CONDUR V.

WO of these (supposed to be male and semale) are in the Leverian Museum, collected by Mr. Parkinson. The first is in breadth from the tip of one wing to that of the other, at least ten seet. The head and neck are covered with cinereous down; on the crown of the head is a long carunculated membrane, like that of Supp. II.

B

a cock,

DESCRIPTION.

a cock, which is irregularly indented at top; part of the throat is also bare, and a kind of pendulous pear shaped substance on the breast, in the manner of the King Vulture: the general colour of the plumage is black, but the lower part of the neck is furrounded with a white ruff, of a fine hairy substance: the lesser wing coverts are wholly black; the middle ones have greyish white ends, forming a bar when closed; the greater ones are half black half white, divided obliquely; the three first quills are quite black, the second quills greyish white, tipped with black: tail even, thirteen or fourteen inches long: thighs covered with longish feathers: legs stout, brown; claws blunt, black: bill strong, moderately hooked; colour black, with a white tip; and nostrils placed in a depression at the base. When the wings are at rest on the body, the middle of the back appears white; which circumstance is observed by Molina, in his Natural History of Chili\*. He also says, the irides are of a red brown, and that the female is rather finaller than the male. These birds make their nefts among the most inaccessible rocks, and lay two white eggs bigger than those of a turkey; they feed on dead carcases; and as there are no wolves in Chili, these birds supply the place of them, and at times prey on sheep and goats, and even young calves, when they stray far from their dams; and these last they fall upon in flocks, first plucking out their eyes, and soon afterwards tearing them in pieces. The country people use every means to destroy this bird, fometimes by a person covering himself with the hide of a newly skinned animal, and so managing, that when the Condur attempts to attack the hide, other persons lying in readiness come to the affiftance of the first, and failing on the bird all at once, overcome the enemy; at other times, a dead carcafe is put within a place enclosed with rails, and when the Condur has satiated himself with the flesh, and unable to rise freely, persons are in readiness to subdue him

\* Fr. ed. p. 247.

by

by blows and every other means possible. The bird, however inactive on such occasions, is at other times of very quick slight, insomuch as not unsrequently to foar to such an height as to be out of the reach of human vision. It is called by the inhabitants of *Chili* by the name of *Manque*; the biggest hitherto observed, measured full fourteen feet from the tip of one wing to that of the other when extended.

Calisornian Vulture, Nat. Misc. v. 9. pl. 301.

CALIFORNIAN
V.
Description.

In fize, this bird nearly equals the Condur. The general colour of the plumage is black; but the fecond quills have whitish tips, and the wing coverts incline to brown: the wings when folded, reach beyond the tail: the head and neck are entirely bare of feathers, quite smooth, and of a dusky reddish colour: across the front is a bar of dusky; and two others of the same on the hind head: the bill is of a pale colour: the lower part of the neck is surrounded with a russ, composed of slender black feathers, of the structure usually seen in many of the genus: the under part of the body is covered with loose downy feathers; the tail is even at the end: the legs black.

This bird was brought from California, by Mr. Menzies, and is now in the British Museum: it seems to have some affinity to the Condur.

it is common in the Pyrenæan mountains; also in Egypt according to Scanini. Mr. Levaillant observes, that they resort to Table Bay, at the Cape of Good Hope; and not unsrequently a surious south-east wind obliges them to quit the mountains, and sometimes beats them down into the streets at the Cape, where they are knocked on the head with sticks. M. de la Peirouse † observes, that the male and semale are different in colour; the first wholly white, the other brown, but only so in the adult state; for when young and incomplete in plumage, they are often of a pale colour; above spotted yellow and brown, with the under parts yellow, and differing so materially from the old ones in external appearance, as to deceive the less experienced naturalist.

Ash-coloured Vulture, Gen. Syn. i. p. 13.

Angola Vulture, Gen. Syn. i. p. 18. 14.

DESCRIPTION.

THIS has been before described under several of the respective heads above quoted; but I think it not amis to add here, Mr. Levaillant's account of it, who says, that it is about the size of a female Turkey; the whole front of the head much beyond the eyes, and

taking

<sup>\*</sup> Bechst. Must. p. 55. † Neu. Abh. der Schw. Ac. der Wiss, S. 99.

taking in the threat, is bare, and of a faffron colour: the bill long and stender, of a rather deeper colour, but blackish towards the point: the rest of the neck, on the sides, and behind, is covered with long stender feathers, but before, as far as the crop, it is scarcely more than downy; and the crop itself bare, and orange brown: the general colour of the plumage and tail, is dirty rusous white, rather pale: the quills are mostly black, but the secondaries are outwardly the colour of the rest of the plumage: tail rather rounded in shape: legs yellowish brown.

The femcle exceeds the male in fize, and differs chiefly in being lefs tinged with reddiff; and the young birds have the whole of the naked parts about the head covered with a greyish down.

This species is generally seen in pairs, but does not unite in large flocks, like many of the vultures; indeed ten or twelve are often feen together about one carcafe, but they have been brought there by common attraction, allured thereto by the fmell, which though unperceivable to human fensation, attracts their infinitely more delicate organs at inconceivable distances. Said to build among the rocks, laying four eggs: are most frequent among the sterile lands of Karow and Camdeboo; also in the Country of Hottniqua, though more rare; the fame in respect to the neighbourhood of the Cape: is capable of being made tame; and there are few of the hordes in which one does not fee a pair; and the natives feemed pleafed with their company, as they ferved to free them from every stinking thing which might otherwise annoy them. This natural tameness occasions their being eafy to shoot at, though, unless with a large ball, they are not eafily killed. Their food feems general, all manner of carrion. Lizards, fnakes, frogs, and even the excrements of beafts do not escape them.

This feems to be the V. de Norvege of Buffon\*, and in course his

Petit Vautour †, as also the Sacre d'Egypte of the same author ‡, to which I may add, the probability of its proving the Angola Vulture of Pennant, and the Rachamab of Bruce, which is common near Cairo, and if it should not prove likewise a variety of the V. de Malthe S, it at least corresponds with it in the shape of the bill, in which part the whole of the last-mentioned differ from other vultures. When, however, the decision of the Vulture genus into real species may take place, is not for us to determine; the variety among individuals, from different periods of life, as well as the different appearances of those in a state of confinement, to what the plumage has when at large, cannot fail to create no small difficulty; added to that, very few travellers are naturalists in a sufficient degree to discriminate one part of nature from another; besides, the subjects in question being mostly extra-European, we cannot wonder at being fo long in the dark: let us however attempt all we can, with the hopes of some future day being able to arrive at greater precision; nor let any writer be ashamed of correcting his mistakes the moment he may be possessed of better information.

Bruce observed these birds near Cairo in abundance, where it is a great breach of the police to kill one of them. According to Dr. Shaw it is a very tame species; and the Bashaw is said daily to distribute two bullocks among them, being esteemed sacred birds.

6. BEARDED

Description.

THE bird quoted above, as described by Mr. Bruce, extends from wing to wing eight feet sour inches, weighs twenty-two pounds, and is in length sour seet seven inches. The crown and front are

land (8vo. vol. ii. p. 280.) a figure of the head.

bare and bald; a strong forked bush of hair, divided into two at the point, arises from the lower jaw on each side: the thickness of the thigh little less than four inches: the legs remarkably short, only four inches in length; and the thigh joint only six inches. The colour of the feathers of the back brown; of the belly gold colour.

From Mr. Bruce's description, although too concise by far, I am led to conclude that it is no other than our Bearded Vulture, or at least a slight variety, which this author met with on the highest part of the mountains Lamalmon, not far distant from Gondar, the capital of Abyssinia. It was a bold species, as it went so far as to take away part of the provision which Mr. Bruce and his company were regaling themselves with on that spot. On moving the body of one of these after being shot, a dust corresponding with the colour of the feathers both above and below, slew out in pretty large quantity; but this is not peculiar to this species: we have observed it in the King Vulture and some others, as also in the White Cockatoo.

- Vultur Papa, Ind Orn. i. p. 4.—Spalowsk. Vog. i. t. 2.—Daudin. Orn. ii. p. 6. pl. ix.

V. Sacra, or white-tailed Vulture, Bartram's Trav. p. 285.—Damp. Voy. ii. part ii. p. 67.

King Vulture, Gen. Syn. i. p. 7. No 3.

EITHER this nor the Carrion Vulture are shy, for on one of the first being shot and winged, in seven or eight days it sed freely, and became tame. I experienced this myself, in respect to the last; I have had one which was brought from Jamaica, running about: my garden, persectly tame, where it lived throughout the whole: summer, and was killed by a cold frosty night, which came on unexpectedly.

KING V. VAR. A.

Le Roi des Vautours varié, Levaill. Ois. 1. pl. 13.

THIS feems a variety from age, having many black feathers mixed among the white ones on the neck and upper parts: hence Mr. Levaillant supposes, that these birds are black or dusky whilst young, and change to the pure white or cream-colour, as they approach the adult state; and indeed Dampier mentions, that some are all over white, but the seathers look as if they were sullied, with bald heads and necks like the rest, and adds, we never see above one or two of these together; and seldom a great number of black ones without a white one among them \*.

8. ARABIAN V. Vultur Monachus, Ind. Orn. i. p. 5. N° 9. Le Chincou, Levaill. Oif. p. 53. N° 12.—Daudin. Orn. ii. p. 12. vi. Der Einstedlergeyer, Allg. Ueb. d. Vog. i. 5. 655. 25. Vautour Moine, Daudin. Orn. ii. p. 15. ix. Arabian Vulture, Gen. Syn. i. p. 8.

DESCRIPTION.

THIS bird is nearly of the fize of the Sociable Vulture. The bill is ftout; the base half pale, the rest dusky black: the whole sace beyond the eyes, chin, and hind head, covered with a black down: on the crown behind, is an elevated tust of a grey brown colour, in shape like a swan-down puss; below this, the neck is naked and white, giving the appearance of a white ring; the rest of the neck is cloathed with seathers, the upper ones of which are long and narrow, forming a kind of russ; but the whole of the neck is bare on the fore part, as also the crop, which at times is large and round: irides whitish: the plumage of the body for the most part is plain brown; but the quills and tail are nearly black: legs whitish; claws black: supposed to measure from the tip of one wing to the other,

nine

<sup>\*</sup> I suspect that the Vultur Sacra, or White-tailed Vulture of Bartram, is the above species, and his Black Vulture the Carrion Vulture.

nine feet. In a state of rest, especially after a full meal, it draws its head into the russ, with the bill resting on the crop, in which state it appears a shapeless mass of feathers. It was also observed, that this bird never solded its wings on the tail, but always suffered them to hang down carelessly on each side. Mr. Levaillant says, that this bird comes from China; however, we have little doubt of its proving no other than the Vultur Monachus of Linnaus, our Arabian Vulture\*, exceedingly well expressed in Edw. pl. 290; also sufficiently characterized in Gerini, under the name of Vultur Leporarius †.

M. de la Peirouse ‡ observes, that it is found in the same places with his Arrian, which I take to be the Cinereous Vulture; but is more scarce: the colours of the plumage are not far different, being brown for the most part, but the neck less naked: and it differs likewise in the head being elevated on the top: the cere and feet incline to red.

9. SECRETARY

LEVAILLANT observes, that the creft feathers are ten in number, the lowest the longest; the shortest four inches only, and that this bird not only preys on snakes, &c. but all oviparous quadrupeds: its claws, on account of its being oftener on the ground than other birds of prey, become less sharp than is commonly seen, and will not serve to

DESCRIPTION.

\* Syn. i. p. 8. No 4. + Vol. i. pl. ix.

‡ N. Schw. Abb. B. 3. S. 100.—Another is also mentioned, called Der Mistgeyer, which is whitish: head with the knob and cere saffron-colour: legs blueish and naked, known by the name of Asimock.

SUPP. II.

C

grasp

orafo its victim; on which account it makes use of its wings, with which it beats whatever it attacks with great violence; this it has the power to do, by means of a bony protuberance at the bend of the wing, enabling the bird to strike most destructive blows with that part; and it is with their wings that they defend themselves against venomous fnakes, by fometimes opposing one wing and fometimes the other, whereby they evade the bites of those which might otherwife prove mortal, till the enemy being tired with its efforts, or bruifed nearly to death with blows, becomes an easy prey. Young turtles and lizards also bear part in the food of the Secretary Vulture; and even grafshoppers and other infects are at times not rejected by it. These birds are not unfrequently kept tame, and in this state no food comes amiss to them: if young birds are offered, they take them by the bill foremost, and swallow them whole. One of those which M. Levaillant killed, had twenty-one young turtles, eleven fmall lizards, and three fnakes in his stomach: like other birds of prev, it is observed to bring up the undigested parts of its food, in the shape of round pellets. In pairing time, two males will often be found fighting for a female in a violent manner. These birds make a flat kind of nest, like that of an eagle, full three feet in diameter. lined with wool and feathers, in some high tust of trees, and often conceal it so effectually as not easily to be found. The female differs in that she inclines more to grey, with a shorter crest, and the two middle tail feathers shorter than those of the male.

BOLD V. Description.

THE fize of this bird is uncertain: the bill is pale yellow, with the tip black: the plumage wholly of a deep brown; but the fides of the head are bare as far as the eyes, and fomewhat beneath them, and the colour of these parts very pale: the quills and tail are of a darker colour than the rest of the body, being nearly black: the shins are covered with feathers quite to the toes; shesh colour dotted with black.

This is a native of New Holland; but although the fize of it is uncertain, we may suppose it not to be one of the smallest, and certainly is a fierce species, as it is faid to kill the Pottegorang, and even to attack the natives themselves; who know it by the name of Boora-morang.

PLACE.

L'Oricou, Levaill. Oif. i. p. 36. pl. q. Daudin. Orn. i. p. 10. iii.

SOCIABLE

THIS is a very large species of vulture, and measures ten feet DESCRIPTION. from wing to wing extended: the bill is moderately hooked, and of a pale brown; cere horn colour: irides chesnut brown: head and neck naked, of a flesh colour, beset with a few straggling brownish hairs; throat blackish: the general colour of the plumage is dark brown on the upper parts, the feathers with paler edges; at the back of the neck a ruff of pale brown; fome long loofe feathers of the fame colour mixed with white, hang over the breaft, and continue to the vent; into these the bird frequently draws down his head in a state of indolence or rest: the thighs are covered below the knees with foft whitish down, as are all the under parts of the body: the tail is somewhat cuneiform: legs covered with brown fcales; claws very moderately hooked, and black.

It frequents the mountainous parts of the interior of the Cape of Good Hope; never feen near the Cape itself, but particularly in the Namaqua Land, as well as another species, and chiefly among the European plantations.

PLACE.

Builds among the rocks; lays two, feldom three, white eggs; pair in October, and hatch in January; never builds in a tree, nor indeed does any other true Vulture. The pairs feem to be in amity one with another, as three or four nests have been found by the side of each other, in an hollow of a rock: the eggs are not ill flavoured when The Natives mostly call this bird Ghaip. The Dutch colonists  $C_2$ 

colonists call it black Carrion Bird; to distinguish it from the next species, which is of a pale colour, and which they call Stront-jager, by which name, as also Stront-vogel, or Aas-vogel, the colonists call all kinds of Vultures; said only to be found about the confines of European plantations.

KOLBEN's V.

Le Chasse-fiente, Levaill. Ois. i. p. 44. pl. 10. Daudin Orn. i. p. 15. x.

This is not quite so big as the last, but is greatly more common: the bill is pale lead colour; irides deep brown: the head and neck bare of seathers, or covered with a sew scattered hairs, and of a pale dirty yellow: round the lower part of the neck is a pale coloured rust of loose seathers, common to many of the genus: the plumage for the most part is a pale tawny yellowish or Isabella colour: the quills and tail black; and the quills reach almost to the end of the tail: the male is smaller than the semale. If we compare this with the Alpine Vulture, the colour is greatly different, and the wings are shorter in proportion in this last bird, nor has it the heart-shaped spot on the breast, seen in the Alpine Vulture; besides, a bare inspection of the two sigures will detect the difference.

PLACE.

This species is found in every part of Africa through which Mr. Levaillant traversed, on the contrary, the Sociable Vulture is only met with in the consines of the European plantations. Both of them, however, pass under the name of Stront jager. This species frequents the rocks or the high mountains, which cover the point of Africa, from the Cape Town to False Bay, from thence it spreads itself all around wherever food is to be found, seasting on every kind of offal, and approaching near to habitations, and even the streets of the Cape, in quest of it, as well as crabs and other shell-sish; and not unstrequently on land turtles, which it swallows whole, also locusts, &c.

Le Chaugoun, Levaill. Oif. p. 50. pl. 11. Daudin. Orn. i. p. 14. viii. Bengal Vulture, Gen. Syn. 1. p. 19. pl. 1. Id. Sup. p. 3. 16.

CHAUGOUN V.

DESCRIPTION.

THIS is a small species, scarcely so large as our King Vulture:

Bill dusky horn colour, but yellowish at the bend: the head and neck can scarcely be called bare, but they are only covered with scattered hairs, and are of a blueish slesh colour: the crop is prominent, and covered with fine silky black seathers: the plumage in general dusky brown, but the seathers of the under parts have a white line, as well as those on the thighs: a large white spot appears on each side the breast, but unless the wings are listed up, cannot be seen: the head and hind part of the neck are covered with glossy, dusky-white seathers, but the lower part blending with a ruff of a soft downy structure: the greater quills and tail are black, but the secondaries are bordered with rusous brown: wings and tail nearly of equal length when closed: the legs are pale brown, or slesh colour; and the middle toe nearly double the length of the others.

This inhabits Bengal, where it goes by the name of Chaugoun.

This feems clearly to be a variety of my Bengal Vulture, if not the fame-bird.

Nisser Tokoor, Black Eagle, Bruce's Trav. App. t. p. 159?

VULTURINE E.

Description.

SIZE of the Golden Eagle, but has the bill very strong; the claws are moderate, and not greatly curved, in this approaching to the Vulture genus: the general colour is deep black; but the head is cloathed with seathers: the wings when closed, reach eight inches beyond the end of the tail; the end of which is usually damaged from rubbing on the rocks on which it perches: the shape of the tail is rounded, the outer seathers being much shorter than the others: the legs are covered three-sourths of the length with seathers, and are of a dirty yellow: the bill pale yellow, with a dusky blueish base: irides chesnut brown.

This species inhabits Casfraria, but is rare, and feeds principally on dead carcases, which causes it to smell horridly offensive: from the length of wing, it rises from the ground with difficulty: said to build among the rocks; will attack sheep, and devour them on the spot, except it has occasion to bring any part to its young, in which case it carries it in the claws; in this differing from the true Vulture, which disgorges the nutriment it supplies to the young from the throat. The natives of the Cape of Good Hope call it Stront Vogel, (dung-bird), or Aas Vogel (carrion bird).

I greatly

PLACE.

I greatly suspect this bird to be the same with the Black Eagle of Mr. Bruce, alluded to above, the chief difference of which, is the latter having the seathers of the head elongated into a crest of a considerable length, which it carries erect. Mr. Bruce's bird is also bare from the bill quite to the eyes, and yellow, in this greatly approaching to the Vulture genus, and may fairly be said to form a link between the two. It was met with in the year 1770 at Dinglebor, among a cloud of Vultures and other birds of prey, which sollow the army in Abysinia, and was struck down by some of these, by which means it came under Mr. Bruce's inspection.

MARTIAL E. Le Griffard, Levaill. Ois. i. pl. 1. Aigle Griffard, Daudin. Orn. ii. p. 38. ii.

DESCRIPTION.

thirty pounds: the male measures from the tip to tip of the wings extended, seven feet and an half, and the semale one foot more. The bill is moderately curved, and of a pale colour: irides bright hazel: the general colour of the plumage is brown; the edges of the seathers paler, with the same mixture of white about the nape of the neck; the under parts nearly white: quills black, reaching three-sourths of the way on the tail at least; some of the lesser ones are barred with black and whitish: tail even at the end, marked as the second quills: legs feathered to the claws, which are pale as the bill.

PLACE.

This is an inhabitant of Africa, frequenting the Great Namaqua, about the twenty-eighth degree of latitude, chiefly the parts uninhabited by whites: is a courageous bird, preying on antelopes, hares, &c. is in its turn attacked by crows and vultures, in order to deprive it of its prey, though feldom with success: mostly seen in company with its mate, and builds a large flat nest, of large sticks and twigs, on the tops of high trees, of so compact a structure, as to enable any one to stand upon it firm, without breaking through, such an one

ferving

ferving for feveral years; it is lined with dried leaves, moss, and other soft materials: it also has been observed to make the nest on an appropriate rock, but when any tree of a proper size, stands singly in its neighbourhood, it is always preferred: the semale lays two white eggs. This bird may be heard very far off, making a very sharp cry, mixed at times with rough and mournful tones. It is an high slier, mounting sometimes to such an height as scarcely to be seen.

Le Huppard, Levaill. Ois. 1. pl. 2. Aigle Huppard, Daudin. Orn. ii. p. 40. iii.

OCCIPITAL E.

THIS is less in fize than the last: the bill is pale blue: the general colour of the plumage dusky reddish brown, the under parts paler: the middle of the outer webs of the greater quills is white, forming a patch on the wing: the base of the tail mixed brown and white, but the end is plain dark brown, and rounded in shape: quills black, reaching to near the end of the tail: on the hind head is a crest of feathers six or seven inches in length, hanging down behind in a graceful manner. The legs are covered with pale yellow short down, quite to the toes, which are yellow.

Description.

This is found in Caffraria and Hettniqua Land; is content with finaller game than the last, such as hares and partridges; slies with rapidity, the male and female mostly together; makes the nest on trees, lining it with wool and feathers, and lays two eggs, spotted with red brown: it is sierce towards its prey, but is sometimes attacked by troops of crows, which not only drive it from the nest, but even destroy the eggs, or the young it contains: it has a plaintive cry, which it utters at intervals. The semale differs from the male in being bigger, in having a smaller crest, more white on the thighs, and some spots of white about the eyes, and top of the head.

PLACE.

CINEREOUS E.

DESCRIPTION.

PLACE.

Falco Albicilla, Ind. Orn. i. p. 9. 2. Var.? Cinereous Eagle, Lath. Syn. i. p. 33. 8.—Id. Sup. p. 11?

THIS is of a large fize: the bill is large and black: legs the fame: the general colour of the plumage deep brown, but the under parts are much paler, and the wings much darker than the rest: the rump and tail are very pale ash-colour, nearly white.

This inhabits New Holland, and from its make and shape seems nearly allied to the Cinereous Eagle.

THARU F. Falco Tharus, Ind. Orn. i. p. 16. No 24.—Molin. H. Nat. Chil. p. 234.—Id. (Fr. ed.) p. 244.—Daudin. Orn. ii. p. 41. v.

DESCRIPTION.

THIS is the fize of a large fowl: the bill whitish, in form like that of the common eagle: the plumage of the male is whitish, marked with black spots: on the head is a fort of crown composed of long black feathers, of which those situated outwardly are longest: the quills and tail are black: legs yellow and scaly, and the claws hooked.

PLACE.

The female is smaller than the male, of a grey colour, with only a small crest on her head. This species inhabits Chili; makes a nest in the highest trees, composing it of sticks twined together, on which it heaps up a considerable bed of wool, seathers, &c. The eggs are five in number, white, spotted with brown. It feeds on living as well as dead animals, although it is not seen to pursue after its living prey, but seizing them by lurking and catching them unawares. The male advances with a stiff neck and an air of gravity, and when it cries, which it often does very forcibly, it draws its head back towards the rump, with the bill upright. The name at Chili is Tharu.

F. tigrinus, Besek. Vog. Kurl. S. 10. 11 -1 Taf. 2. Der getiegerte Falke, Allg. Ueb. d. Vog. i. S. 676.

б. TIGER F.

THIS is the fize of the Golden Eagle, if not bigger: the cere is blue: irides and legs yellow: head, neck, and breast pale brown, but the upper part of both are black; the crown appearing in fine streaks: the rest of the upper parts are dull brown: quills black: greater wing coverts black brown, paler: tail dull brown, crossed with three narrow distinct bands: beneath, from the breast, white, marked with some light brown spots on the thighs, and under part of the wings, in manner of a tiger. This was a male. It seems like one figured by Frisch, t. 76.

DESCRIPTION.

Inhabits *Courland*, whereabouts it breeds; and is a fpecies equally fierce, agile, and beautiful; it approaches farm houses, and is a dreadful enemy to the grous tribe, and hares, on which it feeds.

PLACE.

Der Rothlichweisse Falke, Allg. Ueb. d. Vog. i. Zusas. S. 676. 120.—Besek. Vog. Kurl. S. 10. 12. a. und 13. b.

COURLAND F.

THIS is somewhat smaller than the last: cere, irides, and legs yellow: general colour of the plumage reddish smutty white: but the back, wings and tail, are dull brown; and the ends of the wings paler: the head, neck and breast, are marked with longish dull brown spots: the seathers which hang over the thighs rusty brown, for the ends of each seather having an oval spot of that colour, and being consused mixed together, give that appearance: the tail crossed with sour paler bands: this is the semale: the male agrees nearly in colouring, but is one-sourth smaller in size.

DESCRIPTION.

Inhabits Courland.

PLACE:

GLAUCOUS F. Falco Glaucopis, Ind. Orn. i. p. 26. No 25.—Merrem. Ic. Av. ii. p. 25. t. 7. Aigle de Gottingue, Daud. Orn. ii. p. 59. xxix.

DESCRIPTION.

THE length of this species is twenty-one inches and a quarter: the bill is glaucous: inside of the mouth and tongue rose colour: irides yellowish; cere the same: the general colour of the plumage is brown, but the head and nape are of a yellowish white, streaked with brown, and the forehead marked with crescents of brown; and the breast wholly of that colour: the thighs are short, covered with downy feathers, and the shins half cloathed with yellowish feathers: the quills are black: the tail reddish brown above, dirty white beneath, crossed with six black bands.

PLACE.

Inhabits the mountain Dransberg, near Göttingen, in Germany.

DESTRUCTIVE
E.
DESCRIPTION.

Aigle Destructeur, Daudin. Orn. ii, p. 60. xxxii. Grand Aigle de la Guiane, Mauduit Encyc. Meth.

THIS is a large species, being in length three seet two inches: the bill is pretty much curved, but chiefly so at the end, and of a horn colour: the top and sides of the head are dusky grey; the seathers of the hind head are grey, very long, and of different lengths, forming a crest; the tip of the longest grey: neck grey: the body is black, banded above with greyish: the shoulders grey and black mixed: breast and belly greyish white: quills black, reaching two thirds on the tail, which is also black mixed with grey on the upper part, but nearly white on the under, with a dusky bar at the tip: the shins are covered with white seathers transversely banded with black: toes naked yellow.

The male is smaller, and of more lively colours.

PLACE.

Inhabits Guiana, and is a powerful species, said to prey on the sloth, and other quadrupeds, as well as pheasants.

Le Blanchard, Levaill. Oif. i. pl. iii. Aigle Blanchard, Daud. Orn. ii. p. 45. xi.

NOISY E. DESCRIPTION.

THIS is about one-third as big as the Martial Eagle, being smaller in fize than most eagles, and more elongated: the plumage is white, soft, and spotted with black brown: the tail barred with black; but the semale is more mixed with brownish yellow, especially on the wing coverts: the male has the seathers on the hind head elongated into a crest, in which the semale is not desicient, though considerably smaller; but in bulk, she exceeds the male by one-third: the irides and legs are yellow: the bill is pale; the claws black: the tail is rather long, and the wings reach about one half way thereon.

It flies well, and its chief prey is wood pigeon, from which it first tears the seathers; it frequents forests, and prefers the largest trees: it likewise feeds on a small species of antelope, called by the Hottentots Nometjes. Its cry consists of several sharp sounds, quickly repeated, somewhat similar to Cri-qui-qui-qui, and when perched on a tree, will spend whole hours in repeating this, though in a tone of voice seemingly weak in proportion to the size of the bird: it builds on high trees: the semale lays two white eggs, about as big as those of a turkey, but more round: the male and semale sit by turns. It has only been sound in the country of the Hottniquas.

MANNERS.

PLACE.

Le Bateleur, Levaill. Ois. i. p. 31. pl. 7 and 8. Aigle ecaudé, Daud. Orn. ii. p. 54. xxii.

SHORT-TAILED F. Description.

THIS is the middle fize between the Sea Eagle and Ofprey: the head, neck, and all beneath, are of a deep black: back and tail deep rufous: fcapulars dufky, varying with the light to blue grey; leffer wing coverts pale Isabella colour: quills black within, edged outwardly

edged ·

outwardly with filvery grey: the bill and legs are dusky; base of the bill yellowish, cere large: the tail in this bird is characteristically short, and half hidden by its coverts; irides deep brown: while young, the general colour is brown, palest on the head and neck, with the edges of all the seathers light coloured: the semale is one-fourth bigger than the male. It builds in trees, lays three or four white eggs. The young are so unlike the old one, that were it not for the short tail, they might be mistaken for a different species, and are more like the semale in every stage: the male is not complete in its plumage till the third year's moult.

MANNERS.

PLACE.

These feed on all forts of carrion, yet will attack young antelopes, also lurk about inhabited places, for the sake of attacking any sick sheep. It is most common about Queer Boom, near Lagoa Bay; very common in all the country of Hottniquas and Natal, quite to Castraria. The male and semale always seen in company; rarely in troops, except many pairs are invited to the same repast. The name given this bird by Mr. Levaillant, arose from its slapping the wings in a singular manner while in the air, so as to be heard at a great distance, and this repeated from one to the other as if at play, or rather as if to amuse the spectators below, as bussions do on a stage. It is known to the inhabitants by the name of Berg-baan (mountain cock) but perhaps not sufficiently distinguishable, as they call so all birds of prey, particularly eagles.

BACHA F. Description. Le Bacha, Levaillant, Oif. i. p. 68. pl. 15 .- Daudin. Orn. ii. p. 43. ix.

HIS in fize and refemblance is not unlike our common Buzzard, but rather more elongated: the general colour dirty brown, the wings and tail deepest: the bill is lead colour; cere yellow: the crown of the head black, and the feathers at the back part of it elongated into a crest, of which the feathers are half black half white, the ends

ends being black, and at times is spread out horizontally like a tail: at the bend of the wing, and beneath it on the sides, the seathers are marked with roundish white spots: the tail is dusky, crossed in the middle with a broad rusous white band; the very tip almost white: the legs are oker yellow; claws black. The semale as usual is larger than the male.

PLACE.

It frequents only the barren and fultry parts of the country of the Grand Namaguas, and from thence to the tropic of Capricorn; it preys chiefly on the Klipdas, or Cape Cavy\*, though it is obliged at times to take up with lizards, &c. It is observed to watch the Cavy for three hours together, with the head between the shoulders, in an immoveable posture, and the moment it observes the animal issue from its retreat, springs suddenly upon it, and devours it with great apparent ferocity. It however sometimes misses of its prey, in which case it utters a kind of lamentation, somewhat similar to the words boui-bi-bi, thrice repeated, and immediately afterwards changes its place, in order to watch as before; this seems absolutely necessary, for the plaintive cry of this bird, added to its fruitless attempt to seize on its prey, does not fail to alarm and frighten all the cavies into their lurking places, not to appear again for some hours.

It is a folitary bird, except in the breeding feason, and then only feen in pairs; this is about the month of *December*, and after rearing two or three young ones, they again return to a folitary life: the neft is among the rocks, composed of a bed of moss and leaves, ill put together: it is a very shy and fierce species.

Falco maritimus, Ind. Orn. i. p. 20. 35.—Lichtenb. Mag. für das neueste auf der Phys. iv. 2. 6.

THE short account we can obtain of this bird, informs us, that it is four feet two inches in breadth, and seventeen inches

in length; that the bill is yellow, as well as the cere: the body and end of the tail white: legs of a reddish and whitish colour mixed.

PLACE.

Inhabits the sea coast of Java, feeding on carcases and fish.

BOOTED F. F. pennatus, Ind. Orn. p. 19. 34. La Buse Gantée, Lewaill. Ois. i. p. 79. pl. 18.—Daud. Orn. ii. p. 163. cxxxv. Booted Falcon, Gen. Syn. i. p. 75. Var.

DESCRIPTION.

THIS feems to vary very little from our Booted Falcon, met with in the territory about the Cape of Good Hope, particularly inhabiting the forests of the Hottniquas. This variety seems to have a less mixture of white in the plumage: it frequents the woody parts, distant from habitations, and lives singly; is a bold bird, more so than some others; is quick in slight, and often seizes partridges. Mr. Levaillant likens it to a species he has seen in Lorraine, in France, which is very probable, as we also have the bird in some of the counties of England.

SCLAVONIAN F. F. Sclavonicus, Ind. Orn. i. p. 26, 54.—It. Pefegan. p. 29. Busard Esclavon, Daudin. Orn. ii. p. 166. exxxviii.

DESCRIPTION.

INHABITS Sclavonia, and is of the fize of a fowl: the bill is blue black; cere and legs yellow: plumage testaceous, marked with black spots: head and neck most inclined to white: legs woolly, quite as far as the toes, of a dull yellow colour, spotted with dusky: the rump and vent are whitish, marked with scattered spots of brown and dull yellow: the tail white from the base to the middle, towards the end brown; in some crossed with five dusky bands. I suspect that this may possibly prove a variety of our Booted Falcon.

F. ..
Description.

F. Marginatus, Ind. Orn. i. p. 26 55 .- It. per Posegan. p. 28.

THIS inhabits Sclavonia, and is of the fize of the laft: the cere is blue; the legs yellow: the plumage mixed brown and ferruginous above, and ferruginous with oval brown spots beneath: tail feathers

feathers marked on both fides of the shaft with dusky and white bands: quills brown, croffed with dull bands: the tip ferruginous white...

> Le Tachard, Levaill. Ois. i. p. 82. pl. 19. Buse Tacharde, Daudin. Orn. ii. p. 104. cxxxvi.

TACHARD

DESCRIPTION.

THIS is the least of the buzzard kind, as far as relates to bulk of body, but has a longer tail in proportion: bill dusky; cere brown: irides deep reddish brown: the head is greyish brown, with here and there some irregular whitish streaks: the under parts are greyish yellow, with a mixture of brown blotches: the upper parts of the plumage are deep brown, with the edge of each feather paler: the tail is deep brown, banded with black, beneath greyish white, with obscure bands; the feathers of it equal in length: the feathers of the thighs reach below the knees, but not at all to the toes, as in the Booted Falcon: the legs are mottled brown; toes dull ferruginous.

PLACE.

This was shot on the banks of the river of Lions, in the Giraffe country, in Africa, among the Kaminiquas, who did not know the bird, and as Mr. Levaillant never faw another, he supposes it to be a rare species.

> F. cirrhatus, Ind. Orn. i. p. 36. Var. A. Le Faucon huppé, Levail. Oif. i. p. 121.28. Faucon huppé, Daudin. Orn. ii. p. 118. xci.

CRESTED

THIS, were it not for fize, seems to be coloured most like the Peregrine Falcon; but the male is no bigger than a common pigeon, and the female one-fourth larger: the general colour of the plumage is flate colour, or greyish blue: the top of the head furnished with long feathers, which are considerably darker, inclining to brown, also the hind part of the neck, and a long patch of the

DESCRIPTION.

SUPP. II. fame fame over each jaw, as in the *Peregrine*: the under parts from the chin, and rest of the sides of the neck, are dirty white, but the belly and thighs are marked with transverse black streaks: the quills are dusky brown, and reach beyond the tail, which is crossed with seven or eight streaks of the same; the extreme points of the seathers white: the bill is pale, with the tip dusky; the under mandible is not only singularly notched, but is as it were cut off square at the end: the legs are yellow.

This species inhabits the lakes and borders of the sea, and rivers, which abound in fish, on which it feeds, as well as crabs and shell fish, which it easily breaks to pieces in the bill: it is seen too to sly after gulls, terns, and even the albatros's, all of which give way to him; and it is probable that the true reason is to oblige those birds to resign up the prey they have taken. This bird makes the nest on the rocks, when it frequents the neighbourhood of the sea, otherwise on the trees near the rivers: lays four rusous white eggs. The male and semale sit in turns, and the young brood often remains with the parents till they have occasion to breed in their turn.

Mr. Levaillant supposes this to have some relation to the Tanas of the Senegal negroes, according to Adanson; but it is much smaller, besides, the singularity of the under mandible being cut off square, is not noticed by him, and which could not surely have escaped his observation had he seen it, therefore probably is not precisely the same; nor can it be the Tanas of Buffon\*, as it neither corresponds in colour nor crest, only in manners, as being fond of sish, which is not uncommon to many other species.

Le Chicquera, Levail. Oif. i. p. 128. pl. 30. Faucon Chicquera, Daudin. Orn. ii. p. 121. xciii.

CHICQUERA F.

THIS is probably a further variety of the last, as it corresponds as to the general distribution of colour, though it has not the least appearance of a crest: the bill, however, in singularity, exactly corresponds with it as to formation, and nearly so in colour; the upper mandible has a double notch, and the under truncated before: the top of the head and hind part of the neck are rusous, and a tinge of the same appear about the base of the bill, and bend of the wing; but the upper parts of the body and wings in general are blue grey, mottled with darker spots: the tail much the same as to colour, and crossed near the end with a broad band of dusky black: the tips of all the seathers very pale, nearly white: legs and irides yellow: the under parts in general are white, but the breast, belly, thighs, and vent, are crossed with small dusky streaks: the quills when closed reach two-thirds on the tail, the end of which is rounded.

This Mr. Levaillant supposes has not been figured before. He bought it in a collection from Bengal, where it is said to be called Chicquera.

BLACKINGED

Le Blac, Levaill. Ois. i. p. 147. pl. 36 and 37.

Milan Blac, Daudin. Orn. ii. p. 152. exxiv.

BLACK-WINGED F. . Description.

SIZE of the female Kestril: top of the head, back of the neck, body, wings, and tail, more or less pale ash colour: wing feathers fringed round the ends with white: the tail has a slight tinge of rusous, is a trifle

a trifle forked in shape, and the seathers fringed at the ends with white; the under part of it white: sides of the head, and all beneath white: the seathers of the thighs are silky and delicate, and reach almost to the toes: the eye is situated in a bed of blackish, which continues betwixt it and the nostrils: irides orange: bill black: legs short and yellow: the wing coverts are wholly black; but the quills are the same colour with the back.

The female chiefly differs in being bigger, and the colour of the plumage less distinct. The young birds have such parts as are white in the adult inclined to rusous, especially on the back feathers, with a large portion of rusous in the middle of the breast, and the top of the head.

These birds build between the forks of trees, lining the nest with moss and feathers, and lay four or five white eggs.

This species is found throughout all the African coast, from Duyven-Hoek to Castraria, and in the interior in Camdeboo, and the borders of Swarte-Kop and Sondag; is always perched on high bushes, where it may be seen afar off by its pure white under side. Its cry is, piercing, and it repeats it often, especially in slying. It seems to feed principally on insects, such as grashoppers and mantes; but Mr. Levaillant has not seen it kill small birds, however, it attacks crows, kites, and shrikes, and drives them from its haunts. It is a wild bird, and difficult to be shot. It is observed to smell of musk, which its skin retains, even after prepared for the cabinet. It is said also to have been killed in Barbary, as also in India.

Mr. Levaillant thinks this has some affinity with the Swallow-tailed Falcon, which makes its chief food insects.

MANNERS.

PLACE.

KITE.

F. Milvus, Ind. Orn. i. p. 20. Kite, Gen. Syn. i. p. 61. 43.—Id. Sup. p. 17.

THIS is faid to be most frequent in the temperate and well inhabited parts of Russia, more scarce in Sibiria, but does not venture far to the north; about Lake Baikal not uncommon, but none beyond the Lena. This bird frequents sheep downs in the breeding season, especially those which are skirted with wood, but in winter delights in the neighbourhood of towns watered by rivers, where it has been observed to sweep off dexterously any offal floating on the surface: will lay as far as sour eggs, some of which are of a pure white, and others much speckled. This bird, as well as other birds of prey, drives away the young as soon as they are able to shift for themselves. It has been observed to me, that a semale kite will weigh two pounds and ten ounces, and the egg two ounces and a half, so that seventeen eggs would but just exceed the weight of the bird; but the raven is so disproportionate as to require forty-eight to answer the same purpose\*.

PARASITE F.

Le Parasite, Levaill. Ois. i. p. 88. pl. 22. Milan Parasite, Daudin. Orn. ii. p. 150. cxxii.

Description.

THIS by many may be esteemed only a variety of our Kite, but Mr. Levaillant assures us, that it differs materially in having the tail less forked, and in being of smaller size: the bill yellow instead of black, which the common kite has, and the cere blueish instead of yellow; however the legs in both are yellow: irides brown hazel: the general colour is that of tanned leather: the middle of each seather darkish; the under parts more inclined to cinnamon colour:

· Col. Mentagu.

cheeks

cheeks and throat whitish: most of the feathers have a blackish line down the shaft: tail brown, banded with deeper brown.

This is common throughout Africa, especially in Cassian and Grand Namaquas; called at the Cape Kuykendief, which also is the name the Dutch give the common Kite. It builds both in trees and rocks, lays four eggs, spotted with rusous: the young have the end of the tail nearly even, which also takes place with the European species, and Mr. Levaillant supposes the Black Kite\* to be no other than a young bird. This is a very bold species.

PLACE.

Le Buzon, Levaill. Ois. i. p. 86. pl. 21. Busard Buson, Daudin. Orn. ii. p. 168. cxlii. HOBBY BUZZARD

SIZE of the *Hobby*: the bill is horn colour, covered at the base with a deep yellow cere: the legs are also yellow: the head and neck are dusky to appearance; but the bases of the feathers are white: the upper parts of the body and wings are rusous and black, irregularly mixed: the greater quills dusky; the secondaries the same, outwardly rusous: the tail is even at the end, black, having a narrow band of white about the middle of it, which according to the sigure, seems composed of white spots; the very tip also white: all the under parts are pale rusous, crossed with dark markings: thighs the same, but not feathered beyond the knees: this differs from the Buzzaret, in not having the quills reach beyond one-third of the tail, whereas in the Buzzaret the wings and tail are equal: the bill is by much more broad and short than in that bird.

PLACE.

Inhabits Cayenne, and seems in many things greatly allied to my Spotted-tailed Hobby †.

PI. Enl. 472.

BUZZARET.

Le Buseray, Levaill. Ois. i. p. 84 pl. 20. Busard Buserai, Daudin. Orn. ii. p. 168. cxli.

DESCRIPTION.

SIZE of the Marsh Buzzard: the bill black; cere lead colour: the head and neck rusous white, mixed with brown, the last deepest on the back part of the neck: the back and wings are rusous brown, or chesnut, more or less spotted or streaked across with dusky black: the tail barred with the same, but the base of it inclines to rusous yellow, towards the end dusky; the wings when closed reach to the end of it: the belly and thighs are light rusous, marked with transverse bands of black brown: quills black.

PLACE

Inhabits Cayenne, and is supposed to be the same bird which M. Mauduit mentions in the Encyclopedie Methodique, by the name of Busard Roux de Cayenne.

PONDICHERRY E. F. ponticerianus, Ind. Orn. i. p. 23. 46. Oifeau Brame, Eff. Philof. p. 55. Aigle de Pondichéry, Daudin. Orn. ii. p. 55. xxiii. Pondicherry Eagle, Gen. Syn. i. p. 41.

PLACE.

DESCRIPTION.

THIS is not unfrequent on the coast of Malabar and Coromandel, where it is called Tchil and Kuercuden, but not of so generous a nature as to be trained for falconry. The figure of the Garroora, is a bird, which is frequently found in the temples of the God Vishnou, immediately in front of his image, and sometimes sitting on a serpent with several heads: this is a large brown kite, with a white head: the Brachmans at some of the temples of Vishnou, accustom oirds of this species to come at stated times to be fed, and call them to their meals by striking a brass plate \*.

A bird feemingly of this last kind is found in New Holland, in

Sketches of the Hindoos, 8vo. 1790.

which

which the head, neck, and belly are pure white, without any streaks: the rest of the body of a dull rust colour. It is called *Girrenera*: part of its food consists of eggs, as the stomach of one was found full of egg shells.

Le Vocifer, Levaill. Ois. i. p. 17. pl. 4.

Aigle Vocifer, Daudin. Orn. ii. p. 65. xxxv.

Nonette, Gaby, Voy. in Nigritie.

PISCIVOROUS E.

THIS bird is the fize and make of the Ofprey, and greatly refembles it in manners: extends from wing to wing eight feet: the bill is lead colour: the legs yellow: irides red brown: the head, neck, breaft, and scapulars, are pure white edged with brown; on the breaft a few black brown spots: the tail of a pure white: the rest of the plumage is rusty brown, streaked with dingy black; the lesser wing coverts more inclining to rust colour: quills black, crossed on the outer webs with fine rusous and black lines: lower part of the back and rump, mixed black and dirty white: between the bill and eye, a yellow skin barely covered with hairs: the lower part of the belly and thighs deep rusous, feathered only to the knees: the wings when closed reach to the end of the tail. The semale is more dull in colour.

DESCRIPTION.

This species inhabits the more inward parts of the Cape of Good Hope, about fixty or eighty leagues up the country; most common about Lagoa Bay. The colonists at the Cape, call it Groote Vis-vanger, or Witte Vis-vanger, as it feeds on fish, descending upon them into the water after the manner of the Osprey, retiring to a rock to eat it; supposed also now and then to feed on young antelopes, as the bones of one have been found in the nest; also on the great lizard, common in the African rivers. The male and semale are rarely seen apart; they build on the tops of trees, or on the rocks, and lay two Supp. II.

PLACE.

or three white eggs, bigger than those of a turkey. By some it is called the *Crying Eagle*, as it slies high, and frequently utters loud cries, and may be heard far off; is very watchful, and difficult to shoot, and it has been known that to obtain one, a sportsman has been obliged to remain concealed for three days under a turf covering, before he could obtain a shot. It seems to be a variety of the *Pondicherry Eagle*.

BLAGRE E. -Le Blagre, Levaill. Ois. i. p. 23. pl. 5. Aigle Blagre, Daudin. Orn. ii. p. 70. xxxvii.

DESCRIPTION.

SIZE and habit of our Ofprey: the head, neck, and parts beneath, are glossy white, but the top of the head, and hind part of the neck incline to brown: lesser wing coverts and tail pale grey brown, and the end of the last white: the great quills are dusky black; secondaries are outwardly like the rest of the wing: the seathers for the most part very rigid: bill brownish: iris deep brown: legsyellow; claws black.

PLACE.

This species is sound in the dry internal parts of the Cape of Good Hope, but only on the borders of rivers, where it frequents for the sake of the fish, which it takes in manner of the Osprey, by plunging in after them; its sight seems very piercing, as it will frequently descend at once, from a height in the air where it is scarcely visible, into the water after its prey.

AMERICAN B. F. borealis, Ind. Orn. i. p. 25. 50. Falco aquilinus, cauda ferroginea, Great Eagle Hawk.—Bartram Trav. p. 286. American Buzzard, Gen. Syn. i. p. 50.

DESCRIPTION.

THE iris of this bird is brownish yellow: cere and legs yellow: thighs of a sulphur colour. It is called in Georgia, the great Red-tailed Hawk; is said not to be very common; is much on the wing, and very shy, therefore very difficult to be shot.

F. apivorus

F. apivorus, Ind. Orn. i. p. \$5. 52. Honey-Buzzard, Gen. Syn. i. p. 52—Id. Sup. p. 14.

HONEY B.

THIS is found in open countries, in Russia and Sibiria, where woods are near, and plenty of small Lizards, which are commonly met with in its gizzard on dissection; not only so, but likewise Caterpillars, both smooth and hairy: builds a large shallow nest of twigs, lined with dead leaves, upon a tall slender beech, as observed by Mr. White\*. The egg was smaller than that of the Common Buzzard, less round, dotted at each end with small red spots, and surrounded in the middle with a broad bloody zone.

Le Grenouillard, Levaill. Oif. i. p. 95. pl. 23. Busard Grenouillard, Daudin. Orn. ii. p. 170. cxliv. RANIVOROUS

DESCRIPTION.

A T first sight it seems most like the Moor Buzzard, being much of the same size and stature, but differs in colour, for the upper part of the body is pale umber colour: the cheeks and throat are covered with whitish tender feathers, each marked with a longitudinal brown band: the under part of the body light brown, slightly mixed with white on the breast and lower belly: on the upper part of the breast, and lesser wing coverts, a sew white spots: thighs and under tail coverts rust colour: wings brown; tail the same, even at the end, but crossed with bars of deeper brown: the wings when closed reach two-thirds on the tail: irides grey brown: legs slender, yellow.

Inhabits chiefly the marshy parts of the Cape of Good Hope, where it preys on frogs, whence the name of Kikvors-vanger, or frog-catcher, but it also preys on young water-fowl.

It makes the nest among the reeds, with stalks and leaves of aquatic plants, and lays three or four eggs, which are quite white.

PLACE.

• Hist. Selb. p. 107.

In the fame places have been met with, another, which appeared still more like the Moor Buzzard, as well as a third, quite black, with the rump entirely white.

RUSTY

Falco rubiginosus, Ind. Orn. i. p. 27. 6.

DESCRIPTION.

THE bill is black: legs yellow: the head wholly of a whitish yellow; cheeks rufty: body above brown, beneath yellowish white, with an irregular rufty-coloured spot on the breast: quills brown, with the outer edges hoary, within brown, with feveral white bands: tail brown, croffed with four testaceous bands.

PLACE.

Inhabits Sclavonia.

TESTACEOUS DESCRIPTION.

Faucon testacé, Daudin. Orn. ii. p. 125. ci.

SIZE of a Gofhawk: length twenty-one inches: bill blueish: cere, irides, and legs yellow: the head, and all the upper parts of the bird, are testaceous brown: the shafts of the feathers blackish: throat and fore part of the neck nearly white, inclining to testaceous on the breast; from thence to the vent reddish brown: the vent itself white: quills dusky, spotted on the inner webs with white: tail brown above, and pale beneath, where it is croffed with five indiffinct dusky bands.

PLACE.

Inhabits the island of Java: it was first observed perched on a rock, feizing on fuch small birds as passed by within reach of him, and was by chance killed by a flone thrown at him.

36. \ JAVAN Description.

F. Javanicus, Ind. Orn. i. p. 27. 58 .- Lichtemberg. Magaz. iv. 2. 8.

THE cere is black, but the middle of it is yellow: the head, neck, and breaft chefnut: the back brown: legs yellow. Inhabits Java, and is found chiefly on the fea coasts, feeding on fish.

The

The flight account which we are enabled to give of this bird, will not enable us to fay whether it is the fame with the preceding species.

GOSHAWK.

REEDS in Scotland: the young one is very different from the adult, and it is not at all clear that the Falcon Gentil of Br. Zool. No 50, is not the Gospawk in its first feathers. In Germany, it is not an uncommon species in the forests, where it is stationary, preying on various kinds of large and small game; among others geese, hence perhaps has arisen the name of Goose Hawk or Gospawk: said to be found in numbers on the Azores islands, and by some supposed to have given a name thereto, as azor in the Spanish tongue signifies a Gospawk. The American species weighs three pounds and a quarter, and measures twenty-one inches in length.

Epervier pie, Daudin. Orn. ii. p. 85. 51.

Black and White Indian Falcon, Gen. Syn. i. p. 81.—Id. Sup. p. 20.—Young bird.

DESCRIPTION.

THIS feems greatly allied to the Hen-barrier, for in fize it corresponds as well as shape: the bill is black: the head, neck, back, and wings are mostly of a deep brown; but the back part of the head inclines to black, with a mixture of white at the back part of the neck, and wing coverts: the greater quills are dusky, the secondaries partly dusky white: all the under parts from the breast, the belly, thighs, vent, rump, and tail are white; but the tail, which is nearly even at the end, inclines a little to rusous grey, and the two middle feathers of it have a fort of brown crescent on the tips: the legs are long and yellow: this appears to be a bird not come to its adult plumage, on account of the mixture of white among the feathers.

PLACE.

This specimen came from Bengal, where it is known by the name of Tchoug; is thought also to be a native of the Cape of Good Hope, as Mr. Levaillant saw a bird of this kind pass over his head, in which the head and neck were black, and rump and under parts were white: this was probably our Black and White Falcon in its persect plumage.

CHANTING F. Le Faucon chanteur, Levaill. Oif. i. p. 117. No 27.—Daudin. Orn. ii. p. 116. lxxxviii.

DESCRIPTION.

THIS beautiful species is the size of the Common Falcon, and the plumage in general of a very pale lead or dove colour, but the top of the head and scapulars are much darker, inclining to brown; and

and the under parts from the breast are pearly grey, crossed with numerous blueish grey markings: the quills are black: the tail is greatly cuneiform, the outer feather being shorter by one-third than the middle ones; it is of a dusky colour, but the very tip of the feathers are white, and all but the two middle ones are crossed with white bands: the bill and claws are black; the legs and cere orange, and the iris deep red brown: the *female* is bigger than the *male* by one-third, but does not differ from that fex materially in colour, except in some parts, especially the cere and legs, being paler.

This bird imitates the Hen-harrier in colour, but independent of other points in which it differs, I do not find that it has any appearance of the ruff-like collar round the lower part of the head. It is found chiefly in Caffraria, and the neighbouring country, as Karow and Candeboo. In breeding time, the male is remarkable for its fong, which it makes every morning and evening, and like the Nightingale, not uncommonly even the night through; it fings in this loud tone for more than a minute, and after an interval begins anew; during its fong, it is so regardless of itself that any one may approach; but in the intervals of quiet it is so wary as to take flight at the least suspicion; should the marksman shoot the male, the female will soon fall under his gun, as in the attachment to him, and calling every where with the most plaintive voice, it is so continually passing within gun shot, that it is no difficult matter to shoot it; but in case the semale should be shot first, the male does not testify so much attachment, for retiring to the top of some distant tree not easily approached, it does not cease to fing, but becomes so wary as to fly intirely away from that neighbourhood on the least alarm. The female is faid to make the nest between the forks of trees, or in bushy groves, and to lay four white round eggs: this species preys on partridges, hares, quails, moles, rats, &c. and for its fize, feems a very destructive species.

PLACE.

MANNERS.

LONG-LEGGED HEN-HARRIER. L'açoli, Levaill. Oif. i. p. 130. pl. 31. Sous-buse acoli, Daudin. Orn. ii. p. 176. cli.

DESCRIPTION.

Hen-barrier, but seems to stand higher on the legs: the under parts from the breast, crossed with fine dusky lines or stripes, somewhat in the manner of the Chanting Falcon, though not so numerous or delicate; one likewise at first sight might suppose it to be the same bird on a larger scale, did not the great disproportion of length of legs at once shew the difference: the tail is pale grey, and likewise pretty long, even at the end, and not graduated as in that species: quills dusky black: reach two-thirds on the tail: the bill is blueish; cere red, as is the skin round the eyes: irides and legs yellow.

PLACE.

This frequents the cultivated parts of the Cape of Good Hope, and not unfrequently the fandy deferts; many of them about places in which the last is never seen. In the interior it is only observed about the rivers Swarte-kop and Sondag; it is called Witte-Valk (White Falcon) and Leeuwerk-Vange (Lark Catcher.) The male and semale are seen usually together; make their nest in the bushes; lay sour dirty white eggs, oval in shape, whereas those of the Chanting Falcon are nearly round.

46.
AXILLARY
F.
Discription.

SIZE and shape of the Hen-barrier, and not unlike it in colour, but differs essentially, as the wreathed seathers round the lower part of the head are not conspicuous: the bill is black: legs pale yellow; claws black: the plumage on the upper parts is pale cinereous blue; the under whitish: over the eye a long irregular narrow stripe of black; a large long patch of black also occupies the whole of the inner part of the wing when closed: the quills are black, and reach to the end of the tail, which is rather rounded in shape, and of a moderate length.

Inhabits

Inhabits New Holland, but is not very common. The specimen from which the above description was taken, was caught alive, and kept for two months, being fed with small birds, fish, &c.

KESTRIL.

F. Nisus, Sepp. Vog. 3. pl. 117. - Scop. An. Nat. Add. p. 10. Kestril, Gen. Syn. i. p. 94. 79. - Id. Sup. p. 25.

Think that this is the bird which in India is called Chouce. I have feen a bird, seemingly a Kestril, among some Chinese drawings, which was called Maw-ing, which signifies Speckled Bird, or ravenous. The word Maw, means Brachet or Broken, as the face after the small-pox. In the same collection, I observed another called also Mawing, but this had the breast crossed with numerous bars like the Sparrow-hawk.

DESCRIPTION.

\* Bechflein.

48. KESTRIL. VAR. C. Description.

Epervier des alouettes, Bris. Orn. i. p. 379. 22?

SOME few years fince, I received the following bird, which was shot in Surrey: it was fourteen inches long: the bill pale, with a black tip: cere and legs yellow: the forehead over the nostrils white: head grey, streaked with black; under the eye a black mark like a whisker: back rusous brick-colour; at the tip of each feather a spot of black: rump pale ash: all the under parts of the body pale rusous white, streaked with black down the shafts: thighs the same, with here and there a spot of black: chin and vent nearly white: wing coverts crossed with black bars: quills dusky; within barred with reddish white: tail pale rusous ash-colour, barred on each side the shafts with black; those on the inner webs most complete, and all the feathers marked at the ends for an inch, with a bar of black, but the very tips quite pale. This I judge may prove merely the bird alluded to above, noticed by Brisson; and probably no other than a young male of the Kestril, in the first year's plumage.

48. KESTRIL. VAR. D. Description.

1

Falco brunneus, der Braunrothe Falke, Allg. U. d. Vog. I. i. Zusass. S. 679. 127.

-Taf. 2. f. 1. Mannch.-f. 2. Junges.

THIS in plumage feems not unlike the Kestril, but as big as the Hooded Crow, being fourteen inches long, and two feet broad: the bill is blue; the cere yellow: the ground colour of the plumage is a fort of rusty yellow, crossed with brown bars, as in the Kestril: the under parts paler, with perpendicular strice: tail crossed with lines of black, and deeply tipped with black at the end.

The young bird is not greatly different, but the cross streaks of blackish are edged with white on the upper parts, the under not unlike the first; but the end of the tail is tipped with black in a less degree.

This

PLAGE.

This bird is said to inhabit *Thuringia* in the breeding season, and appears as a bird of passage, as it is not seen in winter; it makes the nest as late as May, whereas the rest of the birds of prey build theirs in March and April.

I much suspect that the above described are no other than the Kestril, which is known to wear the semale plumage for some length of time; and to say the truth, very many of the Falcon genus have so mixed an appearance in their plumage, partaking both of male and semale, as to appear to the less informed naturalist as a distinct species.

Le Montagnard, Levaill. Oif. i. p. 144. pl. 35. Cresserelle Montagnard, Daud. Orn. ii. p. 135. cix.

AT first sight this bird has greatly the appearance of the male Kestril; but on comparison with that bird, in respect to size and make, it will be found to differ in many particulars: it is a little bigger: the bill is black; cere and legs yellow: the head rusous, inclining to brown at the nape: the back rusous, marked with crescents of black: tail pale rusous, crossed with several brown bands: chin white: under parts of the body pale rusous, streaked with dusky spots down the middle of each feather; but the lower belly, vent, and thighs are the same, on a pale grey ground: quills black above, beneath barred with white; all the under wing coverts rusous white, with dusky spots: tail almost even at the end, or rather rounded, and the quills reach to about the middle of it. The semale, as in other

It is very common in various parts of the Cape of Good Hope, and its neighbourhood; called there Rooye-Valk (Red Falcon) or Steen-Valk (Stone Falcon); also seen in most parts of Africa, especially mountainous

birds of prey, a little exceeds the male in fize.

**49**% t

RUFOUS-BACKED KESTRIL: Description.

PLACE.

mountainous and rocky fituations; it refides in the fame place the whole year: feeds on fmall quadrupeds, lizards, and infects; makes its neft among the sharp rocks, unsheltered, composed of dry twigs and grass carelesty put together; lays commonly six, seven, and even eight eggs, intirely of a deep rusous, like its own plumage; is a sherce and daring bird, setting up a noise like cri-cri, many times repeated, on the sight of any person, especially during the time of incubation, or when it has young ones.

ORANGE-LEGGED HOBBY. Falco Subbuteo, Ind. Orn. ii. p. 47. 114. Var.?

Falco rufipes, der rothfusfige Falke, Allg. Ueb. d. Vog. ii. Zusass. S. 677. 122.—

Besek. Vog. Kurl. S. 19. 27.—Tas. 3 & 4.—Pl. Enlum. 431.

DESCRIPTION.

M. BESEKE here mentions two hawks, about the fize of a Kestril, shot together late in the spring. The one supposed to be the male wholly black, but the great wing seathers and under parts of the body blackish lead colour: thighs, vent, and under tail coverts fine red brown: eyelids, the bare space round them, the cere and legs, of a brick red: bill half yellow, half blueish.

The one supposed to be the female had many things in common with the other, but was larger: head and neck plain whitish yellow, or fox colour: eyes placed in a patch of brown: throat as far as the breast whitish yellow, as are the thigh coverts, vent, and under the tail: the shoulders duller fox-coloured yellow, waved with black; upper part of the body pale brown, with dull ash-coloured and black waves: tail crossed with nine small black bands.

This feems to approach very nearly to a fingular variety of the Holby, figured in the Pl. Enluminées, if not the fame bird.

William of Home north the married

Falco Subbuteo major, der Groffe Baumfalke, Allg. Ueb. d. Vog. i. Zusas. p. 660. 29. Taf. i.—Id. Naturg. Deutsch. ii. S. 315. 19.

GREATER HOBBY. -

DESCRIPTION.

Raven; in length nearly eighteen inches, breadth three feet: the bill an inch and an half long, horn colour: cere and legs yellow: iris pale yellow: head and neck black brown; cheeks black: back and wing coverts blackish blue, croffed with obsolete dull brown, ash grey, and reddish grey bands: chin, fore part of the neck, and upper part of the breast dusky reddish white, banded with dull brown, appearing on the breast as oval marks: quills blackish, marked on the inner webs with eight or more pale grey oval spots; on the tail twelve alternate dull brown and ash grey bands.

The female almost one-third bigger than the male, and the colours not so well defined; she wants also the black on the cheeks, and the breast and neck are plain smutty white

breast and neck are plain smutty white.

This species inhabits the pine forests of Germany, preying on grous, hares, and small birds. It may by some be mistaken for a variety, but Mr. Bechstein assures us that it is a distinct species.

PLACE.

Le Gabar, Lewaill. Oif. i. p. 136. pl. 33. Epervier Gabar, Daudin. Orn. ii. p. 87. lvi.

RED-LEGGED F.

DESCRIPTION.

THIS is the fize of the Sparrow-bawk, and the wings, as in that bird, do not reach much beyond the rump: the bird is however a trifle flouter than the Sparrow-bawk, and the tail rather shorter: the head, neck, and upper part of the body and wings are grey brown: upper and lower tail coverts white: quills dusky, banded beneath transversely, and the secondaries tipped with white: tail even, banded darker and lighter brown, beneath the same with black and white: all from the chin to the breast, the colour is blueish grey,

8

from

from thence to the vent, dusky white, crossed with light brown bands: the bill is black: cere and legs fine red: irides yellow. The female as usual one-third bigger than the male.

PLACE.

These are sound only in the interior parts of the Cape of Good Hope, on the borders of the river Swarte-kop and Sondag, also about Karow, Camdeboo, and other parts; but not near the Cape itself: supposed to lay about sour white eggs, as big as those of our Sparrow-bawk; it hatches in September.

DWARF F. Description. Le Minule, Levaill. Oif. i. p. 140. No 34.

THIS is a small bird of prey, being even less than the Merlin; it has the same proportion as the Sparrow-hawk, but on a less scale: the bill is black: cere and legs yellow: irides yellow orange: all the upper parts of the body, wings, and tail are brown; the under parts white, with a sew small brown spots on the throat; but the breast marked with larger, which increase in size as they approach downwards, becoming at last bars across the belly and thighs: the quills reach a small way beyond the base of the tail, which is even at the end, the greater ones banded with white on the inner webs; the secondaries much the same, with broader: under wing coverts rusous spotted with white: the tail feathers are brown, with obsolete darker bands, but the bands are whitish on the inner webs.

MANNERS.

This is a bold species, generally preying on smaller birds, but in defect of these on *Grashoppers*, &c. drives the *Shrike* totally away from their quarters, and even many birds of prey larger than themselves, even *Buzzards* and *Kites*: male and semale most times together; build on trees, the nest of flexible twigs intermixed with most and leaves without, and wool and feathers within, and lay five eggs, spotted with brown near the ends; the *female* almost twice the size

of the male; but the plumage nearly the fame: was fo bold as to take away a bird from the table where Mr. Levaillant fate preparing others.

Le Faucon à culotte noire, Levaill. Ois. i. p. 126. pl. 29.—Daudin. Orn. ii. p. 120. xcii.

BLACK-THIGHED F. DESCRIPTION.

THIS is somewhat bigger than a pigeon: the bill is singularly formed in respect to the under mandible, as in the Crested Indian Falcen, lead coloured, with a yellowish cere: the plumage on the upper parts of the body and wings is grey brown, with a darker streak down the middle of each seather: the throat is white: the rest of the under parts very pale rusous, with dashes of dark brown, principally down the shafts: the thighs are black: the quills and tail dark coloured; and the wings when closed reach two-thirds of the way thereon; the tail in shape rather rounded: the legs are yellow: irides hazel brown.

PLACE.

This species frequent the Grand Namaquas. M. Levaillant killed three in the action of feeding on a leveret, at the same time roused another somewhat larger, which was supposed to be a female. He was informed, that this bird is not uncommon on Sneeuw-bergen (snow mountain) where it is called Klyne berg-baan (little cock of the mountain) but by this name they call all the middle sized birds of prey, and the smaller ones by the name of Valk or Falcon.

Le Rounoir, Levaill. Oif. i. p. 73. pl. 16. Buse Jakal, Daudin. Orn. ii. p. 161. cxxxiii.

JACKAL F. DESCRIPTION

THIS is the fize of our Buzzard, but comparatively more bulky, and the tail shorter in proportion: the bill is dusky: cere and legs yellow: iris deep brown: the colour of the plumage is mostly dusky brown: from the chin is a mixture of white, which changes on the breast to rusous: the quills are dusky, banded with Supp. II.

paler at the base, and the secondaries mixed outwardly with white; tail deep rusous, with a spot of black near the end of each seather; the two outer ones only banded with dusky: beneath all is rusous grey. The semale differs in being larger, and the red on the breast not so high coloured.

PLACE.

This species is mostly seen about habitations of the colonists of the Cape of Good Hope, where it is known by the name of Jakals-Vogel (Jackal Bird) on account of the cry imitating the voice of that quadruped; called also Rotter-Vanger (Rat-catcher); it is not shy, being seen every where following the lesser kinds of vermin, as rats, moles, and the like, and like the Buzzard in Europe, is esteemed an useful species; it is cowardly, insomuch, that even the Fiscal Shrike will occasionally put it to slight.

It inhabits chiefly the thick groves which furround the houses, and in the thickest part of them makes the nest of twigs and moss, lined with seathers: lays three or sour eggs, sometimes only two, which are generally hatched, as the nest is rarely destroyed, from idea the natives entertain of the utility of this species.

DESERT F. -DESCRIPTION. Le Rougri, Levaill. Ois. i. p. 77. pl. 17. Buse des deserts, Daud. Qrn. ii. p. 162. cxxxiv.

HIS is smaller than the last, and less robust in proportion, but has a longer tail: the bill, cere, and legs are yellow: irides reddish: the reigning colour of the plumage is serruginous or rusous, paler beneath, with the chin to the breast and vent very pale grey, nearly white; the quills are black; the rest of the under parts are rusous as above, but paler, and streaked sparingly with dusky: the tail is like the back above, but greyish beneath, marked with some transverse obsolete bands.

The female is a trifle bigger than the male, and is less distinct in the colours.

Is

It is less frequent about the inhabited parts than the Jackal Falcon, being only seen in the dry and uncultivated spots. It lives however on the same kind of food: its cry not unlike the European Buzzard. The male and semale are mostly seen together, and they make the nest in the same kind of places, and of nearly the same materials.

PLACE ...

Falco Nisus, Ind. Orn. i. p. 44. 107. Var S. Sparrow-hawk, Gen. Syn. p. 99 85. Var. C.

N. HOLLAND SPARROW-HAWK.

LENGTH eighteen inches; in appearance not unlike the Sparrow-bawk: bill pale blue: irides and legs yellow: the top of the head is ash colour; hind part of the neck rusous: back and wings dark ash colour, nearly black: breast and belly dirty white, crossed with numerous pale rusous bars: tail long, marked with several pale bars; wings short, reaching only to the base of it.

PLACE.

Inhabits New Holland.

58. SPECKLED SPARROW-HAWK. Description.

Le Tachiro, Levaill. Oif. i. p. 100. pl. 24. Epervier Tachiro, Daudin. Orn. ii. p. 9. 58.

THIS is little inferior in fize to our Gospawk: the head and neck are varied with white and rusous, with spots of brown black: breast white, mixed with rusous: above the plumage is dull brown for the most part, beneath white, shaded with rusous, marked with crescent-like spots of brown: the quills have white tips: the tail is as long as the body, brown above, crossed with deeper bands, beneath white, with broad blackish bands; the quills reach to about the middle of it: the bill is blueish: legs yellow: irides topaz colour: the female less bright in colour.

PLACE.

This frequents only the deep forests, which border Queer Boom, and in those of Hottniqua Land, and makes the nest between the forks of the branches of the great trees, formed of small twigs and moss;

H 2

has

has three young at a time: supposed to feed on small birds without distinction, but nourishes the young with grasshoppers; has a piercing note like *Cri*, *cri*, often repeated. The eggs are white, marked with rusous spots.

SONNINI's
F.

New species of Hawk, Sonnin. Trav. (Engl. ed.) ii. p. 52.

LENGTH eleven inches and an half: bill very hooked, full an inch long: cere and legs yellow: irides orange: the tail nearly even, but the outer feathers rather longest, though not perceivably forked unless expanded: the length of it four inches eight lines, and the wings when closed reach eight lines beyond it: the first quill feather ferrated outwardly \*: legs covered with feathers on the fore part almost to the toes: the forehead and under parts are white; above the eye and anterior angle of it, covered with slender black feathers: body, head, and upper wing coverts ash coloured, tipped with grey, the shafts black: the two middle tail feathers white, mingled with ash colour: the rest white within, and light grey without.

PLACE.

Inhabits *Egypt*, where it is commonly feen fuspended in the air over the rice fields, like the *Kestril*, and is sometimes seen to perch on date trees, but never observed on the ground.

60.
BLACK-EYED
F.
Description.

THIS species is about thirty-four or thirty-five inches in length: the bill is black; pale about the nostrils: legs pale red: the head and neck are ash colour: the eye placed in a triangular rusous patch, but immediately round the eye black: the back, wings, and tail, which last is rather long, are of a dusky brown: round the lower parts of the neck, and all beneath, ferruginous, crossed with numerous fine lines of a blueish ash colour.

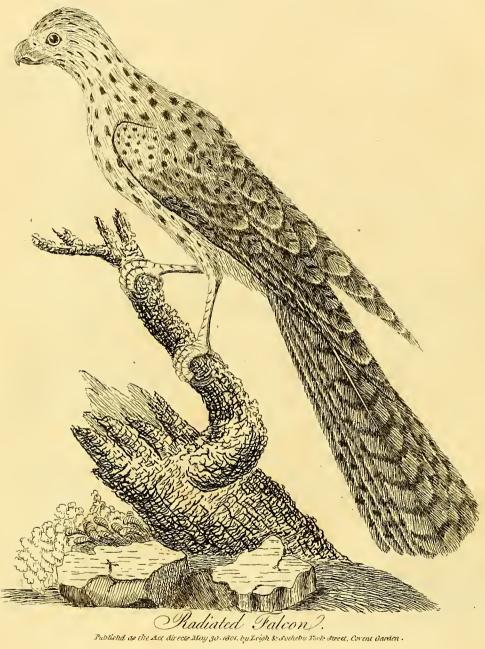

PLACE.

Inhabits New Holland.

<sup>\*</sup> This circumstance, added to the shins being feathered before, and the black feathers half round the eye, inclines us to think the bird allied to the Owl Genus.

Pl.CXXI.

THIS species is twenty-two inches long, and sour seet broad from the tip of one wing to that of the other: the bill is black: the cere and space round the eye pale blue: irides brown: the plumage in general of a fine rust colour, spotted and streaked all over with black, but crossed on the head and neck with fine lines of the same: wings and tail brown, marked with blackish or dusky bars: the tail is very long, with eight or nine black bars, the wings reaching to the middle of it: the legs are blue; claws long, black, and sharp.

This inhabits New Holland, but is probably a fcarce species, only one having been met with, which was found nailed to the side of a barn.

SIZE of the Ringtail; length eighteen or nineteen inches: bill pale, with a black point: irides yellow: the general colour of the plumage is a deep chocolate brown, spotted with rusty white on the lower part of the neck behind, and on the axillaries of the wings: the quills are obliquely, and the tail feathers transversely barred with the same: the under parts as far as the breast, dirty yellowish white, with short dusky streaks: legs covered to the toes with pale ash-coloured feathers.

Inhabits New Holland, but no history annexed, further than that it has a wonderful faculty of contracting and dilating the iris; and that the native name is Goora-a-Gang.

Falco discolor, Att. Soc. N. H. de Paris, i. pl. 1. p. 911. 4. Der bunte Falke, Allg. U. d. Vog. ii. S. 680. 128.

THE fize of this bird is not mentioned; but the description obferves, that the upper parts of the plumage are dusky grey; the under, breast, belly, and thighs, dusky rust colour: the under wing coverts and those of the tail white.

PACIFIC F.
Description.

HE length of this bird is from fixteen to eighteen inches: the bill, legs, and irides yellow: the head and most part of the neck are white, but the rest of the plumage in general is brown, blotched on the back with dark spots, and marked on the belly (which is paler than above, and inclining to yellow) with black streaks: The tail is long, even at the end, crossed with seven or eight oblique black bars: the quills are also barred as the tail, with the ends black.

PLACE.

This was met with in New South Wales, and probably is not a numerous species, as only one has been shot, though others have been now and then seen.

65. LUNATED F. Description.

THIS species is twelve inches long: the bill is blue: legs yellow: the forehead buff colour: all the upper parts of the plumage are brown, as also the wings and tail: the throat and under parts of the body buff yellow, passing upwards in the shape of a crescent on each side under the eye, and again below this, but not so far: the breast is marked with numerous brown spots: thighs crossed with sine brown lines: the tail long; the wings reach about half way thereon.

PLACE.

Inhabits New Holland, and was taken in March. The native name is Goo-roo-wang.

66. FAIR F. Description.

THE length of this species is about twelve inches: the bill is pale brown: legs and irides yellow: head, neck before, and all beneath, white: the crown of the head, and middle of the belly pale blue: back, wings, and tail brown: the bend of the wing brownish blue, occupying in an oblique manner above half the coverts.

PLACE.

Inhabits New Holland, but neither name nor manners are recorded. Another, very similar, was spotted on the nape with black; the back paler: rump pale dusky blue: tail tipped with pale colour; all beneath white, but not tinged any where with blue.

## EARED

Str. Bubo, Ind. Orn. i. p. 51. 1 .- Muf. Lev. tab. 5. Le Grand Duc, Lewaill. Ois. i. p. 160. pl. 40 .- Daudin. Orn. ii. p. 208. Great-eared Owl, Gen. Syn. i. p. 116. 1 .- Id. Sup. p. 40.

GREAT-EARED

IT is observed, that this bird sees better in the day than any other of the genus, as it is frequently observed preying on its game in full day light. It feems to be a species univerfally spread over both the old and new continents, as M. Levaillant met with it in Africa, as also the Long-eared Owl, and Scops, on the borders of the River of Elephants, but smaller, and having a greater degree of black in the plumage.

DESCRIPTION.

56

LONG-EARED O. Str. Otus, Ind. Orn. i. p. 53. 7.

Moyen Duc, Levaill. Oif. i. p. 166.

Long-eared Owl, Gen. Syn. ii p. 121.—Id. Sup. p. 42.

DESCRIPTION.

IN one of these which fell under my observation, the weight was eight ounces and a half; the length twelve inches and a half; breadth thirty-four inches: the horns, so called, consist of nine seathers each; those in front are the shortest, and the sist he longest, and when they all lie in their places, there appears a black broad stripe, edged with yellow outwardly, within crossed with three or four bars of a darker shade. It is found in the neighbourhood of the Cape of Good Hope, as well as in other parts of Africa.

PLACE.

SHORT-EARED

Duc à courtes oreilles, Daudin. Orn. ii. p. 216.

Short-eared Owl, Gen. Syn. i. p. 124. 9.—Id. Sup. p. 43.

CAPTAIN Dixon brought over two specimens of this bird from Sandwich Islands. It is found also in the Orkney Isles, where it is faid to nestle in the ground \*.

From the almost impossibility of discovering any one feather longer than the rest in dead specimens, added to the similarity of this bird to the Hawk Owl of Edwards, or at least one sent to me under that denomination, I suppose them both to be but one and the same bird; be this as it may, they are known by the name of the Sbort-eared-Owl in England; and sufficiently common on the American continent. In respect to the received opinion of its having the capability of erecting a single feather of the crown at will, the sact is much to be doubted;

\* Arct. Zool. Pref. xxv.

indeed

indeed it has a fort of tuft or feries of feveral feathers running backwards, and springing out of a yellowish line above each eye, which goes over the crown of the head, and these tusts the bird erects mostly in a quiescent state, never much more than a quarter of an inch in height, and never so much as to be perpendicular; when alarmed, they are ever depressed \*.

In one of these shot near me in February 1792, I observed the elongated seathers above mentioned very clearly, and from this am persuaded, that this bird having in his power to erect a single seather only, has no foundation.

I think not improper here to remark, that the Tawny Owl of Mr. Pennant, if it has yellow irides †, I never met with, and except it may hereafter prove the Short-eared Owl, in some one stage of its life, I know of no such bird in England: our brown Wood Owls have dark or blueish irides, and one sex of these inclines more to reddish tawny than the other, differing also in weight; therefore till convinced to the contrary, I am of opinion that the Tawny Owl should be erased from our calendar, unless we allow it to be the same bird with the brown species ‡.

<sup>\*</sup> Col. Montagu.

<sup>†</sup> I once received from my late friend Mr. Pennant, a drawing of what he called the Tawny Owl. but it had yellow irides.

<sup>‡ &</sup>quot;M. Buffon a fait tres gratuitement deux species de la Hulotte & du Chathuant;

<sup>&</sup>quot;tandis que très certainement son Chathuant n'est que la Hulotte, dans son jeune age,

observation dont je suis très certain, ayant elevé plus de dix nichées de ces oiseaux.

<sup>&</sup>quot;On voit que Frisch, a eu grande raison de regarder l'un de ces oiseaux comme une

<sup>&</sup>quot;simple varieté de l'autre, malgré des pretendues caractères par lesquels Buffon pre-

<sup>&</sup>quot; tend les distinguer." Levaill. Ois. i. p. 164. Note (1.)

MARSH O.

Strix palustris, Die sumpseule, N. G. Deutsch. 2. 344.—Allg. U. d. Vog. i. Zusas. S. 683. 16. B.—Gr. Must. S. 82.

DESCRIPTION.

THIS is as big as a Crow, and not far from nine inches long: the bill brown blue; tip and edge yellow: legs hairy; claws black: the upper part of the plumage is white, grey, and brown mixed; but in the head and shoulders the white predominates: the ears consist of six feathers; about the neck is a kind of yellowish ring, marked with coffee-coloured spots: the under parts of the body are reddish grey, on the sides streaked with chesnut brown, and some smaller cross streaks: thighs ferruginous, with dull tranverse lines: quills grey, with coffee brown spots, making sour cross stripes; the tail has sive bands made up in the same manner: in some specimens the ear feathers consist of three or sour feathers only.

PLACE.

This fpecies inhabits *Pomerania*, *Hesse*, and *Thuringia*, where it is called by some the *Moor Fowl*, being found in the peat marshes among the high grass; it lays sour white eggs, the size of those of a pigeon, and seeds chiefly on field or other mice.

WHITE-FRONTED O. DESCRIPTION.

White-fronted Owl, Nat. Mife. pl. 171.

SIZE of the Little Owl; length eight inches: general colour of the plumage on the upper parts brown: the circle of feathers round the eyes dark, fringed at the back part with white; between the eyes, and over the bill and the chin white; the under parts from thence yellow buff: across the breast a pale brown band; on the wing coverts a spot or two of white: the first five quills marked with a white spot on the outer, and the second quills with the same on the inner margins: the first quills ferrated on the outer edge the whole length; the second quill the same half way from the tip: tail marked as the quills: legs feathered: bill black: toes dusky.

π.

This

This was brought from Quebec, by General Davies, in 1790; and with it another much smaller, which he had in his possession alive; it differed in being more dusky, and the circles of the face not fringed on the back part, otherwise so like, as to be supposed merely differing in age or sex: the general observed to me, that this bird frequently erected two seathers over the eye; but although I inspected the specimens very narrowly, I could not observe any seathers longer than the rest, which circumstance is also noticed in respect to the Shorteared Owl.

## \* \* WITH SMOOTH HEADS.

Snowy Owl, Gen. Syn. i. p. 132. 17 .- Id. Sup. p. 45.

Str. nyctea, Ind. Orn. i. p. 57. 20.—Seelig. Vog. Th. 3. Taf. 17.—Spalowofk. Vog. 2. t. 2.
Strix arctica capite lævi, &c. Bartr. Trav. p. 285.
Chouette Harfang. Daudin. Orn. ii. p. 188.

SNOWY O.

FOUND fometimes in Saxony, Hesse, and Thuringia, in Germany. From its preying on hares, among other things, it has probably acquired the name of Harfang. In summer it is marked with dull pale brownish spots, but in winter as white as snow.

DESCRIPTION.

The Kalmucs are faid to pay divine honours to this species, and augur good or ill luck, according to the bird tending in its slight to the right or left.

In Lapland, it is found useful in destroying numbers of the Lemmings: the inhabitants of Hudsons Bay make these birds supply part of their food, eating their siesh when cooked, and drinking the broth made with it.

Bartram observes, that it arrives in Pensylvania in autumn, from the north, and continues through the winter, departing in spring, and that they sometimes continue their journies as far south as Carolina.

PLACE,

ERMINE O.

La Chouette blanche, Levaill. Ois. i. p. 174. pl. 45. - Daudin. Orn. ii. p. 190.

DESCRIPTION.

THIS bird, from the authority of Mr. Levaillant, appears to be distinct from either the Snowy Owl or Wapacuthu; neither can it be a white variety of our Great E.O. as it is entirely earless; besides, the comparative measurements of various parts will shew at once, that it ought to stand alone as a species; in fize it is smaller than the Snowy Owl, and of a more squat form than that bird: the head too is much larger in proportion: the tail is short, and the wings exceed it in length when closed some inches, whereas in the Snowy Owl the tail is pretty long, and the wings do not reach more than half way thereon: the legs in the species here treated of are very short, and so completely covered with seathers, as nearly to hide the claws: the whole plumage is snow white, with exception to a few scattered spots of black on the wing coverts and quills: the bill, which is nearly hid in the sace feathers, and the claws, are black.

It is uncertain from whence this bird came, but a specimen is in the collection of M. Raye de Breukelerward, at Amsterdam.

<sup>8.</sup> WHITE O. Str. flammea, Ind. Orn. i. p. 60. 28. L'Effraie, Levaill. Ois. i. p. 164.—Daudin. Orn. ii. p. 197. White or Barn Owl, Gen. Syn. i. p. 138. 26.—Id. Sup. p. 46.

PLACE.

THIS is very common at the Cape of Good Hope, but in defect of barns, out-houses, and old buildings, it is constrained to make the nest among the rocks, in the hollows of which it lays seven or eight white eggs, on a nest composed of a few twigs and dried leaves. The natives call it Doodvogel (Bird of Death) and the other kinds of owls. Uylers, by which name they call all night-birds.

Var. A. Str. Javanica, Ind. Orn. i. p. 64. 39. - De Wurmb. apud Licht. Mag. iv. 2. 10.

VAR. A.
JAVAN
O.

THIS is faid to have an ash-coloured body, here and there spotted with white and black; beneath dirty white, with a tinge of rusous, and spotted with black. It inhabits Java. By the description, it seems too like our Barn Owl to admit of a controversy, especially as this bird has been already sound in most parts of the world, both on the old and new continent.

O.
Description.

PLACE.

Le Choucou, Levaill. Ois. i. p. 151. pl. 38. Chouette Choucou, Daudin. Orn. ii. p. 186.

FALCONINE

DESCRIPTION.

THIS kind of owl feems, like the Hawk Owl\*, a species approaching not a little to the Falcon genus, it is however clearly an owl, and must be ranked as such: the plumage on the upper part of the body a pale grey brown, inclining to rufous on the crown of the head and back of the neck, and on the wing coverts are a few spots of white; the greater quills are like the rest of the wing, with whitish tips, and reach when closed about half way on the tail; which is cuneiform in shape, and grey brown; all but the two middle feathers are marked on the outer web with transverse white lines, ten or twelve in number: the inner and all the under side of it intirely white, like other owls: the fides of the face and the eyes in part furrounded with a ruff of hairy feathers, covering the nostrils; these are white, as are also all the under parts of the body from the chin, most delicately pure: the thigh feathers hang over the legs quite to the toes, and the legs themselves covered with short bristly feathers: the bill is small, and legs are black; irides yellow: the toes placed two and two, or three and one, at the will of the bird.

\* Edwards, v. ii. pl. 62.

Inhabite

62

PLACE.

Inhabits various parts of Africa, where the people in the country of the Hottniquas, call it Nagt-valk (Night Falcon); it does not appear till twilight, and from this circumstance, and its flying rapidly, not easily shot.

Mr. Levaillant caught two of them by chance in a net, for he had in vain before attempted to shoot them: the female is rather smaller, and the white of the under parts less pure.

VARIEGATED
O.
Description.

Le Choucouhou, Levaill. Ois. i. p. 157. p. 39. 'Chouette Choucouhou, Daudin. Orn. ii. p. 187.

THIS is the fize of the Long-eared Owl, but is less bulky, and stands higher on its legs: the circles of the face round the eyes are white, with dusky markings: chin white; but the plumage in general is brown in various shades, with a mixture of white, and on the under parts of the body irregularly barred brown and white: the legs are covered with downy grey feathers: the tail banded dusky brown and rusous white, cuneiform in shape; and the wings when closed reach two-thirds thereon: the bill is black: irides yellow.

PLACE.

Inhabits Africa, met with in the neighbourhood of the Orange river, and Grand Namaquas: supposed to prey of evenings; for although it has been seen in the day, it has been only when the small birds have surrounded it as an object not usually met with. The female is somewhat larger than the male, but differs very little in the plumage, except that she has less white about her, and the irides of a paler yellow.

FASCIATED O. Le Huhul, Levaill. Ois. i. p. 167. pl. 41. Chouette Huhul, Daudin. Orn. ii. p. 190. Chouette de Cayenne, Mauduit Encyc. Meth.

DESCRIPTION.

THIS is about the fize of our Brown Owl: the bill and legs yellow: the general colour of the plumage of the head, neck, and body is dufky, croffed with white bars, which are broadest on the

the under parts; but the head is only dotted with white: the wings are brown, croffed on the coverts with fine lines of white: quills plain, reaching when closed to the middle of the tail: the tail itself is cuneiform and long, each feather croffed with three narrow white bands, which do not exactly correspond on each fide the shaft: legs feathered to the toes with dusky and white feathers.

Inhabits Cayenne, and appears to be a new species; by a label applied to the leg of the specimen, it was called Chouette de Jour, hence it should appear to be a bird that takes its prey in the day, which some of the Owl tribe are known to do.

PLACE:

La Chouette à aigrettes blanches, Levaill. Ois. i. p. 170. pl. 43.—Daudin. Orn. ii. SUPERCILIOUS p. 207.

SIZE of the Long-eared Owl: the bill yellow: the upper parts of the head and body, wings and tail, rufous brown, with a few fpots of white on the two last: the under parts from the chin dirty white, tinged more or less with rufous, with a few dusky specks, and the seathers of the knees covering the shin almost to the toes; the shins themselves clothed with fine hairs: above the eye passes an arch, consisting of a series of loose white seathers, over the ears on each side of the neck; these are longer than the rest, but not capable of being erected as in the great and other eared Owls: the tail is somewhat cuneiform, and the wings when closed reach to about the middle of it.

This species inhabits Guiana, but is not very common in our cabinets; one specimen, however, filled a place in the collection of our late friend and correspondent M. C. G. D'orcy, and M. Levaillant mentions two others, one in the collection of M. Mauduit, and another in his own.

Description.

PLACE.

64

GEORGIAN
O.
Description.

SIZE of the Barn Owl: length fixteen inches and a half: bill yellow: the plumage on the upper parts of the bird is brown, banded with yellowish: throat and breast pale brown, croffed with whitish bands: belly yellowish white, marked with longish red brown streaks: thighs and legs woolly, whitish or very pale in colour, varied with small blackish spots: quill and tail feathers brown, croffed with four or five white bands.

PLACE.

I met with this specimen in the collection of Mr. Humphries, said to have come from several miles within South Georgia, in America.

BOOBOOK O.

DESCRIPTION.

SIZE of the Brown Owl, and at first sight somewhat resembles it, especially on the upper parts; but marked with yellow streaks on the head, and with spots of the same on the back: the chin and throat are yellow, streaked and spotted with rusous: belly ferruginous, with pale irregular spots and markings: thighs and legs covered with yellow downy feathers, marked with black: toes of a brownish red: the bill is small and dusky.

PLACE.

This inhabits New Holland, where it is known by the name of Boobook.

SPECTACLE O. Var. A. Str. perspicillata, Ind. Orn. i. p. 58. 24?

La Chouette à collier, Levaill. Ois. i. p. 169. pl. 42.—Daud. Orn. ii. p. 193. Spectacle Owl, Var. Gen. Syn. Sup. p. 5. pl. 107.

DESCRIPTION.

THE whole head in this bird is deep rufous, with a white throat, which colour passes between the eyes, and over them as an eyebrow; whereas in that figured in the Gen. Synopsis, Sup. pl. 107, the whole head is white, with a large rufous patch, in the middle of which

which the eyes are placed: the band across the breast is the same in both, and in respect to the rest of the colours, they agree sufficiently, as to suppose them mere varieties, if not sexual differences of the same bird.

Mr. Levaillant's specimen was killed at Surinam. It appears to be a variety of the Spectacle Owl, and the following no doubt a variety also of the same bird.

Str. perspicillata, Ind. Orn. i. p. 58. 23.

Var. B. La Chouette à masque noir, Levaill. Ois. i. p. 172. pl. 44.—Daudin. Orn. ii. p. 192.

VAR. B.

THIS feems to be our Spectacle Owl for a certainty, differing from the specimen in the Lev. Museum, merely in wanting the rusous bar across the breast; but the large dark patch, in which the eyes are placed, seems absolutely black, whereas in our specimen it was merely dark red brown; added to this, that the whole of the under parts from the chin are nearly white, having below the bar, the belly inclined to yellow; we may therefore suspect that the two were of different sexes, or of different periods of age.

DESCRIPTION.

This is faid to have come from Cayenne, from whence we are certain the Leverian one was brought; as to the Collared Owl we cannot efteem it otherwise than a further variety of our Spectacle Owl, arising from age or sex.

PLACE.

Chouette nudipède, Daudin. Orn. ii. p. 199.

BARE-LEGGED
O.
DESCRIPTION.

THIS is seven inches in length: the plumage is sulvous brown on the upper parts, with a white spot on each side of the neck, and other spots of white on the wing coverts: the under parts of the body are white, with a longitudinal lyre-shaped brown spot on each feather: legs long, naked, and brown; claws black.

SUPP. II.

K

The

The young birds are rufous, the belly more white, as the spots at that age are less conspicuous.

PLACE.

This inhabits Porto Rico in America, also at Cayenne.

17. ВООТЕ**D** О.

Chouette Phalenoide, Daudin. Orn. ii. p. 206.

Description:

the general colour of the upper parts of the plumage is fulvous; the under wing coverts marked with fix white fpots: the cheeks are white: the under parts of the body varied with rufous and white: the wings reach to the end of the tail, which is fhort: the shins are covered with feathers, as well as the toes, and are of a rufous colour; claws blackish.

TLACE.

Inha bits the island of Trinidad, in America.

TENGMALM'S

Strix Tengmalmi, Ind. Orn. i. p. 64. 42.—Act. Stockh. Ann. 1783, trim. i.—Arct. Zool, Supp. p. 60.

Chevechette de Tengmalm, Daudin, Orn. ii. p. 205. 29. Var.

DESCRIPTION.

THIS is the fize of a black-bird: the bill dusky, tipped with white: from its corners to each eye, is a line of black; the irides yellow; the circlet of feathers round the eyes is white, mixed with dusky: head grey, striped with white, and surrounded with a dusky circle, spotted with white and dusky: primaries dusky, barred with white: breast and belly white, varied irregularly with dusky marks: tail above of a dusky grey, striped with white: toes feathered to the claws, grey, with pea-shaped spots of white.

VAR. A. DWARF

La Chevechette, Levaill. Oif. i. p. 176. pl. 46. Chouette Chevechette, Daudin. Orn. ii. p. 205.

DESCRIPTION.

THIS is inferior in fize to the *Little Owl*, though fomewhat corresponding in plumage: the bill is yellow, and covered at the base with hairs, which stand forwards upon it: the ground-colour of the

the bird is dull brown, with spots of white, on the head, wings, and tail more numerous, and smaller on the forehead and sides of it: the throat, neck, belly, and under tail coverts are white, spotted with brown; mostly brown on the breast: the feet are feathered to the claws: the tail is pretty long, and the wings short in proportion, as they scarcely reach beyond the base of it. This character is sufficient to distinguish it from the Little Owl, in which the wings and tail are equal in length.

The native foil of this species is unknown. This and the last defcribed are varieties only of each other.

Lanius collaris, Ind. Orn. i. p. 69. 10. Le Fiscal, Levaill. Ois. ii. p. 35. pl. 61. 62. Collared Shrike, Gen. Syn. i. p. 163. 7.

IN my Supplement, I supposed the Ferruginous Shrike\* to be the Canary Biter, or Fiscal Bird, of the Cape of Good Hope; but I am inclined to think it to be the collared species.

Thunberg, in his travels †, fays, "Fifcal and Canary Byter were the appellations given to a black and white bird (Lanius Collaris) which was common in the town, and every garden there ‡; it is a bird of

<sup>•</sup> P. 51. No 8. + 1. p. 293.

I am aware that more than one or two birds go by the name of Canary Byter at the Cape of Good Hope.

prey, though fmall, its food infects, fuch as beetles and grass-hoppers, which it not only caught with great dexterity, but likewise when it could not confume them all, it would stick them on the pales of farm yards, till it had occasion for them. It also caught sparrows and canary birds, but did not devour more of them than the brains."

Mr. Levaillant ascertains likewise this last fact, and gives a figure of the young as well as the adult bird. He adds also, that it is found in Senegal, and in all the interior parts of Africa, and that it is not a variety of our Great Shrike, differing in the quills, of which this last has sisten marked with white, in the Collared Shrike only seven; also in the Great Shrike, the tail seathers are twice as broad as in the Fiscal.

PLACE.

Lanius Collurio, Ind. Orn. i. p. 69. 11.—Spalowsk. Vog. 2. tab. 5. Pie-griesche rousse, Darnegas, Hist. Prov. ii. p. 335. L'Ecorcheur male, & de jeune age, Levaill. Ois. ii. p. 50. pl. 69. Red-backed Skrike, Gen. Syn. i. p. 167. 25.—Id. Sup. p. 52.

RED-BACKED Shr.

THIS is common in Egypt, and called there Dagnousse, caught in large numbers alive in nets, and are sold alive, as well as all those birds which the law forbids to be strangled, and which must not be used for food till they have been bled; but as these shrikes are very vicious, and cruelly nip the singers, the bird catchers take care to tie together the two ends of their beak, with one of their feathers \*; they are also frequently met with in Africa, about the Cape of Good Hope, and other parts.

PLACE.

MAGPIE Shr.

Lanius picatus, Ind. Orn. i. p. 73. 20. La Pie Piegriesche, Levaill. Ois. ii. p. 33. pl. 60.—Daud. Orn. ii. p. 246. Lanius Leverianus, Leverian Shrike, Lev Mus. t. 59. Magpie Shrike, Lath. Syn. i. p. 192. 49 .- Id. Sup. p. 54.

PLACE.

IF the native place of this bird had not been already afcertained to be South America, we might have brought the authority of Mr. Levaillant to confirm it, who as well as Sir Albton Lever received a specimen from Cayenne.

WOODCHAT.

Lanius rutilus, Ind. Orn. i, p. 70. 12. La Pie-griesche rousse, Levaill. Ois. ii. p. 46. pl. 63. Woodchat, Lath. Syn. i. p. 169. 17.

IN England, this bird is certainly very uncommon; most authors suppose it to be a different species from the Red-backed Shrike, whilst others esteem it as only a variety. I have only seen one bad specimen, which is in the Leverian Museum, but Mr. Levaillant observes, that it is met with in Senegal, and not uncommon at the Cape of Good Hope, especially the interior parts of it, and that such birds as are brought from thence do not effentially differ from the Euro-

pean one.

HOOK-RILLED Var. A. DESCRIPTION.

PLACE.

Lanius curvirostris, Ind. Orn. i. p. 72. 15. Hook-billed Shrike, Lath. Syn. i. p. 171. 19. Var.

THIS species extends farther than generally imagined, as it has been found in New Holland; it differs in having the whole top of the head black, below the eye on each fide; but the base of the bill on the forehead is white.

Fighting Shrike or Bulbul, Penn. View of Hindostan, 2. p. 261.—Orient. Collect.

for Jan.—Jun. 1797, plate in ditto.

Bolbol, Le Brun, Trav. (Engl. ed.) t. 95. f. 1.

6. JOCOSE Shr.

THE Chinese Nuthatch seems to be the same bird as this, as both have a similar name; called in Mr. Pigou's drawings, Cow Kee Quan, or High-hair Har, the people comparing it to a Chinese woman's head dress or hat, which is composed of horse hair added to their own.

Pennant observes, that it has probably a most harsh note, notwith-standing which it has gained the name of Bulbul, or Nightingale. This is called Fighting Bulbul, being trained to combat for the amusement of the natives.

The Fighting Bulbul, is faid to be enamoured of the rose. Captain Dixon had two of these, male and female, bought at Canton, which were alive off the Cape of Good Hope, but perished by neglect in hard weather. They would eat rice, but were fondest of Cock Roaches, which they were principally fed with.

Description,

PLACE.

I faw one of them in the British Museum, full nine inches long: four or five briftles at the base of the bill; bill and legs brown: the colour of the plumage brown above, beneath very pale; a pointed long crest on the head: rump white: vent and under tail coverts crimson: tail long, all the seathers tipped with white. This came from Guzurat, in India. With the last, I also saw another of only seven inches in length: head black at top, and crested: plumage above of a darker brown than the last, all beneath white: under the eye, the vent, and under tail coverts crimson: rump as the back; tail feathers shorter than the last, and not tipped with white; the bill was also smaller, with a slight notch at the tip.

SENEGAL Shr. Lanius Senegalus, Ind. Orn. i. p. 74. 24. Le Tchagra, Lewaill. Oif. ii. p. 81. pl. 70. f. 1. 2. Senegal Shrike, Gen. Syn. i. p. 162. 6.

DESCRIPTION.

THE description given in the Gen. Synopsis, accords intirely with the bird in question: the female is rather smaller than the male, and the top of the head is not black, in other things it agrees with the male, except in the colours being less brilliant; whilst young both sexes are cinereous brown, but paler than in adult age, and the white inclines to rusous.

PLACE.

This is found at the Cape of Good Hope, about the river Gamtoos, and from thence to Caffraria, also at Senegal, for it seems to be the same with that called by Buffon, in the Planches Enluminées, Pie griesche à tête noire du Senegal\*, it is said to make the nest among the bushes, and to lay as far as five eggs spotted with brown.

8. BARBARY Shr. Lanius barbarus, Ind. Orn. i. p. 79. 45. Le Gonolek, Levaill. Ois. ii. p. 78. pl. 69. Barbary Shrike, Gen. Syn. i. p. 173. 23.

DESCRIPTION.

THE female is rather smaller than the male; the crown of the head only is yellow, with a tinge of green, and the red on the belly less brilliant.

In one presented to the British Museum, by Mr. Schotte, the whole plumage is black, except the crown and thighs, which are yellow; but the belly red: this appears to me to be a young male.

PLACE.

Mr. Levaillant met with the Gonolek at the Cape of Good Hope, in the country of the Great Namaqua, but it does not appear to be very common. The individuals feen by him, did not appear to have any

• N° 479.

particular

particular note, nor could the food be exactly determined, but in three which he opened were found the remains of infects.

Lanius Tyrannus, Ind. Orn. i. p. 81. 53.—Bartram's Trav. p. 287.

Tyrant Shrike, Gen. Syn. i. p. 184. 37.

TYRANT Shr.

IN a letter from Mr. Abbot, of Georgia, he observes the following circumstance: "A Tyrant Sbrike having built its nest on the outside of a large losty pine, I was one day considering how I should procure the eggs, when viewing the nest, I perceived a Crow alight on the branch, break and suck the eggs, and displace the nest, appearing all the while unconcerned, notwithstanding both the cock and hen continued slying at, and striking it with their bills all the while, but as soon as the crow had completed the robbery it departed. The eggs are sless coloured, prettily spotted at the larger end with dark pink, and a few black spots."

CLOUDED Shr. Description.

SIZE uncertain: bill large and blueish: lore ferruginous: head, hind part of the neck, and sides beneath the eye brown; back and wings the same: under parts of the body not unlike the upper, but clouded with white: tail longish: legs dusky.

Inhabits New Holland.

PLACE.

DUBIOUS
Shr.
DESCRIPTION.

LENGTH eight inches: bill and legs yellow; general colour of the plumage dusky ash: the tail is cuneiform, the two middle feathers three inches and a half long, and the shortest or outmost two inches; but what most beautifully distinguishes this bird from others is, that all the feathers of the rump, and some of the upper tail coverts, have a dash of sine crimson at the ends, for one third of Supp. II.

an inch in length, in appearance like the fingular feathers in the wing of the Waxen Chatterer, but on a near inspection, are not of an horny texture as in that bird, for the webs are perfectly divisible.

I met with this bird at Mr. Thompson's, in Little Saint Martin's Lane, London; but without any history of its manners or country annexed.

ROBUST
Shr.
DESCRIPTION.

THIS is a large species, being sull twenty-one inches in length the bill is strong and black: legs lead colour: the plumage in general that of the Cinereous Shrike; but the head and the whole of the neck as far as the breast are black: the under parts of the body the same as the upper, but very pale, nearly approaching to white: quills black: the tail in colour like the body, crossed near the end with a broad bar of black, but the very end of it is nearly white.

PLACE.

Inhabits New Holland, and from its fize feems to approach greatly to the Falcon genus.

ERECT
Shr.
Description.

THE size of this bird is by no means determined, as it has come under our inspection no otherwise than by means of a drawing; both mandibles seem curved towards each other, of a moderate size, and yellow, but no perceivable notch in either: the head and hind part of the neck are black: the crown very sull of feathers, which when carried erect, appears highly crested: the plumage of the body is pale green above, and white for the most part beneath; but the breast and belly incline to yellow: the tail rather long, and dusky, and some of the outer feathers very pale: quills dusky.

PLACE.

Inhabits New Holland.

Trontal Shrike - variety.
Publishid as the Act directs May 30, 1801 by Leigh Southby & Son Nork Street Cover Garden.

FRONTAL Shr.

HEAD and neck black, the first crested; from the nostrils to the back of the head a white streak, broadest behind; sides of the jaw the same as far as it is black: body fine olive green above, beneath fine yellow: quills brown; tail the same, with the feathers more or less tipped with white: bill black, and very strong, as in many of the Grosbeak genus: legs brown.

Inhabits New Holland, and is in the collection of general Davies.

PLACE!

YELLOW-BELLIED Shr. Description

SIZE of the great Cinereous Sbrike: bill rather strong and black: head crested: the whole of the head below the eyes very full of seathers, and appears crested; colour black: the upper parts of the body and tail rusty brown, but with some restections of green on the last: chin white: breast and belly yellow: quills dusky; tail rather cuneiform: legs black.

Inhabits New Holland, where it is called Weebong; but it is not a common bird; is a bold and fierce species, as it drives all the smaller birds from its neighbourhood.

PLACE.

Lanius rubiginosus, der rossfarbenen Wurger, Allg. Ueb. d. Vog. 1. i. Zusass. S. 696.

Lanius ferrugineus, Att. de la Soc. d'Hift. Nat. de Paris, vol. i. p. 1. p. 911.

16. RUSTY Shr.

THE whole of the upper parts of this species is full rust colour; the under parts of the body pale yellowish red: quills blackish within: the forehead a trifle crested, and rust-coloured: hind head and cheeks spotted.

DESCRIPTION.

Inhabits Cayenne.

PLACE.

AFRICAN
Shr.
Description.

ENGTH five inches: bill black; crown the fame; forehead white, passing in a line beneath the eye on each side, to the hindhead; hind part of the neck, and from thence to the rump, black, more or less spotted or mixed with white; but the feathers of the back in general have the ends white, margined with black: wings black; on the middle of the coverts a large triangular rusous white patch; some of the middle secondary quills are outwardly marked with the same, making, when the wings are opened, a longitudinal patch: under parts of the body white, streaked with ferruginous on the sides, breast, and belly: tail black; two or more of the outer feathers white at the ends, and the outermost of all white on the middle of the outer margin: legs brown.

PLACE.

Inhabits Africa: communicated by Mr. Walcot.

18.
MUSTACHOE
Shr:
Description.

La Pie-griesche rouge à plastron blanc, Levail. Ois. ii. p. 55. pl. 65.

half or eleven inches, of which the tail, which is long and cuneiform, occupies full half: the bill and legs are dusky: the head, hind part of the neck, back, scapulars, and wings in general brown black: the throat and under parts of the body are of a fine red, growing yellowish or much paler on the vent, not unlike in colour those parts in the Barbary Shrike, which it also approaches in the fize and shape of the bill; across the breast is a broad bar of white, as also a kind of streak or whisher of white on each under jaw, from the gape of the bill: the tail is greatly cuneiform in shape, the longest or middle feather being five inches long, and the outer one an inch and three-quarters, the intermediate ones lessening in equal proportions; the whole of the tail is composed of ten feathers, of a lively red plain co-

lour

lour, paler on the under parts; two of the middle quills have the outer webs red, forming a streak on the wing; and the wings when closed reach a very little way beyond the base of it.

This is faid to have been brought from one of the isles of the South Seas. In some specimens, the streak on the wing is white instead of red, perhaps owing to difference of sex.

PLACE.

Le Pendeur, Levaill. Ois. ii. p. 58. pl. 66. 1.

CRUEL Shr. Description.

SIZE of the Woodchat: length nearly feven inches: the crown, nape, hind neck, back, and rump, are fine blue grey; fides of the head, taking in the eye, the throat, and before as far as the breaft, black; from the gape, passing over the eye, is an arch of white bounding the black, as far as the middle of the neck; from the same springs another, passing down on each jaw to meet the first, and including a black space between them: the wings are black: the belly, thighs, and vent are white: the sour middle tail feathers are of equal length, and black throughout; the others unequal in length, the outer one being very short, these are partly white partly black, and the wings reach scarcely beyond the base of it: bill and legs black.

This is faid to come from *India*, and to feed on infects, flicking those it has not immediate occasion for on a thorn, in the manner of our *European* species: by the colours, one may justly suppose it to be a male bird.

PLACE.

Le Rousseau, Levaill. Ois. ii. p. 60. pl. 66. f. z.

SUPERCILIOUS Shr. Description.

THIS is about the fize of the Woodchat, and at first fight might be mistaken for the semale of that bird\*: the top of the head and neck, back, rump, and wing coverts are rusous: from the fore-

. See Pl. Enl. 31. f. 1.

head

head over the eye, passes a white band, and through the eye, from the corners of the mouth, a black one; the under parts are all rusous white: the quills are black, edged outwardly with rusous: the tail is cuneiform, rather more so than in the Woodchat; the two middle feathers of it are wholly, the others on the outer web rusous: the bill and legs are dusky.

PLACE.

Inhabits Java, in the neighbourhood of Batavia, and is in the collection of M. Levaillant.

CAPE Shr.

Le Brubru, Levaill. Oif. ii. p. 85. pl. 71. f. 1. 2.

THIS species is about five inches and a half in length: the bill is black; irides brown: the top of the head, and hind part of the neck are black; the rest of the upper parts the same, with a mixture of white: from the forehead, a white line passes over the eye towards the hind head: the under parts are white, but the sides under the wings ferruginous; on the wings is a patch of white: the four middle tail feathers are black, the others more or less tipped with white, and the outer one wholly so on the outer margin.

The female is not unlike the male, but those parts which in that sex are white, in her are more or less inclined to serruginous, and the black of a brownish hue.

PLACE.

It inhabits various places of the interior of the Cape of Good Hope, especially the great river; often in flocks, except in the season of incubation, at which time it is seen only in pairs; makes the nest on the Mimosa trees, composed outwardly of moss and fine roots, within with wool and seathers; lays five whitish eggs, spotted with brown.

Le Cubla, Levaill. Ois. ii. p. 89. pl. 72. f. 1. z.

HOTTNIQUA

THIS is full fix inches in length: the general colour of the plumage black, except the under parts from the chin to the vent, the rump, and an oblique bar on the wing coverts, all of which are white: the tail is a trifle rounded in shape, black, and all the feathers tipped with white: the bill and legs are dusky: irides yellow: the female is smaller than the male, though much the same in colour, but on the whole is inclined to brownish or dusky.

DESCRIPTION.

These birds are sound in small flocks in the forests of Hottniqua Land, and from thence along the eastern coast of Africa, where they seed on insects, and the pupæ of them, which they search for in the crevices of the barks of trees. They separate into pairs during the time of incubation, build in thorny bushes, making the nest of moss and small roots, and lay five or six eggs. The note expresses the two syllables châ, châ; for the most part is a very shy species.

HYACI**NTHINE** MACCAW.

MACCAW.
Description.

Pfitt. Hyacinthinus, Ind. Orn. i. p. 84. Hyacinthine Maccaw, Lever. Mus. p. 99. pl. in do.

THIS rare species is the size of the Blue Maccaw, length two feet four inches: the bill is very large and black; the head blue: the body very deep blue, inclining to violet: the quills and tail are violet blue,

blue, with a tinge of green on the margins: the legs dufky ash colour: the orbits and chin are both destitute of seathers, and of a yellow colour: the tail shaped as in the Blue Maccaw, but not much more than half the length.

This is in the collection of Mr. Parkinson, to whom it was given after death by lord Orford; it is by no means afcertained from whence it came, but as all the other Maccaws are of American origin, it may not unreasonably be presumed that the same country gave birth to this species.

PLACE.

Pfitt. Tabuensis, Ind. Orn. i. p. 88. 19. Pfitt. atropurpureus, Pompadour Parrot, Lev. Mus. pl. in p. 142. Tabuan Parrot, Gen. Syn. i. p. 214. 16. t. 7.

TABUAN P.

THE one described in the General Synopsis is a male: the female is mostly green: the head, neck, and under parts are olive brown: belly red; rump blue: the upper surface of the tail is green, the under dusky.

DESCRIPTION.

In Cook's last voyage, Parrots are said to have been seen at Tongo Taboo, somewhat smaller than the common grey ones: these are of an indifferent green on the back and wings: tail blueish: the rest of a sooty or chocolate brown; surely Captain Cook must have seen very indifferent specimens, as the green is particularly vivid, and the purple, though deep, is by no means sooty.

PLACE.

Pf. Tabuenfis, Ind. Orn. i. p. 88. 19.  $\beta$ . Tabuan Parrot, Phill. Voy. t. p. 253.

Var. A.

THIS is twenty-four inches in length: bill brown; the upper mandible tinged with red: head, neck, and all the under parts bright fearlet: back and wings fine green: on the lower part of the neck behind, between that and the back, a crefcent of blue: tail long Supp. II.

DESCRIPTION.

and cuneiform, most of its feathers of a deep blue: legs ash coloured: on the upper part of the wings a narrow line of a fine saxon green colour.

The *female* is generally green, but the fore part of the neck inclines to olive brown: the belly alone is crimfon, and the rump blueish: tail green above, beneath dusky.

PLACE.

This inhabits New Holland, and is a remarkable variety, if indeed it be one; it differs firstly, in having those parts, which in the former are deep purple, of a most beautiful crimson; it has in common with the other, the blue crescent behind the neck, and the blue rump; but differs materially in having a vivid oblique pale blue-green band near the bend of the wing; both the wings and quills are wholly green, without any mixture of blue on the edges; and in the female the tail is also green, but the crescent at the back of the neck is wanting.

VAR. B.

Tabuan Parrot, White's Journ. t. p. 168. 169?

PLACE.

I N New Holland is observed a Parrot very similar, which we may possibly strain a point in ranking as a variety, as all the drawings which I have seen convey the idea of an even ended tail; in several, the pale vivid streak on the wings is not conspicuous: the rump blue, but the blue at the base of the neck behind is wanting.

One faid to be a *female*, was green, with a pale blue rump; beneath from the breast crimson; but between the breast and belly only patched with crimson: no crescent at the back of the neck: wings and tail wholly green: the native name of this bird said to be *Wellat*. It seems to me not improbable that some of the above described, may hereaster prove birds in incomplete plumage.

ENNANTIAN P.

Beautiful Lory, Gen. Syn. i. p. 217. 28?

Pennantian Parrot, Gen. Syn. Sup. p. 61.—White's Journ. pl. in p. 174-175. male and female.

THE male has been already described in the Supplement to my Synopsis, and I am almost certain that the Beautiful Lory does not materially if at all differ therefrom.

DESCRIPTION.

The female has the upper parts of the neck and body greenish: top of the head red, and a patch of the same under each eye: chin and throat blue: lower part of the neck and breast red, as also the rump and vent: middle of the belly dusky green: tail dark blue, fringed with chesnut: shoulders blue; the rest of the wing the same, but darker. In some drawings which I saw from New Holland is one of these, differing only in not having the blue on the chin and throat.

Pennantian Parrot, Phill. Bot. Bay, t. p. 154.

VAR. A.

THIS is of the fame fize, and fixteen inches in length: bill horn colour; head, neck, the under parts and rump crimfon: back feathers black, margined deeply with red: inner wing coverts black, the outer pale blue, making an oblique band on the wing: quills and tail dufky, edged with blue; the three outer feathers of the last from the middle to the tip hoary blue: legs grey.

DESCRIPTION.

LENGTH ten inches and a half: general colour of the plumage fine jonquil yellow, paler beneath: crown of the head and cheeks crimfon: a largish spot of the same at the bend of the wing next the M 2 shoulder:

JONQUIL PARAKEET. Description. shoulder: the tail is half as long again as the bird itself, and greatly cuneiform; the two middle feathers pale buff colour, the others more or less yellow, most so nearest the base: the quills are pale yellow, with the inner webs very pale: round the neck, just beneath the crimson, is a collar of white, or very pale, changing to greenish at the hind head: the bill and legs are flesh colour.

PLACE.

This was alive in the possession of Miss Hunter, of Greenwich; called Toto Parakeet, said to come from the Ramgbur Hills, in the province of Bahar, in the kingdom of Bengal. I am indebted to General Davies for the above.

CAROLINA P. Pfitt. Carolinenfis, Ind. Orn. i. p. 93. 33.
Parrot of Carolina, Bartram. Trav. p. 286.—Gen. Syn. i. p. 227. 29.—Id. Sup. p. 59.
Orange-headed Parrot, Gen. Syn. i. p. 304. 111. Var.

BARTRAM observes, that these birds never reach so far as Pennsylvania, which is singular, being a bird of such rapid slight, as it
could easily perform the journey in ten or twelve hours from North
Carolina, which abounds with all the fruits they delight in.

I have already observed in my Supplement, that the Orange-beaded Parrot and this are the same; and Mr. Bechstein supposes that Frisch's bird tab. 52. is probably the female.

PALE
PARAKEET.
Description.

Psitt. pallidus, Pale Parakeet, Nat. Misc. pl. 258.

THIS is about eight inches in length, and has a moderately cuneiform tail: the bill and legs are pale: the general colour of the plumage pale yellow: the quills more or less of a rose coloured dirty white, in some lights tinged with green.

PLACE.

Inhabits New Holland.

Psittacus Jaguilma, Ind. Orn. i. p. 96. 40.—Molin. Chil. p. 228.—Id. (Fr. edit.) p. 237.

JAGULMA P.

SIZE of a Turtle: the plumage wholly green, except the tips of the quills, which are brown, and the orbits fulvous: tail very long, and cuneiform.

DESCRIPTION.

PLACE.

It inhabits *Chili*, in *South America*; most frequent in the plains situated between the 34th and 35th degrees of latitude. It is a very clamorous species, and often met with in inconceivably large troops, so as to obscure the light of the sun, making great havoc among the cultivated lands, feeding on the buds of trees, and herbs; happily, their arrival on such spots is rarely till after the end of harvest, for they often tear up plants with the bill, to the root itself. Multitudes are destroyed yearly, without appearing to diminish their numbers: the peasants mounted on horseback, with a pole in their hands, ride into the middle of a flock, settled on the ground, and before they are able to escape, kill great numbers: their flesh is said to be extremely delicate, and in course is preferred to every other.

Nonpareil Parrot, Nat. Misc. pl. 93 .- New Holland Birds, pl. 2.

8.
NONPAREIL
P.
Description.

SIZE of the Pemantian Parrot: bill dusky horn colour: head, sides, and fore part of the neck and breast crimson: vent and under tail coverts crimson: the lower part of the breast mixed crimson and yellow; belly yellow, changing to yellowish green towards the vent: the chin, and all the feathers surrounding the lower mandible, white: the middle of the nape behind black and dull green, with a sew small spots; hind part of the neck and back, as far as the middle, green, each feather marked with a large spot of black, or rather the seathers are black, with green margins: lower half of the

back

back and rump pale green: fhoulders black: leffer wing coverts pale blue; beneath deep blue: greater quills dufky, with the outer margins deep blue: the fecondaries edged with pale green, like the feathers of the back; all the greater quills except the outer one, and fix or feven of the inner fecondaries marked with a transverse pale yellow spot about the middle, on the inner web: tail blue; the two middle feathers of one colour, the others have the ends pale and nearly white.

PLACE.

Inhabits New Holland, where it is a common species.

ALEXANDRINE P. Psitt. Alexandri, Ind. Orn. i. p. 97. 46.—Spalowsk. Vog. 3. tab. 8. Dourra, Sonnini, Trav. (Engl. ed.) v. 3. p. 83. Alexandrine Parrot, Gen. Syn. i. p. 234. 37.

DESCRIPTION.

IN Spalowski's figure, the ring round the throat is very broad, with no red on the wings or breast.

PLACE.

Somini affirms that this species is brought in numbers from Nubia to Cairo, and that its Arabian name is Dourra.

Black-spotted Parakeet of Van Diemen's Land, D'Entrecasteux's Voy. ii. p. 47. pl. x.

DESCRIPTION.

IN fize this is rather smaller than the Pennantian Parrot: the bill and legs are black: the general colour of the plumage green on the upper parts, each feather banded with black and yellow: the crown and nape are marked with numerous longitudinal black streaks: the forehead fine orange colour, nearly scarlet; all beneath the body the plumage is yellow, crossed with numerous waved blackish bands: the under part of the wing cinereous grey, with a pale broad

broad yellow stripe: the two middle tail feathers are green, marked with several oblique bars of black; the others yellow, barred in the same manner; and all the feathers towards the ends growing paler, and without bars: the tail is very cuneiform in shape.

This is a most elegant and beautiful species, inhabiting New South IVales, and other parts of New Holland, where it is known by the name of Goolingnang: it is found in tolerable plenty; but rarely if ever seen except on the ground, and particularly in moist places: the legs and toes are more slender than usual in this genus, and the claws more straight. It is not known to perch on trees like other parrots, but constantly seen to rise from among the grass, and to alight therein again almost immediately.

PLAGE.

Pfitt. pacificus, Ind. Orn. i. p. 104. 65. Var. E. Pacific Parrot, Lath. Syn. i. p. 252. 56. Var.

PACIFIC PARROT.
VAR. D.
DESCRIPTION.

IN this the bill and legs are black: the fore part of the head crimson; under each eye a large patch of the same, and another on each side of the rump; but the general colour is deep green, the under parts paler: the five first quills are dusky, and both wings and tail dusky beneath.

This inhabits New Zealand.

PLACE.

Pfitt. australis, Ind. Orn. i. p. 104. 66. Crimson-fronted Parakeet, Nat. Misc. vol. 3. t. 87. CRIMSON-FRONTED P. Description.

THIS is the fize of the *Pacific Parrot*; length nine inches: the bill is brown, with a red tip: general colour of the plumage deep brown: forehead as far as the crown, and the base of the bill all round, fine crimson; from the eye on each side descends a large patch of the same: the hind parts of the crown and the back part of the neck

half

half way fine blue, with here and there a yellow ftreak, fhoulders of the wings yellow: legs dufky.

PLACE.

This inhabits New South Wales, and has great affinity to the Pacific Parrot. In the Naturalifts Miscellany, the forehead only is crimson, and a streak of the same below the eye: the shoulders are not yellow.

A bird which appears to be a variety, is among the drawings of A. B. Lambert, Esquire, which came also from New Holland. In this the crimson patch below each eye is much larger, with the addition of a yellow ring round the neck, at the bottom of the blue nape.

In another collection I have feen one which differs further in having the lower part of the neck behind reddish instead of yellow: the shoulders across the wings tinged and mixed with red, and the sides of the breast reddish; the whole of the nape is olive brown: the tail feathers red at the base within: this variety is in the possession of General Davies. I have likewise seen it in another collection.

SMALL PARAKEET.

DESCRIPTION.

PLACE.

Pfittacus pufillus, Ind. Orn. i. p. 106. 71.—Small Parakeet, White's Journ. t. p. 262.

THIS is nearly the fize of the Guinea Parakeet, and under feven inches in length: the bill dufky, furrounded at the base with crimson: body olive green, paler beneath: tail the same; but the inner webs at the base are crimson: legs blue.

Inhabits New South Wales: in fome, the base of the tail is yellowish instead of red; it is found in great numbers all over the country about Sydney Cove, and has a brush-like tongue, well adapted to extract honey from the flowers of the trees, with which almost every flower of the country abounds.

Mr. Bechstein mentions a variety\* which had the whole of the face crimson: the upper part of the body dull green, beneath paler; each feather of the tail is crimson within, with the end yellowish; at the bend of the wing is a red spot. Mr. Bechstein suspects this to be the male, and that the one in li bite's fournal may possibly be the other sex.

Turcofine Parakeet, Nat. Mi/c. v. 3. pl. 96.

TURCOSINE PARAKEET.
Description.

SIZE of the Crested Parakeet: bill black: the upper parts of the plumage are green, and the two middle tail feathers; the two next have a little yellow at the tips, which increases in all the others, as they are more outward, till the two outmost are perfectly yellow; the tail itself being greatly cuneiform: the head is pale blue; hind head brownish, the back part of it inclining to chesnut: the whole of the wing is blue, but the coverts are paler and brighter than the rest; at the inner bend of the wing is a long crimson patch: legs pale brown.

PLACE.

Inhabits New South Wales, but is a rare bird; is observed not to fly far at a time, and never seen but in pairs, and oftener on the ground than on trees. The above described from the drawings of Mr. Lambert: one of these, in the collection of General Davies, has four of the middle tail seathers green without, and dusky within, the outer one wholly yellow, except just at the base; the next black half way, from thence to the end yellow; the third black within, green without, with a yellow tip.

\* Der Kleine Sittich mit halbrothen Schwanze.—Allg. U.b. d. Vog. 1. i. Zusas. S. 704.

RED-SHOULDERED PARAKEET. Description.

Red shouldered Parakeet, White's Journ. t. p. 263 .- Phil. Voy. t. p. 269.

SIZE of the Guinea Parakeet: length ten inches and a half: general colour of the plumage green, paler beneath: the whole face and throat are crimfon, mixed with yellow round the eye: top of the head, outer edge of the wing, and fome parts of the middle deep blue: shoulders of the wings, and beneath them blood red: greater quills dusky, fringed outwardly with yellow: tail greatly cuneiform, of a chesnut red at the base, and dull blue at the end: bill and legs brown.

PLACE.

Inhabits New South Wales.

16.
ORANGEWINGED
PARAKEET.
Description.

HIS bird is about feven or eight inches in length: the upper parts of the plumage are darkish green; the crown inclining to blue: cheeks beneath the eye pale ash colour: quills very dark: shoulders of the wings, and all beneath orange: bill pale: legs red.

PLACE.

This inhabits the *Brafils*, or at least supposed to do so, as it was brought into *England* by one of the ships trading to the *South Sea* whale fishery, and is in the collection of General *Davies*.

BLACK-NECKED P. Description.

SIZE of the Alexandrine Parrot: bill and legs black: general colour of the plumage green: forehead and orbits of a lemon colour: chin, throat, and breast black; the lore is white, and a white line on each side of the neck, between the green and the black: belly dusky green: quills and tail black: the lesser quills wholly, and the edges of some of the others, are blue.

PLACE.

Inhabits the Brafils. The description taken from a drawing at General Davies's.

\*\* WITH TAILS EVEN AT THE END.

Pfitt. Bankfii, Ind. Orn. i. p. 107. 76. B. Banksian Cockatoo, White's Jeurn. tab. p. 139.

DESCRIPTION.

THIS is fomewhat smaller than the one described in the Synopsis: in length twenty inches: the bill lead coloured; the head moderately crested, black; the feathers of it varied with yellow: throat and neck yellow: fides of the neck mixed white and black: body and wings wholly black: the two middle tail feathers black; the others have the base and ends black, but the middle crimson, banded with black, as in the first described, and is found in the same places.

18. VAR. B.

Pfitt. Bankfii, Ind. Orn. i. p. 107. 76. 2. Banksian Cockatoo, Phill. Voy. tab. p. 166.

DESCRIPTION.

THIS is twenty-three inches in length: bill as in the last, the base of it hid in the feathers: head, neck, and under parts of the body dull brown, margined on the crown and nape with olive: the body above, the wings, and tail gloffy black; all but the two middle feathers of the last crimson in the middle, but not banded with black.

Funereal Cockatoo, Nat. Misc. vol. vi. pl. 186.

DESCRIPTION.

THIS is rather larger than the common or first described, and differs chiefly in having the four middle feathers of the tail of a yellow buff colour, marked with numerous black spots instead of bands.

> OTHER VARIETIES.

I Suspect that this bird differs exceedingly, as I find many varieties among the drawings from New Holland, where it is known by the name of Karratt.

The

The first is black, except a large yellow patch under each eye: the base of all but the two middle tail feathers buff, dotted with black: bill and legs pale, not common.

Second variety has no yellow patch beneath the eye: tail feathers from the base to near the tip plain crimson: bill and legs brown; this is most common.

Thirdly, without the yellow patch under the eye; but the black plumage fprinkled with yellow dots: the tail crimfon, barred with black, just as in the Supplement to my Synopsis.

Fourthly, the yellow patch under the eye composed of pale streaked feathers: side tail feathers deep buff yellow, mottled with brown: fore part of the neck and breast marked with pale yellow buff crescents.

Fiftbly, feems a compound between the two last, being both spotted on the wings, and waved beneath: the tail barred above with crimson, and beneath with yellow buff colour.

19. CRESTED COCKATOO. Description. Pfittacus galeritus, Ind. Orn. i. p. 109. 80. Crested Cockatoo, White's Journ. tab. p. 237.

SIZE of a Dunghill Cock, and two feet three inches in length: the bill is moderate in fize, and black: the general colour of the plumage white: the orbits covered with feathers, those of the forehead elongated into a crest; they are ten or twelve in number, brimstone coloured, about seven inches in length, and pointed at the tips; behind this the crown is bare: the tail is even at the end, eight inches long; the feathers sulphur coloured at the base: legs dusky.

PLACE.

This inhabits New South Wales, and is by some persons thought to be only a variety of the lesser White Cockatoo, which I find to be common in China, where it is called Jing-wos, signifying the bird which talks other men's words.

Psittacus varius, Ind. Orn. i. p. 112. 90 .- Maerter, Phys. Arb. i. 2. p. 48.

VARIED
P. Discription.

THIS is a little more than five inches long: the bill and legs yellowish: the general colour of the plumage varied with brown and blue: the cheeks, chin, and throat whitish: quills and tail dull brown, with the outer margins blue.

PLACE.

Inhabits South America.

Psittacus fringillaceus, Ind. Orn. i. p. 112. 92. - Maert. Phys. Arb. i. 2. p. 47:

SPARROW P.
Descriptions

SIZE of a Sparrow; length fix inches: bill and legs pale yellow: general colour green: head blue: cheeks, chin, throat, and a spot on the belly pale sanguineous; belly itself violet: the tail feathers have the insides and tips yellow.

Inhabits South America.

PLACE.

Psittacus choræus, Ind. Orn. i. p. 112. 93.-Molin. Chil. (Fr. ed.) p. 237.

CHILI

THE general colour of this bird is a fine green, beneath cinereous.
grey, with the tail of a moderate length: the orbits are flesh coloured.

DESCRIPTION.

Inhabits *Chili*; has the fame manners, and lives on the fame food as the *Jaguilma* parrot, and is faid to talk remarkably well.

head almost wholly white: body green: lesser wing coverts, some
of the middle quills, and tail feathers red.

DESCRIPTION.

Inhabits Brafil.

PLACE.

PILEATED P.

DESCRIPTION.

Psitt. pileatus, Ind. Orn. i. p. 115. 123.—Scop. Ann. Hist. Nat. i. p. 32. No 32. —Gen. Syn. i. p. 294. Note ...

THIS is the fize of a Niffel Thrush: bill horn colour, base of it brown: forehead and crown red; cheeks naked: general colour of the plumage green: quills and tail blue on the outer edges; the last yellow at the tip: rump yellow green.

M. Scopoli suspects it may be a variety of the Golden Crowned Parakeet, yet does not mention whether the tail is even or not at the end.

THECAU
P.
Description.

Pfittacus cyanolyseos, Ind. Orn. i. p. 127. 134.—Molin. Chil. (Fr. ed.) p. 235.

THIS, according to *Molina*, is larger than a *Pigeon*: the head, wings, and tail are green, fpotted with yellow: back, throat, and belly yellow: tail even at the end.

PLACE.

Inhabits Chili, and known there by the name of Thecau; is a numerous species, and does much injury to the corn, often slying in vast troops, and when settled, have a centinel on a tree, who gives the alarm on the approach of any one, from hence it is very difficult to shoot. It breeds in the holes of rocks, laying two white eggs in the most inaccessible craggy parts; from the tops of these, the inhabitants let themselves down by ropes, to take the eggs and young birds, which are thought excellent, and sell at a good price, eight of them setching about three French sous; if robbed of their young, they lay a second and even a third time, rarely a sourth. It is easily tamed, and learns to speak well.

Pfittacus vernalis, Ind. Orn. i. p. 130. 147. - Mus. Carls. fasc. ii. 29.

26. VERNAL P.

THIS is five inches and a half in length: the bill reddish: general colour pale green: wing coverts deep green: quills grass green: rump sanguineous: tail above sanguineous, beneath blue: legs pale.

It is uncertain from whence this bird came.

Description.

Psittacus purpuratus, Ind. Orn. i. p. 132. 150. Purple-tailed Parakeet, Gen. Syn. i. p. 315. 121.—Nat. Misc. i. pl. 16. PURPLE-TAILED

DESCRIPTION.

SEVERAL of these have been brought into England, from Cayenne, which differed greatly from each other in fize; some of them had the purple tail seathers green for one sourth of an inch from the tip, and the two middle seathers dashed with purple down the shafts.

LEVAILLANT''s

SIZE of the Ash Coloured Parrot: general colour green in various shades, on the bend of the wing, and the thighs fine aurora colour. Inhabits the internal parts of the Cape of Good Hope, found frequently at Koks Kraal river, at which place numbers of them come to drink.

DESCRIPTION.

PLACE ..

## GENUS VIII. CHANNEL-BILL.

BILL large, convex, cultrated, furrowed or channelled on the fides, with the tip bent.

Nostrils round, naked, placed at the base of the bill.

TONGUE cartilaginous, bifid at the end.

Toes placed two before and two behind.

TAIL confisting of ten feathers. At present we are acquainted with only one species belonging to this genus.

N. HOLLAND CHANNEL-BILL. Sc. Novæ Hollandiæ, Ind. Orn. i. p. 141. 1. Psittaceous Hornbill, Phill. Bot. Bay, t. p. 165. Anomalous Hornbill, White's Journ. t. p. 142.

DESCRIPTION.

THE fize of this bird is nearly that of a Crow, and the total length is twenty-seven inches: the bill from the gape to the point three inches and an half, or rather more \*; it is very stout at its base, and curved its whole length; the upper mandible hooked at the point; the upper part is narrow, ridged, and the sides are channelled; at the base, close to the setting on of the seathers, the nostrils are placed; these are round, and the edges of them surrounded with a naked red skin, which continues on each side, between them and the eye, and also surrounds the eye itself, but the bare parts are most considerable above the eye: the tongue is three-sourths the length of the bill, thick at the base, from thence to the end stat and cartilaginous, and bisid at the end: the head and neck are of an ash coloured grey; the under parts of the body the same, but paler: back and wings blueish

alh

<sup>\*</sup> The few I have feen have differed much in the proportionate fize of the bills, but I do not recollect any one with fo small a bill as in that figured in White's Journal.

ash colour; the end of each feather tipped with black: the quills are much the same, but darker; and the inner webs, as they approach the base, are very pale. The first quill feather is shorter by three inches and three-fourths than the fecond, and the fecond full an inch shorter than the third, which is the longest of all; and the wings when closed, cover full three-fourths of the tail. The tail itself is cuneiform, and confifts of ten feathers, of a deep ash colour; the two middle feathers are eleven inches long; the outer ones only feven inches and three quarters. Near the end of all the feathers is a bar of black, which takes up most space in the middle ones; the very tips of all for about an inch, are white: the margins of the inner webs, from the middle to the base, in all but the two middle feathers, are barred black and white; the feathers over the thighs, and the vent and under tail coverts, barred with the same, but paler: the legs are fhort, measuring from the heel to the toe joint only two inches; the toes of the fame length, and placed two before and two behind, as in the Toucan; their colour is blueish black.

This bird inhabits New Holland, where it is called Goe-re-e-gang; it is not very common, and first appears about Port Jackson in October; is seldom seen unless mornings and evenings, sometimes seven or eight together, but oftener in pairs: both on the wing, and when perched, they make a strange loud screaming noise, not unlike that made by a common cock and hen, when they perceive a hawk or any other bird of prey hovering over them. They probably come to this part of New South Weles only to breed, after which they depart elsewhere in January, but where is not ascertained. In the crops and gizzards of several, were found the seeds of the red-gum and peppermint trees, which is believed to be their principal food, and supposed to swallow them all whole, as the pericarpium or capsule has been found in the stomach; exuviæ of some beetles have also been found, but not in quantity. The tail, which is not far short of the length Supp. II.

PLACE,

of the body, is fometimes displayed like a fan, and gives it on flight, or when sitting, a very majestic appearance. The natives know very little of its habits, haunts, &c. however, they consider its appearance as an indication of wind and blowing weather, and that its frightful scream is through fear, as it is not a bird of very active or quick flight. The pupil of the eye appears uncommonly clear. It cannot easily be tamed, for Mr. White observes, that he kept a wounded one two days alive, though he could get it to eat nothing, but bit every thing that approached it very severely.

# GENUS IX. HORNBILL.

Nº 1: Abyssinian H.

Nº 3. Indian H.

2. African H.

4. Crimfon H.

Buceros Abysfinicus, Ind: Orn. i. p. 143. 4.—Meyer, Ueb. der Neuest. Zool. Entd. S. 117.

ABYSSINIAN H.

Abba Gumba, Erkoom, Bruce's Trav. v. 3. p. 102.— & App. t. p. 169. Abysfinian Hornbill, Gen. Syn. i. p. 347. 4.

THIS is fully described by Mr. Bruce, who says the total length is three seet ten inches, breadth six feet; breadth of extended wings twenty-two inches: the bill is ten inches long, of which the horn measures three inches and an half: the plumage in general is sooty black: the large wing feathers are ten in number, and milk white: on the neck are several protuberances, as in the Turkey Cock,

of a light blue colour, changing red on various occasions: the eye is

reddish or dark brown; eyelashes long, especially the upper.

Description.

This bird is found in Abysfinia, generally among the fields of Taff, feeding on green beetles, which frequent that plant; it has a putrid fmell, which has occasioned a supposition of its feeding on carrion: in the eastern parts it is called Abba Gumba, but in the language of Tigré, on the west side of the Tacazzi, it is called Erkoom. It has been seen with eighteen young ones, and runs on the ground for the most part, but when raised slies both strong and far.

PLAGE.

It builds in large thick trees, and when it can near churches; has a covered nest like that of a magpie, but four times as large as an eagle's, placing it firm on the trunk, without endeavouring to make it high from the ground, the entry always on the east side. On the

MANNERS.

 $O_2$ 

frontiers

frontiers of Sennara and Raas el feel, it is called Teir el Naciba, or Bird of Destiny.

AFRICAN H. Buceros africanus, Ind. Orn. i. p. 143. 5. Der africanische Hornvogel, Allg. Ueb. d. Vog. i. S. 287.—Id. Zusas. S. 716. African Hornbill, Gen. Syn. i. p. 348. 5.

M. BECHSTEIN observes, that Mr. Geoffroy the younger, supposes this and the foregoing to be one and the same bird \*.

INDIAN H. Buceros Hydrocorax, Ind. Orn. i. p. 144. 7. Indian Buceros, Afiat. Researches, vol. iv. p. Indian Hornbill, Gen. Syn. i. p. 351. 7.

IT is observed in the Asiatic Researches, by Lieutenant Charles White that the name of this bird is Dhanésa, that it seeds on the Nux Vomica, and the sat of it is highly esteemed by the natives.

CRIMSON H. Description

PITHER the fize of this bird is known, any more than the place it inhabits: the head feems full of feathers, and a trifle crefted: the upper part of it even with the eyes, and between them and the bill black; the rest of the plumage a fine crimson: across the back and shoulders a band of white: the bill is longer from the gape, than from thence to the back of the head; the colour of it black or dusky, except at the base, where it is surrounded with white, and just at this division the nostrils are placed; the bill is stout, running to a point at the tip, and a trifle curved for one-third of its length: the legs are the colour of the bill: the tail is cuneiform, and pretty long, as the quills reach just beyond the base of it.

I met

<sup>\*</sup> See Ast. d'Hist. Nat. de Paris, v. i. p. 1. his definition is, "B. niger, remigibus majoribus albis, rostro nigro cornu artrorsum aperto, mas gutture rubro, seminas cœruleo."

I met with this bird among some drawings belonging to Mr. Smith, most of which were of Indian birds. I am greatly at a loss where to place it, for if the drawing is exact, it does not exactly tally with any of the known species, except the Wreathea Hornbill\* of Dampier, supposing the wreathed parts to be smoothed off, and in this case it has a greater curve at the tip. It seems a curious bird, but I have not met with any one who has seen an original specimen.

<sup>\*</sup> This is well figured in D'Entrecasteux's Voyage, ii. p. 304. pl. xi-

## GENUS X. BEEF-EATER.

AFRICAN BELF-EATER. Buphaga Africana, Ind. Orn. i. p. 147. 1. Pic-bœuf d'Afrique, Levaill. Oif. pl, 97.—Daudin. Orn. ii. p. 294. pl. 22. African Beef-eater, Gen. Syn. i. p. 359. i. tab. 12.

HITHERTO we have heard of this bird only as a native of Senegal; but M. Levaillant affores us that he has met with it in the country of the great Namaquas, near Caffraria, and that it coincides much with the Starling in point of manners, forming itself into small troops, of a dozen or more in each, alighting on the backs of oxen, antelopes, and other quadrupeds, where by pressing the elevated part of the hide of the animal, containing the larve of the oestrus, it forces it out to the great relief of the animal, enjoying itself a delicate repast. Besides these, the bird is said to feed on various kinds of infects. It has a sharp kind of cry, by no means approaching to any thing like what may be termed a song.

#### GENUS XI. A N I.

Crotophaga varia, Ind. Orn. i. p. 149. 3. Crotophagus varius indicus, Ger. Orn. ii. p. 54. tab. 192. VARIEGATED: ANI.

THIS is the fize of the Lesser Ani, and eleven inches in length: the bill is black, less strong than in the common species: head, fore part of the neck and breast black: the middle and greater wing coverts and tail black; the rest of the body sulvous, inclining to rusous: legs yellow brown. It is not said from whence this bird came, but we are informed that it was alive for some time at Ver-sailles, where it went by the name of Indian Pie, and a drawing of its sent to Florence, from which M. Gerini copied his figure.

DESCRIPTION.

### GENUS XI\*. PLANTAIN-EATER.

BILL stout, triangular, the upper mandible elevated at the base above the crown; both mandibles dentated on the edges.

Nostrils in the middle of the bill.

Tongue entire, and flout.

Toes placed three before and one behind.

VIOLET
PLANTAIN
E.
Description.

Musophaga violacea, Musafresser, Schr. der Berl. Gesell. ix. S. 16. tas. 1. Royal Cuckow, Lev. Mus. pl. in p. 167?

length, of which the tail is fix inches and one-third: the bill from the tip to the gape is one inch and an half, and very fingularly shaped, especially the upper mandible, being nearly triangular, losing its attachment at the back part, where it is elevated, and hangs over the crown; the colour of the bill is yellow, growing red towards the end, and the edges of both mandibles are dentated; the tongue not unlike that of a Parrot in shape: irides brown: the top of the head is purple: lose violet: beneath each eye is a line of white; eye-lids purple: the neck, breast, and body violet; wings the same: the prime quills purple in the middle: the tail iongish, cuneiform, obtuse, the same colour as the quills; legs dusky black, and very strong.

PLACE.

This beautiful bird is found on the plains near the borders of rivers,

+ M. Isert says the tail consists of nine seathers only, which might be the case with his specimen, but as we know no bird in which the tail seathers are not even in number, I should suspect that this bird also may have at least ten feathers, or even more.

in

Tivlet Plantain - cater.
Published as the set directe May 30. 180, by Leigh Southly, & Son, 15th Street Covers Garden.

in the province of Aera, in Guinea, and is faid to live principally on the fruit of the plantain †; is very rare, for notwithstanding every pains he could take, M. Hert was not able to obtain more than one specimen.

I have ventured to affimilate this with the Royal Cuckow of the Leverian Museum, as it seems to agree in every point, except the disposition of the toes, which in that figure are placed two before and two behind. This however may be reconciled, by supposing the bird capable of placing the toes in the two different positions at will, a circumstance observed likewise in respect to the Touraco: however, the affertion of M. Isert, that the toes were situated as his figure represents, ought to weigh with us, especially as he seems to be the only one who professes to have seen the bird.

RAVEN.

DESCRIPTION.

THE one figured by M. Sparrman, in the Mus. Carls. differed from the common species, merely in having the chin white.

This species is found in Egypt; a few small flocks appearing about Rosetta in February only. These mix freely with the flocks of Crows, remaining on the ground with them, round inhabited places \*. It has

<sup>&</sup>quot; Sonnini's Traw. (Engl. ed.) 2. p. 239. .

been observed to me †, that a female raven weighs two pounds ten ounces, but the egg scarcely seven drams, so that forty-eight of them would only make up the weight of the bird. The egg of the Cuckow is less disproportionate, requiring only thirty-eight to equal the parent in weight.

Levaillant found that of which he gives a figure, in Saldanha Bay, at the Cape of Good Hope, where it not unfrequently unites in large flocks, attacking young antelopes, and likewife killing them: that the male and female are generally together, making the neft in the clefts of rocks, as well as in old buildings. This is certainly a variety only of our Raven, differing merely in being bigger, and the bill a trifle more bent.

PLACE.

Var. C. Corax Crucirostra, Corbeau Bec croisé, Daud. Orn. ii. p. 226.

THIS is only a variety, with the two mandibles croffing each other; an accidental circumstance merely, and which is not unfrequently seen in other birds.

SOUTH SEA

M. Levaillant is certain that it is a distinct species; he observes, that it is rather less than a Raven, and is eighteen inches in length, with a cuneiform tail, and the wings are three inches longer: it is strongly characterised by a white patch at the nape of the neck, added to a white mark separating the sides of this white patch, and encircling the neck; this stripe is itself not very apparent, being

DESCRIPTION:

† Colonel Montagu.

P 2

formed

formed by a fingle row of white feathers, or rather half white, the outer border being only visible: the feathers of the throat are forked; the beards extending beyond the shafts, and less black than the rest of

the plumage: irides brown or hazel.

Mr. Levaillant found this every where in his African travels, but particularly among the great Namaquas, and in Swarte-Land, but less common at the Cape of Good Hope itself. The female is less than the male; the white on the neck lefs extended, the black lefs gloffy, more inclined to brown: it is a bold bird, attacking young lambs and antelopes, also feeding on carrion.

I observed a figure of this among Mr. Bruce's drawings; the bill elevated not unlike that of the Ani: shoulders of the wings brownish: tip of the bill white. Mr. Levaillant thinks it a link between the Crow and Vulture, and that it is not a bird of passage.

CROW.

PLACE.

Corvus Corone, Ind. Orn. i. p. 151. 4 .- Sepp. Vog. 3. t. 15. Corvus maritimus, Rook, Bartram's Trav. p. 286? Corneille Corbine, Daudin. Orn. ii. p. 228 .- Hist. Prov. i. p. 486. Carrion Crow, Gen. Syn. i. p. 370. 3.

THE manners of this species are well known; but a singular anecdote of one of these has come to my knowledge, attested by Mr. Edwards. In March 1783, a Crow was observed to build a nest on the vane of the top of the Exchange at Newcastle, and the more remarkable, as the spindle on which the nest was constructed, being fixed to the vane, moves with it, and it appeared very fingular to view it in windy weather, when the nest in course turned round to every point of the compais. A fmall copper-plate was engraven with a representation of the circumstance, of the fize of a watch paper; and fo pleased were the inhabitants with it, that as many of them were fold as produced to the engraver the fum of ten pounds.

Birds of the Crow genus are faid to be so numerous about Astrasban, chan, that could any one find out the means of destroying them, it would be doing very great service.

Corvus frugilegus, Ind. Orn. i. p. 152. 5.—Sepp. Vog. 3. tab. 103.—Bartram. Trav. p. 286?

ROOK.

Corneille du Cap, Levaill. Ois. ii. p. 11. N° 52. Corneille Freux, Daud. Orn. ii. p. 229.

Rook, Gen. Syn. i. p. 372. 4.

IT is faid that there are no Rooks in the island of Jersey, although crows and magpies are not unfrequent; nor is it certain that Jays inhabit that island\*; yet we are certain that Rooks migrate into France from this country. This species is apt to vary in colour, like the Crow, as two white ones are mentioned by Mr. White, in his History of Selborne †.

Mr. Levaillant met with these at the Cape of Good Hope, but obferves, that they differ only in the nostrils not being bare of seathers, as observed in Europe. This probably arises from some difference in their manner of seeding, for the young Rooks have the nostrils well covered with bristles, and in proportion as they root with their bills into the ground, the bristles are rubbed off, and at last the roots themselves are destroyed, the nostrils remaining bare for ever after.

PLACE.

Corvus Cornix, Ind. Orn. i. p. 193. 7.—Sepp. Vog. 3. tab. 106.. Corneille mantelée, Daud. Orn. ii. p. 231. Hooded Crow, Gen. Syn. i. p. 153. 5.

HOODED

THIS species changes place according to the season in this country, breeding in the more northern parts; I do not hear of their doing so more southward than Northumberland; they approach the south about the middle of October, are common in the summer about

· Col. Montagu.

† P. 42.

the.

the Highlands of Scotland, where they breed on all forts of trees; are indifcriminate feeders, living on both carrion and shell fish, also will eat at times Cranberries, and other mountain berries. I have also been informed, that in the stomach of one were found several small shells and horse beans.

6. WHITE-BREASTED CR. Corvus dauuricus, Ind. Orn. i. p. 154. 8. Corneille à fcapulaire blanc, Levaill. Ois. ii. p. 14. pl. 53. Corvus scapulatus, Corneille à scapulaire, Daudin. Orn. ii. p. 233. White-breasted Crow, Gen. Syn. i. p. 376. 6. pl. 15.

Description.

THIS is figured in the Planches Enluminées, but the wings are there too short, for they reach three-fourths of the way on the tail: the female is smaller than the male, and the colours less vivid: are found at the Cape of Good Hope in plenty; make the nest in trees or bushes not well cloathed with leaves, and lay five or fix green eggs spotted with brown. The Hottentots hold this bird and some others of the crow kind in great estimation, being of singular use in picking out infects from the backs of oxen, with which they are sometimes so covered as to be in danger of losing their lives. In one of these, supposed to have come from China, I observed the belly and under parts to be black, and I have no doubt of its being found in Abyssinia, as I observed a figure of one among the drawings of Mr. Bruce.

JACKDAW.

Corvus Monedula, Ind. Orn. i. p. 154. 11.—Sepp. Vog. 3. t. 113. Choucas commun, Daudin. Orn. ii. p. 233. Jackdaw, Gen. Syn. i. p. 378. 9.—Id. Supp. p.78.

I Have observed that this bird will frequently make the nest in rabbit burrows, and in the Isle of Ely, for want of ruined edifices, in which it most delights to build, it sometimes makes the

nest in the chimnies; on an occasion of this fort, a fire was once lighted on a hearth below, which had not been used for some time, at last the materials of the nest above took fire, and were in such quantity, that it was with the greatest difficulty that the house itself could be preserved from the slames.

Corvus Stelleri, Ind. Orn. i. p. 158. 20. Pica glandaria carulea, &c. Bartr. Trav. p. 170. Geai de Steller, Daudin. Orn. ii. p. 248. Steller's Crow, Gen. Syn. i. p. 387. 21.

STELLER'S CR.

I judge this to be the one mentioned in Bartram's Travels, of an azure blue colour; no crest or tust of seathers on the head; said not to be so large as the blue Jay of Virginia, but equally clamorous; found in clumps and coverts in the space between the lower trading house and Rock Point.

DESCRIPTION.

Dr. Pallas mentions it as being shot by Mr. Steller, when Bering's crew landed upon America.

Corvus cyanus, Ind Orn. i. p. 159. 21. La Pie bleue à tête poire, Levaill. Oif. ii. p. 28. pl. 58.—Daudin, Orn. ii. p. 236.

9. BLUE: CR.

Corvus cyanus, blue Magpie, Pall. Trav. iii. p. 694.—Gen. Syn. i. p. 394. 30.

Description.

THIS species migrates from the Mongolian Defarts and China, only into that part of the Russian dominions which lies to the south of Lake Baikal. The figure in Levaillant's work seems to have the feathers of the hind head elongated into a pointed crest, and the whole of the head below the eyes and the chin black: the body is blue grey beneath, more blue above, wings and tail fine blue: tips of the second quills white: tail very long and cunciform, confisting:

fisting of twelve feathers, all of them white at the ends: bill and legs black. This came from *China*, but Mr. *Levaillant* is not aware or is filent in respect to its being the one mentioned by Dr. *Pallas*.

CINEREOUS CR. Corvus Canadensis, Ind. Orn. i. p. 160. 23.
Geai du Canada, Daud. Orn. ii. p. 250.
Cinercous Crow, Gen. Syn. i. p. 389. 23.

DESCRIPTION.

THE weight of this bird is two ounces and a half; length ten inches and a half; bréadth fifteen inches: faid to live among the pines of America; in pairs at all times of the year; are detefted by the natives: the young fly in May.

RUFOUS CR. Corvus rufus, Ind. Orn. i. p. 161. 28. Pic rouffe, Levaill. Oif. ii. p. 31. pl. 59.—Daud. Orn. ii. p. 245. Rufous Crow, Gen. Syn. Supp. p. 84.

DESCRIPTION.

THE length of this in Levaillant's plate is nearly eleven inches: head and neck ash colour: back, scapulars, rump and belly rusous; the two last pale, inclining to orange: middle of the wing greyish white: quills black, and reach just beyond the base of the tail, which is long and cuneiform, the general colour of it pale grey; the ends of the feathers black, more so in proportion as the feathers are outward, so that the two middle ones are grey nearly the whole of their length; at the end of each a rusous grey spot: bill greyish horn colour: legs yellowish, said to come from Bengal.

RED-BILLED CR.

Corvus erythrorynchos, Ind. Orn. i. p. 161. 29. La Pie bleue, Levaill. Oif. ii. p. 24. pl. 57.—Daudin. Orn. ii. p. 240. t. 15. Red-billed Jay, Gen. Syn. i. p. 390. 24.

DESCRIPTION.

THE description in the Gen. Synopsis of birds, gives every idea of the bird sufficient to discriminate it from others of its genus; but but in respect to the tail seathers, they are faultily expressed in the Pl. Enluminées, for instead of being as there represented, of a moderate length, and scarcely more than rounded in shape at the end, the fact is, that the tail is full half as long again as the whole of the rest of the bird; this we can testify from a fine specimen in the Leverian Museum, in which the tail is fully as cuneiform in its shape as in the Magpie; each of the seathers being blue, with the ends black, and ultimately marked with an oval spot of white at the tip. Mr. Levaillant also has remarked the same circumstance.

Corvus Pica. Ind. Orn. i. p. 162. 32. Pie commune, Daud. Orn. ii. p. 237.—Hist. Prov. i. p. 487.—Hist. Alepp. p. 69. Magpie, Gen. Syn. i. p. 392. 29.—Id. Sup. p. 80.

MAGPIE.

IT has been observed, that no greater numbers of this bird are seen than in the temperate and southern latitudes of Russia; it is common all over Sibiria, and even in Kamtschatka; it was met with also in the adjacent islands by Steller.

PLACE.

In Clayton's account of Virginia, it is observed that neither Jackdaw nor Magpie are there, and that they prize a Magpie full as much as we do the Red Bird. Many varieties of this bird have been noticed, and others continually fall under observation; I observed at the late Mr. Charles Boddam's, of Bull's Cross, one of a dun colour, with white wing coverts: breast and belly white; this was eleven years old.

One shot at lord Temple's at Stow, now in the Leverian Museum, is almost white, longitudinally streaked with black: tail white, streaked with black at the ends; added to these, a magpie's nest was found some years since in Somersetshire, in which were sour young, three of them had the bills white; the rest of the body, tail, and legs cream colour: the sourch of the natural colour.

Supp. II.

SENEGAL CR. Corvus Senegalensis, Ind. Orn. i. p. 163. 33. Le Piapiac, Levaille Ois ii. p. 17. pl. 54.—Daudin. Orn. ii. p. 239. Senegal Crow, Gen. Syn. i. p. 394. 31.

PLACE.

THIS M. Levaillant found in Africa, far distant from the great Namaquas; it agrees with that in Pl. Enluminées, 538, but has a far longer tail. Mr. Levaillant called it from its cry, which is truely expressive of its name; it perches on high trees, sometimes twenty together: the males have the longest tail, more graduated than in the European Magpie, than which it is more slender. It builds on the tops of high trees, defends the nest entirely with thorns, only leaving one opening; lays from six to eight white eggs, marked with some spots of brown, biggest at the large end; is seen in the inward parts of the Cape of Good Hope, but rarely if ever at the Cape itself. Mr. Levaillant mentioned a singularity in one of the tail feathers having two shafts coming out of one quill, one of them entirely without webs, but whether a mere lusus natura, or common to the species in general, he had not an opportunity of observing.

ALPINE CR. Corvus Pyrrhocorax, Ind. Orn. i. p. 165. Crave des Alpes, Daudin. Orn. ii. p. 252.—La Peirouse, neu. Schw. Abh. B. 3. S. 104. Alpine Crow, Gen. Syn. i. p. 381. 11.

PLACE.

L A Peirouse observes, that this species is found in the highest Pyrenean Alps, descending at the end of the year into the vallies and meadows. The distinguishing character by no means to be drawn from the colour of the legs, as they differ at different ages, for in some they are black, in others orange coloured, and in old birds quite crimson: the colour of the plumage is dusky black: the bill

bill is yellow, and bent, but not pointed as in the Cornish Chough or Hermit Crow.

Corvus Graculus, Ind. Orn. i. p. 165. 41. Crave Coracias, Daudin. Orn. ii. p. 253. Red-legged Crow, Gen. Syn. i. p. 401. 39.

RED-LEGGED CR.

LIASSELQUIST observed this bird in the fields of lower Egypt during the months of September and October; faid to be common about all high rocks of the fouth latitude of Sibiria, also about Mount - Caucasus, and the mountains of Persia, and that in the first year the bill and legs are black.

PLACE.

The eggs are longer than those of the Jackdaw, of a cinereous white, marked with irregular dusky blotches.

Corvus Eremita, Ind. Orn. i. p. 166. 42. Crave huppé, ou Sonneur, Daudin. Orn. ii. p. 254. Der Alpen Rabe, N. G. Deutsch. B. 2. S. 470. taf. xvii. Wood Crow from Switzerland, Borowsk. Nat. pl. 71. 5. B. Hermit Crow, Gen. Syn. i. p. 403. 41.

HERMIT CR.

THE figure in Borowski's work, which seems to been taken from Albin, is bare about the head, and the crest begins at the nape, continuing to the lower part of the neck, falling off to nothing at top and bottom, but the feathers of it very long in the middle of the neck: the eye is furrounded with black.

DESCRIPTION.

The figure in Gerini's work is faid to be this bird, but it feems to have a longer bill, and no doubt ought rather to be referred to the Cornish Chough.

18. SHORT-TAILED CR. VAR. G.

Turdus triostegus, Muf. Carlf. Fasc. iv. tab. 84.

IN this the bill is yellowish, with brown edges: the head and nape rufty green, with three longitudinal black streaks: the upper DESCRIPTION.

parts

Q 2

parts of the body and wings green for the most part: shoulders, rump, and tail greenish blue: the greater wing coverts and quills black, on the latter a bar of white: throat, breast, belly, thighs, and legs pale rust colour: vent rose colour, inclining to white under the tail, which is very short, and mostly black, with the end of a glossy blue.

• M. Thunberg is said to have brought this variety from some of the East India islands: size of our Var. C.

BLACK-FACED CR. Description.

SIZE of a fay: bill flout and black; tongue rounded at the end: the face and throat black: the plumage on the upper parts is blueish ash colour for the most part; beneath paler: quills blackish, with pale edges: tail six inches and a half long, and dusky brown, all but the two middle feathers tipped with white: legs dusky blue.

PLACE.

Inhabits New Holland, where it is called Kai-a-lora; faid to be a bird of prey. I am obliged to Mr. Lambert for the above description; among his drawings I likewise observed another which had a stouter bill; the head black much beyond the eyes, and the plumage rather of a darker hue, and the tail feathers not tipped with white.

CALEDONIAN CR.
DESCRIPTION.

Magpie of New Caledonia, D'Entrecasteux's Voy. ii. p. 226. pl. 35.

LENGTH twenty inches: head black, feathers of it filky and distinct, round the eye fomewhat bare; all the neck white, and in the middle of the belly a little of the fame: the general colour of the plumage otherwise black: the bill is black and stout, the end of it for one third yellowish, and slightly notched: tail very cuneiform, the two middle feathers eleven inches long, the next on each side nine, diminishing regularly to the outer ones, which measure no more than three inches and a half: legs dusky.

Inhabits

Inhabits the woods of New Caledonia. I saw a specimen of this at Mr. Thompson's, Little Saint Martin's Lane.

PLACE.

THIS is a large species, but the true size not certain, as the drawing from whence this description is taken did not identify it: the bill is strong, seemingly less than in the Crow, though characteristic of that genus: the plumage dusky brown, with resections of blue and reddish in different lights: bill and legs black.

VARIABLE CR.
Description.

This was met with in New Holland, and was the only one of its kind feen there. Mr. Lambert.

PLACE.

THIS species is smaller than a magpie: bill and legs dusky brown: irides brown: from the middle of the crown, the nape, back of the neck to the middle of the back, the greater part of the wings, and the end of the tail for one third, of a deep blue; the rest of the

BLUE AND
WHITE
CR.
DESCRIPTIONS

Inhabits New South Wales; known by the name of Karrock. It feems much allied to the Thrush genus, as it has not any bristles covering the base of the bill; it is esteemed a rare species.

plumage white: quills towards the ends brown.

PLACE.

THIS is about twenty inches in length: the bill and legs dusky black: irides blueish: the chin and throat, the middle of the greater quills, the rump, vent, and middle of all but the two centre tail feathers, are white: the rest of the plumage black.

BLACK AND
WHITE
CR.
DESCRIPTION.

Inhabits New South Wales; probably changes place in different feasons, as it is chiefly met with in May.

PLACE.

118

WHITE-CHEEKED CR. Description,

SIZE uncertain: bill dusky; legs pale: the head is tusted, or rather fuller of feathers than the rest of the body, and is, as well as the neck, breast, and belly, black: the feathers of the chin and breast margined with white; on the ear a white patch: back, wings, and tail olive green: quills dull rust colour: the shape of the tail cuneiform; the outer feathers tipped with white.

PLACE.

Inhabits New Holland, and at first fight seems to resemble somewhat the White-eared Jay, but differs in not having the forehead whitish, nor does the white patch come so near the eye as in that bird; besides, the shape of the tail is cuneiform in the present described, but in the White-eared Jay it is simply rounded at the end.

RUFOUS-BELLIED CR. Description.

La Pie à culotte de peau, Levaill. Ois. ii. p. 20. pl. 55.

THIS is about the fize of a Blackbird, but differs in having a cuneiform tail, which is half as long again as the bird: the whole of the plumage is gloffy black, with a tinge of blue in some lights; but the feathers of the belly, thighs, and vent, are of a slesh colour, or pale rusous, and the vent rather inclines to brown: the bill and legs are black.

PLACE.

This bird is figured from one in the collection of M. Ray de Breukelerward, of Amsterdam, and said to have been brought from one of the South Sea isles. It seems to have some affinity to the Senegal Crow, from its shape and cuneiform tail: the bill is not so strong in proportion as in the Magpie, but more approaching to that of the Thrushes. In this single specimen, were observed only eight feathers in the tail, and on the most minute investigation, no traces of more could be found; if it be really the case with others of the same species, as may be known hereafter, it is, we believe, a singular occurrence, as although frequently more, we do not at present know any bird which has sewer than ten feathers in its tail.

Le Temia, Levaill. Ois. ii. p. 22. pl. 56.

changeable CR.

DESCRIPTION.

THIS is about the fize of our Song Thrush in the body, but rather longer in proportion: the general colour of the plumage is black, and the texture of the feathers fine, delicate and soft; but those round the base of the bill, as far as the eye and chin, are stiff and short, appearing more like black velvet, and those on the rest of the body, in different reslections of light, are glossed with green and purple; those of the tail above, seem glossed with green, the four middle ones wholly so, but the others only on the outer webs; the tail is greatly cuneiform, and contains ten feathers; the four middle ones or longest are of equal length, and longer than the rest of the body; the others lessen till the outer ones are very short: the bill and legs are black, and perhaps may be allied to the Crow genus, however, the bill in shape is greatly similar to that of the Beefeater, and the bird may not unlikely be possessed of the same manners.

This was fent from *Batavia*, to Mr. *Temminck*, of *Amsterdam*, but it is by no means certain that this was its native country.

PLACE.

Pie à pendeloques, Daudin. Orn. ii. p. 246. pl. xvi. .

WATTLED CR.
Description.

ENGTH fifteen inches: bill black, slender, and a little elongated: the general colour of the plumage brownish grey: the feathers at the top of the head and neck edged with whitish; on the cheeks a little downy, at the bottom of which arises a cylindrical caruncle, ten lines in length, hanging on each side of the neck; throat white; fore part of the neck, and under parts of the body dirty white, the middle of each feather dashed with brownish: on the middle of the belly a patch of sine yellow: quills tipped with white: tail greatly cuneiform, each feather tipped with white: legs greyish yellow; claws brownish grey, sharp, crooked, and strong.

Inhabits New Zealand.

BENGAL R. VAR. Description. Cor. Bengalensis, Ind. Orn. i. p. 168. z. Var. Rollier tacheté, Daudin. Orn. ii. p. 258.

SIZE of the Common Roller; length thirteen inches: bill black; head rufous, with a whitish mixture in the face: the general colour of the plumage is rufous, tinged with dirty green on the back, and inclining to red beneath, marked with a longitudinal white stripe on each feather: wings dull pale green: quills sky blue: tail rufous brown, pretty long, and the feathers of equal lengths: legs dusky.

PLACE.

A specimen of this bird is in the Museum at Paris, brought from Senegal, by M. Geoffroy de Villeneuve. It has been also killed in Caffraria by Mr. Levaillant. It is probably a young bird of the Bengal Roller.

DOCILE R. Coracias docilis, Ind. Orn. i. p. 172. 17.—S. G. Gmelin, It. iii. p. 378. t. 42.— Daud. Orn. ii. p. 266.

Description.

THE fize of a Jackdaw: bill and legs yellow; the bill is rather bent, feathered on the fides, and the under part at the base covered with white feathers: eyes black, round them dull grey, behind and beneath them whitish, with a slight mixture of red; the upper parts of the head, neck, and breast are much the same; belly and vent chesnut

chefnut brown: the nine first quills are half white half black; the rest wholly black: tail black, with the tip white.

Inhabits *Perfia*, and has obtained its name from imitating words and actions of those around, such as crying, laughing, and such like.

Coracias strepera, Ind. Orn. i. p. 173. 21.

Reveilleur de L'Isle Norsolk, Dand. Orn. ii. p. 267.

Corvus graculinus, White-vented Crow, White's Journ. Bot. Bay, tab. p. 257.

NOISY R.

LENGTH nineteen inches; fize fomewhat bigger than a Jack-daw: bill two inches and three quarters long, curved at the point, with a flight notch at the very tip; colour black; nostrils elongated, oval: the irides are orange: the general colour of the plumage is black; the feathers about the head short and stiff: the first quill feather is half the length of the fifth, which is the longest of all; the first fix quills are white at the base, producing when closed a white patch on the wing: vent, and base of all the tail feathers white: the tail is eight inches long, even at the end, and the feathers pointed at the tips, marked on the inner web with white, except the two middle ones, which are wholly black •: the wing when closed reaches more than half way on the tail: the legs are strong, feathered rather below the heel; hind toe very large and strong.

Description.

This species is very numerous at *Norfolk Island*, and is very clamorous, especially of nights; called a *Magpie* by our failors, perhaps on account of the colours, added to the similarity of voice. It is a very foolish bird, running after any person, and suffering itself to be knocked down with a stick.

PLACE.

• In the engraved coloured plate of this bird, in White's Journal, all the tail feathers have white ends, whereas the two middle ones are black the whole of their length.

SUPP. IL

122

STRIATED R. Description.

ENGTH fifteen inches: bill flesh colour; tongue bristly at the end: plumage on the upper parts olive green, marked on the back with fine streaks of black, inclining to ash colour on the cheeks: the under parts of the body white streaked with black: lesser wing coverts black, edged with pale grey; the rest, as well as part of the quills, are pale grey, almost white: quills black: tail pale ash colour, and pretty long: legs black.

PLACE.

Inhabits New South Wales.

PIPING
R.
Description.

THIS bird is eighteen or nineteen inches long: bill two inches or more, straight, except at the point of the upper mandible, which is bent; the colour blue, the tip black: general colour of the plumage deep black, except the nape, wing coverts, and some of the greater quills at the base, rump, vent, and base of all the tail feathers for two-thirds of the length, which are white, but the end of the tail is black, as is the whole of the outer feather on the outer web: legs dusky state colour.

PLACE.

Inhabits New South Wales, where it is known by the name of Tarra-war-nang; it has a fost note, not unlike the sound of a well-toned flute; it preys often on small birds.

CRIMSON R. Description.

Crimfon Roller, Lew. Mus. tab. in p. 63.

SIZE of a Crow: bill red: the whole plumage crimfon, inclining to pompadour red, but somewhat deeper: the tail is even at the end, of the same colour as the rest of the plumage, but darker; the under part of it dusky black; quills of this last colour: legs dusky.

PLACE.

This most beautiful species inhabits Cayenne; a fine specimen is in the collection of Mr. Martyn, of Great Marlborough Street; that from which

which the figure in the Leverian Museum was engraven, was taken from a painting in the collection of the late M. G. D'Orcy, communicated by Colonel Woodford: this feems to differ in some degree, for the feathers of the crown are elongated, so as to make it appear somewhat crested, and the quills and tail are said to be wholly black.

HAIRY R. Description.

THE bill and legs in this bird are dusky blue; the whole of the neck, breast, and belly testaceous brown, streaked with white, and the seathers rather loose and elongated: back and wing coverts green brown, edged with blue and changeable red: quills deep blue: tail long, even at the end, and like the quills in colour: above the eyes a streak of white, and beneath them a dark one.

A drawing of this bird is in the collection of Colonel Woodford.

Red-breasted Roller, Lev. Mus. tab. in p. 199.

RED-BREASTED R. Description.

THIS is nearly the fize of a Common Crow: the bill is strong and black: the general colour of the plumage is also black, slightly glossed with blue on the back and wings: the fore part of the neck and breast are bright scarlet, inclining to crimson, changing to serruginous at the lower part: the tail consists of twelve feathers, and is slightly cuneiform: legs black.

The above description taken from a specimen in the collection of the late Mr. Bailey, dealer in curiosities in the Haymarket, who informed me that it came from South America.

PLACE.

#### GENUS XV. ORIOLE.

N° 1. Chesnut and Black Or.

Nº 4. Golden Or.

2. Lesser Bonana Or.

5. Carthagena Or.

3. Olive Or.

CHESNUT and BLACK OR. Oriolus castaneus, Ind. Orn. i. p. 181. 25. Carouge varié, Daudin. Orn. ii. p. 334. Chesnut and Black Oriole, Gen. Syn. ii. p. 437. 24.

DESCRIPTION.

The Chefinit and Black Oriole is not common in these parts; the bird you describe as its hen, I esteem another species; but considering what you remark about the Baltimore and other young birds, I believe it to be a young cock of the second summer; they sing loud, and but little different from your No. 24: the size, colour, bill, and legs agree, and the spots and shades differ in different birds, having all the appearance of moulting and becoming like the former, but the hen is quite a different bird, having no chesnut about her: the young birds are all like thens, which is the case with several of this country."

MANNERS.

The nest is built in the beginning of May, in the fork of the top sprigs of Sweet Gum, curiously woven with the small twigs of a plant like green hay, and lined with wool: the eggs are of a very pale or whitish blue, marked or streaked round the larger end with dark brown.

I very much rely on the opinion of Mr. Abbot, who is an excellent observer, and am inclined to think from what he says, as well as what has been hinted to me from my friend General Davies, that these

these birds vary exceedingly before they arrive at mature plumage, for in one pointed out by this last gentleman to me as a semale, the chin and throat were black: head mottled green and black, in the manner of the *Pewit Gull*, before its final change into deep black: wings brown, with a rusous bar: under parts of the body pale yellow, but the middle of the belly inclined to rusous: the tail dark olive green, with the two middle feathers nearly black.

Oriolus Xanthorus, Ind. Orn. i. p. 181. 26. Carouge cul jau n, Daudin. Orn. ii. p. 384. Lesser Bonana Bird, Gen. Syn. ii. p. 438. 25.

LESSER BONANA OR.

If the bird figured by *Brisson*, and that of *Edwards* be the same, the last is by much the biggest, as appears by the *Leverian Museum*, which contains specimens of both. In *Brisson*'s bird the lore and chin only are black, but in that of *Edwards*, the fore part of the head, chin, throat, and the wing coverts have a large portion of white: the yellow parts in *Brisson*'s bird are very full and bright, but in that of *Edwards*, of a greenish yellow.

DESCRIPTION.

Oriolus olivaceus, Ind. Orn. i. p. 186, 41. Var. Icterus castaneus, Troupiale chatain, Daudin. Orn. ii. p. 353. Cayenne Olive Oriole, Gen. Syn. ii. p. 447. 39.

OLIVE OR. Var.

SIZE of the Olive Oriole: bill black: head, neck, and general colour of the plumage fine velvet black: throat, breaft, belly, back, rump, and vent fine gloffy chefnut: belly and thighs dufky: wings and tail black: greater wing coverts tipped with white, forming a transverse band of that colour: legs black.

DESCRIPTION.

The female is of a colour less deep, inclining to brown above, and to rusous beneath, with the vent feathers grey.

M. Daudin received the above from Cayenne, with the Olive Oriole,

Oriole, to which it feems to be allied at leaft, if not that bird in any of its changes of plumage: faid to make the nest of a plain rounded hemispherical shape, of dried roots and fibres, and commonly many nests are found on the same tree.

GOLDEN OR. Oriolus Galbula, Ind. Orn. i. p. 186. 45. Galbula Aldrov. Ger. Orn. iii. t. 307. 308. 309. Golden Oriole, Nat. Misc. viii. pl. 285.—Gen. Syn. ii. p. 449. 43.—Id. Sup. p. 89.

IN Sepp's plate, the nest seems composed of pale moss mixed with seathers, and fastened round the divarication of a bisid branch. In the first plumage the males and females resemble each other: they seem to inhabit the greater part of the old continent; Russel \* found them at Aleppo, in autumn, where they are used as food; Sonnini † observed them migrating through Egypt, and in doing this they take up sisten days, during which they are caught for food; is certainly the Mango Bird of India, as Mr. Macneil ‡ found it in great plenty in the island of Salset, and says the notes are plaintive and melodious, though simple: it is probably the bird called at Malabar by the name of Magnakli; said to be entirely yellow, except the wings, which are black §.

CARTHAGENA OR.

Coracias cartaginiensis, Scop. An. Hist. Nat. i. p. 40.

DESCRIPTION. SIZE of the common Oriole: bill black; head the fame; throat white: breaft, belly, and rump yellow: wings and tail rufous, spotted with black; a white streak passes from the base of the upper mandible on each side to the nape: back varied rusous and brown.

PLACE.

Scopoli found this in the Emperor of Germany's menagerie at Vienna, to which place it was brought from Garthagena, in South America, by Cl. Jacquin. It was an unquiet and clamorous bird.

\* Hist. of Aleppo. † Trav. (Engl. ed.) iii. p. 318. ‡ Archael. viii. p. 252. § See Bartholomeo's Voy. to India, (Engl. ed.) p. 234.

PARADISE Gr

DESCRIPTION.

TX7E believe that this bird varies greatly: in a specimen from India, in possession of General Davies, the whole space on each side of the head, from the gape, through the eye, and much beyond it, was bare; the whole of the head otherwise cloathed with greenish black feathers; but the chin, and fore part of the neck to the breaft, were ash colour: the rest of the bird as before described in the General Synopsis. In this work \*, it is mentioned from M. Buffon, that the inhabitants of the island of Bourbon having imported some of these birds for the purpose of destroying the Grashoppers, the birds increased fo fast, that after having destroyed the intects, they attacked not only the fruits, but young Pigeons, and became a greater fcourge than the Grashoppers had been before. We learn, however, that this affertion is not precisely the fact, and most likely M. Buffon had been misinformed; for M. Duplessin, who gave it as his opinion, that these birds might be useful to be introduced into that part of Spain situated towards Africa, by way of destroying the Locusts there, had been many years resident in the island of Bourbon, where he had seen those birds introduced, that indeed they have been much multiplied in that island, but so far from themselves being considered as a nuisance, the laws for their preservation are still in force.

\* Gen. Syn. ii. p. 459.

CRESTED Gr. Gracula cristatella, Ind. Orn. i. p. 192. 8. Quiscale cristatelle, Daudin. Orn. ii. p. 320. Crested Grakle, Gen. Syn. ii. p. 464. 7.—Id. Sup. p. 90.

Description.

ONE of these, or very like, is in the British Museum, which came from the Mabratta country in India: the forehead is moderately crested: length of the bird nine inches and a half: bill and legs yellow: the plumage is brown, but the head and neck are black; the last inclining to dusky: the greater quills are white, but black towards the tips: second quills like the back: under tail coverts white: tail black, more than three inches in length; the seathers of it decreasing in length a triste towards the middle: the ends of all the seathers are white, but the two middle ones the least in proportion, being only tipped with white.

EGYPTIAN Gr. Gracula Atthis, Ind. Orn. i. p. 192. 10. Quiscale Atthis, Daudin. Orn. ii. p. 321. Egyptian Grakle, Gen. Syn. ii. p. 466. 9.

DESCRIPTION.

THE only representation I have seen of this, is among the drawings of the late Mr. Bruce: the colour of the plumage is green, but on the ears, the axillæ, and under parts, a purplish blue: tail blue green: bill and legs black.

PLACE.

This is faid to inhabit Abyssinia, where it is known by the name of Warda\*.

ABYSSINIAN
Gr.
Description.

SIZE of the last: bill black: irides straw colour: head deep ash colour: body green, ending in a point on the breast: beneath the body dull ferruginous orange: legs black.

PLACE.

Found in Abyssinia, with the last species, to which it seems greatly allied.

\* Sonnini calls it Egyptian Raven. See Trav. (Engl. ed.) ii. p. 239. Note .

GREEN
Gr.

THIS is fomewhat less than one foot in length: general colour pale dull green: the chin mottled, dusky and brown: the under parts of the body from the breast whitish, with a few dusky streaks; wings and tail dusky, the first edged with white, the last even at the end, tipped with white: the bill is stout, a little bent at the point, and of a horn colour; tongue half the length of the bill, pointed at the end: legs black.

Inhabits New Holland, where it is faid to be a rare bird.

PLACE.

It is with no little difficulty that we have been able to fix limits to the genus of Grakle, more especially to those which inhabit New Holland: and to say the truth, great uncertainty has arisen in respect to other genera also, not only in regard to birds, but quadrupeds, as well as other classes. It is true, that whenever any difficulty presents itself, it may often be obviated by creating a new genus, and many persons are of opinion, that this is the only way to ascertain the place any individual ought to hold in the system; but although it may be allowed in some instances, it should be in such only where necessity may make it unavoidable: a far better way being in our opinion rather to strain a trissing point, than burthen the memory by forming numerous new genera. On this account, I venture to enumerate the sollowing species, reserving to others the full right of differing in sentiment:

ENGTH nine inches: bill yellow, a trifle bent, and stouter at the base than is usual in the *Thrush* genus, though not greatly dissimilar: the forehead is white, but the rest of the head black: the throat, whole of the neck, and all beneath are white, but inclining to blueish in some parts: the back, and all the wing coverts, without exception, are sine pale blue grey, with a trace of white across the lower part of

BLACK-HEADED Gr. DESCRIPTION. 130

the last: the quills are dusky, edged with pale rust: tail three inches in length, blueish ash colour, some of the outer feathers inclining to pale grey near the ends: legs longish, scaly, of a pale yellow oker colour; claws dusky and stout.

PLACE.

Inhabits New South Wales. I am indebted to General Davies for the knowledge of this species, having been brought from Port Jackson, by Governor King.

PIED Gr. Description.

LENGTH ten inches: bill formed as in the last, and yellow: fore-head, chin, and throat white; also a trace of the same from the nape on each side of the neck to the bottom of it; the rest of the head and neck are black, coming forwards on the breast as a broad bar: the back, second quills, and all the outer edge of the wings, as also the whole of the prime quills, are black, with a tinge of blue in some lights; the rest of the seathers of the wing white, and when the wing is closed, giving the appearance of two white bars connected in the middle: the under parts from the breast are white: tail white, the feathers pretty nearly equal in length; near the end a bar of black: legs dull slate colour.

PLACE.

Inhabits New South Wales, with the last species.

8.
BLUE-EARED
Gr.
Description.

ENGTH eleven inches and a half: bill, forehead, crown of the head, and fides of the cheeks, black: chin, throat, and breaft lead colour: under the cheeks, fides of the neck, and all beneath from the breaft, white: at the back part of the head a crefcent of white: hind part of the neck, shoulders, back, wings, and tail, yellowish green quills dark brown, with yellow margins; towards the ends grey: round the eyes a bare space of a bright blue colour: legs blue black; claws black and crooked.

Inhabits New Holland: brought from Botany Bay. I am obliged to General Davies for the above description.

### GENUS XVIII. CURUÇUI.

The Leverian Trogon, Lev. Mus. p. 175. pl. p. 177.

LEVERIAN C.

DESCRIPT

THE bill in this bird is lead colour, paler at the tip: head, neck, and breast fine deep violet blue: wings black; quills edged with white: back blueish green, with a tinge of gold colour: the upper tail coverts silky, of a deep lucid blue green: tail black, with a greenish cast; the feathers square at the ends, the middle ones slightly tipped with black; the two outer ones on each side gradually shorter, black, obliquely edged and tipped with white: belly white, with a very slight reddish tinge or buff colour: legs black.

Inhabits South America; in fize about that of the Violet-headed Curucui, to which it very nearly approaches, and may possibly, on future enquiry, prove to be a mere variety or sexual difference of that bird.

# GENUS XIX. BARBET.

GERINI's
B.

Bucco Gerini, Ind. Orn. i. p. 207. 29 .- Ger. Orn. ii. p. 51. t. 181.

Description.

SIZE of a Thrush: length nine inches: bill black, flout: crown of the head blue, spotted with black in the middle; beneath the eyes, the cheeks, and fore part of the neck for half way, black: quills black: hind part of the neck, as far as the beginning of the back, and most part of the belly and vent, rusous red.

The native place of this bird is quite uncertain; I have only met with it in the engravings of *M. Gerini*, who calls it a *Woodpecker*; but the bill is large, and more like that of the *Barbet*, hence I have ventured to rank it in that genus.

\* WITH FOUR TOES.

Cuculus canorus, Ind. Orn. i. p. 207. 1. Cuckow, Gen. Syn. ii. p. 509. 1.—Id. Sup. p. 98.—Phil. Trans. vol. lxxviii. p. 219.—Jenner.

COMMON CUCKOW.

WE have some reason to suppose that the egg of the Cuckow is not generally known, for some authors † tell us that it weighs still a quarter of an ounce; that it is not laid in the nest of another bird, but between the roots of old trees on the ground; that the eggs are two in number. It is clear from this description, that it can mean no other than that of the Goatsucker.

Such is the case likewise in respect to that figured in Sepp's plate of the Cuckow, and cannot by any means be mistaken. The egg of the Cuckow, however, is scarcely half as large as either of the figures above alluded to, and in size is more disproportionate to the bird than any, except the Raven. The Cuckow's egg weighs rarely ever more

than

<sup>†</sup> Naturforsch, xiv. p. 49 .- Beschi d. Berl. Ges. iv. t.18. f. 1.

<sup>1</sup> Sepp. Vog. p. 117. tab. 62.

than fifty grains \*, and the bird itself barely four ounces, so that thirty-eight of such eggs will about make up the weight of the parent, whereas the Raven weighs two pounds ten ounces, and the egg not quite seven drachms, so that forty-eight are required to equal the weight of the bird.

The Cuckow is supposed to lay a great number of eggs, for in one diffected by my friend Mr. Lamb, there were not only two eggs in the ovary, one of them just on the point of being laid, the other about half the size, but besides, a vast number of small ones; and in respect to food, the stomach contained not only small caterpillars, but small feeds likewise. Similar observations, as well as others of much import, may be obtained, by consulting Dr. Jenner's excellent Essay on the subject, in the Philosophical Transations above quoted.

CUPREOUS C.

Cupreous Cuckow, Lev. Mus. pl. in p. 159.

Description.

SIZE nearly that of a Lark, but of a longer and more delicate form: the head, neck, and upper parts of the body are of a bright copper colour, with a metallic splendour, being glossed with gold and red tinge of copper: the seathers are of a rounded shape, and are so disposed as to resemble scales: the belly and thighs are of a beautiful jonquil yellow: the tail is slightly cuneiform; one or two of the exterior seathers marked at the tip with a triangular spot of white: bill and legs black.

PLACE.

This bird is supposed to have come from Africa, and is in the Leverian Museum: in general shape and appearance, it is somewhat allied to the Gilded Cuckow, but differs much in its colour, and in having the tail longer in proportion.

<sup>\*</sup> Not unfrequently as low as forty-four grains; Dr. Heysham: from forty-three to fifty-five grains; Jenner.

Cuculus auratus, Ind. Orn. i. p. 215. 27. Le Didric, Levaill. Voy. (Fr. ed. 8vo.) i. p. 234. Gilded Cuckow, Gen. Syn. ii. p. 527. 23.

GILDED C.

THIS Mr. Levaillant found about Koks Kraal, inwards from the Cape of Good Hope, and properly remarks, that it is undoubtedly the finest bird of the genus. It sings continually, perched on the extremities of large trees, and utters with varied modulation the syllables di-di-didric, as distinctly as can be written; hence he has named it Le Didric.

Cuculus Indicator, Ind. Orn. i. p. 218. 35. Coucou indicateur, Levaill. Voy. (Fr. ed. 8vo.) i. p. 253. Var. Honey Cuckow, Gen. Syn. ii. p. 533.—Id. Sup. p. 101.

HONEY

THE cock, described by Sparrman, has the neck encircled with a black ring \*; according to Levaillant, it is said to be larger than the common Cuckow, very tame, and not assaid to come near him, and that the Hottentots held it in great veneration †. He likewise adds, that nothing was found in its stomach on dissection but wax and honey, not a vestige of any insect: the skin so remarkably thick, as when sresh scarcely to be pierced with a pin, a wise provision against the stings of the insects which he is to encounter: the nest is in the hollow of trees, which it climbs like the Woodpecker, and it hatches its own eggs; from hence the manners seem to be totally distinct from the European Cuckow.

DESCRIPTION.

Cuculus Vetula, Ind. Orn. i. p. 218. 36. Long-billed Rain Cuckow, Gen. Syn. ii. p. 535. 32.

LONG-BILLED RAIN

MR. Abbot, long resident at Savannah, in Georgia, observed to me, that the Rain Cuckow, is not unfrequent about Burke country,

and

<sup>\*</sup> See Sparrm. Voy. (12mo. ed.) ii. p. 142. called there Capistrum. Called by the Cape farmers, Honey Bird, Barrow's Traw. p. 321.

and that it fits on its own eggs: the nefts of these birds not uncommon, he having procured three or four of them; one discovered by himself, was built in the fork of a small oak, made of sticks lined with moss, and over that dead *Hiccory* blossoms: the eggs were five in number, of a rough blue colour, but not deep, and found complete about the latter end of *April*.

TOURACO.

Cuculus Persa, Ind. Orn. i. p. 222. 49. Touraco, Gen. Syn. ii. p. 545. 46.

M. LEVAILLANT, in his travels \*, observes, that numbers of Touracos are in the country of Hottniquas, but are difficult to shoot, perching only at the extremities of the highest branches of trees, out of gunshot, and rarely suffer any one to come near enough: feeds on fruits, but not on insects, and is easily caught alive by snares baited with such fruits as are in season; in another place he talks of having killed many Flycatchers and Touracos, which when fricassed, were superior to the Pintado or Partridge †.

7. NOISY C. Description.

Coucou Criard, Son. Voy. (Fr. ed. 8vo.) ii. p. 6.

THIS is faid to be wholly of a brown black colour, having nothing otherwife remarkable.

PLACE.

Inhabits the inner part of the Cape of Good Hope, in the country of Gonaquois, where it is known to the Europeans by the name of Criard, being a very noify species, and may be heard at a great distunce. The note consists of divers sounds, very distinct, and it passes whole hours in singing without interruption, by which the sportsman is led to the place where it is.

\* (Fr. ed. 8vo.) Vol. i. p. 106 .- ii. p. 7.

<sup>†</sup> We beg leave here to notice an error in our zd vol. of Synopsis, p. 531. wherein the three paragraphs from line 16, should have been placed after Touraco.

ELUE-HEADED C. Description.

of a pale blue colour: the upper part of the head, taking in the eyes, the fides and back of the neck, deep blue, inclining to blackish: the rest of the upper parts pale brown, dotted on the back with white, and marked with narrow bars of the same across the wings and tail, which last is rather long, nearly even, being a very trisle rounded at the end: the under parts are wholly white, transversely marked with narrow dusky lines: the throat and fore part of the neck incline to orange: legs blueish, very stout, and scaly.

Inhabits New Holland: Mr. Lambert informs me, that the above was the only one of the kind feen there by Mr. White, but that one of a fimilar form and fize, of a gloffy black colour, was taken at the fame time, and it was then supposed that these two only differed in fex.

PHEASANT C. Description.

PLACE.

HIS is a beautiful species, and is in length from sixteen to eighteen inches: the bill, head, neck, and all beneath are of a fine black: the whole of the back and wings varied with rusous, yellow, brown, and black, somewhat similar to a Pheasant or Woodcock: the tail is long, and barred elegantly with the same colour: the legs are dusky black; the toes placed two before and two behind, as in other Cuckows, but the hind claws are pretty long, and less hooked than the fore ones, resembling in this the Egyptian Cuckow, which however differs materially in colour, as in that bird the back and wings are plain rusous, and the tail, though long and cuneiform, is wholly black.

Inhabits New South Wales, known there by the name of Pheafant.

PLAGE. .

138

TIPPEF

DESCRIPTION.

HIS is nearly twelve inches long: the bill brown, rather stour, and a trifle curved at the point: the upper parts of the body are dull green, the under white: the crown full of feathers, and as far as the eyes on each fide black; on the fides of the neck, the black comes forward, and almost meets in the middle, giving the appearance of a cloak or tippet: fides under the wings yellowish: thighs marked. with a few rufty spots: quills black: tail very short, the outer margins of the feathers marked with white spots: legs dusky blueisn white, dotted with black: irides orange.

PLACE.

Inhabits New Holland, where it is a rare bird.

FAN-TAILED DESCRIPTION.

THIS elegant bird is about the fize of a Song Thrush, and ten inches in length; the tail occupying at least one third: the bill is black, fomewhat bent at the tip: the upper parts of the body are dusky black, coming forwards on the breast, and encircling it as it were with a crescent: the cheeks and throat are ferruginous buff; fides of the breaft the fame, but the middle of it and the belly are pale oker yellow; the tail is greatly cuneiform; the two middle feathers black; the others the same on the outer webs, but barred on the inner with alternate black and white: the wings when closed reach rather beyond the middle of the tail: legs yellow.

PLACE.

Inhabits New Holland.

GLOSSY

I ASCRIPTION.

SIZE uncertain: general colour above rufous, inclined to purple; beneath dusky white, croffed with several broad bars of a glossy or brownish copper colour: tail of a moderate length, and barred with

Fan tailed Cuckow.

Published or the Act directs May 30, 1801. by Ligh Socheby & Son Jork Street Covent Garden.

with the same beneath: the bill is pointed, and dusky; the tongue sharp at the end, the length of the bill: irides blue: legs brown.

Inhabits New Holland: for feveral of the last described birds, I am indebted to Mr. Lambert.

PLACE.

#### \* \* WITH THREE TOES ONLY.

Bee Cackow, Moroc, Bruce's Trav. App. t. p. 178.

ABYSSINIAN
C.
Description.

THIS bird is faid to be feven inches in length: the head and neck plain brown; at the base of the beak a number of very small hairs: inside of the mouth and throat yellow; tongue sharp pointed, and capable of being drawn to almost half its length out of the mouth: eye-brows black; bill pointed, a trisle bent: irides dusky red: fore part of the neck light yellow, darker on the sides, reaching nearly to the shoulders: breast and belly dirty white: the wing feathers are mostly tipped with white: the tail has twelve feathers, of equal length, the ends tipped with white: thighs covered with seathers half way down the legs, which are black: the toes are only three in number, placed two before and one behind.

This species inhabits such parts of Abyssinia where honey is chiefly produced as revenue, as Agou, Goutto, and Belessen. It feeds on bees, but kills more than it eats, as numbers are found scattered on the ground. It makes a fort of snapping noise, when catching the bees, otherwise it has no note.

This Mr. Bruce supposes to be the Cuckow of Lobo, who attributes to this bird the faculty of discovering honey. He ridicules Dr. Sparrman, for giving an account of a species of Cuckow to which he attributes the same faculty; but these two are very clearly different birds, therefore Mr. Bruce's criticisms on Dr. Sparrman must in course fall to the ground.

### GENUS XXII. WOODPECKER.

Nº 1. Chili W.

2. Lesser spotted W.

3. Bank W.

4. Cape W.

N° 5. Yellow-headed W.

6. Guinea W.

7. Mahratta W.

CHILI W. Description.

Picus lignarius, Ind. Orn. i. p. 224. 2.—Molin. Nat. H. Chili, (Fr. ed.) p. 215.

THIS bird is fearcely as large as a *Blackbird*; it has a red-crefted crown, and the body is banded with blue and white: the bill is fo ftrong, as not only to enable the bird to make holes in decayed trees, but even in living and found ones, in which it makes the nest. It is faid from this last circumstance to destroy many fruit-bearing trees.

PLACE.

Inhabits the kingdom of Chili:

LESSER SPOTTED W. Picus minor, Ind. Orn. i. p. 229. 15. Lesser spotted Woodpecker, Gen. Syn. ii. p. 566. 14.—Id. Sup. p. 107.

Thas been hinted to me, that there is every reason to believe that this bird does not resemble the semale parent, till after it has thrown off the nestling seathers, as in sour or sive young ones brought to an intelligent naturalist at various times, all of them had red crowns; however, this matter could not be ascertained by dissection. The egg of this bird and that of the Wryneck are so alike, as to be mistaken for each other, but differs in weighing less by about sour grains.

We are now pretty certain that the Middle Woodpecker is only the young of the Greater Spotted Woodpecker, both fexes having the whole of the crown red during their imperfect state of plumage.

Picus Pitius, Ind. Orn. i. p. 234. 26. Le Pitico, Molin. Chil. (Fr. ed.) p. 216.

BANK W.

THIS species is about the size of a Pigeon: the plumage brown, spotted with white.

Description.

Inhabits *Chili*: it is faid not to make the nest, as others of the genus, in the hollows of trees, but in those of the elevated banks of rivers, and to lay four eggs: the sless much esteemed by the natives.

PLACE.

Picus capenfis, *Ind. Orn.* i. p. 237. 37. β. Cape Woodpecker, *G.n. Syn.* ii. p. 586. 34.

CAPE

I N this variety, the head, neck, and under parts are pale grey; back and wings greenish olive brown: crown, rump, and belly crimfon: wings and tail dusky: bill and legs black.

DESCRIPTION.

I observed this among Mr. Bruce's drawings, as an Abyssinian bird; and the name it is there known by is Wye-wa.

Picus icterocephalus, Ind. Orn. i. p. 241. 49. Yellow-headed Woodpecker, Gen. Syn. ii. p. 595. 46. YELLOW-HEADED W. Var.

ENGTH fix inches and an half: chin and throat spotted with pale red; the under parts from thence to the vent dusky white, crossed with irregular brownish streaks; otherwise resembles the Yellow-beaded Woodpecker.

Description.

I am indebted for the above to a drawing taken by General Davies; the specimen supposed to have come from Cayenne.

Picus altivolans ex Guinea, Ger. Orn. ii. p. 49. t. 173.

GUINEAL

THIS is a doubtful species, nor from the drawing is it quite certain whether it is not a Jacamar: the bil is longer than usually seen in Woodpeckers, colour of it black: crown and chin-blueish green:

Descriptions

body.

body duil red, inclining to brown on the back: fides of the neck mixed with yellow: wings and tail dull blue; quills brown: legs pale.

PLACE.

This was faid to inhabit Guinea, met with only among the drawings of M. Gerini.

MAHRATTA W.

DESCRIPTION.

THIS is rather larger than the least spotted species: the head yellow brown, on each side the nape white: the body on the upper parts is black, with large spots of white: rump white: the chin and all the under parts pale brown, with darker streaks down the middle of each feather: middle of the belly red: quills and tail black, spotted with white, three spots on each tail feather on the outer margin.

PLACE.

Inhabits the *Mabratta* country in *India*; described from a specimen in the *British Museum*.

## GENUS XXIV. KINGSFISHER.

Nº 1. Great brown K.

- 2. Coromandel K.
- 3. Little Indian K.

Alcedo gigantea, Ind. Orn. i. p. 245. 1.

Great brown Kingsfisher, Gen. Syn. ii. p. 609. 1.—Phill. Voy. pl. in p. 287.—
White's Journal, pl. in p. 137.

GREAT BROWN. K.

THIS inhabits New Holland, where it is called Googo-ne-gang; is not numerous, and never feen but fingly; feeds on infects, worms, and fometimes feeds. The note like a laugh: the flight is flow and fhort: fometimes varies in having a little white in the middle of the wing.

Description.

Alcedo Coromanda, Ind. Orn. i. p. 252. 19. Coromandel Kingsfisher, Ind. Zool. (4to.) p. 73. 9. COROMANDEL K.

SIZE of a Blackbird: bill and irides reddish: the head, hind part of the neck, back, wings, and tail, are of a reddish lilac colour, glossed with violet: the quills are much the same outwardly, but of a yellowish rusous colour within: on the rump is a perpendicular streak of blueish white: throat white: the rest of the under parts light rusous: legs reddish.

Description.

Inhabits the coast of Coromandel.

К.

Alcedo Bengalenfis, Ind. Orn. i. p. 254. 25. Little Indian Kingsfisher, Gen. Syn. ii. p. 631, 21.

DESCRIPTION.

N Vojmaer's Monogr. 1768, t. iv. are two Kingsfishers, which feem to belong to this or the blue-headed species, both are rusous yellow, more or lefs, but one of them has a blue back: fize of our European species.

Among the drawings of my late friend Frederick Pigou, esquire, I observed a bird of this fort called Taaou-yu-tchin, signifying a catcher of fish: this is greenish grey, has a white patch under the ear: the under parts of the body dull red; fecond quills blue; tail dufky: bill red brown: legs lead colour.

Inhabits China.

#### GENUS XXV. NUTHATCH.

Nº 1. Carolina N.

2. Least N.

3. Orange-winged N.

Sitta Carolinensis, Ind. Orn. i. p. 262. 3. Grey black-capped Nuthatch, Bartr. Trav. p. 287.

CAROLINA
N.
Description.

N a manuscript of the late Mr. Hutchins, relating to the birds and quadrupeds of Hudson's Bay, I find one described, which seems to be clearly this: the length is five inches; weight two drains troy; breadth seven inches and an half: bill black; head, throat, and breast glossy black: belly mottled with black, orange, and white: back dun black, with saint orange streaks: near the junction of the wings, are long feathers of a bright orange, not unlike a shoulder-knot, which pass down on the sides and end on the thighs, where they are pale: lesser wing coverts black; the greater are brown, tinged with red: quills brown; vent white: the two middle tail seathers are brown, the two next with an orange spot on the outer web; the other six are orange tipped with brown: legs black.

Inhabits Hudson's Bay.

PLACE.

Sitta Pufilla, Ind. Orn. i. p. 263. 5. Least Nuthatch, Gen. Syn. ii. p. 651. C .- Id. Sup. p. 118.

LEAST N.

FROM the same source as the last, I derive the following account of a small Nuthatch, weighing five penny-weights, five inches long, and seven broad: the bill short, black, triangular, with sine hairs:

Supp. II.

U

irides

Description.

#### NUTHATCH.

irides dark blue: head brown, inclining to ash colour: throat dusky white: back and scapulars greenish brown; on each side of the breast a broad spot of yellow: belly and vent dusky white: thighs tinged with yellow: lesser wing coverts dull green, the greater inclining to black: quills black, the outer margin greenish, inner web paler: the four middle tail feathers black; the others pale yellow, with the ends for nearly one-third tipped with black: legs black.

PLACE.

This bird inhabits *Hudson's Bay*, where it is known by the name of *Keebe min nuc ca ha mauka shifh*; it builds its nest in the willows, lays four eggs, and hatches the end of June: it is migratory, and derives its name from being remarkably voracious of berries, which it carries to such excess, as to be always attacking other small birds who are feeding near it.

ORANGE-WINGED N. Description.

SIZE of the Surinam Nuthatch: general colour of the plumage on the upper parts dull ash colour, the under blueish white; rump and upper tail coverts of this last colour: quills and tail brown: the base of the quills, for two-thirds of the length, are orange colour; all but the two middle tail feathers tipped with dusky white: bill brown: irides reddish: legs lead colour.

PLACE.

Inhabits New Holland. Mr. Lambert.

Orange-Winged Nuthatch D. Published as the see the Starten.

## GENUS XXVI: T O D Y.

No r. Yellow-bellied T.

2. Red-breasted T.

Todus flavigaster, Ind. Orn. i. p. 268. 15.

YELLOW-BELLIED T.

DESCRIPTION.

SIZE of the Brown Tody: length fix inches: bill short, broad, and pale coloured, with a few bristles at the base: the head, chin, and all the upper parts of the plumage ash colour, or brownish; the wings deepest, but the middle of them paler: tail even at the end; the wings when closed reach to about the middle of it: all the under parts, except the chin, are yellow: legs dusky.

Inhabits New Holland.

PLACE.

RED-BREASTED T.

SIZE of the Yellow Hammer: the bill is ftout and broad, furnished with some bristles at the base: the tongue bisid, the points on each side of the cleft are a little divided or feathered: the crown is rather sull of feathers: the general colour of the plumage on the upper parts is a slate-coloured grey: wings and tail brown: throat and breast orange, from thence to the breast nearly white: legs slender and dusky.

Inhabits New South Wales, where it is not plentiful, at least not above two or three have been seen of the kind.

EUROPEAN B. E. Merops apiaster, Ind. Orn. i. p. 169. 1.—Vosm. Monog. 1768. p. 6.—Ger. Orn. v. t. 494.—Schrift. d. Berl. Gesellsch. iii. S. 194. (Schrank.)
Bee-eater, Gen. Syn. ii. p. 667. 5.—Id. Sup. p. 119.

DESCRIPTION.

THE male has the forehead to the middle of the crown green; the rest of the head, back of the neck, upper part of the back, wing coverts, fine rusous; lower part of the back yellowish: shoulders and lesser wing coverts green: quills and tail green.

In the *female*, only the forehead is yellow green; crown rufous: the rest of the upper parts brownish green; in other things, both are alike, except the two middle tail feathers, which exceed the rest more in the male than the female.

PLACE.

The Bee-eater is common in Egypt\*, where it is called Melino-orghi, (Bees Enemy) and is eaten for food.

MANNERS.

At the Cape of Good Hope, this bird is called the Gnat-fnapper, as observed by Kolben †, who adds, that the note is not so fine as that of

+ Hist. Cape, ii. p. 154.

<sup>\*</sup> Sonzini's Trav. iii. p. 318.

a Titmouse, and that it is a guide to the Hottentots, by directing them to the honey, which the bees lay up in the clefts of the rocks.

The Bee-eater has been observed at Mattishal, in Norfolk, in a flock, about twenty in number; and one of them shot by the reverend George Smith, which was exhibited to the Linnaan Society. This flock paffed near the above place in June, and again, on their return in October following, 1793, but in reduced numbers.

> Merops erythropterus, Ind. Orn. i. p. 274. 15. Red-winged Bee-eater, Gen. Syn. ii. p. 681. 14. pl. 31.

RED-WINGED DESCRIPTION.

HAD an opportunity of examining feveral of these which were in the possession of J. Walcot, esquire; one of which he added to my collection. The general length fix inches and a quarter: the tail a trifle forked; the two middle feathers of the fame colour as the back; 'all the others reddiff orange, with dufky ends; the outer feathers, as well of the tail as of the wings, greenish brown outwardly: the fecond quills and wing coverts also the colour of the back: through the eye, and passing under it, is a black streak; chin and throat yellow; beneath these a triangular spot of black; from thence to the vent rufous bay: legs weak and brown.

Merops fasciculatus, Ind. Orn. i. p. 275. 19. 7. Yellow tufted Bee-eater, Gen. Syn. ii. p. 683. 18. Var. - Dixon's Voy. p. 357.

pl. 19.

DESCRIPTION.

I N this variety, the plumage did not differ from the general colour; but the ends of all the tail feathers were white.

> VAR. B. DESCRIPTION ..

AMONG these birds, I have remarked another variety, which differed in having the tail feathers wholly black, and the fides under the wings rufous.

150

WATTLED B. E. Merops carunculatus, Ind. Orn. i. p. 276. 20. New Holland Bee-eater, Phill. Bot. Bay, t. p. 164. Wattled Bee-eater, White's Journ. t. p. 144. male.—Id. p. 240. female.

DESCRIPTION.

THIS species is from sourteen to sisteen inches in length: in the male, the bill is black; nostrils pervious, but covered in part with a membrane; crown dusky: at the gape of the mouth a silvery band: behind the base of the under jaw, an elongated caruncle, of an orange colour, hanging down as in the Cock: the body is brown on the upper parts, the shafts of the seathers whitish: quills and tail dusky; the last cuneiform in shape; the outer quills are white at the tips: the tail seathers are all of them more or less tipped with white: legs brownish; the outer toe connected to the middle at the base.

The female is faid to be flouter of the two, more brilliant in plumage, and the bill more curved: the tail shorter: it is destitute of a wattle; but the feathers on the chin are dark, long, and hang diffusely.

At General *Davies*'s is one of this species, which differs; it is smaller, twelve inches long; the whole bird appears brighter, and more streaked with white down the shaft, swelling out into a spot at the tip of each feather: no silvery band at the gape. It appears to be a young bird. In a full grown *male*, in the same collection, the middle of the belly is yellow.

These birds probably differ greatly among each other, for in Mr. Lambert's collection of drawings, I remarked one which had the top of the head and hind part of the neck black or dusky, the rest pale brown or dusky ash colour, each feather margined with whitish, and a few dashes of white on the back of the neck and back; top of the head, taking in the eyes, black: the under parts of the body are paler than the upper, with a few obscure markings: the bill is black: legs

pale

pale ferruginous: a red caruncle on each fide of the chin, as in the former.

The above inhabit New Holland, especially the sea shores, and are pretty numerous: they chatter much, and are bold to a great degree, for when other birds, even larger and stronger than themselves, approach, they drive them away. Their chief food is insects, but they likewise are very fond of sucking the honey from the different kinds of Banksia. They are known to the natives by the name of Googwar-neck, which word much resembles the kind of note they are incessantly chattering.

PLACE.

Merops corniculatus, Ind. Orn. i. p. 276. 21. Knob-fronted Bee-eater, White's Journ. pl. p. 190. KNOB-FRONTED B. E.

SIZE of a Missel Thrush: length sourteen inches: bill one inch and a half long, rather bent downwards; colour pale brown, with a dusky tip; nostrils oval, placed in an hollow, and the seathers come forwards to near the middle of the bill to meet them: the tongue bristly at the end: on the forehead is a blunt short eminence, like the rudiment of an horn: the colour of the plumage on the head is whitish, streaked with brown, and the seathers are short: sides round the eye brown: upper parts of the body brown, with olive brown margins: quills and tail darker than the rest; the first quill only half the length of the second: the under parts of the body are pale: the chin, breast, and belly dusky white: tail even at the end, and about six inches long, the shafts and tips of the seathers whitish: the wings when closed reach half way on the tail: legs brown; the segments near the toes rough and scaly; outer and middle toe joined at the base; hind claw very long and stout.

Description.

Inhabits New Holland, and is a fingular species. That figured in White's Journal is an exact representation. This was first brought into England by Sir Joseph Banks.

6. SUPERB B. E.

Superb Bee-eater, Nat. Misc. pl. 78.

DESCRIPTION.

THIS is nearly nine inches in length: the bill black: general colour of the plumage red: the forehead, all round the eye, and throat blue: rump blue: the two middle tail feathers are longer than the rest, and the parts which exceed the others are black.

This is in the British Museum. Dr. Shaw feems to think it allied to the Brasilian Bee-eater, in which opinion I readily join him.

EASTERN B. E.

DESCRIPTION.

SIZE of the Red-winged Bee-eater: the general colour dull green: the feathers rather full: quills red but not bright; the outer edges of them dull green, with black tips: tail green; the two middle feathers produced beyond the others, where they are narrow and black, as far as they exceed them.

PLACE.

This species is in the British Museum, said to come from the Mahratta country in India.

8.
BLUE GREEN
B. E.
Description.

ENGTH eight inches: colour of the whole plumage blue green, with a deeper gloss, appearing black in some lights: legs black.

The native place of this is uncertain.

9.
HOODED
B. E.
Description

ENGTH from nine to ten inches: bill yellow, curved, and rather flout; tongue twice the length of it, and fringed at the tip: front of the head whitish; across the crown of the head black, which colour passes through the eyes on each side to the throat; the rest of the head whitish grey and dusky, in fine transverse lines: belly dirty white, crossed with clouded dusky lines: upper parts of

the

the body pale lead coloured brown: lower belly and vent white: the fix outer quills brownish; the first very short; the others incline to brown; but fix or seven of the middle ones are of a greenish yellow in the middle, on the outer webs, and the tips greenish yellow: tail rounded, of a pale greenish lead colour, with a dirty white tip: legs yellow brown.

Inhabits New Holland. In the collection of General Davies.

PLACE.

GOLDEN-WINGED B.E.

DESCRIPTION.

ENGTH uncertain, supposed about twelve inches: general colour brown: the shafts of the seathers very pale: greater quills darker than the others, sour or five of the outer ones have the middle part for two-thirds of a golden orange; the ends white: tail greatly cuneiform, brown, consisting of twelve seathers, all but the two middle ones tipped with white: bill and legs black: tongue bristly at the end.

Inhabits New South Wales; feeds chiefly on flies and other infects, as well as by fucking honey from the various kinds of Banksia, &c. The natives name it Goo-gwar-ruck.

PLACE.

BLACK-EARED B. E.

DESCRIPTION.

THIS species is about seven inches long: the bill of a moderate size, and the legs brown: the plumage on the upper parts of the body is pale rusous brown; beneath dusky white, spotted on the lower belly, vent, and thighs with black: behind the eye is a broad streak of black ending in a point: quills black: tail dusky.

Inhabits New Holland.

154

BLACK and YELLOW B. E.

DESCRIPTION.

SIZE of the Song Thrush: general colour of the plumage black, but the feathers of the breast, back, and belly, are margined with golden yellow: the wing coverts are not far different, but the greater ones have the ends more or less of that colour, as are the outer margins of the quills, though the ends of them are for the most part tipped obliquely with black: the bill is black: legs pale brown; though in some the bill and legs are both of a dusky colour: from the bill a greenish streak runs through the eye, which is broader in the middle, and in some specimens descends on the lower jaw; the feathers which compose this streak are shorter than the others, and somewhat rigid: the tail is cuneiform; the two middle seathers black, fringed at the ends with yellow; the others yellow: vent plain yellow.

PLACE.

Inhabits New Holland. From the drawings of Mr. Lambert.

BLUE CHEEKED B. E.

DESCRIPTION.

ENGTH fixteen inches: bill black; tongue briftly at the end: the upper part of the body, wings, and tail are brown: the top of the head, taking in the eyes, nape, and back part of the neck, black; throat and fore part of the neck the fame; the fides of the neck between these, from the gape, and all the under parts, white: the eye surrounded with a blue patch, lengthening behind to the ears: bill black: tail even at the end: legs scaly, blue.

FLACE.

Inhabits New Holland.

CHATTERING B.E. Description.

SIZE of a Thrush: length ten inches: bill yellow; tongue bristly at the end, and longer than the bill: the upper parts of the body pale

Pl.CXXVIII.

pale brown: forehead dufky: neck and under parts white, a little mottled with dufky, most so on the throat and breast: thighs barred dufky and white: across the crown of the head black, passing on each side behind the eye, and bending down on each side below the ears; within this, behind and close to the eye, a round spot of yellow: the wings are black, but the greater part of the prime quills are yellow, with-dusky or black ends: the tail is long and cuneiform, the feathers dusky, tipped with white: legs strong and yellow.

This bird inhabits New South Wales, and is faid to be a noify chattering species, infomuch as to give the alarm in the manner of the Jay, so as to prevent the sportsman getting a shot at the Pattegorang.

PLACE.

COWLED B. E. Description.

HIS is a large species: the bill stout and bending, colour black; tongue very bristly at the end, appearing like a brosh: the head and part of the neck are black, and covered with a fort of down: the nape at the back part is elongated with a kind of bristly tust: the hind parts of the neck and back are brown, the first mottled with a paler colour; the under parts white, marked on the chin and throat with dusky sagittal streaks: quills and tail dark brown: legs dusky blue.

PLACE.

This is found about *Port Jackson*, in *New Holland*, in *January*. The hind head projecting, and being of a black downy texture, giving the resemblance of a cowl or hood, has occasioned it to be called a *Friar*. The natives call it *Wergan*.

VARIEGATED B. E. Description.

THIS is somewhat bigger than the Red-winged Bee eater: the bill black: legs dusky: top of the head and nape dull orange, the middle of the feathers darker; through the eye from the base of the bill a broad black streak, continuing a good way beyond it, and X 2 ending

ending in a point; beneath this a streak of pale blue: chin orange yellow: on the throat a triangular patch of black; from thence to the belly, the parts are yellow, but the belly itself, the thighs, and vent are blueish white: the back part of the neck and wing coverts are green: back mixed green and brownish orange; lower part of it and rump blue: the middle part of the wing has some series of seathers green, with sulvous margins, and others wholly sulvous: quills green outwardly and black within; the second quills edged with yellow: the two middle tail seathers prolonged to double the length of the others, as in several of the genus, the additional part being very narrow, and surnished with very slender webs, the colour of them blue; the other feathers of the tail chesnut.

This is faid to be the male bird; I met with it in the collection of General Davies. In Mr. Lambert's collection of drawings, I observed one of these which I suspect to be the other sex. In this the forehead to the middle of the crown is blue, the nape only being dust orange, which last colour also occupies the chin: the black through the eye, the blue beneath, and patch on the throat, the same as in the other; the back brownish green: rump blue: the two middle tail seathers as in the other: the rest black: the wing coverts like the back; the rest of the wing varied not unlike the other, but less brilliant.

PLACE.

Inhabits New South Wales, where it is known by the name of Dee-weed-gang.

WHITE
FRONTED
B. E.
DESCRIPTION.

HE male is about eight inches in length: bill brown; tongue longer than the bill: the back and wings are of a fine rufous, but the forehead and all the under parts are white; the feathers of the latter marked down the shafts with a black-line, as are also the rufous feathers above: between the bill and eyes, sides of the head,

the

the crown and nape, wholly black: fides of the body under the wings marked with five dark blueish bands: quills and tail pale blue, marked outwardly on the edges with white spots, within darker; the tail even at the end, or a trifle rounded, the wings reaching thereon to about the middle: legs yellow brown.

The female, or one supposed to be so, was brown on the back and wings, and dirty yellowish white beneath, with dashes down the shafts, as in the male: the forehead is brown and white spotted; the rest of the head brown, where in the male it is black: the tail seems shorter than in the male, and appears in the drawing to be wholly spotted with dirty yellow and brown, or rather dirty yellow, with the brown spots in bars: bill and legs as in the male.

I am obliged to General *Davies* for the above descriptions, having made drawings of them from specimens in the possession of Captain King, which were brought from *Port Jackson*, in *New South Wales*.

Red-throated Bee-eater, Nat. Misc. 9. pl. 337.

SIZE a trifle less than the common species: general colour on the upper parts black: the forehead fine blue, passing a little way over the eye; behind the eye a patch of the same: the fore part of the throat and neck of a fiery red: rump blue, marked with spots of black: belly clouded blue and black: some of the quills and tail feathers have blue edges; the base of the greater quills ferruginous, forming a patch of that colour on the wings; the wings when closed reach but little beyond the base of the tail, which is even at the end, or nearly so.

Inhabits Sierra Leona in Africa.

SIZE very fmall: colour brownish: the neck and quills inclining to hoary,

Di.

Inhabits New Caledonia. From the MS. of Mr. Anderson.

RED-SPOTTED CR. Vak.

Certhia cruentata, Ind. Orn. i. p. 296. 51. Red-spotted Creeper, Gen. Syn. ii. p. 736. 40. Var.

AMONG some fine drawings in the collection of Mr. Lambert, I observe one nearly the same with this, but instead of being white beneath, it is pale blue; also another not far different; in this the under parts are white, but the eye is placed in a patch of black.

Both these inhabit New Holland.

PLACE.

PEREGRINE CR. Description.

Certhia peregrina, Ind. Orn. i. p. 297. 54.

SIZE small: general colour of the plumage olive: wings and tail dusky, across the wings two pale bars: the under parts are yellow as far as the belly: tail a trifle forked; the inner webs of the two outer feathers white.

The female like the male, but paler. In the collection of Mr. Parkinson.

GARTERED CR.

Certhia armillata, Ind. Orn. i. p. 298. 55.—Mus. Carls. fasc. ii. t. 36.

CR. Description.

TENGTH five inches: bill black: the upper parts of the plumage emerald green, the under greenish white: vent yellowish: wings black: shoulders glossy blue or sapphire colour; beneath the wings yellow, with the outer margins and tips black: quills black, the inner margins yellow: legs yellowish: the rump speckled with sapphire colour, and the lower part of the thighs surrounded with the same at the joints.

PLACE.

Inhabits Surinam: is apt to vary in having here and there a feather more or less inclined to blue, and in some specimens a band of black passes from the bill through the eye, and adjoining to it a line of yellow.

CUPREOUS CR. Certhia ænea, Ind. Orn. i. p. 300. 68.—Mus. Carls. fasc. iv. t. 78.

THE bill in this species is rather stout and black: head, neck, shoulders, belly, thighs, and vent green, glossed with gold and copper: breast and back marked with a series of gilded blueish spots: wings dusky soot colour: tail black, tinged with glossy blue: legs black.

PLACE.

Inhabits the West Indies.

Certhia gularis, Ind. Orn. i. p. 300. 69. - Mus. Carls. fasc. iv. t. 79.

BLUETHROATED
CR.
Description.

BILL black: throat, fore part of the neck and breaft gloffy blue; lower part of the breaft, belly, vent, sides, and thighs yellow: from the gape a yellow streak passes beneath the eye on each side of the neck, dividing it into two parts; the upper, with the top of the head, nape, and back, are cinereous brown, as also the wings and the rump: under wing coverts pale yellow: quills soot colour: tail black; the two outer quills marked with white at the tip and outer edges as far as the middle, and those adjoining have the tips whitish.

Inhabits Martinico.

PLACE.

Certhia trochilea, Ind. Orn. i. p. 300. 70.—Mus. Carls. sasc. iv. t. 80.

TIG.
WREN
CR.
DESCRIPTION.

SIZE of the Willow Wren: bill brown, beneath yellowish; plumage above brown and greenish olive mixed, beneath yellowish dusky white: under wing coverts very pale yellow: first quills ferruginous, the others very dark, with the outer edges only inclining to ferruginous: tail black: legs pale.

Inhabits America, but what part uncertain.

PLACE.

Certhia prasinoptera, Ind. Orn. i. p. 300. 7 .- Mus. Carls. fasc. iv. tab. 81.

GREEN-WINGED CR.

BILL and legs black: top of the head, nape, back, lower part of the breaft, and fides black: throat, fore part of the neck, and upper part of the breaft purple, wings wholly of a gloffy changeable green: tail greenish brown.

DESCRIPTION.

Inhabits Surinam.

PLACE.

164

CRIMSON-BELLIED CR.

CR. Description.

ENGTH five inches and a half: bill black: head, neck, and breaft of a most brilliant amethystine purple, mixed on the breast with vermilion red, forming a kind of bar thereon: belly black: vent and under tail coverts glossy purplish blue: the upper part of the neck, lesser wing coverts, back, rump, and upper tail coverts most brilliant green gold; the rest of the wings and tail greenish black; two or three of the outer feathers fringed on the outer margins with green gold: on each side of the breast, under the wing, a tust of sine yellow: wings black.

PLACE.

Inhabits Africa. It feems to approach very near to the Certhia Polita of the Carlfonian Museum.

LEONA CR. Description.

Leona Creeper, Nat. Misc. x. pl. 369?

ENGTH four inches: bill and legs black: head, hind part of the neck and back green gold: chin, throat, and breaft purplish black: the belly and vent pale brimstone or yellow: quills dusky: tail glossy blackish steel colour: under the wings a tust of yellow feathers as in the last, but paler.

Brought from Africa with the last, and communicated by Thomas Wilson, esquire, who obligingly furnished me with specimens of both; this is about one third smaller than the former, and has many things in common with it, but whether it differs therefrom in sex or age only, wants further investigation.

MAHRATTA CR.

ENGTH four inches: bill and legs black: general colour of the body violet purple: wings dufky brown: tail dufky black, but the two middle feathers are entirely, and the outer edges of all

Stender-billed Creeper.

Rublished as the Act directs May 30. 1801. by Leigh & Setheby & Son Nork Street. Covent Garden.

the others are violet: on each fide of the breast under the wing is a tust of yellow feathers, as in some others of this genus.

Inhabits the Mabratta country in India, and is in the British Mufeum; it seems allied to the Asiatic Creeper, Ind. Orn. N° 22. PLACE. .

BLACK-EYED CR.
Description.

HIS is more than feven inches in length: the bill one inch long, curved half way from the point, and black: legs brown: the tongue longer than the bill, and fringed at the point: the plumage on the upper parts is mottled brown: the forehead, lore, and all the under parts are white; before the eye, between that and the bill, begins a black band, which passes through the eye, growing broader, after which it narrows to a point, and ends on each side of the breast.

Inhabits New South Wales: faid to be fond of honey, and also to feed on flies: in a fecond of these birds, the forehead differs in not being white, but the lore is black, passing under and a little way beyond the eye.

PLACE.

SLENDER-BILLED CR.

DESCRIPTION.

LENGTH rather more than fix inches: bill one inch and a quarter long, very slender, and moderately curved; tongue longer than the bill, and fringed at the end: the crown of the head is black, taking in the eyes on each side, and passing in a broad band quite to the breast: the back, wing coverts, and rump are pale slaty grey: quills and tail black, the last somewhat cuneiform: the chin is very pale rusous, and from that to the breast white; the rusous colour surrounded with a crescent of black, with the horns pointing upwards.

Inhabits New South Wales, and is a beautiful species.

Prier.

DIRIGANG CR. Description.

N fize this species somewhat exceeds our Common Creeper: plumage above pale olive or greenish brown; beneath white, inclining to dusky on the belly: on the forehead and crown are a few short, transverse, black lines: under the eye a patch of yellow, and behind it another of a reddish colour: at the bend of the wing a few pale spots: bill and legs dusky.

PLACE.

Inhabits New South Wales, where it is called a Woodpecker, from hence we may suppose it to frequent and run up and down trees in the manner of that bird. The native name is Dirigang.

CHIRPING CR. Description.

SIZE of the Nightingale: general colour pale green, inclining to brown on the back, and to pale yellow beneath: quills and tail dusky: thighs dusky, barred with white: bill slender, black: tongue bristly at the end: legs brown: irides blue.

PLACE.

Inhabits New Holland; and has a chirping kind of note.

MELLIVOROUS CR.

DESCRIPTION.

SIZE of the Missel Thrush: the bill moderately curved and black: tongue briftly at the tip: general colour of the plumage black, marked on most of the seathers with slender crescents of white, and with short streaks of the same: the axillary coverts have pale edges, and the margins of some of the quills the same: several of the greater wing coverts are longitudinally marked with rusous: on the rump a sew white markings: the ends of the tail very pale, nearly white.

PLACE.

Inhabits New South Wales, and is called Goo-gwar ruck; is a numerous species, seldom seen but near the sea shore, especially about where the natives resort; is a lively bird, constantly in action, in suck-

ing

Sunguineous Creefier

ing honey, taking flies, or contending with other birds; two or three of these will often rout a flock of *Blue-bellied Parrots*, with which genus they are often engaged. For the above information I am indebted to Mr. *Lambert*.

BLACK-HEADED CR. Description.

ENGTH fix inches: bill dusky; tongue bristly: top of the head, and from the base of the upper mandible, black, passing through the eye, and below it some way on each cheek: hind part of the neck, back, wings, and tail pale green, but the wings and tail are brown, with pale edges: chin, sides of the neck, and sore part of it, as well as the under parts of the body, dusky white: legs pale brown.

Inhabits New South Wales.

PLACE.

SANGUINEOUS CR. DESCRIPTION,

SIZE of the White Throat: all the upper parts of the bird crimson, marked here and there, except on the hind head, with a few irregular large black spots: chin and throat white: breast and belly dirty pale brown: quills black, edged with white: bill and legs black: tongue bristly at the end.

Inhabits New South Wales.

PLACE.

28.
COCHINEAL
CR.
DESCRIPTION.

SIZE of the Red-spotted Creeper: general colour crimson, but the under parts from the breast are white; on the red of the breast six black spots: a large spot of black occupies the beginning of the back, a second below it, besides some other smaller ones of the same on the rump: through and round the eye a black streak of an oval shape and pointed: wings and tail black; the last very short: bill and legs black: tongue bristly.

Inhabits

- PLACE.

Inhabits New South Wales; feen only in the spring, and is a rare species.

HOARY CR. Description.

LENGTH eight inches: body flate coloured above, white beneath, inclining to rose coloured purple on the breast: quills and tail dusky: bill stout and black; tongue bristly: on the wing coverts a few markings of white: legs brown.

PLACE.

Inhabits New South Wales.

yELLOW-WINGED CR. Description.

LENGTH feven inches: bill black; tongue briftly: head, neck, and back pale flate colour, inclining to yellow on the rump; beneath whitifh, with a few narrow lines on the breaft: on the ears a yellow fpot, below it a patch of black: quills dufky, the greater ones from the base to two-thirds of the length yellow: the two middle tail feathers dufky, the others of a pale yellowish colour.

PLACE.

Inhabits New South Wales; with this is another, perhaps differing in fex: the plumage is pale cinereous grey above, and pale yellowish white beneath: vent spotted with ferruginous: quills as in the last, but pale ferruginous instead of yellow: both of these continually observed in the action of catching slies.

AGILE CR. Description.

LENGTH fix inches: bill black; tongue briftly: top of the head, nape, and hind part of the neck black; the rest of the upper parts of the body, wings, and tail brown: under parts white: the white and black join each other on the sides of the neck irregularly: legs blue black.

PLACE.

Inhabits New South Wales; is an active species, feeds on honey and slies, in the manner of several others of this genus.

CŒRULEAN CR. Description.

SIZE of the White Throat: bill a trifle curved, but stender as in the Warbler genus, colour dusky: the plumage on the upper parts is pale brown; beneath pale stesh colour: fore parts of the neck pale blue grey: quills and tail dusky: legs dusky.

Inhabits New South Wales.

PLACE.

YELLOW-EARED CR.

DESCRIPTION.

SIZE of a *Hedge Sparrow*: length fix inches: bill and legs black: tongue briftly: irides dirty pale red: the plumage on the upper parts of the body pale dirty brown; beneath white: below the ear an oval spot of a fine yellow colour, and above it a smaller one of black.

Inhabits New South Wales.

PLACE.

SIZE uncertain: bill and legs black: tongue briftly: the plumage on the upper part of the body is pale brown; beneath dufky white: rump crimfon: on the fide of each jaw three or four dashes of crimfon: outer part of the quills and tail dufky; some of the outer feathers of the last pale or nearly white at the end.

Inhabits New South Wales; faid to be very rare.

CR.
Description.

PLACE.

BLACK-FRONTED CR.

THE body in this species is green on the upper parts, and yellow beneath: the forehead and cheeks black: tail cuneiform. In the Leverian Museum; from whence unknown.

\* WITH CURVED BILLS.

EKEBERG'S H B. Description.

Trochilus capenfis, Ind. Orn. i. p. 303. 6.—Lin. Mantiss. 1771. p. 525.

SIZE of a Swallow: general colour green gold: quills black; the wing coverts nearest to them margined with glossy blue: tail feathers even at the end, except the two middle ones, which are three times the length of the others; colour of them all black, margined at the base with glossy green: vent black, marked with shining blue spots.

PLACE.

This is faid to inhabit the Cape of Good Hope, for which we have the authority of M. Ekeberg; it has however never fallen to our lot to meet with any one of the genus which came from that place.

CHILI H. B. Description. Trochilus galeritus, Ind. Orn. i. p. 304. 10.—Molin. Chil. (Fr. ed.) p. 127. 2.

THIS species is rather less than a Wren: the bill is somewhat bent: the general colour of the plumage green gold: head crested; the crest radiated with purple and gold: the under parts of the body are fire colour: quills and tail brown, varied with gold.

PLACE.

Inhabits Chili.

Trochilus Mango, Ind. Ond. i. p. 307. 20. Mango Humming Bird, Gen. Syn. ii. p. 758. 18.—Id. Sup. p. 135. B.

MANGO H. B.

ME have before related a circumstance of the possibility of keeping Humming Birds alive for some time, by means of sugar and water \*; but this was in their own country and climate. In addition to this, we have been informed, on undoubted veracity, of the following fact: a young gentleman, a few days before he fet fail from Jamaica to England, was fortunate enough to meet with a female Humming Bird, fitting on the neft and eggs, when cutting off the twig, he brought all together on board the ship; the semale became sufficiently tame, fo as to fuffer itself to be fed with honey, and during the passage hatched two young ones; however, the mother did not furvive long, but the young were brought to England, and continued alive for some time in the possession of Lady Hamond. Sir H. Englefield, Baronet, and Colonel Sloane, both witnesses of the cirumstance, informed me that these little creatures readily took honey from the lips of Lady Hamond, with their bills: one of them did not live long, but the other furvived at least two months from the time of its arrival. I am not positively certain that it is the species I have here arranged it under; but I am inclined to think fo, from the above gentlemen comparing it with the figure of the bird pointed out to them, and especially as it is the most common species found in that island.

> GILT CRESTED H.B. Description.

THIS is a finall species, being only two inches and an half in length: the general colour green: the top of the head surnished with a glossy gilded green crest: quills and tail black.

\* Gen. Syn. ii. p. 771. Note §. Burnab. Trav. p. 17. Note \*.

 $Z_2$ 

The

### HUMMING BIRD.

The female is greenish brown above, and whitish beneath, with dusky spots on the breast.

The nest is chiefly composed of pappose down, as in the major part of this genus. I am indebted to Colonel Woodford for this description.

ORANGE-FACED H. E. Description.

THIS is about three inches and a quarter long: the bill black, three quarters of an inch in length, nearly strait, being only a trifle bent just at the tip, the colour of it white: the head seathers a little elongated at the hind part: the general colour of the plumage is dusky, inclining here and there to blue: belly wholly dusky: between the bill and eye an orange spot; chin orange, and the outer margins of the wing of the same colour the whole of its length: tail blue above, orange beneath: legs black.

From the drawings of Colonel Woodford; from whence it was brought uncertain.

#### . WITH STRAIT BILLS.

6.
BLUE-HEADED
H. B.
Description.

Trochilus cyanocephalus, Ind. Orn. i. p. 319. 63.—Molin. Chili, (Fr. edit.) p. 227.

THIS is faid to be the fize of a walnut, but the tail is three times the length of the body: the bill is strait, pointed, and of a whitish colour: the head is of a gilded blue: the back glossy green: the belly yellowish red; the feathers of the wings blue varied with purple.

PLACE.

Inhabits Chili.

Trochilus maximus, Mus. Lesk. Nº 76. T. ii. Nº 2. Der großte Kolibri, Allg. U. d. Vog. i. Th. 2. S. 737.

GREAT H. B.

THE length of this species is about eight inches: the bill is sharp, and half as long again as the head: the plumage is glossy: the crown, quills, and tail blueish: hind part of the head, back, breast, rump, and wing coverts greenish gold: the throat white as snow: vent rust colour; tail pointed and blackish.

Native place uncertain.

SONG THR. Description. Turdus musicus, Ind. Orn. i. p. 327. 2.—Ger. Orn. iii. pl. 290. 291. 292. Throstle, or Song Thrush, Gen. Syn. iii. p. 18. 2.—Bolson's Brit. Birds, pl. 5. 6.

THIS bird is known in some parts of Hampshire by the name of Storm-Cock, as is also the Missel Thrush; is a more hardy bird than the Redwing, which in hard frost is observed first to suffer from it; and in defect of other food, both this and the Missel Thrush are known to live on the roots of Arum, which they break from the ground with their bills, as well as shell snails, misseltoe, and ivy berries.

In Ray's letters, page 137, a bird is mentioned by the name of Heath Throstle, taken from the Epitome of Husbandry, the author of which first noticed it. Mr. Ray supposes it to be the Ring Ouzel, as that bird is called Heath Throstle, in Craven; be this as it may, the late Mr. Lewin shewed me a pair of thrushes similar to the Song Thrush in colour, but they were darker, and the tail seemed rather shorter; these were shot near Dartsord in Kent; I remember to have made some remarks upon these birds at the time, but having missaid them, I cannot venture here to say more on the subject.

PENRITH OUZEL.

SIZE superior to the common Water Ouzel: head, wings, upper part of the body, and tail dusky: chin and throat white, at the bottom of the last a bar of dusky: breast, belly, and thighs white, with short black streaks pointing downwards, more numerous towards the lower belly and thighs: vent rusty yellow, crossed with bars of black: legs rusty yellow.

Description,

This is faid to be found about *Penrith*; given to Mr. *Pennant*, by Miss Calvin \*.

PLACE.

Turdus Plumbeus, Ind. Orn. i. p. 334. 29. Le Thili ou Chili, Molin. Chil. (Fr. ed.) p. 230. Red-legged Thrush, Gen. Syn. iii. p. 33. 29.

THE male of this species is wholly black, and has a cuneiform tail; under the wings a large spot of yellow.

RED-LEGGED THR.

The female is grey, paler on the under parts; between the bill and eye a black patch: chin white, with black markings, fometimes wholly black: tail feathers dufky, the four outer ones white at the tips: bill, eyelids, irides, and legs orange red.

Description.

\* I took the above account out of the late Mr. Pennant's notes, of a journey from Downing to Alson Moor, in which is painted a figure of the bird. Mr. Pennant thought it to be a new species.

SUPP. II.

Aa

This

178

PLACE.

This species inhabits *Chili*: makes the nest of twigs by the river sides, mixed with mud, and lays sour eggs. Its song is excellent, but the bird does not bear confinement. It is a very numerous species, occasioned perhaps by its sless being unsavoury, and therefore not sought after.

NEW
ZEALAND
THR.
DESCRIPTION

Turdus australis, Ind. Orn. i. p. 338. 43 .- Mus. Carls. fasc. iii. t. 69.

SIZE of the Song Thrush: bill and legs black: the general colour of the plumage is dusky black: breast and belly white, but the base of the seathers are black.

PLACE.

Inhabits New Zealand.

THENCA
THR.
DESCRIPTION.

Turdus Thenca, Ind. Orn. i. p. 339. 46. - Molin. Chil. (Fr. ed.) p. 231.

SIZE of the *Mocking Thrush*: bill, irides, and legs brown: general colour of the plumage cinereous, spotted with brown and white: breast and belly pale grey: quills and tail white at the ends.

PLACE.

Inhabits *Chili*: makes a cylindrical neft, a foot long, defended on the outfide with thorns, within lined with wool and feathers, with a fmall entrance on one fide; lays four white eggs spotted with brown. It possibly may hereafter prove a variety of the *Mocking Thrush*.

6. CHILI THR. Turdus curæus, Ind. Orn. i. p. 342. 53.—Molin. Chil. (Fr. ed.) p. 232. (Le Cureu.)

Quiscale du Chili, Daud. Orn. ii. p. 318.

DESCRIPTION.

SIZE of a Blackbird: bill rather angular, black, a trifle turning up at the end: plumage wholly black and gloffy: tail cuneiform and long.

This is a very common bird in *Chili*, finging well, and imitating the notes of other birds, hence often kept in cages; attacks other birds, picking out their brains; also feeds on feeds and worms: con-

gregates

π

gregates with Starlings: makes a neft of twigs and fibres, mixing it with mud, and lining it with hair; the eggs are three in number, of a blueish white: the flesh is not good eating, being black.

Turdus Zeylonus, Ind. Orn. i. p. 349. 80.— Spalowsk. Vog. tab. 5. Le Bacbakiri, Levaill. Ois. ii. p. 65. pl. 67. f. 1. 2. Ceylon Thrush, Gen. Syn. iii. 62. 73.

CEYLON THR.

M. Levaillant confirms what has been before mentioned in the Gen. Synopsis, that this species is not uncommon at the Cape of Good Hope, and that it there goes by the name of Bacbakiri, and adds, that in some of the cantons it is called Jentje-bibi, and Couit-Couit, from some of its notes imitating those words; it is also called by others Geele Canari-byter, or Yellow Canary-eater; that it is not only commonly seen at large, but frequently comes into the gardens at the Cape.

We learn that both *male* and *female* have the black crescent on the breast, but in the *female*, the crescent and the rest of the colours of the plumage are less vivid; also that the young birds of both sexes do not obtain it till of mature age, in which case we can easily suppose our *Orange-beaded Thrush* may prove to be a young bird of this rather than a distinct species.

The male and female are for the most part observed together, and make the nest among the thick bushes, and the hen lays four or five eggs, which both sexes sit upon by turns, and the young continue in society with the parents till the spring following.

Turdus bicolor, Ind. Orn. i. p. 350. 84.

Turdus bicolor, Stourne Spreo, Daud. Orn. ii. p. 311.—Levaill. Oif. pl. 88.

White-rumped Thrush, Gen. Syn. iii. p. 64. 75.—Thunb. Trav. ii. p. 48.

8. WHITE-RUMPED THR.

M. Thunberg observes, that this bird is known at the Cape of Good Hope, by the name of Spreuw, and that it very frequently accompanies the larger cattle and sheep, "mornings and evenings, A a 2 "picking

"picking the infects, which dropping from the bushes upon the animals, and biting deep into their skins, stick very fast to them, and occasion them great pain;" that it is a shy bird, and makes the nest in the sides of rivers and brooks, and digs holes in the banks: they are observed also to feed on ripe grapes, and slying in great slocks, not unfrequently do much damage to the vineyards; however, by such kind of food the slesh is rendered very delicate: these birds do not always make the nest in banks, but sometimes in old ruined buildings, or holes of decayed trees, at others rob the swallows of their nest; the eggs are sive or six in number, greenish spotted with brown.

This we are inclined to believe is the Locust-eating Thrush mentioned by Mr. Barrow\*, as the chief if not the only food, appears to be Larvæ of the migratory Locusts, following the troops of these wherever they are. He observes that the bird is gregarious, making the nest in vast numbers together, not greatly different from the Sociable Grosbeak, appearing as one large nest, big enough for a Vulture; which circumstance he observed at Sneuwberg, on a clump of low bushes: on examination, the nest was found to consist of a number of cells, each of which was a separate nest, with a tube that led into it through the side; and of such cells, each clump contained from six to twenty, and one roof of interwoven twigs covered the whole, like that made by a Magpie: most of them had young birds, generally five. The eggs are of a blueish white, with small faint reddish specks.

ETHIOPIAN THR. Turdus æthiopicus, Ind. Orn. i. p. 357. 110. Le Boubou, Levaill. Ois. ii. p. 73. pl. 68. f. 1. 2. Ethiopian Thrush, Gen. Syn. iii. p. 78. 103.

DESCRIPTION.

THE female is a trifle less than the male: the parts which are black in the last are in the former brownish, and the under parts almost intirely sulvous, except the throat, which is rusous white, and

<sup>\*</sup> Travels into South Africa, p. 256.

the bar across the wing inclined to rusous at the back part: whilst young, the *male* appears like the *female*, but the *female* wants the bar of white on the wing coverts, many of which are bordered with rusous.

In the fouthern parts of the Cape of Good Hope, this species is very numerous as far as Cassfraria. The note of the male expresses the words Bou-bou, and that of the female Cou-i. They make the nest among the thorny bushes, laying four or five eggs.

PLACE.

Turdus minutus, Ind. Orn. i. p. 363. 136. Muf. Carlf. fasc. iii. t. 68.

MINUTE THR. Description.

THIS is a small species, being less than four inches in length: the bill and legs are brown: general colour of the plumage rusty brown, beneath inclining to ash colour: chin whitish: two or three of the prime quills are dusky, the others black, but ferruginous in the middle; many of the secondaries tipped with ferruginous, and the rest wholly of that colour: the four middle tail feathers are black, the rest ferruginous.

RESTLESS THR.

DESCRIPTION.

SIZE of the Song Thrush: length eight inches, in shape somewhat slender: the bill three quarters of an inch long, and curved at the point, colour black; tongue sharp: the plumage on the upper parts of the body is black, on the under white: tail a very trisle rounded at the end: legs black.

Inhabits New Holland, faid to be a restless species.

PLACE.

BLACK-EYED THR. Description.

LENGTH eight inches: bill stout, slightly curved; tongue bristly at the tip: the crown of the head and under parts of the body are yellow: the forehead mottled with dusky: nape, wings, and tail rusty brown, the two last margined with yellow: from the gape springs a black streak growing broader, surrounding the eye,

nd

and descending on each side below it, growing more narrow; just within at the bottom part is a small spot of yellow: tail moderately long; the wings reach only to the base of it: bill and legs brownish.

PLACE.

Inhabits New South Wales.

DOUBTFUL THR.

ENGTH nine inches: bill one inch long, blueish: tongue bristly at the end: plumage blueish black, beneath white: quills and tail brown, the last rather long: legs dusky.

PLACE.

Inhabits New Holland, and is a bird of a dull uninteresting appearance.

DILUTE THR. Description.

THE bill in this species is straight and blueish: the head, neck, and rump are pale blue grey: back and wings pale brown: the under parts of the body blueish white: tail dusky pale brown: legs blueish.

PLACE.

Inhabits New Holland.

GUTTURAL THR.

DESCRIPTION.

SIZE of the Ceylon Thrush, and somewhat resembles it in figure: the head is black, reaching sorwards as far as the breast, but the chin is white, and the nape inclines to yellow: back and wings green: breast, belly, and vent yellow: bill and legs black.

PLACE.

Inhabits New Holland; not unfrequently feen at Port Jackson in the winter months.

16.
HARMONIC
THR.
Description.

ENGTH nine inches: bill and legs horn colour: plumage on the upper parts pale brown, on the under whitish, with a stender brown line down the shaft of each feather: wings and tail dusky black.

Inhabits

Inhabits New Holland: called from its note, which is harmonious, the Port Jackson Thrush, but seems different from the sollowing one, which goes by that name in White's Voyage.

PLACE.

Port Jackson Thrush, White's Voy. pl. in p. 157-

PORT JACKSON THR.

THE top of the head in this bird is blueish grey; from thence down the hind part of the neck and the back, the colour is a fine chocolate brown: the wings and tail are lead colour; the edges of the feathers pale; the tail itself pretty long, and even at the end: all the under parts from chin to vent are dusky white, except the middle of the neck just above the breast, which inclines to chocolate: the bill is of a dull yellow: legs brown.

This is faid to inhabit the neighbourhood of Port Jackson, in New South Wales.

PLACE.

PRASINE
THR.

SIZE of a Song Thrush: bill dusky, both mandibles somewhat curved: general colour of the plumage pale slaty blue, marked on the wing coverts with black; the inner part of the quills is also black: chin white: belly dirty pale yellow oker colour: below each ear a large oval patch of black: the tail is wholly black: legs dusky yellow.

Inhabits New South Wales; met with in the month of December.

PLACE.

VOLATILE)
THR.
Description.

LENGTH nine inches: shape slender: bill rather slight and black: the head, neck, upper parts of the body and tail are black; the under parts of the body white: tail long, and even at the end, and the wings when closed reach to the middle of it: legs slender, dusky.

Inhabits various parts of New Holland, and is not uncommon; observed in company with another of the Grosbeak genus, to hover frequently

PLACE.

frequently about two feet from the ground, making sudden darts at fomething, which on more minute attention was found to be a fort of worm, which this bird by a chirping note and tremulous motion of the wings, with the tail widely expanded, seemed to sascinate or entice out of its hole in the ground. The account adds, that the bird itself is in its turn frequently sascinated by a *Snake*; but this circumstance we have reason to suppose is not peculiar to this species, as we find it recorded of other birds.

BLUE-CHEEKED THR. Description.

SIZE of the Miffel Thrush: length twelve inches: plumage above pale green; beneath pure white: the eye placed in the fore part of an oval patch of blue: quills dull rust colour: tail rounded or slightly cuneiform: bill and legs slate colour.

PLACE.

Inhabits New Holland, where it is rare: has a fingular whiftling note, and is often feen pursuing smaller birds.

BROWN-CROWNED THR. Description.

HIS species is about fix inches long: bill pale blue: legs black: back and wings black; but the quills are edged with white: the chin is black, from thence to the vent white; but the sides of the body next the wings, and the crown of the head, are brown.

PLACE.

Inhabits New Holland; frequently feen about Port Jackson, in New South Wales.

LUNULATED THR. Description

SIZE of a Missel Thrush, but of a stouter make: bill black, rather bent towards the tip: legs pale, inclining to yellow: tongue short, bristly at the end: the plumage on the upper parts of the body, wings, and tail are brown; beneath from the chin to the vent white, every where marked with crescents of black: tail short.

ACE. Inhabits New South Wales.

SOOTY THR.

f Description.

SIZE of the Song Thrush: bill pale, in shape much like that of the common Thrush; tongue sharp at the tip: the general colour of the plumage is dark greenish brown: chin, and fore part of the neck pale grey; the breast marked with large dusky spots: tail even at the end: legs yellow.

Inhabits New Holland.

PIACE.

BLACK-BROWED THR. Description.

SIZE of the last: plumage in general pale olive brown, paler beneath; wings and tail darkest: the crown of the head appears remarkably flat, rising scarcely above the level of the bill; between the nostrils and eye, the parts rise into a fort of yellowish crest, margined above with black; behind the eye a roundish crimson spot, edged with black: bill and legs red.

Inhabits New South Wales, where it is known by the name of Dilbong: described from a drawing of Mr. Lambert.

PLACE.

FLY-FLY-CATCHING THR. Description.

SIZE of a Song Thrush: length ten inches: bill bent a trifle at the tip, and brown: legs brown: the head and sides of it beneath the eye, hind part of the neck and back blueish black: chin and all the under parts white: wings and tail brown.

Inhabits New South Wales, called there Bana-will will; faid to feed on flies and infetts.

PLACE.

26.
BLUE-HEADED
THR.
Description.

SIZE of the last: bill stout, blue; tip black: the top of the head even with the eyes deep blue: back, wings, and tail brown; the quills darkest, tipped with white: the under parts of the body from Supp. II.

B b

### HRUSH.

the chin yellowish white, croffed with many fine lines of black next the wings: tail rounded, the outer margins of all the feathers marked with triangular fpots of white: legs blue.

PLACE.

Inhabits New South Wales: manners and name unknown.

MAXILLARY THR. DESGRIPTION.

CIZE of the last: crown of the head black, passing between the bill and eye on each fide, and ending in a large patch below the jaw: hind part of the neck dull blue: back, wings, and tail brown, with a tinge of greenish bronze on the shoulders, mixed with black and green: all the under parts of the body pale blueish white: tail even at the end; the tips of all the feathers of it white: the bill has both mandibles slightly curved, and brown: irides orange: legs yellow.

PLACE ..

Met with at Port Jackson, in New Holland.

28. FRIVOLOUS THR. DESCRIPTION.

SIZE of the others: bill black: legs lead colour: the upper parts of the body and wings brown; beneath white, inclining to rufous on the sides of the neck and breast, and to yellow on the sides under the wings: forehead and half the crown mixed cinereous and white: quills somewhat paler, and the tail darker than the rest of the plumage; the last rather short.

PLACE.

Found with the former at Port Jackson.

29. SORDID THR.

DESCRIPTION.

THIS has a strong bill, of a pale blue colour: the plumage in general is greenish ash: wings and tail black; on the outer edge of the wing a long streak of white; the tips of all but the two middle tail feathers white; the wings long, reaching almost to the end of the tail.

PLACE.

Inhabits various parts of New Holland.

30.
SHORTWINGED
THR.
DESCRIPTION.

ENGTH about ten inches: general colour of the plumage pale brown, inclining to ash colour beneath, and a little mottled on the breast: the tail is cuneiform, and pretty long, but the wings are remarkably short, scarcely reaching to the rump: the bill and legs are dusky: at the gape and before the eyes a few black bristles: irides blueish.

Inhabits New South Wales, and is chiefly feen on the ground, or at most taking very short slights, being unable to accomplish long ones, from the shortness of the wings. PLACE.

YELLOW. BELLIED THR.

DESCRIPTION.

SIZE of a Missel Thrush: bill pale red; tongue bristly: legs pale red: head, hind part of the neck and sides of the breast dusky black: back and wing coverts greenish brown: breast and belly olive yellow: chin, fore part of the neck and vent white: quills olive brown; the lesser ones barred with black: tail olive above and pale beneath: at the back of the neck are transverse black marks, and between that and the sides of the breast a sew sagittal marks.

Inhabits New South Wales: is migratory, coming in the spring for the purpose of incubation, and departing in autumn.

PLACE.

PUNCTATED THR.
Description.

THIS species has the upper parts pale brown, spotted with black: the fore part as far as the breast slate colour, from thence reddish white: sides over the thighs and vent marked with short black streaks: over the eye a white streak: the chin is white; below this on each side is a rusous patch reaching behind the eye: quills and tail dusky: bill black: legs yellow.

Bb 2

Inhabits

PLACE.

Inhabits New South Wales. For the description of several of the above, I am indebted to my friend Mr. Lambert, and for many to real specimens from time to time brought into this kingdom, now in possession of Mr. Wilson, and others of my friends, but unfortunately in either case with little or no history of their manners annexed.

ASIATIC THR. Description.

SIZE of a Nightingale: length near fix inches: bill and legs black: the head, just including the eye, and all the upper parts of the body and wings, are black; but the greater quills are edged with yellow, and the lesser have white margins: the greater wing coverts have white ends, making when closed a bar on the wing; above this is a shorter bar of white: all the under parts are yellow: tail dusky, inclining to olive green.

In the collection of General Davies, who supposed it to come from China, as he met with it among other preserved birds from that part of the world,

#### GENUS XXXIII. CHATTERER.

Nº 1. Carolina Ch.

2. Cupreous Ch.

N° 3. Yellow Ch.
4. Crested Ch.

Ampelis Garrulus, Ind. Orn. i. p. 364. 1. B. Crown Bird or Cedar Bird, Bartr. Trav. p. 288. Chatterer of Carolina, Gen. Syn. iii. p. 93. 1. A.

CAROLINA CH.

M. Bartram observes that this bird is to be seen in little slocks or slights, in all the regions from Canada to New Orleans, on the Missisppi, but how much farther south and south-west not certain. The longest period of their appearance in Pennsylvania, is in the spring, and first of June, at the time when the early cherries are ripe; also in the autumn, when the Cedar berries are in persection; and they generally arrive in large slocks.

PLACE -

The late Mr. Tunstall informed me, that here and there one of these had not only the waxen appendages to the quills, but that three or sour of the tail seathers were tipped in the same manner: the same circumstance happens also in the one which inhabits Europe; as in a bird of this kind sent to me by Dr. Heysbam, killed in Northumber-land, one of the wings had eight appendages, the other seven, and sive of the tail seathers were tipped in a similar way; but the sex of this bird could not be ascertained.

Juniperus Americana.

CUPREOUS DESCRIPTION. Ampelis cuprea, Ind. Orn. i. p. 366. 8. Cotinga cupiea, Merrem. ic. Av. p. 5. t. 1. f. 2.

SIZE of the Red Chatterer, with a corresponding bill, and at first fight not unlike that bird: the general colour is olive; the feathers gloffed with copper and orange bronze at the tips: the crown is red; cheeks orange; the breast and belly sanguineous, glossed with green on the margins. On comparing it with the Red Chatterer, we further find that the feathers of the head and neck are smaller and stiffer than the others; those on the cheeks curled, on the ears full and long; and the wings are longer, for they reach above a quarter way on the tail, which is rounded at the end: legs brown.

PLACE.

Inhabits Surinam.

DESCRIPTION.

Ampelis lutea, Ind. Orn. i. p. 368. 13. - Mus. Carls. fasc. iii. t. 70.

I ENGTH six inches and a half: bill black; at the gape a spot of white: the body above is olive brown; beneath yellow, growing white towards the vent.; rump yellow: the two middle tail feathers are black, tipped with yellow, the others dufky yellow: the legs are black.

We are not told from whence the above came: the bill is a trifle bent, but very sharp at the tip, appearing more like that of an Oriole than a Chatterer.

Ampelis cristata, Ind. Orn. i. p. 368. 14. J. F. Miller, Ill. t. 15. C.

IN this the head is crested: the back red: the cheeks and belly white: wings and tail black.

PLACE.

Inhabits America.

Grenadier Großbeak, Var. Gen. Syn. iii. p. 120. 16. Var. .

GRENADIER GR.

I T may be observed, from viewing the different figures of this bird, that it varies greatly. In one of these said to come from Senegal, the black on the chin was wanting; the tail short and brown, and the tail coverts so long as to entirely hide the tail from view: and in another from the same place, the same circumstance of the length of tail coverts occurred; the black on the belly mixed with white, and the colour by no means of a deep red, but a siery orange.

Mr. Thunberg observes, that these are seen at the Cape of Good Hope in immense slocks, near the rivers, and make the nest among the reeds; and that the eggs are persectly green: the hen always grey; but from July to January the blood-red seathers of the male gradually appear; they are said first to devour the blossoms of the wheat, and afterwards the corn itself\*.

This species is said to be gregarious, and build their nests in large societies †.

. Thunberg's Trav. ii. p. 14.

+ Barrow's Trav. p. 243.

HUDSONIAN GR. Description. Loxia Hudsonica, Ind. Orn. i. p. 379. 28. Bouvreuil de la Baye d'Hudson, Daud. Orn. ii. p. 416.

ENGTH five inches: bill short, thick, and brown: plumage above deep brown, but the seathers mostly margined with rufous; the greater and middle wing coverts tipped with the same, producing a bar on the wing: breast and belly white, marked with long brown dashes: the middle of the belly and vent white: tail a trisle forked: legs brown.

PLACE.

Inhabits *Hudson's Bay*; known there by the name of Atic-koom-a-shish.

SOCIABLE GR. Thexia focia, Ind. Orn. i. p. 381. 35.

Tifferin republicain, Daud. Orn. ii. p. 397.

Loxia, Paterson's Cap. p. 133. t. in p. 126.—Bird and neft.

DESCRIPTION.

SIZE of a Bulfinch: length five inches and a half: bill and lore black: the general colour of the plumage rufous brown; beneath yellow: region of the ear yellowish: tail short: legs brown.

PLACE.

Inhabits the interior parts of the Cape of Good Hope, building in vast numbers, in one society, on the Mimosa Trees, uniting their several nests under one common roof; and it is said that not sewer than 800 or 1,000 form together one community; not perhaps that this circumstance happens in one year, for they are observed to add to the size of the nest from year to year, till the tree, unable to bear any surther addition of weight, necessarily salls beneath its load, when the birds are in course constrained to search a new place of abode. Mr. Paterson, on examining one of these, sound many entrances, each of which formed a regular street, with nests on both sides, at about two inches distance from each other. The material with which these birds build, is called Boshman's Grass; and the seeds of it said to be their principal food; but the wings and legs of insects have been likewise observed in the nests.

-14

M. Daudin

M. Daudin supposes the Totty Grosbeak \* to be a variety, which I must leave for further investigation.

This species not only is observed to make the group of nests on the Acacia Trees, but likewise on the Aloë Dichotoma, which grows to the stature of a tree of no inconsiderable size; for Mr. Barrow † mentions the circumstance of one which had steps cut out on its trunk, to enable a person to climb up to obtain the nest of these birds.

Philippine Grosbeak, Gen. Syn. iii. p. 129. 30.

PHILIPPINE GR.

DESCRIPTION.

IN E are inclined to think that this is the bird called Baya in India, faid to be larger than a sparrow, having a yellow brown plumage, yellowish head and feet, light coloured breast, and a conic very thick beak; and that it is the most docile of all birds, perching on its master's hand; that it builds the nest chiefly on the highest trees, especially on the Palmyra or Indian Fig Tree, preferring such as hang over the water; the nest is of grass, shaped like a bottle with a long neck, and suspended at the ends of the branches, the entrance from beneath; it is faid to usually consist of two or three chambers: supposed to feed among other things on fire flies, as the remains are found in the nest; is so docile as to fetch and carry like a dog at command; it lays many eggs refembling pearls, when boiled the white is transparent, and the flavour of them excellent; it has a lively note, but is rather what may be called chirping than finging; much the same account is given by M. Bartolomeo, in the work above quoted, who adds, that these birds chiefly frequent the cocoa-nut trees, in which also the greater part of their nests were observed.

\* Gen. Syn. Sup. p. 156. Supp. II. + Travels in South Africa, p. 393.

SUMATRAN GR. Description. Loxia hypoxantha, Ind. Orn. i. p. 384. 44.—Daudin. Orn. ii. p. 429.—Mus. Carls. iii. t. 71.

SIZE of a Yellow Hammer: the bill and legs are of a pale colour: irides rufous: the general colour of the plumage of the upper parts is yellowish green: the forehead and all the under parts yellow: wings dusky black, with yellow margins: tail black also, even at the end, and the margins of the feathers yellow.

PLACE.

Inhabits the rice fields of the island of Sumatra, from whence a specimen was brought, and continued alive for sometime in the collection of Count Carlson.

caffrarian GR.

Loxia Caffra, Ind. Orn. i. p. 393. 78 — Act. Stock. 1784. p. 289. Fringilla Caffra longicauda, Spalosusk. Vog. iii, t. 42. fem?

DESCRIPTION.

SIZE of the *Bulfinch*: bill cinereous brown: general colour of the plumage black; with a tail longer than the body, and fometimes of double the length: the quills are brown margined with white: wing coverts white: fhoulders crimfon: legs grey.

PLACE.

Inhabits the Cape of Good Hope: at certain feasons the male is grey, but the female is continually of that colour: said to build in marshy places \*. I suspect this bird to be the same as my Orange-shouldered Bunting, but as I do not find the bird any where sigured, I cannot ascertain the circumstance; perhaps the one above referred to in Spalowski may prove the female.

Mr. Thunberg, in his travels †, talks of a bird called Langstaart, which is found in the marshes and low fields about Sea Cow River; likens it to a goldfinch in its red velvet or summer drefs; but dif-

† Vol. ii. r. 64.

I

kring

<sup>\*</sup> Mr. Barrow fays the nest is curious, composed of grass, plaited into a round ball, fastened between two reeds; the entrance through a tube, the orifice of which is next the water: thought to be polygamous; for although thirty or forty nests are often in one clump of reeds, never more than two males are seen amongst them. Barrow's Trav. p. 244.

fering in that the tail was longer than the body: in winter the cock is grey, as the hen, who has not a long tail, is all the year round. Its flow flight, on account of the length of its tail, make it not only eafy to shoot, but in rainy or windy weather may almost be caught with the hands; there is little doubt but that this and the foregoing are the same.

Loxia fasciata, Ind. Orn. i. p. 395. 87.—Nat. Misc. ii. pl. 56.—Ger. Orn. iii. tab. 358. f. i. sem?
Fasciated Grosbeak, Gen. Syn. iii. p. 156. 80.—Id. Sup. p. 154.

FASCIATED GR.

HAVING an opportunity of examining both sexes of this bird, I observed that in the male, the chin and throat were of a silvery whiteness: breast and belly pale cinnamon colour; middle of the belly chesnut: quills black, with the secondaries tipped with pale cinnamon: tail black; all but the two middle seathers have a spot of white on the inner web at the tip, but on the outermost the whole of the inner tip is white.

DESCRIPTION.

The female differs in being every where paler, and in wanting the crimfon band on the throat; the under part wholly pale cinnamon colour, and the white at the tips of the tail feathers less conspicuous.

Loxia prasina, Ind. Orn. i. p. 396. 91.—Mus. Carls. fasc. iii. t. 72. 73. Bouvreuil prasin, Daudin. Orn. ii. p. 422.

8.
PRASINE
GR.
Description.

SIZE of a Sifkin: the male is olive green; beneath yellowish grey: the rump red, as also a feather or two on the belly: the legs yellow: tail rounded, black; the two middle feathers red above; the others the same on the outer margin.

The female is olive brown, beneath yellow grey: the rump dull red; quills cinereous, eight of the secondaries whitish on the anterior margins and tips: the tail feathers black tipped with white: the bill in both black.

Inhabits the island of Java; found in the rice fields.

9.
SUNDA
GR.
Description.

Loxia Javensis, Mus. Carls. fasc. iv. t. 89.

SIZE of a Bulfinch: general colour greyish brown: top of the head black; from the chin, the under parts are paler than the upper, and the belly and thighs white: quills black; the secondaries brown, with ferruginous margins: tail black: legs pale yellow.

Inhabits Sumatra and Java.

PLACE.

ASHCOLOURED
GR.
DESCRIPTION.

Loxia cinerea, Mus. Carls. fasc. iv. t. 88.

THIS may be ranked among the larger fized Großeaks: the bill is flout, and very pale: the plumage above cinereous brown: belly nearly white: the head has the feathers elongated into a crest at the back part: the tail is pretty long, and rounded in shape; the feathers black, margined outwardly with white: the legs red.

Inhabits Malacca, Sumatra, Java.

PLACE.

FERRUGINOUS
GR. :
Description.

Loxia ferruginosa, Mus. Carls. fase. iv. t. 90.91.

SIZE of the White-headed Großeak, which it much resembles: general colour of the body ferruginous: crown, nape, and sides of the head white; base of the bill, chin, and throat black: on the belly before the thighs a large spot of black: quills black: tail dull ferruginous: bill stout and cinereous: legs black.

The female is of a general brown colour, paler beneath, or pale ash colour: quills black, more or less edged with ferruginous: bill and legs black.

PLACE.

Inhabits the East Indies.

Bengali à front pointillé, Daudin. Orn. ii. p. 445.

FRONTAL GR. Description.

SIZE of the Amaduvade: bill pale grey; at the forehead and corners of the mouth a few ferrated black feathers, each tipped with whire: upper part of the head and neck pale rufous, of the body cinereous grey, the edges of the feathers paler: throat and under parts of the body white: legs and claws pale grey.

PLACE.

Inhabits Senegal, from whence feveral have been brought alive to Paris.

Bengali mystacin, Daudin. Orn. ii. p. 446.

MUSTACHOE GR. Description.

SIZE of a Wren: length under four inches: bill reddish brown, with a black tip: head, and upper parts of the neck reddish brown; above the eye a streak of bright red, and another of the same at the corners of the mouth: throat and fore part of the neck pale grey: upper parts of the body, wings, and tail brown, inclining to olive; beneath whitish grey: legs sless flesh colour: claws grey.

Inhabits Cochin China.

PLACE.

BLUE-WINGED GR.

DESCRIPTION.

SIZE of a Bunting: length feven inches: general colour cinereous brown: round the base of the bill as far as the eyes considerably darker: wings wholly of a deep blue, but the base of the outer quills white, forming a long white spot on the outer edge of the middle of the wing: tail the same, but paler than the wings; the ends of all the seathers white: bill and legs blue.

Inhabits New South Wales; found at Port Jackson. From a drawing by General Davies.

PLACE.

FASCINATING GR. Description.

SIZE of a Bulfinch, but longer: the plumage on the upper parts in general dusky black, inclining to brown; the under white: one or more of the outer tail feathers white: bill and legs dusky.

Inhabits New Holland: at Port Jackson is called the smaller sascinating bird, having the man ners exactly of the Fascinating Thrush.

198

BLACK-LINED GR. Description.

SIZE of a small Linnet: general colour grey, paler beneath, crossed every where with numerous slender lines of black; between the bill and eye black, surrounding the eye, and ending in a point just behind it: the bill is stout, and of a fine crimson colour: the lower part of the back and rump are also fine crimson: legs pale brown.

PLACE.

Inhabits New South Wales, where a fingle specimen was met with in May; called Weebong.

NITID GR. Discription.

SIZE of the last, but stouter in the body: the general colour of the plumage pale olive brown above, and dusky white beneath, crossed every where with short abrupt curved lines of black: quills and tail brown, marked with several bands of a darker colour: the bill, irides, lower part of the back and rump are crimson: legs yellowish.

Found in the same place and at the same time as the last.

18. WAX-BILL GROSBEAK. Loxia astrild, Ind. Orn. i. p. 376. 75.. Waxbill Grosbeak, Gen. Syn. iii. p. 152. 71..

THE amazing flocks of this species may in some degree be conceived, from the circumstance of sixty-three having been shot at one discharge of a small sowling-piece \*.

\* Barrow's Trav. p. 373.

Nilid Grosbeak.

Emberiza chrysoptera, Ind. Orn. i. p. 401. 9. Yellow-winged Bunting, Portlock's Voy. pl. in p. 35. Male and female. YELLOW-WINGED B. Dascription.

SIZE of the Yellow Bunting: bill brown: plumage on the upper part of the body reddish brown: sides of the head quite round the eye, the chin, and fore part of the neck white; at the lower part a bar of reddish brown like a collar: breast yellowish, from thence to the vent dusky white: the lesser wing coverts yellowish; the rest of the wing as the back, the edges of the seathers yellowish: tail as the back, but the two outer seathers on each side yellow: legs yellow. This is the male: the female is not greatly different, but the lesser wing coverts are pale ash colour: sides of the head, chin, and throat dusky white.

Inhabits Falkland Islands.

PLACE.

Emberiza Cirlus, Ind. Qrn. i. p. 401. 10.—Ger. Orn. iii. t. 349. 1. & 2? Cirl Bunting, Gen. Syn. iii. p. 190. 26.

CIRL B.

THE Cirl Bunting has not we believe hitherto been ascertained to be a British species: Colonel Montagu has however been fortunate enough to detect it last year in Devonshire, in the month of February,

February, fince which he has met with feveral of both fexes, and conjectures that this species breeds in those parts; it cannot be wondered how the circumstance may till now have escaped the observations of the naturalist, the female being extremely like that sex of the Yellow Bunting, so as to deceive almost any one. In a letter from the late Mr. Hudson, he says: I am convinced that I saw in Devonshire, in pretty good plenty, the Ember. Cia or Foolish Bunting, and which might before then have been mistaken for the hen of a Yellow Bunting; but on my relating this to Colonel Montagu, he says he has never met with it, which he most likely must have done had it inhabited those parts, and where the Colonel has resided himself for a long time past.

CRIMSON-BELLIED B. Description.

Emberiza coccinea, Ind. Orn. i. p. 410. 34.—Naturforsch. xiii. p. 199. (Sanders.)

SIZE of the Yellow Hammer: the bill, head, eyes, and a small streak beneath the bill are black: hind head and tail black glossed with blue: the upper parts of the body are silvery grey, the under crimson: vent white: on the wings a spot of white.

PLACE.

Inhabits the woods of Baden, in Germany, feeds on hemp feeds.

BADEN
B.
DESCRIPTION.

Emberiza Badensis, Ind. Orn. i. p. 411. 39 .- Naturforsch. xiii. p. 198. (Sanders.)

THIS has much affinity to the Olive Bunting; is almost a span long, and in breadth rather more: the bill is black, beneath it yellowish, in the middle of the upper mandible a single stout indentation; nostrils covered with feathers: the general colour of the plumage is olive streaked with dusky, beneath paler: throat orange: breast streaked with dusky: legs yellowish: found at Baden with the last species.

Emberiza rutila, Ind. Orn. i. p. 411. 40.—Pall. It. iii. p. 698. 23.

RUDDY B.

SIZE of the Yellow Hammer: general colour rufous, with a fanguineous tinge; beneath brimftone coloured: wings rufty grey.

Inhabits the willows on the borders of the Onon, in Sibiria, towards the borders of Mongolia, but is a rare species.

PLACE.

Emberiza rustica, Ind. Orn. i. p. 413. 51.—Pallas reise, iii. p. 698. 21.

RUSTIC

B.

DESCRIPTION.

SIZE of the Reed Sparrow: the head is black, marked with three white bands, one down the crown, the two others above each eye: the general colour of the plumage on the upper parts like that of a sparrow; the under white: the nape and shoulders are ferruginous: the throat marked with testaceous dots: the two outer tail feathers obliquely tipped with white.

Inhabits the willow beds of Dauuria, most frequent in March.

PLACE.

Emberiza pusilla, Ind. Orn. i. p. 414. 54.-Pallas reise, iii. p. 697. 20.

DWARF

THIS is fearcely fo big as a Siskin; in general colour not unlike the last: on the head and sides of it five testaceous bands, the intermediate spaces between which are black: throat spotted.

DESCRIPTION.

Inhabits the rivers, and the larch grounds, among the torrents of the Dauurian Alps.

PLACE.

Emberiza Ciris, Ind. Orn.i. p. 416.61. Linaria Ciris, or Painted Finch, Bartr. Trav. p. 289. Paffer brafilienfis, male and female, Ger. Orn. iii. t. 344.1.2. Painted Bunting, Gen. Syn. iii. p. 206. 54.—Id. Sup. p. 159.

8. PAINTED

M. Bartram observes, that the song of this bird is remarkably low, soft and warbling, exceedingly tender and soothing; that it is not seen north of Cape Fear, in North Carolina, generally about ten Supp. II.

D d miles

miles from the sea coast, or perhaps twenty or thirty miles at farthest, and for the most part near the banks of great rivers, in the fragrant groves of oranges.

VAŔIED DESCRIPTION.

Emberiza mixta. Ind. Orn. i. p. 416. 62. - Aman. Acad. iv. p. 245. 20.

CIZE of a Siskin: the general colour of the plumage grey: the bill is thick, and of a pale colour: the grey colour is fo mixed with blue, that in some lights this last colour appears predominant: the region of the ears, throat, breaft, and bend of the wing blue green: the belly is white, but the base of the feathers is brown: thighs grey, intermixed with blueish feathers: legs pale.

PLACE.

Inhabits China.

10. COLOURED В. DESCRIPTION.

Emberiza fucata, Ind. Orn. i. p. 419. 73 .- Pall. reise, iii. p. 698. 22.

SIZE of the Foolish Bunting: the general colour above is like that of a Sparrow; but the crown and part of the nape hoary ashcolour; the shafts of the feathers brown: the neck white, with a circle of brown spots on the throat, and a round rusous spot on the ears.

PLACE.

Inhabits the rivers Onon and Ingoda, in Russia, on the banks of which it is found plentifully; first met with in April.

DAUURIAN DESCRIPTION.

Emberiza spodocephala, Ind. Orn. i. p. 419.74.—Pall. reise, iii. p. 698. 29.

SIZE of a Reed Bunting: plumage like that of a Sparrow, with the under parts yellowish: the head and neck hoary ash colour: face round the bill black.

PLACE.

Found sparingly about the torrents of the Dauurian Alps in spring.

Emberiza chrysophrys, Ind. Orn. i. p. 419. 75 .- Pall. reise, iii. p. 698. 25.

YELLOW BROWED B.

DESCRIPTION.

THE general colour of this species is not unlike the last: the crown is black, over the eye a yellow streak; a white band from the middle of the crown to the nape.

This is found in the same places as the last: from our want of better information concerning this species, we dare not positively affirm that it is not somewhat allied to the White-crowned Bunting \*.

PLACE.

Emberiza luteola, Mus. Carls. fasc. iv. t. 93.

LUTEOUS B.

THIS species on the upper parts is reddish brown, with markings of darker brown; beneath more or less yellow: rump greenish brown: quills and tail brown, with pale margins: bill brown: legs pale yellow.

PLACE.

Inhabits India; the above brought from Coromandel.

\* Gen. Syn. iii. p. 200.

## GENUS XXXVII: TANAGER.

Nº i. Silent T.

N° 3. Rude T.

2. Yellow-fronted T.

4. Showy T.

SILENT T. Tanagra filens, Ind. Orn. i. p. 432. 42. Tanagre de la Guiane, Pl. Enl. 742.

Description.

ENGTH seven inches: bill black: general colour of the plumage green, but the head and under parts are hoary; sides of the head black; over the eyes a streak of white: throat white; beneath this a curved bar of black: shoulders yellow.

PLACE

Inhabits the thick woods of *Guiana*: is a folitary bird; oftener found fitting on the ground, than perched on a tree; and by no means endowed with a fong.

YELLOW-FRONTED T. DESCRIPTION.

Emberiza flavifrons, Mus. Carls. fasc. iv. t. 92.

SIZE of the Rufous-beaded Tanager: bill and legs black: crown, hind head, and beginning of the nape blue; but the feathers are brown at the base: the forehead yellow: the rest of the plumage green, but inclining to yellow on the throat: quills and tail dusky black.

Its native place is not mentioned, but we suspect it to be South America; and that it is very probably the young bird, or a female of the one we have compared it with above.

Tanagra rudis, Mus. Carls. fasc. iv. tab. 94.

RUDE T. Description.

THIS is about eight inches in length: bill cinereous brown: the top of the head, nape, and between the shoulders, black brown: back and rump rusty brown: breast, belly, and vent, ruso-ferruginous: wings and tail dusky; the last rather long: legs cinereous. Inhabits the Coromandel Coast, in the East Indies.

PLACE.

Tanagra ornata, Mus. Carls. fasc. iv. tab. 95.

SHOWY
T.
Description.

SIZE of the Sayacu: the upper parts of a brownish green; the under pale grey: the head of a pale blueish violet colour; the lesser wing coverts not unlike the back; the middle ones tipped with yellow, making a bar on the wing; the rest brownish green: quills black; the outer margins greenish yellow: tail not unlike the quills: bill and legs dusky grey.

Inhabits the East Indies.

RED-CROWNED F. Description.

Fringilla ruticapilla, Ind. Orn. i. p. 438. 14.—Mus. Carls. fasc. ii. tab. 44.

THE bill in this bird is brown; the plumage on the upper parts of the body of the same colour: crown and hind head reddish, margined before and on the sides with black: face and cheeks white, dotted with black: chin ferruginous; breast ferruginous ash colour; belly and vent ash colour: tail black.

SWAMP F. Description.

Fringilla iliaca, Ind. Orn. i. p. 438. 15.—Merrem. ic. av. p. 37. t. 10.

SIZE of a Starling; length nearly seven inches: bill and legs yellow: cheeks white: body above greyish olive, the seathers tipped with black; beneath white; breast spotted with grey brown: rump and tail rusous; the last even at the end, and grey beneath.

PLACE.

Inhabits North America. I have feen this brought both from Georgia and Hudson's Bay; at the former it is rare; at the latter called Great Sparrow, Swamp, or Wilderness Sparrow.

Fringilla rosea, Ind. Orn. i. p. 444. 33.—Pall. It. iii. p. 699. 26.

SIZE of the Brambling: the back is grey and brownish, mixed with a general tinge of rose colour: face white: wings and tail dusky, externally margined with rofe colour.

PIACE.

Inhabits among the willows about *Uda* and *Selenga*, in *Sibiria*; but not common.

Crimson-headed Finch, Art. Zool. ii. No 257.

THIS has a crimfon head and breast, the first faintly marked with dusky spots; space behind each eye dusky: back, wing coverts, primaries, and tail black, edged with crimfon: belly white, tinged with red.

Inhabits New York; arrives there in April; is very frequent among the red cedars, and shifts most nimbly around the stems. The Crimson-headed Finch, Gen. Syn. iii. p. 271. 29. seems to be a further variety.

PLACE.

Fringilla Pinetorum, Ind. Orn. i. p. 445. 40.-Lepech. It. ii. p. 188.

THIS is testaceous, inclining to rusous above, beneath yellow; on the breast a transverse ferruginous band.

Inhabits the pine forests of Sibiria.

PLACE.

Fringilla sylvatica, Ind. Orn. i. p. 446. 41 .- Lepech. It. ii. t. 7. f. 2.

FOREST

THE head of this bird is fasciated; the body mixed grey and black: breast and belly hoary.

DESCRIPTION.

Found with the last.

BEARDED F. Description.

Fringilla barbata, Ind. Orn. i. p. 456. 76 .-- Le Siù, Molin. Chil. (Fr. ed.) p. 227.

SIZE and habit of the Canary Bird: the bill is white at the base, towards the tip black: head black and velvety: body yellow, with a slight tinge of green: wings variegated with green, yellow, red, and black: tail brown: from the chin hangs an elongated tust of black feathers, like a beard, which in very old birds reaches to the middle of the breast.

The female is wholly grey; the wings spotted with yellow; but is destitute of the chin beard-like seathers; and has not the least song.

PLACE.

Inhabits the mountainous parts of *Chili*, next the fea; builds in trees, making the nest of straw and feathers: the eggs are only two in number. The sless accounted savoury, and is therefore in much estimation.

The male is often kept in a cage for the fake of its fong, and it is faid also to be a mimic of others. The Spaniards call it Jilguero, or Goldfineh, which it somewhat resembles in colour.

8.
CHILI
F.
Description.

Frigilla Diuca, Ind. Orn. i. p. 456. 77. Molin. Chil. (Fr. ed.) p. 229.

THIS is rather larger than the last: the general colour blue, with the throat white.

PLACE.

Inhabits Chili; chiefly about dwellings; fings remarkably well, efpecially about fun-rife; it feems much allied to, if not the fame as the White-throated Großeak \*.

SHARP-TAILED F. Description. Fringilla caudacuta, Ind. Orn. i. p. 459.85.

HIS is four inches and an half in length: bill and legs pale: iris dark brown: general colour of the plumage mottled brown and pale rusous; the last chiefly at the edges of the feathers: the

\* Gen. Syn. iii. p. 115. 10.

throat

Throat is pale rufous, and a streak of the same over the eyes; the lower part of the neck behind rufous, but darker than the throat: tail even at the end; but the tips of the seathers run off to a sharp point.

Inhabits the internal parts of Georgia, in America. I met with this at Mr. Humphries's, among other specimens brought from thence. It was entitled Spotted Grass Sparrow.

PLACE.

Fringilla Georgiana, Ind. Orn. i. p. 460. 86.

GEORGIAN
F.
Description.

LENGTH fix inches: bill dusky: irides brown: head brown, full of feathers: middle of the back dusky brown; the under parts are white: chin and throat grey; beneath the jaw a divaricated streak of black: the lesser wing coverts are rusous, and the quills and tail feathers are rusous on the outer edges: legs brown.

Found in the same places as the last.

PLACE.

Fringilla cannabina, Ind. Orn. i. p. 458. 82.—Bolton's Br. Birds, pl. 29. 30. Greater Red-headed Linnet or Redpole, Gen. Syn. iii. p. 304.

REDPOLE

HAVE been long inclined to think the possibility of the Common or Grey Linnet, as it is called, and the Redpole, proving only one species; and in this I am encouraged by that excellent observer Mr. Boys, of Sandwich, as well as by Colonel Montagu, both of whom have hinted their suspicions in respect to this fact; the way to account for it is, to suppose that the Common Linnet is not complete in respect to the red of the forehead, till the end of the second year at soonest, yet is capable of breeding in the first spring after being hatched. I have observed in the male of the Grey Linnet, the head seathers to appear externally like the rest of the upper parts, but on lifting them up, a tinge of red was very manifest. One of these birds brought to me in the month of January, was seemingly in its change, for the seathers of Supp. II.

the forehead were apparently grey, but on lifting them up with a pin they were fine crimfon in the middle. As to the red on the breaft, it is well known that it is only to be feen at certain feafons; and if the bird be kept in a cage, it entirely loses it, so as never to return during confinement.

WHITE.
HEADED
F.
DESCRIPTION.

SIZE of a Bulfinch: head; neck, and under parts from the breaft white, marked on the fides and under the wings with a long patch of black, charged with numerous white fpots; across the breast a broad bar of black communicating with the black on the fides: before the eye a crescent of black: tail short and black: the upper part of the back, the wings, and tail, are rusous brown; the lower part of the back and rump crimson; the bill also is crimson: legs pale brown.

PLACE.

Inhabits New South Wales. From the drawings of General Davies. Among the drawings of Mr. Lambert, I find a bird greatly correfponding with the above, and which may not unlikely prove different only in fex: the bill and legs are the fame: the head, initead of white, is pale ash colour: back, wings, rump, and tail, similar to the other, but rather more pale; but the crescent of black on the upper part of the breast is the same, joining with the black on the sides in the same manner, and the sides marked with the same white spots; the under parts from the breast white.

SULTRY F. Dascription.

LENGTH five inches and an half: bill dusky: general colour of the plumage fine pale rusous brown; the under parts are plain, but on the upper, each feather is streaked down the middle with dusky black, especially the crown, where the streaks are very broad and distinct: tail even at the end: legs pale yellow.

PLACE.

Inhabits the Mahratta country in India.

Mile headed Finch.

NITID F.

SIZE of a House Sparrow: the bill pale red: legs yellow: plumage Description. above, including the tail, pale ash colour; the under parts white, but the sides next the wings incline to yellow: quills dull ferruginous yellow: over the eyes a black band, passing down a little way on the ears in a broad patch.

Inhabits New South Wales.

PLACE.

TEMPORAL F.
Description.

SIZE uncertain: bill and legs reddish brown: crown of the head blue grey: upper parts of the body, wings, and tail pale brown; all the under parts white: from the bill a dull crimson streak arises, growing broader at the back part, and forming on the cheeks an oval patch: rump crimson.

Several drawings of birds probably allied to this, have come under our observation: in one of them, the bill is crimson, a broad streak of the same over the eye, and the rump and vent crimson also: the crown rather sull of seathers: the whole of the upper parts of the plumage and tail green; beneath greenish white, with a slight reddish tinge on the breast: tail short:—in another, the bill was pale red; the streak over the eye and the rump crimson: tail short, as in the other: the plumage above greenish brown; beneath cinereous white. For these I am indebted to the drawings of General Davies; and in those of Mr. Lambert, I have remarked a third, in which the upper parts were green; the under greenish white: bill, streak over the eye, and rump, crimson; but differed from the others in having the tail much longer.

All these said to inhabit New South Wales.

## GENUS XXXIX. PLANT-CUTTER.

BILL conic, strait, serrated on the edges.
Nostrils oval.
Tongue short, obtuse.

#### \* WITH FOUR TOES.

CHILI
PL. C.
Description.

Phytotoma Rara, Ind. Orn. i. p. 466. 1.—Molin. Chil. (Fr. ed.) p. 234. Phytotome du Chili, ou Rara, Daudin. Orn. ii. p. 366.

SIZE of a Quail: bill very strong, pointed at the tip, half an inch long, indented like a faw on the edges: tongue very short, blunt: irides brown: the back is dusky grey; the under parts paler: tail of a moderate length, rounded at the end: quills and tail seathers spotted with black. The soot consists of sour toes, three before and one behind; the hind toe much shorter than the sorward ones.

PLACE.

Inhabits Chili, where it is far from uncommon. The voice is rough, and the bird at intervals utters the words Ra, Ra, very diftinctly: its food is vegetables, perhaps preferring the parts next the root, for with much pains, it digs about and cuts off the plants with its bill, as it were with a faw, close to the ground; from this circumstance, it does much injury to the gardens, and is detested by the inhabitants. These birds build the nest in high trees, well cloathed with leaves, and in unfrequented places; the eggs are white, spotted with red.

Abyfsinian Plant-cutter.

Publishid as the Act directs May 30. 1801, by Leigh. Sotheby. & Son. Fork Street. Coven Garden.

#### WITH THREE TOES,

Loxia tridactyla, Ind. Orn. i. p. 397. 93. Le Guisso Balito, Buf: Ois. iii. p. 471. Phytotome d'Abyssinie, Daudin. Orn. ii. p. 366. z. Three-toed Grosbeak, Gen. Syn. iii. p. 471. ABYSSINIAN PL. C.

SIZE of the common *Grosbeak*; length about fix inches: bill brown: the head and fore part of the neck red; the rest of the plumage black; about the shoulders brownish, with a tinge of green: the greater wing coverts appearing as black scales, margined with white, slightly tinged with olive: tail a trisle forked: legs brown, with only three toes, two placed before and one behind.

This is the description given by M. Daudin, from a drawing sent him figured from a Nubian specimen: it seems, however, to differ a little from that described by Buffon, for that bird is said to be black, with not only the head and fore part of the neck of a beautiful red, but that colour prolonged in a narrow band quite to the vent: wing coverts brown, edged with white; and the quills edged with green.

M. Buffon described his from Mr. Bruce's drawings done in Abysfinia, where it is said to be a solitary species, living on the kernels of almonds, the shells of which it easily breaks with the bill.

FERRUGINOUS FL. Muscicapa ferruginea, Ind. Orn. ii. p. 477. 41.—Merrem. Ic. Av. p. 19. t. 6.

DESCRIPTION.

SIZE of a Goldfinch; five inches and an half long: bill black, depressed at the base, with chesnut edges: general colour grey brown; beneath yellowish white: throat white: wings black; the margins of the quills ferruginous: tail short and black; the wings reach to the base of it.

PLACE.

Inhabits Carolina.

Muscicapa Aedon, Ind. Orn. ii. p. 478. 42.—Pall. reise, iii. p. 695. 11 \*.

MELODIOUS FL.
Description.

SIZE of the *Reed Thrush*: above ferruginous brown; beneath yellowish white: tail cinereous brown, pretty long; the two middle feathers equal in length, the outer are much shorter.

PLACE.

Inhabits the rocky and funny places in *Dauuria*, where it is not uncommon: fings fweetly, and even in the night, in manner of the *Greater Nightingale*, to which it is not inferior in melody, and fully fupplies the place of that bird; the *Nightingale* not being found in *Sibiria*.

Muscicapa Novæ Hollandiæ; Ind. Orn. ii. p. 478-43: Yellow-eared Flycatcher, White's Journ. pl. in p. 161. YELLOW-EARED FL. Description.

SIZE of a Martin; length seven inches: bill broad at the base, and yellowish: general colour of the plumage brown; whitish beneath: belly quite white: behind the eyes, and beneath them, a streak of yellow, growing broader at the back part: tail pretty long, and the middle feathers of it rather shorter than the others.

Inhabits New Holland.

PLACE.

YELLOW-TUFTED FL. DESCRIPTION.

THIS is confiderably larger than the *Hedge Sparrow*: bill and legs black: tongue briftly at the tip: the general colour of the plumage on the upper parts is olive green: the crown, and all beneath, from the chin, yellow: through the eyes, from the gape, a large patch of black; at the back part of which, on the ears, a tuft of yellow, which tuft confifts of feathers longer than the others: the outer tail feathers yellow.

Inhabits, New Holland, where it is called Darwang, and is a common species.

fpecies. The English named it, as well as the last, the Yellow-eared Flycatcher: is said to seed principally on honey, which it obtains from the slowers, by means of its feathery tongue: makes the nest on the extreme pendent branches of low trees or shrubs, and by this means escapes the plunder of various smaller quadrupeds, who are unable to reach the nest with safety. Whether this is allied to the last, I will not take upon me to ascertain.

RED-BELLIED FL. Muscicapa erythrogastra, Ind. Orn. ii. p. 479. 50. - Nat. Misc. xlix. pl. 147. Red-bellied Flycatcher, Gen. Syn. iii. p. 343. pl. 50.

THESE birds are observed to be more numerous in Norfolk Island, than in New South Wales; and seem to vary much.

In one from *Port Jackson*, in the drawings of General *Davies*, the head, neck, back, and wings, are flaty black: quills and tail black: chin and throat the fame, but paler; on the forehead a white spot: breast purplish or deep red lake colour: belly and vent white.

In another, the forehead is not white; instead of which is a white streak over the eye: the chin is white: the general colour is black, as in the others: breast and belly crimson: vent white: tail rather shorter than in common. The native name Booddang.

In a third variety, there is an oblique streak of white on the wing; and most of the outer tail feathers white. I have also seen this same wary with the tail feathers wholly black.

In a fourth, the plumage is black above; beneath wholly deep crimfon: forehead, just over the bill, white: on the wing coverts fome motlings of white.

A further variety has the general colour of the upper parts dusky or cinereous black: the chin, fore part of the neck, and breast, crimfon: spot over the forehead, an oblique broad longitudinal streak on the shoulders of the wings, and all the belly and vent white. This, came from Port Jaskson, and was communicated by General Davies.

DESCRIPTION.

Muscicapa Paradis, Ind. Orn. ii. p. 480. 54. Paradise Flycatcher, Gen. Syn. iii. p. 345.

PARADISE FL.
Description.

I Suspect the Sifuil Boulboul and White Nightingale, so called in India, to be this bird: it is white; the head crested, and mottled a little about the sides and crest with black: the tail pretty long\*: vent red: bill like that of a Thrush; that and the legs black. Another of these had the crest black, and the vent red; no red about the eye: it was called Full Doon, or Entire, or Full Tail, as the tail is pretty long.

Both these from India.

PLACE.

Dr. J. R. Forster, in his notes on Bartolomeo's Voyage to the East Indies, wonders that this author could affert that the Bird of Paradise existed at Malabar; but this point is without difficulty cleared up, when we know that it is one of the names which the Paradise Flycatcher is known by in India.

Muscicapa Deserti, Ind. Orn. ii. p. 478. 44 .- Mus. Carls. fasc. ii. t. 47.

DESERT FL Description.

SIZE of the Long-tailed Titmouse: bill yellowish: legs black: general colour of the plumage dusky rust colour: wings and tail black; the last half as long again as the body.

Inhabits the deferts of Africa; met with between the river Heui and the spring Quamodacka.

PLACE.

\* The tail of this, in a drawing which came under my inspection, appeared to be forked; but I have not observed this circumstance in real specimens which I have yet seen.

+ See a translation of this work by William Johnston, 8vo. 1800. p. 224. Note \*.

8. CAT FL.

Muscicapa Carolinensis, Ind. Orn. ii. p. 483. 64. Cat or Chicken Bird, Bartr. Trav. p. 288. Cat Flycatcher, Gen. Syn. iii. p. 353. 54.

HIS breeds in Pennsylvania; I have likewise received it from Georgia: it is faid to be very little inferior in fong to the Mocking Bird; but as an imitator of others, it far exceeds it, for it repeats the melodious and variable airs from instrumental music: it will also often imitate the notes of chickens, and especially their cry when in diffress, insomuch as frequently to put the mother into a great fright when no danger is nigh: is an early fongster, often beginning before day-break; feeds on both infects and fruits; comes in the fpring, and breeds there, making the neft in coppices and in gardens, near habitations: the irides are dark brown.

COLOURED FL. DESCRIPTION.

Muscicapa dichroa, Ind. Orn. ii. p. 490. 94. ---- bicolor, Mus. Carls. fasc. ii. pl. 46.

THIS is eight inches in length: bill and legs dusky: the general: colour of the plumage cinereous above, and yellow oker coloured beneath: wing coverts hoary on the margins: tail about the same length as the body; the feathers of it oker coloured and cinereous.

Inhabits the fouthern parts of Africa. PLACE.

10. IAVAN FL. DESCRIPTION.

Muscicapa Javanica, Ind. Orn. ii. p. 490. 95 .- Musc Carls. fasc. iii. pl. 75.

SIZE of the Spotted Flycatcher: bill and legs black: seathers on the upper furface dusky, with ferruginous margins; beneath, on the forepart of the neck, a bar of black; over the eye a line of white? tail pretty long, rounded at the end; the four middle feathers wholly black; the others black, with the ends white.

PLACE.

Inhabits Java.

Muscicapa alba, Ind. Orn. ii. p. 490. 96.—Mus. Carls. fasc. iii. pl. 74.

WHITE FL. Description.

THIS bird is wholly white, the head a little tinged with brimftone: tail long, as in the Wagtail; from this circumstance, the stenderness of bill, and make of the whole bird, it would appear rather to belong to that genus than to the Flycatcher.

PLACE.

Found at Stockholm.

seum.

Muscicapa Cambaiensis, Ind. Orn. ii. p. 490. 97.

CAMBAIAN FL. Description.

SIZE of the Black-capped Flycatcher: bill depressed, broadish, dusky, with a few hairs at the base: the colour of the upper parts of the body is black, with a yellowish green tinge on the back; beneath sulvous yellow: wing coverts white at the ends, from whence arises a double band of that colour on the wing: legs blueish.

Inhabits Cambaia: described from a specimen in the British Mu-

PLACE.

Southern Motacilla, White's Journ. pl. in p. 239.

SOUTHERN FL. Description.

THIS rather exceeds the Cinereous Flycatcher in fize: bill and legs pale brown: the general colour of the plumage is cinereous brown on the upper parts and tail; the under a fine yellow: over the eye a streak of yellow, and a double trace of the same behind it: the chin and vent paler than the rest of the under parts.

PLACE.

Inhabits New Holland. The specimens vary; some of them have the crown, hind part of the neck, and back, blueish brown: wings brown; the edges of the quills whitish: the traces above and beneath the eye white; and the ends of the two middle tail feathers white: the crown seems also suller of feathers. I suspect that these two differ only in sex.

SUPERCILIOUS FL. Description.

Muscicapa superciliosa, Mus. Carls. fasc. iv. pl. 96.

SIZE of the Small Thrush: the upper parts of the head, taking in the eyes, neck, back, and wings, are dark brown; from the nostrils, over the eyes, a broad streak of white: chin and throat ferruginous; from thence to the vent fine pale ash colour: the tail rounded at the end; two middle feathers like the back, the others ferruginous, with the inner margins and tips brown: bill black, with a pale brown base: legs pale brown.

BLACK-CROWNED FL. Description.

Muscicapa meloxantha, Mus. Carls. fasc. iv. pl. 97:-

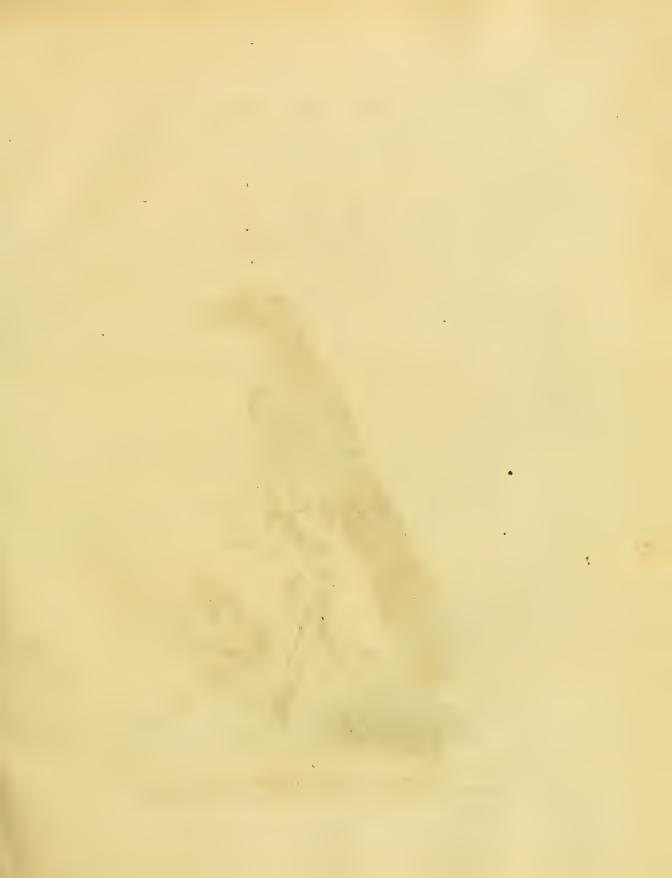

SIZE of the White Throat: bill black: general colour of the upperparts of the plumage dusky ash: crown and forehead black: wing coverts black, with the tips and margins yellow: the underparts from chin to vent yellow: quills black, edged with yellow: tail short, rounded, black; all the feathers tipped with white, but the outerone has the end for nearly a fourth of the length of that colour: legsdusky.

The native places of the two last are not ascertained.

RUFOUS-FRONTED FL. Description.

SIZE of the Nightingale, but more slender: the crown of the head, back of the neck, the wing coverts, and half of the tail, and under parts of the body from the breast, pale brown: the forehead, middle of the back, and base of the tail are of a deep rusous, inclining to red: chin, fore part of the neck and breast yellowish white; spotted on the ears and breast with black: on the middle of the neck before, a large patch of black: tail rather long, and in a small degree cuneisorm: bill and legs pale brown.

Inhabits.

Enimson-bellied Flycatcher.

Inhabits New South Wales, where it is known by the name of Burril: has hitherto only been met with in November.

PLACE.

CRIMSON-BELLIED FL. Description.

ENGTH five inches and a half: bill and legs pale brown: plumage olive brown above; but from the base of the bill to the middle of the crown, taking in the eye, black, and passing backwards into a point on the ears: the chin and sides of the neck are white: breast and belly deep crimson: the wings are black; but the quills are white half way from the base: tail longish; the two middle seathers wholly black; the others the same half-way from the base, the rest of the length white: the wings reach one third on the tail.

Inhabits New South Wales: specimens of this species are scarce.

PLACE.

18.
BLACK
CHEEKED
FL.
DESCRIPTION.

SIZE of the White Throat: plumage above brown; beneath pale yellow, growing white towards the vent: crown of the head black, and a broad streak of the same occupies the sides of the cheeks, beginning beneath each eye: the quills are darker than the rest, some of them edged with yellow: tail longish: bill black: legs blueish.

Inhabits New South Wales; met with there in July.

PLACE.

MUSTACHOE FL. Description.

LENGTH from eight to nine inches: bill flender; black: legs black: tongue fringed at the tip: general colour of the plumage pale green; but the under parts from chin to vent greenish yellow; the last most conspicuous on the chin and breast: from the gape springs a black band, which grows broader, and passes under the eye to the hind head, where it is fringed with yellow.

Inhabits

222

PLACE.

Inhabits New South Wales; is a pugnacious bird, attacking others, especially the smaller Parakeets.

ROSE WINGED FL.

DESCRIPTION.

SIZE of a Nightingale: bill and legs brown: general colour of the plumage brown; beneath white: the feathers of the crown feem loofe, giving the appearance of a crest, and spotted with black: the middle of the outer quills, and the four middle tail feathers, from the base to three-fourths of the length, are rose colour, the last marked with a few black spots.

PLACE.

Inhabits New South Wales.

COACH-WHIP FL.
Description.

SIZE of a Thrush: general colour of the plumage slaty black: chin and throat crossed with fine lines of dusky white: the feathers of the crown are long, and can be erected into a crest: tail slightly cuneiform: bill stout, black: legs slender, black: irides blue.

PLACE.

Inhabits New South Wales; native name Djou. It has a long fingle note, not unlike the crack of a coachman's whip, hence called the Coach-whip Bird; it appears a lively species, and menacing in its manners; for erecting the crest, it gains a formidable appearance, which it takes the advantage of in contending with other birds, especially Parakeets, about the right of extracting honey from the slowers; it is not a common species.

BLACK-BREASTED FL.

DESCRIPTION.

THIS is rather more than eight inches long: bill brown; legs black: the head, taking in the eyes, the nape, and fides of the neck, are black, continuing in a band on the breast; within this, the

chin and throat are white: the upper parts of the body are greenish yellow; the under yellow: wings black; but the coverts are edged with yellow: the tail black, with a yellow tip.

This species is found at New South Wales, in April.

PLACE.

HOODED FL. Description.

BILL and head black; the last full of feathers: general colour of the plumage clouded black; but the under parts are white: the whole of the wings and tail are black; but the lesser quills are fringed with white: legs dusky.

Inhabits New South Wales.

PLACE.

ROSE-BREASTED FL. Description.

THE upper parts of this bird are pale brown; the under pale: breast rose colour, inclining to carmine; on the wing coverts a few pale spots: the bill is brown, rather long, and bent towards the point: irides blueish: legs brown.

Inhabits New South Wales.

PLACE ..

GRÉY FL. Description.

THIS is nearly the fize of a *Sparrow*: bill rather broad, furnished with a few briftles at the base, and black: the upper parts of the body and wings are pale slaty grey; beneath from chin to vent pale yellow: quills and tail dusky black: legs pale brownish steph colour.

Inhabits New South Wales.

PLACE.

26.
SOFT-TAILED
FL.
DESCRIPTION.

Soft-tailed Flycatcher, Lin. Trans. iv. p. 240. pl. 21.

ENGTH from bill to rump three inches: bill brownish black; base furnished with strong bristles; nostrils low down on the bill: the general colour of the plumage serruginous, but the seathers of the upper parts of the body and wing are streaked down their middle with brownish black; the middle of the belly nearly white: over the eye, arising at the base of the bill, is a pale blue streak: throat and fore part of the neck of the same blue colour: the seathers of the rump are soft, long, and silky: wings short, scarcely reaching to the base of the tail: the quills are dusky, edged with ferruginous: the tail is sour inches or more in length; the shafts very stender and black, the webs on each side consisting of minute stender hairy black silaments, placed at distances, and distinct from each other, as in the seathers of the Cassowary: legs pale brown.

The *female* is like the *male* in colour, but wants both the blue ftreak over the eye, and the chin and throat are of the fame colour as the rest of the under parts.

PLACE

Inhabits New Holland; being found about Sidney and Botany Bay, in marshy places, abounding with long grass and rushes, which afford it an hiding place, and where, like the Bearded Titmonse, it is supposed to make the nest; when disturbed, its slight is very short, and is found to run on the ground with great swiftness; feeds on small slies and other infects. The name it is known by in the country is Merion Binnion, or Cassowary Bird; we are indebted to General Davies for the above notices concerning this singular bird, which is well represented in the Linnaan Tomsations.

OR ANGE-RUMPED FL.

THE head and neck in this species are pretty full of feathers, and black: back and rump orange colour or reddish; all the under parts of the body are white, marked with several longish streaks of black on the breast: wings and tail brown; the seathers of the last have the webs much separated and distinct from each other, as in the Soft-tailed Flycatcher: legs pale brown.

Inhabits New South Wales; and is an active species, frequently carrying the tail erect, and expanding the same at the moment it springs from a branch on its prey.

3. Yeltonian L.

SKY L. Alauda arvensis, Ind. Orn. ii. p. 49. Sky Lark, Gen. Syn. iv. p. 368. 1.

SOME of these birds will measure as far as eight inches in length, and even more.

I find that the custom paid at Leipsic for Larks, amounts to 12,000 crowns per annum, at a Grosch, or 2½ pence sterling, for every sixty Larks. The quantities may seem prodigious, but the fields appear to be covered with them from Michaelmas to Martinmas; that they do not all breed here is manifest, from the sudden appearance of such vast slocks. But this is not confined to Germany; for we are informed, that the same circumstance happens about Cairo, in Egypt, in respect to Larks, as they come to that place about the beginning of September, and continue for some days; during which, they are taken in vast quantities in nets, and esteemed for eating. They are supposed to come from Barbary, and are called in Egypt, Assour Dsjebali, or Mountain Birds\*.

DUSKY L.

from fix to feven drams: the bill is slender, three-fourths of an inch long, dusky, with a darker point: the plumage on the upper parts of the bird dusky greenish ash colour; the middle of each feather darker: fore part of the neck and breast mottled dusky white and brownish ash colour: the chin, and fore part of the neck, dusky white; and the middle of the breast is like the fore part of the neck, but paler: belly dusky yellowish white: the wings are much the same colour as the back, but edged with a paler colour: the four first prime quills are nearly of equal lengths, the second a trifle longest; the second quills almost even with the first at the ends: tail full three inches long, even, of much the same colour as the quills; the

outer feather has all the outer web and half the inner cinereous white; the next whitish at the tip: legs brown; hind claw crooked, no longer than the toe, which is the same length as the outer one

before.

THIS species rather exceeds seven inches in length; and weighs

DESCRIPTION.

This, till within a few years past, has not been sufficiently discriminated. I saw it first among the preserved birds of the late Mr. Leman, where it was marked as a singular variety\*. Mr. Walcot and Mr. Lewin afterwards found it in the marshes of Kent; and Colonel Montagu likewise met with it in more places than one, in similar situations. This gentleman observes, that it is only to be seen on

I suspect it to be the variety of the Titlark, in Br. Zool. fol. pl. P. i.

Gg 2

the

the sea shores, or at least a little more than a quarter of a mile from the sea water, and especially in rocky situations, at least no where except in places where the tide occasionally covers. It makes the nest in the tusts of grass on the shelves of rocks, &cc. by the sea side, where it is rarely to be got at without the help of a ladder. The nest is made of dry grass, marine plants, and a little moss, lined with siner grass, and a few long hairs. The eggs of a dirty white; spotted: with brown, mostly so at the larger end. This species is not observed to associate in large slocks like other Larks, only three or sour having been seen together. Marine insects seem to be its principal food. The note is a very insignificant one, being very rarely more than a chirp, not unlike that of a Grassbopper. For a suller account, consultation. Trans. iv. p. 41. &c.

YELTONIAN L.
Description.

Alauda Yeltoniensis, Ind. Orn. ii. p. 496. 16.—Phil. Trans. Ivii. p. 3500. (Forster.)

SIZE of the Starling: bill cylindric; strait and pointed; base black, with the tip very pale; tongue bisid: the colour of the plumage is black, varied on the head, back, and shoulders with rusous: the the quill has the outer margin white; the two middle tail feathers are rusous, the others like the rest of the plumage: the hind toe pretty strait, and larger by much than the others.

PLACE.

This inhabits the neighbourhood of the Volga; found about the lake Yelton: that it is gregarious, and very fat in August, at which time it is of a most exquisite flavour.

DIXON'S L. Description. Alauda Novæ Zealandiæ, Ind. Orn. ii. p. 497. 19. 6. Cinereous Lark, Portlock, Voy. pl. in p. 37.

SIZE of a Titlark; length fix inches: bill and legs black: the upper parts of the body ash colour; the under very pale ash colour,

lour, inclining to white towards the vent: quills and tail black; the outer edges of the quills, and the outer tail feathers white.

This inhabits New Zealand: described from Captain Dixon's drawings; and except in being less, seems greatly allied to the New Zealand Lerk.

PEACEE

Alauda Gorenfis, Mus. Carls. fasc. iv. pl. 99.

FERRUGINOUS
L.
DESCRIPTION

THE bill in this bird is brown; the crown, nape, and beginning of the back, dusky, the feathers margined with ferruginous: back and rump deep ferruginous; chin and under parts ferruginous, but the throat and breast have each feather streaked with dusky: belly much the same, but the ground nearly white: vent white: quills very pale on the margins: the feathers of the tail have the margins nearly white; but the middle ones are serruginous brown, and the outermost towards the end obliquely white, marked with a triangular spot of white at the tip: legs pale.

## GENUS XLII. WAGTAIL.

No I. White W.

Nº 4. Black-crowned W.

2. Dauurian W.

5. New Holland W.

3. Hudsonian W.

Motacilla alba, Ind. Orn. ii. p. 501. 1.—Ger. Orn. iv. pl. 385. 1. White Wagtail, Gen. Syn. iv. p. 395. 1.

WHITE W.

ROM various observations made by my friends and myself, it appears clear that there is very little if any diffinction of fex in adult birds of this species; neither sex gains the black about the head and throat the first season after hatching; but as spring comes on, both fexes gradually obtain it, and both again lose it after incubation; not perhaps wholly, for in old birds fome traces are visible at most times. and under this mask have been described as different birds. This circumstance likewise happens in respect to the Grey Wagtail, which is only met with in the fouthern and western parts of England in the winter months. I faw one of them at the edge of a rivulet in my garden, September 28 of the last year, but they do not often appear before October. That both fexes have a black throat, I am well informed, and more or less tracing of it may be observed before their departure towards the north in spring, where they breed. However authors may multiply this genus, we have certainly no more than three in England; viz. the White Wagtail, common almost every where at all feafons; the Grey Wagtail, inhabiting all the fouthern counties the winter half of the year, departing northward as spring approaches; and the Yellow Wagrail, which is not observed any where except in the fummer feafon.

Motacilla melanopa, Ind. Orn. ii. p. 503. 5 .- Pal. It. iii. p. 696. 16.

DAUURIAN W. DESCRIPTION.

HIS species has the habit of the Yellow Wagtail, but is not so large; the legs also are smaller: the general hue is blueish ash colour above, beneath yellow: lore and throat black: over the eye a streak of white, beginning at the gape: the three outer tail feathers are white, except the outer margin, which is black.

Inhabits the eastern borders of Dauuria.

PLACE. -

Motacilla Hudsonica, Ind. Orn. ii. p. 503. 6.

HUDSONIAN W.

LENGTH fix inches: bill pretty short, yellowish brown; legs the same: plumage above brown, the seathers margined with ferruginous: chin and throat pale ferruginous, streaked with dusky: breast, belly, and vent dusky white: quills dusky; second quills edged with ferruginous: tail three inches long; the outermost feather white; the next to it on each side white, with the inner margin brown; the third dusky, with a slender streak of white down the middle; the others plain dusky: the tail even at the end.

Inhabits Hudson's Bay: the name it is there known by is Puck-i-tow-o-shift.

PLACE;

BLACK-CROWNED W.

SIZE of our Wagtail: bill and legs yellow: crown of the head black: back and wings red brown; the under parts of the bird white, inclining to orange on the breaft: the quills are black: tail long, fomewhat cuneiform; the middle feathers a little pointed; colour of all of them red brown half way from the base; from thence to the end yellowish.

Inhabits New South Wales; but is a scarce bird.

PLACE.

NEW HOLLAND W. Description.

SIZE and habit of our Grey Wagtail: bill and legs black: tongue bristly at the tip: the general colour of the plumage above pale blue; beneath pale yellow: the quills and tail are black; the last remarkably long: the bastard wing is small, and of a reddish white.

Inhabits New South Wales.

NIGHTINGALE.

N Lower Egypt, at least in the most eastern part of that quarter of the globe, the Nightingale is very common; also in the islands of Supp. II.

Hh

of Germany are also great numbers, for we are told, that they are found in vast abundance in the wood of Rosendahl, near Dresden; in which neighbourhood Larks also are in such amazing quantities, as to furnish a considerable revenue to the crown .

It has not escaped the writers on this subject, that the males and se-males of some birds, for instance, Chassinches, separate for a time into different flocks, each flock consisting of one sex only; but my ingenious friend Colonel Montagu hints to me, that the males of all the Warblers come first, and if the weather should afterwards prove cold, with the wind at East or North, all communication is cut off between the sexes till the wind changes, frequently for a fortnight or more; but if the weather is warm, with a South or West wind, the semales follow the males in a sew days. The arrival of the semales may be foretold by the singing of the males: if they are very vociserous, the semales may be immediately expected; if, on the contrary, none will appear, for both are actuated by the same cause; the same stimulus that occasions the song in one, gives the other locomotion to seek its mate; and from this cause no doubt it is that more males of the Nightingale are taken than semales.

GREATER PETTICHAPS. Motacilla hortensis, Ind. Orn. ii. p. 507: 3.
Ficedula cinerea major, Bigia, Ger. Orn. iv. t. 395. 1?
Die Bastardnachtigale, Naturf. 27. S. 39. 1. (Beckstein.)
Greater Pettichaps, Gen. Syn. iv. p. 413. 3. sect. 2d.

DESCRIPTION.

THIS species weighs about five drams; the length nearly six inches: the bill a trifle broader at the base than the common Wbite-throat: irides dusky yellow: the upper parts of the bird in general, light brown, inclining to olive green: quills and tail edged

† 6,000 dollars. Keysler.

<sup>.</sup> Sonnin. Travels, ii. p. 51. 52.

with the same: below the ears a dash of ash colour: throat, neck, and upper part of the breast, dirty white, inclining to dull buff colour: lower part of the breast, belly, and under tail coverts white; beneath the wings buff: legs dusky. When in fine plumage, an obscure streak of pale or yellowish colour appears over the exercises.

In one of these, from Mr. Boys, of Sandwick, I observed the tongue to be jagged at the end; the length was five inches and three quarters, in breadth eight inches and three quarters. This was a semale. Colonel Montagu met with it in Gloucestershire; but remarks, that he has never seen it in Cornwall, notwithstanding he has been long resident there. I have met with it in more than one place in Kent, and have heard of it in Berkshire and other parts, but believe it to be no where exceedingly common. The males of this species come generally the last week in April, the semales a sew days later. It builds in thick bushes or hedges, composed of dried sibres, some wool, and a little green moss outwardly; within sometimes lined with horse-hair. The eggs generally four in number, weighing each thirty-six grains; colour a dirty white, marked with brownish specks, pretty numerous, and running frequently together at the larger end.

In fong, this bird is little inferior to the Nightingale, either in melody or variety. Some of its notes are fweetly and foftly drawn, others are quick, lively, loud, and piercing, but reaching the distant ear without inharmonious discord.

Mr. Beckstein thinks the song to be even more varied than that of the Nightingale, bursting into various kinds of modulation as it proceeds, and at times warbling like the House Swallow; and observes that it is found in Sweden and Germany throughout, departing thence the latter end of August.

Its general food appears to be infects, which it fearches for under the leaves, but will frequently come into gardens, when in the neighbourhood of its haunts, making free with fruits likewise. The young

Hh 2

are observed to remain in the nest till they are grown very large, and almost as well seathered as the parents.

LESSER PETTICHARS. Sylvia Hippolais, Ind. Orn. ii. p. 507. 4. Motacilla Fitis, Naturf. 27. S. 50. 5. Leffer Pettichaps, Gen. Syn. iv. p. 413. 3 \*. Chirping Willow Wren, White's Selborne, p. 45.

THIS has been sufficiently described before in the Synopsis. It sometimes comes before the 20th of March +, but is in general before the 1st of April, departing before the end of September; and is perhaps as early as any migrant, if we except the Wryneck: the weight is about two drams; length five inches; breadth eight inches: the first quills shorter than the second, and the two middle feathers rather shortest.

We believe this bird to be every where pretty common; but it has not been observed in *Guernsey*, although the *Willow Wren*, a much more scarce bird, is there in plenty.

This species is perpetually singing, or rather chirping: the notes feemingly like the words Twit, Twit, Twit, Twit, Twit, hastily and delicately repeated, or as Mr. Beckstein calls it Fit; and from whence he has derived his name.

SARDINIAN W. Description.

Sylvia melanocephala, Ind. Orn. ii. p. 509. 7 .- Cett. Ucc. Sard. p. 215.

THIS is faid to be smaller than the Blackcap, but very like it; of a greenish ash colour above, and grey beneath: crown black, and a red band over the eyes.

PLACE.

Inhabits Sardinia: has very little of a fong.

once heard it on the 14th of March.

Sylvia moschita, Ind. Orn. i. p. 509. 8 .- Cett. Uc. Sard. p. 215.

HIS is lead colour, with a rufous crown.

Inhabits Sardinia: the eggs of the Cuckow said to be frequently said in the nest of this bird. There is little doubt but M. Cetti has unnecessarily made two species of this and the last, as they appear to be no other than the male and female Blackcap.

RUFOUS-CROWNED W. Description.

Regulus non cristatus major, Bris. Orn. 3. 482. A.—Ind. Orn. ii. p. 550. 8.—

Larger, not crested Wren, Will. Orn. (Engl. ed.) p. 228.—Gên. Syn. iv. p. 574. C.

Larger Yellow Wren, White Selb. p. 55.

Sylvia Sylvicola, Wood Wren, Lin. Trans. iv. p. 35 .- Id. vol. ii. p. 245. pl. 24.

WOOD WREN.

THAVE ever had my doubts of this bird being a variety of any species before described; but it is to my friends that I am indebted for fixing it as a distinct species. It is indeed not greatly differing in colour from the Willow Wren; but is of a more elegant make, and the colours infinitely brighter. The length is five inches and an half; the weight two drams forty-two grains: the bill is horn colour: irides hazel: nostrils furnished with bristles: upper parts of the body in general yellow green: throat, cheeks, and under part of the shoulders yellow; breast paler yellow: belly and vent a most beautiful silvery white: over the eye a streak of yellow: feathers of the wings mostly brownish, with green margins outwardly, and inwardly whitish: tail rather forked, dusky brown, edged with green: legs horn colour.

The female caught on the nest weighed three drams.

This is a migratory species, the males as usual coming first, and as Colonel Montagu observes, there is a greater distance between the arrival:

DESCRIPTION.

arrival of the two fexes than in any other bird, being often a week or ten days between. First observed the very end of April: are oftenest seen in coppice woods of oak or beech, about eighteen or twenty years growth; on the top of the most lofty of which, it may be found uttering a kind of fibilous note, during which it expands the wings, and moving them in a shivering or fluttering manner. Some have compared the note to that of the Bunting, but more shrill; it has also other kinds of notes, which may be compared to that of the Marsh Titmouse, or the spring note of the Nuthatch. The place of residence will ever detect it, as it is not to be met with in hedges or bushes, but in woods only. It makes the nest on the ground, beneath the shade of trees, constructing it of dry grass, dead leaves, and moss, lined with finer grass, and a few long hairs; in shape oval; the entrance near the top, like those of the Yellow Wren and Pettishaps, but materially different, as those birds line the nest with feathers. The eggs weigh from eighteen to twenty-two grains, are white, fprinkled all over with ruft-coloured fpots, and in fome the markings are confluent \*. They are generally fix or feven in number; and the young are hatched in thirteen days +.

YELLOW W. Sylvia Trochilus, Ind. Orn. ii. p. 550. 155.

Afilus, Small Yellow Bird, Raii Syn. p. 80. A. 10.

Afilus, Le Pouillot, ou Chantre, Brifi. iii. 479. 45.

Muscicapa Cantatrix, Green Wren, Bartram. Trav. p. 288.

Yellow Wren, Gen. Syn. iv. p. 512. 147.

DESCRIPTION.

THIS, if we except the Gold-crested Wren, is the smallest of our European birds: seldom measures more than sour inches and a quarter in length, and the breadth six inches and three quarters: the

<sup>\*</sup> In Lin. Trans. iv. tab. 2. f, 1. is the representation of it. f Mr. Beckstein.

tail fomewhat less than two inches: the plumage above is brownish green, the head darkest, and most inclined to green towards the tail: over the eyes a dusky yellowish streak: beneath, the body dusky white, tinged lightly on the sides of the neck and breast with red: knees greenish grey: tail even at the end; and the quills dusky with pale edges: legs pale.

The female differs very little from the male, except in being paler; but in the young birds, the tinge of green is more conspicuous than in the adult, and in this state somewhat approaches in colour to the Wood Wren, which is above an inch longer, besides differing in other particulars. This sometimes appears in the last week in March, but more frequently not till the first in April; and this circumstance alone will distinguish both this and the Lesser Pettichaps from the Wood Wren, which seldom appears before the end of the last-named month.

Sýlvia Sylviella, Ind. Orn. ii. p. 515. 24. Motacilla longirostra, Der Spisskopf. Naturf. 27. S. 43. 22 Lesser White-throat, Gen. Syn. Sup. p. 185. pl. 113.

LESSER WHITE: THROAT,

THIS is sufficiently described in our former Supplement, so as to make any thing further on that head unnecessary. Mr. Beck-stein makes the length of its bill, a characteristic distinction, and it certainly is a trisle more so in proportion than in the Reed Wren, Willow Wren, or Lesser Pettichaps; but it appears even greater than it really is, from the face itself being a trisle prolonged. It both hops and slies well, and may be observed at times sitting with its bill upright, continually opening and shutting it, and harshly uttering the words aetsch atsch\*. I must not omit, that a sew years since I received this very bird from Sweden, under the name of Motacilla Curreca; but whether it is the same or not with what goes by the name of Kruka in that country, and is described under that head in the

Fauna Suecica\*, can scarcely be determined. I have in another place † given some reasons for supposing it to be the Mot. Sylvia of Linnæus; but whether I may have been right in that conjecture, or that it is the Mot. Curruca of that author, or distinct from either, I leave others to determine.

GRASSHOPPER W. Sylvia locustella, Ind. Orn. ii. p. 515. 25. Ficedula pectore susco, Gerin. Orn. iv. t. 393. 27 Fauvette tachetée, Pl. Enlum. 581. 3. Grasshopper Warbler, Gen. Syn. iv. p. 429. 20.

DESCRIPTION.

SIZE of a Reed Wren; the weight three drams, sometimes more: length rather more than six inches; expands seven inches and an half: the bill is slender; the upper mandible dusky, the under whitish, with a duskytip: over the eye in the male is an indistinct trace of buff colour: the upper parts of the plumage not unaptly resembles the Sedge Warbler; but the tail differs, for it is cuneiform in a consistent degree, the two middle seathers being sull two inches and an half long, and much pointed at the tips; the outer one only one inch and a quarter, and rounded at the ends, the intermediate ones decreasing in sharpness, in proportion as they are more outward: the first quill is shorter than the second; the under parts of the body are plain dull white, inclining to dusky rusous on the breast; over the thighs, the vent, and under tail coverts, dull white, with a dusky streak down the shaft: the tail seathers viewed obliquely, appear to

<sup>\*</sup> N° 247. In this work, Linnaus says, "extima (rectrice) margine interiore as alba,"—in the Systema Natura, he writes, "extima (rectrice) margine tenuiore alba," no doubt meaning that the margin of the inner web is white. Yet adds at the end of the description in the Fauna Suecica: "Rectrices susceptible, fed margine exteriore longitudinaliter alba," which is the case in our bird, at least the outer web is very pale, approaching to white.

<sup>†</sup> Supplem. p. 186.

have eleven or twelve undulated bars of a darker hue across them, but in full light, such appearance vanishes: legs one inch long, and yellow.

The Grashopper Warblers come to us about the 17th of April: they frequent commons for the most part, and are met with there among the bushes and surze, but are excessively shy, and keep constantly in the middle of the bush; like others of the genus, the males arrive first, and are to be seen on the top of the spray, emitting a kind of grinding note, but at some times has a very agreeable kind of warble; and the male is said sometimes to entertain its mate with a song of nights, when the weather is mild and savourable. The nest is of an elegant structure, and the egg of the size of the White Throat's, not quite so round; of a delicate blueish white, or pale blue.

This species is said to be found in America \*.

PLACE.

Sylvia dartfordiensis, Ind. Orn. ii. p. 517. 31.

Curruca sepiaria, Gerin. Orn. iv. t. 391. f. 2?

Dartford Warbler, Gen. Syn. iv. p. 435. 27.—Id. Sup. p. 181.—Lewin's Birds, vol. iii. pl. 106.

DARTFORD W.

THIS species is sufficiently known, or at least nothing can be added to the description of the bird; but I am indebted to Colonel Montagu for some further knowledge of its history and manners. This gentleman found it in tolerable plenty among the surze, near Penryn, Cornwall. The bird he first shot, was the 27th of September 1796, and proved to be a young one, just beginning to throw out the ferruginous seathers on the breast; it had lost all the tail seathers but three, and the young ones were grown about half an inch: the irides were yellowish, and the orbits dull orange: the bastard wing was not white, but the edge of the wing beneath whitish; from hence

\* General Davies.

it did appear to him, that these birds probably breed in the parts adjacent. The Colonel continued to shoot these at various times till Christmas, after which none were feen: the last he killed was from a furze bush covered with snow: he is inclined to believe that they are full as common as the Stone Chat, for notwithstanding he faw and heard feveral every time he was out with the gun, they proved fo fhy. that it was impossible to procure many good specimens, nor can we be always fure of shooting them at all. The above would appear to bring some proof of their breeding thereabouts, or at least to make us suppose, that if migratory, they might be found in the same parts at flated feafons; but strange as it is, notwithflanding the strictest fearch, they have not been met with from the above period to the present time, nor can their movement be at all accounted for; it is not probable that after Christmas, with fnow upon the ground, they would be inclined to move northward, nor could they go to the fouth, except they passed the channel, which at that time of the year does not feem a likely circumstance.

PROTHONO-TARY W. Sylvia protonotarius, Ind. Orn. ii. p. 542. 128. Parus aureus alis cæruleis, Blue-winged Yellow Bird, Bartr. Trav. p. 290? Prothonotary Warbler, Gen. Syn. iv. p. 494. 123.

DESCRIPTION.

IN addition to the former description of this bird, I find that the four middle tail feathers are black, the outer one white on the inner web, except at the tip, which, as well as the whole of the outer web, is black; the next on each fide the fame; the third differs only in having the white occupying less space; the fourth wholly black, except a spot of white on the middle of the inner web.

PLACE.

I am indebted to Mr. Abbot, of Georgia, for the above, who informs me that it inhabits that province, but that it is a very rare species.

Sylvia Platenfis, Ind. Orn. ii. p. 548. 149. Avis a Corarao, Ger. Orn. iv. tab. 400. f. 1.

PLATA W.

SIZE of the Common Wren; but the tail is a trifle longer: the general colour of the plumage varied with rufous, white and black: the head and upper part of the neck streaked longitudinally: the under parts of the body from the chin white: sides inclined to ferruginous: the quills and tail crossed with several darker bands: that sigured by Gerini, was rufous above, white beneath: wings and tail dusky black.

DESCRIPTION.

Sylvia striata, Ind. Orn. ii. p. 527. 67. Black Poll Warbler, Gen. Syn. iv. p. 460. 65.

BLACK POLL W.

IN the female, the crown is the fame colour as the rest of the upper parts of the plumage; the double band on the wings less conspicuous, and the spot at the tip of the tail feathers much smaller than in the male.

Description.

Sylvia cucullata, Ind. Orn. ii. p. 528. 72.

COWLED W.

THIS is greenish above; beneath white: forehead and cheeks black: tail cuneiform.

I met with this in the Leverian Museum; and is probably a variety of the Hooded Warbler, or not very far different:

Motacilla Cyane, Ind. Orn. ii. p. 541. 122 .- Pall. reise. iii. p. 697. 18.

INDIGO W.

Pallas informs us that this bird is the fize of the Ruby-throat Thrush: the general colour of the plumage on the upper parts is deep blue; beneath white: from the bill to the wings a streak of black: outer tail seathers white.

Description.

SIZE of the Nightingale: bill brown: eye lids naked: crown and DESCRIPTION. nape cinereous brown; lower part of the last and the back black:

246

rump and vent cinereous and white mixed: throat and breast glossy black: belly yellow: legs dufky.

PLACE.

Inhabits the mountainous parts of Perfia.

24. PERSIAN

Sylvia Sunamifica, Ind. Orn. ii. p. 552. 166 .- S. G Gmel. It. iv. p. 181. 182. -Pall. N. Nord. Beytr. iv. p. 60.

DESCRIPTION.

SIZE of the Blue-breafted Warbler: general colour rufous ash: chin and throat black: breast and belly pale rusous; the seathers with white tips: wing coverts and quills white on the outer margins and tips: the two middle tail feathers are brown; the others fulvous: the vent is white; and a line of white passes over the eye towards the nape.

PLACE.

Inhabits the rocky parts of the Alps of Persia.

CAMBAIAN

Sylvia Cambaienfis, Ind. Orn. ii. p. 554. 172.

DESCRIPTION.

CIZE of a Nightingale: bill black: plumage dusky brown above; gloffy black beneath: bottom of the belly and vent dull rufous: wing coverts white: tail three inches long, even at the end: legs brown.

PLACE.

Inhabits the kingdom of Guzurat. In the British Museum.

26. GUZURAT

Sylvia Guzurata, Ind. Orn. ii. p. 554. 173.

DESCRIPTION.

CIZE of the Yellow Wren; length four inches and an half: bill and legs pale brown: body above dull green; beneath white: crown chesnut: quills and tail brown, with green margins: tail rounded.

PLACE.

Inhabits the kingdom of Guzurat, in India.

Sylvia afiatica, Ind. Orn. ii. p. 554. 174.

ASIATIC
W.
Description.

SIZE of a Nightingale: bill dusky, furnished with a few hairs at the base: head and neck black; lore and chin white: the body above brown; beneath yellowish, with a few spots of white on the breast: tail three inches and three quarters in length, cuneiform; all but the two middle feathers, from the middle to the ends of a pale colour.

This varies in having the forehead, ftreak over the eyes, and all the under parts white, and fuch of the tail feathers as are pale in the former, are in this quite white.

Found in the fame places as the two last.

PLACE.

YELLOW-VENTED W. DESCRIPTION.

HIS is pale brown above, beneath dull white: under tail coverts yellow: irides red: bill and legs brown.

Inhabits New South Wales: met with in January.

PLACE.

STREAKED
W.
Description.

SIZE and shape of an *Hedge Sparrow*: bill black; legs dusky: the upper parts of the body, wings, and tail, are not greatly different from that bird, but incline on the rump to rust colour: all the under parts are white, with sagittal streaks of black: the top of the head is black, marked with the same sigured streaks of white, and the upper parts of the body with similar black ones; from the not-trils, through the eye, and some way behind it, passes a ferruginous stripe: tail loosely webbed, and brown.

Inhabits New South Wales in July; is faid to fing remarkably well.

PEACE.

248

TERRENE W.

DESCRIPTION.

THE general colour of this bird is greenish yellow, inclining to brown, but paler beneath: quills black: the ends of the tail feathers pale ash colour: bill and legs black.

PLACE.

Inhabits New Holland; not uncommon at Port Jackson: it is a bird of short flight; not so often seen on trees as on the ground; in this agreeing with the Wagtails.

BLACK-CHEEKED W. Description.

BIGGER than a Sparrow: bill and legs dusky: tongue bristly at the end: upper parts of the plumage reddish brown; the under dusky white: cheeks black; in the middle of the patch the eye placed; through the eye an irregular streak of sine yellow, which is seen also beneath the eye, but not above it: chin blue grey.

PLACE.

Inhabits New South Wales: is a lively species, and is supposed to live principally on honey, as those birds whose tongues are jagged at the end are sound to do.

RUFOUS-VENTED W. Description.

Warbler, which it formewhat refembles: bill and legs dusky: tongue bisid at the tip, and seathered on the sides: plumage above slaty grey, coming forwards on each side of the neck, and forming on the breast a bar or crescent, at which part it inclines to blue: above this the chin and fore part of the neck are white: breast, belly, thighs, and vent, rusous: tail even at the end.

PLACE.

Found with the last described.

GOLD-BELLIED W.

DESCRIPTION.

SIZE of the last: bill slender; both that and the legs dusky black: the head, hind part of the neck, back, wings, and tail pale ash or slate colour; wings and tail darkest: rump yellow: all the under parts golden yellow; but from the chin to the breast deepest: between the bill and eye, and just round the latter, black.

Inhabits the same places as the former ones.

PLACE.

RUDDY W. Descriptions

THIS is a trifle larger than the Red-breaft: the bill is slender and dusky: irides hazel: legs yellow: the plumage above brownish ash colour; beneath wholly ferruginous, inclining to yellow: wings and tail brown; the last rounded in shape.

Inhabits New South Wales.

PLACE.

CHASTE W. Description.

THE upper parts of the plumage is ferruginous brown; beneath yellowish white; clouded on the breast with pale blue, and on the sides with ferruginous: over the eye an irregular dusky brown streak: tail dull pale yellow, blotched down the middle with spots of brown.

Found with the last.

PLACE. 36. WHITE-TAILED

THIS is brown above; beneath blueish white: quills black; across the middle of them a patch of white: tail longish; all but the two middle feathers white: legs lead colour.

Inhabits New South Wales: not unlike the Dirigang Creeper in colour, but is clearly distinct from that bird.

Description.

PLACE.

SUPP. II.

CRIMSON BREASTED W.

W. Description

SIZE uncertain: bill and legs brown: plumage above blue; beneath white: fore part of the neck and breast fine crimson. Inhabits New South Wales.

38.
RUSTY-SIDED
W.
Description.

PLACE.

SIZE of a Wren: bill dusky: legs pale: the greater part of the head and wings, lower part of the back, and all except the two middle tail feathers green: hind part of the neck, the beginning of the back, and the two middle tail feathers blue grey; under parts of the body whitish, but the sides of it are ferruginous: between the bill and eye a narrow streak of black.

PLACE.

Found with the last.

SWALLOW W.
Description.

Sylvia Hyrundinacea, Nat. Misc. iv. pl. 1145.

THIS is a small species: all above the plumage is black; from the chin to the breast fine crimson; from thence to the vent white, divided down the middle with a broad black streak: the vent and under tail coverts orange.

PLACE.

Inhabits the same places as the last, of which it is probably a variety.

VARIABLE W. Description.

BILL black: legs pale brown: plumage above brown, clouded with purplish red; beneath blueish white: the two middle tail feathers brown; the others purplish red, tipped with white.

PLACE.

Inhabits New South Wales.

Motacilla flammea, Muf. Carlf. fasc. iv. tab. 97.

FLAME-COLOURED W.

THIS elegant little bird is the fize of a Wren: the bill, legs, wings, and tail, are black: the head, neck, and back, a beautiful pale orange or flame colour: eyes black: tongue furnished with two hairs at the end: the belly pale grey.

PLACE.

Inhabits the *Palm Trees* of *Java*. Dr. *Sparrman* fays there are feven prime quills, nine fecondaries, and ten tail feathers; but in the *Warbler* genus we find in general not fewer than twelve.

Motacilla Pusilla, White's Journ. t. p. 257.

DWARF W.

THIS is about the fize of the Superb Warbler: the upper parts of the plumage brown; pale beneath, with a band of brown towards the tip of the tail: bill and legs black.

DESCRIPTION.

Inhabits New South Wales: has evidently some affinity with the species to which it is compared above; but the tail is not cuneated, being even at the end.

PLACE.

## GENUS XLIV. MANAKIN.

Nº 1. Superb M.

2. Picicitli M.

3. Miacatototl M.

4. Speckled M.

N° 5. Supercilious M.

6. Cærulean M.

7. Long-tailed M.

8. Crimfon-throated M.

SUPERB M. Description. Pipra superba, Ind. Orn. ii. p. 556. 4.

Manacus superbus, Pall. Spic. sasc. vi. pl. iii. f. 1:

SIZE of the Blue-backed Manakin: bill black: general colour of the plumage deep black; but the crown of the head has the feathers pretty long, forming a creft of a glowing red colour: back between the wings pale blue: prime quills brown: tail short, composed of ten feathers: legs yellowish.

This feems to differ very little from the Blue-backed Manakin.

PICICITEI

M.

Description.

Pipra Picicitli, Ind. Orn. ii. p. 559. 16.. Avis Picicitli Tetzcaquensis, Fern. N. Hisp. p. 53. cap. CC.

THIS is a small species: general colour cinereous: head and necked black: on the sides of the head a white spot, in which the eyes are placed, which proceeds on each side to the breast.

PLACE..

Inhabits Mexico; appears there after the rainy feason; is destitute of a song; will not bear confinement; is esteemed as good food: not known where it breeds.

MIACATO-TOTL M. Description.

Pipra Miacatototl, Ind. Orn. ii. p. 560. 19.-Fernand. Hift. N. Hifp. p. 30.

THIS is black, with white feathers intermixed: belly pale: wings and tail beneath cinereous.

PLACE ..

Inhabits Mexico; is feen frequently perched on the Maize plants;

affects the cooler situations; is accounted good food. Both this and the last are of a doubtful genus.

Speckled Manakin, Nat. Misc. pl. 111.

SPECKLED M.

SIZE small; and the different specimens vary considerably: the bill black: legs brown: the whole top of the head and back of the neck black, marked with pale spots: back and wing coverts brownish yellow, with the middle of each feather dark brown: the outer edge of the wing, the quills, and tail black, spotted with white; all the under parts of the body yellowish white, with a tinge of red on the breast: lower part of the back dull yellow: rump crimson.

In another, only the top of the head is black, spotted with white: hind part of the neck blue grey. In both, the forehead, and between the bill and eye, are yellowish, and in the last-mentioned, the yellow appears to pass through the eye, and is just seen at the back part of it.

Inhabits New Holland. I am indebted to the pencil of General Davies for these descriptions, taken from specimens in the possession of Captain King. These seems to have some affinity to the Striped-headed Manakin.

PLACE.

SUPERCILIOUS M.

Description.

SIZE of the Speckled Manakin: bill and legs brown: general colour of the plumage above pale reddish chesnut; beneath dirty yellowish white: over the eye a whitish mark, bounded above with black: quills brown: tail short, black; the two middle seathers dotted on the sides, and the others at the ends, with white,

Inhabits New Holland.

PLACE.

6. CÆRULEAN M. Description.

SIZE of the last: bill and legs brown: tongue jagged at the end: plumage on the upper parts of the body blueish: crown, quills, and tail dusky black; under parts of the body yellowish white.

Native place uncertain.

LONG-TAILED

M.
Description.

Long-tailed Manakin, Nat. Misc. vol. v. pl. 153.

SIZE of the Blue-backed Manakin: the general colour of this bird is a fine blue: the whole crown of the head crimfon: wings black: two middle tail feathers elongated to a point three quarters of an inch beyond the rest: the plumage, especially about the neck, is glossed with green: bill brown: legs of a pale colour.

Native place not mentioned.

CRIMSON-THROATED M. Description.

SIZE of the Gold-headed Manakin: the upper parts of the plumage blueish black: chin, throat, fore part of the neck and vent crimfon: belly white: bill pale: legs dusky.

I met with a specimen of this bird in the collection of General Davies, who informed me it came from the island of Huaheine. In stature and appearance it is not unlike our Crimson-vented Manakin; but whether at all allied to that bird must remain for suture inquiry.

## GENUS XLV. TITMOUSE.

Nº 1. Crimfon-rumped T.

Nº 4. Indian T.

2. Crested T.

5. Knjaescik T.

3. Alpine T.

Parus peregrinus, Ind. Orn. ii. p. 564. 4.—Mus. Carls. ii. p. 48. 49. Crimson-rumped Titmouse, Gen. Syn. iv. p. 539. 4.

CRIMSON-RUMPED T. Descriptions

In the male, according to the figure in Mus. Carls. the head, neck, and back, are ash colour: between the bill and eye, and under the last, dusky black: fore part of the neck and breast high orange colour; rump the same: bill and vent whitish: under part of the wings pale brimstone; above black; but the bases of some are orange, making a spot on the wing: the sour middle tail feathers are black, the rest black as far as the middle, from thence to the ends orange: the semale has the upper parts the same ash colour as the male, but paler: the whole of the under parts are dusky white: rump orange: spot on the wing the same, but paler: tail as in the male, but more of the seathers are tipped with orange: bill and legs in both black.

This is a doubtful species, and is so like the Flammeous Flycatcher in some of its changes (for we have seen several varieties of that bird) that it has been with difficulty that we have kept it apart therefrom.

Parus cristatus, Ind. Orn. ii. p. 567. 14. Crested Titmouse, Gen. Syn. iv. p. 545. 12:

CRESTED T.

E have heard of this species being plentiful in some parts of Scotland, especially in the pine forests, from whence I have received a specimen, now in my possession.

ALPINE T. Parus alpinus, Ind. Orn. ii. p. 569. 21.—S. G. Gmel. It. iv. p. 171.—Pall. N. Nord. Beytr. iv. p. 49.

Description.

SIZE and shape of the Long-tailed Titmouse: the seathers on the upper part of the body are black, margined with ash colour; beneath pale rusous, spotted with black: a white line from the base of the bill, running towards the nape: quills black: tail the same, a trisse forked in shape; the outmost feather marked with a cuneiform spot of white at the tip.

PLACE.

Inhabits the higher parts of Persia; and lives on insects.

INDIAN
T.
ESCRIPTION.

Parus indicus, Ind. Orn. ii. p. 572. 29.—Mus. Carls. fasc. ii. tab. 50.

SIZE of the Greater Titmouse: bill and legs brown: forehead dusky; the rest of the upper parts of the plumage cinereous: chin and throat dusky white: breast, belly, and vent, serruginous: wing coverts dusky black, with cinereous margins: quills and tail dusky; the last a trisle forked.

PLACE.

Inhabits India.

KNJAESCIK T. Parus Knjaescik, Ind. Orn. ii. p. 572. 30 .- Lepech. It. i. p. 181.

THIS is white, with a livid coloured collar; a stripe of the same through the eyes, and a continued stripe on the under parts of the body.

PLACE.

Inhabits the oak forests of Sibiria.

Esculent Swallow with the Nest.

## GENUS XLVI. SWALLOW.

Nº 1. Esculent Sw.

2. Aculeated Sw.

5. Javan Sw.

3. Needle-tailed Sw.

Hirundo esculenta, Ind. Orn. ii. p. 580. 26.—Olear. Mus. tab. 14. fig. 2 and 6. (the nest.)

' Chinesische Felsen Schwalbe, De Vries, S. 279.

Small Grey Swallow, with a dirty white belly, Emb. to China, i. p. 288.—Id. ii. p. 5.

Esculent Swallow, Gen. Syn. iv. p. 578. 28.

ESCULENT SW.

DESCRIPTION.

SIZE of the Sand Martin: length four inches and a half: from the tip to tip of the wings expanded, full eleven inches: the bill is small and black; gape wide: general colour of the plumage dusky black, and glossy above; all the under parts from the chin to the vent pale ash colour: the wings are very long, measuring from the joint of the shoulder to the end of the quills, four inches and a half; and when closed, exceeding the end of the tail by at least one inch: the tail is rather forked, all the feathers rounded at the ends, and all of a plain dusky black colour; the three outer feathers on each side are one inch and three quarters long, and of nearly equal lengths, but the three interior shorten by degrees as they approach inwards, the two middle ones being no more than one inch and a quarter: the legs are dusky, and bare of feathers.

We are inclined to credit, with Sir George Staunton\*, the possibility of more than one species being concerned in making the much esteemed nests; but in case it be not so, the bird formerly supposed

· Emb. to China, i. p. 290.

SUPP. II.

L 1.

to

to be the fabricator of the nests in question, must be totally distinct from the one here described, as that is represented smaller than a Wren, with a white belly, and white spots on the end of the tail \*; but no such marks are to be found in our species.

It is far from improbable to suppose, that even more than the two species above hinted may be concerned. Willughby, Ray, Klein, and some others, call their bird particoloured, the meaning of which is by no means clear. De Vries, specifically as large as a Swallow, and black †; and Sir George Staunton, in his short description, says, small grey Swallows, with bellies of a dirty white; but he observes, they were so small, and slew so quick, that they escaped the shot fired at them. The way to reconcile these differences must be left to suture observers.

The specimen from which the figure is taken, is now with its young in my collection, presented to me by Sir Joseph Banks, having been sent to him from Sumatra.

I have also been enabled to give a figure of the nest, being not only furnished with an accurate drawing of one, but likewise the nest itself, from Mr. Hay, junior, of Portsea.

ACULEATED SW.

Hirundo Pelasgia, Ind. Orn. ii. p. 581. 30.—Bartram's Trav. p. 290. Aculeated Swallow, Gen. Syn. iv. p. 583. 32.

THIS Mr. Bartram calls the House Swallow, because it builds in chimnies, in the same manner as our Chimney Swallow does in Europe; which last is also found in America. He observed vast flights not only of this, but the Bank Martin, pass northward from Carolina and Florida, towards Pennsylvania, where they breed in spring, about

\* Described by M. le Poivre, and taken up by Brisson and Linnæus, and afterwards by M. Busson.—See also Gerin. Orn. iv. t. 411. fig. 2. In all these figures, the wings reach no farther than the rump.

+ "Men find int Konighryck Tanquin, des gelycks op de Küst van Coromandel Seekere Soort von Swarte Vogelen so groot als eene gemeene Swaluw."

the

the middle of March, and likewise in September and October, on their return southward.

NEEDLE-TAILED SW.

THIS is twice the fize of the last, though in many things not unlike: the bill is broad and stat, and the claws strong: the general colour is dusky, with a gloss of green on the wings and tail, and the inner wing coverts mixed with white: the forehead is white, and the throat nearly so, being very pale: the tail feathers surnished at the ends with projecting points, as sharp as a needle.

Inhabits New South Wales; met with in most plenty in February; and among other insects, observed to feed on a large locust, which at that season is very common.

PLACE.

NEW-HOLLAND SW. Description.

SIZE of the last: general colour dusky brown, and without any tinge of green on the upper parts: throat and rump blueish white: the tail feathers run to a point, but are destitute of the needle-shaped processes at the tips.

It is found with the last, and report affirms it to be the female; but it may be doubted, because in the American species, both sexes have the tails alike.

PLACE.

Hirundo javanica, Mus. Carls. iv. tab. 100.

JAVAN SW. Description.

A Trifle less than the Chimney Swallow: bill flat, pointed, black; nostrils oval; gape wide; tongue bifid: wings longer than the tail: the body above blueish black, glossy: forehead, throat, and fore part of the neck ferruginous: breast, belly, rump, and under part of the wings, pale ash colour: quills black: tail even at the end; the two middle feathers plain black, the others the same, marked with a white spot on each: legs black.

Inhabits Java; makes the nest in the earth.

BOMBAY

Caprimulgus afiaticus, Ind. Orn. ii. p. 588. 16. L'Engoulevent à collier, Levaill. Oif. i. p. 186. pl. 49. Bombay Goat-sucker, Gen. Syn. Sup. p. 195. 16.

DESCRIPTION.

THIS, by M. Levaillant, is likened to our European species in size, and differs not in description from the Bombay Goatsucker above referred to, except in having the white on the throat broadening out on the sides into sine yellow orange.

The female is faid to be fmaller; and the white on the throat inclines to rufous, but without the accompanying orange feathers for confpicuous in the male; and the fpot on the tail rufous instead of white. It is in the orange streak being a continuation of the white one on the throat, that this bird differs from our Bombay species, in which it is not seen; and may arise from different periods of age.

PLACE.

This is found in the inward parts of the Cape of Good Hope, but not at the Cape itself; is well known on the borders of the Gamtoos, in Hottniqua Land, especially towards the bay of Lagoa, or Blettenberg; called there Night Owl; seeds on insects, especially beetles, which it takes from the ground, as it does others in slying, swallowing them whole, like the rest of this genus.

They pair in September; lay two white eggs on the ground, sometimes in a hedge; the male and semale sit by turns: if the eggs are disturbed; disturbed, take them to another place in their bills; make a horrid noise for an hour at least after sun-set, and before sun-rise, so as todisturb the neighbouring inhabitants; and in fine nights, sometimes the whole night through,

Caprimulgus Novæ Hollandiæ, Ind. Orn. ii. p. 588. 18. Crested Goat-sucker, Phill. Bot. Bay, t. p. 270.—White's Journ. t. p. 241.

NEW.
HOLLAND
G.
DESCRIPTION

entry control of the plumage on the upper parts brown, mottled and croffed with obscure bars of white: quills plain brown, but the edges of four or five of the outer ones dotted with dusky white: the tail rounded in shape, or slightly cuneiform; the two middle feathers five inches long, the outmost four; the two middle ones croffed on both webs with twelve dusky white bars, dotted with brown; but the others only on the outer webs: the under parts of the body mostly white; but the throat, breast, and sides are marked with narrow dusky bars: bill black; inside of the mouth yellow; sides of it furnished with bristles, as in many of the genus; besides which, at the base of the bill, before the eyes, are terr or twelve stiff bristles, barbed sparingly on each side, and standing erect, so as to represent a crest: the legs are pale yellow: the toeslong and slender: claws black, but not pectinated.

Inhabits New Holland: no account has been hitherto learned of the manners, further than that it appears about our fettlement at Port Jackson, in March.

In some drawings in possession of Mr. Lambert, I observed one very similar, though smaller; but does not seem to differ sufficiently to require a separate description.

PLACE:

3.
BANDED
G.
Description.

HE fize of this bird is not certain, but supposed to be ten or eleven inches long: the bill is black, not very large, and bent; and the gape exceedingly wide, as usual in the genus: the irides orange or yellowish: the head is sull of seathers, and of a dirty stell colour; the rest of the neck and under parts of the body not much different, with a ferruginous tinge: under the eye, on the sides of the neck, and beneath the wings, crossed every where with broken dusky lines and other markings: the crown and back part of the neck are black, coming forwards on each side in a curved point over the eye: across the nape is a band of black, ending on each side about the middle of the neck, where it divides into two parts: the back and wings are dusky blue, powdered with black: quills dusky, edged and spotted with dusky rust colour: tail dusky, with dull pale ferruginous spots on each side of the webs of the feathers; in shape somewhat forked: legs reddish slesh colour.

PLACE.

Inhabits New South Wales, where it is called by the English, Musquito Hawk, a name, it must be remarked, the Goatsucker of North America is known by: most frequent in July.

STRIGOID
G.
Discription.

THIS is twice the fize of the European species; and at a distance having the appearance of the Short-eared Owl: the general colour of the plumage is rusty brown above; marked on the head with rusty brown streaks, and the back mottled and streaked with the same: on the wing coverts are three oblique palish mottled bars: quills brown, with pale spots on the outer margins: the under parts of the body not unlike the upper, marked with narrow sagittal streaks of brown: tail somewhat sorked: the sides of the head, through the

eye,

eye, pale brown; above the eye, a pale clouded whitish streak: bill black: legs yellowish.

Inhabits the fame parts, and at the fame time with the last: the native name Bir-reagel.

PLACE.

GREAT. HEADED G.

THIS is a large species, being full thirty inches in length: the bill very stout, more so than in any other species; colour pale brown: general colour of the plumage dull black or dusky brown, mottled and streaked with whitish and rust colour: breast pale dull ferruginous: belly pale ash colour: the quills are barred or spotted with black and white alternate, the tail the same; on both webs the white transverse mark being bordered above with black; in shape rounded at the end: the head and neck are remarkably large and full of feathers, with a series of longer feathers arising at the base of the bill, standing up like a crest: irides yellow: legs pale yellowish brown.

Inhabits New South Wales, with the others.

PLACE.

GRACILE
G.
Description.

THIS is a large species: the bill stout, pale brown, with several erect bristles at the nostrils: irides and legs yellow: the plumage above is mottled and streaked, not greatly unlike our European species, but seems to be of a more slender make, and has a larger tail in proportion: all the under parts from the chin are whitish, mottled and streaked with ferruginous yellow.

Inhabits New South Wales; called by the natives Poo-book.

PLACE.

FORK-TAILED
G.
Description.

Engoulevent à queue fourchue, Levaill. Ois. i. p. 178. pl. 47. 48.

recorded; for it measures from the tip of the bill to the end of the tail, twenty-fix inches: the body does not exceed the fize of the Brown Owl; but the neck and the tail make two-thirds of the general length: the bill is black, much bent, and when the mouth is closed, appears very small; on the contrary, the gape is astonishingly large; the upper mandible has a singular kind of notch about the middle, into which the under one shuts, whereby the union of the two becomes most complete: the plumage is not far different in colour from that of the European species, being composed of a mixture of black, brown, rusous, and white; but the most conspicuous character is the enormous length of tail, which is greatly forked in shape, the middle feathers not being more than half the length of the outer ones: the legs are yellow.

PLACE.

A male and female of these were by chance procured by Mr. Levaillant; they had taken their abode in a hollow decayed tree, which had fallen by the side of the river of Lions, in Great Namaqua Land, in the interior of the Cape of Good Hope. It makes a noise sounding somewhat like Gher, r, r, r, r, in this not greatly differing from the European species.

8.
LEONA
G.
Description,

Caprimulgus macrodipterus, Afzelius Descr. Sierra Leon. tab. in Do. Leona Goat-sucker, Nat. Misc. 8. pl. 65.

THIS fingular species is about the size of the European one, and not far different from it in the general markings: the length from the bill to the end of the tail is eight inches and a quarter; but

the remarkable circumstance belonging to it, is the having a single feather springing out of the middle part of the coverts of each wing, full twenty inches in length: this continues as a plain unwebbed shaft for sourteen inches and three quarters, having a few solitary hairs on the inside only, from thence it expands into a broad web for the remaining sive inches and a quarter of its length. This part is mottled, not unlike the darker part of the rest of the plumage, and crossed with five dusky bars: the web or blade has almost the whole of its breadth on the inner side, being there more than one inch broad, but very narrow on the outer part of the shaft: the legs are small.

Inhabits Sierra Leona, in Africa; several of them have been brought into England: one of which was added to my collection by Th. Wilson, Esquire.

Lev. Mus. p. 227. t. 55.

BRONZE-WINGED P. Description.

SIZE of a Common Pigeon: bill and legs red: the general colour of the plumage is cinereous brown on the upper parts; on the under cinereous, with a tinge of red on the breast: on the middle of the wing a large patch or rather double bar of beautiful resplendent copper bronze, varying in different lights to red and green, arising from each of the middle coverts, having a large oval spot of bronze on the outer webs near the ends; some of the adjacent seathers have also similar spots, but in a less degree, and making no part of the large patch: the tail consists of sixteen seathers; the two middle ones brown;

brown; the others dove colour, croffed with a bar of black near the ends: the forehead in some specimens is buff colour, nearly white, with the chin the same, passing beneath the eye: in others, the whole of the sace is brown, with a dark streak through the eye.

This inhabits Norfolk Island, also various parts of New Holland, and no where more frequent than in the neighbourhood of Sidney Cove and Botany Bay; more especially in fandy and defert tracts; is only feen from September to February, and at that time very numerous; and chiefly in pairs. They make a nest either in the stump of some low tree, or on the ground; lay two white eggs in a very slight nest, and hatch in November: are observed to feed chiefly on a fruit like a cherry, the stones of which have been found in quantities in their stomachs. The places they frequent are easily known, as they make a loud kind of cooing noise, which at a distance may be mistaken for the lowing of a cow. The name it is known by, in New Holland, is Goad-gang, and by the English, Ground Pigeon, being unable to take long slights, and seen chiefly on the ground or low trees; called by some also Brush Pigeon.

Columba brunnea, Ind. Orn. ii. p. 603. 38.

THE bill and legs in this species are blood red: the crown, upper part of the neck, back, and wing coverts, red brown: breast, fore part of the neck, and rump, glossy green.

Inhabits New Zealand.

Columba Ægyptiaca, Ind. Orn. ii. p. 607. 49 .- Forsk. Faun. Arab. p. 5. 15:

THE bill is black: head flesh colour, with a tinge of violet: orbits naked, and blueish: the feathers of the throat are cuneisorm, black, divided at the tips into two slender lobes, which diverge, are truncated at the ends, and of a rusty flesh colour: back cinereous:

M m 2 breast

PLACE.

BROWN P. DESCRIPTION

PLACE.

EGYPTIAN
P.
Description.

breaft violet flesh colour: belly and thighs whitish: wings chiefly brown: the two outermost tail feathers are cinereous at the base, in the middle black, the rest white; the two next on each side cinereous at the base, black in the middle, and whitish at the very tip; the sisten on each side brown, with a dusky middle; and the two middle ones wholly brown: legs slesh colour.

PLACE.

Inhabits Egypt; mostly seen about houses: whether this is the most common species which frequents those parts is not said; but Savary \* informs us, that in Egypt, Pigeons are more numerous than in any other country whatever, being in such vast slights as to darken the air; and this seems credible, as every hamlet, every town, as we are told, forms one vast pigeon house.

WHITE-FACED
P.
DESCRIPTION

THIS is much larger than our Turtle: the bill and legs reddish: face and sides of the head, as far as the eyes, white: before each eye a triangle of black, and behind a crimson spot: crown and hind head pale ash; and the rest of the neck dusky: upper part of the body and wings dull green; some of the inner quills ferruginous: beneath from the breast white; sides of the breast next the wings black: sides of the body marked with a double series of black spots.

PLACE.

Inhabits New Holland: native name Goad-gang.

PIED P. Description.

SIZE of the last: bill and legs the same: the whole of the sace, reaching beyond the eyes, white: the general colour of the plumage greenish black on the upper parts, which colour wholly surrounds the neck; and below this, coming forward on each side irregularly on the breast, but not meeting thereon; from that part where

\* Letters on Egypt. Let. 31.

the

the black furrounds the neck, the under parts are white, but the fides of the body near the wings, and the vent, marked with feveral spots of black: the tail is black, tipped with white.

This feems greatly allied to the last, perhaps differing only in fex or age. Both of them were feen at *Port Jackson*, in *New Holland*, in *December*.

PLACE.

Waalia Pigeon, Bruce's Trav. iv. p. 282. 290.—Id. App. tab. p. 186.

WAALIA P.

THIS is less than the Common Blue Pigeon, but larger than the Turtle Dove: the general colour is green, inclining to olive: head and neck darker and less lively than the rest: the pinion of the wing is of a beautiful pompadour colour; the outer edge of the wing narrowly marked with white: tail dirty pale blue; below the tail spotted brown and white: thighs white, spotted with brown: belly of a lively yellow: the bill is a blueish white; nostrils large: irides dark orange: legs yellowish brown; seet large.

Description.

This inhabits the low parts of Abyfinia; perches on the highest trees, sitting quietly during the heat of the day; slies, high, and in vast slocks; frequents mostly a species of beech tree, on the mast of which it seems chiefly to live. In the beginning of the rainy season, in the Kolla, they emigrate to the south and south west, and are frequently so extremely fat, as to burst on their falling to the ground. Mr. Bruce, from whom the above account is taken, observes, that it is the sattest and best of all the Pigeon kind; yet the Abyssinians will not taste the slesh, holding it in abhorrence. The name Waalia, given to it by Mr. Bruce, is from the bird being frequently met with there, and lies due north west from Gondar: it seems greatly allied to the Pompadour Pigeon\*.

PLACE.

GUINEA P. Numida Meleagris, Ind. Orn. ii. p. 621. 1. Guinea Pintado, Gen. Syn. iv. p. 685.—Id. Sup. p. 204.

R. Sparrman fays, he found these birds in great plenty in the inner parts of the Cape of Good Hope; and Mr. Levaillant \* gives much the same account; but adds, that being frightened from the trees, they run a good way, and on their attempting to take wing again, are often caught in numbers by the dogs, without firing a shot; the dogs first frighten them, by barking at the roots of the trees, where they sometimes rooft by hundreds of evenings.

They are likewise very common on the mountains in the island of Hinzuan or Johanna +.

EGYPTIAN
P.
DESCRIPTION.

Meleagris ægyptiaca, Ind. Orn. ii. p. 622.—Ger. Orn. ii. p. 80. tab. 232.

THE bill in this bird is pale red: legs blueish black: the head and neck rusous, and very thinly beset with hairs; the seathers on the top of the head long, standing upwards as a crest; on each jaw a folded rugose skin, of a pale blue colour, but not enough elongated to be called a wattle: the body is black, marked with blueish spots, much larger than in the Crested species, of which it may perhaps only prove a variety.

This description was taken from a living specimen in the aviary at Versailles, in 1728.

\* Lewaill. Voy. i. p. 195. (Fr. ed. 8vo.)

+ Afiat. Refearch. ii. p. 86.

ublished as the Act directs May 30, 1801 by Loish Salledy & Son Fork Sweet Covert Barden

### GENUS LIII\*. MENURA.

BILL flout, conico-convex, a trifle naked at the base.
Nostrics oval, placed in the middle of the bill.

Tail long, confifting of fixteen loofe webbed feathers; the two middle ones narrow, exceeding the others greatly in length; the outer one on each fide growing much broader, and curved at the end.

LEGS stout, made for walking.

SUPERB M. Description.

"I'HIS singular bird is about the size of a Hen Pheasant; the total length from the point of the bill to the end of the longest tail feathers is more than three feet and a half: the bill, from the tip to the beginning of the feathers at the base, is one inch and a quarter, but to the gape about half an inch more; it is nearly straight, except towards the end, where it is somewhat curved; the nostrils are a longish oval sit, placed beyond the middle part, where it is depressed; round the eye so little furnished with seathers, as to appear nearly bare: the head of the male is somewhat crested: the general colour of the plumage on the upper parts brown: the greater part of the wing inclining to rufous: the fore part of the neck, from the chin to the breast, inclines also to rusous, but the rest of the parts beneath are of a brownish ash colour, paler towards the vent: the tail confifts of fixteen feathers, and is of a fingular construction, being chiefly composed of loose webbed feathers, much resembling those springing from beneath the wings of the greater Bird of Paradise, but the vanes are placed at a quarter of an inch distance each; these feathers are twelve in number, and more than two feet in length; besides these are, firstly, two slender feathers which take rise from the centre of the tail above, and reach confiderably beyond the ends of the others, and curve towards the end, they are fully webbed on the outer fide, but on the inner only furnished with short vanes, one eighth of an inch long; and lastly, the exterior feather on each side is fingularly conspicuous, in length somewhat shorter than any of the others, but the webs fully connected throughout, at the base about

an inch wide, gradually increasing from thence to the extremity, where it is full two inches broad, and considerably curved; the outer web is pale brown, and narrow; the inner very broad, inclining to grey, but from the middle to the edge fine rusous, marked with fixteen curved marks seemingly of a darker colour, but on close inspection are perfectly transparent; the end of the seather dusky black, fringed all round with white: the thighs are covered with seathers quite to the knees: the legs scaly and rough, surnished with strong claws, curved much like those of a Fowl or Turkey: the colour of both bill and legs is glossy black.

I find a fecond specimen of this bird in the British Museum, supposed to be the female, but I suspect it to be a young bird. In this the loofe webbed feathers are only fo from the middle to the ends, being the rest of their length closely connected as in other birds, and not only the exterior feather has the crefcents, but the next to it likewife on each fide, though much-less distinct. In this the two slender middle tail feathers were wanting, whether accidental or not could not be determined. Since my penning the above, I have been favoured by Mr. Thompson, of Saint Martin's Lane, with the inspection of specimens of both male and female; the former feemed to answer to the first description; the latter is in comparison a very plain bird: it is not at all crefted, and thirty-five inches long from bill to tail, which is cuneiform in shape; the longest feathers being nineteen inches long, the outer eleven inches; all the feathers as perfectly webbed as birds in general: the colour of the plumage is deep brown: belly inclining to ash colour, but the quills and tail are darker than the rest: the quills reach about two inches on the base of the tail.

PLACE.

The above curious bird inhabits New Holland, where it is faid to be rare; as yet we know only of five specimens having arrived in England, nor have we been able to obtain any account of its manners, or name it is known by among the natives. It may be suspected that the bird rather affects to be upon the ground, in the manner of our poultry, as the manifest wearing of the ends of the claws seem to justify; not but in all probability these birds may perch on trees of evenings occasionally, as is usual in many of the gallinaceous tribe.

### GENUS LIV. PHEASANT.

Nº 1. Superb Ph.

Nº 2. Fire-backed Ph.

Phasianus superbus, Ind. Orn. i. p. 628. 2. Var.—Lin. Mantiss. 1771. p. 526. Var.
Phasianus varius, Nat. Misc. 10. pl. 353.
Superb Pheasant, Gen. Syn. iv. p. 709. 2. Var.

SUPERB PH. VAR.

THIS bird is of the fize of a small Cock: the bill and legs yellow: it is furnished with a crest and wattles, which last occupy almost as much space as in the Turkey: on the neck are hackles, as in the Cock, of a dark green, with pale edges: the feathers over the shoulders are long and black, edged with chesnut: the breast and under parts black: the rump surnished with long black hackles, with pale edges: the tail of a dark shining green, with the long sickle-shaped feathers hanging on each side, as in the domestic Cock: the quills are brown: on each leg is one spur behind, at the usual place.

DESCRIPTION.

This was shewn to me by Mr. Humphries, a collector of curious subjects in Natural History; but he was able to give no account of it, further than that it was supposed to have come from India.

In a drawing shewn to me by Colonel Woodford, the feathers of the neck were blue, edged with yellow: lesser wing coverts golden yellow; the rest of the wing orange tawny: vent white: rump hackles black, with deep yellow edges: quills and tail deep blue, with two sickle feathers on the sides, as in the common Cock: bill and legs yellow, with one spur behind.

FIRE-BACKED PH. Fire-backed Pheasant of Java, Emb. to Chin. i. p. 2.46. pl. 13.—Nat. Misc. 9. pl. 321.

DESCRIPTION.

SIZE of a common Fowl: the bill long, pale in colour, and pretty much curved, yet less so than in the Impeyan Pheasant: the face and sides of the head, much beyond the eyes, covered with a bare rugose skin, as in others of the genus, and hanging in a kind of wattle on each side the throat: the general colour of the plumage black, with a gloss of blue in some lights: the feathers at the back part of the head much lengthened into a sort of crest: the lower part of the back ferruginous, varying into a bright stery orange colour in different resections of light; this surrounds the belly, and is much of the same colour, but without the brilliancy of orange as above: the feathers of the neck and breast are rounded at the ends, and appear distinct and scaly, as in the common Turkey: the tail of the same colour as the body: legs stout, scaly, each surnished with a long and stout spur, sharp at the end; the colour pale like that of the bill.

The above was presented to Sir George Staunton at Batavia; but whether indigenous to Java or not, is far from certain.

The tail was mutilated, fo as to make it impossible to ascertain of what length it had been originally.

## GENUS LVI. GROUS.

Nº 1. Hybrid Gr.

Nº 2. Gooto Gr.

Tetrao hybridus, Mus. Carls. fasc. i. t. 15? Hybrid Pheasant, White's Nat. Calend. pl. in p. 65.

HYBRID GR.

DESCRIPTION.

THIS, from the appearance in the plate, is certainly more allied to the Grous than the Pheafant genus; and does not feem to differ materially from that in the Carlfonian Museum. Did not Mr. White in another place \* expressly say, that the Black Grous was at the time of his writing extinct at Selborne, we should have no hesitation to pronounce it a mixed breed between that bird and the Pheasant; however, the fact is not impossible, as the Black Grous still remains in several parts of Hampshire. This bird weighed three pounds three ounces and a half: the back, wings, and tail pale russet, curiously streaked, somewhat like the upper parts of a Hen Partridge: the tail blunt and square at the end: head, neck, and breast, glossy black; some of the feathers edged with pale yellow: round the eye a bare scarlet red space; the bill stout and black, as in the Black Grous: legs pale brown, totally bare of feathers; claws black.

This was shot at large in a coppice in the Holt, a seat belonging to Lord Stawel.

\* Hift. of Selborne, p. 16.

GOOTO
GR.
Description.

Gooto, Bruce's Trav. i. p. 80. 241.

M.R. Bruce says, that a bird like a Partridge, and better than a Pigeon, is common in the desarts of Africa: he gives, however, but an impersect description of this species, if distinct from those already known: he describes it as being of different colours in different places: that of the desarts of Tripoli and Cyrenaicum very beautiful; that of Egypt spotted white like a Guinea Fowl, but upon a brown ground, not a blue one, as the latter is. About Tor, very small, and coloured like the back of a Partridge; but indifferent food, as all of them are. Mr. Bruce expressly says, this is not of the same kind as the Partridge, as the legs and feet are covered with seathers, and has but two toes before. It feeds on insects.

Mr. Garnet, in his Tour through the Highlands of Scotland, mentions, that on account of the different temperatures of the air of the mountain Benlomond, the perpendicular height of which is faid to be 3,262 feet, that the Plovers abound near the middle of the mountain, Grous a little higher, and near the top Ptarmigans, which were remarkably tame.

CAPE P.

THERE are many reasons to suppose this bird and the Senegal Partridge to be not far distant in species, though we by no means are able to confirm it. It may however be observed, that both inhabit Africa. The first supposed to be the male, the latter the female, in incomplete plumage: our bird has two spurs, the lower one of which is stout and sharp; the Senegal Partridge has likewise two, but both of them blunt, a circumstance not uncommon in semale birds, both of the Partridge and Pheasant genus.

What the *Partridges* were which Mr. Levaillant talks of finding at the Cape, we are not able to affirm. He merely fays, they were as big as *Pheasants*, and of three kinds, and in such quantities as to serve them as ordinary food; and they put them by scores into the pots, in order to make soup of them \*.

278

CEYLON P. Tetrao Ceylonensis, Ind. Orn. ii. p. 644. 3. Ceylon Partridge, Gen. Syn. iv. p. 758.

IN the only description extant of this bird, the fize is not mentioned; but having seen drawings of the female, both in Lady Impey's drawings, and those of Mr. Middleton, it appears to be at least as big as a Fowl.

ASIATIC P.
Description.

Perdix asiatica, Ind. Orn. ii. p. 649. 20.

THIS is fix inches in length: the bill short, obtuse, brown; the lower mandible pale: head and throat yellow brown: the upper parts of the body varied with rusous yellow and brown, here and there mixed with black: beneath whitish, each seather marked with two black bands: towards the vent, the colours are less distinct: quills rusous yellow, variegated with brown: legs reddish, surnished with a blunt spur at the back part, about the middle.

PLACE.

Inhabits India; common in the Mahratta country.

BOTH the above birds have been before described in the respective places above reserved to, as birds not only different in species, but of a different genus. Later observations however have proved

to

to us that they are one and the fame bird, differing only in fex, and that in general both have the hind toe not furnished with a claw. That it is so in Sonnerat's bird, both the figure and description testify; and it feems fufficiently clear alfo, that Dr. Badenach meant the fame in his description of the bird in the Philosophical Transactions\*, although his draughtsman has figured it with a back claw; but it cannot be denied, that now and then an individual may have a claw: for in the one described by us from the Leverian Museum, it was the case, and the legs fashioned so exactly like those of a Pigeon, added to the attitude of the bird being different from the usual one of any of the genus, as to induce us to call it a Pigeon. In a collection of living birds at Exeter Exchange, some few years since, was one of those alive, which had every gait and appearance of a Partridge or Quail: but to put the matter beyond all doubt, we have had the point cleared up by the examination of three specimens of the male sent to England in spirits from Sumatra, all of which wanted the back claw: and as an additional proof, Sir Joseph Banks some time since produced to me two specimens of these birds sent to him as male and female; henceforth therefore, the ornithologist will do right in considering the Lesser crowned Pigeon and Green Partridge as differing in fex only.

COMMON P.

I T is generally supposed that the female Partridge differs from the male in wanting the horse-shoe mark on the breast. We have however been informed, that this is by no means the case, from the observations of our friends. The male certainly obtains the horse-shoe on the breast before the female; but in the female, after the

<sup>\*</sup> Pedes tridactyli, fissi, incarnati, subnodosi; digitus posticus reliquis crassior, brezior, truncatusque, vol. lxii. p. 2. tab. 1.

first year, some marks of it begin to appear, gradually increasing, till it is nearly as conspicuous as in the male; hence it is no uncommon thing to hear sportsmen affirm their having killed or taken several male birds together, led no doubt to this supposition from external appearance only. I have been informed by Colonel Montagu, that having killed nine old birds at the end of September, which appeared all to be males, he had the curiosity to open them, when sour of them proved to be females: and this gentleman farther observed to me, that the sexes were without much difficulty distinguished by their head, that of the female being paler, particularly about the bill and ears, and that the major part of such birds as have the horse-shoe mark on the breast less bright, are more likely to turn out females.

6. COMMON QUAIL. Perdix coturnix, Ind. Orn. ii. p. 651. 28.—Gerin. Orn. iii. pl. 243. 244. Common Quail, Gen. Syn. iv. p. 779.—Id. Supp. p. 222.

WE are told that no country has more quails than the Crimea\*; these birds during the fine weather are dispersed, but assemble at the approach of autumn, to cross the Black Sea, over to the southern coasts, whence they asterwards transport themselves into a hotter climate; the order of this emigration is invariable: towards the end of August, the quails in a body chuse one of those serene days, when the wind blowing from the north at sun-set, promises them a fine night; they then repair to the strand, take their departure at six or seven in the evening, and have sinished a journey of sifty leagues by break of day. Nets are spread on the opposite shore, and the bird-catchers waiting for their arrival, take tithe of the emigrants,

Memoirs of the Baron de Totto

being an esteemed sood\*. We are told by Sir William Hamilton †, that great quantities of these birds occasionally visit the island of St. Stefano, which has only Hawks and a kind of large Gull for its general inhabitants; but that in the month of May, great slights of Quails arrive there from Africa, spent with satigue, and many of them sall an easy prey to the Hawks and Gulls. Quails precisely the same with ours, are also said to be met with both at Robben Isle and the Cape of Good Hope ‡.

It is not uncommon to find twelve eggs or even more in one nest; but I have known two instances, in both of which the number of eggs was twenty. In another place, the bringing Quails to London from France, for the use of the table, is mentioned; the time of their being sent over is sometime in May; and a late friend of mine shad once an intent of purchasing a quantity of them to turn out on his estate, in hopes of their breeding, till he was assured that the whole of those exported from France were males, which are taken by imitating the cry of the hen.

SIZE of a Common Goose: bill olive brown: nostrils, eyelids, and orbits, bare and yellow; eyes black: legs yellow, not feathered, nor furnished with spurs: general colour of the plumage cinereous grey, spotted with brown: ends of the quills, and part of the tail white.

Inhabits Ghilan, in Persia.

PLACE.

NEW
HOLLAND
P.
DESCRIPTION.

### \* \* WITH THREE TOES ONLY.

SIZE of our Quail, or at least between that and the Partridge: the bill is horn colour: plumage on the upper parts of the body somewhat like our Partridge, marked with large triangular spots of black, which arises from the middle of each seather being of that colour: the forehead, and round the eyes, spotted with small dots of white: fore parts of the neck and breast pale ash colour: on the ears a blueish spot; from thence on each side of the neck, pale dusky red or ferruginous: belly, thighs, and vent, dull white: quills black: the legs pale yellow, surnished with only three toes, all placed forwards:

Inhabits New South Wales; met with in July: faid to have the habits of our European Quail.

PLACE.

#### GENUS LIX. BUSTARD.

N° 1. Chili B.

Nº 2. Arabian B.

CHILI B.
DESCRIPTION.

Otis Chilenfis, Ind. Orn. ii. p. 658. 2 .- Molin. Chil. (Fr. ed.) p. 241.

THIS species is larger than the Great Bustard of Europe: the bill and legs similar to the same parts in that bird: the colour of the plumage is for the most part white; but the crown of the head and the forward part of the wings are grey; and the quills black: the tail consists of eighteen white seathers, and is rather short: the legs are furnished with three toes placed forwards, besides which is a fourth, situated a little way up behind.

PLACE.

It inhabits the plains of Chili, in South America, called there Piuquen; mostly met with in flocks, and seeds on herbage. It does not begin to pair before it is two years old: the female lays six white eggs, about as big as those of a Goose: is found to be easily made tame, for many persons of the country have domesticated it, in manner of other poultry. As we have not seen this bird, nor even a figure of it, we are constrained to follow the name given by Molina, who ranks it with the Bustard; but from the circumstance of the back toe, we are not clear that hereafter, on our further investigation, it may with more propriety occupy some other situation.

ARABIAN B. Otis Arabs, Ind. Orn. ii. p. 659. 4 — Gerin. Orn. iii. t. 266. Wilde Pauw, Wild Peacock, Barrow. Trav. p. 139. Arabian Bustard, Gen. Syn. iv. p. 801. 3.—Id. Sup. p. 226.

DESCRIPTION.

THIS bird is faid to measure sometimes as far as three seet and a half in length, and to expand from the tip of one wing to the other as much as seven seet, and that it is nearly as large as the Bustard:

Bustard: the feathers of the neck are long, very thick, and loose, like those of a domestic fowl, of a bright chesnut colour on the upper part, and an ash coloured blue under the throat and on the breast: the feathers of the back undulated with black and brown lines: the belly white: tail feathers from sixteen to twenty in number, marked across with alternate bars of black and white.

It is generally met with in the neighbourhood of farm houses of the internal parts of the Cape of Good Hope, and Mr. Barrow thinks might be easily domesticated; the slesh exceeding good, with an high slavour of game.

### GENUS LX. D O D O.

Didus ineptus, Ind. Orn. ii. p. 662. 1.

Cygnus cucullatus, Dodo, Grew. Mus. p. 60. last Paragr.—Nat. Misc. vol. iv. pl. 143. the leg.—Id. vol. v. pl. 166. the head.

Dodar from the Island of Mauritius, Mus. Tradesc. p. 4.

Hooded Dodo, Gen. Syn. v. p. 1. pl. 70.

NO fewer than three species of this genus have been enumerated by authors, but all of them do not rest upon the same authority as the Hooded one, of which feveral have been formerly met with in the island of Mauritius, from undoubted testimony of authors \*. Edwards's figure of it, which is confessedly the best, was copied from a picture drawn from the living bird brought from St. Maurice's Island. Dr. Grew, who enumerates the leg of one of these among other treafures of the British Museum, sufficiently describes this part, but it is to Dr. Shaw that we owe a figure of it, being the very one mentioned by Grew; and besides, has also savoured the world with the head of the bird in question, which, with a leg of the same, now exists in the Ashmolean Museum at Oxford; but if we mistake not, a specimen of the whole bird must have been in the museum of John Tradescant, as fuch an one is recorded under the name of *Dodar*, as composing part of that curious man's collection at South Lambeth +. In a late history of

\* Compare notes on these birds in Journ. de Physique, t. xii. p. 154 & seq.

<sup>†</sup> The Museum Tradescantianum was published in 1656. As to the island of Mauritius, where these birds are said to be found, it went by the name of Cerne or Swan

of the Island of Mauritius\*, we are told that "it is no longer found "in the Isle of France, Bourbon, Rodriguez, or Sechelles, and must now be placed among those species which have existed, but have been destroyed by the facility with which they were taken. No hope can now be entertained of finding them, but on the shores of uninhabited islands."

issand, before the *Dutch* took possession of it in 1598, as the failors found thereon a great number of white sowls without tails, which on that account they took to be *Savans*. Surely these birds could mean no other than our *Dodo*; and if they are now extinct it is no wonder, since their extreme difficulty of moving from place to place must have rendered them an easy prey to any one who might chuse to knock them at head.

\* Hist. of Mauritius, by Charles Grant, Visct. de Vaux, 4to. 1801.

### GENUS LXI. OSTRICH.

OSTRICH.

Struthio Camelus, Ind. Orn. ii. p. 663. 1. Black Offrich, Gen. Syn. v. p, 6.

DR. Sparrman\* is of opinion that the male and female Offrich fit upon and hatch the eggs by turns; for in one of his journies, he frightened a male from a nest, which he sound made only on the bare sand, on which the eggs lay scattered and loose; these were eleven in number, from another sourteen were brought to him, and several lest behind, from whence he concludes, that from sixteen to twenty may be the usual quantity. These circumstances happened in December.

Thunberg † affirms, that a male Offrich makes a neft with three or four females, which together lay twenty or thirty eggs, on which they fit by turns, in a hole made with their feet in the fand, and that if any one take away the eggs, never lay again in the fame place; and if the eggs are diffurbed only, they break them to pieces with their feet. These birds are very destructive to the farmers, doing much damage to the corn, as they come in flocks to eat the ears of the wheat, so that nothing but the bare skin itself is left behind. The flesh is far from good, yet the Hottentots eat it; but the eggs are relished both by the colonists and others, though not esteemed so good as hens eggs.

Dr. Sparrman observes, that the shell weighs eleven ounces, is six inches and a half deep, and holds five pints and a quarter, liquid measure; the weight of the fresh egg does not greatly exceed this.

<sup>\*</sup> Vy, ii. p. 120. & feq.

<sup>†</sup> Trav. v. ii. pp. 10. 53. 142.

These eggs may be seen suspended under the vaulted roofs not only of the *Mahometan* mosques, but also of the *Greek* and *Cophtic* churches, and could not fail of being esteemed a beautiful ornament every where, if the difficulty of procuring them was greater.

Mr. Barrow thinks, that among the very few polygamous birds that are found in a state of nature, the Ostrich is one: a male is generally seen with two or three, and frequently as many as five of the semales, which lay their eggs in one nest, to the number of ten or twelve each, which they hatch all together, the male taking his turn of sitting on them; between sixty and seventy eggs having been found in one nest; the time of incubation six weeks: for want of knowing the Ostrich to be polygamous, an error respecting this bird has slipt into the Systema Naturæ, where it is said, that one semale lays sisting eggs\*. The circumstance also of small oval substances, the size of peas, of a pale yellow colour, and very hard, being sound in these, is mentioned by Mr. Barrow: in one egg he sound nine, and in another twelve of such stones †.

Barrow's Trav. in South Africa, p. 94.

† 18. ib.

### GENUS LXII. CASSOWARY.

NEW HOLLAND C. Struthio Novæ Hollandiæ, Ind. Orn. ii. p. 665. 2.

Southern Cassowary, Nat. Misc. vol. iii. pl. 99.

New Holland Cassowary, Phill. Voy. pl. in p. 271.—White's Journal, pl. p. 129.

DESCRIPTION.

THIS is a large bird, measuring more than seven feet in length: the bill is black: the plumage for the most part brown and grey mixed; paler on the under parts: the head differs greatly from that of the Common Caffowary, being covered with feathers; nor has it any helmet or rifing protuberance whatever, as in that species: the seathers however about the head and neck are of a hairy texture, and the fore part of the chin and throat nearly destitute of any, so as the purple colour of the skin may be seen through them: the long spines observable in the wings of the common fort are here wanting, but inflead of them are real wings, though of fo small a size as to be useless for flight; they are covered with feathers like the rest of the body, and when the bird is quite at rest, are scarcely discernible therefrom: the legs are dufky and flout, in colour not unlike those in the other species, but are greatly indented or serrated at the back part; the three toes placed in the fame manner, all forwards: fo far the external appearance of the bird; internally it is faid to differ from every other species, particularly in having no gizzard, and the liver so small as not to exceed that of a Blackbird, yet the gall-bladder was large and diftended with bile: the crop contained at least fix or feven pounds

pounds of grass, flowers, and a few berries and seeds: the intestinal canal fix yards long: the heart and lungs separated by a diaphragm, and bore a tolerable proportion to the size of the bird.

Inhabits New Holland, where it is not uncommon, being frequently feen by our fettlers there; but is exceedingly fhy, and runs fo swiftly, that a greyhound can scarcely overtake it. The slesh said to be very good, tasting not unlike young tender beef. A fine specimen of this bird is in the collection of the late Mr. Johns Hunter.

PLACE.

### GENUS LXIII. RHEA.

BILL strait, depressed, somewhat rounded at the tip. Wings useless for slight.

Lower part of the THIGHS bare of feathers.

Legs furnished with three toes forward, and a knob behind instead of a back toe.

AMERICAN RHEA. Rhea Americana, Ind. Orn. ii. p. 665. 1.
Le Chenque, Molin. Chil. (Fr. ed.) p. 241.
Nhanduguacu, Will. Orn. 150. § II.
American Offrich, Encycl. Brit. xvi. p. 205. pl. 437.—Nat. Misc. pl. 72.—Gen. Syn. v. p. 23\*.

DESCRIPTION.

THIS bird, notwithstanding it is sufficiently common in the southern parts of America, has so far escaped the researches even of later naturalists, as to render it at best but an obscure species. The description in Willughby is not amiss, but although Faulkner, Wallis, and other voyagers saw them in the greatest plenty in Patagonia, it so happened, that a full grown specimen has never to our knowledge been brought to England. The author who has most noticed it is Molina, who, in his history of Chili, describes it nearly thus: it is rather less than the common Ostrich; when standing, the head is elevated from the ground about the height of a man: the neck is two seet eight inches long: the head small, rounded, and covered with seathers: eyes black; eyelids supplied with eye-lashes: the bill short and broad, not unlike that of a Duck: legs the length of the neck, furnished

furnished with three toes placed forwards, and the rudiment of a fourth behind: tail composed of short feathers of equal lengths, springing from the rump: the wings stretch from tip to tip no less than eight feet; but, on account of the want of unity of the webs of the feathers, are useless in slight, hanging over and hiding the tail: the general colour of the plumage on the back and wings is dull grey, otherwise white; but some individuals are wholly white, and others black, which may be esteemed as varieties.

This bird is found in various parts of South America, but no where more plentifully than in the neighbourhood of lake Nahuelguapi, in the valley of the Andes. It is faid to live on fruits; is a voracious species, and like the Ostrich, swallows indiscriminately any thing offered to it; but its chosen food appears to be flies, which it catches with peculiar address; it defends itself with the feet; whistles like a man, when it calls its young: lays from forty to sixty eggs on the bare sand, of such a size as to contain about two pounds of liquid each. The feathers are made much use of by the Indians for every purpose, where either ornament or shade is required. We believe that no other specimen has yet been in England, besides that in the Leverian Museum, which appears to be about an half-grown bird, and from which the figure we give of it has been taken.

No 1. American J.

N° 3. Senegal J.

2. New Holland J.

Mysteria Americana, Ind. Orn. ii. p. 670. 1. American Jabiru, Gen. Syn. v. p. 22. pl. lxxv.

AMERICAN J.

WE beg leave here to expunge the fabiru-guacu and Nbandbuapoa of Ray and Willughby, as well as the Touyouyou of M. Bajon.
We have before had our doubts in respect to this matter, and further observations oblige us to restore them to their place in a distinct genus, noticed above under the name of Rhea. The rest of the synonyms quoted on this occasion may stand, as also the figure given of it in the Gen. Synopsis, pl. 75.

NEW
HOLLAND
J.
Description.

New Holland Jabiru, Linn. Trans. v. p. 34. 2.

THIS species measures, from the tip of the bill to the end of the claws, full six feet: the bill is a foot long; neck sisteen inches; thighs ten inches: legs almost the length of the bill: the upper mandible of which is nearly strait, or but just sensibly curved upwards;

New Holland Jabiru.
Published as die Act directs May 30 1801, by Leigh, Sotheby, & Son, York Street Covent Garden.

the under rather more so; the colour of both black: the chin is for a little way bare of feathers, and of a reddish colour: irides yellow: the head is pretty sull of feathers, and with about half the neck is black, with a tinge of green in some lights, in others of purplish: the middle of the wing coverts, and secondary quills, as well as the middle of the back, are greenish black; and the tail also is of the same colour: the rest of the plumage white: the whole of the leg and bare parts above the knee are of a fine red; the toes surnished at the end with pale coloured claws, shaped not unlike those of the human species.

Inhabits New Holland. The description and figure which we have given of the bird, is taken from a specimen in the Leverian Museum, drawn for me by my friend and relation, Mr. Shaw, of Great James Street. Among the drawings of Mr. Lambert, is a representation of one apparently the fame, in which the skin beneath the lower mandible and throat is of a fine crimfon, and faid to be capable of great distention: head and half the neck brownish black, with a variable green and copper gloss; between the bill and eye, grey: the general colour of the plumage of the lower part of the neck, the body, and wings, is white, except on the shoulders, which appear blackish, with the fame bronzed hue as the head and half the neck: the tail is black. I apprehend, that from the difference between the two birds, they are of opposite fexes. Mr. Lambert informs me, that only two have yet been met with, but are now and then feen on the muddy banks of the harbour of Port Jackson, searching for fish, when the tide is out, on which, no doubt, they principally live.

PLACE.

SENEGAL J. DESCRIPTION. Senegal Jabiru, Lin. Tranf. v. p. 32. pl. 3. the head.

THE length of this bird, from the bill to the end of the claws, is fix feet two inches: bill itself thirteen inches; neck fifteen inches; body twelve inches; the naked part of the thighs eleven inches, the feathered part four inches; knee joint one inch; leg thirteen inches and a half; the middle toe is five inches and a half, the two outer ones four inches and a half, all flightly connected at the bottom: the upper mandible is very pale for three inches from the gape; the under the same, for about one inch and a half, then begins a bar of black for about three inches; from thence to the tip the colour is reddish, increasing in depth to the end, where it is of a deep vermilion: on each fide of the base of the upper mandible, is a large semioval and femitransparent space, which, at its back part, is continued upwards in a curved direction across the fore part of the eye: over the nostrils, a bare flattened part, fomewhat in the manner of the Coot, and other birds of that tribe: beneath the bafe of the bill, just at the beginning of the feathery part, are two very small pear-shaped pendant wattles, adhering by very fmall necks: the head and neck are black; scapulars black, with pale bottom, and fifteen inches in length; the remainder of the bird white: the wings and tail both wanting: the legs are very long, and the thighs, to a distance nearly equal to that of the leg itself, quite bare: the whole leg and thigh black, except that round the knee, as well as round each joint of the toes, is a pale The whole length of the leg and thigh is coated with band or zone. hexagonal longitudinal fcales:

PLACE.

This appears to be quite a new species, approaching somewhat to the New Holland Jabiru, yet differing from it in several particulars. We are indebted for the description of it to the Linnaan Transattions, in which it is fully described by Dr. Shaw, from a skin of one lent to him by the Rev. Mr. Rackett. Said to inhabit Senegal.

the wind pipe.

DEMOISELLE H.

THIS elegant species has been sufficiently described before, as far as relates to external appearance; but the singularity of the windpipe is, we believe, not so generally known; it does not, as in the generality of birds, go strait forwards into the lungs, but first enters a cavity in the keel of the breast-bone, for about three inches, when it returns, after making a bend sorwards, and then passes into the chest.

THE scarcity of this bird as a British species, has been before noticed, for it is only now and then, at long intervals, in the present times, that it is at all met with in these realms. History however informs us, that they were formerly in great numbers, and served up by dozens at feasts. As far as relates to myself, I have only been able to ascertain three which have been met with in this island; viz. one shot near Cambridge; a second met with on the Kentish coast, communicated by Mr. Boys; and a third, on the shores of the Medway, mentioned to me by Sir William Bishop, in January 1794. The structure of the windpipe in this bird is singularly curious, somewhat in the manner of the Wild Swan, but is doubly restected, as may be seen in the sigure above referred to in the Philosophical Transactions, as also in those of the Linnean Society.

I am informed that the Grue du Japon, which is esteemed as a variety, has somewhat singular in the structure of the trachea; which some suture observations may probably confirm. The crown of this bird seems to vary, for in the sine drawings of Lady Impey, both the crown and fore part of the neck are black, body and wings white; the incurvated seathers on the rump ash coloured, tipped with black.

In fome drawings in possession of the late Mr. Pigou, the crown is red; and from thence called Chu-ting-nock, Chu-ting signifying a red crown, and Nock, the name of the bird.

INDIAN
CR.
VAR. B.
DESCRIPTION.

Ardea Antigone, Ind. Orn. ii. p. 674. 4. Var. Indian Crane, Gen. Syn. v. p. 38. 4. -39. 4. A.

THIS differs from the others, in having the bill and fore part of the crown yellowish: lore, and space round the top of the neck, bare, and crimson: irides pale orange: chin and throat beset with black

black briftles: general colour of the plumage dull pale blue: quills and tail black: legs and bare part of the thighs black, dotted with white.

Inhabits New South Wales.

PLACE.

Ardea canadensis, Ind. Orn. ii. p. 675. 7. Grus Freti Hudsonis, Ger. Orn. iv. t. 416. Great Savannah Crane, Bartr. Trav. p. 199. 218. 291. Brown Crane, Gen. Syn. v. p. 43. 7.

BROWN CR.

THIS is a shy species. Mr. Bartram relates the mode of hatching their eggs, of which the female lays only two at a time, which are very large, long, and pointed at one end, of a pale ash colour, powdered or speckled with brown: they form their nests by choosing a tussock, and there collect together a rude heap of dry grass, or such like materials, nearly as high as their belly is from the ground, when standing upon their seet: on the top of this they form the nest, of sine soft dry grass. When they cover their eggs to hatch them, they stand over them, bearing their bodies and wings upon the eggs; in this imitating the Flamingo, and perhaps many other long-legged water birds. The male is frequently seen to traverse backwards and forwards, as if upon the watch; but we are not informed whether he sits on the nest in turn or not; some persons will eat the sless, but it is more esteemed when made into soup, and is then thought to be excellent.

'Ardea caledonica, Ind. Orn. ii. 579. 15. Caledonian Night Heron, Gen. Syn. v. p. 55.

CALEDONIAN N. H.

THIS bird, with very little variation, is found in New Holland: the bill and legs are brown: general colour of the plumage a chefnut brown, paler on the fore part of the neck: belly white: on the Qq2. breaft,

breaft, and each fide the back, towards the tail, below, the plumage is very downy, appearing of a filky texture.

This is clearly very little different from the Caledonian species; and we have even doubts, whether this last is not a mere variety of the common Night Heron, which has been met with in almost every part of the globe yet known, not excepting our own kingdom, as we have known the circumstance to have happened three times at least in our memory.

OBSCURE
H.
Description.

Ardea obscura, Ind. Orn. ii. p. 679. 16 .- It. Poseg. p. 24. t. ii.

SIZE and habit of the Bittern: the bill rather bent, and of a blackish green: on the hind head a dependent crest of one seather: sorehead, crown, and nape, dull chesnut: back and wing coverts the same, with a gold green gloss: neck behind ferruginous chesnut; before, with the breast and belly, chesnut, spotted longitudinally with white and serruginous: quills dull chesnut, tipped with white: tail chesnut: legs short, greenish.

PLACE.

Inhabits Sclavonia. In compliance with our wish of describing every thing possible, we have retained the above as a distinct species; yet we will not be positive that it is really so, especially as the Night Heron is so subject to vary in the different stages of life; hence on suture investigation, perhaps, the Common, Jamaica, Caledonian, with the last described, will be found to constitute only one species.

BITTERN.

Ardea Stellaris, Ind. Orn. ii. p. 680. 18.—Ger. Orn. iv. t. 432. Bittern, Gen. Syn. v. p. 56. 17.—Id. Sup. p. 234.

MUCH has been faid concerning the fingular kind of noise this bird makes at certain times: which we believe to arise from a loose membrane, which can be filled with air, and exploded at pleafure.

fure. I am informed by a friend, that he has diffected several, and clearly observed a loose membrane at the divarication of the trachea, capable of great distention, and it is no doubt by this singular construction, that the bellowing kind of noise is made \*; another of our correspondents † mentions his having found, during the frost in winter, a female Bittern, which had in its stomach several warty Lizards perfect, and the rudiments of several Teads or Frogs, which were probably taken out of the mud, under shallow water, in the swamp where it was shot. The Lizards were not differing from those in our waters in summer, having the sin on the tail.

Ardea minuta, Ind. Orn. ii. p. 683. 27. Little Bittern, Gen. Syn. v. p. 65. 66.—Id. Sup. p. 235.

8. LITTLE B.

ONE of these was shot on the river Avon, near Bath, in the winter of 1789.

We already have recognized it as a species belonging to many parts of Europe, though very rarely coming into England; and that it is found in Asia, more particularly in Arabia. We likewise find it to be an inhabitant of New Holland, at least a trisling variety of it, differing merely in having five or six longish black spots down the fore part of the neck. This is found in the marshes and other moist ground about Port Jackson, in December. Its native name is Duralia.

<sup>•</sup> Mr. Lamb.—Willughby mentions the circumstance of the loose membrane, but seems not sufficiently aware of its being the cause of the noise which this bird makes.

<sup>+</sup> Colonel Montagu.

SGUACCO H. Var. Ardea comata, Ind. Orn. ii. p. 687. 39. γ. Ardea comatæ fimillima, It. Poseg. p. 24. Sguacco Heron, Gen. Syn. v. p. 74. 39. Var. β.

Description;

THIS has a white bill tipped with black: the head not crefted: forehead and hind part of the neck dusky testaceous white; the feathers margined with black: tail feathers white, the two middle ones pale testaceous at the tips: the rump, belly, and thighs white. We suspect this to be a variety or sexual difference from the Squacco Heron.

One of the common fort was shot at Boyton, in Wiltshire, by Mr. Lambert, in 1775.

BLACK-BREASTED H. Description.

Ardea torquata, Ind. Orn. ii. p. 688. 42 .- Miller Illustr. t. 36.

THE colour of the plumage in this bird is brown on the back and upper parts: the hind head crefted, and black: neck and belly dirty white: breaft black, marked with yellowish crescents.

PLACE.

Inhabits South America.

RED-CRESTED
H.
Description.

Ardea erythrocephala, Ind. Orn. ii. p. 688. 43.—Molin. Chil. (Fr. ed.) p. 214.

THIS is about the fize of the Common Heron: the general colour of the plumage white: from the head fprings a long crest of a red colour, which reaches quite to the back.

Inhabits Chili.

PLACE.

THULA
H.
Description.

Ardea Thula, Ind. Orn. ii. p. 688. 44 .- Molin. Chil. (Fr. ed.) p. 214.

PLACE.

This inhabits *Chili*, where it is known by the name of *Thula*.

Ardea cyanocephala, Ind. Orn. ii. p. 688. 45. - Molin. Chil. (Fr. ed.) p. 214.

BLUE-HEADED H. Description.

HE bill in this bird is black: the head and back blue: wings black, edged with white: belly yellowish green: tail green: legs yellow.

PLACE.

This species is found in Chili, with the three former ones.

Ardea cinerea, Ind. Orn. ii. p. 691. 54.—Ger. Orn. iv. t. 421 i 427. 428. Common Heron, Gen. Syn. v. p. 83.

COMMON

THE circumstance of this species building in societies has been before noticed: these are for the most part in tall trees, but likewife in high cliffs over the fea. In this kingdom, we may mention a few of these Heronries, as they are called; viz. a considerable one at Penshurst Place, in Kent; at Hutton, the seat of Mr. Bethel, near Beverley, Yorkshire; in Gobay Park, on the road to Penrith, near a rocky pass, called Yew-cragg, on the north side of Ulleswater; but we believe none more confiderable than that at Cressi Hall, fix miles from Spalding, in Lincolnshire. In the northern parts, where Eagles frequent, they are often frightened from their nefts, and the Crows not unfrequently watch opportunities of stealing the eggs. It is not only in England that the two long feathers of the crest of the male of this bird are valued, but every where throughout the East. Chardin mentions that the Persians catch the Heron, and after depriving the bird of the long feathers, fuffer it to depart\*; in another place + we are also told, that these feathers form a part of the Persian crown or bonnet. It is mentioned by Thunberg ‡, that this species and the Blue Heron are both found in the Velooren Valley, inward from the Cape of Good Hope.

<sup>\*</sup> Trav. p. 82.

<sup>†</sup> Coronat. of Solyman the Third, p. 40.

<sup>†</sup> Trav. 2. p. 143.

VARIEGATED DISCRIPTION.

Ardea variegata, Ind. Orn. ii. p. 692. 56 .- Scop. Ann. Hift. Nat. i. p. 88. 120.

THIS is of a ferruginous colour, spotted with brown; beneath paler: throat white: forehead black: thighs rufous; legs brown.

This was in the collection of Count Turrian, and probably is a mere variety of the Great Heron.

16. LACTEOUS DESCRIPTION.

Ardea Galatea, Ind. Orn. ii. p. 696. 68 .- Molin. Chil. (Fr. ed.) p. 214.

THE bill in this species is four inches long, and yellow: the head is fomewhat crefted: the plumage in general as white as milk: the neck is two feet and a half in length: the legs fully as long, and of a beautiful crimfon colour.

PLACE.

Inhabits Chili.

BROWN H.

Ardea fusca, Ind. Orn. ii. p. 700. 83. Le Heron brun, Buf. Ois. 5. p. 381. Pl. Enl. 858.

DESCRIPTION.

HIS is two feet and a half long: the bill brown: legs yellow: the head furnished with a moderate crest hanging down behind, and of a dusky colour: the upper part of the neck, body, and wings, are dusky brown; beneath white, spotted on the breast with longish streaks of brown.

PLACE.

Inhabits Cayenne.

18. WHITE-FRONTED

Ardea Novæ Hollandiæ, Ind. Orn. ii. p. 701. 88. White-fronted Heron, Phill. Voy. pl. p. 163.

DESCRIPTION.

THIS is about half the fize of the Common Heron, being twentyeight inches in length: the bill is four inches long, and black; base of the under mandible yellowish: lore and orbits naked, and of a greenish

a greenish colour: the body on the upper parts is blueish ash colour: crown of the head black, and the feathers elongated: the forehead, cheeks, chin, fore part of the neck, as far as the middle, white: quills and tail blueish black: the feathers of the breast are elongated, and hang down in a graceful manner; these, with the belly and thighs, are of a rusous cinnamon colour: back covered with long slender feathers, which fall over the tail, and conceal about half its length: legs yellow brown.

Inhabits New Holland: the specimen above described met with at Port Jackson.

THIS at first sight appears not unlike the Little Bittern: the bill is dusky green; the under mandible yellow at the base: round the eye bare, and of a greenish ash colour; irides yellow: the general colour of the plumage is pale brown above, spotted on the back and wings with white: quills pale ferruginous, with paler ends: under parts of the body dusky white: legs dusky green.

Inhabits New South Wales. Manners unknown.

THE fize of this species is uncertain, though we believe it not to be a small one: the bill is of a moderate fize, and horn coloured; the upper mandible somewhat curved, the lower straight; tongue the length of the bill: irides pale red: the head and neck dull white, marked on the fore part of the latter with dusky spots; behind the eye a dusky mark: back and wings dusky, with a green and copper glos: breast, belly, thighs, and vent, dusky white; the feathers margined with dusky, giving a leafy appearance.

This inhabits the sea-shores in various parts of New Holland, where it goes by the name of Bulla-ra-gang; but is not a common species.

Nº 1. Common C.

Nº 2. Crying C.

COMMON C. VAR. Description. Numenius arquata, Ind. Orn. ii. p. 710. 1. Var. Common Curlew, Gen. Syn. v. p. 119. 1.—Id. Sup. p. 243. Var.

A Bird of this kind has been brought from New Holland; it feems to differ chiefly in having the bill confiderably larger in proportion, and the ground colour of the plumage dull ferruginous, instead of brown: bill black: irides yellow: legs dull blue.

CRYING
C.
Description.

Ephouskyca, Crying Bird, Bartr. Trav. p. 145. 291.

SIZE of a large domestic Hen: bill five or fix inches long, and arched downwards; square at the bottom; colour dusky green: the eye large, placed high in the head, and very prominent: the neck is long and slender: all the body above and beneath of a dark lead colour, every feather edged or tipped with white, which makes the bird appear speckled: tail very short, the middle feather the longest, the others on each side shorten gradually, of the colour of the rest of the bird, only somewhat darker; the two outermost perfectly white, which the bird has a faculty of slirting out on either side, as quick as a slash of lightning, on being disturbed: the legs are long, and bare of feathers above the knee, and of a black or dark lead colour.

This

e Place.

This species, if it be really distinct, inhabits the swamps of the Musquito River, and the lakes of Florida, as well as Georgia, and called by the Indians, Ephouskyca, which signifies Crying Bird. Mr. Bartram calls this an Ibis\*; but as he does not mention its being bare on any part of the head or throat, we may safely rank it with the Curlew genus, for he seems himself undetermined where to place it in the system.

## GENUS LXXII. S N I P E.

Nº 1. Great Sn.

N° 3. Courland Sn.

2. Godwit. Var.

4. New Holland Sn.

GREAT SN. DESCRIPTION.

WEIGHT eight ounces and a quarter: length from the bill to the end of the tail twelve inches; to the end of the toes fixteen inches: bill two inches and three quarters \*, black; the under mandible pale half way from the base: the top of the head brown, mottled with rusous; down the middle a clay coloured line; sides of the head pale clay colour, speckled with brown: through the eye, from the bill, a dark brown streak, and a paler one curving round the under mandible: hind part of the neck, half the back, and scapulars, chocolate brown, the seathers streaked on the sides with clay colour, and barred with serruginous; the lower part of the back brown, crossed with numerous greyish white lines: tail coverts pale rusous clay colour, barred with black brown, and so long as to cover the tail for two thirds of its length: the tail when spread out is rounded at the end; the eight middle seathers are dusky for three sourchs of the

length

I have seen one in which the bill was four inches long, and another in which it was more than three inches.

length from the base, the rest of the length rusous, crossed with two or three bars of black; but the sour middle seathers are deep rusous, and the two on each side very pale; the two outermost seathers on each side wholly white and black in alternate bars: the wing coverts black brown, spotted with rusous white; rest of the wing dusky black; every seather but the greater quills tipped with white: beneath the wings beautifully crossed with white and dusky bars: the sore part of the neck is the same as behind: the breast, belly, and vent, crossed with numerous dusky bars, inclined to a zigzag shape on the sides: legs pale blueish brown, and bare above the knee for half an inch.

This is a rare species, and has not been met with more than three times to my knowledge, nor does it appear to be at all plentiful in this kingdom, a circumstance which will apologize for describing it so fully, from a recent one now in my collection, shot in Suffolk, September 1792. I have seen this very species more than once brought from South America, and have every reason to suppose that the Savanna Woodcock and this bird form together but one species.

PLACE.

 GODWIT.

HIS bird is about fixteen inches in length: bill nearly four inches long; dufky orange, with a black tip: head and neck as far as the breast ferruginous: crown spotted with dufky; from the nostrils through the eye, dufky white: belly, thighs, and vent, white; the breast mottled with a few dufky spots: back dufky brown, the margins of the feathers ferruginous: the tail is even at the end, and the base of all but the two middle feathers are white, as are also the tail coverts: legs long and black.

DESCRIPTION.

### S N I P E.

The Godwit feems to vary much; in fome, the under coverts and fides have black markings, in others plain: the rump also is more or less white, as also the base of the outer tail feathers, otherwise black: great similarity appears to be between this and the Red Godwit; but from the rarity of both in this kingdom, it is to be feared a clear discrimination between these will not soon be effected.

COURLAND SN.

Scolopax curonica, Ind. Orn. ii. p. 724. 37.—Naturf. Gesch. vii. p. 462.

THE very short description we are able to obtain of this species, says, that it is spotted with grey, with dusky wings and bill; the lower part of the under mandible crimson from the base to the middle; and the legs brick coloured.

Inhabits Courland.

PLACE.

4.
NEW
HOLLAND
SN.
Description.

BILL strait, large at the base, the upper mandible dilating a little at the point, and twice the length of the head: colour of the plumage above brown, mottled somewhat in the manner of a Wood-cock: sides of the head and the neck dusky white: back of the neck marked with brown streaks, and clouds of the same: on the sides next the wings, a sew clouded crescents: bill and legs pale yellow: irides blue.

PLACE.

Inhabits New South Wales.

fides of the head are minute specks of the same: chin, belly, thighs, vert, and rump, white: the two middle tail feathers rusous brown, with black bands; the others plain pale rusous brown.

PLACE.

Inhabits Europe; fometimes on the shores of England, but rarely \*.

SELNINGER S. Tringa maritima, Ind. Orn. ii. p. 731. 18.—Brun. Orn. p. 54. 182. Sea Sandpiper, Linn. Trans. iv. p. 22. pl. 4. Selninger Sandpiper, Arct. Zool. ii. p. 481. E.—Gen. Syn. v. p. 173. 15.

E have the authority of Mr. Markwick to rank this among the British species. A flock of about ten or twelve being met with on the sea coast near Bexbill, the 8th of December 1796, of which two were shot. I have likewise been informed, that several specimens have at times been killed on other coasts, in hard winters; and that they vary much at different periods of life, as the Stint, Dunlin, and others of this genus, which circumstance has we fear been the occasion of multiplying the number of species unnecessarily: possibly this and the striated Sandpiper are one and the same bird.

FASCIATED S.
DESCRIPTION.

Tringa fasciata, Ind. Orn. ii. p. 738 .- F. G. Gmel .- It. ii. p. 194. t. 26.

In this bird, the bill, crown, hind head, a streak through the eyes, and the belly, are black: the forehead and the tail, which is rounded in shape, are white.

PLACE.

Inhabits Astrachan.

SIBIRIAN
S.
Description.

Tringa Keptuschca, Ind. Orn. ii. p. 738 .- Lepech. It. ii. p. 229.

THIS has an ash coloured body, a black crown, a dusky belly, growing rusous towards the bottom.

PLASE.

Found in the marshes of Sibiria.

<sup>\*</sup> Five shot at Sandwich this spring, with pale orange legs. Mr. Boys.

Tringa atra, Ind. Orn. ii. p. 738 .- Naturf. xiii. p. 193.

BLACK-HEADED S.

HE head and neck in this are black: back and wings pale brown, mixed with black: breast and belly cinereous: rump cinereous, undulated with white and black.

Inhabits the banks of the Rhine.

PLACE.

QUEBEC S. Descriptions

SIZE of the Song Thrush; length nine inches: bill nearly one inch and a half long, and slender; the base reddish, the rest of its length black: general colour of the plumage dusky plumbeous ash colour: the feathers on the back margined with ash colour; of the wing coverts and breast, with greyish white: the three first quills dusky, with white shafts; three of the inner ones just fringed with white at the tips; the two or three next white, marked with ash colour on the outer web; then follow two or three almost wholly white; the rest plain dusky: the four middle tail feathers dusky, the others pale ash, fringed at the edges and tips with white: between the bill and eye, and the chin, dusky white, mottled: fore part of the neck plain ash colour: belly white; sides of it, close to the wings, marked with a few dusky spots: the thighs are (contrary to the usual nature of the genus) covered with feathers quite to the knees, and even below the joint: legs short, and of a pale yellow colour.

This was brought from Quebec, by General Davies.

PLACE.

S. DESCRIPTION.

HIS is at least nineteen inches in length: the bill pale: irides yellow: the crown and nape are black: sides of the head, and round the eye, furnished with a carunculated yellow membrane, hanging down on each side, in a pointed wattle: the neck and all beneath Supp. II.

is white; but the fides of the breast next the wings are black: back and wings olive brown, with a tinge of rust colour: the quills and end of the tail black; but the very tip of the last is fringed with white: the bare part of the legs above the knee, and a small space below it, is of a rose colour; the rest black, with rose coloured segments: at the bend of each wing a stout yellow spur, somewhat bent.

PLACE.

Inhabits New South Wales; is fometimes met with in the flats going to Parramatta, but is not a common bird. It feems to be a species between the Louisiana and Senegal Sandpiper, but is clearly distinct from either.

BROWN-EARED S. Description.

THE bill in this is as long as the head, and dusky: plumage above rusty ash colour, crossed with numerous whitish lines on the back and wings: the feathers on the outer ridge of the wing all edged with white: over the eye a white streak; all the under parts pale, a little mottled or streaked: on the ears a brown patch, which passes through the eye, but less distinct: quills and tail dusky: legs dusky white.

PLACE.

Inhabits New South Wales.

It may not be amiss again to remark the great uncertainty in refpect to some of the species of Sandpiper, and in none more than the Ruff, of which we suspect many species to have been made during its advances to the adult, for the male does not gain the long neck feathers the first season, and afterwards only during breeding time: we have also had doubts whether our Equestrian Sandpiper may not be a young bird of this species: the same also of the Selninger and striated species; and in respect to the ash-coloured Sandpiper, it is probable that on a longer acquaintance, it may prove merely the young of the Knot. These are however hints only, thrown out for the sake of inciting others to a more strict investigation of the subject.

SANDERLING.

THIS species is found in New South Wales, but not plentifully: the bill is rather shorter than in the European species. I have as yet only seen it in the adult dress, but no doubt it is subject to the same variety in its progress to that state as ours is known to be. The English call it at Port Jackson, Sea or Shore Lark, from its being met with in that situation; but it is known to the natives by the name of Waddergal.

It is certain, however, that the Ringed Plover is found there likewise, hence it is probable, that both these birds are known indiscriminately by the name of Sea Larks.

Charadrius Alexandrinus, Ind. Orn. ii. p. 744. 9.—Hasselq. Voy. (Engl. ed.) p. 190.
—Brun. Orn. in App. p. 77.—Mull. No 210.—Faun. Aragon. p. 78. 1.
Alexandrine Plover, Gen. Syn. v. p. 203. 9.

ALEXANDRINE.

W E beg leave here to omit the fynonym of Brisson, whose bird having the addition of a black streak through the eye, and a collar of the same, ought not to have place here. The description then S f 2

Description.

of the Alexandrine Plover will ftand thus: fize about that of a Lark: bill black: head and back greyish or pale brown: forehead at the base of the bill white, which passes over the eye in a line of the same, and blends itself with a collar of white, passing round the neck; the under parts of the body are every where white also, and the brown colour comes forward on each side of the breast, but does not meet thereon: the quills are dusky grey, within whitish, and lessen in length inwards, but the three inmost are nearly as long as the outer ones, and of the same colour with the back; from the sifth to the eighth quill, an oblong white spot on the outer margin; the secondaries tipped with white: four of the middle tail feathers are dusky black, the others shorter; the two outer ones on each side are white; the two next dusky white, with brown tips: legs blueish brown: toes and claws black.

I was favoured with a drawing of what I conjecture may be a variety, by my late friend Mr. Pennant: in this, the head was pale brown, but the forehead not white, nor was there any streak of white over the eye; all the under parts from the chin white, passing round the neck in a collar: the back, wings, and tail, as in the former: bill and legs black \*.

KENTISH PL. Description.

Kentish Plover, Lewin. Br. Birds, pl. 185.

SIZE of the Ringed Plover: length fix inches and a half; breadth fifteen inches; weight an ounce and a half: the bill is black: top of the head ferruginous brown, bounded on the fore part with black; but the forehead is white, and passes over the eye, and a little beyond it: from the bill, through the eye, a black streak, broadening behind

the

<sup>\*</sup> We should think that whatever further variety may be of this bird, it is not likely to be with a black streak through the eye, or a black breast; such more probably belong to the Egyptian Plover.—Gen. Syn. v. p. 205. 9. A.

the eye, and reaching over the ear; all beneath, from the chin to the vent, white, passing round the neck as a collar: on each side of the breast, next to the shoulder of the wing, is a black patch: back and wings pale brown: quills dusky; the shaft of the outer one, the whole of the length, and the middle of the next white: the greater coverts for the most part tipped with white: tail rounded in shape, not unlike the quills; the three outer feathers white, except a dusky spot on the inner web of the outmost but two; the others have the bases very pale half way, but the two middle ones are of one colour: legs blueish black.

I received the above from Mr. Boys, of Sandwich, 23d May 1787, being shot in that neighbourhood; and in the month of April 1791, two others: the weight of these was about twenty grains more than the former: the bill and legs were black: in one of them the whole nape was of a fine pale reddish bay, the other pale brown, inclining to bay towards the nape: the three outer tail feathers white, but the inner of these inclining to dusky on the inner web; the next very pale brown, or brownish white, with a dusky tip; the four middle ones brown, with the ends dusky, approaching to black; in other things they were like the first described; but in one of them, the black patch at the bend of the wing was much larger, and approached on each fide towards the breast. We do not find the above described or figured except in British Birds; to the author of which I first communicated it. That it does not at all belong to the Ringed Plover, in any stage, the colour of the bill and legs will testify; for in the last, both of them incline more or lefs to yellow or orange, even whilft very young, and in the adult are ever of a fine orange.

RUSTY-CROWNED PL. Description.

Charadrius Falklandicus, Ind. Orn. ii. p. 747. 18. Rusty-crowned Plover, Portlock's Voy. pl. in p. 36. Male and Female.

SIZE of the Ringed Plover: length feven inches and a half: Bill three inches and a quarter, black: forehead, chin, all the fore part of the neck, the breaft, and belly white: across the top of the head a bar of black, passing downwards on each side of the neck, in an irregular manner, to the wings, and from thence forwards to the breast, forming a broad bar thereon: behind the black bar, on the top of the head, is a stripe of ferruginous, encircling all the back part of the head as a wreath: the crown of the head within this, all the upper parts of the body and wings are cinereous brown; but the greater quills and tail are black: legs black.

The female is much the same in colour with the male, but differs in wanting the ferruginous wreath at the back part of the head.

PLACE

Inhabits Falkland Isles, in the Pacific Ocean.

SIBIRIAN PL. Description.

Charadrius Sibiricus, Ind. Orn. ii. p. 747. 19 .- Lepech. It. ii. t. 6.

THE forehead in this bird is variegated with black and white; the crown fasciated with dusky: breast brown, bounded by a white band: belly ferruginous.

PLACE.

Inhabits Sibiria.

6.
CURONIAN
PL.
Description.

Charadrius curonicus, Ind. Orn. ii. p. 750. 31.—Shrift. d. Berl. Naturf. Gesch. vii. p. 463. 48. (Beseke.)

THE bill in this is dusky: the head, breast, belly, and vent are white: the forehead is white; in the middle of which is a black crescent: on the crown grey: from the bill, through the eyes, and beyond them, passes an undulated dusky stripe: on the breast a black band: back, wings, and tail grey, with pale dull markings: the three first

first quills are dusky, and the outer one has the shaft white: the upper tail feathers black at the ends: the bill is black: irides yellow: legs reddish.

Inhabits Courland: feeds on fish.

PLACE.

Charadrius nævius, Ind. Orn. ii. p. 750. 32.—Schr. d. Berl. Naturf. Gesch. vii. p. 464. 49.

COURLAND PL.

DESCRIPTION.

THE bill and legs in this bird are dusky: the whole of the under part of the body white; the upper part of the body is grey, marked with black and white spots: beneath the eyes, over the ears, passes a dotted black stripe: the three outer wing feathers are black. Inhabits Courland.

PLACE.

GREAT-BILLED PL. Description,

SIZE of the Golden Plover: bill black, ftout, and very broad, refembling the Tody genus: the general colour of the upper parts is blue grey, ftreaked with black; beneath pale ash, but with the same markings: forehead, part of the crown, and ears, minutely spotted: quills black: base of several of the primaries white: legs dull blue.

PLACE.

HIGH-LEGGED PL.
DESCRIPTION.

THIS has a nearly strait black bill: the crown, back, and wings, blue grey, marked with black streaks, largest on the back and crown: irides yellow: beneath the eyes, on the ears, a large patch of brown: the under parts are dusky white, streaked on the neck and breast with pale brown: inner ridge of the wing ferruginous: quills black. It stands very high upon its legs, not much less so than the Long-legged Plover; the colour of them pale blue.

Inhabits New South Wales.

Inhabits New South Wales.

PLACE.

BROWN
PL.
Description.

HIS fpecies has the habit of our Golden Plover: bill black: irides yellow: legs lead colour: plumage above a mottled brown; beneath brownish white, a little mottled: tail black, dotted with white: legs lead colour.

PLACE.

Inhabits New South Wales.

GR.SLED PL. Description.

ABOVE pale brown; beneath white: crown fpotted with black; the wings with white: quills black: tail dufky: bill dufky: legs blueish: irides hazel.

PLACE.

Inhabits New South Wales.

BRIDLED PL.
Description.

THE bill in this bird is blueish: the plumage on the upper parts of the body and tail pale cinereous blue, dashed with small brown streaks: sides of the neck marked with a broad dusky streak, taking rise beneath the eye, and descending to the beginning of the back: the under parts of the body are pale, marked with narrow dusky lines on the breast; belly white: quills dusky: legs yellow.

PLACE.

Inhabits New South Wales.

GREEN-HEADED PL. DESCRIPTION.

A new species of Plover, Sonnini's Trav. ii. p. 209.

LENGTH eight inches: head deep green, with a changeable lustre; a fort of white diadem surrounds the head, passing through the eyes: back and lesser wing coverts of a pretty bright ash colour: greater wing coverts white: quills white, tipped with black, having each a black spot about the middle, forming a black stripe across the middle of the wing: throat white: under part of the neck and body white.

white, with a reddish tinge: on the upper part of the breast a narrow band of deep shining green passing half round: tail feathers short, and of unequal lengths, of the same grey colour as the upper part of the body for two-thirds of the length, where it is crossed by a broad black band; the remainder white: eyes brown: legs and feet blueish: bill and claws black.

Such is the description of *M. Sonnini*, who thinks it comes near to our *Black-beaded Plover\**; and indeed the description seems somewhat to justify the sentiment; but on comparison, they appear to differ in many particulars. He saw several in various parts of *Egypt*, mostly in pairs, seldom in troops, and then not exceeding seven or eight: seed on aquatic insects; never alight on the mud, but frequent the sandy parts only. When they take wing, they utter a little sharp cry, repeated several times: are observed to run rather than sly, seldom quitting the ground: are by no means shy, suffering themselves to be easily approached.

Nº 3. Dwarf R.

2. Doubtful R.

TROGLODYTE R.

Rallus australis, Ind. Orn. ii. p. 756. 3.

Troglodyte Rail, Gen. Syn. v. p. 229. 3.—Id. Sup. p. 255.

DESCRIPTION.

I Find this bird to be a native of New Holland as well as New Zealand, but not very common; and varies in some particulars; it is smaller, and wants the white streak over the eye, in the same manner as seen in Mus. Carls. i. pl. 14. I remark in a specimen seen by me, that the spur of the wing seems large and formidable. In another variety, I observe the bill to be two inches long, more bent at the tip: nostrils in a deep surrow of the bill: total length source inches: the general colour of the plumage much the same as in the others on the upper parts: sides of the head, and streak over the eye, pale ash colour: all beneath deeper ash colour: thighs feathered to the knees.

PLACE.

This was brought from Lord Howe's Island.

DOUBTFUL R.
Description.

Rallus dubius, Ind. Orn. ii. p. 760. 19 .- It. Poseg. p. 26.

MEARLY the fize of the Common Gallinule: bill and legs dufky green: the face pale ferruginous: chin dufky white; round the neck a broad collar of white: the general colour of the plumage barred with brown and ferruginous: the belly white; fides brown, banded with ferruginous ash colour: the first quills on the outer edge white.

PLACE. Inhabits Posegania.

Rallus pufillus, Ind. Orn. ii. p. 761. 24.—Pall. reise. iii. p. 700. 30.—It. Poseg. p. 26.

DWARF R.

THIS is fomewhat fimilar to the Water Rail, but not bigger than a Lark, and fomewhat the colour of it: the face, fore part of the neck, and down the middle of the breast, blue grey: chin white: through the eyes a pale ferruginous streak: the upper parts are black and ferruginous mixed, marked on the back with longitudinal lines of white: belly and vent black, crossed with narrow white bands: legs green.

DESCRIPTION.

Inhabits the falt lakes and reedy places in *Dauuria*; and is observed often to slirt up the tail between the wings, and carry it in that manner.

PLACE.

# GENUS LXXIX. JACANA.

Nº 1. Chinese Jac.

N° 2. Chili Jac.

CHINESE JAC. Parra chinensis, Ind. Orn. ii. p. 764. 7. Chinese Jacana, Gen. Syn. v. p. 246. 8.—Id. Sup. p. 256. t. 117.

DESCRIPTION.

A Species which seems very little different from the Chinese one, was met with on the island of Java\*. The utility of the great length of toes seemed manisest, for these birds were thereby enabled to walk over the leaves of the Great Water Lilly † with wonderful agility, thus keeping themselves at the surface of the water.

CHILI JAC. Description. Parra chilenfis, Ind. Orn. ii. p. 765. 11. - Molin. Chil. (Fr. ed.) p. 239.

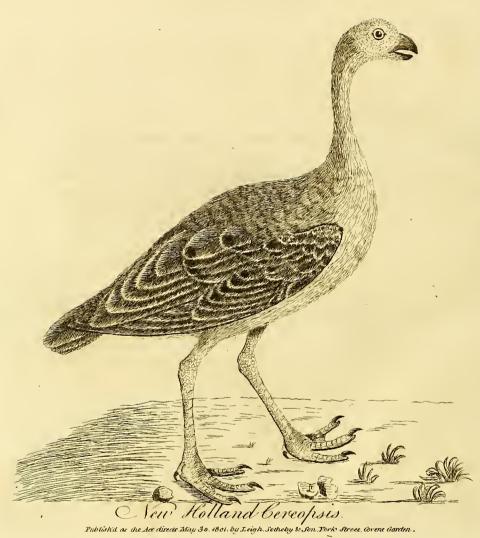

SIZE of a Magpie, but stands higher on its legs: the bill is conic, somewhat bent at the tip, and two inches long: irides yellow: on the forehead a bilobated red caruncle; back part of the head somewhat crested: the neck, back, and wings, on the fore part are violet: neck before, to the middle of the breast, black: belly white: the tail short and brown; quills the same colour: at the bend of the wing a yellow conical spine, half an inch in length: legs black; above the knees naked, as usual in the genus: the toes shorter than in most of the genus.

Inhabits

D'Entrecasteaux Voy. ii. p. 332.

<sup>+</sup> Nymphæa nelumbo.

# GENUS LXXIX \*. CEREOPSIS.

BILL short, convex, bent at the tip.

Nostrils at the base, under the cere.

HEAD wholly covered, beyond the ears, with a rough skin or cere.

At the bend of the wing a blunt knob.

TAIL short, consisting of sixteen feathers.

Legs frout, bare much above the knee: toes cloven: the outer one connected to the middle at the base: back toe small.

CIZE of a small goose; length thirty-nine inches: neck long: bare part of the thigh one inch and three quarters; leg feven inches and a half; middle toe three inches and three quarters: the bill is black, three quarters of an inch in length; but from the tip to the gape an inch and a quarter; the under mandible shutting close under the upper; from the base of the bill begins a bare rough skin of a vellow colour, covering the whole of the head beyond the ears: the plumage is pale ash grey, but the neck and under parts are paler, the upper inclining to brown; some of the wing coverts and axillaries have a dusky blackish spot near the ends, and the quills are dusky towards the tips: tail the fame, confifting of fixteen feathers, and rounded in shape: at the bend of the wing a blunt knob: the second quills nearly as long as the prime ones: the legs are orange colour, but the fore part above the bend, the toes, and claws, are black: toes four in number, the three forward ones frout and cloven, but the exterior is connected to the middle one by a membrane at the base:

this a very small sourth toe, which scarcely reaches the ground.

Inhabits New Holland: the only specimen we have seen is in the British Museum.

the sole of the foot is a solid knob on which the foot rests, and above

# GENUS LXXX. GALLINULE.

N° 1. Purple G. VAR. A.

VAR. B. N° 2. White G.

PURPLE G. Gallinnla porphyrio, Ind. Orn. ii. p. 768. 6.—Gerin. Orn. v. t. 485.—Aldrev. lii. pl. in p. 439.

Pindàramcòli, Bartolom. Voy. (Engl. ed.) p. 224. Purple Gallinule, Gen. Syn. v. p. 254. 6.

THIS is known in *India* by the name of *Pindaramcoli*; in *China* called *Chinka*: are common at *Rosetta*, and other parts of *Egypt*, called there *Sultanas*\*.

VAR. A.

Porphyrio alter, Aldrov. Av. iii. p. 438. t. 440-Faun. Arag. p. 78.

DESCRIPTION.

THIS M. Aso thinks a remarkable variety, if not a new species; it is of a violet black colour: fore part of the neck blue: forehead and legs red: vent white.

VAR. B.

DESCRIPTION.

IN New Holland is a fine variety of the Purple Gallinule, of the usual fize, and differing very little from the last described: general colour of the plumage deep black, except the throat, fore part of the neck and breast, outer part of the wing coverts, and the quills, which are of a deep blue: the bill, bare part of the crown, legs, and bare part of the legs above the knee, are red; but the knees and joints of the toes are black: the vent white: irides orange.

PLACE.

This bird is seen in the swamps about New South Wales, in August, but is rare: native name Goola-warrin.

<sup>.</sup> Sonnini's Trav. (Engl. ed.) ii. p. 56.

Gallinula alba, Ind. Orn. ii. p. 768. 8.
White Gallinule, Phill. Bot. Bay, t. p. 273.—White's fourn. t. p. 238.

WHITE

SIZE of a Hen; length two feet: bill very ftrong, and much the fame in shape and colour as in the Purple Gallinule: a bare red space in like manner is also on the crown: irides red: round the eye, the skin visible through the slender covering of feathers: the whole of the plumage in general is of a pure white: legs red: claws brown: at the bend of the wing a sharp spur.

Some of these, supposed to differ in sex, are of a bright blue between the shoulders, and spotted on the back with the same.

These inhabit Norfolk Island, and are there very common; are exceedingly tame, insomuch as to be easily knocked down with a stick. They feed on various things, and have more than once been observed to be content with the ejected food of the Booby. It is much to be suspected, that this is no other than a casual variety of the Purple species, and the more so, as that bird is in sufficient plenty in Tongotaboo, Tanna, and other islands of the Pacific Ocean, independent of Java, Madagastar, and various parts of the East Indies, as well as China. I have likewise observed some specimens, which appeared to belong to this species, in which the plumage was of a general brown colour, with a strong gloss of blue and green when exposed to different restections of light, and such I apprehend to be young birds not yet having attained their state of persection.

DESCRIPTION.

PLACE.

# ORDER VIII. WITH PINNATED FEET.

# GENUS LXXXIII. COOT.

Fulica atra, Ind. Orn. ii. p. 777. 1.—Gerin. Orn. v. t. 425. Common Coot, Gen. Syn. v. p. 275. 1.—Id. Sup. p. 259.

THIS bird is no where in greater plenty than in the Isle of Sheppey; and the inhabitants receive great benefit therefrom, and in course will not suffer the eggs to be taken. The birds are a great article of food, being eaten by most people there, and thought very good; they are first skinned, after which they are dressed in various ways like pigeons.

#### GENUS LXXXIV. GREBE.

Podiceps caspicus, Ind. Orn. ii. p. 784. 7.—S. G. Gmel. It. p. 137.—N. Nord. Beytr. iv. p. 9.

THE body on the upper part is dusky brown, beneath filvery white: bill lead colour: throat and cheeks white: wing coverts brown.

Description.

Inhabits the Caspian Sea. We suspect that this bird has some affinity to the Red-necked Grebe.

PLACE.

A species of *Grebe* is found in *New Holland*; it is about the size of the *White-winged Grebe*, and not unlike it in plumage. The head is more like *Pl. Enlum.* 945\*, but the chin is not white.

Sonnini mentions one found in Egypt, where it is called Farha reheit, varying but little from our own; the first and last of the quills are blackish, the rest white.

\* Castagneux des Philippines.

# ORDER IX. WEB-FOOTED.

\* WITH LONG LEGS.

# GENUS LXXXVII. FLAMINGO.

CHILI FL. Description. Phænicopterus chilenfis, Ind. Orn. ii. p. 789: 2.-Molin. Gbil. (Fr. ed.) p. 222:

THE height from the point of the bill to the tips of the claws is five feet; and the body itself about one foot: the back and the wings are of a fiery red colour, the rest of the plumage of a beautiful white: the head is very small, oblong, crowned with a fort of crest: bill five inches long; it differs in many things from the species generally known, but in none more than the quills, being in this of a pure white, which in the common American and African fort are quite black: the young said to differ from the adults, in being of a grey colour.

It is probably one of the finest birds in Chili; frequents only the fresh waters. The inhabitants set great store by this bird, as it furnishes them with the beautiful seathers with which they adorn their helmets and spears: the wings also are converted into sans, and used for the same purpose.

2. Pacific G.

4. Skua G.

Sterna obscura, Ind. Orn. ii. p. 810. 25. Brown Tern, Gen. Syn. vi. p. 368. 23.

BROWN
G.
Description.

A Bird which we have very little doubt is the Brown Tern, hitherto so called, fell under the observation of my friend Mr. Boys, of Sandwich, a few years fince. He observes that it is a beautiful species, but without a fingle character of the Tern; the bill like that of the Cinereous Tern, but longer and more slender, yellow to the hook in the upper mandible, and to the gibbous part of the lower: from thence black: length to the toes and tail fifteen inches and a half; to the tips of the wings eighteen inches; breadth eighteen inches; weight eight ounces and a half avoirdupois: the hind head and nape dusky: at the anterior angle of the orbit, a black spot; another of the fame behind the ear: forehead, throat, fore part of the neck, belly, vent, and rump, pure white: back, fcapulars, upper range of coverts next the body grey; middle feries of coverts brown, edged and tipped with white; lower feries grey, with white tips: baftard wing composed of three feathers black and white: quills deeply tipped with black, fringed with white: middle of the feathers and the shafts white: outer web banded with black; inner webs with dusky, but deeper; fecondaries dusky, tipped with grey: tail of twelve feathers; the two external ones white, the rest white with a bar of dusky: legs dusky orange: claws black.

U u 2

Should

Should this prove what Mr. Boys suspects, it ought no longer to be retained as a Tern, as it manifestly belongs to the Gull genus: it was met with in the neighbouring shores of Sandwich.

PACIFIC G.
Description.

THE general colour of the plumage in this bird is deep brown; but the under parts, the rump, and tips of the leffer wing-coverts are very pale brown, approaching to white: tail rather short, rounded at the end: bill dirty orange, swelling near the point, where it is crossed with dusky or black: legs dusky.

PLACE.

Inhabits New South Wales; where is also found the Black-backed! Gull, or a species so similar thereto, as not to merit description.

PULO CONDOR G. Description.

Larus Pulo Condor, Mus. Carls. fasc. iv. t. 83.

HE forehead in this bird is ash colour; crown the same, with a mixture of white: the plumage on the upper parts rulty ash colour and brown mixed; beneath white: bill, hind head, nape, shoulders, and claws, black: legs yellow.

PLACE.

Inhabits Pulo Condor ...

SKUA G. Larus Catarractes, Ind. Orn. ii. p. 818. 12., Skua Gull, Gen. Syn. vi. p. 385. 14.

WE suspect that this is the species called at St. Kilda, Fuilag\*, which is said to be a large Gull, insesting the birds, by breaking their eggs, and often killing their young, and many of the old sowls. The inhabitants discover the greatest rage at seeing or hearing of this cruel enemy, and exert their whole address to catch it; when they excel the Indians in torturing it, they pluck out its eyes, sew the wings together, and send it adrist; at other times, they extract the meat out of the egg, on a supposition that the animal may sit till it pines away; and for any one to eat the egg, would be accounted flagitious.

# GENUS XCV. PETREL.

N° 1. Great black P.

Nº 3. Cinereous P.

2. Norfolk Island P.

Precellaria æquinoctialis, Ind. Orn. ii. p. 821. 3. Fuliginous Peterel, White's Voy. pl p. 252. Great Black Peterel, Gen. Syn. vi. p. 398. 3. Var.

GREAT BLACK

THIS is nearly as big as a Raven: the whole bird of a deep footy brown or blackish colour, except that on the chin is a small patch of white, running down on each side the lower mandible: the legs are dusky: bill pale dirty yellow.

DESCRIPTION.

Inhabits the sea in the neighbourhood of Port Jackson, in New South Wales, and has the same manners with its congeners. No one is a greater enemy to the Albatross than this bird, whenever it is seen on the wing, but quits it as soon as the Albatross takes to the water, sensible no doubt that an encounter on this element would end to its disadvantage. It is however a still greater scourge to the Broad-billed Petrel\*, for although multitudes of these are destroyed by it, it only devours the heart and liver, leaving the rest untouched; hundreds of them thus eviscerated have been found lying upon the ground in this situation †.

PLACE.

· Procellaria Forsteri, Ind. Orn.

+ Embaff. to China, i. 223.

NORFOLK ISLAND P. Procellaria alba, Ind. Orn. ii. p. 822.6. White-breafted Petrel, Gen. Syn. vi. p. 400.6. Norfolk Island Petrel, Phill. Way. pl. p. 161.

DESCRIPTION.

LENGTH fixteen inches: bill one inch and a half long, black, and very hooked at the end: the head, as far as the eyes and the chin, mottled brown and white in waves: the rest of the bird on the upper parts of the body of a sooty brown, and on the under, of a deep ash colour: the inner part of the quills white, especially next the base: the wings, when closed, exceed the tail by nearly one inch: the tail is rounded at the end, composed of fixteen seathers, of the same colour as the upper parts: the legs pale yellow: the outer toes black the whole of their length; the adjoining web the same, except just at the base, where it is pale; the inner toe and web black for about one third: the claws and spur behind black.

PLACE.

This inhabits Norfolk Island, where it is in great plenty, and burrows in the fand like a rabbit. On Mount Pitt, the highest land in the island, the ground was as full of holes as a rabbit warren, and an immense number of aquatic birds burrowed and built their nests in them \*. These, during the day, were at sea, but as night approaches, they return in vast slocks. The settlers lighted small sires every night on this mount, about which the birds dropped as fast as the people could pick them up and kill them, for the wings of sea birds are generally so long, as to prevent their rising till they can ascend some small elevation; hence the difficulty in the Albatross to detach itself from the surface of the water, which it can never do without the greatest exertion. When, however, it is fortunate enough to gain a small rock or shelf, it has only to throw itself therefrom, and take wing immediately.

<sup>\*</sup> Hunter's Hift. of Port Jackson, 18,000 faid to have been taken in the space of about fix weeks.

Procellaria cinerea, Ind. Orn. ii. p. 824. 10. Cinereous Petrel, Gen. Syn. vi. p. 405. 10.

CINEREOUS P.

THIS, or a flight variety, is found about Port Jackson, in New Holland, and parts adjacent: it is wholly of a dusky black; but the sides of the head, the neck, and all beneath, are ash colour: the bill and legs dull yellow. In a specimen of this, we observed the whole of the under parts from the breast to the vent occupied by an ash coloured down, projecting greatly more than the seathers, which we supposed would afterwards supply its place, for it may be conjectured, that birds in this state are no other than in their first seathers and impersect plumage.

Greater Goofander, Linn. Trans. iv. p. 122. 26.

OUR reason for mentioning this bird again, is to request that naturalifts will be more diligent than ever in regard to fuch birds, whose identity as species may be ascertained by diffection. We have in more places than one remarked the uncertainty in respect to the external appearance of birds, till arrived at the adult state. The Dun Diver, amongst others, has caused us to waver greatly; for naturalists having fet this bird down for certain as a female of the Greater Goofander, and finding that some of these supposed semales were endowed with the fame conformation of trachea as the male adult, known to be fuch, doubt arose, whether, as there were both sexes under this livery, it might not be totally different in species. The fact however seems, that both fexes, for the first season at least, have the appearance of the Dun Diver, which the female retains throughout life, whilft the male gradually gains the beautifully white plumage he is known by; but the distinguishing character of the windpipe, wherein he entirely differs from the other fex, will be detected at any age whatever \*.

Red-breasted Merganser, Gen. Syn. vi. p. 423.—Edw. t. 95.—Lin. Trans. iv.
p. 121. tab. xvi. f. 1. 2. the windpipe of the male.

DESCRIPTION.

WE do not find that externally the male and female of this species have been at all mistaken by authors, but still the intuitive naturalist will observe the same internal difference to exist as takes place in the greater species. The male has an enlargement of the trachea about the middle of its length, consisting of bony plaits of the same texture as the rest of it, the lower part of it ending in a large and remarkable bony cavity, of an irregular heart shape, with two openings on one side, and one on the other: all of which are covered with sine membranes \*, and from the bottom of this the two bronchiæ spring, which there dividing, lose themselves in the lungs.

Mergus imperialis, Ind. Orn. ii. p. 829. 3 .- Cett. uc. Sard. p. 326.

IMPERIAL M.

THIS is the fize of a Goofe: the body is variegated with black, brown, and grey: the head is without a creft: the prime quills are black, and without any speculum: bill and legs rusous white: tongue ciliated.

PLACE.

Inhabits Sardinia.

Smew, or white Nun, Gen. Syn. vi. p. 428. 5. (Male.)—Lewin's Br. Birds, vi. t. 234.—Lin. Trans. iv. p. 234. pl. xvi. f. 3. 4.

Minute Merganser, Gen. Syn. vi. p. 429. 6. (Female, or young bird.) Lewin's Br. Birds, t. 235.

DESCRIPTION.

MITE have observed in another place \*, that the Minute Merganser, with its fynonyms, and the White Merganser, all make up but one species, occasioned by the male having the female plumage for some length of time after growing to fize; for having attentively examined and compared the windpipe of a supposed male Minute Merganfer, with the fame part of a full grown Smew, the fimilarity at once was manifest, no other difference whatever being visible, further than that the parts were less offified in one than the other; henceforward therefore we may venture to affirm, that three distinct species only of the Smew genus will be found in England, instead of the five now on record. The trachea or windpipe of this species is smallest near the upper part, but enlarges as it approaches towards the middle, from whence to the bottom it continues of nearly equal dimensions, the texture confisting of completely bony rings, with scarcely any cartilage intervening; at the bottom is a bony cavity, as in the others, smaller in proportion, and differing in shape, the greater expanse being from fide to fide, whereas in the others it is almost upwards and downwards; on one fide is a round hole, covered by a drum-like membrane, and on the opposite, an oval smooth hollow bone uniting with it: from the bottom arise the bronchiæ.

Mergus furcifer, Ind. Orn. ii. p. 832. 8 .- Schr. d. Berl. Nat. Fr. vii. S. 458. 32.

FORKED M. Description.

THE bill in this bird is black at the tip and base; but the middle is reddish: the irides pale brown: the forehead and back are light brown: from the ears, down the sides of the neck, quite to the breast, a black stripe, shaded for half the length with chesnut: hind head and neck white: breast, back, and rump black, the seathers appearing scaly: belly and vent white: tail sorked, as in the Swallow; the outer seathers white: wing coverts shaded not unlike the back: lesser quills like the back, part of them white, making a long spot of that colour between the back and wings.

Inhabits Courland.

PLACE.

Mergus fuscus, Ind. Orn. ii. p. 832. 9. Brown Merganser, Aret. Zool. ii. Sup. p. 74. 6. BROWN M.

THE length of this is feventeen inches and a half; weight twenty-three ounces: the head is dark brown: from the orbits a whitish brown streak, extending backwards, and ending in a large pendent crest; the upper part of it brown, the lower black: greater and lesser coverts, scapulars, and tail, black: secondaries the same, but each web broadly mottled with white: belly white: vent tawny: beyond the junction of the thighs with the body, a few black feathers marked with red: legs dusky yellow.

DESCRIPTION.

This species arrives at *Hudson's Bay* in *May*, as soon as the rivers are open: makes its nest about the lakes, with grass, lined with feathers pulled from its own breast: retires when the rivers are frozen.

PLACE.

# MERGANSER.

Whistling Swan, Gen. Syn. vi. p. 433.—Id. Supp. p. 272.—Lin. Trans. iv. p. 105. pl. xii. f. 1. z. The trachea, &c:

WHISTLING SWAN,

THE Wild Swan is now known to be an inhabitant of Dorsetshire, as Dr. Maton\* faw them in their wild state, on the east side of Chesil Bank, in August.

. Observations on the Western Counties, by Dr. Maton, i. p. 68.

In the neighbourhood of Tzaritzin, on the Lower Volga, a great number of Swans appear about the 20th February, particularly upon the Sarpa, and towards the lower grounds of the Achtuba: they are of two kinds; but that which distinguishes itself by its very sharp scream, and has the lower part of its bill yellow, is the most numerous \*. Among the Kalmucs, the Lama Dardsha had for his title Erdeni Lama Baatur Khan Taïdshi, which signifies noble father of souls, brave prince of Swans †.

The circumstance of the trachea entering the keel of the breastbone, has been before noticed in this work, as well as by many authors before; but as no words are able to convey a sufficient idea without engravings, Dr. Parsons has given a good representation in the Phil. Trans.; another will be also found in the Lin. Transactions above referred to.

MUTE SW. MANNERS. Anas olor, Ind. Orn. ii. p. 824. 2.—Ger. Orn. v. t. 553. Mute Swan, Gen. Syn. vi. p. 436. 2.

PIRDS of this species sometimes live together in society with perfect complacency: two semale Swans have for three or sour years past agreed to associate, and have had yearly each a brood, together bringing up eleven young. They sate by turns, and never quarrelled. This is not the only instance which has come under our observation; and numbers are to be seen together in many waters in this kingdom; but the most noble swannery is, we believe, very near Abbotsbury, Derset, about a quarter of a mile to the west of which, in the open part of the sleet, are kept 6 or 700—formerly 1,500 Swans‡, the royalty belonging anciently to the abbot, since to the family of Strangeways, and now to the Earl of Ilchester. That this species is very pugnacious, is

\* Russia (8vo. 1783) vol. iv. p. 283. † Id. p. 205.

As far as 7000.—Maton's Tour, i. p. 72.

known

known to most people; and it must be a powerful man who is able to withstand the sury of an enraged one. A circumstance has come to our knowledge, shewing at least the superiority the Swan has on its own element, for a semale of one of these, whilst sitting, observing a fox swimming towards her from the opposite shore, instantly darted into the water, and having kept the fox at bay for a considerable time with her wings, at last succeeded in drowning him, after which, she retired in triumph, in the sight of several persons. This happened at Pensy, in Buckingbamskire.

Nat. Misc. pl. 108.—Phillips's Voy. p. 98.—White's Journal, p. 137.

BLACK SWAN.

THIS is a large bird, not inferior in fize to our European species, and extends from the tip of one wing to that of the other, sour seet eight inches: the bill is large and red; towards the end paler; on the base of the upper mandible, at the nostrils, a bisid protuberance; the under mandible white beneath, and red on the sides: irides red: the general colour of the plumage is deep black; but the greater part of the second quills, and all the prime ones, are white; also two or more white seathers on the coverts: belly and thighs ash colour: legs sless coloured brown.

DESCRIPTION.

In what other particulars the *female* differs from the *male*, we are not told, further than that the protuberance at the top of the bill is wanting.

Inhabits various parts of New Holland, where it has been long noticed. I find it first mentioned in a letter from Mr. Witsen to Dr. M. Lister, about the year 1698, which says, here is returned a ship, which by our East India company was sent to the south land, called Hollandia Nova, and adds, that Black Swans, Parrots, and many Sea.

PLACE.

Corus.

Cows were found there \*. In 1726, two of them were brought alive to Batavia, as confirmed by Valentyn †: several being found in New Holland, near Dick Hartog's Bay.

Since that time, our later circumnavigators, from Captain Cook to the present time, have found them every where in these parts, eight or nine having been met with together, and they are said to say one after another like Wild Geese; but the general manner, &c. remains yet to be ascertained. The natives of New Holland call this species Mulgo.

BLACK-NECKED SWAN. Anas nigricollis, Ind. Orn. ii. p. 834. 3.

Anas melancorypha, Cygne Chilien, Molin. Chil. (Fr. ed.) p. 213.

Black-necked Swan, Gen. Syn. vi. p. 436. 3.

DESCRIPTION.

MOLINA observes, that it is the fize of the European Swan: the head and half the neck black; the rest glossy white: the female has commonly six young, which it never leaves alone in the nest, but carries them on its back every time it goes out in search of food.

BLACK AND WHITE GOOSE. Description.

THE fize of this bird is uncertain: the bill is not unlike that of the Wild Swan, extending far backwards, and taking in the eyes: it is yellowish at the base, red in the middle; the point as well as the under mandible pale: the head, neck, beginning of the back, major

<sup>\*</sup> Pbil. Trans. v. 20. p. 361.

<sup>†</sup> See Valentyn Oud en Nieuw Oost Indien. Amst. 1726, where it is observed that two, and afterwards more black swans were found in New Holland: two of them were brought alive to Batavia. This account accompanied by an engraving, representing the Lagoon, with the black swans swimming in it; and the catching of one by the boat's crew.

part of the wing and quills, tail, and thighs, are black: fome large fpots of black are also on the last; the rest of the plumage white. It stands high on the legs, which are yellow: and the webs do not reach above half way between the toes.

Inhabits New South Wales: were it not from the extreme distance between Chili and New Holland, one might think it a variety of the Black-necked species.

PLACE.

Anas hybrida, Ind. Orn. ii. p. 835. 6. Le Cage, Molin. Chil. (Fr. ed.) p. 221. 6.
HYBRID
GOOSE.
Description

THIS is about the fize of a Domestic Goose; but the two sexes differ exceedingly in colour: the male is of a pure white, with the bill and legs yellow: the bill is half cylindrical; the cere red: the female is black, except some streaks of white, arising from the tips of several of the feathers being bordered with white: bill and legs red: the neck is somewhat shorter than in the Common Goose, but the wings and tail longer; and the legs of nearly the same shape and make.

PLACE.

This species inhabits the Archipelago of Chiloë, in South America: may be called monogamous, for the male and female are never apart, never being found in flocks, as other forts: during the time of incubation, they retire to the rivers, where the female generally lays about eight white eggs, in a hole formed out of the fand.

Anas Coscoroba, Ind. Orn. ii. p. 835. 7 .- Molin. Chil. (Fr. ed.) p. 213.

COSCOROBA

G.

DESCRIPTION.

THIS is probably the fize of a Goofe, at least Molina calls it by that name, and fays it is of a large fize: that it is wholly white, except the bill and legs, which are red: the eyes of a fine black; whether the female differs from the male is not mentioned.

PLACE.

This inhabits *Chili*, and is valuable for its extreme docility and tameness in confinement and domesticity, particularly attaching itself to the person who brings it food.

SUPP. II.

BLUE-WINGED G. Description. Anas cærulescens, Ind Orn. ii. p. 836. 13.

Blue-winged Goofe, Gen. Syn. vi. p. 469. 28.—Bartr. Trav. p. 292.

THIS species is apt to vary much. I have received several from Hudson's Bay; one of them corresponded exactly with our description in the Synopsis; another had the head and a little part of the neck white, behind mixed with black; half the neck before white; the rest of the bird much the same as in common. In a third, the head, all the neck, the whole of the body, except between the wings, of a pure white: at the lower part of the neck behind, and between the wings, dufky black, or deep lead colour: scapulars the same, margined with white: wing coverts as generally feen in this species, but paler, and inclined to white: the second and third greater quills black; all the fecondaries black, beautifully fringed on each fide with white, purer than in the others, but not unlike: tail white; the four middle feathers pale lead colour, down the middle, half way from the A ticket affixed to this last bird, fays, that it is produced from a Blue and a White Wayway \*; but this is only according to the tradition of the Indians.

ÇOMMON G, Anas anser, Ind. Orn. ii. p. 841. 26.—Ger. Orn. v. t. 561. 1. 558. 559. 560. —Sepp. Vog. iii. t. 105. Grey Lag, and tame Goose, Gen. Syn. vi. p. 459. 21.—Id. Sup. p. 273.

ON the strictest examination of the trachea of both sexes of the Goose, scarcely any difference can be found between them, excepting that of the male appears to be the thicker and larger of the two.

Every one experiences the utility of the feathers of the Goofe; all of which are applied to the various wants in life; and the quills in

lodious,

lodious, and the bird observed sometimes to perch on trees, in the manner of the Whistling Duck: the native name is Newal Gang.

MUSCOVY G. Anas moschata, Ind. Orn. ii. p. 846. 37.
— indica, Ger. Orn. v. t. 568. 569.

Muscovy Duck, Gen. Syn. vi. p. 476. 31.—Lin. Trans. iv. p. 113. pl. xvi. f. 5. 6.

DESCRIPTION.

THE male of this differs in the formation of the trachea from the female, as in feveral of the Duck genus: the windpipe is flout, nearly equal in diameter, but a trifle smaller towards the bottom; the bony arch, as in others, finishes the bottom part, and appears as if furnished with rings, but they are not moveable as in the rest of the trachea: the orbicular labyrinth is attached to the fide of it: this is not smooth on the surface, as in the Pintail and Wigeon, but universally rough and irregularly furrowed with fine indented lines; the oppofite fide runs into a pear-shape, and is placed obliquely, with the point lowest, but is flatted considerably on the surface: the bony arch is on this fide smooth, having no appearance of rings, and is bent at a fmall angle from the trachea, although it conflitutes a continuance of it. In old birds, the bony labyrinth is more rounded, and larger, but stills retains the roughness on the surface; in a very old bird, furnished to me by Mr. Boys, the labyrinth is not only much larger, but nearly globular, and the bony arch quite fmooth, yet is finely granulated and faintly wrinkled, and the texture more bony. figured by Dr. Block, in the Berlin Transactions, appears by much too large, but it is not for us to fay that it is faulty, for in case his figure is taken from a foreign specimen, and supposing that the Muscovy Duck arrives at twice the fize we fee them in England, and which they are faid to do, no doubt but the labyrinth and its trachea would bear a due proportion.

Lobated Duck, Nat. Misc. pl. 255.

LOBATED DESCRIPTION.

SIZE of the Mallard: the bill large, bent at the tip; colour dufky black; from the under mandible springs a roundish large slap or wattle, of a very clark colour, hanging downwards: general colour of the plumage dusky black, croffed with numerous transverse pale or whitish lines, intermixed with minute irregular markings and spots of the same: the chin, fore part of the neck, and belly, have the ground white, marked and irregularly spotted with dusky black: quills and tail dusky black, the last somewhat pointed in shape: legs lead colour.

Inhabits New Holland.

SOLITARY
D.
Description.

Anas monacha, Ind. Orn. ii. p. 847. 40. - Scop. Ann. i. Nº 86.

THIS is larger than the *Mallard*: bill yellowish, with a black tip: lore grey: plumage varied black and white: head and beginning of the breast spotted with black: prime quills white; tips variegated with brown: speculum violet green: tail pointed; the feathers white, marked with a brown spot at the tip.

VELVET D. Anas fusca, Ind. Orn. ii. p. 848. 44.—Gunth. Nest. und Ey. t. 90. Egg.—Schr. des Berl. Nat. iii. p. 374. t. 8. f. 1.

Velvet Duck, Gen. Syn. vi. p. 482. 37.—Id. Sup. p. 274.—Lin. Trans. iv. p. 119. pl. 15. f. 3—7. the trachea.

DESCRIPTION.

THIS bird being for the most part black, excepting a white mark on the under eyelid, and a spot of the same on the wing, carries nothing interesting outwardly; but on dissection, the windpipe of the male will be found curiously constructed: just below the larynx, is a bony cavity, of almost an inch long, from this the trachea descends for nearly two-thirds of its length, when it swells out into a strong bony hollow, about the size of a small walnut, slat on one side; and at the bottom, where the trachea divides, the parts again become bony, but not much enlarged; at the under parts of this, the two bronchiæ take their rise: some diversity takes place in birds of various ages, but not enough to cause any mistake in regard to the species.

Anas Boschas, Ind. Orn. ii. p. 850. 49. Wild Duck, Gen. Syn. vi. p. 489. 43.

MALLARD D.

TT has been mentioned before, that this species is found common in very many places. In India, about the neighbourhood of Cochin, it is called Tarava \*: the flesh however is almost unfit for food, as they chiefly live on Pilchards: on board a ship therefore, these are kept a long time on different food before they are killed. An immense trade is carried on with them in the maritime towns of India, giving employment in particular to the Christians, Mahometans, and black Fews. Sir George Staunton + affirms, that the Wild Ducks are caught by the device of empty jars or gourds put over the heads of the divers, who wade for them upon the Wee-chaung-hoo Lake, in the manner we have before noticed ‡. The windpipe of the male of this species differs from that of the female, by having a globular or labyrinthic cavity, about three-quarters of an inch in diameter, just before the entrance into the lungs; for the shape of which, see Lin. Transact. vol iv. p. 112. No 17. tab. xiii. f. 10. whether the Hook-billed Duck is distinct, or a variety only of the Mailard, remains to be determined; perhaps an accurate inspection and comparison of the trachea may determine the point.

THE description of the male of this bird has been already given, which is known to vary in colour most exceedingly

DESCRIPTION.

<sup>.</sup> Bartolom. Voy. to the East Indies, 8vo. Engl. ed.

<sup>†</sup> Embaff. to China, ii. p. 400. 1 Gen. Syn. vi. p. 492.

in different stages of life, and no doubt but some of the males of inferior plumage have been taken for semales: but the true semale has only of late been precisely determined. I owe the first hint of this to my valued correspondent the late Mr. Tunstal, but the positive certainty of the circumstance to that indefatigable naturalist Mr. Boys, who was at the pains to procure for me several specimens.

The length of the female bird is eighteen inches and three-quarters: from the bill to the end of the toes, twenty inches and a half; breadth thirty-one inches; weight thirty ounces: the bill is broad, flat, of a pale blue, with a black knob: irides yellow: head dark brown: at the base of the bill is a band of white, nearly half an inch broad, paffing quite round the forehead, cheeks, and throat: breaft dark brown, the feathers tipped with darker brown: back and scapulars light grey, transversely waved with irregular dusky lines: belly dirty white; vent the same, waved with narrow dark lines: rump and tail very dark brown; the last very short, consisting of fourteen feathers: greater quills the fame: fecondaries white, tipped with brown; but the ends of the greater quills are darker than the reft: legs dusky blue: webs black. The tracheal labyrinth in the male of this species, is placed the same as in the Mallard; it is rounded on one fide, and flat on the other; in shape irregular: the flat surface is for the most part open, except round the rim, and an irregular bony arch croffing it from fide to fide: independent of these, the furface is covered with a delicate fine elastic membrane, stretched over the furface, giving the appearance of the head of a drum: a just idea of the Arructure may be formed by inspecting the plate above referred to in the Lin. Trans.

Anas Tadorna, Ind. Ocn. ii. p. 854. 56,-4Gec. Ocn. v. t. 576.—Sepp. Vog. ii. p. 192. t. 99. 100.

SHIELDRAKE.

Shieldrake, Gen. Syn. vi. p. 404. 51.—Id. Sup. p. 275.—Lewin's Birds, vii. pl. 248.—Lin. Tranf. iv. p. 117. pl. xv. f. 8 9.

DESCRIPTION.

THIS bird has been fully treated of by most authors. We have only to add here, that the male is to be distinguished from the other sex, by the addition of a labyrinth in the trachea at the lowest part, and is unlike that of any hitherto mentioned, confishing of two roundish bladders, the one bigger than the other, of unequal surface, and most delicate bony texture, being of so tender a fabric, as scarcely to bear the pressure of the singer, without indenting in young subjects or breaking in old ones. For the sigure, see the Linnaan Transactions above quoted.

Anas clypeata, Ind. Orn. ii. p. 856. 60.—Ger. Orn. v. t. 572. 573.—Sepp. Vog. t. 130. 131.

SHOVELER D.

Shoveler, Gen. Syn. vi. p. 509. 55.—Lewin's Birds, 7. No 252.—Lin. Tranf. iv. p. 109. pl. xiii. f. 4. 5.

Description.

WE have nothing to add concerning this bird, further than to notice the labyrinth in the trachea of the male, which confifts of a roundish bony arch, but very small in proportion to the bird, as may be seen in the plate in the Linnaan Transactions above referred to.

Anas strepera, Ind. Orn. ii. p. 859. 69.—Ger. Orn. v. t. 574. 575. Gadwal, Gen. Syn. vi. p. 515.—Linn. Trans. iv. p. 111. t. 13. f. 7. 8.

GADWAL D. D. DISCRIPTION.

THE windpipe of the male has a bony bladder and arch, fomewhat like that of the Pintail Duck; but the globular part not quite so large: we may observe too, that it adheres to the side of the arch, quite to the bottom, whereas in the Pintail, it is attached to the side of the arch by a small portion only.

SUPP. II.

Z z

WIGEON.

Anas Penelope, Ind. Orn. ii. p. 860. 71.—Ger. Orn. v. t. 585. 586.—Sepp. Vog. iii. tab. 109. 110. Common Wigeon, Gen. Syn. vi. p. 518 .- Lin. Trans. iv. p. 111. tab. xiii. f. 9.

DESCRIPTION.

THE only reason for mentioning this species here, is to notice the windpipe, which at first fight does not seem materially to differ from that of the Pintail; the bony orb is most perfectly globular, and differs somewhat in respect to the attachment at the sides, which may be noticed by comparison of one figure with another, better than by words.

POCHARD DESCRIPTION. Anas ferina, Ind. Orn. ii. p. 862. 77 .- Ger. Orn. v. t. 583. 584. Pochard, Gen. Syn. vi. p. 523. 68 .- Lin. Trans. iv. p. 116. pl. xiv. f. 5. 6.

THE trachea or windpipe of this bird is like that of the Scaup, but two inches shorter, and of nearly the same diameter through-The drum-like labyrinth is more round on the upper fide, but croffed with a small bony partition, as in that bird. The bony box of which the other portion confifts, is scarcely elevated on this side, and on the other much lefs fo than in the Scaup; it likewise forms an obtuse angle with the rest of the trachea, but in the Scaup, it does not deviate from a continuation of a straight line, though forming a confiderable enlargement.

Anas acuta, Ind. Orn. ii. p. 864. 81 .- Ger. Orn. v. t. 581 .- Sepp. Vog. t. 92. 93. Pintail, Gen. Syn. ii. p. 526. 72 .- Lin. Trans. iv. p. 110. pl. xiii. f. 6.

DESCRIPTION.

THE trachea of the male of this bird ends in a bony arch, and attached to it a nearly round bony bladder, about the fize of the end of the thumb; the upper part is about even with that of the bony arch, but the bottom greatly below it; from one of these one of the divisions arises to pass into the lungs, and from the other the second.

An

An inspection of the figure in the plate of the Linnaan Transactions, will make further description unnecessary.

Anas Clangula, Ind. Orn. ii. p. 867. 87.—Ger. Orn. v. t. 593-594. Golden Eye, Gen. Syn. vi. p. 535. 76.—Lin. Trans. iv. p. 118. pl. xv. f. 12.

GOLDEN-EYE D. Description.

THE windpipe in the male of the Golden Eye, is of a curious conftruction, and the labyrinthic part different from any other, a fingular enlargement taking place about the middle. This swelling or ventricose part, consists of divers plaits or joints placed obliquely, not differing in texture from the other parts of it, and folding over each other, so as to admit of being contracted into a very short compass, or dilated to a great distance, as the lengthening or shortening of the neck may require. In the recent state, these rings are by compression capable of being solded into a space of little more than an inch, but by extending, may be made to occupy sour inches or more, and being cartilaginous, easily recover their tone when left to themselves. A perfect idea may be obtained by inspecting the plate in the Lin. Transations above referred to.

Anas Fuligula, Ind. Orn. ii. p. 869. 90. Anas Glaucia minor, Mas cristata, Ger. Orn. v. t. 591. 592. Tusted Duck, Gen. Syn. vi. p. 540. 79.—Lin. Trans. iv. p. 117. xxi.

TUFTED D.

THE trachea of the male of this bird greatly refembles, in the drumlike portion of it, that of the Pochard\*, but the bony box-like portion is elevated, and scarcely to be distinguished from that of the Scaup †, except in being smaller. The trachea also itself is of smaller dimensions throughout: these comparisons cannot fail to identify the species, if properly attended to.

DESCRIPTION

† Id. pl. xiv. f. 3. 4.

SPARRMAN'S D. DESCRIPTION. Anas Sparrmanni, Ind. Orn. ii. p. 876. 110. Anas alandica, Mus. Carls. fasc. s. iii. tab. 60.

HIS is twenty-three inches long: the bill and legs black: the upper parts of the plumage varied with black, ferruginous, and white: fcapulars black, margined with ferruginous white: breast and belly dirty white: tail ferruginous, fasciated with black.

PLACE.

Inhabits Aland, in Sweden, towards Abo.

GMELIN'S D. Anas Gmelini, Ind. Orn. ii. p. 876. 111.—S. G. Gmel. reise, 1. p. 70.—Id. ii. p. 182. t. 16.

Description.

THIS is larger than a Teal: at the corners of the mouth a fpot of white: the general colour is black: the head chefnut: the breast crossed with reddish lines: belly whitish, with dusky spots: sides and vent snow white: the first sour outer quills are black, but within cinereous; from the fifth to the tenth wholly cinereous; eleventh to nineteenth white; the twentieth, on the fore part half white half dusky, at the hinder part cinereous; all of them tipped with black; from the twenty-first to twenty-fifth, as also the wing coverts, wholly black: tail black.

PLACE.

Inhabits the Caspian Sea, and the neighbouring parts of the South of Russia.

KEKUSCHKA D. Description. Anas Kekuschka, Ind. Orn. ii. p. 877. 112 .- S. G. Gmel. reise, iii. p. 249. t. 26.

THIS exceeds nineteen inches in length: the general colour is an oker yellow; the under parts white: the back ash colour: rump and tail deep black: quills from the fifteenth to the nineteenth white at the tips.

PLACE.

Inhabits the neighbourhood of the Caspian Sea: it is eaten by some; but the sleich is said to be rancid.

Anas Arabica, Ind. Orn. ii. p. 877. 113. Anas Scharchir, Forsk. Faun. Arab. p. 3. 7. ARABIC D,

THE bill is yellow, with the middle part black: the body spotted with grey: beneath and on the rump whitish, with cinereous spots: speculum or wing-spot dusky, banded before and behind with white: legs yellowish ash colour.

DESCRIPTION.

PLACE.

Inhabits Arabia.

Anas Alexandrina, Ind. Orn. ii. p. 877. 114.

Sau Sarai, Forsk. Faun. Arab. p. 3. 8.

ALEXANDRINE
D.
Description.

N this, the bill and vent are black: the neck ash colour, marked with black crescents: belly white: legs yellow ash colour. Inhabits Alexandria.

PLACE.

SIRSÆIR

BILL lead colour; beneath yellow: chin white: crown brown: back brown, the feathers whitish on the margins: belly whitish speculum of the wings divided obliquely, above silky green, beneath black; before and behind white: legs grey.

DESCRIPTION.

Inhabits Arabia.

PLACE,

HAWKSBURY
D.
Description.
Frontispiece.

I ENGTH twenty-two inches; fize of a Wigeon: bill rather shorter than in that bird, colour black: head and neck chocolate brown; at the back part of the nape, the seathers are much lengthened, somewhat paler, and black at the ends: the upper part of the back and wing coverts brownish ash colour, the last palest: the lower part of the back, rump, tail, and middle of the belly, vent, under tail coverts, and quills, are black; but the sides of the breast and belly under the wings are grey, crossed with minute undulated lines: speculum of the wing green, bounded on each side with wire, but beneath the white is broader than above: the outer we is on the scapulars are black: but the most distinguishing character is, that the seathers of the breast have the ends of a pale silvery grey, and on each side of the grey a spot of blackish, giving that part an undulated appearance, spotted with black: the wings when closed do not reach quite to the end of the tail: the legs are brown.

The female differs in having the vent white instead of black, and the green speculum on the wings smaller and less conspicuous.

Inhabits New South Wales; frequently met with about Hawksbury River, and now and then observed perched on trees.

The male is now in my own collection, but among the drawings of Mr. Lambert, I observe some variety, for the elongated seathers at the nape take up much more space in some than in others: the head and neck too in some are sine rusous, not unlike those parts in the Pochard: from the lower part of the breast to the middle of the belly ash colour, beautifully marked with curved lines of brown: on the back sour or sive irregular large patches of black: legs black.

PLACE.

36. NEW HOLLAND D. Description.

THE length of this bird is about nineteen or twenty inches, and is nearly the fize of our Duck: the bill is large, growing broader at the end, which part is foft and membranous; colour black: irides blue: the upper part of the head, a large patch round the eye, and the back part of the neck, dufky: back and wings ferruginous brown: above and behind the eye a ferruginous ftreak: some of the inner feathers of the wings have very pale tips, as well as the lower part of the rump, and across the tail: the under parts from the nostrils, sides and front of the neck, and all beneath the body, dirty white, transversely mottled with grey; towards the vent, and the sides under the wings, nearly black.

Inhabits New South Wales; but is rare: the native name is Wrongi. A bird with a bill of a fimilar foft texture is found at New Zealand\*; but as the colours of the plumage do not by any means correspond, I dare not venture to fay they are allied to each other.

PLACE.

NEW HOLLAND SHOVELER.

DESCRIPTION.

THIS species is about eighteen or nineteen inches in length, and resembles in colour the Blue-winged Shoveler, but the plumage is in general darker, and is destitute of the white crescent observed behind the eye of the male of that bird: the bill is full as large as in the Shoveler: the vent is black, with many mottlings of black contiguous thereto: legs pale slesh colour. The female said to differ in not having the vent black; in other things both sexes sufficiently, agree.

\* Soft-billed Duck, Gen. Syn. p. 522, 67.

Inhabits

360

PLACE.

Inhabits New Holland: was fhot at Boteny Bay, in May. It appears to agree in fo\_many things with the Blue-winged Showeler, that with many it might pass for a variety only of that bird.

GARGANEY D. Anas Querquedula, Ind. Orn. ii. p. 872 99.—Ger. Orn. v. t. 595. Anas Circia, Sepp. Vog. z. tab. 94. 95. Garganey, Gen. Syn. vi. p. 550. 87.—Lin. Trans. iv. p. 108. pl. xiii. s. 2. 3.

DESCRIPTION.

HIS bird, though no more than three inches longer than the Teal, has the bony labyrinth of the windpipe comparatively of a much larger fize: it is nearly oval in shape, of the fize of the singer's end, and appears in one view as a continuation of the end of the trachea, but a trifle flatted on one side, to admit of the insertion of the usual muscles: at the upper part, on the side next the breast, it is also slatted, and from thence the two bronchiæ have their origin.

TEAL.

Anas Crecca, Ind. Orn. ii. p. 872. 100.—Ger. Orn. t. 598.
Teal, Gen. Syn. vi. p. 551. 88.—Lin. Trans. iv. p. 108. pl. xiii. f. 1.

DESCRIPTION.

THE male of this bird has not only a small windpipe in proportion to the size of its body, but it has also a very small labyrinth, being scarcely bigger than a pea. Nothing more needs here be added: a bare inspection of the sigure in the plate of the Linnaan Transattions, will explain every thing necessary.

#### GENUS XCVIII. PENGUIN.

N' 1. Chiloe P.

Nº 2. Three-toed P.

Aptenodytes Chiloensis, Ind. Orn. ii. p. 881. 10. Diomedea Chiloensis, Molin. Chil. (Fr. ed.) p. 219.

CHILOE P. Description.

THIS is about the fize of a *Duck*: the body not unlike that of other *Penguins* in fhape, and covered with a kind of ash coloured down, which is of so fine a texture, as to be made great use of by the natives, for it is capable of being spun into threads, and made into garments, which are greatly valued.

This is found in the Archipelago of Chiloe, and is a very common species: the native name of this bird is Quethu.

PLACE.

Aptenodytes Molinæ, Ind. Orn. ii. p. 881. 11. Diomedea Chilensis, Molin. Chil. (Fr. ed.) p. 217.

THREE-TOED
P.

SIZE of the last; but the neck larger, and the head compressed at the sides, and small in proportion: bill slender, a little bent towards the point: the seathers on the upper parts of the body are blue, changing into grey, according to the light; those of the breast and belly white: the tail not distinguishable, being a mere elongation of the seathers of the rump: legs surnished with three toes only, and placed almost in the vent, as in others of this tribe.

Inhabits *Chili*; but the flesh is not esteemed there: it lays five or fix white eggs, spotted with black, on the sand: the skin is said to separate easily from the body, and perhaps, as the plumage consists of sine hair rather than feathers, might be made use of for coverings. The natives give it the name of the *Infant*, from its manner of walking, its gait being unsteady like that of a child.

PLACE.

SUPP. II.

#### GENUS XCIX. PELICAN.

N° 1. White P. 2. Corvorant.

N° 3. Chinese C. 4. Gannet.

WHITE P.
DESCRIPTION.

Pelecanus Onocrotalus, Ind. Orn. ii. p. 575. 1.—Ger. Orn. v. t. 499. Great White Pelican, Gen. Syn. vi. p. 575. 1.

loured *Pelicans* of the eastern and southern oceans were truly distinct, mere varieties of each other, sexual differences, or arising from age only. In Lady *Impey*'s drawings, is the figure of one met with in *India*, with the head white, speckled with black: wing coverts reddish brown: prime quills and tail dusky: breast and belly white, marked with great spots of pale yellow: legs whitish. This same bird, in Mr. *Middleton*'s drawings, is named *Gungunneer*. I observed also among the drawings of Mr. *Bruce*, one similar, by the name of *Gungunnab*: the general colour of this was white: belly even with the thighs; the thighs themselves, and vent black; wings black and white spotted: bill pale red, much hooked at the tip of the upper mandible: irides red: legs black.

The New Holland one is seven feet from the tip of one wing to that of the other: the bill yellow: round the eye bare and yellow; but between the bill and eye feathered: the plumage in general is white: the beginning of the back, and all the quills black: legs blue.

It is called by the natives Karrangaba. I must not omit to mention the beautiful fost down which lies immediately under the feathers of this species. Mr. Barrow\* notices the circumstance in respect to the

\* Travels in South Africa, p. 70.

Pelisans

Pelicans of the Cape of Good Hope; and we have heard it remarked, that this down is at least equal, if not superior to that of the Swan.

Pelecanus Carbo, Ind. Orn. ii. p. 886. 14. Phalacrocorax, Ger. Orn. v. t. 501. Corvorant, Gen. Syn. vi. p. 593. 13.

CORVORANT.

DESCRIPTION.

BOTH the Corvorant and Shag are frequent at Lougharn, and eels are supposed to be their chief food; but the Sea Geby has also been taken from their stomach, hence it may be supposed, that they prey at times on Fish also \*. It is no uncommon thing to see twenty of these birds together on the sand, by the river side, with extended wings, drying themselves in the wind, and in this position to remain sometimes for near an hour, without once closing them; and as soon as they are sufficiently dry, to enable the feathers to imbibe the oil, they press a portion thereof from the receptacle on their rumps, and dress the feathers with it; and it is only in one particular state that the oily matter can be spread thereon, by no means when quite dry, but in a state of dampness, and the proper moment known to the birds by instinct alone.

It has been observed, that the Corvorant builds at Ramsey Island, in the highest cliffs and most inaccessible places; the Shag much lower, and is by much the more familiar bird of the two. Instances have been noticed, of the Corvorant not being easily frightened from any place on which it perches; in addition to which, I have been credibly informed, that the end of July 1793, one of them was found sitting on the vane of St. Magdalen's Church steeple, on Ludgate Hill, in London, and was shot from thence in the presence of a number of people †.

\* Colonel Montagu.

<sup>†</sup> A further description of the manners of the Corvorant may be seen, well drawn up, in Gilpin's Remarks on Forest Scenery, 2 vols. 8vo. 1791.

CHINESE C. Louwa, Ogilty. Chin. pl. in p. 92.—Id. pl. p. 699. Loufoo, Du Hald. Chin. v 4. ii. 142 pl. in p. 102.—Ofbeck. Voy. ii. p. 35. Leu-tze, Emb. to China, ii. p. 388. 412. pl. 72.

DESCRIPTION.

UCH has been faid heretofore concerning the bird used by the Chinese for fishing: we were led to think, from what Linnaus had been informed, that at least one of the sexes was white, but we owe to Sir George Staunton, the intire development of the true species, not only by his observation on the mode whilst in Chine, but by having brought home various specimens for examination, from whence it appears that the bird is strictly neither a Corvorant nor Shag, though approaching thereto, but a distinct species: the bill is yellow: irides blue: the general colour of the plumage brownish black: chin white: the body whitish beneath, spotted with brown: tail rounded, consisting of twelve feathers.

In the journey to Han-choo-foo, on the river Luen, fir George obferved, on a large lake close to this part of the canal, and to the eastward of it, thousands of small boats and rafts, built entirely for this species of fishery; on each boat or rast were ten or twelve birds, which at a signal from the owner plunge into the water, and it is astonishing to see the enormous size of fish with which they return grasped in their bills. They appeared to be so well trained, that it did not require either ring or cord about their throats, to prevent them from swallowing any portion of their prey, except what the master was pleased to return to them for encouragement and food. The boat used by these fishermen is of a remarkably light make, and is often carried to the lake, together with the fishing birds, by the men who are there to be supported by it \*.

<sup>•</sup> See vignette in Emb. to Chino, ii. p. 389. at the bottom

Pelecanus Bassanus, Ind. Orn. ii. p. 891. 26.—Ger. Orn. v. t. 515. Gannet, Gen. Syn. vi. p. 603. 25.—Tour in Scotl. 1769, pl. in p. 199.

GANNET.

T has been observed, that when these birds pass from place to place, which they are fometimes observed to do in flocks, from five to fifteen each, they keep low, near the shore, but never pass over the land, on the contrary, doubling the capes and projecting parts, keeping at nearly the same distance. It has been before mentioned, that at Saint Kilda, the inhabitants hold them in much estimation. Mr. Pennant fays, that the natives tie a herring to a board, and fet it afloat, fo that the Gannet, by falling furiously upon it, may break its neck in the attempt, This, however, appears to be unlawful, for the fastening herrings thus to planks at sea, to catch the Soland Goose, is forbidden under a fevere penalty. It is an unfatiably voracious bird, disdaining to eat any thing worse than Herrings or Mackarel, unless it be in a very hungry place, which it endeavours to avoid or abandon: an hundred thousand of them are supposed to be round the rocks of Saint Kilda, which is far too moderate, as 20,000 of them are killed annually for food, including the young ones; and we shall suppose that the Soland Goose sojourns in these seas for about seven months of the year, and that each of them destroys five herrings in a day, a subsistence by no means adequate to so greedy a creature, unless more than half supported by other fish. Here we have 105,000,000 of the finest fishes in the world devoured annually by one fingle species of Saint Kilda birds \*.

The Gannet, before it gains its white plumage, is brown, most beautifully spotted all over with white; one of these was taken alive near me in September 1798: it weighed three pounds and a quarter; length three seet; breadth six seet: irides blueish grey. It was on the whole so exactly like the bird represented in pl. 986 of the Pl. Enluminées, as to render any surther description unnecessary.

\* See Buchanan's View of the Fishery of Great Britain.

DESCRIPTION.

#### GENUS C. TROPIC BIRD:

TROPIC B.

IN our Synophis, we have mentioned three species of this genus, with their varieties, but I suspect that there is at least one more species, having been shewn a long tail of a Tropic Bird, the shaft of which is black, and the web buff colour: it is about the size of the common one, but much suller webbed, and does not end in a point, as is the usual manner.

PLACE.

It was faid to come from fome part of the South Sea, but the place uncertain.

#### GENUS CI. DARTER.

Plotus anhinga, Ind. Orn. ii. p. 895. 1. Colymbus colubrinus, Snake Bird, Bartr. Trav. 130. 243. White-bellied Darter, Gen. Syn. vi. p. 622. 1. WHITE-BELLICD D.

MR. Abbot, of Georgia, feems to think that this bird stays throughout the year in his neighbourhood, having feen it at times the whole of the winter.

Mr. Bartram, after describing the bird, adds, that they have a way of spreading out the tail like an unsured fan: they delight to sit in little peaceable communities, on the dry limbs of trees, hanging over the still waters, with the wings and tail expanded, and when approached, they drop off the limb into the water as if dead, and for a minute or two are not seen, when on a sudden, at a vast distance, their long slender heads and necks only appear, and have much the appearance of Snakes, as no other part of them is to be seen when swimming in the water, except sometimes the tip of their tail; in the heat of the day, they are seen in great numbers, sailing very high in the air, over lakes and rivers.

#### ADDITIONS.

CHINA O.

#### GENUS III. O W L.

DESCRIPTION.

LENGTH feventeen inches: bill dusky black: the head is smooth; the face pale, with dusky markings; the feathers surrounding it margined with dusky: the general colour of the upper parts of the plumage is ferruginous chesnut, with dusky markings, but at the back part of the head and neck, with black and white irregular spots: the quills and tail powdered with darker chesnut dots, and crossed with bars of the same, at half an inch distance: the chin and throat are white; the rest of the under parts of the body and thighs are white also, but crossed with numerous sine dusky lines: legs feathered to the toes, and of the same colour; claws dusky.

PLACE.

Inhabits China: for this, and many of the following, I am indebted to General Davies.

UNDULATED O. DESCRIPTION.

that of the Brown Owl; but most of the wing coverts and lesser quills are marked at the ends with white: the whole head and throat are of one colour, but from thence to the vent each seather is margined with white, giving an undulated appearance: the bill is large, strong, of a blueish lead colour, beset with stiff bristles at the base: legs yellow; toes bare of seathers; claws black.

PLACE.

Inhabits Norfolk Island.

Published as the Act directs. May 30.1801, by Leigh. Sorbeby & Son Forde Street. Covene Garden.

#### GENUS V. PARROT.

RED-TOPPED P.
Description.

LENGTH eighteen inches: bill large, blue, with a black point: general colour of the plumage dark green, under parts paler: forehead and middle of the crown crimfon: quills deep blue: tail long, dusky, greenish brown above, brown beneath: legs brown.

PLACE.

Found at Port Jackson. It appears most to coincide with the Var. A. of the Pacific Parrot, Gen. Syn. ii. p. 253. 56. A. but seems to be of nearly twice the size.

RED-CROWNED P. Description.

SIZE of the Grey Parrot; length thirteen inches: general colour dusky, with a slight gloss of green, and the margins of the seathers very pale: the head feathers are full, and the bird thereby enabled to erect them as a crest at will; the whole of these are a deep scarlet, except the chin, which is dusky: the under parts of the body are paler than the upper, and undulated with a mixture of reddish and green, arising from the margins of the seathers being of that colour, but not very conspicuous, except just at the bottom of the belly, where the red predominates: the quills and tail are plain dusky, but appear somewhat undulated with darker in a strong light; the bill is yellowish: legs dusky: the tail is short; the wings reach three parts thereon.

Another, supposed to be the female, was fifteen inches in length; on the upper parts much like the other, but the seathers more conspicuously barred with a pale colour, more particularly the quills and tail, in which last the bars are six or seven in number: the head is tusted with seathers as in the other, but the seathers the same colour as the back: the chin dusky green: breast and belly barred across beauti-

SUPP. II.

3 B

fully

fully with red, yellow, and brown, growing more dull towards the vent.

Besides the above, I saw another at Mr. Thompson's, in which only part of the head had the red crest, seemingly an intermediate state between the former two, and may be supposed a young bird not yet in adult plumage.

PLACE.

These inhabit New South Wales.

### GENUS IX. HORNBILL.

HELMET HORNBILL.

DESCRIPTION.

Buceros galeatus, Ind. Orn. i. p. 142. 2. Helmet Hornbill, Gen. Syn. i. p. 343. 2.

AS the bill in this bird has been before described at large, it is necessary here only to say, that it is about eight inches long, and has a prodigious square callosity, rising three inches and a half in height above the base of the upper mandible, projecting over the eyes. The plumage on the head, breast, back, and wings, is black; belly, thighs, and vent, white: the tail is long, cuneiform in shape, and white, with a broad bar of black near the end of each seather. The total length of the bird is four seet, of which the tail measures two, for the two middle seathers occupy that space, the two next on each side are twenty-one inches, and the three outer ones one foot: the wings reach about three inches on the tail: the legs are stout, scaly, and black.

A pretty complete specimen of this bird is in the British Museum.

<sup>9</sup> Good figures of it may be seen in Edwards, pl. 281. C .- Pl. Enl. 933-

Buceros plicatus, Ind. Orn. i. p. 146. 12. Calao of the Island of Waigiou, D'Entrecast. Voy. (Engl. ed. 8vo.) ii. p. 304. pl. xi. Wreathed Hernbill, Lath. Syn. i. p. 358.—Id. Supp. p. 76. WREATHED HORNBILL.

BY the description given in the above voyage, it will be found to tally not unaptly with that given by Dampier. The bill is said to be arched, of a dirty white, each mandible unequally indented; the upper one surmounted by a fort of yellowish crest, which is slattened and grooved: the wings and body are black; the tail is white; and if we may judge by the figure, short, and even at the end: the neck of a pretty bright rusous colour.

DESCRIPTION.

#### GENUS XIII. CROW.

BLACK-BREASTED CR. DESCRIPTION.

ENGTH ten inches: bill and legs black: upper parts of the plumage in general, from the crown to the tail coverts, as well as the wings, fine pale blue grey: the face, to beyond the eyes, chin, throat, and breaft, full black; all from thence beneath, thighs and vent, pure white; the outer edge of the wing and quills black, edged with white: tail black.

PLACE.

Inhabits Port Jackson. It has much affinity to the Black-faced Crow\*; but the black proceeds as far as the breast, not finishing on the throat; and the under parts are not of so pure a white as in the one here described; however, we cannot be positive that it may be only a variety.

#### GENUS XIV. ROLLER.

PACIFIC R.
DESCRIPTION.

LENGTH nine inches: bill and legs red: head and neck chefnut: chin and throat, down the middle, black, bounded on each

> • Supp. ii. p. 116. 19. 3 B 2

&de

WOODPECKER. KINGSFISHER. CREEPER.

fide with a line of white: the lower part of the neck from the chefnut changes to green, and from thence all beneath is paler green: wings fine blue; base of the quills white, forming a spot of white when expanded: rump and tail coverts green: tail itself, and ends of the quills, dufky blue black.

PLACE. Inhabits Port Jackson.

GORGET W.

GENUS XXII. WOODPECKER.

DESCRIPTION.

T. ENGTH about nine inches: bill pale horn colour: head, neck, and upper parts deep 'cinnamon or chesnut, growing very pale on the rump: back and wings marked with numerous curved tranfverse black crescents; across the breast a large black crescent; from thence to the vent pale dusky rusous, spotted with black: rump and vent paler than the rest, marked with black: tail feathers black.

PLACE.

Inhabits Queen Charlotte's Sound: it comes nearest in colour to the Rufous Woodpecker, but is a larger bird, and most probably is a distinct species.

AZURE K. DESCRIPTION. GENUS XXIV. KINGSFISHER.

I ENGTH fix inches and a half; fize of the European species: bill an inch and three-quarters long, and black: the plumage on the upper parts of the body, wings, and tail, is of a fine deep blue: between the bill and eye a buff coloured streak: on each side of the neck, a long oblique streak of white; all the under parts of the body, from chin to vent, deep buff colour: quills brown: legs red.

PLACE.

Inhabits Norfolk Island.

BLUE-FACED CR. DESCRIPTION.

GENUS XXIX. CREEPER.

I ENGTH five inches: bill three quarters of an inch, black: general colour of the plumage dusky, nearly black on the under parts,

372

parts, but on the crown of the head and the back brown: quills and tail wholly dufky black: the face, all round the bill, and the chin and rump, are fine blue: legs dusky black.

Inhabits Africa. Described from a specimen found preserved in the collection of the late Mr. Bailey, of the Hay Market.

PLACE.

ASH-HEADED

THR.

#### GENUS XXXII. THRUSH.

DESCRIPTION.

I ENGTH feven inches and a half: bill and legs yellow: general colour of the plumage dusky or purplish black: head and neck pale ash colour: one supposed to be the hen, has the head and neck of a darker ash colour, and the rest of the plumage somewhat paler, otherwise not unlike.

Inhabits Norfolk Island.

PLACE.

WHITE-EARED

THR. I ENGTH feven inches and a half; fize of the Black-eyed Thrush: DESCRIPTION. top of the head above the eyes, and nape, fine blue grey: chin,

fore part of the neck and breast, black: behind the eye a large white patch: the lower part of the neck, the back, wings, and tail, fine pale green: belly, thighs, and vent yellow: bill and legs black.

This inhabits the fame parts as the Black eyed Thrush, and is supposed by some to be the other fex of that bird.

WHITE-BROWED THR.

PLACE.

DESCRIPTION.

I ENGTH feven inches and a half: head, neck, back, wings, and tail, black: a large patch of white on the lower coverts or fecondary quills: the under parts of the body from the breast white: over the eyes a long streak of white, like an eye-brow: thighs black, dotted with white: wings when closed reach half way on the tail: bill and legs black.

Found at Port Jackson: described from a drawing made from a *specimen* 

PLACE

fpecimen brought from thence by Governor King: in appearance it most resembles the Restless Thrush, N° 11.; but in this last, the white trace over the eye, and white patch on the wing, are both wanting.

COCHIN FL.

#### GENUS XL. FLYCATCHER.

DESCRIPTION.

LENGTH four inches and three quarters: bill dusky, with several hairs at the gape: crown above the eye, nape, hind neck, back, and wings, olive brown, darker on the forehead; all beneath, level with the eye, to the vent, pale rusous; very light about the throat and neck: quills dusky: at the outer edge of the wing a white spot: tail brown, but paler than the back, and greatly cuneiform; the middle seathers being two inches long, the outer ones sive eighths of an inch; the three outer seathers are white at the ends, with a crescent of black just within the white: legs pale red.

PLACE.

Inhabits Cochin China.

GOLD-BREASTED M. Description.

#### GENUS XLIV. MANAKIN.

ENGTH four inches: bill pale: head, neck, breast, back, wings, and tail, deep blue black; across the breast a band of fine yellow, curved upwards on each side of the neck; from thence, the belly, thighs, and vent, are deep ferruginous: legs pale ash colour.

PLACE.

Inhabits Brazil.

WORFOLK P. Description.

#### GENUS XLVIII. PIGEON

LENGTH fourteen inches: head and neck, as far as the breaft, white; from the last to the vent black: quills black: back and wings deep dusky purple, with a sew darker markings: tail dull purple, with the inner webs of the seathers dusky: bill black: legs red.

With

4

With this was another, faid to differ only in fex. In it, the head, neck, and breast were ferruginous: back and wings green: quills dusky: belly, thighs, rump, and vent, brownish purple: the two middle tail feathers ferruginous, the rest pale brownish purple: bill and legs as in the other.

Inhabits Norfolk Island.

PLACE.

CHESNUT-SHOULDERED P. Description.

LENGTH twenty inches: bill deep red; towards the tip yellow: irides crimfon: head and fore part of the neck, as far as the breast, fine glossy deep green; towards the breast paler: shoulders deep chocomic red, or chesnut; behind the neck glossed with copper: the lower part of the back, the wings, and tail, pale blue: quills within dusky: breast, belly, and vent, white: legs red.

Inhabits Norfolk Island.

PLACE.

GREY-NECKED
P.
DESCRIPTION:

LENGTH eight inches: head, neck, and breast, pale grey: belly, thighs, and vent, white: back and wings light sandy brown: wing coverts marked with white spots: quills deep brownish grey: tail cuneiform in shape; the two middle feathers three inches and a half long, the outer, one inch and a quarter; the end half of all but the two middle ones white.

Inhabits New South Wales.

PLACE.

#### GENUS LXXX. GALLINULE.

GREY-HEADED G. DESCRIPTION.

PILL red and large, as in the Purple Gallinule, and rifing on the forehead: head and neck blue grey, growing to azure towards the chin: back purple: wings and tail deep indigo: breast and belly verditer green: vent white: tail indigo: legs scarlet.

Drawn from one in Exeter Exchange, by General Davies.

Another

#### GALLINULE.

Another, faid to come from *Madagafear*: bill the fame, but not coming fo high on the forehead: head and neck pale grey: back deep green and black intermixed: chin, breaft, and shoulders of wings, verditer green: belly and sides blue: vent ultramarine: legs and bare part of the thighs scarlet. These seem to be varieties only of each other, if not of a different sex.

#### SUPPLEMENTUM

### INDICIS ORNITHOLOGICI,

SIVE

#### SYSTEMATIS ORNITHOLOGIÆ.

STUDIO ET OPERA

JOANNIS LATHAM, M.D. S.R.S.

#### LONDINI:

PROSTAT APUD G. LEIGH, J. ET S. SOTHEBY, YORK-STREET, COVENT-GARDEN.

M,DCCC,I.

#### SUPPLEMENTUM.

### A V E S.

#### DIV. I. TERRESTRES.

#### ORDO I. ACCIPITRES.

GENUS I. VULTUR.

v.

euricularis. V. fuscus, corpore subtus albido, capite colloque denudatis, gula tomentosa.

L'Oricou, Levaill. Ois. î. p. 36. pl. 9. Vultur auricularis, Daudin. Orn. i. p. 10. 111. Sociable Vulture, Gen. Syn. Sup. ii. p. 11. No. 11.

Habitat in Africa, & infignis magnitudinis, lat. ped. 10. Caput denudatum, carneum, ut in V. Papa, at nares non carunculatæ. Rostrum & pedes susci: nidificat in rupibus a mari longe distantibus, ponens ova tria alba.

2. V.

Kolbii. V. pallidus, collo denudato, torque albo, remigibus rectricibusque nigris.

Le Chasse-fiente, Levaill. Ois. i. p. 44. pl. 10. Vultur Kolbii, Daudin. Orn. i. p. 15. x. Kolben's Vulture, Gen. Syn. Sup. ii. p. 12.

MAGNITUDO fere V. auricularis. Habitat in Africa, ubique frequentissimus in plateis oppidorum quisquilia colligens: cadaveribus potissimum & stercore vescitur, etiam testudinibus parvis quas integras devorat.

SUPP. II.

B

V. corpore

3. V.

audax. V. corpore fusco, orbitis pallidis, pedibus lanatis nigro maculatis. Bold Vulture, Gen. Syn. Sup. ii. p. 10. No. 10.

HABITAT in Nova Hollandia, & inter majores numerandus: victitans quadrupedibus mediocribus, & ferox intrepide etiam hominibus resistit: rostrum pallidum apice nigro.

Ÿ.

california- V. niger, rostro albido, capite colloque denudatis pallidis, torquis pecnus. torisque plumis lanceolatis.

> Wultur californianus, *Nat. Mife.* v. 10. pl. 301. Californian Vulture, *Gen. Syn. Sup.* ii. p. 3. No. 2.

Hæc avis magnitudine pene par Grypho est; torquis & pedes nigri: alæ complicatæ ultra apicem caudæ extendunt.

E California in Angliam detulit hunc vulturem D. Menzies, qui confpici possit in Museo Britannico.

#### GENUS II. FALCO.

F.

vulturinus. F. niger tibiis pennatis, rostro pedibusque siavescentibus. Le Cassre, Levaill. Ois. i. p. 28. pl. 6. Falco vulturinus, Daudin. Orn. ii. p. 53. Vulturine Eagle, Gen. Syn. Sup. ii. p. 15. No. 1.

Habitat in Africa, Caffraria, et inter rariores habetur: magnitudo F. Chrysaetos, victitat cadaveribus, hinc sætidum odorem spirans, etiam voracissimus oves invadit et capit. Vulturibus affinis, at collum plumis tectum.

F. bellicofus.

bellicosus. F. fuscus cervice varius, subtus albus, tibiis pennatis, rostro pedibusque pallidis.

Le Griffard, Levaill. Oif. i. pl. 1. Falco bellicosus. Daudin. Orn. ii. p. 38. ii. Martial Eagle, Gen. Syn. Sup. ii. p. 16. No. 2.

HABITAT

Habitat in Africa, Caffraria: pond. 25.—30. libr. lat. ped. 7. poll. 5. fem. lat. ped. 8. poll. 7.—remiges fecundæ exteriores & rectrices albido nigroque fasciatæ.

3. F.

cecipitalis. F. criftatus fuscus, tibiis pennatis, macula alarum basique caudæ albo variegatis.

Falco occipitalis, Daud. Orn. ii. p. 40. iii.

Le Huppard, Levaill. Ois. i. pl. 2.

Occipital Eagle, Gen. Syn. Sup. ii. p. 17. No. 3.

HABITAT ad Caput bonæ Spei: F. Vulturino paulo minor: occiput eleganter cristatum: rostrum cærulescens: pedes flavicantes.

F.

Albicilla. F. obscurus, remigibus saturate suscis, uropygio caudaque albo-cineras-Var. centibus.

Falco albicilla, Ind. Orn. i. p. 9. 2. Var.?

Cinereous Eagle, Lath. Syn. i. p. 33. 18.—Id. Sup. p. 18. No. 4.

Habitat in Nova Hollandia: habitus albicilla: rostrum nigrum: corpus suscum subtus dilutius: uropygium & cauda cinereo-alba: an varietas F. albicilla.

5. F.

tigrinus. F. fuscus subtus albus, semoribus susco maculatis, tectricibus alarum inferioribus nigro sasciatis.

Falco tigrinus, Befek. Vog. Kurl. S. 10. 11.—1 Taf. 2.—Allg. Ueb. d. Vog. ii. S. 676.

Tiger Falcon, Gen. Syn. Sup. ii. p. 19. No. 6.

Habitat in Germania: magnit. F. Chrysaëtos: cera cærulea: irides & pedes stavi: caput & pettus suscessens: vertex & nucha nigra: remiges nigræ: rettrices sasciis 3 angustis nigris notatæ: alæ subtus sasciis tigrinis nigris: sæva & impavida species.

6. F.

germani- F. ruso-albus, dorso alis caudaque suscis, rectricibus sasciis 4 pallen-

Der rothlichweisse Falke, Besek. Vog. Kurl. S. 10.12. a und 13. b.—
Allg. U. d. Vog. i. Zus. S. 676. 120.

Courland Falcon, Gen. Syn. Sup. ii. p. 19. No. 7.

B 2

HABITAT

111

HABITAT in Germania, F. tigrino minor: cera, irides, & pedes slavi: caput, collum, & pettus striis longitudinalibus suscis: pennæ semora tegentes apicibus macula nigra.

7. F.

destructor.

F. cristatus niger sasciis griseis, capite griseo, corpore subtus albido.
Falco destructor, Daud. Orn. ii. p. 60. xxxii.

Grand Aigle de la Guiane, Encycl. Method.

Destructive Eagle, Gen. Syn. Sup. ii. p. 20. No. 9.

Habitat in Guiana: long. ped. 3. poll. 2.:—caput superius grisconigricans: occipitis pennæ longissimæ: corpus nigrum zonis subgriseis
notatum: pestus & abdomen grisco-alba: remiges & restrices nigra:
tibiæ plumosæ digitis slavis.

8. F.

albescens. F. subscriftatus albus susce varius, remigibus rectricibusque albo nigroque fasciatis.

Le Blanchard, Levaill. Oif. i. pl. iii. — Daudin. Ornith. ii. p. 45. Noify Eagle, Gen. Syn. Sup. ii. p. 21. No. 10.

HABITAT in Africæ sylvosis, prædatur palumbis, nidificat in excelsis arboribus ova 2 ponens alba: rostrum cærulescens: pedes slavicantes, tibiis lanugine alba vestitis.

F.
ecaudatus. F. niger, alis pallidis, dorso caudaque breviore rufis.
Le Bateleur, Levaill. Ois. i. p. 31. pl. 7. & 8.
Falco ecaudatus, Daudin. Orn. ii. p. 54.
Short-tailed Falcon, Gen. Syn. Sup. ii. p. 21. No. 11.

Magnitudo inter F. offifragum & baliætum: habitat in Capitis Bonæ Spei interioribus: mas & femina individui comites simul cadaveribus victitant; non raro oves & gazellas prædantes: hæc avis inter volandum alas fortiter quatit, ut solet columba percussor: cauda brevissima: corpus feminæ & juniori avi suscentia, remigibus caudaque nigricantibus.

10. F.

Bacha. F. fuscus subtus albo maculatus, occipite cristato, sascia rectricum alba. Le Bacha, Levaill. Ois. i. p. 68. pl. 15.—Daudin. Ornitb. ii. p. 43. Bacha Falcon, Gen. Syn. Sup. ii. p. 22. No. 12.

HABITAT

HABITAT in Capitis Bonce Spei aridis & incultis: prædatur caviam capensem & lacertas: rostrum & pedes pallide slavi.

Magnitudo Buteonis, pennæ verticis totius albo nigroque variæ ad occiput elongatæ: cauda nigricans, medio fascia alba.

I1. F.

Tachardus.

F. suscus, subtus stavescens susceptibles varius, cauda fasciata, tibiis maculatis. Le Tachard, Levaill. Ois i. p. 82. pl. 19.

Falco Tachardus, Daud. Orn. ii p. 164. cxxxvi.

Tachard Falcon, Gen. Syn. Sup. ii. p. 25. No. 17.

Habitat in Africa ad ripas fluviorum, habitus Buteonis at minus: cauda longiore fusca fasciis nigricantibus: femora pennata: rostrum nigricans: pedes rubicundi: F. Lagopo affinis.

12. F.

Chicquera. F. cærulescens subtus albus, vertice nuchaque serrugineo-rusis, cauda fascia nigra.

Falco cirrhatus, Ind. Orn. i. p. 36. Var.?

Le Chicquera, Levaill. Ois. i. p. 128. pl. 20.—Daudin. Orn. ii. p. 121. xciii.

Chicquera Falcon, Gen. Syn. Sup. ii. p. 27. No. 19.

Habitus & statura F. cirrbati, an satis distincta: caput non cristatum: abdomen & femora sasciis plurimis abruptis: versus apicem cauda tænia lata nigra: rostrum slavum superius apice nigro, inferius truncatum: pedes slavi.

13 F.

Parasiti-

F. cauda forficata, corpore ferrugineo, cera cærulea, rostro pedibusque flavis.

Le Parasite, Levaill. Ois. i. p. 88. pl. 22.

Falco Parasiticus, Daudin. Orn. ii. p. 150. cxxii.

Parasite Falcon, Gen. Syn. Sup. ii. p. 30. No. 25.

HABITAT in Africa, Caffraria: habitus F. Milvi at minor: cauda minus forficata: genæ & gula albidæ: cauda fusca fasciis saturatioribus: impavida avis, nidificat in arboribus & rupibus, ponens ova 4 ruso maculata.

14. F.

Buzon. F. nigricans rufo varius, subtus rufus, rectricibus nigris medio sascia interrupta alba.

Le Buzon, Levaill. Of. i. p. 86. pl. 21. Falco Buzon, Daud. Orn. ii. p. 168. cxlii. Hobby Buzzard, Gen. Syn. Sup. ii. p. 31. No. 26.

HABITAT in Cayana, magnitudine F. Cyanei: restrices nigricantes elongatæ medio fasciola e maculis confertis: rostrum nigrum: cera lata slava: pedes slavi.

15. F.

Busarellus. F. sasciatus supra ruso-suscus, subtus slavescens, remigibus nigris.

Le Buseray, *Levaill. Ois.* i. p. 84. pl. 20. Falco Busarellus, *Daudin. Orn.* ii. p. 168. cxli. Buzzaret, *Gen. Syn. Sup.* ii. p. 32. No. 27.

HABITAT in Cayana, magnitudo F. aruginosi: rostrum nigrum: pedes slavi.

16. F.

melanopterus.

F. pedibus plumofis, corpore cærulescente subtus albo, tectricibus alarumanigris.

Le Blac, Levaill. Oif. i. p. 147. pl. 36. 37. Falco melanopterus, Daud. Orn. ii. p. 152. cxxiv. Black-winged Falcon, Gen. Syn. Sup. ii. p. 28.

HABITAT in Africa, India: magnitudo tinnunculi: corpus pennis cæruleo-grifeis vestitum margine rusis: cauda subsorcipata: regio oçulorum nigra: rostrum nigrum: pedes breves slavi.

Juniore ave vertex ruso varius: pectus toto-rusum.

17. F.

vocifer. F. ferrugineo-fuscus, capite collo pectore caudaque albis.

Le vocifer, Levaill. Oif. i. pl. 4. Aigle vocifer, Daud. Orn. ii. p. 65. xxxv. Aigle nonette, Gaby, Voy. en Nigritie.

Piscivorous Eagle, Gen. Syn. Sup. ii. p. 33. No. 29.

HABITAT ad Caput Bonæ Spei, maris littora frequentans; pisces prædans uti baliætus, quam statura & magnitudine æmulatur: rostrum cærulescens:

rulescens: pedes flavi: cauda brevis vix apicem alarum complicatarum attingit.

18. F.

Blagrus. F. fuscus, capite collo cauda corporeque subtus toto-albis.

Le Blagre, Levaill. Ois. i. pl. 5.
Falco Blagrus, Daudin. Orn. ii. p. 70.
Blagre Falcon, Gen. Syn. Sup. ii. p. 34. No. 30.

Habitat in Africa, ad ripas fluviorum Capitis Bonæ Spei, procul a mari satis frequens: magnitudo F. vociseri: statura & moribus F. Haliæto simillimus, & pariter piscibus victitans: an ejustem varietas?

19. F.

ranivo- F. fuscus subtus albido varius, semoribus crissoque ruso-ferrugineis. rus. Le Grenouillard, Levaill. Ois. i. p. 95. pl. 23.

Falco ranivorus, Daudin. Orn. ii. p. 170. cxliv. Ranivorous Falcon, Gen. Syn. Sup. ii. p. 35. No. 33.

HABITAT ad Cap. B. Spei: nidificat inter arundines, ponens ova 3-4 alba: magnitudo F. aruginosi: vertex nigricans: collum lateribus & humeri albo varii: cauda elongata fasciis saturatioribus: rostrum nigrum: pedes graciles slavi.

20. F.

testaceus. F. testaceus subtus albus, abdomine rusescente, remigibus albo maculatis, cauda alba sasciis nigricantibus. Falco testaceus, Daudin. Orn. ii. p. 125. ci. Testaceous Falcon, Gen. Syn. Sup. ii. p. 36. No. 35.

HABITAT in Java, magnitudine F. Palumbarii: caput & corpus totum fupra fusco-testaceum: uropygium subserrugineum: gula & collum subsus album: pestus testaceo-album: abdomen rusum: remiges nigræ intus albo maculatæ: cauda supra susca, subsus albida fasciis 5 nigricantibus.

21. F.

ornatus. F. cristatus suscus, subtus ruso-albus, gula alba, semoribus albo nigroque fasciatus.

L'Autour huppé, Levaill. Oif. i. p. 114. pl. 26.—Daudin. Orn. ii. p. 77. xlv.

Crested Goshawk, Gen. Syn. Sup. ii. p. 37. No. 38.

HABITAT

Habitat in Cayana: habitus F. Palumbarii at major: occiput pennis valde elongatis nigris: lateribus colli striga nigra: cauda elongata, restricibus suscessiones fuscescentibus fasciis nigris.

22. F.

Mauduyti. F. cristatus fasciatus, supra susco-nigricans, subtus albus, medio alæ cine-reo-griseo.

Falco Mauduyti, Daud. Orn. ii. p. 73. xl. Grand Autour de Cayenne, Mauduit, Enc. Meth.

Mauduit's Falcon, Gen. Syn. Sup. ii. p. 38. No. 39.

Habitat in Cayana: long. ped. 2.—rostrum & cera nigra: cauda elongata griseo & nigro quater sasciata: pedes slavi.

Femina major, non cristata.

23. F.

Guianen- F. cristatus albus, remigibus rectricibusque nigro sasciatis.

fis. Falco Guianensis, Daudin. Orn. ii. p. 78. xlvi. Guiana Goshawk, Gen. Syn. Sup. ii. p. 38. No. 40.

HABITAT in Guiana: long. poll. 22.—occipitis pennæ elongatæ, apice exterioris macula nigra: pedes nudi, longi, flavi.

24.

rufiventris. F. fuscus subtus rufus, capite susco-cinereo, gula alba lateribus rufis. Falco rufiventris, Daud. Orn. ii. p. 86. liv.—Mauduit, Encycl. Meth. p. 687. col. i.

Rufous-bellied Falcon, Gen. Syn. Sup. ii. p. 39. No. 41.

HABITAT in Cayana, magnitudine Nifi: rostrum nigrum: pedes flavi.

25. F.

hyemalis. F. cinereo-fuscus, subtus albus maculis ferrugineis, uropygio albo, pec-Var. tore ferrugineo.

Falco hyemalis, Ind. Orn. i. p. 35. 78. Var. Falco europogistus, Daudin. Orn. ii. p. 110. lxxviii.

Northern Falcon, Gen. Syn. i. p. 79. Var. p. 39. No. 42.

Habitat in America, provincia Noveboracensi: long. poll. 16.—caput cinereum ferrugineo varium: gula alba: dorsum cinereo-fuscum: pestus ferrugineum albido varium: corpus subtus album singulis plumis 2 vel 3 maculis cordiformibus ferrugineis: cauda cinereo-susca apice saturatiore, subtus griseo-alba sasciis suscis obsoletis.

F. cera

26. F.

musicus. F. cera pedibusque rubris, corpore cæruleo-canescente, abdomine albido fasciis numerosis.

Le Faucon Chanteur, Levaill. Oif. i. p. 117. No. 27. Falco musicus, Daudin. Orn. ii. p. 116. lxxxviii. Chanting Falcon, Gen. Syn. Sup. ii. p. 40. No. 44.

HABITAT in Caffraria, magnitudine F. Communis, coloribus F. Cyanei, at fatis distincta: cauda valde cuneata rectricibus exterioribus albo fasciatis.

Mas voce canora tempore incubationis longe auditur.

27. F.

Acoli. F. pedibus elongatis, corpore cærulescente subtus lineato, cauda alba. L'Acoli, Levaill. Ois. i. p. 126. pl. 33. Falco Acoli, Daudin. Orn. ii. p. 176. cli. Long-legged Hen Harrier, Gen. Syn. Sup. ii. p. 42. No. 45.

Habitat ad Cap. Bonæ Spei ripas fluviorum, magnitudine F. Cyanei, ejusdem sere coloris, at variat pedibus & cauda longioribus: abdomen & femora albida lineis incurvis nigricantibus: uropygium albidum & cauda: rostrum nigrum: pedes slavi.

28. F.

axillaris. F. corpore cærulescente subtus albo, superciliis & axillaribus nigris. Axillary Falcon, Gen. Syn. Sup. ii. p. 42. No. 46.

HABITAT in Nova Hollandia, magnitudine & habitu F. Cyanei: rostrum nigrum: irides susci: pedes slavi.

29. F.

rupicolus. F. dorso ruso maculis nigris, subtus ruso-albidus striis rusis: cauda fasciis fuscis.

Le Montagnard, Levaill. Ois. i. p. 144. pl. 35. Falco rupicolus, Daudin. Orn. ii. p. 135. cix. Rusous-backed Kestril, Gen. Syn. Sup. ii. p. 45. No. 49.

Habitat ad Caput B. Spei: Tinnunculo paulo major: corpus supra rusum maculis sublunatis nigris: caput ruso-suscentia subrus ruso-album striis nigris: remiges nigræ: cauda ruso-alba sasciis 6 vel 7 suscentia rostrum nigrum: pedes slavi.

Habitat in Africa: habitus Str. Funereæ, capite parvo acciptrinino: regio periopthalmica & narium alba: cauda longa cuneiformis, restricibus extus lineis 10—12 transversis albis notatis: rostrum parvum, nigrum.

Str.

nisuella. S. corpore susce ruso alboque vario, cauda cuneata, pennis periopthalmicis apice nigris.

Le Choucouhou, Levaill. Oif. i p. 157. pl. 39. Strix nisuella, Daudin. Orn. ii. p. 187.

Variegated Owl, Gen. Syn. Sup. ii. p. 62. No. 10.

HABITAT

HABITAT in Africa, magnitudine Str. Otus: corpus fuscum supra maculis ruso-nigricantibus & albis, subtus lunulis varium: facies albida, apicibus pennarum nigris.

6. Str.

Huhula. S. albo fasciata corpore cinereo, alis suscis, cauda fasciis tribus albis. Le Huhul, Levaill. Ois. i. p. 167. pl. 41. Strix Huhula, Daudin. Orn. ii. p. 190. Fasciated Owl, Gen. Syn. Sup. ii. p. 62. No. 11.

HABITAT in Africa, magnitudine Str. Ululæ: corpus cinereum lineis numerosis transversis albis, subtus undulatum albido fasciatum: cauda cuneata fasciis tribus obliquis albis: rostrum, irides, & pedes slavi.

7. Str. grifezta.

S. varia, corpore supra fusco rusoque, subtus ruso-alba, tectricibus alarum caudaque albo maculatis: superciliis albis.

La Chouette à Aigrette blanche, Levaill. Ois. i. p. 169. pl. 43. Strix grifeata, Daudin. Orn. ii. p. 207.

Supercilious Owl, Gen. Syn. Sup. ii. p. 63. No. 12.

Habitat in Guiana, magnitudine Str. Otus: regio periopthalmica vix conspicua, supra oculos vitta alba ad axillas utrinque sere ducta: rostrum mediocre slavum: pedes nigricantes.

8. Str.

Georgica. S. fasciata capite lævi, corpore fusco subtus albo, regione periopthalmica albo annulata.

Georgian Owl, Gen. Syn. Sup. ii. p. 64. No. 13.

Habitat in Georgia Americana: long. poll. 16½.:—magnitudo Str. Flammeæ: rostrum flavum: gula & pestus suscum fasciis albidis: abdomen albidum maculis susco-rubris: femora albida punctis nigricantibus.

9. Str.

Boobook. S. capite lævi, corpore fupra fusco subtus ferrugineo longitudinaliter maculato.

Boobook Owl, Gen. Syn. Sup. ii. p. 64. No. 14.

HABITAT in Nova Hollandia, magnitudine Stridula: corpus supra susco-ferrugineum maculis slavescentibus: gula slava ruso maculata.

S. capite

Str.

nudipes. S. capite lævi, corpore fupra fusco albo maculato, subtus albo maculis lyriformibus suscis.

Strix nudipes, Daudin. Orn. ii. p. 199.

Bare-legged Owl, Gen. Syn. Sup. ii. p. 65. No. 16.

Habitat in Cayana: long. poll. 7.:—corpus supra sulvo-suscum, macula lateribus colli alba: tettrices alarum minores albo maculatæ: corpus subtus album striis longitudinalibus suscis: pedes nudi, susci.

II. Str.

phalænoi- S. capite lævi, corpore fulvo, tectricibus alarum inferioribus albo macudes.

latis, fubtus albo rufoque vario, pedibus hirfutis.

Strix phalænoides, Daudin. Orn. ii. p. 206. Booted Owl, Gen. Syn. Sup. ii. p. 66. No. 17.

Habitat in America insula Trinitatis: longit. poll. 6.:—rostrum nigricans: tettrices alarum inferiores maculis 6 albis notatæ: corpus subtus & genæ albo & ruso variæ: tibiæ & digiti plumosi rusescentes.

¥2. Str.

Tengmal- S. capite lævi, corpore fusco-albo vario, vertice & genis albo punctatis.

mi. Strix Tengmalmi, Ind. Orn. i. p. 64. 42. Var?

Var. Le Chevechette, Levaill. Ois. i. p. 176. pl. 46. Strix Pusilla, Daudin. Orn. ii. p. 205.

Dwarf Owl, Gen. Syn. Sup. ii. p. 66. 18. Var.

Habitatio dubia, Str. Passerina Minor: corpus suscum, subtus albo varium: vertex & genæ sub oculis punctis numerosis albis: regio oculorum & gula alba: remiges albo maculatæ vix basin caudæ attingunt: varietas Str. Tengmalmi.

13. Str.

Sinensis. S. capite lævi, corpore supra castaneo ferrugineo vario, gula alba, abdomine lineis transversis obscuris.

China Owl, Gen. Syn. Sup. ii. Add. p. 368.

Habitat in China: long. poll. 17.:—nucha & cervix maculis albis & nigris notata: remiges & restrices fasciis susco-castaneis.

14. Str.

2.

undulata. S. capite lævi, corpore rufo-fusco, abdomine albo undulato, tectricibus alarum remigibusque albo marginatis.
Undulated Owl, Gen. Syn. Sup. ii. Add. p. 368.

Habitat in Insula Norfolk maris Pacifici: long. poll. 12.:—rostrum validiusculum cæruleum: pedes nudi slavi.

## ORDO II. PICÆ.

#### GENUS IV. LANIUS.

L. collaris. Lanius collaris, Ind. Orn. i. p. 69. 10.
Le Fiscal, Levaill. Ois. ii. p. 35. pl. 61. 62.
Collared Shrike, Lath. Syn. i. p. 163. 7.—Id. Sup. ii. p. 68. No. 1.

Habitat ubique in Africa.

L. Collurio. Lanius Collurio, Ind. Orn. i. p. 69. 11.—Spalowsk. Vog. 2. tab. 5.—

Hist. Prov. ii. p. 335.

L'Ecorcheur male & de jeune age, Levaill. Ois. ii. p. 50. pl. 64.

Red-backed Shrike, Gen. Syn. i. p. 167. 25.—Id. Sup. ii. p. 69. No. 2.

Habitat ad Cap. B. Spei: in Egypto.

j.
picatus. Lanius picatus, Ind. Orn. i. p. 73. 20.
Lanius Leverianus, Mus. Lev. p. 241. t. 59.
Corvus Collurio, Daud. Orn. ii. p. 246.
La Pie Piegriesche, Levaill. Ois. ii. p. 33. pl. 60.
Magpie Shrike, Gen. Syn. i. p. 192. 49.—Id. Sup. i. p. 54.—Id. Sup. ii. p. 70. No. 3.

HABITAT in Cayana.

SUPP. II.

D

L. fuscus

4. L.

torquatus. L. fuscus subtus albo nebulosus, loris ferrugineis. Clouded Shrike, Gen. Syn. Sup. ii. p. 73. No. 10.

HABITAT in Nova Hol'andia: rostrum cærulescens: cauda elongata.

5. L.

dubius. L. cinereus cauda cuneiformi, uropygio tectricibusque caudæ apice coccineo striatis.

Dubious Shrike, Gen. Syn. Sup. ii. p. 73. No. 11.

Habitatio dubia: longit. poll. 8.—rostrum & pedes slavi: cauda valde cuneata.

6. L.

robustus. L. cinereo-cæruleus, capite collo remigibus sasciaque caudæ nigris. Robust Shrike, Gen. Syn. Sup. ii. p. 74. No. 12.

HABITAT in Nova Hollandia, magnitudine corporis ultra Excubitorem: longit. poll. 21.:—caput, collum, & initium pectoris nigra: cauda elongata versus apicem tænia lata nigra.

L. erectus.

L. virescens subtus flavicans, capite tumido colloque nigris, rostro pedibusque flavis.

Erect Shrike, Gen. Syn. Sup. ii. p. 74. No. 13.

HABITAT in Nova Hollandia: caput pennis elongatis tectum, unde crista erecta: caput ultra oculos utrinque & cervix nigra: at gula & totum corpus subtus slavescens.

8. L.

frontatus. L. cristatus suscus, subtus flavus, capite colloque nigris, lateribus vittis duabus albis.

Frontal Shrike, Gen. Syn. Sup. ii. p. 75. No. 14. tab. 122.

Habitat in Nova Hollandia, magnitudine Collurionis: rostrum validum nigrum: caput tumidum pennis erectis: linea alba a fronte utrinque descendens lateribus maxillæ: altera pone oculum.

9. L.

flavigaster. L. corpore supra susce subtus flavo, capite supra rostro pedibusque nigris.

Yellow-bellied Shrike, Gen. Syn. Sup. ii. p. 75. No. 15.

HABITAT in Nova Hollandia, magnitudine Excubitoris: caput sub-cristatum, ultra oculos nigrum: cauda subcuneisormis.

10. L.

rubigino: L. ferrugineus subtus flavescens, fincipite subcristato. genis maculatis.

sus. Lanius ferrugineus, Att. de la Soc. D'Hist Nat. de Paris, v. i. part i.

Rufly Shrike, Gen. Syn. Sup. ii. p. 75. No. 16.

Habitat in Cayana: corpus totum supra saturate serrugineum, subtus slavescens: remiges intus nigræ: sincipitis pennæ elongatæ serrugineæ: occiput & genæ maculatæ.

II.

Afer. L. niger subtus albus, dorso maculato, linea suboculari albo, medio alarum macula ruso-alba.

African Shrike, Gen. Syn. Sup. ii. p. 76. No. 17.

Habitat in Senegala: magnitudo L. Nævii, cui similis, at distincta avis: linea alba a naribus utrinque sub oculis ducta fere ad nucham.

12. L.

mystaceus. L. suscus, corpore subtus caudaque rubris, fascia pectoris strigaque sub oculis albis.

La Pie griesche rouge à plastron blanc, Levaill. Ois. ii. p. 55. pl. 65. Mustachoe Shrike, Gen. Syn. Sup. ii. p. 76. No. 18.

MAGNITUDO Merulæ: longit. poll. 10.:—cauda elongata cuneiformis: remiges 2 majores intermediæ extus rubræ: rostrum & pedes nigricantes in nonnullis: remiges 2 extus albæ.

13. L.

pendens. L. niger, corpore supra cinereo, abdomine vittaque supra infraque oculos alba.

Le Pendeur, Levaill. Ois. ii. p. 58. pl. 66. 1. Cruel Shrike, Gen. Syn. Sup. ii. p. 77. No. 19.

D 2

HABITAT in India, magnitudine Lan. Rutili: vertex, nucha, dorsum cæruleo-grifea: abdomen album: cauda cuneiformis, restricibus 4 intermediis nigris, reliquis albo nigroque dimidiatis.

14. L.

Superci-L. rufus fubtus albidus, striga per oculos nigra, superciliis albis. liofus. Le Rousseau, Levaill. Ois. ii. p. 60. pl. 66. f. 2. Supercilious Shrike, Gen. Syn. Sup. ii. p. 77. No. 20.

> HABITAT in infula Java, magnitudine Rutili: corpus supra serrugineo-rufum: finciput album fupra oculos in linea ductum, per oculos vitta nigra: corpus totum subtus ruso-albidum: remiges nigræ: cauda cuneiformis.

15. L.

Brubru. L. niger, corpore supra albo vario subtus albo, superciliis albis, lateribus terrugineis.

> Le Brubru, Levaill. Oif. ii. p. 85. pl. 71. f. 1. 2. Cape Shrike, Gen. Syn. Sup. ii. p. 78. No. 21.

HABITAT C. Bonæ Spei interioribus: longit. poll. 5 1.:- in mimosis nidificat, ova ponens 5 alba fusco maculata: femina fusca ubi mas niger.

16. L

ī.

Cubla. L. niger, corpore subtus fascia tectricum uropygioque albis, cauda apice alba.

> Le Cubla, Levaill. Ois. ii. p. 89. pl. 72. f. 1. 2. Hottniqua Shrike, Gen. Syn. Sup. i. p. 79. No. 23.

HABITAT in Africa, ad Cap. B. Spei: longit. poll. 6.:—victitat infectis, larvis, pupis: femina magis obscura ad fuscum inclinans.

## GENUS V. PSITTACUS.

Tabuensis. P. macrour. viridis, capite collo corporeque subtus coccineis, uropygio cæruleo. Var. y.

Tabuan Parrot, White's Journ. tab. p. 168. 169 .- Gen. Syn. Sup. ii.

p. 82. No. 2. β.

HABITAT in Nova Hollandia: magnitudo & habitus Pf. Tabuensis: cauda elongata at vix cuneata.

2. Pf.

Narcissius. P. macrour. luteus, collari albido, capite maculaque axillari coccineis. Jonquil Parrakeet, Gen. Syn. Sup. ii. p. 83. tab. 123.

Habitat in Bengala, magnitudine Pf. Rufiroftris: caput rubro-coccineum: collare albidum postice dilute viride: corpus totum læte flavum: remiges apice pallidæ: macula axillaris coccinea: rostrum & pedes obscure carnei.

3. Pf.

pallidus. P. macr. flavus, alis albidis rosaceo leviter tinctis, virescenteque pro luce variatis.

Psittacus pallidus, Nat. Misc. pl. 258. Pale Parrakeet, Gen. Syn. Sup. ii. p. 84. No. 6.

Pf. eximius.

P. macrour. viridis, capite collo crissoque coccineis, tectricibus alarum cæruleis, gula alba.

Psittacus eximius, Nat. Misc. pl. 93.

Nonpareil Parrot, Gen. Syn. Sup. ii. p. 85. No. 8.

Habitat in Nova Hollandia, magnitudine Pf. Pennantii: dorsi pennæ medio macula nigra notatæ: humeri nigri: tettrices alarum minores pallide cæruleæ.

5. Pf.

pulchellus. P. macr. viridis subtus luteus, capistro alisque cæruleis.

Psittacus Pulchellus, Nat. Misc. pl. 96.

Turcosine Parrakeet, Gen. Syn. Sup. ii. p. 89. No. 14.

· Habitat in Nova Hollandia: caput pallide cæruleum, nucha fusces-cente: alæ totæ cæruleæ, axillis coccineis: cauda valde elongata.

6. Pf. difcolor.

P. macrour. viridis, rectricibus basi serrugineis, humeris subtus sangui-

Red-shouldered Parrakeet, Phill. Voy. i. p. 269.—White's Journ. tab. p. 263.—Gen. Syn. Sup. ii. p. 90. No. 15.

Habitat in Nova Wallia Australi, magnitudine Ps. Pullarii: long. poll. 10 $\frac{1}{2}$ :—facies tota cum gula coccinea: vertex cæruleus: cauda valde cuneiformis basi castanea apice cærulescente.

7. Pf.

pyrrhopte- P. submacr. viridis, vertice cærulescente, humeris tectricibusque alarum inferioribus aurantiis.

Orange-winged Parrakeet, Gen. Syn. Sup. ii. p. 90. No. 16.

Habitat in Brafilia: long. 7-8 poll.—rostrum nigrum: pedes pallidi.

8. Pf.

nigricollis. P. macrour. viridis, collo subtus nigro, loris lineaque lateribus colli albis.

Black-necked Parrakeet, Gen. Syn. Sup. ii. p. 90. No. 17.

HABITAT in Brasilia: sinciput & orbitæ sulphureæ: gula & pettus nigra: lateribus colli linea longitudinalis alba: remiges & rettrices nigræ marginibus cæruleis.

9. Pſ.

verticalis. P. macrourus viridis, vertice medio rubro, remigibus cæruleis. Red-topped Parrot, Gen. Syn. Sup. ii. p. 369.

HABITAT in Nova Hollandia: long. poll. 18.—nimis affinis Psittaco Pacifico, at multo major.

10. Pf.

funereus. P. brachyur. niger, cauda medio melina nigro imbuta.
Pfittacus funereus, Nat. Nife. pl. 186.
Bankfian Cockatoo, Var. A. Gen. Syn. Sup. ii. p. 91. No. 18. C.

Habitat in Nova Hollandia, magnitudine Pf. Banksii, cujus forte varietas: cauda non coccinea nigro fasciata, sed melina, punctulis parvulis nigris creberrimis irrorata.

11. Pf.

Levail. P. viridis varius, humeris femoribusque aurantiis. Levaillant's Parrot, Gen. Syn. Sup. ii. p. 95. No. 28.

HABITAT ad Cap. Bonæ Spei: magnitudine Pf. Erythroleuci.
9
P. brach.

12. Pf.

folitarius. P. brach. viridis, abdomine purpureo-cæruleo, capite collo corpereque fubtus coccineis.

Solitary Parrot, Gen. Syn. Sup. i. p. 65.

Habitat in infulis Maris Pacifici, magnitudine Sturni: rostrum & pedes slavescentes: cauda brevis.

13. Pf.

galeatus. P. brachyur. criftatus fusco viridis, vertice rubro, abdomine rubro viridique undulato.

Red-crowned Parrot, Gen. Syn. Sup. ii. p. 369.

HABITAT in Nova Hollandia: magnitudo Pf. Eritheci: long. poll. 13.: - rofirum flavescens: pedes obscuri: femina, uri mas, vertice cristato minime rubro: corpus ei coloribus magis splendentibus undulatum.

## GENUS IX. BUCEROS.

B.

Abysfini- B. Abysfinicus, Ind. Orn. i. p. 143. 4.

cus. Abba Gumba, Bruce's Trav. v. iii. p. 102. & App. tab. p. 169. Abyssinian Hornbill, Gen. Syn. i. p. 347. 4.—Id. Sup. ii. p. 99. No. 1.

HABITAT in Abyssinia: long ped. 3. poll. 10. lat. ped. 6.:—nidificat in arboribus, victitat scarabæis, an eadem avis cum B. Africano.

2. B.

ruber. B. ruber, capite nigro, fascia dorsali alba. Crimson Hornbill, Gen. Syn. Sup. ii. p. 100. No. 4.

Species dubia, magnitudinis incertæ: rostrum elongatum validum. versus apicem incurvum nigricans, basi albidum: pedes nigricantes: caput nigrum, tumidum: corpus cum alis & cauda rubrum, sascia dorsi ante alas alba: cauda cuneisormis.

3. B.

galeatus. B. fronte gibbosa subquadrata, corpore nigro, abdomine caudaque cuneiformi albis, fascia rectricum nigra.

Buceros

Buceros galeatus, Ind. Orn. i. p. 142. 2. Helmet Hornbill, Gen. Syn. i. p. 343. 2.—Id. Sup. ii. p. 370.

HABITAT in Asia: pedes robusti, nigri.

#### GENUS XI\*. MUSOPHAGA.

Rostrum crassum, trigonum, mandibula superiore bass supra verticem elevata, maxillis dentatis.

Nares in medio rostri.

Lingua integra crassiuscula.

Pedes ambulatorii.

M. violacea. M. cæruleo-atra, striga aurium alba, rostro remigibusque sanguineis. Musophaga violacea, Schr. d. Berl. Gesell. ix. S. 16. tas. 1. D. Isert. Cuculus regius, Mus. Lev. pl. in p. 167. Violet Plantain-eater, Gen. Syn. Sup. ii. p. 104. tab. cxxv.

Habitat in Africa, Guinea: long. poll. 19.:—rostrum flavissimum, maxillis utrinque' dentatis apice coccineum: loræ violaceæ: sub oculis linea albida: collum, pettus, corpus violaceum: alæ violaceæ: remiges primariæ medio utrinque purpureo-coccineæ: cauda elongata cuneiformis: pedes nudi, nigri.

## GENUS XIII. CORVUS.

C. melanops. C. cinereus, facie juguloque nigris, rectricibus lateralibus apice nigris.

Black-faced Crow, Gen. Syn. Sup. ii. p. 371.

HABITAT in Nova Hollandia, magnitudine Glandarii: rostrum nigrum: pedes cærulescentes: corpus cæruleo-cinerascens: remiges nigricantes.

C. cinerascens

2. C.

C. cinerascens, corpore subtus albo, facie jugulo pectore margine alamelanorum remigibus rectricibusque nigris. gaster. Black-breafted Crow, Gen. Syn. Sup. ii. p. 371.

HABITAT in Nova Hollandia: an præcedentis varietas?

Caledoni- C. niger, cauda cuneiformi, collo toto pectoreque albis. Magpie of New Caledonia, D'Entrec. Voy. ii. p. 226. pl. 35.—Gen. Syn. us. Sup. ii. p. 116. No. 19.

> HABITAT in Nova Caledonia: longit. poll. 20 .: - rostrum nigrum apice flavescens: cauda valda cuneiformis.

versicolor. C. cæruleo-fuscescens rubro varians, cauda cuneiformi apice alba. Variable Crow, Gen. Syn. Sup. ii. p. 117. No. 21.

> HABITAT in Nova Hollandia: speciosa avis & inter majores numeranda: corpus fuscescens rubro & cæruleo splendens: rostrum validum & pedes nigri.

cyanoleucus.

C. cyaneo alboque varius, rostro pedibus remigibusque fuscis. Blue and white Crow, Gen. Syn. Sup. ii. p. 117. No. 22.

HABITAT in Nova Wallia Australi, magnitudine Picæ: facies cum gula, latera colli, tectrices alarum interiores, uropygium, cauda fere tota, & corpus inferius alba: caput superius, nucha, dorsum, ala, & rectrices versus apicem nigro-cærulea: irides suscæ.

6. ucus.

melanole. C. niger, gula uropygio crisso remigibus rectricibusque exterioribus medio nigris.

Black and white Crow, Gen. Syn. Sup. ii. p. 117. No. 23.

HABITAT in Nova Wallia Australi: long. poll. 20.:-irides cæruleæ.

SUPP. II.

E

C. olivaceus,

7·

olivaceus. C. olivaceus, capite & corpore subtus nigris, macula aurium pectorisque albis,

White-cheeked Crow, Gen. Syn. Sup. ii. p. 118. No. 24.

Habitat in Nova Hollandia: caput tumidum: remiges ferrugineæ: cauda cuneiformis rectricibus extimis apice albis.

8. C.

rufigaster. C. cæruleo-niger, cauda cuneiformi, abdomine crisso & femoribus carneis.

La Pie à Culotte de Peau, Levaill. Oif. ii. p. 20. p. 55. Rufous-bellied Crow, Gen. Syn. Sup. ii. p. 118. No. 25.

Habitat in partibus meridionalibus, magnitudine Merulæ: cauda cuneiformis valde elongata: abdomen & femora carneo-rufa: rostrum & pedes nigricantes.

9. C.

varians. C. fericeo-niger viridi-purpureo varius, cauda cuneiformi elongata. Le Temia, Levaill. Oif. ii. p. 22. pl. 56. Changeable Crow, Gen. Syn. Sup. ii. p. 119. No. 26.

Habitat in Java, magnitudine Turdi musici: corpus totum plumis nigris tectum, viridi & purpureo pro luce variantes: cauda valde elongata, rectricibus 4 intermediis æqualibus, exterioribus gradatim brevioribus.

10. C.

T. C.

Paradox- C. fusco-griseus subtus albidus, abdomine medio slavo, lateribus colli caus. runcula cylindracea.

Corvus paradoxus, Daudin. Orn. ii. p. 246. pl. xvi. Wattled Crow, Gen. Syn. Sup. ii. p. 119. No. 27.

Habitat in Nova Zealandia: longit. poll. 15.:—rostrum nigrum: gula alba: cauda cuneiformis: remiges & restrices apice albæ.

# GENUS XIV. CORACIAS.

Sagittata. C. corpore striato, supra olivaceo subtus albo, genis cinerascentibus. Striated Roller, Gen. Syn. Sup. ii. p. 122. No. 4.

HABITAT in Nova Wallia Australi: longit. poll. 15.:—remiges secundariæ griseæ, majores nigræ: cauda cinerea: rostrum carneum: pedes cærulei.

2. C.

Tibicen. C. niger, nucha tectricibus alarum crisso caudaque (excepto apice) albis.

Piping Roller, Gen. Syn. Sup. ii. p. 122. No. 5.

Habitat in Nova Wallia Australi: long. poll. 18.:-rostrum apice incurvum, cæruleum apice nigro: pedes cinerei.

3. C.

militaris. C. coccinea, remigibus caudaque subtus nigricantibus. Coracias militaris, Mus. Lev. p. 61. tab. in pag. 63. Crimson Roller, Gen. Syn. Sup. ii. p. 122. No. 6.

HABITAT in Cayana, magnitudine Corvi: rostrum rubrum: pedes nigricantes: pulcherrima avis.

4. C.

pilofa. C. testacea striis longitudinalibus albis, dorso susceptibus caudaque cæruleis.

Hairy Roller, Gen. Syn. Sup. ii. p. 123. No. 7.

MAGNITUDINIS incertæ hæc avis: habitat forte in Africa: rostrum & pedes cærulescentes: dorsum & alæ purpureo splendentes: supra oculos stria alba, per oculos nigra: pennæ abdominis striatæ elongatæ.

5. C.

scutata. C. nigra, jugulo pectoreque coccineis.
Coracias scutata, Mus. Lev. p. 197. tab. p. 199.

Red-breasted Roller, Lev. Mus. p. 199. pl. p. 199.—Gen. Syn. Sup. ii. p. 123, No. 8.

HABITAT in Nova Wallia Australi: long. poll. 18.:—cauda rotundata: rostrum nigricans subtus pallidum: pedes nigri.

6. C.

pacifica. C. viridis, capite castaneo, alis caudaque cæruleis, remigibus basi albis. Pacific Roller, Gen. Syn. Sup. ii. p. 371.

E 2

I.

Habitat in Nova Hollandia: long. poll. 9.:-rostrum & pedes rubri: gula cærulea, lateribus albo marginata.

## GENUS XV. ORIOLUS.

O. Cartage- O. fusco rusoque varius, corpore subtus uropygioque slavis, capite ninensis.

gro, superciliis gulaque albis.

Coracias Cartagenensis, Scop. Ann. i. p. 40.

Carthagena Oriole, Gen. Syn. Sup. ii. p. 126. No. 5.

Habitat in Cartagena, magnitudine Or. Galbulæ: alæ caudaque rufæ nigro maculatæ: rostrum nigrum.

## GENUS XVI. GRACULA.

Abyssini- G. viridis, abdomine ferrugineo, capite cinerascente.

ca. Abyssinian Grakle, Gen. Syn. Sup. ii. p. 128. 4.

HABITAT in Abyssinia: an var. Grac. Atthis.

g.
G. viridi-olivacea subtus albida, gula abdomineque maculis suscis, cauda apice alba.

Green Grakle, Gen. Syn. Sup. ii. p. 129. 5.

Habitat in Nova Hollandia: long. poll. 11.:—rostrum apice sub-

incurvatum corneum: lingua subulata.

melanoce- G. griseo-cærulescens subtus alba, capite nigro, fronte fasciaque tectriphala. cum albis,

Black-headed Grakle, Gen. Syn. Sup. ii. p. 129. 6.

HABITAT in Nova Hollandia: long. poll. 9 .: - rostrum & pedes slavi.

G. corpore

4. G.

picata. G. corpore superiore fasciaque pectorali nigris, subtus fasciaque duplici alarum albis.

Pied Grakle, Gen. Syn. Sup. ii. p. 130.7.

HABITAT in Nova Hollandia: long. poll. 10.:-rostrum flavum: pedes grisei: facies tota cum gula alba.

G.

cyanotis. G. viridis fubtus alba, vertice nigro postice albo, regione oculorum & aurium cæruleis.

Blue-eared Grakle, Gen. Syn. Sup. ii. p. 130. 8.

HABITAT in Nova Hollandia: long. 11 1. poll.:—rostrum & pedes nigri: gula & jugulum medio cæruleo-grisea.

## GENUS XVIII. TROGON.

I. T.

Leveria- T. violaceus viridi-aureo nitens, alis nigris, abdomine albo, remigibus nus. tribus exterioribus nigris apice albis.

Trogon Leverianus, Mus. Lev. p. 175. tab. p. 177.

Leverian Curucui, Gen. dyn. Sup. ii. p. 131.

HABITAT in America Australi, magnitudine Tr. violacei, cui nimis similis.

# GENUS XX. CUCULUS.

C.

cupreus. C. aureo-cupreus, abdomine femoribusque flavis.
Cuculus cupreus, Muf Lev. t. in p. 159.
Cupreous Cuckow, Gen. Syn. Sup. ii. p. 134.

Habitat in Africa, magnitudine fere Alaudæ: corpus supra & collum plumis cupreis & versicoloribus tectum, subtus cum pectore pulchre slavum: cauda longiuscula, restricibus exterioribus ad apicem macula triangulari notatis: rostrum & pedes nigri.

3

C. ex

2. C.

clamosus. C. ex toto susco-nigricans.

Cuculus criard, Levaill. Voy. (ed. 8vo.) ii. p. 6. Noify Cuckow, Gen. Syn. Sup. ii. p. 136. No. 7.

HABITAT Capitis B. Spei interioribus: cantus varius & continuo repetitus longe auditur.

3. C.

cyanocephalus. C. maculatus fupra fuscus subtus albus, capite colloque supra nigrocyaneis, gula rufa.

Blue-headed Cuckow, Gen. Syn. Sup. ii. p. 137. No. 8.

Habitat in Nova Hollandia: longit. poll. 9.:—rostrum & pedes cærulescentes: dorsum maculis albidis notatum: latera abdominis lineis transversis nigris.

Č. phaliani-

nus.

C. niger, corpore supra caudaque ruso slavo nigroque variis, rectricibus elongatis.

Pheasant Cuckow, Gen. Syn. Sup. ii. p. 137. No. 9.

Habitat in Nova Hollandia: longit. poll. 18.:—corpus variegatum: -cauda elongata fasciis numerosis: ungues postici elongati sere recti.

٥٠ C.

palliolatus. C. corpore virescente subtus albo, lateribus colli tænia obliqua nigra. Tippet Cuckow, Gen. Syn. Sup. ii. p. 138. No. 10.

Habitat in Nova Hollandia: longit. poll. fere 12.:—vertex subcristatus: caput ad oculos usque nigrum: cauda brevis, restricibus extus albo maculatis.

6. C.

flabelliformis. C. cauda cuneiformi, corpore nigro fubtus fulvo, rectricibus lateralibus intus nigro alboque fasciatis. Fan-tailed Cuckow, Gen. Syn. Sup. ii. p. 138. No. 11. tab. 126.

> HABITAT in Nova Hollandia, magnitudine Turdi: caput, corpus superius, alæque nigra: rostrum nigrum: pedes slavi.

> > C. rufo

7. C.

plagosus. C. ruso-purpureus, subtus albidus tæniis transversis susco-auratis, rostro pedibusque slavis.

Gloffy Cuckow, Gen. Syn. Sup. ii. p. 138. No. 12.

HABITAT in Nova Hollandia: rostrum fuscum: pedes pallidi.

8. C.

\*\* Pedibus tridactylis.

Abyssini- C. suscus subidus, remigibus rectricibusque apice albis, pedibus cus. tridactylis.

Bee Cuckow, Moroc, Bruce's Trav. App. t. p. 178. Abysfinian Cuckow, Gen. Syn. Sup. ii. p. 139. No. 13.

HABITAT in Abyssinia: longit. poll. 7.:-victitat apibus.

## GENUS XXII. PICUS.

P.
icterocephalus.
Var.

P. olivaceo-fuscus, capite slavo, pileo rubro, corpore subtus albido sasciis interruptis suscis.

Yellow-headed Woodpecker, var.? Gen. Syn. Sup. ii. p. 141. No. 5.

An varietas Pic. Icterocephali: gula tota maculis rubescentibus notata: corpus subtus maculis subincurvatis suscis.

P.
sltivolans.

P. fusco-ruber, pileo gulaque cæruleo-viridibus, lateribus colli slavo variis.

Picus altivolans ex Guinea, Ger. Orn. ii. p. 49. t. 173. Guinea Woodpecker, Gen. Syn. Sup. ii. p. 141. No. 6.

HABITAT in Guinea: hujus avis præter imaginem & nomen non aliam in Geriniana ornithologia invenimus notitiam: affinis Galbulæ.

P.
Mahrattenfis.

P. niger albo varius, subtus suscus maculatus, uropygio albo, abdomine medio rubro.

Mahratta Woodpecker, Gen. Syn. Sup. ii. p. 142. No. 7.

Habitat in *India: Pic. Minore* paulo major: corpus fubtus a gula fuscum maculis saturatioribus: remiges & restrices nigræ albo maculatæ.

P. rusus

4. P.

pectoralis. P. rufus nigro undulatus, abdomine rufescente nigro maculato, fascia pectorali nigra.

Gorget Woodpecker, Gen. Syn. Sup. ii. Add. p. 372.

HABITAT in Nova Zealandia: long. poll. 9 .: - cauda nigra.

#### GENUS XXIV. ALCEDO.

A. azurea.

A. faturate cærulea, corpore fubtus lorifque flavescentibus, lateribus colli macula obliqua alba.

Azure King's-fisher, Gen. Syn. Sup. ii. Add. p. 372.

HABITAT in insula Norfolk Maris Pacifici: magnitudo Ispida: rostrum nigrum: pedes rubri.

## GENUS XXV. SITTA.

chrysopte- S. cinerea subtus albida, alis caudaque suscis, remigibus medio aurantiora. ferrugineis.

Orange-winged Nuthatch, Gen. Syn. Sup. ii. p. 146. 3.

Habitat in Nova Hollandia, magnitudine S. Surinamensis: rostrum suscum: pedes plumbei.

## GENUS XXVI. TODUS.

T.
Rubecula. T. cinereus, gula pectoreque aurantiis, abdomine albo.
Red-breafted Tody, Gen Syn. Sup. ii. p. 147. 2.

HABITAT in Nova Hollandia, magnitudine Emb. Citrinellæ: vertex subcristatus: rostrum obscurum, basi vibristis instructum: lingua bisida.

GENUS

#### GENUS XXVII. MEROPS.

I. M.

fuperbus. M. ruber, fronte gula uropygioque cæruleis, rectricibus duabus intermediis longioribus.

Merops superbus, Nat. Misc. tab. 78.

Superb Bee-eater, Gen. Syn. Sup. ii. p. 152. 6.

Habitat in America Australi? longit. poll. 9.: -M. Brasiliensi valde assinis.

2. M.

orientalis. M. viridis, rectricibus mediis elongatis, remigibus rubris apice nigris. Eastern Bee-eater, Gen. Syn. Sup. ii. p. 152.7.

HABITAT in India, magnitudine Erythropteri.

3∙ M.

cærulef- M. cæruleo-viridis nigro varians.

cens. Blue-green Bee-eater, Gen. Syn. Sup. ii. p. 152. 8.

Habitatio dubia: longit. poll. 8 .: - pedes nigri.

4. M.

cucullatus. M. fusco-plumbeus subtus albidus susco lineatus, cucullo verticali per oculos ducto nigro.

Hooded Bee-eater, Gen. Syn. Sup. ii. p. 152. 9.

Habitat in Nova Hollandia: longit. 9.—10. poll.:—rostrum & pedes slavescentes: abdomen album: remiges 5—6 intermediæ medio viridislavicantes: cauda plumbea apice albida.

5. M.

chryfopte- M. fuscus, macula alarum fulva, remigibus rectricibusque exterioribus rus. apice albis.

Golden-winged Bee-eater, Gen. Syn. Sup. ii. p. 153. 10.

HABITAT in Nova Hollandia: longit. poll. 12.:—cauda cuneiformis fusca: rostrum & pedes nigri; victitat insestis, melle.

SUPP. II.

F

M. corpore

XXXIV

6. M.

auritus. M. corpore supra ruso subtus albido, striga pone oculos remigibus recitricibusque nigris.

Black-eared Bee-eater, Gen. Syn. Sup. ii. p. 153. 11.

HABITAT in Nova Hollandia: long. poll. 7.:-rostrum & pedes susci.

7. Tv1.

phrygius. M. niger flavo varius, macula per oculos rectricibusque exterioribus

Black and yellow Bee-eater, Gen. Syn. Sup. ii. p. 154. 12. - New Holland Birds, pl.

HABITAT in Nova Hollandia, magnitudine Turdi: rostrum nigrum: pedes fusci: color pennarum niger marginibus flavis: latera capitis macula magna flava: cauda cuneiformis, restricibus 2 intermediis toto-nigris margine flavis, exterioribus flavis.

8. M.

cyanops. M. fuscus subtus albus, capite supra gulaque nigris, macula oculari cyanca.

Blue-cheeked Bee-cater, Gen. Syn. Sup. ii. p. 154. 13.

HABITAT in Nova Hollardia: long. poll. 16.: - genæ cæruleæ: roftrum nigrum: pedes cærulei.

9. M.

garrulus. M. fuscus subtus albus, fascia verticis nigra, macula pone oculos remigibusque magna ex parte flavis.

Chattering Bee-eater, Gen. Syn. Sup. ii. p. 154. 14.

HABITAT in Nova Hollandia, magnitudine Turdi: rostrum & pedes flavi: cauda cuneiformis: inquieta & garrula avis.

10. M.

Mona-M. supra suscus subtus albus, capite subtomentoso nigro, vertice elechus.

Cowled Bee-eater, Gen. Syn. Sup. ii. p. 155. 15.

HABITAT in Nova Hollandia: rostrum validum subincurvatum nigrum: pedes cærulei: vertex & nucha tomentoso-setacea.

M. cæruleo

M.

cornatus. M. cæruleo viridique varius, nucha gula remigibusque basi sulvis, rectricibus duabus elongatis.

Variegated Bee-eater, Gen. Syn. Sup. ii. p. 155. 16. tab. 128.

Habitat in Nova Hollandia: Erythroptero major: per oculos vitta lata nigra, fubtus cærulea: gula macula triangulari nigra: corpus fubtus flavum: roftrum & pedes nigri.

12. M.

albifrons. M. rufus fubtus albidus, capite fupra nigro, fronte nivea, remigibus rectricibusque maculatis.

White-fronted Bee-eater, Gen. Syn. Sup. ii. p. 156. 17.

Habitat in Nova Höllandia: longit. poll. 9.:—corpus subtus album, lineis abbreviatis obscuris: remiges & restrices obscure cæruleæ, margine albo maculatæ: rostrum & pedes susci.

Femina fusca subtus fusco-albida.

13. M.

gularis. M. niger, fronte uropygioque cæruleis, abdomine cæruleo maculato, gula rubra.

Merops gularis, Nat. Misc. pl. 337.

Red-throated Bee-eater, Gen. Syn. Sup. ii. p. 157. 18.

HABITAT in Africa, magnitudine Apiastri: gula splendide rubra: remiges majores basi serrugineæ.

#### GENUS XXIX. CERTHIA.

C.

coccinigal- C. viridi-aurea, pectore purpureo-amethystino coccineo vario, abdomine tra. nigro, fasciculo subaxillari slavo.

Crimson-bellied Creeper, Gen. Syn. Sup. ii. p. 164. 18.

HABITAT in Africa: longit. poll. 5 1. :- affinis C. Polita.

C. venusta.

C. viridi-aurea, gula purpureo-atra, abdomine pallide flavo. Certhia venusta, *Nat. Misc.* 10. tab. 369.

Leona Creeper, Gen. Syn. Sup. ii. p. 164. 19.

F 2

Habitat in Africa: longit. poll. 4.: - sascicula axillaris slava ut in C. coccinigastra.

Ĉ.

Mahrat- C. violaceo-purpurea, remigibus rectricibusque exterioribus nigricantitensis.

bus, fasciculo subaxillari flavo.

Mahratta Creeper, Gen. Syn. Sup. ii. p. 164. 20.

HABITAT in India: affinis C. Afiatica.

4. C.

melanops. C. fusca subtus alba, fascia per oculos ad latera pectoris utrinque nigra. Black-eyed Creeper, Gen. Syn. Sup. ii. p. 165. 21.

HABITAT in Nova Wallia Australi: longit. poll. 7—8.:-frons alba: variat fronte fusca loris nigris; fascia sub oculis nigra.

C. tenuirof-

tris. Clardon hilled Greener Can Sun Sun ii p. 165, 22, 5th 122

Slender-billed Creeper, Gen. Syn. Sup. ii. p. 165. 22. tab. 129.

Habitat in Nova Hollandia: longit. ultra poll. 6.:—rostrum tenue, elongatum, modice incurvum: lingua setacea: lunula gulæ nigra intus rusa: corpus subtus album: victitat insectis, melle.

б. С.

leucophæa. C. olivaceo-fusca subtus albida, vertice nigro transversim lineato, pone oculos macula slava.

Dirigang Creeper, Gen. Syn. Sup. ii. p. 166. 23.

HABITAT in Nova Hollandia: magnitudo C. familiaris: macula flava infra & pone oculum, altera aurantia.

7· C.

pipilans. C. fusco-virescens subtus flavicans, femoribus albo suscoque fasciatis, remigibus rectricibusque fuscis.

Chirping Creeper, Gen. Syn. Sup. ii. p. 166. 24.

Habitat in Nova Hollandia: magnitudo Luscinia: vox pipilans: rostrum gracile: lingua setacea.

8. C.

mellivora. C. nigra lunulis striisque albidis, tectricibus alarum medio rufis, cauda apice albida.

Mellivorous Creeper, Gen. Syn. Sup. ii. p. 166. 25.

Habitat in Nova Hollandia maritimis, magnitudine Turdi: species numerosa: inquieta avis & pugnax, victitans Muscis, Melle.

Psittaco Hamatod, valde infesta.

9. Ć.

atricapilla. C. fusco-viridis subtus albida, vertice genisque nigris. Black-headed Creeper, Gen. Syn. Sup. ii. p. 167. 26.

HABITAT in Nova Hollandia: long. poll. 6.:—rostrum modicum: lingua setacea.

10. C.

fanguino- Certhia coccineo-fanguinea, dorso maculis deformibus nigris, subtus cinerea, gula juguloque albis.

Sanguineous Creeper, Gen. Syn. Sup. ii. p. 167. 27.

Habitat in Nova Hollandia, magnitudine Sylvia: rostrum & pedes nigri: lingua apice setacea.

т. С.

dibapha. C. coccineo-rubra, abdomine albo, maculis dorsi pectoris per oculos alis caudaque nigris.

Cochineal Creeper, Gen. Syn. Sup. ii. p. 167. 28.

HABITAT in Nova Hollandia: magnitudo C. Cruentatæ: medio pectoris maculæ 6 nigræ: alæ, cauda, rostrum & pedes nigri: lingua setacea.

12. C.

gibus rectricibusque obscuris.

Hoary Creeper, Gen. Syn. Sup. ii. p. 168. 29.

HABITAT in Nova Hollandia: long. poll. 8.:—rostrum nigrum: lingua apice setacea: testrices alarum albo maculatæ.

C. Cinerea

13.

pyrrhopte- C. cinerea fubtus alba, macula aurium fulva fubtus nigra, remigibus medio rectricibulque exterioribus flavis. ra. Yellow-winged Creeper, Gen. Syn. Sup. ii, p. 168.30.

> HABITAT in Nova Hollandia: long. poll. 7.:-remiges majores a basi ultra medium flavæ: uropygium flavescens: lingua setacea.

> Femina supra cinereo-grisea subtus stavescens, crissum maculis ferrugineis: remiges a basi ad medium pallide serrugineæ: victitat insectis.

14. agilis.

C. fusca subtus alba, vertice nucha colloque supra nigris. Agile Creeper, Gen. Syn. Sup. ii. p. 168. 31.

HABITAT in Nova Hollandia: longit. poll. 6 .: - rostrum nigrum: lingua apice setacea: victitat melle, injettis.

15. C.

C. fusca subtus incarnata, gula juguloque griseo-cæruleis, remigibus reccærulefcens. tricibulque cæruleo-nigris. Cærulean Creeper, Gen. Syn. Sup. ii. p. 169. 32.

> HABITAT in Nova Hollandia: magnitudo Sylvia: rostrum-tenue obfcurum.

16.

chrysotis. C. cinereo-fusca subtus alba, macula pone aures ovata aurea, alteraque, superius nigra.

Yellow-eared Creeper, Gen. Syn. Sup. ii. p. 169. 33.

HABITAT in Nova Hollandia: magnitudo Fringilla: lingua fetacea.

17.

gia.

erythropy- C. fusca subtus albida, uropygio strigisque maxillaribus rubris. Red-rumped Creeper, Gen. Syn. Sup. ii. p. 169. 34.

> HABITAT in Nova Hollandia: rostrum & pedes nigri: lingua apice fetacea: folitaria & rara avis.

> > C. viridis

18. C.

nigrifrons. C. viridis subtus slava, fronte genisque nigris. Black-fronted Creeper, Gen. Syn. Sup. ii. p. 169. 35.

HABITAT in Africa? cauda cuneiformis...

19. C.

frontaiis. C. obscura, vertice dorsoque fuscescentibus, gula uropygioque cæruleis. Blue-faced Creeper, Gen. Syn. Sup. ii. Add. p. 372.

HABITAT in Africa: long. poll. 5.:-rostrum & pedes nigri.

## GENUS XXX. TROCHILUS.

T. criftatellus.

T. curvirostris viridis, capitis crista viridi-nitente aurea, remigibus caudaque nigris.

Gilt-crested Humming Bird, Gen. Syn. Sup. ii. p. 171. 4.

Parva species, longit. 2½. poll.:—nidus papposus ut in congeneribus.

Femina supra viridi-susca, subtus albida maculis pectoralibus nigri-

2. T.

fulvifrons. T. curvirostris saturate cæruleus, abdomine nigro, sacie margine alarum caudaque subtus sulvis.

Orange-faced Humming Bird, Gen. Syn. Sup. ii. p. 172.5.

Habitatio dubia: longit, poll. 3 1.:—rostrum rectum apice adunciusculum, albidum: caput postice subcristatum: corpus nigricans cæruleo varium: abdomen nigricans: macula lori, gulaque sulva: pedes nigri.

3. Т.

maximus, T. viridi-aureus, gula nivea, crisso ferrugineo, vertice remigibus caudaque cærulescentibus.

Trochilus maximus, Mus. Lesk. No. 76. t. ii. No. 2. Great Humming Bird, Gen. Syn. Sup. ii. p. 172. 6.

Habitatio dubia: longit. poll. 8.:—rostrum capite longius: gula nivea: cauda subulata nigricans.

# ORDO III. PASSERES.

#### GENUS XXXII. TURDUS.

T.

gularis. T. fuscus subtus albus, crisso slavescente, fascia pectorali obscura. Penrith Ouzel, Gen. Syn. Sup. ii. p. 177. 2.

HABITAT in Cumbria: Cinclo paulo major: petius, abdomen, & fe-mora lineis abbreviatis nigris

2. T.

inquietus. T. corpore supra nigro subtus albo, rostro pedibusque nigris. Restless Thrush, Gen. Syn. Sup. ii. p. 181. 11.

Habitat in Nova Wallia Australi: magnitudo Turdi musici: longit. poll. 8.:—rostrum nigrum, apice subincurvatum: cauda apice integra.

3· T.

melanops. T. ferrugineo-fuscus, subtus cum vertice slavus, per oculos macula longitudinali nigra, intus ad imum macula parva slava.

Black-eyed Thrush, Gen. Syn. Sup. ii. p. 181. 12.

Habitat in Nova Hollandia: longit. poll. 8.:-rostrum nigrum: lingua apice setacea.

4. T.

dubius. T. nigro-cærulescens subtus albus, remigibus rectricibusque suscis. Doubtsul Thrush, Gen. Syn. Sup. ii. p. 182. 13.

Habitat in Nova Hollandia: longit. poll. 9::—rostrum cærulescens: lingua apice setacea: corpus supra cæruleo-nigricans, subtus album: rectrices elongatæ: pedes susci.

5. T.

dilutus. T. pallide fuscus subtus cæruleo-albus, capite collo uropygioque griseocærulescentibus.

Dilute Thrush, Gen. Syn. Sup. ii. p. 182. 14.

HABITAT in Nova Hollandia: rostrum pallide fuscum: pedes cærulei.

б. Т.

gutturalis. T. viridis subtus luteus, capite nigro, gula alba. Guttural Thrush, Gen. Syn. Sup. ii. p. 182. 15.

Habitat in Nova Hollandia, magnitudine T. Zeyloni: rostrum & pedes nigri: nucha slavescens.

7· T.

harmoni- T. pallide fuscus subtus albidus, remigibus rectricibusque obscuris. cus. Harmonic Thrush, Gen. Syn. Sup. ii. p. 182. 16.

Habitat in Nova Hollandia: longit. poll. 9.:—pennæ corporis inferioris scapis suscis: remiges & restrices nigricantes: rostrum & pedes cornei.

8. T.

badius. T. badius subtus albidus, vertice cærulescente, pectore nebuloso, remigibus rectricibusque plumbeis.

Port Jackson Thrush, White's Voy. pl. in p. 157.—Gen. Syn. Sup. ii. p. 183. 17.

Habitat in Nova Hollandia: rostrum flavum: pedes susci: cauda elongata apice integra.

9. T.

prasinus. T. cinereo-cæruleus subtus slavescens, macula aurium ovata nigra. Prasine Thrush, Gen. Syn. Sup. ii. p. 183. 18.

Habitat in Nova Hollandia: magnitudo Turdi musici: rostrum & pedes nigricantes: testrices alarum nigro maculatæ: gula alba: cauda tota nigra.

10. T.

volitans. T. supra niger subtus albus, alis suscis, capite colloque nigris. Volatile Thrush, Gen. Syn. Sup. ii. p. 183. 19.

HABITAT in Nova Hollandia: longit. poll. 9.:-rostrum nigrum: cauda elongata apice integra.

SUPP. II.

G

T. viridis

11. T.

cyanous. T. viridis subtus niveus, cauda rotundata, macula oculari cærulea. Blue-cheeked Thrush, Gen. Syn. Sup. ii. p. 184. 20.

HABITAT in Nova Hollandia: longitud. poll. 12.:-rostrum & pedes cæruleo-nigricantes: latera capitis cærulea.

12. T.

tenebrosus. T. dorso alis gulaque nigris, corpore subtus albido, vertice susco. Brown-crowned Thrush, Gen. Syn. Sup. ii. p. 184. 21.

HABITAT in Nova Hollandia: longitud. poll. 6.:—rostrum cærules-cens: pedes nigri: vertex & latera corporis fusca.

13. T.

lunulatus. T. lunulis nigris notatus, supra suscus subtus albidus, rostro nigro, pedibus pallidis.

Lunulated Thrush, Gen. Syn. Sup. ii. p. 184. 22.

HABITAT in Nova Hollandia, magnitudine T. viscivori: lingua apice setacea: cauda brevis.

14. T.

fuliginosus. T. susceptibles de la fusción de la fulción de la fulción de la fusción d

Sooty Thrush, Gen. Syn. Sup. ii. p. 185. 23

HABITAT in Nova Hollandia, magnitudine T. musici: Lingua apice acuto: color corporis superioris obscure viridi-suscus: cauda integra: pedes slavi.

T. melanophrys.

T. flavo-fuscus, loris elevatis, rostro macula pone oculos pedibusque rubris.

Black-browed Thrush, Gen. Syn. Sup. ii. p. 185. 24.

HABITAT in Nova Hollandia, magnitudine T. fuliginosi: lora elevata rigida slava nigro marginata: rostrum & pedes rubri.

16. T.

Muscicola. T. capite collo superiore dorsoque nigris, corpore subtus albo, alis caudaque suscis.

Flycatching Thrush, Gen. Syn. Sup. ii. p. 185. 25.

HABITAT in Nova Hollandia: longit. poll. 10.:-victitat Muscis.

17. T.

cyanoce- T. supra suscessibles flavescens, vertice saturate cæruleo, rectricibus phalus.

margine albo maculatis.

Blue-headed Thrush, Gen. Syn. Sup. ii. p. 185.26.

Habitat in Nova Hollandia, magnitudine T. musici: rostrum cæruleum apice nigro: restrices apice albæ: hypochondria lineis transversis numerosis notata: cauda rotundata: pedes cærulei.

18. T.

maxillaris. T. fuscus subtus cæruleo-albus, vertice sasciaque maxillari albis. Maxillary Thrush, Gen. Syn. Sup. ii. p. 186. 27.

Habitat in Nova Hollandia, magnitudine T. musici: nucha obscura cærulea: cauda integra, apicibus rectricum albis: rostrum suscum: pedes stavi.

19. T.

frivolus. T. fuscus subtus ruso-albidus, fronte cinereo alboque varia. Frivolous Thrush, Gen. Syn. Sup. ii. p. 186. 28.

HABITAT in Nova Hollandia, magnitudine T. musici: cauda modica potius abbreviata: rostrum nigrum: pedes plumbei.

20. T.

fordidus. T. cinereo-virescens, alis caudaque nigris, macula remigum alba, rectricibus exterioribus apice albis. Sordid Thrush, Gen. Syn. Sup. ii. p. 186. 29.

HABITAT in Nova Hollandia: rostrum cærulescens: restrices 2 intermediæ cinerco-suscæ, reliquæ albæ.

21. T.

brachypte- T. cauda cuneiformi elongata, corpore cinereo-fusco, alis abbreviatis. Short-winged Thrush, Gen. Syn. Sup. ii. p. 187. 30.

G 2 HABITAT

Habitat in Nova Hollandia, magnitudine T. musici: longit. poll. 10.:—corpus supra pallide suscum, subtus cinerascens: pestus nebulosum: alæ abbreviatæ vix ad caudæ basin attingunt: rostrum & pedes nigricantes.

22. T.

melinus. T. fusco-virescens subtus albus, abdomine slavo, superciliis albis, capite & cervice nigris.

Yellow-beilied Thrush, Gen. Syn. Sup. ii. p. 187. 31.

Habitat in Nova Hollandia, magnitudine T. viscivori: rostrum & pedes rubii: lingua setacea: gula, collum anterius & crissum alba: pettus & abdomen olivaceo-slava: latera pectoris maculis sagittatis notata.

23. T.

punctatus. T. fuscus nigro punctatus, subtus cæruleo-albus, superciliis albis, sub oculis macula rusa.

Punctated Thrush, Gen. Syn. Sup. ii. p. 187. 32.

Habitat in Nova Hollandia: rostrum nigrum: pedes flavi: gula alba: abdomen ruso-album: latera sub alis & crissum strigis abbreviatis nigris.

24. T.

afiaticus. T. niger fubtus flavus, fafcia alarum duplici alba. Afiatic Thrush, Gen. Syn. Sup. ii. p. 188. 33.

HABITAT in Sina: longitud. poll. 6.:—rostrum & pedes nigri: caput ultra oculos & corpus superius nigra.

25. T.

polioce- T. obscurus, capite colloque canis.

phalus. Ash-headed Thrush, Gen. Syn. Sup. ii. Add. p. 373.

HABITAT in infula Norfolk Maris Australis: long. 7 1. poll.

26. T.

leucotis. T. viridis fubtus flavus, vertice canescente, jugulo pectoreque nigris, macula aurium alba.

White-eared Thrush, Gen. Syn. Sup. ii. Add. p. 373.

HABITAT cum T. melanope, cujus forte sexus alter.

T. niger,

27. T.

leucophrys.

T. niger, superciliis abdomine maculaque alarum albis, semoribus albo maculatis.

White browed Thrush, Gen. Syn. Sup. ii. Add. p. 373.

HABITAT in Nova Hollandia: restrum & pedes nigri.

## GENUS XXXV. LOXIA.

I. L.

Tavensis. L. fusco cinerea, capillitio remigibus ac rectricibus nigris, temporibus abdomineque cinereo-albicantibus.

> Loxia javensis, Muf Carlf. fasc. iv. t. 88. Sunda Grosbeak, Gen. Syn. Sup. ii. p. 195. 9.

HABITAT in Sumatra & Java, magnitudine L. Pyrrhulæ: rostrum validum nigricans: peaes flavicantes: abdomen ac crissum alba.

2. L. cinerea.

L. fusco-nigricans, capite cristato, abdomine albido, pedibus rubris. Loxia cinerea, Mus. Carls. fasc. iv. t. 88. Ash coloured Grosbeak, Gen. Syn. Sup. ii. p. 196. 10.

Habitat in insulis Malacca, Sumatra, Java: rostrum conico-ovatum album apice nigrum: corpus fub us album: irides rubræ: crifta rostro duplo longior: alarum remiges 1. 2. 3. 4. anteriores fere æquales: cauda rotundata, restricibus margine exteriore albidis: pedes rubri.

ſa.

ferrugino- L. ferruginea, rostri basi jugulo macula abdominis alarum apice pedibusque nigris, capillitio ac cervice albicantibus. Mas.

> Loxia supra ferruginea subtus cinerea, rostro & pedibus nigris, remigibus rectricibulque ferrugineo-fuscis. Femina.

Ferruginous Grosbeak, Gen. Syn. Sup. ii. p. 195-11.

HABITAT in India Orientali: rostrum cinereum subtus nigrum: caput & cervix cinereo-albida: gula jugulum cum parte pectoris superiore fusco-nigra: remiges nigricantes: cauda brevis, sordide ferruginea: pedes atri.

Femina.

Femina mentum, gula, tempora cinereo-albicantia: jugulum cinereum: cæterum ut in mare.

4. L.

frontalis. L. cinereo-grisea subtus alba, vertice & cervice rusescentibus. Loxia frontalis, *Daudin. Orn.* ii. p. 445. Frontal Grosbeak, *Gen. Syn. Sup.* ii. p. 196. 12.

Habitat in Senegala, magnitudine Fr. Amandavæ: rostrum & pedes pallide grisei: penn.e sinciput & rictum oris tegentes serratæ nigræ apice albæ.

5. L.

mystacea. L. susco-olivacea subtus albida, capite & cervice ruso-suscisis, superciliis & macula oris coccineis.

Loxia mystacea, Daudin. Orn. ii. p. 446.

Mustachoe Grosbeak, Gen. Syn. Sup. ii. p. 197. 13.

Habitat in Cochin Sina, magnitudine Reguli: longit. vix pollic. 4.: — rostrum ruso-susce nigro: supra oculos tænia splendide coccinea & macula ejusdem ad rictum oris: pedes carnei.

6. L.

cyanopte- L. cinereo-fusca, capistro saturatiore, alis & cauda cæruleis, remigibus ra. exterioribus basi albis.

Blue-winged Grosbeak, Gen. Syn. Sup. ii. p. 197. 14.

Habitat in Nova Wallia Australi, longitudine pollic. 7:-rostrum & pedes cærulei: remiges saturate cæruleæ, exteriores basi albæ, unde macula alarum: restrices apice albæ.

7: L.

fascinans. L. suscending fubtus alba, rectricibus exterioribus albis. Fascinating Grosbeak, Gen. Syn. Sup. ii. p. 197. 15.

HABITAT in Nova Hollandia, magnitudine Pyrrhula: rostrum & pedes nigricantes.

8. L.

bella. L. grisea nigro transversim lineata, loris nigris, rostro uropygioque rubris.

Black-lined Grosbeak, Gen. Syn. Sup. ii. p. 198. 16.

HABITAT in Nova Hollandia, magnitudine Linariæ: corpus grifeofuscum lineis transversis numerosis nigris: inter rostrum & oculum macula nigra, quæ circumdat oculum & desinit in acutum: pedes pallide
fusci.

9. L. nitida.

L. lineolis transversis interruptis nigris notata, corpore supra susceptibles albido, rostro uropygioque rubris.

Nitid Grosbeak, Gen. Syn. Sup. ii. p. 198. 17. tab. 131.

HABITAT in Nova Hollandia, magnitudine L. bellæ: rostrum, irides, uropygium rubra: pedes flavescentes.

## GENUS XXXVII. TANAGRA.

T.

flavifrons. T. viridis, fronte lutea, capillitio violaceo, rostro pedibus alis caudaque nigris.

Emberiza flavifrons, Mus. Carls. iv. tab. 92.

Yellow-fronted Tanager, Gen. Syn. Sup. ii. p. 204. 2.

Gula flavo-viridis: confer Tan. Cayanam.

2. T.

rudis. T. rostro jugulo pedibus susco-cinereis, pectore abdomine crisso ac uropygio ferrugineo-rusis, reliquis susco-nigris.

Tanagra rudis, Mus. Carls. iv. tab. 94. Rude Tanager, Gen. Syn. Sup. ii. p. 205. 3.

HABITAT in India Orientali.

3. T. ornata.

T. subtus cinereo-nitens supra sufco-virescens, capillitio cervice & humeris violaceis, macula alarum aureo-lutea.

Tanagra ornata. Mus. Carls. iv. tab 95. Showy Tanager, Gen. Syn. Sup. ii. p. 205. 4.

HABITAT in India Orientali: magnitudo & habitus T. Sayacu.

GENUS

#### GENUS XXXVIII. FRINGILLA.

F.

leucoce- F. fusco rusa, capite albo, uropygio rubro, sascia pectoris lunulaque ante phala. oculos nigris.

White-headed Finch, Gen. Syn. Sup. ii. p. 210, 12, tab. 132.

Habitat in Nova Hollandia, magnitudine Pyrrhulæ: rostrum rubrum: caput & collum totum alba: ante oculos lunula nigra: abdomen medium album: latera corporis nigra maculis parvis albis: pedes pallidi.

Variat capite cinerascente, an fexus alter.

2. F.

calida. F. fusco-rufa, corpore supra striis longitudinalibus nigris, pedibus pallidis.

Sultry Finch, Gen. Syn. Sup. ii. p. 210. 13.

Habitat in *India*: longit. poll.  $5\frac{1}{2}$ : — rostrum nigricans: pennæ corporis superioris & verticis medio striis nigris notatæ: cauda apice integra: pedes pallide slavi.

3. F. nitida.

F. cinerascens subtus albida, remigibus ferrugineo-flavescentibus, super-ciliis nigris.

Nitid Finch, Gen. Syn. Sup. ii. p. 211. 14.

Habitat in Nova Hollandia, magnitudine Cælibis: rostrum rubrum: latera corporis flavescentia: supra oculos fascia nigra postice dilatata: pedes slavi.

4. F.

temporalis. T. fusca subtus alba, vertice cærulescente, genis uropygioque coccineis. Temporal Finch, Gen. Syn. Sup. ii. p. 211-15.

Habit at in Nova Fiellandia? regio oculorum macula ovata coccinea notata, postice dilatata: rostrum & pedes ruso-fusci.

GENUS

## GENUS XXXIX. PHYTOTOMA.

P. Rara. \* Pedibus tetradastylis.

P. tetradactyla grifeo-obscura, remigibus rectricibusque albo maculatis. Phytotoma rara, Ind. Orn. i. 4. 466. 1.—Molin. Chil. (Fr. ed.) p. 234.—Daudin. Orn. ii. p. 366. 1.
Chili Plant-cutter, Gen. Syn. Sup. ii. p. 212.

HABITAT in Chili.

2. P. \*\* Pedibus tridactylis.

Abyssinica. P. tridactyla nigra, capite gula juguloque rubris.

Phytotoma tridactyla, Daudin. Orn. ii. p. 366. 2.

Loxia tridactyla, Ind. Orn. i. p. 397. 93.

Le Guisso Balito, Buf. Ois. iii. p. 471.

Three-toed Grosbeak, Gen. Syn. iii. p. 159.

Abyssinian Plant-cutter, Gen. Syn. Sup. ii. p. 213. tab. 133.

Habitat in Abyssinia, Nubia, magnitudine Coccothraustis: longit. pollic. 6:— caput & collum antice rubra: corpus cum alis & cauda nigrum: bumeri susco-virescentes: testrices alarum majores marginibus albidis: cauda sorsicata: pedes tridactyli susci, digitis 2 anticis, i postico.

In ave a Buffonio descripta caput, collum, & abdominis medium usque

ad criffum, rubra.

#### GENUS XL. MUSCICAPA.

7. M.

auricomis. M. olivacea, vertice corpore fubtus maculaque aurium flavis, per oculos ftriga alba.

Yellow tufted Flycatcher, Gen. Syn. Sup. ii. p. 215. 4.

HABITAT in Nova Hollandia, fatis numerofa.

Supp. II.

H

M. cinerea,

1

2. M.

australis. M. cinerea, corpore subtus & superciliis slavis. Southern Motacilla, White's Voy. tab. p. 239. Southern Flycatcher, Gen. Syn. ii. p. 219. 13.

HABITAT in Nova Hollandia.

3. M.

superciliosa.

M. fusca, abdomine cinerascente, gula rectricibusque ferrugineis, superciliis albis.

Muscicapa superciliosa, Mus. Carls. iv. tab. 96. Supercilious Flycatcher, Gen. Syn. Sup. ii. p. 220. 14.

Magnitudo Turdi minoris: rectrices 2 intermediæ fuscæ, reliquæ ferrugineæ apicibus suscis.

4. M.

Meloxan- M. cinerea subtus slava, vertice alis caudaque nigris, rectricibus apice tha.

Muscicapa Meloxantha, Mus. Carls. iv. tab. 97. Biack-crowned Flycatcher, Gen. Syn. Sup. ii. p. 220. 15.

PARVA species: tectrices alarum & remiges marginibus slavis: caput superius nigrum.

5. M.

rusisfrons. M. fusca, fronte dorso basique caudæ rusis, remigibus nigris, auribus pectoreque nigro maculatis.

Rusous-fronted Flycatcher, Gen. Syn. Sup. ii. p. 220. 16.

HABITAT in Nova Wallia Australi: magnitudo Luscinia: cauda elongata, subcuneisormis.

M.

gastra.

M. olivacea, gula alba, pectore abdomineque coccineis, fronte nigra, remigibus rectricibusque albo nigroque dimidiatis.

Crimson-bellied Flycatcher, Gen. Syn. Sup. ii. p. 221. 17. tab. 134.

HABITAT in Nova Hollandia: 5 1/2. poll. longa:-rostrum & pedes suscessentes.

. M. fusca

7. M.

barbata. M. fusca subtus alba, vertice maculaque gulari nigris. Black-cheeked Flycatcher, Gen. Syn. Sup. ii. p. 221. 18.

HABITAT cum priore: remiges margine flavescentes; cauda elongata.

8. M.

mystacea. M. virens subtus slava, tænia a rictu oris sub oculis nigra. Mustachoe Flycatcher, Gen. Syn. Sup. ii. p. 221. 19.

Habitat in Nova Hollandia: 8-9. poll. longa: rostrum gracile & pedes nigri: lingua apice laciniata.

9. M.

rhodop- M. fubcristata susta fusca subtus alba, remigibus medio rectricibusque a basi ultra medium roseis.

Rose-winged Flycatcher, Gen. Syn. Sup, ii. p. 222. 20.

HABITAT in Nova Hollandia: magnitudo Luscinia: occiput postice subcristatum maculis nigris.

10. M.

crepitans. M. cristata atro-cinerea, cauda subcuneisormi, gula striis transversis albis. Coach-whip Flycatcher, Gen. Syn. Sup. ii. p. 222. 21.

Hавітат in Nova Hollandia: magnitudo Turdi: rostrum nigrum: irides cæruleæ.

11. M.

pectoralis. M. flavo-virescens subtus flava, capite lateribus colli sasciaque pectoris nigris, gula juguloque albis.

Black-breasted Flycatcher, Gen. Syn. Sup. ii. p. 222. 22.

HABITAT in Nova Hollandia: ultra 8 poll. longa: - tecirices alarum' margine flavæ: cauda nigra apice flavo.

12. M.

cucullata. M. nigra fubtus alba, remigibus albo marginatis, rostro capiteque nigris.

Hooded Flycatcher, Gen. Syn. Sup. ii. p. 223. 23

HABITAT in Nova Hollandia: caput tumidiusculum.

H 2

M. fusca

13. M.

rhodogas- M. susca subtus pallida, pectore roseo, tectricibus alarum albido margitra. natis.

Rose-breasted Flycatcher, Gen. Syn. Sup. ii. p. 223: 24.

HABITAT in Nova Hollandia: rostrum elongatum.

14. M.

flavigastra. M. cinerascens subtus flava, remigibus rectricibusque obscuris. Grey Flycatcher, Gen. Syn. Sup. ii. 223. 25.

HABITAT in Nova Hollandia.

15. M.

malachura. M. fusca subtus ferruginea, gula cærulea, cauda longa cuneata rectricibus pinnulis disjunctis.

Soft-tailed Flycatcher, Lin. Trans. iv. p. 240. pl. 21.—Gen. Syn. Sup. ii. p. 224. 26.

HABITAT in Nova Hollandia arundinetis: 7 poll. longa: gula femina & junioris avis cum pettore ferruginea.

16. M.

melanocephala.

M. capite colloque nigris, dorso sulvo, corpore subtus albo maculis nigris, alis caudaque suscis.

Orange-rumped Flycatcher, Gen. Syn. Sup. ii. p. 225. 27.

HABITAT in Nova Hollandia: caput & collum tumidiuscula: caudam frequenter gerit expansam erectam.

17. M.

cochinfi- M. olivaceo-fusca subtus rusescens, cauda cuneata, rectricibus tribus exnensis. terioribus apice albo nigroque maculatis.

Cochin Flycatcher, Gen. Syn. Sup. ii. Add. p. 374.

HABITAT in Cochin Sina: long. poll. 42.:-rostrum fuscum: pedes pallidi.

## GENUS XLI. A L A U D A.

1. A.

Gorensis. A. nigro-maculata ferrugineo-fusca subtus ferruginea, abdomine albo, cauda nigricante, rectricibus extimis oblique albis.

Ferruginous Lark, Gen. Syn. Sup. ii. p. 229.

## GENUS XLII. MOTACILLA.

1. M.

atricapilla. M. fusco-rubra subtus alba, vertice remigibusque nigris, rectricibus fuscis flavescente dimidiatis.

Black-crowned Wagtail, Gen. Syn. Sup. ii. p. 231. 4.

HABITAT in Nova Hollandia, magnitudine M. alba: rostrum & pedes slavi.

2. M.

cærulef- M. pallide cærulea, fubtus flavescens, alula alba, remigibus rectricibuscens. que nigris.

New Holland Wagtail, Gen. Syn. Sup. ii. p. 232. 5.

HABITAT in Nova Hollandia, magnitudine M. Boarula.

# GENUS XLIÌI. SYLVIA.

S.
fylvico!2.

S. virescens subtus slavescens, superciliis luteis, abdomine crissoque niveis.

Motacilla Sibilatrix, Naturf. xxvii. p. 47.4.

Regulus non cristatus major, Bris. Orn. iii. p. 482. A.—Ind. Orn. ii. p. 550. S.—Will. Orn. p. 164.—Ray's Letters, p. 108. Gen. Syn. iv. p. 514. E.

Larger Yellow Wren, White's Selb. p. 55.

Wood Wren, Lin. Trans. ii. p. 245. pl. 24.—Id. iv. p. 35.—Gen. Syn. Sup. ii. p. 237. 6.

HABITAT

Habitat in Europa, Anglia: 5½ poll. longa: rostrum corneum: irides avellaneæ: excelsos arbores frequentat: nidificat in terra, ova ponens alba maculis minutis ferrugineis.

2. S.

anilis. S. fuscescens subtus albida, crisso slavo, iridibus rubris. Yellow-vented Warbler, Gen. Syn. Sup. ii. p. 247. 28.

HABITAT in Nova Hollandia: rostrum & pedes susci.

3• S:

fagittata. S. nigro fagittato-striata, corpore supra susce fusion ftriis albis, per oculos vitta ferruginea.

Streaked Warbler, Gen. Syn. Sup. ii. p. 247. 29.

HABITAT in Nova Hollandia, egregie cantillans: magnitudo S. mo-dularis.

4. S.

inornata. S. flavo-susception fubtus flava, remigibus nigris, cauda apice pallida. Terrene Warbler, Gen. Syn. Sup. ii. p. 248. 30.

HABITAT in Nova Hollandia.

5. S.

chrysops. S. ruso-susca subtus alba, genis nigris, sub oculis striga slava. Black-cheeked Warbler. Gen. Syn. Sup. ii. p. 248. 31.

HABITAT in Nova Hollandia, magnitudine Passeris: lingua apice laciniata.

6. S.

rusiventris. S. cinereo-susca, abdomine ruso, jugulo albo, lunula pectoris cærulea. Rusous-vented Warbler, Gen. Eyn. Sup. ii. p. 248. 32.

Habitat in Nova Hollandia, præcedente paulo major.

7· S.

flavigastra. S. cinereo-susca, corpore subtus uropygioque flavo, loris nigris. Gold-bellied Warbler, Gen. Syn. Sup. ii. p. 249. 33.

Habitat cum præcedente.

+-

S. cinereo-

8. S.

rubricata. S. cinereo-susca subtus toto serrugineo-rubra, alis caudaque suscis. Ruddy Warbler, Gen. Syn. Sup. ii. p. 249. 34.

HABITAT in Nova Hollandia: rostrum gracile: pedes slavi: irides avellaneæ.

9. S.

casta. S. fusco-ferruginea subtus flavescens, pectore cæruleo-nebuloso, superciliis obscuris.

Chaste Warbler, Gen. Syn. Sup. ii. p. 249. 35.

HABITAT in Nova Hollandia, magnitudine Rubeculæ.

10. S.

leucophæa. S. fusca subtus albo-cærulescens, macula remigum rectricibusque (2 intermediis exceptis) albis.

White-tailed Warbler, Gen. Syn. Sup. ii. p. 249, 36.

HABITAT in Nova Hollandia.

11. S.

rubricollis. S. cærulea fubtus alba, jugulo pectoreque coccineo-rubris. Crimfon-breafted Warbler, Gen. Syn. Sup. ii. p. 250. 37.

HABITAT in Nova Hollandia.

12. S.

lateralis. S. grifeo-cærulescens subtus albida, alis uropygio rectricibusque lateralibus viridibus, loris nigris.

Rusty-sided Warbler, Gen. Syn. Sup. ii. p. 250. 38.

HABITAT in Nova Hollandia, parva species magnitudine Troglodytis: latera corporis ferruginea.

13. S.

hirundina- S. corpore fupra nigro, jugulo pectoreque coccineis, abdomine albo striga cea. longitudinali nigra, crisso sulvo.

Motacilla hyrundinacea, Nat. Misc. iv. pl. 114. Swallow Warbler, Gen. Syn. Sup. ii. p. 250. 39.

HABITAT

HABITAT in Nova Hollandia, magnitudine præcedentis, cujus forte varietas.

14. S.

versicolo- S. suscendences substantial description of the substantial substant

HABITAT in Nova Hollandia.

flammea. S. supra slammea subtus grisea, alis caudaque nigris. Motacilla slammea, Mus. Carls. iv. tab. 98. Flame-coloured Warbler, Gen. Syn. Sup. ii. p. 251. 41.

HABITAT in Palmis Java, magnitudine Reguli: rostrum & pedes nigri.

16. S.

Pusilla. S. susca subtus pallida, cauda prope apicem sascia susca. Motacilla Pusilla, White's Journ. pl. in p. 257. Dwarf Warbler, Gen. Syn. Sup. ii. p. 251. 42.

HABITAT in Nova Hollandia, magnitudine & habitu S. cyanea, cui valde affinis.

## GENUS XLIV. PIPRA.

т. Р.

punctata. P. grifea fusco undulata, vertice alisque nigris albo punctatis, tectricibus caudæ rubris.

Speckled Manakin, Nat. Misc. t. 111. - Gen. Syn. Sup. ii. p. 253. 4.

Habitat in Nova Hollandia, magnitudine congenerum: pettus rubescens: per oculos vitta albida.

2. P.

fuperciliofa. = P. castaneo-rusa subtus slavescens, superciliis albidis supra nigro marginatis, rectricibus albo maculatis. Supercilious Manakin, Gen. Syn. Sup. ii. p. 253. 5.

HABITAT

الم الم

HABITAT in Nova Hollandia: cauda brevis nigra, rettricibus 2 intermediis latere, lateralibus apice albis.

P: cærulea.

P. fupra cærulea fubtus flavescens, vertice remigibus caudaque nigricantibus.

Cærulean Manakin, Gen. Syn. Sup. ii. p. 254. 6.

MAGNITUDO præcedentis: rostrum & pedes susci.

4. P.

caudata. P. cærulea, vertice subcristato coccineo, alis nigris, rectricibus 2 intermediis elongato-acuminatis.

Long-tailed Manakin, Nat. Misc. pl. 153 .- Gen. Syn. Sup. ii. p. 254. 7.

HABITAT in America Meridionali, magnitudine & forma P. Pareola: latera colli & caudæ viridi-splendentia: rostrum suscum: pedes pallidi.

5. P.

gularis. P. nigro-cærulea subtus coccinea, abdomine albo. Crimson-throated Manakin, Gen. Syn. Sup. ii. p. 254. 8.

Habitat in insulis Maris Pacifici, Huabeine: magnitudo Pipræ erythrocephalæ: rostrum pallidum: pedes obscuri.

6. P.

pectoralis. P. cæruleo-nigra, abdomine ferrugineo, lunula pectoris aurea. Gold-breasted Manakin, Gen. Syn. Sup. ii. Add. p. 374.

HABITAT in Brafilia: long. poll. 4 .: - rostrum & pedes pallidi.

## GENUS XLVI. HIRUNDO.

H.

caudacuta. H. obscura viridi-nitens, fronte gulaque albida, rectricibus apice subu-

Needle-tailed Swallow, Gen. Syn. Sup. ii. p. 259. 3.

HABITAT in Nova Hollandia.

SUPP. II.

1

H. obscura

2. H.

pacifica. H. obscura, gula & uropygio cæruleo-albidis, rectricibus apice acutis. New Holland Swallow, Gen. Syn. Sup. ii. p. 259. 4.

HABITAT in Nova Hollandia, præcedenti affinis?

3. H.

javanica. H. nigricans cæruleo nitens subtus cinerascens, fronte gula juguloque ferrugineis, rectricibus lateralibus apice macula alba.

Hirundo javanica, Mus. Carls. iv. t. 100. Javan Swallow, Gen. Syn. Sup. ii. p. 259. 5.

HABITAT in Java: nidificat in terra.

## GENUS XLVII. CAPRIMULGUS.

vittatus. C. albidus, dorso cæruleo nebuloso, vertice sasciaque nuchæ nigris, remigibus rectricibusque serrugineo-suscis.

Banded Goatsucker, Gen. Syn. Sup. ii. p. 262. 3. pl. 136.

HABITAT in Nova Hollandia.

2. C.

ftrigoides. C. ferrugineo-fuscus, supra striis maculisque obscuris, subtus lineis suscis, fasciis tectricum tribus pallidis, superciliis albis.

Strigoid Goatsucker, Gen. Syn. Sup. ii. p. 262. 4.

HABITAT in Nova Hollandia.

C. negacephalus.

C. cinereus maculis striisque pallidis, abdomine ferrugineo, remigibus rectricibusque albo maculatis.

Great-headed Goatsucker, Gen. Syn. Sup. ii. p. 263, 5.

HABITAT in Nova Hollandia.

4. C. gracilis.

C. cinereo fusco alboque varius, subtus albidus striis maculisque serrugineo-slavis, cauda elongata.

Gracile Goatsucker, Gen. Syn. Sup. ii. p. 263. 6.

HABITAT

HABITAT in Nova Hollandia: corpus gracile: rostrum validum: irides & pedes slavi.

Ç.

forficatus. C. cauda forficata, corpore nigro fusco ruso alboque vario, mandibula superiore medio crenata.

Engoulevent à queue fourchue, Levaill. Oif i. p. 178. pl. 47. 48. Fork-tailed Goatsucker, Gen. Syn. Sup. ii. p. 264. 7.

Habitat in Africa, magnitudine Strigis ululæ: longit. poll. 26.:— rielus amplissimus: cauda valde cuneiformis: rostrum nigrum: pedes stavi.

6. C.

macrodip- C. grifeo varius, alis rufo fuscoque maculatis, penna utrinque humerali terus. denudata longissima.

Caprimulgus macrodipterus, Afzel. Descr. Sierr. Leon. tab. in ditto. Leona Goatsucker, Nat. Misc. pl. 265.—Gen. Syn. Sup. ii. p. 264. 8.

HABITAT in Africa, magnitudine C. europei.

# ORDO IV. COLUMBÆ.

## GENUS XLVIII. COLUMBA.

r. C.

melano- C. viridi-nigricans, subtus alba maculis nigris, vertice cinereo, pone leuca. oculos macula triquetra rubra.

White-faced Pigeon, Gen. Syn. Sup. ii. p. 268. 4.

HABITAT in Nova Hollandia, Turture major: facies ultra oculos alba ante oculos macula nigra, pone oculos macula rubra.

2. C.

picata. C. albo nigroque varia, facie alba, abdomine albo maculis nigris, cauda apice alba.

Pied Pigeon, Gen. Syn. Sup. ii. p. 268. 5.

Habitat cum præcedente, cujus orte varietas.

1 2

C. olivaceo-

3. C.

Abyffinica. C. olivaceo-viridis, abdomine flavo, macula alarum purpurea, femoribus albis nigro maculatis.

Waalia Pigeon, Bruce's Trav. iv. p. 282. 290.—Id. App. tab. p. 186. —Gen. Syn. Sup. ii. p. 269. 6.

HABITAT in Abyssinia, Waalia, magnitudine domestica, affinis C. Pompadora.

4. C.

meridio- C. rubro-fusca, tectricibus alarum minoribus purpureo-nigris, rectricibus lateralibus apice albis.

Southern Pigeon, Gen. Syn. Sup. ii. p. 270. 7.

Habitat in Nova Hollandia, magnitudine Turturis: cauda brevis cuneiformis, restricibus 2 intermediis nigro-fuscis, fascia versus apicem nigra.

ζ. C.

pallida. C. albo-virescens, capite cinerascente, remigibus minoribus nigro maculatis, rectricibus lateralibus apice albis.

Pale Pigeon, Gen. Syn. Sup. ii. p. 270. 8.

HABITAT in Nova Hollandia.

6. C.

Norfolci- C. atro-purpurea, capite colloque albis, abdomine remigibusque nigris.

Mas.

C. fusco-purpurea, dorso viridi, capite collo pectoreque ferrugineis. Femina.

Norfolk Pigeon, Gen. Syn. Sup. ii. Add. p. 374.

HABITAT in insula Norfolk Maris Australis: long. poll. 14.: rostrum nigrum: pedes rubri.

7. C.

spadicea. C. capite colloque viridi-aureo rubentibus, humeris spadiceis, dorso alisque cærulescentibus, abdomine albo.

Chesnut-shouldered Pigeon, Gen. Syn. Sup. ii. Add. p. 375.

Habitat cum præcedente: long. poll. 20.:-rostrum & pedes rubri.

5

C. cauda

8. C.

cuneata. C. cauda cuneata fuscescens, alis albo maculatis, capite collo pectoreque pallide grifeis.

Grey-necked Pigeon, Gen. Syn. Sup. ii. Add. p. 375.

HABITAT in Nova Hollandia: long. poll. 8 .: - cauda valde cuneiformis, restricibus apice acutis, 2 intermediis griseis, reliquis ultima medietate albis.

## GENUS LIII\*. MENURA.

Rostrum validum, conico-convexum, basi nudiusculum. Nares ovatæ medio rostri.

Rectrices elongatæ pinnulis distinctis, intermediæ duæ longiores angustæ, exteriores ad apicem patulæ revolutæ. Pedes robusti, ambulatorii.

T. M.

N. Hollan- New Holland Menura, Gen. Syn. Sup. ii. p. 271 \*. rab. 136 \*. diæ.

HABITAT in Nova Hollandia, a rostro ad apicem rectricum long. ped. 3 1.: - rostrum basi nudiusculum nigrum, corpus ruso suscum subtus cinerascens: gula rusa: rectrices prælongæ, scapis a bast ad medium binis, pinnulis disjunctis distantibus; intermediæ 2 angustæ albidæ longissimæ; exteriores basi modicæ, versus apicem revolutæ, pinnulis interioribus multo ladoribus lunulis diaphanis ferrugineis, apice nigræ: pedes validi, obscure nigri, unguibus modice incurvatis.

Femina minor, capite lævi, 35 poll. longa: color totius avis fuscus:

cauda cuneiformis, restricibus pinnulis conjunctis.

## GENUS LIV. PHASIANUS.

I. Ph. ignitus.

Ph. niger chalybeo-nitens, lateribus corporis rufis, dorso imo igneo-ferrugineo, rectricibus intermediis fubfulvis.

Fire-backed Pheasant, Emb. to China, i. p. 246. tab. 13.—Nat. Misc. tab. 321. - Gen. Syn. Sup. ii. p. 274. 2.

HABITAT in Java? magnitudine Galli; pedes calcari valido acuto instructi: caput postice subcristatum.

GENUS

## GENUS LVII. PERDIX.

### GENUS LXVI. MYCTERIA.

M.

australis. M. alba, capite colloque viridi-nigris; tectricibus pennis scapularibus caudaque nigris, rostro nigro, pedibus rubris.

Mycteria australis, Linn. Trans. v. p. 34. No. 2.

New Holland Jabiru, Gen. Syn. Sup. ii. p. 294. pl. 138.

Habitat in Nova Hollandia: longitudo ab apice rostri ad extremos ungues pedes sex: gula nudiuscula, rubra.

2. M.

Senegalen- M. alba, rostro apicem versus rubro, basin versus albido sascia nigra,
sis. macula utrinque senestrata.
Mycteria Senegalensis, Linn. Trans. v. p. 32. tab. 3. (caput.)

Senegal Jabiru, Gen. Syn. Sup. ii. p. 296. 3.

HABITAT in Senegala, magnitudine australem paulo excedens: corpus album: caput, collum, pennæ scapulares, & pedes nigra.

## GENUS LXIX. A R D E A.

A.

maculata. A. fuscescens subtus albida, dorso maculis albis, remigibus subferrugineis.

Spotted Heron, Gen. Syn. Sup. ii. p. 305. 19.

HABITAT in Nova Hollandia: Ratura A. minuta.

A. corpore

2. A.

I.

J.

pacifica. A. corpore supra obscuro viridi & cupreo splendente subtus albido, capite colloque albidis.

Pacific Heron, Gen. Syn. Sup. ii. p. 305. 20.

HABITAT in Nova Hollandia.

## GENUS LXXI. NUMENIUS.

N. vociferus. N. plumbeus albo maculatus, cauda cuneata, rectricibus extimis albis. Ephouskyca, Crying Eird, Bart. Trav. p. 145. 291. Crying Curlew, Gen. Syn. Sup. ii. p. 306. 2.

HABITAT in Georgia Americana, magnitudine Gallina.

# GENUS LXXII. SCOLOPAX.

S. australis. S. corpore scolopacino, cervice nebulosa, genis & collo albidis, lateribus corporis maculis lunatis susciss.

New Holland Snipe, Gen. Syn. Sup. ii. p. 310.

HABITAT in Nova Hollandia.

# GENUS LXXIII. TRINGA.

T. canadensis. T. cinereo-obscura, jugulo cinerascente, abdomine albo lateribus meculato, pedibus flavis.

Quebec Sandpiper, Gen. Syn. Sup. ii. p. 313. 7.

Juence Sandpiper, dem sym super in Fr 3.3. 7.

HABITAT in Canada: magnitudo Turdi musici.

T. lobata.

f.

T. carunculata armata olivaceo-ferruginea subtus alba, vertice nigro, remigibus rectricibusque nigris.

Wattled Sandpiper, Gen. Syn. Sup. ii. p. 313. 8.

SUPP. II.

K

HABITAT

Habitat in Nova Hollandia: 19 pollices longa: rostrum pallidum: pedes obscuri segmentis roseis: semora rosea: ad slexuram ala spina stava.

T.

T. ferrugineo-cinerea lineis transversis albidis, subtus nebulosa pallida, sugerciliis albis, macula aurium susca.

Brown-eared Sandpiper, Gen. Syn. Sup. ii. p. 314.

HABITAT in Nova Hollandia.

## GENUS LXXIV. CHARADRIUS.

i. C. Cantianu

Cantianus. C. fuscus, fronte collari abdomineque albis, vitta per oculos lateralibusque pectoris nigris.

Kentish Plover, Gen. Syn. Sup. ii. p. 316. 3.

HABITAT in Europa, Anglia, magnitudine & facie Ch. Hiaticula, at distincta avis: vertex susco-ferrugineus: rostrum & pedes nigri.

2. C.

magnirof- C. rostro dilatato, corpore nigro striato supra cærulescente subtus cinetris. rascente, macula remigum alba. Great-billed Plover, Gen. Syn. Sup. ii. p. 319. 8.

HABITAT in Nova Hollandia, magnitudine Ch. Pluvialis; rostrum validum, latum, nigrum: pedes cærulei: frons & vertex maculis minutis nigricantibus.

*3*⋅ C.

Grallarius. C. cærulescens nigro striatus, subtus albus striis suscis, macula aurium susci, pedibus longissimis.

High-legged Plover, Gen. Syn. Sup. ii. p. 319. 9.

HABITAT in Nova Hollandia: rostrum nigrum: pedes cærulescentes.

4. C.

fuscus. C. nebulosus supra suscus subtus albus, cauda nigra maculis albis. Brown Plover, Gen. Syn. Sup. ii. p. 320. 10.

HABITAT in Nova Hollandia: rostrum nigrum: pedes plumbei.
C. suscus

5. C.

griseus. C. fuscus subtus albus, vertice nigro, alis albo maculatis. Grisled Plover, Gen. Syn. sup. ii. p. 320. 11.

HABITAT in Nova Hollandia: rosirum obscurum: pedes cærules-centes.

6. C.

frænatus. C. cærulescens fusco striatus, abdomine albo, lateribus colli vitta lata obscura.

Bridled Plover, Gen. Syn. Sup. ii. p. 320. 12.

HABITAT in Nova Hollandia: rostrum cærulescens: pedes slavi.

7. C

Africanus. C. cinerafcens, capite fasciaque pectoris viridibus, corpore subtus vittaque annulari verticis albidis.

Green-headed Plover, Gen. Syn. Sup. ii. p. 320. 13.

Habitat in Egypto: habitus Ch. melanocephali: longitudo 8 pollicum: testrices alarum majores albæ: restrices prope apicem fascia nigra.

## GENUS LXXIX\*. CEREOPSIS.

Rostrum breve, convexum, apice declive.

Nares cera tectæ.

Caput totum cera rugosa obtectum, ad slexuram alæ calcar obtusum.

Pedes tetradactyli fissi, femoribus seminudis, digito postico brevissimo.

I. C.

N, Hol- New Holland Cereopsis, Gen. Syn. Sup. ii. p. 325. tab. 138\*.

Habitat in Nova Hollandia, magnitudine Anseris: long. poll. 39.:

—rostrum nigrum: caput totum ultra aures cera, seu cute rugosa, tectum: plume totius corporis cinereo-griseæ, subtus dilutius, maculis aliquot tectricum nigris: cauda rotundata restricibus 16: pedes & femora K 2 seminuda

feminuda fulva, tarsis & digitis nigris: digito exteriore basi membrana medio connexo, postico breviore vix terram attingente.

## GENUS LXXX. GALLINULA.

I. G. poliocephala.

G. purpurea fubtus viridis, capite grifeo-cærulescente, remigibus caudaque cæruleis, crisso albo.

Grey-headed Water Hen, Gen. Syn. Sap. ii. Add. p. 375.

HABITAT in India: rostrum validum rubrum ut in Porphyrione, cui nimis affinis: pedes rubri.

2. G. carienfis.

madagaf- G. purpureo-fusca subtus cærulea, capite griseo-cærulescente, gula pectore humerisque viridibus.

Grey-headed Water Hen, Gen. Syn. Sup. ii. Add. p. 375:

HABITAT in Madagascaria: an sexus alter præcedentis: rostrum & pedes rubri.

## GENUS XCIV. L A R U S.

1. L. pacificus. L. fuscus, pectore uropygioque albidis, rostro fulvo prope apicem nigro. Pacific Gull, Gen. Syn. Sup. ii. p. 332. 2.

HABITAT in Nova Hollandia.

2. L. Pulocondor.

L. cinereo-fuscus subtus albus, occipite nigro, fronte cinerea, pedibus

Pulo-Condor Gull, Gen. Syn. Sup. ii. p. 332. 3.

Habitat in Mari Sinensi.

## GENUS XCVII. AN AS.

A.

melano- A. alba, capite collo alis cauda femoribusque nigris. leuca. Black and White Goose, Gen. Syn. Sup. ii. p 344.

HABITAT in Nova Hollandia: avis speciosa: rostrum sulvum cera slava, ultra oculos protensa, obtectum: pedes elongati slavi, digitis vix ultra medium membrana connexis, sere ut in A. Semipalmata.

A. femipal-mata.

A. grifea, capite collo femoribufque fusco-nigris, collari uropygio corporeque fubtus albis, pedibus femipalmatis.

Anas semipalmata, Linn. Trans. iv. p. 103. vi.

Semipalmated Goose, Gen. Syn. Sup. ii. p 347. pl. 139.

Habitat in Nova Hollandia, magnitudine Anseris: rostrum suscum: pedes rubri: trachea longissima circumvoluta pectus insternens, cute solum tecta: arboribus frequenter considet & sibilans uti A. Penelope & arborea.

3. A. iubata.

A. fubcristata grisea, capite colloque ferrugineis, pectore undulato, abdomine crissoque nigris.

Hawksbury Duck, Gen. Syn. Sup. ii. p. 358. tab. in titulo.

Habitat in Nova Hollandia: pollices 17—18. æquans: rostrum & pedes nigri: latera abdominis nigro pulchre transversim lineata: pennæ pectoris maculis parvis nigris: speculum viride anterius & posterius album.

A. membranacea.

A. ferrugineo-fusca subtus alba transversim lineata, superciliis ferrugineis, rostro apice membranaceo.

New Holland Duck, Gen. Syn. Sup. ii. p. 359. 36.

HABITAT in Nova Hollandia: 19 pollices longa: rostrum nigrum, apice dilatatum, membranaceum: regio oculorum & verten cum cervice obscura.

A. tectricibus

5. A.

Rhyncho- A. tectricibus alarum cæruleis, corpore griseo, crisso nigro, pedibus paltis. lidis.

New Holland Shoveler, Gen. Syn. Sup. ii. p. 359. 37.

HABITAT in Nova Hollandia: rostrum apice dilatatum ut in A. discorde; an ejustem varietas?

## GENUS XCIX. PELECANUS.

P.
finenfis.

P. fuscus, gula alba, corpore subtus albido maculis suscis, cauda rotundata.

Leu-tze, Emb. to China, ii. p. 388. 412. tab. 72.—Id. 389. tab. ad imum.

Chinese Corvorant, Gen. Syn. Sup. ii. p. 364. 3.

Habitat in Sina numerosissimus, ad piscium prædam adhibitus: rostrum slavum: irides cæruleæ: cauda restricibus 12: pedes nigricantes.
