Here, on Mt. Rose, Nevada, Dr. J. E. Church made
the first western snow survey 50 years ago.

FEDERAL - STATE - PRIVATE COOPERATIVE
SNOW SURVEY and WATER SUPPLY FORECASTS
for
MONTANA & NORTHERN WYOMING

UNITED STATES DEPARTMENT of AGRICULTURE...SOIL CONSERVATION SERVICE,
and
MONTANA AGRICULTURAL EXPERIMENT STATION

In cooperation with the U.S. Forest Service, U.S. Geological Survey,
National Park Service, U.S. Bureau of Reclamation, State Engineers of
Montana and Wyoming and other Federal, State and private organizations.

AS OF
MAY 1, 1959

UNITED STATES DEPARTMENT OF AGRICULTURE - SOIL CONSERVATION SERVICE

TO RECIPIENTS OF COOPERATIVE SNOW SURVEY AND WATER SUPPLY FORECAST REPORTS:

The climate of the cultivated and populated areas of the West is characterized by relatively dry summer months. Such precipitation as occurs falls mostly in the winter and early spring months when it is of little immediate benefit to growing crops. Fortunately, most of this precipitation falls as mountain snow which stays on the ground for months, melting later to sustain streamflow during the period of greatest demand during late spring and summer. Thus, nature provides in mountain snow an imposing water storage facility.

The amount of water stored in mountain snow varies from place to place as well as from year to year and accordingly, so does the runoff of the streams. The best seasonal management of variable western water supplies results from fore-knowledge of the runoff.

A snow survey consists of a series of about ten samples taken with specially designed snow sampling equipment along a permanently marked line, about 1000 feet in length, called a snow course. The use of snow sampling equipment provides snow depth and water equivalent values for each sampling point. The average of these values is reported as the snow survey measurement for a snow course.

Snow surveys are made monthly or semi-monthly beginning in January or February and continue through the snow season until April, May or June. Currently more than 1300 western snow courses are measured each year. These measurements furnish the key data for water supply forecasts.

By relating snow survey measurements taken over a period of years to spring-summer runoff during the same period, relationships have been developed which make it possible to forecast seasonal runoff several months in advance of occurrence. In order to make a forecast, once a forecast relationship has been developed, the maximum snow water content at previously selected key snow courses is usually entered in the forecast relationship. More accurate forecasts are often obtained when other factors such as soil moisture, base flow and spring precipitation are considered and included in the forecast relationships.

Listed below are the Federal-State-Private Cooperative Snow Survey and Water Supply Forecast reports available for the West which contain detailed information on snow survey measurements, streamflow forecasts, reservoir storage, soil moisture and other guide data to water management and conservation decisions.

WATER SUPPLY OUTLOOK
FOR MONTANA
May 1, 1959

The 1959 Water Supply Outlook for the State of Montana is GOOD. The only apparent shortage is in the extreme southern end of the Beaverhead River, where a 75 percent normal supply is forecast.

The Sun River inflow to Gibson Reservoir is forecast at 159 percent average or 912,000 acre feet for the April-September period. Stations along the Missouri and Yellowstone Rivers are forecast for near normal flows this season.

The Blackfoot River near Bonner, the Swan River at Big Fork, and the Clark Fork River above Missoula are forecast to have extremely high flows from the record snow-pack in the mountains feeding these streams.

The April-September flow of the Clark Fork is forecast at 135 percent average below Missoula; a decrease to 125 percent average is forecast at Plains and Thompson Falls.

For May first, irrigation and hydro-electric reservoirs are at satisfactory levels to receive the anticipated spring runoff from the winter snow-pack.

In the Flathead basin, soil moisture under the snow-pack is, in general, slightly higher than last season.

At Bozeman, soil moisture is one-half inch less than last season.

MISSOURI RIVER BASIN

JEFFERSON RIVER:

The Red Rock portion of the Beaverhead River is forecast to flow 25 percent below average this season. This is the only apparent shortage in the State. April precipitation was only 27 percent of normal at Lima and snow cover on April first was 25 percent below average. The tributaries to the Beaverhead River between Armstead and Barratts are forecast to cover the apparent shortage. The April-July flow at Barratts on the Beaverhead is forecast to be 94 percent average or 126,000 acre feet.

MADISON RIVER:

May first snow surveys on the Madison River indicate that an above-average snow-pack exists at high elevations; low elevation snow-pack is below average or non existent. This could mean a prolonged runoff period.

GALLATIN RIVER:

Snow surveys made on May first indicate an above-average water supply for this river this season. The snow course at Devil's Slide, elevation 8,100 feet, showed 30.6 inches water content. This measurement is only one inch less than the record high of 31.6 water content measurement made in 1948.

MISSOURI RIVER MAIN STEM:

May first snow surveys on the tributaries to the Missouri between Toston and Fort Benton indicate an above-average snow-pack for this late in the season. Record high measurements at Kings Hill, Stemple Pass and Upper Tenmile Creek snow courses could produce local high water and a prolonged seasonal runoff.

UPPER YELLOWSTONE RIVER, MONTANA

May first snow surveys at a few key stations indicate a GOOD water supply outlook for the Yellowstone River and tributary streams from Gardiner to Livingston. The Yellowstone River is forecast to flow 99 percent average and 26 percent greater than last season. There was a normal decline of snow water content during April.

SHIELDS RIVER BASIN:

Although no snow surveys are made on May first in this basin, precipitation has been close to average at most stations. The April forecasts have not been lowered. The Shields River and tributaries should produce about 9 percent more water than last season and 90 percent of the average year.

COLUMBIA RIVER BASIN

FLATHEAD RIVER:

May first snow surveys indicate an above-average snow-pack this season. A heavy snow-pack of record proportions exists on the high elevation snow courses on the Mission and Swan mountains. Record water content measurements exist at Big Creek, east of Polson; North Fork Jocko, east of St. Ignatius; Trinkus Lake, Upper Holland Lake and Strawberry Lake on the Swan Range; and on Big Mountain, north of Kalispell. This heavy snow-pack is likely to cause extremely high water in the streams being fed from this area. The snow-pack on these courses is greater than it was in 1950.

The Flathead River at Columbia Falls is forecast to flow 117 percent average or 6,502,000 acre feet from April 1 through September 30. The South Fork of the Flathead River is forecast to flow 2,404,000 acre feet for the April-September period, with 2,034,000 acre feet during April, May and June. These figures are 117 percent of the average.

CLARK FORK RIVER:

The upper portion of the Clark Fork River, from Butte to Milltown, has a good snow-pack this season. All courses measured about May first were above average. The Clark Fork River above Bonner is forecast to flow 117 percent average this season.

The Blackfoot basin, to the north of the Clark Fork, has a heavy snow-pack at the higher elevations. May first snow survey measurements show record highs, exceeding 1950 by 4 inches of water content. This heavy snow-pack is certain to bring high spring flows during June and July. The Blackfoot River at Bonner is forecast at 169 percent average or 1,363,000 acre feet of water during the April-July period. This flow will enter the Clark Fork River above Missoula with a forecast of 151 percent average flow for the April-July period or 2,160,000 acre feet.

The Bitterroot River basin will produce only 107 percent of the average flow during the runoff season.

MONTANA STREAM-FLOW FORECASTS MAY 1, 1959

The following summarized runoff forecasts are based principally on mountain snow cover and on the assumption that precipitation and temperature during the forecast period will be near average. Appreciable deviations from normal of temperature and/or precipitation during the forecast period will correspondingly modify these forecasts.

| UPPER MISSOURI RIVER IN MONTANA | | Seasonal Stream-Flow in Thousands of Acre Feet | | | | | 1938-52 Average |

MONTANA SNOW SURVEY DATA - MAY 15, 1959

Following are snow survey measurements made on or about May 15, 1959 in the Kootenai River basin in northwestern Montana:

| COLUMBIA DRAINAGE BASIN AND SNOW COURSE | No. | Elev. | Survey (In.) | SNOW COVER MEASUREMENTS | | | | | | |
|--|-----|-------|--------------|-------------------------|------------------------|---------------------------|-------------|------|------|-----------------------------|
| | | | | Date of Survey | Snow Depth (In.) | Water Content (In.) | Past Record | | | |
| | | | | | | | 1959 | 1958 | 1957 | Years 15-Year Average |
| | | | | | | | | | | of Record 1938-52 |

KOOTENAI RIVER

| | | | | | | | | | |
|----------------|-------|------|------|-----|------|------|------|--------|---|
| Baree Creek | 15B11 | 5500 | 5/15 | 90 | 47.4 | 32.8 | 27.7 | - | 3 |
| Baree Mountain | 15B1 | 6000 | 5/15 | 108 | 54.0 | 35.6 | 36.0 | 48.5** | 8 |
| Red Mountain | 15A1 | 6000 | 5/14 | 42 | 18.8 | 13.5 | 9.0 | 19.6** | 7 |
| Weasel Divide | 14A7 | 5450 | 5/15 | 72 | 32.3 | 24.5 | 22.9 | 32.2** | 8 |
| Sullivan Mine | Can | 5100 | 5/15 | 21 | 9.6 | T. | - | 7.2** | 6 |

Following are snow survey data for the Flathead basin for insertion (page 14) in the May 1, 1959 Snow Survey and Water Supply Forecasts bulletin:

FLATHEAD RIVER

| | | | | | | | | | |
|-------------------|--------|------|-----|-----|------|------|------|--------|----|
| Spotted Bear Mt. | 13B2M | 7000 | 5/4 | 34 | 13.8 | 11.2 | 9.4 | 12.2** | 8 |
