## The Improvement of Land

THE proper preparation of land so as to insure maximum crops is a weighty problem with most farmers and gardeners, if we can judge from the number of requests that come in daily for information on this subject.

To prepare old worn-out soils that have been allowed to get into a hard, poor, weedy condition, for a Vegetable Garden, it is necessary to get the soil mellow, well enriched with decayed vegetable matter and wellrotted barnyard manure, and clear of weeds.

The ground should be plowed as early in spring as it can be worked, putting in about one ton of burnt lime to the acre. Harrow and pulverize, giving the soil a thorough working to get it as fine as possible. Sow  $1\frac{1}{2}$ bushels Canadian field peas and 3 bushels oats to the acre. Late in June or early in July this crop should be plowed under, applying thirty or forty loads of coarse, well-rotted barnyard manure, well worked in, and sow 2 bushels of buckwheat and rye and 20 lbs. crimson clover to the acre, or  $2\frac{1}{2}$ bushels cowpeas to the acre. If buckwheat, rye and clover are used, let the buckwheat die down when frost comes and plow all under early next spring —if cowpeas are sown, turn them under in September and apply a ton of unleached hardwood ashes to the acre and sow 2 bushels rye to the acre, and in spring apply another thirty or forty loads of well-rotted barnyard manure plowing under as soon as dry enough.

In place of the June or July sowing of cereals mentioned above, the oats and peas may be followed with white beans, planted in hills, cultivated both ways and hoed. In September sow rye among the beans and in spring plow all under; another half ton of lime can be used to advantage, and the cultivating and hoeing will clean out the weeds and give a cleaner garden. This soil, if thoroughly plowed and harrowed, should be mellow and rich enough to grow any kind of vegetables,

Another plan would be to plow the ground as deeply as possible in fall. Harrow and pulverize, to make it friable and easy to work. Apply as a top dressing 50 bushels air-slaked lime and sow to rye, 2 bushels to the acre. Apply thirty or forty loads of coarse barnyard manure early in spring, and plow all under about the middle of June, then sow cowpeas,  $2\frac{1}{2}$  bushels to the acre, and harrow or cultivate them in. About the end of September turn the cowpeas under, applying one ton of unleached hardwood ashes and again sow to rye. Next spring apply forty loads of well-rotted barnyard manure and plow all under as soon as dry enough.

In order to renovate ground used as a Vegetable Garden that has been run down, as soon as frost comes the ground should be plowed, applying a liberal quantity of sheep manure, working it well in, then sow winter rye, 2 bushels to the acre. In early spring this should be plowed well under, applying our Complete Manure at the rate of 1200 to 1500 lbs. per acrethis will give a good foundation for the new garden.

# J. M. THORBURN & CO.

N presenting this our 116th successive annual Catalogue, we have to thank our innumerable customers and friends for their patronage in the past, which we trust will continue in the future to our mutual advantage.

Our Seeds hold the record for being always *Reliable*. Over a century in business means something—and it does much to emphasize the reliability of our goods. The Thorburn experience—the Thorburn knowledge of what's what in seeds—the Thorburn reputation for fair dealing—these are your safeguards in buying.

Our catalogue has always received a considerable amount of study. The cultural directions and descriptions therein are concise and to the point. You can make up your order from its pages with entire confidence in the exceptional quality of the products we are offering.

We would suggest that your order be made up as soon after the receipt of this catalogue as possible. It will help us to ship promptly, and it will help you by giving you your goods just when you want them. Placing orders late sometimes makes delays unavoidable.

The difficulties and delays in obtaining supplies from our European Growers, as well as the shortage of many crops, both abroad and in our own country, make it more important than ever that orders should be placed as early as possible this year. We have the facilities for handling a vast amount of business, and your orders will receive the most prompt attention regardless of when they come.

Owing to the conditions at present prevailing in Europe, some kinds of seeds may be late in reaching us this season. It also sometimes happens that certain articles are not ready when the bulk of the goods ordered is shipped. In such cases, rather than hold back the whole order, we send what is ready and keep a memorandum of what is to follow when available. Customers would, therefore, in such cases, do well to await our advice or invoices before writing in regard to items not sent them.

If there is any information you want that is not given in this catalogue, write us about it. We will give all inquiries our careful attention.

May we have the pleasure of filling your order?

WE ASK THAT YOU READ THE NEXT PAGE BEFORE SENDING IN YOUR ORDER

	FENTS see pages 159 and 160.

#### **ORDERS**

Orders should be written on our order sheet or on a blank sheet separate from letter, preferably in ink, and, to receive prompt attention, should be directed to the firm and not to individuals. Orders from new customers should be accompanied by a remittance in the form of a Post-Office or Express Money Order, Bank Check or Bank Bills.

#### PRICES

The prices quoted are net, and do NOT in-clude free transit, EXCEPT FOR SEEDS IN PACKETS, OUNCES or QUARTER-POUNDS, on which WE pay postage or expressage any-where in the U. S.

#### SEEDS BY MAIL OR EXPRESS

If wanted by mail in the United States, add postage according to zone rate, as per table at foot; except for seeds ordered by the packet, ounce or quarter pound, which we mail free. By special arrangement with the express companies, we can ship seeds and bulbs at a reduction of about 25 per cent from the regular rates. In view of the greater safety, it will be found best to send parcels of 15 lbs. or over by express, as packages are apt to get crushed in the mail. Unless otherwise instructed, we send orders from persons unknown to us C. O. D.

### NAME, ADDRESS, ETC.

We beg our correspondents to give us on each order the correct name and address; also to indicate very precisely the means of carriage which they prefer-mail, express or freight, and the office or railroad station which best serves their locality. In case these directions are not followed out, or if they are not sufficient, we ourselves shall of course choose the most advantageous and convenient means.

#### CULTURAL DIRECTIONS

These apply to the climate of New York and vicinity. For more nothern and southern localities the necessary changes in time of sowing, etc., will readily suggest themselves to gardeners.

### WARRANTIES

Seeds of best quality will sometimes fail through improper treatment. Thus, a small seed may be sown so deeply that the young plant cannot reach the surface. More failures result from disregard of the conditions necessary to germination than from informity of the and word inferiority of the seeds used.

These conditions are: A proper temperature, sufficient moisture and free access of air. Besides these, the soil must be in proper condition and present no physical obstacle to the growth of the young plant. If heavy rains have compacted the surface of the soil, and the sun has baked it to a hard crust, it will be impossible, even if all other conditions are favorable, for the seedling plants to force their way through it, and many perish from this cause alone.

Seeds differ greatly as to the temperature required for germination. Beets, Cress, Peas, etc., germinate rapidly at a temperature of 45 deg.; but if Melons and other seeds of that family, Bush or Pole Beans, and other plants of sub-tropical origin are sown under the same conditions, they will be apt to de-cay, as for their prompt germination they require a heat of at least 60 deg. For this reason many seeds fail yearly from too early sowing.

The second condition, proper moisture, is likely to be violated by an excess rather than by too small a portion. The proper amount is that which a welldrained soil will naturally hold.

Free access of air is all-important, and this is interfered with by an excess of water in the soil.

In germination, complex chemical changes take place in the seeds, in which the air performs an important part. A portion of the seed is consumed, carbonic acid gas being given off in changing the starch and other constituents of the seed into nutriment to forward the growth of the germ or embryo plant, which depends upon the contents of the seed until it forms roots below ground and leaves above, and is able to sustain itself.

Besides these conditions affecting the germination of the seed, the young plants, after they have made their way to the surface, are liable to various accidents; a sudden current of very cold air, or a con-tinuous drying wind may check their growth or destroy them altogether.

In addition, there are numerous insects, both below and above ground, that may attack the plants, some of them being so small that they often destroy a crop before they are discovered.

We may also mention the well-known tendency of many vegetables to revert to their original types, notwithstanding the care of the seed-grower; the Yellow-Podded Wax Beans becoming green, the Yellow and White Celery becoming more or less green, dwarf Peas becoming running sorts, etc.

J. M. Thorburn & Co. give no warranty, express or implied, as to description, quality, productiveness or any other matter of any seeds, bulbs or plants they send out, and they will not be in any way responsible for the crop. If the purchaser does not accept the goods on these terms, they are at once to be returned.

## Directions for the Cultivation of Vegetables

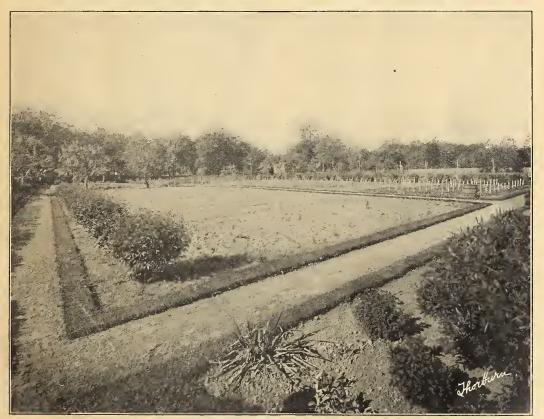

To SECURE a good crop of vegetables, three things are necessary, viz., a suitable soil, pute seed and clean culture. The exposure for a vegetable-garden should be south or southeast, or nearly so. The soil should be naturally rich and friable, a sandy loam being about the best. If the soil be stiff, it should be gradually mellowed by the free use of barnyard manure, or, if convenient, by the addition of sand. If wet, or inclined to hold an excess of moisture, it should be underdrained, preferably by tile, but if possible, a location should be selected naturally dry and free from surface water.

A dark-colored soil, or one supplied with a goodly portion of decayed vegetable matter, will produce the earliest crops. If the soil be shallow, it should be deepened gradually by plowing or spading an inch or two deeper each year, and not all at once by trenching or subsoiling, unless manure and money both be abundant. A sandy soil may be greatly improved by adding vegetable mold from the woods. To produce the best results, the vegetable garden should have at lease one foot of good, rich soil. The roots of large trees should not be allowed to encroach on any part of the garden, though large trees, sufficiently far off, afford a valuable protection on the north and west. Mark the garden off into squares or beds of

Mark the garden off into squares or beds of convenient size, to facilitate the practice of a rotation of crops, which is an important matter. As a rule, never let the same crop or kind of vegetable occupy the same bed or spot two years in succession. Potatoes, Onions and a few other things may form exceptions to this rule. Every year the beds must be warmed up by a liberal coat of manure, which should be thoroughly mixed with the soil. From seeds sown in drills, larger crops from a given surface are grown, and cultivation is simple and comparatively easy. The space between the drills, and other special information, is given in the body of this catalogue; the least distance is named, in order to economize space; it might be increased in some cases to advantage. The ground should be frequently hoed, to kill the weeds and to keep the soil mellow; and the proper time to hoe is just when the weeds appear above the ground.

Much time may be gained by starting certain kinds of plants in a hotbed, or even in a coldframe, the latter being a convenient thing, even on a small place. The hotbed is chiefly intended for raising early Tomatoes, Eggplants, Peppers, Cabbage, Cauliflower, Lettuce, etc., but as all these plants can now be bought cheaply of this company at the proper time, the expense and labor of a hotbed may be dispensed with, especially on small places.

be dispensed with, especially on small places. **To Prepare a Coldframe.**—The coldframe is simply a frame set on the ground, no bottom heat being applied. It is banked up on the outside during the Winter with salt hay, straw or coarse litter. The soil is prepared by forking in and thoroughly mixing to the depth of 10 to 12 inches a liberal quantity of old, well-rotted manure. The manure of an old hotbed is good for the purpose. The frame is prepared in the Fall, and young Cabbage, Cauli-

A Section of Our Trial Grounds

THORBURN & CO., 53 BARCLAY ST., NEW YORK I. M.

flower and Lettuce plants are set out in it in time to get well established before very cold weather. Cauliflower and Cabbage should be set down to the first leaf, and the soil made firm around the plants. The seed is usually sown, in the vicinity of New York, from the 15th to the 20th of September, but the very early kinds some 8 to 10 days later. The young plants will be ready to transplant in about 25 to 30 days. During the cold nights and stormy days, the beds should be closely covered with the sashes, and these further protected by straw mats or shutters. Cauliflower needs more

4

and closer protection than Cabbage, as it is rather more tender. During mild days admit air freely, the object being to keep the plants in a dormant state, without actual freezing, so that when Spring comes they are in a forward state for setting out early crops. Seeds of Cabbage, Cauliflower, Lettuce and Radish may be sown in a coldframe in the Spring from the last week in February to the first week in March. The frame should stand in a warm and sheltered spot, and be kept from freezing by mats or a thick covering of straw during cold nights.

#### laking a Hotbed Directions for M

N the vicinity of New York, from the first to the latter part of March is quite early enough to make a hotbed. The time must vary according to the latitude. Use fresh horse manure, and add to this.

latitude. Use fresh horse manure, and add to this, if possible, one-third to one-half of its bulk of leaves. Mix them thoroughly, tramping down the mass in successive layers, and form into a large pile, so that fermentation will proceed. In two or three days fermentation will be apparent by the escape of steam from the heap. Now turn again, and allow the heap to remain until the second fermentation commences. Make a pit  $2\frac{1}{2}$  feet deep, and of a size suited to the number of plants required. The pit will be better if built up of brick. It should and of a size suited to the number of plants required. The pit will be better if built up of brick. It should be located in a dry, sheltered spot, facing the south or east, if possible. Hotbed sashes are usually 3x6 feet, and one or two sashes will give early plants enough for a small family The frame of the bed should be 18 inches high at the back and 12 inches in front, which will give the proper slope to catch the sunlight. Crosspieces should be placed for the sashes to slide on, to facilitate opening and shutting the frames. When everything is ready, the manure is placed in

the pit and trodden down firmly in layers to the required depth, z to  $2\frac{1}{2}$  feet. Then put on the sashes and keep the pit closed until the heat arises. At first it will probably be 100 deg. or more, which is too hot to sow the seed in; but in two or three days it will subside to go deg. or a little less, when the soil may be put on to the depth of 6 to 8 inches. Try the heat by plunging a

thermometer into the manure. The soil should be of well-rotted sod (or common garden soil will do), mixed with about a third of fine old manure; and in this the seeds may be sown thinly in of the seed-leaf) either thinned out or else transplanted

of the seed-leaf) either thinned out of else transplanted to another frame. Air must be given every mild day by raising the sashes at the back. Water with tepid water whenever necessary, and during cold nights and snow storms keep covered with mats or board shutters. Tomatoes, Peppers and Egg-plants should be sown in a separate frame from Cab-bage, Cauliflower and Lettuce, as they require more heat. Hotbeds may be made on the surface of the ground, if the maura extende a fact under an all cides then the if the manure extends a foot wider on all sides than the frame.

Another Section of Our Trial Grounds

## Novelties and Specialties in Vegetable Seeds

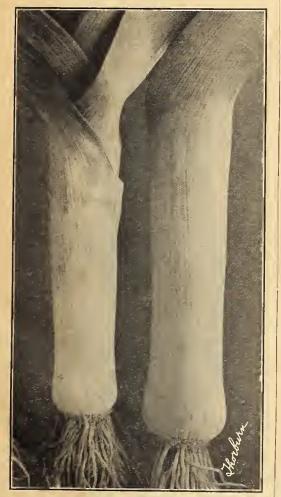

## New Dwarf Green-Podded Snap Bean

**Thorburn's Earliest of All, Long, Round Green Pod, Stringless.** Very early, prolific and of finest quality, also a good forcer. Our trials show this to be the **earliest of all**, as the name we have given it indicates. <sup>1</sup>/<sub>2</sub> pt. pkt. 25 cts. No less quantity sold.

## New Green-Podded Beans

Pale Dun, or Cream Color. A fine, stringless variety.  $\frac{1}{2}$  pt. pkt. 25c.

**Dark Dun.** Liver color and stringless. Pkt. 15 cts., ½ pt. 25 cts.

Thorburn's Model Leek

## Dwarf Green-Podded Bean

Masterpiece (Sutton's). The plant is a robust grower, very prolific, the pods are straight, handsome, very tender, and stringless. Early and well adapted for forcing, an exceptionally fine green, round podded variety. Pt. 50 cts., qt. 85 cts.

#### Thorburn's Gilt-Edge Cauliflower

Best and surest of all. Produces large, heavy, solid, white heads of finest quality. Undoubtedly the best variety. Pkt. 25<sup>2</sup>cts., oz. \$2.50, 1/4 lb. \$9.00.

## Early Jersey Wakefield Cabbage

#### Thorburn's Selected Stock

Undoubtedly the finest strain of this most popular, well-known early Cabbage in cultivation. The heads are extremely solid, pyramidal in shape, with very little outside foliage. Pkt. 10 cts., oz. 30 cts., 1/4 lb. 85 cts., lb. \$3.00.

#### Extra-Early Nordheim Sweet Corn

The earliest Sweet Corn in cultivation. Produces stalks from 6 to 7 feet high, each bearing three or four nearly perfect ears of finest quality. On style of Minnesota, but far exceeding that variety in the deliciousness of its flavor, as well as in earliness and productiveness. Pt. 20 cts., qt. 30 cts., ½ pk. 85 cts., pk. \$1.50.

#### Golden Evergreen Sweet Corn

Late; very sweet, round grains. Pt. 30 cts., qt. 50 cts.,  $\frac{1}{2}$  pk. \$1.65.

## Cucumber, Thorburn's Noroton Selected White Spine

A selection of the Improved White Spine, but earlier, more perfect in shape and more prolific. The best slicing variety we have seen, being solid in flesh, fine-grained, tender and of delicious flavor. Vigorous, healthy grower. A splendid sort for the home garden, and absolutely without an equal for market. Pkt. 10 cts., oz. 15 cts., 1/4 lb. 35 cts., lb. \$1.25.

## Celery, Thorburn's Gilt-Edge Golden Self-Blanching

Golden Self-blanching is the variety of Celery par excellence, and we can recommend our strain with every confidence. The chief characteristics of this sort are its self-blanching qualities and the beautiful waxy yellow appearance of the stalks. It is of compact, heavy growth and produces stalks that are brittle and crisp in the extreme, and hearts that are large and solid. Pkt. 20 cts., oz. \$1.00, ¼ lb. \$3.50, lb. \$12.00.

## Thorburn's Model Leek

Grand exhibition variety of mild, agreeable flavor. The long, thick, pure white stems of immense size are a great improvement on other varieties. Pkt. 15 cts.

6

Pimiento Pepper

## Thorburn's Big Boston Lettuce, Improved

Our strain of this well-known and most popular sort is without doubt the finest in existence. It is too well known to require any lengthy description. It is sufficient to say that it is equally valuable for growing in greenhouses for Winter use, in frames for Spring, or for sowing the seed in the open ground for use in Summer and Fall. It is unequaled by any other variety for crispness and tenderness; produces large, solid heads with few outside leaves, and stands long before running to seed. See illustration of a head of Big Boston Lettuce, Improved, on page 31. Pkt. 5 cts., oz. 15 cts., 1/4 lb. 35 cts., lb. \$1.25.

## Egyptian Deity Muskmelon

A new Melon of Casaba type, from South Africa, said to be very fine quality. 20 cts. per oz. (See page 33.)

## Pea, Quite Content

A giant-podded, second early Pea, the pods mostly grow in pairs and are quite distinct from all other Peas. The pods are well filled with large, round peas of excellent flavor, very prolific, a stout, robust grower, height about 5 feet. It has been pronounced by experts to be the finest largest, second early Pea. Pt. 30 cts., qt. 50 cts.

### Pepper Pimiento, dulce

The mildest of all Peppers. This new sweet Pepper has a flavor unknown to Peppers, absolutely free of the pungent flavor that so many consider undesirable. It has a thick, firm flesh which permits its being scalded and peeled; when fully ripe, the fruits are brilliant scarlet. Should be in every family garden. Pkt. 10 cts., oz. 50 cts.

### Tomato "Noroton Forcing"

This new variety will be found to be valuable for the market gardener, as well as for private gardens. Color bright crimson, of uniform size, averaging about six to a pound. Solid, very prolific and of perfect form. Pkt. 15 cts., oz. 40 cts.,  $\frac{1}{4}$  lb. \$1.25, lb. \$4.00.

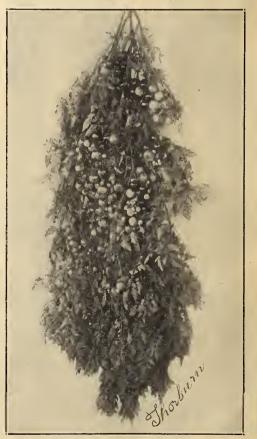

## Tomato—Thorburn's Improved Early Cluster

A valuable new variety, color bright scarlet, grows in bunches like grapes, each plant producing 100 to 150 Tomatoes of excellent quality. Pkt. 15 cts., oz. 40 cts.,  $\frac{1}{4}$  lb. 125, lb. 4.00.

### Turnip

#### **Prince Engalitscheff**

New early, scarlet, striped, yellow, flat. Pkt. 10 cts., oz. 20 cts., lb. \$1.25.

Thorburn's Improved Early Cluster Tomato

# Flower Seed Novelties and Specialties of Merit

### Aster, Hercules White

A new type of great merit. In form it is similar to the well known "Ostrich Plume," but of dwarfer habit, it is a strong grower and produces very large flowers of a refined shape, pure glistening white. Per pkt. 25 cts.

#### Asters, Hercules Lilac

An artistic flower of a beautiful rosy lilac shade, a decided acquisition to any garden. Per pkt. 25 cts.

#### Aster, Single Japanese (hA)

This Aster is of a branching habit, which is greatly in its favor as a cut flower, it having a fine, long stem. The central disc of the flower is encircled by a wreath of long, quilled ray petals either white or delicate rose.

White, pkt. 20 cts. Delicate Rose, pkt. 20 cts.

## Alyssum Benthamii compacta lutescens

Dwarf, compact, upright growth, with yellowish flowers; useful for carpet-bedding or ribboning. Pkt. 20 cts.

## Antirrhinum nanum grandiflorum, "Mauve Beauty"

A unique color in Antirrhinums and quite a new break. The color is a lovely shade of pale clear mauve; the flowers are large and the habit of the plant all that can be desired. A welcome addition to the Nanum type. Pkt. 20 cts.

#### Antirrhinum, Silver Pink

New, silvery pink, splendid variety for greenhouse culture; semi-dwarf. Pkt. 25 cts.

#### Aquilegia, Veitch's Long-Spurred Hybrids

A magnificent strain of many years selection, truly beautiful; mixture of Columbines, long stemmed and beautiful colors. Pkt. 40 cts.

## Bellis Perennis fl. albo Giantflowered Daisy

Monstrosa alba—White flowers,  $2\frac{1}{2}$  to 3 inches diameter. Pkt. 25 cts.

Monstrosa rosea—Rose flowers,  $2\frac{1}{2}$  to 3 inches diameter. Pkt. 25 cts.

### Centaurea Cyanus, Double Blue

A double flowered form of the popular old fashioned blue cornflower or bachelor's button, which it eclipses in every way, producing its large, fine double flowers on long, strong stems. Per pkt. 25 cts.

### Centaurea moschata rosea (hA)

This new, beautiful annual Sweet Sultan is  $2\frac{1}{2}$  to 3 feet high, with flowers of a very delicate rosy white, and light pink stamens and style; the flowers are about the same size as the white and purple varieties, and will make fine flowers for cutting. Pkt. 25 cts.

#### Calceolaria, Veitchii White

"A white Calceolaria for the conservatory." In many respects, this Calceolaria, is remarkable, and an extraordinary departure from the conventional color of greenhouse Calceolarias, being milk white in color. It is a true perennial, has a strong habit of growth, with healthy, strong, lance-shaped, shining, serrated foliage. It bears an abundance of bloom on first season plants, which grow to a height of about 3 feet, and are quite bushy. It is of great value for decorative work. Pkt. 50 cts.

#### Calceolaria, Bronze Age

This is another remarkable hybrid and differs from all others in being of deep red mahoganybronze shades, some light, others dark, ranging between crimson and bronze, softened to a warm murillo tin<sup>t</sup>, while the apex or lid of the pouch in some instances is a deep yellow, free bloomer and robust constitution. Pkt. 40 cts.

## New Cardinal Climber (hA) (Ipomœa Quamoclit Hybrida)

This beautiful annual is the result of a cross between *Ipomea coccinea* and the Cypress Vine (*Ipomea Quamoclit*). It is one of the best introductions as regards an annual climber for many years. It is a strong and rapid grower, attaining a height of from 20 to 30 feet, and is of a branching habit. It flowers perpetually from July until frost, the foliage is deeply laciniated, and the flowers are borne in clusters of five to seven, and are of a fiery cardinal-red. It is well worth trying. Pkt. 25 cts.

## **Celosia** Pompon

(Chinese Woolflower)

Brilliant Scarlet.....Pkt. 15 cts.

**Do You Need a Gardener?** At all times we have on our books the names of capable men in search of employment on private estates, farms and the like, and all persons in search are requested to call here, or drop us at any time for such men. Gardeners and Superintendents desiring positions are requested to call here, or drop us a line for application blanks.

## Chrysanthemum Maximum laciniatum

#### White Comet Marguerite

Of remarkable beauty, quite different from all other varieties, the petals of this novelty come in light, tufty waves, partly covering the yellow center of the flower, creating a graceful, charming effect. About 40 inches high, with long, strong stems; flowers abundantly in July and August. Pkt. 50 cts.

### New Cosmos

Thorburn's Extra Early Flowering Cosmos. Rose pink and shell pink, the foliage of this variety is not dense, and shows all the long, graceful stems tossing their airy, fairy blossoms in the air, making a most beautiful sight; in our trial grounds the past season this variety was in flower from June 15th until frost. Pkt. 25 cts.

#### Cosmos, White Lady Lenox

An exact counterpart in every particular, except as to color, of the favorite Pink Lady Lenox Cosmos. Well worth a trial by all lovers of these splendid annuals. Pkt. 25 cts.

#### Cosmos, Crimson Ray

The flowers while equally as large in diameter, show a new departure in form, number and shape of the petals, the petals greatly increased in number, are narrow and fluted, separated in star-like form, and of the most brilliant crimson. Pkt. 15 cts.

#### **Crested Cosmos**

## Cyclamen Persicum Giganteum Marginatum "Victoria"

Of strong, vigorous growth, these Cyclamen give an abundance of flowers of most beautiful colors in great variety of shades; the quaintly formed flowers standing well above the prettily marked foliage. Pkt. 50 cts.

## Dimorphotheca aurantiaca hybrida

### fl. pl. (hA)

Double-Flowering African Daisy, Pkt. 25 cts.

This is the double and semi-double form of the African Golden Daisy hybrids which we offered last season.

#### Dimorphotheca Aurantiaca Hybrida, Purplishred. Pkt. 25 cts.

#### Dimorphotheca Aurantiaca Hybrida, Lilac, Bluish Tint. Pkt. 25 cts.

Those rare and quite new colorings are very pleasing, ranging from purplish red to purplish rose, mostly with large white center, also to orange red with claret red tips or edges, while in the bluish tints there will be found lilac selves or purplish lilac varieties tinged white or white and yellow centered. Very attractive when in full bloom.

#### **Delphinium Pauli**

A new perennial hardy Larkspur from East Africa. The plants form loosely branched bushes,  $1\frac{1}{2}$  to 2 feet in height, with wire-like, stiff stems and branches bearing pure white flowers,  $1\frac{1}{2}$  to  $1\frac{3}{4}$ inches in diameter, with spurs of equal length; the stamens are dark violet-brown. A feature of this new Delphinium is the intense, sweet. eucharis-like scent of the flowers. Pkt. 20 cts.

### **Erigeron Multiradiatus Roseus**

A new variety of these handsome perennials; producing on graceful, long stalks an abundance of beautiful blooms measuring about  $2\frac{1}{2}$  inches across; innumerable rosy-colored petals surround the golden yellow disc, giving the appearance of a small, rose-blooming Marguerite; excellent for cutting. Pkt. 25 cts.

#### Gazania Longiscapa

A magnificent annual from South Africa. Forms round bushes about 8 inches in height, with dark green foliage, and covered with large, long-stemmed flowers of a lovely golden yellow with unique brown markings. Blooms continuously all through the season; of the easiest culture; succeeds best in a sunny location. Pkt. 25 cts.

#### **Giant Pink Moonflower**

The Giant Pink Moonflower produces a luxuriant vine. It grows very fast and dense, with thorns all over stems. The blooms are about the size of a Brazilian Morning Glory. Pkt. 10 cts.

#### Gloxinia Hybrida

Crassifolia Crispa "Waterloo" Black-purple Delicate white margin, giant flowers with seven lobes. Very valuable for florists. Pkt. 50 cts.

#### Crassifolia Crispa "Meteor"

Undoubtedly the most beautiful of all the Crassifolia Gloxinias, deep pure white throat, tinted bluish towards the petals, which are of a bright scarlet red with white underneath. Pkt. 50 cts.

#### Crassifolia "Scarlet Queen"

This hybrid is of vigorous growth, with wonderful big wave-shaped flowers of true scarlet. Pkt. 50 cts.

## Leucanthemum secundum giganteum

#### Giant Shasta Daisy (hP)

This strain has flowers which measure 4 to 5 inches across, borne on strong stems, 2 to 3 feet high; the discs of this beautiful Daisy are very small, of a deep golden yellow, surrounded with extremely long florets of snow white. Pkt. 25 cts.

### Lupinus polyphyllus Moerheimii

#### A perennial plant that everyone should have.

This *new* Perennial Lupine is of rather dwarf habit, with beautiful rose-and-white flowers, and blooms continuously during the Summer. 69230. Pkt. 25 cts.

#### CATALOGUE OF HIGH-CLASS SEEDS

New Hybrid Lupine All are hardy herbaceous perennials.

#### Pink Perfection. Splendid, half hardy, herbaceous perennial for pot culture, or outdoors in sheltered situation. When massed they are very beautiful. Clean, bright pink, with markings on the throat, continuous

## Nasturtium Lobbianum, Ivy-Leaved, "Emma Alida"

Dark, Ivy-leaf-shaped foliage, with golden yellow and orange to deep scarlet, laciniated flowers; very lively colors. Pkt. 15 cts.

## Petunia Hybrida Grandiflora Superbissima "Nana" Selected Mixture

Dwarf Petunia with a high percentage of compact large flowers; colors from dark to light and finely veined in all shades. Pkt. 50 cts.

Lupinus Polyphyllus

## **Polygonum Orientale**

#### (Persicaria) (Lady's Thumb)

This old-fashioned hardy annual is suitable for backgrounds; pink or greenish purple flowers on short spikes. 1 to 2 feet. Pkt. 15 cts.

## Primula Japonica

#### (The Hardy Japanese Primrose) (Veitch's)

In mixed colors. Primula japonica has, for a generation, been a favorite of those who love the miscellaneous flower border. This mixture comprises every shade of color in primulas. Pkt. 30 cts.

#### Virginia Poppy (hA)

#### Papaver Somniferum

This new, large-flowering, single Poppy produces beautiful, large, white flowers with fringed, soft pink edges. They are especially recommended for cutflowers, for they last long in vases, especially when cut in the morning before they are full blown. Pkt. 15 cts., 2 pkts. 25 cts.

### **Ricinus Laciniatus**

Distinct new variety of Castor-Oil Bean of medium height, with light green, deeply-cut foliage, the elegantly narrow lobes being divided nearly to the stalk. The appearance of the whole plant is very graceful. Pkt. 25 cts.

Ricinus Laciniatus

#### Salvia Patens

#### (Veitch's Special Strain)

This particular strain is exceptionally hardy, and has been saved from long established hardy plants. Pkt. 30 cts.

### Salvia Splendens, Ostrich-Plume

The most attractive Salvia recently introduced, of Salvia splendens type; the bush is well covered with beautiful plume, each plume being a bouquet in itself; color brightest scarlet. Pkt. 25 cts.

#### Stocks

#### Dresden Perpetual or Branching

"Princess Alice," white, profuse and perpetualblooming; double white flowers, excellent for cutting. Our strain of this is very fine. See page 123. Pkt. 25 cts.

## Yarrawa Sweet Pea

This is a splendid early-flowering Spencer variety, especially valuable for Winter flowering as well as the open ground. The color is rose on first opening, changing as the flower develops to a charming combination of light pink standard and blush wings; of vigorous habit; the flowers are produced on long stiff stems. 54590. Pkt. 25 cts.

#### Thermopsis Caroliniana

#### (St. Peter's Staff)

Pretty yellow, Pea-shaped flowers, adapting itself to almost any situation, but succeeding best in a light, rich soil. They are deep rooted plants and endure drought very well. Pkt. 15 cts.

#### Vinca Delicata

This is the handsomest of all Vincas. Soft, delicate shade of pink in color, very desirable for rockery and shrubbery borders. The plants are quite hardy. Pkt. 15 cts.

## Verbena grandiflora, "Helen Willmott"

A very pretty, bright salmon-rose, with white eye. The seed produces plants with flowers, many of which are of the true "Helen Willmott" color, with a percentage of varied shades, which are also very fine both in color and size. Pkt. 25 cts.

#### New Double semi-dwarf Wallflower

The plants grow 18 inches high, colors ranging from golden yellow to brown and purple. Seed saved from extra selected plants. Pkt. 25 cts.

## Zinnia, Double Mammoth-Flowering (hA)

A new and distinct class of this ever-popular flower, producing large, very double blooms, from  $4\frac{1}{2}$  to 6 inches in diameter. We offer five distinct colors, viz.: Crimson, Flesh-color, Sulphur-Yellow, Violet and White. Each color and mixed, pkt. 15 cts. Collection of five varieties, one pkt. of each color, 60 cts.

#### Extract from one of the numerous unsolicited testimonials we receive:

"The seeds you sent us last Spring were simply perfect, and I trust these now ordered will be as good—they could not be better.

Eighty years ago, Elizabeth Dickinson began planting Thorburn seeds. When she passed away, her daughter, Mary Bube, used Thorburn seeds, and now her daughter. Levantia Bard (my wife) will have no other seeds, and our daughter Bess, is a staunch advocate of Thorburn Seeds. Four generations sticking to one brand of flower and vegetable seed is speaking pretty well for their excellence, and rather unusual I think. JAMES E. BARD."

#### ollections Vegetable Seeds

Only the choicest sorts are put into these assortments, and they are picked out so as to give a continuous supply of vegetables from your garden all season.

The amount charged for these collections is considerably less than you would pay for the individual seeds, on account of the fact that we are able to put them up during the slack Winter months.

Owing to this, we cannot permit any alterations in the varieties, and the reduced price will not be allowed unless the collection is taken in full and without change.

## COLLECTION NO. A, \$1 (Including free)

This collection was gotten up primarily for rather small gardens, such as back-yard gardens and the like.

## COLLECTION OF VEGETABLE SEEDS—Continued

COLLECTION NO. 4, \$19 (Including free delivery by express)

If your needs require quite a quantity of fresh vegetables, and you have around three acres that you wish made into a garden, you could not do better than to buy this collection. There are quite a number of private estates and farms that are now doing away with the trouble of going through lengthy lists of vegetables suitable to their needs, and are leaving the matter to our judgment. This collection represents our recommendation as to just what should be used, with the exact quantities for planting approximately three acres, and getting the most out of the land.

## ARTICHOKE

ARTICHAUT

Alcachofa

Artischocke

CULTURE.—Deep, rich, sandy loam with plenty of well-rotted manure. Sow seeds in April or May, and when plants are large enough, transplant into rows 3 to 4 feet apart and 2 feet in the rows. They reach maturity the second year. When cold weather sets in, bank the earth to the top, first cutting off and tying up the leaves so that they will occupy less space, and in the spring fork in a dressing of manure. Artichoke may also be treated as an annual by sowing the seed in hotbeds during February and transplanting in May. The heads should be cut off and used as they get ready. If left to ripen on the plant, they will exhaust it, and no more will be produced that season. Heads are unfit for culinary purposes after the flowers expand.

Colossal Asparagus Giant Argenteuil. Pop FRENCH GLOBE ARTICHOKE ROOTS. (Ready in April.) Extra large, strong roots, from selected plants,—not seedling plants, which rarely come true. 25 cts. each, \$2.50 per doz.

## ASPARAGUS

ASPERGES

Esparrago

Spargel

Pkt.

CULTURE.—Sow the seed thinly in rows 1 foot apart in April or May (4 or 5 lbs. to the acre), and keep down all weeds. To secure strong, healthy plants, thin the seedlings to 3 or 4 inches in the rows, saving only the strongest. The one-year-old plants should be set out in spring in rich, sandy loam, dug 18 inches deep, into which has been worked plenty of well-rotted manure. If a stiff clay soil is all that can be had, add plenty of sand and sifted coal-ashes to loosen it up, and also see that it is well underdrained. In planting for private use, set out in beds 5 feet wide, three rows in a bed, the outer being each 1 foot from the edge, and allow 18 inches between the rows; set the plants from 4 to 6 inches below the surface. If set out in autumn, top-dress with 6 inches of manure. For market, on a large scale, set out 4 by  $1\frac{1}{2}$  feet. Every fall apply a good dressing of coarse manure, after the tops have been cut, and in spring fork in. Never cut too closely. The roots need the benefit of some foliage during the year, else they will weaken and die. Slugs are easily destroyed by applying air-slaked lime or paris green. Asparagus from seed does not always come true to name.

Colossal. The approved standard sort. The famous Oz. 1/4 lb. Lb. Argenteuil of the French is identical with it...170 \$0 10 \$0 15 \$0 40

Palmetto. 2-year-old roots	60	1 00 8 00

In France a business is now made of growing small, green, delicate shoots of Asparagus during the winter. Strong roots may be forced in hotbeds out-of-doors. They should be packed closely into the frames, and by making a new bed every five or six weeks these tiny shoots may be had all winter and are valuable served with omelets, green peas, etc.

We pay postage or express charges on all garden seeds bought by the packet, ounce or quarter-pound

1/4 lb.

## BEANS

As a farinaceous food for man, the Bean is considered far superior to any other legume, and next in impor-tance to wheat. The modern varieties leave little to be desired; the great care given to their improvement

has resulted in superior sorts, greatly extending the ground is perfectly warm, select a warm, dry, sheltered spot, CULTURE.—About the first of May, if the ground is perfectly warm, select a warm, dry, sheltered spot, dig and manure slightly; make drills 2 inches deep and 18 inches to 2 feet apart; drop the Beans 3 inches apart in the drills, and cover not more than 2 inches deep. Hoe well in dry weather to keep down the weeds. Sow every two weeks for a succession. One quart to 100 feet of drill; one bushel to the acre, in drills.

### ENGLISH DWARF BEANS

FEVE DE MARIAS

Haba

Große Bohnen

CULTURE.--Sow in drills 2 feet apart, as early in the spring as the ground can be worked (these are as hardy as peas), in order to get them into pod before the heat of summer. When in pod, break off the top of the plant to check the growth. Plant and hoe the same as for Dwarf Beans. A strong soil suits them best.

Properly cooked, these Beans form one of the most delicious vegetables. To each half gallon of water allow one heaped tablespoonful of salt. The Beans should be young and freshly gathered. After shelling, put them into boiling water, salted as above. Boil rapidly for fifteen or twenty minutes, then serve with a sauce of parsley and butter. Boiled bacon is often served with the Beans.

### POLE, or RUNNING BEANS

HARICOTS A RAMES Frijoles de Bejuco Stangen=Bohnen

#### We supply packets of Pole Beans at 10 cts. each, postpaid; other quantities NOT prepaid; add postage at zone rate 1 lb. per pint, 2 lbs. per quart.

CULTURE.—Sow as the soil becomes warm and dry, from the first part of May (for all except Limas) to the latter part of May, in hills 4 feet apart each way. Limas should not be planted until warm weather has fairly set in. One quart of Limas will plant about 100 hills, allowing four or five Beans to a hill and of the smaller sorts, about 200 hills. Poles 8 to 10 feet long should be firmly set in the hills before planting seed. Pt. Qt. 1/2 pk.

Crimson Globe Beet

Thorburn

## BEET

#### BETTERAVE

Remolacha

Salatrübe

CULTURE.—Sow as early in the spring as the ground can be worked (one ounce to 50 feet of drill, five or six pounds to the acre), and every two weeks after for a succession up to the first week of July. For general crop, sow about the middle of May. The soil should be light, sandy loam, well enriched with stable manure and plowed and harrowed until very fine. Sow in drills 1 foot to 15 inches apart, and when well up, thin to from 4 to 6 inches. The young Beets with their tops, pulled out of the row, are excellent used as a spinach. For this purpose, sow frequently and use when of the size of a hickory nut.

## MANGEL-WURZEL AND SUGAR BEET Muntelrüben

CULTURE.—As all Mangels require a deep soil in order to grow well, plow and subsoil at least 1 foot to 18 inches and apply plenty of rich stable or Thorburn's Complete Manure. Sow in May or June, in rows 18 inches to 2 feet apart, and thin to 8 inches in the rows. Young plants may be transplanted to fill up 18 inches to 2 feet apart, and thin to 8 inches in the rows. Young plants may be transplanted to fill up vacancies. Sow in addition, when the plants are 3 to 4 inches high, at the rate of 200 pounds of Complete Manure, 200 pounds of bone meal and 400 pounds of salt to the acre. As soon as frost occurs, dig the crop. In order to be well preserved for gradual consumption during the winter, the Roots should be heaped to a height of perhaps 6 feet, on a dry, sloping situation; cover at first with a piece of canvas, and as the cold increases, this should be replaced by about 6 inches of either salt hay, straw, seaweed or cornstalks, with a light layer of earth on top. 'As soon as this surface soil becomes frozen, about 6 to 8 inches more of earth should be placed over it. By following up this gradual process of covering, all danger of heating will be obviated, and the roots will keep in perfect order. Sow from five to eight pounds to the acre.

#### BORAGE

BOURRACHE Borraja

Borretsch

19

The young leaves of this annual, which smell somewhat like a cucumber, are used as a salad, or boiled like spinach. Should be sown at intervals, as the leaves are palatable only when young. Sow in the spring, in light soil; transplant in shallow drills, a foot apart, when of six weeks growth. 240. Pkt. 5c., oz. 15c., <sup>1</sup>/<sub>4</sub> lb. 40c., lb. \$1.50.

#### BROCCOLI BROCCOLI Spargelkohl Broculi

CULTURE—Sow early sorts as soon as the ground can be worked in the spring, in shallow drills, drawn 3 or 4 inches apart. Plant out 2 feet apart each way when the plants are about 4 inches high. Cultivate the same as cabbage, in rich soil, and use the same remedies for insect attacks. The following are sorts best adapted to this climate; they are excellent and deserve much wider culture than is usual in this country. 1/15 Th

#### BRUSSELS SPROUTS CHOU DE BRU Berza de Brusels CHOU DE BRUXELLES Rosenkohl

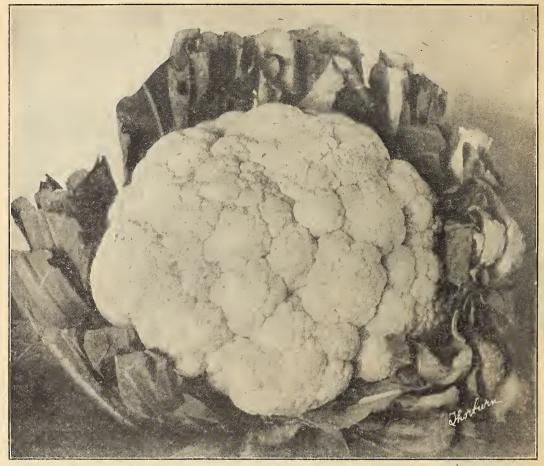

CULTURE .-- Sow in May, in the same manner as cauliflower, and transplant in July 1 foot apart in the rows which should be  $1\frac{1}{2}$  feet apart. The Brussels Sprout is, without exception, the very best winter vegetable that can be grown. Not the least valuable point connected with it is that it is as hardy as the com-mon, curled greens. The real Sprout is not much larger than a marble, and as firm and hard almost as the stalk itself. Strip off the outer covering, cook them whole, and serve them in that fashion. When cooked through and no more, such Sprouts melt in the mouth like the tenderest cauliflower, and are equally good.

Oz. 1/4 lb. Lb. Of dwarf growth, producing large, solid Dalkeith. sprouts ......pkt. 10 cts...2190 \$0 35 \$1 00 \$3 50

Thorburn's Gilt-Edge Cauliflower

## CAULIFLOWER

CHOU-FLEUR

Coliflor

Blumenkohl

CULTURE.—The same as for cabbage except that extra manure and plenty of water will pay upon Cauliflower. If the soil be dry, water frequently, and, if the plants have a heavy mulch of hay or straw, it will keep the soil moist, and they will not suffer from drought. The early kinds should be strong enough to plant out not later than the middle of April; the late kinds may be planted out the same time as cabbage.

#### Thorburn's Early Jersey Wakefield Cabbage

## CABBAGE

Сноυ

#### Berza de repollo

Rahl

21

CHOU Berza de repollo fable CULTURE.—Soil for Cabbage should be rich and heavy loam, with good drainage. On such a soil, with an abundance of stable or Thorburn's Complete Manure, excellent crops are sure to be grown. For early spring, sow in fall not too early, for the plants are liable to bolt in the spring, instead of heading. In a month the plants will be fit to transplant to coldframes, where they are wintered, taking care in planting to set the young plants down to the first leaves. Transplant in spring as soon as the ground can be worked, setting the plants 2 feet apart one way and from 12 to 18 inches the other, according to the variety. If it is desirable to economize space, lettuce, or radish may be sown between the rows, as they will be out of the way before the Cabbage needs the room. For late or winter crop, the seed is sown in May, and the plants set out in July. In this case, they are set in rows 2 by 3 feet, so as to work them with a horse and cul-tivator. To destroy the green worm, an experienced grower says: "Take one ounce of saltpeter and dis-solve it in twelve quarts of water; then take a short-handled whisk-broom dip it in the solution and sprinkle the plants well. One application is sufficient unless the stuff is washed off by heavy rains. The liquid being perfectly clear, never colors the cauliflower or Cabbage heads." To prevent the turnip flea attacking the young plants, sift fine air-slaked lime or tobacco dust over them as soon as they appear above ground the young plants, sift fine air-slaked lime or tobacco dust over them as soon as they appear above ground

Chantenay Carrot

## CARROT

CAROTTE

CARDOON

22

Zanahoria

Möhren

CULTURE.—Sow No. 2890 as early as the ground can be worked; or, for late crop, until the latter part of July, or early in August for a winter crop. This is the finest and most tender for table use. For main crop sow other sorts from middle of May to the first of July. Thin out early crop to 5 inches in the row, main crop, 6 to 7 inches, the rows 10 inches apart for early crop, 14 for main crop. Hoe often and deeply between the rows. Soil should be light and loamy, richly manured and deeply dug. Sow at the rate of two to three pounds to the acre; one ounce to 100 feet to drill. Carrot-tops cut from fairly young plants may be used for pretty indoor greenery. Put one cutting into each thumb-pot, or three or four into a larger pot around the sides. Fairly good and sandy soil should be used, syringing frequently until growth is well forward. About 1 inch of Carrot should be left to put in soil, but this should be surrounded with soil or moss to hide it. When fully grown it is very pretty, the long fronds hanging over gracefully. **Parisian Eorcing Fark**. Tender and sweet for early and late crops and

## CELERY

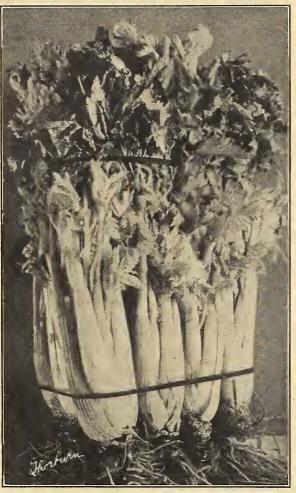

#### Celeri

A pios

Sellerie

CULTURE.—Sow the seed in a light, rich, dry border as early as the ground can be worked, in drills 8 to 10 inches apart, and cover the seeds about a quarter of an inch deep, rolling or treading them in if the ground be dry. When fairly out of the seed-leaf, they may be transplanted to another

bed, or they may be thinned out to 6 or 8 inches apart, and let grow until wanted to plant out in beds or trenches. The beds should be kept well weeded, and an occasional soaking with water in dry weather will do the plants good. Early in July in the North, a month or six weeks later in the southern states is the proper time to set the plants out in beds or trenches. Press the soil firmly against the roots. In the garden the better way is to set the plants in shallow trenches. We say shallow for it is obviously a bad plan to remove all the good soil (as must be done in a deep trench) and put the plants in that which is poor. The plants must be set in a single row in a narrow trench; or the trench may be made into a bed wide enough to hold two, three or four rows, 1 foot apart, and the plants about 8 inches apart in the rows, and in this case the plants are in a com-pact form to be covered for the winter where they grow. This will save much labor where there is no root-cellar for storage, as often happens to be the case. The bed should be made very rich with thoroughly decomposed manure. The plants will need to be earthed up two or three times, and, in doing this, care should be taken not to let the earth get into the heart of the plant. In field culture, the plants are set on the surface in rows 4 feet apart when the Celery is to be earthed up in the field for early use, and 2 feet apart when the plants are to be taken up and blanched in the cellar for winter use. The plants are set 6 inches apart in rows. If not grown in bede the best ways to the set of inches and the set of the set beds, the best way to store is to dig trenches in a well-drained spot in the open ground, 1 foot wide, and at a depth of a few inches less than the height of the Celery. The plants are then lifted and set close together. When severe cold weather comes on, cover gradually with leaves, hay or straw, and place boards on top. The turnip-rooted Celery (Celeriac) needs no earthing up, and may be planted in rows 1 foot apart. Early spraying

#### COLLARDS

## CORN SALAD, or FETTICUS

#### MACHE

Macha o Valerianilla

CULTURE.-Sow during August or early in September, in drills one-fourth of an inch deep and 6 inches apart. If the weather is dry when the seed is sown, tread it lightly to insure germination. Keep weeds 

### **CRESS**

#### CRESSON

#### Bara o Mastuerzo

CULTURE.—Sow No. 4520 thickly in shallow drills, every two or three weeks. It should be cut often and it will continue to grow. It is useful not only for salad, but for the breakfast table and for garnishing. Nos. 4550 and 4570 should be sown in damp soil; or, if a stream of water can be utilized, they will be much finer. They will also thrive well in damp hotbeds. Rightly managed, their culture is very profitable. To obtain early salad, it is a good plan to sow with Water Cress seed a strip 4 inches wide on the outer margin of a hotbed, inside the frame, where it is always cool. Curled or Paper Creas

CULTURE.—For very early, sow in hotbeds upon pieces of sod, or in small pots. They can be readily transplanted with a gain of about six weeks over those sown in the open ground. Plant out in rich soil when danger of frost is over, or protect by hand-glasses, or by paper held down at the corners with a handful of earth. For general crop, sow in the open ground as soon as the weather is settled and warm, and every two weeks for a succession. For pickles, sow from middle of June to first week in July. Sod land, turned over in fall, is the best for them. Plant in hills 4 feet apart, putting a shovelful of well-rotted manure in each hill.

#### Grand Rapids Forcing Lettuce

LETTUCE LAITUE

Lechuga

Salat

CULTURE.—Sow 6030, 6120, 6230, 6340 and 6350 in hotbeds in March, and these as well as all the other varieties, in the open ground as soon as it can be worked, and transplant to rows 8 inches apart. Sow in two weeks' time again for a succession; also Cos sorts. Latter part of August, sow any of the varieties. In October some of these may be planted in frames, to head in winter and early spring. Always sow thinly and thin out well, or the plants will not be strong. The last spring sowing had better be grown where sown, being thinned out to 6 to 8 inches apart. Cos Lettuce may be sown in a hotbed early in the year, and transplanted to a coldframe, so as to have good plants to set out at the opening of the ground. Lettuce requires good ground, enriched with thoroughly rotted manure, and well pulverized. The after culture should be close and careful, to secure the best results. Lettuce seddom, if ever, heads well in hot weather.

MUSHROOM SPAWN BLANC DE CHAMPIGNON Seta Champignonbrut CULTURE.—Mushrooms may be grown in cellars, under benches of greenhouses, or in sheds, wherever the temperature of 50 degrees can be kept up through the winter. The beds should be made from November to February, according to the time the Mushrooms are wanted, and it requires about two months for them to begin bearing. Secure fresh horse manure, free from straw and litter, and mix an equal bulk of loam from an old pasture with it. Keep this under cover, taking care to turn it every day to prevent heating. until the pile is large enough to make a bed the required size. Three to 4 feet wide, 8 inches deep and any length desired are the proper porportions for a bed, but these may be varied. Prepare the mixture of loam and manure, making the bed in layers, and pounding down each with the back of the spade. Leave this to heat through for a few days, and as soon as the heat subsides to 90 degrees, make holes in the bed about

a foot apart each way, and about one inch deep, into which put pieces of the spawn 2 or 3 inches in diameter; fill up the holes with the compost, and at the expiration of a week or ten days the spawn will have thoroughly diffused itself through the bed. Spread a layer of fresh soil over the heap to the depth of 2 inches and cover with 3 or 4 inches of hay, straw or litter. Examine the bed often to see that it does not get dry. Take special care, however, when water is given, that it be at a temperature of about 100 degrees. From our experience with French and American Spawn we find there is an important dif-

Take special care, however, when water is given, that it be at a temperature of about 100 degrees. From our experience with English, French and American Spawn, we find there is an important difference between them. If the manure in the bed is in proper condition, the French Spawn will take hold and grow fully as well as the other two; but, if the bed is not in the right state, it will often rot. The American and English Spawns, on the contrary, after starting a little, will remain in a comparatively dormant state for a long time without losing their vitality. It is well to keep these points in mind in ordering Spawn.

# (Cantaloup)

MELON MUSCADE Melon Muscatel Cantaloup

CULTURE.—Select a light, rich, sandy soil, and, after all danger of frosts is over and the ground has become warm and dry, plant in hills 4 to 6 feet apart each way, six to twelve seeds to a hill. When up and all danger of insects has passed, pull out all but three plants. Cultivate until the vines cover the ground, and pinch the ends of the growing shoots to induce early fruiting. Ashes, lime, or even dry roaddust, are excellent to sift over young plants when the dew is on, to prevent the attacks of insects. A few hills for early use may be had by sowing in hotbeds, on pieces of sod or in pots. The seed may also be started outof-doors under hand-frames or glasses. It is quite important that proper soil be selected for growing Muskmelons.

Eden Gem Muskmelon

# SALMON AND YELLOW-FLESHED VARIETIES

Banquet. Beautifully netted, medium size; rich salmon flesh; fine quality6790       \$0       15       \$0       30       \$100         Brockway's Sport. # PEAS

38

#### POIS Chicharos o Guisanthes Erbjen

CULTURE .- A week may be gained in earliness by sowing a quantity in moist sand placed in a box in the cellar, and planting outside when well sprouted. Light, dry soil, not over rich, suits the Pea. Sow as early as the ground can be worked, and again every ten days for succession. Peas may be sown in this vicinity as late as the 20th of August. Medium and Late Peas must be planted early; Extra-Earlies may be planted again in August. Sow in single or double rows, from 4 to 6 feet apart according to the different heights, about an inch apart in the row (except such sorts as we note to sow thinly), and 4 inches deep; one quart to 100 feet of drill. In this climate, the O'Rourke Pea, if planted from the 10th to the last of August, will pro-duce a fair crop for fall picking, when Peas will be most acceptable. Hoe often and keep the ground clean and fine. The tall sorts can be made to bear more freely by pinching in. The dwarf varieties may be grown in beds like bush beans with rows about the same distance apart. The holes which are sometimes found in Peas are caused by the Pea weevil (*Bruchus pisi*). The beetles lay their eggs on the young pods, and the larvae as soon as hatched, make their way through the pods and into the nearest Peas. If the new aphide attacks the Peas, spray the vines every day with clear water of the same temperature as the atmosphere.

Those marked with a star (\*) are wrinkled marrows, and, unless otherwise stated, should be sown thicker than the round Peas and not

Gradus

until the ground has become warm, as they are more liable to rot. They are the finest flavored of all Peas. Those marked thus (†) are large-podded sorts.

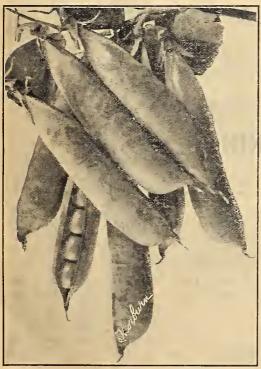

We supply packets of Peas at 10 cts. each, postpaid, except where quoted otherwise; other quantities NOT prepaid. Add postage at the zone rate of 1 lb. per pint, 2 lbs. per quart.

Sir Walter Raleigh Potatoes

# POTATOES, Grown Expressly for Seed BARRELS) Rartoffeln

POMME DE TERRE

Patatas

CULTURE.—Three to four barrels to the acre. In order to have the best success in growing Potatoes, it is necessary to plant as early as the ground can be made ready. Select a rich soil, and plant in rows 3 feet apart, and the sets 1 foot in the rows. If wood-ashes and plaster can be procured, sow a good dressing over the field after the Potatoes are up. If a very early crop is desired, it will be necessary to sprout the Potatoes before planting. Cut the Potatoes into pieces of any size desirable, and place in a warm, light room for four to six weeks before required for planting in the open ground. During this time shoots will start out strong and vigorous, so that, as soon as planted, they will send out roots and grow much more rapidly than those treated in the ordinary way. Another method is to place the sets in a hotbed two weeks before they are wanted and then lift carefully and set out on fresh horse dung, so that the heat will cause them to start at once. If the Colorado Potato beetle makes its appearance the vines must be dusted with paris green mixed with about 80 parts of plaster; or what is better, mix the paris green in water, one small tablespoonful to a pailful, and apply with a small brush or broom. Take care to stir the mixture often, or else the paris green will settle to the bottom. Two or three applications during the season will usually suffice to clean off all the beetles.

# RADISH

RADIS ET RAVE

AVE *Rabanos y Rabanitos* Nadies und Rettig

CULTURE.—Sow as soon as the ground is dry in the spring in rows 8 to 12 inches apart, every week or ten days for a succession up to the middle of June after which they are but little used unless a cool northern spot can be had, where the ground is shaded during a part of the day. They should be sown in light rich soil, as a crisp Radish cannot be produced in heavy soils. Sow also in early fall for late crops and winter use. Sow 8 to 10 lbs, to the acre. Radishes should be eaten when quite small; it is a mistake to let them grow too long and too large. This applies particularly to the French Breakfast and small turnip-shaped sorts. Varieties marked with an asterisk (\*) are best suited for market gardeners.

Mammoth "Tokyo."

# RAMPION

RAIPONCE

Reponche

Rapunzel Rübe

CULTURE.—Sow in the open ground early in May, either broadcast or in drills 10 inches apart. As the seed is very fine, it merely requires to be pressed firmly into the soil. Thin out the seedlings if they come up too quickly, and water frequently during hot weather. The roots may be gathered for use from October onward throughout the winter. The roots and leaves are excellent as salad. **11550**. Pkt. 10 cts., oz. 30 cts.

# ROQUETTE

CULTURE.—Sow early in spring, in rows, and thin out to 8 to 10 inches. If kept well scuffled and watered the tart flavor of the leaves is greatly diminished. This flavor is not pronounced in the small leaves, which are used for salad. The flowers, appearing from May to June, have very much the odor of orange-blossoms. **11590**. Pkt. 5 cts., oz. 25 cts., 1/4 lb. 75 cts., lb. \$2.50.

# RHUBARB

CULTURE.—Sow seed in a coldframe, in a fine, rich, sandy loam, about the first of March, in drills 4 inches apart. Keep the frames covered during nights and cold days, so that the soil will not freeze, and in six to eight weeks the plants will be large enough to set in the open ground. Transplant to a rich soil, and set in rows 12 inches apart and 12 inches in the row. The following spring transplant again to a permanent location, setting 4 to 5 feet apart each way. In good soil, Rhubarb is ready to use the second year from seed. When roots are set out plant them 4 to 5 feet apart each way, and keep weeds down. If roots are used, a crop may be had after one season, which is much better than sowing seed where only a few plants for family use are needed. In the fall, the bed should have a thick dressing of coarse manure, to be spaded under in

 spring.

 ROOTS, of Victoria only.

Transportation charges extra.

# SCOLYMUS

The roots resemble a small parsnip, and will keep through the winter like a turnip. It is cultivated exactly like the carrot, except that it should be grown in rows 3 feet apart and 18 inches in the rows. It is eaten boiled like salsify. **11740**. Pkt. 10 cts., oz. 20 cts.,  $\frac{1}{4}$  lb. 60 cts., lb. \$2.00.

# SCORZONERA

#### CORZONERE Escorzonera Schwarzwurzel

CULTURE.—Cultivate the same as salsify. It is cooked in the same manner, but, on account of being somewhat more difficult to raise, is seldom seen in cultivation. Considered by many superior to salsify. It is also called Black Salsify. 11780. Pkt. 10 cts., oz. 30 cts., 1/4 lb. \$1.00, lb. \$3.00.

# SALSIFY, or VEGETABLE OYSTER

SALSIFIS

#### Ostion Vegetal Saferwurzel

CULTURE.—Sow as early as the ground can be worked in the spring, in drills 12 inches apart, 1 inch deep, and thin out to 6 inches in the row. Keep the plants free from weeds. Cultivate the same as carrots and parsnips. A part of the crop may be left in the ground till spring, when it will be found fresh and plump. The roots are cut into pieces ½ inch long, boiled until tender, and then served with drawn butter, in which way it is a delicious vegetable. They are also mashed and baked like parsnips, and have a sweet and agreeable flavor. Mashed and fried, the flavor is much like that of the oyster. Sow eight to ten pounds to the acre.

Mammoth Sandwich Island. Large. 11850. Pkt. 10 cts., oz. 25 cts., 1/4 lb. 75 cts., lb. \$2.50.

Mammoth Sandwich Island Salsify

# SORREL

Oseille

Acedera

Sauerampfer

CULTURE.—Sow in spring in drills 18 inches apart, in a rich soil, and keep the flower-stems cut off as they appear. It remains in the ground year after year, and needs to be taken up and divided only once in four or five years. To be cut and cooked precisely like spinach; or it is excellent cooked with it, one-third Sorrel to two-thirds spinach. It is also used for soups. Very nice to be eaten after it has become cool. Inasmuch as the hot sun tends to increase its acidity, a northern exposure is preferable.

Giant Lucullus Swiss Chard

# SWISS CHARD, or SILVER BEET

Silver Leaf. This is a Beet producing leaves only, of a quality superior to those of the ordinary Beet, and excellent as greens. Cultivate about the same as spinach, by sowing the seed in early spring in drills about a foot apart. As it grows, thin out for use, and keep clear of weeds if success is desired. Good cultivation will increase the delicacy and tenderness of the leaves. 1690. Pkt. 5 cts., oz. 15 cts., ½ lb. 40 cts. lb. \$1.25.

Giant Lucullus. Large, crinkled leaves; tender and of fine flavor; dark green; pure white ribs. 1700. Pkt. 5 cts., oz. 15 cts., ¼ lb. 50 cts., lb. \$1.50.

Spinat

# SPINACH

#### EPINARD

Espinaca

CULTURE.—Sow in early spring, in drills a foot apart (10 to 12 lbs. to the acre), every two weeks for a succession, and, as it grows, thin out for use. For fall use, sow in August, and for winter crop in September. Cover that which is left out over winter with straw or leaves after the weather becomes quite cold. Keep clear of weeds. Sow the seeds of New Zealand in hills 2 feet apart each way, three or four seeds in a hill. Raund Viraflay (Thick-leaved). Has very large thick dark green leaves; the

# TOMATO

Томато

Tomate

Liebesapfel

CULTURE.—Sow in a hotbed in early spring, or the seed may be sown in shallow boxes and placed in a window when one does not wish to have the trouble of making a hotbed. Transplant to the open ground when all danger of frost is past, setting the plants 3 to 4 feet apart each way. Fruit may be had several weeks earlier by sowing seed quite early and transplanting to small pots. Tomatoes that have not ripened at the end of the season may be taken from the vines and placed in empty coldframes, or wrapped in tissue paper, and carefully packed in flat boxes—where a large proportion of them will ripen from time to time. frequently until Christmas.

# The varieties marked \* are best for forcing.

# TURNIP

Nabo Rübe NAVET CULTURE. - For early Turnips, sow as soon as the ground opens in spring. Nos. 13845 to 13930 should be sown from any time in July to first of August; but the other kinds, for winter use, may be sown from the middle of July to the end of August. Turnips are generally sown broadcast, but much larger crops are obtained (particularly of the Rutabagas) by cultivating in drills 18 inches apart, and thinning to 6 inches in the drill. Sow in drills, one pound to the acre; broadcast, two to three pounds to the acre.

WHITE VARIETIES

THORBURN & CO., 53 BARCLAY ST., NEW YORK T. M.

Lawns like this can be produced by sowing Thorburn's Lawn Grass Seed

# About Lawns and Lawn Grass Seed FORMATION OF LAWNS FROM SEED

There is nothing more attractive than a well-kept lawn.

Many things are to be considered in connection with the making and proper care of lawns. A good

Many things are to be considered in connection with the making and proper care of lawns. A good lawn cannot be made in one season, success coming only through intelligent care for a period of years. The ground should be thoroughly drained and well prepared. The soil ought not to be too rich, as a rapid growth is not wanted in the grasses of a lawn; but the surface should be as much alike in quality as possible and thoroughly pulverized. After sowing, the ground should be rolled and cross-rolled in order to press the seed firmly into the soil, and ten days or so thereafter a light application of Thorburn's Lawn Ferti-lizer, mixed with an equal quantity of good loam or sand, will serve to stimulate the growth of the young grasses. The proper time to sow grass seed depends, of course, upon the latitude. In the central and eastern states from March 15 to the middle of May is the best time; but in favorable seasons the sowing may be done up to July 1. Seed may also be sown in the Fall, from the latter part of August to the end of Sep-tember. The sowing should be done when the ground is moist, or before an expected rain, and a subsequent tember. The sowing should be done when the ground is moist, or before an expected rain, and a subsequent rolling is always advisable. As to weeds in newly-made lawns, it may not be generally known that many weed seeds actually lie dormant in the ground for six or seven years and will germinate and make their ap-pearance when the soil is turned up. The annual wild grasses, such as crab grass or Summer grass, must be pulled up by the roots before they ripen their seed in the Fall.

Rolling.—As soon as the frost is out of the ground in the Spring, the land should be gone over with a heavy roller. Winter frosts loosen the soil, and rolling is necessary to compress it again. Roll frequently. Mowing.—All turf-forming grasses are improved, both in vigor of root-growth and in fineness of tex-ture, by frequent mowings. It is impossible to say just how often the grass should be mown, as that depends upon the rate at which it grows. Too close cutting should be guarded against, however, especially during the hot Summer months, when the roots require some top-growth to protect them from the burning sun. A good top growth is also necessary to protect the roots from severe Winter frosts. To Grass a Bank or a Torrace —For each causer and take a pound of Terrace Lawn Grass Seed and

To Grass a Bank or a Terrace.—For each square rod, take a pound of Terrace Lawn Grass Seed and mix it thoroughly with 6 cubic feet of good, dry garden loam; place in a tub, and add liquid manure, diluted with about two-thirds of water, so as to bring the whole to the consistency of mortar. The slope must be made perfectly smooth, and then well watered, after which the paste should be applied, making it as even and thin as possible.

It is a good plan to sow on good land, in any out-of-the-way place, strips for sod to be used for patching poor parts of the lawn, or for grass borders, etc. The best mixture of seed for this purpose is Cynosurus cristatus (Crested Dog's-tail), Kentucky Blue Grass and Fancy Red Top.

This Lawn was sown with Thorburn's Lawn Grass Seed Mixture for Shady Spots

# Lawn Grass Seed Mixtures

Prices of all Lawn Grasses include free delivery in the United States by mail, express, or freight, at our option

# THE THORBURN LAWN GRASS SEED

Many of the finest lawns in America were produced from this mixture. It is composed exclusively of permanent grasses that make a finer and thicker turf the older they become, and yet give a rich greensward in three or four weeks from the time of sowing. Sow at the rate of four bushels to the acre (per bushel of 20 lbs.) One quart of our Lawn Grass Seed will sow a plot 15x20 feet, or 300 square feet.

# Permanent Grass Seed for Golf-Links, Tennis-Courts, Polo-Grounds, etc.

We have devoted much attention to the seeding and preservation of golf-links, tennis-courts and polo-grounds, and offer the following mixtures, which have been used on many of the finest links, etc., in the country, with very satisfactory results.

# **Polo-Grounds Mixture**

56

A mixture of fine-leaved and deep-rooting grasses forming a strong and lasting turf that will stand hard usage. Per bushel of 20 pounds, \$5.00.

# **Tennis-Court Mixture**

A mixture of extra-fine grasses peculiarly adapted to tennis-courts. This mixture will make a firm, green and lasting turf of the finest texture, that will improve with the trampling it receives.

# Grass Seed Mixtures for Meadows and Pastures

It is a well-ascertained fact that a thicker and more prolonged growth is produced by a mixture of many sorts of grasses than by only one or two. For every different kind and condition of soil there are grasses that are especially suitable. Some sorts do best on high ground and in dry weather; others prefer plenty of moisture. Some mature so early and others so late that from the beginning of Spring until Winter sets in there is no time when one species or another is not at its best. Grass seed may be sown either early in Spring or in Fall from the first of September to the middle of October; in this latitude the best time to sow meadow grass seed is during the late Summer and early Fall, that being the natural seeding time for grass. This will, of course, not give very much of a crop the following year; the grass will be fine and thick, but rather short, and not a heavy yield. The best meadows are seeded alone, without any "nurse" crop, while if seeded with Rye, that crop being the stronger and quicker grower will monopolize the ground so that it will be another year before much of a crop of grass can be had.

For over a hundred years our house has made a specialty of grasses. We were probably the first to introduce to this country, for commercial distribution, the many valuable natural and cultivated foreign species that now take such an important part in our agricultural economy. The formation of permanent pastures and meadows has, for many years, been a subject of careful study with us, and the following for-mulæ for seeding grass-lands have received universal recognition. The quantities given are the minimum, and may often be increased to advantage.

# MEADOW MIXTURES FOR ONE ACRE

### No. 1. On Good Land, neither Too Dry nor Too Wet.

- 8 lbs. Fancy Red-Top.
- 1/2 " Perennial Sweet Vernal.
- " 2 Sheep's Fescue.
- 10 11 Perennial Rye Grass.
- 66 17 Timothy.
- " Red Clover. 2
- 1/2 " Alsike Clover.

### 40 lbs. \$9.00.

Sow 40 lbs. to the acre.

No. 2. On High and Dry Land.

8 lbs. Fancy Red-Top.

- 1 " Tall Meadow Oat Grass.
- 6 " Crested Dog's-tail.
- 2 " Orchard Grass.

Sow 40 lbs. to the acre.

#### No. 3. On Wet Late Land.

57

12 lbs. Fancy Red-Top.

- 6 " Orchard Grass.
- 2 " Meadow Fescue.
- 1/2 " Tall Fescue.
- " 1 Kentucky Blue Grass.
- 12 " Perennial Rye Grass.
- " Timothy. 5
- 1 " Red Clover.
- $\frac{1}{2}$  " Alsike Clover.

No. 6. On Wet Land.

10 lbs. Fancy Red-Top.

12 " Perennial Rye Grass.

3 " Kentucky Blue Grass. 1 " Alsike Clover.

Sow 40 lbs. to the acre.

10 " Orchard Grass.

1 " Tall Fescue.

1 " Red Clover

2 " Timothy.

40 lbs. \$9.50.

#### 40 lbs. \$9.00.

Sow 40 lbs. to the acre.

PASTURE MIXTURES FOR ONE ACRE

### No. 4. On Good Land, neither Too Dry nor Too Wet.

- 7 lbs. Fancy Red-Top.
- 9 " Orchard Grass.
- 12 " Perennial Rye Grass.
- " Kentucky Blue Grass. 7
- 3 " Timothy.
- " Red Clover. 2
- 40 lbs. \$9.00.

Sow 40 lbs. to the acre.

The various Grasses used in the above mixtures are fully described on the following pages.

We are always glad to make up Special Mixtures, and are pleased to answer inquiries as to the best grasses for different purposes and for sowing on various soils under varying climatic conditions.

# 40 lbs. \$8.50.

Sow 40 lbs. to the acre.

4 " Kentucky Blue Grass. 40 lbs. \$12.00.

No. 5. On Dry Land.

5 lbs. Fancy Red-Top.

10 " Timothy.

2 " Red Clover.

4 " Sheep's Fescue. 13 " Timothy. 2 " Red Clover.

# **Grass Seeds**

We desire to call particular attention to the fact that Grass Seeds are sold in the trade by sample, and each sort is divided into three or four grades of quality, according to purity, germination and weight. The price of the best grade is often double that of the ordinary. The Grass Seeds here offered by us are in every case the VERY HIGHEST GRADE.

Not less than one pound of any one sort sold

#### Prices subject to market fluctuations during the season

The weight per bushel is average actual weight

AGROSTIS CANINA (*Rhode Island Bent Grass*). Resembles Red-Top (*A. vulgaris*, described below), but is of dwarfer habit, with shorter and narrower leaves. It makes a beautiful, close, fine turf, and is one of the very best grasses for lawns in mixture with other sorts. It adapts itself to almost any soil, rich and moist, or dry, sandy and sterile. 60 lbs. of seed to the acre is recommended for lawns. (16 lbs. to the bushel.)

58

Lb\$0	60	25 lbs	\$12	50
10 lbs 5	50	100 lbs	48	00

- AGROSTIS STOLONIFERA, TRUE (Creeping Bent, or South German Fiorin). The only true Creeping Bent Grass. The distinctive feature of this species is, as the name implies, its compact, creeping, rooting stems. It is of rapid growth and, spreading habit, and the stoloniferous roots which it sends down into the soil form a strong, enduring turf that is positively improved by constant trampling. The other varieties of Agrostis are distinguished from this sort by their flattened, parallel surface roots. Being of fine texture, it is most valuable for lawns and putting-greens. If sown alone, 60 lbs. to the acre should be used. Doubtful if obtainable owing to conditions in Europe at present. Will give prices on application if practicable.
- AGROSTIS VULGARIS (*Red-Top*; *Herd's Grass*). A very hardy, native perennial grass, succeeding best on moist land. It accommodates itself to a variety of soils, however, even to dry situations and stands our hot climate admirably. It is, perhaps, the most permanent grass we have, and it enters largely into the composition of our best natural pastures. It remains green for the greater part of the year, and its long, trailing stems form a very close, matting turf that is not affected by trampling. The seed, as usually sold, weighs 15 to 18 lbs. to the bushel, in its natural condition. Sow 4 bushels to the acre. Lb. \$0 25 1 25 lbs \$4 50

LD	0 40	20 IDS
		100 lbs16 00

- ALOPECURUS PRATENSIS (Meadow Foxtail). One of the best permanent pasture grasses for rich, moist soil. Its chief characteristics are its earliness and its faculty of standing high Summer heats without burning. It prefers moist, low

#### **ALOPECURUS PRATENSIS**—Continued

grounds, but it accepts drier situations, and makes an earlier Spring verdure than any other variety. Sow only in connection with other grasses, 3 to 4 lbs. to the acre; if sown alone, 25 lbs. to the acre.

Lb......\$0 75 | 25 lbs.....\$16 00 10 lbs......7 00 | 100 lbs......60 00

- ANTHOXANTHUM ODORATUM (True Perennial Sweet Vernal Grass). For a mixture with pasture grasses, it is valuable on account of its vernal growth, and also for continuing to throw up root foliage until late in the Autumn. For meadows, its chief merit is the fragrant odor which the leaves emit when partially dried, thus sweetening hay. It is a vegetable condiment, rather than a grass of much nutritive value. From 2 to 3 lbs. to the acre when mixed with other grasses.
  - Lb.....\$0 90 | 10 lbs.....\$8 00
- AVENA ELATIOR (*Tall Meadow Oat Grass*). Most valuable for pasture on account of its early and luxuriant growth; it produces an abundant supply of foliage, which is relished by cattle early and late. For hay it may be cut twice a year, and for green soiling it may be cut four or five times in favorable seasons. It is very hardy, and withstands extreme drought and heat and cold. It is very valuable for our Southern states, where it is extensively cultivated for Winter grazing and for hay. 50 lbs. to the acre.

Lb\$0	35	25 lbs	.\$6	50
10 lbs 3	00	100 lbs	.24	00

BERMUDA GRASS (Cynodon dactylon). A most valuable grass for our Southern states, both for pasture and lawns. It is of dwarf habit, with long, creeping stems rooting at the joints and covering the ground with a matting of fine turf, which no amount of trampling will impair. It is also useful for binding drifting sand and for steep embankments subject to wash. When established it is difficult to eradicate, and is therefore unsuitable for temporary pastures. It requires heat and moisture to start it. As it cannot endure frost, it is of no value north of Virginia. It thrives in the poorest and sandiest soil, and resists extreme drought and intense tropical heat. It should be sown at the rate of 15 lbs. to the acre.

Lb\$0 65   25 1 10 lbs	lbs	)0

BLUE GRASS, Canada. See Poa compressa.

66

\*\*

- " English. See Festuca pratensis.
  - " Kentucky. See Poa pratensis.

# **GRASS SEEDS**—Continued

**BROMUS INERMIS** (Awnless or Smooth Brome Grass). An erect perennial, 3 to 5 feet high; native of Hungary. The nutritive quality of its hay, however, is generally inferior to that of our standard native sorts, so that we should recommend it only for dry, arid soils where the better and more delicate grasses would not grow. It is strongly stoloniferous, its creeping rootstocks spreading rapidly under ground and giving out new plants. It is on this account undesirable for temporary meadows, being difficult to eradicate when once established. Sow 35 to 40 lbs. to the acre.

Lb\$0 25	25 lbs\$5 25
10 lbs 2 35	100 lbs

BROMUS PRATENSIS (Meadow Brome Grass). A hardy perennial, 2 to 3½ feet high, much used in mixtures for meadows, both for mowing and pasture. It is not recommended to be sown alone except in poor soil, on dry, stony hillsides, where better grasses will not grow. It withstands extreme cold and drought, and, if cut before flowering, it makes a good hay. If left to grow older, it becomes very tough. 30 lbs. to the acre.

Lb\$0	25	25 lbs	.\$5	00
10 lbs 2	25	100 lbs	.18	00

**CYNOSURUS CRISTATUS** (*Crested Dog's-tail*). A stoloniferous perennial, forming a smooth, compact and lasting turf. It thrives best on rich, moist land, but it can accommodate itself to almost any soil. Its roots penetrate deeply into the ground, which enables it to stand severe droughts. It makes a good bottom grass and is therefore valuable in mixtures for lawns and putting-greens. It thrives well in the shade. The color is the same as that of the Kentucky Blue Grass, and it is, therefore, excellent in mixture with that sort. If sown alone, 30 pounds to the acre is none too much, but it is recommended only in mixture with other sorts.

Lb\$0	40	25 lbs\$8	00
10 lbs 3	50	100 lbs	00

- DACTYLIS GLOMERATA (Orchard Grass; Cocksfoot). One of the grasses most employed in permanent meadows, either for pasture or for mowing. It is very hardy and succeeds well anywhere in the United States. It is very productive and makes excellent hay. If cut before it flowers it is less hard and the pith of the stem is soft and sweet. It blossoms about the same time as Red Clover, and is therefore, desirable in mixture with that plant. Stock of all kinds are very fond of it, either dry or green, and it endures constant cropping better than any other grass. After being mown, it grows up quickly and yields a heavier aftermath than any other variety. It can stand considerable shade, and is recommended as a pasture grass for woodlands. Its tendency to grow in tussocks is diminished if it is sown with other grasses, and also by heavy rolling in the Spring; but it is quite unsuitable for lawns. (14 lbs. to bushel.) Sow 3 to 4 bushels to the acre. Lb.....\$0 40 10 lbs..... 3 50
- **DOG'S-TAIL, CRESTED.** See Cynosurus cristatus.

- FESTUCA DURIUSCULA (*Hard Fescue*). This is a variety of *F. ovina*, dwarfer and less vigorous in growth, but possessing all the other valuable characteristics of that variety. It is emphatically a grass for dry lands, doing well on sandy and shallow silicious soils. It is exceedingly hardy and withstands extremes of heat and cold, and also long periods of drought. For permanent pastures on poor lands, it is especially valuable; but it may also be used in meadow mixtures for well-manured clayey lands. In the latter case it has been known to yield a good crop of excellent hay and a very large aftermath. On account of its stooling habit, it is not recommended for lawns. Crop doubtful on account of the war in Europe—will give price on application, if practicable.
- FESTUCA ELATIOR (*Tall Fescue*). This grass succeeds best in moist, alluvial and strong, clayey soils. It is very productive and of long duration, and is especially valuable for permanent pasture. Stock of all kinds eat it readily, and its nutritive value is very great. On rich, moist lands it yields a large amount of hay of excellent quality. It is not suitable for lawns. 40 lbs. to the acre. Lb.......\$0 70 | 25 lbs......\$15 50
  - Lb......\$0 70 | 25 lbs......\$15 50 10 lbs......6 50 | 100 lbs......60 00
- FESTUCA HETEROPHYLLA (Various-leaved Fescue). A very early, hardy perennial, 2 to 3 feet high, thriving best in cold, moist soils that are rich in humus and potash. In such soils it yields heavily, and is valuable in grass mixtures for permanent meadows either for mowing or grazing. Its great production of root-leaves makes it an excellent bottom grass. Its nutritive value is very high. It grows very well in the shade and is highly recommended for shaded lawns in mixture with other grasses. 40 lbs. to the acre. Crop doubtful on account of the war in Europe—will give price on application, if practicable.
- FESTUCA OVINA (*Sheep's Fescue*). A native both of America and Europe. In our Northwestern states there are many varieties of it, some of which grow 2 to 3 feet high. It prefers dry uplands and thrives in poor, shallow, gravelly soils, where other grasses would fail. It is very hardy, resisting extreme heat and cold. Though of dwarf growth, it grows thickly, yielding a large amount of nutritious herbage. In grass mixtures, for pastures on high and dry lands, it is especially valuable. Though a "bunch grass," it may be included in lawn mixtures as well as in fair-green mixtures on account of its fine foliage and dwarf dense growth. 35 lbs. to the acre. Crop doubtful on account of the war in Europe—will give price on application, if practicable.
- FESTUCA PRATENSIS (Meadow Fescue, or English Blue Grass). One of the grasses most used in permanent or temporary meadows for mowing or for pasture. It succeeds best in cold, moist, light soils, in well-drained meadows and in low valleys rich in organic matter. It should not be grown at all on warm, dry land. It does not reach its full development till the second or third years, when it far exceeds most other sorts in the

### **GRASS SEEDS**—Continued

#### FESTUCA PRATENSIS—Continued

quantity of its produce and nutritive matter. After being mown, it grows again very quickly. The forage, either green or dried, is very nourishing and much relished by cattle, especially when cut young. 40 lbs. to the acre.

Lb.....\$0 30 | 25 lbs.....\$5 50 10 lbs.....2 50 | 100 lbs.....20 00

FESTUCA RUBRA (*Red* or *Creeping Fescue*). True. A creeping-rooted species forming a close and lasting turf, and especially adapted for dry, sandy soils. It resists extreme drought, and thrives on very inferior soils, gravelly banks and exposed hillsides. It is also valuable for shady places in lawns, as well as for golf-courses and for binding shifting sands on the seashore. (24 lbs. to bushel). 30 lbs. to the acre.

Lb......\$0 50 | 25 lbs.....\$10 50 10 lbs.....4 50 | 100 lbs.....40 00

FESTUCA TENUIFOLIA (Slender Fescue). This is really a variety of Festuca ovina, with much finer leaves. It will grow on very dry and inferior soils, and its dwarf habit of growth and fineness of leaf render it not unsuitable for dry slopes on lawns and golf-links. It stands grazing well, is very hardy, and lasts long, and may therefore be recommended for permanent pasture on high and dry situations. 30 lbs. to the acre. (22 lbs. to bushel.) Crop doubtful. Owing to the war in Europe—will give price on application, if practicable.

FOXTAIL. See Alopecurus pratensis.

HOLCUS LANATUS (Meadow Soft Grass; Velvet Grass). This grass is of fair agricultural value and it will thrive on poor soil, where better sorts will not grow. It is a perennial, very hardy and grows rapidly. As a forage plant its nutritive value is small, yet it makes a hay that is eaten readily by cattle, especially when it is sprinkled with salt. 35 lbs. to the acre. Crop doubtful. Owing to the war in Europe—will give price on application, if practicable.

# HUNGARIAN GRASS. See Panicum germanicum.

#### JOHNSON GRASS. See Sorghum Halepense, p. 66.

LOLIUM PERENNE (Pacey's Perennial Rye Grass). Although called a perennial, it seldom lasts more than three or four years. It is the most valuable grass of Great Britain; both for pasture and for meadows, occupying there the same relative position of importance that Timothy holds here. The cool, moist climate of England seems to suit it best, yet it succeeds very well in our middle and eastern states, and adapts itself to a great diversity of soils. The seed is large and heavy, and produces a strong, verdant growth in four or five weeks after sowing. It cures into hay having a sweet flavor, and is much relished by cattle and horses. Its nutritive value, especially in mixture with Red Clover, is very great. It is excellent in mixtures for quick effects in lawns or golf-links. 60 lbs. to the acre. (28 lbs. to bushel.)

Lb\$0	20	25 lbs	\$3	00
10 lbs 1	40	100 lbs	11	00

LOLIUM PERENI			
short-seeded, dw			
lawns. Makes a	a fine green	turf in three	weeks.
Lb\$ 10 lbs			

LOLIUM ITALICUM (Italian Rye Grass). Though lasting two or three years, under very favorable circumstances, it is practically an annual. Like the Perennial Rye Grass, it is a remarkably rapid grower, and has, in addition, the advantage of standing extremes of temperature, remaining green throughout the Winter, and retaining its freshness in the hottest Summer months and during prolonged drought. When sown very thickly or in mixture with other sorts, it makes a good, dense turf, and it has been used with much satisfaction on lawns as far south as Jacksonville. On rich, moist soils, it is exceedingly productive and may be cut in four or five weeks after sowing, and every six weeks after that until frost. For temporary meadows, on good soils, it is a most valuable grass. 50 lbs. to the acre. (22 lbs. to bushel.)

Lb\$0	20	25 lbs	3 25
10 lbs 1	50	100 lbs1	2 00

OAT GRASS. See Avena elatior.

ORCHARD GRASS. See Dactylis glomerata.

- PANICUM GERMANICUM (Hungarian Grass). One of the most valuable annual soiling plants. It grows on any ordinary soil; withstands drought well. As it is of very rapid growth, being ready for cutting within sixty days, it may be sown in this latitude as late as the middle of July for hay, or in the middle of August for green fodder. It should be cut just before blooming, when it makes a tender and nutritious hay. Sow 1 to 1½ bushels to the acre. (50 lbs. to bushel.) Doubtful if obtainable owing to the war in Europe—will give price on application, if practicable.
- **PASPALUM DILATATUM** (Australian Water Grass). A somewhat leafy perennial, growing in clumps. Valuable as a pasture grass for the South, endures Summer heat and drought very well and is especially desirable for furnishing late Summer and Autumn feed, during which period it makes its principal growth. Sow lightly on the surface in warm weather. The seed should barely be covered with soil. Sow from 8 to 10 lbs. to the acre, with 5 lbs. of Hungarian Grass as a temporary protection.

Lb\$	0 50	25 lbs	\$10 50
10 lbs 4	150	100 lbs	40 00

PHLEUM PRATENSE (*Timothy*). A native of Europe, but long ago naturalized in America, where it ranks as by far the most important of hay grasses. On moist, loamy or clayey soil it produces a larger hay crop than any other grass. It is not so well suited for light, sandy soils, though preferring a moist, temperate climate, it withstands drought and extreme heat and cold. Its hay is very nourishing and can be preserved for a long time. It should be cut when flowering, as if left later the hay becomes hard and coarse.

# GRASS SEEDS—Continued

#### PHLEUM PRATENSE (Timothy)-Continued

It is often sown with Red-Top Grass and Red Clover, and the nutritive value of the hay is greatly increased by this mixture. If sown alone, at least 25 lbs. to the acre should be used; with Red-Top Grass and Red Clover, 15 lbs. of Timothy, 12 lbs. of Red-Top Grass (Fancy) and 3 lbs. of Red Clover; or with Red Clover only, 20 lbs. of Timothy and 5 lbs. of Clover. The seed weighs 45 lbs. to the bushel. Several grades are always on the market, differing in purity and vitality, but the seed we offer is of the very highest quality and extra clean. It is always most economical to buy the highest grade, known as "Fancy."

Lb......\$0 20 | 25 lbs.....\$3 50 10 lbs......1 50 | 100 lbs......13 00

**POA COMPRESSA** (*Canada Blue Grass*). Highest grade. A very hardy perennial grass, with creeping root-stocks. It grows on the poorest and driest soils, sandy, gravelly or clayey, standing extremes of wetness or drought, and keeping green until the severe frosts of Winter. It is especially valuable for dairy pastures, cows feeding on it yielding the richest milk and finest butter. It is distinguished from the Kentucky Blue Grass by its flattened, wiry stems and by its decidedly bluer color. 60 lbs. to the acre.

Lb\$0	20	25 lbs\$4	00
10 lbs 1	75	100 lbs15	00

- **POA NEMORALIS** (Wood Meadow Grass). The chief characteristic of this grass is its special fitness for shaded positions in lawns and woodland parks, where other grasses will not grow. It is very permanent and hardy, resisting extremes of heat and cold, and is one of the first grasses to show a rich green growth in the Spring. The creeping roots are formed under ground, and make a good turf. Excellent for pasture. 30 lbs. to the acre. (19 lbs. to bushel.) Doubtful if obtainable owing to the war in Europe—will give price on application, if practicable.
- **POA PRATENSIS** (*Kentucky Blue Grass; June Grass*). Highest grade. One of the most widely distributed and valuable native grasses. It combines more points of excellence than any other sort. It is a true perennial, lasting indefinitely and improving every year. Its densely creeping root-stocks, spreading habit and smooth, even

# POA PRATENSIS (Kentucky Blue Grass)-Continued

growth, fine texture, and rich green color render it one of the very best grasses for lawns. It forms a close turf, starts, very early in the Spring, and lasts till frost. It succeeds in almost any soil—dry, rocky, sandy or gravelly—and stands long-continued dry weather and hot suns. It takes, however, two or three years to become well established, and should, therefore, be sown only in connection with other grasses. If the soil is especially suitable it will eventually crowd these out, and make the finest possible sward. It is one of our most valuable pasture grasses, very productive and nutritious. 50 lbs. to the acre.

Lb\$0	30	25 lbs\$6	50
10 lbs 2	75	100 lbs	00

POA TRIVIALIS (Rough-stalked Meadow Grass). A spreading, thickly matted, stoloniferous-rooted species, forming a fine turf, and adapted for shaded portions of lawns. It thrives on rich, moist soil and in sheltered situations, but not on dry land. Valuable for forming bottom grass in mixtures for permanent pastures. 20 lbs. to the acre. (26 lbs. to bushel.)

Lb\$0 70	25 lbs	\$16	00
10 lbs 6 50	100 lbs	60	00

SUDAN GRASS. This recently introduced grass belongs to the Sorghum family, and, according to the reports of the U.S. Department of Agriculture, is a very valuable grass for hay, especially in sections subject to drought, making good yields nearly everywhere; it grows 4 to 9 ft. high according to cultivation, yielding 2 to 5 tons of excellent hay per acre, with as high as 9 tons under irrigation; should not be sown until the soil has become warm, about corn-planting time or a little earlier. Sow broadcast at the rate of 25 lbs. to the acre.

Lb.....\$0 75 | 100 lbs....\$60 00

# Clovers

We quote **present prices on Clovers** as near as it is possible to offer them at, as we go to press. We shall be very glad to quote prevailing prices on all of them from time to time, and we solicit inquiries. It is understood, of course, that all are subject to market fluctuations.

- BERSEEM, or EGYPTIAN CLOVER (Trifolium alexandrinum). Suitable for a rotating crop on irrigated lands. It is very succulent and much relished by stock. Its value as a soil-renovator is very high. Lb. 75 cts.
- BOKHARA CLOVER (Melilotus alba).Valuablesort for soiling and for ensilage and bees.Growsfrom 3 to 5 feet high; sown in rich soil may becut three times; lasts for years if cut beforeflowering.15 lbs. to the acre.Lb.......\$0 4025 lbs.....\$8 0010 lbs......3 50100 lbs......30 00

- **RED CLOVER, MEDIUM** (*Trifolium pratense*). One of the most valuable farm crops of the eastern states for pasture, hay, or for turning under for green manure. Sow in the Spring, 15 lbs. to the acre. Market price.
- KIDNEY VETCH, or SAND CLOVER (Anthyllis vulneraria). A deep-rooted, herbaceous hardy perennial plant, valuable for dry, sandy and inferior soils, upon which Red Clover will not thrive. Eaten with avidity by sheep, cattle and horses; useful in mixture for dry soils. Sow 20 lbs. to the acre.

Lb.......\$0 60 | 25 lbs......\$12 00 10 lbs......5 00 | 100 lbs......45 00

CRIMSON, or SCARLET CLOVER (*Trifolium incarnatum*). Erect annual, 1 to 2 feet high, with bright scarlet flowers. A native of southern Europe; largely grown in our Southern states for improving the soil by turning under. Will not endure severe frost, and cannot be depended upon to stand the Winter north of New Jersey. It is a valuable crop for pasturage or green manure. For hay, cut when in full bloom. Sow 20 lbs. to the acre.

Lb.....\$0 30 | 25 lbs.....\$5 50 10 lbs.....2 50 | 100 lbs.....20 00

WHITE CLOVER (*Trifolium repens*). White Clover is of dwarf habit, spreads rapidly and is very hardy. It is valuable in permanent pastures, being sweet and nutritious. Sow in Spring, 8 to 10 lbs. to the acre.

Lb.....\$0 65

At the present time White Clover is extremely scarce and high—price for large quantities on application.

N.B.—All prices are subject to market fluctuations.

Soja Beans

# Forage, Economical and Miscellaneous Seeds

Except where noted, these seeds are not sold in packets. From 10 cts. to 25 cts. worth is the smallest quantity put up. All subject to change in price.

- AUSTRALIAN SALT BUSH (Atriplex semibaccata). Thrives in soils on which nothing else will grow, and it is highly recommended for alkali soils and all regions subject to periodical drought. It is very nutritious, and good for all kinds of livestock. Two or three pounds of seed are sufficient for an acre. The seed may be sown in beds, and the seedlings planted out when 2 inches high, 3 feet apart. Grows strong and vigorously in the driest seasons. Oz. 15 cts., lb. \$1.
- BEANS (60 lbs. to the bushel)-
  - Velvet Bean (Dolichos multiflorus). Used in the South as a forage plant, and as a fertilizer plant for turning under. Stock readily eat the vines and leaves, and the Beans, when ground with or without the pod, are used in place of oats or corn, or mixed with them. Plant in rows 4 feet apart and 1 foot in the row, 2 or 3 Beans in a place, as soon as danger of frost is past. The vines are strong and vigorous in growth, rapidly covering the ground, and bearing immense quantities of Beans. Qt. 25 cts., bus. \$5.
  - Soja Bean (*Glycine hispida*). Thrives well in hot and dry weather. Plant at the rate of  $\frac{1}{2}$  to  $\frac{3}{4}$  bushel to the acre, in drills  $2\frac{1}{2}$  or 3 feet apart and cultivate same as field corn. It does not make good hay, but is good as ensilage or green fodder.

Soja Beans-Continued

- Hollybrook Early. A vigorous, quick-growing variety. Pk. \$1.50, bus. \$5.
- Mammoth Yellow. The largest-growing Soja Bean, valuable for green fodder and for improving the soil. Pk. \$1.25, bus. \$4.50.
- **BEGGAR-WEED** (Florida or Giant Beggar-Weed; *Desmodium tortuosum*). An erect, leguminous annual, growing from 3 to 8 feet high, with abundant foliage, valuable as forage or for soil renovation in subtropical regions; it also makes hay of a fine quality. It should be sown at the rate of 10 lbs. to the acre, after the ground is warm and moist. The seed should be but very lightly covered. If for hay, it should be cut just as it begins to bloom. Lb. 40 cts., 100 lbs. \$35.

BERSEEM. See under Clover, page 62.

- **BROOM CORN** (Sorghum vulgare). (12 quarts to the acre). Broom Corn succeeds in a good, deep soil, fresh but not damp, and it is very sensitive to cold.
  - Long-Brush Evergreen. Lb. 15 cts., 100 lbs. \$6.

Improved Dwarf. Lb. 15 cts., 100 lbs. \$6.

California Golden Long-Brush. Grows from 12 to 14 feet high. Lb. 15 cts., 100 lbs.

#### FORAGE, ECONOMICAL AND MISCELLANEOUS SEEDS—Continued

- CASTOR BEAN (*Ricinus*). The plant from which Castor-oil is made. Qt. 25 cts., bus. \$6.
- CHICORY, Large-rooted (Cichorium Intybus). When the roots are dried, roasted and ground they become the Chicory of commerce, and are used in adulterating coffee. Oz. 10 cts., lb. 90 cts.
- **COWPEAS** (Vigna Catjang). Specially adapted to warm countries; extensively grown in our Southern states, also valuable in this latitude as a fodder-plant. The chief value of Cowpeas, however, is as a green crop to plow under. The seed should not be sown till the ground has become well warmed. Sow 1 bushel to the acre, in drills; 2 or  $2\frac{1}{2}$  bushels to the acre if sown broadcast.
  - Black. Standard variety; early and very prolific. Pk. \$1.50, bus. \$5.
  - Clay. A little later than the Black; prolific in both peas and growth of vine. Pk. \$1.50, bus. \$5.
  - New Era. Upright-growing, quick to mature and very prolific of peas. Pk. \$1.50, bus. \$5.25 Whippoorwill. A favorite sort; makes a good
  - Whippoorwill. A favorite sort; makes a good growth of vine and very good for improving the land. Pk. \$1.50, bus. \$5.
- EMMER. (Sometimes advertised as "Speltz," though this name is incorrect, the true Speltz being a different article.) It is grown quite extensively in the Northwest, having been brought by the Germans from Russia, where it is considered a valuable cereal on account of its hardiness and drought-resisting qualities. Lb. 15 cts., 100 lbs. \$7.

**ESPARSETTE.** See Onobrychis sativa.

- FURZE (Ulex europaea). Also known as Whin and Gorse. A perennial leguminous shrub. The crushed sprigs of one year's growth of this shrub furnish an excellent green fodder in Winter. It grows well on barren hillsides and in sandy soil. Sheep are fond of it. 25 lbs. to the acre. Oz. 15 cts., lb. \$1.50.
- JERSEY WINTER KALE, or Cow Cabbage. Excellent for feeding cattle; very hardy. Pkt. 5 cts., oz. 10 cts., 1/4 lb. 20 cts., lb. 65 cts.
- JUTE (Corchorus). Annual. Thrives in any good Corn ground. Sow in drills, about 8 inches apart, 4 lbs. to the acre. Requires no cultivation, as it will outstrip in growth all weeds. May be also sown broadcast, 6 or 7 lbs. to the acre. Oz. 15 cts., lb. 75 cts.
- KAFFIR CORN. See Sorghum, page 66.
- KIDNEY VETCH, or Sand Clover. See Clovers, page 62.
- LOTUS corniculatus (Bird's-foot Trefoil). Perennial; used in pastures. Cattle and sheep eat it readily, and it is said to be quite nutritious. It grows on the lightest and most sterile soils, and can withstand severe droughts. Is excellent for sowing in mixture for dry pastures. Lb. \$1. villosus, or major (Greater Bird's-foot Trefoil).
- Lb. \$2.
- LUPINE, Yellow. Succeeds well in the poorest soil, and is exceedingly valuable for plowing in to improve sandy soils It makes good forage, either green or as hay. The seeds are very fattening when used with hay. Sow in the Spring when the ground has become thoroughly warm, at the rate of 90 lbs. to the acre. Lb. 15 cts. 100 lbs. \$8.00.

LUPINE-Continued

- White (Large Flat Seed). One of the best plants known for green manure, as it gathers large quantities of nitrogen from the air. It may be sown from April to July, and plowed under when in flower. The seed, when burned, is excellent manure for orange and olive trees. Lb. 15 cts., 100 lbs. \$10.
- Blue. Used for the same purpose as the White. Lb. 15 cts., 100 lbs. \$8.00.

MILLETS. See Miscellaneous Cereals, page 63.

- **ONOBRYCHIS sativa** (French, Sainfoin; German, Esparsette). A perennial leguminous plant, belonging to the same family as Clover and Lucerne. It is a valuable plant for growing on poor land and barren hillsides. When once well established, it lasts for many years. If to be used for hay, cut just before the flowering period. Sow in Spring, covering the seeds quite deeply, at the rate of 80 lbs. to 100 lbs. to the acre. Lb. 25 cts., 100 lbs. \$15.
- **OSAGE ORANGE** (*Maclura aurantiaca*). Useful for hedges. Lb. 75 cts., 25 lbs. and upwards at 60 cts. per lb.
- PEARL MILLET (*Penicillaria spicata*). A valuable fodder-plant for the South; is enormously productive. Sow the seed in drills 18 inches apart and 8 to 10 lbs. to the acre. Lb. 20 cts., 100 lbs. \$16.
- PEAS, Canadian Field. Valuable for northern climates, for cattle-feeding, especially for milch cows. This pea also makes fine ensilage and for plowing under as a green manure has no equal. It is sown broadcast in the Spring and harrowed in 2½ to 3 bushels to the acre. If sown with oats, about 1½ bushels to the acre. Qt. 25 cts. bus. \$4.50.

PENICILLARIA spicata. See Pearl Millet.

- **POPPY, Opium** (*Papaver somniferum*). The seed furnishes an agreeable sweet oil, used for the table, also for painting and for illuminating. May be sown in Spring, either broadcast or in drills, covering thinly. Also cultivated for opium. Oz. 20 cts., lb. \$1.
- RAPE, Dwarf Essex English (Brassica napus). Largely grown in the northern United States, and in Canada. It is excellent for sheep-pasture and also for soiling. It may be sown in May, and will be ready for pasturing in July and August; or, it may be sown in June or July, and yet furnish a large amount of pasture or fodder. In drills, sow 5 lbs. to the acre; sown broadcast, 10 lbs. to the acre. Lb. 20 cts., 100 lbs. \$12.
- REANA luxurians (*Teosinte*). (Short crop.) A valuable fodder-plant from Central America, in growth resembling Indian corn. Well adapted to our Southern states. Oz. 15 cts., lb. \$1.
- SAINFOIN. See Onobrychis, above.

SALT BUSH. See Australian Salt Bush, page 64.

- **SORGHUM.** Twenty-five pounds required to the acre if sown in drills. For dry fodder, 2 bushels should be sown to the acre.
  - Early Amber Sugar Cane. Ripens wherever Indian corn matures. Grows 10 to 12 feet high. Lb. 15 cts., 100 lbs. \$7.
  - Brown Dhoura. Lb. 15 cts., 100 lbs. \$7.

# FORAGE, ECONOMICAL AND MISCELLANEOUS SEEDS-Continued

# SORGHUM-Continued

66

- Halepense (Johnson Grass). One of the most valuable Southern fodder plants. On rich soils it may be cut three or four times in a single season, and it is claimed that hay made from it is equal in value to Timothy. Sow in August and September, 35 to 40 lbs. to the acre. Lb. 20 cts., 100 lbs. \$12.
- Holcus saccharatus (Sugar Millet). Rich in saccharine matter, and a large amount of nutritive fodder can be obtained from it. Lb. 20 cts., 100 lbs. \$12.
- Jerusalem Corn (White Dhoura). Lb. 15 cts., 100 lbs. \$10.
- Red Kaffir Corn, or Sorghum. Non-saccharine. The plant is low, stalky, perfectly erect. The whole stalk, as well as the blades, cures into excellent fodder, and in all stages it is available for green feed. Lb. 15 cts., 100 lbs. \$6.

White Kaffir Corn. Lb. 15 cts., 100 lbs. \$6.

- Early Orange Sugar Cane. Ripens about ten days after Early Amber, and is said to pro-duce a larger crop. Lb. 15 cts., 100 lbs. \$6.
- Shallu. A non-saccharine Sorghum from India, also known as Egyptian wheat. Requires more room to develop than ordinary Sorghum, and consequently needs less seed to sow an acre. Lb. 15 cts., 100 lbs. \$7.
- Yellow Branching (Yellow Millo Maize). Non-saccharine; useful for the large amount of foliage, green feed or cured fodder that it furnishes, and for its grain. Lb. 15 cts., 100 lbs. \$5.
- SPURRY (Spergula arvensis). Annual. Grows well on poor, dry, sandy soil; may be sown every month from March to August. Excellent pasture for cattle and sheep; also of much value as a fertilizer for light soil. 15 lbs. to the acre. Lb. 20 cts., 100 lbs. \$12. Giant Spurry. Lb. 20 cts., 100 lbs. \$12.
- SUNFLOWER, Large Russian. Lb. 12 cts., 100 lbs. \$9.

See Reana luxurians, page 65. TEOSINTE. TOBACCO SEED. See pages 50, 51. ULEX europæa. See Furze, page 65. VELVET BEAN. See page 64.

Vetch

- VETCHES, Spring Tares (Vicia sativa). Sown broadcast at rate of 60 to 100 lbs. to the acre. with oats for soiling. Used in France and Can-ada as a substitute for Peas. Price variable. Present quotation, lb. 12 cts., 100 lbs. \$10.
  - Sand, Winter or Hairy Vetch (vicia villosa). Thrives on poor, arid, sandy soils. It may be sown either in Fall or in Spring, mixed with rye for a support. Grows 3 to 4 feet high, and can be cut as soon as the bloom appears and again for the seed. Perfectly hardy. Sow from 30 to 50 lbs. to the acre. Price variable. Present quotation: Lb. 25 cts. 100 lbs. \$22.

# FARMOGERM

A preparation of high-bred, nitrogen-gathering bacteria in sealed bottles, ready to use, with water added according to directions. Bottles contain enough Farm-ogerm to inoculate the seeds for one acre. Prepared Prepared for the following crops:

White Clover **Red Clover Crimson Clover** Alsike Clover Alfalfa Clover Garden Beans

Cowpeas Vetches **Canada Field Peas** Garden Peas Sweet Peas Soy Beans

Price per acre bottle, \$1.50; per five-acre bottle, State for what crop Farmogerm is \$5. wanted, when ordering.

Also in garden size, enough for 1,000 square feet or a 200-foot row, at 50 cts. per bottle, for Peas, Beans, Sweet Peas and White Clover, each crop requiring a different bottle. We secure cultures fresh from the laboratory, hence it takes two or three days to fill orders. Also

	ARMOGERM
good for any Crop, Gan	den or Field.
	\$1.00

Fraxinus Americana alba

# Tree and Shrub Seeds

To preserve seeds of Conifers and other Evergreen Trees, it is best to keep them in perfectly dry sand until the time of sowing. For this latitude the seeds should be sown thinly, as early in the Spring as the ground can be worked, in beds of fine, sandy loam. Cover to the depth of about the thickness of the seed, and press the beds gently with the back of the spade to firm the earth around the seeds. Great care must be taken not to give too much water, as the young plants damp off very easily. Water with a very fine rose, but never so that the ground becomes soggy. Some shade must be used to protect the young plants from the hot sun and winds, and to keep the birds from destroying them. Seeds of the rarer sorts may be sown in coldframes or boxes; if in coldframes the sashes should be shaded and the frames raised at the corners 3 or 4 inches to allow the air to circulate freely. Keep the young plants well weeded, and allow them to remain one to two years before transplanting.

The propagation of Deciduous Trees from seed is less difficult than that of Evergreen species. Acorns, Hickorynuts, Chestnuts and Walnuts should be planted in Autumn, or kept during the Winter in earth or moss. They shrivel up by too long exposure to the air, and many of them lose their vitality. Those seeds with hard shells, like the Locust, Gymnocladus, etc., should be planted in Autumn or placed in boxes with sand, and exposed to frost before planting. They may not germinate till the second year after planting, and if they are received too late in the Spring to expose them to the action of the frost, they may be put into a vessel of hot water for an hour or so before planting. American Elm, Silver Maple and a few other sorts ripen their seeds early in Summer, and, if gathered and planted soon after they fall from the tree, will make fine plants the same season. The seeds of other Deciduous Trees and Shrubs should be planted from the middle of April to the middle of May, in drills about 2 feet apart, and covered about  $\frac{1}{2}$  inch in depth, according to size.

Some of the varieties here offered are on hand now; many are due from foreign countries, where they are being collected for us. Owing to the war in Europe, we are, of course, uncertain of getting all of them. As the season advances, many sorts become worthless from various causes, or are sold out, and cannot be replaced until the new crop is ready next season.

# EVERGREEN TREE AND SHRUB SEEDS

We do not sell Tree or Shrub Seeds in quantities of less than an ounce of any one variety, except those quoted at over 25 cents per ounce; of these, 25-cent packets may be ordered.

## PRACTICAL DIRECTIONS FOR CULTURE, TREATMENT, ETC.

HARDY ANNUALS (hA).—Sow in April or May, according to the latitude, in shallow boxes or pots placed in a warm window, a hotbed, or, if possible, in a greenhouse. A second sowing ought to be made from two to four weeks after for a succession, as well as to provide against failure the first time. For sowing seeds in there is nothing better than shallow boxes from 2 to 3 inches deep, and of any convenient size. The most suitable soil for all the smaller kinds is a very fine, rich, sandy loam. That from old hotbeds is excellent, or sods from an old pasture piled up and allowed to rot for two or three years and then mixed with a little old stable manure and sand. After the seeds are up care must be taken to give them plenty of air and moisture, yet not too much water, or they will "damp off." When the young plants are well out of the seed-leaf they must be transplanted to new boxes. If pots 2 inches or more in diameter can be had, set out from three to a dozen or more of the young seedlings along the edges of the pot, so that as soon as the ground is warm enough they may be easily turned out and planted singly, as by that time they will have made good roots. When pots cannot be had, boxes, tin cans, etc., may be substituted.

A common mistake in sowing flower, as well as other seeds, is covering too deeply. The exception to this is the Sweet Pea which is seldom planted deep enough. As a general rule, cover only to the depth of the thickness of the seeds; or, with medium-sized seeds, like Balsams, Zinnias, etc., half an inch or so is none too much. Such fine seeds as Portulacas need only to be pressed into the soil with a piece of board or the palm of the hand. Always press the earth down firmly after sowing all flower seeds, else there is danger of their drying up before the roots can get firm hold of the soil. Seeds of the hardier Annuals may be sown where they are to grow; but, as a rule, it is preferable to transplant, as the plants are generally stronger and stand the drought better. During very dry weather, and when the seedlings are first set out, they should be watered frequently. Provide some support for all such Annuals as require it.

The weeds should be kept down and the ground loosened often, so that the plants will receive the full benefit of the rains and dews, which they will not if the ground is allowed to become hard and baked.

Seeds of Biennials and some Hardy Annuals may be sown in July and August in the open, and in September in boxes and placed in coldframes. They will make strong plants by Spring, and flower early. Do not put on the sashes until heavy rains and frosts begin, and then always remove during the day whenever the temperature is above freezing in Winter.

Owing to the presence in most soils of Weed Seeds, it is well to mark where seeds are sown in the open, so that the weeds (which are apt to germinate first) can be destroyed before they crowd out and smother the Flower Seeds as they spring up.

**HARDY BIENNIALS (hB) and HARDY PERENNIALS (hP).**—These require the same treatment as the Hardy Annuals. In addition to the above, both Hardy Biennials and Perennials may be sown in the open border from July to September. The seeds of many Perennials require several months, some even as long as two years, before they germinate. It is a good plan, at the commencement of frost, to cover the plants lightly with straw, leaves'or any dry litter, in order to afford some protection from the extreme severity of the Winter. As soon as the frost is out of the ground in the Spring, remove the covering and loosen the surface around the plants, which, when large enough, may be transplanted to the flower garden where they are to remain.

**HALF-HARDY ANNUALS** (hhA).—These may be sown in shallow boxes, pots or a hotbed, as directed for Hardy Annuals. They may be sown thus at any time after the middle of April, as the hotbed will be sufficient protection; but it is best to cover the glass with a mat or straw at night until danger of frost is past. In the day give all the air possible. After the end of May sow in the border, like Hardy Annuals.

HALF-HARDY BIENNIALS (hhB) and HALF-HARDY PERENNIALS (hhP) require the same treatment. Though plants and their blooms are greatly forwarded by sowing the seeds early in boxes under cover, it may be stated that nearly all kinds of Hardy and Half-hardy Flower Seeds may be sown in the open border in a warm and sunny spot as soon as the soil has become dry and warm; so that those who have no glass frames or greenhouses need not be without flowers. They can have them, but it will be later.

**TENDER ANNUALS, BIENNIALS and PERENNIALS.**—The best method to obtain an early bloom of the Tender Annuals (tA), and to insure strength to the plants, is to sow the seeds in boxes or pots in March, placing them in a warm greenhouse or plunging in a moderate hotbed, carefully protecting them from the cold, shading from the midday sun, and watering with a fine rose. The seed should be sown in a very light, sandy compost, and the pots well drained by placing broken pots or bits of sod in the bottom. The finer seeds must not be covered more than an *eighth of an inch deep*, and the soil pressed down closely over them. Water frequently, particularly if the house or hotbed is very warm. As soon as the plants are out of the seed-leaf transplant them into shallow boxes or small pots, and when they have acquired sufficient strength transplant into the flower beds; not, however, before the middle of May.

**GREENHOUSE SEEDS** (g) should be sown as directed for Tender Annuals, in pans, pots or shallow boxes, and be kept in the house, carefully watched, slightly watered occasionally, and sheltered from the hot sun till strong enough to transplant. Most varieties may be sown at any season of the year.

The smaller seeds of Greenhouse Plants are sometimes difficult to make germinate unless great care be taken in the mode of sowing. Hence the supposition arises that the seed itself is not good, whereas the fault is not in the seed, but in the treatment. Fine seeds of this description should be sown in leaf-mold or peat, with some fine sand added to it; press firmly down in the seed-pan or pot, and make perfectly level at the top so that the mold may not afterward sink materially with watering. Sow the seed very thinly and cover very lightly with a little compost or with silver sand. Success is more certain if a pane of glass is placed over the pan or box till the plants have appeared, when it should be removed. As soon as the young plants have two leaves they should be transplanted into similar compost in another pan or box. After transplanting they should be kept in a shady part of the greenhouse for a few days and watered very sparingly.

Aster, Giant Grego

ASTER hhA One of the very best Annuals for cut-flowers

The Aster is of easy culture and very popular. Plants from seed sown in the open ground in May bloom finely in September and October. For July and August flowers sow in March or April in coldframe, spent hotbed, or in pots or boxes in the house. Cover the seeds about half an inch deep with rich, light soil, and when the plants have three or four leaves transplant about 18 inches apart each way into well prepared beds. Manures too-fresh or used in too large quantities sometimes induce disease in Asters. When used they should be thoroughly well decayed and mixed with the soil. Small quantities of slaked lime or fresh wood-ashes stirred into the surface of the Aster beds form good tonics for the plants and keep disease and insects from the roots. insects from the roots.

BALL, or JEWEL. Flowers long stemmed, quite

# SWEET PEAS (Lathyrus odoratus) hA

N.B.-Intending purchasers are strongly advised to order as soon as possible after receipt of catalogue.

Through the skill of specialists the Sweet Pea has become much larger and lovelier than before it became so popular. There are flowers of quite distinct shapes, some of which are a great improvement upon the Sweet Pea of the old type. For garden decoration it is now grown in clumps and in separate colors. The plants are more robust, dwarf and branching, and bloom more freely, some varieties showing three or four blooms on a stem.

A deep, rich, moist soil is best suited to Sweet Peas, hence a trench should be dug  $1\frac{1}{2}$  feet deep and filled with very best loam mixed with bone meal or well rotted manure. The vines are usually grown in double rows, with a wire trellis or a row of brush between. For each double row make the drills about 12 inches deep, and 9 to 10 inches apart. Sow plentifully, covering about 2 inches deep, and, by degrees, as the vines grow up, fill the trenches with soil, and thin out to about 2 or 3 inches apart. Spring sowings should be made just as early as the ground can be prepared, whiteseeded varieties should not be sown until the ground is fairly warm. The earliest flowers are from seed sown in Fall, preferably in a dry situation, and 6 to 8 inches deep, giving them level culture. Sweet Peas should not be grown on the same soil year after year. If the location cannot be changed the soil, to the depth and width of a foot or so, should be removed and replaced by soil from another part of the garden or grounds. If the soil is in good, rich condition, bone meal is the best fertilizer.

Sweet Peas (Grandiflora)

We do not sell less than 1 oz.,  $\frac{1}{4}$  lb. or  $\frac{1}{2}$  lb. at the prices quoted per oz.,  $\frac{1}{4}$  lb.,  $\frac{1}{2}$  lb. and lb. respectively. This applies to all types and to the mixtures.

In order to assist our customers in making their selections, we group the different varieties according to color.

### NEW GIANT, EARLY-FLOWERING, LONG-SEASON SPENCER SWEET PEAS

This new race of Sweet Peas is expected eventually to take the place of all other Early and Late varieties, as they bloom from four to six weeks earlier than the late-blooming Spencers sown at the same time and continue blooming for four months. They are vigorous growers with immense waved flowers borne on long strong stems in threes and fours adaptable to our warm Summers and free flowering. We strongly recommend a trial of these new creations.

<b>Early Melody.</b> This is a deeper shade of pink Pkt. than Early Song Bird, on white ground. It might be described as rose pink on white ground, very pleasing; mostly four well waved blossoms to each stem; free flower- ing	<b>Early Song Bird.</b> Soft blush-pink shade; large, Pkt. fine flowers, borne on long stems in threes and fours. When in full growth it appears as though every stem has four blossoms, and of great quality
Early Morning Star. Deep orange scarlet or	Early Spring Maid. The color is light pink on
flame color in standard, with rich orange-	a cream ground. A most lovely variety, with
pink wings, keeping its color well and does not burn badly. Flowers are large and waved,	very large, waved flowers; for an early cream pink Early Spring Maid is unex-
borne in threes and fours abundantly; when cut and under artificial light its coloring is	celled
exquisite	Yarrawa. Rose color on first opening, chang-
Early Snowflake. The blossoms are very large	ing as it develops to a charming combination
and of the best waved form, resembling the	of light pink standards and blush wings of
noted White Spencer; a free bloomer, with	vigorous habit, the flowers are produced on
good, long stems54566 25	long stiff stems

#### EARLY AND WINTER-FLOWERING SWEET PEAS

# Selected List of Flower Seeds

We have unquestionably the largest assortment of Flower Seeds in America, and our strains are far superior to those commonly sold often under fancy names and at fictitious prices. We avoid extravagant descriptions, meant only to effect sales.

There are many minute plants from the finer seeds killed by drenching with water while very young. In the first stage of their existence plants require moisture in a minute quantity, often repeated, and not in such large quantities as to saturate the soil in which they are growing.

FLOWER SEEDS DELIVERED FREE BY MAIL ON RECEIPT OF THE STATED PRICE PRICE PER OUNCE OR POUND FOR THOSE NOT OUOTED, ON APPLICATION

## Not less than $\frac{1}{4}$ oz. or 1 oz. sold at the prices quoted per $\frac{1}{4}$ oz. or 1 oz. respectively Explanation of Signs Employed in This List

The asterisk (\*) designates ornamental-leaved plants. This mark (‡) prefixed indicates the climbers.

	(., 1
S represent	s Shruhs—plants of hushy habit.
g "	greenhouse plants.
Bu "	bulhous plants.

Biennial—lasting two years. Perennial—lasting three or more years. в .... P

A represents Annual-lasting hut one year.

46 E Evergreen-retains foliage the entire year.

As a large number of Biennials and Perennials, if sown early, flower the first season from seed, this distinguishing mark (†) is affixed to such.

The hardiness is denoted by the following abbreviations, but it should be understood that this is intended to apply to the climate of the Middle Atlantic States. Farther north or south, these designations apply only in a comparative way.

h represents hardy—plants for open border. hh represents half-hardy—plants that require to be forwarded in pots or frames. t represents tender-requiring protection.

Our Imported Collections are sent out as received from Europe. The assortments are good and highly recommended, bnt it is impossible to make any alteration in the contents thereof.

Customers will find it more convenient to order hy number. If ordered from any catalogue other than this (1917) kindly state from which year's catalogue the numbers are taken. This will facilitate the filling of orders and will insure prompt shipment.

Many of our Flower Seeds are grown in Europe. Owing to the war some sorts may not be received until later in the season than usual. At the time of going to press we expect to receive all the varieties we quote, but may be disappointed. A memorandum will be kept of any items not sent and the seeds will be forwarded as soon as they arrive.

<ul> <li>Verbena). Handsome, trailing plants, these hardy annuals with large, rose-colored flowers, are especially adapted for vases and rock gardens, doing best in light, sandy soil. Sow in the open ground in May</li></ul>	<ul> <li>ACANTHUS (Bear's Breech). Hardy perennial plants, flourishing in almost any soil or situation. Much prized for decorative purposes. Pkt.</li> <li>mollis. White; 3 ft</li></ul>

#### CATALOGUE OF HIGH-CLASS SEEDS

- AOUILEGIA (Columbine). Few hardy from seed, and will give such unalloyed satisfaction. A most desirable border plant. It forms large clumps, blooms early, long and abundantly, is useful for cutting and elegant in habit. Sow seed in the open ground in Spring, preferably where the plants are to grow, and thin to about a foot apart. Sow in the Fall for flowering the following season. They thrive well under ordinary garden culture, but such rare sorts as A. cærulea and A. chrysantha do best in partially shaded, welldrained nooks.
  - canadensis. Scarlet and yellow; for shade; Pkt. 10
  - long spurred; 3 ft.....56520 25
  - cærulea (Rocky Mountain Blue Colum-bine). One of the most beautiful of our native flowers. Sepals blue, petals white; 15
  - hardy perennials; stems 2 ft. high, with sometimes 50 to 80 blossoms 3 in. in diameter, of the deepest blue, with white corolla; a splendid flower....56560 50
  - Jætschaui. Large flowered, yellow; long ..... 56570 10

- BALLOON VINE (Cardiospermum). A Pkt. pretty and fast-growing, half-hardy annual climber, with white blossoms; 10 ft. oz. 40c...57080 5

BALSAM (Lady's-Slipper). These favorite half-hardy annuals are of the easiest culture, but love hot sun, rich soil and plenty of water. The young plants are quick, sure growers, and, from seed sown in the open ground in May soon form handsome bushes thickly massed with large, Rose-like flowers. Transplanting two or three times has a tendency to dwarf the plants into better shape and to make the flowers more double. Balsams are not often given room for perfect development; they will easily cover 12 to 18 in. of space each way. For the finest flowers

#### CANDYTUFT-Continued

PERENNIAL CANDYTUFT. Hardy evergreen plants, making a magnificent showing the second year from seed. They bloom very early, cushioning rock ledges, borders, etc., with banks of bloom. Sow outdoors in Spring or Fall in any sunny place.

sempervirens. White flowers remain Pkt. fresh nearly a month; 1 ft.....58990 15

- \*CANNA (Indian Shot) (hhP). One of our best bedding plants; beautiful, ornamental foliage and large, brilliant flowers. Much employed in subtropical gardening, groups on lawns and mixed flower beds. Soak the seed before planting; 4 ft.
  - \*Queen Charlotte. Scarlet and yellow. Pkt. **59040** 10
  - \*Finest Mixed. Crozy's hybrids; very fine. 59050 5
- CANNABIS gigantea (Giant Hemp) (hhA). A fine foliage plant for borders; 8 ft. 59070 5
- CANTERBURY BELLS. See Campanula.

Campanula Medium Single

T.

**CARNATION** (Dianthus Caryophyllus). The splendid Carnation of the florist is a very interesting plant to grow from seed, and it is not over-exacting. Sown under glass in early Spring or later in the open ground the plants will flower finely the second Summer. For largest, richest flowers we recommend culture in pots of rich soil. With many they are also garden favorites, and, grown in this way, flowers of good quality may be enjoyed all Summer if given plenty of water, good soil and a mulch about their roots. With tall varieties staking and tying is necessary. Young plants are perfectly hardy outdoors, but when two or three years old they are injured by Winter cold, so that sowings should be made every year. The more expensive sorts produce the finest flowers. The prices we quote, although seemingly high, are most reasonable for strains such as we offer.

MARGARET CARNATIONS are an extra vigorous race, especially adapted for outdoor culture. They are very neat in habit, and remarkable for their rich profusion of flowers, produced in five months from sowing. Grown as annuals from seed sown every Spring they are most satisfactory. Our seed of these varieties is grown exclusively in the famous Chabaud Garden of Carnations, Provence, France.

Carnation, Thorburn's Margaret

**CARNATIONS**—Continued

- Giant Margaret. Extra large and per-Pkt. fect, flowering in a rich variety of colors; 80 per cent. of the flowers generally come double. A splendid sort for cutting; 1 ft.......59150 25
- **PERPETUAL CARNATIONS.** This race has large, elegantly formed flowers, continually abloom, upon closely branched, symmetrical plants, often called, from their neat habit, Tree Carnations.

CHRYSANTHEMUM Do not con- found these
annuals with the Winter-flowering sorts
of the florists. They bloom profusely from
early Summer until frost, and, when grown in
large beds or masses their bright colors make a
splendid show. The plants can be brought
into bloom early by sowing the seeds in
frames or window-boxes, and afterward trans-
planting to the garden; or seed may be sown
where the plants are to flower, if the seedlings
are thinned to 8 to 10 inches apart. Pinching
back in early growth makes the plants bushy
and shapely. Average height, 1 to $1\frac{1}{2}$ ft.

- **CINERARIA** One of the most useful and ornamental of greenhouse plants, with flowers of the richest and most brilliant colors and shades, and of the finest texture. It is rather a difficult plant to grow if its requirements are not understood. The mistake generally made is in growing it in a warm house instead of a cool one. The seed should be started in the greenhouse. For Winter blooming sow in April and May in shallow doxes, in fine soil; drop the seed in shallow drills, cover, and press the earth rather firmly with a piece of board or the bottom of a pot. Set the box where it will get the morning sun, water moderately and carefully. Average height, 2 ft. Pkt. Azure Blue. Dwarf; fine for edging..60780 25 Large-flowered. Crimson. Very brilliant

#### COREOPSIS. See Calliopsis.

**CORNFLOWER.** See Centaurea Cyanus.

- **COSMOS** One of the notable Fall flowers. A strong, tall-growing annual, with bold flowers of exquisite daintiness and airiness, heightened in effect by their foliage setting of feathery green. It is most effective when planted in broad masses, or long background borders against evergreens or fences. We offer only the choice, large-flowering strains. To make sure of flowering early Cosmos should be started indoors and transplanted into dry, sandy or poor soil, in a sunny situation.

Cosmos, Early Flowering Mixed

**CYCLAMEN** These bulbous greenhouse plants are all very beautiful and are unapproached among Winter-flowering plants for duration of bloom, variety of shades, and wealth of coloring. They are among the best plants recommended for house culture, as they thrive well and bloom profusely in the average temperature of the living room. Sow the seed in small boxes or seed pans in a compost of well rotted manure, leaf mold and sand, in the early Winter months. Cover lightly with moss, which should be kept moist and should be removed after the seed germinates. Prick out into small pots when the young plants have two leaves. If grown steadily without any check, they will flower in from ten to twelve months. Average height 9 in.

<sup>62654 25</sup> 

- **DELPHINIUM** (Larkspur). In variety and beauty of its blue tints which are as numerous as they are charming, no other plant can equal the Delphinium. The brilliant flowers are strongly effective in beds or masses, in borders, shrubberies, or in combination with white lilies. Improvements are continually being made in the size of the flowers, as well as in the length and fulness of the spikes. Some of the species flower both early and late; the season for all can be prolonged by cutting away withered flower-stems. All varieties are easily cultivated and adaptable to many conditions, but in a soil deeply dug and well enriched with fine old manure, their blooms are the finest. Setting them 1½ to 2 ft. each way is not too much for the taller sorts.
  - ANNUAL VARIETIES. These include the Rocket or Hyacinth-flowered, so called from their long, narrow flower spikes. They bloom best in a rather cool, moist soil. Sow seed in the open border, either in Spring or Fall, preferably the latter, so that germination may take place very early in the Spring As the seedlings grow, thin them to stand 6 to 18 in. apart, according to variety. The varieties are seldom kept separate, as they are quite as pretty and convenient for cutting when sown in mixture. Some of these are really hardy biennials, but, because they bloom the first season, we treat them as hardy annuals. The shades of color cover a very wide range.

ESCHSCHOLTZIA Commonly called California Poppy. The state flower of California. This much esteemed hardy annual is very bright and rich in its pure tints of yellow, orange, etc. The plants average about a foot in height, with silvery foliage, and produce their large, Poppylike flowers from early Spring until frost. They are most effective when grown in beds of considerable size, over which the seed may be sown broadcast thinly, and lightly raked in. These sowings may be made early in Spring or late in Autumn for earlier germination, blooming the next Spring. Useful as a potplant and for cut-flowers.

THORBURNI. Coppery orange; the ef-Pkt. fect of a plant in bloom is simply gorgeous; the flowers are larger than those of other Eschscholtzias, and are borne with equal profusion; finest of all. (See cut.)

100 J. M. THORBURN & CO., 53 BARCLAY ST., NEW YORK

**HOLLYHOCKS** (Althæa rosea). Although Hollyhocks are very permanent and hardy for the first Winter, it is advisable to sow seed every year of these splendid, hardy perennials, as the flowers on young, vigorous plants are much finer than on old ones. Sowings should be made in April or May, and not later than June, to flower the next year. In final transplanting give each seedling a foot or more space each way for development. They succeed best in an ordinary deep, rich soil. They make a glorious show in the garden with their splendid spires of flowers. Water well in dry

**IPOMOEA** (Moonflower; Morning Glory; Cypress Vine). Of all climbers for garden and greenhouse these are the quickest and most luxuriant in growth. Ipomœas grow so easily from annual sowings that it is no longer thought necessary to Winter over roots or young cutting plants under glass. The large, thorny seeds of some varieties should be soaked in hot water before planting. For early flowers sow in hotbeds, or pots and boxes under glass, and transplant to rich, deep soil in Summer quarters as soon as danger of frost is over, when sowings may also be made in the open ground. Nothing finer for porches, trellises, etc.

\*These are very hard-seeded, and in order to hasten germination, a notch should be filed in the seed before planting.

ANNUAL VARIETIES. From early sowings these begin to bloom about Midsummer, and are full of beautiful flowers all the season, often blooming freely until cut down by frost. \*bona nox (Good Night, or Evening Pkt. Glory). Large, blue flowers open in the  $\mathbf{5}$ lutea. A yellow-flowered va-5 sky-blue flowers with white margins; 15 ft.....67230 5 IMPERIAL JAPANESE MORNING GLORY. ## NASTURTIUM

#### We do not sell less than one ounce of any one kind by weight

A marvelous range of new colors has been developed in this favorite flower which, for three or four months of the season, makes a better display than almost any other plant. No other hardy annual will produce such a lavish profusion of flowers for so long a time with the same small outlay of time and labor. The maximum of bloom is produced on thin soils, and never flags through the hottest weather. In soils too rich, leaves predominate, and the plants are apt to rot off in wet weather, especially if standing too close.

For the celebrated Lobb's Climbing Varieties, see next page

We can supply most of the Dwarf Varieties Nasturtium at 30c. per oz.

#### THORBURN & CO., 53 BARCLAY ST., NEW YORK 110M. J.

Pansy, Thorburn Superb

# PANSY (Viola tricolor; Heartsease)

#### Our strains have never been excelled

The Pansy is a plant that we all delight to grow in plentiful supply for flowers all the year. For very early outdoor bedding the seed is sown from August to October, in a coldframe, or in rich, moist garden beds, from which the plants can be transferred to a coldframe, setting them 2 to 3 in. apart each way before severe Winter weather begins. In Spring three-fourths of them can be lifted out for bedding and the rest left to bloom in the frame. For Winter blooming in a frame set the plants about twice as far apart, and thin out half of them in the Spring. Cover the blooming plants with sashes, adding a covering of matting thin out half of them in the Spring. Cover the blooming plants with sashes, adding a covering of matting or straw in very cold weather. In mild weather remove the mats and tilt the sashes to admit light, heat and fresh air. In outdoor beds, raised a few inches above the ground, with a mulch of dry leaves and some brush to hold them in place, Pansies will often Winter nicely and bloom until Midsummer, when a relay of young, vigorous plants should be ready to replace them. Spring sowings should be made early so as to secure good flowers during the early rains. Seed sown in a cool, moist place in June and July, and well tended, will give good flowering plants for Fall. If they come into bloom in the heat of the Summer, the flowers may be small at first, but, as the weather becomes cooler they will increase in size and beauty, and make a glerious show in the garden. Through Summer heat the flowers are finer in a somewhat shaded place, but in almost any situation good Pansy seed will give fine flowers in Spring and Fall. Early Fall sowings give the finest flowers in Spring, and a bed of Pansies is one of the most beautiful sights a garden can show. The higher-priced sorts produce the largest flowers and the most brilliant colors. This should be borne in mind when ordering. borne in mind when ordering.

Petunia, Thorburn's Century Prize

PE'

PETUNIA HYBRIDA (hhA). Once fairly started,

Petunias grow almost as easily as weeds and furnish a glorious succession of bloom from early Summer until frost. The large-flowered strains are very beautiful and of almost endless variety. Seed of the Double and Giant-flowered Petunias is made expensive by the great amount of labor involved in hand-fertilization, and it is well to handle seed and tiny seedlings with some care. Sow in hotbed, coldframe or in boxes of fine soil in the sunny windows of a warm room in April or May, and transplant about 1 ft. apart in garden beds. Seed of the double varieties has not so much vitality as that of single sorts and needs a little more care in watering to be sure of germination. We have no better plants than the Petunias for beds and masses, borders, window-boxes, baskets and vases. They will grow in almost any soil and bloom profusely through long droughts. The newer varieties are of brilliant colors. The highest priced sorts produce the finest and handsomest flowers, and those we offer are from the most carefully selected strains, saved at great expense. Apparently similar sorts offered at lower prices are not to be compared with those we offer. Average height,  $1\frac{1}{2}$  ft.

SINGLE LARGE-FLOWERED. These have flowers 4 or more in. across. Our strains are superb and the collections offered contain only the finest varieties.

#### **PETUNIA**—Continued

DOUBLE LARGE FLOWERING. Our seed will produce flowers large, fragrant, elegantly formed and beautiful either for house, garden or conservatory. Only a small proportion of the double strains bear double flowers. The reason of this is the fact that the seed must be selected from single flowers, the double ones not producing seed. The single flowers must be collimated with coller from the double ones be pollinated with pollen from the double ones. Cuttings may be made from double-flowered plants and inserted in light, sandy loam for rooting, thus increasing the percentage of double-flowering plants. Pkt.

Parryi. Dark violet blue; 1 ft..... 73710 5

- (Flame PHLOX DRUMMONDII Flower.) The hardy annual Phloxes are dazzling in
  - effect, particularly so when sown in masses or ribbon beds of contrasting colors. Few flowers are so easy to grow from seed, so pretty and compact in habit, so quick to bloom, or give such a brilliant display of color for so little cost and care. There are few desirable colors beyond their range, and if given good soil and planty of water, they furnish a long supply of delicate flowers. For pot culture,

as trailers, and as an undergrowth for tall, bare-stemmed plants they are also valuable. The first. sowings should be made as soon as the frost is out of the ground in Spring, later ones in May, either where the plants are to bloom, or in a seed-bed, as the Phlox transplants readily. In transplanting set the taller kinds about a foot apart; if planted too thickly they suffer from mildew. Cutting away the flowers and seed-pods makes the plants more bushy and compact, and lengthens their blooming time. Average height, 1 ft.

GRANDIFLORA. This section has beautiful, round-petaled flowers, larger than in the older sorts; showy and constant, blooming in the greatest profu-sion from early Summer to frost. Our strain is far superior to that ordinarily sold.

Platycodon

116

#### J. M. THORBURN & CO., 53 BARCLAY ST., NEW YORK

**POPPY** (Papaver). Before Tulips are fairly gone our gardens begin to be gay with Poppies. Few flowers have the same grace of stem, airiness of poise and delicacy of tissue. For beds and borders with a background of green there is nothing finer; some sorts are admirable for naturalizing in open wooded grounds; others, like the Shirley, are beautiful for cutting. A sandy loam suits Poppies best, and, as their strong tap-roots are difficult to transplant, it is well to sow seed where the plants are to bloom. Sowings made in Fall and at intervals in Spring will provide a long succession of flowers. Sow thinly, covering very lightly, and thin the plants to stand about a foot apart. The best plants are those grown from early sowings while the soil is cool and moist.

- **PERENNIAL VARIETIES.** Tall, large flowered and showy; average height, 2 to 4 ft.

#### PORTULACA-Continued

**DOUBLE VARIETIES.** The flowers are so full and perfect as to resemble tiny Roses. Toward the close of the season they will increase in size and beauty. As the full, double flowers do not produce seed, it must be saved from the semi-double flowers growing with the full-doubles. The product of that seed will produce many single flowers. As these bloom earlier they can be pulled out like weeds. When the full-doubles appear cuttings can be made from them and the bed extended indefinitely with only full-double flowers. *Our strains must not be confused with the ordinary, cheap seed usually sold.* Pkt.

Primula Stellata

## PRIMULA

66

CHINENSIS (Chinese Primrose) (gP). Primu-la, or Chinese Primrose, stands in the first rank among greenhouse plants, and is fine for Winter and Spring blooming. It is free flowering and is especially valuable for cut-flowers and for house and window culture. A cool place suits it best. Sow the seeds in drills in a light, rich soil, in shallow boxes, at any time from the widdle of March to the at any time from the middle of March to the end of May; the earliest sown seed will naturally produce the earliest bloom. Cover the seed about an eighth of an inch and press the soil on them with a board or the bottom of a pot. Water moderately; avoid forcing the seed. The plants must be well ventilated, well watered, and slightly shaded. Average height, 9 in. Pkt.

SALVIA (Flowering Sage). The Salvia splendens is a standard bedding plant that keeps the garden bright with color until late in Autumn. For pot culture, for cutting and for borders, etc., it

is very valuable. In this climate sow seed in window-boxes or frames in March or April, and set the plants outdoors the latter part of May; or sow outdoors not before June 1, and protect from heavy rains and strong winds. The plants grow and bloom profusely in any light, rich soil. Both the tender and hardy perennial sorts bloom the first year, and all are treated as annuals.

- gentea (hP). Silvery leaved; flowers Pkt. white; blooms in Spring; 3 ft......77300 5 argentea (hP).
- farinacea (hA). Light blue flowers in great abundance; good for cutting; forms a neat bush; 3 ft.....77320 10
- patens. A handsome, tender perennial, with erect spikes of rich, blue flowers; fine for borders or the greenhouse; 2 ft.. 77330 25
- SPLENDENS (Scarlet Sage) (hhP). These are the well-known bedders, single plants of which carry many long, flaming flower spikes open at one time, keeping up the display until frost.

  - Ball of Fire. Very dwarf and compact, ball-shaped variety, especially suitable for pot culture. The plants are about 2 ft. high to the top of the flower spikes, and about the same in diameter. Color dull red; large spikes, similar to No. 77410. 77390 25
  - Bonfire. Our well-known, compact Salvia --the freest blooming of all, seemingly on fire all the time, with dense, flaming

STOCKS (Matthiola). Stocks have good habit, fine leaves, beautiful and fragrant flowers, a long season of bloom and adaptability to many conditions of culture. They are unsurpassed for bedding, edging, pot culture and for cutting. For fine early flowers sow under glass in March or April, transplanting the seedlings when an inch high into other pots or boxes, or into fine soil spread over some discarded hotbed. In May transfer to garden beds of deep, rich soil, setting the plants a foot apart. Transplanting several times in the early stages of growth tends to make them more dwarf and compact. For later flowers sowings may be made in the open ground in May. If plants that begin to bloom late are carefully potted in Fall they will flower finely all Winter in a house that is tolerably cool and moist. Average height, 1 to 1½ ft.

Verbena Hybrida

**CRBENA** (hhA). In rich soil, single plants of this pretty annual creeper will carpet a space 3 to 4 ft. in diame-VERBENA ter. For beds, borders, mounds, windowboxes, etc., it is particularly fine, and is frequently used as an undergrowth to tall plants like Lilies. Plants raised from seed are cheaper, more vigorous and produce more flowers than those grown from cuttings. For early Spring bloom, sow under glass in February, for later flowers sow in March or April. Soak the seed a few hours in tepid water and sow in boxes filled with light, rich soil; cover one-fourth of an inch deep, press down firmly and water sparingly. When the seedlings are about an inch high, transplant into other boxes. Use a liberal amount of manure in the beds, and set out 10 to 15 in. apart each way in May in a sunny situation. The plants bloom from early Summer until frost.

# ORNAMENTAL GRASSES

The Ornamental Grasses are very attractive to use in mixed flower-beds or borders, and for grouping by themselves give fine effects. Many of them, if cut before they are entirely ripe, will be found very useful, when dried, in the formation of Winter bouquets, in connection with the "Everlastings."

Not less than one ounce of the cheaper sorts at ounce rate.

## **GLADIOLI**

ALL EXTRA-SELECTED, LARGE BULBS, NO SECOND SIZE

If to be sent by mail, add postage at zone rates—10, 1 lb.; 100, 8 lbs.

Gladioli are very easily grown. Any good soil suits them. Plant the bulbs as soon as all danger from frost is past, about 3 inches deep and 7 or 8 inches apart. By planting at intervals up to the first of July, these fine flowers can be had in bloom all through the Summer and Fall-the later flowers being the best. About the end of October, when the leaves begin to wither, the bulbs should be taken up, dried in the open air, and then stored in a dry place, free from frost, for planting next Spring. It is a mistake to plant Gladioli without some suitable subject to hide the surrounding soil; to do this we suggest planting lower growing plants such as Saponaria calabrica, Nigella Miss Jekyll, Violas and Dwarf Godetias. Those marked with an asterisk (\*) are used extensively for forcing.

# CANNAS, Dwarf, Large-Flowering French

Not less than 5 of a kind at 10 rate, 25 at 100 rate. If wanted by mail, add 15 cts. per 10 for postage.

Cannas do well in almost any kind of soil, but they well repay liberal treatment. For the best results they should be planted in good loam that has been well mixed with an abundant supply of well-rotted stable or other manure. The beds should be spaded 2 feet deep, or more, and the soil well pulverized. Water should be applied abundantly at all times, but good drainage is essential.

Cannas are most effective when planted in masses, either alone or in combination with Salvia (Scarlet Sage) and bordered with Coleus or other dwarf-growing bedding plants. They are also frequently used with some of the tall-growing ornamental grasses, with which striking combinations can often be secured. They do best in sunny situations, and should be set out about 2 feet apart each way.

#### PAEONIES

#### If to be sent by mail, add postage at zone rates

Double Pæonies are too well known to require description. Their present popularity is due to the great improvement in them in recent years, their easy culture, the handsome appearance of the plant, and the brilliant and striking effect of their massive, finely formed and richly colored flowers. The attention given to them in Europe and in America has resulted in the production of many notably fine new varieties. Among hardy, herbaceous perennials, the Chinese Pæonies rank about first for lawn or flower-border, or shrubbery decoration.

Our assortment includes some of the best and most distinct sorts, new and old. There are many kinds, including varieties showing but trifling variations, which we omit.

## LILIES

#### If to be sent by mail, add postage at zone rates

Lilies are easily grown and require little care. They do best in a light, well drained soil. Some peat or leafmold may be used to advantage. They also prefer partial shade, and the taller sorts must have protection from high winds. *L. auratum* cannot bear manure, but thrives in ordinary light soil.

#### LILIUM HARRISII (Bermuda Easter Lily)

The large, handsome, pure white, trumpet-shaped flowers are very sweet-scented and of great substance, lasting a long time after cutting. They are easily grown and can be forced into flower in a remarkably short time. They require rich soil but without manure. Each 10 100

- Berlin and Hamburg Cold-Storage Pips. From cold storage; the very highest quality. Price on application.

## JAPAN IRIS (Iris Kaempferi)

If ordered sent by mail, add postage at zone rates

#### SUPERB COLLECTION OF LARGE-FLOWERED SORTS

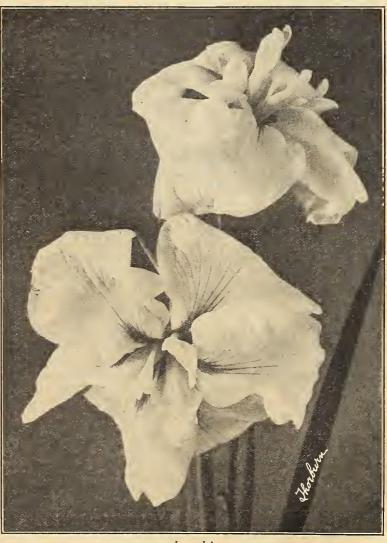

We are importing from Japan a large supply of the following twenty of the best of these magnificent Irises, which are remarkable for the beauty of their colorings and stateliness of habit. Some of them send up ten to twelve spikes, 3 feet high, each bearing two to four enormous blossoms, 8 to 10 inches across. They are most valuable for cut-flowers and table decoration—as handsome as Orchids. Supply water liberally when growing. Cut in the early morning or after sunset. The descriptions given are those furnished us by the growers in Japan.

30 cts. each, \$2.50 per 10, \$20 per 100. The following may be ordered by number; mailing rate

#### 1 lb. each

- 13 Boteki-no-Koe. Pure white, heavily veined lavender, with pale primrose blotches; standard wine color. Three large petals. Striking.
  26 Date-dogu. Claret red, yellow blotches. Three
- petals.
- 89 Fuyoho. Large; pure white, yellow blotches.
- **31 Gei-Sho-Ui.** Claret red, veined white; standards shaded lavender, darker edges, yellow blotches.
- 4 Ho-o-jo (Ho-o-castle). Ruby crimson, primrose blotches; standards white and lavender.
- 37 Katsuraotoko. White, veined lavender; standards white, suffused with lavender, darker edges. Six petals.
   15 Momiji-no-Taki.
- 15 Momiji-no-Taki. Ruby red, yellow blotches; standards white, spotted toward edges pale wine color. Six petals.
- **30 Noboro-Ryu.** Intense Tyrian blue, with yellow blotches; standards white, edged violet.

#### AMARYLLIS

#### If to be sent by mail, add postage at zone rates

The Amaryllis produces, under the simplest conditions, one to three spikes 2 or more feet high, crowned with from two to six large and beautiful, trumpet-shaped blooms lasting long in good condition. They should be planted as soon as received, in pots an inch or so larger than the diameter of the bulb.

The most suitable soil is good loam, with one-fourth part of leafmold or pulverized manure, and some sand. Good drainage is very important. The growing season is from early Spring until September. Manure-water during this time is essential.

   Double and Single, all colors mixed, 10c. each, 90c. per 10.
- BEGONIA CRISPA (Single Fringed Begonias). These comparatively new Begonias have beautifully shaped, gracefully frilled and crested flowers, borne above the foliage on long and erect stems. An exceedingly fine strain. RED per 100.

141

long and erect stems. An Begonia Crispa exceedingly fine strain. RED, ROSE, WHITE, YELLOW and SALMON. \$1.25 per 10, \$10

# CRINUMS

The most suitable soil is a compost of turfy loam, cow manure and sand. They should be grown in large pots or tubs, about three-fourths of the bulbs being out of the soil. In late Fall remove to a cool house and allow to rest till new leaves begin to appear in February. If placed outside when warm weather begins, they will flower through the Summer, making splendid lawn or veranda plants.

Amabile, Giant Pink. Extra large; bright	Powelli. Produces long stems, bear-
pink, with white stripe; splendid flower. Each	ing at the top five to eight large,
Enormous bulb. Mailing rate 11 lbs\$4 00	dark rose, bell-shaped flowers, 3 to 4

	beautiful sort

### GLOXINIAS

#### Mailing rate 1 lb. 10, 7 lbs. 100

Beautiful greenhouse plants, remarkable for the intensity and variety of their colorings, and the exquisite manner in which they are often blotched, mottled, penciled and blended. They thrive best in a soil composed of leaf-mold and peat, in equal parts, with a little sand added. When growing give plenty of water, but it should always be tepid.

### **Clay's Celebrated Fertilizer**

One of the best manures for all horticultural purposes, either in greenhouse or garden. Splendid for mixing with potting soil and as a top-dressing. Notwithstanding its apparently high price, it is quite economical.

# Thomson's Special Chrysanthemum Manure

### Pulverized Sheep Manure (Sheepshead Brand)

A rich, pure, natural manure. Excellent as a topdressing for lawns. Its effect is immediate and lasting. Apply at the rate of 1,500 lbs. per acre. There is nothing better for mixing with the soil for greenhouse plants-one part manure to six parts soil. It is recommended for the vegetable-garden, promoting a steady and rapid growth. It makes a rich and safe liquid manure-one pound to five gallons of water.

# CATALOGUE OF HIGH-CLASS SEEDS 153

- No. 3. Large size. Has one stream and two spray roses, with side pieces on barrel. Length of barrel, 18 in., diam.  $1\frac{1}{2}$  in. \$7 each.
- No. 4. Large size. Has jet and three rose sprays, two of which are kept in the handle. Length of barrel, 18 in., diam. 1½ in. \$7.50 each.
- No. 6. Large size. Has one spray rose and goose-

neck angle joint,

turning in all directions for washing the under surface of the leaves of plants and flowers, cleansing them from insects, etc. Length of barrel, 18 in., diam. 1½ in. \$8.50 each.

### Spray Pump, Bucket

Being made of brass, it is not affected by the arsenites used for spraying. Easily operated; throws a solid stream 50 feet. It is provided with a combination nozzle, and also with a sprinkler for flowers. For spraying large trees, an 8-foot pipe extension is supplied for 60 cts. extra. This pump is also valuable for washing windows. \$4.

Operates on the compressed air principle and throws a continuous spray. Interchangeable brass nozzle—one to throw the spray straight ahead, and one to spray up or down. Capacity, one quart.

	Each	Each
Tin	\$1 00   Brass	

# "Pomona" Spray Pump

Of large capacity and exceptionally powerful. It is easily operated by one person when necessary, but is especially built for spraying with two leads of hose. The airchamber is rather large, and enough air is stored up for a continuous spray for some time. Plunger, valves and all working parts are made of very

#### "POMONA" SPRAY PUMP, continued

good quality brass. It can be quickly inserted or removed from the barrel. Its paddle agitator is far superior to the old return-discharge method of stirring. Adjustable to different-sized barrels. Pump only with agitator, \$16.50.

Outfit C. Pump, agitator, 15 feet of discharge hose and spray nozzle, \$20.00; fitted to barrel, \$23.50

Outfit D. Pump, agitator, two leads of discharge hose and two spray nozzles, \$23.00; fitted to barrel, \$26.50.

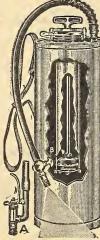

### "Fruitall" Spray Pump

Same as Pomona, but smaller. Pump with agitator and one lead of 15 feet of ½-in. discharge hose, with spray nozzle, \$13.75; fitted to barrel, \$18.25.

### Vaporizing Spray Pump, Hand

A very useful sprayer for a small garden. Simple and effective; no valves to get out of order. Made of tin or brass.

Each Each Each Tin.....\$0 50 | Brass.....\$1 00

# "Auto-Spray" Spray Pump

A self-operating Sprayer of simple construction, durable, easy to carry and to work. Made of galvanized iron or solid brass, with 4-ply rubber hose. For spraying trees, cleaning windows, etc. A perfect pump.

With brass tank and stopcock nozzle, hose and fittings, \$8.

With galvanized iron tank and stop-cock nozzle, hose and fittings, \$5.

Either kind of tank fitted with Auto-Pop nozzle, in-

stead of stop-cock nozzle, 50 cts. extra. Brass extension pipes, 2 feet long, 60 cts. Auto-Pop nozzle, if sold alone, \$1.50.

#### Knapsack Spray Pump FOR VINEYARD, ORCHARD AND FIELD SERVICE

Made entirely of brass and copper, with ball valves and metal plunger all easily accessible. The

discharge is at the bottom, and the pump can be entirely drained of the liquid. It should be carried on the back with the straps crossed in front. The reservoir is made of heavy copper and will hold about five gallons. Complete with 3½ feet of 3%-inch discharge hose, Vermorel nozzle and lance for degorger, \$18.

# Water-Barrel, Truck and Barrel

CAN BE MADE INTO SPRINKLER, LEAF-RACK AND HAND-CART

The barrel is easily disconnected from the truck, either while full or empty. The following extra attachments can be furnished if required: (1) Box with trunnions and spring catch, forming a dumping hand-cart.

(2) Sprinkler for watering walks and lawns. (3) Leaf-rack.

# The "Velvetlawn" Grass Seeder

#### 18 inches wide

The use of a machine in the seeding of new lawns or grass plots, the re-seeding of old lawns, the drilling of grass seeds into putting-greens, and the renewing of grass plots every month or so has proved a decided success wherever it has been tried. The machine to do this work is the "Velvetlawn" Grass Seeder.

Price \$20 net cash.

# The Thorburn Century Ball-Bearing Lawn Mower

Thorburn's Century Ball-Bearing Lawn Mower is a marvel of simplicity, as one screw adjusts both bearings. It has a simple, self-adjusting device, which keeps the bearing properly adjusted for a long time, and a double interchangeable ratchet. By shifting handle bails from the front to the rear lugs on the side frame, the Mower can be made to cut terraces and steep banks.

While cheaper mowers are sold all over, they will be found far dearer in the end. It pays to get a good mower.

"Velvetlawn" Grass Seeder

Manufactured expressly for us, and is, in every respect, the BEST LAWN MOWER ever made.

# Chain Roller or Golf Mower

This mower is made to meet the demand for a machine that will more perfectly cut borders, verges, etc., and yet retain all the other features necessary in a mower for general work. Its great advantage is the substitution of a bicycle chain for the gears generally used in this style of mower. This reduces the friction to a minimum. The machine with six blades is highly recommended for work on putting-greens.

# Improved Horse Lawn Mower

This well-known standard mower has side draft attachment, to enable the horse to walk on the cut grass only, and caster-rollers which will not mark the lawn. Eveness of cut is assured by an adjustment which raises or lowers the two sides at the same time by means of a simple lever movement; the same lever serves the purpose of raising the knives from the ground when driving over gravel walks or roads. # Clark's A5 Double-Action Cutaway Harrow

This Harrow will cut and reduce the toughest sod to plantfood without the aid of a plow. It will cut from 28 to 30 acres or will double-cut 15 acres in a day. It can be set so as to move the earth but little, or at so great an angle as to move all the earth one foot. It keeps the surface true and the machine runs true in line of draft. Price, \$45 net, f. o. b. factory (Conn.).

# Cutaway Grading or Smoothing and Leveling Harrow

With this tool any field can be made smooth and the soil pulverized fine enough for a flower-bed. Will smooth an acre in twenty minutes. It is adjustable with a lever, by which the entire action is controlled by the driver, and he can remove at will all the earth possible for the team to haul, taking it from hills or uneven places and putting it into hollows, to level up field. No. 6, for one horse (6 feet wide), \$19.50. No. 8, for two horses (8 feet wide), \$22, f. o. b. factory (Conn.).
