

Media Viewer

A new way to view images and media files
on Wikipedia, Commons and MediaWiki sites

Proposed by the Wikimedia Foundation
CC-BY-SA-3.0

08/21/2013

Media Viewer

Purpose:

- Provide a richer multimedia experience to match user expectations
- Display images in larger size, on the same page as the thumbnail

Users:

- All users, including 500M 'readers/viewers'

Features:

- Show images in larger, media viewer panel when you click on them
- Include a description and credit below the image, link to file page
- Option to go to next image if it is part of a category or collection

Multimedia Map - View images (current)

Goal: As a visitor, I want to view images in large size, to see them better and learn more.

Systematics [edit source | edit beta]

The Golden-crowned Sparrow is one of five species in the genus *Zonotrichia*, a group of large American sparrows.^[2] It has no subspecies.^[3] It is a sister species with, and very closely related to, the *White-crowned Sparrow*; studies of *mitochondrial DNA* show the two *evolved* into separate species very recently in *geologic time*. The *White-throated Sparrow* is a slightly more distant relative.^[4] Hybridization with both *White-crowned* and *White-throated Sparrows* has been reported.^[3]

Ornithologist *John Latham* first described the species in his book *General Synopsis of Birds* in 1781, but he thought it was a variety of what he called the "Black-crowned Bunting" and neglected to give it a scientific name. That lapse was corrected in 1789, when *Johann Friedrich Gmelin* assigned it the name *Emberiza atricapilla* in the 13th edition of *Systema naturae*.^[5] Various authorities in the 1800s (including *John James Audubon*) placed it in the genus *Fringilla*, but many assigned it to its current genus, *Zonotrichia*, once *William John Swainson* had established that genus. *Peter Simon Pallas* described the same species in 1844 as *Zonotrichia coronata* and, for much of the 1800s, this was the name used by most authorities.^[6]

In the bird's scientific name, the genus name *Zonotrichia* is a compound word: the Greek *zone* means "band" or "girdle" and the Greek *thrix* or *trikhos* means "hair".^[7] The specific epithet *atricapilla* is Latin for "black-haired": *ater* meaning "black" and *capillus*, meaning "hair of the head".^[8]

Description [edit source | edit beta]

Measuring 15–18 cm (5.9–7.1 in) in length^[9] with a wingspan of 24.75 cm (9.74 in)^[10] and ranging from 19.0 to 35.4 g (0.67 to 1.25 oz) in mass,^[3] the adult Golden-crowned Sparrow is fairly large for an American sparrow.^[9] Like all *Zonotrichia* sparrows, it has a relatively long, square-tipped tail and a slightly peaked crown.^[11] Males and females are similarly *plumaged*, though males average slightly larger than females. Other than a plain gray nape, the adult's upperparts are grayish-brown, with broad brownish-black streaks on the back and scapulars, and unstreaked nump.^[9] Its underparts are gray, slightly paler on the belly and buffier on the flanks.^[12]

Golden-crowned Sparrow

from Wikipedia, the free encyclopedia

The **Golden-crowned Sparrow** (*Zonotrichia atricapilla*) is a large sparrow found in the western part of North America.

Contents

Other Images from “Golden-crowned Sparrow”

The Golden-crowned Sparrow is one of five species in the genus *Zonotrichia*, a group of large sparrows. It has no close relatives; it is a sister species to the White-crowned Sparrow, with which it is very closely related to, the two species of which studies of mitochondrial DNA show the two species diverged into separate species very recently in evolutionary time. The relationship between the Golden-crowned Sparrow and White-throated Sparrows has been reported to be a slightly more distant relative.

The ornithologist John L. Bonaparte first described the species in his book *General Synopsis of Birds* in 1781, but he thought it was a variety of what he called the "Black-crowned Burdick" and neglected to give it a name. That lapse was corrected in 1789, when the naturalist Alexander Wilson assigned it the name *Emberiza atricapilla*.

Related

Various authorities in the 1800s (including the ornithologist John L. Bonaparte) had established that genus *Zonotrichia* as the current genus for the Golden-crowned Sparrow.

Measuring 16–19 cm (6.3–7.1 in) in length, with a wingspan of 34.75 cm (13.74 in), and ranging from 19.0 to 36.4 g (0.67 to 1.26 oz) in mass, the adult Golden-crowned Sparrow is fairly large for an American sparrow. Like all *Zonotrichia* sparrows, it has a relatively long, square-tipped tail and a slightly peaked crown. Males and females are similar, though males average slightly larger than females. Other than a plain gray nape, the adult's upperparts are grayish-brown with broad brownish-black streaks on the back and scapulars, and unstriated rump. Its underparts are iridescent buff.
