarded. Dissatisfaction is expressed at tho shortness of the time,-only a few hours, -during which the works of the com.
petitors were open to the puhtic. The terms of petitors were open to the puhlic. The
the programme are singularly vaguc.

## THE NEW BOARD SCHOOLS, WOLVER.

 MAMPTON.Two new Board Schools-one on the Dudleyroad, and the other in Redcross-street,-have been completed. The buildings are light and The Dudley-road Schools were the firy school. menced. They are situated on the nirst conk having a frontage to the Dudley-road of 156 ft ., the total area consisting of 2,420 square yards, the accommodation heing for 200 infants, 200 girls, and 200 boys, though at 8 ft . superficial for each child the total accommodation would be 630. The boys' and girls' school-rooms, each 15 ft . hy 20 ft ., have each two class-rooms, 18 ft . by with ; the infant school-room is 48 ft . by 24 ft ., fin a class-room 2. N. oy 10 . For each class of children here is proyide a lavatory. The play-grounds are walcd in, and the necessary Redcross. street a convenjent character.
hedcross.street Schools are erected on a site having a frontage of 114 ft . to Redeross-street, dren will accommodate an equal number of chit. ren to those of Dudley-road. Owing to the narrower width of frontage a different arrangement of plan from Dndey-road schools was ecossary, hat the rooms correspond in dimensions, and there is a similar arrangement of lavatories for each class; the play-grounds nad The style of arghimilar.
The style of architesture is simple. The walls are of brick, the roof tiled, with floors to school and class-rooms of wood.
The contract for Dudley-rood schools was taken by Mr. Horsman, of Wolverhampton; Mr. Clark, of the same town, being the contractor for Red. cross-street schools. The architects are Messrs, Bidlake \& Fleeming, of Wolverhampton.

The Professorship of Anatomy, Royal Academy.-Amongst the candidates for the vacant chair in the Royal Academy is Dr. John Marshall, F.R.S. From his acqnaintance with both art and science, he is particularly well qualified to teaoh anatomy to artiats, as his lectures at South Kensington will attest.

## ON THE ART OF "SGRAFEITO" DEOORATION. <br> ROYAL INSTITUTE OF BRITISH ARCHITECTS.

 Is the courso of the discussion which ensued after the reading of Mr. Alan S. Cole's paper, 㭗Sir M. Digby Wyatt, Fellow, Sir M. Digby Wyatt, Fellow, said:-When the
student examines the condition of what remains student examines the condition of what remains
of sgraffito in Italy, he cannot bnt feel that a of sgraffito in Italy, he cannot bnt feel that a
great deal of the evidence of durability he may great deal of the evidence of durability he may
encounter must have been due, in the first place, to a climate of peculiar dryness, and in the second, to the excellent quality of the lime habitnally used. Mr. Cockerell appenrs to have hit exactly upon the best kind of lime, and, indeed, of mortar, to nse in connexion with this sort of work. His employment of marhle.dust especially corresponded with the best traditions of Vitruvius and Alberti for finishing off the "setting" coat. He was also right, I conceive, not to make the floated" coat, which comes hlack. The Florentine "日graffitisti" made it of groy (not black) by mixing it with straw or burnt wood; and by using only a thin coat of white, through which they scratched their drawing, they got a half-tint, heightened by white. To intensify the chiaroscuro, and to get where the point of the scratcher had already removed the white. By this moans they get a removed the white. By this moans they ret a
style of treatment something like that of the style of treatment something like that of the
noble wood engravings of the period of the sixteenth century, such as some of those of Ugo dixteenth Centui, Titian, Andreani, \&c. Thus they employed three tints, and obtained a rotundity and ployed three
softness which give a very beantiful effect to
their work, and is a little wanting in some of their work, and is a little wanting in some of
the specimens to be seen at South Kensington. the specimens to be seen at South Kensington.
An active revival of cinque-cento "sgraftito" An active revival of cinque-cento "sgratito"
took place in Italy, dating from about five-andtwenty years ago. I regret, however, that most of the earliest specimens of this kind of revived
work in that country have suddenly failed. I work in that country have suddenly failed. I
observed some very good attempts in Florence in 1859 , particularly those specimens in the street leading to the Baptistery, which were nearly opposite the Or-San. Miohele, where they
at that time stood well ; but on looking at them at that time stood well; but on looking at them
again last autumn I found that there and elseagain last autumn I found that there and elsewhere many had nearly disappeared. I do not tion in the working of tho modern as compared with the old process, but I attributed it mainly to imperfection in the lime used to give the white, which was neither as white nor as hard as that of the older specimens of cinque-cento work. artists, referred to briefly hy Mr. Alan Cole, and in detail by Vasari, Morto da Feltro, and Andrea di Cosimo dei Feltrini. The first of these was a contemporary of Pinturicchio's, and the earliest
painter who devotedly studied the "grotesqne." painter who devotedly studied the "grotesqne."
Having drawn all the classical "grotte" at Rome, he went to Naples, where he worked Rome, he went to Naples, where he worked
eqnally carefully at Baïa, Pozzuoli, \&o. In fact, eqnally carefully at Baia, Pozzuoli, do. In fact,
hestudied from top to bottom the whole system of ancient stucco work, and the composition of painting and ornament, in connexion with stucco
work. In the course of his investigations, Morto da Feltro must have found that the ancients
dations hahitmally scratched and scraped their plastering free-handedly, much after the process of what remains in the haths and other parts of
Pompeii, the Villa of Hadrian, \&o. In such free-hand works the Romans often got curious results analogous to sgraffito, but in one tint; and by running floating colours and wiping them off, they rnhhed in dark and tints into the lines
they sketched, and the surfaces they "sank." they sketched, and the surfaces they "sank."
I have no doubt that Morto da Feltro in his investigations had picked up some such process of executing white ornaments upon a coloured gronnd) analogous to the frequent cutting away by the ancients of snperimposed layers of contrasting colours in glass working and cntting, as
in the Auldjo and Portland vases, to form "camei"), as it is certain that the ancients sketched in plaster work, and then introduced different colours and probably different coloured plasters, rescraping and scratehing both plastic and hardened plaster so as to approximate to such knowledge, no doubt, Morto da Feltro picked up in the course of his studies in Rome and
Naples. Vasari does not positively state that he lept the secret to himself, after he got back to Rome, although he passes under silence tho anthorship of some few peculiarly early relics

[^4]of cinquo-cento sgraffito which remained thero not far from the Massimi Palace thirty year Morto suhsequently went to Florence and sought to improve himself in fignre-painting profiting by stndy of the famons competition between Leonardo da Vinci and Michelangelo Which attracted artists from all parts of Italy. Being a stranger there himself, he sought naturally such of his own "paesani" as had come to Florence from Feltro, that being district of tho Venetian Repuhlic which had acquired some little distinction in art. Amongst these Feltrine was one Andrea, who placed him. self as a pupil with Cosimo Roselli, a, painter of moderate merit in Florence, in order to learn to paint as a figure-painter. When Andrea, Vasari tells us, found that his countryman had come to Florence, he received him very kindly, took him ratitude for the there is no doubt that, in the fact of Andrea's obtaining eceped, and for him under the Signora Morto, taurht Andren art and mystery of imitating ancient decea the and stuceo work in different ways, and execution ornamental arow in so fully qualified himself. I think I am justified in saying, from Vasari's text, that Morto was the of actor, the use of sgraffito. There is no doubt that Morto picked in the process from his close stndy of the antique in Rome; and there seems equally little doubt of the training he it to fall perfection hy means of the training he got under Morto (who himself urned soldier), while practising the art of arabesque painting. Vasari distinctly tells us that Andrea for a time gave himself up alnost dar meincipio" sgraftito," which he,-"comincio a use for decorating, "began to begin," to se for decorating the façade of palaces and hat bnildings at Florence. His first work was his second, that of the Laufredinj, on the Santi; Arno; his of the Lanfredini, on the Alre Sertini, in the Piazza Padella. Of three interesting drawings by the laand of Andrea preserved in the Uffizii, I am happy to be ahle to produce copies of two, of especial interest to us, as con. fidently believed to have heen made by the man who was the very originator of this process, in, ask youte, its extended application. recognise, on comparing carefully, and yon wil several others by later men of the greatest merit,-such as Giovanni da Udine, Porino del Vaga, \&c., which for outline and the spirit in which they are designed are of the first order of art, —that Andrea dei Feltrini's skill was at least equal to theirs. Though there rabespe of knowledgo of nature in the will find more command over antique style in the "grotesque" of Andrea, and a spirit of free grotesque" of Andrea, and a spirit of free
conventional design, which has not been excelled by that shown by any other artist of his time After the example set hy Andrea, "scraffito" After the example set hy Andrea, "sgraffito" ther cities than Florence, where examples of heir works may forence, where examples of near the cathedral, there is a large palace, severed with splendid designs attribnted to Inlio Romano. In 1845 I went to that town, in company with a French artist, specially sent by the editor of the Magasin Pittoresque, to make drawings of the words executed in sgraffito "hy Inlio Romano," on this very palace, which affords the largest and finest examples of the process I have seen. There is but little of the old work now to be seen in Florence or Rome, but much of modern, npon a great scale, in different Italian citics. The oinque-oento revival did not ast long; but as what was done was almost all of an early period, all the specimens of it I have cver seen are artistic; and I have never seen an inerior design executed in any good period of graffito. It was mainly ruined hy the great could be for a time imitated by perishahle paint In fact, the Italians secm to pere foll upon the "Shihboleth" of Mr. Moody. His exper ments are of nuquestionable interest and importance not only for their artistic merit $\mathbf{i m}$ one can question that any process of a perma. nent nature which enriches our vocabnlary of art may enable us to speak to posterity in better langnage than we habitually use. "Sgraffito" langnage than we habitually use. "Sgraffo"
may load us to enrich arohitecture with more raceful forms than are as yet common in this country, becallse the facilities of the process are sucl that they help to engender a bold and free style of mural decoration. There is especial
interest in this technical accessory to the archi-
tect, as forming a judicious combination with his simply formative or constructional architecture. One cannot bat observe, in some of the drawings Mr. Cole has been so good as to exbibit, that association of pictorial ant with architecture, which the medium of a facile decorated process beautiful ardity wanting to the full snccess of is a process which opens itself now easily to onv. hational practice, and I hail with satisfaction the fair success and the noble acale on which these experiments have been tried, I may almost say, for our special henefit as architects, at South Kensington.
Mr. Gambier Paxiy...I am afraid I shall he repeating myself if I say that art is in itself as inexliaustible as the alphahet; and I conceive such on idea as that will not only apply to it generally, but specially. There is in every phase anstione an utter inexhanstibleness of expression. Mr. Cole has has said his remarks, very much to material : he has said very little about the development of the art. It was crident that Sir Digby Wyatt had the extreme diffionlty to contend against, viz., the excess of his information, and that he wanted to say a great deal more than he did; but there no time this evening to open this subject with advantage to its fnll extent. I will, however, venture to offer a slight sketch as it occurs my mind now, although i came here monprepared to do so, and rather to learn than to teach. If we consider what this sgraffito work is, we must see it applies to more than the South Kensington of the future. It is a work capable of being developed in every possible style; and I venture to sugrest, if pon look npen art even from its earliest days till now, yon will see that sgraffito work is an element which has intraded into it in all directions whel has has been 80 in all the best periods and that arts where desion has best periods of the rather from architeotural received its impulse tion. While the spirit of than pictorial inspira you feel respect for it, man is self restrained, in its bosef liberty, and you conld not do its boastrubery; and thus the old idea of it is in all hreeding contempt is true in axt, as more ather matcers. There can be nothing look severe than outline iliastration. If yon all thosestyles and ohjects of art which receis, in all thosestyles and ohjects of art which received their original inspiration from architecturesacli as Greek, Gothic, or Roman ornamentation, - that there has been, in their best periods, an attention to completeness, fonnded on construction 4, a characteristic totally distinct from the modern libertinism of picturesqneness or the sensuous ideal of beauty. If you take the best period of art of almost any place or period, such as is illustrated by the vases and wall paintings of Athens, Pompei, or Herculaneum, or even times and conntries far more distant, you find 8graffito work in perfection; and nearer to our own date you find that Byzantine and Gothic paintings were essentially things of outline, with colour put in to fill $n p$ the spaces. Then, again, f you look to the different arts of enamel paint ing, especially that of translucent enamel, done apon silver, you find the basis of the desion to be essentially scraffito work. So it is also fom the prohistoric scratching of the forms of ex tinct animals on bones to the hacks of classic mirrors, and that refined kind of art upon "Henri Deux" ware and painted glass, tho Hencip glass, tho principle of sgramto rules supreme, and the ouls or orental ornamentation on metals owes whatever period you find that the simplicity of studied outline gives a dignity to art, which at once makes you respect and admire it Now, what is sgraffito? It is simply a method of expressing an idea by abstract form. You have oonndless materials at disposal, and you can use colonr if yon will; thus we see how wide all the opportunities in art for doing what we want to raise the ideas and command the feelings of the people. When Mr. Cole went into the subject: of sgxaffito as a cheap ornament, I congratulated myself that we were going to ohtain a thing that was cheap, which would not end hy being worth. ess. And so it has proved to be. He has given us that illustiation of a house front which might he a house out of a street where I had the misfortane to live Harley.street, ahout which, I helieve, one of our members aas said, All things have an end; happily, even Harley-street." I confess, if it had been ornamented with this cheap sgraffito the end might not have been so immediately desired; but I do not myself go in for what is
cheap. I think the skotch I suggested of all these different processes and materials and means of prodncing these outline effects, shows how we may produce the highest effects of art say it is essentially the rido ; architectural mode of surface decoration, and I say so not only in reference to the remarks this evening or to tho specimens hefore you, hat on a general principle, because it is, more thau any other style of art that can be conceived, essentially conventional. There is no sach thing as outline in nature, and art is not necessarily the copy of nature, but rather the expression of ideas. forms of art expressed by outline are of neces sity more conventional than any other, and tho harmonious application of it to architecture is perfectly harmonions, hecauso architectnre is the most completely conceived by man.

Mr, Henry Cole, C.B.
Mr, Honry Cole, C.B., said :-With reference to the durability of this particular kind of procoss, I may state that it has been tried at Ken. sington Museum for fifteen years. Mr. Sheep shanks made it a condition that we should have a suitable bailding to hold his pictures, and hefore he gave up his pictures. A huilding hefore he gave up his pictures A huilding affair at the time. Upon the outside of these walls in 1858.9, some crude experiments were tried of this sgraffito. I had seen in Italy some of the buildinge Sir Dighy Wyatt has spoken of and I was struck with the faciliuy of this process, and Mr. MecCallum, now celehrated for his landscapes, made the designs for the Sheep. shanks Gallery. Although I did not go through the train of idees - or if I did I was not conscious of it-which Mr. Gamhier Parry has expressed, and in which I concur, ggraffito certainly did strike me that it was a mothod which might make our houses a little less nusightly than wo find them generally. Like Mr. Gambier Porry, I hate thinge chenp. You cannot have a good thing without its costing a good deal of money In this conrutry there is a great tendency in all wo do to insist apon cheapness as a first condition. We do not say, "Let us have a good thing, or the best thing, and let us pay for it like gentlemen," but we ont the work down, and it mnst not cost ahove a certain sam. We do that in this country too mneh, and we shall no doubt continne to do so till we get wiser. If a public building is to he execnted, you begin with a preliminary dictum that, whatever tho cost only a certain sum of money. The country, through Parliament, pledges itself that it shall cost only a certain sam. We do not hegin by saying it shall be good, and cost a reasonable sum, but that it is to come down to a certain contract price, and people think they can keop to it. My experience is that thoy cannot. We have plenty of cases in which Parliament makes a contract, and another hreaks it. It must be not the contract fulfilled fire yearg afterivards hate cheapness as cherpnese, and never take it as a first consideration for onything I am responsible for. As far as my lights go adro responsible for. As far as my lights go, I advocabe havin the process is one comparatively cheap in material, and one that woald rather commend itself to enterprising huilders who want to make fifteen or twenty per cent. on huilding houses. Of conres, as long as the State does not huild honses, and as long as the individual builds his own house, and is only controlled by soune kind of municipal and vestry law, bo long will people build houses as cheaply as possihle ; and so it is that from Bethnal-green to Belgrava houses aro
built to cost as little money as possible. It built to cost as little money as possible. It
does seem to me that if the outsides of houses, instead of being of ugly stock hrick, could he somewhat decorated, and if, as MLr. Parry says, yon can get the highest art with these simple lines and materials, you would make it more pleasant to walk throngh the streets. To return to the Sheepshanks huilding. The sgraffito is outside the Sheepshanks Gallery, and for the most part remains good. You will see it has defied the London smoke and dirt, and after fourteen years it remains nearly as distinct as it was originally. There is a large bnilding which Parliament in its wisdom has orected for teaching science, in the Exhibition.road, which, hike all things, has a hack, and this hack not heing much seen, and being constructed cheaply, is withont the terra-cotta decoration on its front. General Scott, who presided over the design,
was persuaded to have the common stock hrick.

Work treated with sgraffito, and the Lord Pre sident approved. Thus we have scratched a great deal of plaster on the Science Sohool a South Kensiugton. You have heard how the early practitioners of this art were reduced into My friend, Mr. Moody, has heen rednced in like manner to paint, and the painting will not last still ho has scratched some beautiful lines, which will probably last a hondred years. As my son has said, this is not a very good situation for the public to see it; indeed, the whole thing must be regarded as an experiment brought forward into the street. I think it is well it is in the hackgroand. I hope something hetter may come ont of it. I am pleased to have had the opportanity of coming here this evening, and I am happy to have heard the dis. cussion of a question which may eventinally ake it even the interest of entcrprising bailat o make Sloane-street and Harley-street a littlo ore attractive than they are now

MEDALS AND PRIZES OF
THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.
The list of snhjects for medals and prizes 1872-3, is published, and may he obtained at the rooms of the Institute by those who con template competing.
The Soane Mredallion and, under the ueual conditions, the sum of 50 l , will be awarded to the author of the best design for "A London Rosidence, situated between honses of a corre sponding character and plan, with a frontage of 55 ft . and depth of 120 ft ., inclusive of the front area, and exclusive of the space devoted stablos; in five stories above level of street. The silver Medal of the Institute, with geometrically drawn from actual measuremont, orether with descriptive particulars of an ballding of any importance-Classical or Mediaval, -in the United Kingdom or abroad, hitherto unpublished in that manner. The council sugreast certain subjeots, hat others may equally well be taken, if moro couvenient to the competitor

## mpetitor.

The Silver Medal of the Institnte will b warded to the author of the best essay on the Architecture of London in the Sixteenth Cen.
Candidates for the Pugin Travelling Student ship arg requested to send in their applications on or before 25th January, 1874 .

## HYDE PARK CORNER.

In an articlo of the Builder, 5th April, reference is made to the opening of Park.lane through Hamilton-place, and its continuation across the angle of the Green Park so far as Constitution-hill; implying also that the Earl of Longford first suggested that improvement. Now, as the orginator of that great and indispensable thoroughfare, the writer may he peropened pnhlio improvements, he had many years back advised, through the Builder, the extension of Park-lane through Hamilton.plece, not only to Constitation-hill, hut to Grosvenor-place, There is no doubt but that a communication with Constitution-hill, across the angle of the Green Park, would be an accommodation to Members of Parliament and those privileged to risit Buckingham Palace, to whom the right of no advon ho no advana indisers this grand causeway wore opeced out for an scriminate nee to Groseor-place. By such would be estahlished between Paddington, Bayswator, and the great north-western metropolitan wator, and the great north-western metropolitan districts, and the no less important and yet more At present these extensive and popnlous districts are severed and blocked out from intercommunication for the distance of two miles; from Hyde Park.corner on the south to Kensington Church and, on the north, from the Marble Arch to siver.street, Notcing-hili; so that for commercial purposes the more direct cut from Hamilonplaoe to Grosvenor-place would he of greater value to an enormonsly increased populatio with a still growing extension of houses.
The proposed extension of Park-lane from Hamilton-place, would strike forward into Gros-venor-place by a very slight deviation from a
straight line, between Halkin-street and Chapel street. It is true that Constitution-hill is 10 ft higher than Grosvenor placo at this point, but, hy a trifling bend or serpentine curvature of the new road, that difficulty might be got over. There is, however, a greater obstacle in the way, as Buckiagham Palace garden extends in an acute anglo just to Halkin.street; so that without obtaining the width of the new route say 80 ft ., across that angle, it wonld be impos sihle to oarry out such an improvement.
The new route could in nowise interfere with the puhlic user of the footways and traverse road, as it should be bounded by iron railings, with openings, or gates, for continuons paths long the borders towards Hyde.park. corner. In point of fact, the site of Buckingham alace and offices inclnded, with the palace pardens, occnpies a space equal in extent to the Green Park, in the form of a scalene triangle btanded a little at the S.E. and S.W. angles ut extending towards Hyde-park.corner to an cute angle. In style and taste of ornamenta tion no intraw urban gardeu can be more effective till, as a royal abode, even of short sojour? is too low. Kensington Palace adrance owards the Round Pond, with the site of th antiqnated buildings and the ont.lying wast gronnds thrown into external park or gardene would form an abode for royaly far moro healthful and attractive, and, as being now the centre of the most aristocratio quarters of residence, might prove equally convenient for more freqnent ahode. It will be seen that a the termination opposite Halkin-street is in a
very acute angle, the saggested new ronte could very acute angle, the saggested new ronte could hasdly require one acre of the nook nearest to the Wellington effigy, and could in no wis interfere with freedom of space or the effect o hortalan plantations
A.s this seems to bo the only easement that can bo given for puhlic traftic, it is again sug.

ST. JOSEPH'S CHURCH, PADERBORN.
THE charch represented in our illastration i new huilding now boing erected at Paderborn in Westphalia, from the designs of Mr. Gulden pfennig; in connexion with a couvent of the Jesuits. The charch, as will he seen from the plan we puhlish, consists of a nave and aisles of three bays, transepts, which show as such only on tho exterior, but are internally treated as two extra bays to the nave, and a chancel of two hays.
In designing this church the architect followed the traditional plan adoptod ly the Jesuit order, viz,, that of making the aisles iv wo stories, the upper one forming a gallery. This gallery is approached hy means of two staircases, entered from the west end of the arch, forming a kind of western porch, they enter the western gallery at the same point below the rose window. This is a singularly original treatment, and makes a really striking foature out of what is generally a difficulty the staircases to galleries. Below the deeply recessed arch whick we have mentioned is douhle doorway, and there is another doorway on transepts is a well-designed fêche. The chnrch is vanlted throughont in stone; the galleries heing also vaulted nnderneath. As will he seen from our plan, the palleries cross the transepts, which latter project yery slimhtly heyond the which latter project very slightly heyond the
 transept aro tisl The and a the and a pictare ${ }^{\text {ane }}$ staircase.turret givigg access to a passago in the walls of the chancel, which
is in communication with the galleries. The materials used are the local hard gyey limestone; materials used are the local hard gey limestone;
hat externally tho doorways, windows, and hat externally tho doorways, windows, and colnmne, arches, vaulting rihs, \&c., are of the same material
The dimensions of the chnreh are as follow :Length, 125 ft ; across transepts, 70 ft ; пате from centre to ceatre, 30 ft ; leugth of chance,
35 ft ; height to crown of vaulting, 56 ft ; to 35 ft . ; height to crown

## top of timher roof, 80 ft .

The church has progressed as far as the top of the walls of the nave, and the roof will he placed on and the vaulting turned; but owing to the notice to quit which the Jesuits at Paderbori
have received from the police of the Berlin have received from the police of the Berlin
Government, the church will then be shut up and left incomplete.

ST. JOSEPHS (R.C.) CHURCH, PADERBORN.

St. Joseph's CHURCh, PADERBORN, WEStPHALIA.--Herr A. Guldeypfennia, Arcertect.

THE READING SEWAGE FARM CASE.
Mr. Bosanquet, of the Oxford Circuit, and a special jary, have been sitting at the Assize Court, Reading, in accordance with a warrant directod to the Sheriff of Berks, to determine the amount of purchase money, and also the compensation for damage, to be paid by the
Looal Board of Health to Mr. Richard AttenLooal Board of Health to Mr. Riohard Atten-
borough, of Piccadilly, and owner of the Whitley borough, of Piccadilly, and owner of the Whitley
Grove Estate at Reading, in connexion with the Grove Estate at Reading, in connexion with the
compnlsory taking, for the purposes of the town compnlsory taking, for the purposes of the town sewage, of rather more than 416 acree of land
at Whitley Manor Farm, belonging to Mr. Attenborongh, and adjoining his residential estate. Mr. Hawkins, Q.C. and Mr. Philbrick appeared for Mr. Attenborougb ; and Mr. Horace Lloyd, Mr. Bumpus, and Mr. Barber for the Local Board of Health. The witnesses subpoenned on each side inoludod competent valuers, chemists, and others, and the ovidence given in sup. valuation made by Mr. Clark (Farebrother, Clark, \& Co.), who was called for Mr. Atten borough, amounted to $68,75 \mathrm{I} l$. These figures, howover, were materially rednced by the valua tion of Mr. Jobn Clutton, of Whitehall, and hy appeared on behalf of the Lrocal Board. When the matter was brought to a conclusion, the jury His claim was originally 75,000 l. was Dr. Letheby, M. B., Professor. Atteaborough was Dr. Lethoby, M.B., Professor of Chemistry and Oftioor of Hoalth for the City of London, wbose prejudico acrainst sewage farming is well
known. Fixamined by Mr. Philbrick, he said he liad never seon a sewage farm that bad not been a very great nuisance. Sewage farms were always offensive, and, at times when visits were not expeoted, very offensive. That which was
in solution, and was used by tbe plant, was speedily got rid of; but a large portion, con. sisting of solids, rested upon the land, and prodnced offensive decomposition. During a large portive, and the ground was sodden with rainwater, the sewage would give off gases, and, in his opinion, render Mr. Attenborough's bouse uninbabitable.
In cross-examination by Mr. Lloyd, tbe witness gaid he had a strong opinion with regard to these sewage farms. The liquid sewage could be into a running stream; a sewage farm would bowever, necessarily become a nuisance, and it was easy to discover a sewage farm half a mile which Parhamont had senctioned Bills similar to that whiob Reading had obtained. Another witness on the part of Mr. Attonhorough, Mr. Daniel Watney (of the firm of Notton, Trist, \& Watney, land valuers, of Old
Broad-streot), deposed that he had inspected the Whitley Manor Farm, which bo estimated the Of they manor farm, which bo estimated was
of annal of $1,300 l$. His total valua of the annaal value of 1,300 . His total valua
tion was 53,625 l, including 25 per cent. for compulsory sale.
mess-examined.-He bad for two years beon a member of the Croydon Board of Health. He Croydon they were all firmly irrigation. Croydon they were all firmly satisied they
purified the sewage. A cousin of his bed bnit purified the sewage. A cousin of his bad bnilt a mansion balf a mile from the sewage farm timber between the mansion and the sewage farm. The mansion was on a hill. Witness was awarc
that Mr. Quilter, jnn., a stockbroker, ocoupied a that Mr. Quilter, jnn., a stockbroker, ocoupied a
house at about 100 yards from the Croydon sewage farm.
Re-examined. -The present case would be very different if there were hills hetween Mr. Attenborough's house and Manor Farm. Sewage farms mnst ocoasionally cause a nuisance. That nuisance exoited a prejudice against sewage
farme, which affceted the value of contiguons properties.
On the part of the Corporation, Mr. James He said he bad been a farmer for was examined years. He was now farming the Camp farm at Aldersbott, which he leased of the War Office. He had farmed it since 1864, at wbich time it was a sandy waste belonging to the War Departmont, who leased it to witness for sixteen whole of tbe land there helonged to the War Department. The North Camp was about 800 yards off. Soldiers had encamped from two to confines of at a time within 150 yards of the confines of his farm. He never heard of illness
among thom, or of ague or fever among the people who ordinarily lived near. There were honsands of acres where the troops might have encamped if that place was unhealthy. per day. Ho ndopted the systemt 1,000 tons per day. Ho adopted the system of sewage ingation. Witness described the system. The subsidence tank was emptiod every five months. Nmoty.ave acres were farmed npon the sewage irrigation prooess. The land irrigated per day varied from one to three acres. A borse-boe was sent down after the dressing. The ary ditohes. He lived an cleaning out ordi. good healtb, and his labourers were very healtby, He considered the plan adopted in Reading was the best, speaking as a farmer. He would not, as a farmer, give any thing for sewage wbich was not snpplied uader the conditions contemplated in the Reading system. He did not think them would be any nuisance from the proposed sewage farm. Tbe sewage farm at Tunbridge Wells had let lately at an increase of 1002 per annum Vitness had another gowace farm . Wernum Cross-examined by Mr. Philhrick. Witne. aid out the land as a sewage farm himself farm was on the mentioning his nrangens. He tr Mr Me . Ald Mr. Attenborougg he wonld rather have Mr. Attenborough's farm at 3 l . per annum than here and and here bad been oompleted. Ninety-five acres of his farm were irrigated with the sewaze
Re-examinod by Mr. Lloyd.-In the case of farm such as Whitley Manor Farm there was amplo room for all tho sewage operations. He if he had the cbanco. Heconsidered the feeding value of the grasses on the Manor Farm must be very small indced. The ground was full of water-grasses. Italian rye-grass would not grow there. Fiverything he grew at Aldersbott was sowage put into another form.
By the Foreman. - If standing over the arriers, tbeir presence might he detected by mell, but be did not think there would be any mell at a distance of 14 yards.
By the Assessor. - The land at Worthing sewage Farm was beavier than at Wbitley, but Dr was not much nuisance as at Aldershot Dr. Edward Franklaud, F.R.S., Professor of Hemistry to the Scbool of Mines, and one of causes of the pollntion for investagating the Mr. Bumpus, said he had extensive experiene as regards हewace forms, and bad visited mos of such farms in tho contry He con mored that a sewrere farm, if properly manared wes healtly as any other farmeny managed, was as any smell could he perceived the did not think 100 yards from a form He had neo 100 yards from a sewage farm. He had never be ived form soil of tbe Hanor Farm was adapted for sewage irrigaborough's honse, be did not of Mr. Atten. borough's honse, be did not think the sewage He considered the nuisance to the occupants. He considered the water-logged meadows calcu. Cross-examined by Mr. marsh fever.
Cross-examined by Mr. Hawkins.-He was not n adrocate of sewage irrigation. He was rather in favonr of intermittent filtration. There was
a prejudice against sewage farms-a sentimental prejudice.
Re-examined by Mr. Lloyd-The sewage was doodorised the instant it reacbed the ground At Merthyr Tydfil the sewage of 300 persons was applied per acre.
Dr. Alfred Carpenter, M.D., of the London Eniversity, examined by Mr. Lloyd, stated that he was in practice as a surgeon at Croydon, and as a member of the Croydon Board of Health eware years. He described the Croydon which consisted of 520 wood and Beddington) not cause the least nnisance, when the carrier were in proper order as at present. A great number of houses had been bailt in the neigh bourhood botb of the Beddington and Norwood farms, and be knew of scarcely one that was vacant. Tbere was no objection on the part of the occnpants in respect of the nearness of the sewage farms. Witness reoommended his patients to take a drive round the neighbourood if they wanted to get an appetite.
Cross-examined by Mr. Philbrick.-There was measure of health in connexion with these ewarge farms, in consequence of the produotion of ozone, thrown out by the enormons amonnt of egetation produced there. There was, however prejudice against these sewage-farms just as a

He once had occasion to complain to the Croydon Board of Health of the state of things which be found on the sewage farm at Lower Norwood, when he visited it with some foreign gentlemen wbo were anthorities on sanitary matters. That tate of hinge, however, only lasted for one day Ro-examined.-That was the only tbing be had knows in tbe shame of a nnisance in connexion with the bewage farms mentioned.

THE POSITION OF THINGS.
Sir, -The recent scandalous casting-away of the great steamer Atlantic, witb her valnable ireight of emigrant passengers and crew, some 1,036 in number, of whom nearly 600 are lost to ns and tbeir friends by the disaster, forcibly calle attention to a subject which, by your favonr I have on former occasions been permitted to bring nuder tbe notice of your readers, viz., the exodins of our working people. I then pointed out that in consequenoe of advancing prices, and greatly increased cost of the prime necessarie of life, the working-classes are worso off, not withstanding their advanced warres, than tbey were in former years, and that as no escape was offered them in these islands of ours, they were seeking in other countries for that competency they were nnable to find here. The eraigration returns for the year 1872 show, I believe, a larger exodus from Great Britain than was ever before recorded; and it is some symptom, in my opinion, of what this present year's emigration is likely to he, that fully one month before the usnal yassenger season begins (May 1st) a single ship, nowy lost, as above, took away nearly 900 pas seugers. Another ship of the same line, which sailed later, had on board, I am told, nearly 1,000 passengers, bonnd for tbe same port (New passercrers pablished list of respective ages, hy which it is sbown in a very conclusive manner that those wbo leave ns aro in the very prime of life (except the children) mostly between twenty and forty years of age, having youtb and energy, and just the very class of persons that this country can least afford to In consequence of tbe various cause which have tended to restrict labour, the demand for it has been during the past year, and is yet muob greater than tho sapply,-more especially juvenile and nnakilled labonr. In my owi personal exporienoe, it is almost impossible to retain sufficient labourers on any important works; and I was told recently by the manage of a machine factory that he is obliged to employ men to do work which could easily be done by boys if be oould get them. The result of this tate of things is that boys of fourteen to seven een earn nearly men's wages, and, as a social result, are scarcely amenable to parental control. This state of things will be intensified as tbo season advances by the witharawal from this conntry of a very large number indeed of healthy, energetic people, who go to the United States or one of our colonies to bettor their positions in life; people who are quite willing to work hard, and, if need be, live hard, for a rew years to enable them to obtain a position and accumulate a store wbich will place them beyond the ordinary roach of want in their old age. Those who go are tbe workers in our great hive, if a corresponding num. ber of drones could be shipped off to accompany them, those of us who are left here would have much less cause for grief tban seems likely. Of course our loss is their gain; but that it is a loss, and a very serions one for this hard-working heavily-taxed country, is, I think, not to be denied. Besides the immediate lose of their productive labour, they go to countries whicb place in heavy tax upon our mannfactures for the pur. pose of fostering their own, and to find the means indirectly of supplying their current ex penses. The emigrant is thus completely snuffec out as a consumer and castomer of ours, and $i$ he continues to work in his new home at his old trado, he becomes a possible rival to ns. We place no protective duty on our imports, and it i8, I think, a very important sign of the times that we who have hitherto snpplied the whole ceivable parth the best macbinery for every oonin quality and price by now be distanced both in quality and price by American productions sold in our own country. Take wood-working machinery, for example. Yon lately reviewed in a favourable manes a specimen of American forma formed by your advertisement oolumns that the machinery itself can be bought in London in compericon with English maoninery for the same purpose. In the prodnets of tbis machinery,
also, we are now distanced. Time was not so very long ago when we exported to our colonies and other places finished joinery, such as doors sashes, and frames, mouldings, sce., having first imported the timber from wood-producing coun tries. Now the machinery goes in charge of a few skilled men to theso wood-producing countries, and we ourselves become liko our former customers, importers of finished joinery, fron full-sized first-class mansions, as in Devon re cently, down to a single architrave mould or angle head. In the matter of railway iron or steel, also, we can no longer be said to take the lead, and we may expect very shortly to be distruced in that manufacture also, and if the price of coal is maintained to become importers of it. Most other products in metals will doubtless follow that lead, and we shall then be forced to turn our attention to the cultivation of our own soil, and the reclamation of our waste lands. We can go abroad to reclaim the land of other countries, why not our own at home? Why should a wealthy few so hold this land with an iron grip that the great bulk of our people are denied and must perforce seek elsewhere for that area of productive soil they are determined to have Would to heaven a statesman might arise, who, forgetting the interest of party, should be able to rise to the beight of this great question, which must in the coming time force itself upon the public notice by its paramonnt interest. new "Holy Alliancc" be formed against Enc. land, and the want of men bred on the land of our conntry may in the end cause us to lose it.

THE CONSTRUCTION OF TRAMWAYS. AT a recent ordinary meeting of the Society of Engineers, Mr. Jahez Church, president in the chair, a paper was read by Mr. H. crore on "Horse Railways and tramways." The author commenced hy giving a brief sketch of from the and progress of road-making in Lngland period when Telford, MTYeill, Macadam, and others devoted thcir attention to perfecting our great bighways. He then descrihed the early attempts to construct tramways or trolleyways in the mining districts, commencing with the wooden railways of the Tyne and Wear of 1680. He then traced the history of this description of roads, and the application of iron an thair con. str'uction; showing also, by reference to documents in the Patent Office, that so early as 1803 the idea was started for consiructing street tramways with iron rails. The author then descrihed some of the earlier street railways in the United Statcs, and the attempts made by Mr. Train to introdnce the system into the metropolis, and pointed out the cause of their he bad himself constructed in 1863 at Valpa raiso, on the West coast of Sozth America. Having concluded the listorical sketch, the anthor then proceeded to describe the principal featores of the various forms of coustruction adopted in the street tramways which have recently been laid. This part of the paper was centlystrated by a series of diagrams, embracing all tbe important details of each type of conall the important detaik of each type of constrinotion, including the use of concrete, transverse timher sleepers, cast-iron b
continuous cast-iron girder rails.
After descrihing each system of construction, tbe author pointed out the more prominent ohjections observable in the several types now in use, among the chief of which was the employment of concrete, which he held to be highly prejndicial. He pointed ont the effect of vibration in destroying the cohesion of the particles of cement, and the constant tendency there was for the mass to be broken up. He then called especial attention to the evils arising from the want of sufficient bearing surface or proper lateral support to maintain the gauge. Mr. Gore advocated strongly the use of transverse sleepers as the best means of distributing the load and nentralising the effects of ribration; he also pointed out the importance of thoroughly sound workmanship, hoth as regards the laying of sleepers and rails and in well consolidating the foondation of the road by ramming and packing. He recommended the use of a species of tar and asphalte concrete as a bed to receive the stone pavement, and also for packing round the timber sleepers. He disconntenanced the nse of lime or cement concrete as a foundation for tramways, and concluded his interesting paper by nrging the nse of thoroughly desic-
greatest possible durability, and a system of paving or roadway which should be as far a practicable free from any material that was hable to break up into dnst or mud.
The meetiug was attended by a number of engineers and others connected with tramways.

## STRIKING ASSERTIONS.

Ho that striles first takes the law into his own handis
A. SIRTKE is not a fit weapon of defence, for ${ }^{\circ}$ has ever worked more barm to the nser than the used against.
A lock-out is but a rongh law of retaliation and though it were tho punishment of a crime, is searcely defensible.
A striko is unmanly, and unchristian, for in all stikes the innocent are certain to suffer. A lock-out, whether it precedes a strike or acceeds it, is but the aggregation of a wrong ion and convincing
A strike is seldom or never promoted by tbose who have really suffered by the action of one, o intend to suffer by the certainty of another A lock-out is not only a lock-out of men, but is a lock-out of capital and interest.
Whether the precipitation of a strike or lock-out be well timed or not in the opinion o those interested, the forelock that produces a dead-lock must be always ill-timed and pernicious Strikes and lock-outs are little better than senseless faction fights, in which both combatant not only injure themselres, but others, and who in making peace or coming to terms, forge bave injured and outraged by their quarrels.

Strikes and lock-outs would sensihly diminist and probably disappear altogether, if the parties to them were subject to a tax for the exercise of the lionnco.
As a means towards reform, the Registrar General shonld furnish a return of the number of those in every district who have been stricken by the strike and lock-ont epidemic, masters and men, and tbe effects in the amount of illness, deaths, unemployed, bankrupts, criminals, and emigrants produced by the same.

NET WORKS AT BATHERSEA FOR THE LONDON GAS COMPANY.
Ts consequence of the gasometers in con. nexion with their works at Nine Elms being unequal to the strong anpply of gas required, the London Gas Company have secured a large plot of land at Battersea, situated hetween the Dover, and London and Brighton Rilwas and panies On his lan which threo erect five larce additional company inuend to of these are now in progrs one of and already nearly already nearly completed. The tanks of eacb 30 ft in dopth from the coing of the her and 30 ft in dopth from the coping of the hearing stones supporting the iron columns. The piers and are and are It .6 in . in thickness, and tbe walls enclosing the tanks vary from 3 ft .11 in . at the base to 15 in , at the top of the coping, which is finished witb Staffordshire blue brick. The foors of the tanks are covered over with concrete, 10 in . iu thickness; and, in ordor to render the walle impervious to water, there are 2 ft . of puddling at the back of them from the bottom of the tanks to the coping. The iron columns supporting the gasomevers are frmly connected with the holding bolts, which are sunk 10 ft . below the surface.
The gasometers are telescopic in conctruction, with a lift of 30 ft . in height, the diameter of the lower lift being 182 ft ., and that of the nigher lift, 180 ft ., and the capacity of each gasholder is $1,500,000$ cubic feet; the entire additional quantity of gas, therefore, which the whole of the five gasometers, wben completed, will adroit of being stored, amounting to 7,500,000 cuhic feet beyond that of the company's existing gasometers at their present works. They will be supplied with gas for storage from the works at Kine Elms, pipes being specially laid in connexion with them for that purpose. One of the new gasometers will be fully completed and supplied with gas in about a month from the present time.
The works have been designed by Mr. Morton, the company's engineer, and are being carried
out under his snperintendence and that of his as sistant, Mr. Colson. Messrs. Aird \& Sons are the contractors for the construction of the tanks and he gasometers and iron work are being executed by Messrs. Horton, of Birmingham,

EXTENSION OF MESSRS. PEASE'S MILLS DARLINGTON.

Fon some time past Messrs. Henry Pease \& Co. have been carrying out a large extension of their spinning-mills in Darlington. The Northgate, or the Railway Mill, has just emerged from the hands of the architect and builder, with an additional weaving-shed, erected at the end contiguous to the gasworks, and measuring 112 ft . in length by 93 ft . in breadth. The light is admitted from the roof, which is divided into bays, sloping north and south. The north slope is entirely composed of glass. Hot-air or steam pipes heat the hnilding. Cast.iron girders and ilhars of a light form enpport the roof and the hafting for the macbinery at the same time In this one shed about 400 additional weavins looms will be employed, ciring employment 200 additional hands, most of them women Extensions and improvements of a more extensive character are in progress at the Priest-gato Mills. Here Mr. Edward Pease, one of the founders of the Stockton and Dartingtom Railway, instructed his son, the late Mr. Joseph Pease, in fabricating " woollens." The new mill will be five stories in heirht and will menar 200 ft in length by 121 ft in breadth. It will contain all the ontain al the wocesses or worsted spung, and will comprise wanes, and outbilding. Whenive and boile ouses, and outbuildinge. When completed, the machinery now used in the Low Mill will be transferred to the new buildo but twere will be entirely new engines and boilers. The new解 he Mill Holme, sitnated between Priest-gate anc he new street ahout to be opened up there to be called East-street. A covered gangway over the latter street will connect the new kuill with The of wool warehonse.

There will be attached to the new mill a large cbimney, which is now all but completed. This chimney is situated at the bottom of Priestgate. It is octagon in plan, and its outside diameter at the base is 17 ft .6 in .; the outside diameter at the top is 11 ft . ; the diameter
of the flue inside is $9 \mathrm{ft} G \mathrm{in}$. From bottom to the lovel is 152 ft . The large capacity of the chimney inside has be large capacity of the and fumes of nine boilers can be led into it and exhaled at the same time. The number of bricks used in its erection has been 395,000 . No accident to life or limb has oocurred to any person employed in building it. Messrs. Michael Watson \& Son, builders, erected the shaft, under the instructions of Mr. William Hodgson, archi. tect, who has also designed the extensions to the mills.

CIIALK (WITH COAL) AS FUEL.
A Goon deal has heen said of late on this subject, but nothing very explicit. Chalk is a carhonate of lime, and mnst yield a laxge quantity of carhonic acid gas, which, one would think, mist carry off much heat in its produc degree of qniok-lime left doen yield a singulai for by chemists, but the main heat to he yielded for by chemis in biel all, before the shalk care mase be yielaed, if at converted the time when its carhonic fumes are flying off up time when its carhonic fumes are flying off up
the chimney, if a good going one, or into a room, the chimney, if a good going one, or into a room,
if not; much worse indeed than from a coke fire, if not; much worse indeed than from a coke fire,
and vieing even with a charcoal one. Of what is anid in faveur of the nse of chalk (with coal) for fuel we may quote a passage from the Bostorb (D.S.) Globe, which comes closer to the point than what has elsewhere heen said on the suh ject :-
matter gentleman who has made a thorough test of the superionty in heat giving properties of chalk of the the idea is an old one, but we have never heard of any With those who being rade to ture it to account before. of cball, or the laryo evmount of carhonic acid cont heat in it, sud the convertibulity of that acid into conthonic oride by means of heat (z), or with those who have merely by a comparatively ast amount of heat which, generated a limeliln ; or, again, the effect in smeltiog ore of a few
hundred pounds weight of limestone or chall; it has long
been an metter of sirong persuasion that the timo must been a metter of slrong persuasion that the time must
come when chall, and perhaps limestone, ohall be made subservient to tho increnge of heat and the diminution in
the coneumption of cosi. Our late fire pregented hundreds of instances of the intensity of the heat of limestone, and The length of time it was rotained even by small frag.
ments. With regard to tho experimente reforred to, it is
asferted that, by using chsolk and coal in about equal pro atserted that, by using chbik and coal in about equal pro portions, the chalk heing placed at the back of the grate effected in cost, with a more intenso heat and cheerf
blazo thas would have boen obtaiable from coal aloue.

DAMAGE BY LIGHTNING.
Cromer.- A severo thunderstorm recently passed over Cromer, during which the parish church was struck by lightning. The conductor on the church tower had carried tho electricity to the earth, yet suoh was the violence of the shock, that it had torn up the earth round about for twenty yards. The lightning had also forced itself through the wall of the tower 3 ft . from the ground, where from the outside a spike is driven in to secure the conductor. The wall is from 4 ft . to 5 ft . thick. There are two old unused church-doors stowed away inside the tower. The lightning, in going through the wall, knocked 9 some pieces off these old doors, and threw some Outside tho charoh, end in the immediate reigh. bourhood of it, portions of the windlows of private houses were knocked out, and also one square in the reading-room, which is at least two hundrod yards distant from the chureh. It two hundrod yards distant from the church. It post-offioe, and did much other damage. Mertham.-Tho tower of damage. was also struck by lightning. Only one flush was aiso struck oy lightring. Only one flush
was ohserved, und this struck the vane, the fluid passing from that to an iron stay, through the roof of the tower, shattering the parapet bells, and hreaking the gear. Thence it travelled bells, and hreaking the gear. Thence it travelled
to the clock, hursting open tho wooden casing to the clock, hursting open tho wooden casing,
dout without doing material injnry to the but without doing material injnry to the
works, and, passing down the connecting. rod to tho outside, wronchod off the dial-plate, stripped the tower of a considorable portion of its facing, and greatly damaged the sonth-east angle hut-
tresses. The force seoms to have dispersed over tresses. The force seems to have dispersed over
the roof, and to have made its way along the gntters, down each of the water-pipes, into the Some of tho stop the earth for some distanco. Some of tho stones were hurlod as far as fifty yards from tho tower. A meeting of the parishioners is to he held to receive the report of the architect, Mr. J. B. Pearce, of Norwich, and to take the nccessary steps for repairing
the damage. The chancel of the church was re-built a fest years ago by Mrs. Dawson, and the nave was also thoroughly restored.

PROPOSED ASSOCIATION OF HUNICIPAL AND SANITARY ENGINEERS AND SURVEYORS.
At Birmingham, on Saturday afternoon last, he second general meeting of ongineers and arveyors was held at the Union Hotel, Unionineet, for the purposo of furthering the objects itreet, for the purposo of furthering the objects Association of Municipal and Sanitary Engirets and Surveyors.
Mr. Angrell, engineer to the Wost Ham Local $30 a r d$, London, and chairman pro tems. of the lissociation, presided; and the following towns vero represented: - Southampton, Coventry, eicoster, Leamington, Balsall Heath and Aston Hanor (Birmingham), Stockport, Great Malvern, fedditch, Stow-on-the-TYold, Walsall, Willenhall, Caling, Hanloy, Warwick, Rugby, Oldhury, and Yolverhampton.
Mr. Edward Pritchard, sarveyor to the Warvick Corporation, who has been acting as hon. ecretary for the district, read the following, which had heen adopted at the first general neeting beld at the Institution of Civil Engileers, London, February 15th :"1. That the society be named tho 'Association of
funicipal and sanitary Engineers and Surseyors. 2 . 'bat the objects of the Association be, -a. Thepromotion
nd interchange among it, members of that gecies of nd interchange among its members of that apecies of f sn enginecr nad surveyor engayed in the diecharge of
he duties imposed by the Public Fealth, Local Govern. aent, and other Sanitary Acts. b. The promotion of the romotion of the objects of sanitary science.;
The Chairman explained the modus operandi I the Association. The first annual meeting of nembers would be held at the Institntion of Civil

Engineers, Westminster, London, on the 2nd of May, when the president, vice-president, and officers would be elected, and the executive council would also be appointed.* The country would be divided into districts, each district appointing its own secretary, who would be a member of the executive council. Birminchom would be the centre of one of the Willand di tricts, and Mr. Pritchard had hitherto acted as its honorary secretary.

A discussion followed, several matters of de tail were gone into, and ultimately it was decided tail were gone into, andultimately it was decided to argree to the rules of the Association, as
adopted hy the meeting held in London on the adopted hy the meeting held in London on the a hope that as many surveyors of the conntry as a hope that as many surveyors of the conntry as the inaugural meeting of the Association, to be held in London, on the 2nd proximo.

## COLOUR OF TTMBER.

We should be obliged if any of your correspondents could givo us any information as to preserving timber its natural colour:- the end the only part to be secn.

S .

TUNSTALI NEW WESLEYAN CHAPEL AND SCHOOL COMPETITION.
Twelve competitive dosiges were sent in for the above, and those of Mr. G. B. Ford, of Burslem have been nnanimously selected; the buildings are to he erected forthwith. The estimated cost is about 3,000 l.

A BUILDLNG CO-OPERATIVE COAL IINING COMPANY.
A co.operative coal-mining company, combining the novel feature of huilding dwellings for its shareholders, under certain stated circumstances, is in course of formation in South Yorkshire. The proposed capital of the company is 150,000l., and the sharesare $1 l$. each. Tho object of the society is to conduct mining on the co.operacave prinoiple of dividing profits with labourer, capitalist, and consmmer; and in case the pit be
some distance from a town, power is taken to huild dwellings for the work-people. It is inended that each worker shall be a shareholde in the society, and that one-third of the profit (after providing for interest and reserve fund) ies, or fees apart as a bonus on all wares, sala. ies, or fees paid. It is also provided that a fair share of profit shall he divided with the con. samer, and it is also intended, as far as possible, to supply the shareholders with coal in preference to tho general public. The profits are to he divided into three equal parts,-one for capital, one for labour, and one for consumer. The committee appeal to the 20,000 miners of Sonth Yorkshire, and to consnmers everywhere, and sidernhe and from the district co.operative societies, well as from those in Lancashire and London, and that they intend to commence operations as soom as suflicient capital is snbscribed.

## THE TRADES MOVEMENT

Birmingham.-The arbitrators appointed to settie the claims of the masters and men in the Birmingham building trades have now given advance frd as to wages. The men claimed an arbitrators $7 \frac{1}{2} \mathrm{~d}$. to $8 \frac{1}{2} \mathrm{~d}$. per honr, and the fartling an hour, which award, it is said, "has given satisfaction.'
Blacloburn.-.The builders are threatened with a strike unless they either advance their men's wages 3s. a wreek or diminish their working time to eight hours.
bradjord.-The master hnilders have agreed to give the masons' labourers 23 s. a week in summer for $49 \frac{1}{2}$ hours' work, and 228. a week in winter the men working from light to dark.
present agitating for shorter hours ane at present agitating for shorter hours, and have addressed a letter to their employers, in which they respeotfully urge upon them the necessity of their conceding certain demands. They complain that theyare hehind their brethren in other powns, and ask to be made participators in the privileges which of late years have heen obtained
Particulars will be found in our advertising columns.
hy their fellow-workmen in many parts of the country. They ask for a decrease of two hours a week on the present working hours, and nlso an increase of wages, the proposed alteration to come into operation on the first Monday in May. At a recent meeting resolutions were adopted to At a recent meeting resolutions were adopted to the following effect:-"That carpenters and hricklayers hours of labour in the summer months be $55 \frac{1}{2}$, at 6 d . an hour ; in the winter months at $50 \frac{2}{2}$, at $6 \frac{1}{2} \mathrm{~d}$. ; and that the rate of labourers' wages be $4 \frac{1}{2} \mathrm{~d}$. an hour for winter and summer
Edinburgh.-Some time ago the operative masons of Edinburgh and Leith forwarded a circular to their employers, intimating that after 5 th May their wages should be $7 \frac{1}{2} d$. per hour At the request of the employers a conference was held consisting of an equal number of em. ployers and employed, when the employers pro posed 7d. per hour, and if the state of trade warranted a further rise, they would give $7 \frac{1}{2} d$. per hour on 1st Angust. At a numerously. attended meeting of operatives, it was unani mously resolved to adhere to their former demand.

Alloa.-At a meeting of the operative joiners of Alloa, Alva, Tillicoulty, and surrounding district, it has been resolved to acoept the masters' proposal of an addition to their wages of one halfpenny per hour. The men's demand was one penny per hour.

Coupar-Angus.-The journeymen slaters in this district have heen agitating for some time for an advance of $\frac{1}{2} \mathrm{~d}$. per hour, which request has heen granted. They are now paid 6d. per hour, and work nize hours per day.
Dunfermline.-The mastermasons have granted the demand of the mon for an advance of wages from 6as d. per hour to 7 d .

THE HOUSE OF COMMONS IN SUPPLY. On the vote of $128,431 \mathrm{l}$. for public buildings, Mr. Powell asked what were the Royal monu ments for the restoration of which sums were taken in this vote, and also under whose gridance the restoration was taking place. Mr. Ayrton said he did not know why the hon. gentleman should assume that the person charged with superintending the restoration of these monu. ments was incompetent to discharge the duty The monuments which were being restored were one of King John in Worcester Cathedral, and some monnments in Westminster Abbey, and the restoration was taking place under the superin. tendence of an officer of the Department of Works. The vote was agreed to, as was also a vote of 14,500l. for furniture for the public offices.
On the vote of 25,670 l. for the Houses of Par. liament, Mr. Borring inquired of the First Com. missioner of Works what were his intentions with respect to the light on the Clock Tower. Mr. Ayrton said that before coming to any conclusion on the subject he thought it desirahle that they should have the benefit of all the experiments which persons were desirous of making at their own expense. The light rocently put up was much more brilliant than the one previously ex. hihited. Another gentleman had got a newlyinvented electric light which would be exhihited in competition with the present light in ahout a fortnight honce, and by comparison they shonld be able to see which was the most brilliant and the most economical light.
Mr. Alderman Lusk complained that tho snm of 1,000l., the halance of $4,000 l$. for a pictare of no "Judgment of Daniel," although it had ap. peared in the votes for four successive years, lained yet been expended. Mr. Ayrton ex plained that the sum in question had not heen paid hecause the picture was not yot completed When it was nearly completed the canvas exhihited signs of swelling, and the artist was un willing to pat it up in that condition. The pic ture was the work of an artist of great ominence and genias which it was desirahle they should possess, and the $1,000 l$. had been inserted in tho rotes in anticipation of its completion.
In reply to Mr. Anderson, Mr. Ayrton stated that steps were heing taken for the preserva tion of the stone in the Honses of Parliament Experiments had been made, but unfortunately the results could only be tested by time.
lington vote of $4,650 \mathrm{l}$. on account of the Wellington monument, Mr. Goldney said this vote required some explanation. At present, if any ono went to St. Paul's to look at the monument, he would see nothing but a dilapidated chapel, and something that looked like a chimney. The
Chancellor of the Exchequer said Mr. Stevens

Was appointed hy the First Commissioner of Works under the late Government. Mr. Stevens, though an ahle artist, was a bad financier, aud he did not get on with the work. The Goveru. Mr. Coilmann to be answerahle to complete the Mr. Coilmann to be answerahle work, and they went on very well for a consider. work, and they went on very well ahle time ; bat Mr. Stovens then became para. lysed. What the Goverument proposed to do lysed. What the Government proposed to do
was to call on Mr. Collmann to oomplete the work, and if Mr. Stevens was unahle to give his assistance to get some one else. Mr. Julian Goldsmid said Mr. Stevens always was ill when any work was required of him, and the Cliancellor of the Exchequer how woal be. The Chancellor of the -ralequer ham pul this work into the hands of a London uphols terer. The Chancellor of the Exchequer aaid he could only congratulate the hon. memher on his prescience in foreseeing that Mr. Stevens wonld have a paralytic fit. The vote was agreed to.

THE PROPOSED TRADES GUILD OF Learning.
A conperence took place at the Artizans' Clnh in Newman-street, on Saturday evening last, in farther promotion of the movement for giving some of the advantages of University education to working mon. The idea is to form a Guild of Operative Tradesmea to arrange for the delivery of lectures in various places by lecturers pro. vided by, and sent from, the Tniversity of Cam. bridge. The Rev. H. Solly, who presided at the conference, stated what had heen done since last meeting. The council of trades' delegates had passed a resolution expressing great satis. faction with the progress of the proposed soheme, while in the interviews which the chairman had had with the heads of the University, every encouragement had been afforded to the pro. ject, provided that a firm organisation could be secared to deal with. Iu furtherance of this end Mr. Solly recommended agitation for the purpose of interesting persons in the matter; the obtaining of the active co-operation of the trades; the establishment of a permanent centre retaining of teohnical teachers to aid in carry. ing into offect the theoretical knowledge given in the lectures. In the course of diacussion it was suggested that the feeling of various trade organisations should be ascertained, but a general opinion clearly prevailed in favour of tech. nical and practical, rather than parely theoretical and scientifio education. Mr. Behington argued departmeate, and would to some extent super sede existing syatems of apprenticeship, hy which a man could only partially learn his trade. Observations on the points at issue trade. Obserrations on the pointss at isade Mr. Alaager A. Hill, Mr. Savage, Mr. Dodd, and individual memhers of trade societies, including carpenters and joiners, sawyers, compositors die-ainkers, coldamiths and jewellers, cabinet makers, zinc.workers, watch-case makers, eng neers, emhossors, and elastic web-makers, It was resolved,-
"That, in the present defective state of techrical and higher education for the wortman, no adeqnate provision private endespour, this meeting hailo with satiofactio The proposal to form a Trades Guild of Learning to eo
-operate with the University of Cambridge and othe operate with the University of Cambride and

Names were added to the existing provisional committee, and the meeting afterwards ad. journed.

## ACCIDENTS

Fall of Roof at Euston Station, - Almost at the extreme eud, aud hetween the two departure platforms, a space of ground is used as a carriage. shed, or "standing," the circular roof of which was being removed, prior to re-constraction, hy the employes of Mr. Cubitt. A strange noise wirders and pillars supporting them the iron wirders and pillars supporting them gave way with a load craah. There were nearly twenty tanate enough to escape. A slater, however, who was at work on tho roof, was taken to the Who was at work on tho roof, was taken to the Both cases are rather serious.
Fall of a Factory Roof in Birmingham.-The roof of the works of Messrs. David Jones \& C 0 . has fallen in. Ahout a dozen men were em. ployed in the galvanising department, but forployed in the galvanising department, but for-
hours hefore the accident. The part of the works used for galvanising purposes is ahout the ceng and 40 ft . wide. It had a slated root, served as a ventilator.
Fall of the Gaswarlis Roof at Rome.-The roof of the gasworts in Rome was struck hy lightning on Thursday in last weok and foll in conse nence, barying furty workmen in the debris. wence, bers lilled, and seventeen otwers hadly injured.

SOME RHYME AND REASON. At a goneral meeting in the parish of St. Dunstan.in.the. West, it was proposed by Mr. J. Preedy, and seconded by Mr. Reynolds, "Tbat t was the opinion of the inhabitants of this parish that Temple Bar should be kept standing as long as possible, and that a memorial he pre. cnted to the Common Council to this effect. Mr. F. H. Fowler said that if Temple Bar was to como down, the sooner the hetter. Mr. J. Reeve said that this might be the heginning of a work of destruction which might end no oue know whore. He hoped Flect.street would not $1 \theta$ injured by any future operations. Mr. Fowler replied hy saying that there was a large amount of improvements contemplated between St. Dunstan's and St. Cloment's Charches, and if they wanted a broud street, he did not know why the Bar should not come down. Mr. Butterworth aaid that Mr. Fowler seemed to represent the important Board of Demoitions, which must even put its battering. rams against the resideace of a duke. They did not want the Metropolitan Board of Work to dictate to them, and he thought they should appeal to tho City. Temple Bar admitted tivo carriages, and ho thought a space three or three and a half carriages wide would oreate confusion, and that there was no necessity for remorin: Temple Bar. Lord Selborue had a Bill befor Parbiament by which oue.fourth of the site for the Law Courts would not be required. The resolution was carried.

THE MARCE OF TMPROTEMENT.

But Citymaxd there's yet ono Bar,
The Board point out, that stops simproveuent ;
Twould omash their grand trinmplat car
To drive against tha Strand-still moverueat.

## THE PALESTINE FUND.

Tere Quarterly Statement, dated April, 1873, of the Palestime Exploration Fund has been mhlished at the Society's office, 9, Pall-mall, and by Bentley, of New Burlington-street. It is more than usnally interesting. The contents include letters and roports from Lieut. Conder, R.E., and Mr. Drake; an account of the discoveries at Mount Gerizim and Ehal, hy Captain Wilson; Mr. Sohick's recent work in Jernsalem ; inserip. inscriptions; the royal oity of Gezer, and other matters. There is a map to illustrate Lieut, tion from Aleppo; Mr. Wright, on the Hamah summit of Mount Gerizim, where traces exist of an azoient castlo and an octagonal churoh, helieved to havo heeu built hy Justinian, circu A.D. 533. The archroological explorations of Lieut. Conder are thus summed np:-
"We find 35 per oent, of tha raus ' indistinguishable", of Jewish remains, the rock cut tembs and reservoirs,
the tells, and a fow ancient wells end cisteras, are the principal, tombst, reaservoirs, tomples, ard traces of ad
pown, are amongat the Roman remains. Churches and
the

 would show, but this proportion enanot be reasonally
expected. It scems probuble, bowever, that we hava now
 at least 100 ruins, whiol may some day serye
light on the Biblical topography of Paleatine."

New Consexvative Hall at Boeton,--The foundation-stone of a new Conservative hall has now 600 memhers, principally consisting of working men. A company has been formed, and shares of 11. each issued. A commodions Conservative hall is to be erected, at anestimated cost of hetween 6,000l. and 7,000 \%, the architecta heing Mr. G. G. Scott, jun., and Mr. J. O Scott.

## SALFORD DEATH-RATE.

Sir, -Salford now enjoys the reputation of a death-rate of 40 per 1,000 . This is doubtless we have had during the past few weeks, causing ineroased evaporation and exhalation of noxious vapour from open middons and other vile places vapour from open middons and other vile places
attached to nearly every house. These are astally left for montbs nsuany left for months Logother unemptied of thei a ccumniating contents, and become in warm High wages and much drinking also help largely in producing the result. The Builder bas much in producing the result. The Buwat bas much
work yet to do.

## CHURCH-BUILDING NEWS.

Potherham.-The Rotherham Church council propose shortly to make certain alterations and improvements in the parisb church, and it is stated that the Earl of Effingham intends to pn Gilbert Scott has been down from London to in speot the churoh. It has been thought desirable that the gallery, which was erected abont ninety should also be demolished ; but as yet Sir Gilbert has not reported on the matter, and nothing has been definitely docided upon.
Bristol.-The whole interior restoration of the Temple parish chnrch is so near completion that it has been re-opened. The work of restoration has been many months in progress. The whole livine worghip. Tho pillars and walls through. out have been cleansed of their many coats of Nhitewash, a dozen or moro, -and the stones gointed. Almost as much work has been done inder the floor as above it; for not only have The vanlts beon sealed and the ground concreted, unt one of Haden's hot air and water apparatus
aas heen laid down under the floor. The nave ans heen laid down under the floor. The nave rith cathedral glass. The old high pows have jeen removed, and open seats of varnished pine, These arved oak ends and tops, suhstituted about 3 in, ahove the aisle These are raised about 3 in , ahove the aisle
loors, whioh are Iaid with coloured tiles. Gas supphed from coronæ round the pillars, and in be aisles elso. The roofs of the aisles have peen renewed, and the roof of the nave panelled nd decurated. A stained.glass window for the yest ond has been promised. The space under ho tower has been cleaned out, and a groinod
tone cailing put in, and it is now used na aptistery. Around the walls have beeu placed he tablets which were formerly scattered ahout ho churoh. The restoration work in the chancel ad at the east ond of the building is vory
xtensive. The chancel floor has been lowered bout 2 ft ., thus improving its somewhat low ppearance. The pavement is of encaustic tiles. he coiling has heen panelled. The old Colston oreon has been removed from the back of the ommunion.table, and is put up in the Wearers' Gained glass, the work of Clayton \& Bell with indow, which is in fivo oompartments, repreonts the Last Supper. In the Weavers' Chapel re two stained.glass windows. One, at the end, y Bell, of Bristol, is put in in commemoration
the Rev. John Wesley. It is in compartments, epresenting the presentation of the infant esus, Simeon prophesying, and other scenos in ae Temple. At the top aro the figures of the
ariour, David, and Solomon. The second ariour, David, and Solomon. The second
indow is at the side, and is a present from
Lessrs. Hall, of lessers. Hall, of Broadmead. It has two irtuons woman (Prov. xxxi. 19, 24). During 10 progress of the work an ancient sepulchre if the thirteeuth century was found in this bapel, from the position of which it would ppear that the original floor of the church was
foot lower than the present one. The execu. on of these and other alterations will cost [r. Diment, and the work has been done hy
ane superintendence of [r. Diment, under the superintendence of
Cessrs. Ponton \& Gough, architects, with whom as assooiated Mr. B. Ferrey, of London, as conBrecon architect.
Brecon.-The committee entrnsted with the astoration of the edifice of the Priory Church, let on Friday, the 28 th ult. The wrork will be urried out under the superintendence of the
tehitect, Sir Gilbert Soott. Five tenders for 10 work reqnired to he done in the nave, north id south aisles, and porch, were reoeived and ad, viz.,-Messrs. Williams \& Sons, Brecon,

4,4207. ; Messrs. Wood \& Sons, Worcester, 4,237l.; Messrs. Coleman, Gloucester, 4,195t. ; Mr. Wil. Tams, Llandaff, $3,954 l$. ; Messrs. Collins \& Cullis,
Tewkesbury, 2,910l. The lowest tender was Tew kesbur
Totnes,-Gradually, and not before it badly wanted, the work of restoration is taking place in St. Mary's parish chnrch. Several years ago the building was inspected by Sir G. G. Scott, and the restoration having been placed in that gentleman's hands, tho works then suggested by him have since been carried out in sections, acoording as means have allowed. The additions that have been made, as seen from the exterior, are a north aisle built of blue limestone, with dressings of Doulton stone, and a new vestry. Insido, the transformation is almost oomplete, by the removal of two-thirds of the old pews that ohoked the nave and aislos, and the introduction of low, open benches of a modern oharacter. Beneath the new north aisle, which bas a flat panelled timber roof, ornamented by carred bosses at each intersection of the varions members, a gallery, under Sir Gilhert's directions, has heen erected, -an addi. tion renderod necessary to meet the demands for space by the congregation. The columas of the north and south arcades have been straight. nod as far as possible, and cleaned down. Three now windows have been put in on the south side of the church, and two others for the west end are now in progress. The grand tower-arch, the existence of which bad the organ.gallory, cotten, has been which bad almost heen for. gotten, has been opened to view, and will now re speedily restored, The organ has heen renoved to the east end of the north aisle. The The works have with hlack and red enoanstio tiles. The works hare been carried out principally by r. Roeves, bailder, Totnes. The stonework in he south aisle, and of that portion now in pro gress, is hy Mr. J. Pulsford, of Barnstaple. Mr.
Harry Hems, of Exeter, has, from time to time Harry Hems, of Exeter, has, from time to time secuted the stone and wood carving.
East Orchard-The parish churolh of St. completely rebuilt, excent the oned, after being completely rebuilt, except the tower. It bas lition, and the pews were both rotten and ill-arranged. It was for somo time hoped that by underpinning the walls, renewing defective stones, and the like, the old church might have been put in proper condition at a cost of about 350l. ; hut it was eventaally found necessary to rebuild it entirely. The chancel has been re built, with on increaso in length of 4 ft ., by the Ecclesiastical Commissioners and the prosent lesseo of the great tithes, for 235l., under the superintendence of Mr. E. Cbristian, who has retained the old form of circular roof, and the windows have been rebuilt with the old stones in the old places. The дave bas boen rebnilt from tho plans of Mr. Crickmay, of Weymonth, room en wider than the old, thus giving extra to be dispensed with, and showing off the proportions of the tower arch. The roof being con. structed without tie-beams does not obstruct the view of it from the nave or chancel. The work was not contract work.
Northampton.-A movement is in progress for under the supervision Peter's Church, Ranands, is car the supervision of Sir Gilbert scott. It reach abore that the total cost of the work will has been raised by the half of this amount assisten raised by the vicar and his friends, assisted by the inhabitants of the village generally; and they appeal for assistanco to lovers of ccclesiastical architecture and promoters of The Wesleyans at Raughout Northamptonshire. The Wesleyans at Raunds ore also putting forth extra exertions. They advertise for tenders for She erection of a new chapel to soat 800 persons. a restoration. The church here is now nndergoing centre and north aisles, the walls re-plastered, a The aisle added, and the porch brought forward. The chancel and other parts of the church have recently been done, and the tower is in good dreservation, but needs a turret, which untend to mak the edife will be added, anduroh. yard is to he enlarged, and the old unsightly mud wall to he removed and replaced by a hrick wall, so that the church will be thrown much more open, and a better view obtained from the oad and rectory. The plans and specifications have been drawn by Mr. Wyatt, the diocesan architect, and Mr. T. Miles, of Shaftesbury, is St. Asaph - The
St. Asaph.-The list of subscriptions to the
fund for restoring St. Asaph's Church, amounting in the aggregate to 1,825 l., with an ahstract of aocount, has just been issued. The work has been designed and executed by $\operatorname{Sir} G$. G. Scott Oxford.-The new chapel at Keble College Oxford, is about to be ereoted at a cost, it is stated, of abont $30,000 \%$. Mr. Gibbs, of Tyntesfield, will provide the menns.
Tiffeld.-The parish church of Tiffield, near Tow cester, has been re-opened after nndergoine a restoration. It had been eularged in 1859 by the addition of a south aisle for the use of the boys of the Reformatory School close by. This Was done mainly at the expense of the late Lord Southampton, the patron of the living, the come mittee of the Reformatory contributing 1001 . The ohuroh at Tiffield was in a wretched condition, and grievously needed the restoration which has just been effected. The style is Early English, of a plain and unpretentious type, entirely devoid of ornament ; and the work has been carried out in conformity with the character of the edifice. With the excep tion of the tower, the north wall, and the new aisle, the whole has been rebuilt. One of the chief features of the interior of the church was the arcade which divides the north aisle from down, but it ho rial bur have A new tower arch and a new chancel arch have been constructed. Theiz place was previously ocoupied by the merest apology for an arch, lath and plaster, tnrned, covering un carved stonework. The chancel arch consists of wo mombers, each supported by corhel shafts of Caen stone. The east window is of stained glass, and is the gift of the rector and members of his family. It is of three lights, the head being fllicd in with two quatrefoil and one tre foil light. The oentre light contains a repre sentation of Christ as the Good Shepherd, carry ing a lamb in His arms; the other lights con. tain the sacred monograms. The window is the work of Messra. Jones \& Wilis (of London and Birmingham). The roof of the charch is oper and of stained timher. The seats, which are of stained deal, are new. A. new screen of stained deal separatos the nave from the lower chamher of the tower. The west window in the north aisle is the gift of Mr. Wm. Brown. The cost of the restoration has heen some 600l. or 700 l . The restoration of the chancel, costing some 200 l ., has been effected at the expense of the rector. The work has been done from the designs, and under the sqperintendence, of Mr. T. H. Ver. being the builder. In the fonndations of the south wall of the chancel was found the upper part of a cross-the stem entirely broken off, out the three limbs with floriated terminations still intact. It has been built into a niche of the chancel wall for preservation. Another relic of the past was also discovered built in the chancel wall. It appeared to he the fragment of a miniature stone coffin, and contained the roken romains of some undecipherable stone figure, the legs of which, however, were apparently uninjured.

DISSENTING CHURCH-BUJLDING NEWS. Swansea, - The opening of Libanus Chapel, or rather "Cathedral," which is situate at Morriston,- -in the midst of a dense population of smelters, tin-plate workers, iron pudulers, furnacemen, and colliers,-took place on Snnday, the 22nd ult. The architect was Mr. John Humphreys, of Morristou. The total cost of the huilding can scarcely he less than between $8,000 \mathrm{l}$. and $10,000 \mathrm{l}$. The erection of the chapel is due, principally, to the liherality of Mr. R. Hughes, of Xnistawe, and of the Landore Tin. plate Works. The chapol is erected on freehold latd, previonsly puroliased by Mr. Hughes from Sir John Armine Morris, baxt., for 640t. The building is in the Italian style of architecture with a tower and spire 160 ft . high from the base. All the walls are built of native hlne stono with Bath stone dressings. The front contains four pairs of detached columys, and pilasters one elliptic and two semi-arches aro adopted to relievo the entablature over the columns There are eight doorways: four in front and four on the sides; the side doorways being entered by steps and slopes so as to relieve the steps as much as possible. The halustrading and hand-rails to the steps externally are also in Bath stone. The internal arrangements inclnde a spacious room on the basement, 15 ft . high with class.rooms ;"vault for the hot-air apparatus
tea-making, and ante.room and offices roind is well adepter for which have foul staircases to main floor. The floor of the chapel is circular, and so arranged that by placing the foci in the pulpit all the sittings on the gronnd floor aro facing the minister direct. con nected with the gallery by seats, each rising 6 in . The organ is placed at the back of the orchestra. There are four sets of stairs to tbe gallery. Tho internal measurement of the chapel is $91 . \mathrm{ft}$. by 58 ft . in clear, providing sittings for 1,450 adults in the gallery and ground floor,--not including the aisles and standing room, The building will, however, accommodate, when necessaxy, a much greater
numbor. Fresh air is let in by a number of woodon tubes comected with ventilators in the outer walls, lot in by iron ventilators in the aisles of the ground and gallery floors. The foul air is carried oll by a 9 -in. iron tabe from sunburners in the ceiling conveyed to the tower. The various parties who took part in the work are as follows:-The masonry was done by Mr. Daniel Bath stone masons. Mr Joseph Tracey heing foreman of tho carpenters and joiners, and acting as clerk of works; the plastering was of the carving, internally and externally done by Mr. Georce Houghton, of Bristol. the painting and decorating, providing and fixing Mr. T. W. Morgan, Swansea; the plass was sup plied by the St. Helen Glass Company, Bristol the sun-burners and gasfittings wero supplied hy Messers. Hulett, London; the wrought.iron entranco-gates supplied by Mr. J. W. Dover, Manchester; the Bath stone from Messrs. Stone, Brothers, Batb. The whole was carried out monder the superintendence of Mr. J. Humphrey who supplied the plans and specifications.
West Hartlepool. - A chapel, erected by tho
Weslegan community of West Hartlepool, has beon opened for divine service. The new edifice is situated at the top of Church-street, imme. is situated at the top of Church-street, imme-
diately adjoining the Camhridgeand Hart roads. The architecture is Corinthian, and the chape is capable of accommodating 1,250 persons. new Primitivo Methodist chapel at Guilden Sutton have heen laid in the presence of a good number of persons from the village, and Cboster and neighbourhood. The chapel is to be built in the Gothic style of architecture, from designs prepared by Mr. W. H. Radingston, of Sydonham, and is to be 24 ft . wide by 30 ft . long, in the rear of which is a vostry, 21 ft . by $11 \mathrm{ft.4} 4$ in., which sliding doors, and thus accommodation will be niade for about 150 hearers on special occasions. Messrs. W. \& J. Vernon do the hrick, plastering, and slating, Mr. Joseph Duckers tho stone work, and Mr. Reuben Jones the joiuers' work.
The site of frechold land is 29 ft . wide by 46 ft . in depth, and is the gift of Mr. Robert Smith. Thiitby. - The memorial-stones of a nev Primitive Methodist Chapel have been laid at Whitby. The new chapel is being erected on land given by Mr. James Worrall. It is Gothic in style, and presents to the road leading to Ellesmere Port a gable, with a double twollight window in the centre and a circular one above.
Below there will be a square porch, with stone Below thero will be a square porch, with stone
cornice, with a two-light window in it in front and accoss to the chapel can bo had from either sido. The remaining mindows consist of three two-lights on each side, a circular one in the grabe behind the minister's desk, and two side of the door. The materials used are bricks principally,-blne, red, and yellow in the windowheads, and white stone sparingly introduced The interior fitlings will be of pitch-pine, stained and varnished, the seats open ; and accommodation will be proxided for about 120 or 130 persons. The principals and spars are up, so that the place is nearly ready for roofing in corbels, and the roof will be hate rest on stond architect and builders are the half open. The encared on the Guild are the same as thos engaged on the Guilden Sutton Chapel, namely, Mr. Joseph Duckers, and Mr. Roubon Jones.
Halifano. - It is proposed to build a noer ch for the Primitive Methodists at Halifax. The intention was reported at a recent moeting to cured; then to brild a good school and class-
room, and pay for them; and afterwards "to
erect a chapel, at a cost of some 3,0001 ., and pay erect that. It might be a long time hefore this project was completed. The report was adoptod. project was completed. The report was adeptea.
Keighley. -The corner-stone of a nerw Wesle yan Keighlicy. -The corner-stone of a new Wesleyan shool chapel has been lail, at Hermithole, New. road Side, Keighley. The building, which is intended to be used both as a chapel, Sunday. school, and day-school, is from designs supplic Dy Mr. George Smith, architect, Keighleg, and will be in the Gothic stylo of architeotnre. It 24 ft ; an infant school-room 3.4 ft by 16 ft . by $24 \frac{1}{2} \mathrm{ft}$; an infant school-room, $3+\frac{1}{2} \mathrm{ft}$. by $16 \mathrm{ft}$. ;
and two class-rooms, each 17 ft . by 16 ft . There and two class-rooms, each 17 ft . by $16 \mathrm{ft}$. . There
will be accommodation for 300 to 400 scholars, will be accommodation for 300 to 400 scholars, and the cost will he 1
have been promised.
Little Horton. A new chape] and schools for Little Horton are to be built. A site has bee Fixed npon which will cost $400 \%$. It is intended to erect a building of two stories, the lower on to contain a school-room and class-rooms, an the second story to be fitted up as a chapel, the cost of which is not yet ascortained. $\Delta$ huilding committee has been formed, and the working people of the neighbourhood have for some time contributed weekly snms towards the movement. London. - The new Welsh Congregationa chapel in Southwark Bridpe-road has been pened for divine servico. Mr. Samnel Morley, I.P., has given 500l. towards the purchase money of the ground, which is abont 430 square yards. The entire cost of the work is but hali efrayed, so that near! $3,000 \mathrm{l}$, are yet required. Thest Cannock.-The new Wesley an chapel a West Cannock (or Hednesford) has been opened for public morship. The trnstees have alread determined to cylarge their chapel, all the sittings in the present building being taken, an thers applied for The enlarrement will b mder the merintend of N Joyce, Stafford, the architect of the chapel.
Wellingborough.-The now Wesleyan chapel recently erected in Park-street, on the Poplar ostate, bas been opened for public worship. It is capahle of seating about 700 persons. It is built from a plen anpplied by Mr. C. Ball, archiect, London: tho contractors being Messrs. Barton \& Poach, of Rothwell : the superintendent of the works, Mr. John Blumt, of Wellingborough $t$ is of the Italian style of architecture, and chiefly of black, white, and red bricks. Th font is supported by a portico of stone pillars rallerverved capilals. Two hohbs lead to the f thes, the entrances to which are independen of the body of the chapel, the staircases being of stone. The interior is fitted up with oper eats of varnished deal. There are three alleries, which are ibted with open seats, the ront of the galleries being ornamented with pen woodwork. Instead of the old-fashioned pulpit a platform is erected, capable of accomnd immediately behind the At the east end, and immediately behind the platform, is an aroked recess for the choir. This was an afterthought, and was mado at an extra cost of 60 The place is lighted from numerons oval win lowe for daylight, and for evening worship there are two large star gas pendants. Attached to the chapel at the east end is a large schoolroom, 39 ft . by 25 ft ., besides a vestry and numeron offices. The cost was somewhat over 2,0001 ., the principal part of which has already been sub scribed.

## SCHOOL-BUILDING NEWS.

Chester:-The new school of St. Thomas, for girls in the parish of St. Oswald, has just been completed. The school is of Early Gothic conspicnous building when viewed from the lower ground of Bouverie.street. It is built of red bricks, and has a tiled roof. The entrance is through a porch at the south east corner, and a restibnle, with a lavatory at the further enc The principal room is 64 ft . long by 25 ft . wide corner, 16 ft . long by 13 ft .6 in . wide, will accommodate 187 children. Abeve a high vrain soot of wood, stained and varnished, the wall are lined with white bricks up to the caves, and the sohool is well lighted by four three-light windows on wo fio a bec-light window in an weat gible tho single log in the east and ventilated both by means
Gloucester.-The chief stone of Barnwo new national school has been laid on a site oon
present school. The contract having been puinto the hands of Mr. Clutterbuck, he is nom busily engaged in building a school from designuin hy Messrs. Waller \& Sous, architects. Thi structure will be of brick, and will consist of : school and class-room, with apartments for the teacher.

Rhind, architect, left a boquest of the reversionary interest of the estate of Sibster, in Caithness, to the Conncil of the Society of Antiquaries of Scotland, for tho foun. turer to be appointed by the council of the society, either for life or for a torm of years, to
deliver annnally a conrse of lectures on some branch of archreology, eth. nology, etlinography, o1. allied topic, and the counoil to determine whether these lectures shall be frec to the puhlic, or whether admission
shall be by a rooderate fee. The becquest will now come into operation as originally intended, now come into operation as originally intended Archeoology will be added to the number of per. manent inatitntions for the advancensent of science in Edinhurgh. Mr. Rhind alsoleft a sum
of $5,000 \mathrm{l}$. for the foundation of two scholarships of $5,000 \mathrm{l}$. for the foundation of two scholarships
in the University, and $7,000 \mathrm{l}$. for the establish. in the University, and 7,0001 . for the establish.
ment of an institation for the industrial training ment of an institntion for the industrial training
of orphan girls at Wick, whioh will now also come into operation. The saperintendenco of monnments, suggested in the memorial, is still, however, unprovided for; but perhaps the
Government will agree to place this superintend Government will agree to place this superintend.
ence in the hands of the lecturer to be appointed ander Mr. Rhind's bequest.

Unwholesome Water.-The following is an extract from the annual report of the consultin chemist, Dr. Vöelcker, to the Royal Agricultnral Society, relative to the unwholesome water fre. quently found in villages and farmhouses:-"In my last report I directed attention to the fact well supplied with rood wholesorog dying not well supplied with good wholesorae drinking. water, and that as a rule the water in towns is purer than in the country. I have now to report that, during the last twelve months, as many as fafty.three samples of water were sent to me by members of the society. A consider. able number of these waters I found unmistakably contaminated with sewage products and utterly unfit for drinking purposes; and I tho bad quin circet attentor which is omplozed in country places for drinking and general domestic purposes is a cause of the prevalence ocalities fer and other disorders, less coloured, and at the same time has a dis. agreeable smell, or should it he quite clear and exhihit particles of white flocenlent matter, I mould urge upon those who habitnally use the vater to discontinue its nse at once, and to have it submitted to a thorough chemical analyais

Close" Hiouses.-Mr. Justice Arohibald suffering from a serious illness, "the result of miasma at his lodgingrs in Liverpool." The odgings of the judges are at Newsham House, last visit of tho, it appears that drring the a disagreeable smell in his bedroom. He com. plained of the faet to the mayor, and the worongh engineer attended with a numher of pipes with chloride of lime. In addition to this, orders have been issued by the Health Committee to have a searching investigation madc, and the matter is to be rectified hefore tho next assizes. It appears that a similar complaint was made by it was tice Mellor during his visit last year, and been cansed by a rat making a hole through the lead pipe leading from the hand-basin in the hedroom to the main Bewer.-The Philadel phia Medical Times roports that a stndent was thoing his examination was asked what replied, "They snucll so hadly that the people pen the windows, and the frees air gets in." Something more, however, scoms to he wanted at the Liverpool lodgings of the judgos.
Sir John Lubbock's Shop Howrs Regula tion Bill.-The seoond reading of the Shop Hours Regulation Bill, introduced hy Sir John Lubbock last week, is fixed for Tuesday, the 20th of May. By it it is proposed to apply the pro-
risions of the Workshops Act to the regulating risions of the Workshops Act to the regulating
of the hours of lahours of children, young per. sons, and women, in the shops far the sale of goods and otherwise. The term "shop" aefined to include any huilding in which any artiole is sold or exposed for sale. As in the
case of workshops, employment is to be limited case of workshops, employment is to be limited
in shops to ton honrs and a half suday and it in shops to ton honrs and a half a-day, and it
must not begin before six a.m. or continue after nine not begin before six a.m. or concinue to the Saturday half.holiday does not apply, Christmas Day, Good Friday, and the Bank holidays are made compulary. The term young person includes every apprentice, male or female, The Secretary of Stato may anction employ ment in any retail shop for fifteen hours. Pro mises liconsed for the salo of intoxicating liquors or in which articles of food are sold for consumption on the premises, and bakehouses, hut not hakcrs' shops, are exempt.

Sale of Land, \&ce, in Bristol. -Last wee Mr. George Nichols, auctioneer, of this city, ofrered for sale by auction, at the White Lion farm ground.rents, and building land, situated in various parts of Bristol. The prices were as Brisw :-Lot l, a freehold farm, Hengrove Farm 4807 ; 3r. 37p., at Knowle, 300 l .; lot 3 , a freehold close of arable land, 2 a .20 p ., at Knowle, 200 l . ; lot 4, a jearly feefarm rent of $50 l$., issuing out of houses in Temple, 1,1102.; lot 5, two freehold Totterd-rents of 3 l . 3 s . each, the houses being at rents of $3 l$. 3s. each, the houses being at Totter. down, $160 l$.

The House of Commons' Signal Light. On the north face of the upper part of the clook rected 11 fonse lantern has been temporarily of intensoly. high. In this lantern is a pillar resolves its white hght, which on a noar view flames placed into thrce steady and briliant these three flames appear to unite in one round sun-like blaze, which throws a strong beam to a great distance. The light is the invention of Mr. John R. Wigham, who is a member of the firm of Edmundson \& Co., of London \& Dublin. It is produced by the combustion of ordinary gas, and is a naked light needing no chimney. A large iron pipe, howover, is brought down to the top of the flame, and the oxygen of the air is so hrought into immediate contact with the incandescent carbon, which is thus completely hurued, with an intensely white heat. The flash is produced hy passing a dioptric lens in front of the light passing a dioptric lens in front of the light, thus concentrating it,
into a singlo heam. The inventor claims into a singlo heam. The inventor claims for and necds but little attention. We underatand and necds but little attention. We underatand periment is also to be tried with the electric periment is also to be tried with the electric
light, which will be exhihited from the western face of the tower, in a weol or two.

A New Doomsday Book.-At a meeting of the Statistical Society, held last week in the Socioty's rooms in St. James's-square, a paper was read by Mr. Frank Fellows on the subject of "A New Doomsday Book." Dr. Fart, F".R.S., president of the society, ocenpied the chair Mr. Fellows said the full title of his paper was "Our National Parliamentary Accounts, with Sugges.
tions for Establishing a Doomeday Book, givinc the Yalae of National Governmental Property or Assets as the Basis of a Sound Syatem of Account, by which Expen-
diture for Capitat and Current Account shall be Sepa rately Shown."
There appeared to him to be a great incomplete. ness in the manner in which our national Government finance accounts were presented to Parliament. The incompleteness was mainly in this, that the Government of this country did not and conld not tell the value of their assets We did not know what wo were worth in national property, and till we knew that he maintained that we could have no thoroughly satisfactory system of national finance acco There was a general concurrence of opinion in the meeting as to the importance of the quesment wonld give it their best that the Govern ment wonld give it their best attention.
Iondon Parlrs. - The Registrar General gives the following statement of the area of the pnblic parks in and ahout London, as ascer St. Jamen's Park, 58.5 acres ; the Green Park, $60 \cdot 3$ acres; Hyde Park, 386 acres; Kensington Garderes; Hyde Park, 386 acres; Kensington Gardens, $245 \cdot 5$ acres; the Rerent's Park, 406.2 Pares; Victoria, Park, 2268 acros; Sonthwark Park, 63 acres; Kemnington Park, $19 \cdot 7$ acres;
Battersea Park, $119 \cdot 4$ acres; Greenwich Park, Battersea Park, 119.4 acres; Greenwich Park,
190.4 acres. These ten parks together contain. $190^{\circ} 4$ acres. These ten parks together contain.
ing $1,852 \cdot 8$ acres, are all within the reristration ing $1,852 \cdot 8$ acres, are all within the reristration
division designated "London," which comprises division designated "London," which comprises
78,050 acres, including 2,718 acres of the Thames Beyond these limits, but still within the Tistrict served by the Motropolitan Police, thero aro also Richmond Park, with 2,015-5 ares; Kow Gar. dens, de., with $322-8$ acres; Old Deor Park, with Hampton Coushey Park, 993.9 adres; and five parks cont added to the area of the ten parks first above named, make a total of 6,1189 acres of public or about Lozdon.

Disestablished London Pumps.-At a recent meeting of the Marylehone Vestry, a Weatern District Postooffice asking that of the pumps be searched for missing letters, and that precautions be taken to provent letters being deposited in them in future. It was resolyed that permission he given to the surveyor to search the pamps for missing letters. It trans. pired that the postmaster had written the letter in consequence of the non-delivery of letters entrusted to a servant.girl; and when asked where she had posted them she took tho postman to an tnnsed pump in which three letters mere found. The new dust-shoots in the streets are not nnlikely to form traps to catch letters at times, too, ander similar circumstances, or when even more intelligent persons have their attention engaged, in talk or othermise, while posting letters.

Society for the Encouragement of the Fine Arts.-Dr. Hyde Clarbe delivered a lec. ture on Thursday evening in last week, beforo the memhers of this Society, on the "Races of Monument Builders in America," - Major Britten in the chair. The lecturer was of opinion that, having regard to the othnological and linguistic conditions, there was a commnnity of origin of the several monument-hvilding races in the old and New Forld. After referring to the Pygmean and Araw (represented in the Guarini and Amagaa), as examples of common migration, he expressed a douht whether there was any snff. cient rcason for entertaining the idea of a dis. tinct or indigenons American language or gram. mar. The lecturer also referred to the tradi. tional knowledge of the Americans preserved daxing the Greek and Roman periods in the theory of fonr worlds entertained by the school of Pergamns in Asia. The third conversazione of the session will he held at the South Kensing. ton Mnsenm, on May 8 .

Death of Dr. Bence Jones, F.R.S.-This distinguished physician and chemist, who was Secretary to the Royal Institution, expired on the 20th inst., after a long and, latterly, severe illnoss. Dr. Jones, who was consulting physician to St. George's Hospital, was tho hiographer of Faxaday, and by his many and valuahlo contributions to the advancement of scienos, amongst which may be mentioned his Croonian Lecturos on Matter and Force, Animal Chemistry in rela. tion to Stomach and Renal Diseases, Lectures on Pathology and Therapentics; the Royal Institution, its Founders and First Professors, \&c., Dr. Jones was well known. Ho was a member of many learned and scientifo socioties at home and aliroad, and married some vears since Lady Mellicent, daughter of the Earl of Gosford, who, it is believed, survives her distingrighed husband.

The Working Men's College.-On Monday evening the summer term of the Working Men's College in Great Ormond-street was inaugurated by the newly-chosen Principal of that institu. present students of the Collece The old and entertained at a suhstantial tea in the new buildings, the company adjourned to the art. room, where Mr. Mughes took the chair, sup. ported by several of the fellows and professors, and also by several visitors, including Mr. R. W. Emerson and several ladies. The room was full to overflowing. The Principal made a short speech. The meeting was snhsequently addressed hy the Fice-Principal of the college, Mr. Litchfield, and other gentlemen, and the programme of lectures and the class arrangements for the ensuing term were made public.

The Channel Tunnel. The committee of the Channel Tunnel Company has had an inter. view with the French MLinister of Puhlic Works, at the Ministry in Paris, for the purpose of oh. taining from him an order for opening the Loeal Enquête, which is tho prelininary legal step to granting a concession. The committee was re. presented by Lord R. Grosvenor, M.P. (chair. man), Major Beaumont, M.P., Count ML. G. de Wecale, M. Bergeron, M. de Gamond, and the seoretary to the company (Mr. Bellingham). MI. de Fourton assured the committeo that in prin. ciple he cntered heartily into the views of the company, He mnst necessarily consalt the Council of Ministers hefors issuing a decree. But he saw nothing to prevent the project from being favourahly considered hy the Council.

Opening of the Birmingham Sanatorium. The institution at Blackwell, near Bromsgnove, known as the Birmingham Sanatorium, has been the president. The site of the building is M.P., elepated part of the ridge the building is on an grove Lickey, between Birmingham and Broms. grove Lickey, between Birmingham and Broms.
grove, and forms a prominent ohject on the west side of the Bristol and Birmingham Railway. In course of the proceedings, Sir John Pakington cours that from proceedings, sir John Pakington said that from $1,200 l$. to $1,300 l$. Were given for that admirahly chosen site, that the huilding
itself would cost 9,000 , and that it wonld itself would cost 9,0007 , and that it woald
require a further snm of $2,500 \%$ or $3,000 \%$ to require a further snm of 2,500 . or $3,000 \mathrm{~L}$. to of patients ; making an arg fit for the occupation of patients; making an aggregate snm of 14,000l.
contrihated mainly hy Birmingham.

Bronze Casting.- Messrs. Yonng \& Co. intond casting Mr. Nohle's statue of the late Lord Derby at their Works in Eccleston-street, Pimlico, on (this) Saturday, the 26th.

Dangers of the Tram. The practice of tram-conductors leaving their stations to collect payments from outsido passengers is fraught with much danger, as tho communication with the driver is thereby interrupted. We have recently witnessed two or three instances where the passengers, after having in vain sought the driver's attention to stop the carriage (even thongh the conductor had heen told previously) have been induced to jump off the step, and met in one instance with dislocation of the shoulder, and in others with severe hruises, to say nothing of injured clothes and the risk of heing ran over. The system of collecting the fares requires amendment. The conductor has quite enough to do in assisting the passengers in and ont.
The New Assize Courts, Winchester:Workmen are now actively engaged in excavating the ground and concreting it for a foundation for the walls of the inner or connecting hall between the old hall and the new courts at Winchester Two or three interesting objects have heen disoovered. A conple of Roman Bronze coins, of Licinins, A.D. 311, and Carus, A.D. 292 ; also an old pit, or cesspool, part of the ancient Norman Castle. This is very deep, capitally constracted of fine hewn chalk hlocks, and as good as when first made. It commnnicated with the castle ditch, the drain being still in existence. The ancient ronnd tower, close to this pit, is to he
excarated, and its foundations will he arched over.

Valnation of Property for Rating. Mr. Stansfeld will, on the 1st of May, propose a Bill to amend the law rolating to the liahility and valuation of property for the purposes of taxes The rates and the making and collection of rates. The importance attaching to this suhject is shown hy the fact that according to the last return the poor.rates in the year ended Lady. day last year amonnted to $12,381,278 l$., of which 8,007,403l. Were applied to the relief of the poor ; 26,196l. law charges; 588,2136. for pnrposce partly connected and partly nnconnected with relief and $3,750,466 \%$. for purposes wholly unconnected with relief. Mfore than one-third of the poor rates was expended for "other parposes" than the relief of the poor
Proposed Lecture-hall and School of Art for Leicester:-The Town Council of Leicester have appointed a committee to consider and report upon a resolation passed at a pnhlio
meeting held in the mayor's parlonr on tho Jannary last, viz., "That this meeting cordially commends to priblic support the proposal to raise the saln of 3,000 s. towards the expense of providing, in connexion with the Mnseum, large lecture-hall and suitahle accommodation for the school of art: such sum to be offered to the Corporation of Leicester on condition that they spend an additional sum of at least equal amount on the accomplishment of the two objects."

The late Rajah Brooke.-An effort is being made to raise a memorial to the late Sir James Brooke Rajoh Brooke of Sarawa wh died nearly fire years ago, and of whom no memorial exists. "It is a reflection on our nation," writcs General Sir G. le Grand Jacoh, in the Homeward Mail, "that one who did ench wonders in the East should he so soon forgotten. I, who lived and travelled with him in Borneo, knew his worth, and witnessed the child-like veneration of him hy his people." Sir James Brooke' eminent scrvices ought to ho publicly rocognised hy a statue to his memory in Westminster Ahhey, side hy side with that to Sir Stamford Raffles, tho henefactor of Jara.
Statue of the late Mr. John Biggs, M.P A marble statue has been puhlicly nnveiled at Leicester, by the Mayor. Mr. Biggs was identified with the town for his whole life, and helonged to a family traced in the connty for 300 jears, Mr. Biggs died in 1871 , and was arvarded a puhlic funeral. The statue has been placed in the centre of the town. It is of white
marhle, by Mr. G. $A$ Lawson, of London, and is, it is said, a good likeness.
Church of the Sacred Heart, Camber-well.-This newly.erected chnrch has heen further emhelisished by a copy of the Madonna desimed to he exeented in mosaic The picture the gift of a late picture the gilaster adjoining the pady placed against executed hy Mr. Frederick Blackbourn daring his residence in Rome.

The New Surveyor of Westbromwich. A complmentary dinner has heen given at Pen. pointed to the surveyorsip, who has heen ap. Ahout sixty friends man, in porends were present, Mrd Lofthouse said that he had for the last fourteen year honourably ocenpied the pnblic position of sar veyor of Pendleton, nnder the Corporation of Salford. The handsome timopiece which he liad the honour to present to Mr. Lofthonse, and a purse of gold which wonld he suhsequently pre sented, had been snbscrihed for by orer 400 rate. payers in the district. The timepiece was valued at $14 l .14 s$, and the purse contained 225 sore reigns.

Alderney Harbour and Brealwater.Government seems at last likely to arrive at a definite decision witl respect to the maintonance or ahandonment of the hreakwater and harbour at Alderney. Colonel Sir Andrew Clarke, Colonel Jervoise, and Mr. Hawkehaw have been despatched to the island, and it will greatly depend npon the nature of their report whether the fissures in the masonry shall be made good, the breaches in the hreakwater repaired, and the construction finished; or whether this work, which Earl Cowper denominated "an extra ordinary monnment of mismanagement and folly," he left to the mercy of the maves and to inevitahle rxin.

Monumental.-A cross has been erected in he Southern Necropolis, near Glasgow, from the design of Mr. J. L. Bruce, architect. The body of the monument is of stono from Williamwood Quarry, which is of a warm yellow colour when new, turning to a rich hrown on exposure to the weather. The shafts of the columns are of Ser. pentine marble, and a oheruh's head, introducod in the hase, is, of a light red stone from the neighhourhood of Dumfries. Tho body of the monnment was executed by Mr. W. Buchanan, and the head by Mr. W. Moseman. The height over all is ahout 12 ft .

The Fairbairn Engineering Company.The report of the Fairhairn Engineering Com. pany (Limited) reoommends a dividend of 5 s . per share, which will ahsorb $5,805 l$., and make, with 2s."6d. previonsly paid, $7 \frac{1}{1}$ per oent. for the year ; and the eppropriation of 2,000l. in reduction of the sum paid for goodwill, learing 1,7372. to be carried forward. It is added that the "enormons rise in the values of iron, coal, and all other materials has seriously diminished the profits of the year, and given a graat check to engineering entorprise which will probably be felt for some time to come,"
Laying Foundation-stones with Masonic Ceremonial.-The Freemasons of Gloucester shire have offered their assistance in laying the foundation of the new hospital at Stroud with Masonic honours. Lord Sherhorme, the Provincial Grand Master, with several other distinguished Masons, will take part in the ceremony. The foundation stone of an asylum for idiots near Warwick was recently laid by tho Warwickshire Masons, with Lord Leigh as their chief. Drriag the day a sim of 1,081 . was contribnted towards the institution.
New Building Works at Westminster.Near Victoria.strect an extensive range of promises called the Fictoris Works has just heen ompieted, and is now in full operation fo carrying on the hnsiness of Mr. Heury Wagner, contractor. The works comprise omees, works joinery and other work, stahling, dwelling-housc, \&c. They extend to a depth of 470 ft ., with good ight, and bave a principal frontage of 50 ft . The designs were furnished hy Mr. Proctor
Withers, of Chelsea; the huildings being erected Withers, of Chel
hy Mr. Wagner.
The Ashmolean Miuserm and the Drainage of Oxford. - As there can he no donht that during the excavations for the drainage of oxill, many interesting relics of "old times" will be fonnd, a correspondent or the local Journal suggests that means shonld he adopted
for securing the deposit of them (as far as pos. for securing the deposit of them (
sihle) in the Ashmolean Musenm.
Artists' General Benevolent Institution. At the annnal dinner of this oxcellent In. titution, to be held on Saturday, Nay 10tb, he Right Hon. Sir R. P. Collier will preside Eighty.six applicants w
with the sum of $1,545 \%$.

## VOL XXXI.-No. 1578.

## The lato Sir William Tite.

UR readers are aware of the death of Sir William Tite, which took place on the 20th altimo, at Torquay. Sir William bad suflered for many years past from bronchitis, and, in conse quance, spent his wintera away from London, some times in the South of France and sometimes at Torquay. The immediate cause of his death was congestion of the lunge, hrought on by a chill caught on Easter Eve. His strength rapidly failed, and finally, after a weck of painless malady, he sank from exhaustion. His ro. mains were brought to London, and interred in his family vault at Norwood Cemotery, on Satur day, the 26th; the funeral which was very plain, ac cording to his express sire, being attended only by membors of the mily, Mr. Edward N. Clifton, and two or three hers. The procession, however, was met at the metory gato by many old friends desirous of Wing their respect, amongst whom wer orace Jones, Dr. Dalrymple, M.P., the presi. nt of tho Society of Antiquaries, and several embers of the Royal Society, tho Society of tiquaries, and other sooieties of which the ceasod gentleman was a member, while his 1 friend the Rev. Wm. Rogors, the rector of shopsgate, read the service,
Sir William Tite was the only son of Mr. thur Tite, a merchant who carried on the siness of a Russia merchant in the parish of - Bartholomen the Great, in the City of ondon, Aocording to the cnstom of the time the mercantile community, Mr. Arthur Tite od in the house which contained his counting. inse. In that house, long since pulled down, ir, Wilham was horn, in February, 1798. He ceived his education at a day.school in wer-street, and was distinguished as a vory telligent onergetio lad. Amongst the useful ings at that day muoh thonght of and ry carefully taught, but now almost eutirely glected, was writing. Sir Williana was remark. Ie for his penmanship, an accomplishmont nich he retained all his life. It was a favourite rprise of his in later days to challenge his mpany to a trial of writing,-a challenge Ulingly talon np, for his ordinary band. riting was not over legible,-and Sir William ould then produce, by taking a little pains, a recimen of writing which was usually unsnr. tssed. At the age of fourteen be was ap. enticed to Mr. Laing, an architect of repute that time, who was engaged on the then portant work of building the Cnstom Houso. uring his apprenticoship Sir William parsued o professional studies with the greatest ardour, dd acquired what was at that time rare knowdgo and skill as a Gothic arohitect. Soon after e termination of his apprenticeship his father ed, leaving him a competency; but this, so far
from having any onervating cffect on his ener. gies, seemed to strengthen them, and he had tho good sense to pursne his profession, of which he was independent, and to use his fortune in furtherance of his career. He began business on his owa account, having his office in Jewry. street, and soon, by means of his oonnexion, of his great activity, and intelligence, became known in his profession as a young man of considerable promise. While in the office of Mr. Laing, tho restoration of the chnrch of St. Dunstan in the East was mainly carried out by him. He was assistant-surveyor of the parish, and as such reoeived, in 1821, a vote of thanks from the Vestry for the zeal and ahility evinoed in the restoration of the church.
Tho first known work in his own name was the building of the Scotch Charch for Edward Irving in Regent-squaro, Cray's.inn.road,-a church which was at the time highly thought of, and is still considered a yery fair specimon of ita class considering the date of its erection.
In 1832 he was married to Emily, daughter of H. Curtis, esq., of Kerne.hill, who survives and nourns him.
At this time Sir William parsued his career with unabated ardonr, and was in the babit of sending designs for almost every public competition.
In 1810, when the compotition for the Royal Exchange was announced, it was considered naturally a great prize, and most of the loading architecta of the day contended. Amongst the many unsuccessful candidates on this occasion ras Sir William, and he owed his after appoint. ment to the circumstance that nono of the premiated designs were considered snitable, whereupon the Gresham committee, who were charged with the conduct of the matter, decided to ahan don the prinoiple of unlimited competition, and to rcquest five architects of high standing to send in designs from which the most suitable was to be selected, Sir William's influonoe and character were such that he wasisvited, in company with Professor Cockerell, Sir Chas. Barry Sir Robert Smirke, and Mr. Gwilt. The three last-named gentlemen, however, declined, and nltimately the committee decidod in favour of Sir William. His design, as every oue knows, was carried ont, and at once placed him in the first rank of his profession. Soon after the Royal Exchange was begun, Sir William was reqnested to prepare designs for new Law Court for the City, and it will surprise some to hear that the atyle he adopted was Late Cothic or Tudor. He afterwards andertook bnt few works of an artistic character. The best known of them are the London and Westminster Bank, in Loth hury, exocuted by him in conjunction with tho late Professor Cockerell; the original Vauxhall Ter minns of the Sonth-Western Railway, and the Terminus of the samo line at Southampton; the Blackwall Terminus of the London and Blackwall Railway; the termini and most of the stations on the Caledonian and Scottish Centrol Railwaya; stations on the line from Havre to Paris; the London station of the Woking Cemetery Com pany; and several other buildings intended for commercial purposes. The stations on the lino from Yeovil to Bxeter he oxecuted in conjunction with Mr. Edward N. Cliftor, with whom he had been connected more than twenty years at the time of his death. One of his most recent archi. tectural works was a memorial church, Byzantine in style, at Gerrard's Cross, of which a view and particulars will be found in the volume of the Builder for 1859.* In this he was assisted, as on some other occesions, by tho late Mr. Trotman. It is a brick building; the plan, a Latin crose; with an octagonal dome at the intersection. The general design grevs out of the stndy of the monumente of Pisa, with mhich were connected some associa tions in early life on the part of Major. General

Reid, in whoso momory it was erected at the cost of his sisters.

His endcavours to get the Exchange well decorated should not he overlooked. He brought in Mr. Sang to adorn the ceilings; and it was no fanlt of Sir William's if the parement be not fino mosaic. It was so laid down, but failed. He desired, also, to have all the iron gates eleotro.bronzed; bat it could not then be done He was known as a very skiiful constrnctor, an admirable man of business, and of untiring energy, and was thus naturally associated with the Stephensons, Locke, Brassey, and the other distinguished men conneoted with rail way works then going on rapidly in all parts of the country. He was also largely employed as a snrveror in the valnation, purchase, and sale of the enormons quantity of land required for sach undertakings. In these and other ways he added very largely to the fortune he inherited from his father, pursuing his career with mabated energy till 1851, when he fell a victim to hard work, and was brought nearly to death's door by a very sevore illness, which necessitated a temporary relaxation of business. This he em. ployed by a jonrney in Italy, whenoe he did not get back till the middle of the following year. Wo printed somo interesting notes which he sent na from Florence on that occasion.
Sir William had few pupils. Professor Hayter Lewis was with hira for two years, and then traveiled abroad with his nephew, Mr. Arthur John Green. But in his office, in varions capacities, wore Mr. Trotman (aince dead), Mr Arthur Baker (Baker \& Wadmore), Mr. Charles Bailey, now in the office of the City architect, and Mr. J. H. Steinmetz, who has since left the profession.
Mr. Steinmetz promptly came forward a few days ago in the Times to deny the trath of an assertion, unwisely made by Mr. Harley Grellier, that Sir William had merely adapted Mr. Grel. Iier's father's desigu for the Royal Exchange to the regnircments of the Gresham committee.
On the return of Sir William from Italy he resumed his career, bnt with less ardour, and being the possessor of a largo fortane he bccame ambitious of taking a place in Parliament. In 1854 he unsuccessfully con. testod Barnstaple, hat in the following year, on tho resignation of Mr. Phinn, and at the invita. tion of the Liberal electors of Bath, he stood for that borongh, and was elected. From the time of his entry into Parliament he gradually abandoned hisprofession, deroting himself instead to all manner of public afiairs, As a governor of Dulwich Collego ho took a very active part in its revival. As a governor of St. Thomas's Hospital his share in the work connected with the transfer of the hospital from London Bridgo to Lambeth was very great. As a member of the Metropolitan Board of Works he had much to do with the construction of the Thames Embankment. At the London and Westminster Bank, of which he was a director; at the Bank of Egypt, of which he was chairman; at the Assam Company, of which he was depaty-chair. man, he was a oonstant attendant. He was amongst the first to respond to his friend, Mr. Rogers's, call for middle-class education in London, and to give his money and advice in the founding of the Cowper-street Schools. He was president of the Architectural Socioty, which preceded the lnstitnte of Architecta, and twice president of the latter. Through this body ho received in 1856 the Royal Gold Medal annually awarded by the Sovereign for the promotion of architecture. As a member of the Society of Antiqnaries, and ultimately vice.president, he found many occasions to promote its objects. As a fellow of the Royal Societs, and at times member of the conncil, he took a great interest in its procecdings. On the death of the Marquess Carnden in 1866, he was elected preaident of the Camden Society, and signalised his:
accession to this last office by presenting to the memhers the＂Diary of Johw Manningham，＂ admirally edited for him hy his friend the late Mr．John Bruce，F．S．A．He was for a long time honorary secretary to tho London Institu－ tion．He was also largely engaged as direc． for and ebairman of sereral important com－ panies connected with the hanking and insurance vorld ；and was a trustee of the Soane Bluseum． He was a magistrate for Middleser and Westminster，and also for Somerset，and a Com－ missioner of Lieutenancy for London．He was rice－president of the Administrative Reform Association，which was not a success，and director of the Globe Assurance Company， which at one time he bad tho management on his hands．The conduct of the secretary，and tho loss which consequently fell on the company caused Sir William much distress，and led to serious illness．
The death of his nepbew，Mr．Artbur John Green，which took place suddenly，at a family dinner party，on the 12 th of December， 1855 ， was another and a heavier blow，and long affeoted him．Mr．Green，who was in his thirty－ fifth year，when he died，held the appointmont of architect to the East．India Company，and was surveyor to the Globe Insurance Company． note to us from Sir William immodiately after the event，shows tho relationship existing be－ tween thom：－
＂Green［he seys in the course of it］，was my son in
every seuse of the Word，He never gave me an anxious orery seuse care in my life，and from the age of fourteen thought or a care in
was always with me．
In Parliament Sir William introducod and carried the Metropolis Local Management Act， 1864，and he promoted，with Mr．Ayrion，the Metropolis Improvements Bill，1807．He was， moreover，an active memher of committees， amongst which was the committee appointed He alwars took an earnest part in any dehat． on questions with which he was known to be on questions with which he was known to be works，and supported Lord Palmerston in insisting that the style of the Foreign Office huildings should not be Gothic．He headed a deputation to Lord Palmerston on the suhject， and after the interview，wrote to us thus：－ architects；surely they had as much ripht to fo and tion．A great professional wrong I feel has heen done merely to push horward a style of architecture I alhhone $I$ now as much about Gothic，and admire it as much as any
man，but this Lombardo ．eneto，is＇neither fish，nor
Qcsh，nor good salt herring．＇ ach，nor good sadt herrig．
Althougb elected to Parliament as the repre－ sentative of a particular interest，he had long for which city he sat eighteen years，and his food qualities are admitted and extolled，equally Sy political opponents and snpporters．The last by political opponents and snpporters．The last formal recognition he received in Batb was the
recent presentation hy his friends to tho city of f the Guildhall．When bis placed in the loblhy of the Guila When hecame known there many tradesmen put up their shatters， the flag on the abhey tower was raised to halt－ St．Michael＇s Churehes tolied at the Abbey and St．Michael＇s Churches．
With general politics，on the other hand，be did not meddle，contenting himself with voting with his party．In connexion with a committeo appointed by the Government to inquire as to the stone of the Parliament Ionses，Sir William acted as chairman．In recognition of his public services the Government of Mr．Gladstone，in 1869， made Mr．Tite a koight，and，in the following year，a Civil Companion of the Bath：thus a ifo of great activity and puhlic usefulness was ittingly crowned with puble recognition．
In private life Sir William had many attached friends，who sincerely mourn his loss．Gifted with rave good sense，an extraordinary memory， and inspired with a great love of knowledge，he contrived，notwithstanding his constant occupa－ ion，to amass a great deal of learning．He was ucquainted with Latin，French，German，and Italian，mostly acquired hy diligent application sfter he had left school．With English literature bis acquaintauce was very great，and he had eneral knowledge of most sciences，so ns to ho able to takean intelligent interestin their progress As an author，he was known hy his＂Descriptire Catalogue of Antiquities found in the Eroava fions of the New Royal Exchange，＂and by rarions essays and lectures．He was a pains taking and prolific writer on archwological and architectural matters；a frequent contribntor to the Archaologia of the Society of Antiquaries，
and was the anthor of many＂Sessional Papers，＂ in the＂Transactions of the Royal Institute of British Architects．＂
Ie was the frie
He was the friend of all persons who knew anything thorougbly，and nothing pleased hins more than assisting them with his influence and his purse．In his charities he was munificent， so that a public subscription without his name in tlie list of snhscribers was rare．So great and weli known was this liherality，that it was thonght ho would devote a great part of his large fortune after his death to publio purposes． This，however，is not the case ；for，content with a wide and munificent liherality during his life ${ }_{2}$ he has left but one hequest by his will to puhlic purposes，and that is the sum of 1,0007 ．to the Royal Institute of British Architects．The 1，000l． to the Middle Class Schools，and 500l since towards a hall for the schools；I， 000 l．towards the restoration of St．Bartholomew＇s，Smith－ field； 1,000 ．to St．Thomas＇s Hospital ；and 1，000l．towards tho Fund for the Orphans of Artists，established in connexion with the Artists＇General Benevolent Fund，are donations that will he remembered．He had also founded a scbolarship in the City of London school，called the Tite scholarship；a hursary in St．Thomas＇s Hospital，to which he also contributed an altar piece（by Horsley），having for suhject＂Christ the Physician＂：and contrihutedect＂Christ the Physician ；and contrihuted largely to Cathedral．He had a large professional income， probably 10，000l．a year，for many years；and we shall not be surprised to hear that he has left hehind him half a million of money
The London Institution possesses his portrait painted when a young man，hy Mr．Renton；and his bust in marhle，done in 1870 ，by Mc．Theed； and the Institute of Arohitects has his portrait， painted by Mr．J．P．Knigbt．

Amongst his frionds he was deservedly popular．His prodigious nemory enahled him to have recourse to an unfailing stock of aneo－ dote，and his collection of old songs beard in youth was very great．We can remember him quoting as many as twenty English proverhs
having reference to one particular subject，and having reference to one particular subject，and
referring to many books for others．Sir William＇s love for art was shown hy the pictures he purcbased，amongst which are works of the highest exccllence：the＂Interior of
St．Stephen＇s，Vienna，＂by Roherts；＂Dort， St．Stephen＇s，Vienna，＂by Roherts；＂Dort， ＂Raising the Maypole，＂hy Goodall；besides many otbers of great merit．He possessed also a liking for old china，of which he had some excellent specimens；and for artistic silver and voly work，some varieties of which were in his cahinets．His chief passion，bowover，in this direction was for oboico and rare hooks，so that his lihrary is one of the most interesting and valuable private collections in the kingdom，cons prising，amongst other rarities，copies of most of the quarto Shakspeares pablished during the poet＇s life，and of the first，second，third，and fourth editions ；also original editions of most of the early Englisb poets and dramatists；a most valuable collection of early Bibles，inclu－ ding Coverdale＇s and Cranmer＇s；many beautiful and rare missals，and otber illustrated manu－ scripis ；a large and most interesting collection living pegraphs of distinguisbed historical and Caxton and Wynkyn de worde
Very early in his career Sir William mani－ fested his interest in the study of antiquities． When the existence of remains of great value at Halicarnassus hecame known after the return of himgelf in calling the Minor，Mr．Tite intereste

1863．＂＂On the Paris Street Improvements，and their de
ment to the facts．A deputation of the Archi． tectural Society attended Lord Palmerston，before whom Mr．Tite and the honorary secretary，Mr． Grellier，laid all the anthorities they had collected with reference to the existence and condition of the rains．Lord Palmerston promised ho would write to Lord Ponsonby and Admiral Stopford on the subject，and，being pressed by other bodies also，the result of the nerotiation was that the remains were obtained，as every ono now knows， for our national museum，where they form a most important link in the historic chain of Grecian art．
In 1863，when passing througb Chester，Sir William Tite＇sattention was drawn to some Roman remains discovered daring the rebuilding of the old inu，called the Feathers，in Bridge－street， a building supposed to he of the time of Edward III．He afterwards cansed a plan of the remains to be made，attempted a restoration of the building，and read a paper on the subject at the Society of Antiquaries．He considered that puhlic baths had occupied two sides of an open court，and that in the centre of this court was a small temple，or shrine，supported by columns and roofed．，A local antiquary， investigating Sir William＇s knowledge had heen ence，and differed from him in opinion with what seerned to us very unnecessary acerbity We said then，as we should say now，＂Why sncli an amount of temper sbould haro heen shown because of a mell－meant and kindly effort followed hy a most courteons and reasonable mplanation，must still remain a modern ＇Chester Mystery＇though no Miracle．＇
We havo mentioned in the course of onr too hastily written memoir the election of Sir William Tite to the presidency of the Institute of Architects．This was not obtained withont an effort．There were two points at issue，the question of a professional or non－professional president and the question of Gothic versus Classic．The first had been a suhject of long discussion earlier，and had been settled by the election of Professor Cockerell．One of the in cidents on that occasion which strengthened the views of those who desired a professional pre sident，at any rate occasionally，was the omission of a representative in the Commission for the 1851 Exhihition，wbich was thus alluded to by Sir William ：－
8＂Mon cher Godwin，－I wroto you a note from the Cits ha－day amidat many interruptions，mad story．It was like Hudibras＇

Adventare of the Bear and Fiddle，
Begun，but broke off in the middle．
I meant to say further that they tell me that Earl de Gray
mentioned＇that he was invited to bo on Prince Albert＇ Commisgion as President of onr Institute，but shat he
declined on the geore of age and ill health．Surely this declined on the greore of age and instheath．Sut Surely this
malkes for our view most strongly，because the regult is make for our view most strongly，becuuse the regult is
most unfriendy to us as architects，and thet owing to this
unhappy accident wo unhappy accideat we are unrepresented as a class，and
but for this accidental explanation were considerably nubbed．＂
At the close of Professor Cockerell＇s reign，186I， the question again arose，and Sir William was looked to as the professional representative， Mr．A．J．Beresford Hope（to whom the profe日 sion owes mucb）heing put up on the other side． to stand，as the foliowing letter sbows：－

## ＂＇I have carefully considered the question you sug

 to me yesterday，so so the presidency of the Institis an offce of some reaponsibility and labour．
been well fille s
been well filled，particularly by my friemd＇s（the it hasent president）Iearaing and position in the scientife world． larly tha deanand on my time．
But I think there are occasions on which men ought not to shrink from an obvious course of duty，and so far es 1 am concerned，frozn the part I have talen in the
questions concerniug this very honourable oflice，I think $I$
ought not to decline．
But if I oome formard，I could only do so under the
保 condition tbat my appointment
the council add the Institute．
seek，and nothing ropld ind emberk in any contest．Induce me
from the Great Exhibition in the cireumss for it，on to bearing on our profession；and if I were che in their lignting me health，I would do my best to gupport the I gaid before，nothing would induce ane to come forward， without feel
acceptable．＂

However，he assented，a sbarp atruggle took place，into the particulars of which we need not po，and he was elected．On the next occasion， the same honour was very properly conferred on Mr．Beresford Hope．
Ho must now，however，bring our notice to a close．＂I inheritod a fortune，I married a for－ tune，and I have mado a fortune，＂the suhject
of it said to us more than once．＂Wbat a lacky
of it said to us more than once．＂Wbat
man ! " replied the Prince of Wales, at tbe dinner in aid of the fund for artists' orphans already allnded to, when this remark was repeated to also an abie and energetic one-a man of acute perception, rapid judgment, and firm decision. He was a rough diamond, at times impatient of opposition, and with little consideration for any who attempted to impose on him. On the other
hond, be was munificent to a priucely degree, hand, be was munificent to a priucely degree,
generous to every olaim of misfortuue, and a real generous to erery olaim of misforture, and a real
lover of literature and the arts. The profession bas lost a true friend, and society a good citizen, by the death of Sir William Tite.

## ARCHITECTURE AT THE ROYAL ACADEMY.

Tee collection of architectnral drawings hung tbis year at the Academy shows a very high standard in regard to draughtsmanship, while in regard to design the proportion of quality to quantity is on the whole decidedly ahove the avernge. Chureh arohitecture is in great force on this ocession, and to this branch of the collec.
tion some of the leading designs in the late oom. tion some of the leading designs in the late oompetition for Edinhurgh Cathedral form, as might G. G. Scott exhibits the intcrior and exterior perspective views of his design $(1,119,1,156)$; both of them beantiful specimens of line draw. ing, the iuterior particularly so, although its excessively "conservative" charactor rendera its in point of desirn, unsatisfactory to those who look for something more in modern arohi. tectnre than archroological exactness. The ex. terior view is more interosting as a design
mainly owing to the fine treatment of the centra tower and spire; bat whether this portion of the building is not on a scalo somewhat disproportionate to the rest of the struetnro may be ques. tioned. The angle tarrets whiob flank the octagon stage for the tower, and wbich are mere octagon stage for the tower, and wbich are mere
accessories, dwarf overy featuro of a similar nature in the rest of the design. Mr. Streat's interior and exterior designs are also exhibited $(1,132,1,143)$ : the former, sbown in a coloured colour, offers little for remark; the latter, a fiue pen-and-ink drawing, exbibits in the treatiment of tbe admirably considered western tower a
thoronghly characteristio originality. The main portion of tho huilding is marked hy that osten. tation of simplicity (as we should term it) whicb bas been affected of late by some of our architects, and which is carried to even greater excess in some other drawings exhibited, Mr'.
Burges's exterior design for the same building Burges's oxterior design for the same building
is shown in a beautiful water-colour drawing $(1,133)$; the treatmont of the spires and fêohe is most pieturesque, but porhaps a little too prettily piqnaut for the snbstructure. surronnding the apse does not slope direct from the main work, hut a flat is left at the jnnction of the roof with the wail, upon wbich tbe but. tresses between the clearstory windows of the
ebancel are stopped. This is hetter tban the usual mothod of letting tbe clearstory buttresses cut into the slope of the aisle-roof; but we ques. tion whether, in aly case, a huttress ought to be brought down into a roof in this way withont its thrust being visibly and oxternally carried across the roof to the outer wall. Mr. Burges's interior design ( 1,148 ) is a noble drawing, showing a general treatment very similar to that of his Cork cathedral. The spandrels and piers of the by colour laid npon the stone as a ground,-hy far the best way of applying colour to a stone far the best way of applying colour to a stone
interior,-at least, in a building aiming at monu. mental character, Among ecclesiastical archi. tecture, and as, in somo respects, the most important coutribution, we minst reckon Mr.
Brewer's fine drawing of Mr. Ponrose's sobeme Brewer's fine drawing of Mr. Ponrose's sobeme
for the decoration of the choir of St. Paul's $(1,155)$. The interior surface of the dome which forms the erown of each compartmeut of the vault is divided into panels, varying in design in each compartment, the panels being alternately occupied hy gilt arabesques and hy heads of
angels, as far as can be perceived (the drawing angels, as far as can be perceived (the drawing
is hung too high to be fairly studied) ; the pen. dentives heing occupied by entire figures. The general effect is ricb and barmonious, and has the additional merit of giving (through the subdivision into panels) scale to tbe architeoture.
The organ, placed on each side of the western The organ, placed on each side of the western
choir-arch, hetween the pilasters, scarcoly appears otherwise than as an excrescence on the
arebitecture, witb which we think it might be ess abrnptly combined, by altering the mannex as we have hefore said, is probably the best position in which the instrument could be placed, position in which the instrument could be placed, musio.

Among the desigas for churches of a less mbitious type, we find Mr. Brooks's "St. Mary's Wednesbnry " ( 1,115 ), an unpretentious coloured drawing of a bnilding looking wonderfully like a gonuine Medioval church, which may be taken as a compliment, or the reverse, according to the reader's proclivities. The same arcbitect' "St. John Baptist Church, Kensington" ( 1,145 1,172), sbows far more of his characteristio talent and temper in design, both in its merits and defects; the former consisting mainly in the
hold massive treatment of the tower, with its hold massive treatment of the tower, with its low short spire, with curved lines; the latter consisting in that exagrerated sternness and gives to Mediæeval fort or behtion rather than a house for divine worship. This stern simplicity of character is exhibited also in the "Schools and Charch at Clapton" $(1,185)$, which is, nevertheless, a very pleasing group of building; the charch is decorated by a ligbtiron belfry, which, whether by accident or intention, is shown on one side of the ridge, instead of on its centre; a whimsicality for which there can he no possible cutting " architecture, and tho power shown in many of Mr. Brooks's designs is undeniable ; hut there is a mediam short of absolate baldness and naked stone walls ; whicb latter, apparently will soon como to he considered the consumma tion of architectural effeot. Mr. Norman Shaw's 'St. Michณel's, Bournemonth," again (1,170) tbough scarcely anytbing from his hand can he witbout interest, is litcrally harn. like in appearance; the "saving clause" lies in the helfry, placed at the south.west anglo parallel with the south wall of the nave; and which, moreovor, looks as if the hells really could he swung in it without briuging it down, which man belfries do not show. Mr, J. P. Seddon's charch of ince. James, at Yarmoush, a throe:aisled building successfully modesica on the type of the grand old Church of St. Mioholas, in the same torfn, illustrated in a good water.colour drawing by
Mr. Howard Saye, who has also executed drawings of the same architect's staircase at Aberystivith College, and of his design for tbe stall-work for the choir of St. Nicholas Cbureb, Whove mentioned. Mr. Pearson's chnrches, at of Man ( 1,116 and 1,121), are scaroely up to his mark in point of design, judging from these drawings. The first-named is, for a clever archi. tarred. looking spire. The socond has more of cbaractex, but we sbou!d doubt whether eitber of these buildiugs will add greatly to its in Croct's reputation. Mr. Conybeare's church, elaborated water-colour drawing of the interior ( 1,127 ), wbieh is in an Early Gothic (Romanesque) manner, but presents notbing new in treatment, if we accept the assiduity with whioh tbe roof is "powdered" everywhere, with three distinct "orders" of powdering; the extorior $(1,152)$ shows some novelty in grouping. The from Mr. Robson's designs ( 1,128 ), looks a solid but not very beantiful building; the drawing (a pen-andink one) bas been somewbat over aboured; it is a great thing to know "where to stop" in this style of excention, which the great madess on or chever draughtsmen has made popular. Hr. Pugin's Cower and Spire is tho Carmenvo Chirch, Kensington ( $1,1,9$ ) where it will add to the offament is appied where ; the hasement is solid, the upper portion very gracefully treated, and the result is a very of chonions and Well-halanced work. A conple
of the Bnsilica type ([talian) present thomselves among their Gothic compeers, and must bo noticed, if only for tbo rarity of such apparitions. "St. John's Church, Hult, as abont doos Ne. modelled," by Mr. U. G. Wray (1,122), we discover from theh of interest, nor can original and how mnch is remodelling; but we must point out to the architect that he has hit upon a most unhappy treatment of the roof, pilasters (or square columns), and apparently
stand on the back of the tie-beam: they should be altered in form so as to appear as what they are, viz., pieces of timber in tension, and not as if supporting the roof ahove, and throwing an apparent cross-strain on the tie-heam. Tbe other Busiliea design is Mr. Heffer's "Church of St. Bridget, near Liverpool " $(1,153)$, the interior of which lonks well in the drawing, which has been very carefully executed. Of this, as of several other designs meutioned, illustrations have been given in our pages, Mr . Sormers Clarke, jun., exhivits a large sketen of the is satisfortory in is satisfoctory in general appearance, but pre senting nothing for comment, The exterior
$(1,203)$, shown in longitndinal elovation, is plain to extremity, bat presents in the rathor shor square tower and conical roof (yather than spire) a certain novelty in tho treatment of this im portant feature in regard to general outline and fenestration, whieb may be characterised a nonsisting in an application of the Campanile type to a cburch essentially Gothio in most of its features. Among the ecolesiastical designs wo may class the elaborate drawing representing Sir G. Scott's design for a new rerodos for th grand (though "late") Charch of Boston. This, like some other drawings in the room, is hang too bigh to be very well examined. It appear to consist of a gilt motal.work dosign, having o shrine in the lower portion containing canopy work and figares illustrative of sacred subjects, and closed by doors (sbowu standing open in the drawing), the interior surfaces of which are ornamented by figure-subjects in has-relief Below the principal shrine is a has-relief of the wast Supper, closed by a door opening down work on the interior in lave retief. Abose the principal shrine the Above th principal shiter the design culmioates in glitter of mimic pinnacles and turrets. There oxecutod extremity of the nohle nave of Bioston Chut th extremity of the nohle nave of Boston Church. and mnnicipal ohjects there are not many designs exhibited. Of those which are to h seen, the most important, as far as size and elaboration of drawing are concerned, is Mu Emerson's design sent in competition for the Berlin Honses of Parliament, which, however has merits heyond mere draughtsmansbip. Tbe architeot (whetber from a belief in its fitness fo the locality, or from a wish to puzzle the judges in the competition as to his nationality) adopted to a considerable extent the feeling and characte of the Gothic architecture of Gormany, a choice whicb has led him to indulge in an outburst of "pinnacles" and an exuberance of open stone panelling in spires and cupolas, altogether a variance with tbe sober thongh rather hear atyle which his drawings have usnally exhibited Bat there is hreadth of treatment and compo sition in the lower portions of the design ; the gronnd.floor story is particularly good, and the douhle tier of statnes which form the base to his large angle tower have a fine effoct at that point, The upper portion of the huilding sprouts intomul drawis drawing. Professor Kerr's sketch for the same sition, witb a $(1,138)$ is a dignified "Classic " compo hemispberical cupola at each of the angles. The grand staircase of the Goldsmiths' Hall corried ont nnder the superintendence of Mr. Mcsice ( 1,113 ) lous in all $(1,113)$, looks thell in the drawis as it does in colonred hordering on vulgarity or ostentation. The entrance to New Burlington Houso, as seen from the interior of the quadrangle, is not happily deliveated in the drawing ( 1,118 ), and certainly does not look as well here as in the reality; and the perspective of the upper angle of the centre block is faulty, the angle heing too sharp. One or two fearful exhibitions of course oocur among tho public buildings illus course oocur among tho public buildings illug trated, thankfniness that at least they are fewer than We have seen in previons exlibitions. Mr Watson's "Premiated Design for St. Ann's Heath Asylum " ( 1,135 ) is abont equal to mos buildings of its olass that are erected, but is noticeable for a somewhat original treatment of the upper stage of tho tower, which, good in itself, is unfortunntely quite too heavy for and out of keeping witb the lighter and more ornate detail of tho lower part. To striking manner, withont in any way clashing

With the suhstractare, is a difficnlt cruv for the architect, not (apparently) very often surmounted. Mr. Green's design for the Berlin
Housce of Parliament $(1,163)$, ambitious as it is, can scarcoly, we fear, be accepted as contributing much to the axlvancement of the art; nor can we regard the design for the Brighton Aquarium, hy Mr. Nightingale ( 1,179 ), as a snccese: it is an unfortunate adaptation of a poor phase of Gouhic arcmitectnre, and has no which it is constructed. Mr. Street exhibits a vier of the Central Hall of the new Conrts of Justice, the general treatment of which is well bnown. A design sent in competition for the proposed Conservative Club at Manchester, hy Mr. Collcutt, has very praisewortiy qualities, in regard to soliduty and hreaden of treatment of Garly cotion the chiefly through want of due emphasis and im . chiefly through want of due emphasis and importance, in regard to scale and dec
the window-tier of the principal floor.
As to the designs which may bo classed nuder the head of "domestic arckitecture," two or three of whicb are of remarkable excellence, we shall hare something to say in our next. We mast defer also any detaited mention of the paintings in this year's Academy. In the meanexpected a hirher expected a nigher general average of works than asial this year will, we fear, he disappointed (a hasty inspeotion appearing to reveal to as fully the usual proportion of pictares which one cannot sce any reason for"); on the other hand, some of the hest of our well-known contributors oxhbit works of more than usual excellence. Mr. Millais's portrait of Mrs. Hengh is behind none of his best efforts in portraiture, and even saperior to one or two of those which have been most talked of in former exhihitions. Mr. Poole
is even moro weird and impressive than nsual in his colour barmonies in "A Lion in the Path," picture on a larger scale than is nsaal with him Mr. Leslie's Finglish girle in Greek dress look as charming as ever in "The Fountain;" Mr. Cal. deron's "Moonlight Serenade" is in a double senso very striking; Mr. Brett has surpassed himself in his intense realism of sea-shore colour and detail "Among the Granite Bonlders" \& M Alma Tadema touches a deeper chord than his wout, thougu with all his wonted oxecative power, has seldom interpreted the poetry of nature to ns as he has in his "Storm coming on at Sunset" unearthly glow over the rusered coantenance of the Memnon statue. Other old acquaintancesMr. and Mrs. Ward, Boughtod, Pettie, EImore, Storey, \&c.-aro here "in good form"; nor must we forget our slayer of dragons, Mr. Poynter who has contrived to render the "Dragon of Wantley" (tupromising suhject as he may scem) both more interesting and more "possiblolooking (if one may he allowcd the phrase to jump at one hound from Medimzal romance to the most realistic modern life, M. Tissot has fairly out.Tissoted himself in his stndies of has fairly out.Tissoted himself in his stndies of cha "Too Early" The latter (No. 914 in the and logue), commonplace as the suhject may he deem is certainly one of the cleverest things, one of the most perfectly successful within itsown range, that has incen exhibited at the Academy an old gentleman and some younr ladies, hase arrived a moment or two sooner than they have expeotod, and find their hostess inste they were in waiting to receive them in instead of heing room, riving her last instrutions cornor of the cians . Tho her last instructions to tho musicose the careful, carnest autade of the as thoy the various expressions of the mnisicians intrey look over the music or handlo their monusonerts, the half. embarrassmont, half. arsemeat of the early arrivals, the nonchalant conness of the charming young girl who expects trutheur bello of tho evening, are giron with a trumuluess and delicate perception of the hamour of the "situation," for a parallel to whe we mush look in the novels of Jane Ansten, the great painter of the humour of "polite

Proposed Cobtage Hospital at Coleford. The idea of erecting a cottage hospital here is at length assuming a practical form. A sito for the hospital is heing looked for, and it is said the Forest labour will be appealed to to furnish it.

## ART-UNION OF LONDON.

Trie annual meeting of this society for the distribution of prizes, was held in the Adelphi Theatre on Tucsdny last, Lord Houghton, president, in the chair. There were present, amongst others, Messrs. Pocock \& Antrobus, bon. seccs. ; Mr. Frost, R.A.; Sir Walter Stirling; Professor Donaldson; Mr. F. Broon, engraver; Mr. Wm. Smith, F.S.A.; Mr. R. B. Butterworth, F.S.A.; and Mr. James Hopgood.
Mr. Pocock road the annnal

## REPORT.

The amount
11,2600 . 1.1 s .6
of subscriptions for the year now ended The Council cannot hut feel that to hare collected ao Iarre an amount, in thi face of that prosent ecxepection ally
high price of nearly all the uecessaries of life in all quarters, is a most sutisfactory proof of the interest felt by the people in the promotion of the Fine Arts, and of the
perfect confldenca in the good faith and earnest endea rours of this Society to orrir out the principles on which it was estahlithed; notwithstanding the persevering on.
deavours of the managers of numerous schemes which borrow the name of the Art. Union, gud improperly
endeavour to avail themselves of the services of itsagents, endeavour to arail themselves of the services of its agents,
although such projects were nerer contemplated by those although such projects were never contemplated by those
who framed the Act of Pbrlisment by which our procendings are ganctioned.
The plate of " Reboliah" has juatified the anticipations of the Council that it would give satigfaction to the subcribers, a large proportion of whora are already in supplied writh all posaible despatch.
Vacancies in the Council have been cansed by the retiremeat of the Gon. Alf. Bagot and Mr. Chas, Mayhow. To
liilt these the Rev, Ed. Coleridige and Mr. Jas. Andergon
 ocal secretaries and agents, both at home, sud iu the colonies, and foreign countries. Our relations with are contianally incrensing; eight aew agencies hating beon established during the past year. From Australia and Now Zesland the subscriptions received last year amounted
$01, n 86 \mathrm{~L}$. ; from Canada and the Uvited States to Surprise is often expressed at the large number of prizes mhich generally falls to members in these distant hands, hat, on examination, it is not found to be larger
than the amount of their contributions rould lead us to expect.
On this occasion the Council would wish to mention, as having contributed largely to the funds of the year by
their exertious, Mr. Wright, of Hackney; Mr. Hasse, Laeds: Mr. Sincluir, Dundee; Mr. Dicker, Dunolly; and The accounto have heen audited hy three mexnbers of
the finance committec, and by Mr. C. S. Cartwright and Mr. W
posed.

nothing of the kind had ever heen attempted, and it was a huppy thoug ht to in inuegrete tbe opening of the building xceedingly valnable and interesting exhibtion was the result. Speciaily noticeable. was the fine collection of
engraved engraved portraits. made with groat judgment by Nr .
Iames Anderson Rose, - remarrixble, not more for tho henuty of the works, regarded as speoimens of engraring fery many of the persons porme inct selection of engravings, oomprising worles by Albort Difer, Marc Antonio, and Rembrand thid others, bolonging to Mr. Alfred Morison, was another fanture. Mr. Coolk ooi-
 Mr. Gurdner lent.

Wlustrating the buildings of london, past and present, filled 1,390 Jrames. This layge store of pictures of Loudon is most interesting, and hns been got together by unveary. The third of the serios of the London Intcrnational Exhibitions was opered on the lith ingtant, and it was a sonsible decision on the part of the Royal Commission to opening the doors to the pullie, since Easter Monday, the first great holiday of the year, gave to so large
mulkitude an opportunity of benelling by the ooosion. mulkitude an opportunity of benefling by the ooogsion.
Each year's exbibition has its speciul fentures, in eddithere was a blaze of gems in the Eastern gulliories, jerrels of almost fabulons value, and musical instruments of all kinds. The machinery oxhibited was chiefly that employed
in printing, and in the manufacture of cotton. This year ootton is replaced by silks, sating, and velvet, of exqui-
sito hrightness and benity. There are, too, collections of drinking-ressels of all sorts ; curious old hooped cups
vast leather blackjacks; tall gilt Yonetian alase Fist leather blackjacks; tall gilt Fenetian glassen; and
the fragile and daiuly ornaments of the moders table besides tobaeco-pipes of all kinde, aud from all countries, sedan-chairs and the state conches and modern, inoluding footmen carried Alambenux a century and more runnivg worthy atteropt bas beeu mado to imgracre; and arraise. our London stret conveyances, Which now oontrast of unfavouraliy with those of some provincial cities.
The fine art display does not represent the schools European art to the extcnt of former years; hut there ar paintings enough to onabie us to appreciate the merits of
living British, German, and living British, German, and lalnh painters; and two
large rooms areo ocaraped by about 300 pictures of Thos.'. Cres wicle
One novel featnre in the International Exhihition of tho
present year is the appropriation of one seetion in the present jear is the appropriation of one section in the pictnre gallories to the works of amateur artiats, offioers
in the army and nasy. Many of these worlis desery ospeoial notice, not only from their illustrating scenes in countries not hitherto renched by artiats, but as showing
considerable skill and knowledge of art. The collection considerable skill and haowledge of art. The callection
will be doubtlesy received winh great interest, not only
by the friends of by
larg in the exhibition of prizes last year took place, as noual Colours, and many of the notices of Paich appeared io the public journals especinlly noted the progressive improve
zuent in the quality of the worlas selected, nad some them were disposed to attribute this to the cireumstance of a larger number of the prizeholders, from year to
year, coming to the Council forassistnnce in making their selection. Howorer this mny lus, the improvement is undeninble, notwithstanding the increasing ditionlty of
Anding good works unsold, and to tiono who fortunute enongh to gaio to-day tho right to select worl be for thernselves, the Council cean.only say, most earnestly, "Pray take care that the improveme
fully mainteined lay your selections."

## $\left.\begin{array}{l}\text { Lewis Pococt, } \\ \text { Edyid. E. ANtronve, }\end{array}\right\}$ Hon. Secs.

The prosident, in moving tho adoption of the eport, said that in doing so he was embarrassed by a course which did not frequently occur, viz., he uniformity of success in this Art. Union, aud also the ahsence of criticism. From the position he had the honour to hold he appeared before the meeting with pleasure, and had been asked to make some remarks upon the general condition of art in this conntry. But he always felt impeded hy the circumstance that in so doiag he was delaying the meeting in the excitement it would have when the wheel in front of them went round, to know if any of those present were fortionate erough to gain a prize. The conditiou orart in this country seemed to him to go on in judge from the enormous manner, if wa might roductions the enormous prices given for art and labour he thought that art got its fair share of capital. The reproach still continned that in this society we gave encomrarement to me diocrity, but gach xeproach comes from a ferr porsons who considered themselves so far raised that they could afford to look down upoz others. He could not see how there could he a progress in the art-oultnre of any country unless it were made gradnally, and so encouraged. By "kradually," he meant that men and women perception, risin to the commonest taste of culture, till thoy fonnd a gradual prooess of and this was the best means for elovated; art-calture in Encland. means for promoting tion in ote oduca promote. It was an interestiny thing to see promote. It was an interesting thing to see how greatly, not only institutions of this conntry, but private individuals, had beeu interested in the promotion of this culture, Very proper nse had been made in the report of
the name of Sir Richard Wallace, whose exhib: tion in Bothnal-green most of the meeting, no doubt, had seen, and derived advantage there from. He looked on that exhihition as almost a secular event in the history of art in this country, and he trusted that snoh an example would induce alt persons having collections, at fit occasions to make them aocessible to the puhlio. He oould congratalate the meeting on having anch an exhibition as Sir Richard Wallace's, for it contained boautiful works
approciation of that art, ho went on to say, was growing every day. The names of Reynolds and Gainsborongh rose in the hearts of mon prices given for their productions interest in tho fame of Sir nerese nished member of the Dilettanti Society, objoct of which was the promotion of classic art. The beautiful works of this society garded their colour, and made them at the present time, in thie exbibition of the work of that artist, the most noble master pienes of the time. On the other hand, whio art was beautifu itself in this way, there ocourced, in the rruo processes of unturo, certain events which de stroyed in a few momonts the works of years and the admiration of centuries. He could not lose this opportunity of reforring to that lament. able fire at Lord Ashhurton's, which destroyed about thirty of the finest works of Italian

These productions could not be replaced and we might well look upon such a calamity with great a dread as we looked upon In conuakes and other convulsions of nature Art.Union of London was deserving of support and the meeting should endeavour to promote its action, and so continue to devolope art by every means iu their power.
Nr. Godwin, in seconding tho adoption of the part in the proceeding , soke, at the roung, follo much pleasure in seconding the adoption of the report. He remarked that, for the many year during which he had taken part in tho manago. ment of the socioty, be had acen always struck with astonisiment that, year after year, they of the able to collect iniformy from all quarters of the world a sum never varging very mach from about $11,000 l$. or 12,000 l. a year, and that
he thought this a most satisfactory guarantee for the firm position of the institation. He had not purposed saying more than this, hut, happening, on the way to the theatre, to be reading an article in the Quarterly Review, just pahlished professing to describe the progress of art iu London as heing upheld only as a matter of greed, by those who made a gamhling affair of tho so-called promotion of art, ho could not lose the opportunity of indignantly repudiatiug any such accusation. Either prejndice or ignorance hind prompted this writor. He knew not and cared not who he might he. In this article he utterly ignored the fact that many amongst the first artists of the dar,-Calder Marshall, Trith, Pickerscill, and others,-had over and over again stated in publio the la:go measure of gratitudo they felt towards this fame. It was with in their first struggles fur Society that years ago Wron, Woodington and others, soncht and found men and mean to estahlish the art of fue bronze-casting, which medal did not engring was magly. The art of Art-dion nith yer after year alive hy the the production of a fine medal commemor the production ar fine medal commemorativ and especially bat for this Society thero would he ahsolutely no demand for pure line engraving. He protested agninst a writer who ignored al these facts, and could see in the Art. Union only
an association for gambling, being taken as any authority on tho state of art in England.
Professor Donaldson proposed, and Mr. Butter worth seconded, a rote of thanks to the honorar moting the best interosts of the Society; and after a prospective vote of thanks to tne ladies who were to preside at the wheels, and to the
chairman, the distribation of prizes was pro ceeded with. Warm testimony was horne on Watson, the resident secretary.
The following is a list of the principal prize. holders:-

## A Mansion destroyed by Fire. -. The

 country sent of Mr. Morrison, M.P., at Malham, books and the pictures were saved,
## NEW PUBLIC BUILDINGS

Doncaster.-The Now Corn Exchange has beeu opened. It fronts the old corn market, in the two wings of the existing market-hohl, -a spa cions building used as a meat-market and for hucksters' stalls. Tbe external elevation is of Classio character, and in a measure correspond with the building with which it has been incorporated. Tho Tuscan order of arohitecture is employed for the columns and entablature of the entrances, and the Doric order for the upper story. This bas projecting columns of red Hausneld stone, Thain with entablature and balastrade. The main entrance is recessed, sides. Immediately over this entrance the stone sides. Immediately over this entrauce the stone ront is sculptared, the subject represented being a dens blessing the special incustries of the conis. To each of sprenar windows are shields, supported by ornamental corbels, on whicb are car connty York, Livcoln, Nottivgham, and Derby. Passing into the building, a large, lofty, decorated, and well-lighted apartment presents itself. The well-lighted apartment prosents itself. The
main room is 92 ft . long by 84 ft . wide, and main room is 92 ft . long by 84 ft . Wide, and cross-ties, griving a clear and uninterrupted space, from the foor of the buncing to the apex of tbe roof inside, of about 63 ft . The lantern light runs the entiro length of the building, and additional skylights spring out from this, and cover the roof, giving a lighting surface of between 4,000 and 5,000 superficial fect. The main ribs of the roof are supported on each side by conpled iron columns, having ornamental capitals, bases, and bands; and these colnmns are connected laterally arain by semicircular cast-iron douhle ribs, with ornamental soffitplates to connect tho ribs. Galleries ran along both sides of the huilding, and across the front ontrance; here also under this latter gallery are offices for settling and other purposes. At tho opposite end are two retiring-rooms, witb the necessary conveniences adjacent, and between them a recess, which gives depth and side to the platform and orchestra. The general interior of the huilding is decorated, the groundwork being a brouze green, and the embellishments, snch as foliage, capitals, bases, mouldings, crestings, \&c., heing in gold, and picked ont with mauve and vermilion. The hnilding is warmed by hot-water pipes. The lighting apparatns, which is by Messers. Hardman, of Birmingham, is not yet fixed: it will be supplied and fitted hy Mr. John Smith, Doncaster. The architect is Mr. Watkin, of Lincoln, Whose plans for the extension of the Doncaster markets obtained the first prize of 100 l . in a competition some few years ago. Tho builder is Mr. Athron, of Don. caster. Mr. Slater bas supplied tho hot-water heating apparatus; and the gasfittings for the entrance, offices, dic. Messes. Rankin, of LiverMessre. Waller \& Wright for plambing and glazing ; and Mrs. Joe Wright for the painting glazing; and Ma

## Hartlepool <br> Harile foundation-stone of the

 Hartlepools Exchange has heen laid. In April, Buildinge it West Hap Builaings at west rartiepoo invited twelve Eschange Company, Limited, chose a defnite scheme for the erection of a block of huildings in Mainsforth-terrace, near the railway station, to be designated "The Hartlepools Exchange." G. G. Hoskins, of Darlington, architect. The huilding will have three principal frontages, in Italian Gothic, and will possess a tower, with angle turrets, hreaking the line of the north façade. The materials proposed to he used are red pressed hricks, which will be relieved with stone dressings. The Post-office authorities having bad copies of the plaus submitted to them, and expressed satisfaction with the internal strnctural arravgemeuts, negotiations have sinoe been concluded hy which the new post-office, so much needed for West Harilepool, wnildings. The North.Eastern Banking Com bnildings. The North-Eastern Banking Company will also lave a branch office here, and most of the other offices in the building are already secnred, on promise, by private firms in the town. The same architects also submitted designs for a club-house for the Exchange Com pany, to be erected on a site facing the Ex. change; and in this case also, Mr. Hoskins gotthe prize. This building will be in tho sarme style of architecture as the Exchange. A few shares for the new clob-house remain to be this undertaking, essured themselves commencing buildings conld be carried out for the estimated cost. The contractors for the whole of the works are Messrs. T. Robson \& Son, of Darlington.
westoft.-The new public hall, sitnate on the London-road, Lowestoft, has been opened with a grand banquet, at whioh abont 200 ladies the bnilding is Mr. Olaham C bambers.

DEATH OF M. DE CAUMONT.
M. De Causiont, who a sbort time since noceived a tribute respect in our columns, is now no more. He died at Caen, on the 16 th of April. Active to the last, we find him present opened at Pan on the 31 st March, and reopened at Pan on the highest compliments from tho Prefect of the Basses-Pyrénées (tho Marquis de Nadnillac). M. De Caumont was, indeed, the originator of these concresses; and he it was Who inspired the wonderful spirit and comprehevsive scope of action which, for so many years, have sustained them in vigour nnabated. These congresses are models for imitation: they aim at work, and do it in earnest.
As we before intimated, the Bulletin Monumental is now conducted by M. De Courgy ; and two parts have appeared which promise that in his hands this first of all French archwological serials will be conducted with an intelligonce and spirit worthy its illustrious founder
nd director.

## Earls barton church.

The restoration of this very interesting church is being proceeded with. The chancel has been ased for some little time, and is now being to take service. It has been found necessary to the dangerous fractures in the piers, and the very great inclination of the wholo towards the fonnd. When the bases were taken up it was fonnd, as is too often the case, that they rested might hand soft hottom, white the soin rock lower. The new forudations rest on the rook, and it is likely that those of the grand Saxon ower are equally secnre, for it is as npright as imes, anfortunately, in Norman side, and so badly that the work noar it cracked, and was thrust outwards, to such an extent that the arch had to he rebuilt in the next century, and in it were introduced tho Norman billet-moulded stones in a pointed form. The nnsatisfactory ruinons appearance of this arch is in great contrast with the stnrdy ason work around it. Great care was taken during the taking down of the arches of the work near the arch, which was thoroughly socnred by shores, aud by a hed of concrete round it to keep out wet from penetrating down. wards. When the areade is up again and the clearstory, tho new roof will bo put on. They are of oak, and of ffteentli-century date. The works are heing carried on mnder the direction of Mr. . . Herbert Carpenter hy Mr. Allen, of Tithingborough, Mr. Lucas heing clerk of works. The restoration is also under the care of the Architectural Society of Nortbampton, and to them itg heing taken in hand is mainly dne ucch, lowever, yet remains to be done; th aisles, roof, and walls are in an ansatisfactory tate, and reseating is also necessary

Bristol Cathedral Nave Restoration. The anmiversary of the commencement of the work of adding a nare to Bristol Cathedral has divine service in the cathan commenced hy gation was a large one. After service there was a public luwoheon at the Royal Hotel, at which a large namber of ladies and gentlemen were present. Mr. Street, the architect, reported that the work was progressing satisfactorily, and that in ahout two years, should the funds be forthcoming, the nave would bo available for divine service. The secretary's report stated $36,007 l$, in all had been contributed and promised

ON THE CHURCHES OF BRITTANY, NORTH COAST.*

## Royal instifute of beitish architects.

Not far from Landernau, in a dreary and desolate situation, stands the celebrated chnreh of Notre Dame de Folgoat ; it is a fine Second Pointed building of rather singular plan, and consisting of a nave and aisles nuder one ex ternal roof, with two western towers, a short choir and aisles, and a lond and important looking south transept at the extreme east ond The church bes threo very magnificent porches, adorned witb sculpture oxecated in tbe black Kersanton stone. The north-wost tower is crowned by a spire of great beauty, 160 ft . high The long double belfry windows are richly shafted and monlded, and above thom is a pierced open gallery. The pinnacles at the angles of the spire are octacoual in plan, and are kept well within the square of the tower, so that they do not break the outline too mucb. The east window consists of a very fine large rose, with a pierced arcado beneath it, bolow which is the holy well, whioh gives the renson for the erection of this church. The interior is rather disappointing, as it is very dark and low and the vaulting has either nerer been con structed, or has fallen in. This church, how ever, is rich in ancient furnituro, and possesses one of the finest rood-screens in Hrance: it is vanlted in tbree compartments, two of which contain their original stone altars, with richly panelied frontals. The high altar is old, and is of great size, nearly 14 ft . long; it is ornamented with a series of fiat niches with ogee canopies richly cnsped and crocketed and divided from one another by pinnacled buttresses. The mensa, which is an immense slab of black Kersarton stone, is supported upon a very rich!y carved cornice, There are no remains of tables or rerecoses to any of the altars in this church and it may be doubted whether they had any There is a fine douhlo piscina near the high altar. $\dagger$ I cannot better conclude this paper than hy an account of the anoiert episcopal city of St. Pol de Leon. This town is of great antiquity. here as tellum Leoneusi, but it was either abandoned or depopnlated at the commencement of the sirth century ; for when St. Pol visited it in the yoar 530, he found only the remains of tho oarth ramparts, and the only inhabitants he conld discorer were a sow with a litter of young pigs, wild bull. St. Pol, whow tre, a Enclishman from Cornwall, founded a monastery here, and died on the Isle of Batz, opposite to Roscoff, in the year 570, after having been previously consecrated bishop. The city of St. Pol de LeonWas frequently in the hands of the English during the Middle Ages, and this may acconnt or somo architectural peculiarities which I shall have presently to point ont. The cathedral of St. Pol de lieon is a fine chnrch consisting of nave and aisles, western towera, transepts, a long choir and aisles, terminating in a cherot with radiating chapels. The western arch of the crossing carries a large zanctas bell-cot of stone, and is flanked by two lofty octagonal turrets. The western towers are surmonnted with stone spires of dissimilar design, piereed with many cusped openings, the belfry windowe re long and shafted, the western not a rery striking composition, has a gallery for givng the episcopal benediction from; and one of "leaper" door" The clearstory of called the leaper's door. The clearstory of tho nave is spported by flying huttresses, and a large hapel dodicated to A. Alchael projects from the south side aisle. The south transept end contains one of the most magnificent lose windows 1 have ever seen. It is of fully-devcloped decorated work, aud is said to he composock entirely of granite. The apse is not very striking externally. The effect uponentering this cathedral quite astonishes one. The nave is like the best English lato thirteenth-century work, and very much reminded me of Wells. The length of the church is giren in a Tistory of Brittany whichs have seen as 260 ft , and the heigbt to the vanlting only 52 ft . bat, to judge from the effect prodnced by the interior, I shonld have thought that the height was at least 13 ft . more, and the length grenter by vearly 100 ft . It is ne of the most pleasing interiors I have ever seen, and all the parts seem to harmonise most

* Frora a paper by Mr. Brewner See p. 32), ante.
admirahly. The proportions are singularly Batisfactory, and altbongh the height is ample, there is none of that exaggeration of loftiness which is to be seen in some Continental chnrches.
The transepts are rather later than the nave, The transepts are rather later than the nave, choir is said not to have heen completed hefore the year 1431. It is a very fine example of late Second Pointed work, with richly-monlded arches; in fact, I think that one of the features which give the great richness of the mouldings in every part of it. The arches of the apse ings in every part of is the usnal plan in France are not stiltod, as very acutely pointed. The aisles and out are very acutely pointed. The aisles and chapels are all simply hut effectively vaulted. Tbis church is rich in ancient furniture. The choir-stalls, which are said to date from the year 1430, are remarkably fine, and rather like
very excellent German work than either French very excellent German work than either Frencl state of prescrvation. There are ancient stone screens sarrounding the whole ohoir, and cut it off from tho aisles; and short and very pretty little altars project at right angles from them; ernamented with arcades

Tho piscinas attached to those on the south side of the chnrch are cut in the side of the altars. Soveral other ancient altars exist
in the transepts. They are rcmarkably small in in the transepts. They are rcmarkably small in size, only ahout 3 ft . long, and are supported upon hrackets. All along under the aisle.winLlows of the nave are ogeo-headod recesses,
intended either for tombs or altars; hat as they intended either for tombs or altars; hnt as they possess neither inscriptions nor sculpture, and are now quite empty, it is most dilficult to conceive what they were intonded for. I should havo many of them have aumbries attached to them. This church possesses few of the peculiarities of Breton architecture, and I shonld Ne inchaed Its srohitecturo hears some resemblance to that of the cathedral at Constance. Another peculiarity the Kersanton stono not at all. Tho whole of the interior is of a fine white stone, probably Casn stone ; whereas at Dol, whioh is of pretty mruch the same date, nothing bot granito is used. The apse and chevet, again, are uncommon featnres in Brittany; and although it is true the choir is later than the nave, there is such the beme general design was carried through from the first, only the detail varied to snit the from the thrst, only the detaril varied to
taste of the age. A modern monument, in the Gothic style, covers the remains of William de la Marche, the last Bishop of St. Pol de Leon. Ho died over here shortly after the great Revotation, and was buried in Old St. Pancras Cemetery. His body was, however, removed to his cathedral church some ten years ago. The
diocese of St. Pol de Loon is now united to diocese of St. Pol de Leon is now united to that of St. Brienc, where the present bishop resides. St. Pol de Leon contains another very remarkable church,-the collegiate church of Notre Dame de Kreisker. This building consists of a nave and one-nisle transepts, a rather shallow choir, and one side chapel. Over the crossing is a lofty tower and spire, 260 ft . high, and a large north porch. This ohurch dates from the yeare 1345 and 1399; and it is said that Mary, the wife of John IV., Duke of Brittany, sent over for an English architect to constiuct the spire!

Now, the peculiarity of the matter is that which is entirely nnlike English work; whereas the colnmas and arches which divido the nave from its aisle, and other portions of the interior, bear a strong resemhlance to English work The colomns are octagonal, and have octagona moulded capitals, not of the best English time, but very like what one sees in churche in the north of Kent. The east window, again, bears a strong resemblance to that of Lincoln Cathedral, excopt that it has only bix lights instead of eight, and has an ugly springing of the tracery. The tower and spire springing of the traccry. The tower and spire,
abont which all the guide-hooks rave, aro simply on exaggerated imitation of St. Pierre at Caen, and are, I fancy, the work of a native architect and are, 1 fancy, the work of a native architect
who had seen that fine spire, and thonght he who had seen that fine spire, and thonght he could improve npon it: so he lengthened tho belfry windows, increased the projection of the cornice over them, and enlarged the proportions of the pinnacles to such an extent that there is not room for them to stand upon the tower, hu
tied into the spire hy huge stone hraces, having a most disagreeable appearanoe. The consequence that his spire is simply an architectura exaggeration, and aluough rather btriking at rst sight, like all suoh worke, after a hittle stnd ceases elher for from improbable that di he mind. It St Maria dur at Morlat di the spire at st. Maria du lor at Morlaix stil oxist, it wonld throw some light upon the history of this one, as the spire of that chnrch was erected more than fifty yeare earlier than the Kreisker one, and it is possible that St. Maria du Mur may have been a copy of St. Pierre at Caen, and this a copy of St. Maria du Mur. Thereare wo other churches in St. Pol de Leon, hut I will not occnpy time hy describing them, or the many interesting little village charches which abound in this district. Of oourse the chnreches which it has heen my pleasant task to describe oo you cannot he compared to the magnificent edifioes of the same class in other parts of France, but they aro the modest and earnest works of a pious, indnstrions, and thoughtfnl people, who, though labonring nnder great disadvantages, and against nearly incurmountable difficnlties, always noor, always a prey to the foroign invader, in a bare, barren, and bleak country and with only coarse materiale at hand managed to stsmp a certain character of originality and genuineness upon their worls, which must commend them to our respect and admiration.
In the debate which followed, Mr. Cooke, R.A. Mr. Brooks, Mr. Paley, Mr. Phené Spiers, and thers, took part
The Chairman (Profegsor Kerr) complimented Mr. Brewer on his paper; and remarked that althougli Mr. Brewer was not a professional architect, yet he possessed a power or describing architectural works whioh he had rarely heard equalled in that room. With regard to the
drawinge which were exhibited, he could only repeat what had already been said by severa gentlemen, that they were second to the work of no architectural dranghtsman living with whom he was acquainted, for pictaresque feeling and artistic representation of detail. He hoped that they might see them transferred to
of some of the architectural journals.

DUBLIN TMPROVEMENTS AND DUBLIN REQUIREMENTS.
Dublin has aotnally diminished in population luring the last fow years, but, in some respects, she has advanced; sevoral of her oitizens have proved themselves patriots in the real meaning of the word; they have conferrod immense henefit on their city and on their fellow
as well as upon the conntry generally.
The visitor to Dublin may see evidenco what wo state in the rehuilding of the cathedrals; and in the greatly increased accommodation for shipping, obtained by the opening of tho Spencer Dock, and the recent additions to the quayqge, at the month of the Liffey, afford additional evidence that al reland is not engaged in political agitation, that many thinking men aro expending capital to the hest advantage, and that the interests of their conntry are rightly appreciated hy some ndustrones and hy individuals whose energetic benefit their own and future generations.
Such works have in many instances heen comparatively noiselessly designed and carried out to complotion, whilst other public anthoriies have been either at varianoe amongst themselves, or engaged about measares foreign to their province, instead of carrying out matters urgently demanded, either for their public utility or for tho promotion of public health.
Tho Dublin press teems with correspondence, reports of meetings, \&c., about the New Gas
Bill for Dablin, by whicb it is sought to compel the citizens to purchase the business and plant of the present Gas Company for a sum scarcely, if at all, short of a million of money, which is more than one hnndred per cent ofer its valuation, according to the esti mate of leading experts. Poryers of
the Honse of Commons approve of the project, will he therehy conferred on the corporation, so that whatever deficiency occurs in the management of the gas husiness in its new form, will he at onco met by increased taxation on the unfortnate citizens. This is a matter that should meet with more consideration on the part of the
Imperial Legislature, for it is truly of national
importance, inasmnch as the too freqnent sop thrown to a body ever more ready to take up anything connected with a passing political excitement, than steadily to pursae measures of puhlic intility, such as the enlarging or rebuilding of our hridges, the remedying tho present anhealthy state of Dublin, or the carrying out of improved main drainare, for which large sumb of money have been already expended on legal and other expenses.
It is not easy to see where taxation is to end in Dublin proper; at present every one who possibly can lives outside the city houndary, consequcntly the pressure of taxes (yoarly increasing) is hecoming more and more a
pauperising element. Many a time of late have the clergy, the medical profession, and tho visiting officers or members of eleemosynary societies of Dublin, seen the half-famished and halfstarved room-keepers without a particle of fuel to cook their food or warm their wretched tene. ments, whose walls ran with rain or snow water to say nothing of the impossibility of obtaining the necessary hot water for cleansing, washing, \&c. It is not to he wondered at that such a stato of things shonld exist when the price of coal, of meat, and the heary taxation compe every one to avoid adding to his oxpenses hy employing lahour (an article also so highly enhanced in price) unless on works of absoluto necessity.
Such a state of matters should therefore indnce our rulers to panse beforo increasing the burdens of the people of Duhlin by enabling a body with taxing powers to undertake a com. mercial concern, which has, it is said, proved so unremunerative, though it nambers amongst its most activo manacers some of the very hest business men of the corporation who now seek to add to their other so nnmerous public engage. ments.

How would the prosperous andertakings of our Guinnesser and Roes, and Jamiesons and Pims, Findlaters, and others, he esteemed if their ahle and responsible proprietors soaght fictitious props for their businesses? Or what would the pnblio think of individuals or a com pany getting power from Parliament to undertake new lines of husiness when they had found their previous occupations too onerous for them to carry ont? Moreover, we think the public have hardly taken the trouhle to read the proposals of the Duhlin Corporation contained in the new Gas Bill, which asks for pensions for the present directors and staff, whilst several of the same pensioned officials are to be retained as ;directors in tho new regime if Parhament grants the powers asked for.
We were surprised to read the following in the Dublin daily papers on April 21st, 1873. Professor Haughton, in his lectare to a crowded assembly on the previons Satnrday, stated:-
"They shonld take time by the forelock, and before
these diseases visit the country, calmly consider what whese diaeases visit the country, calmly consider what fectly unprepared for an outbreak. It would not do to remember the duty they owed to their neighbours. We shonld not only do onr duty to the poor, whea the poor
get $\begin{aligned} & \text { fick, but when they are living about our stables and } \\ & \text { hack lanes, endangering our lives and the lives of our }\end{aligned}$ back lanes, endangering our lives and the lives of our

In the adjoining column we read that the Puhlio Health Committee (of the Corporation) met on Friday, and,
"From the report laid before the committee, it ap-
peared that but four deathy from zymotice within the city wero registered during the past week, and that during that period, -through the absence of those con-
tagions or infections diseases in which chemical disinfec. tion of premises is considered neceasary, -no occasion
ocenred for the atoption of that process. In these reports
during t
Havin during the past six years, been without a precedent.
Haring disposed of the businesa submitted, the com mittee adjourned at two p.m.
Turning to the Registrar-General's (Ireland) Report for the week referred to, as wo thought for the moment that possibly the learned pro ahout the state of Dublin, as snrely tho Public Health Committee must have accurate data to 00 upon, we find that seventeen persons were registered as having died from zymotic diseases althongh "no return of deaths in the South althongh no return of deaths in the South Duhin Union Workhouse had been received during the week." To form some notion of the importance of the ahsence of hare the workhonse named, we have only to grote the raistered deaths of the district in to quole the registered dealls of the district in nd in aros and in last any list of deaths from the workhouse) :-No. 1,
Sonth City District, April 12 th (without work-
house return), 19 (annnal ratio) per 1,000 ;
ditto, April 5 th (with workhouso return), 60 (annual ratio) per 1,000.
The Publin sanitary anthority did not consider chemical disinfection of premises necessary in a single case, though the registered dcaths from zymotic disease numbered 17, hut, aceorring to
their own officinl report, only 4 How it it that the halanco, -13 doaths,-has been overlooked; and why in the four cases was no disinfection practised, to say nothing of the other thirteen?
In the Saunders's Newsletter of tho 2nd of January last thero appears an admertisemont of an auction, to take place in James'ss-street, Dnhlin, -"Highly important to eapitatisiste, dairy. men, graziers, \&c. Sale of valuable leaseliold men, graziers, ec. Sale or valuable leaseloid interest in commodious prenises, a very large
number of very superior milch cows, horses, number of very superior milch cows, horses,
over seventy tons of liay, uppucurds of 200 tons of macmare, charns and cluruing-machines," \&c.
Now, as the 200 tons of mannre had boen cathered Now, as the 200 tons of mannre had boen gathered
dnring part of Novemler and Deconnber, it would during part of Novemher and Decenber, it would
ho an interosting sulbject for the eonsideration of tho Dublin Civic Sazitary Authority to ascertain how mueh had beer annually; colleeted in the one dairy. yard advertised in an avorage season of the 1sanal length (less than six months), when in less than two months over 200 tons had been aecumulated. Morcover, it will he necessary, in
the next place, to obtain correctly the number of dairies in Dublin, and the average number of cattle in ench, then to computo the numher of provision dealcrs and othors holding serviee in Duhlin city, and to add tho snm of all to the
number of dealers in and colloctors of manure, and lastly, the number of Corporation depots of filth, covering collootivoly several acres of land in the city, bcfore we can enter into tho feelings of those who declared that in the week onding Aprill 12 th there was no need for the du
of premises in any instance in Dahlin.
of premises in any instance in Dablin.
Is it net matter for wonder, looking at all this, registered in Dublin but 8,499 bixth here werd 8 deaths?
Surely if the Gas Company of Duhlin has proved unsuccossful, though managed by several members of the corporation, it is not hy handing it over bodily to that hody that better results wil he attained when such sad results have followed the inproved sanitary measures administered ly that body with tho inoreased powers of tho A of 1866.

THE IUITON QUARRY SCHOOLS,
KNOWSLEY, NEAR LIVERPOOL.
The first store of the schools we illustrate was laid by Lord Derby last year Huyton Quarry, a rural village, is in the neigh. hourhood of Knowsley, and some six or sever milcs from Liverpool. The building is in the Gothic style of the thirteenth century. It is erected on a convenient site on the main road from Hnyton Quarry to Huyton Park, and at the comer of two roads. The building is approached from the prhlic road hy a large porel constructed of timher, with rustic Gothic panelling above the arched doorway and also at tho sidcs. There is a lofty school-room, with side aisles, divided from the rest of the huilding by arehes and colamns, having a eleartory above and six large tracery windows. At the east end, and raised a few steps, is a deep recess, lightod hy a large triplet window, this appropriated to the relicions services of the church on Sundeys. The west end of the building is lighted by two traoeried windows, and a large rose-window above, while the aisles are lighted by windows of a lanect shape coupled together. Adjoining the chaneel forms a clas-room, under a separate roof, which the opposite side eloak. rooms bnilding, and on will be provided. The huildings are heated with hot-water pipes, the hoating-chamhers are of Stor the elass-room. The dressings reilding insiden stone; the main body of the the arches, quoins, and bands grey hrick; and patent moulded hricks , the ands are of Grundy's paith black mortar ; the whole being pointed with black mortar. All the roofs are of pitch pine,-opon timhered, cusped, and curved itd moulded corbels and roulded corbels. Tho roof is surmounted by a reat open-timbcred bell-turret and weather ane, and an the gables are to have metal finials and colour and the ridges have erested ridge-tiles, of Gothic
pattern.

The eontraetors are Messrs. Cassidy, Foxcroft woso plas, and the arehiteet is Mr. H. H. Vale, ion, plans were seleoted in a limited eompet; was carried ont. The total eost is cstimated at a little over 1,000 ?.*

THF COLLEGLATE CHURCH OF FOLGOAT BRITTANY.
One mile from Lesnevin, and standing in on fritte bleakest and loast inhahited portions of Folgoat. It is fine Chureh of Notre Dame de such a splendid church in such a remote and unfrequonted neighbourhood, but the wonder eascs when the history of the hnilding is related this ebnuch war the rosult of a row is an whe for the dake the grave of a pious idiot who had inharited this pot. Thero is much beauty in tho singular egend of this half.witted heing and it hear with it a moral which mirht well be stndied in theso days of intellectaal pride. This is not howevor, the placo to relate such a history, so
we will simply mention that John de Montfort in fulfilment of his vow commenced the crection of falfilment of his vow commenced the erection of tho church of Folgoat, which was comploted in Judging from pretty much as we now see it. Judging from the date of its eroction, would not expect to find the architecture of tho chureh of Folgoat very pure, hut it mnst he remembered that Gothic architecture in Brittany was nearly a century bohind tho same archi. tecture in the north of France or England, and this acconnts for the comparatively early appear ance of many portions of this fine eharch.
The plan of tho Church of Folpoat is
singular: It oonsists of a nave and aisles, nnder one external roof; two western towers, one rowned by a spire and tho other left nufinished. ehaneel of moderate length, with an aisle to the north; and a largo and doep transept to the south. This transcpt is higher and willer than the nave of the ohurch, and ahout 70 ft long; it is placed in such a position that ronte-wall forms a oontinuation of the cas from of the charch. It is, in fact, in a simila? position to the eastern transepts of Durham athedral or Fountains Abbey, only there Darham and Fountains thensept, whereas at ing into this transopt on its western siclo, and attached by its side.wall to the sonth aisle of the nave, is a most magnificent porch, and joiuing this, in such a way as to fill up the emainder of the west wall of the transept, is nere sacristy in two stories. Thero is a shallow one at the west end. The the nare, and a simila one at
ruins.
The

The north-western spire of this ehurch is of singular beanty, and it is diffienlt at first sight to imagine that it is not a century earlier than closer inspection, the detail will Howercr, npon quite Flamboyant the detail will be seen to be is a most beantiful and charming example.
The other portions of this ehurch most wor of notice are the bcantiful porches hefore men tioned and an extornal fountan herore men directly below the high altar. The porch whies leads into the south transept is indeed arch whieh able work. The doorway leading into it is adomed with the morway leadig into is the arch is finely and delicately cusped; the sides of the porch itsclf aro occupied with large niches, containing life-sized statues. The poroh is about 30 ft . deep, and is vaulted in stone. The porch leading into the south aisle has a double canopy over it,-tho suncr one ogee and the onter straight.sided. The areh is richly cusped. There are no statues in the jannos, hat there are niches flled with statues in the large and clabo. rate buttresses which Hank this doorway. There is also a statue in rather singular costume upon doorway pilar of this doorway. The western hut the porch over it fell down some ceseribed and it is dificait to understand exactly how it canopy was \&rranged.
The holy well at the east end is a pretty pieco of Gothic arohitecture, hat has reeeived some addi. tions at a later period. A singular feature about
"Writing on this subject, Mr. Vale adds:-"Tha vier irom Amerios abeut a church required from same design.
I owe the $B$ wilder my best thanks.,
this chnceh is the way in whicb the parapets are exried over the gables, forming a kind of staircase over the gable walls. This will he best which the by reference to our illnstration, in which the sacristy gable is represented. Noar the south porch is a Calvary, which is evidently not in its original condition. The lower portion onsists of the hase of a eross, Which is hexagonal on plan, very similar to Waltham. The upper portion of this strnetare is of much later work, and has probably been brought from some other place and put here after the destruction of the apper part of the original cross.
The interior of the Church at Folgoat is very inferior te the exterior, and, owing to the want of height and the absence of the vanlting which was never constructed, the general effect poor. Notwithstanding these defects, how ver, the archmologist will find much to interest him, for tho charch not only containg a rery erfeet stonc rood.screen, hut as many as sir of its original altars. The rood-screen consists of hree richly.vaulted eompartments crossing the nave of tho church. The centre is piered the doorway leading, into the choir, and the other two contain original altars.
The high altar is a noble example of anciont chrreh furniture. It consists of a solid base. mont, finely moulded, and the podium is adorned with a series of flat canopied niches ormamented with tracery in their heads. Ahove thero is a very elaborately undercut cornice, which sup. ports the altar-slah. This altar is of very large dimensions, measuring more than 12 ft . lone and ahove \& 4 ft . deep. The reredos ft . long exist, and it may be doubted whether it ever had one, for the great east window, below ever had is placed, and is placed, and which by the hye is a fine example noble rose of very the upper portion forming a domen to of very elaborate design, eomes quite very similar to the slab. The other altars are simple more the in desiga. There is a fine old statue of roodseren ander the ood.screen, and a great deal of modern glass, Thich is not so satisfactory as it might be, although it must bo acknowledged that the great rose in the large eastern window is treated with reen skin, and has a very hriliant effect when seen ovor the rood.screen from the west end of the churoh.
The Church of Folgoat, like so many others in Brittany, is built entirely of granite and Ker. santon stone. Now although this latter material is highly praised for its enduring qualities (the sculptare at Folgoat is as sharp as if it were carred yesterdny), and it seems to he camable of being carved into the most delicato and intricate forms, yet it has one terrible defeet, and that is its detestable colour. It is so like cast iron that until one gets one's eye within a few inches of it is diffieult to eonvince oneself that the rood-screen and many other portions of the Church at Folgoat are not really of that most nartistic material. Nor is the granite of which his charch is brilt of a much better colour than the Kersanton stone, and when we mention the act that tho whole huilaing is pointed in very white mortar, and the roof eovered with wory black slates, our readers cen roaliso the foet the the Church of Folgoat depends entirely npon its fine architecture for its beauty, and gains nothing from colour.
Opposite this church is the ancient college, which is a most valnahle and interesting example of the half. domestic and half-ecolosiastion the fifteenth contruy ; its ohief orman is very hold and charmingly.designed octagonal turret. It is really a shame that the French Government, to whom this that the French antiquity has belonged sincethe Revolution, doos not do something to prescrve it from its preseat state of rain and degradation. It is positively now let out as a cheap lodging. Toouse for begrars And it stank so vilely, aud was so filthy, that we were unahle to explore its interior, which, if we may judge from the staircase whioh we saw must be interesting.
We feel sure tha
properly which is generally so the French Goverament, art is generally so lineral in matters where art is concerned, something would be done to preserve this heautiful example of Medirval architecture from destrnction.

A French Inventor proposes to photograph despatches to microscopic fineness, and blow Dom through a trine sunk in the Straits of Dorer. When at their destination, the despatehes
could be enlarged arrain.

the collegiate church of folgoat, beittany.

SCULPTURE TECHNICALLT CONSIDERED.
Ar the Society for tho Encouragement of the Fine Arts, on April 2 l, Mr. Cave Thomas gave a Production of Sculpture." The lecturer said Production of Sculpture." The lecturer said
there appeared to be ne snhject on which the public generally was less informed than the mode of producing works ef art in marble and bronze. The pablic had no idea of the material difficulties which beset the sculptor, and the losses to which he is liahle by lahour thrown
away npou impuro marble and hy accidents in away upon impuro marble and hy accidents in
casting. He ther adverted to the very common and erroneous impression that the transferof the sculptor's eriginal model to marble was the great difficulty in plastic art; whereas i was tho model in clay which requircd all hi this in marhle was mainly merhanical, an intrusted to skillod workmen, the master merel supervising, and finishing with subtle tonches of the chisel. He then explainod the methods of waste and piece moulding, of pointing and carving the marble, of bronze-casting, and of the collateral processes of copying sculpturo hy ruechanical means; of modelling in wax, of elcctrotyping and repousse work, In the discussion which followed, and in reply to a suggestion sculptare was in the maperiority of the Grecian of the material, Mr. Thomas said that the mate rials for both Egyptian and Roman sculpture were locally ahundant, and that nevertheless Egyptian and Roman sculpture wero inferior to ar Grecian, and that therefore the cause of the Grecinn superiority must ho sought decper. That ion more completely the principles of educa. ion more completely than any other pcople; vith them ednoation was a formative and plastic he development of and symmetrical system for he development of men in flesh and hlood. The yreeks did not award crowns for excessive feats f strength; but to perfect moderation, halance
ad heauty, intellectual and physical, and that ad heauty, intellectual and physical, and that re conld never expect a grand epoch of British
rt till we also commenced with education, and $\mathbf{r t}$ till we also commenced with education, and
dopted the true system. If our educational ystem were right, true art would follow. The seturer stated that when first impressed with 1 f force of this great truth, he resolved to mm which education shonld assume of the trae e hopos to havo accomplished assme, and that hich will soon he before the puhlic, and atitled "The Proportionate or Symmetrical rently applauded, and a cordial voter was fre as passed.

LE SOCIETY AND THE INSTITETE OF PAINTERS IN WATER COLOURS.
BoTI Water-Colour Societies have a capita
ow of pictures this senson ow of pictures this season, hnt, as might have former years so far as very hittle from those eirmer years so far as the greater numher of eir members are concerned. A little varioty is ren to the ene by the superexcellence of Mr. Pinwell's drawing of "The Great Lady"; 3), with its curious misture of modern and
odisval appearance (splendid colour and the licacy of maxipulation by which so much eadth and power are attained make this quite nspicuons oven herc); by the clever auto-
ahic work "The Pictare" (236) of Mr. Alma ahic work "The Picture" (236) of Mr. Alma
dema, who, the more thoronghly to identify nself with English artists, jumps at once into front rank of water-colour draughtsmen ; d by an nnusually ineffective if not a weak play on the part of the fignre painterg gene. At the other,-the Institute,-hy a alarity of the same or similar nature to Mr . awell's, attributahle in this case to Mr. James. Linton, representing "a great gentleman" by some wonderfully good workmanship . Androw C. Gow's ; and by the faot of . E. Fi. Corbould and Mr. L. Harghe being in ch more force than has lately occarred. The importance of these exhibitions is ond to that of the Royal Acaderay, and it is pity it sbould be made so mach the second. ongst iron, cood, and calico, included from ago some credit for a speoiality in art,--tbe is of the boasted and hest than one, wo antages of the island, and thero is no fear of
landsoape drawing degencrating whilst there ar so many able masters remaining,

## So exeellent in art, and still so rising,

A hox and a brush or twe with their virtue." tho clever landscapist at last becomos mister One half the drawings collected for this cease, show are so like the moiety of what for Jon' gone have delighted; astonished or not, "for inere is nothing either good or bad, but think. minises it so," when perfect representation ministers to tasto only, and not judgmont, - that it seems superfluous to give notice of their The
Thengh too school of figure painters whose aim, though too often confined to minute elaboration, and promises some hetter rosults presently it nombers amonest may find proper nse when dicate oven to the extent Mr. E more who inthe Ins ovea to the extent Mr. E. J. Gregory, at To speak of the oricinality and thought. Gilbert's ready and forcible method of dopiction makes it an easy matter for method of dopiction makes it an easy matter for him to maintain a reatrcputation. By the dashing, skotchy style that gnalises his processional compositions, like the ne illustrating the chapter in history of "Mary, veen of Scot's Surrender to the Confederate Lords" (117) ; or in his emphatic pronunciation of the strong traditioual colour cavalier ardour is susceptible of when "Getting Gans into Posi tion" (25-1), for instance, midst the hlaze of trumpets, jibbing of horses, waving of feathers all colours bnt white, and the struggles of strong arms that would anatomise an enemy ; or in the more settled arrangements of "A Conncil" (27.), and picturesque composnre of "A Knight be one of $t$, ,Sir John Gilbert is betokened to inventive of illnstrators. Mr. Frederick Taylor will ever be associated with hunting scenes. He is here, in "Full Cry in the Feng" (218) wres hounds, horses, and red coats; with the aresence of air and idea of motion, which his Mr. Carl ans always convey
The Swooping Torror of thang, designated bears the imapresg of of the Desert" (68), tive knowledge only gircs ; probability as positreatment an ordinary episode of travellers perionce hefore crossing tho of travellers ex. common route. An cxhausted besert became tracted the insatiahle valturo, and its Bedouin wner is taking careful sight to shoot the hird of for wate wife and child, who have ween to seek the conscions camel, so intimeting that the vulture does not wait for a dead feast. Very seldom have the resonrecs of pure water-colour painting met with a more convincing exponent tional interest, and. With such help as sensational interest, and the rare opportanity of employing brilliant colour that Eastern fact so often offers, it might be safely predicted that this account. A portrait, "Abances to magnificent Pasha's body-guard (I43), corrohorates of Said dence of truthfulness and vigour that charac terize the greater work. Mr. F. W. Topham's pencil, like Mr. Samuel Lover's pen, used to tell in pretty lines the poetry of Irish peasant life Spain is the locality now where agreeable obser phases of the wide world's behaviour are Irish in by him. There is something really Andalusian or Valentian incident " rising of to hor Lover's Letter" (I7). Did "Listening cinated damasel fail to listen to her lover's halluWriting is a trade in Spain. lar? Mr. Topham's donna employing theguscribe and reader, knows hetter the ing the old tbe words, words, words hetter the meaning of oan give them; hat the incident has afforded material assistance to the mating of a clever pleasant pictare. It is a bold assertion, when the tender passion inspires so many an apprehen. dran of it, wheu the theme has been written and it must upon antil, but for its everlasting interest, worn -out the classed centuries ago with tbe from further say that never was the pen or brash; to told than by Mr. J. D. Watson. "Tho Meet. ing " ( 733 ) is just such as the refined instinct for lady authors, years ago, would have chosen for visible definition of what their endeavour was to describe, when heroes and heroines who ruled and reigued in village dominion, we destined to becomo one. It is a lovely drawing, accidental-grace than by any effort to force it
appeal shown in presentment. Bfr. Watson's ing, by reason of their exhibition are charm. of naturalness ; others the ; but there is nothing by him or others that can compete with this delightfully from Hostive story of true and chaste love. "Far a sloepince" (9), by Mr. W. Goodall, shows a slceping littie vagavond in a favourable light of nieely drawn, and everaplifying the effects of shared mannex: It might have been hy Mr. F. Goodall, R.A., judging hy "La Jolie Bretonne" (180) at the Institute, if the hands wredisproportionate and less well drawn. A beantiful head and some masterly adaptation of hlaes in the drapery make Mr. F. Goodall's dmpes in great acquisitiou nevertheless. "From ove the Sca" (105), by Mr. A. D. Fripp, a over with a parrot on his shoulder to astonish ailor easily-astonisbod father and astonishing mother and "Foeding Time," by Mr. E. K. Johnson (121) will find their admirers, no doabt, if effort at firish tends to any account.
Mr. W. Goodall's "School in tho Cloisters' (180) a very tame show of learning. Mr with. T. Dohson's head of "Siuppho" (136), is far better than "The Camellin" (\%ul) done, is simply an "eyesore" for ballia" (24), which Mr. E. K. Johnson's idea of "Sophia Westorn" (159), though admirably finished and an estern representation of a delectable and an abstract more Sopby Western tban Joan of Arc. "A Child's Lead" (211), by Mr. E. Luadgren, is swectly pretty, as Ar Landgren's drawings usually are. Of some others we will speak next week

## COOKERY AT THE INTERNATIONAL EXHIBITLON.

TuEnE are two main points invelved in tbe consideration of the food question-one the rood-producing resources of a country or dis. trict, and tho other the capahility or skill of tbe people to utilise its resources. It is remarkahle that it is not tho countries or districts that are hlessed with tho richest soil or the finest climate, that lave always the best crops, the clicooks, or the best fed people. It has, the best mitted that some of the counties for neen ad Scotland send the finest becf that is the Londor market. Deronshine Homphed to otber English countios como after Aberd, and shire with respect to produce; but the common poople of these sonther reahsed, as the Scottish hot is stated on good anthority - have done-so it and nutritive virtaes of well bilue nutriment that there porridge and brose, that aro only simple and nexpensive preparations of eatmeal
Tr. Bectures on oookery given twice dally by are very intor at the International Exhibition whetber the interesting, but it may he donbted to reach or benefit theal lessons given are likely fairly bo presumed that they are designed may do not effer it as an they are designed. Wo with tbe reverse of a desire to in limine, but, rest that reverse of a desire to cavil, may sug. nnder which the lectures are regards admission ander which the lectures are given must neces. week the lecture popular usefalness. This Week the lecture given from twelve to one clock has been on "Poor Man's Soup," "Cabbage Sonp," and "Omelettes." The lectare from three to four has boon on "Maccaroni, rith Cheese and Battor," and "Maccaroni, with Tomato Sauce." Last weok, the second lecture given this week was taken first, and the seoond related mainly to the preparation of Pot au feur witb a practical illustration on the making omelettes.
It can scarcely be expected that maccaroni in any variety of its preparations, will hecome speedily naturalized amoncst us, or wil hecom into the domestic cookery of ordinary Euglis life, and thero is no cood reason Lugus Majesty's Commissions sbould not why he missiou fee from those who to the mysteries of preparing "Maccaroni with proriding excellen even of "Omelettes," but in lar cookery," tbey need to lessons on "popu course. There may be practical diff popalar be surmounted, and we cortainl difficultios to Buckere should be freo admission to all Mr tbat, una secfares; but we do strongly urge a number suale conditions and regalations, wives and daughters as possible, of workmen's see when hagnters should be there to hear and

Sonp," "Cahhage Sonp," or even Pot au feu. Lessons on the preparation of suche class that not likely to he of much use to ets, and to pay in addition, sixpence for admission to the lecin addition, sixpence, and another sixpence for reserved seats and the privilege of tasting the dishes prepared in the the privilege of the company., "The proof of the padding is in the eating, and if either Macgregor's guggestion, referred numher, of admitting 1,00 giros, scho London hetter still, prpil teachers, from the Londlar Sohool Board schoors, the likely to Conkery, or any other plan be adopted women or ensure the attendance of a number of wome or girls roally of the working classes, we hole con. privilege of ceded to them.

In his interesting lectures, Mr. Buckmaster has abundant and efficient assistance, and all themate. rials and accessories he needs for the complet illustration of his suhjects. Having mounted his rostrum, where a variety of ohject hee arranged to his hand for illustrative purposes, he is waited upon by four dapper female cooks, appropriately attired, who watch his eye and hand, and bang npon his lips, suiting thcir actions to his words. He vindicates his mission manfully as a teacher of practical cookery, and contends that there is greater dignity in a house wife, or a woman of any class, heing ahle to cook economically a wholesome, palatahle dinger than in heing ahle to fashion and manipulate Hounces. His ohject, he stated, was not to show how to prepare costly, higheclass dishes, hat to point ont defects in onr domestic coosery, and to snggest romedies. He conld not help it that Pot out jeu was a French name; it was an ex. cellent, economical dish, that could he produced in England ander any name they pleased. It could be prepared either with 5 h . or 6 bb . of the silver side of the round-that was the best; or of lower-priced pieces, such as half an ox-head, of lower-priced pieces, suc. dc., with 2 lh . or 3 h . of grod bones. The meat should be firmly tied, as was done by "Charlotte" and his other handmaid, who had each charge of a capacions maid, who had each messel mnst be scrupulously clean and empty. The meat and hones having clean and empty. The meat covered to ahout heon placed in the pan are covered to
2 in . over the top with pnre, soft water 2 in. over the top with pnre, sort water. An onion is next pecled, and put down to roast.
Another onion is peeled, and garnished with a Another onion is peeled, and garnished wother dozen cloves, stuck ronnd ite centre. Thed a few vegetahles are then scraped and sliced, a words heing interspersed concerning thes conspective characters and qualrnes, two turnips (these can scarcely he peeled too thickly, whilie (these can scarcely he peeled too thicky, whine potatocs cannot he peeled to thely, as celery, a the mere cuticle goes), halr a hean of celcry, leek, and, for a thyme, a small bnnch of marjoram, another of thyme, a sman of carlic parsley, trio bay-leaves and a clove raluahle of the last herg kitchen regetahles, an and with great caution. The saucepan, which has been simmering on the cooking stove, is then carefilly skimmed, and minutes heforo the other vertapoonfal of balt, ingredients heing a dessert-apoonful of salt, a tea.spoonful each of whole pepper and or allspice. The whole is then put to simmer for three or fonr hours, hat shonld not he allowese to boil. An earthenware po as well as a metal sancepan.
The contents of Mr. Buckmaster's pots on one day are warmed up for the company to taste on the day following. In referring argain to the aime and ohjects of the school, Mr. Buck.; master quoted the proverb, "God sends meat," but another party "sends cooks." His numerous and respectahle andience relished his soup, heef, and omelettes, and his lecture, too highly to suspect for a moment that he or his assistants were in the service of the said other party; and although all present might he in accord in ap. plying to them the adjective clever, not one, we feel assured, could dream of attaching the suhb stantive.

New Lighthonse on Holyhead Break-water.-The Trivity Honse, London, has just given notice that the lighthouse on the hreak. water at Holyhead, which is rapidly approaching completion, will he opened in the early part of June next. The light which will he exhihited will be a red Bashing one, showing every fifteen seconds. The lighthouse is clevated 66 ft , ahove the level of high water.

## an effective grate.

The great difficulty is solved, viz., how to get a healthy, cheerful fire, freeing the room from draughte, which will impart a genial heat with from one.third to one.fourth of the coal com monly nsed.
The Rev. Thos. Wolstencroft, rector of Syde near Cirencester, has jnst taken out a most simplo patent (No. 1,020) which can easily be applied to all open fircgrates, improving the appearance of the grate, at a cost of a few shillinge, and is particularly adapted
ttached to ontside walls or over cellars.
ttached to ontside walls or over cellars.
The patent consists in cutting of the supply f air to the fire from within the room hy putting a spring plate from the ashpit to the lower har under the front of the grate, and supplying th air from without by a tuhe 2 in . or 3 in . in diameter and 3 ft . or 4 ft . long. The portion of the tuhe protruding through the wall is sunk into the ground, or is otherwise protected from stron winds or currente acting upon it. The tuhe con ducts the air to the ohnmer thus formed ander the firegrate, and care is taken to make thi chamber connplete hy stopping up all joints or cracks under and around the firegrate, so that the external air cannot possihly pass into the chimney except throngh the fire.
After tho fire is kindled the hack is covered with small coal, coke, or cinders, which canse the fire to hurn first in front, and in a few minutes all tho thin layer of small coal or cinders hecomes of a choerful red heat,-the air in the room is quickly warmed and maintains its heat on from withont. The ouly requisite for keeping the fire bright is an occasional poking so as to clear the hottom of the grato from ashes to allow of the action of the air npon the fuel. Tho bottom of the grate must always be covered with fuel but only a thin layer: the grato bars in front are in fact, unnecessary, for a fire can he kent hurning hrichtly as small as the palm of one's hand. Jayes D. Cuntis,

Coramander Rogal Navy.
SAXMONDHAM CHURCI RESTORATION Thr parish chnrch of St. John the Baptist, Saxmundham, has heen partially restored under the superintendenco of Mr. Phipson, the architect, and re.opened for divine service. The galleries and pews have heen swept away, and the latter are replaced hy henches nade cntirely of New Zealand Kaurie wood, which is very hard, of heautifnl grain and colonr, and free from knots. The gallery at the west end has also heen taken Whay, and the tower arch is opened to view The organ, which formerly stood npon this gat lery, is now removed to the south aisle. It has been repaired "hy Mr. Walker, of London, and a new pipe, Kerariophen," has heen added. Buth the aisles are divided from the nave by arches, four in numher, on either side. Tho columus are octagonal. On the sonth side, the columns, formerly surrounded with pewe, have heen cleaned down, and in one or two cases renewed. Space has heen saved hy the removal of the south porch, and the main entrance to the church is now through the tower which faces he entrance to the churchyard, and the doorway is led np to hy a hroad flight of atone steps. An oak screen separates the tower porch from the nave. A further saving of space has heen west end of the north aisle. A new vestry, of Decorated work, is now placed on the north side of the chancel. The removal of the vestry and south porch has the effect of lengthening the church. The south chancol aisle has heen thrown more open to the chancel hy the introduction of two Decorated arehes with circular piers, caps, and hases. A ncw three-light window has heen inserted in the west hay of the south aisle, recovered by the removal of the porch. Tho walls re faced with wrought flint work, and the buttresses are all restored, the tower has also been restored. The south aisle has heen newly roofed the timhers are of pitch pine varnished roofed ; the thes her the vall of the The spana file with treary charncteristic of the Pere, andicular style, which has heen followed Perpendicular style, which has heen followed thronghout the nave and sonth aissle. The win. dows are all of a late period, and hoth in the sonth wall and in the clearstory have elliptical heads with trucery. Mo.
to he entirely renewed.
The chancel had heon shockingly defaced hy the cheap repairs of hanr.
fixed in the cast end, and the wall has heen refaced in the samo manner as that on the south side. The reredos is not yet finished. It is presented by Mrs. Crampiv, and will he from
Mr. Thnrlow, sculptor, Saxmundham.
Mr. Thnrlow, sculptor, Saxmandham.
The clrirch is warmed hy one of Goldsworthy The clareh is warmed hy one of Goldsworthy Gnrney's radiating stoves, whioh is placed sonth aisle, near the organ. The lighting with gas is by means of jets ronnd the capitals of the colamns in the nave. There
Several stained-glass windows now appear in tho chnrch: one, a two light window, on the north side of the chancel; another at the east end of the sonth aisle; a third is the east mindow in the sonth well of the chancel aisle ; and a fonrth, geometrioal, is the one next it. Besides these, there is a twollight window in the east end of the north nisle, with fignres of angels. This was minted and presented by Mary and Bessie McKean, and is a thanksgiving of ering for the recovery of a relative from illness.
The outlay, inclnding that of the chancel, was 1,7007. The contract was taken by Mr. Grimwood, of Weybread. Mr. Vine, of Ere, was the suh-contractor forthe stove work; and Mr. Gibson, of Fressingield, for the plumher's work.

READING GRAMMAR SCHOOL
The old Tindor Grammar School of Reading seems doomed. It is the only architectural domestic example loft remaining to the town of the olden time, when it formed part of the Henry VII., heing empty, was apportioned and endowed as a free grammar-school for tho sons of tradesmen in the town.
Owing to systomatic neglect and mean patch. work repairs, those in an thority considered it not sufficiontly grand or extensive enongh for the regnirements of this age, and accordingly a new and extensive one has heen hnilt a mile distant, the old one now boing occnpied in various tene. ments by a dingy looking species of the working classes.
In this age, when the revival of the Gothic stylo throughout the length and hreadth of the country is cansing the owners of ancient haild. ings to do their ntmost to prescrve them, it seems mysterious that in an increasingly prosperous town like Reading there has not heen aroused that spirit of regard for the memory of the many ancient men who received their educaion within ite walls as to canse them to make n effort to uphold their time.honoured school instead of seeking to hasten its demolition.
It is fifty yards from tho town.hall, near the contre of the town, and any projected improve. ment of the latter need not in the least interfers with the restoration of the school, for any find for the pnhlic henefit, instead of heinc regarded as a disficurement whicb it now is. The situation is snch as few puhlic huildings possess. The north and soutll fronts have an extensive open area heyond them, while the ontline of the hnilding, with its oetagonal bell-tower on the north side, is sufficiently interesting to a stranger as to canbe regret that one of the few links connected with the past is to be removed throngh the want of a leading spirit to stir up the in. hahitants to preserve, at a comparatively small cost, what may prove a public benefit in the end.
J. B. Watts.

## DECAY OF IRON ROOFS.

Sir,-1 have as yet seen no explanation of the canso of the scale of paint ardiron falling of the rool, as mentioned hy Mr. Raymond. Nemience and ohservation during seventeen years I have designed and carried ont railway works? The matter is very simple: in both wrought an cast iron a skin is formed npon the surface in the process of manufactnre into the shape required. In wronght iron this skin will come off soonel or later in scales, even if the iron is painted. IT cast iron it is thrown of in a grannlar rust.
This skin is of no material value, and woole he hetter removed as soon as manufactured, if $i$ was not for the cost of doing so; when it it removed and the iron is painted, there will he Is recurrence of the scaling, as far as I hav recurrenc.
ohserved.

Lead paint should not be used; an iron oxia paint heing cheaper and in every way preferable

Wr. Prichey.

## MANSIONS OF OLD ROME

Ar the last meeting of the Architectural Asso. ciation, a paper was read by Mr. R. P. Spiers, on this subjeot, illustrated by a large number of sketches, drawings, photographs, and engravings. The titlo given to the paper, "The Palace of Soauras," indicated tbe intention to take as a
gaide the woll-known work of M. Francois gaide the woll-known work of M. Francois
Mazois, -"Le Palais de Scaurns, ou Description d'uzois, Maison Romaine." The convenience of the form into which this anthor has thrown his
information, and tho exact and pecnliar notnre information, and tho exact and pecrliar natnre
of bis studies, wero noted. The form- letters of his studies, were noted. The form,-letters from an imagined prince of the Sueri, the son
of the Ariovistns defeated by Cæsar (De Bell. Gall., lib. i.), to a friend remaining in Gaul,is, of course, one of the many ingeenious adapta. tions of the Abbá Barthelemi' idea of sending (350 B.C.) the Scythian Anarchasis to trave and obsorvo in Greece (Barthelemi's work was
first pnblished in 1788). Mazois had projected an extension beyond the Roman residence, -the only part treated of in tho work published in termple. This, up to his dcath in 1826, he had not found time to execute. Tbe exact and de Pompéi " the finest work on that subject yet published. The details of tbe private life and of the arts of Rome were, by living for years
nmong their relics, thoroughly realised by him not merely treated with laboured detail derived not merely treated with laboured detail derived
from old, even if contemporary, writers. Tho from old, even if contemporary, writers. Tbo the section on "Thoman Architecture" in Gwilt's Encyolopædin of Architccture, and elsowhere,
and tbus made known still more widcly, owe and tbus made known still more widely, owe
somo of their cbarm to this fact. Mr. Spier exhibited to the meeting tho plan of tho socalled restoration by Mazois of the Palace of Scanrus, enlarged to a scale of 16 ft . to an
inch, and called attenicon to it, as inch, and called attention to $i t$, as one of
the completest expositions to be found anywhere of tho general plan of the palace of an immensely rich man in the last days of the republic and later. Of tho actual palace
of the real Marcus Scaurus, mentioned by of the real Marcus scauras, mentioned
Pliny, nothing is known. Its site even is doubtful. Mazois placed it, after discussion of authorities, on the Cœlian Hill. The splendour of its decoration, incidentally alluded to in Roman writers,-notably the 38 ft . high Lucullinn black marble columns, -led Mazois to conceive finish. In all he followed actual examples at Pompeii as far as they wonld carry him, and added tho special details from difforent souroes, mainly from tho precise descriptions of luxurious arrangements fu
ancient authors
After treatin
After treating each part of sucb $n$ bouse in Aetail, -the pablic scetion, the family section, cooms for the master, for his wife, halls for fames,
vants ${ }^{\prime}$ dwellings, pictaregles, and the rest,-Mr. spiors drew the attention of students to the
stans Spiors drew the attention of stadents to the
value of the study of Roman architectrre, - of what is known as Classic architecture generally, - in training the mind to properly appreciate symmetry and regularity in the disposition of ouildings in which the expression of dignity or
of refined elegance is to be prodnced. The urrangement of tho courts of a Roman house, zapable as it is of modification to suit climate mind by Engligh architects designing modern residcnces. In the honses in Paris and its neighbonrhood, the effect of the careful study of Roman building shows itsclf to the instructed eye in a certain dignity and case and finish in
yeneral idea as well as detail, never out of the aim of French architects in their most vivacious works.
Treating of the decorations so spccially essoand elsewhere in Italy, bnt discovered in rome the ruins of early buildings, Mr. Spiers said:" In the construction of raulted halls, centres would seem to have been placed nnder the chief Tho ribs boards were laid from centro to centre. which, being not more than from 1 in. to 2 in. in thickness, and 2 ft . square, were more like tiles. Between these and on the boards were laid thick labs of wood, which formed the moulds for the coffers, and then the whole was filled in with oncrete. On the removal of the centres and tucco, and paiuted. Sometimes when tbere were no coffers, aud when tho vault was going
to be painted or enricbed with mosaics, a layer of tilcs was placed on tho boards, which formed more solid and better constructed ceiling.
Tbe paintings with which the halls and rooms were adorned may be divided into three classcs: ontation and highest being the pictorial repre. call the ideal based on nature ; which 1 would sentation of animals, foliage, plants, sc.,-i.e the real based on nature; 3rd. The represontion of imaginary perspectives of imaginary architectural features,--the ideal based on conventionalities, fantasies, and conceits.
Tbe first are of the most importance, and au nspection of any grod engravings of those class Roman town) will) give some idea of the standard of art which was renohed by the Greeks at this time. It must be remombered 1 threeks they were executed in fresco, - a style of painting which demands celcrity in execation, and the drawing of which cannot with facility be corrected; and 2nd, tbat they were drawn by men estecmed only second-rate artists,-for provincial clients. Tbe socond class of paintings fank quite as high in their own particular style and the freedom from the conventionalitios of and the freedom from the
limited powers remarkable.
Both of these classes of painting, however, exist in our own day. It is in the third class that we find a style of decoration pcealiar to the Greeks and Romans, which has never to any
considerable extent been attempted since. The walls above the dados of halls and rooms were often painted with representations of porticoes and courts, so arranged that at first sight they seem as if one could look out of the room into them. They have the effoct of large mirrors, and give great effect of size. It teenth conturies the walls and oeilings great halls were painted with columns and balustrades, and figuros disporting themselves beyond; but tbe eye is rarely deceived by these and the imagination carried beyond the wall or ceiling on which they are painted, as it is by of persinan pictures. Beaides, the knowlodg the Italian and French painters (who generally executed thcse works) to establish one point of sight and work everything from it, with tbe con sequence that there was only one point of sight from which the pictures ought properly to be viewed. But in Pompeii and Heroulanenm the arcbitectural perspectives seem to have been kind, and have many points of sight; the lines converge to theso various points, and curionsi enough do not always seem to do so until after critical examination. Of the cxact meaning of such perspectives I have no definite knowledge they would seem to be based on some rccognised frequently recorrent architectural objects, and probably the ormamental features of the solaria or open terraces, with gardens (bauging gardens) common in such mansions,-forming a great portion of the roof space,-supplied the chicf snbjects. I cannot but think, however, that the necessity for rapid erecution in fresco bas sometimes led to the execution of forms of such wild fantastic kinds as in more sober and reasoning moments would have been discarded at once."

STEAM LOCOMOTION ON COMMON ROADS
A paper has been read at the Institution of Civil Engineers, Mr. T. Hawlssley, president, in Locomotion On the Rise and Progress of steam Head, Assoc. Inst. C.E. It was divided into four parts :-1st. On road locomotives for conveyance of passengers, aloo locomotives for use on tramways; 2nd. Road locomotives for conveyance of grd tions, stenm plouring in ; 4th. Locomotives for military purposes. The author commenced by reviewing the listory of the road locomotive from the time of its introduction, about the year $1827, \mathrm{np}$ to the present time, showing the energy and talent which bad been displayed by Gurney Hancock, Scott, Rnssell, and others of the early iuventors, and the great difficulties which appoared to beset tbem in their endeavonrs to stated that there were only two feasible It was applying steam power to tramways,--first, by applying steam power to tramways, - frrst, by
means of a self-contained steam car running
upon four or moro wheels; and, secondly, by a detached engine, drawing one or more cars.
Wo may here remark with reference to an application from Mr. C. Gilpin, M.P., addressed the Metropolitan Board of Works for per mission to try a new steam tramway car on the hine of rails between Vanxhall Bridge and Tictoria Station, that a committee of the Westminster District Board of Works, by whom tho subject das been considered, report that they have grave donbts as to the power of the Metropolitan Board of (Vorks to make a special bye-law or orde nnder the "Loconnotives on Roads Act, 1865", sanctioning the nse of steam locomotives, and are further in doubt whether any permission from the Metropolitan Board of Works would override the Tramways Act, by which the use of steam cars on trambyys is prohibited, and being, moreover, of opinion that running locomo tives through the strects of London in the daytime is dangerous to the public, they decline all responsibility in regard to tho proposal to run steam tramway-cars along the Yauxball.bridge. rond. At the mecting of the District Board on Fridey, this report was adopted.
Mr. Cawley has withdrawn his Locomotives on Roads Bill, whicb was on in the Commons for sccond reading, and has announced that he will move for the appointment of a Select Committee to inquire into tho whole sulject.

## POROUS TLLE ROOFS.

Ive reply to an inquiry in our pagcs as to the best modo of rendering porous tile-roofs water proof, three separate correspondents recommend the use of the composition patented under the Griffiths, of Liverpool. Tho letters exhibit . ittle too mach friendly feeling, if not concert but we lave reason to believe nerertheless that the material named might answer the purpose.

## EWELME AND CHAUOER.

IT seems a sort of profanity, if one raay arcuse the term, to risit Ewelme and ignore Cbazcer.
The founders of the alms-bouse described by r.. Watts wero, in their day, great peoplo-viz. rapbical of Suffolk, whose tragic end is so "Frapicaily recorded hy Shakspeare in his
"Fenry lioved to have been Cbaucer's granddaughterThis cull and their lived at eime in great splendour, nd their benevolent plans for founding and ndowing the old charity in question were most efficiently carricd out by themsolves, and respected, if not augmentod, by their successors. The sight-scer's tion of Ewelme, however, is the churoh, which contains two of the very finest tombs in England. Tbey wero the work of Ducbess Alice in her last and long third Fidowhood. She was the daughter of Mr. Thomas Claucer, landowncr, M.P., envoy, or parvenu, for we cannot ranly but neverthcless his father. He married a lady named Burgbursh, of an old baronial family, with whom he acquired his estates at Ewelmo and elsewbere. His mother's name was Rouelt.
rradition and every probability make him the son of Geoffrey Chaucer, poet, courtier, envoy or ambassador, and landowner in a very smait way. He married a lady namod Philippa, wbose urname we do not know.
These tombs illustrate the whole subject. They show the arms and alliances of Burgide, 'they show Alice's family on tho mother's Earl of Salishury who was tho duchess's second husband; ditto, ditto, of the Duke of Suffolk, her third hnsband. Theso tombs prove nothing whatever about Cbaucer, but they say a good deal abont Roueit, the name of Thomas Chauccr's motber, and of her family alliances.
Sir Payn lo Rouelt,was a king-at-arms ; that is, he was a professional herald of very high named Philippa, was twa ders, one of whom, Chaucer, above named: thns the duchess would have all this love of heraldry in her very blood. The other danghter, Catherine, became governess in Jobn of Gaunt's family, even vally Dachess of Lancaster and mother of all the Beauforts. This was a great allinnce, connecting plain Alice Cbaucer collaterally with the
Lancastrian monarehs, Henry IV., Henry F.,
and Heary VI.; while through the Beauforts she was related iu blood to the cival Yorkist line Her son, the second Duke of Suffolk, married a sister of Edward IV.; her grandson, the Earl of Lincoln, was reoognised heir to the English
crown, and this tie of blood endeared him to crown, and this tie of blood endeared hima the Tudor

It has beon objected, if Duchess Alico was of kin to Geoffrey Chaucer, why does the frot not appear, when she had so evidently the opporInnity to prove it? I fenr that she was too pions, and preferred to ignore one whom the priests condemned. We have a similar cose with Shakspeare's granddanghter, who, from Puritanical motives, ignored her progenitor.
Briefly, the case stands thus :-
Gooffer

Thomas ctaucer= Burghursh.
Alice Chaucer= Philip,

It is to be hoped that some Record-searc may yet supply the missing link.

THE CHUROH OF ST. CLFMENT, BOURNEMOUTH
Os Tnesday in last week this charch was consecrated by the Lord Bishop of Winchester. The plan of the building consists of a nare, with one broad aisle on the north side; a chancel,
40 ft . in length, separated from the nave by a lofty stone rood-screen. On the south side of the chancel are the sacristy, organ-chamber, and choir-vestry, each of whicli commnnicates with the other, and with the adjoining clergy-hous by means of a covered cloister. On the north side of the chancel is a chantry chapel, having open stone screens at the west and south sides The style of architecture adopted is of the latter half of the fourteenth centnry. On the oak ohoir-stalls are representations of the Annunciation and the Nativity, and the figure of the founder, Mr. Edmund Christy, offering the church "to tho glory of God and in honour St. Clement."
The Communion-table is approached by a liggbt of white marble steps, with encaustic tilcs
designed by the architect for this work designed by the architect for this work Both here and elsewhere in the church the emble of St. Clement appears.

The churel cost 6,0002 ., and holds abont 500 persons. Mr. Sedding, of Bristol, is the archiand Mr. Green, of Manchester, executed the carving.
kING ADWARD THE SIXTH'S GRAMMAR SCHOOL, SOUTHAMPTON, RE-OPENED. Try ancient Grammar School at Sonthampton has been re-opencd, after the re-building of the main portion of the institntion, and some renovation of the rest. The Mayor and Corporation vere present officially, as well as the Bishop of Winchester, Mr. Cowper-Temple, M.P., and large party of ladies and gentlemen.
The new school buildings and cloisters have heen erected by Messrs. Brinton of Bone, from designs furnished by Mr. R. Critchlow, of Southampton, architect. On the site of the old school-room, which was dark and ill-ventilated, being only 99 ft . high, there has been erected a room 15 ft . high, and with errangements for ventilation. These include the fitting of the windows on a principle invented by Mr. Critch. low, by which the opening of the lower sash opens the higher also, thongh the former may be in effect closed, and at the same time leave the upper one so far open as to provide ample means of egress for fetid air. There are sliding venti. lators in the lower walls, and open ones near the ceiling, and the fireplaces have been built of a height equal to that of an ordinary boy. The room built in 1860, which was a mere woll, with a light on the top, has been improved, windows having been put in the walls, and fireplaces for the parpose of ventilation introduced. The lan. tern has heen removed, and a perpendicular window inserted in the eastern wall, light being ohtained through it from French-street. A class-room in connexion with both the rooms has been boilt, as well as a porch common to
both rooms, and a new hat and coat room. The latrines, too, have been rebuilt, as hitherto nothing could be worse than the sanitary rrangements in this respect; an air passage ated up, and to be nsed as a lavatory, separate hazed brick, set in tement The walls are of paved with slate, and they are to be fitted up paved the best self-acting sanitary appliances at with the best sel-acting sanitary appiances resent known. some new and commodiou dormitories have been fitted up in the upper part of the new buildings, where, too, the paramount necessity of proper ventilation has not been forgotten, tho partitions dividing the sleeping-place being entirely open at top, and fire-places are fixed on both sides. The cloister at the east end of the quadrangle are 45 ft . by 25 ft ., the width being here extended to dmit of the place being used as a hand fives court. The south cloisters are 126 ft . long, and 10 ft . wide, and are terminated at the west end by a perpondicular window of three lights, containing iron stanchion bars, with flour-de-lys heads. The cloisters are formed by a succession of arches, piers, and buttresses, built of red brick. The roof is construeted with beams, to admit of gymnastic appliances being fitted, and the floor is of Bishop waltham glazed red diamond tiles. Tho quadrangle has been levelled and drained, and will be gravelled when funds admit, and the dwarf wall at the west end completed.

## THE EMIGRATION OF WORKMEN.

Trast some better idea may be formed as to the extent of exigration of a given particnlar trade from this oountry, 1 quote fiom a retnrn, very recently issued, of the number of miners and quarrymen who have loft this conntry in passenger-ships in each year since 1861 :-

| Year. |  | N |
| :---: | :---: | :---: |
| 1862 |  | 1,720 |
| 1863 |  | 3,220 |
| 1864 |  | 3,266 |
| 1865 |  | 5,643 |
| 1866 |  | 6,030 |
| 1867 |  | 5,611 |
| 1868 |  | 8,500 |
| 1869 |  | 0,913 |
| $18 \% 0$ |  | 4,769 |
| 1871 |  | 5,272 |

CHESTER WORKHOUSE COMPETITLON.
Mr. Culshsw, architect, of Liverpool, in his report as referee in the workhonse corapetition placed the design bearing the motto "Custrum" first, that with the motto "Alpha" second, and "Cestria" third. The desigu "Castrum" is by Mesers. W. Perkin \& Sons, arehitects, of Leeds,
The guardians have not confirmed Mr. Culshaw's The guardians have not confirmed Mr. Culshawi on in consequence.

## THE TRADES MOVEMENT.

Oxford,-At a meeting of master boilders, held in the Town-hall, to consider the request of the operative masons fox an advance of wages and other privileges, it has been unanimonsly agreod that they were not in a position to comply with the request, owing to their having taken conunderstanding that the last artemen upon settle disputes for a reasonable time. They also expressed an opinion that the masons wer adequately paid for their labour, and condemned the practice of making repeated and unreasonable demands, which, they considered, tended to stop and even banish trade, and injure

Rotherham-A meeting has been held
masons of this district to consider what conrse
should be pursaed in order to obtain the reduo-
they demanded. The reporters were excluded from this mecting; and on the same evening the master builders held a meeting, at the White Hart Inn, to consider the demand of the men, which was for a reduction in the hours of labour from $55 \frac{1}{2}$ hours to $50 \frac{1}{2}$ hours per week. The masters considered that for the Rotherham district, which, for many reasons, is not on an equality with Sheffeld and other places, this was an unreasonable demand; but their meeting was adjourned in order that the matter mig be further considored.

Liverpool. - An aggregate meeting of the operative house carpenters and joiners of Liver. pool, Birkenhead, and vicinity, was held on Thursday in last week at the League-hall, Whitechapel, "on business of importance to the rado." The week's working hours of the men are at present fifty-five, the rate of payment boing 63, d, per hour. The men sought to reduee the hours to fifty, and increase the rate of wages to 8 d . To this the masters would not agree, and at a meeting in Hope-hall a resolution offering, on the part of the men, to agree to $52 \frac{1}{2}$ hours, at $7 \frac{3}{3} \mathrm{~d}$, an hour, was passed. To this tho masters declined to agree, but renewed a previous offer of an advance of a $\frac{1}{2} d$. in summer and $\frac{1}{4} d$. in winter. It was then resolved that the masters should be seen individually on the subject; but this did not lead to any satisfnctory result, and the meeting was to consider the best ourse to adopt under the circumstances. Mr. Suthertand occupied the chair; and there wero nearly 1,000 persons present. The Hoperha.l resolution was almost umanimonsly negatived. The chairman expressed his gratification at this result, as he said there was no telling wlat the ond of a strike might be. From what he coald learn lie thought the masters, although they woald not concede the diminution of hours, would bo perfectly willing to givo a riso in wages. A resolution to the effect that the meeting, in order to fivally settle the dispute betweon the employer and employed, agreed to withdraw their demand for a reduction of hours, and to aak only for an adrance of 1d. an honr in tho rate of wages was carried, only one hand being held up against it. It was then resolved that the meeting determine to cease work on Wednesday, April 30, if their demand be not acceded to on or before that date? The resolutions to be communicated to the Builders' A seociation.
Darlington, Stockton, and Middlesbrough.-The Darlington joiners made another demand for 3 s Darlington joiners made another demand for ss. that unless their recuirements are complied with by the 20th of May, they will take other steps to secure them. Tho masters are nawilling to grant the required ooncession. They consider that they yielded a trifle too easily to the re duction in the hours of Labour, from $56 \frac{1}{2}$ to 50 hours, asked for last year, and they are now taking steps to resist the present demand. In Stockton, failing compliance with their demand for 3s. per week additional, and an hour's less work on Saturday's,一, knock off at twelve oclock instead of one-the joiners have aireasy come ond oncrike, and here is a general suspension of building opera. tions, which will probably become still more widely diffused nuless a settiement is effected. In Middlesbrough, also, there is a prospect of a
ruptnre arising out of similar canses. Indeed, the present demand appears to be only the initia five step in a general mopement on the part of the building trades, in the north of Eugtand, for additional wages, or failing that, shortor hours of labour. Honses are in great demand throughout all the North of Engl-nd, but mure especially in the Tees-side towns. In Middles. brongh alone something like a thousand new houses were erected las jear, and the demand or honse accommodation remains unabated. In Darlington and Stockton the domiciliary requirements of the population are equally urgent. Work is, therefore, plentiful, and wayes are better than they have ever been before.
Edinouerg. - At a joint meeting of the Edin. burgh and Leith operative masons held in St. Mary's-street Hall on Wednesday in last week, a letter, which had been received from the Haster Builders Association, was submote burgh and Leith Master Builders' A.soociation, thas unanimously agreed to accede to the operatives' demand, namely, $7 \frac{1}{2} \mathrm{~d}$. per hour, to commence on 3rd May. It was ananimously resolved to retarn thanks to the Master Builders Association for complying with the demand. As there are a nanber of employers not con-
rised the committeo to take immediato steps to get them also to concede the iucreased rate Strikes at Vienma．A correspondent of the

OPENING OF THE NEW PUBLIC HALL AND LIBRARY，LOWESTOFT．
Perfaps few towns in the Eastern connties bave progressed more than Lowestoft in building its position which fact is mainly attributable to Entire districts have，during the past six peace been transformed from pasture and amber Coets and houses．The Local Improvement Pommissioners have just determined to the want of a library and public hall supply months aco a company whe puble hat few freehold land was purchased on the London． road，and Mr．W．O．Chambers undertook the architectural arrangements．Contracts for the building were entered into，and the commence－ ment of the erection has just been celebrated by architecture seleoted for the the style of Italian，faced with wite brick and elovation is ings．All the white brick and stone dress． the principal features in the facade are pilasters， with Corinthian caps，supporting a projecting cornice of stone and brick over which is placed an ornamental parapet，relieved with finial ter． minations．As the building is divided into two two entrances，ono half being devoted to the Freemasons，who liave，independent of the company，erected at their own expense a spaoious hall for the meetings of the Masonic lodges of the district，with ante－rooms，kitohen，and other accommodation for the craft．The other half of the building oontrins a large library，amusement． in the roar of the library．The pablic hall is
duced in the side walls，surmounted by plaster caps．Ribs divide the ceiling into recessed burners，to light the hall，of forty patent sun－ ourners，to light use hal，of corty－two jets each into the ascening shaf or the sunlights are connected ventilatio trunks in tho roof．At the west end of the hall is a gallery，and at the the platform，apsial termination，in which is placed the latform，raised about 30 in ．from the floor A．ccommong a rise of 15 in ．from ond to ond sons in the hall．The ontire cost of the library public hall，and Musonic hall is about 4，000t． Messrs．Gibbons，of Ipswioh，were the builders． Mr．J．G．Balls，of Lowestoft，was the snb－ contractor for the 日tono work，and Mr．Scarlett tor the plumber＇s work．The gas－fittings were executed by Mr．J．W．Ling．

OHURCH－BUILDING NEWS．
Scarborough．－Obrist Chnrch is to be ax tended eastward by the erection of a chancel Which the charch does not at present possess The contemplated impropements include a uniform system of sittings．A new tesselated flooring will be laid down．Ont of the three atained windows reqnired two bave already been promised by parishionors in memory of departed friends，and it is hoped the third one will be fortheoming．The entire cost of the improve． ments will be 1,2001 ．，and of this 800 ．have ableady been promised．It is also hoped to be Hanley Castle．－St．Gabriel＇s Church．Hayler Castle，has been consecrated．s The The Gite Hanley new church was prosented by Sir Edmund new church pyas prosented by Sir Edmund in Rohertsend－road，is adjacent to acre of land leading from Hanley to Malvern，and is ver suitably situated as regards distance for the cattered population of the parish．The archi－ tect is Sir Gilbert Scott，R．A．；the contractor， Mr．Wm．Porter，of Malvern Wells；and Mr Burlinson，clerk of the works．The ohurch is built in the Early English style，and consists of chancel ；nave，with aisles separated therefrom by four obtaso pointed arches，and clearstory above；tower and spire at the north side of the chancel，It is built of Cradley stone，with Bath stone dressings and faoings．The lower stage of the tower will serve as a vestry，anderneath Which is a chamber for the hot－air apparatns． the tower is of tbree stages，supporting a broach spire，with gables and duplicated lights．Tho roof of the churoh is steeply pitched and slated， with foliated crosses at the gables，and open timber work of Mernel deal supporting the the church，at the were are three entrances to angle，and in the east wall of great east window are five the tower．In the real east window are five lancet lights under head．Thene，wit quatretoil tracory in the head．The west window has fonr lights，－two and two．Along the clearstory are cinquefoil windows，and in the aisles duplicated lights． There are about 4.00 sits adora the pavemert． here are about 4.00 sittings，all free and unap． Eropriated．There is a small peal of six bells．The reredos is from a design by sir Gilbert Scott． It is of alabaster，and is formed of three com． partments，the centre one bearing in inlaid work Latin cross，clevated on degrees，and sur． rounded with the emblems of tho Crucificion The side compartments bear figures of St Gabriel and St．Michael．A retable，also of ajabaster，forms part of the reredos．There are carred oak sedilia，and a credence nicho，on the right of the altar．The altar－rails are of brass and iron，and by a telesoopic arrangement of the upper bar the entrance to the altar may be closed or opened．The fort occupies a position in the sonth－west of the building．It is caryed in Bats stone，stands upon a cluster of Purbeck stono columns，and is sarmounted by a carced oat canopy．The chnrch is lighted by four pendent oronze，three equi－distant in tho nave，and the fourth in the chancel．The chancel foor ia with encautio tiles of a suitable patem cost of the edifice will probably erceed 5,0007 Bath．－The foundation stone of St Part Church，which is intended to replane St Mar， Oh ipel，Queen－square，and is built neaty site，has beon laid by the sister of the late Tard Midion．Haria Brodrick of Bath．The church，we aren，a former rector in the Gothic style of an informed，is to be present consists of a nave，early type．It at chêvet but provision has been circular．ended chevet，but provision has been made for future estension，with organ－chamber and temporary
vestry. The entire length of the nave, including
chancel, is about 97 ft . ; the width, 38 ft . (in. chancel, is about 97 ft ; the width, 38 ft . (in.
ternal dimensions). The height to the top of the cross is 63 ft .6 in ., and 28 ft .9 in . to the wall-plate, and it is arrunged to accommodate 700 persons. The extcrior of the walls will be finished in band-dressed freostone; the interior will he clean.worked ashlar, relieved with strings of red stone from the Bishop's Lydiard quarries. The passages are to be laid with Godwin's encanstic tiles, those of the sanctaary of a snperior desoription. The trusses to the roof will be curved and moulded, and supported to be covered with the best Bangor conntess slating, with terra-cotta ridges. The doors are from the Bristol-road, where a double-ordered doorway will be approached from steps on each side. Over this doorway is a group of windows. he otber entrances are, -one from Chapel-row, the north. The south elcration towards Chapel. tow is dirided into five hays, and the church will be lighted from this side by fire two light win be lighted from this side by five tworlight win.
dows. The east end, that facing towards Queen. dows. The east end, that facing towards Queen. square, has folume with ornamental caps and witb two columns with ornamental caps and Bishop's Lydiard stone alternately. There will be an ormamental stone cornice ranning ronnd this east ond, as also along the Chapel-row elevation, There wing the nave arches, and the columns supporting the same will he of blue and bases. The whole of the work is heing carried out from the designs and under the superintendence of Messrs. Wilson, Willcox, \& Wilson, arohitects; and the contract has been taken by Mr. Josepb Bladwell, at a sum of 3,2402 , but this does not include any of the internal fittings, sucb as the pulpit, font, choirbenches, seats for the congregation, \&c. It is proposed, when funds permit, to erect the aisles and a campanile tower, with an entrance from Queen-square.
Hastings. - It is proposed to enlarge the new church in St. Andrew's.road, by the addition of a north aisle; and the board of directors of the Gas Compary are willing to facilitate the proposed enlargement by giving op a small piece aisle.
Cheveley.-The chnrch has been reopened, afler restoration, under the superintendence of Mr. J. D. Sedding, of Bristol, architect. The works have heen completed by Mr. R. Tooley, of the Cbrroh Restoration Works, Bary St. Edmund's. The cost will be about 3,000 , The greater part of this is borne by the rector. parish, offered to restore the south transept, phich work will cost 300 l . The chancel has been taken down and entirely rebrilt, with an open. timber hammer-beamed roof. The stonework of triple-lights are partly filled with stained glass, tripie-lights are partly filed with the completed form, will represent the Crucifixion. At present, the centre light is wanting. The reredos is of al¿haster, having in wanting. The reredos is of almhaster, having in the centre a Decorated Latin cross of white statuary marhle, with dove-coloured marbla for
a back-ground. On the left there is a repre. a back-ground. On the left there is a representation of the Expulsion from Eden, and on the right the Nativity. Nhe fooming is laid with tiles of ancient design, from Godwin's, of Lugwardine. On the sonth side of the chancel
a new organ-chamher and vestry, in keeping a new organ-chamher and vestry, in keeping whither the monumental slabs from the chancel Whither the monumental slabs from the chancel have been removed. The side. Walls of new opentransept had to be rebuilt, and a new open-
timbered roof put on. The plaster on the walls timbered roof put on. The plaster on the walls of the nortb transept has been removed, and the old oak roof restored. The tower has boen re.
stored. It was fonnd necessary to thoroughly stored. It was fonnd necessary to thoroughly
muderpin one of the piers. The belfry has been supplied with new windows. The plaster on the exterior of the walls has beeu
knocked off, and the plinth-work pointed np. knocked off, and the plinth-work pointed np. The seats will be open henches, in oak, with carred poppy.heads. The flooring of the aisles of the church consists of Peak's Tunstill tiles (hlack and red), worked in patterns; and new oak doors have been provided throughout. windows have been principally glazed with cathe dral glass. The chnreh will be warmed with heated air, when neceseary, by an apparatus supplied by Mr. Gidney, of Dereham; and to prevent the walls boing affected hy damp, the earth has walls boing affected hy clamp, the earth has
drain inserted to take away the snrface water. The contractor was Mr. Tooley
Clossop.-An elaborate memorial-stone, ecclesiastical design has been placed in the parish cburch orer the family vault of the late Rer. Christopher Howe, who died September 15 th, 1819 , and was the oldest vicar of Glossop of whom there is any record. He held the living for upwards of half a century. The inscriptions, made in black and red letters, are sarmounted by a cross, on which appear the Latin words, "For in heaven there is rest," whilst in the centre is placed the sacred mono. gram of Jeswe Hominum S'uluator, first engraved, and afterwards gilded, with ornamental emblems grouped around. The railings are of Shemeld manufacture, and terminate in the pattern of a mitre, on six of the bars, which will suhse. quently he gilded, in order fully to complete the the sonlptor

Putiney. - The ceremony of laying the founda. tion-stone of the new church of All Saints, at Putney, has heen performed by her Royal Holstein. A large company, numbering npwards of 1,500 , bad assembled on the spot, within the arez, covered by a circular tent. Messrs. Adam. son are the builders, and Mr. G. E. Street tbo architect. Baron Pollock, chairman of the com. spencer, the lord of the manor. The chorch was to he free and open. The amount subscribed was 3,2002 ., and 2,0002 . more were required.
Nunbumholme.-The parish chnrch of Nun. buraholme, at the foot of the Wolds, a few miles distant from Pucklington, bas been reopened, after restoration, hy the Archbishop of York. Tho church was in a deplorable condition before restoration. The roof of the nave was of post-Refornation date, flat, and poor in character,
and ready to fall, from decay. Tho chancel had and ready to fall, from decay. Tho chancel had There was no chancel arch. The seating and There was no chancel arch. The seating and
fittings were of the meanest description. A fittings were of the meanest description. A chancel.arch has been put up, and new tic.beam have been restored, and the steps arranged so as to give elevation to the holy table. The charch brs been reseated with oar benches, with carved poppy.heads. The chancel is seated stall-wise,
in oak, with desks for the clergy against the in oak, with desks for the clergy against the jambs of the new chancel-arch; these are arranged so as give the suggestion of a low screen, without ohstracting the view. A pavement of Minton's encaustic tiles has been laid down in the chancel. The chancel is hnge all round with diapered hangings, and the altar.cloth, of red
damask silk and velvet, is richly embroidered : damask silk and velvet, is richly embroidered :
the work has been designed hy the architect, and the work has been designed hy the architect, and field, Hampshire, a skilful anatenr embroidress who offered her services. It is the gift of Miss Rose and Miss Lanra Morris. Seats for children aro placed in the tower. A new sonth porch and doorway have heen added, in place of a wretched hovel of brickwork, which used to serve as a porch. The whole of the exterior las been placed in repair, and the ground levelled where it needed it. The external effect is improved, hat it still suffers from the plain and unsightly tower. It is a part of tho scheme to carry up this tower to a proper proportion to the dimen and an emhattled parapet surrounding a low tiled roof, which will be surmounted by a cross and vane. This work is delayed for want of The tor unds, about 170 l. being stil requied out, will be 1,1002., towarde which Lord Mun. caster has contribnted 400 z , and further has promised an additional 50t. towards completing he tower. The arebitect is Mr. G. G. Scott, jun., of London. The contractor and builder is ho bave worked with him are Mr. George Grant for the woodwork, and Mr. J. Richardson for the stonework and masonry.

Fall of a New Bridge. Ford Bridge, tuated near Titley, on the Presteign Railway has fallen. The hridge has been some time in courge of erection, and was an immense structure Great damage has been done by the fall, the iver Arrow having in consequence, overnowed its hanks and inundated the country for a cou siderable distance. The houses in the neigh hour:hood were greatly fooded, and a large number of fish were killed by the lime from the bridge.

## STAINED GLASS.

St. Luke's, Liverpool,-An addition has just een made to the painted windows which are in this church. A new window of stained glass has been put up on the north sicle of the church, to the memory of Mr. John Rimmer Who for several years held the position of eburch warden. The subjects depicted in the window wbich is divided into six lights, aro illustrative of the Christian graces, Fuith, Hope, and Charity, and the virtues, Justice, Mercy, and Meekness. The figure of Charity occapies tho centre of the upper light, with tle words Charity never failcth; "on the one side of her Hope, and the legend, "Be not moved away from the hope of the Gospel; " and on the other Faith, and the words, "Withont faith it is im. possible to please Eim." Underneath each of these figures there is an appropriate group, repre. senting works in harmouy with the graces. Under Faith is the sacrifice of Isaac, the youth bound on the altar, the angel staying the hand of tha atriarch, and the ram which was ordained as the suhstitute; below Hope is Noah's first acrifice after leaving the ark; and beneath Charity is Dorcas distrihuting garments to the oor. The three lower lights are also occupied with representative figares, - Solomon in his regal robes, the loving Shepherd bearing a lamb in his arms, and Moses with the tablos of the . The corresponding tableaux underneath these are the famous judgment of solomon; the charge to Peter, "Feed my sheep," and the efusal by Moses of the crown of Egypt. Hessrs. were the artists.
Woodditton Church.-The west window of this church has heen filled with stained glass, by the directions and at the expense of Miss Dohito, of the Woodditton Church Hall. This gift is a memorial of ber late father and mother and two hrothers. The window is of the Perpendicular rothers. The window is of the Perpendioular ra, and has three lights, divided in six penings, and the bistorical suhjects 45,36 . The work was desioned and exccuted by Messrs. Favell \& Ellis, of Camhridge.
by Acssrs. Favell chrrch.-A window has been laced in this church, given by Sir Cecil Beadon, K.C.S.I. It is intended as the first of a series with whicb it is pronosed to fll the windows of he church, the idea being to illustrate the life four Lord in the large windows of the nave, in he same manner as the life of St. John the Baptist is heing illustrated in St. Johu's Chapel, The window now given consists of four lighte, llastrating the infaney of our Saviour. The first ight represents the Annunciation (St, Luke i. 6.38). The second lipht represents the salu. ation of Elizuheth hy Mary (St. Luke i. 39.45). The third light portrays tho Virgin Mary wor shipping the Infant Saviour (St. John i. 14).
The last light is the announcement of the hirth The last light is the announcement of the hirt
of Christ to the Shepherds (St. Luke ii. 8.14). f Christ to the Shepherds (St. Luke ii. 8.14).
Stt. Paul's, London Docks.-Messrs. Cox \& Sons, St. Paul's, London Docks.-Messrs. Cox \& Sons,
Southampton-street, Strand, have recently of Southampton-street, Strand, have recently placed a large three-ligbt wipdow in St. Paal's
Church, Dock-street, London Docks. It has een , Dock-street, ohn Franklin, who was one of the fonnders of the church; and as the church is principally ttended by sailors, nautical subjects from the ihle have been chosen. The suhjects are illusrations of the following passages:-"Me reanked the winds and the sea, and there was a ealin"; "He that hath ears to hear let him ear"; "Fear not, from henceforth thou shalt catch men"; "O thou of little faith, wherecore didst thou doubt?" The centre light is about 23 ft . high. A portion of the window was exhibited in the late International Eshibiion. The style is thirteenth centary.
Canterbury Cathedral.-A stained.glass win. dow, by Clayton \& Bell, has been placed in the outh-eastern transept of Canterhury Cawn Its main featurcs consist of three large circles, each containing five others, one concentric, and four smaller ones disposed around it. Each of theso larger circles is devoted to scenes of our Lord's Temptation, the actual Temptation occupying the principal inner circle, and illustrative or conprincipal inner circle, and industrative ope heing ropresented in the ubordinate circles.
Christ Church, Oxford, - After the murder of Mr. Frederick Vyner, hy Greek Brigands, in 1870, is friends and contemporaries at Christ Church, Oxford, determined, with the permission of the dean, to put ap a painted wiudow as a memorial
to him in Christ Church Cathedral. The nomto him in Christ Church Cathedral. The nom.
mitteo appointed with that objoct,-LLord Rose. berry, Mr. E.W. Hamilton, and Mr. J. R. Dasent, state that the window has bcen completed hy Messrs. Morris \& Co., and put up in its place in the catbedral. The position selected was the second window northwards from the altar, where four large lights havo been filled with the figures of
Samuel, David, St. John, and Timothy, a subject from the eariy life of each being represented from the eary life of each being represented
beneath the figures. A suitable inscription has been placed on a tablet on the adjoining wall,

## ditiscellanea.

Coal Supply. - At Monday's sitting of tbe House of Commons' Committee of lnquiry into our Coal Supply, Mr. Booth, manager of the Glaremont Collieries, Ashton-undor-Lyne, gave
evidence at some length. He stated that in his evidence at some length. He stated that in his
district the mou would work only when they pleased. They would play on Monday and Tuesday, and then it was impossible for them to make up the loss daring the remainder of the week. Witness attrihuted tho recent great rise in tho price of coal to the demand suddenly -raking the supply, to the incroase of colliers produced. Tho Mines Regulation Act too had
pron caused greater oxpense in getting the coal. In tho najority of cases, notwithstanding the higher wrages, the condition of the colliers had not improved, cither in tho matter of elothing, habitations, or gencral mode of living. It is consolatory under present circumstances, to find it suid that never in the history of the coal rraue wero so many new collieries opened out in that the high wages and luxurious indolence of from other employments to the of stout youth

Piercing the Pyramids. - A party o American scientists are still worrying the poor Sphynx, and pogring and digging away inside of the yramids in search of the toenails of more A letter from Cairo says :- "Our next hore wil be through a pecnliarly placed stone in the floor of the entrance passage, which may be corking upp another passage, as it has been fonnd that the coffer in the king's chamber could not be intro. duced by the present known passage. .Was it not the Pyramid built around it,-1e? by layer, year by year, of the life of the Pharaoh, as was the ancient practice, till he dicd, when the Pyramid was completed, and the sarcophagus

We its duplicate below, became
We have spent many nights at the Pyra mids, and have made many important discoveries.
We have opened np tivo small passages leading Wrom the Queen's chamber to-we do not now
frome wherc. These will have to be explored further We have also discovered in the ascending passage to the 'Grand Gallery' some very
strange Masonic symbolism, which still remains strange Masonic symbolism, which still remains Jiom
Cornish Industry developed.-Ahout three years since a company with a heavy capital, knowing of the doop beds of good fire-clay whicb abound in the locality of Hingston Downs, purchased a sett, erected kilns, and commenced fire-brick hnrying. Since then other companies have been formed, one of which, witb a capital of $200,000 \mathrm{l}$, is combining with brick-burning general smelting, the extraction of mineral oils from shale, and the manufacture of bitumen,
asplalte, and other snhstances ; extensive work for this purpose being in erection. There aro now, says our authority, the Cornish Telegraph, four fire-clay firms in full work, manufacturing tbe clay into fre-bricks, gas retorts, tiles, crucompany has nearly completed the orection of a large Hoff mann's kiln on their own estate for tbe same purposes. The total number of operatives already cmployed at these various works hridge clay gradaally becoming exhansted, great demand is being made on the Cornish fire-clay.
Competition, Walthamstow. - A limited competition has just taken place for schools a children, four architects being invited to 400 pete; one deolined. Ultimately the plans by Mr. John Ladds were accepted, and will be carxied out.

Mr. Plimsoll and our Seamen.-It is to be hoped that Mr. Plimsol's Bill for the protec. tion of our jolly tars from rotten ships and over. loaded cargoes will be supported by memorials in its farour from all guarters and in overy vailablo form-from congregations of every denomination; from corporations, chamhers of commorce, and associations of our countrymen of all sorts; and, above all, from our countryFomen; praying Parliament to lose no time in passing a sbort Act to probihit deck-loading, and over-loading in general, and to prevent ships in disrepair, or otherwise not sea-worthy, from going to sea. In the promotion of this important morement, a noble example has been set hy
the working " Diners' Association of South the working "Diners' Association of South Yorkshire," wbo, withont any capital to speak of, any lands, any special interest in favour of our seamen or against our ship - owners, but clearly from generous and brotherly feeling, have mado the princely grant of 1,000 , to the Plimsoll Defence Fund.
Report on Works executed in the City. the annual report of Mr. Haywood, engineer and survejor to the City Sewers Commission on the works executed during tho year 1872, has
just been issued in \& printed form. The setting ack of frontages, the various trials of asphalte in different forms, and wood pavement, the improvement of footways, and the widening of the publio way on the western front of St. Panl's Cathedral, are prominent items in the list of woris in progress or completed. Val de Travers asphalto appears to maintain its good position among the forms of asphalte in course of trial. A hope is expressed that when the western front of St. Paul's is open to traffic it will lead to the removal of the romainder of the iron railings from around the Cathedral.
Discovery in Furness. - For some time past a numher of more bave heen engaged removing the earth from the limestone which cxists at the Butts, Dalton, about two miles rom Furness Ahhey, with the view of quar ying it. While thus engaged recently, thes ame upon a large square block of stone roighing nearly a ton; and on removing th 4. ft. wide, and rather more in depth, with bones some human, others those of an animal, probably horse, and a bronze pike-head and douhlc odged sword. A largo slab of stone, completely covering the landward side of the vanlt, having circular-shaped crevice, running in wards, but it was too small to admit of its then heing ex plored.
The Royal Society.-The president (Sir George B. Airy) and council of the Royal Society had their customary conversazione on Saturday night last, at Burlington House There was an unusnally numerous attendance of the fellows of the Society and of other learned and scientific bodies of the metropolis seven rooms belonging to the Society wer harow open, and ahounded with scientifio nstruments of the newest invention, beside ome recontly-ohtained antiqnities, and many bjocts of interest, among whicb was an eleva tion of the external façzade of tbe Palace of Chosroes, at Mashita, in Moab, restored and xhibited hy Mr. James Fergnsson, F.R.S. suite of rooms thrown open were lighted by Messrs. Gardner, of the Strand, with oillamps, tted with Silher's burners.
Coal on Lord Houghton's Estate.-The Con. Robert Ashburton, son and beir of Lord Houghton, has turned the first sod of an intended coal pit, situate upon the Fryston ostate, which German Orean the the por of Hull and the the ceremony was very larce, including nes Honchton, who delivered a speocb upon therl question. The Fryston Coal Compory coal rented some 2000 acres from his lany have the North- 2,0 antern Railway from Pontefret the coal, about two mile 50 yards from the surf, is sapposed, lio thickness, from the surtace, and is 5 ft . in means of excellent machinery, 300,000 tons of oal will be brought to tbe surface per annum.
Hop Offices and Show-rooms in Denman street, Borough.-A building for these pur poses has been completed under the superinGihbons, at a cost of ahout $3,500 \mathrm{l}$. The build is a similar one to that to he built adjoining to , and for which tenders appeared in tbo Builder of April 26 th.

Russian Lighthonses. - It is intended, according to a plan prepared by the Russian Admiralty, to build successively ligbtbouses in all the Russian seas. A commoncement has already been made in 1872, and the whole of the projected number will be finisbed by 1885. During the first three yoars, bighthouses are pro posed to be completed in the Baltio, Black Sea, Sea of Azor, and the Caspian Sea. In 1875, the works will he begun in the White Sca. A yoarly credit of 100,000 roubles for five years, for tho erection of limhthonzes in the North Polar Sea and the Pacific, has also heen asked for. Alto gether, the suuns to he expended for this purposo are said to be very considerable.
Tramways in London.-The Committee of the House of Commons appointed to consider the Bill for confirming the provisional orders granted by the Board of Trade for several proposed lines of tramways in the metropolis hare met under the presidency of Sir F. Goldsmid, and passed the following resolution:-"The committee are of opinion it is inexpedient that a construction of tramways in the City (including Blackfriars Bridge) or over Waterloo Bridge should be sanctioned by Parliament, more.espe cially having regard to the fact that no consent has been given to it hy the corporation of the
city of London or tho trustees of Waterloo Bridgo.'
Schools for the London School Board. On the recommendation of the Works Committee it has heen resolved tbat the following tenders for tho erection of schools be accepted:-Of Messrs. Henshaw \& Co., to erect for $7,810 \mathrm{l} .10 \mathrm{~s}$. school to provide accommodation for 1,062 children on the Walworth-common site, a further expenditure of 900 l . heing sanctioned for the necessary boundry walls and tar paving; of Mr G. S. Pritchard, of 103, Paul-street, Finsbary to erect for 5,919l. a school to provide accomrodation for 833 children on tho site in Central street, Finsbury; of Messrs. W, H. \& J. Mans bridge, of Bangor Wharf, King's-road, to erect for 9,915 . a school to provide accommodation road, Shoreditch.
Proposed Now Building for Airedale College.-At a special meeting of the constituents of Airedale College, to consider the report and recommendations of the Airedale section of the Yorkshire Colleges Amalgamation Committee it has been resolved "That in accordance with the recommendation of the Airedale section of the Colleges Amalgamation Committee, supported by the Goneral Committee, the said General Committee be requested to take immodiate steps for the erection of a new college, with power to purchase land for the parpose, if necessary, and to
report to the annual meeting." The meeting
 regrettod that the scheme for amalgamating the
two Yorksbire colleges bad failed, and thayked Sir Titus Salt for his generons aid.
An Ancient Glass Cnp.-An interesting archoological discovery bas just been made by a peasant while ploughing in the neighhourhood of Arles, Bouches.du-Rhone, consisting of an ncient glass cup. It is composed of two portions : one in simple ordinary glass, forming the vase, whilst the second is an ornament in red glass superposed. This latter forms a series of one of the sides is a Latin inserintion, which bas been deciphered, "Divus Maximianns Augustus." This object, therefore, belonged to the Empcror Haximianus Lercules, who resided in Gavil for a considerable time. As was rather usual, the cup has no foot.
Screws in Plaster.-lt sometimes hecomes desirable to insert screws in plaster walls, with. out attaching them to any woodwork; but when we turn them in, the plaster gives way and our effort is vain. The plan suggested is to enlarge the bole to ahout twice the diameter of the screw, fill it with plaster of Paris, such as is issued for fastening the tops of lamps, and bed the screw in the soft plaster. Wbenthe plaster bas set, the screw will be beld very strong! y
A Testimonial to an Assistant En-gineer.-Mr. J. G. Warner, assistant engineer, on bis retiring from the services of the Metropolitan Railway Company, was presented by the officials, employés, and friends, on Thursday, tbo etti1 nit., with a gold watch and chain; also a purse of twenty-five sovereigns. The chairman presented the testimonial with a fevt appropriate remarks, to which Mr. Warner made a suitable reply.

Keble College Chapel.-The foundationstone of the new chapel of this, the most modern of Osford colleges, has heen laid, in modern of Oxford colleges, has heen laid, in the presence of a large and distinguisbod
gathering of tho friends of the iustitation. When the college was formally opened in 1870 a temporary ohapel formed part of it, but it was temporary ohapel formed part of it, but take its understood that a fitting edicice would take its place as soon as the funds were fortbooming to
ereet it. These have now been supplied by exect it. These have now been supplied by
Mr. W. Gibhs, of Tyntesfield, who bas taken the Mr. W. Gibhs, of Tyntestield, who bas taken the no loes than 30,000t. to worthily carrying out hib no loss that
The New Police Station at Swindon. This new station is almost completed. The building is constrncted of local stone, orna. monted with Bath stone dressincs. The residences of the superintendent and inspector are on either side of the entrance. The west portion of the building is composed of three constables' dwelling honses, and in the centre is a large Petty Sessions Hall, with raised hench for the magistrates and a dook. Connected with the hall are retiring-rooms, also guard and waiting rooms, and superintendent's office. The cost of the building is ahout 3,500 . The contract has been exeonted hy Mr. II. Dyer, of Ramabury.
The Derby Memorial Statue at Preston. Active preparations are now heing carried on for tbe erection of this statue in the Miller Park, Preston. The helvedere, which stands on the site on which it has heen decided the statue shall be fixed, is being pulled down, and in a few Weeks the work of erection will be commenced. Tbere are many persons in Preston wbo protest against the razing of the helvedere, and contend that it would be far better if the statue of Sir Robert Peel, which stands in the Winckley Gardens, was placed at one side of the belvedere and the statue of the lete Earl of Derby on the other.
Election of a Borough Engineer and Surveyor fer Halifax. - At a special meeting Surveyor fer Hawifax.-At a special meeling
of the Halifar Town Council in committee, held for the purpose of selecting a suitable person for the office of borough engineer and surveyor, there were three candidstes, viz, Mr. Escott, borongh engineer, Burnley, who obtained four teen votes; Mr. Hardwick, assistant horough engineer, Bradford, ten votes; and Mr. Bryson, boroagh surveyor, Newcastle-on.Tyne, four votes. this result was afterwards made known to an pon council, and the choice of Mr. Escott was onfirmed. The salary is 400 l. a year
Her Majesty's Opera.-The annnal trans. formation of Old Drury into an opera-house was carried ont for Mr. Mapleson this year, as previonsly, by Messrs. Bracher \& Son, bailders, inder the directions of Messrs. Nelson \& Harvey, architects. The stage has as nsual been cut back, which mnch improves the "acoustics" of the honse. The anditorinm is fitted with the usnal tiers of boxes, and the pit is transformed as stalls: the whole is draped with the amber satin hangings which formed a well-known featnre at Her Majesty's Theatre. 'Tbe houso has a very handsome appearance.
Spring Drains and Gas Tar.-Mr. Meohi writes to the Agricultural Gazette as follows :An agricultural friend assured me (when discnssing the filling np of drain-pipes by the roots of trees or plants) that wbere the drain-pipes have heen well coated with gas tar there is no risk of choking with roots, for the roots turn away from the tar, evidently sensible of their danger. I hope this hint may prove useful, for I know that no spring drain is safe near trees, fences, or even strong-rooted weeds.
Practical Surveying.-A profesbor in an American cellege had taken bis class out, on a pleasant afternoon, to excroise them in practical surveing. The next morning they were to be surveying. The next morning they were to be up. Said the professor, "How would you zo to work to surve professor, "How would you go to but no answer.) "If a man should come thinking to no answer.) If a man shou cone to you to get you to survey a lot of land, what would fou do ? I Ihink, said the stndent, thougbtfully, "I should tell him he had hotter get some-
body else." ody else.
New Bridge at Leith Harbonr. - A new iron swing-hridge is in conrse of constraction at Leith Harbour, at a oost of about $30,000 \mathrm{l}$. The bridge, wbich is te extend from the West to the East Harhonr, will have a total length of 214 ft . The structure weighs ahont 700 tons, and will he worked by hydraulic power.

Accident through the Falling of a Brick. A serions accident has happened to a boy whilst playing in Elm-conrt, Elm.street, Gray's Innoad. Some honses in the court were in conrse of repair, and a pail of cement which was heing drawn to the top of one of them by a pulley, struck against the conine cansine a hrick to fall upon the boy's head, fracturing his skull, and severely lacerating his scalp.
Institution of Surveyors. - The next meeting will. be held on Monday evening, May 5th, 1873 , when a paper will be read by Mr. WY. Hope, entitled "Sewage Farming," and the discussion on Mr. Menzies's paper entitled "Arterial Drainage Works, Water Supply, and Seware Drainago Works executed at Windsor, between the years 1867 and 1873 ," will be resumed.

The Shakspeare Oak on Primrose-hill.It has heen resolved to inclose the tree planted by Mr. S. Phelps, on 23rd April, 1864, or Shakspeare's day, within an ornamental iron palisade, and erect a tablet in connexion with it. A design is in preparation, the estimateid oost of which will he ahout 200l, to be raised by suhscriptions of 2s.6d. and upwairds.

## Nature and Value of Prisoners' Labour.

 A Government return, in reply to an address of Mr. Kennaway, dated August of last jear, to the House of Commons, has just heen issued. This document gives the nature and vaine of prisoners lahour and other interesting information, from each prison in Great Britain during the year 1871.New Board-room for the Helborn Board of Works.-A committee of the whole Board having recommended that a puhlic hall should not he erected, but that a Board-room should be bnilt, at a cost of 500 z , and that the surveyor be requested to prepare plans, the Board bave adopted the report of the committee.

VOL. XXXI.-No. 1579.

On the Determination of certuin Ancient Architectural Tcrms.

HE exact im port of ancient architectural terms is a matter of no small import. ance. The interest of the suhject is by no means confined to the professed student of archaology. Few persons roal.
ise how far we owo to the elegant pre. cision of the Greek lanuage many of the words tbat are daily current 1 our workmen's mouths. Tho term "triglyph," or instance, at once betrays its origin and onotes its moaning. It is one proper to classic yle. The kindred word "architrave" is con. antly used by every joiner. The bricklayer ho sets baok a plinth is not aware that the
ord ho thus employs is appbed hy Xenophon denote the matorials used in the military alls of Bahylonia, and that "plinths toasted the sun" were the predecessors of the small Ito-shaped, well-burned, bricks of the great
coman builders, as well as of our own more bapeless and less enduring " stocks."
The interest, and indeed the utibty of the searcb is enhanced by the faot that, in our wn, and prohably in most other, languages, our chnical terms are partly native and partly im. orted. In the former or vernacnlar words the arivation is generally to be traced. In the reign terms, on the other hand, it freqnently ifors dislocation in the process of time. The ord "pbinth," which we have just cited, is a ood example of this change of meaning.
In speaking of any of those teohnical terms in bioh we may think we trace a direct link he, veen Oriental and European languages, we are d maware that the general set of philological sinion in the present day tends to discourage ay attempts to show the existence of such a mexion. A conple of centurios ago men who ere erudite, if not scientifio, attempted to arive many Euglish words from Hehrew sources, ad great nonsense they wrote accordingly. othing is more established in language than te fact that similarity of sound does not denote lentity of meaning, of root, or of structure, nt a scepticism of this kind may he pushed too

Even without resorting to the possible gpothesis that some ancient and extinct tongue as the common parent of the 200 Torconian. 2e 100 Aryan, and tbe 9 Semitic languages, hen we find similarly-soonding words, in very Wexent dialects, denoting the same architec ral element, we can hardly douht that, how. ver it may have come shout, there is some stual. relationship hetween them.
Of all ancient arohitectaral descriptive writing aere is no example that is at the same time so ctailed and so obscure, from the want of clear
definition of terms, as the account of the Temple at Jerusalom, which is contained in the last few chapters of the book of the Prophet Ezekiel We shall confine our remarks exclusively to the architectural inquiry; hat it is necessary to remark tbat the idea almost aniversally enter tained that the dimensions given in this descrip. tion are so vast as to be inapplicable to any actual huilding, is entirely founded on mis. translation. We aro not asking our readers to accept this statement on our own autbority alone. The Greek writers of the ancient Alezandrine translation of the Old Testament, called the Septuagint version, the Latin translators of this same version made nnder the auspioes of Pope Sixtus V., and, to some extent, the Latin Vulgate, fully hear us out in tho assertion.
Tbe first thing done in this most ancient specification is to fix the unit of measurement, which is the cuhit, called A melt in Hebrew. This dimension is the length from the elbow to the end of the middle finger, and the English word taken from the Latin name for that part of the body, being prohahly derived from the habit of leaning on the elbow. Like most ancient measnres which are derived from the dimensions or movements of the human hody, tbo cubit varies in length among diffexent people. It is one-fourth of the hoight of a well.proportioned man. With tbe Greeks, tbo unit of height, at the hest period of art, is such as to make their orguia, toise, or human height, very closely correspond with our own fathom, heing only $\frac{1}{2}$ in. longer than 6 English feet. Thus the Greek cubit is hard upon 18 English inches, or in exact decimals $18-13125$ in. The Russian fathom, or sajene, is equal to 7 English feet. It is divided into three arschenes, so that if the cubit were a Russian dimension, it would be 21 in. loug. Egyptian cubits, marked on the Nilometors, have been measured by Mr. Greaves at 21.847 in ., and hy Sir Gardner Wilkinson at $21.4 . \mathrm{in}$. The derab, or land mea. sure, now in uso in Egypt, gives a cubit of 20.7 in . The ordinary Egyptian cnlit is stated at 1.719 ft . English. The Roman cubit is $17 \cdot 406$ in. The Jewish cubit is defined hy the writers in the Talmud as heing equal to the length of 48 barley.corns. If wo take these grains as they are taken for the starting.point of English long measure, that is to say, in an average enr of harley, from the heel of one grain to the top of the third grain, on the same side of the ear, we find the Jewish cubit is eqnal to 16 in. English. All the dimensions taken within the precincts of the noble sanctary at Jerusalem aro, in point of faot, commensurate with English feet and inches. In the measurements given in the book of Ezekiel a balf ouhit is added to every six, giving a great cubit of 17.33 in ., or 063 in . shorter han the Roman cubitus.
The first architectural term which meets ns is one which we mnst represent in English lottors as Rehb. In Greek it is called proeichisma, in Latin antemurale, the exact Engjsh of whicb would he "forewall"; a good word, hut not one to be found in our dictionaries. As to the meaning of the original expression we are not left in donht. It designates what we should call a superh plinth; a step or footing to he great external wall of the temple inclosure 104 in . in height, and with a set.back of the same dimension. As an architectaral feature, the effect must have heen very grand. There is some reason to conjecture that this colossal pbith was mado of wholostones. At all events, there actnally exist several hundred feet of a master.course in the south wall of the great inclosnre, the thickness of which varies from 70 in . to 73 in . There is reason to hebeve that this course is not now in an undisturhed condition. If its upper and lower arrisses were destroyed hy violence, and the stones aftor. wards reworked and reset, on the restoration of the wall (which was evidently the case with
much of the masoury), the loss of depth would be accounted for. There are two colossal mono. litbs in the entrance to the eastern or golden gate of the Ifaram which present a similarity to the great course on the south wall, and are at the same level; but tbeir full depth has not beer ascertained.
It may bo observed that a plinth of this description, but only 3 cubits in height and in set-off, is described hy Josephus as surrounding the tower Antonia.
The next word of a technical nature is one of very ordinary occurrence,-"Shor,"一which is translated Pyle, porta, and gate, hut which is better represonted hy tbe Euglish word "gate. way." In the present instance a word which we have horrowed from the Greek, to denote a large and architecturally imposing gatervay, sucb as tbose so often met with in Egyptian temples. namely, "pylone," would not be inapproprinte. The entire stracture of tbe gaterray, including an internal vestibule, three recesses on each sido, and an inner, as well as an outer, doorway, is comprehended under this term.
The rext word wbich we have to determine is one involving some difficulty. It is by no means sure that we have an exact eqnivalont for it in either English, French, or Italian. It may he represented hy the word yol or $i o l$, and it appears in the Hehrew to be the root of tbe next term, iolant, or alem; for it is spelt both ways. As to the latter, there can be little donht that it is best rendered by the Latin word restibutum, which literally means an apartment within or beforo a door, where the onter garments, worn in time of cold or rain, are taken off by the wearer. As the jol, wberever it is mentioned, is spoken of in the same connexion with the alcum; it is perhaps bost rendered by the word "doorway," which we regard (with Viollet.le.Due) as essentially consisting of threshold, jambs, and lintel. Threshold alone might perhaps be a correct equivalent for the word; but the idea of a narrow division forming tho bonndary of the gateway is certainly implied.
The second word, alam, is applied to the ves. tibule of the gate, to the lofty portico or pronaos of the temple, and to the "peristyle or cloisters, of two hays wide, which surrounded hoth the sauctuary, or raised platform, and the great outer court. On the south this cloistor was three bays wide, as is described by Josephus. It is spoken of in the Book of Kings as composed of three thurim, ranks or rows, of stone pillars, with a roof on codar heams.
The next technical word tbat occars is Tha, in the plarel Thaim. This the Greek translators, and those of Pope Sistus V. have left nutranslated. St. Jerome renders the term hy the word thalamus, which is Anglicised by "little chanber." The feature in question was a recess on the side of the vestibule; hut there is no men. tion of any side-door. The entire structure desoribed scems to have resembled, to some extent, an entranoc.gateway, with a carriageroad in the centre, between two footpaths. But as carriages and horses were not to be admitted, the central road was the common entrance. It led through a long vestihule, aud tho side. walks were divided into recesses, preventing thoroughfare, and adding to tho strength of the entire gatehouso, which, as we know, from the account of the siege, was eminently adapted for the purpose of defence,
The word cil, which nest occurs, is probably another form of that whicb we bave before spelt as iob. It is translated "frons" hy St. Jerome, and "sub divo" by the Papal writors. It dist:actly imples a landing, or smalt platform, immediately outside the gate. Wo hare thus all the terms which are necessary to describe the plan of a gateway (irrespective of the elevation). distinctly fixed. As to the latter, we find the word seph to he the equivalent of door, the valva of the Romans, here given as osticm in Latin $d_{f}$
and as thuroma in Greek. This word has a wide aud altogethcr unsuspected eurrency in our language, in the form borrowed from the Arabic, of cyppler; a name given to letters in the ancient cabbalistic books, with reference to their nu. merical and transcendental ralue, as the doors of knowldge.
In the alcum we can hardly bo in error in rccognising a connoxion with the Greek word
curle, tho Latin aula, and the Engligh hall. culle, tho Latin aula, and the Englisb hall.
Whether a similar connexion may bo truceable Whether a similar comnesion may be tracoable letween the Latin atrium and the Hebrew etser is more doubtful, hut the signification, at al. the Temple, which bad, Joseplussays, according to the Jewish law, a peculiar degree of separatio from tho others, is designated hy this term ; the syccial word naziveh, or sanctuary, heing re. which the holy bouse itself stood. This was surroanded by a separate boundary, called canon
in Hebrew, and diorizon in Greek. No exact in Hebrew, and diorizom
Latin equivalent exists.
The four courts exterior to the sanctuary were (1), the court of the priests, in which stood the great altar, In the Temple of Herod the court does not appear to bave becn maintained. The limit of the priests' court was defined by the gisus, or lodge, a dwarf stone wall of a cubit in height.
Without the court of the priests was (2), the court of Isracl, which Maimonides calls the to be confounded with the ambulatorics, pathe, or treads respectively occupied hy the priests and representatives of the whole body of TsraelThese latter werc each only 11 cubits wide, and extended across the altar court to the cnst of the extended across the altar court to the cnstorne
altar. On the first was a suggestum, or bench, en which stood the priests who blew the trumpots at appointed intervals in the sacred rites. pots at appointed intcrvals in the sacrear chise court was surrounded by a peristyle, or double cloister, aud was raised $7_{2}^{1}$ cubit or double oloister, and was raised ater court which surrounded it.
above the outer court which surrounded it.
Below and around the chicf court was (3), what Josephus, reckoning from without, calis, in elsowhere, "the court of the women." It was an aroa into which, he tells us, both sexes wero admitted. The men passed through it, into tbeir own court within, Tho women were the Talmud Chil, aud in the Bible, by Joremiall os well as hy Ezekiel, Chel, aroand the secoud court, which was 10 cubits wide, and protected by lattice.work. It is not stated whether this podium was roofed; but, as the peristyle aronnd the chief conrt, and also that ronnd the great court, were roofed, it is prohable that this women's gallery was like wise protected, like the slaughter blocks in the altar
conrt, by a roof, "from the sun and from the rain.
(4.) The exterior conrt, the first court of Josephns, and the great conrt, outcr court, and
court of the Gentiles of the sacred and rabbinical coort of the Gentiles of the sacred and rabbinical Writers, was that which was immediately within the peribolus or fortress. wall of the great Temple enclosure. It was surrounded by a peristyle or cloister. The north, west, and sonth cloisters were rebuilt hy Herod; the latter heing the famous Royal Portico, of which Josephus gives such a distinct account. It is by no means clear that its dimensions, hefore the time of Herod, were so magnificent as thiose determined by that splendid builder. This great cloister had threo walks, of which, at all events, the central one Temple mountain and the city on the west, to the precipitous ravine of the Kedron on the east. Josephus is clear and cistinct on this point as well as ou the fact that the north cloister also reached to the verge of the profound Kedron ravine; though le speaks of the side-walk of the royal porch as if it were of less (Ant., xr., 11 reference is somewhat obscure the features of the ground there can be very oldest type, and marked in some places rock at a depth of 103 ft . angle, 108 ft . at the south.west ancle, and 158 f at the eonth.east ancle of this colossal
No measurement of the area inclosed by this great wall is given by any ancient writer. It is great wail is given hy any ancient writer. It is heigbt, notwithstanding the veil of more than $z 0 \mathrm{ft}$. of debris poured around its base, impresses
on the mind. Before the second, and still mor hefore the first, destruction of the Temple, th great height must have been prodigious. Th rriter of the book of Ecclesiasticus speaks of "the sublime clevation." Josephus say "the depth was frightful." In fact, the bed of the Kedron is 100 ft . below the lowest point which we bave mentioned, so that the height rom the pathway of the cloister to the bottom of the ravino, at the south-east angle of the inclosure was 258 ft .; and the roof of the centro aisle was yet 100 ft . highcr, giving a clear depth of 358 ft . to the torrent. As to the length of the latticed wall called Soreg, in Hebrew, and Thiningos or Iruphax, in Greck, which separated the frst from the second court, we have ample testimony. The length of 500 cubits on either side is attributed to it in tho Middoth. This same distance is probably indicated by Josephus by the round term of a stadium. In the book of Ezelsiel this length is given no less than six times, " 500 cubits east and west, and 500 cuhits in width, to divide the holy places from the antemurale, which is in the order of the House, That last phraso is added to distinguish the antemurale within the peribolus, to which frequant refereuce is made in the Talmud, from hat portion without the great wall to which we callod attention at the beginning of this notice. Bearing on this part of the question, is a passage to his version of the Middoth,-"The mountain of the Tcmple was to the north of Jerusalem, and the mountain indeed was much larger than the space of 500 cubits square, but beyond that its sanctity did not extend."
The determination of architectural phrases which we have above attempted has been some. what algebraical in its method. That is to say, by putting untranslated words in their proper places, and then comparing the different passages, we arrive, with considerable certitnde, at the real sense in which they were employed hy the writer. But comparison is of the essence of this method. Ono word exists which only, so far as we have discovered, occars once. Wo hesitate to make even a suggestion as to its import. The Groek translators bave not translated it. They have simply written turafi in Greck or Latin characters. If we turn to St Jerome for light we find darkness. For what the other translators have regarded ns a noun, he treats as a verb. Fo says, vidi, I saw. "I savy, also," says the English Tulgate, "' tho height of the house round about." This is consistent with our copies of the Hebrcw, but the writers of the Seventy bad evidently another text hefore chem. With the bare suggestion that a clearstory may he meant, we commend this verse,-
the 8th of the 41st ehapter, - to Oriental scholars.

The words denoting door-posts and lintel do not occirr in the description we are citing, but they are too important to omit. Phliai is the
word used by the Septuagint to denote doorposts; and the septaas of inquiry is illu trated by the inportance of of this wor by Danbar. who meres it in the singular, "the vestibule, the threshold, or lintel," as if these terms were eqnivalent; , and in the plural, "the posts of folding. doors." Hyperthumizm is tho Homerio word for lintel. Superliminare is the Latin term used by Pliny. Limen, postes, and jambs, ind are cossica idea convered by the Holrew wand trisited "jamh" or "door.post" is that of a division, as if hetween the inner and tho outer, oy hetween indoors and out-of-doors, as we have it. Tho word translated "lintel" in the Middoth bears a relation to that nsod by Amos (ix. 1), similar to that which obtains in the Latin. No diffoulty is likely to arise from the uss of these terms.
We may thus, by the careful determination of the exact sense of the ancient technical terms used hy a writer 2,330 years ago, comprehend a remarkable passage in ancient and sacred hiterature, which has been long considered unin. telligible, hat which, by this gaidance, comes out with all the detail of a specification. It is the most ancient record of the kind, going at all into details, with which we are acquainted. Our mode of determination, which is simply the coraparison of each passage in which the same technical term is nsed, from which its import neccssarily becomes apparent, fails with refer ence to the word which only occurs once. It is subject for future in vestigation to determin whether there is not here (Ezek. xli, 8) the earliest reference to a clearstory.

The close correspondence hetween this ancient description of this unrivalled huilding and the results of the recent Ordnance Survey is close and striking. Maimonides, the great Jowish Writer of the twelfth conbury, tells ns that the description giren by Ezekiel was used for the guidance of the rebuilders of the Temple in the reign of Darius. We do not ventura to hope that the very obscure language of the Euglish Valgate will be mado perfectly intelligible by onr explanation. But we do heliove that those who can read the Greck version will understand it readily by means of the abore given determi. nation of torms. It would be a useful servics to many if the managers of the Palestine Exploration Fund were to publish a grod transla. tion of the septaagint version of this passage, which often differs from the Hehrew.
The colossal and unique ruin of the great peribolas of the Sanctuary was unknown at the the Then Dr. Ligatfoot wroto his account of disoomple. 1 is one of the most prodyous imes. ran around their fortress wall a master-course of 72 in. in depth, and who raisod into place stonos one of which attaius the measnred length of 38 ft. 9 in. Englisb!

## ARCHTECTURE AT TEE ROYAL ACADEMY.

## second notice.

Avone works at the Academy which may be considered under the head of domestic rather than of civil architecture, may be olassed the designs,- of which there are two or three, - for Bodley's desim ( 1158 ) which is to ho erected on the E (le racobean style or what may broduction in the Jacohean style, or what may be called a Gothio
architect's version of that stylo. The architcct, architect's version of, that style. The architcct,
it must he presumed, has heen drawn aside from his nsual style hy considerations of locality and his nsual style hy considerations of tocality and
association, nnless we aro to regard this as part of thation, hless wart Queen Anne fashions, of which there is other Queen Anne fashions, The building will not bo without a certain pioturesque character, but it is picreed with large windows to such an extent as to leayo a somerwhat thin and weak aspect. Tho building wants unity, too, and we feel obliged to say that a good architectural opportunity has not been made the most of. Mr. J. O. Scott's design, for the same object, is a rich and solidlarge front in Early ceoraetric Gotbic, with a large use of deeply-moulded foliated arches; some of the cletails a little overpower the rest, the façade wants comhining more into one whole. And what are we to say to Mr. Norman Shaw's
"New Offices, in Leadenhall.street" $(1,167)$ ? The first impression if, What a capital drawing!" and our admiration is thus enlisted at once in favour of a design showing much bold. ness of treatment, especially in the manner in which the tro massive piers which give stability to the whole are carried up unbroken through the whole of the stories, affording a point d appua for tho indulgence of fantastio fancies in windor. frames between them. There is the picturesque in this design in a high degree; hut why sacri. fice every thing to the picturesque? Why should the main piers stop in such an awkward manner against the curve of the principal cornice, as if the huilding was erected by some one who did not know bow to do that kind of thing without making a hoteh of it ? Why place all the ornain the so pointedly part, and leave the growt so un. necessarily the manner of a bygone age ? Mr. Shaw is an architect of genius; be is one of the few who appear to know wherein
lies the "pootry" of buildiug ; yet we feel sure that, with his talents, he could give ns this poetical and picturesqne element withont so entirely contradicting the tone and feeling of his own day. We feel bound to admit, nevertheless, that such a building is a welcome con, trast to the arerage respectabilities of "office", designs. In the "Premises in Ludgate.circus," hy Messrs. Woodzell \& Collnitt $(1,136)$, chan. racter and picturesque expression have heen ohtained without sacrificing strictly architectural effect. The treatment of the centre portion of the front, in one lofty'arch rising from the ground and terminating in the centre gable, is stories of windows included under this arch are
sufficiently varied and contrasted in design; the setting hack of the npper story by a railed baloony, at the springing of the main arch, gives opportunity for a deep shadow at this point, which will add materially to tbo effect. The whole design is a very satisfactory instanco of the applioation of true Gothic prinoiples to moderu street architecture : we will only point out that the system of running one large arch almost ensuring a good effect, is to be used " with ceution, as too frequent a nse of such the scale of a long street. The "New Curriers" Hall" $(1,169)$, by Messrs. J. \& T. Belcherr, is a simple and suitable domestic Gothio building in a manner which is more effective, however,
in a line drawing than in execution,-a fact which is somotimes forgotten; great part of the oxpression of such a building must depend on
tho mere treatment and bond of the masonry, which is often manipulated in drawings in manner not realised in the actual building. One
of the most singular whims of architeotural archroology we have seen is exhibited in Messrs Stevenson \& Rohson's three desigus for Loaden Board Sehools ( 1,200 ), which seem to be in. tended to keep up the genius loci hy adopting the old London architecture of the locality they bappen to be huilt in,-a view of the matter Which has committed the authors to reproducing century building.
Among designs for "domestic" arcbitecturo, in the strioter sense of the word, wo have a smal villa at Bexley by Mr. Edis ( 1,125 ), which is very pretty, hut Which we should say we had seen 80veral times before; perhaps its anthor is adopt. the district. Mis competition sketch for proposed sohools at Battersea $(1,126)$ is a good and suit. able design, picturesquely grouped; and the
"Hotel at
Boscomhe Spa, Bournemouth " ( 1,159 ), is interesting as an instance of the appli. cation of the simple domestic English style to a botel, a class of building which, even when on a oomparatively small soale, is too ofter as com. plete a combination of pretentiousness and
dulness in aspect as cay be accomplished. Tho aniness in aspect as cau be accomplished. Tho
design referred to here really looks an inviting design referred to here realy looks an inviting
bomelike place, with its brick and tiled walls, and the timber and plastic work in the upper story. Perhaps the expression verges too much
on the farm-houso type; but it is, at all events a desirable variation from the regulation hotel The "Devonshiro Laboratory, Camhridge" (1,149), is a very nice drawing of a most unin teresting-looking building. Mr. Pearson's "V iew
of Honse near Crickhowel, South Wales" $(1,1 / 7)$ of Honse near Crickhowel, South Wales" $(1,117)$,
should he looked at, hoth as a drawing and as bappy exam pleof the combination of something of the stern custellated outline suitable to a hilly situ-
ation, withan entirely domestic aspect and expres. ation, withan entirely domestic aspect and expres.
sion in details - in the treatmentand placingof the windows. Mr. Cockerell's "Mansion at Ballards," built for Mr. Goschen ( $\mathbf{1}, \mathbf{1 7 8}$ ), is a characteristically treated house, somewhat hcavy, in that heavy eighteenth-century manner again, with the style is the taste of the client rather than of the architect, which we all know is the case sometimes in the designs of dwelling houses.
$M r$. Gibson's "Interior of Eall and Staircase Nutfield Priory" ( 1,177 ), is a remarkably groo water-colour drawing of a late Gothic interior, satisfactory, hat presenting no marked charac. teristic. Mr. TAnson exhibits a drawing of his $(1,180)$, a red hrick building of a plain Gothic type with white stone dressings ; and Mrr. Street, who seldom exhibits desigus in domestic architecture, sends a druwing of the new parsonage at Wigan a house with a stone lower story very solidly treated; tho upper story, silghtly corbelled out
being formed nainly with brick and timher, th brickwork arrnged at various angles hetween the posts. The general effect is satisfactory We misst regret the freak of corhelling out the garden entrance; it may look hetter from the garder entrance; it may look hetter from the
other side, but in this riew the effect is mose annoyiag to the eyc. The large "Building for - Messrs. Cox \& Sons, in Maiden-lane, Strand" $(1,186)$, by Mr. Nicholl: an elahorate Gothic design, shown in a good pen-and.ink drawing, fuils in effect from want of any grouping oi learding motive in the composition. It is merely
so many wiuthows in a wall, ornamentally treated. We may conolude our remarks on the class o domestic huildings hy a reference to Mr. Brooks "Schools, Parsonage, \&c., St. Columba " ( 1,211 ),
concerning which, whatever may be thought that some of the details, no one can dispute effectivo and picturesquo grouping and outline. The few drawings which illustrate decorative and ornamental work, include a earefully executed water.colour drawing of the "Interior of a Pompeian House" ( $\mathbf{1 , 1 5 4 . 1 ) \text { , by Mr. Longfield, }}$ Musco Nazionale, Naples: the spet, and in the cool and pleasant to the ege, and might fnrnish cool and pleasant to the ege, and might fnrnish
hints for interior treatment in onr own resi. dences, with modifications necessary for onr in. dences, with modifications necessary for onr in.
clement summers. Sir M. D. Wyatt sends the clement summers. Sir M. D. Wyatt sends the original working drawing for the chimneypiece in
Clare Collego Hall; and Mr. Moyr Smitb two studies Clare Collego Hall; and Mr. Moyr Smitb twostudies or wall decoration, "Homeros" and "Epitha.
mios" ( 1,150 and 1,160 ), consisting of fignre subjects in white, slightly sladowed, on a gold ground; but the drawings, which are small, are hung too high for the figures to he fairly judged of. Mr. Talbert's " Entrance to.a Vestibule Hall" ( 1,198 ), is an excellent specimen of decoration looke classic type, perhaps a little sombre, or it duced lat the drawing; the effect is procolonr being used tertiary toaes, 1 Fountain" (1,199), by Mr. Armstead, the subject from "Comus;" a square centre blook of marble, is occupiod by a small and very spirited bas-relicf, representing the moment when "Comus" presses the euchanted cap on the lady: the centre is surmounted hy a brouze figure of Sabrina, with swans at her feet, and val pertase on figures on sea-horses (not a very novel conception), and from a deep surbase moulding in these pedestals the water issues forth in a wide oircular sheet, the pedostal below the surbase being treated with a kind of reminiscence of aquatic vegetation, in a regular series of tall bronzes This would have a very good effect; the bronzes are perhaps the least happy portion of the design which, as a whole, is a very pleasing Newman and Miss C. S. Newman are mere re. productions of Sedieval crudity of form and colour. 1t is really astonishing that such dosign as No. 1,209 should seriously be offered to us as an adequate illustration of the soloun associations raised by the words, "The harvest is the end of the world, and the reapers are the augels." Much of what is called "religious," or
"churoh " art, certainly degrades the Bihle "churoh" art, certainly dogrades the Bihle

almost the only sketches of architectural remain I this on's sketches or architectural retain the Erechtheam, and the monument of Lys orates, in his well.known style. It is sad to contsmplate the skotch of the last.mentioned es. quisite monument, in its present state, battered mofacen, the beautiful cuial a shapeless po, sordid-looking huildings iutrading close ponit, and girls hanging clothes to dry, as a heanty and the most typical remanant of the This is what we must all expect to come to however, modern Greoks, or modern Gothics, shall we he if 2,000 rears hence fortunat enough of interest lefc in any of our buildings to farnish the harbarians from foreign shores with matter for a sketch

ROYAL ACADEMY EXHIBITION
The frst essential towards securing favour decidedly, fine weather: Academy Exhibition is lecidedy, the sky is clearest and the sun not quite at it warmest, only so far cheoks the easy access arough passages to tho realms of picture delight as to remind the happy anticipator that here is never sunshine without sunshade; that here rever cau be bright happiness for som aless it sometimes carries a parasol with it into custody your to wait one's turn for giving into custody your lately hest friend, pro tem. When every one else is enguging the attention o he civil ollicers who take the charge, all hope of piacid enjoyment is left bohind with your morella, and your patience has heen too much bied to allow of fair play for a happy disposition orety flings nay he, when so much of the time llotted for special pleasur'e has been absorbed How particnlar vesation in arriving at it. However, the passages are considerably short
encd since the handsome huilding unmarked its entrance, and a cab fare to the doors of it might encroach on the extra milo since last year. The British ast. Year aftor year the mimio pros brish att. Year alceryear che mimic presenta. darken whatever the sun lightens and shadow darken is to be found amongst the hundrods an bundreds of pictures the walls display and wil display ; and yet, with such a vast amount of learning visible, too little is taught or recorden by tbe painters of to.day, simply by reason of Cheir having or showing so little sympathy witl to.day. Pictorial newspapers and photograpby have, in a measure, out the ground from beneath the feet of those who would tread the old conrs of illastrating the times in which they live, so far as depicting actual events as thoy pass: raw facts to dispnte an artiatio apprehension an treatment of them are likely to deter whon tb ohject is to give all possible truth to them, but in pichuresque form: for divergence slight from what is known to bo tratb would belie any attempt to adapt it, and make th result worthless, compared, perhaps, with that, whon speonlation and appropriato ase of proha hilities have been left at disposal ; and in givin with all possible truth a prohnble rersion a what is exactly known to mobody, the doubtful becomes olothed with positive fect doubt hide it. and all doubt that tends to eaongh t pointin. precept shared by worse delinquents, no donbt, than shared.
Pictures at the Royal Academy are past all doubt of goodness with the multitude. Let all he said thoodness wita the multurde. Let all of evory dorn whis year's sbow, te the the same pleasure and belief in its being a nature of its charms may vary. sometimg the pictures may charms may vary: sometimes groa ti othors as now the br this rergo tion is seen in a diffused form of excellence ; but the fact remains all tho form of oxcellence; but reace tbe Exhibition of the Royal Aoademy is only to be jndged per se.
A cnrsory view of its 1,600 constituent items would lead to the belief that no great demand could bave been made on half their eatalogue's motto "Ingenium;" the hard work necossary to furnish the supply of so many hundreds of instazces is far more apparent, and less doni able. "Labor et Ingonium," mulcted of some ef its classio and sonorous meazing, vory well durk estes respectively thoso who find it bard it ea to paint, and thnse whose ingenuity makes painsyusizess. Long since it was part of the prepars task to find and grind colour, to make shopkeoper's sho oo devise means by whioh he could tell in ont ward show the worth of his thonghts and learning that, like hidden jewel.mines' wealth, needed but implements to be made known. The met, to were found, the treasuro divulged, and set, to hocome procions for ever. Paint, more apply rich means is the question of to do opposed to the old yearning request for means to apply.
Executive skill, based on such acquirements as kuowledge, taste, and the sense of what is delightful and beautiful, marks the production that many hands have helped to sign, in deod that conveys great property, but with a spend. hrift's careloseness English art now is equal to any demand on its appliance, and yet fritter may mako small
things of it . It is this very domand that, in. fluencing the supply, cramps whilst eniarging t, the natare of tois supply
Fashion is exacting, and iu its tortuous course and hinding influences must over have much to answer for in what effects io may impose on art; portrait.painting inevitahly illustrating its real emporaly status for ater-opinion more that any other practice could, whether portraying the time or its people,-whether, as in the case of Mr. W. P. Frith, it takes the comprehensive ienv, and faithfully rapresents "Derby Day, "Railway Station," "Fureign Gambling Resort," or when applied to convincing delineation of Mr - Wally, such as Mr. Millais, Mr. Watte, posterity's, and others are handing down for the pry's knowledge aud consideration, with all cresent benefit of allowing some of us, at One of to see ourselves as others see us. the portraits Mr. Millais paints, is their freedom from all appearance of trick or adoption of
recipe in lis method of working ; bis faculty for mivating anything and everything paintahle and repalations, of prescribed flesh.tints and and regalations, of prescribed tesh-cints an ployment for another's contrast. The little ployment for another's eontrast. The little ohitd seated in the garden nursiog her kittem, witb spring flowers, gay croeuses, for quie company, which eertainly suggests likeness to Reyublds's chilaren, wor "r " Dolly Varden costume of "Early Days'" (a9) tban from any real resemhlance, is intended fo coatrast, no doubt; bat therc is little need to add such to prove the perfect rcalisation of ver great age that the picture "Mrs. Heugh" (21) presents; nor to typily old-fashoned rusticity by the oharming portrait of the yonng lady who collecting the "Yenr.laid Eggs" (260), raer to emphasise the gay raagiloence rocade, lace, ritual predomiven ano eartiful head splendidly eopied, "Mrs. Bis choffsheim" (228). There arc more portrait han ever this year, inctuding some fine speci ans ; and thongh there arc not many work illnstrating history, poetry, or romanoe, ther sro numerous instances of the pleasing or other wise affecting clags of narrative pictnres. The portraits, as exhibiting the current chief clain n pairter s time, prould need separate consider ation; but for the preacnt,--lad we a wife, we would thank Mr. G. Pope to paint her picture, if he were at all like "Mrs. Hartwell" (209) but then we should crave, on our own side, to b omething like "The Hon. Francis G. Baring" (325), one of the most anmirable portraits eve painted; and if Mr. H. T. Wells wore fortunato in bis sitter, the sitter was fortunate in hi panter. Never was gentleman and soldio bettor presented: it is a jewel of a portrait Hrving already, however; given space to sgecial clepartment, wo are ohliged to stay onr

THE GOVERNMENT AKD MMPROVED DWELLINGS FOR TEE POOR
The Special Dwellings Committee of the Dluarity Organisation Society have heen engaged at their last two weekly meetiugs in discussing the question whether the State onght not to for the indugtrial classes. The disoussion arose aut of the following resolntions, brought forward by Mr. J. S. Storr, a momher of tho com. nititee:-
 In London, wherely overcrowting bas been so much
xeyravated, have been conduted onder compulsory
puwera conferred by Acts of Parliament, it is ingumbent seon the state to proside thetion of dwellings
secons.
2. Thast this commniittees recommend that Parliamentary unumissioners, to act under, and in conjuuction weith
the Presidint of the Local Government Board, or the

 onduc Commisioncrs to me managed by them, and sold
muler appropriate restrictions, from time to time, and
the amounts realibed on such sales to be reinvested b ine and Connwissioners in like manner as before ; any
altimate profit or loss on the sale of the said bnildings t to carried to thy acconnt of the Metropolitan Board dipumd by Parlianent to be uvailable for this propose."

At the meeting of the Committee on Wednes ahjeet was first brough arcard, Lord Napier \& Ettrick presiding, there cus a humerous attendance of memhers, in Arding Lord Elliott, the Hon. W. Cowper Chmples Trevelyan, Sir Leighton Baldurin, \&c. Sir Me. Storr had forwarded copies of his resolu-
no Nouse af number of Peers, memhers of the Honse of Commons, and others, known to b several were read question, and the replies of several were read previously to the commence melicited are of interest from the position and standing of the writers
Juhu Lubloock, MP Pers read was one from Sir ohis Lubbock, M.P., who states tbat he is not ment to provide dwellings for tho forkeing 1ヵя ョes."
The letter of Mr. Thomas Brassey, M.P., wes farliatic iu ita condemmation of the Government jung oalled upon to undertake the erection of suck dwellings. He remarks,-"The interven tion of the Siate in matters of local goveramen
is not popular in tbe present day. I should, withever, be glad to see the Government invested dwelling.houses unfit for the poor. I am also of pinion that State loans for the purpose of building workmen's dwellings might be granted, but I should hesitate to give my support to comprehensive scheme for rebnilding the houses of the working classes being undertaken hy the Government. I cannot believe that it would be an advantage that the State should be the niversel landlord of the working men of Fngland, and I shonld oppose sueh a proposition I I shonld oppose the proposal that the Státe Tould purchnse and work the railways of the nite th Com. I quive ace with yon, how ever, that Parkiament may have given its con. sent too readily to Aots empowering railway companies to pull down the dwellings of the accommodation in lieu of the bouses tbus destroyed.'
The Marqnis of Salisbury in his reply says, I shall bo kappy to consider any seheme which you have to snggest for the purposes named in pour letter, but I need hardly say that the practical diffienlty of entrusting to Governmont the duty of providing houses for the working Elasses is very great.
Earl Russell writes to say that he cannot give an opiuion on so complicated points of law as those involved in the resolutions; hut he quite agrees with the spirit of the resolutions, that tho law on the subject requires material alteration.

Archbishop Mauning says:-" I am much obliged to you for the copy of your resolutions on the compulsory destruction of dwellings. Having lad experience of this in many parts of Londou from which tho poorer classes have been swept out, I am convinced that, though in the main benefieial, scob wholesale destruction has caused both loss of life and hardships to many Who from poverty have felt it very sensibly. Some such provisions as you propose I believe to he necessary. Enougb has not yet been done to provide fitting houses for onr working classes. Tho efforts of individuals havo done much, hut some more public and adeqnate provision ought far to meet the onse"
Mr. Storr introduced his resolations in specch of upwards of an hour's duration, remetropolis, we were that, year by year; in the reasury many millions ang from the puhtic yorkhouses, hospitals, and reformatorigs, and sanetioning a still further expenditure in Thame mbankments, railesys, sites for lam courts, and ther large puhlic improvements, which were riving out and reudering houseless haudreds of tbonsands of the poor classes, who had either go into the suburbs, seattered and removed far rom their work and their employers, or other. vise to paek themselves still eloser in the already ver.crowded distriets. Lord Shaftesbury esti. mated that 50,000 poor persons had been so isturhed for varions pahlic works in London early since 1853, which gave a total of 1,000,000 ip to the present year. Having eomplained that he Goverument were inert on the suhject, and tate large nuznise of hich could he prevented hy the Gorcrument hey had but the nerve to graprle with the qnes ton, he alluded to wobe to grapple with the ques tion, he alluded to wbat had already heen accom plished hy ene sopolitan association or proviang honses for tbe poor, ehowing that rected buildinge for 817 feabilieg consisting 407 bundings for 5.7 families, consisting of 3,407 persons, occupying 3,328 rooms, at an verage rontal of 1s. 10. per room per week me Mouropolitan Association for Improving the Wellings of the Industrial Classes had erected Improved Iudustrial accoming 507 familios; the mproved Iudustrial Dwellings Company bad provided accommodation for 9,000 persons, whic agd caused an expenditure in haildings of 250,000 . ; and by these efforts, mided hy those of other societies, houses had heen found for hout 20,000 persons ; hat, notwithstanding these efforts, and however much it might he agreed that reliance could be safely placed npon the law of supply and demand, supplemented by inteligen hereficence, the conclusion was, he thought absolute that the difficulties connected with the housing of the poor, and of the working-classe enerally, in the metropolis, were of such mag nitnde, and the case was of sucb great nrgency as to be beyond the reach of private
of the State, of Munieipality, if London had ne. Tho populatiou within the metropolitad district was rapidly approaching four millions, aud tbey bad as yet only crected new houses for 20,000 persons since the jear 801, when the first two assooiations for the purpose came into being. In oontinuation, he olserved that, during his interviow with Archbishop Manning on the prerions Monday, the archhishop took pains to make clear to him his conviction that the minds of the lower orders pere hecoming more and more impregnated with sense of the indifference of hoth the Govera. ment and the upper classes to mncb that con. cerned their material well-heing, and that tbey abonred under a feeling that injastioe had been done to them, especially in the matter of their bouses heing taken from them. He (Mr. Storr) regarded the condition of the honses of so many of onr people in London as a discrace to ourr profession alike of Christianity and civilisation, and a common dancer to the puhlic health, and the security of the state. The legislation of reeent years had on the one hand intensely ggravated the great evil of over-crowded wellings, aud on the other provided bnt per. missive, tentative, and comparatively futile means towards the condemnation of bouses anfit for human habitation, and the re-building of lofty houses in their stead. He then proceeded to suggest the only remedy that could, as be thought, prove adequate to the vastness and urgency of the case. This consisted of the sketch of an Act of Parliament, witb elauses, appointing commissioners with powers as set forth in the resolutions. Uuder suoh an Act he believed that all the evils of tbe present condition of the people's homes wonld, in a few years, he romedied, and the maltitude would not be slow to feel that they were living nnder a Go. vernment that concerned itself praetically in matters that lay at the root of their social state. We should have atronger men and women, and in the long run less to pay for prisons and prisoners, hospitals and sick, workhouses and paupers. Whilst as for education, with cood houses to go to when the day's work was done, the people might learn the greatest lesson which any education could teach them, that home was swee, and that home inflacuce was the best of hotb body and mind.
The Chairman, at the close of Mr. Storr's emarks, said the committee must feel greaty laying before them the paine be had tanen in wich he had made upon sucb a vitally important question.
A prolonged discussion followed, in wibicb several members took part, but it appeared to ho tho opinion of many of the speakers that before urging the Government to take any such teps as those indicated hy the resolutions, they rith the themselves thoroug local puthoritios in what hat other great cities with the view of preventing rerorong ings.

Charles Trevelyan had great doubts wbe ther the daty of providing improved dwellings shonld be thrown on the Government or Parlia on
Sir Leighton Baldwin was also opposed to he Government being asked to undertake the proposed duty. What, however, he thought might be done in the way of legislation was to rive to local bodies more legislative powers tban hey at present possesped, not to destroy, but to restore dwellings. He thoucht the actnal work of building better houses for the poor must be oft to private enterprise and beneficence

The Rov. G. D. Murphy thought that all the requirements of the case would be met by Government being asked to give every possible encouragement to private individuals disposed to orect dwellings for the large nambers of those whose houses bad been destroyed by public works.
The Hon. W. Cowper-Temple, M.P., said tbey vere all agreed as to the existence of the great evils which had heen so ably laid before them by Mr. Storr, bat he douhted the somntness of asking the Government to undertake the remedy. All he thonght they conld do was to stimnlate the local authorities, and continue to rely on the efforts of private hodies and organisations. The ommission which Mr. Storr proposed would not have elvier the power or the aathority to carty ander discussion. Moreover, he belioped that,
as a rnle, all the existing local authorities wonld saise their voices against the creation of such a commission as that proposed. Ho could not bring himself to believe that the State would he
willing to undertako the suggested duties, nor willing to undertako the suggested duties, nor
indeed did he think it was competent to do so. indeed did he think it was compctent to do so. As to the work being imposed upon the minister whoso time was so much oocupied in subjeots of wrave imperial importance could ho expeoted to tundertake or to be responsihle for all the details and minutie involved in such a complioated social question as tho one nnder disoussion? He folt that the wisest and most prudent course was to enlarge the powers of municipal and Socal authorities, so as to give them a greater scope for the erection of tho required huildings, sud to trust to those heneficent organisations minder the influonce of which so many dwellings for the industrial classes were heing ereoted.

The discussion was oontinued for some time longor, and was ultimately adjourned until Wedr
Ross.
At the meeting on Wednesday last, when the discussion of the snbject was resumed, Lord Napier, of Ettrick,"again presided, and amongst those present were the Lord Provost of Clasgow, and Mr. Carrick, the city architect, with Mr. Marwick, the town clerk of Glasgow, who
attended as a depatation to explain to tho comattended as a depatation to explain to tho committee the steps whioh had improve its sanitary corporation of that city to improve its sanitary honses for the working classos.

Dr. Roses, the medical officer of health, having opened tho adjourned disonssion, aud stated his opinion to the offect that the proposed Improve. ment Commissioners should not be Government officers appointed hy them, hat should he ap-
pointed iointly hy the Metropolitan Board of pointed jointly hy the Metropolitan Board of
Vorke, tho Corporation of London, and the Local Vorks, tho Corporation
Government Board

The chairman called upon the Lord Provest of - Glasgow to state to the committee what were the powers possessed hy the corporation there with regard to the destraction of houses unft the industrial classes.

The Lord Provost then went into the history of tho popnlation of Glaggow for some yoars past, When, in different portions of the city, the inbahitants' were huddled together in dwellings not fit to live in. This led to an Act of Parlia$1,250,000$ ? in parchasing property unfit for haman habitation, and to pallit down, and either to hnild npon tho sites themselves or to sell the sites for others to build apon. They had already purchased property and sites to the exalready purchased property and sites to the ext
tent of $1,000,000 \mathrm{l}$, and resold to the extent of 400,0002 ., and on what they had resold they had made a considerable profit. The result was that wholo streets had hecn widened and improved, and large pumhers of improved dwellings had been erected for the lahouring classes. Mitherto they had not gone ou the
principle of building themselves, although they did hnild a numher of lodging-heuses at once, immediately on ohtaining their powers. They rdepted the principle of selling the sites to builders upon certain restrictione, letting it he known that certain housos would bo reqnirod, and the consequence was that whole streets of new and comfortable thoases and rooms had been erected. According to the arrangeinge, one room was let at an average of 5l. a year, and two and three rooms at $10 l$. and 'I2l. a year. Under the terms of tbeir Act, in taking down honses which they had phrchased for improvements, they did not dispossess more thnn 500 persons at once, and this was not done nntil they were assured that new dwellings for that number had already heen onitt, and were rendy for occnpation. Tbe trost satisfactory results had already been shown in the altered coudition and sanitary improvement of tho Civy; andoments would cost them more than from 150,000 t to 200,000 ?.
Mr. Carriek, the city architeot, Glasgow, corrohoratod the Lord Provost's statements, and Mr. Marwick, tho town clerk, and who had formerly held the office of tomn clerk of Edinburgh, explanner in tho last-named city.
The chairman then suggested na adjourument, as they had beou favomred with most valuable information upon which they might profitably
reflect before coming to a decision on the resolutions, and the discussion was then forther adjourncd to Wednesday next.

## OPENING OF THE VIENNA EXHIBITION

The Emperor of Austria oponed the Exhi. bition at Vienna on the Ist of May. The Prince of Wales was in the place of honour on his right, and the Crown Prince of Prussia on his left. The Crown Prince of Austria wes with the German Crown Prince's son, and the Princoss of
Prussia with the Empress. The Archduke Charlos Prussia with the Empress. The Archduke Charlos
Louis, the "protector" of the Exhibition, adLouis, the "protector" of the Exhibition, adhrilliant assemblage, and the ceremonial was accompanied with music, led hy Strauss, The actual ceremony of the opening occupied less
than twenty minutes, and the wholo proceedings Frere over in less than two honrs.

## FROM VIENNA.

Mray 1st.
Sir,-I am here in Fienna, and having a fow minutes to spare, it has occarred to me to write you from this very hoautiful city, where oxpectation on tip-toe waits the events of to day, the oponing of this mighty Exhibition, -in which brains, will exhihit to the world all the varied brains, will oxhigit to the world all the varied tiou, and who, desiring to earu something more only, hut often the long night through, to only, hut often the long night through, to
seoure that which money cannot purchase, nor seoure that which
Having been associated with every Exhibition sinoe 185 I , I am ahle to comparo the presont with those of the past. Tho novelty of 185 I took the world by sarprise, and the ntilisation of iron and glass on so grand a scale secured puhlio favour for the huilding, which, when filled with the varied contributions of the whole world, mado this, the first of Exhihitions, a great snccess.
During the past twenty-two years tho world has not heen idle, and all contiected with the present building deserve great praise for the cfforts made to meet the requirements of all daily, I ara more thinn pleased. All approve the plan and arranyement.
The exhibits aro all good, many of them traly magnificent. The statuary and pictures in the Fine-art Court, as also within the Exhibition, are alone worth a journey
apart from Haehinery Hall rans the entire lenerth of the bnilding, and is filled with very beantifu] machines, small and large, all tending more thar ever to prove that scieuce is the providence of ment of his duties will consist in simply puiding the mechanical and chemical forces of nature whilo proriding those necessaries, and evon the lusuries, his condition of lifo may require.
I once-held the opinion that there were
men like Engishmen, and no placo like England. I bave a notion that many of my conntrymen are of the same epinion still. It would he well for those who think fo, to work a little overtime saring the extra money for a trip to and from this place: the whole distance may be done in forty-eight honrs. A month since I worked here, all the Saturday, and left the same after. noon, or rather evening, ahont $60^{\prime}$ clock, and on
Monday nicht at 8 o'olock I was at Viotoria Station.
Last Saturday night I left Charing-cross at 8.15; at $70^{\prime}$ clook the next morning I was in Paris, where I spent the day seeing poor Paris, the Lonvre, \&c. I left Paris at S*35 Sunday night, passing through Nancy, Luneville, and other plaees, still bearing evidence of the struggle betrreen the Prussians and French.
At Strashourg I. had plenty of time for re. freshment, and to see this quaint old place, with its wenderful olock; yet with all this I was in Vienua soon after 9 o'clook on Tuesday morning, haviag lost but one working day. It is wonderful what may he done in a very shor titue if we only try, and I do hope many of my comutryn
I think a certain sum should be roted to assist foremeu and others haring charge of works in the United Kingdom to come out here. Know gein mould make our common country more
powerful to hold her own in the struggle for manufacturing supremacy that will surely come. The Germans, working with pipes in their mouths (a thing I decidedly ohject to), may look a heavy listless race, wanting the energy to impulsiveness so common to our people; but their productions are not to he despised. Thoy are steadily gaining ground, and are even now competing with ns in manufaotures that, a fow years since, the English alone supplied.
I advise those of my friends who can sparo the time to run direct to Cologne, via Brnssels, stop at the Hotel Disch, or any other good hotel for the night, and tho next morning take" the steamer up the Rhino to Mayenoe, then on to Yionna hy way of Salzhourg, the soenery thero boing very grand.
As regards lodgiugs, they are not so difficult to ohtain, neither aro they so dear, as thoy are represented to he. We had our Exhihition prices, the Viennese have theirs. As I shall be moch here duriug the Exhihition, I shall be plewsed to bo useful to those of my countrymen who may come, or desire to come. If you approve, I shall he pleased to write to you occa. approve, I shall he pleased to writy on Exhition matters. Meantimo, I trust you will accept this basty communication in the spirit in which it is offered. Tbo drams are heating and I am warned to prepare for the opening.

Georae Jennings.

ANNUAL JEETING OF THE INSTITUTE OE ARCHITECTS.
The report of the council read to the meeting, Iny 5th, shows tbat since the last annual meeting, "fifteen Fellows (five of whom had passed from the ranls of the Associates) have been elected, whilst the list of Associates has heon increased by thirty new names. Four gentlemen have been admitted as contrihnting: visitors, and five passed candidates in the proiminary architectnral examination have hoen enrolled as students of the Institute. Tbere additions are, on the whole, ahove the neval average; while in the case of the Associate class, the accession lias been oreater than any class, the accession has been greater than any Which has occurred for many years." The
report continues:"To prevent any futare excess of disbursements ore
receipts, the counoil propose that an aunual budget shal receipte, the counoil propose that an aunual budget shall
be prepzee, giving au estimate of the income and
expenditure for each year. It has also been arranged expendure heneforth the confercnce and the archit tectural examioztion shall take pisce in ale erbate years, that tha

We will give on another occasion a list of th office-bearers elected at the annual meeting
inaugural meeting of tie ASSOCTATION OF MUNICIPAL $\triangle N D$ SANITARY ENGINEERS AND SURVEYORS

On Friday, the 2nd inst., the inangural meet ing of the newly.formed Association of Municipa and Sanitary Engineers and Surveyors was held at the Institution of Civil Engineers, West minster, London, Mr. Lewis Angell, Mem. Inst. C.E., of London, and engineer to the West Ham Local Board, as chairman pro tem., presiding. There was a large attendance, inclading engineers and surveyors from the following places:Ealing, Grindley, Portsmonth, Bristol, South. ampton, Kingston-upon.Thames, Hornsey, Old. bury, Tranmere, Warwick, Leamington, Maiden. head, Boston, Sheerness, Birkenhead, Lancaster, Wellingborough, Tottenham, Beaford, Longh. borongh, Congleton, Eton, Barnsley, Maidstone, Hamley, Bromley, Hacclestiela, Stookport, Ches bunt, Hereford, Ramsgate, Woolwich, \&o.
The chairman gave a brief history of the formation of the society. Ho had felt for years past the need thero was for some organisation ander looal aulhorities; and a fow other memhers of the profession being of the same mind as himself, a meeting was held at the Institution of Civil Enginecrs, London, on the 15 th of last February, when it was decided to form an association, the objects of which shonld be "the promotion and interchange among its members of that species of knowledge and practice which falls withio the department of an engineer and surveyor engaged in the discharge of the duties imposed by the Public Health, Local Govern ment, and other Sanitary Acts; the promotion the general promotion of the objects of sanitary science."

A meeting was afterwards held in Birming. bam, where a number of additional names, as memhers of a 100 and that day they were ascembled for the parpose of holding the inaugural meeting of the Association. He also reminded the gentlemen present that although town clerks, medical rities had their various associations, engineers and surveyors had, up to the present time, been disunited, and had now handed themselves together for their own and the public benefit.
The proceedings of the previous meetings having heen conflimed, it was decided that the Association should he managed by an executive council, composed of the engineers and surveyors of West Harm, Reigate, Ramosgate, Euling, Hertford, Kingston-on-Thames, Suuthampton, Portsmouth, Brighton, Tottonham, and Boston; and also a representative from Middlesbrough, Shields, Hull, Manchester, Salford, Leeds, Birkenhead, Leicester, Bristol, Derhy, and Batrow-in-Furcess, to which would also be
added the secretaries of the various districts of added the secretaries of the various districts of the Association, when they are appointed.
The chairman, in reply to a question by Mr.
Marshall, of Tottenham, said he would suggest Marshall, of Tottenham, said he would suggest
that tho Association should also take in the that tho Association should also take in the Ireland.
It was deeided that one-third of the conncil should retire annually, and that it should be
determined by hallot who should retire, and筑 whom their places shonld he filled. Reting re-election.
The London and County Banking Company ere selceted as the bankers of the Associaton, Mr. Jones, of Ealing, who has been aeting as hon. seoretary, was elected secretary
As to whether or not assistant sarvcyors should be eligible for membership in the Asso iation, the council were left to decide
Mr. Angell was unanimously elected president or the ensuing year, on the proposition of Mr Lemon, seconded by Mr. Thornburn; and Mra . Lemon, of Southampton was unanimously elected vice-president, on the proposition of Mr Pritchard, seconded by Mr. Thornburn. Botl gentlemen suitably acknowledged the compli ment of election, Mr. Angell also receiving hearty vote of tbanks for his efforts in pro moting the Association
Mr. Rohert Rawlinson and Mr. J. T. Marrison were elected vice-presidents, letters of
rence having been received from them.
It was decided that the first annual meetin hould be held in Birmingham in May, 187 t.
The Chairman then read an inaugural address professional and sanitary subjects, and the meeting shortly afterwards terminating, the nembers repaired to the London Tavern, wher they dined together, Tho Association promises to be useful.

THE PROPOSED REMOVAL OF NORTHUMBERLAND EOUSE.
We nnderstand that the Soleot Committee appointed hy the Houso of Commons to consider the provisions of the Bill promoted by the Metropolitan Board of Works for making a new approach from Charing-cross to the Tharnes Embankment have agreed to the preambl declaring it desirable that the road shonld run hrough Northnmberland Fouse. A clanse ha been introduced referring the approval of the clevations of the houses on the line of the nen treet to the Royal Institute of British Archi tects, -a step which will douhtless lead to dis oussion. Mr. T. H. Wyatt, who was present as witness, acoepted the duty on the part of the Institute, should the recommendation become
law. If this be a good step in respect of the Metropolitan Board of Works, our informan remarks, why not for tbe Corporation of London and if for the Corporation, why not for the Government? We shall be curious to know more of this arrangement. The Gothic or Classic tendencies of succeeding Conncils may
be made to bave a curious effect on the archibe made to bave a

WITHINGTON CHURCH, GLOUCESTER, The parish of Withington, situated in the and about seven miles from Cheltenham, con. tained at one time a nunnery founded in the Saxon times, ahout the eighth century, and con. nected with the see of Worcester
The present church, dedicated to St. Michael was founded at a later period, and contains several interesting specimens of various styles Gothio arehitecture from the Norman to the Perpendicular, - the Norman of which the north and south doorway in the nave are good examples, as are also the arches and piers supporting tho Norman to Early English exemplified hy the north and south chancel windows, the lowe window in the tower, and some romains of arches in the west front; the Geometric by
windows in tho south transept; and the Perwindows in tho south transept; aud the Per pendicnlar hy the clearstory and south windows he nave and chancel. The church consists of a long and lofty nave, and oentral tower dividing it from the chancel, with a transept on the south side only; the tower is 7.4 ft . in height, and contains a peal of six bells. Encased in the sonth wall of the nave was found an elaborate canopied monument for a recurnhent statue of fifteenthcentury work, hut the figure had disappeared.
Tbere were also fonnd entrances to a rood.loft Tbere were also fonnd entrances to a rood.loft of Roman tesselated pavement
The walls and roofs having become in a very dilapidated condition, especially those of the tower, it was determined by the rector, the Hon. and Rev. G. G. C. Talbot, to undertake the
criptions from the Incorporated Society for Building Churches, the Diocesan Society, Dr. Warneford's fund, and from private friends. Designs were obtained from Mrr, David Brandon, wbich have since been carried out at a cost of about $3,000 l$., and the church was reopened for divine service on Tuesday, the 15th ult. The Earl of Eldon, to whom the south transept belongs, subscribed the sum of 300 l .
The chancel has been taken down except the east wall, and rebuilt as it originally was, including Early open . timbered oak roof, and vestry, with space for the organ, has been Perpendicular north side. The ceiled under Pexpendicular work, which was ceiled under. neath the tie-heams, has been thrown open to The plastering has heen removed from the in ternal faces of the walls, and the masonry oleaned down and repointed. The dilapidated stonework of the windows, doorways, and strings, has been repaired, and made good with new tone. A font of Cacn stone, a new pulpit, and a reading-desk, have heen snbstituted for the old ones, and the whole area of the church has beon re-seated. Nearly the whole of the work has heen executed by the local work. people of the village of Withington; Mr. W. II. Knight, of Cheltenham, having assisted in superintending the carrying of it out
The organ, originally built hy Mr. Nicholson, of Worcester, has heen considerably enlarged by him, and a beating apparatus bas heen constructed by Messrs. Marshall, of Cheltenham.

THE ANTIQUITIES OE ROME.
Mr. J. H. Parker says these are in dangery and makes a fresh appeal for help to save them. The cost of sites now wonld be moderate, as compared with what it will be a few years hence. Dpwards of 2,000 houses are now building in Rome, and many more will be vanted, as well as manufactories and warebouses: the price of land is therefore pretty sure to rise.

## PROPOSED RESTORATION

OF GATESHEAD PARISH CHURCH.
A meEting of the churchwardens and parishioner8 of Gateshead has been held in the considering the desirability of making certain alterations in the interior of the church. The rector of Gateshead, the Ven. Archdeacon Prest, presided, and iuformed the meeting that the question of restoring the mother church had been taken up by the churchwardens. The alterations which it had been suggested should he made were the removal of the present closed pews, and the substitution of open seats, bat pews, and the substitution of open seats, entire removal of the galleries over the sonth and north aisles. The roof of the aisles wereso low that, with the gallories at present existing, it was often very uncomfortable and unhealthy for persons sitting in them and below them, on account of the vitiated air, especially at evening services, when the congregation was large. It services, when the congregation was large. It
was also contemplated remoring the organ. was also contemplated remoring che orgau-
gallery at tho west end of the church, and placing the organ in an organ-chamber to bo placing the organ in an organ-chamber to be
ereeted on the north side of the chancel; the chancel, in the event of this alteration heing carried out, to be occupied hy the choir. The arried out, to be occupied hy the choir. The transept.galleries would also he removed, and the whole area of the ground floor opened ont as far as the tower, whilet the arches and pillars woald be cleared of the paint, plaster, and other colouring, and restored. Mr. Crichton said he thought they would require from $3,000 \mathrm{l}$. to , 000L. to carry out these suggested alterations. Mr. R. W. Hodgson said the first step for themo take was to get an architect of taste and ability in such matters to report non what was necessary to he done, and to give an estimate of the cost of carrying out his recommendation. Mr. Ralph Carr.Ellison sngrested that they ought to have some alteration of the exterior of nondescript appearance into a good fifteenth. century tower. They need not carry out this part of the scheme at the present time, but it was hest whon they were ahout to restore the charch to hwye a plan taat should be karmonious throughout. After some conversation, a com. mirtee was appointed for the purpose of con. sulting Messrs. Austin \& Johnson, architects, as to the alterations that may be desirable,

## THE MARYLEBONE SQUARES.

Two large and historical mansions in the north f London are now in the hands of the builders, and being enlarged, viz., Montagu House, in Portman-sqnare, and Manchester House, in Man. chester-square; aud the present, therefore, seems a good opportunity to set down a few notes about the neighhourhood in which these houses are sitnated. At the beginning of the eigbteenth century Marylebone was a village entirely sepa. rated from London, and the ground to the nortb of the Oxford-road was chiefly occupied by fields. The manor of Marylebone was granted by James I. to Edward Forset in 1611, and afterwards passed into tbe family of Austen, by the marriage
Arabella Forset to Thomas Austen. In 1710 , John Holles, Duke of Newcastle, purchased tho manor of John Ansten, afterwards Sir John Austen; and his only daughter and heir, Lady y Henrietta Cavendish Holles, marrying Edward Harley, second into that family. The only danghter and passed into Earl and Countess of Oxford, Lady Margaret Cavendish Harley, married William, second Doke of Portland, on July 11, 1734, and took the property into the Portland family, wher it still remains, the present duke being lord of the manor. The various names of those nowle
families are all represented in the streets of the neighhourhood. Lady Henrietta Cavendish Holles gave her names to Henrietta-street Cavendish-square, and Holles-street; her hushand to Harley-street, Oxford.street, and Mortimer. street; and thoir daughter, Lady Margaret, to Margaret-street. Bentinck, Duke, and Duchess
streets, and Portland-place, take their names streets, and Portland-place, take their names
from the Duke and Duchess of Portland. Ono of tho titles of tbo Earl of Oxford was Baron Harley of Wigmore, after which place Wigmore-
strcet was named. Welbeck was an estate of strcet was named. Welbeck was an estate of
the Duke of Newcastle, and Bulstrode the family the Duke of Newcastle, and Bulstrode the family
seat of the Dake of Portland, and hoth places are represented by Welheck and Bulstrode streets.
In the year 1715 Cavendish-square and the neighbouring streets were planned ont, but they were not completed until several years after. There is an engraved plan (dated 1719) "de-
sign'd and delineated by Jobn Prince" and "ingraven by Sutton Nicholls," which is entitled "A Design of $y^{e}$ Bnildings already begun in $y^{e}$ Right Hon ${ }^{\text {ble }}$ Edward Lord Harley and ye Right Hon. Lady Henrietta Carendish Holles Harley." In this plan the whole of the north side of the square is marked as to he occupied by one nificent Duke of Chandos, called by lis contemporaries the Grand Duke and the Princely Chandos. The scheme was not, however, carried out, for the duke died of a broken beart, caused by the death of his infant heir while being christened, in the midst of the greatest pomp
and magnificence. This side of the square was and magniticence. This side of the square was
still unfinished in 1761; for at that date, we read in Dodsley's "London and its Environs," "In the centre of the north side is a space left "In the centre of the north side is a space left
for a bouse intended to be erected by the late Duko of Chandos, the wings only being built; however, there is a handsome wall and gates before this place, which serve to preserve the
aniformity of the square." It was at first intended to place a statue of Queen Avme in the centre of the square, and in the plan ahove referred to this staulue is marked; hut the scheme was not carried ont, and the site remained
vacaut until 1770 , when the leaden equestrian vacaut until 1770, when the leaden equestrian
statue of William Duke of Cumberland, "the statue of William Duke of Cumberland, "the
hutcher of Culloden," which has lately heen hutcher of Culloden," which has lately heen
taken away, was erected by General Strode. The statne of Lord George Bentinck, some time leader of the Conservative party in the House of Commons, at the south side of the square, opposite Holles-street, was set up soon after his death, in 1818 . The square was formerly en-
closed by a dwarf brick wall, surmounted by heavy wooden railings, and these wero allowed to decay, so that in 1761 they made "but an indifferent appearance."
Harconrt House, the large mansion on tho trest side, was huilt by Lord Bingley, tbe foundation.stone being laid in 1722 , and was purchased had previously huilt a bouse on the east side of the square. It was afterwards hought by the Dake of
hahits it.
Annong the celehrated inhahitants of Caven. dish-square may he mentioned Lady Mary
Wortley Montagu; Princess Amelia, daughter
of George II.; Geiorge Romney, the painter of such oxquisite portraits as to hecome a dangor ous rival to Sir Joshua Reywolds; Marshal Beresford ; Matthew Baillie, the fashionable "Ahysician; and Thomas Hope, the author of "Anastasius," The Princess Amelia', was the the
large honse at the corner of Harley-street, after. wards inhabited by Hope and Watson Taylor Romney was always referred to by Reynolds as the man in Cavendish.square." The house he lived in had heen previously inhabited hy Mr. F. Cotes, R.A., the portrait-painter, who built it,
and was subsequently rented by Sir and was subsequently rented by Sir Martin Archer Shee, P.R.A.
St. Peter's Chapel, in Vere-street, the fame of which must ever be associated with the late lamented Frederick Maurice, long its minister, was designed and built by Gihbs about 1724 . It was for some years called Oxford Chapel. William, second Duko of Portland, was married at this chapel, on the 11th of Jnly, 1734, to Lady Margaret Cavendish Harley. Rysbrack, the scnlptor, lived and died (1770) in Vere. street, on the right-hand side of the street going street, on the right-band side of the street going
from Oxford-street. Gihbon lived in Bentinckstreet: Martha Blount; Edmund Hoyle, of whist celehrity; Mrs. Piozzi; and Lord George Gordon, in Welbeck.street : Turner, the painter, in Queen Anne-street : and Sir Philip Francis in Harley. street, previously to his taking a house in St. street, previously to his taking a house in St
James's-square. Lord Byron was born in Holles-James's-square. Lord Byron was born in Holles-
street, and a tablet has been placed on tbe front of the house (No. 24) by the Society of Arts, to ecord the fact.
In the view of Hanover-square by Sutton Nicholls, dated 1754 , Cavendish-square is shown as standing almost alone to the north of Oxford-
road, and surrounded by fields, with an unroad, and surrounded by fields, with an uninterrupted view of Hampstead and Eighgate. At this time Harley-street extended very little way to the north, and Harley fields were resorted preach there Sands who went to hear. Whitefield huilt, and abont the fcar 1764 Portman-square was laid out and commenced. The north side was frat built, and it was nearly twenty years before the whole was finished. This square takes its name from that of the proprietor of the land npon which it was huilt, viz., William Hency who died in 1796 , and present Lord Portman. Orchard-street avd Somerset-street retain the memory of tho seat of the family.
The Portmans were a family of distinction in Sumerset, as early as the reign of Edward I., William Portman, Lord Chief Justice of England, wbo died in 1555 .
Portman-square was built on high ground, with an open prospect to the north, which gave Mrs. Montagu called it the Moutpellier of Frs. Montagu called is the houtpellier of bealth as since she came to live in it.". It is one bealth as since she came to live in it." It is one
of the largest and handsomest squares in London for its general effect, but the honses have no arohitectnral character. They were, however, built with dne consideration for tbe require. ments of the wealthy, and were inhabited hy a large namher of the "quality" at their first
building. In 1822 the following members of the nobility were living in the squaro:-Lord Clifford, Lord Teignmonth, Earl of Beverley, Lord Lovaine, Lord Kenyon, Lord Petre, Earl Manvers, Earl of Scarhorough, Duke of New. Nelson, Dowager Duchess of Roxh Cardigan, Dowager Countess of Clonmell, Dowager Conntess of Harcourt. In this same year Thomas Assheton Smith, lived gentloman, and the Right Hon. Hugh Elliot at No. 40 . Lord Garvagh, the possensor of the celehrated "Aldobrandini Madonna" of Rafiaelle, now in years.
The sqnare still keeps up its distinguished character, for it appears by the "Directory" that in the present year eleven titled persons ve in it.
M. Otto, the French ambassador, was living in Portman-scuare at the time of the short-lived Treaty of Amiens. Peace had long been wished signed at Lord Hawkesbury's office in Downingstreet on the 1st of October, 1801. On the arrival in London of General Lauriston, first fications, he was greeted with entbusiastic cheers by a vast concourse of people. Some of the
men took the horses from his carriage and drew him to M. Otto's house with tumultuous expres-
sions of joy. A general illumination took place on the joy. A general illumination took place terest of Portman square centres in the dark hrick house standing by itself in a garden at the north-west corner, which was built by the once celebrated Mrs. Elizabeth Montagu (Dr. Doran's Lady of the Last Century"), and inhahited by her and her nephew and heir, Matthew Montagu. The house has remained in the family up one present time, when the lease, having fallen Rokeby has had to the ground landlord, Lord Montacu, who watched its progress with much interest. In the year 1781 she moved into wbat Mrs. Boscawen called her Chor pal Puto woal six years after the death of her busband, Edward Montagu. Mrs. Montagu was a woman of great note in ber day, but her fame had died away, until Dr. Doran a few months ago revived it hy the publication of some of her letters under the title of "A Lady of the Last Century". Witb the belp of this interesting hook we will now note a few particulars of Mrs. Montagu Yor 1720 . Soninson was horn a York in October, 1720. She was a lively girl, loving fun and pursuing learning, so that the Duchess of Portland nicknamod her La petite
Fidget. In Angust, 1742, she married Edward Midget. In Angust, 1742, she married Edward Montagu, M.P., a mathematician of eminence, and a ooal-owner of great wealth, after which
event she became more sober, and told her. friend the Duchess that her fidgetations were much spoiled. She became a power in the literary world, and was one of the chief leaders of the Blue Stockings. Her house in Hill-street became a favourite resort of statesmen, poets, and wits, and the young aspirant for fame felt tbat he had his foot on the first rung of the adder when he was invited to her table. Dr. Johnson thought Mrs. Montagu excrted more mind in conversation than any person he over met with, and he said that in conversing with her, "you may find variety in one." The perfect being than Mrs. Moutaru, and Edmund Burke was incbned to agree with hin. Hannah More descrihes her as having "the sprightly vivacity of fifteen with the judgment and experience of a Nestor" ; and Cowper, when be had read her "Essay on the Genius of Shakspeare," no longer wondered that she stood "at the head of all that is called learned." Edward Montagr left his wife a widow, after thirty-three years of married hife, well provided for, with 7,0007 . a year, and sbe soon afterwards entertained thonghts of leaving her old house in Hill-street. The building of the new houso in Portmon. quare was a constant source of pleasure and square was a constant source of pleasure and
interest to its owner. In one of her letters Mrs. Montagu says, "I will get the hetter of my passion for my new honse, which is almost equal that of a lover to a mistress whom he thinks very handsome and very good, and such as will make bim enjoy the dignity of life with ease"; and in another she writes, "It is an excollent honse, finely situated, and just such as I have
always wished, but never hoped to lave." The always wished, but never hoped to lave." The
satisfaction did not wear off, for we find her fterwards writing "I am a great deal younger, think, since I came into my new bouse, from ts cheerfulness, and from its admirahle con. veniences less afraid of growing old. My friends and acquaintances are much pleased with it." in this last particular she was quite correct, for Valpole, who was not over-prone to praise the hobbies of others, wrote as follows to Mason :On Tnesday, with the Harcourts, at Mrs. Monagu's new palace, and was much surprised. Instead of vagaries, it is a noble, simple edifice Magnificent, yet no gilding. It is grand, not tawdry, not larded, embroidered and pomponnod with shreds and remnants, and clinquant like the harlequinades of Adem, which never let the eye repose an instant." In 1781 Mrs . Montagn moved her farniture from Hill-street, and three years previously she had "bought a largo glass at the French ambassador's sale, and some other things for my new honse, pretty cheap." One of the rooms in the new house was ornamented in a novel manner with "feather hangings," and Mrs. Montaga begged all sorts of birds' feathers from er friends. She tells one correspondent that "the brown tails of partridges are very useful, tbough not so hrilliant as some others," and nother she asks for "the neck and breast eathers of the stubhle goose. Things homely and vulgar are sometimes more nseful than the olegant, and the feathers of a goose may he better adapted to some occasions tban the plumes
of the phonis." Cowper wrote some lines in
of tbe phonis. Cowper wrote some lines in
1788 on this unique room where Mrs. Montagu beld her court, commenening as follows:-

## The birds put off their esery hue <br> To dress a room for Montagu ;

The peacock sends his hearenly dyes,
His rainbows and his starry eyeg
The pheasant, plumes whict roupd infold
His mantling neck with downy
His mantling peck with downy gold;
The cook his arch'd tail's azure show;
All tribes beside of Indiau name,
That glossy shine or vivid fame,
Where risen nad where sets tha day,
Contribute to the gorgeous plen,
Proud to adrance it all they can
This plumage neither daghing ahower
Nor blasts that shake the dripping bouer,
Shall drench again or discompose,
But serencrid from every storm that blows, It boasts a splendour ever new,
The Blue-stocking gatherings did not much lurive in the new house, for mauy of their chie supporters had passed away; Mrs. Montagu' breakfusts, however, were contioucd, bat the became more sumptuous and the rooms were often overcrowded. In 1788 Mrs . Montagu adopted a fashion introduced from France hy he Duke of Dorset of giving teas. Three year before Cumberland had writton an essay in the Observer on the assemhlies at Montagu House, in which he lightly satirizes the hostess as Vanessa, and her assembly as the Feast of Reaso Cowper afterwards moro politely wrote:-

There genius, learning, fanct, wit,
Their ralled plumage calm refit."
In 1500 Mrs , Montagu died, and many moumed he loss of "an affectionate, zealons, and constan riend, as well as a most instruetive and pleasan companion." She was snceeeded by her nephew Matthew Robinson, who, on being made her heir took the name of Montagn. There is an amusing anecdote in Wraxall's "Memoirs of his own nau's name after conford the House of Commons. Tbere was some difficulty iu distin guishing between Matthew Montagu aud Montag tatthew nntil "General Mattherr himself cefine the distinction. 'I wish it to be understood, said he, "that there is no more likeness between Montagu Matthew and Matthew Montagu than between a chestnut-horsc and a horse-chestnut.'
TVe have hitherto only mentioned tho house but the garden that surrounds Montagi House has a history as well. Mrs. Montagu made practice of colleeting together tho little chim-aey-sweeps of London every May-day, an iring them a treat in her grounds, as she said hey should at lenst have one happy day in th year. After her death the Turkish ambassado ccupied the house for a timo and orected kiosk in the gardens, where he smoked in state surrounded by his suite. The house itself has ust now been enlarged in the pery worst atyle of London street arehitecture.
The two squares to the north of Portman quare do not doserve the name, as tbey are uniformity. They are fortunately out of th way, and few people see them. Dirs. Montaru' name survives in Montagu square, street, and plnce: and Bryanston-square takes its name lince ; and Bryanston-square takes its nam Portmari family. In 1890 Queen Coroline, Portman family. In 1820, Queen Carolime, on her return to Eagland, took up her residence fo short time in Portman-street as the guest o Lady Anme familon, her lady or the bed Sheridan, who made it his frst London residence herian, who rade ith fter his marriage with the beautiful Miss Linley. H

## Duenna."

解 man-square, on a site that had previonsly heen proposed for a sqnare with a church in th centre, to be called Queen Anne's-sqnare. Th round, after lying waste for a time, was pur chased by the Dake of Manchester, wbo cora menced hailding the large house on the north side of tho square in 1776 . In 1788, on the sudden deatb of the duke, Manchester House Was purchased by the King of Spain as a residonce for his ambassador. It afterivards became the property of the Marquis of Hertford, one of the friends of George IV. when Regeut, and tbat prince made a daily practice of catling at the house in his incog. carriage, a practice to whichTom Moore refers in his "Diary of a Poli-tician":-

Through Mauchester-square took a canter just now,
3 set the old yellow chariot, and made a low bow."
Tbe marchioness was the great attraction,
and Moore, in another place, introduces her into "Or who will repair

```
Or who will repsir
    And see ic the lovely Murchega be there?
    Or bid ber come, with ber bair durily flowing 
```

    Manchester House was for a time ocenpied as
    the French embassy, and Talleyrand lived there.
    It is now being enlarged for occupation by Sir
Richard Wallace, the son of the late Marquis of
Hertford. William Beckford, the magnificent,
once notorions as the proprietor of "Fonthill,"
and author of "Yathek," lived at No. 12 in the
square in 1829.
Duke.street takes its name from the Duke of
Manchester, and Hinde-street from Jacob Finde,
a lessee of part of Marylebone Park in 1765 and
1772

Here we must bring to a close our notice of hree of tho eighteenth-centnrysquares, which on their first building were considered to be at the extreme limit of the tomn, hat are to-day in the very centre of London.

PERSEPOLIS AND THE PERSIAN KING OF TO.DAY.
IT may often have occurred to some that the aistory of the world might he, not a little instruotively, divided into two eras or divisions: the one, wherein each separate nation or tribe with a distinct language, mannors, and individuality, did its own work in its own way; aud seemed to bo bent on resisting to the uttermost all attempts at amalgamation with other nations, or, as wo should say, to protect itself against all help and reciprocity of ideas. In short, to keep itself to itself, and to bo its that made therld. It was this idea of isolation were, and such as history has recorded. In these modern days those old ideas are being completely reversed. The nations of to-day, however isolated, seeb, as a general rule, to give and to take; and there is hardly now left a single nationality, uot exceptiug even Japan, whole world beexing to interchange with the universally levelling process is at pork all the world over, and a system of things, the absolute reverse of the old way of work, from which all our art "precedent" is taken, is and must be ject is well woith a little cogitation, and a few words about it may interest a reader bere and there. In a few weoks' time there will come to see London, for the first time in the world's history, the living representative of, in old earth. Talk of historic fame potentate on lineare in these morern lays! Why ancestral nothing to it; all are comparatively of yoster nothing to it; all are comparatively of yestcr. from, and can more or less rividly from, and can more or less vividy realise to our. tbe tben sy tern of thincrs. But here place in appearance of thor ape pearance of the dead past in the very present, things could be. Nothing it is erenow sucb things could be. Nothing, it is certain, in the antique history ever surpassed the strange posi. him was to eatch sight of a present deity, to hy from bim was impossible, and to resist his power equally impossible. It was the very romance, far more so than iu old Egypt, or imperial Rome,-of concentrated power and empire. But we must not dwell on these fancies witbout a practical and arcbitectural purpose. For 80 peeuliar a state of things as existed in the old Persian monarchy it was necessary that there should be the material and artistie means of working them out, and of dis. playing them; and it is here that the subject becomes practically interesting.
In these modern days, when to come and to go is so easy, it has come to pass that tbe same sort of "apparatus" is common almost every. where. A king's throme, for instance, is at hest hut a state armchair, pretty much alike every. where. In London, Paris, Vienna, it is tbo same thing, a grand piece of farniture, and which might have been made in either of these cities in any workshop; for, wherever manufactured, it would equally answer its purpose. And the same may be said of tbe huilding, or room, in which it is placed. All is in process of being made atike after one pattern, -even kings' thrones, and the rooms they stand in. But in ancient Persia it was necessary to do But in ancient
for the purpose, and it was this necessity that gave birth to the vast masses of architecture Wbich are jet to be soen in the ancient eapital, we have but feeble records of these great works, and but little idea of what they were, or looked like, when in their primitive and perfect state. In Sir Ker Porter's book, and in the more elabo. rate work of M. Coste, may be gathered a good desl that is interesting, but not enough, by a long way, to enable any one to realise the old idea. These rxins, almost like a scene raised by the wand of a magician, stand on a. vast platform, level, and raised from the general surface of the surrounding country. They consist of tall columns and remains of walls and doorways, not a little difficult to make out and to restore in the mind's eye. The whole of the roofing is utterly gone. It was probably of wood. The main snpporting beams, from colunin to column, certainly were; but in all probability tbe main and leading idea was that of vast tents, wherein lanyings of some kind or other were a most important and striking part of the work : indeed, it was the idea of a tent solidified, so to speak, and made "arehitectural." The contral iden of the whole was to provide a thirone, and its covering, and a platform on whicb it migbt might be risible to the multitudes gathered together before it and at the foot of it on the surrounding plain, and so that these multitudes raight be visible to the great king when crowded together before him, it is this peculiar architectural arrangement which enables us to realise, to a certain extent, the idea of the vast multitudes which at times were gathered together before the throne of such mighty potentates as Xerxes and Darius, when the individual was everything, the multitnde nothing...a position now, fortnnately, much changed, All that we have spoken of is, indeed, to a certain extent proned by the sculptureg which remain and of which apecimens hrought here by Sir Ker Porter may be seen in the British Museum. These sculptures are not fanciful and invented things, he it observed, but simple copies in stone of the real men and their ways, as they were visible at the time to tho eye of the copying sculptor. The suleman and immovable guards portrayed in stome on the sides of the great flights of stairs which lod up to the platform on wbich the throne stood are really nothing more nor less than the portraits of the men who stood, on state occasions, on those stairs, so that we may yet see a little uto the mystery of this great act of state and visible empire, as it once existed. All this may in realse, wind found pages or M. Coste's book, and will be cound not a little striking and singestive, when compared with some other of the plates repre. senting things as they yet are at Ispahan, one the moderu capital city of Persia, aud wherein the throne arrangoments are almost a copy, although on a smaller scale, of the grand and magnificent works at Persepolis,-Istaker, in the land of dreams! The visit of the modern Persian kiag, the successor of the great king of a remote antiquity, makes these things of poetic
interest. That sueh thinos as tbese should bave at the prosent hour any not a littlo hour any livin rode and doings are leavig all ways far behind tbem. To.day reads and dreams of them, but "mproves" them well out of existence.
It may be usefnl to give a few details of this uniqne palace, and its arrangements, bearing in mind that the ceutral idea of all was to provide covering for a throne, and a suitable tent.ike a brilliant court. But the main thoucht was, and it is necessary to bear this in mind,-to provide a throne, so placed that the greatest possible nnmber of human beings might see it and its ocenpant at the same time. For this purpose it was raised on an artifieial, or partly artiticial, platform, three sides of whieh are separato bloek of building on it wonld seem also to havo had its separate, thougb lower, platform on wbich it stood. There were two distinct fights of steps or staircases, the frst leading to the lowest platform, and to an entring colossal materny, flanked by the mell.known winged human headed bils. This arrangement is extremely incenions for those ascending the preat donble-fliphted stairease most need have tnrned to the left, and then again to the right, hefore finding themselves in front of tbe gato way, and with the second staircase, with its double fligbts of stairs, before them. These
stairs led to the second great platform wbereon tbe throne itself stood, in a hall, or pavilion, a sort of tont-like arrangement, fancifully
restored hy M. Coste, supported by thiriy. six columns, six on each side. In the centre of this columued hall the great king's throne was
placed. It would be impossible to derise anyplaced. It would be impossible to derise any-
thing more tborougbly well adapted for its thing more tborougbly well adapted for its purpose, or more artistically arranged. It may help to show what architectpre con do when help to show what architecture can do when it has to meet an idea, and to supply a practical want, that want being first well defined. In these days kings mast go forth to meet their people; in old Persia, the great king came
to the door of his palace, literally, and his people in their multitndes camo to him.
We have not space to descrihe over so sbortly the reat of the buildings on this strange and romantic spot of the earth's snrface; it must suffice to say that they are the remains, without nected topether, each with a separate purpose, to accommodate the king and his multitudinous court. Bnt the idea was, and it is that which guided the whole arrangement, to provide a raised and wisible throne for the "King of kings,' as he named himself, "and Lord of Asia." Anc what makes all this more than ordinarily inte mere dead antiquity, a thing wholly of the past. mere dead antiquity, a thing wholly of the past.
It is in trath more or less yet living, not a little altered in details, but still a living reality. the Print Reom of the British Muscum may seen, hy tho very curious prints and evidences or paper, the persistency with which things in the
East continue and repeat themselves from age to age. In these records may be seen represen tations of the court of the great king's successor and curiosity lad done more than ind iscovences existence of matters so remote from itself. In these records may be seen the Sophi of Persia surrounded by his oouxt, hy the princes of his family, his prime adviser, his captain of the guard, and a whole multitude of retainers, diminished as to numbers when compared to the
Darius and Xerxes days, but still there in form Darius and Xerxes days, but still there in form and idca. It is in all probability the same to bis day, and the fact makes the coming of the Persian shab to London city a subject of no small a reduced scale, and with many short-comings, acts out the part of the antique Persian of is to he removed so many centuries from himaself and the things which helong to him. Neve herore, it is ce
meet together.

GLASS MAKING IN THE MDLANDS. THE glass trade appears to have heen intro duced into Stonrhridge 2 early as the year 1557 by a little hand of Hungarian refnrees, who side the town lnowes on an eminence just ont hill. Hennezel the loaders of theso the loaders of theso enterprising exiles, and i was dounless owing to their ingenuity that the existence or abundant freclay, adapted for glass. pots, together with the liberal supply of mineral the advantages offered by this district suggested portat descendants of the first-named Fnngarian, wh adopted the name of Ensell, established, and for some years maintained, a monopoly of the trade in the vicinity of Stourbridge. A local historian writing in the last centary, remarks,-"Broec glass has heen mado luere for several generations, ever siuce it was first hrought into England from Locraiu; and crystal giass has lont been made herc; but the art of cutting and engraving it was not long since hrought from Germany to London and from London hither.,"* In the year 1688 there were twenty-eight farnaoes in operaWilliam Sll theridge; hut in the reign of the produce of glass at the latter period wa, nearly equal to that of the former.

In tho year 1760 the glass mannfacture of the stourbridge district was in the hands of the following producers:-Broad glass and hottlos Grazehrook, Denbam; flint-glass, best ordinars Grazehrook, Denham, Bradley, Barrar, Rogers Honeyhourne, Russell, Little; phials, Pidcocl Goneghourne, Russell, Little ; phials, Pidcock,
Grazehrook, Denham, Barrar, Rogers, $\dagger$ Russell * Schinner, a foreigu artist, was the first successfu:
engraver of glass at Stourbridge, A.D. 1660 . $\dagger$ This nas a grandturther of Rogere, the poet.
and Honeybourne. In the year 1789 the names of Bradley, Ensell, Grazobrook, Hill, Waldron Scott, Kier, and Jones were mentioned in Tun, nicliff's survey of the principal manufactures The name of Bradley was associated with the Stourbitge glass trade as early as the yca 1691, and thero is bitle doubt that Bradley Hall n ancient half-timhered mansion, near kings winford, was originally the homestead of this ramily. Tbe production of glass, however, up a comparatively reoent period, lacked the advantage of scientific enterprise which had long before heen applied with success to
leading industries in the neighhourhood.
Ahout the year 1830, Mr. Benson, of Dudley, and Mr. Dovoy, of Stourhridge, successfully introduced the application of steam power the cutting and grinding of glass. The repeal of the glass duty in 1815, produced for a time considerahle increase in tho number of the smaller flint-glass honses known as "cribs" but the present teudency is in the direction of concentrating the businees in the hands of a few extensive factories.
In the Stourbridge district (which includes Amblecote, Wordsley, and Dudley) there are now the following glass-works:-Flint-glass, 10 ottle-plass, 2 ; plate-glass, 1 ; total, 13. Thes establishments at present afford employment to 1,200 men, 150 women and girls, and 350 hoys The sand used in tho manufacturo is almost exclusively obtained from Fontaineblean.
Cast plate-glass is produced at Smethwick the works of the Birmingham Plate-glass Company; crown, sheet, and rolled plate-glass at the gigantic establishment of Messrs, Chance Brothers, \& Co.; and at Stonrbridge, by the Stourbridgr Glass Company (Limited). In 1838, Mr. Robert Lucas Chance successfully introduced the manufacture of Bohemian sheet glass into this district. The process of grinding and polishing sheet-glass was perfected by Mr. James Chance, and the glass thus manufacture became known as patent plate. We are indebted to a report hy an eminent member of this firm for tho following record of improvements in he glass tra

1. Tho suhstitntion, ahout tho year 1830, of carhonate of soda as the alkaline ingredient in glass in tho place of kelp, and subsequently for place of carbonate

An incroase in the size and improvement tables prodnced

An improvement in the colour of the glass hy the use of purer materials and modifications in the process of melting
ements in the flatteniu fheet-glass, resulting in the removal or diminuion of many imperfection.
plitting cylinders in the place of the process of plitting cylinders in the place of a red-hot iron. 6. An increase in the size of the molting-pots and furnaces, with the view of economisiag cool and lahour.

The adoption, in the casting of plate-glass of varions mechanical contrivances. The origin duo to tho prosent manager of the Birmingham Plate.glass Company
8. The use of the same pot for the two pro cesses of melting and casting plate -glass superseding the old method of transferring the contents of the melting-pot into the vessel used for casting.
9. The substitution of small coal or slack in the melting processes in the placo of the large coal or lumps.
10. The application of Siemen's regenerative process to the melting of glass, hy which the mount of smoke is greatly diminishod, the colour or the glass is improved, a greater 000 of fuel is effed over the furnace, and a saving can he efrinsted wherever hy this process slav These advantages are to some extent counter halanced hy the increased cost of the furnace and its increased liahility to got out of order. The process, however, as applied to glassmaking, is so new that there has been scarcely time as yet to overoome the difficulties which have presented themselves,
Messrs, Cbance are widely known for the pro duction of dioptric apparatus for lighthouse Ilumination. Mr. Alan Stevenson remarks:apparatos for a consists of a central bin or the hollow cylinder 6 ft t. in diameter, and 30 in, high ;
below it are six triangnlar riners of glass rangell thirteen cylindrical form, and abovo a crown of hollow eace of glass, forming by their union a high and 6 ft . in diameter I know of no work of art more beautiful or creditable to the bold. ness, ardour, intelligence, and zeal of the artist." More than 100 of these dioptric ligbts hava aready been produced by Messrs. Cbance, for almost all parts of the world.
With reference to the three firms mentioned, the following statistics may he given to show the extent of their aggregate husiness :-Wages paid yearly, 120,0002 ; coal used, 165,000 tons sand, 10,000 tons . alkali, 4,500 tons; chats limestone, 3,500 tons; glass produced, 17,000 tons ; workmen employed 2,500 .
The industry is and has for some time been steadily increasing in this part of the country. With reference to the various qualities of prodnction, it may be well to quote from the official report of Mr. George Wallis (South Ken. sington AIuseum) on the glass shown in the Wolverhampton Exhihition of last year:- "Tho prodnctions of the origrinal seat of the class trade in Eugland,-Stourhridge, -were so tho roughly represented hy Messrs. T. Wehh \& Sone that it is scarcely a matter of regret no other mannfacturer contributed, since this firma corried ont the representation of decorated and tahle glass in a most effective manner. The forms of the articles were all well considered, and thoroughly adapted to the use of the vessels. The details and decorations, whether ongraved, cut, or blown on, give evidence of tho most perfect matery over the material, and a distinct perception of the hesu art qualitice, as well as wbon to stop in thomatter of decoration,-always a most difficult point to attain. Some of the specimens of Hasbed 'glass were very delicate, alike in forra colous, and detail of ornamentation. It wonld he very difficult to particularise, were it desirahle to do 80 , where everything presented com. mendahle features, and it is snfficient for the present parpose to say that in no previons Exhihition has there been so perfect a display made by any one house. It is needless to remark on tho quality of the metal or its purity of colont since in these respects it is all that can be deSociety of Arts, on the glass at tho Paris Exhibition, remarks on the products of Alderman Copeland, that his dessert-dishes are beantiful in colour and richly out. His claret-jugs and vines are executed in a very fine style of workmanship, and of a superior colour, which is much enriched hy. cutting. This practical authority further adds :-"Wo in England are making straw-stemmed wine-glasses from 1 oz to $1 \frac{1}{2}$ oz., whereas the foreigmers make thei ightest wines about 3 oz ., using twice the weight of metal that the English workman does. myself (working on the borders of Staffordshire) have made an antique jng 10 oz , in weight, Which is capable of holding an imperial quart. I have seen no French or foreign work so light English maters" Thers makers makers. The Staffordshire glassiderale undonhtedy shown or lavo con their wares. material they are certainly unsurpassed. The Venotian style is ahly executed, and denotes a clear conception of the original, asthougb it must oo confessed that in the mimute details it is all done by hand. In the suhtle combination of the utite with the dulce, the Staffordshire and other English glass-makers are foremost in the race of rivalry.

Property in London.-A large hlock of property, having a frontage of 110 ft . in St. Mary $A x c$, and 81 ft . in Camomile-street, has heen laid out for the erection of five warehouses of whicb four will he at present huilt, covering an area of about $8,800 \mathrm{ft}$. This has been taken of tbe Skinners' Company hy a City merchant, vho intends to dovelop a class of huilding specially convenieut for tradinr pnrposes. Mr Chatfeild Clarke is the arohitect. The followine tenders have been oubmitted :-Messrs. Myers is Sons, 12,987l. ; Mr. Hipgs, 12,378l. Mr Braнs 12,365l. : Mr. Conder, 11,993l. Messrs. WiI liams \& Son, 11,8742. ; Messrs, Axford \& Whil lier, 11,7002. ; Messrs Ashby \& Sons 11,559 Mr. Hart, 11,470l. Mesor © Downs \& 11,290t.; Messrs. Merritt \& Ashby, 11,099l. Mr. Pritchard, 11,094l.; Messrs. Newman \& Mann, 11,065l. ; Messra. J. \& F. Goleman,
11,037l. ; Messrs. Browne \& Robinson, 10,880l.

VILLA RESIDENCES, CRYSTAL PALACE PARK ESTATE.
In the session 1868.9, the Crystal Palace Company obtained an Act of Parliament authorising them to grant leases, for a period of ninety-nine years, of certain outlying portions of their freehold estate for the erection of villa residences.
Tbat portion of the estate abutting upon Laurie Park and Sydenbam, on the south-east, bas already been let, and a number of good residences are now in course of erection upon it. Our illnstrations show tbree of tbese already finished, as fair specimens of the whole, the others heing of similar character. Wben complete, tbey will form a picturesque fringe of gabled bouses bounding the freehold estate of the Company,
Tbe bouses are all faced with red hrick, tbe windows and othor dressings are of Bath stone, roofed with green Whitland Ahbey slates or Staffordsbire tiles.
Tbe examples illustrate (No. 3) a bouse huilt for the late Dr. E. L. Bryan, at a cost of 3,550l, ; a smaller house (No. 2) built for Mr. James Hendrey, at a cost of 2,2002 . ; and a third, built for Ceneral Bayly, at a cost of 3,3466 .
These bave been designed and superintended hy Mr. John Norton, the architect to tbe Crystal Palace Company's Estate.

OHUROII OF HOLY EVANGELISTS, BAYENO, ITALY.
On May list, a churcb erected at Baveno, on the Lago Maggiore, at the solo cost of Mr. C. Hedirey, was opened for divine service hy the Rigbt Rev. Dr Nixon, lately Bishop of Tas. mania It is in tbe late Byrantine style, with a few Lombard features. The plan is octagonal, ike that of San Vitale, at Ravenna, with an eastern apse and north and south porches. Theso porches have granite columns, resting on lions sculptured in white marble, as at Cenoa, Ancona, and Trent. Tbe walls are constructed of grey marhle and reddisb gramite, in alternate courses. On the sides of the actagon not occu. pied by the porches or the apse there are triplet windows, witb black marhle colonnettes, the base and capitals being of white statuary marble. Tbe same arrangement exists in the clearstory.
In the interior there are eight monolithic columns of granite, witb grey marhle capitals and bases. Every part of the interior is covered with ricb decoration, the roof and upper part of the walls with elahorate patterns in positive colours, executed in tempera and oil, the lower part heing lined with slahs of green serpentine, rosso di Levante, and grey marhle, from Carrara. Tbe pavement is of that sort of mosaic known in Italy by tbe name of "Vene. ziano," and a tolerable imitation of tbe parement in Byzantine cburches,
In semicircnlar spaces over the doors there re two mosaics, representing tbe Nativity and the Cracificion, These and the reredos, hich hos ceometrical patterns, wereexecuted by Salviati, of Yenice
The windows are all filled witb stained glass, by Messrs. Clayton \& Bell, in their hest style. The lectern is of brass, hy Mesars. Cox \& Co., of Soutbampton-street. The church and its decorations were designed by Mr. R. P. Pullan, and carried out by Italian workmen, witb the two ast-named exceptions
Tbe churcb, the dedication of which is to tbe Holy Evangelists, is situated in the grounds ad. oining Mr. Henfrey's mansion, on the finest part of the lake, opposite the Isola Bella, and is a conspicuous object in approaching Baveno from Pallanza or Stresa.

ARCH $A O L O G Y$ IN FRANCE.
THe reneral assembly of delegates of the learned Societies of France recently met at the Sorben of France recently met ab Simon Minister of Public Tnstruction. Assis. tanco to Archæological and Historical Societies was rendered as follows :-
Pour la section a'histoire et de philologie, un prix de , C00 fr. ₹ été décerué is 13 Société archéologiqno de Montpallier $; 1,000$ fr. is la Socí́té archéolosique de
Touraine; $1,000 \mathrm{fr}$. à société de l'Histoire de Noursine;
Pour las section d'archéologio: Société archéologique de Lorraine, à Namey, $1,000 \mathrm{tr}$; Société d'Émulation dn Donbs, Besaçon, $1,000 \mathrm{fr}$; ; Société ćduenne, ia Aaturs,
$\mathbf{1}, 000 \mathrm{fr}$.

THE ARCHITECTURE AND ART OF THE Present.
Sir,-It is a singular anomaly of our existing modes of art that our artists-especially our ar chitects-should possess so little confidence in
their own inventive capabilities, aud, with a their own inventive capabilities, and, with a
questionable devotion to art, pin their faith to precedents and types. This very indirect means of acquiring success, if it wero not also the most fashionable, heing pursued by the leaders of architecture of the diny, conspicuously our cburch architects, would be lookod upon as a verystrange procednre if applied to any other scientific pur. suit or art. The medical practitioner would little dream of referring to past methods of cure without knowing the diagnosis of the patients, nor would he consult old doctrines on pathology or therapentios in preference to modern experience. of his science at a remote age. He demands the latest results and experience. Again, ancient models of the poetic art exist and excite onr ad. miration; but what would be the result if onr modern attempts were hat the reprodnced thoughts and sentiments of them? Translations and copies are known and appreciated as such; we do not demand originality in them, hut in on.
modern art we ask for at least such a measmre of modern art we ask for at least such a measure of
skilful adaptation, if not invention, as will at any skilful adaptation, if not invention, as will at any
rate place our works in the rank of a fine or liberal urt, and not a mechanical one, which is simply skilled reproduction or repetition. Do simply skilled reproduction or repetition. Do The answer is ohvious to all candid observers Take our cburel architecture: what is it bat the art of reproducing, if not the letter, the types, examplos, and sentiments of a Mcdiaval poriod? Our most costly churchcs are, with few excep.
tions, Mediseval in their idea, their arran tions, Medineval in their idea, tbeir arrangement,
aud their ritual. They are simply modelled after and their ritual. They are simply modelled after
our old eathedral types, in which the avenue system of arrangement, with all its drawbacks, prevails.
There is no notion of altering this planso long as a fictitious ritual is required, though it is manifestly false throughout,-false for the pur. poses of a Protestant church, false to tho idoa of congregational worship in the present day, and lastly, false in character and design. Tho most simple, and certainly the noblest mode of meeting the requirements of our day in the matters of church accommodation,-namely, that in otherwise, forms the leading idea,-is utterly or jected as unorthodox, if not heretical, and any architect who proposed such a plan would he condemned to ecclesiastical censure or quietly ignored. Chnreb architects are, however, not alone and foot to traditional custom. are tied hand writer in the Spectator ohserves, the an able writer in the Spectator ohserves, the clerical
body, as representative of the modern Chareh body, as representative of the modern Charch, past; and there is an immobility charm of the past; and there is an immobility characteristic of the Ohureh of the day which rejects all udvances, even at the risk of losing its prestige. that which howimater, is sadly out of accord with that which animates the Christian Gospel, whioh looked forward to a future, and everywhere
ignores the past and its crystallisation (if I may so torm it) of prejudice and custom. The immo. bibity of ecclesiastical art is only a reflex of this stubborn opposition to progress; though, as a class, hy no means uninfluential, our cburch architects for their own sake would do well to lead tho van to a more trnthful and progressive condition of their art.
Let as for a moment turn to secnlar architec. ture. Here a different aspect is presented. We discover a great deal of confusion, it is trne, yet anid all the discordant elements there are indications of thought and invention. In no other branch of constructive art do we find more originality than in our larto railway stations, factories, and hotels. However unpleasing they may often he througb their requirements and size, or however wanting in the agreeahle blend. to be fore useful and ornamental, there is yet design which indicate a though ful working out of the prohlem yet to be learned by our conven tionally trained artist,-namely, how convenour scientific knowledse, or how, how to utilise cconomy and our sense of the beadapt, with
sen the cconomy and our sense of the beautiful, the
materials at our disposal?
Sir Gilbert Scott's great work at the Midland Station, for example, is an illustration of this, true spirit of art, though they sometimes lack
its charms.

Another fact is forced upon us, that our mos succossfal works in secular art have emanatod from minds least trammellod by custom, or the conventional training of an architect's office; engaged, much of the success or originality aro be traced to the ideas of the employers, or their interference in matters of necessity. Every practical architect knows the value of many such a suggestion, however he may have spurned it at the time.
It is not difficult to adduce instances of this hoth in ancient and modern practice. Our masons, smiths; in fact, wero not engineers, architect's drawing-office; while some of our foremost modern buildings, such as the Albor Hall, and other works at Kensington, which attest both originality and adaptation of means, are the works of military men. Not a few of our greatest inventions in huilding and ant appliances are the worl of men least trarmmelled There is ant notions or customs.
There is unqucstionahly a tondency among the broressional class to run into grooves; quires som class interest is strong, and it requires some conrage and more mental superiority of fashion also hinder a trnthful followinces art. It is this wbich has operated following of against original thought in every calling, but more especially among architcets. Their oduca. tion, however, has done much to encourage a seatimental rather than an intellectual regard for their art. Tho writer docs not underrate tbe velue and importance of a studious course of historical example and precedent, from which a useful generalisation may be drawa. Liko reading, such stndy may become a stimulus to thought; but, like a course of reading, it should of fune after, never precode, the acquirement of fuadamental knowledge, and a due exerciso relatire facnlties. The mistake mado is in the and scientific and historical studies. oxperimenta order is reversed, —the accidontal or the proper sign and symbol of knowledge, heing ignorantly placed before the actual facts and meaning: As at present pursued, the student must be a prowhich is an impossihility and of thought, becomes a mere pedant, - a smatterer tberofore becomes a mere pedant, - a smatterer in a few and detail. His office training is confined to drawing and copying, as a rule, and his pnpilage is passed before a knowledge of the nataral properties of materials, or their connexion The consequence of suctly, is acquired.
The consequence of such an irrational mode of training is obvions. The mind, unacquainted with actual and practical knowledge of mate. rials and modes of construction, resorts to those ypes and forms which have heen orammed into regardless of any test or principle. Hence the designs which he makes are invariably the results of an ill-regulated process of comhining the conventional types of a past age, aidod by the imperfect experience he has gained of actnal requirement. The traditional custom and routine of his office,-which are generally his master's predilection,-are accepted without proof as an article of faith. From first to last an implicit and unquestioned faith is placed in precedent, and the architect who has the largest and most accessihle store of precedouts is the inost successfal, at least in one field of practice,-the ecclesiastical
It must be noted that this conventional train. ing leads to " draughtsmanship," or copyism, ather than to "design." Liko school educa. student is crammed classical attainments, the he nnderstands the properties and nses of there - a species of book leowm or thes or things vords and names becominer to the medinm or the ultimatum of knowems Tho regarded as ning with the "facts" orercise of the pereptire knowledge, and the is hurried through a series of thes, the student symholic language, without the required preparation.
Nature and pbilosophy, as well as the orolu mon of civilisation itself, point to a law of mogression, or a process of education which must he accepted, which Comto, Dr. Spurzheim, herbert Spenser, and a host of our foremost thinkers of modern timos have laid down and are elaborating; a process to which modern art and religious tbought carionsly stand, forsooth, process indicates a gradal erolution from the
empirical to the scientific, the metaphysical to the positive, and from the simple and abstract to the complex and concrete
So long as it advanced in conformity to the abovo law, art was pre-eminontly original and tratbful; but directly it accepted the traditions of men, and an indirect appeal to nature, it faled. Ever since it has heen a dead and obsolete art.
G. Husisson Guileaive

## malgration of workmen.

SiR, -My anticipations as to the extent of the cmigration of our working people daring the present season have already received a striking confirmation from the returns just issued by tho Emigration Commissioners for tho port of Liver. pool. From these it appears that the numhers and nationality of those who left that port for the United States and Canada during the past month of April, ander Government supersision, were as follow :-English, 14,816; Scotch 750 . Irish, 6,232 ; foreigners, 11,025 ; total, $32,85,3$ of this number only 1,603 were cabin passengers leaving 31,250 as steerage passengers, all of whous may fairly bo assnmod to be workin people. In addition to these there sailed 561 passengers in "sbort ships," making a total of $33,41-1$ emigrants, being an incresso on the of sponding month of last peor of $3,80 \%$ from thi ne port alone. Twara nd Ireland contributed al sis and of Britain find that Miss Rye $-1,828$, and of these 1 party of serenty thee roine birls froada a party of seventy.three young girls from the ther places, there to be drafted off in, and familics of settlers, to be drafted off into tho thern, as a part of their families. Ladies who ind great difficulty in obtamining. Ladies who nd great difteulty in obtaining good servants ere, or, as in thoneighhourhood of manufacturing trenuously to thants at all, are ohjecting ver strenuously to this action on the part of Miss Rye hut that lady has very graphically shown, in recent letter to tho Times, that the fanlt, if ther he any, lies rather with the mistresses, who for the most part neglect to train such servants as hey have. In any onse, the girls are well provided for. But largo numbers of boys are being sent out also from our town refuges, \&c. A shor time since 1 had a conversation with an employe of lahour on this matter. He was excited. "Sif," he said, "I bave just received an application for a subscription from the managers of a boys refuge, for the purpose of sending a number of them away to Canada; and here 1 am unahle to get jupenile labour in sufficient quantity to do my work, and most of my neighhours are in th same condition. To send working people out of the country is almost equiralent to commer of suicide." Throughout the manufacturina tricts the same ory is raised everywhere with littlo result The emigration recs with douhtless, with advantar to the bocs on, but the girls in their new homes in the bool join and in the end becom their adopted country.

Another and much more important section of the great total mnst be mentioned. A second party of English tenant farmers from the sonth and midland counties to the number of some 180, have gono out to join the pioneer party on the Pacific railroad, at their pew sottle ment of Yoovil, in Nehraska. A notice the departure of the pioneer party is to be found is to is, to those who can soe, a "sign of the times." dissatisfied dissatisfied with their prospects here, and have, in the first instance, deputed their clergyman to select a spot for a new colony of English farmers in the midst of the praixie. This has heen done had the settement is taking prace.
But why are these people dissatisfied? Surely here neyer was a time when prices of all farm produce ruled so high as now. With hecf and mutton at 18. to 1s. 2d. per 1b.; huttor, 1s. Gd. to ls. 8d.; corn and hay above the average, farmers ougbt to be making money. But such is not the case with those who occupy small holdings. Why? Because rents are exorhitant Twenty-fivo to thirty years ago, in the south of England, land of fair average quality let at rental of 303. per acre per annum, even at a short distanoe from towns; hut now, in the neighhourhood of some towns in the West Riding of lorksbire, 4l. to $4 l .10$ s. is the sum paid. Lancashire it is even more. I have recently had case reported to me of a small farmer in had neighbourhood of Manchester raring 81 the acre for his land, hut being unahle to make both
ends meet, has recently given it up, and the land is absorhed in a larger holding. This state of things is donbtless the condition of the majority of those who have joined this colony, and many more besides, who are learing their native sol for our colonies and the United States, where they can become the possessors in fee simple o their own farms with even less capital than it has required to work rented farms in England. Surely this system of grinding depression is ons of national suicide, when it has for its result the depopnlation of our country.
"Far, far away, our children leaze the land"
If ever there was a timo in our history, when those heart.-rending lines of Goldsmith were applicable, snrely it is now :-

Tl fares the land, to hast'ning ills a prev,
Prinees and lordis msy flourish or may fade:
A breath ean make them, as a broath has made;

When once destroy d, can never be supplied
A time there was, ore England" grief began,
For him light labour spread har wholesome siore,
Juit gave what life required, but gave no more.
His best companions, innocence and heallth,
nd his best riches, ignorance of wealth.
But times are alter d, trade' $\theta$ nfeeling train
Usurp the land, and dispossess the swain !"
And trade, in spite of present appearances, will, unless properly regulated, lead on to the ruin of our country. The people must he called back to the land. The very root and foundation of all permanent national prosperity lies in agriculture. then, to then, to become so hlind to our national interests that we shall permit the tillage of the soil to wano an lands, ware for theix labours denied to them here? Surely for their labs surely time their own self interest, and urge upon the time their own self.interest, and urge upon the
Government and the conntry tho paramount importance of this great suhject.

PROVERBS FOR GENERAL CIRCDLATION As grest ability may be dissipated in the elaboration of error as would, by more fortunate direction, have ennnciated the truth.
Men may be perfectly competent to search after trith, and yet strike into the wrong path. It should not be forgotten that the discovery of error is as nccessary as that of trath, and tha we perhaps owe as m

or their display.
If you have talent, and wish to try tho readiest way to offend, display your superior ability in conversation.
Of all government, that of the tongue is the most difficult.
Beware of the man who is fond of pitting people against one another.
Avoid a contest if possible, for you can never e sure how a contest will cnd.
The parts of a trath often lie so wide asunder that it is difficnlt to attain to a full viers.
There would be a marvellons reformation if the world wonld only throw open its iron cates to Love.
Accuracy is the foundation of all good art. Art has little power to teach, hat it aithfol index of what has been taught.
There is wrong nature as well as right, hut nothing in the universe can be unnatnral.
The best art selects the best nature for
Tho hichest as the lowest art aims to be patural, but only at the naturalncss of the ideal the perfect, the heantiful.

## LONDON STATISTICS

Fross the annual snmmary of births, deaths, and causes of death in London, and other large cities, 187, we condense the following abyear year growing greater. Vienna and Berlin have vious and deplorahle, has remaincd nearly stationary since the war; hut the population amounted at the last census to $1,851,792$, and the capital of France is, after violation by a moh in the race of her enemies and of her own citiens, still the queen of continental cities. Rome is to he no longer a city of rains for poets to
sigh over, but the living capital of the Italian sigh over, but the living capital of the Italian nation, in sisterly umion with Florence, Naples,
Turin, Milan, and Venice. In no land, however, Turin, Milan, and Venice. In no land, however, are the cities greater than in the English empire. The cities of India are flourishing. The United States are emulating the land of their origin. But Eugland maintains its ascendancy; and her capital is the greatest the wera ever saw. Bahylon, Thehes, Home were uever so populous as London, which has now within its widest houndary npwards of four within the limits of the weekly tahles, $3,311,298$. Cities are the radiating centres of civilisation. And in English cities many economical as well as social advantares are enjoyed; these advan. recent years, othersiso the increase could not bave gone on, without their inhahitants exhibiting signs of deterioration, of which no trace exists in the returns. But there is a limit to the growth of every city. Some of the canons of the law of limitation are self. evident: a city, for instance, is limited by its watersupply, by its supply of food, by its snpply of fuel, hy its security from enemies within or without, by its powers of purchasing various reqnirements, hy the attractions it offers in competition with the attractions of other places, and tho prices at which these attractions can be parchased. Loudon, in the midst of other
centres, attrects and repels various kinds of centres, attracts and repels various kinds of
population in various degrees, and its resident
popalation at a given moment is the result or the equinarium established at that moment hetween the various conflicting forces.
The estimated increase of population in the year 1872 was 41,839 ; and the registered birth oxceeded the deaths hy 46,307 in registration London.

London, with impure wells and without sewers, was a city of plagues up to the seventeenth century, and was called in the eighteenth century one removal of impurities is now carriod ont to some extent, with the best effect; but aificulles inbe hrought into the field. Tbe demand, in truth, for nem methods of हaving and invigorating lifo is ns urgent as the demand for new imple. ments of human destrnction.
There is, physically, a limit to the number of people that can live on a given space; in crowded homes poison eoh the tin crowded homes poison can otber. the limit varies. London, unlike Venice, bas no practical limit of area. As far as houses are concerned, by adopting the system of vertical superposition in stories, so prevalent in the Continent and even in some tomns of Scotland, the oubical dwelling spres on the same area may he aucmented; but happily that system has not hitherto provailed in England. Lofty houses, throwing darls, damp sladows on the streets, each with a common staircase, hy which impurities are distrihuted to many families, however grand to look at, can scarcely fail to be nohenlthy to live in.
The population in England is less than one person to an acre of cround ; in twonty of the great towns of the United Kingdom the population to an acre is 29 ; in London within the limits of the weekly tables it is 42 . But the population is unevenly distributed ovor the London area of 78,080 acres ; for while, iu the large districts, the persons to an acre are in Lewisham, for instnnce, 5 , in Woolwich 10, Wandsworth 11, the proportions run up to 200 in Holborn, 219 in St. Giles's, and 237 in Westminster. In some of the suh-districts the density of population is still greater : in BerwickRtreet, Westminster (St. James's), in St. Andrew are 429,410 , and 418 persons to an acre. 150 are 3 , limit herd which the density of population limit heyond which the density of popuation yent in doner districts there bes been years; and in denser districts decrease.
Tho mo or the population to derease
Tho population has decreased in St. George's, Hanover-square, in Westminster (St. James's), and in Marylebone in all the central districts bout the Ciy, in Homorn, the stand, and st. Giles's; in Shoreditch, Whitechapel, and St. George's in the East-where the density, if we exclude the river area and th
the ahope standard of density.
That ahove standard of deusity.
That the Lnndon area is not yet covered is evident from the fact that if the whole area persons to river had a unpran o $11,301,300$. That such a limit will ever be onched is not prohable, as the difficulties of healthy hahitation increase with the numbers. It is a well-established law that, other things heing equal, the insaluhrity of a place increases with the density of its population, and that the evers generated in crowded dwellings have a tendency to spread among the whole of the popnlation. The State, therefore, while it has no right to prevent people in any numbers settling in or near London, has a right to prescribe such conditions of residence as are required in the interests of Puhlic Heal th.
What is at the present hour especially wanted is the hreaking down of the restricted barriers London, and the extension of mumicipal laid down in Sir Rohert Peel's Metropolitan Police Act, which seems to have taken the prospective increase of population into account. Any narrower boundary, while the population is increasing within the great circle at the rate of 75,000 annually, could only be temporary whereas it is desirahle to make the chance once for all or for at least the next hundred yerm And it is evident that within this limit the Aater supply the drainage the lighting the water reprlations and all other municinal居 trol of one manicipality, with a great adminisrator at its head.
If the whole of the people, amounting in 1871 If the whe of the people, amonnting in 181
miles, can be aduinistered for police purposes together in one community for tho purposes of local government, with the City for the centra point of its administration? A city is a cooperative society for the supply of common
wants; and as the police now diseharge the duties of defence whieh were formerly left to houselsolders and to parish constables, as common sewers carry away impurities whick w water light, gnd rid of hy each householder, so water, light, and perhaps heat, and force, to a certain exteut, may be provided hy a sound manicipal organisation.

## STRIKES IN GERMANY.

AT Westend, Berlin, the entire body of masons and bricklayers bave eeased work. They demand shorter hours, and, including the so-called "hlue Monday," two thalers (6s.) per day.
In Sachsenhansen, near Frankfurt-on-the. Maine, the hricklayers employed on railway now constrncting have likewise struck.
On account of a refusal to raise wages, the hricklayers of Harburg, and the carpenters of Zürich, ha
old rates.
The strike of the joiners at Hanau has been setticd
On the other hand, the journeymen joiners at Graz demand an increase of 20 per cent., an threaten to cease work in ease of non.com. pliance with their desires,

## ACCIDENTS

Fall of a Chapel in Whitechapel.-The German Church of St. Boniface, situato in Union-street, close to Whitechapel ehurch, has hoen deatroyed hy the falling in of the copper dome which covered the building. The chapol is now a com-
plete wreck. The hnildiug plete wreck. The haildiug was formorly a chapel. It was purchased for tho German Breaking of eight years ago.
Breaking of an Iron Casting at Oldham.-An aceident attended with fatal results has occurred near Oldham. Some workmen were making alterations in a cotton-mill at Butler Green, when an iron casting snapped in two and caused the floor of one of the rooms to fall in, carrying with it the workmen, two carding ongines, and ther machinery. One man was killed, and nother was sereroly injured. Falling of a Bridje and Temporary Inundation at Presteign.-On the 20th ult, the railway oridge over tho river Arrow, at a place called
he Forge, fell into the river. the Forge, fell into the river. For a year or more a branch line has heen eommenoed to conNect Prosteign with the Knighton and Great rosses the river at right angles, and the aborge ments of the bridge giving way through $n$ heary fush from tho provious rains, and possilly other canses, fell into the river, and suddenly inter ered with the conrse of the stream, thus cansing in inundation over a considerable district. The water surmounted the débris, and making new yourses on each side, flooded the cottages, garlens, and lands in various direotions. Cart vere spread over the fields, gardens, and roads. several days elapsed before the material could e removad from the river bed Foll of into its usual conrse -The foundation of at Bristol Floating Harbour, -The foundation of about 60 ft . of the quay Yall, botween Guinea-strect Lock and Prince itrect Bridge, Bristol, has given way, and an mmense mass of masonry slid down into the larbour. For abont a week the water had been
ant of the Float, and the wall thus lost a suppren The hreaking extends from the junotion of the new and old wall right to the corner of Guineastreet Lock. The linge mass of masonry seems o have fallow in one great block, seooping up ts clayey foundation and tho bed of tho harbour n its descent, and it now lies in a slanting posiion, with a mound of mud and clay over its . The mass looks strong and compaet, with anly ono or two fissures in it, and the coping itones are scarcely disturbed. The masonry varics from +ft . to 6 ft . in thickness, and in ts fall has tuken with it from 20 ft. to 30 ft. of
he earthwork at the hack. About 100 worl. nen are employed, nnder the superiutendence of Mr. How.red, the city dock engineer, in remor-
ng the debris, and taking measuros to prevent.
any extension of the damare. A coffer.dam will be constructed, and the wall rebuilt on a more eeare foundation.
Fall of a Scajold in Dundec.-An acciaent has oceurred in Dalfield Walk, Duudee, by which a number of workmen have hcen somewlat seriously injured. A hanse in that strcet is present undergoing repair, and, to enable the workmen to point the walls, a scaffold of plank "fas plaeed on what are tcehnically ealled "figures." About half-past eight o'clock the eentre "figure" suddenly gave way, and the whole scaffold, with fonr inen sitting on it, fell to the ground. The men fell on tho pavement and were very seriously bruised.
Oldham.-On Tuegday a chimney of a nes factory helonging to Messrs. Henthorne, whieh had partially given way, was heing repaired, when it suddenly fell, killing one of the work men. Two others had a narrow escape.

THE PURIFICATION OF SENAGE AT BRAMLEY WOREHOUSE.
The Poor-law Guardians for the Bramley Union having, a few months ago, decided to adont the process patented hy Mr. Fulda, of Leeds and Harrogate, for the treatment of the Ton, the mer new workhouse, at Armley Hill Top, the works considered neeessary by the patentee have just boen completed, and inspected. The apparatus reqnired for the process seems to he very simple. It has also the merit of being inexpensive, the cost of the plant, including tbree brick reservoirs or tanks, an agitator, and a two.horso engine, heing under
3201 . The plant has heen constracted under the direction of Mcssys. C. Nelson, of Leeds, the architects of the workhonse, and in accordance with Mr. Fulda's recommendations. Tho building has about eighty inmates, and the whole of tho seware is passed along drainage. tuhes into a rceeiving tank about 30 ft . long, 6 ft . wide, and 6 ft deep, at a point abont 150 yards from the sonnowest corner of the infirmary, from this "agitator" an adjoining shed, lime and solphate of soda in certain qnantities are mixed with it. The and both these tank, and again iuto a lirid. In carried on, and the process of precipassa into a watereourge at the corner of the estate, whence it flows throngh a neighbouring farm. At present there are not more than two or three water-closcts on the workhouse premises, the hnilding being principally fitted up with earth. closets. As it flows into the first tank the workhonse sewage is objeetionable enough, how. cver, but a sample of the efflueut water taken appearance to the water was almost equal in appearance to the water supplied for daily con. sumption to the people of Leeds. Mr. Fulda witbont or two gentlemen present drank of it witbont hesitation; but, although bright
appearance, a faint smell could be detected.

## RAILWAY ITEMS.

The Midland Hotel.-The Grand Midland Hotel forning the frontal to the extensiro terminus of the Midland Rnilway system in Euston-road, is now on the point of completion, and is so far ready use. The pisitors, that it has bcen opened for ears, and all wans have heen erected for some have long sinee disappeared. There are 250 public and private sitting and hed rooms. The prineipal apartments are decorated in a costly and artistie manner. Sir G. G. Soott is the arehitect.
Fares on the District Railway.-Large priuted plaeards have heen posted at the varions stations on the Metropolitan Distriet Railway anoouncing that a revision of mauy of tho fares on the line had come into operation, tho directors having heen compelled to take this step owing to tho high prices of coal and materials and the rigid manucr in which the Inland Revenueoffice enforeed the passenger duty on third-elass trains. The suddenness of the annomncement has taken the public who travel on the line by surprise, and a great amount of dissatisfaction has becn expressed. The fares now ebarged for ingle journeys are in many cases the same as The company, it may be rer the donble journey.
took advantage of the opening of the Exlibition, at South Kensington, to raise their fares, and this seems just to he a repetition of the dodge, not withstanding what is said about the rise in coal which has been a stalking-lorse to all sorts of greedy raisers of prices.
4 Ship Railway.-Gencral Hutebinson of West ward Ho! has designed a carriage for transporting ships by railway across the Istlimus of Caballos on the railway wonid connoct Puerto on the Pacific, a distanee of 168 miles. It has alroady been proposed by an ominent ongineer to transport ships aeross the Isthmus on earriages requiring curves of at least 2,000 fù. rank, which large circle would necessitate apon cattings. General Hutchinson improves would admit of 300 ft . radins, and this enable any Company to utilise the sisty-seven miles of railway already existing. The general's ingention embraces also an engine of immense tive power, as the lond to be moved mise tracquently weigh 2,000 tons, and $a$ novel method of fastening the rails. The engine would he farnished with numerous driving-whocls, worked hy piston-rods projeeting from hoth ends of eaed eylinder. Wonld not toothod rails and wheels in this ease really be requirod?

## IMPROVEMENTS IN DICTORLA PARK.

Several improvements of an important charaeter have just been completed in Victoris Park. The great lake has boen eleansed and reGiled with watcr, and advantare bas heen takcn of this opportunity to ereet a new oonoreto wall, with gratite coping axound it. All the unprotected portions of the lake have also heen fur nished with wireguard nettiog whieh, amongst other advantages, will prevent dog.washing and fivimming, a nuisanee which has for several Fears past heen considered a great sonrce of the islance. A further improvement consists in he islands on the lake having been re-eovered ing slopes greeu turr, as well as all tho surround. ing alopes. A number of now shruhberies have been planted, as also the orection of several ffect effect.

## COMPETITIONS.

Ohorlton.road Congregational Ohurch, Man-chester.-The design submitted hy Mr. II. J.
Panll, of Manchester and London (Paull Biekerdike), in ander and London (Paull \& church, hes, in a limited competition for this execution heen selected by the committee for which was crected adjoins the prosent chureh two haildings will twelve years ago; and the arcade. The will be connected hy an open 1,200 adults, and the presont buildince is to be converted into Sunday sohools. The stylo is English Gothic of the Geometrical period.
Great Malvern,-In a limited competition for the proposed memorial church at this plaee, the plans of Messre. J. D. Barry \& Sons, of Liverpool, have heen selected. Mr. Middleton, of Cheltenham, was consulted by the committee, to advise them in the matter.
the late sir willian tite.
Sir, -I have read with much pleasure and interest your memoir of the life and active eareor of my valued friend and preoeptor, the late Sir William Tite. Having been a school fellow, and afterwards fellow panil with Sir William's nephew, the late Mr. Arthur Green and with Mr. Steinmetz, whom I regret to have lost Bight of for many years, I ean confirm, from personal recollection, the aecount given hy the latter of Sir William's anthorship of the designs for the Royal Exchange. The dosign was in a very incomplete state when I first joined the office; and while I was there the working draw ings and details were prepared with the able assistance of the late Mr. Trotman
You have omitted to mention (except as the resting-place) one important work of Sir Wil liam's, viz., the Norwood Cemetery, of wbich my rather, the late Colonel Gant, was the originator in the valuation sir William was also engaged in the valuation and surveys of all the property if I recollect Binckwall Railway Company, and, if I recollect rightly, of the London portion of the Eastern Counties line. He also held the office of surveyor to many of the City companies, for
whose estates he was largely concerne whose estates ho was largely concerned.

E With respect to the late Mr. Trotman you have scarcely said crough; and I amsure Sir William would have been tho first to do justice to his memory. He was for mazy years onr friond's bripi hand, not only on the Royal Erchange bnildings, but on the Southampton Railway
station ; also the Vauxhall and Blackwall termini, station; also the Vauxhall and Blackwall termini,
the Norwood Cemetery, and, in fact, every work the Norwood Cemetery, and, in fact, every work
of importance which Sir William had in hand, of importance which Sir William had in hand, for many years, and in many of which $I$ also took a hamble part, heing many years funior to
Mr. Trotman. Of Sir Willam's long.continned and warm testimony; for, although my ahsonce from London, and residence abroad, prevented onr meeting, except at long intervals, for many years; still, the letters which I have received
from Sir William within the last two months from Sir William within the last two months display the warm-hearted and genial kindness
which he always evinced when. we were daily which he always evince
together thinty years ago

Sayil. Castie Gint, C.E.

STATUE OF THE LATE LORD DERBY FOR WESTMINSTER.
The bronzo statuo of the late Eiarl of Derby, by Mr. Noble, destined to he placed in Parlia. ment-square, Westminster, has heen cast at the fonndry of Dessers. Young, in Eocleston-strect, Pimlico. The statue, including its plinth, is 9 ft .6 in . in height, and represents the Earl in his rohes, as if addressing tho House of Lords. His left-hand holds a despatch, and his right. hand and arm are outstretohed. The portrait is considered satisfactory by the late Earl's friends and family.
The preparation of the monld had heen a work of much time and lahour ; it was buried, in an inverted position, beyeath the floor of Messrs. Young's casting shop, so as to he cast in a single piece. A large trough was placed over the base of the mould, and in the hottom of this trough were three holes, stopped hy plugs which conld When all was prepared ant of a lever cande. taken to the furnace, filled with four tons weight of melted hronze, and then conveger by a travelling craze to the side of the trough. The cauldron was then titled, and the gloming metal ponred into the trongh. Lady Constance Stanley then ascended upon a platform prepared for the parpose, and, with the assistance of the Dake of Riclimond, depressed the lever by Which the plugs were raised. The metal rushed down from the openings through those prepared the air was driren out in flaming streams, and, the air was coments, the casting. was complete, save for the time required for the cooling of the metal.
When completed the statue will be ploced apon a quadrilateral pedestal of granite, esch side of which will bear a hronze has.relief, in commemoration of some leading incident in the career of the doceased statesman. The subjects selected are, - a speech in the old House of
Commons, on the slave question in 1833 , Commons, on the slave question, in 1833; a meeting of the Cabinet; a meeting of the Lan cashire Relief Committee; and the inauguration of the Earl as Cbancellor of Oxford. In each bas-relief the principal figure will he surrounded and thrown into prominence by those of fellow workers whose names, like his, will live in history.

## AMERICAN ARTISTS.

At the Royal Academy dinner, last week the American Minister, General Schonck, made a delimh
Althongh as a young and new people it has heen mainly our task thns far to clear the forest to hnild railways, to dis oanals, and to develop, in a thousand other ways, under our free institu, tions, onr abundant natural resources, yet it is trae that, even from the beginning, something also has heen done for those fine arts whioh it is the ohject of this institntion to cultivate and enconrage. Yon have rememhered that, in
Benjamin West, we had the honour to furnish an early president of this Royal Academy. In that timo, and after, we gave to painting the Stuart, a Newton, a Leslie a Copley, a Gilhert had a Chnreh, a Bierstadt, a Cropsey, a Lentze. On your wallg here now, emong tho heautiful works which surroaud us to-night, are pictures
hy Tilton, Benson, Broughton, and Niss Lea. in soulpture, tye have had Powers, Clevenger Storey, Hill, Connclly, Hosmer, and Rogers. And others there are too-not a lew,-some of them known ahroad as well as at home, but whose names do not at this moment come into my mind. In rememhering these, onr candidates for art frme from the Now World, while you aro doing homage to your own great and distingi artists, and to the xnany who have older civilisation and refinement than ours, you do but justice to the universality of art. Art has really no conntry, but is of the world. And yet there are reasons why the alliance in every. thing should bo, and aaturally is, closer between Great Britain and America than any other two nations. It is not identity of language, a comnations. It is not identity of language, a comwhich must constitute the ties between ns. These are strong. But a strongor and more uniting influenco, springing in part ont of these uniting influenco, springing in part ont of these, is to be found in that commour we reach forward into the future, seeking in the career to bo ran by each of us much the in the career to bo ran by each of us anch the same hopes, the same improrements, the same arts, the same progress. ht is theso muto sympathies, interests, and hopes which are than else-more, if we will only caltivate them.

TEE WAKEFIELD PARISH CHURCH RESTORATION
AN effort is now being made to complete the restoration of tho ancient parish charch of Wakefield. Commenced in 1857, under the superintendence of Mr. G. G. Scott, architect, the work so far has been carried out in sections. First the tower was re.cased, and the spire re-
built, at a cost of $6,600 l$; next the chanoel, including the filling up of the east win dow with stained glass, the renewal of the carved oak screen, the laying down of a tile floor, and the erection of a rerodos, at a cost of 4,000t; ; and recently, when it was docided to complete the regtoration of the interior, $4,200 \%$ were readily subscribed, but 2,000 . more are yet noeded; and to contribate towards the raising of this sum, a bakaax and exhibition were Houghton, and are to last for a fortnight

The site of the old Saxon churel at Wakefield has not been found, but it is thought to be at the north end of the town, The present edifice stood on the site of the old Norman churol dedicated to All Saints or Hallows, and given hy him to his convent of Lewes. On the site of the old Norman edifice a second structure was erected hy William de Melton, Archbishop o York, in the year 1322 or 1329. This church was also dedicated to All Saints or All Hallows, The church had four altars. Tho great altar was dedicated to All Saints, the south altar to St. Mary the Virgin, the north altar to St Nicholas, and tho altar in the middle of the church to St. Petor. The tower of tho present church to St. Petor. The tower of tho present
building, now cucused in stone, was the only remains of that structuro. 1469.70 the body of the charch was rebuilt, but no reason was given why tho erection of 1329 was taken down. In 1794 the south side of the charch was entirely renewed, and tho north side and
south end had also heen rebuilt within the last eighty years.

## AN OPLNION ON COMPETYTIONS.

## arehitectuedl associatron.

Ar the last moeting of the Association, on the and instant, a letter was read from Mr. Edmund Sharpe, presenting ten copies of each of his fuller provision for the calls of conntry member for these works, in consegnence of the recent altered remulations. Mr. Sharpe also promised to contribute a similar number of copies of any works publisbed bereafter by him. The thanks of tho Association pyere very heartily poted for this splendid contribation in aid of the service. ablencss of this, the only arohitectural lending library

The rest of the evening was occupied in a discussion on "Architectural Competitions." Mr. T. Blashill opened the dehate, maintaining that snch competitions cannot be made beneficial to art, the puhlic, or the profession. This view of the case was comhated by Br. Rilge, who
ties to young men possessed of ability and know ledge, for making their mark at the proper tim in their professional life,-for obtaining notan practico and important works thet would not come otherwise to unknown men. The valne o accurate study and haid work, and of sustaine intorest in real fine architecture and simila considerations, were also onforced by him and b succoeding speakers. On the other hand, the corruption of judges, the mean incidents of un fair contest, tho neglect of genuine serviceable ness to employers, owing to indisposition th attend to the minutire that make up real archi accepted success, thero urged; and all the othe its delusions, and disappointed hopes, ard waste energies.
Mr. R. P. Spiers, Mr. Boll, Mr. Banisto Fletoher, Mr. T. H. Watson, and others, too part. Mr. Blashill replied before the vote wh caken, pressing for the sake of his argumont th success in architectaral competition, notwitl uccess in ares tanding that exrmples may wo aducca of ne who seem to owe much to tt , has rarely been any case an nnmised good, -a good suft proper sanse bonoficial. Every occupation proper sonse boneficial. Every occupation
ho contended, was best pursued steadil. ho contended, was best purgued steadil
and high honours had hetter bo slowly woil Few yount men, just launched into practioe, ar Few young men, just aunched into practioe, as
ahle to take charge of a very large and impo ahle to take charge of a very large and impo tant and complicated huilding, with its almo endless calls for speoia! construction, and knowledgo and managemont of men
things. Fewer still can undertake such a tas
lat and have only moderate snccess in it; an hereafter win lasting recognition ly the sobs industry which must nnderlie every valuah. architectural pratice of the aperage type. An in the case of older men, no jsolated success competition, however seemingly (or really hriliant, can make up to a man for years full isappointments, and for the lost opportaniti of obtaining iu actunl oonduct of husiness the raining in the real work of an arohitectes is which is not to bo dispensed with wisely safely.
On tho rote being taken, the anti-oon petition side was not fornd well supported; an mo iews of jnior architocts, as far as seomed to be that, with all their faults, oomp titions are not hopeless;-that they might eserved for monumontal and similar building and inight he properly conducted;-and thi hen they would bo usefol "to art, to the publ and to the profession."

## THE TRADES MOVEMENT.

Lomion. The first of a series of mectin organisod by the carpenters and joiners London was held on Thursday night in la week at the Earl Grey, Mrile-end-road, Mr. Davis in the chair. The Chairman aaid th agreement with the masters last summer wi
acoeded to nnder protest, and the carpenter acceded to nnder protest, and the carpenter committee were pledged to the trade to com out to as suocessful issne the original terms their memorial, namely, "nine homs and uin ence. It was moved :- That in the opinio Master Builders' Ascociation for ard advance wages of one-halfpenny per honr, to come int operation on the first Saturday in June, is a fa and just demand; and, further, that this mee ing pledges itself to support the committ pecuniarily and otherwise in carrying out th samo." The two carponters, Tamplyn an Pile, who are at present out on bail in relatio o tho case of reputod intimidation \& Taylor at Pimfico, next addressed the moeting in ref tation of the charges hrought against them.
Bristol. -Tho carpenters and joiners hay strack work for an advance of $\frac{1}{2} d$, per hour their rate of pay. The determiuation to resor thoir rate of poy measure for demands wna arived at by the mon at a lare mecting oul the previons Tuesday nicht, and Weelng mopire they fere a dog's notice t their employers. Several small firms grante the concession, hat all the large employers ro sisted the demand, and on Wednesday night th mon left off work. The masters held a meotins at the Athenæum, to consider what conrs should he adopted. Mr. Brock, of Temple mead, presided, and there were present hetwee hands. It was stated by several that they ha
men at work who hail not struck, and who were so satisfiod with the present rate of pay that they did not intend to strike at all. After some discnssion, it was unanimously resolved that
nothing had transpired to altor tho decision at the meeting held on March 13. It was also resolved to advertise in the West of England and the district for men to fill the places of those out on strike. It was stated in the course of the discussion that there are still 190 men at work who have not gone ont, and that tho
number of those on strike did not exceed 250 or 260. The masters generally seemed to think that it was uscless to entertain the thonght of arhitration, for it was only nine or ten menths since the last arhitration, and no sooner had Mr. Lewis Fry given his award than the men again bocamo discontcnted, and wished to have somo other changes mado. Tho meeting was
the largest that has hecn held in tho trade for a very long timo, and mach unanimity prerailod. Swansed-The stone-catters and masons of this district having somo time ago given notice to their cmployers that they would reqnire an increaso of three shillings a wreek in their wages, the ma-ters, when the notice expired, intimated their willingness to concedo the mon's demand. Work
Liverpool.-Between 2,000 aud 3,000 joiners have come out on strike, in consequence of the refusal by tho masters to agree to their demands. The advance demanded hy the workmen was 4s. 6d. per week, but tho omployers would only concedo half that sum, Tho men had originally
demanded a rednction in tho honrs of lahour, from 55 to 50 ; hut they had ahandoned that clain.

Fork.-The progress of the works in connexion with the restoration of the south transept of York Minster has hecn brought to a sudden atop numher, who are demanding an adrance in the rate of their wagos. Tho strike has not come upen the Dean and Ohaptcir as a anrprise, inns year of such an unfortnnato evout occmrring at year of such an
Potherham, - Tho stonemasons who struck Fork in consequence of the masters' refusal to grant them the reduction in the hours of labour
which they demand, from $55 \frac{1}{2}$ hours to $49 \frac{1}{2}$ honrs which they demand, from $55 \frac{1}{3}$ hours to $49 \frac{1}{2}$ honrs Horso Hotel, High-street. It was roported that no cemmunication had yet boon reoeived from tho general body of employers, and it was determined to continue firm in the domands made. It was also reperted that two firins,- -Messrs. Holt, Parkgate, and Messrs. Dohhs, -had decided to accede to the domands of the mon, and in consequenco of this about eight men resamed work at once. It has heen alleged hy some of the employers that the men working in Rotherham are inforior in ahility to those of Sheffeld and other towns in the district. This the men deny; and they state that their wages are 30 s., They, however, do not ask for an increase pay, but merely wish to he for an increase of pay, but merely wish to he placod on the sfme hasis as tho men in Barnsley, Shefficld, Atterrespect to working hours. The onen belong to respect to working hours. The men belong to
the union of Operative Stonemasens. It has the union of Operative Stonemasens. It has
hranches and lodges in all parts of the country, ard they are now heing supperted out of its, funds.
Soulh Shields:-Tho builders' strike has terminated, the usasters conceding the men's terms. St. Andrews.- The masons' loheurers applied for an advanco of wages from 4 d . to 5 d . per
hour. An advance of $\frac{1}{2}$. per hour lias beon mutually agreed to
Perth.-The firtors, blacksmiths, joiners, \&o., at the Caledonian Railway cngine-shods, Perth, have memorialised tho directors for an increaso An por cent. on their wages. Anti-Trade Union Movement.-It is stated on goed authority that a movement is on foot amongst the employers of lahour throughout the conntry for opposing the trade-uning. A con-
ference of employers held at Westminster ference of employers held at Westminster
Palace Hotel, London, was attended hy the represontatives of firms employing is million werkmen. The proceedings were plivate, hut resolutions were passed for carrying ont the main object, to organise for the protection of the interests of employers against the adrorse action trade-unions.
A Result of Increased Wages.-According to the stipendiary magistrate at Longton, the pre-
drankenzess. Addressing one of the men hreught before bim, ho said cirunkenness had nanceased. Afty por cont. sinco wages had advanced. Hen wore earning a great deal of
wages, but instoad of saving monoy and investing , they spent it on drink, and in paying fines in police courts, while if they were careful they would soon bocome rich men. In auother case tho defondant caused some amusement by intimating, as the result of illuess, a decreased capacity for the innocent ahsorption of drink. He said, "If I get three or four quarts now it makes me tipsy," and be spoke in a tone of

## Question as to sewers.

 shatts to the sewers in Liverpool are a sacoess, where I may find suy account of then, and if any anch are used
in Londou, where, and with what resultg ? 2ud. Whether
the charconl filters introduced hy Dr Staho dorizing sewer-gas as it escapes from air-shafts, are still My experiapeo hasoss, and it they are used in London Hy experiopee has been, certainly ju olevated pasitions,
that the foul gas escapes as freely with as without then.

SPECULATIVA HOUSE BUILDING.
Slisen, up by some of the societies,-that is wil soon be system of speculative house buildiug, as there is scarcely a week passise but some of your correspondents give cases af "scanping." The comic and cother jourunts often hold
up to ridicnle the housso and suburban villas of this
speculating ape, which onght speculating age, which ought to be lovied apou as scrious.
One of the officers of health iu a very great distriet - I
forget which, bat I think in the neizhbourhood of forget which, bat I think in the neighbourbood of Min officers did not use sulficient energy nad eoondenn half the property that was being erected even in Nottingham.
Three times this winter in the lo Fer part of the town, and
near the Trant, although they are "villas," the watere hare risen to a grest extent; and in the part of the town
called "The Meadow " the refuse from the ashpits mud the excrement from the closets wrom tloating about the
back premises; and two or threo times every year the litchens in nearly every house are uninhabitable, as there
are ofter 4 ft , or ereu 8 ft of water in them, as was stated at a recent maeting of the town counvil to alter and amend the Enclosure Act, which is undonbtedly very

## THE PROPOSED NEW SCHOOLS AT

 OXFORD.THE delegates appointed to procure a desiga for now sohools, to be erected on the site of the Angel Hotel, have issued their report. They stato that in the instructions issued by them to the architects they onumerated among other requirements - (1), five reoms for paper work, each containing space for 100 examinees, with 30 square feet for each porsen, giving a total of 15,000 square feet ; (2), fourteen rooms for examination vivi voce, eaoh with an area of 1,000 square feet ; (3), coverod space, as colonnade or cloister, to acoommodate 400 or 500 persons, assemhling at the same time for examization (4), private rooms for examiners, an office for the clerk of the schools, residence for the oustodian sc.- (5), the chief entrance to he in the High. architeets another from Merton-street. Th designs were Mr. Blomkield, Mr. Deane, Mr John O. Seott, Mr. Street, and Mr. Waterhouse hat the last two of these deelined. Designs from the other three were received in Junuary last, and were shortly afterwards suhmittod to the surveyors for valuation; and, at length, after oareful examination both of the elovations end of the internal arrangemants, the delogatos unanimously determined to recommend to Conrocation the adeption of the design sent in hy Arr. John O. Scott. The cost of exeouting this design, as first sent in, was estimated at 49,0002 . hat on the suggestion of the dolegates Mr. Soott reduce the cost of his work hy 1,5002. or $2,000 \mathrm{l}$ Tho delegates, in conclusion, recommond the approval of Mr. Scott's design.

## SCHOOL.BUILUING NEWS.

Jarrow-on-I yne.-The new schools erected hy order of the Hedworth, Monkton, and Jarrow School Board, on the Grange estate, havo heen opened. The Grange Goverament School is s.id to he the first in the north, which has heen erected specially under the provisions of the Government. The school is designed to accem modate 400 beys, 300 girls, and 300 infantstotal of 1,000 children. The contract for the whole of the warks, except the fittings, lias been carried out hy Mr. Richard Wylam, of Jarrow,
who has had asseciated with him as suh-con tracters, Mr. Place, of Nerth Shields, for slating Dir. Collio, of Nowcastlo, for ronwork and plumbing; and Mr. Folmes, of South Shields, for painting and glazing. Mr. Bowman, of New castle, has supplied the woodwork of, and fised, the fittings, the standards heing supplied hy Mr. Somorset, of Newcastle. Mr. J. J. Lish Newcastle, is the architect. The cost of the whole, exclusire of site, has heen $5,000 \%$.
Liverpool. -The sites and huildings committee amended recommended the acceptance of the amland plans of Mr. Cook for the proposed and the North Corporation Schools and acceptance of Mr. Bell's terms for negotiating for the purchase or the temporary nse of al es or buildings, at the rate of 102. 10a for each site purohased, and 2l.2s. for each sito or hailding temporarily hired : the acceptance of the tender of Mcssrs. Burroughs \& Son, amount ing to $8,083 l$, with 3202 . additional, if the hoild ing he faced with stone, for the erection of the sohools in Chatsworth-street; the acceptance of Mr. Joshua Henshaw's tender, amounting to 7,4301 , for the erection of the Queen's-roal Schools, the huilding to he faced with stone; the acceptance of the tender of Mr. Thomes Ray amounting to $5,797 \mathrm{l}$., less 48 hl , 15s. for furni ture, for the erection of the Roscommon-street School. The recommendations were agreed to.
National Sche foundution-stone of St. Luko' National Schools, South Park, has been laid. The erection of this school for 150 children, will com plete the edncational accommodation of the borough according to the standard of reqnite ments of the Elementary Education Aot, 1871 The contract has heen taken hy Mr. Gratohfield of South Park, for 520 k , from plans gratnitously prepared hy wr. Marshall, of Mr. Clutton's office the school will he a mixed one at first, but wil he so built that it can ho subsequently divided if fonnd necessary, to form separato schools for hoys and girls.
Salisbury,-The now Freo schoel at Salishnry Mr. Hardinen. The building was designed hy tractor being Mr. Plowman, of Barford Saint Martin. The style is plain Gothic, the material nsed heing red hrick, with stone windows and dressings. It centains two sohool-rooms one ahove the other, capahle of holding 263 children with class-rooms, lavatories, and other offices, two square playgreunds inclosed heing at the rear of the premises. The cost has heen ahout 1,500 . Norwich.-I'he new schools in St. Milcs's, bril hy the City School Trust, are now oompleted and in full working order. They consist of a school on the ground-floor for 200 infants, with a class-room adjoining. On the upper floor there is a school for There a class-room for the same number respect well fitted. The ries and offices in every respect well huted. The rooms are heated with het water. Internally, tho walls are clad with matched boarding and plastering; hook-closets are provided for each olass, and there are desks and galleries hy Mr. Hawes. Extcrually, the chools are hall of rod hrick with stone drossings, and there is a hell.turret over the principal entrance. DIr. J. W. Lacey, of this city, was the sole contracter; Mr. E. Steward, the clerk of the works; and Messrs. Boniton \& Co anpplied tho heuting apparatus. The tetal cost of the huilding, iucluding architeot and olerk of works, was $1,630 \mathrm{~lm}$, heing at the rata of 4 ll . per child. The original estimate of the architect, Mr. J. B. Pearce, Norwich, was $1,610 \mathrm{~L}$
Loadon. - Lord John Manners has laid the fouzdation stone of new sehools in connexion witb All Saints' Chnreh, Kensington Park. His lorcship suid the Duchess of Teck was unahle to carry out her intention of heing present to perform the ceremony
Blackburn,-A new school has been opened at Blackhurn, in connexion with All Saints' (Rashton Memorial) Church. Daring the last three years school extension in Blackhurn has heen notahle. In that period five now schools have heen erected, and one sohool enlarged, at a total cost (including sites) of $15,670 l$., 11,500l. of which have heen raised hy suhscriptions from churchmen, and the major pert of tho remainder has heen given hy chnrch sooieties. In the same period one new church (All Saiuts') has heen built at a cost ahont gate) are now in oourse of erection, towards which, inchuding sites, $5,600 \mathrm{l}$, have alroady been raised hy hos stes, 5,600. have alroady been t50l pre
 the last three years, bave suhscribed a round
sum of $20,000 \mathrm{l}$. for school and charch extension In addittion to this we may mention that Mr Thomas Dugdale, of Witton, has huilt a school in that township, at bis own expense, wbich he allows to be used for church day and Sunday scbool purposes. Exclnsive of ther, extran accom modarch in the town has now good schools in church in the tow
West Felton. -The foandation stone of a new school bas been laid here. The school, which is to be built from the designs of Mr. W. II. Spanll, architect, Oswestry, will accommodate 130 children, and, with the master's house, will cost 960 h. Mcssrs. Morris \& Chaplin, huilders Oswestry, are the contractors.

## FARIORCM.

Concerning the frescoes in the Houses of Parliament, the Art-Joumal says:-" Repeated visits to the Poets Hall would show the walls, under certain conditions of our variable climate,
streaming with water; and this has been of very frequent occurrence in spring and autumn. In frequent occurrence in spring and autumn. In
all the reports and notices tbat we have seen of all the reports and notices that we have seen of or, being known, has not been considered; and, independently of all other canses, how mucb further need we searcb for a sonrce of destruction
to a delicately-coloured wall, than its sufferiou by moisture, supposing even the water entirely free from cbemioal admixture? Thus, allowing tho absence of compound chemical action, what
delicately painted lime-surface could withstand tbe destructive effect of the continuous operation of damp? The question has been tbe sub. ject of much inģniry, both by individuals and committees. Some years ago a committee was appointed to investigate the causes of the injuries to these paintings, but we could never learr tbat any satisfactory conclusion had been arrived at. Indeed, it is a curions fact that the tbeory of damp is generally repudiated by many axtists wbo profess perfect faith in the acclima. tisation of fresco." -Tbe Gardeners' Chronicle Writes as to the remoral of soil from building constantly falling into the market as eligible building sites, there is muoh need for an energetic protest being entered, in tbe interests of horti. speculating builders. Durin practe ost quarter speculacing builders. During the past quarter character, wbich formed a portion of the suburbs both of the metropolis and of thriving provincial towne, bave, in consequence of the rapid increase in population, first been built close ap to, as increased honse accommodation became necessar'y, and then gradually absorbed as building sitces. As soon as the builder takes possession of one of interests of horticulture. He frat of all disposes of the surface turf, which is always in request ; next he sells a spit or two in depth (sometimes more) of the fine fibry loam which invariably underies the turf; and then, if gravel forms the subsoil, this is escerated and sold likewise, or rather all the best of it, the refuse being kept
for the formation of paths, \&c.. Should clay form for the formation of paths, se. Should clay form the subsoil, this is dug out till the gravel is
reached, and the latter removed, and tho reached, and the latter removed, and tho excavations are filled in witb any rubbish that may be
obtainable, and the clay, or other ansuitable article becomes the apper surface or garden ground. Such is the history of the formation of many a suburban garden in tbe neighbourhood of London, as well as elsewhere, - a history so well known that it bns given riso to the proverbial saying,-a bricklayer's gardcn.' The Dean of Canterbury, in the Bible Educator, for May, has these observations:-
"The art of writing is of the very highest antiquity amonr the Semitic nations thenselves All tho words connected witb the art, 'to write, 'book,' 'iuk,' are Semitic, and not Egyptian,
and, as Ewald remarks (Gesch, Isr., i. Ti), Are common to all bemarks (Geschn, Isp, i. 77), are they munst have been their common property before the original stock broke up into distinct branches. The names of the letters, too, are Semitic, and were carried by Cadmus, - $i . e$, the Oriental,-and che Phcerricians to Greece, whence all European nations have reccived them. Weber has even shown that the Hindoos borrowed their Alphabet from the Semites, thus carrying back the invention of letters to a mont remote an. tiquity. But thongh the Phoenicians taurht the ort of writing to the nations of Europe, they did not invent the alpbabet ; for the names are all
derived from pastoral occupations, and not from maritime affairs. Aleph, the Greek alpha, is an ox; Cimel, a camel; Vau, a tent-peg; Cheth, a cattle-fence; Lamed, an ox-goad; and though Nun is a fsh, and Tzade a fish-hook, no letter is pamed from any part of a ship. It is cortain, too, that the Canannites at a very early age possessed the art of writing. The Kheta, gene rally undorstood to be the Hittites, appear in Early Egryptian monuments as a nation of scribes In exact accordnnce with this wo find a Hittite lown, captured by Joshua, calldd Kirjatbsepher Book-town,' or, as the Serenty render it, 'the city of scribes' (Josh. x7. 15). In verse 49 is called Kirjath-sannah, which Fürst render 'city of writing'; whilst its other name, Dehir, probably menss 'parchment,' or the city where that matorial was prepared. There is little doubt that the Canaanites, as far as civilisation and tbe arts which minister to refinement and uxury are concerned, had attained to a far higher level than the Israelites; yet the latter carried with them into the wildorness the art of ongraving on jowels, of embroidery, and of working in gold and silver. Settled in the land of Goshen, on the confines botween Egypt and he semitic races, and aided at first by all the influence of Joseph, the powerful minister of a monarch of the twelfth dynasty, when Egyp was in the very heigbt of prosperity, it is unourished in botb the region between whicb Goshen lay.

## fitiscellamea.

National Health Society.-At a meeting of the National Healtb Society, leld at the rooms Science, Mr. Edwin Chadrick in the chair, Dr Carpenter read a paper on the "Causes of In fant Mortality." He said the wholesale destruc tion of infant life in the manufacturing district was worse than the slaughter of the innocent be servage Near a large sewage farm, where toe sewage of 4, ,ooo peopte was used in manuring tbe soil by irrigation, the mortality of infants
was not one-twelfth, and this sbowed that the development of vegetable life, together with pure milk, tended to preserve life the densely populated area of the metropolitan district wa more healtby than were many other places. Mr Chadwick said the paper was one of the greatest importance. In Croydon, by rough samitary regnations and improvements, the mortality had been reduced from 28 to 17 per 1,000 . He hare noted the infant mortality among the Society of Friends, which was extremely small. The duration of hife among tbat body, owing to temperance and other causes, was nearly doable that of the country at large. It was also noticeable finct that the deatbs of women in cbildbith were but one in 700 among the work ing classes, white tbey were one in 70 amon tbe higher classes. Dr. Biklicrs read a paper by Dr. Coronel, of Fricsland, a member of the sani cary Council of Holland, and secretary to th Sanitary Council of Friesland, "On the Origir and Progress of the Ladies' Association for Pro moting the Sanitary Condition of the People" in Holland.. - A pamphlet has been issned by the National Health Society (9, Adam-strect Adelphif), on the Etrectual Prevation or Epiby the Sanitary Aid Associntion of the Buph f Hastines, By Member of that Asocition Hcad before tbe Society, 6th March, 1873."

Proposed New Hospital for Skin Disenses. he erncm originating with the authorities of Diseases of the Skin, in Leicester-sonare has been got op for the erection of a proper hospital for such diseases, capable of containing beds for at least 100 in-patients. The want of such a bospital, it appears, is most urgent, and the sooner supplied the better. Indeed, a hospital of suffisient dimensions, to which the ekin can be confined, is absolutcly essential ; for ceneral hospitals are not proper places in whic? to treat such diseases, and indeed, gs a rale they do not receivo them; and the hospital in nd carried ou for ten yey Mr. J. L. Milton. and carried ou for ten yeara by him and other nosalatied medical men, has become far ton re-
stricted in its dimensions, although 20,000 stricted in its dimensions, although 20,000
patients have been treated in it since it opened.

Working against Time. -The writer of paper on "Louis Napoleon" in the Cornhill give the following anecdote:-"Wednesday, April 19 851: I called early this morning on Madame I fer brother is the architect who superintend the work at the Elysice. His story to her w that at seven in the morning of Good Friday th Emperor and the Erupress met bim at th ball on Monday to the Duko of Cambridge; tha there was a difficulty in doing so at the Tuileries and that bo mrost get ready the Ely sée for it. 'Bnt he said, "there are 3,000 cubio yards of stone the court, there is no staircase, tho walls ar mere wet stono and mortar; nothing, in fact, Enished oxoept tho roof; it is impossible ; an ae looked towards the Emperor for protection Cest un caprice de ferme,' said the Emperor
I am sure,' said the Empress, 'that nothing it impossiblo to yon.' So he 'or workmen who had gone bome were sent for, and 400 of them wore kept at work from that tim antil Monday evening, when the ball began They were well fed, and a little brandy wa added to their winc. When they left off they had ween at work for nearly eighty-two conseantio unti ; that is, from the morning of Good Frida im. the evening of Easter Monday. In to ad, besides fitting up the existing rooms, the he baill tiree sitchens and a new ball-room ight the 20 fl . by 35 ft . and 30 ft . hish. ing torches. One of their difficulties was thi presence every day of the Empross, ordering ections. came. He looked with dismay at the court still covered with tho 3,000 square yards tone, and at the pap where tho staircase wa to be. Lacrois thon explained to him that ho meant to employ these vast masses of stone ir building up a vast straight outside staircase from the court to the first floor, protected by roof of glass. This was done by seven o'clock hat evening, and wbile it was doiug 400 load of rubbish werc carted out. Tho poor architec was nearly killed by the incessant worry, wan of sleep, and fatigue. 'He seemed to me yester day,' said Madamo R., ' to have grown te years older in four days,",

Interesting Discovery at Stoke Bishop Mr. J. F. Nicholls, of the Bristol City Library states, in the Bristo times, that an interestin塱 the parish of stoke Bishop, on the hill over oking sea-mills station. Beneath tbe ancien colch ars that crown the eminence, men in 6 mey or Mr. J. Evens have found (about 6 in having on it some rude scalpture and a Roma ascription. Together with this they diseovere a portion of a skeleton, the bones honeyco mbe by lapse of time.
semicirculur lis mand line, within which is the head nud bust o numan ligure, cowled, with either a rayed glory or ${ }^{2}$
rown on the upper portion of the heand, and eardrops in each ear, the lower portion of each dro being an opon
ring. On the right of the bust is the gur of a ong
rampant, with his pars against the semicircle.
On the eft, on the ganme level, is a cock. $A$ ferw wucheo beneath contre of the stone, on which is soulptured in Roman capitils the word SP.ES: beneath this sre the following
letters: $=-\mathrm{C}$ SEXT. The whole is caclosed in an inciod letters: - C SEX
ined pentagoo.
At the first glance the figure might be taken for he head of the Virgin; but from the supporter Mr. Nicholson is inclined rather to look upon it a meant for NEsculapius, to whom both the dog and ock were sacred: lois god is aiso represonted witb a crown. The ear-drops, he thinks, do not militate against this theory. It is a well-esta blished fact that costly and bandsome ornament of this siad were wosh by the men in the luxa ious dectinc of the Roman empire. The inscrip ion remaining, he thiuks, meant "Spes Con enti.'
Building Prospects at Dumfries. - At resent there is not much prospect of the milding trade in Dumfries being brisk this ummer, after the buildings in course of bein rected are finished. Fur some ycars past at this eason there were usually a number of villas, dwelling-houses, and other buildings to be conracted for, but nothing of any consequence has et been heard of this spring. Owiug to th ncreased prices of materials and high wages building on speculation is not proftable; and, Horeover, the masons strike last year put \& stop
to preparations for building nt the Lovers'-walk nd probably has deterred bvilding speculations isewhere.-Dumfries Standarl.

## A. New Building for the Medical School

 at Owens College, Manchester.-A meeting of the subscribers azd friends of the medical Echool in conncxion with Owens College has been hold in the mayor's parlour of the Town-hall, for tho purpose of receiving a report from an exechtive committee on the progress of the sub. soriptions for the new building to be erected for the convenience of the medical students in con. nexion with the college, and to inspect plans and consider future proceedings. Tbe report stated that the building contract has been let for the for extras and fittings, so that 4,000l. at least are still needed to complete the work, Professor Roscoe said the council of the college had chosen site for the building which be thought a very boundary of their land faoing Copeland.street Some time ago some of the committee round to all the medical sohools in Jondon where thero was anything worth sccing, and with the hints thus obtained they had succeeded in prodacing plans which be believed would turn out to he very satisfactory. The meetingexpressed its satisfaction at the completeness of the building plans, and heartily recommended tbe schemo to tho support of the public.

## Grosvenor Club for Workinen.-The new

 Grosvenor Cluh for workmon has been inauga. rated by the Marquis of Westminster. Among those present were the Earl of Ducio, Lord George Hamilton, M.P., Sir Charles Trevelyan, Sir Harcourt Johnstono, M.P., Mr. W. M. Srrith M.P., Mr. Brassey, and Mr. Hodgson Pratt, M.P., Mr. Brassey, and Mr. Eodgson Pratt.The working mon of the south.western district have already a building in which amusoment and information are provided for. On tho ground floor are a large reading.room, dining, and sup.
per rooms; on the basement, a hilliard-room; per rooms; on the basement, a hilhard-room;
and on tho first floor a hall or concert-room, in which 300 persons can meet; and a library. On the second floor are three class-rooms. The
institution was, in fact, opened on the 23rd of institution was, in fact, opened on the 23rd of
November last, and has already nearly 1,000 mombers, who Eubscribe 2s. 6d. per quarter. The site for the building, which is at the end of the Buckingham Palace-road, was given by the late Marquis of Westminster at a nominal rent, and the bnilding has becn erected principally by subscriptions, to which the working men The Marquis of Westmiuster before leaving informacd Mr. Pratt that he would contribute 1,000 2. to the fund for the erection of a large arll for the club
Trains and Honse-Vibration.-The Court for the consideration of locus standi sat in a committee-room of the House of Commons, under the presidency of Mr. Bonham-Carter, chairman of Ways and Means, when the Metropolitan and St, John's Wood Railway Bill came before them petitioners against the Bill :- -238 inhabitants of St. John's Wood, Madlle. Titiens, and Mr. A. H. Crowther. Tbe main object of the Bill is to rive power to widen the line from Baker-stroet to St. Jobu's Wood for heavy traftio. The fifth olause provided that the company should under. pin or strengthen any building within 100 ft . of the railway, The inhabitants near the line shaken in tbeir beds by the vibration of the rail. way, and in tbeir petition state :-
"Your petitioners are seriously nnnoged and risturbed by the passing trains. The conveyance of heary goods Wrould be positively dangerous to thcir dwellingg, aud so
disturb them with increased noise as to make it inpossille them to dleep in their beds.
Ibe case of Madlle. Titiens arainst the Bill was tbat she bought, on a part of the sarplus land, a honse from the company, and that it was part of heavy traflic on the line. The Conrt allowed the petitioners locus standi against clause 23 of the Bill, and as much of the preamblo as rolated hareto.
Oxford Main Drainage.-On the 1st and 2nd inst. Major Tulloch, R.E., one of the inspec. tors of the Local Covernment Board, held an in. quiry at Oxford upon a potition from the local irrigation, \&o. Mr. Bailey Denton, C.E., Mr. S. W. Leach, C.E., and Mr. W. H. White, C.E., Engineer to tbe Board, were examined on hehalf of the Oxford Board, and Dr. Odling, Dr. C. C. Pode, Rer. J. C. Clutterbuck, and Dr. Saukey, Asylum, wbo are the principal objectors.

The Assyrian Expedition.-Mr. George Amith, of the Britibh Museum, wbo has gone to Assyria as the special correspondent of tho Daily Telegraph, for the purpose of making explora-
tions, has sent a tolegram from Mosul, in which tions, has sent a tolegram from Mosnl, in which
ho says:-"I am happy to inform you tbat my ho says:-" I am happy to inform you tbat my researches ap to the present time in Mesopotamia have been crowned with much good fortune, and that I have obtained results of real value and interest.
containing most curt of the and se ancient Babylonian lerends, as well as sylla. barics of great utility, a bilingaal collection of proverbs, and some astrological and mythological tables. seventeen days, and ceplored there the North weat Palace of Esarhaddon, the Tcmple of Nebo, and also some entirely notouched portions of the Soutli-anst Palace. I found spacious halls and mented with bands of plain colonrs. One of my monted with bands of plain colours. One of my
most recent discozeries is that of a perfectly now text of the annals of Tiglath. Pitcser. 1 am at present digging bard to olitain, if possible, the remainder of this higbly important piece o history."
Ineicester-square.-A committee, consisting of the leading tradcsmen in Leicester. $8 q u a r e$ was some time ago formed for the purpose of square. The present condition of Leicester with the committee has been held at M. Vargues' Paris and Europe Hotel, at which a large number of gentlemen interested in the movement were present. Mr. J. C. Pawle occupied the chair He referred to the difficulties of the improve ment of the square, and proposed by the Metropoliten Board of worl of bring by the Setropolitan Board of Works of bringing a street from Tottenham.court-road mont was that of huilding a large Continental hotel in tho present open space. He was glad of Why scheme of improvement. Tho Board e Works had not proved able to deal with it, and should be hencefortb taken by the committce. It is expected that the lawsuit in progress with regard to the hoarding erected hy Mr. Tulk will soon be concluded, when a radical alteration in the aspect of the square is expected.
Society of Engineers.-At the ordinary moeting of the Society of Enginears held on dent, in the clair, a paper on charging and drawing gas retorts by machinery, was read by Mr. John Somerville, of Dublin. Working the Best \& Holden's machine at his gas works, gave the anthor an opportunity of secing its defects. He therefore designed anothcr machine, cmhodying improvements upon the other. He uses tivo separate machines, one for clrawing, and another for chalging, the retorts being served at hoth ends, and the machines following each other up working by these author gave the results of working by these machines, which showed that the cost of carbonising coal was 6 d . per ton with This was taking the price of manual labour. This was taking the price of labour in Dublin, hat hy adopting London rates of wages in the

Restoration of Chester Cathedral.-Since new impulse to the work of restoring this cathedral was given at the begioning of last year considcrable progress has been made, but Fio great tasks remain to be accomplished. choir, and the bringing of decorations of the tectual tambarg with tectural combination with the great south transept ; and, secondly, the extornal restoration began on both the east and west sides. The total subseription list at the end of 1872 realised 4,7,000l. To this must he added a recent supple. Commissiont of 5,0002 , from the Ecelesiastical Commissioners for substantial repairs. In addi. tion to this total sum of 52,0002 ., it is estimated that $18,000 \%$. will still be required

## Baths and Washhomses at Bedminster.-

 The new baths and washhouses, built hy the Corporation on the Mayor's-paddock, New-cut forminster, have been opened without any 15,0002 . and $16,000 \%$ The entire cost is between 10,000t. and 16,000 . The charges will be, in and in winter, with tepid water, $4 . d$, and $2 d$. the only difierence being that first-class bathers are supplied witb two towels, whilst the secondare supplied wias two towelsclass bathers bave only one.

Physical Geography.-Eton and its masters may be congratulated on the award of the Prize
Medals of the Royal Geographical Society the present year. The Geographical Society for Geography, was awarded to S. E. Spring Rice (16) ; and.A. C. Cole (18), and R. C. Reade (19), are hononrably mentioned in Physical Geograor Phesical being of Eton. The Gold Medal, Hudson (18). We observe with surprise tbe ab. sence of Westminster, Charter House, Mer. chant Taylors', Cbrist's Hospital, \&c., in the list of the selected; and, worse still, we believe there was no candidate from any of them. Are tbese schools disregarding the signs of the times?

## A Rothschild's Hospital at Geneva.-

 Baron Adolphe de Rothschild, who lives occasonally in a villa near Geneva, intends to endow and build tbere, at his own expense, a hospital or diseascs of the eye. He will give about 20,000l., 8,000t. for the ground, buildiugs, and fittings, and the rcvenue of tbe remaining 12,0007 . or its yearly support. Suitable grounds have bcen purchased, and the now building will bo completed and opened in the middle of next summer. The hospital is to be fitted for treenty n-door patients, witb rooms for out patients, and clical demonstrationProposed Park for West Ham, At a meeting of the London Common Council, a
petition has been presented from the inbabitants potition has been presented from the inbabitants of West Ham and Stratford, Essex, praying the Court to contribute 12,000l. towards the purchase of a park at Wost Ham, owned by r. Gurney, in order that it may be dedicated to the uso of the public. That gentleman and his family aro willing to give $10,000 \mathrm{l}$. towards the pnrchase ; 3,000l. more had heen promised by differont gentlemen, and tbe balance was sought memorial was referred to tho City Lands Committee.
Baths for Marylebone.-The Commissioners of St. Marylehone Baths and Wash-houses have nstructed Mr. H, Saxon Snell, architcet, to prepare tho necessary working drawings for the construction of a new first-class swimming-bath adjoining their present premises, but fronting the new street which forms the continuation of Seymour place. Tbe bath will be 7.1 ft . long and 26 ft . wide. The roof is to be partially of glass, and supported on elliptic cast-iron ribs. The estimated cost is under 4,000l, and tenders will shortly he invited for carrying out the work
Restoration of Kirkstall Abbey. - Tbe Torksluire Post says that a scheme is at last in ontemplation to remove some of the vandalism which disfigure the noble pile of Cistercian ruins at Kirkstall. The reprosentatives of the late Earl of Cardigan, who own the monastery having evinced a desire to dispose of the place, the lessees havo resolved upon parchasing the property, and they purpose to restore the ahbey to some extent. Sir Cilhert Scott bas been instructed to report upon wbat should be done.
Selenitic Mortar.-On Wedneaday evening Provid at the invitation of the members of the Clerks of Institution of Builders' Foremen and General Scott on the "Method of Treating Lime General Scott on the "Method of Treating Lime by the Selenitic Process. The lecture was illustrated hy experiments whicb demonstrated the peculiar action of sulphate of lime in counteracting the slaking or lime and the valu able results which this produces when atilised in the preparation of mortar for building parposes The lecture was largely attended.
New Hospital at St. George's. - The foundation.stone of a new hospital for pit accidents, to he erected by the Lillesball Company, has heen laid at St. George's in presence of a large company. The hospital will be erected from a design partaking of tho Elizabethan and Tudor atyles of architecturo, and will accommodate six heds in its present form, with pro Fision made to add another wing if nocessary There will be thirteen rooms in all, and the oost of tho building will be abont $3,000 \mathrm{l}$. Mr. I Fogarty, of London, is the architect; and Messrs. Millington \& Son are the contractors.
Proposed Church, Hornsey.-The Rock informs us that the Rev. Canon Harvoy ha announced that be has been offered 2,000t. and two acres of ground for a new church in the ricinity of the Green-lanes.
Ancient Monuments Bill.-Sir J. Lub bock's Bill bas been read a second time.

The Fire in Blackburn.-An appeal is being made to the puhlic on hehalf of the family of the late W. P. McCallum, engineer, who lost his life at the fire which took place at the Canterhury-street Works, in this town, reoently. Mr. MeCallum was beroically assisting Mr. Superintendent Joy to extinguish a fire wbich threatened to be extensively disastrous, and hreatened to be extensively cisastroas, and was kiled, a or portion of the Lulang. Contindions may be orwarded to the
Blackhurn; or to Mr. J. Thompson, the mayor.
Caterham Asylum for Imbeciles.-For some weeks past rapid progress has been made with the adailional hocks in comnexion with the ahove asylum. During the last few weeks, however, one of lbose dimbulies now so com. monly known as "strikes" has been threatening, but last week, on assembing at the Asylum cavern, it was intimated on behalf of tbe contractors that no alteration would he made, and those that were discontented could take their money, and seek employment elsewhere. With tbo exception of some eight or ten, all resumed their work.
Opening of Greenore New Harbour.The Dundalk line of railway and harbour have been 1000 . bere Conan Stor an Countess spenci, Lord I.. Grosvenor, Lord Newry, Lord Crichton, with several memhers of Pariament, and of the no. bility and gentry of Ireland. The Lord Lieu. tenant expressed a strong opinion in favonr of the new ronte, as it could not fail to dovelop the resources of the north-western counties of Ireland.
Rev. Dr. Hannah's Chapel.-The chapel which the Wesleyans intend to erect in the parisi of St. Peter-at.Gowts, is a memorial to the late Dr. Hannah, is about to bo proceeded with forthwith. The committeo invited desiens from the following architects, viz,, Mr. Watkin (Lincoln), Mr. Botterill (Hull), and Mesars. Bellamy \& Hardy (Iincoln), and, after a careful consideration, have selected those subuitted by Messrs. Bellamy \& Hardy.
Proposed Public Hall for Ripley.-A company has been formed the purpose of purchasing certain freehold land (already so. cured) in Ripley, and on the site of whioh it is proposed to erect a Public Hall and Temperance Hotel, with British Workmen Pablio-house, batbs, and suitable rooms for Good Templar Lodges, \&c
Bath Abbey Church Restoration. - A meeting of the committee has been held at which it was stated by Mr. Gill that sometbing like 3,000 . would still he wanted to complete the third and last portion of the work, and a discussion took place as to the best mode of realising the sum required, and appropriate resolntions as to it were passed.
National Hospital for Incurables at Ozford.-On Wednesday his Royal Highness Prince Leopold performed the ceremony of laying the foundation-stone of a National Hospital for Incnrables, dedicated to St. Jobn the Evan gelist, at Cowloy St. John, near Oxford presont about 50,000 . have been raised,
Irish National Monuments.-Mr, Glad. stone has informed Mr. Agar.Ellis, in the Com mons, that the Irisb Church Commissioners were now making inquiries with the view of taking steps for the preservation of the Irish national raonnmerts. Wben bbose inquiries had been concluded, the information procured would be laid on the table.
Testimonial for Opposing the Chelsea Waterworks Bill.-A handsome warble timepiece bas been presented to Mr. A. Marks, and a purse containing ahont 70l. to Mr. Watts, by the inhabitants of Long Ditton and Thames Ditton, in acknowledgment of those gentlemen's services in opposing the Chelsea Waterworks Bill.
New Gasometers at Battersea.-Five now gasometers, with $7 \frac{1}{3}$ million additional feet of storago space, are being planted by tbo London Gas Company at Battersea, between the two staisons on the railway-lines crossing the York. road. One is completed, and a second is in progress.
American Institute of Architects.- We Lave betore-us the Proceedings of the Sixth Aunnal Convention, and will take an early tunity to refer to them.
Obituary.-We regret to see the death of Mr. G. L. Taylor, eighty.four, and tbat of Mr.
S. S. Teulon, sisty.one, announced.

## (al) ghilder.

VOL. XXXI.-No, 1580.

## Another Visit to the Royal Aeculemy Echibition.

## UITE truo it is that the

 dearth of groat things gives all the mere value to what comes next in estimation; and if the scareity of what may he taken for superlative exumaples of the werk of lead. ing members of the Academy, or of those most capahle of supplying loading pictures, be too apparent to learo douht of it, it produces a result of partial good fortune in the prominence of comparatively remarkable pic. tures that would take but socond rank in more exalted socicty. For these have the chanoe now of a memorahle distinotion in the abscnoe of anything hetterworth rememhering, and thus will advance the position of their painters. Extended opportunity of arguing what tho rcal attraotion may bo is another delightful advautago. Splendid landseapes hy Messrs. Linnell, P. Graham, Vicat Cole, A. Moore, and others, seem to suggest an inreased consideration for this section of dciotors. Mild imaginative work, forcible realiation of character-stady, pathetic and hnmorous; ad general excellence of workmanship through. int, must he amongst the prevalent causes for mpressions left upon the ohserver of this ummer's treat at Burlington House, and tho act of ita heing so really enjoyable, with no ielp or little from previous sources of sinilar injoymont, should gratify, and to some degree nalify, the disappointment that the feast should onsist more of entrees than romoves,- light lishes in lien of more solid foorl.There are some fow of the Royal Academacians sho remain faithful to a helief in the dignified urposcs of art; and whatover difference of pinion the definition of "high art" may inolre, there can he little douht that ite nohlest xemplifications exist in furthering the lessons und direction of Scripture, so well done formerly vhen the church gave the painter his chief mploymont. It would be saying too mmoh to Frort that any one of the illustrations of Moly Frit to he found in the chief gallery (III.) now
rould obtain a very rould obtain a very wide acceptation as horoughly satisfactory examples of their class.
Bve would be so, but the artist's idoal (and Mr. . Elmore's is a very heautiful one) has more of rarth's than hearon's association; the more lefensible, perhaps, as it is "After the Expul. ion" (282). Mr. T. Armitage enlists the especiful attention of all for his carnest and harisees" (187) when they would have had it hought that tho day of rest should he one of leprivation ; Mr. G. F. Watts is not so fortunate is to secure great intercst for his version of
"The Prodigal" (2si). Mr. J. R. Herhert The Prodigal" (281). Mr. J. R. Herhert
ind Mr. C. W. Cope have each a "Mary Magdalene" incicative of their respeotive porver and different styles $(302-309)$, but to this lepartment the present exhibition owes no very great share of its strength, though it helps to rary and contrast the numerons instances of less oftily applied talent.

Whatever may hetide for varying Royal
cademy exhibitions, it may a afely ho predicted Academy exhibitions, it may safely ho prodicted so four as Mr. E. M. Ward is concerned that histerical painting will he represented so long as bo centrihutes to them. Britain and France are oue to him; and in less time, and with fewer qualms,--net only of conscience,-it is te he hoped, than it costs some others; he is naturalised, and as muoh at homo on oither side of the Channcl, with no sign of having saffered by the jeurney. It is in France on this occasion that Mr. Ward sets up his easel, trims his palctte, and succeeds in interesting, hy his recall of old stirring incident, those who have read of it : and even with the fact te his disadrantage, that the histery of France that stirs most just new dates from 1870. But historical incident may be liko wine, and requires the rest of many years hefore its value becomes matured for judgment and fit for draught: if it he so, the thought is father of the wish that there may he a Mr. E. M. Ward ready at tho right hour. It reflects ill on humanity that violence, treachery, iu. gratitude, and any evil passion that possihly forms part of its dcepest shadow, should have a fascination for visual rccognition that the show of sweetest virtue can never claim ; and it is not to he denied that the hest and kindest of peoplo who can never see or hear of anything dreadful without sluaddering, really enjoy a shudder sometimes. The dramatic painter's ocoupation would ho gone if there were no pleasure in heing most thumbed wero not the horrid ones,
Were it not for this unacknowledged affection for strong facts that invite the deepest colouring of imagination, who would not, if it were possible, forget the "Evo of St. Bartholomew?" Who can care very much for such a vacillatiug impotent as Charlcs IX., whose royalty alone,-and that was hat a name, -sarod him from being 2 thief of halfpence,-mean, in honest estimation, as the reancst ; or Catherino de Medicis, uuless for her traditional beauty and love of the fine arts? She would have had lcas latitudo in modera times, or have killed urbane, clevor Mr. Mills hefore his time had she left him room to talk of the rights of women according to her views of thom; for no man was moro conscientiously actuated and led by honoster conviction than Mr. John Stuart Mill. Mr. Ward has painted a very striking picture (207) of the caitiff king's visit to tho old hero after his attempted assassination, directed hy the amiable Catherine or Catharine, who now accompanios her sons, the King and Duc d'Anjou, to condole, The fignre of the royal puppet is admirahly expressive: looking aekance at the unhuckled sword that has done the State so much service, he seems to shy, and it is almost possible to hoar the words, - "My father, you have the wounde, hat I the pain." This he said at the moment when the massacre of the Protestants was arranged and impending. Two days after the poor old admiral was stahhed te dcath and his hody thrown out of window, that the moh, who loved him not, night do as they liked with Mr. Calderon painted, some yeara ago, a tage-room for camntic effect, It is scarcel necessary to say, that to look back indicates a stoppage on the road of progress ; it tolls, too, hy finger-post, that little progress has heen made. Mr. P. H. Calderon painted and paints admirahly : he raws carelessly soraetimes; witness the pon. derous arms of his charming lady-mother, who is saying " Good Night" ( 44 ) toa darling, with a summer seven o'cloek's glow to qualify her notion of time for her bahy-hoy, who has lept awake to see how mamma looks hefore stepping into hor hrougham, that is to convey her to a dinner.party. Moonlight was never hetter painted, seldom heiter imitated, than in the clever narration of fumny imcident, to those not immediately related, of guardian, hnshand, or
father diagarccahiy surprising a guitar-tinkling, bonquet-offering admirer of barrod attraction, by prosent chase and promised chastisement for his "Serenade" (181). Half the point ef the story is lost in the cemplete habilimont of the angry pursuer, for it dees not tcll of the hour, and in the certainty of his catching the denkey, who has already dropped a shoe, to say nothing e@ the poor attractiveness of the attraction, the caged hird of aong. An ordinary opportanity for the use of such geod means as are nudeniahly possessed hy Mr. Calleron shonld not suffico forhis application of them, any mere than mere mothed should ho trasted for right meaning gonerally. Suoh splendid aequirements as "Victory" (215) shews should get for him who has got them mere than the triumph of a temperary success. Reduced to the level of a present day's apprehension, this demonstration of a play on the gamut of female sensibility proper to tho occasion is but precodent, and its like may he found in more civilised times. Nohle dames of ancient story, who were awfully fond of fighting,-and may the shade of Dr. Watts reduce and again reduce the light of such pleasure for ladies,-are witnessing from a grand stand the athletic sports of the period. From the hattlements of a castle a bevy of fair women and ohildren, woll composed as twell as discomposed, wait the issue of a sortio to repel an attack, such as in foudal times was as common es an applioation for settiement of a butcher's bill is now. Some are glorying in the prowess of their lovers; others fcar for dcar lives; the widowed damo, who knows of old the cost of chances, contrasts the carelessness that certain youngheroes show,-long-haired, fringed-hrowed, fifteenth-century specimens, who think it a lark that their fathers should have to fight for their home, whilst swallows are quietly making nests in its embrasnros, to tspify, perhaps, tho grateful recognition of help that small and poor depondence sometimes gives with the selifishness of a gratitudo that wonld make the most of tho hencfit, and the least of the henefactor. There is nothing in common be. tween the splendidly-dressed dames and maidens -fair samples of tourvament times, when amongst the recommendations of a husband was the number of widows he had made,--no likeness at all shared with tho soft, dreamy dears that hask about "The Fountain" (72), Mr. G. D. Leslie's ladies aire lovely if lazy, ineffahle beings of languor, who live and breathe in perfumed atmosphere, and whose diet must ho vegetarian, rosc-leavos probably, for heef would be their death. The intcrested interesting lioness who waits the issue of the deadly combat of Mr. If Hardy's fierce lions (129) before fixing her affoction, gives a better idea of the spirit that ralcs the more heroic of the hcroines that wait and watch for "Tho Victory." "After the Victory" (91), by Mr. J. Faed, tells with great pathos of a soldier's death, an itera in the cost of battle lost or won. A letter has just arrivod that tells of the loss to mother, wife, and hnirns. The elder woman hends over the hearth made desolate, and is silently giving way to hor grief, inattentive to tho inquisitiveness of the grandson, a little fellow, too young to guess the cause of it, and even to the demonstration of misery's bittercst visitation to the loved aud loving one, wifo once, now widow, who, in paroxysu of lamentation, seems lost to all sense hut that of overwhelming sorrow. The orderly room, has such show of frugal comforts as makes it clear prosperity had given some promise of a happy returu for the soldier; and the evidence of housowifely care helps to convey the sentiment and point the force of the affliction. It is so grod and unaffected a rendering of matter-offact text, that if the story of the pictnre he a painful one, it is so well told as to release it of all other infuence than a very wholesome teaching of war's exaction, and that let death come when and in what form it may, there are tluse
to be left, perlaps, who can never be prepared for if. Even the brapest, who voluntarily face death in stern acceptance of a known daty, and are willing to face it to the last, arc turned thie dread they can appreciate, thongh they have it not. Mr. J. Pettie's three warriors with "The Flag of Truce" (.101); the old burgomaster, young caprain, and searlet.cloaked officer, an
wonderfully expressive of readiness to die; but wonderfully expressive of readiness to die; but the chanour of starred women and wailing of
infonts have quite persuaded them as to the right direction their valonr should take; no better fed han the most attennated of the sickly garrison the last to complain, the first to be hlamed for failure they least nccount for; these and such like heroes make a greater sacrifice than loss of life隹 their courage to keep arlow. Elected hy their cllow-suterers to carry deed of capitulation they are learing the besierged town, attended to the gate by a troop of women, who are lowd in their thanks and blessings for salration from further experience of a siege's horrors. This i certainly one of the very best pictures to h seen this jear, and will add very much to Mr. Pettie's repatation, -evidently a srowing onc, "ILo Roi esti Mort; Vire le Roi !" (G63), is the quack cry of remedy, - of substitute, - for many blessings gone, that may bo replaced. Mr. Marcus Stoue gives a literal and artistic prosentment of the proverb: for an old king lies dead on lowed his beek, and kissed the strong hand so long as it conld lift or fell, turn their backs to dead majesty, and cringe to the successor, can be but a small ono after all for whom toy and tolfy are riches; and tbe right of appoint. ing his own hour for croing to bed is the acmo of told, clown to the warrnat of the ry is very well smperiority compared with the human cnus for the Jast regaid paid to royalty's cold cnes; for from a dor in Nir. Stone's. relief to accompany Mr. J. C. Hook, and ander chate watch the mayes that mor sleep and seo thot out of doors lires The arioss Mr Hoo's pieturesty sibly; be should never step bero natural pos. sibly; he should never step beyond the agree.
able; cormorant-fishing is not in his way and is in his way if he would remain frce naturo's disciple
The next hest thing to finding a remarkahlo picturo by Mr. W. P. Frith, of the class that may torical Episode, is to perceive iu the lighter and slighter riews he takes of life's course his relaxa-ion,-recreation between the whiles of more exacting stucy. Such pleasant, pretty work as looking on, secures success for "Tbo Wianims Hazard" ( 221 ), though, as many a daucing daudy knows, the impulse of the ball does not always meet the pocket: and, then, archners and archery had, long ago, aflinity, beforo Sbakspeare's lover made "woful bullad to his "Euglish Archers, Nineteenth Century" (90) prull the long bow, if they assert anything that beyond showing the charms their pretty faces, sraceful attitudes, and unexcentionable get np grescnt, their aim can be ether than dreadful to thoso who cannot afford to be targets. Poor, impressionable young men have no husiness to laok at them. It was national and natural and nice to represcut "A London Flower-Girl" (976) as far more handsome than one of Boulogne ( ${ }^{\circ} 71$ ), though they both carry actual art of painting few can rival Mr Tritl It may be judged of Mr. T. Faed Mr. Frith. he is busy at something great, his contri butions here heing of small account to the summing up of his fame. "A Lowland Lassio" (222) hlithely tramping it with a brsket of brother and sister, - one on cither side litte is deftly donc. Her hazds, though, aro very hig. "A Skye Lassie" (2,77) is less striking bot more nateral still. "Happy as the Day's long would betoken that coolish weather and
no walking have made this lassie, -or yonigit "mo walking have made this lassie, - or yonngish bumnions: her boots are unconscious of her bumnions: her boots are homid story-tellers else. She must suffer in the opinion that is particular with regard to pretty feet.
Mr. A. Moore shows the salue
Mr. A. Moore shows the salue of good feet Follow my Leader" (146) would he poor bid. ding without. It is quite in conventional string
that Mr. Moore's darnsels run : scase of artistic adaptation has outstripped all natural appear. ance, and the artist's chief aim is at origivality -he out-Leslie's Mr. Leslic, and his ladies are not half so lovely.
Mr. G. A. Storey paints after Dintel example, and capitally well, too. "Scandal" (158) gives the school of its belovgiog, that taught the method of producing its day.light effect. This is a rery clever pictmre, and, with other evidence
besides, tells that Mr. Storey is not at bis hest

Mr. E. Nicol contributes several "studies" but his pictures are so good usually that his slighter work, if it bears his name, must be H. S. Marks seems to hare devoted all lises. Mr. H. S. Marks seems to have devoted all his eaergy to close imitativeness. "What is it p" (195), that his spectators hehold from the bridge that crosses clear river's run, suggests that bo with paints ilits so nicely that it must be wished lis capa. hall bring proof o " " Ornithologist" ( 380 ) is an ornithological wonde and it would be a clever bird that could top the fight of this, to show exactly the stuff of birds, and how well they cau be stuffed.
We hare promised ourselres more half-hours
the Royal Academy Exhibition.

A PROVINCIAL VISITOR IN LONDON STREETS.
To the occasional visitor to the copital, de sirous to note what changes or improvements (if ny) have manifested themselves in the more fwo, the completed fucade of the last year or Ho, the cowpleted facade of the Burlington hoardire and foardiug and scaffolding, will natorally be the first point of interest. Any expectations that bigh architectural ideal in a reasation of a bigh architectural ideal in a huilding specially connected with science and art in thoir higher forms, will, howcyer, meet with a hittlo disap. pointment. The one striking feature in the Piccadilly front is the large cotrance-archway in the centre, which is a success. The panelling and goneral treatment of the soffit of the arch is satisfactory, and to a certain oxtent original; but here the origiuality of tho structuro ends. In regard to gencral style, no douht, the archi. tect was tied to follow, to a great extent, at least, that of Old Burlington House forming part of the northern side of the quadrangle. But in such a building something of novelty and effect in the combination at least of the well. worn architectural features miglit have heon ralised. Wishing to see architecture vindicate her place among the living arts, one would hare preferred to find in a building erected as the home of our leading artistic and scientific hodies, more of tho picturcsque or poetic element in architecture than is here observahle.
The large building nearly completed, at the corner of Piccadilly and the Haymariset which is to be the liead qnarters of our leading upnosed) fine arts of eating and drinking, is a stately composition cnough in its way, the centre cutrance seems to hove been to some extent in spired hy the archway in the Burlington huild. igs ahove mentioned; the attic is somewhat eary for the rest of the building. It is not difficult to imagine why this design should have heen selected in the competition : the estahlish. ment is a vast advertisement, and the building exactly carries out the idea. It was a happy thought to indicato externally the special pur pose of the building by covering it with a pro usion of ornement of the kind usually found on vodding-cakes; and the London soot will before ong hriug out the points of the work in pquant manner. The best portion of the orna mental detail is in the panels under the third loor windows; these are boldy treated with pierced scrol.work of good and freo design he portrait statues of the proprietors, altixed to the front, with the names "Spiers and Pond dditom, $n$, ra ane the tind so much of the nohler and of those ormanity preserved in the persons in the nimeteenth century.
Crockford's Auction Hall, in St. James's.street
aso nearly completed, is ene of those solid, heary , wildings witb big columns, in the Roman style,
which seem to say in so many words, "See how much solid masonry we can afford to indulge in ? If the characteristic of too largo a portion of modern society he, as some oynical people say, wealth without intelligence, surch bnildings a this at least reflect the spirit of their day, and are, so far, truthful architecture. This kind of arohitectural expression is too often found in huildings erected as hanks, aud it is on that account the more gratifying to find, in the smal front of the National and Provincial Branch Bank in Piccadilly, a design totally free from vulgarity or ostentation, and in which the details are treated with no little refinement and originality. The design is of the Classic variety with columns ruyniug through the ilet and second stories, the angle portions of the wal treated similarly as pilasters; both columus and pilasters encircled by a broad brud in the centre. A peculiar character obtaiued by the use of sharp straight lines and equare edges, is is ap throughout the ornamental detain, which is hoth refined, and for the most part effective reatment of the capitals of the ground foo Altogetber this is a very nice little bit of work. Turning our steps Citywards to note what has been done in the regions moro strictly devoted to hnsincss, we recornise in the nery "Ludgate Circus" an admirable site for the effective grouping of street architecture. At the porth cast angle a pretty good Gothic building has heen, some little time since, erected, and the oorth.west angle is now newly occupied by the large huilding for "Cook's Tourist Offices" thy hope that such a site may be adequately treated is much sued by the aspect of this rely treated contribation to the architectur ensemble How much io suggested by a buildiog for such Hour pose is of a pur ion an detal ion and detail gos the business of "f tow ${ }^{2}$ to al1 purts of wuropo (or of the world) touring to all parts of Europo (or of the wortd) was to he arranged: And this ande site, whin three frontages, and all these associations, could mothing better than a tame collectiou of pedi monted windows and wreaths of stone festoonery the one detail in which any sxgniacance is at. tempted heing in the plum-pudding shaped lamp meant for the "globe" over the door, flanked by two cheruhs, Cupicls, or some euch cnttle. It really is deplorahle. Next to this architectural elfort is the building by Messrs. Woodzell \& Collnitt, the drawing of which was noticed in tbe review of architecture at the Royal Acadomy, and which quite bcars out, in execution, what was there said inl cjmmendation of it. Opposite to this an inlinman block of "hole in.the-wall" orickwork lies heary on the soil, is further con. tribution to the new arelitecture of the London streets. On the wost side of Bridge. strcet, near the river, the Economic Lifo Assurance Company aro going into an economical building, which, however, is by no menns in the chcap-and-nasty" style. The matcrials are mostly hrick and terra.cotta, treated in a kind of Lombard-Gothic manner; the brick reveals showing bold roll monldings at the angles. The erracotta is chicly applied in quoins and in abmental archivolts of a somewhat too caz refinemescription. There is rather a lack of wortby. Further up, on the east side of Farrincdon-street, is a great development of Geometric Gotbic of the orthodox type, in the shape of a largo block of building at present only half-way up, and therefore not to be rasbly criticised The senso of sotiety whe one cxpericnces howerer in soming weross his now well wown trpe of Gothic so sminahle ste in is instructive, as indiounle how surely erery orle sood on bad mus. all whelly archroologieally. Ladgate-hil presents nothing Mescre Tribber, publishing ponse and Messrs. Trubner's publishung-house, and an of architecture at tho cormer of Old Bailes. It is in the east cnd of Victoria-street that the tug of war comes. Passing over a large hlock of half.finished building between this street and Bucklersbury, we come at the corner of the attor to a just completed facade of Frencb Gothic type, which has considerable merit, 80 far as the scaffolding still remaining at tho time these notes were made would allow a fair view. The pointed arches over the windows are deeply
*The premises erected in Piecadilly for Messrs
Sotheran, Baer, \& Co., hare been before fully deacribed
recessed, but with square window.heads nnder thera, tho spaco over the window docornted with carved rosettes cnt into the stone; wall-diaper is used in the outor spandrels; the arches are
carried on dark marhle sluafts. An interesting carried on dark marhe shafts. An interesting
comparison may bo institnted between this and the hailding adjoining it, -a loug row of shops and offices, also refined and oriminal, though in a different typo. This is a palatial Italian build ine, the main story consistivg of a deep arende of circular-headed arches, carried on semi octagonal piers, panelled on each face. The octayonal piers, panelled on oach face. The window-he:ulle are again square, and the spaces
over them filled in with flat ornamental carving, showing much grace and variety of desigu; in showing much grace and pariety of desigu; in
the story over this the pilasters are well and the story over this the plasters are well and
piquantly treatod; the attio dormers are somepiquantly treated; the attic dormers are somewhat fromy, ono chimney-stack to another, looks mery odd and out of place. This is a building, however, charactorised by much refinement and good taste, and taken, as it is now, in tho hloom
of fresh.hewn stone, may very well be preferred to its Gothic neighhour just reforred to: the question is, how will it ho when a few jears of smoke hare dono their work? The details are
too delicate, tho projections too slight, to stand against that for long. We should suggest to the
a architect to gild the centre portion of the spandrel ornament over the principal windows ; it
is in the style of flat conventional ornament, is in the style of flat conventional ormament,
which will very well bear snch treatment. It which will very well bear such treatment. It
is unfortunate that no attempt has heen is unfortunate that no attempt has heen
made here to contend against our enemy plate. glass, upon which the whole structure will apparently have to stand, as nsual in shop archi. tecture. Opposite to Bueklersbury is a long the samo haud, exhihiting the stock feutures of pilastors, pediments, and wresths, withont a surgection of anything nrther being neccssary
to make a respectable strect huilding. The huildifg at the corner opposite the Mansion Honsó (erected some timo ago), shows that the architeet appreciated the opportunity afforded for a sationt featuro at this angle; hut the type of Gothíq oxhibited is by no means fery refined. farcs of "tho City" time-bonoured thoroughfow new architectural features, the most note. fow now architect ral featares, the most note.
worthy being Nir. Norman Shaw's offices, which wor so well illustrated in his drawing in tho Acodomy. The building scarcely looks so well in execution as in the drawing; a groyer brick would surely have heen proferable for tho piers, or, at all events, a hrick with more tone and texture than those somewhat raw-looking "patent
red." There is an arwkwardness in the carved stone panel in tho upper portion of tho centre, whioh follows the plan of the window, curring
ontwards in tho centre portion, and as the outwards in tho centro portion, and as the
stone thus has no straight hearing between the brick piers, and no visible support but tho wooden framework below, there is a certain ofr of instability ahont it not satisfactory to the eye.
This building, however, will certainly make a This building, however, will certainly make a feature in the streot, and one which overy newcomer, probably, will tarn to look at. No. 119 ,
Leadenhall street, is a neat design, a kind of misture of modern French and "chamferesque," well dominated by a strong cornice across it, with attic over; a more strip of building, but showing sensible and careful treatmoni. No. 7 k
is a work of the same class, with much more is a work of the same class, with much more
decisive aim at originality, and into which colour as well as form enters. The design is in that hard straight-lined manner, rather resembling cabinet-work, which is affected by a certain to a great cxtent, aud wants diraity and truly architectural character ; but it is in thisinstanco well treated, and bas a consistent effect. The polychromy consists in the employment of red brick aud two tints of stone-a drab and a very
delicately-tinted blueish-rrey stone. Tlie effect is exceedingly good now that the building is new; hut it certainly cannot last very long. The small square granite sticks, upon which the
whole desirn stands, are an unsnccessful com wromise hetween arohitectural effect and the promise hetween arohitectural effect and the
demand for light; the building could not really depend for all its support on these, althongh it is made to appear as if it did. T'lie bands of grey stone across the piers of the middle story are decorated with flating and rosettes; the attic and dormers are ratber heayy. There is, however, distinct and definite character in this
building.

Returning along Victoria-street, and past the
terrace of "harmless" buildings hefore menterrace of "harmless" buildings hefore men-
tioned, one maj a tice in the block called "Albert

Buildings" (south side of the street), a someWhat picturesque treatment of a character based a French Cothic. The shops on the ground. story are divided by pilasters which givo a solid story, with its wide secmental wehes, including wo smatler openings nnder them, has a not uupleasing air of "Viollet.le-Duc" about it. Thore uilding cantilever cornioes on the faco-of the cantilevers of the mais cornice are continued brough, and a similar cornice is repeated os a rown to tho raised story, so that here there are thee rows of cantilevers one over another. his is too muoh, and overweights the design. The treatment of the string over the design. foor, with an overhanging anved bonling ourbed on the onder sido is good mong curved on tho under side, is good, and snitable bo some ornament neor the there stousd always be some orname near the eyo to attract the parser-by on the parentent. The attic is heary, defect which the new town bnildings seem generally to run into. Near this building, a few
steps from the main street, the new premises for he Mutual Co.operative Society, present an example of a well and broadly-treated classic (Roman) design, of moro than average merit. A large " order " of two columns, upon a simpla rusticated basement, flanks the centre portion, anning through the second, third, and fourth stories, the fifte story of the design being occupied by a largo arch springing from the archi. rave over these columns; the space between the columns is treated as a bay with a flat scgmental Garve on plan, The wings of the design are by a tolerably heary cornica, which the centro over the columns. The ornanental detail is not novel in type, but is executed in a manner to retain its effict, depending rather on plain sinking than on surfaco work. The front is further enlivened by ornamental iron balconies ie la Français. Though in an old style, this deserves to bo called an original design, and is treated with a pleasing breadth and sitnplicity.
In the western portion of Victoria-strcet, buildings are at present spriaging up, but slowly and separately, and in the main there is no high averago of architectnral merit among them. The the north side, with the monogram, "P $P$ in $P$ and S .," over the door ; and tho haads of a lion, a bear wolf, and a ber which mysterious animals the deponent did not gather. Thte building is a very good solid-looking construction, of brick, stone, and terra-cotta with heavy square stone pillurs on the ground story; hrick piers are run through the two next tories, and torra.cotta wall-diaper introduced in tho spaces hetween the windows. The heary bracketed cornice, abruptly stopped in the centre inder a dormer, has rather an awkward look; front in tho main this is a very satisfactory "front," and the carving, especially the conven. tional foliage of the mpper capitals, is exceedingly good and suitahle to its position. A warehouse ronting to Ear-street, but at present seen from Fictoria.streot, in which considerahle use is inade of monlded brick and terra-cotta diaper, looks very well, has heen carefully studied, and is worth ittention. Furthor down on the south sido is a sample of what to avoid, in the shape of a fearful buff hrick building, with yellow brick dressings,-i combination odious to tho eyes, even as regards tone, let alone design; a scraggy griftin aud a couplo of garlands adoru the peament at the top, with the date, 1873, posterity to bnow over, as if it woun such a thiner was erected. Next to this is a brick huilding apparently prepared for cement decoration at salient points; this may provo a good
idea; the use of cement, richtls treated as a partial decoration, is quite worth experimenting apon more than has been done at present. Next comes another yellow hick affair, with white stone dressings, and a mighty development of koystones; and next, acein, a very "streaky" building of parti-coloured hrick is gettine inito shape, and is facell ou the opposite aide by a collection of pilasters and consolos in the ortho dox manner. On the whole, things in this noighhourhood are not very encouraging to future architectural prospects, and it wonld seem that some at least of the dregs of architecture have settled at the lower extremity of Victoria. street. There is appareutly, however, a now epoch just started in moderu architecture, which as yet has ecarcely got boyond tho drawing-
papor stage of derelopuent ; but on some fature
accasion the "Visitor" may find his ocenpation chronicling and characterising the developwhich of the Jacobean and Queen Anne styles in Euglish nineteenth-century architecture.

MACHINES AND HARDWARE IN TIE INTERNATIONAL EXHIBITION.
Wrien the opening of the Explibition was noticed in the Builder of April 19th, it was stated that a good many finishing tonches stil? remained to be given in certailu departments, and more serions arrangements had jet to hi made in others. The machinery-in-motion condition, but may be said to be now in complete working order, several important exhibits having ween added sinco that time and now all that to be orpected in this inor, and be seen at work throurghoat the day, or partially be seen at wortervals.

In Room V., western side, a powerful, beauti fully-made machine, by Creerson, Ormerod, $d$ Co., of Manchester, has been erected to sliow the working of Beaumout \& Appleby's Patent Diamond Prospecting Machino for deep bort holes, capahle of boring, by a "crown" stadded with eight or ten real diamonds, a hole in granite $1,000 \mathrm{ft}$. deep in three months ; with two singlo drills, forming part of such a set as is used in tnanel-driving nachincs. Tho machine has beet shown in motion, and works vely smoothly, bui its capabilitics can no nore bo judged of, mnder the circunstances, thau the quality and flarom
of the preserved meats, fraits, \&c., of which of the preserved meats, fruits, \&c., of which
such an enomons variety is displayed, can such an enomnons variety is displayed, can bo the outsides of the tins. The drill-head, how ever, is to he shown in operation, as used in mines, quarries, and railroad-cuttings,
Harris's Disiutegrating Machines, one for grinding flour, the otber for pulverising ores, minerals, clays, manures, de., call only be shown in operation partially and at intervals, an in snperahle difficulty existing in the impractica bility of either convering enough of raw material to satisfy their rapacious nuas of of carrying off their produce. Mr, Marsden, of Leeds, avoids thio practical difficulties just referred to hy exhibitince models, with the latest improve ments, of Blake's stone-breaking and palverising machines. A full-sized maohine was exhibited at the International Exhihition of exst vea which was attended, in showing it at work, wit the inconvenicnces named. The models with exhibited are woll made and of moucieuts now shor machines withont prolacing an embarras th embarrassing In the same reon
mang manes for arrying out the sund-blast process for engraving gluss, stone, sc., by stean-power, is also at work of almost any the sheet of almost any length can be dealt with; the sand-blast in it is directed from above upou the glass. In the perforating rachine the blast is sent upssards by the action of a vacuum. I engraving, somo beautifully delicate specimens from lace, \&c., are executed in the presence of the visitors. In the perforating machine, roses stars, Maltese crosses, and a great variety o complex geometrical designs are cut out with the greatest rapidity and precision.
Noxt the sand-hlast machine is the maccaron making machinery, which was put to work foc the first time on Honday wees. The attendants are picturesquely dressed in the Neapolitan cos tarmo, in which white and scarlet are the pre vailing colours, the mether cxtremities of the workmen being encased in tight-fitting buft lacing boots, with patent leather tips. The mill in which the dough is worked is a poncerous machine, being a circular trough in $w$ hich a heary grinding stone attached to a vertical shaft, and itself placed vertically, revolves and works the moistened scmolina into it thoroughly homogenoous plastic condition. "'lle prepared dough is then pressed through tubes, and con into any length that may be desired.
The machinery of the sugar hakers and boilers now in active operation, some of the rotary and eccentric morements of the copper pans: effected by very ingenious mechanical contrivances, prodaciug motions admirably adaped for the purposes they are designed to serve. The same may bosaid in so far as the excellence nd suitability of the machinery emplosed is concerned, of the exhibits of the mamipulators of
chocolato, coffee, cocoa, and the mal
aërated and socaa watcrs, and lernouade
Tho machinery and apparatus for mustard-
making of Messre. J. \& J. Colman, are now in full making of Dessre. J. \& J. Colman, are now in ful operation, and are, in the character of the work. manship and materials of the fittings, the ingennity of the machinery, and the excellent
taste displayed in the entire erection, highly taste displayed in the entire erection, highly
creditable to the firm, who do not need to be creditable to the firm, who do not need to be referred to any Continental oxhihitors as patterns of taste, but rather set an example to them. The sive processes of bruising, ponndivg, sifting, dc. aro well worth attention. The firm does not claim or exercise the right to sell goods in the building:
In Room I., west galleries, the most attractive ohjects are the marvellous Jacqmard loom of Mr. T. Stevens, of Coventry, and his artistic productions, which are among the highest triumphs of textile art, and probably unequalled for the delicacy and perfection with which they are executed. Wo can conceive of collectors, hiblio. graphers, or others, of futnre ages, glorying in cho number and beanty of their specimens of loom was employed, whon we save it at work, in tho prodnction of enshes of rich and elaborat design, that required the nse of no fewer than 16,000 cards
Amoug the specialties in the present Exhibi tion, the cooking-stoves, and other culimary atensils, of which there is a large show and i inspection. Mr. Sidney Leoni, who mares al extensive display, publishes a very importiant extensive display, problishes a very inporthat
letter, in fuc simide, from Mr. Nixon, House Tovernor and Sceretary of the London Hospital, who testifies that the saving from a year's working of Mr. Leoni's cooking arrangements at Sio hospital was $10,000 \mathrm{lb}$. of meat, and about 3132. I2s Ther about 3132. 12s. This was in the first year of its ase, iu the second year, the $1872-73$, the saving has tmounted to 500l. Sereral practical demontrations have been given of the capabilities of the family kitchoner. In twrenty minutes, and with a consumption of 12 ft . of gas, a breakfast whas prepared for five adults and three chilitren. It consisted of two pints of cofliee, 1 pint of tea, $\frac{1}{\frac{1}{2}} \mathrm{lb}$, of bacon, $\frac{1}{2} \mathrm{lb}$. of oatmeal for porridge, wind six rounds of toast. Tn one honr and a balf, was cooked fadiure of 18 ft . of gas, a dinner ${ }_{t}$ consed for twelve adnlts and three children. f beef, 5 d . 6.10 . leg of mutton, $4 . \mathrm{ib}$. sirloin ${ }_{2}$ large frnit-pies. To 100 ft . of ordinary from 35 to to parts of air are added by the pro. ※s3: rcflectors are also employed to take the ditinost value ont of the heat evolved. In the same class Messrs. Billings \& Co., of Hatton. farden, have a variety of cleverly-contrived, rell-made cooking-stoves for roasting, bakins, looiling, grilling, and toasting. From a stove, 36 in. by 15 in., with a hot-plate, 22 in. by 16 in., the following resulis have been obtained:-A oint weighing 9 lb ., a large family pie, two ducke, two sorts of vegetables, fish and sonp, have beenc cooked in two hours, with a consumpiccording to the rate per I,000. Wrisht, of Birning buma, also shows a munber of excellent sound and square gas.cookiner stoves for wes with atmospheric gis and atmospherio burners. Tr. TYright hins silso numerous pther ourners. trivances for culinary operations of different kinds. Amony o'ber exhibits of stoves and ranges, is a very gond display of handzome stoves, heated by coal or wool, by Messrs. Murlange, by T. Cusstantine, of Kingsland, in wange, loy T. Cusstantine, of Kingsland, in portant extent; and Messrs. Bailey's, of Hol. portant extent; and Messrs. Bailey's, of Hol. stores. Ainong the more imposing exhibits, in Toom YXIII. Well worth attention are,- the superior improved ranges of Brown \& Green, Bishopsgate-street; the cooking apparatus
Benham \& Sons, of Wiguore-street; rnd of Benham \& Sons, of Wirmore-street; and of
Edvards \& Son, Great Marlbornach-street ; th Edivards \& Son, Great Marlborough-street; the Declipse Range of T. Nock, Birmingham; the Devon Tor Range of J. W. Gray, Torquay; and
the Woroaster Rance of Messrs, Jones \& Rawe the Woroester Ringe of Messrs. Jones \& Rowe ; with numerons otletrs, of which limited spac prevents mention.
If Roors XXXII
 ing, marks, as it does, great progress, during the list quanter of a centnirs, the evidence of pro-
Ifress in the East and West 0 izadranis is no less luarked, and impresses the visit or with a sens of the maguitude and importance of ners branches
of industry that have sprang into existence during that period. In the West Quadrant, the Exhibition may bo said to commence with Pro fessor Frankland's valuable illnstrations of the ingredients contained in water taken from variuus sources of supply, and his illastrations of adnltera tions of food, that are worth fuller comment thar can now he devoted to them. The exhibits of preserved meats, fish, poultry, sonp, frnits, vegetables, se., are quite bowildering in num her and variety. The number of exhibitors is also large, and, curionsly it may seem, some of the largest exhibirors hail from Sootland, and cven from as far north as Aberdeen.
Passing on to the Albert Hall, it will he foumd that, in the interesting display of steel and cutlery goods, that part of the Exhihitiou has been linshed hy the filling up of the cases and the wall-space appropriated to Mr. Wm. Mitchell, Londoninent pen-maker of Birmingham and a distinct and new indinstry that reminded of into existence in the liffotime of the present generation. Mr. Mitchell's exlibits show stee pens of numerous sinds in all stages of progress, fron the crnde steel to the polished, finished pen. The case containing examples of tho varions sorts of pens has ahout I00 varieties, varicd alike in price, shape, and capability,-one or other fit, and more than fit, to execute any lind of caligraply that was ever done hy either the bests. dressed and finest-pointed crow-quill or hy the messed flexible harrcl ever taken from a swan's wing. The well. known Perry, and a firm from Boulogne, rake also good displays of steel pens of rarious kinds.
In this room the trophy of the Hisquarna Small Arms Manufacturing Company, Jōnkōping, Sweden, is well worth attention, as an excellent piece of cabinct-work, - excellent alike in design, material, and workmanship. The collection of 8 words, as used in every hranch of the service, Son, of Pall-mall, commands attention, as do also the swords, lances, javeline, fencing foils, \&o., displayed by Messrs. Wole \& Sons, of Birmingham. In locks, keys, and safes, Chubb \& Son are conspicuous for the exquisite beanty of the workmanship shown. Messrs. Hobbs, Hart, \& Co. and Mr. S. Chatwood also make good displays of their work. Messrs. Spear \& Jackman, of Shetheld, have a case and space so filled with saws, files, ediged toons, agricultural, horticultiazal, engineers', smiths', and mining tools, as to gratity beyond wor interest in their inspection an catulogne entry. Messrs. Unwin \& Rodgers, of Sheffelk, hold their own, which is sarying a good deal, in the fine display they make of table cutlery, armonr, dirks, and knives of all sorts Messrs. Howell \& Co., of Sbelfeld, show welk in fles, in "homogencous" cast steel for boilers, Cobes, circnlar cntters, \&c. W. Gilpin, gen., \& display of beautifully-finished garden tools, choppers, augera, hatchets, axes, adzes, with other' oarpenters', shipwrights', masons', plate. lagers', and other tools. Althoagh a prominent and excellent display, we do not find Messrs, Gilpin's exhibits entered in our edition of the official catrlognc. Messrs. Pearee, and Messrs. Taslor, Brothers, of Sbeffield, have each admirable displays of filos, the latter firm showing saws also, and machine and other iknives. Messrs
 great in joinors' tools, in mortising irons, gouges, risticully artistically prepared nud arranged, and forming objects.
Time would fail to tell of all the effective displays made in this department, chiety by London, Sheffeld, and Redlitel firms. Kirby, Beard, \& Co. slow largely in fish-hooks, harpoons, and needles of various kinds, and some xquisitely beautiful needle-cases. W. Bartlett sons, of Redditch, showr a great variety of needles, of almost all sorts. Thos. Newton, of Walsall, takes the lend in his display of hidide. hits, stirrups, hridoons, spurs, curhs, and what may he calied eqnestrian cutlery, or metal fur niture. Messrs. Mappin \& Webb show a variety of cocd cutlery for domestic and private use; exculent display of table-cutlery, spirs, \&ic.
Whatever may beasserted of other departinen the Exhibition of 1873 , it may not be sai with trnth, - so we feel, - that the exhibition of ment is feebly or inadequately represented.

THE THEATRE IN THE ALEXANDRA PALACE.
THE stage for dramatic and operatio perform inces, which is situated in the north-east tranept, is of very large proportions. It is 60 ft . in depth, while its extreme width is 85 ft . The prosceniun
n height.
Above the stage are the fies, consisting of wo tiers, and above them arain is the ron floor, from which are worked the various loths, borders, gas battens, \&c., used in the ifferent representations. The height from the and the oxtreme heirht to roof go f
A spiral iron staircase, 5 ft . in diameter, com municates from scene-dock to upper flies, affordng the quickest possible access to sll the vorking machiuery of stage and barrel-loft, as aliso for the development of
tion and other scenic effects.
Beneath the stage is a large
Beneath the stagc is a large cellar, capable of eceiving the heariest set scenes that may be equira. The oph for the reqnite comesion he the it may feqnite morsing of orking, thay be noticed lac for its safe y perang fluy persons falling through the stage when ron" ${ }^{\prime \prime}$, or保 nvention, and for some other contrivances in
connexion with the same, Mr. Walford Grieve connexion with the sam
Great caro has boeu taken that the stage of his theatre should be unexceptionable. In order o arrive at this resnlt, the machinery and appli. nces of theatres, not only in England, hut on the Continent, have been studied and examined. the consequence is that there are many features this parb of the bindiug which have not been een hefore in this country, and the whole conomy of the scenic att will here be carried out, it may he hoped, withont that confusion, noise, and delay which so disfigure the drama yen in many of our prinoipal theatres.
The dressing-rooms, wardrobe, lavatories, and other conveniences, are sitnated at the rear of the stage, from which they are divided by a par-
tition wail and corridor extending across the ntire width They consist of hasement, gronnd loor, and story above, approached by spacions taircases, tho number and size of the opart. ments on each floor being nniform.
The front of the stage on each side of the proscenium has been handsomely decorated. Ornamental pilasters and mouldings, with csrved capitals, from which spring an arch wary extending painting executed by wr. Jich is filled by a large eiety of Painters in Water Colours. The designs for the modelled ormamentations and coloured decoration have been supplied by the architects of the Palace themselves.
The auditorium space in connexion with the theatre will be that portion of the main avenue immediately in front, with the sonth.enst transcpt opposite, thas forming one huge parterre for spectators, with reserved stalls sitnated direetly behind the orchestra, which is slightly sunk below the ground floor of the theatro, doing away with the asnal obstructions to the view of the andience. The galleries imuediately adjoin. ing will also be thrown into the theatre. While the theatricat performances are taking place the theatre will be screened off from the rest of the Pdiace, and daring the atternoon perform.
ances it will be darkened by an ingenions con. ances it will be darkened by an ingenions contrisance, this allowing
have their full effect.

The whole of the drawings for the construc thon of the stage have been 8upplied by Messrs. Thomas Grieve of son, and the wo:ks have heen of 3 r . stocked lirs Gieve. Nite sufici-nt been general purposes, and which has beon painted hy Messis. Gricre \& Son
The opening of the Palace is fixed for the 2tth inst.

The Frescoes in the Royal Gallery. - In隹er to Visconmt Hardinge, in the Honse of Lords, the Dake of St. Albau's said that a report on the state of the frescoes had not yet been testing Mr. Wright's process, which wruld neeus. sarily toke time. As soon as the report was received it would he laid before their lordships.

THI MIDLAND HOTEL, ST. PANCRAS. Tasat portiun of the costly Gothic atructurd in the Euston-road known as the Midland Grand Hotel, which has heen iu course erection for somo years past, and which is
from the desigus of Sir Gibbert Scott, has beon opened, as wo lave said, for business The architectural character externally of this building is well known, and has already beer described. It is the enstern portion only whicl was opened, but this alone contains betweer
-250 and 300 apartments, including ladies' and 250 and 300 apartments, including lidies' and rooms, hilliard and smoking rooms, and private sitting rooms and bedrooms. The principal dining-rooms, coffee-rooms, and other public rooms will be in the western portion of the hailding, now in course of erection, and when
this is completed this hotel will he one of the largest of its kind in the United Kingdon, aud have aceommodation for upwards of 800 visitors. The wisdom or otherwise of the expenditure incurred we will not now discues. The interior of the structure partakes of the same strictly Gothic chavacter which distinguishies the exte Gothic chavactor Which distinglisises the exte
rior. This is specially obscrvable in the spacious corridors, upwards of 330 ft . in length, which run the whole lengtl of the hotel on the several floors. These several corridors contain hand somely-soulptured areades, with marhle columns. The sides of the floors of the corriflore are laid and patterns, and tho ceiling of the colours corridor is richly decorated in pauels on a palo blue groumb in gold and varied culours. The Whole of the interior is most elaborately and lavishly decorated, apparently withont the slightest regard to cost. The spacions aud massive staircaser, of which thero nse three in
number, arc not the least striking in their structural arrancements as well is in their decore tive and ornamental character. All theso several staircases are painted and enriched. They are all open to the top of the building. A description of the principal circularstaircassin the centre of the buiking will apply to the otber two so
far as regards both their structural features and far as regards both their structural features and
ornamentation. The aren of this staircase is 20 ft . by 15 ft ., and on the first.floor landing thero are two circular marble colimns, with arches in Portland stone, whilet on the floor above there are also open Gothic arches springing from hlue and Devonshive marble columns, and in their general chavicter being uniform with the columns on the first-floor landing. Arourd an ornamental lantern-liglit over the staircase painted and gitt ceiling, and in nngular compurt. painted and citt celing, and in angilar compurt. The whole of the rooms on the first.fluor more The whole of the roms, on the frst-noor more ,ynt the principal sfate-room, as it is designated, Wht the principal sfate-roon, as it is designated, piecially ho noticed as the most gorgeons apart. speciatly bo noticed as the most gorgeons apart.
ment- in tho entire building. This eplendid ment- in tho entire building. This aplendid apartment is divided in the centre hy two orna-
mental metal and gilt arohes epringing from mental metal and gits arohes spmining from double marble columns, sarmounted by richlygilt capitals. On cach sitio of the colverns Gothic canopies supportine ancgorical painted chase. The walls are decorated with dark green tapestry, with entichments in goll and red diaper. The veiling is divilod into geometric combinations of a circular form, and the gilding nind decorations are on a pale blie backgronnd. Tho Indies' small coffee roon, or reception room, adjoining the last-named apartment, is also most. Inxnrionsly decorated, the wnlls heing enriched with ornainental woodwork, gilt and relieved in varied colomrs. The oeiling is painted in ava. besque, with fignres ropresenting the seasons It is unneceseary to say more of the rest of the apartments in the hotel, than that they are ail very highly decorated.
The contractors for the building are Mesers Jaekson \& Shaw; the decorations, of which we Sang. The cast of the builling, when finished is set down at something more thau 300,0001 irrespective of the furnishing, which, it is said, will amnunt to about 100,000 . more, It it confidently stated, however, , inat prach on thit large outlay by tho rentala of vaults and ot hes premises on tho site originally purchased ta them in Somers - town. This, however, if yet to bo seen. It is understood that, is
property at a comparatively low figure, a con idcrable portion of it consisting of back land and infertor stroet cotuages; and that the new horoughifares which they have constructed in the neighhourhood, and the large and spaciou vanlts uuder the whole of the station area which they have erected, hare for some years been pro ducing a very large maual rental, thus onn.
tributing towards the eroction and completion of tributing towards the erection and comple
the building which has heer inangarated.

THE HOUSE OF THE LATE THOBAS поРе.
A buef forgetinlness led, in the arciele a onr last number, on "The Marylebone Squares," to the error of reckoning Thomas Hope, tho author of "Anastasiss," armong the elebrated inhabitants of Cavendish - square, The honso (now divided) at the corner of square and of Harkey-street, occupied aring the last century by ho Princess Amelia, and in tho present oue by Wr. Wason zaylor and Marshal Beresford, was, luring an iatermediate period, the property of his kinsmau, Mr. Henry Hope, also helouging to that hranch of
the Scoteli fannily of IIope which settled at the Scotel fanily of IIope which settied at
Amasterdam in the earlier part of the seventeenth century. Henco the mistake. Mr. Thomas Iope's own houso, howevor, stood within a stono's throw. It was a argo mansion, ontre cour et jardin, facing Duclese, Mansfied, and Queen Ame streets, originally built daring the lust centinry ou a fircproof plan by a Colnstess of TVarwiok. Afterwards it was ozlarg. d with picture and senlpture galleries by Mr. Iopo at the beginning of tho prosent one, and by its contents became a veritable masean; whilo its fittiugs and furniture,-designed by its owner in the revired Cassical style, of which ho was protest in recentages in larour of the application of art to domestio uso. This mansion has lunc boen replaced by small, common-place streot houses, and its memory chiefly survives in its proprietor's sumptanus folio ou "unsecs is described aud figured in illustration of the prinoiplos of induatrial art.

THE GOVERNMENT AND IMPROVED DWELLINGS FOR THE industrial classes.
Tras adjourned disoussion, before the Special Dwellings Committee of the Charity Organisa tion Society, of the resolntions proposed hy Mr Storr, with regpest to the Government heinis
called upon to uudertake the erection of dwell ings for ther inder Wednesday last, Lord Napies in was resnued
The discussion was renowed hy Dr. Liddel Who stated in the outset that he could not agre with tho resolutions of Mr. Storr. A Board of Commissioners, appointed as suggested by the resolutions, would not ohtuin the confidence o the ratepryers, aud he was convinced that on Goveruneut whatever would under take the for mation of such a commission. He contended Boards required wors was altngelier for local But ho was of opision that the Legislature might advantagoonsly bo called upon to bring into oxistence on additiomal sanitary power with reference to the demolition of uninhabitable houses. The several private associations had inrs, butt thes lued buitaing of improved acd the renopal of houses not fit to live in : and he hel ofat the Leegislature night fairly be asked t civo further powers to local and other Boards fur this pow Tisl referenve to the coard demmation of uninhabitathe dwellings, too mhel power was now centrel in the hands of th uedical officer of luealth of a district, who hat Bisinclination to condemu bouses totally mufis for hnman habitation, for fear, on the one hand, of iving offence to the ratepayers, and on the ther, of coming juto collision with the locn Boards themselves, who in many cases place hcraselves in opposition to the views of the medical oficer. What was, therefore, wanted was the constitntion of a central Board o Health, whose aid should be called in in the ases of houses not fit to live int, and the re huilding of hetter dwellings. It was true that
The resolutions, toger ther with the discussions
wo had already the Local Government Roard and the Metropolitan Board of Works, hut neither the one body nor the other had powers aeither the one body nor the other had powera propesal was that the Miptronolitan Board of Wroposal was the the Works shoul he ahe wowers dwellings es the ruardians and local bodies divelings as the guardians and ocal bodies, and shonld be appointed, who shall mive ther healu shonld be appointed, who shall give their assist ance to the existing medical otficers, and that the medical officers to he so appointed should be constituted a court of appeal.
Tho Rer. Mr. Dentor was opposed to Mr. Storr's motion, on the gromed that it would lead the community to rely noon the Governmont rather than upon themselves. He attrihuted one of the evils under which tho industrial olasses in the metropois wcre suffering to the demolition of their dwellings and over crowding, to the evasion of a standing order of the Hnise of Lords, that in all railway and other Bills of a like character, the promoters should state the oxact number of houses and persons they inteuded to displace within a given area. The reasou why so many of the poor bad been removed and rendered houseless by public works within the metropolis, without the slightest compensation, was, that they had no rishts in their holdings like leaseholders. It was worthy of remark that railway companies in the metro. polis avoided, as a rule, going throngh the property of those who were entitled to compensa. tion, aud carried thoir lines, oven by a circaitous ronte, throngl districts in which the poor resided, who were thus turned out without the Elizhtest oompansation. Ho strongly urged the impostanes of tho standing orders of Parliament being complied with, and of railway companies boing compelled, even at the throsbold, to declare in all their Billa for new wolks, the number of honses which they proposed to remove, and the number of persons they intendod to dispossess.
The Rev. R. J. Simpson was uuder the impres sion that in the fuce of existing evila as housing the industrial classes, it was nowise any lunger to leave the subject in the hands of local Bourcts anl privato associations, and that somo such resolations as those proposed by Mr. Store asking the Government to interpose, were highly desirable
Dr. Greenlikl sugrested that Mr. Storr's oject wonld he attained by the Legislature ex tending the borrowing powers of existing build ing associatione, accompanied also by their being armod with oorapusory powers to pur. chase and take down inferior property, and huid new dwellings for the industial classe Ie moved an amendment to that effert.
Mr. Freann, member of the Metropolitan Buard of Wurke, forcibly urged the desirability of some great central authority being constituted iu the inetropolis for the oarrying out of the rennired work. The Metropolitan Boark of Works had not power to grapplo with tho evits The Corporation of London ought to opeu tis sanction being givon to a comprelensive measure appointing as etcat central authority, with corporato and nunicipal powers over the cntire netropolis. Liverpool, Munchester, Glascow, and ather gront commonitios had alvendy these owe ho did wot see why the metropalis should not hare them also.
Afer somo furcher fiscussion the chaiman snil he was strongly in favour of Mr. Storr's esolutions, that the Government should be salled upon to tike action; for the ovil, which had been clearty laid befuro them, was bryond the paswer of local bullies or private effurts to remely. There could be no donbe that some sach wreat central mulicipality as sug. estela by Mr. Frecmm was desirable ; lut what security had they that such a central tuet:opo lith1 muncipiphity wonht obtain Parlinmentary sabetion within a reasonable perioc? And in the noun timo immediate action and some fem. porary rooasure were necessary, and he looked
upon the Govervment appoint ment of Corcuis. apon the Govervment appointment of Co teniss sioners, as
desirablo.
Mr. Kayc Sluttleworth, M.P., was atrongly opposed to Mr. Storr's resolutions, which he was sure Parliameut would niver sutuction, and he (Mr. Sluttleworthi), as a member of Parlimment, would never vote for any sucli measure as the resolutions iudicated. it had heen suggested with Governmont were not prepared of the netropolis; hat le had only to refer them to he speech of Mr. Gludstono the night previously
to show them that the Government were prepared to deal with this great London question, and he advised the commitiee, before coming to $n$ decision on the resolutions, to defer it until a n decision on the resolutions, to defer it until a
deputation which mas about to wait upon Mr. Brnce on the question of a reform in the mnvicipality, on Saturday, had heard the Home Secrepality, on Saturda
A conversation of some length followed, and A conversation of some length followed, and
ritimately Mr. Storr consented to adjourn the ritimately Mr. Storr consented to adjourn the discussion of his resolutions, as suggested by Mr. Kaye Shuttleworth; and in compliance with a request from the committee, the Chairman cousented to accompany the depatation to the Home Secretary on Saturday (this day), and communicate to Mr. Bruco what bad takon
place before the committee during the discus. place before the com
sion of this question.
Before the meoting broke up, the following resolution, moved by Mr. Bosanquet, and seconded hy Mr. Storr, was unanimously car-ried:-"That it is desirable, in the interests of the labouring classes, that extensive improve. ments, sucb as bave been carried out in other oities under local improvement. Acts, should be made in London.'

## SCHOOL BOARDS

Ditifield.-Mr. Henry Adamson, the clerk of tho works at the new schools, attended, and reported that the contractor for the bricklayer's work was not doing his work satisfactorily. He was not brilding the corners and angles solid, according to the specifications, but was leaving them hollow. Fe had 1emonstrated, but to no effect. This had been going on for three weeks. The stated that Mr. Gage, the bricklayer, said he had been told by Mr. Crouch, an architect, that if he left the angles hollow the Educational Bonrd would not find fanlt. IIe had deferred communicating with the architect in order to save expense. The chairman advised him to communicate with the architect immediately, and lay a full statement of the case before him Leeds. The new schools whicb the Board propose to build on Sarille.green, and the plans for which were approved, will comprise two departments, viz., one for boys and girls (mixed), and the otber for infanta. The entire accommodation will be for 469 children. The plan is in the form of the letter $L$, with prin. cipal infants school-room, 50 ft . by 26 ft ., and three class-rooms, fitted up with galleries and desks ; and boys and girls school, 50 ft . by will be provided for boys rirls, and infants, and will be provided for boys, girls, and infants, and Each eatrance will be fitted up with lavatories. Each department will have a covered playground, Moule's patent earth closets Moule's patent earth-closets. There will also be largo playgrounds at the front, and at the back will be yards. The building material will be red brick, with stone dressings and moulded brick strings and labels. The several gables and tympana arches will bo fillod in with patent
brickwork. The roofe will havo fromed prin. cipals, with curbed braces and lnmmer beams ceiled on tbo upper side of tho collar, and covered externally with dark Westmoreland
slates. Tho buidding will bo lighted with sash. windows, filled in with Hartley's euted plato glass. The walls around the schools and olass rooms will be boarded to a height of 4 ft .6 in . and will have a moulded top.rail. Ventilation will be secured by means of flues running up alongside the smoke. flues in the chimney-shafts. There will also be air-trunks ranning trans rersely across the several rooms, with valved operings, and communicating externally by means of gablets, filled in with louvre boarding The whole of the site will be enclosed in boundary.walls and palisading, with entrancegates to cach department. The plans are by Mr. Adams (of Messrs. Adams \& Kelly's), arch tect to the Board.
Leicester.-The clerk said he bad received the apecifications for the Elbow-lane Schools from Mr. Tait, and he wished the Board to give him mored that the mater for readers.-Mr. Barr sent, on these grounds, that the Board had not taken any steps to fill the present schools. There eridently required a school for the North Bridge District, buts as to the school in Elhow-lame, he had a doubt as to its ever being filled at all.School Board Chronicle he found to his over the School Board Chronicte he found, to his surprise, were bnilding did not exoeed in cost those which
were being built in Leicester. They seemed to run parallel, or, if anything, a krifle lower, aud he was astonished that such should be the case. If in London they could build at the samo cost as they were doing in Leicester, be thought that Leicester ought to he somewhat lower. He did not think it was the fault of the builders, but it wns possible that their designs might require a was possible that their designs might require a secret of the matter was this,-the specifications were laid! on the table, and not gone iuto befor the committee at all. In the present instance, there were twenty pages of matter; and they slipped through them in ten minntes. The Rcv A. A. Isaacs said the whole matter had been
before the architects' committee, and fully gone intore-The motion was then put and carijed.

## FALL OF A FACTORY CEIMNEY IN

 OLDHAM.AN accident, unfortunately attended with loss of life, has occirled at the new works of Messrs Abrabam Stott \& Son, Osborn Mills, off Foatherstall.road, Oldham. In connexion with this mill a large chimney 165 ft . high had been built, but it was found necessary to straighten the pile which leaned considerably over on one side The owners tberefore entered into a contract with two brothers named Gradwell, who wore chimney.builders living at Nowton Meath, to "Ealy" the chimney. Mr. Stott, on observing the two men at work, saw that, instead of merely saming out some of the mortar, a whole conrse of bricks had been taken out, and one of the men from the scaffold about a third of the distance owner at once remonstrated with the other nenn but he declared the one plan to bo as safe as the other, and took Mr. Statt to a rising ground to observe the safety, when, as if in ridicule of his assertion, the whole chimney toppled bodily over axcept ahont 30 ft at the hase, and the poor fellow on the scaffold was bnricd under thousands of bricks. Adjacent to the chimney was the boiler.bouse, a large new building, and a portion of the bricks falline on this, $i t$ is now a completo wreck. It was some time beforc the workman's body was recosered. The chimney was "carity" chimney, and was scren bricks thick at tbe bottom. The cavity was thirty yards high and a yard in thickuess. The chimney
was 16 ft . in diameter at the base and 7 ft .6 jn . was 16 ft .
at the top.

An inquest was held, and, according to the evidence addnced, the deceased and his brother had persisted in doing the forls by cutting a hole in the side of the chimucy, where the bend was most marked, and removing a layer of bricks on the highest side, temporarily supplying its place with a series of wedges of wood and iron. In this way they bad sapped the whole of the upper two thirds of the erection. Mr. E. Whittaker, a builder and contractor of great experience, gave it as his opinion that the chimney was huilt on sound principles but in a faulty manner. The material, too, was decidedly inferior, tho bricks being many of them soft and the mortar impropelly mised, consisting too largely of sand. The fall of the chimney he attributed solely to the conduct of the men themselves in cutting so large an aperture through the brickwork, and removing a course of bricks perfectly needlessly
After hearing this evidence, the jury intimated hat they were satisfied, and returned a verdict that the " Deceased was accidentally killed by the fall of a mill chimney.

A NEW CHURCH AT LORDSHIP LANE, DULWICH.
On Thursday, 1st inst., the memorial.stono of large and handsome new church now in course of erection in Lordship.lane, Dulwich, was laid, with much ceremony, by Mr. Richard Thornton, of Syderham.hill, in the presence of a very the architect for the building, which, in its architectural features, is Gothic. The materials used in the erection of the edifice are, externally, white patent brick, with Kentish rass stone for facinge patel droesing, the walls ros stone for acings and dressinge, the walls of the interior brick bricks, arranged in diferent patterns. The chancel, when completed, will consist of a chancel, organ-chamber, and vestries, together 172 ft . in height. The cbarch will have an opon
roof, the interior being of pine, stained and arnished, and the exterior ornamental coloured slate. There will be prominent columns the chancel, consisting of rouge royal marble, the intcrior will be ornamented wither parts of he inter we ornamenced wilh Pither's patent bricks. The seats (which are to be open), stalls, and general interior fittings aro intended o be in harmony with the architectural charactor of the building, and there is also to be an elabo. rately.carved pulpit in Caen stone, orvamented by marblo columns and capitals. The tatal length of the church, when finished, will be 120 ft ,, but it is not intended to complete the whole at once, the present contract comprising tho erection of the chancel, organ-cbamber, por tion of the tower', aud tho principal part of the nave, and the west end will be temporaril closed by brickwork. The builders are Messrs Downs, of Unionstreet, Borongh, and the amount of their present contract is $7,800 \mathrm{c}$.

At the close of the ceremony, Mr. Thorntors who had laid the memorial-stone, and who takes a deep interest in the building, gave a banque at his residence, the Hoo, Sydenham.hill, tho company numbering upwards of 200. Mr. Barry the architect, was amongst the guests on tho occasion, and, referring to the pulpit, stated that he should be disappointed if the charch were not provided with a handsome one. The cost of such a pulpit as he contemplated would be about 60 ? half of which sum he would mive himself, pro vided a pentlemar conld be found to rive the other half. Upon this, Mr. Crocker a onlem present, signiged his intention of sharior the cost of the pulpit with Mr. Barry. Duin the festive proceedings, a contribution . Dariug the puinens was announcel from Mr. and an Thornton, and the amount towards the object subscribed during tbe day was 1,500 l.

## A DESERVED TESTIMONIAL

Mr. Marswaly Fowlyr, who will in a few daye complete lis eighty.fourth year, has beeu an active magistrate for tbe North Riding of the and of lork for forty fivo years, and chairts for petty sessions of that district sina county of Durham, and chairman of the Stockton bench for thirty-five years. He bas been ohair man of the Board of guardians of the Stockton Union, jucladine tho large town of Middles brough for thirty-fye years. Fe has been Admiralty Commissioner of the river Tees since it was formed. He bas been an acting trustee of the Stockton Sarinos Bank fur fity years and chairman for the last presided over rarious othor Borda and trus with tho wost gratuitous services and benevolenco to every local iustitution for the public good, and has been tbe unwavering friend and unvarying counsellor of rich and poor over three.score years past. He of rich and poor over three.score years past. He
has fought a hard fight against the canses of disease, crime, and intomperance. His purse disease, crime, and intomperance. His purse,
like his breast, has been open to the calls of distress, and he has blushed to hear his good nised
The time has now come for his northern friends and admirers to perform an act that might more properly bave been rolegated to tho Crown, and hefore this good old English squiro is gathered to bis foretathers the Durham and Yorksbiro men, rich and poor, have determined to recognise the merits of their friend by a puhlic testimonial aud Marshall Fowler has agreed to it, on condition that the subscriptions aball be devoted to the building of a wing of the new Stockton Hospital. The Marquis of Londonderry and Mr. Farres bave each put down IOO gnineas, and large sums are being added daily. The miners, tradesmen, and artizans will supplement the testimonial offering, so that this good old Englisb shall be carried out in his lifetime.

Institution of Surveyors. - At the ordinarg general meeting held on Monday, May 5th, a paper was read by Mr. W. Hope, entitled Mr Mr. Hope's paper, and upon that read by Mr. Drainage Works, Water Supply entiod Arterial Drainage Works, Water Supply, and Sewage a long debate, the discussion was adjourned to a long debate, the discussion Was adjourned to
the next meeting. A vote of tbanks was unanithe next meeting. A vote of thanks was
mously given to Mr. Hope for his paper.

THE PRESENT POSITION OF GOTHIC ARCHITECTURE.*
IT must he a matter of a very considerable lifficulty for those engaged in a comhat to form a clear perception of what its ultimato issne will he. The circnmstances of the case, the din and excitoment of the battle, are altogether opposed to any calm and collected exercise of the judg ment. In like manner it is difficult for architects practising at the present day, amid the confusion cansed by many rival styles and schools, to predict with any degree of certainty which of the antagonists will come off victorious in tbe strife.

It is one thing to assert that the particular Btyle of our adoption is sure to hecome the archi. tecture of the futnre: it is quite another to stand aside from the throng and then oalmly and dispassionately pest us, to estimate accurately the relative strencth of each so as to arrive at a sound judg. inent as to which is destined to become the main siver, absorbing the rest, and making their waters contribute to swell its own mighty current. This is no easy thing to accomplish bnt it behoves us now and tben to make the attempt, so that we may accertain whether w re pursning the truo path of progrese.
After describing the principal circumstances which have been the means of moulding cevived architectnre, and of bringing it to its present state of developrnent, the writer con tinned, -

Other minor canses have been at work, hut I am compelled to leave them unnoticed, and to trim to the more immediate consideration of our sub. ject. The important question will here naturally 3nggestitself: has our rovived Gothic realised in any great degree the high hopes and bright anticipations which in its earlier days were formed of it? Is it in a fair way of becoming in due time our national architectnre of the future, afit exponent of the expansive culture of this nine. teenth century ? Tbis is the great question, bnt it is one which there appears to me to be much difficulty in answering decisively,

There can be no doubt bat that the confluent streams which have joined the main river of onr English Gothic, lave materially deflected its which its earlist advocates neithor intended nor foresaw. It is by no means certain, however foresaw. It is by no means certain, however, sily evil thing for the future of our art. Many noble lessons, and many fresh and excuisite noble lessons, and rany fresh and exquisite combiations of form may be drawn from the magnificent examples of Pointed architecture with which most portions of the Continent abonnd. It would be folly to reject these, and to Gothic. Snch a course, even if practicable, Gothic. Such a course, even if pn
wonld prove fatal by its exolnsiveness.
wonld prove fatal by ts exolnsiveness. architecture has its uses, it has also its abuses, and it mnst be conlessed that the latter are making themselves very apparent just now. Tbe frequent and eapricions ohanges which have characterised Gothic work of lato years do not sngnr well for its future supremacy. We see on all sides a restless craving for novelty and sencation. New phases appear quickly upon the scene, bvo their little day, and are then cast aside for no better reason, apparently, than to make room for something more fresh and striking.
Our very advantages are apt to become a snare to us. Modern science hos placed the art.treasures of the world bofore us, and, like children, we turn from one beautifal playthi
The fact is, as it appears to me, architecture is in great danger of becoming merely a thing of fashion and caprice, much in the same way as millinery is. Unfortnanately, the resnlts are widely different. Oar creations will aurvivo the transient fashion of the day, and will, if designed upon no hicher principles, remain only as monuments of the rage or folly which happened to obtain at some particular date. If our architeoture aspires to sometbing more poble tban this, it mnst rest on a more enduring foundation. It mast be founded on, and must express in its features, the immutahle principles of truth, fitness, and heauty, if it is ever to become a living art to us in the sume deep sense that hoth Greek and Mediooval art were to their fonaders.

* From a paper read by Mr. W. M. Mitchell, at a meet-
ine of the Architectaral Association of Ireland, April 2 ing of the 183.

PAINTERS IN WATER COLOURS.
Contivuivg onr notice of works exhibited by the two societies, we would add to our observa tions in the Old Gallery that Mr. F. Walker contribntes a very choice little study of what must be a choice nook in "The Villago" (230). It is so exquisitely done that, small as it is, it conveys a notion of space and reality that many a larger drawing fails to give. Space and real appearances are the leading characteristics of Mr. J. W. Whittaker's magnificent drawing, "A Misty Morning among the Welsb Monntaine" (6), and of Mr. Thomas Danby's equally fine and clearer view of "Merionethshire" (127). The poetry of closing evening effect gives the chief cbarm to Mr. A. W. Hunt's principal land. scape, the title "Working Late," applying to scape, the title " Forking Late, applying to of soft shadows from the high hills that sub. merge and half.hido, betokens that Mr. Hurt must bave worked early and late in his observa. must bave worked early and late in his observa. tion of nature to becorne so able to express his
knowledge. It would reqnire a knowledge, knowledge. It would reqnire a knowledge,
indeed, nearly equal to that exhibited in the indeed, nearly equal to that exhibited in their superlative specimens that tbis collection numbers in the landscapo portion of it.
To change gronnd here, it mnst be allowed that if not so strong as the senior society in making land, sea, and sky; mountain, plain, and dell show some of their natural aspects within doors, the Institnte of Painters in Water Colours nevertheless includes some saperlative practisers of tho art.
Perhaps it is to celebrate his iuauguration as President of the lnstitnte of Painters in WaterColours tbat Mr. Louis Haghe makes an extra display,-eight drawinge, and all of size and (43), "Stance. Interiors of "St. Mark's, Venice" Ghent" (89), showing a tomb; of "St. Peter" Rome" (166), the transept; and some of his well-accoutred, real.looking soldiers and citizens, in "A Flemish Cabaret" (126), or shooting at hutts, "Cross.bow Practice" (215), Hest. No one can bent M. E. H Courbonld at stippling ; applied to flesh-painting it is realy marvellous. The precision and pink mado ont, the rich spread of splendour that purple and gold colour for the substantial past of it, and cernlean and crimson and emerald for What is supposed to he visionary, invert this version of "Enid's Dream" (86) witb a share of the very best peculiarities of a style that, in spite of some extravagance, does not appear to be easily imitated. A fusion of the manners that mark Mr. Jozef Israel's somewhat slight thongh heavy method of colouring snch snbjects as a Datch frau, with no pretension to any good looks beyond what light and shade would give to the ugliest; and the interesting anticipation sng; gesked in its title, "Preparations for the Futnre" (196), wonld help; and the hrilliantly bright prettiness that permeates everytbing belonging to or snrrounding "La Jolie Bretonne" (by Mr. . Goodall, R.A.), wonld seem to be perfectly if sussible; and yet how desirable would Mr H. Carter's study, "Contemplation" (32), and again, "On the Sands, Scheveningen" (76) have mnch in common with Mr. Terael's works. Mr. J. D. Linton's row of mendicants under going the "Manndy Thursday's" proceedings, already alluded to, gives a series of physiognomies that he must have searched for in many a casnal ward; each is a distinct and marvellously well-defined character: the lady--queen, duchess, or dame of other high degree,-affords very strong contrast, by her loveliness and magnifi. cent attire, to the sorry, sordid group her husband is tending. There is a heautiful tone pervading this composition which subdues, without affect ng, too much the richness of colour that quaint Medixval costume, cloth of gold, jewels, damasks, tional production, and will keep Mr. Linton's name in memory until one surpassing it shall take its place.
In "Norse Pirates in the Mediterranean," rovelling after a victory that has brought rare spoil to compensate slight wounds, one of the leaders is heving his arm dressed by an old woman, whilst his Thais lolls amongst valuable trophies of the robhers' success, admiring the glittering splendour of a bracelet, part of her share in it. Anotber female is stretching for ward to regain a ecarf displaced by the wind and these, with the figure at the tiller, putting
out all his strength to alter the vessel's conrse
are the chief components of a very attractive and original picture, by Mr. E. J. Gregory (52) with heantiful colour and finish to lend interest and probability to romantic circumstances. 1 is mather puzzling to make out the size and shape of the boat, and where they could stow the women in case of a scrimmage, nevertheless.
Mr. Andrew C. Gow conld scarcely carry elaborate finish further than in "The Labora. tory " (237). The experimentalist in Vandyck dress stands the general minute completeness of every item surrounding him, without losing tithe of his proper significance. The drawing of the bead, hands, -in fact, of all, -is so cood, so thorough, that hy natural result the man is quite the chief object where every other object is a clearly visible. A larcer work, introducing or eight figures, in last.century dresses six habits, a soldier son or century dresses and experiences of ban or nephew relating hi experiences of battle to his wondering friends, is just as remarkable, or more remarkable, for the manjpulative skill exhibited. "Tbe Attack Described" (62), with wine-grouts spilt on
the polished surface of the table, and buocen the polished surface of the table, and broken forts and advancing hrigades, is a well-bighted forts and advancing hrigades, is a well-bighte and nowhere-slighted picture
Mr. C. Green's workmanship is always very careful and effective. The quiet, unassuming presentation of a seated female figore, bringing back the fashion-book idea of "Ninety Years ago" (188), is very agreable, and very dex terously done. There is more evidenco of bis cleveraess in apprehendiug character with as much of the nice method of delineating ordinary incidents that adds extrwordinary interest in "A Deputation," perhaps to resent co.operative movement. A string of busybodies is about to be ushered into tbe presence of a botbered autbority, and the variously.expressed importance of eacb member of it, so far as each member's opinion of himself goes, provides ample room for capita depiction of individnality (257). "Facing the Storm" (10), is a Swiss motber, with her child at her back, in a croel, clinging to the rocks, in spite of the wind, by Mr. J. Absolon. Mr Absolon's pleasant little personages, of an orango and pink complexion, that makes them so easy of recognition and of welcome appearance when interspersed for a difference from weightier thinge, aro of freqnent ocenrrence on this occa sion, vide "Italy" (19), "Going to Bed" (29) A Waif" (68), one of the best, and "Morning" (236), for instances; and Mr. J. H. Mole' natural transcripts of country and coast scenery with pretty peasant children fo. habitants, are merons and nice as ever. Mr. Huher Herkomer's peasants are unlike tbese, as far part as miles and miles can leave nationabities to be unlike. The poor old country folk at thei scant meal, "Abendbrod" (233), or such as are the customers of "An Alpine Cheesemonger" (252), however powerfnlly and well sketcbed, "A Wallachian Girl" (23), by Mr a tractions.
A Wallachian Girl" (23), by Mr. A. Bouvier A Wonnded Comrade" - cavalier soldier rescuing the drummer-boy (78), by Mr. C. Catter mole; "Tho Convalescent" (82), nnnecessarily moce ill-looking tban ill-favoured, hy Mr. H. B Roberts: "Washing Casks at St. Milo," by Mr R. Beavis (99) ; "Italian Shepherd Boy" (160), and "Vesper Bells" (204), hy Mr. Guido Bach; ery powerfully indicate tbe variety that exists bere.
Mr . Carl Werner sends two of his interesting studies of Eastern fact (34 aud 72) ; and of Mr C. Vacher's drawings, the most imposing is "Tho City of Tombs, Desert, South of Cairo" (143), with the Pyramide of Memphis in the distance. Mi. H. G. Hine has painted the sea with a gradation of beantiful tints that look very exactly copied. "Durlstone Head, Dorset" (18), is one of his hest examples. Mr. W. L. Leitch is seen to Gloe-Farly Mornio"" (56), and Mr w Warre in "Epping Forest," with big heech.trees casting in "Epping Forest," with big heech.
dark sbadows on ferny gronnd (66).
Mr. J. Mogford, Mr. J. Orrock, Mr. P. Mitchell Mr. Harry Jobneon, Mr. J. G. Philp, and Mr J. C. Reed, are now amongst the best-known members of the Institute who paint landsoape, and, like tho older helpers, Messre. McKewan Fahey, D'Egville, Telbin, Rowbotham, and Whymper, do much to maintain its repatation or excellence in this department.

St. Gahriel's Church, Hanley Castle.-
The tiles nsed in this church were manufactured and supplied hy Messrs. Minton, Hollins, \& Co.

PRIVATE GAS-MAKING.
Numbrous inventions have heen patented, if not perfected, to enable consumers of artificial light to produce their own supply, independently of gas companies; hut, for one reason or another, these projocts do not seera to haro ever made muoh way with the public, or to have got exten. sively into use. Another of theso sets of appa. ratus has been fitted up since the opening, in a space adjoining Room XXVT, Western Galleries, of tbo International Exhihition at South Kensington, that is well worth attention. It is a portahle apparatus for making gas i connexion with an ordinary kitchen-range.
The essential foature of this gas-making appa. ratus is the utilisation of the raw material in gas that, under the ordinary system, is now
wasted hy passing up tbo chimney; it is, in fact, an instrumentality for the consumption, or rather the conversion, of smoke, from a noxious and offonsive, into a nseful agent. The dense columns of smoke that ascond from the finnels of steamers, from the chimneys of factories, and from now-laid household fires, are so much wrasted carhonaceous matter. The principle of Mr. Fearnley's invention is to seize this matter
and to convert it into gas, fit for either illu. minating, cooking, or heating purposes. This is minating, cooking, or heating purposes. This is placed over the open fire, which is supplied with placed orer the open fire, which
fuel by the coke from the retort.
It is stated by the inventors, Mosers. G. B. Fearzley \& Son, of West Brompton, that the apparatus may he constrncted witb range, oven hoiler, \&c., or may ho adapted to an ordinary kitchon-range. It can he made quite portable, construoted of wrought and cast iron, or may be permanently get in hrickwork. The retort and purifier aro of a novol shapo and arrangement, and such, it is stated, as to generate the gas quickly, and to purify it thoroughly. The retort loting or packing. The spaco nvaing wp withont ing purposes is not The spaco availablo for cook apparatus. The range has an oven at orie end and a hoiler at the other. Over tho oven thero is a hot-air chamber, into which the fire can Sancepan by an arrangemont of the dampers, plate paver may, of course, be placed on the hot pete over his chamher, and the flat top of the comfortably high temperature same uses. should suspect as a possiblo is the fitchen we of the apparatus. It is stated that any domestio servant may manage it witbout interfering with ordinary duties; that the apparatus emits no smell; and tbat the safoty-valves provided render accidcnt impossible. It is further stated mado to the apparatus hy which a stream of pure heated air may he sent, hy aimply turning a tap, into any room of the building in which it is fitted up, and the temperature regulated, degree desired. For wreenhapparatus, to any tories this nse of the apparatus would seem to bo peculiarly well adapted. It may also be applied to tho distillation of water hy self-acting apparatus.
In the exhibit that Messis. Fearnley show at South Kensington, the gas gonerated in tbe retort over the fire of a kitchen-range is passed along to the condenser, in line with the range ; it descends through that to the gauge-tap heseath, where the tar is deposited; thence the gas passes upwards throngh the purifier, from which it is carried to the gasholder in the rear. The apparatas is stated to ho capable of pro. ducing a sufficient quantity of mineteen.candle gas daily, to supply ter lights for six hours. The cost of the gas, if the apparatns is fitted to a kitchen.range, is statod to be threepence per
1,000 cuhic feet; when constructed for the 1,000 cuhic feet; when constructed for the
mannufacturo of gas alone, without ranoe, so, mannacturo of gas alone, without range, \&o., che cost of the apparatus will bo loss, but the
cost of the gas produced will bo 2s. 2d. per 1,000 cnbic feet.
We do not insinnate that the inventors "pro. test too mnch," hut verture to think their apparatus well worth the inspection and scrutiny
they challenge.

Increase of Surveyor's Salary.-The salary 3002 , to 350 l . per aunum well was increased from the vestry. Some ohjection was of meeting of the vestry. Some ohjection was offered to the proposal on the ground that the surveyor, when to apply again, hut the opposition was defeated.

## THE LATE Mr. S. S. TEULON,

 ARCHITECT.Mr. Stmuel Savders Teuton, whose death we rogretfrlly mentioned in our last, was the rhest son of Mr. Samuel Teulon, of Greenwich, whero he was horn on March 2nd, 1812. H was of French descent, an ancestor of the family of the Edict of Nantes which tro revocatio the IIuguenots put of France dre so many of artieled to Mr. George Legg, and afterwards was for some time in the oftice of Mr. George Porter, of Bermondsey. Ahont the ycar 18.10 Mr. Toulon received the first premium in a competition for some almshouscs for the Worshipfinl Company of Dycrs, which were afterwards crected under his superintendence, and from this timo may he dated the commencement of he large and important practice which be rapidly obtained. Among tbo new churchics built hy him may ho mentioned tbose at Battle (Netherfield), Sussex; Borwick, Cambridge-
shire; Birch, shire; Birch, Essex; Birmingham (Edgbaston and Ladywood) ; Burringham, Lincolnshire; Frosdon (Christ Cburch), for Archbishop sumner; Foshury, Wilts; for Mr. R. C. L. Bevan, Hastings
(Holy Trinity); Lincoln (St. Michael's on the (Holy Trinity); Lincoln (St. Michael's on the Mount) ; Riseholme, near Lincoln, for Bishop
Kaye; (St.Andrew's): Wells, Somerset (St ; Watford (St. Andrew's) ; Wells, Somerset (St. Thomas's), Dean Jonlyng W, Wa nemorial or her husbanc Gloucestershire: and in and near London, St. Paul's and St. Stephen's, Bermondsey; St. Andrew's and St. Thomas's, Lamheth; St. Mark's, Nortb Woolwich; St. Pan1's and St. Peter's, Greenwich; St. Thomas's, Camdeu. town ; St. Panl's, Hampstead, and St. Stephen's, hat just completed, closo to his own residence a Hampstead
Amongst many chnroh restorations, tho most important have been Morsham, Snssex; St Weald, Fsget ; iter ; Littleport, near tyy; churches of comparatively modern date which havo heen re.0ast hy Mr. Teulon, in which was particnlarly successful, wo may mention Holy Trinity, Leicester; the parish chorches of Windsor; Sunhury and Ealing, Middlesex; St Holhorn ; and St. Mark's, Konnington, the last only formally re-opened a week beforo his death
The mansion at Tortworth Court, Gloncester shire, for the late Earl of Ducie, was one of Mr. Teulon's largest domestio huildings, erected about 1850-52; and more recently Bestrood Nottinghain, was erected from his designs, for the Duke of St. Alhan's. He also made very extensive alterations and additions at Shadwel Court, Norfolk, for Sir R. Jacob Buston, hart. at Elvetham, Hants, and at Perry Hall Staffordshire, for the late Lord Calthorpe; and at Woodlands, Rydo, Islo of Wieht, for his son, Col. the Hon. Somerset J. G. Calthorpe.
Mr. Teulon carried out varions farm hnildings, cottages, and other works, under the direction of the Olfice of Woods on her Majesty's Sunk Island and Windsor Park Estates, and has built many scbools and parsonage-honses in alrost all parts of England. He was an early memher of tbe Royal Institnte of British Architects, of which ho had heen a Fellow for more than a quarter of a century, and had served on the council for four years. His bealth had heer for some time failing, and for the last three months there had been no bope of his recorery. His deatb occurred at his residence, Tensleys, Hampstead, on the 2nd inst., at the compara. tively early age of sixty-one years and two months. He was huried on Tuesday, the 6th inst, at Highgate Cemetery, the first part of the funeral service having heen said in his own remarkahl church,-St. Stephen's, Hampstead.
Illastrations of several of his works will be found in qur volumes.

British Department of the Vienna Exhi-bition.-The Princo of Wales, Prince Arthur, and the Crown Prince of Demmark attended the celebration by the English workmen held in honour of the completion of the British Department of the Exhibition. The Prince of Wales, in replying to a toast, especially dwelt apon the good conduct and sense of order displayed by the Englisb workmen, and thanked Mr. Owen for the care he had exhibited on their behalf. The exPrince.

THE NEW BUILDINGS ON THE HOLBOR FIADUCT.
Tee vacant land on the north and south sid of the Holborn Viaduct will shortly he covere witb soveral new huildings of an imposing ch in the poutess. Tho new station and botel Chatham, and Dover Riadray Company, has he commenced, and at the east ond near the 0 Bailey, the elevation has already becn carriel to the first floor. When completed, it will one of the largest railway hotels in London. Th riaduct elevation will he 85 ft . in height, whil pavilion towers at each cnd will bo carried to height of 110 ft . above the street level. Th extremo length of the viaduct frontago from eas to west will he 240 ft ,
Amongst othor structures in block on prominent and extensive is the lar mail way station north side, noarly opposite to time heen in courso of erection for Messrs. Tenk Holt, \& Co., cabinot makors and upholsterer and which has this week heen covered in. Tbi huilding, which has threo frontagos, oceupies a area of nearly $10,000 \mathrm{ft}$., or ahont a quarter an acre in extent. Tbe viaduct elevation is 55 in length, the west frontage, which rung imm diately parallel with the London, Chatham, an Dover, and Metropolitan Railways, is 133 ft . lengu, whitat there is another frontago to Snow hill 10 ft . in length. Architecturally the princip elevation is that facing the viaduct, which is 65 in height to the top of the dormers. The frontac from the groand-tloor to the first-story window is of Portland stone, on polishcd gramite hase Immediately ahove the ground-floor is a massi carved cornice, and at tho east end is the prin cipal entrance to tbe ofices. On oach side the entrance there are hroad fluted pilasters and the key-stone of the circular-headed door way consists of a colossal soulptared figure-head There are also double pilasters at tbe soath-wes angle of the ground-floor uniform with those a the south-east angle. There are cight dombl with win circular heads in the first 1100 pand in Portland stone hetween then mental iron columns dividing each window ret seing story, having quadrant corners instead with the story below, having double pilaster between each window, and also ornamental iron columns. Tbe third-story windows are uniform vitb those in the second. Immediately ove be third story there is a cornice sapported h russes, and a bove these are lofty dormors carrie nto a mansard roof. Tho elevation from th irst story to the top of the huilding is of whit uffolk hrick with Portland stone facings an dressings. Tho west frontage, running paralle ith the railway from the Viadnct to Snow-hill hough not so imposing as the Viaduct elevation nevertheless a prominent featuro in tbe struc ure. Larco windows for tbe display of article ro carried along the ground.floor, whilst in the everal stories ahore thero are eight clustere indows in the centre, and four windows of imilar character on each side. The ground oor of the Snow.hill frantace consists of five of ty divisions, intended for shops or warehouses, whilst the three several stories aboro eacb con tain twenty continuers cirorles hoaded window A considerable portion of the building will ho occupied hy Messrs. Jenks \& Co. as their show rooms and worbshops, whilst the rest of the pre mises are intended to he let as offices, $\$ 0$. Messre Tress \& Innes, of Queen-street, Cheapside, are th architects ; and Mr. Edward Conder, of Kings land.road, is the contractor.
Considerable progress has heen made with the foundations of the new City Temple, which is in course of erection on the south side of the Fiadnct, adjoining St. Androw's Church. This edicice will have a frontage to the Viaduct 75 ft wide, and will extend 150 ft . sonthward in depth The foundation walls are between 3 ft . and 4 fb in thickness, and are nearly 40 ft . helow the level of the Yiaduct. They are now nearly com pleted, and ready to receive the superatrnctoro The edifice will bave a tower rising to a height of 130 ft ahove the level of the Viadnct. We understand that the fondation-stone of the hnild. ing is to he laid on tbe 19th of May. The osti mated cost of the hnildiug is ahout 30,000 .

There is also another hlock of huildings at the corner of Soow-hill, adjoining St. Sepulchro's being made for the ereotion of the huildings on both sides of the Viaduct.

the little seminary, paderborn, westphalia.-Herr Guldenpfenmig, Architect.
sedinary at paderborn.
We have on several occasions called the attention of our readers to the works now being carried out in Westphalia from the designs of
Mr. Gnldempfennig of Paderborn. To those we Mr. Goldenpfennig, of Paderborn. To those we
have already illustrated we now add another. The subject of our illustration is the " little seminary," or preparatory theological school, erected some six or seven years ago in Paderborn. In this building Mr. Guldenpfennig has closely ndhered to the old traditional domestio architectrare of the neighbourhood. As will be seen from our illustration, this school is built in a very simple but picturesquo and effective style. It is chiefly of rough stone, and the roof, which is broken up with many dormer windows, is covered with common pantiles. In plan, the building consists of two portions placed at right angles to ench other, and thus forming the letter L. The lesigns of the two wings, or limhs, are not similar, as one has ouly a single story above the basement, whist the other possesses two. The
lower or basement in each case formsa larce and well-lighted schoolsoom, while the upper story is used as a dormitory

WESTMINSTER ABBEI: ITS DARK SIDE.
This ancient structure, renovated on the north and west sides by Sir Christopher Wren, in a style not accordant with tho grandeur of the true Gothic, has heen lately embellished by the restoration of its majestic chapter-houso on the south side, so that now the whole sonth range nunatilated by the intrusion of different styles, presents the most perfect aspect to those who may take the trouble of viewing it from an upper floor in Great College-street, it from an lair of the dismal surromndiug cathedral closes. The wretched condition of all the vicinal slums, from Millbank to Stratton-ground, is perhaps not inoonsistent with the state of chapter property, as it stood about thirty years hack in great cathedral towns; but since then
atonsive clearances have been made in most English cathedrals, and most notably in Dublin where St. Patrick's was restored by the manifi cence of sir A. Gamness, and Christ Chureh by the Dean and Chapter.

If there is any quarter of the metropolis worthy of improvement, surely it is this locality, which iucludes within a small area the majestic Houses of Parlinment, the Abbey, Westminster Hall, and St. Margarct's Church
but open out tho Ahhey there is comparatively Victoria-street from the end The continuation of (where it diverges towards Westminster Brid through the still vacant plot of buildin and onwards throun plot of bullding ground, straight into Ahingion-street, College-street clear of the Victori opeu plot on the river direct access to the open ronto would net bank line of traftic. This and might wass and needing hut the and hact yave purchase of hive or six old houses andery line upon the new str a rectification of the wallto ho less the new street, which here ought not to ho less than 90 ft . wide
By thas clearing away the old slums, a splendid Fiew of the best side of the Ahhey could he direct direct route to the Houses of Parliament, while new chage would give free intercourse with the and give stimulus to tending towaras Chelsea, in the dull and morhid tringings a a better order Penitentiary, Bridewell, and the Houses of Parliament.
There is no other quarter of London so sacred and so illustrious, from its advantages of river scenery, -the venerablo Palace of Lambeth, the uridges, and the sever palaces of St. Thomas's Hospital,-nor is there any other improvement which, at so small an outlay, and within so short period, might be effectuated to beautify our City.

ROYAL ALEXANDRA THEATRE, PARK STREET, CAMDEN TOWN.
THE north-western district of London is now about to have a theatre of its own and it seems strange it has not had one before this
The site of the Royal Alexandra Theatro is lose to the great thoroughfares, Park-street Regent's Park, and the High-street, Camdenown ; and is, moreover, contirsous to the main roads to Hampstead, Highgate, and Holloway, to each of which places there is constant com munioation hy omaibus, rail, or tramway.
The front of the theatre is very simple, and in Park-street, and has entrances to the hoxes, talls, and pit. These are approached by two long corridors, fioored with tiles in geometrio patterns. Ahove these corridors are two conservatories, ith refreshment-bar and other conveniences.
The interior of the house has a light and tastefnl eflect; tho tints are so delicate as to appear almost white. All the ornaments are raised and gilded. Thero aro sixteen pendants or haskets of cut glass, within which the gas is placed; these drop from a hroad border composed of a band and leaf pattern, perforated so as to admit of ventilation, as is also the centre ornament of the ceiling. As these lights are placed, no obstruction can possihly occur to mar the effect of the scenery. The fronts of the dress-circle, private boxes, and halcony, are whito, with raised gilded ornament. The Heirht of the proscenium is 37 ft . by 32 ft . wide. The height of the bouse from the pit to the ceiling is 44 ft . The auditorium is 66 ft . by 63 ft . The stage is 35 ft . deep.
The contracts for the various parts inavo been carried out by Mr. Vanghan, builder; Dessrs. Pashley \& Nevton, decorators, Red Lion-square Messrs. Audas \& Leggott, upholsterers, Hull Messrs. Berry \& Son, Regent-street, Westminster, gas-fitters. Mr. J. T. Robinson, of Haver-stock-aill, is the arehitect. Mr. T. Thorpe Pede, responsibie manager. Mr. J. H. Watson is clerk the stago.

## PNEUMATIC FOUNDATIONS:

amprican society of civil engineers.
AT a meeting of this Society, held at the rooms in Now York, February 19th, a paper by General W. Sovy Smith, of Maywood, 111., on "Pneu matic Fonduations, was read The first two bridges on pnenmatic pile founover the Santee River, on the North-Eastern over the santee River, on the North- Eastern
Railroad, huilt in 1855 ; and the other over the Great Pedee River, on the Wilmington, Columbia and Augnsta Railroad, brilt in 1857 The air-lock used in sinking these piles was
invented hy Alexander Holstrom. It was a invented hy Alexander Holstrom. It was at
cast-iron cylinder, 6 ft . in diameter and 4 ft . cast-iron cylinder, 6 ft . in diameter and 4 f . plates, through which were man-holes opening
downward for ontrance, and bulls'-eyes of glass downward for cntrance, and bulls'-eyes of glass
for light; two goose-neck pipes passed through for light; two goose-neck pipes passed through
the sides and bottom,-one for the introduction the sides and bottom, one for the introduction
of air, and the other for the discharge of water when it would not escape through the material underneath the pile. A windlass was attached
for raising the earth within the pile, all of which for raising the earth within the pile, all of which
was removed by hand. Thero were fonr airpnmps, set in a single framo, of such excellent construction that they served for the sinking of their foundations,-those of the Third Avenne Bridge, New York, across Harlem River, and of
tho Leapenworth Bridge, across the Missonri tho Leavenworth Bridge, across the Missouri
River, -and aro now heing repaired for use for sinking tho piles for the Littlo Rock Bridge across the Arkansas River
Construction of the pnenmatic pile piers for 8 ton and Savannah Railroad, was, begun in the fal. of 1859. The air-lock nsed was 6 ft . instead of 4 ft . high, and, to save weight, the cylinders were of wrought instead of cast iron. Two defects were was admitted into tho pile throngh the bulls'. ©yes in the air-lock plates, those in tho hottom being covered with dirt most of tho tine; another, tho air-lock was too stinal to stow the material
raised, so that, when disharging the same, work in the pile was muol delayod. To overcome in the pile was muon delayed. mado of less
these defects, an air-look was mato diameter than the pile, so that an annular space
was left between tho two, in the plate crossing was left between tho two, in the plate crossing the
introduced. Through the side of the air-lock was
ind a pipe or trap, inclined at an angle, to discharge readily any material put into it, and arrangod for closing at eithcr end. The outer end being closed, the trap was filled with material, the
inner end was then closed, tho compressed air inner end was then closed, tho compressed air
thus cat off from the air-lock tiberated, and the outer end oponed, when the material wonld pass . By reversing tho process, the trap was made ready to receive material again. By this modification, no artificial light was required
during the day, and at night it could be reflected into the pilo, without the inconvenience of candles or lamps burning in a compressed atmosphere. No detention occurred from this, or from voiding the material raised, and nearly
thrice as much worl was done in the with the Holstrom air-lock
It was soon found that the sandy material throngh which these piles were snnk could be raised by the escaping compressed air through a disohargo pipe, and delivered outside in a continuous stream. For this the mouth of a flexible tube, fitted to the lowcr ond of a fixed pipe, was to place, as the material disappeared. The place work done to that with the old air-lock, to 1 . Tho improve to 10 , now became as have been generally usedents thas introduced nave been generally used sinco, by Gen. Smith, n sinking foundations by the pronmatic process.
For the flexible tube, one iron pipe sliding int For the flexible tube, one iron pipe sliding into
another, with a heapon gasket between, has ben substituted with still better resnlts, therehy seven men have excavated six oubic yards per hour for soveral hours; hy hand, two-
thirds of a cubio yard per day per man is about the rate.
The late war interrnpted this work, and also prevonted consideration of a plan submitted to the Unitgd States Lighthouse Board in 1860, for the erection ol a lighthouse on Frying-pan Shoals, or a similar position on the coast, embraoing the sinking of a caisson, from 30 ft . to $50 \mathrm{ft}$. . in
diameter, to any required dopth, less than 100 ft ., inside of which a masonry foundation of dovetailed stones was to be laid.
Soon after the
Soon after the war, the plan was adapted to
the repairing of Wangoshanoe Lighthouse, located at the western entrance of the straits of
at

Mackinac, npon a rocky reef two miles and a half from shore. It is a brick tower 24 ft . in diameter, 84 ft . high from water surface to focal plane, and stands upon a foundation 24 ft . square, consisting of a crib, filled with concrete and rubhlo masoury; this crib was surrounded hy others filled with loose stones, all framed together into one pier 100 ft . square.
At this time the timbers, put in placo in 184.8, were decaying under the action of seas, as heavy as any upon the northern lakes, and the ice ; the atter destruction of the pier was threatened. It and ice hy surrounding it the tower from waves and ice hy surrounding it with a strong sea-wall, 6 ft . long and 48 ft . wide on the outside, 8 ft . hick, and semicircular at tho ends. An aunular ppenmatic coifer-dam of boiler iron was huilt up in place around the tower, large enongh to inclose
the wall. 1 t was provided with two air-locks, dhe wall. 1 t was provided with two air-locks, each having a rectangular trap, through which material and workmen passed; and a windlass driven by steam. The daun was suspended by chains from heams resting upon the woodwork of the old pier, and, with stones, loaded somewhat in excess of its buoyancy. For 6 ft . below the water surface, the crib timbers of pine, $12 \mathrm{in}$. hy 12 in., built up solid, and strongly drift. bolted with round 1 -in. iron bolts, had to be cut through. The reef then reached was made up of boulders varying in size from a hen's egg, to 10 tens weight: the large ones, when found ander the edge of the caisson, were first split with plugs and feathers, or undermined, drawn into the caisson, and then rolled against the dam, and kept it from sink. ing, the dam was allowed to rise, and the stenes were rolled inward. The dam was sunk to a depth of $12 \frac{1}{4} \mathrm{ft}$. below tho water surface and 6 ft . helow the foundation of the tower which, though not upon hed rock, as expected when the work was begun, was where depth increased) were most perfoctly sompacte depth increased) were most pertoctly compacted
togcther, and below the scouring action of the wares, from which the dans was protected hy wares, from which the dans was protected hy
the remaining portion of the crihs. The bottom of the dam was then sealed with two successive layers of the quickest setting Louisville cement each 6 in. in depth, and set under water, which, when the air pressure was reduced, cntored It was found left for it in the layers.
It was found the 12 in . of cement thus laid would not, after four days' setting, resist the pressare of water outside : hence the first throe
courses of masonry, each 2 ft thick, were laid in a compressed dowelled together with iron pins, $2 \frac{2}{2}$ in, in diameter; the end of each pin was drilled 1 in in diameter, 3 in . deep, and sawn, so that when in place, and a taper bot was driven therein, the dowel was permanently enlarged.
When the wall was finished, the space between it and the tower was filled with concrete, and covered with flagging. The coffer-dam, which might have heen removed for usc elsewhere, was left in place.
Work could only he done in the six months, heginning with May, and freqnently it was interrupted hy storms. During tho first season, the chamher to receivo the dam was excavated, the machinery was put in place, the dam huilt, and sunk 4 ft ; during the second season, the sinking was concluded, and soven courses of masonry laid; and during the third season, force of forty men cost, inclurly meal employed. The entire keeper, was less than 200,000 dollars. This is the first instance of the sinking of a pneumatio coffer-dam or caisson, in sinking of a pneumatio After the componetion in this country.
After the completion of this work, General Smith, in 1869 , proceeded to put down at Omaha, for a hridge across the Missouri river, the first pneumatic piles sunk west of the Alle-
ghany mountains, and to a depth greater than ghany mountains, and to a depth greater than
ever before reached- 82 ft . below the waterever before reached- 82 ft . below the water. snrfaco. The material was very difficult to penetrate. It consisted of a fino ailt, stratified with layers of coarse sand and tough blue olay, stratum of more than 2 ft . deep, and with a next to the bed-rock, The first pile went doep vertically. The second, after sinking 27 ft took an inclination which conld not be corrected in the next 20 ft . by the varions means applied; which, although they failed here, in many other cases have succeeded at a depth of from 40 ft . is to exoavate the material ander the pile and with heary wooden wedges, firmly wedge op the
lowermost edge ; then, by letting the air escape suddenly, bring the atmospheric pressure and the weight of the pile to bear like a blow. In this case the silt came in so rapidly as to carry tho wedges hefore it. Another cylindrical secleng was put in place, thus adding 10 ft . to the length of the pile, making it 16 ft ., and, with the air-lock, 22 ft . above the earth-sarface. A strong frame of 12 in . by 12 in . timbera was laid down for a fulcrum; blocks and falls were attached to the arr-lock, and a sevore strain was pat npon the pile. The material was arain excavated, and instead of the wedres, a strong heam, cut to the segment of a circle, put down The pressare was let off, and the pile descended out without any correction of the inclination although the timbers of the fulcrum were broken. A pine strut, 8 in . hy 8 in., 11 ft . long, was set at a slight angle, its top against the leaning pile, and its foot against the pile already in place, Without avail; and at last the cylinder hroke off rit. helow the surfaco, whero there was a cold shut" in the metal. With 15 ft . of sand nch didlinder, 45 lb . air-pressare to the square were sufficient after the hroken of ; hut 27 lb .
This is the ouly measure approsimately the friction has had to iron pile. The friction por square inch of sur. face in contact, hefore tho square ras removed was greater than $1 \cdot 77 \mathrm{lb}$.; and after, it was less than 1.39 db . This friction mnst vary with the depth of material, and is diminished when the throug loosened by the? passage of air-currents hrough it. The case instancod differs from that a pilo in place, under a load. An important the er inquiry is, what shonld bo taken as the safe resistance of snch a pile, in sand, to sinking alone, where no bed-rock can ho reached, $2 s$ along the lower Mississipi, and ou the Gulf coast, it may he dosirahle to sastain structures apon piles or caissons, resting wholly in and on sand. The next two piles were put down withont reat difficulty,-ono at the rate of 10 ft . per day. To cause the piles to sink, they were oaded by filling the cylinders with stones, excopt a central passage or well-hole. Frames muilt within the cylinders kept the stones in place. After reaching a certain depth, it was neoessary to increase the downward pressnare on the pile, by allowing a portion of thens pressed air to escape. The pile would then aink roun 2 ft to 4 ft . at a time. The for hottom cylinder was covered with lop of the Hiaphragm, through which there wast-iro hole, closed hy a valve opening inward, which, when shut, prevented more sand from entering cylinder, whale sinking, than world fill the lowe the distur, 一thereby tho tendency to " lurch" and At this ance of outside material was lessened succeeded Mr Thoo. F Sicl-l Gea. Smith was employed levers in forin the noccessfull corrected theinclination the bigher sido aify hroles throug which the comp at heal hers throug outside mation oscaped, loosened the outsiug the pal, and thus lessened tho friction agrers for the. Gen. Smith then sank tho piers for tho railroad-bridge across the Missour (two in the river (two in the river and oue on tho east hank) upor which, and a stone ahutment, thren spans, finish 10. lon, were erected. This was inished in two years after its commencement. The difficulties enconntered were similar to those at Omaha.
Tho following conclusiens are doduced from an expericnce of fourteen years, in sinking 1. The phe ouncations:-

1. The greatost dificulties to be overcome should keeping tho pile vertical. For this reducte to fllow the excavation, In righting the pile whon inclined ; for this wedging under the hottom, or propping the top on the lowermost side, and drilling through the uppermost side, are the hest moans yet tried 2. The "air- lift," as described, is the cheapest and most efficient mothod of remoring sand or mud from within a pneumatic pile or caissen.
2. A strong and reliahle pier can bo always built of pneumatic piles, their number, diameter, and the thickness of metal being determined by the conditions of the case.
3. In celd climates, these piles may he fractured by frost; to provent whioh a filling helon the frost line, from 2 ft . to 5 ft . deep, of asphaltic concrete, is recommended.
ohtained suitable timber and stone are to be caisson can be sunk with greater certainty, and
at less cost, than a pier of three or more pnenmatic piles, where it has to he sunk for a considerahle depth through a soft material to a hard one. A pier of masonry on such a wooden caisson, cellmlar, with its walls well rin-howed, cubhle, is the cheapest and best bridge foundation yet devised.
4. Concrete does not "set" well mider air pressure; the water was let in throngh a pipe inserted therefor in the cement, to cover the successive layers as put do i, was added in the open air.

THE LONDON SCHOOL BOARD
Mr. C. Reed, M.P., hrought up a report of the works committee on the 21 st ult., which was received.

1. The committee have iuvited tenders for the erection of a school to provide accoramodation for 1,062 children on the Walworth-common site. [We gave the respective amounts on the 5 th ult.
The committee, as in somo previous cases, thought it necessary, hefore recommending the acceptance of any tender, to make such modifeations in the plans as would reduce tho cost of the huilding, and a second tender has now heen sent in hy Messrs. Henshaw \& Co., amounting to $7,840 \mathrm{~L}$. 10 s ., hased npon the plans as altered. This sum is exclusive of a further provision o 900 ., which it will be necessary to make for boundary walls and tar-paving; hut as the great cost of these latter items is caused hy the unusually large area of the site (over threequarters of an acre), the committee are of opinion that they should he considered distinct from the building itself. They therefore recommend that the amended tender of Messrs. Henshaw \& Co. of the wharfs, City-road Basin, N., amounting
to $7,8401.10 \mathrm{~s}$., for the erection of these schools, to $7,840 \mathrm{l} .10 \mathrm{~s}$., for the erection of these schools, be accepted, and that a further provision of $900 \%$. be sanctioned for the necessary houndary walls, and for tar-paving the site. Total cost of site,
$4.365 \%$. 7 s . 8 d . Cost of ouilding per child, $4,365 \% .7 \mathrm{~s}$.
$7 \mathrm{fl}, 7 \mathrm{~s}, 8 \mathrm{~d}$.
2. The committee have also invited tenders for the erection of a school to provide accommodation for 833 children on the site in Central street, Finshary. The respective amounts were given in our lists of 12th nlt.] The committee recommend the a.cceptance of the lowest tender, Finshnry. G. S. Pritchard, of 103, Paul-street cost of site, $4,370 \%$. 5 s . ; cost of building per child, 7l. 2s. 1d.
3. The committee have also invited tenders for the erection of a school to provide accommo. dation for 1,355 children on the site in New North-road, Shoreditch. Subjoined is a list of the amonnts:-F. and F. J. Wood, $11,9832$. J. Hearle, $10,6722$. ; W. Henshaw \& Co., 10,343l. ; J. Perry \& Co., $10,339 L$; G. S. Pritchard 3.,993l. - J. High, $9,965 \mathrm{~L}$; T. Ennor, $9,930 \mathrm{l}$.; W. H. \& J. Manshridge, 9,915 Q $^{2}$.

The committee recommend the acceptance of the lowest tender, that of Messers. W. H. \& J Manshridge, of Bangor Wharf, King's-road, N.W., amounting to 9.915 . Total cost of site $4,132 \mathrm{l}$. 1s. 6 d . ; cost of hnilding per child, 7 l 68. $4 a$.
4. The Board have already accepted the tender of Mr. W. Wehster, amounting to $617 l$., for the necessary excavation for the foundations for the Board officos. In order that no time might he lost, the committee bave farther invited tenders for putting in the concrete foundations, 5 ft . thick, over tho whole area of the site, and also for getting in the footings and building up the external walls to a height of 6 ft .
The amounts of tho tenders for this work we have already given.
As it was necessary to give seven days notice hefore a tender could be accepted, and the commencement of the work would thus have been delayed for three weeks, till after the adjournment, the Board, on April 9th, as a matter of emergency, nuthorised the committee to instruct Messrs. Dove, Brothers, to commence this part of the work without waiting for a formal vote, and they now ask that the sanc. tion then given should he confirmed in the uenal way.
Mr. C. Heed also moved resolutions in accord. ance with the recommendations in the report. The committee reported that Mr, W. G. Doolin
departma appointed a tracer in the architect's 12th therefore recomraended that Mrs. Thos. Chandler he appointed in his stead, at a salary of 258 . per week, subject to one month's notice on either side, such appointment to date from 28th [April]

THE NEW MUNSTER BANK, DUBLIN.
The new huilding for the Munster Bank in Dame-street, adjoining Palace-street, is progressing, and will he ready for occupation in
Septemher. The plans and drawings selected Septemher. Nhe plans and drawings selected
were those sent in by Mr. T. N. Deane, and the works were commenced in the Octoher of 1870 , and had advanced considerably, when a much desired corner-honse hecame the property of the company. This rendered it necessary that the entire plan of the bnilding shonld he altered. During the necessary alterations in the plans, the works had to remain in abeyance for a considerThe time, hat were resumed in March, 1872 to the new maserm hiuldings in hears a likeness also erected from designs hy Mr. Deane. The west wall does not squarc with Palace-street fice is could not he avoided without the sacri noe of much valuable space. The architect had with the provie a dwelling-house in connexion with the hanking office, or to provide for kitchen,
pantries, \&c. The edifice is principally huilt of finely:chiselled limestone from the Ballinasloo quarries. The upper cornices are composed of Drogheda limestone. The east front faces
Dame-strect, and consists of two stories. O Dame-strect, and consists of two stories. On
the lower story there is a triplet of arched win. dows, flanked with clusters of pillars, with carved Portland stone capitals on polished Aherdeen granite shafts. In the upper story there are four arched windows similar in character and decoration. The npper cornice is enriched with carved panels, corhels, and stringcourses in Portland stone; and the piers are adorned with medallions in the same material. The principal entrance and vestihule are at the north-west angle at the comer of Palace-street. The arched doorway is supported hy clustered pillars, with foliated capitals, and there is an arched window above it. At the west end is a triplet of windows similar to those in front.
The cash office is 75 ft . long hy 37 ft . wide and 42 ft from the floor to the ceiling. It is lighted by the five great windows in front, and by four at the back, in Trinity.lane. An arcade of arches, resting on pilasters of Caan stone with carved capitals, surrounds the apartment. Besides the wiudows above mentioned, there are two in a southern apse, from which is approached the strong-room, brilt of granite, fire-proof, and furnished with massive iron doors. From the apse is also the entrance 'to large vaults in the hasement story, lighted with gas, and sapplied with heating apparatus. These vanlts will he nsed for kecping plate or other valuahles enbeing to the bank. The caah-office ceiling is being executed by Messrs. Hogan \& Son, who have contracted for the entire stuoco work
required in the hailding. The fnrnitare and fittings of the eash offices are being made hy Messrs. Strahan. The directors' and manager's rooms are situate at the Palace-street side, and will be approached hy a stairway in Porcland stone. The stone carvings on the several
capitals, panels, string-courses, \&c., are heing capitals, panels, string-courses, \&c.,
executed hy Messrs. Good \& Sharp.
Mr. Thomas Butler is the clerk of the works.

## HOMES IN AMERICA

The system of living in hotels aud brarding houses in the great cities of America will strike an Euglish visitor as antagonistic hoth to health and comfort, as well as generally unnecessary and the renting of farmished houses or apart. ments hy the wealthy part of the commnnity as ending to recklessness and restlessness in hahit of life. In these curiously-crowded ahodes, where there is perpetual coming and going, he will meet every where the same dried-np society warped, mentally and physically, with sitting over stoves, passing from one furnace to another antil the time ahall come for huruing. Debcate refined, and over-heated ladies, suffering much from the claims of "society"; and nervons, excitahle men, rushing from hnsiness to pleasore, ever ready to lend a helping hand to some one $r$ something,-hut never at rest.
The dwellings themselves will
coming from England as very home.like, and i many respects more admirable than his own eautiful doorways, the massive woodwo and carved panellings, which give a sense olidity and repose on first crossing the thres old, will always he rememhcred; the nnusu depth and length of the reception-rooms i streets where the frontage is necessarily narron giving of itself a feeling of retirement an emoval from the outer world which is ofte ound inconsistent with the habits of the ocen pants. The ahsence of the pretentions wal papers that disgrace so many English honses ad the arrangements for heating and wate supply, and the domestic appliances for savin ahour, are as remarkahle as they are enviahle. But how is it, one is inclined to ask, that, wit nome is so readily deserted for the lecture-hal ond that the inhahitants of the most comfortahl nodern houses in the world seldom live in them The answer seeme to be that " they are not the won property," and that a nomed hohit of life rowior up in our of which an $A$ or e omed Ho a restese moving crontur at he has at lesta a hergo or ant from which he can dispense hospitality. Th ew Yorker seems instinctively hospitahle an chivalrous in hearing, hat he displays these unhl qualities under unfavourable conditions; how for instance, can a man dispense hospitality, i he true sense of the word, who is numhered au ives in a piseon-hole ; and how oan he displa hat gracious ease of hearing that he inheri rom his Celtic fathers, when he has to ploug his way daily to Wall-street in a pair
uhhers!
Iew York have no reflection that the majority if they had one; hot snrely the day is not fa istant when ; hat snrely the day is not fa ere, and the feeling and the wish to posse something to hand from father to son will be a eager an amhition as a "salary grat."
With reference to the facilities that exis (outside the schools) for the stady of line-draw ug, I saw the other day at Bostou some spec mens of the reproduction of etchings and en graviugs hy the heliotype process, which will d are to aid stadents than anything yet pro duced in this country, giving facilities for ex amining fac-similes of the hest masters a moderate cost. If, with such aids, they do no hortly excel in line-drawing, the reason mus he far to seek.
At Boston they were not only studying th vorks of Alhert Dürer, hat at the Lowell inst Professor Waterhouse Hawking was exhili erfne shorthand of pictorial arb ontline and anatomy of a whale 20 ft . long the speaker, in explaining the structure of th creature, made half his remarks pictorially, an howed the power of the pencil as a means gested too the qnickly to the mind. It sus ome day established of erpressing form in less clumsy way than hy syllables and words, suhject too prolific of saggestion to do mor than hint at here
The value of appealing to tho imagination i pictorial form is ouly half understood, an there is an opportunity for its development $h$ American artists which should not he light thrown away

Henky Blackbleq

## BEGIN AT THE BEGINNING.

In these days of novelty, a practice ha ecome popular of heginning a note at the en f the paper. The sheet is folded as heretofor hat instead of the writing commencing on th right-hand pago and continuing overleaf con seoutively to the fourth page; the sheet is opene oat, and the left.hand page is made the firs and the fourth page the second, so that whe is refolded the counexiou is cal oiting coe thraing the paper inside out, the wris on th econd the third page, and hetter planned Consider the waste of time, when the shee happens to bo cut np the hack, or, as frequentl: occurs, into smaller divisions, for the convenjeno of printing, and the difficulty of conuexion especially when the note is closely written or hin foreign paper, and in a hand at hest of time the result. Common sense demands a stop to suc a backward, crah-crawling progress, and a retur to the straightforward course, which will reliev many a puzzled, time-driven Transcriber.

A NATIONAL HOSPITAL FOR COIVLEY, IN OXFORDSHIRE.
Tre foundation.stome of St. John the Evangelist National Eospital for Incurables has heen linid by Prince Leopold, in the presence of a large number of spectators. The ohjects of the proposod hospital are to offer a well-regulated Home, with suitable attendance and sympathy, to those afflicted with incurable and it may he lingering disease, and unahlo to find elsewhere the comforts they require, and also, and especially, to assist the relations of those who can contrihuto small payments. It is furthor ease for the district of Cowloy St. John. A convenient sito of four acres has heen given, situate near the Magdalen Cricket-ground. The placed 1,000 l. in the hands of Mise Sandford for e purpose. Probahly not less thar $50,000 \mathrm{l}$.
bo required for its complation, but the building will he carried ou gradually, as the
fands may allow. The edifice will consist of a large quadrangle sarrounded by a cloistor, with rooms for the accommodation of single patients and patients in pairs, with wards allowing them to look into the church which is to he built in to look into the church which is to he bailt in
connexion with the hospital. By this arrangement the helpless patients will be enahled to ment the helpless patients will be enahled to
hear and see a religious service conducted when y are unable to leave their rooms. There he every facility for the extension of the building, which will be in the Early Pcrpendicular
style, while the church will he in tho Early De. style, while the church will he in tho Early De.
corated style. It is proposed to accommodate 150 patients, with a large staff, and the church will he spacions enough to contain 1,000 persons. The architect is Mr. C. Buckeridge, fondon and Oxford, aud the huidders are Messra. ILonour \& Castlo, of Oshey.

## PREVENTION OF FIRES.

Sri,-A fire (of no great importance) occurred $n$ Oxford recently, at which, excepting the occupants of the house, I was the first, and for a time tho only, person. The fre hroke out in du outhouse, with no meats for communication, by staircase or otherwise, with the rooms above much astonished ly tho volume of flame which issued from the doorway whilo the fire seemed to mike but littlo or no progress into the rooms above. At the time I thought the place must havo heon arched over with hick or stone, but pace between the plaster of the ceiling and the Hooring abovo it, had been fillod with sawdust, and this, I helievo,-hy preventing for a time an upward draught, and perbaps also the flaming of the timhers when they did ignite,-seemed to have held the fire in check, to some degree, for time, although the ceiling was not more than 7 ft . from the Aloor, and therefore fully exposed to the fire which raged helow it.
Perlaps some of your readers will test my pinion on this subject hy experiments on a smaller seale; hut at prescnt I fecl certain that Glling-in with sawdust hetween the joists of the apper flop's would matorially check the burning a house on fre, especially at the firat out. sawdust was sprinkled with alnm. water, and red hefore used. The sawdust would add but e to the weight on the ceiling; it would he between room and room; it would prevent ; and often prevent effluvia from the In ground. floors or places liable to damp check to ventilation miglit be injurious. G. A. Rowele.

THE EXTINGUISEMENT OF FLRE, Sin,- In the latter part of the summer of the year 1838 ,
being then in New Yorr, I was n witness to the trial of stomanfecngine, built, in Philadelphias, said to be the finest at cum lire.engine made in Americs. The oceasion
of the trial was a fre in a larke block of huildings in the
Bowery, and the superiority

 which has ever owecrred in Man Mester, when the work-
mops of the Lanenhtice and Yortcshire Railway at Miles Pinting sere completely destroycd, togather with thei gee in more or less forwurd runging locomotives, carIIerc, ngain, I witnessed the performanee of one solitary
uteam fire engine, the superiority of which orer its hand
assistants was very marked. But why, I should like t ask, does Manchestcrallow itsolf hut one steam firce-engine?
Why, in fact, should ail not bo worked by sternm power In fires of any magritude, the small stream thrown on the fire by the hand.power engines serves mostly to increase case with the water thrown by the steam-engine. In m
m opinion, if half o dozen stcam fire-engines lad appeare
upon the scene at an early stage of the fire, Fith the upon the scene at an eary stage of the gire, with the
plantiful supply of water there to he obtained, the ralue
of the property safed would have been equal at least to of the property sazed would have been equal at least to
the value of the ongines themselves, and a great industry would not have been disfocated, men's tools destroyod the nume of charity. Cannot we puthic to reinstate in pelliug all fuctories to he built in smaller compartmonts with good suhatantial party-walls, thd iron doors of com
munication where necessary, and then urge corporation and insuranee companies to adopt the best means and adequate to extinguish fires at an early stago of their
growth. Surely half a dozen steam fire-engines would

## CAUTION TO BUILDERS.

Sir, - The contract fir tho restoration of the parish
church, Jirbystephen, Westmoreland, uns let to Moife church, Kirbystephen, westmoreland, Whs let to Moiflet firm of Austin \& Johnson, Newcastle.upon. Tyne, was the
arechitect. It was commenced in Muy, Is70. Iu Deemher 1871, the architect gave the buitder a certinicate for 2002 . Rer. Dr. Simpano, the vicar, who declined to phy it to the architect gnve a shatement to the vicar, showing what was
due, whict h he made to alout thou., with 200, to complete The contractor finished the whole in May, 1872 , and sent ficar gave the contractor 1001 ., but declined to pay more.
The architect also refused to give any account or state ment; the refore tha builder took procedings to recoper
his account of 8162.38 . 6 d . In the latter tember the architect gave a statemeut certifying for only
160 c . It came hefore Justico Queen's Bench, where the architect by nutidavit claimed to he the sole arhiter under the ngrecment. The judge sair he could not aet as such ; he was only architect, ani
orderce it to be referred to arbiration, mad M1. T. C,
Forster was ehosen (mutuatly), who enpoiuted it to he bard at Manchester on the 1sth of March last, where the
game tectical point was reised, that the same tecancal point was raised, that the architcct was sole
arbiter, which Mr. Forster doeided in his farour, thas re
rersing the decision of rersing tho decision of Justico Quain, and saying he bad
no power in the matter. Council argued that there wer four aecounts, which. Were signed hy the huilder and
elcris of Horks, for $165 t$, which formed certificates ; but elcri of horks, for
the architect had for upwards of twelve months, after
being signed, altercd without consulting the huilder. had also altored the whole of his own necount given to the clause in the agrecmeut that he is to beve power opr the fings in regard to the worl, and his decision lo to he
finsl. Thus the builder has to do whatever the architeet orders, and ho decidns that nothing is to be paid for it, but
admits it is not shown on plans, or specitied. Hnvin mysclf been the vietim of an agreanent, I think I amin in others. It is monstrons that a buidees as a warning to pelled to do work which is not in his sontrald he comproprietor to bo able coolly to tell him he admits the is
done, and in a proper manaer, hat hy a technical in the agreement her can get clear of paying for it. point
Morkzt Litmb. Mogerf Litile.

## CURE OF SMOKY CHIMNEYS.

sra,- I nuticed an inquiry, a short time ago, fiom
correspondent, who desired some iuformation as to tho beedlesstment to obdopt for a smoky chimney. It is almost crsal remedy for this eril any more than for the other upon the exciting esuse, and it is absolutely necessary
that this should bo discovered hefore applying anoy means of relief. I have, however, lately made use of an inven. tion called an injecteur by its author, a Frenchman (M,
Papier, of 7 , Yolygon, 8omers-town), which is con struatod on a scientific principle, and appears to answer
its purpose remarkahly well. IIs chice recomateadation
is, that unlike most invention in is purpose remarknhly well. Ho chice recomraendation
is, that unlite most inventions of the kind, it is not an
uneightly ohject; it atands only 5 in. ahove the top of the tue, so that it is scarcely risihle frout the ground; it is
lised readily and is not expeusive. It is diflicult to explain the principlo without a model or a diagrama hut upward current at the top of the itue. The ing eafeur has Heen fixed at the Tower of Londno, St. Baritholomer's success. The circumstance of the inventor heing foreigner, and that he is unacquainted with our language
and the Eanglish mode of husiness, will, Itrust, he sufficientexcuse for you to depart from your usual practi ty publishing this letter

## OAK.

Sir, - Cun any of your renders who have fioored houses
with oak tell mo what are the best sizes with ouk tell mo what are the best sizes, and what is the 3,006 square feet or therpabouts of flooring (ortinary wood desl stuff), with a (bin layer of polished onl, in the sanuefishion as mand fibe French and other forcign loors year, and I had the timber all ready cut thit time last
yeark What and to do with it? for I
wish to door my own rooms with Wish to tloor my own rooms with my own timber, and do
not at all care to order a lot of the parquetrie adpertiscd What aort of patteru shontd I use?-the simpler the
better. Wouid not herring bone do? And if size must the trukk of the trees ho cut into? should the stutf be all cut out at once-say in in. thick, or deft in
plannl, or what should I do ? Also, ought uails or screws the upper to tack it down with; thd how ahout polishing Can I use a common circular-sam for sawing paling, or
will it require to be cut in a fner manner? Pray excuse and my architect questions: bat, heiog quit ignorath, noformy architect tom those who are really competent to
indvise.
J. R. HstG.

THE WAY TO VIENNA.
$8_{1 \Omega}$,-I am very much ohliged to your correspondent
Mr. George Jennings, and he has wo well th thanks of many others connected with the building cordial and with whom I amanaciated, for his letter in this
week's issile replying to the query asked through the mediom of your excellent paper a fow whecks ago. Viennand concerning that city and its E shibition, will be perised with much itterest by a very large clase of your readers, especisuly those to whom Murray is a stranger, naturaly limited. port is necessary or not? Of course we know that, contiuental countring, an Englishman can trasel in many ceno ouly do so on proof of $h$ 's nationality, sud the rub at times is how to prose oneself a Britannic subject, if un-
provided with a passport and no British cousul huppens Awkward things happen sometimes, and although I Aatter myself that I look the vory oppoqite to ": $a$ con-
spipator," yet I thall not readily forget how a few years markets at latyonar on waspicion af apeded in one of the affer ieing marchad a milc or of being one, and how, police, I Was thrown, or rather pushed, into prison.
Fortunately, I Hand in my possession a passport for in another country, and after a good deal of humpan for us? delay aud some lat leugth got out, bat not wi hout nucis Perhaps, too, Mr. Jennings will ba so good ns to tell us posing that the Cologne, Rhine, and Salzhure ront in tukcu; and also as to how letters ead papers should be uddreased for strangers at Voune. Thase wido experiat the "Poste Restante" during the two Paris Fixhibicope with the cxtra pressure munde hy the immense inflax of strangers, would he glad it another such edition of
that sort of thing could bo apoided. Csn people have their correspondenco adressed to some
other place?

THE BRITISH MUSEUM PURCHASES AND COLLECTION゙S.
On the vate, in Supply, of $102,161 \mathrm{l}$. for the British Museum, in the Honse of Commons, Tr. Walpoie, who was imperfectly heard, said tho collection of Roman coins was now complote, and was, he helicved, the finest in the world. The trustces had lately, with the sanction of the Treasnry, purchased one of the finest colleotions this works of art that had ever been brought into this country. Amongst them be might mention a heautiful hust of Juno, a bronzed head of Venus, and an Etruscan sarcophagus of terva. cotta. Mr. Bowring remarked that there was a general impression that from the crowded state of the Museum the accommodation for the Natural History collection was very insuffient Mr. Mundella suggested that the trustees of the Museum should lend daplicates of works of art and of books to the museums of large provincial towns. Mr. Tralpolo said, with respect to tiue Natural History collection, they were taking an increased rote this year for huildings in South Kensington. With respect to the suggestion of again and aber for Sheffield, tho tristees had apart from the difficulties of thequal distribution they were of opinion that, so far at least as regarded duplicate copies of hooks, it was of the highest importance to have all the editions under one roof. The voto was agreed to.

## THE COAL SUPPLY

IN the Select Committee of the House of Commons on Corl Supply, Mr. Pease, M.P. for South Durham, and a member of the committe has heen nuder examination. The honourable member, who said he had heen connected wit the trade for the past twenty years, furnished some elahorate statistics of the coal.production and warges. Wares had risen recent rise in price and wages. Wages had risen from 60 to 75 per cent., and the cost of materials from 30 to 40 per cent., and the latter; ho said, must have the effect, as much as any thing, of keeping up prices, As in other districts, demand had exceeded supply, and the rise of wages followed the advance in price. High wares liad a tendency to iuduce the men to work less time, hat the Mines Inspection Act coming into operation at tho same time as the increased demand, had to some extent retarded production. From his own ohservation, he could say the rise of warges had greatly mproved the comfort and position of the men. The concition of their posinges of improved, and their little gardens better looked after. In some of their homes which he had recently visited he fomad hooks and other esi denoes of the occupants applyine their money doouse. Owe man zept him half an honr where he saw signs of grent impects, and every
deposits in one of their building societies, consisting of 268 members, a nounted in 1872 to $3,900 \mathrm{l}$. Most of the men, too, belonged to cooperative stores, and were subscribers to the
