Oak very abundant, and more rapid in its growth in this county than in any other part of Great Britain. In the Lord Oxford's estates and Croft Castle contain the finest trees in the county; fine woods at Foxley, U. Price, Esq.; most luxuriant oak timber and coppices at Moccas Court and Stoke Park; a curious weeping oak at Moccas. Most productive ash coppices at Hampton Court and Ledbury, cut every thirteen years for crate wigs, hurdles, &c. and bring from 18l. to 50l. per wood acre, which is to the statute acre as 8 to 5. Elm trees are interspersed in the hedge-rows with fruit trees.

10. Improvements.

Drainage much wanted, but practised chiefly by proprietors, watering little practised, though introduced in 1610 by R. Vaux, Esq. of New Court, whose tract on the subject has been already mentioned. (1376.) One of the greatest experiments in this way which have been attempted of late years in Herefordshire, has been attended with complete success on the estate of T. A. Knight. By making a weir on the river *Tem*, with proper courses for the water, that gentleman is now enabled to irrigate two hundred acres of land, which were never watered before, with the assistance of the least flood; and one half of that quantity even in the driest season.

11. Live Stock.

Herefordshire is esteemed superior to most in its agriculture; breeds; those of Devon and Sussex nearest them in its agriculture. Large size, an athletic form, and unusual neatness, characteristic the true sort; the prevailing colour is a reddish brown, with white faces. The rearing of oxen for agricultural purposes is generally pursued; nearly half the ploughing is performed by them, and they take up the greater part of the labour of the harvest. They are shod with iron in situations which frequently require their exertions on hard roads. The show of oxen in their thriving condition at the Michaelmas fair in Hereford, cannot be equalled by any similar annual collection in England; on this occasion they are generally sold to the principal graziers in the counties near the metropolis, and there perfected for the London markets.

Herefordshire *not being a dairying county*, breeders direct their attention to producing that form of animal best adapted for feeding rather than milking. "The whole attention of the Leicestershire breeder has been directed to the improvement of his cow; and for the use of the grazier, he has made her an excellent animal. The Herefordshire breeder, on the contrary, has sacrificed the qualities of the cow to those of the ox; he does not value his cow according to the price which the grazier would give for it, but in proportion as it possesses that form and character which experience has taught him to be conducive to the excellence of the future ox. Hence the cow produced in Herefordshire is comparatively small, extremely delicate, and very feminine in its character. It is light-fleshed when in common condition, but capable of extending itself universally in a short space of time, when fattening. Experience seems fully to have proved, that these qualities in the cow are necessary to perfection in the ox, and that the more the cow is large and masculine in its character, and heavily leaved with flesh, the ox will be coarse and brawny, and consequently, unkind and tedious in the process of fattening. It may here be remarked, that there is an extraordinary difference between the weight of a Herefordshire cow and that of a Leicestershire; perhaps other sorts, eminent for producing fine oxen, are similarly distinguished; but it is a fact, that a Herefordshire cow will not infrequently be the mother of an ox of nearly three times her own weight. T. A. Knight, who made this observation, recollects not instance of the great disproportion in the weight of the males and females of the long-horned cattle. That gentleman farther observes, that he is unable to discover what advantage the public have derived, or are likely to derive, from a breed of cattle which are not calculated for the dairy nor for breeding oxen. The difference in the dairy between a good and an indifferent milking cow, on the pasture which is adequate to the keep of the latter, will seldom exceed five pounds, and if the animal be good, a very poor pasture will be sufficient; but the difference between a good and bad ox will often exceed twenty pounds, where both have consumed in fattening equal quantities of food: individuals and the public are, therefore, equally and evidently interested in the improvement of the labouring ox. Persons of little experience, Knight adds, in the breeding of cattle, are apt to think that a sort is obtainable which will unite the two objects; but experience will convince them, that in endeavouring to

approach two opposite points at the same time, they will never be able to reach either. Where the soil is well calculated for the dairy, every attention should be paid to obtain and improve the best sorts of milking cows; and where the ox is kept to a proper age as a beast of draught, nothing conducing to his excellence ought to be neglected. A cow must, however, give milk enough to keep its calf fit, or it is disqualified for breeding a good ox; because the calf would be spoiled before it had acquired the proper age to be weaned.

Sheep. The provincial breed, the Ryeland, named from the sands district in the neighbourhood of Ross. They lamb in February and March; but during winter, and particularly in time of lambing, the store flocks are generally confined by night in a covered building, provincially termed a cot, in which they are sometimes fed with hay and barley straw, but much more frequently with peas-hulls. Some breeders accustom them to the cot only in very severe weather, and in lambing time. The practice was derived from the Flemings, and introduced into England about the year 1660. A cross has been made between the Ryelands and the new Leicester sorts, to the

advantage, perhaps, of the breeder who is situated on good land, but certainly to the detriment of the wool. A cross between the Ryeland and real Spanish seems the most probable mode of adding to its fineness and value. Dr. Parry's experiments have been already related. (7232.)

12. *Rural Economy.*

"If a certain proportion between the price of labour and the average price of wheat could be fixed by law, so as to render the applications for parochial aid necessary only in cases of a very large family, of unusual illness, of scanty seasons, or any other real emergency; the measure, it is presumed, would be honourable to the country, would stimulate industry and fidelity, would check dishonesty, and endear to a numerous class their native soil."

13. *Political Economy.*

Reads formerly bad; now improving; materials, coarse limestone. Gloves, to a small extent, manufactured in Hereford. An agricultural society established in 1797, which has given many premiums, and done much good.

7795. SHROPSHIRE. A surface of 890,000 acres; in general flat, but with hills of considerable height on some of its margins. The soil is chiefly clay, but in part light turnip land; both are devoted to the raising of corn-crops. Breeding and dairying is also practised to a moderate extent. The greatest improver in the county is the Marquis of Stafford, whose extensive and important operations on the estate of Lilloshall are described at length by Loch, in his *Improvements on the Marquis of Stafford's Estates*, 1819. (*Lishton's Shropshire*, 1794. *Plymley's Shropshire*, 1801. *Marshal's Review*, 1819.)

1. *Geographical State and Circumstances.*

Climate. Considerable difference according to the soil and surface; more warm on the eastern side than in the middle of the county. E. winds prevail in spring, and W. in autumn.

Soil. Nearly an equal quantity of wheat and turnip land, the former rather predominant. S.W. side of the county variable; thin soil upon clay or rock; extensive tracts of hills and waste; and most sorts of soils except chalk and flint.

Minerals. Lead in granulated quartz very productive. Copper ore found but not worked. Coal of excellent quality on the eastern side of the county; lime, building-stone, chalybeate and spa waters, at different places. At Kingly Wick a spring of salt water, used for making soda at a work established at W. in 1842. Extensive iron works at Coldbrook Dale, where the first cast-iron bridge was erected by Mr. Telford about 1780.

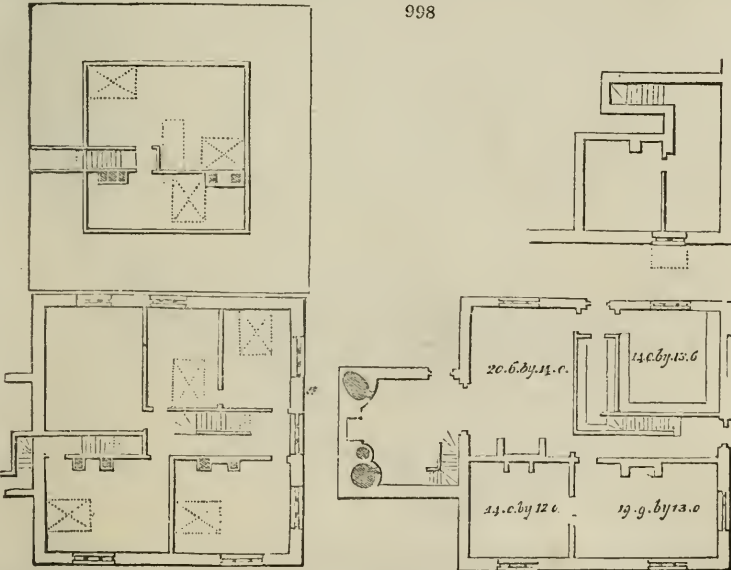

Water. Twenty-two sorts of fish found in the Severn in Shropshire. Salmon in season from Michaelmas to May.

2. *Property.*

Estates of from 10 to 25,000 acres, and an infinite number of freeholders; yeomanry estates of all inferior sizes; much copyhold, but the lords upon some customary manors have enfranchised the copyholders upon receiving an equivalent in money.

3. *Buildings.*

Some good new mansions; above eighty of these named in old maps become farm-houses. Farm-houses generally in villages. Excellent new ones on the Marquis of Stafford's estates. (fig. 998.)

Comfortable cottages with gardens much wanted. Some judicious observations by Plymley; prescribes no particular forms, but suggests the impropriety of making them, or indeed any other objects, bear an outward appearance, intended to contradict their inward use; all castellated or gothicised cottages, all churchlike barns, or forlike piggies, he conceives to be objectionable. They are intended to deceive, and they tell you that they are intended to deceive. It is not pleasant to encourage any thing like deceit, but in these instances imposition effected is rarely gained; it amounts only to imposition attempted; or, could the deceit succeed, it would only present a prospect with fewer propensities about it than there really are. Almost every species of country building has a good effect, if properly placed and neatly executed; and what are the least ornamental, or indeed the most disgusting, of their appendages, cease to shock when supported by the relative situation they stand in, showing their necessity and their use. A dung-hill in a farm-yard creates no disagreeable idea; but connected with a Gothic gateway or embattled tower, it is bad; (but protected by the side of a barn from a picturesque group; but sheltering under a Grecian portico, the impropriety is

glaring. Linen hanging to dry on the hedge of a cottage garden may be passed without displeasure; but the clothes of men, women, and children surrounding the cell of an anchorite, or the oratory of a monk, have their natural unseemliness increased by the contrast. On the other hand, a fine-dressed lawn with miserable cottages may be compared to the laced clothes and dirty linen some foreigners were formerly accused of wearing. The whole of a gentleman's estate should be his pleasure-ground: the village should be one object in the scene; not shut out from it. There may be a little more polish about the mansion, but it should not be an unnatural contrast to the surrounding objects. The face of no country is bad but as it is disfigured by artificial means; and the cheapest and best improvement is merely to remove what offends; and to take care that the buildings or fences that are wanted are neat and appropriate, exhibiting distinctly their real intention. Plymley is a friend to single cottages, because two families under one roof may have more causes of contention arise between them. On the other hand, in illness poor people have frequently the merit of forgetting their differences; and then the assistance they are inclined to give each other is made more easy by near-

ness of situation. It is possible, however, where two, or even three houses are joined together, to contrive the gardens in such a manner that there may be little interference; and sometimes three neighbouring families may do better together than two.

4. Occupation.

On the borders of Wales the farms are small, many not exceeding twenty acres; on the east side of the county from one to 500 acres; farmers in general very industrious; work along with their servants; wives brew, bake, dairy, and at spare hours spin, and get up a piece of linen cloth for sale every year. Leases for lives formerly very common. Bishton of Kilsall has taken great pains to prepare printed leases, which answer very well. The term he recommends is seven, fourteen, or twenty-one years. By being printed the farmer can read them at his leisure.

5. Implements.

Plough with two wheels, drawn by four or five horses, or six or eight oxen, in the strong lands, and two horses with a boy to drive in the turnip soils. Various improved implements and threshing-machines: some excellent mills on Lord Stafford's estates, driven by steam.

6. Enclosing.

Much practised, and still going on. Plashing hedges is usually very ill done in Shropshire; it is a business which requires great nicety and judgment, and has the most ignorant operators to perform it in general; who in the first place cut downwards, through mere idleness, instead of upwards, and so expose the heart of the plant to the weather. Many miles of hedges lately planted on the Stafford estates.

7. Arable Land.

Fallowing very badly done on the strong lands. Common crops of the county wheat, barley, oats, peas, and turnips. Peas found not to boil well unless grown on a sharp gravel or sand; those grown on clay given to pigs and horses. Some hemp and hops cultivated.

8. Grass.

Some natural meadows on the Severn and other rivers; not much attention paid to them. Artificial herbage and grasses grown on the turnip soils.

9. Gardens and Orchards.

Many farmers have small orchards, from whence they make a little cider for home consumption; and on the confines of Herefordshire and Worcestershire the orchards are larger, and cider is made for sale.

10. Woods and Plantations.

A good deal of hedge-row timber, and some fine oak woods; also numerous young plantations. Narrow-leaved elm reckoned an excellent hedge-row tree, but the broad-leaved better timber, and less difficult as to soil and situation. In this county few persons will bury their relations in any but the best oak timber, which contributes much to its scarcity.

11. Improvements.

Marl used, and some irrigation. A good deal of draining done with brick, stone, and faggot wood. Some hogs drained in Elkington's manner. On the Lilleshall estate of Lord Stafford (*fig.* 999.), in 1816 and 1817 there has been executed about 17,000 yards of embankment; 27,000 yards of water course deepened and scoured; 46,000 yards of main ditches made or

deepened; 315,000 yards of fence-ditches deepened, scoured, and straightened; 49,000 yards of old fences stocked; 50,000 yards of new quick fences made; 21,000 yards of turf draining; and 462,000 yards of under-ground draining, laid with tiles and filled with stones; besides the erection of many new farm-eries of the most commodious plans and substantial execution. But to have an adequate idea of these and other improvements effected by this munificent and patriotic nobleman, it is necessary to peruse the very interesting work of Loch already referred to.

On the *Wildmoor estate* of Lord Stafford (*fig.* 1000.) excellent roads have been formed; so that several parts, before inaccessible in winter and during wet weather, may now be approached at all times with ease. The effect, as Loch observes, has thus been to add so many acres to the estate. But the most considerable work executed upon these estates is the drainage of the extensive district alluded to, called the *Wildmoors*. The extent and nature of this improvement is such as to deserve a particular and detailed description. Some adjoining properties have benefited by this work, and contributed to the expense of it, which was done under the authority of an act of parliament; but as almost the whole of the land belongs to the Marquis of Stafford, and the expense having been chiefly borne by him,

the direction of its progress, and its preservation hereafter, is entirely vested in a surveyor chosen by his lordship.

These moors consisted of an extensive tract, amounting, with the land similarly circumstanced, to near twelve hundred acres. The soil is composed of a fine black peat, incumbent on a bed of red sand, full of water. They are bounded chiefly by the upland part of these estates, and surround the parish of Kynnersley, which also belongs to it, and which is composed of some of the finest turnip and barley soil in the kingdom. They had evidently formed the bottom of an extensive lake. The different brooks from the surrounding country held their course through them. These brooks are known in the country by the name of *Strines*, being distinguished from each other by the name of the places from which, or past which, they flow. Their course to the *Tearn* (which river drains the whole of this country into the Severn) was devious and crooked in the extreme, injuring to a great extent the land through which they ran.

A great proportion of these moors was occupied by the tenants of the adjoining farms, who turned their stock in upon them for a portion of the summer season only. During the rest of the year it was impossible to use them. They afforded but a small quantity of food, and were in most places so wet that it

was at all times difficult to walk over them, it being necessary to select the hardest places to step on. They were covered with water after almost every severe rain, owing to which the

inhabitants of the neighbourhood were subject to frequent attacks of ague. The adjoining lands besides, to an extent exceeding six hundred acres, were kept in nearly a state of

1000

nature, owing to there being no level by which they could be drained while this extensive district continued subject to such inundations.

The difficulty which occurred in draining this tract of land arose from the want of level, and from the river Tern being ponded so high by the mill-pools as to throw the water back to a great distance upon the land. The plan for draining this extensive district was extremely well conceived and judiciously laid out, in the double view of securing this object and of interfering as little as possible with private property and the existing establishments situated on the Tern. It was suggested by John Bishton, Esq., the first commissioner under the Act. The great object was to gain as much additional level as would create a run throughout the whole extent of the moorlands. This was to be obtained by beginning the cut which was to carry off the water a considerable way lower down the Tern than the water had hitherto been discharged into that river; and a good deal below the mill-pool at Long, which occasioned this pondage. The original courses of the strines were straightened and widened, but they were still made to convey the water from the uplands, and to discharge them into the Tern in their original direction. To prevent them overflowing the adjoining lands, and to cut off the effects of the back pondage of the Tern on the upper moors, these brooks were embanked for the whole length of their course through the Wildmoors. These are technically called argue banks. At the back of these banks deep ditches were carried, but in a more direct line than

the course of the strines. Into these ditches the drainage of the moorlands is emptied. The level which was thus brought from the river Tern, from below Long Mill, was carried in a tunnel under the Shrewsbury canal, and was conducted below the several strines in siphon culverts, and thus communicated with the ditches described as having been made behind the banks which confined the waters of these brooks.

In some instances it has been necessary to construct one set of culverts over another, in order that the waters coming from the uplands may be kept in the several brooks through which they had constantly flowed, and that this water flowing from the uplands might not fall into the back drains; it being again explained, that the water flowing from the higher grounds is still confined to the original strines or brooks on an upper level; the drainage water alone of the moorlands being thrown into the back drains. Thus has a great additional level been obtained, and the whole of this district is now entirely relieved of water, and such a thing as a flood has not been known for years. This district is in some instances so flat, that the old course of the Preston strine, which formerly conducted the water of that brook in one direction, has with little difficulty been made a part of the drainage, and to carry the drainage water in exactly the contrary direction, a new channel having been cut for the strine. Taking advantage of this drainage, main ditches upon a regular system have been carried into all the neighbouring parts of the estate, thereby enabling the landlord and the tenant to execute various other improvements.

1001

This district has been subsequently divided into regular enclosures, by great ditches, which fall into the main drains; and wherever it has been possible, these ditches have been made to serve this purpose, as well as that of a fence to the new roads which have been constructed across these moors. In one instance, one of these roads has been carried in a straight line for about two miles. On each side of this road trees have been planted, at regular distances, which will soon form one of the finest avenues in England. These moors have besides been all regularly under-drained by turf drains, which stand remarkably well. In the different ditches are placed flood-gates, to pound back the water during the summer, preserving the meadows in a state of perpetual verdure. The water is let off at least once in every fourteen days, and being drawn off with as much velocity as possible, it scours and keeps clear both the ditches and the underground drains; — the mouths of these latter are all defended with tides. The moorlands have been greatly improved by very heavy and repeated rollings and top-dressings; and their value as let to a

farmer, in many instances, is fully doubled. This improvement has cost a very large sum of money; which was increased beyond what was necessary, owing to the inefficiency of the late surveyor belonging to the commission, which is not yet closed. The drainage, however, has lately been put under a surveyor (Lewis), approved of by Lord Stafford in terms of the Act, and the expense is diminished, and the whole put in better order.

A very rapid improvement has taken place on these lands. In place of being the very worst part of the estate, they are rapidly becoming equal to the best and finest meadows on it. In order to shelter them from the blasts which come round the Wrekin, from the Welsh mountains, they have been intersected with various plantations. A plan of the Wildmoors previous to (fig. 1000.), and another subsequent to this improvement (fig. 1001.), will serve to give an accurate notion of what has been done; the whole being well worthy the examination and inspection of an intelligent agriculturist and improver. (Lech, p. 225.)

12. Live Stock.

Cattle of mixed breeds: some dairy, chiefly for butter to the manufacturing towns; some cheese, but not very good. Calves raised as stock; and sometimes suckled for veal. Sheep in breeding flocks of various kinds. Stock in general neglected as to improvement; all sorts of crosses permitted, so that the original breeds of sheep and hogs are now lost. Pork and bacon are much used among the poorer people, when they can procure them; therefore the sort which is to be fed with the least trouble is to be preferred. A mixture of the Shropshire and Chinese has, in this respect, been found to answer for bacon, and a cross of the wild breed for pork. Geese, reared on the commons, and sold to farmers, who fatten them on their stubbles. Turkeys, reared in large quantities by some farmers, and

sold to highers, who drive them to Birmingham and other large towns. Markets in general well supplied with fowls. It is to be lamented that they are generally carried alive to market. Death is no misfortune to an animal that has no previous apprehension of it. But poultry, carried in bags or baskets to market, have several hours of previous suffering, and the burden and trouble of carrying them thither seem much increased thereby.

13. Political Economy.

Roads generally bad; various canals; trade of Shrewsbury, flannel, and Welsh wels, used for clothing for the slaves in the West Indies and South America. Manufactures in the county numerous; iron, pottery, porcelain, glass, dyeing cloth, woollens, flannels, linen, gloves, &c. An agricultural society at Drayton.

7796. **STAFFORDSHIRE.** 765,000 acres of hill and dale, some parts rugged and others smooth, but the whole more a mining and manufacturing than an agricultural county. The Marquis of Stafford, Lord Anson, and the Marquis of Anglesea, are the chief improvers. Excellent markets for produce within the county in consequence of the numerous manufacturing towns and villages. (*Pitt's Report, 1808. Marshal's Review, 1813. Loch's Improvements, 1819. Edin. Gaz. 1827.*)

1. Geographical State and Circumstances.

Climate. Air sharp and cold, and inclining to wet: annual rains thirty-six inches; those of London twenty or twenty-one inches; of Upminster, in Essex, nineteen inches and a quarter; Lancashire forty-two; and Ireland forty-two to fifty. Annual rain on the west side of the kingdom double that on the east side.

Surface. In the north side of the county hills arise, forming the commencement of a ridge, rising gradually higher and higher into Skipton, and different names: here called Moorlands, then Peak, then Blackstone Edge, then Craven, then Stanmore; and then, parting into two horns, called Cheviots.

Soil. Very various; about one third of the county strong loam or clay; one third mixed soils of various sorts, and the remainder light, calcareous or alluvial; no chalk.

Minerals. Valuable and extensive; 50,000 acres or upwards of coal. Iron ore and lime of unknown extent.

2. Property.

Largest estates 10,000, a year, and many of all sizes, from that amount down to 40s. a year. Attorneys generally the managers, but some excellent examples of gentlemen; here called one 500l. a year managing their estates themselves; residing on them, and cultivating a part, and giving every encouragement to their tenants.

3. Buildings.

Some noble mansions, as Trentham, Beadesart, Ingestree, &c. Excellent farm-houses constructed on some estates, as Trentham, Lord Stafford's; but the majority as in other counties, bad, and badly situated. A farm-yard has been constructed at the family seat of the Ansons, for a demesne farm of 2000 acres. It was built by S. Wyatt, of London, and consists of the farming steward's house at one end; a range of building along one side contains a brew-house upon a large scale, a water corn-mill for the family and farm use, and in which corn is ground for the neighbouring poor grates, and a malt-house: the opposite side and end are occupied by stalls for feeding cattle, stables, rooms, stables, and other appendages; and in the middle of the yard is a very complete hattery, built of large stones set edge-ways, and covered with slate, with a boiler for heating hog-wood, a cold bath supplied by the mill stream, for giving an occasional swill to the young pigs. In this building a number of hogs are fattened on dairy refuse, boiled roots or vegetables, pulse, ground barley or bran, supplied by the mill near at hand. At some distance above is the stack-yard and barns, where a powerful threshing-machine is worked by the same stream that afterwards supplies the garden, and turns the corn mill in the farm-yard.

4. Occupation.

Farms of all sizes, from twenty-five to 500 acres; many consolidated since 1795. Some very good cottages with gardens, and containing comfortable and commodious accommodation for agricultural or manufacturing operatives. A specimen of one is given (fig. 1002), which contains a living-room (*a*), working or edging-room (*b*), pantry, dairy, cellar, &c. (*c*), cow-house (*d*), with a water closet, and three bedrooms over. Leases generally granted for twenty-one years. Little made by farming unless

with a combination of all, or most of the following circumstances.—First, an easy rent; second, a pretty good and extensive farm; third, economy and industry; and fourth, length of time. In the present system of farming, at a moderate rent, the writer of this knows from experience, that it requires not only the most diligent industry, but also the most prudent economy, to keep the balance on the right side. To which Marshal adds, "I have rarely found a farmer making a fortune by his profession alone, unless on fresh land, on virgin marsh, old grazing-ground, ancient sheep-walk, or well sowed common; a fortune,

I mean, any way resembling that which, with the same ability and industry, and with a small share of the outset capital, he would have been making by trade, manufacture, or commerce."

5. Implements.

Very various; double furrow-ploughs drawn by four horses, a good deal in use in the light lands. Excellent threshing-machine, and various new implements introduced by proprietors, and especially by the Marquis of Stafford.

5. Arable Land.

Most annual field-crops cultivated, including hemp and flax.

7. Grass.

Meadow on the rivers and brooks, and artificial grasses sown; feeding in general preferred to dairying.

8. Gardens and Orchards.

Common to many farm-houses; but few or no sale orchards, and scarcely any fruit crushed for liquor.

9. Timber and Woodlands.

Best-timbered estate Blithfield Park, Lord Bagot; the park contains many hundred trees of extraordinary bulk, containing from 200 to 400 feet of timber each; much of it is mentioned by Dr. Plot as full grown in 1686. Chillington and Beadesart also remarkably well timbered. The remains of Needwood forest, chiefly remarkable for its beautiful hollies. On the whole the county abundantly wooded. Sneyd's coppices cut once in six years to make crates and large hamper for the potteries.

10. Improvements.

Irrigation and draining practised, the former only to a moderate extent. Jessop, the engineer, suggests that nine parts in ten of the waters of the kingdom at present run away in waste, a great part of which might be usefully employed; nay, farther (putting expense out of the question) that every stream in the kingdom may be made to run equally through the whole year. This position, however extraordinary, is easily demonstrable; for if, upon any given stream, one or more reservoirs be made, capable of containing its flood water, and through the dam or dam be laid a pipe or pipes, whose apertures will discharge the average produce of the business is done; and though there may be no probability of this business being ever brought to so great a nicety, yet from hence some idea may be formed of the prodigious extent to which improvements by water may be carried.

Great and radical improvements have been effected on the Trentham estates. The first object was the laying the lands together, in farms of considerable extent, varying in size according to the nature of the soil, and other circumstances. In effecting these necessary changes, wherever the old tenant was removed, which was done as seldom as possible, he was, unless he took a farm elsewhere, accommodated with his house and his best grass crofts for his life, at a low and inadequate rent; and in every case where it was possible to treat with the person beneficially interested in the lease, and whose continuance in the farm was incompatible with the new arrangement of the land, his interest was purchased either for an annuity or a sum of money, to enable him to look out for, and to stock a new farm. The size of the farm being thus enlarged, it was necessary to enlarge the size of the inclosures, and to lay several closes into one, and, where possible, to give them a more regular and uniform shape. This arrangement enabled the landlord to get rid of the long useless lanes, by which a considerable addition to the number of arable acres was acquired.

In order to give each tenant every advantage in draining his farm, the great lines of ditches were executed by the landlord; and wherever it was possible, there were made the boundaries of the farms. Thus the whole drains on the estate were conducted according to one uniform plan, by which the system of drainage was rendered much more complete, and the interests of the whole, and not that of any individual tenant, were consulted, nor was any one allowed to interfere with the interests of his neighbour. Such a perfect system will have the effect of rendering the condition of these estates more complete in this respect than that of any other kingdom. Attention has also been paid, in the execution of these works, to make the water available for the construction of water-meadows; and for impelling the three-hung-machines of the respective farms.

In consequence of the complete state of ruin in which the farm buildings on these estates were found, it was necessary to incur a serious expense in constructing new ones. In this way it has been necessary to erect thirty-seven new, and to repair throughout eight other, extensive sets of farm offices, besides the smaller repairs which such estates necessarily require. They have been executed in the most substantial manner. They are built of the best possible brickwork, covered with tiles or slates; and their cost, including the expense of those thoroughly repaired, may, on an average, be stated at from 1500l. to 1600l. each.

We have already given examples of these buildings (2955, and 2957), which are remarkably complete in design, and substantial in execution; and several of them are furnished with

threshing-machines, driven by water or steam, a thing rare in England, excepting in Northumberland. It is believed, Loch observes, that they unite as many advantages with as few faults as any buildings of the sort, and that they will supply useful hints to others.

It had been at one period the custom to permit *huts* to be erected in all parts of the estate. These huts amounted in number to many hundreds; they were inhabited by the poorest, and, in many instances, by a profligate population. They were not regularly entered in the rental book, but had a nominal payment fixed upon them, which they paid annually at the court leet. These cottages were built on the sides of the roads, and upon the lord's waste, which was gradually absorbed by the encroachments which the occupiers of these huts made from time to time, by enclosing that which lay next to them. They gradually fell into the hands of a body of middlemen, who underlet them at an extravagant rent to the actual occupiers. In this manner the poor people were oppressed, and the landlord was in danger of losing his property.

To remedy the evils arising out of this system, *the cottagers were made immediate tenants to the landlord*, and their rents made payable at the half-yearly audits; an arrangement perfectly satisfactory to them, as they were no longer exposed to the vexations of an intermediate possessor, and, in many instances, their rents to their landlord were less than they had been accustomed to pay to those from whom they had hitherto held their houses. Since they have been placed in this situation, greater attention has been necessarily paid to the conduct of the tenants, as well as to their rents. As they know that their good conduct will now be noticed by, and meet with the approbation of, their landlord, a considerable improvement in their habits has taken place. There can be no doubt but that these important and necessary arrangements were far from being agreeable to those who suffered from them. In altering such a system, not only was the direct interest of the existing middlemen affected, but also the expectant interests and influence of many who contemplated the chance of one day inheriting from their fathers the estate which they had not always happen that the person who expressed his dissatisfaction loudest, was the one most likely to succeed in his wishes; and in proportion as this object was near its completion, was the vexation and discontent of those who were disappointed. The largest number of cottages were taken down, in order to enable the occupier to put into them married farm-servants, who have thus a great inducement to behave honestly and industriously, and to attend with good will and zeal to the interest and the business of their master. It is by giving such inducements to the tenants, and by securing for them the right of acting right, that this most invaluable class of labourers can alone be maintained and supported.

What has been done by the proprietor, has been well seconded by the exertions of his tenants. A more respectable and enterprising body of tenants has arisen, while the better educated and improved situation of life than a great body of this class, they have not allowed themselves to forget, that it is by a constant attention to their business, by their keeping in the line of life to which they belong, and never attempting to commit the management of their affairs to hand, that they have gone on steadily improving and bettering their condition. In the knowledge of stock, in their capacity as excellent market-men, in the management of their grass land, and in the cultivation of it and in cleaning their lighter soils, they are surpassed by no farmers in the kingdom. Their corn follows in the rotation the Norfolk husbandry; and in the cleanness of their crops, and the excellence of their drill turnips, they cannot be surpassed. The breadth of turnip annually sown is very great, and the rapidity with which they have adopted the direct system of husbandry is as creditable to them as it is laudable to the proprietor.

Except ploughing with too many horses, and not being sufficiently active in getting in their harvest, they have fewer practices to abandon, and there are fewer things which they have to adopt from any other of the well-cultivated districts of the island, than is generally the case. Every means has been used to explain to them the advantages of ploughing with fewer horses; and there is every reason to expect that their good sense will soon see the propriety of these suggestions, as many of them have already adopted this system. The fact is, that the difficulty consists in persuading the proprietor to plough with as the labour of holding the plough is more severe: it is impossible for one or two individuals to contend successfully against the feelings of a country; but when undertaken by so numerous and wealthy a tenantry, supported by the influence of the landlord, these feelings must speedily give way.

This mode of ploughing has made rapid progress at Trentham. The reason of which is, that it is more generally admitted, that this system is calculated to suit the stiff heath than the lighter soils, inasmuch as two oxen drawn by two horses almost do much more work than a double plough, drawn by four horses, can do in such soil: the superiority of the work, also, is very conspicuous. On the other hand it is argued, and with some apparent force, that on that soil the double plough, drawn by four horses, and guided by one man, can do as much work as two ploughs drawn by two horses each, and guided by two men. In this way the labour of one man is saved. It must be admitted that the argument would be in favour of the double plough, were it not that the work it performs is neither so neat, so perfect, nor can it plough so deep as is done by the two-horse system. It is remarkable that this mode of ploughing with two horses should be confined to the eastern parts of England, from which it was adopted, at no very distant period, in Scotland, where the ploughing with a number of horses yoked along with oxen existed to an extent never practised in any part of this country.

In order to encourage these men to make this change, an annual ploughing-match has been instituted, at which prizes are distributed to the best ploughmen. The effect of this has already had is very considerable; and at the exhibition in October 1814, no fewer than fifty ploughs started for the premiums. The progress of such a system must be also slow; as it cannot be expected that the tenants should at once lay aside all their old implements; and the difficulty of procuring such improved ploughs operated much against the adoption of this mode of ploughing. In removing this inconvenience, there has been established, both in Shropshire and in Staffordshire, manufactory for the construction of the more improved implements of modern husbandry; and it is strongly recom-

mended to the persons who have been thus established, that they should take their apprentices entirely from the lads of the country.

It is in the management of their stiff lands that tenants are most defective. Of late, however, they have made so great exertions in draining their lands, that it is hoped they are beginning to adopt a better system. The defect of their management consists in their ploughing very shallow; the effect of which is, that the depth of soil is not sufficient to protect the roots of the plant from being chilled with the cold and wet (which is upheld by the impervious nature of the subsoil), when the ground is wet, and exposes it to the too rapid action of the drought when the weather is dry. To plough deeper is, therefore, the first, the most simple, and the most important improvement which can be adopted in these soils.

They also, until lately, hurt these cold lands by making use of a large quantity of a bad sort of red clay marl, which they dug out of every field. The effect produced was, to increase the fertility of the soil, and to render it still less fit for the purposes of agriculture. Of this fact, all the intelligent part of the tenants are themselves convinced, though some of those who are still wedded to their old customs, lament the regulation which prohibits them from using this article. On those farms where the inclosures have been entirely renewed, and where, in consequence, a portion of several of the ancient inclosures have been thrown into one close, the bad effects of this system of marling is perceived in a remarkable degree, and a distinct proof in the appearance of the crops. On the same farm, the land which had been formerly so treated, from that which it had not. The consequence of this prohibition has been, that the tenants have applied themselves much more to the use of lime as a stimulant, which has repaid them, as might have been expected. It has also had the effect of increasing the value of property, which was occasioned by the digging of the pits, which every where disfigure and destroy a considerable portion of the farms of this district.

To level down these marl-pits, and to render them again fit for the purposes of agriculture, has been an object of great attention. In this way there was applied the labour of a great proportion of the parishioners, to whom, from time to time, employment had been afforded, in those years when the circumstances of the country rendered such an exertion of the labour of the county necessary. This was more particularly the case in 1814, in which year a vast body of men was employed on each of the Marquess's estates.

In another particular, the management of the stiff soils might be considerably amended; which is, in the system of working the crops, and from using the crops left too green to grow full of weeds, in place of being cleaned as they ought to be. The muck, also, is laid on at an improper season of the year, by which its good effects rather go to encourage the growth of weeds, than to improve the crop. At Trentham, the system of the most improved system of wheat and bean husbandry. But the lands were so much subdivided, and the capital of a large proportion of the tenants, until lately, was so inadequate to the right cultivation of their land, that no improvement could take place or be expected, and this estate remained stationary, amidst the general progress which was so conspicuous in the other parts of the county. These defects have been remedied in both instances; and the introduction of some skilful farmers from Shropshire and Cheshire, at Trentham, has given rise to that spirit of enterprise which at present characterises the tenants of these estates, and which must prove so beneficial to the country, by the additional surplus produce which will be brought to market.

The rotation which they followed, on both estates of the stiff soils, was, fallow, wheat, oats, clover. That is now altered, by clover being substituted after the wheat; and an attempt has been made to induce them to try a six-shift course of husbandry, by introducing beans into their rotation. Little progress, however, has as yet been made in this respect. To this they have considerable objection, which arises from the defective mode of cultivating their bean-crop. In the first place, they are unwilling to sow them in drills. They are, besides, loth to plant them, and allow them to stand later in the year than they ought to do. The consequence is, that their crop is often damaged, and the nutritious matter of the bean-straw is entirely lost. They cannot be persuaded, therefore, that it forms an excellent and nourishing food for horses and cattle; and the complaint that they make of its being an exhausting crop is quite correct, in consequence of their permitting it to stand so long upon the ground.

One improvement the tenants have paid much attention to, and a more valuable one they could not adopt, which is the construction of water-meadows. They have lost no opportunity of making use of whatever water they could find to that purpose. They were allowed the rough materials to construct the flood-gates, and the example was shown them as to what could be done in this respect to a very great extent at Trentham. The value of this improvement is very obvious. It is now necessary should be lost in taking advantage of every circumstance to promote its adoption. There has been lately finished a new water-meadow on the home farm at Trentham, at the expense of about twenty pounds an acre, which will give rise to four pounds an acre, besides the advantage derived to the adjoining upland. This meadow was not worth ten shillings an acre previous to such an improvement. It consists of a small deep dingle, with steep banks, in which a copious spring rises near the top; the upper part is being formed into a fish-pond. From this the water is conducted on the different levels on each side, with the proper catch-water-drains carrying the water round the various knolls. The whole being adorned by some fine trees, it forms for its extent a very perfect union of useful and ornamental farming. It shows it is now many years of useful occupation.

Much money, however, in this neighbourhood has been thrown away by watering land which has not been previously thoroughly drained; this latter improvement is the foundation of all the rest. Another mistake has also been fallen into, by attempting to convert into water-meadows peat soils, without first liming them to a proper state of consistency by means of repeated heavy rollings and top-dressings. A proportion of ten acres of water-meadow in every hundred acres of arable land, adds at least two shillings and sixpence an acre

to the value of every acre of such a farm, in addition to a fair rent being put upon the meadow.

The attention and influence of Lord Stafford has been used in extending whatever way it could be employed beneficially in extending the comfort or advancing the good behaviour of his cottagers; a conduct so characteristic of the great and wealthy proprietors of these kingdoms, that it must ever distinguish them in the history of human benevolence.

Schools, wherever they have been necessary, have been encouraged, either aiding them by subscription, or by granting the accommodation of school-houses. Two Banks for Savings, one at Lilleshal and another at Trentham, of which Lord Stafford is the treasurer, have been established, and the whole details are conducted by his managers, assisted by the parochial clergymen and the principal tenantry, and their success among the agricultural labourers has been very gratifying.

The charities of this family are worthy of an English nobleman; and during the residence of the Marquess and Marchioness at Trutham, there is distributed daily to every poor object, who is travelling along the road, and who applies for the same, a portion of good wholesome bread, in quantity about fourteen ounces to each full-grown man, and less in proportion to women and children, with a pint of good table-beer. The number of people who received this doat on in 1819, amounted to 2504 men, 2576 women, and 1789 children, consuming 1590 loaves, and 1705 gallons of beer. From this charity are excluded the officers and sailors receiving the King's pay, all persons residing within the parish of Trutham, or in its immediate vicinity. Other distributions take place on particular occasions; for example, to those who reside in the parish, annually on St. Thomas's day, there is a distribution of a certain quantity of bread to the poor. During 1819, there were 12,785 quarts of rich soup, and above 8500 quarts of milk, distributed within the parish, besides 14,154 quarts of milk given away under the head of allowances. Such facts are strongly illustrative of the beneficial effects derived to the poor from the residence of the great families of England on their respective estates.

The foregoing statement would have been given with some hesitation, had not the facts been of a nature rather to exhibit and illustrate the character and extent of the charities distributed by the great families of England, than as being at all but peculiar to the instance to which the details belong; and these facts may help to explain to foreigners the nature of the connection which exists between the richer and poorer classes in this country.

The town of Lane-End, one of those which compose the Staffordshire potteries, is partly situated on, and is partly contiguous to the east end of the Trentham estate. The inhabitants being ill supplied with water, carried in barrels, were petitioned to be provided with this necessary article, which request has been complied with; and this town, after a very considerable outlay, now enjoys a regular supply of water, conveyed in iron pipes.

7797. WARWICKSHIRE. A surface of nearly 639,760 acres, mostly flat, but generally rich in soil and beautiful in appearance. It is chiefly a corn country, and produces excellent wheat; but also many fat cattle, and formerly much cheese. There are no distinguished agriculturists in the county; but it has produced more good to agriculture than many others, by giving birth to Elkington, who gave rise to much discussion on draining. (*Wedge's Report, 1794. Murray's Report, 1808. Marshal's Review, 1813. Edin. Gaz. 1827.*)

1. Geographical State and Circumstances.

Climate, mild and healthy. S. W. the prevailing winds; effects of an easterly variation felt till the middle of May, and vegetation checked; not, however, by excess of damp or frost.

Soil, chiefly clay or sand, marl, and limestone. The portion of sandy or moorish soil very small. The tract of land called the county of Coventry is a rich, red, sandy loam, chiefly in grass. The land near Birmingham is generally either sand or stiff clay.

Minerals, coal, limestone, freestone, iron, blue flagstone, marl, blue clay, and snappy clay, which the late Earl of Warwick attempted to prepare for sale as a soap.

2. Property.

Largest estate Stoneleigh, Chandos Leigh, Esq., 25,000 acres; but a great variety of extent, and some curious and absurd tenures.

3. Buildings.

Warwick Castle and Ragley first-rate edifices. Old farm-houses built of mud and timber, and frequently at the extremity of the farms. The Duke of Buccleugh, at Dunchurch, has constructed some good farm-houses.

4. Occupation.

Farms from 80 to 500 acres; 150 the average size; on the increase. Farmers in general exceedingly shy and jealous; one considered as the best of his profession, said Murray "he did not see any advantage the county of Warwick would derive from such a survey; that it must do a great deal of hurt instead of good; and that such being his opinion, he declined giving any information on the different heads of queries put to him." Lands generally held at will, but very low rental. Cheap farms, in general, are a drawback on industry and improvements: farmers that have cheap farms may farm well; but those that have dear farms must farm well, or their career will soon terminate.

5. Implements.

Ploughs the double and single Rotherham with wheels, the double drawn by five or six horses in a line, the single plough by three and four, or five horses in a line, and in both cases with a driver. Small's plough, with two horses abreast, and no driver, the reporter remarks, would make a better work, and do more of it. Some winnowing and threshing machines in use by proprietors.

6. Tillage.

Large crooked ridges gathered very high with a small one between; so only one raking per day throughout the year. Following general, and then two white crops.

7798. LEICESTERSHIRE. 522,240 acres of gently varied surface and fertile soil; distinguished for its pastures, and for the progress that has been made in the improvement of cattle and sheep. It is the county of Bakewell, whose name will ever stand at the head of breeding farmers. (*Monk's Report, 1794. Pitt's Report, 1809. Marshal's Review, 1813. Smith's Geological Map, 1821.*)

The character of the numerous cottagers upon the estates is also an object of great solicitude, and without any interference with the manner in which a man may choose to occupy himself, their regular and decent behaviour is made the subject of care and attention; and the steward has strict directions to watch carefully over them, and where possible to promote their improvement. Wherever a potato garden can with advantage be added to their cottage, that accommodation is afforded them. In the vicinity of Trentham the cottages are of the best sort, and with their gardens kept in the nicest order. To almost every one of them is attached land for the maintenance of one or two cows. It is a circumstance worthy of remark, that of all the labourers who possess a cow, none receive more from the poor's rate, except one widow at Trentham, who has a large family, and even in this instance, the relief she receives is in a less ratio than any person labouring under similar difficulties. (*Loch in 1819.*)

11. Live Stock.

Cattle generally of the long-horned breed. The Staffordshire cow is generally considered a tolerable milker, as well as feeder.

Sheep. Three sorts considered native breeds: the grey-faced hornless, or Cannock heath sheep, with fine wool; the black-faced horned, with fine wool; and the white-faced hornless, with long wool.

Swine. A cross between the slouched-sared and dwarf breeds; require little attention or feeding, and easily get fat on the refuse of the dairy or barn. Pitt, the reporter, had a very fine sow, which littered ten at the first litter.

Rabbits. Wild in the sandy lands. A good many bees kept; but for the most part in towns. Many thousands both of men and women employed in making nails. An agricultural society at Newcastle, and another at Litchfield.

12. Political Economy.

Roads now generally good; numerous canals; several private rail-roads; Manufactures, iron, hardware, nails, glass, toys, japanned goods, potters' ware, cotton cloth, silk fabrics, leather, woollen, linen, and many others. Manufactures sometimes carried on in the country in straggling groups of houses, and for the most part in towns. Many thousands both of men and women employed in making nails. An agricultural society at Newcastle, and another at Litchfield.

Experimental Farming. "It would be a wholesome plan for the Board to commence farming upon their own ideas, particularly in counties where the modes of agriculture seem improper; for instance, Lancashire, Westmoreland, Cumberland, Northumberland, &c.; by which ocular demonstration their plan might be limited; for hearing or reading of any particular practice will not do for farmers in general." Such is the reporter's opinion, in ours a most erroneous one.

7. Grass.

235 acres in meadows and pastures, and 60,000 in artificial herbage. Formerly dairying common, and Warwickshire cheeses produced in abundance; but now breeding is fast assuming the place. Old pasture overrun with ant-hills and rubbish. Murray very prophetically observes, that if peace were to take place, grass lands would be safer for the farmer than corn lands. Dairying and feeding both in practice.

8. Gardens and Orchards.

The gardens of the Marquis of Hertford, at Ragley, noted for their pine apples; few sale orchards of any extent.

9. Woods and Plantations.

Oak and elm every where abundant; the Leigh estate the best wooded, but every where abundance of timber.

10. Improvements.

Much draining done in the northern part of the county; but it is rather singular that the names of Fazley, Elkington, or their farms, are not once mentioned in Murray's report. Joseph Elkington lived at Princethorpe, in Stretton on Dunsmoor, six miles S. W. of Coventry, and afterwards in Birmingham. He died in 1806. He was a mere empiric practitioner, and knew nothing of geology, the only foundation for draining on scientific principles; less even than some of his contemporaries, as Farey has ably shown in the Derbyshire report. Irrigation practised in a few places on a small scale.

11. Live Stock.

No particular breed of cattle; but as feeding is the prevailing practice, farmers buy in whatever breed they think will pay them best.

Sheep. A good deal attended to; the large-poled sheep, or ancient Warwickshire, now generally mixed with other breeds. The first cross of a Leicestershire ram and Warwickshire ewe produces the best sheep for the butcher.

Horses, the heavy black Leicestershire breed; a good many bred for cart, coach, riding, and hunting horses.

Poultry abundant, owing to the prevalence of small farms; great quantities sent to Birmingham and London.

Game, as pheasants, partridges, and hares, more than commonly abundant.

12. Political Economy.

Roads tolerably good; several canals; innumerable manufactures, especially at Birmingham, for iron, and others of the metal kind, and Coventry for ribands.

13. Means of Improvement.

Leases; a more economical mode of labouring; draining; drilled root, and herbage crops, and better rotations.

1. Geographical State and Circumstances.

Climate mild and temperate; no mountains or rocks to produce a cold or moist atmosphere.

Soil; no stiff clay or sand, no chalk; the peat bogs which existed have been long since drained, and become meadow soil; clayey loam, sandy loam, and meadow, compose the soil of the county. Dishley farm is well known as a most friable loam, of a good depth, on a clay or marl bottom.

Minerals; coal, lime, lead, iron, slate, and freestone; all worked. A mineral spring at Burton Lazars.

2. Property.

Estates generally large; that of the Duke of Rutland has been much improved, and always managed in the most liberal and benevolent manner.

3. Buildings.

Many very magnificent, as Belvoir Castle, Donnington Priory, &c. Farm-houses not built since the commencement of this century are of very inferior construction; timber and plaster covered with thatch. In general, the modern enclosed parishes have the worst farm-houses, they being almost always cooped up in the villages; in the more ancient inclosures, farm-houses have been erected in the midst of the occupations, and built with better materials. Dishley farm-house is of ancient construction, and has probably been built at different times, which it wants regularity and compactness; it has, however, taken altogether the style of pastoral simplicity, united with neatness, and exhibits a specimen of that judgment and taste which joins convenience with economy, so far as it can be attained without regular design; the out-buildings too seem to have been put up at separate times, as wanted; the yards and pavements are remarkable for neat cleanliness, and the whole farm business for being conducted with good order and system. The houses of other principal breeders are comfortable and substantial, and of course fitted up in a style suitable to the taste and situation in life of the occupier.

Cottages generally in villages, and formed of mud walls and thatch; a few good new ones of brick and native slate.

4. Occupation.

Farms of all sizes; a great many from 80 to 100 acres, on which the farmers work by their own hands; near market-towns, many under 100 acres, occupied by tradesmen and manufacturers; general size, 100 to 200 acres; and those of the principal breeders, from 200 to 500 acres. Land chiefly in pasture for sheep, the dairy feeding cattle, breeding horses, and hay for winter use; dairy farms have also sufficient arable land to produce straw and turps for their own use; the most inferior soils in cultivation. The Duke of Rutland has 2000 acres in hand, including the park, woods, gardens, &c. At Donnington, Lord Moira had 370 acres, under a Northumbrian bailiff, besides the park of 450 acres. Dishley Farm, near Loughborough, in the occupation of the Duke of the Bakewells for three generations, and now of Robert Honeybourne, nephew to the last Robert Bakewell, who died a bachelor, contains between 400 and 500 acres.

Irrigation is judiciously practised, and the culture of the arable uplands has been long conducted on so correct a system that few weeds now come up; the most troublesome is chickweed. Heifers of three or four years old draw in the cart or plough; three of them form a team, and work nine hours a day. Farmers in general intelligent. Leases not universal.

5. Implements.

Plough with two wheels, and drawn by three, four, or five horses, or cattle in a line walking in the furrow. Thirty years ago, wheels were first applied to the fore end of the beam, and it was found that by pitching the ploughs a little deeper, and setting the wheels so as to prevent its drawing in too deep, the wheels were a sufficient guide, and the plough required no one to hold it, except in places of difficulty; one person attending was therefore sufficient to drive on the team, turn the plough in and out at the ends, or guide it in particular hard or soft places. Soon after another furrow was added, by slipping an additional beam in the off side of the former one, somewhat lengthened, with foot-handles and sheaves; the same number of wheels, viz. one on each side, guiding the two furrows. Among the uncommon implements may be included, a rack and manger for four colts on wheels, to be drawn from one pasture to another. It is square in the plan, and therefore each colt has a side to itself, and cannot kick or bite at the others; a break for shoeing oxen; a fastening for ewes, to lessen the fatigue of the ram during copulation; and also several ploughs, rakes, &c. the invention of Hanford and Co. at Hathern, near Leicester.

6. Arable Land.

Many farms have none. Drilling corn crops principally introduced; but not for turneps, even at Dishley; thought to lose ground; cabbages and rape a good deal cultivated on the soils too strong for turnips.

7. Grass.

Excellent meadows on the rivers and rills; fertilised by inundations; upland pastures, sometimes manured. Sixteen cheese made in most villages about Nettle Howarth. On the Trent, considerable patches of reed, which pay as well as the best meadow land.

8. Gardens and Orchards.

Gardens much wanted to cottages; orchards rather neglected, though the soil is in many places well adapted for them.

9. Woods and Plantations.

Few, excepting about gentlemen's seats, and in the hedge-rows. Willows, as willows, grown on Dishley and other farms, to supply staff for hurdles, rails, and gates.

10. Improvements.

Ekington was a good deal employed by the proprietors. Irrigation more extensively practised in this county than in most others.

11. Live Stock.

Cattle, the long-horned breed. What was the particular breed of cattle in Leicestershire before the middle of the last century, about which time Bakewell began his exertions, it is difficult to determine; perhaps there was not any distinct breed, with particular specific characters, whereby they might be distinguished; although there were always great numbers bred, yet the produce was never equal to the supply of the

county; there always was, and still is, an influx from Ireland, Wales, Scotland, Shropshire, Staffordshire, Herefordshire, Northumberland, and Lancashire; the latter of which were most probably the stock from which Bakewell began his breed. His first best cows, it is believed, were artfully obtained from Westcott of Canley, in Warwickshire; and his famous bull, Two-penny, was bred from one of these cows, or from one procured from Phillips of Garrington, and a bull from Northumberland. From these beginnings, with great judgment and attention, in a short time he reared some excellent cattle; they were long and fine in the horns, had small heads, clean throats, straight backs, wide quarters, and were light in their bellies and offals; they were gentle and quiet in their tempers; they grew fat with a small proportion of food, but gave less milk than some other breeds. Some years ago, Bakewell had put three new-milched cows in three separate stalls, a Holderness, a Scotch, and one of his own breed; the Holderness ate most food, and gave much the greatest quantity of milk; the Scotch ate less food, and gave less milk, but produced most butter; his own cow ate the least food, gave the least milk, and made the least butter, but laid on the most flesh: hence it will follow that the Dishley cattle are most adapted for the grazier, and the produce of beef. No man, perhaps, ever made more comparisons between the different breeds of cattle than Bakewell, and no one who was able to tell so much of the merits and faults about them. Many capital herds of cattle in the county, and a number of dairies, from which great quantities of cheese is sent to market.

Sheep. The present stock consists of three varieties, the old and new Leicester, and the forest she. The old herd, which is spread over Northamptonshire, Warwick, and Lincolnshire, are an improvement on the ancient stock of the common flocks. The new breed Bakewell produced by breeding from selected sheep from his neighbours' flocks, or those of the Gibbers. A ram society was formed, six years since, and has still exists, the object of which was a monopoly of ram-letting. The late Bakewell bound himself, and his successor, Honeybourne, binds himself, not to engage nor show his rams to any person till the members of the society have seen them and are supplied, and not to let a ram to any person within fifty miles of Leicester, for a less sum than fifty guineas, for which, and other privileges, the society pay a large annual sum; and Honeybourne, and the other members of the society, consent to let, not to sell, nor to let, nor to show, for any price, nor to show their rams at any public fair, nor at any other place than their own houses, and that only at stated times, from the 8th of June to the 8th of July, and again from the 8th of September till the end of the season; with several other regulations of a similar kind.

Ram-letting alone has produced to Bakewell 5000*l.* in one year. The greatest prices were paid about 1759; since that time they have declined; still, about 1807, from a sum of one hundred guineas have been given for the use of a ram for one session. Much curious information on this subject will be found in the report.

Folding is not practised.

Fattening is practised as usual with grass, and in winter and spring with artificial food. Bakewell frequently fattened sheep in stalls; in these days they were once or twice a week content, and began to feed. "Further than this," the reporter's informant, Bakewell's successor, "knows not, or is not inclined to communicate."

The forest sheep are confined to Charrwood; they are grey-faced, and partially horned, but now almost extinct.

Horses have been bred in Leicestershire from time immemorial, and the breed considered superior. Bakewell went through Holland and Flanders and purchased some Friesian mares, which excelled in those points wherein sought his own horses, viz. in their feet, from which, with great labour, expense, and judgment, he produced some capital horses, and in particular, his famous horse Gee, the noblest, and most complete and beautiful, creature of the kind that had been seen in Europe. He got far his elegant points, and adapted for the labour that horses of this sort are principally deemed to perform, is a question, perhaps, undetermined; be this as it may, beyond all controversy he was strong and handsome, and commanded the admiration of all who saw him; for a time he was the first subject of conversation, and almost the wonder of the day; he was taken to Tattersall's, and shown there to the nobility and gentry, with great approbation; and Bakewell had the honour of showing him personally to Geo. III.; he is said to have been very quiet and docile, and Bakewell, in describing his points, invited his majesty to touch him, which was declined. He was killed by lightning, in his pasture. The present horse-system at Dishley is this:—Three or four very capital black stallions are constantly kept; these are occasionally worked, and are always rendered docile enough for that purpose, if not for sale; those kept at home cover at two guineas the mare, and those let out never at less than one guinea. Eight or ten brood mares, of the same stout black breed, are also kept, but no geldings; these do all the farming work of between 400 and 500 acres, with occasional sales of the stallions, as well as from bullocks and heifers; of the mares, all that are fit are put to the horse, of which three are reckoned upon the average to rear two foals, allowing one in three for casualties.

Asses used in many parts of the county for carrying burdens, and lately introduced as farmer's stock; especially for clearing green crops from clayey soils, in wet weather, their step being light. The turnip panniers open at bottom, to let out the load. Lord Moira had Spanish stallion asses, fourteen hands high, which he let out to cover at two guineas a mare, and the plough.

Hogs greatly improved by various breeds. Honeybourne's seem to have a cross of the wild boar. Astle's is believed to be Chinese or Berkshire. At Donnington is a German boar, the bacon from whose progeny is of extraordinary sweetness and good flavour.

Bees attended to, but not so much as they deserve.

12. Political Economy.

The roads in the north-west of the county, in the neighbourhood of Loughborough and Ashby, are many of them laid out upon the concave system.

Bakewell and others were advocates for this system; but it does not appear that they are considered to be attended with

any advantages by those who live beside them, and constantly use them. Various railways and canals. Manufactures, wool-combing, woolen yarn, worsted, and especially worsted stock-

ings; also cotton-works, hats, patent net-lace for veils, &c. The Leicestershire and Rutlandshire agricultural society established 1794.

7799. DERBYSHIRE. A mountainous and hilly surface of 622,080 acres of great variety of soils, but more remarkable for its mining and manufacturing productions than its agriculture. It is, however, at the same time both a corn and pasture county, and noted for its cheese; it is every where full of ingenuity and interest; and the Report by Farey, in three volumes, is one of the most interesting and valuable of the county reports: it is an example of extraordinary industry, research, and excellent general views, and will be read with great profit by every class of readers. Farey, indeed, was a philosopher ahead of the age in which he lived. (*Brown's Derbyshire*, 1794. *Farey's Agricultural and Mineral Survey*, 3 vols. 1811 to 1815. *Marshall's Rev.* 1812.)

1. Geographical State and Circumstances.

Climate. Cold on the hills, but mild in the plains; in the vales hoar frosts often injurious; no prevailing winds; rain about twenty-eight inches per annum.

Soil very various, chiefly calcareous.

Minerals. Lead and iron those chiefly worked; also some zinc, calamine, black jack, manganese, sulphur, &c.; coal, lime, alabaster, slate, freestone, paving stone, rolling, grinding, scythe, and cutlers' stones, and a variety of others, both for use and ornament, as spar, &c. Clay in some districts, as at Overmoor, is burned by spade-fuels, dried, and mixed with small coals in heaps, for the roads. E. M. Munday, Esq. of Shipley, formed his private roads of a sort of bricks, made without the corners to avoid the duty.

Water. When scarce, drinking ponds made by puddling and plying in the Gloucestershire manner. An artificial pond discovered in 1808, concealed under peat, the head of which was puddled in the centre: a proof that puddling is no new art. Stone cisterns, placed in the lines of neatly cut thorn hedges, serve to supply two fields: the water brought to them in thin zinc pipes, as being cheaper, and perhaps more durable than lead.

2. Estates.

Of various sizes as in other counties; managed by attorneys, at a low salary, who make it up by law business, and otherwise.

3. Buildings.

Chatsworth, Kedleston, and some other noble stone mansions in this county; some good houses, covered with cement (known in London as Atkinson's), made from clay stones found on Lord Mulgrave's estates in Yorkshire, and which Farey considers as superior to that made from the clay-balls of the London clay stratum. Groves frequent, fitted up with the spar of the county. At Ashover a frieze of a chimney-piece, representing a section of the strata taken across the parish. At Chatsworth, and various places, the spits in the kitchens turned by water-wheels, of the overshot kind, supplied by small lead pipes. Hair lines, in covered boxes, placed on drying parts, and the lines wound and unwound by a handle, for drying clothes. At several houses foot latb-wheels, turning spindles, on which were other wheels, dressed with emery for cleaning knives; also brush spindles for boots and shoes, as at the Angel Inn, Oxford; boot-racks, in which boots are reversed on upright pins and taken off by a stick, which prevents dust settling inside the boot.

Farm-houses as in other counties; a few good ones recently erected. One of the most complete farmhouses is that of the Earl of Chesterfield, at Bredley Park; it is of hewn stone, slated, and combines a general farm-yard, dairy court, and two poultry courts, including pheasantry. Buildings in general roofed with grey stone or other slate; water, in some cases, conducted down from gutters by a light wooden rod, down which the water runs as well as if it were in a spout or tube, and not blown about by the winds, as it would if no rod were there. Fire-proof floors made by arching them with hollow bricks; in the cottages, cast-iron ovens by the sides of the fire very common, and also iron cisterns for hot water; both these were originally brought into notice by the Griffin Foundry, about 1778.

Cottages better than in most other counties; some good ones erected by the principal manufacturers and noblemen. Virgin's bower, or other beautiful flowering creepers, and shrubs, and plants, are not uncommon at the cottage doors in this county, among other indications of their attention to neatness and of their comforts, compared with the inhabitants of the miserable huts in many other districts.

4. Occupation.

Farmers generally of small size; farmers rank higher in intelligence than those of most southern counties; nothing but leases and larger occupations wanting to render this one of the most improved counties of England. Best farmers also at same time manufacturers or miners.

5. Implements.

Swing ploughs, and pair; one-horse carts; good harrows (*fig.* 1005); weeding scissors, for clipping off weeds among corn

and from the crib, it is turned half round for them to tread and dung, &c. in the opposite direction, (*fig.* 1001.) Turnip-slicers, chaff-cutters, crushers, slate cisterns as milk vessels, &c.

1001

6. Enclosures.

In setting out fences, less attention paid to separating the different kinds of soils than is requisite; walls frequent; and holes often made in them for pass-ut sheep; to be closed when not wanted by a flat stone; slacked lime plastered on the face of a newly planted hedge (as clay is in Norfolk), to prevent the weeds from rising. Young thorn hedges, with a northern aspect, do less well in the morning sun in spring; injures the bud of those facing the south when previously covered with frost. Roots of thorns, sometimes planted as sets with success; old thorn-hedges effectually renewed by cutting off the shoots below the surface of the ground; the roots then throw up vigorous shoots. Neatly clipped hedges at Ashbourne. Magnesian limestone, and marly soils found to suit the holly better than any other.

7. Arable Land.

Only one fifth of the county in aration; formerly six horses were generally employed in ploughing, now only two; turnips drilled in the Northumberland manner in various places; some wheat drilled; a good deal cultivated, and oat-cakes or Haver (*Ger.*) cake made, by pouring sour dough on a hot stone: a sprinkling of parsley sown with clover to prevent cattle hawking; sides of oat ricks tacked in with a spade, to leave no loose straws for sparrows to nest on.

Chamunille is cultivated to a very considerable extent on the limestone and coal strata near Ashover; the flowers are picked by children, dried first in the shade and then on a malt kiln, afterwards packed tight into loaves, and sent to the London druggists; the crop stands three years, and then gets weedy and declines.

Wood cultivated on a small scale.

Widow's-weed (*Genista tinctoria*) infests old pastures, and is pulled when in flower, and dried and sold to the dyers.

Yarrow (*Achillea Millefolium*) is in some places also taken up, tied in bunches, and dried for the dyers.

Valerian (*Valeriana officinalis*) is grown at Ashover, and also elecampane (*Anula Helenjani*), lavender, peppermint, and rhubarb, on a small scale, in one or two places.

Truffles (*Tuber cibarium*) collected in various places, especially under the shade of the beech trees, and on dry hedge banks. Roses formerly cultivated for the flowers, but not at present.

8. Grass.

Three fifths of the county under permanent grasses (though it appears by the marks of ridges to have been formerly every where arable), and the application chiefly cheese-making. Droppings of cattle and horses on pastures spread by rakes, which injure the grass less than any other implement. Fern and other weeds collected from wastes, and dried and burned, and their ashes made into balls, and laid aside, to be used as ley for washing. This practice declines with the frequency of enclosures. When worms are engaged forming worm-casts in fields, scatter barley chaff, fresh and dry from the winnowing machine, which, sticking to the worms when they come out, prick them, and prevent their return to their holes, till ricks, &c. devour them.

9. Gardens and Orchards.

Good market-gardens at all the principal towns, and few of the farm-houses and cottages without gardens. Samuel Oldknow, Esq. of Mellor keeps a professed gardener, on three acres of rich sheltered land, by the river Goyte, on the Cheshire side of it, who cultivates, gathers, prepares, and delivers all the useful vegetables and common garden fruits in season to his cotton mill work-people and tenants, and renders an account once a fortnight to the mill-agent, who deducts what they have purchased from the garden from their several wages; the perfection and utility of his arrangement for these purposes cannot but prove highly gratifying to those who wish to see the labouring classes well and comfortably provided for from the fruits of their industry. Proper rooms, for drying, cleaning, and preserving garden-seeds and fruits, and his wool-chamber and other like offices, are attached to the gardener's house, and

1003

close, or rather under ground; weeding pincers; threshing-machines; cast-iron rick stands; cattle cribs mounted on posts, which turn round on a pin, so that when the cattle have well trodden the litter on the two opposite sides, in standing to

placed under his care.' A most productive garden at Belper, on a very poor soil, but irrigated in winter from a cess-pool, in which cain's the liquid manure of fifty cottages, belonging to Messrs. Strutt's cotton-mills.

Orchards seldom planted, though the soil is well adapted for them in many places.

10. Woods and Plantations

A good many coppices, the produce of which is much in demand both for roofing and agricultural purposes. Sir Joseph Banks, at Ashover, has planted some exposed sites in a new manner: first planting narrow slips of Scotch fir at the distance of 100 yards, then intersecting them by others, so as to leave the surface checkered; after the Scotch firs are grown a few years, it is the intention to fill the intervening patches with arches, at such a distance as that they will never require thinning. This plan, as Farey justly hints, is more ingenious or fanciful than likely to be useful; the mixture of the larch and Scotch firs, with a proper attention to thinning, would be a more effectual, speedy, and economical mode of producing timber. Some judicious observations on pruning trees, and the propriety of Ponty's mode, pointed out by various examples. Hedge row trees, sparingly introduced and well trained, are nearly all that fertile agricultural land ought to contribute to the national stock of timber. Key-bearing ash trees, or an, forest tree much given to beater the water, and to be immediately sent to a mill and crushed. A most complete seasoning kiln for timber at Belper. Timber often sold by ticket sale, — thus described: the vender meets the proposed purchaser, writes his price in an envelope, and puts it in a glass; the officers do the same; the vender opens the envelopes, and if any price comes up to his, then he accepts it, if not, the process is three times repeated, and then the vender must show his price, if none has come up, but not if any one has gone beyond it. In felling trees with an axe, cut *diagonal*, if young shoots are expected to succeed, as the sooner the centre is struck the waterers thrive. Larch trees bear neglect better than any others, as they never produce timber boughs.

Birch *none* has been made from an open grove of about 100 birch trees, near Overton Hall, for sixty or seventy years past. Thirty trees or more are tapped in a season, about six or eight inches above the ground, in March. A piece of bark, about three quarters of an inch in diameter, is cut out with a gouge, and the wood penetrated an inch or more; an iron spout (fig. 1005a).

1005

is then driven into the bark below the hole, which conducts the sap to a bottle. In warm weather the holes soon grow up, and will cease to run in four or five days; but in windy weather they will run for a month. Some trees will run twenty-four gallons in twenty-four hours, others not half a pint. The water is sold at sixpence a gallon, to those who make small wine as a substitute for small beer. If the water is scalded (not boiled), it may be kept a month before it is made into wine; if not, it will not keep above a day or two. For making the wine, two pounds of coarse sugar, and a quarter of a pound of Malaga raisins, are added to every gallon of birch water, when cold: it is then boiled about an hour, until it is observed to grow clearer, when it is set to cool; and when about at the same heat that beer is set to work, a toast of bread, spread with yeast, is put into it, and for four days suilled to work freely, when it is barrelled, and the same quantity of raisins as before, and about an ounce of singless to every twenty gallons is added. It seldom works out of the barrel, and in two or three weeks is ready for close bunging down, to remain for three months, when it should be bottled off, and in two or three weeks after it is fit for drinking, but is the better for keeping long.

11. Improvements

Magnesian or hot lime very thinly spread has its inimical properties; and it would seem such limes may be used where a stimulant rather than an addition of calcareous earth is required. Lime over-burned melts and runs together, will not slack, and becomes useless; the consequence of too strong a fire being applied to magnesian limes more especially. Might not the dried mud of limestone roads be used instead of lime? Many bone mills in use: they are composed of ratchet-like iron wheels and rollers, between which the back-bones of horses, with their adhering ribs, pass with facility, and are crushed into small pieces; the bones collected in London, from the churchyards and other sources; seven quarters dress an acre. Coal ashes almost entirely neglected, though a valuable manure. Importance in draining of bearing in mind the difference between surface and spring draining, and bog and upland draining.

12. Live Stock

Cow stock of the dairy the prevalent stock in Derbyshire; no particular breed; noticed nine breeds and nine crosses of these. Many consider that rather poor land makes the best cheese, and old sward more and better than artificial grasses. In some cases some slacked and powdered lime strewed on the willow trees within the reach of cows, to prevent their eating them, and tasting the butter. Milk set to raise its cream in yellow dishes, with lips; in some places in slate troughs; carried home in ass's milk-bags (fig. 1006).

Sheep. Ten different breeds, and seven crosses of these and others; wool chambers generally form a part of the accommodations of the farmeries.

Horses. Those of Derbyshire ranked next to those of Leicestershire, for being stout, hony, and clean-legged.

1006

used in considerable number used by the smaller manufacturers, and in the coal-works, potteries, &c.; also on the iron railways.

Swine. The Earl of Chesterfield supplies his table with delicious sucking pigs, of a fortnight old, from his Otahite sow; plan of shaving off the gristly or horny projection of the snout, to prevent digging, recommends a feathering by the neck also suggested for eating down sturdy herlage crops. A pin and screw to be used like those for fixing down Salmon's harmless man-trap. (Trans. Soc. Arts, vol. xxvii. p. 183.)

Poultry. The Earl of Chesterfield's poultry yards at Bredley, perhaps as complete as any in the kingdom. The roosting-house is well contrived, with covered places for the ducks and geese under the fowls, and the whole is constantly kept strewed with fresh saw-dust. The sitting-house, and which serves also for hatching, is furnished with flues, to preserve an equal temperature in frosts. In the feeding-houses, the fronts, partitions, and floors of the pens, are all of lattice-work, which readily take out in order to wash them thoroughly; shallow drawers with fresh sawdust pass under each pen to catch the dung. The fattening pens are fed twice a day, and after each the food is taken away, and the daylight excluded, for them to rest and sleep.

A breed of brown American turkeys at Brailsford; they roost upon trees or the high parts of buildings; cocks weigh twenty pounds when fat, but the hens much smaller.

Geese when let out have a stick about six feet long slung before the breasts of the old ones, which is found to prevent them creeping through hedges, &c.; feed on *Festuca luitans*, &c. When waters are much impregnated with lime, the eggs of geese and ducks that frequent them are so much thickened that hatching becomes difficult.

Hens. At Mesley a fine breed of black fowls; round Winger worth many game fowls kept for cocking. In Tansley the cockpit converted into a methodist meeting-house. Eggs preserved hung in nets, and turned into a fresh position each day; this being the main essential in preserving eggs, whose yolk subsides slowly when left unmoved, and come at length to touch the shells on the lower side, when rottenness almost immediately commences.

See kept in various places.

Fish. Certain ponds in Sir Thomas Windsor Hunslocke's Park, in Wingerworth, are appropriated to the feeding of castrated male carp and tench, which are found very superior in size and flavour to other fish; the late Sir Windsor Hunslocke saw this practice in Italy, many years ago, and had one of his servants, who was with him, instructed in performing the operation; which is less difficult or dangerous than might be supposed, and in consequence of which, not more than one in fourteen or fifteen of the fish die.

Angling permitted at Combs-brook reservoir of forty-five acres, the angler paying sixpence per pound for the fish taken. Salmon pass and trap on the Derwent, at Belper bridge.

31. Rural Economy

Rewards are offered by the Agricultural Society at Derby, as by most others in the kingdom, for long and meritorious hired or day service, but seldom for having performed the greatest quantities of ob work, or earned the most money by such at fair prices. At the beginning of the present century, it was calculated, taking the labourer's wages at two shillings and sixpence per day, that he must work four and a half tillings as many days to earn the same quantity of food, as from three to five centuries back he could, when his daily wages was from fourpence to twopence per day! Part of this was doubtless occasioned by the many idle saints' days which the church of Rome imposed on the people at the earlier periods.

32. Political Economy

Various convave roads formerly, made through the influence of Joseph Wilks, Esq. of Mesdham; these in a very indifferent state, and illustrate the absurdity of the principles on which they are constructed. To level across a road a string level used. It consisted of a piece of box wood eleven inches long, one end half broad, and one and a quarter deep, into the top of which a spirit-level tube was deeply sunk, and to the top, at each end of this level, several yards of strong whipcord was fastened. In using this instrument, a labourer was placed on each side of the road, having the cord in his hand, which they pulled very tight, and steadily against each other, and thereby made the bubble assume the middle of the tube or either end, according as the two ends of the string were held level or one higher than the other.

Some convave roads (551.), but nothing to justify any deviation from the general form of slightly convex roads, with straight or even surfaces as to length. The road between Ripley and Little Eaton, where washing or irrigation has been adopted as a mode of clearing (Com. B. Ag. vol. i.) was "miscerably deep, loose, and bad."

In Manufactures Derbyshire ranks next to Lancashire, Staff. fordshire, and Warwickshire.

1. Trades, &c. depending on the Animal Products of the county, Blanket-weaving, and scouring. Bone-crushing mills.

Butter.
 Button-moulds, of horn and bone.
 Candle-making, of tallow.
 Carpet-weaving.
 Cheese.
 Carriers or leather-dressers.
 Fellmongers.
 Felling mills.
 Glue-makers.
 Leather mills, for oiled and chamomile leather.
 Meat, beef, lamb, mutton, pork, veal.
 Shoe factory.
 Skimmers, of leather-dressers, chamomile, &c.
 Soap-makers.
 Stockings, of worsted.
 Tanyards.
 Woolen-cloth factories, yarn spinning, weaving, and cloth dressing.
 Worsted spinning, for the hoosiers, by hand and jennies.

2. *Trades, &c. depending on Animal Substances, imported.*
 Hat-making and unsplit straw hats.
 Silk-spinning mills.
 Silk-stocking weaving.

3. *Trades, &c. depending on Vegetable Productions of the county.*
 Basket and wicket making.
 Besom or broom do.
 Boat or barge building, for the canals
 Breweries.
 Chamomile flowers.
 Charcoal burning and grinding.
 Charcoal kilns, for grinding it.
 Corn, barley, beans, oats, peas, wheat.
 Hoops for casks, of wood.
 Malt-makers.
 Mattresses, chair-bottoms, &c. of straw.
 Millers, flour or meal makers.
 Sieves, or riddles for corn.
 Shelling, or oat-meal mills.
 Timber.
 Turning mills, for wood, bobbins, howls, cheese-vats, dishes, tool-handles.

4. *Trades, &c. depending on Vegetable Substances, imported.*
 Bleaching-houses, and grounds.
 Calico-printing.
 Calico-weaving.
 Cambric-weaving.
 Candle-wick, bump or bomp spinning-mills
 Cotton-spinning mills.
 Dye-houses.
 Flax-spinning mills, linen-yarn mills.
 Fustian-weaving, tickets.
 Hop-bag spinning and weaving, wool-bags, &c.
 Lace-weaving, or warp frame-lace making.
 Lace-working, or needle-working of frame-lace.
 Linen-weaving, sheeting, checks, &c.
 Muslin-weaving.
 Nightcaps, of cotton frame knitting.
 Packthread spinning, string, twine.
 Paper-making.
 Rope-making, cords, h. lvers.
 Sacking weaving, corn-bags.
 Sail-cloth weaving.
 Stocking-weaving; principally of cotton, some of worsted frame-knit.
 Tape-weaving mills.
 Thread-spinning.
 Whisky-spinning.

5. *Trades, &c. depending on Mineral Products of the county.*
 Bakestone making.
 Boiler-making, of wrought iron, for steam-engines.
 Brick-making, building, draining, fire, paving.
 Building-stone, or free-stone, ashlar, capping, eaves-slates, gable-stones, paving, ridging; grey slates, or tilestones and stack posts.
 Cannon-bills, or shot and shells.
 Cannon-casting and boring.
 Chain-making, iron and cast-iron.
 China-stone, or white potter's chest-pits.
 Cisterns and troughs of stone, to hold water.
 Clay-pits, brick, china, fire, pipe, pottery, and tile.
 Coal-pits.
 Coke-burning.
 Coppers-stone, brasses or pyrites pits.
 Frying-pans of iron.
 Grind-mills, blade-mills, grindstone mills.
 Grindstones.
 Gypsum, alabaster, plaster.
 Hammer mills, forge, tilt, planishing mills.
 Hoops for casks, of iron.
 Iron forges and furnaces.
 Ironstone pits, argillaceous ore.
 Lead-mines, or veins of lead ore.
 Lead-smelting cupolas, and slag-mills.
 Lime-kilns.
 Limestone quarries.
 Malt-kiln pits, of perforated cast-iron
 Marble quarries.
 Marble sawing and polishing mills.
 Marl pits, for manuring.
 Mill-stone quarries.
 Nail-making, of cast-iron.
 ——— clasp (or carpenter's), and spikes, &c.
 ——— horse-shoe.
 ——— shoe-makers.
 Ore dressing washing, budding.
 Patten rings, or clog irons.
 Pipe-making, tobacco pipes.
 Pipes, of earthenware, hollow bricks, for conveying water.
 — of lead, drawn.
 — of zinc.
 Plaster of Paris works, gypsum.
 Potteries, earthenware, stoneware.
 Pot-stones, pye or lump stones for the iron forges.
 Punchions, staunchions or pyes, for the coal pits.
 Red-lead works, minimum.
 Rivets, of iron, softened, for coopers, boiler-making.

Rolling and slitting mills, for iron bars, plate iron, nail rods.
 Rotten-stone, or polishing earth.
 Sand-pits, casting or founders', house-floor, mason's mortar, scouring, and scythe-stick sand.
 Saw mills, for stone and wood, also with circular saws.
 Screws, carpenters', for wood.
 Scythe-sticks and stones for sharpening scythes, hay-knives.
 Sheet-lead, milled lead, rolled lead. Common sheet-lead is cast by most of the plumbers and glaziers of the county.
 Shot, leaden.
 Slitting mills.
 Spar-workers, petrification workers, gypsum, calcspar, fluor.
 Sulphur-works, annexed to the principal smelting houses.
 Tenter hooks, of cast-iron, softened.
 Tile-kilns, draining, gutter, hip, pan, plane and ridge.
 Tire for carriage wheels.
 Whitestones, rubbers, hones.
 White-lead works.
 Wire-drawing, steel.
 Wire-working, safes, sieves, screens.
 Zinc mines, blend and calamine.
 — work, malleable plates, wire pipes, &c.

6. *Trades, &c. depending principally on Mineral Substances, imported.*

Axes, hatchets, bills, adzes.
 Brass foundry.
 Bridle-bits and buckles.
 China factories.
 Chisels, gouges, plane-irons, and other edge tools.
 Clock and watch making.
 Colour-grinding mills, paint.
 Cotton machinery makers, for the cotton-spinning mills.
 Cutlery, knives, forks, &c.
 File-making, rasps.
 Flint-grinding mills, for pottery glazing.
 Frame-smiths, stocking-loom makers.
 Glass-making.
 Gunpowder-making.
 Hoes (garden, turnip), paring shovels, trowels, &c.
 Implement makers, agricultural tools.
 Malt mills, steel mills.
 Mangles, for linen clothes.
 Mechanism, machine, tool and engine makers.
 Millwrights.
 Needle-making.
 Reaping-hooks, smooth-edged.
 Scissors, of cast-iron, cemented to steel.
 Scythe-smiths.
 Sickles, toothed reaping tools.
 Snufflers.
 Soda water makers.
 Spades, shovels.
 Spurs, of steel.
 Stirrup-irons of cast-iron, cemented.
 Tin-plate workers, tin-men.
 Washing machines for clothes.
 Worsted machinery maker, for the worsted spinning-mills.
 Notwithstanding that many of the man-factories and productions above mentioned are separately of small importance and may contribute little or nothing towards an export trade from the county, yet, taken in the aggregate, they must be admitted to present a most flattering picture of the varied and great manufacturing industry of the county; showing it to contribute far beyond most other counties towards the supply of all its own wants, and contributing at the same time, in no small degree, towards the supply and general trade of the kingdom at large.

Education.

Among the labouring classes, the reporter observes, is better attended to than in most of the adjoining counties. He approves of the great attention paid to bringing up children in habits of frugality and industry; and contemplates, as "the great and desirable end, their complete emancipation from the moral slavery of poor-law dependence, and its attended vices and misery." There are some persons, no doubt, who may not approve of all that Mr. Farey has advanced on this subject; for there is the writer that can please every reader? but there are none, we hope, who would not be gratified with his sincere and ardent desire for the more general and universal happiness of the British poor. Though we are of opinion that very little amelioration of that division of society which constitutes the agricultural or labouring class can be effected without an alteration in the laws; yet we are equally convinced, that no great alteration of what are called the poor laws would be advisable, till the poor are prepared for it, by having imbibed such a degree of knowledge as would enable them to meet the consequences with advantage, or at least without an increase of misery.

We agree with the reporter, that the case is somewhat different with the operative manufacturers, and mechanics congregated together in towns; for the wages of their labour depends, in most cases, as the wages of all labour ought to do, on the demand and the supply; whereas the weekly wages of the agricultural labourer depends but too often on the decision of the parochial vestry. The consequences of this state of things are ruinous to the rustic labourer, and call loudly for legislative interference and general sympathy. The extraordinary exertions at present making by the different classes of mechanics, to enlighten and ameliorate themselves, cannot fail in a short time to awaken the dormant powers of the country labourer.

15. Means of Improvement.

There are reading societies in most of the principal towns: to be regretted that the funds of the board of agriculture do not permit it to circulate cheap agricultural books; agricultural books being largely sold in Derbyshire as in most other counties; some take the "Farmer's Magazine" and a great number the "Farmer's Journal;" which, if the stamp duty were taken off, would greatly increase in circulation, and be an incalculable source of improvement. An agricultural society at Derby, since 1791; a society for fat wether sheep at Repton; at Hayfield, a society of mountain sheep keepers, since 1790. A list given by Farey of ninety-three agricultural societies in England and Wales. The late Earl of Chesterfield's premiums annually to his tenants, as recorded in the Farmer's Journal, 27th December 1813, and 15th January 1816.

7800. NOTTINGHAMSHIRE. 495,000 acres of uneven or hilly surface, in great part a sandy soil, and more a corn than a pasture county. It contains the Forest of Sherwood, the only one belonging to the Crown north of the Trent. This forest was once celebrated as being the scene of the adventures of the famous Robin Hood. Very little wood, however, now remains. The report is one of the most defective and least interesting which the board have published, and is, besides, above a fourth of a century old. (*Low's Report*, 1798. *Marshal's Review*, 1812. *Smith's Geological Map*, 1821. *Edm. Gaz.* 1827.)

1. *Geographical State and Circumstances.*

Climate, remarkably dry.

Soil, chiefly sand, great part clayey, and the remainder a lime and coal district.

Minerals. Stone, lime, coal, gypsum, and marl.

2. *Property.*

Estates from 12,000*l.* a year, downwards.

3. *Buildings.*

Five countries contain more gentlemen's seats in proportion to its size. Alston Grove, a noble residence; the gardens formerly in the ancient style, but lately modernised. Clumber Park contains four thousand acres. Newstead Abbey, celebrated as having been the residence of the Byron family; but now sold and divided. Thoresby park, thirteen miles round. Welbeck Abbey, the scene of the horticultural improvements of Mr. Sneyth. Woolston Hall, a singular mansion of the date of the reign of George the second, the architect who built Holland House, near London. Farmhouses "not very spacious," of brick and tile, sometimes

thatched; now and then of mud. Good farmeries, and central on the new enclosures.

4. *Occupation.*

Few farms exceed 500*l.* per annum; generally from 100*l.* to 200*l.* Few leases.

5. *Implement.*

Bothum plough general; waggons have wide frames invariable for harvest use.

6. *Variou.*

Enclosing going on rapidly; in arable culture, rotations good, but no remarkable practice mentioned; various hop-grounds and orchards, many woods and plantations; extensive woods raised from seed on the Welbeck and Clumber estates; the ground is first cleared of surface incumbrances, then cropped with corn two years, and turnips one year; the fourth year acorns, at the rate of four or six bushels, ash trees four, Hawthorn berries one, and Spanish chestnuts one bushel, are sown broadcast on an acre, and ploughed in. The stocking and lace trade, cutlery and silk manufacture, pottery, and various others carried on at Nottingham and other towns.

7801. LINCOLNSHIRE. 1,848,320 acres of uplands, vale and water formed lands. The soil in most places rich, and chiefly devoted to grazing; yielding any county in the island. Examples of embanking, draining, and warping, are numerous along the sea-coast and the Humber. (*Stone's Report*, 1799. *Arthur Young's*, 1794. *Marshal's Review*, 1812.)

1. *Geographical State and Circumstances.*

Climate, formerly unhealthy in the low parts, now the age much less frequent. N. E. winds prevail in spring; much of the rain in summer from the northern and eastern quarters.

Soil, of a great extent of low land, once marsh, and fen along the coast, now rich land in consequence of the embankments and drainage, which have been going on for nearly two centuries. Adjoining the lowlands are the wolds or calcareous hills, and the mainland part of the country is in general flat and uninteresting. Notable seats of the county, however, as, about Balby, Spillay, Stanton, &c. are varied and wooded, and command fine views of the low country.

Soil. There are large districts of clay, sand, loam, chalk, peat, and considerable extent of mixed soils.

2. *Property.*

Very much divided in the Isle of Axholme; inhabitants collected in hamlets and villages, and almost every one is proprietor and farmer of from one to forty acres, as in France; and, as in that country, every farm cultivated by the hands of the family, and the family poor as to money, but happy as to their mode of existence. The poorer farmers and other families work like negroes, and do not live half so well as the inhabitants of a poor-house; but it is made amends by possessing land." Lord Carrington, Sir John Sheffield, and — Goulton, Esq. great proprietors in the county; largest estate 25,000*l.* a year, others of 14, 11, 10, 8, 7, &c. and six of 2000*l.* a year. Lately, a pretty village, "where each man lives on his own."

In the management of a great estate, "I remarked a circumstance at Revesby, the use of which I experienced in a multitude of instances. The liberality of Sir Joseph Banks opened every document for my perusal, and I perceived the singular facility with which he laid his hand on papers, whatever the subject might be, I could not but remark the method that proved of such sovereign efficacy to prevent confusion. His office, of two rooms, is contained in the space of this leaf by sixteen; there is a well-contrived lattice-work partition, which is fastened to the room in which a fire is always burning might be burnt down without affecting the inner one; where he has 156 drawers of the size of an ordinary conveyance, the inside being thirteen inches wide, by ten broad, and five and a half deep, all numbered. There is a catalogue of names and subjects, and a list of every paper in every drawer; so that whether the enquiry concerned a man, or a drainage, or an enclosure, or a farm, or a wood, the request was scarcely named before a mass of information was in a moment before me. Fixed tables are before the windows (to the south), on which are spread maps, plans, &c. commodiously, and those labelled are arranged against the wall. The first room contains desks, tables, and book-cases, with measures, levels, &c. and a wooden case, which when open forms a book-case, and joining in the centre by hinges, when closed, forms a package ready for the carrier's wagon, and in every corner of the drawers in the form of books; a repository of such papers as are wanted equally in town and country. Such an apartment, and such an apparatus, must be of incomparable use in the management of any great estate, or, indeed, of any considerable business. At Wintingham, Lord Carrington has a man employed, whose only business is to be constantly walking over every part of the estate in succession, in order to see if the fences are in order; if a post or rail is wanting, and the quick exposed, he gives notice to the farmer, and attends again to see if the defect is removed." (*Young's Report*.)

3. *Building.*

Several good new farm-houses; old cottages of stud and mud, thatched; but new ones of brick, and tiled.

4. *Occupation.*

Farms on the Wolds from 300 to 1500 acres, on the rich lands 400 and 500 acres, downwards; many very small. The late Sir Joseph Banks declined throwing his farms together, because he would not distress the occupiers, though he lost considerably in rental by it. Farmers met with at ordinaries, liberal, industrious, active, enlightened, free from all foolish and expensive show, or pretence to emulate the gentry; they live comfortably and hospitably, as good farmers ought to do; and in my opinion, the remark is void of those rooted prejudices which sometimes abound among this race of men. I met with many who had mounted their rage, and quitted their homes, purposely to examine other parts of the Kingdom; and had done it with enlarged views, and to the benefit of their own cultivation." Leases rare.

5. *Implements.*

Plough with wheel couler used in the fen tract as in other fens; the wheel couler being considered as better adapted for ploughing among stuble and couch grass than the sword one. The plough is covered of canvass and boards for ricks, and a boat with a net fence round for conveying sheep; at best, we fear, but an expensive incumbrance on agriculture.

6. *Arable Land.*

Near Market Deeping the common fields in alternate ridges of pasture and arable, the latter gathered high; three to five horses used in both plough and cart teams; wood extensively cultivated by Barby, at Barby, and near Boston. Parsley sown along with over to prevent the rot.

7. *Variou.*

"Rich grazing land the glory of Lincolnshire." In some places will carry six sheep per acre, or four bullocks to ten acres. One of the most extensive graziers was T. Fyell, Esq., M.P. at Boston. Very few orchards; some considerable young plantations on the Wolds, but not much old timber.

8. *Improvements.*

Most extensive drainages and embankments. Deeping Fen drained, which extends eleven miles to Spalding. 10,000 acres taxable, for maintaining the drains and banks, which are managed by a commission. Through all the fens what is called the soak exists; viz. water, supposed to be that of the sea, rising and falling in a salutarium of silt; hence low lying lands were washed with moisture to a certain height. Sticklebush sometimes sold at a half-penny a bushel, and used as manure. In the Wolds dry straw spread on the land and burned.

Embankments. Since 1630, 10,000 acres have been saved from the sea in the parish of Long Sutton, and 7000 acres more might now be taken in, by altering the channel of the river. Holland Fen is a country that absolutely exists but by the security of its banks; they are under commissioners, and very well attended to.

At Humberstone there is a large piece taken in from the sea by a bank, which is well sloped to the sea, but too steep to the land; so that if the sea topped it, the bank must break. Great tracts of valuable land remain yet to be taken in from the sea about North Somercotes, and other places on this coast; but I do not find that any experiments have been made in Sir Hyde Paine's method of making hedges or gorse fences, and leaving the sand to accumulate of itself into a bank. Mentioning this to Neve, he informed me, that he had observed at least a hundred times, that if a gorse bush, or any other impediment, was by accident met by the sea, it was sure to form a hillock of sand. The extent of sand dry at low water on this coast is very great; the difference between high and low water mark extending even to two miles.

In the reparation of the banks which secure the marsh land from the sea, the frontage to be raised at the expense; but in case of banks, which are rendered a new bank necessary, the expense is assessed, according to the highest tides ever known, by level over all the country below such level of high water, under the direction of the commissioners will, therefore, vary according to the level of the country.

South Holland, grossly estimated at 100,000 acres, within the Old Sea-dyke bank, has long been an object of embarkment. Ravenbank, the origin of which is quite unknown, appears to have been the third bank which had been formed for securing a small part of this tract from the sea, leading from Coult to Todd St. Mary's. About six miles nearer to the sea is another bank, called the Old Sea dyke bank, which is unquestionably a Roman work.

A very curious circumstance is, that a fifth bank, called the New Sea-dyke bank, two miles nearer than the Roman one, remains, but it is utterly unknown when or by whom it was made. The new bank mentioned above takes in about two miles more in breadth. In staking the level of the country, on my new drain, it was found that the surface of the country, on coming to the Roman bank suddenly rose six feet, being six feet higher on the sea-side than on the land-side, and then continued on that higher level, being the depth of water, or silt, deposited by the sea since first that bank was made.

The first navigable canal that was made in England is, in all probability, that which was made from Lincoln to Torksey; which served to prevent the living waters from running down upon the fens, and skirting the whole of them, from Peterborough

rough to Lincoln, afforded a navigation of the utmost consequence to this fertile county.

Some irrigation; and *warping*, on the Humber, where, as already described (411.), it was invented.

9. Live stock.

More attended to in this county than the culture of corn. The Durham short-horned cattle are preferred, but any sort fatten well, and there is little dairying.

Sheep. County carries one sheep and an half per acre at an average. Lincoln breed preferred; Leicester much tried, and crosses between them frequent; upon inferior land the Leicester preferred, as fattening easier; since the enclosure no folding; several ram societies.

Horses, of the heavy black kind a good deal bred both for carts and coaches; in various places saddle horses also; some farmers keep their horses all the winter in open sheds, with littered yards for them to go out and in at pleasure. Groundsel eaten, said to cure the grease; oats malted in salt water

given for three weeks or a month, found preferable to spring physic.

Rabbits. Several warrens on the wolds. *Geese* formerly much kept in the fens, and plucked four or five times a year. "The Fathers of a dead goose worth sixpence, three giving a pound. But plucking alive does not yield more than three-pence per head, per annum. Some wing them only every quarter, taking ten feathers from each goose, which sell at five shillings a thousand. Plucked geese pay in feathers one shilling a head in Wildmore fen.

10. Political Economy.

Roads in many places made of silt; "dreadfully dusty and heavy, and very much kept in the fens, and in the interior." A number of canals, and, as already observed (3802.), the first in England, made from Lincoln to the sea. A fabric of brushes and sacking at Gainsborough; flax spun in various places. An agricultural society at Falkingham, established in 1796.

7802. RUTLANDSHIRE. 91,000 acres, resembling in soil and surface the uplands of the adjoining county of Lincolnshire. The western part of the county is under grass, and the eastern chiefly in aration. The soil is almost every where loamy and rich; and the agriculture partaking of that of Lincolnshire and Leicestershire. The operative classes seem more comfortable in this county, and more humanely treated by the proprietors and farmers, than in many others. The Earl of Winchelsea has made great exertions to this effect. (*Cratchley's Report*, 1794. *Parkinson's General Review*, 1808. *Marshall's Review*, 1812.)

1. Buildings.

Some comfortable cottages built by the Earl of Winchelsea, containing a kitchen, parlour, dairy, and cow-house, &c. with two bed-rooms over.

Others for the cows, and with a calf-house, piggery, dairy, kitchen, living room, and two bed-rooms over.

A third sort for operatives without a cow, containing a kitchen, pantry, closet in the stair over, and two bed-rooms, one with a fire. Several with small farms of from five to twenty acres attached. (*fig.* 1007.)

1007

2. Arable Lands.

Generally better managed than in Lincolnshire, and very productive. The barley said to be of very superior quality.

3. Pasture.

Chiefly upland. The custom of letting part of it to labourers, and also of taking in labourers' cows at so much per head, prevails, and is encouraged by the Earl of Winchelsea.

4. Several Orchards.

In several places the cottagers take small portions of fields from the farmers to use as gardens. At one place, three acres and a half is divided into fourteen gardens; and at Oakham, a field of three acres is divided into twenty-four gardens, and let at five shillings per garden.

5. Improvements.

Parkinson, one of the reporters, and a man of sound judgment, has altered his opinion on the subject of irrigation, and says, it is now in conformity with that of a correspondent who

thus writes to him:—"In my opinion watering renders the quality of the herbage and the land the worse for the process. Where land is tolerably productive, and in a situation where a quantity of grass food is not required, I should certainly not advise it. I think the land may be turned to better account without it. But I think there are many situations, particularly on gravel, sand, or open soils, where it may be very advantageous; and the produce, by such means, is certainly much increased, and, in some instances, rendered larger when very little otherwise would be produced. Though the produce is increased, yet it becomes in time, in a few years, of so coarse a nature, and mixed with rushes and plants, that cattle frequently refuse to eat it; and when it is eaten, the appearance of the cattle proclaims it far from being of a nutritious nature." He adds, "I was formerly an advocate for irrigation, and am still on such soils as are described in the above extract; but having had since opportunities of viewing several water meadows which have been of long standing, which have operated to the disadvantage of both the herbage and land, I have been obliged, in a great measure, to alter my opinion."

6. Live Stock.

Not much breeding, but chiefly feeding. P. considers that much depends on the application to fallow, and is of opinion, that the large Durham ox did not eat more food to raise him to that enormous size, than some others would to bring them to half the size or weight at the same age. Nor is it at all probable that Lambert, of Leicester, who arrived at such an astonishing weight, had eaten more food than Powell, the celebrated pedestrian, who was a very thin man. An animal for the shambles is seldom too large if he has an aptitude to fatten; and much depends on the constitution of an animal in this respect.

A good plan for washing sheep at Bureleigh; but not so simple as the Duke of Bedford's.

Horses of a very heavy, slow, unprofitable sort are raised in the county.

Of bees, 1176 hives kept by the cottagers.

7. Political Economy.

The Leicester and Rutlandshire Agricultural Society established in 1806, met at Melton Mowbray and Oakham alternately. Less want of knowledge in this county than in most others.

7803. NORTHAMPTONSHIRE. 617,600 acres of billowy surface, rich in wood lands and pasture lands, but much behind in the culture of corn. The soil is almost every where excellent; and by the introduction of good husbandry, the marketable produce of the county might be amazingly increased. (*Donaldson's Report*, 1794. *Pitt's Report*, 1805. *Marshall's Review*, 1812.)

1. Geographical State and Circumstances.

Climate. Favourable both to health and vegetation; exempted from deep falls of snow and long-continued rains; highest point in the county supposed about 800 feet above the level of the sea, and there is neither mountain nor bog. Donaldson found that wheat harvest generally commences here about a fortnight earlier than in Perthshire.

Soil. Great part on a calcareous bottom, limestone, schistus, or slate, and the remainder of sandstone. The surface earths may be classed as strong, and in deep ridges, light thin reddish soil, thin light clay, and fine meadow.

Minerals. Clay, limestone, marl, freestone, and slate.

2. Property.

Almost wholly in large estates; thirty-seven of or above 50000. a year, half of which are from 50000. to 10,0000.; managed by stewards.

3. Buildings.

Althorpe, Bureleigh, and Castle Ashby, noble mansions. Farm-houses "as badly constructed as improperly placed;" built of stone or brick, and covered with slate or straw; farmers and their families crowded together in towns and villages; cottages of mud and thatch.

4. Occupation.

No large farms; 150 acres the average of open fields, and 200 the average of inland farms; few or no leases.

5. Implements.

"Though a clumsy piece of work, with a long massy beam and timber mould, being drawn by four or five horses in a line." Donaldson says, a small plough, with two horses abreast, will make better work, but Pitt (who seems to know very little of the matter) joins with Smith of Tuchmarsh, who says, "I have heard and read much on the subject, and tried a great variety of ploughs; but it is ridiculous to assert that two horses can plough abreast in almost any part of this county. I have met with no ploughs which serve so well (or) run so easy as the ploughs in common uses." No much for the ignorance and presumption of Farmer Smith, and the prejudiced

opinions of Pitt the reporter. A ribbed or plated roller, formed by letting in sixteen bars of iron lengths ways of the roller, is found preferable either to a spiky or smooth roller for breaking clods.

6. Arable Land.

Fallow, wheat, and beans, the common rotation, but others, which include turnips and clovers, beginning to be introduced on the light lands. Most of the other plants in cultivation tried by amateurs or others. Wood cultivated by two woad growers, which the woad grower pays the landlord from 54. to 76. per acre, per annum, for two or three years, the farmer being compelled to give it up for that term, and to take it to again afterwards at the old rent. The land is ploughed early in spring, well sown, and sown broadcast, as thick as grain, by hand-fuls; a great deal of harrowing and dressing necessary to bring it to fine tilth. When the plants appear, they are hoed, and kept perfectly clean, in a garden style of culture; and the crop appears somewhat like a broadcast crop of spinach; the leaves are gathered by hand, in baskets, three times in a season (except a plot sometimes saved for seed), and carried to a mill, where they are ground to a pulpy mass, by vertical wheels, crossed with iron plates, and moved round by horses; this pounce, or jelly, is then formed into balls, by hand, and dried on hurdles, in a shed; these balls are afterwards broken up, and fermented, and finally dried in small lumps, somewhat resembling horse-dung in colour and appearance; it is then packed up in casks for use.

Quince cultivated to great perfection about Northampton; 220 quarters known to have been sent to Daventry fair at one time.

Tobacco cultivated by some farmers for the purpose of dressing sheep for the scab.

Hurze in a few places for oven-fuel.

7. Grass.

Supposed to cover 575,000 acres; 40,000 acres in meadow, on the borders of the Nen and other rivers. One farmer says, "A great improvement on all mowing meadows, incapable of

being watered, is to graze, once in two or three years as bare as possible, and finish with store sheep; shut it up at Christmas for mowing; this is as good as a top-dressing. Feeding sheep and cattle the chief application of the grass lands, and next, dairying and breeding horses.

8. Gardens and Orchards.

Good market gardens and orchards about Northampton; all common articles grow there well, but melons, grapes, peaches, and pine-apples to be had from London cheaper than they can be grown in the county.

9. Woods and Plantations.

Very extensive; there are forests, chases, purlieu woods, and woods and plantations being freehold property. Rockingham forest the most considerable, nearly twenty miles in length, and covering 8 or 10,000 acres. Whittlewood eleven miles, and 7000 acres, with Salcey forest, making in all 20,000 acres; the chases and other classes are supposed to amount to 20,000 acres more, making in all 40,000 acres of wood in the county. The forest lands are in general very unprofitably managed; the Crown has a right to the timber, the Duke of Grafton and others to the underwood, and the township to the pasturage, &c.; woods which are private and entire property are better managed.

7804. YORKSHIRE, 3,698,380 acres divided into three Ridings, each of which is as extensive as the generality of other counties.

7805. WEST RIDING OF YORKSHIRE. 1,568,000 acres of irregular country, hilly and mountainous towards the north, and more level on the east. It contains a great extent of surface well adapted for husbandry, and is the seat of large and extensive ability and interest, was made by three Scotch farmers; and the reprinted copy, as it contains the notes of several gentlemen of the county, will in future times be considered as a curious document; displaying as it does local opinions so different from those considered as liberal and enlightened. (*Brown's West Riding*, 1799. *Marshal's Review*, 1818. *Smith's Geological Map*, 1821.)

1. Geographical State and Circumstances.

Climate, moderate and healthy, excepting on the low surface near the Ouse; rain at Sheffield about thirty-three inches in the year.

Surface irregular, but the middle and eastern parts nearly level; arable lands generally enclosed with walls and hedges.

Soil various, from deep strong clay to peat.

Minerals. Coal, lime, iron-ore, lead and some copper, which have been wrought for ages past.

Rivers. Ouse, Don, Calder, Aire, and Wharfe, all considerable, besides others of lesser importance.

2. Property.

Much divided, but some large estates, as those of the Duke of Norfolk, E. Fitzwilliam, E. Harewood, &c.

3. Buildings.

Wentworth House one of the largest and most magnificent in the kingdom; farm-houses bad and badly situated as in most English counties; Lord Hawke has erected a commodious and elegant farm for his own use. Great want of cottages for farm operatives.

4. Occupation.

Farms small; for one of 400 acres a dozen under fifty; occupier of 100 acres styled a great farmer; few leases; the tenants on one estate warned off because they had become methodists; tenantry in general much plagued by attorney stewards, who must have business or make it.

5. Implements.

Rotherham plough general over the whole district, but one-horse carts and other improved implements, as well as better ploughs, are wanting.

6. Arable Land.

Manufacturing towns great part of the land held by manufacturers, that by farmers not well managed compared with Scotland, but tolerable compared with other districts of England. No grain will ripen on the eastern moorlands at an elevation of 800 feet; but on the calcareous woods of the East Riding it ripens considerably higher, and at 500 feet better than here at 800. Such is the effect of a calcareous soil. Besides the usual crops, some flax, rape, liquorice, rhubarb, and woad, cultivated. Some excellent remarks on fallows.

7. Grass.

Great part of the county under old pastures, including some meadows, chiefly applied to the feeding of horned cattle: cattle

7806. NORTH RIDING OF YORKSHIRE. 1,311,187 acres of bold hilly country, with some fertile vales and extensive moor lands, chiefly remarkable for breeding horses, and especially the sort known as Cleveland bays. (*Tuke's Report*, 1799. *Marshal's Review*, 1808. *Smith's Geological Map*, 1821.)

1. Geographical State and Circumstances.

Climate dry, like that of other districts bordering on the German Ocean. Cold east winds during the first half of the year. Milder in June, when west winds begin to prevail, vegetation not vigorous till June.

Soil and surface: on the coast, clays, and lightish soil on alum strata; a loam upon freestone, and in some valleys west of Whitby a deep rich soil of Cleveland, fertile chalk, and surface hilly; vale of York generally a rich soil.

Minerals. Inexhaustible beds of alum in the hills of the coast and Cleveland; and the only alum works in the island carried on there; pyrites being found in the alum mines, sulphur was formerly extracted from them; but as it required a good deal of coal, and pyrites are equally abundant in the coal at Newcastle, the manufacture of sulphur was transferred to the latter place. Some coal and freestone in the moors, but not much worked; also copper, lead, ironstone, slate, marble, &c., little worked or abandoned.

2. Property.

One third of the Riding possessed by yeomanry; rent of estates from 500l. to 18,000l. per annum; many gentlemen's seats, and the proprietors reside most part of the year on them; tenures mostly freehold.

3. Buildings.

Mansions and farm-houses, as in the West Riding, but rather inferior; cottages decidedly inferior; small and low,

10. Live Stock.

Cattle of the county, the long-horned breed; but various others introduced for fattening and the dairy.

Sheep of various breeds; a good many new Leicesters.

Horses of the strong black breed, bred for the coach, the army, or large waggon. Blood horses formerly bred, but left off, as the least blemish renders them unsaleable.

Hogs, a breed between the Berkshire and the Tonguin.

11. Political Economy.

Bad roads, but many handsome bridges; some canals. Manufactures; — shoes for the army and navy, and exportation; bone lace, woollen stuffs, as tammies, callimancoes, and everlasting. Several small friendly societies for the promotion of agriculture, consisting chiefly of farmers. The Lamport Society is one of those which was found in 1797, meets at Lamport; it has a fund for purchasing books on agriculture and domestic economy, and seems to be a description of association very commendable. A great source of improvement would be the breaking up of the inferior grass lands, and the temporary laying down of the continually cropped tillage lands. Donaldson has drawn an able comparison between the management of lands in the Carse of Gowrie, in Perthshire, and those of Northamptonshire, which shows how very far behind the latter county is in arable culture.

generally made fat on grass, and finished by stall feeding on turnips; sheep sometimes fed on turnips, by hurding. Grazing much better understood than aration.

8. Gardens and Orchards.

A particular species of plum grows at Sherborne and in the neighbourhood, called the wimesour. It grows well both upon gravel and limestone, is hardy, a good bearer, and answers upon any soil; but does not bear so well, nor is its flavour so good, on any as on limestone or gravel. On a strong deep land, the trees run too much to wood, and do not bear fruit in proportion. These plums blossom better than any other sort, and are produced from suckers. The fruit sells from 2s. per peck, when sound and good, to 4s. 6d. when cracked and damaged. They are easily hurt by rain. Plants are to be had from most public nurseries, and in gardens they should be planted on a layer of lime or chalk.

9. Woods and Plantations.

Much oak and ash wood grown, and a ready market found at the shipping and manufacturing towns.

10. Waste Lands.

Two hundred and sixty-five thousand acres capable of cultivation.

11. Improvements.

Warping the most remarkable; ably described by Lord Hawke, and Day of Doncaster.

12. Live Stock.

A great variety of breeds of cattle and sheep in use, but no one generally preferred. Near Leeds, when milk tastes of turnips, a tea-cup full of dissolved nitre is put among eight gallons of milk, which entirely removes the flavour. Horses generally used in draught; not many bred excepting in the eastern part of the district; sort in use among the farmers a small hardy race.

13. Political Economy.

Many good and many bad roads; various canals. Numerous manufactures of shalcoos, callimancoes, flannels, and every branch of woollen goods. At Sheffield every kind of cutlery, since Clauver's time; at Rotherham, iron-works. These and other manufactures the cause of the wealth of the West Riding.

14. Means of Improvement.

Leases, division of commons, enclosing of wastes, better rotations, &c.

rarily with two rooms; dump and unwholesome hovels. Close wainscoted beds used, as in the poorer parts of Scotland, which are sources of insects and infection, and every way unwholesome.

4. Occupation.

Farms on the whole small, many very small; farmers sober, industrious, and orderly; most of them have been educated, and educate their children. Few leases.

5. Implements.

Rotherham or Dutch plough; hay sweep for drawing hay together with a horse and a simple sort of cart (*fig.* 1008. *a*) in use, formed almost wholly of timber, and to be drawn by one, two, or three horses abreast (*b*); wheels entirely of wood (*c*); when to be emptied, the shaft horse is taken out, but not the others. Another variety for harvest work (*fig.* 1009.).

6. Arable Land.

In the vale of York one third in tillage; about Cleveland one half; on the moors much less. Culture and rotations as in the West Riding. Rye more frequently sown than wheat on the light sandy soils; often mixed with wheat, and then called Medin.

Tobacco much cultivated a few years prior to 1782 in the vale of York and Ryedale. In the latter district it did not excite the notice of regal authority; and was cured and manufactured by a man who had formerly been employed upon the tobacco plantations in America; who not only cured it pro-

bridge across a narrow channel, serving as a drain to the adjacent country. It contains at present within the banks about 4700 acres and twenty-four families, and is continually increasing in size, an extensive tract having been recently embanked, with a probability of its being still further enlarged.

Minerals. Chalk and a very hard shell limestone, producing a lime little valued either by the farmer or builder. Chalk of the wolds much harder than that of the southern counties. Marl in many places. Gypsum in some places, but no mineral veins of coal, and in many places not even clay for bricks.

2. Property.

Less divided on the East Riding than in other parts of the county; perhaps less than in most parts of England; which assigns a good deal from the nature of the county: one half of wolds where land is held in little estimation, and occupied in larger tracts; the other a flat low country, partly rich and clayey, and partly sandy and barren. Most of the families have possessed their estates for many centuries, and some from the Norman conquest: largest 15,000*l.* a year; ten at 10,000*l.* a year. Only three noblemen have seats in this Riding.

3. Buildings.

Seventy-four manorial houses, of which twelve are going to decay; nineteen let to tenants, or remain empty; forty-one occupied by their owners (*Temp. Eliz.*); ninety-two families bear arms resident in the county.

Farm-houses generally good, excepting on the wolds, where they are built of chalk, thatched, and miserably bad; generally in villages, excepting the best lately.

Cottages more comfortable than in many places; generally two rooms below and two bedrooms over them: a disposition in the proprietors to let their cottages go to decay.

Village cow club. A plan for insuring cows having been lately adopted on an extensive scale, and with striking success, in the north of Lincolnshire, from which it appears that an average payment of about three halfpence per cow per week (or six shillings per year) is fully adequate to replace the ordinary losses of cows by death, it is proposed to institute a similar club in the contiguous parts of the East and North Ridings of Yorkshire, with a view of relieving the labourer and his family, at a trifling expense, the great benefits of that useful animal, without his risking more than one sixth part of her value, upon certain conditions.

4. Occupation.

Farms in general small; one or two of 1200*l.* per annum, but from 200*l.* to 300*l.* more common. Leases so rare that the surveyor could not recollect of one, unless under suspicious circumstances, where something incorrect is aimed at, some advantage intended to be given or taken; where either the landlord wanted something more than customary from the tenant, or the tenant was disinclined to trust his landlord; great estates are let in full confidence in this Riding, where a lease was never asked for, probably never wished for; because the tenure is equally secure, and more permanent without than with one. Many estates have been occupied by the proprietors of the present tenants, during two, three, or four generations.

5. Implements.

Waggons here of a bad construction; but well yoked in the German manner. The four horses are yoked two abreast, in the same manner as they are put to a coach, two drawing by the splitter-bar and two by the pole; those at the wheel drawing also by a swinging bar, which the wheel-horses of every carriage ought to do, as they thereby obtain considerable ease in their draft, and are less liable to be galled by the collar than those which draw by a fixed bar; the driver then, being mounted on the near-side wheel horse, directs the two leaders by a rein fastened to the outside of each of their bridles, they being coupled together by a strap passing from the inside of each of their bridles to the collar of the other horse. In this manner, when empty, they trot along the roads with safety and expedition; and when loaded, the horses being near their work and conveniently placed for directing labour with much greater ease and effect than when placed at length. Were the waggon, indeed, of a better construction, the team would be excellent.

The post-hook and the bean-hook, both made out of old scythe-blades, and used in teaming, rees and beans, are peculiar to this Riding; as was the lime-burner's fork till lately. (*See fig. 682, h, c.*)

The moulding sledge is a useful implement for levelling the small inequalities of meadow and pasture land, and spreading the dung dropped by the cattle. It is a frame of wood about

five feet square (the sides of which are about four inches thick to give it weight and strength), having three bars of iron fixed to the lower side, the points of which are thinned to sharp edges. When in use, some thorns are drawn under the hinder wooden bar, and above the middle one, to which they are fixed by cords. If it is wanted to be removed from one field to another, it is turned the other side up, which preserves the edges of the bars from injury. It is drawn by two horses, and will go over a great extent of land in a day.

6. Enclosing.

The taste for this has been carried too far, and land enclosed which has not and probably never will repay the expense.

7. Arable Land.

Two thirds of the wolds, and one third of the rest of the Riding, under the plough; fallow, wheat, oats, or fallow, barley, beans, common rotations.

8. Grass.

The marshy meadows adjoining the Derwent, a few grazing pastures in Holderness and Howdenshire, and the small garths or paddocks in the immediate vicinity of the towns and villages, form the principal part of natural grass lands.

The salt-marshes on the outside of the embankments are of no great extent. Unless the mud is so elevated as to be contained above water for a few days at neap tides, no plants take possession of the surface; but when vegetation can go on, the first plant which takes possession is the *Salicornia* or samphire, and next the *Phœa maritima*, which in a short time covers the surface with a close short sward. A few sheep are occasionally put on it when not too much dirtied by the mud of the spring tides.

In laying land to grass, caraway and parsley sown among it by some, to preserve the health of the sheep.

9. Gardens and Orchards.

Almost unknown, excepting among the higher classes; farmers rarely use any other vegetable than potatoes and turnips; cottagers cultivate their gardens with more care than the farmers.

10. Woodlands.

Of no great extent in proportion to the Riding; extensive plantations made on the wolds.

11. Improvements.

Holderness drainage an extensive work of the kind, on the east side of the river Hull; it extends over nearly 12,000 acres, and is managed by commissioners. Various other extensive drainages.

12. Live Stock.

Holderness cattle, remarkable for their large size and abundant supply of milk, prevail universally. This breed is supposed to have been introduced from Holland about a century ago, and improved by attentive management. The late Sir George Strickland the greatest modern breeder in the district. Breeding a principal object in most parts of the Riding, and feeding in Holderness when the pastures are rich.

Formerly this Holderness breed, resembling that of Lincolnshire and the Wold sheep; now the Leicester and various other breeds.

Horses for the coach and saddle, the grand branch of breeding in this Riding, and as many or more produced, in proportion to its extent, than in any other. But it is allowed by all that the breed has of late much degenerated, owing to the intention of the farmers. About twenty years ago, a cross of blood was introduced, by which, though good saddle horses were produced, the coach horse was lost. This error discovered, an opposite and still more pernicious one was produced by the introduction of black stallions from Lincolnshire. These produced a mongrel breed, which will not be got rid of for several generations. In breeding, some castrate the foal while sucking, and think it a preferable practice to that of the North Riding.

13. Rabbits.

About twenty warrens, containing together probably 10,000 acres.

13. Political Economy.

Not more than 140 miles of turnpike road in the whole Riding; few of these good, and the cross roads and lanes very bad; manufactures few; white lead, glue, glass, iron-foundry, oil-mills, cordage, sail-making, patent wholesome, bricks, &c. pottery, &c. at Hull. White-lead and Spanish-white for whitening prepared from chalk, at Hessel. Nowden coarse canvass for mail bags; near Driffield spinning and weaving wool; other manufactures near York. Several agricultural societies; one for books and implements at Howden.

7808. DURHAM. 582,400 acres of surface, in some places mountainous, and in most places hilly; the soil in great part poor; the agriculture generally approaching the best model, that of Northumberland; and the county distinguished by the Durham or Teeswater breed of cattle, and by its lead and coal mines. The celebrated farmer and breeder Culley was a native of this county, and farmed here as well as in Northumberland. (*Granger's General View*, 1794. *Bailey's General View*, 1810. *Marshall's Review*, 1818. *Smith's Geological Map*, 1821.)

1. Geological State and Circumstances.

Climate fine and mild in the low districts; but on Cross-fell, the highest land in England, being 5100 feet above the level of the sea, snow frequently lies from November till the middle or end of June. General time of harvest from the beginning of September to the middle of October.

Soils principally of clay loam and peat; the latter prevails in the western part of the county or lead-mine district; there is a tract of calcareous soil in the interior of the county.

Minerals: coals found over a considerable portion of the county, workable to the extent of 100,000 acres; those in the northern parts of the county wrought for exportation, in the western and southern parts for land sale only. In various parts of the coal districts are dykes or fractures (*fig. 1010, a, b*), and consequent derangement of the strata, which throw the beds of coal (*c*) on one side of the dyke often many feet up or down. The fissures between being commonly filled with clay, stops the water in its course along the different beds (*d, e*), interrupts the drainage, and greatly damages the working of the coal.

Lead-mines numerous in the western district; the ore mostly in vertical fissures of limestone and other rocks like the dykes.

Millstones, grindstones, freestones, slates of the grey or free-

stone kind, silver sand, lime stone, whinstone, clay stone or black metal stone, and, yellow ochre, also found.

Water. Salmon fishery on the Tyne has greatly declined, owing to the building of weirs, which prevent their getting up. *Bailey* remarks, that if dams of this description were put across the river Tweed, a revenue of nearly 16,000*l.* per year, received for rents of fishings, and 100,000*l.* a year, the value of the fish taken in that river, would be reduced to a mere trifle, in a few years.

Salt springs, from which salt is made near Brit and other places. A spa

or salt sulphur spring near Durham, and another on Lord Durham's estate, with public baths and dressing-rooms. Various others of less note.

2. Property.

Largest estates, 20,000, to 22,000, a year; several from 1000, to 3000, from which they descend by regular gradations to the smallest sums. Some estates let by proposal; but the general mode is to ask a rent, and treat with tenants six or seven months before the existing leases expire.

3. Buildings.

Generally of stone and slate; cottages of one story, covered with thatch or tiles.

4. Occupation.

Largest farm about 1000 acres, greatest number from 150 to 500 acres. The larger farmers almost only those who have made improvements; among these, Messrs. Culley and Charge first led the way, and have been followed by Messrs. Collins, Mason, Taylor, Trotter, Nesham, Seymour, and many others, by whose exertions and judicious selection of stock this district will be lastingly benefited.

Greatest number of small labouring farmers greater slaves than their servants, being generally employed through the summer, in some kind of work or other, from four o'clock in the morning till eight at night; and in every other season of the year from twilight to twilight; and may truly be said "to rise early, take rest late, and eat the bread of carefulness."

Leases, three, five, and seven years, excepting church and corporation leases for 21 years, and lives. Those farms let for short terms remain stationary, as no prudent man will lay out his money in improvements, for which, when completed, he will be rewarded in an advance of rent, proportioned to the improvement he has made.

5. Implements.

Swing ploughs of the Rotherham kind; of late the Small's plough; various other good implements, and in many parts now (1870) the improved forms of Northumberland and Berwickshire.

6. Enclosing.

On dry soils hedges are frequently planted on a raised mound, forty inches broad, and the height twelve inches; a small ditch is cut on each side to make it, and the quicks are planted in the middle. In this mode the land may be ploughed nearly to the mound, and when the thorns are grown to a sufficient height, almost close to the hedge. When they are five or six years old, every other stem is cut clean off, within two or three inches of the surface, and the remaining ones straightened to the principal elements, then stakes of thirty inches high are driven in at proper distances, and the splashing stems, having a slight cut on one side to make them bend easier, are wound amongst the stakes at an angle of about twenty-five degrees, and a single edder is wound round the top to keep the stakes tight.

7809. NORTHUMBERLAND, including those detached parts of the county of Durham, called Northamshire, Islandshire, and Beddingtonshire, mountainous or breeding districts, but including 450,000 acres proper for tillage. The celebrity of this county both for its tillage and breeding is well known. Here turnips were first extensively cultivated in the drill manner, and the best principles of breeding practised by Culley. To this gentleman and Bailey agriculture owes much: the latter was, perhaps, one of the most enlightened and accomplished of modern agriculturists. (*Bailey and Culley's General View*, 1805. *Marshal's Review*, 1808. *Smith's Geographical Map*, 1821.)

1. Geographical State and Circumstances.

Climate subject to great variation of temperature; snow to a considerable depth on the mountains, when there is none in the lower districts; weather runs in extremes; very cold in spring, and seldom mild before June.

Soil and Surface. Strong fertile loam along the coast; sandy, gravelly, and dry loam on the Tyne, from Newbown to Haltwhistle, on the Coquet about Rothbury; on the Aln, from Alnwick to the sea; down Tweedside, but chiefly in the vales of Breadish Hill and Beaumont. The hills surrounding the Cheviot mountains are mostly a dry sharp gravelly loam. Moist loam occupies a large portion of the county, unsafe for sheep, and unfit for turnips, and peat earth prevails in the mountainous districts.

The aspect of the surface is marked with great variety; along the sea-coast it is nearly level; towards the middle more diversified, and thrown into large swelling ridges, formed by the principal rivers. These parts are well enclosed; in some places enriched with wood and recent plantations, but the general appearance is that of those mountains. The western part (except a few intervening vales) is an extensive scene of open mountainous district, where the hand of cultivation is rarely to be traced. Of the mountainous districts, those around the Cheviot are the most valuable, being in general fine green hills, thrown into numberless varieties of forms, enclosing and sheltering many deep, narrow, and sequestered glens.

Minerals. Coal in abundance in the greatest part of the county; it is like that of Durham of the caking kind, and is found in the south-east quarter of the best quality; quantity exported, chiefly for the London market, 956,450 London chalders. Calculated that the whole coal of the counties of Newcastle and Durham will be exhausted in 550 years. Limestone, stone-marl, clay-marl, lead-ore, and ore of zinc in small quantities; freestone, whinstone, and iron are all worked.

Water. The Tyne and Tweed have been long celebrated for their salmon fisheries: in the latter a rent of 800*l.* a year is paid for a fishing of two hundred yards in length, near the mouth of the river; and the same rent is paid for each of two other fishings above the bridge, not more than two hundred and fifty yards in length each. The fish taken here are, the salmon, bull-trout, whitling, and large common trout, and nearly the whole of them sent to London; in the conveyance of which, a great improvement has taken place of late years, by packing them in pounded ice; by this means they are presented nearly as fresh at the London market, as when taken out of the river. For the purpose of carrying them,

7. Arable lands.

Ploughing generally well executed, but in some places the subsoil prevents sufficient depth of furrow, i. e. six inches. The turnip culture, rotations, and general management of arable land, the same as in Northumberland; that is, of the most improved kind; seventeen tons of Roots bags are equal to thirty-one tons of white turnip in feeding cattle or sheep.

Mustard was formerly much grown in this county, and Durham mustard was proverbial for its excellence. At present a crop of mustard is rarely met with. It is generally sown upon good and learned lands in parts of ground per acre. The produce about twenty bushels per acre; and price from eight to sixteen shillings per bushel.

Potatoes in the village of Hamstead have been the principal article of trade, and the principal employment of several families for eighty years; they are very productive in every good soil, each with two eyes; use reddish or pink sorts, plant in March and April, and both horse and hand-hoe; no curl appears among them, but sometimes they "run wild," or tend to that state, producing more flowers than usual, and continuing flowering much later, sometimes till Michaelmas, and producing few tubers and slender stems. Whenever this is observed, the tubers of such potatoes are no longer used for propagation.

8. Grass.

Not much old surface, what there is chiefly upland.

9. Woods and Plantations.

Scampton elm, from a place of that name in Yorkshire, brought originally from America, will make shoots from grafts, in one year, of 5 or 6 feet; introduced in young plantations by Messrs. Falla, eminent nurserymen of Gateshead; vale of Derwent well wooded; Sir J. Eden a great planter.

10. Embankments.

Began on the Tees in 1740, and about 1500 acres secured between that period and 1800.

11. Live Stock.

Short-horned cattle. The famous Durham ox bred by Charles Colling of Kellam, in 1796.

Sheep. Teeswater and Leicestershire breed; stock bred, reared, and fed in the most scientific manner, especially by the larger farmers mentioned above (4).

12. Political Economy.

Turnpike roads first made in 1742; materials, whinstone, limestone, river gravel, and freestone. Roads excellent where materials are broken sufficiently small; they are also in good repair. Distances on some roads, hollow triangular prisms of cast-iron, with projecting letters and figures. They are two and a half feet high, and fixed on an oak post, four and a half feet long, sunk two and a half feet in the earth. Guide-posts much wanted. No iron railways, and no public roads or canals.

Manufactures. Wrought iron foundries, glass-houses, potteries, salt, copperas, sal ammoniac, coal tar, paper, woolen, cotton, and linen cloth. Several agricultural societies; the first established at Darlington in 1785.

detached parts of the county of Durham, called Northamshire, Islandshire, and Beddingtonshire, mountainous or breeding districts, but including 450,000 acres proper for tillage. The celebrity of this county both for its tillage and breeding is well known. Here turnips were first extensively cultivated in the drill manner, and the best principles of breeding practised by Culley. To this gentleman and Bailey agriculture owes much: the latter was, perhaps, one of the most enlightened and accomplished of modern agriculturists. (*Bailey and Culley's General View*, 1805. *Marshal's Review*, 1808. *Smith's Geographical Map*, 1821.)

and keeping up a constant and regular supply, vessels called snacks sail three times a week, and being purposely constructed for swift sailing, frequently make their run in forty hours. These vessels are from 70 to 140 tons burden; on an average twelve men are employed in each vessel, and make about fourteen voyages in a year; and not less than 75 boats and 300 fishermen are employed in taking the fish in the River Tweed.

2. Property.

One estate upwards of 40,000 acres, the rest vary from 10 to 20,000; small estates rare in the northern part of the county. Few counties in which estates have been so rapidly improved; several instances of the value trebled in forty years; principal cause letting large farms on twenty-one years' leases. Usual mode of letting farms is to fix a rent six or twelve months before the expiration of the lease; but upon one of the largest estates in the county (the Earl of Tankerville's), the tenants have an offer of their farms two years and a half or three years before the expiration of the lease, which is a mutual benefit to both landlord and tenant, and is attended with so many advantages, that it is in a fair way of being generally adopted.

3. Buildings.

Farmsteads formerly very shabby and ill contrived, now totally different. The most approved form of distributing the various offices is, on the east, west, and north sides of a rectangular parallelogram (fig. 1011), which is generally divided into two fold-yards for cattle of different ages, the south being left open to admit the sun; and for the same reason, and also for the sake of cleanliness and health, the farm-house (a) is removed in front thirty or forty yards; between which and the south wall of the fold is a small court for cows and young poultry; the barn (b) is 15 feet by 60, with thrashing-machine driven by horses, water, wind, or steam; on each side are sheds (c), over which are granaries; beyond these, as wings to the main square, are sheds (d), upon which are built corn-stacks. One of these sheds is for wintering yearling calves, the other for holding implements of the larger kind. On the east of the main square is the stable (e), and in the west a house for cows and fattening oxen (f), each 16 feet by 45 feet. Over the pigsties (g) are poultry houses which open into the court-yard of the house, as the piggeries do into the fold-yards for wintering young cattle (h, h).

Cottages of stone and lime and tiled; floor of lime and sand; the living room fifteen feet by sixteen, and the cow-house nine feet by sixteen.

3. Occupation.

Farms generally large in the north, some from 2000. to 4000. a year; in various parts farms from 500. to 1000. and from 1000. to 10000. or 15000. a year. The capital necessary for such farms entitles the farmers to a good education, and gives them a spirit of independence and enterprise, that is rarely found amongst the occupiers of small farms and short leases. Their minds being open to conviction, they are ready to try new experiments and adopt every beneficial improvement that can be learned in other districts; for this purpose, many of them have traversed the most distant parts of the kingdom to obtain agricultural knowledge, and have transplanted every practice they thought superior to those they were acquainted with, or that could be advantageously pursued in their own situation, and scarcely a year passes without some of them making extensive agricultural tours, for the sole purpose of examining the modes of culture, of purchasing or seeing the most improved breeds of stock, and of hiring the operations of new invented and more useful implements.

5. Implements.

Of the most approved kind; and some of these, as the plough, drill, horse-hoe, &c. owe their chief merits to the improvements of Bailey. A pair of pruning shears recommended as preferable to those in common use for cutting hedges. They consist of a strong sharp knife, six inches long, moving hutchin two square-edged cheeks; the upper handle is two feet six inches long, and the other two feet three inches. (See *Encyclopaedia of Gardening*, 2d ed. 1334, fig. 122.)

6. Enclosures.

Size of fields varies with the size of the farms; in some parts from two to six or eight acres; in the northern parts, where the farms are large, from 20 to 500 acres. The quicks should never be planted nearer each other than nine inches, and upon good land, a foot. Quicks four or five years old, and upon clean stems, are always to be preferred to those that are younger and smaller. It is a custom in some parts to clip snags; but it checks their growth, and keeps them always weak in the stem, and, when they grow old, open at bottom; while those that are left to nature get strong stems and side branches, impenetrable hedges, and if cut at proper intervals (of nine or ten years), will always maintain its superiority over those that have been clipped from their first plantings. In many spots of profit, and of labour saved, there is no comparison; and for beauty, to be preferred to nature, and think a luxuriant hawthorn, in full bloom, or laden with its ripened fruit, is a more pleasing, and more gratifying object, than the stiff, formal sameness produced by the shears.

7. Arable Land.

Trench ploughing practised by a few in breaking up grass lands. About 1795, when horses were scarce and dear, a good many oxen were used for ploughing and carting about the farm; but after a few years' trial, they were given up; they were harnessed both with yokes and collars, and only ploughed half a year at a time.

Following on all soils; once in three or four years, was general through the county till the introduction of turnips. On soils improper for this root, the naked fallow still prevails; but the quantity of fallow profits on all soils will, after a long series of good culture, become less necessary, and may in many cases be finally dispensed with.

Turnips were first grown in the northern parts of the county about 1725. Proctor, the proprietor of Roch, brought Andrew Willey, a gardener, to cultivate turnips at Roch, for the purpose of feeding cattle; that at Stewards settled at Lestbury, as a gardener, and was employed for many years to sow turnips for all the neighbourhood; and his business this way was so great, he was obliged to ride and sow, that he might despatch the greater quantity.

Hoing turnips was introduced at the same time, and at first practised by gardeners, and other men, at extravagant wages. Ildeston, about thirty years since, had the merit of first reducing the price of hoing, by teaching boys, girls, and women. The mode he took was simple and ingenious: by a light plough, without a mould-board, he divided the field into small squares of equal magnitude, and directed the boys and girls to leave a certain number of plants in each square. In a short time they became accurate, and directed the boys and girls to leave a year, all the turnips in the county were hoed by women and boys, at half the expense, and better than by men.

The broadcast culture of turnips, in the northern parts of the county, was not inferior to any we ever saw; and in respect to the accurate, regular, clean hoing, superior to what we ever observed in Norfolk, Suffolk, or other turnip districts which we have frequently examined. (Bailey.)

Drilling turnips was first introduced to the county about 1780. Drilling this, as well as other crops, evidently originated with Tull, whose first work, *Specimen of a Work on Horse-hoing Husbandry*, appeared in 1751. It appears that Craig, of

Arbigland, in Dumfriesshire, began to drill turnips about 1745; and next we find Philip Howard of Corby drilling in 1753; and Pringle drilling "from hints taken from Tull's book," in

1011

1756 or 1757. William Dawson, who was well acquainted with the turnip culture in England, having been purposely sent to reside in those districts for six or seven years, where the best cultivation was pursued, with an intention, not only of seeing but of making himself master of the manual operations, and of all the minutiae in the practice, was convinced of the superiority of Pringle's mode over every other he had seen, either in Norfolk or elsewhere; and in 1769, when he entered into a farming near Kelso, in Roxburghshire, he immediately adopted the practice upon a large scale, to the amount of 100 acres yearly. Though none of Pringle's neighbours followed the example, yet, no sooner did Dawson, an actual or rent-paying farmer, adopt the same system, than it was immediately followed, not only by several farmers in his vicinity, but by those very farmers adjoining Pringle, whose crops they had seen, for ten or twelve years, so much superior to their own; the practice in a few years became general.

8. Grass.

Not much old grass in the county.

9. Woods.

Not very numerous, though a considerable demand for small wood by the proprietors of the collieries and lead mines. Artificial plantations rising in every part of the county.

10. Impracticables.

Embanking and irrigation practised in a few places which require or admit of these operations.

11. Live Stock.

Cattle the short-horned, long-horned, Devonshire, and wild cattle.

Sheep, the Cheviot, heath, and long woolled. The modern maxims of breeding were introduced into the county by one of Bakewell's first disciples, Cully of South Durham, well known for his work on Live Stock, previous to which, "big bones" and "large size" were looked upon as the principal criterion of excellence, and a sacred adherence to the rule of never prejudices are at this period in a great measure done away; and the principal farmers of this district may now be classed amongst the most scientific breeders in the kingdom, who have pursued it with an ardour and unremitting attention that have not failed of success.

Horses for draught brought from Clydesdale.

Goats are kept in small numbers on many parts of the Cheviot hills, not so much as an object of profit, but the shepherd asserts, that the sheep flocks are healthier where a few goats do pasture. This probably may be the case, as it is well known that goats eat some plants with impunity that are deadly poison to other kinds of domestic animals. The chief profit made of these goats is, from their milk being sold to invalids, who come to Wooler in the summer season.

12. Political Economy.

Lords of whin or limestone, and mostly good. Manufacturers, gloves at Hecham, plain straw for cottagers' and labourers' hats, and also for those of the higher classes. Woollens in a few places; and a variety of works connected with the coal trade and mines at Newcastle. No agricultural societies, these Bailey holds in little estimation; but thinks if public farms were established in each county, and supported by a rate on the income of its proprietors, they would be the most effectual means of promoting agricultural improvement.

7810. CUMBERLAND. 970,240 acres of mountainous district, remarkable for its picturesque beauty, and also of late greatly improved in its agriculture. The exertions of the late Bishop of Llandaff in planting, and of J. C. Curwen, Esq. in field culture, have contributed much to the improvement of this county, which, as far as its soil and climate permit, may be considered as on a par with Northumberland. (Pringle's *General Review*, 1794. *General View*, by J. Bailey and G. Cully, 1804. *Marshall's Review*, 1808.

1. Introductory Observations.

Pringle informs us that, as the snows, being altogether accurate, accommodate themselves very slowly to a change of climate; but the idea has been already thrown out, that even those of the torrid zone may be made to flourish in the northern climate itself may be even gradually injured to the climate; that the thousands of years hence, reposing under their own olive trees, sweetened with the juice of their own sugar-cane."

Pringle "found it impossible" not to mention to the Board that he was remarkably well treated when he surveyed the county, which "filled him with peculiar feelings of pleasure and respect." Some of those feelings he voids on Sir John Sinclair, in the following terms:—"What gratitude is due to him (!) who first called the attention of the nation to its most important interests, and whose unremitting efforts are directed to promote the good of his country! How well does he deserve, and what a sure road has he chosen to, immortal fame that will survive the ravages of time, and smile at the fleeting celebrity

of martial achievements!" "This," Marshal observes, "most assuredly means, not him, but me."

In some preliminary observations to this report by Watson, Bishop of Llandaff, are suggestions for settling poor people in cottages on the wastes, as has been done in Spain, and on the advantages which would result from planting them, especially with the larch and oak.

2. Geographical State and Circumstances.

Climate. Healthy, though subject to great and frequent falls of rain, especially in autumn, which renders harvest late and precarious; snow on the mountains for six or eight months. Average rain a. Keswick seventy inches.

Soil. Clays and loams on the better parts of the valleys and hill sides, and peat earth on the mountainous districts.

Surface. Beautifully and greatly diversified, chiefly mountains, and incapable of being improved by the plough; but part of the valley and plains are cultivatable soils.

Minerals. Chiefly coal, lime, and lead ore; there are also black lead, copper, gypsum, lapis calaminaris, and excellent slate and freestone.

Waters. Sixty-seven miles of sea-coast, several large and small rivers, and the lakes well known for their beauty, and the excellent char, trout, and other fish which some of them produce.

3. Property.

Five counties where land is in such small parcels, and these occupied by their owners. In the same, small or these farms, rents vary from 5*l.* to 50*l.* a year; generally from 15*l.* to 50*l.*, some few 100*l.* Largest estate in the county 15,000*l.* a year. Tenure of a by far the greater part of the county "customary tenure," a species of vassalage, by which the holder is subject

7811. WESTMORELAND. 540,160 acres, chiefly of mountain and moor, but with some few tracts of vale lands, cultivated or capable of cultivation. On the whole it is naturally the most unfavourable county to agriculture or comfortable living in England, owing to its wet and cold climate, ungrateful soil, and rugged surface. (*Pringle's General View*, 1794. *Marshal's Review*, 1808. *Smith's Geological Map*, 1834. *Edin. Gaz.* 1827.)

1. Geographical State and Circumstances.

Climate. S. W. winds and rains prevail for eight months in the year; in 1792 six or three inches, medium forty-five or fifty inches, which is twenty inches above the medium quantity that falls in Europe. Air pure and healthy; winters long and severe. In 1791-2 thirty-six pounds were paid for cutting in the snow ten miles of horse-tract between Shap and Kendal. The soil most prevalent on the low lands is a dry gravelly mould, and peat on the mountains.

Surface. Mountainous and hilly, and in most places incapable of cultivation by the plough. Large tracts of black barren moors, called the Fells.

Minerals. Some thin veins of lead; limestone in abundance in most parts of the county; excellent blue slates; gypsum used for laying floors; freestone, and marble near Kendal.

Water. Several rivers and some lakes, corresponding in beauty and products with those of Cumberland.

2. Property.

As in Cumberland; land-owners called statesmen (for estatesmen), as in Ireland.

7812. LANCASHIRE. 1,150,000 acres; (1,155,840, *Brook's Gaz.* 1809, 12,000,000) *Edin. Gaz.* 1827, included in a very irregular outline, extending above a degree, or about seventy-four miles from north to south, containing mountainous and moory surface, and a large portion of low, flat, or moderately varied lands, of good quality. The soil in great part sandy, and successful culture of the potato distinguishes this manufactures, and very considerable foreign commerce from Liverpool. It is also the country of Brindley, the engineer. (*Holt's General View*, 1795. *Dickson's General View*, prepared by Stevenson, 1815. *Marshal's Review*, 1808.)

1. Geographical State and Circumstances.

Climate. Air very where pure and salubrious, but on the elevated parts cold and sharp; protected, however, by the northern and eastern ranges of mountains from the N. and E. winds; not much snow or long continued severe frosts. In 1819-20, when the thermometer in gardens near London had fallen not degrees below zero, that in the botanic garden at Liverpool never fell to zero. Average of rain in the county probably about forty-two inches; in 1792, sixty-five; and in some years fifty. From a register of the times during a series of years, at which potatoes, asparagus, and gooseberries were first brought to the Liverpool market, it appears that the difference between an early and late spring is not less than six weeks.

Soil. On the mountains and moors rocky and peaty; on the northern part of the low lands moist, cold, and rusty silt; on the rest chiefly sand.

Minerals. Principally coal, copper, lead, and iron; the first and last very abundant; there is also slate, grey-slate, and flagstones, freestone, and limestone.

Waters. Seventy-five miles and upwards of sea-coast, and several rivers and meres.

2. Property.

Very variously divided; a considerable number of yeomanry from 10*l.* to 700*l.* per annum; a general spirit for possessing land and agricultural improvement; tenures, as usual, chiefly freehold.

3. Buildings.

Old farmhouses the work of chance and random; houses often there formerly occupied by proprietors, and offices without order or design, but various new erections on the most approved plans; cottages in many places comfortable, with good gardens, especially those occupied by operative manufacturers and mechanics. There is the less improved parts of walled studd work, plastered or wrought in with tempered clay and straw; provisionally "cat and clay."

4. Occupation.

Farms in general small; education and knowledge of most of the small occupiers very circumscribed; larger farmers more enlightened, and in the less command of capital, are improving the culture of their farms.

5. Implements.

Little improvement, but the Northumberland plough and Meikle's threshing-machine introduced; horse patterns are

to fines, heriots, and various services to the lords of manors. A good deal has been enfranchised. Copyhold and leasehold are rarely met with; what is not customary is freehold.

4. Buildings, Implements, Arable Land, &c.

Approaching to that of Northumberland. A great many young plantations rising on the sides of the mountains.

5. Live Stock.

Cattle of various kinds; breed of the county a small long-horned kind; but the most improved varieties are now introduced.

Sheep bred in the county the Herdwicks, a hardy mountain sheep. Some horses bred by the farmer, and bees very common. In every parish the taking of moles is let at a certain sum, and defrayed by a parochial rate per acre; a plan which will soon eradicate this animal from the county.

6. Improvements.

Various kinds, as draining, watering, planting, &c. made by Watson, Bishop of Llandaff, at Colgarth Park. Those of J. C. Curwen, Esq., of Workington, especially in feeding and fattening stock, have made a distinguished figure in agricultural writings; but their practical merits have been questioned. We paid a high compliment to Curwen in the first edition of this Encyclopædia, on which a scientific and practical man, who was personally acquainted with him, made the following note:—"I doubt if Curwen has any right to the compliments here paid to him. If I may judge, both from his writings and conversation, he is certainly not a first-rate farmer, and, what in his situation is worse, not very much the friend of farmers. He admitted to me, indeed, that his management was not profitable, which is saying all in one word."

3. Buildings.

Very indifferent; few mere cottages; the labourer and mechanic generally reside in a small farm-house, and occupy more or less land.

4. Occupation.

Farms small; and farmers, who are generally proprietors, "live lightly and labour hard," in the fields in summer, and weaving in winter; wear cloag, the upper part of leather, and the soles of birch, alder, or sycamore. The culture of arable land is very limited, and, like that of grass land, is in a very backward state at the time the reporter wrote, but is gradually improving. Thyring in a small way is generally practised, but little attention to the sort of cow or breeding. The Earl of Lonsdale, and Watson, Bishop of Llandaff, were among the first to set the example as to planting.

5. Manufactures.

Woollen cloth, or Kendal coatings, stockings, silk, gunpowder, &c. A private carpet manufactory at Lowther, by the Earl of Lonsdale.

almost peculiar to this county, and are used in cultivating light peaty soils.

G. Arable Land.

Less prevalent than grass; but great attention paid to the culture of potatoes, both by farmers and cottagers; the former generally cultivated in drills, and horse-manured; the latter in beds or dibbled in rows, and hand-hoed. The method of growing early potatoes, and several crops on the same soil in one season, has already been given. (5521.) Onions are cultivated extensively near Warrington, and rubarb and madder have been tried, and grown to very great perfection, but not so easily dried and prepared for sale as to induce a continuance of the practice.

7. Grass Lands.

Extensive, but chiefly coarse upland pastures; some good meadows and productive marsh lands. Application chiefly for the dairy, for home consumption of milk and butter; not much cheese made, excepting on the Cheshire side of the county.

8. Gardens and Orchards.

Excellent market gardens, some of the large towns. Liverpool remarkably well supplied; great quantities of cabbages and onions used by the shipping, and of dried herbs and onions exported; the dried herbs sent to Africa. "There is a certain farm in Kir-bay, about eight miles north-east from Liverpool, the owner of a small part of which is black loamy sand, and which produces great quantities of early and strong asparagus, and another farm, a part of which is of the same nature at a place called Orrel, about four miles north-west of Liverpool; both which produce this plant with less attention and less dung than requisite in the rich vale of Kirkdale, about two miles from Liverpool, where the greatest quantity of land in any place of this neighbourhood is appropriated solely to horticulture."

Gardens of Mechanics. "A small patch of ground appended to his cottage furnishes the weaver, smith, or carpenter with health and pleasure, and contributes to his sobriety; temperance not infrequently proceeding from want of recreation to fill up a vacant hour. This small space is devoted to nurturing his young seedlings, trimming his more matured plants, contenting his new varieties, in expectation of honours through the medium of promised premiums. Thus, starting at intervals from his more toilsome labours, the mechanic finds his stagnating fluids put in motion, and his lungs refreshed with the fragrant breeze, whilst he has been raising new flowers

of the aurelia, carnation, polyanthus, or pink, of the most approved qualities in their several kinds; and which, after being raised here, have been dispersed over the whole kingdom. But not only flowers, but fruits, have been objects of their attention. The best gooseberries now under cultivation had their origin in the county of Lancaster; and, to promote this spirit, meetings are annually appointed at different places, at which are public exhibitions of different kinds of flowers and fruits, and premiums adjudged. These meetings are encouraged by master tradesmen and gentlemen of the county, as tending to promote a spirit which may occasionally be diverted into a more important channel. Those little societies for promoting the improved culture of the gooseberry prevail most in the southern parts of the county. They have unquestionably had much influence in bringing the different sorts of this fruit, and the currant, as well as some others, to their present state of improvement. The gooseberry, both of the red and white kind, is now in most places grown to a very considerable size, in some situations as large as a pigeon's egg. This is chiefly effected by keeping the plants much cut at their branches, and having well rotted rich manure applied frequently about their roots, the land being kept perfectly clear about them. The annual publications, called *The Manchester Gooseberry-book*, and *The Manchester Flower-book*, contain the names of the principal societies, and of the prizes awarded each year, and a variety of other information." (Dickson, p. 428.)

An orchard of sixty-four acres on the banks of the Irwell, near Manchester, and some others in sheltered places near the principal towns; but the prevailing west winds is much against their increase.

9. *Woods and Plantations.*

A good deal of planting going forward in most parts of the county, but not much old timber or copse.

10. *Improvements.*

Of mosses bogs and marshes there is great extent, and we have already noticed the principal modes of improving them. (4535.) A good deal of drainage, by cutting drains, and liming, has been done, and also irrigation in several places. A good deal of low sod embankment along the northern part of the coast, especially at Rosshall, by Hesketh. It was proposed some years ago to embank Lancaster and Ulverstone sands, by which nearly 40,000 acres of sandy soil would have been gained at an

expense of 150,000*l.*, or according to some much less; but owing to the difficulty of getting the small proprietors of fisheries and other trifling interests to agree, the idea was dropped at the time and not resumed. The proposed modes of procedure for this, and other intended embankments, are given in the report. Bog lands have been extensively cultivated by the celebrated Roscoe, of which some account has been already given. (1549.)

11. *Live Stock.*

Cattle, the Lancashire, or long-horned, made the basis of Bowdler's improvements: a good many short-horns also bred, when the dairy is the object. Larger grass farms near the populous towns furnish milk, the smaller ones butter, and the remote farms cheese. 100 cows kept in Wakefield's dairy near Liverpool. Cheese made resembles that of Cheshire, and chiefly from the long-horned, or native breed.

Sheep not very common in this district. Horses very generally bred of the strong team kind, stout compact saddle horses, and middling size and bone for the stage and mail coaches.

12. *Political Economy.*

Roads in most places, owing to the want of good materials, and the moist climate. In the coal tracts about Manchester, Bolton, and Wigan, the roads are all paved, as it was thought no other would stand the heavy traffic on them. These paved roads are said to be the most expensive, and most disagreeable of any; but they have here no other kind of material that will stand heavy carriage.

An ingenious road-maker in the neighbourhood of Warrington has of late explored the common convex form, and adopted that of one inclined plane; the inclination just sufficient to throw off occasional water. The road between Worsley and Cloweston was made in this form, but it was found not to answer, as, though it threw off the water, high and heavy laden wagons were exposed to much danger of being overturned.

Various canals and iron railways; of those of the Earl of Bridgewater's most celebrated; but others of recent date more extensive. Many different manufactures; cotton in its different branches the most important; also, woollen, flax, iron, and, in short, almost as great a variety as in Yorkshire. Several agricultural societies; that of Manchester established in 1767.

7813. THE ISLE OF MAN contains about 220 square miles. (Edin. Gaz. 1827.)

General View. The interior is mountainous, ridges of hills being separated by high table lands; the climate is moist, with frequent fogs; and the soil is chiefly loam, on a bottom of stiff clay. No minerals of any consequence are found on the island, except lead, and some copper, and iron. Limestones, thin blue slate, greywacke, and granite are found in several places; an immense tract called the Curragh, which was formerly a bog, extends nearly across the island. It now produces excellent crops; but an extensive stratum of peat is still found under the gravel and clay, containing trunks of very large oaks and pines, which all lie in one direction, as if overturned or deposited by a common impulse.

The Duke of Athol was formerly lord proprietor of the whole island, but the sovereignty was purchased from him by the British government in 1765.

Agriculture has of late years made some progress, though nearly two thirds of the island still remain in a state of nature, and are only used for grazing; there is a good deal of wood in

the north part of the island; wheat was formerly not cultivated on account of a prejudice which prevailed respecting its liability to be infected with the smut; large crops are, however, now raised, of the cleanest and best quality. Barley and oats are raised in great quantities, as are also turnips and potatoes. Flax and hemp are grown in rich enclosures. Many of the finer sorts of fruit, however, cannot be raised. The sheep are small and hardy, and their flesh is excellent; the wool of a particular breed, called the Loughon, is thought of a very superior quality. Cattle and swine are also raised here for exportation; and 50,000 hogs-heads of tutter are sent to England annually. Poultry, eggs, and fish, are abundant and cheap. This mistake are the usual bread of the inhabitants.

Political Economy. The roads to the principal towns are tolerably good, but the bye-ways are almost impassable. The island is considered healthy, and the inhabitants generally attain a great age.

7814 CHESHIRE. 665,600 acres of verdant surface, exclusive of upwards of 10,000 acres of naked sands in the estuary of the River Dee. It is one of the grass retaining its growth and verdure, in a great degree, during the whole year, owing to the moisture and mildness of the climate. The department of husbandry in which it excels is cheese-making; and it is also noted for its salt-worts from brine springs. (*Holland's General View*, 1806. *Marshal's Review*, 1809.)

1. *Geographical State and Circumstances.*

Climate, supposed the most rainy in the kingdom.

General surface an extensive, granular, and highly covered with wood. Barren hills on the eastern margin of the county.

Soil chiefly clayey or sandy; clay prevails, but very generally the two earths blended together, producing clayey loam and sandy loam.

Subsoil chiefly clay, or marl; but also rammel, foxbench, gravel, or red rock. Rammel is a composition of clay, sand, gravel, and oxide of iron; it is in strata of from eighteen to thirty inches, on white-coloured sand, or clay marl. Foxbench is iron ore or oxide, which crumbles to pieces when exposed to the air; but is hard and rocky when under the soil, and is more injurious to trees than rammel, as it cannot be penetrated by their roots.

Minerals. Fossil salt and coal both extensively worked. There is also copper, lead, and ironstone, and a quantity of stone, salt is made in the springs, as at Droitwich (7792.), and from beds of fossil salt. The former have been worked from time immemorial, and the latter from about 1670. By the operation of blasting, and the mechanical instruments usually employed in mining, the rock is obtained in masses of considerable size, differing in form and purity. The purer rock is pounded and used without other preparation; but the less pure is dissolved and refined in the same manner as brine.

Water. Several rivers and meres; the former are very muddy after rains, and not remarkable for their fish; but the latter abound in pike, bream, perch, dace, and eels.

2. *Property.*

Few counties of equal extent with so many wealthy landowners. Fifty proprietors resident in the county, with estates of from the 10,000*l.* a year, and as many from one to 3000*l.* From the advantages which have been derived from trade, and from the effects of the increase of taxes, which have prevented a man living with the same degree of comfort on the same portion of land he could formerly, many of the old owners have been induced to sell their estates, and new proprietors have spread themselves over the country, very different in their habits and prejudices. The change has been disadvantageous. Land, when transferred, is generally improved by its new possessor. With

a view, and often a more enlightened view, of its advantages and resources, he brings with him the means and the disposition to try experiments, and to give to his new acquisition its greatest value. He feels the want of comforts and conveniences, which custom had rendered familiar to a former occupier; he builds, drains, and plants; and, by his spirit and example, stimulates all around him to increased exertions.

3. *Buildings.*

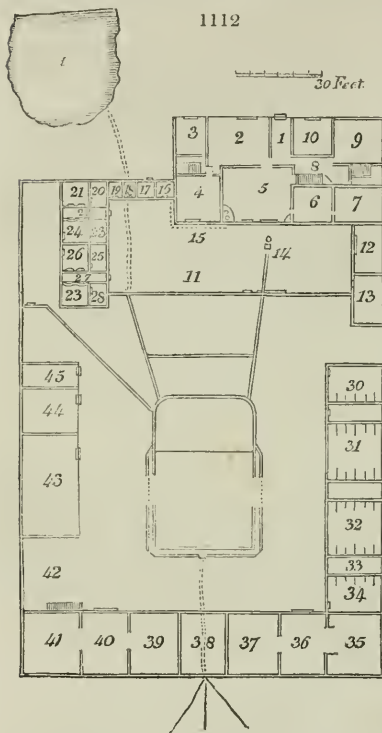

Many noble mansions, especially that of the Earl Grosvenor, at Eaton.

Farm buildings, on the large dairy farms, in the middle of the county, extensive and convenient; in other places the reverse, and crowded in villages; old buildings shod-work, wattle-work, and clay, and covered with thatch; new of brick and slate. An excellent set of buildings (fig. 1112.) has been erected at Bromfield, near Warrington, on the estate of Sir P. Warburton. "A gentle descent from the ground at the front of the house has afforded Beckett, the occupier of this farm, the opportunity of conveying from a pond to a small stream through the farm-yard, with which he irrigates the meadows below the buildings. The superior richness of vegetation in these meadows furnishes abundant proof of the advantage which Beckett derives from availing himself of this assistance."

Beginning with the dwelling-house of this farmery, it contains an entrance and passage (1), house-plate (2), servants, dining-room (3), back parlour (4), dairy, with which pans and sink-stone (5), room for the cheese after it is taken out of the salt (6), milking-house and salting-room (7), stairs to the room (8), parter with a cellar under (9), pantry (10). The immediate appendages of the house chiefly connected with the dairy are ranged on three sides of the inner yard (11), and consist of a coal-house (12), wash-house, with pig-cot-house over it (13), pump (14), piggery (15), boiler for pig-meat (16), pigsty (17), place for ashes (18), ivery (19), inner pig-cot (20), outer pig-cot (21), passage (22), inner pig-cot (23), outer pig-cot (24), inner pig-cot (25), outer pig-cot (26), passage (27), inner pig-cot (28), outer pig-cot (29).

The farmery consists of a court, containing a large duck-pond, which is surrounded by a broad passage, and enclosed on the west, east, and south sides by buildings, the north side being the wall of the inner yard. These buildings

consist of a cow-house (50), double cow-house (51), double cow-house (52), fodder-bin (53), cow-house (54), corn-bag (55), threshing-floor (56), corn-bag (57), corn-bag (58), corn-bag (59), threshing floor (60), corn-bag (61), calf-cove, with granary above it (62), stable (63), stable or calf-cot (64), calf-cot (65).

Cottages much the same as in other counties; improving with the age. All the intelligible persons whom Dr. Holland conversed with have invariably found, that the attachment of a small portion of land to the cottage of the labourer has been the direct means of rendering his situation in life more comfortable and easy, and of inducing those habits of honest independence, of temperance, and of industry, which are most efficacious in promoting the happiness of individuals, and, consequently, the general interests of society.

Lord Penrhyn's poultry-houses, at Winington, are supposed the most magnificent that have ever been built. They are united in a building, which consists of a handsome regular front, extending about 140 feet; at each extremity is a neat pavilion, with a large arched window. These pavilions are united to the centre of the design by a colonnade of small cast-iron pillars, painted white, which support a cornice and a slate roof, covering a paved walk and a variety of different conveniences for the poultry, for keeping eggs, corn, &c. The doors into these are all of lattice-work, also painted white, and the framing green. In the middle of the front are four handsome stone columns, and four pilasters, supporting likewise a cornice and a slate roof, under which and between the columns is a beautiful mosaic iron gate; on one side of this gate is an elegant little parlour, beautifully papered and furnished; and at the other end of the colonnade a very neat kitchen, so excessively clean, and in such high order, that it is delightful to view it. This front is the diameter or chord of a large semicircular court behind, round which there is also a colonnade, and a great variety of conveniences for the poultry: this court is neatly paved, and has a circular pond and pump in the middle of it. The whole fronts towards a rich little field or paddock, called the poultry paddock, in which the poultry have liberty to walk about with meals. It happened while the reporter was there to be their dinner-time, at one o'clock. At this hour a bell rings, and the beautiful gate in the centre is opened. The poultry being then mostly walking in the paddock, and knowing by the sound of the bell that their repast is ready for them, fly and run from all corners, and rush in at the gate, every one striving who can get the first share in the scramble. At that time there were about 600 poultry of different kinds in the place, and although so large a number, the semicircular court is kept so very neat and clean, that not a speck of dung is to be seen. This poultry place is built of brick, excepting the pillars and cornices, and the lintels and jambs of the doors and windows, but the bricks are not seen, being all covered with a remarkably fine kind of slate from his lordship's estate in Wales. These slates are closely jointed and fastened with screw

nails, on small spars fixed to the brick; they are afterwards painted, and fine white sand thrown on while the paint is wet, which gives the whole an appearance of the most beautiful freestone.

4. Occupation.

Farms very small; a great many under ten acres; only one or two at 350 or 400 acres; excluding all those under ten acres, the average of the county may be seventy acres. Large and small farmers completely different characters;—different in their habits, and, by consequence, in their ideas. Industry and excellent management of the dairy-women of this county much to be commended; leases generally for seven years.

5. Implements.

Goodish plough and other good implements. A short strong scythe, with a blade twenty inches in length, and concave in the middle, is used for scooping out the crowns of rush stools.

6. Arable Lands.*

In small proportion to the pastures. Cabbages a good deal cultivated for cattle. Carrots near Altringham for the Manchester market, and also used for the London fresh-markets. Onions also for the Lancashire markets. The soil about Altringham dry and loamy; the carrots large, coarse, and fit only for horses and cattle.

7. Grass.

Natural meadows numerous, rich, and fertile. They are situated on ridges, which, from the frequency of heavy rains, overflow and enrich them. Extent of upland pasture very considerable; that on a tolerably stiff clay soil, especially with a substratum of marl, is reckoned the best for the dairy; more milk may be had from cows pastured on a rich loamy soil, but it is esteemed inferior in point of quality. Many farmers complain that their land is too rich for the dairy, by which the adhesive properties of the cheese is diminished; feeding of cattle little practised.

8. Gardens and Orchards.

Good gardens to most of the farm-houses. "All the varieties of raspberries, currants, strawberries, and gooseberries, are to be met with in the farm and cottage gardens in Cheshire. The culture of the latter fruit has been particularly attended to of late years; and there are several meetings in different parts of the county, where small premiums are adjudged to those who produce, out of their own gardens, gooseberries of the greatest weight. The common fruit trees, such as the apple, pear, cherry, and plum, are likewise grown in almost every garden. Of the latter kind, the damascene plum is by much the most common; and is an article of considerable profit to the cottager.

Orchards not numerous, and rather on the decline.

9. Woods and Plantations.

Few of large extent, yet the quantity of timber very greatly exceeds what would be a fair average for the kingdom at large. In the northern and middle parts the number of trees in the hedge-rows and copices is so considerable, that, from some points of view, the whole county has the appearance of an extensive forest. The most considerable ancient woods in the Earl of Stamford's park at Durham Massey. A few spots can boast such an assemblage of stately oaks, elms, and beeches. During a storm of wind, on the 21st of January, 1802, several hundred trees were torn up by the roots. One of these, which had been contained 403 feet of timber, and was sold at six shillings and sixpence per foot, to the extent of 373½ feet. An elm blown down at the same time measured 146 feet. A colony of herons had for ages fixed their residence on the summits of these trees; but on one of them being torn up, they retreated to a neighbouring grove of beeches, where they have ever since enjoyed a secure abode.

A plantation of 1000 acres at Taxall, F. Jodrell, Esq.; it was planted by White, the landscape gardener of Woodlands, Durham, five pounds per acre, and is now a fine extensive plantation by Ashton, on Delamere forest.

Whitely, an ingenious tanner, at Ashley, near Knutsford, made some experiments a few years ago with the twigs and ends of the boughs of oak, as a substitute for the bark. These ground down, and used in the same manner as the bark, manifested strongly astringent properties; but the necessity there was found to be for their immediate application took away very greatly from their value; and their use is now almost entirely discontinued, though the plan at that time was adopted by several other tanners.

10. Improvements.

Draining a good deal practised, especially with bricks and stones. Paring and burning, marling, sanding, claying, and liming, also practised to different degrees of extent. Sand of advantage, chiefly by altering the texture of the soil, as that which contains no calcareous matter.

11. Live Stock.

Present stock of dairy cows a mixture of the long and short horned, the Derbyshire, Shropshire, Staffordshire, Welsh, Irish, Scotch, and New Leicestershire cattle. These cows reckoned best which are bred on the farm. Calves reared from the best milkers, and at two years old put to the bull. Cows housed about the middle of November, and carried to dry ten weeks before their time of calving; usual dry foods, wheat, barley, and oat straw, hay, and crushed oats. The two former kinds of straw are found to make cows go dry much sooner than the latter; and another generally allowed effect attributed to such straw is, that more than the usual time will be required to churn the cream of cows when so fed; but wheat straw is esteemed much more wholesome than barley straw, as having less of those effects attending it. Three or four weeks before calving, hay given; and from calving to turning to grass, some ground or crushed oats twice a day. The cows are turned into an outlet (a bare pasture field near the buildings), about ten o'clock in the morning, and housed again about four in the afternoon the winter through, or earlier if they showed an inclination to return; but have no fodder in the outlet. Turning the cows out to grass in good condition is a matter much attended to, in order that they may, as the term is, "start well;" for if a cow is not in good condition when turned out to grass, or has been too much dried with barley straw, it is a long time before she gets into full milk.

The ox-cabbage and Swedish turnip are the kinds of green food most esteemed and cultivated in Cheshire. The former is

usually given to the cows when the after-grass is consumed; it is sometimes given in the spring to cows that have newly calved. The after-grass and leeks have been occasionally used, when the pastures begin to fail and the after-grass is not ready; a circumstance which frequently happens, especially in dry weather. Turnips are given to the cattle in the winter, while they are feeding on straw; and as, at this time, no cheese is made, any objection to their use from the flavour they give to the milk, is of little consequence. The reporter made enquiries from several farmers, with a view of ascertaining whether the stall-feeding of their milk cows might not be continued during the whole year, but he found the general opinion to be against this practice; though it did not appear that any experiments, sufficient for the decision of the point, had hitherto been made. It was suggested to him, however, that it would be an improvement upon the present management, to let the cows stand in their houses during the heat of the day in summer, where, by giving them a few calabages or tares, the milk would continue flowing, and the cattle be defended from the gad-fly, which, by tormenting them in the fields, frequently injures both the quantity and quality of the milk.

Time of milking March and April. At calving-time the cowman, or the master, are frequently up two or three times in the course of a night, to see whether any thing is amiss. The racks and mangers are every day well cleaned out, white due attention is paid to the apparatus and different parts, and the quantity of food is given accordingly. After this is done, the master himself generally goes round from stall to stall just before bed-time, and adds to or diminishes the quantity of fodder as occasion may require.

In making butter the whey of the milk and cream is churned together. Cheese made from the whey pressed from the curd used in making cheese.

Cheese-making has remained stationary in Cheshire for many years; best size of cheeses sixty pounds. Cows milked during summer at six o'clock, morning and evening. The evening's milk (of sixteen or twenty cows) having stood all the night in the coolers and brass pans, the cheese-maker, in summer about six o'clock in the morning, carefully skims off the cream from the whole of it, observing first to take off all the froth and bubbles, which may amount to about a pint; this is not being thought proper to put into the cheese, and the cream may be churned for butter, and the rest of the cream is put into a brass pan. While the dairy-woman is thus employed, the servants are milking the cows, having previously lighted a fire under the furnace, which is used for heating the cheese-tub, except about three fourths of a brass pan full (three or four gallons), which is immediately placed in the furnace of hot water in the pan, and is made scalding hot; the half of the milk thus heated in the pan is poured also into the cheese-tub, and the other half is added to the cream, which, as before observed, was skimmed into another brass pan. By this means all the cream is liquified and dissolved, so as apparently to form one homogeneous or uniform fluid, and in that state it is poured into the cheese-tub. But before this is done several bowls or vessels full of new milk will generally have been poured into the cheese-tub, or perhaps the whole morning's milk. Care is taken to skim off all the air bubbles which may have formed, in pouring the new milk into the cheese-tub. The night and morning's milk, and melted cream, being thus

all put into the cheese-tub, it is then ready to receive the rennet and colouring, or, in the terms of the art, to be set together. The rennet and colouring being put into the tub, the whole is well stirred together, a wooden cover is put over the tub, and over that is thrown a linen cloth. The usual time of coming is one hour and a half, during which time it is frequently to be examined; if the cream rises to the surface before the curd takes place, as it often does, the whole must be stirred together so as to mix again the milk and cream, and this as often as it rises, until the coagulation commences. A few smart strokes on different sides of the tub, with the cheese ladder, &c. will forward the coagulation, if it is found to be too long in forming.

The curd is in the next place broke by the knife and hands, and then left half an hour to subside; when it is gently pressed, the curd broken by the hands, and they laded out of the tub as it drains from the curd. Afterwards, the curd is broken in a brass pan and salted, and next put into the cheese-vat, and pressed with a sixty pound weight, till all the whey is removed. It is then again broke, washed with warm whey, and finally put in the press under a weight or power of about 14 cwt. After being forty-eight hours in the press, it is put in the salting tub, where it remains three days covered with salt; it is then taken out and placed on the salting benches, where it is turned once a day; it is then washed in warm water with a brush, and wiped dry with a cloth; in two hours it is smeared over with whey butter, and then put in the warm part of the cheese-room. In the cheese-room it is well rubbed, to take off the sweat or fermentation which takes place in cheese for a certain time after it is made, and turned daily for seven days, and smeared with whey latter; it is turned daily, and rubbed three times a week in summer, and twice in winter.

The cheese-rooms are commonly placed over the cow-houses; and this is done with a view to obtain that moderate and necessary degree of temperature so essential to the ripening of cheese, to which the heat arising from the cattle underneath is supposed very much to contribute. On dairy farms, one woman servant is kept to every ten cows; these women are employed in winter in carding, spinning, and other house-wifery business; but in milking, the women, both night and morning, during summer, where large dairies are kept, are assisted by all the other servants, men and boys, except the man who drives the team.

Sheep little attended to in Cheshire.

Horses brought from Derbyshire and Leicestershire.

Hogs, a mixture of long and short eared breeds. **Poultry**, of the common kind abundant in most farms for their eggs. Geese kept by the cottagers till midsummer or later, and then sold to the farmers, who fatten them on their stubble.

Bees to be found at many of the farm-houses, and at some of the cottages.

12. Political Economy.

Roads had; various canals, an extensive commerce of coal and salt, and manufactures of silk, woolen, linen, and cotton. An experimental farm established at Waverham, near Northwich, by some gentlemen and farmers of the neighbourhood, but it was soon found so expensive and losing a concern as to be abandoned. Those on the plain suggested by Bailey (7809.) seem the most likely to be effective and permanent.

7815. HAMPSHIRE. A maritime county, which includes also the Isle of Wight: the latter contains 94,000 acres, and the continental part of the county 968,150 acres. The climate of this county being remarkably mild, and the soil in many places being calcareous, and consequently warm, very early arable crops are produced in some places, and peas grown better than in many districts. The culture of the county, however, has little to recommend it, either in its tillage or pasturage. Its woods are extensive. (A. and W. Driver's General View, 1794. Vancouver's General View, 1808. Warner's Isle of Wight, 1794. Marshal's Review, 1817.)

1. Geographical State and Circumstances.

Climate generally mild.

Soil in the central parts a strong flinty calcareous loam: in other parts generally gravelly, or sandy and calcareous. The soil of the Isle of Wight is partly a clayey and calcareous loam, and in part lighter.

Minerals: none of any consequence; potter's clay, sand, and building-stone in different places.

Water scarce in dry seasons in the chalk districts, where it is preserved in tanks, and drawn up from wells 300 or 400 feet deep. In some parts, after a long dry autumn, there has been more strong ice than elsewhere, and a good deal of fishing on the coast; of eels after floods in the smaller streams; and some fish ponds on Bagshot Heath.

2. Property.

Largest estates on the chalky districts; largest 8000l. per annum. Great bulk of the lands held and cultivated by yeomen; tenures, copyhold and leasehold, from the superior lords or freeholders.

3. Buildings.

Houses of proprietors numerous: farm-houses mostly of great antiquity; those of the larger kind were formerly grange or manor-houses; out-buildings numerous, and generally ruinous; cottages of an old manly (poor) sort of building, but better on the whole than in some other counties. Some fair rustic structures as shelters or temporary lodges for cattle, in the forest district. (Fig. 1115.)

4. Occupation.

Farms various, rather small.

5. Implements.

Hampshire plough, an extraordinary bulky clumsy structure; the Southolk plough is used in the southern parts of the county, and in the Isle of Wight. The patent Hampshire wagon is formed by uniting two carts, corresponding with the fore and hind parts of a wagon, by joining them together. The front of the hind part passes under the feet, and rests on the pillow of the fore-cart. The union is simple, yet so complete as to render this wagon as strong as the common kind, if not stronger.

6. Arable Land.

Tillage difficult and expensive in the chalk district, light and easy in the vale of Avon. Peas a good deal cultivated on

the chalks, especially the Marlborough grey or partridge, the charlton and pearl; in warm situations they are drilled and often sown before Christmas, or in January. "A considerable

1113

mystery still seems to hang over certain properties of these peas, with regard to their boiling well for soup or porridge; good boilers being sometimes sown in the same field, have never been known to refuse yielding a produce possessing a similar quality, but that effect afterwards ceasing, and a hard indissoluble pea has been produced that continued for several successive periods; whilst, on the other hand, land that had never been known or even suspected of being able to communicate a property of quality to its peas, would unexpectedly give to the produce of a hard and almost impervious pea all the properties of being excellent boilers. Through all the cedar-colored sand and gravelly loams in Devonshire, good boilers are stated to be uniformly produced, and in continued succession. This kind of soil, and in every respect under similar circumstances, in the Isle of Wight will only occasionally, and by accident as it were, produce good boiling peas. Some opinions seem to refer this effect to a peculiarity in the seasons; but this cannot stand against a well known truth, that good boilers are produced every season."

Saintfoin cultivated with success on the chalky soils, and very productive. Hops on the borders of Surrey. A vineyard was planted at Uadercliff, in the Isle of Wight, by the late Sir Richard Worsley, in 1793; and an African wine-dresser brought over to attend to it; the extent was about two and a half acres, and a light wine was made; but in 1809, when M. Vancouver called to see it, he found the vines had been grubbed up, and the ground changed to a lawn of turf.

7. *Grass Lands.*

The county famous for water meadows, which are well managed, and productive; they are chiefly in the neighbourhood of Winchester, on the Itchen; but there are instances on most of the other rivers and streams.

8. *Gardens and Orchards.*

Excellent market gardens near Gosport and Portsmouth; Portsea island noted for its broccoli; white-washed mud walls, with copings of thatch used as fences, and for wall fruit in some cases; and fruit walls only half a brick thick, and waving at the rate of one foot in twenty in use. In other cases angular walls, are in use, the angles being right angles, and the sides ten feet each. The advantage in both cases is the saving of bricks; but it is evident they cannot be carried very high, nor, subject as they are to the driving and drawing of nails, can they be of great duration. (See *Gardening*, &c. of Wellington's). Oak abundant in the New Forest district, and many young plantations there, and throughout the county. Collett raised a great many American trees of various species at Bole. There are several considerable forests, viz. the New Forest, Alice Holt, Woolmer, and Basing.

The *New Forest* is situated on the south side of Hampshire; it was formerly bounded on the east by Southampton river, and on the south by the British Channel, being near thirty miles in length, and ninety in circumference; but, since the dissolution of the Tithes and the Duke of Wellington's, its boundaries are much reduced, and now only extend from Godshill, on the north west, to the sea, on the south-east, about twenty miles; and from Hardley, on the east, to Kingwood, on the west, about fifteen miles; containing within those limits about 92,565 acres, the whole of which does not belong to one crown, as several manors and freehold estates, to the amount of 24,797 acres, are private property; about 625 acres are copyhold, belonging to His Majesty's manor of Lyndhurst; 1074 acres are leasehold, held under the crown; 902 acres are encroachments; 195 acres are held by the master keepers, and groom keepers, attached to their respective lodges; and the remaining 65,844 acres are the woods and waste lands of the forest. The other forests are of much less extent and interest.

10. *Improvements.*

Good examples of draining by tapping were exhibited by Elkington, on Caillard Park estate; the strata lying at a small angle with the horizon, enabled the principles of what is called Elkington's mode of draining to be carried completely into effect. In the eastern part of the Isle of Wight are various tracts of marshy ground, the largest of which, Brading Haven, containing about 390 acres, was granted by James I. to one Gibbs, a groom of the chamber. The owners of the adjoining lands contested this grant, which the king was very

7816. WILTSHIRE. 870,000 acres of varied surface, partly chalky downs, and partly rich vale land; and both a corn and grass county. It produces excellent cheese and butter, fat cattle, pigs, and store sheep. The agricultural report of this county was drawn up by T. Davis, steward to the Marquess of Bath, at Longleat, a man of great experience as a land steward, surveyor, and farmer, and universally respected. He divides the county into two districts, the south-east and north-west; a very judicious plan for giving correct agricultural information. (*Davis's Wiltshire*, 1794. *Marshall's Review*, 1801. *Edin. Gaz.* 1829.)

7817. SOUTH WILTSHIRE.

Wiltshire downs contain about 500,000 acres of hilly surface, mostly unenclosed and in common pasture; the atmosphere cold and sharp, with a chalky soil, seldom varied by patches of loam, sand, or other earths. There is scarcely a river or brook in this district that is not applied in some way or other to the purposes of irrigation.

1. *Property.*

Near large towns property is generally subdivided when sold; in this district, when any is sold it is generally bought up by such as are considerable proprietors; hence estates generally large. Some of the manors shew that many of them were the property of one lord; each lord's estate contains a rivulet to supply water and the accompaniment of rivulets in that district, meadow land, with hill for wood; or, where these were wanting, they were supplied by a grant of those articles from other property. Proprietors generally resident on their estates.

2. *Buildings.*

Farm-houses generally crowded together in villages, for convenience of water. Some of late years erected central to their farms, by the Earl of Pembroke, and other proprietors; wells and ponds an important article in these erections.

3. *Occupation.*

Farms of two kinds; those in severalty, or not subject to rights of common, are from 1500. to 5000., and one or two to 10000. a year; customary tenants, subject to rights of common, are from 250. to 400. or 500. per annum. There are extensive sheep commons and cow commons, to which the occupiers of both descriptions have a right to turn in stock, according to certain fixed and customary regulations. Leaves seven, fourteen, or twenty-one years.

4. *Impliments.*

A heavy two-wheel and one-wheel plough in use; the latter sometimes with a foot instead of a wheel.

5. *Arable Land.*

An old error exists, that of over-pulverising the uplands by too frequent ploughings, by which the wheats were thrown out during winter, or if they stood the winter, the March winds blew away the earth from their roots, and "hanging by one leg," and thus not receiving any assistance from the coronal root, the plants are weak in straw, and produce small thin ears. "Many

ears in supporting. After a verdict obtained in the Court of Exchequer against the gentlemen of the island, Gibbs sold his share for 20000. to Sir Bois Thelwall, a page of the king's bed-chamber, who admitted the famous Sir Hugh Middleton to a share. They employed a number of Dutchmen to enclose and recover the bay from the sea. The first taking of it cost 40000. and 100000. more was expended in building a dwelling-house, barn, water-mill, trenching, quick-setting, and other necessary works; so that, including the original purchase, the total expenditure amounted to 70000. Entirely to enclose the middle of the ground did not answer the expectations of the undertakers; for though that part of it adjoining Brading proved tolerably good, nearly one half of it was found to be a light running sand; nevertheless, an incontestable evidence appeared, by the discovery of a well, called with stone near the middle of the haven, that it had formerly been good ground. Sir Hugh Middleton tried a variety of experiments on the land which had been taken in, before he sold his share; sowing it with wheat, barley, oats, cabbage, and finally with rapeseed, which last was alone successful; but the greatest discouragement was, that the sea brought up so much oozed, weeds, and sand, which choked up the passage for the discharge of the fresh water. At length, in a wet season, when the inner part of the haven was full of fresh water, and a high spring tide, the water overflowed the bank, and made a breach. Thus ended this expensive project; and though Sir John Oglander, who lived in the neighbourhood, confessed himself a friend to the undertaking, which, besides its principal object, tended to render that part of the country more healthy, he declared it as his opinion, that the scheme could never be resumed to any profitable purpose.

11. *Live Stock.*

No exclusive breed of cattle. The Sussex, Suffolk, Leicester, Hereford, Devon, &c. are indiscriminately met with. Several ox teams.

In the Woodland district the heath sheep, old Hampshire, or Wiltshire breeds, but most of the improved breeds also to be met with.

The horses used in teams generally large, heavy, inactive animals. Small horses bred in vast numbers upon the heaths and fens, and which have not improperly acquired the name of heath coppers. Their ordinary height is about twelve hands. They propagate indiscriminately upon these wastes, where they seek their living throughout the year, and at four years old may generally be purchased at above five pounds.

The soil of this county is a heavy, red, iron-boned, flat-sided animal, agreeing in no respect with the idea entertained of it in other parts of the kingdom. The great number fed for a few weeks in the close of autumn, upon the acorns and mast which the forests and other woodlands produce, in the county, and the excellent mode of curing hog-meat practised by the house-keepers, have contributed in a far greater degree to establish that superiority ascribed to Hampshire bacon, than any inherent excellence in its native breed of hogs. Very few, however, of the genuine native hog are to be met with, the common stock being either the native Berkshire breed, or a considerable predomance of that blood in the native swine of the county.

12. *Political Economy.*

Roads in general good, especially in the New Forest. Several canals, and various manufactures and public works at Portsmouth and other places. The machinery for making blocks (1830) is reckoned the most ingenious and complete of its kind in the kingdom.

modes have been introduced to prevent this evil, by giving a sufficient texture and firmness to the land previous to a wheat crop. The best Farmers have made a point of getting their lands clean ploughed by midsummer, and treading it as firm as possible with the sheep-fold a long time before sowing; while the slovenly farmers have invented, and generally practise, a very short and cheap way of attaining this firmness in the land. They rafter the land (as they call it), that is, they plough half of the land, and turn the grass side of the ploughed furrow on the land; the rest is left unploughed. The machinery for making blocks (1830) is reckoned the most ingenious and complete of its kind in the kingdom. They can spare the feed of the summer-field, and leave it in that state till near seed-time, when they harrow it down and plough it for sowing. This rafter is usually ploughed across the ridges, or what is better, diagonally; the latter mode being less subject to drive the land up in heaps before the plough. The land thus raftered is sometimes ploughed twice, but more frequently only once, previous to sowing; and after it is sown they drag it two, three, or four times, and harrow it four, five, or six times. A very heavy kind of drag is used; and as Wiltshire Down Farmers are very cautious of ploughing their land too much, they make much use of these drags instead of ploughing, and frequently let in their seed-wheat with them. This practice having been found to answer, has been gradually improved upon. The down lands of this district will not bear following, especially in a dry weather; they do not require to be sown already, and require rest. Two years' rest for wheat is equal to the best coat of dung. Dung may give the quantity, but rest must give the quality.

The course of crops was formerly fallow, wheat, barley, oats; but now, even on the common fields, is wheat, barley, oats, sown one year, and fed two years; with necessary ploughing for wheat. Turnips, Swedes, and rape grown for winter food for sheep, though less necessary than in districts less amply provided with water meadows. Error that of sowing too much corn.

Gardens near Devizes, Lavington, Warmminster, Westbury, &c. Many families subsist by this kind of husbandry, occupying from two to five acres each as garden ground. The produce supplies the adjacent towns in the district, and Frome and Bath, in the county of Somerset; with turneps, peas, beans, carrots, turnips, and vast quantities of potatoes.

Orchards in some places, and cider made; but as the district

is famous for its barley and ale, the predilection for this beverage renders the want of cider little felt.

Woods not numerous, but a great spirit for forming plantations; and some excellent remarks on the subject in the Report.

Irrigation introduced into this district the end of the seventeenth, or the beginning of the eighteenth century. Many of the most valuable and best-farmed meadows, particularly those in the Wyley Bourne, were made under the directions of one Farmer Baverstock of Stockton, between the years 1700 and 1705.

Between 15,000 and 20,000 acres watered; its great value in April between "hay and grass," by which the farmer is enabled to breed early lambs. "As soon as the lambs are able to travel with the ewes (perhaps about the middle of March), the flock is put into the water-courses. Care is, or ought to be, taken to make them as dry as possible for some days before the sheep begin to feed them; and on account of the quickness of the grass, it is not usual to allow the ewes and lambs to go into them with empty bellies, nor before the morning dew is gone. The general hours of feeding are from ten or eleven in the morning, till four or five in the evening, when the sheep are driven to the fold, which at that time of the year is generally in the barley fallow. The grass is daily huddled out in portions, according to the number of sheep, to prevent their trampling it down; but a few spades are left in the hands of the labourers to get through and feed forward in the rich grass. One acre of good grass will be sufficient for 500 couples for a day; the great object is to make the water-grass last till the barley sowing is finished; the meadow is then laid up for hay.

The *water meadows* of the Wyley, six miles N. W. of Amesbury, have been long celebrated. What is called the long grass of these meadows is said by Davis to be the *Agrostis stolonifera*, or black couch; but this has been subsequently ascertained to be a mistake. The grasses which compose these meadows were examined by Thomson, a scientific botanist, in 1811, and reported on in the *Farmer's Magazine*, vol. xiv. p. 129; and the following very interesting extract deserves the attention and reflection of the farmer, for other reasons besides its botanical information. It appears probable from it that deep dry soil, which will admit the roots of sward and other meadow than other grasses, may, one year with another, yield as much nutriment as rich irrigated surfaces, and probably at much the same expense:—"Much has been said of the excellent quality of the hay, when well made; that, for instance, it will fatten pigs; and that it abounds with the saccharine quality more than other grasses. The testimony of the present occupier and his neighbours can settle this question (and I see no reason why they should not), the average produce is not of great value, take seven years together, than an acre of good sainfoin, or other artificial grasses. There is no risk in making the meadow-keepers, or common cowmen, and meadow fox-tail. In the last spring I again examined the meadow very particularly, and found the crop to consist of the same grasses as before, varying a little in their proportions. The *Triticum repens* made a greater appearance. In the month of August I took another ride to see if I could discover the least of the other grasses. This I was prepared for, and expected to find; but it was by no means the case: I could discover no more of the stolonifera than before. On examining the hay of the second crop, it consisted of the *culmi* of various common tall meadows, with the seeds of *Festuca ovina* &c. The long grass, at this season, prevailed. In soils in general, when laid down to pasture, the common couch (*Triticum*) soon wears out, it will not bear the constant treading of cattle. Wherever this grass is found in pasture, it proves either that the field has not long been in pasture, or that the rest is very rich. The latter is the case in this instance. But you will say, What is the long grass of which we read so much? It remains for me to mention a peculiarity in the grasses in this meadow, and some others in its vicinity, which I do not recollect to have seen in any other to which I have been riding. It is the *richness and richness of the soil*. When the water begins to recede, in the late spring months, the *culmi* of all the grasses (the *Poa trivialis* in particular), from their great luxuriance, lodge on the soil, and form a complete mat; and in this state throw out roots at their joints, and appear, before their *panicles* show, to be the *stolonis* of some *stolonifera* grasses. Let a person, not previously informed of this circumstance, visit the meadow in the latter end of April, and he would probably, with others, suspect the whole, or greater part of the produce, to be *stolonifera* produce. I examined the *culmi* of the *Poa trivialis* and of other grasses, for fourteen or fifteen feet, with roots at all the joints, till, at the last, they shot up erect, and were taken off by the scythe only about two feet long. The mat of *culmi* on the ground is cut off underneath the scythe, and the roots of the *culmi* to a *stalks* of an *overgrown* crop of vetches. The *Agrostis stolonifera* is one of the *best* grasses we have, and never was known, even in a cultivated state, to produce a crop till the autumnal months. But it is asked, How is it that it grows so rapidly in its natural state, as to take long into a hay field, and cut the last week in May? Here is the mistake;—the *culmi* of other grasses, throwing out roots at their joints, have been considered as the *stolonis* of this *Agrostis*." (*Farm. Mag.* vol. xiv. p. 151.)

These meadows are not laid out in any regular form for watering, the supply of water being too partial, but they depend entirely on the floods; and being situated at an sharp turn of a narrow part of the valley, the water makes an eddy, and deposits its sediments upon them. The substratum of these meadows is an almost entire bed of loose flints.

On examining other meadows in different bores of this district, we find the same grass uniformly to abound in those situated near the spring-heads, and which in some years have plenty of water, and in others none at all. The same remark on its variation in quality and quantity, according to the wet-

ness or dryness of the winter, is equally just. The most probable way of accounting for it is, that it is almost the only grass common to water-meads that will stand wet and dry; for though it nourishes most when under water, yet no dry weather will kill it.

Live Stock. Cattle few in this district; oxen not generally under the plough; sheep the chief stock and the basis of the Wiltshire Down husbandry; object, folding and wool; breeding a consequence rather than a cause of keeping sheep. Horses a heavy, very unsuitable breed; great error in principle of breeders here as every where among the old school, that of enlarging the size of the animal.

7818. NORTH WILTSHIRE.

Climate milder than that of the S. E. district; soil not so uniform; under stratum broken stones, and surface reddish calcareous loam.

Properly more divided than in the east side of the county. *Buildings*, a noble pile, by Inigo Jones. Farms generally enclosed, and chiefly under grass, and applied to the making of cheese; leases from fourteen to twenty-one years.

Scottish farmers. "Within these few years several of the great landholders in Wiltshire have introduced into this district Scotch farmers, who, from a supposed superior skill in the science of agriculture, have leases for twenty-one years, with scarcely any restrictions as to husbandry. The ancient pastures are allowed to be broken up; buildings are erected for their accommodation at a low rate of interest; and a degree of countenance and assistance given to them above the other tenants of the day. These men give nominally a large rent for their farms; but as their maxim is to pay neither repairs, tithes, nor parochial taxes of any description (these dues and services being all included in the rent received by the landlord), I have strong doubts whether the advantage held out to the above system will be, ultimately, any increase of net cash into their pockets. In strong loamy counties, or in rich sands, I am aware much profit may be made by an economical system of husbandry in the tillage; but the practice of the Scotch farmers not embracing sheep, or water-meadows, will never make them rich on the Down farms of Wiltshire; and if the Downs be broken up by the tenants, who have no stock to maintain them, the land and the farmer will soon come to poverty together." (*Davis*, 174.5.) Among these farmers was the unfortunate Goutry, who was ultimately ruined by the speculation. Of his farming system, nothing, nor are we aware what description of Scotch farmers they can have been whose husbandry in an inland turnip district did not embrace sheep. On the Earl of Suffolk's estate at Charlton, some Berkshire farmers were introduced in part through other means, whose chief object was to improve the soil. The Lord Suffolk, however, of that time being a weak man, without an opinion of his own, got so alarmed by his family at the idea of breaking up old turf, that he bought up the leases of these farmers almost as soon as they were granted.

The greater part of this district, on the north-west verge, being a part of the Cotswold hills, and treated like them. *Grass land* prevails almost to the exclusion of arable on all wet and heavy lands; their management of late much improved by draining, manuring, water burning, early mowing, and feeding and moving every piece of land alternately. The grand object in these improvements is, to get an early mow for the cattle in the spring, and thereby, in fact, to shorten the winter.

The cheese of this district was many years sold in the London market by the name of Gloucester cheese; but it is now perfectly well known by the name of "North Wiltshire Cheese." It was at first, doubtless, an imitation, and perhaps an humble one, of that made in the vale of Gloucester, but it is now allowed by many to be at least equal, if not superior, to the cheese of the favourite district of Gloucestershire, the hundred of Berkeley.

Gardens not numerous: some near Wootton Bassett, for supplying the market of Cricklade, Cirencester, &c.

Orechards frequent as an appendage to farm-houses, but no cider made.

Wood frequent in hedgerows, but not in masses. *Irrigation* not common; springs scanty, and land too absorbent; alleged they produce coarse grass, but this is owing to its not being mown in time.

6. Live Stock.

Cattle of the long-horned breed; Devons bred, and found better for fattening, but it is questionable if they are so good for the dairy. Breeding cattle not the fashion. "The dairymen say, that the advantages which their situation gives them of sending their veal to London and Bath markets, makes it more their interest to fat their calves than to wean them for stock; but the opponents of the long-horned cows say, that the oxen are generally so ugly, and the calves frequently so weak, that they would wish to keep; and therefore they prefer buying cows (of which they can have a choice) to breeding them, and to use horses for the plough instead of oxen."

Many sheep bred in the district, some for fattening, and others purposely for fattening; for these purposes a kind to walk, and a kind to stand still, necessary: the Wiltshire answers the former purpose, and the Leicester the latter.

There are yet left in North Wiltshire a few flocks of the native Wiltshire horned sheep, possessing qualities of perfection, both for fattening and for the cloth. They start short in the leg, with wool under their bellies; are wide and heavy in the hind-quarter, light in the fore-quarter, and in all their offals, with the Roman nose, and quick piercing eyes. The e are in the hands of a few farmers near Broad Linton.

7. Political Economy.

As applicable to both districts it is observed, that the turnpike roads are numerous and good in most places; three canals; extensive woollen manufacture at Salisbury; also cutlery of superior excellence there; carpets at Wilton, and fancy woollens; and of superfine broad-cloths at a great many places. No agricultural society, but many farmers and others are members of the Bath and West of England Society.

7819. DORSETSHIRE. 711,250 acres of undulating surface, in great part chalky soil, and celebrated from the time of the Romans for its pleasantness and fertility. Like Berkshire and some other counties, it is called by the inhabitants the garden of England. It is chiefly under grass, and is celebrated for its

breed of sheep, which bring three lambs in two years; and for its watered meadows, of which Boswell, of this county, has given a valuable account. (*Claridge's General View*, 1793. *Stevenson's General View*, 1812. *Marshal's Review*, 1817. *Edin. Gaz.* 1829.)

1. Geographical State and Circumstances.

Climate dry and salubrious rather than mild and bland; supposed colder since the elevated Downs were denuded of their native forests.

Soil chiefly chalk, next clay, then sand, and of loam, gravel, &c. nearly equal and moderate portions. Chalky and sandy soils of the uplands very thin.

No metallic mines or culs, but the peninsula of Portland, four miles and a half in length, two in breadth, one entire of Portland stone, so extensively used, especially in London. Potters' clay found in various parts of the county.

2. Property.

Estates large compared with those of other counties; 5000 of the principal under the care of land-surveyors, others of lawyers. Tenures chiefly freehold and leasehold.

3. Buildings.

Farm buildings as in other counties; generally ill situated, built of stone, and covered with reeds or thatch.

4. Occupation.

Farms very large, 1500 or 2000 acres of sheep farm being frequently the rule. Many of the proprietors great farmers. Leases of twenty-one years common till the beginning of the present century, now for shorter periods.

5. Implements.

Two sorts of uncouth wheel-plough in use. Small's plough tried in one or two places; from the difficulty of ploughing flinty soils, which are deemed an advantageous appendage to wheel-plough, ever sort is adopted. Threshing, winnowing, and various other modern implements introduced in a number of places. The watted hurdles of Dorsetshire consist almost invariably of ten stakes which the hurdle-makers drive into agur holes, that are made for that purpose in a piece of timber, which is supported at a convenient height from the ground by other pieces of timber, and then the stakes are watted. Stones set on edge, and rustlestone walls used as fences in various parts.

6. Arable Land.

Deep ploughing generally less approved of on the chalky soils, and cross ploughing never practised, even for turnips; two or three horses form a team. Following general all along the coast; but what is here termed a summer fallow, in most cases, no other than a preparation of ley ground for a crop of wheat, by ploughing it three or four times, the first ploughing being given in June or July, and sometimes as late as August.

Upon the thin chalky soils around Blandford, and upon the hills in the neighbourhood of Abbey Milton, the course of crops with the best farmers is as follows: viz. one seventh of the land is in sainfoin, and the rest of the arable is cultivated in the rotation of one, wheat; two, rye, winter barley, or winter vetches, to be fed with sheep in the spring, and the whole followed by turnips, rape, &c.; three, barley or oats; and four and five, artificial grasses, to be followed by wheat as before.

Upon the thin chalks and shallow flinty loams, wheat is generally sown on the hick of a two years' clover ley; but, even on those thin soils, a great deal is sown after turnips, rape, &c. fed off with sheep early enough to sow it in the same autumn, and in most instances a good crop is produced of a fine sample. On the better sorts of chalky soil, and gravelly soils, the same practice prevails, except upon the ley-ground, which continues in grass but one year instead of two; the wheat is taken after the first year's ley, and is supposed to answer better than it would in the second year, upon the latter description of soils. Old saintfoin leys broken up without paring and burning. Hemp and flax a good deal cultivated.

7. Grass.

500,000 acres, or about three fifths of the county; 6000 acres of meadow in the chalky districts irrigated. Application of the meadows; fattening cattle, and of the uplands the dairy.

8. Gardens and Orchards.

Both are frequent appendages to farm-houses and cottages; some of the cottage gardens are small enclosures taken from the sides of the highways. The goose-foot (*Chenopodium bonus Henricus*), cultivated by a few persons here, as in Lincolnshire and elsewhere, and calculations made by Dutcher, to show what would be the expenses and profits of an acre for the London market. The plant is greatly inferior to spinach, but might be used as a substitute for it in spring, as it is a perennial, and very early in the season, which grows on the shores near Burton, is now generally introduced into the gardens of farmers.

Orchards to the extent of 10,000 acres; application cider, in making which hops are sometimes added to make it keep; proportion one pound of hops to several bushels of apples will make a hoghead of cider.

9. Woods and Plantations.

Timber scarce, and chiefly to be found in parks and hedge-rows. Many young plantations lately made on the heath lands.

10. Improvements.

Irrigation carried to considerable extent and great perfection,

7820. SOMERSETSHIRE. About one million of acres, chiefly of meadow and pasture land, hilly and mountainous in some places, and with marshes and bogs in others, but on the whole, though far behind in artificial culture, celebrated for its natural fertility. The climate is various, in general cold and boisterous on the elevated parts, but almost without a winter near the sea. The county is divided into the north-east, middle, and south-west districts, by its very able reporter, J. Billingsley, Esq. of Ashwick Grove. (*Billingsley's General View*, 1797. *Marshal's Review*, 1817.)

7821. NORTH-EAST DISTRICT.

Surface very irregular, intermixed with lofty hills and rich fertile plains: climate various; soil chiefly clay, and in part peat; application chiefly hogshead; several thousands of acres overflowed by the tide in the river Ye; 4000 acres protected by a wall of stone and lime, elevated ten feet above the level of the land within, but high tides frequently break over it and make breaches.

and one of the best books on the subject is by Boswell of Piddletown. A dry meadow of good quality is worth forty shillings; watered, sixty-five shillings per acre; produce of hay two loads per acre. The streams in Dorset are in general shallow, and have a considerable fall; the meadows are narrow, and the water is supplied with comparative regularity, in consequence of its having to filter through immense masses of chalk previous to its exit at the springs; and hence the process of irrigation is much facilitated.

The sheep of Dorsetshire are well known as supplying the metropolis with house-lamb at a very early season. Parkinson considers the Dorset ewe as the best horned ewe in the kingdom, those of Somerset excepted; and they are so nearly alike, that few people, save the natives of the two counties, would know the difference. In the Isle of Portland there is a small breed, which some contend is the true breed of the county. Lowman of Portland observes, it is the practice there to produce these dwarfish animals from Clandemas to Martintide, putting them in late at night, and letting them out early in the morning. The mutton is deemed the best in England, and the wool as good as the South Down kind. Some of them have been purchased by sheep-breeders, with a view to obtain a cross between these and the Merinos. Both ewes and wethers are kept, and generally till they are five years old; sometimes they remain till a greater age, but it is not thought a profitable method. Such as are fattened are put into a common, at the northern part of the island, which is preserved in that kind, and remain there from the 12th of August to the 6th of November, on which day Portland sheep-fair is held. All the sheep of the island are kept pretty generally upon the commons from November the 21st to Clandemas. The Portland mutton is sold by the quarter in general at ten shillings per stone. It is never weighed, but would come to one shilling a pound when common mutton is only seven-pence; it seldom weighs more than ten pounds a quarter. Several flocks of pure Merinos, Down Merinos, and other breeds.

General management of sheep. The lambs which are bred for the regular supply of the flock are dropped at Christmas, or soon afterwards, and the couples are kept in the best ewe-leazes, &c. on grass, hay, and turnips, if necessary; and such as have watered meadows, depasture their sheep there, on the early grass, till the 1st of May-day, when they are put to the fold, and sheep go to fold; but sometimes the two latter circumstances take place as early as Lady-day. The ewes are fo'ed constantly, and kept on the Downs, on artificial grasses and other pastures, till near the ensuing Christmas, at which time they have another crop of lambs, the rams having been put to the flock about the end of July.

There is, probably, no part of England where the practice of sheep-folding is more admired, or more earnestly pursued, than in the county of Dorset. Fifteen dozen of hurdles, with a like number of stakes and withes, are put together, will enclose a statute acre of ground, and will contain 1200 or 1500 sheep very commodiously. The hurdles are moved every morning; consequently the same number of sheep will manure an acre in a day's time. The regularity of the fold here is no means of ascertainment, but it is undoubtedly very beneficial to the arable land, but it has reduced the Downs to a state of poverty.

Ewes are generally kept till they are four years and a half old, when they are sold to the dealer. A singular custom prevails of colouring them with ochre, for which no other reason is given than that of being able to distinguish them from the Somerset sheep.

Asses were formerly kept by some farmers, but are now given up, having been found destructive to hedges. It appeared that six asses would plough as much land of an acre in a given time as three horses, and four asses were sufficient to plough broken land. It is believed that two asses will perform as much work as one horse, and they do it more conveniently in the hilly part of the county, as they carry their load in pannier, where it would be difficult to use wheel carriages. Geese kept on the corn pastures in Purbeck, from an idea that they promote the health of the cattle.

Bees kept in various places; does not answer to feed them; the only way to render them profitable is, after the honey-season to destroy all hives under twenty pounds weight.

11. Political Economy.

Roads of flint, and in general good: an iron railway, of three miles and a half, for conveying potters' clay from Norden to a place opposite Poole, where it is shipped for Liverpool. No canals. Manufactures of flax twine, hemp, Bridport and Bournemouth; upwards of 2000 people employed in making silk, cloth, cordage, sackings, tarpaulin, &c.; flannel at Shaftesbury, and woollens at Lyme Regis; twisting and making up raw silk into skeins at Sherbourne and other places; shirt buttons extensively at Shaftesbury, Blandford, and the surrounding villages; the buttons made of wire and thread; many thousands of children in this manufacture; wicker baskets, with a small hole at top, called lobster pots, at various places on the coast, and a variety of other articles. Many very uncommon provincial terms used in this county.

Minerals. Lead and calomine in the Mendip hills, but little worked, for want of a proper level to carry off the water. Good amounts of lead is worked for at Shaftesbury, Wiltshire, and Somersetshire, from 800 to 1000 tons raised weekly.

Property. Many large proprietors from 2000L to 6000L per annum, but the greater part in the possession of respectable yeomen, from 50L to 500L a year.

Buildings. There are many splendid gentlemen's seats,

ornamented with extensive plantations. In this district, and the farm-houses and cottages are for the most part commodious and comfortable, but, on all the dairy farms, a shameful intemperance prevails in respect to outhouses and sheds for their stock to retire to in the winter months. Cattle are almost universally served with their provender in the field; and many a dairy farmer, with twenty cows, scarcely makes, in the whole year, a quantity of dung sufficient to manure one acre of land.

Occupation. Farms seldom exceed 200l. a year; some of the dairy farms are so small as not to exceed 60l. or 70l. per year; and many instances can be produced of such little farmers bringing up a large family in a very respectable way. In such instances, it is generally found that the wife undertakes the whole management of the cows, and the husband goes to daily labour.

Implements. Plough with a foot or wheel; spade with the blade curved in its breadth, to prevent adhesion of soil; it is much narrower and longer than those used in other counties, eighteen inches by six inches.

Arable land but in small proportion, and little attended to. Turneps and wood grown for the clothiers; potatoes cultivated to a very considerable extent. The reporter has known thirty successive crops of potatoes from the same field, and the finishing. This will puzzle the theorist, with his peculiar substances of nutrition. A sack of potatoes is equal to a hundred weight of hay.

Grass the predominating surface. "On the rich marsh land near the Bristol Channel, the grazing system prevails. In the vicinity of Bristol and Bath, the scythe is in constant use; and at a greater distance nothing is scarcely seen but the mowing; on the stonebrash, and freestone grit soil, saintfoin takes the lead; next to saintfoin, rye grass, marl grass, and white Dutch clover are in deserved repute, when the land is intended to remain some years in grass; but when it is intended to be ploughed again in the course of a year or two, broad clover is preferred to all others.

Hay-tea (1807.) much in use, by which means it is considered as much nourishment is obtained as if the hay were eaten, while after boiling the culms may be dried and used as litter. In some places, however, a prejudice exists against using hay for litter, on the supposition that it breeds vermin in cattle.

Market Gardens for the supply of Bristol and Bath. A clergyman has eight or ten acres of nursery ground, the labour of which amounts to 25l. per acre.

Orchards abound throughout the whole district; the favourite apple, both as a table and cider fruit, is the court wick pippin, a seedling from the golden pippin.

Woods and Plantations not numerous.

Live Stock. Cattle mostly short-horned; the long-horned breed of North Wiltshire have been tried, but the customary breed preferred. Both cheese and butter made.

Roads pretty good; some canals; woollen manufacture extensive, and that of knit worsted stockings considerable.

7822. MIDDLE DISTRICT.

Between 4 and 500,000 acres of varied surface and soil, and mild climate; including a great extent of marsh and fen land, great part of which has been drained and embanked. Half this district occupied by the owners. Grass the chief product; farms from 40l. to 600l. per annum, partly grazed with heifers, but chiefly by cows for the dairy; the cows let out to dairymen, as in Dorsetshire.

Arable Land, flax and hemp extensively cultivated, and also turnips.

Orchards numerous and very productive; soil particularly suitable; plantations few.

Live Stock. Small cows, well fed, preferred for the dairy, the others in general sold in London as double Gloucester. A dairy-maid can manage the milk of twenty cows.

Roads excellent, especially from Wells to Bridgwater; extensive woollen manufactures, many of hemp and flax, and

7823. SOUTH-WEST DISTRICT.

Rough mountainous hills, and rich fertile slopes and plains; farms rather less than in the last district, but the husbandry much the same; more land in tillage; mountains uncultivated, and pasture with sheep and young bullocks; in the vicinity of these hills the principal corn crop is oats.

Fences. The beech hedges around Dulverton, Dunster, &c. are not only beautiful to the eye, and excellent fences and shelter, but are a source of annual profit to the proprietors. The banks on which they are planted are six or seven feet high, and between four and five feet wide at the top; the mouldering of the sides is frequently prevented by a dry stone wall, three rows of beech, planted on the top of the bank, at about one foot distance. Their growth is very rapid, and they seem to defy the destructive qualities of the sea breezes, so fatal to the middle row is cut to the ground, and the outside rows plashed. The quantity of fuel supplied by these hedges is very considerable; and the only objection that can be made to them is, that able a quantity, that a large portion of the field is robbed of its vegetable matter, and rendered for some years unproductive.

Some Norfolk farmers introduced on the Baysard estate, and Zubarb cultivated to great perfection by Bell, at Wilmot, near Watchet. Many orchards, and excellent cider hedges, not much wood, but elms attain to a large size in the hedges.

Live Stock. North Devon cattle and Dorset shorn used round Taunton Dean; oxen worked chiefly in yokes. Manufactures for Lack, Minehead, and Watchet. A salmon and herring fishery at

7824. DEVONSHIRE. 1,595,369 acres of strongly marked hilly surface, including the vale of Exeter, Devonshire, each with distinct features. The county is celebrated for its breed of cattle, its dairy, and its meuse depot for 10,000 prisoners of war. (fig. 1114.) (*Tyrwhitt's Tracts on the Improvements at Dartmoor, 1819.* *Fraser's General View, 1794.* *Vancouver's View, 1807.* *Marshal's Review, 1817.*)

1114

1. Geographical State and Circumstances.

Climate in North Devon less mild than in South Devon, but still myrtles are used as garden hedges; in South Devon the climate is supposed more mild and salubrious than in any other part of England.

Soil in great variety, but in general calcareous.

Minerals. Some iron and copper worked, also freestone, limestone, and marble, &c.

2. Property.

Much divided, only a few large estates; formerly letting for five or six mch in use. It has frequently happened, that in letting

an estate, the landlord agreed to discharge tithes and all pecuniary payments. About the years 1800 and 1801, the rent of several estates in this county was absolutely insufficient to meet such disbursements, and consequently all the estates so circumstanced brought their proprietors in debt.

3. Buildings.

Houses of proprietors too generally going to ruin from non-residence. "We defy ingenuity to plan and place farm-houses worse than they are." Garden-walls, farm-houses, barns, stables, lime-kilns, village fences, and cottages, are all built

with mud, and left without roach-cast, or whitewash, to conceal the native colour of the loam."

4. Occupation.

Farms of all sizes from 10l. to 5000. a year.

5. Implements.

Plough of the swing kind, with a wooden mould board. Scarifiers, called *tormentors*. Two sorts of grubbing mattocks are in use (fig. 1115, a, b), one called the *lax* (a), and the other a two-bill or double-bitted mattock (b). Paring-shovels (c) are very well constructed. Corn-trucks in harvest secured from the sudden and heavy thunder showers to which this country is liable, by canvas coverings, like those used in Middlesex for covering hay ricks.

6. Arable Lands.

Much less than the grass land; not much to be learned from its culture; artificial herbage not generally sown, and rotations bad.

7. Grass Lands.

In the low tracts of good quality; application, breeding and the dairy; but the food, cheese indifferent, and generally consumed in the country.

8. Orchards, Woods, and Plantations.

Very abundant in most parts of the county, and excellent cider made in the Herefordshire manner. Fruit trees rather neglected than otherwise; generally pasture beneath; often in the hedges.

The Forest of Dartmoor is parcel of the Duchy of Cornwall; its extensive improvements have lately been proposed, and in part carried into execution, under the direction of Sir J. Tyrwhitt, the steward of the Duchy. Extensive salt marshes on some parts of the coast.

9. Improvements.

Drainage and irrigation not much practised. The Rev. M. Frode, of Dartington parsonage, communicated to Vancouver a mode of emptying the water from a pond without the necessity of attending to it personally when full. It is more matter of curiosity than ingenuity or use. The water, when the pond is overflowing, flows by a gutter into a basin, suspended below the head of the pond, by means of a lever, raises a plug at the bottom of the pond. After a time, the plug being leaky, it becomes empty, and when the pond is nearly empty, the plug re-drops in its place. If the plug were placed nearer the surface of the water, it would in general cases be more useful, and less likely to lose the fish.

10. Live Stock.

The North Devon cattle well known for their superior adaptation, both for feeding and draught. For the uses of the dairy or for milk, it is a breed by no means held in general estimation, as their aptitude to look well (without being fleshy) is derived from the peculiar nature of the animal, which disposes its secretions in the accumulation of fat, rather than in the production of milk. For the purposes of labour, this breed can nowhere be excelled for docility, activity, or hardihood, in proof of which no stronger circumstance can be adduced, than that it is a common work on a few land, for four steers to plough two acres with a double-furrow plough; and that a general use is thus made of them, and for most of the other purposes of draught in the country where they were originally found, and in others to which they have been since transported.

The rules generally pursued in breeding and raising this valuable animal, may be considered as follows:—The greatest number of calves fall between Candlemas and May, and some much later; but among the best breeders, such late calves are not so generally approved. The usual mode of raising them is, to let the calf suck as much as it will three times a day, for the first week; then bring it to the finger, and feed it with warm new milk, in like manner for three weeks longer. This is the ordinary treatment for the first month, and the calf is then fed for two months longer, twice a day, with as much warm scalded skim-milk as it will drink; when, gradually abating its morning and evening meals, at the end of four months the animal is weaned from all milk draughts, and left to itself. Small portions of finely crushed cakes are often used, and recommended with this mixed, with the skim-milk, particularly in the first period of its being given in the place of new milk.

The full-sized North Devon cow, when fattened to its frame, will not exceed eight score per quarter; and the ordinary average of its ox, at five years old, and equally well fattened, must not be rated higher than three score per quarter above the weight of its fattened mother.

The usual practice in this district, is to sell the steers, at four or five years old, to the graziers in the county of Somerset, who feed them for a supply to the Bath, Bristol, and London markets. Very few in the proportion raised are fed in the district, which may in a great measure be ascribed to the great indifference hitherto manifested in the culture of green food for a winter supply; and to which, indeed, a sufficient reason may be drawn, from the deplorable wet state in which the lands are suffered to remain from the want of draining.

In South Devon we find a mixture of the North Devon with a larger animal of the same kind, called the Old Marlborough Red. This breed is said to have originated from the South Malton stock, although at this time they differ very materially from them in size, and in having a dirty brown, or rather blackish colour at the ears, nose, and encircling the eyes, and in all such parts as the orange hue prevails in the genuine North Devon breed. A cross with this breed is, however, much preferred, as it produces a greater aptitude to fatten in a given time than is experienced in the South Devon stock, which in all its points is a much coarser animal, and produces a greater offal. There does not appear to be any particular choice with regard to colour in this breed.

Sheep, the Exmoor breed, a horned animal, with a moderately long and close wool, which heretofore, and before the cloth manufacture fled from this county into Yorkshire, was much used by the clothiers of North and South Malton, Collyampton, Thorverton, Tiverton, and other places in the county.

The sheep most approved in the division of Tiverton are the Bampton New. The first cross of this breed with the New Leicester is growing greatly in esteem, from its improving the form, and bringing the animal three months sooner to market.

The sheep generally depastured on the moorlands are the Exmoor, Dartmoor, and the light hardy breed of the lower moors and commons in the county. The autumn rains frequently inundating the cold clay lands, are very apt to occasion the caw, or rot, among them, and which has been sometimes experienced to an alarming extent.

The Merinos, Ryelands, Downs, and other fashionable breeds have been tried by amateurs, but Devons is a shew that a cattle county. Native breed of hogs large, and long-legged.

Horses, a small compact breed; with the exception of the farm-horses in Ireland, those in Devonshire have perhaps as hard a measure of neglect and ill-use dealt out to them, as is any where to be met with in the united kingdom.

11. Political Economy.

Had the roads of this county been laid out in the judicious manner practised by the Indians of North America, they would have been found to follow the water-courses in all cases where they might lead in their general direction, towards the point assigned for carrying the goods. The autumn rains, more judgment would have been displayed, and a far greater benefit secured to posterity, than in that which has been adopted by the original projectors of some of the most important and most frequented roads in this country. This is clearly demonstrated by the road between Exeter and Plymouth, which, instead of being conducted through the valley of the Taw, is carried over the highest brows of the river hills, where the traveller is unceasingly compelled to ascend and descend the sharpest hills in the country. The same may be said of the road between Doleford and Torrington, by the great omission of its not being carried along the foot of the river hills, and through the valley of the Torridge river.

Manufactures of woollen of various sorts were formerly common; but are at present on the decline; many manufactures and works employing numerous hands, and many agricultural societies, but both ill attended and on the decline.

Education of the Poor, or Lower Classes. Vancouver concludes his report by some pages of observations which, happily, are seldom equalled in liberality and candour. He tells us, "I do, they compel us to look on him as an enemy to human nature, and to turn from his book, his name, and memory, with feelings of dislike. 'It is an incontrovertible truth,' he says, 'that the restless disposition of the Irish, and their emigration to America, is owing to their being generally instructed, read, and write.' The disposition of the Scotch and Germans to emigrate arises from the same reason, and the English peasant under the same influence will be acted on in the same manner." He "respectfully submits to the consideration of the Honourable Board, the propriety of opposing any measure that may rationally be supposed to lead to such a fatal issue." This man, like Charles X. and his ordinances of 1850, and Wellington, with his speech against reform of the same year, may have done good without knowing it.

Marshal, who so judiciously and humanely spirit justly objects to the term peasantry, as at all applicable to the operative classes of Britain, has the following excellent remarks on this subject:—

"With respect to the emigration of the Irish, 'well it is,' he says, 'for Ireland and America, that they do so.' The one is overstocked with the class that furnishes work-people; the other wants enlightened workmen. Of slaves and savages it has enow. The unlettered Irish stay at home, to riot, plot, and murder; to commit acts of treason, stratagem, and spoil; or emigrate to England, to revel awhile in outrage, and be hanged."

On Vancouver's ideas on education, Marshal observes, "After some other groundless arguments, the reporter sums up in Italics, and with the aid of foreign tongues, in the following ultra-royal manner: 'In short, the peasantry of this land should never be inspired with a desire to amend his circumstances by the quitting of his cast' (this, says Marshal, is Hindoo), 'but every means the most benevolent and feeling heart can desire should be employed to make that situation as comfortable and as happy to him as possible; and to which nothing more essential could contribute than by exciting a general emulation to excel in all their avocations, even to those of breaking stones for a lime-kiln, or for repairing the high-ways, 'hear, hear' says Marshal, 'and the peasantry are good heaven! And is there an Irishman (or a Dutchman—they are brothers in sentiment) with nerve enough to write the two first lines above quoted!!! He surely could not know that many men of 'the brightest genius,' and who are much more estimable members of a community,—than the good men have in England, been moulded and nurtured in the 'peasant cast.'"

"Fortunately for society in England, the writer's exotic notions have not taken root. Seminaries, for civilising the children of the labouring classes, have been, and are rapidly increasing."

"In a civilised nation, early schooling tends to reclaim children from savage propensities, and to prepare them for civilised society; incults a propriety of behaviour, one of the very first lessons a child should be induced to learn in a civilised nation. In the savage state, savage manners may be deemed a virtue, as being, in that state, conducive to self-preservation."

"Attendance in a school injures children to requisite degree of restraint; and a disposition of time employs their minds, and prevents idleness, and other vicious habits, from taking root; thus tending to raise them to the rank of rational beings. While the unfortunate offspring of indigence, that are suffered to loiter away their early days on commons, in lanes, and bye-places, acquiring the habit of idleness, and indulging in their own wills and unrestrained tempers; commit acts of mischief, and add to them the guilt of lying (the seed-bed of fraud) to screen them from correction."

"The discipline of a well-governed school impresses on youthful minds subordination, industry, patience, and its

consequent perseverance; and thus habituates them to receive instructions.

Where Vancouver is at present we do not know; we hope he may long live to witness the extension of education which is now taking place, not only in this, but in almost every country

in the world; and we hope all those whom he designates pen-santry, who may ever happen to read the above extracts, will see the necessity of fortifying themselves, by knowledge and good conduct, against the degradation attendant upon ignorance and vice.

7825. CORNWALL. A peninsular hilly surface, of 758,484 acres, remarkable for its mines, and of late greatly improved in its agriculture, the object of which is chiefly corn. It is the country of Sir H. Davy, who may be considered as having eminently contributed to agricultural science by his agricultural chemistry. The inhabitants have been remarkable from the time of the Romans for their mildness and complacency of temper, urbanity, hospitality, courteousness, and liberality. (*Fraser's Cornwall*, 1794. *Worgan's Cornwall*, 1810. *Marshal's Review*, 1817. *Edin. Gaz. abridged*, 1829.)

1. Geographical State and Circumstances.

Climate, like that of other peninsular situations lying far to the south and west, inconstant as to wind and rain, and mild as to heat and cold. Plants, shrubs, and even the most hardy trees on the sea-coast, sustain much injury from the violence of the westerly wind, and the salt spray of the sea, which it drives with great force before it; hence crops of wheat and turnips have been totally destroyed. After a storm, the plants have their roots much torn, and their leaves corroded and shrivelled as if scorched, and taste of a pungent saltiness. Trees and shrubs shrink and lean away to the eastward, and appear as if clipped by the gardener's shears. The only shrub which seems to bear the sea air is the tamarisk.

Surface remarkably unequal; ascents and descents follow in rapid succession; some hills very steep.

Soil generally slaty and loamy, mixed in a manner that renders it almost impossible to designate the boundaries and extent of each.

Minerals chiefly tin and copper; for the former Cornwall has been famous from the remotest antiquity, as some think, from the days of the Phœnicians.

2. Property.

Very much divided, subdivided, and vexatiously intermixed. Estates from twenty acres to 500 acres, very few exceeding 4000. per annum. Many gentlemen and clergymen in this county occupy their own estates and glebes, and keep their grounds in a very superior state of cultivation. The management of great estates is generally given to attorneys.

Entailed estates. "I was in hopes that I had been a singular sufferer in Cornwall, from this kind of deceptive tenure; it would then not have been worthy of notice; but in my excursions through the county I have met with fellow-sufferers, and with others who are likely to become so. As such cases have occurred, and may occur again, it behoves every man who is about to occupy a farm for a term by lease, to make enquiry whether it be an entailed estate or not; because the possessor having the power of letting for his own life only, in case of his death, the occupier is left entirely at the mercy of his successor." (*Worgan's Survey*, 22.)

3. Buildings.

Old farm-houses of mud and thatch; the lower divisions consist of a kitchen, and an apartment dignified with the name of parlour, but called (provincially) the higher side, a cellar, and dairy-room; but these latter are frequently under a lean-to roof; the rooms very low, not ceiled, and two bed-chambers over; the floors of the chambers are of oak plank; the ground-floor earth, lime-ash, or flag-stone.

The farm-offices, built of the same materials, consisting of a barn, cow and ox sheds, and hog-sties, stand in confusion about the dwelling. The intervening and circumjacent ground is called the farmer's town-place; for as to that essential appendage, a regular farm-yard, it is a convenience not often met with in any part of the county.

Some good new farmhouses erected centrally on newly enclosed lands. One for forty-six acres has a very neat elevation (*fig. 1116.*), and the plan (*fig. 1117.*) contains a feeding place into which the turnips are carried (the cart being backed into it), and from whence the sheep and oxen are fed (*a*); place for a yoke of oxen (*b*), either for soiling or winter-feeding; the oxen are tied to posts (*c*); there are troughs for turnips (*d*); cribs, or racks for hay or straw (*e*); lean-to, for store sheep (*f*); lean-to, in which half a score sheep are kept to fatten, the number

being completed again soon as any are sold (*g*); fodder house, used as a barn (*h*); open shed for tools (*i*); hanging doors with

bolt inside, and through which the fodder is handed to supply

the cattle, and is thus kept always dry (*h*); door and staircase leading up to the wool chamber (*l*). The stairs rise quick, so as to be quite out of the way of the ox feeding in that side of the house.

Cottages. "I had occasion often, in my dreary walks during my survey, to take shelter in some of these miserable dwellings, and found the poor inhabitants busy in placing their bowls, crocks, and pans, to catch the water pouring in at the roof. However, the meanest cottage generally has that great source of comfort, a garden, attached to it." Some very comfortable plans of cottages, by Captain Penson of Ely, are described by the surveyor.

4. Occupation.

Farms from three or four to three or four hundred acres, mostly from 500 to 500. a year. Leases on rack-rented farms generally from fourteen to twenty-one years.

5. Implements.

No county affords a greater variety of wheel and other carriages. The harvest waggon (*fig. 1118.*) has a lade before and

behind, and is open in the middle, it carries about 500 sheaves of corn. When drawn by horses, shafts are applied; when by oxen, a pole. An arch of boards over the hind wheels prevents the corn from bearing on them.

The wain is another light useful carriage for carrying corn

and hay. It consists of a light, open, long body, borne upon two wheels; a railed arch over the wheels prevents the load from bearing upon them; it will carry from 200 to 250 sheaves which are secured by ropes, it having no sides or lades.

A *ledge* for corn, hay, or faggots (*fig. 1119. a*); slide butt (*b*);

quarry butt for earth or stones (c) dung-pots or dung-panniers (d) for dung or stones; and panniers with hooks, for faggot wood and sheafed corn (e), are also in use.

Box hand-labours and grass barrows (fig. 1120.) are also used on a few farms.

1120

The Cornish plough is a small swing plough with a straight piece of wood as a mould-board.

Beam hawks for threshing on are four or five planks laid across beams, but about one third of an inch asunder; so that the corn as it is threshed may fall through and not be bruised. In some places wheat is separated from the straw by beating it on a barrel or inclined plane, usually by women. Fences generally made of stone, or raised banks of stone, slate, and earth, sometimes planked.

6. Arable Land.

The pilez, or naked-out, cultivated on worn-out ground; its straw very fine, and reckoned nearly as good as hay. A quantity of potatoes exported yearly, but not enough of wheat grown for home consumption.

7. Grass.

Chiefly near towns and villages, on sheltered slopes, and the uncultivated lands known as moors, downs, crofts, and wastes; some meadows watered.

8. Gardens.

Common to cottages and farms, and better attended to than in most counties; orchards also attached to many farms.

9. Woods and Plantations not abundant.

10. Improvements.

Draining practised to a considerable extent, and one or two examples of embanking.

The maritime situation of Cornwall presents the farmer with three valuable manures; fish, sea sand, and sea-weed. In some years the farmers who live in the vicinity of fishing towns have an opportunity of buying the bruised and small pilchards; which being damped unfit for market, are rejected and called "coff"; four cart-loads of twelve bushels are considered as the proper quantity for an acre. The usual mode of management is to bury the coff in a pile of earth, deep enough to secure it from dogs and hogs, adding to the pile a sufficient quantity of sand, well mixing and turning all together after having lain some months. Without this practice the fish would not decay sufficiently for perhaps a year or two. The fish are sometimes used alone; they are then spread thinly over the ground before the plough, and turned under furrow. One pilchard cart up small will amply dress one square foot of ground.

The old salt which has been used to cure the pilchard, and judged to be no longer fit for that purpose, is advantageously applied for a barley or a turnip crop; twenty to thirty bushels

7896. *The islands of JERSEY, GUERNSEY, ALDERNEY, and SARK*, which lie in the Bay of St. Michel, and form the remnant of the ancient Duchy of Normandy, though naturally belonging to the continent of France, have yet for nine centuries been subject to the British Government. The agriculture of all of them is nearly the same; but we shall follow the Reporter to the Board of Agriculture in considering first that of Jersey, and next Guernsey. These islands are chiefly remarkable for their breed of cattle, their parsneps, and the degree of perfection to which many plants arrive in the open air, which are kept in England under glass. (*Quayle's General View, &c. of the Norman Islands, 1812.*)

7877. *JERSEY*, 89,580 acres of warm and rather moist climate, diversified soil, and features: the soil is for the most part light, on granite or schistus, and there is some peat and marsh. No calcareous soil or rocks; granite and gneiss quarries worked; and granite pillars of fifteen feet in length extracted. Water abounds; and belief is still entertained in the efficacy of the divining rod for discovering springs.

1. Property.

Minutely divided, and mostly in the hands of a resident yeomanry. Some singular laws and customs as to tenures, as, for example, the *retrait lignager* and *retrait seigneurial ou fœdal*; also the legitimation of children not born in wedlock, by the marriage of their parents, as in Scotland, and most other countries of Europe except England.

2. Buildings.

Those of all classes substantially built of stone, sometimes rough-cast, neatly lined in imitation of squared stone-work. Farm houses generally covered with thatch or pantiles. Cottages generally of stone, with a vine in front.

3. Occupation.

Farms small, and fields diminutive; farmers frugal, and their wives good managers, and industrious.

4. Implements.

Plough with wheels, resembling that of Hampshire; sometimes drawn by two bullocks, and six or eight horses; a sort of large plough used for ploughing deep, for parsneps, and held in partnership by several farmers; instances of this plough being drawn by six oxen, and sixteen horses. (p. 64.)

5. Enclosing.

Fields very small and irregularly shaped, and the fences of high earthen mounds, often twelve feet wide at least, and six feet high, crowned with a hedge, or timber trees and pollards.

6. Arable Land.

Soil deep, and deep ploughing generally practised, but no improvement in it for ages; no unked fallows. The spelt wheat (*Triticum Spelta*), here called *blé tremais*, *frumentum trimestris*, here enters into rotation; it is sown in February, produces short stiff straw, is difficult to thresh, but never lodges.

Parsneps are grown by every farmer, and either by the sward culture alone, by the plough and spade, or by the small and great plough; any soil in good heart and tith suits them, but particularly a deep loam; and in the same spot generally are raised beans, peas, cabbage, and occasionally potatoes.

When the ploughing or digging is completed, the field is once harrowed; straight lines are then drawn across, by means

per acre. It is commonly hand-sown, in the manner of corn; and it should remain on the land five or six days before the seed is sown. It is best adapted to light lands, particularly furze crops. Twenty bushels per acre have been sowed over grass lands, and over a wheat crop, in the month of March, with evident advantage.

Another article of manure obtained from this useful fish is the liquor which drains from it while under the process of curing, consisting of blood, brine, and some oil which escapes, and which is caught in pits; the diligent farmer carries this away in casks, for the purpose of pouring over and mixing with his piles of earth and sand, which it greatly enriches.

11. Live Stock.

Devonshire cattle prevail; but it is only among the more enlightened and spirited breeders that the genuine North Devon are to be met with. Cows are kept in winter in sheds open to the south; one of which for seven cows and a fattening calf (fig. 1121.) described by the surveyor, contains cribs, bins, or straw in winter, and lurns, vetches, &c. in summer (a); troughs for turnips, potatoes, cabbages, &c. (b); beds or platforms for the cows to stand and lie on (c); gutters sunk two or three inches to receive the dung (d); head-way and feeding place (e); dark place for fattening a calf (f); the division outside (g) for a cow that has, or is near having, a calf. She is not tied up.

1121

The cows are tied to posts by means of a strong chain and rope, which by means of a ring runs on a long staple.

Oxen very generally worked both in plough and cart; shod in irons, and yoked in the bow.

Sheep a mixed breed; Cornish breed lost among crosses.

Horses a small hardy active breed, well adapted to the hilly nature of the country.

Cornish hog always white; a long-sided razor-backed animal; crossing by the D. von, Suffolk, and Leicester breed, has taken off length and sharpness, and added breadth and depth; a mixture of Chinese and Suffolk is another variety.

12. Political Economy.

Public roads tolerably good; lanes bad. Some travellers who met Parzani, the reporter, hoped he would notice with reprehension the straw-traps that the farmers lay in some of the cross roads, and which, concealing the deep ruts, endanger their horses, gigs, and their own necks.

Manufactures few; some of woollen carpets, and paper. The three great staple commodities for export are tin, fish, and copper, the moor stone, China stone for porcelain, barley, oats, potatoes, and some wheat.

of a gardener's rake, usually from north to south; women then proceed with dibbles, and set the beans in rows, at a distance of four inches or five inches from bean to bean; in four, three, and sometimes in two ranks of beans, leaving intervals of five or six feet between each of the sown rows. In the use of the dibble, and in dropping the beans, the women have acquired considerable dexterity. In many instances, they are followed by children, who drop into each hole made by the dibble, after the bean, three or four peas; the parsnep seed is then sown, at the rate of one third to one sixth of a bushel to the acre.

The parsnep, not usually relished elsewhere as an article of human food, is here consumed by all classes of people; it is eaten with meat, with milk, and with butter; but not, as is the common mode of using it as human food in England, with salt fish; or, as in Ireland, together with potatoes.

The next most valuable application of this root is hog-feeding; at first it is given to the animal in a raw state, afterwards boiled or steamed, and finally, for a week or a fortnight with bean and oat meal. A hog, treated in this way, is sufficiently fattened for killing in about six weeks. Its flesh is held superior to that arising from any other food, and does not waste in boiling.

Bullocks are also fattened with parsneps, in about three months; their flesh is here considered of superior flavour to any other beef, and commands, on that account, an additional half-penny in the pound on the price. To milk-cows they are also usually given; on this diet the cream assumes a ye-ow colour; by the accounts here given, it appears, in proportion to the milk to be more abundant than when the animal is kept on any other food whatever. When the cow receives at the rate of thirty-five pounds per day with hay, seven quarts, ale-measure, of the milk produce seventeen ounces of butter. It is generally allowed, that the flavour of the butter is superior to any other produced in winter.

Geese are sometimes shut up with the hogs, to fatten on parsneps, which they will eat raw. The root is also given boiled, and for a week before killing they are fed with oats or barley-cake. Horses eat this root greedily; but in this island it is never given them, as it is alleged, that when on this food,

their eyes are injured. About Morlais, horses are not only ordinarily fed on parsneps, but they are considered as the best of all food, superior even to oats.

Lucern a good deal cultivated, and found productive. *Hops* to a moderate extent; the reporter could not find that the *Telœcium Scordonia* was employed as a substitute, as related in some botanical works. A species of *Cyperus* (most likely *Carex arenaria*) is used for twisting into halters and other ropes.

7. *Grass Lands.*
Of very limited extent, but meadows very productive.

8. *Gardens and Orchards.*
Very productive, and in general carefully attended to. Chaumontelle pears brought to great perfection, and with grapes, bulbs of the Guernsey lily, parsnep seed, and some flower seeds, sent to the London fruiterers and esculents.

Orchards generally attached to all farms. Jersey cider in much esteem, and a principal article of export. Most of the farm-houses have large arched doors, made wide on purpose for the passage of cider-casks. A valuable work on the subject of cider by the Rev. F. Le Conteur, entitled *Aperçu sur la Culture de Pommes*, Jersey, 1806. The pomeil, lamme, noir-toit, and gros-amer, the cider-apples at present in vogue.

9. *Woods and Plantations.*
Very limited extent, and the waste ground a little more so; only about 300 acres of rocky summits of hills; these might be planted.

10. *Improvements.*
No calcareous manures found on any of the Norman islands. Sea shells tried on clay with great advantage; and sea weeds (*vaie*, whence *vraic*). Irrigation in a simple manner, practised in the narrow valleys from time immemorial. Sea encroaching in some places, and jetées and embankments proposed, but nothing done.

11. *Live Stock.*
Alderney cattle well known. Though there can be no doubt that the breed was derived from the contiguous Continental coast, yet it is not known that in any part of it at present the same breed is preserved in equal purity. Next, perhaps, to the possession of *vaie*, the treasure highest in a Jerseyman's estimation is his cow. She seems to be a constant object of his thoughts and attention: that attention she certainly deserves, but she absorbs it too exclusively; his horse he treats unkindly; his sheep not so barbarously; but on this beloved cow his affections are riveted as firmly as those of an Eastern Bramin on the same animal. It is true that in summer she must submit to be staked to the ground; but five and six times in the day her station is shifted. In winter she is warily housed by night, and fed with the precious parsnep. When she calves she is regaled with toast, and with the nectar of the island, cider, to which powdered ginger is added. Could she be prevailed upon to participate in all her master's tastes, there is no doubt but that she would willingly bestow on her the quintessence of *vaie* itself.
To guard the purity of her genealogy, and to prevent others from being conveyed to England, under the semblance of Jersey cows, he has invoked the interference of the insular legislature. On the 8th of August, 1789, an act of the States passed, by which the importation into Jersey of cow, heifer, calf, or bull, is prohibited under the penalty of 200 livres, with the forfeiture of boat and tackle. A fine of fifty livres is also imposed on every sailor on board, who does not inform of the attempt. The offending animal is to be slaughtered without

mercy on the spot, and its flesh distributed among the poor. The same act of the States directs, that when cattle of the enumerated descriptions are exported, a certificate of their being natives of the island is to accompany them. On the vessel's return, another certificate is required, that the same identical number, and no more, have been landed.

There is, indeed, at present, little danger of the occurrence of that evil which the Jerseyman so much deprecates, as he will not speedily become a convert to any heretical opinions which he may happen to hear from an Englishman; for in this, as in every thing else, it may be observed, that the rooted opinions of a people are more powerful than any law.

The oxen are distinguished by rising to a stature and bulk much superior to the female. Persons who have not seen any other than Alderney cows, would be surprised to witness the size attained by some oxen of the same breed, which may be seen in the Jersey carts.

The object of the *dairy* is butter: the cows are milked thrice a day from the middle of April to the middle of July, and twice a day during the rest of the year; the milk is kept in glazed earthenware dishes till it flows off the cream, which is separated, kept five or six days, and then curdled by itself. The prime milkers are not generally exported. After the young cow has borne a calf or two, it is sometimes significantly remarked, "qu'elle est bonne pour l'Angleterre;" and she goes to the cow-jobs.

As to the *meaty*, if the Jersey cow the reporter alludes to, if the palm can be contested with them by any, it will be by a breed little known in the south, the Dunlop (in *Ayrshire*) cattle, cross between the short-horned and the Alderney.

Sheep a bad-shouldered coarse-bred breed, small horned, and bred on a black and brown colour; largest flock in the island forty! weight of carcass fifty pounds; in the winter many perish from want, and many by dogs.

Horses a hardy small breed, very ill treated. *Swine*, white, long-legged, flap-eared. *Geese* are plucked alive, when the feathers begin to drop, as a measure of economy, and also to prevent the grazing-ground being injured. It is also thought a relief to the animal.

Pigeons. Here, as in France, the *Droit de Columbar* is attached to certain residences; but not exclusively, as appeared to be the case in France, to those held by a noble tenant.

Bees. The flavour of Jersey honey highly valued; probably from the numerous flowering plants, legumes, fruit-trees, garden plants left to seed, &c.

12. *Political Economy.*
Roads numerous, narrow, winding, crossing each other, and consequently intricate; flanked by high earthen fences overcanopied by trees. In rainy weather they are canals of mud. Two carts meeting each other on the *chemin du roi* could not pass; one or the other must back till it reaches the nearest field, gateway, or some other recess, to which it might retreat during the passage of the other. To this little circumstance in their internal economy, and the disputes which it engendered, may, perhaps, in part, be attributed the remarkable proficiency of the Jersey populace in swearing.
Manufactures few: some boots, shoes, and cradge exported; an oyster fishery to the east of the island. English law as to poor-rates exists; but as the poor are few, it is not necessary to act on it. Dialect of Jersey a corrupted French, and a bad English.

7828. GUERNSEY. A rocky hilly surface, of which moister than that of Jersey, and the soil generally light, the operative classes resemble those of England more than those of Jersey.

Agriculture much the same as in Jersey; Guernsey figs much esteemed. Some land embanked and sold with permission of government, and the produce applied to improving the roads.

Live stock. Guernsey cattle are larger-boned, taller, in every respect more stout and coarsely made than those of Jersey. The front is wide, horns divergent and thick, but not long; never with the graceful short curve observed in some Jersey cattle, and in the short horned breed. The dewlap is also coarse and pendant. They are deep-chested, and the carcass, compared with their neighbours, more bulky. Their coat is also not so fine; and the colours, though varying as in Jersey, on the whole appear more dark. Some, but not so many, are found cream-coloured, and the breed may safely be pronounced more stout and hardy. In one respect, a similarity appears in the best milkers in each island: these are observed to have a yellow, or rather orange, and a little yellowish; and, in particular, the skin of the tail at its extremity appears of a deep yellow, approaching an orange colour. The same circumstance has been since observed to exist in good milkers of other breeds; but in Guernsey at least, on examination, this yellowness is general, and the cream the better produced by the milk of each breed is also naturally of a rich yellow colour.

As to the question of superiority between the cattle of either island, it is settled most decidedly by the inhabitants of each, as may be supposed, in their own favour. The people of Jersey have gone furthest in support of their opinion. By the third

section of their law of 1789, respecting cattle, they expressly apply "aux lies volaines" the same penalties and restriction on importation of cows, heifers, and bulls, as on importation from any other quarter. Into Guernsey, where no similar restrictions exist, Jersey cows have occasionaly been imported. The comparison between the cows of each breed, as milkers, leads to that result which, in the place where it is made, might be anticipated.

Next it may be noticed, that though the exportation of Guernsey cows, compared with that of the same animals in Jersey, is not extensive; yet that their price in Guernsey is higher. One was noticed for which a farmer had offered a price of thirty guineas, for his own use, and had the offer refused. As to the quality of the butter also, in each island, it may be observed, that the preference is usually given to that of Guernsey. In this article, indeed, in some degree, the difference may arise from their different practices in the process of churning. The cream is here left unskimmed, till the milk becomes coagulated: on the third day milk and cream are churned together. As little attention has yet been given to the improvement of the breed of cattle, as in Jersey.

Roads improved under the government of Sir John Doyle. Bricks and tiles manufactured, and some spirits distilled, d which formerly found its way into England under the name of French brandy.

SECT. II. Agricultural Survey of Wales.

7829. A hilly mountainous surface of 5,206,900 acres, with a climate colder than that of England, and more moist in the proportion of thirty-four, the average number of the inches of rain which falls in Wales, to twenty-two, the number for England. The soil is generally of an inferior description, and the great proportion of mountainous surface is fit only for pasturage and planting. Little exertion was made in cultivation till the middle of the eighteenth century; from that period to the present agriculture has been gradually improving. A general view of it, as in 1819, has been published by the Rev. W. Davis of Montgomeryshire, whose work we shall adopt as our guide.

7830. NORTH WALES. 1,974,510 acres, chiefly of mountainous surface, in six counties, including the Isle of Anglesea. The climate humid and cold in elevated situations, but warmer in the vales and near the sea. The soil moory, coarse, clayey, and otherwise unfavourable in most places, excepting in the vales on the banks of streams. Minerals chiefly copper, lead, and iron. The famous Mona and Paris Copper mines in Anglesea have been worked since 1768; lead is chiefly worked in Flintshire. Excellent slate

is found in various parts of Caernarvonshire, and worked to a great extent, especially on Lord Penrhyn's estate. Marble is worked in Anglesea; and limestone, freestone, and other stones and minerals abound in different places.

1. Property.

Estates from thirty shillings to 30,000. The effect of the custom of gavelkind, which prevailed all over Wales, was a too minute division of property. Equality and poverty went hand in hand. But when the custom was abolished, and alienation permitted, an accumulation of property was the necessary consequence, which became very prevalent in the two last centuries: and having arrived at its maximum early in the eighteenth century, it has, since that period, shown some instances of retrogradation; but subdivision and accumulation of estates will naturally fluctuate. Here are petty lairds or tacksmen, as in Scotland and Ireland.

Gentlemen of moderate income, and residing in the country, transact the affairs of their own estates. Those of greater property commit the whole care of rents, repairs, and contracts of sale or purchase, to the management of agents; who, in general, are persons well qualified for the undertaking, brought up solely to the business, and are, at a point of honour and integrity to do justice to the landlord, and a point of conscience not to oppress the tenant. Some of the lawyer agents, having by their own indolence and rapacity destroyed the very *viz* of litigation in the people, necessarily diminished the number of their successors.

Only two copyhold tenements have been noticed in the whole district. All the other estates are held either mediately or immediately in *capite* of the king, by a kind of mixed tenure, between the feudal and allodial, going under the common appellation of freehold.

2. Buildings.

Some nice castles, as Powys Penrhyn, and Chirk. Of farm-eries, about seven in ten are in a very wretched state; good new ones in Anglesea, and Caernarvonshire, Flintshire, and Merionethshire.

Cottages in these and other counties are truly the habitations of wretchedness. One smoky noarth (for it should not be styled a kitchen), and one damp beer-cell (for it cannot be called a bedroom), are frequently all the space allotted to a labourer, his wife, and four or five children. The consequences are obvious; filth, disease, and, frequently, premature death; and they would be more obvious, had not these evils an almost insubduable vigour of constitution to encounter. Three fourths of the victims of the putrid fever perish in the mephitic air of these dwellings. However, in some parts, especially near lime-works, mines, collieries, &c., the example of one neat cottager is followed by others. Here, their dwellings are frequently white-washed; their children are industrious in collecting road manure, which is preserved within circles of loose stones, for the use of their gardens. These minutiae, though trifling, are worthy of record, as they are descriptive of their general character.

Some exceptions in different places, and especially on Lord Penrhyn's estate. The reporter gives an excellent plan of a cottage for a cottage farm, and also plans of farms of different sizes, adapted to such cottages.

The cottage farm-house (fig. 1122.) contains a kitchen (a), bed-

room or parlour (b), pantry (c), barn-room (d), two bays (e and f), cow-house (g), calving place and calf-house (h), pigsty (i), and stairs (k) to garret and bedrooms.

One *cow-house* farm for the same house, and nine acres of land, contains seven small enclosures (fig. 1123.) including the garden. One for six acres, contains six enclosures (b) including the garden.

3. Occupation.

Largest farm of cultivatable land about 600 acres, on the mountains 1000 acres and upwards, at one shilling, or one shilling and sixpence per acre: sown on the 1st of May, admitted to be favourable to wealth by the reporter, who adds, "yet that wealth should be valued, not in proportion to its national aggregate, or quantity in the abstract, but as it is

widely and generally diffused. An analogy exists between monopoly in all its forms and monopolous constitution, which never can possess the energy of a body superproportionate.

Farmers, properly so called, are, as we may naturally expect them to be, rather too tenacious of old customs. It is, however, illiberal to charge them with obstinacy, in delaying the adoption of pretended improvements; for, as it is not all gold that glitters, neither are one half of the patent implements and machines, nor one tenth of the writings of visionary theorists, better than lumber and trash; for which the farmer should not throw away his hard-earned money, before they are put to the test of experience, by those who have opportunity enough to bear disappointment; and who, from the advantage

of superior education, may be better qualified to form a judgment of the probable effects. Show the farmers their true interests, and, in general, their minds are as open to conviction, and as susceptible to reason, as any other class of men whatever.

Leases out of repute. It cannot be denied that leases have done good in Scotland. We are, therefore, driven to the necessity of supposing, that the Scotch and Welsh tenantry are very different kinds of beings. The circumstance that renders the Welsh leases ineffectual, is the want of capital; and what enhances the evil of this want is, the ignorance of many farmers in the right application of what small capital they have. By filling too many acres, they, as well as the public, suffer loss in every acre. Many a farmer, who has means barely sufficient to manage a farm of 50*l.* a year tolerably well, thinks a farm under 100*l.* or 150*l.* beneath his notice; and granting a lease to such a tenant, who has not one fourth of the capital requisite to carry on improvements, would be preposterous.

Lord Penrhyn executed drainings, fences, roads, and all improvements requested by his tenants, and approved of by his agents, at five pence per cent on their amount added to the rent.

4. Implements.

The original Welsh plough, a clumsy wooden fabric, still in use in Caernarvonshire, and a few places in other counties; about 1660, Laumas's variety of the Rotherham introduced, and now common; Scotch plough now generally known and approved; and the other improved implements tried by the antaeths.

5. Arable Land.

"That farmers convert too much of the lands which were formerly in tillage, into pasture, is but a groundless cause of alarm. Farmers should, and always will, consult their own interests, in enquiring whether the conversion of their lands into tillage or into pasture be found most beneficial to themselves, the same will eventually be found most beneficial also to the public."

The corn raised in North Wales not equal to its consumption: fallow general and defended as necessary. In Anglesea, a rotation of five white crops in succession; most of them barely return the expenses. Very little wheat grown, main corn-crop oats, and next barley. Scarcely any flax or hemp grown; potatoes beginning to become a general crop. On the whole, the management of arable land wretched, excepting by the amateurs or proprietors.

6. Grass.

Land well adapted for tillage; is commonly left too long in pasture; by which neglect it becomes mossy, and in some instances covered with ant-hills. It has been said of some meadow lands in Wales, that a man may now in them all mow and carry home his day's work at night. This may appear hyperbolic; but it is so far true, that in some meadows the mark of the swath never disappears; and a mow may be certain of having followed the same line, to a half-inch width, for twenty or any number of years back. In such meadows, the trouble of raking the hay together is the great work of harvest.

In the eastern parts of the counties of Denbigh, Flint, and Montgomery, consisting of the most fertile vales, the principal object of the farmers is to convert their hay and grass, as much as possible, into butter and cheese.

In the hilly parts of the afore-named counties, and in Anglesea, Caernarvon, and Merioneth, their peculiar province is to rear cattle, to be sold lean to the graziers of other districts. There are but few acres of land that will fatten cattle; the vales of the Severn and Yrwyw in Monmouthshire, the banks of the Dee in Flintshire, and the banks of the Clwyd in Denbighshire, are the principal places where the pastures afford sufficient nutriment for that purpose.

7. Gardens.

Much wanted for the cottagers, especially in Caernarvon and Merionethshire. Too many poor cottagers have not as much as a leek or a potato, except by the labour of pig or buy. In the greater part of the district, the planting of orchards would be thought a very wrong application of the soil. On the borders of England are some orchards; and in plentiful years, a few farmers make either cider or perry for their own beverage.

8. Woods.

Have been abundant in former times, especially in Anglesea; now very scarce there and in Caernarvonshire; more in Denbighshire, especially round Chirk Castle, Wynnstay, Erthing, Vale of Clwyd, &c. Extensive young plantations made in these counties, especially at Wynnstay and Lord Penrhyn's. A great deal of wood; various young plantations in Merionethshire, and much timber, wood lands, and plantations in Montgomeryshire, which will long be the best wooded county in North Wales. Proprietors planting trees upon a large scale, and not raising trees from seed in their own nurseries, formerly used to procure seedlings of larch, firs, and pines, &c. from Scotland; but owing to their heaving in close bundles, and otherwise damaging upon the road, not above one fourth, and frequently not above one eighth of the number could be expected to grow. They are now more given to encourage nurseries at home, and nurseries are accordingly established in different parts of the district. "One and two year old seedlings of all sorts of forest trees, nearly as cheap as in Scotland, reckoning carriage, and one thousand worth of two thirds." This is true when the tenderness of seedlings, distance of carriage, and length of time, are considered. Williams, and other nurseries, insure trees of their own growth and planting for a number of years.

9. Improvements.

A marsh of 5000 acres in the southern corner of the island of Anglesea attempted to be embanked in 1730. The embankment was brought forward from both sides at the same time, and was intended to be joined in the middle of the marsh, where the force of the tide was greatest; when within about twenty rods of a complete junction, owing to some of the proprietor withholding their goods, the work was deserted, after expending nearly 12,000*l.* and when a few pounds

more would have completed the whole, as the materials were already carried on the spot. On the 23d of January, 1796, an uncommonly high tide added twenty rods more to the breach, in which state it now lies. The bank was made of furze fascods, and on the sea-side with a stone pavement, eighteen inches deep at the top, and diminishing to nine inches at the bottom. It was fifty-one yards wide at the base, four yards at the summit, and five yards high; the slope of the sea-side to that of the land-side, as seven to four.

The *embankment and improvement of Traeth-Mawr and Traeth-Brychan sands*, between Caernarvon and Merioneth-shires, have been above 170 years in contemplation, and never yet performed. In 1625, Sir John Wynne, of Gwydir, an eminent engineer, to undertake the work; but no materials were wasted, save ink and paper. In the year 1719, some Dutch adventurers made a proposal to the proprietors, but to no effect. In 1770, the late Bell Lloyd, Esq. who was always just and honest under consideration; at the same time proposing a nearer road from London to Dublin, across the Traeth-Mawr sands, when embanked. Golborne, the engineer, was sent

down by the Duke of Ancaster, and two estimates were made. The late Dr. Worthington was peculiarly active in forwarding the work. He had gone so far as to procure subscriptions to the amount of 29,000*l.* and upwards, when the whole scheme was frustrated by the mean spirit and refractoriness of some neighbouring proprietors.

In 1809, W. A. Madocks, Esq. M.P., having a considerable estate on the Caernarvonshire side, and having there embanked Penmorra marsh with great profit (*fig. 1184. a.*), and the sands of Traeth-Mawr (*b.*), commenced embanking shores an immense bank (*d.*) of stony materials deposited and laid to find their own slope by the washing of the tides. The two banks were within less than a furlong of the tides. The middle; but owing to the force of the tides, and the employment before he was ruined. The persons, however, into whose hands the property fell brought it to a successful conclusion; and its proprietor, who had settled in the neighbourhood, and is lately dead, yet lived long enough to see realised by others all that he had anticipated, and for which he had sacrificed a very considerable fortune.

1124

The *River Dee Company*, established by Act of Parliament in 1740; by several embankments made in the years 1754, 1765, 1769, and 1790, on the river Dee, in Flintshire, to keep out the tide and land-floods, they have been enabled to gain 3100 acres, which are now covered with good crops of corn of lucern, and of artificial grasses; and the whole redeemed waste is incorporated into a township, bearing the very appropriate name of Sealand.

"In various parts of the coast of Anglesea, and the other maritime counties of North Wales, there is still much to be done by embanking. Caernarvonshire has been eminently fortunate in the acquisition of W. A. Madocks among its leading improvers. Indeed his improvements are of such magnitude and variety, designed with such taste, and executed with such facility, that a minute report of them would appear, to those who have not personally visited the place, more like the reveries of romance, than the narrative of genuine description. In harbours, embankments, canals, buildings, roads, plantations, and rural and commercial improvements in general, nothing less than a *Tremadoc Guide* pamphlet can do justice to the founder."

10. *Live Stock.*

Cattle and copper the staple exports of Anglesea. When numerous herds are brought in the island for the English markets, they are consigned to swine in droves across the strait of the Menai; and although numbers of the weaker sort are sometimes swept down by the force of the current for some miles, yet losses seldom or never happen. A chain bridge has been thrown across this strait.

The characteristics of a choice Anglesea ox, must agree in most points with those of a Roman one, as described by Columella: cross-black colour, with white appendages; remarkably broad ribs; high and wide hips; deep chest; large dewlap; flat face; and long horns, turning upwards. Baked well thought, that in some points they were nearer his idea of

perfection in shape, than any other he ever saw; his own improved breed excepted. Some farmers aspiring at a select stock, by having their he-calves gelled under their dams, their horns become of a yellowish colour, longer, and finer than common; and, upon the whole, nearer the present idea of symmetry. The average weight of their quarters, when fat, at three or four years old, is from eight to eleven score pounds.

The promontory of Lleyn and Erionydd, in Caernarvonshire, having the same kind of undulated surface, though not altogether so good a soil as Anglesea, has likewise a breed of cattle similar in several of their characteristics.

The cattle in the remaining part of Caernarvonshire, and in the whole of the county of Merionydd, some few select stocks excepted, seem to be diminutives of the above breeds of Anglesea, Lleyn, and Erionydd; having nothing to recommend them, save their extreme hardiness, and consequent cheapness of rearing. The highlands of the counties of Denbigh and Montgomery abound with the same puny race. In the vales, and in the county of Flint, the cattle are of a superior kind, larger, and of all varieties of colours. The natives of the sea-coast from Abergefen to Holywell, and thence along the Dee towards Cheshire, are reckoned very quick feeders.

Neither good butter nor cheese are made in North Wales by ordinary farmers.

Sheep. The largest of the native breeds is that of Anglesea; they have white legs and faces, and are generally without horns.

The second kind of sheep in North Wales is that peculiar to the mountains. They have generally white faces and legs, some have horns, and others none. The smaller sort of them weigh from seven to nine pounds per quarter; and give wool from three quarters of a pound to one pound and a half.

The third kind is peculiar to the Kerry hills in Montgomeryshire; being, perhaps, the only species in North Wales which produces perfect wool: that of every other Welch

breed being more or less mixed with coarse long hairs, called by the manufacturers kemps, making the articles in which they appear of much less value. The characteristics of this breed are, large woolly cheeks, white lumpy forehead, white legs covered with wool, no horns, and a broad beaver-like tail. They are very hardy, and comparatively tame; being not so much disposed to ramble as most other wild sheep. In shape, however, they are of short compact symmetry; and were this defect improved by the care and attention of the farmers, the breed would be worthy of being universally adopted throughout the principality. They weigh, when fat, from ten to fourteen pounds per quarter. The average of wool, including the whole flock, is ten stone, of fifteen pounds each, from every 100 sheep.

The fourth kind is the black-faced and fine-woolled sheep, bred on the Long Mountain, near Welsh Pool; and on other hills, on the borders of England, in a line from thence to Wrexham.

The flavour of the mutton of the sheep feeding upon the Llanymynech and Porthwennan lime-rocks is reckoned very delicious, by the nice-palated pupils of the Epicurean school; and their wool is as fine as any in England; that of the Highland breed, perhaps, excepted. A person in travelling through the country may observe several other kinds of sheep; being crosses from some or other of the above four distinct breeds; but they are in general the offspring of chance and instinct, without being directed by any plan or system.

The Merinos with their different crosses; the Leicester, Downs, and others, bred by amateurs.

Horses. In Anglesea, for want of fences, the horses, as well as the sheep, are commonly fattened. Few colts of the best landed breed in this fettered island, as it may be termed, are weaned from their dams, and the practice used from generation to generation, their natural gait and shape must necessarily be changed, at length, into awkwardness and deformity. Few English stallions have as yet been introduced into the island; and those that have do not appear to have done much towards improving the native breed.

In the county of Merioneth, and the hilly parts of Montgomeryshire, great numbers of ponies, commonly called merhans, are reared. They are exceedingly hardy, having during winter as well as summer only the range of the hills, from whence they are never brought down until they are three years old, and fit for sale. What has tended to, and will in time destroy, the shape and good qualities of this hardy race, is, that in the propagation of their species they are left entirely to chance and instinct.

They are driven from the hills to fairs, like flocks of wild sheep; and the place of sale exhibits, in some degree, an amphitheatre, where manhood and ponyhood strive for the victory. When a champion is fixed upon, the rider, at a distance, the wrestler, being generally the seller's servant, rushes into the midst of the herd, and seizes the selected animal; which, never before touched by human hand, struggles with all its might to extricate itself; and in some particular situations, both have tumbled together; from the summit of a steep hill down into a river beneath; the hiped stall continuing his grasp, and the quadruped disdaining tamely to submit.

Another breed, somewhat larger than these, and probably raised by a series of crossing between the English and the natives, are here bred, and are exceedingly active. Some of them are too small for the team; but for the road, under moderate weight, they have no rivals. "They will ascend and descend our mountainous staircases" with the greatest agility; and without giving their riders, who have more fool-hardiness than humanity, the trouble of alighting. The larger kind of them is exceedingly well adapted for the team, on small or steep mountainous farms; where the great strength and sluggishness of the heavy kind of horses would be egregiously misapplied.

The vales of Montgomeryshire have long been noted for an excellent breed. Some attribute this superiority to a stud of horses kept by Queen Elizabeth at Park, near Caer Sws, in the Severn vale, and to others brought into this part of the country from Spain by Robert Earl of Shrewsbury.

Gentlemen in most parts of the district, and farmers in the vales of the three counties adjoining the English coast, for some time furnished themselves with excellent draught horses, both for the coach and the wagon; which, when the markets are open, are sold in great numbers. They are generally either black or bay, strong, active, well made, and measure from fifteen to sixteen hands high.

A custom, very injurious to the growth, strength, and soundness of horses, prevails over the greatest part of the six counties; that is, working them too young, when their bones have not attained firmness from their cartilaginous state, nor their power that of elasticity, contraction, and extension, which is necessary to endure exertion and labour. Instances have, however, occurred of horses being worked from two to twenty years old, without any apparent detriment saving a diminution of their natural size.

"The predilection which farmers manifest in favour of horse teams may, in time, reduce the nation to the dilemma of enacting a law to repeal the Mosaic law, and enjoin the flesh eating."

Tender furze, bruised with mallets or ground in mills erected for the purpose, was formerly a great article of fodder in the counties of Anglesea and Caernarvon. Farmers were then accustomed to sow furze for their horses, and sometimes to let the crop at a certain price per acre, which was frequently found to pay better than a crop of wheat; but Ceres at length seems to

have grown ashamed of such husbandry, and the lands are in general converted to bear more useful crops.

Hogs. The original Welsh breed had small ears, which, probably by a cross with the Berkshires, produced the slouch-eared hogs, which were lately general through the country. They are slow feeders, and the rearing of them is now upon the decline, in place to that of more improved breeds, especially Berkshire.

Bees. "The ancient Welsh held these industrious insects in great veneration, and believed them to be of Paradisaical origin." (*Walton's Leges Follia*, p. 294.) For this reason their price is so high that the chanting of mass was not acceptable to the Deity unless the lighted tapers were made of their wax. Out of their duct stores they brewed their national liquor, methelin, or the medicinal beverage.

When the country was almost one continued wilderness, almost every hollow was a hive. Their swarms, and the wastes were the property of the lords of the soil, and rented by some of their vassals. On freehold lands they were claimed by the respective proprietors. The discoverer of a swarm was entitled by law to a reward of one penny, if they were domesticated bees; and one penny and a dinner, or in lieu of these the whole of the wax, if they were of the wild race. Whoever cut a tree upon another person's property, in order to get at the nest of bees, was to amercede the full value of both tree and bees. The respective prices of different swarms were ascertained by law.

Early swarms were reckoned of full value by the first of August, such as swarmed after that day were not valued above fourpence until the following May.

In comparison with the prices of other articles at the time the Welsh ladies were so vain, they seem to have been very dear, and consequently scarce; but the price set upon them by law was much above the real price in commerce between buyer and seller. This was owing to the veneration they were held in by the legislators, and intended to deter the subject from offending against the statutes made to preserve them. It is a confirmation of this opinion, every thing that belonged to bees had its value exaggerated in law; even a beehive was appraised at two shillings, when a new plough without iron was valued only at two pence, a cow forty-eight weeks, a yearling calf fourteen pence, and a suckling calf one penny.

The sacred esteem in which bees were held at length declining, aparies were gradually reduced to their present fewness of number. However, several persons still excrete the profane act of disposing of their bees for money; but will nevertheless let them out for one half share of the honey and wax when they are killed annually in autumn, and the whole live stock to be parted equally between them at the end of the fourth year.

Wales, as in Poland, when spirits and beer became more common, the use of methelin declined, and bees were neglected. Hence it may be inferred, that the veneration in which this insect was held in these and other countries was owing to its affording almost the only, and at all events the cheapest and most powerful, means of inducing in that which man, in all ages and countries, has considered the *summum bonum* of enjoyment — intoxication; an enjoyment which, whether, with Noah, it be procured legitimately from that "transcendent liquor" wine; with the American Indians, from cider; or, with the Turks, from opium, has these advantages over all others, that it is more immediate and more intense; that it is within the reach of every one; that every one can have it to the full; and that for the enjoyment of it no man is envied by his neighbour.

II. Political Economy.

Great improvements have been made in the roads and bridges of late years, especially by Lord Penrhyn, Wynn, Madocks, and government, under the direction of Telford. Previously to the year 1785, the annual export of slates from Lord Penrhyn's quarries at Dolauven did not exceed 1000 tons; which, owing to the rapidness of the road, were conveyed from the quarries to the port, a distance of six miles, in panniers on horses' backs. His lordship formed a new road, which gave immediate employ to about 120 broad-wheeled carts and waggon; and from the quarry he extended the road nine miles further to Capel Idraig, through Nant Francon, and the romantic interior of Snowdon, at his own expense, the whole tract being his property. The increase of the slate trade caused his lordship afterwards to have an iron railway, the length of six miles, from Dolauven quarries to Port Penrhyn.

The chain bridge erected across the Menai by Telford is one of the most extraordinary works of the kind in existence.

Of canals there are several, with stupendous aqueducts and bridges. The aqueduct of the Ellesmere canal, thrown over the Dee is the first in Europe. It was completed in the year 1810.

Manufactures chiefly blue cloth, blankets, flannels, and Welsh plains or cottons. The best Welsh flannels manufactured in Montgomeryshire. Welsh flannels made since the time of James the First have the warp of fleece wool, and the woof a more or less of one third or one half of flax. Flannels from cottages, stockings and caps very general among the families of cottages and small farms. Argillaceous schistus is converted into slates for the roofing of houses and other purposes, to a very great amount within this district.

Hydriugaceous aloe extracted from brushwood, at Hope in Flintshire, for the use of cotton dyers. A variety of other manufactures to a moderate extent. Several agricultural societies.

7831. SOUTH WALES. Six counties, and some islets, comprising together 2,470,400 acres of hilly and mountainous surface; generally of a salubrious climate; cold on the mountains; but, on the whole, more temperate than the air of North Wales. The soil argillaceous red loam, or calcareous, but generally rich in the vales and declivities. Of minerals there is abundance of iron, coal, lime, and a good deal of lead.

1. Properly and Buildings.

As in North Wales. In South Wales the custom of white-washing cottages is prevalent. In Glamorganshire, not only the inside and outside of houses, but barns and stables also, walls of yards and gardens, the stone banks of quickest hedgcs, and even solitary stones of large dimensions, house

blocks, &c. near the houses, are white-washed. This practice is traced to a very remote antiquity. Diodorus Siculus is quoted as mentioning the British custom of white-washing houses. Gentlemen's seats are likewise white from cottages, not only by their size and plans, but also by their colours. In Glamorganshire gentlemen mix ochre with lime, to make their

seats of Isabella y. llow. In the north of Pembrokeshire, &c. the taste is reversed; the cottages are of a very dingy colour, and gentlemen's houses are white-washed; the maxim is — not to be what the poor classes are; not to coincide with the vulgar in their practices.

2. Occupation.

Farms of all sizes; two mountain farms of 1400 each; general run from fifty to one hundred acres; average of the district between thirty and sixty acres. In the uplands rearing of stock is the main object, without neglecting the produce of the dairy; whilst they find convenience, though without profit, in a scanty and precarious tillage. In the lowlands, or moist loams, especially in the more humid climate of the western counties, grazing is considered, and generally recommended, as the most profitable.

Upon an average of the whole, the district may be said to be occupied in that kind of system called mixed husbandry; breeding, dairying, and tillage; varying in the proportion of each in different places, according to the impersuasions of existing circumstances, which will be hereafter more fully explained.

Farmers may be classed as proprietors farming a part of their own estates, small proprietors or yeomen, farmers of the old school, and book-farmers.

"Book-farmers" are the disciples of Marshal, are those who know agriculture only by reading about it. Theory is their *non plus ultra*, as they generally grow tired before they are much acquainted with practice. The practice of the country they come to reside in is all wrong, and the inhabitants all savages. They order ploughs and ploughmen generally from a distance; and when the masters retire, the ploughmen return and the ploughs are laid aside. They hold the farmers of the old school, as they call them, in sovereign contempt; who in return deride their puerilities, and, in their own quaint phrase, style their inefficient attempts to establish a system of improved agriculture "a flash in the pan." They do considerable good in the vicinity they dwell in by employing labourers; and by their imported implements they open the eyes of mechanics. Most of the harm they do is to themselves. They injure others mostly by an exorbitant advance in the wages of servants, especially of such as pretend to be farm bailiffs. They give double the wages that the old established farmers in the best cultivated counties, Salop or Hereford, &c. will give. They have generally very exalted notions of the value of land, and the powers of soil. They read of the produce of crops in England or elsewhere, and calculate there upon the value of land in the uplands of Wales; which, if they have farms to let, makes it extremely difficult to deal with them. Their opinion of manure depends on the book they have read last. If Jethro Tull is their authority, they require no dung, but ploughing and stirring. With *A. line is every thing*; with his brother B., only a few miles distant, and on the same kind of soil, *lime is nothing*."

3. Implements.

The Welsh plough is in common use; and perhaps a more awkward, unmanoeuvring tool is not to be found in any civilized country. It is not calculated to cut a furrow, but to tear it open by main force. The share is like a large wedge; the coulter comes before the point of the share sometimes, and sometimes stands above it; the earth-board is a thing never thought of, but a stick (a hedge-stake or any thing) is fastened from the right side of the head of the share, and extends to the hind part of the plough; this is intended to turn the furrow, which it sometimes performs, and sometimes not; so that a field ploughed with this machine looks as if a drove of swine had been mowing it.

The Rotherham and other improved ploughs are in use among the proprietor and book-farmers, and the Scotch plough is coming into very general use. A gentleman, a naval officer, in Cardiganshire, introduced the light Rotherham, and insisted on his ploughmen using it. As soon as they returned to their backs, the new ploughs were dismissed the service, and the old ones brought into the field. One day, in a rage, he committed the old to the flames, and set the new ploughs a-going. Afterwards taking a ride to cool himself, and returning, he found the new ploughs in the ditch, and old ploughs borrowed from the neighbours at work: the master then thinking it useless to persevere, gave up the contest. "I have," said he, "seen various kinds of human beings, in different parts of the globe, from latitude ten to latitude fifty-four, but none so obstinately bent on old practices as the Welsh."

H. Lewis, Esq., of Gally y Gog near Carmarthen, being equally unsuccessful in effecting a revolution at once, tried the plan of altering the old ploughs in a slight degree, and hopes, by one alteration after another, at length to transform them into Rotherham ploughs "unaware as they are of their ploughing."

Waggons and clumps (as they are called) are in general use; almost every farmer of forty pounds a year rent has a waggon. Single horse carts gain ground but slowly. They were introduced into the vale of Towy, several years ago, by Lord Robert Seymour; into Cardiganshire, by the late Thomas Johns, Esq.; and into Breconshire, by Sir Edward Hamilton.

A hay rake, with the head forming unequal angles with the handles, is in use in Glamorganshire, the only advantage of which is said to be that of not obliging the raker to step his foot backward at every reach.

4. Arable Land.

In general wretchedly managed, especially the fallows. The reporter proposes to send farmers' sons to improved districts to serve apprenticeships, as better than examples set by strangers, which have been tried without success. A patriotic land proprietor brought what were considered as enlightened farmers from Scotland into North Wales; but as H. Lewis very judiciously observes, "New practices in husbandry will be most likely to succeed through the medium of the natives of the country. They have an unconquerable dislike to every thing introduced by strangers; and not without some reason, as most of the people who have come into this country from the English counties, and commenced farmers, were in bad circumstances at the outset, and therefore have not succeeded in their undertakings; and the natives, eager to reprobate any thing new, readily attributed their failure to defective practice, rather than to the real cause, want of capital. This observation will be found to be generally true in every country. Few persons in good circumstances can be tempted to migrate; whilst others

of a different description are frequently under the necessity of doing it; and, generally, it can only tend to hasten their total failure. Then the teaching of the natives, as recommended above, would have a much superior effect in establishing the doctrines of the new schools, than the introduction of any strangers into the country.

The sand banks checking the progress of the tides into a flat tract in Glamorganshire, in order to render them more firm, they are matted with the roots of the sea-mat-weed (*Juncus arenaria*). The Hon. T. Mansell Talbot binds each of his tenants, who rents land in the adjoining marshes, to give yearly the labour of a day or more, in proportion to his holding, as a kind of statute duty, for the planting of this reed; and experience has proved its good effects.

5. Grass.

By a correct map of the rivers of a district, with a scale of their fall in a given number of furlongs or miles, and of the mountains from which they flow, and those distinguished by kinds of "quality colours," a zoologist might give a fair estimate of the quality of the soils and grasses of the respective valleys interesting that district, though anomalies frequently form exceptions in valleys as well as on sideland places.

The practice of fogging pastures, almost peculiar to Cardiganshire, has been already described. (5857.) The reporter saw a piece that had been fogged successively for sixteen years; and according to the tenant's information, was improving annually. When land has been mowed too long, one year's fogging is supposed to recover it. Mossy pastures are benefited by it. It replenishes the soil with seeds, that by this means are suffered to ripen and shed on the ground; and it is said that two years' fogging will recover lands, let them never be ever so run out by tillage or mowing. Cattle used to fog will quit lay that may be given them, and clear away the snow with their feet to get at the fog. The fields proper to be kept in fog must be of a dry, sound, and close soil; the argillaceous rather than the siliceous earths should prevail in it; but not so much as to be over-retentive of water.

The late Thomas Johns, Esq., of Hafod, observes, "Fogging is getting out of repute; it must have originated in chance, and want of a summer stock of cattle."

Clover is grown in some few places for seed, which is separated from the heads in a common corn mill, the upper millstone being replaced for a time with a square piece of oak furnished with eight wings studded with nails on their upper surfaces. These spokes, by their rapid motion, soon beat out the seed.

8. Gardens.

On the maritime coast of South Wales generally very productive; those of the cottagers better attended to than in other parts of the district; a pleasing mixture of flowers, small fruits, and vegetables.

Orchards in Radnorshire and Brecknockshire thrive well in the valleys, but more especially in the vales of Wye and Usk. Not much cider made, except on the Wye.

7. Woods and Plantations.

It appears from old deeds, that estates were formerly sold at an inferior price, in consequence of their being crowded with timber. Times are now changed."

There are a great many oak woods and coppices in hilly parts of the district, and many thriving plantations in every part of it. It is calculated that at an average six millions of trees are annually planted; if this be the fact, it is probably nine tenths of them either die or are doomed to come to nothing; for at this rate, in fifty years, there would be 150 trees for every acre in South Wales, which, added to the old wood and copse, would give 500 trees, or enough to render the country one entire forest.

8. Improvements.

Numerous enclosures have been made, and fencing, draining, and, in some cases, watering practised as in other countries. There are nearly 15,000 acres of fen and sands on the coast of Cardiganshire, which are considered highly improvable, and which it has been at different times in contemplation to embank. Of ones of the worst parts of this land, the late agriculturist Dr. Anderson, who was much with Johnes of Hafod, said he could make it carry wheat in five years.

9. Live Stock.

From ancient records it appears that the colours of Welsh cattle were white, with red ears, like the wild breed at Chillingham (6804.); they appear to have been in a wild state so late as the time of King John. The present stock is of four kinds: the coal-blacks of Pembrokeshire; the brownish blacks, or dark browns, of Glamorgan; the black runts of Cardiganshire, Carmarthenshire, and the western parts of the counties of Brecon and Radnor; introduced breeds, from Herefordshire and Shropshire, into the eastern and more fertile parts of Brecon and Radnor.

Cows are kept for breeding, and making butter and skim-milk cheese. Johnes has proved, that at Hafod these may be made at will so nearly resembling Parmesan, Stilton, Gloucester, or Cheshire, that the difference cannot be perceived by good judges; and that the whole mystery consists in various modes of producing it from the milk.

The sheep of South Wales are of four kinds: mountaineers, Glamorgan vale sheep, Glamorgan Down sheep, and cross and intermixed breeds.

Mountaineers occupy the hills in the several counties of the district. The Glamorgan vale sheep is the only breed in Wales, not introduced within memory of man, that produces combing wool.

The Glamorgan Down sheep is a beautiful and excellent small breed. Feeding upon the oldest and sweetest pastures of the limestone tract, their mutton is superior in quality to most, and inferior to none; their wool is of the short clothing kind, and fine.

It is crossed and intermixed breeds many experiments have been tried within the district, and most of them confessedly without the expected success. Particular breeds of sheep have their peculiar diseases, which continue in their constitution, whether they are removed. The limestone tract may be considered as the healthiest for sheep within the district, but even there the imported modern breeds have brought with them the scab, the foot-rot, the goggles, maggots, and a long train

of diseases never heard of before in Wales; these are to be ranked among the profits of commerce.

Horses. The small Welsh merlins or palfeys are now in many parts nearly extinct: they are a pigmy race, and may now and then be found in the hilly walks of the interior of the district. There were formerly a very good breed of hardy strong punches, fit for riding and walking upon the farm, being a cross between a good-sized horse and the small merlins; and very useful they were; but the breed has almost been totally neglected and lost: for they cross now too much with the large and sluggish cart-horses.

10. Political Economy.

Roads as in North Wales, or worse. Road ploughs in use; a characteristic both of their state and of the nature of the materials. Good limestone, however, in the coal districts, and especially in Glamorganshire. Manufactures of woollen in many places; and, owing to the abundance of oak copes, many hides tanned. Potteries on a large scale at Swansea, Cardiff, and other places. Extensive iron and coal works, lime works, and a slate quarry in Cardiganshire, &c.

The Lias limestone, (lime and iron combined, the stone of a bluish or greyish colour,) though found in many parts of

England, is nowhere so valuable as that at Aberthaw. When burnt into lime, it is of a buff colour, the characteristic, according to the engineer Smeaton, of all limes setting in water. Lias limestone in all parts has a peculiarity of stratification and exterior character, so that a rock of it may be known at a distance. The strata are of various thickness, from a few inches to a few feet; and those commonly separated by a few inches' thickness of marly clay. The ferruginous ingredient seems to be concentrated in the interior part of each stratum; the outer sides thereof being more porous, and of a paler colour. In inland places the strata are burnt altogether, the argillaceous as well as the ferruginous calcite. Here, at Aberthaw, or other maritime coasts, the strata tumbled down, within reach of the tides, are broken and rolled about, until they are reduced to rounded pebbles or nodules, from a few ounces to many pounds weight; and these consist only of the nucleus or kernel part, the more useless shell being worn off by the abrasion of the furious tides. These rounded lias pebbles are driven on shore in inexhaustible quantities.

Of agricultural societies there are several; that of Brecon instituted in 1755, the earliest in Britain after that of Edinburgh.

SECT. III. Agricultural Survey of Scotland.

1782. *The surface of this country is estimated at 18,944,000 acres, in three natural divisions. The first lies north of the chain of Highland lakes, which stretches from Murray to Mull, and consists of little else than dreary mountains and some moors: the second, or middle division, extends from this chain of lakes to the rivers Forth and Clyde; it is mountainous, but cultivated in the valleys, and on the eastern shore to a considerable extent: the remaining division is covered by hills with some mountains, but almost every where cultivated or improvable, and highly favourable for most branches of agriculture. Though Scotland, as elsewhere observed (770.), was far behind England in cultivation till the middle of the last century, it has now greatly outstripped that country, especially in arable husbandry; a proof that this is the general opinion of enlightened men may be deduced from the notices given of the English and Welsh counties, in which it appears that the improvements introduced or attempted to be introduced on arable land are, with few exceptions, the implements and practices of Scotland. In the management of meadows or old pasture, Scotland cannot be conspicuous; as the climate is not naturally calculated for that kind of husbandry. The winters are too long and severe, and the surface too irregular. In regard to live stock, the palm of improvement was till lately borne away by England; but though there is not that enthusiasm in Scotland, nor such large prices given for capital specimens, it may be safely asserted that breeding and feeding are conducted as systematically and successfully there as in England. We shall glance at the different counties in the order of their proximity, beginning with that containing the capital. It may be sufficient to mention here that leases are universal in Scotland, generally for nineteen years, often for twenty-one, sometimes for fourteen, but seldom for a shorter period. The poor are supported by voluntary contributions at the church doors; though an assessment on property, half paid by the proprietors and half by the tenants, may be made if necessary, which is not generally the case. Assessments for the poor are common in the border counties and the Lothians, and occasional assessments, imposed upon the same principle, are resorted to in most of the other counties. Voluntary contributions are found inadequate, except in the most thinly-peopled districts. It is therefore a great though common mistake in England, to suppose that there are no poor-laws in Scotland; but they are comparatively moderate, and will likely continue so while the power of assessment remains with those (the landed proprietors) who have to bear an equal share of the burden with their tenants. It is here that an essential distinction exists between the poor-laws of England and Scotland. Tithes were commuted for their value in land and land's produce at an early period. Every parish has a schoolmaster, who is paid jointly by the proprietors and the farmers. There is a professorship of agriculture in the Edinburgh University, ably filled by Dr. Coventry, a man of whom it may be truly said, that he is universally esteemed and beloved. The best account of the agriculture of the Scotch counties is to be found in Black's edition of the *Encyc. Brit.* Edinburgh, 4to, 1820.*

783. **MIDLOTHIAN, or EDINBURGHSHIRE**, contains 230,400 acres; one third hilly and inaccessible to the plough, and two thirds in tillage, pasture, or wood. The store sheep farming is practised on the hills, and a mixed agriculture on the low grounds. Green crops and potatoes are extensively cultivated for the Edinburgh market, and most farmers are more indebted to the manure they receive in return, than to the soil, or their superior skill: many of them are townsmen, amateurs, and speculative cultivators. The Dalkeith Farmers' Society, one of the most useful that has been formed, and which still exists, belongs to this county; and in it also was founded the British Wool Society, now extinct. A variety of interesting information respecting the progress of improvements in this county, and in East and West Lothian, will be found in *Rural Recollections*, 8vo, 1829, by George Robertson, author of several county surveys, and whose personal knowledge extends from 1765 to the present time. (*Robertson's Survey*, 1795. *Edin. Gaz. abridged*, 1829.)

1. Geographical State and Circumstances.

Climate free from extreme heats or colds; snow seldom falls on the low parts of the country before December, less from three to ten weeks. In eight years, the greatest quantity of rain that fell in any year was 56.8 inches, and the least quantity 9.6 inches.

Soil much diversified; lands hanging to the north almost the most fertile.

Minerals. A bed of coal extends across the county from S. W. to N. E. from seven to eight miles in breadth; worked for two centuries. Limestone, freestone, granite, and whinstone very abundant. In some parts of the parish of Dalkeith and marble. Some copper and iron ore, marl, and Jasper pebbles on Arthur-seat.

Water. Streams inconsiderable. *Esk* (Uak, Gael.) the largest river; few fish from the rivers or streams, but abundance from the fifth or sea.

2. Property.

About 510 estates in the county, divided by the reporter into seven classes: first class from $\frac{1}{2}$ to 5000*l.* or upwards; fifth class 100*l.* and upwards; sixth class, less properties; seventh class, properties of corporate bodies. Total rental in 1795, 191,000*l.*; Duke of Buccleugh the first proprietor.

3. Buildings.

Many gentlemen's seats, and some fine ruins of castles and religious houses.

A farmer's mains, as it is here called, consisted formerly of a set of low buildings, in the form of a square; one side was occupied by the master himself, whose habitation was composed of two or three dismal apartments, on an earthen floor, having a low ceiling and a few diminutive lights. On another side stood the barn, in which the roof timbers, from the idea of giving

more strength, were built into the wall from the foundation; the wall itself not being more than five feet in height. Opposite to the barn were the stables and the byre, or cow-house. The stables were totally without division, and the horses fed in common; but the neat-cattle, less passive, were each confined to their stalls. The cottages occupied the remaining side in the midst of all by the danglehill. These buildings were made of turf and stone alternately, or with stone, and clay for mortar: the roof of thatch, or of thatch and *diot* (turf or sods) intermixed. Further details on this subject will be found in *Robertson's Rural Recollections*, p. 70.

Farmers were now in the first style of commodiousness. An example given of Gugarban farm.

Cottages formerly very mean, now much improved. Robertson, in his *Recollections*, gives a figure of a modern Lothian cottage in its last stage of refinement, which is by no means inviting.

Farms vary from 100 to 500 acres. Farmers divided into three classes; speculators, converts from other professions; industrious laborers who have acquired some property; and farmers sprung from farmers.

Speculators. In the immediate vicinity of the town, the greater part of the lands are cultivated, not by actual farmers, but what may be more properly termed speculators in agriculture, people with whom farming is but a secondary object; their chief employment being still what was their original profession, as bakers, brewers, innkeepers, or some other distinct occupation; and who are often to be found in their town lodgings, or in their counting-houses, than in the midst of their farms, attending to the operations of husbandry. One cent of the rent, which the speculators of this class produce is, that the rent of land is raised above its natural level; for, as they have always some other business to live by, they are

enabled to afford more rent; and in fact give more than an actual farmer, whose sole dependence upon husbandry, is able to pay; while their exertions in agriculture, though in general founded on good principles, commonly end in disappointment to themselves, for want of that unceasing attention which is indispensable to successful cultivation, but which their other avocations prevent them from bestowing.

The *moor land farmers*, as if in conformity to the soil, which has undergone very little melioration, and to the climate, which meners of their forefathers, and to live and toil under the same and diminutive; their fare simple and limited; and their labours hard and even oppressive. But they have days of relaxation, in which they enjoy themselves at fairs and markets; funerals are pompous and ostentatious. Religion is maintained in all the austerity of Oliver Cromwell and the covenant.

These farmers are the only ones in a county containing a capital town, who are like to better their condition. Being when translated to a warmer climate and richer soil, they will forcibly feel a melioration in their circumstances; and if they have fortitude enough (as the first race of them generally will) to persevere in their habits of frugality, they may, by cent yearly on their capital, accumulate in a lifetime, a sum which will only last during the first generation. Their sons have luxury with which they are unacquainted, and the great simplicity of manners, and with it the faculty of saving, on which alone their prosperity depends.

4. Implements.

Old Scotch plough, long and heavy, and drawn by four or six horses or oxen, and drawn by 7, when Drs. Griev and Carlisle, clergymen, tried that plough of a lighter construction, which they had seen in use in Dalkeith Park. Soon afterwards Small's improved plough came into notice. Robertson mentions that the older race of farmers were very implements of husbandry, and makers of their own professional mechanic. These implements from the most in very clumsy manner, but otherwise strong and handy enough. (*Rural Recollections*, p. 84.) The late Mr. Thomas (at Grouthill, near Edinburgh) made with his own hands the first winnowing machine used in the counties, from a model of one imported from Holland. (*Ibid.* 143.)

5. Enclosing.

No commons or common-fields. Hedges first planted about 1760.

6. Arable Land.

When ridges are raised high, they should not be laid south and north, as the crop on the east side of such ridge is commonly found very defective. The same thing holds in the county of Lancaster.

7. Grass.

Very little permanent grass exclusive of the hills and moorlands. Alluvial lands on the banks of streams so liable to immense floods, bringing down soil, &c. that grass is not profitable to keep them in corn. Considered therefore more productive meadow land near Edinburgh, irrigated by the water which flows from town, carrying along with it night-soil, &c. 1860 at an average of 42l. per acre; part of it reached near 60l., the purchaser cutting and carrying it off, and incurring but little yield four or five cuttings, is only for one summer, but between the end of spring and the beginning of winter.

8. Gardens and Orchards.

Henry Prentice, who died about 1786, was the first who cultivated white peas, potatoes, turnips, and sundry other cultivated plants, on an extensive scale, for the Edinburgh market, about the year 1746. Before that period, the supply was limited that appeared with kitchen stuff in the streets. He even with so little sale, as not to encourage a repetition. Though name deserves to be noticed with respect to the Canongate, his introduced several of our best vegetables into cultivation, but curious, however little, he turned on to his own account.

Stranberries. About 2000 acres on the banks of the Esk, and without end; but digging down and replanting every fourth year. To change every twenty or thirty years esteemed a better practice. Lands in numerous places, Mawer's houses at the hot-houses heated by steam. Mawer was a Lancashire man, and formerly gardener and steward to the Earl of Aberdeen. He was an excellent gardener and farmer; a man of very general information, and in every respect, he was extensively employed as a lover out of gardens and roads, and had some settlements on his estates. The compiler of this Encyclopedia in years preceding his death, which happened suddenly from an apoplexy in 1800.

9. Woods and Plantations.

About 5000 acres so occupied, the greatest part artificial, and planted since 1750. Hedge-row trees never come to any thing for want of shelter; but do no good unless twenty rows thick at least.

10. Wastes.

None; but extensive tracts very poor.

11. Improvements.

Draining well understood and extensively practised. Johnston, who wrote an account of E. King's mode of draining, a cubic yard of the county. Edinburgh and Leith afford about 40,000 on the lands within five miles of town, which is commonly laid carried twelve miles or further.

More success for reeding on the arable lands of this county than in those of any other in Scotland; and it is supposed from more town manure being used. The town manure consists of the seeds brought in from the country in hay and straw, which are of various kinds; but chiefly wild mustard, wild radish, dock, thistle, poppy, couch-grass, &c.

12. Live Stock.

Little attention was formerly paid to this department; but it is now conducted on improved principles; and a great many cows are kept in Edinburgh, and well kept as well as judiciously selected. See the article *Dairy in Sup. to Encyc. Brit.* Clydesdale horses. Some buffaloes of the Mysore variety introduced by Col. Murray; not supposed to turn to any advantage, either as milkers, or for work, or the butcher, but form a variety in parks. Lord Morton subsequently introduced the quagga (*Equus Quagga*) in his park at Morton Hall for the same purpose. One of a very popular species of live stock with all classes.

13. Rural Economy.

Well supplied with work-people from the highlands and immediate vicinity of Edinburgh, they are, in general, orderly and shilling and four-pence, writing and arithmetic, reading at one and sixpence per quarter; Latin, &c. in proportion. The cottages and ground floor, with a pistole, and 100 square yards, or upwards, of garden ground. The furniture consists of two beds, a few chairs or stools, table, chest of drawers, clothes-press, &c.; and they are all ambitious of having a time-piece, if it were only a cuckoo clock. The wife may be worth from ten to twelve pounds. The summer dress of a young ploughman consists generally of a coat of blue cloth, and five shillings and sixpence the yard; velvet vest, corduroy breeches, white shirt with ruffles at the throat, white muslin fringed cravat, and a hat worth eight or ten shillings. The shoe-knots and ruffles are very much in use. They make a very good appearance, and even pay attention to the fashion. In their food they eat oatmeal for the basis, or principal part of their sustenance. They have it regularly to breakfast and their supper. At dinner they eat it with a small allowance of butter-milk of soup made of barley-malt, intermixed with greens and kind herbs. To this they add at times potatoes, and fish of different kinds; seldom whole bread, and still more rarely their variety. This mode of living, in which, although with no great abundance, there is always abundance of food, seems to be very conformable to the natural constitution of the people, as they are found to go through their labour without feeling themselves oppressed, and enjoy a state of health which is very seldom interrupted. At an average, they are not above two days sick in a year.

What is above stated refers chiefly to the condition of farm servants, who are hired by the year, and whose principal employment is about the horses, in the fields, or on the road. There is, however, another class of work-people attached to the farm, who are hired by the day, or by the week, and whose employment is usually in jobbing about the barns, the fences, or the water furrows. These are called labourers, and in their circumstances and mode of living there is a considerable difference between them and the others.

Although their wages are in general at a higher rate than the hired servants, yet they make not such a good appearance in their dress, nor are so well seen to in their vicinities, as these. They are generally, as we term it, *from hand to mouth*, which seems to arise principally from getting their continually in money from week to week, which leads them to waste their wages in the purchase of their daily sustenance; a provision left generally to the charge of their wives, who, from this constant running about, get into habits of idleness, and want of attention to that good housewifery which is the glory of a decent cottager's wife.

The quantity of coal used by the common labourers is about three fourths of a ton for each person in the family yearly, by farmers about two tons, and in families of the highest rank to seven and sixpence the ton, according to its vicinity to Edinburgh.

Such was the state of things in 1795. Now (1830), at the distance of five and thirty years, they are doubtless materially altered. The use of wheaten bread is general; butcher's meat much more common, and cottages more commodious.

14. Political Economy.

Roads so bad, were only to 1744, that wheel carriages for the purposes of agriculture were very scarce; even till 1760 hay and straw carried to Edinburgh on horse backs, and even till 1760 dug taken back the same way in bags. Sledges a good deal employed in some times; they are mentioned in the *trumpet* of 1751, but annihilated in that of 1755, which shows they had been dis-used; a proof of the extraordinary progress of improvement when once commenced, in consequence of a demand or desire for it. Forced improvement goes on very differently. The roads of this county are now under one of the best of them. One of the most important improvements is the Union Canal from Edinburgh to the Forth and Clyde Canal, at Falkirk, which has added greatly to the value of property on each side of its line. See *Edinburghshire*, and *Canals*, in *Sup. to Enc. Brit.* and also Robertson's *Rural Recollections*, on Glass-ropes, and soap the chief manufactures. Iron works at Craigmiles, where nails, spikes, files, &c. are extensively fabricated. Several paper mills, flour mills, and various minor manufactories and works for local consumption.

15. Obstacles to Improvement.

Illiteracy of landlords, game, thirlage, the dogs of Edinburgh, who are used to harass the sheep, the chief obstacles.

16. Miscellaneous Observations.

The Farmers' Society of Dalkeith, for the prosecution of thieves and encouragement of agriculture, instituted in 1760, still exists, and has done much good. It is composed almost entirely of practical farmers. Small's plough, the winnowing

and threshing machines early noticed and recommended by this society. The farmers in this county have long had in contemplation to get instituted by legal authority a society for the creation and management of a pensionary fund for the widows and orphans of farmers, on principles similar to those which govern the widows' fund of the ministers of the Church of Scotland.

An appendix to the report contains thirteen papers, some of which are curious in an historical point of view; and as showing

7834. EAST LOTHIAN. 190,363 acres of surface, under an exceedingly variable climate, the greater part of excellent soil, and well adapted for cultivation; but the southern district, Lammermuir, hilly and mountainous, with a moory soil, severe climate, and chiefly under native grass and herbage. Some of the most distinguished Scotch agricultural patriots, authors, and mechanics belong to this county, as Cockburn of Ormiston, Thomas sixth Earl of Haddington, Fletcher of Salton, Adam Dickson, Robert Brown of Markle, the projector, and for a long time editor, of the Farmer's Magazine, Somerville, author of the agricultural Report, Meikle, inventor of the threshing machine, and various others. (*Somerville's General View*, 1805.)

1. Property.

Generally in considerable estates; the largest about 15,000, and not many under 1000. a year. Tenure generally of the crown (i. e. freehold), some hold of subjects superior (copyhold), and some of the corporate towns of Haddington and Dunbar.

2. Buildings and Implements.

It may be sufficient to state that they are such as we have described in the body of this work as of the best description. Farms generally large; medium of the county about 4000. a year; higher 15000. to 18000. The first enclosures were made about 1760; and the first introduced from Holland in 1710; the two-horse plough in 1772; and the first threshing-machine in 1786. Fallowing was introduced from England about the same time as hedges. The sixth Earl of Haddington was the first proprietor, and John Wark of Bonshaw of Dunbar, the first farmer. It was first brought from some English travellers, while they spent a night at his house, and with whom he had a good deal of conversation upon the subject, so much to his satisfaction, that he made an experiment upon six acres the following summer, which he carried through in spite of the animadversions of his neighbours, who were divided in their opinions as to the sanity of his mind, or the stability of his circumstances. The result of the experiment gave them a better opinion of both, and the return was so abundant as to induce him to extend it to his next year's fallow to twenty acres; soon after which the practice began to spread, and so early as the year 1724, fallowing upon all the deep strong soils was common throughout the county, and has continued to be so ever since. There can be no doubt that the early excellence of the East Lothian agriculture was in a great measure owing to the introduction of fallowing, which, together with the use of drill crops, have continued to place it at the head of the Scotch counties. Potatoes introduced to field culture about 1760; and cultivated in the drill manner in 1760. Flax sown from time immemorial, but chiefly on a small scale, and for the home consumption of the country inhabitants. Every cottager has a small quantity, from half a peck to a peck sown, the produce of which furnishes linen for the use of his family. *Lucern* tried with the greatest care; but owing to the climate, it was found to produce less bulk of herbage than red clover.

3. Grass.

Natural meadows and pastures are not found only where the East Lothian system of husbandry, as they are admitted to be, nature, or certain local circumstances, render them, in some measure, unavoidable, and are never kept voluntarily, or from an idea of profit. Many farmers fallow land to be for a few years in grass, especially where it has been exhausted by long and imperfect tillage; but fields of this description are not to be ranked as permanent pastures, for the object is to restore them, as soon as possible, to a state capable of bearing crops to advantage.

Covers introduced by the sixth Earl of Haddington and Cockburn, about 1720 or 1725, but made little progress till 1740; now generally sown with ryegrass. Application, grazing, soiling, and hay, but chiefly soiling.

4. Gardens and Orchards.

Some few market gardens and nurseries; but the climate does not admit of orchards, which are very rare. Every cottage has a garden annexed, sufficient to produce the various common kitchen vegetables for the cottager's family. This class of people are remarkably attentive to the cultivation of their little spots, and derive great advantage from them, at small cost; the labour is entirely performed after their ordinary work is finished.

5. Woods and Plantations.

Scarcely any of the former, and none of the latter, of any extent, excepting in gentlemen's parks. 800 acres on Lynningham demesne planted by the sixth Earl of Haddington, who wrote a treatise on planting, about 1715. Oaks cultivated by the late Mr. Sherriff, of Cantin Head, for which, in 1805, he received the gold medal of the Society of Arts.

6. Wastes and Commons.

Are in this as in other Scotch counties generally enclosed, which is here an easy matter in comparison to what it is in England, in consequence of a general Act of Enclosure by the Scottish Parliament, in 1695.

7. Improvements.

Faring and burning little known, and not wanted, because very little ground is kept long in pasture that can be profitably employed in tillage, and new grass lands do not require these operations.

One attempt at irrigation on a sandy waste near Dunbar, the levels of which were taken by, and the water turned on under the direction of, the compiler of this work, in 1805.

8. Live Stock.

The practice of East Lothian, in this department, does not present much that is generally interesting. Grazing, in nine cases out of ten, is carried on only as subservient to tillage, and therefore held a secondary object by cultivators. Many cattle are fed, but very few reared, in the county. Almost

how soon, in a rapidly improving age, a man's best ideas and remarks are distanced by those of a few years afterwards. One of these papers describes the origin and progress of the British Wool Society, which was begun in this county by Sir John Sinclair, in 1791. The economy of Johnston's dairy is deserving of notice for accuracy in the details, and for new practices, such as making butter from whey, feeding cows on whins, &c. Macknight, another amateur, and Hepburn, an ingenious landlord and cultivator, are also worth reading.

every person who practises the sheep husbandry, in the lower districts, buys and sells within the year. Some recent attempts have been made to keep flocks of full bred sheep, and, there is reason to believe, with considerable success. In bringing the county generally, such attempts are of little importance.

Cattle. Every farmer keeps a small number of milch cows, but few keep more than are sufficient to furnish a regular supply through the whole year, of milk, butter, and cheese, for their own family use. The same attempts are made to keep flocks of the kinds of cattle, as in other districts, where they form a more important object of farm management.

A very considerable number of black cattle are purchased annually at fairs and markets, to be wintered in the fold-yard, or fed on turnips, for the most part, for the dairy, or to be sent for the butcher-market, comprehend all that are to be found in the county; none are employed in labour. Every part of farm-labour, in which beasts are employed, is executed by horses.

sheep. Permanent flocks, and regular sheep management, may be said to be almost confined to the higher parts of the county. In the low country they are kept chiefly to eat the turnips, and sometimes sown grass, which is permitted to lie a year or two for pasture. Flying flocks are therefore generally kept; and as soon as they are fitted for the market, which is usually within the year, they are sold off. A considerable number of lambs likewise are reared, only so far, however, as to render them fit for the butcher.

As the general object in the lower districts is feeding, little attention is paid to particular kinds; every farmer keeps those which he thinks are likely to pay best for the food which they consume. The black-faced, or Tweed-dale breed, are most generally preferred for feeding on turnips, because they are most esteemed in the market; but many of the Cheviot land are likewise kept, and even some of the improved Leicester.

The kind of sheep bred, and most generally kept, in Lammermuir, is the black-faced, or more properly what is called the brocked-faced, a sort of dirty-looking mixture of black and white; the one for the most part, however, for they are fed the widders weigh from ten to twelve pounds per quarter, and the ewes from eight to ten an average.

The Hawell breed has been tried, but not extensively till lately. Leicester's are now much more common in East Lothian than they were twenty years ago.

The Cheviot sheep were introduced several years ago, and are kept with advantage in many places. It is not the general opinion, however, that they can ever universally supplant the native breed, or even become equally numerous, with profit. *Horses* very few are bred in the county, not one perhaps in a dozen that are kept. In a district so well calculated for raising corn, it is more profitable to purchase horses, ready for work, than to be at the trouble and expense of rearing them. The farmers here are supplied with this part of stock chiefly from the dealers at Aberdeen and Lanarkshire, who collect many of them in these counties, and procure not a few from Ireland. The horses generally kept are of that moderate size, which may be considered as equal perhaps to any others for combining strength with activity. They may be stated, generally, to be about fifteen or sixteen hands high, and strong built. Many teams are well matched, very handsome, capable of great exertion, and kept in excellent condition.

One will hardly be at a loss to determine the character of a farmer, from the condition of his horses. Very fine high bred horses, exhibiting an appearance of being prepared for the market, may rather suggest the idea of idleness than of labour; but, on the other hand, lean spiritless creatures, worn out by toil and hunger, are the certain indicatives of a bad farmer, of one who is not thriving, and does not deserve to thrive. The man who uses bad instruments cannot have his work well done; and one important and primary step towards good farming, is to keep the labouring stock in good condition. Horses regularly fed and regularly wrought will perform a great deal of labour without tiring off, either by overwork, or by want; it is of great importance, therefore, to distribute the labour as equally as possible, through the various seasons of the year; and if, as must sometimes be the case, an extraordinary exertion ought to be made, they are in a proper condition for making it. When horses do fall off, it requires much more to restore them, than might have kept them in a good state.

Hags are kept in considerable numbers, in this county, at distilleries, starch work, mills, and breweries. Every farmer keeps a few, chiefly for supplying his own table, and the generality are reared to sell annually. Farm servants too, who have houses, are generally allowed to keep a pig for each family, which adds greatly to their comfort.

Poultry, pigeons, and bees, kept to a moderate extent for home use. Much land on the coast, which may be thought to be a very unfit for any thing but rabbit warrens, now bears turnips and rye.

9. Rural Economy.

There are not, perhaps, in the island more active or correct labourers than the farm servants here, and certainly none more sober and respectable; and this may be ascribed to the terms on which they serve. Those servants, who lodge in the houses of their masters, are generally speaking, on the same footing here as in other places; there is no

thing, with respect to them, which merits particular notice. A small proportion of farm servants, however, belong to this class; married servants are uniformly preferred; those who reside in their master's house are, in many cases, not employed in regular labour, but perform that sort of extra work, and kind of household drudgery, which requires some hands on every considerable farm.

The far greater part of the regular labour is performed by married servants, called hinds; a class more numerous here than in other districts. These dwell in houses provided by their masters, and receive their wages wholly or chiefly in kind; the circumstances are so comfortable under which they are generally placed, as to secure a full supply of such servants at all times. They are more steady generally than young men; their families, and the property which they have acquired, give them a sort of interest in their situations, and afford some security for their continuing long in their places.

The hind occupies a house provided by his master, for which his wife works in harvest; he has a cow kept all the year round, generally ten bolls of oats, three bolls of barley, two bolls of peas, all of the best quality upon the farm, seed-corn excepted. He has likewise a peck of flax seed sown, and about the sixteenth part of an acre of ground, well prepared, and sufficiently dunged for planting potatoes; his fuel is carried; he has his victuals during harvest, which is always four weeks, sometimes six; and in farm servants' corn to market, he has an allowance, provisionally called mags. Those who are employed in sowing and building the corn-ricks have, besides the ordinary wages, a pair of shoes and half a boll of wheat. On all well-managed farms, the labour is carried on regularly at set hours; and though it is not so regular that servants, who work horses, are absolutely exempt from extra work, yet they are very seldom required to do any thing of this nature.

It is evident, that the value of hinds' wages, in money, cannot be accurately stated; that must vary according to the market price of the articles in which he is paid. On an average of some years past, it could not be less than 25*l.* sterling per annum: now from 30*l.* to 35*l.*

The circumstance which deserves particular attention with regard to this class, and which renders their condition so much more comfortable than that of the labourers in many other places, is the receiving payment of their wages in the necessities of life. They are far more comfortable than those who receive the same rate of wages in money, any where; they are generally more faithful to their employers, and infinitely more attentive to the interests of their families. They have all the necessary articles of food continually at hand, and seldom need to purchase any thing considerable, except shoes. Their wives make linen for their own flax sufficient for their families, and often cloth, for other articles of dress. The quantity of corn which they are allowed to carry to market, and the sale of their cows and hens, brings them as much money as fully answers every demand, and enables them to give a better education to their children than is sometimes obtained by persons, considerably above their condition, in some other parts of the island. There are few of this class in East Lothian who cannot read, most of them can write; none of them fail to have their children instructed in these necessary branches of education, including the rules of arithmetic. One sees, about every farm-house, a number of children, vigorous and healthy,

decently clothed, and exhibiting every appearance of being well fed. Not an instance occurs of any of these people soliciting relief from the public, unless they are by some accident disabled from future labour, or overtaken by the infirmities of age. Indeed the times which are hardest for the lower classes, in general, are usually favourable for them; because the corn and other articles which they have to sell bear a better price, while what they have to purchase is not so much affected.

The cottage system, which found many advocates some time ago, was inferior in every view of the matter to the manner in which labourers in agriculture are accommodated here. Many of those who laboured to introduce the new cottage system, deserved all praise for the purity of their motives: every friend of humanity will honour them for the generous interest which they felt in behalf of the labouring poor; but if they had understood the condition of the hinds in this country, they would have found out a much better plan for accomplishing their object, than giving to every cottager land to produce his subsistence. A hind here receives as much corn as such a cottager might be expected to raise: his labour is not interrupted to his employer, nor his self worn out by extra and excessive labour; he has no care upon his mind, no rent to pay, no bad seasons to dread; for whatever may be his master's crop, he is sure of his full share. If the labourer profit by this system, the employer and the public profit still more: the employer does not pay a man who wastes half his strength at other work, nor rely on a servant who may sometimes disappoint him, by attending to other concerns. The public must gain in the increased quantity of human food produced; for, without doubt, an acre of land occupied by a cottager will not yield as much, at as little expense, as if it made part of a farm cultivated by a person with sufficient capital.

Were all the farm servants over the kingdom paid in kind, it may be safely affirmed, from the experience of the places where this practice prevails, that the advantage would be great to themselves and to the public. The master might probably, in some case, find it more convenient to give money, but he is far more than recompensed for any trifling disadvantage attending the other mode, by the valuable moral habits which it is calculated to preserve. Every master, who properly understands his interest, will admit, that he had better pay sober, honest, and industrious servants, than have those of a different description almost for nothing. From their being accustomed to have little money pass through their hands, many of the farmers' servants in this country acquire such habits of saving, that they lay up a few pounds for old age, or to meet any contingency which may require more than their ordinary income.

10. Political Economy.

The first turnpike bill for Scotland was obtained for this county in 1750. The main roads are on the whole good; but the bye-roads still admit of much improvement. The commerce is chiefly in grain from North Berwick and Dunbar. There are oyster and other fisheries on the coast; and starch-works, distilleries, and breweries, but no manufactures deserving notice. The agricultural society of Edinburgh, the earliest in the United Kingdom, was founded chiefly by gentlemen of this county, and especially Cockburn of Ormiston. There are now two county societies; one, that meets at Haddington, and another at Salton. They give prizes annually for the best cattle, &c. and seem to be in a flourishing condition.

785. BERWICKSHIRE. 285,440 acres (*Edin. Gaz. abridged, 1829.*), chiefly of gently varied surface, but partly of hilly and mountainous pasture. The soil, in the cultivatable part of the county, is chiefly clay; the mountainous part, which occupies fully one third of it, is a continuation of the Lammermuir hills. Climate of the higher parts comparatively dry, but cold and late; of the lower parts, which stretch down to the Tweed, comparatively warm and early. There are no metals or coal in the county; very little lime, but some stone quarries of the trap, and other coarse stones. Every one knows that this county is one of the best cultivated and most systematically managed in the island, and that its products are nearly equally stock and corn. It is the county of Lord Kaimes, one of the greatest patriots and best agricultural authors, and the first to propose a board of agriculture. It is also that of Small, well known as the improver of the plough. (*Kerr's Berwickshire, 1808.*)

1. Property.

No very large estates; largest from 5000*l.* to 10,000*l.* a year. Many of the owners reside on their estates; some farmers have of late years become respectable proprietors. Resident proprietors usually draw their own rents; and those who live at a distance employ an agent, or, if only temporarily absent, have it sent in a bank bill. Proprietors and tenants live in harmony and mutual good will, the rents of the former progressively advancing with the improvements of the country, and the fortunes of the latter augmenting continually, by industrious and judicious attention to improved agricultural practices, and to the amelioration of live stock.

2. Buildings.

Farm-houses formerly of rough stone, clay, and thatch, now greatly superior to the houses that were occupied by the middling gentry, forty or fifty years ago. An excellent plan of a farmery given; but the cottages of the hinds appear unaccountably small, and are calculated for close-paneled beds, which, wherever health and cleanliness are objects, ought to be discarded. These cottages contain only one apartment, and a sort of dark lumber place, formed by the position of the paneled beds. We much wonder that the reporter, who talks so much of the common sense of the houses of farmers, should not have displayed a little more feeling on the subject of the accommodations of cottagers. These remarks apply more particularly to three plans of cottages, given in Kerr's Report, Dec. 14, 1820, in the general plan of a farmery. (*Pl. facing 97.*) A detached plan of a cottage (*fig. 1125.*) is given, rather better arranged than these double ones, but still, in our opinion, highly objectionable. It has two windows, whereas the others have only one each. The larger window is in the kitchen (a), the smaller in the back place (b); these are separated by two beds (c); in the kitchen are shown a harck and dresser (d), table (e), and two chests (ff). In the lobby a place for coals (g). No water-closets in any of the plans.

3. Occupation.

Farms generally large, and held on lease for different periods, from ten to thirty years, but commonly for nineteen years. Mode of culture, rotation, &c. Under the system of this system of alternation, judiciously conducted, it may confidently be asserted that a farm of 1000 acres will raise as

much grain as one of equal size entirely under perpetual tillage, and will produce in addition as much 1*£*, and mutton, and wool, as a separate farm of 200 or 300 acres under

1125

permanent grass. If this estimat on be well founded, of which the reporter has no doubt, this alternate system is obviously of superior profit to the tenancy in the first place, to the landed interest secondarily, by increased rents, and to the public ultimately and always, in the proportion of at least

twenty-five per cent beyond what can be produced from the two branches separately pursued on the same extent of equal land.

In the hill district, the lands are mostly occupied as breeding sheep farms; taking advantage of all the favourable pieces of land, susceptible of cultivation, for raising a little grain to supply the farmer's family, servants, and horses; to afford litter and fodder for the straw during winter, by which dung is produced; to apply that dung to raise turnips, to carry on their sheep stock during winter, and, finally, to produce crops of artificial or sown grasses, for hay and early pastures, and to the great improvement of permanent grass lands.

In the neighbourhood of towns and villages, various small possessions, from two or three acres or less, to twenty or more, are let on leases of various endurance, but mostly for short periods to villagers who keep one or two horses, which they chiefly occupy in the carriage of materials for road makers, coals to the other villagers, lime, or any such employment as may occur. The great mass of the land throughout the county is let in farms of every variety of size, from 40 to 50 acres, up to 1000 or more, to tenants on leases of fixed endurance, mostly for nineteen years.

The character of farmers in a large district of country must be various; but those of Berwickshire are very generally most respectable and intelligent, and their success has been deservedly proportional. They have almost universally a firm and completely adequate speculative class in knowledge, education, and manners, assimilating in every respect to the character of country gentlemen. In every corner of the county they are to be seen carrying on extensive and costly improvements, by draining, enclosing, liming, and marling; and by careful and judicious improvement of their live stock, sheep, cattle, and even horses, with all the eagerness and intelligence of commercial speculators. They trust to the certain profits of future years to reimburse their large expenditures with reasonable profit, which they are enabled to do through the sufficiency of their capitals and the security of their leases. The former is derived from their own successful and intelligent industry, or that of their fathers; the latter from the good sense of the landlords, in seeing their own interests most materially intervened in the security and success of their tenants.

4. Implements.

No waggon or wheel ploughs, and, though drilling turnips is universal, only one or two sorts of drills in use. Few implements, and those of a simple construction, suffice for the best practitioners in every art.

5. Enclosing.

The cultivatable lands are universally enclosed, and subdivided into regular fields, generally by hedges; but sometimes by stone walls. In the mountain district, the farms are neither enclosed nor subdivided. The boundaries of each farm are indicated by landmarks, and round each farmy there are generally two or three small fields for convenience of cultivation. Trees very generally planted in hedge-rows; hedges always cut with a bill in the wedge shape; never clipped and rounded, or broader at top than bottom; and the sure means of hindering the production of side shoots, and in time producing naked places and gaps in that part of the hedge.

6. Arable Land.

Ample details of the turnip culture in drills is given.

7. Orchards. Woods.

None of the former worth notice. Some native copes and woods, and artificial plantations, but not much woodiness, except round gentlemen's seats.

8. Improvements.

Farmers, the county were begun about 1730, when Swinton of Swinton drained, marled, and completely enclosed his whole

7836. ROXBURGHSHIRE or TEVIOTDALE contains 448,000 acres, of which about three fifths are in sheep pasture, and the remaining two fifths, are occasionally under the plough, except about 8000 acres occupied in woods, pleasure-grounds, and the sites of towns and villages. The surface is exceedingly irregular, being in some places ninety, and in others 9000 feet above the level of the sea. The climate is equally various, and excessive rains, winds, frosts, and even hail and snow are by no means uncommon in spring and harvest. There is a good deal of moss, and peat soil in detached portions over the county; but the general character of the district is, that the low or arable part consists chiefly of a light or turnip soil, and the hilly division of dry green pastures. There is a good deal of high, wet, barren land; but this is by no means the character of the county at large. Limestone abounds in most parts of the district, and that of Berwickshire, and that of the pastures resembles the stone farming of the latter county and East Lothian. Dawson, of Frogden, belongs to this county, and may be looked on as one of the greatest improvers of British agriculture. (*Douglas's Roxburghshire*, 1794. *Edin. Gaz. abridged*, 1829.)

1. Property.

Generally in large estates, and little change of proprietorship has taken place for many years. The largest between 25,000l. and 35,000l. a year.

2. Implements. Arable Land.

Farmers, the reporter states, were first made in this county by one Rogers, a farmer, of a mechanical turn, near Hawick, in 1755, or at least before 1757, who is said either to have seen a model, or a description of one, which had been brought from Holland. (*Report of North m.* Robertson states (*Rural Recollections*, p. 117.) himself conversed with an old farmer, the late Mr. Thomas Shiells, at Crothill near Edinburgh, who with his own hands made the first winnowing machine in the Lothians, from a model of one imported from Holland.)

Arable land enclosed, partly by hedges and partly by walls of horse stones, without a ditch.

Ploughing with two horses, without a driver, was practised in this county before it was in any other. It was taught by Dawson, of Frogden, who introduced the drill culture, to James Macdonald, farmer, at Linton, in Tweeddale, alive at the time of making up Douglas's report: it spread rapidly afterwards through the county, and the neighbouring ones of Northumberland, Berwickshire, East Lothian, and Tweeddale. Potatoes first planted in large beds about 1754; in 1768, in drills in the fields. Tobacco, arising from the American war, was cultivated to a considerable extent in the neighbourhood of Kelso and Jedburgh, and in some other spots. Its produce was so great, that thirteen acres at Crailling fetched 104l. at the late rate of fourteen per pound and would have brought more than three

estates. Nearly about the same time, Hume of Eccles effected similar improvements. Both of these gentlemen were actuated by the example and acquaintance of Cockburn, of Ormiston. Henry Home, Lord Kaimes, was one of the early improvers of this county about 1746, at Kaimes, now Hesburgh. About 1750, the ardour of enclosing and improving the land spread generally among the Berwickshire proprietors.

Faring and burning, irrigation and embanking, not practised or required.

9. Live Stock.

The cattle of Berwickshire are so much mixed by crossing, as scarcely to admit of any particular description. Upon the whole, they are short horned, thin sided, and kindly feelers, and have been much improved by crosses with bulls of the Teeswater breed, which is the kind chiefly admired in this district. Generally speaking the oxen are not carried on to any age, and they are never worked. They are well fed from their youth up, and are generally fed off for market in their fourth year, very few reaching five years old. Cows, on the contrary, are generally old before they are fed off. Great numbers of smaller cattle are bred upon the lower hills, and are disposed of to graziers in the low country for feeding, either on grass or turnips; or by a succession of both; and many Highland cattle of various descriptions are bought in yearly for consuming straw, or for feeding on turnips during winter, and on grass in spring and summer.

The sheep bred in Berwickshire are of several kinds. In the most exposed of the Lammermuir and Lauderdale hills, the flocks are mostly of the black faced, or Tweeddale kind, and are there exclusively kept for breeding. In the cultivated tract the new Leicester breed, in a great variety of degrees of perfection, now universally prevails; and it is believed that no other known breed, in the peculiar circumstances of this county, could be so profitable to the farmer. They require, however, always to have abundance of food, and easily procured; for, being short-legged, heavy-bodied, and carrying a great weight of wool, they are very liable to suffer from fatigue or hardship, and do not thrive unless plentifully supplied at all seasons. This supply the agricultural system of the district amply affords, and is indeed admirably calculated for providing. On some of the best interior hills, and upon the higher exterior lands, the Cheviot, Lammermuir and Lauderdale, called the intermediate, the Cheviot breed, or long sheep, are kept. An intermediate breed between the Cheviot and Leicester, usually called half-ried sheep, is very prevalent upon the best of these situations. As a singular circumstance, the reporter records the case of a cross of this county, which produced eleven lambs in three succeeding seasons.

Horses, as in East Lothian, brought from the west of Scotland.

10. Rural Economy.

Farm servants managed as in East Lothian, and indeed, almost every where in the low country of Scotland.

11. Political Economy.

Commerce chiefly grain, wool, and salmon; scarcely any manufactures, excepting the paper-mills. The salmon fishery, including Berwick bounds and the English side of the river, employs about seventy small boats, and nearly 340 fishermen. All their fish are sold to a very respectable fraternity of traders in Berwick, named coopers, from their former business of making kits, and boiling the fish, which is now entirely discontinued. By them the salmon are packed in ice, and sent to London, to be disposed of by factors on commission. This employment of ice was first essayed by Messrs. Richardson, of Perth, on the suggestion of Messrs. Dempster, of Dunfermline, Esq. who had accidentally read that such a practice was not unusual in China.

times as much, had not an Act of Parliament obliged the cultivator to dispose of it to Government at that price. This county lost about 15000l. sterling by that Act, which passed while the tobacco was growing; yet it excited not so much murmuring and clamour among the sufferers as have been elsewhere repeatedly raised, with less reason, against other Acts in no respect so arbitrary and oppressive.

3. Gardens and Orchards.

Thrive better in the lower parts of this county than in those on the eastern coast. At Melrose, Edinburgh, and Kelso are the remains of orchards planted by the priests several centuries ago, the pear-trees of which are very productive. Wonderful stories are told of their fertility. A single tree of the Thistle pear at Melrose has for these fifty years past yielded the interest of the money paid for the garden where it stands, and for a house let for seven pounds sterling yearly. Another tree there has carried fruit to the amount of three pounds annually, at an average for the same period. In the year 1793, two trees there brought to perfection about 60000 pears, which were sold for eight guineas. These facts are well authenticated. There are also several more recent orchards near the same places, and 120 acres of nurseries. Of these one of the oldest and largest in Scotland is that of Messrs. Dicksons, of Hawick.

4. Woods and Plantations.

To the extent of 5290 acres; nearly two thirds artificial.

5. Live Stock.

Cattle, a mixed breed, as in Berwickshire. Sheep of the Cheviot kind said to be greatly improved by a cross with the

Dishley breed, introduced about 1765, by Robson, a pupil of Cullity; but this is stoutly denied by most of the Cheviot breeders. Merinos and other sorts have been tried, but sufficient time has not elapsed to ascertain the result.

7837. SELKIRKSHIRE. 172,160 acres, almost wholly of mountainous surface, the lowest part 300 feet above the level of the sea; many houses are 600 and some more than 1000 feet above its level. The highest mountain is 2370 feet. These mountains are generally of granite or whinstone, and the surface soil is commonly gravelly and dry. In the valleys are clay, peat, morass, and lakes. The climate is cold and rather moist. There are no metals, nor coal, lime, or freestone. The most remarkable thing attending this county is, that its hills and mountains are almost every where clothed to their summits with sound sheep pasture, of which there are estimated to be 148,000 acres; 8800 acres in aration, 2400 in wood, and the rest in gardens, houses, roads, lakes, &c. (*Douglas's General View*, 1796. *Edin. Gaz. abridged*, 1829.)

Property in few hands, and in large estates. The farms are large, and the lessees generally shorter than on arable farms. The sheep are a variety of the Cheviot produced by repeated crosses with the native mountain black-faced breed. In all respects the husbandry of this county may be considered the same as that of the mountainous districts of the preceding

6. Rural and Political Economy.

Farm servants on the same plan as in East Lothian. Roads improving; no canals; little commerce, and almost no manufactures.

There is a woollen cloth manufactory, and an excellent peticular brewery, by a pupil of Neux, at Galahills. Some agricultural societies were attempted in this and the adjoining counties about 1793, but they were of very short duration.

7838. PEEBLESHER or TWEEDDALE. 229,778 acres, mostly of mountain, moor, and bog, but with about one tenth part arable. The lowest part of the county is 400 feet above sea-level, and grain is cultivated to the height of 1000 feet. The climate is late, cold, and moist, and the soil moory, clayey, or sandy, according as the water is pent up; the rocks of the mountains are freestone, granite, trap, or claystone. The only minerals worth notice are lime, whinstone, and freestone. The general appearance of the country is wild, and rather dull and dreary, than romantic or sublime. The agricultural survey of this county is by the Rev. Charles Findlater, and it abounds with more valuable matter on political agriculture, on leases, prices, restrictions, markets, &c., than any survey that has been published, without a single exception. In fact, it was found to take such a masterly view of the moral incitements to agricultural industry; to expose the system of tithes, entails, lawyer's leases, &c., that it was rejected by the Board, as likely to offend the English clergy and higher classes, and the author was reduced to publish it himself. It has certainly, through the medium of the extracts from it published in the *Farmer's Magazine*, been the means of enlightening thousands, both of farmers and landlords. The fundamental principle which Findlater lays down and illustrates under the heads of leases, size of farms, usury, capital, dearth, monopoly, forestalling, government interference, tithes, poor, and other topics, is, "That the best demo of ensuring the invention and prosecution of the most advantageous measures is, an arrangement which shall communicate to those on whom their execution is devolved a sufficient personal interest in their invention and execution." To some he doubts not such views will be considered as foreign to the report of a county; whilst to others they will constitute its most essential value.

The state of property and husbandry of the country may be considered as the same as that of the other mountainous districts. The black faced sheep are in almost universal use, except in milder situations, where the Cheviot has been introduced. There is no commerce but by retail, and only some very trifling woollen manufactures in the county.

In the Appendix an account is given of the improvement of the Whim, a flow-moss of 100 acres, twenty feet deep, and at an elevation of 700 feet above the level of the sea. It was begun to be drained in 1731, and in ten years a mansion was built, and surrounded by woods and pleasure-grounds, which show, as the Duke of Buccleugh, the proprietor, intended, the wonderful influence of art over nature. "The plantations (originally extensive) have been improved and enlarged since the property came into possession of the Lord Chief Baron; and he has also greatly enlarged the house, adding a court of offices upon a large scale, and ornamented in front, extending also the lawn. The place has, upon the whole, an air of magnificence. In the pleasure-grounds there are several artificial pieces of water. East of the house (where the soil is dry and covered with sweet grasses) the surface is agreeably diversified by gentle swells, tufted with trees. A wild wilderness walk, through a small wood, lands you upon the banks of an artificial lake, with islands, covering an extent of six or seven acres of surface. What chiefly strikes the visitor at Whim is the strongly marked contrast betwixt the improvements of human art, and nature in her wildest form, here found in immediate contact. Your ears are at once saluted with the warblings of the blackbird and thrush from the plantations, and the wild notes of the plover, the curlew, the grouse, and other moss birds from the flow-moss." (*Findlater's Report*, &c. 1804.)

7839. DUMFRIESHIRE. 644,385 acres of maritime, vale, and mountain lands, in the proportion of one, four, and seven. The climate is variable, comparatively mild, but moist. The soil of the maritime district is light, and generally on sand, gravel, or rock; that of the vale or midland district is gravelly, sandy, or moory. The mountains are of schist, whinstone, or red freestone, and thinly covered with corresponding soils or moss. In some places they are covered with dry pasture, but more frequently with a mixture of grass and heath. The principal metalliferous ore found in the county is lead; but several others, as iron, copper, antimony, &c. exist, and the latter has been worked. Coal has been found, but not in strata sufficiently thick to be workable. Marble also and slate have been worked, and lime, freestone, and whinstone in abundance. There are several mineral springs in the mountain district, the principal of which is the spaw at Moffat. Fish, and especially salmon, are caught in moderate quantities in the Nith and Annan. The celebrated improver Craik was a proprietor in this county, at Ardbigland, near Dumfries, now the property of his son. (*The Rev. Dr. Singer's General View*, 1812.)

1. Minerals.

The lead mines occupy very barren grounds, remarkable by bleak and elevated; but they are a great fund of industry and riches, and they furnish a part of the county with an excellent market for the surplus grain produced in that part. Lead hills, with the mines, are in the county of Lanark, and belong to the Earl of Hopetoun, who draws about 7000*l.* a year from these mines. Wanlockhead mine is in Dumfriesshire, belonged to the Duke of Queensbury, and returns to the proprietor near 5000*l.* a year.

2. Property.

In large estates, owned by 453 persons. The Duke of Buccleugh's estate of very great extent. Some estates are managed by their owners, and others by commissioners having power to let. In large properties it is common to entrust the collecting rents, and arrangements relative to leases, buildings, fences, and courses of crops, to factors residing on or near the lands, who represent their constituents (if not personally present) in county and parish meetings. Millar of Dalswinton has gone over an estate of 5000 acres in twenty-five years, and improved the whole of it, with the exception of a portion which, in 1812, was under process and promised to be soon completed. His plan was not to farm his lands himself, but to prepare them, by improvement, for being let to farmers.

3. Buildings.

While the reporter expatiates on the ample accommodations of the modern farm-houses in this and other counties, he gives the following information as to cottages, which, we regret to find, seem by no means improved, either in this or in other

parts of Scotland, in the same ratio as the habitations of inferior animals. "A common, and not inconvenient, cottage is put up as follows, viz: stone and lime walls, seven feet high, thirty-six feet long, and fourteen to sixteen feet wide within, the roof of Scots fir, which is preserved from the warm by smoke, and covered with thatch; a chimney at one end, and an open passage for smoke in the other; affording two apartments below, one of them a kitchen, and a central apartment opposite to the door; the one end boarded over, and the other open. Such a cottage may be erected for about 50*l.* or 40*l.*; and, with half a rood for a garden, it would let at 5*l.* a year, or more, according to its finishing." Doubtless the reverend gentleman made but short prayers when he visited the sick in such smoky cottages; the surgeon need not dismount from his horse; he may speak to his patient through the window, and feel his pulse with the butt end of his whip.

4. Occupation.

Sheep farms from 500 to 2000 acres; arable farms from 50 to 600 acres. Leases universal, and generally for nineteen or twenty-one years. Wilkie's variation of Smal's plough is in general use, as being the mould-board better in soft soils. The Berwickshire system of culture is practised on the turnip soils; the East Lothian on such as are loamy or clayey; and the store system on the mountain district. The cattle are of the flow-moss breed, and 3 ceps, Cheviots, or the black-faced mountain kind. More poultry is kept than in most other counties, in order to consume the light grain. Many of the fowls and eggs go to Edinburgh; but the greater part of the produce and sales in eggs go in small oval baskets, packed in

erits, to Berwick, for the London market. In one or two instances the *Eden* variety has been cultivated on reclaimed lands with success, but is intended to be succeeded by better varieties as soon as they will bear them. The drill culture of turnips was introduced by Craik about 1745. Draining has been extensively practised, irrigation in a few places, and some embankments made on the Leithway Firth, and the Nith and Annan. There are few orchards. Some remains of coppice and forest, which, according to appearances and authentic records, seem in former times to have spread over great part of the county; and numerous young plantations. Some vestiges of many young Scotch firs died from the attacks of the *Teredo pinorum*, as some suppose; but the cause does not seem clearly known. Some very large oaks, beeches, elms, ashes, and larch firs are described in the Report.

5. Improvements.

As a specimen, we will give some notices of what has been done on the estate of Mount Annan, by General Drom. The extent of Mount Annan estate is 2750 acres. The general began his improvements in 1795, and planted, before 1819, 168 acres. Assisted in laying out a considerable extent of public road and building bridges, the road passing through the estate. Made an improvement in the construction of lime-kilns, since perfected by Boker of Dublin. (3865.) The lime quarried and dried by means of a small stream from more elevated lands; this stream being made to turn an overshot wheel, which works two pumps for the drainage of Brae's bog, an 1800 (3850.) on the new road, and where the river Annan affords ample falls for machinery. Farms arranged of different sizes, and three eminent farmers settled with a view to improvement—domestic farms, one or two; cottages or improved stock on machine consists of wood-cutting knives, if they may be so called, six inches deep in the blade, with a blunt edge fixed upon and embracing

784). KIRCUDBRIGHTSHIRE, 561,641 acres, and WIGTONSHIRE 288,960 acres (*Ed. Gaz. abr.* 1829), possessing great similarity of agricultural character, have been included in one report, as the district of Galloway. The climate moist but rather warm; in some parts of Wigtonshire, in general seasons, figs ripen on the open garden walls. The soil and surface of Galloway is exceedingly various. Almost the whole of Wigtonshire is very little elevated above the surface of the sea, but great part of Kircudbrightshire is hilly and mountainous. The better soils are for the most part light, and of this and hazel loam there is a considerable portion in Wigtonshire. In some places in Kircudbrightshire it is clayey or alluvial; and there is a great deal of peat-moss, and bog, as well as improved, or grass-bearing peat. The rocks of the county are argillaceous, granite, or whinstone with some freestone. Some mineral veins have been found; and one of lead, near Gate House of Fleet, was worked at the expense of the compiler of this work for some time, but without success. In an agricultural point of view, Galloway is chiefly remarkable for its breed of cattle. Gladstone, a millwright, who has invented a reaping machine, and proposed some improvements on the threshing machine, and other implements, is of this district. (*Smith's General View*, 1810.)

1. Property.

More divided than any of the counties of Scotland. Largest estate, 50,000, a year, Earl of Galloway, in Wigtonshire. Estates in general well managed; landlords in general advance money at five, six, or seven and a half per cent, for buildings, fences, drains, mineral manures, roads, &c. Dunbar Earl of Selkirk, a disciple of Craik's, one of the first who sees the example of the present time, has been persevered in by the same family to the present time.

2. Occupation.

In the moors, where breeding cattle and sheep is the object, farms sometimes seven or eight miles square, some ten or twelve. Arable farms 500 to 600 acres; 2000 acres worth up to the average. Leases, nineteen or twenty years, to which the Earl of Galloway superadded the tenant's life. "From this two good effects were supposed to result; 1. That the landlord was freed from the expenses of buildings and repairs. 2.ly, That the tenant presuming (as we always do) on the continuance of life, would be disposed to go on with his improvements to the last. There is certainly, however, much liberality in the idea."

3. Enclosing.

Galloway dykes (5000) very generally in use; some few remarks on the necessity of bounding them sufficiently, and working the coping-stones to a flat under-surface.

4. Arable Land.

Till the middle of the eighteenth century, four and sometimes six horses yoked abreast in the old Scotch plough, and tumbrils (carts with low wheels without spokes) and cars in use; now all the improved implements; the husbandry of East Lothian on the river lands and farms, too heavy for turnips; that of Berwickshire on the turnips soils; cattle-bred on the mountains and moors; carrots cultivated in some places, and found to answer well; forin tried on bogs; some irrigation; embanking near Wigton and at Kirkcudbright; and much draining, all in farming and burning, and various other means of improving bogs and flow-mosses tried, in conjunction with draining. Corn in the late districts galled. (5176.) Barley is a good deal cultivated, and thin hot barley cakes, from dough, baked the same morning, and spread with butter, and the same evening, and folded or rolled up (like the *teff* of the Abyssinians), form a part of the breakfast bread of all who can afford it in Wigtonshire.

5. Orchards.

Rare. "Some proprietors furnish their tenants with fruit-trees for their gardens, when they are willing to be at the trouble of cultivating them. But, from the scarcity of fruit in the country, and the idea that the plundering of an orchard is a very venial trespass, such as do cultivate them, frequently do not gather the fruits. In this we believe there is nothing peculiar to Galloway. There are a few market gardens and several nurseries.

the whole of the exterior circle of two small broad wheels, and as they go round the knives cut the furrows across. The axle and frame of a roller are used for these wheels, so that the weight may be increased by loading the box of the frame, if it should be necessary to make the knives cut through the furrows. It is dragged with great ease across the ploughed mow by one horse; and when it is moist the furrows are cut thorough with the greatest facility, in pieces of any length, according to the number of turns taken by the machine. The furrows, when a little dry, are then turned over by the brake (break) harrow, and being all cut into small pieces, are in the best state for being reduced by repeated harrows, or for being thrown together in heaps and burnt.

6. Weekly Reports.

"In carrying on the improvements which have been mentioned, at a considerable distance from my general residence, they have been greatly facilitated by requiring my overseer, or manager, to send me a weekly report of what was doing upon the farm and the estate. It shows how the servants and horses have been employed during every day; contains a journal of the weather, and of the progress of different works; and a state of his receipts and disbursements during the week. These reports, besides enabling one to judge of what is doing, and to give any directions that may be necessary, are extremely useful to refer to, and excite the overseer and servants to be diligent in my absence."

Increase of population on the estate in fifteen years, 306; viz.: from 175 to 571 inhabitants. Total expense of purchase and improvements up to 1811, 50,000*l.* Clear annual rental at that time, 2000*l.* a year, exclusive of the value of timber, and of the mansion, garden, and hot-house, &c. as a gentleman's residence.

7. Political Economy.

Improving roads, and some canals and railways; some commenced by sea with the port of Dumfries; manufacturers inconsiderable; paper, stockings by frames, muslin weavers. A small iron-work at Kirkcudbright, in which from three to four dozen spades daily are made. Cotton spinning and weaving in a few places. Carpet weaving, &c. "Salt, from the richest parts of the sea sleek, collected with horse drags in dry weather in abundance, and then placed so as to be washed and filtered, and the brine that runs out of it boiled."

6. Woods and Plantations.

Of a very limited extent, but rapidly increasing. John Earl of Selkirk planted extensively at Mount Kennedy, in the beginning of the eighteenth century; and Douglas Earl of Selkirk soon afterwards. The Earl of Galloway, the present Earl of Selkirk, Murray of Broughton, and various others, are great planters.

1. Line Stock.

The Galloway breed of cattle is well known. The breeders perhaps, in general, understand the management of cattle as well as, or better than, most others in the kingdom. They all know how to distinguish a good bull or a good cow from a bad one; and will not fail to select from their own stock such as are best adapted for the improvement of the breed; and in this general attention, it no doubt arises, that the cattle in Galloway are pretty uniformly good. But among them have arisen no enthusiasts in the profession; none who have studied it scientifically, or dedicated their talents almost exclusively to this one object. No fair test has yet been given, of what might be done by a proper selection of the choicest individuals of both sexes for breeders, and uniting them in such a manner, as seemed best calculated to diminish their faults and heighten their properties, by crossing the progeny of these from time to time; and still carefully pursuing proper combinations of the most approved males with the finest females, till the improvement was carried to the greatest perfection of which the breed is susceptible. No Bakewells, no Cullens, no Collings have yet appeared in Galloway; who, by their study and experience, have united sufficient capital, and by the success of their experiments have made great fortunes, and transmitted their names to the most distant parts of the kingdom. Few of the Galloway cattle (compare) are fed for home consumption. Dairying with *Ayrshire* cows has lately been introduced, and very good Dunlop cheese made.

The sheep for the low districts are of various breeds, those of the highlands the same as in the mountain districts of the counties already described. The South Down is found to answer well in Wigtonshire, and also the Leicester.

Horses. Galloway formerly possessed a breed of horses peculiar to itself, and in high estimation for the saddle; being, though small, exceedingly hardy and active. Accustomed to a rugged and mountainous country, and never reared in the drought, these were sure-footed and travelled with spirit in very bad roads. They wore of a larger size than the ponies of Wales, or the shetlies of the north, being from twelve to fourteen hands high. It is reported that this breed originated from Spanish horses, which escaped from a vessel of the Armada, that had been wrecked on the shores of Galloway; but it appears probable from some passages in Shakespeare, that the Galloway horses were in repute at an earlier period. It is much to be regretted that this ancient breed is now almost lost. This has been occasioned chiefly by the desire of farmers to breed horses of greater weight, and better adapted for the

draught; and from the little value attached, in times of tranquillity, to horses well calculated for predatory excursions. As the soil and climate of Galloway are peculiarly adapted for rearing horses, there cannot be a doubt that under proper management, they would in general become excellent, and add much to the value of its produce. Hitherto few more have been bred than what were necessary to supply the demands of the district. So far increasing since the introduction of potatoes; and the prejudice against eating the flesh common to this and most districts of Scotland gradually declining. Ringing not practised; but the two strong tendons of the snout cut by a slight

incision, about an inch and a half above the nose, when the animal is about two months old.

Bees of this district produce honey equal, if not superior, to any in the world; its excellent, is supposed to depend on the profusion of wild flowers, especially white clover and heath. Game abundant; a few ptarmigans in the highest mountains.

8. Political Economy.

Roads greatly improved of late; and some cotton, woollen, paper, and other manufactures introduced.

7841. AYRSHIRE. 664,960 acres of irregular but not mountainous surface, and clayey or mossy soil, under a moist climate; half the county bog, hilly pasture, grass and corn. The agriculture followed is in great part the dairy system; Dunlop cheese, already described (7063.), being chiefly produced in this county. (Aiton's General View, 1811.)

1. Minerals.

Coal and limestone are to be found in most parts of the county, and there are several kinds of building stone, but no metallic ores worth working, excepting iron. Coal is the staple mineral, and is exported in large quantities to Glasgow and other towns, along the west coast, northward and southward.

2. Buildings.

Some good castles and mansions, as Culzean, London, Eglington, &c. Farm buildings are improving, though but slowly. Some neat elevations, and comfortable interiors on Lord Eglington's estates; single (fig. 1126. a.) and double (b.)

Each of such cottages is surrounded by a neat garden, containing a pigsty, pump, and bee-house; and the house containing a porch (1), kitchen, oven, and stair to bed-rooms (2), parlour (3), stove closet (4), bed closet (5), pantry (6), coal closet (7), back entrance (8), tool house (9), and water closet (10), with two garret bed-rooms over.

3. Occupation.

Farms small from 50 to 150 acres, and their culture imperfect and irregular, though rents are high from the population of the manufacturing towns.

4. Live Stock.

Horses are bred and sold under the general name of Lanarkshire or Clydesdale, and are in great demand; as are the Ayrshire cows for the Edinburgh and Glasgow dairymen. Indeed these cows, as we have seen (6783.), are preferred to others in most parts of the low country of Scotland. The native horses began to be improved by crosses about 1740. In that year Robert Woodburn, in Mains of Loudoun, sold what was then considered the best stallion in the county, at the price of five guineas. The common price of draught horses did

not then average more than 3*l.* each. Till about 1780, the work usually done by farm-horses was not more than one half of what they now perform. Four horses were then yoked to every plough, while as much is now turned over by two horses. (Aiton's Dairy Husbandry, p. 180.)

5. Woods and Plantations.

Most of the proprietors are extensive planters. On the Culzean estate are extensive woods, raised in the face of the west winds; most of the trees lean to the east, excepting the common maple, which is generally erect, or nearly so, and is one of the best trees for an exposed soil. There are also a few native coppice-woods, and some fine old birch, ash, and oak trees round Eglington Castle.

6. Improvements.

Captain Smith, the proprietor of a small place abounding with peat bogs, about 1790, began to drain and dig, and lime the surface, and succeeded in reducing the peat to a black mould, and rearing tolerable crops of oats, potatoes, and clover. After five or six years, he was able to venture horses and cattle on these bogs; but at first every operation was manual.

7. Political Economy.

Carpet and other woollen manufactures at Kilmarnock; thread at Beith, cotton at Catharine, iron at Muirkirk, salt and kelp on the shores, and earthenware and the usual minor manufactures, as leather, hats, &c. are also wrought. The harbour and other works carried on at Ardrossan, under the auspices of the Earl of Eglington, and the harbour of Troon, and the railway from thence to Kilmarnock, formed almost entirely at the expense of the Duke of Portland, are worthy monuments, no less of the enlightened judgment and energy, than of the wealth of these two patriotic noblemen. The harbour lately completed is one of the safest, most capacious, and most accessible on the west coast of Britain; possessing many advantages over the harbour in the Frith of Clyde, situate in a narrow channel, which can be navigated only when the wind blows from particular points, and which, for upwards of twenty miles below Glasgow, is both shallow and dangerous. A circular pier of 900 yards was finished in 1811, and every thing was then ready to begin the wet-dock, which, according to Telford's plan, was to contain from 70 to 100 vessels, in water sixteen feet deep. The other works have rather languished of late, and are not likely to be completed soon without public aid. It was part of the Earl of Eglington's plan to raise a neat regular-habit town at Ardrossan, in which some progress has been made; and he has constructed excellent baths, which draw to it a number of visitors at the proper season.

The harbour at Ardrossan was only a part of the general plan, and that from which, viewed as it is, the small advantages perhaps were to be expected. The leading idea was to open a direct communication between Glasgow, Paisley, and other large towns in the vicinity and the west coast, instead of the present circuitous passage by the Frith of Clyde. A canal was therefore to be cut from Glasgow to Ardrossan, about thirty-one miles and half, at the estimated expense of 125,000*l.* Of this a third part was executed, that is, from Glasgow to Johnstone, and this part, it is said, cost about 90,000*l.*

The harbour at Troon, connected, as it now is, with Kilmarnock, by means of an excellent railway, seems to possess almost all the advantages of that of Ardrossan, and promises to become, in a much shorter period, of vast utility to the populous country around it.

7842. LANARKSHIRE OR CLYDESDALE. 556,800 acres, in great part mountain, moor, and peat-bog, with a portion of friable loam, and some retentive clays. The climate is cold, moist, and unfavourable, excepting in the low vales, where vegetable is chiefly injured by spring and autumn frosts. Average of the rain which falls at Glasgow, 50.8 inches. The minerals are lead, ironstone, coal, limestone, freestone, and whinstone, all worked to a considerable extent. The lead mines at Leadhills have been already noticed under Dumfriesshire. The husbandry of the county is chiefly distinguished for its breed of horses, and for orchards, the latter a rare production in Scotland. John Naismith, the author of a work on Industry, another on the Elements of Agriculture, and also of the Report, seems to have been a native of this county. (Naismith's General View, 1803.)

1. Property.

Three fourths of the surface the property of great landholders; the rest much divided. Farm-houses and offices were formerly very indifferent; but in this as in other adjoining counties, where the leases of farms fall in, the landlord generally enlarges or renews the buildings, as a necessary step to getting the full rental value for the land. A good deal of ground fenced out to operative mechanics, weavers, &c. for building cottages.

2. Occupation.

Much the same as in Galloway. Breeding farms are large, and corn farms moderate. The mountainous district is occupied mostly with flocks of sheep: upon the ridges on the E. and W. sides, where the ground is marshy, and less proper for sheep, and the exposure too bleak to encourage the cultivation of corn, cattle are mostly pastured, and those generally milch cows and their young, many of which are reared; a small quantity of corn only being cultivated, principally for the sake of winter provender. The less rugged and less exposed parts are more occupied in the culture of corn; and the banks of the Clyde, between Hamilton and Lanark, with orchards.

3. Gardens and Orchards.

Glasgow is abundantly supplied with the common culinary vegetables from market gardens. Orchards are chiefly found in two districts in Scotland, in Clydesdale, and the Garse of Gowrie. The Clydesdale orchards lie mostly between the bottom of the lowest fall of the river, and the mouth of the south Calder. They are chiefly of apples, with a mixture of pear trees, and some plums. Cherries are more rarely cultivated, being much subject to the depredations of birds. Few of the orchards are large, but many small ones are planted up and down the country. The whole may cover 540 acres or upwards, and are on the increase. The produce is very precarious, the fruit being frequently destroyed in the blossom, by spring frosts and caterpillars. The value of the fruit is not always in proportion to the number and size of the trees. Those who cultivate the ground around the trees, taking care not to injure the roots, and giving manure from time to time, have finer fruit, and a much greater quantity in proportion, than the others do not. Much depends on the depth of the trees to the soil and exposure. These orchards are mostly planted on very steep hanging banks, and on such they have

been found to succeed better than on plains, as subterraneous water flows most quickly away. Most of them stand on soils greatly cohesive, and on such the trees have been supposed to be surer bearers than on open sandy soils: yet there are instances of orchards, on friable and gravelly soils, uncommonly productive. Plum trees are generally planted round the verge of the orchard, and are profitable, not only for the fruit they bear, but for sheltering the other trees. The deprivations committed on the orchards are become more frequent and daring, as the manufactures of the county have increased, and are a great discouragement to this species of cultivation, particularly that of small orchards, which cannot defray the expense of watching in the night.

Besides the larger fruit, great quantities of gooseberries and currants are cultivated, and, when well managed, are said to pay very well. The gooseberry and currant trees are dug around annually, kept on a single stem, and dunged every second year.

Copewood, or native timber trees, are not abundant; the oldest trees are on the Clyde, in and near Hamilton Park and Bothwell Castle. Many new plantations are forming in every part of the county.

4. Live Stock.

Cattle a mixed breed; the Ayrshire beginning to become general. Oxen formerly employed in labour, and still used by a few of the amateurs in spite of the better sense of their tenants and bailiffs. Few sheep kept, excepting on the mountains, where the black and short wethers.

The daught horses of Clydesdale have long been in high estimation. Dealers from different parts of England come to the Glasgow and Rutherglen markets to purchase them, and prefer them to the Derbyshire blacks. Those of the upper ward, where the greatest number are bred, are esteemed the best. The native breed began to be improved by crosses from England and Flanders about 1760.

The Lanarkshire breed of horses vary in height from 12 to 15 hands; but from 14 to 15 hands is considered the proper size. "His general aspect (fig. 1127.) is stately, handsome, and dignified. He is round, fleshy, well proportioned, strong, and heavy, without being coarse or clumsy. His countenance is sweet and agreeable, yet his eyes small and spirited; and his motions are steady and firm, but nimble and alert. His head is in due proportion to his body, rather small than large, no way clumsy, and not so full and prominent below the eyes as some of the English breeds. His nostrils are wide, his eyes full and animated, and his ears erect. His neck is neither long nor slender, but strong, thick, and fleshy, with a good curvature, and the mane strong and bushy. He is broad in the breast, thick in the shoulders, the blades nearly as high as the chine, and not so much stretched backwards as those of road horses. The arm tapers to the knee. The leg rather short; bone oval and strong, but solid and clean. The hoof round, of a black colour, tough and firm, with the heels wide, and no long hair on the legs, except a tuft at the heel. The body round and heavy; the belly of a proportional size, neither small nor large, and the flank full.

7843. DUNBARTONSHIRE. 147,300 acres of exceedingly irregular surface, in two parts, distant from each other six miles; possessing little agricultural interest. The arable lands are of very limited extent, and lie chiefly on the banks of the Clyde and Leven: the greatest part of the county consisting of lofty mountains incapable of cultivation. Coal, lime, freestone, and ironstone abound, and are extensively worked. There is also ochre, schistus abounding in alum pyrites, which are made into coppers, and a large quarry of blue slate. Lochlomond is well known for its scenery. (*Whyte and Macfarlane's Report*, 1811.)

1. Property.

Two large estates; one exceeds 3000*l.* a year. One third of the county under entail, which greatly retards its improvement.

2. Buildings.

More than a common share of elegant villas and gentlemen's houses. The most magnificent is *Roseneath*, the Duke of Argyll, built by Bonomi, in 1803 *æteq.* It is 184 feet long, and 121 in breadth, with two magnificent fronts, both ornamented with columns of the Ionic order. On his Grace's farm, which is cultivated in a very superior style, there is also a large set of farm offices, surmounted with a high tower. Common farm-houses and cottages formerly very wretched, beginning to improve, but the progress slow. *Dunbarton bridge* 300 feet in length, and twenty-five feet high in the centre.

3. Occupation.

Average extent of arable farms fifty acres; sheep, or mountain farms, average 600 acres. Farmers men of limited education, without capital, and implicitly following the practices of their forefathers. There exists among the labouring class in this district an inveterate attachment to the possession of land. When a young man is disposed to marry, he looks out for a small farm, takes it at an extravagant rent, stocks it on credit, and draws from it a scanty subsistence, while at the end of his lease his effects are often unequal to pay the debt which has accumulated during its currency. In fact the feudal state of society has not entirely disappeared in this county. There were lately, on many estates, and are still on some, farms let to three or four tenants, as conjunct lessees, to be cultivated by their united, or rather discordant exertions. Lands always let on lease, seldom for a shorter period than nineteen years.

The back straight and broad, but not too long; the loin broad and raised a little. Hucks visible, but not prominent, and but a short space between them and the ribs. The sides, from the shoulders to the hip, nearly straight; the thighs thick, and meeting each other so close under the fundament, as to leave only a small groove for the tail to rest on. The tail strong, stiff, heavy to lift, and well haired. A large sheath (*vagina*) is considered to be one of the marks of a good horse, and a small one the reverse. *Aiton*. They have been much improved of late, and are still improving, especially in size and weight.

Hogs. "A kind of Jewish abhorrence of swine seems to have taken place, about the rigid times of the Reformation, in the western counties of Scotland. They were unclean beasts; it was sinful to eat their flesh, and neither credible nor profitable to keep them; and though these prejudices are now pretty much worn out, pork is not yet, in general, a favourite food, and, of course, the number of hogs kept and fed are not considerable."

5. Political Economy.

The roads are in many places bad, but have lately been improved; though the materials be good and abundant, the wet climate is much against them. There are several canals, the river Clyde, navigable to Glasgow, and some railways. The manufactures and commerce of Glasgow are of great extent and well known. There is a corresponding agricultural society there, and some minor societies.

1127

4. Implements.

Curved harrows of a semicircular form are used by the best farmers for dressing their potato ridges. The diameter is equal to the distance between the drills or ridges, generally near three feet; and they are used, before the young shoot of the potato springs, to dress the surface of the ridge, and destroy any weeds which may have begun to appear. The highland hand-harrow is still in use in some corners of the highland district. It is about two feet long and fifteen inches broad, consisting of three bulls, and as many cross bars, with twenty-seven teeth and two bands bent, like a hoop, with which it is wrought. It is employed on bits of land which have been dug with the highland spade, either on account of their being too steep to be tilled by the labour of a horse, or from their consisting of a number of small corners among rocks and large stones, to which a common harrow could not find access. *Wilkie's wheel plough*, with a shifting muzzle (fig. 1128.), is used to clear water-farrows on wet lands, and also for the common purposes of ploughing strong clays when wet; the muzzle being set so as both horses may walk in the furrow.

5. Enclosing.

Gentlemen who pay particular attention to their hedges never allow them to be cut with shears. In place of that implement a hedge-knife is used, with a short and slightly curved blade, thick in the middle, and tapering to a thin and very sharp edge on each side. By cutting always upwards, the twigs are cut clean over without being bruised or cankered, and the hedge is kept, of what is universally allowed to be the best shape, broad and bushy at the bottom, and contracting to a sharp ridge at top.

1123

6. *Arable Land.*

Potatoes cultivated better than any other crop in the county, and with the greatest success. They are planted on every variety of soil, and thrive even on the stiffest clays where there is a sufficient declivity to carry off the surface water; but a gravelly loam suits them best; about twenty tons of manure per acre is the common dressing. Drilling and dibbling are the common modes in the lowlands, and by large beds in the uplands; average produce twelve tons, but eighteen are frequently obtained.

7. *Grass Land.*

Some bog meadows, but no others; some pasture field round gent-men's houses, but none on lowland farms; mountains wholly in natural pasture, moss, heath, bog, and moor.

8. *Woods and Plantations.*

Corswoods form a very important and prominent article in acres of soil which would otherwise be altogether or nearly useless, and yield an income to the proprietors little inferior to what they derive from their best arable land. The steep sloping banks of Loch Lomond and Loch Long, where the trees of the mountains run into the lake, are in many places covered among the rocks seems to be particularly adapted to the growth of oak coppice, which, from its superior value, is chiefly encouraged in such situations, while the moister and more favourable spots are allowed to be occupied by less valuable trees. These are chiefly ash, yellow birch, mountain-ash, birch, hazel, aspen, alder, crab, thorn, and willow. The green land kinds are considered inferior in value to the rest, and commonly known by the name of barren timber.

Copswoods are cut from the twenty-second to the twenty-fourth year; after the latter period the bark of oak becomes fourth and corky, and of less value to the tanner. *Plantations* very generally formed on the uplands. 1000 acres planted at Lass, previously to 1791. The Duke of Montrose, a great planter in Stirling-shire, and partly in this county, allows acre; prefers oak plants of several years' growth; and after they have been established several years, cuts them down, when they push long and strong shoots. Plants by stellate slips, as already described (395,3.), as pits in a retentive soil only serve as a requisite. Fir, pines, and other trees now regularly planted. In the Isle of Skye, Lord Macdonald planted, in 1821, 47,500 trees, and received the honorary premium of the Highland Society of Scotland. (*Trans. Highl. Soc. vol. vi. p. 258.*)

The finest tree in the county is an ash in Bonhill churchyard. Its trunk is about nine feet high, and, when smallest, upwards of eighteen feet in circumference. Of the three principal oaks into which it branches, the largest is eleven, and the smallest near ten feet in circumference. The branches spread in every direction with uncommon regularity, covering an area of near

100 feet in diameter, and the general aspect is singularly venerable and majestic. There are no data from which its age can be conjectured. Nearly 100 years ago it was remarked by Mar- sham of Stratton, near Norwich, a celebrated planter, as one of the first ashes he had seen; and a tendency to decay in some of the boughs seems to indicate that it has stood there for several centuries.

Very trees and hollies abound on the banks of Loch Lomond. A yew at Rosedale is twelve feet round, and very high; one at Stockinbert twenty-eight feet round, and the top spreading in proportion.

9. *Improvements.*

Some proprietors have drained bogs, and rendered them tolerable meadows; and drained and planted moors. Mosses sometimes burn, the ashes ploughed in, and the land cropped with oats, &c.

Irrigation, by means of the rills on the hill sides, tried in some places, with success.

Embankments have been made on a small scale, and some of considerable extent might be formed with success.

10. *Livestock.*

Highland cattle from Argyleshire in general use; but little feeding, dairying, or breeding of this species of stock. Sheep admitted by the upland pastures. Horses, a small hardy breed. Fallow deer occupy two of the largest islands of Loch Lomond. The stag, or red deer of the mountains, has disappeared since the introduction of sheep. A few roes still inhabit the wood- lands.

11. *Political Economy.*

Manufactures of iron, glass, cotton, paper, alkali; printing and bleaching works, &c. Window glass manufactured extensively, and equal in quality to any in the kingdom. Pay 50,000*l.* a year of excise duties; employ 1000 tons of shipping, and consume 1200 tons of kelp; seven hands, and consumes daily a ton of small timber, chiefly oak, from which the liquor, a kind of coarse vinegar, is ex- tracted. The process beautifully simple. A number of iron cut into small pieces. A fire of coals or charcoal is kindled in a furnace attached to each, and by its heat forces the acid in off in the form of vapour. This vapour is conducted by a small metal pipe, on which a jet of cold water from above is continually falling. Here the acid is condensed, and runs from the end of the pipe in a considerable stream, of a reddish brown in mixing colours for the calico printers, there is a considerable quantity of tar and charcoal produced during the process, the value of which is esteemed equal to the expense of fuel.

784. STIRLINGSHIRE. 450,560 acres, much containing some rich alluvial soil, extensive peat-bogs or mosses, and some bleak hilly districts. The culture of wheat and beans is the chief agricultural county by Prentice, a farming gardener at Kilsyth.

Principal river the Forth, and mountain Benlomond; the latter a cone, upwards of 3262 feet high, of sleep-walk, Le- lams, coal, ironstone, granite, whinstone, and freestone abundant.

The *carse lands* constitute one of the most remarkable soils in the county. They lie in a low situation on the banks of the Forth, and extend about thirty miles in length, and two in breadth, at an average. They are elevated from ten to twenty-five feet above high water mark, and a small portion of them in some places is overflowed six times by the river. The soil is universally allowed to be the alluvion deposited by the Forth and its tributary streams, and consequently to be of equal fertility. It chiefly consists of a high-coloured clay, a small quantity of sand, and a pretty large mixture of organic matter. In some places are patches of till of various colours; but not a stone, so large as to obstruct the plough, is to be found. The

diversified by rivers, mountains, woods, and valleys, feature. Potatoes first cultivated in the fields in this (*Leitch's General View, 1796.*)

soil of the best quality; when dug first from the natural bed is of a light blue colour, and of a substance resembling the richest soap, and sometimes even serves as a substitute for fuller's earth. In many places the clay is excellently fitted for making bricks, tiles, and a coarse kind of crockery ware. The depth of the soil is from ten to fifty feet. The subsoils are various; as a stiff brick clay, and till, and sea-shells in a natural state. These beds of shells are from a few inches to four yards in thickness; they are chiefly large oysters, with a mixture of crabs, whelks, and some other shells at present found in the firth. These lands are in farms from fifteen to 100 acres each. In the higher parts of the county the extent is from twenty to 1000 acres.

Of moors above 90,000 acres. *Coppice woods* extensive, and plantations considerable. Carron iron-works of great extent, and well known. Large cattle fairs held at Falkirk. Chief commerce the shipping of Carron articles for London and other places.

7845. WEST LOTHIAN or LINLITHGOWSHIRE. 71,580 acres of gently varied surface, without hills or mountains; clayey soil, and rather cold and variable climate. The minerals are coal and lime in abundance; freestone, whinstone, and some lead and iron, but the latter are not now worked. The coal at Borrowstonness has been worked upwards of five centuries. In an agricultural view, the county may be considered on a par with Mid-Lothian. (*Trotter's General View, 1811.*)

Property is in the hands of about forty proprietors. Lord Stair is supposed to have introduced the culture of clover, turnips, and cabbage, and the New-iston, in this county, as early as 1780; and also the Rotham, in which for which purpose he sent a mechanic to England, to acquire the art of constructing them. A hay drag, of a very simple but convenient construction, is used in this county. Plans of a more decent form of cottages (*fig. 1129.*) are given than are to be found in some reports. Each cottage consists of two rooms (*a, b*); the one to be used as a kitchen has a space for two press or close beds (*c*), and in the other room there is a space for one bed (*d*); in each room is a cupboard (*e*), but no closet, which is a great defect.

The contrivance for making horses draw equally in threshing-machines (786), was invented in this county, by G. Henderson, of Bonhill, and the New-iston is the East Lothian husbandry on the clays and the Erwick-shire on the turnip soils. The chief commerce is from the port of Borrowstonness, and there is scarcely any manufactures, unless spinning, knitting, and tanning in private families may be named.

7846. CLACKMANNANSHIRE. 50,720 acres, principally of carse land, on the north bank of the river Forth; but partly of hilly district, belonging to the Ochills. (*Erskine's General View, 1795.*)

The carse lands are very fertile; but part of the hilly and moory district of little or no value. The agriculture is similar to that of Stirlingshire. After the invention of the three-thing machine, one of the first was erected at Kilbaggie, by George Meikle, in 1787; it is driven by water. A curious source of manure is found in this county. The moss floated down from Blair Drummond (2189), accumulates in the bays, and is mixed as deposited with the sea-weed driven on shore by the tide. This moss and weed is taken out and fermented with a

7847. KINROSS-SHIRE. 47,642 acres, of varied surface, but generally low. There are extensive mosses and muirs, and not much rich soil. Their agriculture is mixed, and of no great interest. (*Ure's General View, 1795.*)

Locheven occupies 3308 acres; three small streamlets run into it, and the difference between its highest and lowest surface, at different seasons, is three feet. The trout of this lake in high esteem; those of the river Leven larger, weighing five pounds and upwards.

Dr. Coventry, the learned Professor of Agriculture in the University of Edinburgh, possesses an estate in this county,

7848. FIFESHIRE. 322,560 acres, exhibiting almost every variety of surface and soil, from the mountain to the plain, and from gravel to moss. The climate is generally mild, owing to the surrounding waters; and what adds to the value of the county, both for culture and for the formation of country-seats, it is rather drier than that of other counties equally far north. The agriculture is mixed, and may be said to excel both in the corn and cattle department. The reverend reporter displays more than the usual share of adulatory phraseology for that "highly patriotic individual, Sir John Sinclair," our "gracious Sovereign," the Board of Agriculture, and the Government, "chalking out to the people a path by which they may rise to opulence and consideration." (*Thomson's General View, 1800.*)

1. Geographical State and Circumstances.

Coal, lime, and the usual rocks abound; ironstone and lead and copper ore abound, but none worked. Nearer Burntisland, upon the shore, and also in some other parts of the county, there are quarries of hard stone, of a dark colour, with the peculiar property of resisting the force of fire. It will endure for many years, without being wasted or broken, though exposed to the most intense heat. On this account it is used for the soles of ovens, and for the sides of chimney grates. Common and fire bricks manufactured of an excellent quality. (*Thomson's General View, 1800.*)

2. Property.

Estates moderate; largest, 8000*l.* a year.

3. Buildings.

Few counties so richly studded with noblemen and gentlemen's houses; about a hundred enumerated as deserving of notice. Many magnificent buildings in ruins. Religious houses, castles, and Falkland Palace. Farm-houses and cottages formerly very bad, now greatly improved, and superior to those in most counties.

4. Occupation.

Farms from 50 to 500 acres of arable lands, and some of mountain pasture twice as large. Some of the largest and best farmers are men who have emigrated from other counties to this less improved district; but the greater number are sons of local farmers, and not a few farms have been in the same family for several generations. The reporter is an advocate for corn-rent, a mode first revived in this county with the improvement of not taking the corn, but paying in money, according to the average prices. Leases for nineteen years; some formerly for one or more repetitions of the period; in general the restrictions reasonable, for the managers of estates in this county are generally resident factors, and not Edinburgh lawyers.

5. Implements.

Ploughs with convex mould boards preferred for loose soils, especially when in a wet state; they free themselves more readily of the earth, and make a neater furrow. An addition to the plough, called a riddler (*fig. 1130. a.*), adopted in some places, and found to clear away the stubble from the coulter.

small proportion of stable dung; or the farmers spread it over their cattle-yards, and it forms most excellent manure. Thus, what is a complete hindrance to improvement forty miles distant, brought here by the river at no cost, and forms a most valuable addition to the resources of the cultivator. Till 1760, no wheat was grown in this county, though it appears by old abbey rentals that wheat was paid as rent at Cambus Kenneth so early as 1147. Now wheat enters into almost every rotation.

where he sets an example of knowledge, industry, and good management to all his neighbours."

Adam, of Blair Adam, the son of the celebrated architect, the most extensive improver in the county; draining, enclosing, planting, more especially the larch and Scotch pine, and building commodious cottages, extensively and judiciously pursued.

6. Grass.

One fifth of the county inaccessible to the plough, and in store sheep- and cattle-pasture; some bog or coarse rushy meadows on peat, and a few spots of good alluvial meadow.

7. Gardens and Orchards.

The remains of an orchard at Lindores, but none of modern formation. Some market-gardens near the towns, but most of the inhabitants have gardens of their own. Some good nurseries. Sang, an eminent nurseryman, and manager of gentlemen's plantations, a valuable man to the county, has introduced an excellent system of planting, pruning, and draining. Some of the first private gardens in Scotland are in this county, as that of Keith, Wemyss Castle, &c.

8. Woods.

Not extensive, but young plantations very numerous and well managed. More cedars and rare sorts of trees in this county than in any other.

9. Live Stock.

Black cattle of Fife long distinguished. The reporter has heard an English dealer say, that a Fife bullock of forty stone will bring an equal, and often a higher, price at the London market than an English bullock ten stone heavier, and equally fat. A good Fife cow will give from five to seven gallons of milk per day, from seven to nine pounds of butter, and from ten to twelve pounds of cheese per week, iron weight, for some months after calving.

Breweries, distilleries, flour and barley mills, frequent. The linen manufacture extensive. Salt made from the sea. Tanneries, vitriol, &c.

The Fife Farming Society and the Inverkeithing Club, supported chiefly by farmers, are considered useful institutions. The first was formed about six years ago, and at present consists of nearly 200 members. The principal objects aimed at by this institution are, a mutual communication of discoveries and improvements in husbandry; common protection against thieves and depredators who shall unjustly invade their property; and raising a joint stock or capital for the benefit of their widows and children, and of members reduced to distress or indigence. Members pay one guinea at their entry, and half a guinea yearly. None are admitted but men of good character; and such members as shall be found guilty of crimes and misdemeanors punishable by the laws of the land, are liable to expulsion, and a total deprivation of all benefit from the Society's fund. No member can draw any thing from the fund till it amounts to 500*l.*; neither can any one be entitled to any allowance until five years after his admission. The allowance fixed for a member fallen into distress or indigence, is thirty shillings per quarter; but this allowance is granted upon the express condition, that he has not brought the distress upon himself by drunkenness, or any other kind of disorderly conduct. And during the time he is receiving the allowance, if he shall be found guilty of dissolute or immoral behaviour, it is put in the power of the managers to deprive him of it. The widow of a member is allowed twenty-five shillings quarterly, so long only as she remains his widow, and maintains a good character. And the children, when no widow is left, are entitled to draw the half of what their father contributed. If a member shall die, and leave neither widow nor children, his next heir, or whoever shall be appointed by him, shall be entitled to the half of what he has contributed, after deducting a proportional share of the expenses incurred by the society since his entry. This society is, at present, in a very respectable and flourishing condition.

7849. PERTSHIRE. 4,068,640 acres, almost every where mountainous, but with intervening vales of strong clayey soils, fertile in corn; some gravelly tracts, and many mosses, bogs, and moors. The mountains on the southern side of the county, where they are less high, are covered with pasture to the summits; those in the northern parts with pasture, heath, and copses. The minerals are coal, lime, freestone, slate, whinstone, granite, &c. the metallic ores, iron, lead, and copper, neither of which are at present worked. This county serves to divide that part of Scotland on the south, which is generally adapted to the raising of grain, from that of the north, which, with few exceptions, is more fitted for pasture. It also divides those parts of the kingdom on the north, where firs abounded in former times, and are still found in the mosses, from those in the south, which carried oaks and a variety of other wood, but no natural firs. It is also the general boundary, in regard to coal and granite, though both are found to a moderate extent, the former in the north, and the latter in the south. The husbandry of Perthshire is noted for its clay, or carse land culture, and for its plantations of larch trees. Its great improvers

have been, or are, Lord Kaimes, the Duke of Athol, and Lord Breadalbane. (Dr. Robertson's *Genera. View*, 1813.)

1. Property.

Estates are of all sizes, but the greater number large. The management of the great estates was uniformly committed in former times to the factor or chamberlain; but agriculture has become so much the amusement of the country gentlemen, since the middle of the last century, that many of the proprietors, besides the general superintendance of their estates, have a farm in their own possession, which they manage by an overseer. Many of our improvements in agriculture are suggested by the gentlemen of the army, in consequence of their remarks on the practice of other countries. The gentlemen of the law, during the recess of their courts of judicature, turn much of their attention to the cultivation of their estates; and their habits of application to the former study, quickens their ardour, and ensures their success in pursuit of the latter.

If the property be extensive, besides an overseer on the landlord's farm, there is generally a factor or steward, and sometimes two or more are appointed to manage the more distant parts of the estate. In these cases, unless the landlord have a turn for business, he is apt to lose sight of the detail of his own affairs; and if the same be infolent, he has a good opportunity for neglecting his interest, because he pays another person for taking that charge off his hand. The property of the estate, and the comfort of the tenants, depend in these cases very much on the disposition of the factor.

The boundaries of estates are marked according to the nature of the country. In the valleys of the highlands, different properties are separated either by substantial stone-walls without mortar (provincially dry stone dykes), or by a river, or a brook, or a range of rocks, or some other natural limit. The lower hills top are sometimes bisected by these walls; but more generally by broad and stony roads, which are set up singly; in other instances, if the stones be small, they are piled in heaps. The higher mountains are frequently divided in a similar manner, especially when different proprietors occupy the same side; but when they occupy different sides of the same ridge, or general line of mountain, as commonly happens between parallel glens, their properties are determined as wind and water divides, which means the line of partition on the top of the mountain in the windward and leeward side, or as it will more nicely marked by the tendency of rain water, after it falls upon the ground.

A great proportion of this county is freshhold. Many of the small proprietors hold of a subject superior. When a great baron in the feudal times had occasion to borrow money, he had recourse to wadsets, or leased off a part of his property at a quit-rent, which was less, according to the amount of the premium that was paid in hand. The wadsets are paid up; but the fees, being irredeemable, remain.

2. Occupation.

Arable farms from 30 to 500 acres. Farms in the mountains large, and their extent generally defined by miles. Leases seldom shorter than nine years, and rarely less. Rent, in a few instances, partly in money and partly in the money value of corn, on an average of two or three by-gone years, according to the modern system. The culture requires scarcely any remark, since there are only two kinds of aration in Scotland, and that of the clay soils of East Lothian, in which a fallow and alternate corn and green crops are introduced; and that of Berwickshire, which substitutes turnips for fallow, and allows from two to five years of pasture, according as the soil is weaker or stronger as resting crops. A full account of the clayland culture has been given by Bonarsson. In the mountainous region, cattle chiefly, and sheep to a certain extent, are bred and sold for feeding in the low arable districts, and sent to the south of Scotland and England.

3. Gardens and Orchards.

In the Carse of Gowrie, a number (perhaps thirty) of orchards of apples and pears, the fruit of which is sold to the neighbouring towns. A few of the best are situated in the Carse of Gowrie, as the banks of the Tay, Earn, &c. In the valleys of the highlands, geans and cherries abound. The trees thrive well, live long, and carry fruit of the finest flavour and most savoury taste. The cream-coloured cherry of Ardvorlich, and the black gean of Cathlenzie, are highly esteemed in respect of beauty and relish.

4. Woods and Plantations.

The highlands of Scotland formerly covered with wood, as the trunks of oaks and firs in the mosses, from that of Moss-Hunders, near Stirling, to the bogs of Sutherland and Caithness decidedly prove. Planting did not become general in Perthshire till after the middle of the eighteenth century. The county is now distinguished by its extensive tracts of larch, common pine, and other trees, and by the enclosure of oak, birch, and hazel; copses and woods formerly left open to the browsing of deer and cattle. Different accounts have been given of the introduction of the larch into this county. Dr. Robertson states it as "said to be brought to Athol, from Carriola, by one of the Dukes of Athol." According to others, the first plants were obtained from a nursery at Edinburgh, and planted at Dunkeld in 1741, having been previously introduced into Scotland by Lord Kaimes, in 1727. The county of Gowrie, 340 a. (7053.) Some of the first planted larches in the low grounds near Dunkeld, have grown to the height of 120 feet in fifty years, which gives an average of two feet four inches and a quarter a year. It is stated by the Duke of Athol, in a communication to the Horticultural Society, made in June 1800, that on mountainous tracts, at an elevation of 1500 or 1600 feet, the larch, at eighty years of age, has arrived at a size to produce six loads (800 cubic feet) of timber, appearing in durability and every other quality to be likely to answer every purpose, both by sea and land. (*For. Trans.* iv. 416.)

"The largest larches in Perthshire, or perhaps in several counties around it, are at Monzie, the seat of General Campbell, which measure five feet in diameter, and about fifteen in circumference. There are larches of a great size at Blair Drummond, Glenalmond, and many other places in Perthshire. Posts of larch, which had been put into a moist soil about fifteen years ago, seemed still to be fresh and strong. It is only of late that this tree has been generally planted, and its excellence known in this country. It is the most rapid in

its growth of any tree we have, and the most valuable species of the pine. It is closer in the pores, has fewer knots, and the wood is more durable than the common pine. The larch increases double the number of cubical feet, in any given time; which is a singular property. It may live in growth and profit with the Huntingdon willow, which has been said to buy the horse, before any other tree could buy the saddle."

There is a natural *fir wood* on the south side of Loch Rannoch which covers 2566 acres. One formerly existed on the Breadalbane estate, but there are now only a few gleanings.

There are more *oak woods*, and of greater value, in this county than in all the rest of Scotland. The counties of Dunbarton, Argyle, and Stirling, come next to that of Perth. A copse of oak is cut once in twenty-four or twenty-six years. A few spare trees of the most promising appearance and of the best figure are left at proper distances, from one cutting to the next, and sometimes for three or four cuttings. The straightest are generally spared, without attending to the circumstance, that crooked oak is more eagerly sought after by ship-builders, and brings a higher price, than oak which is straight. Yet as coppice wood is the object, straight trees will, at least, be spared. Crooked oak has been found to be close in the grain to bend into planks for the sides of ships, and even for the same reason it is found to snap when used as ribs to a ship; its closeness in the grain is the effect of slow growth, and of frequent checks by early and late frosts.

Before agricultural improvements were well understood as they are of late, or occupied so much of the attention of all ranks in this country, many moorish tracts of lands were deemed incapable of cultivation, or of making a return in any other way than their being planted. Proprietors, even in the Carse of Gowrie, and in the Stormont, being actuated by this principle, about thirty years ago, planted the waste lands of their estates with Scotch firs. They have now found that this soil, by being wrought, will make good arable land, and more profitably employed in tillage. Some thousands of acres have accordingly been cleared, the plantations rooted up; and the soil subjected to the plough, which now lets at a progressive rent, in some cases amounting already to twenty shillings the acre. Betwixt Cupar, Angus, and Perth, a tract of thirteen miles, the plantations on two thousand acres, upon both sides of the public road, have been grubbed up; and the operation is still going on, both there and in other places. So powerful is the principle of imitation, that we all go frequently one way until we have gone too far. All men go in imitation, but all men cannot reason so far as to form a principle of action to the amount of the advantage; this operation is salutary; but if carried to excess, it will leave the face of the country naked; and, perhaps, in all cases, the cost is not counted, nor the balance fairly stated between the plantation and the produce arising from some poor soils by an arable system; yet it must be admitted, that no trees are equal in value to corn and grass, either to the landlord or the public, where the cultivation of these can be prosecuted with success.

5. Wastes.

The mosses and moors of this county are very extensive, and great and successful efforts have been made for their improvement. The most remarkable is that of Kincaid Moss, commenced by the late Lord Kaimes, and already described. (2185.) Draining, maring and burning, irrigating, embanking, and all the different modes of improving land, have been practised; and some, as draining and burning, to a very considerable extent.

6. Live Stock.

Breeds of cattle very various; none peculiar to the county; Angus, Fife, and Argyle herds common among the farmers. English, Yorkshire, and most of the approved breeds of the south tried by the proprietors. Breeding is the chief object, and next the butter dairy.

Sheep. The ancient breed of sheep in this county were the white-faced. They were few in number, compared to the flocks at present; and in the highlands were housed in cots every night in winter and spring. A black-faced breed, the black-faced or mountain breed was introduced from the south, and bought in, either when lambs, or at a year old. Their numbers have increased beyond all expectation, since that time, over the whole highlands of Scotland. In gentlemen's enclosures we see different kinds, according to their fancy, or the superior profit expected from one kind more than others.

Horses. The original breed were ponies, twelve to thirteen hands high, and too light for two-furrow ploughs. Four of them were used abreast, as is still the case in some remote places. In the Carse of Gowrie and other lowland districts, oxen were employed to draw the plough, till about 1779; and the horses were only employed to harrow in the seed, to carry out the dung, and bring home the corn to the stack-yard. When oxen were discharged from the plough, it became necessary to purchase larger horses than were then bred in the county; and the markets of Glasgow, Falkirk, Stirling, and Perth were resorted to for that purpose; which practice still continues.

At present some Northumberland stallions have been procured by proprietors, and lent to their tenants in order to raise an improved breed.

Swine. The prejudice against swine's flesh was such, that, not many years ago, no Highlander would touch it; that is now fast wearing off, and the culture of swine extending.

There is a *rabbit warren* at Dunkeld, and red deer and roes in two or three places. There are also three or more kinds of fallow deer in the county.

Bees much attended to, and found profitable. Paterson of Castle Huntly sows mignonette for his bees, which gives the honey a delicate flavour. He also sows the same. The honey of beans is pale; the honey of heath brown. Their flavour is also different.

7. Political Economy.

Roads wretched before 1745; still only bridle roads in many places of the interior. No canals; salmon fishery to a great extent on the Tay. Linen manufactures, bleaching, and various other manufactures and public works. The principal salmon fishery is rented by Richardson from different proprietors, and for the sum of 7000*l.* a year. There are five ovens, which produce from 100 to 200*l.* a year.

7850. ANGUS or FORFARSHIRE. 532,243 acres, one half, or more, of clayey and alluvial lowlands, and the remainder mountain pasture, moor, and bog. The climate cold, moist, and variable. It is both an agricultural and manufacturing county, and in respect to antiquities, facilities of further improvement, natural productions, &c. of great interest. The botanic family of Don are of this county. A most valuable report has been furnished by the Rev. James Headrick, and is the last of the Scotch reports which has been published. (*Headrick's General View*, 1813.)

1. Geographical State and Circumstances.

The *Grampian mountains* abound in granite, which contains topazes, or rock crystals. Quartz, mica, porcelan stone, lead, limestone, slate, jasper, porphyry, breccia, and shell marl occur in various places. The Loch of Forfar abounds with shell marl, which is taken out by scoops, and thrown into boats, by which it is conveyed to the coast. The scoops consist of a large iron scraper, somewhat similar to the Dutch hoe, which has a long wooden handle fastened into it, and a bag of strong leather fastened by whipcord around its rim. The bag is perforated by small holes, to allow the water to drain off, and has a thong at its bottom, by which it can be turned over, and its contents discharged into the boat. After the boat is firmly fastened by anchors, extended from each end, one man forcibly presses down the scoop to the bottom, by means of a long pole at the stern of the boat, while another man, by means of a windlass, or wheel, at the fore end, turns round the end of the bag, draws the scoop along the side of the boat, by a rope attached to it, and then raises it up to the boat's side, where the contents of the bag are emptied into the boat. When the boat has received her load, the marl is thrown out upon a wooden platform at the side of the beach, to be dried.

Soudstone flags are very abundant in the neighbourhood of Arbroath, and are quarried and exported in great quantities. Principal quarry, Carmyle; the flags rise from three to six inches of any portable dimensions. They are called slate-stone flags, but are in fact a soft, bluish, bluish-green, or greenish mica or tirk, of a greyish blue colour; and this mica occasions their easy separation from each other. With very thin plates, called slatestones, houses are covered; they are laid in "plaster lime" or moss (*Sphagnum palustre*), but they seldom make a roof that is water-tight, and slate is now considered cheaper. A most valuable property of the flagstone is, that when laid as pavement on wet soil, they never show this on their upper surface; so that they are excellent for paving kitchens, passages, paths in hot-houses, &c. Coal searching for, at the time the report was printed, is not carried on in any considerable district being considerably out of the boundary of the known coal fields of Scotland. No minerals worked; various chalybeate springs. No rivers, but a number of streams that are of moderate size. Considerable sea, and some salmon fisheries. The herring fishery is very important in this county, and considerable quantities taken in June, July, and August. Those earliest taken were plump and fat, which shows that all former theories concerning this most nutritive and abundant of all fishes are erroneous, and how much it imports the interests of Britain, that the herring fishery should be conducted according to the Dutch method, in the deep sea, and in the Isle of Man, from May to September. Garvies or sprats, and sprirlings or smelts, abound in the Frith of Tay. The sprats resemble herrings, though of smaller size, and of a different flavour. They are taken in great quantities in the open sea, and in places near the junction of the Forth with its estuary, by nets or wicker traps, sunk in the ebb of the tide. The smelts are smaller than the sprats, and when fresh, emit a smell resembling that of green rushes; but when fried, make delicious food. They are caught in the open sea, along the Forth, often as far up as the Bridge of Stirling, by nets in the form of baskets, fastened to the end of long poles.

Haddock, whittings, &c. cured by smoke, a practice first suggested by Headrick, the reporter, in an essay published by the Highland Society of Scotland. Dunrobin, Dumfriesshire, in this county, first suggested the idea of conveying salmon to London packed in ice. Reporter remembers when servants in the neighbourhood of Stirling used to stipulate that they should not have salmon oftener than thrice a week; now they seldom have them.

Every river is said to have its particular breed of salmon. They have recourse to fresh water, to escape the attacks of seals, otters, and porpoises, and to get rid of the sea-louse, a small black animal, whose attacks seem to inflict upon them excruciating tortures. A few gulps of river water seem either to kill the sea-louse, or to deaden the pain it inflicts. Salmon never remain longer in fresh water than is necessary to effect the purposes which brought them there; but sometimes they are surprised in the rivers by long droughts, and cannot get over mill-dams, and other obstructions which lie between them and the sea. When this happens, they soon get lean and mangy, and die, their bodies covered with white worms. But in fresh water, they take various kinds of bait, and eagerly catch at flies, and other insects, and are very susceptible to the angler. During autumn, the salmon always run up the rivers to deposit their spawn.

The spawning of salmon seems to be a very slow and laborious process; and they get very lean, and even become unwholesome food, while they are engaged in it. The scene of this operation is generally where a stream begins to issue from a stagnant pool, over a sandy bottom. They begin by digging a hole in the bottom, by pushing the sand and gravel before them with their snouts, in the direction of the current, until they raise it into the form of a bank, which checks the rapidity of the current, while it allows the water to percolate slowly. The male seems to exert himself most in this work; and before its commencement, his snout becomes longer and harder than usual, while, before it is finished, it is often worn entirely away. While the spawn is being thrown, the male and female rub their bellies upon each other; the latter throwing out her roes or eggs, while the male emits among them a milky juice, which seems to effect their impregnation. After one stratum of eggs is deposited in the artificial hollow described, they cover them with light sand, to prevent them from being washed away by the water; and thus they form alternate layers of eggs and sand, until the hollow be nearly filled up. The eggs being dropped into a hollow place, are warmed into life by the sun's rays, in the spring. The fry, being of a very small size, easily escape from the river, being of loose sand, and soon acquire the size of small trout, and are called salmon fry, or smolts; which seems to be a contraction of *smelt*. The first

flood now washes them into the sea; and they are generally swept from our rivers before the middle of May.

Salmon trout, or grises, which ascend the rivers towards the close of the fishing season, are by some considered a distinct species distinct from some of our British fishers assure the reporter, that they proved by experiment, that grises are only salmon of one year's growth. (*Rep.* p. 105.)

The sea trout re-embles the salmon, and fr. quents all the streams where it abounds.

Fresh water eels, contrary to the practice of salmon, breed in the sea, and thrive and fatten in the fresh-water lakes and ponds. During summer, myriads of their young fry are seen constantly ascending the fresh-water streams, where they keep near the sides, that they may avoid the current. In places where they meet with interruption, such as behind a mill-wheel, they often accumulate in large masses, and frequently make their way up the crevices of the building, or over the dry land, until they reach the stream above, in which they continue their course. The larger eels are caught in this country, while they are descending the streams during autumn, probably to deposit their spawn in the sea.

The observations of the reporter on various other species of fish, and on salmon and other fisheries, are, like every thing which flows from his pen, new and interesting.

2. Property.

Much divided, largest estate 12,000*l.* a year; property, at an average, chiefly its proprietor every forty years. During the dark night of super-stition, a man could take no step respecting his property, or his domestic concerns, without having had a dozen or a score of priests to advise him; and he was obliged to compound for the safety of his soul, and the security of his property, by ann's donations to the church. When a man died without granting these donations, it was presumed to be his intention to do so; and what was originally an alms, or favour, was claimed as a right. In our days, a man can hardly venture upon any step of importance without having a posse of lawyers at his elbow; and, after all, often finds himself as far from his purpose as if he had not employed them.

3. Buildings.

Sixty gentlemen's seats enumerated; not many with handsome buildings. Farm-houses and cottages most wretched, and slower of improvement than in most other counties.

4. Occupation.

Farms all sizes, but chiefly small. On the Grampians, estimated by the number of sheep they will maintain.

5. Implements.

Old Scotch plough still used in a few remote places, and found an instrument well adapted for breaking up waste land that is encumbered with the roots of shrubs, or with stones. At no remote period, it was used to yoke four or six horses, abreast in the plough. The driver walked backwards before the horses, and struck them in the face to make them come forward. At present this plough is commonly drawn by four sometimes by six horses, which are yoked in pairs, and the driver walks beside them. Bute, or a cart for the purpose already specified, the plough which was first invented by it is late small, nor Dalkeith, and from h. an named small's plough, is universally used.

A *threshing-machine*, of a very peculiar construction, adapted to every high falls of water, erected at Dumfriesshire, by Stirling, an ingenious man; but is not yet perfected, and if it were, could never become general.

A *pick or lever* with a tread, used in the same manner as a fork or spade, for loosening hard earth or gravel; in fact it may be called a one-pronged fork.

6. Tillage.

Following general. Seed-wheat washed with a ley of soft soap, to remove the smut. Potatoes introduced to the gardens in 1745, but not to the fields for many years afterwards. The late Dr. Walker, Professor of Natural History in the University of Edinburgh, was in the habit, especially during years of scarcity, of using yams in place of bread in his own family. He cut them into thin slices, and either boiled them over the fire, or dressed them in the frying-pan with as much lather as prevented the pan from burning. When dressed in this way, their taste was very pleasant, and they were used in all cases where bread is commonly used.

7. Gardens and Orchards.

A great prejudice in favour of covering wall trees with nets, to preserve the blossoms from the frost; woollen nets preferred.

8. Woods and Plantations.

Few woods, but many plantations. In the mosses the trunks of large trees found.

9. Rural Economy.

Farm-servants live chiefly on oatmeal, and potatoes and milk. Their breakfast is porridge, which is made by straining meal among boiling water, or milk, in a pot over the fire, with a little butter, when the cook is satisfied with the quantity. It is used *brose*, which is made by pouring warm water upon meal, in a wooden dish, with a little salt, taking care to stir it well. This too is eaten with milk, or with beer which is furnished in place of milk, when the latter is scarce. Sometimes, when they are very hungry, they mix the liquid with the meal in a cold state. Their usual dinner is oat-cake, with sometimes butter or skin-milk cheese, and milk. Their supper is the same with breakfast, except that sometimes they use souse or potatoes, in the place of porridge or brose. Butcher's meat is only used on particular occasions; and fish by those who are near the rivers and the sea-coast.

Much ridicule has been thrown on the Scotch, on account of their immoderate use of oatmeal. This has been represented as arising from their blood being vitiated by the use of a disease called the *Scotch scald*; and other cutaneous eruptions. But oatmeal is as much used in some districts of England as in any part of Scotland; and cutaneous eruptions are much

more frequent in some of these districts than they are here, where they are seldom or never heard of. The latter ought rather to be ascribed to dirty linen or clothing, than to oatmeal, or any particular species of food. Oatmeal, when it is sufficiently diluted with any sort of liquid, is known to be a laxative aperient, wholesome, and at the same time a strengthening food, which is engaged in hard labour. Engineers, who superintend the excavation of canals, have assured the reporter, that those labourers who lived entirely upon oatmeal and milk did a third more work than those who used butcher's meat, beer, and spirits. All of the former saved money, while many of the latter involved themselves in debt. As this sort of work is done by the piece, it affords a fair

comparison, not only of the wholesomeness of oatmeal in promoting health, but of its power in supplying labour.

All families that have a house of their own use tea and wheaten bread; but among cottagers this is a rare and always a ceremonious entertainment, at christenings and other solemn occasions.

Several agricultural societies: the first founded by Dempster of Dunichen, an eminent improver. An account of the native plants and animals of the County by Don, the celebrated Scotch botanist, who resided at Forfar, possesses great interest for the naturalist. Indeed the whole survey ranks, in this respect, with that of Farey of Derbyshire.

7851. KINCARDINESHIRE or MEARNES. 243,444 acres, chiefly of mountain, but containing about one third of culturable surface. The climate is severe and hilly. The soil is gravelly, mossy, or clayey, and scarcely any where naturally fertile. The only minerals are lime, found in a few parts, and granite, whin, and freestone. Improvements commenced in this county about the middle of the eighteenth century, and have since been carried on with great spirit. (*Robertson's General View, 1795.*)

1. Property.
In few hands: largest estate 40,715 acres, the rest in eighty or ninety estates.

2. Buildings.
Some old farm-houses still remain, built of stone and turf, and in all respects wretched; but as leasars are renewed, new farmhouses are erected on the most improved plans, with commodious dwelling-houses. So much cannot be said of the cottages, which have undergone very little alteration in structure, for a long space of time. The habitation of the farmer may have advanced in elegance and accommodation a hundred fold; but the cottager still lives in the same simple kind of fabric as his ancestor did in the most remote ages of civilization. A cottage built of stone and turf, or more generally of stone and clay, commonly consists, like the ancient farmhouse, of two apartments divided by the furniture. In each of these there is a fire-place and a window. The fire is still without a grate; but the window has two, and in some cases four, panes of glass. The house may be about thirty feet in length, and twelve feet (seldom more) in breadth, in the inside. The walls never exceed six feet in height; and the roof is covered first with thin sods, and next with thatch, carefully renewed from time to time, and tied firmly on with straw ropes. The whole has much the appearance of a low hay-stack. Every cottager has a little garden or kail-yard; and many of them bestow much care, and show no little taste, in its cultivation. Besides raising different kinds of coleworts, cabbages, onions, carrots, &c., for the pot, they frequently have rows of gooseberries and currant bushes, together with roses and other flowering shrubs. Some of them decorate the walls of their houses with honeysuckles, or with ivy; and in some instances with cherry and apple trees.

The furniture of a Mearns cottage consists, in general, of two close wooden beds, which are so arranged as to make a separation between two apartments; one or two wooden chests for holding clothes; a cask for holding meal; a set of dairy utensils; an iron pot or two for cooking the victuals; a gridle, or heating iron, for toasting the bread; and a few dishes, some of wood and some of stone ware. Two or three chairs or stools, and a press or cupboard for holding the crockery ware, and the bread, the cheese, the butter, and, at times, the whisky bottle. A tea equipage, on a small scale, has also of late become an indispensable article of cottage fur-

niture; for tea-drinking has now found its way every where. It seems to be a gentle species of ebriety, which sets the imagination and the tongue at work, without incurring the imputation of drunkenness, or breaking any one precept, human or divine. Wherever it is once introduced, it keeps its ground as certainly as snuff or tobacco, and becomes nearly as inveterate a habit; so that finally it serves as a manufacture of years, and lime that it is a luxurious gratification. The value of the furniture of a cottage may be estimated at from ten to twenty pounds.

The cottagers are moderate and plain in their food; but they are not so to their clothing. Hardly any thing but English manufacture will serve them. At Kirk and at market, it is difficult to distinguish the man from the master, and still more so, the maid-servant from her mistress. Either the one or the other have seldom less than five pounds worth of clothes, and often twice that value, on their back at once.

The village of Laurence-kirk was founded by the late Lord Gardenstone, about 1760, and in 1781 he procured a charter by which it was declared a burgh of barony. There is an excellent inn here, with a library and museum for the use of the travellers. There is a manufacture of cyanic acid snuff-boxes; and the lands in the neighbourhood have been raised in value from ten shillings to three and four pounds per acre.

3. Occupation.
Arable farms of various sizes: many small; some 400 or 500 acres. Hill pastures let in tracts by the thousand acres. One farm occupies 30,000 acres. Leases formerly let on periods of two or three times nine or ten years, with sometimes a life-rent after; of late the term seldom exceeds nineteen or twenty-one years, unless when great improvements are expected to be made by the tenants. The arable land is cultivated under judicious rotations, in which either turnips or clover enters, according as the soil is light or clayey. The mountains are devoted to the breeding of cattle. There are few or no public gardens or orchards, but great extent of young plantations, and some patches of native birch and hazel copice. The cattle are a small, hardy, kindly feeding breed. Horses of the Clydesdale variety are reared by many farmers, and most kinds of improved stock have been tried. Bees are generally kept. There is a good deal of sea-fishing, and some valuable salmon fisheries; but excepting ropes, nets, canvases, &c. there are no manufactures of any consequence.

7852. ABERDEENSHIRE. 1,270,744 acres, one sixteenth of Scotland, and one fiftieth of the area of Great Britain. The surface for the greater part not very irregular, but hilly and mountainous in the district adjoining Inverness-shire: the soil in general clayey and moory; the climate milder in winter than that of Middlesex, owing to the circumambient sea, but the summers short and cold; the agriculture assiduously pursued, and the products chiefly corn and cattle; — the greater part planted with trees. The report of the county is more than usually intelligent, and contains two preliminary sections, on the lessons which other counties may derive from Aberdeenshire, and on the improvements which this county may derive from others. Aberdeen exhibits a successful example of spade and plough culture combined, in the small holdings of tradesmen, mechanics, cow-keepers, and gardeners; and may profit from other counties southwards, by greater attention to collecting manure, employing women and children in the lighter operations of husbandry, and limiting tenants to a certain number of subtenants. The celebrated Dr. James Anderson farmed extensively in this county at Mounie, now the property of his eldest son, Alexander Anderson Seaton, a distinguished horticulturist. (*Keith's General View, 1811. Edin. Gaz. 1827.*)

1. Geographical State and Circumstances.

No metals or coal, and very little limestone, but abundance of excellent granite beds, and every sort of building stone, and exported to London in great quantities. Besides the durability, there is one other excellence attending the use of this stone; the expense of carving it has simplified the style of architecture. The Braemar mountains abound with cairngorms and other precious stones; some topazes and beryls have been found, the latter of great value.

2. Property.

Much divided; only two or three large estates. Lord Aberdeen's the most valuable, consists of 50,000 arable acres, and 25,000 waste.

3. Buildings.

A number of ruined castles and religious buildings, and a few handsome modern houses. An article describing the list of gentlemen's seats, which are very numerous. Farm-houses, formerly wretched structures of clay, turf, and thatch, are now greatly improved; cottages improving. "Decent farm-houses" first began to be thought of about 1760. In 1794, Dr. Anderson observes in his report of the county on which the present one is founded, that they are "for the most part very poor. This," he adds, "highly impolitic. Nothing contributes more to the content and convenience of a farmer, than good and well disposed buildings. It elevates his mind; gives him spirit to pursue his operations with alacrity; but contributes, in many instances, to augment his profits. I never yet saw a thriving tenant who had not good houses. But on no account should he be induced to expand that stock upon building houses, which should be employed in extending his own proper business. The only ways to be done by the landlord; and, in general, a good set of houses upon a farm, will bring him much greater additional rent than the interest of

the money expended upon them. Nothing will prove such an allurement as good buildings, and long leases on equitable terms." Since 1794, when Dr. Anderson wrote the above paragraph, we have got farmers from Berwickshire, Angus, Mearns, and other southern districts, who have taken farms in Aberdeenshire, and many of whom have shown excellent examples in agriculture, as well as improved their own capital; and the native farmers of the county, in consequence of their example, both in requiring good houses, and in raising good crops, are now in a much more flourishing situation.

4. Occupation.

The greatest diversity in the size of farms; from six acres to thousands; scarcely a mechanic, journeyman, or master, who has not a farm of one acre or two, or a garden; besides the produce, they find the labour highly conducive to health, by counteracting the effect of in-door confinement, and prolonged unfavourable bodily postures, or contaminating respiration.

5. Instruments.

Turnips formerly sown from a small tin box, nine inches long, and one inch square, with two or three holes at one end, through which the operator shook out the seeds; thinned by a part of the blade of an old scythe fastened to a bit of iron like a common hoe; the advantages of the former in its sharpness, but it is easily broken. A child's cradle rocked by water.

6. Enclosures.

Stone fences, or ditches and earthen banks, the common fences; this frees the land from loose stones, which abound every where, or serves to drain it.

7. Arable Land.

Potatoes, as well as various other improvements, first introduced to field culture after the calamitous year 1782; not liked by farmers so well as the turnip. The reporter tried various experiments in distilling from potatoes, which are recorded in

1760, it may safely be concluded, that agricultural knowledge was neither so lit for nor desired. The mode of management which has been practised in these counties, and in other parts of the highlands, and which has been handed down from father to son for many generations, is still to be found in the midst of the most improved districts. We still see the arable land divided into small crofts, and many of the hills occupied as commons. On the west coast particularly, the ground is seen covered with heaps of stones, which have been taken from the divisions between the fields; so that a considerable portion of the land, capable of cultivation, is thus rendered useless, by the indulgence of the most unpardonable sloth. The management of the native farmers is most destructive. The soil of one field is dug away to be laid upon another, and crop succeeds crop, until the land refuses to yield any thing. It is then allowed to rest for a season, and the weeds get time to multiply. Such, we must suppose, was the system of farming before the rebellion; we cannot imagine it to have been worse.

2. Buildings.

The old highland tenantry are universally ill accommodated. They live in the midst of filth and smoke; that is their choice. But wherever farms have been laid out on a proper scale, and are occupied by substantial and well-educated men, we find the farm-houses and offices handsome and commodious. Every proprietor who wishes to see his estate rapidly improved, will erect suitable buildings, at his own expense, before he invites a good tenant to settle on it. The interest of his money will be always cheerfully paid; and if the landlord agrees that the repairs shall be made at the mutual expense of himself and his tenant, the latter will thrive, and the former will never have to demand his rents twice. The present race of highland tenants will yet find themselves much happier, and more com-

7855. CAITHNESS. 305,680 acres, three eighths of which is deep, mossy, and flat moors, covered with heath; three eighths mountain, moor, and some hilly pasture; and the remainder in cultivatable land, lakes, &c. There is very little wood, either natural or artificial; but excellent lime and freestone. On the whole it is one of the coldest, wettest, and most dreary counties of Scotland; and is in no way remarkable, unless for being the scene of Sir John Sinclair's practical attempts at improvement. Of these the chief seems to have been the enlargement of the town of Thurso; of which, and of various other schemes, ample information is given in the report, and in a number of appendices to it, by Sir John himself. (*Henderson's General View, 1812*.)

1. Property.

Is in a few hands, and the Irish practice of tacksmen tenants exists, and has existed from time immemorial in the county. These tacksmen, as they are called, generally occupy a part of the land themselves, and sub-let the remainder to the small farmers, for a certain annual payment in grain, customs, and service (the latter in many cases unlimited); so as to have, upon the whole, a surplus rent for the trouble and risk of recovering their rack-rents from the sub-tenants.

A few young men from the south of Scotland have been brought to this county, to introduce the practice of modern husbandry. These, from time to time, have taken farms in this county; but whether their agricultural skill was superior, or that they did not understand the mode of farming best adapted to this cold and mountain climate, they have neither increased the crops, nor improved the landlords' farms placed under their direction; nor has their industry or skill produced better crops on their own farms than what is raised by a similar class of the county farmers, who have never been out of it.

7856. SUTHERLAND. 1,872,000 acres, chiefly of mountain and moor; and a climate about a fortnight later than that of Edinburgh. The greater part of the county is the property of the Marquess of Stafford, whose astonishing, masterly, and successful work, from which we derived so much information again recur. (*Henderson's General View, &c. Loch's Improvements of the Marquess of Stafford, &c. 1819.*)

The *statute of Sutherland* has only lately undergone that change which began to operate in England as early as the reign of Henry VII. This change had for its object the creation of a middle class, by the depression of the barons and the raising up of the next class of the community. This object was gradually and successfully accomplished in England by the time of Queen Elizabeth, and in the south of Scotland soon after the union of the two kingdoms: but the highlands, or most northerly counties, underwent no change till the discomure of the pretender, and the abolition of the heritable jurisdictions then existing in the north, in 1747. This invaluable act having brought the highland chieftains within the pale of the law, and placed them on the same footing as the other gentlemen of the land, they began rapidly to acquire the same tastes, to be occupied with the same pursuits, to feel the same desires, and to have the same wants as their brethren in the south. In order, however, to induce the peasantry, and to be able to appear in the capital with due effect, it was necessary that they should convert their estates to that mode of occupation most suited to their circumstances, and from which they could derive the greatest income. Luckily in this, as in every other instance, the interest of the community, of the individual, and the prosperity of the state went hand in hand. And the demand for the raw material of wool by the English manufacturers, enabled the highland proprietor to let his lands for quadruple the amount they ever before produced to him. These arrangements soon produced the effect intended. From time to time, in the southern and central highlands, up to about the commencement of the French revolution war; not always, however, without serious resistance on the part of the people.

The northern highlands still remained to undergo that change which the rest of the island had already adopted. In this district it naturally began to be followed in the counties situated nearest to those into which it had already been introduced. In Ross-shire, accordingly, it was undertaken on a great scale, in 1792. The disastrious war was carried to effect, and the most serious affairs took place, and the military had to act, and blood was shed before quiet was restored. Between that time and 1815, the greater portion of the county of Sutherland, so long as the late Lord Stafford was arranged according to those plans so universally adopted. This ancient condition of society prevailed longer on the estate of Sutherland than in any other part of the island, on account of its difficult access

portable, in the capacity of servants to substantial tenants, than in their present situation. The dwellings of cottagers are not worse than those of the native farmers. The same roof covers the children, cattle, dogs, pigs, poultry, &c. It must afford great pleasure to every lover of his country to observe the neat cottages that are erecting in every part of the country; but it will long ere the people will learn the comforts of cleanliness and the use of chimneys. In many places where these have been constructed, the people do not use them, but prefer breaking a hole in the roof of the house, and lighting their fire on the floor. Smoke, they say, keeps them warm.

The occupation and management of land is the same in all other mountain districts. Some grain, chiefly oats, is raised in the low grounds, with root and herbage crops, and the pastures are devoted to the breeding of cattle and sheep. Every improvement is tried by the principal proprietors; and enlightened farmers from the south of Scotland, accustomed to breeding, succeed to settle on these estates, by long leases and moderate rents. From the smaller native farmers take an example, inasmuch that they would from the operations of proprietors, which they are apt to consider as at least of dubious value. When a rent-paying farmer, however, adopts plans new to them, the case is very different. Of woods, in this district, there are very few; but many plantations have been lately made round gentlemen's seats, especially Lord Seaforth's. In 1821, Colin Mackenzie, Esq. of Kilsay, planted 300 acres with 5000 trees; the sort, oak, Scotch pine, larch, alder, birch, &c. and some ornamental trees. (*Highl. Soc. Trans. vol. vi. p. 258.*)

The great post roads in this district have been made, in part by government, and in part by the proprietors. There is a cotton manufactory at Cromarty, and the reporter suggests the mode of manufacturing tar from the trunks of fir trees, found bedded in all the mosses of this and other highland districts.

The principal farmers in the county under review are intelligent gentlemen, who have been for some time in the army, or followed other vocations, either in the southern counties of Scotland or in England, who work their farms upon the principles of modern agriculture, as practised in the southern counties of Scotland, as far as the state of the county, as to climate, roads, the means of improvement, marketing, &c. are adapted to a much greater expense than is done to the southward, and, of course, much less benefit to themselves. In general they have other sources of income, which enable them to live in a social and comfortable state in society; they are better educated than farmers paid a similar rent in England; agricultural knowledge, therefore, is soon circulated amongst them.

The smaller class of farmers, with but few exceptions, are industrious, sober, sagacious, and moral in their behaviour. They have, unfortunately, a turn for litigation, and expend more money than they ought to do in law, by which their circumstances are often injured.

across the Dornoch and other friths, and the total want of roads in the county till 1809. The statute of Sutherland (*fig. 1151. a, a, a*), including the barony of Assynt (*b, b, b*), and the late purchases made by the Marquess of Stafford, up to 1819, was computed to cost more than 800,000 acres. The estate of Lord Keay (*c*) is more than half that extent; it was purchased some time ago by the Marquess of Stafford, and annexed to his own estate. The residue of the county belongs to different smaller proprietors (*d* to *n*).

In 1809 was begun a line of road, conducted according to the best principles of the art, and made in the most perfect manner, from the town of Inverness by Bonny and Dingwall, to the boundaries of the county of Sutherland; two excellent stone bridges, consisting of five arches each, having been built across the Bonny and Conon rivers. The two principal obstructions these roads had to contend with, and to surmount were those which were occasioned by the two friths of Bonoch (*fig. 1151. l*) and of Loch Fleet (*2*). The former, especially, presented obstacles of considerable moment, arising out of the width of the channel, and the want of a proper foundation on which to construct a bridge. If the same plan had been followed in the frith of Bonoch, the instance of which is in the southern ferries, namely, of ascending to the point at which the frith terminates and becomes a river, it would have carried the road so much into the interior, as to counterbalance those advantages which are at all times obtained by the substitution of a long and narrow bridge, in preference of a short one, once established. To avoid either of these inconveniences, a very careful survey of the whole frith was made; and the engineer, Telford, determined to recommend the construction of an iron bridge of magnificent dimensions (See an engraved view in the *Ed. Encyc.*) at Bonny, a point where the frith narrows itself considerably, and above which it again expands, though not to its former dimensions. This structure consists of an extensive embankment, with two stone arches of fifty and sixty feet span, respectively; and one iron arch of 150 feet span. It cost 15,000*l.* From this point, the heritage of the frith narrows itself, a road (*4, 4*) to Tongue (*e*), the seat of Lord Keay, situated upon the Northern Ocean.

In many places, these roads are cut through the hardest rock; in others, they are obliged to be supported on embankments of solid masonry. Extensive drains are constructed to prevent mountain floods, and bridges over the innumerable streams that rush from the hills in every direction, are required. These

must be formed of the most durable materials, and the best workmanship, to resist the impetuosity of the torrents. Nothing will set this in so striking a point of view, as to state, that upon the projected road to Asynt, a distance of forty-six miles,

three bridges of three arches each, two bridges consisting of one arch of forty feet span, five of twenty feet span, three of twenty-four, six of eighteen, two of twelve, besides many others of inferior dimensions, would be required. On the Stafford

1131

NORTHERN OCEAN

estate excellent inns, often combining farmer's, have been built in a number of places at an enormous expense. As an example, we may refer to one (fig. 1132) containing an outer kitchen and servants' stair (a), with a pantry (b), two best parlours, with invariable partition for great occasions (c), principal entrance (d), a small parlour (e), small room (f), kitchen (g), back kitchen and servants' stair (h). Over are five bedrooms, and nine garrets for beds.

Thus, in the course of twelve years, has the county of Sutherland been intersected, in some of its most important districts, with roads, in point of execution superior to most roads in England. And owing to the equally praiseworthy exertions of the counties of Ross and Inverness, on the one hand, and of Caithness on the other, the same perfect means of communication now exists, from the burgh of Inverness to the town of Thurso upon the North Sea.

Five districts of Scotland possess so small a proportion of land fit for cultivation, compared with its extent, as Sutherland; and previously to the year 1811 but even a small portion of that was brought into cultivation. Each shore is fringed (if the expression may be used) with a narrow border of arable land, which, on the south-east coast, extends from a few hundred yards to about one mile in breadth: the interior consists entirely of mountains.

The lands were let to tacksmen, as in Ireland, till in latter times, when a certain district was let to the whole body of tenants resident in each "town or township," who bound themselves, conjointly and severally, for the payment of the whole rent. This land was held, as expressed in Scotland, "run rig," or like common field land in England.

The effect of this arrangement was to scatter thickly a hardy, but not an industrious race of people up the glens, and over the sides of the various mountains; who, taking advantage of every spot which could be cultivated, and which could with any chance of success be applied to raising a precarious crop of inferior oats, of which they baked their cakes, and of bere, from which they distilled their whiskey, added but little to the industry, and contributed nothing to the wealth, of the empire. Impatient of regular and constant work, all the heavy labour was abandoned to the women, who were employed, occasionally, even in dragging the harrow to cover in the seed.

To build their hut, or get in their peats for fuel, or to perform any other occasional labour of the kind, the men were ever ready to assist; but the great proportion of their time, when not in the pursuit of game, or of illegal distillation, was spent in indolence and sloth. Their huts were of the most miserable description. They were built of turf, dug from the most valuable portions of the mountain side. Their roof consisted of the same material, which was supported upon a rude

wooden frame, constructed of crooked timber, taken from the natural woods belonging to the proprietor, and of moss-turf dug from the peat bogs. The situation they selected was uniformly on the edge of the cultivated land, and of the mountain pastures. They were placed lengthways, and sloping with the declination of the hill. This position was chosen, in order that all the filth might flow from the habitation without further

1132

exertion upon the part of the owner. Under the same roof, and entering at the same door, were kept all the domestic animals belonging to the establishment. The upper portion of the hut was appropriated to the use of the family. In the centre of this upper division was placed the fire, the smoke from which was made to circulate throughout the whole hut, for the purpose of conveying heat into its farthest extremities. The effect being to cover every thing with a black glossy soot, and to produce the most evident injury to the appearance and eyesight of those most exposed to its influence. The floor was the bare earth, except near the fire-place, where it was rudely paved with rough stones. It was never levelled with much care, and it soon wore into every sort of inequality, according to the hardness of the respective soils of which it was composed. Every hollow formed a receptacle for whatever fluid happened to fall near it, where it remained until absorbed by the earth. It was impossible that it should ever be swept; and when the accumulation of filth rendered the place uninhabitable, another hut was erected in the vicinity of the old one. The old

rafters were used in the construction of the new cottage, and that which was abandoned, formed a valuable collection of manure for the next crop.

The introduction of the potato, in the first instance, proved no blessing to Sutherland, but only increased this state of wretchedness, inasmuch as its cultivation required less labour.

So long as this system just described remained in full force, no attempt could be made to improve or meliorate the situation of these poor people. To better their condition, however; to raise them from such a state of continual poverty and occasional want; to supply them with the means, and to create in them the habits of industry, was, and is the bounden duty of the owners of every such property. And it was not less their duty to do so, because the same arrangement which was calculated to produce this salutary effect, was at the same time the best suited to increase the value of their property, and to add to the general wealth of the community.

The fundamental principle of agricultural improvement in this case was derived from no speculative reasoning, but from what has actually taken place in a different but similarly circumstanced part of the kingdom.

It is well known that the borders of the two kingdoms were inhabited by a numerous population, who, in their pursuits, manners, and general structure of society, bore a considerable resemblance to that which existed in the highlands of Scotland. When the union of the crowns, and those subsequent transactions, which arose out of that event, rendered the maintenance of that irregular population not only unnecessary, but a burden

to the proprietor to whom the land belonged, the people were removed, and the mountains were covered with sheep. So that it had been for a length of time proved by the experience of the stock farmers of those mountain tracts which comprise the northern districts of England, and the southern parts of Scotland, that such situations were peculiarly suited for the maintenance of this species of stock. Taking this example as their guide, experience had still further proved, that the central and western highlands of Scotland were equally well calculated for the same end. Reasoning from this success, and observing that the climate of Sutherland, owing to its vicinity to the ocean, and to its being considerably intersected by arms of the sea, and much more moderate than this latter district, it was fairly concluded that this county was even better fitted for this system of management than the heights of Perthshire and Inverness-shire. The inferior elevation of its mountains contributed still further to this effect, and held out every encouragement to adopt the same course which had been pursued with such success in both parts of the kingdom.

The propriety of converting the mountainous parts of the county into sheep-walks was in this way rendered evident, provided the people could be at the same time settled in situations, where, by the ex-ercise of their honest industry, they could obtain a decent livelihood, and add to the general mass of national wealth, and where they should not be exposed to the recurrence of those privations, which so frequently and so terribly afflicted them, when situated among the mountains.

The principle of providing for the lower class of tenants by the establishment of fisheries was thus derived:— It had long been known, that the coast of Sutherland abounded with many different kinds of fish, not only sufficient for the consumption of the county, but affording also a supply, to any extent, for more distant markets, or for exportation when cured and salted. Besides the regular and continual supply of white fish, with which the shores thus abound, the coast of Sutherland is annually visited by one of these vast shoals of herrings which frequent the coast of Scot-

land. It seemed as if the local fishermen could by nature that the system for this remote district, in order that it might bear its suitable importance in contributing its share to the general stock of the country, was, to convert the mountainous districts into sheep-walks, and to remove the inhabitants to the coast, or to the valleys near the sea. Several sea-piers were improved by the construction of piers (fig. 1133, a) and breakwaters (b); and the plan of a town being formed, the inn, church, post-office, market-place, and other public buildings, were erected by Lord Sutherland, and the most liberal encouragement given by loans of money, grant of land at little or no rent duty, &c. to fishers, manufacturers, tradesmen, &c., both on a large and

small scale, to come and settle there. Such is the policy of Lord Stafford's operations, in which he has expended, and continues to expend, independently of the cost of improvements on the mansion (fig. 1131), and park of Dunrobin, immense sums. Happily the success has equalled the most sanguine expectations; but for the very interesting details of execution, our limits oblige us to refer to the work of Loch, which, as already observed (7795.), we consider of very singular agricultural interest.

1134

7857. **INVERNESS-SHIRE.** Upwards of 7,000,000 of by far the most mountainous region in Scotland. It reaches from sea to sea on the main land, and comprehends many islands, which are scattered far and wide. The hills and moors were formerly covered with fir woods, the remains of which are dug up in all the moors in abundance. The climate is rainy, mild on the west coast, but less so on the east. The soil of the vales is loamy or gravelly. The principal economical minerals are granite, limestone, and slate; but lead, iron, marble, &c. have been found in different places. The county is remarkable for its native fir woods, and for that stupendous national work, the Caledonian Canal. Improvements were first commenced about Inverness by Cromwell's soldiers. (*Robertson's General View*, 1810.)

1. Property.

In few hands; largest, Lord Macdonald, of the Isle of Skye, the only nobleman who resides in the county. The mountain farms are large, and, as in similar cases, reckoned by miles, or by the number of sheep they are supposed to carry.

2. Gardens and Orchards.

To be found in a few places; and some old pear trees, planted by the monks, are still in a bearing state at Beauly, and one or two other places. There is an excellent fruit and forest tree nursery at Inverness.

3. Woods and Plantations.

The Scotch pine, for the most part, took possession of the south side of the valley, and made choice of a northern exposure; the birch, the hazel, and the oak, occupied the warmest side of every district; while the alder and a few ashes ran along the streamlets. Not only the continental plants, but this natural mantle, but the islands of this country appear, from the fragments of trees found in the mosses, to have been at some remote period, mostly, if not wholly, under forests. The only remains of growing wood at present in the islands are at Portree and Skye, and a little in the island of Raasa.

Trees were burned or felled to make room for men, by enlarging the pasturage of cattle, and affording fresh surface for corn. At present the Scotch pine covers more surface in this county, than all the other kinds of trees taken together; and the natural pine-woods of Inverness-shire exceed the quantity of this wood growing naturally in all the rest of Britain. In Strathpey alone, it is reported, upon authority which cannot be called into question, that fifteen thousand acres of ground are covered with natural firs. On the south-side of Locharkilg, of Glenangry, of Glenmoriston, Strathglass, Glenstrathfarras, and at the head of Lochsheil, as mentioned above, the bounds of country under this wood are reckoned by miles, not by acres. The oak woods of this county are not so large, nor so well taken care of, as those of the other counties. There are extensive birch woods, the timber of which is used for fencing and the coarser articles of husbandry, and the bark for tanning.

4. Live Stock.

Cattle are of the Skye or Kyloe breed, usually, however, known as the highland breed, and is best described. (p. 796.) The cows yield only half the quantity of milk of the breeds of the low counties; generally from two to two gallons and a half; but it is rich, and productive of butter of excellent flavour. The disease of highland cattle are few. The manner of disposing of cattle is as follows: When the drovers, from the south and interior of Scotland, make their appearance in the highlands, which always happens during the latter end of April, or the beginning of May, they give intimation at the churches, that upon a particular day, and in a central place of the district, they are ready to purchase cattle from any who offer them for sale. The drovers are of two descriptions: either those who buy by commission for persons of capital, who, being diffident of their own skill, or averse from fatigue, choose to remain at home; or those who purchase cattle on their own account. Much address is used on both sides, to elude the pulse of the market at these parol meetings, before the price of the season is mutually settled; and it may happen, that many such small trysts or meetings take place in different parts of the highlands, before the price be finally determined. The anxiety on both sides is sometimes so great, that the cattle are given away upon a conditional contract, that if the price rises within

a limited time, the seller will receive so much more; but if the lean cattle fall in value, the drover will get a reduction. Sheep are extensively reared, and generally of the Linton or Lammernuir black-faced sort. The Cheviots are also very prevalent.

Horses either the native pony or improved breeds from the low countries farther south. Horses are frequent in a wild state in all the woody and warm glens.

5. Political Economy.

Roads and bridges have been going forward at the expense of Government ever since 1745, and earlier; and the Caledonian Canal is well known for its magnitude and the excellence of its execution. There are various fisheries on the lakes and coasts; but few manufactures.

As one of the obstacles to improvement, common to this and the other highland counties, and indeed to every county, the remoteness of the habitations of the common people, in adhering obstinately to old and slovenly habits. As men rise in years, the reluctance to make any uncommon exertions, and particularly to introduce change into any thing, which relates to their personal accommodation, gradually grows upon them. Having been long accustomed to a certain course of employment, of gratification, of lodging, of dress, and of food, they resist strenuously the relinquishment of any of these habits; they move on in the current of human life mechanically, like a wheel, without any apparent alteration in their motion, unless it be accomplished by some external force; and, if left to themselves, they never change their course. This propensity to remain the same, and to retain the same customs, is more unchangeable among the illiterate and ignorant, than among the learned or enlightened part of mankind. By means of society, of conversation, and of reading, the latter acquire an enlargement of the mind, to which the former are strangers; and if they are accustomed to reflect on what they hear and see, they are always more open to conviction. When that usefulness of the disposition, which, whether in the rich or the poor, the unenlightened or the refined, is still the child of ignorance, takes fast hold of the mind, it becomes so obstinate, that it can seldom or never be removed. Its universality would lead to the opinion, that it is an original principle in the human frame; its prevalence induces, a habit of prejudice, and a habit of apology which such men urge in their own defence, that their fathers did such things before them, would imply that it is the effect of imitation.

The reporter, notwithstanding the above sentiments, goes on to state that he considers that the prosperity of the world would be more promoted by the steadiness and obscurity of men living in error, than it would be by a spirit of fickleness, and a desire of change. It might easily be shown that the real meaning of such a sentiment is, that those who are already prosperous, that is, those who have already a sufficient share of the good things of life, will stand least chance of losing what they have, while things remain as they are. The prosperity of the world, if unfortunately happens, has hitherto been too frequently understood to mean the prosperity of those only who are already prosperous. This state of things is in the natural course of the progress of society from darkness to light: but it will pass away in its turn, and the time will come when the prosperity of a people will really mean what the words import. When this time arrives, what the reporter would probably call fickleness, and a desire of change, will be found to have had some share in bringing it to pass.

7858. **ARGYLSHIRE.** 2,433,000 acres; the eleventh part of Scotland, and the thirtieth of Great Britain, and nearly the whole of the Scottish kingdom from A. D. 503 to the subjugation of the Picts in 843. The surface of the country is rough and mountainous: in the northern parts "Alps piled on Alps hide their heads in the clouds." The climate is moderately mild, very moist in the vales and on the coast, but cold and severe on the elevations. The soil of the vales is generally light; the minerals are copper, lead, iron, coal, stromtian, freestone, granite, limestone, marble of several different colours, slates, &c., but the two first are not worked at present. There are numerous bays, inlets, and lakes, in some of which excellent fish is caught. The county is in no respects remarkable in an agricultural point of view; it furnishes immense quantities of cattle and sheep to the graziers and feeders of the south; and there are some oak coppices and artificial plantations. (*Smith's General View*, 1810. *Edin. Gaz.* 1827.)

1. Property.

In the hands of 156 owners. Farms of the smaller size reckoned by acres, the largest by miles. One, supposed to be the largest in Britain, is eighteen or twenty in length, by three or four miles in breadth; several contain from two to six square miles; object, as in Inverness-shire, the breeding of cattle chiefly, and next sheep.

2. Improvements.

Have been made by most of the proprietors: some plans of farmhouses are given by the reporter. One is circular, and consists chiefly of cattle sheds; but the elevation is of that mongrel Gothic, which is displayed in most of the modern highland chateaus. The fin-share or Argyleshire plough (2618.) was invented in this county by the reporter.

3. Woods and Plantations.

There are about 30,000 acres of coppice, chiefly oak, birch, and hazel, which, being now valuable for the bark, and the poles to be used as spokes for wheels, is beginning to be en-

closed from the sheep by stone walls. The Duke of Argyll is the chief planter, and his larch plantations are of great extent, and contain an immense quantity of valuable timber. The oldest and largest of the trees at Inverary are supposed to have been planted by the Marquess of Argyll between the years 1650 and 1660. Those of the next largest size and age were raised from the seed by Archibald Duke of Argyll (called a tree-monger by Walpole), in 1740 or 1741. These consist chiefly of larches, New England pines, spruce and silver firs.

4. Live Stock.

Cattle, the west highland breed; the best in the districts of Argyll, Lorn, Hay, Colonsay, and Mull.

Sheep, all lately, much neglected, and of a small size.

Horses, a hardy native breed, larger than the pony.

5. Political Economy.

Roads as in Inverness-shire. A canal from the coal works in Camphelon to the sea: few manufactures. An agricultural society at Kintyre.

7859. THE HEBRIDES, including BUTESHIRE, consist of nearly 300 islands, eighty-six of which are inhabited, and contain 2,037,760 acres of rocky, hilly, and, in some islands, mountainous country, with a severe, unsteady, moist climate, and a soil generally light. Almost all the minerals are found with which the continental part of Scotland is furnished. Slate, lime, granite, marble, and freestone, are in great abundance; and coal has been found in various places, though it has not been successfully worked. Steatite, or soapstone, from which porcelain is manufactured; fullers' earth, and a great variety of other

economical minerals, besides rare and curious species, are found in different islands. (*Headrick's Survey*, 1796. *Macdonald's General View*, 1811. *Edin. Gaz.* 1827.)

1. Property.

In the hands of forty-nine proprietors; highest rental 18,000*l.* and acres 312,500. A great many tacksmen. Those of Islay are said to "combine with the spirit and elegant hospitality indigenous to this country, the accuracy, fidelity, and punctuality in paying, and all the useful qualifications of first rate low country farmers. It must not be forgotten, in mentioning the order of tacksmen, that they are exceedingly useful, and often necessary, for maintaining good order and government in the country. Without their aid, the efforts of the clergy and officers of justice would be painful and unavailing; and therefore they ought not to be rashly banished, were they to be viewed in no other light than merely as subsidiary to the police and moral administration of the Isles.

2. Buildings.

Farm-houses throughout the Hebrides are either houses of tacksmen, of tenants, or subtenants. Tacksmen's houses, though still far behind those of considerable farmers in the principal counties of England and the lowlands of Scotland, are, however, in general, beginning to be tolerably decent and comfortable; and on all the large estates they have been very much improved within the last twenty-five years. Most of them are now built of stone and lime, and roofed with blue slates, two stories high, and furnished with kitchens and other accommodations. In many instances, indeed, the office-houses are still in a deplorable state, but even these are rapidly improving; and should this order of farmers exist for half a century longer, their houses will, probably, be as commodious, and their offices-houses as judiciously planned, as those of the same description of men in any part of Great Britain.

The houses of the occupying tenants are, generally speaking, wretched hovels, and those of the subtenants nasty and miserable beyond description. Pennant describes them as habitations made of loose stones, without chimney or doors, excepting the foggot opposed to the wind at one or other of the apertures permitting the smoke to escape in order to prevent the risk of suffocation. Furniture corresponds: a pot-hook hangs from the middle of the roof, with a pot hanging over a grateless fire, filled with fare that may rather be called a permission to exist than a support of vigorous life; the inmates, as may be supposed, lean, withered, dusky, and smoke-dried.

It cannot be denied, that this picture is, in some degree, realised in a few of the Hebrides, even at the present day.

The cottages in the Hebride are almost universally so miserable, both in plan and execution, that they deserve mention only, as proofs, that a sensitive and sagacious race of men may, by a combination of unfavourable circumstances, not only be gradually brought to endure privations, which, to their equals in other countries, would seem intolerable, but also, in the course of time, may lose the power, and even the will, of surmounting them. Three-fourths of the 40,000 cottagers of these isles live in hovels which would disgrace any Indian tribe; and many of them are found on islands of the first rank in point of population and extent. At least 7000 of the natives of Lewis (for instance) know nothing of a chimney, table, glass window, horse flooring, or even hearth stone, by their own experience at home; and what we call their furniture is, as may be imagined, wretched and scanty beyond description, corresponding with their shabby exterior.

In the woods of the park at Bute are formerly fine specimens of Swiss cottages and other fancy wooden buildings. (*fig.* 1135.)

3. Occupation.

In estimating the size of Hebridean farms, the common plan is to attend to three leading objects: first, the number of live stock which the farms in question can maintain; secondly, the number of bolls of grain which can be sown, or of ploughs requisite for their tillage; and, thirdly, the quantity of kelp that can be made upon them.

Grazing farms, whether for sheep or cattle, must gradually be enlarged; and kelp, or merely agricultural farms, must as naturally become limited and confined in point of extent. The hay on many of the grass-farms, and sometimes the corn on arable grounds, is obliged to be dried by hanging on poles, trees, or rods. (*fig.* 1136.), as in Sweden.

1136

4. Implements.

Some are nearly peculiar to the Hebrides, as the caschorn or crooked spade, (*fig.* 1137.), which, in two parishes in the Isle of Lewis, entirely supersedes the use of ploughs in the raising of corn and potatoes. The great advantage of this instrument is, that it enables the operator to work in mosses or bogs, where no horses can walk, and in stony ground inaccessible to the plough. Many districts of Harris and of Skye would be unproductive of tillage without it. Its superiority to the common trenching spade, or to any tool which penetrates the ground perpendicularly, is very great, resulting both from the ease with which the operator wields it, and the length of the horizontal clod which its powerful lever enables him to turn over.

The *ristle*, or sickle plough (a sort of paring plough), is used for cutting the strong sward of old land, or the tough roots of plants, which would otherwise greatly impede the passage of the plough.

The *clon-moile*, or wooden tong, for drawing thistles, &c. differs little from those in use in England.

1137

5. Arable Land.

Tillage is in its infancy over the Hebrides, in all the isles northward of Mull; excepting half a dozen farms in Skye, a part of St. Leon, of Rasay's estate, two farms in Uist, and a little lately done in Lewis, near Stromaway, and by Campbell, of Islay, on a small island between North Uist and Harris. These improvements have been carried on within the last fifteen years.

It would be rather ludicrous than useful to describe the tillage generally practised in the Hebrides; and, accordingly, we shall not dwell upon it, or insult the common sense of the natives, by seriously requesting them to abandon the many barbarous customs which have so long disgraced their country. A man walking backwards, with his face towards the horse abreast, brandishing his cudgel in their noses and eyes, to make them advance to their enemy, followed by a ristle-plough employing a horse and two men, the three commonly altogether superfluous, still followed by four horses, dragging clumsy harrows, fixed by hair ropes to their tails, and almost bursting their spinal marrow at every tug and writhing of their tortured carcasses. All this cavalcade on ground enclosed, undrained,

1135

and yielding at an average little returns for the seed sown, and sometimes lost altogether by the depredations of cattle, or by accident in a late harvest, is a barbarous spectacle, which must gradually vanish. It will soon give way, as it has already done in Islay, Colonsay, and part of Skye, to improved systems of tillage.

6. Gardens and Orchards.

It is not to be expected that much should be done in gardening, in a district of which by far the greater part of the proprietors are non-resident, nor is the climate suitable for that art. The winds are too violent, and the sun too shy of showing his face. Until trees and other sorts of shelter become, therefore, more general, the gardens and orchards of the Hebrides will probably be little more than an empty name.

7. Woods and Plantations.

In the sixteenth century it appears most of these isles were covered with woods, and even so late as Buchanan's time. One exhilarating remark, however, occurs to the traveller who traverses those bleak and woodless recesses, amidst the melancholy impressed upon him by comparing their present aspect with the description which he reads in Buchanan and Monro, namely, that where trees have formerly grown they will grow again; and that any regions which were once sheltered and adorned by the hand of nature, may still be in a far higher degree improved and embellished by the industry of man.

In Bute the late Lord Bute, in Islay Campbell of Shawfield, and in Skye Lord Macdonald, have planted extensively and successfully, and other proprietors are following the example. The present Marquis has almost naturalised the turkey in the plantations of Bute Park.

8. Live Stock.

The ancient Hebridean breed of cattle is now no longer to be found. Some persons imagine it to be the Skye, others the Mull, and others again the Lewis or Long Island variety. A person habituated to accurate observations on cattle, can easily distinguish those different breeds from one another, and all of them from the larger breed now introduced into Islay, Colonsay,

milder and more equable than that of England; and with the dry soil, as Wakefield remarks, is admirably adapted for pasturage and occasional aration.

7863. *Of the agricultural circumstances of Ireland generally*, we have already given a condensed account (807), and shall here submit some brief notices as to each county. These unavoidably present a degree of sameness incompatible with much interest or instruction. There are agricultural surveys of but a few of the Irish counties; so that we have drawn our resources principally from the copious and highly interesting work of Wakefield, and some more recent statistical writers and tourists. When the first edition of this Encyclopædia appeared, the statistical portion, as far as respects Ireland, was objected to in the *Irish Farmer's Journal*, as representing the agriculture of Ireland as being in the same state in 1823 as that in which it was in 1816, the date of Wakefield's Ireland. We have noticed this in the *Gardener's Magazine* (vol. iii. p. 229.), and have, since then, used every exertion in our power to procure later information from books or correspondents, but without much success. In fact, from all that we have been able to learn, we are compelled to conclude, that even now (1830) agriculture in Ireland is not materially different to what it was in the time when our text-book (Wakefield) was first published.

7864. DUBLIN. 228,211 acres; one eighth in mountain and waste, a tenth in buildings, roads, rivers, &c., and the remainder in arable and pasture. (*Archer's Statistical Survey, &c. 1801. Sup. Encyc. Brit. Edin. Gaz. 1827.*)

The climate of this county is drier than that of some others; east and north-east winds are less frequent than in England, but storms from the south-west and west are more frequent. Average number of dry days in Dublin for ten years, 179; or nearly half the year.

The soil is generally shallow, and the substratum almost universally a cold clay. There is very little turf bog in the northern parts, but some considerable tracts among the mountains in the south. Freestone, granite, Irish slate, ochres, potter's clay, iron pyrites, sandstone, poplary, crystals, limestone, and limestone gravel, abound in various parts.

Landel property in this county is a much more marketable commodity than in most other districts of Ireland. There are here no large territorial domains. Leases vary in their terms, but commonly include a life for the purpose of creating a vote.

Furms are in general very small near the city, seldom more than twenty or thirty acres; but at a distance, from 50 to 150 acres.

The farm buildings are, for the most part, very insufficient. Near the city, the fences are of white thorn; but in the remote parts, they are nothing more than a bank and ditch. Lime, limestone gravel, and marl are used as manures. The city of Dublin might afford the means of enriching a tract of several miles around it; but its street dung is so little valued, that it is

sometimes brought to Scotland by coasting vessels as ballast, and much of it is thrown into the Liffey.

On the arable lands, two crops of wheat in succession, and after these two of oats, without fallow or green crop, are frequent; taken, according to Archer. Oats and potatoes are the standard crops. Barley is not cultivated extensively. The national pastures are, with few exceptions, of an inferior quality. There are few or no flocks of sheep in the possession of farmers. In the city, and within four miles of it, about 1,000 cows were kept in May, 1801, according to Archer, where 1000 were formerly near 7000. The old Irish breed of cows is almost extinct, and their place is supplied by the short-horns and other breeds from England. Fuel is scarce and dear; peat and bog iron cannot be procured, and the tenant is obliged to substitute straw, or any other combustible material that he can get.

There is a considerable salmon fishery on the Liffey, in which also abundance of eel and pike are caught. There are sea fisheries of herrings, white fish of different kinds, and oysters both in natural and artificial beds; the shells of some of the fish oysters have been found as large as a horse-shoe.

The manufactures of the county are chiefly of iron of different kinds, but they are of little importance. The colonial commerce with Dublin is considerable.

7865. WICKLOW. 500,000 acres, in great part mountains and bogs, and without inhabitants. (*Frazar's Survey of Wicklow, 1801. Sup. Encyc. Brit.*)

The climate so mild, that the myrtle flourishes in such profusion, as to have been sometimes used for making stable-brooms. The common laurel, Portugal laurel, and *Arbutus* attain a great size, and can scarcely be recognised to be the same shrubs. Dublin is supplied with early potatoes and house-lamb from the sea-coast of Wicklow, the climate of which, according to Mr. Wakefield, is decidedly different from that of the rest of Ireland. This is the only part of that country where he ever saw grapes growing out of doors.

Metallic ores are supposed to abound; copper and lead have been worked, and gold has been found.

There are no navigable rivers or extensive lakes. Some of the streams precipitate themselves from considerable heights, forming beautiful cascades; the most remarkable one is at Powerscourt, where the water falls from a height of 360 feet.

Landel property in the centre of the county in large estates;

Earl Fitzwilliam's nearly 100,000 acres. The sea coast is much divided, and abounds with villas, the temporary residence of the wealthy citizens of Dublin. "It appears to me," says Wakefield, "to contain more gentlemen's seats than the same space in the vicinity of London." The common period of leases is twenty-one years and a life. Potatoes, and all the usual kinds of corn, are cultivated; but turnips, clover, and other ameliorating crops, only partially. Marl and limestone gravel are the principal manures. Irrigation is practised. A breed of fine-woolled sheep, peculiar to the mountains of this county, exhibit the only traces of a distinct race of short-wooled sheep in Ireland.

The herring fishery in the bay of Wicklow is the best in Ireland after Galway. Flannels are extensively manufactured, but scarcely any linen.

7866. WEXFORD. 597,760 acres, mountainous on the north and west, a light soil and tolerable cultivation on the east, and in other parts a cold stiff clay, unimproved by culture. (*Wakefield. Frazar's Survey of Wexford, 1807. Sup. Encyc. Brit.*)

The climate is mild and favourable to the growth of timber, which abounds here more than in most counties. There are some large myrtles in the open gardens.

The landel estates are large, from 20000 to 10,000, a year, and farms of various sizes; but there is little of that minute division which is common in other parts of Ireland; nor are there any rich grazing farms. Dairies, at which the principal article is butter, are numerous; but generally under bad management. The cows themselves are of a very inferior description; and the same character belongs to their sheep, which forms a very inconsiderable part of the live stock. In their modes of cultivation, however, the farmers here are more advanced than in many other parts of the island. The baronies

of North and Bargie have been long noted for their great crops of barley; beans, &c. are cultivated with success, as well as clover and turnips; the drill system is common for potatoes, and preferred to any other method; and lime, though brought from a distance at a great expense, and also marl, are very extensively employed as manure. The tenantry, including the cottars, are accordingly in a much better condition, industrious, provident, and many of them comparatively wealthy. Here, as in Cork and Waterford, whole flocks are kept under furze, which, in this mild climate, is pretty much used as fuel. The bakers employ it for heating their ovens, of which a considerable number are employed, as a good deal of wheaten bread is consumed in these counties.

7867. KILKENNY. 510,000 acres, mountainous, but with some rich and beautiful vales on the banks of the Barrow, Suir, and Noire, and a climate so mild that in winter the thermometer seldom falls below the freezing point, while in summer it ranges between seventy and seventy-five degrees. There is less humidity than in Dublin and Wicklow, as well as less of the east and north winds. (*Tighe's Survey of Kilkenny, 1802. Sup. Encyc. Brit. Edin. Gaz. 1827.*)

This county has many romantic situations, ornamented with country seats; and its flat districts, where the tiller farms are more extensive than in most parts of Ireland, present a prospect very different from what is often met with in that country.

The soil is for the most part on limestone of good quality, and some of the valleys of extreme fertility. There are very few bogs; for the land declining about 500 feet from the northern to the southern boundary, the water which falls upon the surface is carried off with sufficient rapidity to prevent its making the ground marshy. The largest county in Ireland is at Castle Comber, near the northern boundary of the county. It is a stone coal raised in immense pieces, but of a sulphurous quality, which renders it disagreeable, and sometimes noxious; and it is, therefore, less fit for being used in families. For this reason, and also from the great expense at which it is raised, English coal is used in preference, even within a few miles of the works. There are several quarries of marble, chiefly of a black colour, of which a few tons are exported. Excellent sandstone and manganese, and iron and lead ores, have been observed in different parts.

Property in land is in several large estates, and many of a moderate extent, each yielding a rental of 20000 a year. The principal proprietors are Lords Bexborough, Clifton, and Ormond. The leases are in general for three lives, and partnership leases are common, though prohibited on one of the largest properties. On this estate the tenant is allowed to transfer his lease to one individual, but not to divide his farm.

Of the husbandry the most important department is the dairy, which extends over the greater part of it. The most considerable dairies are in the district called the Welsh, or Walsh Mountains; a tract of dry grassy land fit for tilage, but still in its natural state, and not enclosed. About 2000 Irish acres of the land were held in 1800 by one family, who kept 120 cows. The cattle are not for the most part housed in winter, and only those that are about the time of calving get a little hay on the fields, where the horses also are kept all the year. They fatten pigs to the weight of five hundred weight. The produce of the best dairies is one hundred weight and a half, or three firkins of butter per cow, and each cow requires from one and a half to three Irish acres. The practice of letting cows to

dairymen, which is common in Munster, is but little known in Kilkenny, the cows belonging to the dairymen themselves, and in some situations, breed them on their own farms, and in others prefer buying them at a proper age. Too little attention is paid to cleanliness in their dairies, especially in the northern district; and for this reason, according to Wakefield, though Irish butter, when fresh, is preferable to any in Europe, yet it "is in the lowest estimation in the London market, as it is almost always heavily salted, and very frequently tastes smoky, fishy, and tallowy." The cattle of this county are a mixed race from the native breed and the English long-horned, and their sheep have been, in some parts, improved by the Leicesters. The Merinos have been introduced within these few years by Messrs. Nowlan, the proprietors of a woollen

7868. KILDARE. 392,397 acres, four fifths arable, meadow, and pasture, and the rest bog. (*Rausson's Survey of Kildare, 1807. Sup. Encyc. Brit.*)

Part of the *Bog of Allen* and other similar tracts occupy a large portion of the western side of this county. The surface is varied by a number of small hills and gentle declivities; but for the most part it is flat and nearly level; and when viewed from a commanding station, presents a rich, and, on the banks of its rivers, a beautiful landscape. The Curragh of Kildare, extending to about 1000 acres, and the English long-horned, and the softness of its turf and the greenness of its pastures. But the climate of Kildare is said to be more moist than that of any other part of Ireland, which, if the statement be correct, is a very unfavourable circumstance, as a clay soil prevails very generally, and much of it is not adapted for sheep or cattle.

There are a few large estates in Kildare, particularly the Duke of Leinster's, which extends over a third of the county; and several proprietors, according to Wakefield, have from 6000 to 7000 a year; yet many are less considerable, and property seems to be more divided here than in most of the other districts in Ireland.

7869. KING'S COUNTY. 457,000 acres, half of arable, meadow, and pasture, of a medium quality. (*Coot's Agricultural Survey, 1801. Sup. Encyc. Brit.*)

The *Bog of Allen* occupies a considerable tract on the north-east coast, and the mountains are on the side of Queen's County. The soil of the public lands is either marshy or gravelly; the former productive in dry, and the latter in moist seasons, but neither of them naturally fertile. Limestone and limestone gravel, the means of their improvement, abound every where. The pastures, though in many parts fine, are not luxuriant; better adapted for sheep than for cattle, and very favourable to the growth of fine wool. Much of the mountain district has an argillaceous soil, thickly interspersed with rocks of sandstone, and a deep irremediable bog often occurs at its base; but towards the centre of this range, where lime tone prevails, there is much good pasture; and here the base of the hills, which is composed of a stiff clay, produces abundant crops of corn.

Landed property is in large estates, and many of their owners do not reside; but much of the land is held on leases in perpetuity, and the holders of these form a respectable class. The principal proprietors are Lords Digby, Rosse, and Charleville. Farms were formerly very large, not unfrequently of the extent of 2000 acres; but their size has been diminished, and such as are considered large are now of an average of 400 English acres. Many are as small as twenty acres, though the medium size of the smaller class may be double this. Most of the arable land is tolerably enclosed; chiefly with hedges of whitethorn, which grows here to a great size. Partnership leases and sub-tenancies are less common than in some other parts of Ireland; yet the condition of the tenantry and the peasantry does not seem to be materially more improved. The farm-buildings of every description are generally very bad; the cottages in particular; and yet those who have been long accustomed to these miserable abodes are said to prefer them to more comfortable dwellings (*Fig. 1138.*), which, after having

7870. QUEEN'S COUNTY. 384,000 acres, generally of a level surface, three fourths of which is of a productive soil cultivated, and the rest bog and waste. (*Coot's Agricultural Survey, 1801. Sup. Encyc. Brit.*)

Coal of the Kilkenny kind (7867.) is the only mineral worked; but there is iron ore, freestone, marble, &c. in different parts. The Barrow and Nore are navigable rivers.

Estates are from 5000 to 15,000 a year, and upwards. Some of the most valuable, having been let on perpetual leases, afford a large income to the lessees. It is these lessees who form the middle class of gentry, with clear incomes of from 1000 to 8000 per annum, obtained from tenants to whom their lands are sublet at rack-rent, and commonly in very small farms. Here, and in King's County, Wakefield observed some of the

7871. CARLOW. 220,098 acres, of undulating surface, with some hills and mountains; the lowlands a fertile loam, and the uplands a light gravel; one tenth in mountains and bogs. (*Wakefield's Statistical Account, &c. Young's Tour, &c. Sup. Encyc. Brit.*)

The minerals are various, but little known. There are no large estates in this county; and very little minute description of property. The hiring tenant is generally the occupier, except of small pieces. There are some excellent flocks of long-woolled sheep. Four sheep of the Irish breed and five of the English are called a "collop," and three collops are allotted to two acres of the best land. For its dairies, Carlow is not excelled by any county in Ireland. The farmers spare no trouble or expense to procure good cows. From twenty to fifty are generally kept; and during the season each cow produces, on an average, about one hundred weight and a half of butter. The dairy system pursued in Devonshire, Dorsetshire, and some of the northern counties of Ireland, of letting cows to dairymen, is followed here; but this custom was more prevalent when the Catholics could not legally purchase land, as they then employed their capital in hiring cows. The butter made in Carlow is divided into three sorts, according to its quality. The first in point of quality is sent to Dublin and England, and thence exported to the East and West Indies.

factory, who have now 600 of the pure race; and they find that both the quality and the weight of the fleece have improved since the sheep were imported. The usual corn crops are raised here, but clover and other green crops not in a suitable proportion. It is the custom to work oxen intermixed with horses, in teams of six, or three pair deep, the oxen placed foremost. Yet the fallows are better managed here than in any other part of Ireland. Irrigation has been practised for many years, but not extensively. (*Sup. Encyc. Brit. Kilkenny.*)

Salmon are caught in the rivers, and sent to Dublin packed in boxes of ice. Woollen is the chief manufacture. Messrs. Nowlan and Shaw produce excellent superfine cloths, from an establishment as celebrated in Ireland as that of Owen at Lanark is in Scotland.

The common size of farms is from ten Irish acres to 200; and these farms are frequently held in partnership. Large farms, however, are less rare here than in the arable tracts of the other counties. The leases were formerly for thirty-one years, but are now mostly for twenty-one years and one life. All parish and county taxes are paid by the tenant. With few exceptions, the course of cropping is the same as it has been for a century. Ozen, fallow, wheat, oats. Potatoes are universally cultivated. Oxen are employed in ploughing, and horses for carriages; but in many instances oxen and horses are mixed together in the plough team, which sometimes consists of six, and never less than four animals. A number of mules are also kept on the farms.

There are several streams and two canals. A woollen manufactory at Cellbridge; and a catholic seminary at Maynooth for above 200 students.

it bog, mountain, and waste; and the remainder (*Coot's Agricultural Survey, 1801. Sup. Encyc. Brit.*)

been erected by some of the proprietors, were for some time allowed to stand uncultivated.

1138

Wheat, oats, barley, and potatoes are the most common crops. The average produce of wheat is no more than sixteen bushels; of barley and oats it is about thirty-two bushels; and of potatoes of four tons per acre. Both oxen and horses are employed in labour; the plough is sometimes drawn by only two of either; in a few instances by two heifers; yet this and their other implements are not generally of a good construction. The threshing-machine has been in use in this district for about twenty years.

The leases were formerly for thirty-one years, or three lives; but the more common period of late is twenty-one years, to which the life of the tenant in possession at the end of it is frequently added. Some tenants hold for lives renewable for ever, paying a renewal fine equal to half a year's rent, or more, on the fall of every life. Modern leases often contain a prohibition against alienating. Nothing is so much complained of among the tenantry as the mode in which tithes are collected.

There are no considerable manufactures, no fisheries, and no minerals worked.

best farming in Ireland, with much more attention to a systematic course of cropping, and to keeping the land in good heart. Oxen and horses are used for the plough, the farmer generally preceding the latter. A good deal of cheese is made here for the Dublin market. In other respects the rural economy of this district does not differ materially from that of the Irish counties already described.

The manufactures are linen and coarse woollens, but to no great extent.

It is highly esteemed in the London market, where it is often sold as Cambridge butter. That of the second quality is exported to Spain, and the worst to Portugal. It is all packed in large casks, weighing upwards of three hundred weight.

There is not much wheat grown, and it is not of a bright colour or very good quality; but the barley of Carlow is excellent; according to Young, the best in Ireland. At the time of his tour it was the only inter-county which produced it; and at present more is grown here than in any other part of the kingdom. It is principally consumed by the illicit distilleries in the north of Ireland, by the breweries at Cork, or by the malting houses at Wexford. The potatoes grown in Carlow are excellent. There is little or no flax. The county is tolerably wooded. In the vicinity of Carlow a great many onions are grown, which are sold all over Ireland.

In Carlow, coarse cloth, reaping hoes, scythes, shears, &c. are made. At Leightonbridge is one of the largest corn-mills in Ireland, capable of grinding more than 15,000 barrels a year.

7872. EAST MEATH. 526,700 acres, of low, flat, rich surface; a clayey or loamy soil on limestone or gravel, with little wood, few mansions, and only one twelfth of bogs. (*Curwen's Observations*, 1818. *Thomson's Survey of Meath*, 1802. *Sup. Encyc. Brit. Edin. Gaz.* 1827.)

The landed property of Meath is divided into large estates, a great many of which yield an income of upwards of 2000*l.* a year. These are for the most part let out on leases of twenty-one years and a life; but on some of them there are leases in perpetuity, which have now become more valuable than the freehold property.

Grazing was, till very lately, a more important object in this county than tillage. Many persons fattened from 500 to 500 cows in a season; besides bullocks and sheep. These they purchase at the beginning of the grass season, and dispose of during the summer and autumn, as they are ready, instead of keeping a regular stock all the year. The pastures are considered too valuable to be applied to the rearing of stock. Dairying is not carried to any extent, and the butter made here is said to be held in little estimation. In some instances, where farms are let out for the dairy, the landlord supplies a succession of cows in milk, horses, and land, and the tenant furnishes labour, utensils, &c., paying at the rate of 6*l.* to 7*l.* 10*s.* per annum for each cow. The English long-horned cattle were introduced many years ago into this district, which now contains some of the best specimens of the breed. Some marshes on the Moyalny river feed an immense number of horses in the summer season; and the water is so pure and of so western angle adjoining Cava, are remarkable for fattening sheep. The sheep are brought from other counties, and, like the cattle, the same stock is kept only for a season.

7873. WESTMEATH. 378,880 acres of surface. The surface of this district is exceedingly diversified with woods, lakes, streams, bogs, and rich grazing lands; in no parts mountainous or flat, but gently undulating, or rising into hills of no great elevation. Some of these are cultivated to their summits, and others covered with wood, presenting, in several parts, some of the finest scenery in Ireland. (*Wakefield's Statistical Survey of Ireland. Sup. Encyc. Brit. Edin. Gaz.* 1827.)

The principal river is the Shannon; and there are a number of beautiful lakes well stocked with fish; the trout in Lough Dinn are said to have an exquisite quality. One of the largest of the lakes is full of wooded islands.

There are few large estates, but many gentlemen of moderate fortunes, from 2000*l.* to 5000*l.* a year, most of whom are resident. The leases are commonly for twenty-one years and a life, though in some instances for thirty-one years and three lives. A great many fine long-horned cattle and long-wooled

7874. LONGFORD. 234,240 acres, in great part bog, mountains, and waste; the climate on an average giving 140 dry days in the year. (*Wakefield, &c. Sup. Encyc. Brit.*)

Landed property is in estates from 3000*l.* to 7000*l.* a year. Leases are commonly for twenty-one years and a life; and are, for the most part, very small, where tillage is the principal object; but only a small proportion of the district is under the

7875. LOUTH. 177,926 acres, mountainous towards the north, but in other parts undulating and fertile, with little waste land, no considerable lakes, and a great number of gentlemen's seats, of which Colton is the chief. (*Wakefield, Edin. Gaz.* 1827.)

Landed property is in estates from 1500*l.* to 2000*l.* per annum. Farms are, in general, of a moderate size, and the soil is good land; but there are still many very small; in some parishes, scarcely one above twenty-five acres, and in others they do seldom extend to eighty acres. As the land is chiefly occupied in tillage, little attention is paid to the improvement of cattle and sheep; and as but few are kept on the best farms, the number is inconsiderable. Wheat and oats are the principal corn crops, barley being very little cultivated. The other crops are potatoes, flax, and a little hemp. Clover and turnips are almost confined to the farms of proprietors. It is only on those that the rent is high, and the soil is good; the next common farmers being, for the most part, slovenly; and their lands requiring heavy dressings of lime and marl to keep them

7876. WATERFORD. 454,400 acres, the greater part hilly and mountainous, but rich and productive on the south-east; the climate so mild, that cattle sometimes graze all the year round. (*Wakefield, Curwen, &c. Sup. Encyc. Brit.*)

Some very large estates, of which the most extensive belongs to the Duke of Devonshire. Leases are commonly for twenty-one years and a life; and on the banks of the rivers, where the land is most valuable, farms are small. According to Wakefield's information, "In this county, when the eldest daughter of a farmer marries, the father, instead of giving her a portion, divides his farm between himself and his son-in-law; the next daughter gets one half of the remainder; and this division and subdivision continues as long as there are daughters to be disposed of. In regard to male children, they are turned out into the world, and the way is left for few to keep the best way they can." The rent is chiefly paid from the produce of the dairy, which is conducted on a greater or smaller scale over all the county, and from the pigs, which are partly fed upon its offals. Some of the dairy farmers, most of whom are in easy circumstances, pay 1000*l.* a year of rent; and a great deal of butter is

7877. CORK. 1,048,799 acres of Irish plantation measure of greatly varied surface; bold, rocky, and mountainous on the west, rich and fertile on the south and east, romantic and sublime in many places, and one fourth part waste. (*Wakefield. Townsends's Survey of Cork*, 1810. *Sup. Encyc. Brit. Edin. Gaz.* 1827.)

The climate is mild; but a very general opinion exists that it is changing for the worse.

The rivers of this county flow with rapidity for the most part; a circumstance unfavourable to their being rendered navigable, but presenting many eligible situations for the erection of machinery.

The most useful fossils are limestone, marble, and slate; coal and ironstone have been discovered, but not worked to any extent.

Estates are generally large; tillage farms are very small, seldom above thirty acres; and, when they are larger, often held

Tillage farms are larger here than in most parts of Ireland; but, according to Curwen, the system of management is little better than on the small farms of other districts. The houses and fences are, for the most part, of the worst description, especially the cabins of the farm labourers, which are miserable mud-walled hovels, sunk below the level of the ground adjoining, and occupied by cows and pigs, in common with the family. The principal food of this class is potatoes with churn-milk, and occasionally oatmeal; butchers' meat being rarely used even among the farmers; and, to add to their privations, fuel is very scarce in different parts of the county. An uninterrupted succession of oats and other corn crops for several years is common; in a few instances even for twenty years. The common rotation is wheat, oats, fallow, potatoes, clover, all without the application of manure. It is customary to work horses intermixed with oxen, of which six are generally yoked together, three pair deep, to a very ill-constructed plough; yet, notwithstanding this management, the wheat crops are in some parts excellent. Agriculture has, of late years, extended very much, and at present nearly three fourths of the county are under tillage.

Manufactures do not afford employment to any considerable part of the population, though here, as in most parts of Ireland, that of linen is carried on to some extent; and also the weaving of cotton. On the Blackwater and the Boyne there are several extensive flour mills.

The surface of this district is exceedingly diversified with woods, lakes, streams, bogs, and rich grazing lands; in no parts mountainous or flat, but gently undulating, or rising into hills of no great elevation. Some of these are cultivated to their summits, and others covered with wood, presenting, in several parts, some of the finest scenery in Ireland. (*Wakefield's Statistical Survey of Ireland. Sup. Encyc. Brit. Edin. Gaz.* 1827.)

sheep occupy the grazing grounds, which extend over much of the best part of the district. Tillage is accordingly upon a limited scale, though more corn is raised than the inhabitants consume; and besides the crops common in other places, flax, hemp, and rape are cultivated, with clover and turnips; the two latter, however, not generally. The soil is mostly light, but in some parts it is rich and deep.

Few or no manufactures.

It is chiefly occupied in grazing, in which the residue of the population is almost exclusively employed, so that they retain in their own hands. Some linen manufacture.

productive. Yet a spirit for agricultural improvement has lately happily appeared in this county, and many of the tenants are in easy circumstances, well clothed, use meat in their families, and in every thing but their houses and farm buildings are in a condition superior to that of their brethren in most other parts of Ireland. It is common to renew the leases some time before they expire, so that the tenants are not often changed; but fines are frequently paid on these renewals, which carry away much of the capital that should be applied to the soil. Tithes are very seldom taken in kind; and their value is ascertained about the end of harvest, and the tenants grant their rates for the amount, which, though payable in November, is, in some cases, not exacted till almost twelve months after. The linen manufacture is carried on to a considerable extent.

made, even among the mountains, where small cows, suited to the nature of the pastures, form the principal stock. In the neighbourhood of Waterford, cows were let for sixteen pounds, eighteen pounds, and even twenty pounds, for the season. There are very few sheep, and those of a bad description; and, comparatively, but a small portion is in tillage. Where lime is used as a manure, it must be brought from a distance, as there is no limestone to the east of Blackwater, and it costs upwards of five pounds for an acre. Orchards are numerous on the banks of this river, and extensive plantations of timber-trees have been formed in various parts. Furze is so much used as fuel, that whole fields are kept under this shrub for the purpose.

Hogs are an important branch of trade at Milford Haven; glass and salt the principal manufactures.

in partnership, and the shares of each further diminished by the common practice of dividing the paternal possessions among the sons. The leases used to be for thirty-one years, or three lives; but of late the term has been reduced to twenty-one years, or one life; and the farms, instead of being let out to middlemen, who used to relet the land in small portions to occupiers on short leases or at will, are now held in most cases by the occupiers from the proprietor himself. There is here the usual minute division of tillage lands, cultivated by the spade in preference to the plough; the usual dependence on potatoes, as the common and almost exclusive article of food; with miser-

able cabins, crowded with filth, poverty, and indolence. The crops are potatoes, in favourable situations, succeeded by wheat and oats, for one or more years; sometimes barley follows the wheat. Flax is cultivated in many small patches. Hemp very rarely. Turnips and clover are seldom to be seen on tenanted lands. Sea sand, sea-weed, and lime, form a useful addition to the stable and farm-yard manure; which is, however, in many cases, allowed to be washed away by the rains, and greatly reduced in value by careless management. Faring and burning is practised in every part of the county, as an established mode of preparation for the first crop in the course. The implements of husbandry are generally bad; the common Irish plough and harrows, seldom furnished with iron tires, drawn by horses or mules, and, in a few instances, by oxen; wheel carriages have become common. A considerable number of dairies are kept in the vicinity of the water in the county. The implements of husbandry are generally bad; the common Irish plough and harrows, seldom furnished with iron tires, drawn by horses or mules, and, in a few instances, by oxen; wheel carriages have become common. A considerable number of dairies are kept in the vicinity of the water in the county. The implements of husbandry are generally bad; the common Irish plough and harrows, seldom furnished with iron tires, drawn by horses or mules, and, in a few instances, by oxen; wheel carriages have become common. A considerable number of dairies are kept in the vicinity of the water in the county.

7878. TIPPERARY. 882,398 acres, diversified with heaths, mountains, and fertile vales; of which the Golden Vale is among the richest land in the kingdom. The climate so mild, that cattle graze out all the year. There are 36,000 acres of bog in this county, including part of the Great Bog of Allen. From the survey made by Mr. Ather, under the direction of the commissioners for enquiring into the nature and extent of Irish bogs, it appears that this waste land might be easily drained. (*Wakfield, &c. Sup. Encyc. Brit. Edin. Gaz.*)

Minerals. Slate, lead, and coal are worked. *Estates* are of various sizes, some of them very large, but a greater number of a medium extent, worth from 4000l. to 6000l. a year. Of the proprietors, the influence of Lord Lansdowne is by far the most extensive; though several others have estates worth from 10,000l. to 15,000l. a year and upwards. The graziers here, as in Roscommon, have leasehold properties, frequently of much greater value than the freeholds, of which, also, they often become the purchasers. Properties of this description, worth from 2000l. to 4000l. a year, are very common. Tillage farms, however, are generally of small extent, one of ninety Irish acres being thought large; yet the management is, in many instances, more respectable than in most other parts of Ireland. But the principal business is grazing, every variety of this kind of land being found here. The exemption of graz-

7879. LIMERICK. 622,975 acres, of low-lying fertile lands, surrounded by higher grounds. (*Wakfield, &c. Sup. Encyc. Brit. Edin. Gaz. 1827.*)

Landed property is in large masses, generally let to tacksmen, on long leases, and sub-let almost *ad infinitum*. The land seems to be of greater yearly value in most parts of Britain at a distance from the sea, according to Wakfield's information, the green acres would have let, in 1808, for three guineas the Irish acre, or almost forty shillings the English. Considerable farms brought five guineas the Irish acre, and in some instances more. The rent of the mountain land had increased in a still greater proportion than the grazing and corn farms. One grazier held land of the value of 10,000l. a year; and in one season slaughtered, in Cork, 800 head of cattle. Many of the best long-horned cattle of the United Kingdom are fattened here, and also a considerable number of sheep. Two-year-old wethers sold then, without their fleeces, at from 2l. 10s. to 3l.

7880. CLARE. 962,560 acres, nearly half productive land, and the remainder moors, mountains, and bogs, with more than 100 lakes interspersed. The climate, though moist, is not unfavourable to health and longevity; fevers, which sometimes prevail to dampness of the houses, and inattention to domestic and personal cleanliness. (*Dutton's Survey of Clare, 1808. Sup. Encyc. Brit. Edin. Gaz. 1827.*)

Limestone abundance, and coal, ironstone, black marble, lead, &c., have been found, but not worked.

Landed property is in a few large estates, of which the most noted was that belonging to the Marquess of Thomond's heirs, lately sold and divided. The size of farms varies greatly. Those under tillage are from one or two acres to fifty, but of the latter size there are few. Grazing farms extend from 100 to 800 acres, several of which, and sometimes in distant situations, are held by one individual. Frequently several persons join in the occupation of an arable farm, and have about ten acres each. The general term of leases from proprietors is for three lives or thirty-one years; sometimes, but not often, for three lives and thirty-one years; twenty-one years or one life, and twenty-one years and a life. The tenure of under tenants is variable, and often arbitrary.

All the different species of grain are cultivated with considerable success. Rape and flax, the former chiefly for its seed, and the latter for home manufacture, are sown to a moderate extent. Potatoes occupy a part of every farm, and their culture is conducted with more care and judgment than that of any other crop, though at a greater expense of time and labour than would be thought necessary in most other places. In regard to the kinds of crops cultivated, the greatest defect is in what are called green crops, corn being, with potatoes, the chief and almost the only objects of attention to the arable farmer; and turnips and cultivated herbage being either grown on a very small scale, or, as is the case throughout the greater part of the county, altogether disregarded or unknown. The corn crops thus necessarily follow each other, until the soil is exhausted; and where extra manure, such as sea-weed or sand, both of which are used, is applied with good effect, cannot be procured, it must be left in an unproductive state for several years afterwards. Potatoes are in most cases planted upon land that has been prepared by burning; and the same crop is sometimes taken for two years more without manure; in the fourth year wheat follows, and then repeated crops of oats, as long as they will replace the cost of seed and labour. The implements in common use are generally rudely con-

7881. KERRY. 1,128,320 acres, more than three fifths mountainous and waste; the sea-coast and islands being the most westerly land in Europe. Some of the mountains 3000 feet high. (*Smith's History of Kerry. Wakfield. Sup. Encyc. Brit. Bicheno's Ireland, 1830, &c.*)

let out to a dayman, at a certain rate for each, by the year; yet many farmers conduct the business of the dairy themselves. The average number of cows in a dairy may be from thirty to forty. A few sheep are kept on every farm, commonly in fetters, and upon the most worthless pastures. Proprietors have introduced stranger breeds, and find them to answer; but sheep can never become an object of importance in a district where farms are so small.

Tithes, of which no inconsiderable part are lay property, are generally paid by a composition with the farmers. The usual mode is to have them valued before harvest, and to appoint days of meeting with the parishioners, for the purpose of letting them.

The principal manufactures are sail-cloth, duck, canvass, and drilling; osanburgs for negro clothing; coarse woollens; spirits at several large distilleries in Cork, and rum-distilleries in the neighbourhood of the same city, the only manufactory of that article in Ireland; it belongs to Government.

ing land from every kind of tithe operates as an encouragement to persevere in this system. Leases are commonly for twenty-one years and a life. The cattle, which are long-horned, may be ranked with the best in Ireland, and many of the fine flocks of long-woolled sheep are not inferior, in Wakfield's opinion, to those of Leicestershire. The rich lands produce a kind of flax, very different from that which is raised in the north: it grows to a great height, and appears to be exceedingly well adapted for spinning cloth.

The manufacture of broad-cloth is carried on to some extent at Carrick; and that of linen, worsted, and coarse woollens, as branches of domestic industry. But the wealth of this extensive district chiefly consists in its cattle and sheep, corn, and other land produce.

Only a small proportion of the land is in tillage; the produce of this, and some of the adjacent counties, in proportion to the seed, is stated by the same author to be at a medium: of wheat ten, bere seventeen, barley twelve, oats nine, and potatoes ten. Hemp was formerly cultivated extensively on the rich low grounds, called the Carrasses, on the banks of the Shannon; but this tract is now occupied in grazing. Flax of an excellent quality for sail-cloth is still grown in several parts. The common term of leases is thirty-one years and three lives. Great part of the provision and corn trade is possessed by the city of Limerick.

The soil is remarkably fertile, and consists chiefly of fine mould covering a light limestone gravelly soil: it produces all kinds of grain in abundance.

structured, and imperfect as well as expensive in their operation; in many parts, even where the soil is light and dry, the plough is drawn by four horses abreast, with traces of rope, and collar of straw. But from the roughness of the surface, the poverty of the tenantry, and the minute division of farm lands, the spade is much more extensively employed than the plough, over all the arable land of this county.

The pastures of the Carrasses or low grounds, on the rivers Shannon and Fergus, are equal to the fattening of the largest oxen. This rich tract extends from Paradise to Limerick, about twenty miles, and is computed to contain about 20,000 acres, of a deep dark-coloured soil, over a bluish or black clay, or moory substratum; producing, owing to the indolence of its occupiers, along with the most valuable herbage, a great quantity of rushes and other useless weeds. The rent of this land for grazing was, several years ago, as high as 5l. per acre, equal to about 5l. 2s. per English acre, and for meadow, in many instances, much more. These meadows are said to produce at the rate of more than four tons of hay the English acre. The cattle of this county are almost all long-horned, good milkers, and very hardy. The sheep have been greatly improved in shape, by crosses with Leicester rams; but there is a general complaint that the quality of the native wool has been deteriorated. A vast number of mules are bred here; asses are very generally employed by the poorer classes; but little attention is paid to the breed of horses, which has degenerated.

Clare was formerly noted for its orchards, and for cider of a very fine quality, made from the celebrated corkage apple, which is still found near the small town called Six Mile Cross. "An acre of trees," says Young, "yields from four to ten bushels per annum, average six; and what is very uncommon in the cider counties of England, yields a crop every year." It does not appear from the latest accounts, that any considerable quantity of this cider is now produced here, though what there is seems to maintain its former character, and is held in great estimation.

Manufactures are yet in their infancy. All the linen made in the county is used for home consumption.

The mountains are chiefly occupied with young cattle and goats; sheep, apparently the most profitable animal in such situations, are neither numerous nor of a valuable kind; and the little cultivation to be found here is so generally performed with the spade, that, in some entire parishes, as Young assures us, there was not a single plough.

The prevailing soil in the low grounds is clay, of different qualities; some of it is fit to be a species of red clay, and other sorts might be converted into bricks and earthenware.

Estates are very large, both in extent and value; some of them, according to Wakefield, worth 30,000*l.* a year. Leases are in general for three years and three lives, and a considerable portion of the whole county is let to partnership tenants. Few of the tenants in the north quarter about Kerry-head occupy so much land as to require them to employ labourers; they pay their rents by the sale of butter and pigs, and by turf which they carry to the market. It is the practice for farmers to hire large tracts, which they stock with cows, and these cows

are then let out to dairymen upon such terms as leave them but a very small return for their labour. The best corn land is about Trales, and towards Dingle, where more flax is raised than in any other part of the county.

The principal articles which Kerry affords for export are its raw produce, beef, butter, hides, and tallow. It does not raise more corn than is necessary for its home consumption, and carries on no manufacture for sale but that of coarse linen, which is only on a small scale.

Agriculture is at a low ebb; and the general face of the country gives the impression of wildness and discomfort. Instead of hedges, mounds of earth and stone, called ditches, are every where to be seen; and as these afford but a slight protection against the trespassing cattle, it is customary to tie the legs of each quadruped together with wisps of straw, and sometimes to yoke two together; even fowls and turkeys are thus bound. (*Zicheno.*)

7882. ROSCOMMON. 556,847 acres of flat surface, in some places sprinkled with rocks, and in many interrupted by extensive bogs; and the richest land on limestone, and adapted either for aration or pasture. (*Wakefield. Sup. Encyc. Brit. Edin. Gaz. 1827.*)

Coal and iron works were formerly carried on, but are now neglected.

Estates were once very large; but they have been broken down in some instances, by the granting of leases in perpetuity; a practice which has given rise to a class of landholders, interposed between the great proprietors on the one hand, and a numerous body of cultivators on the other.

Some of the best long-horned cattle and long-wooled sheep in Ireland fed, but there are few dairies. During the late war, its fine green pastures, under the management, afforded a very ample rent, and tillage was therefore conducted on a small scale; but the plough has been more in request since the

7883. GALWAY. 1,659,520 acres of varied surface; above a third part bogs, mountains, and lakes, and very unproductive, and thinly inhabited. (*Dutton's Survey of Galway, 1824. Wakefield. Sup. Encyc. Brit., &c.*)

The east part of the county is flat, warm, and fertile, with many seats, though none of note. Rivers and lakes abound. Lough Reagh and Lough Coutra are fine pieces of water; the latter is said to possess all the beauties that hills, woods, and islands can impart to that feature of landscape.

Several large estates, affording an income of from 5000*l.* to 10,000*l.* a year, and upwards. One of these, the most extensive in the Briti-h Isles, stretches along the sea-coast for twenty miles. Only a small portion is held by absentees. A full third of the land is let on partnership leases, to an indefinite number of persons, very often twenty, who by law are joint tenants, and entitled to the benefit of survivorship. The leases are commonly for three lives or thirty-one years. "These people," says Wakefield, "divide the land and give portions to their children, which consist of a fourth or fifth of what they call a man's share; that is, of the land which originally belonged to one name in the lease. A certain portion of the whole farm, or take, as it is styled, is appropriated for tillage, and this portion is then divided into lots, perhaps twenty or thirty. These lots are again subdivided into fields, which are partitioned into small lots, each parcel being one or two ridges; but these ridges do not continue in the hands of the

same occupier longer than the time they are in tillage. The pasture is held in common; and the elders of the tillage, the legislators, who establish such regulations as may be judged proper for their community, and settle all disputes that arise among them. Their houses stand close to each other, and form what is here called a village."

The *cottles of Galway* are long-horned and of an excellent description, fully equal, in the opinion of Wakefield, to any in England. But sheep form the most valuable part of their live stock; "some of the first flocks in the world," says the same writer, "are to be found in this county." The crops are the same as in other parts of Ireland, but potatoes are not cultivated to so great an extent. They plant potatoes on an oat stubble, or on ley that has been burned or manured, and follow with wheat, here or barley, or oats; the latter kind of grain is not infrequently taken after wheat and barley. Fencing and burning the soil is very common. The greater part of the rent of some of the estates on the shore is paid from kelp, which is prepared in large quantities.

In common with the greater part of Ireland, Galway employs some of its people in the linen manufacture, and it seems to be the only manufacture in it worth notice.

7884. MAYO. 1,270,144 acres, in great part mountains, bogs, and lakes; half-heathy mountains, with valleys very fertile, but neither woods nor plantations, excepting on one or two estates. (*M'Parlan's Survey of Mayo, 1802. Wakefield. Sup. Encyc. Brit. Edin. Gaz. 1827.*)

Many valuable fossils; iron formerly made, but discontinued for want of fuel. Excellent slate; and petro-siliceous semilucidus, similar to what is used in the English potteries. The low grounds of the county are composed of limestone, or limestone gravel, and are equally well adapted to tillage or pasture.

The estates worth from 7000*l.* to 20,000*l.* a year; but their extent, owing to their containing a great proportion of waste land, is still greater than the ratio of their value.

The size of farms varies with the nature of the soil and surface; but, though several hundred acres are sometimes let out in one farm, yet, as the farms are commonly held in partnership, the space allotted to each tenant is generally only a few acres. As each of them keeps a horse, it is computed that there is one for every ten or twelve Irish acres. The leases are for different periods, fifteen years, twenty-one years, and one, two, and sometimes three lives, or thirty-one years.

Agriculture is in a very backward state. The plough, commonly drawn by four horses abreast, is of the worst descrip-

tion, and the harrows are often furnished with tines of wood, instead of iron. It is still the practice, in the mountain district, to yoke the horses by the tail. But in some of the baronies, the plough is seldom or never employed at all, the tillage being performed by the spade; and in others they use the spade in cultivating potatoes, and the plough only for corn. Yet potatoes, oats, and on the sea-coast barley, are sown to a considerable extent, and also flax. Wheat is cultivated only in particular spots, and chiefly by proprietors, a few of whom have also introduced turnips, peas, beans, rape, and cabbage. There is some excellent grazing land for cattle in the barony of Tyrrawley, and good sheep pastures in Kilmatin. Some graziers hold 5000 Irish acres. The English long-horned cattle, which were imported by the principal proprietors, have greatly improved the native breed.

The habitations of the labourers, or cottars, are in general very wretched, and shared by them with their cow and pig.

7885. LEITRIM. 407,260 acres, one half bog, waste, and water, and the remainder dark fertile soil, incumbent on limestone. (*M'Parlan's Survey of Leitrim, 1802. Wakefield. Sup. Encyc. Brit. Edin. Gaz. 1827.*)

Coal, ironstone, lead, copper, &c. are found, but not worked. Estates large, and numerous, but many proprietors are absentees.

The leases are commonly for three lives or thirty-one years. Agriculture is here in a very low state. The tillage farms are small, seldom exceeding fifty or sixty acres, and these are almost always occupied in common by a number of tenants. The plough is of the Irish pattern. The most common implement is the loy, a kind of spade, fifteen inches long, about four inches broad at the bottom, and five or six inches at the top, where it is furnished with a wooden handle about five feet long. The first two crops are potatoes, which are followed by flax, and then oats for one or more years. Clovers and other green crops are unknown to the practice of the tenantry. The county raises grain and potatoes sufficient for its own consumption, but exports very little of either. Its cattle have been much improved by the introduction of English breeds, to which some of those now bred and reared in it are said to be not inferior. There are no considerable dairies, yet a good deal of

butter is made throughout the district. The sheep are of the native race, small, and but few in number.

About the beginning of the eighteenth century, Leitrim is said to have been almost a continued forest. There is now little wood in it, and no considerable plantations. The proprietors, however, have of late paid some attention to this method, and several large nurseries have been established for the sale of forest and other trees.

There are several bleach-fields, and some coarse potteries; and a number of people are employed in weaving. But the linen made here, as well as the coarse woollen goods, is chiefly for the use of the inhabitants themselves. The houses of the lower classes are of the worst description; even the more recently erected farm buildings, including a little barn and cow-house, do not cost more than ten or twelve pounds. Turf is their only fuel, and potatoes and often bread the chief articles of food, meat being used on extraordinary occasions only.

7886. SLIGO. 597,060 acres, a third part bogs, mountains, and waters, and the remainder fit for tillage or grazing. (*M^rParlan's Survey of Sligo, 1802. Wakefield. Sup. Encyc. Brit. Edin. Gaz. 1827.*)

The soil is generally of a light, sandy, gravelly loam, or moory; in some parts the lands are rich and fertile, but the subsoil of a considerable tract is a grey flag, provincially leuca, and unfavourable to vegetation. Numerous streams and lakes; the wooded islands and scenery around Lough Gill very striking. On the Sligo and Moy, considerable salmon fisheries; trout abundant, and white fish on the shores.

Estates of almost every size. A few are worth from 500*l.* to 9000*l.* a year; yet a considerable proportion of the county is divided into small properties. The principal proprietors are absentees. Farms vary in size, from three Irish acres to 500; the larger farms, however, are not held by individual tenants, but in partnership. The leases are for thirty-one years and three lives, and, in some instances, for sixty-one years and three lives; being, in general, longer here than in other parts of Ireland. Tillage-farming is still in a very backward state. The plough is worked by three or four horses yoked abreast,

7887. CAVAN. 499,957 acres, almost entirely covered with hills; the surface, soil, and climate, being alike bleak and uncomfutable. There are no fewer than 91 bogs, occupying 17,000 acres. (*Coote's Statistical Account. Wakefield. Sup. Encyc. Brit. Edin. Gaz. 1827.*)

Near Farnham, the appearance of the country is favourable; the lakes there are picturesque, and communicate with each other by a river. The fossils are various, but neglected.

Two *estates* are of 2000 and 25,000 acres; besides these there are none of very great extent. Nearly the whole of the land is under tillage, but the agriculture in every respect is very bad. The size of the farms is from 50 to 100 acres; but these are generally subdivided into farms of from two to twenty acres, which are let to the manufacturers or "cottars," who pay a high rent for them, by means of their other employments. Their principal object is to raise a sufficient quantity of oats and potatoes to feed their families, and of flax to give employment to the women and children. Most of the land is dug with the spade, and trenched: where the plough is used, they put three or four horses to it; and when Young visited the county, he found that all over it the horses were yoked to the ploughs and harrows by the tail; but practice, however, is now discarded. Almost the only grain sown is oats, which are reckoned to be in the proportion of seventy to one, to all other grain; there is scarcely any wheat. In 1809, there were 4300 acres of flax, from which 6500 bushels of seed were saved.

7888. FERMANAGH. 450,000 acres, in great surface rugged and mountainous, but better wooded *part covered by water, and much of the rest of the than other parts of Ireland.* (*Wakefield. Sup. Encyc. Brit. Edin. Gaz. 1827.*)

The ash grows in the hedge-rows; beeches come to a large size, and also the yew, near Lough Erne; and fir, oak, and yew are found in the bogs. The grand feature in the natural scenery of this county is Lough Erne, which occupies about one eighth of the surface, and contains more than three hundred islands. The water is very pure, and is found in other fresh water lakes, and is noted for its salmon and eels, particularly the latter. Four of the eel weirs near the falls of Lisleck afford a rent of 100*l.* each.

Estates are large; three proprietors mentioned by Wakefield have 14,000*l.* and upwards, and other three from 6000*l.* to 7000*l.* The leases are most commonly for twenty-one years and a life. In the northern part of the county, the farms are larger and

7889. MONAGHAN. 298,500 acres of low grounds, with detached hills, and a considerable space occupied by bogs and small lakes. (*Coote's Survey of Monaghan, 1801. Wakefield. Sup. Encyc. Brit. Edin. Gaz. 1827.*)

There are a few large *estates*, but the greater part small ones, many of which have even sold for the income equal to the ordinary wages of labour. A few years ago, there were only 172 freeholders of 50*l.* and upwards, out of nearly 6000; most of the considerable proprietors are absentees; and very little of the landed property is in the hands of Catholics.

Farms were so small a few years ago, as not to average ten Irish acres over the whole county; and the management, as might be expected, was exceedingly unskillful and unproductive. The spade was used much more than the plough; the latter being an implement which, with the team required to work it, and the party to attend and direct it, could be brought into action only by the united efforts of several tenants. The

7890. TYRONE. 813,440 acres in great part mountainous, and containing, among other mountains, Bessy Bell and Mary Gray, celebrated in song. The territorial value of this inland and northern district is much inferior to that of most others. (*M^rEvoy's Survey of Tyrone, 1802. Sup. Encyc. Brit.*)

Various valuable *fossils* found, but not worked: the best pottery in Ireland, near Dungannon. Lough Neagh, the largest lake in Ireland, covers 110,000 acres, but is not celebrated for its scenery.

Estates are of very great extent, many of them worth from 5000*l.* to 7000*l.* a year, and the productive or arable land divided into very small farms, not often exceeding twenty Irish acres. The chief proprietors are the Marquess of Abercorn, Lords Belmore, Northland, and Montjoy. The leases are for various periods, thirty-one years and three lives, three lives, and twenty-one years and a life. On some estates the land passes through the hands of millmen, in portions of various sizes, till it reaches the actual cultivator; for the most part, in very minute subdivisions. It is customary for several persons to be concerned in one townland, which is held in what is called rundale; the cultivated land being divided into shares, which are changed every year, and the estate passing in common—a system utterly inconsistent with profitable occupation, or the amelioration of the soil and live stock. The cattle

7891. DONEGAL. 1,100,000 acres of ragged, boggy, and mountainous surface, with a cold, wet effluvia, and neither woods nor plantations to shelter from the blast. (*M^rParlan's Survey of Donegal, 1802. Wakefield. Sup. Encyc. Brit.*)

directed by a man who walks backward before them. Oats, barley, and potatoes are the principal crops. Of the two former, a great proportion is consumed in illicit distillation, which, within these few years, was carried on in almost every part of the county. It was to the sale of these spirits that many of the small tenants looked as the means of paying their rents. In some parts, both cattle and sheep are kept in considerable numbers, and a great deal of butter is exported from the town of Sligo; but the land occupied in this way bears but a small proportion to the whole; to grow corn, being the principal object. Limestone and limestone-gravel, which are in abundance in all places, are in general use as manures; also marl, and, on the coast, sea-weeds. Among the hills are several large lakes, and abundance of rivers.

The manufactures for export are linen, salt, and kelp. The cabins, food, fuel, and clothing of the lower classes, seem to be as uncomfortable as in any of the Irish counties.

Though the very tops of the hills are tilled, yet it does not appear that this county produces more grain than is necessary for its home consumption; nor has the bounty on the inland carriage of corn to Dublin, increased the very trifling quantity brought to that market. From the coldness and moisture of the climate, all the corn of Cavan is obliged to be kiln-dried.

The *stock-farms* generally consist of about 100 or 150 acres, the farmers buy young cattle, and sell them again without fattening; a few, however, fatten bullocks or sheep, but the latter are very poor. There are very few dairy farms, though from these, as they are in the richest parts of the county, a good deal of butter is sent. Many pigs are kept by the cottars; and near all the cabins are to be seen goats tethered to the tops of the banks, or "ditches," as they are here called, which divide the fields.

Cavan was formerly celebrated for its extensive woods, and trees of an immense size; but at present it is, in general, bare of timber, except near Kilmore, Farnham, and a few other places. Wakefield remarks, that the ash is confined to parts of the county, and to Tyrone and Fermanagh.

The *linen manufacture* is the staple.

more productive than in most other parts of Ulster. Oats, barley, potatoes, and flax are the principal crops: very little wheat, clover, or turnips being cultivated, except in small patches near the towns. The high grounds are chiefly occupied in rearing cattle, and much of the better pastures with dairy stock. There are no large flocks of sheep, and the breed of this animal is of a very inferior description. Agriculture is in a very backward state, and as lately as the year 1808 the peasantry were accustomed to fasten their ploughs to the horses' tails.

Linen, seven eighths wide, manufactured to some extent; and there are several bleach-works, and a few of the linsens sent to England. Illicit distillation is said to be very general.

general term of leases is twenty-one years and a life, or sometimes three lives. These crops are oats, potatoes, and flax, with wheat and barley in a small proportion. These last, however, extend over a much greater tract now than they did a few years ago. They make a good deal of butter, but there are no large dairies. Goats are in greater numbers than sheep, which is of itself a sufficient proof of the low state of its agriculture.

The *linen manufacture* is said to have averaged, twenty years ago, about 200,000*l.* a year. It is carried on by the greater portion of the inhabitants of both sexes, all the small farmers being also weavers.

and sheep are accordingly of a very inferior description; and the latter, which are not numerous, may frequently be seen tethered upon the small patches of herbage which are interspersed among the shares of these partnership concerns. The tillage land, too, is more frequently stirred with the spade than the plough; and where a plough is used, the team, consisting of horses, bullocks, and even milk cows, must be supplied by the contributions of three or four neighbours, who unite their means for the purpose, each attending the operation, less his poor animal should have more than his proper share of the labour. Potatoes, oats, and flax are the principal crops.

The *linen manufacture* is carried on to a great extent, and the potteries and collieries, of considerable number, furnish the hands; to which we may add illicit distillation, which prevails throughout the north-western counties of Ireland. The food of the lower classes is oatmeal and potatoes; wheat bread and butcher-meat never being used but on extraordinary occasions.

Landed property is in few hands.

Agriculture is in a very backward state in Donegal. The use of the plough is confined to a small proportion of the cultivated land, and is generally of a bad construction; spade labour is preferred in most places. Barley is the chief grain crop, and it is almost all used in distillation; oats are only grown for home consumption, and wheat is confined to a few favourite spots. There are only two flour mills in the county. The culture of flax is considerable in the barony of Raphoe, and is extending even in the mountain districts. Potatoes are cultivated every where; turnips, clovers, and other green crops, are almost unknown among the tenantry. Village or partnership farms still abound, but farms now begin to be let to individuals as separate holdings. In the low country there are from ten to fifty acres in extent, and from 40 to 500 in the mountains. The fences are commonly nothing better than ditches, with banks of turf or clay, so that the cattle require to be herded while

the crops are growing; and in many parts they are allowed to graze promiscuously as soon as the crops are removed. Sea-weed and shell-sand are used as manures, but very little limestone, or limestone gravel. The practice of paring and burning, so common in many parts of Ireland, is seldom resorted to in this county. Leases are granted for twenty-one years and a life.

The staple manufacture of Donegal is linen. Women are much employed in knitting stockings. Kelp is prepared along the north-west coast; and, during the fishing season, three or four salt-pans used to be kept in full work. But whisky, says Dr. McFarlan, particularly in the mountain region, and all around the coast, is the chief manufacture. "It is by running their barley into this beverage that they provide for one half-year's rent." This is, therefore, a tax raised by the rich on the morals and industry of the poor."

7892. LONDONDERRY. 510,720 acres, generally mountainous, fertile and beautiful in the valleys, and containing every variety of soil. (*Sampson's Survey of Londonderry, 1802. Wakefield. Sup. Encyc. Brit. Edin. Gaz. 1827.*)

Landed property. With the exception of lands belonging to the church, and the towns of Londonderry and Coleraine, and certain portions reserved by the crown to be afterwards erected into freeholds, the whole of Londonderry was granted by James I. to the twelve companies or guilds of London. The estates are, therefore, held from these companies, either in perpetuity, or on determinable leases. The principal proprietors or leaseholders are Lord Waterford and Londonderry, Conolly, Ogilby, and the families of Beresford and Ponsonby.

The average size of farms is from five to twenty Irish acres, or at a medium little more than fifteen acres English. Whole districts are subdivided into patches of seven, eight, acres, but in a few situations there are farms of upwards of 500 acres. The leases, though most commonly for twenty-one years and one life, are frequently for such very short periods, as to be a great drawback upon agriculture. The practice of letting land upon short leases is, however, only recently introduced.

7893. ARMAGH. 293,871 acres of varied and rather interesting surface of mountain, plain, and bog; with rivers, streams, and lakes, and a climate mild for the latitude; 244,000 acres are esteemed fit for cultivation. The celebrated George Ennor is a native of this county, and resides on his own estate at Loughgall, near Armagh. (*Coole's Survey of Armagh, 1804. Wakefield. Sup. Encyc. Brit. Edin. Gaz. 1827.*)

Marble of an excellent quality, and of great beauty, is wrought in Armagh. The chain of mountains called the Fews, of which Slieve Gallian is the highest, present many highly sublime and picturesque scenes.

Estates in this county are not large, there being only seven or eight proprietors who possess them of the annual value of from 6000l. to 10,000l. The farms also are small, being commonly from five to twenty acres, and seldom exceeding forty or fifty.

Neither the arable nor the pasture husbandry of this county present much that is worthy of notice. Potatoes, flax, and oats are the chief produce of the arable districts; and these are cultivated in a very rude and inferior manner, in consequence of the ignorance of the farmers, and their want of capital.

There are no extensive dairy farms, nor are there any farmers exclusively in this branch of husbandry; nevertheless a considerable quantity of butter is made here. One hundred weight

per-cow is considered as the average produce. The proportion of the milk cows to the size of the farms is, on small farms under five acres, one cow on farms exceeding five, and under ten acres, perhaps two cows, seldom more. A considerable number of cattle are reared. From the low country they are sent to the mountain farms, and frequently afterwards sold in the Scotch market. They are in general of a small stunted breed. The native sheep are an awkward breed; the wool is coarse, and in small quantity; very little of it is exposed to sale, there being hardly sufficient for domestic use. Goats, swine, and poultry abound. Wild geese, swans, wild ducks, and several other species of aquatic birds, are indigenous to the lakes and rivers. Formerly bees were much attended to, but at present they are neglected.

The roads in general are bad; and what is extraordinary, the turnpikes are the worst, and the cross roads the best. The principal manufacture is that of linen.

7894. DOWN. 559,995 acres, of which one eighth are mountainous and waste, the remainder hilly and productive, cultivated by small manufacturers, and embellished by plantations, bleaching grounds, and neat white-washed habitations. The climate is variable, but not subject to extremes. (*Dubourdicu's Survey of Down, 1802. Sup. Encyc. Brit. Edin. Gaz. 1827.*)

Landed property. There are some large estates, though in general it is much divided, and has all the different gradations, from the most opulent nobleman to the tenant in perpetuity who farms his own land. Most of it is freehold. The rental was above the average rental of the best counties in Scotland, as returned to the commissioners of the property-tax in 1811.

The farms may be divided into two kinds: the first, such as are possessed by farmers who have recourse to no other branch of industry; the second, such as are held by weavers and other tradesmen. The former run from twenty to fifty, and, in some instances, so far as 100 acres; the latter are of every size, from one to twenty acres. It has been remarked that the divisions of the farms are so minute, as to be extremely prejudicial to agriculture. The rent is always paid in money; personal services are scarcely made in its agriculture within these twenty years. Fences consist chiefly of a ditch and bank, without quicks of any kind, or sometimes with a few plants of furze stuck into the face of the bank; but dry stone walls are frequent in the stony mountainous parts. Great improvement has been made in its agriculture within these twenty years. Threshing-mills and two-horse ploughs have been introduced; but it cannot be said that a good system prevails generally, which the small size of the farms, indeed, renders impracticable. A regular rotation is rarely followed in the crops; fallows, clover and turnips, are upon a very small scale; and from the greater part of the arable land, it is still the practice to take crops of grain in succession, only partially interrupted by potatoes, flax, and peas. Oats, the principal grain, are grown on all soils; barley is usually sown after potatoes, and also wheat to some extent on the coast. Of flax they sow four bushels an Irish acre, and the medium produce is fifty stones. Rye and peas occupy but a small space. Lime, marl, shelly-sand, and sea-weed, are used as manures. Paring and burning are confined to the mountains.

7895. ANTRIM. 622,059 acres; on the east and north mountainous, destitute of plantations, and abounding in bogs; the other parts more level and fruitful, and the climate drier than in some other counties. (*Newenham's Statistical Survey. Wakefield. Dubourdicu's Survey of Antrim, 1812. Sup. Encyc. Brit.*)

There are extensive meadows on the banks of the Bann and the Laggan; but the soil, except on the mountains, is thought to be better adapted to tillage than pasture. A good many beasts are fattened, but cows are the prevailing stock, kept in small numbers on every farm. They are long-horned, thin in the sides, and deep in the belly, but yield much milk when well fed, and each of them from 60 to as much as 120 pounds of butter in the year, or about two thirds of the medium produce of the better dairies of England. Numerous horses are reared in the mountainous districts; and goats, furnishing the inhabitants with milk are seen around all the cottages. Sheep, in flocks of any size, are confined to the mountain districts. They are very small, many of them, when fat, not weighing more than seven or eight pounds a quarter. On the low ground there are a few, seldom exceeding half a score, on almost every farm. A great number of hogs are fattened; many of them bred in the county, but not a few brought from the west of Ireland. The dry hills of this county, covered with heath and odoriferous herbs, are well adapted to bees, but the number of hives has greatly decreased within these twenty years.

The principal manufacture is linen, which is carried on in all its branches. Kelp is also an article of commerce.

Copper and lead are found within the precincts of Down, and marine exuviae among the hills at a great distance from the sea. There are also bluish marble susceptible of a high degree of polish, slate, coal, freestone, and crystals. Natural woods are seen in some parts, but plantations are scarce; there are a good many orchards, a small one being attached to almost every cottage in the bleaching districts on the low grounds. Bleaching is conducted on a considerable scale upon the banks of the rivers; and vitriolic acid is made in several of the towns. Fish abound on the coast; but the inhabitants of Down derive little benefit from the bounty of nature in this particular.

Mineral. Besides basalt, limestone, gypsum, coals, fossil-wood, or wood-coal, sandstone, &c. are found. The fossil-wood, or wood-coal, in most places, is covered with columns of basalt, and is curious as explanatory of the origin of coal. Notwithstanding the compressed state in which it is found, the bark and knots are quite distinct, and the rings denoting the annual growth of the wood may be counted. In some instances the roots of the trees may be traced. Of the only two coal mines which are wrought in the province of Ulster, there is one in Antrim, at Bally Castle. The coals are bituminous, and of a bad quality; a great part of them are exported.

Landed Property. Estates are in general freehold, being either immediate grants from the Crown, or held under those grants. The exceptions are the properties under the see of Connor. Some of the estates are very large. The Marquess of Hertford and the Antrim family possess the fee of the major part of the county. The former has 64,000 *green acres*; that is, land capable of tillage, and independently of bog and mountain. Most of the Antrim estate is let on perpetuity, in farms worth 2000*l.* or 3000*l.* per annum. The other great proprietors are the Marquess of Donegal, Lord Templeton, and Lord O'Neil. The estate of Lord Templeton, however, is only leasehold under the Marquess of Donegal, who lets his land for sixty-one years and a life, but renews at the end of a few years for a price.

The farms are generally very small. The principal feature in the tillage system is the potato fallow. The small size of the farms, and, in some places, the rockiness of the soil, precludes the use of the ordinary means of culture, and therefore a part

of the land is dug with the spade. The quantity of potato-land is regulated by the quantity of manure that can be collected. After potatoes, flax is sown, and the quantity of flax ground is regulated by the ability to purchase the seed. A crop of oats finishes the regular rotation. When the ground is exhausted, it is turned to rest, that is, it is suffered to lie till it is covered with natural grass. Such is the most general plan of husbandry pursued in Antrim. In those parts where the farms are too large for the spade culture, the land is ploughed by three or four neighbours uniting their strength; one supplying the plough, and the others bringing a horse, bullock, or even a milch cow. Wheat is a plant of very modern introduction in Antrim, and very little of it is sown.

The most important crop is flax. The cattle consist chiefly of milch cows, belonging to small occupiers, of a small stunted breed. Sheep are very little attended to; and the few that are kept are of a very inferior kind. Goats are numerous in the mountainous parts of the county. Pigs also are kept in great numbers.

This county by no means abounds with wood; nor are fruit-trees cultivated in great abundance, or with very much success. Of the apple, however, several new and valuable varieties have lately been introduced, and advantageously cultivated.

Antrim has long been distinguished for its *linen manufacture*; but latterly the manufacture of cotton has, in some measure, supplanted it, especially in the vicinity of Belfast.

There is a considerable salmon-fishing on the coast. The stupendous assemblage of basaltic columns, called "the Giant's Causeway," lies on the maritime confines of Antrim.

CHAP. IV.

Literature and Bibliography of Agriculture.

7896. *The first books on agriculture* were written by the Greeks before the Christian era, and by the Romans about the commencement of that period. Hesiod is the only writer of the former people exclusively devoted to husbandry: the earliest Roman author is Cato; and the latest, Palladius, in the fourth century A.D. The works of these and the other agricultural writers of antiquity have been already enumerated (25. and 44.), and the most interesting have lately been re-translated (7110. anno 1800).

7897. *In the dark ages* few books were written except on religion. The first author that appeared on the revival of the arts was Crescentius in Italy, in the fifteenth century; and soon after, in the sixteenth, Fitzherbert in England, Olivier des Serres in France, Heresbach in Germany, and Herrera in Spain. Since these works appeared, many others have been published in every country in Europe, especially in England, France, and Germany. Though our business is chiefly with the works which have appeared in Britain: yet we shall, after enumerating the chief of them, notice also what has been done in other countries; many foreign works, especially of France, Germany, and Italy, being familiar, either in the original or by translations, to the reading agriculturists of this country. All the works of importance, whether foreign or domestic, published or to be published since 1825, will be found noticed or reviewed in the *Gardener's Magazine*, commenced in that year, and in continuation,

SECT. I. Bibliography of British Agriculture.

7898. *A general view* of the literature of British agriculture having been already given (801.), we have here only to supply the bibliographical enumeration confirmatory of that view. Of agricultural books very few at the present day are worth reading for their scientific information; they are chiefly to be considered as historical documents of the progress of opinions and practices; and this is the reason we have arranged them in the order of their appearance, instead of classing them according to the subjects treated of. Those who wish to see them so classed will be amply gratified by *Watts's Bibliographia Britannica*. In our list we have omitted many works on subjects belonging to political agriculture, as the corn laws, tithes, poor-rates, &c.; and also most of those on veterinary surgery, horsemanship, bees, hunting, planting, &c., as not strictly belonging to the subject, and as being for the greater part, those on the veterinary art in particular, worse than useless. In short, the improvements in chemistry, animal and vegetable physiology, and the comparatively clear views of political economy which have taken place chiefly since the commencement of the present century, have rendered most books on agriculture, whether political or professional, not published within the last ten years, of very little value, and a number of them more injurious than useful. This second edition of British authors on agriculture is considerably reduced, in order to render it more select; and, through the obliging disposition of Mr. Forsyth, perhaps the only man in existence thoroughly acquainted with the bibliography of British agriculture and gardening, it is rendered much more accurate.

1500. *Groshede*, Bishop of Lincoln.

Here begins a Treatise of Husbandry, which Mayster Groshede, sometime Bishop of Lyncolne, made and translated out of Frensch into Englyshe. Lond. 4to.

1523. *Fitzherbert*, or *Fitzherberde*, Sir *Anthony*, a very learned lawyer, and also known as the father of English husbandry, was born at Norbury, in Derbyshire, and died there in 1538. He was made judge of the Common Pleas in the 15th of Henry VIII., and wrote several books on law.

1. The Book of Husbandry, very profitable and necessary for all persons. Lond. 1525, 4to; 1532, 16mo.

2. Surveying. Lond. 1525, 4to; 1539, 16mo.

3. De Extentia Mancrill. Lond. 1539.

1558. *Benese*, Sir *Richard*, Canon of Marton Ab-

bey, near London.

The Manner of Measuring all Manner of Land. 16mo.

1557. *Tusser*, *Thomas*, styled the British Varro, was born near Witham, in Essex, 1515; received a liberal education at Eton School, and at Trinity Hall, Cambridge; lived many years as a farmer in Suffolk, and afterwards removed to London, and published his experience in agriculture and gardening. He died in 1580.

1. A hundred good Pointes of Husbandry. Lond. 4to.

2. Five Hundred Pointes of Good Husbandry, suited to as many of Good Huswife; with divers approved lessons concerning Hops and Gardening. Lond. 4to. 1573.

1581. *Mascall*, *Leonard*, author of a work on sowing, planting, and grafting trees, &c. 1572.

The Husbandly Ordering and Government of Poultry, &c. Lond. 8vo.

2. The First Book of Cattel, &c. Lond. 1587, 4to.

3. A Booke of Fishing with Hooke and Line, and all other Instruments thereunto belonging; another of Sundrie Engines

and Trappes to take Polecats, Buzards, Rats, Mice, and all other kinds of Vermin and Beasts whatsoever; most profitable for all Warriners, and such as delight in this kinde of sporte and pastime. Lond. 1590. 4to.

1601. *Anon.*

God speede the Plough. Lond. 4to.

1601. *Plat, Hugh.*

The new and admirable Arte of setting of Corne, with all the necessarie Pooles; and other Circumstances belonging to the same. Lond. 4to.

1610. *Langham, Rowland.*

Most approved and long experienced Water Works: containing the Manner of Summer and Winter drowning of Meadow and Pasture by the Advantage of the least River, Brooke, Fount, or Water Trill adjacent. Lond. 4to.

1613. *Markham, Gervase, Jarvis, or Gervas.* An author who wrote on a great variety of subjects during the reigns of James I. and Charles I., and died about 1685. He appears, says Harte (*Essays*, i. 32.) to be the first Englishman who deserves to be called a hackney writer.

1. The English Husbandman; 2 Parts. Lond. 1613. 4to.

2. Farewell to Husbandry. Lond. 1620. 4to.

3. Cheap and Good Husbandry, for the well ordering of all Beasts and Fowls, &c. Lond. 1616, 1651. 4to.

4. Enrichment of the Weald of Kent, &c. Lond. 1620, 1651. 4to.

1616. *Stevens and Liebauit.*

Maison Rustique, or the Country Farm; translated into English by Richard Surflet, Practitioner in Physicke, newly reviewed, &c.; and the Husbandrie of France, Italy, and Spaine reconciled and made to agree with any here in England. By Gervase Markham. Lond. fol.

1635. *Calthorpe, Charles.*

The Relation between a Lord of a Manor and the Copyholder, his Tenant. Lond. 4to.

1639. *Plattes, Gabriel*, author of some tracts on Gardening; a poor man but a useful writer. Harte says, he had a bold adventurous cast of mind, and preferred the faulty sublime to faulty mediocrity. As great a genius as he was, he was allowed to drop down dead in London streets with hunger; nor had he a shirt upon his back when he died. He bequeathed his papers to Hartlib, who seems to have published but few of them.

1. Discovery of infinite Treasure, hidden since the World's beginning, in the Way of Husbandry. 4to.

2. Discov'rie of subterranean Treasure, viz. all manner of Mines and Minerals, from the Gold to the Coal, &c., with directions for the finding them. Lond. 1653. 4to.

3. Observations and Improvements in Husbandry, with Twenty Experiments. Lond. 1653. 4to.

1642. *Vermuyden, Sir C.*, a native of Holland, and a colonel in Cromwell's army.

Discourse touching the Drenninge the great Fens lying within the several Counties of Lincoln, Northampton, Huntingdon, Norfolk, Suffolke, Cambridge, and the Isle of Ely. 4to.

1645. *Weston, Sir Richard.*

Discourse of Husbandry used in Brabant and Flanders, shewing the wonderful Improvements of Land there. Lond. 4to.

1649. *Blith, Walter*, an officer in Cromwell's army, who, with other English gentlemen holding commissions at that time, was eminently useful in introducing improvements into Ireland and Scotland.

1. The English Improver, or a new Survey of Husbandry, discovering to the kingdom that some Land, both Arable and Pasture, may be advanced Double and Treble, and other, Five and Ten fold. Lond. 4to.

2. The English Improver improved; or the Survey of Husbandry surveyed. Lond. 1652. 4to. 3d Edit.

1651. *Hartlib, Samuel*, an ingenious writer on agriculture, and author of several theological tracts. He was the son of a Polish merchant, and came to England, according to Weston, about 1640; but the time when he died is unknown. He was a great promoter of husbandry during the times of the commonwealth, and was much esteemed by all ingenious men in those days. Milton addressed to him his treatise on education, and Sir William Petty inscribed two letters to him on the same subject. Cromwell allowed him a pension of 100*l.* a year.

1. Legacy; or, an Enlargement on the Discourse of Husbandry used in Brabant and Flanders. This work is said in the *Censura Literaria* to be written by Robert Child. With an Appendix. 1651. 4to. Lond.

2. Appendix to the Legacy, relating more particularly to the Husbandry and Natural History of Ireland. Lond. 1652. 4to.

3. Essay on the Advancement of Husbandry and Learning, with propositions for erecting a College of Husbandry. Lond. 1651. 4to.

4. The Reformed Husbandman; or, a brief Treatise of the Errors, Defects, and Inconvenience of our English Husbandry, in ploughing and sowing for Corn; with the Reasons and general Remedies, and a large yet faithful Offer or Undertaking for the Benefit of them that will joyn in this good and publick Work. Lond. 1651. 4to.

5. Design for Plenty, by a Universal Planting of Trees; tendered by some well-wishers to the Public. Lond. 1652. 4to.

6. Discovery for Division or Setting out of Land in England and Ireland. Lond. 1653. 4to.

7. The Complete Husbandman; or, a Discourse of Husbandry, both Foreign and Domestic. And a particular Discourse of the Natural History of Husbandry in Ireland. Lond. 1659. 4to.

1659. *Speed, Adam.*

1. Adam out of Eden; or, an Abstract of divers excellent

Experiments, touching the Advancement of Agriculture. Lond. 12mo.

2. Husbandman, Farmer, and Grazier's Complete Instructor. Lond. 1697. 12mo.

1662. *Dugdale, William.*

History of the embanking and draying of divers Fens and Marshes, both in forrain parts and in this kingdom. Lond. fol. 2d edit. pt. 1772. Revised by C. N. Cole, Esq.

1664. *Forster, John.*

England's Happiness increased; or a sure and easie Method against all succeeding dear Years, by a Plantation of the Roots called Potatoes, &c. Lond. 4to.

1665. *Dotson, Colonel William.*

The Design for the perfect Draining of the great Level of the Fen, called Bedford Level, with Maps, &c. Lond. 4to.

1669. *Worlidge, John*, gentleman, author of some works on gardening.

Systema Agricultura, &c. Lond. fol.

1670. *Smith, John, Gent.*

England's improvement revived; jointly discovering the several Ways of improving the several Sorts of waste and barren Grounds, and of enriching all Earths; with the natural Quality of all Lands, and the several Seeds and Plants which naturally thrive therein, observed; together with the manner of planting all sorts of Timber Trees and Underwoods; experienced in 50 Years' Practice; in 6 Books. Lond. 4to. 1675.

1681. *Houghton, John, F.R.S.*

A Collection of Letters for the Improvement of Husbandry and Trade. Lond. 4to. Again in 1728, 4 vols. 8vo, revised by R. Bradley.

1683. *Lister, Martin, M.D.*, an eminent physician and natural philosopher; was born in Buckinghamshire about 1638; practised in London; died 1711-12. He wrote various works.

Of Plants which may be usefully cultivated for Grass or Hay. 1696. (*Phil. Trans. N. Abr.* iv. 156.)

1685. *Moore, Sir Jonas*, Knight, F.R.S., a very respectable mathematician, and surveyor-general of his majesty's ordnance, was born in Lancashire, 1617; died 1679.

1. History or Narrative of the great Level of the Fens called Bedford Level; with a large Map of the said Level, as drained, surveyed, and described. 8vo.

2. England's Interest; or the Gentleman and Farmer's Friend. Lond. 1695. 8vo.

1694. *Floyd, Edward.*

1. Account of Locusts in Wales. (*Phil. Trans. Abr.* iii. p. 61.)

On the spontaneous Combustion of several Hay-stacks, &c. (*ib.* p. 618.)

1697. *Donatdson, James*, a native of Scotland, and one of the earliest and most useful writers on the agriculture of his country.

Husbandry Anatomised; or an Enquiry into the present manner of Tilling and Manuring the Ground in Scotland. Edin. 1720.

1697. *Meager, Leonard*, author of *The English Gardener* and other works.

The Mystery of Husbandry. Lond. 12mo.

1700. *Nourse, Timothy, F.R.S.*

Campania Felix; or a Discourse of the Benefits and Improvements of Husbandry. Lond. 8vo.

1707. *Mortimer, John*, author of some tracts on religious education. His works on husbandry were translated into Swedish, and published in Stockholm, in 1727.

The whole Art of Husbandry, in the way of Managing and Improving Land. Lond. 8vo.

1717. *Lawrence, Edward*, brother to John Lawrence, a clergyman, author of a work on gardening. (See A. D. 1756.)

The Duty of a Steward to his Lord; with an Appendix on Farming. Lond. 1727. 4to.

1721. *Bradley, Richard, F.R.S.*, and Professor of Botany in the University of Cambridge; a most voluminous writer on gardening, botany, &c.; died 1732. (*Encyc. of Gard.* p. 1102.)

1. Philosophical Treatise of Husbandry and Gardening. Lond. 4to.

2. The Country Gentleman, and Farmer's Monthly Director. Lond. 1721. 8vo.

3. Experimental Husbandman and Gardener. Translated from the German of G. A. Agricola. Lond. 4to. 1726.

4. A Complete Body of Husbandry. Lond. 1727. 8vo.

5. The Weekly Miscellany for the Improvement of Husbandry, Arts, and Sciences. 21 Nos. 1727. 8vo.

6. The Science of Good Husbandry, or the Economy of Xenophon; translated from the Greek. Lond. 1727. 8vo.

7. The Riches of a Hop Garden explained, with the Observations of the most celebrated Hop Planters in Britain. Lond. 1729. 8vo.

1724. *Anon.*

A Treatise concerning the Manner of following Ground, raising of Grass Seeds, and training of Line and Hemp. Edin. 8vo. Plates.

1726. *Lawrence, John, M.A.*, author of *The Clergyman's Recreation*, a gardening work of use in its time; he died in Durham 1732. (*Encyc. of Gard.* p. 1102.)

The New System of Agriculture; being a complete Body of Husbandry and Gardening in all the parts of them. Lond. fol.

1729. *Mackintosh, Borland.*

Essay on Ways and Means for Inclosing, Following, Planting, &c. Scotland, and that in sixteen Years at farthest. Edin. 8vo.

1730. *Richards, John.*

The Gentleman's Steward and Tenants of Manors instructed. Lond. 8vo.

1730. *Rye, George*. Observations on Agriculture. Dub. 8vo.
1731. *Tull, Jethro*, was born in Oxfordshire; he was a barrister, and made the tour of Europe; after which he settled on his paternal estate, which he cultivated with so much attention as brought on a disorder in his breast. He then went abroad, and on his return, fixed his residence on a farm in Berkshire, where he renewed his experiments in horse-hoeing husbandry; he died in 1740. His son, John Tull, was an officer in the army, but ruined himself by projects, and died in the Fleet in 1764. (*Gent. Mag.*) Mr. Tull's farm was "situated at a place called Prosperous (probably so called from his great success), in a tract of very indifferent land, lying on the north side of the Hampshire hills, near the borders of Wiltshire, but being itself in the county of Berks. It is, I believe, in the parish of Ink-pen. I visited it in the company of Mr. Budd of Newbury, who had visited it long before with Arthur Young, who, like me, visited it in the character of a pilgrim, and in honour of the memory of the real founder of every recent improvement that has been made in the agriculture of England." (*Cobbett's Treatise on Cobbett's Corn*, chap. vi.)
1. Specimen of a Work on Horse-hoeing Husbandry. Lond. 4to.
 2. New Horse-hoeing Husbandry; or an Essay on the Principles of Tillage and Vegetation; wherein is shown a Method of introducing a sort of Vineyard Culture into the Corn Fields, in order to increase their Product, and diminish the common Expence by the use of Instruments, described in Cuts. 1733. fol.
 3. Supplement to the New Horse-hoeing, &c. Lond. 1739. 1732.
 4. *Ellis, William*, a farmer at Little Gaddesdon, near Hemel Hempstead, in Hertfordshire.
 1. The Modern Husbandman; or, Practice of Farming. Lond. 1744. 8 vols. 8vo.
 2. The Country Housewife's Family Companion. Lond. 1750. 8vo.
 3. The Complete Planter and Ciderist. Lond. 1757. 8vo.
 4. *Ellis's Husbandry* abridged and methodised. Lond. 1772. 2 vols. 8vo.
 1737. *Phillips, Robert*. Dissertation concerning the present State of the High Roads of England, especially those near London; wherein is proposed a New Method of repairing and maintaining them. Lond. 8vo.
 1741. *Blackwell, Alexander, M.D.*, a native of Aberdeenshire. Blackwell studied physic under Boerhaave at Leyden, took the degree of M. D., practised as a physician at Aberdeen, and afterwards at London, but meeting with no success, turned printer, and became bankrupt in 1734. About 1740 he went to Sweden, turned projector, and laid a scheme before his Swedish Majesty for draining the fens in a plot with Count Tessin, and was beheaded August 9. 1748. His wife Elizabeth was the author of a curious herbal.

A new Method of Improving cold, wet, and barren Land, particularly clayey Grounds, &c. Lond. 8vo.
 1743. *Mazwell, Robert*, an eminent Scotch improver.
 1. Select Transactions of the Honourable Society of Improvers in the Knowledge of Agriculture in Scotland. Edinb. 1743. 8vo. Plates.
 2. The Practical Husbandman. Edin. 8vo. 1757.
 1744. *Clavidge, John*. The Shepherd of Banbury's Rules to know of the Change of the Weather. Lond. 8vo.
 1751. *Home, Francis, M.D.*, Professor of Materia Medica in the University of Edinburgh. The Principles of Agriculture and Vegetation. Lond. 8vo.
 1751. *Lisle, Edward, Esq.*, late of Crux-Easton, in Hampshire. Observations on Husbandry. Lond. 4to, and 2 vols. 8vo.
 1759. *Stillingfleet, Benjamin*, grandson to the bishop of that name, and an ingenious naturalist and miscellaneous writer, interesting in agriculture as a promoter of the introduction of artificial grasses; was born about 1702; died 1771.
 1. Miscellaneous Tracts relating to Natural History, Husbandry, and Physic. Translated from the Latin; with Notes. Lond. 8vo.
 2. Calendar of Flora, Swedish and English, made in the year 1755. Lond. 8vo. 1761.
 1759. *Mills, John, F.R.S.*, author and translator of several works, and among others of Gyllenberg's *Natural and Chemical Elements of Agriculture*, an ingenious work for its time and country.
 1. A Practical Treatise of Husbandry, collected by Duhamel, and also the most approved practice of the best English farmers. Lond. 4to.
 2. A New and Complete System of Practical Husbandry. Lond. 1762-3. 5 vols. 8vo.
 3. An Essay on the Weather; with Remarks on the Shepherd of Banbury's Rules for Judging of its Changes, and Directions for prescribing Hives and Buildings from the fatal effects of Lightning. Lond. 1770. 8vo.
 4. A Treatise on Cattle, &c. Lond. 1776. 8vo.
 1760. *Hilt, Thomas*, gardener to Lord Manners,

- at Bloxholme in Lincolnshire, and author of a meritorious work on fruit trees.
- A Treatise of Husbandry; or the Improvement of dry and barren Lands. Lond. 8vo.
1761. *Mordant, John*. The Complete Steward; or the Duty of a Steward to his Lord. Lond. 2 vols. 8vo.
1762. *Dickson, Adam, A.M.*, minister of Dunse in Scotland. Considered a good classical scholar, and an excellent practical farmer. He died before *The Husbandry of the Ancients* was prepared for the press, which is the occasion of some defects in that work.
 1. Treatise on Agriculture. Edin. 8vo. This is one of the best works on tillage that ever has appeared.
 2. The Husbandry of the Ancients. Edin. 1778. 2 vols. 8vo.
1763. *Anon.* Museum Rusticum et Commerciale; or Select Papers on Agriculture, Commerce, &c. Lond. 6 vols. 8vo.
1764. *Ladnar, J.*, of Kroy, in Yorkshire. The Farmer's New Guide. Lond. 8vo.
1764. *Randall, J.*, some time master of the academy at Heath, near Wakefield, Yorkshire.
 1. The Semi-Virgilian Husbandry, deduced from various Experiments. Lond. 8vo.
 2. Construction and extensive Use of a new-invented Seed Furrow Plough, suited to all soils; of a Draining Plough; and of a Potato Drill Machine; with the Theory of a Common Plough; illustrated with 7 plates. Lond. 1764. 4to.
1765. *Fordyce, George, M.D., F.R.S.*, a distinguished physician, and teacher of medicine in London; was born at Aberdeen, 1736; died 1802. Elements of Agriculture and Vegetation. Edin. 8vo.
1766. *Homer, Henry*, an excellent classical scholar, was born in Warwickshire, 1752; died 1791.
 1. An Essay on the Nature and Method of ascertaining the specific Shares of Proprietors upon the Inclosure of Common Fields. Lond. 8vo.
 2. An Inquiry into the Means of Preserving and Improving the Public Roads of this Kingdom. Oxf. 1767. 8vo.
1766. *Anon.* The Complete Farmer; or a General Dictionary of Husbandry in all its branches, &c., by a Society of Gentlemen, Members of the Society of Arts, Manufacturers, &c. London. Fel. Plates.
- London, 1807. 2 vols. 4to, 5th edit. entitled *The Complete Farmer; or General Dictionary of Agriculture and Husbandry, &c.*, wholly re-written and enlarged. Plates.
1767. *Young, Arthur, F.R.S.*, an eminent agricultural secretary to the Board of Agriculture, was the son of Arthur Young, a prebendary of Canterbury, and author of *An Historical Dissertation on Corruptions in Religion*. He was born in 1741. He served his apprenticeship to a wine merchant; but on entering into the possession of his paternal estate, near Bury St. Edmunds, he became a farmer, and impoverished himself by experiments. After this he set up as a teacher of others, and in 1771 published a volume called *The Farmer's Calendar*, which was followed in 1784 by *The Annals of Agriculture*, in which he had Ralph Robinson, George III.'s farming bailiff, for a correspondent. Young also made excursions through the British islands and on the Continent, to collect information on subjects of rural economy. At length a Board of Agriculture was established, of which he was appointed secretary, with a salary of six hundred a year. He became blind some years before his death, which happened February 20. 1820. His works are numerous, and his travels amusing. (*Annual Biography*.)
 1. The Farmer's Letters to the People of England, &c. Lond. 8vo.
 2. The Farmer's Letters to the Landlords of Great Britain. Lond. 1771. 8vo.
 3. A Six Weeks' Tour through the Southern Counties of England and Wales. Lond. 1768. 8vo.
 4. Treatise on the Management of Hogs. Lond. 1769. 8vo.
 5. A Six Months' Tour through the North of England. Lond. 1770. 4 vols. 8vo.

2. Real Improvement in Agriculture, on the Principles of A. Young, Esq. To which is added, a Letter to Dr. Hunter of York, on the Rickets in Sheep. Lond. 1772. 8vo.
1770. *Hunter, Alexander, M.D., F.R.S.L. and E.* was born at Edinburgh, 1733; settled as a physician at Gainsborough, at Beverley, and finally at York, where he died, 1808.
1. Geographical Essays; in which the Food of Plants is particularly considered. Lond. 4 vols. 8vo.
2. Outlines of Agriculture. York. 1785. 8vo.
3. A new Method of raising Wheat for a Series of Years on the same Land. York. 1796. 4to.
1772. *Parlo, C. Esq.*
A New System of Husbandry. Lond. 5 vols. 8vo.
1774. *Barron, William, F.R.S.E., Professor of Logic and Belles Lettres in the University of St. Andrew's.*
Essays on the Mechanical Principles of the Plough. Edin. 8vo.
1775. *Kent, Nathaniel, of Fulham, Middlesex.* He studied agriculture in Flanders, and became an eminent land valuer and agent. He was also for some time farm bailiff to George III. He died in 1818.
1. Hints to Gentlemen of Landed Property. Lond. 8vo.
2. General View of the Agriculture of the County of Norfolk; drawn up for the Board of Agriculture and Internal Improvement. Norwich. 1796. 8vo.
3. Account of the Improvements made on the Farm in the Great Park of His Majesty the King, at Windsor. (*Nicholson's Journal*, iii. 428.) 1799.
1775. *Harrison, Gustavus, Esq.*
Agriculture Delineated; or, the Farmer's Complete Guide, being a Treatise on Land, in general. 8vo.
1775. *Anderson, James, LL.D.,* an eminent agricultural writer, was born at Hernistoun, a village near Edinburgh, in 1730, on a farm which his parents had possessed for some generations, and which he was intended to inherit and to cultivate. He lost his parents at an early age, but his education was not neglected; he studied chemistry under Dr. Cullen, and soon leaving his farm near Edinburgh, took office in Aberdeenshire of 1500 acres, which, after improving and cultivating for twenty years, he let, and enjoyed an annuity from it during his life. He settled, after leaving Aberdeenshire, in the neighbourhood of Edinburgh, where he published the *Dec.* in weekly sixpenny numbers, till it extended to 15 volumes. In 1797 he removed to Isleworth, near London, where he published *Recreations in Agriculture*, six volumes, and his *Description of a Patent Hothouse*. Here he enjoyed his garden, and died of a decline in 1808, aged 69. Besides the works which bear his name, he wrote the reviews of books on rural matters for the *Monthly Review* for many years.
1. Essays relating to Agriculture and Rural Affairs. Edin. 8vo. Lond. 3 vols. 8vo.
2. Miscellaneous Thoughts on Planting and Training Timber Trees, by Agricola. Edin. 1777. 8vo.
3. An Account of the Present State of the Hebrides and Western Coasts of Scotland, with Hints for encouraging the Fisheries, and promoting other Improvements in these countries; being the Substance of a Report to the Lords of the Treasury. Edin. 1785. 8vo.
4. A Practical Treatise on Peat Moss, considered as in its Natural State fitted for affording Fuel, or as susceptible of being converted into Mould, capable of yielding abundant Crops of useful Produce, with full Directions for converting and cultivating it as a Soil. Edin. 1794. 8vo.
5. A General View of the Agriculture and Rural Economy of the County of Aberdeen, with Observations on the Means of its Improvement. Chiefly drawn up for the Board of Agriculture, in two parts. Edin. 1794. 8vo.
6. A Practical Treatise on Draining Bogs and Swamps

- Grounds; with cursory Remarks on the Originality of Elkington's Mode of Draining. Lond. 1794. 8vo.
7. Recreations in Agriculture, Natural History, &c. Lond. 1799. 6 vols. 8vo.
1776. *Home, Henry,* usually called Lord Kames, an eminent Scotch lawyer, philosopher, and critic, was born at Kames, in Berwickshire, 1736; died 1782. He farmed his own estate in Berwickshire many years; he afterwards removed to Blair Drummond, near Stirling, where he made various and extensive improvements, the most important of which was the clearing, cultivating, and peopling great part of Flanders Moss.
The Gentleman Farmer; being an attempt to improve Agriculture, by subjecting it to the test of Rational Principles. Edin. 8vo.
- 1777—1816. *Anon.*
Letters and Papers on Agriculture, Planting, &c., selected from the Correspondence of the Bath and West of England Society. Bath. 11 vols. 8vo.
1771. *Clarke, Cuthbert.*
The true Theory and Practice of Husbandry, deduced from Philosophical Researches and Experience, &c. Lond. 4to.
1778. *Forbes, Francis, gentleman.*
1. The extensive Practice of the New Husbandry. Lond. 8vo.
2. The Improvement of Waste Lands. Lond. 1778. 8vo.
1778. *Wight, Andrew,* a farmer in East Lothian, and one of the earliest writers among that class in Scotland.
The Present State of the Husbandry in Scotland. Edin. 6 vols. 8vo.

Observations on the Tillage of the Earth, and on the Theory of Instruments adapted to this end. Lond. 4to.
1778. *Marshall, William, Esq.,* a native of Yorkshire, brought up to trade; he was some years in the West Indies, as a planter; returned about 1775, and took a farm in Surrey; went down into Norfolk as agent to Sir Harbord Harbord's estate in 1780; he left this situation in 1784, and went and resided at Stafford, near the junction of the four counties of Leicester, Warwick, Stafford, and Derby, where he remained till 1786, occupied in collecting materials for his *Economical Surveys*, and in printing some of his works. From this time till about 1808, he resided chiefly in Clement's Inn, London, in winter, and visited different parts of the country during summer. He spent one summer in Perthshire, chiefly on the Earl of Breadalbane's estates at Tay, and partly also on the Earl of Mansfield's at Scoon. He proposed arrangements for the tenantable land, and also the park and woody scenery on various estates; and finally retired to a considerable property he purchased in his native country, in the vale of Cleveland, in 1808, where he died at an advanced age in 1819. He was a man of little education, but of a strong and steady mind; and pursued in the most consistent manner, from the year 1780 to his death, the plan he originally laid down; that of collecting and condensing the agricultural practices of the different counties in England, with a view to a general work on *Landed Property*, which he published; another on *Agriculture*, which he did not live to complete; and a *Rural Institute*, in which he was supplanted by the Board of Agriculture.

The Experimental Farmer. 8vo.

1808. *Cocentry, Andrew*, M.D., professor of agriculture in the university of Edinburgh; a learned, ingenious, and most benevolent man. He cultivated his own estate in Kinross-shire, and was extensively employed as a land valuer and rural counsellor. He died in December 1830.

1. Discourse explanatory of the Nature and Plan of a Course of Lectures on Agriculture and Rural Economy. Edin. 8vo.

2. Observations on Live Stock, in a Letter to Henry Cline, Esq. Edin. 8vo.

3. Notes on the Culture and Cropping of Arable Land. Edin. 1814. 8vo.

1808. *Gray, Andrew*, a retired machinist at Edinburgh.

Plough-wright's Assistant; or, a Practical Treatise on various Implements employed in Agriculture; illustrated with 16 Engravings. Edin. 8vo.

1808. *Beddoes, Thomas*, M.D., born in Shropshire, 1760, was lecturer in Boton, at Oxford, and afterwards physician at Bristol, where he died, 1808.

1. Good Advice for the Husbandman in Harvest, and for all those in Labour in Hot Births; as also for others who will take it in Warm Weather. 8vo.

2. On the Means of foretelling the Character of the Summer Season, and the Benefits to be expected from the Cultivation of Grasses which vegetate at low Temperatures. (*Nic. Jour. v. 131.*) 1802.

1808. *Bakewell, Robert*, Esq., an eminent geologist and mineralogist, author of *Travels in the Tarentaise*, &c.; an instructive and entertaining work, published in 1823.

Observations on the Influence of Soil and Climate upon Wool, with an easy Method of improving the Quality of English Clothing Wool, and Hints for the Management of Sheep, &c.; with occasional Notes and Remarks by the Right Hon. Lord Somerville. Lond. 8vo.

1. Statistical Survey of the County of Clare. Dublin, 8vo.

2. Statistical Survey of the County of Galway. Dublin, 1824. 8vo.

1808. *Curwen, John Christian*, M.P., of Workington Hall, Cumberland.

1. Hints on the Economy of Feeding Stock, and bettering the Condition of the Poor. Lond. 8vo.

2. A Tour in Ireland. 2 vols. 8vo. 1819.

1809. *Stevenson, W.*, Esq., M.A., librarian to the Treasury, author of various works, and a writer in the principal encyclopædias. He died in 1829.

General View of the Agriculture of the County of Surrey. Lond. 8vo.

1809. *Kerr, Robert*, surgeon, F.R. and A.S.S. Edinburgh, an excellent naturalist and general scholar; died, 1814.

Statistical, Agricultural, and Political Survey of Berwickshire. 8vo.

1809. *Williamson, Capt. Thomas*, upwards of 20 years in Bengal.

Agricultural Mechanism; or, a Display of the several Properties and Powers of the Vehicles, Implements, and Machinery connected with Husbandry. Lond. 8vo.

1810. *Davies, Walter*, A.M.

A General View of the Agriculture and Domestic Economy of North Wales. Lond. 8vo.

1810. *Hunt, Charles Henry*, Esq.

Treatise on the Merino and Anglo-Merino Breeds of Sheep. Lond. 8vo.

1810. *Adams, George*.

A New System of Agriculture and Feeding Stock. Lond. 8vo.

1810. *Farish, John*, Dumfriesshire.

A Treatise on Ficin Grass. 8vo.

1810. *Edgeworth, Richard Lovell*, Esq., F.R.S. and M.R.I.A., civil engineer, resident at Edgeworth Town, Ireland, author of various works.

An Essay on the Construction of Roads and Carriages. Lond. 8vo.

1811. *Keith, George Skene*, D.D.

A General View of the Agriculture of Aberdeenshire. 8vo.

1811. *Henderson, Robert*, farmer at Broomhill, near Annan, Dumfriesshire.

Treatise on the Breeding of Swine and Curing of Bacon; with Hints on Agricultural Subjects. Edin. 8vo.

1811. *Farey, John*, sen., mineral surveyor. A man of sound views on all subjects; a philosopher and an agriculturist, and territorial improver of great experience.

General View of the Agriculture and Minerals of Derbyshire. Lond. 3 vols.

1811. *Loudon, John Claudius*, F.L.G. Z. and H.S., landscape gardener, author of the *Encyclopædia of Gardening*, and other works, and founder and con-

ductor of the *Gardener's Magazine*, and of the *Magazine of Natural History*; born in Lanarkshire in 1782, began to practise in 1803; to farm extensively in Oxfordshire in 1809, and in Middlesex in 1810; travelling on the Continent in 1813-14-15, in 1819, and again in 1828-29; now residing at Bayswater.

1. Designs for laying out Farms and Farm Buildings in the Scotch Style, adapted to England; comprising an Account of the Introduction of the Berwickshire Husbandry into Middlesex and Oxfordshire. Lond. 4to.

2. An Encyclopedia of Agriculture. Lond. 8vo. 1825.

1813. *Walker, W.*

An Essay on Draining Land by the Steam Engine. Lond. 8vo.

1813. *Davy, Sir Humphry*, president of the Royal Society, LL.D., V.P.R.I., F.R.S., Edin. M.R.I.A., &c.

Elements of Agricultural Chemistry; in a Course of Lectures for the Board of Agriculture. 4to and 8vo.

1814. *Shirreff, John*, farmer at Captain Head, near Haddington, Scotland, and one of the authors of the *Survey of the West Riding of Yorkshire*, along with Mr. Brown and Mr. Rennie (see 1799); afterwards a land agent, and finally steward to a nobleman near Stirling.

General View of the Agriculture of the Orkney Islands. Edin. 8vo.

1815. *Moubray, Bonnington, Esq.*

A practical Treatise on the Method of Breeding, Rearing, and Fattening Domestic Poultry, Pigeons, and Rabbits. 8vo.

1815. *Little, John.*

Practical Observations on the Improvement and Management of Mountain Sheep and Sheep Farms. 8vo.

1814—1815. *Simpson, Pinder.*

1. Treatise on the Cultivation of Mangold Wurzel, as Winter Food for Cattle. Lond. 8vo.

2. On the improved Beet-root as Winter Food for Cattle.

1815. *Birkbeck, Morris, Esq.*, formerly a farmer in Suffolk, afterwards an extensive proprietor and resident cultivator in the Illinois. Drowned there in 1825.

1. Notes in a Journey through France from Dieppe, through Paris and Lyons to the Pyrenees, and back through Toulouse in 1814; describing the Habits of the People, and the Agriculture of the Country. 8vo.

2. Notes in a Journey in America, from the Coast of Virginia to the Territory of Illinois. Lond. 1818. 8vo.

1815. *Hornby, Thomas, Esq.*, surgeon, York.

Dissertation on Lime, and its use and abuse in Agriculture, embracing a View of its Chemical Effects. 8vo.

1816. *Anderson, William*, farmer, Angusshire.

Observations on a new Mode of Stacking Corn, peculiarly adapted to Wet Seasons; recommending a Plan, successfully practised, by which corn may be stacked with advantage soon after being cut down. 8vo.

1818. *Macwilliam, Robert, Esq.* architect and surveyor, London.

An Essay on the Origin and Operation of the Dry Rot; to which are annexed, Suggestions for the Cultivation of Forest Trees, and an Absence of the Forest Laws. 4to.

1819. *Radclyffe, Rev. T.*

A Survey of the Husbandry of Eastern and Western Flanders, made under the Authority of the Dublin Farming Society. 8vo.

1819. *Williams, T. W.*

The Farmer's Lawyer; containing the Whole of the Law and local Customs in regard to Agricultural Possessions, Properties, and Pursuits. 8vo.

1819. *Swinburne, R.*

The Farmer's New and Complete Account Book.

1819. *Blaikie, Francis*, first gardener, and afterwards steward to T. W. Coke, Esq. M.P. of Holkham.

1. On the Conversion of arable Land into Pasture, and on other rural Subjects. Lond. 1819. 12mo.

2. On the Management of Farm-yard Manure, and on other rural Subjects. Lond. 1819. 12mo.

3. A Treatise on the Management of Hedge and Hedgerow Timber. 12mo.

4. On the Economy of Farm Yard Manure, &c. 12mo. 1820.

5. On Milder, and the Culture of Wheat. 12mo. 1821.

6. On Smut in Wheat. 12mo. 1822.

1820. *Rigby, Edward, M.D. F.L.S.*

1. Framlingham, its Agriculture, &c., including the Economy of a small Farm. 8vo.

2. Holkham, its Agriculture, &c. 8vo. 1821.

1820. *Grisenthwaite, William*, apothecary, of Wells, in Norfolk.

A new Theory of Agriculture, in which the Nature of Soils, Crops, and Manures is explained, many prevailing Prejudices are exploded, and the Application of Bones, Gypsum, Lime, Chalk, &c. determined on scientific Principles. 12mo.

1820. *Monteath, Robert*, a forester in considerable practice as agent and valuator.

The Forester's Guide. Shirling, 12mo. 2d edition with Additions, &c. Edin. 8vo. 1824, plates.

1820. *Mather, John*, Castle Hill, Carse of Gowrie.

The Farmer and Land Steward's Assistant; or, a Specimen of Farm Book-keeping, exhibiting, in a concise and simple Form, the Transactions in the arable, grazing, and woodland Departments; a general Cash Account; and an Account of the Charge and Discharge upon each Department; the Whole selected from Books of real Business. 4to.

1820. *Johnson, Cuthbert William, F.L. and H.S.*

An Essay on the Uses of Salt for Agricultural Purposes, with Instructions for its Employment as a Manure, and in the Feeding of Cattle, &c. New Edition in 1827.

1820. *Burroughs, Edward, Esq.*

Essays on Practical Husbandry and Rural Economy, 8vo.

1820. *Beatson, Major General Alexander*, late Governor of St. Helena, &c.

A new System of Cultivation without Lime or Dung on Summer Fallows, as practised at Knowle Farm, in the County of Sussex. Lond. 1820, 8vo, Plates, and Supplement. 1821, 8vo, Plates.

1822. *Fintlayson, John*, of Kaines, near Muirkirk, Inventor and Patentee of the self-cleaning Ploughs and Harrows, a practical farmer and an ingenious man.

A Treatise on Agricultural Subjects. 8vo, plates. Subsequently changed to The British Farmer, &c. London. 1830. 8vo.

1822. *Salisbury, W.*, formerly a botanical nurseryman, now a private teacher of botany, &c.

The Cottager's Agricultural Companion. 12mo.

1822. *Munro, Colonel James*

A Guide to Farm Book-keeping, founded upon actual Practice, and upon new and concise Principles. Royal 8vo.

1822. *Napier, Hon. William John, F.R.S. Edin.* post captain in the Royal Navy; a vice-president of the Pastoral Society of Selkirkshire, &c.

A Treatise on Practical Store Farming, as applicable to the Mountainous Region of Ettrick Forest, and the Pastoral District of Scotland in general. With Engravings. 8vo.

1822. *Cleghorn, James, Esq.*, formerly a practical farmer, afterwards editor of *The Farmer's Magazine*, author of the article "Agriculture" in the Supplement to the *Encyc. Brit.*, and of various articles in that work. One of the best modern writers on agriculture. Mr. C. is now an accountant in Edinburgh.

On the depressed State of Agriculture. Edin. 8vo.

1823. *Fairbairn, John.*

A Treatise upon Breeding, Rearing, and Feeding Cheviot and Black-faced Sheep in high Districts; with Observations on laying out and conducting a Store Farm, &c. Perth. 8vo.

1823. *Low, David, Esq.* said to be editor of the *Quarterly Journal of Agriculture*.

Observations on the present State of Landed Property, and on the Prospects of the Landholder, and the Farmer. Edin. 8vo.

1824. *Morice, Francis.*

An Essay on Agriculture, and the Management of Landed Estates. Aberdeen. 8vo.

1824. *Sinclair, George, F.L.S. F.H.S.*, formerly gardener to the Duke of Bedford, at Woburn, now of the firm of Cormack, Son, and Sinclair, nurserymen, New Cross, Deptford.

Hortus Gramineæ Woburnensis; or, an Account of the Results of various Experiments on the Produce and Fattening Properties of different Grasses, and other Plants used as the Food of the more valuable domestic Animals; instituted by John Duke of Bedford. To which is added, an Appendix, pointing out the different Grasses best adapted for the Manufacture of Loughon Bonnets, &c. Lond. Royal 8vo.

1824. *Western, C. C., Esq. M.P.*

A few Practical Remarks on the Improvement of Grass Land, by means of Irrigation, Winter-flooding, and Drainage; in a Letter to the Owners and Occupiers of Land in the County of Essex. Lond. 8vo.

1824. *Slaney, Robert A., Esq. barrister.* Essay on the beneficial Direction of Rural Expenditure. Lond. 12mo.

1825. *Halditch, Benjamin*, a farmer on the Duke of Bedford's estate, near Peterborough, and for some time editor of the *Farm Journ.* newspaper.

Essay on the Weeds of Agriculture. Lond. 8vo. Edited by G. Sinclair, for the benefit of his widow.

1825. *Hayward, Joseph*, author of the Science of Horticulture.

The Science of Agriculture, comprising a Commentary on, and comparative Investigation of, the Agricultural Chemistry of Mr. Kirwan, and Sir Humphry Davy; and the Code of Agriculture of Sir John Sinclair, &c. &c. Joseph Banks, and other authors on the subject; with Remarks on the Rust, or black Blight in Wheat; of which the true Cause and its Prevention are explained. Lond. 8vo.

1825. *Anon.*

A Treatise on Milk. Lond. 8vo.

1825. *Bayldon, J. S.*, land-agent and appraiser.

The Art of valuing Rents and Tillages, and the Tenants Right on entering and quitting Farms. 2d ed. Lond. 8vo.

1825. *Buchanan, George*, civil engineer.

A Treatise on Road-making, Railways, Wheel Carriages, and the Strength of Animals.

1825. *Cleghorn, James*, accountant in Edinburgh, conductor of the *Farmer's Magazine*.

Thoughts on the Expediency of a general Provident Institution for the Benefit of the Working Classes, &c. &c. Edin. 8vo.

1824. *Steele, Andrew*, a proprietor in the neighbourhood of Edinburgh.

The National and Agricultural History of Peat Moss, &c. Edinburgh, 8vo.

1826. *Withers, William*, junior, Esq. of Holt, Norfolk.

A Memoir addressed to the Society for the Encouragement of Arts, Manufactures, and Commerce, on the Planting and Rearing of Forest Trees, &c. &c. Holt and London, 8vo. pamph.

1825. *Waistell, Charles, Esq.*, chairman of the

Committee of Agriculture, of the Society of Arts, Edited by Joseph Jopling, architect, member of the Institution of Civil Engineers, inventor of the Sep-tenary System of generating Lines by simple con-tinuous Motion, Instruments for drawing Curves, &c. &c.

Desays, or Agricultural Buildings, &c. &c.: to which are added, Plans and Remarks on Caterham Farm-yard, as it formerly was; and also as it has been improved. Lond. 8vo. 1826. *Collyns, W., Esq.,* surgeon, Kenton, near Exeter.

Ten Minutes' Advice to my Neighbours, on the Use and Abuse of Salt as a Manure, &c. Exeter, pamph. 8vo.

1826—1831. *Fleming, —, and J. Mann,* Flensing's British Farmer's Magazine. Lond. 2 vols. 8vo. Continued under the name of the British Farmer's Magazine, 2 vols. 8vo.

1827. *Anon.* The Farmer's Register and Monthly Magazine of Foreign and Domestic Events. Glasgow. In 8vo numbers, monthly. Completed in one volume.

1828. *Meadows, Arthur, Esq.,* Hints to the Farmers of the Baronies of Forth and Bargo on the Cultivation of Mangold Wurzel, Beans, Carrots, and Parsneps. Wexford, 8vo.

1828—1831. *Anon.,* believed to be *David Low, Esq.,* The Quarterly Journal of Agriculture. Edinburgh, 2 vols. 8vo.

The Prize Essays and Transactions of the Highland Society of Scotland are publishing along with this work. See 1799.

1828. *Kennedy, Lewis, Esq.,* son of Mr. Kennedy the late eminent nurseryman of Hammersmith, steward to Lord Willoughby De Eresby, author of the *Tenancy of Land in Great Britain, &c.* 1. On the Cultivation of the Waste Lands in the United Kingdom, for the purpose of finding Employment for the able Poor now receiving Parochial Aid, and thereby diminishing the heavy Burdens of the Poor Rates; and on the Expediency of making some Provision for the aged and disabled Paupers of Ireland. Lond. 8vo.

2. The present State of the Tenancy of Land in Great Britain; showing the principal Customs and Practices between incoming and outgoing Tenants, &c. Lond. 8vo.

1829. *Lambert, Joseph, Esq.,* Observations on the Rural Affairs of Ireland, or a Practical Treatise on Farming, Planting, and Gardening, adapted to the Circumstances, Resources, Soil, and Climate of the Country. Dublin, 8vo, pp. 367.

1829. *Stephens, George, drainer,* member of the Nerecian and Wermlandska Agricultural Societies in Sweden.

The Practical Irrigator; being an Account of the Utility, Formation, and Management of Irrigated Meadows, with a particular Account of the Success of Irrigation in Scotland. To which is added, a Practical Treatise on straightening

Water-courses, protecting River Banks, and embanking Low Lands. Edin. 8vo.

1829. *Doyle, Martin,* Hints originally intended for the small Farmers of the County of Wexford; but suited to the Circumstances of many Parts of Ireland. Dublin, 18mo.

1829. *Fall, Thomas,* Surveyor of Roads. The Surveyor's Guide; or, every Man his own Road maker: comprising the whole Art of making and repairing Roads; Prices for Work. East Retford, 12mo.

1829. *Harley, William,* originally a manufacturer in Glasgow; afterwards a great cow-keeper and builder there. He died in London in 1830.

The Harleian Dairy System, and an Account of the various Methods of Dairy Husbandry pursued by the Dutch. Also, a new and improved Mode of ventilating stables; with an Appendix, containing useful Hints (founded on the Author's experience) for the Management of Hedgerow Fences, Fruit Trees, &c., and the Means of rendering Barren Land fruitful. Lond. 8vo.

1829. *Strickland, G., Esq.,* A Discourse on the Poor Laws of England and Scotland, on the Poor of Ireland, and on Emigration. Lond. 8vo.

1829. *Trimmer, Joshua Kirby,* Practical Observations on the Improvement of British Fine Wool, and the National Advantages of the arable System of Sheep Husbandry; with Remarks on the Saxon and French Systems.

1830. *Anon.* The Library of Useful Knowledge; Farmer's Series. 8vo, 15 numbers to January 1, 1831.

1830. *Jennings, James, Esq.,* author of the *Family Cyclopaedia, &c.* A Practical Treatise on the History, Medical Properties, and Cultivation of Tobacco. London.

1830. *Berry, the Rev. Henry,* an extensive farmer in Worcestershire, and understood to be the principal proprietor of the *British Farmer's Magazine.*

Improved Short-horns, and their Pretensions stated; being an Account of this celebrated Breed of Cattle, derived from authentic Sources: to which is added, an Enquiry as to their Value for General Purposes, placed in Competition with the improved Herefords. Lond. pamph. 8vo. 2d edit.

1830. *Brodigan, Thomas, Esq.,* A Botanical, Historical, and Practical Treatise on the Tobacco Plant, in which the Art of growing and curing Tobacco in the British Isles is made familiar to every Capacity, as deduced from the Observations of the Author in the United States of America, and his Practice in Field Cultivation in Ireland. Lond. 8vo.

1830. *Davey, John, Esq.,* Observations on the Disease which has lately been so destructive to Sheep, called Bane or Coath; particularising the Causes; and minutely describing the Modes of effecting its Cure; and pointing out those Means which ought to be adopted to prevent its Recurrence. Bath, pamph. 8vo.

SECT. II. Bibliography of Agriculture in Foreign Countries.

7899. *Numerous works on agriculture* are published in the French and German languages, and a considerable number in the Italian; but a great proportion of these are translations from British authors. Very few agricultural books have been printed in the Dutch, Flemish, Danish, Swedish, Polish, Spanish, or Portuguese languages, and scarcely any in those of Russia or Hungary. We shall notice the principal French, German, and Italian works, exclusive of translations, and add a few American books.

SUBSECT. 1. Bibliography of French Agriculture.

7900. *Of French books on agriculture* we have given a selection only: those who wish to see a complete list are referred to the *Bibliographie Agronomique*, Paris, 8vo; in which are given the titles of upwards of 2000 works, including translations and books on gardening. A general idea of French culture in all its branches may be obtained from the *Nouveau Cours Complet d'Agriculture*, 16 vols 8vo (edition of 1821.), compiled by the members of the Section of Agriculture of the French Institute, each of whose names are given to the articles he contributed.

1529. *Etienne, Charles, et J. Liébault, physicians.* *Etienne, i.e. Stephanus or Stephens,* in the beginning of the sixteenth century published various small tracts on Gardening and other rural topics; and in 1529 he collected them together and published them, under the title of *Prædium Rusticum*, treating of gardens, trees, vines, fields, meadows, lakes, forests, orchards, &c. Having married his daughter to Liébault, they afterwards studied agriculture conjointly, and published the *Maison Rustique*, the modern editions of which are still the most popular agricultural works in France.

1. *Prædium Rusticum*; in fol.

2. *L'Agriculture et Maison Rustique.* Paris, in 4to, 1570.

1569. *Hesou, Jacques, of Dauphin.* De l'Art et Science de trouver sagement les Eaux, Sources, et Fontaines cachées sous Terre, autrement que par les Moyens Vulgaires des Agriculteurs et Architectes, in 4to.

1583. *Hegemon, Philibert, a lawyer* born at Châlons-sur-soane. Died in 1595.

La Colombière et Maison Rustique, contenant une Description des Douze Mois et des Quatre Saisons de l'Année, avec Enseignement de ce que le Laboureur doit faire par chaque Mois. Paris, in 8vo.

1600. *Serres, Olivier de, the Lord of Predel* in Languedoc. He was born in 1539, and died in 1619, at the age of 80 years. He was employed by Henry IV. to form a plantation of the white mulberry in the garden of the Tuilleries; and he is generally considered as the father of the culture of that tree in France. He published a great many useful works, the principal of which is his *Théâtre d'Agriculture*, the first edition of which was published in 1600, and the 20th in 1675.

Le Théâtre d'Agriculture et Mesnage des Champs. Paris, small 8vo. An enlarged edition in 2 vols. 4to, with voluminous Notes, and a Historical Introduction, in 1804.

1672. *Letellier.* Brief Discours contenant la Manière de nourrir les Vers à Soie, &c. Avec de belles Figures. Paris, in 4to.

1694. *Laffans, Barthelémy de, valet de chambre* to Louis XI.

La Façon de faire et semer la Graine de Mûriers, les élever et replanter, gouverner les Vers à Soie au Climat de France. Paris, in 12mo.

1697. *Pinet, Elie,* a learned professor at Bourdeaux, author of a work on land surveying.

La Maison Champêtre et Agriculture. Paris, in 4to

1663. *Patin, Charles*, son of a physician of that name.
- Traité des Tourbes Combustibles. Paris, in 4to.
1703. *Liger, Louis*, born 1658, died in 1717. In the latter part of his life he seems to have been a bookseller, or an author by profession.
1. Dictionnaire Général des Termes propres à l'Agriculture, avec leurs Définitions et Étymologies. Paris, in 12mo.
 2. La Nouvelle Maison rustique, ou Économie Générale des Biens de la Campagne. Paris, 2 vols. in 4to. 1755.
 3. L'Économie Générale de la Campagne, ou Nouvelle Maison rustique. 1762.
 4. Nouveau Système d'Agriculture. 3 vols. in 8vo. 1775.
1749. *Boucher d'Argis, Antoine Gaspard*, advocate and author of some works on jurisprudence.
- Code Rural, ou Maximes et Règlements concernant les Biens de la Campagne, 2 vols.
1749. *Recaumur, René, Antoine Ferchault, sieur de*, a learned naturalist, born at Rochelle in 1653, died in 1757.
- Art et Pratique de l'Art de faire éclore, en toutes Saisons, des Oiseaux Domestiques de toutes Espèces. Paris, Imprim. Royale, 3 vols. in 12mo, avec fig.
1750. *Hamel, Du Moncaur, Henry Lewis* dit, a famous French writer on Rural Economy and Vegetable Physiology, was born at Paris, 1700; died there 1782.
1. Traité de la Culture des Terres. Par. 6 vols. 12mo.
 2. Elémens d'Agriculture. Par. 1764, 2 vols. 12mo.
 3. Traité de la Conservation des Graines, et en particulier du Froment. Par. 1754. 12mo.
 4. Traité des Arbres et Arbustes, qui se cultivent en France, en pleine Terre. Par. 1755, 2 vols. 4to.
 5. Traité complet des Bois et des Forêts. Par. 1758, 6 tom. 4to.
 6. Des Semis et Plantations des Arbres, et de leur Culture. Par. 1760. 4to.
 7. L'Histoire d'un Insecte qui devore les Grains de l'Aigoumois. Par. 1762. 12mo.
 8. De l'Exploitation des Bois, ou Moyen de tirer Parti des Tailis demi Futayes et hautes Futayes. Par. 1764. 2 vols. 4to.
 9. Mémoire sur la Garance et sa Culture, in 4to. 1765.
 10. Du Transport, de la Conservation, et de la Force du Bois. 1767. 4to.
1751. *Desbois, Francis Alexander Aubert de la Chesnate*, a laborious Dictionary-maker; was born at Ernée in the Maine, 1699; died 1784.
- Dictionnaire d'Agriculture. 2 vols. 8vo.
1755. *Blavet*, librarian to the Prince of Conti.
- Essai sur l'Agriculture Moderne. Paris, in 12mo.
1755. *Tillet, du*, of Bourdeaux, a zealous agriculturist, author of several works. He died in 1791.
- Dissertation sur la Cause qui corrompt et noircit les Graines de Blé dans les E'paves, in 4to.
1756. *Hastier, F. H.*
- Instruction sur la Manière d'élever et de perfectionner les Bêtes à Laine. Paris, 2 vols. in 12mo.
1760. *Alletz, Pons Augustin*, an advocate, and indefatigable compiler.
- L'Agronomie, ou Dictionnaire portatif du Cultivateur, 2 vols. in 8vo.
1760. *Buchoz, Pierre Joseph*, a physician, and member of several societies; born at Metz in 1731, died in great distress at Paris in 1807. He wrote above three hundred volumes relative to medicine, agriculture, the veterinary art, and natural history. A plant (*Buchoziana*) was named after him by L'Héritier.
1. Lettre sur la Méthode de s'enrichir promptement et de conserver sa Santé par la Culture des Végétaux, in 8vo.
 2. Lettre sur le Blé de Smyrne, in 8vo. 1768.
 3. Histoire des Insectes nuisibles à l'Homme, aux Bestiaux, &c. in 12mo. 1764.
 4. Manuel usuel et économique des Plantes, contenant leur Propriétés pour les Usages économiques. Paris, in 12mo. 1782.
 5. Histoire des Insectes utiles à l'Homme, aux Animaux, et aux Arts. Paris, in 12mo. 1785.
 6. Traité de la Pêche, ou Art de soumettre les Poissons à l'Empire des Hommes, précédé de l'Histoire Naturelle de ces Animaux, in 12mo. 1786.
 7. Dissertation sur la Betterave et la Poirée, leur Culture, Méthode pour en tirer du Sucre, &c. fol. 1787.
 8. Dissertation sur le Cochon, in fol. 1789.
 9. Dissertation sur le Lin de Sibérie, in fol. 1789.
 10. Dissertation sur la Taupe; les Moies de la prendre, in fol. 1790.
 11. Dissertation sur le Tirage de la Soie, in fol. 1792.
 12. Manuel Tabacal et Sternutatoire des Plantes, ou Traité des Plantes qui sont propres à faire éternuer, avec la Manière de cultiver le Tabac, de le préparer, et de juger de ses bons Effets dans la Société, in 8vo. 1799.
 13. Manuel Territorial et Sternutatoire des Plantes, in 8vo. 1799.
 14. Manuel Vétérinaire des Plantes, in 8vo. 1799.
 15. Mémoire sur le Blé de Smyrne, sur le Blé de Turquie, le Millet d'Afrique, et la Poirée d'Abyssinie, Plantes Alimentaires pour l'Homme; in 8vo. 1824.
 16. Mémoire sur la Manière de former des Prairies Naturelles, in 8vo. 1805.
1760. *Turbilly, Louis François Henri de Menon*, Marquis de, a proprietor in Anjou, who had been in the army, but who retired to his estates and broke up and improved a number of acres, of which he published an account, well known at that time in England. Arthur Young, when in France in

- 1787, was anxious to visit the Marquis; but after, with difficulty, finding out the estate of Turbilly, he found the Marquis had died in 1776, having ruined himself by establishing a pottery. There is a very interesting account of this visit in *Young's Tour*, part I. p. 294. et seq.
1. Mémoire sur les Défrichemens, in 12mo.
 2. Pratique des Défrichemens. Paris, in 12mo. 1701.
1761. *Gailliot, Julien Jean Jacques*.
- Dictionnaire des Branches d'Agriculture les plus avantageuses à la Province de Normandie.
1761. *Neuve-Eglise, Louis Joseph Bellepierre de*, an officer in the army.
1. L'Agronomie, ou Corps complet des Principes de l'Agriculture, &c. 8 vols. in 8vo.
 2. Boussole Agronomique, ou le Guide des Laboureurs, in 8vo. 1762.
 3. *Desplaces, Laurent Benoist*.
 1. Préservatif contre l'Agronomie, ou l'Agriculture réduite à ses vrais Principes. Paris, in 12mo.
 2. Histoire de l'Agriculture française, extraite de l'Histoire Naturelle de Plaine, avec des Eclaircissements et des Remarques. 12mo. 1765.
1762. *Despommiers*.
- L'Art de s'enrichir promptement par l'Agriculture. Paris, 12mo.
1762. *Lafaille, Clement*, advocate, and member of several societies.
1. Mémoire sur les Moyens de multiplier aisément les Familles dans toutes les Pays d'Annis.
 2. Essai sur l'Histoire naturelle de la Taupe; sur les différents Moyens qu'on peut employer pour la détruire. La Rochelle, in 12mo, fig. 1768.
1762. *L'Elang de la-Salle, Simon Philibert de*, of Rhcims, a lawyer.

2. Mémoires sur diverses Constructions en Terre ou Argile, propres à faire jouir les petits Ménages de l'Economie des combustibles. Poitiers, 8vo, 1804.

1770. *Amiot*, *Le P.*, missionary at Pekin.

Reflexions sur l'Agriculture, et sur ceux qui s'y consacrent: tirées de l'éloge de la Ville de Moukden et de ses Environs. Poème composé par Kien-Long, Empereur de la Chine et de la Tartarie, actuellement régnant, traduit en Français par le P. Amiot, et publié par M. Desjardins, Membre de l'Académie Royale des Inscriptions et Belles Lettres, et Professeur des Langues Orientales au Collège Royal. Paris, 8vo. Cet ouvrage est curieux sous plus d'un rapport.

1770. *Beauvill, Antoine*, an eminent French chemist, was born at Senlis, 1728; died 1805.

Mémoire sur les Argiles; ou, Recherches sur la Nature de Terres les plus propres à l'Agriculture, et sur les Moyens de fertiliser celles qui sont stériles. Paris, 8vo.

1770. *Rim*.

Encyclopédie Economique, ou Système général d'Economie rustique, contenant les meilleures Pratiques pour fertiliser les Terres, la Conservation des Grains, &c.; par quelques Membres de la Société d'Agriculture de Berne. Yverdon, 16 vols 8vo.

1770. *Rozier, François*, born in Lyons, 1734, and killed there on the 29th September 1793, during the siege of that city, by a bombshell, which buried his shattered remains in the ruins of the apartment which he occupied; he began his career as an author, by writing in the *Journal de Physique et d'Histoire Naturelle*, of which Gauthier Dagoty was editor. He next occupied himself with his *Agricultural or Rural Dictionary*, the work by which he is chiefly known. He cultivated a farm near Beziers, which Arthur Young went to see when on his tour in France in 1787; but the Abbé had left it on account of the Bishop of Beziers, who kept a mistress somewhere near, and for his more comically visiting her, got a road made across the farm at the expense of the province. This occasioned a quarrel between the Abbé and the Bishop, which ended in the former being obliged to quit his farm. The Abbé, like all other men who depart from common practices, was looked on as a fanciful and wild cultivator; and, because he paved his stables and cow-houses, it was reported by his neighbours that he paved his vineyard. He wrote a great many works, chiefly on agriculture.

1. L'Art du Maçon piseur, extrait du Journal d'Observations sur la Physique, in 12mo.

2. Traité de la meilleure Manière de cultiver la Navette et le Colza, et d'en extraire une Huile Dépouillée de son mauvais Goût et de son Odeur désagréable. Paris, in 8vo, 1774.

3. Cours Complet d'Agriculture, Théorique, Pratique, Economique, etc.; ou Dictionnaire universel d'Agriculture. 12 vols in 4to, 1796.

SUBJECT. 2. Bibliography of German Agriculture

7901. The German agricultural works are as numerous as those of the French, but chiefly translations, and these, for the most part, from the English. We have given a very limited selection, the German language being less generally understood than either the French or Italian. In forest management (*Forstwissenschaft*) the German bibliography is very rich; and it is chiefly these books, and descriptions of local practices, which can be of any interest to the British cultivator. The older German works in rural affairs are enumerated in Haller's *Bibliography*; and the modern ones, and new editions in Ersch's *Handbuch der Deutschen Litteratur*, and the *Leipsic Catalogues*, published annually. Thäer of Meoglin is decidedly the highest in repute as an author, and Sickler's *Deutsche Landwirthschaft*, a voluminous work, will give a general idea of every part of German husbandry.

1578. *Heresbachius, Conradus*, counsellor to the Duke of Cleve; was born in 1508, died in 1576. He wrote various theological works, besides his *Rei Rusticæ*, libri iv., which was published in 1570, and his *Legum rusticarum et Operarum per singulos Menses digestæ*, in 1595. The former was translated by Barnaby Googe, of Lincolnshire, with the following title:—
Four Books of Husbandry, containing the whole Art and Trade of Husbandry, Gardening, Graffing, and Planting, with the Antiquitie and Commendation thereof. Newly Englished and increased by Barnebe Googe, Esquire. At London, 4to.

1578. Leaves 194, besides the Dedication, Epistle and Table at the beginning; and Old English Rules in Verse for purchasing Lande, at the end.

His authorities extend from the Bible and doctors of the church, through the Greek and Roman writers, Homer, Cato, &c., to the moderns as low as Ruellius, Fuchsius, Matthiolus, Cardanus, and Tragus. He subjoins a list of his friends and others who assisted him. S. Nich. Malbee, M. Cap. Byngham, M. John Somer, M. Nicas. Zwertzert, M. Fitzherbert, M. Willi. Lambert, M. Tussor, M. Tho. Whetenhall, M. Ri. Deering, M. Hen. Brookhu l M. Franklin, H. King, Richard Andrews, Henry Denys, William Pratte, John Hatche, Philip Partridge, Kenworth Darforth.

The work is in dialogue. The persons are Cono, a gentleman retired into the country; Rego, a courtier; Metella, wife of Cono; and Hermes, a servant.

1591. *Colerus, J.* l. Calendarium œconomicum et perpetuum. Wittebergæ. 2. *Economie Paris prima*; qua tractatur quædammodum bonus *Œconomicus* famulus suos regere delect et bona sua augete potest per veras honestas Artes, et utilis Compendia circa Res domesticas, Agriculturam, Piscatum, Aucupia, Venationes et Vinearum Culturam. 1829. *Elsner, J. G.*

Uebersicht der Europ. veredelten Schafzucht. Prag. 2 theil, 8vo.

SUBJECT. 3. Bibliography of Italian Agriculture.

7902. *A number of Italian agricultural works* have been published; such as they are, perhaps more of them are original than of the books of the French or Germans, because the culture of other parts of Europe is but ill adapted for Italy. The vine, olive, mulberry, orange, and the irrigation of lands, have a good deal occupied the Italian writers. Ré may be reckoned their general and popular author, and his *Nuovi Elementi*, 4 vols. 8vo, 1815, and *Annali dell' Agricoltura*, &c. 2 vols. 8vo to 1814, will give a good idea of Italian husbandry and gardening, the two arts in that country being for the most part combined.

1471. *Crescentius, Crescenzo, or De Crescentiis*, was born at Bologna about 1233; died 1320.

1. *Opus Ruralium Commodorum*, sive d'agricultura, libri xii. Augsburg, fol.

2. *De Agricultura, Omnibusque Plantarum et Animalium Generibus*. Basil, 1538.

1496. *Bertochus, Dionysius*, of Bologna, who printed some very early works at Vicenza.

Scriptores de Re Rustica. This contains the Agriculture of Columella, Varro, Cato, and also of Palladius, &c.

1546. *Alamanni, Luigi*.

La Coltivazione e gli epigrammi, colle Api di Gio. Ruellai, ed annotaz. Rome, 8vo.

1561. *Gallo, Agostino*.

1. Le dieci giornate della vera Agricoltura, e Piaceri della villa: in Dialogo. Bresc. ap. G. B. Bozzola. 4to.

2. La Vita Civile dell' Agricoltura, e de' Piaceri della Villa. Turin, 1579. 4to.

1622. *Soderini, Giovanventura, e Bernardo Davanzati*.

Coltivazione Toscana delle viti e d' alcuni alberi. Aggiuntovi Coltivazione degli Olivi, di Pietro Vettori. Firenze, 4to.

1628. *Castelli, Benedict*, an Italian mathematician, and the particular friend of Galileo, was born at Brescia, in the year 1577; died about 1640.

Treatise of the Mensuration of Running Waters; also, Letters and Considerations touching the Draining of Fens, Divisions of Rivers, &c. Translated by Thomas Salisbury. Lond. 1661. fol. Published at Rome in 1628.

1658. *Fanara, Vincenzo*.

L'Economia del Cittadino in villa. Roma, in 4to.

1718. *Borzo, Alessandro del*.

Dimostrazioni e prove sopra l'Altivita, ed uso vantaggioso del Gran Coltivo. Milano, in 4to, fig.

1736. *Aquino, Charles d'*.

Nomenclator Agriculture. Roma, in 4to.

1758. *Gavellus, Nicholas*.

Storia distinta, e curiosa d' il Tabacco, concernante la sua scoperta, la Introduzione in Europa, e la Maniera di coltivarlo, conservarlo, e prepararlo. Pesaro. 8vo.

1767. *Cattaneo, Giacomo*.

Della Idropisia de' Gelsi. Milano, in 8vo.

1773, or earlier. *Tarvello, Camillo*.

1. Ricordo d'Agricoltura colle note del Padre Scottoni. Venezia, in 4to.

2. Ricordo d'Agricoltura corredato d'Annotazioni da Paolo Sangioi. Milano, 1816, in 8vo.

1776. *Canciana*.

Saggi sopra la Legislazione propria alle arti dell' Agricoltura. Udine, in 8vo.

1777. *Selvini, Gio*.

Istruzione al suo fattore di campagna, in cui si dà una piena notizia di tutto ciò ch' appartiene alla maggior promozione dell' arte agraria, e suoi metodi, &c. Venezia, in 8vo.

1778. *Cantuni, Carlo Antonio*.

Istruzioni pratiche intorno all' Agricoltura, e tenuta dei Bigattelli. Berg. in 8vo.

1778. *Castello, Costans*.

Istruzioni circa il modo di coltivare i gelsi, di allevare i bachi da seta, e di filar le sete, con nuove applicazioni e riflessioni. Torino, in 8vo.

1778. *Bidet, M*.

Trattato sopra la coltivazione delle viti; del modo di fare i vini, e di governarli. Ven. zin, in 8vo, fig.

1780. *Bertrana*.

Elementi di Agricoltura, fondati sui fatti e sui raziocinii ad uso delle persone di camp. gna. Vicenza, in 8vo.

1780. *Carrera, Antonio*.

Dissertazione sull' Economia Rurale. Venezia, in 8vo.

1781. *Brugnonc, Gio*.

1. Trattato delle razze de' cavalli, col disegno della fabbrica della ruggia mandra di Chivasso, e quello dei pascoli e prati. Torino, in 8vo, fig.

2. Boomeria, o sia della conformazione esterna del corpo delle bestie bovine, delle loro bellezze e difetti, e delle avvertenze da aversi nella loro compra. Torino, 1802, in 8vo.

3. Ippometria, o sia della conformazione esterna del Cavallo, dell' Asina e del Mulo, e de' loro bellezze e difetti, e delle attenzioni da aversi nella loro compra. Torino, 1802, in 8vo.

1785. *Anoretto*.

1. Istruzioni pubblicate della Società Patriottica di Milano, intorno ad alcuni quesiti della medesima proposti per l' anno 1785. 4to.

2. Della coltivazione delle Patate, e loro uso. Milano, 1801, in 8vo, fig.

3. Delle Torbierie esistenti nel dipartimento d'Olona e cimitof, e del loro vantaggi ed usi. Milano, 1807, in 4to.

4. Coltivazione delle Api nel Regno d'Italia. Milano, 1811, in 8vo, fig.

5. Della Torba e della Lignite nel Regno d'Italia. Milano, in 8vo, fig.

6. Domande relative all' Agricoltura. Mil. in 4to.

1785. *Barbaro, Marco*.

Esperimenti sopra il grano fermentato, ed altre agrarie scoperte. Milano, in 8vo.

1790. *Rocca, Abbé Della*, vicar general of Scyros.

Traité complet sur les Abeilles, &c. &c. A Complete Treatise on the Management of Bees, as practised at Scyros, together with an account of that Island. Paris. 8vo.

1791. *Caronelli, Pietro*.

1. Apotegmi Agrarii, o sia istruzioni per via di massime tratte dalle opere de' due insigni agronomi Catone e Varrone. Venezia, in 8vo.

2. L'Agricoltura Italiana ridotta in proverbi, ovvero istruzioni per via di massime tratte dalle opere de' due insigni agronomi Catone e Varrone. Venezia, 1807, in 8vo.

1793. *Lastri, Proposto*.

Calendarj dodici, o sia Corso completo d'Agricoltura pratica. Venezia, vol. iv., in 8vo.

1798. *Conparetti*.

Saggio sulla coltura e governo dei Boschi. Padova, in 8vo.

1798. *Doria, Luigi*.

1. Saggio sopra la Coltivazione de' grani ad uso delle campagne Romane. Roma, in 8vo, fig.

1800. *Livy, Cav*.

Three Memoirs on Agriculture; 1. On the Use of the *Alga marina* in Agriculture and in the Arts; 2. On the Treatment of Vines; 3. On the Economy of the Flour which flies away in the Mill, and during the separation of the Bran. Palermo.

1801. *Simonde de Sismondi*, a distinguished literary character, who formerly managed an estate in the Vale of the Arno.

Tableau de l'Agriculture Toscane. Genève.

1802. *Fabbroni, Adamo*.

Dissertazione sopra il quesito: indicare le vere Teorie, con le quali devono eseguirsi le stime dei terreni, &c. Firenze, in 8vo.

2. Della economia agraria dei Chinesi. Memoria. Venezia, 1802, in 8vo.

1802. *Targioni, Luigi*.

1. Lezioni di Agricoltura specialmente Toscana. Firenze, vol. vi., in 8vo.

2. Memorie su l'Agricoltura, la Pastorizia, e l'Applicazione dei Naturali prodotti agli usi degli abitanti dell' Italia, ed alla loro industria. Napoli, 1814, vol. ix., in 8vo, fig.

1803. *Carradori, Gioachino*.

Della fertilità della terra. Pisa, in 8vo.

1803. *Vallée, Alexandre*.

Instructions élémentaires d'Agriculture, ou Guide Nécessaire au Cultivateur traduit de l'Italien de Fabroni.

1804. *Bonconi, Ignazio*.

Dizionario d'Agricoltura, o sia la Coltivazione Italiana, in cui si contiene cultura e conservazione dei diversi prodotti riguardanti le terre seminatrici, i prati, i boschi, le vigne, ed i giardini, &c. Venezia, vol. v., in 8vo.

1805. *Piacenza, Giovanni*.

Nuovo metodo di fare le misure dei fieni, a che si aggiunge qual sia la migliore Agricoltura de' prati. Milano, in 8vo.

1807. *Burlet, Giuseppe*.

1. Della Malattia de la Golpe del grano turco. Milano, in 8vo, fig.

2. Saggio intorno la Fabbricazione del Cacio detto l'Parmigiano. Milano, 1808, in 8vo.

3. Monografia Agronomica dei Cereali del Frumento, trattato diviso in tre parti. Milano, 1809, in 8vo, con rami e tavole.

1807. *Biroli, Giovanni*.

1. Del riso, trattato economico rustico. Milano, 8vo.

2. Trattato di Agricoltura. Novara, 1812, vol. iv. in 8vo, con tavole.

1807. *Galeotti, Francesco*.

Metodo per migliorare ed accrescere l'Agricoltura nello stato di Parma. Parma, in 8vo.

1807. *Gautieri, Giuseppe*, inspector of woods and forests to the Viceroy of Lombardy, author of a tract on forests. (See *Encyc. of Gard.* p. 1128.)

1. Della ruggine del Frumento. Milano, in 8vo, fig.

2. Dei vantaggi e dei danni derivanti dalle capre in confronto delle pecore. Mil. 1816, in 8vo.

1808. *Abbate, Antonio*.

Coltivazione dei Bigattelli, o sia Metodo pratica per farli nascere, coltivarli nei vari periodi della loro vita, e fabbricarne la semente. Milano, 8vo.

1808. *Re, Filippo*, librarian to the Patriotic Society at Milan, afterwards in the employ of Government, at Turin, where he died in 1820 or 1821. He wrote a great number of works on rural and economical subjects.

1. Elementi di economia campestre, ad uso de' Licci. Milano, in 8vo, carta fina.

2. Annali dell' Agricoltura del regno d'Italia cominciati in Gennaio 1809, e terminati in Giugno, 1811, fascicoli 66, formanti 22 vol. in 8vo, con circa 20 rami e tavole.

3. Del Cotone, e delle avvertenze per ben coltivarlo. Milano, 1811, in 8vo.

4. Nuovi Elementi di Agricoltura, volumi 4 in 8. Dedicati a S. A. R. Francesco IV. d'Este, Duca di Modena, &c. &c.

5. Dei letami e delle altre sostanze adoperate in Italia, per migliorare i terreni e del come profittarne; Saggio. Milano, 1815, in 8vo.

6. Saggio sopra la Storia e il Coltivamento dell' Erba Medica. Milano, 1817, in 8vo.

7. Saggio storico sullo stato e sulle vicende dell'Agricoltura Antica dei paesi posti fra l'Adriatico, l'Alpe, e l'Appennino, sino al Frontone. Mil. 1817, 8vo.

1807. *Tapputi, D.*

Réflexions sur l'Etat de l'Agriculture, et de quelques autres parties de l'Administration d'uns le Royaume de Naples, sous Ferdinand IV.; précédées d'une Introduction ou Coup-d'œil sur l'ancien Etat de ce Pays, et suivies d'un Mémoire, intitulé Recherches sur la Plante vulgairement nommée Storta dans le Royaume de Naples. 8vo.

1809. *Arduinino, Luigi.*

1. Memoria intorno la coltura ed usi economici del Cinosuro Corakan. Mil. 8vo, fig.

2. Nuovo metodo per estrarre lo zucchero dalle canne dell'Olio di Caferra. Padova, 1811, 8vo, fig.

1809. *Tozzetti, Oct. Targ.* M. D., professor of

agriculture at Florence, and director of different national establishments there.

1. Dizionario dei Nomi di Botanica e di Agricoltura, Latino-Italiano e Italiano-Latino. Firenze, 2 vols. 8vo.

2. Lezioni d'Agricoltura. Firenze, 6 vols. 8vo.

1810. *Beccuti, Santo.*

L'accorto Fator di Villa, o sia Osservazioni utili ad un fattore per il governo della Campagna e per la soprintendenza ai Coloni. Venezia. 8vo.

1810. *Spadoni, Paolo.*

1. Modo di coltivare il Napo Silvestre detto volgarmente Itavizione, e del metodo di cavarne l'olio alla maniera dei Bolognesi. Venezia 8vo.

2. Dello sbrucimento, piantarione e conservazione delle siepi, con il disegno per formarle. Venezia, 1810, 8vo.

1811. *Albrizzi, Jacopo Antonio.*

Il Padre di famiglia in casa ed in campagna. Milano, vol. vi. 12mo.

1811. *Giacinto, P. Carlo*, professor of botany in Malta.

Agricultural Essays, adapted to the Island of Malta. Messina.

1811. *Lampadius, Augusto Guglielmo.*

Esperimenti sopra lo zucchero di Barbabietole. Novara. 8vo.

1811. *Losana, Matteo.*

Delle Malattie del Grano in erba non curate o ben conosciute. Carnagnob. 8vo.

1811. *Bassi, Agostino.*

1. Il Pastore bene instruito. Milano. 8vo.

2. Dell'utile ed uso del Pomo di Terra, e del metodo migliore di coltivarlo. Lodi, 1817. 8vo.

1812. *Dandolo, Vincenzo.*

1. Nuovi cenni sulla coltivazione de' Pomi di Terra, e vantaggi della medesima, rapporto al ben essere dell'uomo e dello stato, Lettera al Cav. Filippo Re. Como. 8vo.

2. Enologia, ovvero l'Arte di fare, conservare, e far viaggiare i vini del Regno d'Italia. Milano, 1812, vol. ii. 8vo, fig.

Giardiardo, G. B.

Catechismo agrario per uso dei curati di campagne, e de' fattori delle ville. Napoli, terza edizione, con aggiunte. 8vo.

1815. *Galliziotti, Filippo.*

Osservazioni sopra i mezzi di conservare i Boschi mediante.

1827. *Bouafous, M. Mathieu*, Director of the Experimental Garden of the Royal Central Agricultural Society of Turin.

Osservazioni ed Esperienze agrarie. Turin. 8vo.

SUBJECT. 4. *Bibliography of the Agriculture of the other Countries of Europe.*

7903. *Germany and Britain* are the only countries in Europe in which it answers to print agricultural books for the sake of the indigenous readers. In Britain, education is so general among the middling and lower orders, that reading among them is a necessary convenience of life; in Germany, education and reading are equally general and essential: and consequently, in either of these two countries a book will pay by its sale within the country. But this is not the case in any other European country. In France the mass of the people do not read, but books printed there pay, because they are in a language more universal than any other, and perfectly understood by all men of education in Europe. Italian books pay, because they are required for by the agriculturists of the south of France, all Spain, and in part of Spanish America.

7904. *Spanish and Portuguese books on agriculture* are in much too limited a demand for production. The earliest Spanish author is Herrera, in 1596; and there are scarcely half a dozen since. After the most particular researches of a book agent at Madrid, he was only able to send a list of translations, and the transactions of the Economical Society of Madrid; who have also published Herrera's work with notes within the present century. In 1815, a professor at Madrid published *Lecciones de Agricultura explicadas en el Jardén Botánico*, 2 tomes 4to. An anonymous author, *Disertaciones sobre varios Plantos Agronomicos*, 1 tom. 4to. Of Portuguese books we could hear of none.

7905. *Of Flemish and Dutch books on agriculture* there are scarcely any. These languages are very limited, and every reader in Holland or Flanders understands French or German. Many works have been published in the Low Countries in Latin and French, but these cannot be considered indigenous. The few Dutch works on culture belong almost all to gardening (*Encyc. of Gard. 7695.*). The result of our correspondence with Amsterdam is a *Nieuwe Naamlijst van Boeken, &c.*, from which we see little worth taking. There are several translations from British works on culture, and French veterinary books, and the following seem the latest on husbandry.

Magazijn van Vaderlandschen Landbouw, door J. Kops, Commissaris tot den Landbouw. 6 deelen compleet met register.

Aanwijzing ter verbetering van de Akkerbouw en Landhuishoukunde, in de Nederlanden, door Professor A. Bruchausen. 2 deelen.

De Boeren Goudmijn, of kunst, om van verschillende soorten van Landerijen, het meeste nut te trekken, meer Vee te kunnen houden, en andere Wetenswaardigheden tot den Landbouw, door J. F. Serurier en J. Kops, met platen.

Lichtervelde, J. F. de, Member of the Royal Society of Agriculture and Botany of the city of Ghent: La Beche, ou la Mine d'Or de la Flandre Orientale. Brussels. 8vo.

Cale's, M. F. M., M. D. at Liege: Instructions sur le Parage des Moutons; ou, Moyen d'engraisser les Campagnes en faisant coucher les Moutons dans les Champs. Liège. Pamph. 8vo.

7906. *Of Swedish and Danish books on agriculture*, there are necessarily very few; these languages being of very limited use, and the mass of the people too poor to be able to afford to read about ordinary matters, or what they consider as already well known to them. The time such a people give to reading will be devoted to religious subjects, heroic and romantic poetry, or history. The universities of Stockholm and Upsal, every one knows, have produced some useful naturalists: some of these have

written tracts on agricultural improvements, especially on planting fruit-trees (*Frukt-Träd*) and cultivating culinary vegetables (*Köchs-och Krydd*). A few of such works we have enumerated in our Bibliography of Gardening (7096.), but we can scarcely find any fit to be inserted here as agricultural. The *Natural and Chemical Elements of Agriculture*, by Count Gustavus Adolphus Gyllenborg, a learned Swedish statesman, were translated by John Mills in 1770, and may be considered as the prototype of Davy's *Agricultural Chemistry*. There are several treatises on the culture of the potatoe in the *Swedish Transactions*; also on tobacco, on the management of sandy soils, on the cultivation of the Cerealia; and on the hop and plants for fodder.

1825. *Anon.*: Kongl. Svenska Landtbruks Academiens Annala. Year 9. Part I. 8vo.

1826. *Winstrop*, M., machinist to the king at Fredericksberg, near Copenhagen; Afbildninger af de bedste og nyeste Agerdyrkningsredskaber, &c. Copenhagen. 4to.

1797. *Of Polish and Russian books on agriculture*, it may be easily conceived, there are very few. Some translations from French works were made into the Polish language under Fred. Augustus II.; but few or none since that time, the German or French being universally understood by the reading class. Books of agriculture in the Russian language could be of little use. The only things printed in that way there are in the transactions of the Economical Society of St. Petersburg, by foreigners resident there, and in Latin or German. The best informed Russian nobles read French or German like the Poles. There is an agricultural society at Warsaw, which occasionally prints its transactions; and another has lately been established at Moscow, which publishes an agricultural newspaper. (*See Gard. Mag.* vols. i. and ii.)

1825. *Partof*, M.; Zemliédeltchetskaia Chinnia. Moscow. 8vo.

1825. *Apraxin*, M., a nobleman possessing one of the largest houses in Moscow; Zemliédeltchetsky Journal, &c. Moscow. 8vo.

1825. *Anon.*: Avantages résultant de l'Introduction de la Culture variée des Terres. Warsaw. 8vo.

SUBJECT. 5. *Agricultural Bibliography of North America.*

7908. *There are a few American books of agriculture*, and republications thereof of most of our best works on the subject. Dean's *New England Farmer's Dictionary* and Dwight's *Travels* may be considered as giving an idea of the husbandry of that part of the country, and Roughley's *Jamaica Planter* of the agriculture of the West India Islands. A number of interesting papers on the subject will be found in the transactions of the American, New York, Philadelphia, and other societies.

1744. *Bartram*, John, M.D., Philadelphia.

On the Salt Marsh Musell: On Oyster Banks and the Fresh Water Musell of Pennsylvania. (*Phil. Trans. Abr.* ix. p. 70.)

1754. *Fleming*, or *Pleming*, Malcolm, M.D., of Brigg.

A Proposal in order to demonstrate the Progress of the Distemper among Horned Cattle: supported by Facts. York. 8vo.

1755. *Belgrove*, William.

A Treatise upon Husbandry and Planting. Boston, New England. 4to.

1764. *Elliot*.

Essays upon the Husbandry in New England. Lond. 4to.

1779. *Carver*, Jonathan, Esq., born in America in 1732; died at London, 1780, in great poverty.

A Treatise on the Culture of the Tobacco Plant, with the Manner in which it is usually cured, adapted to Northern Climates, and designed for the Use of Landholders of Great Britain, with two Plates of the Plant and its Flowers. Lond. 8vo.

1785—1826. *Anon.*

Memoirs of the Philadelphia Society for promoting Agriculture; containing Communications on various Subjects in Husbandry and Rural Affairs. Philadelphia. 8vo.

1789. *Antill*, Hon. Edward, Esq., of New Jersey.

1. An Essay on the Cultivation of the Vine, and the making and preserving of Wine, suited to the different Climates of North America. (*Americ. Trans.* i. 181.)

1829. *Lathrop*, E. L., Esq.

The Farmer's Library; a Series of Essays and Papers for the Promotion of the Study of Agriculture. (Windsor, U. S. 12mo.

CHAP. V.

Professional Police and Public Laws relative to Agriculturists and Agriculture.

7909. *By professional police* we mean those associations which agriculturists have formed, at different times and in different manners, for mutual benefit or instruction; and also those institutions for the same purpose established by the legislature, or of such a nature as to be considered public or national. By laws we allude to those special legislative enactments which affect more particularly agriculture. These are so numerous that we must refer the reader to his lawyer or law dictionary.

7910. *There are few or no agricultural lodges* of the nature of those of masonry or gardening. In Scotland it would appear something of this kind had existed among ploughmen at one time, as the passwords and initiatory ceremonies are talked of in some of the counties by old men. In Forfar, Kincardine, Bant,

&c. it is not uncommon for ploughmen, as well as various descriptions of operatives, to belong to gardeners' lodges. In the southern districts where sheep farming is followed there are some shepherds' societies, for mutual interchange of experience, and aid in case of losses of such sheep as are the shepherd's perquisite. There are some ploughmen's clubs in different places, and various associations among them of the nature of benefit societies; but these do not come under the description of professional.

7911. *Agricultural societies* for interchange of knowledge are of modern date, but they have increased rapidly since 1794: the number at present or lately existing in the British isles is at least equal to the number of the counties. Societies of this description are either general, as the Board of Agriculture and Society of Arts; national, as the Highland Society and Dublin Institution; particular, as the Bath and West of England Society; provincial, as county societies; or parochial, as being limited to a few individuals within one parish. Of this kind are farmers' clubs, ploughing societies, &c. In regard to the end in view, these societies either embrace the arts in general; the rural arts in general; some branch of the rural art, as agriculture; or some department in that branch, as live stock, sheep, wool, &c.

7912. *All these societies hold meetings* at stated periods. Most of them offer premiums for particular objects,—specimens of vegetable or animal culture or produce, agricultural operations, moral and professional merits as servants, &c.; some of them form a library and museum of models or full-sized implements; a few publish transactions; and one or two, as the Dublin Society, send out itinerant ploughmen and agricultural mechanics to instruct practical farmers. These societies are almost wholly supported, and the funds for premiums raised, by the subscriptions of members, and by voluntary donations, legacies, &c.; but some, as the Board of Agriculture and the Dublin Society, have received assistance from government.

7913. *Of English agricultural societies* the oldest is the Society of Arts, founded in 1754 by Lord Folkestone, Lord Romney, Dr. Hales, and Shepley. They have published many volumes of transactions, awarded immense sums in premiums, and on the whole done much good. (See *Rees's Cyc. art. Society*.)

7914. *The Bath and West of England Society* was founded in 1777, for purposes similar to those of the London Society of Arts. They have published some valuable volumes of transactions, and distributed various rewards, &c. (*Rees's Cyc. &c.*)

7915. *The Board of Agriculture* was founded, under the authority of government, in 1793. Much was expected from this Board; but, except the publication of the county reports, and the general attention which it called to agriculture, it may well be asked what advantages arose from it. Their *Communications*, in several quarto volumes, contain fewer valuable papers, in proportion to their total number, than the publications of either the London Society of Arts or the Bath Society. In short it has been ably shown, in *The Farmer's Magazine* and

the article *Agriculture* in the supplement to the *Encyc. Brit.*, that the Board never directed its efforts in a manner suitable to its powers and consequence; and that, instead of discussing modes of culture, its attention ought to have been directed to the removal of the political obstacles to agriculture, and to the eliciting of agricultural talent by honorary rewards, &c. No idea is more erroneous than that of such a Board, or any other, doing much good by a national "experimental farm." The government withdrew its support from this Board about 1816; and there being no longer funds for a handsome salary for a secretary, it soon after fell to pieces, and is now only remembered, at least by us, for its lofty pretensions and its worse than inutility.

7916. *Of Welsh societies* there are only two or three, of inferior note, which have been already noticed in the topography of the country.

7917. *Of Scotch societies* the principal now existing are the Highland Society and the Dalkeith Farming Society.

7918. *The Highland Society* of Scotland was established in 1715, to enquire into the state of the highlands, to consider the means of their improvement and the preservation of their language; it is chiefly supported by the subscriptions of its mem-

bers, at a guinea each a year, and soon after its establishment it had a grant of 3000*l.* from government. It has published 7 vols. of prize essays and papers, and now extends its prizes to all the low counties of Scotland. (*Farm. Mag.* vol. 16. p. 316.)

7919. *Of Irish societies* the principal are the Dublin Society and the Cork Institution.

7920. *The Dublin Society* was established in 1751, and incorporated in 1749. Arthur Young observes, that it was the parent of all the similar societies now existing in Europe; but the Edinburgh Agricultural Society, as we have seen (775. and 801.), was established nearly ten years before. The Dublin Society, in its present advanced state, is one of the most complete establishments of the kind. (*Rees's Cyc. art. Dublin*.)

7921. *The Farming Society of Ireland* was established under the patronage of the Dublin Society, in 1800. The object is to improve the agriculture and live stock of the kingdom. (*Archer's Dublin*, 166.)

7922. *The Cork Institution*, for applying science to the com-

mon purposes of life, originated in private subscriptions, about the beginning of the present century. It has since been incorporated, and has received the assistance of government. It possesses a house and a large botanic garden, and under its auspices are delivered lectures on chemistry, botany, agriculture, &c.; it is not, however, in a flourishing state, and has never been of much use.

7923. *The principal county societies* in the three kingdoms have been noticed in the topography of agriculture: many of them were established several years before the Board of Agriculture.

7924. *The only other institutions for the improvement of agriculturists and agriculture* are public professorships. Of these there is one in the university of Edinburgh, established in 1795; one in Dublin, supported by the Dublin Society; one in Cork; and one is destined to be established at some future period in Oxford, agreeably to the will and donation of Dr. Sibthorpe (806. and 7789.), professor of botany there.

BOOK II.

THE FUTURE PROGRESS OF AGRICULTURE IN BRITAIN.

7925. *THE improvement of agriculture*, like that of every art, manufacture, or commodity, necessarily depends on demand and production: a powerful or effectual demand will ensure produce, and excellent produce will, to a certain extent, create demand. A general nicety of taste in coach or saddle horses will call forth a superior description of these animals, and superior animals will tempt purchasers; if the inhabitants of any district who live chiefly on barley or oats indicate a preference for wheat, and a willingness to pay for that grain, wheat will be produced, and so on. Again, as the object of every individual who engages in art or trade is to acquire gain, the advancement of an art will depend mainly on the profits it affords; an art or occupation which affords less than the average profits on capital will only be followed by such as, from habit or other reasons, cannot apply themselves to any thing better, but extra-profits

will command both capital and skill. From these considerations it is obvious, that the improvement of agriculture depends on the profits on capital employed in it, on the taste of those who purchase its products, and on the knowledge of those who are engaged in agriculture as a profession. The first subject would lead us further into political economy than would be of much use in a work of this kind, and therefore we shall limit ourselves to a few remarks on the other topics.

CHAP. I.

Improvement of Agriculture, by refining the Taste of the Purchasers of its Products, and increasing the Knowledge of Agricultural Patrons.

7926. *The desire of being comfortable* is the first step towards improvement; but before any thing can be desired, we must know what it is. Men, when they know of nothing better, rest satisfied with what they have; and therefore one of the main sources of improving the taste both of those who purchase agricultural produce from necessity, and of those patrons of agriculture who purchase from the conjoined impulses of necessity and choice, is the increase of knowledge. However paradoxical it may seem, discontent is the parent of all improvement, as certainly as the acorn is the germ of the future oak, or the time present that of all future times. The grand achievement of the present age, an eminent writer observes (*Examiner*, Jan. 9. 1831.), "is the diffusion of superficial knowledge;" and on this diffusion, superficial though it may be, the progress of agriculture and of every other art depends far more than on any thing else.

7927. *In Scotland and Ireland* could a taste for wheaten bread and butcher's meat be introduced generally among the operative classes, the advantages to agriculture would be immense. Could the same persons be taught to desire a greater degree of cleanliness, light, and warmth in their cottages; a greater variety of potherbs, salads, fruits, and flowers in their gardens; and handsome dresses for their wives and daughters, how great the general benefit! Much may be done to bring about this change, by the opulent who are willing to reside on their estates and to take a little trouble. Building good and comfortable cottages; attaching proper gardens stocked with trees and plants from the demesne garden; and offering little premiums, or marks of distinction for keeping them in the nicest order, and for decently clothed well-bred children, would soon have a sensible effect. Attending to that kind of education which consists in teaching infants civility and politeness, with mutual respect and restraint as occasion requires; and instructing grown children how to work at almost every thing likely to come in their way, as done in the improved German and Swiss schools, would, independently of reading and writing, do a great deal to soften and humanise the peasant mind. Encouragement should be given to save money for unforeseen wants, or against old age; and the certain effects pointed out of early marriages, followed by a numerous offspring. These and a variety of similar means would be productive of some change of taste in the operative part of rural society.

7928. *The introduction of manufacturing establishments*, wherever it could be properly done, would contribute to the same effect: those who work at manufactures, and even common mechanics, generally live better, and are better clothed and lodged, than the common country labourer; therefore their example would be of use in introducing a salutary degree of luxury. "The endeavouring to impress on the minds of the lower classes the propriety of being contented with the simplest and cheapest fare, is extremely pernicious to the best interests of mankind. Encomiums ought not to be bestowed on those who are contented with mere necessaries: on the contrary, such indifference ought to be held disgraceful. A taste for the comforts, the enjoyments, and even the luxuries of life, should be as widely diffused as possible, and, if practicable, interwoven with the national character and prejudices. This, as it appears to us, is the best mode of attempting the amelioration of the condition of the lower classes. Luxuries, and if you will have it so, even wasteful habits, are incomparably better than that cold, sluggish apathy, which would content itself with what can barely continue mere animal existence." Mr. Peel observed in the House of Commons that "he thought it one of the first duties of the legislature, to do all in its power to excite a taste in the humbler classes of society for those comforts and those enjoyments—those luxuries, he might add—of civilised society, the desire for which, and the habitual possession of which, would form the best guarantee for their good conduct, and the best guarantee that the higher classes could have for the possession of their property and their power, as at present enjoyed." (*Manual of Cottage Gardening, Husbandry, and Architecture*, &c.) "In those countries," Ricardo judiciously observes, "where the labouring classes have the fewest wants, and are contented with the cheapest food, the people are exposed to the greatest vicissitudes and miseries: they have no place of refuge from calamity; they cannot seek safety in a lower station; they are already so low that they can fall no lower. On any deficiency of the chief article of their subsistence, there are few substitutes of which they can avail themselves, and dearth to them is attended with almost all the evils of famine." (*Sup. Encyc. Brit. art. Corn Laws*.) Such is the case in Ireland, where, amidst the germs of the greatest riches and luxury, the inhabitants are contented to live on less than any other people in the world.

7929. *The taste of the superior patrons* of agriculture is to be improved by visiting the best cultivated districts, reading agricultural works, attending agricultural societies, and, above all, by cultivating a farm, and establishing on it a systematic order and regularity in every detail. Let such observe the hedges, gates, verges of fields, and the beautiful rows of turnips, of Berwickshire or Northumberland; the correctly drilled beans of East Lothian; and the live stock of Leicestershire. But few are the proprietors of lands who either employ a proper bailiff or demesne steward; and of those who do, how few who do not limit and fetter them in their operations, or else neglect them and leave them to sink into that supine state in which the uppermost wish is to enjoy the comforts of the situation with the least possible degree of exertion! Some proprietors desire to have their home farm managed with a view to profit, as the cheapest way of getting hay, straw, mutton, &c.; these are sordid patrons. A home farm ought to combine an elegant orderly style of management, high-kept horses, harness, implements, &c., well clothed servants, and every thing in a superior style to what is seen on common farms. Particular attention ought to be paid to the buildings, which should combine architectural design, fitness, strength, and elegance; the roads ought to be like approaches to a mansion; the hedges like those of gardens; the green verges round the fields kept mown like lawns or grass walks, and the ditches, bridges, and gates in corresponding neatness; the finest trees ought to be encouraged in proper situations, and correctly pruned; substantial watering places formed and kept supplied; every operation on plants, or the ground, performed in a garden-like manner; and no individual of any species of stock kept, of which a drawing might not be taken and preserved as a beauty. Even the dress and deportment of the servants on such a farm ought to harmonise with the rich culture, orderly display, and high keeping of the whole.

CHAP. II.

Improvement of Agriculture, by the better Education of those who are engaged in it as a Profession.

7930. *By education* is generally understood that portion of knowledge which is obtained at schools; but in a more extended sense (as Mills observes), it may be defined the means which are employed to render man competent for pursuing the part which he undertakes to perform in life, with increased satisfaction to himself and others. Education may thus be considered as extending to every thing which operates on the body or mind, from the earliest periods of our existence to the final extinction of life. It is unnecessary here to embrace the subject in its full extent; but we shall offer some remarks on the education of practical men in general, on the professional education of an agriculturist, and on the general conduct and economy of his life.

SECT. I. *Degree of Knowledge which may be attained by Practical Men, and general Powers of the human Mind as to Attainments.*

7931. *The kind and degree of education* that we think ought to be given to every human being in this and in every country, and in every state of civilisation, may be thus defined:—All the knowledge and accomplishments that a child's body or mind, and the state of knowledge and the art of teaching at the time, will admit, previously to the age of puberty; giving preference to those branches of knowledge considered the most useful, and those accomplishments and manners considered the most humanising, by the wise and good of the age. It seems unreasonable to employ any child in aiding to procure the means of its subsistence, or that of its parents, before the age of puberty. Previously to that age, by means of infant schools, and of the adoption of the various improvements that have been recently made in modes of teaching, all that is worth knowing may be taught more effectually than common reading, writing, and arithmetic are, during the same time, by the common methods. Man, so trained and instructed, and living under an enlightened government, will become as different an animal from what he is at present, even in Britain, as the most enlightened modern moralist and philosopher of Europe is from an African savage. "It is not necessary," says Lequinio, writing in 1792, "to render an agricultural labourer a learned man;" but I am well assured, from my own experience, that the knowledge of every thing useful, and of much that is agreeable, both in knowledge and manners, is perfectly consistent with a life of labour in the fields. But hitherto the education of the labouring classes in the country has proved rather an obstacle to the development of reason than otherwise. Eight or ten years are employed in filling the head of a child with chimeras and prejudices, which twenty years of study will scarcely succeed in entirely rooting out. It remains for national philosophical institutions to destroy this national evil; and we shall one day have under the thatched cottage of the country hamlet thinking men endowed with reason, and capable at once of taking a part in the political and moral affairs of their country, and holding the plough or guiding the cart on their own farm. "Il faut," says this admirable writer, "que les premières leçons soient l'apprentissage des droits de l'homme, et qu'ils soient enseignés sans aucun mélange des perfides principes du fanatisme et des fruits barbares des gothiques préjugés, de quelque espèce que ce puisse être. Les notions de la raison et du bon sens tombent sous tous les intellects. Les droits de l'homme intéressent tous les individus, et l'esprit et le cœur seront bientôt d'accord pour s'en faire une science impréissable; gravés une fois, je le répète, ils ne s'effaceront jamais; ils se conçoivent avec aisance, et ils se fixeront bien plus solidement que ces antiques assertions données sur la foi d'autrui, et transmises à travers les ténèbres des siècles les plus obscurs; assertions ridicules, et qui, pour la plupart, n'ont seulement pas en leur la simple vraisemblance; ils se fixeront, sur-tout, parcequ'ils seront aisément et avantageusement comparés à toutes ces faussetés miraculeuses et folles dont le néant alors éclatera pour tous, et parcequ'ils seront encore plus avantageusement mis en parallèle avec ces mystères absurdes que l'homme ne pouvait admettre qu'en rejetant l'évidence, et en se dépouillant totalement de son intelligence et de sa raison. C'est par ce simple enseignement que s'éleva tout d'un coup dans nos campagnes une espèce raisonnable et libre. Sortie, par cette création morale, du cahos ténébreux, et de l'existence l'thagorique où, depuis le commencement des siècles, elle croupissait sous le joug de tous les impudens habiles qui se permettaient de la dominer, nous la verrons une race nouvelle, intelligente et hardie, laisser un espace incommensurable entre'elle et les générations qui l'ont précédée." (*Les Préjugés détruits, par J. M. Lequinio. Paris, 1792. Parochial Institutions; or, an Outline of a Plan for a National Education Establishment, &c.; and Des Etablissements pour l'Education Publique en Bavière, dans le Wurtemberg, et dans le Pays de Bade.*)

7932. *A high and equal degree of education* has some powerful advocates in North America, and it is thought by many, will, at no distant period, be adopted in several of the states. The *New York Daily Sentinel* and the *Working Man's Advocate* are two of several newspapers which support what are called "working men's measures." Among these the first and most important is a "republican education, free for all, equal for all, and at the expense of all; conducted under the guardianship of the state, at the expense of the state; embracing every branch of useful instruction, moral, intellectual, and operative, and extending to the entire protection, maintenance, and guidance of children and youth, male and female, without distinction of class, sect, or party, or reference to any of the arbitrary distinctions of the existing state of society." (*Six Essays on Public Education, New York, 1830; Cooper's Lectures on Political Economy, as quoted in the Spectator, Dec. 4, 1830; and Gard. Mag. vol. vii.*)

7933. *This high and equal degree of education* we consider to be as much the birthright of a child in a community where there is a high degree of civilisation, as food and clothes are its birthright in the rudest state of society; because, without it, a man or woman is ushered into society without a fair chance of being able to procure those means of subsistence and of happiness which belong to human nature under the given degree of civilisation; in short, without a fair chance of making the most of life. To introduce an ignorant youth into a highly civilised country, under the supposition that he could obtain the requisite degree of prosperity and happiness, would be more absurd than to turn an educated child into a country of savages. This is one view of the subject, and it is a view on which all who can afford the expense act with respect to their own children. If we regard the subject in the light of humanity, and the sympathy of one part of society with another, this principle will equally dictate the duty of bestowing, as far as practicable, that good on others which we feel to be a good in ourselves, and which we are convinced would add to the general happiness. Viewed as a matter of public policy, and considering that the grand object of every government ought to be, with reference to its subjects, their happiness and prosperity; and, with reference to other governments, its own stability; reason dictates the use of the most important means for gaining these ends; and that it would be prudent, no less than just, in government so to legislate, as that every individual subject should have the degree of education above defined. Let none,

therefore, exist in society who have not their minds matured by the care and culture of public teachers, as their bodies are by the nourishment and clothing of their parents. The religious and humane owe this to the poor as a part of human nature; the benevolent, as sympathising with the miseries they suffer; the enlightened, in order to raise them to their rank in the scale of creation; the rich, to give them a greater chance of possessing property, in order that they may respect the property of others; the prudent, that they also may become prudent; and government, that they may not be made the tools of faction, foreign or domestic. (*Parochial Institutions, &c.*)

7934. *Knowledge gives power*; and if one part of society has the degree of cultivation desired, and the other has it not, it is evident that there can be very little sympathy between them. The experience of ages shows the continual tendency of the powerful in wealth or in skill to oppress the weak; and the continual tendency of the weak to re-act by personal force, by cunning, or by numbers, on the strong. Materials so discordant can never form the basis of a sound, healthy, and permanent state of society: the poor and ignorant becoming, under such circumstances, little better than slaves to the rich and enlightened, regard them as their enemies, and often finding them to be such, must and will rebel; and the result is, sooner or later, a subversion of society. It would evidently contribute to the stability and harmony of society to moderate this action and re-action, by a more equal distribution of power; and, as knowledge gives power, the most obvious and effectual way of attaining the end proposed is, by diffusing such a high and equal degree of school education as we have defined. It must be evident, we think, that the state of society which this degree of education will sooner or later produce, will include in it every amelioration and happiness of which human nature, under any given circumstances, is susceptible. (*Ibid.*)

7935. *The knowledge of languages, history, geography, arts, sciences, and literature*, which an agriculturist, whether a ploughman, shepherd, bailiff, steward, or rent-paying farmer, daily occupied with his profession, may acquire by his own exertions, provided he begins at the earliest moment, say at fifteen years of age, and continues to employ his leisure hours in reading till he is twenty or twenty-five, is by no means inconsiderable; not that he can or need become learned; but, if desirous, he may become generally intelligent, render himself fit, as far as conversation is concerned, for good society, prove instructive and entertaining to others by his conversation, and provide a reserve fund of enjoyment, by laying up a store of ideas for reflection in misfortune, disease, or old age.

7936. *The utility of knowledge* to that part of mankind who are doomed to a life of mechanical labour, or rather who suffer themselves to be doomed to it, has been questioned; it is said to render them dissatisfied with their condition, to produce various other evils, and at all events in no way to add to their happiness or the good of society. To a man whose business in life is the mere mechanical performance of operations which any other animal might perform if furnished with hands, education is doubtless less necessary than to a man whose business is to direct the operations of others; but it does not follow, that though less necessary, it may not be highly useful: if, for example, it renders him dissatisfied with his condition, it will, at the same time, be more likely than any thing else to lead him to some proper mode of improving it; or if almost unimprovable, education certainly will be more likely than a state of ignorance to teach patience and submission, by enabling him to reflect on the folly of grieving at what is inevitable, and the consequences of committing what is unjust or criminal to relieve himself. The low Irish, Marshal remarks, "are sufficiently dissatisfied with their condition; those who know how to alleviate it by emigration, go to Britain or America; those who know nothing, stay at home, commit acts of violence, and are hanged."

7937. *To decide as to the utility of knowledge to the operative parts of society* would perhaps require a previous decision of the question, "What constitutes happiness?" The general answer is, the exercise of all our faculties of body and mind: every one who has lived thirty or forty years in the world, knows that there is no such thing as absolute happiness: the Prince de Ligne, a man of great natural parts, with every advantage of person, birth, and wealth, and in favour at all the courts of Europe; fond alike of war, literature, gallantry, and agriculture, and who lived to be upwards of 90 years of age, has left on record that he was only perfectly happy two or three times in his life, and only for a few minutes each time. Forsyth (*Principles of Moral Science*, vol. i. chap. 1.) says perfect happiness is a thing not to be thought of; and that all that men and women can do in order to make the most of their existence, is to occupy themselves and make progress in whatever they engage in: progress in enjoyment, or approximation to happiness, is therefore the object to have in view.

7938. *The utility of knowledge to every human being* is consequently, in our opinion, unquestionable, on the mere principle of adding to enjoyment; nor do we believe that there is more danger from excess of knowledge in any particular class of society, high or low, than there is from excess in their eating or drinking. A number of men possessed of property or power by inheritance, favour, or chance, who are very conscious that they never could have acquired those advantages by the common competition of talent and industry, and who are in fact wrapt up in selfishness, are naturally jealous of the progress of knowledge; their secret maxim is to keep down the lower orders, and to impress on their minds only the duties of loyalty, religion, and, as Vancouver adds, hard work. This monopoly of power and knowledge, however, cannot be maintained for ever, and in every country it is found rapidly yielding to the general progress of society. It is only those who have to dread this progress that fear the diffusion of education and liberal principles.

7939. *Education in all countries*, in as far as it has been carried, has had the effect of rendering the poor content. Compare the poor of Sweden and Germany with those of England. The uneducated are prone to consider wealth and happiness as synonymous, a delusion which knowledge quickly dispels; philosophy teaches its fallacy, and history exemplifies it. For our own part, we can see nothing in education but increased security to the rich, and increased happiness to the poor. One of the great evils which at present afflict society in this country is over-production; not only of manufactured goods, but also of human beings. We are apt to believe that even this calamity might be remedied, if every labourer in the country considered a high and equal degree of education as a necessary of life, and no more to be dispensed with in a child than food or clothing; as in that case he would not think of marrying till he could bestow this degree of education on his children. If any labourer acted otherwise, he would bring himself into disgrace among his own class; he would suffer a loss of reputation for good sense and good taste; and his wife and himself would no longer be able to associate with their neighbours, either from the extraordinary exertions which they must make, in order to educate their children up to the general level, or in consequence of not being able to do so, and having it done for them by the parish as paupers. The dread of the reflections and neglect of the children when they arrived at maturity, and found that they were indebted to the parish more than to their parents for their education, and that they had, in fact, to pay the parish for this education themselves, would also act as a powerful inducement to prudential conduct. Besides, when parents themselves have once enjoyed the degree of education defined, they will consider it cruel and unjust not to bestow the same degree of education on their children. This is, in fact, the feeling of all educated parents; and one great object that we have in view is to communicate the same feeling to the very lowest member of society. We are justified in concluding that universal education would do so, by what actually takes place at present among the educated classes. (*Parochial Institutions, &c.*; and *The Objects to be obtained by Reform in Parliament, &c.*)

7940. *The terms knowledge and ignorance are entirely relative*: the knowledge of a modern chemist's porter would have subjected him to be hanged and burned in the days of the first popes; and any bricklayer's labourer of the present day, who reads the London newspapers, has more correct ideas of the principles of political economy than nine tenths of the nobility in Russia and Spain. It is impossible to set limits to the knowledge which may be obtained by those who are destined even to the most severe and constant labour; the intelligence of the miners in Scotland and Sweden may be referred to as proofs

The miners at Leadhills have a regular library and reading society; and the works they make choice of are not only histories, voyages, travels, &c. but even works of taste, such as the British classics, and best novels and romances. The degree to which knowledge will prevail among any class of labouring men will depend jointly on their own ambition, on the demand for knowledge, or the reputation in which it is held, and on the opportunities of acquiring it. A dull, stupid person, with little native activity, will never desire to know more than what enables him to supply the ordinary wants of life; but where the workmen of any art are required to have technical knowledge of any particular kind, they will be found invariably to possess it. Thus carpenters and masons require some knowledge of the mechanical principles of architecture, and working engineers of the strength of materials; and these kinds of knowledge are acquired by them without an hour's interruption of their daily labour: on the contrary, the habit of evening study renders them more steady, sober, and industrious than other workmen: than bricklayers and paper-hangers, for example, whose employments require much less intellectual skill. If every cook-maid, before she could obtain a first-rate place, were required to be able to read *Apicius* in the original tongue, there would be no want of learned cooks; and if no bailiff could obtain a first-rate situation who had not written a thesis in Greek, or who had not made the tour of Europe, there would soon be found abundance of bailiffs so qualified. A Caledonian, when he comes to the low country, soon acquires the English tongue, and, if he has been taught Latin, thus knows three languages. The servants at the inns on some parts of the Continent, frequented by different nations, often acquire a moderate knowledge of three or four languages: a late custom-house officer on the island of Cronstadt spoke and wrote ten languages; and the bar-maid at the hotel de Londres, at which we lodged in Moscow, in 1814, could make herself intelligible in Swedish, Russian, Polish, German, French, Italian, and English.

7941. *The certain way of obtaining any thing* is to be impressed with the necessity of possessing it, either to avoid the evil of being without it; or to satisfy the desires of others as to ourselves; or our own desires. There is scarcely any thing a rational man can desire that he may not obtain, by maintaining on his mind a powerful impression of the necessity of obtaining it; pursuing the means of attainment with unceasing perseverance, and keeping alive that enthusiasm and ardour which always accompany powerful desires. All may not acquire, by the same degree of labour, the same degree of eminence; but any man, by labour, may attain a knowledge of all that is already known on any subject, and that degree of knowledge is respectable; but many never attain to, and what few go beyond.

7942. *The grand drawback to every kind of improvement* is, the vulgar and degrading idea that certain things are beyond our reach; whereas the truth is, every thing is attainable by the employment of means; and nothing, not even the knowledge of a common labourer, without it: there are many things, which it is not desirable to wish for, and which are only desired by men of extraordinary minds; but let no man fancy any thing is impossible to him, for this is the bane of all improvement. Let no young ploughman, therefore, who reads this, even if he can but barely read, imagine that he may not become eminent in any of the pursuits of life or departments of knowledge, much less in those of his profession: let him never lose sight of this principle—that to desire and apply is to attain, and that the attainment will be in proportion to the application.

SECT. II. Professional Education of Agriculturists.

7943. *In order that a professional man should excel as such*, every other acquirement must be kept subservient to that of his profession. No branch of knowledge should be pursued to any extent that, either of itself, or by the habits of thinking to which it gives rise, tends to divert the mind from the main object of pursuit; something, it is true, is due to relaxation in every species of acquirement; but judicious relaxation only serves to whet the appetite for the vigorous pursuit of the main object. By the professional education of agriculturists, we mean that direction of their faculties by which they will best acquire the science and manual operations of agriculture, and we shall suppose agricultural pupils generally to have no other scholastic education than some knowledge of reading, writing, and arithmetic.

7944. *All young men who intend embracing agriculture as a profession*, whether as ploughmen, bailiffs, stewards, land-valuers, or rent-paying farmers, ought to undergo a course of manual labour for one year or more, in order to acquire the mechanism of all agricultural operations. When the pupil is not destined for any particular county, then he should be sent to a farmer in a district of mixed agriculture; as, for example, East Lothian, where he would, if placed in a wheat and bean culture farm, see at no great distance the turnip system and feeding, and a few miles off, the mountain sheep-farming or breeding: when the pupil is intended to be settled in any particular county, he ought to be sent to a county as near as possible of similar soil and climate, where the best practices are in use; as from all the turnip counties, pupils should go to Northumberland or Berwickshire; from the clay counties to East Lothian, or the Cause of Gowrie; from a mountainous district to the Cheviot hills, and Tweeddale, &c.

7945. *The term of apprenticeship completed*, the future time of the pupil ought to be regulated according to the ultimate object in view: if he is intended for a ploughman, shepherd, or hedger, perhaps to introduce new practices in other counties, he may remain for a year or two longer with other masters in the same district, in order not merely to acquire but to habituate himself to all the improved operations and practices. If he is intended for a bailiff, then, after having been two years on one character of farm, let him engage himself for a second two years in a district of an opposite or at least of a different character; and for a third two years, on a third character. There are, as already shown, only three descriptions of farming in Britain: the bean and clover, or clay-land farming, which includes feeding by soiling; the turnip farming, which includes feeding both by soiling and pasturage; and the hill, or mountain, or pasture farming, which includes all the varieties of breeding. A young man therefore of ordinary intellect, who has worked two years in East Lothian on a clay farm, two years in the lower Berwickshire, or in the low part of Northumberland, and two years on the Northumbrian hills, must have a very competent knowledge of that part of agriculture known as farming or husbandry.

7946. *The higher branches of agriculture*, or what may be called the engineering valuing, and estate-agency departments, can only be completely acquired by first going through the course above described, as suitable for bailiffs and common stewards, and next placing themselves under an eminent steward, land valuator, drainer, road engineer, irrigator, &c. as the case may be; making choice of a steward who has extensive woods and plantations, and also, if possible, some quarries, fisheries, or even mines under his care, and of a land valuer or drainer in full employment. When a solid foundation is laid by a thorough practical knowledge of all the operations of common agriculture, the higher part is attained with ease, and may be practised with confidence; but, on the contrary, when young men who know nothing of common country work are sent direct from school, or from an attorney's office, to a land steward or agent, in order to acquire the art of managing landed estates, the worst consequences may be dreaded, both to the proprietors and the occupiers of the territory which may be subjected to them. The condition of many estates and tenants, managed by attorneys, may be referred to in proof of our assertion.

7947. *Young men intended as rent-paying farmers*, after two years' labour as common servants, should be kept as assistant bailiffs on other farms, till they are at least 25 years of age: no young man, in our opinion, ought to be put in a farm on his own account, or employed as a master bailiff, at an earlier period.

7948. *In all cases when young men are destined for particular purposes*, they should be sent chiefly to particular districts; as, for example, young men intended for road-surveyors, to where roads are best managed, drainers to a draining county, embankers to Lincolnshire, wipers to the Humber, irrigators to South Cerney, hedgers to Berwickshire, woodmen and foresters to Dunkeld, or Blair in Athol, &c. It

would contribute much to the improvement of agriculture in the backward counties, if landed gentlemen would prevail on their tenants to send their sons as apprentices, or even as ploughmen or farm labourers, to the improved counties; or if lads brought up by the parish were sent there with a view to their acquiring the use of the improved implements.

7949. *Whatever is the kind of professional knowledge to be acquired*, the means of attainment is the pupil's paying such attention to what he sees and hears as to fix it in his memory. One of the first things, therefore, that a young man should do is to cultivate the faculty of attention, which he may do every hour of the day, by first looking at an object and then shutting his eyes, and trying whether he recollects its magnitude, form, colour, &c.; whether he would know it when he saw it again, and by what special mark or marks he would know it or describe it. When he goes from one part of the farm to another, or is on a walk or journey, let him pay that degree of attention to every thing he sees and hears, which will enable him to give some account of them when returned from his walk or journey; and let him try next day, or some days afterwards, if he can recollect what he had seen then, or at any particular time and place.

7950. *The attention to be exercised in such a way as to impress the memory*, and enable the observer or hearer, not only to recollect objects, but to describe them, must be exercised systematically. A thing or a discourse must be attended to, not only as a whole, but as a composition of parts; and these parts must be considered not only as to their qualities of dimension, colour, consistency, &c., but as to their relative situation and position. To be able to give an account of a town or village, for example, the first thing is to get a general idea of the outline of its ground-plan, which may be done by looking from a church tower or adjoining hill; next, its relative situation to surrounding objects, as what hills, or woods, or waters join it, and in what quarters; next, the direction of the leading street or streets must be noticed; then the intersecting or secondary streets, the principal public buildings, the principal private ones, where the lowest houses and narrowest streets are situated, and what is the character of the greatest number of houses composing the whole assemblage.

7951. *To treasure up in the mind the characteristic marks of particular varieties and subvarieties of stock* is a most important part of an agriculturist's professional education. To do this effectually, some knowledge of sketching is of great use, and, if possible, ought to be acquired by every person intending to fill the situation of bailiff or steward. The knowledge of soils, plants, and their culture is a very simple business compared with the knowledge of stock, which is not only of difficult and tedious acquirement, but easily forgotten or lost: for one gentleman's bailiff that knows any thing of stock there are at least a score that know nothing.

7952. *In connection with professional studies*, the pupil may find it necessary, if his education has been neglected, to go on at his leisure hours with all the usual branches of education, either assisted by books alone, or by books and the best assistance he can procure. If his school education has extended to arithmetic, mensuration, mathematics, and drawing, he should occupy himself in acquiring a knowledge of botany, zoology, geology, and mineralogy, without a tolerable knowledge of each of which he will ever be in the dark among modern agriculturists, and in reading books on the subject. Next, let him study the various arts and manufactures that have any relation to agriculture, and store his mind with all he can acquire from one of the best general *Encyclopedias*, as that of Rees, or the *Encyclopaedia Britannica*, with its excellent supplementary volumes. If he will go farther, and if he wishes to know the extent to which he may go, he may consult what we have advanced on the subject of education in the *Encyclopaedia of Gardening*.

SECT. III. *Conduct and Economy of an Agriculturist's Life.*

7953. *A plan for the general conduct of life* should be fixed on by every one when he arrives at manhood, and steadily pursued for the time to come: most commonly such a plan is formed by the parents soon after the child's birth, and, at the latest, when the boy is taken from school. The boy arrived at manhood, however, is entitled to examine this plan, and amend it, or devise another more congenial to his own notions; but the risk of any change of this sort by persons so young and inexperienced is so great, that no youth ought to venture on it without the utmost consideration, and the firmest persuasion in his own mind: where the parent has done his duty, such changes of plan will not often be attempted; for, by the early infusion into the mind of a child of ideas relative to the pursuit that is intended for him, a taste for that pursuit or employment will grow up with him, and become as it were his own natural inclination. This will happen in most cases, but in some children the bias or force of nature for some particular purpose is so strong, that by no parental intreaties or reasoning can it be overcome; even where a sense of duty induced compliance with a parent's wishes for a time, the dormant inclination has at last broke out and taken the lead. In such cases, the parent may generally conclude, that where the pursuit or purpose is not bad, the force of natural inclination will be more likely to command success than the influence of parental authority; and that a pursuit or business, commonly of little profit or repute, will be more profitable and respectable when followed by a genius powerfully impelled to it, than a profitable and reputable business followed by any one against his inclination.

7954. *The plan and conduct of life are in most cases determined by accidental circumstances*. The son of the labouring man grows up without any regular training or education for a particular end, and finds himself at the age of manhood engaged in rural labour, and apparently incapable of any other; his notions and his ambition are so limited that he dare not venture to desire a change for the better; for no man ever desires that which he thinks it impossible to attain, and the mere idea of this impossibility, however erroneous, effectually restrains the attempt at improvement. The life of the ploughman or labourer, much as it differs from that of a man of eminent natural powers and superior education, is capable of much amelioration by being directed to a suitable end or object as the ultimatum, or in other words, by proceeding on a plan; plan indeed, as we have elsewhere observed (*Encyc. of Gard.* 2d edit. 7778.), is predestination, as conduct is fate.

7955. *The greater part of mankind enter on life without any fixed plan or object in view*, or, if they have some general notion of acquiring wealth or distinction, they form no plan by which it is to be accomplished; the consequence is, that such persons, after blundering on through their best years, arrive at the end without having gained any thing but experience, now of no use to them. No man is born in possession of the art of living, any more than of the art of agriculture; the one requires to be studied as well as the other, and a man can no more expect permanent satisfaction from actions performed at random, than he can expect a good crop from seeds sown without due regard to soil and season. When we look round and observe the quantity of misery in the world, the greater proportion is, or seems to be, the result of a want of plan, or of a bad plan of life. How many parents are unsuccessful in their struggles to maintain a large family, the result of too early marriages: how many find themselves arrive at old age with no other resource for support but charity, the consequence of want of foresight in expenditure: how many are suffering under poverty, brought on by their own want of frugality, or positive extravagance; or under disease from excesses and irregularities committed in the heyday of life: and how many among those not born to inherit property, who, at no period of their life, have any other alternative between hard labour and deficient food, than disease and want!

7956. *Want of plan* may not in every case be the cause of all this misery, because accident enters into life for something, both on the unfavourable as well as the favourable side of the question; but we have no hesitation in asserting, that want of plan, as a cause of misery, is as ninety-nine to a hundred: any plan at all, even a bad plan, is better than none; because those who set out on any plan will, in all probability, sooner discover its errors if a bad one, and correct them, than those who set out on no plan will

discover the want of one and form a good plan. The young man who is just setting out in life may well tremble at the consequences of proceeding on the journey without the guide of a judicious plan; this plan he must form himself, because he alone feels what he wants, and what he can do to gratify them; all that we can do is to offer a few hints.

7957. *In order to be able to form a plan* it is previously necessary to determine the object to be attained by it. Happiness is the object of every action of human life, and consists in the gratification of certain wants and desires: some of these desiderata are peculiar to youth, and others to old age; but many, as clothing, food, rest, relaxation, entertainment, &c., begin with the earliest, and continue to the latest period of life. All these gratifications are procured by labour; in savage life, by hunting, fishing, and gathering fruits, till the man, no longer possessing strength enough for these labours, is obliged to lie down and die of want: in civilised society, they are also obtained by labour; but here what is called property exists, and man, in the vigour of his days, when the supplies of his labour are greater than the demands of his wants and desires, or when he chooses not to gratify the latter to the full extent admitted by the former, can, as it were, embody a part of his labour, to be made use of when he is no longer able to perform it with ease: a man in this case is said to arrive at independence, instead of want, as in the case of the savage, or of beggary, as in the case of the improvident.

7958. *Independence is the grand object* which every man destined to live by the exercise of his labour or talents ought to have in view. At certain periods of life, when the imagination is vivid, and health and animal spirits in their utmost vigour, some may prefer present enjoyment, mere animal gratifications, or imaginary distinctions, amatory conquests, titles, rank, military glory, and high literary or professional reputation: it is a noble attribute of our nature to prefer some of these to the mere accumulation of money; but a great warrior, poet, or painter, arrived at old age and want, if the latter be brought on by common improvidence, will not find himself surrounded by many marks of distinction; and though it may possibly be some consolation to him that the three or four letters composing his name will be sometimes pronounced together after he is dead, yet it will not be much.

7959. *The exercise of his profession* is the most rational mode in which an agriculturist, of whatever grade, can pursue independence. Only extraordinary circumstances can justify a change of profession; in common cases it indicates a want of steadiness of character, or a want of success, and the latter is commonly attributed to want of skill; it is better, therefore, to pursue unremittingly the profession to which we have been educated, even though we should not be very successful in it, than to risk an infringement on character by adopting another. The practice of agriculture, as we have already seen, (7710.) is carried on by three different classes, serving, commercial, and artist agriculturists: on each of these classes we submit a few hints to aid them in forming a plan of life, and regulating their expectations.

7960. *The greater number of agriculturists must ever belong to the lower grades of the serving class*; and act as ploughmen, herdsmen, shepherds, hedgers, woodmen, and labourers of all-work. These form the greater proportion of mankind in every civilised country, and must ever remain the bulkiest material in the social fabric. Comparing one age and country with another, however, there may be the greatest difference in their intellectual and physical condition. The ploughman of Russia is but a remove from his horse. The ploughmen in different parts of Britain are as intelligent as their employers: in Scotland they have the Bible by heart, are familiar with the history of their country, and not ignorant of its literature; they lead a laborious life, but they enjoy the inestimable blessings of health, sound sleep, and peace of mind, till the latest period; they are almost always independent, either from their labour, their savings, or, in old age or sickness, from the assistance they receive of their children in return for what was laid out on their education. These men are as happy, relatively to their capacity for happiness, as any other class whatever: if their measure is smaller, it is as full as the largest; for the essential materials of comfort and happiness are the same in all classes, and in all classes a man's wants and wishes accommodate themselves to the means of gratifying them. The rich have no wants, and their desires for the most part are no sooner expressed than gratified; the pains and pleasures of life are neutralised into a kind of insipidity, till ennui brings on disease, which to this class becomes a blessing, by procuring for them the occupation of taking medicine, the duty of attending to the doctor's regulations, and the pleasures of convalescence.

7961. *Constant labour*, even that of the humblest description in the country, when it is not oppressive, and where it is accompanied with abundance of food, sufficient clothing, and good health, is by no means inconsistent with happiness. It is a common but most erroneous idea, that happiness is confined either to the rich or the independent. Health and activity are the woods, and a rich man who has nothing to do is unquestionably more miserable than any ploughman in the empire. "Happiness," says one who has thought much on the subject, "is the full and vivid satisfaction of the mind; and it consists in content and uninjurious enjoyment, that is, enjoyment not injurious either to oneself or to any other. Among the very first requisites to this satisfaction, it will readily be perceived, is employment, either bodily or mental; and the more energetic, without exhaustion, is the employment, the more full and vivid will be the satisfaction. The human mind is naturally active; and, except in sleep, if even then, cannot with impunity be motionless or torpid. Occupation is as necessary to its health as circulation of the blood is to the body's. Employed it must be, to know content or feel enjoyment; for, by any want productive of pain, either bodily or mental, especially the latter, content and enjoyment are, according to the degree of the pain, destroyed or diminished; and the want, which the unemployed mind invariably feels, is as invariably productive of uneasiness, of listlessness, and lassitude, and their inseparable attendant, mental pain. Indeed this pain is, not unfrequently, altogether unendurable. 'All the importunities and perplexities of business,' says Dr Johnson, 'are softness and luxury compared with the incessant cravings of vacancy and the unsatisfactory expedients of idleness.' 'It is this intolerable vacuity of mind,' says Paley, 'which carries the rich and great to the race-course and the gaming-table.' It is this vacuity, says experience, which often arms them against themselves, and hurries them to self-destruction. If, also, employment is necessary to the health of the mind, exercise is to that of the body. Employment to the mind and exercise to the body are in some degree substitutes for each other; but, for the full content and enjoyment which constitute happiness, they both, in due proportion, are necessary." (*Co-operative Magazine*, vol. i. p. 6.)

7962 *The plan of life suitable for the operative agriculturist* may very well be founded on the condition of this class of men in the northern counties of Northumberland, Berwickshire, East Lothian, and others. We have already (7809. and 7834.) described in general terms the manner in which farm servants are hired, lodged, and paid in these counties; and details by an eminent Northumberland farmer will be found in the sixth volume of the *Gardener's Magazine* (p. 589.). The essence of the mode consists in the employer providing the employed with comfortable cottages and gardens, and paying them chiefly in the necessities of life, in so much meal or flour, so much ground to grow potatoes and flax or hemp, a cow's keep, the run of a pig, if a shepherd so much wool or so many sheep, the loan of a team to bring home coal or other fuel, and a certain proportion of money. By this mode of payment the operative countryman is always sure of a comfortable home and food; sure of milk, butter, meal, bread, and potatoes, the produce of a pig, poultry, and bees, and of the produce of his garden; and this, however high may be the prices of these articles in the public market. These good things can only be rendered nugatory by the evil of a bad wife. All country servants hired by the year might be accommodated and paid more or less in this manner; and to this mode of life and payment they ought to look forward as the ultimatum of their grade in the scale of operative agriculturists. By prudent conduct, in regard to the increase of their family, and by frugality, they may live in decency and comfort, educate one or two children, and save something for old age, or unforeseen occurrences.

7963. *The Northumberland ploughman* is the happiest of labourers, and never feels a bad season. His wages are certain; and with frugality and care, his wife may bring up a large family upon this income. The reverse is sometimes the case; but this is attributed to a bad wife, who wastes the produce of the cow. The small stock of the hind being always his own, and the cow generally so, makes him prudent and careful during single service to save as much of his wages as will set him up for himself. To this, and the fact that the wages of labour are never paid out of the poor's rate, the enviable state of the Northumbrian labourer is to be attributed. It appears to operate as a preventive check upon population, and beautifully illustrates Mr. Malthus's theory; or, in the words of Burns, it teaches them to "know that prudent cautious self-control is wisdom's root." They are all anxious to give their children such education as they can command. When they are within the reach of a charity-school they thankfully avail themselves of it, and we find in every hamlet some person who teaches the younger children the rudiments; and several of these, when they get older, work and save the wages of summer to pay for putting themselves to schools in winter. (J. C. in *Gard. Mag.* vol. vi. p. 591. See also *Denson's Peasant's Voice*.)

7964. *The day labourer who has no particular employer*, and probably no fixed residence, is much less comfortable than the yearly servant; in England more especially, under the present system of poor laws and parish management, which is calculated to degrade him, and effectually to prevent any attempt at improving his condition. If, as Slaney observes, "by unremitted industry, he has been enabled to do without parochial relief, and bring up his children decently, it is as much as could be expected; for an attack of illness, or the temporary loss of employment, he is in general totally unprepared; he thinks not much of the morrow, and, as it stands, it is perhaps well for him that he does not anticipate evils which he cannot prevent. Every one knows how beneficial to the community, how advantageous to the individual, the hope of bettering his condition in life is: it cheers him in adversity, encourages his industry, promotes his content, yet from this hope the major part of the agricultural labourers of England are excluded; they toil indeed, but it is to confine, not to better their existence." (*Essay on the beneficial Direction of Rural Expenditure*, p. 170.; see also the succeeding chapters of these judicious and intelligent essays.)

7965. *The condition of the labouring classes* has lately been considered by the editor of the *Scotsman*, in an article in his xvth volume (Nos. 1131, and 1132.), which is also published separately in a tract entitled *The Scotsman's Advice to the Labouring Classes*. The condition of the labouring classes, it is observed in this tract, may be deteriorated in two ways; "by increasing their numbers too rapidly, and by diminishing the capital which provides them with employment. Now capital is either diminished, or its natural growth is impeded, by the enormous sums paid to the government, by the tax on corn imposed for the benefit of the aristocracy, and by the many absurd restrictions on industry, which have arisen from the ignorance or misconceptions of our legislators. To repeal or reduce taxes, and relieve industry from the restrictions which fetter it, benefits the working classes by enlarging the fund which creates a demand for their labour. The sufferings of these classes are therefore, in no small extent, imputable to the exactions and misconduct of the government. Culpable and injurious, however, as the extravagance of the government has been, I am convinced that were all the public burdens annihilated, and all the obstacles to freedom of industry removed, the relief given would be but temporary. The misery of the working classes might be mitigated by such means, but it cannot be eradicated by legislation, nor by any human means except such as shall put some check on the increase of their numbers. Scientific thinkers regard this conclusion as established on the clearest evidence; how then is the principle of increase to be checked? Only in one way: by enlightening the minds of the working classes; by inspiring them with feelings of self-respect; by teaching them the immense importance of habits of prudence, forethought, and self-control to their own happiness; by giving them true notions of their situation as moral agents, responsible for the consequences of their acts, and endowed with powers which, if rightly used, would make them to a great extent masters of their own destiny."

7966. *A radical evil in human conduct*, is that "in the article of marriage men consider life as a lottery, and they rush into the most important of all ties, without making any provision for discharging the obligations it lays upon them. This applies to the middle ranks as well as to the lower." Thousands and tens of thousands marry every year whose earnings hardly suffice for their own subsistence; and multitudes throw their offspring on the world "with as little rational consideration about its future well-being, as the crocodile shows when she drops her egg in the sand, and leaves it to the sun and the winds to hatch her young into life." Such persons shelter their thoughtless conduct under the plea of trusting to Providence: but what is trusting to Providence but trusting to chance? Nature has endowed us with reason to regulate our conduct, and in most of the common concerns of life has enabled us to foresee the consequences of our acts. After making all the use of our reason that we can, enough will still be left for chances, which may turn out, as every day shows, as much against us as for us. "To neglect the admonitions of reason, and then trust to Providence to free us from the evils induced by our own thoughtlessness, is to call upon the Deity to work a miracle in our favour; and this, instead of promoting our improvement, is only to harden us in our folly."

7967. *There are two truths of vast importance* to the well-being of the labouring classes; the first is, that as no efforts of legislation can lift them out of their misery, their happiness must always depend on their own habits of prudence, forethought, and self-control. The second is, that no man has a right to bring human beings into the world, who is not able to provide for their support and education. The law punishes severely the act of exposing a child; but the man who marries and becomes the father of children, without having any reasonable prospect of being able to keep them from beggary with all its attendant miseries, is guilty of the same crime in a lower degree.

7968. *To convert the burthens which marriage brings with it into money*, the *Scotsman* suggests the following scheme: he takes the case of an industrious mechanic beginning to earn 1*l*s per week at the age of eighteen, and he shows what he could accomplish by living economically, and deferring marriage till he was twenty-eight: he supposes him able to live upon 1*l*s. 6*d*. per week, and to place 3*s*. 6*d*. per week in a savings' bank, by which his stock, including interest, will amount in ten years to about 100*l*. At his marriage he is supposed to spend 30*l*. of this 100*l*. in furnishing a house, &c. and to dispose of the remaining 70*l*. to provide against the following casualties.

7969. *The first casualty after marriage* which he has to provide against is sickness, which may be done by a weekly contribution of 4*d*. for himself and his wife.

7970. *The second casualty* is the infirmity of old age. This is to be provided against by an annuity from government, or a benefit society; and 1*l*. 1*s*. 9*d*. paid at once, or an annual payment of 9*s*. 6*d*. by a man at the age of twenty-eight, will obtain an annuity for him of 20*l*. per annum for whatever number of years he may live beyond the age of sixty-eight.

7971. *The third casualty* to be provided for is the possible widowhood of his wife: this he may do by paying down 32*l*. 12*s*., for which a man of twenty-eight may secure for his wife, supposing her age to be the same, an annuity of 10*l*. for life, in the event of her being left a widow, at whatever period it may happen. On this subject the benevolent and philosophic author of the scheme observes, "When society is more enlightened, it appears to me that a provision against the chance of widowhood will be considered as indispensable at marriage as a suit of wedding clothes."

7972. *The fourth casualty* is the chance of the death of the father before his child is able to shift for itself; that is, before it is fifteen or sixteen years of age. To ensure each child against this casualty, it is proposed to secure a small annuity to it in the event of his death, of say 3*s*. per week, up to its fifteenth year. This, the father being aged thirty, he calculates may be purchased for 5*l*. paid down the first year of the child's life. "A similar deposit of 5*l*. would be requisite at each addition made to the family; and as a marriage is assumed to produce on an average four children, the whole sum expended under this head would be 20*l*." Those who have more than four children must make extraordinary exertions.

7973. *A reasonable degree of security against the casualties of life* may be afforded to a working man about to enter into the married state and his family for the sum of 100*l.*, which it is shown he might save by the age of twenty-eight. That sum would be disposed of thus :

Furniture, exclusive of what was provided by the wife	-	-	-	£30
Annuity for himself in old age of 20 <i>l.</i> per annum	-	-	-	17
Annuity of 10 <i>l.</i> per annum for his widow	-	-	-	33
Provision for four children	-	-	-	20
				<hr/>
				£100

Therefore, let no man whatever, not even the most humble country labourer, think of marrying before he has saved 100*l.*; and let him beware of spending any part of this sum, even that part which is allotted for his furniture, before he has provided for the four casualties of the married state.

7974. *To carry this scheme into effect*, mutual assurance societies by the working classes themselves, or benefit societies, would probably be the best mode, and government and the more wealthy members of society ought to lose no time in assisting in their formation. It is justly observed, however, that it cannot be too often inculcated upon the working classes, that the improvement of their condition must be their own work. Were this scheme carried into practice, "it would diminish their numbers relatively to capital, and as a consequence, *their wages would rise*." Secondly, it would rescue them and their families from extreme poverty, give them independence of character, secure to all of them the advantages of education, and thus break down the barrier which confines them to the sphere they are born in, and precludes them from obtaining any of the higher prizes in the lottery of life. To society the system would be equally beneficial: poor's rates, with all the abuses they engender, would be done away; crimes would be rare when pauperism was eradicated; and by the universal diffusion of education, all the talent in society would be made available. And last, not least, when every grown-up man had either a small stock of savings in hand, or investments in a common fund, we should have the very best guarantee for the public tranquillity. Did the working classes fully understand this scheme," its excellent author continues, "nine tenths of all the poverty, misery, and crime which we see around us would disappear; and we should in fact find ourselves in a new world, full of intelligence, peace, and good order, in which life and property would be ten times more secure, happiness more equally distributed, and an admirable foundation laid for the further amelioration of the lot of mankind." (*Scotsman*, Nov. 13, 1830.)

7975. *The plan of life for the directive class of agriculturists* need hardly be pointed out; the rise from a farm bailiff to a steward's bailiff, or to a demesne bailiff or steward, and thence to the general steward or factor of an estate, is an obvious object of ambition. In another direction he may rise through the different gradations of the commercial agriculturist, or, adopting the rank of counsellor or artist, he may become a salesman, appraiser, timber or land-surveyor, land-valuer, agent, or agricultural engineer: rarely, however, can he attempt the veterinary profession, or that of draftsman, author, or professor.

7976. *The remuneration to which a directive agriculturist is naturally entitled*, should be regulated by his professional abilities and experience; that which he will commonly receive will be regulated by the quantity of agricultural talent and experience in the market; it ought always to be such as will render it worth his while to be honest, assiduously attentive to the interest of his employer, and of polite and obliging manners. A handsome salary to such a servant is wise economy.

7977. *The object of the artist or counsellor agriculturist* may be either to ascend to the rank of author or professor, conditions of more honour than profit; or to realise property and become a proprietor cultivator. For a rent-paying farmer, no artist or author is at all adapted.

7978. *The legitimate object of a commercial agriculturist* is to rise in the different grades of his class, and become either a large farmer, a gentleman farmer, or, best of all, a proprietor cultivator.

7979. *The profits to which a commercial agriculturist is entitled*, comparatively with those of other commercial men, are theoretically determinable by the risk attending the employment of his capital, and the skill requisite to prosecute his art; but, practically, this remuneration will depend on the quantity of skill and capital in the market. The risk attending capital employed in the culture of the useful products of the soil, is evidently less than the risk of capital employed in many or perhaps most manufactures; and the skill requisite to enable any one to become a farmer, according to the customary practices of the country surrounding him, is less than that required for almost any branch of manufacture. In consequence of these things, there are men every where ready to become farmers; hence the profits of farming are naturally less than those of most other pursuits; but, to counterbalance this, the farmer has several advantages peculiar to his profession. First, the nature of his residence in the country, which assumes a certain degree of consequence from its connection with a considerable group of out-offices, surrounded by a garden, orchard, fields, woods, and other rural scenery, all in his occupation, and inhabited by servants in cottages, horses, cattle, sheep, and other domestic animals, in subjection to him, gives him a degree of consequence both real and apparent; and assimilates him more nearly to a lord of the soil, and to the possessor of that sort of rural retirement and independence which is the object of almost every commercial man's ambition, than any other mode of life could do. Secondly, many trades and professions preclude (according to general prejudices) their followers from being gentlemen: whereas, though every farmer is not a gentleman, yet any gentleman may become a farmer, without in any degree lowering his rank and character; a farmer may, therefore, if he chooses to adopt the habits and manners of a gentleman, be reckoned as such. Thirdly, the farmer's products are in universal demand, and he is sure of a market at some reasonable rate, a fact otherwise with many manufactures. Fourthly, he is sure of a home, of the necessaries of life, and, in general, of most vigorous health. Fifthly, he is generally a man of more parochial influence than the tradesman or manufacturer.

7980. *Scarcely any farmer makes a fortune by his profession*: the utmost exertions of the most skillful and industrious men, in the most improved districts, seldom do more than enable them to keep pace with the times; and the great majority, in all countries, lead a life of great labour and anxiety, and end as they began. No farmer, in a general way, can raise more than one corn crop in a year, and in this respect the farmer of Russia and Poland has the advantage of the British farmer; for the lands of the former being from five to eight months under snow, all root-weeds are destroyed, and the ground so loosened by the frosts and thaws, as to require very little stirring for the seed: the rapid summer which succeeds ripens all annual plants that will grow there, nearly as well as in England, and better than in many parts of Scotland and Ireland. The British farmers, however, have the great advantage of perpetual pastures, owing to the mildness of our winters; but still no art of man will shorten the period of animal gestation, and originate a lamb or a calf in shorter periods than five months and forty weeks. How often does the tradesman or manufacturer turn his capital in that time! There are three varieties of professional farmers, however, who occasionally realise some property: the grazier who feeds with oil-cake, grains, and other artificial foods; the dealer in corn or cattle, who has the art to buy at a falling and sell at a rising market; and the dealer or jobber in farms, who sublets or sells his lease, or in purchases of land, who subdivides and sells estates. The profits of the first are not great, and those of the last two are attended with great risk: the only farmer whose lot is to be envied, lives under a landlord who does not take the full marketable price for his lands: such as Burdett, Coke, Bedford, Northumberland, and many others in the south; but few in the north, or in the west.

CALENDARIAL INDEX.

Though agricultural operations, in general, require less nicety as to the exact time of performing them than many of those of gardening, yet there are exceptions in respect to some field crops; for example, beans and turnips. It is proper to observe, therefore, that the *almanac time* in this Calendar is calculated for the meridian of London; but as a *Calendar of nature* is given for the metropolitan district, the almanac time may, in every part of the empire, be varied to suit the local climate and vegetation.

In general, other circumstances being alike, four days may be allowed for every degree, or every 70 miles north or south of London; in spring, operations may be commenced earlier in that proportion southwards, and later northwards; but in autumn the reverse, and operations deferred as we advance southwards, and accelerated as we proceed to the north. In every case allowing a due weight to local circumstances.

Our notices under each month extend only to a few of the leading features of country-work; — to attempt to insert every thing, or even most of the things that require attending to, we conceive impossible; and, if it could be done, quite useless. A man will always act better when guided by his own judgment, than when following implicitly that of another. Calendars should only be considered as remembrancers, never as directories.

JANUARY.

Weather at	Average of the Thermometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS.
London -	55 9	6	29 56	1-957 inch.	A cold January is reckoned seasonable; the air being drier during a low state of the thermometer than when it is a little above or below the freezing point; winter-cold is generally less felt by animals than that of March. Winds often prevail during this month. The calendar of animated nature is much more to be depended on than the vegetable calendar; for except the catkins on trees, the state of the other plants during this month depends much on the character of the preceding autumn.
Edinburgh	51 5	-	29 194	2-991	
Dublin -	39 92	-	29 721	2-697	

1. Calendar of Animated Nature round London.

In the first week: shell-less snails (*Hélix*) and earth-worms (*Lumbricus terrestris*) appear.

Second week: redbreast (*Motacilla Rubicola*) whistles, nut-hatch (*Nitta europæa*) chatters, mistle thrush (*Turdus viscivorus*) sings, and wagtails (*Motacilla alba et flavia*) appear.

Third week: the common lark (*Alauda arvensis*) congregates.

Fourth week: snails (*Hélix hortensis*) and slugs (*Limax luteo et hyalinus*) abound in the sheltered parts of gardens; the hedge sparrow (*Motacilla modularis*) whistles, the large titmouse (*Parus major*) sings, and flies appear on windows.

2. Calendar of Vegetable Nature round London.

In the first week: some plants accidentally in flower; and others, as the Laurustinus, continued from December.

Second week: winter acornite (*Eranthis hyemalis*), Christmas rose (*Helleborus foetidus*) in flower, and hazel (*Corylus Avellana*) catkins beginning to appear: common honeysuckle (*Lonicera Periclymenum*) buds begin to appear.

Third week: primrose (*Primula vulgaris*) flowers in sheltered places; daisy (*Bellis perennis*) and chickweed (*Alsine media*) begin to flower.

Fourth week: mezezon (*Daphne Mezereum*) begins to flower; and sometimes spurry (*Spargelia arvensis*), pansy (*Viola tricolor*), white scented violet (*Viola odorata*), archangel (*Lamium rubrum*), and coltsfoot (*Tussilago purpurea et odorata*) show blossoms.

3. Farm-yard. (2902.)

Attend to cattle, whether in the open yard on straw and a few turnips (5411), in hammels for feeding (6855), or in stalls (6832). See at the week are not driven. From six proper share of green food by the stone; notice any in bad condition, and put them in a place by themselves for a few weeks. When the hay or straw is of inferior quality or flavour, sprinkle with salt water, which will make it more palatable.

Threshing (3199) goes on pretty regularly at this season for the sake of a supply of straw. In some districts it is common to thresh an hour every morning by candle-light during the three winter months, the candles being hung up in lanterns. See that the gudgeons and other pieces are kept oiled, and the teeth of wheels greased or soaped, or coated with anti-attrition.

*Implement*s not now in use may be repaired, also harness greased, ropes spliced, and various evening jobs executed, where it is customary to work a part of the winter evenings.

Men's lodges (1166). In some districts the unmarried farm-servants have a common living-room in the farmery, with a sleeping-room over, or sleeping-rooms over the horses. It is the duty of the farmer or bailiff to see that these young men are properly occupied during the long winter evenings. A portion of every man's time will be taken up in mending his clothes or shoes, and sometimes in oiling and cleansing horse harness; the rest they ought to be encouraged to pass in reading, or otherwise instructing themselves. (One may read aloud

to the rest; one may instruct the others on any subject; a master may be got in for an hour or two every evening, who would teach them all. A master suitable for this purpose will often be found among the married servants, or among the village mechanics. To serious studies may be joined recreative ones, such as the flute, violin, story-telling, singing, speech-making, dramatic attempts, &c. The bailiff or farmer should occasionally come and examine each lad, and bestow some mark of approbation on the most deserving.

4. Live Stock. (6216.)

Store farms (7191), whether of sheep or cattle, require considerable attention during the winter and spring months to supply straw and hay, with such green food as can be spared, to stock on scanty pastures; and to shelter during storms, especially of snow.

Lanols are dropped during this month by the Dorset sheep, and near London are generally kept in the house and fed. (7224.) These require regular attention.

Calves fattening at this season (6843.) should be kept very clean, and their supplies of milk liberal. Calves to be reared as stock should never be dropped sooner than April.

Pigs (7285.), *poultry* (7458.), and stock in general, should be kept in good heart at this season, otherwise in the spring months they will be fit for nothing, and half the summer will elapse before they recover the bad effects of winter starvation. *Fish*, when the ponds are covered with ice, require attention, to break holes to admit air. (7572.)

Bees if dormant do not require to be fed; but if the weather is so mild, or they are placed in so warm a situation as to occasion their flying about, they should be examined, to ascertain if feeding be requisite. (7604.)

5. Grass Lands. (5843.)

Dry soils and uplands should alone be stocked with cattle or young horses at this season. (5853.) Sheep should not be allowed to graze either on wet marshy meadows or on young clovers. (5943.) Grass lands, under a system of irrigation, may now be kept covered. (4387.) Clayey soils and others not properly drained should now have that operation effectually performed on the surface (4294.) or under it (4282), according to circumstances.

Worms (7704.) on some soils do considerable injury to grass. Where the labour is not considered too much, and there is a water barrel at any rate, they may be killed by mixing powder of lime with the water, at the rate of one pint to ten gallons. On lawns, and in small paddocks, or in the case of *fermes ornées*, getting rid of worm casts is an object worth attending to; and this month, February, and October, are the best seasons for the operation.

6. Arable Lands. (4925.)

Plough when the soil is not too wet. Lead out dung and farm field dunghills, also compost heaps, with peat or other matters. See that drains, ditches, and water-furrows run freely, and answer their respective ends.

Beans (5222.) are in some dry situations planted in the last week of the month; and also peas, and sometimes oats, are sown. On the whole, however, it is better to defer the beans and peas till the first and second weeks of February, and the oats till the two last weeks of that month.

Spring wheat of the common kind (5025.) may be sown where the soil is suitable.

7. Fences (2960.), Roads (3523.), and Drains. (4213.)

Hawthorns may be planted in fence-lines, in any of the different modes. (2972.) Ditches, walls, palings, and all other fences of the common kind may be formed; but none where hollies or other evergreens are to be used. Repair by the different modes. (2987.) Roads and drains may be formed at all times and seasons.

8. Orchards (4079.) and Hop-grounds. (5997.)

Prune trees and free them of moss. Where digging round each tree is practised, this is a good season. Stake and tie newly planted trees. Plant orchards. Trench ground for hop plantations. (6007.)

9. Wood-lands and Plantations. (3906.)

Prepare the soil for planting. Plant deciduous hard-wooded trees in mild weather. Plant and sow the larger tree seeds, whether in places where they are finally to remain, or in nursery-grounds.

Field timber and coppice not valuable on account of its bark. Stock up roots, stack them, and char them.

Prune deciduous trees; fill up vacancies. Cut hawthorn hedges. (2983.) Gather any tree seeds not before gathered.

Drain wood-lands and cut paths or other openings required through them, the leaves being now off the deciduous sorts.

FEBRUARY.

Weather at	Average of the Thermometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS.
London -	42 3	5	29 94	0.873 inch.	This month (the <i>spring</i> or <i>sprout kale</i> month of the Saxons) is usually subject to much rain or snow; either is accounted seasonable: the old proverb being, "February fill dike with either black or white." Round London, the sap in vegetables shows evident symptoms of motion about the middle of the month, and sometimes a week earlier. The animal calendar, and inflorescence of native trees for this month, will generally be found very correct.
Edinburgh	36 6	-	29 556	1.261	
Dublin -	43 78	-	30 091	2.24	

1. Calendar of Animated Nature round London.

In the first week: bees (*Apis mellifica*) come out of their hives, gnats (*Culex*) play about, insects (*Insecta*) swarm under sunny hedges, and the earth-worm (*Lumbricus terrestris*) lies out; hen-chaffinches (*Fringilla*) flock, and the song-thrush, or throistle (*Turdus musicus*), and common lark (*Alauda arvensis*) sing.

Second week: the buntings (*Emberiza alba*), and linnets (*Fringilla linota*), appear in flocks; sheep (*Ovis Aries*) drop their lambs; geese (*Anas Aser*) begin to lay.

Third week: rooks (*Corvus frugilegus*) begin to pair, and resort to their nest-trees; house-sparrows (*Fringilla domestica*) chirp, and begin to build; the chaffinch (*Fringilla caelebs*) sings.

Fourth week: the partridge (*Tetrao Perdix*) begins to pair, the blackbird (*Turdus Merula*) whistles, and the wood-lark (*Alauda arvensis et arborea*) sings; the hen (*Phasianus Gallus*) sits.

2. Calendar of Vegetable Nature round London.

In the first week: the snowdrop (*Galanthus nivialis*), whin (*Ulex europæa*), white deadnettle (*Lamium album*), poly-anthus (*Primula verna*) flowers; and the elder (*Sambucus nigra*), and some roses and honeysuckles, begin to expand their leaves.

Second week: common crowfoot (*Ranunculus repens*), dandelion (*Leontodon Taraxacum*), and the female flowers of hazel (*Corylus Avellana*) appear.

Third week: *Veronica agrestis* in flower; many of the poplar and willow tribes show their catkins; and also the yew (*Taxus baccata*), alder (*Alnus communis*), the tulip (*Tulipa*), crown imperial (*Fritillaria imperialis*), and various other bulbs, boldly emerging from the ground.

Fourth week: the Erica carnea, wood strawberry (*Fragaria vesca*), some speedwells (*Veronica*), the groundsel, and sometimes the stocks and wall-flower (*Cheiranthus*) in flower. Some sorts of gooseberries, apricots, and peaches, beginning to open their buds.

3. Farm-yard. (2902.)

See last month. In taking in stacks to thresh, destroy vermin as much as possible. (6632.) Clear away the bottoming of straw, faggots, or other temporary matter, and leave the site perfectly neat and clean: the poultry will pick up what grains may have dropped. Be vigilant in keeping stock of every description in order; wintering cattle by frequent supplies of fresh straw and turnips, or other roots; horses by sound corn, and good peas-straw, or clover-hay, dispensing as much as possible with wheat and oat straw. The evening flog should, occasionally at least, be of carrots or potatoes.

Poultry now lay freely; and if some indicate a desire to incubate, so much the better where an early brood is an object.

Men's lodge. There are still a good many hours for mental improvement.

4. Live Stock. (6216.)

Sheep generally begin to lamb during this month, and re-

quire unremitting attention from the shepherd. (7112.) Attend to feeding lambs as before (7224.), and to milch cows (6863.) and fattening calves. (6845.)

5. Grass Lands. (5643.)

See last month. Matures, where applied to grass lands, may be laid on at this season; and such old mow lands are to be broken up may now be pared with a view to burning next month.

The watering of meadows in warm situations may be partially left off towards the middle of the month, to encourage the growth of the grass. (4385.)

6. Arable Lands. (4925.)

Beans should be put in during this month. (5222.) Peas for podding, and for a ripened crop, may be sown at different periods (5121.), and tares for soiling or seed. (5257.) Oats sown from the middle of this month to the middle of March (5120.) unless on very old turf, where they may be sown later. It is a common but erroneous opinion, that old grass lands intended to be broken up and sown with oats or beans, should be ploughed as early as possible, so as the frost may have some effect on the furrow before seed-time. But this, though most plausible, is a most dangerous doctrine, it being found from experience, that lands so ploughed and sown are always more subject to have the plant of corn destroyed by the grub, wire-worm, or other larve. The only safe mode with such lands, is not to plough them till about the middle of March, and then to plough, sow, and roll immediately afterwards. It would appear that by this practice the larve of insects are buried so deep, that they have not time to reach the surface before the grass has germinated and grown out of the reach of their attacks, or probably they may be so deeply buried as to be obliged to remain another season under ground; it being known to naturalists, that the eggs, larve, and chrysalides of many insects, like the seeds of many plants, will, when buried too deep, or otherwise placed in circumstances not favourable for their immediate hatching or germination, remain there, retaining the principle of life, till they can make their way, or are by accident placed in circumstances favourable for their development. The safest plan, however, to break up old grass land is to pare and burn. (5865.)

Spring wheat of the common kind may now be advantageously sown (5004.), and barley is also sown in some warm spots in the last week of the month.

7. Fences (4213.), Roads (3523.), Drains, Ditches (2900.), Ponds. (4467.)

Hedges may be planted (2978.), grown ones pruned (2981.), old ones plashed or cut down (2987.), and imperfect ones repaired. Walls built (3056.), water fences and ponds formed. (4467.)

8. Orchards (4079.) and Hop-grounds. (5997.)

See last month.

9. Wood-lands and Plantations. (3906.)

As in last month. Where there is a nursery store, nut and kernel tree seeds may now be sown.

MARCH.

Weather at	Average of the Thermometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS.
London -	46 4	4	30 20	0.716 inch.	The beginning of March usually concludes the winter; and the end of the month is generally indicative of the succeeding spring; according to the proverb, "March comes in like a lion, and goes out like a lamb." The Saxons called this month <i>the fourteenth month</i> , in allusion to the increasing of the days. This is a laborious and trying month, both for men and cattle engaged in field operations.
Edinburgh	41 7	-	28 886	1.455	
Dublin -	44 09	-	29 707	2.364	

1. Calendar of Animated Nature round London.

In the first week: the ring-dove (*Columba Palumbus*) coos; the white wagtail (*Motacilla alba*) sings, and the yellow wagtail (*Motacilla flava*) appears. The earthworm (*Lumbricus terrestris*), and the small Helix and slug (*Limax*) engender.

Second week: the jackdaw (*Corvus Monedula*) begins to come

to churches; the tom tit (*Parus ceruleus*) makes its spring note; brown wood-wax (*Strix Uhu*) hoot; and the small tortoise-shell butterfly (*Papilio urtica L.*) appears.

Third week: the marsh titmouse (*Parus palustris*) begins his notes. Various flies (*Musce*) appear. The fox (*Canis Vulpes*) smells ranc. The turkey-cock (*Meleagris Gallo-Pavo*) struts and gobbles.

Fourth week: the yellowhammer (*Emberiza Citrinella*) and green wood-pecker (*Picus viridis*) sing; rooks, ravens (*Corvus*), and house pigeons (*Columba*) build; the goldfinch (*Fringilla Carduelis*) sings. Field-crickets (*Scarabea*) open their holes; and the common flea (*Pulex irritans*) appears.

2. Calendar of Vegetable Nature round London.

In the first week: various species of the pine, larch, and fir trees in full flower; the rosemary (*Rosmarinus officinalis*), the willow (*Salix*) and bay (*Laurus nobilis*) in blossom; various trees and shrubs beginning to open their buds.

Second week: the common honeysuckle (*Lonicera Periclymenum*), and some roses in leaf; *Crocus vernus*, and other subspecies, and the columb, nectarine, apricot, Córchorus japonicus, *Pyrus japonica*, crown imperial, Saxifraga cressifolia, *Buxus sempervirens*, and other plants, in warm situations, in flower, or just advancing to that state.

3. Farm-yard. (2902.)
Wintering cattle should be liberally supplied with food from this time, till they can be wholly turned to grass: as straw and hay gets drier at this season, more should be given, and the supply of turnips, or other roots, rather increased than diminished. Where oil cake, brewers' grains, and similar articles can be obtained, they are valuable auxiliaries. Fattening cattle (5852.) and milch cows (5853.) require continued attention to food, cleanliness, and moderate exercise. Working horses must be kept in good condition; if they fall off now, they will not recover themselves for several months. Potatoes may now be cut into sets preparatory for next month.

4. Live Stock. (2915.)
Sheep now drop their lambs freely; and none pay better than such as are turned fed at this time, and finished off in April, on forward pasture. As turnips begin to run to flower about this time, they are apt to prove more than usually laxative, and therefore the stock supplied with them should have an extra supply of hay.

5. Grass Lands. (5643.)

Meadows intended for mowing (5768.) should now be shut up, their surface having been freed from stones or other extraneous matters, the furrows or water gutters made completely effective, and, if the weather will permit, the surface bush-harrowed, and rolled. Meadows which have been flooded during winter will, in favourable situations, show a considerable crop of grass by the beginning of this month. Turn off the water a week or ten days, till the surface gets firm; then feed with ewes and lambs, giving a little hay in the evening. Calves may also be turned on these meadows, but nothing heavier. The best mode is to huddle off the grass in strips, in the manner of eating turnips or clover in the places of their growth. Moles (7631.) and worms (7704.) are best destroyed at this season.

6. Arable Lands. (4925.)

There are few hardy seeds, whether of agriculture or gardening, that may not be committed to the soil during this month. Spring wheat of the common kind (5001.) may still be sown; but if possible, not later than the middle of the month; oats (5120.), rye (5069.), barley (5080.), canary corn (5169.), buckwheat (6111.), beans (5222.), peas (5121.), tares (5257.), &c.

Clover and rye grass (5041.) may now be sown among young wheat after naked fallows, or among spring corn in lands of good heart and fine tilth.

Field beet (5432.), carrots (5433.), parsneps (5471.), and Swedish turnips should be sown the last fortnight of the month, provided the land is dry enough to be sufficiently cleaned, and pulverised to the depth of at least a foot. It more frequently happens that this cannot be done till the beginning of April, and hence this class of seeds is seldom got in before the middle of that month. The carrots should be first sown, and the Swedish turnip will bear to be the latest. Lands intended for potatoes, cabbages, turnips, transplanted Swedish turnip, and other plants of the *Jérusalem* kind should be brought forward by such ploughings, cross ploughings, and workings with the grubber, as their nature and state may require. It is one great advantage of the common white turnip, that it admits of two months more time for preparing the soil than either root or brassica crops. Summer or wheat fallows require at least one furrow in course of the month.

7. Fences (2960.) Roads (3523.), and Drains. (4213.)

Thorns and other hedge plants may be put in, but the earlier in the month the business is completed the better. This is an excellent season for making or repairing roads (3727.), drains, ponds, embankments, &c., the ground being still moist, and the soil sufficiently long to admit of a man's labouring ten hours, or from six to six. In January, the ground is often too wet, or frozen, or covered with snow, and the days too short for advantageous day labour. In July and August the ground is too dry and hard for spade work, and day labour high on account of the proximity of hay time and harvest.

8. Orchards (4079.) and Hop Grounds. (5097.)

Finish pruning fruit-trees (4111.), and also digging round their stems, if that is practised. (4119.) Where young orchards are grazed, see that the guards or fences to the single trees are in repair.

Form plantations of hops (5097.), and open up and dress the hills of established plants, returning the mould to their roots (6025.).

9. Wood-lands and Plantations. (3906.)

In the tree nursery, finish sowing acorns, keys, nuts, mast, berries, stones. Sow also the lighter trees, as poplar seed (where it can be got), willow, birch, alder, elm, &c. Transplant from the seed bed, or from narrow to broader intervals, and attend to other parts of the usual routine culture.

New plantations may still be planted, endeavouring if possible to finish putting in deciduous trees with the month; using the puddle in dry weather (3940.), and fixing by water. (3952.) Where large trees are introduced, the latter generally require to be staked.

Evergreens of the harder kinds, as the Scotch pine, spruce fir, &c. may be transplanted in the last week of the month, but not safely before. They are often put in during any of the winter months, but the result shows the impropriety of the practice.

Fill up blanks (3983.) in young plantations and hedges, and fell timber, cut over coppice woods, and thin out young wood as in last month. When plantations are to be raised from seed where they are to remain for timber (3926.), this is the month for most seed, but April is better for the pine and fir tree. Sow the others in the second or third week of the month; and if resinous trees are to be mixed, a sprinkling of their seeds can be sown over the others in April.

APRIL.

Weather at	Average of the Thermometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS.
London	49 9	5	29 77	1.460 inch.	The weather of this month is distinguished by the rapidity of its changes. It is generally stormy, interspersed with gleams of sunshine, hail, snow, some frost, and occasionally violent storms of wind. It is a month of the most activity in the cultivation of arable lands, who during its course finishes the sowing of spring corn and grasses, and begins that of roots and leaves.
Edinburgh	46 3	-	29 873	2.411	
Dublin	51 125	-	32 909	2.661	

1. Calendar of Animated Nature round London.

In the first week: the viper (*Coleuber bérus*) and woodouse (*Oniscus Asellus*) appear; the miseltoe thrush (*Turdus viscivorus*) pairs; frogs (*Rana*) croak and spawn, and moths (*Phalaena*) appear.

Second week: the stone curlew (*Charadrius Edicnemus*) clamours; young frogs (*Rana temporaria*) appear. The pheasant (*Phasianus*) crows, the trout (*Salmo Trutta*) rises, and spiders (*Araneae*) abound.

Third week: the crested wren (*Motacilla Réticulata*) sings; the blackbird (*Turdus Merula*), raven (*Corvus Corax*), pigeon (*Columba domestica*), hen (*Phasianus Gallus*), and duck (*Anas boscha*) sing; various insects appear; and the fieldfare (*Turdus pilaris*) is still here.

Fourth week: the swallow (*Hirundo rústica*) returns; the nightingale (*Motacilla Luscinia*) sings; the bittern (*Ardea rotellaria*) makes a noise; the house martin (*Hirundo úrbica*) appears; the blackcap (*Motacilla Alricapilla*) whistles; and the common snake (*Coleuber Natrix*) appears.

2. Calendar of Vegetable Nature round London.

In the first week: the daffodil (*Narcissus Pseudo-narcissus*), the garden hyacinth (*Hyacinthus orientalis*), the wallflower (*Cheiranthus cheiri*), the cowslip (*Primula officinalis*), the periwinkle (*Vinca*), and *Prunus spinosa*, and various other herbs and trees in flower.

Second week: the ground-ivy (*Glechoma hederacea*), gentiana (*Gentiana acualis*), *Palmoubaria virginica*, the arbutus, *Iberis sempervirens*, *Omphalodes vérmis*, and most of the common fruit-trees and shrubs in flower.

Third week: some *Rhodiole*, *Androsæole*, *Kalmie*, and other American shrubs; *Daphne Laureola*, *Ulmus campestris*, *Chryso-splenium oppositifolium*, *Mercurialis perennis*, and other plants in flower.

Fourth week: the beech (*Fagus*) and elm (*Ulmus*) in flower; ivy-berries drop from the racemes; the larch in leaf; and the tulip and some white narcissi and fritillaries in flower.

3. Farm-yard. (2902.)

This month will in most situations terminate the wintering of cattle in the straw-yard. Straw is now very dry, therefore turnips, or other green food or roots, should be added in proportion.

Corn should be kept in high order, on account of the hard work and extra exertion often required of them during this month. If there are carrots or potatoes to steam for them once a day, that will greatly aid hay and corn; if not, steam a part of the hay.

The accidental supplies of food for store pigs and poultry are less abundant during this month, because less time can be spared for threshing. There are fewer wintering cattle, and the yards are generally now cleaned out for the field dung-hills.

4. Live Stock. (6216.)

The end of this month is a good time for mares to foal (6629.), and they should have the horse accordingly. (6631.) Attend at the proper periods, first to moderate working, and then to entire ease before foaling time. (6641.)

Cows must still be well fed with roots or steamed food, within doors, letting them taste the grass occasionally towards the end of the month. (6863.)

Sheep and lambs generally require a good deal of artificial food during the first half of this month. When the turnips are expended, clover hay, grains of barley which have been matted, rape cake, or linseed cake, are the next resources. (6094.) About the end of the month they may be turned on the pasture, and then it is that mutton generally drops in price—a hint to the farmer to sell all he can in the early part of April.

Where there are water-meadows, the sheep and lambs will have been fattening on these during the whole of the month, — an immense advantage to a farmer.
Poultry of most kinds have now hatched their broods, and require looking after, to see they do not injure one another, nor are attacked by stronger enemies.

5. Grass Lands. (5643.)

See that the fences are kept up, and the gates regularly shut and fastened; as cattle newly let out are very apt to wander, and more ready to break through fences than when the herbage is more abundant.

Water-meadows (4571.) are generally shut up for hay about the end of the month, the ewes and lambs being then turned on young artificial grasses, or common provincial pastures, in a sufficiently for yard state.

Mowing-meadows of the common kind (5768.), and clovers, and mixed grasses for hay, should be hand-picked, lushly harrowed, and rolled, early in the month, and then shut up for the scythe.

6. Arable Lands. (4925.)

Finish *sowing* all the spring corns (5080.), peas, tares, lucerne (5374.), sainfoin, and all other herbage, plants, and grasses. (5643.)

Summer wheat (5004.) may be sown during the whole of the month, also barley in late situations (5089.), peas for late podding, and under peculiar circumstances, tares for cutting green in October and November.

Manufactory plants, as wood, madder, flax, hemp, mustard, &c.; oil plants, as rape, poppy, and such plants as are grown for medicinal purposes or peculiar uses in domestic economy, as rhubarb, liquorice, buck or beech wheat, creck-wheat, may all be sown or planted from the middle of last to the middle of this month. The first week in April, will, in the greater number of seasons, soils, and situations, suit the most of them.

Carrot (5445.), *field beet* (5452.), *parsnep* (5117.), and *Swedish turnip* (5409.), if not sown the last week of March, should be finished during the first ten days of April. A bed of *Swedish*

turnips should be sown in the garden for transplanting in the field by the end of the month, or the first week in May.

The last fortnight of the month is the best season for planting potatoes (5316.); in the earliest situations this is soon enough for a full crop; in the latest, the middle of May will answer better. For very early crops for the supply of summer markets, dry rich sheltered fields may be planted in March. In the moors of Scotland they are often planted in June, and still have a crop; there the potato is alike obnoxious to late spring and early autumn frost.

7. Fences (2900.), Roads (5353.), and Drains. (4213.)

All these should have been put in order before, so as to leave the hedger of the farm (7714.), and the labourer of all work (7711.), time to assist in getting in planted crops, as potatoes, cabbage, &c. in the fields, cropping the garden, mowing, or otherwise dressing the orchard, shrubbery, lawn, or such ornamental or enjoyment ground as the farmer indulges in round his house.

8. Orchards (4079.) and Hop-grounds. (5997.)

In some cases fruit-trees may be so over-run with insects towards the end of the month as to make it worth while to burn wet straw under them; but this rarely happens before the middle of May, and even then firm orchards will almost always be left to the birds and vigour of the trees. Hops are generally poked in this month, and the ground between the hills afterwards stirred with the cultivator or ridget as it is called in Kent. (6026.)

9. Wood-lands and Plantations. (3906.)

All planting and pruning of deciduous trees should be finished the last week of the month. Afterwards the planting and pruning of evergreens may commence; first the common pine and fir, and afterwards the holly, yew, and other forest evergreens. (5937.) If these can be watered, and staked, so much the better. Barking oaks may in some warm situations be felled the last week of the month, but May is the more general time. (4030.)

MAY.

Weather at	Average of the Thermometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS.
London . . .	56 61	2 5	30 02	0.794 inch.	Vegetation now goes on with great vigour, though there are often very cold and even frosty nights, which materially injure the blossoms of fruit-trees, and sometimes the young shoots of the hop and potato. Man, in common with other animals, being now full of life and vigour, the consumption of animal desire is frequent; but marriage is better deferred till September, when the offspring will be born in the May or June following, a season of the year when the poor man can better support the expenses of an accouchement than in the cold month respondent to marriages in May.
Edinburgh . .	50 4	- -	29 585	1.945	
Dublin . . .	52 193	- -	30 061	1.812	

1. Calendar of Animated Nature round London.

In the first week: the titlark (*Alauda pratensis*) sings, the cuckoo (*Cuculus canorus*) is heard; the gudgeon (*Cyprinus fobio*) spawns; the redstart (*Monticola phoeniceus*), swift (*Hirundo aëneus*), whitethroat (*Motacilla sylvia*), and stinging-fly (*Cynops calcitrans*) appear.

Second week: the turtle-dove (*Columba Turtur*) coos; the red ant (*Formica rübra*), the laughing wren (*Motacilla Curruca*), the common flesh-fly (*Musca vomitoria*), the leaf-tow (*Coccinella bipunctata*), grasshopper lark (*Alauda Locustæ vocis*), and willow-wren (*Motacilla salicaria*) appear.

Third week: the blue flesh-fly (*Musca vomitoria*) appears; bleak snails (*Helix nigra*) abound, and the large bat appears.

Fourth week: the great white-cabbage butterfly (*Papilio brassicae*) and dragon fly (*Libellula 4-maculata*) appear; the glow-worm shines, and the fern-owl, or goat-sucker (*Caprimulgus europæus*), returns.

2. Calendar of Vegetable Nature round London.

In the first week: *Gèum uralianum*, *Artemisia campestris*; lily of the valley (*Convallaria majalis*), water-violet (*Hottonia palustris*), tulip-tree (*Liriodendron tulipifera*), and numerous other plants in flower.

Second week: the oak, ash, sweet chestnut (*Castanea vesca*), hawthorn (*Mespilus Oxyacantha*), the common maple (*Acer campestre*), horse-chestnut (*Æsculus Hippocastanum*), barberry (*Berberis vulgaris*), and the *Ajuga reptans* in flower.

Third week: the water-campion-grass, or forget-me-not (*Myosotis scorpioides*), lime-tree (*Tilia*), milk-wort (*Polypogon vulgaris*), nightshade (*A tropa Belladonna*), and various American shrubs in flower, and rye (*Secale hybridum*) in ear.

Fourth week: oaks, ashes, and beeches now generally in leaf, and the mulberry (*Morus nigra*) beginning to open its buds. The cinnamon rose and some other hardy roses in flower; and also the bramble (*Rubus fruticosus*), moneywort (*Lysimachia Nummularia*), columbine (*Aquilegia vulgaris*), and various other trees and shrubs in blossom.

3. Farm-yard. (2902.)

Feeding and wintering on straw and roots generally ends, and soiling (5512.) or pasturage (5662.) commences, in the first fortnight. Where high-flavoured milk and butter are preferred to quantity, then pasturage on dry bottom uplands is to be preferred; but where quantity and richness is the object, soiling with clover and tares, and two or three hours' pasturage per day, for the sake of exercise, is the preferable system. Even on farms where there is nothing to mow but old meadow, soiling with that will be found more economical than pasturing it. A field of meadow in good heart, mown and eaten green, will, at a rough estimate, produce treble the quantity of milk it would have done if pastured, and four times as much as it would do in the form of dry hay.

The *yard* and *pit* are generally cleared of dung, urine, &c. at this season; and if no soiling goes on, they should be kept

clean during the summer, excepting what room is required for the dung of the few stock which are there constantly, as pigs and poultry, or occasionally, as horses while harnessing, &c.

4. Live Cattle. (6216.)

In turning *cattle* to grass, consider the different systems of pasturing (5316.); adopt what suits your circumstances, and pursue it regularly. See that water is not wanting to each field (4955.); no shade, railing posts, and shelter, (5335.) *Lean stock* are generally dear during this month, from the number of persons who buy in and feed off on grass. When cattle or sheep are very numerous, they are found to feed better, and do less injury to the grass, in small herds or flocks, than in large ones.

Stags may have the horse during the first week, but not later considering the season of parturition. (6637.)

5. Grass Lands. (5643.)

As most grasses send up their flower-stalks during this month, it is of importance so to stock pastures, as to eat these down. This is only to be accomplished in recently sown down lands by overstocking, and not then completely if rye grass prevails. When grass lands are to be mown, the best crop of hay will be obtained by not pasturing after the middle of April. Some may think that where cattle and sheep are fed till May or June, the stalks left will come in as hay; but as such fields cannot be mown till the end of July, the stalks have long before shed their seed and become dry, and so shrivelled as to be unfit for food.

Where *paring and burning* are wanted, this is a favourable season. (5209.)

Water-meadows, having been eaten down in April, are generally watered for the first three or four weeks of this month, to bring forward the crop of hay. (4429.)

6. Arable Lands. (4925.)

Summer wheat (5004.) and *grass seeds* (5875.) may still be sown, but not profitably after the first week or ten days. *Swedish turnip* (5409.), *marigold*, and *yellow turnip* may be profitably sown, and also early crops of common white turnip where the soil is clean and well prepared. (5394.)

The preparation of *turnip fallows* is the great business of this month, and next the sowing of *naked fallows* (4944.), and the culture, by horse and hand hoes, of corns and pulse in drills. In late situations potatoes may be planted during the whole month (5316.); and hemp and flax sown during the first fortnight. (5580. and 5922.) Tares for successional supply. (5257.)

7. Fences (2900.), Roads (3523.), and Drains. (4213.)

Clean young *hedge-rows*. (2952.) Drains may now be advantageously designed, as the springs show themselves more conspicuously during winter. The rest in this department is mere routine.

8. *Orchards* (4079.) and *Hop-grounds*. (5997.)

Grafted trees should be looked over occasionally, and any that the clay has dropped from re-covered. Remove suckers and superfluous side shoots.

Sir and clean the *hop-plantations*; place the poles, tie the vines where necessary; and towards the end of the month, when the number of shoots wanted have taken the lead; cover

the stool or centre of the plant with a small hill of soil, to prevent it from sending up more shoots.

9. *Wood-lands and Plantations*. (3906.)

Continue to bark oak trees, and also the larch, and such others as are adapted for the farmer (4044.), but finish, if possible, by the middle of the month. Keep newly planted large trees properly staked, and all kinds of cultivated ground clear of weeds.

JUNE.

Weather at	Average of the Thermometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS.
London	65 22	2	29 93	0.332 inch.	The weather is sometimes cold at the beginning, but is generally agreeable and steady towards the middle of the month. By observing the columns indicating the greatest variation of the thermometer in each month, it will be seen that it varies, in London, only two degrees in June, which is less than in any of the preceding months. In July and August the variation is the same; but in March and October it is twice as much.
Edinburgh	57 2	-	29 666	1.955	
Dublin	58 76	-	30 06	0.860	

1. *Calendar of Animated Nature round London.*

In the first week: the sedge-sparrow (*Passer arundinacea*), the fly-catcher (*Muscicapa Atreopilla*), the wasp (*Vespa vulgaris*), and several species of the bee and butterfly appear.

Second week: the burnet moth (*Sphinx filipendulae*), and forest-fly (*Hippoboscæ equina*) appear; bees swarm.

Third week: several flies, butterflies, moths, beetles, and other insects appear.

Fourth week: insects abound; and singing-birds begin to retire to the woods, and leave off singing.

2. *Calendar of Vegetable Nature round London.*

In the first week: water-lilies (*Nymphaea et Nuphar*) flower; also *Ficus Pseud-acorus*, *Anthemis Cotula*, *Polygonum Persicaria*, *Melva rotundifolia*, and numerous other plants.

Second week: the vine, raspberry, and elder in full flower; also various Scotch roses (*Rosa spremsissima*), broom (*Spartium*), nettle (*Urtica*), and wheat in the ear.

Third week: the *Orchis*, *Epilobium*, *Tris Xiphium* and *siphidium*, the hardy *Fxine* and *Gladoli*, and a great variety of garden and field plants in flower; also the wheat and many of the pasture grasses.

Fourth week: some black and red currants ripe, strawberries in abundance; young shoots of trees and shrubs have nearly attained their length. Oats and barley in flower; blue-bottle, scabious (*Centaurea Cyanus*), and numerous others in bloom.

3. *Farm-yard*. (2902.)

Soiling is the principal operation now going forward (5342.), and requires the utmost attention to the cleanliness of the animals, whether fattening cattle, feeding milch cows, or horses.

4. *Live Stock*. (6216.)

Wash and shear sheep (7201.); examine flocks individually as to the fly (7173); see to shade for every description of stock when the weather is hot. Bees swarm during this and next month.

5. *Grass Lands*. (5648.)

Hay-making is now a principal business (5514. and 5792.) Any tussocks or flower-stalks (bents) which appear, notwith-

standing the close feeding of April and May, should now be mown (5774.); thistles and similar weeds cut out close by the roots (6202.); pare and burn as in May (3209.); clean out ponds, water-courses, wells, &c. See that clovers, tares, or other soiling crops are mown close to the soil.

6. *Arable Lands*. (4925.)

Great part of the turnip process goes on during the three first weeks of this month and the latter half of May. (5373.) Dung fallows and otherwise bring them forward (4568.), draining (4213.), levelling, altering ridges, &c. as the case may require; weed broad-cast crops, and stir the soil between such as are in rows. Warning, where it can be practised, may now be commenced (4454.); thin out the first sown turnips. (5406.)

7. *Fences* (2960.), *Roads* (3523.), and *Drains*. (4213.)

Weed hedges, but avoid clipping them, which only creates a close surface of feeble shoots, that in the end becomes so thick as to exclude light and air from the central stems, and occasions their languishing and death. (2985.) Dig and otherwise prepare materials for roads (3635.) and drains. (4284.)

8. *Orchards* (4079.) and *Hop-grounds*. (5997.)

Insects, or other effects of what are called blights, can seldom be destroyed on so large a scale as that of the farm-orchard or hop-garden. Burning weeds or wet straw, litter, &c. will do something; and on a small scale, washing with lime-water, soap-suds, tobacco-water, or a mixture of these, will prove effectual. (6056.) Those who tie the binds or vine of the hop to the poles, instead of leaving them to nature, have generally completed the operation by the middle of the month. In some early spots the superfluous shoots are cut off about the end of the month.

9. *Wood-lands and Plantations*. (3906.)

The woodman is now chiefly employed in trussing up the branches of barked trees, and otherwise disposing of what is unfit for timber purposes. (4019.) Old copses or stools of trees, woods, or hedges, may now be advantageously stocked up, stacked, and when dry, charred for fuel. (4063.)

JULY.

Weather at	Average of the Thermometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS.
London	66 3	2	29 89	2.194 inch.	This was called <i>hay month</i> by the Saxons; and though hay-making near London is generally finished in June, yet in places where manure is less abundant, it is chiefly made in this month. The farmer's prospects as to crop may now be determined as to almost every article cultivated.
Edinburgh	60 18	-	29 445	2.516	
Dublin	61 15	-	29 929	2.614	

1. *Calendar of Animated Nature round London.*

In the first week: the cuckoo (*Cuculus canorus*) leaves off singing; the stone-crowler (*Charadrius Edicnemus*) whistles occasionally late at night, and the golden-crested wren (*Monticola Regulus*) now and then chirps.

Second week: the quail (*Tetrao ferrugineus*) calls; the cuckoo-spit, or frog-hopper (*Vehda spumaria*), abounds.

Third week: young frogs migrate. Hens moult.

Fourth week: the great horse-fly (*Tabanus bovinus*) appears; and partridges fly.

2. *Calendar of Vegetable Nature round London.*

In the first week: enhanter's nightshade (*Grewia luteiflora*) and lavender (*Lavandula spica*) in flower, and pinks and carnations in full bloom.

Second week: the fallen star (*Tremella Notoec*) appears; also puff-balls (*Lycoperdon Bovista*), and sometimes the common mushroom (*Agaricus campestris*).

Third week: raspberries and gooseberries ripe, potatoes in flower, asparagus in berry, the illium in perfection.

Fourth week: the truffie (*Tuber cibarium*) now hunted or dug up in commons and forests; nightshade (*Solanum nigrum*), devil's bit (*Scabiosa succisa*), burnet saxifrage (*Pimpinella Saxifraga*), and a great number of plants in flower.

3. *Farm-yard*. (2902.)

As in June, between hay and corn harvest is generally a very good time for the farmer to make a tour to observe more extensively the practices of his own district, and to witness those of other districts.

4, 5. *Live Stock* (6216.) and *Grass Lands*. (5648.)

Lambs are now weaned (7161.) when not fattened off; at first they require the richest keep. As green food will now be abundant, every animal about a farm that can live and thrive or answer its end by the soiling system, should be so treated. The weather being hot, cattle or sheep in fields must be frequently looked to, as to shade, water, and abundant keep. Suffering from thirst, or a want of food, they are very apt to break through fences, which at this season is more than usually injurious, on account of the state of the corn crops.

6. *Arable Lands*. (4925.)

Attend to weeding, hoeing, and otherwise moving the soil between rowed crops, more especially potatoes and turnips. Towards the end of the month, the first-sown white turnips will be a state to thin out; and a further thinning may be advantageously given to field beet, carrots, &c., at this season. Where peas are sown for podding, they will now be in abundance for gathering; in warm situations sooner. Buck-wheat may now be sown for autumnal food for game. (6111.)

7. *Fences* (2960.), *Roads* (3523.), and *Drains*. (4213.)

As in June.

8. *Orchards* (4079.) and *Hop-grounds*. (5997.)

Cherries, strawberries, gooseberries, &c., where grown as field-crops, are now in gathering, and towards the end of the month, fallen apples and plums for tarts. Hop-grounds are looked over, and the superfluous vine pruned off, &c. In Kent

and other places these prunings are often a perquisite of the pruner, who lays them aside as fodder for cows.

9. *Wood-lands and Plantations.* (3906.)

As in June; and prune the gear, which at other seasons is apt to bleed. (3995.) This season answers perfectly for pruning

all sorts of trees; and if their leaves and spray were an object for fodder, as in Sweden and Italy, no doubt it would be preferred. (3994, and 3996.) Wounds in trees do not now heal, as they sometimes do in spring and autumn; and they heal, and are in part covered over with bark, before the approach of winter. (3993.)

AUGUST.

Weather at	Average of the Thermometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS.
London -	65 85	2	30 06	0-824 inch.	This is the barn or <i>harvest month</i> of the Saxons; and, as every body knows, the busiest month of the agriculturalist. It is, in consequence, the most profitable season for the labourer and his family, who are generally in full employ, and at an increase of wages, or perquisites, for four or six weeks at this season.
Edinburgh	60 6	-	29 828	1-996	
Dublin	62 82	-	30 172	5-858	

1. *Calendar of Animated Nature round London.*

In the *first week*: flying ants (*Formica*) appear; bees kill their drones; and the swallow-tailed butterfly (*Papilio Machaon*) appears.

Second week: young martins (*Hirundo urbica*) and swallows (*Hirundo rustica*, begin to congregate, and swifts (*Hirundo Apus*) to depart; the whame, or burrel-fly (*Æstrus ðovia*), lays eggs on horses.

Third week: the black-eyed marble butterfly (*Papilio Semele*) appears. Various birds re-assume their spring notes.

Fourth week: the nuthatch (*Sitta europæa*) chatters, the stone-crow (*Charadrius Gdromenus*) whistles at night, the goat-sucker (*Caprimulgus europæus*) and young owls (*Strix Uula*) make a noise in the evening; robin-reubrest (*Motacilla Rubicola*) sings; and rooks roost on their nest-trees.

2. *Calendar of Vegetable Nature round London.*

In the *first week*: mellilot (*Trifolium officinale*), rue (*Ruta graveolens*), yellow succory (*Paris hieracioides*), burdock (*A-retium Lapsa*) in flower; the bread-corns ripe.

Second week: wild clary (*Salvia Verbenaca*), meadow-rue (*Thalictrum flavum*), ploughman's spikenard (*Conjza squarrosa*), and various other natives in flower.

Third week: the mallow (*Málva Lavatera*), hollyhock (*Alcea roses*), and tobellans, among the garden-flowers; and the polygonum and potatoenous among the wild plants now in blossom.

Fourth week: the autumnal crocus (*Cólchicum autumnale*), *Aster Solidago*, *Senecio paludosus*, tansel (*Dipsacus fullonum*), and various other plants in flower. The earlier varieties of all the hardy kernel fruits ripe.

3. *Farm-yard.* (2902.)

The *rick-yard* should now be attended to (2906.); stack-stands repaired or put in order; bottonning of faggots, and straw or rape haulm got together; thatch in readiness, and ropes made. (3184.)

At any spare period the teams may be employed carting out the summer-made dung to the wheat fallows, or to form field dunghills for spring crops, &c.

4. *Live Stock.* (6216.)

Select the stock of lambs to be kept as breeders. (7170.) Swine commonly bring their second litter of pigs in this month; which, owing to the dropping corn, is generally one of abundant keep, both for them and poultry. Farmers in some places look to the stables as a source of good food for their cows, as

others do to the fallows for keep for their sheep. Where either is the case, the culture must be of a very inferior description.

5. *Grass Lands.* (5643.)

Where meadows are manured, that operation generally goes on after the hay is removed, or during winter; the surface in the former case being hard with drought, and in the latter by frost. After grass should in general be shut up and reserved for later keep, and in some cases as a winter resource. Keep down weeds, tussocks, ant-hills, &c. Turn the water on meadow-lands as soon as the hay is removed, and let it remain till a third crop is in forwardness. (4387.)

6. *Arable Lands.* (4925.)

Weed and stir among green crops, earth up potatoes (5336-), but by no means turnips, unless the soil is very dry indeed, as that operation only prevents them from attaining a full size. Reaping commences in all the southern districts in the first week of this month, and in some by the middle of July. When the operation is executed by day-work, the most unremitting inspection of the master is necessary; and even when the greatly preferable mode of reaping by the acre is adopted, he should be continually in motion from one party to another, to see that the operation is performed low and clean.

Naked fallows in late situations receive the seed furrow during this month, excepting in cases where the seed is ploughed in, an operation generally deferred to the middle of September. Sow cabbage-seeds (4197.) for plants to put out in April next. Sow turnips after early peas which have been podded (5209), or early cut wheat, tares, cabbages, &c., or after hemp and flax, which are generally pulled by the middle of this month. (5880, and 5922.) Grass seeds sown alone at this season (5692) will generally succeed better than at any other; they germinate as well in spring; but the heats of July often burn up the tender plants.

7. *Fences* (2960.), *Roads* (3523.), and *Drains.* (4213.)

As in the two preceding months.

8. *Orchards* (4099.) and *Hop-grounds.* (5997.)

Apples and plums of some sorts are now ripe. Grafts may in general be united. Budding performed, and pruning, if desirable, as observed last month under woods and plantations.

9. *Wood-lands and Plantations.* (3906.)

See last month.

SEPTEMBER.

Weather at	Average of the Thermometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS.
London -	59 63	3 5	30 09	0-482 inch.	The temperature begins now to decline and to vary; the nights begins to lengthen, and heavy dews and diminished transpiration and evaporation promote the growth of grass, herbage, plants, and especially turnips. This is still a busy month with the agriculturists; in the warmest situations he is finishing harvest-work, and in the latest commencing it. Animals of most sorts are now fat; fruits are ripe; honey abundant; and most products of the earth in perfection and plenty.
Edinburgh	54 3	-	29 739	3-470	
Dublin	59 35	-	30 239	3-021	

1. *Calendar of Animated Nature round London.*

In the *first week*: young broods of goldfinches (*Fringilla Carduelis*) appear. The linnet (*Fringilla Linæta*) congregates. The bull (*Bos Taurus*) makes his shrill autumnal noise; and swallows (*Hirundo rustica*) sing.

Second week: common owls (*Strix flammæa*) hoot. The satiron butterfly (*Papilio Hysale*) and willow red under-wing moth (*Phalaena picta*) appear. Herrings (*Clupea Harengus*) are now cheap.

Third week: the ring ouzel (*Turdus torquatus*) appears. The fly-catcher (*Muscicapa Atricapilla*) withdraws.

Fourth week: the stare (*Sturnus vulgaris*) congregates. The wood-lark (*Alauda arvensis*) sings. The woodcock (*Sedopax rusticola*) and fieldfare (*Turdus pilaris*) appear; and the swallow (*Hirundo rustica*) departs.

2. *Calendar of Vegetable Nature round London.*

In the *first week*: some fungi and Ballots álba appear, traveler's joy (*Clematis álba*) and *Farmásia palustris* in flower.

Second week: catkins of the hazel and birch formed; blossoms, and green, red, and black berries found on the bramble at the same time. Leaves of the sycamore, birch, lime, mountain-august and elm, begin to change colour.

Third week: the ivy (*Hédéra Helix*), laurel (*Prúnus Lauro-cerasus*) and furze (*Ulex europæus*) in flower.

Fourth week: hips, haws, and nuts ripe. Leaves of plane-tree (*Plátanus*) tawny; of the hazel, yellow; of the oak, yellowish-green; of the sycamore, dirty brown; of the maple, pale yellow; of the ash, fine lemon; of the elm, orange; of the hawthorn, tawny yellow; of the cherry, red; of the hornbeam, bright yellow; of the willow, hoary.

3. *Farm-yard.* (2902.)

The *rick-yard* is now the chief scene of operations, in getting earlier crops thatched (3185.) and later ones stacked. (3276.) In all operations in this department attend, as far as circumstances will permit, to neatness. In the case of a proprietor or amateur, neatness, order, and high keeping are essential in every department.

4. *Live Stock.* (6216.)

There is generally abundance of fat cattle and sheep in the market during this and next month. Lean stock, especially crows and wealders, are now brought in, and wintered or fed off on turnips. Wintering cattle (8854.) also about the end of the month. Poultry and pigs are now fat, and honey may be taken from bee-hives.

5. *Grass Lands.* (5643.)

As in August. Newly sown grass lands should now be sparingly fed, in order to strengthen the plants for the winter.

5. *Arable Lands.* (4925.)

This is the chief season for sowing winter wheat, whether on naked fallows or after clover, tares, rape, or early crops of peas and beans. Potatoes are generally not taken up till the end of the month, in which case the sowing after that crop is later. (5015.) Sow tares to stand the winter (5257.), and grass seed for permanent pasture; or a hay crop next season will succeed on good soils, if sown before the middle of the month. (5533.)

7. *Fences* (2960.), *Roads* (3523.), and *Drains.* (4213.)

Routine operations of mending, &c. as before.

8. *Orchards* (4079.) and *Hop-grounds.* (5997.)

Gather *fruits* for immediate sale, the keeping sorts not being yet ripe. (4085.) Walnuts for picking not later than the first week. (4102.)

Hop-picking and drying, in the districts where this plant is much cultivated, is the great business of the month. (6056.)

9. *Wood-lands and Plantations.* (3906.)

Routine operations as in the two or three preceding months. Plant evergreens during the three last weeks, and deciduous trees the last ten days. (3937.)

OCTOBER.

Weather at	Average of the Thermometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS.
London -	52 81	4	29 69	2.027 inch.	The weather of this month is very uncertain. Before those rains, snows, or frosts which constitute the practical commencement of winter, there is generally two or three weeks of settled weather; sometimes these weeks are in October, sometimes partly in November. These weeks afford a last resource for bringing forward neglected operations.
Edinburgh	49 7	-	29 359	3.534	
Dublin -	51	-	29 76	2.798	

1. *Calendar of Animated Nature round London.*

In the *first week*: the red-wing (*Turdus iliacus*) arrives. Snakes and vipers bury themselves.

Second week: hooded crows (*Corvus Cornix*) and wood-pigeons (*Columba Palumbus*) arrive; hen-chaffinches (*Fringilla cœulebs*) congregate, and prepare for migration, leaving their males in this country.

Third week: the snipe (*Sclopax Gallinago*) appears in the meadows. Wild-geese (*Anas sylvestris*) leave the fens, and go to the ree-lands.

Fourth week: the tortoise (*Testudo græca*) begins to bury himself in the ground; and rooks visit their nest-trees. Some larks (*Alaudæ*) sing, and the woodcock (*Sclopax rusticola*) returns. Spiders' webs abound.

2. *Calendar of Vegetable Nature round London.*

In the *first week*: strawberry-tree (*A'rbutus U'nedo*), holly (*Ilex Aquifolium*), China hollyhock (*Alcea chinensis*), and China aster (*Aster chinensis*), in bloom.

Second week: catkins of some species of *Salix* formed; leaves of the asp almost all off; the Spanish chestnut, yellow; of the sugar-maple (*A'cer saccharinum*) scarlet; of the common birch, yellow and gold; and of the weeping-birch, gold and bright-red coloured.

Third week: *Clematis calycina* in flower. Some horse-chestnuts and acacias quite denuded of leaves.

Fourth week: various plants, especially annuals, continue in flower. Leaves of marsh-elder (*Sambucus E'bulus*), of a fine pink; of stag's-horn sumach, of a purplish-red; of the American oaks, of fine shades of yellow, orange, red, and purple.

3. *Farm-yard.* (2902.)

This is the season of rural plenty, affording an opportunity, both to men and animals, for laying in a large stock of health, to enable them to support the severity of the coming winter. Operatives should now buy in their winter stores of potatoes, fuel, &c. and ridge up their garden ground, not under crop, for the winter.

Corn crops being generally in the rick-yard by Michaelmas, and the root and herbage crops not taken being at or near maturity, the first of October is the most suitable season for a farmer to take stock and ascertain his annual profit or loss. Michaelmas being also the most general term of entry and removal, especially in the case of arable farms, is another reason why agricultural accounts are conveniently made up to this period. (4883.) Examine your household accounts, and if your expenses have exceeded your income, or even come up to it, look over the particulars with your wife or housekeeper, and see on which you can retrench. This is an essential process for all who would proceed in life with any thing like peace of mind, or the permanent respect of their neighbours. (4921.) Remember that very small indeed is the net income of a rent-paying agriculturist.

Michaelmas is also the general term for hiring farm-servants by the year; but the seldom agricultural operatives are changed the better, unless in the case of senseless, indolent, or viciously inclined persons, who degenerate unless frequently removed.

4. *Live Stock.* (6216.)

Cattle and sheep not sufficiently fatted on grass or herbage, whether by pasturage or soiling, should now be put on other food, to complete them for the butcher. Oil-cake, grains, turnips, carrots, or, in default of these, bruised corn may be used. The same observations may be applied to hogs, which are generally in good condition at this season. (7515.)

Hog porridge. A mixture of oatmeal and water, or any other meal and water, left till it becomes sour, as practised by the millers in the northern counties, will feed hogs rapidly; but milk and peas meal make the finest pork in the world.

The *leaves* which have been soiled during summer, may now be put on hay, straw, and carrots, or other roots, by degrees. (6752.)

5. *Grass Lands.* (5643.)

Where these are manured, this is a good season for the operation (5782.); choose dry weather.

6. *Arable Lands.* (4925.)

Potatoes (5291.), carrots (5443.), field beet (5482.), parsneps (5471.), and Swedish turnips, may now be sown in rows, or housed, and the ground sown with wheat. This grain (5001.), rye (5069.), barley (5080.) in some situations, and tares (5257.) may still be sown in the milder districts. Embrace every opportunity to give the first furrow to fallows (4944.), whether for green crops or otherwise. In general all lands that are to have two or more furrows before they are sown or planted, should be ploughed as soon as possible after harvest; but not so lands that are to be sown on one furrow, which are better ploughed in January and February. It is a great mistake to suppose that sloping land in autumn destroys the eggs or larvae of insects (7695.), or the seeds of weeds; on the contrary, it may often, by giving them a deeper covering, preserve them better from the winter's frost, or what is much more destructive, from being devoured by birds. There are few subjects less generally understood than the economy of nature in regard to the eggs of insects and worms. (Turn to 7644. and 7704.) See that water furrows and drains run freely, and that fences and gates are in repair.

7. *Fences* (2960.), *Roads* (3523.), and *Drains.* (4213.)

Hedges may now be advantageously planted (2978.), grown ones pruned (2963.), old ones replaced (2989.), and imperfect ones repaired. (2993.) The Northumberland practice as to 1809, is well deserved the study of the more southern agriculturalist. Roads and drains may be made or repaired at this season, and in spring, with better effect than during the heat and drought of summer. Road materials now bind better, and land-springs show themselves more distinctly.

8. *Orchards* (4079.) and *Hop-grounds.* (5997.)

The *winter fruits* may now be gathered, and either spread in an airy loft or upper floor, there to remain till used, or sweated in heaps, to extract a part of their moisture, and then buried in dry sand, or packed in close boxes or casks, to be kept in a cool and dry cellar. (1854. and *Encyc. of Gardening*, 2d Edit. 2289.)

Fruits of every kind may now be planted (4105.) and pruned. (4111.)

Hop-picking is generally completed the first week of the month; and as soon afterwards as convenient, the vine and poles removed, and the latter stacked till next spring. (6047.) Young hop plantations may be formed (6005.), and the soil among established grounds manured and ploughed. (6019.)

9. *Wood-lands and Plantations.* (3906.)

Hedges and plantations of evergreen trees may be made during the first week of the month; and no period of the year is better for transplanting all kinds of hardy shrubs.

Timber and coppice may be felled, and in general every operation preparatory to planting, as well as the operation itself, may go forward.

NOVEMBER.

Weather at	Average of the Thermometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS.
London -	41 44	4	29 68	2.527 inch.	This is the <i>windy month</i> of the Saxons; it is generally also cold and moist, and one of the most disagreeable for the labouring agriculturists; but he may console himself with the shortness of the day, and hail the approach of evening, when he may lay aside his wet tress and fortify his mind by converse with books, or enjoy the comforts of his fire-side, and the solace of his wife and children; reading to or otherwise instructing them, or mending his boots or shoes.
Edinburgh	41 1	-	29 638	4.514	
Dublin -	43	-	29 74	0.394	

1. *Calendar of Animated Nature round London.*
In the first week: the lark (*Cervus Capreolus*) grunts.
Second week: the golden plover (*Charadrius pluvialis*) appears.
Third week: snails (*Limax*) and slugs (*Hélix*) bury themselves.
Fourth week: greenfinches (*Fringilla Montifringilla*) flock. The winter moun (*Geometra brunaria Sam.*) and the common flat-body moth (*Geometra apollina Sam.*) appear in gardens about the end of the month.
2. *Calendar of Vegetable Nature round London.*
In the first week: a few plants in flower, by accident, chiefly annuals, according to the season.
Second week: the fungus *Helvella mitra* appears. *Laurustinus* in flower.
Third week: *Chimonanthus fragrans* in flower.
Fourth week: some primroses show flowers at this season; and some plants, unnaturally in flower, still continue if the weather is temperate.

3. *Farm-yard.* (2902.)
 Wintering cattle are now introduced to the straw-yards (2902.) or hammels (2831.), and others to stalls for feeding or fattening. Live stock in general ought to be kept in good condition at this season, otherwise they are apt to fall off towards spring. Threshing goes on at intervals to supply straw. (3193. and 2775.)

4. *Live Stock.* (6216.)
 See Farm-yard.

5. *Grass Lands.* (5643.)

Manure in dry weather (5782.); turn the water on meadows adapted for irrigation (4387.); destroy ant-hills (5775.); drain by surface gutters, or other means, where that operation is requisite; clear out water furrows for the same purpose; admit cattle and horses only on the driest pastures; see that sheep have shelter, and especially Dorset ewes likely to lamb next month.

6. *Arable Lands.* (4925.)

See that water furrows and drains run unobstructed; plough and cart out manure, as weather and other circumstances permit.

7. *Fences* (2960.), *Roads* (3523.), and *Drains.* (4213.)

As in last month; and see that they are in effectual repair, and fairly used.

8. *Orchards* (4079.) and *Hop-grounds.* (5997.)

Complete the operations of last month, where interrupted, deferred, or neglected.

9. *Wood-lands and Plantations.* (3906.)

As in last month, excepting when the weather is unfavourable. Felling all kinds of timber and coppice not adapted for barking for the tannery, may now go on freely. (4041.) Willows for baskets may be cut over (4012.), and baskets, hampers, crates, and hurdles, made by the woodman and hedger.

DECEMBER.

Weather at	Average of the Thermometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.
London	41 4	3	29 64	1.124 inch.
Edinburgh	38 9	-	29 66	2.598
Dublin	36 34	-	29 723	2.916

REMARKS.

Winter month, Sax. Cold but dry. The agricultural operations are chiefly of the laborious kind; but the days are short and the nights long. In the last week the young operator should examine himself as to his professional and intellectual progress during the bye-past year, and form plans for further improving himself for the year to come. Knowledge is a lever by which a man may raise himself as high as he desires.

1. *Calendar of Animated Nature round London.*
 The mole (*Talpa europæa*) throws up billocks. The December moth (*Eriogaster populi Sam.*) appears about the beginning, and the yellow-line quaker (*Noctua flavilinea Sam.*) about the end of the month.

2. *Calendar of Vegetable Nature round London.*
 Some of the last month's plants continue in flower, according to the weather.

3, 4. *Farm-Yard* (2902.), and *Live Stock.* (6216.)
 Threshing, and otherwise preparing corn and straw for the market, and the use of the workings, fattening, wintering, and store stock are the main operations. Next, the regular supply of live stock with food, and cleaning and littering them. Fattening stock should be particularly attended to, especially house lamb (7227.) and calves. (6853.)
 The supply of turnips for cattle and sheep is liable to be interrupted by severe frosts, if the precaution of housing a quantity (5420.), or setting them (5421.), is not taken in time. Where oil cake, rape cake, or dust (6994.), brewers or distillers' grains (5116.) are used, supplies must be secured; and where hogs or cattle are fed on meal and water mixed and soured, a quantity must always be kept in mixture; as a week or ten days in temperate weather, and a longer period during frost, is requisite to induce the fermentation.

5. *Grass Lands.* (5643.)
 See that they are not posched: that water furrows, gutters, drains, and ditches are in repair; and where manuring is practised, cart it out in frosty weather where there is no danger of injury from the feet of horses or cart-wheels. Unless labour is very cheap, carting earths or earthy composts on grass lands will not pay the expenses; they produce more effect on arable lands.

6. *Arable Lands.* (4925.)
 See that all the modes of drainage are effective. (4278.) Plough and cart out manure according to weather and other circumstances.

7. *Fences* (2960.), *Roads* (3523.), and *Drains.* (4213.)
 Plant hedges (2977.) and build walls only in temperate weather, as frosty air injures the roots of plants, and freezes humid mortar, thereby effectually preventing its setting. Roads and drains may be made and mended in all weathers that admit these operations.

8. *Orchards* (4079.) and *Hop-grounds.* (5997.)
 Clear old trees of moss or misletoe; but prune only in mild weather. Dig and dung at any time.

9. *Wood-lands and Plantations.* (3906.)
 Fell timber or copse of sorts not adapted for barking. (4044.) Stack or crush up tree tops, stacking them for fuel or charcoal. (4068.) Trench, dig, or otherwise prepare ground for planting; but lift plants from the nursery, and re-insert them in plantations only in mild weather, and when the soil does not poach by treading, &c. The rest as in November.

Evergreens, as Mr. M'Nab has ably shown and proved by experience, may be planted at any period during winter, when the weather is mild. He says, "I have planted evergreens at all seasons of the year with nearly equal success, except from the middle of June to the middle of August, and even during this period I have planted some; but unless the weather is very dull and moist, and even with such weather, it is difficult to prevent the plants suffering considerably, and in many cases it is years before they recover. Although, however, I have planted evergreens ten months out of the twelve, with little difference in the success, yet one season has a preference over the others with me; and when there is the power of choice, I would recommend late in autumn, winter, or early in spring; that is, any time from the middle of October to the middle of February, and in general the beginning of this period is the best; that is, from the middle of October to the middle of December, always providing that the weather and the ground are favourable; that is, supposing there is no frost, no drying wind, nor much sunshine, and that the ground is not too much saturated with wet, either from continued rain, or from the nature of the soil. One of the principal things to be attended to in planting evergreens is, to fix on a dull day for winter planting, and a moist day for spring and autumn planting. There can be no secret in the proper treatment of evergreens; if there were, I should say, that it is in preventing their roots becoming dry when out of the earth; to choose moist and cloudy weather for planting; and still better, if we had the power, by foresight or otherwise, to secure a continuance of such weather some time after they have been planted." (*M'Nab's Hints on the Planting and General Treatment of Hardy Evergreens in the Climate of Scotland*, &c. p. 17.)

Mr. Cruikshank has shown that poor waste ground, which, if trenched or ploughed would not bear a crop of grain, will, after being planted and kept under wood for some years, become fit for every purpose of agriculture. "On a rising ground, not far from the village of Eilon, a piece of ground of a dry gravelly nature, which has lately been cleared of a crop of full-grown Scotch firs, was trenched in a very partial and imperfect manner, the roots of the trees being scarcely eradicated. It was then sown with oats, without receiving lime, dung, or manure of any other description; yet the crop was so luxuriant, that a great part of it lodged. The following spring, the ground was again sown with the same species of grain, without receiving any enrichment; and, when harvest arrived, the crop was unequalled by that of the richest fields, in a neighbourhood which is generally considered fertile. The experiment was tried a third time, still without manure, and the return was again considerably above an average. The soil, as has already been remarked, was dry and gravelly, and far from possessing any natural qualities that could have been the cause of such extraordinary productiveness. When planted, it had been covered with heath, and in that state had not been superior to those waste lands which we occasionally see improved at a vast expense, and which will produce no kind of crop till they receive a great quantity of manure." (*Cruikshank's Practical Planter*, &c.)

GLOSSARIAL INDEX.

* * In this Index both Pages and Paragraphs are referred to; the letter p. is prefixed to the former, to the latter the letter s.

ABRADING earth, earth crumbling down from the effects of frost, page 483.

Absorbent soil, soil so constituted as to absorb moisture from the atmosphere, 772.

Absorbent system, explained in s. 6352. p. 968.

Acclimatising vegetables or animals, inuring them to a climate in which they are not indigenous. The term naturalising is sometimes substituted, but erroneously. See *Naturalising*.

Acescent, entering a state of acid fermentation, s. 6978. p. 1036.

Aération, exposing the soil to the air, p. 507.

Aërometric beads, hollow beads of glass containing air, for ascertaining the specific gravity of milk, s. 7008. p. 1039.

After-grass, the second crop of grass from lands which have been previously mowed the same year, p. 905.

Aftermath, the second mowing of perennial meadow lands in the same season, p. 515.

Agriculture is used in its most extensive sense in the third line of the title-page, and generally in the historical part of the work (Part I.), as including territorial economy and husbandry. In most parts of this work, for example, in the words of the title-page, "animal and vegetable productions of agriculture," as synonymous with husbandry. In several places as synonymous with aration; that is, the culture of arable lands, as opposed to pasturage, or what may be called agriculture proper. In every case the reader will be able to gather, from the scope of the sentence or paragraph containing this term, in which of these three senses it is meant to be understood.

Aigrettes, tufts of feathers, p. 1058.

Ails, small islands, or islets, in streams.

Alburnous parts, soft woody parts, p. 661.

Alburnum, the soft sappy wood just under the inner bark, p. 646. See *Lindley's Outlines of the Principles of Botany*, p. 17.

Alien waters, a brook or stream passing from one area through another, which has been embanked from a river or the sea, p. 715.

Allotially, independently of any superior, p. 552.

Alluvial soil, soil deposited by streams, p. 747.

Aloetic purge, a purge composed of the scocotorine aloes, p. 1035.

Alterative, alterative medicines are those which induce a change in the blood and juices for the better, without any manifest operation or evacuation, p. 977.

Alveolar sockets, sockets like the cells in a honey-comb, p. 972.

Ambling, explained, s. 6766. p. 1002.

Amerciament, a pecuniary punishment arbitrarily imposed, p. 769.

Ammoniacal gases, s. 6701.

Aniophorous stones, without regular shape, s. 2005. p. 483.

Anbery, an excrescence in some plants of the natural order Cruciferae, and chiefly in the turnip, produced by the puncture and depositing of the eggs of an insect, s. 5437. p. 861.

Anard, a chemical product obtained from plants, s. 1468.

Anomalous, irregular, p. 682.

Aorta, the great artery of the heart, p. 967.

Aorta ascendens, the ascending great artery of the heart, p. 967.

Aorta descendens, the descending great artery of the heart, p. 967.

Appui, a reciprocal action between the mouth of the horse and the hand of the rider; the bit and rein forming the line of communication. Thus a

horse with a sensitive mouth has a good appui, and the same may be said of the rider if his hand be good, s. 6663. p. 1002.

Aqueous humour, the watery humour of the eye; the first or outermost, and thinnest of its three humours, p. 970.

Aration, ploughing or tillage, s. 3562. p. 573.

Arcenarius grasses, grasses suitable for sandy soils, p. 749.

Averruncator, a pruning instrument, consisting of two blades fixed on the end of a rod, acting like scissors, by means of a line fixed to one of them, and pulled by the operator, s. 3155. p. 512.

Awns, the beards or long bristles which project from the chaffs; they are plentiful on spring wheat, and on barley, p. 812.

Axillaries, explained, s. 6344. p. 967.

Azote, the radical principle of the atmospheric air, p. 814.

B.

Backing a horse, explained, s. 6657. p. 1000.

Back-raking, an operation in farriery, by which hardened faeces are withdrawn from the rectum, s. 6543. p. 990.

Back-rents, rents paid subsequently to reaping, p. 768.

Bagging, explained, s. 3173. p. 575.

Bails, a substitute for fixed standings or stall divisions, s. 6799. p. 1006.

Band-win ridges, ridges formed of such a width as to be reaped by what in Scotland is called a band of shearers or reapers, s. 3250. p. 526.

Earbs, explained, s. 6382. p. 972.

Bastard-cocks, small preparatory haycocks, s. 5797. p. 904.

Battering, as applied to fences, leaning inward, s. 4594. p. 754.

Bauk, in Scotland, ground left unturned between the furrow-slices in ploughing, p. 711; in England the same thing, and also strips of ground usually in grass between ploughed ridges, as in common field lands.

Bawins, brush-faggots, s. 3626. p. 584.

Bear, an iron instrument used in the Isle of Ely to eradicate weeds in water-courses, s. 5686. p. 892.

Bents, the dead stems of grass in pasture grounds which have borne seeds.

Bigs, a variety of winter barley, s. 5085. p. 823.

Billet, a term variously employed. A wooden billet is often used in docking a horse, and often forms a separation between carriage horses, s. 6733. p. 1009.

Binding and stooking, binding sheaves of corn, and placing them in stooks or stooks, s. 3175. p. 515.

Binot, a variety of double mould-boarded plough, s. 2620. p. 396.

Blanch holding, a mode of legal tenure in Scotland, s. 3401. p. 552.

Blast, a disease in the stomach of sheep and oxen from wind; also a term for the mildew in wheat, p. 1065.

Blinding, filling up interstices between stones on roads with gravel, &c. s. 3654. p. 589.

Blood spavin in horses, 961.

Blowing lands, lands whose surface-soil is so light as to be liable, when dry, to be blown away by the wind, p. 870.

Blowing sand, p. 749. See *Blowing lands*.

Botes of trees, the trunks of trees, p. 656.

Boll, a measure for corn in Scotland; in wheat and beans, equivalent to four Winchester bushels; in oats, barley, and potatoes, to six bushels, p. 842.

Bone spavin, explained, s. 6507. p. 986.

Boulder stones, large round stones, p. 481.

Bout of the plough, the going and returning with the plough along a land or ridge under ploughing, s. 326*i*, p. 529.

Box drains, explained, s. 3607, p. 581.

Boyn, a vat or tub, s. 7064, p. 1045.

Brails, from braid, to spring up, s. 5397, p. 857.

Brake, a large harrow, s. 2664, p. 405. In machinery, a constraining wheel divided into joints, which stops when needed another wheel that revolves within it.

Bramble bonds, bands made of the long shoots of the bramble or blackberry, s. 3191, p. 518.

Braxy, explained, s. 7258, p. 1065.

Break-share, explained, s. 7259, 7260, p. 1065.

Breasting over a hedge, cutting it down, p. 459.

Breechin, that part of the horse's harness attached to the saddle, and hooked on the shafts, which enables him to push back the cart or other machine to which he is harnessed.

Breeding in the line, or in the same line, explained, p. 301.

Breeding in and in, explained, p. 301.

Breeding, cross, explained, p. 301.

Brochen ligger, a quarter-cleft rod, as thick as the finger, and four feet in length, used in thatching, p. 518.

Brose, a Scotch dish made by pouring boiling water on oatmeal, and sometimes on the meal of peas, and immediately mixing them by stirring; leaving the meal in small knots or lumps about the size of marbles. It is afterwards eaten with milk or butter, s. 5217, p. 837.

Burgage-holding, explained, s. 3404, p. 552.

Butts, short angular ridges, short irregularly shaped lands or ridges in the corners of fields, s. 3253, p. 527.

Byre, cow-shed, s. 6777, p. 1015.

C.

Cadence, as applied to horsemanship, an equal measure or proportion observed by a horse in all his motions when he is thoroughly managed, and works justly at a gallop, *terra a terra*, so that his motions or times have an equal regard to each other, s. 6672, p. 1003. See *Crabb's Technological Dictionary*.

Caissons, temporary chests in which foundations in deep water are built, s. 4357, p. 718.

Calcareous soil, soil abounding with lime, p. 775.

Callipers, or calibers, explained, s. 4075, p. 663.

Calorifere, from *calor*, heat, and *fero*, to bear, explained, s. 7464, p. 1087.

Camping potatoes, explained, s. 5345, p. 851.

Canon of the horse, explained, s. 6232, p. 959.

Candle, the protuberant part of the saddle behind, s. 6675, p. 1003.

Capillaries, the hair-like extremities of the arteries and veins, s. 6352, p. 908.

Cap of straw, explained, s. 5195, p. 518.

Capriotes, leaps made in one and the same place without advancing forward, s. 6672, p. 1003. See *Crabb's Tech. Dict.*

Capulet, explained, s. 6512, p. 997.

Carotid arteries, two principal arteries which carry the blood to the head, s. 6298, p. 972.

Carotids, 967. See *Carotid arteries*.

Caryus, explained, s. 6317, p. 965.

Carriage in irrigation, explained, s. 4408, p. 726.

Carse, explained, s. 4564, p. 747.

Caruncula lachrymalis, explained, s. 6370, p. 970.

Casque, of the nature of cheese, s. 6979, p. 1036.

Castrate, to incapacitate male animals from engendering offspring, s. 7306, p. 1069. See *Spay*.

Catch-drain, explained, s. 4419, p. 727.

Catch-work meadows, explained, s. 4428, p. 727.

Cavesson, a sort of nose-band, either of iron, leather, or wood, fastened round the nose of a horse to forward the suppling and breaking of the horse, s. 6657, p. 1001. See *Crabb's Tech. Dict.*

Cellular membrane, an important membrane in animals in which the fat is lodged, p. 785.

Cereal grasses, the kinds producing corn, p. 723.

Cerebral hyatids, explained, s. 7967, 7968, p. 1066.

Cervical ligament, an apocrosis or strong bandage of packwax, which runs along the neck and upholds the head, p. 972.

Chambrière, a kind of long whip used in riding horses, s. 6662, p. 1001.

Char wood, to partially burn it to enable it to resist wet, s. 3039, p. 492.

Charlock, the *Sinapis arvensis*, a wild species of the mustard family, p. 880.

Chloride of calcium, quicklime, s. 4988, p. 810.

Chyle, a milky fluid secreted from the aliments in the lacteal vessels.

Chyme, that poultice-like mass to which the food is reduced in the stomach of every animal, s. 6404, p. 975.

Cicatrise, to heal over with a scar, p. 513.

Cilia, eyelashes, p. 970.

Claveau, explained, s. 7248, p. 1065.

Clinches, cramps or holdfasts; to clinch, to turn the points of nails which have been driven, as in the shoeing of horses, s. 6710, p. 1007.

Clough, explained, s. 4455, p. 732.

Cob, a kind of wicker basket, made so as to be carried on the arm; hence a seed-cob, or seed-lip, is a basket for sowing from, p. 378.

Cockle oast, a kind of kiln for drying hops upon, s. 6043, p. 927.

Coff, a Cornish term for offal pilehards, p. 1172.

Coffin bone, a bone in the foot of the horse, s. 6417, p. 976.

Coherent soil, a soil whose parts stick together, p. 772.

Collar-blade or *haims*, short segments of wood or metal, embracing the neck of the horse, to which the traces are attached, s. 3235, p. 524.

Collop, explained, s. 7871, p. 1200.

Commutation of tithes, the substituting a fixed money payment, or a portion of land, instead of a tenth of the produce.

Concha cartilages, the gristles of the ear, s. 6764, p. 1013.

Condition of a horse, the state of health and strength, p. 977.

Consecutive, following, p. 525.

Copyhold, explained, s. 3395, p. 552.

Cordæ vocales, or *chordæ vocales*, tendons called into action by braying in the ass, s. 6765, p. 1013.

Córnea, the first or outer coat of the eye, s. 6371, p. 970.

Cornetti, a mode of riding, s. 6672, p. 1003.

Corollary, a consequent truth gained from some preceding truth or demonstration, s. 4961, p. 804.

Coronal roots, explained, s. 4983, p. 808.

Coronary, explained s. 6417, p. 976.

Cotyledon, the first or seed leaf or seed lobe of a plant.

Couples, chains, collars, or mechanical contrivances, by which dogs, &c. are coupled together.

Courses, explained, s. 3189, p. 518.

Crest, upper part of a hedge-bank, p. 483.

Croppers, a variety of pigeon, p. 1095.

Cross-breeding, explained, s. 2023, p. 301.

Crown and *furrow-ploughing*, explained, s. 3256, p. 527.

Crown scab, a disease in the horse, p. 1007.

Crystalline humour, explained, s. 6374, p. 970.

Culmi, stems of grasses, p. 1167.

Culmiferous crops, crops of plants whose stems yield straw, as wheat, barley, &c., p. 768.

Curb, explained, s. 6513, p. 987.

Curly, explained, s. 5371, p. 854.

Curvilinear, formed of curved lines.

Cut over, to cut off the top crop, s. 4043, p. 658.

Cutting in horses, explained, s. 6529, p. 988.

Cut-water of a bridge, the projecting part of the pier of a bridge, which is opposed to the current, and divides it, s. 3612, p. 582.

D.

Dandriff, scurf, s. 6738, p. 1006.

Dashing, or dashed. See *Lipped and harled*.

Dead hedges, hedges made with the prunings of trees, or with the tops of old hedges which have been cut down.

Dead timber, any timber not growing, p. 502.

Deciduous, shedding the leaves in autumn.

Decorticated, deprived of the bark, p. 655.

Defecation, explained, s. 4591, p. 867.

Dendrometer, an implement invented to ascertain the quantity of timber in standing trees, p. 663.

Deportation, carrying away, removal, p. 519.

Dew-retting, spreading hemp or flax on grass to expose it to the action of the dews, which expedite the separation of the fibre from the feculent matter, s. 5904, p. 916.

Dewstone, the name of a species of limestone in Nottinghamshire, s. 3639, p. 587.

Diagram, an explanatory sketch, p. 757.

Diarrhœa, explained, s. 6473, p. 983.

Diastole, explained, s. 6351, p. 908.

Digging his toes, in horses, explained, s. 6289, p. 960.

Dike, explained, p. 496. In Cambridgeshire a ditch is called a dike.

Diaceous plant, a plant bearing its male blossoms on one plant and its female on another, s. 3181 p. 517.
Disbarked timber, timber deprived of its bark, s. 4053. p. 660.
Dished, applied to a wheel, explained, s. 3732. p. 605.
Dishes, in farming, hollow places in the fields, in which the water lies, s. 802.
Diuretics, food or drink causing a copious discharge of urine, s. 6410. p. 975.
Docking and nicking, cutting off part of a horse's tail, and cutting a notch or nick on the under side of what remains, for the alleged purpose of making him carry it well; now almost obsolete, s. 6669. p. 1062.
Domical, shaped like a dome or an arch, s. 4507. p. 740.
Dorsal vertebra, joints of the back bone, s. 6764. p. 1013.
Double broaches, broaches or splits are two-foot lengths of split hazel branches, employed in thatching, s. 578.
Double wind-rows, double ranges of new-made hay, s. 5797. p. 904.
Down together, to join so closely as to form a smooth surface, s. 3710. p. 600.
Down shares, breast ploughs to pare off the turf on downs, s. 3215. p. 521.
Dragoon, a variety of pigeon, p. 1095.
Drain sluice, explained, s. 4409. p. 726.
Draw cut, explained, s. 3151, 3152. p. 512.
Droscheks, the name of a four-wheeled carriage in Russia, s. 6741. p. 1010.
Dry stone walls, walls built without mortar; a common practice in stony countries, s. 3065. p. 497.
Duodenum, the first of the intestines, and connected with the stomach, s. 6405. p. 975.
Duct, a passage through which any thing is conducted.
Dynamometer, or draught machine, explained, s. 2563—2565. p. 335.

E

Earth, as applied to the surface of the globe, one or more of the earths, as lime, clay, sand, &c., in a friable or divided state, and either alone or mixed; but without the addition of much organic matter.
Emphysematous swellings, swellings filled with a windy humour, s. 6946. p. 1033.
Enteritis, explained, s. 6466. p. 982.
Ergot of rye, spur of rye; a disease in the kernels of that grain, s. 822.
Erüca, the larva state of insects, p. 1112.
Estuary, an arm of the sea, the mouth of a lake or river in which the tide ebbs and flows, s. 3425. p. 555.
Etiolated, drawn out into a weak state, p. 808.
Eustachian tube, explained, s. 6385. p. 972.
Evolue, to unfold, disentangle, develop, or separate.
Eye in plants, a bud.
Eyes in cheese, explained, s. 7067. p. 1046.

F

Fagri, or shagreen, ass's skin, s. 6757. p. 1012.
False ribs, explained, s. 6312. p. 964.
Farcy, explained, s. 6495. p. 985.
Farmer (from *fermier*, Fr.), farming agriculturist, farming cultivator, professional farmer, commercial farmer, rent-paying farmer, &c.; a proprietor cultivating his own estate is not correctly speaking a farmer; to be such he must pay a rent. A proprietor who cultivates his own soil may be a gentleman or yeoman agriculturist or husbandman, a *propriétaire cultivateur*, but not a farmer.
Farmery, the homestead of farm-yard, p. 677.
Farming, renting land and cultivating it, or employing it for the purposes of husbandry.
Feather boarding, sometimes called weather boarding, boarding, in which the edge of one board overlaps a small portion of the board next it.
Feculence of cider, the lees or dregs, p. 673.
Fee farmhold, explained, s. 3394. p. 551.
Feeding pastures, pastures used for feeding stock, p. 905.
Fecring, explained, s. 3251. p. 527.
Felon, a disease in cattle, explained, s. 6942. p. 1032.
Femur, the thigh-bone, p. 965.
Ferruginous waters, water impregnated with iron, p. 724.
Few-holding, explained, s. 3402. p. 552.
Few a house, to hold a house on a few right, s. 3861. p. 624.
Fibula, explained, s. 6327. p. 965.
Filicæ, explained, s. 7599. p. 1105.

Finched, explained, s. 6779. p. 1015.
Fingers and toes, explained, p. 861.
Finkins, a variety of pigeon, p. 1095.
Finos, the second best wool off Merino sheep, s. 7140. p. 1052.
Firlot of tares, a measure used in Scotland, in wheat and beans, equivalent to the English bushel, s. 5268. p. 842.
Flakes, hurdles or portable pales for fencing, s. 3046. p. 453.
Flacking, explained, s. 3190. p. 518.
Fleeced cattle, explained, s. 6780. p. 1015.
Fight. See *Glume*.
Flooders, explained, s. 4449. p. 731.
Flow bog, or flow moss, a peat bog, the surface of which is liable to rise and fall with every increase or diminution of water, whether from rains or internal springs, s. 3628. p. 585.
Flowing meadows, explained, s. 4427. p. 727.
Fluke, a disease in sheep, p. 1049.
Fluke worms, animals of the genus *Fasciola*, s. 7271. p. 1066.
Fetus, a young animal in the womb, p. 976.
Fogging pasture lands, explained, s. 5837. p. 908.
Foliage crops, plants cultivated for their leaves to be used green, and which will not make into hay, as the cabbage tribe.
Foot rot, explained, s. 7266. p. 1066.
Forage plants. See *Herbage plants*.
Fore-rents, rents paid previously to the first crop being reaped, p. 767.
Fors and scudda, explained, s. 7137. p. 1052.
Forsing, explained, s. 7137. p. 1052.
Founder of the feet of horses, explained, s. 6517. p. 987.
Free martin, explained, s. 6824. p. 1021.
Freehold, explained, s. 3393. p. 551.
Fret, colic, gripes, or gullion.
Friable soils, crumbling soils, p. 802.
Froniose branched trees, full of branches, which are flat and spread horizontally, like the fronds of ferns, as in the spruce fir, s. 3987. p. 648.
Frontal worms, explained, s. 7270. p. 1066.
Frustum, a piece cut off from a regular figure, s. 3732. p. 605.
Furnished, explained, s. 6247. p. 955.
Fusiform root, shaped like a spindle, as the carrot, parsnep, &c. p. 865.

G

Gaites, single sheaves tied in a particular manner, p. 516.
Gaiting, explained, s. 3176. p. 516.
Gangs, courses or slips in thatching, p. 518.
Gastric juice, the juice of the stomach of any animal, p. 974.
Gaw furrows, explained, s. 4956. p. 803.
Gelding anti-hills, explained, s. 5778. p. 902.
Gean, wild cherry, s. 3994. p. 650.
Gibbous, protuberant, bearing excrescences, s. 6775. p. 1014.
Gid, explained, p. 1066.
Glair, the mucous evacuation in the scouring of horses, s. 6950.
Glanders, explained, p. 985.
Glenoid, the hollow or socket in one bone at a joint which receives the knob, boss, or head of the approximate bone, p. 965.
Glumes, the husks or chaff of corn. Oat flights are the glumes of the oat, p. 888.
Gluten, a tenacious, ductile, and elastic substance, forming a constituent part in wheat flour and other vegetable bodies, p. 771.
Go-downs, explained, s. 6736. p. 1010.
Goggles, explained, s. 7267. p. 1066.
Grass-cocks, hay-cocks, p. 904.
Grasses, all the natural order of Gramineæ, of Linnaeus and Jussieu. Cereal grasses, those grown for bread corn. Pasture grasses, those grown chiefly for pasturage. Fœnicous or feniferous grasses, those grown chiefly for hay.
Grassing flax, bleaching it on the ground, p. 915.
Grease, a disease in horses, explained, s. 6514. 6516. p. 987.
Great rot, explained, s. 7261. p. 1065.
Green acres, land capable of tillage, p. 1206.
Grouding, filling up, s. 3711. p. 600.
Gitta serena, explained, s. 6441. p. 980.
Gutter, a furrow-channel or drain, s. 4418. p. 726.
Gypsum, a genus of calcareous earths, consisting of carbonate of lime, and united with sulphuric acid. The principal species is the *Gypsum Alabastrum*, plaster of Paris, or alabaster. See *Crabb's Tech. Dict.*

H.

- Ha-ha*, a sunk fence, p. 474.
Hacking and picking. See *Picking*.
Hainault mowing, explained, s. 3172. p. 515.
Hammel, a small shed, with a yard for feeding one, or at most two animals, p. 469.
Hands of tobacco, leaves tied up by their footstalks, so that the leaves spread out like the hand, s. 3945. p. 641.
Hangs, slopes, s. 3945. p. 641.
Harled, p. 497. See *Lipped*.
Hash, explained, s. 2716. p. 419.
Hatches, flood-gates, p. 726.
Hatted kill, explained, s. 7105. p. 1048.
Hattocks, shocks, s. 3173. p. 515.
Haulm, the base of the stalks or stems of all crops, after the seeds are reaped or gathered. The haulm of peas is in some places called pea ryse.
Head and heel of gates, explained, p. 501.
Heading down trees, lopping or cutting off the heads of trees, p. 651.
Heading sheaves, the hood sheaf or sheaves of shocks of corn, p. 515.
Headmain, explained, s. 4411. p. 726.
Heckles, iron combs, p. 923.
Heckling flax, combing, p. 916.
Helmets, a variety of pigeon, p. 1095.
Hepatic affections, affections of the liver, p. 1037.
Herbage plants, forage plants, such as clover and other plants cultivated chiefly for the herb, to be used either green or made into hay.
Hide-bound, a disease in horses and cattle when the skin cleaves to the sides, s. 6425. p. 977.
Hink, explained, s. 5171. p. 832.
Hinny, explained, s. 6768. p. 1013.
Hirscl, a Scotch term of the same meaning as the English term "herd," s. 6793. p. 1017.
Hoars, thick mists, p. 772.
Holmes, small islands, but larger than aits.
Hood-sheaf, a sheaf placed on the summit of other sheaves for a covering, p. 516.
Hook bones, bones in the hind quarter of cattle, s. 6799. p. 1018.
Horny frog of the horse, the prominence in the hollow of a horse's foot, p. 976.
Horsemen, a variety of pigeon, p. 1095.
Horses, pieces of wood used in barking trees, p. 659.
Hot fur, explained, s. 5906. p. 824.
Hot yellows, explained, s. 7256. p. 1065.
Howe, explained, s. 7254. p. 1065.
Huckaback, a kind of cloth, s. 5933. p. 917.
Humerus, the arm bone, p. 965.
Humming machine, explained, p. 440.
Hunger rot, explained, s. 7261. p. 1066.
Hungry soil, barren soil needing much manure, p. 713.
Husbandman, one who farms generally; that is, who both produces corn and cattle, and attends to the dairy, the poultry, the woodlands, and the orchard. A farmer may confine himself to grazing, or to breeding or hawking, or milking or raising green crops for the market, &c., but in none of these cases can he with propriety be called a husbandman. This term husbandman, therefore, is not exactly synonymous with farmer.
Husbandry, the culture of arable grass and woodlands, the management of live stock, the dairy, poultry, &c., and, in general, what constitutes the business of the head of a family living by agricultural industry in the country.
Hybrid, bastard or spurious, p. 1013.
Hydatid, the *Tænia globulus*, an insect occurring in the skull of the sheep, p. 1049.
Hydroptic rot, explained, s. 7261. p. 1065.
Hygrometer, an instrument for ascertaining the degree of moisture in the atmosphere, p. 773.

I.

- Imigo*, the perfect state of insects, p. 1112.
Impinge, to strike against, s. 4261. p. 719.
In and in system of breeding, p. 301.
Incision of objects on roads, the marks, traces, tracks, or ruts made, s. 3571. p. 575.
Increments, proportional rates of increase, s. 3552. p. 572.
Indigence, peculiar to, springing out of the nature of, p. 1012.
Induration, hardening, p. 717.
Infield, an obsolete Scottish term for enclosed lands near the farmstead, as opposed to such as are at a distance from it, and uninclosed, s. 802. p. 130.
Ings. See *Saltings*.

- Iris*, the coloured circle in the eyes of animals, s. 6371. p. 970.
Isometrical perspective, explained, p. 472.
Isosecles triangle, a triangle which has only two of its sides equal, p. 503.
Itinerating libraries, libraries, the books of which are carried from one place of deposit to another, and thence issued, p. 756.
Jacobines, a variety of pigeon, p. 1095.
Juniper, a tool used by masons for boring holes in land stones to be refit by gunpowder, p. 743.
Jumping pole, a long stiff pole, by which persons in the fens are enabled to jump across ditches or drains twenty feet wide, by planting the pole towards the middle of the drain, and springing from bank to bank: a small piece of board, called a quant, is fastened to the bottom of the pole to prevent its sinking into the mud. See *Quant*.

K.

- Kelp*, the ashes of any description of *Fuci* or other seaweed, p. 1205.
Knees for ship-building, crooked pieces of timber, having two branches or arms, and generally used to connect the beams of a ship with her sides, s. 3034. p. 491.
Knuckering, explained, s. 6587. p. 972.
Kyloes, the name given to the cattle of the Hebrides, s. 6796. p. 1018.

L.

- Lachrymal gland*, the gland which secretes or supplies the *lachrymæ* or tears, p. 970.
Lacteals, the absorbents of the mesentery, which originate in the small intestines, and convey the chyle from thence to the thoracic duct, p. 968. See *Crabb's Tech. Dict.*
Lactometer, explained, s. 7008. p. 1037.
Lampas, a swelling of the wrinkles or ribs in the roof of the horse's mouth; analogous to the gun-boils in man, p. 980.
Land, a term employed in Cambridgeshire and other counties, to designate what more generally is termed a ridge; that is, one of those compartments which lie between gutter and gutter in arable fields. The ridge, in Cambridgeshire, is the highest part or central line of the lands, just as the ridge of a house is the highest part of its roof. In Scotland, a ridge includes the whole of the surface between gutter and gutter. Land appears the fitter term.
Land, ground, earthy surface in opposition to water or rocks. The term ground is generally applied to a comparatively limited extent of surface, as garden grounds, hop grounds, &c. in opposition to arable lands, wood lands, &c.
Land-fast stones, stones fixed or imbedded in the soil, p. 483.
Land-reeve, explained, s. 4638. p. 760.
Larvæ, the grubs, maggots, or caterpillars of insects, 803.
Laryngeal sonorous sacs, hollows in the windpipe which modulate the voice of animals, s. 6764. p. 1013.
Larynx, the windpipe or trachea, p. 972.
Lateral shoots, shoots emitted on the sides of branches; laterally; quite distinct from latter shoots, with which they are occasionally confounded, p. 478.
Laying in hedge-planting, laying down the sets or plants horizontally on the bed prepared for them, s. 3944. p. 640.
Laying an old hedge, explained, s. 3026. p. 490.
Leaping ill, explained, s. 7253. p. 1065.
Leaschold, property held on lease, p. 552.
Legget, explained, s. 3193. p. 518.
Leguminous crops, crops of the various kinds of pulse, as peas, beans, tares, sainfoin, lucern, clover, &c., p. 800.
Lewelling, explained, p. 535.
Leverage, the act of using levers, or the power acquired by the use of them, p. 575.
Light-lyrced, the dew-lap of a light colour, s. 6798. p. 1018.
Ligneous plants, woody plants, as trees or shrubs, p. 476.
Lipped and harled, a wall built of stones without mortar, but which has the joints afterwards filled with mortar, and the whole wall plastered over with what is called rough-cast, or harling in Scotland. The mixture used for harling is lime, sand, and small stones about the size of peas. Dashing in England is the forcible casting of small stones

like the above, only washed quite clean, into the soft recent plaster of exterior walls, in order to resist the action of rain.

Loam, any soil in which clay and organic matter exist in considerable proportions, and so as to render it neither very adhesive or hard, nor soft and loose.

Lock spit, explained, s. 3823. p. 620.

Longe, a long leather thong, used in the process of lunging or lunging horses, p. 1001.

Lymph, a clear, colourless, rather viscid humour, separated from the blood, and specifically heavier than water, s. 6350. p. 967.

Lymphatics, lymphatic vessels, are the absorbent vessels that convey the lymph into the thoracic duct, and form, with the lacteals, what is called the absorbent system. The use of these vessels is to draw in by a capillary attraction the fluids contained in the circumjacent cavities, p. 968. See *Crab. Tech. Dict.*

Lymphatic absorbents, 968. See *Lymphatics*, and *Lacteals*.

M.

Maceration, the act of steeping or soaking in water, p. 869.

Malic acid, an acid obtained from apples, by saturating the juice with alkali, and pouring in the acetous solution of lead, until it occasions no more precipitate. See *Crab's Tech. Dict.*

Mallinders, a disease in horses, s. 6710. p. 1007.

Manege riding, explained, s. 6672. p. 1003.

Martingal, a thong of leather, fastened at one end to the girths under the belly, and at the other to the noseband of the bridle, to prevent a horse from rearing, p. 1001.

Maturation, the process of ripening, p. 816.

Maxillary glands, the glands belonging to the jaw bones, p. 972.

Meal of milk, the quantity yielded at one time of milking; thus, the morning meal, the evening meal, s. 7103. p. 1048.

Medulla, marrow, p. 957. In plants it signifies the pith.

Meres or *meres*, cattle ponds in Derbyshire, p. 735.

Memel timber, fir timber from the port of Memel in Prussia, in the Baltic, p. 564.

Mere, a lake, pool, or pond.

Mesentery, a membrane in the cavity of the abdomen attached to the vertebræ of the loins, and to which the intestines adhere, p. 975.

Mestin, a union of flocks, s. 736. p. 118.

Mesting, mesling, mescelin, mstin, or mescolidine, corn that is mixed, as wheat, rye, &c., to make bread. This term occurs in old acts of parliament for the regulation of rivers, as that of the Cam; mescelin being in former days a frequent lading in that neighbourhood.

Mesta, explained, s. 735. p. 118.

Metacarpus, the shank, p. 965.

Metal bed of a road, explained, s. 3630. p. 585.

Metalliferous ores, ores which contain metals, p. 629.

Metals of a road, the material of which a road is formed, as broken quarry stone, boulder stones, and other kinds, p. 612.

Metayer system, the system of farming lands in many parts of the Continent, in which the produce is equally divided between landlord and tenant, p. 184.

Midden, dunghill, p. 807. "The midden is the mither o' the meal kist."

Milsay, a provincial term for a sieve, in which milk is strained, s. 7064. p. 1045.

Mortices, holes, cells, or receptacles made in posts, &c. to receive the tenons of rails, &c., p. 493.

Mould, organic matter in a finely divided and decomposed state, with a little earth mixed, as vegetable mould, leaf mould, peat mould, &c.

Mourat, explained, s. 7137. p. 1052.

Mow, a compartment in a barn, into which corn in the straw is stacked or packed.

Mov-burn, to heat by fermentation in the mow, p. 825.

Murrain, a wasting, contagious, and most fatal disorder among cattle, s. 6943. 7250.

N.

Naked disease, explained, s. 7264. p. 1066.

Naturalising animals and vegetables, introducing them to a new climate, in such a manner that they shall in future perpetuate themselves in that climate without the aid of man. See *Acclimatising*.

Navicular or *nut bone* of the horse, explained, s. 6417. p. 976.

Nicking. See *Docking*.

Nictitating membrane, explained, s. 6370. p. 970.

Nuns, a variety of pigeon, p. 1095.

Nurses for young plants, plants of an inferior and rapidly growing kind, planted round those which are choicer and of slower growth, both to shelter them and expedite their growth, p. 653.

O.

Obstetrics, considerations appertaining to the foaling, calving, yeaming, &c., of animals, s. 6969. p. 1035.

Odometer, from *odos*, a way, and *metro*, to measure, an instrument by which the quantity of space passed over on foot, or in a conveyance, may be ascertained, s. 2506. p. 376.

Œsophagus, the weasand or gullet, p. 972.

Omentum, the caul, p. 973.

One bout stitch, a ridgete formed by the going and returning of the plough, s. 5235. p. 859.

Ophthalmia, an inflammation in the coats of the eye, proceeding from arterious blood got out of the vessels, and gathered together between the coats, s. 6758. p. 1012.

Optic nerve, a nerve which perforates the bulb of the eye, and communicates with the brain; so that every sensation derived from sight depends on the optic nerve, p. 970.

Outfall, the lower end of a water-course, p. 714.

Outfield, uninclosed farm lands at a distance from the farmstead, s. 802. p. 130.

Owls, a variety of pigeon, 1095.

P.

Pacing, one of the motions taught the horse, s. 6672. p. 1003.

Pancreas, the sweet bread. It is composed of innumerable small glands, the excretory ducts of which unite and form one duct, called the pancreatic duct, that conveys a fluid very similar to saliva into the intestines, called the pancreatic juice, which mixes with the chyle in the duodenum.—*Crabb*.

Pane of ground, a four-sided compartment of grass ground, adapted for irrigation, p. 726.

Panicle, an irregularly divided branch of flowers, as in the oat, p. 826.

Pantile, a gutter tile, p. 708.

Papier maché, mashed paper, which, when mixed up with glutinous substances, may be moulded into various shapes, p. 810.

Paring and burning, taking off the turf or surface of grass or waste lands, and incinerating it by means of fire, in order to prepare the soil for aration, p. 520.

Parotid glands, explained, s. 6388. p. 972.

Passaging, one of the motions taught the horse, s. 6672. p. 1003.

Pastern, explained, s. 6319. p. 965.

Patella, explained, s. 6325. p. 965.

Paucity, fewness, p. 784.

Peelers, the same as barkers. Persons employed to deprive trees of their peel or bark, p. 602.

Pellicle, little skin or coat, p. 822.

Pelt rot, explained, s. 7264. p. 1066.

Pendro, explained, s. 7267. p. 1066.

Pennultimate, the last but one, p. 801.

Percolate, to strain, or trickle through, p. 581.

Percolation, the act of straining, purification or separation by straining, p. 522.

Perforans of the horse's foot, explained, s. 6420. p. 976.

Perichondrium, explained, s. 6336. p. 967.

Pericranium, explained, s. 6336. p. 967.

Peridæsmium, explained, s. 6336. p. 967.

Periosteum, a general uniting membrane to bones and their appendages, s. 6336. p. 967.

Periphery, the circumference or orbit, p. 429.

Peripneumonia, explained, s. 7251. p. 1065.

Peristaltic motion, the vermicular, worm-like, or creeping motion of the intestines; by which they contract their spiral fibres so as to propel their contents, p. 975.

Petits, a variety of pigeon, p. 1095.

Pharynx, explained, p. 972.

Picking and hacking, loosening with a pick-axe or mattock, and by separating with some cutting tool, s. 3392. p. 538.

Picking of hop plantations, explained, s. 6025. p. 926.

Picework, work done and paid for by the measure of quantity, or by previous estimation and agreement,

in contradistinction to work done and paid for by the measure of time, p. 976.

Pigeon-cat, explained, s. 7540. p. 1096.

Piggery, the compartment in a farm-yard, with sties and other accompaniments allotted to pigs.

Pile, the shag or hair on the skins of animals. Each hair may be called a pile, s. 7140. p. 1052.

Pillow-slip, pillow-case, p. 1049.

Pinning, explained, s. 7272. p. 1066.

Pinning, explained, s. 7260. p. 1065.

Pip, explained, s. 7525. p. 1095.

Pipe drain, explained, s. 4296. p. 710.

Pith and Pithing, by butchers, explained, s. 6308. p. 964.

Plane table, a square board with lines drawn on its upper side, used in taking angles and in measuring land, s. 2993. p. 481.

Plashing an old hedge, interweaving the stems in hedges, s. 3025. p. 490.

Plumassier, one who prepares feathers for ornamental purposes, p. 1088.

Pluviometer, rain gauge, s. 4742. p. 773.

Pneumonia, an inflammation of the lungs, p. 981.

Podders, persons employed to collect the green pods of peas off the plants, p. 837.

Polders, salt marshes in Holland and Flanders, p. 774.

Pole evil, or poll evil, a disease of the poll or head, usually at its hind part, or in the nape of the neck, s. 6442. p. 980.

Polled, hornless, devoid of horns, s. 6786. p. 1016.

Pommage, the pulpy mass to which apples are reduced by grinding in the cider counties, preparatory to pressing out the juice, p. 672.

Pommel, the prominence in the front or fore part of a saddle, p. 1003.

Potato pies, explained, s. 5344. p. 851.

Pouters, a variety of pigeon remarkable for its habit of pouting, p. 1095.

Preventive pruning, explained, s. 3990. p. 649.

Probing, a flexible piece of whalebone with a sponge fixed to the end, used occasionally in probing the throat, s. 6953. p. 1033.

Puddling, explained, p. 620.

Pulls, hills or elevated parts of a road, requiring extra pulling in draught animals, s. 3237. p. 525.

Pulmonary artery, explained, s. 6345. p. 967.

Pultaceous, of the consistence of a poultice, p. 1005.

Puniced foot, explained, s. 6521. p. 987.

Puncta lachrymalia, explained, s. 6370. p. 970.

Pupa, the chrysalis state of insects, p. 1112.

Purchase of the bridle, the command or control of it, s. 6676. p. 1003.

Pursiveness, *pursiness*, shortness of breath, s. 6693. p. 1005.

Pyrites, firestone, s. 3228. p. 523.

Pyroligneous acid, acid produced by distillation of the spray of trees, p. 493.

Q

Quadrant, a mathematical instrument; the fourth part of a circle, s. 3350. p. 544.

Quant, a small piece of board at the bottom of a jumping pole to prevent the pole sinking into the mud by the weight of the jumper's body.

Quarter-staff rod, a measuring staff having four sides, s. 3195. p. 518.

Quartering, the division of planks of wood lengthwise into small four-sided pieces.

Quarters of the horse's hoof, explained, s. 6420. p. 976.

Quick, a live fence or hedge formed of some growing plant, usually hawthorn.

Quick bends, sharp turns, p. 573.

Quicken tree. See *Ronan tree*.

Quickset hedge, a hedge formed of sets or plants that are quick; that is, alive.

Quincunx, trees planted in rows, at the same distance between the rows that the trees are in the rows, and the trees of one row opposite the vacancies in the other, s. 3923. p. 638.

Quit-rent, a small rent or acknowledgement payable by the tenants of most manors, s. 1117. p. 179.

Quittor, explained, p. 988.

R

Rabbit, a moulding, s. 4334. p. 715.

Rabins, explained, s. 7140. p. 1052.

Rafter, a piece of four-sided timber used in roofs.

Raftering land, ploughing half of the land, and turning the grass side of the ploughed furrow on the land that is left unploughed, p. 1166; as applied to timber, sawing up planks of trees into pieces of greater depth than width for rafters to roof buildings.

Rake hot, to steam or reek hot, s. 6723. p. 1008.

Ramose-headed trees, trees whose heads abound in branches, p. 649.

Ramose-rooted trees, trees whose roots are much branched, p. 634.

Rath ripe, the property of being early ripe, s. 5082. p. 823.

Rat's tail, a disease in horses, which causes the hair of the tail to fall off, and not be again produced, s. 6710. p. 1007.

Ray, a disease in sheep, explained, s. 7625. p. 1066.

Rectangular fields, fields whose angles are right angles, p. 680.

Rectangular parallelogram, a figure of four sides, whose opposite sides are equal, and all its angles right angles, p. 443.

Red roan, explained, s. 5106. p. 825.

Redwater, explained, s. 5106. p. 1064.

Rête mucosum, p. 968. A mucous membrane deposited in a net-like form, between the epidermis and the cutis; it covers the sensible cutaneous papillæ, connects the epidermis with the cutis, and gives the colour to the body. — *Crabb*.

Retina, the true organ of vision, formed by a net-like expansion of the pulp of the optic nerve, p. 970.

Rhomboid, a figure whose opposite sides are parallel and equal, but all its sides are not equal, neither are its angles right angles, p. 414.

Ribbing, explained, s. 3255. p. 527.

Ricking, explained, s. 3176. p. 516.

Riddle, a large coarse sieve, s. 3655. p. 589.

Ridging, laying the soil up in ridges, p. 508.

Riffling by gunpowder, riving, splitting, or dividing, s. 4065. p. 661.

Right angles, where a room is exactly square, each of the corners of it is called a right angle; in scientific language it is thus defined, as the fourth of a circle; or thus, when one straight line, standing on another straight line, makes the adjacent angles or corners equal to one another, each of the angles or corners is called a right angle.

Ring-bone in horses, a disease in the feet of the horse, p. 960.

Rippling of flax or hemp, the operation of separating the bales or seed pods, by striking them against a board, or piece of iron, p. 915.

Ristle-plough, explained, p. 1197.

River-meadows, explained, s. 5769. p. 901.

Ronan tree, the mountain ash.

Roguish plants, spurious varieties, s. 5220. p. 838.

Rooflet, explained, s. 3195. p. 519.

Root crops, esculent plants cultivated for their tubers, bulbs, or other enlarged parts produced under or immediately on the ground, and chiefly connected with the root, as the potato, turnip, carrot, &c.

Roots, the fibres and other ramifications of a plant under ground, and by which it imbibes nourishment. Tubers, bulbs, and other fleshy protuberances under ground, are employed by nature for the purposes of propagation or continuation, and therefore ought never to be confounded with common roots, which serve to nourish these tubers, bulbs, &c., in common with other parts of the plant.

Rot, explained, s. 7245. p. 1064.

Rouen, the aftermath, the lattermath, or second crop of hay cut off the same ground in one year, s. 3169. p. 515.

Rough pile in cattle, coarse hair or wool, p. 784.

Roupe, explained, s. 7526. p. 1095.

Rovels, explained, s. 6538.

Rubbies, a disease in sheep, explained, s. 7265. p. 1066.

Rubble stones, loose stones, brick-bats, and the like, which are put together to conduct water; so called because they are rubbed together.

Rumbling drains, drains formed of a stratum of rubble stones, p. 581.

Runner, explained, s. 4140. p. 675.

Runts, a variety of pigeon, p. 1095.

Rural economy, rural affairs, geonics, agronomics, terms considered as synonymous with husbandry.

Rust, a disease to which the cereal and other grasses are subject, and which occasions their herbage to be of a rusty colour, s. 5741. p. 899.

Rut, to cut a line on the soil with a spade, p. 482; also the copulation of deer in the rutting season; also the track of a cart-wheel.

Rutting. See *Rut*.

S.

- Saccharo-saline*, partaking the properties both of sugar and salt, p. 1039.
- Saddle-grafting*, explained by figures, p. 1143.
- Satin*, explained, s. 5360. p. 853.
- Sativa*, the spittle of animals.
- Salt-cat*, a mixture given to pigeons to promote their digestion, p. 1096.
- Saltings or ings*, salt-water marshes, p. 747.
- Sandcracks*, explained, s. 6525. p. 983.
- Sauer kraut*, explained, s. 5507. p. 868.
- Scab*, explained, s. 7265. p. 1066.
- Scalene triangle*, a triangle with three unequal sides, s. 4343.
- Scantling*, all quartered timber under five inches square, s. 4002. p. 652. In masonry, a term expressive of the size of stones.
- Scarcement*, a rebate or set-back in the building of walls, or in raising banks of earth, p. 481.
- Scarification*, cutting through the bark and soft wood of a thick branch with an edge tool, previously to sawing through the hard wood, s. 3164. p. 513.
- Scapula*, the shoulder blade, p. 964.
- Scarifier*, a machine to excoriate and disturb the surface of soil, p. 523.
- Sclerotic coat*, a coat of hard consistence, p. 970.
- Scoop wheel*, a large wheel with numerous scoops fastened in its periphery, s. 4277. p. 706.
- Scoria* of founderies, the refuse or dross of the metals, s. 3643. p. 588.
- Screening*, the act of sifting earth or seeds through a large oblong sieve or riddle, called a screen, p. 509.
- Scudda*. See *Fors and Scudda*.
- Scuffler*, a kind of horse-hoe, p. 523.
- Scutching flax*, breaking the woody part of it preparatory to separating it from the fibrous parts, p. 915.
- Sea-ooze*, the alluvial deposit, the mud or slime left by the sea where its waters have subsided, p. 746.
- Seed-lobes*, the cotyledons, or very first leaves displayed on a seedling plant.
- Sellenders*, in horses, explained, s. 6293. p. 961.
- Seminal roots*, the first roots, those emitted from the seed itself, p. 808.
- Sensible frog* of the horse, explained, s. 6420. p. 975.
- Sensible linnææ*, explained, s. 6421. p. 976.
- Septic*, causing putridity, producing putrescence, s. 6844. p. 1023.
- Serum*, whey, or the remainder of milk after its better parts have been taken away; also, the yellow and greenish fluid which separates from the blood when cold and at rest, s. 6980. p. 1036.
- Sesamoids*, little bones found at the articulation of the toes (in man); so called from their supposed resemblance to the seeds of the plant called sesamum, s. 6319. p. 965.
- Setons*, explained, s. 6537. p. 990.
- Set-rod*, explained, s. 3014. p. 436.
- Sets and eyes* of potatoes, slices of the tubers of the potato, each slice being furnished with at least one eye or bud, p. 848.
- Shab*, explained, s. 7265. p. 1066.
- Shagreen*, or *fagri*, the prepared skin of the ass, s. 6757. p. 1012.
- Shakes* in the boles of trees, fissures, clefts, or rents, p. 656.
- Shakers*, a variety of pigeon, p. 1095.
- Shaking quags*, shaking bogs; wet spongy soil, p. 694.
- Shaley soil*, explained, s. 4750. p. 774.
- Shearer*, a reaper, s. 3250. p. 526.
- Shearing*, reaping, p. 515.
- Sheath*, land guard of embankments, s. 4362. 4366. p. 719, 720.
- Shearing rivers*, the process of mowing the plants which abound in rivers; the instrument with which this is effected is formed of a line of scythe-blades, riveted together by their extremities, and which line of scythe-blades is worked or moved along over the surface of the mud by levers attached to the line, operated upon by men in boats, s. 3171. p. 515.
- Shift of crops*, an alternation or variation in the succession of crops, p. 814.
- Shifting beach*, a beach of gravel liable to be shifted or moved by the action of the sea, or the current of rivers, s. 4332. p. 714.
- Shingles*, pieces of thin board used as tiles, a common practice in timber countries on the Continent and in America, s. 3051. p. 495.
- Shocks*, stooks or hattocks, assemblages of sheaves, never of more than ten sheaves in those places where the tithe is paid in kind, as this arrangement facilitates the taking of the tithe; in Scotland, from six to twelve, independently of the two or four hood or roof sheaves, p. 515.
- Shoughed*, earthen in, p. 640.
- Sidlow peas*, such as boil freely, s. 7791. p. 1140.
- Siliceous*, of the nature of sand or flint, p. 587.
- Siloes*, repositories, explained, s. 4988. p. 810.
- Single wind-rows*, a single range of new-made hay, before it is packed into cocks, p. 903.
- Skirting or great turning*, explained, s. 3210. p. 520.
- Skreen* plantations, plantations made for the purpose of screening or sheltering, p. 753.
- Slab*, the outer board sawed from the trunk of a tree.
- Sleepers*, explained, s. 3785. p. 613. In Suffolk the root stocks, when left in the soil, of such trees as are sawed off level with the surface.
- Slip-cat cheese*, explained, s. 7085. p. 1047.
- Slit planting*, explained, s. 3953. p. 642.
- Slob farrow*, explained, s. 3213. p. 521.
- Sludger*, explained, s. 2518. p. 378.
- Snaffle*, a bridle with a single rein, and without a curb, s. 6734. p. 1009.
- Snag pruning*, pruning or cutting off branches so as to leave snags, s. 4027. p. 655.
- Snags*, stumpy bases of branches left in pruning, s. 3993. p. 650.
- Sob*, a convulsive spasm of the air passages to relieve congestion, s. 6723. p. 1008.
- Soil*, earth, either of one or of several sorts, mixed with decomposed organic matters.
- Soiling*, feeding horses or cattle in houses or sheds with clover or other herbage in a green state, p. 874.
- Sough*, a box-drain, s. 4254. p. 700.
- Sowens*, explained, s. 5146. p. 828.
- Spray*, to incapacitate a female animal for producing young, s. 7306. p. 1069. See *Castrate*.
- Sphacelated*, withered, blasted, mortified, gangrened, s. 6945. p. 1032.
- Spinous processes*, projections resembling spines or prickles, s. 6764. p. 1013.
- Spire*, grown, shot out into spires, s. 5108. p. 825.
- Spiful of earth*, a spadeful of earth, p. 507.
- Splint*, in horses, a preternatural excrescence of bone, or a hard tumour, s. 6293. p. 961.
- Spots*, a variety of pigeon, p. 1095.
- Spray drain*, a drain formed by burying the spray of wood in the earth, which keeps open a channel, s. 4284. p. 703.
- Spray of a tree*, the twigs of the branches of a tree, p. 649.
- Spring feed*, herbage produced in the spring, p. 905.
- Squackers*, pigeons under six months of age, p. 1096.
- Stacking stage*, explained, s. 3289. p. 533. In Cambridge, the object of the stage is effected by a stage hole left in one side of the upper part of the rick.
- Stack guard*, explained, s. 3288. p. 532.
- Staddles*, explained, s. 5796. p. 903.
- Stake and rice*, a fence composed of stakes driven into the ground and interwoven with branches retaining their spray, or with rods without their spray; the latter is frequently called a wattled fence, p. 487.
- Staggers*, a disease of the horse, explained, p. 978.
- Straw mow*, a stack or rick of straw formed in a barn, s. 5045. p. 818.
- Steining a well*, lining it with stone or brick, s. 4479. p. 755.
- Stifle of the horse*, explained, s. 6276. p. 950.
- Stire*, a sort of cyder apple, s. 4082. p. 665.
- Stock*, the animals of agriculture called live stock; also, the implements and other lifeless articles of property on a farm, called dead stock.
- Stocking a pasture*, putting in as many head of cattle as the pasture will maintain, s. 5285. p. 906.
- Stolones*, the creeping rooting shoots of some grasses, and other plants, by which they increase, p. 904.
- Stoloniferous grasses*, grasses producing stolones, p. 887.
- Stone-brash*, a sub-soil composed of shattered rock or stone, s. 4519. p. 742.
- Stooks*, shocks or hattocks, p. 817.
- Stools of a coppice*, the stumpy root-stocks of trees previously cut down, p. 662.
- Stover of rape*, the pods and points broken off in threshing, p. 932.
- Strull*, a bar so placed as to resist weight, p. 498.
- Stubs*, stucky stumpy portions of the stems of trees and shrubs, p. 1009.
- Stud*, a post, a stake, an upright, in a building, p. 500.; a collection of breeding horses and mares.

Stumming, explained, s. 4132. p. 674.
Sturdy, explained, s. 7207. p. 1066.
Subcarbonate of soda, a salt in which soda predominates, p. 837.
Sublingual, under the tongue, s. 6383. p. 972.
Succedaneum, a substitute, p. 846.
Swath, the bands or ridges produced by mowing with the scythe, p. 903.
Swath balk, the line between two swaths where the stubble is cut least closely, presenting a little ridge of stubble, p. 514.
Sways, long bramble rods used in thatching with reeds, p. 518.
Sweating of hay, a slight fermentation, p. 904.
Swing plough, any plough without wheels, p. 390.
Switching bill, an instrument used in pruning hedges, p. 455.
Switching hedges, cutting off the one year's growth which protrudes from the sides of hedges, s. 4005. p. 652.
Synchronous, at one time, at the same time, contemporary, p. 1002.
Synopsis, the seeing all at once, or at one view; a comprehensive volume, p. 881.
Synovia, joint oil, p. 965, 907.
Systole, explained, s. 6351. p. 963.

T.

Tag-belt, a disease in sheep, explained, s. 7260. p. 1065.
Tail drain, explained, s. 4414. p. 726.
Tapetum, explained, s. 6373. p. 970.
Tarsus, explained, s. 6328. p. 964.
Teaching, explained, s. 5524. p. 906.
Tecernos, explained, s. 7141. p. 1052.
Tedding hay, scattering, spreading, turning, and, in short, making hay, p. 903.
Tenon, a projection in a rail, &c., made to fit a mortice.
Tenon joint, a joint formed by a tenon and mortice, p. 598.
Tenure, a holding or occupying, p. 179.
Territorial economy, whatever relates to the valuation, purchase, sale, exchange, arrangement, improvement by roads, canals, drainage, &c., of territorial surface, including interposing waters, as rivers, lakes, and also mines and minerals. Territorial improvements are mostly effected by the proprietors of lands or their agents and stewards, and not to any great extent by renters of land, or farmers.
Tétanus, a spasmodic affection, accompanied by rigidity, one species of which is known by the popular name of a locked jaw, s. 6370. p. 970; s. 6432. p. 978; s. 6965. p. 1035.
Tethering, restraining grazing animals by a rope or chain, fastened to the animal at one end, and to the earth at the other, s. 5560. p. 876.
The line of draught, the direction in which an animal is pulling or drawing, s. 2592. p. 390.
Theodolite, an instrument used in surveying, and chiefly in taking angles, p. 544.
Thill, the beam or draught tree of a cart or waggon.
Thiller or Thill horse, the horse that is put under the thill, or into the shafts or draughts, p. 1139.
Thoracic duct, the trunk of the absorbent vessels, so called from its being placed in the thorax or chest, p. 908.
Thorough-pin, explained, s. 6293. p. 961.
Threave, twenty-four sheaves of straw or corn, s. 3168. p. 517.
Thrush paste, explained, s. 6554. p. 988.
Tibia, the leg bone, p. 965.
Ticks, a variety of bean, called the tick bean, s. 5225, 5226. p. 838.
Tie, a bar so placed as to resist a drawing or twisting power, p. 498.
Till, coarse obdurate land, p. 746.
Tiller, to send forth numerous stems from the root; applied only to culmiferous plants, s. 4984. p. 808.
Tilting. See *Tiltter*, s. 5130. p. 826.
Tith, the degree or depth of soil turned by the plough or spade, that available soil on the earth's surface, into which the roots of crops strike, p. 803.
Tippling, as applied to hay-making, explained, s. 5549. p. 875.
Tithe, the tenth of the produce of the soil, paid to the clergy of England.
Tithing-man, a person employed by the clergyman in a village to set out and collect his tithes.
Torrefied earth, earth subjected to the action of fire, p. 522.
Trachea, the windpipe, p. 972.
Tracking flax, breaking the woody part in the stems of flax, s. 5912. p. 915.

Tramp, an instrument used in making hedges, p. 431.
Tramroad, explained, s. 3795. p. 615.
Translucent, transparent, diaphanous, allowing light to shine through, p. 811.
Trumbings, explained, s. 7253. p. 1065.
Trench, explained, s. 4412. p. 726. To trench, to turn over and mix soil to the depth of two, three, or more spades, or spits.
Trench drain, explained, s. 4413. p. 726.
Trindle, to allow to trickle or run down in small streams, p. 641.
Trochar, an instrument resembling a pipe, used for making incisions, when water or air is received out of the incision through the trochar, p. 1034.
Truncheons, large sets, stakes, or poles, of willow, poplar, &c. planted to form trees speedily, p. 749.
Trumpeters, a variety of pigeon, p. 1095.
 Tubers, knobs, fleshy bodies at the roots of plants, as in potato, yam, pignut, &c., p. 511.
Tumblers, a variety of pigeon, p. 1095.
Turbits, a variety of pigeon, p. 1095.
Turners, a variety of pigeon, p. 1095.
Turnsick, explained, s. 7267. p. 1066.
Tussocks of grass, clumps, tumps, tufts, or minute hillocks of growing grass, p. 518.
Twibil and hink, explained, s. 5171. p. 832.

U.

Urinarium, a receptacle for urine, s. 6098. p. 1038.

V.

Vetum palātū, explained, s. 6382. p. 972.
Vena cava, explained, s. 6348. p. 967.
Vena cava ascendens, explained, s. 6348. p. 967.
Vena cava descendens, explained, s. 6348. p. 967.
Vena porta, explained, s. 6349. p. 967.
Vinquish. See *Vining*.
Viscid, thick, glutinous, gummy, p. 1086.
Vivacious, living, sprouting, very lively, very free of growth, p. 803.
Vives, explained, s. 6388. p. 972.

W.

Wads, explained, s. 5208. p. 836.
Walls dashed with lime. See *Harled*.
Walls en pisé, walls built of mud rammed in between a frame of boards, p. 477.
Warbles, explained, s. 6489. p. 984.
Ward-holding, explained, s. 3402. p. 552.
Warping, explained, s. 4452. p. 732.
Watering of hemp, the maceration, steeping, or immersion of the stems of the hemp plant, in water, s. 671. p. 107. 917.
Water-retted, watered, s. 5929. p. 917.
Water tables across a road, sunk pannels, which conduct the surface water into drains, p. 582.
Water-tabling, explained, s. 3014. p. 485.
Watery head, explained, s. 7267. p. 1066.
Wattle, to weave, to interlace, or plat branches of rods.
Wattled fence. See *Stake and Kick*.
Wattled hurdles, hurdles wattled with rods.
Way panc, explained, s. 4416. p. 726.
Wear, a dam made with stakes and osier twigs interwoven, as a fence against water, p. 722.
Well-bred, explained, s. 2061. p. 305.
Whethring, explained, s. 6971. p. 1035.
Whin, furze, gorse, gorse, or goss, p. 510.
Whinstone, explained, s. 3654. p. 599.
Whipping out grain, striking the ears against a stone or the edge of a board, till the corn is separated from the straw, p. 519.
Whipping in plants, to bruise, abrade, or injure, by rubbing or striking against another, as the competing branches of neighbouring trees, s. 4014. p. 633.
Whirlbone of the horse, the articulation of the thigh bone with the pelvis, 959.
Whitten, the small-leaved lime, p. 1141.
Wilding, trees sprung up from seeds naturally distributed, i. e. by winds, birds, running waters, &c., p. 675.
Wintestraws, the withered flower-stalks of grasses standing in the fields; in English, bents, s. 5058. p. 820.
Wornals or puckeridge, explained, s. 6968. p. 1035.
Woodward, a land-revee or ground officer, s. 4638. p. 760.

Y.

Yellows, explained, s. 6480. p. 984.
Yerking, one of the motions taught to horses, s. 6672. p. 1103.

GENERAL INDEX.

* * * *The Numbers refer to the Paragraphs, not to the Pages, except in the case of the List of Authors, where they refer to the page and the year in which the Author published: in such cases the word page and letters A. D. are prefixed.*

- ABBATE**, Antonio, his work on agriculture, page 1221. A. D. 1808.
- Abeille**, F., his work on agriculture, page 1217. A. D. 1791.
- Aberdeenshire, statistics of, 7852.
- Abortion in plants, 1683.
- Abyssinia, climate, surface, and soil of, 1067; agricultural products of, 1068; live stock of, 1069; agriculture of, 1070.
- Acclimating of plants, 1764; the more tender animals, 7390.
- Account books, farmers', 4886
- Accounts, keeping and auditing, 4708; keeping, 4883; necessity of a regular system of, 3281.
- Acid, fluoric, in animals, 1924; muriatic, in animals, 1925; pyroligneous, distillery of, at Milburn in Dunbartonshire, 7843.
- Acids, 1423; oxalic, 1424; acetic, 1425; citric, 1426; malic, 1427; gallic, 1428; tartaric, 1429; benzoic, 1430; prussic, 1431; vegetable, constituents of, 1432; animal, 1953.
- Adam**, James, his work on agriculture, page 1210. A. D. 1789.
- Adam**, of Blair Adam, 7847.
- Adams**, George, his work on agriculture, page 1212. A. D. 1810.
- Adanson**, Madame Aglaé, her work on agriculture, page 1218. A. D. 1822.
- Adansonia digitata*, 1109.
- Africa, general description of, 1066.
- After-grass on meadows, 5810.
- Agricultural Institution of Moegelin, 576.
- Agricultural Society, Australian, 1043.
- Agricultural Societies of Hanover and Celle, 593.
- Agriculture among the Romans, decline of, 178.
- Agriculture, as influenced by climate, 1248; by temperature and light, 1259; by elevation, 1260; by soil, 1263; by moisture, 1264; by the state of society, 1270; by civilisation, 1271; by political circumstances, 1272; by religion, 1273; by the character of a people, 1274.
- Agriculture, bibliography of, 7896.
- Agriculture during the seventeenth century, 234.
- Agriculture, earliest Spanish works on, 713.
- Agriculture, history of, in the ages of antiquity, 5; in Egypt, 8; among the Jews, 17; of the Greeks, 24; of the Persians and Carthaginians, &c. 36; among the Romans, 42; during the middle ages in Italy, 180; in France, 185; in Germany, 192; in Britain, 195; in ultra-European countries, 47.
- Agriculture, improvement of, by refining the taste of the purchasers of its products, and increasing the knowledge of agricultural patrons, 7926; by the better education of those engaged in it, 7930.
- Agriculture in England during the thirteenth and fourteenth centuries, 210; in the fifteenth century, 211; in the sixteenth century, 216; early in the sixteenth century, 221; during the reign of Elizabeth, 222.
- Agriculture in ultra-European countries during the middle ages, 257, 258.
- Agriculture may be practised without any knowledge of its theory, 1286; object of the art of, 1287; study of the science of, 1289.
- Agriculture of Britain, classification of the, 1280; improved by the Norman conquest, 204.
- Agriculture of irrigation, geographical extension of the, 1254; of manures and irrigation, 1255; of draining and manures, 1256; of science, 1276; of habit, 1277; barbarian, 1278; of savages, 1279; of water-fed lands, 1266; of sun-burnt lands, 1267; of mountains, 1268; common, 1269.
- Agriculture, origin of and importance; practice of, in early times; recent discoveries in; arrange-
- ment of the subject in this work, pages 1 to 3; the operations, 3111; the physical circumstances affecting, 1258; traditional history of, 1, 2; works on, during the commonwealth, 250.
- Agriculturists, commercial, the different kinds of, 7724; itinerant, 7725; professional education of, 7942.
- Aigoin**, his work on agriculture, page 1218. A. D. 1805.
- Ainslie**, John, his works on agriculture, page 1212. A. D. 1806.
- Air, fresh, proper for domestic animals, 2076; noxious in wells, 4480.
- Aiton**, William, his works on agriculture, page 1212. A. D. 1805.
- Alamanni**, his work on agriculture, page 1221. A. D. 1764.
- Alamanni**, Luigi, his work on agriculture, page 1221. A. D. 1546.
- Albania, agriculture of, 758.
- Albertazzi**, Jacopo Antonio, his work on agriculture, page 1222. A. D. 1811.
- Albrecht**, J. F. E., his work on agriculture, page 1219. A. D. 1775.
- Albumen, 1344. 1406; in animals, 1939; use of, 1940.
- Alderson**, John, M. D., his work on agriculture, page 1211. A. D. 1862.
- Alge, utility of the, 1333.
- Algiers, description of the territory of, 1095.
- Alkalies, vegetable, 1500; utility of, 1501.
- Alletz**, Pons Augustin, his works on agriculture, page 1215. A. D. 1760.
- Almond tree, the, at the Cape of Good Hope, 1122.
- Aloe, the, in Spain, 723; of the Cape of Good Hope, 1123.
- Amazonia, agriculture of, 1244.
- Ambergris, 1949.
- Amcithon**, Hubert Pascal, his work on agriculture, page 1216. A. D. 1779.
- America, agricultural operations of, 1170; field labours in, 1171.
- America, North, temperature of the eastern parts of, 2352.
- Amloé**, Le P., his work on agriculture, 1216. A. D. 1770.
- Ammonia in animals, 1929.
- Ammoniac, 1474.
- Amoretti**, his works on agriculture, page 1221. A. D. 1785.
- Amoreux**, his works on agriculture, page 1216. A. D. 1787.
- Amos**, William, his works on agriculture, page 1210. A. D. 1794.
- Amphibia, 7589.
- Analysation of plants, mechanical and chemical processes for the, 1392, 1393.
- Analysis, vegetable, products of, 1394; compound products of, 1395.
- Anderson**, James, LL. D., his works on agriculture, page 1209. A. D. 1775.
- Anderson**, William, his work on agriculture, page 1213. A. D. 1816.
- Angler, the, injurious to young salmon, 3892.
- Anglo-Saxons, origin of the, 200.
- Angus, statistics of, 7850.
- Animals affected by climate, 1249.
- Animals, androgynous, 1984; gemmiparous, 1985; hybridous, 1986; dead, as a manure, 2245; distribution of, on the face of the globe, 1999; local distribution of, 2005; domestic, the rearing of, 2066.
- Animals, external covering of, 1844; importance of, in the arts, 2013, 2019; as articles of food, 2015; in medicine, 2018; influence of soil and climate

- on the general properties of, 8024; killed by accident not unwholesome, 2997; more numerous than plants, 1998; necessity of a partial knowledge of, 1837; of Britain, 1838; noxious to agriculture, 7623; reared by the Romans, 156; the classification of, 1842; the elementary substances composing, 1917; the mode of describing, 1840; viviparous, reproduction of, 1974; vertebrated, distribution of, 2002; marine, distribution of, 2003.
- Animé**, from what obtained, 1468.
- Annuaire de la Société Royale et Centrale d'Agriculture**, Anon. page 1219. A. D. 1826.
- Annuaire du Jardinier et de l'Agronome, pour 1826**. Anon. page 1219. A. D. 1826.
- Annals**, 1569.
- Anomalies in plants**, 1589; in the parts of plants, 1320.
- Anstruther**, Sir John, Bart. his work on agriculture, page 1211. A. D. 1796.
- Ant and mole hills**, removal of, on pastures, 5821.
- Antelope**, the, 7378; the common, 7380; the chamois, 7381; the Scythian, 7382; the white-footed, 7383.
- Ant-hills**, 5775; to remove, 5776; Norfolk mode of cutting and burning, 5777; gelding, 5778.
- Antill**, Hon. Edward, Esq. his works on agriculture, page 1223. A. D. 1789.
- Anton**, K. Glo., his work on agriculture, page 1220. A. D. 1799.
- Antrim**, statistics of, 7895.
- Aphides**, the, or plant lice, 7682; of beans, 5256.
- Apiary**, the, 2845. 7603.
- Apples**, baking, most suitable for orchards, 4088; cider, the most approved sorts of, 4086; table of, 4089; dessert, fit for orchards, 4090; orchard, Ronald's select list of, 4098; Pearson's select list of, 4099.
- Apple-mill**, the, 4145.
- Appraiser**, agricultural, 7749.
- Apprentices**, agricultural, 4879. 7712.
- Aprazin**, M., his work on agriculture, 7907.
- Aquatics**, influence of altitude on the habits of, 1737.
- Aquino**, Charles d', his work on agriculture, page 1221. A. D. 1736.
- Arabia**, extent of, 883; general surface of, 884; agricultural products of, 885; plants and trees of, 886; live stock of, 887; agricultural implements and operations of, 889.
- Architecture of Thibet**, 1019.
- Ardrassan**, the harbour at, 7841.
- Arduinio**, Luigi, his works on agriculture, page 1222. A. D. 1809.
- Argyleshire**, statistics of, 7858.
- Armagh**, statistics of, 7893.
- Armature of plants**, 1318.
- Arrangement of plants**, the artificial and natural, 1302 and 1303.
- Arrow-root**, the, of the West Indies, 1219.
- Artichoke**, Jerusalem, 5512.
- Arum esculentum**, 1217.
- Ash tree**, large, in Bonhill churchyard in Dunbartonshire, 7843.
- Ashes** for lixivation, 682.
- Ashes of plants**, 1498; analysis of, 1499.
- Asia Minor**, climate of, 861.
- Asia**, the islands of, 1029.
- Asparagus**, treatment of, in the Netherlands, 493.
- Aspect** in regard to farming lands, 4771.
- Aspafetida**, 1482.
- Ass**, the, 6756; excellencies and defects of, 6757; the different breeds or races of, 6759; breeding, 6760; breaking the, 6762; to know the age of, 6763; anatomy and physiology of the, 6764; diseases of, 1665; shoeing of the, 6766.
- Asses**, the, of Egypt, 1087.
- Astragalus bæticus**, culture of, 6166.
- Atmosphere**, substances composing the 2333; action of, on plants, 2344; changes in the, 2345.
- Atti del real instituto d'incoraggiamento, &c.** Anon. page 1222. A. D. 1825.
- Auditor of accounts**, the most essential duty of an, 4715.
- Audouin**, Maurice, his work on agriculture, page 1218. A. D. 1829.
- Auger**, the common draining, 4314; the horizontal, 4317; use of the, in well-digging, 4481.
- Australia**, the islands of, 1034.
- Austria**, state of agriculture in, 619; landed property of, 620; crown lands in, 622; appearance of the country of, 623; instruments of agriculture in, 624; agricultural produce of, 625; vine, culture of, 627; culture of plums in, 626; culture of silk in, 630; bees in, 631; live stock of, 632; horned cattle of, 633; horses of, 634; swine of, 635; poultry of, 636; the land tortoise of, 637; implements and operations of agriculture in, 638; forests of, 639; improvement of the agriculture of, 640.
- Author**, the agricultural, 7757.
- Authors**, agricultural, in the time of Elizabeth, 231; Roman, 24.
- Autumn**, temperature of, influence of, on plants, 1729.
- Aviary**, 7566.
- Avouin**, Foulin, his work on agriculture, page 1218. A. D. 1818.
- Awns of barley**, method of rubbing off the, 2798.
- Axe**, the, 2490.
- Axles**, Burges's improvement in, 2751.
- Axle-trees**, the best for preserving roads, 3737.
- Ayrshire**, statistics of, 7841.
- Azote**, in the atmosphere, 2341.

B.

- Bachapins**, description of the, 1138.
- Bacon-grub**, the, 7692.
- Badger**, the, 7630.
- Bagging corn**, 3174.
- Bagot**, his works on agriculture, page 1218. A. D. 1806.
- Barley**, John, Esq., his works on agriculture, page 1211. A. D. 1797.
- Bailiff and gardener**, 7718.
- Bailiff**, choice of a, 4867.
- Bakewell**, Robert, Esq., his work on agriculture, page 1212. A. D. 1808; improvements by, in the live stock of Britain, 787.
- Balsam of Peru**, 1488; of Tolu, 1487.
- Balsams**, 1483.
- Bamboo**, the, uses of, 908.
- Banister**, John, his work on agriculture, page 1211. A. D. 1799.
- Bank** formed with piles, brushwood, and stones, 4350.
- Bar Loch**, drainage of, 4276.
- Barbaro**, Marco, his work on Agriculture, page 1221. A. D. 1785.
- Barbe-Marbois**, his works on agriculture, page 1217. A. D. 1798.
- Barber**, William, his works on agriculture, page 1212. A. D. 1805.
- Bard**, C. P., his work on agriculture, page 1219. A. D. 1825.
- Barelle**, Giuseppe, his works on agriculture, page 1221. A. D. 1807.
- Barilla**, cultivation of, 6104.
- Bark of trees**, drying, 4051; chopping, 4052.
- Bark**, spent, tanner's, as a manure, 2242.
- Barking trees**, 4050.
- Barley**, frosted, 4998.
- Barley**, 5080; species and varieties of, 5081; soil for, 5093; manure for, 5097; climate for, 5098; sowing, 5099; culture of, in a growing state, 5104; harvesting of, 5107; stacking, 5109; thrashing and dressing, 5110; produce of, 5111; uses of, 5112; diseases of, 5119; insects injurious to, 7963.
- Barometer**, use of the, 2346. 2408; the words engraved on the, 2416.
- Barron**, William, F.R.S.E., his work on agriculture, page 1219. A. D. 1774.
- Barrow-drill**, the turnip, 2578.
- Barrows** for hay and straw 2540.
- Barthez** de Marmorées, his work on agriculture, page 1215. A. D. 1763.
- Bartley**, Nehemiah, Esq., his work on agriculture, page 1211. A. D. 1802.
- Barton**, Benjamin Smith, M.D., his work on agriculture, page 1223. A. D. 1812.
- Bartram**, John, M.D., his work on agriculture, page 1223. A. D. 1744.
- Bartram**, Moses, his work on agriculture, page 1223. A. D. 1789.
- Base** of a road, preparation of the, 3622.
- Baskets**, 2525.
- Bassi**, Agostino, his works on agriculture, page 1222. A. D. 1811.
- Bastard sffron**, 5987; soil for, 5990; use of, 5991.
- Bath and West of England society**, the, 7914.
- Bauers**, German, farming of the, 605.
- Bavaria**, former state of agriculture in, 614; agricultural improvement of, 615; surface of, 616; crops cultivated in, 617; forests of, 618.
- Baydon**, J. S., his work on agriculture, page 1213. A. D. 1825.

- Peaks of birds, 1869.
 Beans, Carob, 1104.
 Bean drills, 2683; Weir's expanding, 2684.
 Beans, 5222; drilling of, 5223, varieties of, 5224; choice of, 5226; the best soils for, 5227; climate for, 5232; sowing, 5233; dibbling, 5237; after culture of, 5240; reaping, 5244; stacking, 5247; threshing, 5248; produce of, 5249; application of, 5251; diseases of, 5255.
 Beans, insects injurious to, 7666.
 Beasts of labour, 2014.
Beaton's contrivance for preventing ruts in roads, 3746.
Beaton, Major-General Alexander, his work on agriculture, page 1213. A. D. 1820; new theory of roads, 3695.
Beauné, Antoine, his work on agriculture, page 1216. A. D. 1770.
 Bed of a river, &c., 4420.
Beddoes, Thomas, M.D., his works on agriculture, page 1212. A. D. 1808.
 Bedford House of Industry, 7784.
 Bedfordshire, statistics of, 7784.
 Bee, the common, 7602; feeding, 7608; swarming, 7610; suffocating, 7614; produce and profit, 7615.
 Bees in Perthshire, 7849; in the 16th century, 248; of Galloway, 7840; rearing of, in Hungary, 631; in Poland, 635.
Belair, A. P. Julienne de, his work on agriculture, page 1217. A. D. 1794.
Belgrove, William, his work on agriculture, page 1223. A. D. 1755.
Bell, Benjamin, F.R.S.E., his work on agriculture, page 1212. A. D. 1802.
 Bell's reaping machine, 2737.
 Bend, a, 4417.
 Bends for ship-timber, mode of pruning, for producing, 4000.
Bennett, Santo, his work on agriculture, page 1222. A. D. 1810.
 Benin, description of, 1106.
 Benzoin, 1484.
 Berkshire, statistics of, 7790.
 Berry of plants, 1855.
Berry, the Rev. Henry, his opinion on the choice of live stock for breeding and feeding, 4851; his work on agriculture, page 1214. A. D. 1830.
Berthelot, his work on agriculture, page 1216. A. D. 1782.
Bertrand, Elie, his works on agriculture, page 1215. A. D. 1764.
Bertrand, his work on agriculture, page 1217. A. D. 1794; his work on agriculture, page 1221. A. D. 1780.
Bertrand, Jean, his work on agriculture, page 1215. A. D. 1764.
Bertrichius, Dionysius, his work on agriculture, page 1221. A. D. 1496.
 Berwickshire, statistics of, 7835.
 Besoms used in farming, 2468.
 Betel leaf of Sumatra, 1024.
Bezon, Gabriel Leopold Charles Ame, his works on agriculture, page 1216. A. D. 1773.
 Bibliography, agricultural, of North America, 7908.
 Bibliography of British agriculture, 7898; of French agriculture, 7900; of German agriculture, 7901; of Italian agriculture, 7902.
Bidel, M., his work on agriculture, page 1221. A. D. 1778.
 Billington's opinion on pruning, 3990.
