*History.*—The early history of Tibet is naturally obscure. It is said that a native king established the seat of government at Lhasa in 617 A. D.; that he married a Chinese princess of the Buddhist faith; and that he sent his minister to India, who returned with the Buddhist canonical scriptures, framed the Tibetan alphabet from the Devanagari of India, and commenced the translation of the canon from Sanskrit into the language of the country. For a long time there was a struggle for supremacy between the old nobility and the new hierarchy, in which, after several vicissitudes, the Buddhist monks gained the ascendency. It was during this early period of Buddhist rule in Tibet that the first European visited the country. Friar Odoric, of Pordenone, between 1316 and 1330, traveled through Shansi and Szechuen and reached Lhasa. Three centuries elapsed before another European visited the sacred capital. In the middle of the fourteenth century a great reforming lama, named Tsong-khapa, arose in Tibet. He forbade clerical marriages, prohibited necromancy, and introduced the custom of frequent conferences among the lamas. These reforms led to a schism in the Tibetan Church, the older sect being called Red Caps or Shukpas and the reformers Yellow Caps or Gelupkas, and since the reformation the latter have been in the ascendency. Gedun-tupba, another great reformer, who died in 1474, is said to have revived the spirit of Tsong-khapa, and with him the doctrine and system of perpetual reincarnation began. Two grand lamas then arose, one called the Dalai lama, with his headquarters at Galdan, near Lhasa, and the other at Teshu Lumbo. A third grand lama, called the Taranath lama, is also mentioned as having his seat in the Khalka country in Mongolia. The first of the Jesuits who penetrated into Tibet was Antonio Andrada, who in 1624 set out from Agra and, scaling an appalling mountain, reached Rudok, in Tibet, and eventually made his way through Tangut to China. Other missionaries followed: Grueber and Dorville, who passed from China through Lhasa into India, and Desideri and Freyre, who also visited the capital. The Capuchin mission under Father della Penna was established at Lhasa in 1719. Just before they reached the capital the famous native survey had been completed, a work which formed the basis of d'Anville's well-known atlas. In 1717 an army of Dzungarians or Eleuths stormed Lhasa, but in 1720 order was restored by the Emperor of China, Kang-hi, who established two residents at the capital as his representatives. It was about this time that the Dutch traveler Samuel van de Putte made his remarkable journey from India to Lhasa and China and back again. In 1749 the Chinese residents put the Tibetan regent to death. The people, incensed, flew to arms and a massacre of the Chinese took place. An expedition was duly dispatched by the emperor, but timely concessions were made to appease the wrath of the lamas and people, and succeeding regents were more subservient to China. The Capuchin missionaries were expelled from Lhasa in 1760 and settled in Nepal, where some of them were eye-witnesses of the troubles ending in the Gurkha conquest of that country. At the same time the aggression of Deb Judhur in Bhutan led to British intervention and to subsequent attempts to mediate on the part of the Teshu lama of Tibet. This furnished an opportunity to Warren Hastings to dispatch G. Bogle as envoy to Tibet in 1774 to conclude a treaty of amity and commerce between the two countries. The negotiations were most friendly, and after the lama's death at Peking in 1780 a new mission was sent under Capt. Turner to do homage to the new lama, a child of eighteen months. In 1792 the Nepal regency, tempted by stories of the great riches in the the Teshu lama's palace, determined to invade Tibet, and actually plundered Teshu Lumbo. The Chinese Government on hearing this dispatched a powerful expeditionary force under Gen. Sund Fô, who defeated the Gurkhas on the plain of Tingri Maidan, laid siege to Kuti, and finally routed the enemy 20 miles from Kathmandu, the Nepalese capital. The conditions of peace imposed were humiliating, and included the payment of an annual tribute to China and the dispatch of an embassy to Peking every five years. During this war the policy of the British under Lord Cornwallis was unfortunate, and led to the closing of the passes from Tibet into India, all the good results of Hastings's negotiations being thereby lost. Nevertheless, Thomas Manning, the friend of Charles Lamb, in the guise of a doctor, managed in 1811 to get to Lhasa through Bhutan, a success doubtless due to his knowledge of Chinese, which enabled him to make friends with a Chinese general. In 1834 Golab Sing, of Jammu, afterward Maharajah of Kashmir, sent an army commanded by his general, Zorawar Sing, to invade Ladak. In 1841 this chief advanced into Eastern Tibet, but was utterly defeated by the Chinese Dec. 12 (almost simultaneously with the destruction of a British division at Cabul). Three years later the French missionaries Huc and Gabet arrived at Lhasa and were well treated by the new regent, who had been installed in the place of one Si-fan, who had been disgraced for complicity in the murder of three of the Dalai lamas. Subsequently Chinese jealousy prevailed, and Huc and Gabet were compelled to return to Europe. The Teshu lama, the same who had received Capt. Turner, died at an advanced age in 1854.

The recent history of Tibet has been marked by but few conspicuous events. Numerous European travelers have entered the mysterious land from the west, the north, and the east, but none has been enabled to reach Lhasa. Among these may be mentioned Prejevalsky, Carey, Bonvalot, Rockhill, Bower, and Miss Taylor. The endeavors of these and other travelers, however, seem only to have made the Tibetans more determined to keep out the dreaded foreigner. Their invasion of Sikkim in 1888 aroused the Indian Government, which compelled the Tibetans to retreat and eventually to sign a treaty recognizing Sikkim as British.

Bibliography.—The best general account of Tibet will be found in the *Narratives of George Bogle and Thomas Manning* (London, 1879; 2d ed. by C. R. Markham). Capt. Turner's account of his mission (1800) is most interesting, and the works of Brian Hodgson, Archibald Campbell, Csoma de Körös, and Joseph Hooker deal exhaustively with the scientific sides of the subject. Of late years the travelers above mentioned have all [particularly William Rockhill, *The Land of the Lamas* (New York, 1891) and *Diary of a Journey Through Mongolia and Tibet in 1891 and 1892* (Washington, 1894)] written valuable works on Tibet, while the Indian native travelers, the Pundits Nain Singh and Kishen Singh, have recorded in the publications of the Royal Geographical Society a mass of scientific, statistical, and general information. The *Narrative of a Journey to Lhasa*, by Sarat Chandra Das, a confidential work and still unpublished, gives the latest authentic information regarding the capital and inner government of the country. For a copious bibliography, see vol. ii. of Lansdell's *Chinese Central Asia* (London, 1893; New York, 1894).

Charles E. D. Black.

**Tibetan Language**: the language spoken in Tibet. It is slightly agglutinative and monosyllabic, and forms words and sentences by the juxtaposition of roots and particles, except in the verb, in which changes in the roots are quite frequent. There is considerable resemblance between its dialects and those of Northern Burma. Its alphabet consists of ninety consonants, each with an inherent *a* (as in Sanskrit), and the five vowels *a*, *e*, *i*, *o*, and *u*. Tibetan became a written and literary language more than 1,200 years ago; yet on account of the religious or idolatrous reverence with which the written word is regarded by Buddhists, it has, with some few and insignificant exceptions, maintained its written forms of sounds unchanged up to the present time, while the style and the oral speech have undergone considerable alterations. This clinging to the old, full pronunciation of many sounds characterizes Eastern and Western Tibet, while in Central Tibet, the principal seat of national civilization, a refined but somewhat effeminate pronunciation of the consonants may be observed; here also occurs the greatest difference between the spoken and the written sound. In 632 A. D. the Indian Devanagari alphabet was adapted to the Tibetan language by the order of King Srongtsan Gampo, who also ordered the sacred books to be translated into Tibetan. The work of translation was carried on with remarkable zeal; and for the sake of uniformity, vocabularies of the Sanskrit proper names and of the technical and philosophical terms occurring in the original texts were prepared. King Srongtsan Gampo and his learned translators also issued books written in their native tongue, and, beginning with Tsonkhapa, the great reformer of the fourteenth century, native literature developed itself on a larger scale; even Mongolians write in Tibetan, as it is the language of the divine service. In the beginning of the eighteenth century all the Sanskrit translations were collected in two large and voluminous works, to which were added the sacred and profane native publications of different periods. These compilations bear the title of *Kanjur* (The Translated Word of Buddha) and *Tanjur* (Translation of the Doctrine). The *Kanjur* contains 100 volumes, comprising 689 works, which are classed under seven divisions—discipline, transcendental wisdom, association of Buddhas, jewel-peak, sūtras or aphorisms, deliverance or emancipation from existence, and *Tantra* or mysticism. The *Tanjur* comprises 225 volumes, divided into mysticism and discipline; its contents are of a more miscellaneous character. Tibetan is written from left to right. For printing capital letters are always used. The books are not folded, but consist of loose leaves laid between boards kept together by a string. Little is known of the non-religious literature of Tibet. One of the most popular works is the *Hundred Thousand Songs of Milaraspa*, a mendicant monk of the eleventh century. The Hungarian Csoma de Körös was the first who brought (1832) Tibetan language and literature within the reach of European students. In 1875 a German Moravian missionary, H. A. Jäschke, published a most learned Tibetan-German dictionary, and a grammar in 1883.

**Tibul'lus**, ALBIUS: poet; b. about 54 B. C.; was descended from an equestrian family of good standing in Roman society; accompanied Messalla, his patron, in 28 B. C. to Aquitania, and started with him on a mission to Asia, but, falling ill, got no farther than Corcyra. After these journeys he lived on his estates near Rome, devoting himself to poetry and literary occupation. D. probably in 19 B. C. Three books of elegies ascribed to him have come down to us in the MSS., but the third book is now often divided into two. The first book sings of the love of Delia, the second of Nemesis, both being assumed names. The third book is by a poet much inferior to Tibullus, who calls himself Lygdamus, and sings the praises of Neæra. The fourth book opens with a panegyric on Messalla, in hexameters, which is universally pronounced by scholars to be unworthy of Tibullus. Critics are divided still as to whether elegies 2–6 which follow the panegyric are by Tibullus. For the Sulpicia elegies 7–12, see SULPICIA. Editions by Dissen (Göttingen, 1835, 2vols.); Bährens (Leipzig, 1878); Müller (1880); E. Hiller (Leipzig, 1885); and translated into English by Dr. Grainger (1752) and Cranstoun (London, 1872). On account of the genuineness and simplicity of their feeling, these poems belong to the best Latin literature contains. See also Sellar, *Horace and the Elegiac Poets* (Oxford, 1892).

Revised by M. WARREN.

**Tibur**: See TIVOLI.

**Tic Douloureux**: a form of facial NEURALGIA (*q. v.*).

**Tichborne Case**: an English *cause célèbre*, famous for its length, the estate involved, and the character of the persons concerned. It consists of two trials, one (in 1871) an action in ejectment by an impostor for the recovery of the Tichborne estates in Hampshire and Dorsetshire, England, valued at £24,000 yearly; and the other (in 1872) an action for perjury against the defeated impostor.

The estate in question was that which had belonged to Roger Charles Tichborne, who was born in Paris Jan. 5, 1829, son of Sir James Tichborne, by his wife Henriette Félicité, a French woman of noble extraction. Roger continued to live in Paris, having French tutors and speaking French rather than English as his native tongue. He was later sent to the Roman Catholic College of Stonyhurst, England, having been brought up a Roman Catholic, and here his education practically ended, he being, however, idle rather than dull. In Feb., 1853, he went to Paris to bid his mother farewell previous to his departure upon an extended tour, and on Mar. 4 sailed for Valparaiso. In Apr., 1854, he sailed in the Bella from Rio de Janeiro for New York, having previous to his embarking written a letter showing his intention to stay from home for two or three years. The Bella was lost at sea, and no person on board was ever heard of again, although her long-boat was picked up at sea. The will of Roger Charles Tichborne was proved and his estate placed in the hands of the executors.

Roger's mother had become possessed of the belief that he was still living, and in 1862, after the death of her husband, she advertised in English and Australian papers for her son, and in 1866 a butcher who was then living at Wagga Wagga, Australia, under the name of Thomas Castro, but whose real name was Arthur Orton, asserted that he was the lost Roger, having been saved from the wreck of the Bella. After considerable correspondence between the impostor and Lady Tichborne and the receipt of a remittance to defray his expenses, he went to London, where Lady Tichborne received him as her son. He was repudiated by the rest of the family, but was supplied with money by Lady Tichborne, and went about collecting witnesses and gathering information to be used in establishing his identity. Lady Tichborne died in 1868, but Castro had found so many believers in his claims that he raised considerable sums by selling bonds conditioned to be paid upon his coming into possession of his claimed estates. On May 11, 1871, he began an action in ejectment for the recovery of the Tichborne estates. The trial lasted for 103 days, till Mar. 6, 1872, when he was non-suited, the jury declaring before its close that they believed that the claimant was not Roger Charles Tichborne.

Castro was then arrested upon a charge of perjury, and the trial was begun in the court of queen's bench on Apr. 23, 1873, and lasted 188 days, until Feb. 28, 1874. when he was found guilty of perjury and was sentenced to fourteen years' penal servitude.

For the purposes of the two trials the smallest details of the life of Roger and the claimant were investigated at an enormous expense, and it was proven by a complete chain of the strongest evidence that not only was the claimant an impostor, but that he did not even resemble Roger, nor have any intimate acquaintance with his affairs. It was shown that Castro was the son of a London butcher, and was born June 1, 1834, and that his real name was Arthur Orton; that in 1848 he went to Valparaiso, where he took the name of Thomas Castro; that he later returned to London, and then went to Australia, where he led a disreputable life, one time as a horse-breaker, at another as a butcher, having married a servant girl under the name of Castro, Jan. 29, 1865. It was proved that Roger left balances with two Australian bankers which Castro did not use; that immediately on his arrival in London he sought the Ortons, and sent photographs of his wife and children to them as being the wife and children of Arthur Orton; that he was ignorant of the circumstances of Roger's life in France, and spoke no French; that Roger had a common education, while Castro was extremely illiterate; that Roger's person was thin, his hair straight, and his ears closely adhering to the sides of his head, while Castro was enormously fat, an inch taller than Roger, and had large pendulous ears and curly hair. In 1895 Castro admitted, in a confession printed in a London paper, that he was an impostor, and that he was the original Arthur Orton.

For a full account of the trials, see Morse's *Famous Trials* (Boston, 1874); *The Tichborne Romance: a Full and Accurate Report*, etc. (Manchester, England, 1871, 2d ed.); *The Tichborne Trial: the Summing-up by the Lord Chief Justice of England* (London, 1874); *Charge of the Lord Chief Justice of England in the Case of the Queen against Thomas Castro* (2 vols. 8vo, London, 1874).

F. STURGES ALLEN.

**Ticino**, tee-chee'nō, or **Tessin**; the southernmost canton of Switzerland, on the Italian side of the Alps and on both sides of the river Ticino; borders on Lago Maggiore. Area, 1,088 sq. miles. Its northern frontier toward Uri and Grisons is formed by a range of the Lepontine Alps 12,000 feet high, branches of which cover the whole northern part of the canton. In the southern part the ground becomes low and the surface level. Dairy-farming and cattle-breeding are the principal occupations in the Alpine regions, and agriculture and the cultivation of grapes, olives, figs, almonds, and melons in the southern part. Pop. (1894) 127,940, most of whom speak Italian and are Roman Catholics. Capital, Bellinzona. Revised by M. W. HARRINGTON.

**Tick**: any one of various parasites of the higher animals. The true ticks (*Ixodes*) belong to the ARACHNIDA (*q. v.*), order *Acarina*. They fasten upon the skin, and, burrowing the head beneath the surface, feed upon the blood, the abdomen meanwhile growing to enormous size. The name is also given other parasites belonging to the *Diptera* (flies), as the sheep-tick, horse-tick, and bird-tick, and in some of these parasitism has resulted in a loss of wings, the animal having a spider-like appearance. J. S. K.

**Tickell**, THOMAS: poet; b. at Bridekirk, Cumberland, England, in 1686; was educated at Queen's College, Oxford, of which he became a fellow in 1710; became a friend of Addison, through whose influence he was in 1717 appointed Under-Secretary of State, and in 1725 was made secretary to the lords justices of Ireland, a post which he retained until his death. His principal works are *The Prospect of Peace*, a poem; *The Royal Progress*, verses celebrating the arrival of George I.; a translation of the first book of the *Iliad* (1715); *Kensington Garden*, a poem (1722); a fine *Elegy on Addison*; and the popular ballad *Colin and Lucy*; besides which he contributed to *The Spectator* and *The Guardian*. D. at Bath, Apr. 23, 1740. An edition of his poems was published at Boston in 1854. Revised by H. A. BEERS.

**Ticket of Leave**: originally a kind of permit or license given to British convicts transported to the Australian colonies, by which they were allowed to be at large within a certain specified territory. The ticket of leave was granted upon good behavior for a certain period of years, and was revocable upon misconduct. The term is now popularly applied to what is technically called an order of license, whereby a portion of a convict's time of imprisonment is remitted as a reward for industry and good behavior. This remission was first used in England, about 1840, upon the refusal of the colonies to receive convicts. Since the sentence of those convicts subject to transportation would be much more severe if they were imprisoned for the entire period, a portion of the terms of such as were not transported was remitted; and afterward, when the form of punishment was changed from transportation to penal servitude, the partial remission of sentences was made systematic in order to induce industry and good behavior.

F. STURGES ALLEN.

**Tickets**: See TRAVELERS, LEGAL RIGHTS OF.

**Ticknor**, GEORGE: literary historian and biographer; b. in Boston, Mass., Aug. 1, 1791; graduated at Dartmouth College in 1807; admitted to the bar in Boston in 1813; spent four years (1815–19) in study and travel in Europe, and during his absence was chosen (1817) to the Smith professorship of Modern Languages at Harvard; filled that post from 1820 to 1835, when he resigned; spent three years in Europe, chiefly engaged in preparatory researches for his principal work, to which he devoted several more years of assiduous labor; published in 1849 in London and New York his *History of Spanish Literature* (6th American ed., 3 vols., Boston, 1888), which was translated into French, German, and Spanish, and accepted as the standard work on its subject even in Spain; printed some occasional essays, chiefly on educational topics, and several biographical sketches; wrote an elaborate *Life of William Hickling Prescott* (1864); contributed to various magazines and reviews; and was a munificent benefactor to the Boston Public Library, presenting it with 2,000 volumes in 1860. He was a member of the leading literary societies of Europe and the U. S. D. in Boston, Jan. 26, 1871. The 4th ed. of his *History of Spanish Literature* appeared shortly after his death under the editorship of George S. Hillard, who also published his *Life and Correspondence* (2 vols., Boston, 1876). See E. P. Whipple, *Recollections* (Boston, 1877), section on Ticknor. Revised by H. A. BEERS.

**Ticknor**, WILLIAM DAVIS: publisher; b. at Lebanon, N. H., Aug. 6, 1810; became in 1832 a bookseller in Boston; subsequently added a publishing business, which attained to great importance under the firm-name of Ticknor & Fields (subsequently James R. Osgood & Co., and still later Ticknor & Co.); published *The Atlantic Monthly* and *The North American Review*, and made his office a center for the brilliant literary circle connected with that magazine, including Longfellow, Holmes, Whittier, Lowell, and Saxe, whose poems were issued by the firm. D. in Philadelphia, Pa., Apr. 10, 1864.

**Ticondero'ga**: township and village; Essex co., N. Y.; on the Cent. Vt. and the Del. and Hud. railways; 24 miles N. of Whitehall, and 100 miles N. of Albany (for location, see map of New York, ref. 2–J). The township contains deposits of graphite, from which, for several years, the entire commercial product of this mineral in the U. S. has been obtained. The largest output was in 1891, when 1,559,674 lb., valued at $110,000, were mined. There are also extensive deposits of iron ore. The village and a part of the township occupy a lofty promontory between Lakes George and Champlain, Mt. Defiance, at the extremity, being 750 feet above the level of Lake Champlain. The outlet of Lake George is 4 miles long, has a fall of 220 feet in 2 miles, and furnishes abundant power for manufacturing. Here are several foundries, machine-shops, extensive pulp and paper mills, large lumber interests, a national bank with capital of $50,000, and a weekly newspaper. Ticonderoga was prominent in colonial and Revolutionary history from its celebrated fortress, built by the French in 1755, and originally named Carillon (chime of bells) from the music of the neighboring waterfall. It was the headquarters of Montcalm in 1757; was unsuccessfully assaulted by Gen. Abercrombie July 8, 1758; occupied after a siege by Gen. Amherst July 30, 1759; captured by Ethan Allen May 10, 1775; retaken by Burgoyne July 5, 1777, and again by Gen. Haldeman 1780, but soon abandoned on each of the last two occasions. Pop. (1880) township and village, 3,304; (1890) township, 3,980; village, 2,267; (1900) township, 5,048; village, 1,911.

EDITOR OF "SENTINEL."

**Tidball**, JOHN CALDWELL: soldier; b. in Ohio co., Va. (now West Virginia), Jan. 25, 1825; graduated at the U. S. Military Academy, West Point, 1848; appointed second lieutenant Second Artillery; served in Florida war 1848–50; in explorations to Pacific coast 1853–54; on coast survey 1854–59; captain Second Artillery May 14, 1861, in command of battery at battle of Bull Run, and in the operations of the Army of the Potomac in the Peninsular campaign of 1862, the battles of Antietam, Chancellorsville, Gettysburg, etc.; appointed Aug., 1863, colonel Fourth New York Volunteer Artillery; commanded the artillery of the Second Corps during the Richmond campaign, May to July, 1864, including the battles of the Wilderness and those around Spottsylvania; commandant of cadets, U. S. Military Academy, July–Sept., 1864; in command of artillery, Ninth Corps, Army of the Potomac, in siege of Petersburg, Va., Oct., 1864–Apr., 1865, in pursuit of the Confederate army, and in other operations terminating in Lee's surrender; at close of war returned to duty with his company; promoted major Second Artillery, Feb., 1867; commanded in Alaska 1868–71; superintendent of instruction at artillery school, Fort Monroe, Virginia, 1874–80; aide-de-camp to general of army 1880–84; promoted lieutenant-colonel First Artillery, June 30, 1882, and colonel of same regiment Mar. 22, 1885; in command of the U. S. artillery school and post of Fort Monroe, Virginia, Nov., 1883–Jan. 25, 1889, when he was retired; breveted brigadier-general Mar. 13, 1885; author of *Manual of Heavy Artillery Service* (Washington, 1880) and of numerous professional papers.

**Tidemill**: an apparatus for the utilization of the water-power of the tide. In some cases, as at the old London Bridge tidemills, the water-wheels, mill and all, were afloat, so that no adjustment of the wheels to the height of the water was necessary, and the tide was utilized both on its ebb and flow. In other cases dams are constructed which shut the water at high tide, and its outflow through a raceway gives motion to the mill; and during the return of the tide through the sluice its power may again be utilized. On account of the great expense usually involved in the construction of dams of sufficient extent to retain the quantity of water necessary, and the usually moderate extent of the rise and fall of the tide, it is probable that in very few places in the world will it be found practicable to install tidemills in competition with steam-engines. A project for the continuous utilization of tidal power in connection with the training-walls to be constructed in the estuary of the Seine is described by P. Decœur in the *Proceedings of the Institution of Civil Engineers* (1890). The method proposed is to have two basins separated by a bank rising above high water, within which turbines would be placed. The upper basin would be in communication with the sea during the higher one-third of the tidal range, rising, and the lower basin during the lower one-third of the tidal range, falling. The turbine proposed is of an improved model designed to utilize a large flow with a moderate diameter. One has been designed to produce 300 horse-power with a minimum head of 5 ft. 3 in. at a speed of fifteen revolutions per minute, the vanes having 13 feet internal diameter. The speed would be maintained constant by regulating sluices. The available gross horse-power in such a design is estimated to be about one-thirtieth of the product of the area of the lower basin in acres by the square of the tidal range in feet.

Revised by WILLIAM KENT.

**Tides** [O. Eng. *tīd*, time: O. H. Germ. *zīt* > Mod. Germ. *zeit.* (See TIME.) Cf. Sanskr. *a-diti*, unlimited, timeless]: the motions of the waters of the ocean arising from the attraction of the sun and moon. Those living on the shores of the ocean see it rise and fall regularly twice every day. For six hours the water rises, or *flows*; then, remaining stationary for a short time, it gradually recedes or *ebbs* for another six hours; after a short lull, called *slack water*, it again rises and falls as before. The rising sea is called the *flood tide*; the receding sea, the *ebb tide*. When the water is at its greatest height, it is *high water*; when at its lowest point, *low water*. There are thus daily two high tides and two low tides. The time of high water and low water, at the same place, however, is gradually changing. The mean interval of time between two consecutive high tides or low tides being really twelve hours and twenty-six minutes, and the hour of the day at which high water or low water occurs is later every day by an average amount of fifty-two minutes.

*Cause of the Tides.*—Though the dependence of the tides upon the course of the moon seemed to point out their source, the real cause of these mysterious movements was not understood before the discovery of the law of gravitation by Sir Isaac Newton. Applying here this new principle, Newton showed that the rise of the waters was due to the attraction of the moon and the sun upon the revolving globe of the earth. The moon, on account of its proximity, and notwithstanding its smaller mass, has an influence more than double that of the sun (100 to 38); its action is illustrated by Fig. 1. It attracts the solid earth as if the

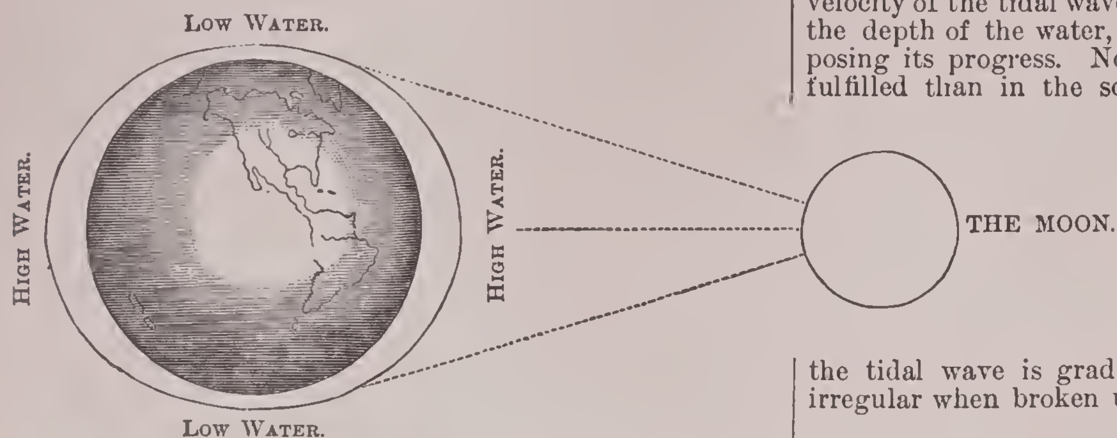

FIG. 1.

whole mass of the earth were concentrated at its center. But owing to the greater proximity of the region marked in the figure "high water" to the moon, the attraction is there greater than for the center of the earth. Hence a tendency to a high tide in that region. On the side opposite the moon, also marked high water, the attraction is less than at the center of the earth. Hence the attraction draws the earth away from the water toward the moon, so that a high tide is produced there also. At the points marked low water the components of the forces shown by the dotted lines converge toward the moon. But for this convergence the attraction of the moon on the solid earth and on the water would be equal. But owing to the convergence the water is drawn toward the center of the earth, and thus low tides are produced. This is why there are two high tides and two low tides in the course of a day. There are thus always simultaneously and directly under the moon two high waters opposite each other, and two low waters at equal distances between them. Owing to the rotation of the earth, this permanent system of swells and troughs travels from E. to W. over every part of the ocean and of its coast, and explains the regular succession of rising and falling waters, at equal intervals of time, which we call the tides.

*Spring-tides and Neap-tides.*—The sun also asserts its attractive power on the ocean, and causes a similar system of four daily tides. Owing, however, to the great distance of the sun, the solar tides are much smaller, and mostly merged in, or masked by, the lunar tides. As the relative position of the moon and sun is constantly changing, the solar and lunar tides seldom coincide; but twice a month, at new moon and full moon, the sun and moon, being on a line with the earth, as shown in Fig. 2, act together, and cause an unusually high water, which is the sum of the lunar and solar tides. These are the spring-tides. High water is then highest, and low water lowest. When the sun is placed 90° from the moon (Fig. 3)—that is, at the time of

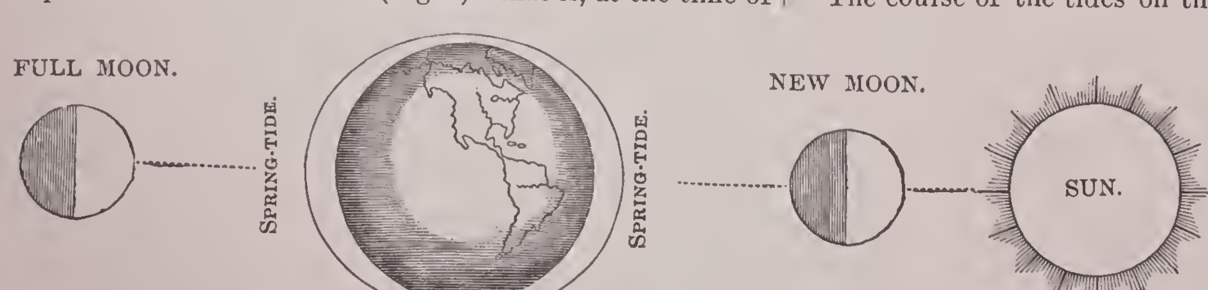

FIG. 2.

the first and third quarter of the moon—its attraction acts against that of the moon, diminishing the height of the high tide and increasing that of low water. These are the neap-tides. High water is then lowest, and low water highest. The proportion of the rise and fall in the spring-tides and neap-tides is nearly as 7 to 3.

*Course of the Tidal Wave.*—If the ocean covered the whole earth with a uniform depth of water, the tidal wave, with its long crest extending from N. to S., would follow the apparent course of the moon, and travel from E. to W. around the globe in twenty-four hours. It would be greatest in the equatorial regions, and move there with a velocity of over 1,000 miles an hour. But the continents which cut the ocean into several large basins oppose its passage, and in each of these basins the course of the tidal wave is subjected to great modifications. The regularity and velocity of the tidal wave depend upon the size of the basin, the depth of the water, and freedom from all obstacles opposing its progress. Nowhere are these conditions better fulfilled than in the southern half of the Pacific Ocean. There is formed what might be called the parent tidal wave, which, advancing rapidly westward, enters the Indian and Atlantic Oceans, and seems to control their tides.

*Tides in the Pacific Ocean.*—In the middle and equatorial part of the Pacific Ocean the advance of the tidal wave is gradually slackened, and becomes very irregular when broken up by the numberless islands of the East Indian Archipelago. The influence of shallow water, and of friction on the bottom and on the coasts of the ocean, is evident in the slow progress of the tide-wave between New Guinea and Australia, and in the Chinese Sea. Its rapid motion, on the contrary, toward the N. W. in the middle of the North Pacific shows the influence of deep and open water. Thence, however, the tidal wave ceases to be direct, and assumes the shape of a free reflected wave, which turns N. and E. toward the western coast of the North American continent. In the Southern Pacific, while the main tidal wave seems to start on its westward course from the 90th meridian, it sends a reflected wave eastward along the western coast of South America, from which this coast seems to derive its tides. This meets, at Cape Horn, the Atlantic tide coming from the E.

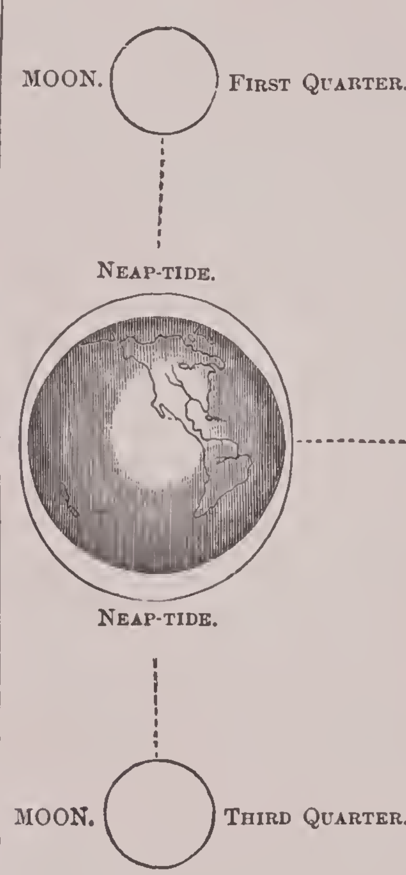

FIG. 3.

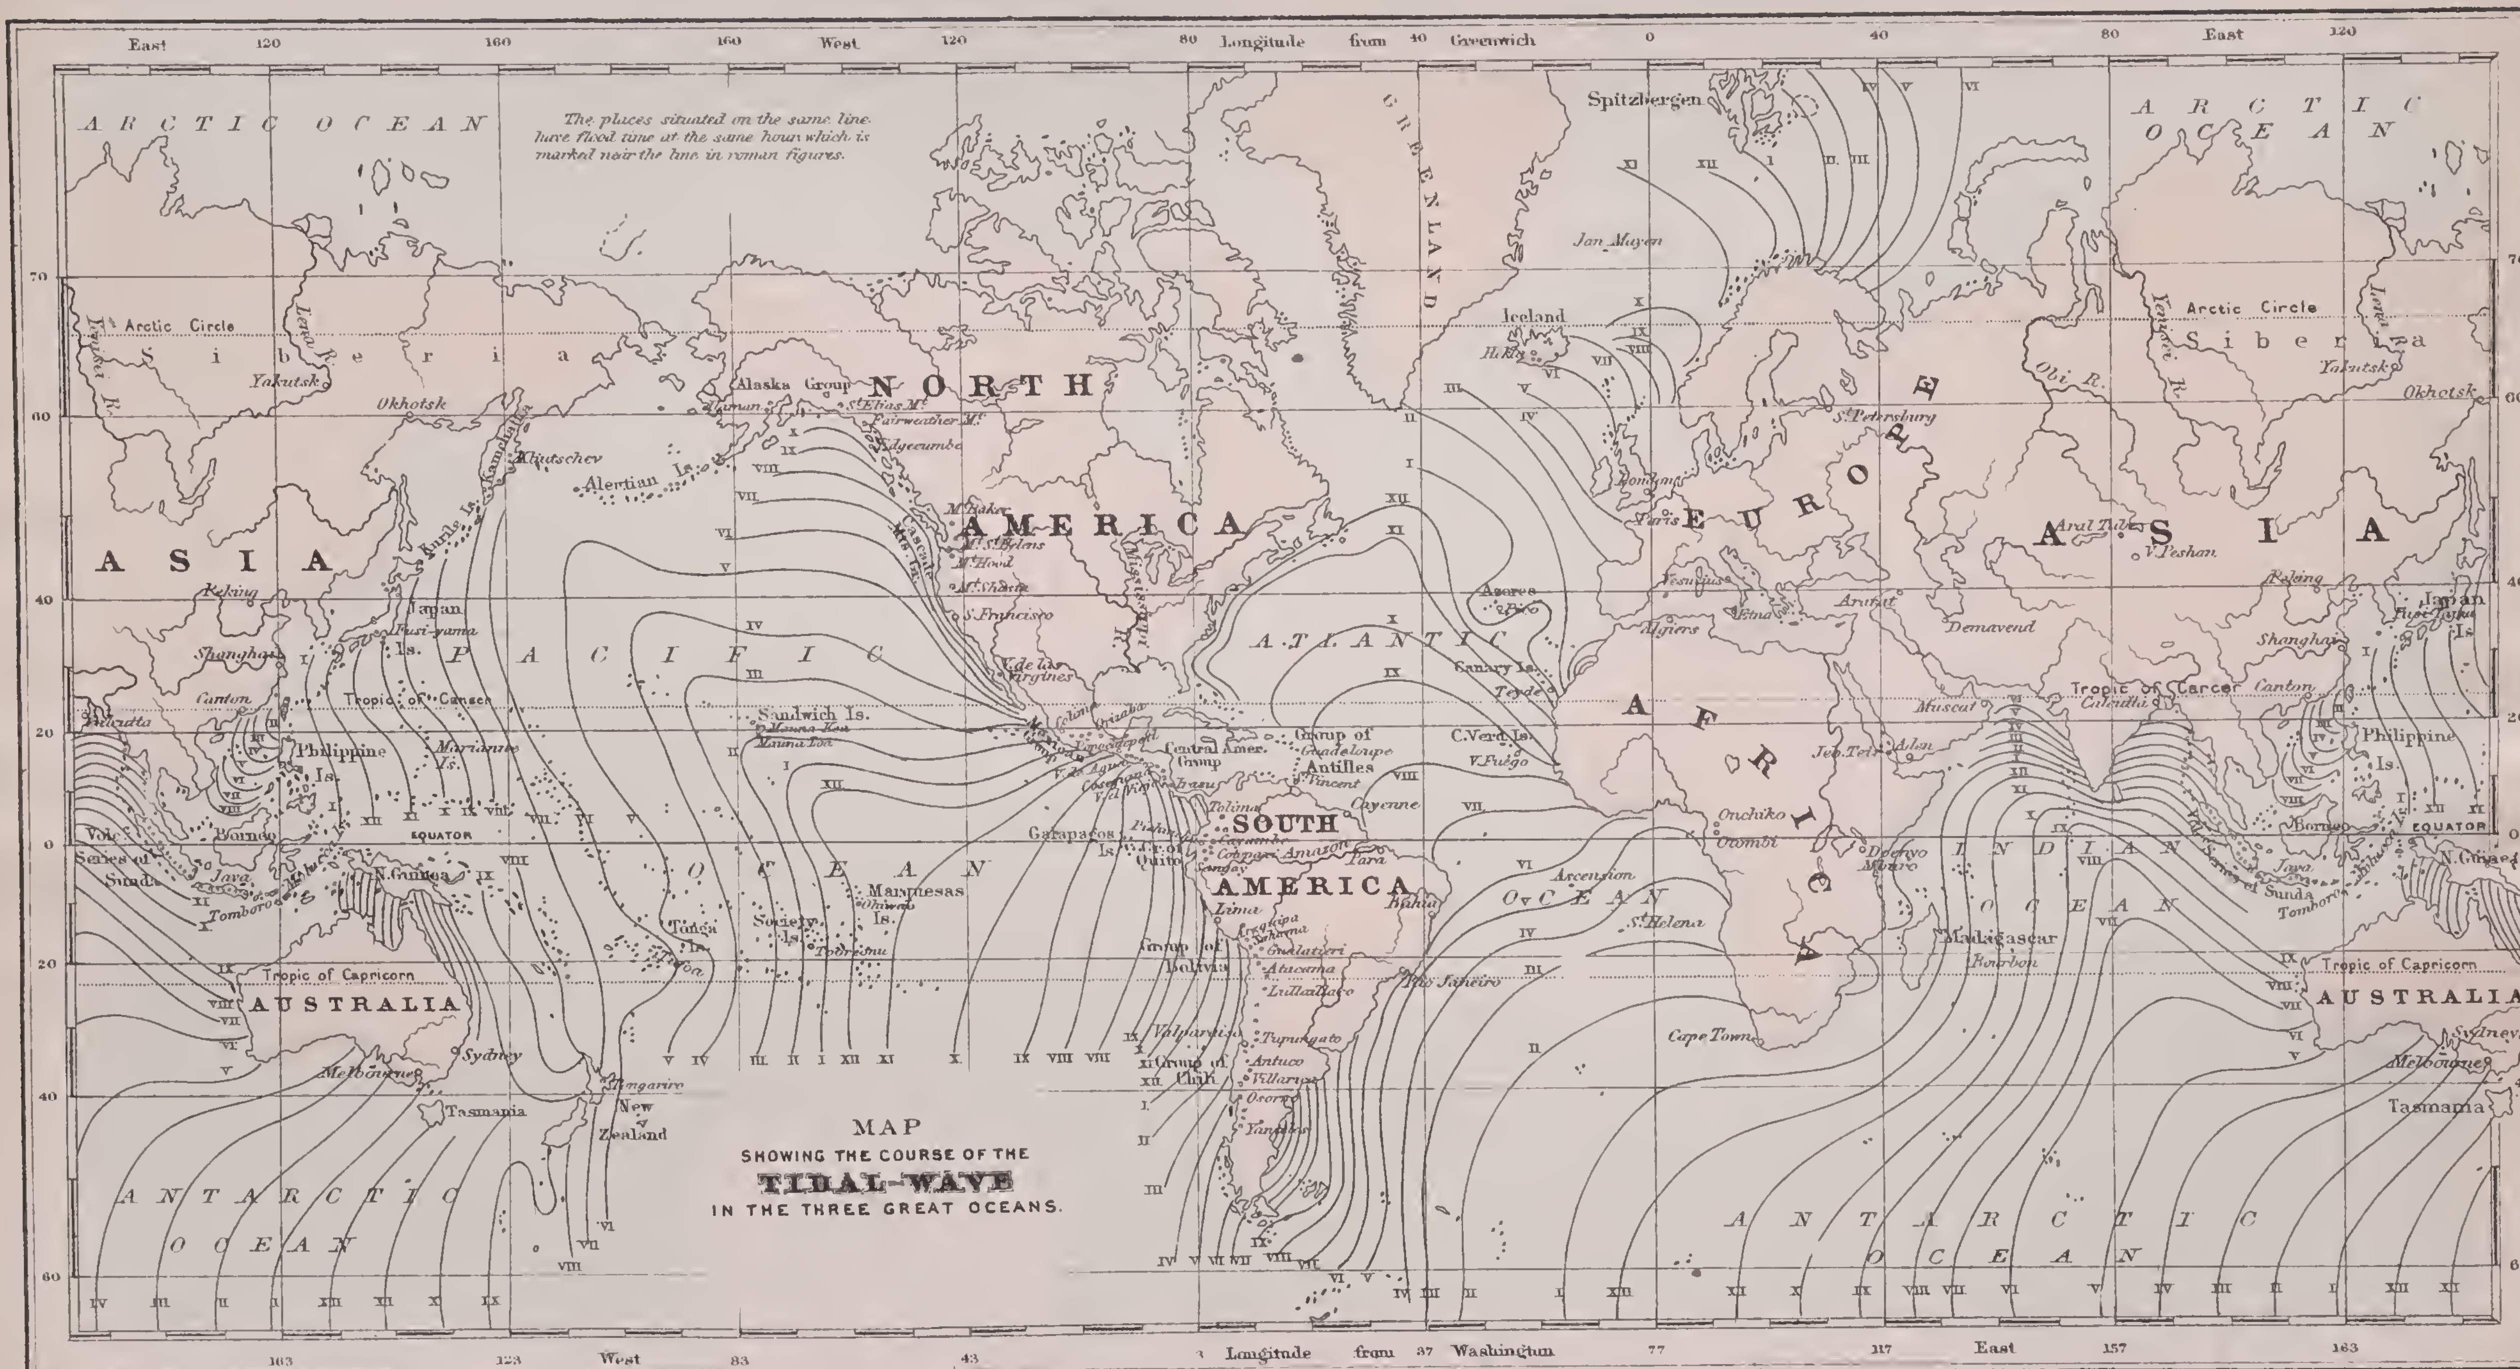
The course of the tides on the coast of Great Britain, in the Channel, and the German Ocean, as shown in the map of cotidal lines in that region (Fig. 4), illustrates the retardation of the tidal wave in shallow and narrow seas. The main tide-wave in the broad Atlantic moves on, unobstructed, around the British isles, reaching the Orkneys in four hours, and moves southward along the eastern coast of Scotland before the slackened tide-wave has forced its way through the Channel to Dover Straits. Each wave then continues its course, the first along the English coast, that from the Channel along the coast of Holland, causing tides at different hours on the opposite shores.



MAP
SHOWING THE COURSE OF THE
TIDAL-WAVE
IN THE THREE GREAT OCEANS.

*The Age of the Tide.*—This course of the tidal wave shows that the tides of the Indian and Atlantic Oceans are not generated in these basins, but are mainly derived from those of the Pacific Ocean. But the tide-wave takes some

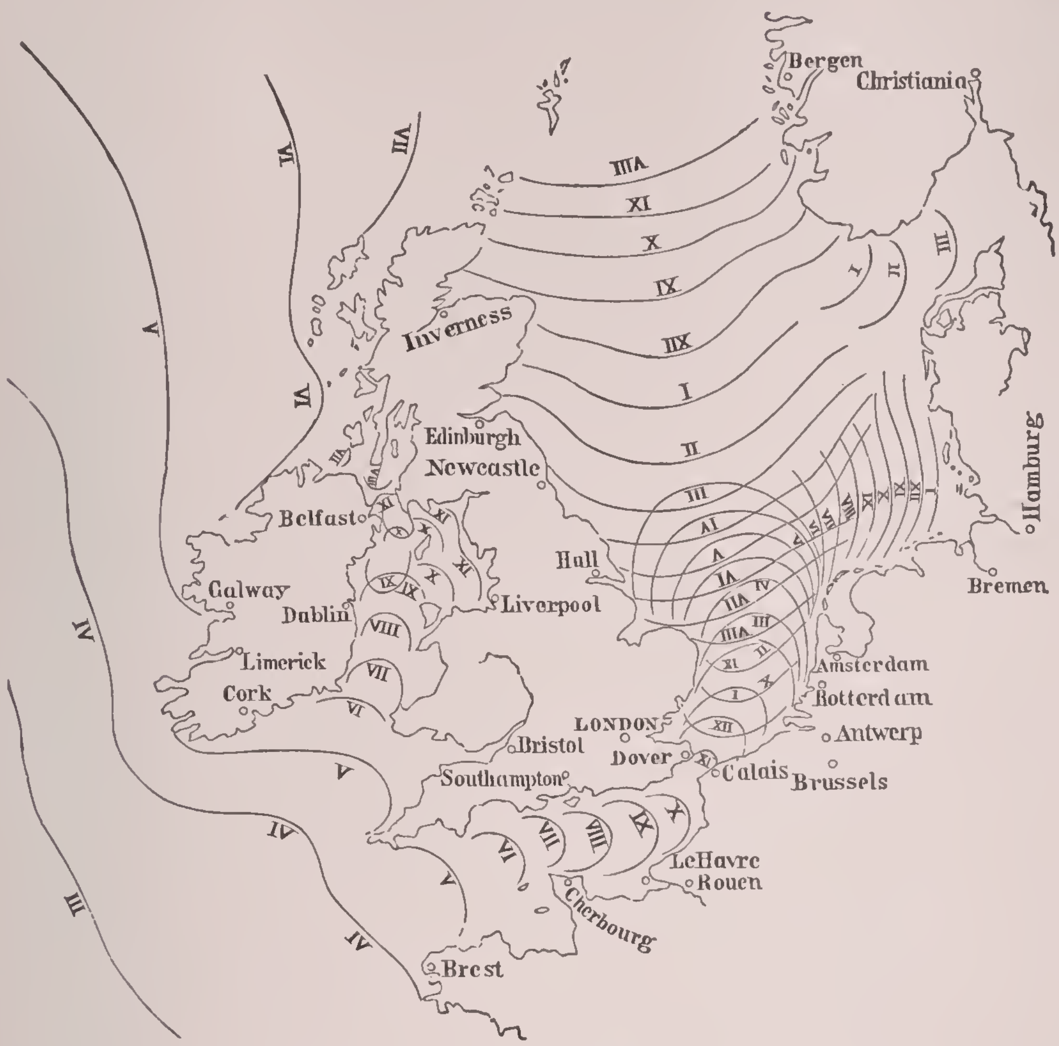


Fig. 4.

time to travel over this vast extent. The map shows that in twelve hours the Pacific wave reaches Tasmania; in twelve hours more, the coast of India; another twelve or thirty-six hours brings it to the coast of North America; a few hours more, to the shores of Europe. Therefore the tide on the eastern shores of North America is not the one caused by the last passage of the moon over them, but the one which had its origin thirty-six hours before in the Pacific Ocean, and is therefore one day and a half old. It is two days old in London.

*The Height of the Tide.*—The height of the tide depends very much upon local circumstances. In the midst of the Pacific it is scarcely more than from 2 to 5 feet, which may be considered as the natural height of the tide. But when dashing against the land and forced into deep gulfs and estuaries, the accumulating tide-waters sometimes reach a very great height. On the eastern coast of North America, which is directly in the path of the great Atlantic wave, the tide rises on an average from 9 to 12 feet. In the Bay of Fundy, which opens its bosom to receive the full wave, the tide, which, at the entrance, is 18 feet, rushes with great fury into that long and narrow channel, and swells to the enormous height of 60 feet, and even to 70 feet in the highest spring-tides. In the Bristol Channel, on the coast of England, the spring-tides rise to 40 feet, and swell to 50 in the English Channel at St.-Malo, on the coast of France. It is obvious that differences so considerable in the level of the water will cause strong currents, constantly varying in force and direction with the tide, such as those witnessed in Hell Gate, a few miles west of the point where Long Island Sound connects with New York harbor. To the same cause may be traced the dangerous whirlpools which have long been celebrated on various coasts. The famous Maelstrom off the Norwegian coast is but a tidal current rushing with great violence between two of the Lofoden islands, causing a whirling motion, which is reversed at every new tide. Such, too, in the Straits of Messina, are the classic Scylla and Charybdis, so much dreaded by the navigators of old, and many other whirlpools of less celebrity.

Bibliography.—The mathematical theory of the tides is developed very abstrusely by Laplace in *Mécanique Céleste* vol. ii. Much simpler and more modern is Airy's treatise on *Tides and Waves*, forming a part of the *Encyclopædia Metropolitana* (London, 1848). Yet later developments are found in Ferrel's *Tidal Researches*, published in the annual report of the U. S. Coast Survey for 1874.

Revised by S. Newcomb.

**Tidioute′**: borough; Warren co., Pa.; on the Allegheny river, and the West N. Y. and Pa. Railroad; 35 miles N. E. of Oil City, and 160 N. by E. of Pittsburg (for location, see map of Pennsylvania, ref. 2–C). It has large lumber and petroleum interests, and contains several saw, planing, and grist mills, manufactories of lumber, chairs, and hubs, a savings-bank, and a weekly newspaper. Pop. (1890) 1,328; (1900) 1,237.

**Tieck**, teek, Ludwig: poet; b. in Berlin, May 31, 1773; studied theology, philology, and literature at Halle, Göttingen, and Erlangen; resided in Berlin 1795–99, went in the latter year to Jena, where he founded with the Schlegel brothers, Novalis, and others the so-called romantic school; returned to Berlin; lived for a number of years at Frankfort-on-the-Oder; visited Italy in 1805 and England and France in 1817, and finally, in 1819, settled in Dresden, where he was made director of the court theater, and where he became the center of a large and select literary circle. On the invitation of King Frederick William IV., who assured him a large pension, he went in 1841 to Berlin, and here assisted in the production of *Antigone* and other Greek plays. D. in Berlin, Apr. 28, 1853. In the literary career of Tieck, who has always been recognized as the head of the older romantic school, we can distinguish several periods. In his earliest productions the influences of the Storm and Stress period are decidedly noticeable, and his novel *William Lovell* (1799) is in this respect an especially interesting document of his literary development. The pronounced predominancy of the imagination, which is quite apparent in his first productions, may be considered the chief characteristic of Tieck's entire poetic activity. Thus, in accordance with the cardinal doctrine of romanticism which proclaimed the sovereignty of the poet's imagination, Tieck revived the mediæval legends and fairy-tales (*Der blonde Eckbert*, *Haimonskinder*, *Magelone*, etc.); thus he wrote his fantastical comedies (*Der gestiefelte Kater*, *Prinz Zerbino*, *Die verkehrte Welt*, etc.), and thus he was first attracted by Shakspeare as the poet of unlimited imaginative powers. The result of this one-sided accentuation of the imagination is the absolute lack of plastic power in Tieck's earlier productions, none of which became popular with his nation. Even his reproductions of mediæval legends and fairy-tales are artificial, and can not compare with the naïve and truly popular style of the fairy-stories of the Grimm brothers. Despite his vivid imagination, Tieck's poetic genius was decidedly of a reflective nature, as may be seen from his *Gedichte* (1821), which lack the ring of the true lyric. A greater and more lasting influence was exerted by Tieck in his masterly translations from the Spanish (*Don Quixote*, 1799–1801), the English (*Shakespeare*, *Altenglisches Theater*, 1811), and the Middle High German (*Minnelieder*, 1803, *Ulrich von Lichtenstein*, 1812), by his critical writings (*Dramaturgische Blätter*, 1826, and *Kritische Schriften*, 1848), and by his excellent editions of the works of Solger, Novalis, Lenz, and Kleist. During the last period of his literary activity he devoted himself exclusively to the writing of novels, taking his subject-material partly from history (*Dichterleben*, a sort of biography of Shakspeare, *Aufruhr in den Cevennen*, etc.), partly from real life (*Vittoria Accorombona*, *Musikalische Leiden und Freuden*, etc.), and producing a number of stories which will be read and enjoyed when his romantic productions are recorded in histories of literature only.

See *Schriften von Ludwig Tieck* (20 vols., Berlin, 1828–46); R. Köpke, *Ludwig Tieck* (1855); von Friesen, *Ludwig Tieck* (1871); K. von Holtei, *Briefe an Ludwig Tieck* (1864); R. Haym, *Romantische Schule* (1870). JULIUS GOEBEL.

**Tiele**, tee′le, CORNELIS PETRUS: theologian; b. at Leyden, Holland, Dec. 16, 1830; studied theology at Amsterdam; became pastor at Moordrecht in 1853 and at Rotterdam in 1856; professor in a seminary at Leyden in 1873; and Professor of the History of Religions in the University of Leyden in 1877. He has written many important theological works. His *Comparative History of the Egyptian and Mesopotamian Religions* (1869–72) and *Outlines of the History of Religion* (1876) have been translated into English and French; the latter also into German. Other works treat of the Gospel of John as a source of the life of Jesus (1855), the religion of Zarathustra (1864), and Babylonian-Assyrian history (German trans. 1886–87). S. A. T.

**Tiel-tree**: See TEREBINTH.

**T′ien′-Shan** or **Thian-Shan** (celestial mountains): a lofty mountain chain in Central Asia, in lat. 42° N. from lon. 70° to 90 E., forming the boundary between the Balkash basin and that of the Kashgar and Tarim, and lying partly in the Russian provinces of Syr-Darya and Semirechensk and partly in Chinese Turkestan. Its mean elevation is 10,000 to 12,000 feet, highest at the west, and descending in Chinese territory. There are several summits which reach 15,000 to 18,000 feet. The highest peak is Khan-Tengri (24,000 feet), on the Russo-Chinese boundary. M. W. H.

**Tientsin**, teen′tsin′. Chinese pron. tyen′cheen′ (literally Heaven's Ford): a walled city and river-port of the province of Chihli, in China; capital of a department of the same name. The city is situated at the junction of the Grand Canal with the Pei-ho, 80 miles S. E. of Peking and 35 miles (by water 70) from Taku, at the mouth of the river; lat. 39° 10′ N., lon. 117° 3′ 55″ E. (see map of China, ref. 3–J). Next to Peking it is the most important city of the province. Prior to 1872 it was merely a *wei* or military station for the protection of the river traffic. The city itself is comparatively small, its walls having a circuit of little over 3 miles, but its suburbs are extensive, and in them most of the business is transacted. The streets both within and without the city are narrow and filthy, and the buildings lacking in interest or beauty. Tientsin was designated in the treaty made here in 1858 as a treaty-port, but was not opened to foreign residence and trade until Jan., 1863. The foreign settlement, which is called *Tsz′-chu-lin*, or Red Bamboo Grove, is situated 2 miles below the city, and consists of three "concessions," as in Shanghai, the French nearest the city, then the British (the largest and most important), and lastly the "American." City, suburbs, and settlements are all inclosed in a circular rampart, known as "San-ko-lin-sin's folly," because thrown up in 1858 by the Tartar general Sŭng-ko-lin-sin as a defense against the British forces. Since 1881 Tientsin has been connected by telegraph with Shanghai, Peking, and the chief cities of China, and with Europe. It is also connected by rail with the mouth of the Pei-ho, the Peh-tang coal mines, and Shan-hai-kwan and beyond. Though the river is frozen over from the early part of December to the middle of March and later, the trade of Tientsin is considerable. The imports in 1899 were valued at 14,255,209 haikwan, or custom-house taels ($10,235,234); the exports at 10,871,539 taels ($7,805,765). Estimated population, 1,000,000.

Tientsin was the center of important military operations during the Boxer uprising of 1900. Thence Admiral Seymour's unsuccessful relief expedition set out for Peking on June 10. After the Boxers had cut off his communications they turned to the investment of the European quarters of the city, which suffered greatly from the bombardment. The siege was not raised till June 23. The Chinese defended themselves in the native city, and were not dislodged till after the hard fighting of July 13–14, in which 800 of the allied armies were killed and wounded. Tientsin was made the base of the subsequent operations for the relief of Peking. See CHINA.

**Tiepolo**, tēē-ā′pō-lō, GIOVANNI BATTISTA: painter; b. in Venice, 1692, or 1696; pupil of Gregorio Lazzarini, but in a peculiar way the student of Paolo Veronese and other great Venetians of an earlier day, and their follower. His life was spent in constant work, chiefly in Venice and its neighborhood. In 1761 he went to Madrid, it is said on special invitation of the King of Spain, and, although a very old man, painted several large frescoes, one of which covers the ceiling of the throne-room of the palace, and has for its subject the *Majesty of Spain*. Fresco was Tiepolo's especial field, and he did wonderful things in it. He was the last man of the great Venetian school, an embodiment of the traditions of centuries, and almost a worthy successor to Tintoretto and Veronese; lacking in color, but in dextrous and varied composition and drawing one of the most able of painters. D. in Madrid, Mar. 27, 1770. Of his numerous large frescoes, besides several at Madrid, there are a number at the Villa Valmarana, near Vicenza; at Udine, in the bishop's palace, several large ones; at the Palazzo Lobia, in Venice, a series representing the *History of Cleopatra*. Painted in oil there are ceiling-pictures in the Church of Santa Maria del Rosario and the Church of Santa Maria dei Scalzi, both in Venice; an altarpiece in the former church, and in the Academy of Venice another ceiling brought from a church at Castello and representing the *Invention of the Cross*; also at the Hermitage, in St. Petersburg, a large ceiling-picture, *Cleopatra Feasting*; also in the academy is a *St. Joseph and Christ with Saints*; at the Santi Apostoli is a *St. Lucy*. In London, in the National Gallery, are two studies for altarpieces, and in Stockholm two similar studies. In the Louvre is a fine *Last Supper*, and a banner painted on both sides with a *St. Martin* and a *Virgin and Child*. RUSSELL STURGIS.

**Tierce** [Fr.]: a stop in the organ, tuned a seventeenth (or two octaves and a third) above the diapasons.

**Tierney**, teer′nē̆e, GEORGE: politician; b. at Gibraltar, Spain, Mar. 20, 1761; son of a London merchant; educated at Eton and at Peterhouse, Cambridge, where he graduated in law 1784; became a lawyer in London, but soon abandoned law for politics; published a treatise on *The Real Situation of the East India Company, considered with reference to their Rights and Privileges* (1787); entered Parliament in 1789; became a leader of the Whigs, and acquired celebrity as a debater and satirist; fought a bloodless duel with Pitt May 27, 1798; opposed the war with France; brought forward annually a series of resolutions in opposition to those of the Chancellor of the Exchequer; was treasurer of the navy 1803–04, and a privy councilor; Secretary of State for Ireland 1806; president of the board of control 1806–07, with a seat in the cabinet; was the head of the opposition after the death of Ponsonby in 1817, and was master of the mint in the administration of Canning 1827–28. D. in London, Jan. 25, 1830.

**Tierra del Fuego**, ti-er′rā̆ā-del-foo-ā′gō: an archipelago at the southern extremity of South America, separated from the continent by the Strait of MAGELLAN (*q. v.*). Length from N. W. to S. E., about 400 miles. Of the total land-area (over 21,000 sq. miles) at least four-fifths is included in the large island called King Charles South Land, Tierra del Fuego, or Fuegia. W. and S. of this are Desolation, Clarence, Navarin, Wollaston, Dawson, Londonderry, and numerous smaller islands and islets, all separated from the larger island and from each other by tortuous channels; a group at the southern end, separated by the navigable Lemaire Channel, includes Horn island and Cape Horn: and the Isla de los Estados is somewhat outlying, toward the S. E. N. of the western mouth of the Strait of Magellan a group of very similar islands lines the coast; they belong, physically, to the Tierra del Fuego group, but those between the strait and Wellington island are distinguished as the Madre de Dios Archipelago. The Andes are continued into Tierra del Fuego, occupying the greater part of the small islands and the southwestern side of King Charles South Land; some of the peaks are over 6,000 feet high and partly covered with perpetual snow, but there are no active volcanoes. The bases of the mountains are covered with pine forests, and numerous glaciers descend from their sides. All the islands are very irregular and cut by deep fiords, affording the most magnificent scenery. The eastern part of King Charles South Land is lower and contains some good pasture-land. Gold has been found in paying quantities. The climate is damp, very changeable, and subject to violent storms and severe cold, especially from June to October. By the treaty of 1881 that portion of the archipelago lying E. of lon. 68° 34′ W. (the meridian of the eastern entrance to the Strait of Magellan) is held by the Argentine Republic; it constitutes the territory of Tierra del Fuego, with an area of 8,217 sq. miles; there are two or three small civilized settlements. The remaining surface belongs to Chili, and is included in the territory of Magallanes; at present (1895) it is unsettled. The Indian inhabitants belong to three distinct races, but are classed together as Fuegians; all are savages of a low grade, but inoffensive, subsisting on fish, seals, etc. They number about 8,000. FERNÃO DE MAGALHÃES (*q. v.*) discovered the archipelago in 1520. It is said that he named it, in allusion to the smoke from Indian watch-fires, *Tierra de Humos* (land of smoke), and that Charles V. changed this to Tierra del Fuego (land of fire). HERBERT H. SMITH.

**Tierra Firme**: See SPANISH MAIN.

**Tietjens**: See TITIENS.

**Tiffany**, FRANCIS: clergyman; b. in Baltimore, Md., Feb. 16, 1827; educated at Harvard College and at Harvard Divinity School; pastor of Unitarian churches in Springfield and West Newton, Mass., 1852–62, and 1865–82; spent many years in Europe; has charge of the Indian department of the American Unitarian Association; author of *Life of Dorothea L. Dix* (New York and Boston, 1890). J. W. C.

**Tiffany**, LOUIS COMFORT: See the Appendix.

**Tiffin**: city (founded in 1817); capital of Seneca co., O.; on the Sandusky river, and the Balt. and O., the Cleve.. Cin., Chi. and St. L., and the Penn. railways; 34 miles S. W. of Sandusky, and 42 miles S. S. E. of Toledo (for location, see map of Ohio, ref. 2–E). It contains 16 churches, public-school property valued at over $150,000, Heidelberg University (Reformed, founded in 1850), with academical school, college, and theological seminary, public and university libraries, orphan asylum, a national bank (capital $250,000), a State bank (capital $100,000), an incorporated bank with capital of $50,000, a private bank, and 2 daily, 3 weekly, and 3 monthly periodicals. There are woolen-mills, foundries, stone and tile works, machine-shops, agricultural-implement works, flour-mills, pottery and glass, straw-board, and emery-wheel works. Pop. (1880) 7,879; (1890) 10,801; (1900) 10,989. EDITOR OF "SENECA ADVERTISER."

**Tiffin**, EDWARD, M. D.: first Governor of Ohio; b. at Carlisle, England, June 19, 1766; emigrated to the U. S. 1784, settling at Charlestown, Va.; studied medicine and took his degree at the University of Pennsylvania. He became a local preacher in the Methodist Church, but continued the practice of medicine. Having removed to Chillicothe, O., in 1796, he was elected to the Territorial Legislature, and when Ohio was admitted to the Union was chosen Governor (1803–07). He was U. S. Senator 1807–09; commissioner of the U. S. land-office 1812–15, and subsequently surveyor-general of the Northwest Territory. D. at Chillicothe, O., Aug. 9, 1829. Three of his sermons, preached in 1817, were published in the *Ohio Conference Offering* (1851).

**Tiflis**, tif-lees': government of Russia; bounded N. by the Caucasus and S. by Turkey in Asia. Area, 15,306 sq. miles. Tiflis is a mountainous region, covered with splendid forests of oak, chestnut, and maple. The valleys are fertile and, though poorly cultivated, produce tobacco, cotton, indigo, wheat, and all the fruits of Southern Europe. Pop. (1891) 800,875, mainly Georgians, Armenians, Russians, and Tartars. E. A. G.

**Tiflis**: town; former capital of Georgia and now of the Russian government of Tiflis, on both sides of the Koor (see map of Russia, ref. 12–F). It carries on simple manufactures and is famous for the skill of its workers in metals. It is the center of South Caucasian commerce between Russia, Persia, and Europe, and is connected by rail with Baku on the Caspian and Batoum on the Black Sea. Trade is mostly in the hands of Armenians. It was almost totally destroyed by Mehemet Khan (1795), and was ceded to Russia by its last king, George (1801). In the vicinity are naphtha and thermal springs, the latter much frequented. Pop. (1897) 159,862. E. A. GROSVENOR.

**Tiger** [viâ O. Fr. *tigre*, *tygre* (> Fr. *tigre*), from Lat. *ti'gris* = Gr. τίγρις; cf. TIGRIS]: the name applied to certain quadrupeds. (1) Primarily and of right it belongs only to the *Felis tigris*, one of the largest of living *Felidæ*, about equal in size and superior in strength to the largest lions, and more destructive and far more dangerous to man. Tigers have been known to measure over 10 feet in length, including the tail, and to weigh over 500 lb. It is peculiar in the development of spreading thick, whisker-like hairs on the sides of the head; its tail is elongate and smooth-haired, and the color is a tawny yellow transversely striped with black. It ranges N. into Southern Siberia, and S. as far as the Spice islands. E. and W. its habitat extends from Persia to the Pacific. It prefers forests and jungles near river-banks for its abode. It is much dreaded by man, especially in parts

The tiger.

of India. The tiger has been frequently induced to hybridize with the lion in captivity. Old tigers sometimes acquire a great fondness for human flesh, and are then called "man-eaters." The hunting of the tiger is a favorite though perilous form of sport in Oriental lands. (2) The name is also sometimes applied by hunters to the American JAGUAR (*q. v.*). (3) It is further transferred in Van Diemen's Land to the striped *Thylacinus cynocephalus*, a carnivorous marsupial. See THYLACINIDÆ. Revised by E. A. BIRGE.

**Tiger-cat**: any one of a large number of striped and spotted wildcats, mostly rather small tropical animals, often arboreal in their habits.

**Tiger-flower**: the *Tigridia pavonia*, a garden-flower of the family *Iridaceæ*. It is a native of Mexico, and is cultivated for its gorgeous blossoms, each of which lasts but a day. The garden forms known as *T. conchiflora* and *T. grandiflora* belong to this species.

**Tigert**, JOHN JAMES, M. A., D. D.: clergyman and author; b. at Louisville, Ky., Nov. 25, 1856; educated in Louisville public and high schools, Vanderbilt University (1875–77), and Southern Baptist Theological Seminary; served in pastorates of Methodist Episcopal Church South (1877–81); was Professor of Moral Philosophy in Vanderbilt University (1882–90); again a pastor at Kansas City, Mo. (1890–94); since 1894 has been editor of *The Methodist Quarterly Review*, Nashville, Tenn. He has published *Handbook of Logic* (1885); *The Preacher Himself* (1889); *A Voice from the South* (1892); and *Constitutional History of American Episcopal Methodism* (1894). He also edited Summers's *Systematic Theology* (2 vols., 1887–88) and McTyeire's *Sermons* (1886). A. OSBORN.

**Tighe**, tī, MARY (*Blachford*): poet; b. in Dublin, Ireland, in 1773; married in 1793 her cousin, Henry Tighe, of Rosanna, County Wicklow, a member of the Irish Parliament; published in 1805 for private circulation her *Psyche*, a poem of remarkable excellence, based on the story of Apuleius. D. at Woodstock, County Kilkenny, Ireland, Mar. 24, 1810. Her *Works*, which appeared in 1811, have passed through several editions, and she was the subject of a song by Moore and a poem by Mrs. Hemans. Revised by H. A. BEERS.

**Tiglathpileser**: See ASSYRIA.

**Tigra'nes II.**, THE GREAT: King of Armenia (96–55 B. C.). He carried on successful wars against Parthia and the Seleucidæ, conquered all the country between the Euphrates and Mediterranean, and assumed the title of King of Kings. After twenty-two years of prosperity he was involved in war with Rome by his father-in-law, Mithridates, and was twice defeated by Lucullus, who took and sacked his capital, Tigranocerta (69 B. C.). After a final defeat by Pompey (65 B. C.) he repaired to the Roman camp and in sign of submission placed his tiara at the feet of the Roman general. He was compelled to pay 6,000 talents, but was allowed to retain Armenia proper. Armenia Minor was assigned to Deiotarus and most of Tigranes's foreign conquests were restored to their former rulers or incorporated in the Roman dominions. He was succeeded by his son Artavastes. E. A. GROSVENOR.

**Tigré**, tē-grā′: province of Abyssinia, between lat. 12° and 16° N. and lon. 37° and 40° E.; formerly an independent state until conquered in 1855 by Theodore. Its capital is Adua, one of the principal stations on the caravan-route between Massowah and Gondar.

**Tigri**, Giuseppe: author; b. at Pistoia, Italy, Nov. 22, 1806; entered the Church, but spent his life in teaching and writing; journeyed through Europe in 1861; was later an inspector of schools in Pistoia and San Miniato, and finally a librarian in the former place, where he died Mar. 9, 1882. His chief work is the collection *Canti popolari toscani* (Florence, 1856; 2d ed. 1860). He wrote also a didactic poem *Le selve* (1844); a novel, *La selvaggia de' Vergiolesi* (1870); several works treating of the mountaineer, *Il montanino toscano volontario alla guerra dell' independenza italiana, 1859* (1860), *Volontario e soldato* (1872), *Celestina* (1880), and *Matilda*; a versified novel; and several treatises, such as *Contro i pregiudizi popolari* (1870), and *Da Firenze a Constantinopoli e Mosca* (1877). J. D. M. Ford.

**Ti′gris** [= Lat. = Gr. Τίγρις, from O. Pers. *Tigra* (> Pers. *Tīr*), liter., the Arrow, so called from its swiftness]: river of Asiatic Turkey. Under the name of *Hiddekel*, it was one of the four rivers of Eden. It rises in the mountains of Kurdistan, only 4 miles distant from the channel of the Eastern Euphrates. After a winding but generally southeastern course of about 1,000 miles it joins the Euphrates at Korna. Together they form the Shatt-el-Arab, which empties into the Persian Gulf nearly 100 miles distant. On its banks are the towns of Diarbekir, Mosul, and Bagdad, and the ruins of Nineveh, Seleucia, Ctesiphon, and Opis. Its banks above Diarbekir afford pasturage to nomad tribes, and below Diarbekir are finely cultivated as far as Mosul. There the land on both sides becomes a desert. From Bagdad to Korna the banks are steep and overgrown with high reeds and brush which form the haunts of beasts of prey. The upper Tigris as far as Mosul is navigable only by rafts and thence by small vessels to Bagdad, to which steamers of light draught ascend from the Persian Gulf. Its average breadth between Mosul and Bagdad is 200 yards, but the breadth, velocity, and depth vary with the season. Its greatest height is attained toward the last of May, and then rapidly decreases in June. During a brief period (114–117) it formed the boundary between the Parthian and Roman empires. E. A. Grosvenor.

**Til′burg**: town; province of North Brabant, Netherlands; 14 miles E. S. E. of Breda (see map of Holland and Belgium, ref. 7–F). It is the seat of a large cloth-manufacturing industry, employing several thousand persons, and each family has a house of its own. Print-works, breweries, and tanneries are also in operation. Pop. (1899) 40,684.

**Tilden**, Samuel Jones: statesman; b. at New Lebanon, N. Y., Feb. 9, 1814; studied at Yale College and the University of New York; took the course of law at the latter, and was admitted to the bar in 1841. He became prominent in politics as an able champion of Van Buren's administration, and at the same time won for himself a high place in his profession, amassing by a judicious investment of his earnings one of the largest fortunes ever accumulated in legal practice. During the most laborious period of his professional life he was one of the leaders and most trusted counselors of the Democratic party. He was a member of the convention for a revision of the constitution of the State in 1846, and again in 1867. He also served two terms in the lower branch of the State Legislature—first in 1846, and second in 1872. He was one of the foremost in the overthrow of the Tweed ring, and in the establishment of a reformed city government. (See Tweed, William Marcy.) In 1874 he was nominated and chosen Governor of the State of New York by a majority of more than 50,000 votes, defeating Gen. Dix, a Republican candidate, who had been elected two years before by a majority of 55,451. As Governor he exposed the iniquities of the canal ring and crushed its sway over the legislative, administrative, and judicial departments of the State. His was a reform administration and most successful in its results. In 1876 he was nominated without considerable opposition by the national Democratic convention for the presidency of the U. S. At the election he received a much larger popular vote than any other candidate, and 184 uncontested electoral votes. Only one additional electoral vote was required for his election, while twenty additional votes were required for the election of the rival candidate. Owing to differences of opinion as to the proper mode of counting electoral votes and passing upon contested returns, the settlement of the matter was intrusted by Congress to a specially appointed tribunal known as the Presidential Electoral Commission (*q. v.*), which decided in favor of the Republican electors in every contested case, and certified to the election of Rutherford B. Hayes, the Republican candidate for the presidency. Impressed with the conviction that Mr. Tilden had been lawfully elected to the presidency, the Democratic party continued to regard him as its candidate for the succeeding election, in 1880, but he was obliged by failing health to decline the nomination and withdraw from public life. Despite Mr. Tilden's retirement the Democratic party seemed determined to nominate him for the presidency in 1884, public opinion refusing to concentrate upon any other candidate, and it was not till he had again publicly declared his unalterable determination not to return to public life that his party made another choice. During the latter part of his life he spent most of his time at Graystone, his country home on the banks of the Hudson, where he died Aug. 4, 1886. After providing for his heirs Mr. Tilden bequeathed the bulk of his property for the establishment of the Tilden Trust to found a free library and reading-rooms in the city of New York. This clause gave rise to a long contest, which was decided on appeal in favor of the heirs on Oct. 27, 1891. Mrs. William B. Hazard, however, though entitled by this decision to half of the estate, relinquished over $2,000,000 of her share for the purpose of carrying out Mr. Tilden's wishes. On Feb. 22, 1895, it was agreed by representatives of the Tilden Trust Fund, the Astor Library, and the Lenox Library to consolidate these institutions into a single library to be known as the New York Public Library—Astor, Lenox, and Tilden Foundations. See John Bigelow, *The Life of Samuel J. Tilden* (New York, 1895). Revised by F. M. Colby.

**Tiles** [O. Eng. *tigel*, like Germ. *ziegel*, an early loan-word from Lat. *te′gula* > Fr. *tuile*: Ital. *tegola*: Span. *teja*]: originally, flat slabs of baked clay. A tile is broader and thinner, a brick is thicker, and there is no absolute distinction between the two; thus the thin ancient Roman bricks used for wall-facing are often called tiles or tile-bricks. In common usage tiles are of three principal kinds—roofing-tiles, tiles for walls and floors, and drainage tiles. Roofing-tiles may be divided into (1) flat, overlapping tiles, which are used nearly as shingle or slate is used, and which have either a projection made in the solid mass or holes for nails by which they are kept in position; (2) pan-tiles, which are in section both convex and concave—that is, have an ∽ curve, the convex part lapping over the concave part; and (3) ridge-tiles, which are used not only for the topmost ridge or crest of the roof, but also for the projecting hips. There are many varieties of each of these kinds of roof-tile; thus one system of roofing provides flat tiles with small half-tubes of the same material to cover the joints between the flat tiles, and adaptation of the principle of the ridge-tile to a kindred use. Roofing-tiles have sometimes been enameled, and are much better for being so, from the waterproof character of the enamel. Such tiles are also frequently in brilliant colors; roofs made decorative in this way are known both in Asia and Europe, and in ancient and modern times. Perhaps the most remarkable instance of a large roof made decorative in this way is St. Stephen's Cathedral in Vienna. In Western France during the Middle Ages and at the time of the Renaissance roofs were commonly decorated in this way with the addition of crest ornaments and *épis* made of the same brilliant enameled earthenware. Modern taste is rather for unglazed tile, and finds great beauty in the unpolished surface and the slight variation of tint, increased by the varying angles at which the tiles are laid. Unglazed tiles absorb water readily. All tiles are heavy, and necessitate an expensive roof structure.

Tiles for floors and walls are of great variety in form and size and decoration. Old houses in the south of Europe, and even houses of no great pretension, have their rooms floored with tiles of red clay not finer than common bricks, but hard baked and practically a variety of terra-cotta. Throughout the Middle Ages hard-baked clay tile was in very common use for flooring, and the usual method of decorating this was to inlay clays of different colors in the body of the tile, yellow in red, and the like. Some of these tile floors still preserved are of great beauty. Down to the first half of the nineteenth century such tiles were in common use as far north as Holland. Paving with bricks passes imperceptibly into tile-paving, and the sidewalks of Baltimore offer many instances of hexagonal pieces of baked clay, which may be either bricks or tiles, according to their thickness. In the fifteenth and sixteenth centuries flooring, especially of chapels, oratories in private houses, and other rooms considered especially notable, were paved with enameled tiles of great beauty, but extremely perishable. A few such floors remain nearly intaet in Franee and in Italy, as at the manor-house of Oiron, in the department of Deux-Sèvres, at the famous castle of Écouen, in the Cathedral of Ravello, and in the Church of San Domenico at Naples. These beautiful tiles were less used for wall-decoration, because, in a room sufficiently important to call for rich ornament, the walls were usually in stone like the exterior, and beeause a protecting dado, if required, would naturally be of wood. In modern times, however, with the growing tendency to decorate closed and confined interiors with something more effeetive than plastering, there has been an inereased use of tile, painted and glazed and decorated with large and brilliant patterns, or even elaborate pictures, the prineiples of design in which are akin to those of decorative windows. Thus Théodore Deek produeed splendid wall-decorations covering whole sides of large rooms with admirably eonventionalized landscapes, eonsisting eaeh of perhaps 800 square tiles.

In all the above-mentioned instanees the surface is smooth, but much beautiful wall-tiling has been made with figures in slight relief. The Persians of the fifteenth and sixteenth centuries excelled in these. Sueh decoration has been traditional in Persia since antiquity (see *Earthenware, Glazed and Enameled*, under POTTERY AND PORCELAIN), and in that later epoeh they produeed what are probably the most beautiful wall-tiles ever made, sometimes in relief, but mueh more often smooth and painted with eonventional flower-patterns. The use of these tiles extended to the Mohammedan nations of the West; the finest specimens known are in the mosques of Cairo, and similar examples oeeur as far W. as Spain. Tiles with figures in relief are made in the U. S. at Chelsea, Mass., Beaver Falls, Pa., Indianapolis, Ind., Trenton, N. J., and Zanesville, O.

*Encaustic tiles* are those modern tiles made in imitation of the mediæval ones mentioned above, different-colored clays being inlaid upon a clay background and all fired together. The term has no particular significance, and must be considered as a mere trade-name.

BIBLIOGRAPHY.—Mediæval earthenware tiles are well treated in *Les Carrelages émaillés du Moyen Âge, etc.*, by Emile Amé; Turner and Parker, *Domestic Architecture of the Middle Ages* (4 vols., 1851, etc.); Henry Shaw, *Specimens of Tile Pavements* (1852); Viollet-le-Duc, *Dictionnaire Raisonné de l'Architecture* (for roof-tiles, see article *Tuile*; for floor-tiles and wall-tiles, article *Carrelage*). Many works contain colored and other illustrations of fine aneient tiles; for Oriental ones see Prisse d'Avenne, *L'Art Arabe*; Bourgoin, *Les Arts Arabes*; for European specimens, see Jacobsthal, *Süd-Italienische Fliesen-Ornamente*, and Meurer, *Italienische Majolika-Fliesen*. RUSSELL STURGIS.

**Till**: See DRIFT.

**Tillamook Rock**: See LIGHTHOUSE.

**Tilland'sia** [Mod. Lat., named by Linnæus in honor of Dr. Elias Tillands, a Finnish botanist]: a genus of epiphytie air-plants of the family *Bromeliaceæ*. There are many species, eight of which are natives of the southern parts of the U. S. Of these, *T. usneoides*, the long or Spanish moss, is the best known. It is abundant in the more humid districts of the South, where it hangs in long festoons from the trees. Its eentral fiber is largely used in stuffing mattresses. The plant is used in making an ointment asserted to be a cure for hæmorrhoids, and in winter it is eaten by cattle. Revised by CHARLES E. BESSEY.

**Tillemont**, tēēl'mōn', LOUIS SÉBASTIEN LE NAIN, de: ecclesiastical historian; b. in Paris, Nov. 30, 1637; educated by the Jansenists of Port Royal; studied theology at the seminary of Beauvais; took holy orders in 1672, and became subdeacon at the St. Lambert; retired in 1677 to the monastery of Port-Royal, and, when the Government closed this institution in 1679, to his estate of Tillemont, between Vineennes and Montreuil, where he died Jan. 10, 1698. He wrote *Mémoires pour servir à l'Histoire ecclésiastique des six premiers Siècles* (16 vols., Paris, 1693–1712); *Histoire des Empereurs et des autres Princes qui ont régné durant les six premiers Siècles de l'Église* (6 vols., 1692–1738); *Vie de Saint Louis* (first published by the French Historical Society, 6 vols., 1847–51). Revised by S. M. JACKSON.

**Tillett**, WILBUR FISK, A. M., D. D.: clergyman; b. at Henderson, Vanee co., N. C., Aug. 25, 1854; edueated at Trinity College, North Carolina, Randolph-Maeon College, Virginia, and Theological Seminary, Prineeton, N. J.; entered the ministry of the Methodist Episcopal Church South; was pastor at Danville, Va., 1880–82; Professor of Systematic Theology, dean of the theologieal faculty, and viee-ehaneellor of Vanderbilt University 1882–95. Besides frequent eontributions to religious and secular periodicals, he has published *Our Hymns and their Authors* (1889) and *Discussions in Theology* (1890). A. OSBORN.

**Tilley**, Sir SAMUEL LEONARD, K. C. M. G.: statesman; b. at Georgetown, Queen's County, New Brunswick, May 8, 1818; educated at the County Grammar Sehool. He was a druggist until 1854; represented St. John, New Brunswick, in the Legislative Council of the provinee 1850–51, 1854–56, 1857–65, 1866–67; was a member of the Executive Council, New Brunswick, 1854–56, 1857–65, 1866–67; during those several periods held the office of Provineial Secretary, and from Mar., 1861, to Mar., 1865, was leader of the Government. He had a seat in the Parliament of Canada 1867–73, 1878–85; was appointed Minister of Customs for the Dominion July 1, 1867; acting Minister of Public Works 1868–69; Minister of Finanee for a short time in 1873, and from 1878 until 1885. He was lieutenant-governor of New Brunswick from Nov., 1873, until July, 1878, and was reappointed to the same offiee Oct. 31, 1885. He was a delegate to the Charlottetown union eonference in 1864, to that in Quebee the same year, and to the London colonial eonference 1866–67. He was knighted in 1879, and reeeived the degree of LL. D. from the University of New Brunswiek in 1890. D. June 25, 1896. NEIL MACDONALD.

**Tillman**, BENJAMIN RYAN: politieian; b. in Edgefield co., S. C., Aug. 11, 1847; was edueated at Bethany Aeademy, and engaged in farming. He was Governor of South Carolina from 1890 to 1894, and was then eleeted U. S. Senator. As Governor he was well known for the diffieult but persistent enforeement of the dispensary law, assuming for the State a monopoly of aleoholic beverages.

**Tillman**, SAMUEL ESCUE: soldier and edueator; b. near Shelbyville, Tenn., Oct. 2, 1847; graduated at the U. S. Military Academy June, 1869; promoted seeond lieutenant Fourth Artillery; transferred to the Corps of Engineers as first lieutenant June 18, 1872; served on frontier duty in Kansas 1869–70; at the military academy as Assistant Professor of Chemistry, etc., 1870–73 and 1879–80, and as Assistant Professor of Philosophy 1875–76; as assistant astronomer to the U. S. expedition to Tasmania to observe the transit of Venus 1874–75; as assistant engineer on the explorations W. of the 100th meridian (Wheeler survey) 1873–74 and 1876–79 in Arizona, New Mexico, California, Nevada, Utah, Idaho, and Montana; Professor of Chemistry, Mineralogy, and Geology at the U. S. Military Academy sinee Dec. 21, 1880; author of *Elementary Lessons in Heat* and *Essential Principles of Chemistry*. JAMES MERCUR.

**Tillodon'tia** [Mod. Lat.; from Gr. τίλλειν, pluck, tear + ὀδούς, ὀδόντος, tooth]: a group of extinct Tertiary mammals, now regarded as forming a distinct order, possessing characters intermediate between carnivores, rodents, and ungulates. In *Tillotherium*, the typical and best-known genus, the skull resembles in shape that of the bear. The orbits are confluent with the large temporal fossæ, whieh are separated at the middle line of the skull by an obtuse sagittal crest. The nasals are stout, and expanded behind. The dental formula in the adult is ineisors, $\frac{2-2}{2-2}$; eanines, $\frac{1-1}{1-1}$; premolars, $\frac{3-3}{2-2}$; molars, $\frac{3-3}{3-3}$. The anterior ineisors, both above and below, are large, curved, scalpriform, and faced in front with enamel. They grow from persistent pulps, and strongly resemble the corresponding teeth of rodents. The canines are small. The upper molars are peculiar, and the lower are of the palæotherium type. The brain-cavity is small. As in most Eocene mammals, the hemispheres are small, and extend but slightly over the cerebellum or over the olfactory lobes. The latter were large and projected well forward. The eerebellar fossa is large, expanded transversely, and extends above the cerebral cavity. The vertebræ resemble those of some earnivores; the cervicals were short, the lumbars large. The radius and ulna were separate and of nearly equal size. The scaphoid and lunar bones were distinct. The feet were plantigrade, apparently fitted for digging, and each had five toes. There was a well-marked third trochanter on the femur, and the tibia and fibula were distinct. The best-known species (*T. fodiens*, Marsh) was about two-thirds the size of a tapir. The genus *Tillotherium* represents a distinct family. A second family of this order is represented by *Stylinodon*, in which the molars are rootless, subquadrate in transverse section, and faced with enamel within and without. O. C. MARSH.

**Tillotson**, JOHN, D. D.: archbishop and preacher; b. at Sowerby, Yorkshire, England, in Oct., 1630; was educated at Clare Hall, Cambridge, where he was made a fellow in 1651. He was originally a rigid Puritan, and in 1657 became tutor in the family of Cromwell's attorney-general, but at the Restoration went over to the Established Church, in which he took orders, and became in succession curate of Cheshunt, rector of Kedington, preacher at Lincoln's Inn, dean of Canterbury, prebendary of St. Paul's, and, in 1691, Archbishop of Canterbury, having in the meanwhile served as clerk of the closet to William III. and as member of the commission appointed in 1689 to revise the English liturgy. He took an active part in measures in opposition to Roman Catholicism, opposed the declaration of Charles II. in favor of liberty of conscience, and was an earnest advocate of the exclusion of the Duke of York from the succession. He ranks among the foremost of English preachers, and in lieu of preaching with the Puritan prolixity or the pedantic clumsiness of the Established Church he established the practice of speaking in plain almost familiar style, while at the same time his culture commended him to scholars. He published during his lifetime several volumes of sermons, and left many more in manuscript, and for the copyright of these his widow received 2,500 guineas. Several editions of his *Sermons*, in twelve and fourteen volumes, were published. His complete works have been published (3 vols. fol., London, 1707-12, and 10 vols. 8vo, 1820), and many of his sermons have been translated into French and German. D. in London, Nov. 22, 1694. Revised by S. M. JACKSON.

**Til'ly**, JOHANN TSERKLAES, Count von: general of the Thirty Years' war; b. in the castle of Tilly, near Gembloux, province of Brabant, Belgium, in Feb., 1559; being a younger son, was destined for the Church, and educated by the Jesuits, but preferred the military profession; served under Parma in the Netherlands, and under Duke Philip Emanuel of Lorraine in Hungary, and was in 1610 appointed field-marshal by Duke Maximilian of Bavaria. When the Thirty Years' war broke out he was made commander-in-chief of the army of the Holy League; suppressed the insurrection in Bohemia after the battle of Prague Nov. 8, 1620; won the battles of Wimpfen and Höchst in 1622, and Stadtlohn in 1623, and drove the Protestants from the Palatinate. He defeated Christian IV. at Lutter Aug. 27, 1626, and with Wallenstein forced the Protestants to the Peace of Lübeck. Appointed commander-in-chief also of the imperial army after the dismissal of Wallenstein in 1630, he stormed Magdeburg May 20, 1631. The brutal outrages committed by the Walloons and Croats on entering the city have left a stain on Tilly's reputation, though it is questionable how far he was responsible for them. He was utterly defeated by Gustavus Adolphus at Breitenfeld Sept. 17, 1631, and again on the Lech Apr. 5, 1632, in which battle he was mortally wounded. D. at Ingolstadt, Apr. 20, 1632. F. M. COLBY.

**Til'sit**: town of Prussia, province of East Prussia; on the Niemen; 65 miles N. E. of Königsberg by rail (see map of German Empire, ref. 1-K). It is regularly built, and in a fertile and well-cultivated district. It manufactures cloth, hosiery, oil, paper, chemicals, has several sugar-refineries and important fisheries for eel and salmon, and carries on a considerable trade in grain, hemp, flax, wool, and horses. It is famous for the Treaty of Tilsit concluded between Napoleon and the Czar Alexander in 1807 after the humbling of Prussia by the French. By this peace the foundation was laid for a Russian-French alliance, and Prussia lost nearly half of her territory. Pop. (1890) 24,545.

**Til'sonburg**: post-village, Oxford County, Ontario, Canada; on Big Otter creek; 16 miles N. of Port Burwell (see map of Ontario, ref. 5-C). It has good water-power, large lumbering interests, and is a station on the Grand Trunk and Michigan Central railways. Pop. (1891) 2,163.

**Tilt Cove**: port of entry; on White Bay, Newfoundland; 230 miles by steamer N. W. of St. John. It is a picturesque village on the border of a lovely lake, and owes its importance to a rich copper mine which is actively worked. There is also a vein of nickel, occurring in a regular lode; the copper, however, is in pockets or bunches. The harbor is not very good. Pop. about 800.

**Tilton**: town; Belknap co., N. H.; on the Merrimack and Winnipiseogee rivers, and the Concord and Montreal Railroad; 10 miles S. W. of Laconia, and 18 miles N. of Concord (for location, see map of New Hampshire, ref. 8-F). It contains the villages of Tilton and East Tilton; has five churches, a national bank with capital of $70,000, a savings-bank, a union graded school, and the New Hampshire Conference Seminary and Female College; and is principally engaged in the manufacture of woolen goods, hosiery, and pulp. Pop. (1880) 1,282; (1890) 1,521; (1900) 1,926.

**Tilton**, THEODORE: journalist; b. in New York, Oct. 2, 1835; was educated at the New York Free Academy (now the College of the City of New York); entered on journalism at an early age, and in 1856 was employed upon the New York *Independent*, to the editorship of which he succeeded upon the resignation of Henry Ward Beecher in 1863. In 1872, in consequence of disputes, his connection with *The Independent* was discontinued, and he established *The Golden Age*, a weekly journal, which he conducted till 1874. In that year he brought suit against Mr. Beecher, whom he charged with criminal intimacy with his wife, claiming damages of $100,000. The suit lasted six months, and the jury were unable to agree upon a verdict. He published *The American Board and Slavery* (1860); *Memorial of Mrs. Browning* (1862); *The King's Ring* (1866); *The True Church* (1867); *The Sexton's Tale and other Poems* (1867); *Sanctum Sanctorum, or Proof-sheets from an Editor's Table* (1871); *Life of Victoria C. Woodhull* (1871); *Tempest-tossed*, a novel (1875); *Thou and I*, poems (1880), and other works. He was for many years a popular lecturer. Since 1883 he has resided in Europe. Revised by H. A. BEERS.

**Timæus**, tī-mee'ŭs (Gr. Τίμαιος): Greek historian of Tauromenium, in Sicily; b. 352 B. C. The greater part of his long life was spent in Athens, where he studied rhetoric under Philiscus, a pupil of Isocrates. D. in Sicily in 256. His *History of Sicily*, in sixty-eight, or, according to others, thirty-eight books, told the story of the island from the oldest times to 264 B. C., and that of Italy and Carthage as well. Famous also was his chronological work *The Victors of the Olympic Games* (Ὀλυμπιονῖκαι). Timæus was a closet historian, and his writings showed a lack of familiarity with the practical problems of statesmanship. He made diligent use of his authorities, but he was a determined fault-finder, and for this censoriousness, as well as for his other shortcomings, he was mercilessly criticised by Polybius. His style found few eulogists. Fragments in Müller's *Fragmenta Historicorum Græcorum*, vol. i., pp. 193-233.

B. L. GILDERSLEEVE.

**Timber and Timber-trees** [*timber* is O. Eng. *timbor*, *timber*: O. H. Germ. *zimbar*, *timber*, house, room (> Mod. Germ. *zimmer*, room): Goth. *timrjan*, build; cf. Lat. *domus*: Gr. δόμος: Sanskr. *dama*, house, and Gr. δέμειν, build]: wood suitable for constructive purposes, as for making buildings and ships, or for furniture, tools, and the like; also the trees furnishing such material. The most prominent species of timber-trees used in the U. S. are the following:

(1) *Coniferous Division.*—Of those of the Atlantic States and Canada, the most important, and for its uses the best in the world, is white pine (*Pinus strobus*), in England called Weymouth pine. Hard-pine lumber, variously called yellow pine, pitch-pine, etc., is most largely furnished, and of best quality, by *P. palustris*, the long-leaved pine of the Southern States. *P. rigida*, the Northern pitch-pine, both in the Northern and Southern States furnishes a similar but inferior and generally smaller timber; and excellent hard pine is yielded by the short-leaved pine (*P. echinata*); while the loblolly-pine at the South (*P. tæda*) and the red or Norway pine at the North (*P. resinosa*) furnish a softer and less resinous lumber. Larch or hackmatack (*Larix laricina*) of the North furnishes a very valuable lumber, important in ship-building. Next are the spruces, with wood tougher than white pine, but more liable to shakes and splits. Black spruce (*Picea mariana*) has the widest range and yields the best lumber, especially prized for spars. White spruce (*P. canadensis*) is a smaller tree, and the wood inferior. Hemlock-spruce (*Tsuga canadensis*) furnishes at the North a valuable but coarse lumber, very liable to shakes and of moderate durability. The balsam-firs, both the Northern species (*Abies balsamea*) and that of the mountains in the South (*A. fraseri*), are of no value for timber, being small trees, with soft wood, lacking strength and durability. Of the cypress tribe, the bald cypress of the Southern States

(*Taxodium distichum*) furnishes lumber of great size and much durability, but light and shaky; while the arbor-vitæ or white cedar of the North (*Thuja occidentalis*) and that of the Middle and Southern States (*Chamæcyparis thyoides*) yield small timber of exceeding durability, especially for posts; and red cedar (*Juniperus virginiana*) furnishes a red and fragrant fine-grained wood of the greatest durability and value. The yew occurs as a tree only in a limited part of Florida, as does its relative the stinking cedar (*Torreya taxifolia*), rendering their excellent timber practically unimportant.

In the Pacific States and Rocky Mountain region the coniferous trees are numerous, and some are of immense height and girth. Of soft-wooded or white pines no one equals the white pine of the East. The sugar-pine (*Pinus lambertiana*), with its immense trunks, takes its place, but the wood is much coarser-grained. *P. ponderosa*, with its heavy wood, furnishes excellent hard-pine lumber, less resinous than the Eastern species; and there are several other species intermediate as to the character of the wood. For spruces, the *Pseudotsuga taxifolia* or Douglas spruce, of Oregon and California, is far the best of the race, as well as the largest. The hemlock-spruce and the larch are represented by species very like the Eastern; while the Menzies spruce (*Picea sitchensis*) surpasses the black spruce; and the balsam-firs are represented by several nobler species, which furnish better lumber. The cypress tribe is represented by several cypresses of considerable value; also in Oregon and northward by an arbor-vitæ (*Thuja gigantea*), vastly surpassing the Eastern species in size and value for timber, and in California by the famous redwood (*Sequoia sempervirens*), the light and reddish wood of which is incomparable for building and excellent for interior finish. See Sequoia.

(2) *Amentaceous Trees.*—The oaks are the most important, and the most valuable species is the white oak (*Quercus alba*), which in the Atlantic States takes the place of the *Q. robur* of Europe. It grows to a height of 80 to 100 feet and a diameter of 6 or 7 feet, and yields handsome logs. The wood is of a pale-reddish color, straight-grained, compact, tough, strong, durable, and shrinks but little. It is used for frames of structures where strength and durability are required, coachmaking, coopering, ship-building, and for a great variety of purposes in the domestic arts. For cabinet-making and interior decoration it is highly valued. The other annual-fruited species come next to this in value—viz., chestnut-oaks, post-oak, bur-oak, etc. In the Southern States, along the coast, the live-oak (*Q. virginiana*) represents a peculiar type, and for ship-building is prized above all others, but it does not give large timber. Its height is from 40 to 50 feet; diameter, 1 to 2 feet. The wood is yellowish when first cut, and deepens to a dark brown with age; it is hard, tough, strong, heavy, and very difficult to work, on account of the grain being waved or twisted. The pores are minute, and the silver-grain very bright and distinct. The biennial-fruited oaks have a more porous wood, unfitted for casks to hold liquids, less durable, and less strong. The best of them—viz., black oak (*Q. velutina*)—is found on poorer soils than the white oak, and grows to the height of 80 to 90 feet, with a diameter of 4 to 5 feet. The wood is reddish, porous, and coarse-grained. The outer bark is greatly used for tanning, and the inner bark, called quercitron, for dyeing. Red oak (*Q. rubra*) is used for similar purposes, though it is inferior in quality. Spanish oak (*Q. digitata*) and willow-oak (*Q. phellos*) are superior; and so are laurel or shingle-oak (so called because the wood was used for shingles). California and Oregon have oaks of peculiar species, some of them valuable timber-trees, but none which equal white oak. Chestnut (*Castanea dentata*) is a large tree, of the Atlantic States only, essentially of the same species as the European, yielding a coarse-grained and porous but durable lumber, easily worked, and valuable for wainscoting, etc. The medullary rays can not be traced in it. The American beech (*Fagus atropunicea*) has a very close-grained and hard wood, like that of the European species, of which joiners' tools are made. Iron-wood (*Ostrya*) and horn-beam (*Carpinus*), as the names denote, have very hard wood, but they are rather small trees, peculiar to the Atlantic States, with corresponding species in the Old World. The hickory, in several species, is peculiar to the Atlantic States. The shell-bark or shag-bark (*Hicoria ovata*) is the best, but all have a very tough and hard wood of remarkable strength, much prized for tools and the like. The walnut (*Juglans*) is known in the Atlantic States by two species—i. e. white walnut or butter-nut (*J. cinerea*), the favorite wood for gunstocks and of late for wainscoting and cabinet-work, but a small tree; and black walnut (*J. nigra*), the most important of native woods for the cabinet-maker, a tree of ample size. The heart-wood is of a violet color when first cut, but upon exposure becomes dark. It is far superior to the European walnut; it is strong, tough, durable when seasoned, and not apt to warp and split. It has a fine and compact grain, and is susceptible of a high polish. The birches are valuable timber-trees of the second class, having a hard and fine-grained wood, valued by cabinetmakers. Of the five species which in the Atlantic States and Canada form good-sized trees, the black or sweet birch, sometimes called cherry-birch (*Betula lenta*), is most prized, being excellent for furniture; and yellow birch (*B. lutea*) is equally good, but lighter in color. Poplars or cottonwoods (*Populus*) make large trees, as do some willows, but the wood is weak, soft, and usually of no durability.

(3) *Other Deciduous Trees.*—Only the most important can be mentioned. Plane-tree, buttonwood, or sycamore (*Platanus occidentalis* of the Atlantic States, and a corresponding species in California) deserves notice on account of the size which the trunk may attain, but it soon becomes hollow, and the wood, which is handsome on account of the strong silver-grain, is useless for the purposes it would otherwise be well adapted for. The laurel family is represented in the East by the sassafras, and in California by a laurel (*Umbellularia californica*), the light-colored and variegated wood of which is extremely beautiful. Elms are given only to the eastern side of the continent, and white elm (*Ulmus americana*) is the most noted species, a large tree, with handsome but not very durable wood. Slippery elm (*U. pubescens*) is a smaller tree, and the reddish wood is tougher. The ashes are timber-trees of the first class, of which there are six species in the Atlantic and two in the Pacific States. The yellowish wood is very firm and tough, but comparatively light, straight-grained, and easy to work. White ash (*Fraxinus americana*) is the best and most used, and is unexcelled for purposes where strength, elasticity, and durability are needed, and it is preferred to chestnut for interior finish. Black ash (*F. nigra*), a smaller tree, has tougher wood, easily separable into layers, and is therefore used for hoops and strong basket-work. American holly (*Ilex opaca*) of the Atlantic States, like the European species, has a very fine-grained and compact white wood, used for ornamental cabinet-work, wooden screws, etc. Tupelo, pepperidge, or sour-gum trees (*Nyssa*) of two or three Atlantic States species, and sweet gum (*Liquidambar styraciflua*), mostly have a very tough wood, of various uses, but not much used as timber; and flowering dog-wood (*Cornus florida*), although the wood is prized, is seldom large enough to form a timber-tree. The Kentucky coffee-tree (*Gymnocladus dioicus*) is a stately tree, of peculiar aspect, with handsome rosy or brownish wood, well suited for cabinet-work. Honey-locust is of little account, but the true locust (*Robinia pseudacacia*) affords a timber equal to live-oak and red cedar in durability, especially valued for treenails and in naval architecture generally. Maples are fine trees, of which one species on the Pacific coast and two or three on the Atlantic side are important for timber. Sugar-maple (*Acer saccharum*) is much the most valuable, having a hard and close-grained wood, of light color and silky luster when polished, and the varieties called curled and bird's-eye maple are greatly prized for cabinet-work. The soft maples, so called from the character of their wood, are the white or silver maple (*A. saccharinum*) and the red or swamp maple (*A. rubrum*), the former a large and the latter a medium-sized tree, the wood of which is used for lasts, for carvings, etc. Lindens or limes, in the U. S. commonly called basswood, of which there are two well-marked species in the Atlantic, but none in the Pacific States, are first-class forest-trees for size, and their soft and white fine-grained wood is excellent for coach-bodies, interior of cabinets, and various purposes where lightness with moderate strength is demanded. Tulip-tree (*Liriodendron tulipifera*), sometimes called whitewood, but in the eastern part of the Mississippi valley (where it abounds and develops its noblest proportions) commonly known as poplar, has a light and soft wood, like that of the linden, but more valuable and much more extensively employed for the same purposes. This noble tree is of the magnolia family, which in the cucumber-tree and in the great-flowered magnolia of the Southern States furnishes two other fine trees of the same character of wood, but of comparatively small use.

(4) *Exotic Timber-trees.*—Those of Europe are analogues of those of the U. S.—i. e. different species of pine, larch, spruce, oak, beech, elm, ash, linden, etc., only the chestnut being the same or nearly so—but are far fewer in species and in kind, tulip-trees, gum-trees, locusts, hickories, sassafras, bald cypress, red wood, etc., being wholly wanting. As to foreign woods of tropical regions imported for the use of cabinetmakers—such as mahogany, Spanish cedar (*Cedrela odorata*), rosewood, lignum-vitæ, and the like—they are mostly treated under their names in this work. See FORESTRY and PRESERVATION OF TIMBER.

BIBLIOGRAPHY.—C. S. Sargent, *Report on the Forests of North America* (exclusive of Mexico), in vol. ix. of the tenth census of the U. S. (1884); *Silva of North America* (1891–). Revised by CHARLES E. BESSEY.

**Timbre**: See ACOUSTICS and VOICE.

**Timbuc'too**: town of the Sudan, Central Africa; capital of the Fulbe state Massina; 10 miles N. of the Niger, near the desert of Sahara, in lat. 16° 49′ N., lon. 3° 7′ W. (see map of Africa, ref. 3-B). It is in an unhealthful and unproductive district; provisions have to be brought to it from distant places; but for the traffic between Northern and Central Africa it is of great importance, and although it has repeatedly suffered severely from being conquered and sacked by the Moors and by neighboring tribes, it has always risen again and is still increasing. Dates, European manufactures, firearms, gunpowder, tobacco, and paper are brought here through Sahara and exchanged for gums, ostrich-feathers, gold-dust, and palm oil. The rapid development of its commerce has been hindered by the rivalry and jealousy between the British and French merchants. The town is poorly built; it consists mainly of one-story mud huts and, with the exception of a mosque dating from 1325, it contains few buildings worth noticing. It was formerly surrounded by walls. The inhabitants, variously estimated at from 5,000 to 20,000, are indigenous Negroes, but mixed with them are Tuaregs, Fulahs, Bambarras, Mandingoes, Arabs, and representatives of the merchants of Mogadore, Morocco, Fez, and other places in Northern Africa. The city seems to date back to the twelfth century, but was visited by no European until Laing reached it in 1826. See Lenz, *Timbuktu, Reise durch Marocco, die Sahara, und den Sudan* (2 vols., 1884); Constantin, *Alger et Tombouctou* (1885); Caron, *De Port Louis au port de Tombouctou* (1891). Revised by M. W. HARRINGTON.

**Timby**, THEODORE RUGGLES, S. D., LL. D.: inventor; b. at Dover, N. Y., Apr. 5, 1822; he attended a common school, and early showed an inventive faculty; in 1841 submitted to the chiefs of engineering and ordnance a revolving battery to be constructed of iron, the first practical suggestion for the use of iron in the construction of military defensive works, and in 1843 filed a caveat in the U. S. Patent Office for "a metallic revolving fort to be used on land or water, and to be revolved by propelling engines located within the same, and acting upon suitable machinery"; in 1862 he made an agreement with the contractors and builders of the original Monitor for the use of his patent covering the turret system. The most important of his patents are the cordon of revolving towers across a channel (1862); the mole and tower system (1880); the subterraneous system (1881); the tower and shield system (1885); and the hemispheroidal system (1889). He also originated in 1862 the plan of firing heavy guns by electricity.

**Time** [O. Eng. *tīma*: Icel. *tīmi*: Dan. *tid*, time (an hour) < Teuton. **tī-*, found also in **tī-di* > Germ. *zeit*, time: Eng. *tide*. See TIDES]: The measurement of time is of such importance in modern life that a description of the methods by which it is made and the principles which govern it will be interesting. Measurements of long periods, months, and years depend on astronomical phenomena, especially the motions of the sun and moon. Measurements of fractions of a day are made by observing the different directions of the sun, or in our time by clocks and watches.

The longest unit of time which can be determined directly by observation is the year. This is the time occupied by the earth in one revolution around the sun; but, as shown in the article YEAR, there is a slight ambiguity as to the time when a revolution shall be regarded as complete. The sidereal year, which is properly that of the earth's revolution, is slightly longer than the solar year on which the seasons depend. Since it is the change of seasons which fixes the length of the year for practical purposes, the solar year is that universally used both in astronomy and in daily life. The next shorter unit of time is the lunar month or the interval between one new moon and the next. As this interval is neither an entire number of days nor an aliquot part of a year, it is no longer used as a measure of time. It has given way in most nations to the calendar month.

The most certain and exact measure of all is the day. This is the most obvious measure, because on it depends the alternation of day and night, and it is the most exact because the time of the earth's revolution on its axis remains unchanged, so far as observation has yet shown, from century to century. If it varies at all the change does not amount to one-thousandth of a second in a century. The time of one revolution of the earth on its axis is called the "sidereal day" because it is equal to the interval between two passages of a star across the meridian of a place. Owing to the annual revolution of the earth around the sun the sidereal day does not coincide with the interval between two transits of the sun over the meridian. If the sun and the star cross at the same moment to-day, the sun will be nearly four minutes later than the star in crossing to-morrow. In the course of a year the number of revolutions which the earth actually makes on its axis is one greater than the number of days; hence the sidereal day can not be used for the purposes of daily life and the solar day must take its place.

The true or apparent solar day is the interval between two transits of the sun over the meridian. Were this interval invariable no difficulty would be found in using the true solar day as a measure of time; but as a matter of fact it is always changing. Owing to the varying velocity of the earth in its orbit and to the obliquity of the ecliptic the difference between a transit of the sun and that of a star will sometimes change by more than four minutes and sometimes by less than four minutes in a day. Thus the solar days are a little longer at some seasons and a little shorter at others.

A hundred years ago, when men depended mainly on observations of the sun, or on a sun-dial or a meridian-mark, for their time, the difference caused no trouble, but when accurate clocks and watches were introduced they had to be constantly set forward or back in order to keep time with the sun. Thus arose the distinction between mean solar time and apparent solar time, two quantities which may be defined as follows:

*Apparent solar time* is time measured by the actual passage of the sun over the meridian. Owing to the variability of this measure, apparent time is a varying quantity. *Mean solar time* is defined by the motion of a fictitious sun called "the mean sun," which is imagined to move with perfect uniformity, being sometimes behind the true sun and sometimes in advance of it. The hours of this time are those measured by a perfectly regulated clock. The difference of these two times is called the *equation of time*. The diagram on the next page shows the way in which this equation varies in the course of a year. The straight line in the center of the diagram may be supposed to represent the equable course of mean time, while the curved line passes to the left or right of the straight one according as the sun is ahead of the mean-time clock or behind it. It will be seen that about Apr. 15, June 15, Aug. 31, and Dec. 24 the two lines cross; at those periods the mean-time clock and the sun coincide. From Dec. 24 until Apr. 15 the sun is behind the clock; the greatest difference occurs about Feb. 10, when the sun does not cross the meridian until about fifteen minutes past twelve by the clock. During May the sun is ahead of the clock, from June 15 to Aug. 31 behind it again, and then ahead of it from September until December. About Oct. 27 the sun is so far ahead as to pass the meridian sixteen minutes before noon by the clock.

*Local Time.*—On the system of measuring the day by the sun, noon at any place is the moment at which the mean sun passes the meridian of that place. To speak with more exactness, it is the moment at which the place passes under the sun as the earth revolves. Owing to the roundness of the earth different places pass under the sun at different times; one may say, in fact, that noon continually travels around the earth, reaching every part of it in succession during intervals of one day. Noon takes about three hours to pass from New York to San Francisco. When it is noon at San Francisco it is one o'clock in the region of the Rocky Mountains, two o'clock in the Mississippi valley, three o'clock in the Atlantic coast, four o'clock in Labrador, eight o'clock at Greenwich, etc. Hence, when it is noon at any one place, say New York, it is later than noon at every point farther east in longitude, and earlier at every point farther west. The difference is four minutes for every degree of longitude.

So long as men did not travel rapidly this difference of time caused no inconvenience; but when railways were in-

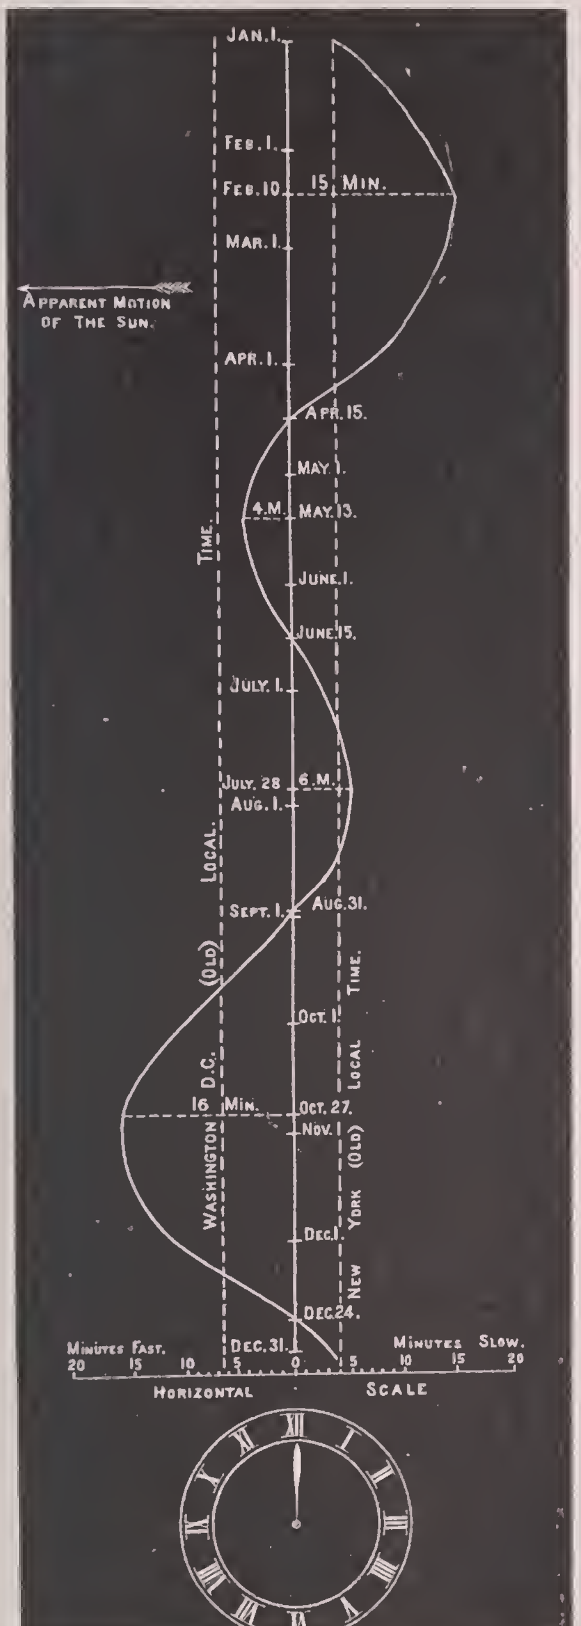

Diagram showing comparison of mean (or clock) time with solar (or apparent) time, at the several seasons of the year. The perpendicular central line represents mean time, and the curved line solar time, at mean noon. If the central line be taken to represent standard Eastern time, the dotted lines represent the local mean time for New York and Washington.

troduced it became a source of great confusion. The Bostonian visiting New York would find his watch eleven minutes fast. If he traveled farther west he would find his watch more and more ahead of the local time at every station he reached. Every railway chose its own meridian for running its trains, and a traveler could never determine at what time by his watch a train was booked to leave unless he knew what meridian the railway time was referred to. To lessen this confusion what is called standard time was introduced in 1883.

*Standard Time.*—The relation of standard time to local time is so little understood that some explanation is necessary. Suppose an astronomical clock to be set up some 6 miles E. of the Central High School of Philadelphia, across the Delaware river. Let the observer be able to fire a cannon, the sound of which could in imagination be heard all the way to the Mississippi valley. He knows the exact instant when the mean sun reaches his meridian. This instant is for him noon. At this moment of noon he fires his cannon. It would take thirty-eight seconds for the mean sun to pass from the observer's meridian to that of the High School. Supposing sound to travel instantaneously, an observer at the High School would hear the gun thirty-eight seconds before his own noon. Of course the farther we move toward the W. the longer it would take the mean sun to reach us, and therefore the earlier in the day we should hear the sound. An observer at Pittsburg would hear the report about twenty minutes before noon, and one at Newark, O., at half-past eleven. But an inhabitant of New York would not hear the report until four minutes past twelve at that place, because the mean sun marked noon for him four minutes before it marked noon for the observer E. of Philadelphia. On the meridian of Boston the report would be heard at sixteen minutes past their noon, and on the meridian of Calais, Me., the difference would be half an hour. Thus between the meridian of Calais, Me., and Newark, O., there would be a range of one hour in the local time. The rule for standard time then is simply this: That within this whole belt—that is, the belt included between the meridians of Calais, Me., and Newark, O., railways and the public shall use the time (which is called Eastern time) determined by the observer E. of Philadelphia, who, as we have placed him, is situated exactly 75° in longitude or five hours in time W. of Greenwich. Going farther west, say to Cincinnati, it will be more than half an hour before noon when the gun is heard—in fact, only twenty-three minutes past eleven. Therefore for Cincinnati a new meridian of 90° W. of Greenwich is taken, which passes near New Orleans, St. Louis, and Davenport. The mean sun crosses this meridian one hour after it crosses that at Philadelphia, and the moment of crossing is taken as noon, not only for all places on the meridian, but for all places within half an hour E. or W. of it; this time is called Central. At Denver the St. Louis noon gun would be heard at eleven o'clock. So we pass a new meridian near Denver, which is 105° W. of Greenwich, and which the sun does not reach until two hours after it has passed Philadelphia, and one hour after it has passed St. Louis. The time of this meridian (called Mountain time) is used for all the places whose time does not differ from it by more than half an hour. A fourth meridian is that of 120° from Greenwich, and it passes near the Pacific coast, E. of Sacramento and Stockton, where the time is called Pacific time. The moment when the sun crosses this meridian is taken for noon for all places not more than half an hour distant from it E. or W. Thus the traveler who wishes to know the time actually used at any railway station, or by the inhabitants of any city, has only to change his watch by one or more entire hours, the minutes remaining the same.

This is a great improvement on the old system, but every improvement in human affairs has its drawbacks, and standard time is no exception. The drawback in this case is that noon corresponds to the transit of the mean sun only on the four standard meridians of Philadelphia, St. Louis, Denver, and that of a point a little E. of Sacramento. If people had to set their watches by the sun, as they did a hundred years ago, this would be a great inconvenience. It is, however, little felt in these days of telegraphs and railways, when nearly every one to whom local time is important can set his watch by the clock of a railway station, or of a telegraph office. It might also be inconvenient if the farmer in Ohio were obliged to take his mid-day meal by standard time, which for him would mean the time of St. Louis. But if he deems this of importance he has only to set his dinner hour at half-past eleven instead of twelve. It will then correspond to the middle of his mean day or to his noon. If he is near the Pennsylvania border, where the time of the Philadelphia meridian is used, and he waits until half-past twelve by his standard time he will have his dinner at true noon at his place.

It must also be remembered in this connection that the almanac times of sunset necessarily correspond to the old local time, and not to standard time. Suppose, for example, that on the parallel of latitude for Philadelphia, which answers for New York, Pittsburg, Cincinnati, St. Louis, Denver, San Francisco, and in fact for almost the entire range of the Middle States, the sun is put down in the almanac as setting on a certain day at twenty minutes past six. The sun sets at Philadelphia five minutes after it does at New York, at Cincinnati thirty-seven minutes after it does at Philadelphia, and so on. It does not pass from place to place by jumps, but gradually, as the earth revolves. Twenty minutes past six, local time, at New York will be twenty-four minutes past six standard time, and so the standard time of sunset will differ four minutes from the almanac. At Newark, O., the error will be nearly half an hour in either direction, and although the almanac will give twenty minutes past six as the time of sunset, the standard time of sunset will be only ten minutes before seven. Hence if the almanac is used by the farmer to set his clock by sunset or sunrise, he must either use the local time of his own meridian or make a proper allowance, never more than half an hour, for the difference between his own meridian and the standard meridian.

In European countries, Greenwich time, six hours faster than Central time in the U. S., is used by the railways of Great Britain, Belgium, and Holland, and it is the legal time for all purposes in Great Britain and Belgium. Ireland uses Dublin time, and France that of Paris. Middle European time, one hour faster than Greenwich time, is used on the railways in Sweden, Germany, Austria-Hungary, Servia, and Western Turkey. It is the legal time for all purposes in Sweden and the German empire, and in 1894 was adopted in Denmark and Switzerland. Eastern European time, two hours faster than Greenwich time, is used by the railways of Eastern Turkey, Bulgaria, and Roumania. The time of the 135th degree of east longitude, nine hours faster than Greenwich time, is the official standard time used for all purposes in Japan. The Australasian colonies adopted standard time Jan. 31, 1895, thus making Melbourne, Sydney, and Brisbane time ten hours ahead of Greenwich time, while Adelaide, Perth, and Wellington are respectively nine, eight, and eleven hours ahead.

*Sidereal Time.*—Owing to the revolution of the earth around the sun, the sidereal day, as already defined, is three minutes fifty-five seconds shorter than the solar day. To state the case with entire precision, 365·2422 mean solar days, which is the solar year, are equal to 366·2422 sidereal days. In sidereal time the day is divided into twenty-four hours, the hour into sixty minutes, and the minute into sixty seconds, exactly as in solar time. The sidereal clock is one whose pendulum is a little shorter than that of the ordinary seconds clock, so as to keep sidereal time. All the units of this time are shorter than those of the solar time in the same proportion, and the sidereal clock gains one day in a year on the ordinary clock, which is a gain of nearly one second in six minutes. Once a year, at the vernal equinox, near Mar. 21, the two clocks agree. At all other times they differ. In astronomy, sidereal time is not used as a standard of measuring time, but only for finding or expressing the right ascensions of the heavenly bodies. S. NEWCOMB.

**Time**, in music: rhythm. Music, every sound, and every rest or intermission of sound, necessarily occupies some portion of time. The duration of such sound or rest is not absolute, but relative—i. e. it is not measured by clock-time, but depends upon the rate or speed assigned to any piece of music by the composer or performer. When that rate is once determined, then the duration of each individual note or sound is also determined, as would be the case with the minutes and seconds of a clock if its rate of motion were subject to change. Notes and rests represent portions of time in the order of 1, $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{8}$, etc. If the duration of the semibreve should be equal to 8 seconds of time, then the minim would occupy 4 seconds, the crotchet 2, the quaver 1, and so on; and if the duration of the semibreve should be arbitrarily fixed at more or less than 8 seconds, the shorter notes must all conform and preserve their relative proportions. This is the simplest and most elementary office of time in music. (See LARGE and NOTATION.) Notes written in a continued series without any regular divisions or periodical accent, would be unmeaning and unfit for the expression of musical sentiment and beauty, except in very rudimentary forms. Regularity of accent and rhythm is at the foundation of all excellence in modern music, which is therefore written in regular periods, phrases, etc., with smaller divisions into measures or bars. These measures are of several kinds, representing various styles of movement and peculiarities of accent, the leading idea being that musical sounds tend to fall into rhythmical groups of equal duration, and that these groups may be reduced into two classes, having one, two, or four times in a bar, and the other having three. Regularity of rhythm is an essential element in all grades of musical composition. There is a certain degree of interest created in the mind even by the repeated strokes of a drum when marked off into groups by a periodical accent. In such a case there is no diversity of musical sound, but yet the mind receives pleasure from such regularly recurring accents or pulsations. A succession of such will naturally fall into groups of twos or threes, or, in technical language, it will be duple or triple, binary or ternary. Other distinctions, as imagined by musicians of the eighteenth century, are unreal and have no philosophical basis. The reduction of all musical times into the genera of duple and triple, says a writer, "would long ago have been recognized had music made advances equal to other arts and sciences." Duple or *common* time (embracing also the quadruple) contains two or four equal beats in a bar, with the accent on the first part of each bar, and (in the latter) an inferior accent on the third beat. In ordinary common time each bar contains a semibreve, or shorter notes unitedly equivalent to it in value. It is known by a large C at the clef, with or without a stroke drawn through it. In church music this time is often written with two semibreves or four minims in a bar. The figures $\frac{2}{4}$ indicate another mode of writing common time, every bar containing *two-fourths* (or the half) of a semibreve. These kinds of common time are essentially one. The ear can detect no difference between them if in performance a bar of one is made equal to a bar of the other in *velocity*. Thus the strain variously written at *a*, *b*, *c* in Ex. 1 might be played by three instruments simultaneously without the least difference being perceptible even to the most critical ear.

Ex. 1.—MM 𝅗𝅥 = 80.

*a*

♩ = 80.

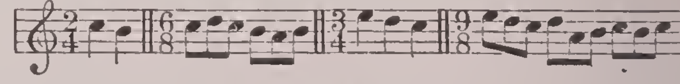
*b*

♪ = 80.

*c*

In regard to accent it was formerly assumed that in a bar with four equal beats the first only was accented, and in a bar of two equal beats the first was accented and the last unaccented. In actual practice, however, this nice distinction vanishes. Albrechtsberger remarks that the difference between these two is not a real one, as "a bar of four crotchets or beats is really only a double bar of two-crotchet time." *Triple* time contains three equal beats in each bar. Like common time, it may be written in minims, crotchets, or quavers, and marked as $\frac{3}{2}$, $\frac{3}{4}$, and $\frac{3}{8}$, which figures give the time-value of each bar as compared with the semibreve. In old collections of music, pieces may be found in $\frac{3}{16}$ time, each bar containing only three semiquavers, or their value in other notes or rests. *Compound* time is a modification of the above simple times, produced by a mingling of the triple element with the duple or quadruple; as when the two crotchets of a bar in two-four time are turned into two groups of three quavers each, or when the same process is applied to a bar in three-four or any other triple time. See Ex. 2, at *a* and *b*.

Ex. 2.—*a* *b*

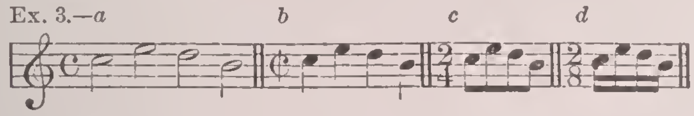


The forms of compound *common* time in most ordinary use are $\frac{6}{4}$ and $\frac{6}{8}$, the former having 6 crotchets (or their value) in each measure, and the latter having six quavers (or their value). The times marked $\frac{12}{8}$ (twelve quavers) and $\frac{12}{16}$ (twelve semiquavers) are less frequently used by modern composers. The forms of compound *triple* time are chiefly $\frac{9}{4}$, having the value of nine crotchets in each measure, and $\frac{9}{8}$, with the value of nine quavers. In the writings of the old masters, and even as late as the time of Beethoven, we find several other varieties of time (and various modes also of indicating the times already described), such as

$$\frac{2}{1}, \frac{2}{8}, \frac{3}{1}, \frac{4}{2}, \frac{4}{4}, \frac{4}{8}, \frac{4}{16}, \frac{6}{16}, \frac{9}{16}, \frac{12}{4}.$$

Much of the difficulty attending the study of musical time would disappear if it were borne in mind that the ear, and not the eye, is the proper judge in all questions of this nature. There are indeed certain reasons of convenience for writing common or triple time in four or five different modes, but the ear infallibly reduces them all to one, provided that they all proceed at the same rate. Everything, in fact, depends on velocity, for in an *adagio* in two-crotchet time every *quaver* may equal in duration a *minim* in moderately quick or four-minim time. The ear knows only one kind of common time; and the most experienced musician can not detect a difference between the groups at *a*, *b*, *c*, and *d* in Ex. 3 when performed at the same speed.

Ex. 3.—*a* *b* *c* *d*



That the same remarks will apply to the several forms of triple time needs no demonstration.

Revised by Dudley Buck.

**Timm**, Henry C.: See the Appendix.

**Timo'creon** (Gr. Τιμοκρέων) **of Iālȳsus**, in Rhodes: a lyric poet who took sides with the invaders during the Persian war. He is famous for his poetical tirade against Themistocles, and for his enmity against Simonides, the friend of Themistocles, was pilloried by Simonides in a familiar epitaph, which may be paraphrased:

> Hearty drinker, hearty eater,
> Hearty railer, hearty hater,
> Here I lie beneath this stone—
> Rhodian Timocreon.

The chief fragments are found in Plutarch's *Life of Themistocles.* See also Bergk's *Poetæ Lyrici Græci* (4th ed. vol. iii., pp. 536–541). B. L. G.

**Timo'leon** (Gr. Τιμολέων): a native of Corinth and a member of one of the most prominent families of the city. He put to death his brother, Timophanes, who attempted to overthrow the democratic constitution of their native city and make himself tyrant. In 344 B. C. an embassy arrived from Syracuse in Sicily, a colony of Corinth, and demanded the intervention of the mother city in the struggle between Hicetas and Dionysius the Younger, each of whom wished to become master of the city, and were ruining it by their strife. The aid was willingly granted, and Timoleon was appointed commander of the expedition. Although the armament was very small, he succeeded in expelling both Dionysius and Hicetas, established a democratic constitution, repeopled the city, and brought it in a very short time into a most flourishing state. This excited the jealousy of the Carthaginians, and under the command of Hasdrubal and Hamilcar they sent an army of 80,000 men against Syracuse, but Timoleon, although his force numbered only 12,000 men, attacked them while crossing the Crimissus, routed them completely in 339 B. C., and a treaty was concluded by which the Halycus was fixed as the boundary between the Greek and Carthaginian dominions in Sicily. He also expelled Hicetas from Leontini and Mamercus from Catana, introducing free constitutions in all the Greek cities of Sicily. The last years of his life he spent in retirement in Syracuse, living as a private citizen, though enjoying the greatest fame and honor throughout the Greek world. D. in 337 B. C. An annual festival was instituted in Syracuse in honor of his memory. Revised by J. R. S. Sterrett.

**Timon** (Gr. Τίμων): surnamed The Misanthrope; an Athenian citizen who lived at the time of the Peloponnesian war, and was embittered against mankind by the ingratitude of his friends. He is frequently alluded to by the comic poets of the period, was made the subject of one of Lucian's most famous dialogues, and has been rendered especially familiar by Shakspeare's play, which goes back ultimately to Lucian's dramatic sketch. *Timonium* was the name of Mark Antony's retreat at Alexandria and is the equivalent of "growlery." B. L. G.

**Timon of Phlius**: a man of letters who flourished at Athens about 275 B. C. His authorship was varied and multitudinous, embracing poetry and prose, tragedies, satyr-drama, elegy, but he is chiefly known as a satirist or writer of *Silli* (Σίλλοι). His brilliant satire was aimed at the dogmatic philosophers, for he himself was a skeptic, and the form which he employed, the heroic hexameter, is noteworthy, as it became the vehicle for the classic satire of Rome. The remains of Timon may be found in Diogenes Laertius, ix., 109–112. Ed. by Wachsmuth in *Corpusculum poesis epicæ ludibundæ* (1885). B. L. G.

**Timoor**: another spelling of the name Timur (*q. v.*).

**Timor**, tē-mōr': an island of the Malay Archipelago, the largest of the chain which stretches eastward from Java; between lat. 8° 16' and 10° 25' S., and between lon. 123° 25' and 127° 10' E.; area, 11,967 sq. miles. It is traversed from E. to W. by a range of lofty mountains, which everywhere show marks of volcanic agencies; earthquakes are frequent. Along the shore the districts are very fertile and densely peopled, and in these rice, sugar, indigo, papaw, sago, pineapples, and cocoanuts are cultivated. Buffaloes, oxen, pigs, and fowls are plentiful; turtles, pearl-oysters, and elegant coral are found along the shores; gold-dust and timber are exported. The inhabitants are partly Malayans, partly Oceanian Negroes, and as the population belongs to two different races, in the same manner the fauna and flora of the island belong to two continents, to Asia and to Australia. The Dutch have a residency, Kupang, in the southwestern part of the island, the Portuguese, a district (6,290 sq. miles with about 300,000 inhabitants) with the chief town, Deli, in the northeastern. Revised by M. W. Harrington.

**Timor-Laut**, -lowt', or **Tenim'ber Islands**: a group of islands belonging to the Malayan Archipelago, and lying E. of Timor. Their area is estimated at 2,120 sq. miles; their population at 20,000. The larger ones, Timor-Laut and Larat, are volcanic; the smaller of coral formation. Birds are numerous and brilliant, especially cockatoos.

**Timo'theus** (Gr. Τιμόθεος): the most admired Greek musician of his day; flourished toward the close of the fourth century B. C. His innovation consisted in the use of a chorus in rendering the so-called Nome (νόμος) and in the employment of mimetic action to enliven the delivery. B. L. G.

**Timothy**, or **Herd's-grass** [*timothy* is from Timothy Hanson, who carried the seed to the southern colonies of North America about 1720]: the *Phleum pratense*, one of the best of forage-grasses, a native of Europe, and much cultivated there and in the U. S. In Pennsylvania, etc., the red-top, *Agrostis vulgaris*, is called herd's-grass. Timothy will not stand close pasturage, but affords fine crops of the best of hay.

**Timothy** [from Lat. *Timo'theus* = Gr. Τιμόθεος, one who honors God]: a disciple and companion of Paul; b. at Lystra or Derbe in Lycaonia, Asia Minor, probably about 20 A. D., the offspring of a Greek father and a Jewess; was carefully trained in a knowledge of the Jewish Scriptures by his mother Eunice and his grandmother Lois, who were Christians, but was not circumcised until Paul in his second missionary journey selected him as a companion. He became the most constant and devoted of Paul's numerous fellow workers; was regarded by him with truly paternal affection, and employed as "the messenger of the churches," as the apostle's "other self," in the execution of the most responsible spiritual commissions, and was doubtless his amanuensis in the preparation of most of the Epistles, his name being associated with Paul's, in a manner to suggest some degree of joint authorship, at the head of the Second Epistle to the Corinthians, those to the Philippians and Colossians, and the two to the Thessalonians. Whether he shared in the voyage to Italy is uncertain, but he afterward appears at the side of Paul while a prisoner in Rome, and finally as overseer of the important church at Ephesus, where Paul addressed him two canonical Epistles. His later history is unknown, as the tradition of his martyrdom under Domitian rests upon no evidence. Revised by S. M. Jackson.

**Timothy, First and Second Epistles to**: epistles addressed by Paul to Timothy, the former in 64, the latter in 65 or 66, both from Rome. They are chiefly occupied with instruction in the duties of a spiritual teacher, mingled with some admonitions of a personal nature and some references to Timothy's personal history; and the Second Epistle is endowed with a peculiar interest from its references to Paul's anticipated martyrdom, this being probably the last extant production of his pen. With the similar letter to Titus they constitute the so-called Pastoral Epistles. See Pauline Epistles. Revised by S. M. Jackson.

**Tim'perley**, C. H.: printer and author; b. in Manchester, England, about 1794; entered the army, and was wounded at the battle of Waterloo; resumed his early occupation of engraver and copperplate printer, and in 1821 became a letter-press printer; wrote *Annals of Manchester*; *Printer's Manual* (1838); *Dictionary of Printers and Printing, with* *the Progress of Literature, etc.* (1839; the second edition of 1842 includes the two last works); *Songs of the Press, and other Poems relative to the Art of Printers and Printing* (1845). D. about 1848.

**Timrod**, HENRY: poet; b. in Charleston, S. C., Dec. 8, 1829. He was educated at the University of Georgia, studied law and supported himself as a private tutor until the civil war, when he became war correspondent for *The Charleston Mercury*, and in 1864 assistant editor of *The South Carolinian*, at Columbia. The burning of Columbia during Sherman's march to the sea broke up his business, and after two years of poverty and ill health he died at Columbia, Oct. 6, 1867. His *Poems*, many of which were inspired by the war, were published in 1873 in New York, with a memoir by Paul Hayne. H. A. BEERS.

**Tims**, THOMAS DILLON: financier; b. at Castle Polland, Ireland, Jan. 6, 1825; entered the civil service of Canada in 1858; in 1865 was appointed Government superintendent of engraving and printing of the first issue of legal-tender notes; in 1867 reported upon financial system for the Province of Quebec; same year placed in charge of Dominion affairs in Halifax; in 1868 appointed to inquire into the management of Government railways in Nova Scotia; 1868–72 organized financial department and savings-banks in Nova Scotia and New Brunswick; and 1872–73 established branches of the Finance Department and savings-banks in British Columbia and Manitoba. He was appointed financial inspector of the Dominion in 1870, and is inspector of Dominion savings-banks and sub-treasurer and auditor of Government railways. NEIL MACDONALD.

**Tim'sah, Lake** [Arab. *timsâḥ*, crocodile]: previous to Nov., 1862, a small body of brackish water in the middle of the Isthmus of Suez, but since the completion of the Suez Canal a lake covering about 6 sq. miles. It is one of a series of lakes intersected by the canal (the Bitter Lakes, Lake Balaḥ, and Lake Menzaleh), which appear to be the remains of an ancient strait separating Asia and Africa. It is supposed to be a portion of the *Kem-ur* (great black water) on the eastern Egyptian frontier mentioned in the papyrus of the twelfth dynasty, now in Berlin, and also a portion of the "sea of reeds" across which the Israelites passed at the Exodus. (Müller, *Asien und Europa*, Leipzig, 1893.) On Lake Timsah is the town of Ismailia, which served as headquarters during the construction of the canal. CHARLES R. GILLETT.

**Timuquan'an Indians**: a family of North American Indians named after an ancient town situated on St. John's river, Florida. The Timukua term *ati-muca*, ruler, lord, embodied in the title, perhaps refers here to a preponderating influence of that town, like the word capital. The area occupied by these people during the sixteenth and a part of the seventeenth century coincided very closely with the northern portion of what is now Florida; and the southern part of the peninsula, held by Calusan and Tekestan tribes, must have used dialects cognate with the Timukua. The oldest map of the region gives the names of thirty-eight villages, and other sources about twenty-two more. The names of the sixty towns are enumerated in the *Seventh Annual Report of the United States Bureau of Ethnology*. Nothing is known of the political subdivisions of this ancient people except the names of five head chiefs existing there in 1564: Saturiwa, Holata Utina, Potanu, Onetheaqua, and Hostaqua. But these are only local designations of five confederacies, for it was customary in those times to call chiefs by the names of their respective tribes. From the writings of the missionary Fr. Francisco Pareja (1612) it may be inferred that there existed at least seven dialects spoken by that people—Timukua, Potanu, Itafi, the Fresh-water District, Tucururu, Mocamu (on the coast), and Santa Lucia de Acuera. This last one probably corresponded with the dialect of the "province" of Asis, spoken on the west coast, N. of Cape Canaveral. To judge by the reports left by the chroniclers of the sixteenth century, these Indians were bold fighters and stubbornly opposed the Spanish invaders. About 1706 their villages were broken up by an armed mob from the English colonies during a war with the Spanish troops in Florida, and their remnants fled to the eastern shore of the peninsula. No trace of Indians speaking this language can be found, but in ancient times they must have been numerous. See De Bry, *Brevis narratio* (Frankfort-on-the-Main, 1591: sketches of the country and people, engravings, and map); Romans, *East and West Florida* (New York, 1775); Réné de Laudonnière's report in French's *Hist. Coll. of Louisiana* (New York, 1869). See also INDIANS OF NORTH AMERICA. F. W. HODGE.

**Timur'**, or **Tamerlane'** (the latter name being a corruption of TIMUR LENK—that is, Timur the Lame): Mongol conqueror; b. about 1336 at Kesh, near Samarcand, the son of a chief of a Mongol tribe and a descendant of Genghis Khan. In 1369 he became chief of his tribe, and from his capital, Samarcand, established a firm and orderly government in his dominions. He then set out on his career of conquest, which resulted in the subjugation of the whole of Central and Western Asia, from the Chinese wall to the Mediterranean and from the Siberian steppes to the mouth of the Ganges. In 1393 he stood on the banks of the Dnieper threatening Moscow, but he turned to the S., burnt Azof, and retreated into Asia. In 1398 he conquered Northern Hindustan, whence he sent an immense amount of booty to Samarcand, and meditated pushing onward to the S., when he was called by the Eastern emperor and some of the princes of Asia Minor to aid in repelling the Turks led by their great chief Bayazid (or Bajazet). On July 20, 1402, the two huge armies, led by Bajazet and Timur, met each other on the plain of Angora, and the Turks were completely routed; Bajazet himself was taken prisoner. In 1404 Timur prepared for a grand expedition to China, and in the beginning of the following year crossed the Jaxartes at the head of a large army of veteran troops, but died at Otrar, Feb. 17, 1405, and his empire soon became dismembered. His cruelty and that of his soldiers were beyond description. Thousands of his captives were put to death, and he is said on one occasion to have had an enormous pyramid built of the skulls of his slaughtered foes. As an administrator, however, he seems to have shown moderation as well as statesmanlike foresight and ability. See *Histoire de Timur-Bei* (4 vols., Paris, 1721; translated into French by Pietis de la Croix from the Persian text by Sharifu 'd-Din). F. M. COLBY.

**Tin** [O. Eng. *tin* : O. H. Germ. *zin* (> Mod. Germ. *zinn*): Icel. *tin* (Fr. *étain*, Lat. *stan'num*)]: a lustrous, white metal, not easily affected even by moist air at low temperatures; soft, malleable, of low tenacity, quite ductile at 212° F. (100° C.), a moderately good conductor of heat and electricity; not sensibly volatile at ordinary furnace-heat, fusing at 442° F. (227·8° C.), having after fusion a specific gravity of 7·292. Very pure tin in blocks is sometimes disintegrated by extreme cold. It is one of the oldest of known metals, being mentioned in the Pentateuch, and obtained long before the Christian era by the Phœnicians from the British isles, hence called Cassiterides (from κασσίτερος, tin). Pliny's *stannum* was an alloy of silver and lead, perhaps also tin, which he called *plumbum album*, white lead; the alchemists called it Jupiter, and gave it the symbol of that planet, ♃. The most important ore is the oxide, called cassiterite, tinstone, and tin ore; it occurs in veins, when it is called mine tin, and also as rolled pebbles in alluvial deposits, furnishing excellent ore, known as stream-tin and wood-tin. It is generally a dark-brown mineral, very hard, of sp. gr. 6·4 to 7·1; crystallizing in tetragonal prisms, with pyramidal ends; generally has a high, vitreous luster, and contains 78·67 per cent. of tin. A far less abundant and less valuable ore is stannite or tin-pyrites, a sulphide of tin, copper, iron, and zinc, with 27·2 per cent. of tin and 29·3 per cent. of copper. Native metallic tin has probably never been found. A little tin has been detected in meteoric iron, some zinc-blendes, and several rare minerals.

According to Charles M. Rolker, in *The Mineral Resources of the United States for 1894* (U. S. Geological Survey), the supply of tin has steadily increased from about 50,000 gross tons in 1886 to the following quantities in 1894:

| | |
|---|---|
| England ...long tons | 8,800 |
| Straits Settlements, shipped to Europe and America | 46,724 |
| Straits Settlements, shipped to India and China | 4,655 |
| Banca, sales to Holland | 6,139 |
| Billitong, sales to Holland and Java | 4,764 |
| Bolivian, imported into England | 3,482 |
| Sing Kep | 261 |
| Mexico | 10 |
| Japan | 40 |
| Burma | 65 |
| Russia | 8 |
| Portugal and Spain | 258 |
| Germany | 950 |
| Austria | 65 |
| Total | 82,045 |

To this should be added about 10,000 tons produced by the Australasian colonies.

Rolker estimates that of this total 82 per cent. is derived from stream-tin. The principal source of tin is the Malay peninsula, and notably Perak, a state under British protection on the west coast, which is divided by three mountain-chains into three plains parallel to the coast-line, the Larut, Perak, and Kinta valleys. The deposits are alluvial, and although the tin-bearing stratum is regularly distributed throughout the deeper plains, it assumes proportions worthy of working only within a certain distance of the foot-hills. It is covered with 6 to 26 feet of unproductive overburden, and carries from 2 lb. and upward of tin-stone to the cubic yard. The tin-stone is generally deep brown, but is found whitish gray and rose in color in the Kinta valley. Perak produced in 1893 18,821 long tons of tin. Next to Perak in importance are the deposits of Selangor, a native state under British protection, the principal district being the Kwalla Lumpor. Sometimes as many as three stanniferous layers occur, running in depth from 3 to 40 feet; the average value of the gravel is 0·5 per cent. of tin-stone. The total product of Selangor in 1890 was 8,798 long tons. Some tin is also mined in Pahang, Malacca, Sunjie-Ujong, and in the Siamese states. In all of these sections coolie labor is employed in washing the gravel, and the majority of the diggings are worked by Chinese companies.

In Burma tin is found on the Tenasserim river and its tributaries. The mines of the island of Banca are largely owned by the Dutch Government. They are washings, the tin-bearing layer of about 3 feet in thickness being covered by 25 to 35 feet of overburden. The average product per man per annum is 0·72 ton of tin. In the fiscal year 1891–92 Banca produced 5,755 gross tons of tin, the principal districts being Djebos, Blinjoe, Soengeiliat, Merawang, Pairg-Kalpinang, and Soengleisleian. Nearly all the metal coming from Billitong and the adjoining island of Sing Kep comes from alluvial diggings, the principal districts being Manggar, Poeding, and Linggar. The total product in the washing season 1891–92 was 6,384 gross tons. A sliding scale of paying wages to the coolies prevails, they being guaranteed a minimum of $48.24 for the working year.

Nearly every Australian colony produces some tin. In New South Wales, which reached a maximum of 8,680 tons in 1883 and produced 2,637 tons in 1893, both lode-mining and stream-washing are pursued, the latter being more important. Two groups of tin-drifts are known—those of recent origin and the Tertiary deep leads capped by lava, in which the gravel is often so cemented together as to make crushing necessary. These Tertiary river-channels are at a depth of 20 to 137 feet, and vary in width from 18 to 400 feet. The stanniferous layer is usually 3 feet thick, but swells up to 13 feet. In Queensland, which produced 2,389 tons of tin ore in 1892, the leading alluvial districts are the Severn river and the Wild river diggings.

Tasmania has been an important tin-producer, and promises to continue to be so. Its maximum product was in 1878, with 5,369 tons, the output in 1893 having been 3,129 tons of white tin. The alluvial deposits, which range in age from Miocene to recent, are in the northeast district along the valleys of the Ringarooma and George's river. It is for lode-mining, however, that Tasmania is conspicuous, the principal dependence being large stockwerks or impregnations of granite low in tin, some of them paying for working down below 1 per cent. of tin ore. The Mt. Bischoff is the most famous of these mines, having paid during a brief career 210 dividends, to 1894 aggregating £1,342,500. In 1892 the company worked 70,584 tons of rock and 960 tons of concentrated sands, which yielded 2,235 tons of black tin containing 68·31 per cent. of tin.

Tin has been continuously mined in Cornwall from the time of the Phœnicians, and for many centuries was the principal source of supply for the world. The ore is found in the "Killas," a metamorphic clay slate, and along its line of junction with granite. In some instances the mines have reached great depth, and some of them have penetrated to considerable distances under the sea. A number of them are still very remunerative, but on the whole the Cornish tin-mining industry has declined in importance.

In Bolivia tin deposits are met at intervals along the eastern border of the Bolivian table-land from Lake Titicaca to near the Argentine boundary. The principal mines are those of the Potosí and Oruro, the tin being sometimes associated with silver.

Germany has old tin mines at Zinnwald, Kahlenberg, and Altenberg, Saxony, while Schlaggenwald and Graupen were once famous producers in Austria.

In Mexico some mining has been done in the state of Durango.

In the U. S. efforts at mining have been made in the greisen lodes on King's Mountain, N. C., at the Martha Cash mine, Irish Creek, Rockbridge co., Va., and at the Broad Arrow deposit, Clay co., Ala. In the Black Hills, S. D., very extensive prospecting has been done at Harney's Peak, and large works were built, but no production of any consequence has been recorded. For a brief period tin-mining was conducted at Temescal on the San Jacinto estate near Riverside, Cal., but the operation did not pay. Tin is reported also from Texas at Barringer Hill, Llano County, and on Herman and Willow creeks, Mason County, but no work has been done.

The most important alloys of tin are britannia metal, 75 to 94 parts of tin, 5 to 10 parts of antimony, and 2 to 8 parts of bismuth; pewter, 4 of tin and 1 of lead; queen's metal, 9 of tin and 1 each of antimony, bismuth, and lead; fine solder, 2 of tin and 1 of lead; common solder, equal parts of each; coarse solder, 2 of lead and 1 of tin; speculum metal, 1 of tin and 2 of copper (but variable) with sometimes a little arsenic; bell metal, 78 of copper and 22 of tin, with sometimes a little zinc and lead; bronze, with less tin than bell metal, and with 3 to 4 of zinc; gun-metal, best with 9 of copper and 1 of tin; sheathing for ships, 32 of copper and 1 of tin; fusible metal, with 1 of lead, 2 of bismuth, and 1 of tin (fuses at 200·7° F.); amalgam of tin and mercury for coating mirrors; and Babbitt metal; type metal, also, for fine work, contains a little tin. Melted tin is used to coat sheet-iron (tin-plate) and copper; copper, zinc, brass, and iron can also be tinned in the wet way; and tin has been successfully deposited on textile fabrics. Phosphor-tin is largely used for the manufacture of phosphor-bronze. See TIN-PLATE.

COMPOUNDS OF TIN.—Stannous chloride, $SnCl_2$, is formed by dissolving tin in hydrochloric acid; it is a powerful reducing agent, and is used as a mordant under the name of *salt of tin*. Stannic chloride, $SnCl_4$, can be formed by heating corrosive sublimate with tin filings, or by passing chlorine over melted tin. It forms with chloride of ammonium a double salt, called *pink salt*, used for a red dye. An impure stannic chloride, formed by the action of nitric and hydrochloric acids on tin, is used for brightening and fixing red colors, under the name of *nitro-muriate of tin*, *composition*, or *tin solution*. Stannous oxide, SnO, stannous hydrate, $Sn_2H_2O_3$, and sesquioxide of tin, $Sn_2O_3$, are unimportant commercially. Stannic oxide, $SnO_2$ (*putty powder*), is formed when tin is heated above fusion in the air. It forms two hydrates; one of these, stannic acid, $H_2SnO_3$, forms various stannates, the stannate of soda being used as a mordant in calico-printing; arsenic-stannate of soda is also employed. The other is metastannic acid, produced by the action of nitric acid of sp. gr. 1·3 upon tin. Dried at 212° F. (100° C.), it is $H_{10}Sn_5O_{15}$. It becomes anhydrous on ignition. Monosulphide of tin, SnS, and sesquisulphide, $Sn_2S_3$, are of little interest. The bisulphide, $SnS_2$ (*mosaic gold*), can be obtained by powdering an amalgam of 12 parts of tin and 6 of mercury, and heating it in a flask with 7 parts of sulphur and 6 of sal-ammoniac; other proportions are also used. Tin forms many other chemical compounds of little general interest. Revised by CHARLES KIRCHHOFF.

**Tinam'idæ** [Mod. Lat., named from *Tin'amus*, the typical genus, from Fr. *tinamou*, from the S. Amer. name]: a family of birds, the sole one of the order *Crypturi*, containing the tinamous, a group of remarkable species of small or medium size, peculiar to Central and South America. They are characterized by having the bones of the palate arranged as in the ostriches, the bones of the pelvis free behind, and a keeled sternum of peculiar pattern. Although Huxley kept the *Tinamidæ* with the *Carinatæ*, he recognized the importance of the above combination of characters, by making the group one of the four main divisions of that section. Other writers justly consider that the divisions *Ratitæ* and *Carinatæ* are not natural, and that this fact is well shown by the *Tinamidæ*. Dr. Stejneger places them in the superorder *Dromæognathæ*, just after the apteryxes, while Dr. Fürbringer puts them in the *Alectornithes*, between the apteryxes and fowls. In external appearance the species resemble the quails and partridges more than any other familiar birds; the head is rather small, the neck rather short, and the back and tail depressed; the bill is rather slender and mostly straight, but more or less decurved at the tip, and with the upper mandible overhanging the lower; the base is covered with a membrane which encroaches on the nostrils; the wings are rounded behind, concave, and short; the tail is short, and sometimes quite rudimentary, and more or less concealed by the decumbent coverts; the tarsi moderate or stout, and provided with large plates in front, the anterior toes well developed and entirely free, the posterior small and elevated or wanting; the claws are curved. The species differ in habits, some inhabiting the thickest forests and others open plains. They feed chiefly on grains, and indeed resemble in many respects the partridges, etc., which they replace in South America. The females generally lay about a dozen (but some not more than half a dozen) eggs, which look as if polished, and are deposited in rude nests made on the ground. The young follow their mother as soon as hatched. There are about fifty species, distributed among the genera *Tinamus*, *Nothocercus*, *Crypturus*, *Rhynchotus*, *Nothoprocta*, *Nothura*, *Taoniscus*, *Eudromias*, and *Tinamotis*. Revised by F. A. Lucas.

**Tinamou**: See Tinamidæ.

**Tincal**: See Borax.

**Tincker**, Mary Agnes: novelist; b. at Ellsworth, Me., July 18, 1833. She was educated at the academy at Blue Hill, Me.; became a Roman Catholic in 1863 and served as a hospital nurse at Washington during a part of the civil war. She afterward lived in Boston till 1873, when she went to Italy, returning to Boston in 1887. She has been a frequent contributor to *The Catholic World*, and has published a number of works of fiction, including *The House of Yorke* (1872); *Signor Monaldini's Niece* (1879); *By the Tiber* (1881); *The Jewel in the Lotus* (1884); *Aurora* (1885); and *Two Coronets* (1889). H. A. Beers.

**Tinctures** [from Lat. *tinctu'ra*, a dyeing, deriv. of *tingere*, *tinc'tum*, tinge, dye, whence Eng. *tinge*, *tint*]: in pharmacy, solutions of medicinal substances in alcohol. In their preparation the medicine should be dried and pulverized, and as a rule it is found advantageous to use diluted or aqueous alcohol as the solvent, as by this means numerous substances which are insoluble in anhydrous alcohol can be brought into solution; but many of the tinctures prepared in this way undergo acetous fermentation, which difficulty is best obviated by preserving them in well-closed and completely filled bottles. Maceration and digestion accelerate the preparation of tinctures, but percolation is extensively practiced. Occasionally the expressed juice of the plant is dissolved in alcohol, which method is especially applicable to the preparation of tinctures of narcotics, such as conium and belladonna. Revised by H. A. Hare.

**Tindal**, Matthew, LL. D.: deistical writer; b. at Beer Ferris, Devonshire, England, in 1657; studied at Oxford, where he took his degree in 1676; became fellow of All Souls 1677, and in 1685 was made LL. D., shortly after which he went over to the Roman Catholic Church, but returned to the Church of England when the revolution of 1688 seemed imminent. After the revolution he held several legal positions, and received from the crown a pension of £200. He took an active part in the polemics of his day, and in 1706 published *The Rights of the Church Asserted*, in which he took ground against the prevalent High Church doctrines. This gave rise to sharp controversies, during which he put forth two *Defenses*, in which he treated of the obedience due to princes, the law of nations, the liberty of the press, and the rights of mankind in matters of faith. In 1710 he issued a pamphlet, the *New High Church turned Old Presbyterian*, in opposition to the famous sermon of Dr. Sacheverell. The House of Commons ordered the productions of both controversialists to be burned publicly. In 1730 he put forth his most noted work, *Christianity as Old as the Creation*, in which he argued that in Christianity there was nothing which human reason might not have discovered without a special revelation; this called forth a host of replies, and a defense by himself of the doctrines which he had advanced. He also wrote a second volume of his work, of which only the preface has been published. D. at Oxford, Aug. 16, 1733. Revised by S. M. Jackson.

**Tindale**, William: See Tyndale, William.

**Tinder** [O. Eng. *tynder*: O. H. Germ. *zuntara* (> Mod. Germ. *zunder*): Icel. *tundr*; cf. Germ. *zünden*, kindle]: a material, usually composed of half-burned linen, formerly used in kindling fires. A flint and steel ignited the tinder, which inflamed in turn a sulphur match. Amadou, touchwood, and touch-paper were substitutes for tinder.

**Tinea**: See Favus.

**Tine'idæ** [Mod. Lat., named from *Ti'nea*, the typical genus, from Lat. *ti'nea*, worm, moth]: a family of *Lepidoptera* including many species, among them the moths so destructive to clothes. The developed insects are of small size, have a slender body, elongated, narrow wings, which when the insect is at rest are rolled round the body, and which are edged with long fringes; the maxillary palpi are very large, and the antennæ are long and filiform. The larvæ are elongate, and generally provided with numerous (14 to 18) feet, although occasionally entirely footless. They differ among themselves chiefly in the form and furniture of the head (whether hairy or naked), the development of the maxillary and labial palpi, and the form of the wings. The imagines are found mostly on the sheltered side of hedges, etc.; the larvæ burrow in leaves, stems, grain, etc., of plants, as well as other substances, such as cloth. The most notable species are the clothes moth (*Tinea flavifrontella*), the carpet moth (*Tinea tapetzella*), and the grain moths (*Tinea granella* and *Gelechia cerealella*). The clothes moth is light buff, glanced with a silvery iridescence on the wings and tawny on the head. It makes its appearance in the Northern U. S. in May or June. The female lays her eggs in cloth, generally woolens, sometimes cotton, and whitish larvæ are soon hatched therefrom. The carpet moth has yellowish-white but black-based fore wings, dark-gray hind wings, and white head. Benzine and carbolic acid, and precautions as to cleanliness, are the best antidotes to the ravages of these little pests. Revised by E. A. Birge.

**Tinel**, Edgar: composer; b. in Belgium, Mar. 27, 1854; educated at first by his father, who was a schoolmaster and organist. In 1863 he entered the conservatory in Brussels, and in 1873 carried off the first prize for piano-playing. He also at this time made his first essays on composition. In 1877 he won the Prix de Rome with a cantata *De Klooke Roeland*, and when Lemmens died in 1881 he succeeded him as organist of the church in Mechlin. He has composed some fine organ music, incidental music for Corneille's *Polyeucte*, and other works. His greatest work is his oratorio *St. Francis d'Assisi* to a text by the Flemish poet Lodewijk de Koninck. It has been performed in Berlin and New York. D. E. Hervey.

**Tin-foil**: See Foil.

**Tinghai**: See Chusan.

**Tinker's Weed**: See Feverwort.

**Tinne**, tin'ne, Alexandrina Petronella Francina: traveler; b. at The Hague, Holland, Oct. 17, 1839, the only child of a rich English merchant; received an excellent education; traveled after the death of her father through most European countries, Syria, Palestine, Egypt, etc., and settled in 1861 in Cairo. From Feb. 2, 1863, to Mar. 29, 1864, she undertook a grand journey of exploration from Khartum to the Bahr el-Ghazal, the western arm of the White Nile. She invited Baron von Heuglin and Dr. Steudner to accompany her, and the valuable scientific results of the expedition were communicated in John A. Tinne's *Geographical Notes of an Expedition in Central Africa*, in the *Transactions* of the Historic Society of Lancashire and Cheshire (Liverpool, 1864); von Heuglin's *Die Tinnesche Expedition im westlichen Nilquellgebiet*, supplement to Petermann's *Mittheilungen* (1865); and Th. Kotschy and Peyritsch's *Plantæ Tinneanæ* (1867). From Tripoli she started on another expedition, Jan. 30, 1869, with the purpose of reaching the upper Nile through Bornu, but at Fezzan she was murdered by her Arab attendants, Aug. 1, 1869.

Revised by M. W. Harrington.

**Tinnevel'li**: town and district of the southernmost part of Madras, British India (see map of Southern India, ref. 8–E). The former is an important Protestant missionary center, and contains a Hindu college. Pop. (1891) 24,768.

**Tino**: same as Tenos (*q. v.*).

**Tinoc'eras** [Mod. Lat.: Gr. τίνεσθαι, punish + κέρας, horn]: a genus of extinct herbivorous mammals from the Eocene of Wyoming and Utah, and the first known representative of a remarkable group now regarded as forming a distinct order, Dinocerata, so named from the best-known genus, *Dinoceras*. This genus may be taken as typical of the order, and its principal characters are as follows: The skull is long and narrow, the facial portion being much produced. It supports three separate pairs of osseous elevations, some of which may have been the bony support for horns. They form the most conspicuous feature of the skull, and suggested the name of the genus, "the terrible-horned." The smallest pair are near the end of the nasal bones; a larger pair rise from the maxillary or cheek bones, in front of the orbits; while the largest pair are on the parietal bones, and are supported by an enormous crest, which extends from near the orbits around the lateral and posterior margins of the cranium, nearly surrounding a deep depression upon the crown of the head. The dental formula in *Dinoceras* is as follows: incisors, $\frac{0-0}{3-3}$; canines, $\frac{1-1}{1-1}$; premolars, $\frac{3-3}{3-3}$; molars, $\frac{3-3}{3-3}$. The premaxillaries are toothless, as in ruminants, and may have supported a callous pad also, as in that group. The upper canine teeth are deeply implanted in the maxillary bones. They are long, decurved, and trenchant, separated by an interval from the molar teeth, which are comparatively small. The lower incisors and canines were approximate, projecting forward, and separated from the small molars. The lower jaw sends down a massive process on each side near its extremity, apparently for the support and protection of the large upper canines while the mouth was closed. The cervical vertebræ are longer than in the elephant, while the legs are short and the skull elongated, so that the head could easily reach the ground. The feet were short and stout, and there were five toes before and behind, but the carpal bones form interlocking series, and the astragalus articulated with both the navicular and cuboid bones. The metapodial bones are of moderate length, and their articular surfaces for the phalanges nearly flat, or even concave, indicating but little motion in the toes. In the hind limb when at rest the knee-joint was straight, as in the elephant and man, instead of being considerably flexed, as in nearly all quadrupeds. The brain-cavity of *Dinoceras*, however, is the most remarkable feature of this remarkable genus. It proves that the brain was smaller than any more recent mammal, whether living or fossil, and was even less than in some reptiles. The entire brain was so diminutive that it could perhaps have been drawn through the neural canal of all the presacral vertebræ, certainly through the cervicals and lumbars. Besides the genera already mentioned, there was at least one other, *Uintatherium*, closely allied. These animals were all large, some of them nearly equaling the elephant in size.

O. C. MARSH.

**Tin-plate**: sheet-iron or sheet-steel coated with tin. *Terne-plate* is sheet-iron or sheet-steel coated with an alloy of tin and lead, the latter predominating. The manufacture of tin-plate originated in Bohemia prior to 1600. Early in the seventeenth century it was introduced into Saxony. In 1625 Andrew Yarranton visited Saxony, and learning the methods of manufacture, started works on a small scale at Pontypool, Monmouthshire, England, but failed to continue the enterprise. In 1720 John Hanbury built a plant at Pontypool. This second start led to the development of the industry in Wales, which soon dwarfed the production of the older centers, and gave the principality the unchallenged control until the industry was finally successfully introduced in the U. S. In 1872 and 1873 two firms, Rogers & Burchfield, of Leechburg, Pa., and the United States Tin Plate Company, at Demmler, near Pittsburg, Pa., started the manufacture of tin-plate, but were forced to abandon it. It was not until the passage of the Tariff Act in 1890, which granted a protection of 2·2 cents a pound under certain conditions, that the manufacture was started on a large scale by numerous concerns. The principal aid to its establishment was the low price of steel. Formerly the sheets to be coated were made of iron, the production of which involved a large expenditure of skilled labor. The introduction of steel as the new material, with its substitution of machinery for labor, brought the labor cost per unit of product so much closer on both sides of the Atlantic that numerous works have been started since the passage of the Tariff Act in 1894, which reduced the duty to 1·2 cents per pound.

Originally the sheets were made from iron produced with charcoal as a fuel, so that when pig-iron smelted with coke was puddled to make the sheets, the term "coke tin-plates" was introduced to designate this method of manufacture. Now no charcoal is employed, so that the term charcoal plates refers merely to the quality, and openhearth and Bessemer steel have almost entirely superseded puddled iron. The method of manufacture may be described as follows: The steel ingot as cast in the steel-works is rolled into a bar about 7 inches wide and from ½ to ⅝ inch in thickness, which is sheared into lengths weighing about 19 lb. each. The bar after being heated is rolled as a single plate until it can be easily doubled, that is, the sheet can be folded over. When this point has been reached the sheet is folded over, reheated, and is then rolled doubled up. The reheating, doubling, and rolling is repeated three times, so that a pack is produced which consists of eight sheets. After the pack has been trimmed and squared the sheets are separated from one another. During the process of reheating and rolling the sheets have been covered with a layer of scale. The black plates, as they are called, must be cleaned by pickling in hot dilute sulphuric acid. This black-pickling is now done in machines, which also provide for the washing away of the acid adhering to the plates. The continued rolling has hardened the steel, but this is softened by annealing, which is accomplished by exposing the sheets in tightly closed iron vessels to a dull red heat for a period varying from ten to twenty hours. In order to smooth the surface of the sheets they are rolled when cold, the operation being repeated if necessary. This hardens the steel, which is again annealed and finally is pickled, this "white pickling" being done in a more diluted solution. The sheets are then ready to be tinned. The apparatus consists of a set of pots, heated by fire-places. The first operation is to plunge the plates into heated palm oil, to remove the moisture and heat the sheets. Then they are allowed to soak for a while in a pot filled with molten tin covered with palm oil. The tinman passes them over to the washman, who allows them to remain for a little while in a pot filled with molten tin, and brushes both sides carefully. Finally they are passed into the patent pot filled with tin, in which a series of rollers revolve through which the plates pass singly, stripping off the surplus material and by their tension determining the thickness of the coating of tin. There are a number of different designs of such patent pots, among the leading ones being the Morewood, Leyshon, Newbold, and Norton. The plates are finally rubbed with bran and with sheepskin, are sorted, and are packed into boxes.

The standard sizes are 10 inches by 14 inches, or 14 inches by 20 inches, the thickness or gauge varying. The latter is designated by arbitrary marks, IC being No. 30 gauge, weighing 107 lb. per box of 112 sheets of 14 inches by 24 inches; IX is of No. 28 gauge, IXX of No. 26 gauge, and IXXX of No. 24 gauge. For several years lighter plates weighing 80, 85, 90, 95, and 100 lb. per box of 112 sheets, 14 by 24 inches, have been made.

No exact statistics of production of tin-plate in Wales are available. The exports were 448,379 gross tons in 1891, and 379,172 gross tons in 1893. The British home consumption was estimated at 65,000 to 75,000 tons. The U. S. imported the bulk of the Welsh tin-plate. The maximum was reached in 1889, when the imports were 331,311 gross tons. In 1900 the quantity imported was 60,318 gross tons. Since 1891 the production of tin-plate in the U. S. has expanded very rapidly. It reached 113,666 tons in 1895 and amounted to 302,655 tons in 1900.

CHARLES KIRCHHOFF.

**Tintoretto**: See ROBUSTI, JACOPO.

**Tio'ga River**: a river which rises in the west part of Bradford co., Pa. Its general course is northward through Tioga co., Pa. At Painted Post, Steuben co., N. Y., its waters enter the Chemung river. The upper part of Tioga valley affords much semi-bituminous coal of great value.

**Tipitapa** (river): See NICARAGUA.

**Tippecanoe' City**: village; Miami co., O.; on the Great Miami river, and the Cin., Ham. and Dayton Railroad; 14 miles N. of Dayton, 14 miles S. of Piqua (for location, see map of Ohio, ref. 5–C). It contains manufactories of paper, glucose, excelsior, flour, and brooms, a high school, a national bank with capital of $60,000, and a weekly newspaper. Pop. (1880) 1,401; (1890) 1,465; (1900) 1,703.

**Tippecanoe River**: a river of Indiana, rising in Tippecanoe Lake, Kosciusko County. It pursues a devious S. W. course for 200 miles, and falls into the Wabash. On the banks of this river, at the present village of Battle Ground, in the county and township of Tippecanoe, Gen. Harrison fought and defeated the Indian tribes commanded by the Prophet, the brother of Tecumseh, Nov. 7, 1811. In the middle of the night, when the whole force, consisting of 300 regular troops and 500 militiamen, was asleep, the Indians suddenly made the attack upon the camp. A desperate fight ensued, the Indians several times advancing and retreating; but after daylight they were finally defeated and dispersed by the two mounted companies belonging to Harrison's force. They left forty of their dead on the field; Harrison's loss was sixty killed and twice as many wounded. On the following day the Prophet's city was visited; it was found completely deserted, and was burned down. Harrison, nevertheless, considered it prudent to effect a speedy retreat, more especially on account of the great number of wounded with which he was encumbered, and he consequently fell back upon Vincennes. Revised by F. M. COLBY.

**Tip'perah**: name of a tribe, a feudatory state, and a district of Northeast British India. The tribe is of Tibet-Burmese relationship, occupies the parts of Bengal and Assam adjoining Upper Burma, and numbers about 60,000, of whom about two-thirds are in the principality, one-fourth in the British district, and the remainder in Assam. The native state is called Hill Tipperah by the British and lies in the extreme east of Bengal, adjoining Assam and Upper Burma with the district of Tipperah on the W. and Noakhali and Chittagong on the S. Area, 4,086 sq. miles. Pop. about 100,000. The rajah belongs to the Tipperah tribe. The country is hilly with much jungle and swamp and many rivers. Travel is chiefly by boat; the principal crop is rice; the government is despotic and patriarchal. There are no towns, and Agartala, the capital, is simply the residence of the rajah. The district of Tipperah lies between the preceding and the river Meghna. Area, 2,491 sq. miles. Pop. 1,500,000. It is flat and open, abundantly supplied with streams, many of which are affected by the tide; is fairly fertile and principally devoted to rice; and is traversed N. and S. by a railway. The capital is Comillah (pop. about 15,000), and the largest town Brahmanbaria (17,500).

MARK W. HARRINGTON.

**Tippera'ry**: county; in the province of Munster, Ireland. Area, 1,659 sq. miles. For the most part, the county lies in the basin of the river Suir, and touches the Shannon on the N. W. The surface is generally level, and the mountains which diversify it are rather groups of peaks than portions of connected ranges. These mountains are the Galtees (3,000 feet high), Knockmeledown (2,700 feet), and Slievenamon on the S., Keeper Mountain (2,100 feet) on the W., and the Slievardagh Hills on the E.; completely isolated is the curious peak the Devil's Bit, the center and source of many popular legends. The soil is a rich calcareous loam, and in the district called the Golden Vale, around the town of Tipperary, is exceedingly fertile and productive. Agriculture, especially dairy-farming, is the principal occupation. Coal, copper, lead, and zinc are found, but not worked, and the formerly flourishing woolen-trade is nearly extinct. The antiquities of the county are numerous and interesting, both those from the Anglo-Norman and Celtic periods. The ruins of Holy Cross, in the city of Cashel, is a noble specimen of the monastic remains of the mediæval period, as the Castle of Cahir is of the military and baronial architecture of the same age. Pop. (1891) 172,882. Tipperary, the county-town, 110 miles by rail S. W. of Dublin, has a butter-market (see map of Ireland, ref. 12–F). Pop. (1891) 7,274. In 1890 a new Tipperary was founded, as part of a plan of campaign against land-owners, but proved a miserable fiasco in the following year.

**Tippoo' Sa'hib**: Sultan of Mysore; b. Nov. 19, 1749, a son of HYDER ALI (*q. v.*); was instructed in European tactics by French officers, and distinguished himself in the war against the British, defeating them at Perimbakum Sept. 10, 1780, and on the banks of the Kolerun Feb. 18, 1782. On Dec. 7, 1782, Hyder Ali died, and Tippoo Sahib then prepared for a still more energetic prosecution of the war. Apr. 28, 1783, he took Bednore, and soon after also Mangalore, but in the meantime peace had been concluded between Great Britain and France, so that Tippoo Sahib was compelled also to conclude peace at Mangalore Mar. 11, 1784, but on advantageous conditions. He continued to intrigue against the British, and in 1790 the war was renewed. In spite of his brilliant tactics in laying waste the Carnatic almost to the gates of Madras, and thereby for a time baffling his enemies, he was finally defeated, and was compelled in 1792 to sue for peace by ceding half of his dominions and paying 3,030 lakhs of rupees. However, he still intrigued with the French, and when Napoleon landed in Egypt Oct. 18, 1798, the British East India Company determined to crush its enemy before it might become too late. On Feb. 22, 1799, the company declared war against Mysore, invaded the realm with two armies, and shut up the sultan in his capital, Seringapatam. Here he fell May 4, 1799, while fighting on the walls; his dominions were confiscated by the company, and the spoils from his palace were carried to London. During the last years of his reign, after 1792, his government was of a very oppressive character, but he was exceedingly popular among his subjects, and after his death he was considered a martyr to the faith of Islam by Mohammedans in general.

**Tipton**: city; capital of Tipton co., Ind.; on Cicero creek, and the Lake Erie and West. Railroad; 38 miles N. of Indianapolis (for location, see map of Indiana, ref. 5–E). It is in an agricultural region, contains new a court-house (cost $190,000), a jail (cost $35,000), canning factory, flour, saw, and planing mills, and stave factory, and has 2 private banks and 3 weekly newspapers. It is in a natural-gas belt. Pop. (1880) 1,250; (1890) 2,697; (1900) 3,764.

EDITOR OF "TIMES."

**Tipton**: town (founded in 1840); capital of Cedar co., Ia.; on the Burl., Ced. Rap. and N. and the Chi. and N. W. railways; 40 miles N. W. of Davenport, 42 miles S. E. of Cedar Rapids (for location, see map of Iowa, ref. 5–K). It is in an agricultural region, and has 6 churches, large public-school building, a national bank with capital of $50,000, 2 State banks with combined capital of $75,000, 2 weekly newspapers, a carriage-factory, machine-shop, creamery, and poultry-packing establishment. Pop. (1880) 1,299; (1890) 1,599; (1900) 2,513. EDITOR OF "ADVERTISER."

**Tipton**: town; Moniteau co., Mo.; on the Mo. Pac. Railway; 25 miles S. of Booneville, 27 miles E. of Sedalia (for location, see map of Missouri, ref. 4–G). It is in an agricultural region, with coal, lead, and zinc mines in the vicinity, and has a high school, several factories, a State bank with capital of $20,000, an incorporated bank with capital of $25,000, and a weekly newspaper. Pop. (1880) 989; (1890) 1,253; (1900) 1,337.

**Tiraboschi**, tēē-rāā-bos'kēē, GIROLAMO: literary historian; b. at Bergamo, Italy, Dec. 28, 1731; educated by the Jesuits, whose order he afterward joined. He taught in Brescia and Milan, producing in the latter university his *Vetera Humiliatorum monumenta* (1766), an account of the order of Humiliati. In 1770 Francis III., duke of Modena, appointed him librarian of that city, where he remained until his death June 4, 1794. The chief result of his labors in Modena was the great *Storia della Letteratura italiana* (14 vols., 1770–82; reissued, in an amplified and corrected form, 1787–93). Though now antiquated, it still remains an example of thoroughness in method. His other monumental work is the *Biblioteca modenese* (6 vols., Modena, 1781–86), devoted to the history of Modenese authors. This was followed by the *Memorie storiche modenesi* (1793–94), and a *Codice diplomatico*, which was in process of compilation at the time of his death. He worked upon the *Enciclopedia italiana* and the *Giornale d'Italia*, and issued many biographical and other monographs. The best edition of the *Storia* is that printed in Milan (16 vols., 1822–26). J. D. M. FORD.

**Tirard**, tēē'raar', PIERRE EMMANUEL: statesman; b. in Geneva, Switzerland, Sept. 27, 1827, of a French family; was educated in his native city, but moved in 1846 to Paris as chief of an exporting-house in jewelry. An open enemy of the second empire, he was elected mayor of the second arrondissement of Paris Nov., 1870, and a member of the National Assembly Feb., 1871. After an energetic protest against the assumptions of the Commune, he resigned his mayorship and fled to Versailles. In 1876 he was elected a member of the Legislative Assembly, and took his seat among the republican left. In 1879–81 he was Minister of Agriculture and Commerce and exercised considerable influence on the formation of the tariff. He was head of the cabinet in Carnot's administration 1887–88, and again 1889–90. D. in Paris, Nov. 4, 1893. He published *Du Développement de la bijouterie et de l'orfèvrerie par la liberté des titres de l'or et de l'argent* (1868). F. M. COLBY.

**Tiree'**, or **Tyree**: an island of Scotland, one of the Inner Hebrides; 13 miles long and 6 miles broad. It is low except on the S., where hills reach 400 feet, and destitute of wood, but affords good pastures. Oats, barley, and potatoes are raised, but the inhabitants are mostly engaged in fishing and rearing poultry. Pop. (1891) 2,600.

**Tire'sias** (Gr. Τειρεσίας): a celebrated soothsayer in Thebes. He was blind, but understood the language of the birds, and lived to a great age. Even after his death he did not lose his power of prophecy. He had a famous oracle near Orchomenus, but after a plague it became silent. The Greek mythology tells many stories of the origin of his blindness and soothsaying power.

**Tir'hakah** [Heb. = Egypt. *Ta-h-r-q*, *Taharqa*, *Taharaqa*; the *Tarkos* or *Tarakos* of Manetho]: an Ethiopian king (702–664 B. C.); an ally of the Egyptian king Shabataka of the twenty-fifth dynasty against Sennacherib (Sanherib) of Assyria, when the latter was subduing Syria and Palestine. The rumor of the approach of Tirhakah into Palestine caused Sennacherib to hasten affairs connected with Hezekiah of Judah and himself to advance toward Egypt, but a sudden pestilence caused an abrupt retreat to Nineveh, where he was soon afterward assassinated. Later, Tirhakah deposed and killed Shabataka (693 B. C.) and usurped the Egyptian throne, becoming the last king of the twenty-fifth dynasty. The remainder of his life was occupied with struggles against the Assyrian power and in attempts to achieve the freedom of Egypt. For his alliances with Hezekiah of Judah and other Phœnician and Syrian princes he was severely punished by Esarhaddon and Asurbanipal, kings of Assyria, who defeated him within Egypt itself and pursued him as far as Thebes, causing him to retreat into Ethiopia (672 and 667 B. C.). According to Greek writers he was a great warrior, but his own lists of conquered peoples are evidently copied from those of his predecessors. He was active in building operations at Thebes, but particularly at his original capital, Napata, near Gebel Barkal, in Nubia, where he erected a temple. C. R. G.

**Tirlemont**, teer'le-mōn': town; in the province of Brabant, Belgium; on the Grande-Geete; 30 miles E. S. E. of Brussels by rail (see map of Holland and Belgium, ref. 10–F). The churches of St. Germain, dating in part from the ninth century, and Notre Dame, founded in 1298, are its chief architectural features. It manufactures machinery, woolen stuffs, hosiery, leather, soap, malt, and gin, and carries on an active general trade. Pop. (1891) 16,157.

**Tir'nova**: town; in Bulgaria; on the Jantra, an affluent of the Danube; 35 miles S. S. E. of Sistova (see map of Turkey, ref. 3–D). It was the capital of the Bulgarian kingdom until 1394, and continued to be the seat of the Bulgarian patriarchate until its suppression in 1767. It has large dyeworks and manufactures cloth and copper utensils. Pop. (1893) 12,858. E. A. G.

**Tiro**, Marcus Tullius: the freedman and pupil of Cicero, to whom he became an amanuensis. He was also an author of some reputation, writing several works, including a life of his patron. To him is due the collection of Cicero's *Letters*. He is commonly believed to have invented the art of short-hand writing, hence the name *Notæ Tironis* or *Tironianæ*. (See Stenography.) It is believed he lived to the age of 100. Revised by M. Warren.

**Tirol**: another spelling of Tyrol (*q. v.*).

**Tirso de Molina**: See Tellez, Gabriel Maestro Fray.

**Tiryns**, tī'rinz (Gr. Τίρυνς): in Argolis; one of the most ancient cities of Greece. Its inhabitants appeared in history for the last time at the battle of Platææ, but shortly thereafter the city was destroyed by the Argives, though its massive walls still exist to excite the wonder of the visitor. Tiryns was excavated by Schliemann in 1884. See his *Tiryns*, but, better still, Schuchhardt, *Schliemann's Excavations* (London, 1891), and Perrot and Chipiez, *History of Art in Primitive Greece* (London, 1894). J. R. S. S.

**Tischbein**, tish'bīn, Johann Heinrich Wilhelm: painter; b. at Haina, Hesse, Feb. 15, 1751; received his first instruction in painting from his father, uncle, and elder brother, who all were painters of reputation; went in 1770 to the Netherlands, in 1779 to Rome, in 1787 to Naples, where he was director of the Academy of Painting from 1790 to 1799; returned in the latter year to Germany and settled in Hamburg. He painted many portraits, among which is one of Lady Hamilton, and some historical and allegorical pictures, but he is most widely known as an engraver. The Hamilton collection of Greek vases, published first in Naples, was his work. Of his original etchings the largest collection is a series of illustrations from Homer, published at Göttingen 1801–04. D. at Eutin, July 26, 1829. Russell Sturgis.

**Tisch'endorf**, Lobegott Friedrich Konstantin, LL. D., D. C. L.: biblical scholar; b. at Lengenfeld, Saxony, Jan. 18, 1815; studied theology and philology at Leipzig 1834–38; was appointed Professor of Theology there in 1845. From an early period of his life he concentrated his study on a critical revision of the text of the New Testament: made extensive journeys in Europe, examining the materials for such a revision contained in the various European libraries, and visited Egypt, the Sinaitic Peninsula, Syria, and Palestine in 1844, 1853, and 1859, the last time at the expense of the Russian Government. From the monastery of Sinai he brought back the famous *Codex Sinaiticus*, the oldest Greek manuscript of the Bible, which is now preserved in St. Petersburg, and was published in 1862 in 4 vols. fol. at the expense of the Emperor Alexander II. He has told the romantic story of its recovery in *Die Sinaibibel* (Leipzig, 1871). The *Codex Sinaiticus* is written upon vellum sheets of extreme fineness and beauty and consists of 346 leaves, of which 199 contain 22 books of the Old Testament and Apocrypha in the Septuagint version, beginning at the first book of Chronicles, while the remaining 147 present the whole of the New Testament, the Epistle of Barnabas, and a part of the Shepherd of Hermas. (To these should be added the 43 leaves of the Codex Friderico-Augustanus.) D. in Leipzig, Dec. 7, 1874. The principal results of Tischendorf's researches were several critical editions of the New Testament, but he also published *Codex Ephraemi Syri* (1843); *Monumenta Sacra Inedita* (1846); *Evangelium Palatinum Ineditum* (1847); *Codex Amiatinus* (1850); *Codex Claromontanus* (1852); *Novum Testamentum Vaticanum* (1867); *Monumenta Sacra Inedita, nova Collectio* (9 vols., 1854–65); *Acta Apostolorum Apocrypha* (1851); *Evangelia Apocrypha* (1853); *Apocalypses Apocryphæ* (1866); *Reise in den Orient* (2 vols., 1845–46); *Aus dem heiligen Lande* (1862); and *Wann wurden unsere Evangelien verfasst?* (1865; translated into English, *When were our Gospels written?*, and many other languages). His prolegomena to the 8th ed. of his larger Greek New Testament were completed in a remarkable manner by C. R. Gregory, who examined every uncial and very many cursive MSS. of the New Testament (Leipzig, 1884–94). Revised by S. M. Jackson.

**Tis'ri** [= Heb. *tishrī*, deriv. of Chald. *sherā*, open, begin]: the first Hebrew month of the civil year and the seventh of the ecclesiastical year. It corresponds to part of September and October.

**Tissapher'nes**: Persian satrap. He was appointed satrap of Lower Asia by Darius II. Nothus in 414 B. C. In the reign of the latter's successor, Artaxerxes II., Tissaphernes received the command also in Asia Minor after the death of Cyrus at the battle of Cunaxa. His attempt, however, to punish the Greek cities which had supported Cyrus was unsuccessful. They were supported by the Spartans, and the Persians were defeated by Agesilaus in Lydia. Meanwhile his treachery and cowardice had made him contemptible in the eyes of Artaxerxes, and on the instigation of Parysatis, the king's mother, he was assassinated at Colossæ, Phrygia, in 395.

**Tissot**, tee'sō', James: genre-painter; b. at Nantes, France, Oct. 15, 1836; pupil of Lamothe and Flandrin; medal, Salon, 1866; first-class medal, Paris Exposition, 1889. He lived for a number of years in London and did not exhibit in the Salon after 1870. He reappeared, however, at the Salon of the Champ de Mars in 1894 with a series of pictures representing the life of Christ. One of his earlier works, *The Meeting of Faust and Marguerite*, painted in 1861, is in the Luxembourg Gallery, Paris. W. A. C.

**Tissues**: See Histology and Fibrous Tissues.

**Tisza**, tee'sǎa, Koloman Borosjenö, von: statesman; b. at Grosswardein, Hungary, Dec. 16, 1830; was educated for the civil service, and became a member of the Hungarian Reichstag in 1861. At first a leader of the moderate radicals, he founded a new liberal party made up for the most part of the followers of Deák, and controlled the majority in the Reichstag. He held the portfolio of the Interior in the ministry of Wenkheim, and on Oct. 21, 1875, became Prime Minister of the Hungarian cabinet, a position which he held for over fourteen years. Possessing the confidence of the majority of the nation, he has done more than any other Hungarian statesman in reorganizing the state and, while promoting harmony between his own and the imperial Government, in raising the position of Hungary to one of controlling importance in the Hapsburg empire. In 1876–78 he opposed the policy of Russia respecting Turkey, but acquiesced in the proposed Austrian occupation of Bosnia and Herzegovina as a necessity of the war, and when the financial condition of the imperial Government prevented that occupation, he resigned with his co-ministers. Subsequently, however, he resumed his office, which he held till 1890, retaining his seat in the new parliament. See Visi, *Koloman Tisza* (Budapest, 1886). F. M. Colby.

**Tit**: See Titmouse.

**Titanic Dioxide**, generally called **Titanic Acid** ($TiO_2$) [*titanic* is deriv. of *titanium*. See TITANIUM]: a compound which constitutes three distinct mineral species—*octahedrite*, *brookite*, and *rutile*. A synonym of octahedrite is *anatase*, and a synonym of brookite is *arkansite*. Of the three mineral forms of titanic dioxide, *rutile* is far the most abundant. The commoner varieties have a peculiar reddish tinge, and a luster of a peculiar dark metallic brilliancy on the cleavages, which, with its high density, enables it to be distinguished at a glance by those expert in minerals. Its hardness is between those of quartz and feldspar. The crystals are dimetric or tetragonal, and usually prismatic, sometimes acicular, and are found in the latter form penetrating transparent quartz-crystals from side to side in a great many directions, like needles, forming interesting cabinet specimens known as "rutilated quartz." In these cases the rutile needles have evidently been first formed, crossing a cavity filled with the menstruum from which they were deposited, in which the quartz has subsequently crystallized out from the same or some other menstruum. In the U. S. there are a great many localities in which rutile is found. *Brookite* is trimetric or orthorhombic in crystallization, translucent, with cleavage less distinct than rutile, but having the same metallic adamantine luster. It has been found in small crystals in North Carolina placer gold, at Paris in Maine, and at Ellenville in Ulster co., N. Y., and in a number of foreign localities. At the celebrated mineral locality at Magnet Cove, Ark., it is found as the variety *arkansite*, so called by Prof. Charles U. Shepard, which is described as iron-black and opaque, though nearly pure titanic oxide, according to Whitney and Damour. *Octahedrite*, or anatase, is tetragonal like rutile, but with very different angles and cleavages. It is usually octahedral in form, highly lustrous like diamond, and sometimes mistaken for it in placer washings. In North America, it occurs in dolomite at Smithfield, R. I. Revised by IRA REMSEN.

**Tita'nium** [Mod. Lat., named in fanciful allusion to the Titans, from Lat. *Tita'nes* = Gr. Τιτᾶνες, Titans]: an element first discovered by Dr. William McGregor, in examining the mineral now called *menaccanite*, from Menachan in Cornwall, in 1791. It was afterward found by Klaproth (in 1794) in *rutile*, and called by him in 1797 *titanium*. Titanium is quite an abundant element. For a long time certain cubical crystals of a copper color found in blast furnaces were believed to be metallic titanium, but Wöhler proved that these contain cyanogen and nitrogen. The element is obtainable by heating the double fluoride of titanium and potassium with sodium. It is described as a dark-green, heavy powder, which can not be burnished and is infusible. Titanium occurs in many minerals. The three minerals *rutile*, *brookite*, and *anatase* are all TITANIC DIOXIDE (*q. v.*). *Menaccanite* or *ilmenite*, in which titanium was first discovered, contains titanic dioxide with iron oxides. *Sphene* or *titanite* contains titanate and silicate of calcium. *Perofskite* is simple calcium titanate, and it is very common in magnetic iron ores and many other minerals. Titanium forms three chlorides, $TiCl_2$, a black powder, $TiCl_3$, lustrous dark-violet scales, and a colorless transparent liquid tetrachloride, $TiCl_4$. It is believed to form two compounds with oxygen, the sesquioxide, $Ti_2O_3$, and the dioxide, $TiO_2$. The chief practical interest that attaches to titanium is in consequence of its frequent occurrence as a constituent of iron ores, chiefly of magnetite, which passes into ilmenite or menaccanite, the two apparently occurring mixed in all proportions, and called titaniferous iron ore. Such ores are liable to be very pure—that is, free from sulphides and phosphates—but, unfortunately, it happens that the titanium is excessively difficult to flux out from the mass, tending apparently to form slags of very difficult fusibility, thus limiting their use greatly. It has been reported that this obstacle has been overcome. Revised by IRA REMSEN.

**Titanothe'rium** [Mod. Lat.; Gr. Τιτάν, a Titan + θηρίον, wild beast]: a genus of extinct mammals first found in the Mauvaises Terres, or Bad Lands, of South Dakota. The formation is Miocene, and the bones of this animal were the first fossils obtained from the region. Later researches in Nebraska and Colorado have shown that this genus is but one of an extinct family of herbivorous mammals including several genera, viz., *Titanotherium*, *Brontotherium*, *Brontops*, and others. The best-known genus is *Brontotherium*, and its principal characters are as follows: The skull is long and depressed, and resembles that of the rhinoceros. There is a pair of large horn-cores on the anterior part of the skull, in front of the orbits. They stand on the maxillary bones, and are placed transversely, as in ruminants. The nasal bones are greatly developed and firmly co-ossified. They are produced in front, and overhang the narial orifice. The dental formula is as follows: incisors, $\frac{2-2}{2-2}$; canines, $\frac{1-1}{1-1}$; premolars, $\frac{4-4}{3-3}$; molars, $\frac{3-3}{3-3}$. The brain-cavity is small in proportion to the skull. The cerebral hemispheres did not extend at all over the cerebellum, and but little over the olfactory lobes. The neck was stout and of moderate length. The atlas is large, and much expanded transversely; the axis massive, and its odontoid process stout and conical. The lumbars are slender and smaller than the dorsals. There are four sacral vertebræ. The caudals indicate a long and slender tail. The limbs were intermediate in proportion between those of the elephant and the rhinoceros. The radius and ulna are separate. The carpal bones are shorter than in the rhinoceros, and support four stout toes. The fibula is separate from the tibia. There were three toes on the hind foot, of nearly equal size. None of the bones of the skeleton is hollow. The *Brontotheridæ* nearly equaled the elephant in size, but the limbs were shorter. The nose was probably flexible, as in the tapir, but evidently there was no true proboscis. All the remains yet known are from the Miocene beds of the Rocky Mountains, in South Dakota, Nebraska, Wyoming, and Colorado. O. C. MARSH.

**Titans** [from (and transl. of) Lat. *Tita'nes* = Gr. Τιτᾶνες]: in Greek mythology, the children of Uranus and Gæa, numbering, according to the most common record, twelve—six male, Oceanus, Cœus, Crius, Hyperion, Iapetus, and Cronus; and six female, Theia, Rhea, Tethys, Phœbe, Mnemosyne, and Themis. Uranus feared his own children, and shut them up in Tartarus, but by the aid of Gæa they broke out of the prison, overthrew their father, and placed Cronus on the throne. The curse, however, which Uranus let fall on his children was fulfilled. Cronus was dethroned by his own son, Zeus, and the Titans were once more imprisoned in Tartarus, where the Cyclopes and Hundred-handed were set to watch them. Among their descendants were Atlas, Prometheus, Helios, Hecate, and Selene.

**Titchener**, EDWARD B.: See the Appendix.

**Tite**, Sir WILLIAM, F. R. S.: architect; b. in London, England, in 1802; educated at a private school; was articled as a pupil to Mr. Laing, the architect of the custom-house; was intrusted with the rebuilding of the Church of St. Dunstan's-in-the-East, which he executed so successfully in the Gothic style, then recently become popular, as to gain a high reputation; was employed to erect a Gothic church for the celebrated Edward Irving; subsequently built many public and private edifices, including some of the largest railway stations of England and France; became architect to the new Royal Exchange 1840; was for some time president of the Architectural Society and of the Royal Institute of British Architects; was elected Liberal member of Parliament from Bath 1855; was governor of the London and Westminster Bank and of the Bank of Egypt and member of parliamentary committees on banking, and was knighted in 1869. He published some essays and lectures, and was author of a *Descriptive Catalogue of the Antiquities found in the Excavations at the New Royal Exchange* (1848), and other miscellaneous writings. D. Apr. 20, 1873.

**Tithes** [M. Eng. *tithe*, *tethe* < O. Eng. *tēoða*, liter., tenth, a tenth, for *teog(e)ða*; cf. Goth. *tigus*, a decade: Gr. δεκάς]: taxes, consisting of one-tenth of the annual profit of land, stock, or labor, which, instituted by Moses, was paid by the Jews for the maintenance of the Levites and in compensation for their service in the temple (Lev. xxvii. 30–33; Num. xviii. 21–24). Of this tithe the Levites paid a tenth to the priests (Num. xviii. 26, 28). Deut. xiv. 22–29 enjoins the payment of a second tithe which was either to be eaten before the Lord, if it were in produce, or turned into money and the money spent for food to be eaten at the central sanctuary. In this feast the Levites shared. Every third year there was apparently a third tithe in kind which was to be eaten by all comers to the feast. Tithes were known also to Roman law, but are no part of New Testament legislation. In the Christian Church they were first enjoined about 350 as due for the support of the clergy, recommended by the Second Council of Tours, 567 (see Harduin's *Councils*, iii., 368), and first decreed by the Second Council of Macon, 585 (see Harduin, iii., 461). They were not firmly established, however, in Germany, France, and England until the ninth century, and in the Scandinavian countries not until the eleventh century. Even before the period of the Reformation, but especially after that time, the tithes became subjects of bargains, of buying and selling, like other property. Originally they were paid in kind, but in the eighteenth century a certain sum of money was generally substituted. In France they were finally abolished by the Revolution. In England tithes were collected from early times in support of the Church. Such tithes up to the value of 40*s.* must be paid. See J. Selden, *History of Tithes* (London, 1618); H. W. Clarke, *History of Tithes* (1891; 2d ed. 1894). See also HEREDITAMENTS. Revised by S. M. JACKSON.

**Titian**, tish'an, or **Vecellio**, vā-chel'li-ō, TIZIANO: painter; b. at Pieve di Cadore, Italy, in 1477. At the age of ten years he was sent to Venice, where he first studied the principles of art with Sebastiano Zuccato; he then worked with Gentile Bellini, but soon preferred the instruction of Giovanni Bellini, whom he left to work under Giorgione. In 1507 Giorgione and Titian painted together at the Fondaco de' Tedeschi, decorating the exterior with frescoes. Titian was after this invited to Padua, where he executed three frescoes in the building called the Scuola del Santo, the oratory or service-house of St. Anthony, in 1511. At the death of Giovanni Bellini, Titian received the order to continue the work in the hall of the Grand Council of the ducal palace at Venice, which Bellini had left unfinished, and the senate showed their satisfaction with the work done by conferring on him an office which brought 120 crowns a year and the obligation of painting for eight crowns the portrait of every doge created during his lifetime. Pietro Lando, Francesco Donato, Marcantonio Trevisano, and the Veniori were all painted by the great master, who on account of the infirmities of age was unable to portray the last two doges of his time. In 1517, at the call of Alfonso d'Este, Titian went to Ferrara and executed several great works, among them the *Bacchus and Ariadne*, and the *Sacrifice to the Goddess of Festivity* and *The Bacchanal*, both in the Madrid Gallery. Titian was employed by princely clients until 1523. He was then recalled to Venice to paint the Doge Gritti, and his fresco above a staircase of the ducal palace of *St. Christopher carrying the Christ Child* is one of this period, and an example of his power in this branch of painting. His marriage took place about this time, and in 1530 he was already a widower with three children. In 1530 Titian was called to Bologna to paint a portrait of Charles V., who had come there to meet the pope. He then went to Mantua with the Duke Federigo Gonzaga to execute several commissions for him. He returned in 1532 to Bologna to paint a second portrait of the emperor, and was then rewarded by receiving the order of the Golden Spur, which brought with it the title of Count Palatine of the Lateran. Ten years later Titian was again called to Bologna to paint a portrait of Pope Paul III. In 1545 he was in Rome, where he produced one of his most famous portrait-pieces, representing the pope and his relatives the Cardinal Alessandro Farnese, and the Duke Ottavio Farnese, the pope's relatives. Titian spent but one year in Rome, and must have declined the post offered to him, according to Vasari, at the death of Sebastiano del Piombo by the holy father. In 1547 Titian was summoned to Augsburg by the emperor, who employed him to paint the portraits of the great or noble men around him there. Titian was in great favor with the emperor, and after two years of court life he returned to Venice much the richer, but always greedy of wealth, even showing himself servile in his anxiety to obtain it. He returned to the imperial court in 1550. Philip II., King of Spain, showed himself as great a patron and friend of Titian as his father. We read of his writing an order to the governor of Milan to pay up the arrears of Titian's pension of 400 crowns, granted by his father, but he seems to have been less ready to pay his own debts, for in Titian's letters, written in the last year of his life, he recalls to Philip the work of the past twenty years, for which he has not been paid. Vasari wrote his notice of Titian during the painter's lifetime, and describes how he went to visit him in Venice, where he was still painting in his house. Titian lived luxuriously, and received all the princes and learned and famous men of his time. He had the most pleasant and courteous manners. He is the only painter who worked for a period of ninety years. He was carried off by the plague Aug. 27, 1576. He had among his scholars his younger brother Francesco, his son Orazio, his nephew Marco, and his cousin Cesare. Among his most famous pictures are the *Tribute Money* of the Dresden Gallery; the *Sacred and Profane Love*, in the Borghese Gallery, Rome; the *Assumption of the Virgin*, in the Academy at Venice; the *Presentation of Giovanni Pesaro to St. Peter*, in the Antwerp Museum; the *Entombment*, in the Louvre; and the *Bacchus and Ariadne* and *Venus and Adonis* in the London National Gallery. For further information, see Crowe and Cavalcaselle, *Life and Times of Titian* (London, 2d ed. 1881); R. F. Heath, *Titian*, portrait and illustrations; S. Ticozzi, *Vite dei Pittori di Cadore* (1819); J. Northcote, *The Life of Titian*. W. J. STILLMAN.

**Titicaca**, tē-tē-kaa'kā: the largest inland lake of South America; on the confines of Bolivia and Peru, 12,545 feet above sea-level. Area, 3,200 sq. miles. The Titicaca, often called the Bolivian plateau, is the most remarkable of the high inclosed basins of the Andes. It is situated between the Eastern Cordillera, here called the Andes, and a broken and irregular western range, known collectively as the Cordillera Real; the latter includes the highest and most imposing mountains in Bolivia, but has comparatively low passes between Lake Titicaca and La Paz. Northward, the basin is separated from the plateau of Cuzco and the Amazonian watershed by the Vilcañota cross-range; southward, other cross-ranges mark its limits with smaller mountain basins near the boundary of the Argentine Republic. The Titicaca basin is thus completely inclosed. It is about 600 miles long from N. to S., 150 miles wide, and has an area of probably 100,000 sq. miles. The average elevation is about 13,000 feet, but the surface is irregular, with isolated hills and low mountains, and partial cross-ranges. Much of the land is sterile, and the climate is so cold that most cereals will not grow; yet the basin supports a considerable population, mainly of Aymará Indians, who plant potatoes, quinoa, etc. The most important Bolivian copper mines are situated in it, and it contains silver and other metals, and perhaps coal. Lake Titicaca is near the northern end. It is irregular in form, contains several small islands, and projecting peninsulas nearly cut off portions on the southern and eastern sides. Near the eastern shore it attains in some places a depth of over 700 feet; elsewhere, and especially at the southern end, there are extensive shallows, covered with tall reeds. For a long time the only navigation was by curious Indian rafts or boats, made of bundles of reeds; small steamboats now ply between the southern end and Puno on the W., whence a railway runs to Arequipa and Mollendo; this is one of the routes from the Pacific to La Paz. The islands, peninsulas, and shores contain many ruins, some of the Incan period, others (as the celebrated Tiahuanacu ruins in Bolivia) much older. Some of the most interesting remains are on the peninsula of Copacabana, near the southern end of the lake crossed by the boundary between Peru and Bolivia. This was a sacred place of the Incas, connected with many of their traditions. In modern times it has been celebrated for a chapel with an alleged miraculous painting of the Virgin, which is yearly visited by thousands of pilgrims. The reedy shallows were long the haunts of Uru Indians, who issued from their secret recesses to attack the Spaniards; the few who remain are harmless. From the southern end of the lake issues the Desaguadero, a deep and rapid river, 190 miles long, lying entirely in Bolivia. It empties into Lake Aullagas or Poopó, which is rather a swamp than a true lake, and has a much smaller area than Titicaca. Beyond this the waters are lost in swamps and sands. It is probable that the whole basin was formerly filled with water, forming an inland sea. See Squier, *Peru* (New York, 1877). HERBERT H. SMITH.

**Titiens**, or **Tietjens**, teet'yens, THERESE CAROLINE JOHANNA: singer; b. in Hamburg, Germany, of Hungarian parents, July 18, 1831. She appeared for the first time at the Hamburg Opera in 1849 as Lucrezia Borgia, and achieved an immediate success. She went to Frankfort, and in 1856 to Vienna, where she was also well received. Subsequently she was engaged for her Majesty's theater in London. She appeared as Valentine in *The Huguenots*, Apr. 13, 1858. Her impersonation was much admired and each repetition of the opera increased her reputation. She afterward sang at Covent Garden and at Drury Lane, as well as at her Majesty's theater, and remained in London until 1876, when she visited the U. S. In the same year she had a large benefit concert at the Albert Hall, London. Her last stage appearance was made May 19, 1877, as Lucrezia. Her voice was a rich and sweet soprano, extending to the highest register. Her versatility was remarkable, and she sang in such completely opposite *rôles* as Semiramide and Fides. Her voice was also well suited to sacred dramatic music and oratorio. D. in London, Oct. 3, 1877. B. B. VALLENTINE.

**Titin'ius**: a Roman comic poet, who, after the death of Terence, was the first to exhibit the so-called *Fabulæ Togatæ*, the scenes of which were drawn from Roman life, and not based upon Greek plays. He was especially skillful in the delineation of character. Fragments of his plays, over 180 verses and fifteen titles, are collected by Ribbeck (*Com. Rom. Frag.*), pp. 133–160. M. WARREN.

**Titlark**, or **Pipit** [*titlark* is *tit*, a small bird + *lark*; *pipit* is a name given on account of its note]: any bird of the genus *Anthus* and group or sub-family *Anthinæ*. The titlarks are generally associated with at least the wagtails (*Motacillinæ*) in a family, *Motacillidæ*, and contrasted with them by the comparative shortness of the tail (shorter than the wings), which is emarginated, and has the two central feathers shorter than the lateral, and all broadest near their ends, and boldly round at the extremities. They are

American titlark.

mostly grayish brown, and in the under parts variously streaked. Over fifty species are known, and almost every land has representatives of the group. They are birds of passage, insectivorous and graminivorous, rather fine songsters, and graceful in appearance and movements. Three species are found in the U. S.—namely, *Anthus pensilvanicus* (American titlark or pipit), *A. spraguei* (Missouri skylark), and *A. cervinus*; a fourth species (*A. pratensis*, or European titlark) sometimes straggles into Greenland and Alaska.

Revised by F. A. LUCAS.

**Title** [from O. Fr. *title* > Fr. *titre* < Lat. *ti'tulus*, inscription, label, title]: in law, a word often used as synonymous with property, or right of ownership, but in its technical signification denoting the sources of such right, or the facts and events whereby property in land or goods is acquired. In this sense the common law divides all titles to real property into two classes—*by descent* and *by purchase*. Title by descent includes the single mode of acquisition through inheritance; title by purchase embraces all other methods. A more convenient classification is that which places in one group the several methods of acquisition of property, real and personal, by acts *inter vivos*, and in a separate group the different modes of acquiring property on the death of the former owner. The first class will then include (*a*) *original acquisition* (accretion, finding, etc.); (*b*) *lapse of time* (prescription and limitation); (*c*) *eminent domain*, or the taking of land by or under the authority of the State; and (*d*) *conveyance* (including gift as well as sale), which may be effected in various forms, but is now, in the case of real property, usually accomplished by deed, known as a grant, and, in case of personal property, by delivery or writing. In case (*a*) it is assumed that there was no previous ownership of the property; in cases (*b*) and (*c*) the acquired title has no reference to such previous ownership as may have existed; while (*d*) presents the ordinary case of the transfer of the right of property from one to another.

The second class comprehends the various modes in which the death of the owner operates to transfer property, viz.: (*a*) *descent*, (*b*) *occupancy*, (*c*) *gift causa mortis*, and (*d*) *wills*.

For more detailed information concerning the several modes of acquisition above enumerated, the reader should consult the several articles bearing those titles. See also Digby's *History of the Law of Real Property*, chap. x.; Schouler's *Personal Property*, vol. ii.; and the treatises of Williams on *Real Property* and *Personal Property*.

GEORGE W. KIRCHWEY.

**Titmouse, Tit**, or **Tomtit** [*titmouse* < M. Eng. *titemose*, *titemase*; *tit*, small, small bird + O. Eng. *māse*, a kind of small bird; cf. Germ. *meise*, titmouse]: any bird of several species of the family *Paridæ*. They are small birds with soft and lax plumage, a stout conical bill shorter than the head, the wings rounded and short, and the sides of the toes expanded into a palm. The group belongs chiefly to the Northern hemisphere, and more to the Old World than to the New; North America possesses but thirty species and

The blue tit.

sub-species out of nearly a hundred. They are mostly birds of dull plumage, although there are some exceptions, like the blue tit of Europe (*Parus cæruleus*), which is blue and yellow. *Parus wollweberi*, the species found in the western parts of the U. S., and its eastern relative, *P. bicolor*, are crested. The CAPE TITMOUSE (*q. v.*) is found at the Cape of Good Hope. One of the most familiar species is the CHICKADEE (*q. v.*), which, like most of the group, is a hardy bird. Titmice feed on insects and seeds; some nest in holes of trees, others make curious, and for the size of the bird large, bottle-shaped structures; the eggs are numerous, eight or nine, and two broods are frequently raised in a season. F. A. LUCAS.

**Tittmann**, OTTO HILGARD: See the Appendix.

**Titus**: a disciple and companion of St. Paul, to whom one of the canonical epistles of the New Testament is addressed. He was a Gentile, but his native place is uncertain, the probability being in favor of Antioch, as he first appears as a delegate from the church of that city, accompanying Paul to Jerusalem. He was a companion of the apostle in his next missionary journey to Asia Minor and Macedonia, and was twice charged with important missions to the church at Corinth. At some time—whether before or after Paul's (first) imprisonment can not be ascertained—Titus took part with Paul in founding the churches in Crete, where he was laboring as an evangelist when Paul's pastoral Epistle was written. He appears to have rejoined Paul at Nicopolis in Epirus, and was thence sent into Dalmatia, from which time all certain traces of him disappear. Tradition makes him Bishop of Crete.

Revised by S. M. JACKSON.

**Titus**: Bishop of Bostra, in Arabia; d. during the reign of Valens; one of the most distinguished fathers of his time, and spoken of with the highest praise by Jerome. Of his life nothing is known but his conflict with Julian the Apostate, who accused him of inciting the Christians to use violence. His work against the Manichæans was published by P. de Lagarde in the complete Syriac version (Berlin, 1859); a partial Latin translation is found in Migne, with the Greek text of the first three books. S. M. J.

**Titus, Epistle to**: one of the so-called pastoral Epistles of the New Testament canon, written by Paul to convey instruction as to the work in Crete, with the execution of which Titus had been commissioned. If the hypothesis of

Paul's second imprisonment be true, this Epistle and the first to Timothy were written during Paul's journey to Asia Minor and Greece, before his last imprisonment. The Epistle, it is thought, was written from Nicopolis, probably the Epirote town of that name, and not the Macedonian city. See PAULINE EPISTLES. Revised by S. M. JACKSON.

**Titus Fla'vius Sabi'nus Vespasia'nus** (commonly called by his prenomen TITUS): Roman emperor (79–81); b. Dec. 30, 40 A. D.; a son of Vespasian and Flavia Domitilla. Titus was educated with Britannicus, the son of Claudius, with whom he formed an intimate friendship. He served under Vespasian in the Jewish war, and on Vespasian's return to Rome as emperor in 69 Titus was left as commander-in-chief, and finished the war by taking and destroying Jerusalem, Sept. 8, 70. After his accession to the throne (June 24, 79) Titus disappointed the general expectation by ruling justly and humanely. The *delatores* (informers) were punished, and prosecutions for treason came to an end. Many splendid public buildings, the Colosseum, the baths, etc., were finished and dedicated with magnificent festivals for the people; and the emperor showed a generous disposition to help the people under the great calamities which befell them during his reign—the destruction of Herculaneum, Pompeii, and Stabiæ by the terrible eruption of Vesuvius; the conflagration in Rome in the following year, by which the Capitol, the library of Augustus, and many of the most magnificent edifices of the city were destroyed; and, finally, the plague. Titus died Sept. 13, 81, at Reate, in the Sabine country, and was succeeded by his brother Domitian.
Revised by C. H. HASKINS.

**Titus Livius**: See LIVY.

**Titusville**: city (village founded in 1832, city incorporated in 1867); Crawford co., Pa.; on the Dunkirk, Alleg. Val. and Pitts. and the West. N. Y. and Pa. railways; 28 miles E. of Meadville, the county-seat, and 100 N. of Pittsburg (for location, see map of Pennsylvania, ref. 2–B). It is regularly laid out on a plateau which slopes to the S., affording natural facilities for drainage, of which advantage has been taken in the construction of an excellent system of sewerage. Water for domestic use and manufacturing purposes is obtained from inexhaustible wells, and is pumped directly to the places of consumption. The city owns the water-works and one of two electric-lighting plants, and contains illuminating and fuel gas plants. There are 10 churches and 2 synagogues, 5 large public-school buildings and a high school, several hotels, a national bank with capital of $300,000, a State bank with capital of $150,000, a private bank, and a daily, a monthly, and 4 weekly newspapers. Titusville has been an important oil-center since 1859, when E. L. Drake successfully drilled the first petroleum well in North America on Oil creek, 2 miles S. of the city. (See PETROLEUM.) The city has several pipe-line systems for conveying both crude and refined petroleum in different directions, and its principal manufactures are in connection with the petroleum industry. These include engines, boilers, car-tanks, oil storage-tanks, and the various kinds of machinery used in connection with petroleum; refineries for making illuminating oil, gasoline, etc.; and plants which turn out various products of paraffin, including soap. Other articles that are manufactured in this city are harness, steel, acids. furniture, novelty goods, steam-heaters and radiators, and leather. Pop. (1880) 9,046; (1890) 8,073; (1900) 8,244.
H. L. HERSHBERG,
SECRETARY TO THE BOARD OF TRADE.

**Tiuchev**, tē̆e-oo-chef', FEDOR IVANOVICH: poet; b. near the town of Briansk, Russia, Nov. 23, 1803. He filled diplomatic positions in Munich and Turin from 1823 to 1841; served in the bureau of censors in St. Petersburg from 1844 until his death July 15, 1873. His occasional short poems, which had long found little favor, suddenly became popular in 1854. Tiuchev may be regarded as a late member of the romantic school prevalent earlier in the century, though he had more dreaminess and delicacy than passion. He was an ardent Slavophil, but his patriotic pieces are not his best. His complete works were published in 1886. His writings have been translated into German (H. Noe, Munich, 1861). See biography of him (in Russian) by his son-in-law, I. Aksakov (1874), and article by M. de Vogüé in *Regards historiques et littéraires* (1892).
A. C. COOLIDGE.

**Tiumen**, tē̆e-ōō-men', or **Tyumen**: town of Siberia; government of Tobolsk; on the Thura, an affluent of the Ob; 90 miles S. W. of Tobolsk (see map of Asia, ref. 3–E). It is the oldest, but at the same time one of the handsomest and most prosperous, of the Siberian cities. It is a central point on the Trans-Siberian railway, an entrepôt for the traffic between Russia, Siberia, the Kirghiz territory, Bokhara, and China, and has extensive manufactures of leather, tallow, candles, pottery, mats, wooden articles, carpets, and coarse woolen fabrics. Pop. (1897) 29,588.
Revised by M. W. HARRINGTON.

**Tiv'erton**: town; in Devonshire, England; at the confluence of the Exe and Loman; 14 miles N. by E. of Exeter (see map of England, ref. 14–E). It has some fine buildings, including a church, portions of which date from the fifteenth century, and Blundell's free grammar school, the later buildings of which were erected in 1880 in the Tudor style at an expense of $20,000. Lace-making is the principal industry, employing about 1,800 people. Pop. (1891) 10,892.

**Tivoli**, tē̆e'vō-lē̆e (anc. *Tibur*): town; 19 miles E. N. E. of Rome, Italy; in a bend of the Anio, left-hand affluent of the Tiber; on the northern versant of Mt. Repoli, 1,060 feet above sea-level (see map of Italy, ref. 6–E). It is a station on the railway connecting with Rome. It is a busy town and manufactures woolens, thread, and wire. The falls of the Anio were utilized for the plant established in 1892 for the electric illumination of Rome. Tivoli was founded about 500 years before Rome, and is equally noted for its natural beauties and for its ruins and antiquities. It has long been a favorite pleasure resort for the Romans, and with it are associated the names of Mæcenas, Horace, Propertius, Catullus, Hadrian, and Zenobia. Among the objects of interest are the Temple of the Sibyl, the falls of the Anio, and the constructions to protect the city from the river, the ruins of the villa of Varus, of the so-called villa of Mæcenas, now believed to be the temple of Hercules the Conqueror, that of Hadrian, and that of Este. Pop. 10,950. M. W. H.

**Tixtla**, teest'lā̆a: a town and the former capital of the state of Guerrero, Mexico; in a valley 5 miles E. of Chilpancingo, the present capital; about 4,000 feet above sea-level (see map of Mexico, ref. 8–H). The valley here forms a fertile and well-watered plain, and the town is surrounded by gardens and fruit-trees. In 1811 Tixtla was captured by Morelos, and soon after he repulsed the royalists here; it was long a revolutionary center. Pop. 8,000. H. H. S.

**Tlaxcala**, or **Tlascala**, tlaath'kā̆a-lā̆a [Mex., liter., land of maize]: an interior state of Mexico, surrounded by Hidalgo, Puebla, and Mexico. Area, 1,595 sq. miles. It is the smallest of the Mexican states, and lies entirely on the plateau. The surface is much broken, and on the western and southern frontier there are high mountains—Malintzin or Malinche, on the S. E., attains 13,500 feet, and is crowned with snow. The principal occupation is agriculture, the most important crops being maize, wheat, and maguey from which the Mexican markets are supplied with pulque. There are few mines, though silver and coal deposits are known. The manufactures, especially of cotton and woolen cloths, are quite important. At the time of the Spanish conquest the territory of Tlaxcala was occupied by the Tlaxcalans, a warlike tribe of the Nahuatlecan stock, who had never submitted to the confederated pueblos of the Mexican valley. They resisted Cortés fiercely (1519), but finally sued for peace and became his allies in the march to Mexico, and the subsequent siege. Pop. of the state (census of 1895), 166,803; a large proportion are civilized Indians descended from the ancient Tlaxcalans. Tlaxcala, the capital and largest town, is on the railway between Puebla and Apizaco, in the valley of the river Atoyac, which here furnishes water-power for several factories (see map of Mexico, ref. 7–H). It exports grain, hides, cloths, etc. The town is on or near the site of the ancient Indian capital. Pop. about 8,000. H. H. S.

**Tlemcen**, tlem-sen': town; in the province of Oran, Algeria; 80 miles S. W. of the city of Oran. It is well built and is in a fine plain, sheltered against the scorching S. winds by a chain of lofty mountains, cultivated with great care, and producing olives, figs, grapes, and other kinds of fruit in abundance. Tlemcen has some manufactures of leather, carpets, and woolen fabrics, and a considerable trade in wool, grain, and fruit. It is on the railway running to Rahgun. Pop. (1891) 19,802. Revised by M. W. HARRINGTON.

**Tmesis** [Gr. τμῆσις, severance, deriv. of τέμνειν, cut]: a technical term of the old Greek grammarians applying to the Epic usage of separating the verb and its qualifying præverb in cases where the later Attic usage shows a compound verb; thus ὑπὸ δ' ἔσχετο μισθόν (for Attic ὑπέσχετο).

As the Epic really represents the more original usage, the term is a misnomer. The term is often given in modern grammar a wider application covering all cases in which a compound term appears with disjoined elements, as *to us ward, what place soever.* BENJ. IDE WHEELER.

**Toad** [M. Eng. *tode, tade* < O. Eng. *tādie*; cf. TADPOLE]: any one of various species of *Salientia*, or tailless batrachians, having a short body and legs and a warty skin. There are no ribs nor teeth, and the tongue is free behind. The young, like frogs, pass through a tadpole stage. Most of the animals thus characterized belong to the family *Bufonidæ*, although a few belong to other allied groups. Toads are found in all parts of the globe (save, of course, the colder portions) except the Australian region. They live upon insects, grubs, etc., which they catch in large numbers with their peculiarly arranged tongue, which can be rapidly protruded and withdrawn, and are of considerable service to gardeners. They either burrow in the earth at the approach of winter, and there hibernate, or pass the cold season in convenient holes. There is no foundation for the stories that toads are found imbedded in solid rock, or in the trunks of trees, nor are toads poisonous except to the extent that their skin secretes an acrid fluid, which is extremely unpleasant to carnivorous mammals, and is thus protective. The common toad of Europe (*Bufo vulgaris*) is found also in Asia and Northwestern Africa. It is about the same size as the common toad of the U. S. (*Bufo lentiginosus*), but the American species has ridges along the skull, while the European has none. Over 100 species are known. F. A. LUCAS.

**Toad-fish**: any fish representing either of the families *Batrachidæ* and *Antennariidæ*. These two forms belong to distinct orders, and have really little in common except a certain hideousness of aspect other than fishes generally have, although they were formerly associated together, even by scientific ichthyologists (e. g. Cuvier), and Günther (*The Study of Fishes*, pp. 467–469) still places them in adjacent families.

The *Batrachidæ* are carnivorous fishes inhabiting many tropical and temperate seas, but the species are not very numerous. They are bottom fishes, living mostly in the mud, and in some instances ensconce themselves in the empty valves of shells. Fish of the genus *Batrachus* are to be feared on account of their bite, as their teeth and jaws are quite strong, and those of *Thalassophryne* on account of the wounds which they can inflict with their opercular spines. The opercular spines of most of the species are solid, but those of *Thalassophryne* are hollowed, and at their bases are poison-glands. The species are generally of moderate size, but one (the so-called *Batrachus gigas*), made known by Günther in 1869 (*Ann. and Mag. Nat. Hist.*, vol. iii., p. 131), from the Seychelles islands, ranks among the largest of true fishes. Less than twenty species of the family are known, which have been generally distributed under three genera, *Batrachus, Thalassophryne*, and *Porichthys*, but the first is a heterogeneous group. The toad-fish of the Atlantic coast of the U. S. is from 10 to 18 inches long, brownish in color in the north and light yellow in the Gulf of Mexico. In spite of its repulsive appearance it is said to be sweet and palatable, by those fishermen and ichthyologists who have had the courage to eat it. See G. B. Goode, *History of Useful Aquatic Animals*, in *The Fisheries and Fishing Industries of the United States*, 1884.

The *Antennariidæ* (or *Chironectidæ*) belong to the order *Pediculati*. The family is quite rich in species, remarkable for their grotesque physiognomy and often rich colors. They are mostly inhabitants of the open or deep tropical seas. Not far from fifty species are known. They are divisible among three sub-families and six genera, viz: (1) *Antennariinæ*, with the genera *Pterophryne, Antennarius, Histiophryne*, and *Saccarius*; (2) *Brachionichthyinæ*, with the genus *Brachionichthys*; and (3) *Chaunacinæ*, with the genus *Chaunax*. The *Pterophryne lævigata* builds a nest in the floating seaweed of the open sea.

Revised by E. A. BIRGE.

**Toad-spit**: See FROG-SPITTLE.

**Toadstools**: a popular name for the plants of the order *Hymenomyceteæ* of the higher fungi. They are otherwise known as MUSHROOMS (*q. v.*). See also the article FUNGI.

**Tobacco** [from Span. *tabaco* = W. Ind. (Caribbean or Haitian) *tabaco*, tobacco, liter., the pipe or tube in which it was smoked]: a plant of the genus *Nicotiana* of the family *Solanaceæ*, first brought to the knowledge of civilized nations on the discovery of America, where it was found in use by the natives as far N. as Virginia. Comparatively little notice was taken of this plant until about 1650, when it entered largely into the trade of the American colonies with Europe. Although the genus contains some species that are shrubby, the cultivated plant is everywhere an annual; the best-known species, *N. tabacum*, is an upright plant, having a single stalk from 3 to 6 feet high. The leaves are broad ovate lanceolate, near the ground, and enlarge to 3 feet in length and 1 foot wide, in some varieties, but diminish in size as the stalk rises. The latter is surmounted by a loose panicle or raceme of funnel-formed flowers, usually with a long tube, bearing purple or light-red petals. The seeds are minute, brown or black, and very numerous. The only other species that is much grown is *N. rustica*, a much smaller plant, with greenish flowers and adapted to a cool climate.

Tobacco-plant in flower (*Nicotiana tabacum*).

The purpose to which tobacco is applied is almost wholly as a tonic, stimulant, or sedative through smoking, chewing, or snuffing. Though no form of direct nutrition is possible, its application to the palate and sensory organs of the mouth undoubtedly supports the strength of those accustomed to its use, calms nervous excitability, and relieves hunger, pain, constraint, and *ennui* in a remarkable manner. The common testimony of almost all nations and all races ascribes value to this singular plant, though it can not be taken into the stomach without injurious results, and is essentially poisonous in its general properties.

The distinctive and valuable properties are found only in the leaf, which is thick, heavy, and pubescent, becoming oily and semi-resinous as it ripens. This leaf, when the plant approaches maturity, is dried and cured by partial sweating, which effects a chemical change, removing the characteristics of the fresh leaves, and developing a powerful aroma, with strong narcotic and acrid properties. After curing, tobacco, either in leaf or manufactured, will remain a long time without decay or change other than drying, and of the vast quantities that enter into commerce very little is lost from such causes. The constituents that give tobacco its value are readily soluble in water and alcohol, but they have little value as an extract.

The analysis of partially cured and cured leaves of Connecticut tobacco showed the following composition:

| CONSTITUENTS. | Unfermented. | Fermented (sweated). |
|---|---|---|
| Water | 26·13 | 23·13 |
| Ash | 17·86 | 18·91 |
| Nicotine ($C_{12}H_{14}N_2$) | 1·51 | 1·14 |
| Nitric acid ($N_2O_5$) | 2·29 | 2·38 |
| Ammonia ($NH_3$) | 0·37 | 0·44 |
| Other nitrogenous matters | 10·06 | 10·58 |
| Fiber | 8·57 | 9·38 |
| Starch | 2·90 | 3·15 |
| Other nitrogen-free extracts | 27·06 | 27·74 |
| Fat | 3·22 | 3·13 |

The average of thirty analyses of the ash of American tobacco gave the following: In the cured leaves, water, 8·12 per cent.; ash, 24·48. In the ash, chlorine, 4·04 per cent.; carbon dioxide, 21·33; sulphuric acid, 5·18; soda, ·86; magnesia, 5·78; lime, 20·89; iron and alumina, 2·57; silica, 14·92; phosphoric acid, 2·45; potash, 20·90; carbon, 1.

*Production of Tobacco.*—The production of tobacco is greater in the U. S. than in any other country, and it may be fairly estimated to furnish one-half the quantity entering the general commerce of the world. According to census returns, the amount of tobacco produced in the U. S. in 1859 was 434,209,461 lb.; in 1869, 262,735,341 lb.; in 1879, 472,661,157 lb.; in 1889, 488,255,896 lb.

TOBACCO PRODUCTION IN U. S. (CENSUS OF 1890).

| STATES AND TERRITORIES. | Number of planters. | Area, acres. | Crop, pounds. | Value. |

The average production per acre in the U. S. for the year 1889 was 705 lb., and at that time 692,990 acres of the richest cultivated land were devoted to its growth. Its cultivation is possible in a range almost as great as that of Indian corn, but it is destroyed by frost, and the risk in this respect in the Northern States is very great. The largest-producing countries other than the U. S. are tropical or semi-tropical. Cuba may be estimated to produce 60,000,000 lb. a year, chiefly in the district of Vuelta del Abajo, a rich plain S. W. of Havana, 80 miles in length by 20 in breadth. A Government monopoly long existed in Cuba, but the production and trade were thrown open in 1820. The finest leaf is grown in Cuba for the manufacture of cigars both there and in the U. S. and Europe. Porto Rico produces tobacco in considerable quantity, but not of so good a quality as that of Cuba. Haiti produces more than Porto Rico, chiefly in its northeastern part. Mexico produces largely, and exports a small share only to Great Britain and France. The Central American states produce and export not more than Mexico; New Granada and Venezuela produce and export largely, furnishing 20,000,000 lb. to general commerce, and consuming freely in addition; the town of Varinas is a chief place of export. Peru furnishes a small quantity; Brazil has greatly enlarged its production, and with Uruguay and the Argentine Confederations contributes largely to the European supply—perhaps 20,000,000 lb. British India produces inferior tobacco, which is largely consumed there, and exported to a small extent to Europe. The Philippine islands produce 2,000,000 lb. for export, chiefly to Great Britain and Bremen, from Manila. Java furnishes 20,000 piculs (2,670,000 lb.) for annual export, and China and Japan together as much more, which is brought to Europe. Turkey produces a considerable quantity of fine tobacco, the best being sent from Latakia in Syria. Other localities on the eastern shores of the Mediterranean produce tobacco for the general European supply, and in Italy, Spain, France, and Germany a considerable quantity is grown which does not enter into general commerce, the several state or government monopolies taking practical charge of it, as well as of all that is imported. In the East Indies some of the finest tobacco is grown, which has an established reputation in American and European markets.

*Cultivation.*—The tobacco-plant is a strong-growing, gross-feeding herbaceous annual, requiring a warm, well-drained soil containing an abundance of available plant-food. As the plant has great leaf-development an abundance of nitrogen and potash in the soil is of the utmost importance, and it is also essential that the plant-food be comparatively free from chlorides for the production of the best quality of smoking-tobacco. The crop is exhausting in consequence of the large proportion of mineral elements and nitrogenous matter found in the leaves, the ash of the dried leaves yielding 24 per cent. of mineral constituents. The value of the tobacco being wholly in the leaves, great care is taken to increase their size and concentrate the strength of the plant upon them. Thin glossy leaves having a silky texture are most highly prized for cigar-wrappers. The seed is everywhere sown in beds, and the young plants transplanted to the tobacco-fields when 2 to 5 inches high. In the preparation of the seed-bed great care is taken to have the soil dry, warm, well supplied with plant-food, and protected from chilling winds. The plants are set in rows 2 to 4 feet apart, that usually admit of cultivation with a horse. As the tobacco-plant grows rapidly when once established, it is essential to give thorough cultivation as well as an abundance of available plant-food. The flower stem is broken out or topped, and the strength of the plant concentrated on ten to sixteen of the larger leaves. Shoots or suckers grow quickly from the axils of the leaves after topping, and these shoots must be frequently removed. About four months are necessary as the period of growth, and when the leaves are mature light-colored spots appear on them, and they crack or break when folded closely.

*Harvesting.*—The process usually is to cut the whole stem near the ground, allow the plants to wilt somewhat, and draw them to the shed or tobacco-house, where they are hung on poles to cure. Sometimes, however, the crop is harvested by removing the leaves from the stalk as fast as they ripen, and curing them in tightly made buildings by artificial heat.

*Curing and Sorting.*—Unless artificial heat is used it is important that the curing-houses be so arranged that the ventilation can be controlled. After the plants are once dried they may be taken down, and the leaves stripped from the stalks whenever the weather is damp. These leaves are tied into bundles, carried into the sorting-house, and sorted into three to seven grades, according to the kind and quality of tobacco. The leaves after sorting are tied into little bundles called hands; these hands are then packed tightly into hogsheads or boxes for the market. Care is used in handling the tobacco during the sorting process to expose the tobacco only in a damp atmosphere, in order to keep the leaves soft and pliable. After the tobacco is packed it is allowed to pass through a process of curing called sweating before it is used in the manufacture of chewing or smoking tobacco.

*Insect Enemies in the U. S.*—Among these are *Protoparca celeus*, the Northern tobacco-worm, and *P. carolina*, the tobacco-worm of the Southern States. The adults of these insects, called sphinx-moths, are strong. rapid flyers and at twilight are often mistaken for humming-birds. The eggs are deposited singly on the tobacco-leaves, where they soon hatch. The larva, known as hornworm, is a voracious feeder and does great damage, particularly to the varieties of tobacco used for cigar-wrappers. The larva burrows in the ground to pupate, where it moults and becomes a chrysalis and remains in the ground in this form until the following spring. The late broods of this insect feed almost wholly upon the tomato-plant. Hand-picking the worm is the chief remedy, although attempts to poison the adult insect have often proved successful. *Greasy cutworm* (*Agrostis ypsilon*), one of the commonest of American cutworms, feeds also on corn, cotton, and other plants. The eggs are laid on weeds or grass, hatch out in a day or two, the larvæ drop to the ground, burrow and feed on roots until the following spring when they come to the surface of the ground, and often do great damage by eating off the young plants; the damage is done almost wholly at night. The *flea-beetle*, or *tobacco-fly* (*Crepidodera cucumeris*), lives through the winter in a winged state, and attacks the young plants in the seed-bed and in the fields soon after transplanting. The remedies are covering the beds with netting and sprinkling the plants with a decoction of tobacco-water. The *boll-worm* (*Heliothis armigera*) sometimes damages tobacco when corn and cotton are scarce; the only remedy is hand-picking the larvæ. The *meadow-grasshopper* (*Orchelimum vulgare*) and the *locusts*, of which there are several species (*Melanoplus femur-subrum* is the most common), all do more or less damage, particularly if the tobacco-fields are near pasture or meadow land.

*Diseases.*—The tobacco-plant is subject to comparatively few diseases, and these rarely result in serious damages. The *brown rust* prevails to a greater or less extent every year, and is caused by an abnormal physiological condition of the leaf structure caused by excessive wet or drouth, or any cause that produces a weak growth. The *white speck* of tobacco is supposed to be caused by the fungus *Macrosporum tobacum*, although its history is not well understood. *White veins* occur in the cured product and have been attributed to a variety of causes.

*Manufactured tobacco* is technically distinguished from both the cured leaf and from cigars or snuff. It is made from ordinary or inferior leaf by twisting, pressing, or cutting, and assumes various forms and names. In the U. S., as elsewhere, sirups and licorice are largely used in its preparation, though adulteration with other leaves or deleterious substances rarely occur. In Great Britain adulteration is carried to great extremes, and stringent laws have been enacted to suppress it. Great improvements have taken place in cutting, preparing, and flavoring tobacco manufactured for chewing and smoking. Cavendish, navy, twist, negro-head, etc., are standard names or brands in the trade for that which is compressed in solid forms; "fine-cut" is shredded and loose in fibrous masses, cut by delicate machinery from leaf of good quality and flavored acceptably. Smoking-tobacco is prepared of every grade and quality, but usually from broken leaves, stems, and inferior parts. In the U. S. less of such grades, or of smoking-tobacco generally, is made or consumed than in Europe, and the tax being relatively higher compared with the small original cost of the materials, little is manufactured in this form for general trade.

The following table gives the number of pounds of manufactured tobacco produced in the U. S. during the year 1893:

| STATES. | Plug. | Fine-cut. | Smoking. | Snuff. |
|---|---|---|---|---|
| Alabama | 5,649 | ......... | 110 | ........ |
| Arkansas | 986 | ......... | 3,793 | ........ |
| California | 15,225 | ......... | 72,720 | ........ |

*Cigars* (Sp. *cigarro*; Fr. *cigare*) constitute the most important form in which tobacco is consumed for smoking, and in fact the largest aggregate in general consumption in any form; and their greater value induces every effort to produce leaves suited to covering cigars by the growers. The cigar is of Spanish or Spanish colonial origin, and it was long in use in Spain before its general adoption by other nations. The greatest skill in the manufacture of cigars has always been shown by Spanish or Cuban artificers, and Havana has been the seat of the best manufacture for a century or more. The materials used for filling must be good, and must be skillfully arranged and combined so as to secure a proper firmness with a good draught. The wrappers must be of elastic and moistened leaf, so applied as to form a perfect ovoid cylinder, one end of which is closed and the other open. Uniformity in size, length, weight, and color is essential. Cigars are tied in bundles of twenty-five to fifty each, and these are packed in boxes of Spanish cedar containing two, three, or four bundles, usually 100 in a box. The Spanish cedar is largely exported to the U. S. for making boxes, and is also imitated in American cedar, but the general form of tying and packing is tenaciously adhered to. Nearly one-half in value of all tobacco grown is made up into cigars.

*Cigarettes* are small rolls of fine smoking-tobacco inclosed in paper wrappers; they are largely made in Cuba and in the U. S. They are ranked and counted as cigars for revenue purposes. *Cigarrillos* is the Spanish term for cigarettes or small cigars.

Average quantity of tobacco used for 1,000 cigars, 19·44 lb.; average quantity of tobacco used for 1,000 cigarettes, 3·41 lb.

*Snuff* has been made from a very early period, first and most largely by the Spanish, who prepared it with care and scented it with various materials. Next the Netherlands, Scotland, and England extended and popularized its use. For many years Scotch snuff has been the favorite in commerce, and large manufactures have existed in Great Britain, with a moderate production in the U. S. The export and import of snuff have not been usually distinguished from manufactured tobacco; the amount, however, has been large, and the consumption in Great Britain larger than all elsewhere. The manufacture was originally conducted by grinding the leaf in conical mortars, and more or less was produced in all tobacco-consuming countries. It is now ground in iron mills by steam-power. The old and standard brands of snuff were *maccaboy*, originally from Martinique and Spain; *rappee*, or the French; and that known as Scotch, or *Lundyfoot*. There has been a great decline in the use of snuff in Great Britain and Germany since 1850, and in the U. S., with local exceptions, an even greater decline.

Revised by George C. Watson.

Tobacco, Chemistry and Physiological Relations of.—The most important ingredient of the tobacco-leaf is the alkaloid *nicotine*, which is present, in the dried leaf, in quantities varying from 2 to 6 per cent. Pure nicotine ($C_{10}H_{14}N_2$) is a colorless, oily liquid of a strong alkaline reaction, disagreeable smell, and hot, acrid taste. It is volatile, inflammable, soluble in water, alcohol, ether, and oils. On exposure to light it turns to a reddish-brown color. With acids it forms crystallizable salts. Nicotine was first isolated by two German chemists, Posselt and Reimann, in 1828. It is a virulent poison, a single drop sufficing to kill a rabbit in less than four minutes. *Nicotianine*, or *tobacco-camphor*, is a principle obtained by distilling the leaves, whether fresh or dry, with water. This is a fatty substance, occurring in the form of minute acicular crystals, having little taste, but a tobacco-like smell. Besides these principles, tobacco contains albumen, resin, and gum, and an unusual quantity (from 16 to 18 per cent. and over) of inorganic ingredients. Lime composes from 25 to 50 per cent. of the ash, and potash about 30. Nitric, phosphoric, and malic are among the acids that occur. By dry distillation tobacco affords a dark empyreumatic oily substance (oil of tobacco), of the peculiar strong smell of old, foul tobacco-pipes, and an exceedingly acrid, sharp, disagreeable taste. This oil is apparently a complex substance, and, like nicotine, is an exceedingly powerful poison. *Tobacco-smoke*, according to careful analyses by Vohl and Eulenberg, contains no nicotine, but does contain the whole series of the pyridine (volatile) bases, whose conjoint effect upon the animal system is substantially the same as that of nicotine; and also, among other ingredients, ammoniacal compounds, hydrogen cyanide, a number of organic acids, and of hydrocarbons of the benzene or analogous series.

The *effects of tobacco upon the animal system* have been critically studied by experimenting with nicotine upon animals. This alkaloid is one of the most powerful of nerve-poisons, producing tetanic convulsions, followed by paralysis, and death through failure of respiration. The cerebrum is little affected, and the pulse-rate, while first lessened, is afterward quickened. The pupil is contracted. In man, tobacco taken in sufficient quantity to show poisonous effects produces giddiness, faintness, and an indescribable feeling of sinking and misery, followed shortly by intense nausea, severe and long-continued vomiting, and great relaxation and feebleness of the muscular system. The skin becomes pale and moist, and the pulse exceedingly feeble. More or less of these effects may persist for a day and more after the poisoning. They are familiarly seen in young lads when first beginning to smoke. As to poisonous dose, there is none, for not only do different persons vary in their susceptibility to tobacco, but habit also makes an enormous difference in the effect following a given dose; so that, as is well known, very large quantities of tobacco can be smoked or chewed without the development of any of the above-mentioned poisoning. In sufficient dose, tobacco proves a dangerous and even fatal poison. The symptoms are, in general, an intensification of those just described—namely, intense nausea and vomiting, faintness, muscular debility, cardiac failure, and general prostration. Often, too, there are violent pains in the abdomen, cramps, convulsions, and profuse purging. An injection *per rectum* of an infusion representing the strength of 30 grains of tobacco has several times killed, and death may take place within an hour from the time of receiving the poison. Extensive external applications of tobacco may also cause poisoning, and even death. There is no antidote, and in cases of acute poisoning the stomach or bowels should be evacuated by appropriate means, and restorative agents employed, such as alcoholics, ammonia, the application of heat, friction, and artificial respiration. *Chronic poisoning* by tobacco, such as occurs from undue indulgence in the weed as a luxury, shows itself in *dyspepsia*, the smoker experiencing loss of appetite, especially in the morning, dry foul tongue and thirst; and in *nervousness*, as evinced by a general physical and mental restlessness, with undue susceptibility to external impressions, and by tremulousness of the muscles and palpitation or irregular action of the heart. With smokers, also, a form of chronic irritability, and even inflammation, of the throat and tonsils is exceedingly common. Graver evils, such as paralysis, mental decline, and loss of sight from wasting away of the optic nerve, have been charged to excessive use of tobacco; but when we consider the enormous number of persons who indulge heavily in the weed, and the comparatively rare occurrence of the affections in question, where there is not some other obvious and valid cause for the same, the claim that tobacco is to blame for the disease must be received with caution. *Moderate* use of tobacco by persons with whom it "agrees" (i. e. does not produce obviously injurious effects) often calms and soothes the exhausted or irritated nervous system, helps digestion, promotes the function of the bowels, removes the sense of fatigue, and tends to compensate for an insufficient food-allowance. The popular question whether good or harm follows the habitual use of tobacco is too broad to admit of a single sweeping answer. According to present physiological knowledge the facts bearing on this subject are as follows: In the first place, tobacco is not a general necessity for the human race; for individuals, whole classes, and even entire races of men, have attained a very high physical and mental development without the use of the agent. In the second place, to young persons, under twenty-five years or so, tobacco, even in small quantity, is so apt to disorder health in some way or other that for such it should be considered generally harmful. Third, many persons, even adults, can never indulge at all in tobacco without being to some degree poisoned. For such individuals common sense teaches that the weed is to be regarded as wholly noxious. Fourth, an enormous number of persons can and do use tobacco (the actual quantity consumed varying with the individual) not only without apparent present disturbance of health, but with maintenance of as full physical and intellectual vigor, freedom from sickness, and longevity, as are found with non-consumers. To say that such individuals, did they abstain, would be still more hearty or long-lived is to assert that which obviously can be neither proved nor disproved. Finally, the exigencies of our artificial civilization often demand a continued overtaxing of either the physical, intellectual, or emotional faculties, and in some such cases, especially where the sufferer is past the most vigorous period of life, tobacco in moderation often seems to counteract in some measure the evil effects of the strain, disposing to emotional and physical calm, removing fatigue, assisting digestion, and supplementing a scanty food-supply. If, then, the abatement of morbid symptoms and restoration of the bodily functions to their normal status be beneficial, we must accord to tobacco in the present instances the right to be regarded as a useful agent. But in connection with this topic it is proper to bear in mind the fact, that while tobacco in due moderation may be often apparently harmless, and even, under some circumstances, useful, yet that to indulge in an excess which, for the individual, is injurious, is both easy and tempting, and, as a matter of fact, is an exceedingly common habit. Any tobacco-consumer, by reverting to the symptoms of chronic tobacco-poisoning detailed above, can easily determine for himself whether he is or not crossing the "poison-line" in his use of the luxury. As to the relative power of the various modes of consuming tobacco, it is probable that a given quantity of a given leaf will most promptly and powerfully affect the system if *chewed*, next if *smoked*, and least if taken as *snuff*. In the matter of smoking, again, less of the active principles will reach the mouth if the tobacco be smoked in a clean pipe than if a foul one be taken, and less with a pipe, if clean, of porous material, like meerschaum, and with a reasonably long stem, than where the same tobacco is smoked as a cigar or cigarette. With both pipe and cigar or cigarette, again, the last portion smoked is proportionately stronger than the first, for it becomes saturated with a certain percentage of the smoke-ingredients of the earlier portions, mechanically arrested in their passage. Actual *inhalation* of tobacco-smoke, as practiced by many cigarette-smokers, apart from an injurious irritation of the air-passages themselves, determines quick and full absorption of the volatile elements of the smoke, and so a maximum of effect from a given quantity of leaf. Partly for this reason, and partly because, from the convenience of the cigarette, cigarette-smokers are apt to keep their systems almost continuously under the influence of the weed, this class of consumers affords a proportionately high percentage of subjects of chronic tobacco-poisoning. There is no reason to charge deleterious effects upon the paper ordinarily used in cigarette-manufacture. The time of day and state of the stomach also modify the effect of tobacco, however used, the influence being comparatively stronger earlier in the day or upon an empty stomach than in the evening or after a meal.

*Medicinal Uses.*—In medicine tobacco is used solely for its relaxing influence upon the muscular system. Before the introduction of anæsthetics it was thus sometimes employed in cases of visceral spasm, or where hernias or dislocations were to be reduced, but its use in these circumstances is almost obsolete. In tetanus the drug has been tried, and shows, as might be expected, a certain power in blunting the irritability of the motor tract of the spinal cord, and thus reducing the severity of the spasms. It has been given in this disease in the form of nicotine, administered by subcutaneous injection in doses of a small fraction of a drop. In asthma some sufferers find relief from smoking tobacco, but as a rule the remedy is not of much use. The most common way of administering tobacco for medicinal purposes is by giving an infusion of the leaf by enema, but great prudence is necessary, as the drug thus introduced is a powerful and even dangerous remedy. Externally, lotions and ointments of tobacco have been used for various purposes, but extensive application is in the highest degree dangerous, fatal poisoning having more than once occurred in consequence. See TOBACCO in the Appendix. EDWARD CURTIS.

**Toba'go** (originally *Tabaco* or *Tabago*): an island of the West Indies, 20 miles N. E. of Trinidad. Length from N. E. to S. W., 26 miles; area, 114 sq. miles. It is essentially mountainous except at the southwestern end, but the highest peak hardly exceeds 2,000 feet; portions are still covered with forest, the valleys and lower lands are well cultivated, the principal products being sugar and cacao. The island is generally regarded as one of the Caribbean group, but by its structure, fauna, and flora it is, like Trinidad, an outlying portion of the South American continent. It was seen by Columbus in 1498, was first settled by the Dutch (1632 and 1654), passed into French possession, and in 1763 was ceded to Great Britain. Since 1889 it has been a dependency of the colony of Trinidad. Tobago is evidently the island which Defoe describes as the home of his imaginary Robinson Crusoe. Pop. (1891) 18,353; this includes less than 200 whites. The capital and principal port, Scarborough, has about 1,200 inhabitants. HERBERT H. SMITH.

**Tobikhar' Indians**: See SHOSHONEAN INDIANS.

**Tobit, Book of** [*Tobit* = Lat. = Gr. Τωβίτ, Τωβείτ, from (supposed) Heb. *Tōbhīth*, liter., goodness]: an Apocryphal book of the Old Testament, found in the Septuagint. Scholars differ as to the date when it was written, some making it as early as the fourth century B. C., and others as late as the second century A. D. Old texts of it are extant in Greek, Aramaic, Syriac, and Latin, and texts not so old in Hebrew. It is canonical with the Roman Catholics and some of the Orientals. R. G.

**Tobler**, ADOLF: Romance philologist; b. at Hirzel, in the canton of Zurich, Switzerland, May 24, 1835; studied especially at Bonn under the guidance of Diez; later visited Italy and Paris; was for a time a teacher in a cantonal school in Switzerland, and in 1867 at the University of Berne; but in the same year accepted a call to the University of Berlin as extraordinary professor, where he still remains, having been made ordinary professor in 1870. Since 1881 he has been a member of the Berlin Academy. Among his published works are *Darstellung der lateinischen Conjugation in ihrer romanischen Gestaltung* (1857); *Gedichte von Jehan de Condet* (1860); *Mittheilungen aus altfranzösischen Handschriften*, i. (1870); *Vom französischen Versbau alter und neuer Zeit* (1880; 3d ed. 1894); *Die altvenezianische Uebersetzung der Sprüche des Dionysius Cato* (1883); *Das Buch des Uguçon da Laodho* (1884); *Das Spruchgedicht des Girard Pateg* (1886); *Vermischte Beiträge zur französischen Grammatik* (1886; a second series 1894; both reprinted with additions from the *Zeitschrift für romanische Philologie*, in which he began in 1894 a third series), besides many articles in various periodicals and in the publications of the Berlin Academy. Here may be mentioned also the volume *Abhandlungen, Herrn Prof. Dr. Adolf Tobler zur Feier seiner fünfundzwanzigjährigen Thätigkeit als ordentlicher Professor an der Universität Berlin von dankbaren Schülern in Ehrerbietung dargebracht* (1895). All his work bears the marks of a wide and thorough scholarship, and perhaps no other scholar has thrown so much light on questions of historical syntax in the Romance languages, notably for Old and modern French. E. S. SHELDON.

**Tobolsk'**: a government of Siberia, bounded W. by the Ural Mountains, and extending from the Kirgheez territory to the Arctic Ocean. Area, 539,659 sq. miles. The western and southern part of the country is occupied by spurs of the Ural and Altai Mountains, from which the land slopes toward the Arctic Ocean in one extensive plain. The northern portion of this plain, between lat. 66° N. and the ocean, is a frozen swamp during nine months of the year; the middle portion, between lat. 58° and 66° N., is a forest region, inhabited by hunters and producing excellent fur; the southern portion is good agricultural land, where rye, barley, oats, and the fruits of Middle Europe are raised. Iron, copper, silver, gold, and platinum abound in the Ural Mountains, and mines are extensively worked. Manufactures of leather, soap, and woolen fabrics, and an important transit trade between Europe and Asia, are carried on. Pop. (1897) 1,438,655. Revised by M. W. HARRINGTON.

**Tobolsk**: capital of the government of Tobolsk, Siberia; at the confluence of the Tobol and the Irtish, in lat. 58° 12' N. (see map of Asia, ref. 3–E). It is a handsome town, though most of its houses are built of wood, and it carries on manufactures of leather, soap, and tallow, besides fishing and ship-building. Pop. (1897) 20,427.

**Tocantins**, tō-kaan-teens': a river of Brazil, rising in Southern Goyaz, flowing with a general northerly course, and entering the Atlantic through the Pará, which may be regarded as its estuary. The Pará receives, through the network of channels S. W. of the island of Marajo, a large volume of Amazonian water, exceeding the outflow of the Tocantins proper; hence the Tocantins is commonly called a branch of the Amazon, and commercially it belongs to the Amazon system. The lower portion is very broad and lakelike. About 200 miles above the city of Pará navigation is interrupted by a series of rapids; above these it is freely navigable for many hundred miles. On the western side it receives the great river ARAGUAY (*q. v.*), which is also navigable for a long distance, and by its length, volume, and direction may be considered the true head. The upper Tocantins (so called above the junction of the Araguay) receives many tributaries, the most important being the Manuel Alves, which, with the main river, forms part of the boundary between Goyaz and Maranhão. Small steamers ply on the upper Tocantins and Araguay, and canoes pass the rapids to Pará; ultimately this river system must form the outlet of Goyaz and Eastern Matto Grosso. The banks have hardly any inhabitants except Indians; rubber and Brazil-nuts are brought down to Pará. Length (from Pará), by the upper Tocantins, about 1,700 miles; by the Araguay, 1,900 miles. HERBERT H. SMITH.

**Tock**: another spelling of TOK (*q. v.*).

**Tocology**: See OBSTETRICS.

**Tocqueville**, Fr. pron. tōk'veel', ALEXIS CHARLES HENRI CLÉREL, de: publicist; b. at Verneuil, Seine-et-Oise, France, July 29, 1805; studied law, and in 1830 became an assistant magistrate. In 1831 he was commissioned to investigate the penitentiary systems of the U. S., which he visited in company with Gustave de Beaumont. In 1832, having returned from the U. S., he resigned his office, and in 1835 gave to the public the first volume of his work *De la Démocratie en Amérique* (On Democracy in America, 4 vols., 1835–40), which met with a brilliant success. About this time he married Mary Mottly, an English lady. De Tocqueville, though himself opposed to democracy, foretold its rapid growth in the world, and was the first to write a systematic work of political science on the facts of democratic government as observed in the U. S. In 1838 he was made a member of the Academy of Moral and Political Sciences, and in 1839 he was elected to the Chamber of Deputies. He became a member of the French Academy in 1841. In 1848, having been elected to the Constituent Assembly, he lent his support to the cause of order. In 1849 he was Minister of Foreign Affairs from June 2 to Oct. 31. The *coup d'état* of Dec. 2, 1851, drove him from the public service. He published *L'ancien Régime et la Révolution* in 1856. His complete works, including his correspondence, were published in 9 vols. (Paris, 1860–65). D. at Cannes, Apr. 16, 1859.

**Tocu'yo**: a town of the state of Lara, Venezuela; on the Tocuyo river; 40 miles S. W. of Barquisimeto and 2,067 feet above the sea (see map of South America, ref. 1–C). It is finely situated in a wide valley, and is the center of one of the most important agricultural districts of Venezuela; the exports are coffee, hides, sugar, etc. It was founded in 1545. There are several tanneries. Pop. (1889), with the immediate vicinity, 15,383. H. H. S.

**Toda, Tuda**, or **Tudawa**: a singular race of people of Dravidian stock, inhabiting parts of the Neilgherry Hills in Southern India. In 1858 they numbered only 337 persons and they do not now exceed 750, yet they are the dominant people of their region, and receive from the inferior tribes a heavy tribute. They have a peculiar language, of doubtful relationship, which is unwritten. Their religion is the worship of departed spirits and of the sun. Their only industry is the herding of buffaloes for their milk and butter. They practice polyandry, all the brothers of one family having but one wife in common. The men, however, claim and receive, at certain seasons, the rights of temporary husbands to the women of the subject villages. The Toda men are tall and well-proportioned, and in many respects are a superior race of men. See Marshall, *Phrenologist among the Todas*, containing a grammar by Pope (1873); Grigg, *Manual of the Nilgiri Hills* (1880).

**Todd**, CHARLES BURR: See the Appendix.

**Todd,** Charles Scott: soldier; son of Judge Thomas Todd; b. near Danville, Ky., Jan. 22, 1791; graduated at William and Mary College 1809; became a lawyer at Lexington 1811; took part as brigade quartermaster and judge-advocate of Gen. Winchester's division in the war of 1812; became captain in the Twenty-eighth Infantry May, 1813; aide to Gen. Harrison at the battle of the Thames; assistant inspector-general Nov. 1, 1813, inspector-general Mar. 2, 1815; settled at Frankfort, Ky.; secretary of State of Kentucky 1817, member of the Legislature 1817–18; editor of *The Cincinnati Republican* 1840, in which capacity he took a leading part in the campaign in favor of his former commander, Gen. Harrison, to whose biography, prepared by Benjamin Drake (1840), he also contributed; and was minister to Russia 1841–45. D. at Baton Rouge, La., May 14, 1871.

**Todd,** David Peck: See the Appendix.

**Todd,** Henry John: clergyman and man of letters; b. in England in 1763; graduated at Oxford about 1785; took orders in the Church of England; became successively a minor canon of Canterbury, vicar of Milton 1792, rector of All Hallows, London, keeper of the MSS. at Lambeth Palace 1803, rector of Settrington, Yorkshire, 1820, prebendary of York 1830, and Archdeacon of Cleveland 1832. He edited *Johnson's Dictionary* (1814), and the works of Milton (1801; 4th ed. 1843) and of Spenser (1805); wrote biographies of Milton, Spenser, Gower, Chaucer, Cranmer, and Bishop Walton; and *An Authentic Account of our Translation of the Bible, and of the Translators* (1834). D. at Settrington, Dec. 24, 1845. Revised by Benj. Ide Wheeler.

**Todd,** John, D. D.: clergyman and author; b. at Rutland, Vt., Oct. 9, 1800; graduated at Yale College 1822 and at Andover 1826; was pastor of the Congregational church at Groton, Mass., 1827–31, of the Edwards church at Northampton 1833–36, of the First Congregational church in Philadelphia 1836–42, and of the First church at Pittsfield, Mass., 1842–72; was one of the founders of Mt. Holyoke Female Seminary, and for some years president of the trustees of the Young Ladies' Institute at Pittsfield, where he died Aug. 24, 1873. He was the author of *Lectures to Children* (Northampton, 2 vols., 1834; 2d series 1858); *Student's Manual* (1835); *Truth made Simple* (1839); *The Young Man* (1843); *The Daughter at School* (1854); *Mountain Gems* (4 vols., 1864); *Woman's Rights* (1867); *Sunset Land, or the Great Pacific Slope* (1869); *Old-fashioned Lives* (1870), and other popular works, some of which, especially the *Student's Manual*, have had a large circulation, and exerted great influence in the U. S. and in Great Britain. See *John Todd, the Story of his Life, told mainly by himself* (New York, 1876). Revised by H. A. Beers.

**Todd,** Thomas: jurist; b. in King and Queen's co., Va., Jan. 23, 1765; received a good English education; was a soldier in the war of the Revolution; emigrated to Kentucky 1786; became a lawyer at Danville; was several years clerk of the district court, and subsequently of the court of appeals, of which he was judge 1801–06; was chief justice of Kentucky 1806–07, and a justice of the U. S. Supreme Court from Mar. 3, 1807. D. at Frankfort, Feb. 7, 1826.

**Todhunter,** Isaac: mathematician; b. at Rye, England, in 1820; studied at University College, London; graduated in 1848 as senior wrangler at Cambridge, where he became a fellow and mathematical lecturer of St. John's College. He was the author of a series of text-books in elementary and higher mathematics which are remarkable for their clearness of exposition. D. at Cambridge, Mar. 1, 1884.

**Tod'idæ** [Mod. Lat., named from *To'dus*, the typical genus, from Lat. **to'dus*, plur. *to'di*, a kind of small bird]: a family of birds peculiar to the tropical regions of America. They resemble in physiognomy and form the kingfishers (*Alcedinidæ*), to which they are allied; the bill is moderately long (at least as long as the head) and much depressed, with the tip rounded or pointed; the wings short and rounded; the tail rather short; the tarsi quite slender and long; toes three in front and one behind; and the anterior syndactylous, i. e. united by their first joints; claws short and well curved. In most details of structure of the skeleton and other parts, so far as examined, they resemble the *Momotidæ* and *Alcedinidæ*. They dwell mostly in damp places in South and Central America and the West Indian islands. Except in the breeding season, they remain generally single and alone. When at rest they sit in a crouched manner on the branches, with the head drawn in between the shoulders, and are so dull and stupid that they are easily approached and caught with the hand. They are nevertheless sufficiently spry to catch insects that come near them. They are said to make their nests generally in holes in the ground, and to lay three or four eggs. Revised by F. A. Lucas.

**Todleben,** tōt'lā-ben, Franz Eduard Ivanovich, Count: soldier; b. at Mitau, Courland, May 20, 1818; educated in the schools at Riga and at the School of Engineering in St. Petersburg; served in the Caucasus against Schamyl 1848–51; was distinguished in the campaign on the Danube 1853–54, and on the outbreak of the Crimean war in the latter year was ordered to Sevastopol on the invasion of the allies. To his genius in developing the inchoate works and in improvising defensive expedients adapted to the peculiar circumstances is attributed the successful defense by which the place resisted for nearly a year (349 days) the efforts of the allied armies. (See Sevastopol.) For his distinguished services at the siege he was breveted major-general and afterward held important positions in the Engineer department. In 1860 he became lieutenant-general and in the following year inspector-general of the Engineer service. When the Russo-Turkish war broke out in 1877, he at first received no command in the field, being passed by for men of inferior ability, but the repeated disasters before Plevna caused him to be summoned to give advice as to the best method of taking the city. Under his direction a regular siege was begun and the garrison cut off from supplies. In December the city capitulated and the entire army surrendered to the Russians. After the peace he was appointed governor-general of Odessa. D. at Soden, Germany, July 1, 1884. He wrote a valuable account of the defense of Sevastopol (French trans., *Défense de Sévastopol*, etc., 1864), and a work on fortifications. See Kinglake, *The Crimean War*, and *Life*, by Krähmer (Berlin, 1888).

**Tody**: any bird of the family Todidæ (*q. v.*).

**Tofana**: See Aqua Tofana.

**To'goland**: the smallest of the German protectorates; on the Slave Coast, West Africa. It was placed under the German flag by Dr. Nachtigal (1884), and is, so far, the most prosperous of the German possessions in Africa. Wedged in between French territory on the E. and the British Gold Coast on the W., it has about 35 miles of coast, and an approximate area of 16,000 sq. miles. Pop. about 500,-000. Its roads to the interior are important routes to and from the thickly populated portion of the Sudan. The commerce is chiefly confined to a barter trade for palm oil and ivory, but all tropical products may be grown, and the forests abound with oil palms, caoutchouc, and valuable woods. An imperial commissioner controls public affairs; the local laws are made by a council of merchants. Thirty Negro policemen maintain order. About 100 vessels annually visit the coast trading-towns, of which the most important are Little Popo, Bagida, and Lome. C. C. Adams.

**Togrul Beg**: See Seljuks.

**Tok**: any one of the small black and white hornbills (*Bucerotidæ*) of the genus *Toccus*, a group distinguished by

The crowned tok.

a thin, compressed beak, and only elevated into a low, sometimes obsolete, crest. These birds are mostly found in

Africa, occurring throughout the larger portion of the wooded districts, the exceptions being *Toccus gingalensis* of Ceylon and *Toccus griseus* of Malabar. They live on fruit and insects and nest in holes of trees. The typical species, *Toccus erythrorhynchus*, is about 18 inches long, and has a bill of a deep-red color. F. A. L.

**Tokaido**, tō-kī'dō: the great coast highway between the two capitals of Japan, noted for its fine trees and picturesque views. Leaving the Nihon bridge in Tokio, from which point distances in the empire are measured, it proceeds S. to Kanagawa, thence to Odawara, whence it ascends the Hakone pass (2,970 feet) and descends on Mishima. Afterward it keeps to the coast, passing through Shidzuoka, the residence of the deposed Tokugawas (see TOKUGAWA), until it reaches Nagoya. Thence it strikes inland across the Kisogawa valley, by Gifu and Ogaki to Hikone on Lake Biwa, follows the southeast shore line to Otsu, and reaches Kioto after traversing 132¾ ri (317 miles). The name is also applied to the provinces through which the highway runs. The inland or mountain road is known as the Nakasendo. J. M. DIXON.

**Tokat'**: town; in Asia Minor, in the vilayet of Sivas; in a beautiful and fertile valley on the Yeshil Irmak (anc. *Iris*), about 65 miles from the Black Sea (see map of Turkey, ref. 4–G). Founded in the Middle Ages, it became an important trade center, but within a generation the main route has been directed to Trebizond, and Tokat has greatly declined. Its population of over 50,000 has diminished to less than 10,000. Manufacture of copperware is its chief industry. At Guemelek (Comana), 3½ miles to the N., Chrysostom died in exile (407). E. A. GROSVENOR.

**Tokay'**: small town of Northeastern Hungary, county of Zemplin; on the right bank of the Theiss, at the influx of the Bodrog (see map of Austria-Hungary, ref. 5–I). It is famous as the entrepôt of the celebrated Tokay wines, produced in the neighborhood. Annual product about 260,000 gal. Pop. 4,480. Revised by M. W. HARRINGTON.

**Tokay Wines**: See WINE and WINE-MAKING.

**To'kio**: the modern capital of Japan; situated in lat. 35° 40' N., lon. 139° 45' E. from Greenwich; area, nearly 30 sq. miles; pop. 1,150,011 (see map of Japan, ref. 6–E). Since IYEYASU (*q. v.*) set up his residence here in 1590 it has been the real government center of Japan, and is associated with all the traditions of modern Japanese bureaucracy. Its former name was Yedo (Estuary Gate); changed to Tokio (Eastern Capital) when the emperor removed his court hither in 1869. Up to the year 1400 its site was a swampy wilderness, but during the following century a castle was built, and a village arose about it. Iyeyasu enlarged the castle, had the marsh drained, and when, after the battle of Sekigahara, he became complete master of Japan, he converted Yedo into one of the most populous cities in the world by compelling the territorial nobles to spend half of the year within its bounds. The city became a congeries of fenced inclosures, within which the several daimios, with their retainers and servants, established themselves. At this period the waters of the bay approached much closer to the castle walls than they do at present, the siltings of the Sumida river having gradually formed the district known as Tsukiji, i. e. made ground, where the foreign settlement is, and the process continues. The center of the city is the castle, the moat of which, in the form of a spiral, incloses many square miles of the city and encircles the central building two and one-eighth times. This moat is a favorite winter haunt of wild fowl, while in summer the pink lotus makes a gorgeous display of color. In the troubles of the restoration in 1868 the central building of the castle, where the shoguns held their court, was burned down, and the emperor, after leaving Kioto, was obliged to make use of a daimio's residence in the vicinity as a palace. In 1889, however, the court removed to a new palace, in which the Japanese and Western styles of architecture are somewhat bizarrely mingled. This palace is on a less elevated but more extensive site within the inner walls of the castle. As a city, Tokio is loosely built, being, in fact, a collection of villages and inclosures. Many of the houses, even in the heart of the city, have small gardens attached. Lying in an exposed position on the sea edge of a large plain, Tokio is a wind-swept city, and as the houses are mostly (formerly altogether) built of wood, disastrous fires sweep over it from time to time. In 1880, 1881, and again in 1892—to mention only more recent disasters—whole districts were laid in ashes. The authorities insist on the houses which line the main streets being built fire-proof. The business portion of the city lies in the flat ground between the castle and the sea, and is a network of canals. The Nihon bridge over the Yedo-gawa, a tributary of the Sumida, is the busiest spot in the empire, of which it is the center for purposes of mileage measurement. Here are the fish-market, the warehouses of the steamship companies, the general post-office, etc. The two main parks of the city—Uyeno to the N. and Shiba to the S.—are connected by a long thoroughfare, the backbone of the city. Along this route street-cars and omnibuses ply; elsewhere most of the passenger traffic is carried on in jinrikishas. At Uyeno and Shiba are two fine temples where the Tokugawa shoguns were buried alternately. Between the castle and Shiba lies the official quarter of the city, where cluster the Foreign Office, the War Office, the houses of Parliament, most of the foreign legations, the residences of the princes of the blood royal, etc. This quarter is quite European in its aspect. The central barracks and parade-ground, formerly here, have been moved out farther W. To the N. of the castle is the educational quarter, where is situated the university with four handsome colleges and a library in brick, the grounds extending to 10 acres; here also are the higher Normal School and numerous private schools. All the ground W. of the castle is undulating, frequently with steep bluffs. The Sumida river, which skirts the city on the N. E., is spanned by five long bridges, one of them of iron. On the flat ground across the river there is an extensive suburb. Tokio is a great commercial entrepôt, its situation at the head of its landlocked bay and near the mouths of three large rivers favoring its growth; but Osaka still remains the commercial center of the empire. Politically and socially, however, the influence of Tokio is paramount. The youth of the empire flock here in crowds, to attend schools where they may acquaint themselves with foreign learning and see the wonders of modern civilization; indeed, there is said to be a floating population of this kind numbering at least 70,000. The garrison numbers 7,000. At Tsukiji there is a naval college; the anchorage is off the extreme southern suburb of the city, at Shinagawa, only vessels of light draught being able to make use of the harbor in the river. The city is lighted with electricity, and extensive waterworks are in course of construction, the supply being taken from the TAMAGAWA (*q. v.*). A small river, the Yodogawa, flows into the moat at the northern suburb of Koishikawa, where is situated the imperial burying-ground. The crematories of the city are found on the right bank of the Sumida E. of Uyeno. There are two terminal railway stations—at Shiba and Uyeno—connected by a loop suburban line. J. M. DIXON.

**Tokugawa**, tō'kōō'gaa'waa: a distinguished family which furnished a dynasty of rulers to Japan. Founded in the twelfth century, it rose to greatness in the sixteenth century in the person of IYEYASU (*q. v.*). From 1603 to 1868 a succession of Tokugawa rulers held sway in Tokio, securing tranquillity for the country and encouraging those arts for which Japan is now famed. The representative of the line has filled the post of ambassador to Italy. J. M. D.

**Toland**, JOHN: deistical writer; b. near Redcastle, Londonderry, Ireland, Nov. 30, 1669, of Roman Catholic parents; was originally called JANUS JUNIUS, but changed his name while at school at Redcastle, where he also became a zealous Protestant, and under the patronage of some Dissenters entered the University of Glasgow 1687; removed to that of Edinburgh, where he graduated M. A. 1690; studied theology two years at Leyden, with a view to becoming a Dissenting minister; his first work, *Christianity not Mysterious* (London, 1696; 2d ed. Amsterdam, 1702), was censured by convocation, replied to by Stillingfleet and many others, and burned by the hangman at Dublin; published an *Apology for Mr. Toland* (London. 1697); went to Amsterdam; published there the first edition of Milton's *Works, Historical, Poetical, and Miscellaneous, with a Life* (3 vols. fol., 1697–98), in which he made an indirect attack on the Gospels, which was replied to by Rev. Dr. Offspring Blackall, Bishop of Exeter, in a sermon preached before the House of Commons; wrote a rejoinder entitled *Amyntor, or a Defense of Milton's Life* (1699), which occasioned a polemic with Dr. Samuel Clarke and others; turned his attention to politics; wrote a pamphlet entitled *Anglia Libera* (1701) in favor of the succession of the house of Brunswick, which procured him the favor of the Princess Sophia at the court of Hanover, and employment in a quasi-diplomatic capacity at Berlin and other German courts; held a theological discussion with Beausobre; returned to England and published *Vindicius Liberius* (1702), a new defense of his first book, in which he asserted his claim to be "a true Christian" and "a good Churchman," but in his *Socinianism truly Stated* (1705) avowed himself a pantheist; in 1704 published *Letters to Serena* (that is, the Queen of Prussia); resided abroad in the employ of Harley 1707–10, and was subsequently a voluminous pamphleteer in London. D. at Putney, Mar. 11, 1722. Among his numerous works were *State Anatomy of Great Britain* (1714); *Nazarenus, or Jewish, Gentile, or Mahometan Christianity, containing the History of the Ancient Gospel of Barnabas, etc.* (1718); *Tetradymus* (four treatises, 1720); and a *Life* of Servetus (1724). A biography appeared in 1722, and a collection of his miscellaneous pieces, with a memoir, was published in 1726 by Peter des Maizeaux (again in 1747).

Revised by S. M. JACKSON.

**Toledo**, Span. pron. tō-lā'dō: one of the oldest cities of Spain, and the capital of a province of the same name (see map of Spain, ref. 16–E). It is built on a circle of seven hills 2,400 feet above the level of the sea, and inclosed on three sides by the Tagus, toward which the town presents steep and abrupt sides, while on the fourth side, where the ground slopes gently, it is defended by two walls—an inner wall built by the Goths in the seventh century, and an outer built by Alfonso VI. in 1109—both profusely adorned with towers and gates. From 467 to 714 it was the capital of the Goths, from 714 to 1085 that of the Moors, and after 1085 it was the residence and capital of the kings of Castile. Its most remarkable edifice is the cathedral, the metropolitan church of Spain, founded in 587, and one of the most magnificent church buildings in the world, 404 feet long, 204 feet wide, and having its chief nave almost overloaded with sculpture. Besides the cathedral, the city contains 26 other churches, 37 monasteries, and other architectural monuments; but its general aspect is gloomy and almost desolate. It contains a royal palace that was originally built by King Wamba, rebuilt by Charles V., altered by Philip II., then changed into a military academy, and burned in 1887. The splendor has become sepulchral; the place, which once contained about 200,000 people, had in 1887 only 20,837. Its once flourishing industry has also died out, the only two branches of manufacture alive being those of sword-blades and confectionery. Revised by M. W. HARRINGTON.

**Tole'do**: town (founded in 1853); capital of Tama co., Ia.; on the Chi. and N. W. Railway; 20 miles E. of Marshalltown, and 50 miles W. of Cedar Rapids (for location, see map of Iowa, ref. 5–I). It is connected with Tama by electric railway; contains 5 churches, 2 public-school buildings, 2 State banks, and 2 weekly newspapers; and has brick and tile works, scale factory, and other manufactories. Toledo is the seat of Western College (United Brethren, chartered in 1856). Pop. (1890) 1,836; (1900) 1,941.

EDITOR OF "CHRONICLE."

**Toledo**: city (incorporated in 1837); capital of Lucas co., O.; on the Maumee river near its entrance into Maumee Bay; 53 miles S. W. of Detroit, and 92 miles W. of Cleveland (see map of Ohio, ref. 1–E). At Turtle Light, 7 miles out, the bay expands into Lake Erie, within its limits affording one of the best harbors on the lakes. The water of the river is 573 feet above sea-level.

*Lake Traffic.*—The city covers an area of 28½ sq. miles, extending for 9 miles on the eastern and western banks of the Maumee, with a dock front of 20 miles. The largest steamers reach these docks with cargoes of iron and copper ore, lumber, salt, fish, and other merchandise from the northern and western ports of Lakes Superior, Michigan, and Huron, and with goods and other traffic from the southern and eastern ports of Lakes Erie, Ontario, and the St. Lawrence river. There are twenty-four important railway lines, bringing hither for manufacture or distribution the coal deposits of Southwestern and Central Ohio, wheat and other cereals from the grain-fields of Indiana, Illinois, Michigan, and Ohio, and ship-timber from the lumber regions of Northern Michigan and Canada. Toledo is also the terminus of the Miami and Erie Canal. The receipts of wheat, corn, oats, rye, and barley in 1900 amounted to 55,000,000 bush. The city is one of the largest soft-coal markets in the U. S.

*Manufactures.*—The manufacturing interests are important and diversified. There are extensive works for the manufacture of malleable iron and furnaces for the casting of plows, steam-boilers, and car-wheels. One of the largest wagon-works in the U. S. is located here, and several bicycle-works, besides factories for the manufacture of carriage-wheels and bent work. There is also an automobile company. The Edward Ford plate-glass factory is said to be the largest glass plant in the world. The Libbey Cut Glass Works have an international reputation. The milling interests are led by the winter wheat flour-mills of the National Milling Company, with an output of from 3,000 to 4,000 barrels daily. The grain interests are represented by 13 elevators, the largest of which has a storage capacity of 1,700,000 bush. Ship-building is carried on extensively.

*Local Interests.*—Toledo has an extensive system of water-works on the stand-pipe plan, constructed at a cost of more than $1,340,000. It has two natural-gas companies furnishing fuel to the city through 200 miles of distributing-pipe. There are 100 miles of electric street-railways. An electric belt-line on both shores of the river connects the villages of Maumee and Perrysburg, bringing them into rapid communication with the city. Three additional suburban electric lines are in operation.

Toledo has an extensive park system in process of development. The most popular of these parks is Walbridge Park, in the southeastern part of the city, on the bank of the river. Riverside Park, also extending along the river, has a fine yacht anchorage. Toledo has 390 miles of avenues and streets, with many fine pavements of asphalt and stone. It has 42 public-school buildings and 23 private and parochial schools, a manual training-school, which, under the name "The Toledo Polytechnic School," maintains co-ordinate literary and scientific courses. It has a central high school and a city normal school. It has a public library, containing 48,000 volumes. There are 18 banks, 91 churches, 4 hospitals, a soldiers' memorial building, an armory, new court-house, and a U. S. Government building.

*History.*—The name The Lady of the Lakes, by which Toledo is widely known, succeeded an older title, The Miami of the Lakes, by which it was known in its early history. The equable climate, with its superior fishing-grounds, made its site a favorite resort of the Miami Indians before its occupancy by the whites. Later it became an important trading-post, but it was not till the famous victory of Gen. Anthony Wayne at Fallen Timbers, in 1794, that peaceful possession by white settlers became possible. Pop. (1880) 50,137; (1890) 81,434; (1900) 131,822.

FLORENCE KENDRICK COOPER.

**Toledo**, tō-lā'dō, FRANCISCO, de: Viceroy of Peru; b. in Spain about 1515. He was a younger son of the third Count of Oropesa, was major-domo to the king, and later was sent to Peru as viceroy, entering Lima Nov. 26, 1569. During his administration he settled the disorders which had resulted from the civil wars, and a code of laws, partly founded on those of the Incas, was prepared; this code, known as the *Libro de Tasas*, was in force during the colonial period. The Inquisition was introduced in 1569. The persecution and death of the Inca TUPAC AMARU (*q. v.*) removed the last focus of opposition to the Spaniards, but the narrow and cruel policy shown in this affair produced a burst of indignation against the viceroy. He was relieved Sept. 23, 1581, and on his return to Spain was severely rebuked by the king and imprisoned. D. at Seville, Sept., 1584. H. H. S.

**Toledo War**: a term popularly given to a contest extending from 1835 to 1837 in regard to the boundary-line between the State of Ohio and the Territory of Michigan. According to the ordinance of 1787 for the government of the Northwest Territory, the line between the States of Ohio, Indiana, and Illinois on the S. and the territory on the N. was to be an east and west line running through the southern point of Lake Michigan. An old map showed the southern end of the lake at 42° 32′ N., while the true location is 41° 37′ 19″, or about 64 miles farther S. When, in 1805, the Territory of Michigan was organized, the line through the southern point of the lake was adopted; but when Indiana and Illinois were organized as States, the northern line was the one chosen. In 1812 Congress ordered a survey, which was completed in 1817, establishing what was known as the Harris line. The line of the ordinance, claimed by Michigan, was known as the Fulton line. The people of Michigan were especially persistent, as the town, now the city of Toledo, was in the disputed belt. In 1836 the Legislature of Ohio passed an act organizing townships in this territory, which for many years had been under the control of Michigan. Both State and Territory appealed to President Jackson in vain. The Governor of Ohio called out the militia, and Gov. Mason of Michigan took possession of Toledo. While matters were in this condition Congress, June 15, 1836, admitted Michigan as a State on condition of the acceptance of the Harris line and the northern peninsula, which formed a natural part of the Territory of Wisconsin. This addition, subsequently bringing such great wealth of copper and iron to the State, was finally accepted as an equivalent for the disputed strip at the S., which went to Ohio and Indiana. After formal acceptance of these conditions, Michigan entered the Union as a State Jan. 26, 1837, and peace was restored. C. K. ADAMS.

**Toleration**: See LIBERTY, RELIGIOUS.

**Tolima**, tō-lee'mâă: a southern interior department of Colombia; between Cauca, Cundinamarca, and Antioquia. Area, 18,434 sq. miles. It embraces the upper portion of the valley of the MAGDALENA (*q. v.*) between the Central Cordillera on the western frontier and the Eastern Cordillera on the E. Peaks in both these ranges, especially near their junction southward, rise above the snow limit, and nearly the whole surface of the department is mountainous. The climate ranges from tropical, near the river, to cold on the mountains, where there are wide stretches of bleak *paramo*. Gold, silver, and a little copper are mined, but agriculture and grazing are the principal occupations. The roads are very bad. Pop. about 230,000. Capital, Ibagüé. H. H. S.

**Tolima**: a quiescent volcano of Colombia; in the central Cordillera of the Andes, near the confines of Tolima, Cauca, and Antioquia, and N. W. of Ibagué. It is the highest mountain in the republic, attaining 18,425 feet; around the central peak and crater are other volcanic vents. Tolima is especially interesting to geologists as one of the few volcanoes at a considerable distance from the sea. It showed signs of activity in 1595 and 1826 to 1829. H. H. S.

**Tollens**, HENDRIK CAROLUSZOON: poet; b. in Rotterdam, Holland, Sept. 24, 1780. His education was not extensive, and all but the last ten years of his life were occupied by the necessities of his mercantile pursuits. In 1846 he was able to withdraw to a country estate at Ryswick, where his last years were given to letters alone. D. at Ryswick, Oct. 21, 1856. Tollens is perhaps the most generally popular of all the Dutch poets of the nineteenth century. He began writing very young, at first translating and imitating French plays; but later he grew discontented with his compositions of this time—the comedies *De Bruiloft* (1799) and *Gierigheid en baatzucht* (1801), and the tragedy *Konstantijn*—and refused to admit them among his works. From 1801 to 1805 appeared the first poems in which he showed his true bent—*Idyllen en minnezangen*. In these we have the sentiment and reflection of the Dutch bourgeois clothed in a style often exaggerated, yet always such as to go to the popular heart. In 1808–15 appeared his *Gedichten*; in 1816, *Tafereel van de overwintering der Nederlanders op Nova Zembla*; in 1818, *Romancen, balladen, en legenden*; in 1821, *Nieuwe Gedichten*; in 1840, *Verstrooide Gedichten*; in 1848 and 1853, *Laatste gedichten*. A. R. MARSH.

**Tolstoĭ'**, ALEKSEĬ KONSTANTINOVICH, Count: author; b. in St. Petersburg, Aug. 24, 1817. He was well educated, was for a short time in the diplomatic service, traveled extensively, served as a volunteer in the Crimean war, and for the last eighteen years of his life held a high position at court. He wrote but one novel, *Kniaz* (Prince) *Serbrianyi* (trans. by J. Curtin, 1893), a work somewhat in the style of Scott, with a well-told story, strongly drawn characters, and presenting a vivid picture of one of the most striking periods of Russian history. This same wild time is portrayed in Tolstoĭ's fine trilogy, *The Death of Ivan the Terrible* (1865), *Tsar Fedor Ioanovich* (1868), and *Tsar Boris* (1870). The first and the best of these plays has been translated into English verse (F. Harrison, London, 1869). Tolstoĭ also wrote a short, strong drama called *Don Juan*, besides another unfinished one, *Posadnik*. As a lyric poet he ranked with the best of his day, being especially successful with his ballads and popular verses. D. near St. Petersburg, Sept. 28, 1875. Complete works, 4 vols., 1890–91. A. C. C.

**Tolstoĭ**, Count LEV (or LYOFF) ALEKSEEVICH (LEV, pronounced lyoff, = English LEO, which is sometimes used): novelist; b. on the family estate of Iasnaïa Poliana, in the government of Tula, Russia, Sept. 9 (N. S.), 1828; entered the University of Kazan in 1843; left without graduating after three years. Having visited the Caucasus in 1851, he joined the army and took part in various guerrilla expeditions. It was now that he began to write. After the war in the Crimea, in which he served, he gave up military life and resided for a time in St. Petersburg and Moscow, traveled twice in Europe, then in 1861, the year before his marriage, retired to his country estate, which has since been his permanent home. His works fall into three distinct periods. To the first belong his *Detsvo* (Childhood), *Otrechestvo* (Boyhood), and *Iunost* (Youth), also his *Kazaki* (Cossacks), a description of life in the Caucasus, his *Sevastopol*, and other military sketches. The second period is that of his two great novels *Voïna i Mir* (War and Peace, 1865–68), an epic of Russian life, national and individual, at the time of the great struggle with Napoleon, and *Anna Karenina* (1875–78), a marvelous study of passion and its consequences. Soon afterward Tolstoĭ began to give himself up to the mystical religious and philanthropic ideas which have so completely mastered him that it has been doubted whether he is to be regarded as perfectly sane. His doctrines have been proclaimed in *My Confession*, *In what my Faith Consists* (more usually known as *My Religion*), a *Commentary on the Gospel*, and other works, many of them forbidden in Russia by the censors. As he believes not only in non-resistance to evil and in asceticism, but in communism, the duty of manual labor, and of every one to live like the peasants, it is only with misgivings that he has continued to write, hence all he has done has been with a didactic or polemical aim which has often detracted from its value. Still nothing can entirely quench his genius. Many of his tales for the peasants are admirable, and in even the poorest of his productions we often find pages of splendid power. The best known of his later works are the *Death of Ivan Ilich* (1884–86); *The Kreutzer Sonata* (1888); and his drama, *Vlast Tmy* (Power of Darkness). Although the influence of his later ideas has created a sect, his reputation will probably depend on his earlier works, and especially on the two novels. Both of them, as well as the shorter productions that preceded them, display a combination of keenness of realistic insight and wealth of poetical imagination, of a wonderful breadth of view with perfect handling of minute detail, seldom rivaled in all literature. The mastery of style is complete, though the author takes no pains to polish it, any more than he cares to spare us trivial incident. In his story *Khozïain i Rabotnik* (Master and Man, New York, 1895) he seems to have returned to his former manner and to show no diminution of power. Most of his works have been translated into English and other modern languages (in English by Dole, Miss Hapgood, etc.). Among the best-known studies of them are those of de Voguë, Ernest Dupuy, Lemaitre, G. Brandes, Matthew Arnold, Rallston, etc. A. C. COOLIDGE.

**Tol'tecs**, or **Toltec'as** (so called from their principal city, Tollan, supposed to be Tula, in Hidalgo): an Indian tribe, said to have occupied portions of the Mexican plateau during several centuries prior to the advent of the Aztecs. The little that is known of this race comes from Aztec traditions or pictographic records as they were collected by Spanish writers soon after the Conquest. It is related that they came from the north, making temporary settlements at various points, and finally fixing themselves at Tollan about A. D. 661. Lists of their chiefs or "kings" are extant, but these are of very doubtful value; the hero-god, Quetzalcohuatl, is said to have lived in their cities before his final disappearance. About 1013 the Toltecs were overthrown by savage tribes. They then migrated southward and do not appear further in the Aztec accounts, but the Quichés and other Maya nations which appear in Guatemala about this time are supposed by some to be their descendants. The accounts of the Toltecs are so vague and contradictory and so mixed with evident fable that many ethnologists have been inclined to deny their existence altogether; others suppose that they were a small Nahuatl tribe settled at Tula. Those who accept the traditions in their fullest sense claim that the Toltecs ruled a powerful empire extending over a great part of the plateau, and that the Aztec civilization, religion, arts, and picture-writing were derived from them. Probably the truth lies between these extreme views. It is certain that some of the Mexican monuments, notably the great pyramid or mound at Cholula, are older than the Aztec period, and traditions generally assign these to the Toltecs. Ruins near Tula indicate communal structures similar to those of Arizona. Unfortunately nothing is known of the Toltec language, hence the supposed relationship with the Maya race is conjectural, and the semi-mythical Quiché records adduced in its support have only thrown the whole subject into more confusion. HERBERT H. SMITH.

**Tolu' Balsam** [named from *Tolú* (or Santiago de Tolú) in Colombia, South America, whence it is obtained]: a balsamic juice obtained from *Myroxylon toluifera*, a lofty tree of the family *Leguminosæ*. The tree averages 70 feet in height, with a straight trunk rising 40 feet without branching. The balsam is obtained by slashing the bark of the stem through to the wood in many places, and allowing the juice which spontaneously exudes to collect in small calabashes fixed to the tree. The balsam when fresh is a light-brown, thick, resinous substance, but by keeping concretes into a solid, brittle in cold weather, but easily softened by slight warmth. It has a delicate and fragrant odor, most perceptible when the balsam is warmed, and a correspondingly pleasant taste. Its most important constituents are an amorphous resin and cinnamic acid. Balsam of tolu was used by the natives when South America was first explored, and was introduced into Europe in the latter part of the sixteenth century. This balsam has scarcely any medicinal virtue, but is largely used in pharmaceutical preparations and extemporaneous prescriptions to impart to mixtures its agreeable odor and taste. The official preparations of it are a sirup and a tincture, and it is an ingredient of the compound tincture of benzoin. Revised by H. A. HARE.

**Tolu'ca**: capital of the state of Mexico, in the republic of that name; 32 miles W. S. W. of Mexico city (45 miles by railway); in a basin of the plateau; separated from the lake valley by a range of mountains (see map of Mexico, ref. 7–G); 8,653 feet above the sea. It is well built and clean, and the climate is cool and salubrious. The town has considerable manufactures. At the time of the conquest it was an important Aztec pueblo, and tradition assigned its foundation to the Toltecs. Pop. (1892) about 17,000. The Nevado de Toluca, a few miles S. of the city, is an extinct volcano over 15,000 feet high and capped with snow. It has been frequently scaled. It is said that on a clear day both the Pacific and the Gulf may be distinguished from its summit. HERBERT H. SMITH.

**Tol'uene**, also called **Toluol, Hydride of Benzyl, Hydride of Tolyl,** and **Methyl Benzene** [*toluene*, etc. are derivs. of *tolu*]: a hydrocarbon, formula $C_7H_8$, discovered in 1837 by Pelletier and Walter in the oily product of the dry distillation of resins. It is obtained by the dry distillation of tolu balsam and many resinous bodies, by the action of potash on benzylic alcohol, and by heating toluic acid with lime; but is most readily prepared by collecting the portion of coal-naphtha which distills between 212° and 248° F., agitating it with sulphuric acid, and redistilling, and collecting the part that goes over between 226° and 230° F. Toluene is the second member of the benzene series of HYDROCARBONS (*q. v.*), as is shown by its formation from monobrom-benzene by the action of methyl iodide. It forms a mobile liquid of sp. gr. 0·883 at 32° F., and boils at 230° F. It is soluble to some extent in alcohol, in ether, and in the fixed and volatile oils, and dissolves iodine, sulphur, and many resins. A large number of substitution products of toluene are known, the most interesting of which are those of chlorine and nitric acid. Revised by IRA REMSEN.

**Tolu'ic Acid**, also called **Toluolic Acid** and **Toluylic Acid** [*toluic* is deriv. of *tolu*]: an aromatic homologue of benzoic acid and an isomer of methylic benzoate, formula $C_8H_8O_2$; produced by the action of nitric acid on cymene or xylene, and by the action of sodium and carbonic acid on bromotoluene. In a pure state it is colorless and tasteless. The fusing-point of the acid is 347° F.; at a higher temperature it sublimes without decomposition, forming fine needles. When heated with lime, toluic acid is decomposed into TOLUENE (*q. v.*) and carbonic acid. It is monobasic, and forms crystalline salts.

**Tolu'idine**, or **Amido Tol'uene** [*toluidine* is deriv. of *tolu*]: an isomer of benzyl-amine, produced by reducing nitro-toluene with ferrous acetate or sulphuretted hydrogen; formula $C_7H_9N$. It dissolves in boiling water, and in alcohol, ether, and chloroform. From a dilute alcoholic solution it crystallizes in large colorless laminæ, which evaporate somewhat at the ordinary temperature of the air, and possess a burning taste. Toluidine fuses at 104° F. to a liquid which boils at about 388° F. It imparts a slight blue color to reddened litmus, and forms a series of compounds with many of the acids.

**Tomah**: city; Monroe co., Wis.; on the Chi., Mil. and St. Paul Railway; 42 miles E. of La Crosse, and 47 miles S. W. of Grand Rapids (for location, see map of Wisconsin, ref. 6–C). It is in an agricultural, lumbering, and cranberry-growing region, and contains 10 churches, the U. S. Government school for the Winnebago Indians, railway-bridge works, a private bank, and 2 weekly newspapers. Pop. (1880) 1,245; (1890) 2,199; (1900) 2,840. EDITOR OF "JOURNAL."

**Tomahawk** [from Amer. Ind.; cf. Algonkin *tomehagen*: Mohegan *tumnahegan*: Delaware *tomoihecan*]: strictly, the war-club of the North American Indians, but for a long time the name has been given, probably through misapprehension, to the war-hatchet, originally of stone. Europeans introduced steel tomahawks, which were sometimes so made as to serve as tobacco-pipes, the handle forming the stem. The natives used them as battle-axes, and possessed great skill in throwing them so that the edge would strike first.

**Toma'to** [from Span. *tomate*, from Mex. *tomatl*]: any plant of the genus *Lycopersicum* of the family *Solanaceæ*, indigenous to the Andean region. The common tomatoes are offspring of *L. esculentum*, which was introduced into Europe in the middle of the sixteenth century. The fruit, also called tomato, although formerly known as love apple, was at first regarded with suspicion and was grown for ornament, although there is a record of its having been eaten as early as 1583. The suspicion arose from its relationship to henbane, belladonna, nightshade, and other virulent poisons of the *Solanaceæ* (nightshade family). This fear of the plant was not wholly overcome until well into the nineteenth century, and even in the last quarter of the century the fruit has been considered to be associated with the production of cancer. Few fruits are more healthful than the tomato, and it ranks next the potato in economic importance among garden products. A chief reason for the popularity of the plant is the excellence of the canned tomatoes, which are consumed in enormous quantities. The output in the U. S. in 1893 was 4,456,443 cases, of two dozen cans each. The tomato needs a warm, quick soil, and the fertilizers should be such as give much available food, in order that the plant may make the most of the early season. There are a number of books and bulletins upon tomato-growing, some of the latter dealing with the forcing of the crop under glass, which is a growing industry. The leading books are *Tomato Culture*, by Day, Cummins, and Root, and *Livingston and the Tomato* (Columbus, O., 1893).
L. H. BAILEY.

**Tomato Blight**: See BLIGHT.

**Tomb**: a burial-place of permanent character or of some pretension, especially a structure destined to contain or to cover the body of one to whom some honor is intended to be done; therefore generally a somewhat ornamental monument. In the widest sense, cenotaphs are also tombs because standing for the actual tomb itself, or, in the case of persons lost at sea or the like, as being the only tomb possible. Tombs are often arranged to contain or to cover a number of burial-places; thus the Roman COLUMBARIUM (*q. v.*) is the tomb of a large number of persons; the tomb of Augustus and that of Hadrian were arranged with many burial-places, and modern funeral structures set up in the large cemeteries are intended for the burials of a whole family. The great pyramids of Egypt were tombs, and the tombs of another type, the mastabas (see MASTABA), though less in size were more elaborate in decoration. Grecian tombs were simple and tasteful, as became a race of such strong common sense and such exceptional gifts in art. The simple flat stone set up at a grave was often carved with all the skill that the time could afford, and these stelæ are found with inscriptions and decorative sculpture. In Athens, after the Peloponnesian war, unusually large gravestones were set up, and some of these are decorated with sculpture of the greatest beauty. The famous stele of Dexileos, upon which is represented in high-relief the young warrior mounted, riding down his enemy, is over 6 feet wide and nearly as high; and others are nearly of the same dimensions. The reliefs upon these very often represent peaceful groups, where personages sit or stand as if in conversation. Sometimes the idea of a farewell, or of regret, is suggested. Sometimes a marble vase with delicate reliefs carved upon it was set up at the grave. Large edifices built as monuments to the dead are not found in Greece, but were common in semi-Greek lands of Asia. The most famous of them was that of King Mausolus of Caria. See MAUSOLEUM.

The monuments erected by the Romans are celebrated in story and tradition, but their form is often altered beyond recognition, even when their mass remains. The Castle of St. Angelo (that is, of the holy angel), in Rome, is the mausoleum of the Emperor Hadrian, stripped of its sculptures, its marble colonnades, and its probably conical superstructure, and crowned with defensive works which make of it a very defensible citadel. The older mausoleum of Augustus, some vestiges of which exist half a mile away, had received the remains of the emperors who succeeded him, until its niches were filled; so Hadrian erected the still more gigantic structure for himself and his successors in office. Private tombs, only inferior in splendor to these imperial ones, remain for study outside the walls of Rome, and the round tower known as the tomb of a Cæcilia Metella had been robbed of its roof and built up into a fortified tower with mediæval battlements, exactly as has been done with the great imperial structures within the walls. Smaller private tombs lined the great highways of approach to the city gates. At Rome those of the Appian Way are well known, ruined as they are. At Pompeii a long street of tombs is found outside of the gate leading to Herculaneum, and others like it are known to exist near other gates. This means that, as burial within the walls was forbidden or made difficult, the place next easiest of access was chosen for the erection of showy memorial structures. For smaller receptacles and such as were deposited within the greater tombs, see SARCOPHAGUS, ROMAN ARCHÆOLOGY, and CATACOMBS.

The tombs of the Middle Ages and of the Renaissance are often of a refined beauty which no Roman work could approach. Both in Northern Europe and in Italy the burial monuments of the later Gothic style are of wonderful interest, and the art of the period can not be understood without a serious study of these structures. What are known as altar-tombs are large sarcophagus-like masses set on the church-floor, and commonly having a life-size effigy of the departed in bronze or stone lying upon the top. These were simple in early times, as may be seen in the Temple church in London, the cross-legged knight in his chain mail forming the only adornment; but in the fifteenth century such tombs become splendid combinations of decorative art of many kinds, as in the Burgundian monuments of about 1400, now in the Dijon Museum, and those which remain where they were first set up in the Church of Brou a century later, at Bourg-en-Bresse. The famous monument of Ilaria del Carreto (1406) in the cathedral at Lucca is made of a Roman sarcophagus upon which the lovely recumbent statue of the lady by Jacopo della Quercia is placed. Tombs of this character and only less beautiful than these exist by hundreds in Italy, France, Spain, England, and parts of Germany. Still more stately are the out-of-door tombs, but there are few of these. The most important group of them is in Verona, in the crowded little churchyard of Santa Maria Antica, where splendid pillared canopies crowned with blunt spires, which in their turn carried equestrian statues aloft, cover the sarcophagi of the princes of the house of La Scala. Nowhere is the beautiful sculptured detail of Italian Gothic more perfectly seen than here. The Castelbarco monument, standing upon the wall of the churchyard of San Pietro Martire, also in Verona, is worthy of comparison with the La Scala tombs. Verona is rich in Gothic wall-tombs as well; and these exist in great number in Venice and Florence, and in scores of smaller towns in North Italy. Wall-tombs of the Gothic period are known in the north, but here they approach rather the type of the altar-tomb with a canopy over it; they project more into the church, they are rarely confessed as upright wall-pieces. There are a few such, however, and these are of great beauty and value.

The wall-tomb reached its highest development during the Italian Renaissance. In Florence the Marsuppini monument in Santa Croce and that of Lionardo Bruni in the same church, and the two monuments by Mino da Fiesole in the Church of Badia; Mino's tomb of Bishop Salutati in the Cathedral of Fiesole; the tomb of Alessandro Tartagni in San Domenico, Bologna; and finally the two superb structures in Sta. Maria del Popolo at Rome, the tombs of Cristoforo della Rovere and the Cardinal di Castro, are enough to cite. All these were sculptured and put up between 1450 and 1505; and a long list might easily be made of such splendid structures still existing and another list of equally precious ones destroyed.

A complete treatise on tombs would require an analysis of the sculpture with which they are adorned. This is peculiarly the case with those of the post-Renaissance times, for the architectural design grows feeble and meaningless in the sixteenth, seventeenth, and eighteenth centuries, and the statues, busts, and groups in marble are by far the most important part of these works of art. The same conditions obtain in the nineteenth century. The diminished power of decorative design, characteristic of the epoch, makes it especially difficult to secure a fine monument, because there is no practical purpose to be served, and no strong leading in one or in another direction afforded the architect. But good sculpture can be had. Accordingly, the tombs in modern cemeteries are generally without merit, although some memorial statues and groups are valuable.

With respect to modern structures the term is generally used in the sense of a somewhat large interior, opening out of which are receptacles for coffins, the whole being either excavated in a hillside with a front of masonry in which the door is arranged or built above ground like a chapel or made by a combination of the two systems. In some cases a similar chapel-like structure is erected above or in connection with a single grave; but as a general thing the term is confined to family vaults of some pretension. Memorial structures erected in cemeteries above or near a grave are more often called monuments (see MONUMENT); but when these are long and low, in general shape like the altar-tombs of the Middle Ages, the word tomb is sometimes employed to describe them. In some cases a family burial-place is merely excavated and built below ground, with a slab on the surface which can be raised, and to these also the word tomb may be applied. In short, any structure which is essentially the receptacle of dead bodies or which contains and covers such receptacles, is, if built in advance, permanent, and of some pretension, a tomb. The difference between a grave and a tomb is, then, that the grave is a simple excavation to be filled up when the coffin has been deposited and the tomb is more elaborate, including something of the nature of a building. The large modern cemeteries contain many tombs in addition to the more numerous gravestones and monuments. Some of the larger tombs are occasionally used for divine service on set occasions, such as anniversaries. These buildings are more commonly a parallelogram in plan, with receptacles for coffins built at one end, the space not so occupied being reserved for vestibule, chapel, and the like. The form of an octagon has also been used, the entrance occupying one of the sides, while the receptacles for coffins are arranged, three or four in the height of the wall, on the other sides. The light in such a case comes from above and the central chamber is covered by a cupola or similar roof. All such chapel-like tombs need to be built in a permanent way of solid materials which defy weather, because such a structure is not certain to be cared for or even visited frequently after the lapse of a few years. It results from this that a certain unusual architectural pretension is common to them, and that in the U. S. tombs may be built of cut stone or marble with vaulted roofs and bronze or wrought-iron doors in the neighborhood of towns whose houses and churches are generally of wood. RUSSELL STURGIS.

**Tom'bac** [from Portug. *tambaque*, from Malay *tambāga*, copper, from Sanskr. *tāmrika*, made of copper, deriv. of *tāmra*, dark red, copper-colored, copper]: any one of several different alloys of copper and zinc, with about 85 per cent. of copper. An English tombac gave copper 86·38 and zinc 13·61. A German tombac gave copper 84 and zinc 15·5. The alloy of copper 84·5 and zinc 15·5 is very malleable and ductile. Dutch metal, pinchbeck, imitation bronze, prince's metal, and Mannheim gold are similar alloys. A *white tombac*, or *white copper*, has been made, containing copper 75 and arsenic 25.

**Tombig'bee River**: rises in Northeastern Mississippi, and after a very indirect S. by E. course of 450 miles in Mississippi and Alabama, joins the Alabama river 45 miles above Mobile, and the stream below the junction is called Mobile river. It is navigable to Aberdeen, Miss., 410 miles from Mobile Bay. Revised by I. C. RUSSELL.

**Tombs**, Sir HENRY, K. C. B., V. C.: b. in Gloucestershire, England, in Nov., 1824; educated at the Sandhurst Military College and at Addiscombe; entered the service in 1842, when ordered to join the Bengal Artillery, and soon engaged in the Gwalior campaign 1843–44, and subsequent active operations; appointed to the artillery staff and engaged in the Sutlej campaign 1845–46; and the Punjaub campaign of 1848–49. On the outbreak of the Indian mutiny, Tombs was a brevet major in command of a troop of horse artillery; ordered to join the army for besieging Delhi, he led the force which captured the Eedgah and commanded the horse artillery at the final assault. Under Sir Colin Campbell he was then engaged in the Oude campaign at Lucknow, etc. He was made lieutenant-colonel Jan., 1858; colonel the following July, and named Commander of the Bath. Besides the many medals of honors heretofore won, the Victoria Cross was now added. He commanded the Bhutan expedition, and was named K. C. B.; major-general 1867. D. at Newport, Isle of Wight, Aug. 2, 1874.

**Tombstone**: city; capital of Cochise co., Ariz.; on the Ariz. and S. E. Railroad; 19 miles S. by E. of Benson, and 30 miles N. by W. of Bisbee (for location, see map of Arizona, ref. 15–O). It is in an agricultural and a rich silver and gold mining region, and has a daily and 2 weekly newspapers. Pop. (1880) 973; (1890) 1,875; (1900) 646.

**Tomcod** [either *Tom* + *cod*, or (by analogy of *Tom* and *cod*) from Fr. *tacaud*, whiting pout = Amer. Ind., liter., plenty-fish]: in the U. S., any small codfish of the genus *Microgadus*. The tomcods, in external characters, do not differ from the large codfishes; the anus, however, is under the last rays of the first dorsal fin, instead of being under the first ones of the second, and the skull is essentially different. The species on the eastern coast is the well-known *M. tomcodus*, that on the western *M. proximus*.

**Tomlins**, William Laurence: See the Appendix.

**Tomlinson**, Charles, F. R. S.: scientist and author; b. in London, Nov. 27, 1808; received an elementary education (all his widowed mother could afford), and at twelve set out to earn his own living; was fond of reading and study, and while serving in many subordinate capacities carried on his own education; taught modern languages and science in a school established at Salisbury by his brother and himself, and in 1838 published the *Students' Manual of Natural Philosophy*; removed to London and became science lecturer at King's College School. He presented to the Royal Society many original memoirs and papers on scientific matters, and wrote many treatises and articles for cyclopædias and magazines, as well as several scientific text-books. Author of Goethe's *Herman and Dorothea* (1849); *The Sonnet* (1874); and a translation of Dante's *Inferno* (1877); author also of *Amusements in Chess*, and *Essays Old and New* (1887). D. Feb. 15, 1897.

**Tomlinson**, Herbert: physicist; b. at York, England, Nov. 18, 1845; educated at Christ Church, Oxford, and took honors both in mathematics and natural science at his degree in 1868; was appointed demonstrator of natural philosophy at King's College, London, in 1870. He has presented a number of memoirs to the Royal Society, *The Philosophical Magazine*, etc., on magnetism, electricity, elasticity, internal friction of metals, torsional vibrations, viscosity of air, etc.

**Tommase'o**, Niccolà: author; b. at Sebenico, Dalmatia, Oct. 9, 1802; went in 1818 to Padua, where he studied law; later for a time in Milan, and then in Florence, where he enjoyed the friendship of Vieusseux and contributed articles to the *Antologia*. On account of an article wrongly supposed to be written by him he was obliged in 1834 to leave Florence, and went to France, where he published various writings, notably *Dell' Italia* (2 vols., 1835), the novel *Il duca d'Atene* (1837), and *Relations des ambassadeurs vénitiens sur les affaires de France au XVI*e *siècle* (2 vols., 1838). In 1838 he went to Corsica, where he collected material for his *Lettere di Pasquale Paoli* (1846), and the Corsican songs published in his *Canti popolari toscani, corsi, illirici, greci* (4 vols., 1841–42). He then went to Venice, where he remained about ten years. Early in 1848 he was arrested, but was liberated by the people, and became minister of instruction in the provisional government and later went as an envoy to Paris. The return of the Austrians to Venice in 1849 caused his retirement to Corfu. In 1854 he went to Turin, where he undertook work on the great *Dizionario della lingua italiana*, published under his name and that of Bellini, but not completed till some years after his death. In 1860 he was elected a deputy, but resigned, refusing to hold any public office. In 1861 he established himself in Florence, where, in spite of blindness, he continued his literary labors. D. May 1, 1874. Among his numerous publications, religious, philosophical, philological, critical, and political, to say nothing of verse and fiction, besides what has been mentioned above, are the *Dizionario dei sinonimi* (1830 and since); *Commento a Dante* (1837); *Studi critici* (1843); *Rome et le monde* (1851); *Le Lettere di Santa Caterina da Siena* (4 vols., 1860); *Il secondo esilio* (1862); *Nuovi studi su Dante* (1865); *Storia civile nella letteraria* (1872), etc. E. S. Sheldon.

**Tompkins**, Daniel D.: Vice-President of the U. S.; b. at Scarsdale, Westchester co., N. Y., June 21, 1774; graduated at Columbia College 1795; was admitted to the bar of New York city 1796; was elected to the Legislature, and also to the convention for revising the State constitution 1801; was a member of Congress 1804–05; appointed judge of the New York Supreme Court 1804; was Governor of the State 1807–17; was conspicuous as an advocate of Jeffersonian principles and an opponent of the banks; commanded the third military district during the war of 1812–15, to the success of which he contributed by his energy in calling out troops and equipping them for service, but by his carelessness in keeping accounts was afterward charged with being dishonest; recommended by a special message of Jan. 28, 1817, the abolition of slavery in New York, which was effected by an act to take effect July 4, 1827; was chosen Vice-President of the U. S. 1816 on the ticket with Monroe, and re-elected 1820, when he was an aspirant for the presidential nomination; was chancellor of the University of New York; delegate to the State constitutional convention of 1821, and for a time its president. D. on Staten Island, June 11, 1825.

**Tompson**, Benjamin; poet; b. at Braintree, Mass., July 14, 1642, graduated at Harvard and taught school at Cambridge. He is remembered as the author of *New England's Crisis*, a long poem on King Philip's war, written about 1675, the prologue of which has been often reprinted. D. at Roxbury, Mass., Apr. 13, 1714. H. A. B.

**Tomsk**: government of Siberia, bounded W. by Tobolsk, E. by Yeniseisk, and S. by China, between lat. 49° and 61° N., and between lon. 75° and 90° E. The surface is one vast plain sloping from the Altai Mountains, which occupy the southernmost part. The foot of the mountains is covered with extensive forests of oak, cedar, and pitch trees, and on the adjacent steppes live large droves of wild horses and herds of oxen. Where agriculture is pursued, in the central parts of the government, good crops of rye, barley, oats, hemp, and flax are raised, as the climate generally is mild. The northern part is marshy, and partly covered with somber forests of fir and pine. The inhabitants live as nomads; hunting and fishing form important occupations. In the southern part an extensive mining business is carried on. Gold-washing is in many places very remunerative. The mineral wealth is considerable, and an important transit trade between Russia and China is carried on on the large system of lakes and rivers which the government contains. Area, 331,159 sq. miles. Pop. (1897) 1,917,527. Revised by M. W. Harrington.

**Tomsk**: capital of the government of Tomsk, Siberia: on the Tom, an affluent of the Obi; in lat. 56° 29′ N.; 2,809 miles E. of St. Petersburg (see map of Asia, ref. 3–F). It is well built, has some handsome edifices, important foundries, tanneries, soap-factories, and other manufactures, and carries on, besides its transit trade, an active trade in furs, grain, and cattle. The Siberian University was opened here in 1886. Snow falls in October, and in December mercury freezes, but the summer is beautiful and the climate generally healthful. It was almost destroyed by flood and fire on May 16, 1890. Pop. (1897) 52,430.

Revised by M. W. Harrington.

**Tom's River**: village; capital of Ocean co., N. J.; on Tom's river, and the Cent. of N. J. and the Penn. railways; 4 miles from Barnegat Bay, and 52 miles E. of Philadelphia (for location, see map of New Jersey, ref. 5–E). It is a popular summer resort; contains 5 churches, graded public schools, 3 hotels, national bank with capital of $50,000, and 2 weekly papers; and is engaged in agriculture, cranberry-culture, coasting trade, and the shipment of fish, oysters, and clams. The village was founded in early colonial days, contained large salt-works, was a noted retreat for privateers in the Revolutionary war, and was burned by the British Mar. 24, 1782. Pop. (1890) 1,147; not returned separately in 1900. Editor of "New Jersey Courier."

**Tomtit**: See Titmouse.

**Ton** [O. Eng. *tunne*, tun, large vessel; O. H. Germ. *tunna* > Mod. Germ. *tonne*]: a measure of weight and capacity in Great Britain and the U. S. As the former it is equivalent to 20 cwt., and as, in Great Britain, and in the U. S. custom-houses, the hundredweight is reckoned at 112 lb., the ton contains 2,240 lb. In the domestic commerce of the U. S., however, it has become customary to reckon only 100 lb. to the cwt. and 2,000 lb. to the ton; and this usage, in some of the States, has received the sanction of law. Thus in the Revised Statutes of the State of New York it is provided that "the hundredweight shall consist of one hundred avoirdupois pounds, and twenty hundredweight shall constitute a ton." This law was passed in 1851. By act of Congress, when not specified to the contrary, the ton is to be construed as meaning 2,240 lb. The ton of 2,240 lb. is commonly called "the long ton," that of 2,000 lb. "the short ton." The old shipping ton of France was 2,158·43 lb., and the metric ton is 2,204·6 lb. As a measure of the carrying capacity of a ship the ton is 40 cubic feet. This is called actual tonnage. The register ton is 100 cubic feet.

The words *ton* and *tun* are etymologically the same, but the former orthography is usually applied to weights and the latter to liquid measure. The tun in old British ale or beer measure was equal to 216 gal. of 282 cubic inches each, and in old British wine measure to 252 gal. of 231 cubic inches each. A tun of water of the larger of these measures weighs a little over 2,200 lb.; and hence it is supposed that the ton weight was originally derived from the tun measure, of which it is a rough equivalent.

**Tonawan'da**: village; partly in Erie and partly in Niagara cos., N. Y.; on the Niagara river, the Tonawanda creek, the Erie Canal, and the N. Y. Cent. and Hud. River Railroad; 11 miles N. of Buffalo (for location, see map of New York, ref. 5–C). It contains a number of manufactories, principally of lumber, and a union school with library, a national bank with capital of $100,000, a State bank with capital of $200,000, and a weekly newspaper.—The village of NORTH TONAWANDA (post-office, Tonawanda) has lumber interests, manufactures of merry-go-rounds, etc., and has a daily paper and 2 State banks with combined capital of $200,000. Pop. Tonawanda (1880), 3,864; (1890) 7,145; (1900) 7,421; North Tonawanda (1890), 4,793; (1900) 9,069.

**Tone** [from Fr. *ton* < O. Fr. *ton* < Lat. *to'nus* = **τόνος**, a stretching, tension, cord, tone, sound, deriv. of **τείνειν**, stretch]: in music, a word having for its primary meaning a *sound*, or the impression made on the ear by a vibrating string or other sonorous body. The derivative meanings of the term relate to the qualities, relations, or conditions of such sounds, as (1) their place on the scale, a high tone or a low tone; (2) the interval made by two sounds, as a major or a minor tone; (3) any special quality of a sound, as a fine, clear, rich, sweet, or feeble tone. In a more technical sense a tone (or whole tone) means one of the steps of the scale, as C—D, G—A, etc. The words step and half-step are much better as scientific terms than whole tone and semi-tone, as the former are not easily confounded in a student's mind with the idea of quality of sound, as is the case with the word tone. Revised by DUDLEY BUCK.

**Tone**, THEOBALD WOLFE: patriot; b. in Dublin, Ireland, June 20, 1763; educated at Trinity College, Dublin; studied law in London; was called to the bar at the Middle Temple 1789; wrote a number of pamphlets to expose English misgovernment in Ireland; was an ardent sympathizer with the doctrines of the French Revolution; promoted the combination of the Irish Roman Catholics with the Protestant Dissenters in opposition to the British Government; founded at Belfast the first society of United Irishmen 1791; became secretary and agent of the Roman Catholic committee 1792; was involved in secret negotiations with France, on account of which he went to the U. S. 1795; resided a few months at Philadelphia and at Princeton, N. J.; sailed for France Jan., 1796; aided the French Directory in fitting out Hoche's projected expedition to Ireland, in which he was appointed brigadier and adjutant general; served in the Bavarian army 1797; was captured in Sept., 1798, on board a French squadron bound for Ireland; was taken to Dublin, tried by court martial, and sentenced to death, but committed suicide by cutting his throat Nov. 19, 1798.—His eldest son, WILLIAM THEOBALD WOLFE TONE (b. in Dublin, 1791), was educated by the French Directory; served in the French army; emigrated to the U. S. in 1816; served a few years in the army; d. in New York, Oct. 10, 1828. He published several works, including the *Autobiography* of his father (Washington, D. C., 1827; new ed. London, 1892).

**Toner**, JOSEPH MEREDITH, M. D.: physician and author; b. in Pittsburg, Pa., Apr. 30, 1825; graduated at the Jefferson Medical College in 1853; in 1855 took up his residence at Washington, D. C.; in 1872 founded the Toner lecture, in charge of the Smithsonian Institution, to encourage the discovery of new truths in medicine; contributed largely to medical literature and to medical biography; and devised a system of symbols to indicate geographical localities, which has been adopted by the Post-office Department. He was a member of many medical societies and learned associations. D. Aug. 1, 1896. Among his numerous publications are *Abortion in its Medical and Moral Aspects* (1859); *Maternal Instinct, or Love* (Baltimore, 1864); and a *Dictionary of Deceased American Physicians*.
Revised by S. T. ARMSTRONG.

**Tonga Islands**: See FRIENDLY ISLANDS.

**Tongaland**: another spelling of AMATONGALAND (*q. v.*).

**Tongue** [O. Eng. *tunge*: O. H. Germ. *zunga* (> Mod. Germ. *zunge*): Icel. *tunga*: Goth. *tuggō* < Teuton. *tung-*: O. Lat. *din'gua* > Lat. *lin'gua* < Indo-Eur. *dngh-*]: the organ of the special sense of taste, situated on the floor of the mouth. This body consists of muscles by which it can be protruded, retracted, and curved upward, downward, and laterally. The base or root of the tongue is attached below to the hyoid bone, and the tip of the tongue, when inactive, rests forward against the inner surface of the lower incisor teeth. The tongue consists of two symmetrical halves, with a fibrous middle septum; hence one side may be paralyzed and the other active, as in cases of apoplexy. The upper surface or dorsum of the tongue is essentially the seat of taste. (See figure of taste-bulbs in HISTOLOGY.) It is covered by delicate processes or papillæ, which contain the ultimate ramifications of blood-vessels and the terminal fibers of the nerves of sensation and taste. The fore part and sides of the tongue derive their sense of taste from the gustatory branch of the fifth nerve. The base of the tongue and sides and the larger papillæ receive their special sense through the lingual branch of the glosso-pharyngeal nerve.

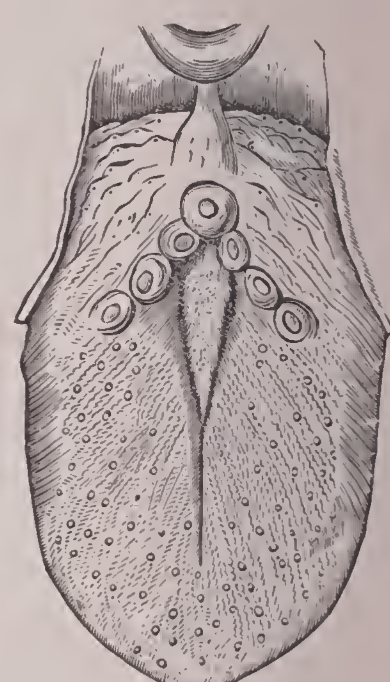

FIG. 1.—The tongue.

The facial nerve also has an influence upon taste, paralysis of this nerve impairing the special sense. The papillæ vary in size and length on different parts of the tongue—broad, circumvallate near the base, fungiform and filiform on the anterior part. Food and viands of decided flavor can be definitely tasted and distinguished by a single papillæ, as found when applied through cylindrical glass rods. It is claimed that only the circumvallate and fungiform papillæ contribute to the sense of taste, the filiform to sensation. Sensation (tactile) is more acute in the tongue than elsewhere in the body. Thus Valentin found that distinct perception of two

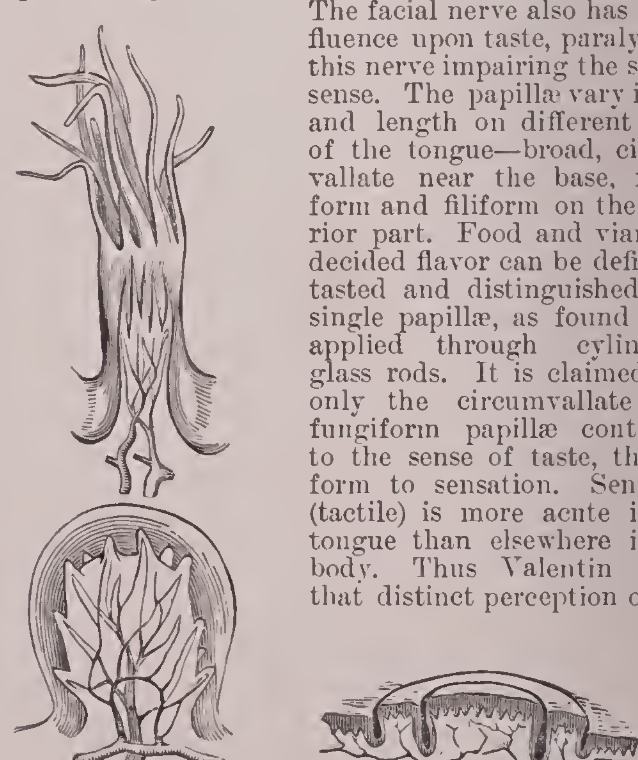

FIG. 2.—Papillæ of tongue: loops of vessels and nerves.

needle-points was obtained at the tip of the tongue when the points were separated only ·483 of a Paris line ($\frac{1}{12}$ inch), the most sensitive part elsewhere, the tip of the finger. requiring ·603 of a line. The several papillæ are imbedded in the corium or body of the mucous membrane, which corresponds to the cutis vera of the skin, and are covered with scaly epithelial cells. The tongue may be inflamed from various causes, as hot drinks and irritants. It is often the seat of apthæ, ulcers, cankers, the result of catarrh of the mouth. A curious form of inflammation sometimes occurs on one lateral half, usually the left, of the tongue (hemiglossitis). There is decided swelling of the affected side. The disease seems of nervous origin. The coated tongue may be due to a relaxed, flaccid, and pale condition of the papillæ, and when noticeably coated has an accumulated stratum of thickened saliva and rapidly exfoliated epithelial cells; the yellow color is the result of the fatty metamorphosis which the cast-off cells speedily undergo. When the stomach is inflamed or irritable, the papillæ of the tongue will often appear as distinct points. The tongue is occasionally attacked by epithelial cancer. Ranula is a cystic tumor beneath the tongue, due to occlusion of some one of the salivary ducts. Exceptionally, in infants the frænum or fibrous cord beneath the tongue is too short; the tongue-tied infant can not nurse well, and when older speaks imperfectly; the cure is by cutting.

Revised by W. PEPPER.

**Tonic**: in music, the keynote, or prime of a scale.

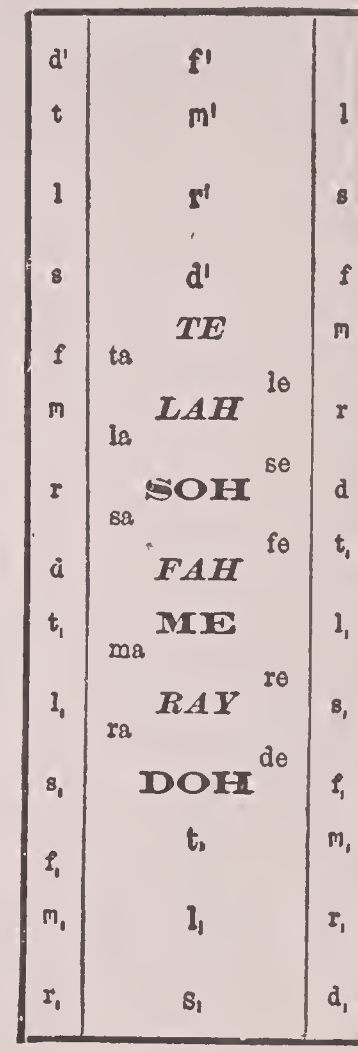
**Tonics** [from Gr. τονικός, deriv. of τόνος, tension, force, strength, tone, deriv. of τείνειν, stretch. See TONE]: in medicine, a term used to refer generically to the means employed by the physician to remove the condition of debility, general or special. Nourishing food, fresh air and exercise, cold bathing, etc., are thus spoken of as having a tonic effect. Drugs, such as directly improve nutrition, or indirectly accomplish the same end by exciting the appetite and increasing digestive power, are called tonics. The most prominent examples of the former are *iron*, which in anæmia directly stimulates the manufacture of the red blood-corpuscles; *cod-liver oil*, which operates as a fatty food of unusually easy assimilation; *phosphorus*, which in some cases of nervous exhaustion or functional nervous derangements seems to improve the nutrition of the nerve-structures; and preparations of some of the metals, as silver, zinc, mercury, arsenic, which in peculiar conditions of malnutrition tend in some unknown way to determine the nutritive processes back into the healthy channels. Of the drugs which are tonic by improving digestive power, the most serviceable are vegetable bitters, as cinchona and its alkaloids, gentian, columbo, quassia, nux vomica, etc.; aromatics and spices; acids, both mineral and organic; and weak alcoholic beverages in very moderate quantity. The list might be greatly extended, for it is a general property of irritants that, taken internally in small doses, their irritation tends to increase the activity of the digestive organs and the secretion of the digestive fluids. Revised by H. A. HARE.

**Tonic Sol-fa System**: a musical notation, and the method of teaching music which grows out of it. It is called a natural system, because it treats music properly as having but one scale or alphabet of seven tones. The other scales are but replicates of this. No lines and spaces are used. It consists of the letters d, r, m, f, s, l, t, which are the initials of the Guidonian syllables doh, ray, me, fah, soh, lah, te (the last changed from se). These notes are applied to all keys alike, in accordance with the tonic principle in music. Tones above the octave are represented by a figure at the top of the letter ($d^1$, $d^2$, etc.); tones below the octave by a figure at the bottom of the letter ($s_1$, $s_2$, etc.). The signs for time (rhythm) are based upon the law of accent. A strong accent is represented by a perpendicular line before a note (|); the weak accent is represented by a colon (:); a medium accent by a shorter, thinner line (¦). The space between any two accents represents a beat or pulse. The space between two strong accents represents a measure. A dash between two accent-marks shows that the previous tone is to be continued. The four principal forms of measure are herewith given as illustrations:

| Two-pulse measure. | Four-pulse measure. |
|---|---|
| {\|d : m \|d : — \|} | {\|d : m ¦ s : m \|d : — ¦ — : — \|} |

| Three-pulse measure. | Six-pulse measure. |
|---|---|
| {\|d : m : s \|d : — : — \|} | {\|d : m : s ¦ $d^1$ : s : m \|d : — : — ¦ — : — : — \|} |

In these measures each pulse is supposed to represent a quarter-note. The shorter notes are represented by divisions of the spaces; eighth-notes by a dot in the middle of the space (\|d . d :); sixteenth-notes by a comma in the middle of the half-space (\|d , d . d , d :); triplets by inverted commas (\|d ‘ d ‘ d :). Other forms are shown by combinations of these signs. Silences (rests) are indicated by the absence of notes in the pulse divisions (\|d :   \|). In the tonic sol-fa system the world's standard of keys is recognized, but no sharp or flat signatures are required. The pitch of a tune is indicated thus at the beginning: Key C, Key G, Key F, etc. Chromatic tones are represented by the old chromatic names written out. The sharps are de, re, fe, se, le; the flats are ra, ma, sa, la, ta. No naturals, double sharps, or double flats are required in tonic sol-fa, as they are only necessitated by the complex nature of the staff notation.



The germs of the tonic sol-fa notation were first used by Miss Sarah Glover, of Norwich, England, as early as 1812. In 1841 John Curwen, a young Congregational clergyman of London, saw its educational value, and thereafter devoted his life chiefly to its development. Through his genius the tonic sol-fa system became not only a complete musical notation, but also a perfect educational method. He introduced many original devices. One was that of indicating each tone of the scale by a position of the hand, which enables the teacher to exercise a class in one and two parts in all keys. Another device is the modulator, by which scales and keys are represented or pictured in their true relationships, as shown in the diagram. This device, combined with the simplicity of the notation, reduces to a minimum the difficulties of modulation, or transition, as the tonic sol-faists prefer to call it. If the key is changed to the dominant (fifth) the *soh* is changed to *doh*, and the other syllables to correspond; thus with any passing change of key that may occur. As a result of this simplicity the tonic sol-fa notation becomes a revelation of the harmonic mysteries of classical music. All vocal music (oratorios, masses, glees, etc.) is printed in this notation in England, and is sung with facility by the common people. Whether the notation is of equal value in instrumental music is a question that is not yet decided. Its value in that is not so self-evident; yet time may prove that its educational power is equally needed with the keyboard as with the voice.

The introduction of tonic sol-fa into the U. S. dates from the publication of a monthly journal, the *Tonic Sol-fa Advocate*, by Theodore F. Seward, in 1881 (since discontinued), and the preparation by him of text-books of the system adapted to the needs of the American public. The relation of tonic sol-fa to the staff notation may be aptly compared with the relation of the Arabic figures to the Roman numerals. As these figures reduced mathematics to a simple expression, and brought its principles within reach of the common mind, so does the tonic sol-fa notation change the relation of music to the entire human race.

THEODORE F. SEWARD.

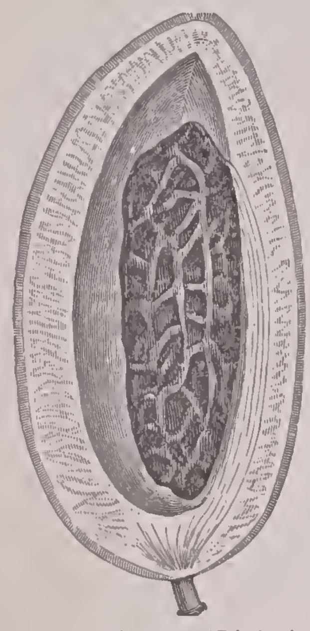
**Ton'ikan Indians**: a linguistic stock of North American Indians, whose historically known tribes lived in close proximity to one another, and appear to have spoken dialects not widely differing. About the year 1700 one tribe lived in Avoyelles parish, La.; another, E. from there, at the Tonica Bluffs, on the eastern bank of the Mississippi river; and a third, near the junction of the Yazoo and Mississippi. Politically, these latter belonged to the Chicasa confederacy. The Tonicas on Tonica Bluffs were steadfast allies of the French colonists. All Tonicas had the reputation of being warlike. A connected history of their migrations, wars, and other deeds can not be composed from documents now extant, and the Tonicas now living are all to be found in Avoyelles parish, about a mile from Marksville. In 1886 the number of those who spoke or remembered their paternal language did not exceed twenty-five. See Pierre Margry, *Découvertes*, iv., 180, 362, 398, v., 401 (Paris, 1883); B. French, *Historical Collections of Louisiana*, iii., 35 (New York, 1846); and T. Jefferys, *History of the French Dominions in North and South America*, i., 145, 146 (London, 1760). See also INDIANS OF NORTH AMERICA.

J. W. POWELL.

**Tonk**: city and state of Rajputana, British India. The state is of very irregular outline, occupying the western slope of the basin of the upper Chambal river. Area, 2,839 sq. miles. Pop. (1891) 380,069, mostly Hindus. The rajah is a Mohammedan Pathan. The city is in lat. 26° 11′ N., lon. 75° 50′ E.; 1,463 feet above sea-level, and a mile from the banks of the Banas river, an affluent of the Chambal (see map of Northern India, ref. 6–D). It is a large town, capital of the state, surrounded by a wall, and protected by a fort. It is a progressive city, and many important hygienic improvements have been introduced. Pop. (1891) 46,069.

MARK W. HARRINGTON.

**Ton′ka Bean** [*tonka* is from Guianan *tonca*, the native name]: the seed of a noble leguminous tree of Guiana, the *Dipterix* (or *Coumarouna*) *odorata*. The tree grows to from 60 to 90 feet in height; the pods, about 2 inches long, are almond-shaped, and the single seed, over an inch long, is shaped like a large kidney bean and shiny black in color. It abounds in the fragrant principle coumarine, with the composition $C_{18}H_6O_4$; is used in scenting snuff and tobacco, and in perfumery. It is also employed to keep moths from woolens. In medicine, it relieves the paroxysm of whooping-cough. Revised by H. A. HARE.



Tonka bean (*Dipterix odorata*). Half of the one-seeded pod.

**Ton′kawan Indians** [so named from a word of the Weko or Hueco language, *tonkaweya*, which is said to signify *many staying together*]: a linguistic stock of North American Indians calling themselves Titskan watitch, *indigenous people* (of Texas). Besides the main Tonkawa, two tribes are reported to have spoken dialects of their language, the Mayeyes and the Yakwal, or *drifted people*.

Fragments of this people appear in many parts of Central and Southern Texas—on the Brazos river, in Fayette County, and near Corpus Christi. Before they removed to the Oakland reserve, Oklahoma (1884), they were living around Fort Griffin, Shackleford County, the men serving as scouts to the U. S. troops stationed there. Their pristine home may have been nearer the Rio Grande. In their language they distinguish certain terms used by "old people" from those employed by the younger generation. They have thirteen clans, partly with totem names. They are first mentioned as Tancaoye, in 1719. In 1862 half of their number were massacred 3 miles S. of Anadarko, Indian Territory (now Oklahoma), by surrounding hostile tribes. Their population in 1890 was seventy-eight and in 1892 they were settling on farms allotted to them by the U. S. Government. They are nicknamed Man-eaters by all the tribes living around them.

The pronunciation of the Tonkawan language is easily acquired by Americans and Mexicans. The inflection of their verb is complex and polysynthetic. Verbs and adjectives reduplicate their first syllable to assume a distributive signification. The personal pronoun possesses a dual, and the substantive is inflected by a number of case post-positions. See INDIANS OF NORTH AMERICA.

J. W. POWELL.

**Tonnage**: a measure of the capacity of a ship, used for the purpose of registry at her port and for levying harbor and other dues. According to the rule of measurement prevailing in Great Britain prior to the year 1835, it was arbitrarily assumed in the so-called "old measurement" (O. M.) that the depth and the breadth of the ship were equal. One step in obtaining the cubic contents of a ship was to multiply the length by the square of the breadth, and the tonnage dues were levied accordingly. This rule led ship-builders to build vessels that were narrow and deep, and accordingly dangerous in rough weather, as well as highly faulty in their plan of structure. The British Parliament adopted in 1835 a new plan, suggested by Mr. Riddle of the Royal Hospital, Greenwich. The statute of 1835 was modified in 1854, and the Merchant Shipping Act of that year (17 and 18 Vict., c. 104) is the basis of the legislation existing in the U. S. The rules established by law in 1799 in the U. S. continued in force until they were superseded by the act of May, 1864. The principle of the latter is to establish at the outset a mode of ascertaining the length, breadth, and depth of the ship, as well as a *tonnage deck* for the purpose of measurement. This is the upper deck of ships of less than three decks, and the second from below in those having three or more. The length of the "tonnage deck" is then ascertained by the following rule: Measure the length of the vessel in a straight line along the upper side of the tonnage deck from the inside of the inner plank, average thickness, at the side of the stem, to the inside of the plank on the stern timbers, average thickness, deducting from this length what is due to the rake of the bow in the thickness of the deck, and what is due to the rake of the stern timber in the thickness of the deck, and also what is due to the rake of the stern timber in one-third of the round of the beam. The "tonnage length" as thus ascertained is then divided into a number of equal parts, depending upon that length. The statute thus creates six classes of ships (five in the British system) for the purpose of measurement. The principle of the classification is to begin with vessels not exceeding 50 feet in "tonnage length" (measured by the prescribed method), and to divide them into six equal parts (four in the British system), increasing the number of parts by two for each increment of 50 feet. Vessels belonging to these classes are then respectively divided into six, eight, ten, twelve, fourteen, and sixteen parts, according to their length.

The next thing is to find the "transverse area" of the vessel. For this purpose the depth of the ship is to be measured at each point of division as above given, according to a prescribed rule. If the depth at the midship division of the length do not exceed 16 feet, each depth is to be divided into four equal parts. "Then measure the inside horizontal breadth at each of the three points of division, and also at the upper and lower points of the depth, extending each measurement to the average thickness of that part of the ceiling which is between the points of measurement. Number these breadths from above, numbering the upper breadth one, and so on down to the lowest breadth; multiply the second and fourth by four, and the third by two; add these products together, and to the sum add the first breadth and the last or fifth; multiply the quantity thus obtained by one-third of the common interval between the breadths, and the products shall be deemed the transverse area." When the midship depth exceeds 16 feet, the "transverse area" is obtained by dividing each depth into six equal parts, instead of four, and with corresponding changes in other respects. This mode of reckoning gives the "transverse area" at each point of division of the length of the vessel, as already noticed.

The final step is to obtain the register tonnage. For this purpose the "transverse areas" found as above are numbered, beginning with the extreme limit of the length at the bow. The even-numbered areas are multiplied by four, and the odd, with the exception of the first and the last, by two. These products are added together, and to the sum the first and last "transverse areas," if they "yield anything," are added. The quantities thus obtained are to be multiplied by one-third of the common interval between the areas. This product is the cubical contents of the space under the tonnage deck. Divide it by 100, and the quotient is the "register tonnage," subject to certain special additions now to be named. Additions (in accordance with a fixed rule) are made to the tonnage under deck, as above ascertained, in case there be a break, a poop, or any other permanent closed-in space on the upper decks or spar deck available for cargo or stores or the "berthing" or accommodation of passengers or crew. The same addition is to be made when a vessel has a third deck or a spar deck, the tonnage of the space between it and the *tonnage deck* being ascertained in a specified way.

In ascertaining the tonnage of open vessels the upper edge of the upper "strake" (line of planking extending from stem to stern) is to form the boundary-line of measurement, and the depth is to be taken from an athwart-ship line extending from the upper edge of such strake at each division of the vessel's length.

The register of the vessel at the custom-house must express the number of decks, the tonnage under the tonnage deck, that of the between decks above the tonnage deck, and that of the poop or other inclosed space, each separately. It is deemed of such importance that the registered tonnage should be known that the law provides that it shall be deeply carved or permanently marked upon the main beam of the vessel, and so continued, or it shall no longer be recognized as a registered vessel of the U. S. No vessel need be registered for tonnage that is used for cabins or state-rooms, and constructed entirely above the first deck, which is not a deck to the hull; nor do the provisions concerning this kind of measurement apply to any vessel not required by law to be registered or enrolled or licensed, unless otherwise specially provided.

This system has been adopted with slight modifications by nearly all European countries, and by Haiti in 1882 and Japan in 1884. It was adopted essentially by the International Tonnage Commission at Constantinople in 1873, which fixed the dues to be levied on ships passing through the Suez Canal, the main point of difference being in the rules with regard to the deduction of engine-room. Displacement tonnage is found in the same way as regular tonnage, except that the measurements are made along and from the load water-line, and the final cubic contents are divided by 35. This system is generally considered the fairest measure for the tonnage of naval ships. It has been adopted officially for the war-ships of France, Great Britain, the U. S., and other nations. For yachts, tonnage is measured according to rules which are framed for the purpose of determining time allowances in racing. The rules vary with each yacht club and association, but are mainly modifications of the old measurement tonnage. Revised by R. A. Roberts.

**Tonnage and Poundage**: an ancient tariff on imports and exports levied by the sovereigns of England, nominally for the defense of the realm and the maintenance of the sea-power of the kingdom. This tariff had its origin in the royal dominion over the ports and waterways of the kingdom, which involved the right to regulate commerce and to impose such restrictions and charges upon the same as the public safety and interests should require. (See Tonnage Dues.) By virtue of his royal prerogative, Edward I. (A. D. 1303) levied on all foreign merchants trading in English ports a duty of 2*s.* per tun on imported wine (which went by the name of *butlerage* or *tunnage*), and 3*d.* per pound sterling on all other imported and exported merchandise. This tariff was in the reign of Edward III. converted by Parliament into a *subsidy* granted to the king, and British as well as foreign merchants were subjected to its operation. From that time on to the final destruction of the royal prerogative in the matter of customs and revenue by the Long Parliament, the legal status of this tariff remained unsettled. It was, as a matter of fact, habitually voted to the sovereign, usually for life, by Parliament, and, on the other hand, it was as regularly exacted during the earlier years of reigns in which Parliament neglected—some times for several years—to take such action. During the Tudor *régime* no question was raised as to the right of the crown to levy tonnage and poundage. It was only when the conflict between the Commons and the royal prerogative reached an acute stage, in the reigns of the first and second of the Stuarts, that the legal and constitutional right of the king to levy this tribute was seriously called in question. The tax derives its great historical importance from the part it played in the downfall of Charles I., who, in consequence of the refusal of the Commons to make him the usual life grant thereof, levied it without parliamentary sanction. The Commons remonstrated, and even went so far as to denounce as a traitor any one who should presume to collect or to pay the tax (A. D. 1628–29), but the remonstrance was disregarded and the imposition continued. The Long Parliament succeeded, however, in breaking up this practice by the Tonnage and Poundage Act, which received the royal assent on June 22, 1841, and the right of Parliament to grant or withhold the tax has been practically undisputed ever since. Tonnage and poundage continued to be levied, under the authority of parliamentary grants, for longer or shorter periods, until the final abolition of the tax by the Customs Consolidation Act (passed in 1787).

A good, brief statement of the origin and history of this tax is given in Medley's *English Constitutional History.* For its bearings on the constitutional struggle of the seventeenth century, see S. R. Gardiner's admirable *History of England* (especially vols. vi., vii., and ix.) and his *Constitutional Documents of the Puritan Revolution.*

George W. Kirchwey.

**Tonnage Dues**: a duty or impost levied by the state on merchant vessels as a fee for the privilege of using the harbors of the state. This tax was formerly based on the number of tons of freight actually carried by the vessel, and was assessed separately for every time that a harbor was actually entered, but it is now measured by the registered tonnage of the vessel, ascertained in the manner set forth in the article Tonnage (*q. v.*), and is usually commuted into an annual tax.

Duties levied by maritime states, by way of toll or tribute, upon all vessels using the territorial waters of the state, are of great antiquity, and flow doubtless from the proprietary rather than the political conception of sovereign rights. From this—which was strictly the ancient and mediæval—point of view the sovereign was looked upon as a great property-owner, owning the bays, straits, and harbors, as well as the seashore and the highways, as portions of the royal domain, and he had the same right to exclude a stranger that any land-owner has to protect himself and his property against trespass. The principle is thus laid down by Azuni, the distinguished author of *The Maritime Law of Europe* (1795): "As the right of sovereignty along the seashore flows from the territorial domain, the sovereign exercises his natural and legitimate empire when he forbids the vessels of strangers to enter his ports or roads, or prescribes to them certain limits for their approach. He has acquired this right by the sacred and inviolable law of property." This right to exclude strangers from the proprietary waters of the state was ordinarily commuted into a tribute arbitrarily exacted for the use of those waters, and this tribute ultimately took on the form of a toll or custom for the maintenance of the guard of the sea and to defray the cost of maintaining the roads and harbors. Accordingly, in the work above referred to, the rule is laid down as follows: "Maritime nations have also a right to impose such contributions and imposts on the territorial sea as they may judge necessary to defray all the charges and expenses which the public security and the convenience of navigation require." It is to this principle that the practice of the Athenians in levying tribute on all ships passing through the Hellespont, and of the Byzantines upon all ships entering the Euxine, is to be referred. In the parliamentary records of the reign of Richard II. (1377–99) in England it appears that a tribute or custom was imposed on every ship that passed through the Northern Admiralty (i. e. "in the sea stretching itself from the Thames mouth all along the eastern shore of England toward the northeast") for the pay and maintenance of the guard or protection of the sea. This was imposed on strangers as well as upon subjects, and was at the rate of 6*d.* a ton upon every vessel that passed by. In modern times all of these exactions have generally been reduced to the single duty or tax imposed on vessels for the use of harbors, the term "tonnage dues" being now usually coextensive in meaning with harbor dues or port dues, although there is nothing in the rules of international law to prevent the imposition of maritime dues for other purposes. The principle is recognized by all of the authorities from Grotius to Hall. It is thus laid down by Sir Travers Twiss: "Every vessel which casts anchor within the jurisdictional waters of a nation becomes liable to the jurisdiction of that nation in regard to all reasonable dues levied for the maintenance of the general safety of navigation along its coasts."

The laws of the leading commercial nations vary a good deal in respect to the amount and the manner of levying tonnage dues, the tendency of modern legislation being strongly in the direction of the reduction and ultimate abolition of imposts of this character, as constituting a serious restraint on free commercial intercourse. The most noteworthy step in this direction is that which was taken by the Congress of the U. S. in 1886, in passing the Reciprocity Act of that year. By that act the U. S. invited the other commercial nations to adopt the policy of abolishing all lighthouse dues, tonnage taxes, and similar burdens on commerce, and agreed to abolish tonnage taxes on vessels from the ports of any country which should grant immunity from similar burdens to vessels from ports of the U. S. This generous and enlightened policy has thus far (1895) been adopted only by Germany and the Netherlands, though it can not be doubted that it will soon become the rule of commercial intercourse throughout the civilized world. By virtue of earlier legislation, reciprocal arrangements for the remission of port charges or harbor dues have been entered into by the U. S. Government with most of the West Indian and Central American nations and colonies, and, so far as the mail-steamships between the U. S. and Brazil are concerned, with the latter country also.

With these exceptions, every vessel belonging to the mercantile marine of the U. S. engaged in foreign trade—vessels employed in the fisheries alone excepted—must pay annually into the Federal Treasury a tonnage tax or duty at the rate of 30 cents per ton. Vessels belonging to foreign states between whom and the U. S. ordinary commercial relations exist pay at the same rate as domestic vessels. But such vessels, not of the U. S., are also subject to a further duty, denominated "light money," of 50 cents per ton. This is levied and collected in the same manner as strict tonnage duties. Ships built within the U. S., but belonging wholly or in part to subjects of foreign powers, are required to pay at double the above rate. This anomalous provision has been much criticised as being a part—and perhaps the least consistent and defensible part—of the illiberal shipping laws of the U. S. (See David A. Wells, *Our Merchant Marine.*) Vessels of the U. S. engaged in domestic commerce are exempt from tonnage duty. This is the case even though such vessels, trading on the northern frontiers, should touch at intermediate foreign ports. Yachts belonging to a regularly organized yacht club of a foreign nation extending like privileges to yachts of the U. S. are also admitted free. (See U. S. Rev. Stat., secs. 1722, 2793, 2931, 3110, 4150–4154, 4216, 4219–4227, 4320, 4335.) From the report of the commissioner of navigation on Oct. 18, 1894, it appears that the amount collected and paid into the Federal Treasury as tonnage tax during the fiscal year ending June 30, 1894, was $539,028.47. The proceeds of the tax are applied to the support of the Marine Hospital service.

The supreme control over the public territorial waters of the U. S., which belonged primarily to the several States, was by the Constitution surrendered by them and conferred upon the Federal Government. That instrument (Art. I., Sec. 10) expressly forbids any State to levy tonnage duties without the consent of Congress. This consent has never been given nor, it is believed, has it ever been invoked. The best authorities regard the present state of congressional legislation as open to grave objection, as being unnecessarily vexatious, unequal, and therefore unjust in its operation, and not based on sound scientific and commercial principles. In particular it is urged that the tax should be levied on the gross rather than the net tonnage of vessels, and that the same rate of duty should be adopted by all the leading commercial nations. For a particularly intelligent discussion of the subject, with a draft of proposed legislation, the reader is referred to the report of the commissioner of navigation for 1894, above referred to.

George W. Kirchwey.

**Tonquin**, ton'keen', **Tonkin**, or better **Tongking** (lit., Eastern Capital): a French dependency of Indo-China, on the Gulf of Tonquin, S. of China, N. of Annam, and E. of the Shan States, but the latter boundary is uncertain. Area about 34,740 sq. miles. It consists of a delta which is densely populated and highly cultivated, and a mountain region which is covered with forests and very sparsely inhabited. The delta is that of the Song-Koi or Red river, which bifurcates at Sontai and incloses between its numerous arms grassy level fields, easy to cultivate, fertile, and covered with villages, cities, and rice-fields. The northern branches connect by canals with the Tai-Bin river, thus combining the two deltas into one, and the latter stream is the more navigable. The capital is Hanoi, a city of Chinese aspect, having about 150,000 inhabitants. The chief port is Haiphong, near the coast. The principal crop is rice, but the sugar-cane, cotton, and tobacco are extensively cultivated. There are copper and iron mines of good promise, and coal mines are worked at Hongay, near Haiphong, and at Kebao. In 1899 the imports were valued at 45.016.918 francs, and the exports at 19.335.971 francs. The transit trade to and from Yunnan amounted to 4.990.000 francs in imports, and 3.180,000 francs in exports. The latter trade is by the Song-Koi, and great expectations are entertained as to its future. Tonquin is yet commercially dependent on the British colonies of Hongkong and Singapore. A railway is under construction from the head of navigation on the Song-Thuong northward to Langson, near the Chinese frontier, which, when opened, is expected to furnish another important trade route. The road begins at Phu-lang-Thuong, 12 miles N. E. of Bac-ninh, and is to be about 60 miles long. The climate of Tonquin is hot, but not unwholesome; the people are very poor, suspicious, avaricious, industrious, and skillful. The interior trade is largely in the hands of Chinese. The country was annexed by France in 1884, but remains turbulent. Pop. about 12,000,000, divided among fourteen provinces and 8,000 villages. Mark W. Harrington.

**Tonsilli'tis**, or **Tonsilitis** [*tonsillitis* is Mod. Lat., from Lat. *tonsillæ*, tonsils (as the form *tonsilitis* is from Eng. *tonsil*) + *-itis*, a medical termination used to denote inflammation]: an acute or chronic inflammation of one or both tonsils, involving the epithelial, glandular, or connective-tissue structures, or more than one of these. The inflammation may be excited by some infectious micro-organism that gains access to the tonsils by the nasal passages or by the mouth; or it may be due to the effects of some specific disease, such as scarlatina, smallpox, or syphilis, which lowers the resistance of the tissues; or it may be due to some constitutional disease, such as gout; or it may be caused by a fungus.

In acute tonsillitis the affected glands become red and enlarged, and if suppuration occurs (see Quinsy) the swelling may be so great as almost completely to block the throat. In chronic tonsillitis the symptoms are similar to those mentioned, but the course of the disease is slower, and often the distended gland vesicles, filled with a yellow secretion, present the appearance of small abscesses. The disease is usually preceded by malaise, chill, and fever; there are a sense of constriction in the throat, a difficulty in swallowing, a thick voice with pain on talking, and often inability to open the jaws. The pain in swallowing may be intense, and the enlargement produced by the inflammation may stretch a muscle (staphylo-salpingeus) which is attached to the orifice of the Eustachian tube and cause pain in the ear and impairment of hearing. The inflammation may extend from the tonsils and involve the anterior and posterior palatine folds, the soft palate, the uvula, and sometimes the epiglottis or the larynx. The salivary secretion becomes viscid and is expectorated with difficulty. The tongue is heavily coated, the breath is foul, there is no appetite, and there is often severe aching pain in the limbs. A first attack is more severe than a subsequent one, and a case that ends in suppuration is more severe than one that terminates by resolution. If the inflammatory symptoms do not subside within five or six days the condition is likely to be that known as quinsy; often resolution will terminate the inflammation in the period mentioned, but a chronic enlargement of the tonsils remains.

Catarrhal tonsillitis is an inflammation of the mucous membrane covering the gland, and if the lacunæ are involved it is called follicular or lacunar tonsillitis; the lacunæ becoming filled with an inspissated yellow or cream-colored mass of epithelial cells, pus, and micro-organisms, and in rare cases these masses undergo calcareous degeneration. If the gland tissue itself is inflamed the disease is called parenchymatous tonsillitis. If there is an eruption of small vesicles on the tonsils the condition is called herpetic tonsillitis. A circumscribed or general membrane may be formed on the tonsils in diphtheritic tonsillitis caused by the Klebs-Loeffler bacillus, as well as in the mycotic tonsillitis caused by the *Leptothrix buccalis* and other fungi.

The diagnosis of the disease is usually easy because the symptoms indicate that the throat is affected, though occasionally rheumatic pains involving the entire body are so severe that the throat pain sinks into insignificance and is not mentioned. If a membrane has formed on the tonsils its characteristics can only be determined by bacteriological examination.

While, as a rule, the prognosis is favorable, there may be serious complications in consequence of suppuration and ulceration into the internal carotid or external maxillary artery, with hæmorrhage; or there may be suffocation from œdema of the larynx or from a discharge of the pus into the air-passages. Rarely there are complications of the kidneys, or paralysis similar to that following diphtheria.

The disease is treated by keeping the patient quiet, giving from 5 to 10 grains of sodium salicylate made from oil of wintergreen every one or two hours until the fever and muscular pains are relieved, and disinfecting the throat by gargles of hot water containing five drops of carbolic acid and a teaspoonful of sodium bicarbonate (cooking-soda) in a cupful of water. If the throat is too painful to gargle, inhalations of five drops of tincture of benzoin poured on boiling water may be taken. In chronic tonsillitis the patient may be given cod-liver oil, or sirup of the hypophosphites made according to Dr. Churchill's formula; generous diet and bathing should be associated with the treatment; and if the tonsils do not become smaller it is necessary to cut them or to apply the galvano-cautery as recommended by Dr. Charles H. Knight. Chronic enlargement of the tonsils should not be allowed to take care of itself, as it is a fruitful source of ear trouble and of recurrent inflammation.

S. T. Armstrong.

**Tonsils**: See Histology (*The Digestive Organs*).

**Tonson**, Jacob: publisher; b. at Holborn, London, England, in 1656; was apprenticed to a bookseller; set up business for himself as a stationer in Chancery Lane, near Fleet Street, in 1678; published that same year some of Otway's and Tate's plays and Dryden's *Troilus and Cressida*; was thenceforth the regular publisher of the writings of Dryden, who edited for him the famous *Miscellanies*; brought out the first good edition of Milton's poems; in 1703 a *Cæsar*, admitted to be the handsomest specimen of English typography to that date, and in 1709 the first complete octavo edition of Shakspeare; established his shop at Gray's Inn Gate 1697, and at the Shakspeare Head in the Strand 1712; had a warehouse in the Savoy and a printing-office in Bow Street; was printer to the excise, publisher to most of the fashionable authors of the day, and stood at the head of his trade; was secretary to, and one of the founders of, the famous Kit-Kat Club, for whose use he built a room at his villa at Barn Elms on the Thames, which became a place of assembly for the wits. He retired from business in 1720, and devoted himself to the management of an agricultural estate. D. at Ledbury, Apr. 2, 1736. His collection of portraits of the members of the Kit-Kat Club, by Sir Godfrey Kneller, is kept intact by a descendant at Bayfordbury Park, Hertfordshire.

**Tonsure** [viâ O. Fr. from Lat. *tonsu'ra*, a shearing, clipping, deriv. of *tonde're*, *ton'sum*, shear, shave]: in the Roman Catholic and Oriental Churches, the shaving of a portion of the hair from the head of an ecclesiastic. In the Roman Catholic Church the size of the tonsure is not uniform, but its place is at present upon the crown of the head. This is the tonsure of St. Peter. In the ancient Irish and British churches the tonsure of St. James, in which the front part of the head was shaved as far back as a line passing over the top of the head from ear to ear, formerly prevailed. In the Eastern churches anciently the whole head was shaved. The tonsure is one of the preparations for orders, and it is regarded as symbolizing the crown of thorns worn during our Lord's Passion. Revised by J. J. Keane.

**Tontine**: the name applied to a financial scheme for securing to the surviving members of an association a proportional share of the profits of those who have died within a stated interval. The name is derived from Lorenzo Tonti, a Neapolitan banker, who proposed to apply this principle in order to raise a fund for the French Government in 1653. The subscribers to the loan were to receive interest from the first, and as deaths occurred the shares of the survivors would be continually increased. The French parliament refused to permit the scheme, but subsequently public tontines were established in France and Great Britain, and private tontine enterprises were carried out in these and other countries. A tontine insurance policy is one in which the policy-holder agrees in common with others to receive no profits till after a certain number of years, and to forego surrender value if he gives up his policy. See Life-insurance (*Tontine Dividend*).

**Tonty**, Henry, Chevalier de: explorer; son of Lorenzo Tonti; b. at Gaeta, Italy, about 1650; accompanied La Salle to Canada 1678 and in his exploration of the Mississippi; was left in command of a fort near Peoria 1680; made an unsuccessful attempt to found a settlement in Arkansas; took part in an expedition of the Western Indians against the Senecas 1685; twice descended the Mississippi to its mouth in search of La Salle, and a third time to meet Iberville; remained in that region and died at Fort Louis (now Mobile) in Sept., 1704. He contributed to Margry's *Relations et Mémoires* an *Account of La Salle's Last Expedition*, of which an English translation appeared in London 1698, was republished in New York 1814, and is included in vol. i. of Benjamin F. French's *Historical Collections of Louisiana and Florida* (1846). See Justin Winsor, *Cartier to Frontenac* (1894).

**Tooke**, John Horne: political writer and grammarian; b. at Westminster, England, June 25, 1736; son of John Horne, a wealthy poulterer; educated at Westminster and Eton schools and at St. John's College, Cambridge, where he graduated in 1758; became usher in a school at Blackheath, Kent; took orders in the Church of England at his father's desire, but much against his own wishes: became incumbent of a chapel at New Brentford 1760; began his political career in 1765 by writing in defense of Wilkes in the newspapers, but his chief work at this period was a pamphlet entitled *The Petition of an Englishman*; became intimate with Wilkes, whose election to Parliament he strongly advocated, and aided him in founding the Society for Supporting the Bill of Rights 1769, but soon afterward had a bitter quarrel with him; was in consequence denounced in the *Junius* letters, and defended himself with vigor 1771; resigned his living and resumed the study of the law at the Middle Temple 1773; started a subscription for the widows and orphans of the Americans "murdered by the king's troops at Lexington and Concord 1775," for which he was prosecuted by the ministry for libel July, 1777; conducted his own defense; was found guilty of libel, sentenced to a year's imprisonment and a fine of £200; wrote while in prison a *Letter to John Dunning, Esq.* (1778), in which he examined the legal aspects of his trial, and incidentally started upon a grammatical disquisition on the irregularities of the English language; was refused admission to the bar 1779 on the ground of being a clergyman; assumed his additional name in 1782 out of regard to Mr. Tooke, of Purley, who made him his heir; published his chief work, *Epea Pteroenta, or The Diversions of Purley* (1786; vol. ii., 1805), an ingenious treatise on etymology which occasioned much controversy, and has been widely read; was an unsuccessful candidate for Parliament at Westminster 1790 and 1796; was an active member of the Society of Correspondence formed by the admirers of the French Revolution, on which account he was committed to the Tower, tried for high treason 1794, but acquitted; obtained a seat in Parliament for Old Sarum 1801, and passed his later years in affluence at Wimbledon, where he died Mar. 18, 1812. He was never married, but had several natural children, to one of whom he left his estate. See his *Memoirs*, by Alexander Stephens, 2 vols., 1813.

**Tooke**, Thomas: economist: son of William Tooke, the historian; b. in St. Petersburg, Russia, in 1774; was for more than forty years successfully engaged in the Russian trade; was a pioneer of free-trade doctrines, and drew up the famous "Merchants' Petition" for free trade in 1820. He was the author of numerous writings on the currency, corn-laws, finance, and banking, including a valuable *History of Prices and of the State of the Paper Circulation from 1798 to 1856, etc.* (6 vols., 1838–57); was the founder of the Political Economy Club (1831), and the promoter of many public enterprises connected with industrial and philanthropic reforms. D. in London, Feb. 26, 1858. After his death his admirers raised a subscription with which they endowed in King's College, London, a "Tooke professorship" of economic science and statistics. F. M. C.

**Tooke**, William: clergyman and historian; b. at Islington, London, England, Jan. 18, 1744; originally a printer, took orders in the Church of England 1771; became soon afterward minister of the English church at Cronstadt, Russia, and was chaplain to the factory of the Russia Company in St. Petersburg 1774–92. D. in London, Nov. 17, 1820. Author of *Russia, or A Complete Historical Account of all the Nations which compose the Russian Empire* (4 vols., 1780–83); *Life of Catharine II., Empress of Russia* (3 vols., 1797); *A View of the Russian Empire during the Reign of Catharine II.* (3 vols., 1799); *A History of Russia A. D. 862–1762* (2 vols., 1800); *Varieties of Literature* (London, 1795, 2 vols. 8vo); *Extracts from Foreign Literary Journals and Original MSS.* (London, 1796, 2 vols. 8vo); of several volumes of sermons, novels, and translations, among which was *The Works of Lucian*, from the German translation by Wieland (2 vols. 4to, 1820); and editor of vols. i.–v. of the *General Biographical Dictionary* (1798).—His son William, b. at St. Petersburg in 1777, was a London solicitor, a Liberal member of Parliament 1835–37, and one of the founders and long the treasurer of the Society for the

Diffusion of Useful Knowledge. D. in London, Sept. 20, 1863. He edited the *Works* of Charles Churchill (2 vols., 1804), and wrote *The Monarchy of France* (1855).

**Toole**, John Lawrence: actor; b. in London, Mar. 12, 1832; made his first appearance on the stage at the Ipswich Theater Royal, and in 1852 adopted the stage as a profession, accepting during that year an engagement at the Queen's theater, Dublin. He made his *début* in London at the Haymarket theater as Simmons in *The Spitalfields Weaver.* At the St. James's theater Oct. 2, 1854, he played Samuel Pepys in *The King's Rival.* He became a great favorite with the British public, and for twenty years appeared every season in London. In 1875 he visited the U. S., but his peculiar style of humor was not appreciated and his tour was not successful. He returned to England, and, with the exception of a visit to Australia in 1891, has played regularly in London at a theater under his own management. *A Fool and his Money* was one of his most successful plays. In 1892 he made a great hit at Toole's theater in *Walker, London.* B. B. Vallentine.

**Toombs**, Robert: b. in Wilkes co., Ga., July 2, 1810; educated at the University of Georgia and at Union College, Schenectady, N. Y.; graduated at the latter institution in 1828, and studied law at the University of Virginia. In 1830, before his majority, he was admitted to the bar by special act of the Legislature, and opened an office at the town of Washington in his native county. When the war with the Creek Indians broke out in Alabama in 1836, Toombs raised a company of volunteers, and led them, as captain, to the field, serving under Gen. Scott until the close of the conflict. In 1837–40 and 1842–43 he was a member of the State Legislature, where from the beginning he took a most conspicuous position. He was brought up in the Jeffersonian school of politics, to which creed he always adhered. In 1844 he was elected a member of Congress. He then belonged to the party known as Southern Whigs, and as such supported Harrison for the presidency in 1840, and Clay in 1844. He remained a member of the House until Mar., 1853, when he took a seat in the Senate. While a member of the House the most conspicuous part he acted was on the adjustment measures of 1850, whose passage he helped actively to bring about. He was re-elected to the Senate in 1859, and continued to hold his seat in it until Georgia passed her ordinance of secession in 1861. He was a member of the State secession convention, where he acted a conspicuous part, and was chosen a delegate to the Confederate congress at Montgomery. In that body, as in all other assemblages of which he was a member, he stood among the ablest and most eloquent. He was for a short time Secretary of State in the Confederacy, but resigned that office and took a commission as brigadier-general in the army. He distinguished himself at the second Bull Run and Antietam battles. He resigned his commission and returned to Georgia, where he was made a brigadier-general of the State militia upon the invasion of the State by Sherman in 1864. After the close of the war he left the country, spending his time in Cuba, France, and England, remaining abroad until after the restoration of the privilege of the writ of *habeas corpus* in 1867. He then returned home, but refused to take the oath of allegiance to the U. S., and was in consequence debarred from the rights and privileges of citizenship. He resumed the practice of law, which he pursued with great success. The reconstruction measures of Congress he denounced in the beginning, and continued to denounce, with all the force and power of language he could command. D. at Washington, Ga., Dec. 15, 1885. Revised by F. M. Colby.

**Tootel**, Hugh or Richard: See Dodd, Charles.

**Tooth**: See Teeth.

**Toothache-tree**: See Prickly-ash.

**Tooth-shells**: a popular name given to the mollusks of the order *Scaphopoda* on account of their long, cylindrical, slightly curved shells. See Dentalium and Mollusca.

**Topaz** [M. Eng. *topas*, from O. Fr. *topaze* < Lat. *topa'zos*, *topa'zion* = Gr. τοπάζιον]: a gem-stone, but not the τοπάζιον of Pliny, which is described as opaque and green, was probably some variety of agate or jasper, and was named from its locality, an island in the Red Sea. The *chrysolite* of Pliny and later writers is generally believed to have included the topaz. The mineral species *topaz* is orthorhombic in crystallization, with a fine basal cleavage which causes it to split into lustrous plates—a feature which distinguishes the white transparent topaz from quartz. Its hardness is 8, between that of quartz and sapphire, and diamond and sapphire scratch it easily. It contains silica, alumina, and fluorine, but the proportions are somewhat uncertain. Groth's formula and Dana's deductions make it $Al_{12}Si_6O_{25}F_{10}$, which yields the following composition: Silicon, 15·5; aluminium, 29·9; fluorine, 17·6; oxygen, 36·9. This is the true topaz, but the name is much confused among jewelers and collectors by being applied to other transparent yellow stones. Thus *Oriental topaz* is yellow Sapphire (*q. v.*), and the names *Scotch topaz* and *Spanish topaz* are given to yellow quartz. (See Quartz.) This latter is the stone commonly sold as topaz by jewelers, and is usually produced by heating smoky quartz, which is thus partially decolorized. The true topaz is of various light colors—yellow, pale green, or blue, and pure white. The finest deep-yellow ones come from the province of Minas Geraes, in Brazil; on heating, these are altered to pink, and are then sometimes called Brazilian rubies. Sherry-colored stones come from Siberia, Colorado, and Texas, and fine green and blue topazes from the Ural Mountains, Ceylon, Japan, and New South Wales. G. F. Kunz.

**Topazolite**: See Garnet.

**Tope**: the English name of the *Galeus canis*, a shark common in the British seas, and widely distributed elsewhere, but not found in the American waters. It belongs to the family *Galeorhinidæ*, and is distinguished by the following combination of characters: The teeth are nearly alike in both jaws, oblique, and notched and serrated ($\frac{3}{3}\frac{4}{4}$ in number); the first dorsal is opposite the space between the pectorals and ventrals; the caudal fin has a single notch, and there are no median pits at its base; the color is the usual slate gray above and lighter beneath. It attains a length of about 6 feet.

**Tope'ka**: city; capital of Kansas and of Shawnee co.; on both sides of the Kansas river, and on the Atch., Top. and S. Fé, the Chi., Rock Id. and Pac., the Mo. Pac., and

State Capitol, Topeka, Kan.

the Union Pac. railways; 67 miles W. of Kansas City; elevation, 800 to 890 feet above sea-level (for location, see map of Kansas, ref. 5–I).

*Public Improvements.*—The city is built on three ridges at right angles to the course of the river, insuring it excellent drainage. There are 118 miles of streets, 26 of which are paved, the pavement averaging 30 feet in width, with a 20-foot parkway for trees between the sidewalk and pavement on each side, and the streets are lighted with 185 2,000-candle-power arc lights. Local transit is accommodated by 30 miles of electric street-railway. The sewerage plant has 39 miles of mains, the gas plant 25 miles, and the waterworks over 33 miles. There are four electric-light and motor plants for commercial uses.

*Notable Buildings.*—Topeka contains the State Insane Asylum (cost $700,000), the State Reform School for Boys (cost $120,000), State Capitol (cost $2,000,000), county court-house (cost $150,000), U. S. Government building (cost $300,000), city buildings (cost $100,000), three large hospitals, an Orphans' Home, and a Home for Friendless Women, besides several costly business blocks and the Santa Fé railway offices and shops.

*Churches, Schools, etc.*—There are 66 church organizations, with a membership of 13,569, owning 87 buildings valued at $668,400. The churches are divided denominationally as follows: Methodist Episcopal, 15; Baptist, 12; Presbyterian, 10; Lutheran, 5; Christian, 4; Congregational, 4; Protestant Episcopal, 4; Roman Catholic, 2;

and ten other denominations, 1 each. The city has an excellent system of public schools, with an enrollment of 10,264 pupils, employing 115 teachers, and costing $174,000 in 1894. It includes a high-school building which cost $85,000. The institutions for higher instruction comprise Washburn College (Congregational, chartered in 1865), coeducational, on a tract of 160 acres, and having buildings which cost $175,000; the College of the Sisters of Bethany (Protestant Episcopal, opened 1861, chartered 1870), occupying four squares in the center of the city, and having buildings which cost $150,000; and the Seminary of the Assumption (Roman Catholic), for both sexes. There are also 4 private schools and academies. In 1895 there were 3 daily, 16 weekly, 8 monthly, and 3 other periodicals.

*Banking and Insurance.*—In 1895 there were 3 national banks with combined capital of $650,000, 3 State banks with combined capital of $413,775, and 2 private banks; 8 investment and loan companies with authorized capital of $6,810,000; and a fire-insurance company with capital of $100,000, assets of $252,502, and surplus over liabilities of $171,976.

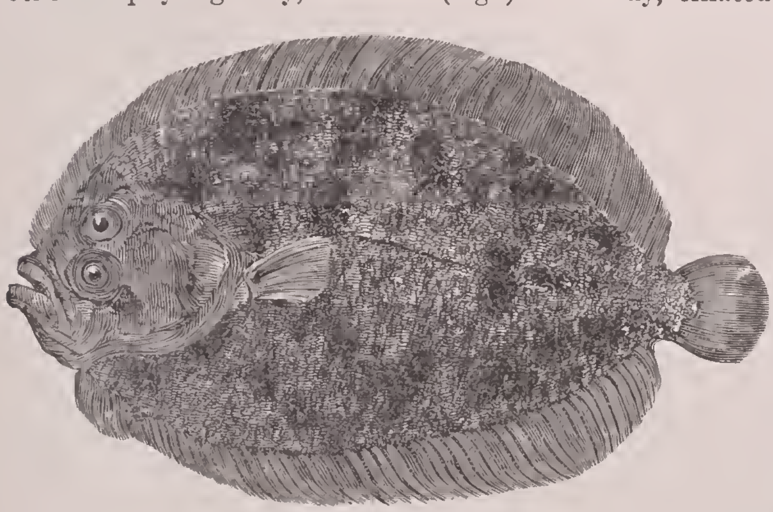
The city was laid out in 1854, incorporated in 1857, and made the State capital in 1861. Since 1885 there have been no saloons in the city. The financial condition of Topeka is exceptionally good. Pop. (1880) 15,527; (1890) 31,800; (1900) 33,608. H. G. LARIMER.

**Topel'ius**, ZACHARIAS: poet and novelist; b. near Ny Karleby, Finland, Jan. 14, 1818. After graduating at the University of Helsingfors (1840) he became editor of the *Helsingfors Tidningar* (1842), which he made a great force in Finnish literature, retaining his connection with it until 1860. He was Professor of Finnish History at his *alma mater* from 1854 until 1878. His earliest publications, which appeared in his journal, consisted of tales and lyrical poems, the latter of which were collected under the title of *Ljungblommor* (Heather Flowers, 1845–54). In these as well as in *Sånger* (1861) and *Nyt blad* (New Leaves, 1870), the influence of RUNEBERG (*q. v.*) is marked. Topelius also wrote a number of dramas—*Efter femtio år* (Fifty Years Later, 1851); *Regina af Emmertz* (1854); and a volume of *Dramatiska dikter* (1863). Many of his children's stories have been translated into English. But the work by which he is best known at home and abroad is *Fältskärens Berättelser* (The Surgeon's Stories, 6 vols., 1872–74), a collection of tales dealing with the history of Sweden and Finland during the seventeenth and eighteenth centuries. D. Mar. 14, 1898. D. K. DODGE.

**Tophet**: See GEHENNA.

**Tophi**: See GOUT.

**Topknot**: a name given in Great Britain, or at least in British books, to flat fishes (*Pleuronectidæ*) of the genera *Zenogopterus* and *Scophthalmus* (or *Phrynorhombus*). They are so called from a long filament on the head. These do not agree in special characters, although they resemble each other in physiognomy, the wide (high) oval body, ciliated



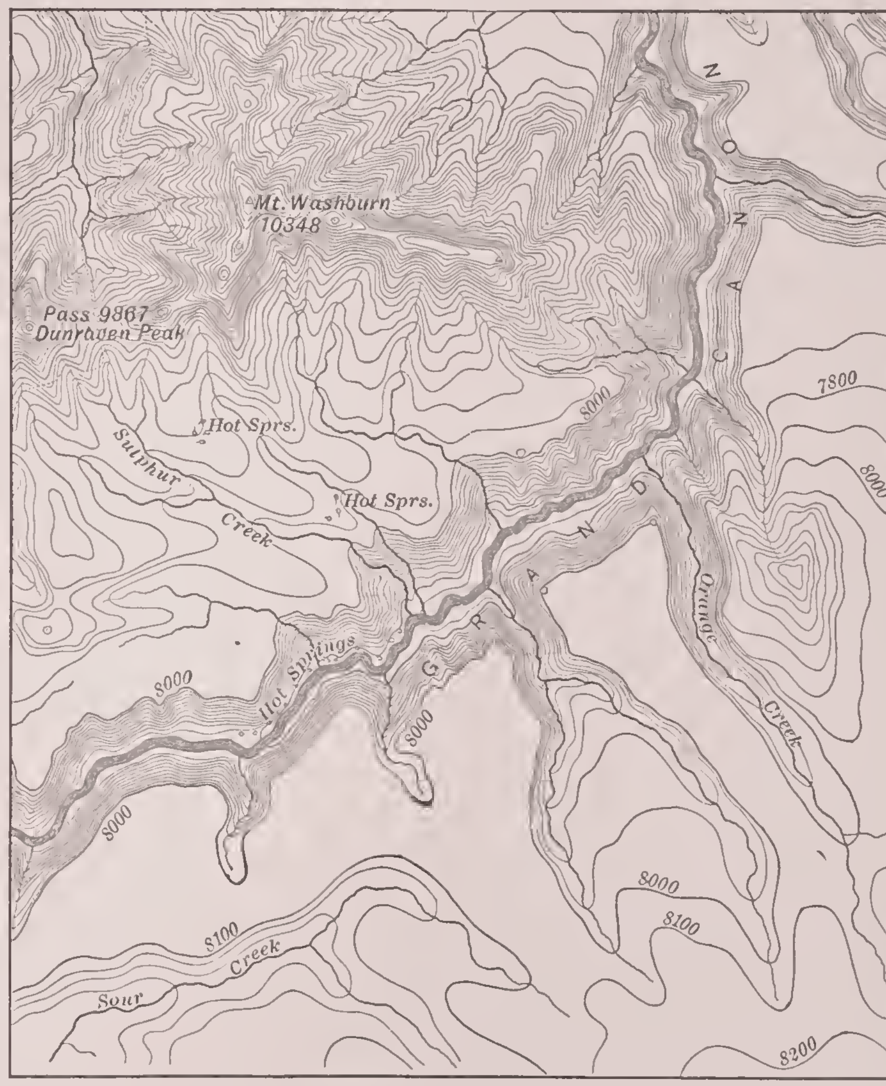
Müller's topknot.

scales, sinistral and fringed eyes, narrow interorbital ridge, and long based ventrals. They rarely exceed 7 or 8 inches in length. Some of the topknots are of the same genus as the turbot, as Eckstrom's *Rhombus norvegicus* and Müller's topknot, *Rhombus punctatus*.

**Toplady**, AUGUSTUS MONTAGUE: clergyman and hymn-writer; b. at Farnham, Surrey, England, Nov. 4, 1740; was educated at Trinity College, Dublin; took orders in 1762; became vicar of Broad Hembury, Devonshire, 1768; preached at the chapel of the French Calvinists, in Leicester Fields, London, from 1775 to his death there Aug. 11, 1778. He was editor of *The Gospel Magazine* and author of many hymns, chief of which is *Rock of Ages*. His Calvinistic partisanship led him into unhappy controversy with John Wesley. His complete works were published in London 1794 and 1825; his verses, best by D. Sedgwick (1860). See his *Life*, by W. Winters (London, 1872). Revised by S. M. JACKSON.

**Töplitz**: See TEPLITZ.

**Topog'raphy** [from Gr. τόπος, place + γράφειν, write]: the representation of the natural features of a portion of



the surface of the earth on a map, or the natural features themselves. The construction of a topographical map involves the field and office operations of surveying, and the delineation on paper, by means of shading or signs, of the outlines and elevations of the surface.

For popular purposes the representation of hills and mountains by lines drawn along the declivities is very common, the steepest slopes being made the heaviest. While this indicates at once to the eye the elevations, it gives little idea of their absolute or relative heights, and hence the method of contours is more generally employed by engineers. In this method the surface is supposed to be intersected by a series of horizontal planes, and the lines of intersection, called contours, are determined in the field by levels and measurements and then plotted on the map. The figure, which shows a portion of the Yellowstone Park about 7 miles by 8 miles in area, illustrates the contour method of representing topography, all points on the line marked 8,000 being 8,000 feet above ocean-level. The contours are drawn at intervals of 100 feet in vertical height, and the closer together they are the steeper is the slope. If lines be imagined to be drawn perpendicular to the contours they will indicate the direction of the drainage, and it will be seen that all of the creeks cross the contours at right angles. By the help of accurate contour maps profiles in any direction can be constructed, and much preliminary work in the location of roads be advantageously done.

In addition to the representation of the elevations and streams, topographical maps generally include roads, houses, swamps, and cultivated land. Special signs, mostly conventional, are used for different kinds of crops, as also for sand, grass, and trees, so as to furnish a picture somewhat similar to that which the country would present if viewed from a balloon. Along the coast are shown the shoals, reefs, high and low water lines, together with contours of the beds of the harbors and sounds. Colored topographical maps, in which water is represented in blue, streets in yellow, fields in green, and houses in red, are frequently made when not intended for reproduction.

The field work of topography is usually based on a triangulation, while the details are mapped by means of the plane-table or stadia. The topography and hydrography of the coasts of the U. S. has been mostly done by the U. S. Coast and Geodetic Survey, and a portion of that of the interior by the U. S. Geological Survey. Several States have made topographical maps in connection with their geological surveys. The cost of topographical work ranges from $5 to $25 per sq. mile, depending on its accuracy and completeness. See COAST AND GEODETIC SURVEY, GEODESY, HELIOTROPE, HYPSOMETRY, LEVELS AND LEVELING, MAP, PLANE-TABLE, STADIA MEASUREMENT, SURVEYING, and TRIANGULATION. MANSFIELD MERRIMAN.

**Topolias**: See COPAIS.

**Topolobam'po Bay**: a bay of the Gulf of California, in the northwestern part of the state of Sinaloa, Mexico. It forms an excellent landlocked harbor, and is bordered by plains which could be profitably cultivated but for their dryness; there is no fresh water, and the nearest stream available for irrigation is the Rio Fuerte, 25 miles N. It has been proposed to make the bay the terminus of a railway line from Eagle Pass. In 1886 several prominent socialists of the U. S. planned to establish a socialistic colony on or near the bay. A company called the Credit Foncier of Sinaloa was chartered under the laws of Colorado, the leading promoter being A. K. Owen, an engineer who had already been interested in the railway scheme. It was proposed to sell shares to colonists, who should all be employed by the company, receiving in payment scrip which could be used in purchasing supplies, etc., under the principle of state socialism. The company, or community, was to own all lands and conduct all business; a model town was planned, and it was expected that the company would build the railway or a part of it. Several hundred colonists joined the enterprise and went to the bay at different times, beginning in Dec., 1886. They suffered greatly, owing to the difficulty of procuring water and food; an attempt to make an irrigation ditch failed; the colony was divided, part of it joining a company which had been formed in Kansas, and most of those who remained (1895) are settled near the Rio Fuerte. The company's scrip is now nearly or quite worthless, and as a socialistic scheme the plan has failed. It is fair to say that this was partly owing to the unsuitable nature of the land. H. H. SMITH.

**Top-shells**: a collector's name for species of shells of the family *Turbinidæ*, especially *Turbo marmoratus*, which has a turbinated solid shell with convex whorls. They are found in tropical seas. The family name is derived from the Latin *turbo*, a whipping-top, in allusion to the shape of the species, which is more or less conical or pyramidal.

**Top'söe**, VILHELM CHRISTIAN SIGURD: novelist; b. in Denmark, 1840. His best-known work is *Jason med det gyldne Skind* (Jason with the Golden Fleece, 1875), the authorship of which was for a long time kept secret. In *Nutidsbilleder* (Contemporary Pictures, 1876) he portrays with marked force some of the social abuses of our time. *Fra Amerika* (1872) gives impressions of the U. S. with greater fullness and insight than are commonly displayed by Danish travelers. Three volumes of *Collected Tales* were published in 1890–91. D. K. DODGE.

**Toqueville**: another spelling of TOCQUEVILLE (*q. v.*).

**Torbanite**: See FUEL.

**Torbay**: a fishing-town of Newfoundland, 7 miles N. of St. John's. The anchorage is poor. Pop. about 1,300.

**Torbert**, ALFRED THOMAS ARCHIMEDES: soldier; b. at Georgetown, Del., July 1, 1833; graduated at the U. S. Military Academy July 1, 1855; assigned to the Fifth Infantry; served on frontier duty in Texas and Florida 1856–57, on Utah expedition 1857–60. In the civil war he was engaged, Apr.–Sept., 1861, in mustering New Jersey volunteers into service, and Sept. 16 was appointed colonel of the First Regiment, which he led in the Virginia Peninsular campaign of 1862; assigned to command of a brigade in the Sixth Corps Aug. 28, 1862, and engaged in the second battle of Bull Run, at South Mountain (wounded), and Antietam. Promoted to be brigadier-general of volunteers Nov. 29, 1862, he was on sick leave until June, 1863, when again in command of brigade in Sixth Corps, and engaged in the battle of Gettysburg July 2–3, and subsequent operations of that corps during the winter of 1863–64. In the Richmond campaign of 1864 he commanded the cavalry, remaining with Gen. Grant's army during Gen. Sheridan's raid on Richmond, and first division on the latter's return May 25, being engaged in the frequent actions from May 15 to Aug., 1864. He was chief of cavalry of the middle military division, and engaged in all the operations in the Shenandoah campaign Aug., 1864–Jan., 1865, and frequently in command; in command of the Army of the Shenandoah Apr.–July, 1865, and of various districts in Virginia till mustered out of the volunteer service Jan. 15, 1866. Brevet major for gallantry at Gettysburg, lieutenant-colonel for Hawes's Shop, colonel for Winchester, brigadier-general for Cedar Creek, and major-general for gallant and meritorious services during the war. Resigned his commission of captain Fifth Infantry Oct. 31, 1866; was U. S. minister resident to Central American states 1869–71; consul-general to Havana 1871–73; and U. S. consul-general in Paris 1873–78; was lost at sea off the coast of Florida, Aug. 29, 1880.

**Torch-wood**: the *Amyris floridana*, a small tree or shrub of South Florida, having shining leaves, clusters of yellowish-white flowers, and a resinous juice. It belongs to the family *Burseraceæ*.

**Tordesillas**, tōr-dā-sēel'yăăs (in Portug. *Tordesilhas*), **Convention of**: an important treaty signed by the envoys of Spain and Portugal, at the town of Tordesillas in the former country, June 7, 1494. It related to the rights of conquest of the two countries, and had the most important results. The popes, in several bulls, had given authority to Portugal to conquer and settle Africa and the East Indies. Soon after the discovery of western lands by Columbus, Pope Alexander VI. issued his celebrated bull of May 3, 1493, in which he divided the world by a meridian "100 leagues west of the Azores and Cape Verde islands," and gave to Spain authority to conquer all lands W. of this line, reserving those E. of it for Portugal. By the convention of Tordesillas it was agreed that the divisional meridian should be moved to "370 leagues west of the Cape Verde islands." Very unexpectedly this gave to Portugal the coast of Brazil discovered a few years after. Spain could not reasonably contest the claim, and Brazil was settled by Portuguese. Unfortunately, the terms of the treaty were vague in not mentioning any particular point of the Cape Verde islands from which measurements could be taken, and in not specifying the length of the leagues, several being then in common use; thus disputes arose as to the position of the meridian, and remains of these have come down to our time. Again, as conquests were pushed E. and W., the two nations eventually met on the opposite side of the globe, and here the uncertainty was increased by the defective means then available for determining longitude. For example, the Philippine islands were claimed and held by Spain on the supposition that they lay within her hemisphere; in reality, they were in that assigned to Portugal. H. H. SMITH.

**Tore'no**, tō-rā'nō, JOSÉ MARÍA QUEIPO DE LLANO RUIZ DE SARAVIA, Count of: statesman and historian; b. at Oviedo, Spain, Nov. 26, 1786; took an active part in promoting the uprising of Spain against Napoleon 1808; was sent to England to negotiate for assistance; was a prominent member of the Cortes at the restoration of Ferdinand VII., but, like most of his companions of liberal opinions, was soon driven into exile; was recalled to Spain by the revolution of 1820; again went into exile on the triumph of absolutism 1823; returned to Spain after the death of Ferdinand 1832; became Minister of Finance under the regency 1834, president of the council and Minister of Foreign Affairs 1835, but retired in September and went into voluntary exile. D. in Paris, Sept. 16, 1843. He was the author of an important work on the Spanish war of independence, *Historia del Levantamiento, Guerra y Revolución de España* (Madrid, 5 vols., 1835–37). F. M. COLBY.

**Torfæ'us**, THORMODUS [Latinized form of Icel. *Thormodr Torfason*, his true name]: antiquary; b. at Engö, Iceland, May 27, 1636: studied at the University of Copenhagen; was sent by Frederik III. to Iceland in 1662 to collect manuscripts of the sagas; made royal antiquary in 1667 and royal historiographer for Norway in 1682, but was compelled to resign on account of having committed manslaughter in self-defense. He was the first to apply the Icelandic literature to the study of Scandinavian antiquities and history. The most remarkable of his writings are *Series regum Daniæ* (1702); *Historia Vinlandiæ antiquæ* (1705); *Grœnlandia antiqua* (1706); *Historia Rerum Norvegicarum* (4 vols., 1711). D. Jan. 31, 1719. Revised by D. K. DODGE.

**Torgau**, tōr'gow: town: in the province of Saxony, Prussia; on the Elbe; 70 miles S. S. W. of Berlin by rail (see map of German Empire, ref. 4-G). It is strongly fortified, and contains barracks, hospitals, magazines, and other military establishments; also manufactures woolen and linen fabrics and hosiery. Pop. (1890) 10,860.

**Torii**, tō'rēe-ee' [lit., bird-perch, or bird-rest]: a construction in wood, stone, or bronze, found in front of every shinto shrine in Japan. It consists of two pillars, set one on each side of the roadway, and joined at the top by two cross-bars, the uppermost of which projects at either end, usually with an upward curve. In all pure Shinto shrines the torii is of unpainted wood; it was originally a perch for the sacred fowls who gave warning of daybreak. Later, especially under the sway of Buddhism, the torii came to be looked upon as a mere portal. The Buddhists were fond of painting it red. J. M. DIXON.

**Torna'do** [Span., meaning turned, twisted]: a small, local, short-lived, but very violent storm, occurring in the warm season, in the warmer hours of the day, and in very moist air. The tornado is most noteworthy for the very high velocities attained by the innermost part of its whirl, reaching, as far as can be judged by its effects, a speed of 200 or more miles an hour, and consequently exerting a pressure of 200 lb. or more to the square foot on structures opposing the motion. The conditions preceding a tornado are generally those of a thunder-storm exaggerated, and active agitation is sometimes seen beforehand in the clouds. When the storm is formed it has a long, slender funnel extending from the clouds toward the ground. This defines the area of greatest velocity of wind, and where it reaches the ground the destructive effects are greatest. The tornado is often accompanied by intense electric phenomena, and accompanied or followed by torrential rain, sometimes by hail. The path is usually but a few rods wide and a few miles long, and it is generally directed from S. W. to N. E. The destructive effects are experienced only close to the path of the funnel, and are somewhat more severe on the south side of the central path than on the north side. The duration at any spot is but a few seconds. Definite forecasts of storms whose entire destructive area is not a square mile are hardly practicable, but the smallness of this area makes the probability very small that any given spot will ever be traversed by a tornado. Tornadoes occur in the temperate regions generally, where there is enough moisture. In the U. S. they are most usual E. of the Great Plains, in early spring in the South, in late spring and early summer in the Northern States. The alleged greater frequency of tornadoes in late years is an illusion due to the greater perfection of the news-collecting and distributing agencies, and to the greater attention paid by the public to meteorologic phenomena.

The theory of tornadoes presents many difficulties, but they are undoubtedly small vortical wind systems, with a long vertical axis, with contra-clockwise rotation at the ground. Many other local storms are erroneously classed with them, as squalls, derechos, riband-winds, rolls with horizontal axes, etc. A serious source of confusion is to be found in the fact that these local storms are popularly called cyclones. A cyclone is several hundred miles in diameter and only a mile or two deep, with a thickness, therefore, only $\frac{1}{500}$th part or so of its diameter. A tornado is only a few scores of feet in diameter and at least several hundred feet high. The first is general, large, and may last several days; the second local, small, lasting at most only an hour or two. MARK W. HARRINGTON.

**Tor'neå**: river of Northern Europe, forming the boundary between Sweden and Russia; rises in Lake Torneå, in Sweden, flows southward, and enters the head of the Gulf of Bothnia after a course of 230 miles. It is rapid, and celebrated for its beautiful cataracts and salmon-fisheries.

**Toron'to**: the capital of the Province of Ontario, and the largest city on the Canadian side of the Great Lakes; on a large and finely sheltered bay on the north shore of Lake Ontario, in 43° 39' N. lat. and 79° 23' W. lon. (see map of Ontario, ref. 4-D). The city was founded in 1794 by Maj.-Gen. John Graves Simcoe, first governor of Upper Canada, who gave it the name of York, in honor of the Duke of York, second son of George III. About fifty years earlier the French had built a trading-post (Fort Rouillé) close to the site of the city, but this was subsequently destroyed. Even in Simcoe's day little trace of the stockade remained, if we except the name Toronto—"the place of meeting"—which the Indians gave to it and the region about, and which was adopted for the city in 1834.

The determining factor in the location of the city was obviously the spacious harbor, which gave promise of safe shelter for the fleet and shipping of the lakes, besides the advantages of fine central position, lying directly northward of the mouth of the Niagara river, and close to the Indian highway, by the Humber and Holland rivers, to the Huron country and the trapper's and *voyageur's* lake route to the far West. Later years have justified the selection of the site, and made tributary to the city's commerce the trade of the Ontario Peninsula and of the vast and fertile plains of the Canadian Northwest. Toronto is 39 miles S. E. of Hamilton, at the head, and 160 miles S. W. of Kingston, at the foot, of Lake Ontario. It is 330 miles from Montreal and 500 miles from New York.

*Area, Plan, and General Features.*—Although not picturesque, in the sense that Montreal and Quebec are picturesque, for it lies too flat, Toronto is not lacking in natural and artistic beauty. Its chief adornment is its fine water front, as seen from the harbor or from the island, a large sandbank 6 miles long, which protects it from the lake. It covers an area of nearly 13 sq. miles, and includes within its municipal boundary, besides the city proper, the once outlying suburbs of Brockton, Parkdale, Seaton Village, and Yorkville. The site has a rising inclination toward the northern limits, $2\frac{1}{2}$ miles from the water front. The shore front extends from the river Humber, on the W., to Norway, in rear of Scarboro Heights, on the E., a distance of $5\frac{1}{2}$ miles.

*Streets, Parks, and Buildings.*—There are 260 miles of streets within the compass of the city, the names of many of them denoting an English origin. As a rule, they are well paved and lighted, are neatly laid out, regularly built, and cross each other, almost without deviation, at right angles. The business area lies adjacent to the water front and the esplanade, which is monopolized by the lake traffic and the railways. The residential portion lies chiefly to the northward, bisected by the city's great artery—Yonge Street—which extends to the northern limits of the county of York. This part is adorned by many attractive streets, the chief of which are Jarvis, Sherbourne, Church, Bloor, St. George, and Beverley Streets, all of which contain many fine churches, elegant villas, and prettily ornamented grounds. The business section is chiefly between Front and Queen Streets, and, extending parallel with the lake, from York Street to the market. The notable buildings within this area are the court-house and municipal buildings (completed and opened in 1900, having cost about $2,500,000), the custom-house, the post-office the Board of Trade building, the Bank of Montreal, Dominion Bank, Canadian Bank of Commerce, Canada Life, and Confederation Life buildings, Union Station (general railway terminus), the offices of the leading newspapers, several fine hotels and clubs, and the varied marts of industry, exchange, and wholesale and retail commerce. Toronto is rich in public parks, gardens, drives, theaters, and places of recreation and resort. High Park, in the western section, is the largest, and Queen's Park is the most accessible and attractive. One of the most popular summer places of amusement is the island which lies off the city front, and which bears the same relation to Toronto that Coney Island does to New York or New Brighton to Liverpool. The other open-air resorts, other than the public squares, comprise the Horticultural Gardens, Riverdale, Bellwoods, Ketcham, and Stanley Parks, and the exhibition-grounds and garrison common.

*Institutions.*—The principal educational institution is the Provincial University. In St. James's Square are situated the Provincial Educational Department, the Museum and Art Rooms, and the Normal and Model School buildings. Here are the headquarters of the educational system of Ontario. In the Queen's Park, approached by a wide street, a mile long, lined with chestnut-trees, is the Provincial University known as the University of Toronto. Affiliated with the university are the theological colleges adjoining, viz.: the Roman Catholic College (St. Michael's), the Presbyterian College (Knox), the Methodist (Victoria), and Wycliffe College, the theological training-school of the Evangelical section of the Church of England. There is also a School of Science affiliated with the university. Besides Wycliffe College, the Anglican communion has, in Trinity University, a fine academical institution and training-college, giving instruction in divinity, law, arts, music, and medicine. Higher education has an historic institution in Upper Canada College, at Deer Park. It was founded in 1829, and was modeled after the great public schools of England. Law has its representative home in Osgoode Hall, situated on Queen Street West, where are the great law courts of the province, together with the Convocation Hall and library of the Law Society of Upper Canada. The public and high schools are fifty-three in number, and the city's annual assessment for their maintenance is, independently of the provincial Government grants, about $600,000. These schools employ 588 teachers, two-thirds of whom are women, besides 128 teachers in kindergartens. The total registered attendance in 1900 was 35,189; the average daily attendance, 24,516; and the cost per pupil, on the basis of average attendance, $12.98. Besides the cost of education proper, the city taxes itself heavily on behalf of art, industrial, and night schools, and has equipped and maintains, on a liberal scale, a large number of hospitals, charities, and other eleemosynary institutions. The more important of these are the Toronto General Hospital and several smaller hospitals of a general character, the Protestant Orphans' Home, the Girls' and the Boys' Home, the Sick Children's Hospital, the Home for Incurables, the House of Industry, the House of Providence, the Convalescent Home, the Homœopathic Hospital, Women's Medical College, Industrial Refuge, and Mercer Reformatory. The parliament buildings of the province, a massive structure in the Queen's Park, contain, besides the single-chambered legislature, the library, the parliamentary committee-rooms, and departmental offices. Government House, the residence of the lieutenant-governor of the province (at present Sir Oliver Mowatt), is on King Street, at the intersection of Simcoe Street. The churches are many and beautiful. The older representative places of worship include St. James's Cathedral and St. George's church (Episcopal), St. Michael's (Roman Catholic), Knox and St. Andrew's (Presbyterian), Jarvis Street (Baptist), and Zion church (Congregational). There are not less than 160 places of worship, exclusive of mission-houses and the headquarters and branch barracks of the Salvation Army. The handsomer structures of a later date include St. Alban's Cathedral (Episcopal); St. James's, St. Andrew's, Central, Westminster, and Bloor Street (Presbyterian); St. Alban's, St. Paul's, and Broadway Tabernacle (Methodist); Bond Street and Hazleton Avenue (Congregational); and College Street, Immanuel, Bloor Street, and Walmer Road churches (Baptist).

*Government and Finance.*—The municipal affairs are administered by a mayor and board of twenty-four aldermen, representing the six wards into which Toronto is divided, aided by a board of control, composed of three salaried aldermen, and the mayor *ex officio*, in addition to which are committees in charge of the various civic departments. The annual civic disbursements exceed $6,000,000, about half of which is raised by taxation, a considerable sum in addition from fees, licenses, water-rents, and rentals from corporation property. The deficiency is made good from the sale of the city's debentures. Toronto's total net debt at the close of 1900 was about $16,285,309, against which the city owns property and other assets to the estimated value of $13,000,000, a large amount of which (the city waterworks) is revenue-producing. The value of the assessable real and personal property rose from about $62,000,000 in 1883 to $128,573,038 in 1900, on which, in 1900, the tax rate was 19½ mills. The gross revenue from taxation in 1900 was $2,855,597, from other sources $672,000.

*Commerce and Banking.*—Toronto shares with Montreal the repute of being the center of Canadian finance. In these two cities are the headquarters of the great banks of the Dominion, whose total assets, available in the main for the transactions of commerce, exceed $240,000,000. The city is the chief field of operation for twenty-eight loan companies and building societies, with a combined paid-up capital of over $20,000,000. Of great service also to the industrial and commercial interests of the city are the operations of the great Canadian and foreign fire and life insurance and loan and savings companies. As a commercial center the city has, if we except Montreal, at the head of tide water, no rival in the Dominion. The richest province in Canada is tributary to Toronto, and her trade ramifications extend not only from the Atlantic to the Pacific, but to other colonies of Britain, as well as to the chief foreign ports. It is difficult to ascertain with accuracy what is the aggregate volume of the annual trade. According to an official report, the value of imports for the fiscal year ending June 30, 1900, was $31,787,053, and the value of exports $9,506,811.

*Communications, Manufactures, etc.*—The industries include the manufacture of ships, marine engines, boilers, furnaces, stoves, heaters, safes, track and bridge spikes, bolts, nuts, carriage-irons, forgings, lead-piping, shot, saws, barbed wire, farm and factory implements, tools, threshers, white lead, paints, colors, sewing-machines, bicycles, pianos, organs, silver-plate ware, domestic, church, and office furniture, paper-hangings, window-shades, etc. There are excellent facilities for shipping and transport, and throughout the season of navigation steamers maintain communication with the principal routes of travel, and trade is carried on over the whole chain of lakes. Railways radiate also from the provincial capital in all directions.

*History.*—In 1884 Toronto commemorated the fiftieth year of its incorporation as a city, and in 1894 it commemorated the hundredth anniversary of the passing of the Constitutional Act of 1791, which set apart the province of Upper Canada and gave rise (1794) to the embryo capital. When Gen. Simcoe and the advance guard of civilization appeared on the site of the city, all that there was of human interest to greet the new comers were two families of Mississauga Indians. By the close of the century, however, much was accomplished. Toronto was fortunate, in its beginnings, in receiving among its sturdy early settlers a considerable contingent of United Empire Loyalists. During the war of 1812 the town, at that time called York, was twice sacked and burned by U. S. troops, though on one occasion at serious loss to the invaders. Recovering from this disaster, and receiving considerable accessions to its population, the town advanced apace. In 1834 it rose to the dignity of an incorporated city, having meanwhile largely extended its limits and gained a population of 10,000. Presently Toronto passed into its high prerogative era and accompanying period of political discontent, the issue of which was the rebellion of 1837, and the hard-won measures of reform, culminating in self-government. With the union (in 1841) of the two old Canadas, and the confederation (in 1867) of all the British North American provinces, Toronto forged ahead, and, aided by the railways, extended her bounds, increased her wealth, and made large additions to her population. At confederation she became the capital of the newly named province of Ontario and the seat of the provincial Government.

*Population, etc.*—In 1871 the population was 56,092; in 1881 it had increased to 86,415; in 1891, with the incorporating of its outlying suburbs, the population rose to 181,220. A special census, taking early in 1895, places the population at 188,914. The estimated population at the census taken Apr. 1, 1901, was 225,000.

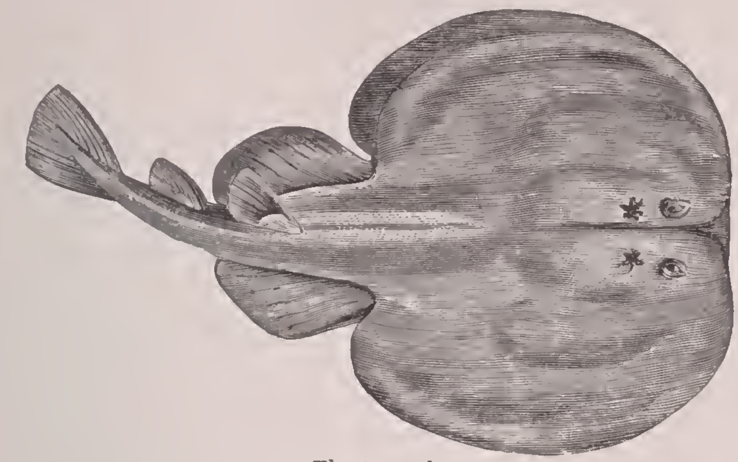
**Toronto**: village; Jefferson co., O.; on the Ohio river, and the Penn. Railroad; 9 miles N. of Steubenville, the county-seat (for location, see map of Ohio, ref. 4–J). It is principally engaged in manufacturing fire-brick, sewer-pipe, terra-cotta building materials, and pottery, and contains a private bank and a daily and a weekly newspaper. Pop. (1890) 2,536; (1900) 3,526. EDITOR OF "TRIBUNE."

**Torpedin'idæ** [Mod. Lat., named from *Torpe'do*, the typical genus, from Lat. *torpe'do*, *torpe'dinis*, torpedo, cramp-fish, liter., a numbness, deriv. of *torpe're*, be stiff, numb]: a family of skates (see RALÆ) noted for their electrical powers, which have caused them to be called cramp-fish, numb-fish, etc. About twenty species are known, but those most studied belong to the genus *Torpedo*, three of which occur in Europe and one (*T. occidentalis*) on the east coast of the

U. S. In these the body (including the pectoral fins) is a broad, rounded disk, the large fleshy tail resembling that of a shark. There are two dorsal fins on the tail, and the ven-



The torpedo.

tral fins are distinct from the disk. The mouth is of moderate size, the teeth pointed, and the skin smooth. The electrical organs, apparently formed by a metamorphosis of parts of the adductor and common constrictor muscles, occur on either side of the head, and receive their nerve-supply from the fifth (trigeminal) and tenth (vagus) nerves. Each organ consists of numerous hexagonal prisms, extending from the dorsal to the ventral surface of the body. The walls of these prisms consist of connective tissue in which run nerves and blood-vessels, while the prisms themselves are filled with gelatinous substance in which are "electrical plates" in which the nerves terminate, and which are apparently the modified motor end plates of the muscle. While the anatomy and physiology of these and other electrical organs have been extensively studied, the physics of the electrical generation is as yet unknown. The current produced will deflect a needle, decompose water, etc., and its production is under the control of the will. It is probably employed by the fish as a means of offense and defense. See F. Boll, *Archiv Anat. u. Phys.* (1873, 1876); Du Bois-Reymond, *Monatssch. Berlin. Akad.* (1881); Ewart, *Philos. Trans.* (1888, 1892); Gotch, *Philos. Trans.* (1887, 1888); different views are maintained by Fritsch, *Die elektrischen Fische* (Leipzig, 1887–90). J. S. Kingsley.

**Torpedo**: See Torpedinidæ.

**Torpedo Boats and Vessels**: those whose function in battle is the use of torpedoes as a principal weapon, or whose general employment is connected with the transportation of torpedo-supplies and with the maintenance of other torpedo boats and vessels in a state of efficiency.

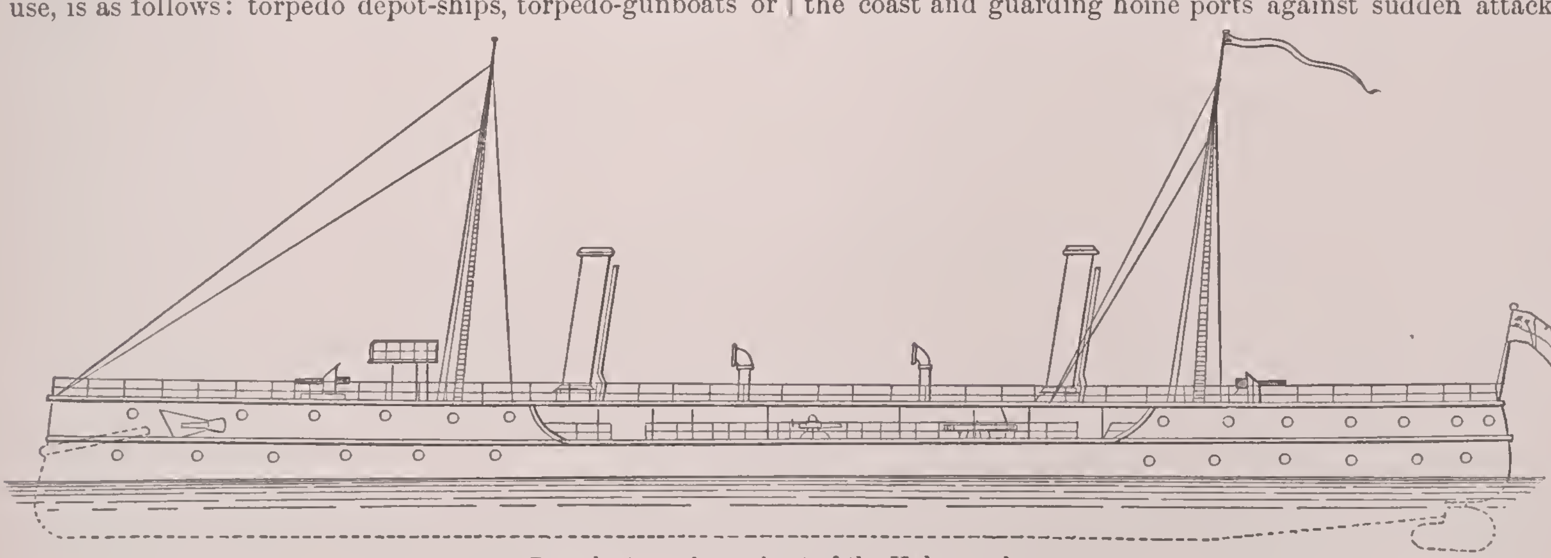
The classification of torpedo-vessels and torpedo-boats in the order of size, and employing such names as have survived among a somewhat perplexing variety at one time in use, is as follows: torpedo dépôt-ships, torpedo-gunboats or torpedo-vessels, seagoing torpedo-boats, and first, second, and third class torpedo-boats.

*Torpedo dépôt-ships*, otherwise known as torpedo-boat transports, torpedo supply and repair vessels, torpedo supply-ships and floating machine-shops, etc., are primarily designed to carry to any required distant point numbers of the smaller or third-class torpedo-boats, which are stowed in cradles on the upper deck in readiness for hoisting out at short notice and in quick time, powerful derricks and steam or hydraulic machinery being installed for this purpose. The torpedo dépôt-ship serves as a movable base from which these boats may operate, departing from an attack on an enemy anywhere within their radius of action, and returning after the attack has been concluded. Torpedo dépôt-ships are armed with a light-gun battery for defense and with automobile torpedoes for attack, and carry a supply of torpedoes and torpedo-stores, not only for themselves and for their own particular flotilla of boats, but sufficient to meet the demands of other boats of the squadron to which they may be attached. They are also equipped with forges and with the tools of a machine-shop, and are available for other repair-work than that of torpedo-boats alone, being of general utility in light repairs of the ships of the squadron and of their engines. They also carry submarine mines, with all the appliances for handling and planting them in any port to be defended, and the electrical appliances required for their operation.

The Vulcan in the British navy and the Foudre in the French furnish two good examples of the torpedo dépôt-ship.

The Vulcan has a displacement of 6,620 tons at a mean draught of 22 feet. Her length is 350 feet and breadth of beam 58 feet. A complete protective deck is fitted, having a thickness of from 2·5 inches to 5 inches over the machinery. The indicated horse-power on her trial was 10,250 maximum, and her speed $18\frac{1}{4}$ knots. Her radius of action is calculated at 3,000 miles for a speed of 18 knots, and 12,000 miles at 10 knots. The torpedo armament consists of automobile torpedoes, for whose ejection four launching-tubes are installed, two above and two under water. The gun armament comprises twenty rapid-fire guns. She carries on deck six torpedo-boats, two countermining launches, and a steam-pinnace. Two heavy cranes, 65 feet in height, worked by hydraulic machinery, are used for hoisting the boats in and out. She is well equipped with workshops and machinery for making repairs. The Foudre has a displacement of 5,970 tons at a mean draught of 20 ft. 2 in. Her length is 370 ft. 8 in., and breadth of beam 51 ft. 2 in.; protective deck, 1·7 to 3·4 inches thick; indicated horse-power, 11,400; speed, 19 knots. Armament, automobile torpedoes, for which five launching-tubes are installed, and sixteen rapid-fire guns, of which eight are 3·9-inch caliber, four are 9-pounders, and four are 3-pounders. She is designed to carry ten torpedo-boats.

*Torpedo-gunboats, or torpedo-vessels*, are a class which occupy what may be called the middle zone between the cruiser and torpedo craft. They are smaller in tonnage than cruisers of the third class and have a much lighter gun armament, and are, on the other hand, at the extreme of size and of weight of ordnance in the torpedo-boat category. They are of especial importance and value in being sufficiently large to keep the sea for a long period, patroling the coast and guarding home ports against sudden attacks by the torpedo-boats of the enemy that might be otherwise unopposed. They may also serve with efficiency as scouts and dispatch-vessels accompanying a cruising squadron. The Halcyon, of the British navy, is given as the latest improved individual of this type. The principal dimensions are as follows: Length, 250 feet; breadth of beam, 30 ft. 6 in.; displacement, 1,070 tons at a mean draught of 9



Dryad; torpedo-gunboat of the Halcyon class.

feet. Indicated horse-power, with natural draught, 2,500; with forced draught, 3,500. Mean speed on measured mile, with natural draught, 17·5 knots; with forced draught, 19 knots. The torpedo armament is of 18-inch Whiteheads, to be launched from five tubes, one tube fixed in the bow and four tubes mounted, two on each side on training-carriages. Two 4·7-inch rapid-fire guns constitute the gun armament, one on the forecastle and one abaft the mainmast. The steaming radius of action of the Halcyon class is 2,500 knots at 10 knots an hour.

To the Argentine Republic belongs an enlarged and improved vessel of the Halcyon type, the Patria, built by the Laird Brothers, of Birkenhead. The displacement is 1,183 tons. Five launching-tubes for torpedoes are installed, and she carries a rapid-fire gun armament of two 4·7-inch guns, four 8-pounders, two 3-pounders, and two machine-guns. Estimated maximum speed, 20 knots.

Closely allied to the torpedo-gunboat is the German torpedo division-ship, in which is also found the equipment of a torpedo supply and repair vessel. This type of vessel is built by Schichau. A summary of the especial characteristics required in these division-ships will serve to indicate their style of construction and the varied nature of the duties to be performed by them. As a class they are intended to serve the purpose of guiding a fleet or division of seagoing torpedo-boats; to have the same or even greater speed than ordinary boats; to be capable of safely riding out any gale; to be able to take on board a full inventory of stores and spare gear for a whole division; to be able to quarter a reserve force of men to replenish crews of boats reduced by casualties; to be fitted with complete workshop arrangements, smiths' forges, etc.; and to be provided with hospital accommodation for the sick and wounded. In common with other torpedo vessels and boats, they are to be armed with automobile torpedoes and rapid-fire guns to enable them to take an active part in an engagement; they are to be of sufficiently strong construction to enable them to ram a hostile torpedo-boat; to have as little draught as possible; to show little surface above the water, thus having small visibility and offering a small target to the enemy; to have large coal-carrying capacity and economical engines, to enable them to make long and fast voyages; and to be cheap in first cost and in maintenance. Division into as many water-tight compartments as practicable, and means for rapidly freeing themselves of water are not omitted.

Two of these having been built for the German Government, they gave such satisfaction that others were speedily ordered. They were 180 feet long and of 22 feet beam, with a displacement of about 250 tons. Each vessel, built throughout of the best steel, is divided into twelve water-tight compartments. The fixed torpedo-tubes, apparatus for launching, and the crew space are forward; abaft this is the workshop, fitted with all necessary tools and appliances; then come the boiler and engine rooms; aft are quarters for the commanding and other officers; next is the hospital; and next are the quarters of mates, etc. Store-rooms and coal-bunkers are judiciously distributed, the latter completely surrounding the boilers and engines. Launching-tubes and rapid-fire guns are distributed to best advantage on deck. The engines, working at 270 revolutions a minute, developed an indicated horse-power of 2,000. The speed on trial was 21 knots, the boat being fully equipped and carrying coal for 2,500 knots at the rate of 10 knots an hour. In a special storm trial for eight hours at full power against a very high sea and a gale of wind, a speed of 18 knots was maintained. A similar but larger boat of 300 tons displacement and 3,000 indicated horse-power, and of estimated speed of 21 knots an hour, was ordered by the Austrian Government.

In addition to services of guidance and care of the boats of its division, a torpedo division-ship will find useful employment in picking up the enemy at times when the torpedo-boats might be quite unable to find him; and also, by virtue of its weight and strength, in clearing passages through booms and in sweeping away nets from a protected vessel.

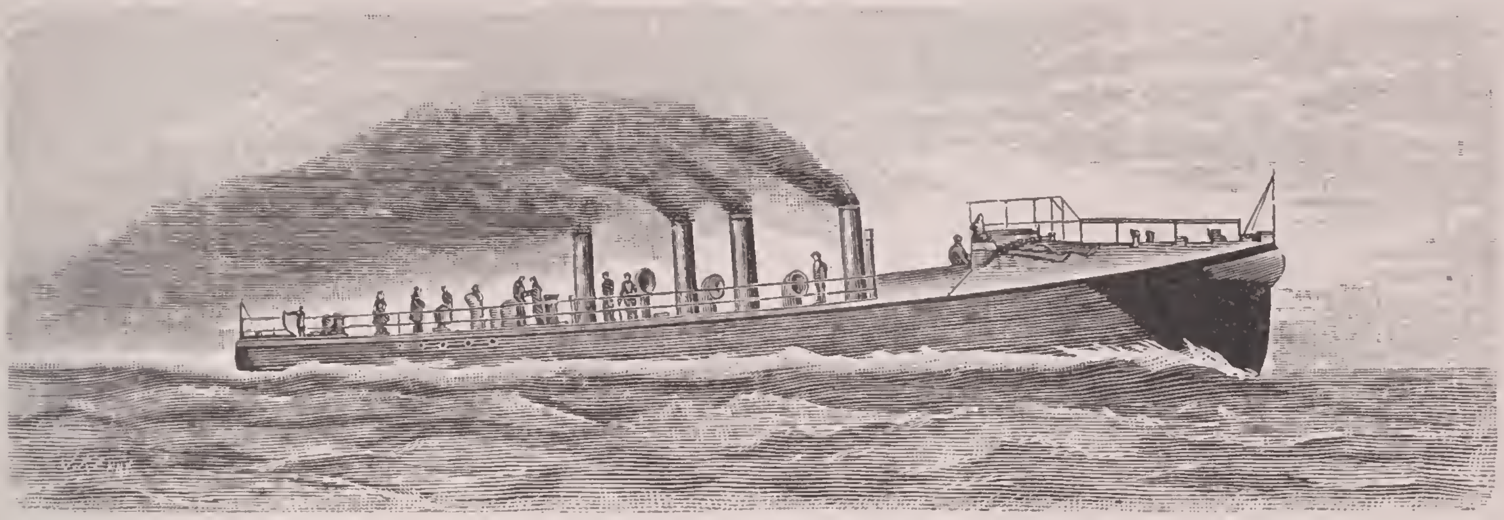
The latest size of this vessel in favor in Germany is of 220 tons displacement at a mean draught of 9·8 feet, 185·3 feet long, and 21·6 feet beam. In addition to the torpedo armament they carry a gun armament of six 37-millimeter Hotchkiss revolving cannon.

*Seagoing torpedo-boats*, often called torpedo-boat destroyers and torpedo-boat catchers, are the largest size of torpedo-boats designed to act independently and with a large radius of action, but without embodying any provision for the repair or maintenance of other torpedo-boats. In these, as in all other torpedo craft, the leading idea of construction has been to install the highest possible power in the smallest possible space compatible with seaworthiness, and to build with the lightest materials consistent with strength. Emulation has been great between maritime nations and among the builders of each nation to produce the boat of highest speed. Victory, resting from time to time with Thornycroft, or Yarrow, or White, of England, with Normand, of France, and with Herreshoff, of the U. S., now appertains to Thornycroft in the record of the torpedo-boat destroyer Boxer, which ran over the measured mile during her official trial at the amazing rate of 30·354 knots per hour, equal to 34·95 statute miles.

The accomplishment of such a result as this has been made possible only by the closest study of scientific principles, and their application in shaping the lines of the hull and in designing the machinery so that the maximum of power should prevail with the practical minimum of size and displacement. In no class of marine architecture has progress been more marked and persistent than in the development of torpedo-boats. Each improvement in naval construction and in marine steam-engineering has been incorporated whenever applicable. In these boats, of all classes, are found exemplified the best modern ideas. Twin screws of powerful lines are driven at a surprisingly high rate of speed by multiple-expansion engines, generally installed in pairs, fed with steam by a number of multitubular boilers whose heating surface is relatively large in comparison with the amount of water-space in the boilers. A large grate surface, with closed fire-rooms and forced draught, permits the generation of steam in sufficient quantity to run the boat in a very short period of time after starting the fires, and maintains the steam in quantity and in pressure for all demands made by the engines at their highest rate of speed. The fuel is selected with the greatest care that the best results may be obtained, hand-picked coal of the best quality being the fuel commonly employed at present. Liquid fuel, such as petroleum and other hydrocarbons, finds many advocates, but its successful use has not yet been established. Safety arrangements are in general use, not only in the form of water-tight compartments and great pumping-out power to insure against sinking in case of a damaging wound to the underwater body, but in and around the boilers and engines, to provide immunity from total crippling should any of these important adjuncts be injured. Each engine and each boiler is isolated from the rest, being placed each in a separate compartment, and the steam-piping so connected that they may act in unison or independently one of another. If one engine or any one of the boilers is crippled, it may be shut off from the rest without stopping the boat or withdrawing from action. Many boats have safety arrangements in connection with the boilers, such that in the event of the bursting of a boiler-tube, the furnace-doors are closed automatically, and the escaping steam finds its way out through the smokestack, being shut off from the fire-room, thus saving the firemen. In some boats, also, the furnace-doors are so constructed that in case of the flooding of any boiler compartment, the furnace-doors of that boiler may be closed water-tight and steam maintained in the boiler for a considerable period of time by the coal remaining in the furnaces. Protection to the inmates of the conning-towers is given by steel plating, and in the larger boats the machinery and boiler compartments are also steel plated, and they are additionally protected in all boats by the coal, which is stowed in bunkers surrounding the vital parts of the boat.

The Boxer belongs to what is known as the Havock type of torpedo-boat destroyers. The British naval estimates for 1894 provide for forty-two boats of this type, inaugurating a building programme which proposes sixty-four of these boats in all, on the basis of four for each battle-ship completed for the Channel and Mediterranean squadrons. The contracts for building these boats have been distributed among a large number of builders, and such as have been completed up to date have been marvels of success. The Havock, a Yarrow boat, the pioneer of the class, recorded a speed of 27·565 knots on her trial. The Hornet, also a Yarrow construction, made 28 knots over the measured mile. Following this, the Daring, a Thornycroft boat, made a mile at the rate of 29·268 knots an hour. Finally, the Boxer, also built by Thornycroft, attained the greatest speed known, of all vessels of whatever size, at the figure already given—30·354 knots.

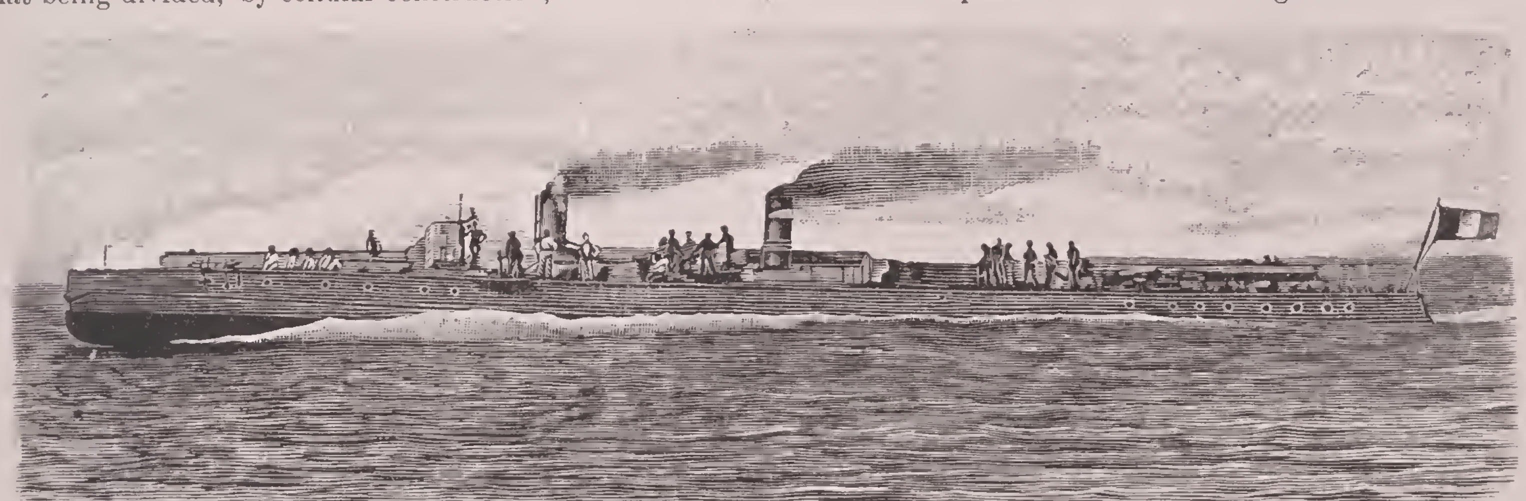
All boats of the Havock type follow very closely the general features of the original type, with the exception of certain minor changes in the design, and in a slight increase of size in the later boats. Each contractor has been allowed to install his own type of machinery and boilers. The dimensions of the Havock are as follows: Length on the load-water line, 180 feet; breadth of beam, 18 ft. 6 in.; displacement, 220 tons at a mean draught of 6 feet. The motive power consists of two triple-expansion engines, fed by two boilers of the locomotive type, with a grate surface of about 100 sq. feet, and a total heating surface of about 5,000 sq. feet. She has three-bladed twin propellers. Her radius of action is about 3,500 knots at a speed of 10 knots an hour. The torpedo armament consists of 18-inch Whitehead torpedoes, for the launching of which three tubes are fitted, one fixed in the bow and two on training-carriages, one on either side of the upper deck. Transportation of the torpedoes about the deck is facilitated by a transporting carriage which runs on a railway from the conning-tower forward to the launching-tubes aft. The gun armament consists of one 12-pounder Hotchkiss rapid-fire gun, mounted on top of the conning-tower, and two 6-pounder rapid-fire guns, abaft the turtle-back. A search-light is mounted on the upper deck. The complement for this type of torpedo-boat is forty-two men all told. Of the important changes in construction affecting the seaworthiness of the boat, the turtle-back may be noted as being carried much farther aft than in preceding torpedo-boats. In the Havock and others of the class the turtle-back extends to abaft the conning-tower, where it meets two high bulwarks and two low deck-houses, which give additional protection from water coming on board, to the deck abaft the conning-tower. Another novel feature is the construction of what is practically a double bottom in the forward part of the boat. This is effected by a water-tight flat at the level of the water-line, running from the eyes of the boat to the forward boiler-room bulkhead, the space under this flat being divided, by cellular construction, into lockers for ammunition, stores, etc. The boat has in all about twenty water-tight compartments, all connected to the bilge ejection. The Havock has two boilers of the locomotive type, with two smokestacks. The Hornet has eight water-tube boilers of the Yarrow type, with four smokestacks. The advantages of this large number of boilers are the avoidance of material diminution of the power developed in the event of the disabling of one boiler, and the facilitation of the removal of the boilers when necessary in making repairs. The Hornet's eight boilers weigh 43 tons, as against 54 tons, the weight of the Havock's two boilers. The boilers of the Daring and Boxer are the Thornycroft improved water-tube boilers. In the trial of the Daring the mean indicated horse-power developed was 4,573, with a maximum of 4,842, and the average number of revolutions of the propellers a minute, for a three hours' run over the measured mile, was 387. In her turning trials the boat's tactical diameter was found to be about 500 feet, and the time occupied in making a complete circle, at 210 revolutions, was 1m. 56s. A serious defect was found in the column of flame, which rose to a height of from 12 to 15 feet above the smokestacks when the boat was running at high speed, and which would render the boat visible at a great distance at night, and would offer an excellent target for the enemy.



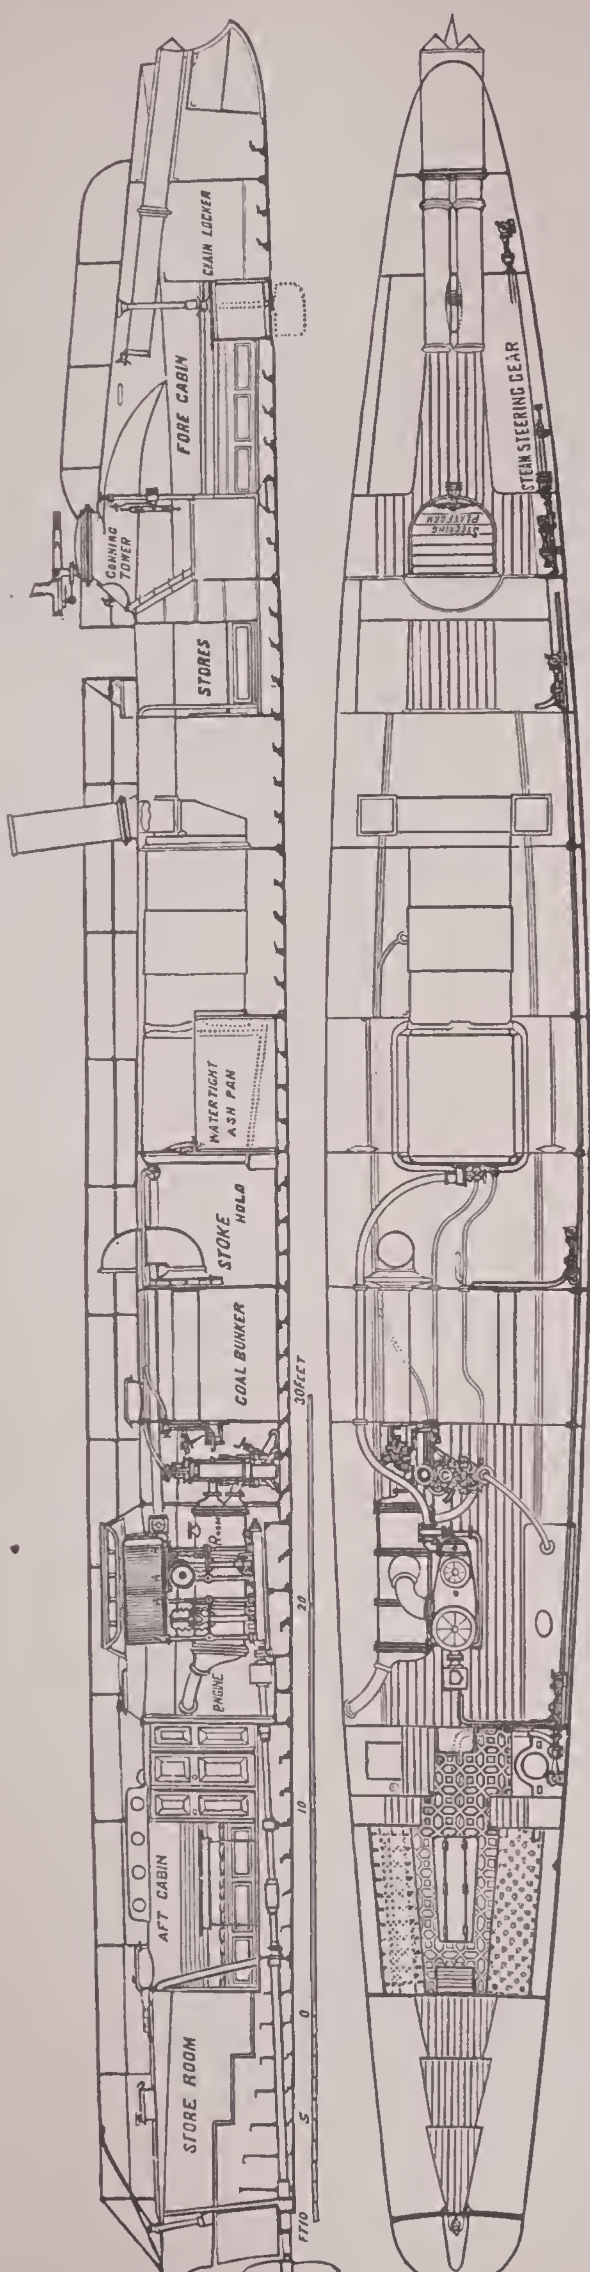
The Hornet; seagoing torpedo-boat.

A typical French boat of this general class, although much smaller, is the Chevalier, a Normand boat, of 125 tons displacement, with an average speed of 27·22 knots on a two-hours' trial. Her length is 154 feet; beam, 15·4 feet; and extreme draught, 6·2 feet. The armament consists of two 18-inch deck torpedo-tubes and two 1-pounder rapid-fire guns. Two Thornycroft boilers furnish steam for two triple-expansion engines, whose cylinders are respectively 15·8, 23·6, and 35·5 inches in diameter, with 15·8 inches stroke. Either one or both of the boilers can be used to feed steam to the engine.

*First and Second Class Boats.*—It is generally conceded, as the result of experience derived from many trials under all circumstances of weather and sea, that the minimum length necessary to an effective seagoing torpedo-boat is 150 feet. Boats under this length are properly classified, in the decreasing order of size, as first-class, second-class, and third-class torpedo-boats. The limiting lines of size and of tonnage in the three classes differ somewhat among different nations, but it may be generally stated that first-class boats are, as a rule, of from 100 to 80 tons displacement, second-class boats of 50 tons or less, and third-class boats of 15 tons and under. First and second class boats find their place in



Mousquetaire; French seagoing torpedo-boat.



Profile and plan of a first-class torpedo-boat.

the home-defense of ports. Stationed in numbers in different ports, or massed at threatened localities, by inland waterways, where such routes of communication exist, their presence would be a constant menace to an investing naval force, which, however powerful, would always be in danger of destruction whenever opportunity might offer for a sortie of the torpedo-boats. The following dimensions are those of one of the most recently constructed first-class boats: Length, 140 feet; breadth of beam, 15 ft. 6 in.; displacement, 110 tons at a mean draught of 5 ft. 4 in. She has engines capable of developing 2,000 indicated horse-power, and her maximum speed is 23·8 knots. Her torpedo armament is of 18-inch Whitehead torpedoes, for the launching of which three tubes are installed. The gun armament consists of three 3-pounder rapid-fire guns.

*Third-class boats* are designed to be carried on the upper decks of battle-ships, or of torpedo-boat transports, to be hoisted out when occasion for their employment arises. The third-class boats for the U. S. S. Maine and Texas, two for each ship, are excellent examples of the most advanced type of construction of this class of boats. The dimensions of the boats for the Maine are as follows: Length on water-line, 58 ft. 6 in.; breadth of beam, 9 ft. 1 in.; displacement, $14\frac{3}{4}$ tons. The boats are completely decked over, with the exception of two water-tight cockpits, one forward and one aft, and are divided into seven water-tight compartments. The boilers are water-tubular, with 12 sq. feet of grate surface and 440 sq. feet of heating surface. The engines are quadruple expansion, compounded, of the inverted, direct-acting form. A speed of 18 knots with 200 indicated horse-power is expected. The radius of action, at 10 knots an hour, is calculated as 500 knots. The torpedo armament is of 18-inch Whitehead torpedoes with one bow tube for launching, and the gun armament consists of one $1\frac{1}{2}$-inch rapid-fire gun. The complement is five men all told. The material of which the boat is constructed is steel. With the object in view of reducing the weight as much as possible, the Yarrow Shipbuilding Company has recently built, for the French torpedo-boat transport Foudre, an aluminium boat, 60 feet long and of 9 ft. 3 in. beam, and of a displacement of 10 tons; speed, $20\frac{1}{2}$ knots. The decrease in weight over similar boats built of steel is about 2 tons, and the gain in speed is about $3\frac{1}{2}$ knots.

*Submarine boats* are still practically in their infancy, although the idea is an old one. See the article SUBMARINE NAVIGATION.

The U. S. S. Vesuvius and the Destroyer, a boat sold by the Ericsson Coast-defense Company to the Government of Brazil during the war of the rebellion in that country in 1894, stand as unique examples of ingenious systems worked out to a practical accomplishment, but not yet generally adopted. The Vesuvius has a battery of three pneumatic guns designed to fire projectiles, known as aërial torpedoes, to an extreme range of one mile. These projectiles contain a large charge of high explosive which detonates, either on impact with the enemy, if a direct hit be made, or shortly after entering the water, with a torpedo effect, if the hull be missed. The Destroyer has for its leading feature an Ericsson submarine gun, fixed in the line of the keel and pointing directly ahead, from which a projectile containing a heavy charge of high explosive is discharged by gunpowder impulse. The projectile explodes on impact with the hull of the enemy below the water-line. The effective maximum range of this gun is 600 feet. See NAVY, SHIPS OF WAR, etc.

GEORGE F. W. HOLMAN.

**Torpedoes** [from Lat. *torpe'do*, torpedo-fish, to whose shocks its destructive explosions may be compared]: submarine devices containing explosives and designed to destroy hostile shipping. They are either contrivances propelled through the water so as to strike the enemy's ship or more or less stationary submerged mines, each so arranged as to be set off when a ship is over it. The germ of the idea is found in the Greek fire of the ancients, from which the torpedo has been naturally developed since the introduction of gunpowder into warfare.

*Historical Notes.*—The earliest "infernal machine" on record dates from the siege of Antwerp in 1585, where an Italian engineer, Zambelli, destroyed an important bridge laid by the enemy over the Scheldt, by setting adrift against it four scows, each carrying a masonry mine heavily charged with gunpowder. Ignition was to be effected either by a slow match, or by a gun-lock discharged by clockwork after the lapse of a certain time. One of these floating mines exploded against the bridge with tremendous effect, and thus stimulated investigation in a new field of warfare. Other similar attempts were made during the next two centuries by the French, British, and Russians, but, like the fiasco before Fort Fisher in the civil war in the U. S., they usually proved to be failures. The condition now regarded as essential in attacks directed against shipping, that the charge shall be submerged, was totally ignored. To an American engineer officer of the Revolution, Capt. David Bushnell, the credit is due not only of experimentally developing this principle, but also of devising a submarine boat, by which the first attempt to apply it to the destruction of an enemy was ever made. By his fertility of invention and persevering efforts to perfect the new weapon he justly won the right to be considered the originator of submarine mining as practiced at the present time. His first practical trial was made in 1776, use being made of his submarine boat, navigated by Sergeant Ezra Lee. The attack was directed against the Eagle, the flag-ship of Lord Howe, lying in New York harbor, and the vessel narrowly escaped destruction. In 1777 Bushnell caused the blowing up of a prize schooner, lying at anchor astern of the frigate Cerberus off New London, by means of a drifting torpedo which he had directed against the latter, and which was ignorantly taken on board the schooner. In the following winter he set adrift many torpedoes to annoy the British fleet in the Delaware, thus giving occasion to the so-called Battle of the Kegs, which was commemorated in a humorous song by Hopkinson, the author of *Hail Columbia.* Twenty years later Robert Fulton revived the general ideas of Bushnell, and attempted to introduce submarine warfare in the French navy. He made a submarine boat named the Nautilus, by which in Aug., 1801, he blew up a launch in the harbor of Brest—the first instance on record of a vessel destroyed by a submerged charge of gunpowder. Rejected by France, he next induced Great Britain to organize an abortive "catamaran" expedition against the French fleet lying at Boulogne. Although supported by Pitt, and successful in experimentally destroying the brig Dorothea by a drifting torpedo, his projects were finally rejected by the British Government as unsuited to the interests of a nation that enjoyed the sovereignty of the sea. Fulton returned disappointed to the U. S., where, after some successful experiments, he finally met a like repulse, largely through the active opposition of Commodore Rogers of the navy. He ultimately abandoned his efforts in submarine mining, as his attention became absorbed in steam-navigation. Although Fulton began his experiments by employing a submarine boat, experience led him to abandon this device. As finally rejected by the U. S. Government, his system included four classes of torpedoes: (1) Buoyant mines, anchored in the channel to be defended, and exploded by a mechanical device set in action by contact with the enemy's hull. (2) Line-torpedoes, designed to be set adrift and fouled by the cables of the hostile fleet at anchor. (3) Harpoon-torpedoes, to be discharged from a gun, and thus attached to a vessel and fired by clockwork. (4) Block ship torpedoes, to be carried on booms projecting from vessels of a peculiar type, and exploded by contact with the enemy. The modern system includes all these devices in a modified form, except the third—a fact which sufficiently shows how far Fulton was in advance of his age in appreciating the capabilities of submarine warfare. In the war of 1812 several abortive attempts were made by individuals to employ Fulton's system against British shipping in U. S. waters, but the Government took little interest in the operations, and no success was achieved, although considerable alarm was excited in the fleet of the enemy.

During the next thirty years torpedo warfare was neither forgotten nor neglected in Europe, as many writings abundantly prove, but it was left to Col. Samuel Colt, of Hartford, inventor of the revolving pistol which bears his name, to make the next great advance. It consisted in introducing, as the igniting agent, electricity, at that date considered rather as a toy of the philosopher's laboratory than as a practical force in engineering. Colt began his torpedo experiments in 1829 or 1830, and after years of labor elaborated a system of buoyant submarine mines, to be planted quincuncially in the threatened channel and operated by electricity. To convey the current he devised one of the very first submarine cables ever attempted, which in the winter of 1842–43 he successfully laid across East river, New York harbor. Gutta-percha was then unknown as an insulating material, and Colt employed a wrapping of cotton yarn soaked in asphaltum and beeswax, and, when used in exposed localities, inclosed in a leaden tube. When designed for torpedo purposes, each cable included two separate conductors, which,

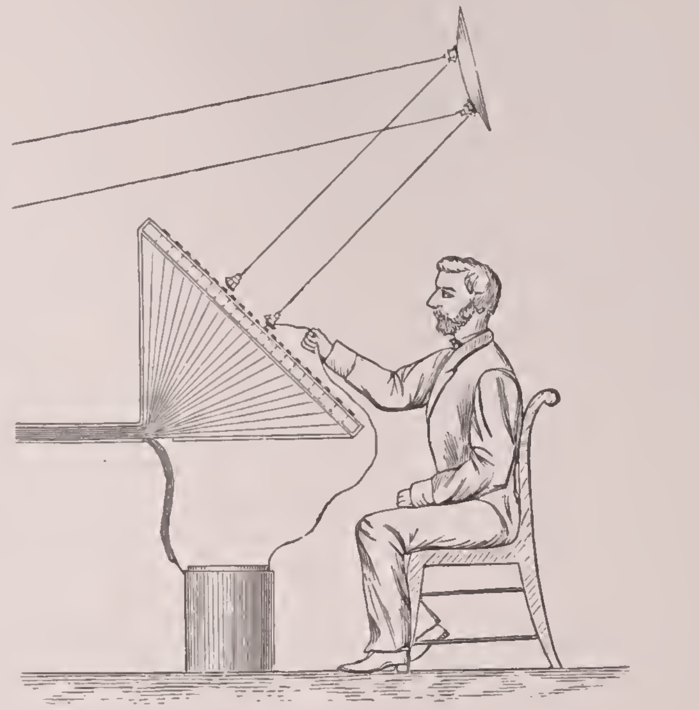


FIG. 1.

entering the mine, were united by a fine platinum wire imbedded in gunpowder. The operator, by sending at pleasure a strong current of voltaic electricity through this bridge, heated the platinum to redness and determined the explosion. For convenience of manipulation the shore-ends of the cables were all led to a casemate. The sketch shown in Fig. 1 was found among Colt's papers after his death, dated 1836; it represents one of his devices for igniting the mines at the proper instant, although it is of course applicable only to an elevated site. A secret believed to relate to a method of making the vessel telegraph her own position died with him. This sketch explains itself. One set of conductors from all the cables are united and permanently attached to a single pole of a powerful battery. The other conductors lead to a map of the channel, and each is secured at the point corresponding to the known position of its mine. The reflector is arranged to throw the image of the hostile ship upon the map, and as it passes over a wire terminal the operator with his other battery-wire closes the proper circuit and explodes the torpedo. Colt's experiments extended over a period of about fourteen years, the latter part of the time under the auspices and at the expense of the Government. He destroyed several vessels at anchor, and finally, on Apr. 13, 1843, accomplished the feat of blowing up a brig under full sail on the Potomac, operating his battery at Alexandria, 5 miles distant. This decisive trial was witnessed by many members of Congress and by the President, and its success at that date stamps Colt as a man of extraordinary ability. The time, however, was not yet ripe for the introduction of the new weapon, and, like those of his predecessors, Colt's plans were ultimately rejected by the Government.

The idea of submarine warfare, although dormant, was by no means dead, as various tentative devices prove; but it was not until the Schleswig-Holstein rebellion in 1848 that they appeared in actual warfare. Prof. Himly, of the Kiel University, then obstructed the entrance to the harbor of that city by barrel mines of his own invention, operated from the shore by electricity. No attack was attempted by the Danish fleet.

The Anglo-French war with Russia in 1855 furnished the next occasion for the application of submarine mines to harbor defense. Sebastopol, Cronstadt, and Sweaborg were protected in this manner by devices of Prof. Jacobi. Unfortunately for the success of his system, the charges were too small (25 lb.), and although explosions occurred under two or three British frigates, no serious damage was done. The fuze consisted of a small bottle of sulphuric acid imbedded in a mixture of potassium chlorate and sugar; the mechanical breaking of the bottle by contact with the vessel effected ignition. The great improvement of placing the igniting apparatus within the torpedo, independent of external levers, is due to Prof. Jacobi, who also made use of electrical mines to be fired by an operator on shore. Some abortive attempts at submarine mining were made by the

Chinese in the war with Great Britain in 1857–58, but they resulted in nothing. The Italian war of 1859 gave occasion for Col. von Ebner, of the Austrian Engineers, to employ in the defense of Venice a system of electrical mines more carefully elaborated than any which had preceded it, but no opportunity for practically testing its merits occurred.

It was reserved for American engineers to demonstrate upon a grand scale the important part which the modern torpedo can be made to play in maritime warfare. The civil war of 1861–65 offered conditions peculiarly favorable to its development. The Southern Confederacy was possessed of no fleet worthy of the name, while a long line of seacoast and many navigable rivers exposed its territory to easy assault by water. It could, therefore, well afford to sacrifice most of those routes of communication, provided they could be closed to the war-vessels of the Union. Every variety of torpedo became, therefore, admissible. After some preliminary trials, the service was formally legalized in Oct., 1862, and an efficient bureau was established at Richmond, which continually extended the scope of its operations until the end of the war. Seven U. S. ironclads, thirteen wooden war-vessels, and seven army-transports were destroyed by torpedoes, and eight more vessels were more or less injured. The Confederates lost four vessels by their own mines, and a fine ironclad, the Albemarle, by the counter-operations of the U. S. fleet. This wholesale destruction occurred chiefly during the last two years of the war; and if at its beginning the system had been as well organized as at its close, the influence which might have been exerted upon the naval operations of the Union forces can hardly be estimated. The details of the Confederate system were published to the world soon after the end of the war, and formed the basis for further investigation and development in many nations. The several devices may be grouped in five distinct classes—stationary torpedoes or submarine mines, automatic drifting torpedoes, infernal machines, offensive spar-torpedoes, and submarine boats.

*Stationary Torpedoes, often called Sea-mines.*—To form an obstruction in the channel which shall stop the enemy,

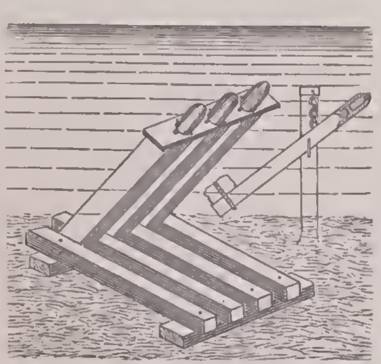

FIG. 2.—Frame and pile torpedoes.

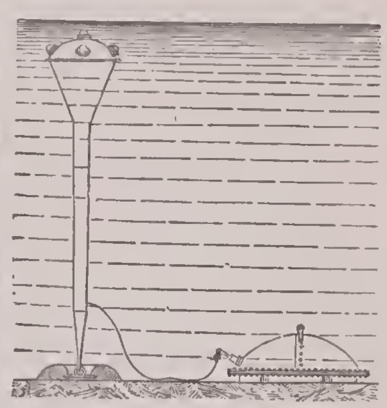

FIG. 3.—Swaying boom and turtle torpedoes.

either by his actual destruction or by his fear of it, is the object of this class. Several types were used. The frame-torpedo was one of the most simple. Each shell weighed about 400 lb., and contained 25 lb. of gunpowder. The fuze, consisting of a vial of sulphuric acid imbedded in potassium chlorate and sugar, was placed in the loading-hole, protected by a thin lead cap to be crushed by the vessel. The pile-torpedo, a similar pattern of mine, also shown on the figure, was found in the water-approaches to Savannah. The swaying-boom torpedo was a marked improvement upon this device, since, being free to move, it was not so easily discovered by dragging. To render it still more effective, it was often attached by a line to a "turtle" containing a fuze made upon the principle of an ordinary cannon-primer. The attempt to grapple and raise the boom-torpedo exploded this auxiliary, which was planted in front, so as to be well under the bottom of the enemy. The charge of the boom-torpedo was about 70 lb., and of the turtle 100 lb.; the whole device was called the devil-catcher. Another approved pattern was known as the Singer or Fretwell torpedo, invented by Singer and introduced by Fretwell. The principle of its action was similar to that of the "turtle," the charge (50 to 100 lb.) being fired by a percussion-cap acted upon by an external plunger released when the inverted saucer-cap was thrown off by the touch of the enemy. The weakening of the spring under continued tension, and the growth of seaweed and shellfish, were found to destroy efficiency after the torpedo had remained a few weeks in position. To obviate this difficulty—which is inherent to all mechanism acting externally—Gen. Rains, when in charge of the laboratory at Augusta, Ga., devised a fuse priming said to consist of fulminating mercury and fulminating silver, which was exceedingly sensitive, a slight blow being sufficient to cause detonation. Fuzes containing it, protected against

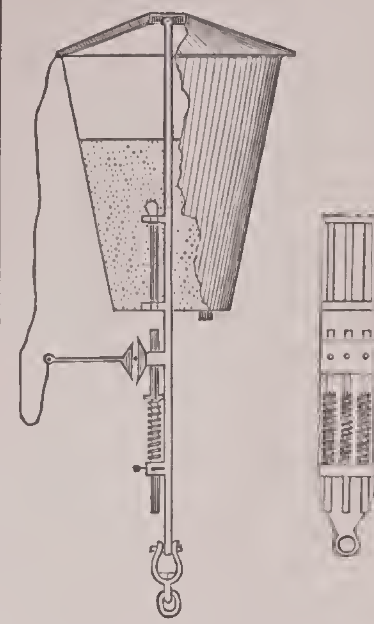

FIG. 4.—Singer's torpedo.

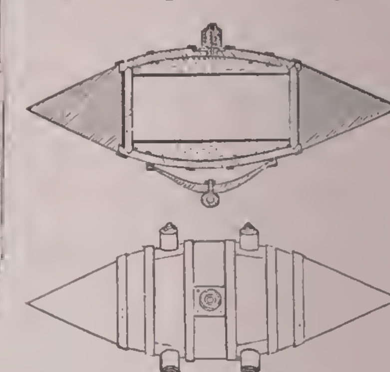

FIG. 5.—Barrel-torpedo.

moisture by a lead cap easily crushed by contact, were used in his barrel-torpedoes. These torpedoes contained from 70 to 120 lb. of gunpowder, conical ends of light wood being added to increase flotation and to strengthen the case. The Rains fuze served its purpose well, and was used in land-mines, in hand-grenades, and in several types of torpedoes. Lastly, electrical mines, to be fired by the act of an operator on shore, were employed; but the difficulty of procuring the requisite insulated cable restricted their use, and it is worthy of note that no attempt was made to make them automatic. The charges employed were usually enormous, amounting to 2,000 lb. of gunpowder. The Commodore Jones was destroyed on May 6, 1864, by a torpedo of this type. It was planted in a narrow part of the channel of James river, in about 35 feet of water, and was operated from a pit on the river-bank containing a small Bunsen battery. The Commodore Jones was allowed to advance safely over the mine, which was reserved for the flag-ship, but, the operator hearing the order given to return preparatory to a more thorough search for torpedoes, the vessel was blown up as she backed down stream. She appeared to be lifted bodily by the explosion, and was utterly destroyed, more than three-fourths of her crew being killed or wounded.

*Automatic Drifting Torpedoes.*—This class was especially designed for rivers where the current, setting in one direction, could be depended upon to sweep the apparatus down to the hostile fleet, and perchance to bring it into contact

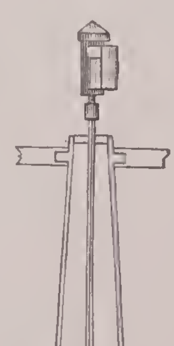

FIG. 6.—Drifting torpedo.

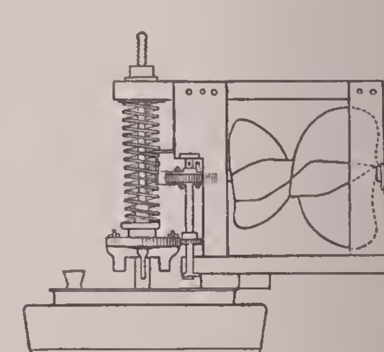

FIG. 7.—Current torpedo.

with some vessel. Night was often selected for the attempt, but the ease with which a ship at anchor may be protected by nettings rendered the several devices of little avail. The simple form shown in the figure was used in great numbers on the James river. A piece of slow-match was arranged to burn down the tube to the charge. These torpedoes were often caught by nets, but did no damage. A more complex arrangement is shown in Fig. 7. This torpedo was often set adrift, connected to a log by a knotted line, which, fouling the anchor-chain, would bring the former to rest under the bottom, when the current acting on the wheel would release the plunger and determine an explosion.

*Infernal Machines.*—This class of torpedoes is not generally considered to come within the limits of legitimate warfare as practiced at the present day, because it subjects non-combatants to great peril without any previous warning. It was designed to be smuggled on board the Union war-vessels or transports, and thus to effect their destruction. Two types were employed. The most simple was known as the coal-torpedo. It consisted of a metal case containing several pounds of gunpowder, cast and colored to resemble closely a lump of coal. When ignorantly thrown into the furnace it caused the explosion of the boiler. The Greyhound was destroyed in this manner on the James river, as were also several transports on the Western waters. The other type was known as the horological torpedo. It consisted of a case containing a large charge of gunpowder and a clockwork arrangement set to run for a certain time, at the expiration of which it released a plunger and fired the charge. A disastrous explosion was caused in the army powder-fleet at City Point in 1864 by an arrangement of this character which was placed on board one of the barges by a spy. At Mound City a similar explosion was effected.

*Offensive Spar-torpedoes.*—This form of the weapon afforded the best opportunity for the display of personal gallantry, and several officers won distinction in its use. An outrigger spar from 20 to 30 feet in length carried a torpedo designed to be brought in contact with the enemy's hull and exploded in a hand-to-hand conflict. The Confederates early supplied ram-torpedoes to their ironclad fleet, but a lighter pattern was chiefly used, operated from a special craft termed Davids, by reason of their small size and insignificant appearance as compared with their adversaries. The type used at Charleston was built of boiler iron and was about 35 feet long, shaped like a cigar, with a low combing to exclude the waves. Small engines driving screw-propellers gave a maximum speed of about 7 knots per hour. The torpedo was of copper, charged with about 50 lb. of fine gunpowder. Under cover of the night these boats approached the hostile fleet, trusting to suddenly dart alongside and discharge the torpedo with impunity in the confusion and alarm created by their sudden appearance. Another type of this class of boats consisted of an ordinary steam-launch equipped in a similar manner. Several of the Union war-vessels—the New Ironsides on Oct. 5, 1863, the Memphis on Mar. 6, 1864, the Minnesota on Apr. 8, 1864, and the Wabash on Apr. 18, 1864—narrowly escaped destruction, and the Confederate ironclad Albemarle was sunk at her moorings by this mode of attack. The latter feat was performed by Lieut. Cushing, U. S. navy, and for its exceptional gallantry it deserves a special description. The boat was an ordinary steam-launch equipped with a Wood and Lay torpedo and a brass howitzer. This torpedo was provided with an air-chamber, and at the proper moment was to be detached from its boom and allowed to rise under the enemy. A strong pull upon the lanyard then released the ball, which, falling on the percussion-cap, ignited the charge. Lieut. Cushing, with a crew of thirteen officers and men, advanced 8 miles up the Roanoke river, passing the Confederate pickets undiscovered. On approaching the Albemarle, moored to the wharf and protected by a pen of logs about 30 feet from her side, he suddenly darted upon her, and under a heavy fire exploded his torpedo against her bottom, thus sinking her. Most of his party were captured and some were drowned; Lieut. Cushing himself and one man escaped by swimming and threading the swamps to the Union lines.

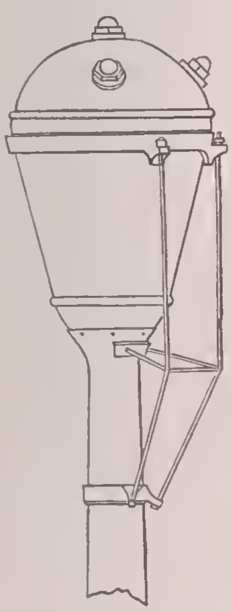

FIG. 8.—Spar-torpedo.

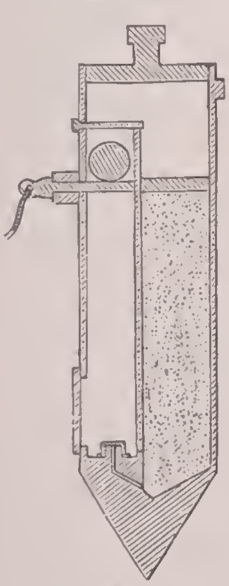

FIG. 9.—Wood and Lay torpedo.

The Schleswig-Holstein war of 1864, although short, afforded an opportunity for employing defensive mines, and one of the invading vessels was sunk through their agency. The Paraguayan war of 1864–68 furnished the next occasion for submarine warfare. Immediately after the Brazilian fleet entered the waters of that state a fine ironclad, the Rio de Janeiro, was sunk by two torpedoes against which she had struck. Subsequently a division of the fleet ran past the batteries of Curupaity, only to find itself entrapped between two lines of torpedoes, one in front and the other planted in rear, after the passage, to bar the retreat; the defective nature of these obstructions alone prevented a serious disaster. Later in the war the Tamandaré was crippled by a submarine mine. The Paraguayan torpedoes belonged to the anchored or drifting class, and the sulphuric-acid fuze was largely used. In the war between Austria and Italy in 1866 the harbors of Venice, Pola, and Lissa were obstructed by mines—the latter after the attack by the Italian fleet. No hostile trial of their efficiency was made. During the Franco-German war of 1870–71 no conspicuous use was made of torpedoes, but the German ports were protected by them, and the French contributed a new device to the list. It is known by the name of the "ball of Verdun," devised by Capt. Bussière, of the engineers, to destroy a military trestle-bridge thrown by the Germans over the Meuse a short distance below the fortress. It consisted of a large sheet-iron sphere over 3 feet in diameter, heavily charged with gunpowder and provided with a clockwork train, which after a certain time was to discharge a pistol and thus ignite the mine. It was but little heavier than water, and was carefully adjusted so as to make the center of figure and of gravity coincident. A body fulfilling these conditions will be rolled along the deepest part of the channel by the current, and will, of course, be far more difficult of detection than a floating object. The capitulation of the fortress prevented a trial of its efficiency, but many letters were introduced into Paris during the siege by similar balls caught by nets spread for the purpose. In the Russo-Turkish war of 1877–78 the Russians made decisive use of torpedoes. Through their agency the armored fleet on the Danube was held in check without the aid of a single Russian war-ship, and successful invasion was rendered possible. The channel was obstructed by mines at strategic points, and an attack with spar-torpedoes upon the fleet where it had taken refuge in the Matchin branch resulted in sinking the monitor Duba Saife and so completely demoralizing the Turks that no further attempt was made to defend the river. For this gallant exploit the names of Lieuts. Dubasoff and Chestakoff will remain associated with that of Cushing. The Russian ports on the Black Sea were defended against an overwhelming superiority in naval power, directed by Hobart Pasha, through the moral influence of their submarine defenses. A Turkish gunboat, the Suna, was sunk by a contact-mine at the Sulina mouth of the Danube. Eight attacks were made by the Russians, use being made of spar, Harvey, and Whitehead torpedoes. Two of them were successful. In one a steamer was sunk at Batoum on Jan. 25, 1878, by a Whitehead torpedo, the first triumph of the weapon on record. Two failures had preceded, one by the British cruiser Shah against the Peruvian Huascar on May 29, 1877, and the other by the Russians at Batoum on Dec. 20, 1877. In the war between Chili and Peru in 1880–81 both parties made use of torpedoes, but without noteworthy results, except perhaps to throw discredit on the Lay torpedo. During the Franco-Chinese hostilities in 1884–85 two naval vessels were sunk by the French with spar-torpedoes, proving that this weapon is not wholly superseded. During the Chilian revolution of 1891 several attempts were made with Whitehead torpedoes, one of which was successful in sinking the battle-ship Blanco Encalada and over 150 of the crew. During the war between Japan and China in 1894–95 submarine operations played only a subordinate part. At the battle of the Yalu, the Chinese fired four or five torpedoes ineffectively, while their adversaries appear to have made no attempt to use the weapon. At the attack on Wei-hai-wei, the Japanese torpedo flotilla entered the harbor on two successive nights, and succeeded in sinking three or four vessels, two of which were armored ships of war. No effective use of submarine mines is reported.

From the foregoing *résumé* it is apparent that torpedoes are no longer to be regarded as experimental devices, but that they have become recognized weapons of maritime warfare, admitting of very varied applications. They may be employed offensively in the combats between hostile vessels, or they may be used defensively to repel an apprehended attack upon a harbor or district by preventing the passage of the enemy's squadron through the channel of approach. Entirely different principles of construction and of manipulation mark these two classes of the weapon. The former requires the technical skill of a sailor to move the charge into position and explode it within destructive range. The latter differs in no essential respect from the mines so long employed in the defense of land fortifications. Accordingly, in Great Britain, the U. S., and some other countries possessing an extended seacoast, the service of torpedoes has been divided between the navy and the engineers of the army—the former operating offensively afloat, and the latter defensively from the shore. The U. S. naval war college is at Newport, R. I., where the needful investigations are conducted, and where classes of officers receive regular instruction in the use of the new weapons. The naval torpedo station also is at Newport, but at this instruction is given to seamen qualifying for the grade of seaman-gunner only. The army school is at Willets Point, New York harbor, where the subject is experimentally studied, and where the officers and the enlisted men of the engineers are exercised in all the duties of defensive submarine mining. While in general the line of demarkation between the two services is thus plainly marked, some of the weapons—such, for example, as fish-torpedoes steered by electricity—may be conveniently operated either from land or from shipboard, and they would be used in war either by army or navy as occasion might offer.

*Offensive Torpedoes.*—In offensive torpedo warfare many devices have been proposed from time to time, and subjected to systematic trial by naval officers. The Harvey torpedo belongs to this type. The charge is contained in a narrow copper vessel, encased in wood strapped with iron, and so ballasted as to ride vertically in the water. A towline of wire rope passes from the slings of the torpedo through a block on the yard of a fast steamer to a reel fitted with a brake on her deck. The enemy is passed at full speed, with the torpedo diverging at an angle of about 45° from the quarter, and the course is so directed as to bring the weapon in contact with his hull. Just before striking him the torpedo is made to dive by suddenly slacking the tow-line, and then to rise under his bottom by checking it with the brake. Explosion is effected through the agency of the projecting levers, which when struck either detonate a contact fuze or close an electric circuit, and thus cause the passage of a powerful current through a platinum fuze. These torpedoes are made of various sizes, one of the largest patterns being 4·5 feet long, 2 feet deep, and 6 inches wide, designed to contain 100 lb. of guncotton or dynamite. The requisite flotation is given by the cork buoys, *a a'*, as when at rest the torpedo sinks by its own weight. This weapon was devised by a skillful sailor, Capt. Harvey, of the Royal Navy, and he claims that it can be successfully used on the high seas even during a gale; but although formerly adopted by several European nations and highly commended, it failed in the Russo-Turkish war (1877–78) and has passed out of use.

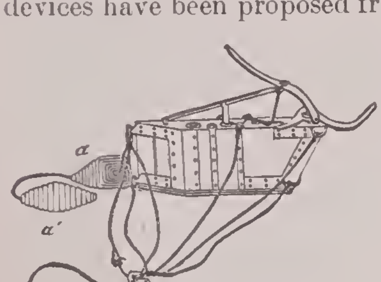

Fig. 10.—Harvey torpedo.

A more successful type of offensive torpedo is that known as the Whitehead. The idea developed by this weapon is due to an officer of the Austrian marine artillery, but the first practical trials were made in 1864 by Robert Whitehead, superintendent of iron-works at Fiume, acting upon the suggestions of Capt. Lupis, an officer of the Austrian navy. The torpedo has undergone great improvements between that date and the present time, and the right to use it has been purchased by the U. S. and by most European nations. The latest type consists of an iron and steel vessel in the shape of a spindle of revolution. It is driven by a propeller moved by compressed air. The 18-inch pattern adopted by Austria is claimed to have a speed of 32 or 33 knots for a run of 437 yards, and of 30 knots for one of 875 yards. The latest British pattern carries a charge of 250 lb. of guncotton of 12 per cent. moisture, with a 16-oz. detonator of dry guncotton. The torpedo can be projected from a launching-tube or started by hand, and is capable of regulating and preserving its depth and direction, within narrow limits, in still water; but cross-currents or seaweed may introduce large variations. It can be set to explode on contact or after a definite time, and either to sink or rise to the surface after finishing its course. The Schwartzkopff torpedo is essentially a Whitehead encased in phosphor-bronze instead of steel. The Howell torpedo, devised by a U. S. naval officer, and patented in 1871, has been slowly developed until it has become a formidable rival of the Whitehead, from which it differs chiefly in motive power. This is derived from the rapid revolution of a heavy fly-wheel transmitted to the propeller shafts by beveled gearing. A speed of 22 knots and, what is more important, an inherent directive force giving great precision of fire are claimed. The U. S. Naval Department has purchased several Howell torpedoes for service, as well as Whiteheads.

Submarine rockets, carrying explosive charges and started from submarine guns, have received and are receiving attention, both in the U. S. and in Europe. Such a weapon, if its course can be successfully controlled, will be especially dangerous in the combats of ironclad vessels at short range, since the blow, being delivered under the armor, can not fail to achieve decisive results.

The fish-torpedo steered and controlled by electricity was first patented by Lieut.-Col. Ballard, Royal Engineers, in Aug., 1870, and again by Lieut.-Col. Foster, U. S. Engineers, in 1872. It has been independently elaborated by Mr. Lay and H. J. Smith in the U. S., and by Col. von Schelīha in Russia. The claim to priority in the invention has been the subject of litigation; but the decision of the commissioner of patents (June 13, 1873) has awarded it to Mr. Lay, whose boat has also been brought most conspicuously before the public. This type of torpedo consists essentially of a boat of the Whitehead class, which carries and unreels a coil of insulated wire through which the electric current from a battery on shore or on shipboard can be passed at will to certain electro-magnets. By closing and breaking the circuit, and reversing the direction of the current, valves connected with the motive power are controlled, and thus the rudder may be put to starboard or port, and the engine may be started or stopped. In this manner the motion of the fish is under perfect control from the instant of starting. The motive power may consist of liquefied carbonic acid, or ammonia, or compressed air, or steam peculiarly applied. The boat may be made to move at the surface or below it. Her position is known to the operator from two small flags carried near the water-level, which at night are replaced by two lanterns shaded in front so as not to be seen by the enemy. Any of the modern explosives may be employed, and detonation results from the action of a mechanical fuse or of a circuit-closer and battery. The Lay torpedo proper has been superseded by later patterns; it was a surface boat driven by liquefied carbonic acid. Exposure to projectiles and freezing of the motive power during expansion were among its inherent defects. They have been obviated in its successors, the Wood-Haight and the Patrick, by submerging the torpedo under an unsinkable float and by heating the carbonic acid during the run with sulphuric acid and lime placed around the pipes. A mile has been traversed in an official trial at a speed of 19 miles per hour. A controllable torpedo was proposed by Capt. Ericsson, who supplied his motive power to the engine by a flexible tube drawn after the boat. This motive power was compressed air generated by an engine near the operator; and by regulating the supply the boat was steered without the aid of electricity. A movable torpedo invented by Mr. Sims has been developed at Willets Point since 1879. All parts vulnerable to machine-guns are submerged. It is moved and controlled by electricity conveyed by a cable from a dynamo on shore to an electric motor on board. The charge is 400 lb. of explosive gelatin. The boat, carrying 11,000 feet of cable, had attained in 1885 a speed of about 10 miles an hour in a run of 2 miles, the turning radius not exceeding 300 feet. This was accomplished with a difference of potential at the poles of the dynamo under 350 volts, and a current under 35 amperes. In 1886 Mr. Edison became associated with Mr. Sims in the invention. A new experimental boat was prepared carrying 6,000 feet of cable, and with improved electrical conditions (1,200 volts and 30 amperes). With this torpedo a speed of about 19 miles an hour for a short run has been obtained; but that these conditions do not overstrain the insulation resistance of any cable the boat can carry has not been proven. The full range of 11,000 feet is regarded as essential in a torpedo suited for defending the harbors of the U. S. The Brennan torpedo has been developed by the Royal Engineers at Chatham, and has been adopted by the British Government. The motive power is supplied by unreeling piano-wire from two drums on board to two drums on shore, the latter driven by a steam-engine of 100 horse-power. A speed of 20 miles an hour, a range of 1·5 miles, and limited lateral control are claimed. The depth of submergence is regulated by a modified Whitehead device, and the position is known from a single steel mast. The charge is 200 lb. The torpedo is operated from an elevated site with the wire in air. Among other experimental torpedoes of this class may be named the Victoria, the Berdan, and the Halpine. The proper field of this weapon appears to be the protection of mine-fields, through which it can pass without doing injury. To a counterminer their anticipated attack would be disheartening. The complexity inherent in their construction, and the consequent large percentage of failures in their attempted runs, have heretofore militated strongly against their adoption in actual service.

*Defensive Torpedoes.*—To understand the full importance of the submarine mine in defending the great seaports of the U. S. against hostile fleets, it is necessary to consider the changes in ships of war which immediately preceded its introduction. Before the invention of the screw-propeller, vessels in attacking forts were at the mercy of winds and currents; and long experience proved that one gun ashore was more effective than many afloat. Moreover, since stone walls were more resisting to shot and shell than bulwarks of oak, the rule introduced into land defense soon after the invention of gunpowder, that no masonry must be exposed to a direct fire of artillery, could be ignored in water-batteries, thus rendering it easy to mass the guns and provide a heavy fire against hostile shipping, even where the site was restricted. The screw-propeller, followed shortly after by armor-plating and big guns afloat, effected a radical change in the conditions of the problem. The fleet was now free to steam rapidly past the batteries under favorable conditions not before practicable. The class of guns required to assail the armor-plating with a reasonable chance of success was far more bulky and difficult to manœuver than the former armament of the forts; moreover, it was considered that earthen parapets and substantial traverses must take the place of the compact masonry casemates heretofore in use. The defense thus found itself at great disadvantage. The hostile ships of war, more under control, less vulnerable, and possessed of much higher speed, were to be encountered by guns more unwieldy, and, in most of the harbors, much fewer in number from the naturally contracted sites available for the earthen batteries. The attention of military engineers was thus urgently directed to the devising of some obstruction which, by holding the enemy under fire and depriving him of the comparative immunity resulting from a high rate of speed, should restore to the defense its lost superiority. The modern submarine mine has accomplished this vitally important object. Evidently, if through its influence the guns can be fired 100 times at a slowly moving ship, instead of once at a rapidly passing enemy, the effective power of the battery is multiplied more than 100 times. Independently, therefore, of its own destructive power, the defensive torpedo has become an essential auxiliary of the land gun. Indeed, they are inseparable in a judicious system of harbor defense, for, while the former is necessary to developing the full power of the latter, the latter is no less essential in protecting the former against the operations of the enemy; for it is an admitted principle that electrical submarine mines can not defend themselves without the aid of flanking guns to keep off boats, and of a fort secure against assault wherein to place the necessary batteries and operating apparatus. The trifling expense and superior power of this combination as compared with monitors for harbor defense has effectually disposed of the latter, which at one time were popularly believed to be the only dependence in the future for protecting the great seaboard cities of the U. S. against the dangers of a bombardment. They are now reduced to the grade of a useful auxiliary reserve force, which should not be neglected in a few of the large harbors. The navy is thus released from an irksome confinement to a defensive warfare in ports, and is free to strike effective blows where the enemy may be most vulnerable to attack, and where he will fear something more than a simple repulse as the result of an unfortunate naval action.

Some of the more important of the recent improvements in submarine mining are the following: The modern explosives (see EXPLOSIVES) have largely superseded gunpowder, because greater power with less bulk may thus be secured. The latter is an important matter, since upon the size of the torpedo depends the depressing effect of the current, and hence the amount of buoyancy necessary to keep the case always high enough to be touched by the enemy in passing. This buoyancy of course regulates the weight of the anchors and the size of the mooring connections, and, in fact, the principal dimensions of the system. The increase in intensity of explosive action is also important, for efforts are being made to give increased strength to the hulls of war-vessels by employing iron in the form known as the double-cellular bottom, thus reducing the destructive range of the torpedo, and exacting the employment of more powerful charges. In England experiments upon the Oberon, a vessel of this type, have shown that the horizontal destructive range of guncotton in charges even as large as 500 lb. is restricted to a few feet. This charge was fired on the bottom in 48 feet of water at horizontal distances from the ship of 100, 80, 60, 50, and 30 feet, and finally vertically under her side. Although she was much shaken and injured by some of these shots, only the last burst through the double bottom and sunk the vessel. At the engineer school of defensive submarine mining at Willets Point, N. Y., a long series of trials has been conducted to determine the effective range of different charges of various explosives sunk at different depths below the surface; and by the careful measurements of several hundred explosions the matter has been successfully brought within the scope of mathematical analysis. The formulas and results have been made public, and they confirm the fact of restricted destructive range.

Electricity is now chiefly used as the igniting agent in submarine warfare, because this enables the obstructed channels to be safely traversed by friendly vessels. The mines are usually arranged to be fired at will, or automatically by the touch of the vessel. By the use of proper fuzes (see FUZE) ignition may be effected with certainty. To cause the explosion to occur automatically by the touch of the vessel, a device called a circuit-closer or circuit-breaker, according to the circuit chosen, is employed. Many ingenious devices have been proposed. Even for contact-mines unconnected with the shore, and hence under no control, electricity is now available for ignition; and its use largely reduces the danger of handling and planting the mines. A small battery is placed in the torpedo or in a hollow anchor under it, and its circuit is closed by the enemy.

In the matter of torpedo cases, experience has shown that metal, usually steel, must be employed where the mines are to remain submerged for long periods. Wood in such cases can not be trusted to exclude water, although lager-beer kegs supply a good temporary expedient. It is an essential condition that the form shall be symmetrical, in order to reduce the tendency to rotary motion to a minimum. Wire rope is found to supply the best moorings. The electric current is conveyed by armored cable, not unlike that employed for the Atlantic telegraphs. To avoid a multiplicity of cables, as well as to reduce cost, several different cores are often united in a bundle and included in a common armor.

While the details of the system of submarine mines in use in the U. S., as elaborated by the writer at Willets Point, are not made public, its general features were exhibited at the Centennial Exhibition at Philadelphia in 1876, and are as follows: Two types of electrical mine are in use, the ground and the buoyant. The former is employed in comparatively shallow water, and consists of a case resting upon the bottom and containing a large charge of dynamite. Floating near it, but so far below the water-surface as to be concealed from view, is a buoy carrying a circuit-closer to regulate the current through a fuze imbedded in the former. The buoyant mine is designed for use in deep water, and consists of an anchor holding in position a torpedo floating just below the surface; the latter contains the charge of dynamite, the fuze, and the circuit-closer. If desired, the latter may be carried by a separate buoy so placed that when touched by outriggers or other torpedo-catchers, the mine will be directly under the vessel. The channel to be defended is thickly studded by lines of these mines, so arranged with respect to each other that no vessel can pass without coming in contact with one or more of them. Single-conductor electric cables running from each mine combine in multiple cables, and are extended through a subterranean gallery to a secure bombproof casemate within the fort, where is placed the apparatus by which, at the will of the operator, the mines may be fired by judgment, or be rendered either inert or automatically explosive when struck by a vessel. The system is arranged to permit easy electrical tests, by which any injury at once becomes known, as well as its nature and locus. Wires also extend from the casemate to flanking guns, so that if a boat succeeds by night in cutting a cable or in disturbing a mine, by so doing it draws upon itself a heavy automatic discharge of canister, grape, or shrapnel, according to its distance from the fort. Electric lights are arranged to sweep the lines of mines, and thus give additional security against hostile operations conducted under cover of the darkness. The casemate is connected by telegraph with a lookout, so that the whole system is under the perfect control of an officer who can see what is required, and instantly give the needful orders. For instance, a vessel might be chased by an enemy's cruiser. She could pass with absolute safety the mines, which for her pursuer would at once become deadly engines of destruction.

Detailed maps and plans for the torpedo defense of all the most important channels in the U. S. have been carefully prepared by the board of engineers for fortifications, and are on file in the engineer department at Washington. The casemates and galleries for the introduction of the cables have been actually constructed at several forts. Large stores of torpedo material are being accumulated at Willets Point, where engineer troops receive the training needful to prepare them, in case of sudden war with a maritime power, to plant and operate the defensive mines along the extended seaboard of the U. S. HENRY L. ABBOT.

**Torqua'tus**, TITUS MANLIUS: a member of the celebrated patrician family, the Manlian gens, of ancient Rome; received his surname TORQUATUS in 361 B. C. for slaying a gigantic warrior among the Gauls in single combat on the Anio, and ornamenting himself with the neck-chain (*torques*) of the fallen foe. He was several times consul and dictator, and finished the wars with the Latin League. During one of his campaigns he forbade all single combats. His son, nevertheless, fought with a Latin warrior and slew him, but when he returned to the camp and laid the spoils at the feet of his father, he ordered him to be punished with death: hence the expression, *Manliana imperia*, common in Latin literature.—Another member of the same family, LUCIUS MANLIUS TORQUATUS, was a conspicuous member of the Pompeian party in the civil war. He was prætor when the war broke out in 49 B. C., fought under Pompey at Dyrrachium, went to Africa after the battle of Pharsalia, and was taken prisoner and killed at Hippo Regius in 46 B. C. He was a friend of Cicero, and is introduced by him in his dialogue *De Finibus* as the advocate of the Epicurean philosophy. Revised by C. H. HASKINS.

**Tor'quay**: town; in Devonshire, England; on Tor Bay, an inlet of the English Channel, 23 miles S. of Exeter (see map of England, ref. 15–E). It contains St. John's church, a fine example of modern Gothic architecture, a town-hall, a museum, and a theater. On account of its equable climate, freedom from fogs, and beautiful scenery, it is much frequented as a health resort and watering-place. It has a good harbor, which is used as a yachting station. Pop. (1891) 25,534.

**Torque** [from Lat. *tor'ques*, a twisted neck-chain, deriv. of *torque're*, twist]: a twisted and bent rod, often of gold, worn as a personal ornament upon the neck by the ancient Celts and other rude races of the Old World.

**Torquema'da** (Lat. *Turrecrema'ta*), JUAN, de: cardinal; b. at Valladolid, Spain, in 1388; entered the Dominican order of friars in Valladolid 1403; was present at the Council of Constance 1417; afterward pursued the study of theology at the University of Paris, where he graduated 1424; became an instructor there; was successively prior of the Dominican convents at Valladolid and Toledo; was called to Rome by Pope Eugenius IV., by whom he was made master of the sacred palace 1431; was papal theologian at the Council of Basel, where he contributed to the condemnation of the doctrines of Wycliffe and Huss, and advocated the doctrine of the Immaculate Conception; participated in the same capacity in the Council of Florence 1439, where he drew up the project of union between the Greek and Latin Churches, for which he received from the pope the title of defender of the faith and the rank of cardinal; attended the Council of Bourges 1440; became Bishop of Palestrina 1455, and of Sabina 1464. D. in Rome, Sept. 26, 1468. He was the author of *Meditationes* (1467); *Expositio brevis et utilis super toto Psalterio* (1470), which were among the earliest productions of the press at Rome; *Quæstiones Spiritualis Convivii Delicias præferentes super Evangeliis* (1477); *Commentarii in Decretum Gratiani* (Lyons, 6 vols., 1519); of a treatise on the Church and the authority of the pope, on the body of Christ against the Bohemians, on penance, on the Council of Florence, on the Immaculate Conception, and other works. Revised by J. J. KEANE.

**Torquemada**, JUAN, de: historian; b. at Valladolid, Spain, about 1545. When a young man he went to Mexico, where he entered the Franciscan order; he became an adept in the Nahuatl language, was professor in the Tlaltelolco College, and from 1614 to 1617 was provincial. Torquemada is best known for his voluminous *Monarquía Indiana* (3 vols. folio, Seville, 1615; 2d ed., Madrid, 1723), which gives a vast amount of information on the Mexican Indians, their religion, laws, customs, traditions, etc. Much of this is valuable; but it is badly arranged, and is loaded down with irrelevant matter. He died in Mexico about 1625. H. H. S.

**Torquemada**, TOMAS, de: inquisitor-general; b. at Valladolid, Spain, about 1420; became a Dominican monk and prior of the monastery of Santa Cruz at Segovia; was appointed by Ferdinand and Isabella first inquisitor-general of Spain 1483; was confirmed in that post by Pope Innocent VIII. in 1487; labored with great vigor and success in organizing the Inquisition throughout Spain, especially at Seville, Cordova, Jaen, and Ciudad Real; drew up the code of procedure subsequently followed, and was influential in causing the expulsion of Jews and Moors from Spain. The number of persons burned during his administration has been greatly exaggerated by Llorente and others. Oscar Peschel and Gams have calculated that not more than 2,000 persons suffered that death in Spain from 1481 to 1524, and not all of those for religious motives. See Gams, *Kirchengeschichte Spaniens*, vol. iii., part ii., p. 72. Torquemada was as much a servant of the state as of the Spanish Church in his conduct as grand inquisitor, since the Spanish Inquisition was largely a civil and political institution. In his later years his authority was curtailed by the appointment of four colleagues by orders of Pope Alexander VI. D. at Avila, Sept. 16, 1498. Revised by J. J. KEANE.

**Tor're del Gre'co** [Ital., Tower of the Greek, the Greek's Tower]: town of Italy, province of Naples; on the eastern coast of the Bay of Naples, at the foot of Vesuvius, whose eruptions have destroyed it several times (see map of Italy, ref. 7–F). It was always rebuilt, however, and it is very celebrated for its wine and fruits; tunny, anchovy, sardine, and coral fishing are carried on with energy by the inhabitants. Pop. 21,580.

**Torre dell' Annunzia'ta** [Ital., Tower of the Annunciation]: town of Italy, province of Naples; at the foot of Vesuvius, 12½ miles S. E. of Naples (see map of Italy, ref. 7–F). It is chiefly noted for its thermal springs and its manufactures of arms. Pop. 20,000.

**Torrel'li**, ACHILLE: dramatist; b. in Naples, Italy, May 5, 1844; began early to write for the stage; was a volunteer in the Italian army in 1866; became director of the theater of San Carlo in Naples in 1878. His first piece, the comedy *Chi muore, giace*, was written when he was sixteen. It was followed by numerous more or less successful plays—*Il buon vecchio tempo*; *Cuore e corona*; *Prima di nascere* (1862); *Il precettore del re* (1863); *La missione della donna* (1864); *La verità* (1865); *Gli onesti* (1867); *I mariti* (1867); *La fragilità* (1868); *La moglie* (1870); *Nonna scelerata* (1870); *Il colore del tempo* (1875); *Triste realtà*; *Scrollina* (1880); and others. He has also published a collection of lyrical poems, which he styled *Schegge*. J. D. M. FORD.

**Tor'rens**, ROBERT: economist; b. in Ireland in 1780; became major-general in India; was for some years a member of Parliament, where he was a vigorous supporter of the Reform Bill, and acquired note as a political economist. His theories had great influence on the statesmen of his time. His views on the corn-laws were finally adopted by Sir Robert Peel and his supporters. D. May 27, 1864. Among his numerous treatises were an *Essay on Money and Paper Currency* (1812); *Essay on the External Corn-trade* (1815); *Essay on the Production of Wealth* (1821); *The Budget, a*

*Series of Letters on Financial, Commercial, and Colonial Policy* (1841–43); *Tracts on Finance and Trade* (1852), and several single *Letters* on similar subjects addressed to prominent statesmen. F. M. COLBY.

**Torrens**, WILLIAM TORRENS MCCULLAGH: statesman and author; b. at Greenfield, County Dublin, Ireland, in Oct., 1813; son of James McCullagh; graduated at Trinity College, Dublin, 1834; sat in Parliament for Dundalk as an advanced Liberal 1848–52; was elected from Yarmouth Mar., 1857, but was unseated on petition; was returned for Finsbury in July, 1865, and sat for that borough in four consecutive parliaments; was prominent during the American civil war as an advocate of the Union cause; aided Disraeli in 1867 to carry his Household Suffrage Bill, to which he procured the addition of the lodger franchise; introduced in 1868 the Artisans' Dwellings Bill, which was carried after protracted debates; obtained in 1869 an important reform in the management of pauper children by the poor-law guardians in London, and secured in 1870 the adoption of the Extradition Act, and in the same year proposed the creation of the London school board. He assumed in 1863 his mother's name, Torrens. D. in London, Apr. 26, 1894. He was the author of *The Use and Study of History* (Dublin, 1841); *The Industrial History of Free Nations* (2 vols., 1846); *Memoirs of Richard Lalor Sheil, with Anecdotes of Contemporaries* (2 vols., 1855); *Life and Times of Sir James Graham, Bart.* (2 vols., 1863); *The Lancashire Lesson* (1864); and *Our Empire in Asia: how we came by it* (1872).

**Torrens System**: See the Appendix.

**Tor'res Strait**: the channel which separates New Guinea or Papua from Australia. It is 80 miles broad, but covered with islands and full of shoals and reefs, which make its navigation difficult. It was discovered by Torres in 1606.

**Torres Ve'dras**: a town in the province of Estremadura, Portugal; 26 miles N. of Lisbon (see map of Spain and Portugal, ref. 17–A). It is best known from the lines of defense constructed here by Wellington in 1810. These consisted, when completed, of 152 distinct works, arranged in three lines, and extended from the Tagus to the sea. They were provided with an armament of 534 pieces of ordnance, and their garrisons were calculated at 34,125 men. The allied army fell back and entered their line Oct., 1810, holding the invading forces at bay till Mar., 1811, when the latter retired discomfited.

**Torrey**, JOHN, M. D., LL. D.: botanist; b. in New York, Aug. 15, 1796; graduated in medicine in College of Physicians and Surgeons, New York, 1818; was Professor of Chemistry, Geology, and Mineralogy in the Military Academy, West Point, 1824–27, of Chemistry and Botany in the College of Physicians and Surgeons 1827–55, and of Chemistry and Natural History in the College of New Jersey 1830–54; was U. S. assayer in New York 1853–73; was one of the founders of the New York Lyceum of Natural History, of which he was for many years president, and at the request of which he prepared, as early as 1817, while still a medical student, a *Catalogue of Plants growing spontaneously within Thirty Miles of the City of New York* (Albany, 1819); published vol. i. of a *Flora of the Northern and Middle States* (New York, 1824), and a *Compendium* of the same (1826); was appointed botanist of the geological survey of New York 1836; published a monograph on the *Cyperaceæ of North America* (1836); began in 1838, in connection with Dr. Asa Gray, the publication in numbers of a *Flora of North America*, which had reached the close of the great natural order *Compositæ* when in 1843 the vast accumulation of materials compelled its suspension; published the *Flora of the State of New York* (2 vols., 1843–44), forming vols. vi. and vii. of the *Natural History* of that State; edited Dr. L. D. de Schweinitz's *Monograph of the North American Species of the Genus Carex* (New York, 1825), and Dr. John Lindley's *Introduction to the Natural System of Botany* (New York, 1831), to which he added an *Appendix*; from 1822 to 1858 he edited most of the numerous reports of U. S. surveying and exploring expeditions; was an original member of the National Academy of Sciences and a founder of the Torrey Botanical Club; was a frequent contributor to periodicals and the proceedings of learned societies; was many years a trustee of Columbia College, to which he presented his valuable herbarium and botanical library. D. in New York, Mar. 10, 1873.

**Torrey**, JOSEPH, D. D.: educator; b. at Rowley, Mass., Feb. 2, 1797; graduated at Dartmouth College in 1816, and at Andover 1819; was pastor of a Congregational church at Royalton, Vt., 1819–27; Professor of Greek and Latin in the University of Vermont, Burlington, 1827–42; Professor of Intellectual and Moral Philosophy 1842–67; and president of the university 1863–65; author of a posthumous volume of lectures, *A Theory of Art* (1875); editor of the *Remains* (1843) of President James Marsh, and of the *Select Sermons* (1861) of President Worthington Smith, to both of which he prefixed *Memoirs*; and translator of Neander's *General History of the Christian Religion and Church* (Boston, 5 vols., 1854), accompanied by elaborate and scholarly notes. D. at Burlington, Nov. 26, 1867. Revised by S. M. JACKSON.

**Torrey'a** [Mod. Lat., named in honor of Dr. John Torrey, a botanist]: a genus of trees of the order *Coniferæ*, allied to the yews (family *Taxaceæ*). *T. californica* is a fine ornamental species; *T. taxifolia* of Florida has a durable, strong-

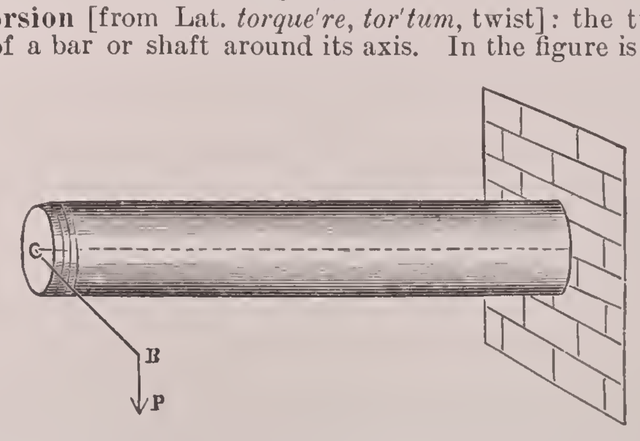
*Torreya taxifolia*: Leaves half the natural size; staminate and pistillate aments enlarged; fruit and a section reduced.

scented, heavy, and close-grained wood and horizontal, whorled branches. It sometimes attains a height of 50 feet. Eastern Asia has several species. *T. myristica* has a useful timber. The seeds of *T. nucifera* afford an oil used in cooking food. When burned the leaves and wood of the torreyas give off a powerful and disagreeable smell. Revised by CHARLES E. BESSEY.

**Torricelli**, tor-rēe-chel'lēe, EVANGELISTA: physicist; b. at Faenza, Italy, Oct. 15, 1608; studied mathematics and physics in Rome under Castelli, and in Florence under Galileo, whom he succeeded in 1642 as professor at the Academy. D. in Florence, Oct. 25, 1647. In 1644 he published his *Opera Geometrica*. His most remarkable discovery is that of the barometer, sometimes called the Torricellian tube.

**Torrington**: town; Litchfield co., Conn.; on the Naugatuck river, and the N. Y., N. H. and Hart. Railroad; 20 miles N. of Waterbury (for location, see map of Connecticut, ref. 8–E). It has 8 churches, 20 public schools, high school, public library, Y. M. C. A. building, a private and a savings bank, a daily and a weekly newspaper, extensive brass-works, and manufactories of hardware, sewing-machine needles, bicycles, and woolen goods. It was incorporated in 1740 and made a borough in 1887, and is celebrated as the birthplace of John Brown, the abolitionist, and of Samuel Mills, the pioneer of American missions. Pop. (1880) 3,327; (1890) 6,048; (1900) 12,453, borough 8,360.

**Torsion** [from Lat. *torque're, tor'tum*, twist]: the twisting of a bar or shaft around its axis. In the figure is seen



a horizontal bar with one end rigidly fixed in a wall and the other subject to a vertical force, $P$, acting with a lever arm,

$BC$. The product $P \times BC$ is the twisting moment whose tendency is to cause all horizontal lines on the surface of the bar to assume a spiral form. This moment is resisted by the sum of the moments of the internal shearing stresses which exist in any cross-section. If the bar be circular and of a diameter $d$, and if $S$ be the shearing unit-stress at the circumference, then

$$P \times BC = \frac{\pi d^3 S}{16},$$

which is the fundamental formula for the discussion of round solid shafts.

The most common investigation is that of the transmission of power by shafts. If $H$ be the number of horse-powers transmitted and $n$ the number of revolutions per minute, the unit-stress, $S$, for a round solid shaft is $321000 \frac{H}{n\,d^3}$, and the diameter required, $d$, is $68{\cdot}5 \sqrt[3]{\frac{H}{nS}}$, in which, for proper security, $S$ may be taken at about 2,500 lb. per square inch for cast iron, 5,000 for wrought iron, and 7,500 for ordinary steel.

Hollow forged steel shafts are coming into use for ocean steamers, their strength being greater than solid shafts of the same sectional area. If $D$ be the exterior and $d$ be the interior diameter, these may be investigated by the formula

$$S = 321000 \frac{DH}{n(D^4 - d^4)}.$$

For example, if $D = 17$ inches and $d = 11$ inches, and 16,000 horse-powers be transmitted at fifty revolutions a minute the value of $S$ will be found to be about 25,000 lb. per square inch, which is too high a value for ordinary steel, but which would be a safe unit-stress for nickel-steel.

Mansfield Merriman.

**Torsion Balance**: an apparatus for measuring delicate electrical or other attractions and repulsions. The attraction or repulsion is measured by the resistance offered to it by the torsion of a metal wire or a filament of spun glass, quartz, or other fiber. By this means Coulomb discovered the laws of electrical attraction and magnetic force, and Cavendish deduced a value of the density of the earth. See Earth (*Density and Mass*).

**Torsk**, or **Dorse** [*torsk* = Dan.: Icel. *þorskr*, codfish: Germ. *dorsch*]: a name applied to the cusk (*Brosmius brosme*), a food-fish of Northern Europe and the eastern coast of the U. S., and also to the Baltic cod (*Gadus callarias*), another food-fish of Northern Europe. They belong to the cod-family, and are eaten fresh, or more generally are salted and dried. The Pacific coast of the U. S. has another torsk, *Brosmophycis marginatus*. F. A. L.

**Tor′stensson**, Lennart: soldier; b. at Torstena, West Gothland, Sweden, Aug. 17, 1603; was educated as a page at the court of Gustavus Adolphus, whom he accompanied in 1630 to Germany; distinguished himself greatly as commander of the artillery in the battle on the Lech in 1632; was taken prisoner before Nuremberg Sept. 3, 1632, and kept for six months in a damp, subterranean dungeon in Ingolstadt by Maximilian of Bavaria; was appointed commander-in-chief of the Swedish army in Germany in 1641, but was compelled by the gout to resign his command in 1646; returned to Sweden; was made Count of Ortala by Queen Christina and governor-general of the province of West Gothland. D. at Stockholm, Apr. 7, 1651. See De Peyster's *Torstenson*, New York, 1886.

**Tort** [from Fr. *tort*, wrong < Late Lat. *tortum*, liter., neut. of *tor′tus*, twisted, crooked, perf. partic. of *torque′re*, twist]: in English law, such an unlawful invasion by one person of another's rights which are created by law as was remediable by a common-law action. A husband or a wife wrongs the other by marital unfaithfulness; a parent wrongs his minor child by unreasonable chastisement; but in neither case is a tort committed. Neither wrong could be remedied by a civil action at common law. The injured spouse might obtain a divorce; the parent might be prosecuted criminally. It is apparent, therefore, that procedure has played a part in fixing the limits of this branch of the law. Again, one who sells and delivers property to another upon the latter's promise to pay a fixed sum therefor at a fixed date has a right to the stipulated payment. The purchaser's refusal to pay, however, is not a tort, but a breach of contract; the right which is invaded was created by the agreement of the parties, and not by the law. One who unlawfully invades another's right to personal security, by Assault and Battery (*q. v.*), or by defamation (see Libel and Slander), or by a Nuisance (*q. v.*) to health, or his right to personal liberty by false imprisonment, or his right to private property, commits a tort. The rights which are interfered with in all these cases do not originate in any agreement to which the wrongdoer is a party, but are created by the law. His liability for the damage caused by his wrongdoing does not rest upon his consent, as in the case of a breach of contract. Nor, in English law, does it rest upon the moral quality of the act. The actor may be free from actual blame and yet be a tort-feasor. See Trespass.

In certain cases, the wrongdoer may be sued on contract or in tort, at the option of the injured party. This is true wherever the contract creates a relation out of which springs a legal duty independent of the contract obligation, as in the case of lawyer and client, of consignor and factor, of shipper and common carrier. The carrier who fails to deliver goods received by him may be sued either on the contract of shipment or in tort for breach of the common-law duty to carry safely and deliver. Acts or omissions of this class are sometimes called *quasi* torts. *Taylor* vs. *Manchester, etc., Ry.*, 11 *Times* Law Reports 27, A. D. 1894.

*Scotch law* employs the terms delicts and quasi delicts instead of torts and quasi torts. Those terms were defined by Lord Watson, in a recent case that went up to the House of Lords from Scotland, as follows: "Delicts proper embrace all breaches of the law which expose their perpetrator to criminal punishment. The term quasi delict is generally applied to any violation of the common or statute law which does not infer criminal consequences, and does not consist in the breach of any contract, express or implied. Cases may and do often occur in which it is exceedingly difficult to draw the line between delicts and quasi delicts. The latter class, as it has been developed in the course of the present century, covers a great variety of acts and omissions, ranging from deliberate breaches of the law, closely bordering upon crime, to breaches comparatively venial and involving no moral delinquency." (*Palmer* vs. *Wick Steam Shipping Co.*, 1894, Appeal Cases 318.) It is clear from this extract that delicts and quasi delicts are not synonymous with torts and quasi torts.

For a full discussion of the nature and classification of torts, the reader is referred to Holmes, *The Common Law*, Lectures 3 and 4; Markby, *Elements of Law*, chap. xvi.; Pollock, *Torts*, bk. i., ch. i.; Ringwood, *Outlines of the Law of Torts*, chap. i.; Wigmore, *Analysis of Tort Relations*, 8 *Harvard Law Review* 200, 377.

Francis M. Burdick.

European Law.—Among the private or civil actions of tort (*ex delicto*) given by the Roman law were actions for the recovery of penalty, actions for the recovery of penalty and damages (*actiones mixtæ*), and actions for the recovery of damages simply. Modern European law generally treats the prosecution of penalty as a matter of criminal law, and confines the action of tort to the recovery of damages. Many of the Roman actions of tort have therefore become criminal actions, and even where the prosecution is instituted only at the demand of the person injured the penalty goes to the state. See Libel and Slander (*History of Libel and Slander*).

It was the general rule of the Roman law that no one was liable for damages *ex delicto* unless wrongful intent (*dolus*) could be shown or inferred. Mere negligence (*culpa*) created no liability unless a duty of diligence had been assumed, and then damages were recovered on the contract, or *quasi ex contractu*, not on tort. In the case of damage to property, however, the *lex Aquilia* departed from the rule and imposed liability for damage occasioned by carelessness. Modern European legislations have generally extended the principle of the *lex Aquilia*, and impose liability for all injuries to the person or to property occasioned by negligence. (See *Code Napoléon*, § 1382, *et seq.*; Austrian Code, § 1295, *et seq.*; German Draft Code, § 704.) The recovery of damages is excluded when the injured person consented to the injury; when the person who inflicted the injury acted in self-defense, or under orders which he was legally bound to obey; also when he was doing what he had a right to do, and (according to some legislations) when he erroneously supposed that he was acting within his rights, provided the mistake was an excusable one. (The German Draft Code declares that a mistake of law may be excusable.) Insanity of course excludes liability; drunkenness does not. Infancy (which lasts until the completed seventh year) excludes liability; after that it is a question of the intelligence of the wrongdoer. For damage done by children and lunatics, their parents or guardians are responsible if by due surveillance they could have prevented the injury. For the torts of employees within the general scope of their employment the employer, at French law, is held to the same responsibility as a parent; it is incumbent on him to prove that he could not have prevented the injury. The German codes make the employer liable only when he has chosen unfit persons or has failed to exercise due superintendence. Analogous responsibilities are regularly imposed upon the owner for damage done by animals or things (defective buildings, machinery, etc.).

At Roman law, as at the English common law, the heirs of a person willfully or negligently killed had no claim for damages. The modern codes generally recognize such a claim, and treat the amount of damages as a question of fact. In place of a lump sum to be paid to persons who were dependent upon the deceased for their support, modern German legislation provides for an annuity, limited to the number of years during which support could legally have been claimed from the deceased, and to his expectancy of life at the time the fatal injury was received.

All actions for the recovery of actual damages descend to the heirs of the injured person and run against the heirs of the tort-feasor. The period of limitation is usually a short one; but when the tort-feasor is enriched by his tort, the quasi-contractual claim for the recovery of the unjust enrichment does not expire with the limitation of the action of tort.
MUNROE SMITH.

**Tortoise** [M. Eng. *tortuce*; cf. O. Fr. *tortis*, crooked, and *tortue*, tortoise < Vulg. Lat. *tortu'ca*, deriv. of *tor'tus*, twisted, crooked. So called from its crooked feet]: a name sometimes applied to any species of turtle, but more correctly restricted to those belonging to the family *Testudinidæ*, a group whose members are distinguished by their club feet, strictly terrestrial habits, and, as a rule, high, arched carapaces. There are something like fifty species of tortoises, inhabiting the warmer portions of the globe, the most remarkable being the large black species found on the Galapagos islands and Aldabra. Although of uniform color these vary in form and proportions, and belong to very distinct species of the genus *Testudo*. At least five species occur on the Galapagos, each confined to a particular island. The shell of some specimens measures over 4 feet in length, the animal weighing as much as 800 lb. They feed entirely on vegetables, are good eating, and yield an excellent oil. Tortoises of this kind formerly abounded in Mauritius and Reunion, but "they have been eaten off the face of the earth," and the same fate threatens the tortoise elsewhere. The GOPHER (*q. v.*) of the Southern and Southwestern U. S. is a true tortoise, but, as the name is more commonly applied to the pouched rat, care must be taken to specify that the gopher in question is a tortoise. There are three species, *Gopherus polyphemus*, *G. agassizii*, and *G. berlandieri*, the first named being the common Florida species.
F. A. LUCAS.

**Tortoise-plant**: another name for ELEPHANT'S FOOT (*q.v.*).

**Tortoise-shell**: the overlapping scales which cover the carapace of *Eretmochelys imbricata*, a large turtle found in the tropical Atlantic and Indian Oceans, and *E. squamata*, a similar species found in the Pacific. They are popularly known as hawk's-bill turtles. Tortoise-shell is remarkable for its plastic quality, which enables the artificer to give it almost any desired shape while under the influence of heat. Pieces of the shell may even be welded together, and the filings and chips are moulded and shaped as desired when heated to the proper temperature. Tortoise-shell is chiefly used for making combs, toilet articles, etc., and inlaying boxes. It is successfully imitated by artificial compounds, such as celluloid, of much less cost. It is customary in some regions to apply heat to the back of the living tortoise, and then remove the plates, but the crop of shell which replaces the first is thin and of inferior quality.
Revised by F. A. LUCAS.

**Torto'na** (Lat. *Dertona*): town; province of Alessandria, Italy; about 12 miles E. of the city of Alessandria, on a hill nearly 900 feet above the sea (see map of Italy, ref. 3–C). It was once strongly fortified, but its last defenses were destroyed in 1799 by Napoleon, after the battle of Marengo. The cathedral, dating from 1575, contains some valuable pictures. The principal industries are silk-reeling and tanning, and there is a local trade in grain and wine. Pop. about 7,150.

**Torto'sa**: an old, well-built, fortified and busy town in the province of Tarragona, Spain; on the Ebro; 40 miles by rail S. W. of Tarragona; in a fertile and well-cultivated district (see map of Spain, ref. 15–I). Its cathedral, occupying the site of a mosque built in 914, contains much carved work and marbles that are worthy of examination. Other public buildings, including the episcopal palace and town-hall, are commonplace. Tortosa has manufactures of paper, leather, soap, and pottery. Its fisheries constitute the most important industry. Pop. (1887) 25,192.

**Tortric'idæ**: a family of insects. See LEAF-ROLLERS.

**Tortricidæ** [Mod. Lat., named from *Tortrix* (*Tortric-*), the typical genus, liter., twister, from Lat. *torque're*, *tor'tum*, twist]: a family of serpents of the sub-order *Tortricina*. They are worm-like in appearance; have no constriction separating the head and trunk; the head is shielded above; the maxillary bones have alveolar ridges and teeth; the pupils of the eyes are round; the body is covered with smooth scales; the tail is short and conic, and there are rudiments of posterior extremities. The family has few species, and is mostly confined, and thus restricted, to South America, Southern Asia, and Australia. The typical species, *Tortrix scytale*, is sometimes known as the coral snake, but is not to be confounded with the *Elapidæ*, which are also frequently designated by the same name; it is a South American species. The Oriental species belong to the genus *Cylindrophis*, and are said to be viviparous. See Günther, *Ann. and Mag. Nat. Hist.*, vol. i., p. 428, 1868.
Revised by F. A. LUCAS.

**Tortu'ga** (Fr. *Tortue*): an island of the West Indies, N. of the northeastern extremity of Haiti, to which it belongs. Area, about 80 sq. miles. It is separated from the main island by the Tortuga or Tortue Channel, 5 miles wide; the surface is broken, but not very high. It was long the most noted resort and settlement of the buccaneers, where they established a rough form of government; eventually the French adventurers accepted a royal governor from their country; passing the channel they conquered and occupied the western part of Santo Domingo, now the republic of Haiti.
H. H. S.

**Tortugas**, Florida: See DRY TORTUGAS.

**Torture** [= Fr. < Lat. *tortu'ra*, a twisting, a wrenching, racking, writhing, deriv. of *torque're*, *tor'tum*, twist]: the infliction of severe pain; specifically, the infliction of severe pain for the purpose of punishing or inflicting revenge, or for the purpose of extracting or forcing evidence or confessions in criminal or ecclesiastical trials. Torture for one purpose or another has been practiced during all ages and among all or nearly all peoples. Among savage races it is most commonly used either as a means of ORDEAL (*q. v.*) or as a means of inflicting revenge or punishment upon captured enemies. As a means of forcing religious conformity, the infliction of torture was carried to an almost incredible extent of cruelty in the later Middle Ages and down to the eighteenth century, especially in Southern Europe, where the INQUISITION (*q. v.*) was unchecked in its use.

*Judicial torture*, as it is called when administered by or under the direction of the courts of law during the trial of causes, has been chiefly directed to the purpose of compelling an accused person during his trial either to confess his crime, clear up contradictions in his previous testimony, disclose his accomplices, reveal other crimes of which he may have been guilty but has not been accused of, or to purge him of the disability of INFAMY (*q. v.*). Judicial torture is rarely used during that stage of a people's existence when ordeals are used, but has very commonly succeeded to the use of ordeals, judicial torture being essentially a product of civilization rather than barbarism.

Although torture is now no longer a part of the jurisprudence of any modern Christian nation, yet until about the end of the eighteenth century, it formed a recognized part of the jurisprudence of European nations, excepting Great Britain and Sweden, and the rules for its application were developed into a regular system as a part of the principles of jurisprudence.

Among the ancients it appears not to have been practiced among the Hindus, the Hebrews, or the Egyptians. Among the Greeks, however, the use of torture was thoroughly understood and permanently established; as a general rule no freeman could be tortured, but only slaves and those who were not members of the body politic of the state. There were various exceptions, as in the case of flagrant political offenses, and among the Rhodians the torture of free citizens was not forbidden.

The people acting as the supreme power, or a despot, could of course decree the torture of any one irrespective of privilege. The evidence of slaves, however, was inadmissible, except when given under torture, and either party to a controversy could demand the torture of his opponent's slaves. The principal modes of torture among the Greeks were the wheel, the rack, the sharp comb, the vault, into which the witness was thrust bent double, the burning tiles, the heavy hogskin whip, and the injection of vinegar into the nostrils.

In the Roman law, upon which the subsequent European systems which recognized torture as a part of their jurisprudence were based, the general principles governing the administration of torture were the same in the earlier days as those of Greece. In later times under the emperors, although nominally still restricted in use to slaves, except in certain specified cases, torture was in fact not infrequently applied to freemen contrary to law; and its use could be authorized in any case by order of the emperor, which power was freely used. There appears to have been no limit set upon the application of torture, but the extent to which it might be carried seems to have been in the discretion of the tribunal; and in Rome, as in Greece, its use was not restricted to criminal cases in respect of slaves, but they might be tortured in any case except for the purpose of testifying against their master. The modes of torture generally authorized by the Roman law were the rack, the scourge, fire in its various applications, and hooks for tearing the flesh.

The barbaric races of Europe with whom the Romans came into contact adopted more or less of the Roman practice of judicial torture; and the Visigoths established a system of torture which continued uninterrupted in Spain from the period of their settlement down to modern times, and their legislation on the subject has been to a great extent a model for other European nations. Generally, however, the use of torture was slow in replacing the barbaric systems of ordeal and sacramental compurgation, and it was not till the latter half of the thirteenth century that the first traces of legalized torture appeared in France, and in Germany it was not used until the fifteenth century, its introduction being powerfully aided by the then increasing rigor and systematization of the Inquisition.

The influence of the Church during the Middle Ages upon the use of torture was to aid in its prevalence, and to add ingenuity in devising new cruelties to be inflicted upon the tortured, although in the earlier centuries St. Augustine, Gregory I., and Nicholas I. had denounced it, and its use had been forbidden. The Church, so far as it could, adopted the Roman law, and torture was inflicted mostly as a means of forcing religious conformity or extorting a confession of heresy. Originally the infliction of torture seems to have been left by the ecclesiastical tribunals to the ordinary civil tribunals, but later they exercised it themselves under a perfected system of rules which culminated in the INQUISITION (*q. v.*), and served as a basis and excuse for the wide extension of the use of torture in civil cases, and furnished innumerable varieties of new forms of torture of unspeakable cruelty. As a result of the interference of the Church the clergy were generally restricted from torture at the hands of the civil courts, the clergy in Catholic countries being specially favored, and the immunity obtained being practically about the same as that accorded to the nobility. In any case, however, the torture inflicted on the clergy by the civil tribunals was of a milder character than that inflicted upon laymen, and much more decisive proof was required before submitting them to torment. If clerical executioners could be had they had the privilege of demanding that they should be tortured only by them. Torture as administered even by the Church, however, was more cruel than the fair construction of the rules of the Church regulating the subject. Owing to the secrecy of its infliction, the helplessness of the accused to prosecute or punish illegal tortures inflicted, and the specious casuistry countenanced in the evasion of the rules, the extent to which torture was carried in any instance, and the cruelties inflicted, rested practically in the discretion of the judges or executioners. The rules themselves generally spoke of it as dangerous and uncertain, and depending largely for its results upon the question of physical strength. The rule that a confession made under torture could not be used against an accused, except it was afterward confirmed by voluntary confession, was in effect nullified by repetition of the torture upon a subsequent retraction of the confession until the tortured person finally yielded and gave the desired voluntary confession.

From the thirteenth century on the use of torture increased until it finally became established as a permanent part of the judicial machinery of European nations, excepting in England and Sweden. Although torture was never a part of the common law of England as a means of obtaining evidence, there is proof that it was practiced for that purpose under Henry VIII. and his children, and also during the reigns of James I. and Charles I., not only in political cases, but in the case of common crimes. Either with or without royal authority torture was in fact frequently inflicted, especially in the case of alleged witches, and why it did not become a recognized part of the jurisprudence there as well as elsewhere in Europe it is difficult to say. Sir James Fitzjames Stephen says: "Probably the extremely summary character of our early methods of trial, and the excessive severity of the punishment inflicted, had more to do with the matter than the generalities of Magna Charta or any special humanity of feeling."

In the British colonies the use of torture was never legally recognized, and only a few sporadic instances of its use occurred, such as the infliction of PEINE FORTE ET DURE (*q. v.*) upon Giles Cory, in Salem, Mass., in 1692.

Although the system of torture was recognized as a legal means for obtaining evidence for so many centuries, there was never any time when its cruelty was not generally recognized and its use justified as a measure deplorable but necessary for the protection of society; and, from the first until its abolishment, there were those among the foremost thinkers who not only denounced its cruelty, but exposed its uselessness and the utter unreliability of the testimony obtained by its use. Its extreme use and the horrors of its practice during the fourteenth to the eighteenth centuries finally led to a revulsion of feeling, and judicial torture was at length abandoned during the latter half of the eighteenth century, although in some countries it continued to be legally recognized and occasionally practiced, until the early part of the nineteenth century. It was swept away in Saxony in 1783, and about the same time in Switzerland and Austria; in Russia it was partly abolished in 1762, and finally in 1801; in Würtemberg it was abolished in 1806, in Bavaria in 1807, in France in 1789 (being temporarily restored in 1814), in Hanover in 1819, and in Baden in 1831. See Henry C. Lea's *Superstition and Force* (Philadelphia, 1870); Stephen's *History of the Criminal Law of England*; Jardine's *Reading on the Use of Torture in the Criminal Law of England, previously to the Commonwealth.*

F. STURGES ALLEN.

**Toru Dutt**: See DUTT, TORU.

**Torula Cerevisiæ**: the name first given to the yeast-plant. See FERMENTATION (*The Yeast-plant*).

**Tory** [from Ir. *toiridhe*, pursuer, searcher, plunderer]: a name applied to the Roman Catholic outlaws who lived in the bogs of Ireland during the reign of Charles II.; afterward extended (1679) to all those, whether English, Scotch, or Irish, who were opposed to the bill excluding the Duke of York from the succession. It was thus sought to imply Roman Catholic sympathies on the part of those who favored the duke's succession. Finally, the name came to designate the anti-Whig party in British politics; but as a formal designation it has been replaced by Conservative since 1830. In the war of the Revolution in the U. S. the loyalists were called Tories.

**Tosa-riu**: the name of a Japanese school of painting, which traces its origin to Fujiwara no Tsunetaka, a native of Tosa, who flourished about the year 1200 A. D. It is a branch of the native or Yamato school, and is the least of all affected by Chinese influences and the fullest of naïve conventions. It is historical in spirit, dealing with famous events in mythology and history, and picturing historic scenes, and was especially cultivated at Kioto. J. M. D.

**Tosti**, FRANCESCO PAOLO: song-composer; b. at Ortona, Italy, Apr. 9, 1846; studied, practiced, and taught music in Italy until 1875, when he first visited London; made annual visits until 1880, since which time he has remained there permanently. He has written very many popular songs in Italian, French, and English, his most popular one being *For Ever and for Ever.* D. E. H.

**Total Abstinence**: See ABSTINENCE, TOTAL.

**Totemism**: a system of beliefs, worship, and social obligations, found in savage communities in nearly every part of the world. The word *totem*, by some authorities spelled *ote*, possessive *otem*, by others *toodaim*, or *dodaim*, is from the Ojibway dialect, in which it signifies a family or tribe. As now used in ethnology it means a species or class of animals or plants, or, rarely, of inanimate objects, which is regarded by a horde, clan, or individual, with superstitious respect. A totem must be distinguished from a fetish, which is always an individual object. The savage believes that he is descended from his totem, and that it helps and protects him in all the affairs of life. As a rule, he will not injure, kill, or eat the totemic animal or plant. Even when the totem is a highly dangerous species, as one of the venomous snakes, or the scorpion, it is regarded without fear, and in this case men suspected of being untrue clansmen may be subjected to a practical test. If they survive the deadly bite of the totemic serpent their fidelity is established.

*The Clan Totem.*—Wherever totemism prevails it is associated with kinship and with tribal subdivisions. Clans are named from their respective totems and identified by rude images or symbols. The North American Indians E. of the Rocky Mountains commonly carved or painted totemic signs on their huts, or embroidered them on tents and blankets. (See *Totemism* under INDIANS OF NORTH AMERICA.) The Alaskan tribes carve them elaborately on the totem posts that guard their houses. In Australia and the Pacific islands tattooing and scarring are methods commonly employed. Not infrequently the totem is painted on the skin and then burned in. Most of the mutilations and adornments characteristic of savagery, such as the breaking of teeth and the wearing of feathers, horns, claws, and beaks, have intimate association with totemism. Sometimes the totem is a part only of the natural object, as among the Omahas, where the buffalo is subdivided into head, shoulder, side, tail, each being the totem of a sub-clan. These split totems, so called, indicate the subdivision of what was once a single clan.

*As a Religion.*—Dire penalties are supposed to follow any disrespect toward the totem. Some clans even avoid looking at their totem. The Elk clan of the Omahas believe that if any clansman were to touch the male elk he would break out in boils and white spots. The Red Maize sub-clan believe that if they were to eat the red maize they would have running sores around the mouth. The Samoans generally thought that death would follow any injury to the totem. So in Australia sickness and death were supposed to be the penalties for eating the totem. Everywhere the totem is worshiped and propitiated, and in many parts of the world, notably in Samoa, the dead totem is mourned for and buried like a dead clansman. Throughout North America, South America, and Africa totemism had become, before the invasion of the whites, an elaborate ceremonial religion, having its festivals, dances, processions, fasts, and mysteries, its medicine-men and priests, and its secret societies, carefully guarding the sacred tradition.

*Social Aspect of Totemism.*—Totemism is inseparably bound up with the social organization of savage communities. Marking the limitations of right and obligation, it is an essential factor in primitive law. Men and women owning the same totem must defend one another and redress one another's wrongs. Absolute prohibition of marriage between man and woman of the same totem is the rule. McLennan believed that the explanation of exogamy must be sought in totemism, but it is probable that totemism serves merely as a means of extending an exogamy previously initiated. (See SOCIOLOGY.) Yet we are not warranted in assuming that clan totems were the earliest totemic forms. Clansmen generally have their individual as well as their clan totems. The American Indian boy usually took as his guardian totem or "medicine," to protect him through life, the first animal of which he dreamed during the long and solitary fast observed on attaining maturity. But on the Isthmus of Tehuantepec when a child was expected the relatives drew on the floor figures of animals, one after another, and the one that remained when the infant was born became its totem. A somewhat similar custom prevailed in Samoa. It is probable that the development of clan totems out of individual totems was the first step in the evolution of the clan itself. See SOCIOLOGY.

Nothing is certainly known of the origin of totemism, and none of the theories that have been advanced has proved satisfactory. Herbert Spencer argues that plant and animal worship grew out of ghost-worship through a confusion of names. Tylor attaches chief importance to the habit of personifying all objects, which is characteristic of the child and of the primitive man. (See ANIMISM.) McLennan has suggested that imitations of animal forms and habits, and consequent nicknamings of neighboring hordes by each other, may afford an explanation. Perhaps in some combination of imitation with those dreams in which the savage imagines himself transformed into an animal is to be found the key to his belief that he and his totem are of one kin.

Tylor, *Early History of Mankind* (London, 1870); Sir John Lubbock, *Origin of Civilization* (London, 1884); W. Robertson Smith, *Kinship and Marriage in Arabia* (London, 1885); A. Lang, *Custom and Myth* (London, 1884); and *Reports* of the Bureau of Ethnology, Washington. FRANKLIN H. GIDDINGS.

**Tot'ila**: king of the Ostrogoths; chosen in 541 after the defeat and capture of Vitiges at Ravenna by Belisarius. He besieged and conquered Rome in 546, and extended and consolidated the Ostrogothic empire in Italy after the recall of Belisarius in 549, but was defeated and mortally wounded in the battle at Tagina by Narses in 552.

**Totipalmatæ**: See STEGANOPODES.

**Totis**, or **Dotis** (Hun. *Tata*): market-town; in the county of Komorn, Hungary; near the Danube; station of the Buda-pest-Bruck Railway (see map of Austria-Hungary, ref. 6-G). It consists of the town proper, of the upper town, and Tóváros; is situated on a great lake; has a fine castle belonging to the Esterházy family, a Piarist college with a classical gymnasium, and other schools, sulphur springs, rich marble-quarries, numerous mills, spirit-factories, a large sugar-factory, and a leather-factory. There are remains of an old castle inhabited by King Mathias Corvinus. Considerable forests, vineyards, and pastures are in the vicinity, which is rich in Roman antiquities, coins, urns, etc. The town was founded about 994. Pop. 10,290. HERMANN SCHOENFELD.

**Totonicapam'**: a town of Guatemala, 60 miles W. N. W. of Guatemala city; on the plateau near the foot of a high mountain (see map of Central America, ref. 3-D). It was a Quiché pueblo before the conquest, and here the tribe gathered to resist the march of Alvarado. Most of the inhabitants are Indians, and some of the better class claim descent from Quiché chiefs. Pop. 20,000. It is the capital of the department of Totonicapam, which has an area of 552 sq. miles and a population (1889) of 158,419. H. H. S.

**Totten**, JOSEPH GILBERT: military engineer; b. at New Haven, Conn., Aug. 23, 1788; graduated at the U. S. Military Academy July, 1805, and commissioned second lieutenant in the Corps of Engineers; aided his uncle, Jared Mansfield, in the survey of Ohio and the Western territories, resigning from the army 1806; returned to the army, and Feb. 23, 1808, was reappointed a second lieutenant of engineers, and was engaged on the construction of Castle Williams and Fort Clinton, New York harbor, 1808-12. At the beginning of the war with Great Britain, Totten (captain in his corps, July 31, 1812) was assigned to duty as chief engineer of the army under Gen. Van Rensselaer in the campaign of 1812, on the Niagara frontier. He was subsequently chief engineer of the army under the command of Gen. Dearborn, in the campaign of 1813, and of the army under Gens. Izard and Macomb in the campaign of 1814 on Lake Champlain; was breveted major June, 1813, and lieutenant-colonel Sept. 11, 1814; at the close of the war returned to duties in connection with the national coast defenses, and served chiefly at Newport, R. I., where he had charge of the construction of Fort Adams, and continued until Dec., 1838; advanced to the grade of lieutenant-colonel in 1828; appointed colonel of the Corps of Engineers and chief engineer Dec. 7, 1838, and took up his residence in Washington. Col. Totten assumed in 1847 the immediate control of the engineering operations of the army destined to invade Mexico, directing in this capacity the siege of Vera Cruz. For his services he was breveted a brigadier-general Mar. 29, 1847, then left the active army and resumed his station at Washington, but was appointed one of the commissioners for arranging the terms of capitulation. On Mar. 3, 1863, he was promoted brigadier-general and chief of engineers, and on Apr. 21, 1864, breveted major-general for long, faithful, and eminent services. During the whole time of his chief-engineership he labored indefatigably to bring the ports and harbors along the whole seaboard into a defensible condition. In addition to the manifold duties of his office, involving the inspection and supervision of the Military Academy, Gen. Totten was an active member of the lighthouse board from its organization in 1851; a regent of the Smithsonian Institution from its establishment in 1846; a corporator of the National Academy of Sciences, created in 1863, and one of the harbor commissioners for the cities of New York and Boston. In 1815 Totten modeled an embrasure for casemated batteries which remained unchanged until 1858, but the casemate continued a subject of study and experiment during most of his life, establishing his right to be considered the inventor of the American casemate, and led to the construction of the embrasure subsequently introduced into the U. S. seacoast forts, and known as the Totten embrasure. He published *Essays on Hydraulic and other Cements* (New York, 1842). D. in Washington, D. C., Apr. 22, 1864.

**Tottenville**: village; Westfield town, Richmond co., N. Y.; on Staten Island Sound, Raritan Bay, Prince's Bay, and the Staten Island Rap. Trans. Railroad; 20 miles S. W. of New York city (for location, see map of New York, ref. 8–A). It contains 4 churches, a graded public school, 2 weekly newspapers, manufactory of dental goods, a printing, electrotyping, and bookbinding establishment, saw and planing mill, ultramarine-factory, fire-brick and retort works, and several shipyards. Many New York business men live here. The village contains the Billopp mansion, built many years prior to the Revolutionary war, and in which Lord Howe had a conference with John Adams, Benjamin Franklin, and Edward Rutledge, a committee of Congress, concerning the possibility of a return of the colonies to British allegiance. Pop. (1894) 2,563. It is now a part of the Borough of Richmond, New York city.

**Toucan**: See RHAMPHASTIDÆ.

**Toucey**, ISAAC, LL. D.: jurist; b. at Newtown, Conn., Nov. 5, 1796; received a private classical education; was admitted to the bar 1818; representative in Congress 1835–39; States attorney for Hartford co., Conn., 1842–44; Governor 1846–47; U. S. Attorney-General 1848–49; U. S. Senator 1852–57; and Secretary of the Navy under President Buchanan 1857–61. D. at Hartford, July 30, 1869.

**Touch** [deriv. of the verb *touch*, from O. Fr. *tochier*, *toquer* (> Fr. *toucher*), from Teuton. **tukkon*, move suddenly > Germ. *zucken*, twitch, shrug, quiver, start]: the sense by which contact or pressure upon the surface of the body is perceived. Bell and Magendie established the distinction of motor and sensory nerves issuing from the anterior and posterior roots, on either side respectively of the spinal cord. Through these, from every part of the body, the sensory nerves, having received impressions at their bud-like, tactile ends, return impressions to the spinal axis and to the brain; the nerves of the head communicating directly. This power is developed to a variable degree upon different surfaces, the tactile sensibility of some, as the finger-tips and tongue, being very acute, other parts being relatively obtuse. The acuteness of touch is due in part to the number and distribution of nerve-fibers, in part to habitual education of the part. The part which has the most finely educated touch, the tips of the fingers, may be far less susceptible to pain, to heat and cold, or to tickling. The tactile sensibility of parts is measured by means of needle-points in arms movable upon a graduated bar—the instrument termed the "æsthesiometer." The shortest distance on the surface at which distinct perceptions of the two points are felt gives the diameter of the so-called "Weber's circles" of sensibility. From the experiments of Valentin the following will suffice to illustrate. The unit of measure is a line, one-twelfth of an inch:

| | |
|---|---|
| Tip of tongue | 0·483 of a line. |
| Palm of forefinger | 0·603 " |
| " " little finger | 0·733 " |
| Surface of lip | 1·500 " |
| " " eyelid | 3·833 " |
| Skin of cheek | 4·541 " |
| Forehead | 6·000 " |
| Back of hand | 6·966 " |
| Lower part of thigh | 10·208 " |
| Leg | 13·708 " |
| Middle of forearm | 17·083 " |
| " " back | 24·208 " |

The finger, tongue, toes, and other surfaces may be highly educated. Each artisan in his special line acquires wonderful tactile recognition of the kind and quality of fabrics, minute sizes, shapes, and relative smoothness of surfaces. The blind learn to read the raised alphabet, recognize persons by feeling their features, and manufacture various articles, many of delicate structure. In the sensitive tactile part at the finger-tip the touch-corpuscles, or nerve termini, are situated near the surface, constituting sensitive papillæ; as many as 108 have been found in one-fiftieth of a square inch. See HISTOLOGY and SENSATION.

Revised by J. MARK BALDWIN.

**Touch-paper**: a loose bibulous paper which is soaked in solution of saltpeter and then dried. It was used in lighting fires with flint and steel, and is sometimes burned in a room to relieve the paroxysm of asthma.

**Touchstone**: See JASPER.

**Touchwood**, or **Spunk**: (1) the dried fungus *Polyporus igniarius*, used in getting fire with flint and steel; also employed as a port-fire. (See AMADOU.) (2) Also the decayed and crumbling wood of the ash or willow which has undergone dry rot. It is used for the same purposes as the foregoing; and it is remarkable that close examination shows that such wood is always the seat of a growth of fungi much like that referred to above. All the varieties of spunk are much improved by wetting with solution of potassium nitrate or chloride and then drying. Spunk, although a native product of the U. S., is also imported from Europe. It is also called *punk*.

**Tougaloo' University**: an institution of learning at Tougaloo, Madison co., Miss., established by the American Missionary Association in 1869 and chartered by the State in 1871. It trains colored youth of both sexes, and has as its object the development of Christian character and of such intellectual and manual skill as shall enable young colored people to become efficient leaders in the uplifting of the Negro race. In the heart of a section called "the Black Belt," because of the density of the Negro population, it is admirably located to reach those for whom it is intended. It has ample grounds—a plantation of 500 acres—and plain and substantial buildings. From the first it has combined handwork with headwork. It has now college preparatory, normal, theological, grammar, agricultural, manual-training, nurse-training, and musical departments, with a model primary school as a practice school for the normal students. A strictly pedagogical course of two years is part of the normal work. The John F. Slater fund trustees have given Tougaloo $3,000 yearly for its normal and manual work. Until the adoption of the new State constitution in 1890 the normal department was in part supported by the State. The enrollment for 1894–95 was 379, with 23 instructors and officers. The school has no endowment, but is supported by the American Missionary Association.

FRANK G. WOODWORTH.

**Toul'min**, HARRY: jurist; son of Rev. Joshua Toulmin; b. at Taunton, England, in 1767; was several years a Dissenting minister at Chorobert, Lancashire; settled at Norfolk, Va., 1793; was president of Transylvania College 1794–96; secretary of State of Kentucky 1796–1804; was appointed judge of U. S. district court of Mississippi 1804; passed his later years in Alabama; assisted in framing the constitution of that State, and served in its Legislature. He was the author of *A Description of Kentucky* (1792); *Collection of the Acts of Kentucky* (Frankfort, 1802); *Magistrate's Assistant*, *A Digest of the Territorial Laws of Alabama* (Cahawba, 1823); and other publications, and aided James Blair in the preparation of his *Review of the Criminal Law of Kentucky* (1804). D. in Washington co., Ala., Nov. 11, 1823. Revised by F. STURGES ALLEN.

**Toulmin**, JOSHUA, D. D.: clergyman and author; b. in London, England, May 11, 1740; educated at St. Paul's school and at the Dissenting academy of Dr. S. M. Savage; was for some time minister of a Dissenting congregation at Colyton, Devonshire; became in 1765 pastor of a Baptist church at Taunton, where he also conducted the business of a bookseller; subsequently adopted Unitarian views; became prominent in their advocacy, and was pastor of Dr. Priestley's church at Birmingham from 1804 to his death there July 23, 1815; author, among other works, of *Memoirs of Faustus Socinus* (1777) and *Dissertations on the Internal Evidences of Christianity* (1785); was editor of D. Neal's *History of the Puritans* (Bath, 5 vols., 1793–97), with notes

and a memoir of the author, and subsequently published as a supplement *An Historical View of the State of the Protestant Dissenters in England under King William* (1814). A volume of his *Posthumous Discourses* was published in 1818.
Revised by J. W. CHADWICK.

**Toulon**, too'lōn': town; department of Var, France; 42 miles E. S. E. of Marseilles (see map of France, ref. 9–H). It is at the head of a narrow but deep inlet of the Mediterranean, from which it rises like an amphitheater on an acclivity, leaning against a row of lofty hills which encircle the bay. Next to Brest, Toulon is the principal naval station of France, and a fortress of immense strength. It is surrounded by a double-bastioned wall, and all the commanding heights in the neighborhood bristle with forts and redoubts. The harbor is double; one part, given up to commerce, is lined with convenient quays; the other, arranged for naval purposes, is surrounded with ship-building docks, cannon-foundries, ropewalks, magazines, arsenals, schools, hospitals, barracks, and naval establishments of every description; and this part of the harbor is separated from the roadstead by hollow but bombproof moles lined with batteries. Toulon carries on a considerable trade with Algeria. Pop. (1896) 95,276.
Revised by M. W. HARRINGTON.

**Toulouse**, too'looz': city of France; capital of the department of Haute-Garonne; in a fertile plain on the Garonne and the Canal du Midi; 160 miles S. E. of Bordeaux (see map of France, ref. 9–E). The streets in the older portions are narrow, crooked, and badly paved, the houses built of brick and without any characteristic style, though the broad quays and boulevards that have taken the place of the old walls are handsome thoroughfares. Of the cathedral, dedicated to St. Stephen, the nave dates from the twelfth and thirteenth centuries, the front façade from the fifteenth. The Church of St. Sernin is one of the most beautiful Ro-

Church of St. Sernin.

manesque structures in France, begun in the eleventh century, completed in the fifteenth, and with a tower 250 feet high. There are many buildings of unusual interest and the promenades are attractive. Toulouse is the residence of an archbishop, and has seminaries, monasteries, etc., a court for the departments of Haute-Garonne, Tarn, Tarn-et-Garonne, and Ariège, a commercial court, faculties of theology, medicine, and law, many special and general schools, a noted museum, a public library of over 60,000 volumes, and numerous benevolent institutions. It also has military schools, arsenals, powder-factories, etc. The manufacturing industry is important, especially in cloth, woolen and cotton fabrics, machinery and agricultural implements, candles, oil, soap, oilcloth, paper, tobacco, etc. The commerce is very active, especially in grain, wine, marbles from the Pyrenees, wood, etc. Four large fairs for cloth, woolens, and cattle are held annually. Pop. (1896) 149,963. Toulouse was the name of an ancient French family which ruled independently over the city and the country along the Garonne. In 852 the possession was made a dukedom, and for some time it was united to the countship of Auvergne and the dukedom of Aquitaine. In 1208 Pope Innocent III. waged war against Toulouse, conquered the country, and gave it to Simon of Montfort. His successor, pressed hard by the legitimate heirs of Toulouse, transferred his rights to Louis VIII. of France, and a war ensued between this king and Duke Raymond VII. The country was finally incorporated with France by Philip III. On Apr. 10, 1814, the French under Soult were defeated by Wellington in a battle before Toulouse.
Revised by M. W. HARRINGTON.

**Tou'raco, Turacou**, or **Turakoo** [from the native name]: any one of the plantain-eaters (*Musophagidæ*) of the genus *Turacus*, a group of large birds peculiar to the warmer parts of Africa, and characterized by their red and green plumage and conspicuous erect occipital crest. The wings are rounded; tail rather long. The touracos go in small flocks, dwell in the woods, and feed on fruit. The red pigment of the feathers (known as turacin) is soluble in water, and the birds are temporarily paler after bathing. F. A. L.

**Touraine**, too'rān': an ancient province of France, in the central part of the country, on both sides of the Loire, with Tours for its capital, consisting of the present department of Indre-et-Loire and part of Vienne. It was inhabited by the Turones when Cæsar arrived in Gallia, and was annexed to the French crown in 1204. On the revocation of the Edict of Nantes it suffered very much, as most of its inhabitants were Protestants.

**Tourcoing**, toor'kwăn': town of France, department of Nord; 10 miles by rail N. E. of Lille (see map of France, ref. 2–F). It is a large manufacturing place, where great quantities of wool, cotton, and flax are spun and woven into various kinds of fabrics; its breweries, distilleries, and sugar-refineries are also important. Pop. (1896) 73,353.

**Tourgee**, toor-zhā', ALBION WINEGAR: author; b. at Williamsfield, O., May 2, 1838; educated at the University of Rochester, New York; served in the U. S. army in the civil war, and was twice wounded; after the war, settled in the practice of the law at Greensboro, N. C., and at the Southern loyalist convention in Philadelphia, Pa., in 1866, prepared the report on the condition of the Southern States. He was judge of North Carolina superior court in 1868–74. With Messrs. Barringer and Rodman he prepared *A Code of Civil Procedure for North Carolina* (1868); author of *A Fool's Errand* (1879); *Bricks without Straw* (1880); *Hot Ploughshares* (1883); *An Appeal to Cæsar* (1884); *Black Ice* (1888); *Letters to a King* (1888); *With Gauge and Swallow* (1889); *Pactolus Prime* (1890); *Murvale Eastman* (1892); and *An Outing with the Queen of Hearts* (1894). In 1882–85 he edited *Our Continent*, a weekly paper published in Philadelphia.
Revised by H. A. BEERS.

**Tourjee**, EBEN: musician and teacher; b. at Warwick, R. I., June 1, 1834; at a very early age displayed great talent for music; at the age of thirteen was organist of a local church; when seventeen went to Providence, opened a music-store, and began teaching; in 1859 went to East Greenwich, R. I., and founded the Musical Institute; in 1863 went to Europe for further study; returned in 1867, and removed the Musical Institute to Boston and renamed it the New England Conservatory of Music; in 1869 received the degree of Doctor of Music from Wesleyan University, Middletown, Conn.; in 1872, with P. S. Gilmore, organized the World's Peace Jubilee. He held many places during his life and edited a number of musical works. D. in Boston, Apr. 12, 1891. D. E. HERVEY.

**Tourmaline** [Cingalese *turamali*; the first gems of it being brought from Ceylon]: a mineral found in granitic and metamorphic rocks, and occasionally furnishing fine gems. It is a complex silicate of aluminium, with about 10 per cent. of boric oxide and smaller amounts of other oxides, its varying composites giving rise to different varieties. It occurs in brittle, prismatic crystals, usually three-, six-, or nine-sided, which have a hardness of 7·5. Its color is usually black, but when found in limestones it is often rich brown. Tourmalines of blue, green, pink, and red colors occur, frequently with two or three colors in the same crystal. These colored crystals, when transparent, make beautiful gems and have received distinct names. The black is called *schorl*, the white *achroite*, the red *rubellite*, and the blue *indicolite* or, when clear, *Brazilian sapphire*; and different shades of green, *Brazilian emerald* and *Brazilian chrysolite*; and the yellow, *Ceylon peridot*. Fine red and green tourmalines occur at South Paris and other Maine localities, in the San Jacinto Mountains, California, in Minas Geraes, Brazil, and the island of Elba; pink and red in Madagascar and Southern California; brown and red in Carinthia and Ceylon. The mineral is remarkable also for its optical properties, and is used for experiments in polarized light. The colored tourmalines of Maine are treated of in published works by Dr. A. C. Hamlin, whose collection of them, as well as those of others, has become the property of Harvard University. See also GEM and PRECIOUS STONES.

GEORGE F. KUNZ.

**Tournament**, or **Tourney** [*tournament* is M. Eng. *turnement* < O. Fr. *torneiement*, deriv. of *torneier*, turn round and round, tilt, tourney; *tourney* is from O. Fr. *tornei*, deriv. of *torneier*]: a friendly contest at arms among the warriors of noble birth in the Middle Ages. The term is general, and denotes the gathering of the nobles and knights, the challenging and settling the terms, and the armed struggles themselves, the whole sometimes lasting for many days. All the lodgings in the town would be taken up by visitors, each intending combatant, and perhaps each man of knightly rank, hung out his pennon or banner from his windows, the lists were laid out and fenced in and fitted with seats for ladies and others, and the combats were arranged with care and fought under exact supervision. This was the condition of the tournaments of the fourteenth and fifteenth centuries; before that these gatherings were less ceremonious, and indeed were less frequent, and were often forbidden, not only by the Church, but by kings, as by Philip the Fair of France and Henry III. of England. This would seem to point to much greater danger to life and limb from the earlier tournaments, and it is certain that the arms of war were more used in these than afterward. In fact, the distinction must have been hard to make at first between the judicial duel (see ORDEAL) and the friendly contest between two (see JOUST); and in like manner a tournament must have resembled a pitched battle at a fixed place and time, fought to establish a noble's right to an estate or to a title, or merely out of bravado. When, however, the tournaments had become matters of regulation, the arms used were exactly specified and were generally blunt and pointless swords, maces, or clubs of wood, and for the tilting-match, lances with heads divided into three or four blunt points. The defensive armor was enormously heavy, because the rider was not to dismount, but only to run so many courses with the lance and to strike so many blows with the sword or mace. In this way the tournaments became more and more occasions for unbounded display of wealth and splendor, and less and less serious and dangerous as contests of armed men. The death of Henry II. of France, by an accident in the tilt, in 1559, is generally thought to have put an end to tournaments in France; but throughout Europe the changing conditions of warfare and the more critical temper of the revival of learning (see RENAISSANCE) were making them impossible. The name lingered on in England as applied to *riding at the ring*—that is, the trying to carry off a ring on the point of the lance, and the *quintain*—that is, the game of charging a figure which revolved when the shield was struck, and flung a bag of sand at the rider, who had to be active to escape it.

RUSSELL STURGIS.

**Tournay'**: an old but very handsome and interesting town of Belgium, province of Hainaut; 35 miles W. S. W. of Brussels (see map of Holland and Belgium, ref. 11–B). It is on the Scheldt, which here is crossed by several elegant bridges and lined with quays which are planted with trees and afford beautiful promenades. Tournay contains many fine edifices, among which the cathedral in the Romanesque style is the most remarkable, and important manufactures of carpets, porcelain, hosiery, lace, and liqueurs. Pop. (1891) 34,442. Revised by M. W. HARRINGTON.

**Tournefort**, toorn'fōr', JOSEPH PITTON, de: botanist; b. at Aix, France, June 5, 1656; studied botany and traveled extensively in Southern Europe; was made professor at the Jardin des Plantes in Paris in 1683; went to the Levant with the support of Louis XIV. 1700–02; was appointed Professor of Medicine at the Collège de France. His *Éléments de Botanique* (3 vols., 1694) he translated in 1700 into Latin, *Institutiones Rei Herbariæ*, and this translation was republished with additions by Jussieu in 1719, and translated into English (London, 1719–30). He also wrote *Histoire des Plantes qui naissent aux Environs de Paris, avec leur Usage dans la Médecine* (1698), enlarged by Jussieu in 1725, and translated into English by Martyn (London, 1732), and *Voyage du Levant* (2 vols., 1717; translated into English, 1741). D. in Paris, Nov. 28, 1708.

Revised by CHARLES E. BESSEY.

**Tourneur**, toor-nėr', CYRIL: an Elizabethan dramatist, the dates of whose birth and death are uncertain; author of two powerful but extravagant plays, *The Revenger's Tragedy* (1607) and *The Atheist's Tragedy* (1611), and of a peculiar poem entitled *The Transformed Metamorphosis* (1600). His works were edited by Churton Collins in 1878 (2 vols., London).

**Tour'niquet** [=Fr., deriv. of *tourner*, turn]: an instrument for checking the flow of blood from wounds or during surgical operation by means of pressure applied to the principal artery supplying the blood. A rude but often very useful tourniquet may be made by tying a handkerchief around the wounded limb between the heart and the wound, passing a stick through the handkerchief, and then twisting it till the flow of blood is checked. In the more effective forms a pad is strongly pressed against the main artery by means of a screw. Revised by W. PEPPER.

**Tou'ro**, JUDAH: philanthropist; b. at Newport, R. I., June 16, 1775; son of Rev. Isaac Touro, a rabbi of the synagogue at Newport; engaged in mercantile business; settled in New Orleans as a merchant in 1802, and acquired a large fortune; served as a volunteer at the battle of New Orleans 1815, where he was severely wounded; gave liberally of his fortune during his lifetime, and at his death, which occurred in New Orleans, Jan. 18, 1854, bequeathed most of his property to the public charitable institutions of that city. Among them was the Touro Almshouse, occupied during the civil war as barracks for colored troops, by whom it was burned.

**Tours**, toor: capital of the department of Indre-et-Loire, France; 147 miles by rail S. W. of Paris (see map of France, ref. 5–E). It is on a small strip of land between the Cher and the Loire, which here is crossed by one of the most magnificent bridges in Europe, built in 1765–77 by Bayeux, and lined with handsome quays and finely planted promenades. It has a magnificent Gothic cathedral, several other remarkable edifices, and good educational institutions. Silk manufactures were established here by Henry IV., and during Richelieu's time more than 40,000 persons were employed in this branch of industry; but the revocation of the Edict of Nantes drove the workmen into exile, and gave the city a blow from which it never recovered, though its manufactures of silk-stuffs, ribbons, serges, pottery, and confectionery are still extensive. The town has given its name to the famous battle between Charles Martel and the Saracens in 732. The latter were decisively defeated, and Western Europe was saved from subjection to the Mohammedans. During the war with Germany Tours was the seat of the national Government from Sept. 11 to Dec. 10, 1870. It was occupied by the Germans on Jan. 19, 1871. Pop. (1896) 63,267. Revised by M. W. HARRINGTON.

**Tours**, BERTHOLD: composer; b. in Rotterdam, Holland, Dec. 17, 1838; received his first instruction from his father; afterward studied at Leipzig and Brussels, and thence accompanied Prince Galitzin to Russia. He removed to London in 1861, where he resided until his death (Mar. 11, 1897), composing, teaching, and playing in orchestras and bands. He composed much church music, services, and anthems, which are immensely popular, and also many very popular songs, much good organ music, a number of pieces for piano and also for the violin, and made piano arrangements of many vocal and orchestral scores. D. E. HERVEY.

**Tourville**, toor'veel', ANNE HILARION DE COTENTIN, Count de: admiral; b. at Tourville, department of La Manche, France, Nov. 24, 1642; was educated for the navy, and made a captain in 1667; distinguished himself in the battle of Agosta 1676; commanded the vanguard in the battle of Palermo 1677; made several successful expeditions against the pirates of Northern Africa 1682–88; was created a vice-admiral in 1689; defeated a Dutch-English fleet off the Isle of Wight in July, 1690, and pursued the English to the mouth of the Thames; attacked a Dutch-English fleet superior to his own off La Hogue May 29, 1692, and was beaten after twelve hours' fight; was made a marshal in 1693, and defeated and destroyed a Dutch-English fleet off Cape St. Vincent on May 26, 1693. On the outbreak of the Spanish war of succession he was made commander-in-chief of the united naval force of France and Spain in the Mediterranean, but died in Paris May 28, 1701. See Delarbre, *Tourville et la Marine de son Temps* (1889). F. M. COLBY.

**Toussaint Louverture**, too'sañ'loo'vār'tür' (or **L'Ouverture**), DOMINIQUE FRANÇOIS; revolutionist; b. near Cap Français, Haiti, in 1743. He was a Negro and originally a slave on a plantation belonging to the Jesuits; they gave him the rudiments of education, and passing into the hands of a creole planter he was made overseer. He did not take part in the insurrections until 1791, when he protected the flight of his master before joining Jean François. With the latter he went over to the Spanish Dominicans in 1793, but in 1794 he deserted to the French republicans, carrying with him a large force of blacks. This step gave the republicans overwhelming power, and as Toussaint was now the acknowledged leader of the Negroes and could turn the scale as he pleased, he became the most influential man in the island. He was made commander-in-chief and deputy governor, and the French commissioner, though nominally the highest officer, was left with only a semblance of power. Mainly through Toussaint's generalship the British, who had aided the royalists, were forced to evacuate the island in 1798. Their commander, Gen. Maitland, surrendered the posts directly to Toussaint, refusing to recognize the French commissioner. Soon after an insurrection, secretly incited by Toussaint, drove the commissioner from the island; the mulatto Gen. Rigaud, to whom he delegated his powers, was defeated by Toussaint in 1799, leaving the latter undisputed master of the western or French part of the island. He used his power with great moderation, protected the whites, and proclaimed a general amnesty. As the only available means of restoring agricultural prosperity he forced the Negroes to work on the plantations, securing to them, however, a part of the profits. The eastern part of the island having been ceded to France, he occupied it in 1801. Finally, in July, 1801, he promulgated a constitution which made him president for life. Under his rule the island was unquestionably prosperous, and he had won not only the respect but the enthusiastic devotion of the Negroes. An admirer of Bonaparte, he modeled his actions and conversation after him, and claimed to have seized the supreme power in the same manner. One of his numerous letters to the First Consul was superscribed, "The First of the Blacks to the First of the Whites." Bonaparte paid no attention to these letters, and when Toussaint threw off all semblance of subjection to France he organized an expedition under LECLERC (*q. v.*) to reduce the island to obedience. During the early part of 1802 Toussaint made a desperate resistance, finally capitulating in April. He was pardoned, but two months afterward was arrested for alleged conspiracy and sent a prisoner to France. He died in captivity at the castle of Joux, near Pontarlier, Apr. 27, 1803. HERBERT H. SMITH.

**Tow**: See FLAX.

**Towan'da**: borough; capital of Bradford co., Pa.; on the Susquehanna river, and the Barclay and the Lehigh Val. railways; 82 miles N. W. of Wilkesbarre (for location, see map of Pennsylvania, ref. 2-G). It is in an agricultural and dairying region; has electric and gas lights and water-supply from springs 16 miles distant; and contains the Susquehanna Collegiate Institute (Presbyterian, chartered 1850), 2 national banks with combined capital of $275,000, a daily, a semi-weekly, and 4 weekly newspapers, an extensive toy-factory, several foundries, planing-mills, and piano, carriage, and furniture factories. Pop. (1880) 3,814; (1890) 4,169; (1900) 4,663. MANAGER OF "REVIEW."

**Tower**: a building or member of a building, simple and compact in its form, cylindrical or prismatic; generally, though not always, higher than wide. The towers of an ancient fortress (see CASTLE and FORTIFICATION) are to be considered partly as flanking works, projecting from the curtain walls in such a way as to allow of a cross-fire of arrows and the like, and partly as higher structures commanding the top of the curtain walls. In Greek and Roman city walls, and in mediæval castles and towns previous to the thirteenth century, the towers are nearly always higher than the walls and serve both the purposes cited above. In the later fortresses of the Middle Ages they are often of the same height as the walls. The evolution of defense against the old means of attack had led to a complete freedom for the garrison of movement from point to point of defensive works, and the towers were often mere bastions, parts of the wall and of the same height with it, as notably in the famous BASTILE (*q. v.*) of Paris. Height alone is, however, of great utility in defense against attacks by sapping and by escalade, and accordingly the donjon of a castle was generally a very lofty and partly isolated tower. In the Italian cities lofty square towers were erected for defense; hundreds of them existed in a single town; but of these very few remain, the greatest number being at San Gimigniano, in Tuscany, though several others exist at Bologna (see LEANING TOWERS), at Arezzo, and elsewhere. The small strong buildings of border barons in the Pyrenees, in Germany, and on the English-Scottish frontier, are commonly in the form of towers; some few of these remain in a partly ruined condition. In parts of the Caucasian mountain country and in Afghanistan whole villages exist of which each important house has a tower of defense into which the family may retreat in case of a violent attack. Church towers, on the other hand, being intended primarily for belfries, are made high so as to lift the mouths of the bells well above the church-roof and all surrounding buildings. From this original utilitarian form they passed into one of the chief means of decorative architecture in the Middle Ages, and of this great height was a necessary feature in most cases, although in some English parish churches the tower is hardly higher than its own breadth across the buttresses. Throughout the north of Europe the church tower was generally closely united with the mass of the church, and in some cathedrals as many as six, in one case eight, towers formed part of the original design. In Italy the tower was always a belfry or *campanile*, and was almost wholly detached from the church building.

Small towers forming part of larger masses of building are generally called turrets or *tourelles*, from the French word of the same meaning. These are often carried on corbeling and in projection from the main wall; they frequently contain winding stairs and often serve as watch-towers; oriel windows also are sometimes built in the semblance of such *tourelles*. The *round towers of Ireland* are slender, nearly cylindrical, but built generally with a slight taper, roughly built of stone, and always very near to a church. Only about a dozen remain nearly complete, but there are more than a hundred of which ruins exist. Their purpose has never been satisfactorily explained, though many works have been devoted to them. See ROUND TOWERS. RUSSELL STURGIS.

**Tower**, ZEALOUS BATES: soldier and military engineer; b. at Cohasset, Mass., Jan. 12, 1819; graduated at the U. S. Military Academy at the head of his class, and was appointed second lieutenant in the Corps of Engineers July 1, 1841. After a brief service as assistant with the board of engineers he was recalled to West Point Aug., 1842, serving as assistant professor until Apr., 1843, and as principal assistant professor of engineering Apr.-Aug., 1843, when, returning to duty with his corps, he served as assistant engineer in the construction of the defenses of Hampton Roads, Va. He served with distinction in the war with Mexico, especially at Cerro Gordo, Contreras, and Chapultepec, and in the assault and capture of the city of Mexico. During 1848-61 he was engaged in the construction of fortifications at Portland, Me., and Portsmouth, N. H.; of the defenses of San Francisco, Cal., and as member of the board of engineers for the Pacific coast. He was promoted major of engineers Aug. 6, 1861, and assigned as chief engineer to defend Fort Pickens; breveted lieutenant-colonel for gallant services; and commissioned brigadier-general of volunteers from Nov. 23, 1861, the date of its bombardment. Assigned to command of a brigade in the Army of Virginia in 1862, he was engaged in the battle of Cedar Mountain Aug. 9, and subsequent operations during Pope's campaign in Northern Virginia, and was severely wounded at the second battle of Bull Run. For gallantry at Cedar Mountain he was breveted colonel, and the brevet of brigadier-general was conferred on him for Groveton. From July 8 to Sept. 8, 1864, he was superintendent of the U. S. Military Academy. In Sept., 1864, he was appointed chief engineer of the defenses of Nashville; was engaged in the battle of Nashville Dec. 15-16, 1864; and from Oct., 1864, was inspector-general of the fortifications of the military division of the Mississippi; chief engineer of the military division of the Tennessee July, 1865–Jan., 1866; breveted major-general Mar. 13, 1865. Returning to duty in Jan., 1866, with his corps in which he had attained the rank of lieutenant-colonel Nov., 1865, he was a member of various engineer and special boards, and during 1866–67 had charge of the construction of the defenses of Portsmouth, N. H.; in May, 1867, was appointed a member of the board of engineers for permanent fortifications and river and harbor obstructions; became colonel of engineers Jan., 1874; and retired Jan. 10, 1883. D. Mar. 21, 1900.

**Tower City**: city; Schuylkill co., Pa.; on the Williams Valley Railroad; 11 miles W. S. W. of Tremont, and 24 miles W. of Pottsville, the county-seat (for location, see map of Pennsylvania, ref. 5–H). It is in an agricultural and coal-mining region, and has a building and loan association and a weekly newspaper. Pop. (1890) 2,053; (1900) 2,167.

**Tower of London**: the ancient citadel of the city of London, standing, as the Louvre does in Paris, on the banks of the river, immediately below and outside of the city, which it once defended. Its government has been intrusted since the days of the Conqueror to a high officer called the constable, which office has been held by the Duke of Wellington, Field-marshals Sir John Burgoyne, Sir George Pollock, and Sir William Gomm. The oldest portion is the isolated donjon or keep called the White Tower, built by William the Conqueror, and contains an interesting chapel of the same period. This is now surrounded by a rampart and moat, with inner wall (the Inner Bail), flanked by half-circle towers, each of which has a distinctive name, as the Bell Tower, the Beauchamp Tower, Wakefield Tower (where are kept the regalia), Bloody Tower, Bowyer Tower. There is also within the inclosure the Horse-armory, a museum of ancient armor; St. Peter's church, where are interred the remains of Anne Boleyn, Katherine Howard, Dukes of Somerset ("The Protector") and Northumberland, Lady Jane Grey and her husband, and many other celebrated victims of the headsman. Closely adjacent to the Tower is Tower Hill, the famous place of execution for persons delivered from the Tower to the sheriffs of London for execution. Here suffered (among others) Bishop Fisher, Sir Thomas More, Lord Guilford Dudley, Earl of Strafford, Archbishop Laud, Algernon Sydney, and (1747) Lord Lovat, the last person beheaded in England. Queen Anne Boleyn and Lady Jane Grey were beheaded on scaffolds within the Tower, the site of which is shown, as also the block on which the former suffered. Within the Bloody Tower took place the murders of the princes, sons of Edward IV., and, elsewhere within the precincts, of Henry VI., of the Duke of Clarence, of Sir Thomas Overbury, and of the Earl of Essex.

The Tower of London.

**Towers of Silence**: the structures on which the modern PARSEES (*q. v.*), in accordance with the tenets of their faith, dispose of the dead by allowing them to be devoured by vultures. This disposition of the corpse is a very ancient one in Iran, and it is inculcated in the AVESTA (*q. v.*) as enjoined by Zoroaster. Allusions to the customs are found also in Herodotus (i., 140), who describes it as Magian, and elsewhere in the classics. According to the Zoroastrian religion the elements, fire, earth, and water, were sacred, and not to be defiled; the dead body, as full of corruption and pollution, could not therefore be burned, buried, nor thrown into the water, but was exposed on mountain heights, upon structures called *dakhmas*, as a prey to the dogs and birds. The modern Parsee *dakhma*, or tower of silence, is a structure from 60 to 90 feet in diameter, and from 20 to 30 feet in height, somewhat resembling a gasometer. The interior raised floor upon which the dead bodies are placed is divided, like the spokes of a wheel, into three concentric rows of troughs (*pavis* they are called), the outer for men, the middle for women, the inner for children. The center or hub is a great pit (*bhandar*), some 30 feet in diameter, into which the denuded bones, parched and dried in the Oriental sun, are later deposited, and there crumble into dust. All flow and exudation of putrid matter is carefully conducted through disinfecting channels, so that the earth is preserved from defilement, and the sanitary laws are preserved. No one is allowed to witness the descent of the "heaven-sent" birds; the body, it is said, is quite stripped of flesh in an hour or two. Remains of ancient Zoroastrian *dakhmas* are to be seen in Persia, for example, at Teheran, and the principal towers of silence in use to-day by the Parsee community of India are found on Malabar Hill, Bombay. See Dosaithai Framji Karaka, *History of the Parsis*, i., 199–210 (London, 1884); Modi, *A Tower of Silence* (Bombay, 1885).

A. V. WILLIAMS JACKSON.

**Towianski**, tō-vēē-aan'skēē, ANDREAS: impostor; b. at Antoszwiniec, Lithuania, Jan. 1, 1799; studied at Wilna, and made himself conspicuous early in life by his mystical enthusiasm and pretensions of receiving divine revelations; practiced law at Wilna 1818–26. After wandering around in Europe, he went to Paris about 1841, and obtained complete control of Mickiewicz, the great Polish poet, especially by the marvelous manner in which he cured his insane wife. He actually formed a sect which accepted him as a Messiah, but was expelled in 1842. He then tried to get a foothold in Brussels, in Switzerland, in Rome, but in vain. From Rome he was expelled as an impostor, and, returning to Switzerland, he gave up his *rôle* of a prophet, settled in Zurich, and died there May 13, 1878. See Semenke, *Towianski et sa doctrine* (Paris, 1859). Mickiewicz wrote in his favor *L'église officielle et le Messianisme* (2 vols., Paris, 1842–43).

Revised by S. M. JACKSON.

**Towle**, tōl, GEORGE MAKEPEACE: journalist and author; b. in Washington, D. C., Aug. 27, 1841; graduated at Yale College 1861, at Harvard Law School 1863; practiced law in Boston 1863–66; U. S. consul at Nantes, France, 1866–68, and at Bradford, England, 1868–70; managing editor of the Boston *Commercial Bulletin* 1870–71; State senator of Massachusetts in 1890–91; author of *Glimpses of History* (1865); *Henry the Fifth, King of England* (New York, 1866); *American Society* (2 vols., London, 1870); *Beaconsfield* (1878); *Certain Men of Mark* (1880); *England and Russia in Asia* (1885); *England in Egypt* (1886); *Young People's History of England* (1886); *The Nation in a Nutshell* (1887); *Young People's History of Ireland* (1887); and *The Liter-*

*ature of the English Language*, of which he had finished two of its three volumes at the time of his death. He also contributed to English and American periodicals. D. at Brookline, Mass., Aug. 8, 1893. Revised by H. A. BEERS.

**Town** [O. Eng. *tūn*, inclosure, fence, village, town : O. H. Germ. *zūn*, inclosure (> Mod. Germ. *zaun*, hedge, fence) : Icel. *tūn*, inclosure, house ; cf. Celtic *dunum* in names like *Lugdūnum*, Lyons]: a word of varying signification, both in popular speech and in legal usage. In its broadest sense, it includes not only every sort of municipality, without regard to size, origin, or form of government, but also populous districts which are destitute of self-governing powers. It has this generic signification in some statutes. The House of Lords has declared that a town exists, within the meaning of that word in a railway statute, "where there is such an amount of continuous occupancy of ground by houses that persons may be said to be living as it were in the same town or place continuously." (*London Ry.* vs. *Blackmore*, L. R. 4 H. L. 611.) See also the Towns Improvement Clauses Act, 1847 (10 and 11 Vict., c. 34). As a generic legal term, however, it ordinarily includes only municipalities; that is, political subdivisions less than counties established for local government. It is employed in this sense in § 23 of Magna Charta ("neither a town nor any person shall be distrained," etc.) as well as in modern statutes. (*Banta* vs. *Richards*, 42 N. J. L. 497.) The common-law definition of the word, in this sense, is "a place with a constable or a church." Baron Parke in *Elliott* vs. *South Dev. Ry.*, 17 L. J. Exch. 262.

As a specific term it is used (1) to designate a municipality, which is not a city nor a borough nor a village, without regard to its size or form of government. It is so employed in § 13 of Magna Charta—"all other cities and boroughs, and towns, and ports." It has this meaning in Pennsylvania, Maryland, Virginia, and some other States, as well as in the Federal statutes relating to town sites on the public lands. (U. S. R. S., §§ 2380, *et seq.*) (2) In some of the States municipalities are divided into cities, towns, and villages; those having 2,000 inhabitants or more, for example, are declared to be cities; those having less than 2,000 and not less than 500 are towns; those having less than 500 are villages. (See Miss. Code of 1892, § 2911.) Even in such States, however, the term is sometimes used in statutes in its generic sense, and includes unincorporated settlements. (*Murphy* vs. *State*, 66 Miss. 46.) So variable is the import of this word that its signification in any particular enactment must depend largely upon the occasion and purpose of the law. (*Broome* vs. *Tel. Co.*, 49 N. J. L. 497.) (3) Again, the term designates a territorial subdivision, which is the unit of local administration. In this sense it is employed by Blackstone, who asserts that it is synonymous with tithing or vill. (1 *Commentaries*, 114.) It bears this meaning in New England, in New York, and in several of the Western States. At first, the New England town consisted of clusters of inhabitants dwelling near each other, but as soon as the territorial boundaries of these village communities were fixed the term was applied to the territory or district. The term township was used interchangeably with town. For example, the General Court of Plymouth ordered, in 1637, that "Ducksburrow shall be a township, and unite together for their better security, and to have the privilege of a town, only their bounds and limits shall be set and appointed by the next court."

TOWNSHIP.—In New Jersey, Pennsylvania, and some other commonwealths, as well as in Canada, the word township is used exclusively to designate this primary division of the State. In the Federal statutes relating to public lands, however, and in the nomenclature of the new western States, the township is a territorial subdivision, made by the intersection of meridians and parallels 6 miles apart, and containing an area of 36 sq. miles, but is not a political subdivision. It has no functions of local government.

The origin of towns, their political powers and duties, and their relations to counties and to States, can not be treated adequately in an article of this kind. For information on these topics, the reader is referred to *Commonwealth* vs. *City of Roxbury*, 9 Gray (Mass.) 451, and note by the editor, now Mr. Justice Gray; *Hill* vs. *Boston*, 122 Mass. 344; *Webster* vs. *Town of Horwinton*, 32 Conn. 131; *Johns Hopkins Studies in History and Political Science*, series i. to viii. inclusive; Howard, *Introduction to the Local Constitutional History of the United States* (1889); De Wolf, *The Town Meeting* (1890); Adams, *Study of Church and Town Government* (1892); *Genesis of the Massachusetts Town*, 2 *Proc.* Mass. Hist. Soc., vii., 172–264; *The Anglo-Saxon Township*, by Ashley, *Quarterly Journal of Economics*, viii., 345; Chalmers, *Local Government* (London, 1883); Bryce, *American Commonwealth*, ch. xlviii.; Stubbs, *Constitutional History*, vol. i., ch. v.; Stubbs, *Select Charters*, part i. FRANCIS M. BURDICK.

**Townley**, CHARLES: archæologist; b. at Townley Hall, Lancashire, England, Oct. 1, 1737, of a Roman Catholic family; received his education on the Continent under the tutorship of the celebrated John Turberville Needham; resided at Rome 1765–72, engaged in the study of antiquities, and enjoying in that pursuit the advice and experience of Winckelmann and other celebrated archæologists; devoted his large fortune to the formation of a magnificent collection of ancient art, which he subsequently largely increased through his agents and by the purchase of the Nollekens collection, and arranged his museum in two houses which he purchased in Park street, Westminster, where he died Jan. 3, 1805. The Townley Marbles were purchased by the nation for £20,000, and in 1814 his bronzes, coins, and gems were also acquired for £8,200. They now form part of the Græco-Roman collection in the British Museum, of which institution Mr. Townley had been a trustee. He was the author of *Antiquities discovered at Ribchester* (London, 1800).

**Townley**, JAMES: clergyman; b. in Manchester, England, May 11, 1774, of parents belonging to a Wesleyan congregation; became a local preacher at the age of nineteen, and was a regular minister from 1796 to 1832. He became secretary-general of the Wesleyan Missionary Society in 1827, and presided over the conference at Sheffield in 1829 and over the Irish conference in 1830. He was well versed in all biblical matters, and wrote, among other works, the excellent *Illustrations of Biblical Literature, exhibiting the History and Fate of the Sacred Writings, from the Earliest Period to the Present Century*, including biographical notices of translators and other eminent biblical scholars (3 vols., London, 1821; 2 vols., New York, 1842). D. at Ramsgate, Dec. 12, 1823.

**Townsend**: town (incorporated in 1732); Middlesex co., Mass.; on the Squannacook river, and the Fitchburg Railroad; 22 miles W. of Lowell, and 44 miles W. N. W. of Boston (for location of county, see map of Massachusetts, ref. 2–H). It contains the villages of Townsend, West Townsend, and Townsend Harbor; has a high school, 12 public schools, public library, a national bank with capital of $100,000, and an assessed valuation of over $1,000,000; and is principally engaged in cooperage and the manufacture of furniture. Pop. (1880) 1,967; (1890) 1,750; (1900) 1,804.

**Townsend**, GEORGE ALFRED: journalist; b. at Georgetown, Del., Jan. 30, 1841; graduated at the Philadelphia High School 1859; became news editor of the Philadelphia *Inquirer*, and subsequently city editor of the *Press*. He was correspondent for the New York *Herald* and *World* during the civil war, and was in Europe 1866–67 reporting the Austro-Prussian war and the Paris Exposition for American newspapers. He was for several years from 1868 on the staff of the Chicago *Tribune* as editorial writer and correspondent; and has been a successful lecturer and a general contributor to periodicals under the pen-name of *Gath*. He has published several volumes, including *Campaigns of a Non-combatant* (1865); *Poems* (1870); *Washington, Outside and Inside* (1871); *Tales of the Chesapeake* (1880); *The Entailed Hat* (1884); *Katy of Catoctin* (1886); and *Mrs. Reynolds and Hamilton* (1890). H. A. BEERS.

**Townsend**, LUTHER TRACY, D. D.: clergyman and author; b. at Bangor, Me., Sept. 23, 1836; graduated at Dartmouth College in 1859; studied theology at Andover, where he graduated in 1862; adjutant in the army in 1863–64; from 1873 to 1893 Professor of Practical Theology in Boston University, and since 1893 pastor of Mt. Vernon Place Methodist Episcopal church, Baltimore. Among his works are *The Arena and the Throne* (1874); *The Chinese Problem* (1876); *Supernatural Factor in Religious Revivals* (1877); *Art of Speech* (1880–81); *Mosaic Record and Modern Science* (1881); *Bible Theology and Modern Thought* (1883); *Real and Pretended Christianity* (1884); *The Bible and other Ancient Literature in the Nineteenth Century* (1889); *Bible Miracles and Modern Thought* (1891); *Outlines of Theology* (1893).

**Townsend**, THOMAS S.: See the Appendix.

**Townsend**, WILLIAM K.: See the Appendix.

**Townshend**, CHARLES, second Viscount Townshend: statesman; b. at Rainham, England, Mar. 10, 1674; succeeded to the peerage on the death of his father Horatio, the first viscount, Dec., 1687; was summoned to the privy council in 1707; was joint plenipotentiary with Marlborough (1709) at the conferences of Gertruydenburg for negotiating a peace with France, and ambassador to the States-General of Holland 1709–10; signed the Barrier treaty at The Hague Oct. 29, 1709; resigned his embassy and returned to England on the fall of the Whig ministry 1712; was censured by the House of Commons for having signed the Barrier treaty, and declared by vote of the same House an enemy to the queen and kingdom; entered into correspondence with the Elector of Hanover, who on his accession to the throne of England made him Secretary of State and Prime Minister Sept. 14, 1714; resigned that post, and was appointed Lord-Lieutenant of Ireland 1717, but never took possession of that office; became president of the council June, 1720, and was again Secretary of State from Feb. 10, 1721, to May 15, 1730, when he retired on account of differences with his brother-in-law and colleague, Sir Robert Walpole. D. at Rainham, Norfolk, June 21, 1738.

**Townshend**, Charles: statesman; grandson of the second viscount; b. in England, Aug. 29, 1725; entered the House of Commons 1747, where he acquired prominence by an eloquent speech on the Marriage Bill 1753. In 1754 he became a lord of the admiralty, but was dismissed for an attack on the ministry in the following year. A supporter of Pitt, he was appointed treasurer of the chamber in Dec., 1756, and in the following spring became a member of the privy council, but in 1760 ranged himself on the side of Bute, and was rewarded with the post of Secretary of War (1761–62). He was for a time in opposition to the Grenville ministry, but toward its close accepted the office of paymaster of the forces (1765), and supported Grenville's Stamp Act of that year. He was appointed Chancellor of the Exchequer and Lord of the Treasury by Pitt Aug. 2, 1766; and was virtually Prime Minister during the retirement of Pitt. His last act was to introduce the celebrated resolutions for taxing the American colonies in 1767. D. in Oxfordshire, Sept. 4, 1767. For the instability of his political opinions he was commonly known as the "Weathercock," but he had an immense parliamentary reputation for oratory and wit. His character has been largely discussed by Macaulay (who said "he was a man of splendid talents, of lax principles, and of boundless vanity and presumption") and by historians of the American war, especially Bancroft, and has been made the subject of a special biography, *Charles Townshend, Wit and Statesman* (1866), by Percy Fitzgerald. F. M. Colby.

**Townshend**, Chauncy Hare: author; b. in England in 1798; educated at Eton; graduated at Cambridge 1821; took orders in the Church of England, but from ill health never engaged in active professional life. He devoted himself to poetry, literature, and art; formed valuable collections of pictures and other objects of art; gave much time to the investigation of mesmerism, in which he was a firm believer, and spent much of his life at his villa of Monloisir at Lausanne, Switzerland. D. in London, Feb. 25, 1868. By his will he bequeathed most of his art collections to the South Kensington Museum, and left a sum of money and the care of his MSS. to Charles Dickens, requesting him to publish such extracts as would illustrate his religious views. Dickens accordingly issued in Dec., 1869, *The Religious Opinions of the Rev. Chauncy Townshend, published, as directed by his Will, by his Literary Executor.* Mr. Townshend was the author of works on mesmerism and several volumes of poems. Revised by H. A. Beers.

**Township**: See Town.

**Townsville**: town of Queensland, Australia; 700 miles N. W. of Brisbane, on Cleveland Bay; lat. 19° 16′ S., lon. 147° E.; E. terminus of railway to Hughenden (see map of Australia, ref. 3–I). It is a rapidly growing town, the outlet of a rich agricultural district, but has a poor harbor, which, however, is being improved. It is at the mouth of Ross creek, and climbs Melton Hill, an elevation of about 1,000 feet just behind. It has numerous churches and schools, a hospital, an orphan asylum, a large concert-hall; has special provisions for immigrants in great numbers, and an excellent water-system. Among the industries are a soap-factory, a foundry, and two distilleries. The railway to the W. is rapidly developing the inland basins of the Herbert and Diamantina rivers. Pop. (1891) 8,564: with the suburbs, 15,015. Mark W. Harrington.

**Toxæmia**: another name for septicæmia or blood-poisoning. See Blood-poisoning.

**Toxicol′ogy** [Gr. τοξικόν, poison (for τοξικὸν φάρμακον, poison for smearing arrows, deriv. of τόξον, bow) + λόγος, discourse, reason]: the science of poisons. It treats of the nature and properties of poisons, their effects upon the animal system, their detection, and the legal questions connected with poisoning. A poison is any substance which, either introduced into or arising in the body, is capable of exercising chemical or vital effects deleterious to health or life. What we speak of as *vital* effects are probably based upon chemical actions, but of such nature that present means of examination will not reveal them. Much depends upon the quantity of the substance acting upon the body; small doses may be tolerated, large quantities poisonous.

*The action* may be local or general. Among poisons affecting particular parts of the body are such as are corrosive. The symptoms may terminate with the local disturbances, or secondary general symptoms, such as fever, depression, or collapse, may result from the effects of the local disorder rather than from a generalized action of the poison. When the action of poisons is general there is always a dissemination through the blood, which may act simply as a carrier or may itself be altered by the poison.

*Entrance into the System.*—Poisons may gain access to the system by subcutaneous inoculation, through open wounds, through the mucous membrane of the stomach, of the rectum, or of the vagina, and sometimes through the unbroken skin; and the order in which these avenues are named is that of the rapidity of absorption in each. Volatile poisons may enter the system with the inspired air, and rarer modes of poisoning, such as from the urethral surface, from the eyes, nose, etc., have occasionally been noted.

*Circumstances affecting the Action of Poisons.*—Every poison must be in liquid or gaseous state to act. Solution may be effected in the stomach, but at times the stomach and intestines free themselves before the solid poison is dissolved. Sometimes elimination is so rapid and absorption so slow that poisoning does not ensue, and thus a substance may be intensely toxic when injected beneath the skin, though harmless in the stomach. The question of absorption depends much upon the character of the poison. Some, particularly certain salts of the heavy metals, exercise so much local change by chemical reaction with the solid tissues that they are absorbed in very small amounts.

After absorption, the effect of poisons depends largely upon the animal species acted upon and upon the individual. It is well known that certain individuals gain by repeated usage a high degree of immunity from the action of certain poisons, such as alcohol, opium, or the like. This immunity may sometimes be inborn; and, on the other hand, there may be marked idiosyncrasy in the opposite direction, so that the individual is affected profoundly or in a peculiar manner by even minute doses of the poison. The remarkable tolerance of entire races for certain poisons is illustrated by the comparatively trivial effects of opium in India. The evidence of the investigation (1893–95) of the British Government shows that the enormous consumption of opium by the natives of India does not lead to anything approaching the evil effects that would result from a like consumption by European races. Alcohol is comparatively trivial in its effects on Europeans as compared with certain savage races among whom it has been introduced.

The fate of poisons introduced into the system varies greatly. Some are absorbed in an unaltered state, circulate in the blood, and are excreted without any change in the urine, sweat, or other excretions. In many cases, however, chemical changes occur, by oxidation, reduction, or various forms of combination. In many cases substances violently poisonous may thus undergo changes which deprive them of toxic properties, as in the case of alcohol, which is soon broken up by oxidation. The place in which the greatest destruction occurs is probably the liver, and in the same organ very frequently a storage of the poison occurs for a time, so that only minute quantities reach the blood at a time, and serious results are prevented.

*Symptoms of Poisoning.*—These depend upon the nature of the poison, its mode of introduction, and the concentration of the solution or mixture taken. There are in general two groups of cases: (1) those in which intense tissue changes are present, and in which the resulting symptoms are irritative or dependent on absorption of abnormal products of tissue destruction; and (2) those in which the anatomical changes discovered are trivial as compared with the violence of the symptoms, which mainly spring from the nervous system.

I. Of the first group there are first those in which the poison acts upon some external surface—that is, some surface which may be reached without the entrance of the poison into the blood. (*a*) The most common form is that in which corrosives act upon the skin, causing redness, vesiculation, or various degrees of necrosis. (*b*) A most important group of cases is that in which some irritant, most commonly mineral, poison sets up gastro-enteritis (inflammation of the lining of stomach and bowel). The symptoms in such cases are primarily irritative—nausea, vomiting, pain, and purging—the dejecta being mucous, serous, and often bloody. Later, as a result of the copious evacuations, or of reflex nervous influences, depression and collapse ensue. (*c*) Gaseous irritants, or more rarely liquids, gain access to the respiratory tract, and set up intense inflammatory changes with violent cough, expectoration, and difficulty in breathing. Sometimes they occasion dropsical swelling of the mucous membranes of the larynx—œdema of the larynx—and thus lead to the most intense obstruction to breathing, ending in suffocation.

Of the same large group of poisons acting by tissue change there is a second class in which the poison gains access to the blood, and occasions alterations in that important fluid, or circulating in it leads to pathological changes in various organs. (*a*) The blood-poisons act in two ways: some enter into combination with the hæmoglobin of the blood, destroying its functional activity, and cause dyspnœa, cyanosis, stupor, and unconsciousness; others occasion more profound alterations of the blood, and when rapidly acting lead to cyanosis, jaundice, hæmoglobinuria, and rapid destruction, while the more slowly acting ones produce a gradually increasing anæmia. (*b*) The class in which the solid tissues are attacked by poisons carried in the blood is variable in the symptomatology, according as one organ or another is involved. In all the pathological changes in the organs are much the same, cloudy-swelling, fatty degeneration, and necrosis (given in the order of severity) being the alterations produced. When the liver is affected, enlargement of the organ and jaundice are noted, as in phosphorus-poisoning; when the kidney is attacked, albuminuria, bloody urine, or hæmoglobinuria, and other pathological characters of the urine are seen, as in turpentine or cantharides poisoning; when the heart muscle is involved, failing circulation, collapse, and sudden death may ensue, as in some cases of phosphorus-poisoning or chloroformization.

II. Finally there is the second large group of poisons in which marked tissue changes are not found at the portal of entrance or within the body, but in which profound nervous symptoms are observed. The symptoms vary infinitely with the part of the nervous system affected, with the peculiar activity of the poison (physiological action), and with the individual susceptibility of the person affected. Excitement, cramps or convulsions, delirium, rapid pulse, and increased rapidity of the breathing may mark one group of cases, while another presents depression, sleep, stupor, or coma, with depression of the general organic functions; but all grades of severity and shades of demarkation exist to distinguish the individual poisons.

*Diagnosis of Poisoning.*—This must be made by taking the sum of the evidence of all kinds. A thorough discussion of this intricate subject in all its medico-legal relations is obviously impossible within the limits of this essay, but the following are the essential points to be borne in mind: In the first place, the diagnosis of poisoning can not be made with infallible certainty from the symptoms alone, for there are no symptoms absolutely distinctive of any single poison. Neither does the mere fact, taken by itself, of the presence of a poisonous substance in the stomach, the excreta, or even the tissues of the dead body, necessarily prove that the illness or death was occasioned by the poison. On the other hand, neither does the absence of characteristic symptoms or lesions, or failure to detect the presence of poison, prove that the case is *not* one of poisoning. Presumptive evidence of poisoning is afforded by the following circumstances: (1) Sudden onset of the symptoms in a previously healthy individual, especially shortly after taking food, drink, or medicine. Still stronger is the presumption where several persons, so partaking, are similarly and simultaneously attacked. (2) Correspondence of the symptoms with those known to be produced by some poison. (3) Finding of a poison in the stomach, excreta, or tissues of the dead body. Proof of the presence of a poison may be obtained by chemical tests, physiological experiments upon animals with the suspected matters, etc. But as regards chemical testing, which is very properly regarded as the means of getting most certain proof, it is important to know that in a body dead from poisoning chemistry may for many reasons utterly fail to detect any traces of the poison. This, because for some poisons no definite test has yet been found, and with others because the poison may have wholly disappeared by reason of volatility, or by being vomited, excreted, or decomposed during life, before the analysis is begun, to such an extent as to be no longer within the power of chemical means to detect. Hence in judicial cases it is not always necessary to demonstrate, quantitatively, a fatal dose within the person of the poisoned individual. (4) Outside corroborative circumstances. Examples are the finding of charred clothing and corrosion of the lips in a case of suspected sulphuric acid poisoning; proof of possession of the suspected poison by the administrator; finding of motive for the poisoning; proof of administration by direct or circumstantial evidence. From the more or less perfect chain afforded thus by the evidence from the symptoms, the results of analysis, and corroborative circumstances, the diagnosis of poisoning is made with greater or less certainty.

*Treatment of Poisoning.*—The aim here is to prevent absorption or local injury by combined attempts at bodily removal of the poison and chemical neutralization of its poisonous property, and then to combat the effects by general medical means. With inoculated poisons, as in bites from venomous reptiles or rabid animals, the part should be instantly washed, and then thoroughly sucked either by the mouth or a cupping-glass. At the same time, where practicable, a ligature should be tied tightly around the limb near the wound and between it and the heart. Then in dangerous cases the wound should be thoroughly cauterized with a red-hot iron, or powerful caustics. In the use of these care must be taken not to injure any large artery or important organ. Where the poison is swallowed, the stomach should be evacuated with the least possible delay, and, if there be one, the antidote to the poison should be immediately given. For emptying the stomach the means are emetics and the stomach-pump. This should be done even though the drug itself had already caused some vomiting and had been in the stomach for some time, for the vomiting is only rarely complete enough to insure removal of all of the poison swallowed, and absorption may be so slow that some of the substance may still remain in the stomach after a long interval. Of emetics, the best is the chloride of apomorphia, because it is prompt, thorough, unirritating, and, most important of all, because it will act if only put under the skin. One-fifteenth of a grain in solution in a little water should be injected under the skin by the hypodermic syringe, or double the quantity given by the mouth. Other useful ones are the following: *Cupric sulphate* (blue vitriol), in the dose of 2 or 3 grains, repeated if necessary; *zinc sulphate* (white vitriol), dose from 15 to 20 grains; common *ground mustard*, a dessert-spoonful diffused through a tumblerful of water; powdered *alum*, a teaspoonful, taken dry, mixed with sugar, in molasses, or in water. *Ipecac* is a safe and unirritating emetic, but is rather slow. Dose, 20 or 30 grains of the powder, or from 1 to 2 tablespoonfuls of the sirup or wine. These doses are for an adult, and must be duly reduced for children. In all cases where an emetic is given, its action should be assisted by free drinking of nauseous potions, as warm water, warm salt water, or warm chamomile tea. The stomach-pump is invaluable where emetics fail to thoroughly empty the stomach, but in corrosive poisoning the stomach-pump should not be used for fear of perforating the corroded or softened walls of the stomach. When employed, water is to be repeatedly pumped into the stomach and then out again. In irritant poisoning, after evacuation of the stomach, copious draughts of bland and viscid fluids should be taken to sheathe the walls of the alimentary canal from the action of the poison. Such are mucilages, oils, flaxseed tea, milk, white of egg, barley-water, etc. As regards antidotes, the special substances to be used will be mentioned in connection with each poison. In general, antidotes act by chemically transforming the poison, while still in the stomach, into a comparatively innocuous compound. Thus for acids *alkalies* are to be given, and, *vice versâ*, for alkalies, *acids*, whereby a salt is formed devoid of the caustic effect of either of its components. For the irritant metallic salts, *albumen*, as white of egg, is given to form the comparatively insoluble, and therefore inert, albuminate of the metal. In poisoning by vegetable alkaloids the antidote is *tannin* (tannic acid), or a vegetable infusion containing the same, such as strong green tea, infusion of galls, of cinchona, of blackberry-root, logwood, rhatany, etc. Here a rather insoluble tannate of the alkaloid is formed. But yet the efficacy of antidotes is generally small; they can not reach such of the poison as has been already absorbed, and with irritant poisons they generally come too late. Effects of the poison necessarily vary greatly. In all cases, besides such local treatment as may be necessary, the special tendency to death should be recognized and intelligently combated by appropriate means.

*Detection of poisons* in medico-legal questions requires the most careful application of all chemical tests as well as of physiological experiments. The materials removed must be sealed or locked by the examiner to prevent any possible suspicion of tampering. All known tests must be tried, and in metallic poisoning the metal should be obtained from the tissues if possible. All vessels employed and the reagents must be absolutely clean and free of contamination.

### Systematic Toxicology.

*Systematic toxicology* is concerned with the classification and study of individual poisons. The best classification is that based upon the symptoms, and we may distinguish the (*a*) irritant or corrosive poisons, which act locally; (*b*) parenchyma poisons, which cause little local trouble at the portal of entrance, but decided inflammatory and degenerative changes in the organs of the body, principally the glands; (*c*) the blood-poisons, whose symptoms result from chemical or morphological changes in the blood; and (*d*) nerve-poisons, which produce marked symptoms, but little or no discoverable anatomical change.

I. *Corrosive Poisons.*—These produce a local death or necrosis of tissue, and reactive inflammation beneath and around. The extent and depth of the process depend upon the individual poison and its concentration. The most common poisons of this group are the acids and alkalies. They may act on the surface of the body, causing most painful destruction of the skin and deeper tissues, or internally with production of intense gastro-enteritis and collapse. The treatment consists in the neutralization of the poison and in the application of bland liquids to protect the inflamed surface. In the case of acids weak alkalies, such as magnesia, chalk, soap, dilute ammonia solutions, lime from the plastering of the wall, and the like may be used; in the case of alkaline poisoning, dilute vinegar or acetic acid, or lemon juice is generally at hand. After the poison has been neutralized, mucilaginous drinks, milk, the white of eggs beaten up with milk or water, and the like are given; and remedies administered to quiet irritation. The results of external application of corrosives are treated like burns, by soothing and protective applications. Among the individual poisons of this group *sulphuric acid* (oil of vitriol) is probably the commonest, and most serious. It is frequently thrown in the face with criminal intent, or accidentally applied or swallowed. Linear scars of a yellowish-brown color on the face, radiating from the mouth if the poison is swallowed, are the characteristic indication. The clothing is charred where the acid has come in contact with it. When the poison reaches the digestive tract the most intense gastro-enteritis is set up. *Nitric acid* is less intense. It produces yellowish areas of corrosion and internally violent gastro-enteritis. *Oxalic acid* and the soluble oxalates (salt of lemon and others) cause marked irritation of the mucous membrane, and also nervous symptoms from action on the brain. The ordinary alkalies are not antidotal, as the oxalates are soluble. Lime forms an insoluble oxalate, and is therefore the most useful antidote. *Hydrochloric acid* and *hydrofluoric acid* act similarly to the others of this group, as does also *carbolic acid*; but the latter occasions specific nervous symptoms as well. Of the alkaline poisons *caustic potash* and *soda* are common forms, because of their use as lye. Concentrated *ammonia* is another common form. The symptoms are of the same irritative nature as in the case of acids. *Chlorine, bromine, nitric oxide*, and other substances in vapor form act as violent irritant poisons of the respiratory tract.

II. *Parenchyma Poisons.*—There are innumerable examples of this group, but only a few of the more common can be referred to here. In concentrated form most of them cause irritation of the stomach and intestines, but the more specific action is due to their solution and absorption by the blood, and the subsequent action on the organs. The symptoms in the several cases are so varied as to require separate description.

*Arsenic* is a very common poison of the accidental and homicidal kind. Arsenic is used as a coloring-matter or for other commercial purposes in the forms of Scheele's green, Schweinfurth green, Brunswick green, Paris green, orpiment (yellow arsenic), and realgar (red arsenic). Green, yellow, and red wall-papers, carpets, and other house-furnishings may be colored with these, and the dust very often occasions slow arsenic-poisoning. Fowler's solution (containing arsenite of potassium) is very poisonous. It is often prescribed by physicians in concentrated form, and over-doses may be used by careless persons. See Arsenious Oxide.

*Acute arsenical poisoning* is generally manifested in the form of violent gastro-enteritis with pain in the abdomen, vomiting, purging of a watery character, cramps in the legs, and finally collapse with the attendant symptoms of this condition. The symptoms in such cases soon resemble those of Asiatic cholera, and the diagnosis may be extremely difficult. In other cases the abdominal symptoms are almost absent, and collapse alone or delirium and coma with convulsions may lead to rapid death. In either form the course of the case is rapid and generally fatal. The fatal dose of arsenic may be placed at from 0·1 to 0·15 gramme.

Arsenic may act as an external poison when brought into contact with the skin or mucous surfaces in concentrated form or as solid arsenious acid. In this case the lesions of a violent caustic are present, but absorption of the poison does not take place to any large extent.

The treatment of acute arsenical poisoning consists in the administration of emetics, in careful washing out of the stomach, and subsequently the administration of an antidote. The best is a freshly prepared hydroxide of iron made by adding magnesia to a solution of sulphate of iron.

Chronic arsenical poisoning is exceedingly common, more so, perhaps, than is generally supposed. In these cases the source of poison is most frequently wall-paper, colored lamp-shades, clothing, tapestries, etc., and the poison enters through the stomach or respiratory tract. Chronic catarrh of the stomach, persistent cough, sneezing, throat troubles, and conjunctivitis may be present. In more serious or protracted poisoning, paralyses, general deterioration of health, or pigmentation of the skin are noted.

*Phosphorus-poisoning* is due in all cases to the common yellow phosphorus, the red being wholly insoluble and inactive. The common sources from which this poison is derived are phosphorus matches, rat-poisons, and the phosphorated oil of the chemists. In chronic cases, mainly workmen in match-factories are affected. The symptoms of acute phosphorus-poisoning are usually those of a severe gastro-enteritis, with eructation of gases having a phosphorescent odor, and a luminous character when seen in the dark, and of vomiting of materials presenting similar characters. Enlargement of the liver, a jaundiced hue of the skin, and the appearance of leucine and tyrosin in the urine are among the more distinctive symptoms. Later, loss of consciousness, collapse, coma, and convulsions may be present. Amounts over 0·15 gramme are usually fatal.

The treatment of acute phosphorus-poisoning consists in the removal from the stomach of every trace of the poison, and the administration of ozonized oil of turpentine, of solutions of ozone in water, or of permanganate of potash. In chronic phosphorus-poisoning, catarrhal conditions of the respiratory and digestive tract are noted, but more characteristic is a form of necrosis of the lower jaw-bone, which is not uncommon among workmen in match-manufactories.

*Lead* is perhaps the most common of all mineral poisons. Acute cases are mainly due to ingestion of acetate of lead, the carbonate, oxide, or chromate; and manifests itself as an intense gastro-enteritis, with white vomiting and dejections of a black color. In more subacute cases, where small quantities of poison are repeatedly inhaled or swallowed, lead colic is apt to occur. In this condition there is intense constipation, with twisting pains in the abdomen, a certain amount of cachexia, and a blue line on the gums at the junction of the teeth.

Acute lead-poisoning may occur in persons exposed to the odors of fresh paint, and is very often met with in painters and others engaged in occupations in which lead is used. In these, however, the subacute form (lead colic) is more common than the truly acute.

In still more chronic cases, cramps of the limbs, paralysis (particularly of the forearms), and marked cerebral disturbances may be developed. Disturbances of sight, chronic Bright's disease, and gout are results of protracted lead-poisoning. Cases of very chronic and insidious lead-poisoning may occur from obscure causes, such as the drinking of water conducted in lead pipes, the use of cosmetics containing lead, and eating canned food contaminated by the lead of the solder. Water containing saline materials is not apt to be contaminated by the lead pipe, because of the precipitation of an insoluble incrustation in the pipe. Pure spring water, however, is more dangerous. In acute cases the treatment consists in emptying the stomach, and the administration of a soluble sulphate, which precipitates an insoluble sulphate of lead. Epsom salt answers this purpose, and acts as a purge as well. In more chronic cases the same purge may be employed, and iodide of potash is useful to eliminate the lead from the system.

*Mercury-poisoning* is similar to lead-poisoning in its varieties and symptoms. Very acute poisoning, with violent gastro-enteritis, results from the ingestion of the corrosive sublimate. Non-corrosive or irritating preparations may produce no local disturbance, but occasion soreness of the mouth, sponginess of the gums, and free flow of saliva with swelling of the salivary glands (mercurial salivation). In very chronic cases, particularly where small particles of vapor or dust containing mercurial compounds are inhaled, nervous symptoms are common, such as tremor, headache, and cerebral disturbances. The fatal dose of corrosive sublimate is not definitely determined; 0·5 gramme has proved fatal, and 1 gramme has been recovered from.

Treatment in acute poisoning (as by the bichloride) demands the administration of egg-albumen, milk, or other albuminous materials. In chronic cases, iodide of potash is given to eliminate the mercury, and if ptyalism is present, atropine and opium are useful.

In addition to these there are a number of other less important forms of mineral poisoning, such as those by antimony, copper, zinc, iron, silver, and chromium. Among the vegetables belonging to this group ergot takes the principal rank, for the symptoms of which see Ergotism; but it may be said at this place that there are two forms: that in which acute poisoning occurs, and in which gastro-intestinal symptoms, with sleepiness, delirium, and coma, play a part, and chronic poisoning, which is apt to affect large communities of people, particularly during periods of famine, and which may occasion a form of gangrene or irregular nervous disturbances.

III. *Blood-poisons.*—The number of these is very great, but none of them is of such great importance as to merit extended discussion. Carbonic oxide gas, bisulphide of carbon, sulphuretted hydrogen are among these. Somewhat more important are the various cyanogen compounds, such as prussic acid, cyanide of potash, oil of bitter almond, and ferrocyanide of potash. These may lead to rapid death in the course of a very few minutes, with loss of consciousness, intensely disturbed respiration, and great weakness of the pulse. When the poison is taken in less quantity, preliminary dizziness, nausea, ringing in the ears, and other mild symptoms may precede more serious disturbances. Chlorate of potash, nitrobenzol, aniline, and nitroglycerin are analogous in action. Among the vegetables the poison mushroom *Amanita phalloides* and certain others less well-known act similarly upon the blood.

IV. *Nerve-poisons.*—Finally, there is the great group of poisons which act through the nervous system, and which for the most part cause no definite and recognizable changes of structure. Many sub-classifications have been attempted, but the actions of the individual poisons are so varied in some directions and so similar in others that it is best to attempt no subdivisions.

*Opium* and its principal alkaloid, *morphine*, are perhaps the most common of all poisons used for suicidal and homicidal purposes. The better qualities of opium contain from 12 to 20 per cent. of morphine as well as other alkaloids. Some of the preparations of opium are specially apt to be taken by accident or design, such as the tincture (laudanum), the extract, and the solution of morphine. Paregoric contains so little opium that it is dangerous only for children. The fatal doses can not easily be estimated, as idiosyncrasy plays a more prominent part in the action of this drug than of any other. Children bear it very badly. From 0·2 to 0·4 gramme of morphine and from 2·0 to 4·0 grammes of opium may be taken as surely fatal doses. Habit will develop tolerance for these or even greater quantities in some persons.

*Acute opium-poisoning* is marked by a preliminary stage of mild or considerable cerebral excitement, in which, as a rule, pleasant emotional stimulation predominates. Later, drowsiness, sleep, and complete unconsciousness follow in order. In the first stage the pulse is excited, and the skin dry and warm; in the second the pulse is weak and irregular, the skin grows cold and moist, and with growing stupor the muscular power and reflexes are completely lost. The pupil is more and more contracted, until just before death, when paralytic dilatation may occur. The respirations become slower and slower, until the individual breathes but once a minute, or even less frequently. The skin becomes livid, and the patient dies gradually and quietly of failure of the respiratory power. In some persons the primary stage of stimulation may alone occur, and wild delirium or convulsions may be the only symptoms.

*Treatment.*—The stomach must be promptly emptied, and repeatedly washed with water. Tannic acid may be given as an antidote, but permanganate of potassium has been found decidedly useful. Cerebral stimulants should be given to combat stupor, such as coffee, atropine, or strychnine. The patient must be kept awake by cold douching or other means, and electrical stimulation of the respiratory muscles or artificial respiration should be practiced. Forced artificial respiration will save many cases apparently dead.

*Chronic Opium-poisoning.*—Opium eating and smoking are scourges of the East, but the consumption of opium or morphine is a common habit in Western countries as well. In the East the results are comparatively trivial. Among Europeans and Americans there is gradual deterioration of health, more and more craving for the drug, and intellectual deterioration. Eventually death ensues from exhaustion and disturbance of the gastro-intestinal tract.

The treatment can only be carried on with satisfaction in institutions where abstinence can be enforced. Regulation of the general health and tonics must be used as adjuvants in the treatment.

*Chloral.*—This substance is in frequent use as a hypnotic, and has often been taken as a poison. The symptoms in acute cases are those of deep sleep, without a previous stage of excitement such as opium produces. The patient may pass into deep coma, and sudden heart failure is not rare. The treatment consists in the rapid removal from the stomach, and in the administration of strychnine, atropine, and other stimulants. Chronic chloral-poisoning leads to symptoms not unlike those of chronic alcoholism in some persons; more characteristic, however, are certain eruptions in the skin, weakness of the heart, with rapidity of its action, and emaciation of the individual.

*Chloroform* and *ether* are the well-known anæsthetics. In overdoses these act as narcotic poisons, and sometimes chronic poisoning is acquired as a habit. The symptoms in the case of etherization or chloroformization may be divided into two stages, like those of opium-poisoning. In the first the patient is excited, the heart is accelerated, the respiration is rapid, and the face flushed. In the second consciousness becomes more and more disturbed, until the patient is wholly insensible, the muscles are relaxed, and the reflexes are wanting. If pushed too far absolute paralysis of the vital functions may occur, and the patient dies of failure of respiration or of the heart's action. If these substances are taken into the stomach they act as local excitants and irritants. Certain persons acquire the habit of inhaling or of drinking ether and chloroform, but such are comparatively rare.

*Alcohol* is perhaps the commonest of all poisons, and may manifest itself as an acute or chronic intoxicant. The details are given under the headings Intoxication and Inebriety (*qq. v.*).

*Atropine*, the alkaloid of belladonna, in overdose produces delirium, flushing of the skin, dryness of the mouth, dilatation of the pupil, and sometimes convulsions. Wide differences exist in different persons with regard to the tolerance for this drug. The smallest dose which has proved lethal is 0·095 gramme in a child of three years, and 0·195 gramme in an adult. The treatment consists in the removal of the poison from the stomach, the administration of tannic acid as an antidote, and of morphine to combat the symptoms.

*Cocaine* is derived from the *Erythroxylon coca*. The symptoms produced by overdoses are rapidity of the heart, cold sweat, nausea, and vomiting, followed by vertigo, unconsciousness, and delirium. The pupils are dilated. Death occurs in collapse. The fatal dose may be placed at 1 gramme.

Morphine may be used as an antidote in the earlier stages, while stimulants will be required in the later stages. Chronic cocaine-poisoning presents many of the symptoms seen in chronic opium-poisoning, and the treatment is the same.

*Strychnine* is the alkaloid of the *Strychnos nux-vomica*. In toxic doses it produces intense excitement of the spinal cord and general nervous system, leading to cramps and convulsive seizures resembling those of tetanus. The slightest irritation, as by a breath of wind, may throw the patient into a violent convulsion, in which the body is bent backward, resting upon the heels and head. The patient as a rule remains conscious until shortly before death, when cyanosis may be present from tetanic arrest of respiration, and coma may be developed. The fatal dose for adults is from 0·03 to 0·1 gramme. The treatment consists in rapid evacuation of the stomach and the administration of chloral and opium.

There are many other vegetable substances which act upon the nervous system in similar manner, and some of these, like aconitine, nicotine, and curari, are intensely toxic. The more important, however, have been named.

*Animal Poisons.*—There are a number of animal poisons, such as the venom of serpents, tarantulas, etc., which are properly considered in this place. The action of these is rather complex. There is, in the first place, decided local irritation at the point of the sting or bite, leading to swelling, redness, and œdema, and, in severe cases, it may be to gangrene. Then the poison after its access to the blood may occasion serious destruction of that fluid, with the production of such symptoms as jaundice, cyanosis, hæmaglobinuria (the blood coloring-matter appearing in the urine), and finally hæmorrhage into the tissues or from the free surfaces; and, finally, there are general symptoms, due on the one hand to the blood-poisoning and on the other hand to direct action upon the nerve-centers. Among these general symptoms are dyspnœa, vertigo, extreme prostration, loss of power of the muscles, slowing of the pulse, with weakening of the heart's action, and finally collapse. Death may occur rapidly, or after a period of prolonged prostration. The treatment of such poisoning consists, in the first place, in the application of a tight band on that side of the point of injury toward the body, so as to shut off rapid absorption; in the second place, the destruction, by the knife or cauterizing agents, of the area of inoculation; and, in the third place, of the administration of remedies, such as ammonia, alcohol, or strychnine, to support the system. The poisons in question are albuminous substances, which may be extracted from the liquid secretion of the poison glands by glycerin and other agents, and even dried and preserved.

*Putrefactive Poisons.*—Many instances have been recorded in technical literature, as well as in the public prints, of poisoning of families or communities of persons by food which has undergone some change of a putrefactive character. The foods most apt to give rise to such poisoning are meat, sausage, and cheese. The poisons in these cases are spoken of as ptomaïnes, and numerous forms have been described. The actions of these are as dissimilar one from another as are those of the various vegetable alkaloids, and there is a strong resemblance in action of some of these ptomaïnes to certain of the vegetable alkaloids. Not only this, but there is a close relation in chemical reaction of some of them, so that it becomes a matter of the greatest medico-legal interest to determine the minute differences between these animal poisons and the vegetable alkaloids. See Vaughan and Novy, *Ptomaïnes and Leucomaïnes*.

William Pepper.

**Toxiglos'sa** [Mod. Lat.; Gr. τοξικόν, pertaining to an arrow, hence poison + γλῶσσα, tongue]: a group of molluscs, including the cone-shells, the augur-shells (*Terebridæ*), etc., in which there is frequently a poison apparatus in connection with the lingual ribbon.

**Toxodon'tia** [Mod. Lat., plur. of *To'xodon*; Gr. τόξον, bow + ὀδούς, ὀδόντος, tooth]: a sub-order of extinct mammals whose remains have been found in South America. They were most nearly related to the perissodactyle ungulates, but differed in several characters, and especially the teeth, showing affinities with the *Proboscidea* and *Rodentia*. The molars of the upper jaw were broad, and extended severally into an externo-anterior angle; those of the lower jaw were narrow, and continuous in a uniform row; the incisors were diversiform in shape as well as the mode of insertion and number; the feet are mostly unknown; the hind feet, however, had the astragalus at its anterior face inclined obliquely inward, and articulating in front only with the navicular, and the calcaneum had an extensive upward-extended surface for the articulation of the fibula, and a large lateral process articulating in front with the astragalus. Two families—the *Toxodontidæ* and *Typotheriidæ*—represent the sub-order. Revised by F. A. Lucas.

**Toxodont'idæ**: a family of placental mammals of the order *Toxodontia*, which formerly flourished in South America, and which were especially distinguished by their teeth, which consisted of large incisors, very small canines, and strongly curved molars, all with persistent roots. Only one genus, *Toxodon*, is known. It was composed of large-sized mammals which lived in South America during the later Tertiary epoch. The remains first obtained of *Toxodon platensis* were found by Darwin during his sojourn in the Banda Oriental, near the Sarandis, a tributary of the Rio Negro, about 120 miles N. W. of Montevideo, and were known to the natives as giants' bones. Revised by E. A. Birge.

**Toxot'idæ** [Mod. Lat., named from *To'xotes*, the typical genus, from Gr. τοξότης, bowman, archer, deriv. of τόξον, bow]: a family of fishes of the order *Teleocephali* and sub-order *Acanthopteri*, remarkable for the power of "shooting" water at insects, etc., to insure their capture. The family is represented by but two known species—*Toxotes jaculator* (see Archer-fish for illustration) and *Toxotes microlepis*—in the East Indian and Polynesian seas. These (or at least the former) catch insects and other small animals which rest on aquatic plants or those growing on the banks near their quarters, by protruding their mouth into a tubular form and shooting drops of water, and it is said they can hit insects thus at a distance of 3 feet and more. This habit is a source of amusement to the natives, and the fishes are kept to give evidence of their skill and industry. They attain a length of about 6 or 7 inches.

Revised by E. A. Birge.

**Toy**, Crawford Howell, D. D., LL. D.: educator; b. at Norfolk, Va., Mar. 23, 1836; graduated at the University of Virginia 1856; attended the University of Berlin 1866–68; was Professor of Hebrew in Southern Baptist Theological Seminary 1869–79; since 1880 Professor of Hebrew and other Oriental languages and Dexter lecturer on biblical literature in Harvard University; translated and edited the volume on Samuel in Lange's *Commentary on the Bible*; edited Prof. Murray's *Origin of the Psalms* (1880). He is author of *The Religion of Israel* (Boston, 1882; 3d ed. 1884); *Quotations in the New Testament* (New York, 1884); and *Judaism and Christianity, a Sketch of the Progress of Thought from Old Testament to New Testament* (Boston, 1890).

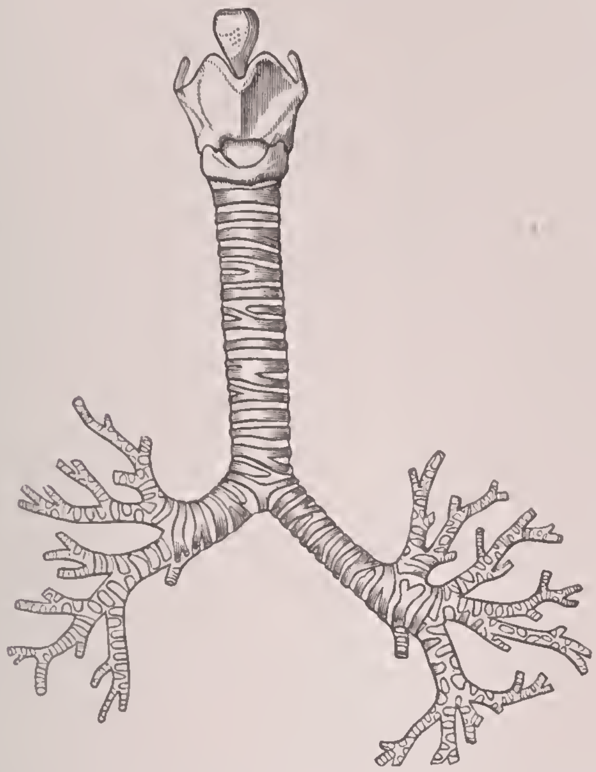
Revised by S. M. Jackson.

**Toynbee**, Arnold: philanthropist; son of Joseph Toynbee, a well-known aural surgeon; b. in London, Aug. 23, 1852; spent two years at a military college, but left and entered Oxford, and after taking his degree proceeded to London. Having a keen sympathy with the laboring classes, he took up his residence in Whitechapel, and devoted himself to improving the condition of the poor, addressing audiences of workingmen, and taking part in religious work. His health was undermined by his incessant labors, and the strain incidental to the delivery of two lectures against Henry George's *Progress and Poverty* was the immediate cause of his death in 1883. From the inspiration of his example arose Toynbee Hall, founded in 1884, as the outcome of a scheme, framed by members of Oxford and Cambridge Universities, to provide education and the means of recreation for the people of the poorer districts of London, and to consider and support plans calculated to promote their welfare. It is a center of social life and organized effort to elevate the masses by educational work, loan exhibitions of pictures, etc. There is a regular force of fifteen residents, besides a body of associates, men and women, who come at intervals to take charge of classes and clubs. In connection with Toynbee Hall are Wadham House and Balliol House, where students and workers reside. Similar institutions, called college settlements, have been founded in the U. S. See University Settlements. R. A. Roberts.

**Trac'adie** [Micmac *Tracadiesh*, or Heron island]: town of Gloucester County, New Brunswick; near the mouth of Tracadie river, and on the Gulf of St. Lawrence; 20 miles S. of Shippigan (for location, see map of New Brunswick and Quebec, ref. 3–I). It has good fisheries of herring, salmon, and cod. Here are about twenty lepers, formerly more numerous, and the disease is said to have been introduced from

Mitylene in 1758. Traeadic contains a Trappist monastery and a convent of Sisters of Charity. Pop. about 1,200, mostly Acadian. M. W. H.

**Tra'chea** [Mod. Lat., from Lat. *tra'chia* = Gr. τραχεῖα, liter., the rough one (scil. ἀρτηρία, artery, windpipe)]: the tube which in all air-breathing vertebrates carries the air from the oral cavity to the lungs. It begins on the floor of the throat and extends backward until it divides into two parts



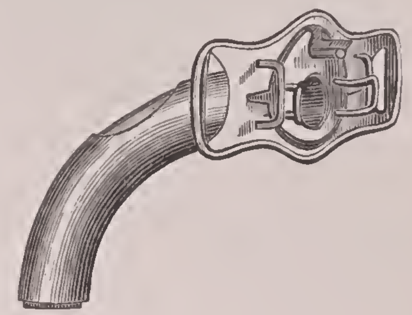
Human trachea dividing below into the bronchi. At its upper end the laryngeal cartilages.

(*bronchi*) connected with the right and left lungs. In its wall are numerous incomplete rings of cartilage; these being to prevent collapse and at the same time, by reason of their incompleteness, to allow the œsophagus to compress them during the swallowing of food. The term trachea has also been applied to the air-tubes which penetrate the body in insects and spiders. These have also a ringed appearance, due to a corrugation of the lining membrane, and not, as was formerly thought, to the presence of a spiral filament. See ENTOMOLOGY. J. S. KINGSLEY.

**Trachea'ta** [Mod. Lat., from TRACHEA (*q. v.*)]: a group of ARTHROPODA (*q. v.*) recognized by many authors, embracing those forms which respire by air-tubes which penetrate the body. Under this head are included the insects ARACHNIDA and MYRIAPODA (*qq. v.*). The later discoveries go to show that this division is unnatural, and that there are at least two distinct kinds of tracheæ in the group.

**Tracheids**: See HISTOLOGY, VEGETABLE.

**Tracheot'omy** [Mod. Lat. *trache'a* = Gr. τραχεῖα + τέμνειν, cut]: opening of the trachea by incision or puncture for the free ingress and egress of air when respiration is labored or suffocation is imminent from laryngeal obstruction. Older writers treat the subject under the title bronchotomy. The operation is chiefly demanded when the larynx is obstructed by the membrane of croup or diphtheria, is the seat of acute œdema or dropsy, is closed by the impaction of foreign bodies, or is contracted by previous inflammation or ulceration. It may also be performed to permit the escape of foreign bodies accidentally passing the larynx and entering the trachea and bronchial tubes. When goiter of great size compresses the upper part of the trachea, tracheotomy affords relief. Older writers advocate opening the trachea before employing artificial respiration in cases of asphyxia by noxious vapors or drowning, but this is seldom done. The air-passage may be opened at either of three points. Laryngotomy, the operation highest up and involving least danger, is preferable when membranous or other obstruction does not exist below the larynx; it consists in opening through the crico-thyroid membrane. Incision a little lower, cutting the cricoid cartilage and one ring of the trachea, is termed laryngo-tracheotomy, while incision of one or more rings of the trachea below the thyroid gland is strictly tracheotomy. The operations are most easily performed on thin, long-necked children; infants with short necks and corpulent persons present difficulty. The incision is always longitudinal, and in the median line over the elected point of opening, the cutting being cautious and progressive; at every step vessels should be pushed to one side rather than cut, as bleeding delays the operation, and the entrance of blood into the air-passage endangers life by causing asphyxia by clot, or at a later period by exciting broncho-pneumonia. When the trachea is fully exposed, it is firmly held with a sharp hook or tenaculum and incised, and a tracheotomy tube or canula, provided with a fenestrated, hollow pilot-trocar as a guide, is inserted, the guide being removed as soon as the tube is in place. The canula is usually of silver or rubber, curved so as to descend in the air-passage. An inner tube is provided, slightly longer than the outer one. Mucus or membrane obstructing the end may be removed by withdrawing and cleansing the inner tube. The tube is retained in the wound by means of a tape around the neck, and should be worn until all danger from the original disease is past and the larynx is again free. Tracheotomy is performed more frequently than formerly, and with increasing success. It should not be left till too late; should be carefully performed at a point below all obstruction; the tube should be of large size, adequate to admit air freely; an attendant should be constantly at hand to keep the tube open; the patient should breathe a pure but warm and moist atmosphere, and should be supported by abundant but easily assimilated food and by tonics.



Tracheotomy tube.

Revised by JOHN ASHHURST, Jr.

**Trachin'idæ** [Mod. Lat., named from *Trachi'nus*, the typical genus, from Gr. τραχύς, rough, rugged]: a family of marine teleost fishes containing the forms known in England as weevers and kindred types. The body is elongated, narrowed from shoulders to tail, and compressed; the scales very small; lateral line high up and continuous; the head terminates in a conical snout; eyes lateral, but separated by a narrow interval, and far forward; the operculum has a strong acute spine arising from its upper surface and pointing backward; villiform teeth are developed in bands on the jaws and palate; the branchial apertures are continuous below; branchiostegal rays in six pairs; the dorsal is represented by two fins, the first short and sustained by a few diverging spines, the second elongated and with branched rays; the anal is very long, and composed of articulated rays; the caudal distinct; the pectorals large, and composed of branched rays; the ventrals are approximated to each other and jugular, and have each a spine and five rays; pyloric appendages are developed in small number (about six); the vertebral column has the normal number of abdominal, but an increased number of caudal vertebræ (A. 10–11 + C. 25–31). The family is composed of a few species, chiefly found in the European seas (where are three) and along the western African coast, but one occurs along the coast of Chili. By most authors these species have been combined in one genus (*Trachinus*), but they have been distributed among three by Bleeker. They are considerably feared by fishermen and others on account of the formidable opercular spines, with which they can inflict severe wounds. These spines are generally cut off when the fishes are caught, and thus they are exposed for sale. The species are of inconsiderable economic importance. For illustration, see GREAT WEEVER. Revised by F. A. LUCAS.

**Trachoma**: See GRANULAR LIDS.

**Trachypter'idæ** [Mod. Lat., named from *Trachyp'terus*, the typical genus; Gr. τραχύς, rough + πτερόν, fin]: a family of teleost fishes of the order *Teleocephali* and sub-order *Acanthopteri*. The body is very long and exceedingly compressed, and gradually diminishes in height from head to tail; the skin is naked; the lateral line is low and continuous; the head is oblong and compressed; the eyes lateral, and in anterior half of head; the opercular bones unarmed, scaleless, and with radiating striæ; the mouth has a small cleft; the teeth are feeble; branchial apertures confluent below; branchiostegal rays in six pairs; dorsal fin very long, extending the whole length of the back, divided into a very short elevated anterior portion and a remaining continuous fin, all the rays of both of which are flexible spines; anal wanting; caudal undeveloped, or composed of an enlarged upward-directed upper and a rudimentary lower portion; pectorals small; ventrals thoracic or absent; there are five gills, and also well-developed pseudobranchiæ, "situated in a pouch formed by a fold of the mucous membrane (*Trachypterus*);" pyloric appendages are developed in large number; the skeleton has comparatively little consistency; the vertebræ are very numerous. This family is composed of large-sized, extremely compressed, and thin fishes, which are inhabitants of the deep or open seas, and rarely stranded on shore or otherwise caught. They are probably widely distributed; specimens have been observed from time to time in many parts of the European seas, as well as in the Bermudian archipelago, the Australasian seas, the East Indian seas, and on the west coast of North and South America. The large species have doubtless in part given rise to the belief in a sea-serpent, and been mistaken for such, as they well might from a distance on account of their size, some species of *Regalecus* attaining the length of 20 feet. Nearly twenty species of the family are known. Revised by F. A. Lucas.

**Trachysto'mata** [Mod. Lat.; Gr. τραχύς, rough + στόμα, mouth]: a group of amphibians by some considered as a sub-order of *Gradientia* or *Urodela*, and by others (e. g. Cope) as an independent order. It has been constituted for the reception of the family *Sirenidæ*, and is characterized by the absence of the basioccipital, supratemporal, supraoccipital, and vomer; there are no maxillary or palatine arches. The frontals and premaxillaries are distinct, as are also the propodial bones and caudal vertebræ. There are but two species in the group, *Siren lacertina* and *Pseudobranchus striatus*, both from the southern parts of the U. S. F. A. Lucas.

**Trach'yte** [from Gr. τραχύς, rough, rugged]: aphanitic or glassy rock, usually porphyritic, having chemical composition similar to that of syenite. Constituent minerals are potash-feldspar (sanidine), some lime-soda-feldspar, and one or more ferromagnesian minerals—biotite, hornblende, augite—besides others in small amount. Abundant alkalies lead to the crystallization of sodalite and nephelite, when the rock grades into Phonolite (*q. v.*). When quartz is present in small amount the rock is quartz-trachyte; with increasing quartz it passes into Rhyolite (*q. v.*) and pantellerite. Trachytes may be rough and porous, or compact and dense, or glassy, dense vesicular, or pumiceous. Non-porphyritic trachytic glass, or trachytic obsidian, is distinguishable from rhyolitic obsidian, the more common kind, only by its chemical composition. Trachytes are usually light-colored rocks, but may be any shade of gray to black. Many rocks formerly called trachyte are andesite, being rich in calcium and in lime-soda-feldspar. The name *trachyte* was introduced by Haüy in 1822 for light-colored, porous, and rough lavas of the Auvergne with glassy feldspars. Afterward it was applied to any rough lava with prominent glassy feldspars. Modern petrographic usage restricts it to the definition given above. Trachytes are much rarer rocks in the U. S. than andesites. They occur in Montana, Wyoming, South Dakota, and Colorado, and are better known in Italy, France, and Germany. J. P. Iddings.

**Tracta'rianism**: the Anglican doctrinal and religious system promulgated in the Oxford *Tracts for the Times*; the principles of the movement known as the *Oxford Movement* and afterward as the *Catholic* or *Anglo-Catholic Revival*. In the first quarter of the nineteenth century the distinctive principles of the Church of England were maintained with little zeal, and public worship and church edifices evidenced laxity and neglect. The old High Church party still existed, but inactive and in the background. Evangelicalism dominated, but had spent much of its force. Constant attacks were made on the doctrines and liturgy of the Church, neological teachings were imported from Germany, and unfavorable political changes seemed imminent. The first marked sign of a reaction was the appearance of John Keble's *Christian Year* and its phenomenal popularity. Keble was a strong Tory and High Churchman and a brilliant scholar, but very modest and retiring. Richard Hurrell Froude, Keble's pupil, and of a more aggressive disposition, brought under Keble's influence John Henry Newman, till then known as an Evangelical. In 1833 the changes connected with the Reform Bill threatened the Church. The Government had suppressed ten bishoprics in Ireland, and disestablishment and alterations of the Prayer-book were feared. In view of the agitation against the Church, Keble preached July 14 a university sermon, which was published under the title *National Apostasy*, and was regarded by Newman as the start of the movement. In the same month a meeting to begin an agitation in defense of the Church was held at the parsonage of Hugh James Rose, editor of *The British Magazine*. Addresses presented to the Archbishop of Canterbury in 1834, one signed by 7,000 clergy and the other by 230,000 heads of families, counteracted the movement toward disestablishment. The publication of the *Tracts for the Times*, prepared by different authors and far-reaching in their influence, began Sept. 9, 1833. The first sixty-six tracts were short papers, some original, but mostly extracts from eminent Anglican writers, especially of the seventeenth century, and from Ante-Nicene fathers. The opening paper struck the key-note. To restore the vigor and authority of the Church it was necessary to reaffirm her divine institution and historical continuity, and so the doctrine first emphasized was that of the apostolic succession. In the course of 1834–35 Dr. Edward Bouverie Pusey, a man of influential position, massive learning, and quiet solidity of character, joined in the preparation of the tracts, which now became carefully digested theological essays or catenæ of authorities, and of considerable length. The teaching of the tracts seemed novel and strange to many. The Anglican understanding of the Catholic Church as one historical body with an organism perpetuated by the apostolic succession, and with a doctrinal system inherited from the past and defined by councils accepted both in the East and West, of which body the Anglican Church was a living part with her own authoritative usages and formularies, was a conception strange alike to Roman Catholics, who considered the historical Church as conterminous with the papal obedience, and to dissenting Protestants and the general public, practically ignorant both of Church history and of the actual existence of the great Greek Church, ancient, orthodox, and non-Roman. The points especially insisted on by the Tractarians in addition to apostolic succession (the grace of the sacraments, and therefore belief in baptismal regeneration, the real presence in the holy Eucharist, and the power of the keys in absolution) were therefore regarded by many as Romish. Tractarian strictness in fasting and favor shown to clerical celibacy were viewed in the same light. During the publication of the tracts Newman was the most prominent figure in the movement. His wonderful powers as a preacher and writer and his immense personal influence over the Oxford undergraduates made him especially influential and prominent. As the movement progressed differences began to appear among its adherents. Some laid aside former feelings against Rome and began to respect and even admire her. Some began to have misgivings as to the Catholicity of the Anglican Church. William G. Ward occasioned many complaints by anti-Anglican and pro-Roman articles in *The British Critic* and by his book, *Ideal of a Christian Church* (1844). After several occurrences which had intensified feeling against the Tractarians, *Tract No. XC.*, the last of the series, appeared in 1841. It dealt with the Thirty-nine Articles from the Tractarian point of view. The Articles had, at the time of the Reformation, been accepted by Anglicans unfavorable to Protestantism as well as by the others, but were afterward considered distinctively Protestant and even Calvinistic. When Newman, therefore, undertook in this tract to show that they were capable of being understood in a Catholic sense, his treatment was taxed as dishonest and tending to Romanism. The tract was condemned by the hebdomadal board of the university, which refused to wait for his defense. After this and other troubles Newman in 1845 entered the Church of Rome. In this step he was followed by others, a number seceding soon after him and others at various dates. These defections were held by those unfavorable to the movement to demonstrate its Romish character. On the other hand, the statement has been made that "one large parish church would hold them all" (i. e. all the converts from Anglicanism to Romanism since Newman). Other leaders of the movement, including the two greatest, Keble and Pusey, remained steadfast Anglicans. Both approved of *Tract No. XC.*, and its positions have since been widely accepted by Anglicans.

The movement, at the time apparently much injured, survived its losses and became vigorous again. As Pusey was now its most prominent figure it was for a number of years termed Puseyism. One very valuable outcome of the movement, begun as far back as 1836, was the series of translations entitled *Library of the Fathers of the Holy Catholic Church anterior to the Division of the East and West.*

In its new stage, since 1845, the Anglo-Catholic revival has assumed a more and more practical character in the institution of guilds, religious sisterhoods and brotherhoods, and parochial missions, improvement of church music, introduction or revival of hymns and popular devotions, restoration and building of churches. Since 1848–50 there has been also a revival of ritual, grounding itself especially on the ornaments rubric of the present English Prayer-book as re-enacted in 1662, directing the retention and use of the ornaments of the second year of Edward VI. Those most prominent in this revival were called Ritualists, and met not only with popular opposition, but with litigation and special legislation, subjecting them to lay judges. A number of priests were even imprisoned for their ritual, and societies were formed to prosecute and to defend them. In a case in 1888–90 (appeal 1892), a bishop (Dr. King, of Lincoln) was tried before the Archbishop of Canterbury, a case important as reviving such exercise of authority. But the general result, whatever the action of these courts, has been the extension of the ritual impugned.

All the principal phases of the Tractarian and Anglo-Catholic movement have reproduced themselves in the Episcopal Church of the U. S.

BIBLIOGRAPHY.—Newman, *Apologia pro Vita mea* (London, 1864 and 1888); *Letters and Correspondence of J. H. Newman* during his life in the English Church, edited by Anne Mozley (2 vols, London, 1890); a *Memoir of the Rev. John Keble*, by Sir J. T. Coleridge (Oxford, 1869); T. Mozley, *Reminiscences, chiefly of Oriel College and the Oxford Movement* (2 vols., Boston, 1882); Dean R. W. Church, *The Oxford Movement* (London, 1891); *Life and Letters of Dean Church*, ed. by Mary C. Church (London, 1894); Canon Henry Parry Liddon, *Life of E. B. Pusey* (posthumous, 4 vols.: three have appeared; London, 1893–94); Wilfrid Ward, *William George Ward and the Oxford Movement* (London, 1889); *W. G. Ward and the Catholic Revival* (London, 1893).

LEIGHTON HOSKINS.

**Tract Societies** [*tract* is from Lat. *tracta'tus*, a touching, handling, treating, treatise, deriv. of *tracta're*, handle, treat]: societies for the publication and circulation of religious literature, other than the Scriptures, which are distributed by organizations called BIBLE SOCIETIES (*q. v.*).

The word tract, though commonly applied to small, unbound pamphlets, includes also, by derivation and early usage, any treatise or bound volume for general circulation, of whatever size. Long before the invention of printing, the importance of multiplying copies of the best religious writings was recognized, for the sake of both preserving and diffusing them, and the early Reformers made great use of them, the timely invention of printing opening the way for a rapid growth of this method of doing good.

*European Societies.*—In the eighteenth century the friends of religion began to associate themselves for greater efficiency in this work, three societies having been organized before 1701 by members of the Church of England—one "for the propagation of the gospel in New England and America," another "for foreign parts," and the third for "promoting Christian knowledge." In 1750 was formed the first tract society in which different denominations united—the Society for Promoting Religious Knowledge among the Poor. In 1793 the Religious Tract and Book Society of Scotland was formed. In May, 1799, the Religious Tract Society was organized in London, and has since become the largest and most efficient tract society in the world. The first year its entire receipts were £2,340; now (1895) its annual income is about £175,000, and its grants £29,000. It has issued a total of over 18,000 different publications, large and small. Its publications at home and abroad are in 212 languages, and amount to a total of 3,000,000,000 copies. Besides this great and undenominational society, each religious denomination in Great Britain has a publication board of its own; and the opponents of religion have adopted the same means of disseminating their views. There are also tract societies in which Christians of all denominations unite, at Paris, Lausanne, Toulouse, Brussels, Geneva, and some other points on the continent of Europe; also at various foreign missionary centers.

*Societies in the U. S.*—In the U. S., where common school education and a free press have formed an eminently reading community, tracts and volumes on religion appeared early and in great numbers, and societies for printing and circulating them were at length formed—the Methodist Book Concern in 1789; the Massachusetts Society for Promoting Christian Knowledge, at Boston, in 1803; and other societies in Boston, New Haven, Middlebury, Vt., New York, Albany, Philadelphia, Baltimore, and Hartford. Prominent among these was the New York Religious Tract Society, organized in 1812, and afterward continued in the American Tract Society, New York; and the New England Tract Society, organized in 1814, which in 1823 changed its name to the American Tract Society, and in 1825 became a branch of the national society of the same name, then instituted. In the present American Tract Society Christians of all denominations in the U. S., and most of the local tract associations then existing, united to publish and circulate whatever would best "diffuse a knowledge of our Lord Jesus Christ as the Redeemer of sinners, and promote the interests of vital godliness and sound morality"—with only this restriction, that it should be "calculated to receive the approbation of all evangelical Christians." Such men, of twenty different denominations, have always been found among its officers, its laborers, and its warm friends and supporters. For the first two years only brief tracts were published, for adults and for children. The issue of volumes, however, was intended from the first, and in the third year volumes began to appear. In the fourth year monthly tract distribution began to be practiced by many churches and church unions. In the eighth year was begun an attempt to supply every family in the Southern and Western States with one or more volumes. The next step was the organization of a system of colportage, in 1841, to carry the Gospel to the doors of neglected, scattered thousands—at least one-third of the entire population of the U. S.—who would never seek it and whom churches did not reach. Each colporteur was to visit every family in his district, induce them to purchase or accept Christian books or tracts, and by his teachings and prayers do as far as possible the work of a Christian pastor. At one time over 600 men were so employed during the whole or a portion of the year.

Another notable point in the progress of the society is found in the establishment of its periodicals. The first three were *The American Messenger*, the *Amerikanischer Botschafter*, and *The Child's Paper*. To these have since been added the *Deutscher Volksfreund* (or *German People's Friend*), an eight-page illustrated weekly; *The Morning Light*, a small illustrated paper for beginners; *Apples of Gold*, a weekly for the youngest readers; and *Light and Life*, a series of monthly tracts. The aggregate circulation of these papers is about 2,500,000 yearly. The distribution of tracts in foreign languages forms a large and very important branch of the society's work. Its home presses print in more than thirty foreign tongues for the millions of immigrants that swarm into the U. S., and for many foreign missions.

Among results may be mentioned the printing of over 8,000 distinct publications, of which over 1,900 are volumes and the others tracts, handbills, wall-rolls, etc. Among the publications for home use are 1,560 in seventeen foreign languages—German, French, Spanish, Italian, Portuguese, Swedish, Welsh, Dutch, Danish, Bohemian, Polish, Armenian, Hebrew, German-Hebrew, Lithuanian, Finnish, and Hungarian—for immigrants, for many of whom scarcely any other Christian literature is provided. Of the periodicals 231,000,000 copies have been issued. Of the other home publications, over 31,000,000 volumes have been printed and over 3,150,000,000 pages of tracts, literature which has had an immense influence. Annual grants to the destitute are made to the amount of over $30,000 worth of the society's home publications, forming a total of $2,180,000. Besides large amounts thus transmitted by shipping to foreign nations, a total of over $720,000 in money has been granted to aid the missionaries in heathen lands to print books which the society approves for their work; and thus 4,600 publications, including 800 volumes, have been printed by its help abroad, in 151 languages.

Since the organization of the system of colportage the society has circulated 15,000,000 volumes, and its agents have made over 14,000,000 family visits. The total amount received in donations and legacies, and expended in the charities of the society, is over $6,000,000; and the sales amount to above $13,000,000.

Besides these undenominational societies, each of the leading denominations in the U. S. has its own board of publication.

WILLIAM W. RAND.

**Tracy**: city; Lyon co., Minn.; on the Chi. and N. W. Railway; 165 miles S. W. of St. Paul (for location, see map of Minnesota, ref. 10-B). It is in a noted wheat and corn belt, and contains 7 churches, a public school with twelve departments, electric lights, water-works, a State bank with capital of $35,000, a private bank, and 2 weekly newspapers. Pop. (1880) 322; (1890) 1,400; (1900) 1,911.

EDITOR OF "REPUBLICAN."

**Tracy**, trăă'see', ANTOINE LOUIS CLAUDE DESTUTT, Count de (commonly called Destutt de Tracy): philosopher; b. near Moulins, France, July 20, 1754; was educated for the army; was a member of the States-General in 1789; joined the revolutionary party; served in the army under Lafayette; was, nevertheless, arrested, but was released after the fall of Robespierre; was made a senator under the empire, but voted for the deposition of Napoleon; opposed the reactionary measures of the restoration. D. at Auteuil, Mar. 9, 1836. He was a commander of the Legion of Honor, and a member of the French Academy. He published *Grammaire générale* (1803); *Logique* (1805; often reprinted); *Traité de la volonté et de ses effets* (1815); *Éléments d'idéologie* (4 vols., 1817-18), containing a full representation of his philosophical system; *Essai sur le génie et les ouvrages de Montesquieu* (1828). As a philosopher he was a follower of Condillac and a representative of the sensualistic school, whose principles he, in common with the other members of the society of ideologists at Auteuil, pushed to their last consequences.

**Tracy**, tră'si, BENJAMIN FRANKLIN: lawyer and statesman; b. at Owego, N. Y., Apr. 5, 1830; educated in the common schools and Owego Academy; admitted to the bar 1851; district attorney for Tioga County 1853-56; member of the State Assembly 1861; appointed by the Governor in the spring of 1862 to recruit for the Union army; personally recruited the 109th and 137th Regiments; accepted the coloneley of the former; participated in the battles of the Wilderness and Spottsylvania; on account of ill health was obliged to go North to recuperate; on recovery became colonel of the 127th Colored Troops, and commanded the military post at Elmira; obtained the rank of brevet brigadier-general; resumed practice of law at the close of the war in New York city; U. S. district attorney for eastern district of New York 1866-73; associate justice New York State court of appeals 1881-83; appointed by President Harrison Secretary of the Navy, Mar. 5, 1889. On the expiration of his term he resumed the practice of law in New York.

**Tracy**, ROGER SHERMAN: See the Appendix.

**Tracy City**: village; Grundy co., Tenn.; on the Nash., Chat. and St. L. Railway; 20 miles S. by N. of Cowan (for location, see map of Tennessee, ref. 7-G). It is on the summit of the Cumberland Mountains, in a coal-mining and coking region, and has railway car and repair shops, foundry, steam sawmill, and a weekly newspaper. Pop. (1890) 1,936; not returned separately in 1900.

**Trade-mark**: a mark by which one's trade or wares are known in business. The rules of law governing this subject have been developed during the nineteenth century. Lord Chancellor Hardwicke declared in 1842 that while every trader had his distinctive mark or stamp, he knew of no precedent for enjoining one trader from using another's mark, and he thought such a precedent would be mischievous. Such a precedent was established, however, by Lord Eldon in 1803 (*Hogg* v. *Kirby*, 8 Ves. 215), and was followed by a very rapid growth of this branch of the law.

STATUTES AND TREATIES.—Trade-marks have become the subject of modern legislation and international conventions. In Great Britain the principal statutes are the Merchandise Marks Acts of 1887 and of 1891 (50 and 51 Vict., c. 28, and 54 and 55 Vict., c. 15). The earliest legislation by the U. S. Congress on this subject was enacted in 1870 as a part of an act to revise the statutes relating to patents and copyrights. Its constitutionality was soon attacked and the Supreme Court decided against its validity, holding that a trade-mark is neither an invention, a discovery, nor a writing, and hence was not within Art. I., § 8, cl. 8, of the U. S. Constitution; also that the statute in question was not a regulation of commerce with foreign nations, or among the several States, or with the Indian tribes (see Art. I., § 8, cl. 3), but was a regulation applicable to all trade. (*U. S.* v. *Steffens*, 100 U. S. 82.) The court declared that the property in trade-marks, like the great body of the rights of person and of property, rests on the laws of the States. At present there is an abundance of State legislation on this subject. Later acts of Congress are limited to trade-marks used in commerce with foreign nations or with Indian tribes, and are therefore constitutional. (See Act of Mar. 3, 1881, 21 U. S. Statutes at Large, ch. 128.) Section first of the last-named act provides that owners of trade-marks used in commerce with foreign nations, or with Indian tribes, provided such owners shall be domiciled in the U. S., or located in any foreign country, or tribes which by treaty, convention, or law, afford similar privileges to citizens, may obtain registration of such trade-marks by recording in the Patent Office the prescribed statement and by paying $25 to the U. S. treasury. The reciprocal privileges referred to above have been secured by special treaties, one of the latest of which is the treaty with Denmark of June 15, 1892, or by the International Convention for the Protection of Industrial Rights, adopted at Paris Mar. 20, 1883, to which the U. S. became a party July 3, 1887, and which was reproclaimed June 22, 1892. 27 U. S. Statutes at Large, Treaties, p. 119.

*Its Nature and Purpose.*—These were set forth with clearness and precision by Justice Strong in a leading case in the U. S. Supreme Court. The office of a trade-mark is to point out distinctively the origin or ownership of the article to which it is affixed. This may in many cases be done by a name, a mark, or device, well known, but not previously applied to the same article. But though it is not necessary that the word adopted as a trade-mark should be a new creation, never before known or used, there are some limits to the right of selection. This will be manifest when it is considered that, in all cases where rights to the exclusive use of a trade-mark are invaded, it is invariably held that the essence of the wrong consists in the sale of the goods of one manufacturer or vendor as those of another, and that it is only when this false representation is made, or the necessary tendency of defendant's acts is to deceive the public, that the party who appeals to a court of equity can have relief. Hence the trade-mark must either by itself or by association point distinctively to the origin or ownership of the article to which it is applied. The first appropriator of a name or device which points to his ownership, or which, by being associated with articles of trade, has acquired an understood reference to the originator or manufacturer of the articles, is injured whenever another adopts the same name or device for similar articles, because such adoption is in effect representing falsely that the productions of the latter are those of the former. Thus the custom and advantages to which the enterprise and skill of the first appropriator had given him a just right are abstracted for another's use, and this is done by deceiving the public, by inducing the public to purchase the goods and manufactures of one person supposing them to be those of another. The trade-mark must therefore be distinctive in its original signification pointing to the origin of the article, or it must have become such by association. There are two rules which are not to be overlooked: No one can claim protection for the exclusive use of a trade-mark which would practically give him a monopoly in the sale of any goods other than those produced or made by himself. If he could, the public would be injured rather than protected, for competition would be destroyed. Nor can a generic name, or a name merely descriptive of an article of trade, of its qualities, ingredients, or characteristics be employed as a trade-mark, and the exclusive use of it be entitled to legal protection. *Canal Co.* v. *Clark*, 13 Wallace 311.

It will be observed that the foregoing decision bases the protection of trade-marks on the power of the courts to prevent fraud. Such is deemed to be the correct view in the U. S. (*Chadwick* v. *Covell*, 151 Mass. 190.) The later English cases, however, place emphasis on the property element in a trade-mark, and no longer conceive of the wrong to be redressed "as a species of fraud, but as being to an incorporeal franchise what trespass is to the possession or right to possession of the corporeal subjects of property." Pollock, *Torts*, p. 264.

The right to use a trade-mark is not confined to a manufacturer or producer of goods. One who exercises skill and fidelity in the selection of goods, or who bleaches goods, or is a shipper, a commission merchant, a seller or a carrier, may acquire the right to a trade-mark which serves to distinguish his vendible commodities from those of others—to authenticate them as the signature authenticates a letter.

*When Acquired.*—It is sometimes said that a trade-mark must have been used for a considerable period before its adopter will be protected. The better view appears to be, however, that as soon as the mark is adopted and used as a trade-mark in connection with vendible articles, the right to protection is complete. *Cope* v. *Evans*, L. R. 18 Eq. 143; *Shaver* v. *Shaver*, 54 Ia. 208.

*Examples.*—As stated above, a name or device which is generic or descriptive of the article, its qualities, ingredients, or characteristics can not be monopolized as a trade-mark. Accordingly, the courts have refused to protect the use of such terms as Cherry Pectoral, Toffe Tulu, Rye and Rock, Straight Cut, Cresylic Ointment, Iron Bitters, Ferro-phosphorated Elixir of Calisaya Bark; while they have protected Cottolene, Bromo-caffeine, Lacto-peptine, Sirup of Figs, and others. The decision in such cases often turns on a question of fact. Is the term, claimed as a trade-mark, either originally descriptive of the article, or had it, before its adoption as a trade-mark, become incorporated into the language so as to be descriptive of the article? If either of these questions is answered in the affirmative, the term can not be protected as a trade-mark. (*Chemical Co.* v. *Meyer*, 139 U. S. 540; *Kearly* v. *Brooklyn Chemical Works*, 142 N. Y. 467.) On the other hand, if the term is employed in an arbitrary or fanciful manner, the person first adopting and using it in connection with his wares will be protected. The word "Ideal," therefore, applied to fountains has been held a valid trade-mark, so La Favorita applied to flour, so Falstaff and Phil. Sheridan applied to cigars, and Roger Williams applied to cotton cloth.

Devices, symbols, or pictures may be used as trade-marks. For example, a star, an elk's head, a picture of a boy doubled up with cramps, a peculiar grouping of letters, an arbitrary combination of numerals such as 3214, may be used to individualize the goods made or dealt in by a particular person, and become a valid trade-mark. Letters or numerals, however, can not be monopolized to indicate quality.

Ordinarily a geographical name can not be turned into a trade-mark. If it is used in an arbitrary or fanciful sense, it may be protected, as in the case of Vienna bread, or Columbia Hotel; and in Britain, certainly, it will be upheld if it has acquired a secondary signification in connection with a particular manufacture, as in the case of Glenfield starch. (*Wotherspoon* v. *Currie*, Law Reports, 5 House of Lords 508.) The name of a mine or of a mineral spring may become a valid trade-mark for its product, where the one asking for protection is the exclusive owner of the spring or mine. "Carlsbad salts," "Clysmic water," "Hunyadi Janos," "Apollinaris" and "Congress water" are examples.

*How Lost and Transferred.*—The owner of a trade-mark may lose his right to it by abandoning it, that is, intentionally discontinuing its use. It is incumbent on one alleging abandonment to show by clear and unmistakable evidence that the right has been relinquished. If the owner is guilty of laches in proceeding against persons infringing his trade-mark, he may lose his right to an account for part profits, but does not lose his right to an injunction. *McLean* v. *Fleming*, 96 U. S. 245.

A trade-mark is a subject of commerce and may therefore be sold and transferred, unless such disposition of it works a fraud upon the public. If it is personal, that is, if it owes its value to the personal skill of a particular individual, it can not be transferred, as it is inseparable from that which gives it its value. Oftentimes a trade-mark is an incident of a particular business. In such cases a sale or devolution of the business carries with it the trade-mark without any express mention of it. Upon the dissolution of a partnership each partner has the right to use a firm trade-mark unless he has vested the others with an exclusive right to this firm asset. (*Merry* v. *Hoopes*, 111 N. Y. 415.) The treatises upon this subject are numerous. Among the best are Barclay, *Law of France relating to Trade-marks*; Sebastian, *Law of Trade-marks* (London, 1890); and Browne, *Law of Trade-marks* (Boston, 1885). FRANCIS M. BURDICK.

**Trad'escant**, JOHN: traveler and naturalist; b. in Holland about 1570; traveled through various countries of Europe, Asia Minor, and North Africa, making a collection of objects of natural history; was in 1608 settled in Kent, England; subsequently established a botanic garden at South Lambeth, where he added largely to his collection of curiosities; was the means of acclimatizing several useful plants in England; was employed by several of the nobility to lay out their gardens, and in 1629 was appointed gardener to Charles I. D. at Lambeth in 1638.—His son JOHN, b. at Meopham, Kent, in 1608, added largely to the collection by his travels, in the course of which he visited Virginia, and published in 1656 a descriptive catalogue under the title *Museum Tradescantium, or a Collection of Rarities preserved at South Lambeth, near London.* D. Apr. 22, 1662. The museum was given by the younger Tradescant to the antiquary Elias Ashmole, and became the nucleus of the celebrated Ashmolean Museum, presented to the University of Oxford 1682. Revised by C. E. BESSEY.

**Trade Schools**: See SCHOOLS.

**Trades-unions**: societies of workingmen organized chiefly to assist members in contest with employers to secure rights and privileges. They are a natural evolution of the ancient guild into more definite, better organized, and larger societies than the guilds were.

*Origin of Trades-unions.*—They made their appearance about the middle of the eighteenth century, by which time mere temporary combinations of workmen to resist employers' exactions and to raise wages crystallized into permanent local societies which were virtually trades-unions. They were at first confined each to its own trade. Each town then separated its union from every other, and isolated societies were the only unions. These were at first supported by voluntary contributions, but as each union hardened into permanency and began to have regular needs, a specified tax was laid upon members and a treasury was established. Later the features of benefit societies were added to attract new members, but the union still retained its primal object as a fighting organization to resist injuries and to secure privileges, the usual objects of every organization in history from the church and the state down to the family and partnership. Trades-unions differ in no way from other combinations of men for self-protection and self-aggrandizement.

In their benefit society features unions agreed to give help to members out of work, for sickness, or other legitimate cause, to pay burial expenses for members and their wives, and sometimes to give superannuation allowances, insurances against accident, and the like. By such provisions unions secured more members and larger funds. But these objects were not the chief purpose of the unions. That was and continues to be the adjustment of relations between men and masters in a way favorable to the men, and the points for which the men are combined were in general always the same, namely, higher wages, shorter hours, provisions against physical dangers connected with work, and equalization of work among different bodies of workmen so as to prevent over-supply in one and scarcity of work in another.

*English Trades-unions.*—It was in England that trades-unions took their rise. The reason of this rise in England rather than elsewhere was because there the wages system consequent on the development of the factory first came into general use. Then for the first time laborers were grouped in large bodies, and this grouping tended naturally to associations for mutual help and protection. The old industrial body had been slack, personal, intermittent, and had called into existence temporary coalitions of workmen for specific purposes which dissolved themselves as soon as those purposes were accomplished. But with the advent of the factory system, with its regular wage payments and promotion of stable habits, workmen began to improve their condition. With the increase of production their average wealth increased, and this turned their occasional coalitions into permanent institutions. English law for centuries bore hard upon all labor combinations and punished them as conspiracies. The common law from time immemorial and many express statutes down to 1825 made them criminal. Workmen were forbidden even to discuss wages rates, hours of labor, contracts between employers and employed, or to try to induce their fellows to join them in efforts to increase wages. In fact they were absolutely forbidden to work out their own interests in any reasonable way down to 1825. Between 1776 and 1814, however, the inventions of Hargreaves, Arkwright, and Watt brought about a vast increase of production, which was succeeded as always by increase of wages. Workmen were gathered into cities and began to consult together. The result was an accession of force which, though against the law, made it possible for them to combine and discuss. Parliament at last began to listen and statutes were passed recognizing the legality of combinations of workingmen. In 1815 the ten-hour movement started, which won its victory in 1847. In 1867 special factory laws protecting children and women were passed; in 1875 laws to improve laborers' houses and preventing payment in commodities were made, and to-day labor finds itself intrenched, protected, and favored on all sides, with political parties bidding against each other for its support and vote.

*Labor Representation in Parliament.*—In 1874 the first labor member of Parliament, Thomas Burt, was elected in England. He was president of the Northumberland Miners' Association. In 1885 the labor interests elected ten members; in 1886 thirteen members. In 1892 seventeen were returned, among whom was Sir Charles Dilke. Up to 1886 these members were all representatives of unions of skilled laborers. They stood rather for defensive than aggressive measures. In the elections of 1895 the labor party received a severe blow in the defeat of most of its candidates.

*Trades-unionism since 1886.*—Since 1886 the development of trades-unions in Great Britain has been most important. A great step was taken in the organization of unskilled labor, which dates from the London dock strike of 1889. Joseph Arch had organized rural laborers between 1870 and 1875. Benjamin Tillett and Thomas Mann organized the dock workmen, and by a strike succeeded in raising their wages to sixpence an hour. This has been followed by the so-called new unionism, a movement to organize unskilled labor everywhere in the United Kingdom. This unionism is aggressive, and elected four members to the House of Commons in Aug., 1892. It goes for the eight-hour day, for "one man, one vote," payment of members of Parliament and election expenses by Government, simplification of procedure in law courts, better factory acts, and other valuable measures. The British unions extend to every department of industry, and are now the fourth estate of the realm. In 1883 Great Britain had 195 unions of 253,088 members, and funds amounting to £431,495 sterling. In 1886 the membership had increased to 800,000, and in 1893 was 1,507,026, or 3·98 per cent. of the entire population.

*Continental Nations.*—In Germany trades-unions of a type differing from the British began to appear in 1868, laws against combinations of workmen having been repealed in 1866. General unions were first formed, and afterward local unions under the direction of the general unions. They originated with the professional classes, and in 1869 had 267 societies in 145 towns with 30,000 members, diminished to 20,000 in 1872, but have since increased. They tend much to theories, unlike British unions, which are for business only. They easily become socialistic, get into politics, and begin to decay because they gain so little of practical benefit to their members. In 1875 France had seventy unions forbidden to meddle with politics. Switzerland and Belgium have many unions in a flourishing condition. Italy has had them since 1865, but they are still subject to some legal disabilities. Poorer countries have none, and all continental trades-unions are more interested in views than in gains of wages or shorter hours as a rule, and are therefore ineffective. Fifteen national organizations, with over 52,000 members, were represented at the International Typographical Congress held at Berne, Switzerland, in 1892. It was resolved to create an international strike and traveling benefit fund, and to agitate for uniform wages and less hours. The next international congress was appointed for 1897.

*Trades-unions in the United States.*—Colonial history shows no labor-unions among its scattered populations. Unions rise in cities, and not till 1840 did the U. S. possess a city of a population of 500,000. Local labor-unions arose, however, from 1800 to 1825. Notably the New York Society of Journeymen Shipwrights, organized Apr. 3, 1803; the House-carpenters of the City of New York, in 1806; the New York Typographical Society, 1818—with Thurlow Weed for a member. In Boston the Columbian Society of Shipwrights and Calkers of Boston and Charlestown was given a charter in 1823 "to have and use a common seal, to make its own by-laws, manage and apply its funds, promote invention and improvements in its arts, assist mechanics with loans of money, and relieve unfortunate mechanics and their families."

Local labor-unions multiplied between 1815 and the beginning of the civil war (1861). These local unions also began to extend to men of the same trades in other cities as the railway developed increased ease of intercourse, and finally the idea of a general national union began to be mooted, though with indifferent success. In these movements the best men among the most skillful laborers took the lead. Boston, New York, and Philadelphia were most prominent in the struggles of labor during those years. In 1820 George Henry Evans and his brother Frederick arrived in New York from England, and soon began to influence laborers with their ideas of land reform, holding that men should have only the use of land, and rent should be abolished. They published *The Workingmen's Advocate* between 1825 and 1829, probably the first labor paper published in the U. S. The General Trades-union, established in New York in 1833, was the first central labor-union in the U. S. Its objects were "to guard against encroachments by aristocracy, to preserve natural and political rights, to elevate moral and intellectual conditions, and to establish the honor and safety of industrial vocations." The right of laborers to combine for protection was asserted, and the position that general trades-unions would diminish the number of strikes and lockouts was maintained. One rule was that "no trade or art should strike for higher wages without the sanction of the convention."

In 1831 Stephen Simpson published in Philadelphia *The Workingmen's Manual*, with the motto "Governments were instituted for the happiness of the many and not the benefit of the few," and to show that "labor is the source of wealth and industry the arbiter of its distribution." The writer had no notion of the economic laws which determine distribution, giving to each his own with small regard to civil laws or society resolutions. Seth Luther published *An Address to Workingmen* in 1832 of greater value, in which he recounted the miseries of workmen of that day. They worked from twelve to fifteen hours per day, beginning often at half-past four. Children eleven years of age and women were treated with incredible brutality, beaten, and maimed, and mangled. Wages were low, from 65 to 71 cents per day. The press was hostile, and employers everywhere denounced trades-unions and combined to suppress them; $20,000 was raised among Boston merchants for that purpose, so ignorant were they of their usefulness.

A workingman's convention in 1830 nominated Ezekiel Williams for Governor and gave him 3,000 votes. Their party was later called Locofocos and joined the Democrats, who favored them more than did the Whigs. Their work and principles show an advanced stage of social thought, though mixed with many uneconomic ideas, such as the abolition of "wages slavery," the inalienability of homes, abolition of laws to collect debts, and the natural right of man to the soil. Other notions, as the abolition of imprisonment for debt, equal rights of women, abolition of slavery, general bankrupt laws, were more reasonable, and some of them have taken their places on the statute-book.

The New England Association of Tanners, Mechanics, and other Workingmen was formed in 1831, and met in Boston Sept. 6, 1832. The labor movement began to enlist much sympathy now among literary people—William Ellery Channing, Robert Rantoul, Horace Mann, and the like—who laid stress on education. Their sympathy was grateful, their help very small, since what was needed was not words but more things and greater production. Poverty could only be abolished by wealth, and poverty was the disease to be cured.

*Dates of Organizations.*—In 1850 the Typographical Union appeared, and in 1852 used first the prefix National, then International. At first New York, New Jersey, Pennsylvania, Maryland, and Kentucky were represented in it; now it extends through all the States and some Territories. At first opposed by employers, it is now welcomed and supported by most and endured by all. Labor organizations were formed by the hatters in 1854, iron workers in 1858, machinists in 1859, and others organized later till twenty-six trades had national unions in 1860, and many have been added since. International unions were formed by cigar-makers (1864), engineers (1864), masons (1865). Unions were also formed by conductors (1868), wool-hatters (1869), furniture-workers (1873), locomotive firemen (1869), horseshoers (1875), granite-cutters (1877), coal-miners (1885), bakers (1886), carpenters, plasterers, tailors, glass-workers, boiler-makers, bookkeepers, bottle-blowers, plumbers, piano-makers, switchmen, spinners, stereotypers, lithographers, and finally messenger-boys. At length women also caught the spirit, and organized their various callings, till now the unions are everywhere.

In 1872 eight-hour leagues began to be formed, and they are now very extensive. Already many trades have secured the nine-hour and some the eight-hour work-day. In the U. S. trades-unions, though numerous, were local and confined to their own special trades until Mar. 3, 1859, when the National Union of Machinists and Blacksmiths was called together in order to make a more extended organization. It met in Philadelphia and took into consideration a long list of workmen's "wrongs," such as "the payment of wages in orders," the taking on of too many apprentices, and the peremptory dismissal of workmen. It recognized, however, the real identity of interests between employers and employed.

The success of this meeting led one of the moulders, W. H. Silvis, to call another for permanent organization. The same Mr. Silvis also called to order the first national union of all trades-unions on Feb. 22, 1861. During the civil war the National Labor-union fell into abeyance, but was revived in 1867, though with little enthusiasm at first. It pushed forward the homestead law, however, and in June, 1868, it succeeded in getting the eight-hour labor-day adopted by Congress as the standard time of Government employees. It adopted a platform, reciting a long list of grievances entailed upon labor by the existing scheme of society, and so deployed into politics, with the usual result of such departures from the proper field. The National Labor-union fell into neglect during the years from 1870 to 1873, and threatened to disappear. A general convention was called at Cleveland, O., on July 15, 1873, to prevent this, under the new name of an Industrial Brotherhood, which passed the usual denunciatory resolutions, and called a second meeting on Apr. 14, 1874, at Rochester, N. Y. But, entering the domain of politics with a very radical programme, this organization perished as the previous one had, and was dead in 1875 from mere "neglect and indifference." Trades-unions properly so called still flourished, but the National Union, to effect by law that amelioration of the laborers' condition which could be accomplished only by an increase of production, fell to pieces for want of a sufficiently practicable purpose.

*Knights of Labor.*—On Dec. 9, 1869, the Garment Cutters' Union of Philadelphia dissolved itself, and divided its money among its members. On the 28th of the same month some of the ex-members of that body met and formed the first association of the Knights of Labor. To save its members from the temptations of the saloon this body resolved to combine reasonable pleasure with business, and had refreshments served at its meetings. The trades-unions had become social, and like most social institutions began to succeed, since a social trend is always better than a political one. The order was made secret, and care was taken to avoid the admission of unfit persons as members. In July, 1870, this organization was opened to others beside garment cutters, and soon began to assume wide relations. It was simply an evolution of the ordinary trades-unions to an extraordinary extension, and carried with it, therefore, that relation to practical business affairs which the more ambitious national brotherhoods had lost in politics. Its secrecy and the consequent limitation of its members gave it an unusual interest to workmen. One of its expressed objects was to harmonize labor and capital. It discountenanced strikes, idleness, and frivolity, and was to labor for the prime object of securing to every man the fruits of his toil. It arose out of the irrational readiness of the trades-unionists to strike all round for the grievance of one man without considering the injuries which the strike might work to all. The unions thought only of the workman; the Knights of Labor began to consider the community. It really marked a step in advance over all previous organizations in the field of thought, inasmuch as it displayed a consciousness of social duties belonging to the mechanic apart from any mere quarrel with his employer, duties which might lead him to waive his own wrongs in deference to the greater evils to be suffered by society in case he insisted upon his contention.

This organization also sought to occupy a higher intellectual plane than any before it. It set to work to compile facts about the classes belonging to it, to learn their work, wages, and mode of living, to keep a record of the number of its employed and non-employed, to encourage men to know the laws of the land, and to learn to read and write at least their own names. The second branch of the Knights of Labor was organized on July 18, 1872, and by Jan., 1876, it had over 100 societies from all kinds of trades, extending as far W. as Wyoming. In 1877 it took part in the great strike on the Baltimore and Ohio Railroad and the Pennsylvania Railroad to resist a 10 per cent. reduction of wages, which resulted in losses of $5,000,000. Four hundred and fifty-six assemblies were in existence in 1877, and in June, 1878, a national body of Knights of Labor was organized. It adopted the platform of the deceased Industrial Brotherhood at Reading, Pa. Laborers still remained under the common misconception that "the development of aggregated wealth" threatened to increase the poverty of the masses and their degradation, which is much like saying that plenty of rain is the cause of drought, or a big crop in a tobacco-field tends to sterilize a corn-field. In 1881 the knights discarded the rule of secrecy.

Many of their ideas are good, as that "Politics are always too late, coming only after the evil is done—that they must be superseded by education." They would have spoken better if they had said "Education is too slow; we must devote ourselves to production and increasing our own wealth —the rest will come." The establishment of labor bureaus in different States occupied the knights' attention with such success as to create such bureaus in twenty-eight States, and finally the U. S. bureau of labor was established in 1884, a really signal step in advance for the civilization of the U. S. In 1888 the Department of Labor was further created at Washington, and at last there was begun a reasonable governmental attention to the main interest for which government exists at all, and that is the increase of the means of living among the people. The eight-hour problem is now the main consideration of trades-unions. The alien-labor law, long seriously contended for, is already in force.

*The American Federation of Labor.*—This organization originated in Nov., 1887. In 1891 it claimed to have 4,453 local unions under its control, included in seventy-four general unions, under Samuel Gompers, president. Its general objects are the same with other unions, namely, short hours, higher wages, protection of laborers in factories and on active duty, prevention of unprepared and useless strikes, prevention of the labor of children under fourteen years of age, passage of laws to improve the laborers' condition, equalization of men's and women's wages for the same work, and the like. Between it and the Knights of Labor there is more or less antagonism, arising from their attempting to cover much the same ground as universal organizations. The knights desire a centralized system, while the Federation of Labor wishes to leave the different trades-unions in a position like that of the separate commonwealths in the U. S., each with its own government. In most matters the two organizations aim at similar results, but with different machineries. Neither of them has as yet attempted the organization of unskilled labor in the U. S., where the difficulties would be enormous owing to differences of nationalities in the laboring classes and the constant influx of laborers from all countries. Many of these importations, unfortunately, are far below the level of organization as yet.

*Benefits of Trades-unions.*—George Howells enumerates the benefits of trades-unions to workmen as follows: (1) Discipline arising from subjection to rules and laws. (2) Unity, which gives strength. (3) Social restraint, inducing sobriety. (4) Thrift, arising from frequent discussions of ways and means. (5) Emulation among members, who ridicule drones and botchers. (6) Educational effects springing out of discussions of important subjects and political issues. Mr. Howells, however, fails here to include the benefits for which the unions chiefly exist, namely, to raise wages and shorten working hours. STARR HOYT NICHOLS.

**Trade Winds**: See WINDS.

**Tradu'cianism** [from Lat. *tra'dux*, *tra'ducis*, a vine-layer trained for propagation, deriv. of *tradu'cere*, lead across, lead along, train, propagate]: the theory that the human soul is derived from the souls of the parents, as the body is from their bodies. Tertullian, Athanasius, Gregory Nazianzen, and the Lutheran theologians are Traducians, generally holding that the parents are the divinely appointed means of a divine act of creation. Augustine leans toward this view, although careful not to commit himself to it. During the Middle Ages, however, creationism, or the theory that each soul is a separate creation and joined to the body just after its conception, was the orthodox view, and is the prevalent view in the Roman and Protestant Churches. Revised by S. M. JACKSON.

**Trafalgar**: See CAPE TRAFALGAR.

**Trag'acanth** [from Lat. *tragacan'thum*, deriv. of *tragacan'tha* = Gr. τραγάκανθα, a shrub producing tragacanth; τράγος, goat + ἄκανθα, thorn]: a gummy exudation from several shrubs of the genus *Astragalus* found in Asia Minor and neighboring lands. The dried gum is slightly translucent, resembling horn in appearance. It is hard, but difficult to pulverize; has no smell, and but very little taste. It does not dissolve in water, but absorbs it, swelling up and forming an adhesive paste. Upon adding an additional quantity of water to this paste, a uniform mixture is formed, from which, however, the greater part of the gum is gradually deposited. It is insoluble in alcohol. Tragacanth appears to consist of two distinct constituents, of which only one is soluble in water. This is very similar to gum arabic, but differs from it in a few chemical properties. The insoluble portion, which is perhaps identical with *bassarine* ($C_6H_{10}O_6$), and is termed *tragacanthine*, is colored blue by iodine, but the coloration is probably owing to the presence of a small proportion of starch. The analysis of tragacanth gives gum, 53·3; tragacanthine and insoluble starch, 33·1; water, 11·1; the ash forming 2·5 per cent. Gum tragacanth is used in calico-printing, and also to some extent medicinally.

Revised by IRA REMSEN.

**Trag′edy** [from O. Fr. *tragedie* < Lat. *tragœ'dia* = Gr. τραγῳδία, deriv. of τραγῳδός, tragic poet or singer, liter., goat-singer; τράγος, goat + ἀείδειν, ᾅδειν, sing, the tragedy originating in a rustic festival]: that variety of the drama which represents the fatal solution of a tragic situation or the final catastrophe in the lives of characters doomed for some cause to misfortune or evil. This definition, however, like all definitions of the forms of art, must be regarded as empirical and incomplete. The most famous and in many ways the most interesting definition of tragedy is that given by Aristotle in his *Poetics* (ch. vi., Butcher's trans.): "Tragedy is an imitation of an action that is serious, complete, and of a certain magnitude; in language embellished with each kind of artistic ornament, the several kinds being found in separate parts of the play; in the form of action, not a narrative; through pity and fear effecting the proper purgation of these passions." Here, as throughout the *Poetics*, Aristotle uses "imitation" not of mere realistic picturing of fact, but of creative reproduction of fact, similar to the original production of it in nature. The process of purgation is undoubtedly a medical analogy, and implies an effect of tragedy on the spectator similar to the effect of medicines according to homœopathic theory.

Historically, tragedy is purely an invention of the Greek genius, and the name is actually given to no dramatic work that either is not Greek or was not composed directly or indirectly under the influence of Greek models. The drama, of course, is found among many peoples that have felt little or not at all the intellectual influence of Greece, e. g. India (compare the dramas of KALIDASA, *q. v.*), China, and Japan. But no dramatic work of these peoples, however violent its incidents, is generally accepted as a tragedy. In the Occident, also, in modern times, tragedies have been composed only where some knowledge of the Greek drama or its Latin imitation was generally diffused.

The origin of tragedy is to be found in the Greek lyric dithyramb in honor of the god Dionysus. This is first mentioned by Archilochus, though it must have existed long before him, particularly in Thrace, where Dionysus was particularly celebrated. Originally probably monodic (that is, sung by a single voice), this lyric form was late in the seventh century B. C. employed by Arion of Lesbos for the choral celebrations of Dionysus introduced by him at Corinth. Arion, furthermore, constituted his choruses of satyrs (τράγοι, τραγικὸς χορός), after a fashion already familiar in the Peloponnesus. In this form the choral dithyramb came to Athens during the reign of Pisistratus in the sixth century, and was made a feature of the new festival of Dionysus—the Great Dionysia—celebrated in the spring toward the end of March. In 534 B. C. the poet Thespis made an important innovation by appearing as a reciter of verses, in colloquy with this chorus of satyrs. It now became possible to relate an action, the chorus by its songs showing the emotion produced by it. The action, however, could not as yet be represented. Nevertheless immense possibilities were already opened to the new literary form. Early in the fifth century we find Phrynichus employing it to bring before an Athenian audience the capture of Miletus by the Persians and the battle of Salamis. The glory of finally constituting tragedy belongs, however, to Æschylus, who, by introducing two reciters or actors, made possible a real reproduction of the events described. This innovation made feasible the representation of all kinds of tragic themes; but Æschylus wisely turned for his material in the main to the great store of heroic legends of the Greeks, many of which had already been employed in the epos. Athenian audiences, therefore, were delighted by the visible portrayal of heroic personages familiar to them, personages involved, too, in those very actions with which they were associated by long tradition. As a consequence, the vogue of tragedy in the fifth century B. C. became very great, and a multitude of poets entered the annual competitions for popular favor. Of these, the most famous are Sophocles, who gave still greater variety to the representation by the use of a third actor; and Euripides, whose innovations in style and in the choral parts of the drama were felt by conservative contemporaries, like Aristophanes, to have robbed tragedy of what was highest and noblest in it.

The rise of Attic comedy, as well as the decay of tragedy itself, prevented the production of tragedies in Greece from being important after the fifth century B. C. The dramas of the three great poets remained, however, objects of admiration and of eager literary study. Thus it naturally happened that when the Romans, in the end of the third century B. C., turned to Greek literature for models for their own, they adopted tragedy among the first literary forms. Both by direct translations and by imitations the Roman playwrights sought to familiarize their fellow countrymen with what they believed to be the noblest achievement of the dramatic art. Livius Andronicus, Nævius, Ennius, Pacuvius, and Accius, all rendered noteworthy services to this end during the third and second centuries B. C. And yet with all their efforts these writers do not seem to have been able to make tragedy really popular at Rome, or so to establish the form and style of it that their successors should have safe models to follow. To judge by the fragments and other indications, the tragedies of the first century B. C. had lost most of their inner meaning and become empty rhetoric or trivial vulgarity. In the first century of the Roman empire, however, there was a kind of purely literary revival of the writing of tragedies, though public audiences seem by this time quite to have ceased to be interested in them. In cultivated circles, however, the *Thyestes* of L. Varius, the *Medea* of Ovid, and the nine tragedies of L. Annæus Seneca, the younger, which last alone survive entire, as well as others by less eminent writers, enjoyed a considerable reputation. This was really the last effort of Roman tragedy. Toward the end of the same century, to be sure, Curiatius Maternus essayed the form, but with no durable success, and after the first century the writing of tragedies practically ceased in the Roman world. The gladiatorial shows were the only tragic spectacles enjoyed by Roman audiences, and in the theaters only comedy in its various forms was given.

We come now to a long gap in the history of tragedy. In the last centuries of the Roman empire there was a steady decline in the condition of the theater, and after the Germanic invasions of the fifth and sixth centuries actors became one of the most scandalously degenerate classes of society. Nothing could exceed the contempt and reprobation with which the Church spoke of the *histriones*, *mimi*, *scurræ*, *thymelici*, etc., during the whole mediæval period. The very names comedy and tragedy ceased to have a determinate meaning attached to them. The former was applied to any poem with a painful beginning and a happy ending; the latter to poems in which the case was reversed. Isidore of Seville puts Horace, Persius, and Juvenal among the *comici*, while others classed the epics of Lucan and Statius among tragedies. Dante was still under the influence of these confusions, and called his great poem *Commedia*, because its style, not being Latin, was not properly that of tragedy; and because, beginning with hell and ending with paradise, the work conformed to the supposed principles of comedy.

As the mediæval period drew to a close, a new form of the drama rapidly developed itself, at first quite without the influence of ancient tragedy or comedy. This was the *mystery-play*, which was followed later by the *miracle-play* and the *morality*. All these forms arose from the necessities and observances of the Church; and through them the world became familiarized with a pathetic drama ungoverned by the laws that had obtained among the classical playwrights from Æschylus down. In it unity of time and place were unknown, the subordination of character to action was unthought of, and the limitation of the number of the actors was impossible. Vivid pictorial effects and psychologic analysis were the chief means of success. From these traditions of the mediæval drama it has been impossible for modern dramatists, however much imbued with the classical spirit, to break away.

The revival of tragedy proper connects itself with the larger revival of the study of antiquity, which is called the Renaissance. During the whole mediæval period, to be sure, there had been considerable familiarity with the comedies of Terence, and the Saxon nun Hrotsuitha (tenth century) had attempted to imitate them. We find also occasional traces of a knowledge of the tragedies of Seneca, and these were destined to have an important part in the revival of tragedy. Indeed, this revival may be said to date from the *Commentaries* on Seneca's tragedies composed by the learned English Dominican Nicholas Treveth (about 1260–1330), at the request of Cardinal Niccolò Albertini da Prato, Bishop of Ostia and Velletri (d. 1321), one of the most influential men at the papal court at Avignon. Treveth's *Commentaries*, both from his own reputation and from that of his patron, were speedily known all over Europe, and greatly increased the interest in Seneca. In Italy particularly, where so many causes were at work to turn men back to classical antiquity, and where during the fourteenth century the powerful influence of Petrarch and Boccaccio definitely established the ideal of humanism, the step was speedily taken from admiration to imitation. Early in this century a learned circle in Padua, of which the judge Lovato was the leading spirit, gave itself to the study of Seneca, and from one of the group—the statesman, historian, and poet, Albertino Mussato—proceeded what may fairly be called the first tragedy of the modern world. The title of this is *Eccerinis*, and it is the dramatized history in Latin of the famous tyrant Ezzelino da Romano, composed in order to inspirit the Paduans in their struggle against Can Grande della Scala. In form, however, the piece follows Seneca as nearly as Mussato knew how. The meters are various and imitate Seneca's, and even the chorus is present. It was largely for this play that in 1315 Mussato received from the Paduans the poet's laurel crown. The example of Mussato was not left unfollowed in Italy, though the choice of a subject from Italian history remained peculiar. Early in the fifteenth century we find Antonio Loschi (1365–1441), of Vicenza, Gregorio Corraro (1410–64), and the Florentine Leonardo Dati winning great applause by their Latin plays after the style of Seneca. From the first we have the *Achilleis*; from the second, *Progne* (about 1428); from the third, *Hiempsal* (about 1441). On the whole, however, the humanists found comedy more congenial than tragedy, and their Latin imitations of Terence and Plautus were both more numerous and more interesting than their tragedies.

Through the efforts of these men the understanding of tragedy in the ancient sense had been restored to the world. And yet their works were works of the closet, or at best designed for mere recitation. Not one of them was ever actually played on a public stage. Here the popular religious drama still held undisputed sway. Furthermore, they were in Latin, and not till tragedies had been written in a modern tongue could modern tragedy be said to have been born. As is well known, the secular drama in the vulgar tongue began in Italy with comedy, or a near approach to it. The *Orfeo* of Poliziano, though it contains pathetic situations, is idyllic rather than tragic in its general character. It was not till 1524 that a regular tragedy in Italian, meant for actual production, was written. This was the piece *La Sofonisba* of Giangiorgio Trissino, which has the glory of being the first tragedy in a modern language.

Tragedy passed to the remaining countries of Europe with the other Renaissance influences that proceeded from Italy. By the end of the fifteenth century the Italians had so completely revived both Latin and Greek that a large body of the ancient drama had become accessible. Not only Seneca, but also Æschylus, Sophocles, Euripides, and Aristophanes were now known. Aristotle's remarks on the drama in the *Poetics* had been studied in the light of the very plays on which he based them. And yet it is interesting to see how long the example of Seneca remained preponderant. In France, about 1540, Buchanan had Latin plays of the Seneca type, *Jephthah* and *John the Baptist*, played at the Collège de Guienne at Bordeaux. And, though the *Electra* of Sophocles and the *Hecuba* of Euripides were translated into French by Lazare de Baïf about the same time, the first original French tragedy, the *Cléopâtre* of Jodelle, acted in 1552, shows much more reading of Seneca on the author's part than of the Greeks. In England the importance of Seneca for the development of tragedy is no less marked, and the first English tragedy, *Gorboduc*, by Sackville and Norton, acted in 1562, shows practically no influence of the Greek dramatists. All is Seneca.

In this manner tragedy was reintroduced and established in the modern world. And yet it must be noted that the greatest modern tragedies are the result of a fusion of the antique type with dramatic traditions of mediæval origin. In France alone did classicism so triumph as to make playwrights attempt accurately to conform to what they supposed to be the rules of the ancient drama. During the seventeenth and eighteenth centuries the unities that Aristotle was believed to have found in Greek tragedy were held to be the law of perfection. Yet even in Corneille and Racine the skilled observer can detect abundant traces of the mystery-play and the morality. In England and Spain, on the other hand, the unities were never really accepted; the limited scope, the subordinated personalities, the dramatic machinery of ancient tragedy were freely disregarded. In Shakspeare and the other Elizabethans, in Calderón, Lope de Vega, and the dramatists of the Siglo de Oro, we have the ample material of the mediæval drama frankly fused with the classical tradition. Hence the superiority of the work of these poets.

**Trag'opan** [Mod. Lat., from Lat. *tra'gopan* = Gr. τραγόπαν, a fabulous Ethiopian bird]: any bird of the genus *Ceriornis*, family *Phasianidæ*. *Ceriornis* is nearly related to the genus *Gallus*. The males, however, instead of a comb, have a crest of soft feathers and a pair of soft horn-like appendages, protractile and retractile at will, above the eyes, as well as wattles in front on the throat; the tail is large, depressed, and rounded at its posterior margin; the tarsi are armed, in the male, with short conic spurs. The species are mostly confined to the pine forests of the Himalaya Mountains and neighboring chains of Asia. They are generally solitary in their habits, dwell in the inmost recesses of their native forests, and are difficult of approach. They average about the size of the domestic poultry, or perhaps are a little larger. They feed upon grain, insects, worms, etc., and indeed resemble in this and many other respects the common gallinaceous birds. Revised by F. A. LUCAS.

**Tragu'lidæ** [Mod. Lat., named from *Tra'gulus*, the typical genus, dimin. of Gr. τράγος, goat]: a family of placental mammals of the order *Ungulata* and sub-order *Artiodactyla*, containing the smallest living representatives of the order. In external appearance they suggest a small deer, but are peculiar in the arching of the back behind and the projection of the buttocks backward; the neck is rather short; the head slender and with a pointed snout; the ears moderate; no horns are developed in either sex; the tail is moderately short; the legs are slender; the feet provided with lateral hooflets; the teeth are in the normal ruminant number (M. $\frac{3}{3}$, P. M. $\frac{3}{3}$, C. $\frac{1}{1}$, I. $\frac{0}{3} \times 2$), and form the chief distinctive feature, consisting of the interruption of the incisorial series at the symphysis and the enlargement and expansion of the middle incisors toward their crowns, and the development of the canines of the upper jaw as tusks in the males; the stomach is tripartite, the psalterium being incompletely developed; the placenta is diffuse; the outer metatarsals are developed. The family is now peculiar to Asia and Africa. It is specially interesting as exhibiting an intermediate condition in the development of the stomach and some other parts between the typical ruminant ungulates and the omnivorous or hog-like forms.

Revised by F. A. LUCAS.

**Trailing Arbutus**: See EPIGÆA.

**Traill**, CATHERINE PARR (*Strickland*): author; sister of AGNES STRICKLAND (*q. v.*) and Mrs. Susanna Moodie; b. in

Kent, England, Jan. 9, 1802; educated at her home; removed to Canada in 1833 with Lieut. Thomas Traill, whom she had married the preceding year. She settled at Douro, Ontario, and subsequently resided in Peterborough, but for many years has made her home at Lakefield, Ontario. She began to write when fifteen years of age, and has devoted much of her time to literary work ever since. Among her works are *The Backwoods of Canada* (London, 1835); *Canadian Crusoes* (New York, 1852); *Ramblings in the Canadian Forests* (1854); *Afar in the Forest* (London, 1869); *Studies of Plant Life* (Ottawa, 1884); *Pearls and Pebbles* (1895). N. M.

**Traill**, ROBERT, D. D.: b. at Lisburn, Ireland, July 15, 1793; graduated at Trinity College, Dublin, about 1817; took orders in the Church of England 1820; became parish minister of Schull, County Cork, 1830, and fell a victim to his incessant labors to relieve his parishioners during the great Irish famine, dying of an epidemic fever in 1847. He is the author of a superior English translation of Josephus's *Jewish War* (London, 1846–47, with Isaac Taylor's notes and Tipping's illustrations of Palestinian scenery; later ed. rep. Boston, 1868). Revised by S. M. JACKSON.

**Traill**, THOMAS STEWART, M. D.: b. at Kirkwall, Orkney islands, in 1782; graduated at the University of Edinburgh 1801; became a physician, and was Professor of Medical Jurisprudence in that university from 1832 to his death July 30, 1862. He was editor of the eighth edition of the *Encyclopædia Britannica* (22 vols., 1853–61), for which he wrote more than 400 articles; wrote for scientific periodicals, and was author of *Lectures on Medical Jurisprudence* (2d ed. 1840; Philadelphia, 1841) and other works.

**Train**, GEORGE FRANCIS: author; b. in Boston, Mass., Mar. 24, 1830; entered upon mercantile business there, and subsequently in Australia; in 1860 went to England, and attempted to introduce street-railways into Liverpool and London, but was met by legal opposition. Subsequently he traveled extensively, wrote considerably, spoke much in public, and developed singular idiosyncrasies. For many years he declined to speak to anyone, using pencil and paper as his only medium for conversation. One of his peculiarities is a special fondness for children, with whom he surrounds himself in his daily visits to Madison Square, New York, which city has long been his place of residence. Among his publications are *An American Merchant in Europe, Asia, and Australia*, and *Young America Abroad* (New York, 1857); *Spread-eagleism*, consisting of some of his public speeches (1859; London, 1860); *Young America on Slavery* (1860); *Union Speeches delivered in England* (4 vols., Philadelphia and London, 1862); *Downfall of England* (1865); *Irish Independency* (1865); *Championship of Woman* (Leavenworth, Kan., 1868).

**Trajan** (*Marcus Ulpius Trajanus*): Roman emperor A. D. 98–117; b. at Italica, near Seville, Spain, Sept. 18, A. D. 52, of Roman descent; was educated in the camp of his father, and distinguished himself so much in the Parthian and German wars that, although not of Italian birth, he was adopted by Nerva in 97, and in January of the following year succeeded him on the throne. Trajan's reign is considered, next to that of Augustus, the most brilliant period of the history of imperial Rome. By two campaigns (101–102 and 104–106) Dacia, the region between the Theiss and the Pruth, comprising the present Transylvania, Moldavia, and Wallachia, was conquered and made a Roman province. Of less permanent importance were the conquests in Armenia and Mesopotamia, made in the wars with the Parthians. Although most eminent as a general, Trajan was a vigorous and capable ruler, and the probity of his administration gave rise to the phrase with which a new emperor was first saluted—*Augusto felicior, melior Trajano* (more fortunate than Augustus, better than Trajan). Cities were founded, colonies settled, fortresses and harbors constructed, and numerous roads, canals, bridges, etc., were built throughout the empire. In Rome the Forum Trajani was constructed, containing the famous column in its center. Large sums were employed in the education of freeborn Roman children. Libraries, among which was the celebrated Ulpia Bibliotheca, were founded, and the Latin literature experienced its afterbloom in Tacitus, the younger Pliny, and Juvenal. Pliny's correspondence with Trajan when governor of Bithynia gives a valuable picture of the provincial government, and throws light on the condition and treatment of the Christians, whose relation to the empire was at this time becoming a question of considerable importance. Trajan died at Selinus, in Cilicia, in Aug., 117. Revised by CHARLES H. HASKINS.

**Trajan's Wall**: a fortification in the Dobrujda, Roumania, nearly 50 miles long, extending from Tchernavoda on the Danube to Kustendji on the Black Sea. It is a double and in some places a triple earthwork on the south side of a natural fosse, consisting of a narrow marshy valley. It is even now a strong line of defense. It was constructed in 377 by Trajan, a general of Valens, to prevent the Visigoths, who had crossed the Danube, from advancing farther southward. E. A. G.

**Trajectory**: See GUNNERY.

**Tralee′**: town; in County Kerry, Ireland; on the Lee, 1 mile from its mouth; 207 miles by rail S. W. of Dublin (see map of Ireland, ref. 12–B). It is well built, and has some trade in agricultural produce. It has ceased to be of importance as a port since ships began to discharge at Fenit, 5 miles distant. Tralee returned a member to Parliament until 1885. Pop. (1891) 9,318.

**Tramps**: See VAGRANTS AND VAGRANCY.

**Tramways**: See RAILWAYS and STREET-RAILWAYS.

**Trance** [from O. Fr. *transe*, extreme fear, swoon, trance, deriv. of *transir*, pass over, fall into a swoon < Lat. *transi′re*; *trans*, across + *i′re*, go]: a state of abeyance of most of the vital functions, resembling in some cases a profound sleep, in others closely simulating actual death. Some cases of so-called trance are clearly cataleptic, and all are associated with abnormal nervous conditions or perverted nerve-functions. Trance sometimes follows extreme religious excitement. In some cases of real or pretended trance the patient can speak, and even address public audiences, the condition being assumed at will. But in the more profound trance all sensibility and power of motion is lost, and in some no sign of breathing or of heart-beat is apparent. This condition has been known to last for months or even years. See CATALEPSY and HYPNOTISM.

Revised by J. M. BALDWIN.

**Trani**, traa′nee: town; in the province of Bari delle Puglie, Southern Italy; on the Adriatic; about 27 miles N. W. of the town of Bari (see map of Italy, ref. 6–G). A few traces of an old castellated wall, with towers and bastions, remain. The port is well sheltered except on the N. W., and during the flourishing period of Italian mediæval commerce with the East, Trani was a very important center of maritime trade. The cathedral, Byzantine in its architecture, was begun in the twelfth century and consecrated in the thirteenth; the tower is one of the boldest in Italy. The law school established here by Charles V. had a wide reputation. In 1799 the city was sacked and burned by the French. It is a place of considerable industry and commerce, the exports being chiefly oil, wine, and fruits, especially almonds from the vicinity. A fine calcareous building-stone, known as *pietra viva*, and found near Trani, is exported. Pop. 25,000. Revised by M. W. HARRINGTON.

**Tranquebar′** [Tamil *Tarangambadi*, or city of the waves]: town of Tanjore, Madras, British India; on the Coromandel coast, in the delta of the Cavery; in lat. 11° 2′ N.; on a small bay which forms a good harbor (see map of S. India, ref. 6–F). It is surrounded by walls, defended by forts, and well built. Pop., with an indigenous suburb, 6,200. The town, with adjacent district, very productive of rice, cocoanuts, and fruits, was originally a Danish possession, but in 1845 was sold to Great Britain. It has declined in importance, partly because of this change and partly because of the advantage given to the rival port, Negapatam, through the construction of the South Indian Railway to it. Tranquebar is a healthful place, has a mild and agreeable climate, and was long a favorite watering-place.

Revised by M. W. HARRINGTON.

**Tranquillus Suetonius**: See SUETONIUS TRANQUILLUS.

**Transbaika′lia** [i. e. across the Baikal; Rus. *Sabaikal*]: province of Eastern Siberia, bordering on Mongolia, and S. and E. of Lake Baikal; between the parallels 49° 8′ and 56° 31′ N., and the meridians 101° 28′ and 121° 30′ E. Area, 236,868 sq. miles, or nearly that of Texas. The eastern part is mountainous; the western is a high plateau with many lakes and marshes. The waters belong to the basins of Lake Baikal, the Lena, and the Amur. The climate is continental, rigorous, and dry. This is the central part of the Nertshinsk mineral region, and is rich in gold, silver, copper, tin, lead, coal, asphalt, and salt. It was rich in forests, but these are rapidly disappearing. Agriculture does not prosper, but stock-raising is profitable. The collection of pelts is a regular pursuit, and the skins obtained include those of the fox, bear, ermine, and sable. The last two are especially fine, but these animals are fast being exterminated. Pop. (1897) 669,721, mostly Russians, but about 150,000 are Buriats, Tunguses, and Chinese. M. W. H.

**Transcaspian District**: province of Russia in Asia; part of the government of Turkestan; E. of the Caspian Sea, S. of Uralsk, W. of Khiva and Bokhara, and N. of Afghanistan and Persia. Area, 214,237 sq. miles, or a third larger than the Caspian Sea. The country is largely steppe and desert. It is traversed by the Transcaspian Railway, and has many caravan routes. The district was formed in 1881, and Merv was added to it in 1884. Pop, (1897) 382,327, of whom 210,000 are Turkomans, 44,000 Kirghiz, 7,000 Russians (not including the troops), the remainder Persians, Afghans, Bokhars, Armenians, and Jews. M. W. H.

**Transcauca'sia** [Lat. *trans*, across, beyond + *Caucasus*]: the name given generally to that part of Asiatic Russia which lies S. of the Caucasian Mountains; between the Black Sea and the Caspian. It includes the provinces of Baku, Daghestan, Elizabethpol, Erivan, Kars, Kutais, Tiflis, and Zakataly, making altogether an area of 91,346 sq. miles, with a population of 5,011,555 in 1890. M. W. H.

**Transcenden'talism**: a term used to describe the doctrine of the New England school of philosophy, initiated by Ralph Waldo Emerson and A. Bronson Alcott, which, however, owed its origin to the study of Plato and the Neo-Platonists rather than of Kant, although the latter, through Coleridge, exercised some influence. Kant called transcendental all those cognitions or elements of cognitions which are not derived *a posteriori* by experience, but underlie all experience as its necessary *a priori* conditions, and which consequently transcend the whole sphere of experience. Transcendental are all those primary, original, and *a priori* principles of knowledge which, as necessary and universal truths, underlie all contingent and particular truths derived from experience; and in this sense of the word transcendental is the opposite of empirical.

Revised by W. T. Harris.

**Transformer**: in electricity, an instrument for converting an alternating current from a higher to a lower potential, or *vice versa*. A step-down transformer converts a small current at a high potential to a large current at a low potential; a step-up transformer converts a large current of low potential to a small current at high potential. The energy obtained from a transformer is equal to that put in, less the losses due to heating. Step-down transformers are commonly used in the ordinary systems of alternating-current distribution for the supply of incandescent lamps at constant potential. The alternating-current transformer is a modification of the old-fashioned induction coil (see Induction Coil), and consists essentially of a primary and a secondary coil of wire embracing the same magnetic circuit.

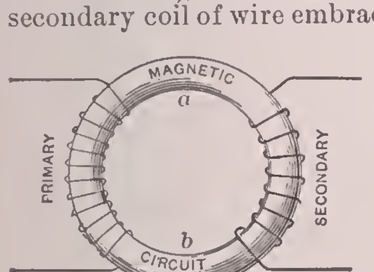

Fig. 1.—Typical representation of a transformer.

The simplest form of such a transformer is shown in Fig. 1. The primary coil, commonly spoken of merely as the "primary," consists usually of many turns of fine wire. This is connected to a supply of alternating current commonly at 1,000 or 2,000 volts. The current which flows in the primary is small, being opposed by the counter-electromotive force of self-induction, which is large on account of the fact that the primary turns are many and embrace an iron coil. The secondary usually consists of fewer turns of larger wire, capable of carrying a larger current than the primary, which is, however, at a correspondingly lower potential. The primary current sets up lines of magnetic force which thread the secondary circuit and induce an electromotive force in the secondary, inasmuch as the magnetization keeps changing with the primary current and the lines of force are reversed with each alternation. It is then the function of the magnetic circuit to convey through the secondary coils the lines of force set up by the primary current. The magnetic circuit is usually a completely closed one made of soft, well-laminated iron. This is not always so, however, and a transformer may be constructed with only a partial magnetic circuit, as typically shown in the upper diagram of Fig. 2. Such is technically known as an "open-magnetic-circuit" transformer in contradistinction to the "closed-magnetic-circuit," as shown in Fig. 1. The open-magnetic-circuit transformer possesses the advantage of smaller losses at no load, due to diminished hysteresis (see

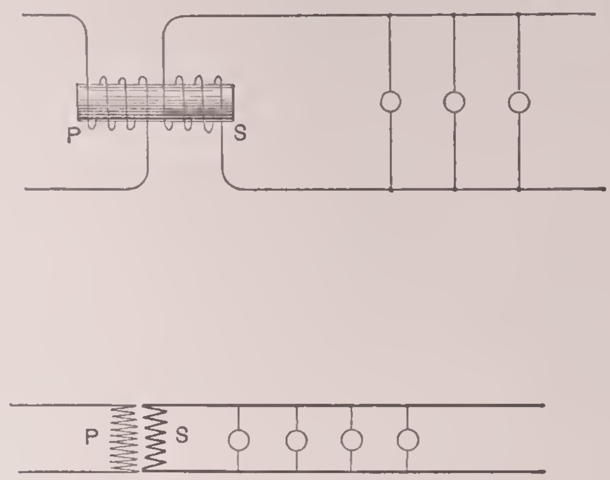

Fig. 2.

Magnetism of Iron); and although little used in the U. S., it is commonly used in Great Britain, notably in the case of the "hedgehog" transformer of Mr. Swinburne. Step-down transformers are used to supply incandescent lamps arranged in parallel, as typically shown in Fig. 2. Although Fig. 1 shows the general arrangement of the parts of a transformer, it must not be supposed that the form there shown is the design of the practical transformer in commercial use.

*Lines of Force due to the Secondary Current.* — We have thus far considered the lines of force passing through the magnetic circuit, due to the primary current; now the secondary current will likewise tend to set up lines of force which will be opposite in direction to those set up by the primary. (See *The Direction of the Induced Current* under Electricity.) These lines will accordingly meet and oppose each other,

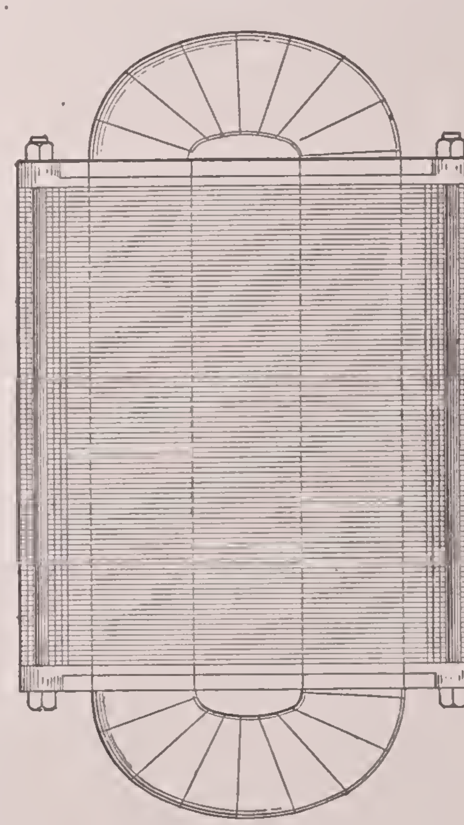

Fig. 3.—Transformer.

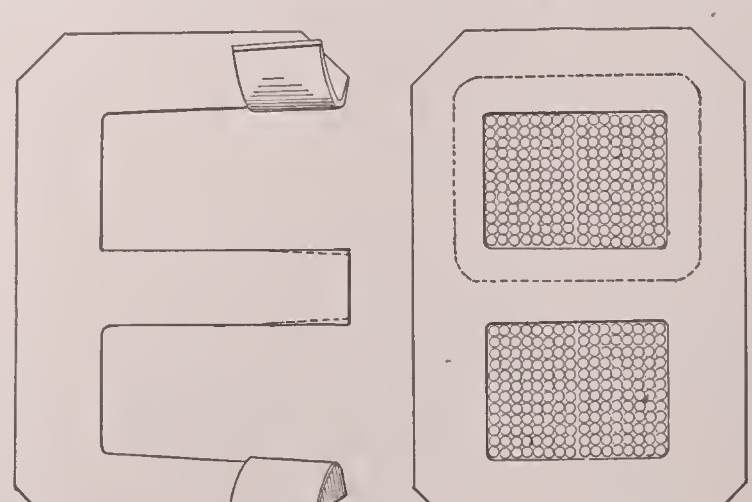

Fig. 4.—Transformer plates and arrangement of coils.

and in a transformer as Fig. 1 there will be a tendency for them to leak across between $a$ and $b$. This magnetic leakage, as it is called, diminishes the effect in the secondary circuit, and likewise interferes with the regulation for constant potential which is necessary for the supply of the incandescent lamps. A commercial form, avoiding to a large extent magnetic leakage and possessing mechanical advantages, is shown in Fig. 3. The primary and secondary coils are compactly arranged and the magnetic circuit built up of plates of soft iron bolted securely together. The shape of the transformer plate is shown in Fig. 4; the dotted line indicates the magnetic circuit—that is, the path of the lines of force. The lamination prevents loss due to Foucault currents induced in the iron.

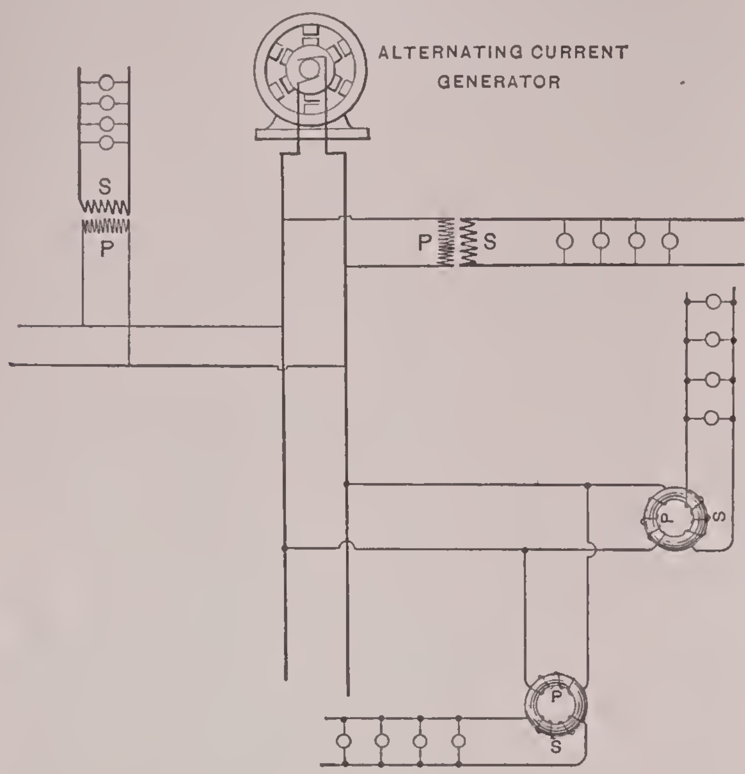

Fig. 5.

The common form of transformer distribution for lighting purposes is shown in Fig. 5. The primary mains are supplied with a potential of, say, 1,000 volts by a constant potential alternating-current generator placed in some central station. Each house to be lighted has installed in it an individual transformer which supplies incandescent lamps at 50 or 100 volts. This potential should be constant at all loads; in reality it decreases slightly with the load on account of the magnetic leakages, already referred to, and the fall in potential due to the resistance of the conductors. The primary mains are usually supplied both day and night. The lamps in the secondary may be turned on and off individually or altogether. This is the common system of supply, but a system of sub-stations is sometimes used. Here each house no longer has its own transformer, but one large transformer is used for each district or group of houses, thus entailing less first cost for transformers and a higher efficiency; for, as the output of the transformer is increased the size and cost do not increase in proportion; and, furthermore, greater efficiency is thus obtained. Although this fact is noticeably true for small transformers, it is, however, not so marked with larger ones, say those of 30 or 40 kilowatts capacity. The energy which is lost in a transformer appears as heat which must be radiated from the surface, and with large transformers the effect of rise of temperature, due to the smaller surface in proportion to the output, must be considered. In a closely settled district where a complicated network is necessary, a system of distribution, as shown in Fig. 6, may be used, in which a complete system of secondary wires is supplied from the secondaries of a number of transformers placed at suitable points.

Alternating-current measurements are necessarily complicated, inasmuch as we have to deal with quantities rapidly varying from instant to instant. In experimental investigations these instantaneous values are commonly ascertained, and are of particular importance in certain lines of research. The value of a quantity varying periodically is sometimes expressed in terms of the maximum value which the quantity attains in each period. These maximum values become more significant when the quantity varies harmonically or nearly so, as is ordinarily the case with alternating currents. For a current differing widely from a sine or harmonic function, the maximum value indicates little as to the magnitude of the current in the usual sense of the term. When a current is of periodically varying value, it is most commonly the case that we wish to know, not the value of the current from instant to instant nor its value when at a maximum, but the value of an equivalent unvarying current, by which we mean a current equivalent in heating and dynamic effects. This value of the alternating current is called its *virtual* value. It is the one commercially used in connection with transformers, being given by most measuring instruments. The virtual value of a quantity is equal to the square root of the mean square of the instantaneous value; and, for an harmonically varying quantity, that is, proportional to a sine or cosine of the variable,

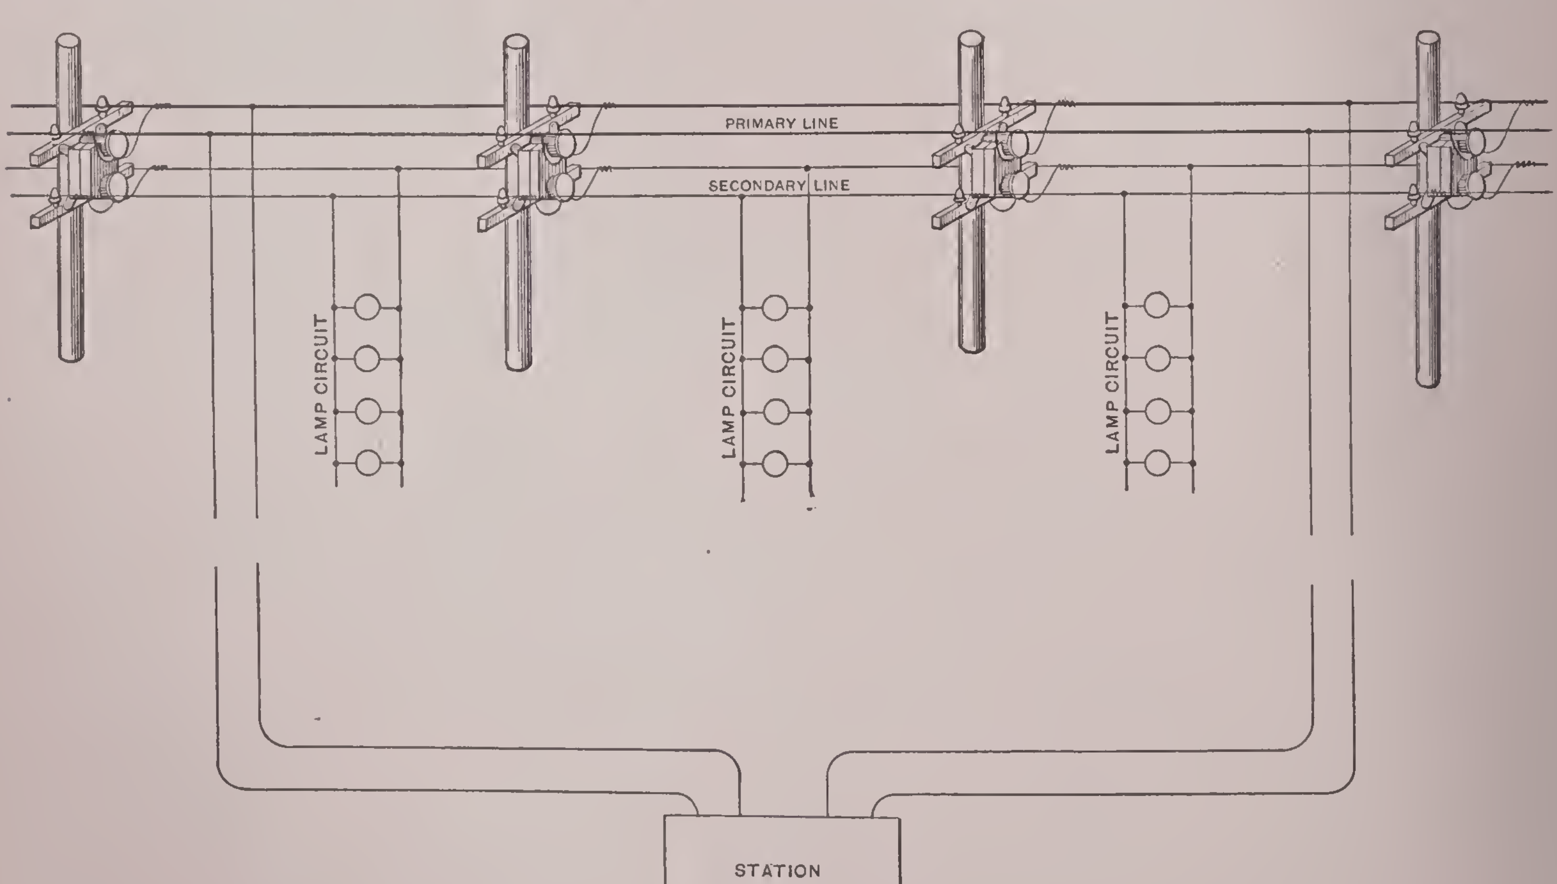

Fig. 6.

is equal to the maximum value divided by $\sqrt{2}$; or the virtual value is equal to 0·707 times the maximum.

The calculation of the efficiency of the transformer consists either in the measurement of the power supplied to the primary and the power obtained from the secondary, or in a determination of the several losses. The efficiency is the ratio of the secondary output to the power supplied to the primary—that is, efficiency $= W_2 \div W_1$.

The losses in a transformer are as follows: The iron losses, due to hysteresis and Foucault currents; the loss in the primary, due to the heating of the primary conductor; and the loss in the secondary, due to the heating in the secondary conductor. The loss due to the heating of a conductor equals the product of the resistance and the square of the current; hence the copper losses in the primary and secondary circuits are $R_1I_1^2$ and $R_2I_2^2$, respectively. The secondary power, $W_2$, utilized in operating incandescent lamps, is equal to the product of the secondary current and the difference of potential at the secondary terminals, inasmuch as the load is non-inductive and the current is in phase with the electromotive force—that is, $W_2 = E_2I_2$. The power put into a transformer is equal to the power taken out and made use of in the secondary load plus the several losses, thus:

$$W_1 = W_2 + \text{iron losses} + R_1I_1^2 + R_2I_2^2.$$

The primary power is also equal to the product of current, electromotive force, and the power factor; thus $W_1 = E_1I_1 \times$ power factor. The power factor is equal to the cosine of the angle by which the current lags behind the electromotive force.

*The action of a transformer* may best be investigated by a determination of the values, from instant to instant, of the currents and electromotive forces. For these determinations the method of instantaneous contact is used, employing a contact-maker (see Fig. 7) which closes a circuit once in each revolution of the armature of the generator, and thus enables measurements to be made at any desired phase of the alternation. (Methods of measurement are described in vol. ii. of Nichols's *Laboratory Manual of Physics and Applied Mechanics.*) The connections for a transformer test by this method are shown in Fig. 8. Curves thus obtained are shown in Fig. 9, which indicates in a complete manner the action of a transformer. (The curves here given were taken from a hedgehog transformer.) The primary current lags considerably behind the primary electromotive force. The secondary electromotive force is almost exactly opposite in phase to that of the primary. The efficiency may be obtained by computing the primary and secondary power from the instantaneous values of current and electromotive force. The results of a test upon a transformer possessing exceptionally high efficiency and good regulation are shown in Fig. 10.

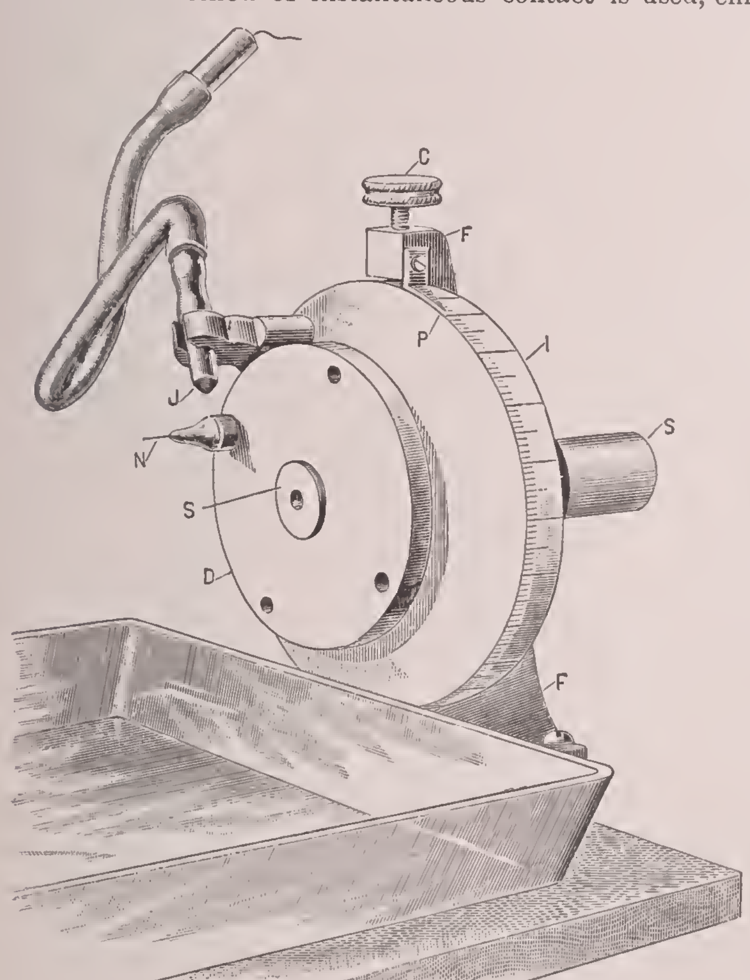

FIG. 7.—Bedell-Ryan revolving contact-maker.

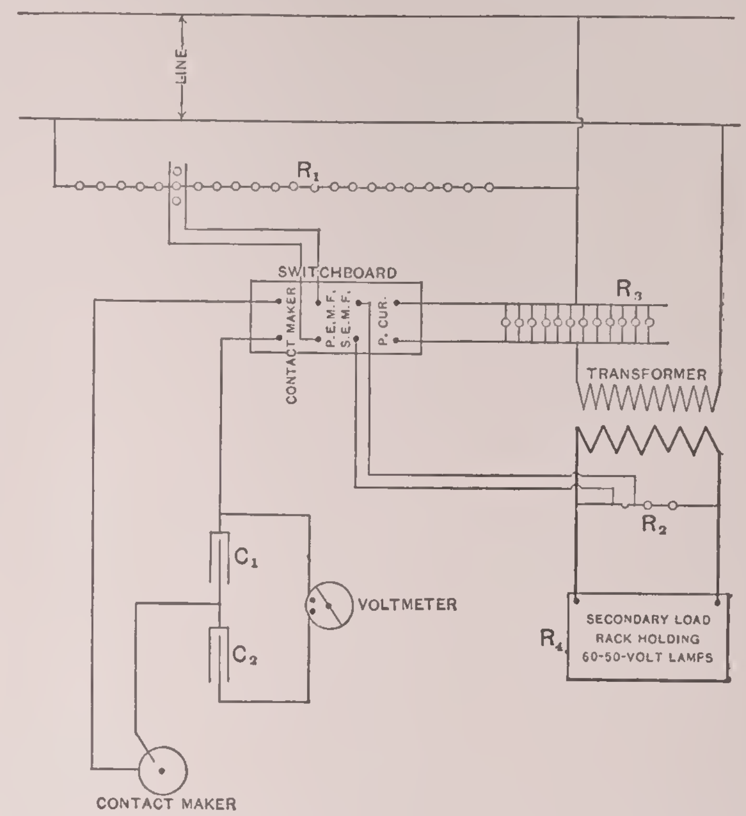

FIG. 8.—Connections for transformer test by method of instantaneous contact.

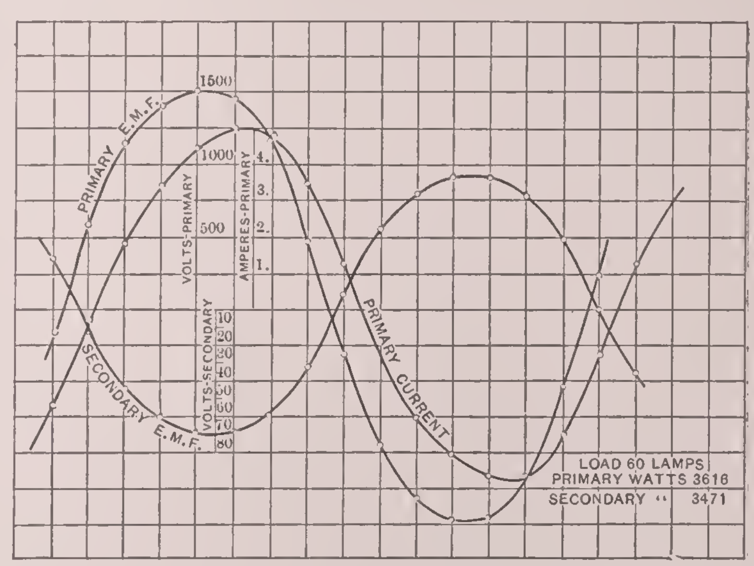

FIG. 9.—Transformer curves by method of instantaneous contact.

The theory of the transformer may be analytically developed from the two equations for primary and secondary electromotive forces:

$$E_1 = R_1I_1 + L_1\frac{dI_1}{dt} + M\frac{dI_2}{dt};$$

$$O = R_2I_2 + L_2\frac{dI_2}{dt} + M\frac{dI_1}{dt}.$$

These express the relation that the electromotive force in a circuit is equal to the electromotive force to overcome resistance, the counter electromotive force of self-induction and the back electromotive force of mutual induction. The coefficients of mutual induction, $M$, and primary and secondary self-induction, $L_1$ and $L_2$, are:

$$M = \frac{4\pi S_1S_2A\mu}{l};$$

$$L_1 = \frac{4\pi S_1^2A\mu}{l};$$

$$L_1 = \frac{4\pi S_2^2A\mu}{l}.$$

Here $S_1$, $S_2$ denote primary and secondary turns; $A$, $l$, and $\mu$ denote area, length, and permeability of the magnetic circuit. The ratio of transformation is equal to the ratio of the number of primary and secondary turns. It is by this

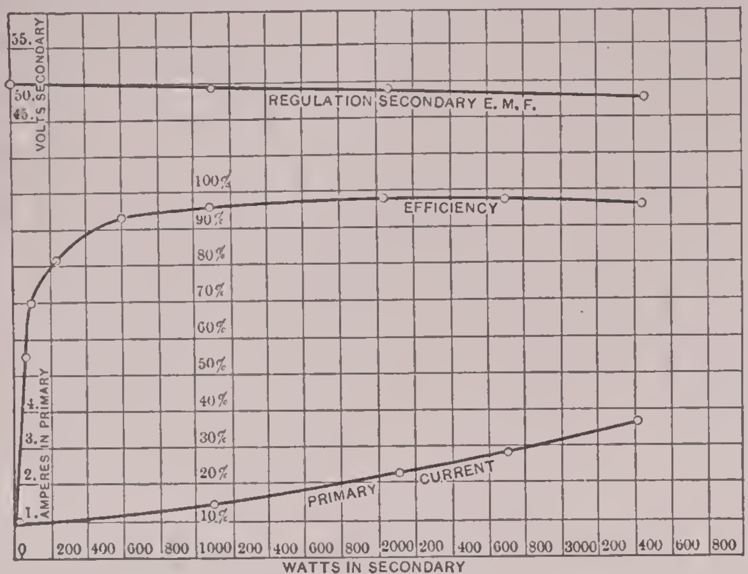

FIG. 10.—Efficiency and regulation curves.

ratio that the potential is transformed up or down—that is, the primary and secondary electromotive forces have the same ratio as the number of turns. Space will not here permit the development of analytical theory. The results of analysis may, however, be well shown by a diagram in which relative magnitudes and phase relations are shown graphically.

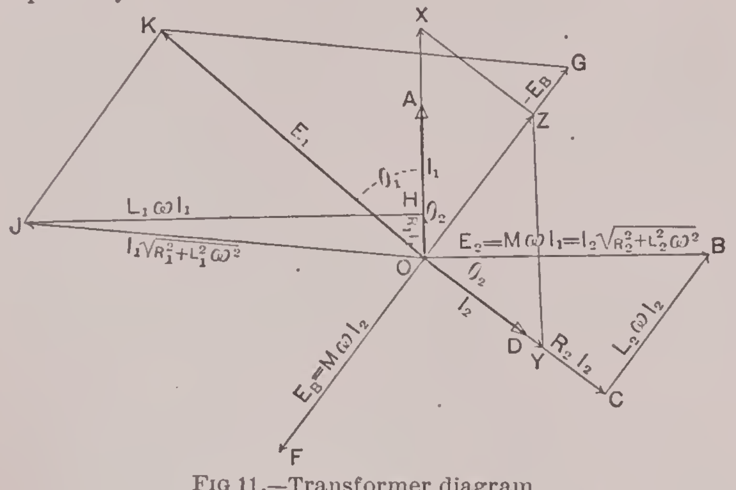

FIG 11.—Transformer diagram.

Such a transformer diagram is shown in Fig. 11 (Bedell and Crehore). Each line is drawn to represent the magnitude of some quantity. The diagram is supposed to revolve with uniform velocity in a counter-clockwise direction. The value of a quantity at any instant is found by projecting upon any fixed line of reference the line which represents it. The primary current is represented by $\overline{OA}$. Ninety degrees behind this is $\overline{OB}$, the electromotive force induced by the primary current in the secondary circuit, equal to $M\omega I_1$ (where $\omega = 2\pi n$, $n$ being the frequency or number of complete alternations per second). The secondary current $\overline{OD}$ lags by the angle $\theta_2$ due to the secondary self-induction. The electromotive forces in the secondary are $\overline{OB}$ induced by the primary current $\overline{CB}$ due to self-induction, and $\overline{OC}$ the resultant pressure at the terminals. The secondary current induces the back electromotive force, $\overline{OF}$, ninety degrees behind it in the primary. The primary electromotive force, $\overline{OK}$, is equal to the geometrical sum of three parts: $\overline{OG}$ to overcome the back electromotive force, $\overline{OF}$; $\overline{OH}$ to overcome resistance; and $\overline{HJ}$ to overcome the self-induction of the primary itself. Evidently the secondary current is about opposite in phase to the primary electromotive force. The magnitudes of the various quantities are indicated by the lines representing them. The angular positions of the lines represent the phase relations of the corresponding quantities. A transformer diagram of this sort can be constructed for a particular transformer under given conditions, and the complete action of the transformer is thus shown by purely graphical methods. FREDERICK BEDELL.

**Transfusion of Blood** [*transfusion* is from Lat. *transfu'sio*, deriv. of *transfun'dere*, *transfu'sum*, pour over; *trans*, across, over + *fun'dere*, pour]: a surgical operation in which blood from a strong and healthy person, or from one of the lower animals, is injected into the veins of a feeble or anæmic patient. It is especially employed after severe puerperal hæmorrhage, great care being taken to exclude bubbles of air or clots, either of which is likely to prove fatal. The blood, either defibrinated or not, is usually introduced by means of a suitable syringe. This operation, though long known and at present recognized as a legitimate one, is not as yet very common; but it may be considered as established that in well-selected cases, and when performed with proper skill, transfusion is an extremely useful and successful operation. The transfusion of warm saline solutions is almost if not equally useful and does not have the dangers of blood transfusion. Subcutaneous injection of saline solutions and rectal injections of water are scarcely less efficacious and prompt in action than transfusion in cases of hæmorrhage. Revised by W. PEPPER.

**Transit** [from Lat. *tran'situs*, a crossing, going over, deriv. of *transi're*, *tran'situm*, cross; *trans*, across, over + *ire*, go]: the passage of a planet over the disk of the sun, or, in a broader sense, the passage of any celestial body over an arbitrary point of reference.

*The transit instrument* is an astronomical instrument used to determine the time of a star's passage over a fixed great circle of the heavens, usually the meridian or the prime vertical. In the latter case the instrument is called a prime vertical transit. Roemer seems to have first used a transit instrument for the determination of right ascensions in 1675, and fourteen years after that he used it in the meridian for the determination of local time. A very excellent form of the most modern construction is shown in Fig. 1,

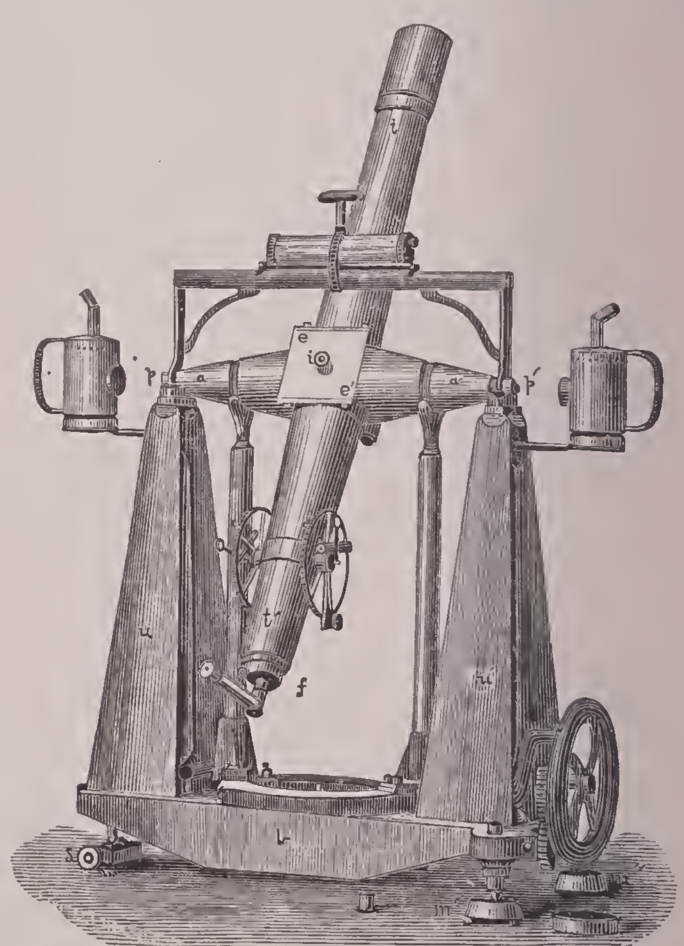

FIG. 1.

where $t\,t'$ represents a telescope of 3 inches aperture and 40 inches focus, which rotates around a horizontal axis $a\,a'$, and is composed of the frusta of two similar cones firmly secured to the hollow brass cube, $e\,e'$, at their larger bases. The axis, $a\,a'$, is also composed of the frusta of two similar cones terminating in two faces of the cube $e\,e'$ at right angles to the other two faces. This axis terminates in two pivots, $p\,p'$, $1\frac{1}{4}$ inches in diameter, made of cast steel, which rest upon V-shaped bearings firmly supported by the cast-iron piers, $u\,u'$, which are firmly bolted to a base plate at $b$, which in turn rests upon three points, $m\,m'\,m''$, of which the point, $m$, is capable of a slight lateral motion by means of the screw, $s$. The telescope is made conical in order to give it the greatest rigidity of form; it is of brass, and may be elevated to any desired angle by turning it on its axis.

The light from a lamp enters through an aperture in one end of the axis $p'$ and strikes a diagonal reflector, the tint of the reflected light of which is controlled by the milled head, $i$, operating colored glasses, and the reflector is so inclined as to reflect the light downward into the field of view; this is necessary to render visible a reticule of fine lines composed of spider's web, placed in the focus of the object-glass at $f$. At night these lines are quite invisible without artificial illumination. The simplest form of this reticule of lines is shown in Fig. 2, where $s$ is a star entering the field between two horizontal lines. The vertical line $c$ is supposed to coincide with the plane in which the instrument rotates: $a$ $b$ $d$ $e$ are four additional lines symmetrically placed, and the time at which the star $s$ is bisected by each of them, as at $s'$, is noted. The mean of these observed times is more nearly correct than the time obtained from the transit across a single wire, $c$, would be. Five or seven wires are usually employed when the times are noted by eye and ear; this number is increased when the times are noted with a chronograph.

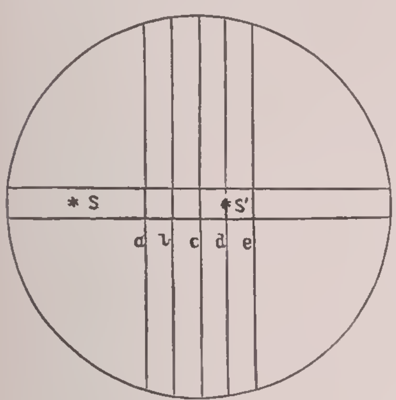

FIG. 2.

To determine the local time, the instrument is set up in the meridian and accurately leveled. The error of the timepiece is found by noting the difference between the observed and true times of transit of stars across the meridian. It is assumed that the horizontal axis is approximately level, and that the reticule has been so adjusted as to make the telescope axis pass through the middle wire, and that the system of wires is perpendicular to the horizon.

*Transit Circle.*—The mural circle was formerly a companion to the transit instrument in a fixed observatory; but by attaching a large circle to the horizontal axis of the transit instrument the results formerly obtained by two instruments and two observers are now more accurately obtained by this single instrument, called the transit or meridian circle; the declination of a star being obtained from the circle reading, while its right ascension is obtained at the same time by observing its transit.

Fig. 3 shows the transit circle of the Harvard College

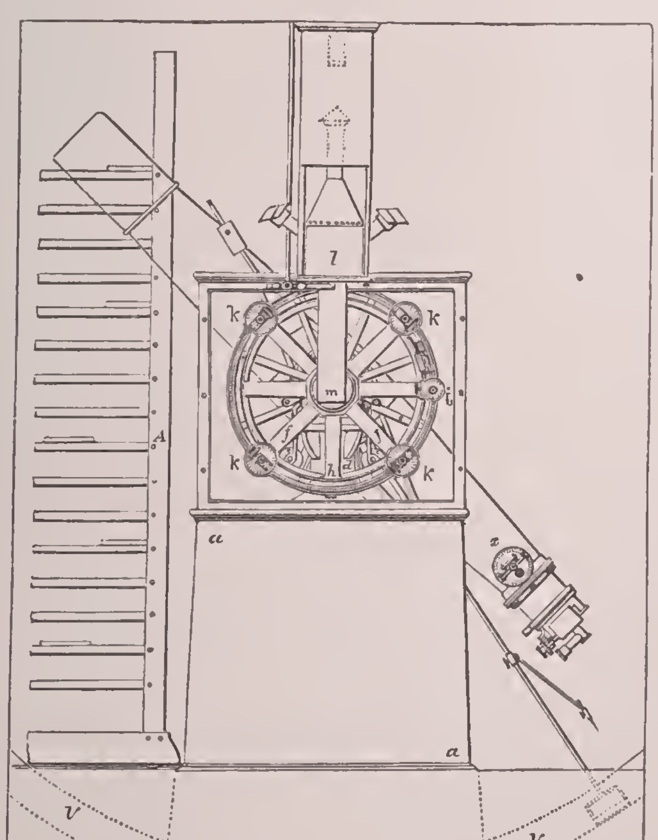

FIG. 3.

Observatory, built in 1870 by Troughton and Simms. The telescope has an aperture of 8¼ inches and a focal length of 9 ft. 4 in. The telescope pivots rest on iron castings imbedded in the solid marble block $a$ $a$. Two circles 3 feet in diameter, graduated on silver to five minutes of arc, are attached to the axis, and move with the telescope. Four microscopes, $k$ $k$ $k$ $k$, provided with micrometers, read to tenths of a second of arc the distance of the last five-minute division on the circle beyond which the telescope has been moved to bring a star into the position $s$ of Fig. 4 from the center of the microscopes. The microscopes are secured to a circular frame, which in turn is attached to the iron casting which supports the bearings for the pivots. A similar arrangement exists with regard to the circle on the other side of the telescope from the one shown in the drawing. Counterpoises at $e$ $e$, working upon the levers, $f$ $f$, diminish the amount of the friction of the pivots against their bearings. Glass cases cover both the circles. For the purpose of easily finding an object, the small finding-circles at $x$ were provided, but in practice it is found more convenient to use a long arm attached to the axis, which describes the arc indicated in the lower part of the figure $v$. A lantern at $l$ throws its light by a system of reflectors upon the circle. The framework at $A$ is used for putting the striding-level in position. The instrument differs from the usual form of transit circles in supporting the circles above the piers, in its system of counterpoises, and in the placing of the circles so near to the floor that they may be read without the inconvenience of using steps. These improvements are due to the late Prof. Joseph Winlock, as also the using of collimators having apertures of the same diameter as the observing telescope.

Fig. 4 represents the reticule of this instrument. It consists of a system of twenty-five vertical lines, fifteen of which are double and arranged as shown in the figure. A

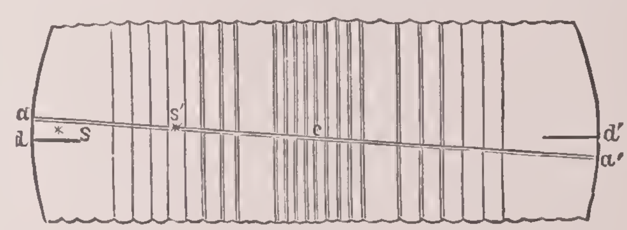

FIG. 4.

diagonal double line, $a$ $a'$, makes an angle of 85° with the vertical system. Fractional parts of a horizontal line, $d$ $d'$, extend far enough into the field to enable the observer to bring the star $s$ between the lines $a$ $a'$ and $d$ $d'$ when the star enters the field. Since $a$ $a'$ would intersect $d$ $d'$ at the center $c$, the star $s$ transits the line $a$ $a'$ at some point $s'$ between $a$ and $c$, and by noting the time when the star is at $s'$, it becomes a matter of simple trigonometry to compute the vertical distance of $s'$ from the line $d$ $d'$, and consequently from the assumed center of the field. The reading of the large graduated circle gives us the observed zenith distance of this central line $d$ $d'$ in space, and we are thus enabled, without any micrometrical measurements, to obtain the exact observed attitude by adding to the reading of the circle the computed vertical distance $a$ $s'$ with its proper sign. For a full discussion of the transit instrument, see W. Chauvenet, *Manual of Spherical and Practical Astronomy*; *United States Coast Survey Reports* (1866, appendix No. 9; 1868, appendix No. 10), by Prof. C. A. Schott. For discussions of transit circle, see W. Chauvenet (as above); *Washington Astronomical Observations for 1865.*

**Transits of Venus and Mercury:** The term "transit" means the apparent passage of a planet as a dark object across the disk of the sun. This can take place only with the two planets Mercury and Venus, whose orbits lie within that of the earth. Transits of Mercury occur at intervals of a few years; never more than thirteen, nor less than three. They have no special astronomical significance, but owing to their interest they are industriously observed when they do occur. The times of occurrence for some time to come are given in the article MERCURY. Transits of Venus are among the rarest phenomena of astronomy, as only two occur in a period of more than a century. They were formerly believed to afford the most accurate method of determining the solar parallax. (See SOLAR PARALLAX.) For this reason the whole astronomical world devoted great attention to the observation of those which occurred in 1761, 1769, 1874, and 1882, and the leading nations sent expeditions to distant points of the earth's surface to make the necessary observations. On the whole, however, they have been a comparative failure, so far as the determination of the sun's parallax is concerned. The last transit occurred in 1882; no other will be seen until the year 2004. Further information respecting them is contained in the article VENUS.

**Translation, Motion of**: See MOTION.

**Transleithania**, trăns-lī-tā'ni-ăā: the common name for that part of the Austrian-Hungarian monarchy which lies to the E. of the river Leitha, an affluent of the Danube. It comprises Hungary proper, Transylvania, Croatia, and Slavonia, or the Hungarian crown-lands. It has never become generally used, and corresponds closely to the present kingdom of Hungary as distinguished from Austria proper.

**Transmigra'tion** [from Lat. *transmigra'tio*, deriv. of *transmigra're*, transmigrate; *trans*, over, across + *migra're*, remove, migrate]: the doctrine of the repeated existence of the soul in different forms of matter, its form in each successive existence being determined by its merits and demerits in the preceding ones. Buddha, replacing the idea of soul with the wholly different idea of KARMA (*q. v.*), denied the entire theory of transmigration. It has, however, extensive sway among the ignorant masses of his followers, in spite of his negative teaching. The most striking fact in connection with this doctrine is its wide prevalence. The ancient civilization of Egypt seems largely to have grown out of this faith. The swarming millions of India also, through the chief periods of their history, have, under its spell, suffered their lives, wrought their great works of government, architecture, philosophy, and poetry, meditated, aspired, and exhaled their souls. Ruder forms of it are reported among innumerable barbaric tribes. It played an important part in the speculations of the early Fathers of the Christian Church, and has often cropped out in the works of later theologians. Men of the profoundest metaphysical genius, like Scotus Erigena and Leibnitz, have affirmed it, and sought to give it a logical or scientific basis. And even amidst the predominance of skeptical and materialistic influences in Europe and America at the present time, there are many individuals with independent minds who earnestly believe the dogma, for to a large class of minds the doctrine has transcendant attraction as well as plausibility.

*An Oriental Doctrine.*—Another striking fact connected with this subject is that it seems to be an ineradicable growth of the Oriental world, but appears in the Western world rather as an exotic form of thought. The pantheistic tendency which possessed and overwhelmed the Brahmanic mind, shaping and tingeing all its views, opened the whole range of sentient existences to an indiscriminate sympathy, and made the idea of transmigration natural, and more pleasing than repugnant. Furthermore, the Brahmanic sages are a distinct class of men whose lives are absorbed in introspective reveries calculated to stimulate the imagination and arouse to keen consciousness all the latent possibilities of human experience, thus furnishing the most favorable conditions for such a belief as that of transmigration. Accordingly, the doctrine has held the mind, sentiment, and civilization of the East through every period of its history as with an irrevocable spell. On the contrary, in the Western world, the characteristic tendencies are all different. Pantheistic theories are rarely held, and the dreams and emotions which those theories are fitted to feed are foreign. An impassable barrier is imagined separating humanity from every other form of being. Speculative reason, imagination, and affection are chiefly employed in scientific studies and social pursuits, or personal schemes external rather than internal. This absorption in material affairs engenders in the spirit an arid atmosphere of doubt and denial, in which no efflorescence of poetic and mystic faiths can flourish. Thus while outward utilities abound, hard negations spread abroad, and living, personal apprehension of God, providence, and the immortality of the soul dies out either in open infidelity or in a mere verbal acceptance of the established creed of society.

*Its Grounds.*—The grounds on which this belief rests are chiefly the following: (1) The strong resemblances, both physical and psychical, connecting human beings with the whole family of lower creatures. They have all the senses in common with us, together with the rudiments of intelligence and will. They all seem created after one plan, as if their varieties were the modulations of a single type. We recognize kindred forms of experience and modes of expression in ourselves and in them. Now the man seems a travesty of the hog, the parrot, the ape, the hawk, or the shark; now they seem travesties of him. As we gaze at the ruminating ox, couched on the grass, notice the slow rhythm of his jaw and the dreaminess of his soft eyes, it is not difficult to fancy him some ancient Brahman transmigrated to this form, and patiently awaiting his release. Nor is it incongruous with our reason or moral feeling to suppose that the cruel monsters of humanity may in a succeeding birth find the fit penalty for their degradation and crime in the horrid life of a crocodile or a boa-constrictor. (2) The conception of a series of connected lives furnishes a plausible explanation for many mysteries in our present experience. Reference is made to all that class of phenomena covered by the Platonic doctrine of Reminiscence. Faces previously unseen, and localities unvisited, awaken in us a feeling of familiarity with them. Thoughts and emotions not hitherto entertained come to us as if we had welcomed and dismissed them a thousand times. Many an experience, apparently novel and untried, makes us start as though the chambers of the soul had often before echoed to its shadowy footsteps. The supposition of forgotten lives preceding the present, portions of which reverberate and gleam through the veils of thought and sense, seems to throw light on this department of experience. (3) Much more weighty, however, than the foregoing considerations is the philosophical argument drawn from the nature of the soul. Consciousness being in its very essence *the feeling of itself*, the conscious soul can never feel itself annihilated, even in thought. It only loses the knowledge of its being when it lapses into unconsciousness, as in sleep or trance. The soul may indeed *think* its own annihilation, but can not realize the thought in *feeling*, since the fainter emotional reflex upon the idea of its destruction is instantly contradicted and overborne by the more massive and vivid sense of its persistent being in immediate consciousness. This incessant self-assertion of consciousness at once suggests the idea of its being independent of the changing body in which it is shrined. Then the conception naturally follows that the soul, as it has once appeared in human form, may reappear indefinitely in any of the higher or lower forms which compose the hierarchy of the universe. The eternity of the soul, past and future, once accepted by the mind, leads directly to the construction of the whole scheme of the metempsychosis—an everlasting succession of births and deaths, disembodiments and re-embodiments, with their laws of personality and fortunes of time and space weaving the boundless web of destiny and playing the endless drama of providence. (4) But the strongest support of the theory of transmigration is the happy solution it seems to give to the problem of the distressing inequality and injustice which appear so predominant in the experience of the world. To the superficial observer of human life, the whole scene of struggle, sin and sorrow, nobleness and joy, triumph and defeat, is a tangled maze of inconsistencies, a painful combination of discords. But if we believe that every soul, from that of the lowest insect to that of the highest archangel, composes an affiliated member of the infinite family of God, and is eternal in its conscious essence, perishable only as to its evanescent disguises of incarnation; that every act of every creature is followed by its legitimate reactions; that these actions and reactions constitute a law of retribution absolutely perfect; that these souls, with all their doings and sufferings, are interconnected with one another and with the whole, all whose relationships copenetrate and co-operate, with mutual influences whose reports are infallible, and with lines of sequence that never break—then the bewildering maze become a vindicated plan, the horrible discord a divine harmony. But the theory of the transmigration of souls remains, to the average modern mind of the Western world, a mere fancy, although it has a deep metaphysical basis, a strong poetic charm, and a high ethical and religious quality. See METEMPSYCHOSIS, PESSIMISM, and BRAHMANISM.

See Alger's *History of Doctrine of a Future Life*, part 5, ch. ii., for full treatment of the subject of metempsychosis; also Leibnitz, *Monadologie*; Hardy's *Manual of Buddhism*, ch. v.; Edward D. Walker, *Reincarnation: a Study of Forgotten Truth* (New York). WILLIAM R. ALGER.

**Trans-Mississippi Exposition**: See the Appendix.

**Transpiration**: the process of exhaling a gas or liquid, as watery vapor from the surface of leaves. The transpiration of gases and liquids is motion through capillary tubes under pressure. See GAS and PHYSIOLOGY, VEGETABLE.

**Transportation** [from Lat. *transporta'tio*, deriv. of *transporta're*, carry across, transport; *trans*, across, beyond + *porta're*, carry]: the act of conveying persons or goods and the like from one place to another. In connection with this subject we have to consider the history of the physical means employed—roadways and waterways, natural or artificial, sail and steam, wagon-road or railway—and the social and economic problems which arise out of the services rendered, including the question of the relation of the various transportation agencies to the government.

*Transportation by Water.*—For a long time in the world's history most of the transportation was by water. There was little internal commerce. Each village or manor lived chiefly within itself, and supplied its own rude wants. Most of the trade was in foreign products. The merchant vessels of the Phœnicians and other commercial nations many centuries before the Christian era, though rude in comparison with modern appliances, represented the highest mechanical and engineering art of the age, and the work done by these ships, both in discovery and in transportation, was of a remarkable character. On land there were no means of transportation to compare with them in efficiency. The earliest roads worthy of the name were built for purposes of war rather than of trade. As conquest preceded commerce, so the question of moving armies was in early days more important than the question of moving goods or travelers.

*By Roads.*—The first important system of roads was developed by Rome. In their first beginnings the Roman roads were military in their purpose and character. They were intended as means of holding the provinces in subjection, rather than as means of exchanging goods with them. But as the power of Rome became more securely established the warlike purpose partly gave place to the peaceful one, and during the days of the empire there was a system of roads through Europe better than existed for many centuries afterward. In fact, down to the present day, in certain parts of Europe the best roads are the remains of the old Roman system.

With the downfall of the empire and the establishment of the feudal system there was again a period of commercial isolation. Trade by sea began to revive as early as the eleventh century, but it was not until the fourteenth century that the efforts of merchants in the towns were sufficient to give security and importance to inland traffic, nor was it until the establishment of the French national power in the seventeenth century that any power was strong enough to resume the work of the Roman empire in road-building. It was Colbert, the great financial minister of Louis XIV., who conceived the idea of the French national system of roads and waterways, which his successors have continued to develop. There is a system of national highways, chiefly radiating from Paris, under the direct control of the department of roads and bridges. These are now supplemented by a system of departmental roads, bearing the same relation to each department or district that the national roads bear to France as a whole, while between them there are the local or communal roads, which are laid out and constructed in the same haphazard way as those in the U. S. The long lines of river in comparatively level country have enabled the French engineers to devise, at comparatively slight expense, an internal system of navigable water routes in connection with the roads, so that France is, on the whole, less dependent on her railways than is any other civilized country.

In England there was no such system of national or departmental roads. Down to the beginning of the eighteenth century the English road system was in the hands of local authorities, and, as is always the case under such conditions, it was imperfectly cared for. The establishment of national highways in England was due to private rather than to Government enterprise. Turnpikes—so called from the bar or pike which can be turned to bar the road at points for the collection of toll—were first established at the beginning of the eighteenth century. They were usually built by trusts; that is, by bodies of semi-public officials who were authorized to borrow money for the purpose of constructing the road, and charge tolls, which should not only pay interest on the money thus borrowed, but ultimately, if possible, extinguish the principal. The English canals were built by private companies. The first important one was constructed in 1760. The next forty years was a period of great activity in canal-building, the Duke of Bridgewater being the most active promoter of these enterprises.

The U. S. was much later in developing a road and canal system than England or France. This was due rather to the poverty of the country than to any lack of interest in the subject. The early roads were in the hands of local authorities—townships in New England, or counties elsewhere. In 1790 the first turnpike in the U. S. was built. The system developed first in Pennsylvania, but appears to have been carried further in New York. Some States gave subsidies to turnpikes, but on the whole they were built by private companies as a purely commercial enterprise. The one great public road of the U. S. was the national pike, or Cumberland Road, running from Washington by way of Wheeling, Columbus, and Vandalia, to the Mississippi river. It was built in sections, from 1808 to 1837. It was intended by its promoters as part of a large national system. Among the most prominent exponents of this idea were Gallatin in 1808, and Calhoun in 1818. Gallatin, as Secretary of the Treasury, urged the necessity of a comprehensive road system on economic grounds. Calhoun, as Secretary of War, argued in favor of the same proposal on military grounds also. Ultimately, however, the plan of national aid to roads was taken up—not by Democratic leaders like Gallatin and Calhoun, but by the Whig party. This party approved of internal highways on principle, as tending to bind the different parts of the country closer together, and to extend the influence of the central government. With the overwhelming victory of the Democratic party under the leadership of President Jackson the project of a national road system failed completely.

*By Canals.*—Canal-building in the U. S. was, for the most part, not in the hands either of private companies or of the national Government, but of the several States. By far the most important work of this kind was the Erie Canal, first projected in 1792, but actually built during the years 1817 to 1825. It proved so successful that it was enlarged in 1836, and for half a century, at least, was the most important internal transportation route in the U. S. The next best canal system was that of the State of Pennsylvania, which was useful and profitable until the development of railways, but afterward fell into comparative disuse. Some of the coal canals were also very successful, but the other canal routes were, as a rule, ill judged, if not ruinous. An important exception must of course be made in favor of those comparatively short ship-canals which virtually formed part either of the lake route or of the Mississippi system.

*By Railways and Steamships.*—The use of steam as a motive power revolutionized all transportion—inland and foreign alike. There were several reasons for this, of which the most obvious is not the most important. The obvious effect of the use of steam was quicker transportation. Its still more important effect was that its application to other forms of business created a greater amount of goods to transport.

When each village or each plantation lived within itself expensive roads were impossible, because the amount of traffic was too small to pay interest on a costly rail or water route, no matter how efficient it might be. But with the development of the factory system there came a chance for handling more traffic. The factories made goods on a large scale at very much lower prices than were admissible before. The difference between the old price and the new could be paid to any transportation agency which would lay down the goods in a market otherwise inaccessible. There thus grew up a demand for a means of placing factory products in distant towns and villages, and these in return were given the opportunity to send farm products to feed the larger towns in which the factories had collected. The amount of such traffic between town and country was now limited only by the question of price. Railways and steamships were developed as a means of doing an enormous business at low rates.

The two inventions were almost simultaneous, that of the steamship being slightly the earlier. The practical usefulness of this invention dates from the early years of the nineteenth century. As early as 1820 or 1830 it was extensively employed on inland waters and in the coasting trade. It was not until 1838 that a systematic effort was made to use it permanently on ocean routes. The first efforts of the British steamship lines, aided and backed by the Government, were connected with political and military considerations quite as much as with purely commercial ones. But by the year 1850 the commercial success of the new method was assured, and then there began the hard fight for supremacy between steam and sail. The owners of the sailing-vessels made determined efforts to hold their own by increase in size, by greater care both in construction and management, and, above all, by a study of the prevailing winds, due primarily to Lieut. Maury, which enabled sailing-vessels to reach their destination faster by somewhat circuitous routes than by the old direct ones. But, in spite of these, each new invention gave steam a new advantage. The substitution of iron for wood as a material in ship-building helped the steamer more than the sailing-vessel. The substitution of the screw for the side-wheel was an important step in economy of propulsion, especially in head winds and rough water. The introduction of compound engines, and afterward of the triple or quadruple expansion, marked a further step in the same direction. Even the increase in size of the vessels gave steamers a new advantage. It increased the consumption of fuel somewhat, but it increased the carrying capacity far more. With each year the percentage of the world's steam tonnage becomes larger, and its sailing tonnage relatively, if not absolutely, smaller. Since 1880, besides these general improvements in construction and economy, there has been a further tendency to systematize ocean traffic by the division of labor among different classes of boats. Formerly each boat was built for general purposes, and took all the traffic that it could get. To-day there are ocean passenger-steamers, built for high speed and on fine lines, and endeavoring to make their passages in the shortest possible time; freight-steamers, running on regular lines, but built with a view to economy in coal rather than economy in time, and attracting freight by their regularity and convenience rather than by their speed or their appointments; and, finally, ocean tramps, or still cheaper steamers, running like sailing-vessels, wherever they can get a cargo. In this competition the sailing-vessel has the advantage of cheapness in motive power, but the steamer can be so much more rapidly utilized that it often more than makes up for this disadvantage.

For history of railway development and of the various devices connected with it, see RAILWAYS. This article is concerned rather with the social and economic effects—with the relation between the progress of invention on the one hand, and the growth of business on the other. Of the kind of use which would be made of the railway none of the early inventors had any idea. When the first charters were granted in Great Britain or Germany it was assumed that the company would own the road, and that private individuals would furnish the vehicles if not the motive power. Railway charges under this view were to be like tolls on a canal or turnpike. Nor has the legislation of the present day everywhere outgrown this view. Equally erroneous was the old view of the kind of service which railways would probably render. It was supposed that they would carry passengers rather than freight. It was predicted in 1830 or 1840 that passengers would very soon be carried at 100 miles an hour. On the other hand it was not supposed that railways could carry freight so cheaply as they now do, least of all that they could do it in competition with water routes. Some early charters actually tried to prohibit such carriage of freight. In 1856 there was an agitation in New York State to prohibit the New York Central Railroad from carrying freight in competition with the Erie Canal. But each decade was marked by a lowering of rates and an increase in freight traffic which usually made the reduced charges profitable. This reduction, which was comparatively slow until 1870, was much more rapid after the introduction of steel rails in place of iron. It was not the direct saving in expense which produced economy. It was rather the capacity of doing more work. The use of steel rails instead of iron made it possible to carry larger train-loads. With the increase in train-loads, as with the increase in size of steamships, the direct expense of running a train was slightly increased, but the amount which such a train could carry increased enormously. In the year 1870 a freight-car weighed 10 tons and carried 10 tons. In the year 1890 a standard freight-car weighed from 12 to 13 tons and could carry 25 tons. Two-thirds of the total weight of the train is profitable under the new conditions instead of one-half. A similar change took place in the size of locomotives. The new locomotives cost perhaps one-fourth more than the old to run, but they do from two to three times the work. In order to utilize this increased capacity, both of the cars and of the traffic, a system of rates was made to develop traffic. It was seen that in certain lines of business little or no movement could be obtained at high rates, while a great deal of business could be had if the rates were made lower. This was the case with cheap articles like coal, stone, lumber, or even food products, especially if these articles were carried for long distances. Thus classification was introduced by which some goods paid more than others for the same weight, while the mileage system, which would make rates proportionate to the distance, was largely, if not wholly, abandoned. The effect of this change has been a reduction of rates at almost every point, combined with vastly increased efficiency of the railway system. It has also contributed to the further development of improvements in construction and economy. In the U. S., instead of cheap railways built to carry a small amount of traffic at two or three cents a ton per mile, there are being substituted more expensive roads carrying much larger traffic at one cent, half a cent, or, in certain exceptional cases, a quarter of a cent a ton per mile. Each increase of traffic makes it possible to introduce improvements in construction. Each improvement in construction renders it profitable to do an increased business at lower rates, and each lowering of rates enables the shippers to increase the volume of traffic furnished.

Yet all this reduction increases rather than diminishes the possibility of extortion on the part of the railway managers (see INTERSTATE COMMERCE), and renders the question of the organization of transportation service and its relation to the Government even more important.

*Service rendered by Transportation Agencies.*—This may be divided into two main heads: first, the transmission of intelligence; second, the transportation of persons and property. The former work has been kept in large measure in the hands of the government. There are obvious reasons for this. As a mere matter of military strength the government must have under its own control the means of transmitting intelligence as quickly as private individuals, if not more quickly. The establishment of political power of any kind has been usually followed by an assumption of the postal service. It was so with the Hanseatic League of free towns in the Middle Ages. It was so with the renewed national life of France in the seventeenth century, just described. In England for a time the postal service was left to some extent in private hands, but the results of this were not satisfactory either to the Government or to the public. It was made a Government monopoly by the legislation of 1649 and 1651, although it continued to be farmed out to some extent until the next century. The usefulness of the British post-office dates from the year 1784, the establishment of low postal rates from 1840. (See POSTAL SERVICE.) The U. S. postal service was a Government monopoly from the outset, and now there is scarcely a civilized country of which the same thing can not be said. The disadvantages in economy due to government administration are more than counterbalanced by the general public considerations already alluded to. The only questions at issue between the advocates and opponents of government activity are connected with the parcels post or express business and the telegraph. In Great Britain the telegraph was controlled by private companies until 1870, and the British parcels business is handled by the railways and private companies, and by the Government since 1883. But on the continent of Europe both of these matters are managed by the Government. In the U. S. the parcels business is done by private companies. The Government is willing to do a certain amount of such business, but under the conditions of Government efficiency it seems impossible for it to handle the great bulk of such traffic in competition with private companies. The rates would probably be higher, the responsibility would certainly be less. The only method of organizing a Government parcels post on a large scale would probably be to prohibit the express companies from doing business of that kind, and for such a measure the public is by no means ready. Neither the higher rates, the lessened responsibility, nor the extension of official patronage would be a desirable result. While the Government, in virtue of long-standing custom, can prevent private persons from carrying letters, it would find it impossible to prevent them from carrying parcels.

The question of the telegraph presents much greater room for doubt. In the first place there is great public dissatisfaction with existing conditions. The telegraph business of the U. S. is almost entirely in the hands of one company, and, rightly or wrongly, it is believed that the rates charged by this company are unnecessarily high. They are on an average higher than those of most countries of Europe, and in connection with this the amount of general use of the telegraph in the U. S. is less than in two or three other countries where the government manages the telegraph lines. Add to this that the Government telegraph in Great Britain has given great satisfaction, and there are strong reasons for the popular demand for the change. On the other hand, it is urged by the opponents of a government telegraph that the rates in the U. S. are not really higher than those of Europe, if we take distance into account, and that, though distance itself is not an important direct factor in telegraph rates, the sparseness of population which is connected with this fact of long distance is overwhelmingly important. They can also show that, in spite of the abuses charged against the Western Union Company, the capitalization of the telegraph lines of the U. S. per mile of line, per mile of wire, or per office is not high as compared with that of Great Britain; that the expenditures of the British Government on telegraph lines have been extravagant, and that the economy of operation of the British Government has been questionable; in short, that most of the economic objections against various forms of state activity may be urged in this case also.

*Railway Ownership.*—This question involves wider interests, and has given rise to more conflicting arguments, than that of the post-office or even the telegraph.

In the early stages of railway development governments were more concerned to encourage railways than to control them. Each nation saw how important it was to have railways. Few, even among the most far-sighted statesmen, perceived that the power connected with railway ownership might one day become dangerous to large public interests. All were anxious to have railways, and were ready to give such help as was necessary to that end. Sometimes the state built the roads, sometimes it gave money to private companies. Partial state ownership or an extensive subsidy system was the general rule. Great Britain was the only exception. There was so much capital in Great Britain seeking investment that no such encouragement was needed. In Ireland, where capital was scarcer and more timid, the British Government did not scruple to grant subsidies. In the U. S. the national Government from 1850 to 1857 gave large grants of land, and after a few years' interruption renewed the same policy on a still larger scale in 1862, also giving to two large railway systems, the Union and Central Pacific, a cash subsidy of $25,000 per mile. (See SUBSIDIES.) Equally extravagant cash payments were made by States and municipalities in the years preceding the crisis of 1873. There are no adequate data on the subject for the U. S. as a whole, but the records of so conservative a State as Massachusetts show that public assistance to the amount of something like $30,000,000 was given to the railways of that State, usually to the ones that did not pay, and sometimes to those that were not built, at least for many years after the payment of the subsidy. Much of the most burdensome part of the local debt of the U. S. is due to grants of this kind, whether in the form of subscriptions to capital stock or to bonds in aid of new roads. France went further than the U. S. The Government systematically defrayed about half of the original cost of the French railways. It laid out the road, did the grading, the tunneling, the bridge construction, and everything to the level of the line itself, leaving to the companies only the expense of track, buildings, and equipment. In addition to this the French Government granted to a few large companies a monopoly in their several districts, and this monopoly has proved so strong that no subsequent efforts have been able to break it.

In other countries of Europe the state actually built and operated the railroads to a greater or less extent. In Belgium this policy was pursued at the outset. The state built the best lines, leaving the private companies to occupy less advantageous fields of traffic. Somewhat later the states of South Germany pursued a policy like that of Belgium. Prussia at first did just tho converse. It allowed the best lines to be built by private companies, with more or less aid and encouragement from the state; it then built and operated on its own account, as a military or political necessity, those lines which private enterprise was unwilling to undertake. Austria vacillated between the German and the French policy, building some roads on Government account which it afterward sold to private companies below their true value. In Scandinavia and in Hungary the roads were generally owned and operated by the Government. In Russia, in Italy, in Switzerland, and in Spain private enterprise was the rule down to 1870. In one sense all the roads of continental Europe are government property because they will, by the terms of their charters, revert to the state about the middle of the twentieth century. Such is the theory, but it is not of much importance in practice.

After the year 1870 there was a strong movement among the nations in favor of increase of government control, if not actual ownership. This was due to several causes. In the first place the wars of 1859, 1866, and 1870 had awakened in Europe a feeling of national life and a desire to have a strong government, with widely extended activity. In the second place, certain abuses of railway power had developed themselves which led people to think that the government might do better. Every day also it became clearer that in the management of railway enterprises monopoly was the rule and combination the exception, and it was thought that the management of any such powerful monopoly should be in the hands of the government itself. In those countries like the U. S., where there were practically no government lines, the agitation in favor of national ownership was fruitless. There was some talk on the subject in connection with the Granger movement, but the only practical results of that movement lay in the direction of legislative control instead of actual ownership. (See INTERSTATE COMMERCE.) But in those countries where there was already a state railway system in existence the government, besides building new roads of its own, bought many of the old roads from private companies. This movement was first felt in Belgium, where the Government, in the years from 1870 to 1885, purchased most of the private lines and made close traffic arrangements with the roads, so that it now owns, in round numbers, three-quarters of the railways in the kingdom, and has considerable control over the policy of the remainder. The same movement was felt in Germany a little later. It seems to have been Bismarck's desire that the German empire, as such, should own and manage its railways. But this project, though urged more or less seriously from 1871 to 1877, met with opposition from the states of Southern Germany, which already controlled their railway systems and were jealous of encroachments by the imperial power. Defeated in his plan of organizing a German state railway system, Bismarck was forced to content himself with the extension of the Prussian state railways, and in this project he succeeded. In 1878 out of 11,000 miles of railway in Prussia, 6,000 were owned and managed by private companies, 2,000 owned by private companies but managed by the state, and only 3,000 miles owned by the state itself. In the years 1879 to 1884 the Government gradually acquired nearly all the railway lines previously managed by private companies. On May 1, 1894, out of 27,589 km., or 17,105 miles, of railway in Prussia only a few hundred miles were in private hands. There was little or no compulsion connected with the purchases. The prices paid were so high as to make it worth while for the stockholders to sell, the stockholders of the Berlin-Hamburg line obtaining Government securities which gave them a guaranteed income of over 16 per cent. on the par value of their shares. Austria followed the example of Prussia, but less completely, because the Austrian Government was not financially strong enough to conduct its operations on so rapid a scale. During this period Italy also moved in the direction of state railway management. Even in France there was a movement, under the leadership of Gambetta, to establish a strong national system of roads, partly as a means of military training for Government officials, partly as a check to the irresponsible activity of private lines. In those countries which had had few railways until 1870, most of the lines were owned or at least managed by the state from the very outset. Such has been the case in the extreme east of Europe, in many parts of South America, and, above all, in Australia. It has been to a considerable extent true of British India also.

About the year 1881 a counter-reaction against state ownership began to make itself felt in some quarters. This was noticeably the case in France, where, by a convention of 1883–84, the state system was confined to a relatively unimportant district in the southwest. The Government went so far as to abandon the idea of a line of its own to Paris, and in so doing it gave up all prospect of becoming a controlling power in the railway system of the republic. Still more important were the developments in Italy. In 1876 the triumph of state railway management there had seemed as fully assured as in Germany, and much more so than in Austria. But the financial burdens of the change were great, and the results of state management not wholly satisfactory. It was considered better to lease the Government roads to private companies for the time being, and to appoint a commission to consider what should be the permanent arrangement. This commission sat from 1878 to 1881, and its conclusions, based as they are on practical experience, form perhaps the strongest argument against government management of railways. The conclusions of the commission were: 1. That the state can not be expected to make lower rates than private companies. The theory that government railways can foster industrial development does not work in practice. The state is much more likely to tax industry than to foster it, and when anything of the sort is attempted, the state is more arbitrary than a private company and less subject to any outside control. 2. State management is, on the whole, more costly than private management. 3. The political dangers connected with state management are very great. So far from finding that the power of railway rings is checked by putting the roads into public hands, the commission believes that the power of such rings is increased. Politics corrupt the railways, and the railways corrupt politics. Rates are made to influence elections rather than to meet the necessities of traffic or of sound finance. On the basis of these conclusions the commission urged the Italian Government to give the railways into the hands of private companies for operation.

On the other hand, it should be said that the feeling in favor of state ownership in Germany and Austria shows no signs of abating; that Switzerland is gradually being drawn into a policy of nationalization of its railway lines; and that neither British India nor Australia shows any tendency in the direction of private ownership. In the U. S. the platforms of the Farmers' Alliance and the People's Party declare in favor of Government railway ownership, though it may be questioned how far those who have framed the platforms would be ready to meet the financial burdens involved in any such change.

It is extremely difficult to compare, with any degree of fairness, the results of the two systems of railway ownership, state and private. Such figures as can be given serve more than anything else to show the difficulties of the subject, and to indicate that the question is one whose solution depends largely upon national character.

The countries which have, on the whole, developed their railway systems most rapidly are Great Britain and the U. S. Care must be taken to avoid laying too much stress on this fact, which is quite as likely to be due to the exceptional wealth of these two countries as to any difference in system. If we compare Germany and France we find that Germany, with state-owned roads, has larger mileage and traffic than France, with subsidized roads. But the French roads are, as already stated, in the hands of a strong guaranteed monopoly. In general, it seems to be the rule that railway development is fastest under free competition, next fastest under government monopoly, and slowest under private monopoly. In the facilities furnished, the results of competition, though imperfect, show a still more marked superiority. The miles run by trains in the U. S. in the year 1891 amounted to over 830,000,000, or 13 miles for every inhabitant. In Great Britain the figures for the same period show an average of about 8 miles, in Germany barely 4 miles, and in France a little less than in Germany. In other words, the amount of railway service offered is vastly greater under competing private lines than under a monopoly, even though it be in the hands of the government. Equally marked is the difference in speed. Much the fastest trains are run in Great Britain and the U. S., a great many of them in the former country, a few of equal merit in the latter. Until recently France came next, though at a long interval, with Germany a bad fourth. Since the accession of William II. there have been efforts at increased speed, but the one fast train between Berlin and Hamburg, of which so much is said, does not surpass in speed the best English or American trains, and there is nothing else in Germany which even approaches them. With regard to rates, the matter is much more even. The average charges for freight and passengers on the railway systems of leading countries in 1887 were as follows:

| COUNTRY. | Per passenger per mile, cents. | Per ton per mile, cents. |
|---|---|---|
| United States | 2·16 | 0·94 |
| Great Britain | About 2 | Less than 2 |
| France | 1·39 | 1·77 |
| Prussia | 1·22 | 1·43 |
| Austria | 1·54 | 1·85 |
| Russia | 0·80 | 1·00 |
| India | 0·54 | 1·36 |

The question of high or low rates, as will be seen from this table, depends not so much upon the form of ownership as upon the character of the traffic. In a dense population and with small train service, like that of India, passenger rates will be relatively low. With a comparatively small population and high demand for train service, passenger rates will be relatively high. The U. S. pays more per passenger mile than any other country in the list, because a saving of time is of more importance to a large part of the people than a saving of money. If the people of the U. S. were willing to have the relatively small train service of continental Europe or of India, they could have the passenger rates of continental Europe or of India also. If a man is making only 20 cents a day, he can afford to wait the whole day to save 20 cents. If he is making $2 a day he can afford to pay $1 to have a train go at the time it suits him. This is in large measure the explanation of the differences in the table. On the other hand, the differences in freight rates are largely influenced by distance hauled and by character of the traffic. In the U. S. or Russia, where there are long-distance shipments of grain or other similar commodities, the freight rates will be low, independently of railway management. In Great Britain, for the converse reason, freight rates must be high. Here again we may say with some qualification that the lowest rates will be found under competition, the next lowest under government monopoly, and the highest under private monopoly.

With regard to abuses of power in the matter of rates, there is little to be said in favor of one system against the other. Wherever there is competition there is a tendency to make special rates and give secret rebates to those who least need or least deserve it. This was one of the controlling facts which drove Belgium and Prussia to extend their government railway systems. The government could not control the acts of its own agents when those agents were working in competition with private lines. In the years preceding 1870 the very worst abuses of the rate-making power were found in the government lines. The question whether special rates can be avoided depends largely upon the extent to which a monopoly can be secured by the railway companies. Whether that monopoly is in the hands of the government or of private companies does not appear to make any very great difference. In either case the advantage, such as it is, is obtained at a sacrifice of development and cheapness. The leveling process results in leveling up, not in leveling down.

There is no greater mistake than to suppose that because government represents the people, therefore if government owns the roads the people will get lower rates. Most of the advocates of state railway ownership in the U. S. think that there is a large fund of profit which now is divided among stockholders, but which would go to the shippers if the nation owned the railroads. Now, in the first place, there is no such large fund of profit. Railways in the U. S. barely pay interest on their investment. Even if we make all allowance for water in stock, it is not likely that the net earnings of railways are equal to 4 per cent. of the capital actually invested. If it be said that there is a fund of legitimate profits of which the community might get the benefit under a state railway system, we may reply that there is reason to believe that those legitimate profits would be larger rather than smaller under national control. Whatever may be said about the unrighteous stock issues of roads in the U. S. it is certain that, quality for quality, the capitalization of these roads is less than that of any similar railway system in the world. The effective or net capitalization of the railways of the U. S. is about $50,000 a mile. Australia, with a vastly inferior system, has an average capitalization of about $40,000, as nearly as can be ascertained. Germany and Austria, with systems approximately equal to those of the U. S., superior in construction, but inferior in usefulness, are capitalized at nearly $100,000. Whatever water there may be in U. S. railway stocks, and whatever waste or abuse may have been incident to private management, it is certain that the capital accounts of foreign railways show an even greater waste, due to the inefficiency inseparable from government contracts.

The important thing for each country is to get the management of its transportation industries into the hands of the most far-sighted and competent men. If a country like Germany has such traditions that the best administrative talent is to be found in the Government service, it is probable that a state railway system, even with the inevitable evils of monopoly, is on the whole the best. If, on the other hand, the best administrative talent is found in private rather than public business, which is noticeably the case in the U. S., a change from private to public management would be attended with all the evils noted by the Italian commission, and would prove a burden instead of a relief to the business interests of the country. See COMMERCE, RAILWAYS, and STREET-RAILWAYS. A. T. HADLEY.

**Transportation**: as a punishment for crime, the transfer of a convict to a limited part of a kingdom, under pains and penalties for leaving the limits before the expiration of the term of transportation, and with or without other forms of punishment being added. This form of punishment was unknown at the common law in England, although in the case of a criminal's taking sanctuary and confessing his crime he was allowed to leave the kingdom, taking an oath of abjuration, which bound him never to return. Sanctuary and abjuration were abolished by the act of 1 James I., c. 25, and 20 James I., c. 18. The earliest case of transportation seems to have occurred in the reign of Charles II., when transportation was made a condition of pardons granted to persons convicted of capital crimes. This practice was subsequently greatly extended by legislation, and especially by the act of 1768; and transportation was first legalized as a direct punishment, by sentence of the court, by the act of 4 Geo. I., c. 11. During the eighteenth century and the early part of the nineteenth an immense number of acts were passed by which various terms of transportation, with alternative terms of imprisonment, and power, in some cases alternative and in others cumulative, to order whipping, were provided for the punishment of particular offenses. This legislation was utterly lacking in uniformity and was guided by no principle, and the statutes themselves contained so many capricious variations as to be incapable of any systematic classification on principles. A statute providing for punishment by transportation might and generally did contain the following provisions:

(1) A maximum term of transportation.
(2) Intermediate terms of transportation.
(3) A minimum term of transportation.
(4) A maximum alternative term of imprisonment with or without hard labor.
(5) A minimum alternative term of imprisonment.
(6) Power to inflict whipping, publicly or privately, and once or more than once.
(7) Power to inflict solitary confinement during a certain part of the term of imprisonment.

And these seven varieties of punishment were combined in all imaginable ways. In making these provisions a very wide, and yet capriciously restricted, discretion was left to the judge, and in the great majority of cases the judge could inflict as little punishment as he chose. In a few cases only was the punishment prescribed absolutely; in many cases a greater or less minimum of punishment was of necessity inflicted.

This condition of affairs continued until in 1846 an act (9 and 10 Vic., c. 24, § 1) was passed which provided that in all cases where any court was empowered to pass a sentence of more than seven years' transportation it should have power to pass instead sentence of transportation for any term not exceeding seven years, or sentence of imprisonment with or without hard labor for any term not exceeding two years.

The places to which criminals were sent from Great Britain under sentence of transportation were some of her colonies, most notably those in Australia, and the great extent to which this form of punishment was carried was made possible only by the fact of her possessing them. The criminal population in this manner became concentrated in small districts, and there they married, and by the natural increase and the numbers constantly added by newly transported convicts, this population was increasing with great rapidity, and extending throughout the colonies to which they had been transported. Meanwhile the colonies themselves were rapidly becoming more thickly settled by colonists of the better class, and their power and resources enormously developed, and they began to make objection to any further practice of transportation to their territory. Principally owing to these objections the punishment of transportation was gradually abolished between 1853 and 1864, and penal servitude or imprisonment and hard labor on public works was substituted for it. The punishment of penal servitude consists in keeping the offender in confinement, and compelling him to labor in the manner and under the discipline appointed by the acts relating to penal servitude. Imprisonment at hard labor consists of the detention of the offender in prison so that he shall be prevented from having any communication with other prisoners, and in forcing him to work at the treadwheel, shot-drill, crank, capstan, stone-breaking, or some other description of labor lawfully substituted therefor. The Penal Servitude Acts authorized the carrying out of the sentence in any part of the kingdom, and under these acts criminals were kept in confinement at Bermuda till 1862 and at Gibraltar till 1875. The difference between the two punishments is thus rather nominal than real, and the provisions of the act which regulated transportation are still in force as regards prisoners under sentence of penal servitude. Actual transportation, however, was practically discontinued.

The usual minimum term of transportation, when that punishment was commonly inflicted, was seven years, but imprisonment might in many cases be alternatively inflicted for three, four, or in some cases seven years. When penal servitude was substituted for transportation the punishment of imprisonment at hard labor had been made more severe and shorter than it had been, and in nearly every instance two years was the maximum term of imprisonment at hard labor permissible to be inflicted. At first the minimum term of penal servitude was three years; in 1864 it was was raised to five years, and in 1891 it was again reduced to three years.

The use of transportation has been practiced more or less by other nations than the British, but its use has never obtained among British colonies nor to anything like the extent to which it was carried in Great Britain, except in the case of Russia, which still uses the territory of Siberia as a place of transportation of criminals of certain classes. See SIBERIA.

See the articles on PUNISHMENT and PRISON DISCIPLINE, etc.; also Sir James Stephen's *History of the Criminal Law of England*, and *Digest of the Criminal Law*.
F. STURGES ALLEN.

**Transposition** [from Lat. *transpo'nere*, *transpo'situm*, set over, remove, transfer; *trans*, across, over + *po'nere*, put]: in music, the act of removing a composition into a key different from that in which it is written. By this is not meant a change of mode also. A piece of music written in a major key, for instance, can not be transposed into the corresponding minor (as from C major to C minor), unless its construction has been such as to make such a transfer possible. A composition in any major key may be transposed into any other major key; and the same rule applies to compositions in minor keys. Transposition is not simply the moving of all the notes of a piece one or more degrees higher or lower, for such a change would at once destroy or impair its distinctive character. If the scale consisted of a series of regular and equal degrees this might readily be done, and a composition would suffer no injury by being moved from any key to any other. But as the scale is not a regular but an irregular series of sounds, consisting of five whole tones and two semitones arranged in a fixed and invariable order, and as all music is now written on such a scale, and no other, it follows that we can not transfer a composition without injury into a new key until we have brought the scale of that key into conformity with that in which the piece is written. A composition in C major, for instance, if carried three degrees higher—i. e. into the scale of F—would be false on every fourth degree of that scale, because one of the semitones in the series differs in its position from the normal pattern in C. To rectify this we lower the fourth (or B) by placing at the clef a flat on that degree; and by thus changing every B into B♭ we correct the scale, and transposition from C to F requires nothing more than a change of the places of the notes. Again, if we would transpose from C to G, we shall find a defect of an opposite kind on the seventh degree of the G scale, which must be corrected by changing every F into F♯. On the same principle we proceed in transposition into any other key, correcting by sharps or flats the deviations of any desired key from the model scales of C major or A minor. See KEY.
Revised by DUDLEY BUCK.

**Transubstantia'tion** [from Late Lat. *transubstantia'tio*, deriv. of *transubstantia're*, transubstantiate; *trans*, over, across + *substan'tia*, substance]: a scholastic term signifying the change of the substance of the natural elements of bread and wine into the very body and blood of Christ in the Eucharist, while the visible form and the appearance of bread and wine remain. According to the teaching of the Roman Catholic Church, this miracle takes place in the Mass whenever the priest pronounces the words of institution: "This is my body," "This is my blood." The doctrine was more or less clearly suggested by several Greek and Latin fathers (under different terms, such as *transitio*, *transmutatio*); it was controverted in the Middle Ages by Bertram (Ratramnus) and Berengar, but defended by Paschasius Radbertus (831), Lanfranc, and the chief Schoolmen, confirmed by the Lateran Council (1215) and the Council of Trent (Oct. 11, 1551), and learnedly defended by Bellarmine, Bossuet, Möhler, Perrone, and Cardinal Wiseman (in a dissertation on John vi.). The Church teaches not only that Christ is present in the blessed Eucharist, but that he is present by transubstantiation. The very words of consecration, as given in the Gospels, seem to prove this doctrine. The teaching of the Church is conformable to the literal interpretation of these words. See Cardinal Wiseman's *Lectures on the Holy Eucharist*. Revised by J. J. KEANE.

**Transvaal Colony**: See SOUTH AFRICAN REPUBLIC.

**Transylva'nia** (Hung. *Erdély*; Germ. *Siebenbürgen*): the southeast part of the kingdom of Hungary. Area, 21,518 sq. miles. There are fifteen counties; pop. (1890) 2,247,049, of whom about 55 per cent. are Roumanian, 29 per cent. Magyars and Szeklers, 10 per cent. Germans, and nearly 50,000 gypsies. The country is hilly and mountainous, with a mean elevation of 1,444 feet, with the Carpathians on the E. and the bold Transylvanian Alps on the S. The drainage is into the Danube, chiefly westward by the Maros and Körös to the Theiss, but the Aluta and some lesser streams make the traverse of the Transylvanian Alps southward directly to the Danube. Of the soil, 37 per cent. is in forests, 23 in plowed land, and 17 in meadows and gardens. The chief crops are maize, wheat, oats, fruits, tobacco, flax, and hemp. Wine is made in large quantities, especially in the Maros basin. The climate is mild and agreeable in the lower lands. The horses number 188,000, and the breed is excellent. Cattle are reared in large numbers, and the breeding of sheep and swine is general. Mining has been a very important industry, and Transylvania used to be called the gold mine of Europe. Gold has been obtained from time immemorial, and is produced in considerable quantities from both mines and placers. Silver and iron are also mined. Manufactures and other industries are not well developed, and are declining because of the recent political and Slavic tendencies which are driving out the Germans. Trade is largely with Roumania, and is in the hands of Armenians and Greeks. About 12 per cent. of the population is Roman Catholic, 27 per cent. Greek Catholic, 32 per cent. Greek Oriental, 10 per cent. Lutheran, and 14 per cent. Calvinist. There is a university at Klausenburg, and there are many secondary schools.

Transylvania was a part of Dacia, acquired by Trajan and colonized with Dalmatians, Gauls, and people from Roman Asia Minor. When the Roman empire was in decay this region was especially exposed, and was occupied by race after race of the invaders—latest by the Magyars. In the twelfth century colonists were again introduced, this time from the basin of the Rhine (Teuton), and there called Saxon. The Saxons built the most of the existing cities. After the defeat of the Hungarians by the Turks at Mohacs in 1526 Transylvania was independent till 1690. After that it became a grand duchy and crown-land of Austria, and so remained till 1867, when it became, politically and administratively, an integral part of the kingdom of Hungary. See Gerard, *The Land beyond the Forest: Facts, Figures, and Fancies from Transylvania* (2 vols., 1888).

MARK W. HARRINGTON.

**Trap**, or **Trap-rock** [*trap*: Germ. *trapp*, from Swed. *trapp*, deriv. of *trappa*, a stair, stairs; so called from the stair-like arrangement often observable in these rocks]: a name indiscriminately applied to any dark-colored mass of igneous rock, regardless of its composition. On account of its lack of definiteness it is passing out of use as a geological and petrographical term. To a very great extent the name has been applied to basaltic masses. See BASALT, BUILDING-STONE, and ROCKS. J. P. I.

**Trapani**, traa'pāa-nee (anc. *Drepanum*): a town on a scythe-shaped peninsula of the extreme point of the west coast of Sicily; lat. 38° 3′ N., lon. 12° 30′ E. (see map of Italy, ref. 9-E). The churches, the municipal palace, the Giudecca, etc., are worthy of notice, and contain interesting artistic objects. The celebrated sanctuary of the Madonna of Trapani (finished 1332) is outside the town. The harbor is convenient for the coasting trade, and it has been made much more safe of access for foreign vessels by the erection of a mole and of lighthouses. About 3,000 vessels enter this port annually, the trade being chiefly in fish, coral, sponges, wine, oil, fruits, cotton, semolino, etc. Among other local industries are works in marble, alabaster, coral, and shell. The art of cutting cameos in shell is said to have been revived here. Here in 249 B. C. the Carthaginians defeated the Romans in a famous naval battle. Charles V. made this place a great military station for the defense of this coast against the Saracens, and it was at this time called *Invitissima*. Pop. of commune (1893) 47,000.

Revised by M. W. HARRINGTON.

**Trapezun'tios**, GEORGIOS: Italian humanist; b. in Candia, 1395. He fled before the Turkish invaders and reached Venice in 1430, and was employed by Francesco Barbaro as a copyist. He learned Latin under Guarino and Vittorino da Feltre, and acquired so great a proficiency in that language that he became a celebrated teacher of Latin literature and rhetoric. He taught in a number of Italian cities—Venice, Padua, Florence, and Rome. Befriended by Pope Nicholas V., he translated Eusebius, Cyril, the *Homilies* of Chrysostom, Plato's *Laws*, and Aristotle's *Zoölogy* and *Rhetoric*, and the *Almagest* of Ptolemæus, translations characterized by an incredible negligence, wanton omissions and changes *in majorem dei gloriam*. He was engaged in unseemly quarrels with most of the great humanists of the fifteenth century, and is withal one of the most typical, albeit disgusting, figures of the Renaissance. He died in abject poverty in Rome, Aug. 12, 1484. Cf. G. Voigt, *Wiederbelebung des klassischen Alterthums*, ii., pp. 138-144.

ALFRED GUDEMAN.

**Trappists**: a monastic order of the Roman Catholic Church deriving their name from La Trappe, an abbey of the Cistercian order, situated in the department of Orne, Normandy, and founded in the middle of the twelfth century. Here Armand Jean le Bouthillier de Rancé, who was consecrated abbot on July 13, 1664, introduced those severe reforms which made the Trappists one of the most austere orders of the Roman Catholic Church. He was at first opposed both by other Cistercian monasteries and by the monks themselves, whose practices had become so disorderly, by neglect of the ecclesiastical authorities and by other unfortunate circumstances, that they were generally called the "brigands of La Trappe." But after some years' persevering exertions he saw his rules adopted not only in La Trappe, but also in Tamié, a Cistercian monastery near Faverges, in Upper Savoy. Twelve hours of the day were given to religious exercises, and several hours to hard labor. Vegetables and water formed the fare; meat, wine, etc., were forbidden, and conversation between the monks themselves or with outsiders was avoided. The whole life tended to concentrate the mind on the sole idea of death. During the Revolution the order was suppressed in France, and it possessed at that time only two monasteries outside of France—one in Germany and one in Tuscany. In 1817, however, La Trappe was reopened, and in the meantime a Trappist colony had settled in 1803 at Pigeon Hill, near Conewago, Pa., whence they removed in 1805 to Kentucky, and finally, in 1813, to Tracadie in Nova Scotia. A second colony settled in 1848 at Gethsemane, Ky., and a third at New Melleray, near Dubuque, Ia. In France the order was dissolved in 1830, though the law of dissolution was not enforced; in Italy it was suppressed in 1870, and in Germany in 1874. See Marsollier and Maupeau, *Vie de l'Abbé de la Trappe*; Chateaubriand, *Vie de Rancé* (Paris, 1844); *Histoire religieuse et littéraire de l'Abbaye de la Trappe* (Paris, 1824); Gaillardin, *Les Trappistes ou l'Ordre de Citeaux au XIX*[e]. *Siècle, Histoire de la Trappe depuis sa Fondation*, etc. (Paris, 1844). Revised by J. J. KEANE.

**Trasime'nus, Lacus**: See PERUGIA, LAKE OF.

**Tras-os-Mon'tes** [Portug., liter., beyond-the-mountains]: province of Portugal; bounded N. and E. by Spain, S. by the river Douro, and W. by the province of Minho. Area, 4,307 sq. miles. Pop. about 400,000. It is mountainous, and of a rather rugged and wild character, but its valleys are very fertile, and produce, besides more wheat than is demanded for home consumption, excellent fruits, and the famous port wines, whose cultivation is confined to one district, called Alto Douro. The mineral wealth is great, but entirely unused; the mulberry is extensively grown, and silk-culture carried on with success.

**Travancore′**: a feudatory state of the British-Indian empire, on the southwestern end of the Indian peninsula; area, 6,730 sq. miles; pop. (1891) 2,557,736, chiefly Hindus, containing, however, the unusually large number of 500,000 native Christians, 300,000 of them Nestorians, as well as remnants of ancient Jewish colonies. A most turbulent sect are the Mophlas, Mohammedans who inhabit the N. of the state. Owing to a large outlay of state money on public irrigation, works, and roads, the condition of the laboring and agricultural classes has been improved; roads connect the harbors of Quilon and Trivandrum with the interior. The British-Indian penal code, altered to suit the characteristics of the people, has become part of the law of the state. The revenues are quite large and are economically used, the expenditures being less than the income. The palace expenditure is very moderate, the greater part of the revenues being devoted to public works, to religious institutions, to education, and to judicial and police establishments. The state pays to the Indian Government an annual subsidy of £80,000. Besides coffee and pepper, the production of which is on the increase, cardamoms, areca, and cocoanuts are among the chief products. The capital is Trivandrum, on the Malabar coast. Revised by M. W. HARRINGTON.

**Travelers, Legal Rights of**: Many of these are stated in the articles on CARRIERS, COMMON; INNKEEPER; HIGHWAYS; NEGLIGENCE, and ROAD, LAW OF THE. The liability of the state, or of its subdivisions, for damages caused to travelers by defective highways is purely statutory; no such liability existed at common law. As a rule, statutes of this character receive a close construction. (See INTERPRETATION.) It is generally held that they require only the traveled portion of country roads to be free from defects, not the entire surface of the street as in cities. Moreover, the liability does not extend to every one lawfully upon the highway, but to such persons only as are using it for the ordinary and proper purposes of travel. Accordingly, children who use the highway as a playground on their way home from school, or who are coasting for pleasure and not for transit; persons who are loafing by the way as distinguished from those who have stopped temporarily for a purpose incidental to their use of the road as travelers; those who are racing horses, and those who have not reached the traveled portion of the highway, have been judicially denied the statutory rights of travelers. *Brown* vs. *Skowhegan*, 82 Me. 273.

*Tickets.*—Travelers may be required by carriers to provide themselves with tickets before taking passage, and to produce them whenever required, as the only evidence receivable by the carrier's servants of the payment of fare. They may be limited in point of time to the day on which they are issued, or to a through trip, or to an excursion-train. (*Elmore* vs. *Sands*, 54 N. Y. 512.) At times, tickets are formal written contracts by whose terms the purchaser is bound, whether he knows them or not. (*Fonesca* vs. *Cunard Steamship Co.*, 153 Mass. 553.) In the case cited the ticket consisted of a sheet of paper of large quarto size, the face and back of which were covered with written and printed matter. Other tickets do not purport on their face to be formal contracts, although they may contain provisions which if known to both parties would make them such. In these cases the provisions are not binding on the traveler unless he knew of them, or unless the carrier did what was reasonably sufficient to give the purchaser notice of them. (*Richardson, etc., Co.* vs. *Rountree* [1894], Appeal Cases 217.) Still others appear to be mere checks or tokens. These do not constitute the contract between the traveler and the carrier. That consists of the offer made by the carrier and its acceptance by the traveler; and the offer may include the public advertisements of the carrier, the general customs of carriers, the usages of the particular carrier so far as notified to the traveler, the special representations by the carrier or his authorized agents, and the language of the ticket which has been brought properly to the traveler's attention. (*Logan* vs. *Railway*, 77 Mo. 663; *Frank* vs. *Ingalls*, 41 Ohio State 560.) The traveler may demand a seat before surrendering his ticket, and upon giving it up or tendering it may take a seat temporarily in a drawing-room car if none is provided for him in a common coach. (*Thorpe* vs. *N. Y. C. Ry.*, 76 N. Y. 402.) If a seat can not be provided for him, he may retain his ticket, refuse to pay his fare, leave the train, and sue for damages, or he may, and he usually does, accept such accommodations as are afforded him, and surrender his ticket. FRANCIS M. BURDICK.

**Traveling Sidewalk**: a pathway or platform, with or without seats and covering, moving in a continuous manner with a uniform speed and utilized as a means of transportation. The idea is not a new one, even as at present developed, but was conceived about 1870. Such a device was suggested for use in the Paris Exposition of 1889, and has been the subject of numerous patents in the U. S. and in Europe, but it remained for a U. S. company to bring it first into practical use in 1892.

The essential features required in a sidewalk of this nature are, first, that it shall be continuous and in the form of a loop or belt railway, and, second, that one or more intermediate platforms or steps between the first platform and the fast-moving platform, on which the seats are usually furnished, shall be moved at such a low rate of speed as to enable the passenger to step readily from the first platform to the next and faster-moving platform and from that to the third and so on to the seated platform, the differences in speed between each two adjoining platforms or steps being the same. Experience has fixed this difference at from $2\frac{1}{2}$ to 3 miles an hour. The most simple form of such a sidewalk is, of course, one in which separate cars or trucks move on separate tracks, each having its own motive power and each moving at its own proper speed; but as the first platforms are merely steps, and as the difficulty of maintaining with different motive power the proper relative motions between the platforms or steps is very great, a simpler means is requisite. The system was not fully developed until electricity had made practical the economical, compact, and direct application of power by means of trolley wires and motors attached directly to the trucks, and mechanism had been devised for moving one or more step platforms by the same trucks that furnished the propelling power for the fast-moving platform.

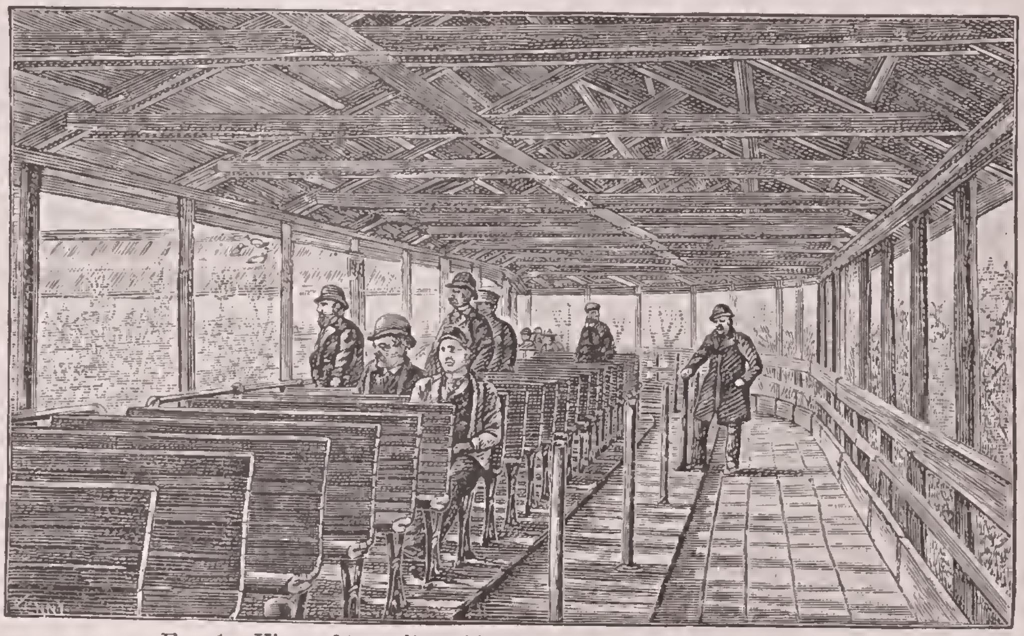

FIG. 1.—View of traveling sidewalk, Jackson Park, Chicago, 1893.

A third and perhaps in many respects the most important feature is a flexible rail to move on the tops of the peripheries of the wheels. These devices and improvements were first put to a practical use on an experimental road constructed under patents issued to Max E. Schmidt and J. L. Silsbee, in the Columbian Exposition-grounds in Chicago. The mechanical and practical success of this device led to its adoption and use on the Long Pier in 1893 and 1894, in the same grounds, where a road in the form of a loop 4,300 feet in length was erected. The radius of the curves on this road was 64 ft. 9 in. at the minimum and 80 feet at the maximum. The gauge was 45 inches and the rails were 30 lb. T-rails. There were 351 cars and the same number of platforms. Of these cars, 12 were motor-cars, carrying each two 15-horse-power motors. It will thus be seen that 360 horsepower was used in starting this road. In running it the average horse-power expended was 130. There were seats for 5,600 persons on the road, and over 1,000,000 people were carried without an accident during the four months that the road was in operation. The total weight of the movable platforms on this road was 450 tons, and the weight of 5,600 passengers would be, on the average, 392 tons, so that the power required as compared with the number of people carried is very small.

Fig. 2 illustrates the methods of construction of this road. The slow-moving platform which is attached to the

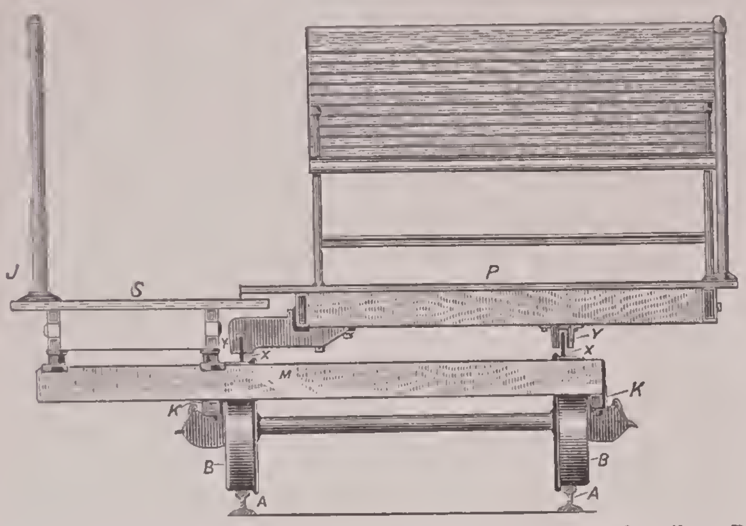

Fig. 2.—End view, showing both platforms: *A*, track-rails; *B*, wheels; *J*, hand-post; *K*, boxes; *M*, transverse frame of slow-moving platform; *P*, fast platform; *S*, slow platform; *X*, traveling flexible rail; *Y*, castings with slots for flexible rail.

trucks may be supposed to move at the rate of 3 miles an hour. The fast-moving platform which rests on the flexible steel rails, that rest in their turn on the peripheries of the wheel, is by the forward motion of the wheels of necessity carried forward twice as fast as the forward motion of the axles of the wheels themselves. If, therefore, the speed of 3 miles an hour be given to the slow platform, the fast platform will of necessity move at the rate of 6 miles an hour. The possible extension of this system is shown in Fig. 3; in

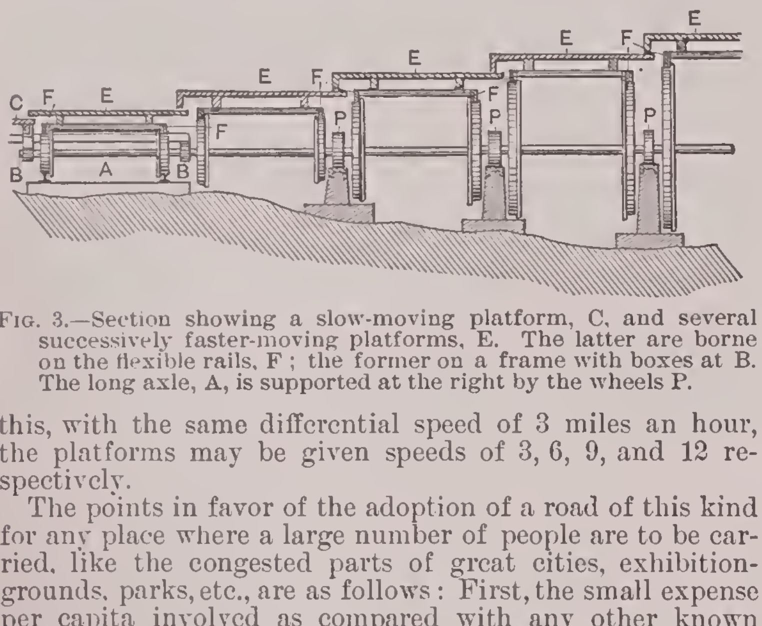

Fig. 3.—Section showing a slow-moving platform, C, and several successively faster-moving platforms, E. The latter are borne on the flexible rails, F; the former on a frame with boxes at B. The long axle, A, is supported at the right by the wheels P.

this, with the same differential speed of 3 miles an hour, the platforms may be given speeds of 3, 6, 9, and 12 respectively.

The points in favor of the adoption of a road of this kind for any place where a large number of people are to be carried, like the congested parts of great cities, exhibition-grounds, parks, etc., are as follows: First, the small expense per capita involved as compared with any other known means of transportation; second, the possibility that the slow speed of the trucks gives of adopting every precaution, like rubber tires, paper wheels, and other light constructions, so that all noise is prevented; third, the great flexibility of the road, which adapts itself to all curves, ascents, and descents; fourth, the facility of heating the train in consequence of the continuity of the system; and fifth, the continuity of the motion, which without great speed, but with great safety and without any waste of time for stops, permits a net running time from one point to another that compares favorably with (and in numbers carried vastly exceeds in its possibilities) any modern urban method of transportation.

In its application to city work it must of necessity be either elevated above the normal street level or sunk below the same, for, as will be evident, grade crossings are not admissible. This system has obtained the indorsement of nearly every engineer of note in the world, and will undoubtedly come into general use. Joseph L. Silsbee.

**Trav′erse City**: city (chartered in 1895); capital of Grand Traverse co., Mich.; on Grand Traverse Bay, and the Chi. and W. Mich., the Gr. Rap. and Ind., and the Manistee and N. E. railways; 70 miles N. E. of Manistee, and 145 miles N. of Grand Rapids (for location, see map of Michigan, ref. 4–H). It is the center of a rich agricultural and fruit-growing region, has a good harbor, and is connected by steamboats with the principal ports on Lake Michigan. The principal industries are connected with the lumber interest. There are 2 electric-light plants, Northern Michigan Asylum for the Insane, a national bank with capital of $50,000, a State bank with capital of $100,000, a library, and a daily, a monthly, and 3 weekly periodicals. Pop. (1880) 1,897; (1890) 4,833; (1900) 9,407.

Editor of "Traverse Bay Eagle."

**Traverse-table**: in surveying, a table from which the latitude and departure of any course can be found by inspection. It is a rough table of the sines and the cosines of arcs, computed to each quarter of a degree from 0° to 90°, and for every radius from 1 to 100. In the ordinary traverse-table the computation is carried out only to two places of decimals.

**Travnik′**: town; capital of the district of Travnik, Bosnia; on the Laskva (see map of Turkey, ref. 2–A). Ill built and unhealthful, its chief importance is due to its manufacture of sword-blades. Pop. (1885) 5,933. E. A. G.

**Trawling** [from O. Fr. *troller*, whence Eng. *troll*]: a method of fishing by means of a trawl, or small bag-shaped net, dragged along the bottom of the sea behind a boat. The name *trawling* is also given to a system of fishing for cod, halibut, and other large fish, by means of a great number of hooks set at intervals along a stout line which lies upon the sea-bottom. From time to time this trawl or ground-line is underrun by men in a boat, and the fish are removed. See Fisheries.

**Trayastrinsha**: See Devaloka.

**Treacle**: See Molasses.

**Treason** [M. Eng. *tresun*, *traisoun*, from O. Fr. *traïson* < Lat. *tradi′tio*, a giving up, betraying, deriv. of *tra′dere*, *tra′ditum*, give over, deliver, betray; *trans*, over + *da′re*, give]: a crime of indefinite and variable limits against the sovereignty of the people or the person of the supreme ruler. The Romans call this crime *perduellio*, and afterward *crimen majestatis*—that is, either hostility to one's own country, such as joining its enemies in war would imply, or afterward hostile attack on the emperor, or, as the latter term denoted, the act of invading the sovereignty of the people. In the expression *lædere majestatem*, to injure the sovereignty of the people or of the state, is found the origin of the term *lèse-majesté*, used by the French to denote treason. The English definition of treason or high treason has included, especially, compassing or imagining the death of the reigning sovereign or his (or her) eldest son and heir; violation of the queen or the king's eldest daughter, being unmarried, or his eldest son's wife; levying war against the sovereign within the realm by a subject; giving aid and comfort in or outside of the realm to the sovereign's enemies; counterfeiting the great or privy seal; importing "false money, counterfeit to the king's money," besides other offenses which at any time of excitement it seemed best to comprehend under the same term. The folly of such legislation led to the simple definition of the U. S. Constitution that "treason shall consist only in levying war against the U. S. or in adhering to their enemies, giving them aid and comfort." It is implied that the crime can be committed only by one owing allegiance to the U. S.

The States of the Union, to some extent at least, have admitted into their codes a crime of treason against themselves similar to that committed against the U. S. But as treason against a State must always be treason against the U. S., and as war against so limited a sovereignty as that of one of the States is hardly an act deserving the name of war, such treason is as little deserving of the name as it is likely to be frequent. If an invading force from a foreign country should land on the territory of a State and be joined by one of its citizens, he would be amenable to the laws of the U. S.; if it were joined by a man from one of the other States, the same would be true, but in this case the State could not try him for treason, as he is in no sense its subject. A general law against seditious or armed assemblages would answer all purposes equally well, and could not come into conflict by any possibility with the laws and judicial arrangements of the Union. On the other hand, if a man were acquitted of treason against a State, he would still be liable to indictment for treason against the U. S. for the same offense.

The law of treason with the growth of monarchy included various offenses against the person of the monarch or his rights or appurtenances, and with the growth of arbitrary power stretched its penalties over various crimes or even peccadilloes that lay outside of its original limits. See on this, and the restrictions which a free government admits into its definition, Lieber's *Civil Liberty*, ch. viii.

Revised by THEODORE S. WOOLSEY.

**Treasure-trove** [*treasure* + O. Fr. *trove* > Fr. *trouvé*, found]: in common law, accidentally found gold or silver coin, plate, or bullion which had been hidden in the earth or in some secret spot so long ago that its existence was forgotten and its owner unknown. Such property technically belonged to the crown, unless the owner were found. In the U. S. the term is not much used.

**Treasury of the United States**: a department of the executive Government of the U. S., having control over the collection, management, and disbursement of the public revenue, and presided over by a secretary, who is, next to the Secretary of State, the most important officer of the cabinet. The present office dates from the law of Sept. 2, 1789, drawn up with such precision and comprehensiveness by Alexander Hamilton, the first secretary, that few changes have since been made in its language. The subordinate officers consist of three assistant secretaries, a treasurer, three comptrollers, six auditors, a register, commissioners of customs and of internal revenue, a solicitor, a director of the mint, and a large number of employees. There are eighteen bureaus, among which are those of the mint, statistics, the coast survey, the life-saving service, and the lighthouse board. Most of the heads of bureaus, etc., are independent of their nominal head, and many of them are appointed by the President.

**Treat**, ROBERT: Governor of Connecticut; b. in England in 1622; emigrated to New England, with his father Richard, in company with Sir Richard Saltonstall; was one of the first settlers of Wethersfield, Conn.; settled in 1639 at Milford, where he was a deputy 1653–59, and an assistant 1659–64; was one of the founders of Newark, N. J., and a deputy to the first assembly 1667–72; returned to Milford 1672; became a major of Connecticut troops 1673; marched to Springfield (1675) to the relief of that place against the Indians; drove them from before the town, subsequently routed them at Hadley; participated in the great Indian battle at the Narragansett Fort on Dec. 19, 1675; was Lieutenant-Governor 1676–83, and 1698–1708, and Governor 1683–98 not including the two years under Andros. D. at Milford, July 12, 1710.—His son SAMUEL, b. at Milford in 1648, graduated at Harvard 1669, and was minister of Eastham on Cape Cod, Mass., from 1672 to his death Mar. 18, 1717. He acquired the language of the Nauset Indians, in which he published a "confession of faith," and was successful in the conversion of those Indians; preached the "election sermon" at Plymouth in 1678 and at Milford in 1713.

**Treaties** [M. Eng. *tretee*, from Fr. *traité* < Lat. *tractatus*, treatise, deriv. of *tractare*, discuss, treat]: compacts or agreements made by two or more nations or sovereigns. States, like individuals, may make contracts. These rest for their fulfillment upon the good faith of the contracting parties. State contracts may be made with private persons—a government bond, for instance—or with other states. These latter are called treaties. A treaty, then, is an engagement between states to do, or to refrain from doing, something which is lawful. Treaties may be considered under the following heads:

I. *The Conditions of a Treaty's Validity.*—1. A state must have capacity to contract. This is lacking to the individual States which compose the United States, being denied them by its Constitution, but may belong to the members of a more loosely organized confederation. It may be lacking, in whole or in part, in the case of a protected state, according to the terms of its dependence. It is lacking also in its fullest extent in the case of a state like Belgium which, under its status of neutrality, has no right of making war save in self-defense, and is thereby debarred from such treaties as alliances which imply the ability to wage war. Yet for most purposes the capacity of Belgium is complete. Such questions of capacity the international status, the history, and constitution of a state will decide.

2. The agents negotiating a treaty must be properly authorized, to make their agreement a valid one. This, again, is a constitutional question which each state must answer for itself. The duty may devolve upon the sovereign or executive head of a country, upon its minister of foreign affairs, or upon agents representing these. For a certain class of state contracts of a military nature, truces, cartels for the exchange of prisoners, and capitulations, for example, the high military and naval officers are competent, and such agreements do not need ratification. Under ancient usage even an unauthorized person might make a treaty, subject, however, to ratification. This was a *sponsio*. A noted case of this kind, referred to by the publicists, was when the consul Postumius (B. C. 321) saved his army by a peace with the Samnites which the Roman senate declared void. Upon this failure of the consideration, good faith demanded that the army should be surrendered to the Samnites, but this did not follow.

3. A third requisite to the validity of a treaty is *freedom of consent* on the part of the negotiators. Duress or intimidation, false representation, bribery, applied to the treaty agent and instrumental in deciding the terms of agreement, will invalidate it. But a mere mistake as to the value of a consideration will not matter. Thus before the thorough exploration of the Mississippi river, the right of free navigation from British territory upon its whole course, a valueless concession, was agreed upon by treaty in return for valuable fishery privileges. Of course force applied to the nation not the mere agent is valid, as when a cession of territory is the result of a war. Or a sovereign in captivity may be of sufficient value to his country to entitle the captor to something in exchange. Where the existence of a nation is at stake it is held that no agents are competent to transfer it by treaty, and yet the partition of Poland has been an accepted fact for a century.

4. Again, treaties are void which involve a violation of accepted principles of international law, which contain stipulations whose execution has become impossible, or which conflict with prior obligations to a third power. For instance, an agreement to engage in the slave-trade or to assert joint control over a portion of the high seas would be invalid.

II. *Forms of Treaties.*—Here the essential fact is the expression of an agreement, no particular form being indispensable. This might be verbal, but in point of fact is always written and signed. The language employed was anciently Latin, then French, as that became the language of diplomacy; but when two states using the same tongue negotiate naturally that will be used. A distinction of small importance is made between treaties and conventions, the former having generally a wider political scope, while the latter relate to some minor specific object. For instance, the Treaty of Washington of 1871, arranging for a settlement of the Alabama claims and the fishery question, was followed by the convention of 1873 settling the place where the sessions called for by its twelfth article should be held.

III. *Ratification of Treaties.*—The general rule may be laid down that ratification of a treaty is expected and necessary to make it valid. Under a Constitution like that of the U. S., where the power of making treaties belongs to the President, while the Senate must confirm or veto (by a two-thirds vote), knowledge of this fact is presumed and notice that ratification is necessary is not required. But also where negotiation and ratification lie in the same hands, the latter is essential and may be withheld if desired. Here we may touch on the question whether, in forms of government where the executive is authorized to conclude a treaty, he is bound by the action of his negotiator, provided the latter proceeded according to instructions. It was formerly held that, if the agent who made the treaty proceeded according to his *full power* but not according to secret instructions, the principal was bound by his action, since the full power, being known to the other party, was the motive in consideration of which he consented to treat. But at present it is held by the best authorities that the principal may withhold his ratification, in certain circumstances, even when the negotiator has followed his private instructions. The refusal is justified in cases like these (see Wheaton, iii., ch. ii., §§ 256–263): (1) "On the ground of the impossibility, physical or moral, of fulfilling the stipulations"; (2) "on the ground of mutual error of the parties respecting a matter of fact, which, if it had been known in its true circumstances, would have prevented the conclusion of the treaty"; (3) on the ground of "a change of circumstances on which the validity of the treaty is made to depend, either by an express stipulation or by the nature of the treaty itself." To which may be added the case where the treaty would involve injury to a third party; or if such representations have been made as to the powers of the negotiator as to make a failure of ratification an act of bad faith.

Ratification should cover the entire treaty. The U. S. Senate in at least two instances has been complained of for loose practice in this regard, in ratifying the main body of a treaty while amending or dropping a particular article, whereas the whole should have been sent back for revision.

Reference may be made here to another point under our usage. In the U. S. if the payment of a sum of money forms one of the conditions of a treaty a majority of the House of Representatives must concur. In this way it would be possible, in certain cases, to defeat the action of the Senate; but to do this, except in extreme cases, would oppose the spirit of the Constitution, which evidently intended to invest the President and Senate finally and absolutely with the treaty-making power. A similar conflict might take place when in Great Britain the king's ministers had made similar agreements with foreign powers; for, as money is voted for particular purposes and not in a lump, the Parliament might refuse to sanction a payment to which the treaty had pledged the country. A question has been discussed as to the extent of power lodged in the hands of the President and Senate by the U. S. Constitution, as it respects the cession by treaty of land belonging to a State. Very high authorities on constitutional law have taken ground which would sanction the idea that the treaty-making power is practically omnipotent. But surely no treaty could alter the relations of the general Government to the States; and as to cessions of land, the better opinion seems to be that while treaty can determine boundaries and so take away from a State what was *supposed* to be its territory, it can not dispose without its consent of territory admitted to belong to a State, unless in the extreme case of conquest, when treaty simply admits the fact of actual transfer of territory to the jurisdiction of another power, and declares this to be inevitable. After the exchange of ratifications a treaty dates back to the time of its signature, so that captures made between these two moments are invalid.

IV. *Interpretation of Treaties.*—Without going at length into this topic the following brief rules of interpretation are given as covering the main ground:

The ordinary meaning of words prevails, but technical language has its technical sense.

Words involving an absurdity should be otherwise construed or else be held void.

Where grants, privileges, or favors are inserted they should be strictly interpreted. For it was the duty of the party for whose benefit they were inserted to make them clear and unmistakable. Obscure expressions may be explained by clearer ones, or interpreted in accordance with the general spirit of the treaty.

Special stipulations are preferred to general ones. If an agreement is inconsistent with an earlier treaty between the same parties, the earlier is superseded by it; but if opposed to treaty provisions made by either with a third power, it is void.

V. *How Treaties may Differ.*—An examination of the collection of its treaties made by every state will show their immense range and variety. Some important ones are led up to by a preliminary treaty and qualified by a subsequent one. Some are common to two states only, while others, like the Act of the Congress of Vienna in 1815, or the Treaty of Paris in 1856, are signed by a number of powers, or receive their subsequent accession. Some make a single commercial or administrative arrangement, like the maintenance of consuls, of a postal service or of copyright privileges, while others cede territory or settle a question of national existence. Some are perpetual in nature or in terms, others are made for a certain number of years, or are terminable at will. Some are of a private nature, to arrange a marriage alliance for instance, while most are of a public character. They may reiterate and enforce a prior treaty or a national right or an accepted principle of international law. On the other hand, they may attempt to introduce some new usage, as was the case in the armed neutrality of the Baltic powers in 1780 and 1800, and in the Declaration of Paris of 1856. Of special classes of treaties the most common are alliances and treaties of guaranty.

*Alliances.*—An offensive alliance is an anomaly, except when made with reference to a particular war. A defensive alliance was made in 1778 between France and the American confederated colonies during the Revolution. A modern example is the Triple Alliance of Germany, Austria, and Italy. An alliance both offensive and defensive binds states together in the strongest way possible short of confederation. It is for the state whose aid is called for to determine whether the circumstances contemplated by the treaty (the *casus fœderis*) have arrived. If only a certain limited aid is promised in case of war, the enemy of either must choose whether in view of this to regard both states as belligerents or only the one.

*Treaties of Guaranty.*—The thing guaranteed may be a particular status, as of neutrality; or the integrity of another treaty or of specific rights under it; or the protection of certain property or territory, as when by treaty of 1778 with France the U. S. guaranteed the French possessions in North America. So likewise by treaty of 1846 with New Granada, the U. S. guaranteed the neutrality of the Isthmus of Panama, free transit across it, and the rights of sovereignty and property of New Granada in it. Under the latter the U. S. has intervened by force to protect the Panama railway. Both of these guarantees were reciprocal in terms.

Here, again, the guarantor must decide whether the occasion contemplated by the treaty has arrived. The guarantor of a money payment differs from a surety in that the latter is bound to make the payment in lieu of the principal, while the former merely uses his influence and offices to secure it. The guaranty of a political status may involve the duty of intervention.

VI. *Execution of a Treaty.*—With this object, hostages were formerly given, but not by present usage, except in military conventions, the last instance being in 1748 to secure the treaty of Aix-la-Chapelle. Solemn oaths to observe a treaty are also out of date. Pledges are still in use. Thus certain French fortresses were left in German hands after 1871, for several years, to secure the carrying out of the terms of the treaty of peace, an enormous money indemnity being one of them. Lastly may be mentioned the guaranty of a treaty by a third power.

VII. *Termination of Treaties.*—When a treaty is made to secure a definite object and that object is attained, the treaty has no longer any reason for existence. Many treaties are of this class, to settle a boundary, to arrange for the arbitration of a special difficulty, to satisfy certain claims. So also when a treaty is made for a specified term or is made for an indefinite term with mutual right of abrogation, or, as is the case with numerous treaties, is made for a term but with a provision for their continuance beyond their limit and until notice of termination is given. Where an evident impossibility of execution appears, there is at least a suspension of the treaty. States may also, unfortunately, terminate a treaty or portions of it by simple repudiation, coupled with a willingness to take the consequences, even war. Though a clear violation of international law, for the fact that a treaty is burdensome is no reason for its violation, such repudiation is practically possible. An excuse for such conduct will of course be given which may or may not be valid. Thus the U. S. formally declared that it should no longer consider the two treaties with France of 1778 as in force, on the ground that France had violated several of their provisions. A treaty is an entire contract, and if one article is violated, the injured party may consider the whole void or may, if it prefers, insist on the enforcement of the remaining articles.

*The Effect of War upon Treaties.*—That a large class of treaties are terminated by war is beyond question. Such are treaties of peace, of commerce, of alliance, of all in fact where friendship is an essential basis. On the other hand, many treaties are by nature or in terms perpetual, like the recognition of our independence within certain boundaries by Great Britain, or the Fishery Treaty of 1818 agreeing that the inhabitants of the U. S. "shall have forever . . . the liberty to take fish" on certain coasts. Moreover, all those treaties which contemplate a state of war must survive, for otherwise they would be useless. Such are treaties laying down the rules of blockade, contraband, convoy, visitation, capture, and so on. Upon a third class of treaties the effect of war must be held doubtful, the special circumstances of each case being considered.

Kent says that "as a general rule the obligations of treaties are dissipated by hostilities." Halleck says, *inter alia*, that "treaties of commerce and navigation are generally either suspended or extinguished by a war between the parties" to them. Of course they must be suspended at least, or war could not exist. Calvo says that "as for postal and custom-house arrangements, conventions relating to navigation and commerce, agreements relative to private interests, they are generally regarded as suspended until the cessation of hostilities." As commercial, postal, and similar conventions are often limited in time by their express terms, it seems safe to say that such arrangements, and others, like them, liable to be changed in these particulars in a few years of peace, ought to be regarded as broken off by war, which brings with it new feelings and interests. We add from Calvo that opinions agree "in favor of admitting the *definitive rupture* of conventional obligations entered into expressly in view of a state of peace, of such as have it for their special object to favor the relations of good harmony between nation and nation, such as treaties of friendship, of alliance, and other acts of the same nature, having a political character." A distinction was made by some of the older writers between the effects of a new war arising from a cause independent of a treaty, which they thought would not affect the provisions of a treaty, and a war growing out of the breach of a treaty by which its provisions would be annulled. Hence, in a given treaty, if one of the articles had been broken, and a war arose out of the breach, the rest of the treaty would be unaffected. It is easy to see that this distinction would complicate affairs between parties wishing to make peace. The practical rule suggested by these doubts is that, as silence may be misinterpreted, it is best always to make mention of the old treaties by way of renewing and confirming them. It is said by Dr. Twiss that Great Britain "in practice admits of no exception to the rule that all treaties, as such, are put an end to by a subsequent war between the contending parties." In conformity with this rule, or to prevent doubt, the Peace of Westphalia and the Treaty of Utrecht were renewed a number of times over when the parties to them after war made new treaties with one another. It may be added to what has been said, that private rights, resulting from rules of admitted justice, are not extinguished by a war; and so a debt due by one nation to another, where the same rules of right prevail as are acknowledged in municipal law, survives a war. An interesting discussion arose between Great Britain and the U. S. after the war of 1812 whether the colonies, after the recognition of their independence, retained the rights of fishery on British coasts, as a matter of course, which they had had while dependencies of Great Britain. John Quincy Adams and others contended that they retained these rights, and in the discussion the question of the effect of war on treaties came up. It seems that the British side of the question had the soundest arguments in its favor. The U. S. placed itself on the footing of an independent nation, and had no more rights than others; nay, even if it had been obliged to submit again to the British crown, this right of fishery might have been taken away.

VIII. *Treaties of Peace.*—The only rational object of war is to secure a state of justice involving reparation and security for the future. Treaties of peace, being appeals to force, do not always bring the adversaries to just terms, but, whatever their result, they are the most important acts of treaty-making powers; they often form epochs in national or in continental history. To name only one or two: the Peace of Westphalia, those of Nymwegen, Ryswick, and Utrecht-Baden, the treaties of Paris and of Hubertsburg in 1763, the Peace of Paris and that of Versailles in 1783, the two treaties of Paris in 1814 and 1815 respectively, the Peace of Zurich in 1859 and of Prague in 1866, and the Peace of Paris in 1856 (on account especially of its international character), indicate memorable changes of relative strength, or mark a new policy, or bring in a new dynasty, or are in some way the eras of some kind of progress. They are the hands of a clock, but the war was the moving force.

Treaties of peace are subject to the same rules of interpretation with others made by the constitutional power in the state. Only two additional points remain to be considered: (*a*) When do treaties go into effect? They bind the parties, as we have seen, when they are signed or when they are ratified. They bind individuals when they receive news that such treaties have been made. In the interval between ratification and knowledge of the peace by military officers or by cruisers, injuries must be made good by the country to which the party committing the injury belongs. Captures made after a peace, but without knowledge of it, have been held to subject the capturing officer to civil damages, for which he would have a right to demand compensation from his government. Captures, again, made before the time for the termination of hostilities, but with knowledge that peace has been concluded, are held to be invalid and subject to restoration. (*b*) The effect of peace is to put an end not only to a war, but also to all complaints relating to the subject for which war was undertaken. It is an oblivion or amnesty of all past difficulties. A new war can be undertaken for similar causes of complaint, but not for the same. They are forgotten and forgiven, whether mentioned in the treaty or passed over in silence. In regard to the state in which the war leaves the parties, if the treaty makes no mention of this point, the principle of *uti possidetis* is admitted. Territory stays in the actual occupant's hands unless passed over by express agreement, and a strong place must be restored without injury to its works. When a part of a country is yielded up at peace to the enemy, the former sovereign is neither bound to make compensation to those who suffer by the change of jurisdiction, nor to secure the new sovereign against resistance from the inhabitants to his authority. All he does is to renounce his own sovereignty and jurisdiction. The cession of Formosa by China to Japan is an instance.

The value of a study of treaties can hardly be overestimated. Quite outside of their statement of the actual relations existing between states, they show the abolition of old usages, the introduction of new ones, and foreshadow the better principles of the future. They mark the growth of international law, while binding only their principals. They furnish an important object lesson to outsiders. Founded upon a mutual sense of moral obligation, they furnish a stable basis upon which the law governing the relations of states is erected, so that the collection of its treaties which every nation will make is the fundamental text-book of principle and of illustration for the international lawyer.

Revised by T. S. Woolsey.

### Notable Treaties.

The following summary of the chief international agreements made between the leading nations is limited to the mention of only the more famous treaties since the year 843, which is taken as the starting-point, because the contract of Verdun, formed in that year, may be regarded as the basis of the international relations of modern Europe.

843. *Contract of Verdun*: the treaty that concluded the war between Lothar, Louis the German, and Charles the Bald over their respective shares of the imperial dominions on the death of their father, Louis the Pious. Lothar claimed the whole inheritance, but was defeated at Fontenay, and though he retained the title of emperor was obliged to content himself with Italy and a narrow strip of land between the dominions of his brothers, extending to the North Sea. This land was afterward called Lotharingia or Lorraine. Charles the Bald governed the western portion of the empire of Charlemagne, comprising chiefly Gallic-Roman inhabitants and corresponding roughly to the limits of modern France, while Louis the German held the eastern portion, peopled by German-speaking inhabitants. In this breaking up of the restored Roman empire the modern nations of France and Germany have their origin. See map of Europe under the Carlovingians in article Europe.

911. *Treaty of St.-Clair-sur-Epte*: concluded the war between the invading Norsemen under Rollo or Rolf and the French king Charles the Simple. The latter's daughter was given in marriage to Rollo, who agreed to become a Christian, and was invested with a part of Neustria, which was afterward known as Normandy.

1122. *Concordat of Worms*: an agreement between the emperor and the pope, closing the long strife known as the war of investitures. Neither obtained by it all that he had been striving for. The emperor renounced his right to confer the ring and crozier as symbols of ecclesiastical office, but retained the right of granting church and other property by the symbol of temporal authority. He also retained the right to be present in person or by proxy at ecclesiastical elections, provided that he abstained from bribery or compulsion. Though a compromise, it was in effect a victory for the Church, which obtained much of what Gregory VII. had striven for and Henry IV. had opposed.

1183. *Treaty of Constance*: between the Emperor Frederick Barbarossa and the Lombard cities. In the peace of Venice (1177), formed in the year after the battle of Legnano, he had acknowledged the independence of the cities and submitted to the pope. In the definitive treaty of Constance the cities recognized his overlordship, but they secured local self-government, together with the right to fortify themselves and levy armies. With this peace a new power appears in the political system of Europe, that of the free cities, and the attempt to re-establish the ancient despotism of the Roman empire failed.

1360. *Peace of Bretigny*: a treaty that interrupted the Hundred Years' war between France and England. Edward III. renounced his claims to Normandy, Maine, Anjou, etc., and to the French crown, but his sovereignty over the south and west of France and over a part of Northern Picardy was recognized.

1397. *Union of Calmar*: the treaty by which the northern powers, Denmark, Sweden, and Norway, were united under the rule of Queen Margaret of Denmark. Its object was forever to put an end to wars and dissensions between the three northern states, and it was enacted that they should henceforth be ruled over by one sovereign, who was to govern with due regard to the laws and customs of each. If the reigning king or queen died without children a joint sovereign should be elected by the senators and deputies of the three realms. National jealousies, however, asserted themselves, and Sweden, who had long been a reluctant member, finally broke up the union in 1523 through the efforts of her national chief Gustavus Vasa.

1420. *Treaty of Troyes*: interrupted the Hundred Years' war between France and England on terms most favorable to the latter. The English king, Henry V., to whom the French princess Catharine was given in marriage, was made heir to the French throne at the death of the insane king Charles VI., and in the meanwhile was to act as regent.

1435. *Treaty of Arras*: a compact between Burgundy and France, in which the former abandoned the English alliance and acknowledged Charles VII. as king of France on condition of réceiving Auxerre and Macon and the towns on the Somme. This weakened the power of the English in France and led the way to their final expulsion.

1466. *Treaty of Thorn*: the instrument by which the Polish conquest of West Prussia was recognized and the rule of the Teutonic Knights was confined to East Prussia.

1482. *Treaty of Arras*: settled the dispute between Louis XI. of France and Maximilian of Austria in favor of the former, who retained the towns on the Somme, and by the betrothal of the dauphin to the daughter of Maximilian was to secure Franche Comté and other territories.

1493. *Bull of Pope Alexander VI.*: arranged the conflicting claims of Spain and Portugal to newly discovered lands. Assuming the authority to apportion the countries of the earth, he fixed a line of demarkation running N. and S. through a point 100 leagues W. of the Azores. All to the E. of this line was assigned to Portugal, all to the W. to Spain.

1494. *Convention of Tordesillas*: between Spain and Portugal, substituted for the line fixed by the papal bull of 1493 one passing through a point 370 leagues W. of the Azores. See TORDESILLAS, CONVENTION OF.

1508. *League of Cambray*: a union formed by treaty between Louis XII. of France and the Emperor Maximilian, which the pope, Ferdinand of Spain, and others were invited to join, for the purpose of crushing Venice and partitioning her territories. War resulted, but the object of the league was not attained, owing to dissensions among the allies, some of whom finally withdrew and joined the Venetians.

1526. *Treaty of Madrid*: formed between the Emperor Charles V. of Germany and Francis I. of France, who had been defeated at the battle of Pavia and was then a prisoner. By it the latter gave up his claims to Genoa, Milan, Naples, Flanders, and Artois, agreed to cede Burgundy to the emperor, and consented to other humiliating conditions. Professing to have signed under constraint, he broke the treaty as soon as he regained his liberty.

1529. *Treaty of Cambray*, known as the *Ladies' Peace*: also between Francis I. and Charles V.; renewed the chief provisions of the Treaty of Madrid except that relating to Burgundy, which Francis was allowed to retain. It pressed too severely on France and the war was renewed.

1544. *Treaty of Crespy*: concluded the fourth and last war between Francis I. and Charles V. with a mutual cession of conquests made since the Truce of Nice in 1538. It left the two contestants in approximately the same condition as before the first war, Charles renouncing his claim to Burgundy, Francis to Naples, Flanders, and Artois.

1552. *Treaty of Passau*: between Charles V. and Maurice of Saxony. The former promised to convoke a Diet to consider the questions at issue, and in the meanwhile granted the Protestants religious toleration.

1555. *Religious Peace of Augsburg*: concluded at the Diet promised by Charles in the preliminary Treaty of Passau; granted toleration to Lutherans, but not to Calvinists; gave each prince the right to choose between the Roman Catholic faith and the Augsburg Confession, and to expel those of his subjects who differed from him in religion. By the *Reservatum Ecclesiasticum*, it was provided that any Catholic ecclesiastic on turning Protestant should forfeit his goods and rights that he had enjoyed by virtue of his ecclesiastical office. This was the source of constant trouble, and led ultimately to the THIRTY YEARS' WAR (*q. v.*).

1576. *Pacification of Ghent*: a union of the seventeen provinces of the Netherlands for mutual defense against the Spaniards. Foreigners were to be driven from the provinces and a meeting of the States-General was to be called to regulate matters of common interest.

1579. *Union of Utrecht*: the union of the seven northern provinces of the Netherlands in defense of their political rights and their religious freedom. It laid the foundation of the Dutch Republic, whose independence of Spain was virtually recognized by the treaty of 1609.

1648. *Peace of Westphalia*: consisting of the treaties of Münster and Osnabrück; concluded the THIRTY YEARS' WAR (*q. v.*), and adjusted the relations of most of the European powers. The provisions of this important peace may be divided into three classes: those making territorial changes, those affecting religion, and those bearing upon the internal constitution of the German empire. I. Territorial arrangements. Sweden acquired Hither Pomerania, the island of Rügen, the archbishopric of Bremen, the bishopric of Verden, the town and port of Wismar, parts of Further Pomerania, etc. These were to continue parts of the empire, of which the King of Sweden was to be a member with three votes in the Diet. Sweden further received a money indemnity. In general she attained much of what Oxenstjerna had striven for, and she ranked for a time, as the leading northern power. France secured the bishoprics of Metz, Toul, and Verdun, the town of Pignerol, Austrian Alsace, the right to garrison Philippsburg, and some minor accessions of territory. Her territorial gains, however, were of less importance than the prestige arising from the strengthening of her friends and the weakening of her enemies by the provisions of the treaty. The aggrandizing policy of Richelieu and Mazarin had completely succeeded, and France stood forth as the first power of Europe. The seed of future strife existed in a clause of the treaty, binding the King of France to permit the bishoprics of Basel and Strassburg, the ten imperial towns in Alsace, and all estates holding immediately of the empire to remain "in that liberty and possession of immediacy toward the empire which they had formerly enjoyed." Brandenburg was compensated for territory ceded to Sweden, by the bishopries of Minden, Halberstadt, and Kammin, and the archbishopric of Magdeburg. Mecklenburg and Brunswick-Lüneburg were also compensated by territorial accessions, and the house of Hesse-Cassel gained important rights and a money indemnity. The Lower Palatinate, with the right of reversion to the Upper, was restored to the family of the unfortunate Elector Frederick V., and an eighth electorate was created in its favor, Bavaria retaining the old electoral dignity and the Upper Palatinate. Switzerland, long independent in fact, was acknowledged to be so of right. The independence of Holland was also formally recognized. II. Religious provisions. Toleration was extended to Calvinists as well as Lutherans. The possession of ecclesiastical property and rights was determined by the status of the parties in 1624. A benefice held by a Protestant or Catholic in Jan., 1624, should forever belong to the same religion, but in the Palatinate, Würtemberg, and Baden 1618 was taken as the normal year. Thus the *Reservatum Ecclesiasticum* of the Peace of Augsburg was superseded. The holder of an ecclesiastical benefice on changing his religion was to vacate his benefice without restoring its former fruits. If a prince changed his religion he could not alter the existing Church, but could enjoy only his own domestic worship. Even if an entire community followed their sovereign in the new faith the old state of things in Church and school must continue. Those subjects of a sovereign differing in faith from their own who had not enjoyed the right of worship in 1624 could be compelled to emigrate, but must receive notice several years beforehand. III. Provisions affecting the constitution of the empire. The weakening of the imperial authority which had resulted from the war was legalized. The emperor was thenceforth of less importance in the political system than the Diet, which alone could make the laws, declare war, and conclude treaties. The separate states of the empire were free to make alliances with one another or with foreign states, subject only to the condition that such alliances be not prejudicial to the empire or the emperor.

The chief features of the Peace of Westphalia are the following: It established the equality of the Calvinists, Lutherans, and Catholics in Germany. It made the states of the empire almost independent of the emperor, thus preventing the attainment of national unity, and preparing for the rise of Prussia as a great Protestant power and the rival of Austria. It further gave to Sweden and France the right of continual interference in the internal affairs of the empire. Its adjustment of European affairs was of course not permanent, but it is the basis of almost all European treaties down to the time of the French Revolution, and it marks the end of the period of religious wars between European nations, whose points at issue were thenceforth to be mainly political.

1659. *Peace of the Pyrenees*: brought to a close the long war between France and Spain, confirming the former power in the possession of Roussillon, granting her Artois with places in Flanders, Hainault, and Luxemburg, and a portion of Cerdagne, and restoring Lorraine to the Duke of Lorraine. The Prince of Condé was pardoned and reinstated in his dignities. A special contract arranged the marriage of Louis XIV. to the Infanta Maria Theresa, who was to renounce her claims to the crown of Spain in consideration of a dowry of 500,000 crowns.

1660. *Treaty of Oliva*: between the King of Poland and his allies and the King of Sweden. By it Poland gave up to Sweden Esthonia and Livonia, and renounced suzerainty over the duchy of Prussia in favor of the Elector of Brandenburg.

1660. *Treaty of Copenhagen*: between Denmark and Sweden, secured to the latter power Schonen, Blekingen, Halland, Hween, and Bohus, and restored to Denmark Bornholm and Drontheim in Norway.

1667. *Treaty of Breda*: between England and Holland; restored the conquests made during the war and secured in the interest of the latter power a modification of the English Navigation Acts.

1668. *Triple Alliance*: between England, Holland, and Sweden to defend Spain against Louis XIV. It was successful and peace was formed in the same year between Spain and France, but within two years from its formation Louis succeeded in detaching Sweden from the alliance and winning over the English king Charles II., so that France was free to avenge herself on Holland.

1668. *Treaty of Aix-la-Chapelle*: between France and Spain, the former retaining a chain of strong fortresses on the northern frontier, but restoring Franche-Comté to Spain.

1668. *Treaty of Lisbon*: between Spain and Portugal through the mediation of England. Spain recognized the independence of Portugal.

1678. *Peace of Nymwegen*: ended the Dutch war. Treaties were formed between Holland and France, France and Spain, and in the following year between France and the other parties to the war. Holland recovered all the territory that she had lost to France, but the latter power acquired Franche-Comté from Spain.

1697. *Peace of Ryswick*: brought to a close the war between France under Louis XIV. and the principal states of Europe, sometimes called the War of the Palatinate or the War of Orleans; comprised the mutual restoration by France and England of the conquests made during the war, the recognition by the former power of William of Orange as the lawful King of England, and the relinquishment by France of a large part of the districts which she had seized from Spain and the emperor through the courts of "reunion" established by Louis after the peace of Nymwegen, but Alsace lost all connection with the empire and became an integral part of France.

1699. *Peace of Carlowitz*: between Turkey on the one hand and the Emperor of Germany, the King of Poland, and the republic of Venice on the other. It was agreed that Transylvania should remain an Austrian province, that the southern bank of the Danube should separate Hungary from the sultan's dominions, and that Venice should hold a part of Dalmatia and her acquisitions in Greece, except Lepanto.

1713–14. *Treaties of Utrecht, Rastadt, and Baden*: concluded between the states that had taken part in the war of the Spanish Succession (see SUCCESSION WARS); comprised nine treaties formed at Utrecht and one between France and the empire at Rastadt, which was subsequently finished with some modifications at Baden. Among the important features of these treaties were the stipulation that the crowns of France and Spain should be forever separate, the cession or restoration by France to Great Britain of Hudson Bay, St. Kitts, Nova Scotia, Newfoundland, etc., the cession by Spain to Great Britain of Gibraltar and Minorca, the transfer of Naples, Sardinia, Milan, and the Spanish Netherlands to Austria, and the confirmation of the Duke of Savoy in the possession of Sicily. A notorious clause of the treaty between Great Britain and Spain granted a company of British merchants the exclusive right to supply Spanish America with Negro slaves.

1717. *Triple Alliance*: between Great Britain, France, and Holland, in which these powers engaged to maintain the treaty of Utrecht, and in which France promised to give no aid to the Pretender to the throne of Great Britain.

1718–19. *Quadruple Alliance*: between Great Britain, France, Holland, and the emperor against the aggressions of Spain, which finally was obliged to give way and acceded to the alliance in 1720. Spain gave up all claim to the Netherlands and the Spanish part of Italy, and the emperor in return acknowledged Philip V. as rightful King of Spain. The emperor exchanged Sardinia for Sicily with the Duke of Savoy.

1718. *Peace of Passarowitz*: between the sultan and the emperor, granted the latter the portion of Hungary previously held by Turkey and extensive territories in Servia and Wallachia.

1721. *Peace of Nystadt*: between Sweden and Russia, granting the latter Esthonia, Livonia, Ingermanland, and part of Carelia, in return for parts of Finland which had been conquered. By it Russia succeeded to the position among the northern powers formerly held by Sweden.

1738. *Treaty of Vienna*: between France and Germany. France received Lorraine and agreed to the Pragmatic Sanction of Charles VI., naming Maria Theresa as his successor to a great part of the Austrian dominions. Austria ceded Naples and Sicily to a younger branch of the Spanish reigning family and received in exchange Parma and Piacenza. Tuscany was bestowed on the Duke of Lorraine.

1742. *Peace of Breslau*, subsequently confirmed by the *Peace of Berlin* and the *Peace of Dresden*: between Frederick II. of Prussia and Maria Theresa of Austria, secured Silesia to Prussia. By the Peace of Dresden Frederick acknowledged Maria Theresa's husband as emperor.

1748. *Peace of Aix-la-Chapelle*: between Great Britain, France, and Holland; Austria, Spain, Sardinia, Genoa, and Modena being accessories; ended the war of the Austrian Succession with the mutual restoration of conquests, but Frederick II. of Prussia kept Silesia.

1761. *The Family Compact*: between the Bourbon rulers of France and Spain, binding them in a close offensive and defensive alliance to which none but members of the Bourbon family should be parties.

1763. *Peace of Paris*: terminated the Seven Years' war, known in the American colonies as the French and Indian or Old French war. Its chief provisions related to the possessions of France and Great Britain in North America, where the latter power gained Canada and secured all lands E. of the Mississippi with the exception of New Orleans, but restored some of her conquests in the East and West Indies and in Africa to France.

1763. *Peace of Hubertsburg*: the treaty by which Prussia ended the Seven Years' war, retaining all that had been recognized as hers in the treaties of Breslau, Berlin, and Dresden.

1772. *First Partition of Poland*: carried out by treaties between Russia, Austria, and Prussia, giving as a reason for their action their insecurity against the internal dissensions of their neighbor.

1774. *Peace of Kutschuk-Kainardji*: between Russia and Turkey; restored Bessarabia, Wallachia, and Moldavia to the latter power, which engaged to protect the Christian inhabitants of these principalities in their religion. Russia obtained freedom of navigation in Turkish waters and arranged for a minister resident at Constantinople. To this treaty Russia afterward appealed as granting her a protectorate over the Christian subjects of the Porte.

1783. *Treaty of Paris*: the treaty in which Great Britain acknowledged the independence of the North American colonies and granted them important fishing privileges in the British dominions in America.

1783. *Treaty of Versailles*: signed at the same time as the above between Great Britain, France, and Spain; was a mutual restitution of conquests.

1792. *Peace of Jassy*: between Russia and Turkey; made the left bank of the Dniester the boundary between their respective territories.

1792. *First Coalition against France*: comprised ultimately all the powers except Sweden, Switzerland, Denmark, Tuscany, Venice, and Genoa.

1793–95. *Second and Third Partitions of Poland*: carried out by treaties between Russia, Prussia, and Austria. See the article POLAND.

1795. *Peace of Basel*: between France and Prussia, the latter withdrawing from the first coalition. It gave up the left bank of the Rhine to France.

1795. Treaty between the U. S. and Great Britain, known as the *Jay Treaty*. See the article JAY, JOHN.

1797. *Treaty of Tolentino*: between the French republic and the pope. The latter surrendered to France Avignon, the Venaissin, and the legations of Ferrara, Bologna, and Romagna, renounced the coalition, and agreed to pay an excessive indemnity and to give up 100 works of art, etc.

1797. *Treaty of Campo Formio*: between Napoleon and the Emperor of Germany. Austria had been humbled in the Italian campaigns and was forced to consent to an unfavorable peace. See the article NAPOLEON I.

1798. *Second Coalition against France*: initiated by Russia; afterward comprised England, Austria, Naples, Portugal, and Turkey. It was formed for the purpose of checking French aggressions, and was at first successful, but its power was broken by the French victories of Hohenlinden and Marengo, and it fell to pieces after the Treaty of Lunéville.

1801. *Treaty of Lunéville*: between France and Germany; renewed several of the most important provisions of the Treaty of Campo Formio. See NAPOLEON I.

1802. *Peace of Amiens*: between Great Britain on the one hand and France, Spain, and the Batavian republic on the other. It was hardly more than a truce, war being renewed in 1803. See NAPOLEON I.

1803. *Treaty between France and the U. S.* touching the purchase of Louisiana. See UNITED STATES (*History*).

1805. *Peace of Pressburg*: between Austria and France. The former gave up to France the Austrian spoils of the old republic of Venice, acknowledged the French seizures in Italy, and recognized the kingdom of Italy established by Napoleon. The terms were most humiliating to Austria, and in the following year occurred the formation of the Confederation of the Rhine, and the disruption of the ancient Holy Roman Empire. The Hapsburg ruler was thenceforth merely Emperor of Austria.

1807. *Treaties of Tilsit*: concluded between France, Prussia, and Russia after Napoleon had successively humbled the last two powers in the campaigns of 1806–07. Prussia gave up all her territory W. of the Elbe and almost all that she had gained by the partitions of Poland, the latter territory to constitute the grand duchy of Warsaw, which was to be dependent upon France; submitted to the occupation of her remaining territory by a French army; was forced to limit her own army to 42,000 men, and to conclude an offensive alliance against Great Britain. She lost about half her territory and was reduced to a condition of virtual vassalage to France. Russia also entered into an offensive alliance with France against Great Britain, promising to make common cause with the former if the latter persisted in her maritime policy. See NAPOLEON I.

1809. *Treaty of Schönbrunn or Vienna*: between France and Austria, preceded by the armistice of Znaym, closing the campaign which had resulted in the French victory of Wagram. Austria lost extensive territories, with a population of about 4,500,000.

1812. *Peace of Bucharest*: between Russia and Turkey; secured Bessarabia to the former, making the Pruth the boundary between the territories of the two powers. The navigation of the Danube was to be free to both nations.

1814. *First Peace of Paris*: between France and the principal European powers; formed after the defeat of Napoleon at Leipzig and the invasion of France by the allies. It cut down the limits of France to what they had been in 1792, and provided for the meeting of a European congress.

1814. *Treaty of Ghent*: between the U. S. and Great Britain; brought to a close the war of 1812, leaving matters substantially as they were before the war. No mention was made of the right of search and the impressment of U. S. seamen by the British, though these were the especial grievances that had provoked the U. S. to declare war. See UNITED STATES (*History*).

1815. *Congress of Vienna*: held according to the provision of the first Peace of Paris, and attended by the principal European powers. See VIENNA, CONGRESS OF.

1815. *Second Peace of Paris*: concluded between France and the allies after the defeat of Napoleon at Waterloo. France was reduced nearly to her limits of 1790, and was obliged to submit for a time to the occupation of her territory by a foreign army.

1815. *Holy Alliance*: an agreement formed at Paris between the monarchs of Russia, Austria, and Prussia, who were afterward joined by other European powers. Its avowed objects were of a vague and general nature, but in its operations it proved to be a league of sovereigns against peoples. See the article HOLY ALLIANCE.

1818. *Congress of Aix-la-Chapelle*: attended by the representatives of Great Britain, Russia, Prussia, and France to settle the affairs of Europe pursuant to the principles of the HOLY ALLIANCE (*q. v.*). See AIX-LA-CHAPELLE, CONGRESS OF.

1820. *Congress of Troppau*: a meeting of the members of the Holy Alliance to take action against the revolutionists in Italy. See TROPPAU.

1821. *Congress of Laibach*: a continuation of the Congress of Troppau; decided upon intervention in Italy. See LAIBACH.

1822. *Congress of Verona*: the fourth and last meeting of the members of the Holy Alliance to suppress the revolutionary spirit. It was here decided to interfere in Spain. See VERONA, CONGRESS OF.

1827. *Treaty of London*: between Great Britain, Russia, and France, to put an end to the war between Turkey and Greece. When the Turks persisted in hostilities the allies destroyed their fleet at Navarino and effected the liberation of Greece, but with narrower limits than she afterward obtained.

1829. *Treaty of Adrianople*: between Russia and Turkey after the war of 1828–29. Russia restored her conquests, but secured a money indemnity and the possession of the islands at the mouth of the Danube and the ports of Anapa and Poti on the eastern shore of the Black Sea. The hospodars of the principalities were to hold office for life, and the opportunities for Russian interference in behalf of the Porte's Christian subjects were greatly increased.

1833. *Convention of Unkiar-Skelessi*: an agreement between Russia and Turkey, which, if carried out, would have reduced the latter to the position of vassalage. It was opposed by the other powers.

1840. *Quadruple Treaty of London*: between Great Britain, Austria, Prussia, and Russia on the one hand and Turkey on the other; formed to settle the dispute between the sultan and his rebellious vassal, Mehemet Ali of Egypt, who for a time seemed likely to receive aid from France. Mehemet was checked in his aggressions, and limited to the pashalik of Egypt, which was made hereditary in his family. France afterward joined the alliance.

1842. *Treaty of Nanking*: concluded the so-called "Opium war" between Great Britain and China, securing to the former a money indemnity, the possession of the island of Hongkong, and the opening of five ports to British trade and residence, a privilege later extended by supplementary treaty to all foreigners. This is one of the most important treaties of modern times.

1842. *Ashburton Treaty*: signed at Washington to define the northeastern boundary between the U. S. and British North America. It also contained provisions concerning the suppression of the slave-trade and the surrendering of fugitives from justice.

1848. *Treaty of Guadalupe-Hidalgo*: between the U. S. and Mexico. It ceded to the former country New Mexico, Texas, and Upper California, but all other conquests by the U. S. were to be given up to Mexico and the sum of $15,000,000 paid her.

1854. *Treaty between the U. S. and Japan*: negotiated by Commodore M. C. Perry; secured humane treatment for U. S. sailors shipwrecked on the coasts of Japan, and the right to appoint a consular agent to look after their interests. It led the way to the establishment of commercial intercourse. Important trading privileges were secured by the U. S. and Great Britain in 1858, and subsequent treaties have added to these and extended them to other nations.

1856. *Treaty of Paris*: after the Crimean war, between Russia, France, Great Britain, Austria, Sardinia, and Turkey, Prussia also being invited to participate. The Black Sea was neutralized and thrown open to commerce. The Danube was also thrown open to commerce, and the limits of Bessarabia were altered with the design of taking from Russia the control of the mouths of the Danube. While Wallachia and Moldavia were confirmed in their privileges by the Porte, no exclusive protectorate was granted to any of the contracting powers.

1858. *Treaties of Tientsin*: concluded between China and each of the four nations, Great Britain, France, Russia, and the U. S. The affair of the lorcha Arrow had caused war between Great Britain and China, and in the treaty of peace the former secured a money indemnity. The chief features of the four treaties are the increase of the number of ports open to foreign trade, the guarantee of protection to both native and foreign Christians in the practice and propagation of their religion, the opening of the country to foreign travel, and the sanctioning of the residence of foreign ambassadors at Peking.

1859. *Peace of Zurich*: the settlements of the points in dispute between France and the kingdom of Sardinia on the one hand and Austria on the other, after the war of 1859, preliminaries of peace having already been signed earlier in the same year at Villafranca. Austria retained Venetia, but ceded to France nearly all of Lombardy, which was transferred to Sardinia. Austria and France promised to favor the establishment of an Italian confederation under the presidency of the pope, and Venetia, while still owning the supremacy of Austria, was to be a member of this confederation. In return for Lombardy, and for the aid given by France in the war, Sardinia ceded to her Savoy and the arrondissement of Nice. This peace and the events which resulted from it put an end to the arrangements respecting Italy made by the Congress of Vienna, and prepared for the unification of Italy under the house of Savoy.

1864. *Peace of Vienna*: between Austria, Prussia, and Denmark, concluded the war that arose out of the Schleswig-Holstein question. The Danish king renounced his rights over Lauenburg, Schleswig, and Holstein in favor of Prussia and Austria.

1865. *Convention of Gastein*: a compact between Prussia and Austria, arranging for the control of the three duchies gained from Denmark by the war of 1864. Prussia was to control Schleswig, and on the payment of a stipulated sum to Austria the Prussian king was to acquire possession of Lauenburg, while the government of Holstein was committed to Austria. Prussia, however, was to have the command and police of the port of Kiel in Holstein, with the right to maintain two military routes and to construct a canal through the duchy. The arrangement was merely provisional, and did not affect the rights of the two powers to both duchies; but it brought Prussia somewhat nearer to the realization of her object, namely, the annexation of the duchies.

1866. *Peace of Prague*: concluded the war of 1866 between Prussia and Austria. The latter power recognized the dissolution of the German Confederation and the establishment of the North German Confederation under the leadership of Prussia; renounced all rights over Schleswig and Holstein in favor of Prussia; agreed to the union of Lombardy and Venetia with the kingdom of Italy, and agreed to pay to Prussia an indemnity of 20,000,000 thalers.

1871. *Treaty of Frankfort*: between France and Germany after the war of 1870-71, preliminaries having been signed at Versailles earlier in the same year. France ceded Alsace and part of Lorraine to Germany and paid an indemnity of 5,000,000,000 francs. A district containing over 1,500,000 inhabitants was thereby annexed to Germany.

1871. *Treaty of Washington*: between the U. S. and Great Britain to settle questions pending between the two countries. To adjust the so-called Alabama claims it was agreed to submit them to a tribunal of arbitration to meet at Geneva and consist of members appointed by each of the parties and by three neutral nations. (See ALABAMA CLAIMS.) With regard to difficulties concerning the fishing privileges of U. S. vessels on the coasts of British America, the treaty adjusted the points at issue on the basis of the Reciprocity Treaty of 1854, giving to the persons of each nation the right of fishing on the coasts of the other. There was a mutual concession of important privileges, such as the privilege of transit without payment of duties, and of transportation from one place to another in the territory of one nation across the territory of the other, and the opening of Lake Michigan, the lower course of the St. Lawrence river, and certain rivers in Alaska to the people of both nations. It was further agreed to submit the question respecting the running of the boundary-line on the Pacific to the German emperor, whose decision, rendered in the following year, was in favor of the U. S.—that is, accepted the line run through the Canal de Haro, leaving the island of San Juan and its group in the territory of the U. S.

1878. *Treaty of San Stefano*: the preliminary treaty of peace at the close of the RUSSO-TURKISH WAR (*q. v.*). The final settlement was reached at the Congress of Berlin.

1878. *Congress of Berlin*: a congress of the chief European powers to settle the questions that grew out of the Russo-Turkish war. See BERLIN, CONGRESS OF.

1879. *Treaty of defensive alliance between Austria and Germany*: Its text was first published in 1888, when the signatory powers were alarmed by the attitude of Russia. It provided that if Russia attacked either party the other was bound to come to the latter's aid, and that if either party should be attacked by some other power than Russia, the other party should remain neutral. In 1882 Italy was reported to have entered this alliance, thus forming the *Dreibund* or TRIPLE ALLIANCE (*q. v.*).

1895. *Treaty of Shimonoseki*: concluded the war between China and Japan on terms most advantageous to the latter power, which secured the island of Formosa, the Pescadores, the acknowledgment of the independence of Korea (the original cause of the war), important commercial privileges, and a money indemnity of about $160,000,000. In addition to these benefits Japan was granted possession of the Liaotung peninsula on the mainland from Port Arthur northward as far as the fortieth parallel of latitude, but the protest of Russia, indorsed by France and Germany, induced Japan to withdraw her claims to any portion of the mainland, on the understanding that she should be compensated by an increase in the amount of the money indemnity. F. M. COLBY.

**Treb'bia**: the ancient *Trebia*, a river of Northern Italy. It rises in the Ligurian Apennines 15 miles N. E. of Genoa, flows northward, and joins the Po 3 miles above Piacenza. On its banks the Romans under Sempronius were defeated by Hannibal in 218 B. C. and the French under Macdonald by Suwaroff June 17-20, 1799.

**Trebel'lius Pollio**: See AUGUSTAN HISTORY.

**Treb'izond**, or **Tarabozan** (Gr. Τραπεζοῦς, gen. Τραπεζοῦντος; Lat. *Trape'zus*; Turk. *Trabizon* or *Tárabzon*): town; in Asia Minor, in the vilayet of Trebizond; on the southeastern coast of the Black Sea (see map of Turkey, ref. 4-I). It is beautifully situated on a slope, facing the water; is surrounded with walls, and fortified. It is the Turkish terminus of the main route to Armenia and Persia, but the trade formerly centering here is being rapidly diverted to Batoum. Regular lines of steamers connect Trebizond with the Danube and Constantinople. The imports are mainly manufactured European goods. The exports are wool, mohair, skins, wax, gum, resin, gall-nuts, tobacco, oil, opium, fruit, shawls, and carpets, brought overland by camel caravans; also timber and box-wood. Trebizond, founded by a colony from Sinope, was a flourishing city in the time of Xenophon, and gave a memorable reception to the TEN THOUSAND (*q. v.*). Trajan made it the capital of Pontus-Cappadocia. In 1204 Alexius Comnenus founded the empire of Trebizond, which lasted till its overthrow by Sultan Mohammed II. in 1461. Population (1889) 45,000, of whom 29,000 were Ottomans, 10,000 Greeks, and 5,000 Armenians. E. A. GROSVENOR.

**Tredegar**, treed'gaar: town; in Monmouthshire, England; 7 miles E. N. E. of Merthyr Tydvil (see map of England, ref. 12-F). It is in a coal district, and is the seat of great iron and steel works. Pop. (1891) 17,484.

**Tredgold**, THOMAS: engineer; b. at Brandon, near Durham, England, Aug. 22, 1788; was for some years a journeyman carpenter; was for ten years (1813-23) employed in London in an architect's office, extending his studies to embrace chemistry, geology, mechanics, and engineering, and for the last six years of his life practiced with great success as a civil engineer, contributing meanwhile scientific articles to *The Philosophical Magazine*, *The Annals of Philosophy*, and the *Encyclopædia Britannica*. He was the author of *The Elementary Principles of Carpentry* (1820); *A Practical Essay on the Strength of Iron and other Metals* (1821); *Description of Iron Suspension Bridges* (1826); and *The Steam-engine* (1827), which was subsequently edited by W. S. B. Woodhouse (2 vols., 1838-40), with 125 plates in atlas folio, and in an enlarged edition (3 vols., 1850-53). D. in London, Jan. 28, 1829.

**Tredïakov'skiĭ**, VASILIĬ KIRILOVICH: author; b. in Astrakhan, Russia, 1703. After a stay of some years in foreign countries he settled in St. Petersburg, where he was made secretary of the Academy of Science. He was a prolific writer, but his verse was so bad that Catherine II. in her games used to punish her courtiers by making them learn lines of it, and his name has remained proverbial in Russia as that of the pretentious, talentless poet who made his way by cringing for court favor. As a prose writer he was of more importance, for some of his critical works, and especially his *Method of Russian Versification*, were of considerable value. He also translated Boileau's *Art Poétique*, Rollin, Fénelon, etc. D. Aug. 18, 1769. A. C. COOLIDGE.

**Tree** [O. Eng. *trēo* : Icel. *trē* : Goth. *triu* < Teuton. *trewo-* : Russ. *drevo* : Welsh, *derw*, oak : Gr. δρῦς, oak : Sanskr. *dru*, tree]: a woody plant with a single trunk rising to more than the height of a man. There are all gradations between shrubs and trees. Some woody-stemmed plants are properly called trees, although of dwarf stature, the branches being elevated upon a single trunk; some, which branch or divide from the ground or near it into a cluster of trunks, reach such a height and magnitude that they must be called trees rather than shrubs. Most common trees increase in thickness by the addition each year of a cylinder of wood around the wood of the preceding years. They are therefore said to be *exogenous* in growth. The seedling stem, almost as soon as it is formed, is traversed longitudinally by some woody threads (fibro-vascular bundles), which are so arranged as to surround a central portion that remains destitute of woody matter; and these increase in size and number until they form a cylindrical layer of wood (in cross-section a ring) between the soft central core, the pith, and an outer more or less soft portion, the bark. When this layer of wood in the seedling stem or other shoot of the season is completely formed, no additions are made to its inner portion, but new wood may continue to be formed on its outer surface, between it and the bark, all through the season. When, after a suspension of growth consequent upon the diminution of temperature in all climates which have a winter, or of moisture where vegetation is arrested or checked by dryness, a second season of growth supervenes, a new layer of wood is formed upon or external to the old one, and so on year after year. Consequently the section of an exogenous tree-trunk exhibits concentric layers—in all ordinary cases one for each year of its age—the oldest next the pith, the youngest next the bark. As the tree has made annual increments of growth in length as well as in diameter, a cross-section at the base of the trunk exhibits a number of annual layers equal to the whole age of the tree, while one at the summit has only a single layer, interposed between the pith and the bark. Radiating plates—in the cross-section lines more or less conspicuous—traverse this layer of wood from the pith to the bark, dividing it into wedges; these are continued through the succeeding layers, and new ones are interposed between them as the wedges widen; these are the *medullary rays* or *silver grain*. The bark of an exogenous tree is always clearly distinguishable from the wood, and for the most part is readily separable from it, the demarkation between the two being a thin zone of undifferentiated cells, called the *cambium*. From this cambium are developed on the one side additions to the wood—on the other to the bark. While the wood, once formed, remains unaltered except as changing from sap-wood to heart-wood, the bark is subject to distension from within, from the increasing size of the woody cylinder. The older and outer bark is consequently sooner or later fissured and riven as well as worn and weathered by exposure to the elements.

The port or character of the tree depends much upon its mode of branching, and this primarily upon the arrangement of leaves upon the twigs; for the branches of the spray proceed from lateral buds, of which there is usually a single one in the axil of each leaf. Accordingly, when the leaves are opposite, so will be the branches of the spray, while alternate leaves originate alternate branchlets; but this symmetry, however evident in the branchlets, is usually more or less obscured in the larger branches by the non-development of some of the buds and the destruction of many branchlets. When the main trunk persists and leads throughout, not being rivaled or supplanted by any of the branches, the tree is said to have an excurrent trunk; when the main trunk is lost in or replaced by the main branches, it is said to be deliquescent.

Palm-trees are the more common but not the exclusive representatives of the type of arboreous vegetation in which the stems do not increase in thickness exogenously. They rise by a simple columnar trunk, not tapering as it ascends, terminated with a crown of large and long-stalked leaves, which are either pinnate or plume-like, as in date-palms, or palmate, as in palmetto. This simple and mainly cylindrical trunk comes from their whole vegetation being the development of a single terminal bud. Such axillary buds as they develop form the inflorescence, and therefore do not result in permanent branches. Nevertheless, a few palms branch habitually and normally after a certain age. The doum-palm of Upper Egypt and Nubia is the best-known example. In contrast with the wood of exogenous trees, that of palms and their relatives has no concentric layers surrounding a central pith, and no proper bark. The wood is made up of separate fibro-vascular bundles, longitudinally traversing and separately imbedded in the cellular and softer fundamental tissue which is represented in the exogenous stem by the central pith and the radiating medullary rays. When these wood-bundles can be traced, they are found to have their upper termination in leaf-stalks, their lower in the circumference or rind, in their course describing more or less of an arch or long curvature. The central portion of the trunk contains fewer of the woody bundles; toward the circumference they are more crowded. Consequently, the denser wood is at the circumference, the softer at the center. The center sometimes remains pithy, as it were, and sparsely traversed by threads of wood, but in many palm-stems nearly the whole becomes so closely packed with woody bundles as to form a very compact and hard wood. On account of this structure such trees have been called *endogenous*, "inside growing," but the term is inaccurate, and is becoming obsolete in this sense. Exogenous trunks increase indefinitely in diameter; palm trunks soon become incapable of further enlargement, except in height. They are accordingly cylindrical up to the crown of leaves, and in place of a bark, distinct, separable, and of different layers, they are invested by an inseparable, more homogeneous, and permanent rind, which, along with the more solidified wood of the circumference, restricts and limits distension. Some such trunks, however, notably those of dragon-trees and yuccas (of the lily family), continue distensible, and therefore continue to increase in diameter; they also branch when old, usually only after blossoming, which takes place from a terminal bud, thus arresting the vegetative growth, which is resumed from axillary buds. Such stems therefore fork at each flowering or other arrest of the terminal bud, and so in time form a branched head, in some respects imitating that of an ordinary exogenous tree.

*Trees as to climate* and distribution can hardly be here treated of, but it must be stated that arboreal growth, of any ordinary type, supposes and requires a considerable amount of moisture, and accordingly of rainfall, either through the year or through a growing season. An ordinary tree expands a large extent of evaporating surface, chiefly in its foliage. Leaves dry up and perish if not supplied with moisture to replace that which is evaporated or transpired. Therefore, not only are rainless districts treeless (except as water is supplied by irrigation), but regions of scanty and precarious summer rain are sparsely wooded or without forest, according to the amount of aridity or length of the dry season; or their arborescent vegetation meets the exigency and stress by some special adaptation. Broad-leaved evergreens abound where rains fall throughout the year, and especially where winter is unknown. Narrow-leaved or needle-leaved evergreen trees are chiefly in cooler or cold climates, well supplied with moisture through the year or through the season of activity. Trees with expanded foliage survive the rainless hot season of the drier tropical and sub-tropical regions only by dropping their leaves, upon which the stress first comes, and thereby reducing the evaporating surface to a minimum. Those which retain their foliage are such as have some peculiar provision—by fleshiness with thick epidermis in the case of succulent foliage, or by firm coriaceous texture, superficially or throughout, to which, especially in Australia, is sometimes added a vertical instead of horizontal position of the leaves, which thus present their edges instead of one face to the high sun. This prevails among the Australian acacias and myrtaceous trees, which compose the larger part of the arboreal vegetation. In climates in which vegetable growth and action are arrested by winter, the trees are nearly all deciduous, except the coniferous evergreens, the leaves of which are peculiarly organized for resisting cold, and individually expose a small surface to the elements.

*Duration of Trees.*—An exogenous tree, renewing annually its twigs and foliage above, its growth of roots beneath, and zone of new wood and bark connecting the two, has no definite limits to its existence. Its actual duration depends upon external circumstances, and upon some inherent liabilities which may practically result in a certain average of life in any particular species, which, however, certain favored individuals may be expected to overpass. Increase of size, height, or spread of branches, and other inevitable consequences of age, however, bring increasing, and at length inevitable, disadvantages and liabilities, so that practically, although most trees, like most men, die an accidental death, the longest survivors may be said to die of old age in the sense in which the oldest of the human race do—that is, of the diseases or accidents which the younger generally resist or recover from, but to which the older succumb in consequence of the disadvantages of age. Suffice it to say, however, that exogenous trees are known, by the actual counting of their layers, throughout or in great part, to have attained the age of from 1,200 to fully 2,000 years; it is probable that some extant trees are considerably older. The tallest trees known rise little less than 500 feet (*Eucalyptus*, in Australia). The largest in girth are trees of *Eucalyptus*, up to 81 feet; giant redwoods in California, up to 91, and possibly 100 feet; baobab-trees of Senegal, some of which have reached the latter circumference, but they are low trees of rapid growth even when old, and probably of no extreme age; and, finally, there is a Mexican *Taxodium* or bald cypress, a slow-growing tree, which measures 112 feet in circumference. If this does not consist of two or more original trunks which have grown into one—of which there are no external indications—it is probably the oldest existing tree known.

Trees like palms, which do not continue to increase in girth, are more strictly and inherently limited in their duration; perhaps they never live more than 200 or 300 years. When such a trunk has a soft living rind, capable of unlimited expansion, and also produces branches, perhaps it may live as long as an exogenous tree. Dragon-trees (*Dracæna*) are examples of this. The celebrated great dragon-tree of Orotava, Teneriffe (now destroyed by a series of storms, but which was in full vigor when Humboldt visited it), was probably as old as any of the existing redwoods of California. Revised by Charles E. Bessey.

**Tree**, Herbert Beerbohm: actor; b. in London in 1853; educated in Germany and England; entered the office of his father, a grain-merchant in London, in 1870, but became devoted to amateur acting, and made his *début* at the Globe theater, London, as Grimaldi in 1878. In Mar., 1884, he made a hit as the timid curate in *The Private Secretary* at the Prince of Wales's. In 1887 he became lessee of the Comedy theater, and later of the Haymarket theater, where he has produced a number of very successful plays, among which are *The Pompadour*, *Hypatia*, *A Woman of No Importance*, and *John-a-Dreams*. In 1894–95 he paid a visit to the U. S. He is remarkable for the very different styles of the parts which he has assumed. He has written several papers on the actor's art, and in 1893 he lectured at the Royal Institution on the imaginative faculty.

**Tree-duck**: any one of ten or a dozen species of ducks of the genus *Dendrocygna*, deriving their name from their arboreal habits. They are readily distinguished by their long legs and the length of the hind toe. They nest in holes in trees, often at some distance from the water, to which they carry their newly hatched young. They are chiefly confined to the tropics, but two species, *Dendrocygna fulva* and *D. autumnalis*, occur in the U. S. F. A. L.

**Tree-ferns**: large ferns having a tree-like form and size, with much the habit of the palms. Tree-ferns formed an important part of the vegetation of the coal-measures. At present they are mostly tropical or insular, but are abundant in Tasmania, New Zealand, and parts of Australia and in the Himalayas. A few species yield a useful starchy pith resembling sago. See Fernworts and Plants, Fossil.

**Tree-frogs**, or **Tree-toads**: those species of tailless batrachians (order *Salientia*) which are adapted for life among trees, and which are provided with terminally dilated toes. This character of dilatation of the tips of the toes, although regarded by some authors as of systematic importance, is of mere teleological significance, and is not co-ordinated with true morphological characteristics. The tree-frogs and tree-toads are now mostly to be found in the families *Hylidæ*, *Cystignathidæ*, *Engystomidæ*, *Dendrobatidæ*, and *Ranidæ*. The North American species, however, all belong to

The squirrel tree-toad.

the family Hylidæ (*q. v.*). The *Hyla squirella*, which is about 1¼ inches in length, is of a brownish or light ash color. It is a southern species. Revised by F. A. Lucas.

**Trefoil**: See Clover.

**Tregelles**, tre-gelz', Samuel Prideaux, LL. D.: New Testament critic and author; b. at Wodehouse Place, near Falmouth, England, Jan. 30, 1813, of Quaker parentage; educated at Falmouth Classical School; was for some years in the iron-works at Neath Abbey, Glamorganshire, 1828–34; was in 1835–36 a private tutor at Falmouth; shortly after devoted himself to the task of preparing a critical edition of the text of the New Testament from the most ancient MSS. and versions, and pursued that object through life; studied the Oriental languages; was long associated with the Plymouth Brethren, though he never joined that organization, and died in the communion of the Church of England. He was stricken with paralysis in 1861, and again in 1870. The second stroke so crippled him that he could not take part in the revision of the New Testament to which the Convention of Canterbury invited him. In the pursuit of his scheme he visited the principal libraries of Europe for the purpose of collating MSS. He published the first specimen in 1837, and the first part, the Revelation, 1844; then his great work in parts, *The Greek New Testament, edited from Ancient Authorities, with the Latin Version of Jerome, from the Codex Amiatinus* (1857, *seq.*; the 6th part completed the text, 1872; the 7th and last part, containing the prolegomena, addenda, and corrigenda, edited by F. J. A. Hort and A. W. Streane, 1879). By this labor he put himself in the line of illustrious scholars who have brought the text of the Greek New Testament to its present perfection. In recognition of this service he received a pension of £100 in 1862, which was doubled after 1870. He was an active philanthropist as well as scholar. D. at Plymouth, Apr. 24, 1875. Besides his New Testament, he published many books. His chief publications were: *Passages in the Book of Revelation connected with the Old Testament Scriptures* (1836); *The Englishman's Greek Concordance to the New Testament* (1839); *The Englishman's Hebrew and Chaldee Concordance to the Old Testament* (2 vols., 1843); *Hebrew Reading Lessons* (1845); *Heads of Hebrew Grammar* (1852); *Gesenius's Hebrew and Chaldee Lexicon* (1847); *The Prophetic Visions of the Book of Daniel* (1847; 5th ed. 1864); *The Book of Revelation Translated from the Ancient Greek Text* (1848); *On the Original Language of St. Matthew's Gospel* (1850); *The Jansenists* (1851); *Historic Evidence of the Authorship and Transmission of the Books of the New Testament* (1852); *Account of the Printed Text of the Greek New Testament* (1854); *Codex Zacynthius, Greek Palimpsest Fragments of the Gospel of St. Luke obtained in the Island of Zante* (folio, 1861), the fourth volume of the 10th ed. of Horne's *Introduction* (1856). Revised by S. M. Jackson.

**Treitschke**, trītsh'ke, Heinrich Gotthardt, von: historian; b. in Dresden, Saxony, Sept. 15, 1834; studied history and political economy in various German universities; was privat docent at Leipzig 1858–63: appointed professor in the University of Freiburg im Breisgau 1863–66. As an ardent adherent of Prussia he resigned in 1866, and removed to Berlin, where he edited the *Preussischen Jahrbücher*. He was called to the chair of History at Heidelberg in 1867, and to that in the University of Berlin in 1874. In the meanwhile (1871) he was elected to the Reichstag, where he continued as a member of the liberal party till 1888. He succeeded Prof. von Ranke, who died in 1886, as Prussian historiographer. He published *Zehn Jahre Deutscher Kämpfe 1865–74* (1874); *Der Sozialismus und seine Gönner* (1875); *Der Sozialismus und der Meuchelmord* (1878); *Deutsche Geschichte im 19ten Jahrhundert* (1879–85); *Zwei Kaiser* (1888); and several other works. D. Apr. 28, 1896.

**Trelaw'ney**, Edward John: author and soldier of fortune; descended from an old Cornish family, and b. Mar. 10, 1792. He is known especially as the author of a novel, in great part autobiographical, entitled *Adventures of a Younger Son* (1830), and *Recollections of Shelley and Byron* (1858), reissued in 1878 as *Records of Byron, Shelley, and the Author*. At the age of eleven he was sent to sea, and after many adventures and some experience in privateering he settled in London and wrote for the magazines. He made the acquaintance of Byron and Shelley at Pisa in 1821, and was present with Byron and Leigh Hunt at the burning of Shelley's body. In 1823 he joined Byron in Greece, and fought in the Greek war of liberation as aide-de-camp to the partisan leader Odysseus. He afterward returned to London, and was prominent in Lady Blessington's circle. D. at Sompting, Sussex, Aug. 13, 1881. His body was cremated, and the ashes interred near Shelley's at Rome. His portrait is preserved in Millais's painting, *The Northwest Passage*. H. A. Beers.

**Trelease**, William, D. Sc.: botanist; b. at Mt. Vernon, N. Y., Feb. 22, 1857; educated in Cornell and Harvard Universities; instructor in botany in Cornell University 1880; Professor of Botany in University of Wisconsin 1881–85; director of Shaw School of Botany, Washington University, St. Louis, 1885–; director of Missouri Botanical Garden 1889–; has published an English translation of Poulson's *Botanical Microchemistry* (1883); *The Botanical Works of the Late George Engelmann* (1887, with Asa Gray); an English translation of Salomonsen's *Bacteriological Technique* (1889); *Annual Reports of the Missouri Botanical Garden* (1890–91–92–93); and many papers in various journals and the proceedings of societies. Charles E. Bessey.

**Tremato'da** [Mod. Lat., from Gr. τρηματώδης, full of holes, deriv. of τρῆμα, τρήματος, hole]: a group of parasitic flatworms (see Plathelminthes) in which parasitism has produced but slight degeneration. The body is usually flattened, lacks cilia and all traces of segmentation; the mouth is anterior and communicates with a digestive tract which forks after a short extent. Upon the lower surface are one, two, or more suckers for adhesion to the host, and sometimes these are re-enforced by hooks. Like all flatworms they lack a body-cavity and distinct circulatory organs, while the excretory system is well developed. Most species have the sexes separate. The group is usually subdivided into the Monogenea, in which the egg develops directly into the adult form without the intervention of an asexual form, and the Digenea, in which there is an alternation of generations, one or more asexual forms being introduced in the life cycle. Correlated with this is a difference in their habits of parasitism. Thus the Monogenea inhabit a single host and usually attach themselves to the external surface of the body. The Digenea, on the other hand, have more than one host, one being usually an invertebrate, the adult living in some vertebrate. Among these last are found some of the most dangerous parasites, especially that group known popularly as flukes (*Distoma*). Some of these cause serious distempers among domestic animals and eight occur in man. The history of a few flukes has been followed, and reveals a wonderfully complex series of alternation of generations. See Leuckart, *Die menschlichen Parasiten* (1867); Cobbold, *Entozoa*; Thomas, *Quar. Jour. Micros. Science* (1883). J. S. Kingsley.

**Tremblay**, François Leclerc, du: See Joseph.

**Trembles**: See Milk-sickness.

**Tremont'**: town; Hancock co., Me.; on the Atlantic Ocean; 25 miles S. of Ellsworth, and 25 miles E. by S. of Castine (for location, see map of Maine, ref. 9–F). It was formerly a part of the town of Mt. Desert, from which it was set off and incorporated in 1848 under the name of Mansel, subsequently changed to its present name. It contains the villages of Tremont, Southwest Harbor, Seal Cove, West Tremont, Sea Wall, Tremont Center, and Manset, and has 5 churches, public high school, public library, 11 hotels, and a savings-bank. Pop. (1890) 2,036; (1900) 2,010.

**Tremont**: borough: Schuylkill co., Pa.; on the Phila. and Reading Railroad; 13 miles W. of Pottsville, the county-seat, and 50 miles N. W. of Reading (for location, see map of Pennsylvania, ref. 5–H). It is in an agricultural and mining region, and contains 8 churches, graded schools, improved water-works, electric lights, a private bank, and 2 weekly newspapers. Pop. (1880) 1,785; (1890) 2,064; (1900) 1,947.
Editor of "West Schuylkill Press."

**Tremulous Poplar**: See Aspen.

**Trench**, Richard Chenevix, D.D.: archbishop and author; b. in Dublin, Ireland, Sept. 9, 1807; educated at Trinity College, Cambridge, and graduated in 1829; spent some years in travel; took orders in the Church of England 1833; was curate at Hadleigh, Suffolk, 1833–35; incumbent of Curdridge 1835–40; curate to Archdeacon (afterward Bishop) Samuel Wilberforce at Alverstoke 1840–44; rector of Itchenstoke 1844–45; was appointed examining chaplain to the Bishop of Oxford (Dr. Wilberforce) 1845; was Hulsean lecturer 1845–46, and select preacher at Cambridge 1843 and 1856; Professor of Theology at King's College, London, 1846–58; Dean of Westminster 1856–63, and was ordained Archbishop of Dublin, as successor to Dr. Whately, Jan. 1, 1864; resigned 1884. In the field of philology he achieved distinction, and his paper on the *Deficiencies in our English Dictionaries* gave the first impulse to the great *New English Dictionary* edited by Dr. James A. H. Murray. D. in London, Mar. 28, 1886. He was the author of many works, including *Poems from Eastern Sources* (1842); *Elegiac Poems* (1846); *Poems, collected and arranged anew* (1865); *Notes on the Parables of our Lord* (1841; 15th ed. 1884); *Notes on the Miracles of our Lord* (1846; 13th ed. 1886); *Exposition of the Sermon on the Mount, from St. Augustine* (1844); 2 vols. of Hulsean lectures, *The Fitness of Holy Scripture for unfolding the Spiritual Life of Men* (1845); *Christ the Desire of all Nations* (1850); *On the Study of Words* (1851; 15th ed. 1874); *On the Lessons in Proverbs* (1853); *Synonymes of the New Testament* (1854; 2d series 1863; 8th ed. recast, 1 vol., 1876); *English, Past and Present* (1855; 11th ed. 1881); *Calderon, his Life and Genius* (New York, 1856); *Some Deficiencies in our English Dictionaries* (1857); *The Authorized Version of the New Testament, in Connection with some Recent Proposals for its Revision* (1858); *Select Glossary of English Words used formerly in Senses different from their Present* (1859); *Commentary on the Epistles to the Seven Churches in Asia* (1861); *Studies on the Gospels* (1867); *Lectures on Mediæval Church History* (1877; 2d ed. 1879); edited several volumes of poetry, and *Remains of the Late Mrs. Richard Trench* (1862), his mother. See his *Letters and Memorials* (2 vols., 1886). Revised by S. M. Jackson.

**Trenchard**, Stephen Decatur: naval officer; b. in New York, July 10, 1818; entered the navy as a midshipman Oct. 23, 1834, serving in the Seminole war in Florida; became lieutenant in 1847, and was on the Saratoga in the war with Mexico; commander in 1862, captain in 1866, commodore in 1871, rear-admiral in 1875; commanded the Rhode Island in both the Fort Fisher fights; retired in 1880. D. in New York, Nov. 15, 1883.

**Trendelenburg**, Friedrich Adolf: classical philologist and philosopher; b. at Eutin, near Lübeck, Germany, Nov. 30, 1802; studied at Kiel; appointed professor extraordinary at Berlin 1833; ordinary 1837; member of Academy of Sciences in 1846. D. in Berlin, Jan. 24, 1872. Trendelenburg's claim to distinction as a thinker rests on his acute criticism of the formal logic of Kant and the dialectical method of Hegel. In his own system he took motion as a starting-point, from which he deduced all other philosophical conceptions, including time and space. The foundation of his teaching is Platonic and Aristotelian. His most noteworthy works are *Elementa Logices Aristoteliceæ* (8th ed. 1878); an edition of Aristotle's *De Anima* (2d ed. by Chr. Belger, 1877); *Historische Beiträge zur Philosophie* (3 vols., 1846–67), in which the *History of the Doctrine of Categories* and the essays on *Kant, Spinoza, Leibnitz*, and *Herbart* are especially valuable; and *Naturrecht auf dem Grunde der Ethik* (2d ed. 1868). See H. Bonitz, *Zur Erinnerung an Trendelenburg* (Berlin, 1872); E. Bratuschek, *Adolf Trendelenburg* (1873). Alfred Gudeman.

**Trent**: a river of England. It rises in Biddulph Moor in Staffordshire, at an elevation of about 600 feet above the level of the sea, flows in a southeasterly direction, and forms the Humber after joining the Ouse, about 15 miles W. of Hull. Its length is about 150 miles, and it is navigable for about two-thirds of its course.

**Trent**: a tributary of Lake Ontario, rising in Rice Lake, Northumberland County, Ontario, and draining a large system of northern lakes and rivers; partly navigable. The Trent itself affords good water-power, and large quantities of lumber are floated upon it. It is 150 miles long, has a basin of 4,000 sq. miles, and discharges its waters into the Bay of Quinté at Trenton. M. W. H.

**Trent** (anc. *Tridentum*): town of Austria, in the southern part of Tyrol; on the Adige (see map of Austria-Hungary, ref. 7–A); beautifully situated and well-built, and traversed by canals. Its cathedral, begun in 1212, is a magnificent edifice of white marble; the palace, in which the famous council held its sittings, and several other buildings are also remarkable. It manufactures leather, glass, sugar, tobacco, bells, cards, and silks, and carries on an important transit trade between Italy and Germany. Pop. (1890) 21,486.

**Trent**, William Peterfield: See the Appendix.

**Trent Affair**: the seizure of the Confederates Slidell and Mason on board the British steamer Trent in 1861, and the resulting international complications. See Slidell, John.

**Trent, Council of** (*Concilium Tridentinum*): the nineteenth œcumenical council of the Catholic Church, held at Trent in Tyrol.

*Occasion of the Council.*—Its convocation was owing to two motives: (1) the desire to stay the spread of Protestantism, and (2) to bring about a much-needed reform within the Church. For several years the project of the council had been discussed between the papal and the imperial authorities without much headway, the former being anxious to convoke the council in some Italian city, like Mantua or Vicenza. The imperial view obtained, and a compromise was effected which resulted in the calling of the council by Paul III. for Nov. 1, 1542, at Trent, an imperial free city under a prince bishop. It was finally opened Dec. 13, 1545, by the papal legates, the cardinals del Monte, Cervini, and Pole, in the presence of four archbishops, twenty-two bishops, five generals of orders, theologians, ambassadors, etc. The Protestants were invited to attend, and such was the sincere desire of the emperor and the King of the Romans, but they refused.

*Procedure.*—It was decided to take up in each session matters of dogma and discipline, and this, too, was a compromise, the pope desiring doctrinal questions to be first decided, and the emperor leaning toward a speedy reform of practical abuses. The subject-matter was proposed by the papal legates, who presided, and was then divided among private congregations, in which the *pro* and the *con* were argued at length by learned and experienced men. Afterward the private congregations met as a body or general congregation, and the final session was usually a formal confirmation of what had already been settled. The doings of each of the twenty-five sessions are divided into *decrees*, i. e. statements of Catholic doctrine or resolutions concerning disciplinary reform, and *canons*, or condemnations of heretical teaching.

*History of the Council.*—The first eight sessions were held at Trent, but in Mar., 1547, owing to the prevalence of the pest, it was transferred to Bologna, where the ninth and tenth sessions were held in spite of the absence of the bishops subject to the emperor, and of the latter's protestations, Sept. 17, 1549. It was therefore indefinitely prorogued. Julius III., Mar. 14, 1550, issued another call to the bishops to assemble at Trent, and May 1, 1551, the twelfth session was held. Neither the emperor nor the King of France desired to look on it as a continuation of the original council because of the susceptibilities of their Protestant subjects. The victories of Maurice of Saxony and his near presence at Innsbruck decided the fathers to suspend the council Apr. 28, 1552. It was again convoked by Pius IV. Jan. 18, 1562, and closed its work Dec. 4, 1563. Nine cardinals, 3 patriarchs, 33 archbishops, 237 bishops, 8 abbots, 8 generals of orders, and 150 theologians and canonists had taken part. Of the bishops, 187 were Italian. Queen Elizabeth was twice asked to take part, but refused. Mary, Queen of Scots, excused herself by the lamentable condition of the Church in her kingdom. Cardinal Pole and Thomas Goldwell, Bishop of St. Asaph, represented England, and three Irish bishops, Thomas O'Herlaghy, of Ross, Eugene O'Hart, of Achonry, and Donald McCongail, of Raphoe, represented Ireland.

*Work of the Council.*—The direct results of the council were visible in doctrinal statements and resolutions for reform. The rule of faith, the nature of original sin, the nature and office of grace (justification), the doctrine of the sacraments in general and particular, the Mass, orders, marriage, the censorship of books, the Catholic practices and traditional beliefs, the invocation of saints, purgatory, the veneration of relics and images, were all treated in the council with great wisdom, moderation, and exactness. The reforms were thorough and extended to the entire Church in the intention and provision of the fathers. Its results were a great relief to the conscience and intelligence of Catholics, and inaugurated at once a counter-reformation, personified in men like St. Charles Borromeo and St. Francis de Sales. It unified Catholics throughout the world, and put an end to the mental wavering and indecision of a great many, while it pointed out the evil and the false in the non-Catholic teachings. Altogether it marks a complete awakening in the Church, and is the starting-point of the modern ecclesiastical law, discipline, administration, and to a large extent of the theological formation itself, so much so that it can be said that no council since that of Nice has had a more profound influence. The council was acknowledged in most Catholic countries; in those whose civil authorities, like France, refused to accept its decrees, provincial councils and public opinion made it the ecclesiastical law and binding. Its doctrinal and disciplinary regulations are binding in the entire Catholic Church, though in some countries the decree *Tametsi* on the necessary presence of the parish priest and two witnesses for the validity of the marriage contract has never been proclaimed, this especial promulgation having been ordered by the council before the decree can obtain the character of a law in any given territory. See Tridentine Profession of Faith.

Literature.—The acts of the council are best found in Le Plat, *Monumenta ad historiam Concilii Trid.* (7 vols., Louvain, 1781–87). The original acts and debates, as prepared by the secretary, Angelo Massarelli, are in the Vatican Library, and were published in part, but unsatisfactorily, by Theiner, *Acta Genuina SS. Œcum. Concilii Trid.* (2 vols., Leipzig, 1875). Döllinger, Calenzio, and Sickel have published diaries, correspondence, and other information concerning the council. The original and authentic edition of the *Canones et Decreta Concilii Tridentini* is of 1564 (Rome). The history of the council has been written by Paolo Sarpi (Pietro Soave Polano) and Sforza Pallavicino, the former a Venetian Servite, the latter a Jesuit and a cardinal. The work of Sarpi appeared at London in 1619; that of Pallavicino in Rome 1652, and after many editions, *ibid.*, with notes of Zaccaria 1833. The work of Sarpi is written with great art, and he dissimulates much of his own feelings by indirect methods. Bossuet declared it the work of an enemy and not of an historian of the council. Pallavicino wrote his history out of the original acts preserved in the Vatican, and in many places has successfully exposed the inaccuracies and evil animus of Fra Paolo, who was for the rest an able, learned, many-sided writer, but proud, and bitterly opposed to the court of Rome. The Catechism of the Council of Trent, the diocesan seminaries, the new editions of the liturgical books and of the Vulgate, etc., are the outcome of the council, which committed to the care of the pope a number of projects left over at the closing. On Sarpi and Pallavicino, see Brischar, *Beurtheilung der Controversen Sarpis und Pallavicinos* (Tübingen, 1843); Ranke, *History of the Popes* (vol. iii., app. 2); L. Maynier, *Études critiques sur le Concile de Trente* (Paris, 1874). Other literature in Hergenroether, *Kirchen-Geschichte*, iii., 231, *seq.*, and Kraus, *Kirchen-Geschichte*, p. 567. The second edition of Hefele's *History of the Councils* (German) will contain the history of that of Trent. Cardinal Hergenroether undertook it (vol. ix., 2d ed.), but did not get beyond the preparatory period. J. J. Keane.

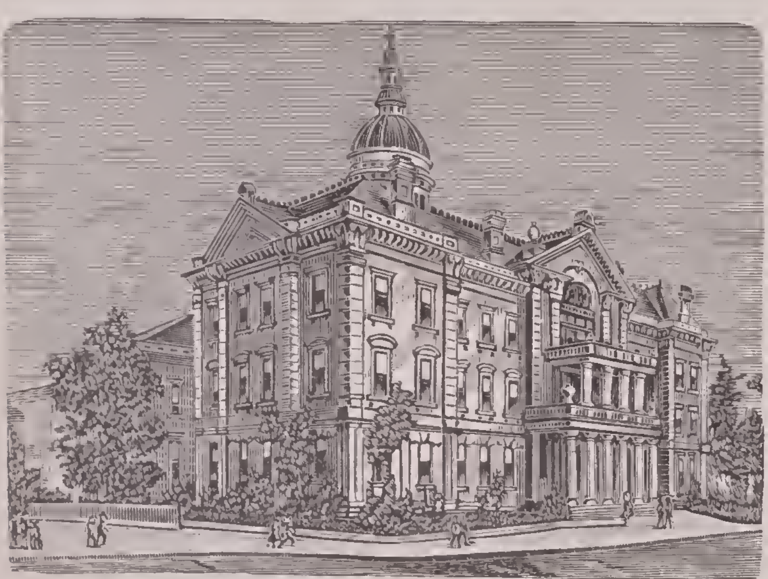
**Trente-et-Un**: See Rouge-et-Noir.

**Trenton**: port of entry of Hastings and Northumberland Counties, Ontario, Canada; on the Bay of Quinté, on both sides of the Trent, and on Grand Trunk and Central Ontario railways; 101 miles E. of Toronto (see map of Ontario, ref. 4–F). Immense quantities of timber are rafted down the river and shipped at this place, and it has large manufactures. Pop. (1891) 4,364.

**Trenton**: city; capital of Grundy co., Mo.; on the Welden fork of the Grand river, and the Chi., Rock Is. and Pac. and the Quincy, Om. and Kan. City railways, 85 miles N. E. of St. Joseph, 101 miles N. E. of Kansas City (for location, see map of Missouri, ref. 2–F). It is in an agricultural and stock-raising region, and has 6 churches for white people and 2 for colored, a public school with 22 rooms and over 1,500 enrolled pupils, Avalon College (United Brethren, chartered 1881), the Jewett Norris library with endowment of $15,000, a national bank with capital of $75,000, a State bank with capital of $75,000, 3 daily and 3 weekly newspapers, 3 flour-mills, 2 cigar-factories, 2 coal-shafts from which 35,000 tons of coal were taken in 1894, butter and cheese factory, gas and electric light plants, water-works, and street-railway. Trenton was founded in 1841, was chartered as a town sixteen years later, and became incorporated as a city with enlarged territory in 1893. Pop. (1880) 3,212; (1890) 5,039; (1900) 5,396.

EDITOR OF "REPUBLICAN."

**Trenton**: city; capital of New Jersey and of Mercer County; on the Delaware river, at the head of steamboat and sloop navigation; on the Delaware and Raritan Canal, and on the Penn. and the Phila. and Reading railways; 33 miles N. E. of Philadelphia, 59 miles S. W. of New York (for location, see map of New Jersey, ref. 4–C). Two iron bridges span the Delaware, connecting the city with its suburb, Morrisville, and the fertile farm-land of Bucks co., Pa. Trenton surrounds an apex in the course of the Delaware, is closely built through eleven of the fourteen wards, and has many wide streets lined with handsome residences. Cadwalader Park and its residential plot, Cadwalader Place, Monument Park, Tenth Ward Park, and Spring Lake Park are the well-kept and beautiful breathing-places. The city has an excellent sewerage system, good water-supply, paid fire and police departments, and an economical administration of local affairs.



State Capitol, Trenton, N. J.

*Public Buildings.*—There are a public library (other than the State Library in the Capitol), large opera-house, Y. M. C. A. building, three hospitals (the Mercer, City, and St. Francis), county court-house, Union Industrial Home, the State School for Deaf Mutes, State prison, arsenal, U. S. Government building, State Asylum for Insane, and the Industrial School for Girls. The Odd Fellows' Home stands in Ewing, near the city line. The Widows' and Single Women's Home, near the State-house, was formerly the barracks used during the French and Indian war.

*Churches and Schools.*—Trenton is the seat of a Protestant Episcopal and of a Roman Catholic bishopric. There are 48 churches and places of worship, including 10 Methodist Episcopal, 8 Roman Catholic, 7 Presbyterian, 6 Baptist, 5 Protestant Episcopal, 3 Lutheran, 2 African Methodist Episcopal, 2 synagogues, a church of the Messiah, and a Hicksite and an Orthodox meeting-place of Friends. The public schools embrace a high school and a score of subordinate schools. The first public school to be founded in the State was located at Trenton. Besides the common schools, the city contains the State Normal and Model Schools with over 1,000 scholars, 3 business colleges, 7 parochial schools and the Franciscan Convent of Minor Conventuals, the Union Industrial Home (formerly Children's Home), and a dozen private schools.

*Business Interests.*—An energetic board of health and a board of trade advance the city's interests. The First National, the Trenton Banking Company, the Mechanics' National, each with a capital of $500,000, and the Broad Street Bank are large financial institutions. Other important organizations are the Trenton Saving Fund Society, the Trenton Trust and Safe Deposit Company, and the Real Estate Title Company. Trenton is pre-eminently a manufacturing city. Thirty potteries making all classes of ware from drain-pipe to Belleek china, two tile companies, and several brick-yards comprise an industry which gives the northeast portion of the city (old Millham) the name Staffordshire of America. Iron and steel works, woolen-mills, flouring-mills, rubber and oilcloth works, and a large brewery are other representative establishments. Here also are located the great wire-works of the Roeblings, famous as the builders of the East river bridge between New York and Brooklyn.

*History.*—Trenton's site attracted settlers as early as 1679, when the place was called "Yᵉ ffalles of yᵉ De La Ware." It took its name from the rifts of rock in front of the town. Mahlon Stacy and other members of the Society of Friends purchased land, and Stacy built on the Assanpink in 1680 the second flour-mill in West Jersey. About 1715 Judge Trent bought a large plantation, and the place came to be called Trent Town (Trenton). A royal charter created Trenton a borough town about the middle of the eighteenth century, but the plan was soon abandoned. The Legislature frequently met here before Trenton became the State capital (1790). In 1792 the town was incorporated. The Continental Congress once met here after the Revolutionary war, and a project to have Trenton made the capital of the U. S. was defeated by State jealousies. Trenton is best known to history as the place where that battle was fought which perhaps turned the tide of the Revolution. On the morning of Dec. 25, 1776, Washington, with about 2,500 men, crossed the Delaware from Pennsylvania about 8 miles above Trenton, and after a forced march surprised Col. Rall, the Hessian commander, and captured his entire force. This event was followed by the battle of Princeton Jan. 3, 1777. A shaft costing $75,000, standing in Monument Park at the old Five Points, commemorates the event. A statue of Washington in the posture of directing his forces at Trenton surmounts the shaft. Previous to 1890 the township of Millham and Chambersburg borough were annexed, forming the eighth, ninth, tenth, and eleventh wards of the city. Pop. (1880) 29,910; (1890) 57,458; (1895) 62,518; (1900) 73,307.

FRANCIS BAZLEY LEE.

**Trenton**: city; capital of Gibson co., Tenn.; on the Mobile and Ohio Railroad; 32 miles N. by W. of Jackson, and 59 miles S. of Columbus, Ky. (for location, see map of Tennessee, ref. 6–B). It is in an agricultural region, and has 8 churches, Peabody High School, Laneview Academy, electric lights, 2 State banks (combined capital $83,000), 3 weekly papers, an extensive cotton-mill, 2 large roller flour-mills, cottonseed-oil mills, several foundries, and a box-factory. Pop. (1880) 1,383; (1890) 1,693; (1900) 2,328.

EDITOR OF "GIBSON COUNTY DEMOCRAT."

**Trenton Falls**: a series of falls and rapids in Trenton township, Oneida co., N. Y.; on the West Canada creek, a branch of the Mohawk river; on the N. Y. Cent. and Hud. Riv. and the Rome, Water. and Ogdens. railways; 17 miles N. by W. of Utica (for location, see map of New York, ref. 4–H). The stream flows through a ravine or chasm in the Trenton limestone from 70 to 200 feet deep, and the water has a descent of 312 feet in a distance of 2 miles by several falls, the most notable of which are Sherman's, 35 feet; High, 80 feet; Milldam, 15 feet; and Prospect, 20 feet. The surrounding scenery is remarkably wild, and the clearly defined stratification of the rocks affords an interesting study. The locality has many other attractions, such as the Alhambra amphitheater and the Rocky Heart, and is a place of popular resort.

**Trenton Group**: a division of the rocks deposited during the Lower Silurian period, and named from Trenton, N. Y., where they were first studied. The terrane is composed principally of limestone, and forms the surface over large areas in the U. S. and Southern Canada. In New York it is about 100 feet thick, and increases to 2,000 in Pennsylvania, but becomes thinner southward along the Appalachians. It has also a broad development in the upper Mississippi valley, where the average thickness is 300 feet. The subdivisions or stages usually recognized are the Trenton, Utica, and Cincinnati. Invertebrate marine fossils abound. It is from the Trenton limestone in Ohio that most of the petroleum of that State is obtained. ISRAEL C. RUSSELL.

**Trepang**: See BÊCHE-DE-MER and HOLOTHURIANS.

**Trephining**, or **Trepanning** [*trephining* is from Fr. *tréphine*, a trephine, an arbitrary deriv. of *trépan*, trepan; *trepanning* is from O. Fr. *trepaner*, to trepan, deriv. of *trepan*, a trepan < Late Lat. *tre'panum*, from Gr. τρύπανον, borer, auger, trepan, deriv. of τρυπᾶν, bore]: the surgical procedure of removing a "button of bone," or circular section of bone, by means of the circular instrument known as the trepan or trephine. The cutting part consists of a circular saw-toothed edge, different sizes having diameters of half an inch to two inches, the older instruments having a vertical body and smooth sides, the more modern having a slightly conical body and burred, cutting sides. The old instrument, the trepan, was worked by a wimble or curved auger-handle; the modern, the trephine, has a short handle with crossbar like a gimlet, and is worked by one hand. A center-pin is provided, which acts as a pivot upon which the sawing edge can revolve; this pin is to be raised after the saw has entered the bone. The trephine is used chiefly upon the skull, although sometimes employed in other parts to evacuate pus in bony cavities, as of the face, the ends and shafts of long bones. Trephining the skull was heroically and recklessly practiced by the ancients, and especially by empirics, for every fancied brain disease; often at several points, and many times upon the same person. Modern surgery limits it to cases of fracture of the skull, where bone is depressed or symptoms of intracranial irritation are present; to the removal of clots from the surface of the brain; to the exposure of the brain to facilitate the removal of tumors or cicatrices from that organ; and to the evacuation of pus which has formed within the cranium, either the result of injuries and disease of the skull or of acute cerebral abscess. The trephine by its conical shape and rough sides is protected from cutting the brain. As soon as the inner table of the skull is cut through, the button of bone is pried out or removed by forceps, and the edges of the circular opening are cleared of all spiculæ of bone. The depressed bone is then elevated by means of a lever, clots are washed out, or the abscess is incised, etc., care being taken never to cut into the great venous sinuses. Trephining is more often performed for the relief of cerebral abscess or tumor than formerly, since modern diagnosis of the site of brain lesions is more definite. But for the relief of depressed bone in fractures of the skull it is less often resorted to. Hey's saw, or "rongeur" forceps, obviates the necessity of trephining in many cases. By these instruments the points and angles of bone may be removed, and a place of entrance for the lever or "elevator" secured, without the loss of sound bone, which the trephine involves. Revised by JOHN ASHHURST, Jr.

FIG. 1.—The trephine.

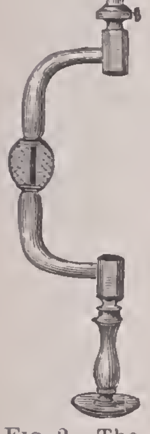


FIG. 2.—The ancient trepan.

**Trescot**, WILLIAM HENRY: diplomatist; b. in Charleston, S. C., Nov. 10, 1822; graduated at the College of Charleston 1840; admitted to the bar 1843; U. S. secretary of legation in London 1852–53, and Assistant-Secretary of State of the U. S. 1857–60; elected to State Legislature, South Carolina, 1862, 1864, 1866; in 1877 appointed counsel for the U. S. on the fishery commission at Halifax, N. S.; in 1880 one of the plenipotentiaries to China to revise the treaties with that country; in 1881 continued and concluded the negotiations with the Colombian minister, and the protocol in reference to the rights of the U. S. on the Isthmus of Panama; in same year became special envoy extraordinary and minister plenipotentiary of U. S. to Chili, Peru, and Bolivia; in 1882 plenipotentiary with Gen. Grant to negotiate a commercial treaty with Mexico; afterward practiced law in Washington, D. C.; author of several works, including *The Diplomatic History of the Administrations of Washington and Adams* (Boston, 1857). D. May 4, 1898.

**Trespass** [from O. Fr. *trespas*, deriv. of *trespasser*, pass over, transgress, die; *tres-* ( < Lat. *trans*, over, beyond) + *passer*, pass]: in law, a species of tort, consisting in an unlawful act done to the person or property of another by means of direct violence, actual or constructive. The essential feature of this delict in legal contemplation is the direct violence, which may be actual, as in the case of an assault and battery, or constructive, as in the case of an unauthorized entry upon the land of another, and doing thereby mere nominal damage. This notion was expressed in the common-law pleading by the necessary allegation that the act was committed *vi et armis*. The amount of force used, the intent, and the extent of the injury done are immaterial elements in constituting the tort, and only affect the damages recovered. Trespasses are separated into three classes—to person, to personal property, and to real property. The principal trespasses to the person are ASSAULT AND BATTERY and FALSE IMPRISONMENT (*qq. v.*). Trespass to personal property may consist either in forcible direct injury to the chattel, or in taking and carrying it away from the custody of its owner. Trespass to real property is an unlawful entry upon the land of another—in the old legal language, "the breaking and entering another's close." The damages may be aggravated by wrongful acts done on the land, but such acts do not form the gist of this species of tort. The commission of a legal act in an illegal manner may be a trespass, as the abuse or wrongful execution of process by an officer, and the like. It is a general doctrine of the law that if one begins to do a legal act in a proper manner, and then in its further prosecution is guilty of wrongs which amount to a trespass, he thereby becomes a trespasser from the beginning (*ab initio*). The remedy in all cases of this tort is the recovery of compensatory damages by the injured party; and if the wrong was willful, malicious, and without excusing circumstances, exemplary or punitive damages may be added by the jury.

The term "trespass" is also the name of the common-law form of action which must be used to recover damages from the wrongdoer when the delict complained of is a trespass. Revised by F. M. BURDICK.

**Trevel'yan**, Sir CHARLES EDWARD: statesman; b. in England, Apr. 2, 1807; entered the civil service of the East India Company; was employed in important posts; made to the viceregal government at Calcutta elaborate reports on various subjects, one of which led to the abolition of some oppressive imposts; secured the aid of the government to the promotion of European literature and science among the natives of India; in 1840 was appointed assistant secretary to the treasury; was knighted in 1848 for services in connection with the Irish famine; was instrumental in the revision of the civil establishment and in throwing open the civil service to competition. As finance minister in India, 1862–65, he made reforms in the system of accounts, and cooperated in the immense extension given at that time to public works; on his return resumed his efforts to secure the abolition of the system of purchasing commissions in the army, which system he had long opposed; was created a baronet 1874, and took a leading part in several important charities. Among other works he wrote *Education of the People of Ireland* (1838); *The Irish Crisis* (1848); *The Purchase System in the British Army* (2d ed. 1867); *The British Army in 1868* (1869); *Christianity and Hinduism* (1881). D. in London, England, June 19, 1886.

**Trevelyan**, Sir GEORGE OTTO: statesman and author; son of Sir Charles Edward; b. July 20, 1838, at Rothley Temple, Leicestershire, England; educated at Harrow School and Trinity College, Cambridge; entered the East Indian civil service; returned from India, and was elected to Parliament from Tynemouth as a Liberal 1865; became civil lord of the admiralty under Mr. Gladstone's second administration Dec., 1868, but resigned office July, 1870, being opposed to the Government Education Bill. He was secretary for Scotland 1885-86, and held that office again from 1892 to 1895. Among his writings are *Letters of a Competition Wallah*, republished from *Macmillan's Magazine* (1864); *Cawnpore* (1865); *The Ladies in Parliament, and other Pieces* (1869); *The Life of Lord Macaulay* (2 vols., 1876; 2d ed. 1877); *The Early History of Charles James Fox* (1880).

**Treves**, treevz (Germ. *Trier*): town of Rhenish Prussia, 69 miles by rail S. W. of Coblenz; on the right bank of the Moselle, beautifully situated among the vineclad hills of that river (see map of German Empire, ref. 6-C). It has a cathedral, chiefly of the eleventh century, containing among its relics the famous HOLY COAT OF TREVES (*q. v.*); a church dedicated to the Virgin dating from the thirteenth century (Liebfrauen Kirche), and other ecclesiastical buildings; a library containing 100,000 volumes, a hospital, manufactures of woolens, cottons, and linens, and a large trade in timber, grain, and wine. The Moselle is here crossed by an eight-arched bridge, 623 feet long. Treves is the most ancient city of Germany (a fabulous Latin inscription on the wall of the Rothe Haus says it was built *before Rome*). The Emperor Augustus established here a Roman colony under the name of *Augusta Trevirorum*. In later days it was the residence of the Emperors Constantius, Constantine, Julian, Valentinian, Gratian, and Theodorus, and if not—as Ravenna was a little time afterward—the head of the Western world, at least the head of all the lands beyond the Alps. Almost annihilated during the subsequent barbarian invasions, it rose under the archbishops of Treves to nearly its earlier splendor. It is now a decayed town, but one of high antiquarian interest from its numerous Roman remains. Pop. (1890) 36,166. Revised by M. W. HARRINGTON.

**Treviso**, trā-vee'sō (anc. *Tauri'sium*, or *Tarvi'sium*): town; province of Treviso, Italy; on the Sile; 17 miles N. of Venice by rail, in a very fertile region (see map of Italy, ref. 2–D). It is an agricultural town, and a center for the silk industry, besides manufacturing hardware, paper, and other articles. The cathedral is an imposing building, the five cupolas producing a grand effect, and in its interior, as well as in that of the Church of S. Niccolò di Bari, pictures and sculpture of much merit are preserved. Treviso has a public library, a theater, a chamber of commerce, and several educational institutions. Pop. of commune (1893) 35,200.

**Trev'ithick**, RICHARD: inventor; b. at Illogan, Cornwall, England, Apr. 13, 1771; was brought up to the business of a mechanical engineer in the Cornish mines; constructed several steam-engines, introducing various improvements, one of which was the introduction of wrought-iron cylindrical boilers (see RAILWAYS), but, his engine having blown up, popular prejudice was aroused and the practical use of the invention postponed for many years. Trevithick devoted himself anew to engineering work in the Cornish mines, continually inventing and making improvements in machinery; sent to Peru in 1814 nine of his small high-pressure condensing engines, for use in some mines in which he acquired an interest; went thither himself in 1816 as directing engineer; returned to England 1827; resumed operations as an engineer; made various inventions and mechanical improvements of widely different kinds, including warming apparatus, iron stowage-tanks, iron buoys, a gun-carriage for single-decked ships, a furnace for purifying silver ores, an hydraulic engine, a salt-water distilling apparatus, and floating docks, some of which were patented by him. D. at Dartford, Kent, Apr. 22, 1833.

**Trev'or**, GEORGE, D. D.: clergyman and author; b. in England in 1809; graduated at Oxford 1836; chaplain on the Madras establishment 1836–45; became chaplain to the high sheriff of Yorkshire, rector of All Saints, York, and canon of York minster 1847; was elected chaplain of the parish church at Sheffield 1850, but was refused induction by the vicar, a proceeding which led to suits in chancery and in the court of queen's bench, in which he was successful; became rector of Burton Pidsea 1868, was the most active promoter of the revival of the house of convocation for the archdiocese of York, in which body he was actuary of the lower house and synodal secretary to the two houses, and was in 1871 collated to the rectory of Beeford-with-Lisset, near Hull. He published a number of works, including *Christ in his Passion* (1847); *Sermons on Doctrines and Means of Grace* (1851); *Origin, Constitution, and Form of Proceedings in the Convocation of the Two Provinces of Canterbury and York* (1852); *The Catholic Doctrine of the Sacrifice and Participation of the Holy Eucharist* (1869); *India, its Natives and Missions* (1862); *Russia, Ancient and Modern* (1862); *Egypt from the Conquest of Alexander to Napoleon* 1866); and *Rome from the Fall of the Western Empire* (1869). D. June 18, 1888.

**Trevor**, Sir JOHN: politician; b. at Brynkinallt, Denbighshire, Wales, about 1633; was a cousin of Chancellor Jeffreys, by whom he was favored in his professional career; was elected to Parliament 1679; chosen Speaker of the new House of Commons May, 1685; became master of the rolls Oct. 20, 1685; sworn of the privy council July 6, 1688; was dismissed from office by William and Mary; was an energetic opponent of the Government in the Convention Parliament 1689, but soon made his peace with the court, with the consent of which he was unanimously elected Speaker Mar. 20, 1690; was intrusted by the Government with the task of conciliating political opponents by means of promises and rewards; made first commissioner of the great seal May 14, 1690; restored to the office of master of the rolls Jan., 1693; reported by a parliamentary committee guilty of bribery Mar. 12, 1695, and by vote of the House, to which he himself as presiding officer had to put the question, was declared guilty of a high crime and misdemeanor; resigned the speakership, and was a few days later formally expelled. He retained, however, the position of master of the rolls for the rest of his life, more than twenty-two years, and seems to have filled that office without reproach, his decisions being still quoted with respect. D. May 20, 1717, and was buried in the Rolls' Chapel.—He must not be confounded with his cousin and contemporary, Sir JOHN TREVOR (1626–72), who was envoy to France and Secretary of State under Charles II., and son-in-law to the celebrated Hampden.

**Triacan'thidæ** [Mod. Lat., named from *Triacan'thus*, the typical genus; Gr. τρεῖς, τρία, three + ἄκανθα, thorn, spine]: a family of teleost fishes of the order *Plectognathi* and sub-order *Scleroderma*, and the most fish-like of the order. The skin covered with small, rough, closely adherent scales; the head compressed and conical in profile; the eyes lateral; the opercular bones comparatively well developed; the mouth small and terminal; the upper jaw has its elements very imperfectly united; teeth are developed on the jaws in variable form; the branchial apertures are narrow slits in front of the pectoral fins; the branchiostegal rays are completely concealed; the dorsal fins are two in number—(1) spinous, with from four to six spines, and (2) an oblong soft one; ventral fins represented mostly by a pair of strong spines articulated with a long and compressed pelvic bone; the air-bladder is closed and simple. The family is composed of three well-marked genera—(1) *Triacanthus*, confined to the Indian and Australian seas; (2) *Triacanthodes*, of which a single species only has been found in Japan; and (3) *Hollardia*, one species of which has been found in Cuba. Revised by E. A. BIRGE.

**Triad** [from Gr. τριάς, τριάδος, the number three, a three of anything, trio]: in music, a chord consisting of a bass or root, with a third or fifth. See HARMONY and MUSIC.

**Trial** [from O. Fr. *trial*, deriv. of *trier*, try < Lat. **tritare*, frequentative of *te'rere*, rub]: the formal judicial examination and decision of the issues, whether of law or fact, pending between the parties to an action, preliminary to the judgment which finally determines the rights and liabilities of the litigants. For convenience, forensic trials in the U. S. may be divided into three generic classes—the trial of (1) legal actions, (2) equity suits, (3) admiralty causes.

*Legal Actions.*—Though formerly all legal actions were ordinarily tried before a jury, recent legislation, both in England and the U. S., has provided that by the consent of the parties, and in some cases without their consent, the jury may be dispensed with and the issues submitted to the court or to a referee; but since the only difference between the proceedings before a court or referee and those before a jury is that in a jury trial there are certain additional details, viz., the selection of the jurors, the judge's charge to them, and their verdict, these three modes of trial (before a jury, judge, or referee) may be described together.

The first step in the proceeding, after a cause has been called and is ready for trial, is (in a jury trial) the drawing and impaneling of a jury, the members of which must be taken, as a general rule, from men who have their domicile within the county where the court sits. From all the names of the jurors, written upon slips of paper and deposited in a box, the clerk draws at random the names of twelve who are to act in the particular case. As each one is announced, either party may challenge the person and proceed to ascertain whether for any reason he is incompetent to sit as a juror in that cause, the qualifications for jury duty being usually fixed by statute and referring to residence, political status, prejudice or liability to bias, mental condition, property, etc.; and a stricter rule of qualification is applied in criminal than civil cases. Besides such challenges for cause, in criminal trials the accused, and in many States the prosecution, are allowed a certain number of peremptory challenges; that is, they may exclude a certain number of the jurors drawn without giving any reason therefor; and a smaller number of peremptory challenges are in some States allowed to the parties to a civil action.

When the twelve men have been obtained they are sworn by the clerk to render a true verdict according to law and the evidence given; and this brings the proceedings to their second stage, which consists of the production of the proofs in the presence of the jury. The counsel for the party holding the affirmative, who is almost always the plaintiff, briefly explains the nature of his client's claim, and examines his witnesses, who are then cross-examined by his opponent, and sometimes re-examined directly. The opposite party then proceeds in the same manner to state and prove his version of the case. At the close of the plaintiff's evidence the defendant may move for a non-suit; and if in the opinion of the court no cause for action has been shown, even assuming the truth of all the facts stated by the witnesses, the motion will be granted and the case at once dismissed. On the other hand, a verdict may be directed for the plaintiff if his right to it clearly appears from uncontradicted proof, but this seldom happens, there being usually a conflict of evidence which must be submitted to the judgment of a jury. The court entirely regulates the admission of evidence, and either party may except to its rulings of what facts are competent and what are not competent, to be proved, and what questions are proper and what improper, and the points of law thus raised are examined upon appeal.

When the evidence is all in, the counsel address the jury on behalf of their respective clients. The order of these addresses varies in the different States, but, as a general rule, the party holding the affirmative closes and sometimes also opens the argument, though in some States the right of closing in criminal cases is given to the accused. Next comes the judge's charge to the jury. This charge is in many States restricted by statute to a simple statement of the legal rules, and in several of them it must be in writing; but at common law the judge may comment upon the facts, and, as it has been held, may even express an opinion, provided the jury is left free to decide. Either party may request particular instructions to be given, and may except to the charge, or a portion thereof, or to a refusal to charge as requested, such exceptions presenting questions of law for review by the appellate court.

After they have been charged, the jury retire to a private room to determine upon their verdict, which must be unanimous. After the jurors have retired to consider their verdict, they are not allowed to separate till it is found and delivered in open court, except in some cases after the finding of a sealed verdict. When they have agreed, they return into court, announce their verdict, and it is recorded by the clerk in his minutes. If they can not agree upon a verdict the court may, in most cases, at least, dismiss them after a reasonable time. If at any time in the trial of a cause it becomes necessary to discharge a jury because of the serious illness or the insanity of one of its members, or because the jury can not agree upon a verdict, the discharge has been held, in the majority of cases, not to constitute a bar to a second prosecution. When the trial is before the court or a referee, instead of a verdict, a written find is filed by the judge or referee containing his conclusions of fact and of law.

The general rules of evidence are the same in criminal as civil cases, i. e. the best evidence must be given. The court decides as to the admissibility of evidence, but it is the peculiar province of the jury to pass upon the weight of evidence and the creditibility of witnesses. See EVIDENCE.

*Equity Suits.*—The original practice in chancery was for witnesses to be examined privately, without the presence of counsel, by an examiner or one or more commissioners appointed by the court. The examination was conducted by means of written interrogatories and cross-interrogatories, prepared by the counsel for the respective parties, or by the court itself, and the testimony was kept secret till all the witnesses had been examined. The reading of the depositions thus obtained, and of the pleadings, together with the arguments of counsel, constituted the trial, and the chancellor then gave his decision as suited his convenience. The great objection to this practice was that till publication of the testimony each party was left in ignorance of what facts his opponent would attempt to establish, so that, although it is still retained by a few States, in most of them the methods and proceedings in the trial of an equity suit have been made the same as those in a legal action before a judge or referee. The testimony of witnesses is reduced to writing, and an accurate transcript of all proceedings preserved by means of official stenographers, who are now generally employed in the superior courts both of the U. S. and of England.

*Admiralty Causes.*—The usual practice in the trial of civil causes in admiralty is very much like that which originally prevailed in equity, the evidence being taken by the clerk, and the court merely hearing the case summed up; but in some States of the U. S. the testimony is taken in open court. The common-law rules of evidence do not apply. In admiralty, trial by jury is not a right unless expressly given by statute; but when it is so given, and in criminal cases within the jurisdiction of admiralty, the same forms are employed as in a jury trial in legal actions. In the U. S. the federal courts alone have jurisdiction of admiralty cases. See the articles on PROCEDURE, PRACTICE, ADMIRALTY, EQUITY, COURTS, and JURISPRUDENCE; and also the treatises on practice by Chitly and Daniell, and John W. Smith's *Elementary View of the Proceedings in an Action at Law*; Stephen's *History of the Criminal Law of England.* Revised by F. STURGES ALLEN.

**Triangle** [viâ O. Fr. from Lat. *trian'gulum*, triangle, liter., neut. of *trian'gulus*, three-cornered; *tres*, three + *an'gulus*, angle, corner]: a surface bounded by three sides, and consequently having three angles. A triangle may be *plane*, *spherical*, or *spheroidal*.

*Plane Triangles.*—A plane triangle is a plane surface bounded by three straight lines. These lines are called *sides*, and the points at which the sides meet are called *vertices* of the triangle. Plane triangles may be classified either with respect to their sides or with respect to their angles. When classified with respect to their sides, we have—(1) *scalene* triangles, in which no two sides are equal; and (2) *isosceles* triangles, in which two of the sides are equal; the *equilateral* triangle is a particular case of the isosceles triangle in which all of the sides are equal. When classified with respect to angles, we have—(1) *right-angled* triangles, which have one right angle; and (2) *oblique-angled* triangles, in which all of the angles are oblique; triangles of the latter class may be *acute-angled* triangles, all of whose angles are acute, or *obtuse-angled* triangles, each of which has one obtuse angle. The sides and the angles of a triangle are called *elements*; the side on which it is supposed to stand is termed the *base*; and the vertex of the opposite angle is then called a *vertex* of the triangle; the distance from the vertex to the base is the *altitude* of the triangle. The area of a triangle is equal to the product of its base by half its altitude.

*Spherical Triangles.*—A spherical triangle is a spherical surface bounded by arcs of three great circles. These arcs are called *sides*, and the points at which the sides meet are *vertices*. The diedral angles between the planes of the sides are the angles of the triangles. In most cases of practice the sides of the triangles considered are supposed to be less than semicircles. Spherical triangles are classified in the same manner as plane triangles, and corresponding parts receive corresponding names. There is, however, this difference: a spherical triangle may have two right angles, or it may have three right angles; it may even have three obtuse angles. In addition to the terms common to both plane and spherical triangles, we may add the following, peculiar to the latter class: Two spherical triangles are *polar* when the vertices of each are poles of the sides of the other; in this case any element of either is the supplement of the opposite element of the other. A *quadrantal* triangle is one in which one side at least is a *quadrant*. The following are some of the properties of spherical triangles: (1) The greater of two sides lies opposite the greater of the two opposite angles, and conversely; if two sides are equal, their opposite angles are equal, and conversely. (2) Any side is less than the sum of the other two, and greater than their difference. (3) The sum of the three angles may have any value between two right angles and six right angles. (4) The difference of any two sides is less than two right angles, and the sum of the three sides is less than four right angles. (5) The sum of any two angles is greater than the supplement of the third. (6) If the sum of any two sides is equal to two quadrants, the sum of their opposite angles is equal to two right angles, and conversely. (7) If the angles are all acute, each of the sides is less than a quadrant; if the angles are all obtuse, each of the sides is greater than a quadrant; if the angles are all right angles, each side is a quadrant. (8) The area of a spherical triangle is equal to its spherical excess multiplied by the square of the radius of the sphere; the spherical excess is found by subtracting 180° from the sum of the three angles; the area of the trirectangular triangle is equal to one-half of a great circle. See TRIGONOMETRY. Revised by S. NEWCOMB.

**Triangle of Forces**: a modification of the parallelogram or polygon of forces from which it may be stated that "if three forces in one plane be in equilibrium about a point, and if on that plane any three mutually intersecting lines be drawn parallel to the directions of the three forces, a triangle will be formed, the lengths of whose sides will be proportional to the magnitude of the forces."

**Triangular Numbers**: See FIGURATE NUMBERS.

**Triangula'tion**: the operation of determining the relative positions of points by means of measured base-lines and angles. A precise triangulation is essential for the accuracy of a survey covering a large area. The base-line, which is rarely more than 10 miles long, is measured with great precision by a special apparatus. This is connected through a series of triangles with the stations whose positions are to be determined, and all the angles being carefully measured, the data are at hand for computing the distances, directions, and differences o. latitude and longitude.

Although the determination of distances by triangles was known to the ancients, it was not until 1617 that the possibility of an extended accurate triangulation from a short measured base was demonstrated. This was done in 1617 by Snellius, who measured such a base at Speyer in Germany. Many triangulations were made during the seventeenth and eighteenth centuries for the purpose of measuring the length of a degree and the size of the earth; those made in Lapland in 1736 and in Peru in 1740 decided that the shape of the earth was that of an oblate spheroid. Near the end of the eighteenth century a triangulation in France and Spain was undertaken for the purpose of finding an accurate value of the length of the earth's quadrant in order that the meter might be made one $\frac{1}{10000000}$th part of this length. During the nineteenth century triangulations have been carried on in all civilized countries for the location of stations for topographical surveys, and also incidentally for the determination of the figure of the earth. Central Europe is covered with a network of triangles, while many long series exist in India and the U. S.

Besides the measurement of base-lines and of angles, triangulation involves the astronomical operations for finding the azimuths of lines and the latitudes and longitudes of stations. These being observed at a few points, those of the others are computed from the angles and distances. See COAST AND GEODETIC SURVEY, and GEODESY.

MANSFIELD MERRIMAN.

**Trias'sic Period**: the division of geologic time following the Carboniferous and preceding the Jurassic. The name originated in Germany, and records the fact that German formations of that date were grouped in three series. These are the Bunter sandstone below, the Muschelkalk, and the Keuper marls above. Modern usage adds the overlying Rhetic clays and sandstones. Formations of this age are extensively developed in Europe and Asia, and are less confidently correlated in Africa, New Zealand, and Australia. The Newark sandstone of the eastern part of the U. S. is probably Triassic, and the red beds of the Rocky Mountain region are with much doubt referred to the same period. On account of the difficulty of classifying the American Mesozoic formations according to European standards, and especially the difficulty of distinguishing Triassic formations from Jurassic, the U. S. Geological Survey, in the publication of its atlas of the U. S., substitutes a single period, the Jura-Trias, for the Triassic and Jurassic periods of the European chronology. See JURA-TRIAS PERIOD, and for the flora of this period, PLANTS, FOSSIL. G. K. GILBERT.

**Tribe** [Lat. *tribus*]: originally a third part of the Roman people—one of the three tribes that founded the city of Rome; hence in historical literature a name for a subdivision of a nation or stock not yet organized as a civil state; hence, further, in sociology and ethnology a name for any union of hordes or clans which is a subdivision of a folk.

*Clan, Tribe, and Nation.*—No ethnographic term has been more often used in the pages of historians, travelers, and missionaries than "tribe," and none has been used more unintelligently. As a rule, it is almost impossible to determine whether a writer means by "tribe" a horde, a village, a clan or gens, or a nation. A horde is an aggregation of four or five to twenty or thirty simple families—each family consisting of father, mother, and children. The horde is found only among the lowest savages, such as the Australian Blackfellows, the Bushmen of South Africa, the Fuegians at the southern extremity of South America, and the Arctic Highlanders of Northern Greenland, or as a degenerate form in civil communities. It has no political organization. A totem-kin (see TOTEMISM), clan, or gens, is a group of real or nominal kindred, claiming descent from a common ancestor, and tracing relationship through mother names (metronymic) or through father names (patronymic), but never through both, and usually forbidding marriages between men and women of the same gentile name. A phratry is a union or brotherhood of clans which is not an independent tribe, but only a subdivision of one. A tribe is a union of hordes under the leadership of a chief for common defense or common aggression, or it is a similar union of clans or of phratries. A tribe always claims a certain territorial region as its domain. A nation, in the ethnic as distinguished from the civic sense of the word, is a federation of tribes which speak dialects of a common language, which have a common culture, and which are crossed by the same clan lines. The nation is essentially a political organization; the tribe is essentially a military organization; the phratry is a religious organization; the clan or gens is a juridical organization; the family is an economic organization.

*Savage and Barbarous Tribes.*—The lowest Australian hordes are loosely united in tribes that number 200 or 300 each. In the more advanced Australian tribes hordes and tribes are crossed by elaborate totemistic kinships.

The North American Indians afford the finest examples of metronymic tribal organization. The Seneca tribe of the Iroquois, for example, was constituted of eight totem-kins, namely, Wolf, Bear, Turtle, Beaver, Deer, Snipe, Heron, Hawk. The Cayuga tribe was constituted of the same eight totem-kins, with the exception of the Eel in place of the Heron. The Onondagas had the same totem-kins as the Cayugas, except the Ball in place of the Hawk. The Oneidas had the Wolf, Bear, and Turtle totem-kins, and the Mohawks had the same as the Oneidas. These five tribes, mistakenly called the Five Nations by historians, were the famous Iroquois confederation, or nation. Each totem-kin religiously maintained the following rights and obligations, namely: The right to elect its sachem and chiefs—women shared in the election; the right of deposing its sachem and chiefs; the obligation not to marry in the totem-kin; mutual rights of inheritance of the property of deceased members; reciprocal obligations of help, defense, and redress of injuries; the right of bestowing names upon its members; rights in a common burial-place. The totem-kin regulated its affairs through a council. The affairs of the tribe were governed by a council of chiefs. As a rule, each tribe occupied more than one village. A similar organization, but patronymic in its relationships, may be studied at the present time among the Wyandottes and among the Omahas.

In patronymic society, where the wife follows the residence of the husband, the clan may become easily identified with a local group, and there is always a probability, therefore, that the hasty observer of patronymic communities has confounded the village with the clan or with the tribe. The local group, nevertheless, upon examination may turn out to be a subdivision of a clan or a cluster of clans, or even a cluster of tribes. All of these forms may be studied among the Semites of the Arabian desert, among the Ostyaks inhabiting the dreary northern country along the banks of the Obi and its tributaries, and elsewhere in Asia and in Africa.

*Historical Tribes.*—Tribes that history represents as descended from an eponymous ancestor were seldom so in fact. More often they were confederations compacted by war. W. Robertson Smith's studies (*Kinship in Arabia*) have shown how artificial were the Arabian and Hebrew genealogies. Artificial, too, was the division of the Hebrews into twelve tribes, of the Athenians into ten tribes. The clans of the Hebrew tribes are designated in the English translation of the Old Testament as "houses" (e. g. Numbers i. 2, 4; Joshua xxii. 14). The organization of the Grecian φυλή and of the Roman tribe, of the Grecian φράτρα and of the Roman curia, of the Grecian γένος and of the Roman gens, were, in essential respects, like those of the tribe, phratry, and clan among uncivilized peoples to-day. The tribal organization of the ancient Irish, as revealed in the Brehon laws, was not less elaborate. The Tuath or Cinel was the tribe, occupying a defined territory, and paying homage to its flaith or chief, sometimes called a king. The Sept was the true clan or gens, though the name *clann* was often applied to the Tuath. The Fine was a sub-clan closely resembling the compound patriarchal family, or "house," that still survives in Slavonic communities. The tribal organization of the Germanic stock has never been satisfactorily made out. The one thing certain is that the so-called seven great tribes—namely, the Swabians, Frisians, Saxons, Alemanni, Franks, Thuringians, and Bavarians—were not tribes, but nations. Each was subdivided into tribes, which, in turn, were subdivided into clans.

*Tribal and Civil Divisions.*—The substitution of territorial subdivisions for tribal lines, and therewith the transition from gentile to civil societies, was brought about, after tribes had settled down to a permanent agricultural life, by the intrusion of men whose ties of kinship had been broken, and whom it was necessary to include in the military and tax-paying population. The transition was marked in the Athenian commonwealth by the institution of the local tribe. The subdivision of the local tribe into demes roughly followed the subdivision of the tribe into gentes. It is probable that English counties correspond roughly to Saxon tribal domains and hamlets to clan settlements. See SOCIOLOGY.

Morgan, *Systems of Consanguinity and Affinity of the Human Family* (Washington, 1871) and *Ancient Society* (New York, 1877); W. Robertson Smith, *Kinship in Arabia* (London, 1885); Laurence Ginnell, *The Brehon Laws* (London, 1894); Frederic Seebohm, *The Tribal System in Wales* (London, 1895); and the writings of J. W. Powell and J. Owen Dorsey in the Reports of the Bureau of Ethnology (Washington).

FRANKLIN H. GIDDINGS.

**Tribonia'nus**: b. at Side, Paphlagonia; quæstor, consul, and master of the offices to Justinian, who in 528 appointed him one of the ten commissioners to form the first *Codex*, in 530 as president of the sixteen lawyers commissioned to compile the *Digest* or *Pandects*, and in 532 one of the three to edit the *Institutes*. He is described as a learned and highly gifted man, but avaricious and of low moral standing. It is hardly possible to form any estimate of the services of Tribonianus as distinct from those of the other commissioners. He had the superintendence of the *Digest*, and may have taken the chief part not only in gathering and sifting the materials, but also in forming the plan. D. about 545.

Revised by M. WARREN.

**Tribune** [from O. Fr. *tribun* < Lat. *tribu'nus*, tribune; liter., chief of a tribe; deriv. of *tri'bus*, tribe]: a person holding any one of several different Roman offices.

1. The military tribunes (*tribuni militum*) were officers standing directly under the commander-in-chief and above the centurions. There were six such tribunes in each legion. They were originally appointed by the king, and, in the republic, by the consuls. In the later republic a portion—ultimately the twenty-four tribunes of the four older legions—were annually elected by the people in the assembly of the tribes (*comitia tributa*). Under the kings there was also a special tribune of cavalry (*tribunus celerum*), an officer who reappeared in the republic when a dictatorship was proclaimed, as master of the horse (*magister equitum*).

2. *Consular Tribunes.*—During the conflict between the orders, when the plebeians were agitating for admission to higher offices, the election of consuls was discontinued for a series of years (444 to 367 B. C.). In their stead were annually elected from three to six military tribunes (an office which plebeians had long been capable of filling) with consular powers (*consulari imperio*).

3. The plebeian tribunes (*tribuni plebis*) were the defenders of their order against the patrician magistrates, and its leaders in its long struggle for civil and political equality. When this struggle ended with the complete triumph of the plebeians and their admission to all the higher offices, the tribunate, endeared to the people by service to liberty, continued to exist, representing, however, not the interests of the plebeians only but those of the whole people.

This office, according to the Roman tradition, was established in consequence of the first secession of the plebs (494 B. C.), and it is probable that the first plebeian tribunes were the *tribuni militum* who had led the plebs across the Anio. Later, ten tribunes were annually elected by the plebeians. Their "right of help" (*jus auxilii*) was made effective by giving them a general power of arrest (*jus prensionis*), from which the consuls themselves were not exempt, and, later, a power of fining (*multæ dictio*). Their persons were inviolable; in the early republic he who offered violence to a tribune could be slain without trial. Their right of help, originally exercised in single cases of injustice and oppression, grew into a general right of prohibiting or "vetoing" any action of the magistrates or senate. They also summoned and presided over the councils of the plebs (*concilia tributa*), and when these councils became regular assemblies (*comitia*), with legislative and judicial powers, the tribunes exercised an initiative in legislation and in criminal prosecution—powers theoretically concurrent with those of the regular magistrates who presided over the centuriate assembly (*comitia centuriata*), but actually superior, since measures proposed by a consul or prætor could be vetoed by a tribune, while only a tribune could veto the act of a tribune. In the later republic, accordingly, the most important bills originated with the tribunes, and they regularly took the lead in the prosecution of political offenses. To the end of the republic the tribunes were always chosen from among the plebeians, patricians being legally ineligible; and they usually represented the popular as opposed to the aristocratic party—a fact which induced Sulla to limit their influence. During the social struggles which preceded the downfall of the republic, the powers of the tribunate (restored by Pompey) were utilized to support the dictatorial authority exercised by Pompey himself and other popular leaders; and the *potestas tribunicia* accorded to Augustus and his successors was one of the most important elements of the imperial power. Under the empire, tribunes were still elected, at first by the popular assembly and afterward by the senate, but the office was "an empty shadow and a name without honor" (*Pliny*). At first the tribunes interposed occasional vetoes—at the instance always of the emperor—later they were charged with minor judicial and administrative duties. The name of the office survived as late as the fifth century.

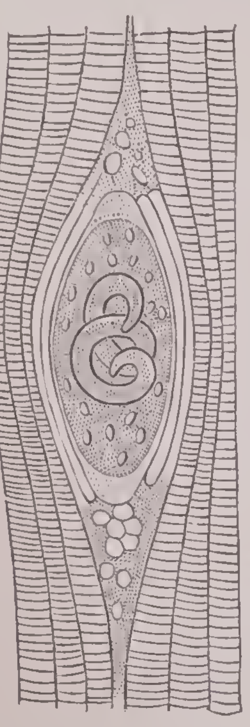
*Mediæval Tribunes.*—The development of the Italian city-republics in the later Middle Ages, and the influence of ancient Roman traditions, occasioned a sporadic reappearance of the title of tribune. It was usually connected, as in the case of Rienzi, with the leadership of the people against the feudal nobles.

MUNROE SMITH.

**Trichechidæ**, trī-kek'i-dē̆e, or **Manat'idæ** [*Trichechidæ* is Mod. Lat., named from *Tri'chechus*, the typical genus; (irreg.) from Gr. θρίξ, τριχός, hair + ἔχειν, have; *Manatidæ* is Mod. Lat., named from *Ma'natus*, another name for the genus, from Span. *manati*, from the Haitian name]: a family of placentiferous mammals of the order *Sirenia*, typified by the manatees of tropical and sub-tropical regions. The form is fish-like and elongate: the skin very thick and rugose; the head naked and depressed, and with a truncated snout; the eyes are very small; the nostrils are close together on the upper surface near the end of the snout, and are simple lunate fissures convex backward; the mouth is small; the molar teeth are typically nine (8–10) in each jaw, each provided with two large tuberculate and two smaller external transverse ridges; they have severally three roots, two on the outer and one on the inner side; incisor teeth wanting in the adult; the pectoral limbs are elongate, and oar-shaped, paddles mostly kept flexed at the elbows; rudimentary nails are developed; the tail is broad, depressed, and somewhat fan-shaped, having a convex border with a median notch or grove. The skull is noteworthy, as distinguishable from that of the other members of the order in that the intermaxillary bones have their branches not prolonged backward, and the anterior portions nearly or quite straight; the last or caudal vertebræ (i. e. $5+x$) are subcylindrical and destitute of transverse processes. Another peculiarity is the possession of only six cervical vertebræ, instead of seven, as in almost all other mammals; the missing one has been regarded by Murie and Chapman as the third. The manatees are found along the coasts of seas and rivers, and live upon the herbage that grows on or near the banks. (See MANATEE.) The name *Trichechidæ* is also used as a synonym of ODOBÆNIDÆ (*q. v.*), in which case the generic name *Trichechus* is considered equivalent to *Odobænus* (walrus) instead of *Manatus*. Revised by F. A. LUCAS.

**Trichi'na** [Mod. Lat., dimin. of Gr. θρίξ, τριχός, a hair]: a genus of parasitic nematode worms, the only species of which (*Trichina spiralis*) has acquired great prominence as, possibly, the most dangerous parasite of man. Its history is rather complicated. Besides man, it inhabits rats, swine, and some other animals. Usually, when found it is in the encysted stage, occurring in the voluntary muscles, inclosed in an ovoid or spindle-shaped capsule or cyst, secreted partly by the parasite, partly formed by the host, in the walls of which are minute particles of carbonate of lime. Inside this capsule occurs the immature worm coiled in a spiral, to which the specific name alludes. The cysts are about $\frac{1}{80}$th of an inch in length and $\frac{1}{100}$th in diameter. The contained worm, when stretched out, is about $\frac{1}{25}$th of an inch in length, cylindrical, and slender. In the cyst it exhibits but slight motion, but its vitality is very great, living worms having been found in man eighteen years after infection. When flesh containing encysted worms is taken into the alimentary canal the flesh and cysts are dissolved by the digestive fluids and the immature worms are set free. In the intestine they rapidly increase in size and attain sexual maturity, the male then measuring 1·5 mm. in length, the female 3 to 3·5 mm. The slender cylindrical body tapers to the anterior end, the posterior end being bluntly rounded. The greater size of the female is due in part to the number of eggs and embryos, a single female giving rise to 1,500 to 2,000 living young. These embryos are very minute, scarcely 0·1 mm. in length. They bore through the intestinal walls and rapidly make their way to the voluntary muscles, either by boring to them or by entering the blood or lymph vessels and by being carried by the circulating fluids. In the muscles they become encysted, as did their parents, and they can not become mature until freed of the cyst by the digestive juices of some animal.

This migration of the young from the intestine to the muscles produces serious and even fatal results in both man and other animals. When the parasites are comparatively few in number recovery usually follows, but when they are numerous severe illness—trichinosis—follows, characterized by many of the symptoms of lead-poisoning. First there are intestinal pains, vomiting, and diarrhœa, then pain in the limbs and muscles accompanied by dropsical swelling. Death may ensue in two days owing to the intestinal disturbances. More frequently it occurs in the fifth or sixth week. If the person survive that period the chances for recovery are increased. In bad cases of infection the number of worms is almost beyond belief, 90,000 having been found in a cubic inch of muscle in the shoulder of a man who died from trichinosis. With man the source of the infection is almost invariably from eating raw or imperfectly cooked pork in which are the encysted worms. It is only the lean meat which is dangerous, as rarely, if ever, are the *Trichinæ* found in the fat. The presence of the cysts in the pork can not be recognized by the naked eye. None of the processes—pickling, smoking, etc.—used for preserving pork serve to kill the parasites, and ham or bacon, unless thoroughly cooked, is as dangerous as fresh pork. In the U. S. cases of trichinosis are comparatively rare, one of the most serious being at Marshalltown, Ia., in 1891, which resulted in several deaths. The worst epidemics on record are those at Hedersleben (1865) and Emersleben (1884), Germany. In the first, in a village of 2,000 inhabitants, 337 were attacked and 101 deaths resulted. At Emersleben 361 cases were traced to one pig, and fifty-seven deaths followed.



A trichina encysted in human muscle (enlarged).

The question arises, how are the swine infected? There is considerable uncertainty upon this point. Examination has shown that pigs fed upon the house offal and the refuse from slaughter-houses are far more apt to be infected than those fed upon corn, and there is not a little evidence which goes to show that rats may play an important part in the process.

Doubtless the disease trichinosis has existed for ages, and probably the observation that the eating of pork was apt to be followed by serious results led to the Levitical prohibition of the flesh of swine as food. The worm was discovered by Richard Owen in 1835. Its connection with the disease was demonstrated in 1860, by Herbst, Zenker, Leuckart, Pagenstecher, and Virchow almost simultaneously. The literature of the subject is large. The most important papers are Pagenstecher's *Die Trichinen* (Leipzig, 1865); Leuckart's *Untersuchungen über Trichina spiralis* (2d ed. Leipzig, 1866), and *Die menschlichen Parasiten* (Leipzig, 1863–66); also numerous papers in the reports of the State boards of health. J. S. KINGSLEY.

**Trichini'asis**, or **Trichino'sis** [Mod. Lat., derivs. of *Trichina*]: a disease induced by eating the trichinous flesh of swine. See TRICHINA.

**Trichinop'oli**: town of British India; capital of the district of Trichinopoli, in the province of Madras; on the Caveri, 56 miles from the sea (see map of S. India, ref. 7–E). It is a very hot place and poorly built, mostly consisting of mud huts, but it is the station of a division of the Madras army, and it has important manufactures of cutlery, jewelry, saddlery, and cheroots; an excellent tobacco is grown in the surrounding district. It is the seat of a Roman Catholic bishopric, and there are missions of several Protestant denominations. It is connected with Madras by rail. Pop. (1891) 90,609.

**Trichiu'ridæ** [Mod. Lat., named from *Trichiu'rus*, the typical genus; Gr. θρίξ, τριχός, a hair + οὐρά, tail]: a family of fishes of the order *Teleocephali* and sub-order *Acanthopteri*, related to the mackerels, but distinguished by the elongated form and the imperfectly developed anal fin. The body is more or less elongated and compressed, and terminates in a slender tail, which sometimes is filiform, but generally capped by a caudal fin; the skin is naked; the lateral line continuous; the head compressed; dorsal fin long, generally single and uninterrupted, sometimes divided into two, with the spinous portion longer than the soft; anal fin represented by numerous almost concealed spines; pectoral fins well developed; ventral fins obsolete, or represented by scale-like spines behind the pectoral region. The skeleton has very numerous vertebræ (e. g. A. 39–43 + C. 57–120). The family is composed of few genera, mostly restricted to the high or deep seas, and comprises three sub-families. (1) *Trichiurinæ*, in which the dorsal fin is undivided, the tail filiform and finless, and the pectorals extended (as usual) toward the upper angles, including the genera *Trichiurus* and *Eupleurogrammus*; (2) *Lepidopodinæ*, in which the dorsal is also entire, but the caudal fin is well developed, and the pectoral fins are produced toward the lower angles, with the genera *Lepidopus* and *Evoxymetopon*; and (3) *Aphanopodinæ*, in which the dorsal is divided. See Gill in *Proc. Acad. Nat. Sci.* (Philadelphia, 1863), pp. 224–229.

Revised by F. A. LUCAS.

**Trichodon'tidæ** [Mod. Lat., named from *Tri'chodon*, the typical genus; θρίξ, τριχός, a hair + ὀδούς, ὀδόντος, tooth]: a family of fishes of the order *Teleocephali* and sub-order *Acanthopteri*. The body is elongated and compressed, and regularly tapers from the head toward the tail; the skin is naked and smooth; the lateral line continuous; the head subquadrate and compressed; the preopercula each armed with five spines; the mouth has a very oblique and lateral cleft; branchiostegal rays five; dorsal fins two, oblong, and of nearly equal length, the first with rather numerous (fourteen) spines, the second with simple branched rays; anal fin very long; caudal separate; pectorals large, and with the lower rays not branched; ventral fins approximated and thoracic, and each with a spine and five rays. The family has been constituted for a single genus (*Trichodon*), which is confined to the western coast of North America.

Revised by F. A. LUCAS.

**Trichome**: See HAIRS and MORPHOLOGY, VEGETABLE.

**Trichomycter'idæ** [Mod. Lat., named from *Trichomycterus*, the typical genus; Gr. θρίξ, τριχός, a hair + μυκτήρ, nostril]: a family of catfishes, containing small species peculiar to South America. The form is long and slender, skin naked, lateral line imperfect, gill covers unarmed or furnished with small prickles; branchiostegal rays eight to twelve. The species range high up in streams on the slopes of the Andes, and many bear a striking resemblance to the loaches of the northern hemisphere. F. A. L.

**Trichonot'idæ** [Mod. Lat., named from *Trichono'tus*, the typical genus; Gr. θρίξ, τριχός, a hair + νῶτον, back]: a family of acanthopterygian fishes containing a few small species peculiar to the East Indian Archipelago and the Australasian seas. The body is long; the scales cycloid and of moderate size; the lateral line continuous; the head depressed and pointed; the eyes directed upward; the opercula unarmed; the upper jaw is longest; teeth are developed in villiform bands on the jaws as well as palate; the branchial apertures are very wide; branchiostegal rays seven; dorsal fin single, long, with articulated but not branched rays, and without a distinct spinous portion; anal fin long; ventrals jugular, each with a spine and five rays; no pyloric appendages; no air-bladder. Two genera have been recognized, *Trichonotus* and *Hemerocœtes*. F. A. LUCAS.

**Trichop'tera** [Mod. Lat.; Gr. θρίξ, τριχός, hair + πτερόν, wing]: that order of insects which contains the caddis-flies or case-flies. The adult insects closely resemble moths, even to the dense clothing of hairs upon the wings, but they differ from these latter in having rudimentary biting rather than sucking mouth-parts. The most interesting, however, are the larval stages. The larvæ are aquatic, and to protect the soft body they build cases by cementing together with silken threads bits of bark, sand, shells, etc., so that a tube is formed in which the animal stays like a hermit-crab in its shell. Each species builds its own type of case. When the time for pupation comes the tube is closed by silken threads. Most of the caddis-flies feed on vegetable matter, but a few are known to be carnivorous. See Hagen, *Synopsis of Neuroptera* (Washington, 1861); McLachlan, *Monographic Revision of Trichoptera* (London, 1874–84). J. S. KINGSLEY.

**Tri'color** [from Fr. *tricolore*, three-colored; Lat. *tres*, three + *color*, color; cf. Fr. *drapeau tricolore*, three-colored flag, tricolor]: the French national flag, colored blue, white, and red in vertical divisions. It was first adopted during the First Revolution, and it is stated (though not generally believed) that the colors of the livery of Philippe, Duke of Orleans (Citizen Égalité), were selected for the national flag. In point of fact, many other national flags are tricolors.

**Tricoupis**, tree-koo'pis, CHARILAOS: statesman; son of Spiridion Tricoupis; b. at Nauplia, Greece, July 23, 1832; educated in Paris and Athens; served in the Greek legation at London 1852–63; was elected deputy from Missolonghi to the Greek chamber in 1863; and was charged with the negotiations concerning the cession of the Ionian islands to Greece. He was made Minister of Foreign Affairs in 1866, and was Prime Minister in 1875, 1878–79, 1882–85, 1886–90, and 1892–95, in the last three changes of government being succeeded by his chief rival, Delyannis. D. at Cannes, Apr. 11, 1896. He was an able orator, a sound financier, and the leading statesman of modern Greece. E. A. G.

**Tricoupis**, SPIRIDION: statesman and author; b. at Missolonghi, Greece, Apr. 20, 1788; studied in France and England; served in the army during the Revolution; was sent as ambassador to London and Paris several times during the reign of King Otho, and continued to participate very actively in public life till his death Feb. 24, 1873. He enjoyed a great reputation as an orator, poet, and historian. His principal work was Ἱστορία τῆς Ἑλληνικῆς Ἐπαναστάσεως (History of the Greek Revolution, 1853–57).

**Trident'ine Profession of Faith** (Lat. *Profes'sio Fid'ei Tridentin'æ*), or the **Creed of Pius IV.**: a clear and concise summary of the doctrines of the Council of Trent, suggested by that council, prepared by a college of cardinals under the supervision of Pope Pius IV., and issued by him Nov. 13, 1564. It consists of twelve articles, including the Nicene Creed, and is put in the form of an individual profession and solemn oath (*profiteor, spondeo, voveo ac juro*). It is binding upon all Roman Catholic priests and public teachers in seminaries, colleges, and universities. It is also used for converts to the Roman Catholic Church, and hence called the Profession of Converts. (For converts from the Greek Church a modified formula was introduced by Pope Gregory XIII. in 1575.) The tenth article reads: "I acknowledge the holy Catholic Apostolic Roman Church as the mother and mistress of all churches, and I promise and swear true obedience to the Bishop of Rome as the successor of St. Peter, prince of the apostles and vicar of Jesus Christ." (See the Latin text in the two papal bulls of Nov. 13 and Dec. 9, 1564, and in Denzinger's *Enchiridion*, pp. 292–294.) A history of this creed was written by Mohnike, *Urkundliche Geschichte der Professio Fidei Tridentinæ* (Greifswald, 1822; Eng. trans. in Schaff's *Creeds*, ii., 96–99). See CREED and ORIGINAL SIN.

**Trid'ymite** [Gr. τρίδυμοι, triplets, or trines, from the crystals being compounds of threes]: an allotropic modification of silica, discovered in 1868 by von Rath in a volcanic porphyry from Cerro San Cristoval in Mexico, and since identified elsewhere. It is hexagonal in crystallization, like quartz, but differs from the latter in possessing double refraction, like calcite, and in having a lower specific gravity (2·2).

**Triest**, tree-est', or **Trieste**, tree-es'te (Slav. *Térst*, anc. *Tergestum*); city of the Austrian empire, and its most important port; on the Gulf of Triest, at the northeast extremity of the Adriatic Sea; 370 miles by rail S. S. W. of Vienna (see map of Austria-Hungary, ref. 8–C). The old town, which mostly consists of narrow and tortuous streets, is built on a steep acclivity, at the foot of which the new town extends along the harbor: between the two parts of the town runs the Corso, a broad, elegant thoroughfare, opening into large squares lined with magnificent edifices and ornamented with fountains and monuments. Ship-building is an important industry. White lead, candles, wax, soap, rosoglio, leather, spirits, and earthenware are extensively manufactured. It is from its commerce, however, that Triest principally derives its importance. Its harbor consisted originally of a safe but small inner port and a rather exposed roadstead; but in 1884 a new and excellent harbor was finished. By running out three piers, 700 feet long and from 250 to 275 feet broad, the old roadstead on the N. E. was transformed into three large inclosures of 85 acres of water-surface and nearly 2 miles of length of quays, protected by a pier 3,600 feet long running parallel with the shore at a distance of 1,000 feet. The value of the annual imports amounts to about $66,000,000, and that of the exports to about $62,000,000. The city has a naval and mercantile academy and a school of navigation, and is the headquarters of the Austrian Lloyds Steam-packet Company, which has magnificent docks and arsenals here. Among the principal exports are grain, rice, wine, oil, flax, hemp, tobacco, silk, iron, lead, copper, and liqueurs. Cotton, cotton goods, dried fruits, etc., are imported. The old town contains a cathedral built between the fifth and fourteenth centuries. Triest was acquired by Austria in 1382. Administratively is a small district of 37 sq. miles, including the city and vicinity, with a population (1890) of 158,344, mostly Italians. Pop. of city, 120,333.

Revised by M. W. HARRINGTON.

**Trifo'rium**, or **Blindstory**: a gallery in a mediæval church above the aisle and opening into the nave, choir, or high central part of the transept corresponding to the nave. The theory of the triforium is that it occupies the space under the sloping penthouse-roof of the aisle and above the vaulting. Such a gallery would be from 8 to 12 feet high at the inner side, where were the openings looking into the nave, etc., which openings formed a part of the architectural design of the interior, coming as they do above the great arches of the nave and below the clearstory windows. It is therefore to be distinguished from a great gallery like that of Notre Dame at Paris, or the Cathedral of Tournay in Belgium, which has its own vaulted ceiling and perhaps even a triforium proper above that vault. In some churches, especially in England, the triforium is built up with a solid wall on the inner side, so that the ornamental arcade serves no longer as an opening from which persons in the triforium could look into the church. In other instances, as in the Cathedral of Rheims, the triforium is a very narrow passage left between an outer solid wall and an open arcade on the inner side, in which case the space beneath the sloping roof of the aisle is shut out and becomes a mere garret. R. S.

**Trigem'inus** [from Lat. *trige'minus*, born three together; *tri-*, *tres*, three + *ge'minus*, twin]: the fifth pair of cranial nerves, which take superficial origin from the side of the pons varolii by two roots, a larger sensory and a smaller motor; the sensory root bears the important Gasserian ganglion, situated at the apex of the temporal bone. The trigeminus, the great sensory nerve of the head, divides into three trunks, the *ophthalmic*, the *superior maxillary*, and the *inferior maxillary* divisions. The first two of these are entirely sensory, the third is a mixed nerve, being both sensory and motor. The ophthalmic nerve enters the orbit, the contents of which, including the eye, it supplies with sensory filaments, and finally is distributed to the forehead, brow, eyelids, and, to a limited extent, the nose. The superior maxillary nerve passes to the face, including the side of the nose, the cheeks and lips, and the upper teeth, and secondarily, through the connections of the spheno-palatine ganglion, the palate and the interior of the nasal cavity. The inferior maxillary nerve is a mixed nerve, and supplies motor filaments to the muscles of mastication and sensation to the lower teeth and the part of the face. One important branch, the lingual, is distributed to the tongue, and, in addition to supplying common sensation to that organ, very probably is also intimately related to the special sense of taste. Each division of the trigeminus is connected with one or more special masses of nervous matter known as the ganglia of the nerve. With the ophthalmic nerve is connected the *lenticular* ganglion; with the superior maxillary, the *spheno-palatine*; and with the inferior maxillary, the *otic* and the *submaxillary* ganglia. Those ganglia are of importance as affording points at which sensory, motor, and sympathetic fibers become intermingled, the nerves passing from the centers containing fibers of all three kinds. See FACIAL NERVES. GEORGE A. PIERSOL.

**Trig'lidæ** [Mod. Lat., named from *Trigla*, the typical genus, from Gr. τρίγλα, mullet]: a family of acanthopterygian fishes, related to the *Cottidæ*, including species popularly known as gurnards, sea-robins, flying fishes, etc. The elongate body may be covered with scales or with bony plates; the head is usually covered with rough, bony plates, some of which bear spines. The eyes are set high in the head; one of the suborbitals is very large, covering the cheek, and articulates with the preoperculum; the upper jaw is slightly protracted and longer; teeth villiform, on the jaws and generally the palate; branchiostegal apertures continuous below; branchiostegal rays in seven pairs; dorsal fins two, the first spiny; anal fin opposite the dorsal; pectorals more or less enlarged, and with their lower rays simple and generally isolated and distinct from the rest of the fin; ventral fins thoracic, separated by a wide area, and each with a spine and five soft rays; pyloric appendages developed in moderate number; an air-bladder is present. The family contains three distinct sub-families—viz.: (1) *Triglinæ*, in which the three lowermost rays of the pectorals are elongated, enlarged, and entirely free, and the scales are small, including the genera *Trigla*, *Prionotus*, etc.; (2) *Peristethinæ*, in which the two lowermost rays of the pectorals are enlarged and separate, and the scales large and plate-like, represented only by the genus *Peristethus* or *Peristedion*; and (3) *Dactylopterinæ*, in which the lowermost rays of the pectorals are mostly united with the others, the whole forming a very large wing-like fin, which enables the animal to skim over the water, and the scales are moderate and carinated, typified by the genus *Dactylopterus*. The family is represented on the eastern coast of North America by five species of *Prionotus* and one of *Dactylopterus*, and elsewhere, in almost every sea, by one or more generic forms. Revised by F. A. LUCAS.

**Trigonom'etry** [from Gr. τρίγωνον, triangle + μέτρον, measure]: a branch of mathematics whose primary object is to explain the method of solving triangles; it also treats of the general relations of circular functions. It is divided into three great branches—*plane*, *spherical*, and *analytical*. *Plane trigonometry* treats of the relations between the sides and angles of plane triangles; *spherical trigonometry* treats of the relations between the sides and angles of spherical triangles; and *analytical trigonometry* treats of the general relations between trigonometric functions.

*Measure of an Angle.*—For the purposes of plane and spherical trigonometry, angles are expressed in *degrees*, *minutes*, and *seconds*, denoted by the symbols °, ′, ″; and in analysis they are expressed in terms of the radius of the arcs which subtend the angles. In the former case the right angle is the *primary* unit; in the latter case the primary unit is the angle whose subtending arc is equal to its radius. In both cases the angle is expressed in terms of the subtending arc. To explain these methods of measurement, let A C D be a right angle; then with C as a center, and with a radius C A equal to 1, describe an arc A P D intersecting the sides of the angle at A and D. Let the angle A C D be divided into 90 equal parts by radii; these will divide the arc A P D into 90 equal parts; the equal parts, both of the angle and the arc, are called *degrees*. If we draw any radius, as C P, the intercepted arc A P will contain as many degrees of the quadrant as the angle A C P does of the right angle. It is in this sense, and in this sense only, that we say an angle is measured by an arc. For convenience of expression, each degree is divided into 60 equal parts called *minutes*, and each minute is divided into 60 equal parts called *seconds*. Again, let the arc A P be equal in length to the radius C A; that is, to 1. If we take A C P as the unit angle, any other angle, as A C Q, will contain as many units as there are units in the quotient of the arc A Q by A P. Because the circumference whose

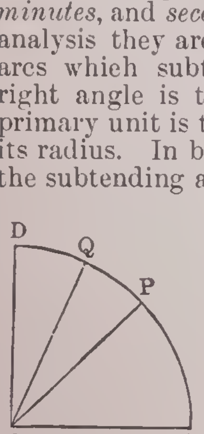


FIG. 1.

radius is 1 is equal to $2\pi$, or 6·2832, the arc A P, in degrees, is equal to $\frac{360}{6\cdot2832}^{\circ}$; that is, to 57·3° nearly, or, more exactly, to 206265″. If the arc A Q contains 75·5°, the linear measure of the angle A C Q is equal to 1·3 nearly; that is, it contains the unit angle 1·3 times.

*Trigonometric Functions.*—Angles are most readily compared by means of certain lines, whose values depend on the subtending arcs, and which are called *functions*. The nature of these lines will be most readily explained by the aid of a diagram. Let a circumference be described from C as a center, and with a radius C A equal to 1. Draw A L and M D, dividing the circumference into four quadrants, and call A L the *initial* diameter. Suppose every arc considered to begin at A, which is then called the *origin of arcs*, and to be estimated around in the direction A D L; let the point where the arc terminates be called its *extremity*. An arc beginning at A, and estimated around in the direction A M L, is said to be *negative*. The *complement* of an arc is the distance from its extremity around to D; it may be either positive or negative; thus E D is the complement of A E, and E′ D is the complement of A E′, the former being positive, and the latter negative. In addition, all distances estimated upward are regarded as positive, all distances downward as negative, all distances counted to the right as positive, and all to the left as negative. We have, then, the following definitions and conclusions:

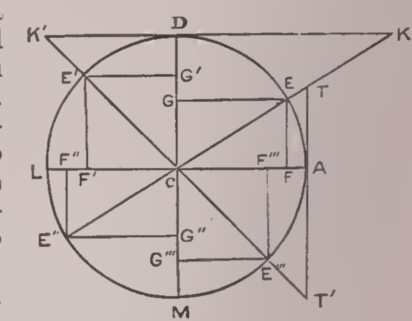

FIG. 2.

(1) The *sine* of an arc is the perpendicular distance from the initial diameter to the extremity of the arc; thus F E is the sine of A E, F′ E′ is the sine of A E′, F″ E″ the sine of A E″, and F‴ E‴ the sine of A E‴. Hence if an arc terminates in either the first or second quadrant—in which case it is said to lie in the corresponding quadrant—its sine is *plus*; if it lies in the third or fourth quadrant, its sine is *minus*.

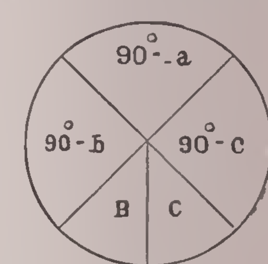

FIG. 3.

(2) The *cosine* of an arc is the distance from the center to the foot of the sine; thus C F is the cosine of A E, and C F′ is the cosine of A E′, etc. If an arc lies in the first or in the fourth quadrant, its cosine is *plus*; if it lies in the second or in the third quadrant, its cosine is *minus*.

(3) The *tangent* of an arc is a portion of a tangent to the arc at the origin, which is included between the origin and the prolongation of the diameter through the extremity of the arc; thus A T is the tangent of A E and A E″, and A T′ is the tangent of A E′ and A E‴. If an arc lies in the first or in the third quadrant, its tangent is *plus*; if in the second or fourth, its tangent is *minus*.

(4) The cotangent of an arc is the tangent of its complement, the origin of the complement being taken at D; thus D K is the cotangent of A E and A E″, and D K′ is the cotangent of A E′ and A E‴. If the arc lies in the first or in the third quadrant, its cotangent is *plus*; if in the second or fourth, it is *minus*.

(5) The *secant* of an arc is the distance from the center to the extremity of the tangent; thus C T is the secant of A E, and C K′ is the secant of A E′. The secant, being radial, is said to be positive when estimated from the center in the direction *toward* the extremity of the arc, and negative when estimated in the direction *from* the extremity. In the first and fourth quadrants the secant is *plus*; in the second and third it is *minus*.

(6) The *cosecant* of an arc is the secant of its complement; thus C K is the cosecant of A E, and C K′ of A E′. In the first and second quadrants the cosecant is *plus*; in the third and fourth it is *minus*.

(7) The *versed sine* of an arc is the distance from the foot of the sine to the extremity of the arc; thus F A is the versed sine of A E, and T′ A of A E′. The versed sine is always *plus*.

(8) The *co-versed sine* of an arc is the versed sine of its complement; thus G D is the versed sine of A E, and G′ D of A E′. The co-versed sine is always *plus*.

The general relations between the circular functions of any arc from 0° to 360° are expressed by the following equations, in which $x$ denotes the arc, and this whether the arc is *plus* or *minus*:

$\sin^2 x + \cos^2 x = 1.$ $\tan x \cot x = 1.$

$\text{ver. } \sin x = 1 - \cos x.$ $\sec x = \frac{1}{\cos x}.$

$\text{co-ver. } \sin x = 1 - \sin x.$ $\operatorname{cosec} x = \frac{1}{\sin x}.$

$\tan x = \frac{\sin x}{\cos x}.$ $\sec^2 x = 1 + \tan^2 x.$

$\cot x = \frac{\cos x}{\sin x}.$ $\operatorname{cosec}^2 x = 1 + \cot^2 x.$

Analytical Trigonometry.—Besides these formulas expressing the relation between the functions of a single arc the following, which express more extended relations, are of continual use in analysis:

$$\sin (a \pm b) = \sin a \cos b \pm \sin b \cos a.$$
$$\cos (a \pm b) = \cos a \cos b \mp \sin a \sin b.$$
$$\tan (a \pm b) = \frac{\tan a \pm \tan b}{1 \mp \tan a \tan b}.$$
$$\sin 2a = 2 \sin a \cos a; \ \cos 2a = \cos^2 a - \sin^2 a.$$
$$\sin \tfrac{1}{2} a = \sqrt{\tfrac{1}{2}(1 - \cos a)}; \ \cos \tfrac{1}{2} a = \sqrt{\tfrac{1}{2}(1 + \cos a)}.$$
$$\sin a \pm \sin b = 2 \sin \tfrac{1}{2}(a \pm b) \cos \tfrac{1}{2}(a \mp b).$$
$$\cos a + \cos b = 2 \cos \tfrac{1}{2}(a + b) \cos \tfrac{1}{2}(a - b).$$
$$\cos b - \cos a = 2 \sin \tfrac{1}{2}(a - b) \sin \tfrac{1}{2}(a + b).$$

Plane Trigonometry.—Every plane triangle consists of six parts—three sides and three angles. When three of these parts are given, at least one of which is a side, the remaining parts may be computed. The operation of finding the unknown parts is called the *solution* of the triangle. The solution is made by means of formulas which express the relations between the parts of the triangle.

*Solution of Right-angled Triangles.*—The following formulas express all the essential relations between the sides and angles of a right-angled triangle. In them the right angle is denoted by A, the acute angles by B and C; the hypothenuse is denoted by $a$, and the sides opposite B and C are represented by $b$ and $c$. Because the angles B and C are complementary, either may be found when the other is known by simple subtraction; hence the formulas take account of only one of them. The symbols $sin^{-1}$, $cos^{-1}$, etc., are read, *The arc whose sine is, The arc whose cosine is*, etc.:

$$a = \sqrt{b^2 + c^2} = \frac{b}{\sin B} = \frac{c}{\cos B}; \quad (1)$$
$$b = \sqrt{a^2 - c^2} = a \sin B = c \tan B; \quad (2)$$
$$c = \sqrt{a^2 - b^2} = a \cos B = b \cot B; \quad (3)$$
$$B = \sin^{-1}\frac{b}{a} = \cos^{-1}\frac{c}{a} = \tan^{-1}\frac{b}{c}. \quad (4)$$

In applying these formulas the multiplications and divisions are made by means of logarithms.

*Solution of Oblique-angled Triangles.*—The solution of every case of oblique triangles may be effected by means of the following formulas, in which A, B, and C denote the angles of a triangle, and $a$, $b$, and $c$ the sides lying opposite to them, and $s = a + b + c$:

$$a : b : c :: \sin A : \sin B : \sin C; \quad (1)$$
$$a + b : a - b :: \tan \tfrac{1}{2}(A + B) : \tan \tfrac{1}{2}(A - B) \quad (2)$$
$$\sin \tfrac{1}{2} A = \sqrt{\frac{(\frac{1}{2} s - b)(\frac{1}{2} s - c)}{bc}} \quad (3)$$

The sine of an arc is equal to the sine of its supplement; hence, when an angle is determined by means of its sine, there may be two solutions. Whether there are two or one must be determined by a discussion of the particular case.

Spherical Trigonometry.—Every spherical triangle contains six parts—three sides and three angles. When any three of these parts are given, the other three may be found.

*Solution of Right-angled Spherical Triangles.*—A right-angled spherical triangle may be solved when we have given any two parts besides the right angle, by two simple rules called Napier's rules for circular parts. If we denote the angles by A, B, and C, A being the right angle, and the opposite sides by $a$, $b$, and $c$, the sides about the right angle, the complement of the hypothenuse, and the complements of the angles B and C are called *circular parts*. Let these parts be arranged in order, as shown in Fig. 3; then each part will be *adjacent* to two other parts, or will be separated from two other parts called *opposite*. When so arranged, the parts are subject to the following rules: (1) *The sine of any part is equal to the rectangle of the tangents of the adjacent parts.* (2) *The sine of any part is equal to the rectangle of the cosines of the opposite parts.*

*Solution of Quadrantal Spherical Triangles.*—A quadrantal spherical triangle is one in which one of the sides is a *quadrant*. Such triangles may be solved by passing to the corresponding polar triangles, which will be right-angled. These triangles are then solved by Napier's rules for circular parts, and from the results we may find the corresponding parts of the given triangles by the reverse process of passing back to the given triangles.

*Solution of Oblique Spherical Triangles.*—Let A, B, and C denote the angles of an oblique spherical triangle, and let $a, b$, and $c$ denote the opposite sides; also let $S = A + B + C$; and $s = a + b + c$; we shall then have the following formulas for solving oblique spherical triangles:

$$\frac{\sin A}{\sin a} = \frac{\sin B}{\sin b} = \frac{\sin C}{\sin c}.$$
$$\cos \tfrac{1}{2} A = \sqrt{\frac{\sin \frac{1}{2} s \sin (\frac{1}{2} s - a)}{\sin b \sin c}}.$$
$$\cos \tfrac{1}{2} a = \sqrt{\frac{\cos (\frac{1}{2} S - C) \cos (\frac{1}{2} S - B)}{\sin B \sin C}}$$
$$\tan \tfrac{1}{2}(A + B) = \cot \tfrac{1}{2} C \times \frac{\cos \frac{1}{2}(a - b)}{\cos \frac{1}{2}(a + b)}.$$
$$\tan \tfrac{1}{2}(A - B) = \cot \tfrac{1}{2} C \times \frac{\sin \frac{1}{2}(a - b)}{\sin \frac{1}{2}(a + b)}.$$
$$\tan \tfrac{1}{2}(a + b) = \tan \tfrac{1}{2} c \times \frac{\cos \frac{1}{2}(A - B)}{\cos \frac{1}{2}(A + B)}.$$
$$\tan \tfrac{1}{2}(a - b) = \tan \tfrac{1}{2} c \times \frac{\sin \frac{1}{2}(A - B)}{\sin \frac{1}{2}(A + B)}.$$

When any part is determined by means of its sine, there may be one or two solutions. Whether there are one or two can only be determined by a discussion of each particular case.

The solution of a spherical triangle may often be facilitated by the introduction of an auxiliary angle. Thus if two sides and their included angle be given, the third side may be found by the formula

$$\cos a = \frac{\cos b \sin (c + \phi)}{\sin \phi}, \text{ where } \cot \phi = \tan b \cos A.$$

In like manner, if two angles and their included sides be given, the remaining angle may be found by the formula

$$\cos A = \frac{\cos B \sin (C - \phi)}{\sin \phi}, \text{ where } \cot \phi = \tan B \cos a.$$

Formulas of this kind are particularly useful when it is desired to determine a single part without completing the solution of the triangle. Revised by S. Newcomb.

**Trilin'ear Co-ordinates** [*trilinear* is from Lat. *tri-, tres*, three + *li'nea*, line]: a system of co-ordinates in which the position of a point is determined by the ratios of its distances from three sined lines. The equation of any right line in Cartesian co-ordinates may be put in the form

$$x \cos \phi + y \sin \phi - p = 0,$$

in which $\phi$ is the angle made by the lines with the axis of $x$, and $p$ is length of a perpendicular upon it from the origin. If $x'$ and $y'$ be the co-ordinates of any point whatever, $x' \cos \phi + y' \sin \phi - p$ will express the length of a perpendicular from the point, or the *distance* of the point $x'\ y'$ from the line. Call this distance $\alpha$. Let $\beta$ and $\gamma$ be in the same manner the distances of the point $x'\ y'$ from any two other arbitrarily chosen lines. We may imagine a system of *trilinear* co-ordinates in which the position of a point is defined by its distances from three fixed lines, and in which the position of any right line is defined by a homogeneous equation between these distances of the form

$$l\alpha + m\beta + n\gamma = 0.$$

See Ferrers, *Trilinear Co-ordinates*; Salmon, *Conic Sections*; Newcomb, *Analytic Geometry*; Clebsch, *Vorlesungen über Geometrie*, part i. (Leipzig). Revised by S. Newcomb.

**Tril'lium** [Mod. Lat; cf. Lat. *tres, tri-*, three, and *trilix*, triple-woven, triple, the parts being in threes]: a genus of perennial herbaceous monocotyledonous plants, of the lily family, embracing a dozen species, all of which occur in

Eastern North America, the Himalaya region, and Japan. Each plant consists of a naked stem a foot or less high, sur-

Large flowered trillium (*Trillium grandiflorum*).

mounted by three ovate netted-veined leaves, a large flower, and a purple or red three-celled berry. *T. grandiflorum* bears a white flower, changing with age to rose color; *T. erectum*, a dark reddish-purple flower. The trilliums are cultivated in gardens, are highly valued for their beauty, and are commonly known as three-leaved nightshade, wake-robin, birth-root, or Indian balm. They have astringent, expectorant, and tonic qualities, and yield resin, tannic acid, and a volatile oil. Revised by CHARLES E. BESSEY.

**Tril'obites** [from Gr. τρεῖς, τρι-, three + λοβός, lobe]: a group of *Crustacea* which became extinct in Palæozoic times. Their affinities have long been uncertain, but the discovery in 1893 of specimens with antennæ places their position beyond a doubt. The body is divisible into three regions—a head with compound eyes, a thorax composed of a varying number of movable segments, and an abdomen (or pygidium) in which several segments firmly united to each other may be recognized. Until recently all knowledge of appendages was lacking, but at present the evidence goes to show that the head bore a pair of antennæ and at least four pairs of leg-like appendages, the basal joints of which served for the mastication of food. In the thoracic region the feet were two-branched, and bore gills of peculiar character, while in the pygidial region the appendages were lamellate. The trilobites are among the most abundant fossils in the older rocks. They appear in the Cambrian and die out in the Carboniferous. The species are very numerous. Besides the various geological reports, see for structure, Walcott, *Bulletin* Museum Comp. Zoölogy, viii. (1881), papers in *American Journal of Science* (1893–94), and Bernard, *Quarterly Journal of the Geological Society* (London, 1894); for development, Barrande, *Système silurien du Centre de la Bohême*, vol. i. (1852). J. S. KINGSLEY.

**Trimble**, ROBERT: jurist; b. in Berkeley co., Va., in 1777. His parents, in 1780, removed to Kentucky, where he received a scanty early education, but became a school-teacher; studied law under George Nicholas; was admitted to the bar 1803; settled at Paris, where he was chosen to the Legislature; became judge of the court of appeals 1808, chief justice of Kentucky 1810, U. S. district attorney 1813; was district judge of Kentucky 1816–26, and justice of the U. S. Supreme Court from 1826 to his death Aug. 25, 1828.

**Trimeter**: See METRES.

**Trimūrti**, trē̆e-moor'tē̆e [Sanskr.; literally, having three forms; *tri*, three + *mūrti-*, body, form]: the Hindu triad or trinity, consisting of Brahma, Vishnu, and Śiva, considered as an inseparable unity, and as representing the creating, the preserving, and the destroying and regenerating principles of the deity respectively. They were produced by Brahma, the one self-existent spirit, from his own body—Brahma from the right, Vishnu from the left, and Śiva from the middle. When represented pictorially or in sculpture the Trimūrti has one body with three heads—that of Brahma in the middle, that of Vishnu at the right, and that of Śiva on the left.

**Trincomalee'**: town of Ceylon; a seaport and naval station on the northeastern coast of the island (see map of S. India, ref. 8–F). It has a large landlocked harbor, but the place is exceedingly hot and unhealthful. Its great renown in ancient time it owed to religious rather than to geographical considerations, as the seat of the temple of a thousand columns, to which pilgrims flocked from all parts of India. Pop. (1891) 11,411. Revised by M. W. HARRINGTON.

**Trinidad**, Span. pron. trē̆e-nē̆e-*thaath'*: an island of the West Indies, belonging to Great Britain; near the northeastern coast of Venezuela, and N. of the delta of the Orinoco. Area, 1,754 sq. miles. It is nearly square in form, with peninsular projections at the angles. These, with the peninsula of Paria and the delta, form the narrow passages called the Serpent's Mouth and Dragon's Mouth, noted for their dangerous currents; and they inclose the Gulf of Paria, between the island and the continent. Trinidad is generally classed as the southernmost of the Caribbean group; but by its structure, fauna, and flora, it belongs to South America, and in all probability was formerly united to it. A range of low mountains, a continuation of those of Paria, follows the northern coast, some of the peaks attaining an altitude of more than 3,000 feet. The remainder of the surface is hilly, or low, with tracts of swamp; a line of hills lines the southern coast. There are no true volcanoes, but some small crater-like cavities emit sulphuretted hydrogen, and sometimes, it is said, flames. The celebrated asphalt lake, called La Brea, is near the southwestern end; it covers about 100 acres, the asphalt bubbling up in the center but hardening around the margins, where it is extracted; it is largely exported for roofing and paving. The soil of Trinidad is fertile, and there are large tracts of forest, especially in the northern and eastern parts. The climate is warm, but generally healthful, and rains are abundant from May to October; during the winter months the ground is watered by heavy dews. Hurricanes are never felt. A large proportion of the inhabitants are Negroes, mixed races, and Hindu coolies. Of the latter Trinidad has more than any other West Indian island. They are imported under contract to work for five years, but often remain and acquire considerable wealth. The whites are of English, Scotch, or French descent, with many refugees from Venezuela. Most of the population is gathered in the western part of the island, where are the principal towns. Port of Spain, the capital, is the commercial center, and is connected with San Fernando by railway. Agriculture is the principal occupation, and the island has an unusually large number of peasant proprietors. The exports are sugar, cacao, asphalt, etc. By its position, Port of Spain controls much of the trade of Venezuela. Trinidad was discovered and named by Columbus in 1498. The Spaniards, after carrying off the Indian inhabitants as slaves, had only small establishments, later increased by French immigrants from Grenada. The British seized the island in 1797, and have since held it. With Tobago it forms the crown colony of Trinidad. Pop. (1891) 208,028. See Charles Kingsley, *At Last* (1871); Hart, *Trinidad* (1865); Wall and Sawkins, *Report on the Geology of Trinidad*. HERBERT H. SMITH.

**Trinidad**: a small rocky island of the Atlantic, in lat. 20° 31' S., lon. 29° 20' W.; about 700 miles E. of Brazil, whose claim to it is now acknowledged.

**Trinidad**: a city near the southern coast of Cuba; 3 miles by railway from its port of Casildas (see map of West Indies, ref. 4–C). It is beautifully situated on high land overlooking the sea. Owing to its mild and very equable climate it is a favorite resort for invalids. It is one of the oldest towns in the island, and was long the center of the coffee-trade, but has lost much of its commercial importance. Pop. (1899) 11,120. H. H. S.

**Trinidad**: capital of the department of Beni, Bolivia, on low land near the Mamoré (see map of South America, ref. 5–D). It was founded by the Jesuits, and was long the most celebrated mission town of the Madeira valley, having a population of over 20,000. The mission buildings remain, but the place is much decayed. Pop. (1885) 4,535. H. H. S.

**Trinidad**: city; capital of Las Animas co., Col.; on Las Animas river, and the Atch., Top. and S. Fé, the Denver and Rio Gr., and the U. Pac., Denver and Gulf railways; 200 miles S. of Denver, and 650 miles W. of Kansas City, Mo. (for location, see map of Colorado, ref. 6–E). It is in an agricultural, stock-raising, bituminous coal, and coking region, and contains 9 churches, 4 large public-school buildings, an academy, business college, parochial school, 2 national banks (combined capital $200,000), 2 savings-banks (combined capital $50,000), a loan and trust company (authorized capital

$150,000), and 3 daily and 4 weekly papers. There are gas and electric light plants, extensive railway-shops, brewery, wool-scouring plant, and coking ovens. Pop. (1880) 2,226; (1890) 5,523; (1900) 5,345. EDITOR OF "ADVERTISER."

**Trinitarians**: See REDEMPTIONISTS.

**Trinitrocarbolic Acid, Trinitrophenol**, or **Trinitrophenic Acid**: See PICRIC ACID.

**Trinity**: See GOD.

**Trinity**: port of entry; capital of Trinity district, Newfoundland; on Trinity Bay: lat. of harbor, 48° 22′ N., lon. 53° 24′ W. It has an excellent harbor. In 1858 the first Atlantic cable was landed in Trinity Bay. The fisheries are the leading pursuit. Pop. about 2,000.

**Trinity College**: an institution of learning in Hartford, Conn., founded in 1823, and bearing until 1845 the name of Washington College. Its first president was Bishop Thomas Church Brownell, 1824–31. The college buildings, three in number, stood on a slight eminence, now the site of the State Capitol. In 1872 the campus was sold to the city of Hartford and a site of 78 acres was purchased, about a mile S. of the former location. Here has been erected a fine range of buildings, forming part of a new structure, which is intended to comprise three quadrangles, in all 1,050 feet by 370, with an aggregate area of 4 acres. It is in the early French secular Gothic style of architecture, and has an imposing effect. There are also, outside the limits reserved for these quadrangles, an observatory, a gymnasium and alumni hall, a hall of science, and a president's house. There is a valuable cabinet and a library of 40,000 volumes. The college offers four courses of study, leading to degrees in arts, science, and letters, with liberal provision for elective and special work; and there are numerous scholarships, in part competitive, for the assistance of deserving students, chiefly for those wishing to enter the ministry of the Protestant Episcopal Church. The Rev. Dr. George Williamson Smith has been president since 1883. SAMUEL HART.

**Trinity College, Dublin**: See DUBLIN, UNIVERSITY OF.

**Trinity River**: a river which rises in the northeast part of Trinity co., Cal., and after a course first to the S. W. and then to the N. W., falls into Klamath river, in Humboldt County. Its length is about 130 miles.

**Trinity River**: a river in Texas, formed by two branches, the Elm or East Fork and the West Fork, which rise in the northern part of the State, the latter in Archer County, and unite in Dallas County. Trinity river is a noble stream, flowing through a fertile, well-timbered country. At its lowest stage it is navigable to Liberty, about 22 miles from its mouth in Trinity Bay, and at high water small boats have ascended 500 miles. The length of the main stream is 550 miles.

**Trinity Sunday**: in the Roman Catholic, Anglican, and other Churches (but not the Greek Church), the Sunday next after Pentecost. It was established as a church festival, in honor of the Holy Trinity, by Pope John XXII. in 1320. It had previously been long celebrated in some Western dioceses, but not very generally before 1400.

**Triodon′tidæ** [Mod. Lat., named from *Tri′odon*, the typical genus; Gr. τρεῖς, τρι-, three + ὀδούς, ὀδόντος, tooth]: a family of fishes of the order *Plectognathi*, so named because the upper jaw is divided by a central suture while the under jaw is entire, thus forming three tooth-like pieces. The body is oblong, with a very dilatable abdomen, and with a slender conic tail; the lateral line well marked; the head oblong, with the snout rather long; the nostrils double; the mouth small; the gill openings narrow clefts in front of the pectoral fins; the branchiostegal rays entirely concealed; dorsal and anal fins very short and far behind; caudal distinct; pectorals narrow; ventrals wanting. An air-bladder is present. The skeleton is well ossified, and ribs are developed; the so-called pelvic bone is large, and serves to keep expanded the abdominal sac-like expansion, "the lower part of which is merely a flap of skin into which the air does not penetrate" (*Günther*). The family is especially interesting as serving to demonstrate the affinity of the gymnodonts with the scleroderms. But one species is known, the *Triodon bursarius* of the Indian Ocean and Archipelago.
Revised by F. A. LUCAS.

**Trionych′idæ** [Mod. Lat., named from *Tri′onyx*, the typical genus; Gr. τρεῖς, τρι-, three + ὄνυξ, ὄνυχος, claw]: a family of turtles containing the soft-shelled tortoises, and distinguished by the leathery and scaleless shell. "The principal habitat of the members of this family is the muddy bottom of shallow waters. They bury themselves in the soft mud, leaving only the head, or a small part of it, exposed. They take breath from time to time, without moving the body, by raising up the long neck and head and carrying the leathery snout above water." They rarely emerge from the water to take to the land, and when on the land their locomotion is laborious and constrained. In the water, however, they are very active and quick in their movements. "They feed upon shells, especially upon anodontas and paludinas." "They lay from twelve to twenty and more eggs, of a spherical form and above the size of a musket-ball, which they deposit on the shore by the water's edge. The shell of these eggs is thick, but very brittle." (Agassiz, *Contributions to the Natural History of the United States of America.*) Representatives of the family are found most abundantly in the tropical regions of Asia and Africa, but a number of species also extend through a considerable area in the U. S., and equally far northward in Asia.
Revised by F. A. LUCAS.

**Tripe de Roche**, treep′de-rōsh′ [Fr., rock tripe]: a name applied by French Canadian *voyageurs* and hunters to several species of *Umbilicaria* and *Gyrophora*, tough and bitter lichens of the barren grounds of British North America. *Tripe de roche* is often used as food when other provisions are exhausted, and, though cathartic and unpalatable, it will sustain life. The genera have representatives growing upon rocks in many high arctic and alpine regions.

**Tripit′aka** [Sanskr., three baskets; *tri*, three + *pitaka*, basket]: the sacred scriptures of the Buddhists; so called because made up of three collections called respectively *Sūtra*, or aphorisms; *Vinaya*, or discipline; and *Abhidharma* or *Abhidhamma*, metaphysics. (See PĀLI LITERATURE.) The name Tripitaka is also sometimes applied to the Chinese *San-tsang* (three storehouses; in Japanese *San-zō*), which consists of translations, from the first century onward, of original Sanskrit texts, and of commentaries and other matter. A complete copy of this (in 2,200 vols., requiring 108 feet of shelf-room) is in the library of the India office, London. An edition in over 500 vols., printed from movable metal type, was issued in 1881–85 by one of the monasteries in Tokio.

**Triple Alliance**: (1) the league between England, Sweden, and the States-General (1668) for the protection of the Spanish Netherlands against Louis XIV. (2) The league of Great Britain, France, and the Netherlands against Spain and the Pretender in 1717. (3) The league of Austria, Great Britain, and Russia, concluded in 1795. (4) The *Dreibund*, or league of Germany, Austria, and Italy, formed for the purpose of mutual protection in case of attack by other powers. A dual alliance between Austria and Germany had been formed in 1879, and Italy was admitted as a third member in 1882. In spite of the opposition of the Italian republicans and Irredentists the alliance has been maintained, and in July, 1891, the Emperor of Germany publicly declared that it had been resumed for a period of six years.

**Trip′oli** [named from the city Tripoli]: one of the thirty-eight vilayets or provinces of Turkey, and, including Barca on the E., the only region in Africa now directly controlled by Turkey. It has over 700 miles of sea-frontage on the Mediterranean, adjoins Egypt and the Libyan waste on the E., includes Fezzan on the S., and has Tunis on its western frontier. Though about one-third larger than Texas, its population is only 800,000 to 1,000,000. Seventeen explorers have visited it since 1800, but they followed chiefly the main routes leading S. from the city of Tripoli, and many parts of the interior remain to be studied in their geological, ethnological, and other aspects. Its coast towns are the natural points of departure for caravans to the Western Sudan, because the coast-line on the deep indentation of the Gulf of Syrte shortens the journey to the Sudan about one-fourth. The routes S. across the desert are also better than those from Algeria, because mountains and sand-dunes oppose few difficulties and wells are comparatively abundant. The explorer Rohlfs urged Italy to acquire Tripoli, on the ground that the Western Sudan would easily fall to its possessor. In other respects Tripoli is much less favored than Tunis and Algeria. Lying farther S. the mean temperature is much higher and the climate is of continental rather than maritime character. Most of the region is poor and sandy, and the sands from the eastern and southern deserts, together with vast quantities blown inland

from the sea-border, have greatly restricted the areas where agriculture can flourish. Nine-tenths of the country has no population because it does not differ from the great sandy and rocky plateau, inhabited only in a few scattered oases, that extends from Alexandria to Tunis. The rainfall is small, and Tripoli has not a single perennial stream. Although thus pertaining to the region of the desert rather than to that of the littoral, Tripoli has a considerable number of small areas that are very fruitful, particularly along the slopes of the low mountains that nearly bisect it from E. to W. and from N. to S., and along the usually dry water-courses. The almond-tree, olive, and date flourish, and the vine is widely cultivated, though not for wine-making. The fauna, like the flora, is poorer in species and in numbers than in countries of the littoral farther west. Neither lions nor panthers are found in the mountains, crocodiles can not live where permanent rivers do not exist, and the elephants that once roamed over the country were long ago driven out by widespread deforestation. Foxes, hares, wolves, some varieties of monkeys, gazelles, and antelopes are the only game. There are a few varieties of reptiles, but not many birds, most of them being birds of passage, which are seen only for a few weeks in spring and autumn during their migrations. Camels and asses are the chief domestic animals, but a diminutive variety of cattle and also horses and dogs are found in small numbers. Fat-tailed sheep are raised to some extent, but goats are much more numerous. The population consists mainly of Arabs and Berbers. The Berbers, representing the ancient inhabitants, are probably more numerous, but there has been great admixture of these families. In many places the Berbers have adopted the language of their conquerors, and it is difficult to distinguish them from the Arabs. In other places, particularly in the oases, the two peoples live in distinct groups, having each its own name and social organization. The Berbers who have most successfully maintained their primitive character live among the mountains of Ghurian and Yefren. Here center the insurrections that, now and then, are a source of much trouble to the Turkish authorities. Thousands of slaves from the Sudan form an important element in the population. The Turks, though in absolute control of the country since 1835, form only a small minority. They hold themselves above the people they govern and are looked upon as strangers. Arabic, and not Turkish, is the official language. The Jews are a very old element in the population and suffer much ill treatment. The only port of importance is the capital, Tripoli, and the chief exports are esparto grass, ostrich feathers, and a little wheat. The total export and import trade with Europe amounts only to about $6,000,000 a year. See Nachtigal's *Sahara und Sudan* (2 vols., Berlin, 1879–81); Barth's *Travels and Discoveries in North Africa* (5 vols., 1857–58) and *Wanderungen durch die Küstenländer des Mittelmeeres* (Berlin, 1849); Rohlfs's *Land und Volk in Afrika* (Bremen, 1870); Vatonne's *Mission de Ghadâmès*; Duveyrier's *Exploration du Sahara, les Tuaregs du Nord* (1864); and Reclus's *Nouvelle Géographie Universelle* (vol. xi., Paris, 1876).
C. C. ADAMS.

**Tripoli** [Lat. *Tri'polis*, Gr. Τρίπολις, liter., three-town]: a port built on the site of three ancient towns on the African coast of the Mediterranean (see map of Africa, ref. 1–D). It is the capital of the Turkish province of Tripoli. The city is strongly fortified, has considerable trade with Europe and a large caravan trade with the Western Sudan, but it is far inferior, in commercial importance to several other cities on the southern shores of the Mediterranean. It presents a charming aspect from the sea, but first impressions are modified by a nearer view of dilapidated buildings, narrow and tortuous streets, and abounding dirt and refuse. It is most cosmopolitan in its architecture, the Arab style with its white, bare walls and courts surrounded by galleries predominating. Almost all the Government buildings resemble the Turkish structures of Stamboul, while the 3,000 Maltese residents, who form the Christian element, have many buildings of Italian aspect, and the water-front is lined with structures like those in the smaller commercial ports of Europe. Negro slaves have introduced in some quarters cabins like those in which they lived in the Sudan. Much has been done in recent years to improve the appearance and sanitary conditions of the city. The town nearly covers a small promontory jutting out into the sea, and behind it is a wide belt of plantations given chiefly to the raising of olives. The capital has a far larger trade with the Sudan than any other Mediterranean port. Of late years its largest source of prosperity has been the export to Europe of esparto grass. The commercial value of the port is considerably impaired by the shallow waters of the roadstead, and the northern winds at times, particularly in the winter months, make it very dangerous to approach the city. Pop. about 40,000.
C. C. ADAMS.

**Trip'oli** (Arab. *Tarābulus*, anc. Τρίπολις, *Tri'polis*): seaport town of Syria; in the vilayet of Beyrout, about 40 miles N. N. E. from Beyrout (see map of Turkey, ref. 7–G). The ancient town consisted of three distinct quarters, each surrounded by its wall and inhabited by colonists from Aradus, Sidon, and Tyre respectively. It was hence called Tripolis, "the triple city," by the Greeks. Renowned for its commerce in antiquity, it was specially important during the crusades. It occupied a triangular promontory projecting into the Mediterranean, and inclosed on the E. by a wall 18 feet thick, which may still be traced, while the entire promontory is strewn with ruins. N. is the harbor, from which the modern town is about a mile distant, embowered in apricot, orange, and lemon orchards. El-Kadisha, "the sacred river," which rises among the grove of cedars on Lebanon, renders the vicinity fertile and unhealthful. Tripoli is the natural outlet of the interior cities Hama and Homs. It has a fine and safe harbor, and French, British, and Russian steamers touch here regularly. It exports raw silk, sponges, soap, olive oil, cotton, and fruits. Pop. 24,000, mainly Mussulmans.
E. A. GROSVENOR.

**Tripolit'za**: town; in Arcadia, Greece (see map of Greece, ref. 17–J). Founded by the Ottomans in 1770, its buildings were constructed from the *débris* of Pallantium, Tegea, and Mantinea. The capital of the Morea, it was taken by the Greek revolutionists (1821) and retaken by Ibrahim Pasha (1825), who razed it to the ground three years later. It is now an enterprising and prosperous place. Pop. (1889) 10,698.
E. A. G.

**Tripos**: the system of honors examination at the University of Cambridge, England. The derivation of the name goes back to a very early period, when the student who was being examined sat on a three-legged stool. The examinations are held at the end of May or beginning of June in each year. The tripos is usually taken at the end of the third year of residence at the university. There are the mathematical tripos, classical tripos, moral sciences tripos, natural sciences tripos, theological tripos, law tripos, historical tripos, Semitic language tripos, Indian language tripos, mediæval and modern language tripos. The one who obtains the highest place in the mathematical tripos is called the senior wrangler.
C. H. THURBER.

**Triptych** [Gr. τρίπτυχος, consisting of three layers; πτύσσειν, to fold]: a set of three tablets or panels hinged together. The use of the appliance is generally to hold either writing or painting in such a way that it is protected from injury. (See DIPTYCH.) Whenever it became necessary to increase the size of the tablets beyond that of an object easily carried in the hand, and especially when one leaf was made fast to a wall or desk, it must have been found better to divide the upper or covering leaf into two. This, then, became the type of folding tablet used for early devotional pictures—a stout panel which could be set upon an altar or secured to a wall, and two thinner leaves or doors, one hinged to each side of the larger leaf, the two meeting in the middle of it and exactly covering it. One picture being painted on the larger leaf, or a large one with a smaller one below, it was natural to paint also the inside of the two doors; next, when greater richness was required, the outside of the doors was painted. The famous altarpiece

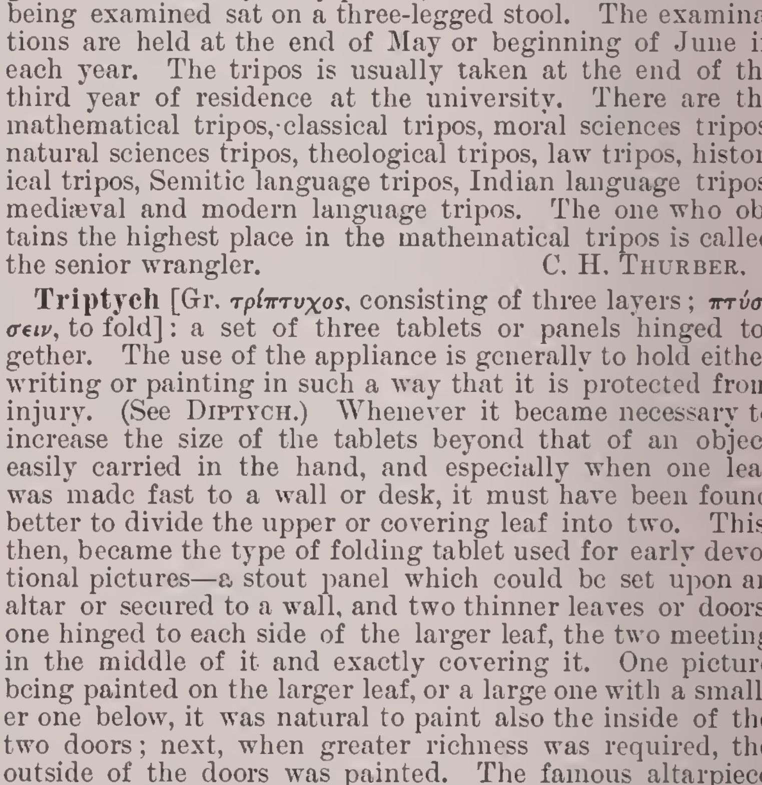

Diagram of the *Last Judgment*, by Rogier van der Weyden.

of the brothers Van Eyck (see EYCK, JOHN VAN) was a double triptych; an upper and a lower back panel had each two doors, but, as each door was itself divided into two folds, a word expressing division into five rather than three is needed to fully explain it. In like manner the *Last Judgment*, by Rogier van der Weyden, in the hospital at Beaune, in Burgundy, has a back panel of the shape of a smaller parallelogram above a larger one, with two small leaves above and two large ones below. The subject of the Judgment Day fills all the irregular-shaped surface offered when the leaves are opened wide; the outside has six different and separate pictures. These examples are, however, of late date, and show the triptych form giving way to the new requirements of an advanced art. RUSSELL STURGIS.

**Triqueti**, trēē'ke-tee', HENRI, Baron de: painter and sculptor; b. at Conflans, department of Loiret, France, in 1802; studied at the Academy of Art in Paris; exhibited in 1831 several pictures and a marble group, which attracted much attention, *Death of Charles the Bold*; devoted himself subsequently exclusively to sculpture; was for a long time engaged in the interior decoration of the Madeleine. Among his works are *Dante*, *Jesus feeding the Birds*, *Bacchus*, *The Holy Family*, and many busts. D. in Paris, May 11, 1874. Revised by RUSSELL STURGIS.

**Trirat'na** [Sanskr., three jewels; *tri*, three + *ratna*, a jewel]: the Buddhist triad or trinity, consisting of (1) Buddha, the founder of the system; (2) *Dharma*, the law or doctrine which he taught; and (3) the *Sangha*, or monastic order which he established. The two latter have been personalized and deified by later Buddhists as the "Three Precious Ones," in whom the seeker after deliverance from individual existence and its sorrow and pain takes refuge. Hence they are also known as the "Three Refuges."

**Trisection of Angle** [*trisection* is from Lat. *tri-*, three + *seca're*, *sec'tum*, cut]: a celebrated problem among the ancient geometers. It belongs to the same class of problems as the duplication of the cube and the insertion of two geometrical means between two given lines. Like them, it can not be solved by the methods of elementary geometry. It may, however, be solved by means of an auxiliary curve called a conchoid; it can also be solved in several ways by the principles of higher geometry. S. N.

**Trismegistus**: See HERMES TRISMEGISTUS.

**Trissi'no**, GIANGIORGIO: grammarian and poet; b. at Vicenza, Italy, June 18, 1478. Exiled from Venice in 1508, he studied philosophy at Ferrara, and then went to Rome, where Leo X. received him. Desirous of reforming the Italian alphabet, he set forth his plans in the *Epistola a Clemente VII.* (1524), and published with it the *Canzone a Clemente VII.*, the *Sofonisba*, the *Ritratti*, and other works. The *Sofonisba*, an attempt to establish a tragic drama in the sixteenth century, was not very successful. As the ban had long been removed from him, he settled down in his home as a papal delegate (about 1526), still applying himself to his favorite scheme of improving the alphabet. The *Alfabeto*, the *Dubbi grammaticali*, the *Grammatichetta*, and the first portion of his *Poetica* and *Rime* appeared there after 1526, and were followed by the *Volgare Eloquio* (1529), a translation of Dante's *De Vulgari Eloquio*, which in this form appeared in print for the first time; the *Castellano*, a dialogue on the proper name for the Italian tongue; and the *Encomion*, a poem in Latin hexameters. During the remainder of his life he traveled about Italy not a little, and at the same time wrote the *Grammatices Introductionis Liber Primus* (1540); the *Italia liberata dai Goti* (1548); the *I Simillimi*, a comedy; and the rest of the *Poetica*. The *Italia liberata dai Goti* is a noteworthy endeavor to revive the historic epic, and on it Trissino's fame came chiefly to rest. Indeed, it was for a time accepted throughout Europe as belonging to the same class of poems as the *Iliad* and the *Æneid*. It is now, however, little read. Trissino died in Rome, Dec. 8, 1550. J. D. M. FORD.

**Tristan da Cunha**, -daa-koon'yā̈a: the largest of a group of islands in the Southern Atlantic, in lat. 37° 6' S., lon. 12° 19' W. Area about 40 sq. miles. It is mountainous, its center rising into a volcanic peak 7,640 feet high, but fertile, well provided with water, and healthful. It was discovered in 1506 by the Portuguese navigator Tristan da Cunha, and occupied by British troops during the captivity of Napoleon on St. Helena. Pop. (1895) 61. Property is held in common; there is no crime and no strong drink. The other islands are Inaccessible island and the three Nightingale islands, Nightingale, Stoltenhoff, and Middle isle. These are frequented by seals and sea-fowl.

**Tristram**, HENRY BAKER: See the Appendix.

**Triton** (Gr. Τρίτων): in Greek mythology, a marine deity, sometimes the son of Poseidon and Amphitrite, sometimes a subordinate sea-god, and sometimes even localized as the god of the Libyan Sea. In art he is represented as a young man with the body ending in a fish-tail, and with a trumpet of conch-shells with which at the command of Poseidon he bade the waves be still.

Revised by J. R. S. STERRETT.

**Triton**: a name given (1) to a gasteropod mollusc; (2) to the aquatic salamanders, especially of Europe.

**Tritone** [from Gr. τρίτονος, of three tones: τρι-, three + τόνος, tone. See TONE]: in music, the interval of the augmented fourth, which consists of three whole tones, or rather of two whole tones and two semitones, as C–F♯, G–C♯, an interval studiously avoided by the old musicians.

**Triumph** [viâ O. Fr. from Lat. *trium'phus* < O. Lat. *trium'pus*, deriv. of *trium'pe*, an exclamation used in solemn processions of the Arval brethren; cf. Gr. θρίαμβος]: in ancient Rome, a state pageant in which a victorious general or naval commander, preceded by the senate and by the spoils and prisoners, was drawn by four horses along the Sacred Way and followed by his army to the temple of Capitoline Jove, where solemn sacrifice was offered. In order to triumph, the general must be in possession of the highest magisterial power as dictator, consul, proconsul, prætor, or proprætor. The war, too, must be one against foreign foes, and must have been brought to a conclusion. There were also other conditions which were not uniformly observed. The triumphal procession was very brilliant, and sometimes lasted two or three days. It was customary to put to death some of the hostile chiefs during the triumphal march. There are in all about 350 recorded triumphs; the last seems to have been celebrated by Diocletian in 302 A. D.

Revised by CHARLES H. HASKINS.

**Trium'virs**, or **Tres'viri** [= Lat.; *tres* (gen. *trium*), three + *viri*, plur. of *vir*, man]: in ancient Rome, a board of three men. Besides certain permanent boards, the name was applied to various extraordinary commissions appointed to perform some special public duty. The coalition of Cæsar, Pompey, and Crassus in B. C. 60 is often, though improperly, called the first triumvirate. The men who constituted it bore no official title, and exercised only an usurped power. The second triumvirate, which was that of Octavian, Mark Antony, and Lepidus, was officially recognized by the senate, and the three magistrates bore the name of *Tresviri reipublicæ constituendæ* (triumvirs for arranging public affairs).

Revised by CHARLES H. HASKINS.

**Triv'ium**: name applied in the Middle Ages to the arts, grammar, rhetoric, and dialectic, which were taught in the cloister and cathedral schools. The trivium and quadrivium—music, arithmetic, geometry, and astronomy—made up the seven liberal arts. See West, *Alcuin and the Rise of the Christian Schools* (1892). C. H. T.

**Trochaic Metres**: verses whose fundamental foot is the trochee (τροχαῖος, running; called also choree, from χορεῖος, dancing). The measure is the dipody, resembling the $\frac{6}{8}$-bar of music in form and lively movement. The most common verse is the tetrameter catalectic, with diæresis between the two diameters. See METRES.

**Trochil'idæ** [Mod. Lat., named from *Tro'chilus*, the typical genus, from Gr. τροχίλος, some kind of small bird; cf. τρέχειν, run]: a family of birds comprising the humming-birds. See HUMMING-BIRD.

**Troch'ophore** [Gr. τροχός, wheel + φορεῖν, to bear]: a term applied to the typical annelid larvæ in allusion to the circles of cilia (one to three or more) which surround the body, and which are the wheels referred to in the name. A trochophore stage is more or less clearly recognized in other worms and in molluscs.

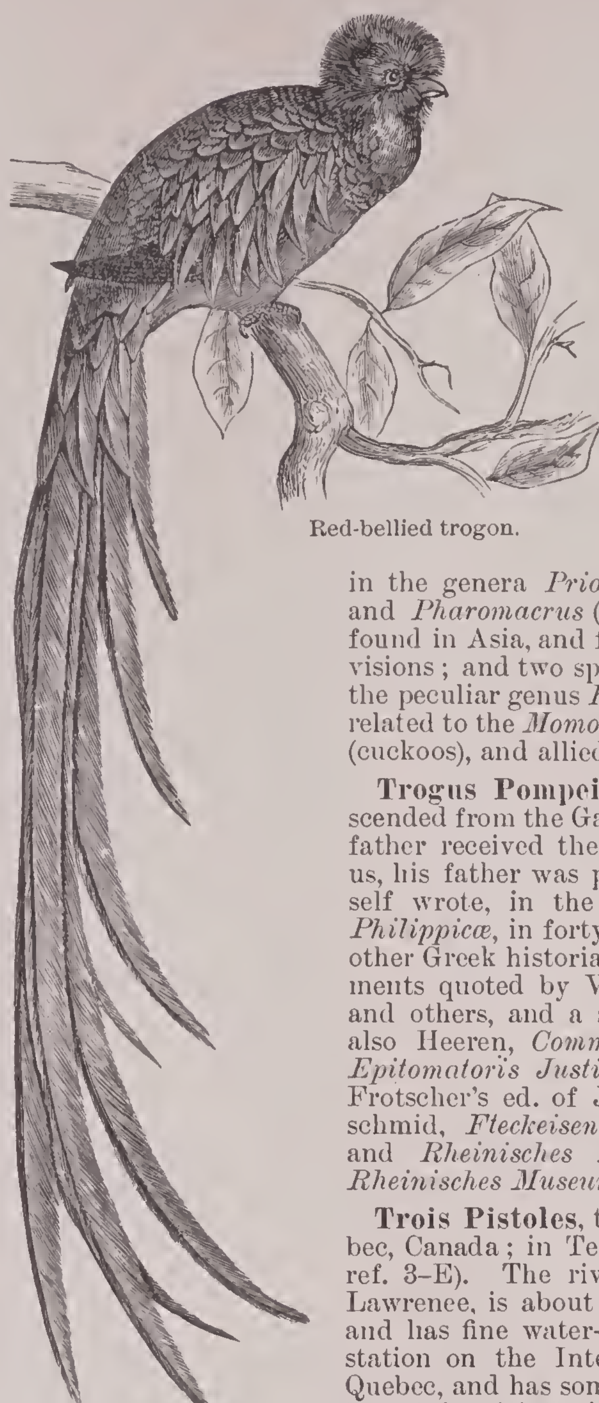
**Trochu**, trō'shü', LOUIS JULES: soldier; b. at Le Palais, department of Morbihan, France, Mar. 12, 1815; made his military career chiefly as aide-de-camp and in the ministry of war. He was aide-de-camp to Marshal Bugeaud in Algeria, to Marshal Saint-Arnaud, and afterward to Gen. Canrobert, in the Crimea, and distinguished himself at the storming of the Malakoff as commander of the first brigade of the First French Corps. He was in command of a division at the battle of Solferino. On account of his scientific education he was generally considered as the future Minister of War, but by his pamphlet *L'armée française en 1867*, which ran through twenty editions in three years, and, revealing the weaknesses of the French army, advocated the adoption of Prussian methods, he lost the favor of the Emperor Napoleon, and received no more offices of confidence. This circumstance, however, made him a favorite with the opposition, and when in 1870 the French army broke down, he was called to the imperial council and appointed governor of Paris Aug. 17. When the Revolution broke out in Paris after the disaster of Sedan, he was also made commander-in-chief of all the forces defending the capital, and president of the government of national defense, which position he held until the surrender of the city. He was chosen to the National Assembly in 1871, but retired to private life in 1873. Author of *Pour la Vérité et pour la Justice* (1873); *La Politique et le Siège de Paris* (1874); and *L'Armée française en 1879*. D. Oct. 7, 1896.

**Trœzen**, tree'zen, or **Trœze'ne** (Gr. Τροιζήν): one of the oldest cities of ancient Greece; in a fertile plain (Trœzenia) which occupied the southeastern part of Argolis. It was founded by Ionian settlers, and was under the authority of Argos at the time of the Trojan war; but although it subsequently, by the conquest of Peloponnesus by the Dorians, received a colony of Doric settlers and became a Doric city, it maintained its Ionian sympathies and traditions. It early grew into an important maritime place. It founded Halicarnassus and Myndus in Caria, and after the battle of Thermopylæ its harbor was appointed the place of rendezvous for the Greek fleet. It received with the greatest kindness the Athenians who fled from Xerxes, and fought with five ships and 1,000 men in the battles of Artemisium, Salamis, Platæa, and Mycale. Up to the Peloponnesian war it was a firm ally of Athens, but after that time it sided with Lacedæmon, and subsequently it became a Macedonian possession. In the second century of the Christian era it was still a splendid city, as shown by the description Pausanias has given of its public buildings, of which some ruins are still found near the village of Damala.
Revised by J. R. S. STERRETT.

**Trog'lodytes** [from Lat. *Troglo'dytæ* = Gr. Τρωγλοδύται, the pygmies, cave-dwellers, liter., plur. of τρωγλοδύτης, cave-dweller; τρώγλη, cave + δύνειν, enter]: with the ancient writers the name of races found in the Caucasus, in Moesia near the lower Danube, and elsewhere, but especially along the coasts of the Red Sea, both the Arabian and the African, which region was called *Regio Troglodytica*. Common to these tribes was their low grade of civilization. They lived in caves and depended on herds of cattle for their livelihood. The name is now applied to cave-dwellers generally. *Troglod'ytes* is the name both of a genus of wrens and of the genus containing the chimpanzee and gorilla.

**Troglodyt'idæ** [Mod. Lat., named from *Troglo'dytes*, the typical genus. See TROGLODYTES]: a family of oscinine birds containing the wrens. They have a ten-primaried wing, slender bill, inner toe united by at least half its basal joint to the middle toe, and scutellate tarsi. See WREN. F. A. L.

**Trogon'idæ** [Mod. Lat., named from *Tro'gon*, the typical genus, from Gr. τρώγων, pres. partic. of τρώγειν, gnaw, chew]: a family of birds common to the tropical and subtropical regions of America, as well as Asia and Africa, distinguished from all others by having the second as well as the first toe turned backward. The bill is rather short, stout, broad at the base, and rapidly narrowed forward, with the edges more or less toothed: the wings are moderate and rounded; the legs are rather weak; the tarsi short; the tail is more or less elongated and graduated. The species are mostly showy birds of moderate size, which in great part live in the depths of the equatorial forests, often perched on the highest branches. They are believed to subsist to a large extent on fruits and berries, but also prey on insects. They nest in holes in trees, or those abandoned by woodpeckers. The most gorgeous species is the resplendent trogon, or quetzal (*Pharomacrus mocinno*) of Guatemala, which is of a brilliant metallic green above and red below. The scapulars and upper tail coverts are long, the latter extending far beyond the tail feathers and often mistaken for them. About fifty species are known, thirty-five occurring in America, comprised in the genera *Prionoteles*, *Temnotrogon*, *Trogon*, *Leptuas*, and *Pharomacrus* (= *Calurus*); some dozen or more are found in Asia, and form the genus *Harpactes* and its subdivisions; and two species in Africa have been isolated to form the peculiar genus *Hapaloderma*. The family is most nearly related to the *Momotidæ*, *Alcedinidæ* (kingfishers), *Cuculidæ* (cuckoos), and allied forms. Revised by F. A. LUCAS.



Red-bellied trogon.

**Trogus Pompeius**, -pom-pee'yŭs: a Latin author descended from the Gaulish tribe of the Vocontii. His grandfather received the citizenship of Rome from Cn. Pompeius, his father was private secretary to Cæsar, and he himself wrote, in the time of Augustus, a work, *Historiæ Philippicæ*, in forty-four books, based upon Timagenes and other Greek historians, of which there exist a few brief fragments quoted by Vopiscus, Cassiodorus, Servius, Priscian, and others, and a series of excerpts by JUSTIN (*q. v.*); see also Heeren, *Commentationes de Trogi Pompeii ejusque Epitomatoris Justini Fontibus et Auctoritate*, printed in Frotscher's ed. of Justinius (Leipzig, 1827–30). A. v. Gutschmid, *Fleckeisens Jahrbücher*, supplement ii., p. 187; and *Rheinisches Museum*, 37, 548; also Wachsmuth, *Rheinisches Museum*, 46, 465. Revised by M. WARREN.

**Trois Pistoles**, trwaa'pees'tōl': river and town of Quebec, Canada; in Temiscouata County (see map of Quebec, ref. 3–E). The river is a right-hand affluent of the St. Lawrence, is about 50 miles long, discharges several lakes, and has fine water-powers. The town is at its mouth, a station on the Intercolonial Railway, 145 miles N. E. of Quebec, and has some trade in wood and stone. The fishing of the vicinity is excellent. Pop. 2,500. M. W. H.

**Troja**: See TROY.

**Trolley**: See ELECTRIC RAILWAYS.

**Trollope**, trol'ŭp, ANTHONY: novelist; third son of Frances M. Trollope; b. in London, Apr. 24, 1815; educated at Winchester and Harrow; from 1834 to 1867 was connected with the British postal service, for which he made many voyages, and subsequently traveled extensively in the U. S., the West Indies, and Australia. In 1869 he was an unsuccessful candidate for Parliament, in the Liberal interest, for Beverley. He wrote several books of travel and many novels. Most of his later novels were originally published serially and simultaneously in British and American magazines. Among his books, which number about seventy, are *The Macdermots of Ballydoran* (1847); *The Kellys and the O'Kellys* (1848); *La Vendée* (1850); *The Warden* (1855); *Barchester Towers*, his first decided success (1857); *Doctor Thorne*, one of his best works (1858); *The Bertrams* (1859); *Castle Richmond* (1860); *Framley Parsonage* (1861); *Tales of all Countries*, stories which had appeared in various magazines (1861; 2d series 1863); *Orley Farm* (1862); *North America*, a book of travel (1862); *Rachel Ray* (1863); *The Belton Estate* (1864); *Hunting Sketches* (1864); *Can You Forgive Her?* (1865); *Clergymen of the Church of England* (1866); *The Claverings* (1867); *The Last Chronicles of Barset* (1867); *Phineas Phinn, the Irish Member* (1869); *He Knew He was Right* (1869); *Sir Harry Hotspur of Humblethwaite* (1870); *The Vicar of Bullhampton* (1870); *Ralph the Heir* (1871); *The Golden Lion of Granpère* (1872); *Phineas Redux* (1873); *Australia and New Zealand*, a book of travel (1873); *The*

*Way we Live Now* (1874); *The Prime Minister* (1875); a series of *Short Stories* (1876) published simultaneously in England and America; *The American Senator* (1877); *The Duke's Children* (1880); *Dr. Wortle's School* (1881); and a *Life of Cicero* (2 vols., 1881). D. in London, Dec. 6, 1882. An *Autobiography*, begun in 1875 and added to in 1879, was published in 1883. In this he described his methods of work, which were very systematic, and testified that for the last twenty years his books had yielded him nearly £70,000. Trollope's fiction is of the realistic type, honest in purpose, truthful, and solid, but often dull and creeping in style. He excelled in the portrayal of clerical characters and the humdrum life of rural parishes. See ENGLISH LITERATURE.
Revised by H. A. BEERS.

**Trollope**, EDWARD, D. D., F. S. A.: clergyman and author; b. Apr. 15, 1817, the younger son of a baronet; was educated at Eton and at Christ Church, Oxford; graduated in 1839; took holy orders; received successive preferments, becoming archdeacon of Stow and prebendary of Liddington in 1867, and bishop suffragan of Nottingham in 1877. Among his works on architecture, etc., are *Illustrations of Ancient Art* (1854); *Life of Pope Adrian IV.* (1856); *Introduction of Christianity into Lincolnshire* (1857); *Labyrinths, Ancient and Mediæval* (1858); *Fens and Submarine Forests* (1859); *Monastic Gatehouses* (1860); *Life of Hereward, the Saxon Patriot* (1861); *Battle of Bosworth Field* (1862); *Shadows of the Past* (1863); *The Raising of the Royal Standard at Nottingham* (1864); *Spilsby and other Churches* (1865); *Norman Sculptures of Lincoln Cathedral* (1866); *Grantham and other Churches* (1867); *The Roman Ermine Street* (1868); *The Norman and Early English Styles of Gothic Architecture* (1869); *Boston and other Churches* (1870); *Church Spires* (1874); *Little Hugh of Lincoln* (1880).

**Trollope**, FRANCES (*Milton*): author; b. in Hampshire, England, about 1778. She was the daughter of Rev. William Milton, vicar of Heckfield, Hants, and in 1809 contracted an unhappy marriage with Thomas Anthony Trollope, a barrister. In 1829 she went to the U. S. and attempted to establish herself in some kind of business at Cincinnati; failing in this, she returned to England, where she published her *Domestic Manners of the Americans* (1831; new ed. New York, 1894), a broad and rather offensive caricature, which met with great favor in England. She followed up this success by writing a novel, *The Refugee in America* (1832), and entered upon a career of literary activity which lasted more than twenty years, the greater part of her works being novels. About 1844 she went to Italy, where her eldest son was residing, and where she passed the remainder of her life. Among her novels are *The Abbess* (1833); *Tremordyn Cliff*, one of her best (1835); *Life and Adventures of Jonathan Jefferson Whitelaw* (1836; republished in 1857 under the title *Lynch Law*); *The Widow Barnaby* (1839); *The Widow Married* (1840); *The Barnabys in America* (1843); *Father Eustace, a Tale of the Jesuits* (1846); *Petticoat Government* (1850); *Life and Adventures of a Clever Woman* (1854); and *Fashionable Life, or Paris and London*, her last work (1856). D. in Florence, Oct. 6, 1863. Revised by H. A. BEERS.

**Trollope**, THOMAS ADOLPHUS: eldest son of Frances M. Trollope; b. Apr. 29, 1810; educated at Winchester and Oxford; traveled on the Continent; published *A Summer in Brittany* (1840), *A Summer in Western France* (1841), and took up his residence in Florence. In 1873 he left Florence for Rome, where he acted as correspondent for the London *Standard*. In 1888 he returned to England and took up his residence in Devonshire. He was a constant contributor to English literary periodicals, and was the Italian correspondent of *The New York Tribune*. Most of his writings relate directly to Italian history, life, and manners. Among these are *La Beata* (1861); *Marietta* (1862); *Giulio Malatesta* (1863); *Beppo the Conscript* (1864); *History of the Commonwealth of Florence* (4 vols., 1865); *Gemma* (1866); *Leonora Casaloni* (1869); and *Life of Pius IX.* (2 vols., 1877). On subjects not Italian he published *Lindisfarn Chase* (1864); *Artingdale Castle* (1867); *Dream Numbers* (1868); *The Garstangs of Garstang Grange* (1869); *A Siren* (1870); *Durnton Abbey* (1871); *Sketches from French History* (1878); and *What I Remember* (3 vols., 1887–89). D. at Clifton, Nov. 11, 1892. Revised by H. A. BEERS.

**Trolls** [= Icel.; cf. Eng. *droll* and Low Germ. *droll*, troll, droll]: a name often applied to the giants of Scandinavian mythology and to a similar class of beings in modern Scandinavian folk-lore. The trolls of folk-lore are very powerful, and hostile to man. They are regarded as extremely stupid, and hence men usually defeated them in their attempts to capture fair maidens. Princesses taken into the subterranean mansions built of gold and silver easily deceive the credulous trolls, and so make their escape.
RASMUS B. ANDERSON.

**Tröltsch**, Baron ANTON FRIEDRICH, von, M. D.: aurist; b. at Schwabach, near Nuremberg, Germany, Apr. 3, 1829; educated at the gymnasia of Bamberg, Augsburg, and Nuremberg; studied law at Erlangen 1847–48, after which he entered on a course of natural history at Munich; entered the University of Würzburg in 1849, graduating M. D. in 1853; then studied under von Gräfe in Berlin, Arlt in Prague, in Dublin under Wilde, in London under Toynbee, and in Paris in 1855–56. In the early part of the latter year he announced a new method of investigating the inner ear by means of a concave mirror and daylight, a procedure that revolutionized the treatment of aural diseases. In 1861, after five years of study at Würzburg, he qualified himself for the post of docent in aural medicine, and in 1864 he was promoted professor extraordinary in that department; in 1864 founded the *Archiv für Ohrenheilkunde*, the first special journal on ear diseases. The immense progress made in aural surgery since 1860 may be largely ascribed to the influence of his teachings. Among his classic works are *Die angewandte Anatomie des Ohres* (Würzburg, 1860); *Lehrbuch der Ohrenheilkunde* (Würzburg, 1862); and papers in Pitha and Billroth's *Handbook of Surgery* and in Gerhard's *Handbook of Children's Diseases*. D. at Würzburg, Jan. 9, 1890. S. T. ARMSTRONG.

**Trombone** [= Fr. = Ital., augmentative of *tromba*, trumpet]: a large brass wind instrument of the trumpet species, supposed to be the same as the sackbut of early writers. Its peculiarity consists in the facility of deepening the tones by means of sliding tubes, making it one of the most effective instruments in an orchestra. There are three kinds—alto, tenor, and bass.

**Tromp**, MAARTEN HARPERTZOON, van: admiral; b. at Briel in 1597; entered the Dutch navy, and in 1624 was placed in command of a frigate. In 1637 he was made lieutenant-admiral, and in 1639 gained a European fame by his two great victories over the Spanish fleet off Gravelines and in the Downs. He was at first less successful in the war between England and Holland, and, having been defeated by Blake, he even lost his command for some time in 1652. He was soon reinstated, however, and defeated Blake completely in the Downs Dec. 10, 1652 (N. S.). In Feb., 1653, he fought against the combined fleet of Blake, Monk, and Deane, and, though somewhat worsted in the encounter, showed remarkable courage and skill and effected a successful retreat. He fought another indecisive battle in June. In July, 1653, he again attacked the English fleet. The battle lasted two days, but was finally lost by the Dutch; Tromp himself was killed Aug. 8 (N. S.), 1653. He is buried in the church of Delft, where a splendid monument has been erected to him.—His son, CORNELIS TROMP, b. in Rotterdam, Sept. 9, 1629, achieved almost an equal fame, held the highest positions in the Dutch navy, and served with great distinction for some time in Denmark. D. in Amsterdam, May 29, 1691.

**Trompe**: See BLOWING-MACHINES.

**Trom'sö**: port of Northern Norway and one of the most northerly towns in the world; lat. 69° 38′ N., lon. 18° 45′ E.; on the eastern shore of an island of the same name in the Tromsö fiord (see map of Norway and Sweden, ref. 2–G). The town is well built, though of wood, and is in attractive surroundings. It has an ethnographic museum rich in material relating to the Lapps. The port is commodious, and is most frequented by Russians, who come for salt and smoked fish. The fishing industry is active, and is devoted to the herring, cod, hake, seal, and whale. The chief exports are fish, oil, pelts, nickel ore, and eider-down. The town was founded in 1794, but did not become important until the middle of the nineteenth century. Pop. (1891) 6,080 with the commune, but the rural population is very small.
MARK W. HARRINGTON.

**Trona** [Egypt. or N. Afr., perhaps connected with *natron*]: the mineralogical name of a native sodium carbonate, the most common native form of that salt. It has the composition when crystallized $Na_2CO_3.2HNaCO_3.2H_2O$, and is known by the name sodium sesqui-carbonate. It occurs as a natural deposit in Egypt, Africa, South America, and elsewhere.

**Trondhjem**, trond'yem, or **Drontheim**: the ancient *Nidaros*, the oldest town of Norway (founded 996); beautifully situated on the southern shore of Trondhjemsfjord, in lat. 63° 25' N.; 250 miles by rail N. of Christiania (see map of Norway and Sweden, ref. 7–D). Of its cathedral, which once was the largest church-building in Scandinavia, only the choir remains, in which the kings are crowned, but the restoration of the entire cathedral was undertaken by the Government in 1880. Its breweries and distilleries are extensive and celebrated. Much copper, salt and dried fish, oil, and timber are exported. Pop. (1891) 29,162.

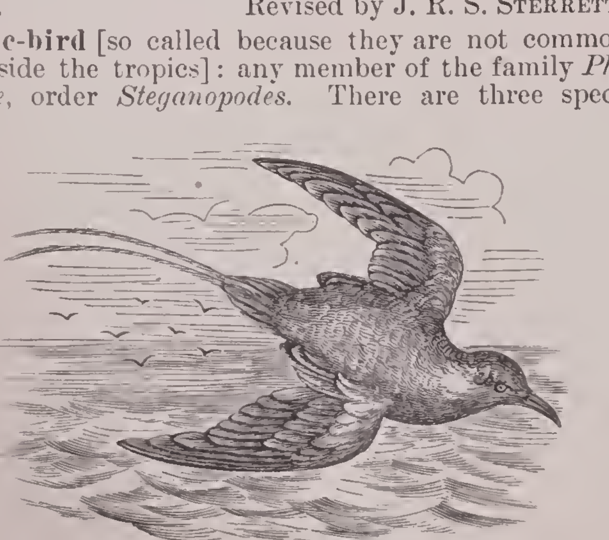
**Troopial** [from Fr. *troupial*, deriv. of *troupe*, troop]: a name used for many of the orioles (*Icteridæ*), and apparently first bestowed on the birds of the genus *Cassicus*, possibly from their associating in flocks or troops. Thus the BOBOLINK (*q. v.*) or rice-troopial, the cow-bunting or cow-troopial (*Molothrus pecoris*), and many others are occasionally called by this vague name. F. A. L.

**Troost**, GERARD, M. D.: geologist; b. at Bois-le-Duc, Holland, Mar. 15, 1776; educated at Amsterdam and Leyden; studied medicine and natural science; served in the army, both as a private soldier and afterward as a medical officer; was enabled by Louis Bonaparte, King of Holland, to devote himself to his favorite studies in Paris, where he translated Humboldt's *Aspects of Nature* into Dutch; embarked in 1809 on a scientific mission to the East Indies, but was taken by a French privateer and carried to Dunkirk; resided a year at Paris; proceeded to the U. S. 1810; settled in Philadelphia, where he was one of the founders and the first president of the Academy of Natural Sciences (1812–17); established at Cape Sable, Md., the first alum-factory in the U. S. 1814; was appointed Professor of Mineralogy in the Philadelphia Museum 1821; settled at New Harmony, Ind., with Owen and McClure 1825; became Professor of Chemistry and Mineralogy in the University of Nashville 1827, and was State geologist of Tennessee 1830–49. D. at Nashville, Aug. 14, 1850. His mineral and geological cabinets were the largest in the U. S. He was the author of geological reports upon Tennessee and upon the environs of Philadelphia (1826), and of numerous contributions to periodicals. Revised by G. K. GILBERT.

**Trope** [from Lat. *tro'pus* = Gr. τρόπος, turn, way, manner, style, trope, deriv. of τρέπειν, turn]: the application of a word or expression to some other than its normal or ordinary use, for the purpose of giving life or impressiveness to a statement. The three principal tropes are METAPHOR, METONYMY, and SYNECDOCHE (*qq. v.*). B. I. W.

**Trophy** [from O. Fr. *trophee* < Lat. *trophæ'um*, *tropæ'um* = Gr. τροπαῖον, monument to commemorate a victory (or defeat of an enemy), liter., neut. of τροπαῖος, pertaining to turning or defeat, deriv. of τροπή, turning, rout, defeat, deriv. of τρέπειν, turn]: among the ancient Greeks a memorial erected on the battle-field by the victors on the spot where the enemy turned to flight or retreat. Originally, trophies were of wood or of simple armor affixed to a tree. It was equally unlawful to destroy or repair a trophy, since it was very justly considered unwise to perpetuate hostile feelings. In later times the Romans adopted the custom of erecting trophies. Revised by J. R. S. STERRETT.

**Tropic-bird** [so called because they are not commonly seen outside the tropics]: any member of the family *Phaëthontidæ*, order *Steganopodes*. There are three species,



Tropic-bird.

somewhat larger-bodied than a pigeon, having the plumage white with fine black markings above, pure white or rosy below; the bill is red or yellow, feet dark. The two central tail-feathers are much longer than the others, and from their faint suggestion of a marlinspike these birds have been dubbed boatswain-birds by sailors. The two species of the Atlantic, *Phaëthon æthereus* and *P. flavirostris*, occur occasionally on the southern coasts of the U. S. F. A. L.

**Tropics**: See SOLSTICE, CAPRICORN, and CANCER.

**Troplong**, tro'lōṅ, RAYMOND THÉODORE: jurist; b. at St.-Gaudens, department of Haute-Garonne, France, Oct. 8, 1795; practiced as an advocate; held various judicial positions; was made a peer of France in 1846, president of the court of Paris in 1848, a senator and president of the court of cassation in 1852; and president of the Senate in 1854. D. Mar. 2, 1869. His principal work is *Code civil expliqué* (28 vols., 1833–58), parts of which—*Des Privilèges et Hypothèques* (4 vols.), *De la Vente* (2 vols.), *De la Prescription* (2 vols.), *Du Contrat de Mariage* (4 vols.), *Des Donations* (4 vols.)—have been published separately, and often reprinted. Revised by F. STURGES ALLEN.

**Troppau**, trop'pow: capital of Silesia, Austria; on the Oppa; 184 miles by rail N. E. of Vienna (see map of Austria-Hungary, ref. 3–G). It is fortified, contains many fine buildings, and is generally well built. Its manufactures comprise woolen and linen fabrics, soap, leather, beetroot sugar, and ironware, and its trade is very active. A congress of representatives of the five great powers was held here in Oct., 1820, to consider measures for the suppression of the revolutionary outbreaks in Italy. No action was taken, and the congress adjourned in November, resuming its session at Laibach in Jan., 1821. Pop. (1890) 22,867.

**Trot**: See GAITS.

**Trotz'endorf**, VALENTINE (real name FRIEDLAND): educator; b. at Trotzendorf, Germany, Feb. 14, 1490; studied at Wittenberg, where he joined the Reformers and was a pupil of Melanchthon; rector (1523–27, 1531–54) of the Latin School at Goldberg, which became under his direction one of the most famous classical schools of the age. He anticipated somewhat the monitorial system of Bell and Lancaster, and introduced a successful plan of student self-government. D. at Liegnitz, Apr. 26, 1556. See Barnard, *German Teachers and Educators*; Williams, *History of Modern Education*. C. H. THURBER.

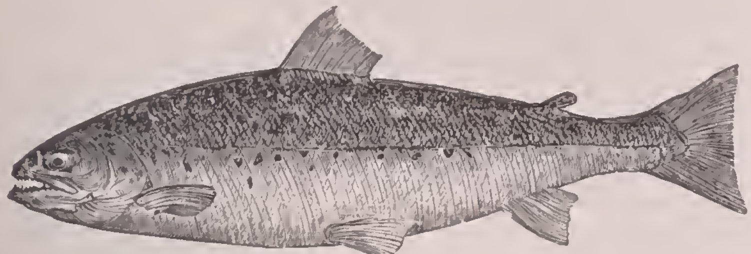
**Troubadours**: See TROUVÈRES.

**Troup**, ROBERT, LL. D.: soldier and lawyer; b. in New York in 1757; graduated at Columbia College 1774; studied law under John Jay; entered the Revolutionary army as lieutenant 1776; became an aide to Gen. Woodhull; was taken prisoner at the battle of Long Island; confined in the prison-ship Jersey and the provost prison, New York; exchanged in 1777; became aide to Gen. Gates at Saratoga; was secretary to the board of war 1778-79; studied law at Princeton under Judge Patterson; was for several years U. S. district judge in New York and member of the Legislature; was an intimate friend of Hamilton, and during his later years resided at Geneva, N. Y., as agent of the great Pulteney estate; published occasional political pamphlets. D. in New York, Jan. 21, 1832.

**Trous-de-loup**: See FORTIFICATION (*Field Fortification*).

**Trout** [O. Eng. *truht*, from Lat. *trūc'ta* (>Fr. *truite*), from Gr. τρώκτης, a sea-fish, liter., gnawer, deriv. of τρώγειν, gnaw]: a name given to several fishes, but originally applied to the trout of England and Northern Europe (*Salmo fario*), and properly used for members of the family *Salmonidæ* only. Trout are mainly restricted to fresh waters, where they reside the year around, not, like salmon, merely visiting fresh water to spawn; but some, like the sea-trout of Labrador (*Salvelinus stagnalis*), may have the same habits as the salmon, while others which thrive in landlocked waters visit the sea when opportunity offers. Trout are all naturally inhabitants of the northern hemisphere only, but some species have been introduced into such southern localities as New Zealand and Australia. They are active and powerful, and on this account, as well as for their beauty and fine flavor, are favorites with anglers. They reside in clear cold streams and lakes, and are among the most northern species of fresh-water fishes. They feed on small fishes, insects, and larvæ, those of the mosquito forming a considerable portion of their food in the lakes of Greenland.

The trout of Europe (*Salmo fario*) belongs to a group having teeth on the body of the vomer as well as on the anterior portion. The scales are quite small, about 120 along the lateral line; the body and head are usually thickly marked with more or less irregular red and black spots, and the anterior edges of the dorsal, anal, and ventral fins are yellowish. The species reaches a length of 30 inches. The brook-trout (*Salvelinus fontinalis*) of the U. S. represents a genus in which there are no teeth on the body of the vomer,



The salmon-trout (*S. trutta*).

these fishes being termed charrs by English naturalists. The scales are minute, numbering something like 200 on the lateral line; there are numerous yellowish spots and many vermilion dots on the body, and the dorsal is marked with dark spots. The ventrals and anal are edged with white, preceded by a dark bar. This species has been known to attain a weight of 7 to 12 lb., but this is very unusual, the American trout averaging much smaller than the European. There are about a score of species in North America, to which the term trout is applied, but only eight belong to the genus *Salvelinus*. The salmon-trout of Europe is *Salmo trutta*, a species residing in salt water and ascending rivers. The salmon-trout or lake-trout of North America is *Salvelinus namaycush*, a large species restricted to fresh water. The rainbow trout (*Salmo irideus*) and Dolly Varden trout (*Salvelinus malma*) occur on the Pacific slope. In the southern parts of the U. S. the name is applied to the weakfish (*Cynoscion*) and to the black bass (*Micropterus*). See BULL-TROUT, CHARR, CUT-THROAT TROUT, DOLLY VARDEN, and NAMAYCUSH. F. A. LUCAS.

**Trouvères**, troo'vãr' [plur. of *trouvère* = Fr. : Prov. *trobador* (whence Fr. *troubadour*, whence Eng. *troubadour*), deriv. of *trobar* : Fr. *trouver*, find. The strict Mod. Fr. form should be *trouveur*, which is preferred by many scholars]: the courtly lyric poets of mediæval France, who must be sharply distinguished from the popular poets, the *jongleurs*, to whom was due the composition of the *chansons de geste* and of the earliest indigenous French lyric poetry. The beginning of courtly poetry in France proper is to be put about the middle of the twelfth century, and the inspiration to it was almost exclusively Provençal. The event which more than any other brought together Provence and France was the marriage of the famous Eleanor of Poitiers (later wife of Henry II. of England) to Louis VII. of France, in 1137. The granddaughter of the first of the *troubadours*, William VII. of Poitiers, this gay and brilliant woman carried with her to France the chivalrous practices and the amorous poetry of the south. Her court and later that of her daughter, the Countess Marie of Champagne, at Troyes, became centers from which the ideas and the poetical forms of the *troubadours* proper diffused themselves through Northern France.

The poetry of the *trouvères* falls into two decidedly distinct periods: the first, that of direct imitation of Provençal poetry, including the twelfth and thirteenth centuries; the second, that of modification and development of this earlier manner along original lines, reaching from the beginning of the fourteenth century down to the Renaissance (about 1550). The chief representatives of the first period are Chrestien de Troies, Conon de Béthune (d. 1224), Gace Brulé, Blondel de Nesle, Guy de Couci (d. 1203), Gautier d'Espinaus, Gontier de Soignies, and, perhaps most famous of all, Thibaut de Champagne, King of Navarre (d. 1253), whom Dante mentions in his *De vulgari eloquio* (i., 9; ii., 5, 6) among the exemplary poets of love. The second period was opened by Guillaume de Machaut, who introduced important musical innovations, and brought elaborate and artificial poetical forms, the *ballade*, the *chant royal*, the *rondeau* (*triolet*), the *lai* with twelve strophes, into favor. The new style was cultivated by Eustache Deschamps (d. about 1410), later by Froissart, Christine de Pisan, Charles d'Orléans, and others. It was finally superseded by the classical and Italianizing manner of which Ronsard and the Pléiade were the aggressive champions. See PROVENÇAL LITERATURE. A. R. MARSH.

**Trover** [from O. Fr. *trover* > Fr. *trouver*, find]: the common-law form of action by which damages are recovered for the *conversion* of chattels. It was originally designed for the particular case of the defendant's *finding* a thing belonging to another, and appropriating it to his own use; whence the plaintiff's pleading necessarily contained an averment of the loss and finding—in law French, *trouver*. See CONVERSION.

**Trowbridge**: town; in Wiltshire, England; on the Biss; 12 miles by rail S. E. of Bath (see map of England, ref. 12–G). There is a fine Perpendicular church (1475) and a town-hall opened in 1889. Woolen cloth, cassimeres, kerseys, and tweeds are manufactured. Pop. (1891) 11,717.

**Trowbridge**, EDMUND: lawyer; b. at Newton, Mass., in 1709; graduated at Harvard 1728; became a lawyer of great eminence; was appointed attorney-general of Massachusetts 1749; was for several years a member of the council, but lost favor with the popular party in 1766 on account of lukewarmness in resisting British aggressions; became chief justice of the Supreme Court 1767; presided with great fairness at the trial of the British soldiers charged with the "Boston massacre" 1770, and resigned his office 1772 in consequence of the impending conflict with England, and remained in seclusion during the Revolution. D. at Cambridge, Mass., Apr. 2, 1793.

**Trowbridge**, JOHN: physicist; b. in Boston, Mass., Aug. 5, 1843; graduated at the Lawrence Scientific School of Harvard University in 1866, and continued as tutor there until 1869, when he became Assistant Professor of Physics in the Massachusetts Institute of Technology. In 1870 he returned to Harvard to establish the laboratory course of instruction in physics, out of which has been developed the Jefferson Physical Laboratory, which has become one of the largest and best-equipped laboratories of its kind in the U. S. He became Professor of Experimental Physics in 1880, and was in 1888 given the Rumford chair of the Application of Science to the Useful Arts, succeeding Dr. Wolcott Gibbs, who had been made emeritus. Prof. Trowbridge has devoted much time to original research, and his many investigations have been issued chiefly as *Contributions from the Physical Laboratory of Harvard College*. These have included the demonstration of the existence of platinum and carbon in the sun, and a study of the so-called oxygen lines in the solar spectrum. In electricity, to which he has devoted much attention, he is well known for his invention of the closed magnetic circuit transformer, which is in general commercial use in the alternate-current system of electric lighting; for his researches on the damping of electric waves on iron wires; and for his photographic studies of electrical oscillations, including a new determination of the velocity of electrical waves. The degree of S. D. was given to him by Harvard in 1873, and in 1878 he was elected to the National Academy of Sciences; also in 1884 he presided over the physical section of the American Association for the Advancement of Science. Besides his scientific papers he was one of the editors of the *Annals of Scientific Discovery for 1869* (Boston, 1870) and since 1879 has been an associate editor of *The American Journal of Science* in the department of physics. He is the author of *The New Physics* (New York, 1884) and *What is Electricity?* (1896). M. B.

**Trowbridge**, JOHN TOWNSEND: author; b. at Ogden, N. Y., Sept. 18, 1827; after teaching and working on a farm, settled in New York 1846 as a writer for periodicals; removed in 1847 to Boston, where he has since resided; became editor of *The Yankee Nation* 1850; wrote many popular tales for the young over the signature *Paul Creyton;* has been a prominent contributor to the *Atlantic* and other magazines; was editor of *Our Young Folks* (1870–73); has published many works of adventure, travel, and fiction, including *Father Brighthopes* (1853); *Neighbor Jackwood* (1857); *Cudjo's Cave* (1863); *The Drummer Boy* (1863); *The South* (1866); *The Vagabonds, and other Poems* (1869); *Lawrence's Adventures* (1870); *Coupon Bonds, and other Stories* (1871); *The Emigrant's Story, and Other Poems* (1875); *The Lost Earl, and other Poems* (1888); *The Satinwood Box*; etc. Revised by H. A. BEERS.

**Trowbridge**, WILLIAM PETIT, Ph. D., LL. D.: scientist and engineer; b. in Oakland co., Mich., May 25, 1828; graduated first in his class at the U. S. Military Academy 1848. Soon after his graduation, he was ordered back to the academy as assistant in the astronomical observatory, where he fully prepared himself for duty on the Coast Survey, to which, at his own request, he was ordered. In this survey he at first acted as assistant to Prof. Bache in the primary triangulation of the coast of Maine, which in 1852 was placed under his immediate charge. In 1853 he was ordered to the Pacific coast to conduct a series of magnetic and tidal observations extending from San Diego to Puget Sound, a work which occupied three years. He was promoted to the rank of first lieutenant in 1854, and two years later accepted the professorship of mathematics in the University of Michigan, but in 1857 accepted a permanent office on the Coast Survey. Upon the breaking out of the civil war he was assigned to the duty of preparing minute descriptions of the harbors, inlets, and rivers of the Southern coast for the use of the navy. In 1862 he was ordered to execute a hydrographic survey of Narragansett Bay, where there was a design to erect a navy-yard, but the results of the survey were not favorable to the project. He was subsequently transferred to the War Department, and was during the remainder of the war in charge of the branch office of the engineer department in New York. He was Professor of Dynamic Engineering in the Sheffield Scientific School, Yale College, 1870–77; adjutant-general of Connecticut 1872–76; and in charge of the engineering department of the School of Mines, Columbia College, from 1877 to his death at New Haven, Conn., Aug. 12, 1892. He was elected to the National Academy of Sciences in 1878, and was a well-known contributor to the leading scientific journals, and author of *Steam Generators*, *Heat as a Source of Power* (1874), and other works. He is said to have been the first engineer to suggest the idea of the cantilever bridge.

Revised by C. H. THURBER.

**Troy**, **Troja**, or **Il'ium**: the scene of the Homeric *Iliad*, and the metropolis of the Troad, the coast region extending from Cape Lectum on the Ægean to Dardanus and Abydus on the Hellespont. The Troad comprised a broad, undulating plain sloping from the foot of Mt. Ida to the sea, and traversed by the rivers Scamander and Simoïs. This plain was densely peopled by a mixed race of Pelasgians and Phrygians, and contained many cities (Achilles boasts of having destroyed eleven), of which, however, Troy was by far the most splendid and powerful. Troy was founded by Ilus, the son of Tros, the grandson of Dardanus, and developed rapidly and magnificently; legend tells how, under Laomedon, the son of Ilus, Poseidon himself built its walls. It had a fortified acropolis, called Pergamum, which overlooked the town proper, and contained the temples of the gods and the royal palaces. Under Priam, the son of Laomedon, it reached its highest splendor and experienced its downfall. Priam's son, Paris, carried off Helen, the wife of Menelaus, and in order to punish this outrage a Greek army landed in Troas, besieged Troy for ten years, and finally destroyed it, though the Trojan state, the kingdom of Troy, seems to have continued to exist for several centuries after the destruction of its capital. The exact site of the city is disputed. According to the Homeric description it was not situated in the plain, but stood on a hill between the Scamander and the Simoïs, which united in front of it. In ancient times it was generally believed that New Ilium, a city of little importance on the right bank of the Scamander, and of which some ruins are still extant near the present village of Hissarlik, occupied the same site as Old Ilium. When this New Ilium was founded is not known. It stood on a low spur of Mt. Ida, separating the basins of the Scamander and the Simoïs. In the time of Alexander the Great it existed, and by the partiality which Sulla showed for it, it even became prosperous. There were, however, even in antiquity, scholars who doubted the identity of the sites of New and Old Ilium; as, for instance, Strabo, who moved the site of Old Ilium several miles farther inland to a village called Ilium. In 1785 Lechevalier discovered at the village of Bunarbashi, on the left bank of the Mendereh, 5 miles S. of New Ilium, a hot and a cold spring which corresponded to those mentioned in the *Iliad*, and some ruins on the hill of Balidagh, beyond the springs, which he identified as the remains of the citadel of Pergamum. Although further excavations did not bring to light any marked traces of a great city, the views of Lechevalier were generally accepted by classical scholars. (See Lechevalier, *Voyage de la Troade*, 3 vols.) Later scholars have returned to the views of antiquity since the extensive excavations of Schliemann at Hissarlik (1871–73, 1876–1878, 1879, 1882). See Schliemann's *Ilios* (London, 1879), but better Schuchhardt's *Schliemann's Excavations* (London, 1891), pp. 17–92, and Perrot and Chipiez's *History of Art in Primitive Greece* (London, 1894), pp. 154–254.

Revised by J. R. S. STERRETT.

**Troy**: city; capital of Pike co., Ala.; on the Ala. Mid. and the Cent. of Ga. railways; 74 miles S. by E. of Montgomery, and 85 miles S. W. of Columbus (for location, see map of Alabama, ref. 6–E). It is an important cotton-trade center, and contains 2 private banks and a daily and 2 weekly newspapers. Pop. (1890) 3,449; (1900) 4,097.

**Troy**: city; capital of Lincoln co., Mo.; on the St. L. and Hannibal Railway; 15 miles W. of the Mississippi river, and 55 miles N. W. of St. Louis (see map of Missouri, ref. 3–I). It is in a region containing coal, iron, glass-sand, and other mineral deposits, and rich farm lands, and has a high school, 2 State banks, a weekly newspaper, flour-mill, and several tobacco-factories. Pop. (1890) 971; (1900) 1,153.

EDITOR OF "FREE PRESS."

**Troy**: city (chartered in 1816, enlarged by annexation in 1901); capital of Rensselaer co., N. Y.; at the head of steamboat navigation on the Hudson river, and on the Del. and Hudson, the Boston and Maine, the N. Y. C. and Hud. River, and several local railways; 150 miles N. of New York (for location, see map of New York, ref. 5–K). It is at the junction of the Hudson and Mohawk rivers; is laid out regularly with streets generally 60 feet wide; and is surrounded by the municipalities of Watervliet, Green Island, Cohoes, and Waterford, whose people are largely employed in Troy and whose local enterprises are chiefly carried on by Troy capital. The city is noted for its extensive industries, which include laundrying and the manufacture of iron, steel, stoves, ship-chains, cotton cloth, knit goods, laundry machinery, valves, horse-shoes, bells, fire-brick, paint, paper, engineering instruments, brushes, oilcloth, and linen shirts, collars, and cuffs. Troy has more than 25,000 persons and $9,000,000 capital employed in the shirt, collar, cuff, and laundry industries, and makes $1,000,000 worth of valves yearly.

There are 63 churches and chapels, of which 11 are Methodist Episcopal, 11 Roman Catholic, 15 Presbyterian, 8 Protestant Episcopal, 6 Baptist, 3 Jewish, 1 Church of Christ, 1 Christian Science, 1 Congregational, 1 Unitarian, 1 Universalist, and 4 Lutheran. The public-school system comprises a high school and 21 grammar schools, and has property valued at nearly $800,000. The most widely known educational institution is the Rensselaer Polytechnic Institute, which was founded in 1824 by Stephen Van Rensselaer, and incorporated in 1826 under the name of the Rensselaer School. It was established as a school of practical science. Much of its early success was due to its first principal and senior professor, Amos Eaton, well known at that time as a scientific investigator and teacher. In 1832 its name was changed to Rensselaer Institute; in 1835 a department of civil engineering was opened; in 1850 the curriculum was completely reorganized; and in 1861 the Legislature sanctioned a change to its present name. Courses in natural science, electrical engineering, and civil engineering have been added since. It has 17 instructors, 215 students, 5,000 volumes in its library, and nearly 1,100 living graduates.

The second institution of note is the Emma Willard School, founded by Emma Willard in 1821, and enlarged in 1895 by a donation of $150,000 by Russell Sage, and by a Gurley Memorial building and a Plum Memorial building. Other schools are the Troy Academy, the St. Joseph's Academy, the La Salle Institute, and the St. Peter's Academy.

The charitable and benevolent institutions include the Church Home (Protestant Episcopal), Day Home, Home for the Aged Poor, House of the Good Shepherd, Marshall Sanitarium, Presbyterian Church Home, Troy Hospital, Samaritan Hospital, Troy Orphan Asylum, Troy Male Orphan Asylum (Roman Catholic), three houses of the Sisters of Charity, the Young Men's Association, with a free library of 40,000 volumes, the Young Men's Christian Association, the Mohawk and Hudson Humane Society, and a Young Woman's Association.

Troy has large business interests aside from its manufactures. Four-fifths of all the merchandise carried on the Erie and Champlain Canals enters into and is discharged from the canals at this point. The city has a daily line of passenger steamers to New York and daily lines of water transportation to the principal Atlantic coast cities. The U. S. Government has a building for post-office, court, and other Federal purposes, constructed at a cost of $500,000. Has a State armory valued at $250,000; and the Earl crematory in Oakwood Cemetery cost $400,000, and is the finest in the world. There are 9 national banks with combined capital of $2,000,000, 2 savings-banks with aggregate deposits of over $8,000,000, and a private bank. The city has an assessed valuation of $59,000,000, and a net debt of $1,300,000.

The city was distinguished for its patriotism during the war of 1861–65, and the remains of three celebrated major-generals in the Union army, John E. Wool, George H. Thomas, and Joseph B. Carr, rest in its beautiful Oakwood Cemetery. The grave of Gen. Wool is marked by an obelisk with a shaft 75 feet high. A soldiers' monument, 90 feet high, is on Washington Square. Pop. (1880) 56,747; (1890) 60,956; (1900) 60,651. JAMES H. POTTS.

**Troy**: village; capital of Miami co., O.; on the Miami river, the Miami and Erie Canal, and the Cin., Ham. and Dayton and the Cleve., Cin., Chi. and St. L. railways; 80 miles N. by E. of Cincinnati (for location, see map of Ohio, ref. 5–C). It is in an agricultural region, and contains a public high school, a public-school library, 2 national banks with combined capital of $300,000, a daily and 5 weekly newspapers, several iron-foundries, planing-mills, and bentwood and buggy factories. Pop. (1890) 4,494; (1900) 5,881.

**Troy**: borough (founded in 1802, incorporated in 1845); Bradford co., Pa.; on the North. Cent. Railway; 25 miles S. of Elmira, N. Y. (for location, see map of Pennsylvania, ref. 2–G). It has public, high, and graded schools; Baptist, Methodist Episcopal, Presbyterian, Protestant Episcopal, Disciples, Roman Catholic, and Universalist churches; water-works, electric lights, farmers' club, with extensive fair-grounds, large creamery, 3 flour-mills, 2 tanneries, 2 foundries, 2 carriage-factories, 2 planing-mills, marble-works, engine-shops, furniture-factory, 2 hotels, 2 banks, and 2 weekly newspapers. It is the center of a noted butter-making region. Pop. (1880) 1,241; (1890) 1,307; (1900) 1,450. EDITOR OF "GAZETTE."

**Troyes**, trwaa: capital of the department of Aube, France; on the Seine; 104 miles E. S. E. of Paris by rail (see map of France, ref. 4–G). The town has many splendid buildings, but is in general an old-fashioned place, partly in a state of decay, partly rebuilding. Its old ramparts have been changed into promenades, and of its many churches that of St. Urbain and the cathedral are remarkable. It has a library of 110,000 volumes, a museum, and a normal school and other educational institutions. Cotton fabrics, cloths, bombazines, calicoes, prints, lace, and hosiery are extensively manufactured; also wax, leather, paper, and sausages. Being the center of a fertile and well-cultivated district, its general trade is very active. It has given its name to an important treaty concluded here between Henry V. of England and Charles VI. of France in 1420. See TREATIES. Pop. (1896) 52,998. Revised by M. W. HARRINGTON.

**Troyon**, trwā̈a'yōn', CONSTANT: landscape and animal painter; b. at Sèvres, France, Aug. 25, 1810; d. in Paris, Feb. 21, 1865; pupil of Riocreux and Poupart; studied later with Roqueplan, and began to exhibit landscapes about 1836. He visited Holland in 1847 and studied the works of the Dutch masters in the museums. He received a third-class medal at the Salon of 1838; second-class 1840; first-class 1846 and 1848, and at the Paris Exposition of 1855; Legion of Honor 1849. He introduced cattle in his landscapes after about 1848, and painted them, as well as sheep, with great knowledge and admirable simplicity. His pictures rank with those of his contemporaries Corot, Daubigny, Rousseau, Diaz, and Millet, among the finest works of the modern French school. He was a colorist of great strength, and his pictures are composed with nobility and grandeur of line. *Morning* and *Evening*, both large canvases, are in the Louvre, and so also is a fine example, *Return to the Farm.* One of his finest works is *The Valley of La Touque*, painted in 1853, which belongs to the Goldschmidt estate, Paris, and was exhibited at the Retrospective Exhibition in Paris in 1889. Many fine works by Troyon are in the U. S. In the Wolfe collection, Metropolitan Museum, are *Cow* and *Landscape and Cattle.* WILLIAM A. COFFIN.

**Troy Weight**: See WEIGHTS AND MEASURES.

**Trüb'ner**, NICOLAS: bookseller and bibliographer; b. at Heidelberg, Germany, June 12, 1817; settled in early life in England; became a bookseller and publisher in London 1852, in which capacity he rendered eminent service to American bibliography, as well as to Oriental and comparative philology, and was himself distinguished for linguistic attainments, especially in Sanskrit and Basque. He published a *Bibliographical Guide to American Literature* (1855; 2d ed. 1859); issued many elaborate sale-catalogues containing important bibliographical data; and edited Dr. Ludewig's posthumous *Literature of American Aboriginal Languages* (1858). He was also a frequent contributor to periodicals. D. in London, England, Mar. 30, 1884.

**Truce**, or **Armistice** [*truce* < M. Eng. *trewes*, plur. of *trewe*, pledge < O. Eng. *trēow*, troth, faith]: a temporary stoppage of hostilities contemplating a longer duration and a wider application than the brief cessation of hostilities at a particular place or for a particular purpose which is called a suspension of arms. A truce implies a return to a state of war, while a peace presupposes that the causes of war have been removed. The former, however, though limited usually in terms, as for a certain time or to secure a certain object, may actually outlast the latter. The cessation of hostile operations may apply to an individual only, through a flag of truce, a passport, or a safe conduct; or it may apply to the whole or a portion of the armies of the belligerent. A flag of truce, a white flag to which attention is called by the sound of a trumpet, is used to open negotiation for any cause during hostilities. There is no obligation to receive it, and in the midst of a battle it may be that injury is done to its bearers inadvertently; nevertheless by law and usage they are inviolable. Of course the flag of truce must not be employed to spy out an enemy's position or to delay a battle until reserves can be brought up; a belligerent can take measures to prevent such abuses.

A truce is *partial* if it relates to a particular district or military force, *general* if it relates to all the forces and the military operations of belligerents in their entire extent. The latter can only be made by the sovereign power of a state. A truce is binding from a certain declared date. If military operations are carried on in widely separated regions, the beginning of a truce may be set at different times for various places, to allow for spreading the news of it. But a force is bound by knowledge arriving prior to such time, and, on the other hand, if war has been carried on subsequent to the date set for the truce, but in ignorance of its existence, compensation for damage inflicted is not due, though property and prisoners captured during this interval must be restored.

*Acts Lawful during a Truce.*—The theory of a truce is that neither party shall be helped in his military operations by it; that such affairs shall be in the same position at its end as at its beginning. But this principle is not carried out so fully as to forbid those operations which could have been carried on without military interference had no truce existed. Thus in the case of a besieged town or fortress, nothing can be done during a truce by either party which the other, by his guns or his forces, was in a position to prevent, but fortifications not under fire could be built or strengthened, and supplies could be brought in by ways beyond the other's control. With regard to revictualing a besieged place, a truce should specify what rule is to be adopted. The allowance of a supply of provisions equal to the amount consumed during the truce would seem to be necessary to put the parties at its termination into the same relative position, for, if the reduction of a place was being attempted by starvation, to bar out provisions would be directly in line with the plan of campaign. Yet, on the other hand, provisions under such circumstances are really material of war; their introduction is unlawful if impossible but for the truce; and the policy of a truce is to be decided with this fact in view. In November of 1870 an armistice was proposed between the French army in Paris and the Germans besieging it, which turned on just this point. Bismarck declined to allow a supply of provisions for a time equal to the truce to be passed through the German lines, and so the negotiations fell through. No changes have been made in the rules governing truces of late years, the articles on this topic in Lieber's code, which governed the U. S. armies in 1863, and those of the Brussels conference in 1875 agreeing with what is here laid down.

Two or three minor rules remain to be mentioned. Violation of a truce by one party causes its immediate termination. So, too, if made for a definite time, and that time has expired, hostilities are resumed without further notice.

Finally, a truce is a form of treaty and to be similarly interpreted. See also INTERNATIONAL LAW and TREATIES. THEODORE S. WOOLSEY.

**Truce of God** (*treuga Dei*): in the Middle Ages, an institution which sprang up in France and Germany by which nobles and princes bound themselves to keep the peace, to abstain from unlawful wars, and to protect clerics, women, merchants, pilgrims, peasants, and other non-combatants.

In the council of Charroux in 989 the Church decreed a special peace to the unarmed clerk and laborer (*pax ecclesiæ*). This attempt to check violence extended throughout France during the opening years of the next century and was in part successful, but the task of maintaining a general peace was hopeless and the Church contented itself with limiting the feudal warfare. Accordingly, at the synod of Tuluges in 1027 it was decreed that warfare should be suspended from Saturday till Monday. This was afterward extended to the interval from Wednesday evening to Monday morning in every week and to nearly all the more important fasts, feasts, and holy seasons of the Church. England and Italy adopted the custom, which was confirmed by several church councils, among which were the second and third Lateran Councils (1139 and 1179). The final triumph of legal over feudal government did away with this institution and with the necessity for it.

**Truckee′**: town; Nevada co., Cal.; on the Truckee river, and the South. Pac. Railroad; 120 miles N. E. of Sacramento, the State capital (for location of county, see map of California, ref. 5-E). It is the center of an extensive timber region, and is principally engaged in cutting and manufacturing lumber. Pop. (1880) 1,147; (1890) 1,350; not returned separately in 1900. EDITOR OF "REPUBLICAN."

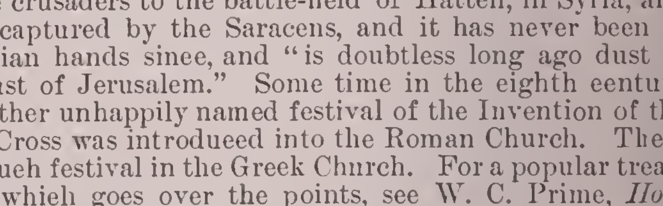
**Trudel**, FRANÇOIS XAVIER ANSELME, Q. C.: Canadian senator, and editor; b. at Ste. Anne de la Pérade, Quebec, Apr. 29, 1838; educated at Nicolet College, and admitted to the bar in 1861. He was editor of *La Minerve*, Montreal, in 1860; is the founder, coproprietor, and editor of the daily newspaper *L'Étendard*, the monthly *La Revue Canadienne*, and the weekly *L'Ouvrier*. He represented Champlain in the Quebec Assembly 1871–73, and was appointed a Canadian senator in the latter year. He was one of the authors of the *Programme Catholique* in 1871, and has written largely on politics and other subjects. NEIL MACDONALD.

**Trueba y Quintana**, troo-ā'baā-ee-keen-taa'naā, ANTONIO, de la; novelist and poet; b. in the Basque village of Montellana, Spain, Dec. 24, 1821. Sent to Madrid to prepare for a mercantile life, he entered the university, and soon gave himself up entirely to literature. In 1862 Queen Isabella made him archivist of Biscay and *Poeta de la Reina*. The former office he lost through the revolution of 1868. D. in Madrid, Mar. 10, 1889. His poems, which are collected in the *Libro de los Cantares* (Madrid, 1852, etc.), are in the main concerned with his native district, and are marked by depth of feeling and mournfulness of tone. They are very popular in Spain. As a novelist he wrote many pleasant little tales of country life that have found ready appreciation. Among them are *Cuentos de color de rosa* (1859); *Cuentos campesinos* (2d ed. 1862); *Cuentos de vivos y muertos* (1866); *María Santa* (1874); *Cuentos de varios colores* (1874); *Narraciones populares* (1875); *Cuentos de madres é hijos* (1879); *Nuevos cuentos populares* (1880). In the *Cid Campeador*, the *Redentor moderno*, and a few other stories, he has essayed the historical novel. Among his later works are *Arte de hacer versos* (1881); *De flor en flor* (1882); *El gabán y la chaqueta* (1884). J. D. M. FORD.

**True Cross**, or **Holy Rood** [*rood* is O. Eng. *rōd*, cross: Germ. *rute*, staff]: the cross on which Jesus was crucified, alleged to have been discovered by Helena, mother of the Emperor Constantine, in Jerusalem, during her visit in 326, in a cave which now is covered by the Church of the Holy Sepulchre. The story as first told further stated that the three crosses were found lying together, but the true cross was known because it raised to life a dead man who was touched by it. The title on the cross of Jesus was found, and also the four nails. Two of them were used by Constantine in his bridle, and another in the head of his statue, while the fourth, dropped by Helena into the sea on her return voyage, calmed a storm which was then raging. The tale is told with variations upon each of the points mentioned. In itself it is one of the most remarkable legends in church history. That the location of the tomb of Jesus had been traditionally identified from the earliest times is not improbable; and that, in removing the structures which had been put upon it in order that Constantine might build a church in front of the holy sepulchre, a cave was found in which was wood which was honestly believed to have been that of the true cross, may be accepted as the basis of the story which afterward received many embellishments. It is incredible that Helena was an impostor, and there is no necessity for adding to Constantine's other crimes that of deliberately deceiving his aged and pious mother. But honesty requires the acknowledgment that there is no contemporary proof that Helena had anything to do with the discovery, or that the cross was discovered in her time, for the earliest witness, the Bordeaux pilgrim to Jerusalem in 333, in his itinerary, only seven years after Helena's visit, says nothing about her in the discovery of the cross (*Itinera*, ed. Tobler, Geneva, 1879, p. 18); nor does Eusebius in his *Life of Constantine*, written in 338, wherein he expatiates upon Helena's visit to Jerusalem and her church-building (iii., xlii.–xlvi.), say anything about her discovery of the holy sepulchre, much less of the true cross. The first mention of the true cross is by Cyril of Jerusalem in his *Catechetical Lectures*, written in 348, who says, "the whole world has been filled with pieces of the wood of the cross" (iv., 10); "the holy wood of the cross bears witness, seen among us to this day and from this place, now almost filling the whole world, by means of those who in faith take portions from it" (x., 19); "the wood of the cross confutes [him if he denied the Passion], which was afterward distributed piecemeal from hence to all the world" (xiii., 4). But he makes no mention of Helena, nor gives any details of the discovery of the true cross. From Cyril, however, we do learn that the true cross was commonly believed to have been discovered, and that pieces of it were even then distributed. Chrysostom in 387, in his *Contra Judæos et Gentiles quod Christus sit Deus* (ed. Migne, *Pat. Gr.*, xlviii., 826), speaks of the desire to possess portions of the true cross, and how they were encased in gold. Sulpicius Severus (*Sacred History*, ii., 34), writing in 395, is the first one to tell of the discovery of the true cross, and he connects it with Helena, and says that it was known because it restored a dead man to life. Ambrose, in a highly rhetorical and irrelevant passage in his oration on the death of Theodosius, delivered in 395, expatiates upon Helena's discovery of the true cross (*De Obitu Theodosii*, ed. Migne, *Patrologia Latina*, xvi., 1399–1402). The story having been thus started, it was repeated in different forms by later writers. Helena was without further question accepted as the discoverer, and the true cross was set up in the church Constantine built, which was dedicated 335. Part, however, she sent to Constantine, who directed that it be put in a statue he was erecting in Constantinople. The title was sent to Rome and there put in the basilica of Santa Croce in Gerusalemme, specially erected by Constantine in 331. It is still shown on Easter Sunday. Portions, generally mere splinters, were sold to persons of eminence or wealth. It is a common jibe that enough fragments of the true cross are shown as relics to make a dozen crosses. But as a matter of fact it is not so, but rather all of these pieces together would not make a piece of any size. On July 5, 1187, the true cross was carried by the crusaders to the battle-field of Hatten, in Syria, and there captured by the Saracens, and it has never been in Christian hands since, and "is doubtless long ago dust of the dust of Jerusalem." Some time in the eighth century the rather unhappily named festival of the Invention of the Holy Cross was introduced into the Roman Church. There is no such festival in the Greek Church. For a popular treatment which goes over the points, see W. C. Prime, *Holy Cross* (New York, 1877). SAMUEL MACAULEY JACKSON.

**True Reformed Dutch Church**: a body that withdrew from the Reformed Dutch Church in America in 1822, and was absorbed into the Christian Reformed Church in 1889. See REFORMED CHURCH IN AMERICA and PRESBYTERIAN CHURCH.

**Truffle** [from O. Fr. *trufle* (Fr. *truffe*) < Lat. *tuber*: Lat. *terræ tuber* > Ital. *tartufo*, Fr. *tartoufle*, whence Germ. *kartoffel*, potato]: any fungus of the genus *Tuber* and other closely allied genera (*Terfezia*, *Chæromyces*, *Hydnotrya*, etc.). Truffles belong to the order *Tuberoideæ*, and are nearly all subterranean in growth, and are from an inch to 6 inches in diameter. There are many species; the best known are *Tuber æstivum* and *T. melanosporum*, both of Europe. The truffle is one of the choicest of the edible fungi, and its cul-



French truffle (*Tuber melanosporum*).

ture has been attempted with some success. Some species are found to a limited extent in the U. S. See FUNGI and VEGETABLE KINGDOM. CHARLES E. BESSEY.

**Trujillo**, or **Truxillo**, troo-*k*heel'yō: capital and largest town of the department of Libertad (formerly *intendencia* of Trujillo). Peru; about 3 miles from the coast, and connected by railway with the port of Salaverry (see map of South America, ref. 4–B). It was founded by Pizarro in 1535, and was long the most important town in Northern Peru; it is now decadent, but controls the trade of the department. The surrounding region is a desert, but before the Conquest it was rendered very fertile by the elaborate Indian system of irrigation. Near Trujillo are the ruins of CHIMU (*q. v.*). Pop. (1889) about 11,000. H. H. S.

**Trujillo**: a town and port of the northern coast of Honduras, near lon. 86° W., on a bay which forms an excellent and secure harbor (see map of Central America, ref. 3–H). It was founded in 1525. The exports are hides, sarsaparilla, etc. It is the capital of a department of the same name. Pop. about 3,000. H. H. S.

**Trullan Councils**, or **Synods**: two ecclesiastical councils; the first convened in 680 by the Emperor Constantinus Pogonatus for the purpose of reconciling the MONOTHELITES (*q. v.*) with the orthodox Church; the second in 692 by the Emperor Justinianus II. in order to confirm and enforce the statutes of the fifth and sixth œcumenical councils, whence it is also called Quinisextum. (See QUINISEXT COUNCIL.) The epithet *Trullan* is derived, like that of Lateran, from the place in which the assembly sat—namely, a great hall in the imperial palace of Byzantium, surmounted by an oval dome, τροῦλλα. Revised by J. J. KEANE.

**Trumansburg**: village; Tompkins co., N. Y.; on the Lehigh Valley Railroad; 2 miles W. of Cayuga Lake, and 11 miles N. W. of Ithaca (for location, see map of the State of New York, ref. 5–F). It contains several flour-mills, foundries, and mower-factories, and has a private bank and two weekly newspapers. Pop. (1890) 1,211; (1900) 1,225.

**Trumbull**, BENJAMIN, D. D.: historian; b. at Hebron, Conn., Dec. 19, 1735; graduated at Yale College in 1759; was pastor of the North Haven Congregational church from 1760 to his death; served as a volunteer soldier, and also as a chaplain, in the war of the Revolution; wrote *A Plea in Vindication of the Connecticut Title to the Contested (Western) Lands* (1776), which influenced the decision of Congress upon the validity of the Susquehanna purchase; *A Complete History of Connecticut 1630–1764* (2 vols., 1797–1818); and began a *General History of the United States of America* (vol. i., 1492–1765, 1810), which was incomplete at his death Feb. 2, 1820. He also published *Twelve Discourses on the Divine Origin of the Holy Scriptures* (1790).

**Trumbull**, GURDON: See the Appendix.

**Trumbull**, HENRY CLAY, S. T. D.: author and editor; b. at Stonington, Conn., June 8, 1830; educated at Williston Seminary, East Hampton, Mass.; settled at Hartford, Conn., in 1851; was appointed State missionary of the American Sunday-school Union for Connecticut in 1858. Ordained as a Congregational clergyman in 1861, he served during the war as chaplain of the Tenth Connecticut Volunteers, and was taken prisoner before Fort Wagner in 1863; was appointed missionary secretary for New England of the American Sunday-school Union in 1865, and normal secretary in 1871; removed in 1875 to Philadelphia, where he became the editor and chief owner of *The Sunday-school Times*. In 1881 he visited the East, and discovered the long-lost site of Kadesh-barnea, on the southern border of Palestine. He has published many books, including *The Sabbath School Concert* (1861); *The Knightly Soldier* (Boston, 1865; rev. ed. 1892); *Childhood Conversion* (1868); *The Captured Scout of the Army of the James* (Boston, 1869); *The Model Superintendent* (New York, 1880); *Kadesh-Barnea* (1884); *Teaching and Teachers* (Philadelphia, 1884); *The Blood Covenant: a Primitive Rite and its Bearings on Scripture* (New York, 1885); *The Sunday School: its Origin, etc.* (1888); *Principles and Practice* (1889); *Friendship the Master Passion* (1891); and *Studies in Oriental Social Life* (1894). Five of his books have been republished in England. Revised by G. P. FISHER.

**Trumbull**, JAMES HAMMOND, LL. D., L. H. D.: philologist and historian; b. at Stonington, Conn., Dec. 20, 1821; entered the class of 1842, Yale College, but did not graduate; aided Rev. James H. Linsley in compiling catalogues of the mammalia, reptiles, fishes, and shells of Connecticut 1842–43; was assistant secretary of State of Connecticut 1847–52 and 1858–61; secretary 1861–65; corresponding secretary of the Connecticut Historical Society 1849–63; was its president, and also librarian of the Watkinson Free Library in Hartford from 1863 to 1891; member of the National Academy of Science 1872; was an original member of the American Philological Association 1869, and its president 1874–75, and was appointed in 1873 lecturer in Yale College on the Indian languages of North America, a subject to which he devoted much time since 1858. Editor of *The Colonial Records of Connecticut 1636–89* (3 vols., Hartford, 1850–59); Roger Williams's *Key into the Language of America* (Narragansett Club, vol. i., Providence, R. I., 1866); Lechford's *Plain Dealing* (Boston, 1867); Pierson's *Some Helps for the Indians* (1873); of vols. i. and ii. of the *Collections* of the Connecticut Historical Society; and of *The Memorial History of Hartford County* (2 vols., Boston, 1886); author of *The Origin of McFingal* (1868); *The Composition of Indian Geographical Names* (1870); *The Best Methods of Studying the Indian Languages* (1871); *Some Mistaken Notions of Algonkin Grammar* (1871); *Historical Notes on the Constitutions of Connecticut* (1872); *Notes on Forty Algonkin Versions of The Lord's Prayer* (1873); *On the Algonkin Verb* (1876); *The True Blue Laws of Connecticut* (1876); *Indian Names of Places, etc., in Connecticut, etc., with Interpretations* (1881); and of many other contributions, historical or philological, to literary periodicals and the proceedings of learned societies. He prepared a glossary to a large portion of Eliot's Indian Bible. D. in Hartford, Conn., Aug. 5, 1897.
Revised by J. W. POWELL.

**Trumbull**, JOHN: lawyer and author; b. at Westbury (now Watertown), Conn., Apr. 24, 1750; was admitted to Yale College on account of extraordinary precocity at the age of seven years, but did not pursue the course until some years later, graduating 1767; wrote with Timothy Dwight a series of essays in the style of *The Spectator* (1769); was tutor at Yale 1771–73, during which time he published *The Progress of Dulness* (3 parts, 1772–73), a satire on methods of education; studied law; was admitted to the Connecticut bar Nov., 1773; continued his studies in the office of John Adams at Boston 1773–74; wrote for the political periodicals; settled as a lawyer at New Haven, Nov., 1774; published anonymously his poetical *Elegy on the Times* (1774), and in the following year, in Philadelphia, the first canto of his *McFingal*, a revolutionary satire, in Hudibrastic verse (completed in 4 cantos in 1782), of which more than thirty unauthorized editions were sold. He settled at Hartford, June, 1781; was associated with Humphreys, Barlow, and Hopkins in the production of *The Anarchiad* (1786–87); was State attorney for Hartford 1789–95, member of the Legislature 1792 and 1800, judge of the superior court 1801–19, and also judge of the court of errors 1808–19; was several years treasurer of Yale College; in 1825 removed to Detroit, Mich., where he died May 10, 1831. Editions of his *McFingal* appeared in 1856, 1860, and 1864, the latter with notes by Benson J. Lossing. His *Poetical Works* appeared at Hartford (2 vols., 1820). Revised by H. A. BEERS.

**Trumbull**, JOHN: painter; son of Jonathan Trumbull, colonial Governor of Connecticut; b. at Lebanon, Conn., June 6, 1756; graduated at Harvard College in 1773; joined the army in 1775 as adjutant; accompanied the army to New York, and went as adjutant-general with Gates, who was appointed to the command of the Northern army; left the service in 1777, owing to his dissatisfaction in regard to the date of his commission; in 1780 went to Paris, thence to London, and studied painting with West; was suspected as a spy during the excitement caused by the execution of André, and imprisoned eight months; released through West's intercession, he returned to the U. S. in 1782, and remained till peace was concluded, then went back to England to resume his studies. His first historical work, *The Battle of Bunker Hill*, familiar through engravings, was exhibited in 1786, and was followed by *The Death of Montgomery before Quebec* and the *Sortie from Gibraltar*, both well known. In 1789 he returned to the U. S. with the purpose of commemorating on canvas the chief persons and events of the Revolution; among the likenesses taken were several of Washington. He returned to England as secretary to John Jay, and passed nearly ten years, from 1794 to 1804, in diplomatic service. Four years afterward he went once more and for the last time to England, and remained till 1815. The next seven years were devoted to painting four grand pictures for the rotunda of the Capitol at Washington—the *Declaration of Independence*, the *Surrender of Burgoyne*, the *Surrender of Cornwallis*, and the *Resignation of Washington at Annapolis*. About 1827 he disposed of his whole collection, fifty-seven pictures in all, to Yale College, in consideration of an annuity of $1,000 for the rest of his life. Trumbull passed the last twenty-seven years of his life mainly in New York; was president of the American Academy of Fine Arts till 1825. D. in New York, Nov. 10, 1843, and was buried in New Haven. See his *Autobiography* (New York, 1841). Revised by RUSSELL STURGIS.

**Trumbull**, JONATHAN: statesman; b. at Lebanon, Conn., in 1710; graduated at Harvard College 1727; studied theology and was licensed to preach, but soon devoted himself to mercantile business, and ultimately to the law; was elected to the Assembly 1733; was its Speaker 1739; became an assistant 1740, to which office he was re-elected; was made judge of the county court and assistant judge of the superior court; was chosen Lieutenant-Governor 1766, thereby becoming *ex-officio* chief justice of the superior court; became Governor 1769; held that office throughout the Revolution, resigning in 1783; was an energetic supporter of the popular cause; was considered a leader of the Whigs of New England, and his advice was much valued by Washington. The popular epithet "Brother Jonathan," now applied as a personification of the U. S., is said to have originated from Washington's habit of addressing him by that familiar title when requesting his opinion. D. at Lebanon, Aug. 17, 1785. See the *Life* by Isaac W. Stuart (Boston, 1859).

**Trumbull**, JONATHAN: Governor of Connecticut; son of Gov. Jonathan Trumbull; b. at Lebanon, Conn., Mar. 26, 1740; graduated at Harvard 1759; was for several years before the Revolution a member of the Legislature and Speaker of the House; was paymaster in the army 1775–80; became in 1780 secretary and first aide-de-camp to Gen. Washington, and as such was a member of his family until the close of the war; was a member of Congress 1789–95; Speaker of the House of Representatives 1791–95; U. S. Senator 1795–96; Lieutenant-Governor of Connecticut 1796–98, and Governor from 1798 until his death, at Lebanon, Aug. 7, 1809.

**Trumbull**, LYMAN: lawyer and politician; b. at Colchester, Conn., Oct. 12, 1813; educated at Colchester Academy; taught an academy at Greenville, Ga., 1833–36; studied law in Georgia; was admitted to the bar 1837; settled at Belleville, Ill.; was elected to the Legislature 1840; was Secretary of State 1841–42, justice of the Supreme Court 1848–53; was a Democrat till repeal of the Missouri Compromise in 1854; elected member of Congress 1855, and U. S. Senator 1855–73; was prominent as a Republican during the civil war; became chairman of the judiciary committee 1861; voted against the impeachment of President Johnson in 1867. In 1872 he joined the Liberal Republican party; after that date supported the Democratic party, and in 1880 was Democratic candidate for Governor of Illinois. From 1863 he resided in Chicago, where he died June 25, 1896.

**Trumpet** [from O. Fr. *trompette*, dimin. of *trompe*, trump, trumpet, appar. from Low Lat. **triumpa're*: Lat. *triumpha're*, triumph, exult. See TRIUMPH]: in acoustics, any instrument used for the conveyance to the ear of articulate sound from a distance. In music a well-known wind instrument, usually consisting of a brass tube some 8 feet in length, expanding at the end into a bell-like shape. By means of slides and keys the capacity of the trumpet has been largely increased. See FOG-SIGNALS.

**Trumpeter**: a peculiar wading bird (*Prophia crepitans*) of South America. See AGAMI and PSOPHIIDÆ.

**Trumpeter**: a breed of domestic pigeons, so called from the deep sound of their coo. The tarsi are heavily feathered, but the characteristic feature of the bird is the thick spreading crest which overhangs the eyes to such an extent that these birds can not care for their young until it is trimmed. The preferred colors are white and black. F. A. L.

**Trumpet-fish**: a name applied on the Atlantic coast of North America to the *Fistularia tabacaria* (family *Fistulariidæ*), and on European coasts to *Centriscus scolopax* (family *Centriscidæ*, which, like the *Fistulariidæ*, is of the order *Hemibranchi*). The first mentioned is without scales, and has a greatly elongated snout, with the mouth at the end of a bony tube. The forked tail has one or two long central filaments. The European trumpet-fish or BELLOWS-FISH (*q. v.*) has a large and very sharp dorsal spine, and a snout much like that of the foregoing. Revised by F. A. LUCAS.

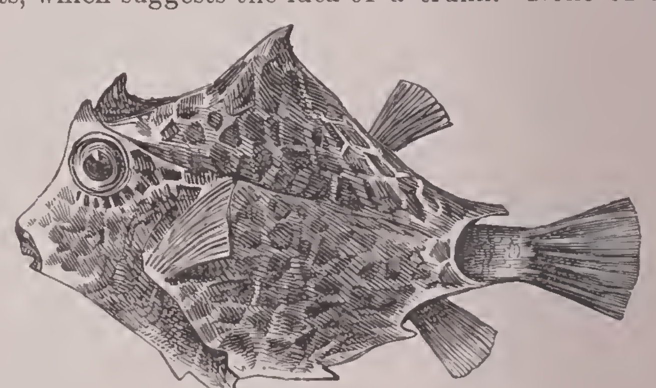
**Trumpet-flower**: a popular name for various species of *Bignonia* and *Tecoma*, mostly shrubs and woody vines, though in tropical regions some of the species are large trees. They belong to the family *Bignoniaceæ*. The native

Trumpet-flower (*Tecoma radicans*).

species of the U. S. are *Bignonia capreolata*, *Tecoma radicans*, and *T. stans*. The first and second are fine climbers. *T. capensis* from South Africa, *T. grandiflora* from Japan, and other fine species are often cultivated.
Revised by CHARLES E. BESSEY.

**Trumpet-wood**: See CECROPIA.

**Trunk-fish**: any one of various fishes of the order *Plectognathi* and the sub-order *Ostracodermi*, forming the family *Ostraciontidæ*. They are so called on account of being incased in an angular case-like development of the integuments, which suggests the idea of a trunk. None of these



The trunk-fish.

fishes are in demand as an article of food, their flesh being small in quantity, and in some species even thought to have a poisonous effect. But the liver is very large and yields a considerable supply of oil. All the trunk-fishes are natives of the tropical seas. Revised by F. A. LUCAS.

**Trunk-turtle**: a name for the LYRE-TURTLE (*q. v.*).

**Tru'ro**: town; in Cornwall, England; at the junction of the Allen and Kenwyn; 54 miles W. of Plymouth (see map of England, ref. 15–C). It is the center of a rich mining district, and exports large quantities of tin ore. The ancient bishopric of Truro was revived in 1876, and a new cathedral, which incorporates the old parish church of St. Mary's, was consecrated in 1887. Pop. (1891) 11,131.

**Truro**: a handsome town; capital of Colchester County, Nova Scotia; at the head of Cobequid Bay, and on the Intercolonial Railway; 61 miles N. of Halifax (see map of Quebec, etc., ref. 2–C). It contains a provincial normal school and has a daily and three weekly newspapers, and manufactures of woolens, boots and shoes, hats, furniture, pianos, organs, etc. Ship-building, fishing, agriculture, and mining are also carried on near Truro, which is a place of some wealth. Pop. (1891) 5,102.
Revised by M. W. HARRINGTON.

**Truro**, BARON (*Thomas Wilde*): jurist; b. in London, England, July 7, 1782; third son of an eminent solicitor;

was educated at St. Paul's school, articled to his father for the study of law, and, after running away in disgust, devoted himself studiously to that profession; was admitted as an attorney in 1805; entered as a student of the Inner Temple in 1811, pursuing with great success the calling of special pleader until called to the bar Feb. 17, 1817. During the next three years he became prominent as a pleader at the bar, and attained distinction as junior counsel in the defense of Queen Caroline; was made serjeant-at-law in 1824 and king's serjeant in 1827. He entered politics as a Whig, and sat in Parliament 1831–32 and 1835–39. In Dec., 1839, or Feb., 1840, he became solicitor-general, and was knighted; June to Aug., 1841, was attorney-general; was prominent in a famous debate on parliamentary privilege; was again sent to Parliament in 1841, and in June, 1846, again became attorney-general, and chief justice of the common pleas July, 1846. On the formation of Lord John Russell's administration in 1850 he was made Lord Chancellor and Baron Truro of Bowe's Manor, Middlesex, but resigned in Feb., 1852. D. at Southgate, Middlesex, Nov. 11, 1855, after a protracted illness. He was during his whole life a progressive Liberal, of untiring industry, and was active in aiding many of the reforms which were accomplished during his time. F. STURGES ALLEN.

**Truss** [from O. Fr. *trousse*, *tourse*, truss < Low Lat. **tur'sus*: Lat. *thyr'sus* = Gr. θύρσος, stalk, stem, staff; possibly akin to Lat. *fustis*, cudgel]: in surgery, a device worn to support a HERNIA (*q. v.*). It consists of a pad so arranged with a spring and straps that it may be retained in position without interfering with the patient's movements. In engineering a truss is a framed structure so arranged that the principal members take only stresses of tension or compression. A simple truss is one supported at its two ends, and it exerts only vertical pressures on the supporting walls or piers, while an arched truss exerts horizontal pressures also. A truss consists of an upper chord, a lower chord, and bracing, which connects them. In bridge trusses the two chords are often parallel, one being in tension and the other in compression, while the braces are alternately tensile and compressive under dead load. The economic depth of a truss of given length is such that the quantity of material is a minimum. Various forms of trusses are described in the articles BRIDGES and ROOF. See also ARCH, CARPENTRY, MOMENT, and STRESSES. MANSFIELD MERRIMAN.

**Trust Companies**: See the Appendix.

**Trusts** [M. Eng. *trust*, *trost*; cf. Icel. *traust*, confidence, security: Germ. *trost*, comfort: Goth. *traust*, convention, covenant. The ordinary meaning is confidence—hence intrusting of property, property intrusted, the organization which controls such property]: in law, peculiar species of ownership, whereby property, real or personal, is vested in certain persons for the use or benefit of others. The persons who hold the legal estate are the "trustees"; those for whose benefit the property is held or administered are known as the *cestuis que trustent*, or beneficiaries. Although trusts—whereby one person holds property on a trust or confidence which another person can enforce by legal proceedings—are of great antiquity, they are, in their present form and variety, essentially modern, dating back only to the Statute of Uses, passed in the twenty-seventh year of Henry VIII. (A. D. 1535). Prior to that statute the practice of conveying lands to one person to the "use" (*ad opus* or *ad usum*) of another, the former having a bare naked title without any rights of control or enjoyment in the lands conveyed, the latter having no legal estate or interest whatever, but being clothed with all the substantial rights and privileges of ownership, had become so common as to affect a large proportion of the land in the kingdom. The article on USES (*q. v.*) describes the inconveniences to which this practice gave rise and the successive efforts—usually all but futile—made by the legislature to restrain or destroy it. The most marked result of the Statute of Uses, which was the most radical as well as the latest of these legislative attempts, was to elevate the *use*, theretofore illegitimate and wholly without legal recognition, into a lawful estate, recognized and protected by the legal tribunals. There remained, however, within the exclusive cognizance of the equity tribunals certain of these uses which, by a narrow and technical construction of the statute referred to, escaped its operation. These were, 1, uses raised on terms of years or other personal estate; 2, uses charged upon other (precedent) uses; and 3, and most important of all, active uses, i. e. those with the performance of which some duty on the part of the trustee (*feoffee to uses*) was connected. These three varieties of unexecuted uses (i. e. uses not covered by and "executed" by the statute), under the name of *trusts*, continued to be fostered and administered by the court of chancery upon substantially the same principles which it had applied to the regulation of uses before the statute. But while the leading principles of the jurisdiction of equity over trusts have long been established, its doctrines have, in very recent times, received enormous expansion, so that they constitute to-day by far the most important part of that jurisdiction.

In consequence of the fact above adverted to, that the *cestui que trust*, or beneficiary, is invested with the whole beneficial enjoyment of the trust estate, the trustee having the title vested in him only for the benefit of the *cestui que trust*, the latter is often spoken of as the "real owner," or, more commonly, as the "equitable owner," and his interest is described as an "equitable estate" in contradistinction to the "legal estate" of the trustee. But this language is in the highest degree improper and misleading. There is only one kind or species of "estate"—that, namely, which is recognized by the courts of law. The interest of the beneficiary of a trust is in no sense an estate or interest in the land or other property affected by the trust. He has, at the most, a right of action against the trustee in whom the "legal title," or estate, is vested. This right of action enables him by the aid of the equity tribunals to hold his trustee to a strict performance of the duties imposed upon him, and even, in certain cases, where the trust is only nominal, to compel the conveyance of the trust estate to himself, but until such conveyance the beneficiary has no right to deal directly with the estate. Not only is he without power to convey the property to another, but he can maintain no action at law for its protection, either against the trustee or a stranger, and he can bring no action of ejectment or trespass for a wrongful possession thereof. It has, however, been held from an early period that equity will recognize the right of the *cestui que trust* to assign his rights in the trust estate, so as to enable his assignee to enforce the trust as the beneficiary thereof; and such is the rule to-day, except where, as in New York, it has been modified by statute. See 1 N. Y. Rev. Stat. 730, § 63.

*Jurisdiction of Equity over Trusts.*—The jurisdiction of equity over the trustee is confined to the ascertainment and enforcement of the trust imposed upon him. There is no authority in the courts to alter the character of the trust, to enlarge or to reduce the powers of the trustee, nor, except in the case of charitable trusts (see below), to confer the benefits of the trust on any person other than the beneficiary designated by the act creating it. Ordinarily, therefore, the trustee of a trust for the life of another can not be empowered by the court to lease the estate for a longer period than such life, nor to sell or mortgage the estate, even where the interests of the estate or of the beneficiary clearly demand such action. In some jurisdictions, however, these rules have been modified by statute so as to give trustees or to authorize the equity tribunals to give them the power to lease, sell, or mortgage the trust estate in cases where it appears to be necessary for the protection of the trust estate, or to the best interest of the persons beneficially interested therein so to do. See, e. g., N. Y. Rev. Stat., vol. i., p. 730, sec. 65, as amended by Laws of 1886, ch. 257.

On the other hand, the power of the courts to enforce the performance of trusts is complete. They may remove a trustee and appoint another; may restrain him by injunction; may call him to account and hold him personally responsible for the results of his fraud or neglect, for improper investments, for profits made or which ought to have been made, and for interest; may avoid conveyances made to himself, and those made to third parties in breach of the trust; may follow the property into the hands of such third persons, as implied trustees, unless they are purchasers in good faith for a valuable consideration; may, in fact, do anything which will give equitable protection to the rights of the beneficiary. The office and function of the trustee are in the highest degree fiduciary and conscientious. He is bound to diligence and discretion in the performance of his duties as well as to the utmost measure of good faith.

*Kinds of Trusts.*—Ordinary private trusts, as usually classified, are of three kinds, viz., *express*, *resulting*, and *constructive trusts*.

*Express trusts* arise from the direct and intentional act of the parties, evidenced by some declaration which is generally contained in a written instrument. The most common examples of this class are those created by marriage settlements, by assignments for the benefit of creditors, by deeds of conveyance, and by wills. Such trusts may, in the absence of statute, be created by parol as well as by a written declaration, but it has been enacted by the Statute of Frauds that no trust over or concerning lands shall be created, assigned, or declared except by a deed or conveyance in writing, but that this provision shall not affect trusts created by will and those implied by law.

*Resulting* (*or implied*) *trusts* arise, in the absence of any express declaration, by implication from the acts of the parties. Where the circumstances attending an assignment or conveyance of property are such as to raise a presumption that a trust, although unexpressed, was intended, such a trust is said to "result" from the transaction. Trusts of this sort are not uncommon. They arise (*a*) where an intended trust can not take effect, either by reason of a failure to declare the beneficiary or because the intended trust, not being capable of execution as a charitable trust, is too indefinite to be carried into effect; (*b*) where an expressed trust fails to exhaust the entire property transferred to the trustees; (*c*) where the legal title is transferred, and a trust declared as to a part of the property, but no intention expressed as to the rest; and (*d*) where the purchase-money is paid by one person and the conveyance is taken in the name of another. In the first case (*a*) a trust results to the person who made the conveyance or, where the property is transferred by will, to the heir or personal representative, as the case may be, of the testator; that is to say, while the transfer to the grantee, devisee, or legatee holds good, and vests the legal title according to the intention of the parties, equity will compel such transferee to hold the property as a trustee for the donor or his lawful successors to the title; in the second and third cases (*b* and *c*) a trust results either to the donor (as in case *a*) or to the grantee, according to the apparent intention of the parties, as expressed in the instrument of transfer; in the last case (*d*) the person taking title is compelled to hold it as trustee for the one who paid the purchase-money. The only general exception to this rule is where the person who pays the consideration stands in the position of a husband or in *loco parentis* to the party to whom the property is conveyed. Where such relationship exists, a presumption arises that the payment was intended as a provision for the wife, or an advancement to the child, and no trust results, unless the presumption is rebutted.

A *constructive trust* is raised by a court of equity "wherever a person, clothed with a fiduciary character, gains some personal advantage by availing himself of his situation as trustee." The trust is in such cases said to arise by *construction*, without reference to any intention of the parties, either expressed or presumed. The power to raise or impose trusts by "construction," in order to obviate the effects of the fraudulent acquisition of property, constitutes a most salutary, important, and constantly growing exercise of equity jurisdiction. As it is impossible to enumerate here all of the cases in which this jurisdiction may be invoked, only a few of the most important and comprehensive rules will be given. (*a*) Where property is acquired by one person by the wrongful use of the property of another—as, e. g., where a trustee, executor, or agent misapplies money or other property which he holds in his fiduciary capacity to the purchase in his own name of other property—the dishonest agent or trustee will hold the property so acquired in trust for the person whose property was misapplied. (*b*) Where a person acquires for himself an interest in property in regard to which, by reason of his fiduciary position, he has a duty to perform for another, he will hold such interest in trust for the person to whom such duty was due. A good illustration of the application of this rule is found in the familiar doctrine that a person occupying a position of trust or responsibility toward another in regard to leasehold property—as a trustee, executor, guardian, mortgagee, tenant for life, cotenant, partner—can not take a renewal of the lease for his own benefit, but shall hold it, when taken, for the benefit of all parties interested in the old lease. (*c*) Where there is a valid contract for the sale of real estate "the vendor becomes in equity a trustee for the purchaser of the estate sold, and the beneficial ownership passes to the purchaser, the vendor having a right to the purchase-money," together with a charge or lien on the estate for the security of that purchase-money. This lien or charge, belonging to the class of interests known as "equitable liens," is sometimes also, although improperly, included among the constructive trusts.

*Statutory Changes.*—In many of the U. S. the law of trusts, as developed by the equity tribunals, has been extensively modified by legislation. The New York statute may serve as a type of the law of trusts as thus modified. Implied, or resulting, and constructive trusts and all trusts of personal property are left substantially unaltered by this legislation. All express passive trusts of land and all express active trusts of land, except certain classes, are abolished. The express trusts which are permitted are the following: (1) to sell lands for the benefit of creditors; (2) to sell, mortgage, or lease land for the benefit of legatees or to satisfy any charge thereon; (3) to receive the rents and profits of land, and apply them to the use of any person during his life or for a shorter period; (4) to accumulate rents and profits of land for the benefit of minors during the continuance of their minority. GEORGE W. KIRCHWEY.

CHARITABLE TRUSTS.—In the ordinary private trusts there must be both a known trustee and a certain, determinate beneficiary, although, if the trustee should die, resign, or refuse to accept, the court can supply the place by appointment. But property may be given in trust for specified objects where the beneficiaries are completely indeterminate—as, for example, a gift to aid in spreading the gospel or to relieve the poor—or where the beneficiaries constitute a known class, but the individuals are uncertain, as a gift to provide for the poor of a particular town or to support the scholars in a designated school. Dispositions of this form and nature, whether made by deed or by will, are termed "charitable trusts." They first appeared in the Roman empire after it became Christian, and were both legalized and fostered by several constitutions of Christian emperors. The researches of modern jurists have established the fact beyond a doubt that the English court of chancery at an early day, by virtue of its own intrinsic authority, assumed jurisdiction over, upheld, and enforced this species of trusts. In the 43d Elizabeth (A. D. 1601) a statute was passed known as the Statute of Charitable Uses, which regulated the whole subject of charitable gifts. It created a new and special jurisdiction of the chancellor, and contained an enumeration of lawful charitable objects. In determining what trusts should be upheld as charitable, the doctrine was firmly settled that all objects embraced within the spirit as well as the letter of the statutory enumeration are lawful. As the result of this principle, all trusts created for any one of the following general purposes are charitable: (1) The support, maintenance, or spread of the Christian religion; (2) the relief, aid, or support of the poor, the sick, or those in any manner disabled; (3) the foundation, erection, or support of institutions, organizations, societies, or other means of general beneficence, either for all needy persons or for particular classes, such as asylums, hospitals, dispensaries, reformatories, and the like; (4) the maintenance and promotion of education, learning, literature, science, or art by the establishment, erection, support, or aid of universities, colleges, schools, libraries, reading-rooms, museums, scientific lectures, societies, art schools or galleries, etc.; (5) any and all objects of interest or advantage to the public, as highways, parks, public gardens, water or gas supplies, and the like.

In administering charitable trusts the English court of chancery exhibited the utmost liberality in carrying out the designs of the donors and in sustaining the gifts. It even invented and applied a special doctrine, known as the principle of *cy pres* (as near to), in pursuance of which, when it was found impossible to carry out the design of the donor in the manner which he had indicated, the court would contrive and establish another scheme or mode, preserving the same general intent, and differing as little as possible in details from the original plan.

The statute of 43 Elizabeth has not been re-enacted in the U. S. In most of the States, however, the courts have adopted the general doctrines which had been formulated by the English chancery, so that charitable trusts as above described are recognized in their local jurisprudence and upheld by their judiciary. In other States the whole system has been rejected as inconsistent with the institutions of the U. S., and especially because it tends to create perpetuities, which are opposed to the policy of the laws. In New York, for example, it has, after some vacillation, been settled that charitable trusts were abrogated by the revised statutes, and that the only mode of establishing a charity is through the instrumentality of a corporation, which shall receive and administer the trust. This narrow and illiberal policy of the New York law has been subjected to much criticism, as tending to make charitable gifts unnecessarily precarious, and thus frequently defeating the benevolent intentions of the donors of such gifts.

Revised by George W. Kirchwey.

Commercial Trusts. — The great trade combinations which, under the denomination of trusts, have become such a marked feature of modern industry, especially in the U. S., owe their form and designation, though not their importance, either in law or in the industrial organization of society, to the trust proper, as developed in Anglo-Saxon jurisprudence. (See above.) The term is therefore not wholly a misnomer, though it becomes so when it is popularly applied to such combinations irrespective of their form and mode of creation, or when the term is employed in a peculiar and exclusive sense to describe the gigantic modern trusts created for industrial purposes. A commercial trust, whatever its magnitude, is neither more nor less a "trust" than any other vesting of property in one person to the use and benefit of another person, while, on the other hand, a trade combination may be equally effectual for the purposes of its creation, and equally obnoxious to public sentiment or to the law, if it is nothing more than an agreement between individuals to prevent competition or if it take on the form of a copartnership of corporations. Not every trade combination is a trust, nor is every trust an industrial monopoly. For the purposes of the present discussion, however, the whole subject of the legal status of all forms of capitalistic combination, whether trusts or not, may most conveniently be considered together.

Notwithstanding the fact that commercial trusts of the modern type had their origin in England before the middle of the nineteenth century, and that they were developed much later in America, by far the greater part of the law of the subject is to be found in the reports and statute-books of the U. S. and Canada. Indeed, in England these combinations of capital, directed either to general investment purposes or to the management and control of industry, have been regarded in the light of a normal development of industrial forces, like great corporations, and the attitude of the courts has been singularly liberal and free from the suspicion and hostility which have attended similar manifestations in North America.

The legality of the combinations under consideration may be considered from three different points of view: (1) Where the combination is of the normal type, the property of several individuals or corporations being vested in trustees, to be administered for the common benefit, it presents the question whether it constitutes a true trust within the scope and the terms of equity jurisdiction and entitled to protection and enforcement by the equity tribunals; (2) where, as has usually been the case, the parties to the combination are corporations or the stockholders of corporations, the question arises whether its organization constitutes an offense or, at least, an unauthorized and therefore unlawful act on the part of the persons of whom it is composed; (3) whatever be the form of the combination, and whether its constituent elements be corporations or private individuals, the question still remains whether the objects of the combination are consistent with the public welfare, and therefore lawful. These positions will be separately examined.

1. "*Trusts*" *in Equity*.—There is nothing in the form, the organization, or the methods of the modern industrial trust to render it obnoxious to law. It is in all essential particulars a trust of the normal, familiar type, such as are habitually enforced by the courts. In these external aspects it differs from ordinary trusts only in the magnitude of the interests involved. But neither the amount of property vested in the trustees, the extensive and secret powers of administration conferred upon them, nor the number and wide distribution of the beneficiaries of the trust affords any reason for refusing to recognize the title of the trustees or the right of the beneficiaries to protection against them. These principles are now undisputed, so far as the law of trusts, as that has been developed by the equity tribunals, is concerned. It is only in those jurisdictions where that law has been radically altered by legislation that any question can arise as to the validity of trusts of this description, and the jurisdiction of equity over them. Thus in New York and several other States it is provided by statute that express trusts of real property can be created only for certain enumerated purposes, not including such a use as is here under consideration. (See N. Y. Rev. Stat. 1, 727, secs. 45 and 55; see also above.) But this difficulty is successfully obviated by the method usually employed for the creation of such trusts. The property vested in the trustees, and forming the basis of the trust, is not the real and personal property of the corporations forming the combination, and with which its business is to be carried on, but the shares of the stockholders of such corporations. These shares are always personal property, whether the corporate property which they represent be real or personal; and, as the restriction of the statute is confined to trusts of real property, its application in the case of corporate trusts is thus ingeniously excluded. When individuals or firms desire to join such a trust, they first become incorporated, and then enter as shareholders of the corporation thus formed. Of course the possession of the shares gives the trustees the actual control, though not the legal ownership, of the property, real as well as personal, of the several corporations composing the "trust."

It is true that equity may refuse to enforce a trust, notwithstanding its regularity and outward conformity to equitable principle, if its objects are unlawful and contrary to public policy. But as such a trust always comes into existence by virtue of an agreement, and as such agreement, if it be really illegal, can more conveniently be directly attacked in an action at law than by invoking the interposition of equity, there is seldom any motive for resorting to the latter course of proceeding. It should, moreover, be borne in mind that equity acts only upon the petition of the beneficiary, showing that the management of the property is wasteful or otherwise hostile to his interests; and, on the other hand, that if these facts are made to appear it is only where the performance of the trust would be manifestly illegal and *contra bonos mores* that the court will allow the trustee to continue to violate the terms thereof. Accordingly, in the litigation which has attended the development of these trust combinations their character as trusts has played little or no part, and those combinations that have been organized on the trust principle have been attacked and defended on precisely the same grounds as those which have taken on some other form. The field over which the battle of the trusts has been waged is covered by the two following points.

2. *Corporate Trusts*.—Corporations, being "artificial persons," created by the state for specific purposes and having only such powers as are conferred upon them for carrying those purposes into effect, have a very much more restricted range of activity than is permitted to the natural man. Many acts which the individual may lawfully perform are forbidden to the corporation. The former can retire from business, or turn his business over to some one else to be managed for him; the latter can not retire without dissolution, nor has it any power to delegate to another corporation or person the duties which its charter requires it to perform. A corporation which abandons the business for which it was organized and allows its property to be controlled and its operations to be carried on by a person or group of persons who have no direct relations to it, and who are not its agents, is acting *ultra vires* and in violation of its organic law, and thereby forfeits its right to exist at all. These principles suggest an obvious ground of attack on trust combinations made up of corporations, and it is upon this ground that the principal and most successful assault upon them has been made. But when the courts would have enforced this principle against the corporate trusts, so called, it was objected that the several corporations whose property and business was administered by the trust were not actually parties to it, and that the corporation, having a distinct legal personality and being capable of acting only by its duly appointed officers, could not be held responsible for the unauthorized, but yet lawful, acts of its individual stockholders in vesting their interests in the obnoxious trust. The courts, however, swept away this reasoning, plausible though it was, as sophistry, and laid down the principle that where the corporation acquiesces in the transfer of the corporate stock to such a trust, and in the real control and management of its interests by trustees, the act shall be deemed to be the act of the corporation, and the latter may be dealt with accordingly.

These principles once settled, the mode of attack is simple enough. Although the trust is, as we have seen above, impregnable against direct attack, it can be effectually undermined and destroyed by breaking down the several corporations from which it draws its strength. Although no stockholder or creditor of the corporation complains, it can be punished for its unlawful and unauthorized abuse of power, in the name and behalf of the people of the State, by a proceeding instituted by the attorney-general for the forfeiture of its charter. It was in this way that the Sugar Trust was broken up in New York, and the great Standard

Oil Trust in Ohio. In each case the attack was directed against one of the numerous corporations alleged to be a party to the trust, and the forfeiture of one charter, with the liability to a similar forfeiture in the case of all the other corporations concerned, operated effectually to dissolve the trust in each case. (*People of State of New York* vs. *North River Sugar Refining Company*, 121 New York Reports, 582; *State of Ohio* vs. *Standard Oil Company*, 49 Ohio State Reports, 137.) The principles of corporate liability were even more conspicuously violated in the organization of the Chicago Gas Trust, where a gigantic corporation, without express legislative sanction, assumed to control the operations of a multitude of lesser corporations by acquiring their capital stock. *People* vs. *Chicago Gas Trust Company*, 130 Illinois Reports, 268.

The principles upon which these cases were decided have been accepted as conclusive, excepting for purposes of academic discussion, by the parties concerned in the trust combinations as well as by the general public, and it is hard to see how they can be disputed. It is to be observed, however, that they are applicable only to the state of facts under examination in those cases—namely, where corporations, acting officially or by their stockholders, have transferred their property and concerns to trustees to be managed for them, or have in some other way exceeded their lawful powers. But this is only one—though it is certainly the easiest, as it has been the most popular—form of capitalistic combination. There are several other forms, of at least equal potency, with which the principles above discussed have nothing to do. Thus they do not touch the case of individuals, not corporations, forming trust combinations of precisely the character and type of those under consideration. They do not reflect upon the right of corporations or of individuals to enter into far-reaching agreements, regulating the rate and character of production and the prices to be charged for goods and services. They are not infringed by the consolidation of many corporations into one, or the acquisition by one gigantic corporation of all of the property and business engaged in a certain line of industry. The "trust," after it has been driven out of one form of organization, can easily take refuge in another and different form. Indeed, this is precisely what has occurred in the case of the trusts "destroyed" by the adverse decisions in New York, Ohio, and elsewhere. Of the large number of such combinations in existence at the date of those decisions, it is not known that a single one has gone out of operation as a result thereof. They have disappeared as corporate trusts, but they have promptly reappeared and are in full operation as great corporations or as combinations held together by contract. And yet the evils, real or imaginary, threatened by the corporate trusts are equally to be feared from the combinations of capital and industry which have generally succeeded them. How are these evils to be met? The question brings us to the third and most comprehensive ground of attack on such combinations.

3. "*Trusts*" *as Monopolies.*—Whether a given industrial combination be made up of individuals or of corporations, whether it be more or less closely held together by contract or be consolidated into a trust, if it constitutes or "tends to create" a monopoly, or if it is found to be a conspiracy in restraint of trade, it is obnoxious to law. This does not signify that it is liable to destruction at the instance of the State, nor that its promoters are subject to criminal prosecution, but only that the agreements and covenants on which it is based, being unlawful and contrary to public policy, will not be enforced by the courts, and that it will thus be reduced to a mere voluntary association without binding force upon its members. Where the monopoly is not based on agreement, but is exerted by a single corporation or individual who has gained control of the market, the rule here laid down has no application. As thus limited and defined, the rule against monopolies is one of the landmarks of the common law. But no rule of that law is more difficult of application. The crucial question as to whether a given combination is or is not a monopoly, as to whether a given agreement is or is not a conspiracy against the common weal, is well-nigh as broad as the rule itself, and the judicial attempts to answer it have thus far failed to develop any clear guiding principle. The common law relating to monopolies and the trade offenses of *engrossing, forestalling, and regrating* (by which were intended the buying of necessaries of life in order to sell them again), founded, as they were, on economic ideas and industrial conditions which have long passed away, are wholly obsolete. Of the common-law doctrine of the invalidity of agreements in restraint of trade and competition, there survives only the general principle that a restriction which is unlimited in respect both of time and place is unreasonable and therefore void. But where, as in New York, the courts lend their aid to enforce a contract made by a competing manufacturer to refrain for ninety-nine years from carrying on a certain business within the United States and Territories, excepting only in Montana and Nevada, especially where the contract in question is part of a general scheme on the part of the plaintiff to gain control of the entire business in the country, even that doctrine becomes too nebulous to serve as a guide. (*Diamond Match Company* vs. *Roeber*, 106 New York Reports, 473). The only principle which has clearly emerged from the mass of conflicting decisions is that a contract restraining competition will be decreed to be unlawful if, in the opinion of the tribunals before which it is brought, it is unnecessary and unreasonable so far as the due protection of the parties is concerned, or is prejudicial to the public interest; and that an industrial enterprise will be deemed to be a monopoly when, in the judgment of the courts, it actually becomes a menace to the public welfare and is not justified or required by the existing conditions of trade and industry.

These principles solve the question as to the monopolistic and therefore unlawful character of trade combinations, so far as it is yet capable of solution. The tendency in most of the States has been to declare against such combinations; but in the great case against the Sugar Trust (above referred to) the New York Court of Appeals refused to follow the lower courts in declaring the combination to be essentially monopolistic and hostile to the welfare of the State. It is believed that, in the absence of legislation, this more temperate and conservative view will ultimately prevail.

*Legislation.*—The epidemic of trust legislation has produced so few conclusive results that it would be unprofitable to go much into detail concerning it. The popular agitation against trusts resulted in 1888 in legislative investigations by the U. S. House of Representatives, the New York Senate, and the Canadian Parliament, and these were followed, in 1889 and the years immediately succeeding, by a crop of hastily conceived and more or less stringent repressive acts. The act of Congress passed in 1890, and known as the National "Anti-Trust Act," is so indefinite in its terms and so inconclusive in character that it is generally regarded as an abortive and practically worthless measure in the campaign against monopoly. Moreover, it is by reason of the limitations of congressional authority confined to acts which come within the definition of interstate commerce. Anti-trust laws have also been enacted in Illinois, Michigan, and several other States in the West and South. In the eastern parts of the country the fulminations of social reformers and legislative committees have thus far (1895) produced but little result, though Maine has a comprehensive law, passed in 1889, and New York one of narrower scope and of doubtful utility, passed in 1893 (chap. 716). All of these statutes are penal in character, and declare all combinations or agreements regulating the supply or the price of "any article or commodity" to be criminal conspiracies, and prescribe penalties therefor. In addition to this the statutes usually declare such contracts or combinations to be null and void. Most of these statutes appear to be sufficiently explicit and drastic to produce the result intended by them, though there is considerable question as to the constitutionality of such legislation on account of its interference with vested property rights. There have been no decisions under these statutes as yet which have conclusively demonstrated their efficacy and legality. Probably it will not be difficult for the combinations at which they are aimed to adopt a form of organization which will avoid their operation. It will be remarked that this legislation does not affect any form of capitalistic organization which does not involve a contract or combination of several parties, and that a single corporation, owning and controlling all of the industries in a given territory or in a certain line of enterprise, is wholly outside its scope. Such an organization, therefore, would clearly seem to be lawful in the present state of the law, though it could doubtless be reached and partially controlled by legislation limiting the amount of the capital-stock which may be issued and of the property which may be held by industrial corporations.

Authorities.—The most comprehensive and practical treatise on the subject of trusts is that of Lewin (*The Law of Trusts*), though Perry on *Trusts*, the works of Story and

Pomeroy on *Equity Jurisprudence*, and the article on *Trusts and Trustees* in the American and English *Encyclopædia of Law* (vol. xxvii.) may also be consulted. There are also several treatises dealing particularly with charitable trusts, among them those by Dwight (Am.), Finlason (Eng.), and Tudor (Eng.). The literature dealing with commercial trusts is very large, but scattered, and usually of inferior quality. Even the law writers have too often substituted denunciation for exposition and reasoning. Spelling's *Trusts and Monopolies* contains the fullest discussion of the subject. See also *The Legality of "Trusts,"* by T. W. Dwight, 3 *Political Science Quarterly*, 592; several articles in vols. i., iv., and vii., of the *Harvard Law Review*; and the article MONOPOLIES. A very complete bibliography of commercial trusts, down to 1890, by William H. Winter, can be found in 7 *Railway and Corporation Law Journal*, 236.

GEORGE W. KIRCHWEY.

**Trutch**, Sir JOSEPH WILLIAM: statesman; b. at Bath, England, Jan. 18, 1826. He was educated at Exeter, studied civil engineering under Sir John Rennie, and removed to the Pacific coast in 1849. He practiced his profession in California and Oregon until 1856; removed to British Columbia in 1859, and till 1864 was employed in constructing public works for the colony. He was chief commissioner of lands and works and surveyor-general of British Columbia from 1864 until 1871, when the colony joined the Dominion; delegate to Ottawa in 1870 to arrange terms of union with Canada; and in 1871 to Ottawa and London to finally settle details of union. He was lieutenant-governor of British Columbia 1871–76; appointed resident agent of the Canadian Government in British Columbia in 1879, and was knighted in 1889. NEIL MACDONALD.

**Truth**, SOJOURNER: See SOJOURNER TRUTH.

**Truxillo**: See TRUJILLO.

**Truxtun**, THOMAS: naval officer; b. on Long Island, N. Y., Feb. 17, 1755; went to sea at the age of twelve years; was impressed into the British navy; became in 1776 lieutenant of the American privateer Congress; equipped and commanded in 1777 the Independence, with which he took valuable prizes; afterward commanded the Mars (20 guns) and other ships, and in 1781 the St. James (30 guns), with which he disabled a British ship of superior force after a severe engagement; was engaged in the East India trade for several years after the war. On the organization of the U. S. navy, 1798, he was selected as one of its six captains, and assigned to the frigate Constellation, with which he captured the French frigates L'Insurgente, Feb. 9, 1799, and La Vengeance, Feb. 1, 1800; was made commander of the West Indies squadron of ten vessels 1801, and appointed 1802 to the command of the naval expedition against Tripoli, but retired from the service, and after living on a farm in New Jersey removed to Philadelphia, where he was sheriff of the county 1819–21, and where he died May 5, 1822. He was the author of *Remarks, Instructions, and Examples relating to Latitude and Longitude, also the Variation of the Compass* (Philadelphia, 1794).

**Trygon'idæ** [Mod. Lat., named from *Try'gon*, the typical genus, from Lat. *try'gon* = Gr. τρυγών, sting-ray]: a family of selachians, of the order *Raiæ*, typified by the sting-rays. The disk constituted by the union of the pectoral fins with the body is rhomboid or oval, and oblong or transversely expanded: the tail is thin and, toward its extremity, whip-like, but otherwise variously developed, being mostly very long, but sometimes very short; the skin is generally more or less armed with scattered spines or tubercles; the head is produced into a pointed snout or at least angulated in front; the mouth is moderate; the teeth mostly transversely elliptical, and ridged or cuspidate; on the back of the tail are generally one or more spines, which, in the typical forms, are compressed from before backward, and armed at their lateral edges with teeth or serrations directed downward, but these are sometimes wanting; there generally are only rudimentary dorsal and caudal fins, or none at all. The species are quite numerous, and disseminated in all seas except the extreme polar ones. They are to be feared on account of their spines. See STING-RAY.

Revised by F. A. LUCAS.

**Tryon**, DWIGHT WILLIAM: landscape-painter; b. at Hartford, Conn., Aug. 13, 1849; pupil of Daubigny, Jacquesson de la Chevreuse and Guillemet, Paris; member of the Society of American Artists 1882; National Academician, 1891; member of the American Water-color Society. He won the second Hallgarten prize, National Academy, 1887 and the Webb prize, Society of American Artists, 1889. His pictures are poetic in sentiment and fine in color; he paints very skillfully in water-color. His studio is in New York.

WILLIAM A. COFFIN.

**Tryon**, WILLIAM: colonial Governor; b. in Ireland about 1725; received a good education: became a distinguished officer in the British army; married Miss Wake, a relative of the Earl of Hillsborough, Secretary of State for the colonies, through whose influence he was appointed Lieutenant-Governor of North Carolina 1764; became Governor by the death of Gov. Dobbs July 20, 1765; suppressed the revolt of the Regulators, treating the prisoners with cruelty; erected at the cost of the province a magnificent residence at Newbern; was advanced to the governorship of New York July 3, 1771; became colonel 1772 and major-general 1777; was detested by the patriots for his many acts of rigor and severity, and especially for the destruction of Danbury, Fairfield, and Norwalk, Conn., by expeditions conducted by him in person; resigned his post Mar. 21, 1778, and returned to England, where he became a lieutenant-general 1782; was given the degree of LL. B. by King's (Columbia) College in 1774. D. in London, Feb. 27, 1788.

**Tsad**: another spelling of the name CHAD (*q. v.*).

**Tsanpo**: See DIHONG.

**Tsar**: See CZAR.

**Tsaritsyn'**, or **Zaritzin**: town; once an important fortress of Saratoff government, southeast Russia; at the great bend of the lower Volga, terminus of an important railway from the N. and of a short line to Kalach to the W. (see map of Russia, ref. 9–F). It is the center of the trade between Astrakhan and the North Caspian districts and Central Russia. It is especially the center for the naphtha, salt, and mustard trades. The town has become the gathering-place for the poor seeking work, and their quarters, especially in summer, contain much misery and filth. It has a large theater, a public library, two gymnasia, and a fine church in the architecture of the sixteenth century. Pop. (1897) 55,914.

MARK W. HARRINGTON.

**Tsars'koye-Se'lo**, or **Zarskoye-Selo**: town of Russia; 14 miles S. of St. Petersburg (see map of Russia, ref. 5–C). It contains two magnificent palaces which are used by the imperial family as summer residences. The park and pleasure-grounds of the palaces cover an area 18 miles in circumference, and the buildings contain many valuable collections. The cathedral of St. Sophia is a copy in miniature of the mosque in Constantinople. Pop. 16,838.

Revised by M. W. HARRINGTON.

**Tschaikows'ki**, PIETER ILIITSCH: composer; b. at Wotkinsk, Russia, Apr. 25, 1840; began the study of music in 1862 in the St. Petersburg Conservatory. His first composition was a cantata to Schiller's *Ode to Joy*. From 1866 to 1877 he was Professor of Harmony, Counterpoint, and Musical History in the Moscow Conservatory: after that he devoted himself entirely to composition. His works include several operas, symphonies, overtures, and other orchestral pieces, solos for piano and other solo instruments with and without orchestra, chamber music, and many vocal pieces sacred and secular. At the opening of the Carnegie Music Hall he visited New York and conducted several of his own compositions. D. in St. Petersburg, Nov. 5, 1893.

D. E. HERVEY.

**Tschudi**, choo'dē, ÆGIDIUS: historian; b. in Glarus, Switzerland, in 1505; studied at Basel, Vienna, and Paris; traveled much in his native country and Italy; held various important offices in Baden and Glarus; went in 1559 as ambassador to the Emperor Ferdinand I. in Augsburg; was banished in 1562 on account of his strong adherence to the Roman Catholic Church, but recalled in 1564. On his travels and in his various offices he made very comprehensive investigations with respect to the history of Switzerland, and the last years of his life he spent in preparing his rich materials for publication, but only *Die uralt wahrhafftig Alpisch Rhätia*, published in Latin and in German, appeared before his death. His principal work is the *Schweizerchronik*, covering the time down to 1470, published by I. R. Iselin in 2 vols. (Basel, 1734–36). In 1758 his *Beschreibung Galliæ Comatæ*, appeared under Gallatis's editorship. D. at Glarus, Feb. 28, 1572.

**Tschudi**, JOHANN JAKOB, von: naturalist, traveler, and diplomatist; b. in Glarus, Switzerland, July 25, 1818. He studied medicine and natural sciences at Neuchâtel, Leyden, and Paris. In 1838–43 he traveled in Peru, making a special study of the Quechua language and antiquities; subsequently he made an extended tour through Brazil, Bolivia, etc. The results of these expeditions were embodied in several works, including *Fauna Peruana* (1844–47); *Peruanische Reiseskizzen* (1846); *Reisen durch Südamerika* (1866–68); and *Organismus der Kechua-Sprache* (1884). With Rivero he wrote the *Antigüedades Peruanas* (1851). He was ambassador of Switzerland to Brazil (1860), and to Austria (1866–83). D. at Jakobsthal, Lower Austria, Oct. 8, 1889. H. H. S.

**Tsêng** (or **Tsŭng**), MARQUIS, whose full name was *Tsêng Ki-tsêh*: Chinese diplomatist; b. in the province of Hunan in 1848; son of Tsêng Kwoh-fan (1807-72), who, though less known to Europeans than his son, was a statesman of wider fame in his own country, having won especial distinction as governor-general of the two Kiang provinces during the Tai-ping rebellion. The young Tsêng was his father's secretary at this time, and accompanied him in his successful campaign. In 1878 he was appointed minister to Great Britain and France, and afterward was sent as special ambassador to Russia to settle the Kulja difficulty, which he succeeded in doing in a satisfactory manner, obtaining the treaty of St. Petersburg, which restored Kulja to China. In 1886 he returned to China, where he was made a grand secretary and president of the admiralty board. D. in Peking, Apr. 12, 1890. F. M. COLBY.

**Tset'se** [S. African]: a dipterous insect, *Glossinia morsitans*, a little larger than the common fly. It abounds in some parts of South Africa, but is absent from large districts. Its bite is nearly always fatal to the ox, horse, and dog, though harmless to man, as well as to goats, asses, mules, and the wild beasts of the regions it inhabits.

**Tsing-tu** [Chinese, liter., pure land]: the Chinese name for SUKHĀVATĪ (*q. v.*), the heaven of Amitabha Buddha, and also of the Buddhist sect which reverences Amitabha and makes re-birth in his heaven their chief aim. In the mouths of the Japanese Tsing-tu becomes *Jōdō*. The SHINSHIU (*q. v.*) is a Japanese development of the Jōdō.

**Tsi-tsi-har**, chee'chee'haar: the most northerly of the three provinces of Chinese Manchuria, known among the Chinese as the *Heh-lung-Kiang*, or Amur province; bounded N. by the Amur, E. and S. by the Sungari, a tributary of the Amur, and W. by the Nonni and Mongolia. Area, 195,000 sq. miles. It is cultivated chiefly in valleys of the Nonni and Sungari, pulse, maize, millet, tobacco, wheat, and the poppy being the chief crops. The rest of the country is mostly an uninhabited mountain wilderness. The inhabitants consist of Manchus, Korchin Mongols, Yakuts (of whom 6,600 families emigrated from Siberia, and settled in the valley of the Nonni in 1687), and Chinese, chiefly from the northern provinces. The chief cities are Tsi-tsi-har (on the Nonni, lat. 47° 21' N., lon. 124° E.), Mergen, and Hurunpir. The city of Tsi-tsi-har, built in 1692 by order of the emperor ruling in the period K'ang-hi in order to overawe the neighboring tribes, is surrounded with a stockade and a ditch. At Igun, in the northeastern part of the province, are a penal settlement and a large garrison. See S. Wells Williams, *Middle Kingdom* (New York, 1883).

**T-Square**: an instrument used in mechanical and architectural drawing. It consists of two arms, one of which is called the *stock* or *helve*, and the other the *blade*. The blade is attached to the stock at its middle point. The stock projects below the blade, forming a shoulder, which, when used, is pressed firmly against the edge of the drawing-board. To use the instrument the blade is first set so as to make the desired angle with the stock; the shoulder of the stock is then pressed firmly against the edge of the drawing-board and moved along that edge; the blade will remain parallel to its first position. In the simplest form of T-square the blade is firmly fixed at right angles with the stock.

**Tsu'ga** [a Japanese name]: a genus of coniferous trees related to the spruces and firs, and including the common hemlock (*T. canadensis*) of Eastern North America, the Californian hemlock spruce (*T. mertensiana*), and a few other species, one or two of which occur in Japan and the Himalayan region. They are distinguished from the spruces (*Picea*) by their flat, petioled leaves, and from the firs (*Abies*) by their pendulous cones, whose scales are persistent. See CONIFERS. CHARLES E. BESSEY.

**Tsuga'rn**: the ancient name of a district which lies in the extreme north of the main island of Japan, and gives its name to the strait separating this from the island of Yezo. The family holding sway in the district also bore this name, their castle-town being at Hirosaki (pop. 33,000), a garrison town, the barracks of which occupy the site of the old castle. The finely symmetrical mountain Iwaki San (4,500 feet) is known as Tsugaru Fuji from its resemblance to Fujiyama. The mottled green and red lacquer known as seaweed also takes its Japanese name from the district. J. M. DIXON.

**Tsuru'ga**: a town in Central Japan; on the west coast, about 50 miles N. of Kioto and 20 miles from Lake Biwa (see map of Japan, ref. 6–C). It is the terminus of a branch line of railway, leaving the trunk line at Nagahama, and possesses the best harbor on the northwest coast of Japan, a coast, however, singularly destitute of good harbors. The deep bay at the head of which the town is situated is much exposed, but is protected by a breakwater, and vessels of the largest draught can anchor in safety. Pop. (1892) 12,000. J. M. DIXON.

**Tsu'shima**: two islands in the sea of Japan, midway between the Korean peninsula and the island of Kiushiu; separated from the former by the Broughton Channel, from the latter by Krusenstern Strait. Area, 361·69 sq. miles. Their distance from the harbor of Fusan, in Korea, is only 30 miles, and their military importance is fully recognized; they are known as the western gate of Japan. During the troubles of the restoration period of 1868–70 the Russians were a short time in occupation; since then the islands have been strongly fortified and well garrisoned. Though the climate is mild, the soil is not productive, and the inhabitants depend almost entirely on fishing for a livelihood. The chief town is Itsukubara, which has a fine harbor. Pop. (1895) 32,135. J. M. DIXON.

**Tuamotu**, twā̆a-mō'too, or **Pomotu**: a Polynesian archipelago belonging to the French, to the E. of the Society islands, extending N. W. and S. E. between 14° and 23° S. lat. and 136° and 149° W. lon., and passing to the S. E. into the Gambier and Mangareva groups. The islands are very numerous and comprise an area of 347 sq. miles, with a population of 4,775 in 1889. The islands are coral, often atols, seldom have an area, individually, of more than 10 sq. miles, and the largest is Turcia or Papakina, with an area of 37 sq. miles. They are divided into three groups, northern, central, and southern, and the central has the greatest aggregate area and population. Navigation among them is difficult and dangerous. The climate is regular, moderate, and salubrious. The soil is poor, the vegetation not abundant, and the principal source of wealth is the pearl-oyster. The language and people of Tahiti have the supremacy, but the racial relations are with Raratongo. MARK W. HARRINGTON.

**Tu'aregs** (*Tawarek*): a race of Mohammedan nomads inhabiting a great part of the Sahara or great African desert, from Fezzan W. to the Atlantic. They are believed to be allied by race to the Berbers, and are fanatic, faithless, and predatory. Their hair is straight, their features are Caucasian rather than African, and their physical development is fine. They have a written alphabet, but no literature. The alphabet contains Hebrew, Greek, and Roman letters, with others. The Tuaregs are divided into large tribes, and greatly oppress the Tibbus (Tebu) their neighbors. Their number is estimated at 300,000. Revised by M. W. HARRINGTON.

**Tuat'**: group of oases in the Western Sahara; to the S. of Oran, Algeria, on the Timbuctu route, in the French sphere of influence. They stretch over an area about 150 miles long by 40 broad, between the Tuareg country and that of the western dunes. The fertility of these oases depends on the waters of the Messaud river and its tributaries, and, to a greater extent, on subterranean water. The climate is rigorous, but salubrious. The soil is a rich alluvium, very fertile and productive. The chief reliance for support is the date-palm, and the number of these trees in the Tuat has been estimated at from 3,500,000 (Deporter) to 4,300,000 (Pouyanne). Barley, wheat, sorghum, pomegranates, melons, and onions are also raised in considerable quantities. Pop. about 100,000, comprising Arabs, Negroes, Sherifs, black and white Berbers, and their intermixtures. M. W. H.

**Tuatara**: See HATTERIA.

**Tuber** [= Lat., swelling, hump, tumor, knob, truffle]: in plants, a thickened subterraneous portion of the stem, often bearing latent buds or eyes, and usually composed of cellular substance richly stored with starch or some other equivalent principle. Many of the tubers, like that of the common potato, are of great value as sources of human food.

**Tubercula Quadrigemina**: same as *Corpora Quadrigemina*. See BRAIN.

**Tubercular Meningitis**: See MENINGITIS.

**Tuber'culin** [from *tubercule* + chemical suffix *-in*]: a dark-brown fluid obtained from the pure culture of the specific germ of tuberculosis, and first prepared by Prof. Robert Koch, of Berlin, in 1891, for the cure of the early stages of tuberculosis; hence known also as *Koch's lymph* and *Koch's specific*. The remedy acts curatively upon lower animals, especially guinea-pigs and rabbits, and many undoubted cures have followed its use in the human subject also; but it was quickly brought into discredit by the exaggerated accounts of its virtue which appeared in the public press, and by its injudicious use upon far-advanced cases. It was also found that the remedy contained some toxic substances which, although well tolerated by lower animals, proved highly poisonous to man in doses several hundred times smaller than could be safely given to a guinea-pig. Those, however, who appreciated the significance of its curative influence in the animal continued the use of tuberculin and increased the dose very gradually, and thousands of apparent cures are now on record by the best authorities both in Europe and America. The treatment was, however, tedious, and successful only in well-selected cases, and efforts were made at an early period for its purification, notably by Prof. E. Klebs in Germany and Dr. Hunter in England. In the meanwhile it was found that tuberculin, when given in larger doses, has a decided diagnostic value by its producing fever in tubercular animals and in man, whereas no such effect follows its application when the subject of such a trial is free from tuberculosis. This test is now largely applied to milch cows, and its benefits in thus preventing the use of the milk and flesh of tuberculous animals as food is of the greatest value in the prevention of human infection, as milk especially is now considered the usual mode by which the disease is communicated to man. Its diagnostic use for the early recognition of human tuberculosis is only a matter of time, and the test can be made perfectly safe. The efforts to purify tuberculin have also been successful, especially in the hands of Prof. E. Klebs, who separated the poisonous principles in the form of a toxalbumen and proved the curative effect of the purified remedy both in animals and in man; he also showed the absolute safety of it in doses many thousand times greater than could be given of the non-purified substance. This purified tuberculin Prof. Klebs called antiphthisin, and it as well as the original crude tuberculin are now being produced both in the U. S. and in Europe. All those who have so far employed it testify to its safety even in large doses, and to its curative value, the time required for treatment being very much shortened. This is confirmed by the present writer's experience of over a year in several hundred cases in which the remedy was employed.

KARL VON RUCK.

**Tuberculo'sis** [Mod. Lat., deriv. of *tuber'culum*, small swelling, tubercle, dimin. of *tuber*, swelling, hump]: an infectious and somewhat contagious disease of man and many animals, which is caused by the growth and specific action of a micro-organism, the bacillus of tuberculosis. No disease has received a greater amount of study and none deserves more, for its ravages are so great that not less than one-seventh of all deaths are due to this cause; and, if the number of cases in which a small focus has existed and become latent or cured are added, it is not unlikely that the favorite saying of a great German physician is true, that "sooner or later everybody has a little tuberculosis."

The favorite seat of tuberculosis is in the lungs, but any tissue or organ of the body may be affected. Pulmonary tuberculosis or phthisis is, however, so much more frequent that it has received the greatest attention, and has been the basis of most studies of the causes and nature of the disease. From the earliest times it has been known that the lungs of persons dead of phthisis contain yellow masses; these were called tubercles (small nodules), and from them the technical name tuberculosis is derived. From 1790 to 1820 Stark, Baillie, Boyle, and the immortal Laënnec contributed to more accurate knowledge regarding the earlier stages of these yellow masses. It was established that at the earliest stage gray or miliary tubercles will be found, and that these subsequently degenerate and become yellow. Gray tubercles may occur also in the membranes of the brain, in the pleura, pericardium, peritoneum, and in any of the solid organs; they may arise in the mucous surfaces, where they tend to degenerate with production of ulcerations.

Clearly as stages of tuberculosis can now be traced, the variety of the gross appearances presented made the pathology of this disease a ground for the bitterest conflicts, and not until the middle or later parts of the nineteenth century can anything like a settled view be said to have been established. This uncertainty and difference of opinion are largely due to the fact that associated and not necessarily specific changes in the affected organs frequently so mask or alter the appearances that it was only with the utmost difficulty that the characteristic were separated from the non-characteristic morbid changes. For example, in the lungs the growth of the tubercles may be unassociated with other changes, and the resulting condition is what is now called miliary tuberculosis; in another case the lung substance between the tubercle may be inflamed and solid, and the condition known as catarrhal or pneumonic phthisis results; while in still other cases nature's effort to cure the disease occasions an abundant growth of dense fibrous tissue, when the term "fibroid phthisis" is applied. The tendency in all parts of the body is for the tubercular masses to undergo cheesy change, and later to liquefy and form excavations. This is eminently true of the pulmonary forms.

*Causes of Tuberculosis.*—Two factors are to be considered —the individual susceptibility and the infection by the tubercle bacilli. *Susceptibility* to tuberculosis depends upon many causes. In the first place, animal families differ in this regard. The disease is rare among the cold-blooded animals, but common among many of the domesticated animals, particularly the ruminants. Of the greatest significance to man is the frequency of the disease in cattle, as has been shown at many large abattoirs and by the studies of veterinarians. Dogs, cats, and horses are less prone. The goat seems quite immune. Races of men differ largely in susceptibility in their natural state and under the influence of environment. In the U. S. the Negro seems specially susceptible.

The individual is affected unfavorably by heredity and by his surroundings, occupation, and the like. Heredity has always been looked upon, and justly, as a strong factor; but recent study indicates that in but very few cases is the disease itself transmitted directly from parent to offspring. There are a few undoubted cases on record, but these are certainly exceptional, and it seems unlikely that new investigations will show direct transmission to be frequent. The tendency to tuberculosis, the susceptibility, however, is regularly inherited, and especially from the maternal side. An individual with hereditary liability may increase this, or one without susceptibility may acquire it by the manner of life and surroundings. Any exposing occupation or ill-constructed residence, or other causes that deprave the system or occasion pulmonary troubles, bronchitis, and the like, make the individual prone to become infected. Certain occupations, such as mining, stone-cutting, grinding, hair-cutting or sewing, which expose the individual to the inhalation of dust, are notoriously liable to aid in the development of phthisis.

As a deduction from what has been said, and as experience proves, individuals strongly predisposed may escape the disease by the most careful attention to the care of health and the avoidance of the causes which specially increase susceptibility.

*The Bacillus of Tuberculosis.*—The history of the discovery of the infectiousness of tuberculosis is of very great interest. Villemin was the first to offer definite proof by showing that inoculation with tuberculous material produces the disease in the animal experimented upon. The final discovery of the bacillus itself was made by Koch and published in 1882. This is unquestionably one of the most brilliant contributions to human medicine and to science in general ever put forth. The bacillus (see BACTERIOLOGY) has been proved by all the tests regarded as decisive to be the specific cause of all forms of tuberculosis. Without this bacillus, tuberculosis can not arise.

*Modes of Infection.*—(1) As a rule, the bacillus enters the system by the inspired air, and in this way the disease is mainly contagious. The breath of phthisical patients does not contain the bacilli, but the sputa become dried on floors or the ground, and are then carried by the air to the lungs of susceptible individuals. Actual proof of the infectiousness of the dust in hospital wards or rooms where tubercular patients had lived was established by Cornet's experiments on guinea-pigs. (2) Intestinal tuberculosis is generally due to the swallowing of infected material. In the case of patients suffering with tuberculosis of the lungs, the sputa swallowed during sleep or at other times frequently causes tuberculosis of the bowels. The infection may, however, be conveyed by milk of tuberculous cows, by infected meat, or other food; and in particular the frequency of intestinal tuberculosis of children is attributable to this cause. (3) Some cases of tuberculosis result from direct inoculation, as in cases of tattooing, vaccination, or injuries to the hands of surgeons or dissectors. Another example is the tuberculosis of the genital organs, arising from sexual congress with an affected husband or wife. (4) Finally, direct transmission from the mother to her offspring during gestation, or from the father in procreation, is possible, but, in the human species at least, is very rare.

*Varieties and Seats of Tuberculosis.*—As has been said before, almost any structure of the body may be affected, and the appearances in the various situations vary widely in individual cases. Among the more common situations are the lungs, intestines, serous membranes, bones, and lymphatic glands. Since the discovery of the tubercle bacillus and the establishment of methods for its detection, a number of diseases have come to be recognized as tuberculous that were formerly not so regarded. Among these are scrofula (at least in many of its forms), certain bone diseases, lupus vulgaris, and other skin affections due to direct inoculation. *Scrofula* is of peculiar interest. In most cases this affects the lymphatic glands, which enlarge, caseate, and soften, discharging thick purulent material. The disease may remain local or may break into the blood-vessels with resulting general infection (general miliary tuberculosis). The glands affected are frequently those of the neck and those within the chest at the root of the lungs. In the former case the infection enters through the mucous membrane of the mouth, or nose, or through the lungs; in the latter through the lungs. It is to be noted that in many instances no local disease arises at the point of entrance of the bacilli, which simply pass through to the neighboring lymphatic glands, where they may lie dormant for a long time (latent tuberculosis), or occasion active disease of the glands. Many cases of general tuberculosis of obscure origin are traceable by careful search to such localized lesions of the glands or other parts which had remained latent before.

*Symptoms.*—These depend to the largest extent upon the organ or part involved, but there are certain general indications to be noted. The individual loses strength and flesh, he grows pale and worn in appearance, fever supervenes and becomes peculiarly irregular, coming on in the afternoon and subsiding in the morning; the patient perspires freely, and sometimes drenching night-sweats add seriously to his general weakness. Chills may be noted; and after a tedious illness, as a rule, the victim perishes of exhaustion and general intoxication. Individuals susceptible to the disease, especially to pulmonary tuberculosis, often present a characteristic appearance, in which the flattened chest, large bones, emaciated frame, straight black hair and dark eyes, and sallow complexion take a prominent part; but very often no doubt the appearances described as those of the "tuberculous diathesis" (or tendency) are in reality those of the beginning disease.

External tuberculosis, such as that of the skin (lupus), bones, and lymphatic glands, is, as a rule, less malignant than that of internal organs, and may be attended by few general symptoms.

*Curability.*—It is a widespread and not unnatural belief that tuberculosis is necessarily a fatal disease, but investigation proves the contrary. Very many persons become tuberculous and recover without having exhibited any decided symptoms, and in many more the disease is arrested before its ravages become extensive. Statistics of large series of *post-mortem* examinations, collected by various authorities, show that from 5 to 40 per cent. of all bodies examined show some evidence of past tuberculous disease which had become arrested. After, however, the disease has reached such extent that the symptoms are decided and the general health has materially suffered, the outlook is certainly grave. External tuberculosis is more hopeful than other forms.

*Treatment.*—Fresh air, change of climate, tonics, nutrients such as cod-liver oil, and the careful regulation of every detail of the life of the patient, constitute the reliable treatment. Special methods are useful according to the locality affected; and, in particular, surgical procedures are valuable in external tuberculosis. Specific remedies have been lauded by hundreds, but as yet none has been found. At the present day such antiseptics as creosote, guaiacol, and iodoform are in the ascendency. Koch, the discoverer of the bacillus of tuberculosis, introduced a hopeful method of treatment a few years ago, which consists in the introduction by hypodermatic injection of tuberculin, a derivative from the growth of bacillus itself. This was supposed to exercise antitoxic action, but the claims made for it (more by others than by Koch himself) have not been substantiated. In external tuberculosis it would seem to have done good in a number of reported instances; in internal tuberculosis it is neither reliable nor safe in the form in which it is now obtained and used. As a diagnostic agent, in the detection of tuberculosis in animals, it has served a most useful purpose. In every case of tuberculosis of animals in which the remedy is injected an elevation of the body temperature of from one to several degrees occurs, and this does not occur excepting in tuberculous animals. WILLIAM PEPPER.

**Tuberculosis** (of animals), also known as **Consumption:** an infectious disease, caused by the tubercle bacillus of Koch and characterized by the development in various organs and tissues of small dense nodules (tubercles) which are prone to undergo softening and cheesy degeneration. This disease is most common in cattle and hogs, but it may occur in other domesticated animals. It is caused, in most cases, by contaminated atmosphere, in which the germs of tuberculosis, having been expelled from the body of a diseased animal, have become dry and mixed with the air as dust. Tubercle bacilli inhaled may lodge on the mucous membrane of the air-passages, and where numerous, or in the case of especially susceptible animals when few, will set up a local irritation at the point of lodgment or will be carried through the lymph-channels to the lymph-spaces or glands, and will there cause an irritation that is followed by the development of a tubercle—the characteristic lesion of the disease. The tubercle is at first a very small grayish mass of spherical shape, and is made up of a dense collection of cells. As the disease progresses the tubercles grow and multiply; they become confluent, their centers soften, and cheesy change takes place, leaving them yellowish, semi-solid, or soft. In many cases of tuberculosis of cattle a strong fibrous membrane forms around the tuberculous areas, and the part inclosed becomes soft and pus-like. A lesion of this nature is usually described as a tubercular abscess.

Tuberculosis may also be contracted by eating infected food, and this means of transmission frequently operates when calves or pigs are fed upon the milk of tuberculous cows, or when pigs are fed the refuse from slaughter-houses. Milk from tuberculous cows is recognized as an occasional, if not a frequent, cause of tuberculosis in people who consume it, and many cases of human disease have been traced to this source. Heating milk to 160° F. for fifteen minutes is sufficient to destroy the tubercle bacilli and render milk from tuberculous cows a safe food. The extent to which the cow must be diseased in order to render her milk infectious is a subject that has received much attention, and it is now well established that the milk is always dangerous when the udder is tuberculous. It is frequently dangerous in very advanced, generalized cases, and some experiments indicate that it may be dangerous in a low percentage of cases in which the disease is not very advanced and is confined to organs at a distance from the udder. It may be, however, that more careful investigation in these last cases would have shown that the udder was in fact diseased, and the infectiousness of the milk thus accounted for. The flesh of tuberculous animals is regarded as dangerous to the health of the consumer only when the disease has reached the lymphatic glands between the muscles or is generalized in the viscera. In all cases both the meat and milk can be rendered innocuous by cooking.

Tuberculosis is spread among cattle chiefly by bringing healthy animals in intimate contact with diseased ones, as when they are members of the same herd. The disease spreads more rapidly in the winter, when the cattle are confined in the stable, than in the summer, when they are at liberty in the pasture. The prevalent impression that tuberculosis is frequently inherited is erroneous, and may be traced to the fact that many of the offspring of tuberculous bulls and cows develop tuberculosis. This is due, however, to exposure after birth, and to the fact that a predisposition to, or tendency toward, tuberculosis can be inherited, and this renders the young animal prone to contract the disease when it is exposed to it.

Tuberculosis of cattle is, in many of its forms and stages, a very difficult disease to recognize during life. This great difficulty in diagnosis has made the extermination of the disease, which is based upon the removal of sources of infection and the improvement of sanitary conditions, a matter of the greatest difficulty, for it is impossible by the ordinary methods to discover the tuberculous animals in a herd. The use of tuberculin or Koch's lymph as a diagnostic has become general, and has given very satisfactory results.

The tuberculin test, or the recognition of tuberculosis in the living animal by the use of tuberculin, is based upon the fact that when a small amount of tuberculin (0·2 c. c.) is injected beneath the skin of a tuberculous cow a reaction, or elevation of the temperatnre to the extent of distinct fever, is caused within from eight to sixteen hours, while in non-tuberculous animals no effect is produced. So far as known, this test is harmless to healthy animals, and has a curative tendency in many that are diseased. After tuberculosis has been recognized in this way, in a milch cow, even though the animal may appear to be in prime order, the milk should not be used in a raw condition, nor should the cow be allowed to associate with healthy animals.

LEONARD PEARSON.

**Tu'berose** [from Mod. Lat. specific name *tubero'sa* (in *Polyan'thes tuberosa*), liter., Lat. fem. adj., tuberous, deriv. of *tu'ber*, tuber]: the *Polyanthes tuberosa*, an amaryllidaceous plant, a native of Mexico, much cultivated in greenhouses, and in the open, for its beautiful and highly fragrant white flowers, which are extensively employed by perfumers. Some 24,000 lb. of tuberose flowers are yearly produced in the valley of the Var, in France, for perfumers' use. The common name is derived from the tuberous character of the plant, and is therefore *tuberose*, not *tube-rose*. The plant has "a solid pear-shaped tuber from the base of which proceed roots, and from the apex long, linear channeled leaves, and late in summer a stem 2 to 3 feet high, the upper part of which is crowded with short-pediceled flowers and the lower part bears a few short leaves. The flowers consist of a funnel-shaped slightly curved tube, with six nearly equal, spreading lobes often tinged with rose without and creamy white within."

Revised by L. H. BAILEY.

Double tuberose (*Polyanthes tuberosa*).

**Tubina'res** [in allusion to the character of the external nostrils]: an order of birds containing the albatrosses, petrels, and shearwaters, characterized by having the nostrils opening in a little, more or less complete tube, which forms a part of the beak. The bill is hooked, toes webbed, hind toe absent, or present as a single joint only. The wings are long, narrow, and pointed, the great length being due to the very elongate humerus, radius, and ulna. The order is usually divided into *Diomedeidæ*, albatrosses, *Procellariidæ*, petrels and shearwaters, and *Pelecanoidiidæ*, the diving petrels; but W. A. Forbes makes only two divisions, one *Oceanitidæ*, containing the genera *Garrodia*, *Oceanites*, *Pelagodroma*, and *Fregetta*, the other *Procellaridæ*, comprising all others.

F. A. LUCAS.

**Tü'bingen**: an old but interesting town of Germany, in Würtemberg; beautifully situated on the Neckar, 20 miles S. W. of Stuttgart (see map of German Empire, ref. 7-D). Its university, founded in 1477, has a botanical garden, a chemical laboratory, an observatory, and several fine museums and collections connected with it. Reuchlin and Melanchthon were among its first professors, and in the beginning of the nineteenth century it developed a new school of theology. The manufacture of surgical and physical instruments and chemicals is carried on, also milling, dyeing, and book-printing. Pop. (1890) 13,273.

**Tübingen School**: the common title of three groups of theological and exegetical writers connected with the University of Tübingen in Germany. (1) The old Tübingen school, founded by Gottlob Christian Storr (professor 1775–1805), and whose best-known members were the brothers Johann Friedrich and Karl Christian Flatt (professors 1792–1821 and 1804–1843, respectively), Ernest Gottlieb Bengel, grandson of the great Bengel (professor 1806–26), and Johann Christian Friedrich Steudel (professor 1815–37). This school based belief in the Bible upon the authority of Jesus. Its theology was the biblical supranaturalistic. Starting with the doctrine that the Bible was a revelation, it defended its position by an appeal to Scripture interpreted by a grammatical and historical exegesis in opposition to the current rationalism. (2) The modern or younger Tübingen school, founded by Ferdinand Christian Baur (professor 1826–60), and whose principal pupil was David Friedrich Strauss. It began with studies in the history of Christian doctrines, transforming the various systematical representations of the divine revelation into a simple historical evolution. It then subjected the documents of the Christian religion, the books of the New Testament, to a searching critical examination, attacking both their authenticity and their integrity. Finally, it undertook a reconstruction of the origin and development of Christianity, without admitting such ideas as revelation, inspiration, miracles, etc., as operating forces. Although Baur refused to acknowledge himself a pupil of Hegel, the fundamental principles of the school concerning the nature of religion and the progress of history were adopted from the philosophy of Hegel. (See R. W. Mackay, *The Tübingen School and its Antecedents*, London, 1863). (3) The Roman Catholic Tübingen school, founded by Johann Adam Möhler (professor 1828–35), which, although sincerely endeavoring to increase friendly relations between the Roman Catholic and Protestant communions, idealizes the Tridentine theology and somewhat caricatures the Protestant. See C. von Weizsäcker, *Lehrer und Unterricht an der evangelisch-theologischen Fakultät der Universität Tübingen von der Reformation bis zur Gegenwart beschrieben* (Tübingen, 1877).

**Tubular Bridges**: See BRIDGES.

**Tubulariæ**: See HYDROIDA.

**Tuckahoe'**: the Indian name of a singular vegetable substance found under ground in the southern parts of the U. S., sometimes attaining the size, and having somewhat the appearance, of a loaf of bread, whence it is often called Indian loaf or Indian bread. Its methods of growth and reproduction are unknown. It has been thought by some observers to be a secondary product caused by the degeneration of the tissues of some flowering plant, the mass afterward becoming invaded by fungus mycelium. It was eaten by the Indians, and is said to be sometimes used, when boiled in milk, as a substitute for arrowroot.

Revised by CHARLES E. BESSEY.

**Tucker**, ABRAHAM: moralist; b. in London, Sept. 2, 1705; studied at Merton College, Oxford, and entered the Inner Temple, but retired to private life at Betchworth, near Dorking, where he died Nov. 20, 1774. After 1756 he devoted himself to the writing of *The Light of Nature Pursued* (7 vols., 1768–78), an unsystematic treatise of great originality on morals, metaphysics, and theology. It has been reprinted several times; standard edition by Sir Henry Mildmay (1805).

**Tucker**, GEORGE: author; b. in the Bermudas in 1775; emigrated about 1787 to Virginia, where he was educated under the superintendence of his relative, Judge St. George Tucker; graduated at William and Mary College 1797; became a lawyer; was a member of the Virginia Legislature; sat in Congress 1819–25, taking a high position as a debater and constitutional lawyer; was Professor of Moral Philosophy and Political Economy in the University of Virginia 1825–45, after which he lived in retirement, chiefly at Philadelphia. He was author of *Life of Thomas Jefferson* (2 vols., 1837); *The Theory of Money and Banks Investigated* (1839); *The Progress of the United States in Population and Wealth in Fifty Years, 1790–1840* (1843); *History of the United States to 1841* (4 vols., 1856–58); *Political Economy for the People* (1859); *Essays, Moral and Philosophical* (1860), and several other works; and contributed to numerous periodicals. D. at Sherwood, Albemarle co., Va., Apr. 10, 1861.

**Tucker**, NATHANIEL BEVERLEY: lawyer and author; son of St. George Tucker; b. at Matoax, Va., Sept. 6, 1784. He graduated at William and Mary College; was admitted to the bar, and was judge of the Missouri circuit court in 1815–30, and Professor of Law in William and Mary College from 1834 till his death, at Winchester, Va., Aug. 26, 1851. He published *Principles of Pleading* (1846); *George Balcombe* (1836); *Gertrude*; *The Science of Government*, and other works; but his most noteworthy book was *The Partisan Leader* (1836), an unfinished historical novel, the scene of which was laid in Virginia in 1849, thus forecasting the future by some dozen years. It was reprinted in 1861 as *A Key to the Disunion Conspiracy*, to prove that the project of secession had been long entertained in the Southern States. H. A. BEERS.

**Tucker**, ST. GEORGE, LL. D.: jurist; b. at Port Royal, Bermuda, June 29, 1752, but removed to Virginia in his early youth; graduated at William and Mary College 1772; studied law; was concerned in an expedition against Bermuda, where he aided in the capture of a fortification and of a large amount of stores 1776; was lieutenant-colonel at Yorktown, where he was severely wounded in the knee and rendered lame for life; married Mrs. Frances Bland Randolph, mother of John Randolph, 1778; became a member of the Virginia general court (legislature), professor at William and Mary College, commissioner to revise and digest the laws of Virginia, and a delegate to the convention at Annapolis, Md. (1786), which took the initiative in recommending the formation of a national constitution; was a judge of the State courts of Virginia nearly fifty years, judge of the court of appeals 1803–11, and of the U. S. district court of Eastern Virginia 1813–27, and was noted for wit, poetical talent, and legal attainments. D. at Edgewood, Nelson co., Va., in Nov., 1827. He was the author of *How far the Common Law of England is the Common Law of the United States*; *A Dissertation on Slavery, with a Proposal for its Gradual Abolition in Virginia* (Philadelphia, 1796); *Letter on the Alien and Sedition Laws* (1799); and edited *Blackstone's Commentaries, with Notes of Reference* (Philadelphia, 5 vols., 1803). See Lanman's *Biographical Annals.* Revised by F. STURGES ALLEN.

**Tucker**, SAMUEL: b. at Marblehead, Mass., Nov. 1, 1747; bred to the sea; was a captain sailing from Boston to London before the Revolution; commissioned a captain in the new American navy May 15, 1777; commanded the frigate Boston, in which he conveyed John Adams, minister to France, to his destination, Feb., 1778; took several prizes 1779; aided in the defense of Charleston, S. C., but became a prisoner at its capture, May, 1780; was exchanged June, 1781; took command of the Thorn, with which he made many prizes; received the thanks of Congress at the close of the war; settled at Bristol, Me., 1792; was for several years a member of the legislatures of Massachusetts and Maine, and in 1812 captured by stratagem a British vessel which had greatly annoyed the shipping of Bristol. D. at Bremen, Me., Mar. 10, 1833. His *Life* was published by John H. Sheppard in 1868.

**Tuckerman**, BAYARD: author; b. in New York, July 2, 1855. He graduated at Harvard in 1878, and has published *A History of English Prose Fiction* (1882): *Life of Lafayette* (1889); *Peter Stuyvesant* (1893); *William Jay and the Abolition of Slavery* (1893); and edited *The Diary of Philip Hone* (1889).

**Tuckerman**, EDWARD, M. A., LL. D.: botanist; b. in Boston, Mass., Dec. 7, 1817; educated in the Boston Latin School, Union College, and Harvard University; lecturer on history in Amherst College 1854–56; Professor of Botany there 1858–86. In 1868 he was elected to the National Academy of Sciences. His most important publications, many of which appeared in *The American Journal of Science and Arts* and the *Proceedings of the American Academy of Arts and Sciences*, relate to the lichens, viz.: *A Synopsis of the Lichens of New England, the other Northern States, and British America* (1848); *Genera Lichenum: an Arrangement of the North American Lichens* (1872); *A Synopsis of the North American Lichens*, part i. (1882); part ii. was published in a fragmentary state after his death (1888). In 1847 he began the publication of the *Lichenes Americæ Septentrionalis Exsiccati*, which reached 150 species (1855). D. at Amherst, Mar. 15, 1886. CHARLES E. BESSEY.

**Tuckerman**, HENRY THEODORE: author; b. in Boston, Mass., Apr. 20, 1813; studied in the public schools of that city; traveled in Europe in 1833 and 1837, and devoted himself to literature, criticism, and the study of art; settled in New York in 1845. Among his writings are *The Italian Sketch-book* (1835); *Isabel, or Sicily, a Pilgrimage* (1839); *Rambles and Reveries* (1841); *Thoughts on the Poets* (1846); *Artist Life*, being sketches of twenty-three American painters (1847); *Characteristics of Literature* (1849 and 1851); *The Optimist* (1850); *Life of Commodore Silas Talbot* (1851); *Poems* (1851); *A Month in England* (1853); *Memorial of Horatio Greenough* (1853); *Leaves from the Diary of a Dreamer* (1853); *Essays, Biographical and Critical* (1857); *Essay on Washington, with a Paper on the Portraits of Washington* (1859); *America and her Commentators* (1864); *A Sheaf of Verse* (1864); *The Criterion* (1866); *Papers about Paris* (1867); *The Book of American Artists* (1867); and *Life of John P. Kennedy* (1871). D. in New York, Dec. 17, 1871. Revised by H. A. BEERS.

**Tuckerman**, JOSEPH, D. D.: clergyman and philanthropist; b. in Boston, Mass., Jan. 18, 1778; graduated at Harvard 1798; was pastor of the Unitarian church at Chelsea, Mass., from Nov. 4, 1801, to Nov. 4, 1826; organized the Benevolent Fraternity of Churches for the support of a city mission called the Ministry at Large, to which he devoted himself and in which he was a pioneer; was the organizer of the first Seamen's Friend Society in the U. S. 1812, and visited England for the organization of charitable institutions. D. at Havana, Cuba, Apr. 20, 1840. He was the author of numerous sermons and *Reports*, of eleven tracts for seamen, of a *Prize Essay on the Wages paid to Females* (Philadelphia, 1830); *Gleams of Truth, or Scenes from Real Life* (1835); and *The Principles and Results of the Ministry at Large in Boston* (1838). The Tuckerman Institute in Liverpool commemorates his philanthropic labors in England, which were fully described by Miss Mary Carpenter in a *Memoir of Dr. Tuckerman* (London, 1849). Revised by J. W. CHADWICK.

**Tuckerman**, SAMUEL PARKMAN: organist and composer; b. in Boston, Mass., Feb. 11, 1819; received his first instruction from Charles Zeuner; from 1840 to 1849 was organist of St. Paul's church, Boston, going in the latter year to England to study the cathedral school of music. In 1853 took the Lambeth degree of Mus. Doc. and returned to Boston. He visited England again in 1856–60. He received the diploma of the St. Cecilia Academy, Rome, in 1852. For a short time he was organist of Trinity church, New York, succeeding Dr. Edward Hodges. D. at Newport, R. I., June 30, 1890. His compositions are entirely sacred and comprise anthems, services, and other church music; he also edited several collections of church music. D. E. HERVEY.

**Tuc'son**: city; capital of Pima co., Ariz.; on the Santa Cruz river, and the South. Pac. Railroad; 86 miles S. E. of Maricopa, and 121 S. E. of Phœnix (for location, see map of Arizona, ref. 14–N). It is in an agricultural, stock-raising, and mining region, and contains the University of Arizona, a public high school, public library, 2 national banks with combined capital of $100,000, 2 daily and 3 weekly newspapers, and works for the reduction of gold, silver, and copper ores. The city was the site of an Indian pueblo and was for several years the capital of the Territory. Pop. (1890) 5,150; (1900) 7,531. EDITOR OF "ARIZONA CITIZEN."

**Tucuman'**: an interior province of the Argentine Republic; bounded N. by Salta, S. E. by Santiago del Estero, and S. and W. by Catamarca. The authorities differ as to the area, but it is about 13,000 sq. miles. The surface is hilly, rising to mountains in the W., and the scenery is more varied and beautiful than that of any other province. The soil is very fertile, though requiring irrigation in parts; the climate is mild and salubrious. Though the smallest, Tucuman is the most thickly populated and one of the most prosperous of the Argentine provinces; it is called the garden of the republic. The most important industry is sugar-planting, which is protected by heavy import duties; most of the sugar and much of the rum consumed in the republic come from this province. Other products are wheat, maize, rice, tobacco, lumber, and fruits. The grazing industry is comparatively unimportant, and there are few mines, though the province is said to be rich in minerals. Pop. according to the census of May 10, 1895, was 215,693; it is rapidly increasing. Tucuman was the Tucma (region of cotton) of the Incas, who annexed it to their domains during the fifteenth century. The colonial government (*gobernación*) of Tucuman embraced, besides the modern province, most of Córdoba, Rioja, Catamarca, Santiago del Estero, Salta, and Jujuy: it was subject to the *audiencia* of Charcas (now Bolivia), attached to Peru until 1776, when it was transferred to the viceroyalty of La Plata. H. H. S.

**Tucuman**: a city; capital of the province of Tucuman, and the fifth town of the Argentine Republic in size and importance; beautifully situated on a plateau near the Sierra Aconquija, and a mile from the river Sali (see map of

South America, ref. 7-D). It is connected by railway with Rosario and Buenos Ayres, Jujuy, and other points, and controls most of the trade of the northern provinces. The town is surrounded by orange-groves, and there are nearly 300 sugar estates in the vicinity, with thirty central factories. It was founded in 1564 and removed to its present site in 1585. The streets are regular, but narrow; the principal square is shaded with orange-trees, and fronting it is the fine modern cathedral, with other public buildings. The town has a national college, libraries, large hospital, etc.; it is celebrated for its delightful climate. A congress of the Platine provinces (except Montevideo, Entre Rios, Corrientes, Santa Fé, and Paraguay) signed here the act of independence July 9, 1816; the building in which this congress met is carefully preserved in its original state. Pop. of the city (1895) 34,300. HERBERT H. SMITH.

**Tuda**: See DRAVIDIAN LANGUAGES and TODA.

**Tudawa**: See TODA.

**Tu'dor**: the family name of an English dynasty which occupied the throne from 1485 to 1603, when it became extinct upon the death of Queen Elizabeth. The family was descended from Owen ap Tudor, an obscure Welsh gentleman, who about 1423 married Catharine of France, widow of Henry V. of England. Their son, who was created Earl of Richmond, married Margaret, daughter and heiress of John Beaufort, Duke of Somerset, whose father was a son of John of Gaunt, Duke of Lancaster, but born out of wedlock. The Earl of Richmond was legitimated by act of Parliament, but was expressly excluded from the succession to the crown; but upon the failure of the real Lancastrian line, Henry, the second Earl of Richmond, was recognized by that party as their chief. He defeated Richard III. at the battle of Bosworth Field in 1485, and assumed the crown under the title of Henry VII., although without any legitimate right. He married Elizabeth, daughter of Edward IV., and thus united the pretensions of the rival houses of Lancaster and York. The sovereigns of the Tudor line were HENRY VII. (1485–1509), HENRY VIII. (1509–47), EDWARD VI. (1547–53), MARY (1553–58), and ELIZABETH (1558–1603), all of whom are treated under their respective names.

**Tudor**, WILLIAM: diplomat and editor; b. in Boston, Mass., Jan. 28, 1779; graduated at Harvard 1796; entered the counting-room of John Codman, an enterprising merchant, in whose employ he twice visited Europe (1800 and 1810); spent some time in literary pursuits at Paris, and traveled in Italy; went on a mercantile agency for the exportation of ice to the West Indies 1805; was one of the founders of the Boston Athenæum; was an active member of the Anthology Club, and editor of and a voluminous writer for its literary organ, *The Monthly Anthology* (10 vols., 1803–11); founded *The North American Review* May, 1815; conducted it as a bi-monthly, and wrote three-fourths of its contents until Dec., 1818, when it was changed to a quarterly and passed into other hands; published *Letters on the Eastern States* (1820), a volume of *Miscellanies* (1821), consisting of selections from his previous magazine articles, and a *Life of James Otis* (1823); was the originator of the Bunker Hill Monument (1823); was U. S. consul at Lima, Peru, 1823–27; became U. S. *chargé d'affaires* at Rio de Janeiro, Brazil, 1827, and wrote while there his last work, *Gebel Teir* (Boston, 1829), an ingenious allegory. D. at Rio de Janeiro, Mar. 9, 1830. Revised by H. A. BEERS.

**Tuesday** [M. Eng. *Tewesday* < O. Eng. *Tiwesdæg*; *Tiwes*, gen. of *Tiw* (See TYR), god of war + *dæg*, day; cf. Germ. *Dienstag*: Icel. *Týsdagr*]: the third day of the week. The name originated as a translation of the *Dies Martis* (liter., Mars's day) of the later Roman pagans.

**Tufa**: See LIMESTONE.

**Tufts**, COTTON, M. D.: physician; b. at Medford, Mass., May 30, 1734; graduated at Harvard 1749; became a physician at Weymouth; wrote the instructions to the representatives of Weymouth to oppose the Stamp Act 1765; married a daughter of Col. John Quincy; was a representative of Weymouth in the general court, State councilor and senator for many years, member of the convention for ratifying the Federal Constitution; was one of the founders of the American Academy of Arts and Sciences and of the Massachusetts Medical Society, of which he was president 1787–95. D. at Weymouth, Mass., Dec. 8, 1815.

**Tufts College**: a coeducational institution at Medford, Mass.; founded in 1852 on land given by Charles Tufts and through the munificence of several donors, among whom Sylvanus Packard gave the most. The college comprises four separate institutions, the College of Letters, the divinity school, Bromfield-Pearson (technical) school, and the medical school. Six courses of study are given in the College of Letters: (1) A course leading to the degree of A. B., equivalent to the regular classical course in New England colleges; (2) a second course, leading to the same degree, in which modern languages take the place of Greek as a condition of admission and during the course, with the option of beginning the study of Greek in the freshman year; (3) a course for the degree of Ph. B.; courses in (4) electrical, (5) civil, and (6) mechanical engineering. The divinity school, opened in 1867, fits students for the ministry in the Universalist denomination. The college buildings consist of a three-story building for recitations, etc., seven large dormitories, a library building, a beautiful stone chapel and a gymnasium, the gift of Mrs. Mary T. Goddard, a large natural history museum, the gift of Hon. P. T. Barnum, a divinity hall, the gift of Rev. Dr. A. A. Miner, a large brick building for the Bromfield-Pearson School, and a large structure for a chemical laboratory. The Bromfield-Pearson School was established in 1893, and the medical school the same year. The college is open to both sexes on equal terms in all its departments, and has an endowment fund of over $1,250,000, 110 professors and instructors, 800 students, and a library of 44,000 volumes. The first president (1854–61) was Rev. Dr. Hosea Ballou; the next was Rev. Dr. Alonzo A. Miner (1862–75), who was succeeded by Rev. Dr. Elmer H. Capen, the present (1901) incumbent.

**Tugaloo' River**, called also **Chattoo'ga**: a river which rises in Jackson co., N. C., and, flowing S., forms for some distance the boundary between Georgia and South Carolina, and then unites with the Keowee to form the Savannah river.

**Tuileries**, Fr. pron. twē̆l'ree' [= Fr.; cf. *tuilerie*, tile-kiln, deriv. of *tuile*, tile < O. Fr. *teule*: Ital. *tegola*: Span. *teja* < Lat. *tegula*; as loan-word in Germ. *ziegel*]: a famous palace formerly existing in Paris, on the right bank of the Seine. The ground was originally occupied by tile-works, whence the name of the palace, and was bought by Francis I. in 1518. In 1564 Catherine de' Medici began the erection of the buildings after the plans of Philibert Delorme, who was succeeded as master-architect by Jean Bullant. This, the original palace, which was subsequently much altered, but of which no exact drawing has been preserved, consisted of the central pavilion, and the adjoining galleries, but not in their later form. Under Louis XIV. the older parts of the palace were heightened, and the spherical dome of the Pavillon de l'Horloge was transformed into a quadrangular one. Thus the front façade was completed, and at the same time the garden, occupying an area of 56 acres between the palace and the Place de la Concorde, was laid out by Le Nôtre. After the erection of the palace of Versailles the Tuileries was seldom used by the French kings until Louis XVI. in 1789 was compelled to remove the royal residence hither, and after that time the palace was the scene of some of the most stirring spectacles of the history of France. Napoleon I., Louis XVIII., Charles X., Louis Philippe, and Napoleon III. resided here, and the palace was stormed and ransacked by the people Aug. 10, 1792, July 28, 1830, and Feb. 26, 1848. In May, 1871, it was finally destroyed by fire by the communists. The long galleries of the Louvre, ending in the Pavillon de Flore and the Pavillon de Marsan which flanked the Tuileries, connected the two palaces, and the pavilions named, are sometimes considered as a part of the Tuileries, but they remain and have been restored. The ruins were removed finally in 1883.

Revised by RUSSELL STURGIS.

**Tuke**, DANIEL HACK, M. D., F. R. C. P., LL. D.: alienist; b. at York, England, in 1827; studied medicine at St. Bartholomew's Hospital College, London; became a member of the Royal College of Surgeons in 1852 and a fellow in 1857; graduated M. D. at the University of Heidelberg in 1853; after visiting the principal asylums for the insane in Europe became assistant medical officer and subsequently visiting physician to the York Retreat for the Insane; in 1874 removed to London. He was coeditor of *The Journal of Mental Science* from 1878–92. With Dr. J. C. Bucknill he wrote a *Manual of Psychological Medicine* that has passed through several editions since its appearance in 1857. Among his more important works are *Insanity in Ancient and Modern Life* (London, 1878); *Chapters in the History of the Insane in the British Isles* (London, 1882); *Illustra-*

*tions of the Influence of the Mind upon the Body in Health and Disease* (London, 1884); *A Dictionary of Psychological Medicine* (London, 1892). D. in London, Mar. 5, 1895.
S. T. Armstrong.

**Tuke**, Henry: b. at York, England, in 1756; was for thirty-four years, from 1780, a minister and distinguished writer of the Society of Friends. He wrote *The Faith of the People called Quakers in Our Lord and Saviour Jesus Christ, set forth in various Extracts from their Writings* (1801; 3d ed., enlarged, 1812); *The Principles of Religion as Professed by the Society of Christians usually called Quakers, written for the Instruction of their Youth and for the Information of Strangers* (London, 1805; 12th ed. 1852), an authoritative manual, translated into German, French, Danish, and Spanish; *Biographical Notices of Members of the Society of Friends* (2 vols., 1813–15), and other writings collected in his *Works* (4 vols., 1815), which were edited, with a biographical sketch, by Lindley Murray. D. at York in 1814.

**Tula**: government of European Russia, bordering N. on the government of Moscow; area, 11,954 sq. miles. The surface is level or slightly undulating, the climate temperate, and the soil fertile. One-sixth of the surface is covered with forest; the rest is under tillage; around the capital are extensive iron and coal mines. Grain, hemp, flax, mustard, turnips, potatoes, tobacco, and hops are grown; sheep, cattle, and horses are raised. Breweries, distilleries, and manufactures of ironware are numerous. Pop. (1897) 1,431,322.

**Tula**: town of European Russia; capital of the government of Tula; on the Upa; 110 miles by rail S. of Moscow (see map of Russia, ref. 7–E). It is well built and has a fine cathedral, many other churches, a theater, several museums, several technical schools, and other educational institutions. Locks, tea-urns, cutlery, bells, muskets, pistols, sword-blades, etc., are made to perfection in large quantities. The imperial manufactory of arms employs many men and women. The manufactures of hats, silks, leather, platinum-ware, jewelry, and ironware are very important. Its niello-work is famous. Pop. (1897) 111,048.
Revised by M. W. Harrington.

**Tula**: a town of the state of Hidalgo, Mexico; on the Mexican Central Railway; at the junction of the Pachuca branch; 6,716 feet above the sea (see map of Mexico, ref. 7–G). It is supposed to be the ancient Toltec capital of Tollan, which, according to the Indian chronicles or legends, was founded in the seventh century. Extensive ruins about it have been studied by Charnay and others, and are frequently visited by tourists. (See Mexican Antiquities.) Some of them appear to indicate communal buildings like those of Arizona. The quaint church and cloister of San José date from 1553. Pop. about 5,000. H. H. S.

**Tulane University**: an institution in New Orleans, La., organized on its present basis in 1884, having formerly been called the University of Louisiana. It is intended for the higher education of the white youth of Louisiana, and includes the medical department, law department, College of Arts and Sciences, College of Technology, the university department of philosophy and science, and the H. Sophie Newcomb Memorial College for Women. The donations of the founder, Paul Tulane, at the time of his death amounted to $1,100,000. The medical department has since its foundation in 1834 matriculated 10,905 students and graduated 3,141 students. It has as its school of practical instruction the great Charity Hospital with its 700 beds and 6,000 patients annually. The law department teaches principally civil law, which forms the basis of Louisiana law. The line of demarkation between the university proper and the colleges is well defined and strictly observed. The courses of instruction are logical and progressive. The growth and expansion of the institution have been steady and rapid. The H. Sophie Newcomb Memorial College, resting upon a separate endowment of $500,000, donated to Tulane University by Mrs. Josephine Louise Newcomb, bids fair to become a rival of the best Northern colleges for women. The separate departments of the university are in different parts of the city in buildings of the best architectural character, and with the fullest literary, scientific, and mechanical equipment. In 1900 it had 77 instructors, 1,296 students, and 25,000 volumes in its libraries, and Edwin A. Alderman, LL. D., was president.

**Tulare**: city (founded in 1872); Tulare co., Cal.; on the South Pac. Railroad; 250 miles S. E. of San Francisco (for location, see map of California, ref. 9–E). It is in an agricultural and fruit-growing region, and contains 7 churches, public high school, grammar schools, public library (opened in 1878), 3 State banks with combined capital of $108,100, railway round-houses and machine-shops, artesian wells, and a daily and 2 weekly newspapers. Pop. (1880) 447; (1890) 2,697; (1900) 2,216. Editor of "Register."

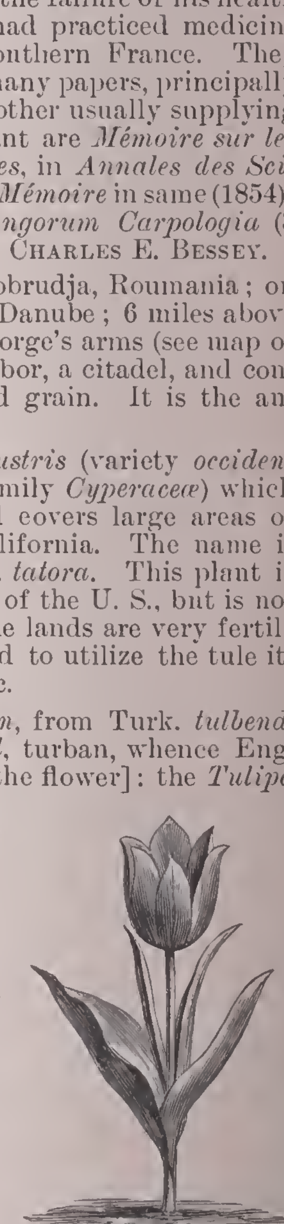
**Tulare** or **Tule Lake**: a shallow lake in Kings co., Cal.; once the largest lake in the State. It formerly had no outlet, but at high water its surplus flowed through a slough into San Joaquin river. It received Kern, Tulare, and King's rivers, and other streams. In 1872 it covered an area of 500 sq. miles; in 1895 its area was reduced to about 220 sq. miles. This result is attributed largely to the cutting of timber on the mountains, the tapping of the watercourses by which the lake was replenished, and to the use of the waters of tributaries for irrigation. Revised by I. C. Russell.

**Tulasne**, tü'laan', Louis René: botanist; b. near Tours, France, Sept. 12, 1815; d. at Hyères, Dec. 22, 1885. Charles Tulasne: botanist; b. near Tours, Sept. 5, 1816; d. at Hyères, Aug. 21, 1884. The brothers Tulasne, as they were called, were intimately associated in botanical work throughout their lives. The first botanical work of the elder was with Saint-Hilaire in the preparation of his *Flora of Brazil* (1825–33); from 1842 to 1864 he was upon the staff of the Jardin des Plantes (Paris), but upon the failure of his health he removed with his brother (who had practiced medicine from 1843 to 1864) to Hyères, in Southern France. They published jointly and individually many papers, principally relating to the fungi, the younger brother usually supplying the illustrations. The most important are *Mémoire sur les Ustilaginées comparées aux Urédinées*, in *Annales des Sciences Naturelles* (1847), and a second *Mémoire* in same (1854); *Fungi hypogæi* (1851); *Selecta Fungorum Carpologia* (3 vols., 1861–65). Charles E. Bessey.

**Tulcha**, tool'chaa: town of the Dobrudja, Roumania; on one of the arms of the delta of the Danube; 6 miles above the junction of the Sulina and St. George's arms (see map of Turkey, ref. 2–E). It has a good harbor, a citadel, and considerable trade in salt fish, wood, and grain. It is the ancient *Ægissus*. Pop. (1890) 17,250.

**Tu'le** [= Mex.]: the *Scirpus lacustris* (variety *occidentalis*), a large club-rush or sedge (family *Cyperaceæ*) which grows to a height of 8 to 10 feet and covers large areas of marshy ground in some parts of California. The name is also applied to the similar plant *S. tatora*. This plant is found throughout the western parts of the U. S., but is not elsewhere of as large a size. The tule lands are very fertile when drained. It has been proposed to utilize the tule itself in the fabrication of matting, etc.

**Tulip** [from O. Fr. *tulipe*, *tulipan*, from Turk. *tulbend*, *dulbend*, turban, from Pers. *dulband*, turban, whence Eng. *turban*; so called from the shape of the flower]: the *Tulipa gesneriana* and other species, liliaceous herbs from Central Asia, now everywhere cultivated for their beautiful flowers. Of this species fully 1,000 varieties have been catalogued, but there are hundreds of unnamed varieties. Conrad Gesner brought the tulip from Turkey to Augsburg in 1559. Haarlem, in Holland, is, and long has been, the principal seat of the production of tulip-bulbs for the European and American markets. During the seventeenth century the value of tulip-bulbs increased largely in Holland, and in some instances they were sold for 2,500 florins, and even, according to some writers, as high as 4,600 florins. The Duc van Thol or sweet-scented tulips (*Tulipa suaveolens*) are smaller and earlier than common tulips with acuminate perianth segments.



Early tulip, Duc van Thol.

Revised by L. H. Bailey.

**Tulip-tree**: the *Liriodendron tulipifera*, a beautiful and noble forest-tree of the U. S. belonging to the magnolia family. Its bark has active tonic powers, and its wood is valued in house-carpentry and carriage and furniture making. It is often incorrectly called poplar, and sometimes whitewood. It is a fine ornamental tree.

**Tull**, Jethro: agriculturist; b. in Oxfordshire, England, about 1680; received a good education; studied law; was admitted as a barrister and made the tour of Europe, after which he settled first on his paternal estate and afterward on Prosperous Farm in Berkshire, near Hungerford, and gave his attention to scientific agriculture; invented the drill-plow, and published a famous work entitled *New Horse-Hoeing Husbandry* (1733), which long enjoyed great authority in England. The essence of his system consisted in planting in rows and in pulverizing the soil around the plants, but he made the mistake of thinking manure unnecessary, and his own experiments consequently involved him in serious losses. Yet he so emphatically and truthfully expounded the importance of tillage that his work is generally considered to have marked an epoch in agriculture. D. Jan. 3, 1740. His work was edited by William Cobbett in 1822, with the addition of some scattered essays on similar subjects. Revised by L. H. Bailey.

**Tullaho′ma**: village (incorporated in 1851); Coffee co., Tenn.; on the Nashv., Chat. and St. L. Railway; 69 miles S. E. of Nashville, and 81 N. W. of Chattanooga (for location, see map of Tennessee, ref. 7–F). It is on the Cumberland Mountain plateau, contains 7 churches for white people and 3 for colored, the Woolwine School (building cost $30,000), public school, 2 national banks with combined capital of $100,000, and a semi-weekly newspaper, and has 3 lumber-mills, flour-mills, and a hub, spoke, and handle factory. Its altitude and accessibility have made it a popular health resort. Pop. (1880) 1,080; (1890) 2,439; (1900) 2,684.

Editor of "Guardian."

**Tulle**, tül: town; in the department of Corrèze, France; on the Corrèze; 61 miles by rail E. N. E. of Périgueux (see map of France, ref. 6–E). It is poorly built, but its paper-mills, sugar-refineries, tanneries, and wool-weaving factories are important, and its manufactures of arms employ between 1,500 and 3,000 men. The thin fabric called tulle takes its name from this place. Pop. (1891) 15,384; (1896) 17,374.

**Tullius**, Servius: See Servius Tullius.

**Tulloch**, John, D. D.: educator and author; b. near Tibbermuir, Perthshire, Scotland, June 1, 1823; educated at St. Andrews and Edinburgh; became in 1845 a minister of the Church of Scotland at Dundee; spent some time in Germany, familiarizing himself with speculative theology as there taught; became in 1849 parish minister of Kettins, Forfarshire, and in 1854 principal of St. Mary's College, St. Andrews, Primarius Professor of Theology, and in 1860 senior principal of the university. D. at Torquay, England, Feb. 13, 1886. He was the author of *Leaders of the Reformation* (Edinburgh, 1859); *English Puritanism and its Leaders* (1861); *Beginning Life* (London, 1862); *The Christ of the Gospels and the Christ of Modern Criticism—Lectures on Renan's Vie de Jésus* (1864); *Rational Theology and Christian Philosophy in England in the Seventeenth Century* (2 vols., Edinburgh, 1872); *Religion and Theology, a Sermon for the Time* (1875); a volume of Croall lectures on *The Christian Doctrine of Sin* (1876); *Pascal* (1878); *Modern Theories in Philosophy and Religion* (1884); *Movements in Religious Thought in Britain during the Nineteenth Century* (1885); and several volumes of sermons. In 1855 he entered the lists with 1,200 competitors and gained the second Burnett prize of £600 for an essay *On the Being and Attributes of God*, which was published under the title *Theism, the Witness of Reason and Nature to an All-wise and Beneficent Creator* (1855). He was confessedly one of the great leaders of liberal thought in Scotland; was a chaplain in ordinary to the Queen, and preached frequently before her at Balmoral, and in 1878 was elected moderator of the General Assembly. He visited the U. S. in 1874. See his memoir by Mrs. Oliphant (1888; 3d ed. 1889). Revised by S. M. Jackson.

**Tullus Hostil′ius**: according to Roman legends, the third King of Rome (672–640 B. C.). During his reign the combat between the Horatii and Curiatii took place, in consequence of which Alba acknowledged the supremacy of Rome. Subsequently the Albans meditated treason, and when Tullus discovered their plans he razed the city and transferred the inhabitants to Rome.

**Tully**: See Cicero.

**Tuman**, or **Mikiang**: See Korea.

**Túmbez**, toom′bā*th*: a town of the department of Piura, Peru; at the extreme northwestern end of the republic, near the entrance to the Gulf of Guayaquil and a little back from the coast. It is of very ancient origin, was conquered by the Incas in the fifteenth century, and was their principal frontier city in this direction. This was the first Peruvian city seen by the Spaniards, and here Pizarro landed and began his march of conquest. The place is now unimportant. Pop. about 2,000. H. H. S.

**Tumble-weeds**: the popular name of many species of herbaceous annual plants whose many branches curve upward so that the whole plant is globular in outline. When dead and dry they break off at the root and roll away before the wind, dropping their seeds here and there for many miles. They occur upon the prairies and great plains of North America, the pampas of South America, the steppes of Russia, and probably wherever similar conditions prevail. The most common tumble-weed of the prairies of the U. S. is *Amaranthus græcizans*, but upon the great plains *Cycloloma atriplicifolium* and *Corispermum hyssopifolium* occur also. About 1890 another tumble-weed (*Salsola kali tragus*) appeared upon the Dakota plains. It is a recently imported prickly weed, and is commonly known as the Russian thistle. Many common plants in dry soils become tumble-weeds, a dozen or more having been catalogued for the U. S. Charles E. Bessey.

**Tumors** [= Lat., liter., swellings, deriv. of *tume′re*, swell. Cf. Tuber]: in pathology, swellings abnormal to the body; but in the usual sense inflammatory swellings are excluded, and the term is limited to distinct and abnormal growths apparently causeless and without purpose. The structure of tumors is in all cases but a reproduction of normal tissue, more or less faithfully simulated. The structure of tumors differs from that of the tissues which they simulate, mainly in being of a less fully developed character, in being less regularly arranged, and in their tendency to undergo secondary degenerative changes. Tumors are in some cases characterized by malignancy, that is by a tendency to recur when removed and to spread throughout the system by portions being transferred from the original seat to other parts through the blood or lymphatic currents.

The classification of tumors may be based upon their shape, their structure, or their nature, whether malignant or benign. The most scientific is the structural classification, according to which there are fibrous, bony, fatty, lymphatic, cartilaginous, and other types, called respectively fibroma, osteoma, lipoma, lymphoma, chondroma, etc. In this manner practically every tissue and organ in the body has its counterpart in some tumor.

The malignant tumors are those which have always attracted the greatest attention. Of these there are two large groups—the *carcinomata*, or cancers, and the *sarcomata*. The former are composed of epithelial cells arranged for the most part somewhat after the manner of glands; the latter are composed of ill-developed connective tissue. The cancers grow where there is normally epithelium, as in the breast, stomach, or womb; the sarcomata, where there is mainly connective tissue, as about bones, in tendons, in the subcutaneous tissues, and the like.

The classification of tumors by their shape is the oldest and crudest. There are recognized in this classification polypoid, papillomatous, cystic, and other forms, but the nature of tumors taking the same shape may be widely different.

It has been one of the great difficulties in the work of pathologists to find a satisfactory explanation of the causation of tumors, and numerous theories have been advanced. Some held that the new growth depended upon a general blood disease or dyscrasia; others that local injury and irritation are the essential causes; others inclined to the view that some defective arrangement of tissue in fœtal life leads to subsequent abnormal outgrowths; and most recently the parasitic theory has gained ground. The last refers tumors to the action of micro-organisms. In the case of certain growths in the lower animals and perhaps in man this theory has been substantiated; but the question is still very undecided. Doubtless each of the theories conveys part of the truth.

While tumors are most dangerous in proportion to their malignant characters, a purely local and benign growth may at times be most dangerous from the pressure or other mechanical effects it exercises. William Pepper.

**Tunbridge**, or **Tonbridge**: town; in the county of Kent, England; on the Medway; 29 miles S. E. of London (see map of England, ref. 13–K). It is noted for its manufactures of toys in Tunbridge ware, a kind of mosaic made of vari-colored woods. It has an important grammar school, founded in 1553, with an endowment of £5,500 a year. Pop. (1891) 10,123.

**Tunbridge Wells**: town; in the county of Kent, England; 5 miles S. of Tunbridge (see map of England, ref. 12–K). It is celebrated for its chalybeate springs, and has been resorted to as a watering-place since the beginning of the seventeenth century. It has a fine common, commanding beautiful views. Pop. (1891) 27,895.

**Tundra** [from Russ. = barren moss-plain]: a type of treeless, moss-covered plain, bordering the Arctic Ocean in Siberia and North America. The tundra in typical localities is a moderately undulating, swampy country, covered with a dense carpet of mosses, lichens, and a great variety of small but exceedingly bright and beautiful flowering plants, with a few species of ferns and rushes. The monotonous surface is dotted with innumerable lakelets which are surrounded with rich verdure during the short summers, and is sometimes broken by mountains and hills rising as islands from the sea-like expanse. The tundra, like other peat-bogs, is formed by the growth of vegetation above and its partial decay and accumulation below. The preservation of the vegetable matter is due to the fact that below the depth of about a foot the peaty soil is always frozen. As the thickness of the vegetable layer increases by growth above, the surface of the continually frozen layer rises. Under existing climatic conditions there seems to be no limit to the thickness that the accumulation may attain. Large rivers flow through the tundras, and in their banks a depth of from 100 to 300 feet of ice and frozen soil is sometimes exposed. The bones of extinct animals are frequently found in these deposits, and in Siberia the carcasses of the hairy mammoth and woolly rhinoceros have been found entire. In Alaska, on the border of Bering Sea, the tundra has a breadth of about 100 miles, but it increases in width along the shore of the Arctic Ocean, and in Asia is of still greater extent. The entire area occupied by these frozen bogs can not be less than 300,000 or 400,000 sq. miles. ISRAEL C. RUSSELL.

**Tung'sten** [= Swed., *tung*, heavy + *sten*, stone, alluding to the high specific gravity of wolframite]: a rare metal related to molybdenum and uranium, whose atomic weight is 183·5 and symbol W. The chief sources are *wolframite*, a tungstate of iron and manganese $(Fe,Mn)O.WO_3$, which frequently accompanies native oxide of tin, and is found in Cornwall, England; Saxony; Bohemia; Wertschinsk, Russia; Limoges; Bolivia; Monroe and Trumbull, Conn.; and elsewhere; and *scheelite*, which is a tungstate of lime $(CaWO_4)$. Tungsten is prepared by calcining a mixture of $WO_3$ and carbon in a covered crucible, or by reducing $WO_3$ in a current of hydrogen, or, again, by the reduction of the chloride in the vapor of sodium. In order to obtain the pure metal the pure yellow-colored $WO_3$ is ignited in a platinum or porcelain tube to redness in a current of pure dry hydrogen. The powder thus prepared has a gray metallic luster, and has a specific gravity of 19·129. Metallic tungsten does not oxidize in air at ordinary temperatures, but it burns at a red heat, being converted into $WO_3$. When thrown into chlorine at a temperature of about 250° it combines with this element. By the action of aqua regia readily, or nitric acid slowly, it is converted into tungstic acid $(H_2WO_4)$, and when pulverulent it is oxidized and dissolved on boiling in a solution of the caustic alkalies or their carbonates. It forms a dioxide, $WO_2$, and a trioxide, $WO_3$. The latter, called tungstic anhydride, may be obtained as a straw-yellow, tasteless powder, insoluble in water or acids, but readily soluble in alkaline solutions by heating ammonic tungstate in open vessels. Tungstic acid, obtained as a yellow powder by adding hydrochloric acid in excess to a boiling solution of tungstic oxide in an alkali, forms acid and normal salts, generally of a complex nature, and yielding a white, sparingly soluble hydrate of tungstic acid, $H_2WO_4.H_2O$, when mixed in the cold with excess of hydrochloric acid. Metatungstic acid, $H_2W_4O_{13} + 7H_2O$, furnishes salts which are mostly soluble and crystallizable, and may be prepared by the action of tungstic acid on tungstates, or by removing part of the base by means of an acid. Tungsten yields several chlorides, oxychlorides, bromides, fluorides, sulphides, and phosphides; also silicotungstates and sulphotungstates. Its compounds are not poisonous. A class of compounds of $WO_3$, $WO_2$ and bases, called tungsten bronzes, are distinguished by their metallic luster and bright colors. They are used as bronze powder substitutes. A sodium compound, $Na_2O.W_2O_7 + WO_2$, has been made in the form of gold-like cubes, which conduct electricity like a metal.

Tungstate of sodium, prepared on a large scale in purifying certain tin ores, is used in place of sodium stannate as a mordant, and also to prevent muslin from suddenly igniting when brought in contact with fire, a little phosphoric acid or sodium phosphate being added to it sometimes, to prevent its decomposition. Tungsten alloys with iron in almost all proportions, making it excessively hard. Steel containing 9 to 10 per cent. of tungsten possesses unusual hardness, but it has not proved a commercial success. An alloy of iron and other metals with 4 per cent. of tungsten, called sideraphite, is said to be very ductile and malleable and not readily acted on by acids. Revised by R. A. ROBERTS.

**Tunguragua**, to͝on-goo-raa'gwaa: an interior province of Ecuador, surrounded by Pichincha, Oriente, Chimborazo, Bolivar, and Leon. Area, 1,686 sq. miles. It is in the Andine region and is crossed by the Eastern Cordillera. The Tunguragua volcano, from which it takes its name, is 16,690 feet high and is noted for its violent eruptions; it is one of the most imposing peaks of the Andes. Pop. of the province (1889), estimated, 103,000. Capital, Ambato. H. H. S.

**Tungu'ses**: a Mongolian tribe, inhabiting the regions of Siberia from the Yenisei eastward to the territory of the Chukchees and to Sakhalin; the Manchus are of Tungusian stock. The Tunguses have flat faces, olive complexion, no beards, straight black hair, and oblique eyes. They are nomads, and generally divided, according to the beast of burden which they principally employ, into reindeer, horse, and dog Tunguses. They are chiefly Shamanists, but Russian missionaries have labored with success among them. They number in Siberia 70,000, mostly in Transbaikalia and Yakutsk. Revised by M. W. HARRINGTON.

**Tunica'ta** [Mod. Lat., liter., neut. perf. partic. of *tunica're*, cover with a tunic, deriv. of *tu'nica*, tunic]: a group of marine animals of great interest to zoölogists on account of their relations to the VERTEBRATA (*q. v.*). Formerly they were regarded as molluscs, then transferred to the worms, and lastly, since 1867, associated with the vertebrates and usually, with these and a few other forms, constituting one of the great divisions of the animal kingdom, the branch or phylum CHORDATA (*q. v.*). The vertebrate affinities are best exhibited in the larvæ, which in general appear-

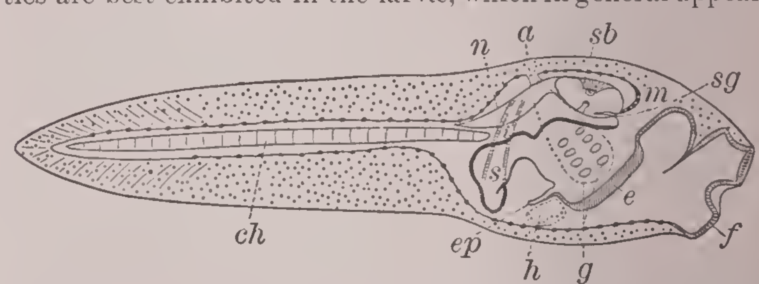


FIG. 1.—Tadpole larva of tunicate (based upon Seeliger), viewed as a transparent object: *a*, atrial opening; *ch*, notochord; *e*, endostyle; *ep*, epicardial process; *f*, fixing process; *g*, gill-openings into peribranchial chamber (dotted); *h*, heart; *i*, intestine; *m*, mouth; *n*, nervous cord; *s*, stomach; *sb*, sense vesicle; *sg*, subneural gland.

ance are tadpole-like. In the larva (Fig. 1) the dorsal mouth connects with a large pharynx, on either side of which are gill-slits through which the water used in respiration passes out to the exterior. On the ventral wall of the pharynx is a groove, the endostyle (so called because earlier regarded as a rod), the function of which seems to be to guide the food back to the opening of the œsophagus. The alimentary canal is folded on itself and opens in close proximity to the outlet of the gills. Below the pharynx and stomach is the heart; dorsal to them is the central nervous system. This has in front a vesicular enlargement in which are the sensory organs, visual and auditory in function. Behind, the body is prolonged into a tail, and in this is an axial structure, the notochord, which, like the structure with the same name in the vertebrates, arises from the entoderm. Gill-slits and notochord are peculiarly vertebrate structures. The tunicate tadpole resembles the vertebrates further in that the nervous system is not traversed by the alimentary canal, in the relative position of the various organs mentioned, and in other details. An important difference must be mentioned: in the true vertebrates the notochord extends forward far into the head; in the tunicates it is confined to the tail, a fact which has led to the name *Urochorda*, sometimes given to the group.

In the typical tunicate the larva, after a short free-swimming life, fastens itself to some solid support by means of a (varying) number of fixing processes on the anterior end of the body; and then begins the metamorphosis. The tail is absorbed and its various portions, including the notochord, degenerate. At the same time the body shortens and changes shape, so that the mouth and the opening through which the gills and the alimentary canal communicate with the exterior (atrial opening) are brought close together; the number of gill-slits increases; and the long nervous cord of the tadpole is contracted to a ganglionic mass situated between oral and atrial openings. The outside of the body soon becomes smooth, and all characters pointing toward the vertebrates are so thoroughly obliterated that no one not knowing the life-history would ever suspect the tunicates of being man's degenerate cousins.

The class of *Tunicata* exhibits considerable variety of form and range of structure, and is divided into three orders: (1) *Larvacea* or *Copelatæ*; (2) *Ascidiaceæ*; (3) *Thaliaceæ*.

In the first, *Copelatæ*, are included a few minute marine forms, belonging to three or four genera (*Appendicularia*, etc.) which may be defined as Ascidian tadpoles with adult characters. They retain the tail of the larva above described, this structure being folded forward on the ventral side of the body. They have but a single gill-slit on either side, and yet, with these apparent characters of immaturity, they are adults and undergo no further change.

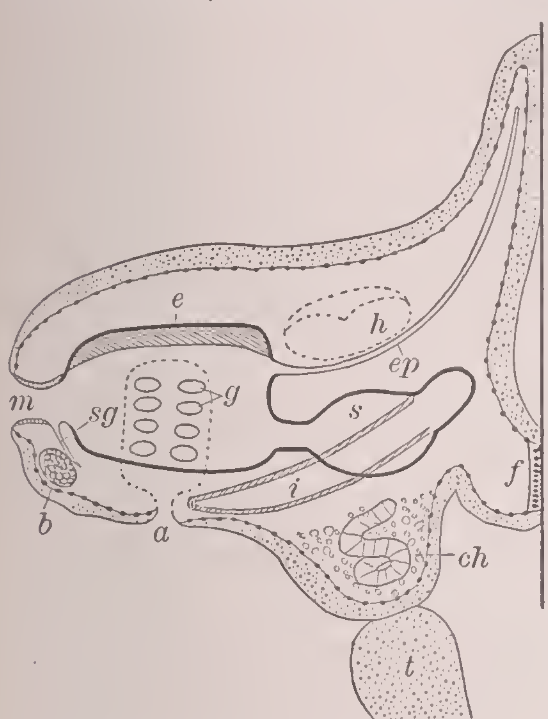

FIG. 2.—Diagram of young tunicate, with nearly adult characters: letters as before, except *b*, central ganglion; *ch*, degenerating notochord surrounded by remains of tail; *t*, cast-off cellulose sheath of tail.

The *Ascidiaceæ*, after passing through the tadpole stage, lose the tail and develop adult characters. The body, typically, becomes more or less globular, the gill-slits increase in number, and by the development of a fold in the body-wall, an atrial chamber is developed, into which the gills and vent empty. The external opening of this atrium is usually near the mouth, but in the *Pyrosomes* it is at the opposite end of the body. Three sub-orders of *Ascidiæ* are recognized. Two of these are fixed to some support during adult life, the third embraces free-swimming forms. The *Monascidiæ* are either solitary, or when they form colonies the new individuals arise from root-like stolons, and each number of the colony has its own atrium. In the second sub-order, the *Synascidiæ*, we find only colonial species, the individuals being covered by a common envelope or mantle, and arranged, usually in a star-like manner, around a common atrium. In the free-swimming *Luciæ* the individuals are colonial, the colonies taking the shape of a cylinder. The mouths are all turned to the exterior, and the atria empty into the central chamber of the colony. Here belong the *Pyrosomes* of tropical seas, celebrated for their phosphorescence. In the largest species the colony may reach a length of 15 inches.

The *Thaliaceæ* have barrel-shaped bodies, with the mouth at one end, the atrial opening at the other, and the similarity to a barrel is strengthened by the circular muscles which run round (incomplete rings in *Salpa*) the transparent body like hoops. The gill-slits also are less numerous than in the *Ascidiaceæ*, there being two rows in *Doliolum*, only two openings in *Salpa*. In these there is an alternation of generations, but only that of *Salpa* need be mentioned, it being especially interesting from the fact that it was the first instance known, and was discovered by the poet Chamisso. From each egg there develops a "solitary form" which is without sexual organs. In the body of this a stolon arises and becomes divided into distinct salps, each of which contains an egg. This second generation remains attached to each other through life, constituting the "chain form." The contained eggs undergo their development and give rise, in turn, to the solitary condition.

The literature of the *Tunicata* must be sought in special papers. In Korschelt and Heider's *Embryologie* is a summary of the development of *Tunicata* and a list of the most important papers on them. Little is known of the American species, excepting those of New England, for which see Verrill in *Report* of the U. S. Fish Commission for 1871–72 (1874). J. S. KINGSLEY.

**Tu'nis** (Fr. *Tunisie*): a French protectorate in North Africa; bounded E. by Tripoli and the Mediterranean, W. by Algeria, N. by the Mediterranean, and S. by the Sahara; area, 45,716 sq. miles. The coast to the E. of the Gulf of Tunis is low and sandy; to the W. it is rocky and bald, forming lofty promontories, among which Cape Blanc is the northernmost point of Africa. The interior is traversed by nearly parallel chains of the Great and Little Atlas, whose average height is between 4,000 and 5,000 feet, and which form several elevated plateaus of great extent. A number of shallow salt-marshes in the southeast are below the level of the sea. The climate is dry and hot, and the soil produces large crops of wheat, maize, dhurra, and barley; cotton, indigo, saffron, and tobacco are also cultivated. Olive and date plantations are very numerous and very remunerative, and all South European fruits grow abundantly. Oxen, sheep, mules, and camels are the common domestic animals, and they are all of good breed. Salt and lead are produced, though mining, like agriculture, is very carelessly carried on. Some branches of manufacture, such as woolen fabrics, especially the well-known red caps, dyed skins, morocco leather, and coral, are extensively developed. Pop. 1,500,000, chiefly Berbers and Arabs.

Tunis occupies nearly the territory of ancient Carthage. With Sicily it formed the granary of Rome. On the dissolution of the Roman empire it became a province of the Greek empire, from which it was conquered by the caliphs of Bagdad. From the twelfth century to the sixteenth it formed an independent state, and became the terror of all the nations around the Mediterranean on account of its piracy, which did not cease until near the middle of the nineteenth century. In 1574 the country became dependent on Turkey. Oct. 25, 1871, the bey obtained an imperial firman which made him virtually independent; but of this independence he was deprived by the French, who landed an army in the country in 1881, and, under form of a treaty signed May 12, 1882, reduced him to a state of vassalage. The French resident is called *chargé d'affaires*, and practically administers the government of the country under the direction of the French foreign office and by means of a staff of French judges and officials of all kinds. In 1900 there was a revenue of \$5,035,235 and an expenditure of \$5,015,725. Tunis has 883 miles of railway, of which 866 belong to the state. See TUNIS in the Appendix.

Revised by C. C. ADAMS.

**Tunis**: capital of the state of Tunis; near the Gulf of Tunis; surrounded by a double wall and defended by a citadel (see map of Africa, ref. 1–D). Its streets are narrow, unpaved, and filthy, but its houses, though only one story high and presenting no windows to the streets, are substantially built, and many are finely fitted up in Oriental style.

The bey's palace, Tunis.

Each house is erected in the form of a court, into the yard of which all the rooms open, and this yard is generally paved with marble and provided with a fountain, which is supplied with water from a large tank or cistern on the roof of the building. The palace of the bey and several of the mosques are fine edifices, and the bazaars are large and well stocked. Silk and woolen manufactures are extensively carried on; caps, shawls, burnooses, turbans, and mantles, soap, wax, olive oil, and leather are also manufactured and exported, and the transit trade between Europe and the interior of Africa is important. Pop. 135,000, of whom 20,000 are Europeans and 40,000 Jews. Revised by C. C. Adams.

**Tunja**, toon′*k*hăă: capital of the department of Boyacá, Colombia; near the sources of the river Sogamoso; 75 miles N. N. E. of Bogotá, and 9,164 feet above the sea (see map of South America, ref. 2–B). It was founded in 1538 on the site of Hunsa, the ancient capital of the northern Chibchas; during the colonial and revolutionary period it was important, but it is now somewhat decadent. Near by is the battle-field of Boyacá (*q. v.*). Pop. about 8,000. H. H. S.

**Tunkers**: See Dunkers.

**Tunkhan′nock**: borough; capital of Wyoming co., Pa.; on the Susquehanna river, and the Lehigh Valley and the Montrose railways; 28 miles S. by W. of Montrose, 32 miles N. by W. of Wilkesbarre (for location, see map of Pennsylvania, ref. 2–H). It is in an agricultural region, and has several planing-mills, iron-foundries, a national bank with capital of $100,000, and three weekly newspapers. Pop. (1880) 1,116; (1890) 1,253; (1900) 1,305.

**Tunnels and Tunneling** [from O. Fr. *tonnel*, tun, cask, pipe, tunnel for partridges (> Fr. *tonneau*, tun, cask), dimin. of *tonne*, tun, cask, pipe, from O. H. Germ. *tunna* > Germ. *tonne*]: Tunnels are subterranean passages constructed without removing the superincumbent earth. The construction of such subterranean passages is called tunneling. Similar works executed by excavating from the surface and refilling after the construction of the arches or other supports are properly "covered ways," although generally called tunnels, and are here included under that term. Mining tunnels which are not strictly through passages are called galleries, drifts, or adits.

The rock-hewn temples of Nubia and India and the tombs of Egypt, although constructed in the same manner, do not come under the definition of tunnels. Fergusson, however, says of the Turanian races, of which the Egyptians are the type, that "the existence of a tunnel is almost as certain an indication of their pre-existence as that of a tomb." The earliest tunnel known was made in Babylon to connect the royal palace with the temple of Belus on the opposite side of the Euphrates river. It was 15 feet wide, 12 feet high, and was arched with brick. There was a very ancient tunnel in Bœotia, said to have been made to drain Lake Copais; and in the sixth century B. C. a tunnel was built in the island of Samos which was 8 feet wide, 8 feet high, and 4,245 feet in length. Few tunnels for passage are found before those of the Etruscans, and after them the Roman works. These are numerous, though generally of small dimensions, made for drainage, for water-works, and some as highway tunnels. One of the latter class, built by Vespasian, carried the Flaminian Way through the range of the Apennines. The tunnel of Posilipo, 2,200 feet in length, on the road from Naples to Pozzuoli, was built about thirty-six years before the Christian era, and is still in use. The tunnel for the drainage of Lake Fucino (or Lake Celano), built about 52 A. D., was about $3\frac{1}{2}$ miles long. Numerous shafts were used in its construction, which extended over eleven years. Its modern reconstruction (see below) is one of the great works of the nineteenth century. In all these tunnels the rock was excavated with the chisel, gad, and pick, blasting being then unknown. In Egyptian quarries blocks are said to have been detached by cutting grooves around them with saws and tube-drills supplied with corundum or similar material. To these methods were added fires built in the face of the heading to heat the rock, which was then suddenly cooled, cracked, and disintegrated by the application of water. Drilling and blasting with gunpowder were first used in mining in 1613 in the Freiburg mines.

A tunnel is adopted for passage through a hill or mountain range when the cost of an open excavation is greater than that of a tunnel, including its protective masonry. This is usually the case when the depth of the cutting exceeds 50 or 60 feet. Tunnels are also built for the passage of rivers over which, for commercial or other reasons, bridges can not be placed; under populous cities where the surface can not be obstructed; and under lakes for procuring water-supplies.

Preliminary to the construction of a tunnel borings are necessary to ascertain the character of the ground to be passed through, and the depth at which water will be found. Upon the data thus obtained the exact situation of the tunnel is determined, and marked upon the ground with great precision and permanency. The small section of a tunnel limits the number of men that can work in it, and renders progress slow. For this reason access to it is sought at many points, where practicable, by means of shafts sunk from the surface to the level of the tunnel, from each of which two additional faces may be worked.

The operations of tunneling may vary according to the character of the ground. A "heading" is a small section which is carried in advance of the other workings, and facilitates their execution. In solid rock the work is slow, but very simple. In small tunnels (as single-track railway tunnels) a heading at the top of the section is enlarged to the full width of the tunnel, and the rest of the section, the "bench," is taken out by "bottoming." In the larger tunnels the same method may be followed, or a "bottom" heading is driven from which "break-ups" rise to the top, where a new heading is made and the work proceeds as before. If the rock be deficient in hardness and cohesion, temporary props of timber are used as the work proceeds, and walls and arches of masonry subsequently replace them. In blasting the holes are drilled by machine-drills operated by compressed air, water under pressure, or electricity, and the explosives used are generally some form of nitroglycerine. The charges are simultaneously fired by electricity. Ventilation is provided partly by the air used in the machine-drills, partly by fans or blowing-machines. Water, which sometimes accumulates in large quantity, is removed by pumps from the shafts, and by drains from the open ends of the tunnel when practicable. Tunnels in earth do

Fig. 1.—Timbering in soft ground.

not require the drill or explosive, but need support at every step. Sometimes, as in the English system, the entire section of the tunnel is excavated before the masonry is begun. When a section (10 to 18 feet in length) of top heading is completed, a bench is cut in the top on one side to receive the timbers that carry the roof. Into this a "crown bar" is rolled and a corresponding bench on the other side receives a second crown bar, all of large, round timber. Lagging boards support the ground between them. Chambers in the sides of the heading are cut down to the floor, in which props are placed to support the crown bars. The heading is widened and the operation repeated until the whole arch section is excavated. A transverse sill is placed under the props, and the excavation continued by similar methods to the bottom of the tunnel. At other times small drifts or headings are made at the sides in which the side walls are built, and the arch section is then excavated as before, or other small headings superimposed upon the side drifts permit the building of the arch in sections, after the completion of which the interior mass is excavated. By the Belgian system the central heading is carried down to the floor of the tunnel, the excavation for the arch is made, and the arch is built before the side walls; the "bench" on each side of the central heading is excavated in short lengths, and the side walls built up under the arch. In more difficult cases, where the ground is very soft, a shield is used. In its modern form this is a short tube of steel or iron plates closed by a diaphragm containing openings or doors. The rear portion of the tube incloses the end of the finished section, and leaves a space between it and the diaphragm in which a new short section of tunnel may be built. The material in front is excavated through the doors in the diaphragm, and the shield is pushed forward by hydraulic or other power.

The earliest tunnel for transportation in the commercial sense was that of Malpas on the Languedoc Canal (now Canal du Midi), in France, constructed by Riquet in 1666–76. It is 767 feet long, 22 feet wide, and 27 feet high. The next French tunnel, that of Rive de Gier on the Givors Canal, was built in 1770; that of Torcy on the Canal du Centre in 1787. The Tronquoy tunnel (St. Quentin Canal) was the first built in soft ground (sand), and the methods there followed are now known as the French or the German system. The tunnel of Riqueval, 3½ miles long, made in 1803 on the same canal, is the longest of the navigation tunnels, all of which are of good size. The Pouilly tunnel (1824) is over 2 miles in length. The Noireau tunnel, on a feeder of the St. Quentin Canal, is 5 feet wide and 7½ miles long. The French canal tunnels which are on the main lines of transportation are now operated by steam or electricity. On the Riqueval tunnel a train of twenty or thirty barges (300 tons each) is taken through by a steam tow-boat working on a chain laid in the bottom of the canal.

The earliest English tunnels were also on canals, but of much smaller section than those of France. The first in point of time is the Harecastle, by James Brindley, on the Trent and Mersey Canal in 1766–77, 8,640 feet long, 12 feet high, and only 9 feet wide, passing a boat 7 feet wide propelled by "leggers," men lying on their backs and pushing with their feet against the sides and roof. Fifty years later it was supplemented and superseded by another tunnel 13½ feet wide and 17½ feet high. Many other canal tunnels were built up to 1826, when the canal system of England was for the time completed.

The tunnel on the Union Canal, built 1818–21, was the first constructed in the U. S. It was 450 feet long, 20 feet high, and 18 feet wide. The first railway tunnel was on the Allegheny Portage Railroad, by Solomon Roberts, in 1831–33. The earliest in which shafts were used was the Black Rock tunnel in 1836–37, by W. H. Wilson. The introduction of railways about 1830 and their rapid extension required the construction of many tunnels, often, in the earlier days, to avoid grades now of everyday occurrence which were then deemed unworkable. Of the older English tunnels the Kilsby, by Robert Stephenson, 1¼ miles long, was of very difficult and expensive construction by reason of quicksands saturated with water. The Box tunnel, by Brunel, 1¾ miles in length, encountered great quantities of water. The brickwork lining of the Sydenham tunnel was pressed out of shape repeatedly by the swelling of the London clay in which it lies, and the final form required to resist this pressure is nearly circular, with the brickwork about 3 feet thick.

In more recent times, owing to the extension of railways, tunnels are of such common occurrence that although many of them are works of great length and difficult construction, it is impossible to refer to any but those of special interest. The three great rock tunnels of the world are the Mt. Cenis (Col de Fréjus), the St. Gothard, and the Arlberg, to which may be added in the U. S. the Hoosac tunnel, all, except the single shaft of the latter, built without shafts. To these will soon be added the Simplon tunnel—the longest of all.

The first in order of time, usually known as the *Mont Cenis* tunnel, is in fact the tunnel of the Col de Fréjus. The Col de Fréjus is a depression in the crest of the Cottian Alps, about 16 miles S. W. from the summit of the Mt. Cenis pass, and rising to a height of about 9,500 feet above the sea, about a mile above the culminating point of the excavation. The material traversed for about 6 miles from the southern entrance was calcareous schist, followed about 1,000 feet of gypsum and dolomitic rock, then about the same distance of refractory quartzite, and finally 1¼ miles

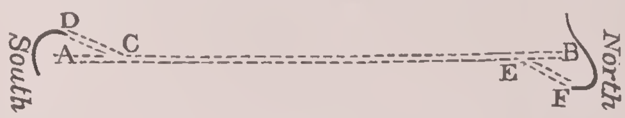

FIG. 2.

of anthraciferous formation. The excavations consist of a straight gallery, A B (Fig. 2), through the mountain, and the two junction galleries, C D and E F, to connect with the railway to Bardonecchia, in Piedmont, on the southern and Modane, in Savoy, on the northern side. The straight gallery, A B, is 38,173 feet in length, the junction galleries, C D and E F, nearly 2,500 and 1,500 feet, respectively. The termini at A and B are left open for ventilation and convenience of access. The length of tunnel traversed by trains is 42,158 feet, or less than 30 yards short of 8 miles. The junction curves were made not only to avoid short curves on the connecting railways, but to leave the mountain more nearly at right angles to its stratification, slight movements of the mountain slope across the line of the tunnel having already been observed. The southern entrance is 4,236 feet above sea-level. From this point the grade ascends 8 feet in 18,325 feet to a summit-level 1,082 feet long; thence it descends by a uniform grade of 115 feet to the mile to the northern terminus, 3,801·4 feet above the sea, or 434 feet lower than the southern entrance. The width of the tunnel is 26 feet, its height is 19·68 feet at one end, 18·68 feet at the other. The total quantity of rock excavated was nearly 1,000,000 cubic yards. The lining is of stone masonry, from 28 to 40 inches thick. About 16,000,000 bricks were employed for subsidiary purposes, about 15,000 tons of hydraulic lime were used, and some 1,200 tons of gunpowder for blasting. From the beginning of the works in 1857 until the invention of the machine-drill by one of its engineers in 1861, progress by hand-labor was very slow. After 1861 in the southern division and 1863 in the northern, drills driven by compressed air were used. The air not only operated the drill, but on its escape from the machine ventilated and by expansion cooled the gallery. In 1863 the rate of progress, average of both ends, was 7 feet a day; but as experience was gained and the machines perfected, the rate increased to 14¾ feet in the last year. The temperature near the center of the tunnel is constant at about 85° F. Upon breaking through the last partition of rock between the headings a strong current of air poured through from the N., and this, as might be expected from the difference of elevation of the two extremities, is said to maintain itself constantly, greatly facilitating the ventilation. As early as 1832 a peasant mountaineer suggested a tunnel under the Col de Fréjus. In 1845 engineers were employed to plan the work. One of them, Maus, a Belgian, invented a drilling-machine which was perfected later by Bartlett, Sommeiller, Grandis, and Grandoni. Colladon proposed the use of compressed air to work the drills and supply ventilation.

*The St. Gothard Tunnel.*—From remote ages until a very recent period most of the travel and a large proportion of the merchandise passing between Italy and her seaports on the one hand, and Switzerland, Northeastern France, Central and Western Germany, and Northern Europe on the other, were conveyed over Alpine passes having their northern termini in Switzerland. After the completion of the three great highways—the Simplon in 1806, the Splügen in 1822, and the St. Gothard in 1824, they monopolized most of this transit. On the completion of the Brenner Railway in 1867 and the opening of the Mt. Cenis tunnel in 1870, a large proportion of this traffic was intercepted, and the construction of a direct and independent railway across the Alps was felt to be of vital necessity to Northern Italy and Switzerland, and of great interest to all the Western and Central German states. The Simplon and the Splügen passes were studied and rejected, the former because it would be tributary to French interests rather than to those of Germany and Switzerland, the latter because the route lay along the Austrian frontier and was therefore exposed to control by a hostile force. The St. Gothard line was free from these objections, the only serious obstacle being the tunnel, 9 miles long, involving a great expenditure and a long delay. In Oct., 1869, a treaty was concluded between Italy and Switzerland by which the principal points relating to location, construction, and connections were determined, and in Oct., 1871, Germany also signed the treaty. The three contracting powers were to contribute 85,000,000 francs—45,000,000 by Italy, 20,000,000 by Germany, and 20,000,000 by Switzerland. In Aug., 1872, a contract was made by the company with Louis Favre, of Geneva, for the execution of the tunnel within eight years from the date of acceptance of the contract by the Swiss Government, at a fixed price per lineal meter, amounting for the whole to 48,000,000 francs. The line of the tunnel runs from Airolo N. about 5° W., passes under the Kastelhorn (9,915 feet high), the St. Anna glacier, the village of Andermatt, the river Reuss at the Devil's Bridge, and comes out at Göschenen. The station at Airolo is 3,756 feet (1,145 meters) above the sea. The grade ascends at the rate of 1 per 1,000 24,280 feet (7,400 meters) to the summit-level, 590 feet (180 meters) long, thence descends by a grade of about 5½ feet per 1,000 (·55 per cent.) to Göschenen. The total length of the tunnel is 9¼ miles. Although great difficulties were encountered in the execution of the St. Gothard tunnel, chiefly from the large quantities of water developed by the workings, the great advances in the art of tunneling since the completion of the Mont Cenis tunnel, and those made during the construction of this work enabled much more rapid progress to be made. The compressed air-drills were more perfect, as were also the installations for power from the torrents Reuss and Ticino, and the tunnel, begun in 1872, was completed in 1881. The excavated rock was removed and tools and materials brought in by a locomotive worked by compressed air instead of steam. Where the tunnel passed under the plain of Andermatt, 1,000 feet above, on a length of 200 feet, it passed through decomposed feldspar with alumina and gypsum, which not only swelled by absorbing water from the atmosphere, but was subjected to the immense pressure due to the height of the ground above. The masonry arches were twice crushed, and were finally made of cut granite 5 feet thick at the top and 10 feet at the sides. The difficulties of the company arose from its embarrassed pecuniary position, which was a consequence of the insufficient estimate and the excessive cost of the work, both due to the shortsightedness of the first chief engineer. In such a difficult country he had abandoned the bottom of the valley and placed his line high on the almost vertical flanks of the mountains inclosing the valley. His successor, Hellwag, suspended all work on the approaches and made a new study of the location. He kept the railway as nearly as possible in the bottom of the valley, and as in its upper portion the valley became too steep for the railway grade, elevation was gained by spiral tunnels, of which there are seven on the approaches north and south. The valleys of the Alps rise, as it were, by steps or terraces, facilitating and perhaps suggesting the use of spiral tunnels, which it is proposed to adopt also on the approaches of the Simplon tunnel.

*The Arlberg Tunnel.*—The province of Vorarlberg is separated from the rest of the Austrian Tyrol by the Arl Mountains, and was accessible therefrom only by a long detour outside of Austrian territory. To connect this province with the rest of the empire, and to make a more direct outlet for Austrian-Hungarian products to Switzerland and France, the Arlberg tunnel was constructed. After much discussion as to the location—eminent engineers advocating a rack railway with a shorter tunnel at a higher elevation—the location was fixed and the works begun in 1880. Its length is 6·38 miles. By reason of the improvements in the mechanical means of tunneling and carefully studied methods, the rate of progress was much more rapid than in the long tunnels which had preceded it, and it was opened in 1883. The estimated cost was less than 35,000,000 francs.

The rate of progress in the execution of these tunnels, although partly dependent upon the character of the rocks encountered, is chiefly interesting as indicating the progress in the implements and processes of the art of tunneling. At Mt. Cenis (Fréjus) the daily advance with machine-drills was at first, in the argillo-calcareous rock, 6 ft. 8 in. a day; in the coal-bearing sandstones 3 ft. 4 in. a day; in the Triassic quartzites superimposed upon the sandstones, 2 feet a day. The average advance in both ends was about 8 feet a day, but in the last year the advance in the schist exceeded 14 feet a day. In the St. Gothard tunnel more improved air-drills were used, and locomotives hauled the cars used in construction. The quantity of water encountered was enormous—the headings were generally a foot deep with water. The material varied greatly in character, some of it being quite soft. The average progress was 14½ feet a day. At the Arlberg tunnel everything was carried on in the most systematic manner. Trains removing excavated rock and bringing in tools and materials were run by a time-table. The heading, 9·2 feet wide and 7·5 feet high, was in the bottom of the tunnel instead of in the top, as at St. Gothard, break-ups 160 feet apart connecting it with the top heading. The most improved drills were used—at one end the Ferroux, a percussion drill operated by compressed air, at the other the Brandt, a revolving drill worked under great pressure by hydraulic power. About 1,760,000 lb. of dynamite was used. In this, as in all these tunnels, hydraulic power for compressing air and other purposes was obtained from the neighboring mountain torrents. The average rate of the advance was 27⅘ feet a day, being more than three times as much as at Mt. Cenis, and nearly twice that of the St. Gothard tunnel, which it more nearly resembles in the character of the strata pierced.

The following table shows at a glance the characteristics of these three great tunnels:

| NAME. | Begun. | Opened. | Time building. | Length, miles. | Ave. daily advance. |
|---|---|---|---|---|---|
| Mt. Cenis (Fréjus)...... | 1857 | 1871 | 13 yrs. | 7¼* | 8·0 ft. |
| St. Gothard............ | 1872 | 1881 | 9 yrs. 5 m. | 9¼ | 14·6 ft. |
| Arlberg................ | 1880 | 1884 | 3 yrs. 9 m. | 6½ | 27·8 ft. |

* Length of straight gallery. The actual length of tunnel operated is very nearly 8 miles.

The *Simplon* tunnel, which connects the valley of the upper Rhône, in Switzerland, with that of the Diveria, about 16 miles from Domo d'Ossola, in Italy, will be 12¼ miles in length—the longest of the Alpine tunnels. The contract for its construction was made in Sept., 1893. The plans have been carefully studied and some new features introduced. Instead of one tunnel for two railway tracks there will be two smaller tunnels, distant from each other 58 feet, each for a single line of rails. The two headings will be driven at the bottom simultaneously, with numerous cross-headings oblique to the line of the tunnels. Only one of the main headings will be enlarged to full dimensions; the other will await the demands of traffic for a second tunnel. The second heading will, however, be used during construction for the return of the construction cars empty or with materials for the work, while those loaded with the *débris* of the excavations will go out through the enlarged tunnel. Air will also be driven in through the second heading and in much larger quantities than in earlier works. The temperature in the middle of the tunnel, estimated to be 104° F., will be cooled to 90° F. by sprays of water combined with a vigorous ventilation. Seventeen hundred cubic feet of air per second are to be provided, 212 cubic feet having been found satisfactory at Arlberg, where, however, the temperature did not exceed 67° F., and the length of the tunnel was but little more than half that of the Simplon tunnel.

The *Hoosac* tunnel, on the line of the Fitchburg Railroad in Massachusetts, passes through the Hoosac Mountains, a southern extension of the Green Mountains of Vermont. Its length is a little more than 4¾ miles. It has one shaft 1,028 feet deep. Begun in 1856, it was seventeen years under construction, including several long suspensions due to discouragements and want of funds. The greater part of the rock penetrated is a micaceous schist of varying characteristics, some of it very hard. Progress was expedited in 1866 by the introduction of machine-drills worked by compressed air. Its cost, including interest, was about $11,000,000.

*Tunnel of Lake Fucino.*—The Lake Fucino or Celano lies in a mountain basin in the Apennines, having no natural outlet. It is about 50 miles E. of Rome and 2,200 feet above sea-level. Its area has varied with its level. In 1816, with a maximum depth of 75 feet, it covered 42,000 acres; in 1835, with a depth of 34 feet, but 33,000 acres were covered. To reclaim an area of fertile soil, to reduce the waters to a permanent level, and to improve the sanitary condition of the vicinity, a tunnel discharging into the river Liris (now Garigliano) was begun by the Emperor Claudius and completed eleven years later. Its length was about $3\frac{1}{2}$ miles, its cross-section variable, but nowhere less than 102 sq. feet, with a grade of 1 in 1,000. A large number of shafts, both vertical and inclined, were employed, and all the work was done with the chisel and similar tools. It fell into decay shortly after its completion. It was reconstructed by Prince Torlonia in 1854–76, at a cost for the entire drainage works of $4,800,000, in such manner as to drain the lake entirely. The new tunnel underlies and replaces the old one, and is 2,200 feet longer. It has a section of 215 sq. feet, and is lined throughout with masonry.

The *Severn* tunnel on the Great Western Railway of England passes under the Severn river at a point where the rise and fall of tide is about 50 feet. The length of the tunnel is about $4\frac{1}{4}$ miles ($2\frac{3}{4}$ miles between shafts on opposite sides of the river), and a drainage tunnel 7 feet square and $\frac{9}{10}$ths of a mile long leads from its lowest point to a pump-well 206 feet deep. It was constructed chiefly through the Permian sandstone on the one side and red marl on the other. Begun in 1873, it was not completed until 1885 owing to the very large irruptions of water. Twice the "big spring" was struck, discharging the second time over 30,000 gal. a minute, and in the same week an extraordinary tide overflowed the surrounding country and flowed down the shafts. After the arch was built the brickwork was crushed by the pressure of the water from the "big spring," which came from a very elevated source, and as a last resort the water was led away to a pump-well and permanent pumps established to pump it out. An interesting incident of this construction was the practical application of a method described in Jules Verne's story, *Twenty Thousand Leagues under the Sea.* When it became necessary, after the flooding of the works, to close an iron door in the tunnel 1,000 feet from the shaft, the head diver placed a Fleuss apparatus on his back and, without communication with the upper air, went into the tunnel to the door, which was rusted on its hinges, found a crowbar near by, and with much effort closed the door, and returned after having been about an hour and a half under the water. The attempt had previously been made in the ordinary diving-dress, but three strong men had been unable to drag after them a sufficient length of air-pipe to reach the point desired.

The *Mersey* tunnel connects Liverpool and Birkenhead. It is about a mile long, between large shafts containing elevators of great capacity, by which passengers between the two cities are brought from and taken to the surface. A drainage and ventilating tunnel under it was excavated at once to full size, in part by means of the Beaumont machine armed with rotary cutters, which cut away the rock to a fairly smooth, true cylindrical surface. The ventilation of the Mersey tunnel, which is superior to that of any other operated by steam, is accomplished by exhausting the foul air through the sub-tunnel by means of fans, fresh air being supplied to the main tunnel from the ends.

These two tunnels—the Mersey and the Severn—are literally "subaqueous," but, having been excavated through rock in the usual manner, they are not included in that class.

The Metropolitan and the Metropolitan District railways of London—the underground—are chiefly "covered ways," having been for the most part excavated from the surface and filled in and repaved after the construction of the arch. Three tunnels, however, aggregating about a mile in length, were made through very difficult ground. Built through the streets and under buildings in the most crowded parts of London, these works are models of ingenious and skillful construction, and are well worth study. The newer subways of London, as of Glasgow and elsewhere, are chiefly small tunnels in pairs built with shields and lined with iron segments. They are traversed by electric cars adapted to the size of the tunnel. This system of construction is well suited to the purpose for which it has there been used. By it the risk of disturbing buildings is reduced to a minimum.

The *Niagara* tunnel is the tail-race of the large water-power established on the New York side of the Niagara river to utilize a portion of the power of the falls. The buildings are erected near the river, above the falls and the rapids. Water is supplied to the turbines by a short open canal, and escapes from the wheel-pits into the tunnel, by which it is discharged into the river below the falls. The tunnel is 7,600 feet in length, 19 feet wide, and 21 feet high, with a

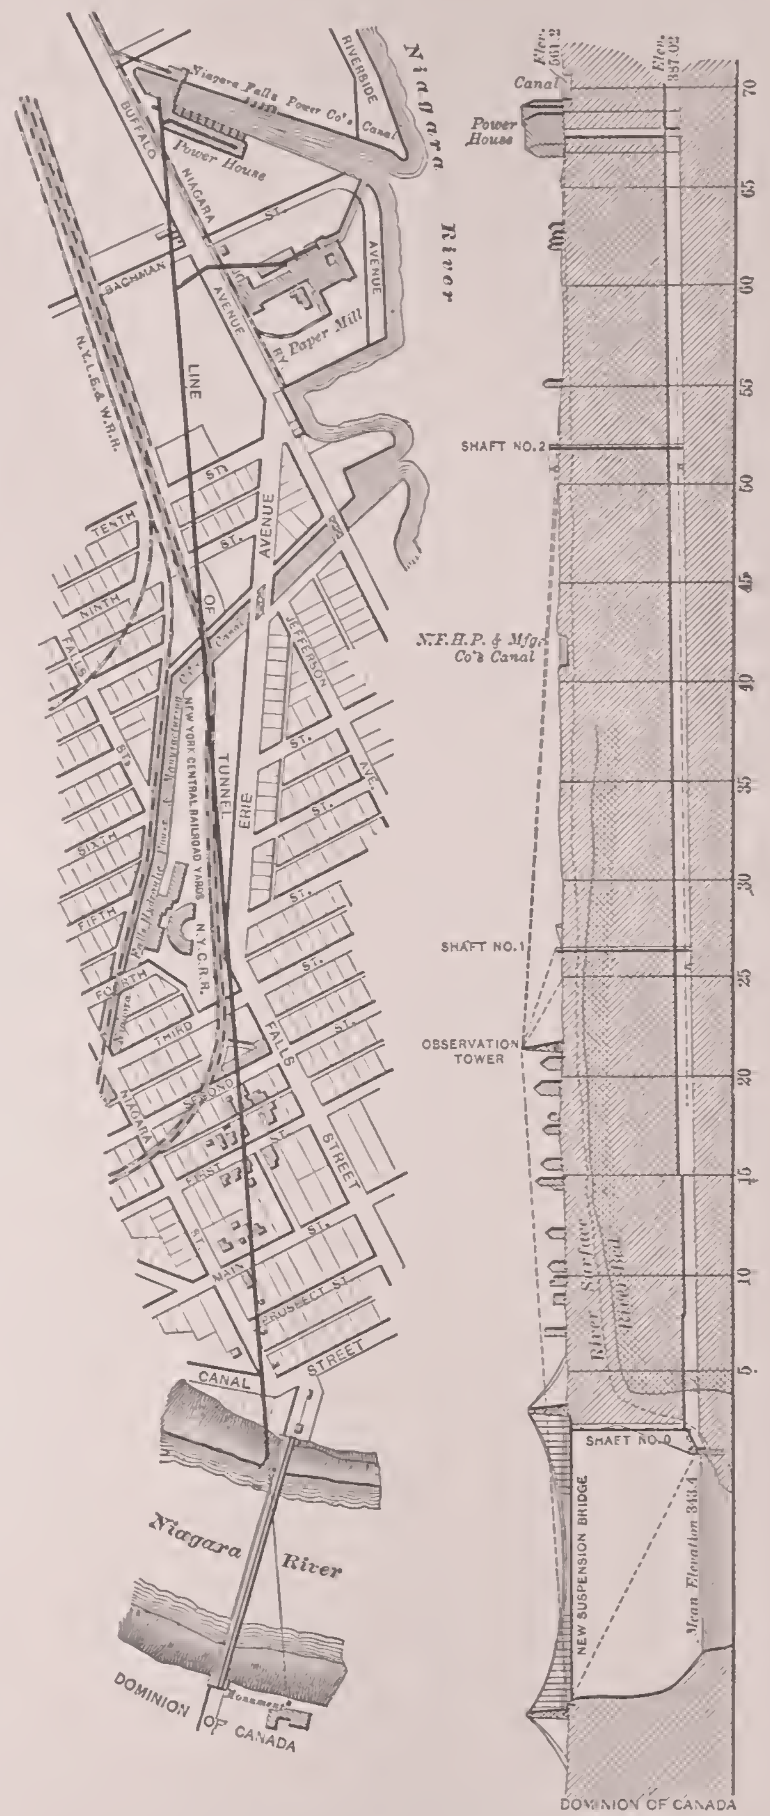

FIG. 3.—Niagara water-power tunnel, map and section.

sectional area of 365 sq. feet. At the upper end it is about 150 feet lower than the water surface in the river above; its discharge is about 200 feet below that level. Its capacity is about 7,300 cubic feet of water each second. See WATER-POWER.

The valley in which the city of Mexico lies has no natural outlet for its waters, and formerly the plain around the city was covered with water in rainy seasons, except the causeways communicating with the capital. In 1607 Enrique Martinez, a Dutch engineer in the employ of the Spanish Government, proposed and afterward constructed the tunnel of Huehuetoca (now the cut of Nochistongo) for the drainage of the valley. It was built in a very short space of time, though 4 miles long, and was arched throughout, but before the lining was completed and the bottom protected the walls were undermined in a great flood, and the tunnel fell in. The engineer was thrown into prison and kept there for three years. He was then released and ordered to make an open cutting in the place of his tunnel, in the execution of which he spent the remainder of his life. The construction of the cutting, however, extended over 120 years, and many lives were lost in its execution. The forced labor of the native Mexicans was so severe and the loss of life so great that it became a conspicuous cause of their hatred of Spanish rule. The excavation was not carried to the depth of the tunnel, and was of little use for the drainage of the valley. During the French occupation of Mexico plans were made for the drainage of the valley, and the project has been studied at various intervals since. In 1888 the plan was put in the way of execution. It consists chiefly of the tunnel of Tequixquiac, 6 miles in length, and 27 miles of large canal. The twenty-four shafts of the tunnel are from 75 to 325 feet in depth. The tunnel has a section of about 150 sq. feet, and a proposed discharging capacity of about 450 cubic feet a second. The works have been carried out by English contractors under the direction of Mexican engineers.

In the construction of the great trans-Alpine tunnels an indispensable condition was the proximity of sufficient water-power to supply the mechanical force needed in their construction. For the tunnels on the trans-Andean line, connecting Buenos Ayres with Santiago, the power obtained from waterfalls was transmitted to the sites 2 and 4 miles away by electricity. The summit tunnel on this line is over 3 miles long, constructed for single track only, at an elevation of 10,460 feet above the sea.

The new (Croton) aqueduct tunnel of New York city, about 14 feet wide and as many high, has a length of 33 miles. It was worked partly from shafts nearly a mile apart, and partly from faces where the grade of the tunnel came above the natural surface. It is chiefly, though not entirely, through rock of variable hardness, and passes under the Harlem river in a perfectly dry rock 306 feet below the surface. Portions under great head are lined with iron inside the brickwork. The work was generally not difficult, but one length of 110 feet occupied two years in its construction, and ranks with the most difficult works of the kind. The attempt was made to carry the conduit under the Harlem river in a tunnel 150 feet below the surface of the water. A pocket of very soft material was encountered, and to escape this, after several attempts to pass through it, the shafts were sunk over 150 feet lower.

The Howard Street tunnel, operated by the Baltimore and Ohio Railroad, lies under one of the principal streets of Baltimore. It has a length of 1·4 miles, of which about 1,200 feet was built as covered way. It passed through sand overlying clay, with a good deal of water in places. The side walls were first built in narrow drifts, the top was then taken out by the crown-bar system, and after the arch was turned the bench was removed. About 90 feet in length of side walls settled into the soft bottom and were pushed inward, deforming and rupturing the arch—all due to the want of an inverted arch between the walls. This portion was rebuilt, together with some other parts in which the crown of the arch had settled, the result probably of defective packing, and perhaps of other causes. The tunnel is lighted with electric (incandescent) lamps, and worked with electric engines capable of hauling the entire train, including the locomotive, the furnace doors and dampers of the latter being closed and steam shut off to avoid the escape of smoke and gases into the tunnel.

All mining drifts are really tunnels, but they will not be treated here except to mention the Sutro tunnel, 4½ miles in length, constructed to drain the lower levels of the Comstock mine, in Nevada, which it reaches at 2,000 feet below the surface of the ground. The principal difficulty encountered was the crushing of the sustaining timber, 16 inches square, by the swelling of the clay in which a part of the tunnel was excavated. It became necessary to cut off the protuberant clay and renew the timbers over and over again. The great heat in the extreme end of the tunnel also rendered the execution difficult, and required special precautions.

*Subaqueous Tunnels.*—The earliest and by far the most costly of these is the Thames tunnel, by Marc Isambart Brunel. Work upon a tunnel at this site (about 2 miles below London Bridge) was actually begun in 1807 by Trevethick, but after a shaft had been sunk the work was abandoned in the following year. The existing tunnel, 1,200 feet long, with two passages 14 feet wide and 16½ feet high, was commenced in 1825 and completed in 1843. It is now used by the East London Railway. The difficulties due to the influx of water and mud from the river were finally overcome by means of a shield invented by Brunel, which protected the whole face of the excavation, 38 feet wide and 22½ feet high. Although entirely different in form and in detail from the modern shields used in tunneling, Brunel's shield contained the principle upon which they are made, that of supporting the face and the perimeter of the excavation during the construction of short lengths of lining.

In 1868–69 the Tower subway under the Thames was constructed by W. H. Barlow, by the aid of a shield similar in principle to that of Brunel, though more nearly resembling the modern shield. This subway was circular, 8 feet in outside diameter, and was lined with ribbed cast-iron plates, the earliest of this kind of construction, now so much in vogue. It lies entirely in the firm London clay.

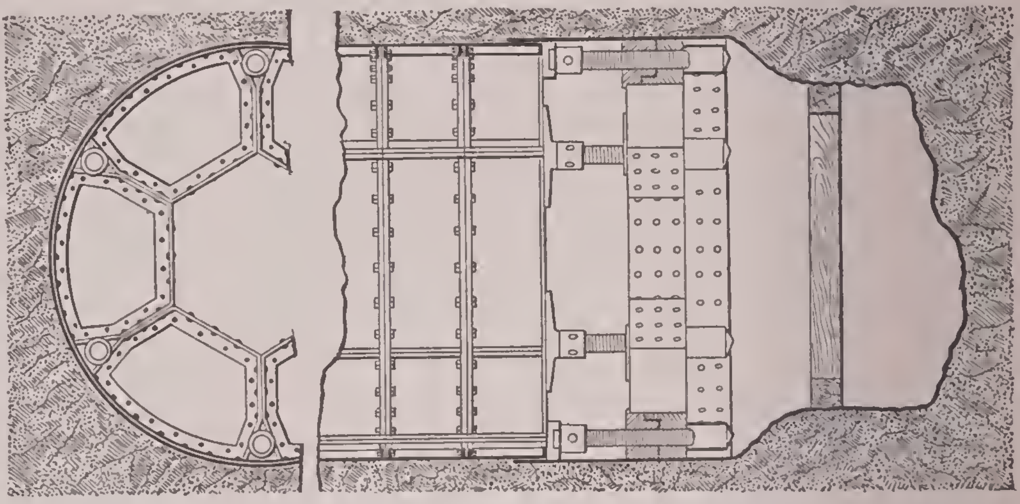

FIG. 4.—Shield and lining, Tower subway, London.

A pair of small tunnels, 10 feet in diameter, for the City and South London Railway, a rapid-transit line, were opened in 1889. They are carried under the Thames at a considerable depth by means of an improved shield, designed by Mr. Greathead, the chief engineer. They are lined with cast-iron plates, and coated on the outside with cement grout injected by air-pressure through holes in the cast-iron rings into the annular space around the tube left by the somewhat larger shield. These methods have been imitated, not only in subaqueous works, as in Glasgow and elsewhere, but for tunneling lengthwise under city streets, because of the small risk incurred of damage to overhead and adjoining property and buildings.

In America the first important subaqueous tunnels were those constructed for supplying water to the cities on the Great Lakes.

*The First Chicago Tunnel.*—The city of Chicago, Ill., which obtained its supply of water from the shore of Lake Michigan, about half a mile N. of the mouth of Chicago river, by means of works constructed in 1852, found that the lake at the point of supply was contaminated by the sewage of the city; and as the nearest, the purest, and the most abundant source was immediately in front of the city, it was decided to construct a tunnel under the bottom of the lake to a point 2 miles out. There is a land-shaft at the western and a lake-shaft at the eastern extremity. The latter is protected by a crib, or hollow pentagonal breakwater, from storms, vessels, and ice. This is 58 feet on each side and 40 feet high. The horizontal diameter of the tunnel is 5 feet, and the vertical 2 inches greater. The work was begun at the land-shaft on Mar. 17, 1864. The main tunnel proper was lined with two shells of brickwork, in all about 9 inches thick, including cement joints. The upper arch was built on a ribbed center of boiler iron, which diminished the open space inside of the tunnel only 4½ inches, and thus allowed the cars which conveyed away the earth to go up to the face of the excavation, usually kept from 10 to

20 feet ahead of the masonry. The excavation was generally through stiff blue clay, but with the irregularities of character peculiar to the drift. Sometimes sand-pockets, sometimes small bodies of quicksand, sometimes clay soft enough for a miner to run his arm into, and sometimes bowlders weighing several hundred pounds, were met. The greatest danger encountered was from inflammable and explosive gas. Early in the progress of the work several accidents occurred from this cause. Cavities containing gas were detected by sound, and bored into with a small auger. The gas was ignited as soon as it began to escape, and explosions were prevented.

The greatest progress made during any one week was 93 feet. Only once was a bowlder met so large as to require blasting. The ventilation of the tunnel was effected by means of tin pipes, through which the foul air was drawn out, and fresh air consequently drawn in through the main opening. The original estimate of the probable cost of the work was $307,552; the actual cost, including all preliminary and other expenses of whatever nature chargeable to the lake tunnel up to Apr., 1867, was $457,844.95. Later there was constructed another and larger tunnel from the same crib, parallel with the first, to the lake shore, and thence in a southwesterly direction about 4 miles farther to a point where new pumping-engines are in operation. Both tunnels have an estimated capacity of 150,000,000 U. S. gal. a day.

*The Second Chicago Tunnel.*—The enormous pollution by sewage of the lake water along the city's front and its extension into the lake nearly and at times quite as far as the 2-mile crib, as well as the rapid increase of the population and the consequent demand for a larger supply, determined the construction of another tunnel 8 feet in diameter, extending to a crib 4 miles from the shore. These works were begun in 1887. Difficulties occurred during the earlier construction from the pressure of a bed of plastic clay which was encountered in the roof of the tunnel at the same time that a water-bearing vein appeared at the bottom. A shield was built and put in place, but it was not strong enough. It was deformed by the pressure and finally abandoned. The mud and sand flowed in, and a conical hole or crater was formed over it in the lake bottom.

Two 6-foot tunnels were then substituted for the one of 8 feet diameter, and the line was diverted to pass around the place where the shield lay. Another shaft was sunk 2½ miles from shore, and work was carried on from it in both directions. Care was taken to keep the tunnel in the layer of hard clay, the soft clay being above and water-bearing sand below, and but little difficulty was experienced. The tunnel was completed to the 2½-mile crib on July, 1890, and to the 4-mile intake in Dec., 1892. At the shore end the tunnel is continued under the streets and blocks of the city 1¾ miles, to the pumping-station.

The Cleveland water-works tunnel under Lake Erie was built during 1869–74; length between shafts, 6,606 feet; diameter, 5 feet; depth of the shore shaft, 67 feet; of the lake shaft, 90 feet; both shafts are 8 feet in diameter. The crib is pentagonal, about 95 feet across and 61 feet high. Great difficulties were encountered. The first was the bursting in of the clay at 1,300 feet from the shaft, and the exposure of a seam through which gas, water, and quicksand poured in large quantities, and were stopped only by building a brick bulkhead across the tunnel. Before this could be done 300 feet of tunnel was filled with sand. It became necessary to abandon this portion and to move the line of the tunnel. This was done by changing its direction about 20° and continuing in this line until 40 feet from the original line, then proceeding parallel to the original line.

When about 4,000 feet from shore, at a point 600 feet back from the heading, the water suddenly poured in through innumerable cracks in the brickwork over a length of 150 feet. The lake shaft was then completed, and work was begun at the outer end of the tunnel. After progressing some 380 feet the same soft clay was encountered and flowed in so fast that the end of the tunnel was bricked up until other preparations could be made for continuing it. For this purpose a shield was made of boiler iron strengthened with two cast-iron rings 4 inches by 4 inches in section. It was 6 feet long and 6 ft. 5 in. in diameter. Two horizontal shelves were put in extending to within 2 feet of the rear end of the shield, the friction on these being found sufficient to prevent the soft clay from flowing in too fast. The brickwork was built within the rear end of the shield in rings 16 inches long. Cracks appeared at every cross-joint so long as the clay was soft, but it was necessary to use the shield for about 140 feet, after which the material was firmer. The shield was moved at first by screws, afterward by hydraulic presses of 135 tons capacity. The external pressure on the shield was about 4 tons to the square foot, and was too much for its strength. The cast-iron rings were broken and the shield flattened 5 inches. After leaving the soft clay the work progressed well until within 20 feet of the outer end of the shore section, when a mass of clay was blown into the tunnel with great force, followed by gas and water, and driving the men out of the tunnel. It was found that both tunnels were in communication and by means of increased pumping power both were soon emptied of water. The lake end, however, was full of gas, and being on an ascending grade it could only be blown out a few feet at a time. This, however, was done until it was clear. A few days later the connection was completed.

At 500 feet shoreward from the connection, near the large leak, transverse cracks were found; farther back the cracks were open and a portion of the masonry had settled 5 feet, breaking into short sections and going down bodily. The attempt was made to rebuild this portion, building up from the settled masonry, but cracks soon reappeared, and the cracked sections were cut off by bulkheads and a new tunnel built around them.

In 1871 it was proposed to construct a tunnel under the Detroit river to connect the Michigan Central Railway with the Great Western of Canada. A small drainage tunnel was driven as an experiment to a distance of 1,240 feet on the Michigan and more than 370 from the Canada shore. Great difficulties were encountered from the inflow of water and gas, the former under a head much greater than that due to the depth below the river. The cost far exceeded anticipations, and the work was finally abandoned.

In 1888 the Grand Trunk Railway undertook to make this connection at Sarnia, and after careful study and preparation a single-track circular tunnel, lined with cast-iron segments, was begun and successfully completed, not without difficulty, but without serious accident or delay. The material was soft blue drift clay with pockets of sand and gravel, and under this the stratum of gas-bearing sand. The work was done with shields, one on each side of the river, and a comparatively light pressure of air was kept up, chiefly to prevent the inflow of gas. The length is 6,000 feet, of which 2,290 feet is under the river. The water is 40 feet deep and the least cover over the tunnel is 15 feet. It was completed and opened for traffic in 1892.

The Liverpool water-works tunnel under the Mersey, finished in 1892, is chiefly remarkable by reason of the great cost, difficulty, and delay incurred in its earlier stages, for want of proper engineering advice, and its rapid execution when the means were properly adapted to the end in view. The tunnel is 10 feet in diameter, lined with cast-iron plates, and has been built with a shield through clay, silt, and sand, all soft and full of water. As the first shield was not adapted to its work, great delay and expense were incurred, and very little progress was made. When the work was taken over by the corporation of Liverpool the shield was strengthened and slightly modified to fit it for its work, and the tunnel, of which but 183 feet had been built in twenty-eight months, was completed in four and a half months, the total length being 810 feet.

The change in the shield consisted in raising a low bulkhead in the rear of the diaphragm and a few inches higher than its lower edge, forming thus an air-seal which prevented the inflow of water so long as the air-pressure was kept in excess of the pressure of water. This idea is said to have been introduced into Sir B. Baker's design for the Humber tunnel shield in 1870, a tunnel which was not made;* it was applied to the compartments of the Hudson tunnel shield, and by the hanging plates in the Blackwall shield. It was patented in Belgium in 1880.

The *Hudson River* tunnel, to connect Jersey City with New York and permit the entry of railway trains to the heart of the metropolis, was begun in 1880, after seven or eight years of litigation. It was proposed to construct two oval single-track tunnels of brick, but, money failing, one was suspended, and work upon the other continued at intervals as money could be obtained until 1886, completing some 1,800 feet of tunnel. This work was executed through the soft river silt by the use of compressed air, and by lining

* Sir John Fowler's plan for the Humber tunnel was to build it by means of caissons with compressed air, as in sinking bridge foundations.

the excavation with thin plates of iron or steel, forming an air-tight surface, by means of which the compressed air supported the pressures of the exterior silt for a short time, enabling the brickwork to be built in 10-foot lengths inside the plates. A "pilot" tube was also used, 6 feet in diameter, of heavier plates, which was driven 20 feet to 40 feet ahead of the main excavation, and from the rear portion of which the thin lining-plates were supported by radial shores. The face maintained itself well under a well-regulated air-pressure, neither too great nor too small, for the short time it was exposed. In 1889 a loan was placed in London, under the terms of which the method of construction was changed. A shield was introduced and the tunnel was made circular, 18 feet in diameter, and lined with cast iron, in flanged segments, weighing about 8,000 lb. to the running foot of the tunnel. The rate of progress, which under the former system had averaged about 3 feet a day and had never exceeded 5 feet, was increased to 10 feet; but many expenses had been incurred in constructing and erecting the shield, closing leaks from the river preparatory to the erection of the shield, etc., and after building about 2,000 feet, and when only about 1,700 feet of the north tunnel remained to be built, the loan was exhausted and operations were suspended.

When in 1889 construction by means of a shield was decided upon, it was required to erect the shield at the end of the finished tunnel, 2,000 feet from the shore. To accomplish this a chamber had to be constructed large enough to permit the shield to be put together, much larger than the former tunnel, and this by a method which had been discarded as dangerous. In the construction of this chamber a fall occurred and the river broke in. When the break was closed and the chamber finished mechanics could not be procured who would work in compressed air, and the shield was put together and riveted or bolted up by common labor. By the break and the means taken to close it the silt in proximity to the site was disturbed and softened, and much trouble arose from this cause, aggravated by the great weight of the shield. As the work progressed, however, the silt became more firm, and no further difficulty was experienced up to the abandonment of the work.

The Hudson tunnel was the first of large size in which compressed air was used. It had previously been employed by Hersent, in constructing a small connecting tunnel at the Antwerp dock works.

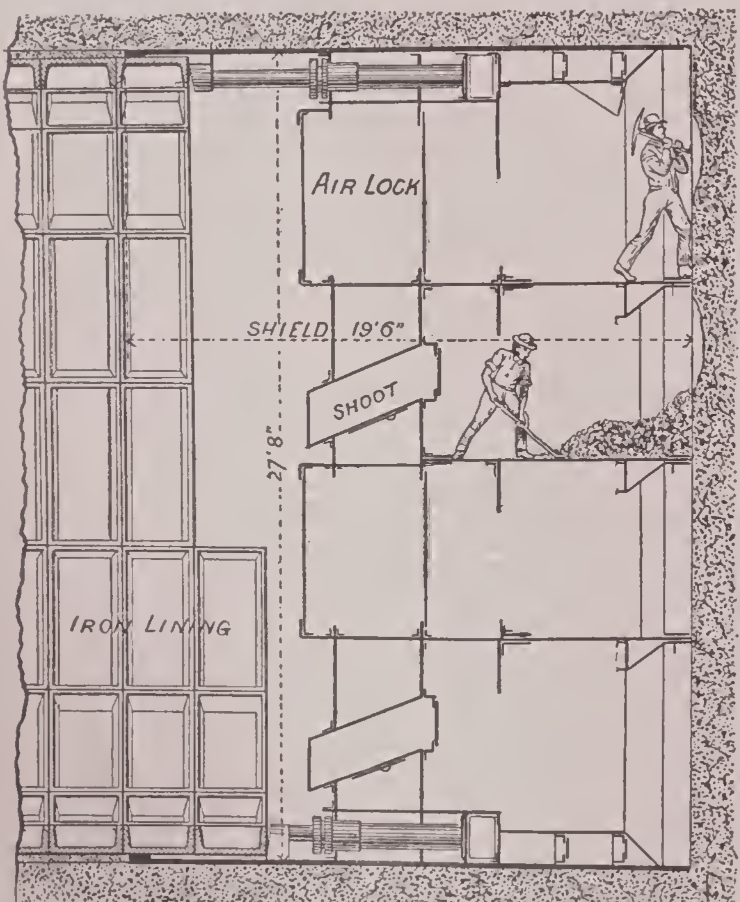

Fig. 5.—Section of shield, Blackwall tunnel, London.

The largest of the subaqueous tunnels is the Blackwall carriageway tunnel under the Thames, at London, which in 1895 was about half completed. The outside diameter of the iron-lined portion is 27 feet, and the cast-iron rings of the shell are 10 and 12 inches deep, making the interior diameter 25 feet, and for 821 feet 25 ft. 4 in. The whole length of iron-lined tunnel is 3,083 feet, of which 1,212 feet is under the water of the river, with in one place but 5 feet of cover (sand and gravel) over it; 1,382 feet at both ends is covered way, and 1,625 feet is open-walled trench. The entire length of the work is thus 6,090 feet.

The shield is a cylindrical shell 27 ft. 8 in. in diameter, and 19 ft. 6 in. long, with two diaphragms. The part in the rear of the first diaphragm is the tail of the shield. In front of this diaphragm is an inner skin or shell, strongly connected to the outer shell, from which it is distant 19 inches. The two skins are brought together to form the cutting edge. The space is divided horizontally by three platforms, forming four stages, from which the face of the work may be attacked. There are also three vertical partitions. The front part of the shield is thus divided into twelve compartments. Air-locks are formed in the space between the diaphragms, and in front of the front diaphragm, and some 6 feet back from the cutting edge, a vertical screen depends from the top of each compartment. The space between this hanging screen and the front diaphragm forms a safety-chamber for the men in case of a sudden irruption of water. The water will not rise in the inclosed space, being held back by the air, as in a diving-bell, and the men may keep their heads above water until relieved. The shield is pushed forward by hydraulic rams, placed in the annular space between the inner and outer shells, and they push against the cast-iron shell of the tunnel. Total pressure available, 2,800 tons. The material excavated is carried through the diaphragm by the shoots, which are also air-locks. The cast-iron segments forming the lining are erected inside the shield: the tail of the shield thus surrounds the last ring put in place. The segments are lifted into place by a hydraulic erector, such as was used in the Hudson tunnel. The air-locks in the shield are for exceptional occasions. A brick bulkhead across the tunnel contains large air-locks of the usual form.

No unexpected difficulties have been encountered (1895). Before reaching the river, while working without compressed air, the cutting edge of the shield at the bottom was damaged by contact with some hard body. A bottom heading was driven into the sand in front of the shield, timbered in the usual way, and a bed of concrete formed to fit the bottom of the shield, upon which it was slid forward until it reached the shaft, where the damage was repaired. In passing through the pure ballast (sand and gravel) the bottom of the river was first covered with a bed of clay 10 feet thick and 75 feet wide on each side. This to a large extent prevented the escape of the air, and also the run of the ballast. A similar plan is provided for the Hudson tunnel when work on it is resumed, there being but 7 or 8 feet of silt between the tunnel and the water in passing under the channel of North river, 62 feet deep. Additional quantities of air-pressure also were required at Blackwall when working in ballast to provide for that escaping to the river.

*The East River Gas Tunnel, New York.*—In view of the high price of real estate in New York, and the numerous objections to the establishment of gas-works in the heart of the city, the East River Gas Company established its works in Long Island City, and constructed a tunnel under the East river through which to convey its product to New York. The tunnel built in 1892–94 is circular, 10 ft. 2 in. in diameter, and 2,516 feet long. It passes under Blackwell's island and both channels of the river at a depth of 109 feet below high tide, and 41 feet under the deepest part of the river. The few borings made indicated that the tunnel would lie entirely in solid rock, but when the heading had advanced 360 feet from the New York shaft a stratum of decomposed rock was met, very soft, with streams of water between it and the adjoining hard rock. The water washed the soft material into the tunnel, forming large cavities overhead. At this juncture compressed air was introduced, and the soft stratum, 29 feet thick, was crossed by using steel roof-plates, after the manner of the first work on the Hudson tunnel, and lining with brickwork. About 80 feet beyond this section a large mass of soft black mud was encountered, and here a shield was introduced, and the lining was made of cast-iron segments, planed on all joints and placed to break joints. The brickwork which had been built across the preceding soft seam was not water-tight, and the iron lining was extended inside of it. About 380 feet of tunnel under the New York channel was lined with cast iron, and two seams, together 128 feet thick, under the Brooklyn channel were similarly protected. The rest of the tunnel was lined with brickwork.

*Special Cases in Tunneling.*—The tunnel of Braye-en-Laonnais, in France, passed through a clay containing pyrites and lignites, overlaid by water-bearing sand which dipped at one point into the tunnel. The compressed air (27 to 28 lb. to the square inch) which was required to pass this point drove back the water and oxidized the pyrites. The heat of oxidation was sufficient to ignite the lignites, the gas from which entered the tunnel and asphyxiated seventeen men. Wells were sunk from the surface to furnish outlets for the gas, and by a rapid ventilation, using a great volume of compressed air, the tunnel was rendered safe for the workmen until the sand was passed and the air was taken off. The water in the sand returned and extinguished the fire, but the water leaking through the arch was warm for six months afterward.

The tunnel of Père-Ternère, in the Pyrenees, lies in a schistose rock inclined about 35°, the layers of which are separated by thin layers of fine green clay, as slippery as soap when moist. The top heading, 6½ by 6½ feet, was completed, and for 180 feet from the Spanish end the bottom of the heading had been sunk below the level of the springing line of the arch. After a long-continued rain the layers cut by the excavation began to slip into the tunnel, crushing the heavy timbering. Work was suspended and the case was studied. The movement continued. Finally, the arch was built in short lengths, 6 feet thick at the portal, 4 feet at the inner end of the disturbance. When the arch was completed, the bench being undisturbed, the right side wall was built in pits excavated in short lengths under the arch. It was made 5½ to 7 feet thick. The attempt was then made to drift for the left side wall, but the ground began to move as soon as the strata were cut, and the method was abandoned. Narrow cross-cuts the whole width of the tunnel were then made, 80 feet apart, and in them the invert and left wall were completed. Intermediate cross-cuts were made and built in and this method was continued until the masonry was completed.

The Boston subway for rapid transit is built of vertical steel beams connected by concrete arches with vertical axes, convex on the outside, to take the pressure of the outside earth. Steel beams, with brick or concrete arches, also form the roof. The tunnel is to be used by electric cars. The use of iron is not to be recommended in tunnels used by locomotives operated with steam.

The use of "lock bars," steel needles, or "poling-boards" is an improvement upon the crown-bar method. Steel beams, 2 or 3 inches deep, rolled of a shape to lock together, replace the heavy timbers of the older system. They are drawn forward by screws or hydraulic jacks, by twos or threes, and supported at intervals by wooden frames the shape of the outside of the arch, one end resting on the completed brickwork. Grout may be injected behind them as they are drawn forward, but the space they leave is so small that the settlements therefrom may be neglected, except in special cases. A tunnel built in London by this method, with but 5 feet cover, has caused no appreciable settlement of the surface.

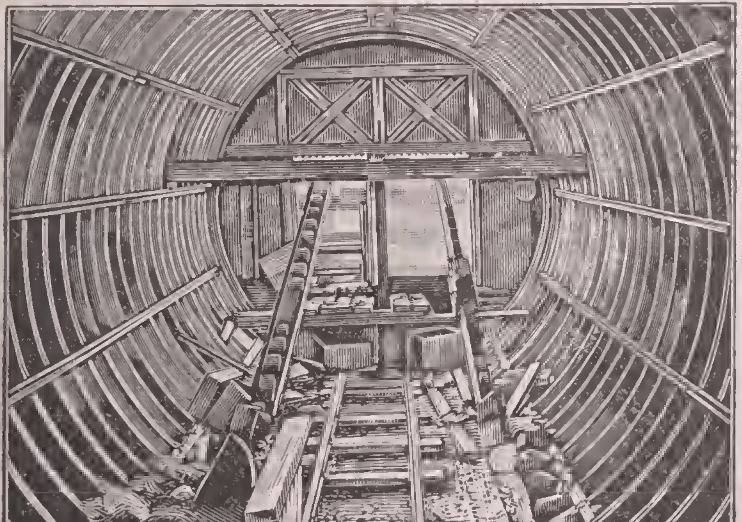

FIG. 6.—Glasgow Harbor tunnel, interior.

Where shields are used they must be adapted to the character of the excavation. The London and Glasgow subways are generally in clay, with very little water, and the men worked in front of the shields. This method was also used in the Mersey water-works tunnel, where the material was very soft and full of water. It was made practicable only by a very nice adjustment of the air-pressure, and there was a constant escape of air through the porous material. In the Hudson tunnel this method would not have been without risk, and the soft material was permitted to flow through the doors of the shield as it was pushed forward. The passage of air through the silt softened it and increased the risks of the work.

The boldest tunnel that has been projected is the Channel tunnel, designed to connect England with the continent of Europe, passing under the Straits of Dover, having a length between shafts of over 21 miles. The project was approved by such eminent engineers as Sir John Hawkshaw and Sir James Brunlees in England, and Thomé de Gamond and Alexandre Lavalley in France, but is for the present in suspense, powers to construct having been refused by Parliament at the suggestion of Gen. Sir Garnet (now Lord) Wolseley and other leading officers of the British army, as exposing their island to invasion from France.

**Tunny** [dimin. of O. Fr. *ton, thon* < Lat. *thun'nus, thynnus* = Gr. *θύννος, θῦνος*, tunny; cf. *θύνειν*, to dart]: the largest member of the mackerel family (*Scombridæ*), known on the coast of the U. S. as the horse-mackerel. It is a heavily built fish, tapering rapidly to the pointed head and slender base of tail. The dorsal and anal fins, as in the mackerel, are followed by six to nine finlets; it reaches a length of 9 or 10 feet, and a weight of 1,000 lb. The tunny occurs on both sides of the Atlantic and ranges to Tasmania, and has been the object of extensive fisheries in the Mediterranean from time immemorial. See FISHERIES. F. A. LUCAS.

**Tunstall**: market-town of Staffordshire, England; in the parliamentary borough of Newcastle-under-Lyme (see map of England, ref. 8-G). It has several public buildings, including a town-hall (1884), market, and court-house, and has extensive manufactures of pottery, tiles, and iron. Pop. (1891) 15,730.

**Tunstall**, or **Tonstall**, CUTHBERT, D. D., LL. D.: b. at Hatchford, Yorkshire, about 1475; entered Baliol College, Oxford, about 1491; removed thence to Cambridge, where he was chosen fellow of King's Hall, now Trinity College; studied at Padua, where he took the degree of Doctor of Laws; became vicar-general to Archbishop Warham and rector of Harrow-on-the-Hill 1511, prebendary of Lincoln 1514, archdeacon of Chester 1515, and master of the rolls 1516; was sent 1516–17 to Brussels with Sir Thomas More as joint ambassador to Charles I. of Spain (afterward Charles V.), with whom they concluded two treaties; made there the acquaintance of Erasmus; became prebendary of York 1519, prebendary and dean of Salisbury 1521, Bishop of London Oct., 1522, Lord Privy Seal May, 1523, ambassador to Spain 1525; accompanied Wolsey to France July, 1527; was a plenipotentiary to negotiate the Peace of Cambray 1529; bought up Tyndale's New Testaments at Antwerp and burnt them in Cheapside 1529; became Bishop of Durham by papal bull Feb. 21, 1530; concurred in most of the ecclesiastical reforms of Henry VIII. and those of the first years of Edward VI., but was deprived of his bishopric and sent to the Tower on a charge of treason Oct., 1552; was restored by Mary, and conducted himself with great moderation during her reign, allowing no persecution within his diocese; was again deprived by order of Queen Elizabeth July, 1559, in consequence of having refused to take the oath of supremacy, and was committed to the custody of Dr. Parker, Archbishop of Canterbury. D. at Lambeth Palace, Nov. 18, 1559. He was described by Erasmus as "a man who outdid all his contemporaries in the learned languages"; was the inventor of a species of technical memory, and author of *In Laudem Matrimonii* (1518); *De Arte Supputandi* (London, 1522), one of the first books of arithmetic printed in England; *De Veritate Corporis et Sanguinis Domini Nostri Jesu Christi in Eucharistica, Libri II.* (Paris, 1554), being an elaborate defense of transubstantiation; *Compendium in X. Libros Ethicorum Aristotelis* (Paris, 1554); *Contra Impios Blasphematores Dei Prædestinationis Opus* (Antwerp, 1555); etc. Revised by S. M. Jackson.

**Tu'pac Ama'ru**: an Inca or chief of the Peruvian Indians; b. in Cuzco about 1544. He was the youngest son of Manco Inca, who after his final struggle with the Spaniards had retired to the Vilcabamba Mountains and kept up a semblance of sovereignty until his death. By the death of his elder brother, Tupac Amaru became the legitimate sovereign of Peru, and was so recognized by the Indians, though he was a mere boy; he avoided the Spaniards, but was not hostile to them. The viceroy, Toledo (*q. v.*), regarded him as a possible inciter of insurrection, and, under pretense that he had been involved in the murder of a priest, sent an expedition against him. He was captured, taken to Cuzco, and beheaded there about Dec., 1571. At the execution he prevented a revolt by using his authority over the Indians, and it is related that thousands of them came at night to do reverence to his head. Herbert H. Smith.

**Tupac Amaru II.** (called the last of the Incas): revolutionist; b. at Tinta, near Cuzco, in 1742. His real name was José Gabriel Condorcanqui, and he was descended from the ancient Incas; he was a man of education and some wealth, and, in accordance with the colonial custom, was the recognized chief of several Indian villages, subject to the viceroy. His Indian name was assumed in 1771. At that time the system of forced labor practically held the poorer Indians in a condition of slavery. After vainly seeking redress he headed a rebellion in Nov., 1780. The Indians, who universally regarded him as their Inca, flocked in thousands to his standard. At one time he had a force of 80,000, and held all the country between Cuzco and Lake Titicaca; even the Indians of New Granada and Paraguay were in secret sympathy with him, and a complete overthrow of Spanish power was threatened. But his army was undisciplined and almost without arms, and after a gallant struggle he was defeated and captured Mar., 1781. By sentence of the judge Areche he was torn to pieces by horses at Cuzco, after witnessing the torture and death of his wife and nearly all his relations, May 15, 1781. His brother Diego held out for some time longer, and was pardoned on condition of disbanding his forces, but was subsequently tortured and killed. In the effort to extirpate the whole Inca race, Tupac Amaru's son, a child of ten years, was spared, but was sent a prisoner to Spain; his fate is unknown, though a person claiming to be him appeared in South America in 1828, and was given a pension. Herbert H. Smith.

**Tupac Yupan'qui**, or **Tupac Inca Yupanqui**: the most renowned of the Inca sovereigns of Peru; succeeded Pachacutec Yupanqui about 1440. His reign was marked by a long series of successful wars, by which he annexed the coast region to the Gulf of Guayaquil, Northern Chili, Charcas, or Bolivia, etc. Tribes as far S. as Tucuman tendered submission to him, and it is said that he sent out an expedition on rafts which discovered the Chincha islands. D. at Cuzco about 1478. H. H. S.

**Tupaia**: See Tupaiidæ.

**Tupai'idæ** [Mod. Lat., named from *Tupa'ia*, the typical genus, from a native name]: a family of mammals of the order *Insectivora* and sub-order *Animalivora*, peculiar to the East Indies and neighboring islands. In form they resemble the squirrels; the head, however, runs out in a pointed snout; the pelage is soft and abundant; the hind legs are notably larger than the front ones, and all have five well-developed toes; the tail is long. The family embraces mammals about the size of squirrels; like the squirrels, the tupaias live chiefly in trees; their resemblance to the squirrels has obtained for them in certain places the same name, the native word "tupaia" being applied to the animal in question and to true squirrels as well. The species are most abundant in the islands of Sumatra, Borneo, and Java. They are generally grouped in two genera, *Tupaia* and *Ptilocercus*. They are truly insectivorous. Theodore Gill.

**Tu'pelo**: See Gum-tree.

**Tupelo**: town; capital of Lee co., Miss.; on the Old Town creek, and the Kan. City, Mem. and Birm. and the Mobile and O. railways; 45 miles S. by W. of Corinth, and 50 miles E. of Oxford (for location, see map of Mississippi, ref. 4–H). It is in an agricultural region, and contains 8 churches, 2 public-school buildings, about 40 artesian wells, foundry and machine-shops, cotton-compress, steam-gin, 2 mills, furniture and spoke factories, a national bank with capital of $50,000, a State bank with capital of $80,000, and 2 weekly newspapers. Pop. (1880) 1,008; (1890) 1,477; (1900) 2,118. Editor of "Journal."

**Tupís**, or **Tupys**, too-peez': a general name for numerous Indian tribes of Brazil. They form part of the great Tupí-Guarany race, which before the appearance of the whites occupied much of Brazil and Paraguay, as well as neighboring regions now included in Uruguay, the Argentine Republic, Bolivia, Peru, Venezuela, Colombia, and Guiana. Those of Paraguay were collectively called Guaranys, but they did not materially differ from the others. The Tupís were divided into a multitude of tribes which are known by different names, as Tupinambás, Tupiniquins, Caetés, etc. Nearly all of these were closely allied by language and customs; but they had no tribal connection, and were often at war with each other. They were scattered, generally along the coast and great rivers, frequently separated by tribes of other stocks. All were agriculturists and had fixed villages, but otherwise they were little advanced. They went naked, painting their bodies; the prisoners taken in war were sacrificed and eaten, at least by some tribes. Most of the Tupís received missionaries soon after the Conquest. Their tribal divisions have been lost, except in a few cases; but their descendants, mixed with Negro and white blood, form the bulk of the country population. Their language was adopted by the missionaries, and in modified form became the *lingoa geral*, long the common tongue in the interior of Brazil. It is still spoken on the upper Xingú and Tapajós. Herbert H. Smith.

**Tupper**, Sir Charles, D. C. L.: statesman; b. at Amherst, Nova Scotia, July 2, 1821; graduated as a physician at Edinburgh in 1843. He was appointed governor of Dalhousie College, Halifax, by act of Parliament in 1862; was president of the Canadian Medical Association from its formation in 1867 until 1870; and is a director of the London board of the Bank of British Columbia. He represented Cumberland in the Nova Scotia Assembly 1855–67; same constituency in the Parliament of Canada 1867–84 and 1887–88; was a member of the executive council and provincial secretary of Nova Scotia in 1857–60 and 1863–67; and prime minister of that province 1864–67. He was president of the Privy Council of Canada 1870–72; Minister of Inland Revenue 1872–73; Minister of Customs in 1873; Minister of Public Works 1878–79; Minister of Railways and Canals 1879–84; and Minister of Finance from Jan. 27, 1887, until May 24, 1888, when he was appointed high commissioner for Canada in London. He was a delegate to Great Britain on public business from Nova Scotia 1858 and 1865; from the Dominion Government relative to the Nova Scotia difficulty in 1868; was leader of the delegation from Nova Scotia to the union conference at Charlottetown in 1864, to that at Quebec the same year, and to the final colonial conference in London to complete the terms of union 1866–67. He was appointed executive commissioner for Canada at the International Exhibition at Antwerp in 1885; of the Colonial and Indian Exhibition, London, 1886, of which he was appointed royal commissioner by the Queen; and was one of the British plenipotentiaries to the fisheries conference at Washington in 1887. He received the honorary degree of D. C. L. from Cambridge in 1886; was knighted in 1879, and made a baronet in 1888. In Apr., 1896, he succeeded Sir Mackenzie Bowell as premier of Canada, but held office only until July, when the liberals came into power with Wilfrid Laurier as premier. Neil Macdonald.

**Tupper**, Sir Charles Hibbert, K. C. M. G.: cabinet minister; second son of Sir Charles Tupper; b. at Amherst, Nova Scotia, Aug. 3, 1855; educated at McGill and Harvard Universities, and admitted to the bar in 1878. He was first returned to the Dominion Parliament in 1882; re-elected in 1887 and 1891, and by acclamation after his appointment to office. He became a member of the Privy Council of Canada and was appointed Minister of Marine and Fisheries May 31, 1888; was appointed queen's counsel Aug. 2, 1890. He acted as British agent in the Bering Sea arbitration case between the Governments of the U. S. and Great Britain at Paris in 1893. He was gazetted K. C. M. G. in 1893. Neil Macdonald.

**Tupper**, Martin Farquhar: poet; b. in London, England, July 17, 1810; educated at the Charterhouse School and at Christ Church, Oxford, where he graduated 1831; studied law, and was called to the bar at Lincoln's Inn, but never practiced; published anonymously a volume of poems

(1832), and in 1838 issued the work by which he is best known, *Proverbial Philosophy* (second series, 1842; third, 1867). This had a prodigious circulation in England, and over 500,000 copies were sold in America. It was, notwithstanding, a very commonplace piece of work, and Tupper became a favorite butt for the ridicule of the critics and a proverb for platitude and inanity. He wrote other volumes of prose and verse: *Hactenus, a Budget of Lyrics*; *Ballads for the Time*; *Stephen Langton, or the Days of King John*; *Probabilities, an Aid to Faith*; *My Life as an Author* (1886). In 1851 and 1876 he visited the U. S., and in 1875 wrote a drama in honor of the centenary of American independence. D. at Albury, Surrey, Nov. 29, 1889.—His three daughters published in 1864 a volume, *Poems by Three Sisters*, and contributed to Dr. Roger's *Lyra Britannica*. Revised by H. A. BEERS.

**Túquerres**, too'ker-res: town of the department of Cauca, Colombia; near the frontier of Ecuador; on a high plateau of the Andes, 10,200 feet above sea-level. It covers a wide area, but is composed mainly of thatched huts; the climate is cold (mean, 55° F.). It has a considerable trade. Pop. about 8,000. The quiescent volcano of Túquerres, near here, rises to 13,350 feet, and is said to be composed almost entirely of sulphur. H. H. S.

**Tura'nian Languages**: See LANGUAGE.

**Turbella'ria** [Mod. Lat., double dimin. of Lat. *turbo*, a whirling, whirlpool, or *turba*, crowd, tumult]: a group of flat-worms, PLATHELMINTHES (*q. v.*), which are so called from the fact that the motile cilia covering the body create small vortices in the water. Unlike the other flatworms (Trematodes and Cestodes), only a few of the group are parasitic, but most of them lead free lives, either in the ocean or in fresh water, a few living in moist earth. The body is usually flat and oval in outline. A mouth is always present, but its position varies; it may be in front, median, or behind the middle of the ventral surface. The alimentary tract is in some a solid rod of digestive cells, in others a cavity occurs, but a vent is never found. The character of the alimentary tract is, with other features, used as a basis of classification. In the *Polycladea* the digestive organs are many-branched, the terminal branches reaching to almost all parts of the body. In the *Tricladea* there are but three primary branches to the digestive tract, one branch being anterior and median, the others paired and posterior. In the *Rhabdocœlida* the tract is straight and rod-like, and either solid or hollow. The nervous system consists of a central portion or brain, usually anterior in position, from which nerves arise; and in many there are eyes near the brain. There is no body cavity, but delicate excretory tubules run through the body, the external openings varying in different groups. Circulatory organs are absent. There are a few Rhabdocœla in which reproduction by transverse division occurs, but in most species the sexual method is the only way of perpetuation of the species. The sexual organs are quite complicated. Some forms develop directly into the adult, while others pass through a larval stage.

The *Turbellaria* are the most primitive of the flatworms, and from a triclad form the passage to the Trematodes is easily made. By many the *Turbellaria* are regarded as nearly allied to the Ctenophores. See Graff, *Monographie der Turbellarien* (*i. Rhabdocöliden*, 1882); *Organisation der Turbellaria Acœla* (1891); Lang, *Die Polycladen des Golfes von Neapel* (1884). J. S. KINGSLEY.

**Tur'bervile**, GEORGE: poet; b. at Whitchurch, Dorsetshire, England, about 1530; was educated at Winchester School and at New College, Oxford, where he obtained a fellowship 1561; studied law at one of the inns of court, London; accompanied Sir Thomas Randolph to Russia as his secretary, and wrote three poetical epistles descriptive of that country, which were printed in Hakluyt's *Voyages* along with Randolph's narrative. He published *Epitaphes, Epigrams, Songs, and Sonets* (1565; enlarged in the edition of 1570, and several times reprinted in the nineteenth century); *Heroycall Epistles of the learned Poet Publius Ovidius Naso, in Englishe Verse* (1569); *The Booke of Faulconrie, or Hawking* (1575); *The Noble Art of Venerie, or Hunting* (1576); *Tragical Tales, translated out of the Italian* (1576); and left a MS. translation of Tasso's *Jerusalem Delivered*, now in the Bodleian Library. D. about 1600. Revised by H. A. BEERS.

**Turbine** [= Fr. *turbine*, from Lat. *tur'bo*, *tur'binis*, anything that whirls around, wheel, top, whirlwind, deriv. of *turba're*, throw into confusion, disturb]: a water-wheel in which the water enters and leaves at all points around the circumference, acting both by its impulse and reaction. Turbines are usually horizontal wheels turning upon a vertical axis, but some forms are vertical and revolve upon a horizontal axis.

The reaction wheel (see BARKER'S MILL) was an early form of the turbine, although an inefficient one. The first

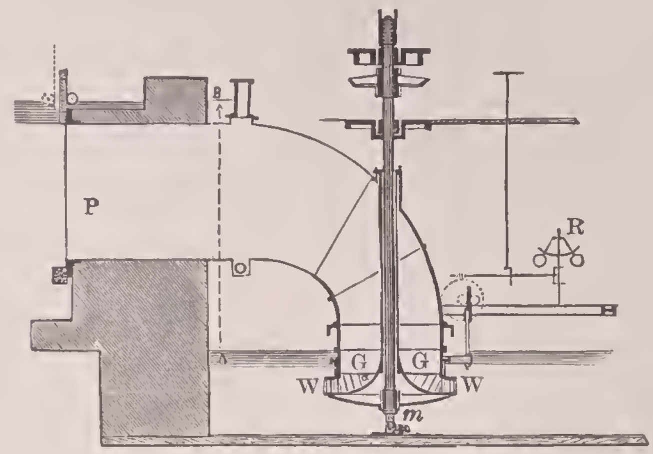

FIG. 1.

real turbine, however, was invented in France by Fourneyron, who received a prize of 6,000 francs for the design in 1833. A modification of this, called the Boyden turbine, has been extensively used in the U. S. Fig. 1 shows a vertical section of the Boyden turbine with its shaft and penstock. The water approaches the wheel by the curved penstock, P, is given a rotary motion by the fixed guide, G, through which it enters the wheel, W. Fig. 2 is an enlarged horizontal section showing the guides, G, and the vanes, W, the latter being rigidly attached to the wheel. Under the action of the impulse and reaction of the water the entire outer annulus, W W, which constitutes the wheel proper, revolves and carries with it the shaft by means of the connecting arms, *m*. At R is seen a governor for regulating the speed.

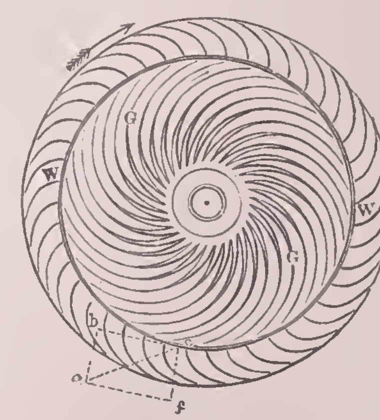

FIG. 2.

The theoretic work of a turbine is the product of the weight of water which passes through it, and the height of fall from the head-race to the tail-race; in Fig. 1 this fall is designated by A B. The work actually utilized, however, is usually only from 70 to 80 per cent. of the theoretic work, the remainder being lost in friction, foam, and leakage. For example, if a wheel discharge 8,000 lb. of water per second with a fall of 11 feet, the work per second is 88,000 foot-pounds, and the theoretic horse-power is 160; if the wheel have an efficiency of 75 per cent. there will be utilized 120 horse-powers. With very carefully constructed wheels efficiencies of 90 per cent. have been obtained.

The turbines of Fourneyron and of Boyden are called outward-flow wheels, as the water enters the wheel upon its inner circumference and is discharged upon the outer circumference. Another very common type is that of the inward-flow wheel, where the water enters upon the outer and is discharged at the inner circumference. Fig. 3 shows a horizontal section of such a wheel, in which, as before, G denotes the guide-spaces where the water enters and W the wheel-vanes. After leaving the wheel the water drops vertically down to the tail-race, having surrendered to the wheel the greater part of its energy.

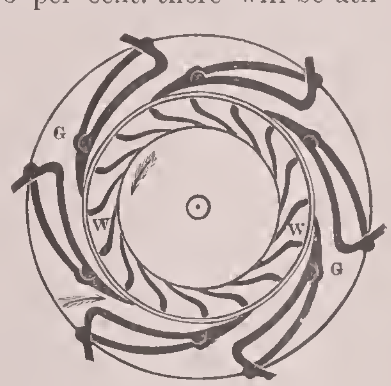

FIG. 3.

Turbines of inward and downward flow, having the wheel-vanes made as warped surfaces, are also very common. In these the water enters horizontally through fixed guides, but after entering the wheel the warped vanes give it also a downward direction. Fig. 4 shows a vertical section of one of these wheels, the arrows indicating the direction of motion of the water, while Fig. 5 shows a portion of a horizon-

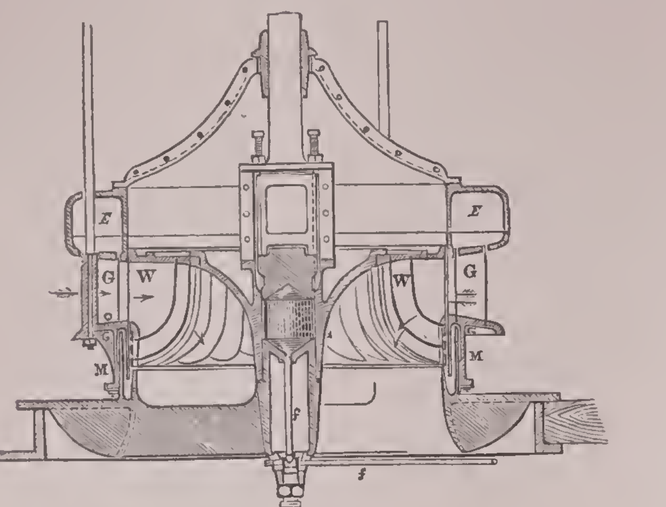

Fig. 4.

tal section through the guides and vanes. This compound motion of the water is not generally employed except for small wheels.

Another class of turbines is that of downward or parallel flow, in which the water moves downward without approaching or receding from the axis. Fig. 6 is an outline diagram showing the method of arrangement of such a turbine; the fixed guides are marked *a a*, while the moving wheel is designated by *b b*, the latter being attached to the revolving shaft, C. It is seen that this wheel is placed some distance above the tail-race and that a draft-tube, A, connects them. By this device the fall due to the total head can be utilized, provided that the wheel is not more than 30 feet above the tail-water, as the atmospheric pressure due to this distance is added to the static head actually above the wheel. Fig. 7 is an enlarged vertical section of one side of this wheel showing the positions of the guides and vanes, while Fig. 8 is a side view showing the edges of two of the guides with their corresponding vanes. This form of wheel is frequently called the Jonval turbine.

Fig. 5.

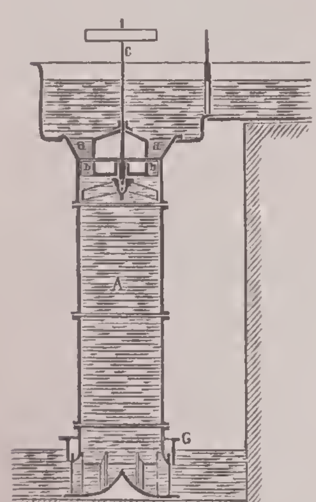

Fig. 6.

The regulation of the speed and power of a turbine is effected by a gate for shutting off the water, and also by a governor. The most common form of gate is an annular one which can be depressed around the entire circumference of the wheel. In Fig. 2 this annular gate fits into the annular space between the guides and vanes. In Fig. 4 the gate is marked by M, and at E, on the left-hand side, is seen one of the rods by which it is moved. In Fig. 3 each of the guide-openings has a gate which moves horizontally on a hinge. In the downward-flow turbine of Fig. 6 the gate is near the lower end of the draft-tube at G. In all cases, except that of Fig. 6, the efficiency of the turbine is materially less when the gate is partly closed than when it is fully opened, on account of the eddies and foam which result from the sudden change in cross-section.

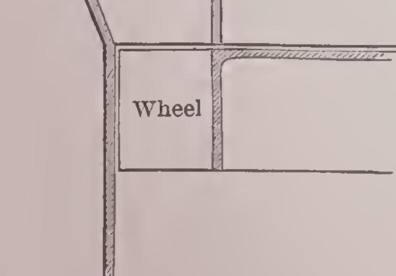

Fig. 7.

In an outward-flow turbine the discharge increases when from any cause the speed increases, while in an inward-flow turbine the discharge decreases if the speed increases. The first form hence requires a governor, and it is also frequently used for inward-flow wheels. Fig. 9 shows a governor of the centrifugal-ball type which is so connected with the main shaft and with the gate of the turbine that the latter is partially closed when the removal of a portion of the work causes an increase in speed. In the large Niagara turbines (see below) this method of control is so effective that the speed can not increase more than 4 per cent. when 25 per cent. of the work is suddenly taken off from the wheel.

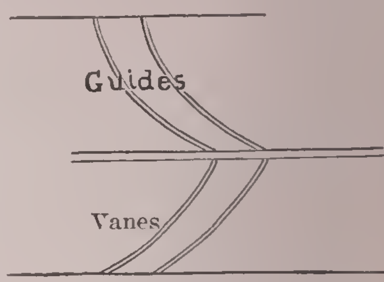

Fig. 8.

The weight of the turbine and shaft may be supported by a suspension box at the top of the shaft, as seen in Fig. 1, but a more common method is that of a wooden step at the bottom of the shaft, as shown in Fig. 4, where a pipe, *f*, is provided through which water is forced to prevent the heating of the bearing by friction. In Fig. 10 a form of step is shown where the shaft, *c*, revolves on a hemispherical seat, *b*, and lubrication is insured by oil which enters through the pipe, *h*, and passes out through *l*. In the large Niagara turbines there is a thrust-bearing at the top, but the weight of the wheel and shaft is supported, when in motion, by the upward pressure of the water on a disk in the upper part of the wheel-case.

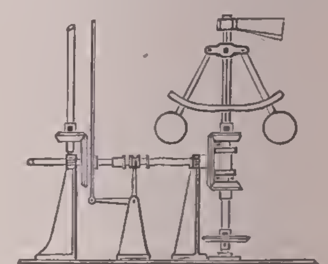

Fig. 9.

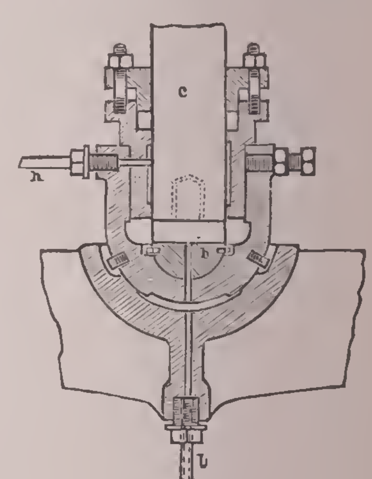

Fig. 10.

An impulse turbine is one in which the spaces between the vanes are not filled with water, and the velocity of the water when entering the wheel is that due to the head. A reaction turbine is one in which the spaces between the vanes are entirely filled with water, which at the same time is under a certain degree of static pressure; the velocity of the water when entering the wheel is then usually much less than that due to the head. Most turbines are built on the reaction principle, but when the gate is partially closed the spaces between the vanes are not filled and they become impulse turbines.

For every turbine there is a certain velocity, called the advantageous velocity, which gives the highest efficiency and power. This advantageous velocity can be ascertained by trial, or it may be approximately computed theoretically when the angles which the guides and vanes make with the direction of motion are known. These angles are controlling factors in the design of turbines, and they are materially different for the two classes of impulse and reaction turbines. A common method is to arrange these angles so that the advantageous velocity shall be that due to half the total head of water.

The large turbines installed in 1894 and 1895 by the Cataract Construction Company, for the utilization of a portion of the power of Niagara Falls, are the most powerful ever built. Three turbines have been erected, each of 5,000 horse-power, and the entire plant is intended to include ten such turbines. Each turbine consists of two outward-flow wheels attached to the same shaft. Fig. 11 shows a vertical section of the lower wheel, the other being $11\frac{1}{2}$ feet above it: the fixed guide spaces are marked G, while the wheel itself is marked W. The gate in this case, designated by E, is on the outside of the wheel. The water is brought to the turbine through a steel penstock, $7\frac{1}{2}$ feet in diameter, and the mean head is 136 feet. The wheel itself is 63 inches in diameter, and, as shown in the figure, it is divided into three stages by two horizontal partitions. The advantageous speed is 250 revolutions a minute, and the discharge about

13,800 cubic feet a minute. These wheels are of the reaction type, the spaces between the vanes being full of water for nearly all positions of the gate. They were designed by

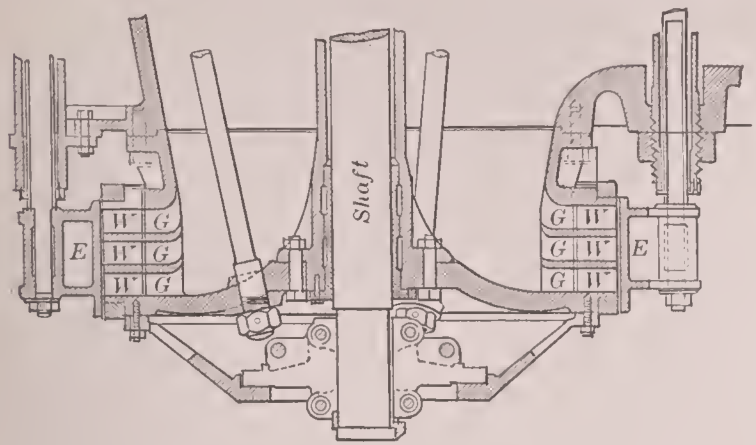

FIG. 11.

a Swiss firm, after an international competition in which engineers of five countries participated.

The theory of turbines is an extensive subject on which many volumes have been written. The fundamental principles of the theory are, first, that the water should enter the wheel without shock or foam; and, second, that it should leave the wheel with as small an absolute velocity as possible. The first requirement is fulfilled by giving proper angles to the guides and vanes at the circumference where the water enters; thus in Fig. 2, if $c\ e$ represent the absolute velocity of the entering water and $c\ b$ the velocity of the wheel, the line $c\ f$ will represent the velocity of the water relative to the wheel, and its direction will determine the entrance angle of the vanes. The second requirement is fulfilled by making the vanes cut the exit circumference at a small angle. As usually built the loss of energy in a turbine due to the absolute velocity of the escaping water is about 6 per cent. In axle friction about 3 per cent. is lost, while the resistance of friction to the water in passing through the wheel, together with foam and leakage, gives a loss of from 5 to 15 per cent. On account of their small size, cheapness, efficiency, and adaptability to both high and low heads, turbines are used more extensively than all other forms of hydraulic motors.

A very full descriptive and theoretical discussion of turbines is given in Meissner's *Die Hydraulik*, vol. ii. (Jena, 1878). See also Francis's *Lowell Hydraulic Experiments* (New York, 1884); Bodmer's *Hydraulic Motors, Turbines, and Water Pressure Engines* (London, 1889); and Merriman's *Treatise on Hydraulics* (New York, 1895). See HYDRAULICS and WATER-WHEELS. MANSFIELD MERRIMAN.

**Turbot**: a large flatfish, the *Psetta maxima*, of the North Sea and adjacent waters; highly esteemed as a food-fish. It is, next to the halibut, the largest flatfish of European waters, reaching a length of 3 feet and a weight of 30 or 40 lb. The general color is brown, with lighter shadings. The true turbot does not occur on the coasts of North America, but on the eastern side the name is bestowed on *Bothus maculatus* and in California on *Hypsopsetta maculata*. Both are medium-sized flounders of indifferent flavor, and both are common. See FISHERIES. F. A. LUCAS.

**Tur′didæ** [Mod. Lat., from *Turdus*, the typical genus, from Lat. *turdus*, thrush]: a family of birds containing the thrushes and allied forms. They are oscines with ten primaries, having a "booted" tarsus—i. e. the front covering of the tarsus entire for the greater part of its length; the young in their first plumage are more or less spotted. The robin and wood-thrush of the U. S. and the blackbird and song-thrush of Europe are typical thrushes. F. A. L.

**Turenne**, tü′ren′, HENRI DE LA TOUR D'AUVERGNE, Vicomte de: soldier; b. at Sedan, department of Ardennes, France, Sept. 11, 1611; a son of Henry, Duke of Bouillon, and Elizabeth, a sister of William I. of Nassau-Orange; was educated by his uncle, Maurice of Nassau, and entered the French army in 1630. During the Thirty Years' war he distinguished himself in subordinate positions in the campaigns in Germany and Italy; received an independent command in 1641; conquered Roussillon in 1642; was created a marshal of France in 1644, and contributed much to the conclusion of the Peace of Westphalia in 1648 by his successful campaigns in Germany and Flanders. In the wars of the Fronde he first sided with Condé, but having been defeated at Rethel in 1650 and driven out of France, he became reconciled with the court; was appointed commander-in-chief of the royal troops; defeated Condé at Gien, and nearly destroyed his army at the Faubourg St. Antoine in 1652, the Spaniards at Arras 1654, and Condé and the Spaniards in the Dunes 1658; and was made a marshal-general in 1660. In the war of the Spanish Netherlands (1667) he conquered Flanders in a brilliant campaign in which the king, Louis XIV., accompanied him, and in the war with Holland (1672) his fame reached its culmination by his conquest and devastation of the Palatinate in 1674 and the victories at Sinzheim (1674) and Türkheim (1675). He was preparing for a last and decisive encounter with Montecuculi, when he was killed by a cannon-ball during a reconnoissance near Sasbach, July 27, 1675. He is considered the greatest general France has produced, next to Napoleon. Turenne left *Mémoires*, comprising the period from 1643 to 1658, published by Grimoard in 2 vols. (1782). Deschamps, an officer of his staff, published some *Mémoires* in 1687 (new ed. 1756). His *Life* has been written by Ramsay (1733; trans. into English 1735), Raguenet (1738; new ed. 1877), Durny (5th ed. 1889), Hozier (1885). See also Neuber (Vienna, 1869), Roy (Paris, 1884), and Chappin (Brussels, 1888) for accounts of his military career. Revised by F. M. COLBY.

**Turf**: See HORSE-RACING.

**Turgénev**, toor-gā-nyef′: the name of several celebrated Russian authors. (1) ANDREĬ IVANOVICH, b. at Simbirsk in 1784; traveled in Germany, Italy, France, and Denmark to make investigations concerning the mediæval history of Russia, and published *Historiæ Russiæ Monumenta* (2 vols., St. Petersburg, 1841–42), and a *Supplementum* (1848). D. at Moscow, Dec. 15, 1845.—(2) His brother, NIKOLAĬ IVANOVICH, b. in 1790; studied at Göttingen; was, with Baron von Stein, placed at the head of the administration of those German countries which in 1813 were reconquered from France; studied subsequently the state of the serfs in Russia; was implicated in the conspiracy of 1825 and condemned to death, but escaped, and lived afterward in Paris. D. in Paris, Nov., 1871. He wrote *La Russie et les Russes* (3 vols., Paris, 1847).

**Turgénev**, IVAN SERGEEVICH: novelist; b. in the city of Orel, Russia, Oct. 28 (Nov. 9), 1818. He was partly brought up at home, but completed his education at Berlin (1838). In 1852 for his *Letter on Gogol*, although it had been passed by the Moscow censor, he was arrested and banished for two years to his estate. From 1863 to his death he lived abroad, chiefly at Baden Baden and Paris. Still he made frequent visits to Russia, and suffered not a little from homesickness in spite of the fact that he was on intimate terms with Flaubert and many others of the French writers of his day. In his ideas he was a *Zapadnik*, or admirer of Western Europe, for which, and for his residence in a foreign country, he was violently attacked by ardent Slavophils. Turgénev made his literary *début* with some verses (1841), but, though in the years that followed he wrote several pretty pieces, he does not rank high as a poet. His dramatic attempts, too, were failures. His earliest prose story, *Andreĭ Kolosov* (1843), did not attract great attention, but its successors were more fortunate. In 1847 appeared *Khor and Kalinych*, the first of his *Zapiski Okhotnika* (Tales of a Sportsman), which continued for four years and put him in the front rank of living authors. These were followed by other stories and sketches almost equally successful: in 1852 *Dimitri Rudin*, the first one long enough to be called a novel; in 1859 *Dvorianskoe Gnesdo* (A Nest of Noblemen, in some translations called Lisa); in 1862 *Nakanune* (On the Eve, in some translations Hélène); in 1862 *Ottsy i Deti* (Fathers and Sons), perhaps his masterpiece; in 1867 *Dym* (Smoke); in 1877 *Nov* (New, in some translations Virgin Soil), and many smaller pieces, the last of which, his exquisite *Poems in Prose*, came out only just before his death, which occurred at Bougival, near Paris, Aug. 22. (Sept. 3), 1883. As a writer Turgénev is characterized by his keen realistic insight into the weaknesses of mankind, always showing, however, a lurking sympathy and tenderness. His characters are marvelously vivid and true to life, while his appreciation of the beauties of nature is profound. None of his stories is long. They have perfect unity, cohesion, and in both substance and style the finish of a great artist. They have been translated into many languages, into French largely by the author himself. A new English edition (7 vols.) by Mrs. Constance Garnett is being published. A. C. COOLIDGE.

**Turgot**, tür'gō': ANNE ROBERT JACQUES, Baron de l'Aulne: statesman and economist; b. in Paris, May 10, 1727; was educated for the Church, but gave up the ecclesiastical career in 1751; studied law and national economy; became noted as a liberal thinker and an advocate of religious toleration, and wrote several essays for the *Encyclopédie*. Early in his career he entered into relations with the physiocrats Quesnay and Gournay, whose views were in some points identical with his own, and whose influence had an important effect upon his economic policy. In 1761 he was appointed intendant—that is, governor—of the province of Limousin. His administration was eminently successful, and although his reforms were crippled by his egotism of the privileged classes and the stupidity of the unprivileged, they proved beneficial. In 1774 Louis XVI. appointed him Comptroller-General of France—that is, Minister of Finance—and he immediately went to work to save, if possible, the state from bankruptcy. His ideas were essentially the same as those subsequently adopted and carried out by the Revolution, and the courtiers, the nobility, the clergy, etc., raised a veritable storm around him. For some time, however, the king supported him faithfully. In 1775 a scarcity of grain occurred, which almost grew into a famine. The artificial barriers between the provinces of the realm, which trammeled the free trade in grain in the interior, Turgot abolished; he compelled the Parliament to acknowledge the measure, and the riots of the mob, excited by secret emissaries of the courtiers, were speedily suppressed by military power. But at this point the king failed him. Although he said that he himself and Turgot were the only two who loved France truly, yet he suddenly dismissed him in May, 1776. Turgot retired into private life, occupying himself with scientific researches. D. in Paris, Mar. 20, 1781. His *Œuvres complètes*, containing his essay on usury, on the best method of taxation, and *Réflexions sur la Formation et la Distribution des Richesses*, etc., were published by Dupont de Nemours in 9 vols. (1808–11), and often reprinted. His *Life* was written by Condorcet (1786) and Tissot (1862). See also A. Neymarck, *Turgot et ses Doctrines*, 1885. He is the author of the famous line on Franklin—*Eripuit cœlo fulmen sceptrumque tyrannis.* Revised by F. M. COLBY.

**Tu'rin** (Ital. *Torino*; Lat. *Augus'ta Taurino'rum*): chief city of Piedmont, Northwest Italy; on the left bank of the Po; lat. 45° 4′ N., lon. 7° 42′ E.; elevation 784 feet above sea-level (see map of Italy, ref. 3–B). It is an industrial city, and makes silks, ribbons, lace, and bonnet-goods; also matches, leather, and tools. Its situation is picturesque. The town is so regularly laid out and built with so much uniformity as to be monotonous, but the constructions replacing the old ramparts and place of arms give some variety. The only building representing the architecture of the Middle Ages is the Madama Palace, a vast building flanked with towers, on Castello Place. The churches are very numerous, but not especially interesting. The city is especially rich in monuments raised in honor of celebrated Italians. The university is, next to that of Naples, the most frequented in Italy. Its library, now become national, has upward of 200,000 volumes and 3,000 MSS. The Egyptian museum of the Academy of Sciences is one of the best in the world, and the Academy of Fine Arts and the Royal Museum of Arms have fine collections. The climate of Turin is salubrious, but variable. The winter is cold and the spring inconstant. The mean annual temperature is 53°, and the mean annual rainfall 32 inches, with eighty-seven rainy days a year. It is the fourth city in size of Italy, is very modern in character, agreeable and full of business, rapidly growing, and affording charming sites for further expansion. Pop. of commune (1893) 335,900.

Turin owes its origin and name to a Celtic-Illyrian tribe, enemies of the Etruscans and faithful allies of Rome. Cæsar established the colony from which the city grew, calling it *Colonia Julia*, afterward changed by Augustus to *Colonia Augusta Taurinorum*. Lying near the border of Italy, it has undergone many vicissitudes and had many different masters. It was the political capital of the duchy of Savoy, and later of the kingdom of Sardinia from the Napoleonic occupation to 1861; and from 1861 to 1865 capital of the kingdom of Italy. With the removal of the capital to Florence, and then in 1871 to Rome, it received a brief check to its prosperity, since overcome. MARK W. HARRINGTON.

**Turkestan'**, or **Turkistan** [liter., country of the Turks; as *Turk* + Pers. *stan*, place, district, region]: a name of varying signification, political, linguistic, or geographic, but always centering about the great interior basins of Asia, generally those of the Tarim river, of Lake Balkash, and of the Sea of Aral. The name is passing into disuse as a general term, but is still employed to designate Chinese and Russian Turkestan.

By Chinese Turkestan, sometimes Eastern Turkestan, is meant by Western geographers the basin of the Tarim, comprising all the southern part of the immense district called *Kansuh-Sin-kiang* by the Chinese. It is mostly a desert, very sparsely occupied, except in the extreme west in the vicinity of Kashgar, was in the path of the migration of nations, and has often changed masters. It was formerly called Little Bokhara by Europeans, Mogolistan during the empire of the Khans of Jagatai, and Kashgaria during the ephemeral domination of Yakub Beg (1878). When recovered by the Chinese it was given the name already mentioned, and meaning the "New Frontier of Kansuh."

The Russian general government of Turkestan was formed in 1867, and later modified so that it now consists of the three provinces of Syr-Darya, Ferghana, and Samarkand. Area, 257,134 sq. miles; pop. (1890) 2,670,035, of whom about 930,000 are Kirghiz, 800,000 Sarts, 400,000 Uzbegs, 353,000 Tajiks, 23,000 Russians (not including troops), and 1,000 Germans, Poles, etc. The capital is TASHKEND (*q. v.*), in Syr-Darya. The next cities in importance are Samarkand and Khojend. Less than 5 per cent. of Russian Turkestan is cultivable, and less than 3 per cent. is actually cultivated. The population is chiefly nomadic and pastoral. MARK W. HARRINGTON.

**Turkey**: a gallinaceous bird, domesticated in many civilized countries, but confined to North America until after

The turkey.

its discovery by Columbus. It was found in the forests from the Isthmus of Darien to Canada when the country was first settled, being then abundant even in New England. See MELEAGRIDIDÆ and POULTRY.

**Turkey**, or more properly the **Ottoman Empire**: an empire comprising large portions of Europe, Asia, and Africa, and having its political center and capital at Constantinople, a city on the Thracian Bosphorus. Politically, geographically, ethnographically, and ecclesiastically, the Ottoman empire is an incongruous bundle of heterogeneous elements. Its territorial possessions may be grouped as direct and indirect. The direct are under the immediate authority of the sultan, whether governed by the common law of the empire or enjoying certain concessions and hence called privileged. To the latter class belong the communities of the Mirdites, Mt. Athos, Zeitoun in Asia Minor, the Lebanon, and Crete. The indirect are vassal provinces, nominally part of the Ottoman empire, but either administered by some foreign power or practically independent. These are Bosnia and Herzegovina, placed by the treaty of Berlin (1878) under the military occupation and civil administration of Austria-Hungary; Cyprus, by secret treaty of June 4, 1878, between Great Britain and Turkey, assigned to

Great Britain to be occupied and administered by her so long as Russia holds Batoum, Ardahan, and Kars; Tunis, occupied by France in 1881; Egypt, since 1882 under the military occupation and control of Great Britain; Bulgaria, created by the treaty of Berlin a tributary principality; Eastern Roumelia, by treaty of Berlin made an autonomous province subject to the sultan, but by revolution (1886) united to Bulgaria. See BOSNIA, CYPRUS, TUNIS, EGYPT, and BULGARIA. This article deals only with the direct possessions which constitute the empire.

*Turkey in Europe* occupies the central portion of the Balkan peninsula. It lies between 42° 50′ and 38° 56′ N. lat. and 19° 20′ and 29° 10′ E. lon. It is bounded N. by Montenegro, Bosnia, Servia, Bulgaria, and the Black Sea, E. by the Black Sea and Bosphorus, S. by Greece, the Ægean Sea, the Dardanelles, and Marmora, W. by the Adriatic and Ionian Seas. It includes also the island of Thasos. Area, 67,810 sq. miles. Its situation is advantageous, possessing an extensive coast-line with many harbors. On the W. are the Gulfs of Drino, Durazzo, Avlona, and Arta; on the S., of Salonica, Kassandra, Monte Santo, Rendina, Kavala, Lagos, Enos, and Saros. It terminates toward the S. E. in the commanding peninsula inclosed by the Black Sea, the Bosphorus, and Marmora. The general surface is broken and mountainous. The mountain system is complicated. Two main ranges, one the Messoro Dagh, which is a northern prolongation of the Pindus, and to which different names are applied, and the other, Despoto Dagh or Rhodope, emerge from the general confusion, proceed generally S. E., and divide the country into three sections of dissimilar shape but nearly equal area. These mountains sometimes attain a height of over 9,000 feet. The first section is Albania; the second, Macedonia, which comprises part of Thessaly; the third, Thrace. Albania is a mass of roughly parallel ranges, through which the rivers Boyana, Drin, Scoumbi, Loum, Voïoutza, Kalamas, and Arta force their way to the Adriatic and Ionian Seas. Here are also the large deep Lakes of Scutari, Ochrida, Janina, Prespa, and Kastoria. All this region is strategically commanded by the table-land of Janina, which is from 1,300 to 1,700 feet above the level of the sea. The ground is fertile only in a few localities, the climate rigorous and moist. Agriculture is in a most backward state, both from the poverty of the soil and from the aversion of the inhabitants to fixed pursuits. Oak, pine, box, and beech forests abound. In the second section, Macedonia, are the rivers Vistritza or Indji Kara Su and Vardar, emptying into the Gulf of Salonica, and the Strouma and Mesta or Kara Su, emptying into the Ægean. The Maritza, the largest river of Thrace, enters the Gulf of Enos. Macedonia and Thrace are fertile, but poorly cultivated. The forests have been almost destroyed. The climate corresponds with that of the same latitude and altitude in Southern Europe. Goats and sheep are exceedingly numerous, the latter furnishing the favorite food-supply. Buffaloes and even mules and asses are employed in cultivation rather than horses and oxen. Cattle and the live-stock generally are inferior. Great attention is paid to the bee and silkworm. Game is plentiful. The bear, wolf, stag, deer, and wild hog are found in Albania and Macedonia; the wolf and jackal in Thrace. Vultures, falcons, buzzards, hawks, and kites abound. Eagles are seen only in the mountains. Maize and the vine are extensively cultivated; also the fig, olive, and pomegranate in the south; wheat, rice, rye, barley, tobacco, cotton, hemp, and flax grow in the plains and low valleys; beans, peas, lentils, onions, cabbages, beets, and cucumbers are raised; the favorite fruit-tree is the plum. Rock-salt, copper, silver, and gold exist in certain localities, but mining is hardly undertaken. The numerous thermal and sulphurous springs are sometimes utilized for baths.

*Turkey in Asia* comprises the Sporades islands in the Ægean, Asia Minor, Crete, the vast basins of the Euphrates and Tigris, Syria, and the west coast of Arabia. Area, 686,370 sq. miles, or more than ten times that of the direct Ottoman possessions in Europe. This widespread territory, exclusive of Arabia, is included between 41° and 28° N. lat. and 25° and 48° E. lon. It is bounded N. by the Dardanelles, Marmora, Black Sea, and Russia, E. by Russia, Persia, and the Persian Gulf, S. by the Mediterranean and the Great Syrian Desert, W. by Africa, the Mediterranean, and Ægean. Turkish Arabia or El Hedjaz and Yemen is a strip of land nearly 1,000 miles long and of indefinite breadth, extending the entire length of Arabia along the Red Sea. Turkey in Asia comprises the many ancient kingdoms and provinces of Asia Minor, Judæa, Syria, Mesopotamia, and Assyria. It includes the modern political divisions of Anatolia, Karamania, Armenia, Kurdistan, El Djezireh, Irak Arabi, and Syria. Its coast is long, sinuous, and abounding in gulfs with natural harbors. Syria is indented by many tiny bays. For further details of that country, see SYRIA. Asia Minor has on the S. the Gulfs of Iscanderun or Alexandretta, Adalia, and Macri, between which project the headlands of Anemour and Khelidonia; on the W. the Bays of Symi, Kos, Mandelia, Scala Nova, Smyrna, and Edrimid, with the Capes Krio, Sancta Maria, Koraka, Karabournou, Baba, and Koum Kaleh, along which may still be seen the splendid ruins of the Dorian, Ionian, and Æolian Greek cities; in the Marmora, the Bays of Artaki and Panormo on either side of Cyzicus, and of Moudania and Ismid; in the Black Sea, innumerable bays, but none of large dimensions, the most notable being those of Sinope, Samsoun, and Trebizond, with the Capes Karpeh, Baba, Karembeh, Indjeh, Boztepeh, Tchalti, Yasoun, and Ieros. The mountain system is even more irregular than in European Turkey. From the great plateau of Armenia, which spreads in every direction around Ararat (17,212 feet), its central point, the Anti-Taurus Mountains extend W. and the Taurus Mountains S. W. across Kurdistan to the Gulf of Iscanderun. Thence the latter range sends the Amanus chain S. into Syria and the Argæus chain N. W. toward the Anti-Taurus and over Asia Minor to the shores of the Ægean. Many of the peaks are over 10,000 feet in height and are covered with snow almost throughout the year. In the Amanus Mountains are the famous Cilician and Syrian Gates, the only passes to the Euphrates and Syria. The Anti-Taurus joins the range of the Bithynian Olympus, from which irregular spurs diverge southward. In addition, isolated peaks and disconnected ranges dot the face of Asia Minor. The most important mountains are Kaz Dagh (*Ida*), dominating the Troad; Manisa Dagh (*Sipylus*), commanding Smyrna and Phrygia; Boz Dagh (*Tmolus*), above Sardis; Tashtali Dagh (*Chimaera*); Ershishi Dagh (*Argæus*), 13,200 feet, an extinct volcano, like Sipylus; Kershish Dagh (*Olympus*). Kurdistan is a wild, mountainous region, sloping southward to El Djezireh (*Mesopotamia*) and Irak Arabi, which form a succession of deserts and steppe lands broken by hills to the Persian Gulf. In Arabia the coast belt owned by Turkey is bordered on the E. by lofty mountain ranges, which collect moisture and thus render it more fertile than the rest of the peninsula. In Asia Minor, from its physical formation, there are few great rivers, and all are winding. The principal are Kizil Irmak (*Halys*), nowhere over 200 feet wide, but over 500 miles long, though the direct distance from its source to its mouth is less than 160 miles; Yeshil Irmak (*Isis*); Muhalitch Chaï (*Rhyndacus*); Khodja Chaï (*Granicus*); Mendereh Chaï (*Scamander*); Buyouk Mender Chaï (*Mæander*); Khodja Chaï (*Xanthus*); Keupri Su (*Eurymedon*); Seikhun Chaï (*Sarus*); Djehan Chaï (*Pyramus*); Tersus Su (*Cydnus*). The most important in the empire are the Euphrates, 1,750 miles, and Tigris, 1,000 miles. Both rise in the plateau of Armenia and finally unite as the Shatt-el-Arab, which empties into the Persian Gulf. The lower course of these rivers was anciently exceedingly fertile, highly cultivated, densely populated, a center of civilization, the seat of the Chaldæan and Babylonian empires. Assyria was W. of the Tigris. Lakes are numerous, some without known outlet, and very salt. The larger are Touz Tcholli, Igridi, Beishehr, and Ak Shehr, in the middle of Asia Minor; and Isnik and Aboullonia, near the Gulf of Moudania. Lake Van, in Armenia, 80 miles by 40, area 1,550 sq. miles, is an inland sea. In a territory so extensive as Turkey in Asia, drawn out through so many degrees of latitude, every kind of soil and climate and the greatest variety of mineral, vegetable, and animal products must exist. Asia Minor is rich in copper, iron, coal, petroleum, lead, meerschaum, and marble. Gold and silver are found in Kurdistan, bitumen and naphtha along the Tigris. The soil is generally fertile. Immense tracts are given up to pasturage. The plains of the interior are scantily wooded, but covered with wormwood, sage, and broom. Large forests, in which oak and fir predominate, spread inland from the Black Sea. Cypresses and junipers abound in the Taurus; plane-trees grow everywhere. Wild grape-vines grow freely in the lowlands and on the western coasts. The vineyards furnish excellent wines. Garden vegetables and fruits of all sorts are abundant. Hemp, flax, cotton, rice, tobacco, indigo, saffron, and madder grow plentifully. Armenia produces wheat, and has chestnut and oak forests. Kurdistan is largely woodland. In El Djezireh trees are rare, but the lilac, jasmine, and vine grow in profusion. In Irak Arabi every kind of palm is found. There the soil is very fertile, but, on account of poor irrigation, the yield of barley and rice is small, though tobacco and cotton succeed better. The melons reach an enormous size, often weighing over 100 lb. Through Turkey in Asia the ox is rare, the buffalo being preferred both as source of food and as beast of labor. The camel likewise supplants the horse, but the horses, mules, and asses are large and strong. The sheep is the most common domestic animal, but its flesh and wool are poor except in the region of Angora, which is justly celebrated for its goats, sheep, rabbits, and cats. The bee and silkworm are reared, especially in Kurdistan, El Djezireh, and Irak Arabi. Game abounds. Flocks of wild sheep live in the Taurus. Partridges swarm near the Dardanelles and swans on the Kutchouk Mender (*Caystrus*). The stork is the bird most frequently seen and most typical of the country. Carnivorous beasts are the bear, leopard, wolf, hyæna, and jackal. Lions are found in the swamps bordering the Tigris and Euphrates. Locusts infest El Djezireh. Despite the almost boundless resources of Turkey in Asia, commerce is little developed, manufactures have terribly decreased during the last century, and the country has grown steadily poorer. This is largely the fault of an improvident and feeble government. Yet the system of administration has somewhat improved, property and life have become less insecure, and injustice is less prevalent than at any other period since the foundation of the Ottoman empire. The real reason for decline must be found in economic causes. Home manufactures in both Europe and Asia, as the muslins of Mosul and the woolen stuffs of Macedonia, have been crowded out by the introduction of machine-made and cheaper European goods. The Oriental is unable to appropriate the inventions and methods of the European, and is invariably worsted in the competition. Moreover, lack of roads, due to governmental indifference and to Oriental lack of enterprise, has largely hindered development of resources. The enormous cost of transport of agricultural articles, generally bulky and often perishable, paralyzes their production at a distance from the coast.

*Turkey in Africa* comprises Tripoli and Benghazi or Barca. It is mainly included between the Mediterranean and the Great Desert, though touching Egypt on the E. and Tunis and Algeria on the W. Its inland boundaries are indefinite. Area, 308,500 sq. miles; according to Turkish estimate, 398,840 sq. miles. The Gulf of Sidra (*Syrtis Major*) partly separates Tripoli and Barca. Ras Sem (*Phycus*) and Ras Tourba (*Zephyrium*) are the most northern capes. There are few good harbors. A belt of fertile land borders the coast. Farther S. are sandy plains and ranges of rocky mountains. The rivers are small, and, like the wells and watering-places, are often dry. Water is deficient, but wherever it is found the fruits, vegetables, and cereals are excellent and abundant, especially the date, olive, lemon, orange, mulberry, tobacco, wheat, and barley. Most of the inhabitants live in tents, and are nomads. Their flocks and herds and agriculture in a primitive way furnish their principal support. The population consists of Moors, Arabs, Kabyles, Ottomans, Negroes, Jews, and Europeans. The latter, mainly Maltese, and the Jews are the traders. The climate is healthful and not disagreeable, notwithstanding the heat. The temperature in winter rarely descends below 50° F., and in summer is ordinarily maintained at from 85° to 95°; when the wind blows from the desert, at from 104° to 113°. Tripoli, being less remote than the other Barbary states, is traversed by the chief caravan routes from the interior to Northern Africa. The caravans bring ostrich-feathers, gold-dust, ivory, dye-woods, skins, and cereals, and carry back cloth, silk, arms, iron, sugar, drugs, glass, coffee, dry-goods, and manufactured articles of all kinds. Barca includes ancient *Cyrenaica*, the remains of whose cities lie along the coast. See TRIPOLI.

*Constitution and Government.*—The Ottoman empire is an absolute monarchy. Succession is hereditary in the family of Osman, vested since 1617 in the person of its oldest male member. The ruler is the sultan or *padishah*. His person is inviolable; he is irresponsible. This absolutism is modified by essential conditions of the Mussulman faith and by certain customs which have the force of laws. Since the conquest of Egypt (1517) by Selim I. the sultan is caliph or spiritual head, not only of his own Mussulman subjects, but of the entire Mussulman world. He is represented in temporal affairs by the grand vizier, first appointed in 1327, and in spiritual affairs since 1523 by the Sheik-ul-Islam. (See MUFTI.) The state ministers are hardly more than state secretaries. Their departments at present are war; marine; interior; foreign affairs; justice and worship; finances, mines, forests, and civil list; *evcaf* (property of mosques and philanthropic institutions); public works; commerce, and agriculture; public instruction; artillery; presidency of the council of state. There is also the divan, a deliberative body; the council of state, charged with the elaboration of laws; and the senate, whose functions are honorary. The government is often styled the Porte, or Sublime Porte. A constitution, proclaimed by Abd-ul-Hamid II. (Dec., 1876), guaranteed equal rights to all subjects, and applied to them without distinction the name Ottoman, heretofore reserved to the Mussulmans. It conferred the privileges enjoyed in the most civilized countries, and instituted a representative chamber. Save for a brief season this constitution has been inoperative. Political legislation is called *kanoun*, and is based on the codes of Mohammed II. and Suleïman I. The civil and religious legislation is that of the *sheriat*, or sacred law of Islam. The *hatti sherif* (1839) and *hatti humayoun* (1856), imperial rescripts of Sultan Abd-ul Medjid, proclaimed general reforms whereby non-Mussulman subjects were to be raised to full equality with Mussulmans. But the intolerance and inertia of the dominant race have rendered these rescripts generally a dead letter in almost all their provisions, such as acceptance of Christian testimony in trials, right of Christians to bear arms, and eligibility to all offices. Foreigners are not amenable to Ottoman law, but by virtue of the so-called capitulations are tried in their own courts. The slaves are the only legally subordinate class. There is no aristocracy. Manumitted slaves and persons of the humblest origin often attain the highest positions. For administrative purposes the empire was divided in 1868 into vilayets (governments), administered by a vali (governor-general), named by the sultan, and assisted by an administrative council. The vilayet is subdivided into sandjaks (provinces); the sandjak into casas (districts); the casa into nahiehs (communes). The name, number, and size of the vilayets is often changed. According to the last apportionment (1889) there are seven vilayets in Europe—Adrianople, Salonica, Kossova, Monastir, Janina, Scutari in Albania, Constantinople with the two sandjaks of Bigha (Dardanelles) and Ismid in Asia; twenty-four vilayets in Asia—Hudavendighiar, Aïdin, Archipelago, Crete, Konieh, Adana, Angora, Kastamuni, Sivas, Trebizond, Erzeroum, Van, Bitlis, Diarbekir, Mamuret-ul-Aziz, Dersim, Aleppo, Lebanon, Syria, Mosul, Mesopotamia, Bassora, Hedjaz, Yemen; two vilayets in Africa—Tripoli and Benghazi.

*Army and Navy.*—Military service is incumbent on every Mussulman subject twenty years of age—three years in the infantry or four in the cavalry or artillery (after five months of active service one may purchase exemption for the remainder of the period); then three or two years in the *shtiad* (reserve), eight in the *redif* (landwehr), six in the *mustafiz* (landsturm). In the navy—five in active service, three in the reserve, four in the landwehr. Non-Mussulmans pay the *haratch* (tax) of about 30 piasters and are not liable. The army is organized in seven *ordus* (corps d'armée), each commanded by a *mushir* (marshal). The headquarters are at Constantinople, Adrianople, Monastir, Erzinghian, Damascus, Bagdad, and Sanaa. There are also three separate divisions, one each in Tripoli, the Hedjaz, and Crete. An ordu consists of divisions, brigades, regiments, battalions, and companies. There are sixty-six *nizam* (regular) infantry and forty-two cavalry regiments. The artillery is in a state of disorganization or attempted organization. The cannon are largely Krupp guns. The infantry are supposed to be armed with Mauser magazine-rifles, though few have been delivered to the troops. It is the endeavor to follow the German system in organization and tactics. No accurate statement exists or can be made of the number of soldiers. The real effective on either peace or war footing differs largely from the nominal force and the cadres are never full. The Government believes the army to number 250,000 in time of peace, and claims ability in case of war to put over 1,000,000 men into the field. Probably not half as many could be raised or officered and equipped. The large number constantly under arms during past years has been a main cause of the decrease in the Mussulman population and of its increasing poverty, as compared with the non-Mussulmans. The Ottoman soldier is docile, patient, enduring, abstemious, content with little, and when behind fortifications almost unconquerable. But, since the foundation of the empire, he has seldom been victorious against Christians in the open field, except when far superior in number. On paper the navy is formidable—forty-one ironclads, almost all obtained in Great Britain, and 131 other vessels of all sorts; also sixteen in process of construction; nominally manned by 977 officers, 30,000 sailors, and 9,650 marines. Yet most of the ships are so superseded or unseaworthy, the crews are so incompetent and so deficient in discipline and experience, and the commanders so generally incapable, that the Ottoman navy hardly counts as a fighting power. Nevertheless in 1877–78 the fleet did excellent service in the transport of troops. See ARMY and SHIPS OF WAR.

*Finance, Money, Weights and Measures.*—In 1854 the empire contracted its first foreign loan; this was succeeded at short intervals by others, until in May, 1875, the total debt was 5,023,860,500 francs, or about $1,000,000,000. Hardly more than half of this enormous sum had been received by the Government. In Oct., 1875, the Government, unable to pay the interest due, announced that during the next five years half the interest would be paid in cash and half in new bonds. The following year it declared that no further payment would be made till internal affairs became more settled. Until 1881 no part of the interest or sinking fund was paid. Then delegates of the foreign bondholders met at Constantinople and effected an arrangement which the Government embodied in the formal decree of Dec., 1881. The various loans, except bonds of the Roumelian Railway, were consolidated and grouped. A commission of delegates was authorized to administer the excise revenues of the empire entirely separate from all other revenue. The acknowledged debt is now over $600,000,000. In this is not included $155,364,000 due Russia as war indemnity, of which $1,539,991.20 is to be paid annually without interest, and also $1,539,991.20 as indemnity to Russian subjects. This payment is guaranteed by the revenues of the vilayet of Konieh. The revenue for 1889–90 was estimated by the budget committee as about $81,400,000, and the expenditure as about $94,160,000. Though the court and palace expenses have been reduced by the present sultan, they must still be very large. Any estimate as to their amount is mere conjecture. The piaster (4·4 cents) is the unit of value. Forty paras make one piaster; 100 piasters make one lira or Turkish pound. Paper money (*kaïmeh*) and copper are withdrawn from general circulation. Notes of the Imperial Ottoman Bank circulate at par. Common coins are pieces of 1, 2, 5 (beshlik), 10 (onlik), and 20 (*medjidieh*) piasters; gold coins are ¼, ½, 1, 2½, and 5 liras. The metallic currency (with exception of gold) is of different issues and alloys, and fluctuates in value. The decimal system of weights and measures was introduced in 1882 and declared obligatory in 1892, but the old names, as of oke and arshine, were retained, and much confusion has resulted.

*Commerce.*—A tax of 8 per cent. *ad valorem* is levied on all imports, except articles for embassies, consulates, schools, and churches, which are admitted free. The introduction of salt and tobacco is prohibited, they being Government monopolies. There is an export customs duty of 1 per cent. on native goods sent abroad, and of 8 per cent. between the different provinces of the empire. The repeated efforts of the empire to reform the customs tariff in its own interest have always encountered the determined opposition of the foreign powers.

| YEARS. | Imports. | Exports. |
|---|---|---|
| 1889–90 | $92,582,688 | $66,758,692 |
| 1890–91 | 100,822,876 | 56,480,468 |
| 1891–92 | 108,037,336 | 67,528,220 |

The value of the imports (1891–92) was: From Great Britain, $44,884,972; Austria-Hungary, $20,227,592; France, $13,294,028; Russia, $8,223,556; U. S., $142,780. The chief imports were linen goods, piqué, sugar, woolen and cotton goods, cereals, cotton thread, medicines and dyes, coffee, rice, duck-cloth, petroleum, skins, animals, iron, cloths, cashmere, butter and cheese, manufactured iron, paper, timber, made clothing, dry goods, silk, bags—·576 being manufactured articles, ·03 animals, ·132 raw materials, and ·262 food articles. The value of the exports (1891–92) was: To Great Britain, $30,197,288; France, $19,830,800; Austria-Hungary, $5,422,888; Russia, $1,114,564; U. S., $1,024,364. The chief exports were cereals, raisins, raw silk, opium, mohair, nuts, coffee, wool, skins, figs, cotton, drugs and dyestuffs, minerals, animals, vegetables, dates, olive oil, carpets, seeds, sesame, fish—·089 being manufactured articles, ·024 animals, ·308 raw materials, and ·579 food articles.

*Shipping and Navigation, Internal Communications.*—The merchant marine consisted in 1900 of 2,205 sailing vessels, of 141,055 tons, and of 177 steamers, of 55,983 gross tons. In 1897–98 altogether 173,739 vessels, of 34,653,457 tons, entered or cleared from Ottoman ports—from Constantinople alone 14,931 vessels of 10,348,269 tons. The mails are largely in the hands of foreigners. Great Britain, France, Germany, Austria-Hungary, and Russia have their own post-offices at Constantinople and in most of the seaboard cities. The Government has made many fruitless attempts to close these foreign offices and to bring the entire postal department under its own control. The number of Ottoman offices in 1889–90 was 1,442; receipts, 4,190,842 francs; expenses, 1,641,633 francs. Through the Ottoman mails passed 9,403,000 domestic letters and 48,000 postal cards, and 3,649,000 foreign letters and 66,000 postal cards; also 559,000 foreign letters and 12,000 postal cards going to foreign countries. Telegraphs: Length of wires, 31,969 miles; receipts (1888–89), 51,615,526 piasters; expenses, 17,669,044 piasters. Railways (Oct., 1899): 1,240 miles in Europe and 1,713 in Asia Minor. The gross receipts in 1899 were $6,333,036.84. See TURKEY in the Appendix.

*Population.*—No other country presents such variety of races and creeds; nowhere is it more difficult to obtain trustworthy statistics. Equally trustworthy authorities differ by 5,000,000 or 6,000,000 in their estimate of the number of the inhabitants. No reliable census has ever been taken. Mussulmans and non-Mussulmans are alike interested in avoiding enumeration, the former to escape conscription, the latter to escape the *haratch*, or capitation tax. The great majority of the subjects may be classed in seven main racial groups: Turkish, including the Ottomans, Yurouks, and Turcomans; Græco-Latin, including Greeks, Moldo-Wallachians, and Albanians; Slavic, including Bulgarians, Servians, and Kossacks; Georgian, including Circassians and Lazes; Hindu, represented by the gypsies; Persian, including Armenians and Kurds; Semitic, comprising Arabs, Jews, Chaldæans, Druses, Syrians, and Maronites. The population of the empire is estimated at about 40,000,000; that of Turkey in Europe, which is more accurately known, is about 4,780,000. In Europe the Ottomans, Albanians, and Greeks must be of nearly equal numbers, each about 1,300,000. The majority of the Albanians are Mussulmans. The Christian Albanians in the north, called Ghegs, are Roman Catholics, and use the Latin alphabet; those of the south, called Tosks, are members of the Greek Church, and use the Greek alphabet. Their dialects are very different, and they hate each other cordially. Macedonia is inhabited principally by Greeks, Bulgarians, Ottomans, Albanians, Moldo-Wallachians, and Servians. Thrace is peopled by a mixed multitude of Ottomans, Greeks, Bulgarians, Jews, Armenians, gypsies, Circassians, by members of other subject races, and foreigners. The Greeks predominate along the coast, not only in Europe and the islands, but in Asia, where they devote themselves to navigation, and, together with the Jews, Armenians, and foreigners, are the tradesmen and bankers. In Asia Minor there are about 9,000,000 Ottomans, double all the other inhabitants of that peninsula put together. The Yurouks are nomadic, and the Turcomans pastoral. Since the conquest of the Caucasus by Russia there has been a large immigration of Tartars and Circassians. The Armenians are scattered everywhere, though many still remain in their ancient country, Armenia. Northern and Central Kurdistan are occupied by 1,000,000 Kurds, ostensibly Mussulmans. They are a fierce people, never entirely subjugated in their mountain fastnesses, a perpetual trouble to their nominal masters, the Ottomans. Their neighbors, the Armenians, have always suffered greatly at their hands, as in the outrages of 1894–96. The 4,000,000 or 5,000,000 of Arabs in Syria, Irak Arabi, and Turkish Arabia are of two classes, sedentary and nomadic. The latter, the Bedouins, by far the more numerous, are the typical Arabs. Though of the same faith as the Ottomans, they are their inveterate foes, and, as far as possible, defy their authority. In case of war, the Porte can count upon only the 10,000,000 or 11,000,000 of Ottomans, on a possible million of Circassians, Tartars, Yurouks, Turcomans, Lazes, and Zebecks, and perhaps on the assistance of the Kurds and Albanians. The remaining 15,000,000 or 16,000,000 members of subject and non-Moslem races controlled by force are secretly hostile or at best indifferent. Pop. of different towns (estimated in 1889): In Albania—Scutari 36,000, Janina 20,000; in Macedonia—Salonica 122,000, Monastir 50,000; in Thrace—Constantinople 900,000, Adrianople 70,886; in Asia Minor—Smyrna 225,000, Broussa 75,000, Manisa 50,000, Kaisairieh 45,000, Trebizond 45,000, Adana 45,000, Konieh 40,795, Sivas 39,368, Angora 37,000, Marash 35,000, Kastambol 33,000; in Armenia—Erzeroum 60,000, Erzinghian 30,000, Van 30,000; in Kurdistan—Mosul 57,000, Kharpout 35,000, Diarbekir 25,000; in Irak Arabi—Bagdad 180,000; in Syria—see SYRIA; in Arabia—Mecca 80,000, Medina 80,000, Sanaa 50,000; in Africa—Tripoli 30,000.

*Religion and Education.*—The state religion is Islam or MOHAMMEDANISM (*q. v.*), but other religions have always been tolerated and have enjoyed a certain degree of protection and freedom. Since the capture of Constantinople (1453) the Porte has preferred to deal with its non-Mussulman subjects as members of different religious communities rather than of distinct nationalities. So the religious chief of each church or sect is regarded by the Government as the civil head and representative of his coreligionists; its church organization has become to each subject people not only a religious institution, but a national center and the preserver of its national existence and language. The principal religious communities thus officially recognized by the Porte are: The Eastern Orthodox or GREEK CHURCH (*q. v.*), with its Œcumenical Patriarch of Constantinople and its Patriarchs of Antioch, Jerusalem, and Alexandria; the Armenian or Gregorian Church, the oldest national church in existence, with its Patriarchs of Constantinople, Sis, and Jerusalem; the Protestant Armenian community, with an official representative or *vekil*; the Jewish community, with a *khakham bashi* or grand rabbi. There are, moreover, a number of less prominent or less numerous religious groups, all recognized and represented. Education has made marked progress since about 1850, specially in the vicinity of the capital and large towns. This advance is due to the efforts of the Government, to the awakened sentiment of the people, and to the Protestant and Roman Catholic missionaries, whose work is largely educational. Formerly Mussulman education was entirely in the hands of the ulema and derived from the school attached to the mosque; that of the Christians was limited to such rudimentary branches as were taught in the school invariably connected with each Greek or Armenian Church. The imperial school of medicine, founded in 1826 by the Government, has been followed by a large number of colleges and of other high institutions, military, naval, polytechnic, etc., and of primary and secondary establishments. The subject nationalities have vied in founding many of various grades for their own children.

*History.*—The Ottomans are a Turkish tribe, originally from Khorassan. Numbering only 400 families, they were led by their chief, Ertogroul, into Asia Minor in 1231. The Seljuk sultan, Alaëddin I., grateful for aid chivalrously afforded him in battle, bestowed on Ertogroul some pasture-lands on the river Sangarius E. of the Bithynian Olympus. This insignificant territory, a few square miles in extent, was the nucleus of the Ottoman empire. There Ertogroul and his followers, hitherto pagans, embraced Islam. The sword played no part in their conversion, and their descendants have continued faithful and zealous Mussulmans. On the dissolution of the Seljuk empire, Othman, son of Ertogroul, was proclaimed *padishahi ali Othman*, Sultan or Emperor of the Ottomans, and his followers have ever since been called from his name Ottoman or Osmanli. His first official act was the erection of a mosque. His possessions slowly increased. At that time Asia Minor was broken up into twelve principal states, one of which consisted of the possessions of Othman, and into many minor fragments. The whole presented a ready field of conquest to whichever power was stronger or more ably governed than the rest. In Europe the Byzantine empire, which still held territories in Asia Minor, had never recovered from its conquest by the Latin crusaders, and the entire Balkan peninsula was divided between jealous and antagonistic petty states. Yet the rapid growth of the Ottoman empire was not due primarily to favoring circumstances, but to the pre-eminent abilities of its early sultans as warriors, statesmen, and organizers, and to the sober and austere virtues of their followers. The first seven sultans, OTHMAN I., ORKHAN, MURAD I., BAYAZID I., MOHAMMED I., MURAD II., and MOHAMMED II. (*qq. v.*), possessed the qualities requisite to the founding of states. Broussa was besieged and made the capital (1325). A code was formulated, the JANISSARIES (*q. v.*) and *sipahis* (cavalry) organized, money coined, and red adopted as the national color before 1330. Tzympe, the first Ottoman acquisition in Europe, was captured (1359); then Adrianople (1365). Gradually Asia Minor and the Balkan states were subdued. The frightful defeat of Bayazid I. at Angora by Tamerlane (1402), and the consequent eleven years' interregnum, threatened the very existence of the empire. Yet when Mohammed II. succeeded (1451), it had already become more strong and compact than before. The Seljuks, as fast as they were subdued, fused with the Ottomans. So did vast numbers of Christians, who became Moslems in the conquered European states. No distinction was made between the born Moslem and the convert. All, the original Ottoman, the Seljuk, and the convert from Judaism or Christianity, were considered equally Ottoman. The majority of grand viziers from 1359 to 1895 have been of Christian or Jewish origin. Duration was assured the empire by the capture of Constantinople (1453), which was at once made the capital. Under MOHAMMED II., BAYAZID II., SELIM I., and SULEÏMAN I. (*qq. v.*) the empire steadily expanded, reaching its acme in the reign of the latter. The unsuccessful siege of Vienna (1529) and of Malta (1565) were its first real checks. Then Europe learned that the Ottomans were not invincible. Their empire in the sixteenth century was the most powerful in the world. It comprised all the European, Asiatic, and African countries situated on the Mediterranean, except Morocco, Spain, France, and Italy; all the coasts of the Black Sea, and nearly all of the Red Sea; Hungary and all the kingdoms S. of the lower Danube. Its possessions extended from 47° 30′ to 12° N. lat., and from 3° W. lon. to 48° 30′ E. lon. Austria and Venice paid tribute; the European powers rivaled each other in congratulating the Ottomans on every victory and in seeking their good will and favor. Yet already the empire was beginning its slow, apparently intermittent, but constant and inevitable decline. Prominent causes of this decline were the gradual abandonment of direct government by the sovereign, and his customary withdrawal into seclusion; the consequent increasing influence of the HAREM (*q. v.*) in political and military affairs, and the demoralization of the janissaries, the Ottoman right arm in war; the progress made by the hostile Christian states in wealth and civilization, while the Ottomans deteriorated, or at best stood still; the fact that the last twenty-four sovereigns, with the exception of Murad IV., Mahmud II., and Abd-ul Hamid II., have each been inferior in ability to any one of the first ten sultans; above all, because the Ottoman empire from the first has resembled an armed camp, because it has always consumed and never produced, because it has lived on the countries which it conquered without conferring any benefits upon them. After the decline began, subsequent fruitless conquests, as of Cyprus (1570), Erivan (1635), and Crete (1669), and infrequent victories only varied the monotony of such irreparable disasters as Lepanto (1571), St. Gothard (1664), Vienna (1683), Zenta (1697), Peterwardein (1716), Belgrade (1717), Tcheshmeh (1770), Ismaïl (1790), Navarino (1827), and Plevna (1878). The whole humiliating history is best indicated by the successive treaties of Sivatorok (1606), when the empire first receded; Carlovitch (1699), by which it was first dismembered; Passarovitch (1718), Kaïnardji (1774), Jassy (1792), Adrianople (1829), resulting in the first recognition of the independence of a hitherto subject people; San Stefano (1878), when Turkey submitted to the loss of several provinces; and Berlin (see BERLIN CONGRESS), when the last treaty was practically ratified by Europe. Even the treaties least unfavorable, Falksen (1711), Belgrade (1730), Bucharest (1812), and Paris (1856), after the Crimean war, contained no permanent or real advantage for the Ottomans. (See TREATIES.) The term "sick man of the East," commonly attributed to the Czar Nicolas, was used in reference to Turkey after the treaty of Carlovitch (1699). The empire is now protected by its relative weakness, which inspires no suspicion or dread, by the mutual jealousies of the European states, and by the antagonisms of its subject non-Mussulman races against each other, which prevent their union. See TURKEY, HISTORY OF, in the Appendix. See also ABD-UL AZIZ, ABD-UL HAMID, ABD-UL MEDJID, MAHMUD, MOHAMMED, MURAD, MUSTAPHA, OTHMAN, SELIM, and SULEÏMAN.

C. Thomson, *The Outgoing Turk* (1897). E. A. GROSVENOR.

**Turkey-buzzard**: the *Cathartes aura*, the commonest of American vultures, resembling a turkey in size and appearance. It is 2½ feet in length and 6 feet in spread of wing; the general color is blackish, lighter on the wing coverts; head and upper part of neck bare and reddish. It ranges throughout the greater part of the U. S., except the most northern and eastern portions, and thence southward over nearly all of South America. It feeds on carrion and is remarkable for its sustained sailing flight. It must not be confounded with the smaller black vulture, or carrion crow, *Catharista atrata*. See also CATHARTIDÆ. F. A. LUCAS.

**Turkey Red**: See DYEING.

**Turkey-stone**, or **Turkey Oil-stone**: a siliceous rock of very fine grain used for sharpening cutting-tools; so-called because obtained from Asia Minor. See HONE.

**Turkish Language**: the most important member of the Ural-Altaic or Ugro-Tartaric family of languages. It is spoken by the Osmanli or Ottoman Turks, regnant since 1453 in the Eastern Roman or Byzantine empire. There are really two Turkish languages: (1) That of the common people, a virtually unmixed language, spoken in its greatest purity by the Turkoman nomads, and practically covering the vast territory lying between the Danube and the western confines of China; and (2) the elevated language used in official life and in the higher flights of both prose and poetry. This elevated language has borrowed freely from both Arabic and Persian. All terms relating to religion, theology, politics, and law have been taken from the Arabic, while Persian literature, and the fact that the Turks first accepted Islam at the hands of the Persians, have caused another host of Persian words to be incorporated into Turkish. In order, therefore, to understand the elevated language, one must know well both Arabic and Persian. But it is with especial reference to the language of the common people, the practically unmixed language, that this article would give information, since its structure is fully preserved in the elevated language.

Originally, Turkish was written in an alphabet of its own, but this was abandoned long ago for the Arabic alphabet, to which were added several Persian letters, thus raising the number to thirty-three, or, if lam-élif be counted in, to thirty-four. Most of these letters have one form when they stand alone, another form at the beginning, another in the middle, and still another at the end of a word. The alphabet is therefore virtually a fourfold one. The names, order, and value of these letters are as follows, it being noted that the right-hand column gives the nationality of the words in which the several letters are used.

| Order. | Name. | Value. | In Turkish, Arabic, or Persian words. |
|---|---|---|---|
| 1 | élif | a e *i ü u* | t. a. p. |
| 2 | bé | b | t. a. p. |
| 3 | pé | p | t. –. p. |
| 4 | té | t | t. a. p. |
| 5 | sé (té) | s (Gr. $\theta$) Eng. th | –. a. –. |
| 6 | jim | Eng. j | t. a. p. |
| 7 | chim | Eng. ch (church) | t. –. p. |
| 8 | ha | h (aspirated) | –. a. –. |
| 9 | khĭ | German ch | t. a. p. |
| 10 | dal | d | t. a. p. |
| 11 | zel (zal) | z | –. a. –. |
| 12 | rĭ (ra) | r | t. a. p. |
| 13 | zé (za) | z | t. a. p. |
| 14 | zhé | French j | –. –. p. |
| 15 | sin | s | t. a. p. |
| 16 | shin | sh | t. a. p. |
| 17 | sad | sharp s | t. a. p. |
| 18 | dad | z dh | –. a. –. |
| 19 | tĭ (ta) | d t | t. a. p. |
| 20 | zi (za) | hard z | –. a. –. |
| 21 | ayn | no equivalent (breathing) | –. a. –. |
| 22 | ghayn | hard g = gh | t. a. p. |
| 23 | fé | f | t. a. p. |
| 24 | kâf | palatal k | t. a. p. |
| 25 | kef (kyef) | k g n | t. a. p. |
| 26 | gyef-i 'adjemi | y | t. –. p. |
| 27 | saghyr noon | ñ (ng) | t. –. –. |
| 28 | lam | l | t. a. p. |
| 29 | mim | m | t. a. p. |
| 30 | noon | n | t. a. p. |
| 31 | vav | v w | t. a. p. |
| 32 | hé | h (t) | t. a. p. |
| 33 | yé | y | t. a. p. |
| 34 | lam-élif | la | t. a. p. |

All of these letters are consonants, though élif, vav, hé, and yé are sometimes used as vowels. The vowels are indicated by seven vowel-signs or diacritical marks, which need not be explained here; these signs, however, are rarely employed, except in the case of a rare or foreign word. This fact adds immensely to the difficulty of learning to read Turkish. In fact, one can not read with ease until one knows and speaks the language. Turkish writing is therefore a kind of stenography. The Turks write from right to left, so that what with us is the end of a volume is with them the beginning. The numerals alone are written from left to right. They have no capital letters and make but little use of punctuation. The accent is usually on the last syllable of a word.

The Turkish language is in some respects the most remarkable of known tongues. It is conspicuous for the pronounced agglutinative character of its grammatical forms, for its law of vowel harmony, for the absolute regularity of its one declension and one conjugation, and for the extreme simplicity and transparency of its syntactical construction. Max Müller has said that "if a college of the most distinguished scholars had met for the purpose of constructing a language, nothing more regular or symmetrical could have come from their hands than we have here in this living tongue"; and again, "but no such society could have devised what the mind of man produced, left to itself in the steppes of Tartary, and guided only by its innate laws, or by an instinctive power as wonderful as any within the realm of nature."

Turkish illustrates most wonderfully the agglutinative stage of language. Under *agglutination* is meant the simple appending of fixed particles to a fixed root in order to modify in various ways the meaning of the root. Primitive languages made free use of agglutination, as may still be seen in Sanskrit, Greek, and Latin. The familiar *-mi*, *-si*, *-ti*, in

| Sanskrit, | Greek, | Latin, |
|---|---|---|
| *as-mi* | *ἐσ-μί (ἐμ-μί)* | *es-um* |
| *asi* | *ἐσ-σί* | *es* |
| *as-ti* | *ἐσ-τί* | *es-t* |

are illustrations of it. In modern languages, however, the tendency has been to reject agglutination and to obscure its particles or suffixes. Only the initiated can trace it, say, in English (slay*eth*, kill*ed*), which is as conspicuous for the neglect of agglutination as Turkish is for its employment. To illustrate agglutination in Turkish, take the fixed particles *lar*, *yñ*, *dan*, which are the signs for the plural, for the possessive pronoun of the second person singular, and for the ablative case. Now take the word *at*, which means *horse*, append thereto these agglutinative particles in the order given above, and there results a word *at-lar-yñ-dan* (*atlaryñdan* = from thy horses). In what follows illustrations of agglutination will abound. These agglutinative particles are called *post*positions in contradistinction from *pre*positions. The Turkish makes no use of any kind of *pre*position.

The second instance cited above to show the remarkable character of Turkish is the law of vowel harmony. In all the languages of the Turkic class the root is never obscured, but remains virtually unalterable, no matter what or how many syllables (postpositions) are added to the end of the root to modify its meaning. The vowels of such modifying syllables are not fixed, but are regulated by a law of euphony, which requires the vowels of the postpositions to harmonize with the vowel immediately preceding the postposition. That is, if the root vowel be hard (a, o, u, y) or soft (e, i, ö, ü), the vowel of the postposition must be hard or soft to correspond therewith. Thus, for instance, the ending of the genitive singular may be either (1) *-yñ*, (2) *-uñ*, (3) *-iñ*, (4) *-üñ*, according as the end vowel of the word is (1) *a* or *y*, (2) *o* or *u*, (3) *e* or *i*, (4) *ö* or *ü*. In like manner the ending of the aor. act. 1st pers. sing. may be (1) *-dym*, (2) *-dum*, (3) *-dim*, (4) *-düm*, according as the end syllable of the verb-stem be (1) *a* or *y*, (2) *o* or *u*, (3) *e* or *i*, (4) *ö* or *ü*. Let the following serve as illustrations of the law of vowel harmony:

(1) *at*, horse.
*at-yñ*, of the horse.
*bak* = see, *bak-dym*, I saw.
(2) *dost*, friend.
*dost-uñ*, of the friend.
*boz* = spoil, *boz-dum*, I spoiled.
(3) *ev*, house.
*ev-iñ*, of the house.
*gel* = come, *gel-dim*, I came.
(4) *göz*, eye.
*göz-üñ*, of the eye.
*büz* = draw together, *büz-düm*, I drew together.

In a similar manner a number of postpositions have either the vowels *a* or *e* according as hard or soft vowels precede. Thus the ablative plural of (1) is *at-lar-dan*, but of (3) is *ev-ler-den*, while the negative of (1) is *bak-ma-dym* (I did not see), but of (3) is *gel-me-dim* (I did not come).

There is no definite article in Turkish, and no gender other than natural gender. Strictly speaking, there is no declension of the noun, the case-endings being really agglutinative suffixes or postpositions, which are appended to the unchanged stem (which is seen in the nominative and vocative cases), and thus form what we are accustomed to call the genitive, dative, locative, accusative, and ablative cases.

There is but one such declension, and one noun is here inflected, but as the vowels of the postpositions vary according to the law of vowel harmony, eight different nouns would have to be inflected to illustrate the declension fully.

*Sing.*

| | |
|---|---|
| Nom. | *Adam*, the man. |
| Gen. | *Adam-yñ*, of the man. |
| Dat. | *Adam-a*, to the man. |
| Loc. | *Adam-da*, at (by) the man. |
| Acc. | *Adam-y*, the man. |
| Abl. | *Adam-dan*, from the man. |
| Voc. | *Adam*, man. |

*Plur.*

| | |
|---|---|
| Nom. | *Adam-lar*, the men. |
| Gen. | *Adam-lar-yñ*, of the men. |
| Dat. | *Adam-lar-a*, to the men. |
| Loc. | *Adam-lar-da*, at (by) the men. |
| Acc. | *Adam-lar-y*, the men. |
| Abl. | *Adam-lar-dan*, from the men. |
| Voc. | *Adam-lar*, men. |

As in English, the adjective is indeclinable and stands before its noun. So *böyük bagh*, the large garden; *böyük baghyñ*, of the large garden; *böyük baghlar*, the large gardens; *böyük baghlardan*, from the large gardens. As in German, French, Italian, etc., the numeral *one* (*bir*) is used for the indefinite article, as *bir kara tash*, a black stone. The comparative and superlative are formed by placing *daha* and *en* respectively before the positive, as

| | | |
|---|---|---|
| *kütchük*, | *daha kütchük*, | *en kütchük*. |
| small, | smaller, | smallest. |

But when two things are compared the simple ablative case with the positive of the adjective expresses the comparison, as *at eshekden eyi dir*, a horse is better than a donkey. A superlative peculiar to Turkish is in common use, viz., if the adjective begins with a consonant, then the first two letters of the adjective plus some consonant serve to make a superlative prefix, as *kuru*, dry: *kup kuru*, very dry; *yash*, wet: *yam yash*, very wet; *bosh*, empty: *bom bosh*, quite empty; *mavi*, blue: *mas mavi*, very blue; *sary*, yellow: *sap sary*, quite yellow.

The verb, however, is the chief glory of Turkish; it is the most complete and most transparent in existence. Here, too, law reigns supreme, so that after one has mastered a complete conjugation, no further difficulties are encountered, as there are no irregularities or exceptions. The root is always seen in the second person singular of the imperative, and it remains unchanged throughout, except that final *t* or *k* is changed under certain circumstances to *d* or *gh*. But that, too, is law. The verb not only has moods and tenses sufficient for expressing every shade of doubt, conjecture, hope, and supposition, but new verbal roots are created by adding to the original verb-stem certain postpositions which modify the original meaning of the verb-stem and create other moods that are inflected regularly. In this way a negative, a reflexive, a reciprocal, an interrogative, a causal, a necessitative, an impossible, and a conditional mood are created.

Mere description can give no idea of the glory of the Turkish verb. Max Müller gives a list of thirty-six present infinitives (to which belong just as many imperatives), but a still more astonishing list of present tenses might be furnished. In the verb *atmak*, to throw, for instance, there is a positive present in both the active and the passive voices (*at-arym*, I throw, *at-yl-yrym*, I am thrown); a negative present in both voices (*at-ma-m*, I do not throw, *at-yl-ma-m*, I am not thrown); an impossible present (*at-ama-m*, I can not throw, *at-yl-ama-m*, I can not be thrown), and so on through a positive, a negative, and an impossible reciprocal present: a positive, a negative, and an impossible reflexive present; a positive, a negative, and an impossible causative present; a positive, a negative, and an impossible reciprocal causative present; a positive, a negative, and an impossible reflexive causative present, etc., with a reciprocal interrogative, a reflexive interrogative, an interrogative causative, a conditional, a necessitative, an optative, and a dubitative present, each with its positive, negative, impossible, reflexive, reciprocal, causative, and other forms in both moods to the number of over 300. The same refinement runs through the other tenses, the aoristic imperfect, past habitual, pluperfect, future, and past future in most of the moods. Space utterly forbids anything like even a synopsis of the present tenses.

For a discussion of the various dialects belonging to the Turkic class of languages, see Max Müller, *Lectures on the Science of Language* (London, 1875). For a good short account of Turkish literature, see Lane-Poole, *The Story of Turkey*. For a more extended study of Turkish literature, see Redhouse, *History, System, and Varieties of Turkish Poetry* (Leipzig, 1879), and von Hammer-Purgstall, *Geschichte der Osmanischen Dichtkunst* (4 vols., Pesth, 1836–38). The chief grammars of Turkish in English are by Wells, *A Practical Grammar of the Turkish Language* (London, 1880); Redhouse, *A Simplified Grammar of the Turkish Language* (London, 1884); Tarring, *A Practical Elementary Turkish Grammar* (London, 1886). The best dictionary is still Redhouse's *Turkish and English Dictionary* (London, 1884–87).

J. R. S. Sterrett.

**Turkistan**: See Turkestan.

**Tur'komans**: certain tribes of Turkish tongue scattered through Transcaspia, Turkestan, Persia, Khorassan, Western China, and Turkey in Asia. Their language is very similar to Osmanli Turkish, but physically they are much modified by Iranian intermixture. They are all zealous Sunnite Mohammedans, and are pastoral and nomadic.

**Turks**: in the broad sense, a race with definite and well-marked ethnic and linguistic characters which has played an important part in the history of Central Asia and Eastern Europe, and is now found scattered over a territory stretching from Yakutsk to Northern India and westward to the Mediterranean and Lithuania. It occupies but a part of this great territory, has extensively intermingled with Aryan and Mongol races, and comprises many different tribes divided into three general groups. The first or Oriental comprises the Yakuts, the Tartars of the Altai and of other parts of Siberia, and the Turks of China, otherwise called Daldes, Taranchi, Kashgarians, etc. The central group comprises the Kirghiz, the Uzbegs, the Tartars of Astrakhan, Lithuania, and the Crimea, and the Bashkirs with their Turko-Finnish mixtures. The western group includes the Turkomans, the Tartars of the Caucasus, the Tauridians of the Black Sea littoral, certain Turco-Iranians of Persia, and the Osmanli Turks, generally called Turks *par excellence*, though perhaps the most distant from the pure Turkish characters by extensive Aryan intermixture. The purest types are believed to be in the Crimea and among the Turkomans of Khiva. Some of the tribes, like the Jats of

India, have lost their language though preserving other characters. More than twenty dialects are known which fall into groups corresponding fairly with the grouping of races already mentioned. The most of the Turkish races are Mohammedan and employ the Arabic alphabet, with some modifications; a few formerly used the Sogdianian or Syrian, and some now the Russian, Greek, or Armenian. They were originally nomads, are generally courageous and warlike, haters of tillage, and eaters of flesh. See Vambéry's works, especially his *Das Türkenvolk* (1885), which is a complete monograph. MARK W. HARRINGTON.

**Turks Islands**: a group of small islands (Grand Turk, Salt Cay, and some uninhabited islets); physically, the south-easternmost of the Bahama group, but politically, with the neighboring Caicos islands, attached to the British colony of Jamaica. All are low, and Grand Turk, the largest, is only 7 miles long by 1½ miles wide. Several lagoons furnish an excellent quality of salt, and about 1,500,000 bush. are annually exported to the U. S. and British America. Total population of the Turks and Caicos islands (1891), 4,745, nearly all engaged in the salt industry. H. H. S.

**Turlupins**: See BRETHREN AND SISTERS OF THE FREE SPIRIT.

**Tur'meric**: the root of *Curcuma longa* (family *Zingiberaceæ*), a native of the East Indies and Cochin-China. It contains a volatile oil, a yellow coloring-matter (*curcumin*), starch, cellulose, gum, and a brownish dye. The root of *Canna speciosa*, a plant occurring in West Africa, also possesses the same physical and chemical properties. Turmeric is used in the dyeing of silk and wool, and is employed in pharmacy for coloring ointments, etc. The tincture of turmeric, or unsized paper stained with the aqueous or alcoholic solution (turmeric paper), is used in chemical operations as a test for the alkalies and for boric acid, which impart a reddish-brown color to the paper.

**Turnbull**, ROBERT, D. D.: clergyman and author: b. at Whiteburn, Scotland, Sept. 10, 1809; graduated at Glasgow University; was for some years a Baptist preacher in England and Scotland; in 1833 removed to the U. S., preaching at Danbury, Conn., 1833, at Detroit, Mich., 1835, at Hartford, Conn., 1837, at Boston, Mass., 1839; from 1845 to 1869 was pastor at the First Baptist church at Hartford, subsequently preached in several places, and was secretary of the Connecticut Baptist State convention; author of *Olympia Morata* (1842); *The Genius of Scotland* (New York, 1847); *The Genius of Italy* (1849); *Pulpit Orators of France and Switzerland* (1848); *Theophany, or the Manifestation of God in Christ* (Hartford, 1851): *Christ in History, or the Central Power* (Boston, 1856); and *Life Pictures* (New York, 1857); translated Vinet's *Vital Christianity* (1846); edited Sir William Hamilton's *Discussions on Philosophy and Literature* (New York, 1855); and for two years was joint editor of the *Christian Review*. D. at Hartford, Conn., Nov. 20, 1877.

**Turnbull**, ROBERT JAMES: political writer; b. at New Smyrna, Fla., in Jan., 1775, son of an English physician who married a Greek lady of Smyrna, and obtained, in connection with Lord Hillsborough, a grant from the British Government in 1772 for settling a Greek colony in Florida, but forfeited his rights by adhesion to the Revolutionary cause, and settled at Charleston, S. C. Robert was educated in England, studied law in Charleston and Philadelphia, and practiced at Charleston until 1810, when he devoted himself to the care of his residence on his large plantation; became a leader of the nullification party; was prominent in the free-trade conventions at Columbia and Charleston 1831, 1832, and at the South Carolina nullification convention of Nov., 1832, which adopted from his pen an address to the people. D. in Charleston, June 15, 1833. A fine monument was erected to his memory by his political associates. Author of *A Visit to the Philadelphia Prison* (London, 1797; trans. Paris, 1800) and *The Tribunal of Dernier Ressort* (1830); wrote much on politics for the Charleston *Mercury* 1827, and a collection of his articles from that paper, republished under the title of *The Crisis*, became the text-book of the nullification party.

**Turnbull**, WILLIAM: civil engineer; b. in Philadelphia, Pa., Oct. 9, 1800; graduated at the U. S. Military Academy July, 1819, when commissioned second lieutenant of artillery, but served on topographical duty until 1831, in which year he was transferred to the corps of topographical engineers with rank of captain; major 1838; was chief topographical engineer in construction of the Potomac aqueduct 1832–43. This work, the piers of which are founded by coffer-dams on rock (covered by sometimes 20 feet of mud), from 30 to 40 feet below the water-surface, was one of the earliest of important works of American engineering—the earliest of its type. He was in charge of improvement of lake harbors 1844–46. In the war with Mexico he served as chief topographical engineer of Gen. Scott's army, from Vera Cruz to the city of Mexico, gaining the brevet of lieutenant-colonel for gallantry at Contreras and Churubusco, and colonel for Chapultepec. In 1848–49 he superintended the construction of the New Orleans custom-house; engaged in the study of the question of bridging the Susquehanna at Havre de Grâce, and of the expediency of an additional canal around the Falls of the Ohio 1852; on lighthouse duty and in charge of the improvement of Cape Fear river, North Carolina, at the time of his death, at Wilmington, N. C., Dec. 9, 1857.—His son, CHARLES NESBIT, b. in Washington, D. C., Aug. 14, 1832, graduated at the U. S. Military Academy in 1854, and attained a captaincy in the corps of topographical engineers in 1862; was chief engineer of Gen. Sheridan's cavalry corps; also of the Eighth Army-corps; breveted colonel; resigned Dec. 31, 1865, and engaged in business in Boston, where he died Dec. 2, 1874.

**Turnbull**, WILLIAM BARCLAY: antiquarian; b. in Edinburgh, Scotland, in 1811; was called to the bar of Scotland 1832, to that of England 1856; was for several years secretary to the Scottish Society of Antiquaries; founded the Abbotsford Club 1833; was its secretary until 1841; edited for it many old MSS. and reprints of rare early publications, and was appointed, although a Roman Catholic, by Sir John Romilly in 1859 calenderer of the foreign correspondence at the state paper office, which post he resigned in 1861 in consequence of dissatisfaction with his method of presenting the religious transactions of the reigns of Edward VI. and Mary in the *Calendar* issued in February of that year. Among his other publications were *Legendæ Catholicæ* (1840); Audin's *Life of Luther* (2 vols. 8vo, 1854); *The Poetical Works of Rev. Robert Southwell* (1856); *The Poetical Works of William Drummond of Hawthornden* (1856); and *The Complete Works of Rev. Richard Crashaw* (1858); *An Account of the Monastic Treasures confiscated at the Dissolution of the Various Houses in England* (1836); *The Miscellany of the Abbotsford Club* (1837); and *The Chronicles of Scotland* (3 vols., 1857–58), the latter forming part of the Rolls Series. D. Apr. 22, 1863.

**Turnbull's Blue** (*Ferrous ferricyanide*): a kind of Prussian blue, which when dry is of a blue color with a reddish luster. It is precipitated when potassium ferricyanide is added to a solution of a ferrous salt; formula, $Fe_5(CN)_{12} + xH_2O$.

**Turnèbe**, tür'nāb', ADRIEN (*Turnebus*): classical scholar; b. at Andelys, in Normandy, France, in 1512; called to the chair of Greek in the University of Paris in 1547, where Scaliger was for a short time one of his pupils; director of the royal printing establishment 1552–56. D. June 12, 1565. Turnèbe is one of the greatest of French Hellenists, distinguished alike for his erudition and his critical genius. He printed the *editio princeps* of Philo, Synesius, Demetrius Triclinius's scholia to Sophocles with a valuable preface; edited Æschylus, Aristotle's *Ethics*, Cicero's *De legibus*; wrote commentaries to Varro's *De Lingua Latina*, and to Horace; and published admirable translations of Arrian, Oppian, Theophrastus, and of several treatises of Plutarch. See his *Opera* (3 vols. fol., 1600). Most of his critical emendations, covering a wide field of classical authors, are collected in his justly famous *Adversaria*, thirty books. A. G.

**Turner** (now **West Chicago**): village; Du Page co., Ill.; on the Burlington Route, the Chi. and N. W., and the Elgin, Jol. and East. railways; 30 miles W. of Chicago (for location, see map of Illinois, ref. 2–F). It is a manufacturing place, with rolling-mills, railway, machine, and carpenter shops, sash, door, and blind factories, creamery, pump-factory, office-furniture factory; and has 5 churches, 2 public-school buildings, a private bank, electric lights, and a monthly and 2 weekly periodicals. Pop. (1880) 1,001; (1890) 1,506; (1900) 1,877.

**Turner**, CHARLES TENNYSON: poet; b. at Somersby, Lincolnshire, July 4, 1808; third son of Dr. George Clayton Tennyson; educated at Louth Grammar School and Trinity College, Cambridge (1828–32), where he did admirable work in the classics, obtaining a Bell scholarship; became vicar of Grasby (Oct., 1835), where he passed the greater part of his life, beloved as pastor and highly esteemed for his good works; married (May 24, 1836) Louisa Sellwood, youngest sister of Lady Tennyson; assumed by royal license the name of Turner (1835), having inherited the Grasby living and Caistor house of his great-uncle, Rev. Samuel Turner. Besides *Poems by Two Brothers* (1827), which contained the juvenile verses of Charles and Alfred Tennyson, his works are *Sonnets and Fugitive Pieces* (1830); *Sonnets* (1864); *Small Tableaux* (1868); *Sonnets, Lyrics, and Translations* (1873); *Collected Sonnets, Old and New* (1880). D. at Cheltenham, Apr. 25, 1879. EUGENE PARSONS.

**Turner**, CHARLES YARDLEY: genre and landscape painter; b. in Baltimore, Md., Nov. 25, 1850; pupil of the National Academy and of the Art Students' League in New York, and of Jean Paul Laurens, Munkacsy, and Bonnat in Paris; National Academician 1886; second Hallgarten prize, National Academy, 1884; honorable mention, Paris Exposition, 1889; member of the American Water-color Society. Studio in New York. W. A. C.

**Turner**, JOSEPH MALLORD WILLIAM: landscape-painter; b. in London, Apr. 23, 1775. He was the son of a hairdresser, and entered the schools of the Royal Academy in 1789; studied perspective with Thomas Malton, and architectural drawing with Girtin, and drew from nature in pencil and water-color. He was elected a Royal Academician in 1802, and soon afterward traveled in France, Italy, and Switzerland. In 1807 he began his *Liber Studiorum*; in 1819 visited Italy, to which country he returned in 1829 and 1840. He had a most successful artistic career, and received many honors. D. at Chelsea, London, Dec. 19, 1851. He left his pictures to the nation, the National Gallery in London thus acquiring over a hundred finished works. His work was enthusiastically championed by John Ruskin, who wrote eloquently about his methods and his faithful study of nature, and exalted him at the expense of Claude Lorraine, who was considered the greatest of all landscape-painters at the time when Turner began to be known. Ruskin's criticism, while sincere and earnest, is pernicious in its effects, and has had much to do with preventing the development of an intelligent appreciation of art in England. Turner was undoubtedly a man of great talent and singularly gifted as a colorist, his chief claim to rank high as an artist depending indeed on the fine color quality of many of his works, much more than upon any real truth to nature. In his later work he paid little attention to form, and occupied himself almost entirely in working out elaborate color schemes, for which almost any subject served his purpose.

In the National Gallery, in London, in Room VI., are a large number of oil-paintings by Turner, most of them coming from his bequest to the nation. Among these are *Calais Pier* (1803); *The Garden of the Hesperides* (1806); *Crossing the Brook* (1813); *Apuleia in Search of Apuleius* (1814); *Rome from the Vatican* (1819); *The Bay of Baiæ*, called also *Apollo and the Sibyl* (1822); *Dido building the Fleet* (1828); *Ulysses deriding Polyphemus* (1830); *The Fighting Téméraire* (1839); *Bacchus and Ariadne* (1840); *The Burial of Wilkie at Sea* (1842). In Room IV. are the two pictures, *Snow Storm, Steamer Signalling* (1842), and *Rain, Steam, and Speed on the Great Western Railway*, of about the same epoch, together with a number of water-color drawings, some of great importance. In Room III. are several large pictures, including two celebrated ones of *Venice* and *Lake Avernus*. In Room IX. are *The Sun rising in a Mist* and *Dido building Carthage*, which two pictures Turner left to the nation with the express proviso that they should be hung beside the two large pictures by Claude Lorraine, *Landscape with Figures* and *The Embarkation of the Queen of Sheba*. In the basement of the building is a very large collection of drawings, all framed and arranged like books upon shelves. Some of these are of great value.

Many of Turner's most important works are in private hands, generally in Great Britain, and a few are in the South Kensington Museum. In New York, the *Scene on the French Coast* (1831) and *Staffa* (1832) are in the Lenox Library; *Norham Castle* and the *Fountain of Indolence* are in the collection of Mrs. W. H. Vanderbilt; and the *Slave Ship* is owned by Thornton Lathrop, Boston.

Turner produced some remarkable engravings, the chief of which are the set known as *Liber Studiorum*. Eighty or more plates were prepared for this publication, of which seventy-one were published. Their general character is that of an etching in line, very carefully and skillfully made, as the framework of the composition, the plate being then mezzotinted; but some few of the plates were engraved in different ways. Five or six pure mezzotints of great beauty also exist. Engravings after Turner's pictures and water-color drawings were made in great numbers, on a large and also on a very small scale. Among the important series of prints may be named the *England and Wales*, the *Yorkshire Series*, the *Harbours of England*, and the illustrations to Rogers's *Italy* (1830) and *Poems* (1834). See the *Lives* by Thornbury (1862), Hamerton (1878), and Monkhouse (1879).
WILLIAM A. COFFIN.

**Turner**, SAMUEL HULBEART, D. D.: clergyman and author; b. in Philadelphia, Pa., Jan. 23, 1790; graduated at the University of Pennsylvania 1807; was ordained deacon in the Protestant Episcopal Church 1811, and priest in 1814; was pastor of a church at Chestertown, Md., 1812–17; was elected Professor of Historic Theology in the General Episcopal Seminary, New York, Oct. 8, 1818; removed with that institution to New Haven, Conn., 1820, and returned with it in 1821 to New York, where it was combined with the New York Diocesan Seminary under the title of the General Theological Seminary, in which he was Professor of Biblical Learning and Interpretation of Scripture from Dec. 19, 1821, to his death, and also Professor of the Hebrew Language and Literature in Columbia College from 1831. He was the author of *Notes on the Epistle to the Romans* (New York, 1824); *Companion to the Book of Genesis* (1841); *Biographical Notices of Distinguished Jewish Rabbis* (1847); *Parallel References Illustrative of the New Testament* (1848); *Essay on our Lord's Discourse at Capernaum* (1851); *Thoughts on the Origin, Character, and Interpretation of Scripture Prophecy* (1852); *Teachings of the Master* (1858); *Spiritual Things compared with Spiritual* (1859); *The Gospels according to the Ammonian Sections and the Tables of Eusebius* (1861); an *Autobiography* (1862); and several volumes of sermons. He translated Jahn's *Introduction to the Old Testament* (1827), in which he was aided by Dr. W. R. Whittingham, and Planck's *Introduction to Sacred Philology and Interpretation* (1834); edited in Greek and English, with analytical and exegetical commentaries, the Epistles to the Hebrews (1852), to the Romans (1853), and to the Ephesians (1856). D. in New York, Dec. 21, 1861.
Revised by S. M. JACKSON.

**Turner**, SHARON: historian; b. in London, England, Sept. 24, 1768; became a successful attorney in London, but retired from the practice of his profession in 1829, and devoted the remainder of his life to literary pursuits, receiving a pension of £300 from the crown. D. in London, Feb. 13, 1847. The most valuable of his writings was the *History of the Anglo-Saxons* (4 vols., 1799–1805: 7th ed., 3 vols., 1853), which was long the standard authority. Besides other works in verse and prose, he also wrote *A History of England from the Norman Conquest to the Death of Elizabeth* (1814–23) and *The Sacred History of the World* (3 vols., 1832; 8th ed. 1848).

**Turner**, WILLIAM, M. D.: physician, clergyman, and naturalist; b. at Morpeth, Northumberland, England, about 1515; educated at Pembroke Hall, Cambridge, where he obtained a fellowship about 1531; studied medicine, botany, and theology; took orders in the Church of England; was imprisoned for preaching the doctrines of the Reformation; proceeded on his release to the Continent, and studied natural history at Zurich and Bologna; returned to England on the accession of Edward VI.; became physician to the Protector Somerset; prebendary of York 1550, dean of Wells 1550, and canon of Windsor; resided in Germany during the reign of Mary; was twice deprived of his deanery, and twice restored, 1553 and 1560, and at one time had a seat in Parliament. He was the author of *The Huntyng and Fyndyng out of the Romish Fox, by Witt. Wraughton* (Basel, 1543); *Avium præcipuarum, quarum apud Plinium et Aristotelem mentio fit, Historia* (Cologne, 1544); *The Rescuynge of the Romish Fox, etc., by Wuittyam Wraghton* (Winchester, 1545); *The New Herball* (book i., London, 1551; i. and ii., Cologne, 1562; i., ii., and iii., 1568), the first scientific work on botany by an English writer. He published a collation of the English Bible with the Hebrew, Latin, and Greek, and wrote the account of British fishes in his friend Johann Gesner's *Historia Animalium*. D. in London, July 7, 1568. Revised by S. M. JACKSON.

**Turner**, Sir WILLIAM, F. R. C. S., D. Sc., LL. D., D. C. L., F. R. S.: anatomist and naturalist; b. in Lancaster, England, in 1832; studied medicine in St. Bartholomew's Hospital, London, graduating M. B. in 1857; became a member of the Royal College of Surgeons, England, in 1853, and a fellow in 1893; was prosector in anatomy in the University of Edinburgh in 1854; and was elected Professor of Anatomy in that body in 1867. He has been coeditor of the *Journal of Anatomy and Physiology* 1866–94. Among his more important works are *An Introduction to Human Anatomy* (Edinburgh, 1875); *Lectures on the Comparative Anatomy of the Placenta* (Edinburgh, 1876); and *Atlas of Human Anatomy and Physiology*. S. T. ARMSTRONG.

**Turner,** WILLIAM WADDEN: philologist; b. in London, Oct. 23, 1810; removed to the U. S. 1818; was apprenticed to a printer in New York 1829; became distinguished for his attainments in modern and Oriental languages; was successively librarian to the University of New York and instructor in Hebrew in Union Theological Seminary 1842–52; assisted Dr. Isaac Nordheimer in the preparation of his Hebrew manuals; contributed to Bartlett's *Dictionary of Americanisms* (1848); translated von Raumer's *America and the Americans* (New York, 1845), and the greater part of Freund's *Latin-German Lexicon* for Prof. E. A. Andrews; superintended the publication of Dr. Stephen R. Rigg's *Dakota Grammar and Dictionary*, and other linguistic works issued by the Smithsonian Institution; contributed to Ludewig's *Literature of American Aboriginal Languages* (1858), to the *Transactions* of the American Ethnological and Oriental societies, *Iconographic Encyclopædia*, the *Bibliotheca Sacra*, and other periodicals. He was for several years recording secretary of the National Institute for the Promotion of Science, and librarian of the U. S. patent office from 1852 to his death, in Washington, D. C., Nov. 29, 1859.

**Turner's Falls**: village; Montague town, Franklin co., Mass.; on the Connecticut river, and the N. Y., N. H. and Hart. and the Fitchburg railways; 3 miles N. E. of Greenfield, the county-seat (for location, see map of Massachusetts, ref. 1–E). A canal 3 miles long here cuts off a long bend in the river, and three falls provide an enormous water-power, which is utilized by extensive manufactories. The village has a public library, a national bank with capital of $200,000, a savings-bank, a weekly and a monthly periodical, one of the largest cutlery-works in the world, 3 paper-mills, cotton-factory, foundry and machine-shops, and leather-factory. Pop. (1890) of town, 6,296; (1900) of town, 6,150.
EDITOR OF "REPORTER."

**Turnhout**, toorn'howt: town; province of Antwerp, Belgium; 25 miles E. of the city of Antwerp (see map of Holland and Belgium, ref. 8–F). It has large paper-mills, tanneries, dye-houses, and manufactures of cotton, flax, hemp, and lace. It was formerly a strong fortress, and in 1597 Maurice of Nassau, supported by a corps of English troops, engaged the Spaniards here, routed them, and captured the fortress. Pop. (1891) 18,747.

**Turning**: See LATHE.

**Turnip** [M. Eng. *turnep*; (perhaps) *turn*, implying something round + *nepe*, turnip < O. Eng. *nǣpe*, from Lat. *nāpus*, a kind of turnip]: a biennial plant, abundant throughout the temperate zone, having a swollen fleshy root of great value as food both for man and more especially for cattle. It is of the same genus (*Brassica*) as mustard, and of the species *B. rapa*. It is found growing wild as a weed in Europe and Northern Asia, and is largely cultivated both as a field and as a garden crop, sometimes reaching 20 or 25 lb. Turnips, when grown in gardens, may be sown early; when raised in the field, they are sown much later, and thrive best in moist cloudy weather. Though turnip-culture is of comparatively recent origin in Great Britain, it has already taken rank there as a most important field-crop, being fed to sheep in the fields, inclosed within hurdles or movable fences. Though an agreeable article of diet for man, it has never assumed great importance in that respect, owing to the enormous proportion of water, 87 to 92 per cent., in its composition. The ruta-baga or Swedish turnip is closely allied to it, but is held by some botanists to be specifically distinct, *B. campestris*. Revised by L. H. BAILEY.

**Turnip-fly**: any one of several insects destructive to turnips. The most common is the small chrysomelian beetle called also turnip-flea (*Altica* or *Haltica nemorum*), from its prodigious leaping powers, a species having an oval body and wide head, long and strong hind legs, large black wings with two yellowish stripes, and claws notched and hooked to enable it to keep firm hold of the cruciferous vegetables which constitute its food. It eats the leaves of the turnip as soon as they appear above ground in the spring, and lays its eggs on the under side of the leaves later in the season. The larvæ thus bred upon the plant are often extremely destructive to the turnip-root, in which they burrow. Other species are the *H. striolata*, or wavy-striped flea-beetle of the U. S.; the *Pontia oleracea*, potherb or white butterfly; and the *Anthyomia radicum*, a dipterous insect of the family *Muscidæ*, of the same genus as the cabbage-fly and the beet-fly, and especially abundant and noxious in Great Britain, where the latter is considered as the turnip-fly proper. Revised by F. A. LUCAS.

**Turnpike**, or **Turnpike Road**: a road, especially a highway, upon which turnpikes or toll-gates are established, and which are kept in repair by the tolls or fees collected from those who use the road.

In England the roads constituting the main lines of communication are, or formerly were for many years, chiefly turnpikes. Each parish, or township, or other particular district, is liable for the maintenance of all highways passing through its lands; but still many such roads are kept in repair, and were formerly built, under the authority of local acts of Parliament which vested their management for a certain number of years in trustees or commissioners who were empowered to erect toll-gates and levy tolls on those passing through as a means of raising a fund for defraying expenses of labor or improvement. The collection of such tolls, however, does not supersede other means for the maintenance of the roads. The turnpikes of England do not generally fall within the operation of the highway acts, and their construction and management are regulated primarily by the local acts relative to each particular trust, which (though temporary) were, until about the middle of the nineteenth century, continued by the legislature from time to time, as they were about to expire; and, secondly, are regulated by certain general acts, applicable (with very few exceptions) to all turnpike roads throughout the kingdom, that is, to all roads maintained by tolls and placed under the management of trustees or commissioners for a limited period of time. There were at one time in England many thousands of these turnpike trusts. In 1864 they numbered over 1,000, but in 1879 were reduced to a little over 200 by expiration of the trusts in accordance with the provisions of the Annual Turnpike Continuance Acts.

The first authorization in England for the erection of toll-gates was in 1346 under Edward III., and from that time the system spread throughout all England, Scotland, and Ireland, being regulated in each country by special laws. The first general turnpike act was that of 13 Geo. III., ch. 64, since which time numerous others have been passed, the effect of which has been to do away with turnpikes to a large extent, and place the roads and their maintenance under the charge of the county officers. The most important, as well as the earliest, of the general acts systematizing the turnpike laws now in force is that of 3 Geo. IV., ch. 126.

In Scotland there were formerly two main classes of roads, statute-labor roads and turnpike roads. The statute-labor roads were intended for local communication, and were maintained by personal services of tenants, cotters, etc., the services being later commutable to a money payment. Turnpike roads constituted the main lines of communication, and were maintained by tolls. These roads in Scotland, like those in England, were maintained by virtue of special acts, many of which were passed from time to time; but in 1878 an act was passed putting all the roads in each county under one system of management, abolishing statute labor, money commutation, and tolls, and substituting a rate upon land and heritages for the maintenance of the roads. This act was at first permissive, but became compulsory on June 1, 1883. Turnpike roads have also been abolished in Ireland.

England's various systems of maintaining roads were practically copied in her colonies. Thus in the U. S. many of the highroads for local communication in rural districts are maintained by the statute-labor system; in others they are maintained by some form of tax, usually a land tax. Where statute labor exists a provision is usually made for commutation into a money payment. Turnpike roads in the U. S. are constructed and maintained by corporations created either under general statutes or by special charters. The legislation of the several States upon this subject varies widely, but in general such corporations (which have practically the same general rights and duties as the commissioners or persons holding the turnpike trusts in England) stand in a position similar to railroad companies in regard to the exercise of the right of eminent domain, being considered so far public that they are authorized to take lands necessary for their own use, upon making adequate compensation to the owners thereof, and even to appropriate existing highways when necessary to carry into effect the rights and privileges granted by their charters. They are also given power to lay and collect tolls, and to erect gates to insure their payment, the rates of tolls, the distance between the gates, and various other details being frequently regulated by their charter. Owing to the importance of the franchise granted in bestowing a right to make and maintain a turnpike road, and the ease with which the rights of the parties concerned may be violated either by the turnpike company or the public, as the case may be, the rights and duties of the turnpike company and of the public are very strictly prescribed by the statutes or charters under which the turnpike companies or trusts are created. Turnpike roads are becoming less numerous, their construction and maintenance being assumed by, or imposed upon, municipal corporations.

Sometimes roads are constructed so that by taking a circuitous route a person traveling upon a turnpike may avoid passing through the toll-gates, and so avoid the payment of toll. These circuitous routes were called *shunpikes*, and they may be erected when public necessity demands it, but the laws are stringent against their being made with the intent and effect of depriving the turnpike company of its legal tolls.

In return for their franchises it is the duty of the turnpike companies to keep the road-bed and its appurtenances in good repair, and in such condition and manner as the statutes prescribe, at least so long as they do not surrender their charter by ceasing to demand payment of tolls. For a failure to comply with this requirement they may be held liable in an action for damages by a person injured through their negligence, and also to an action for such penalties or annullment of their charter as the law provides for. As concerns its use, a turnpike is in every respect a public highway, free to all, except that the legal toll must be paid as a condition of use; and the rules of law concerning the encroachment upon highways apply equally to turnpikes.

F. STURGES ALLEN.

**Turnsol**: another name for LITMUS (*q. v.*). See also ARCHIL.

**Turnspit**: a kind of dog, formerly employed for turning the spit upon which meat is roasted. The turnspit is a very intelligent dog, with a long body, short and often crooked legs, long and pendent ears, and a very large head. It has a dash of greyhound blood. Two or more dogs were kept, to relieve each other at the task, the dog standing in a kind of treadmill, his weight giving motion to the spit. The breed is apparently very old, as similar dogs are figured on the monuments of ancient Egypt.

**Turnstone** [so called from its habit of overturning stones in search of food]: the *Strepsilas interpres*, a wading bird of the family *Hæmatopodidæ*, allied to the plovers, and common on the shores of the U. S. and in nearly all parts of the world. On the Pacific coast is found *S. melanopus*, the black turnstone.

**Turpentine** [from O. Fr. *turbentine* < Lat. *terebin'thina*, *terbin'tina* (sc. *res'ina*, gum), turpentine, liter., fem. of *terebin'thinus*, of the terebinth or turpentine-tree, deriv. of *terebin'thus*. See TEREBINTH]: any one of certain vegetable oleo-resins which exude from coniferous trees, also the resin obtained from the *Pistacia terebinthus*. They are obtained by making an excavation, having a capacity of about 3 pints, in the trunk of the tree, in which the exuded juice accumulates, which is collected, washed with warm water, and purified by straining through straw filters. The several varieties of turpentine are viscid solutions of resin in a volatile oil. American turpentine is chiefly procured from the *Pinus palustris* and the *Pinus tæda*, the principal supply coming from North and South Carolina and Georgia. French and German turpentines greatly resemble the American in most of their properties. Venice turpentine, which is obtained from the *Tarax europæa*, is a ropy, slightly greenish liquid having a rather unpleasant odor and taste. Canada turpentine is produced from the *Abies balsamea* (see BALSAM, CANADA), growing in Canada and the northern part of Maine. The remaining varieties of turpentine are the Strassburg, the Hungarian, and the Chian, which differ somewhat in their properties, but are in most respects very similar compounds. The turpentines as a class form yellowish viscid liquids, possessing a strong aromatic odor, and a bitter, pungent taste, and are very inflammable. They consist of a volatile oil (or oils) and *colophony* (*rosin*). Upon distilling the crude product with water the volatile oil is separated, a brittle residue of rosin remaining.

*Oil of turpentine* (*spirits of turpentine*) ($C_{10}H_{16}$) is obtained by the distillation of crude turpentine, the different varieties of the crude product yielding oils that differ from one another. They all form colorless, mobile liquids of a peculiar disagreeable odor, are insoluble in water, but dissolve in alcohol, in ether, and in carbon disulphide. The oils of turpentine are solvents of many resins and oils, of caoutchouc, and of iodine, sulphur, and phosphorus. The chief differences exhibited by the various varieties are in specific gravity, boiling-point, and optical rotatory power. The ordinary turpentine oil of commerce has a specific gravity of 0·864 and a boiling-point of 320° F. French oil of turpentine consists essentially of a hydrocarbon termed *terebenthene* ($C_{10}H_{16}$), of specific gravity ·8767 at zero centigrade, and boiling-point of 321° F. (*Riban*). *Australene* is an analogous hydrocarbon obtained from the American oil. The oils of turpentine on standing slowly absorb oxygen, a portion of which is converted into ozone. Chlorine, bromine, and iodine are dissolved by them, disengagement of heat and combustion often occurring. Under the influence of heat and of acids turpentine oils assume various isomeric states; when heated to 464° F., *isoterebenethene* and *metaterebenethene* are formed; by the action of sulphuric acid *terebene* and *colophene* are produced. Two other isomers, *camphilene* and *terebilene*, have been prepared by treating artificial camphor with quicklime. Artificial camphors are the results of the combination of hydrochloric acid with oil of turpentine, so far two hydrochlorates, $C_{10}H_{16}.HCl$ and $C_{10}H_{16}.2HCl$, having been obtained. The former, which is termed *hydrochlorate of camphene*, crystallizes in white prisms, which have an aromatic smell and taste greatly resembling that of ordinary camphor; the latter compound possesses the characteristic odor of the oil of thyme. (See THYME, OIL OF.) A numerous variety of seeds and fruits yield by distillation oils isomeric or polymeric with those of turpentine. These have received the generic name of *camphenes* or *terebenes*. Turpentine is sometimes applied externally in medicine in the shapes of salves and plasters; it is also taken internally in the form of pills. The oils of turpentine are extensively used in the preparation of varnishes, and to some extent in medicine as stimulants, diuretics, and anthelmintics. Revised by IRA REMSEN.

**Turpentine-tree**: See TEREBINTH.

**Turpeth**, or **Turbith** [*turpeth* is viâ O. Fr. from Pers.; *turbith* = Fr. from Pers. *turbid*, a cathartic; *turbad*, a purgative root]: a medicinal cathartic root (that of the *Ipomæa turpethum*) from India and Australia. Spirgatis found in it a substance he called *turpethine*, $C_{34}H_{56}O_{16}$, a yellowish resin which possessed purgative properties. It seems to be a glucoside.

**Turpeth-mineral**, also **Turbith-mineral**: an ancient name of what is now known as the basic sulphate of mercuric oxide, $Hg_3SO_6$. It is obtained by boiling with water the neutral mercuric sulphate, $HgSO_4$. It is a lemon-yellow powder, which is very slightly soluble in cold water. It was formerly used in medicine. Notwithstanding its name it is not a mineral substance, but is wholly artificial.

**Turpil'ius**, SEXTUS: a Roman comic poet contemporary with Terence, but outliving him by many years, dying at Sinuessa, 103 B. C. Like Terence he cultivated the *Fabula Palliata*, and six of the thirteen play-titles known to us agree with titles of Menander. In diction he falls far below the purity of Terence, to whom he is ranked next in merit in the canon of Volcatius Sedigitus. The *Fragments*, 215 verses, are given in Ribbeck's *Com. Rom. Frag.*, pp. 85–111. M. WARREN.

**Turpin**, Fr. pron. tür'păn', or **Tylpi'nus**: archbishop of Rheims (d. Sept. 2, 800); the reputed author of a Latin chronicle relating the campaigns of Charlemagne against the Saracens in Spain. The book was declared authentic by Pope Calixtus II. in 1122, translated into French in 1206, printed in 1566 in Frankfort, and edited by Ciampi (Florence, 1822) and Reiffenberg (Brussels, 1836). The first part of the book was evidently written simply in order to encourage pilgrimages to St. Jago di Compostella, and the rest bears the character of a romance written principally for the purpose of entertainment. Many interior features indicate that the work was produced in the twelfth century, perhaps by Pope Calixtus II. himself. See Ciampi, *De Vita Caroli Magni et Rolandi Historia. J. Turpino vulgo tributa* (Florence, 1822), and Gaston Paris, *De Pseudo-Turpino* (Paris, 1865). Revised by S. M. JACKSON.

**Turpin**, EDMUND HART: organist and composer; b. at Nottingham, England, May 4, 1835; studied entirely in London; in 1859 he became organist at St. George's, Bloomsbury; is honorary secretary of the College of Organists; and has edited the London *Musical Standard* since 1880. He has conducted various societies and orchestras, and has composed a large quantity of church music of excellent character, with two cantatas—*A Song of Faith* (1867) and *Jerusalem*—several masses, a *Stabat Mater*, and many songs and organ pieces. D. E. HERVEY.

**Turquoise**, or **Turquois** [from Fr. *turquoise*, Turkish (adjec. femini., turquoise, deriv. of *Turc*, Turk; named (as also *Turkey-stone*, as it was called in the sixteenth century) from Turkey, because derived from the East]: an aluminium hydrous phosphate, owing its blue color to a small amount of copper, always opaque and amorphous, and occurring in small seams in igneous and volcanic rocks. It has long been a favorite gem-stone from its peculiar delicate light-blue color; when greenish in tint it is much less prized. The principal localities for turquoise are at Nichapur, Persia, and in the Sinai Desert in Egypt. The stones from the latter are more liable to change color. Since 1890 very fine gems have been obtained in New Mexico, near Los Cerrillos, where extensive mines have been reopened that were worked by the ancient Mexicans. A single stone from these mines has been sold for $4,000, and the product is one of much commercial importance. Turquoise occasionally loses its color and turns greenish, especially when exposed to fatty acids, as in washing with soap water. A natural imitation, known as *bone turquoise* or *odontolite*, is fossil bone similarly colored by copper. It is easily distinguished by its microscopic structure. GEORGE F. KUNZ.

**Turretin**, Fr. pron. tür'tăn', or **Turreti'ni**, FRANÇOIS: theologian; b. at Geneva, Oct. 17, 1623; studied theology in his native city, in Holland, and in France under Spanheim, Morus, and Diodati; was appointed pastor at Geneva in 1647; removed to Leyden in 1650: returned to Geneva as Professor of Theology in 1653. Died there Sept. 28, 1687. His principal work is *Institutio Theologiæ Elencticæ* (Geneva, 1679–85; n. e. Edinburgh, 1847–48, 2 vols.), a standard treatise on the lines of the strictest Calvinism. His complete works were published in 4 vols., 1688. See his *Life* in Latin, by B. Pictet (Geneva, 1688).—His son, JEAN ALPHONSE TURRETIN, b. at Geneva, Aug. 13, 1671; studied theology; visited Holland, England, and France, and was appointed Professor of Ecclesiastical History in 1697 at Geneva, and of Systematic Theology in 1734. D. at Geneva, May 1, 1737. His complete works were published in 5 vols. in 1775, and contain *Pyrrhonismus Pontificius*, against Bossuet's *Histoire des Variations, Historia Ecclesiasticæ Compendium ad annum 1700, Cogitationes et Dissertationes Theologicæ* (2 vols., 1737), etc. In his theology he tried to mitigate and modify the severe Calvinism, and practically he exerted himself much in order to promote a union between the Lutheran and the Reformed Churches. It was mainly due to him that the rule requiring every German pastor to subscribe to the Helvetian *consensus* was withdrawn; and when Frederick I. of Prussia asked the opinion of the German ministry concerning the union, it was Turretin who drew up the answer which makes a happy distinction between fundamental and non-fundamental differences, reducing the differences between the two great Protestant churches to the latter kind. See his *A Discourse concerning the Fundamental Articles in Religion*, which appeared in an English translation (London, 1720). The work was attacked by the Jesuit François de Pierre (Lyons, 1728), who urged that the Reformed churches, with such an explanation, had no further reason for remaining outside the Roman Church. See E. de Budé, *François et Alphonse Turretini* (2 vols., Lausanne, 1880). Revised by S. M. JACKSON.

**Turrets** [M. Eng. *touret*, from O. Fr. *tourette*, dimin. of *tour*, tower < Lat. *tur'ris*, tower]: in military usage, towers of metal, often revolving, designed both to protect the guns and gunners contained in them, and to afford these a suitable position for offensive operations. Since the civil war in the U. S. they have become a recognized element in land and naval warfare. A patent was issued to Theodore R. Timby, of New York, in 1843, for "a revolving metallic tower, and for a revolving tower for a floating battery to be propelled by steam." This wholly original idea of a revolving battery found its earliest practical expression in the turrets of the monitors. (See MONITOR and SHIPS OF WAR.) For each of the monitors built by Ericsson and his associates the inventor received a royalty. The great military value of the revolving battery once fully demonstrated by the crucial test of war, it was soon adopted by other nations, not only for naval purposes, but also for defensive works on land. "Revolving turrets," observes a high English authority, "if of adequate strength, are the best of all methods of protecting ordnance for coast-defense. They combine the security given by shields with more than the lateral range afforded by the barbette system, and the ease with which they can be turned gives special facilities for firing at moving objects, or for screening the gun-ports from an enemy's fire while loading the guns. The gunners are fully protected."

The Gruson turret (see Fig. 1) has the ellipsoidal form

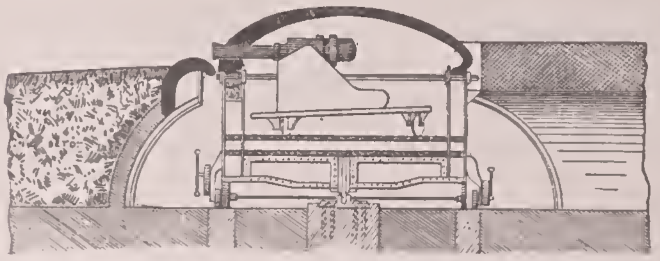

FIG. 1.—The Gruson, a modification of the Timby turret.

in order to deflect a shot striking it. The turret is cast of chilled iron in separate pieces, which when put together are mutually supporting. They are comparatively cheap. Germany, Russia, Holland, Italy, Austria, and Belgium have adopted this type of defensive works. A two-gun turret is generally considered as equivalent to an open battery of six or eight guns.

*The Dover Turret (England).*—The Dover turret (Fig. 2), placed on the outer end of the pier at Dover, England, consists of a live ring and rollers of steel running on a path of steel laid on a massive cylinder of masonry. On

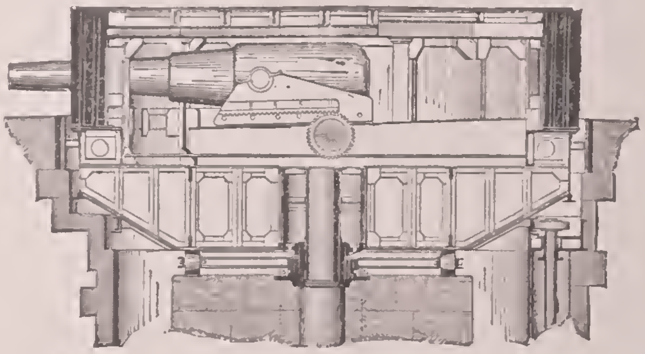

FIG. 2.—Another modification of the Timby turret.

this live ring runs an iron framework weighing about 240 tons. The framework contains the gun-chamber, which is protected by three thicknesses of 7-inch armor, with two intermediate thicknesses of 2-inch plates and 6 inches of wood, weighing together about 460 tons. The weight of guns, carriages, and slides, added to the above makes a total running weight of about 895 tons. This throws upon each of the thirty-two rollers of the live ring a pressure due to about 28 tons. The outside diameter of turret is 37 feet; inside, 32 feet; interior height of gun-chamber, 8 ft. 8 in.; height of turret-armor, 9 feet; armament, two 80-ton guns. The turret is turned by a pinion, the vertical shaft shown, working into a large ring, with steel trundles secured to the framework, the power being given by a set of main engines capable of working up to 300 horse-power, and auxiliary engines of 45 or 50 horse-power. All engines and boilers are in the lower part of the battery, about 30 feet below the guns. The magazines are nearly at the same level as the engines. S. B. LUCE.

**Turret-ships**: See SHIPS OF WAR.

**Turtle**: See TESTUDINATA.

**Turtle**, or **Turtle-dove** [*turtle* is O. Eng. *turtle*, from Lat. *tur'tur* (probably a name imitative of its cooing)]: any one of several small pigeons, especially those of the genus

*Turtur.* The *T. auritus*, or common European turtle, is a migratory bird, famed for its gentleness, its strong conjugal affection, and its loud but pleasant cooing note. The turtle or mourning dove of the U. S. is the *Zenaidura macroura*, whose gentle and mournful note is well known. It is 13 inches in total length, and has a remarkably long tail. Pigeons of the genus *Æna* are also reckoned as turtles. There are perhaps twenty species of turtle-dove. That mentioned in the Bible is *Turtur risorius*, an abundant Eastern species often kept in cages. Revised by F. A. LUCAS.

**Turtle-fishery**: the taking of turtles for commercial purposes. While turtles are used for food wherever they are sufficiently large or abundant, few species are the object of regular pursuit. Among marine species the green turtles (*Chelonia midas* and *virgata*) are taken for their flesh and the hawk's-bills (*Eretmochelys imbricata* and *squamata*) for their shells; the loggerhead (*Thalassochelys caretta*) is also taken, but forms indifferent or poor food. The diamond-back, or terrapin (*Malaclemmys palustris*) of the southeastern parts of the U. S. and the large species of *Emydidæ*, usually called sliders, are much sought for, as are also the soft-shelled turtles (*Trionychidæ*) of the southern parts of the U. S. and Mississippi valley. The Indians of the Amazon systematically hunt turtles for their flesh and eggs, the latter used for making oil, and the Japanese consume numbers of a species of *Trionyx* (*T. japonicus*). Marine turtles are taken on most suitable sandy shores in tropical or warm regions. The island of Ascension is an old and famous locality, as are the Bahamas and the Gulf of Mexico very generally, and the fishing extends as far N. as North Carolina, few, save stragglers, going beyond. The turtles are taken on land by watching on the nights when they come ashore to deposit their eggs, and quickly turning them on their backs. In the water they are sometimes caught by the primitive plan of diving and grasping the front of the shell with one hand and the hind part with the other, giving the animal such a twist that his struggles bring him to the surface. Another method much in vogue is to use a spear with a small round point, which is fastened to a line, though detachable from the shaft, the creatures being speared when asleep, or pursued when the conditions are favorable, as, for example, in smooth or shallow water. Nets are also employed to some extent. The turtles are usually kept until wanted for shipping in inclosures termed crawls, and travel very well if simply laid on their backs in a damp cool place. Fresh-water turtles are caught in nets and in traps on the principle of a lobster-pot, one end being attached to a stake and kept above water in order that the turtle may not drown. They are also scooped up in dredges or taken in the fall and winter after they have entered the mud to hibernate by probing for them with an iron rod. Turtle-culture has been practiced to some extent both in the U. S. and Japan, a suitable body of water being fenced in and, in necessary places, covered with netting to prevent crows and other enemies from destroying the eggs and young. These inclosures are perhaps more used in the U. S. for the keeping and feeding of small individuals until they reach a marketable age than for raising turtles from the eggs. In the States of the Eastern coast of the U. S. in 1890 there were taken 476,630 lb. of terrapin, worth $70,141, and 1,287,256 lb. of turtle, valued at $40,550, besides 1,153 lb. of tortoise-shell, amounting to $2,884, and turtle eggs to the extent of $994, the total, including the product of the Pacific States, reaching $119,569. Florida claims the largest catch of the sea-turtles and Virginia leads in the number of terrapin caught, although Maryland's product stands first in value, owing to the large proportion of the valuable diamond-backs in her waters. F. A. LUCAS.

**Tusa'yan Indians**: See CLIFF-DWELLINGS, PUEBLO INDIANS, and SHOSHONEAN INDIANS.

**Tuscaloo'sa**: city; capital of Tuscaloosa co., Ala.; on the Black Warrior river, and the Ala. Gt. South. Railroad; 55 miles S. W. of Birmingham, 75 miles N. N. W. of Selma (for location, see map of Alabama, ref. 4–B). It is in a cotton-growing and coal-mining region, was formerly the State capital, and is noted for its educational institutions, which include the University of Alabama (post-office, University), University High School, Central Female College, Tuscaloosa Female College, and the Institute for Training Colored Ministers (Presbyterian). It is also the seat of the Alabama Insane Hospital. There are 2 national banks with combined capital of $160,000, a private bank, and 2 daily and 3 weekly newspapers. Pop. (1890) 4,215; (1900) 5,094.

**Tuscan Order**: an order of architecture still simpler than the Roman Doric. (See ORDERS OF ARCHITECTURE and DORIC ORDER.) Its origin is probably to be found in the imitation of Greek designs by the Etrurians and other inhabitants of Italy before the time of the Roman domination. The Roman builders took this, with other features of Etruscan architecture, into use before importing Greek forms more directly. It may well be that the Roman Doric so called was a more decorated form of Tuscan. R. S.

**Tus'cany** [from Lat. *Tusca'nus*, Tuscan, Etruscan, deriv. of *Tusci*, another name for *Etru'sci*, Tuscans, Etruscans]: a compartimento of Italy, comprising the eight provinces of Arezzo, Florence, Grosseto, Leghorn, Lucca, Massa-Carrara, Pisa, and Sienna; now not recognized as a legal division. Area, 9,304 sq. miles. Pop. (1893) 2,296,011. It was formerly an independent grand duchy of Italy. Its territory corresponded nearly to that of the ancient Etruria, and after the fall of the Roman empire it formed at first part of the kingdom of the Goths, then of the kingdom of the Longobards, and then of the empire of Charlemagne. He gave it a somewhat more independent position, erecting it into a marquisate, and giving it away as a military fief. Guelph VI. sold his fief in 1160 to the German emperor Frederick I.; but as the connection with the German empire was somewhat loose from the very beginning, Tuscany was soon broken up into a number of independent republics, of which Florence, Pisa, and Sienna were the most important. Florence conquered Pisa and the greatest part of the Tuscan territory, but was conquered itself in 1532 by Charles V., who appointed Alessandro de' Medici Duke of Florence. In 1569 Cosmo I. united the whole of Tuscany into a grand duchy, and from that time to 1737, when it became extinct, the Medici family ruled the country, and made it one of the most prosperous and civilized in Europe. In 1737 it fell to Francis, Duke of Lorraine, who had married Maria Theresa and later became Emperor of Germany, and with exception of a few years, during which Napoleon first made it a part of the kingdom of Etruria, and then annexed it to France, it was ruled by the house of Lorraine until Aug. 16, 1859, when by an almost unanimous vote of the people it annexed itself to the kingdom of Sardinia. In 1861, by a similar process, it was annexed to the kingdom of Italy. From that time until 1871 Florence was the capital of the kingdom. Revised by M. W. HARRINGTON.

**Tuscaro'ra** or **Tuskarora Indians**: See IROQUOIAN INDIANS.

**Tuscia**: See ETRURIA.

**Tusco'la**: city (founded in 1856); capital of Douglass co., Ill.; on the Chi. and E. Ill., the Ill. Cent., and the Ind., Decatur and W. railways; 150 miles S. of Chicago, and 150 miles E. of St. Louis (for location, see map of Illinois, ref. 6–F). It is in an agricultural region and the broom-corn belt of Illinois; contains several churches, 2 public-school buildings, a national bank with capital of $60,000, a private bank, and 3 weekly newspapers; and is the largest broom-corn shipping-place in the U. S. Pop. (1880) 1,457; (1890) 1,897; (1900) 2,569. EDITOR OF "REVIEW."

**Tusculum**: See FRASCATI.

**Tuscum'bia**: city; capital of Colbert co., Ala.; on the Tennessee river, and the Memphis and Charleston, the Louisv. and Nashv., and the Birmingham, Sheffield and Tenn. River railways; 125 miles N. W. of Birmingham, 175 miles N. W. of Montgomery, the State capital (for location, see map of Alabama, ref. 1–B). It is in an agricultural region, and contains a public school, several private schools, the Deshler Female Institute (chartered in 1870), an excellent spring-water supply, Baptist, Methodist Episcopal, Presbyterian, Protestant Episcopal, and Roman Catholic churches, a State bank with capital of $25,000, flour and feed mill, plow-factory, and a weekly newspaper. Pop. (1880) 1,369; (1890) 2,491; (1900) 2,348. EDITOR OF "NORTH ALABAMIAN."

**Tushita** [Sanskr., satisfaction or joy]: the heaven of "the perfectly contented ones"; the fourth of the six Buddhist devalokas or celestial spheres or abodes of the gods. Here dwell the Boddhisattvas, or beings whose essence has become intelligence, and who have only once more to pass through human existence before attaining to Buddhaship. Here dwelt Gautama, and it was from this heaven that he descended in the form of a white elephant to be born for the last time. Here also dwells Maitreya, the coming Buddha of the present age. In Tushita life lasts 4,000 years, but twenty-four hours are there equal to 400 years on earth.

**Tuske'gee**: town; capital of Macon co., Ala.; on the Tuskegee Railroad; 40 miles N. by E. of Montgomery, 135 miles S. W. of Atlanta, Ga. (for location, see map of Alabama, ref. 5–E). It is in a cotton-growing region, is an attractive winter resort, and contains 2 cottonseed-oil mills, an incorporated bank with capital of $50,000, a private bank, and a weekly newspaper. It is widely noted for its educational institutions, which comprise the Alabama Military Institute, the Alabama Conference Female College, the Alabama Normal School, school for colored people, and the Tuskegee Normal and Industrial Institute. The latter was founded in 1881 by Booker T. Washington, a graduate of the Hampton Normal and Industrial Institute, and in 1894 had 48 professors and instructors, all colored, 915 students, 1,810 acres of ground, and 31 buildings valued at $200,000. The institution is exclusively for colored youth, is thoroughly equipped for advanced normal and industrial education, and nearly if not all of the work of laying out the grounds, erecting the buildings, and constructing the operating plants, was done by the students. From its opening till the 1894 commencement the institute received from all sources $421,-955, and the students paid in labor $187,612, put over 500 acres under cultivation, and made over 500,000 bricks. Mr. Washington has been principal of the institute from its organization. Pop. of town (1890) 1,803; (1900) 2,170.

**Tusser**, Thomas: successively a musician, schoolmaster, serving man, husbandman, grazier, and poet; b. at Rivenhall, Essex, England, about 1515; educated at Eton and at Cambridge. D. in London about Apr., 1580. He was the author of *Five Hundred Points of Good Husbandry, united to as many of Good Housewifery, etc.* (1573), in verse, with a metrical autobiography. His book is chiefly valuable for its picture of the manners and domestic life of English farmers. Revised by H. A. Beers.

**Tutmes**: See Thothmes.

**Tuttle**, Daniel Sylvester, D. D.: bishop; b. at Windham, Greene co., N. Y., Jan. 26, 1837; graduated at Columbia College in 1857; studied theology in the General Theological Seminary in New York; entered holy orders, and in 1866 was elected Bishop of Montana, having jurisdiction in Idaho and Utah; was consecrated in 1867, his election to the missionary episcopate having taken place before he was of canonical age to be made a bishop. After nearly twenty years service in the far West he was chosen to succeed Dr. Charles Franklin Robertson as Bishop of Missouri. He has published missionary reports, episcopal addresses, sermons, and pastorals. Revised by W. S. Perry.

**Tuttle**, Herbert, A. M., L. H. D.: historian; b. at Bennington, Vt., Nov. 29, 1846; A. B., University of Vermont, 1869; after graduation engaged for several years in journalism at Boston, afterward at Paris and Berlin, where he continued studies in history and public law; lecturer on international law, University of Michigan, 1879; received appointment to Cornell University 1881, where he held for a time the chair of politics and international law, and afterward became Professor of Modern European History. He was the author of *German Political Leaders* (New York and London, 1876); *History of Prussia to the Accession of Frederick the Great* (1884); *History of Prussia under Frederick the Great* (2 vols., New York, 1888); and many articles in magazines and reviews. D. at Binghamton, N. Y., June 21, 1894. C. H. Thurber.

**Tuttle**, Joseph Farrand, D. D., LL. D.: clergyman and educator; b. at Bloomfield, N. J., Mar. 12, 1818; educated at Marietta College and Lane Theological Seminary; tutor in Marietta College 1843–44; pastor of the Presbyterian churches at Delaware, O., 1845–47, and at Rockaway, N. J., 1847–62; president of Wabash College 1862–92. Besides contributing frequently to several reviews, Dr. Tuttle has published a large number of important historical sermons, addresses, and pamphlets: *Life of William Tuttle*; *Way Lost and Found*; *Self-reliance*; *Revolutionary Fathers of Morris County, N. J.*; *The Western States of the Great Valley*; *Presbyterianism on the Frontiers*; *Our Half Century*; *The General Assembly's Jubilee*; and *Sixtieth Anniversary of Lane*. C. K. Hoyt.

**Tutuila**: See the Appendix.

**Tux'pan**: a town and port in the northern part of the state of Vera Cruz, Mexico; on the Tuxpan, 7 miles above its mouth (see map of Mexico, ref. 7–H). Vessels anchor in the roadstead, the bar only admitting small craft. Coasting steamers touch here regularly, and there is a thriving trade in cabinet woods, dyewoods, honey, rubber, hides, etc. Tuxpan dates from before the Conquest and is connected with the legends of the Toltecs. Pop. 9,000. H. H. S.

**Tver**, tvãr, or **Twer**: government of European Russia; bounded S. by the government of Moscow; area, 25,225 sq. miles. The ground is elevated, but the surface level, covered with forests, and dotted with small lakes; the Volga and several of its affluents rise here. The climate is somewhat severe, and the soil is not very fertile. Rye and oats are produced, sufficient for home consumption; flax and hemp are cultivated. Cattle are neither numerous nor good, but the fisheries are remunerative. Pop. (1897) 1,812,559.

**Tver**: town of Russia, government of Tver; at the confluence of the Tvertsa and Volga, which latter here becomes navigable for steamers (see map of Russia, ref. 6–E). The town contains an imperial palace, a cathedral, a college, various schools, and barracks, and, situated as it is on the highway from Moscow to St. Petersburg, its trade is considerable. Nails and cotton goods are extensively manufactured. There are several chalybeate springs in the vicinity. Pop. (1897) 53,477.

**Twachtman**, John Henry: landscape-painter; b. in Cincinnati, O., Aug. 4, 1853; pupil of F. Duveneck and of the Munich Academy; member of the Society of American Artists 1879; Webb prize, 1888. His work may be properly classed as of the impressionist school, and is remarkable for luminousness and atmospheric quality. W. A. C.

**Twatu'tia**: the capital of Formosa (*q. v.*).

**Tweed**: next to the Tay the largest river of Scotland. It rises in the southwest corner of Peeblesshire, at an elevation of 1,500 feet above the sea, flows northeastward, eastward, and again northeastward, and enters the North Sea at Berwick after a course of 97 miles. It is tidal for 10 miles and forms a part of the border with England for 18½ miles.

**Tweed**, William Marcy: politician; b. in New York city, Apr. 3, 1823, of Scotch descent; the son of a poor chairmaker; when twenty-eight years old went into partnership with his brother in the chairmaking business; soon became prominent in local politics, and in 1853 was elected to Congress. For many years he was a member of the Tammany Society, of which he was chosen grand sachem in 1869, holding the office till 1871. From his appointment as deputy street commissioner in 1863 may be said to date the foundation of the famous Tammany Ring, of which he was the chief spirit. He became at once the virtual head of the department of streets, afterward the department of public works, and by extending enormously the expenditures for public improvements acquired vast political influence and began to accumulate a fortune. His position as president of the board of supervisors enabled him to increase the city's pay-roll to unprecedented dimensions, giving sinecure positions to an army of political friends. The ring gradually grew in power and influence till 1868, and at the opening of 1869 found itself master of nearly every department of the State government. In 1868 the ring's greatest scheme of robbery, the building of a new county court-house, was planned. The work was begun under the stipulation that the cost should not exceed $250,000. Before 1871 over $8,000,000 was pretended to have been expended on it and it was still unfinished. When by the charter of 1870 the power of auditing accounts was taken from the board of supervisors and vested in certain city offices then filled by Tweed and his friends, all restraints on the system of plundering by fraudulent bills was removed. Such bills, amounting to $6,000,000, were passed by the board of audit at its first and only meeting. Of this amount over $1,000,000 was traced to Tweed's private pocket. A secret account of the money thus paid was kept in the auditor's office under the title "County Liabilities." During the winter of 1870–71 a clerk employed in the auditor's office copied by stealth the items in this account and gave them to his patron, James O'Brien, an opponent of the Tammany Society. O'Brien subsequently gave the figures to *The New York Times*, and that journal published them in July, 1871. The excitement created thereby started an investigation which through the earnest efforts of Samuel J. Tilden and others resulted in the exposure of the frauds and the complete overthrow of the ring in the elections of Nov., 1871. Tweed was tried for grand larceny and forgery, and sentenced on Nov. 22, 1872, to twelve years' imprisonment in the penitentiary and to pay a heavy fine. On Dec. 4, 1875, he escaped and fled to Spain, where he was captured and returned to the city Nov., 1876. Tweed was married in 1844 and had eight children. D. in Ludlow Street jail, New York, Apr. 12, 1878. See Bryce's *American Commonwealth.* Revised by F. M. COLBY.

**Tweedmouth**, LORD: See MARJORIBANKS, EDWARD.

**Twelve Tables, Law of the**: See ROMAN LAW.

**Twer**: See TVER.

**Twesten**, AUGUST DETLEV CHRISTIAN, D. D.: theologian; b. at Glückstadt, Germany, Apr. 11, 1789; studied at Kiel and Berlin; Professor of Philosophy and Theology at Kiel from 1814; called to Berlin in 1835 to fill the theological chair of the great Schleiermacher, which position he occupied till his death Jan. 8, 1876, retaining his vigor and faithfully attending to his academic duties to the last. He was also member of the Oberkirchenrath of the Evangelical Church of Prussia from 1850 till 1874. He was a pupil and admirer of Schleiermacher, but more positive and orthodox. As a teacher and writer he was remarkably clear and accurate. He wrote *Die Logik* (Schleswig, 1825); *Vorlesungen über die Dogmatik der evangelisch-lutherischen Kirche nach dem Compendium des Herrn Dr. W. M. L. de Wett* (vol. i., Hamburg, 1826; 4th ed. 1838; vol. ii., part i., 1837, unfinished); *Matthias Flacius Illyricus* (Berlin, 1844); *Erinnerung an Frdr. Dan. Ernst Schleiermacher* (1869); and an introduction to Schleiermacher's *Ethik*, which he edited (1841). See his *Life*, by C. F. G. Heinrici (Berlin, 1889). Revised by S. M. JACKSON.

**Twichell**, JOSEPH HOPKINS: clergyman; b. at Southington, Conn.; graduated at Yale College 1859; studied for the ministry at Union Theological Seminary and Andover Theological Seminary; was chaplain of a regiment in the civil war (1861–64); became minister of the Asylum Hill Congregational church, Hartford, Conn., in 1865. He has published a *Life of John Winthrop* (New York, 1891) and edited *Some Puritan Love Letters*, correspondence of John and Margaret Winthrop (New York, 1893). G. P. F.

**Twick′enham**: town; in Middlesex, England; on the Thames, opposite Richmond; 11 miles S. W. of London (see map of England, ref. 12–J). It has powder and oil mills, and contains many fine villas and summer residences. It was the home of Pope, who is remembered there by his grotto and a monument in the parish church. Among the other curiosities of the place are the Orleans House, where Louis Philippe lived while a refugee in England, and Strawberry Hill, the seat of Walpole. Twickenham is connected with Richmond by a handsome bridge. In 1894 a new lock, weir, and footbridge was opened. Pop. (1891) 16,026.

**Twiggs**, DAVID EMANUEL: soldier; b. in Richmond co., Ga., 1790; appointed captain in 1812, major 1814, and served throughout the war with Great Britain; was retained in the peace organization of the army in 1815 as captain, major May 14, 1825, lieutenant-colonel 1831, colonel June, 1836. In the war with Mexico he was promoted brigadier-general and breveted major-general. In Feb., 1861, being in command of the department of Texas, he surrendered his army to Gen. McCulloch of the Confederate service, together with all the Government stores, munitions, and material to the value of $1,500.000, for which he was dismissed from the service of the U. S. Mar. 1. He was soon after appointed a major-general in the Confederate army. D. at Augusta, Ga., Sept. 15, 1862.

**Twilight** [*twi-* (< O. Eng. *twi-*, *twā*, two) + *light* (< O. Eng. *lēoht*, light); cf. Germ. *zwielicht*, twilight]: the glow in the morning and evening sky caused by the reflection of the light of the sun by the atmosphere after sunset and before sunrise. This very familiar phenomenon offers many interesting features to the observer who carefully watches it immediately after sunset under a clear, unobstructed sky. He can see what is equivalent to the shadow of the earth cast upon the sky. Suppose the observation to begin five minutes after sunset. Then if one could in a moment ascend to the height of half a mile above the earth he should again catch a view of the setting sun. All that portion of the atmosphere above this point is therefore in full sunlight, while that below it is illuminated by the reflection from other portions. Ten minutes after sunset the line of demarkation will have risen to a height of 2 or 3 miles; all below that limit will be in the shadow of the earth. Now, looking toward the E., the shadow will be distinctly seen, the portion of the atmosphere near the horizon being in comparative darkness, while at the height of a few degrees will be seen the edge of the illuminated portion shining by the red light of the setting sun. As the sun sinks farther and farther below the horizon, the illuminated part will be seen to shrink away toward the W. Then no part of the air overhead is illuminated by direct sunlight; to see the sun one would have to ascend above the limits of the atmosphere. Yet later the only illuminated portions of the atmosphere to which sight can extend are near the western horizon. The sun is then so far below the horizon that only the most distant parts of the atmosphere visible are illumined by its direct rays. Twilight is found to end entirely when the sun is between 15° and 18° below the horizon. The amount of depression varies with the place and the season, and has not been reduced to any satisfactory law. One conclusion from the observations of twilight is that the atmosphere ceases to reflect the rays of the sun at a height of about 45 miles. Did any part of the air higher than this reflect any light it would be visible when the sun was more than 18° below the horizon, and thus there would be a longer twilight than we actually have. S. NEWCOMB.

**Twillingate**: a port of entry; on the two Twillingate islands, off the northeast coast of Newfoundland, 190 miles by steamer from St. John's; lat. 49° 42′ N., lon. 54° 44′ W. The town is the capital of Twillingate and Fogo district. The name is apparently a corruption of Toulinguet, a cape in Brittany, near Brest. Pop. 2,800. M. W. H.

**Twills**: See TEXTILE-DESIGNING.

**Twining**, KINSLEY, D. D.: clergyman and editor; b. at West Point, N. Y., July 18, 1832; graduated at Yale College 1853, and at Yale Theological School 1856. He was pastor of Congregational churches at Hinsdale, Mass., 1857–63, at Cambridgeport, Mass., 1867–72, at Providence, R. I., 1872–76. In 1880 he became literary editor of *The Independent*, New York. G. P. F.

**Twining**, WILLIAM JOHNSON: soldier; b. in Indiana, Aug. 2, 1839; appointed a cadet from that State to the Military Academy at West Point, and was graduated in 1863, the fourth in a class of twenty-five. He was then appointed first lieutenant of engineers, and served in the civil war as assistant engineer of the department of the Cumberland and as chief engineer of the department of the Ohio, and was engaged in the invasion of Georgia, in the operations against Gen. Hood's army in Tennessee, in the battles of Franklin and Nashville, in the movement to the mouth of Cape Fear river, and in the operations in North Carolina in Feb., Mar., and Apr., 1865. Captain of engineers Dec. 28, 1868; major of engineers Oct. 16, 1877. He was breveted major and lieutenant-colonel of volunteers for gallant and meritorious services. After the civil war he served as Assistant Professor of Engineering at West Point 1865–67, as chief engineer of the department of Dakota, as commissioner for the survey of the U. S. boundary-line along the 49th parallel 1872–76, and as commissioner of the District of Columbia 1878–82. D. in Washington, D. C., Mar. 5, 1882.

**Twiss**, Sir TRAVERS, F. R. S., D. C. L.: political and legal writer; b. in Westminster, Mar. 19, 1809; graduated at Oxford University: public examiner at Oxford in classics and mathematics 1835–39; called to the bar at Lincoln's Inn 1840; afterward admitted as advocate at Doctors' Commons; Professor of Political Economy at Oxford 1842–47, and afterward served in various other collegiate and public offices; created queen's counsel and bencher at Lincoln's Inn; made advocate-general 1867: knighted in 1867. He retired from his professorship of Civil Law at Oxford, and gave up the office of advocate-general in 1872, after which time he devoted himself chiefly to literary work. He drew up in 1884 for the King of Belgium a constitution for the Congo Free State. D. Jan. 15, 1897. He was a man of remarkably wide attainments, and a brilliant but somewhat unreliable scholar. He published *Niebuhr's History of Rome Epitomized*; *Livy's History* (editor); *The Oregon Question Examined in Respect to Facts and the Law of Nations* (in which he treats it as of little present weight); *View of the Progress of Political Economy in Europe since the Sixteenth Century*; *The Law of Nations considered as Independent Political Communities*; *Monumenta Juridica: the Black Book of the Admiralty* (editor); Henry de Bracton's *De Legibus et Consuetudinibus Angliæ* (editor; London, 1878–83); *Belligerent Right on the High Seas* (London, 1884). F. STURGES ALLEN.

# APPENDIX.

**Soulé**, Caroline Augusta (*White*): b. in Albany, N. Y., Sept. 3, 1824; graduated at Albany Female Academy in 1841; was on the staff of the Boston *Ladies' Repository* 1855–63, and for eleven years edited and published in New York city *The Guiding Star*, a Sunday-school periodical; was ordained as a minister of the Universalist Church, and became its first foreign missionary in 1879; afterward became pastor of a congregation in Glasgow, Scotland. She is the author of *Home Life* (1855); *The Pet of the Settlement* (1859); and *Wine or Water* (1861).

**Sousa**, John Philip: conductor and composer; b. in Washington, D. C., in 1854, of a Spanish father and a German mother; began the study of music very early, and attracted attention while still a boy by his violin-playing. He became an orchestral leader at eighteen years of age, and when twenty-six was appointed leader of the U. S. Marine Band, holding the position for twelve years, in which he made the band famous. He resigned in 1892 to form a band of his own, with which he has since traveled all over the U. S. He is a famous composer of marches, and has also composed four operas, viz., *Angela*, *El Capitan*, *The Bride Elect*, and *The Charlatan*. D. E. Hervey.

**South African Republic**: In 1897 there were 198 gold mines, capitalized at $363,863,750. Twenty-eight mines, with a capital of about $50,000,000, paid $14,750,000 in dividends, or nearly 30 per cent.: 64 mines were producing gold, but paying no dividends, and some could not pay dividends without a reduction in working expenses; 106 mines were being opened up.

The gold output in 1897 was $58,306,600, and in 1898 $81,203,150, the republic leading the world in these years in gold production. Nine-tenths of the yield was obtained from a strip of land 30 miles long and 1 to 2 miles wide, being about half of the gold-bearing area of the Witwatersrand (white water slope) that extends 25 miles to the E. and 30 miles to the W. of Johannesburg. The reefs have been found to a depth of 2,500 feet, and the structure of the country seems to show that they continue to a great depth. Estimates by experts of the probable yield of this area accord fairly well. The estimate of Messrs. Hatch and Chalmers embraces the whole Rand to the 5,000 feet level, from which they figure that about $3,500,000,000 may be obtained. Mr. G. F. Becker, of the U. S. Geological Survey, says: "I have found no grounds for regarding this as an overestimate, and I know no one familiar with the deposits who thinks it exaggerated."

For an account of the Transvaal war of 1899–1900, and the events leading up to it, growing out of the grievances of the large foreign mining population against the Boer Government, chiefly in regard to taxation and citizenship, see the article Africa. C. C. Adams.

**South Carolina College**: an institution of learning in Columbia, S. C.; chartered by the General Assembly in 1801, and opened in 1805. The Confederate Government took possession of the buildings of the institution in 1863, and used them as a hospital until the close of the civil war. After an amendment of the charter the school was reopened in 1866 as the University of South Carolina, but in consequence of political conditions it was again closed in 1877. Another amendment of the charter, in 1878, divided the university into two branches—South Carolina College, in Columbia, and Claflin College, in Orangeburg. In 1880 the Columbia branch became South Carolina College of Agriculture and Mechanics, but in 1882 the previous name was resumed and the number of professors increased. The charter experienced two more amendments, in 1887 and 1890, the first considerably enlarging the scope of the college, providing for 19 professors, 1 assistant professor, and 7 instructors and tutors; the second discontinuing six courses and reducing its scope to four courses—classical, literary, scientific, and law. Two courses had been previously discontinued. Normal courses were added, and a professorship in Pedagogics was established in 1894. The college is coeducational. F. C. Woodward is president.

**South, University of the**: an institution of learning in Sewanee, Tenn., founded in 1857 in the interests of the Church and of Christian education. A charter was soon afterward obtained from the Legislature, and a domain of nearly 10,000 acres of land was secured for the university site. About $500,000 had been subscribed toward an endowment and the corner-stone of the central building had been laid when the civil war interrupted all operations. At the close of the war little remained except the university land, but through the untiring efforts of Bishop Charles Todd Quintard, of Tennessee, the project for a university was revived, and in 1868 the institution was put into operation on a moderate scale. Since that time there has been a rapid development. The university has now a teaching staff of 62 members and an attendance of 518. Its eight buildings stand in the middle of the extensive grounds, portions of which are leased for building lots. The university embraces colleges in theology, medicine, pharmacy, and law. Courses are also offered in engineering, finance, and economy. In its grammar school the university gives preparation for the college. B. Lawton Wiggins, M. A., is vice-chancellor.

**Spain, History of**: The death of Alfonso XII. in 1885, and the accession in 1886 of his posthumous son, Alfonso XIII., failed to disturb the political conditions. The Carlists, indeed, have been uneasy at certain crises, and the adherents of a republic are not unimportant. Nevertheless, affairs have been in the hands alternately of the Liberals, led by Sagasta, and the Conservatives, led by Cánovas until his assassination by an anarchist in 1897.

Spain has in fact had her share of anarchism; she has suffered from labor trouble, and her finances have been on the verge of collapse. Externally, the chief recent event is the loss of the Spanish colonial empire, incident to the American-Spanish war of 1898. Edmund K. Alden.

**Spanish Law**: The present laws of Spain are the result of a modification and coalescence of the Roman law and the laws of the Visigoths with ingrafted portions of the canon and feudal laws. With the conquest by the Romans, Spain became a province of the Roman empire and subject to the Roman law; and this law, with the modifications arising from the necessities of its administration, continued to be the law of the land until the conquest of the country by the Visigoths, which took place early in the fifth century. The Visigothic ruler, Euric, upon his conquest of Spain, had the "customs of the Goths" embodied in a code, which was amended and published by his successor, Alaric II., as the *Breviarium Alaricanum*, under the superintendence of civil and ecclesiastical lawyers, and this code is mainly based upon what is known as the Theodosian code. The codes of Euric and Alaric seem to have furnished the basis for the code known as the *Fuero juzgo*, which became the general law of Spain probably about the seventh century.

The *Fuero juzgo* is divided into 12 books containing 54 titles and 559 distinct laws. The first book treats of the nature of law and of the instrumentalities for enacting and enforcing it; the second book of judges, their powers and attributes, modes of conducting sittings, written and oral testimony, and the solemnities required in the execution of last wills and testaments. The third book treats of marriage, conjugal infidelity, etc.; the fourth of the law of descent and the rights of inheritance, the rights and duties of guardians and orphans, etc. The fifth book treats of the established rules of the Church, ecclesiastical property, donations as well as exchanges, deposits, loans for a consideration, debts, pledges, and manumissions. The subsequent books treat of criminal matters and some subjects of special legislation, such as the rights and duties of physicians, foreign merchants, etc.

This code continued to be the general law of Christian Spain during the subsequent dominion of the Arabs, but it was modified and supplemented by the code known as the *Fuero viejo*, which was promulgated about the end of the tenth century. The *Fuero viejo* is divided into five books, which contain the ancient and general usages and customs of the nation, treating of the king's prerogatives, the rights of vassals, rules of single combat, laws relating to tenants and dependents of the nobility, penal laws, the administration of justice, contracts, the acquiring of property, successions to estates, partitions, disinheritance, legitimacy of children, etc. This work is much less comprehensive than the preceding act, the *Fuero juzgo*, and it is now practically obsolete, being seldom cited except to establish some historical fact.

In the twelfth and thirteenth centuries the Roman law became a subject of zealous study, and led to the promulgation of the code known as the *Sietes partidas*, preceded by the *Fuero real*, both of which introduced modifications based upon the Roman law. The *Fuero real* was imperfect in its analysis and arrangement, and seems to have been intended rather as a guide to the administration of the law than as a full and exact exposition of the jurisprudence of the country.

Such an exposition, however, is made in the *Sietes partidas*, which, although published about the middle of the thirteenth century, appears not to have been promulgated as the law of the land until 1348, in the reign of Alfonso XI. This code embodies the substance of the actual laws of Spain today. It is divided into seven parts (*partidas*), of which the first treats of the nature, origin, and object of laws, usages and customs, and religious matters. The first *partida* is essentially a digest of the canon law, and gives exorbitant powers to the pope and clergy. The second *partida* treats of the prerogatives and duties of the crown and the duties of the people toward the sovereign. The third *partida* treats of judicial proceedings, responsibilities of judges, lawyers, and public functionaries, and is copied almost exclusively from the Roman law. The fourth *partida* treats of the subject of marriage, and the marriage relation, feudal laws, and vassals. The fifth *partida* treats of the obligations of contracts of merchants, partnerships, security, mortgages, etc., and is largely copied verbatim from the Roman law. The sixth *partida* treats of wills and heirs, estates and the administration of them, guardianships, tutorships, etc. The seventh and last *partida* treats of the criminal laws.

After the expulsion of the Arabs from Spain, although the *Fuero juzgo* and the *Sietes partidas* still remained the law, generally speaking, the law in particular respects was modified. Among others, two important laws were enacted, entitled *Las ordenanzas reales*, *Ordenamiento real*, or *Ordenamiento de Montalvo*, which is a compilation made by the order of Ferdinand and Isabella in the year 1484, and the *Leyes de Toro*. The former is divided into eight books, and contains the most important royal edicts and ordinances subsequent to the publication of the *Sietes partidas*. The *Leyes de Toro* is a code of eighty-three laws published in the cortez of Toro in 1505 as supplemental to the *Ordenamiento de Montalvo*.

These various codes and laws supplementing each other, but none of them making a complete statement of the law of the land, produced a state of great confusion, which was partially remedied by the publication of a general code, called the *Nueva recopilacion*, in the reign of Philip II., and the publication of the *Novisima recopilacion* in the year 1805. The general legislation of Spain at the present time, therefore, is found in the *Fuero juzgo*, the *Fuero real*, the *Sietes partidas*, and the *Novisima recopilacion*, which is the latest and highest authority. The specific provisions of the Spanish law in general follow very closely the Roman law. See ROMAN LAW.

The development of the system of Spanish jurisprudence differs from that of England and America in the important particular that there is no judicial legislation, or (as it is sometimes called) judge-made law, in Spain. None of its tribunals render decisions which are considered as authoritative precedents, and hence there is no such record or records of adjudications as those which are so useful and conclusive in England and the English-speaking countries where the common law prevails. The different codes of the kingdom, often enriched by the commentaries of learned jurists relying chiefly on the doctrines of the Roman law, are the only authorities ever quoted in the courts of justice, and where these are insufficient, or doubts arise as to the proper interpretation of the law, the subject is referred to the monarch. This mode of administering justice is doubtless one of the reasons why the law of Spain abounds in codes and so few treatises have been published treating of detached portions of the law.

*Spanish Colonial Legislation.*—The Spanish codes were found ill adapted for the purpose of colonial government, so that many of the laws of the Spanish colonies were newly devised to meet the exigencies of the occasion. They were enacted in Spain for the government of the country, and forwarded under various titles, such as *cedulas*, *decretos*, *resoluciones*, *ordenamientos*, *pragmaticos*, etc., which laws variously emanated from the superior tribunals, officers having authority to impose them, and from the king himself. The actual administration of the government of the colonies was given to agents appointed and removable by the sovereign; and the colonies were regarded as royal monopolies, the administration of which belonged exclusively to the monarch. These different orders and decrees became in course of time so numerous that it was frequently uncertain as to what laws were actually in force in the colonies, and to remedy this a collection was made of the colonial laws, which was completed in 1680, in the reign of Charles II., commonly known as the *Recopilacion de Indias*. This work, or code, however, is a mere digest of the royal orders, etc., issued from time to time for the better government of the American colonies, and is practically an enumeration of exceptions to the general and common law of Spain. It was provided in general that where the *Recopilacion de Indias* had no provision affecting a subject the laws of Castile should be observed, so that the civil law of Spain became likewise the civil law of her colonies. It was, however, also provided by a general decree that no law enacted for Spain should be obligatory in America unless accompanied by a *cedula* to that effect, emanating from the council of the Indies. Later the colonial law was again revised in order to include the gradual changes which had been introduced, and a new code was published in 1792.

The revolution in Spain which followed the French invasion gave rise to a new form of government, which arose under the direction of the Cortes, whose decrees were held obligatory in Mexico whenever expressly declared so to be or when there promulgated. After the re-establishment of the monarchy in Spain the Spanish sovereigns continued to enact laws for the American colonies, until in 1820 a republican government was again established, since which time further codification of the laws previously existing has taken place. The civil law of the American colonies of Spain is therefore, with some few exceptions, hardly dissimilar to that of Spain.

See Schmidt's *The Civil Law of Spain and Mexico*; Johnston's *Law of Spain*; and general Spanish histories.

F. STURGES ALLEN.

**Spartel, Cape**: the northwestern point of Morocco on the south side of the entrance to the Strait of Gibraltar. It rises 1,040 feet above the sea, and is conspicuous for the lighthouse near its point, which was erected and is supported by the civilized nations that are interested in Atlantic-Mediterranean commerce. The cape yields the best grapes in Morocco.

**Speer**, WILLIAM, D. D.: missionary; b. in New Alexandria, Pa., Apr. 24, 1822; graduated at Kenyon College, Ohio, in 1840; studied medicine under his father in Pittsburg, Pa., and divinity at the Presbyterian Theological Seminary in Allegheny; was licensed to preach in 1846; with two colleagues established the first Presbyterian mission in Canton, China; was the first preacher in their own tongue to the Chinese in California in 1852; founded a Chinese school, established a dispensary, and built a mission-house; organized the first Christian Chinese church in America; founded *The Oriental*, a Chinese-English religious and secular paper devoted to the interests of immigrants; became corresponding secretary of the Presbyterian board of education at Philadelphia in 1865; traveled in Japan and China 1876–77. He is the author of *China and the United States* (1870); *The Great Revival of 1800* (1872); and *God's Rule for Christian Living* (1875).

**Spence**, Henry Donald Maurice, D. D.: Church of England clergyman; dean of Gloucester; b. in London in 1836; graduated B. A. at Cambridge 1865; was Professor of English Literature and Modern Languages and Hebrew lecturer at St. David's College, Lampeter, 1865–70; rector in Gloucester 1870–77; principal of Gloucester College 1875–77; vicar and rural dean of St. Pancras, London, 1877–86; dean of Gloucester 1886. Besides contributing to Bishop Ellicott's and Dr. Schaff's commentaries, he edited *The Pulpit Commentary* (London and New York, 1880, *sqq.*) and *The Teaching of the Twelve Apostles* (1884); *Dreamland and History—the History of the Norman Dukes* (1890); *The Cloister Life in the Days of Cœur de Lion* (1892); *Voices and Silences* (1894); *Gloucester Cathedral* (1897); *The Church of England: a History for the People* (1897–99, 4 vols.). S. M. J.

**Stall**, Sylvanus: clergyman; b. in Elizaville, N. Y., Oct. 18, 1847; after studying at Union Theological Seminary, graduated at Pennsylvania College, Gettysburg, in 1872, and at the theological seminary there in 1874; was ordained in the Hartwick Lutheran synod in 1874, and has held pastorates at Cobleskill, N. Y., Martin's Creek, Pa., and Lancaster, Pa., 1874–87; retired in 1887 to devote his time to *Stall's Lutheran Year-book*, which he founded in 1884; has been statistical secretary of the Lutheran general synod since 1885. He has published *A Pastor's Record* (1876); *Handbook to Lutheran Hymns* (1879); *How to Pay Church Debts and How to Keep Churches Out of Debt* (1880); and *Methods of Church Work* (1887).

**Stanton**, Oscar Fitzalan: naval officer; b. in Sag Harbor, N. Y., July 18, 1834; graduated at the Naval Academy 1855; became master 1855, lieutenant 1856, lieutenant-commander 1862, having served in the Paraguay expedition, on the coast of Africa, and in the Pacific squadron: was with the West India and the Gulf blockading squadrons 1862–64, on ordnance duty at New York 1865, and on duty at the Naval Academy 1867; was advanced to commander 1867, and was with the North Atlantic squadron and on special service 1867–69; commanded the receiving-ship at Portsmouth, N. H., 1871; served with the Asiatic squadron 1872–74; became captain 1879; was on duty at the naval asylum at Philadelphia 1881–84, then commanded the flag-ship Tennessee on the North Atlantic station; was advanced to commodore 1893, rear-admiral 1894, and retired the same year.

**Starr**, Frederick, Ph. D.: anthropologist and author: b. in Auburn, N. Y., Sept. 2, 1859; prepared for college in the Auburn high school; B. S., Lafayette College, 1882; M. S. and Ph. D., Lafayette College, 1885; teacher of science, Wyman Institute, Upper Alton, Ill., 1882–83; teacher of science and history, Central State Normal School, Lockhaven, Pa., 1883–84; Professor of Biological Sciences, Coe College, Cedar Rapids, Ia., 1884–87; in charge of geology and associated sciences, Chautauqua University, 1885–88; curator of ethnology, American Museum of Natural History, N. Y., 1889–91; Associate Professor of Anthropology, University of Chicago, since 1892. Author of *On the Hills*; *Ancient Pictures for Little Moderns*; *Some First Steps in Human Progress*; *American Indians*; and many papers in periodicals and scientific transactions. Lecturer on anthropological subjects; traveler and explorer in Mexico.
C. H. Thurber.

**Stavenhagen**, Bernhard: pianist; b. in Greiz, Germany, Nov. 24, 1862; pupil in Berlin, and (1885) of Liszt in Weimar, with whom he remained until the latter's death in 1886. He is a renowned pianist all over Europe, and made a visit to the U. S. in 1896. He has received many court decorations and orders from the reigning sovereigns in Europe. Since 1898 he has resided in Munich.

**Stearns**, John William, LL. D.: educator; b. in Sturbridge, Mass.; A. B., Harvard, 1860; A. M., Harvard, 1864; LL. D., University of Chicago, 1874; tutor in Latin, University of Chicago, 1865–67, and Professor of Latin there 1867; director of the National Normal School, Argentine Republic, 1874–78; president of Whitewater Normal School (Wisconsin) 1878–85; Professor of the Science and Art of Teaching, University of Wisconsin, 1885–88; Professor of Philosophy and Pedagogy there since 1888, and director of its School of Education since 1897. He is editor of the *Wisconsin Journal of Education.*

**Stejneger**, stī-nee'ger, Leonhard, Ph. D.: naturalist; b. in Bergen, Norway, Oct. 30, 1851; educated at the university in Christiania, where he received the degree of Ph. D. in 1871. In 1881 he settled in Washington, and in 1882 visited the Commander islands for the purpose of studying their natural history and to make collections for the U. S. National Museum. He returned a year later, bringing with him numerous skulls and bones of the northern sea-cow, an extinct mammal, and then worked up the material collected by him. The installation of the ornithological portion of the exhibit of the U. S. National Museum at the Cotton Centennial Exposition, held in New Orleans in 1885, was prepared by him, in which year he was also made assistant curator of birds in the U. S. National Museum. This office he held until 1889, when he was made curator of reptiles and batrachians, which place he has since held. Again in 1895 he visited the Commander islands under the auspices of the U. S. Fish Commission, and in 1896 he was detailed as a member of the fur-seal commission to visit the Pribiloff, Commander, and Kurile islands. Dr. Stejneger prepared the greater portion of the volume on birds for the *Standard Natural History*, and besides numerous papers in the *Proceedings* of the U. S. National Museum, under the serial title of *Contributions to the Natural History of Commander Islands*, he is the author of the following monographs: *Results of Ornithological Explorations in the Commander Islands and in Kamtschatka* (Washington, 1885); *Directions for Collecting Reptiles and Batrachians* (1891); and *The Poisonous Snakes of North America* (1893).
Marcus Benjamin.

**Stembel**, Roger Nelson: naval officer; b. in Middletown, Md., Dec. 27, 1810. He became midshipman 1832, was on duty at the New York naval school 1834–38, and became passed midshipman in the latter year; was advanced to lieutenant 1843; served in the Coast Survey, on the Brazil station, and on the East India station 1847–59; at the beginning of the civil war he was engaged in fitting out river gunboats at Cincinnati; serving in the Mississippi river flotilla, he took part in the successful engagements at Lucas Bend, Fort Henry, Island No. 10, and Fort Pillow 1861–62; in action with the rams at Fort Pillow, his vessel was sunk and he was severely wounded, after which he was assigned to special duty at Philadelphia and Pittsburg until 1865; was promoted to captain 1866, cruised in the Mediterranean 1866–67; was made commodore 1870; was appointed commander-in-chief of the Pacific squadron 1872, was retired in the same year, and was advanced to rear-admiral on the retired list 1874. D. Nov. 20, 1900.

**Stephen**, Sir Herbert, Bart., K. C. S. I., LL. M.: English lawyer and law-writer; b. in London, June 25, 1857, the son of Sir James Fitzjames Stephen, the famous criminal lawyer, law-writer, and judge; was educated at Rugby and at Trinity College, Cambridge; read law and was called to the bar in 1881, when he entered upon the practice of his profession; was made clerk of assize for the northern circuit in 1889. He has published *The Law Relating to Actions for Malicious Prosecutions*, and other minor legal works.

**Stereor'nithes**: a name given by Florentino Ameghino to a group of extinct gigantic birds, whose remains are found in the Tertiary of Patagonia. They are mostly comprised in the family Phororhachidæ (*q. v.*).

**Sternberg**, Constantine: pianist; b. in St. Petersburg, July 9, 1852; studied in Germany. In 1871 he was appointed conductor of the Strelitz Hofopera, and in 1876 court pianist. He traveled all over Europe in concert tours, and finally went to the U. S., settling first in Philadelphia and later in Atlanta, Ga., where he is director of a music school. He has composed many pieces for the pianoforte which are often heard in the concert-room.

**Sternberg**, George Miller, M. D., LL. D.: surgeon; b. in Otsego co., N. Y., June 8, 1838. He graduated at the College of Physicians and Surgeons of Columbia University in 1860, and on the breaking out of the civil war was appointed as assistant surgeon in the U. S. army, and has since been advanced through the various grades of the medical service until May 30, 1893, when he was made surgeon-general with the rank of brigadier-general. While stationed in Baltimore, he devoted much attention to bacteriology, and he was a fellow by courtesy of the Johns Hopkins University 1881–85. Besides many assignments on important Government boards, he was appointed especially to make (1887–89) investigations in Brazil, Mexico, and Cuba, relative to the ætiology and prevention of yellow fever. He was director of the Hoagland laboratory in Brooklyn, N. Y., from its inception in 1890 until his appointment to the surgeon-generalship. The degree of LL. D. was conferred upon him by the University of Michigan in 1894, and by Brown in 1897. He is a member of many scientific and medical societies, holding honorary membership in the Academies of Medicine in Rome and Rio Janeiro, and in the Epidemiological Society of London. In 1887 he was president of the American Public Health Association, which society, in 1885, awarded him the Lomb prize of $500 for an essay on disinfectants, and in 1897 he was made president of the American Medical Association. He has written 125 papers, in addition to which he has published 29 single works, including *Photomicrographs and How to Make Them* (Boston, 1883); *Malaria and Malarial Diseases* (New York, 1884); *Disinfectants and Individual Prophylaxis against Infectious Diseases*, Lomb prize essay (Concord, N. H., 1886); *Report on the Etiology and Prevention of Yellow Fever* (Washington, 1890); *A Manual of Bacteriology* (New York, 1892); *Protective Inoculations in Infectious Diseases* (Concord, N. H., 1893); *Immunity, Protective Inoculations in Infectious Diseases, and Serumtherapy* (New York, 1895); and *Researches Relating to the Specific Infectious Agent of Smallpox and the Production of Artificial Immunity from this Disease* (Chicago, 1896).

MARCUS BENJAMIN.

**Stetson, John B., University**: an institution of learning in De Land, Fla.; non-sectarian; chartered in 1887. It has an endowment of $201,500, five buildings, a library of nearly 9,000 volumes, chemical, physical, biological, and bacteriological laboratories, a museum containing numerous mineralogical, geological, and marine biological specimens, and a collection of Florida birds. Work is done in the following departments: Collegiate, academic, normal, commercial, music. Instruction is also given in art. The college has two courses, the classical and the scientific, leading, respectively, to the degrees of A. B. and S. B. After the freshman year a liberal range of electives is permitted. The university is active in university extension work, and offers correspondence courses. In 1898 it was affiliated with the University of Chicago. There are three scholarships which pay all expenses. In the academic work a distinctive feature is instruction in philosophy, political economy and political science, and constitutional law. Seven professors, 2 acting professors, and 23 instructors and assistants compose (1899) the faculty. The attendance in all departments is 375. John F. Forbes, A. M., Ph. D., is president.

**Stevens**, JAMES GRAY: lawyer and legal writer; b. in Edinburgh, Feb. 25, 1822, receiving his education in the Edinburgh schools and university; went to New Brunswick in 1840, and was called to the bar in 1847, since which time he has practiced his profession at St. Stephens, New Brunswick; was a member of the New Brunswick Assembly 1861–64 and 1866–67, when he was made queen's counsel and appointed county court judge. He is a popular public speaker and active in agricultural and educational affairs. He has published *An Analytical Digest of the Decisions of the Supreme Courts of N. B. from 1825 to 1873 inclusive* (1873), and *from 1873 to 1887* (1887); *Indictable Offenses and Summary Convictions* (1880). F. STURGES ALLEN.

**Stoddard**, WILLIAM OSBORN: author; b. in Homer, N. Y., Sept. 24, 1835; graduated at the University of Rochester in 1858; edited the Chicago *Daily Ledger* for a short time, and was for three years editor of the *Central Illinois Gazette*, vigorously opposing slavery; was a private secretary to President Lincoln 1861–64, and U. S. marshal for Arkansas 1864–66; has secured patents for improvements in desiccating processes and in machinery, and invented a center-locking printer's chase. He has published *Royal Decrees of Scanderoon* (1869); *Verses of Many Days* (1875); *Dismissed* (1878); *The Heart of It* (1880); *Dab Kinzer* (1881); *The Quartet* (1882); *Esau Hardery* (1882); *Talking Leaves* (1882); *Wrecked?* (1883); *The Life of Abraham Lincoln* (1884); *The Volcano Under the City*, depicting the draft riots of 1863 in New York city (1887); *Inside the White House in War Times* (1890); and *Men of Business* (1893).

**Stoeckel**, GUSTAV J.: musician; the first Professor of Music in Yale University; b. in Bavaria, Nov. 9, 1819, and went to the U. S. in 1848 with letters of introduction to members of the Yale faculty; began his connection with Yale in 1852 as instructor of music and college organist. In 1864 he received the degree of doctor of music, and, the Battell professorship of music having been founded, he was appointed to the position in 1890. Besides his work in the college, he has directed many concerts and musical enterprises in New Haven, produced several oratorios, compiled a number of music-books, composed four operas, several overtures, many anthems, orchestral pieces, and small works. The breaking down of his health compelled him to retire in 1894, and he was succeeded by Horatio W. Parker.

D. E. HERVEY.

**Stokes**, HENRY NEWLIN, Ph. D.: chemist; b. in Moorestown, N. J., Oct. 24, 1859; graduated at Haverford College in 1878, and then entered the Johns Hopkins University, where he spent six years as a fellow, studying chemistry under Ira Remsen and biology under Henry M. Martin, and received the degree of Ph. D. in 1884 for a thesis on *Phthalic Sulphinide*. From 1885 to 1892 he was a student in chemistry at the University of Munich and at the Polytechnikum in Zurich. On his return to the U. S. he became assistant chemist in the U. S. Geological Survey, which place he held until 1892, when he became assistant professor in the University of Chicago in charge of general and inorganic chemistry. This appointment he resigned in 1893 and returned to the U. S. Geological Survey as assistant chemist, which place he still holds. Dr. Stokes is a member of the American Chemical Society, and also of similar organizations in Germany and France. He has been very active in chemical investigation, especially in the field of inorganic chemistry. The results of his researches have been published mainly in the *American Chemical Journal* and have been on oxy- and amido-oxy-pyridines; on esters of silicic acid; on amides of phosphimic acid; on metaphosphimic acids; and on chloronitrides of phosphorus, which constitute a remarkable and unique series of inorganic polymers.

MARCUS BENJAMIN.

**Stone**, FREDERICK DAWSON, Lit. D.: librarian; b. in Philadelphia, Pa., Apr. 8, 1841; was educated in private schools, and entered his father's silk-importing house as an accountant; enlisted in the Union army at the outbreak of the civil war, and took part in the Gettysburg campaign; became a member of the council of the Historical Society of Pennsylvania, and librarian of that association in 1876, holding the post until his death; was recognized as an authority on the colonial history of the U. S.; received the degree of Lit. D. from the University of Pennsylvania; was for several years editor of the *Pennsylvania Magazine of History*. His works include *The Founding of Pennsylvania*; *The Struggle for the Delaware*; *Pennsylvania and the Federal Constitution*, in collaboration with John B. McMaster (1888); *The Battle of Brandywine*, a monograph; and *A Plea for the Study of Genealogy*, an address. D. in Philadelphia, Aug. 12, 1897.

**Storage Batteries**: batteries of voltaic cells for the storage of electric energy. Voltaic cells may be conveniently divided into two classes: primary and secondary cells. The primary cell, which consists of two chemically different metals, such as zinc and copper, plunged in an electrolyte, gives an electric current whenever the two metals are brought into metallic contact. This current, the energy of which is obtained by the combination of one of the metals with the acid radical of the electrolyte, will continue to flow until the supply of metal and electrolyte is exhausted. The products of the reaction must then be removed and fresh material supplied before the cell can be brought into activity again. In the secondary cell the necessary difference between the two metals is brought about by the direct action of the current flowing through the cell. The current employed for this purpose, which is called the charging current, has a portion of its energy transformed into potential energy of chemical combination, in which form it may be said to be stored—whence the term storage battery. After the charging process has gone on for a sufficient length of time the cell may be taken out of the circuit, its terminals may be metallically connected, and it may thus be made to give current just as any primary cell would do. This current, which is called the discharging current, flows in the opposite direction from the charging current. The amount of energy which may be obtained from it can never exceed the total energy stored in the cell by the action of the charging current, but under the best conditions it may approach very near to the latter in amount.

There are numerous combinations of metals and electrolytes from which action such as this can be obtained, but in order that a storage battery shall be of practical use it is necessary that charging may take place over and over again without serious deterioration in the capacity or performance of the cell. The combination of materials which most completely fulfills this condition, as has been pointed out in the article ACCUMULATOR (*q. v.*), consists of two plates of lead submerged in dilute sulphuric acid. If the electric current be sent through such a cell the metal plate from which the current enters the electrolyte will be oxidized, and the other where the current leaves the liquid to enter the metal will be converted into spongy lead.

Of the two original processes of making secondary cells described in the article just cited, that of Planté (1860), which consisted in oxidation of the surface of the positive plate and the production of spongy lead on the surface of the negative plate by long-continued action of the voltaic current, was for many years almost completely supplanted by the later process of Faure (1878). The latter process, which was independently discovered by Metzger, consisted in applying oxides of lead, chiefly red lead and litharge respectively, to the surfaces of the plates in order to shorten the operation of formation by the action of the current. There has since been a reaction, and in the manufacture of storage batteries, which has grown to be an important industry, modifications of both processes are extensively employed.

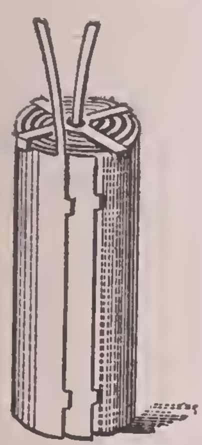

FIG. 1.

Planté, in order to secure a very large surface and low resistance, rolled two sheets of lead side by side, as shown in Fig. 1. These sheets, which were kept apart by means of flexible strips of vulcanite, formed respectively the positive and the negative element of the cell. The roll was submerged in a cylindrical jar of dilute sulphuric acid.

The Planté process is modified in modern commercial practice in several ways. The plates are sometimes built up of bundles of corrugated ribbons of lead, as shown in Fig. 2. Sometimes they are folded back and forth with a frame or grid of lead or alloy, a device due to Sorley (Fig. 3). Such ribbons are sometimes coiled into flat spirals and forced into circular holes in a solid plate. In other cells the grid is grooved or slit in a variety of ways to increase

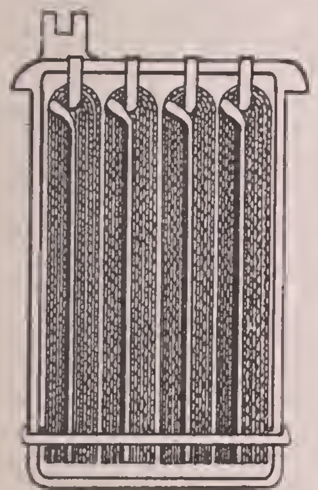

FIG. 2.

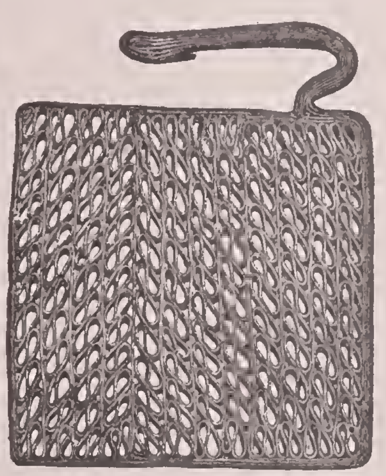

FIG. 3.

the surface. Another important modification consists in submerging the plates, constructed in any of the ways described above, in a solution which attacks the lead and greatly hastens the subsequent formative action of the current.

The modern development of the process of Faure or Metzger consists essentially in constructing the grid, which is cast of lead or of some alloy of lead, in such a form as to hold as large a quantity as possible of the oxides applied in the form of pasté. Great difficulty has been experienced from the loosening of this active material in the process of charge and discharge through which the battery has to go alternately in the course of its existence, and a large number of ingenious forms have been given to the grid for the purpose of holding the paste securely in place. The grid is sometimes cast in a form similar to that shown in cross-section in Fig. 4, with deep recesses on each side to hold the paste. Another plan is to cast the grid in halves, which are placed face to face, leaving pockets beveled inward for the active material (Fig. 5). A highly developed example of this type is the *Correns* grid shown in Fig. 6. This consists of a double latticework, beveled within the network, the halves placed as shown in the figure so that the openings on opposite sides do not coincide. The entire space between the two lattices is filled with the active material, which in the case of the positive plate is minium, and for the negative litharge.

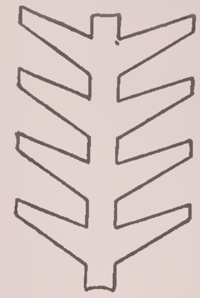

FIG. 4.

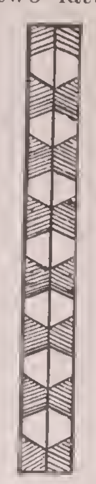

FIG. 5.

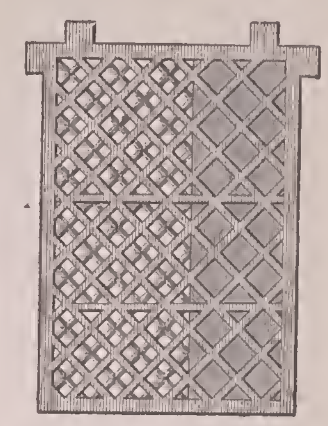

FIG. 6.

A very serviceable home-made grid, which has been found to render excellent service, is made by splitting ordinary lead pipe, about 1 cm. in outer diameter, and mounting the sections one above another, as shown in Fig. 7. The interstices are filled with litharge for the negative and with red lead for the positive plates, and the formation is accomplished by means of the electric current in the usual manner. The sections are held in place by casting a frame of lead around them in such a manner as to give support to the ends of the pipe.

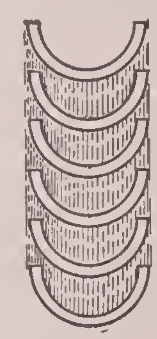

FIG. 7.

It would greatly exceed the limits of this article were mention to be made of even the most important of the numerous variations that have been introduced into the construction of storage batteries. In some cells porous partitions are placed between the plates to hold the active material in position; in others the oxides are placed in a porous dish of non-conducting material. Other salts of lead have been used instead of the oxides before formation; various salts have been dissolved in the electrolyte to increase the conductivity or modify the reactions; other metals than lead and likewise non-metallic substances have been used for the grids.

Whatever form be given to the storage battery, the final result produced by the charging current and the change which the battery undergoes during the process of discharging is much the same. The discharging current gradually undoes the work which the charging current has done in the process of forming the battery, reducing the oxide on the surface of the positive plates, and oxidizing the spongy lead of the negative plates. The result is a falling off in

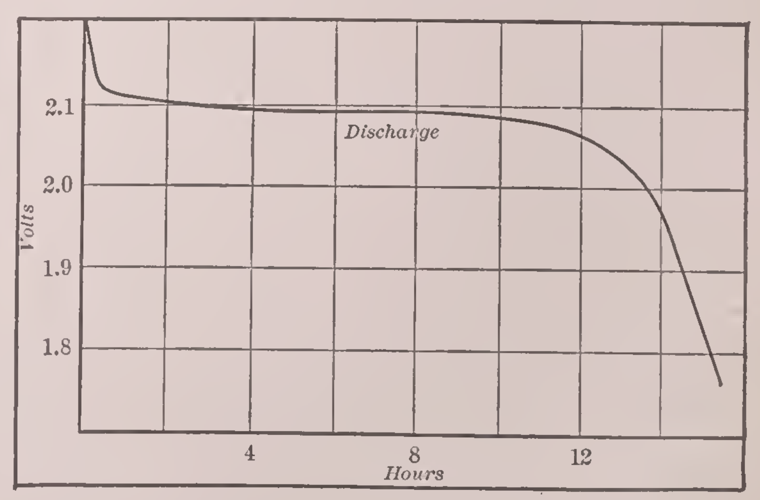

FIG. 8.

electromotive force, slow at first, then after a certain period much more rapid. The character of this change as it occurs in a normal discharge of a battery is shown in Fig. 8. When the point is reached where the curve of electromotive force begins to bend suddenly downward the discharge must be interrupted, otherwise a new set of reactions begin to take place as the result of electrolysis within the cell which are not to be readily undone by the subsequent action of the charging current. The further use of the battery without recharging is then likely to do it permanent damage, and perhaps to ruin it. The approach of this danger-line is indicated in a number of ways. The voltameter, which at the beginning of discharge should have indicated a potential difference for each cell of about 2·1 volts, will have fallen to about 1·9 volts. The density of the acid, which is at its maximum when the battery is fully charged, falls off during discharge, and a suitable hydrometer merged in it can therefore be made to indicate the degree of depletion of the cells and the approach of the condition of complete discharge.

If the circuit be opened before the critical point is reached and a charging current be sent through the cell from an outside source, these processes are all reversed: reoxidation of the positive plate occurs, together with a reduction of the surface of the negative plate to its normal condition of spongy lead, and after an amount of energy slightly greater than that which has been taken from the cell has been expended, the cell will have returned virtually to its original condition. That there must be loss of energy in this cycle of operations is obvious, and this must manifest itself primarily through the development of heat both during charge and discharge.

The chemistry of the secondary cell of a storage battery is in reality much more complicated than would be inferred from the foregoing statements. Much attention has been given to this subject, especially by Ayrton, by Frankland, and by Gladstone and Tribe, who have pointed out—what is indeed recognized by every student of the subject—that there are formed in the electrolytical processes which go on in the cell a variety of oxides and hydrates of lead, as well as of basic sulphates of that metal, and that the changes which occur in charging and discharging do not supplement each other completely throughout to such an extent as to bring the cell back to precisely its original condition. The existence of these irreversed reactions leads to depreciation of the battery, and it is an important part of the art of operating such batteries to keep this depreciation at a minimum.

The principal function of the storage battery is to supplement the work of dynamo-electric machines. Batteries do this in various interesting ways. The character of the work to be done by a station for the distribution of electric light or power, for example, is very unequally distributed throughout the twenty-four hours. In a lighting station the times of chief demand will be during the early morning and the early evening, and there will be times during the day and between midnight and early morning when the load will be so light that engines can be kept running only at a loss. A storage battery the electromotive force of which equals that of the generators of such a station can be made to carry these light loads without the assistance of the engines, thus enabling the latter to be taken out of service altogether for several hours of each day. The demand for energy during the busy hours of the day at such a station is, moreover, so greatly in excess of the average load that it becomes necessary to build engines and generators oftentimes of more than double the size necessary to carry the average load. This may be avoided by the use of a storage battery put on in addition to the engines and generators during these hours. If the capacity of the battery at its maximum discharge rate is equal to the capacity of the generators, it makes it possible to reduce the size of the latter to that adapted to the average instead of to the maximum load.

In order that the battery shall be able to do work in these two ways, (1) by taking the place of engines and dynamos during the comparatively idle hours of midnight and midday, and (2) by supplementing them during the early hours of the morning and evening, it is necessary that it shall be charged between times, and it will be found that there are certain periods during which the load, while considerable, falls below the average, and that the generators can be employed in charging the battery during these hours of light load to great advantage. The result of this application of the storage battery is that, instead of having machines of double the size necessary for the average load, running at full load for a few hours only, and running at light loads uneconomically during the remainder of the day, it becomes possible to operate smaller engines for a portion of the day at full load, which is the most economical condition, and to stop them altogether during the remainder of the day. The economy and convenience of such an arrangement are very great.

Fig. 9 represents graphically the changes of load which might be expected to occur in such a station as that just described. The diagram shows the part of the load taken

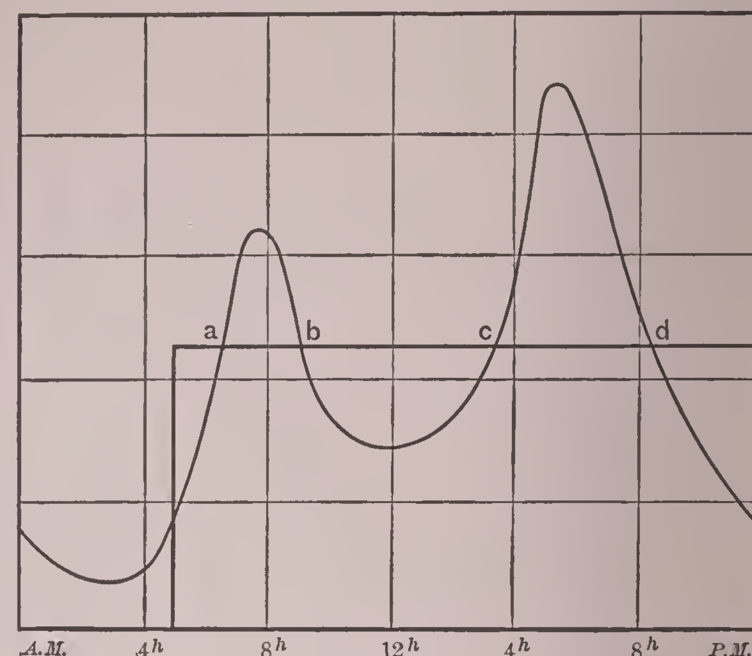

FIG. 9.

by the engines and that which is taken by the battery in the course of twenty-four hours. From midnight until 5 A. M. the engines are shut down and the battery carries the light night load. After five o'clock the engines carry the now rapidly increasing load and charge the batteries until, soon after six, the load-line crosses the horizontal line which indicates the full capacity of the engines at *a*. The batteries then help the engines with the "peak" of the load until the curve crosses the engine load-line again, soon after nine o'clock, at *b*. The engines then charge the batteries and carry the load until 3 P. M. (*c*), and in turn are supplemented by the batteries until nearly 9 P. M. (*d*). From this time until midnight, when the engines are shut down, the batteries are being charged. In stations for the distribution of power a similar state of affairs usually exists, and the function of the battery is similar to that just described.

Another very important use to which such batteries have been put consists in equalizing the sudden fluctuations of load that occur on electric railroads where a small number of cars are employed. The first application of this kind was to a suburban railroad in Zurich, Switzerland, where 270 cells of storage battery were connected in parallel circuit with the generator. Owing to the heavy grades encountered by the cars on this road, the fluctuations and the demand for current are very sudden and through a great range. Fig. 10 shows the demands on the power station of

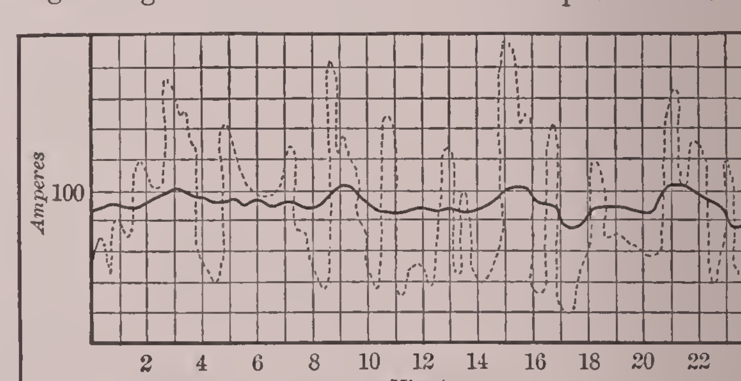

FIG. 10.

this road for current during an interval of twenty-four minutes. The battery is so arranged that whenever the load exceeds a certain normal value—namely, about 100 ampères—the surplus current will come from the battery. During such intervals of time as the demand for current falls below 100 ampères the battery is charged by the generator. The black line in this diagram shows the current demanded from the generators; the shaded areas above and below that line show the intervals during which the battery is receiving current and is delivering current to the line. As a regulator or equalizer used in this or in some similar manner the storage battery fills a very important place.

Still another way in which the storage battery has been utilized consists in locating it in a sub-station at some distant point where from time to time power is needed. To carry the current for power-distribution to such a distant station would require lines the weight of copper in which would be sufficient to furnish capacity for the maximum current ever demanded. By the installation of a storage battery in the sub-station, however, smaller currents can be transmitted to the new center of distribution over correspondingly smaller wires, and when the time of heavy demand comes the battery may be used to aid in supplying it. The saving in copper thus effected has been found an item of very great economical importance.

These are the most important uses to which storage batteries have thus far been put, if we measure importance by the number of cells or by the tons of lead thus employed. The minor applications are, however, very numerous. For electrically driven boats and launches the storage battery may be said to be the only available source of current. Electrically driven motor vehicles have to depend upon the same source. There are many instances where it has been found advantageous to place storage batteries on street cars instead of obtaining current from feed-wires along the track or from the rails of the road. The modern practice in this respect has, however, in most instances tended toward the installation of the batteries in stations and toward the feeding of the motors on the cars by means of the trolley or some substitute for that device.

It would be impossible to enumerate in this article the almost infinite variety of applications to the arts which have been made of the storage battery. There is scarcely a technical process in which at the present day electricity does not play some part, and in a large majority of cases the most convenient source of electricity for these varied purposes is the accumulator.

L. Nichols.

**Strachey**, John St. Loe: English lawyer and journalist; b. in 1860; received his college education at Baliol College, Oxford, where he graduated first class in history; then took up the study of law and was called to the bar, but since 1884 has given his entire time to journalism; was editor of the *Cornhill Magazine* 1896–97; is now (1899) joint editor and joint proprietor of *The Spectator*. He is best known, aside from his general writings for periodicals and newspapers, by his book entitled *From Grave to Gay*. F. Sturges Allen.

**Strack**, Hermann Leberecht, D. D.: Protestant German theologian; b. in Berlin, May 6, 1848; studied there and in Leipzig; became a teacher in a Berlin gymnasium 1872–73; in 1877 professor extraordinary in the Berlin University. He is eminent as a biblical and Talmudic scholar, and is much interested in the conversion of the Jews to Christianity. Among his numerous independent publications may be mentioned *Prolegomena Critica in Vetus Testamentum Hebraicum* (Leipzig, 1873); *Prophetarum posteriorum codex Babylonicus Petropolitanus* (1876); *Hebräische Grammatik* (Carlsruhe, 1883; 6th ed. Berlin, 1896); *Einleitung in das Alte Testament* (Nördlingen, 1883; 5th ed. Munich, 1898); *Einleitung in den Talmud* (Leipzig, 1887; 2d ed. 1894); *Das Blutaberglaube in der Menschheit, Blutmorde und Blutritus* (Munich, 1891); *Grammatik des biblischen Aramäisch* (Leipzig, 1896; 2d ed. 1897). With K. Siegfried, he issued *Lehrbuch der neuhebräischen Sprache und Litteratur* (Carlsruhe, 1884); with Zöckler, he co-operated upon the *Kurzgefassten Kommentar zu den Schriften des Alten und Neuen Testaments* (Nördlingen u. Munich, 1886, *sqq.*; 14 parts). In 1883 he founded and has since conducted the Berlin Institutum Judaicum, and, as the organ of the Mission to the Jews, in 1885, *Nathanael, Zeitschrift für die Arbeit der evangelischen Kirche an Israel*. He has published, with notes and vocabularies, the Mishna tracts *Sayings of the Fathers* (Karlsruhe, 1882; 2d ed. Berlin, 1888); *Day of Atonement* (Berlin, 1888); *Idolatry* (1888); *Sabbath* (Leipzig, 1890). S. M. J.

**Stranahan**, James Samuel Thomas: b. in Peterboro, Madison co., N. Y., Apr. 25, 1808; attended a district school for a few terms, then studied in an academy; taught school for a year, and afterward became a surveyor. He went to the Northwest in 1827 for the purpose of trading with the Indians, but failed, and returning entered the wool business in Albany, N. Y. In 1832 he established the town of Florence, N. Y., and in 1838 he was elected Assemblyman for that town. In 1840 he moved to Newark, N. J., and became a railroad contractor, taking part of his pay in stocks, thus acquiring a large interest in several profitable roads. In 1844 he settled in Brooklyn, N. Y., because of his interest in the Atlantic Docks there, an enterprise then only beginning, and from which no dividend was declared until 1870. In connection with the construction of these docks, which are 2 miles in length, 200 acres of land were reclaimed from tide-water, warehouses were built with a frontage of a mile, and the dwellings on the reclaimed land accommodate 15,000 inhabitants. Mr. Stranahan was also a large owner of the Union Ferry Company and prominent in its management. He became an alderman in 1848, and in 1850 was nominated for mayor, but not elected. In 1854 he was elected to Congress. In 1858 he was a police commissioner under the metropolitan system, which embraced the two cities New York and Brooklyn. The institution of this system nearly led to rioting, in the prevention of which he was largely instrumental. He was a delegate to the Chicago convention in 1860, and voted for the nomination of Abraham Lincoln. During the civil war he was active in raising funds in connection with the women's relief committee, of which his wife was president. Under the act of 1860 providing for the making of a park Mr. Stranahan became a park commissioner, and he remained at the head of the commission twenty-two years, during which time he virtually controlled its action in the expenditure of nearly $9,000,000. He was also prominent in the movement that led to the building of the Brooklyn bridge, and through this and the park was popularly called "the wizard," "the magician," and "Brooklyn's first citizen." On June 6, 1891, a bronze statue of Mr. Stranahan was unveiled at one of the entrances to Prospect Park. The last public work in which he engaged was the consolidation of New York, Kings, Queens, and Richmond Counties into the present city of New York. He was a member of the first commission that considered the project, and a strong advocate of consolidation. D. in Saratoga, N. Y., Sept. 3, 1898.

**Strathcona and Mount Royal**, Sir Donald Alexander Smith, Lord: b. in Archieston, Scotland, in 1820; entered the service of the Hudson Bay Company in 1838, and was promoted until he became resident governor and chief commissioner of the company in Canada. In 1870 he entered the Legislature and the House of Commons, but resigned his seat in the Legislature four years later. He remained in the House until 1880, and entered again in 1887, remaining until 1896, when he retired from Canadian political life on his appointment to represent the Dominion in London as high commissioner. In 1897 he was raised to the peerage as Baron Strathcona and Mount Royal. He received the degree of LL. D. from Cambridge University in 1887, and from Yale University in 1892.

**Strong**, George Templeton: musician; b. in New York city, May 26, 1856; studied music as an amateur, in both the practical and theoretical branches, and became an expert oboe-player; began to compose about 1883, and since then has produced a large number of works for orchestra, piano, and voices. These are all marked by high purpose, fine musicianship, fluent melodies, and clever construction. Of late years he has lived mainly abroad. He composes only as an amateur. D. E. Hervey.

**Strong**, Sir Samuel Henry: chief justice of Canada; b. in Poole, Dorsetshire, England, Aug. 13, 1825; was taken by his father to Canada in 1836, and received his education in Quebec; studied law in Bytown, and was called to the bar in 1849 in Toronto, where he entered upon the practice of his profession; he early achieved distinction in equity practice and in 1856 was appointed a member of the commission for the consolidation of the statutes of Canada and Upper Canada; was elected bencher of the Law Society of Upper Canada in 1860, and created queen's counsel in 1863; was appointed vice-chancellor of the court of chancery in 1869, in 1874 was appointed to the court of error and appeal of Ontario, and in the following year made puisne judge of the Supreme Court of Canada, then newly created; became chief justice of this court in 1892, and was knighted in 1893. He has filled many high positions of public trust, including the office of deputy governor and that of privy councilor in the judicial committee of her Majesty's most honorable privy council of the British Empire League.

F. STURGES ALLEN.

**Strong**, WILLIAM L.: b. in Loudonville, Richland co., O., Mar. 22, 1827; was employed in a store in Ohio till 1853, when he moved to New York, where he acquired wealth as a dry-goods merchant. In 1895 he was selected as candidate for the mayoralty of New York by the independent voters represented by a body known as the "committee of seventy," and was elected. D. Nov. 2, 1900.

**Stuart-Wortley**, CHARLES B., M. A.: English lawyer and statesman; b. in Eserick Park, York, Sept. 15, 1851; attended school at Rugby, and afterward at Baliol College, Oxford, where he received his master of arts degree in 1879; was called to the bar in 1876, and practiced on the north-eastern circuit until 1885, when he was made Under-Secretary of State for the Home Department under Lord Salisbury; served in this office until 1892; was made a member of the chairman's panel for standing committees in 1895, and also in the same year was appointed as ecclesiastical commissioner and commissioner of church estates; was a Conservative member of Parliament for Sheffield 1880–85, and for the Hallam division of Sheffield 1885–99.

F. STURGES ALLEN.

**Sturgis**, JULIAN: English lawyer and author; b. in America, Oct. 21, 1848; was taken to England when seven months old and educated at Eton and at Baliol College, Oxford; studied law and was called to the bar, becoming a British subject; traveled in the Levant in 1878, and visited the armies of Turkey and Russia then before Constantinople, and in 1880 spent some time in traveling in America. He has devoted most of his time to literary pursuits, and has published *John-a-Dreams*; *Dick's Wandering*; *John Maidment*; *My Friends and I*; *Comedy of a Country House*; *A Master of Fortune*: *After Twenty Years*; *The Folly of Pen Harrington*; *Count Julian, a Tragedy*; *Nadesha* and *Ivanhoe* (libretti); *Little Comedies*; *A Book of Song*. F. STURGES ALLEN.

**Sulte**, BENJAMIN: author; b. in Three Rivers, province of Quebec, Sept. 17, 1841; graduated at the Military School, Quebec, and was in active service with the volunteers in 1865–66. He began to write for the newspapers as early as 1860. Among his published works are *Les Laurentiennes* (1870); *Histoire des Trois-Rivières* (1870); *Melanges d'Histoire et de Littérature* (1876); *Le Coin de Feu* (1877); *Chronique Trifluvienne* (1879); *Les Chants Nouveaux* (1880); *La Poésie Française au Canada* (1881); *Histoire des Canadiens-Français* (1882–84); *Histoire de St. François-du-Lac* (1886); *Pages d'Histoire du Canada* (1891); *Causons du Pays et de la Colonisation* (1891).

**Support of Land**: in law, the support of the land of one owner which is afforded by the adjacent or neighboring land in its natural condition, or such support as will prevent its falling into an excavation made in the underlying land, the first being called *lateral support*, and the second *subjacent support*. Every owner of real estate has a right in the nature of an easement to have his land supported in its natural condition by the resistance or support of the land of the adjacent owners; and if excavation be made by the owner of adjacent lands, he must so make his excavation as not to deprive the adjacent owner of the natural support necessary to retain the adjacent owner's land in its natural position; and if excavation be made in such a manner that the adjacent land falls into the excavation, he is liable in damages to the owner of the land injured by the excavation. This right of support may, by prescription or easement, also include the right to the support of any buildings or erections which are upon the land in the same condition in which they existed before the excavation.

The right of subjacent support arises usually in the case of persons having a right to mine under the surface of another's land, as where a lessee has a right to mine coal under land over which buildings have been erected or over which a railroad is operated, or where a miner has a location at the apex of a lode and may follow it in a downward course, even though it may enter the land of an adjacent owner. In either of these cases, and in other analogous cases, the owner of the adjacent land has a right to have the surface of his land supported in its natural condition, and the excavating miner is liable for damages occasioned by the settling or sinking of land caused by his excavation.

Generally speaking, the right of support does not extend to the support of the land where the lateral pressure has been increased by the erection of structures or buildings upon the land; but every owner has a right to assume that the land will be permitted to remain in its natural state, and an action for damages arises for any violation of this right independent of the question of negligence. As respects the support of buildings upon the adjacent land, in the absence of an easement, or the like, the excavating owner is held only to reasonable care, it usually being held that he is only required to give reasonable notice to the owner of the building of his intention to excavate the adjoining land, in order to enable the owner to take the necessary measures for the preservation of his own property. After giving such notice, however, the excavating owner is bound only to reasonable and ordinary care in the prosecution of the work. If the buildings erected upon the adjoining premises, however, shall have been erected for more than twenty years to the knowledge of the adjacent owner, the right of easement of support in the adjacent wall may arise in the owner of the buildings so supported.

The measure of damages in an action for removing the support of land to which another is entitled is the amount required to restore the property to its former condition with as good means of lateral support. Special damages must be pleaded.

See EASEMENT and PRESCRIPTION. See Wade's *American Mining Law*; Lindley's *Treatise on American Law Relating to Mines and Mineral Lands* (1897); Walmsley's *Mining Laws of the World* (1804); Stephen's *Law of Support and Subsidence* (London, 1890); Washburn's *Treatise on the American Law of Easements and Servitudes*.

F. STURGES ALLEN.

**Surette**, THOMAS WHITNEY: musician; b. in Concord, Mass., and studied in Boston under Prof. J. K. Paine, of Harvard University, and during his student period composed the opera *Priscilla, or the Pilgrim's Proxy*. He established himself as a teacher of the piano and theory in Boston, remaining there eight years, and then began lecturing on musical topics in various cities, and in Sept., 1894, made his home in Baltimore. He has composed another opera, entitled *Cascabel*, a cantata on Keats's poem *The Eve of St. Agnes*, a sacred cantata, and some church music. D. E. HERVEY.

**Surveyors and Surveys**: The position of a surveyor as respects his legal relation to his employer or client is covered by the general rules and regulations controlling the rights of persons employed in any other professional capacity. An implied contract exists that he is qualified to practice his profession and make a survey which shall be accurate and reliable, and he is responsible to the party for whom the survey is made for such damages as shall arise directly to the person relying lawfully upon it by reason of any inaccuracy or mistakes made in the survey and attributable to the surveyor's negligence or the lack of proper knowledge of his profession. In the giving of evidence in a question or proceeding at law a surveyor acts as an expert witness, and his reasonable skill in his profession must be proved, as in the case of any other expert testimony, and when so proved surveys made by him personally or under his personal supervision are admissible as evidence.

A map or survey made by a person who can not appear to prove the survey may be admissible if it be proved that it was made by a person having adequate knowledge of the art of surveying, as in the case of certain ancient surveys which have been in existence for a long period of time and are admissible as ancient documents under the law of evidence. See EVIDENCE and EXPERT TESTIMONY.

F. STURGES ALLEN.

**Sutro**, ROSE and OTTILIE: pianists; sisters, daughters of Otto Sutro, of Baltimore, Md., where they were born, and received their first instruction from their mother, herself an accomplished pianist. In 1888 they went to Berlin in company with Mrs. Sutro, and remained there studying until 1893 in the Royal High School of Music, receiving the official diploma of the Royal Academy of Arts. In 1893 they played in Paris, and in 1894 in London, and in Oct., 1894, they went to New York. Since then they have played frequently in various cities of the U. S., with annual visits to Europe. They always play together on two pianos, and their ensemble playing is so exact that it is impossible to distinguish between them. D. E. HERVEY.

**Sweden, History of**: The friction between the two neighboring Scandinavian countries has been referred to under NORWAY. One notable movement in recent years is the so-called Gothenburg system for regulating the liquor traffic. The position of Sweden has kept it out of the complications of Continental politics; its leanings, however, are toward the Triple Alliance. EDMUND K. ALDEN.

**Swete**, HENRY BARCLAY, D. D.: Church of England clergyman; b. in Bristol, England, Mar. 14, 1835; graduated B.A. at Cambridge 1859; was fellow 1858–71, and tutor of Gonville and Caius College 1872–75; divinity lecturer in the university 1875–77; rector of Ashdon, Essex, 1877–90; Professor of Pastoral Theology, King's College, London, 1882–90: since 1890 has been Regius Professor of Divinity at Cambridge. Of his works may be mentioned *On the History of the Doctrine of the Procession of the Holy Spirit, from the Apostolic Age to the Death of Charlemagne* (Cambridge, 1876); an edition of the commentary on the Pauline Epistles by Theodore of Mopsuestia (1880–82, 2 vols.); but chiefly his *The Old Testament in Greek according to the Septuagint, edited for the Syndics of the University Press* (1887–94, 3 vols.; 2d ed. 1895–98); *The Psalms in Greek according to the Septuagint, with the Canticles* (1889; 2d ed. 1896); *Fragments of the Apocryphal Gospel of St. Peter* (1893); *Apostles' Creed and Primitive Christianity* (1894); *Church Services and Service-books before the Reformation* (1896); *The Gospel according to St. Mark*, Greek text with notes (1898). S. M. J.

**Switzerland**: On June 1, 1898, a system of remarkably cheap travel on all the railroads of the country was inaugurated. First, second, and third class tickets are sold, which give the purchaser, whose photograph is attached to the ticket, the privilege of riding as much as he desires over the entire railroad system and also on the lake steamers during the time of the validity of the ticket. The price varies according to the time limit of the ticket, which is issued for periods from fifteen days to one year. The Swiss have increased their exports of dyed and raw yarns, which are now distributed to 22 countries, marking a decided advance in the spinning industry. The chief characteristic of Swiss industry is that the country does not aspire to produce a large amount of cheap stuffs, but rather to gain reputation for excellence and fineness of manufactures. Textile and metal industries lead. In textiles, cotton manufactures hold the first place, followed by embroidery and silk manufactures. Cottons employ 1,800,000 spindles, chiefly in the cantons of Zurich, Glarus, St. Gallen, and Appenzell. They are usually noted for fineness of texture and excellence of dyes and prints. Embroideries are exported to the average value of $18,000,000. The silk industry has declined somewhat, owing to American competition. Woolen and linen manufactures are less developed. The most prominent metal industries are the manufacture of watches and clocks, jewelry, music-boxes, and machinery. Watch-making has been passing through a severe crisis, owing to over-production and American competition. About 3,000,000 watches, however, are produced annually, mostly cheap grades, and five-sixths of the product is exported. Manufactures of chocolate, preserved fruits, straw braid, chemicals, dyes, wood-engravings, leather, and scientific instruments have more or less importance in the export trade, while manufactures of flour, beer, glass, china, artistic metal products, etc., are not largely produced, and are mainly consumed at home. The exports to the U. S. in 1900 were valued at $17,393,268, of which laces and embroideries, silk and silk goods, clocks and watches, cheese, and aniline colors were the chief items. In 1900 the imports from the U. S. were valued at $250,477, raw cotton, petroleum, raw tobacco, preserved meat, and cereals heading the list. C. C. ADAMS.

**Synchronograph**: an apparatus for the rapid transmission of telegraphic signals by means of the alternating current. This instrument depends upon the principle that an alternating-current circuit may be made and broken without the production of a spark, provided the interruption occurs at the instant when the current is changing sign, at which time there is no current flowing in the line. This statement does not hold strictly true of circuits of large capacity, but it is approximately true of all ordinary telegraphic lines. In order that the interruptions of the circuit used in signaling may occur at the proper instants, they are made automatically by the following device: A metallic disk or drum is mounted on the shaft of the alternating generator which supplies the circuit, or is driven synchronously with the same, or is geared in some known and exact ratio with the shaft of the alternator. The current used in signaling enters this disk from an adjustable brush bearing upon its periphery, and the interruptions of the circuit are made by means of a previously perforated tape similar to that used in other systems of machine telegraphy. This tape, which travels with the revolving disk, passes under the brush, which is thus lifted from contact during a portion of the time, and which is allowed to make contact as it drops into each successive perforation. To bring the make and break thus automatically produced at the precise instant of time when the current is changing sign, the brush is adjusted backward and forward until all appearance of sparking ceases. This is found to be a simple matter, which can be performed in a moment. The lengths of the gaps in the tape are made to correspond with the angular portion of the periphery of the disk, which measures a single alternation of the current, so that when the brush is adjusted for one interruption all the subsequent ones come into the proper place. Slipping of the tape is followed by sparking and calls for readjustment of the brush.

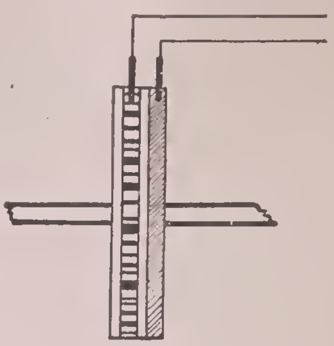

FIG. 1.

To get the requisite variety of signals for use in the telegraphic code, positive loops of the alternating current may be interrupted to indicate dots and negative loops to indicate dashes, or a positive and a negative which would correspond to the ordinary continental code (Fig. 2). Current may be carried out of the revolving disk by means of a second brush, as shown in Fig. 1, or a single brush may be used and the current may be carried out through the shaft. The circuit may be supplied directly from the alternator, or the voltage of the machine may be modified to suit the conditions of the line by the interposition of a transformer. In the latter case the arrangement would be that shown in Fig. 3, where L and L′ are the line wires, A is the alternator, T the transformer, and D the synchronous drum. It is also possible, by means of a number of independent generators arranged in multiple, to send several messages over the same line simultaneously. These may be distinguished from each other by using different frequences in the different circuits.

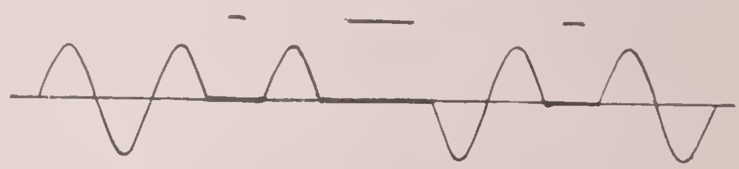

FIG. 2.

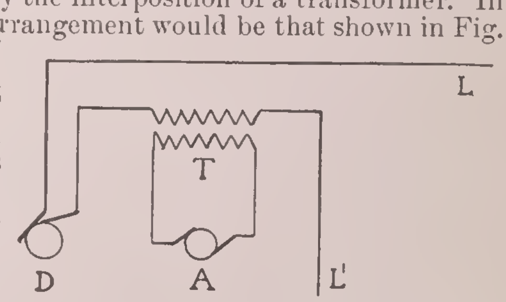

FIG. 3.

Since all interruptions of the circuit occur at the instants of time when no current is flowing, high potentials may be utilized for signaling without fear of injurious sparking.

The apparatus just described may be used with many of the forms of telegraphic receiver already employed in machine telegraphy. The ordinary Wheatstone receiver or the chemical receivers of Bain and of Delaney are suitable for this purpose. Experiments made under the auspices of the British Government showed that with the ordinary receiving instruments on their lines a notable increase in speed could be obtained. In various experimental trials the inventors of the synchronograph, Messrs. Crehore and Squier, have found it practicable to send from three to four thousand words a minute. In signaling through submarine cables the synchronograph used in connection with the ordinary commercial receivers is found to increase largely the speed of transmission without diminution in the sharpness of the indications at the receiving end of the cable. In order to reach the highest possible speed of signaling, the inventors propose to use the synchronograph in connection with a receiver based upon the principle of their photochronograph, in which a beam of light passes through a pair of crossed Nicol prisms (N' and N'', Fig. 4), and between these through a tube of carbon bisulphide (C) in the magnetic field. The field, which is caused by the current in the signaling circuit, rises and falls with each alternation and disappears altogether at each change of sign. At each alternation of current the magnetic field turns the plane of polarization of the beam of light within the carbon bisul-

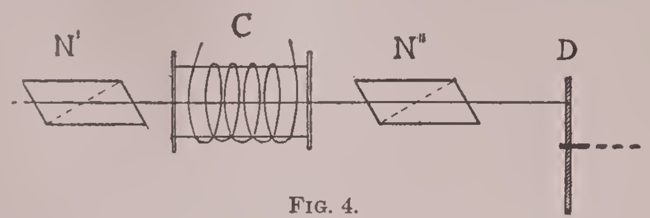

FIG. 4.

phide and permits it thus to pass momentarily through the second Nicol and to reach the sensitized surface of the revolving disk D, on which the photographic record is to be made. The record, therefore, when no signals are made, consists of successive equidistant spots of light on a dark ground, as shown at the extreme left and right in Fig. 5. The dots and dashes of the code, which are made, as has already been explained, by the suppression of one or of two

FIG. 5.

successive single alternations respectively, are signalized by the omission of the corresponding light spots from the series. The appearance of record of the word *telegraph* is shown in the middle of Fig. 5.

This form of receiver, which has the advantage of complete freedom from inertia, is not limited in the speed of its operation, as the ordinary commercial receivers used in telegraphy must be. The very high speeds at which it is capable of working have been demonstrated in its use in the determination of the velocity of the flight of projectiles and in similar experiments. (See, further, CHRONOPHOTOGRAPHY.) For details concerning the synchronograph, the reader is referred to *Transactions of the American Institute of Electrical Engineers*, vol. xiv., p. 93; also *Tests of the Synchronograph on the Telegraph Lines of the British Government*; *A Report to the Postmaster-General of the United States*; *Journal of the Franklin Institute*, vol. cxlv. (1898). E. L. NICHOLS.

**Szumowska**, shoo-mov'skaa, ANTOINETTE: pianist; b. in Lublin, Poland, Feb. 22, 1868, the daughter of a Polish professor who was banished to Siberia. After his return from exile he settled in Warsaw, where his daughter studied under local teachers. Later she went to Paris and worked for five years with Paderewski. Then she began a career as a concert pianist, and aroused great approbation in Paris and London. In 1890 she went to New York, and made a concert tour of the U. S., and a few years later was married to the Boston violinist Timothee Adamowski, with whom and his brother, a violoncellist, she has continued her professional career. D. E. HERVEY.

**Taft**, WILLIAM H.: jurist; b. in Cincinnati, O., Sept. 15, 1857; was graduated at Yale in 1878, and at the law school of Cincinnati College in 1880. He was law reporter on the *Cincinnati Commercial*, 1880–81; assistant prosecutor Hamilton County, 1881–82; collector of internal revenue, first district Ohio, 1882; judge of the Superior Court of Ohio 1887–90; Solicitor-General of the U. S. 1890–92; and U. S. judge, sixth circuit, 1892–1900. In Mar., 1900, he was appointed by President McKinley president of the commission to organize and establish civil government in the Philippines, and on July 4, 1901, became Civil Governor of the islands (appointed June 22).

**Tait**, ARTHUR FITZWILLIAM: artist; b. near Liverpool, England, Aug. 5, 1819; studied painting at the Royal Institution, Manchester; chiefly relied upon self-instruction; removed to the U. S. in 1850, and soon became celebrated for his pictures of animal life, many of his productions having been lithographed or engraved; became a member of the National Academy in 1858; studied and sketched much in the Adirondacks, where a number of his hunting scenes are laid. His paintings include *A Duck and Her Young*; *Ruffled Grouse*; *Woodcock-Shooting*; *Snowed In*; *Halt on the Carry*; *Racquette Lake*; *There's a Good Time Coming*; *The Portage*; *Jack in Office*; *Thoroughbreds*; *Startled*; *A Mother's Solicitude*; and *Quail and Young*.

**Tait**, JOHN ROBINSON: artist and author; b. in Cincinnati, O., Jan. 14, 1834; graduated at Bethany College, Va., 1852, immediately afterward traveling for several years in Europe, devoting himself to literature and painting; studied and worked in Düsseldorf 1859–71; was awarded first-class medals at the Cincinnati Industrial Exhibition 1871–72; visited Europe again in 1873, working and studying in the Tyrol and in Munich; returned to the U. S. in 1871, and has resided in Baltimore since 1876; designed the art hall of the second Cincinnati Exposition. His principal publications are *Dolce Far Niente* (1859), and *European Life, Legend, and Landscape* (1860), and he has written a comedy in German called *Ein aufrichtiger Heirathsgesuch*. Among his paintings are *Siebengebirge*; *Lake of Wallenstadt*; *Meyringen*; *Lake of Four Cantons*; *A Norwegian Waterfall*; *Solitude*; *A Rainy Day*; *Under the Willows*; *Vesper Hour*; *A Tyrolean Cottage*; *Noon*; *Crossing the Brook*; and *Landscape and Cattle*.

**Tait**, Sir MELBOURNE, D. C. L.: jurist; b. in Melbourne, Quebec, 1842; educated at St. Francis College, Richmond, Quebec, and in 1859 began to study law in Montreal, graduating with the degree of B. C. L. from McGill University in 1862; was admitted to the bar of the province of Quebec in 1863; practiced law a short time in Melbourne, and then removed to Montreal; after a period of very successful practice at the bar he was, in 1882, appointed queen's counsel, in 1887 was appointed judge of the Superior Court, and in 1894 was made acting chief justice for the Montreal division. F. STURGES ALLEN.

**Tarr**, RALPH STOCKMAN, B. S.: educator; b. in Gloucester, Mass., Jan. 15, 1864; B. S., Lawrence Scientific School, Harvard University, 1891; assistant U. S. fish commissioner, 1883–84; assistant, Texas Geological Survey, 1889–90; assistant, U. S. Geological Survey, 1888 and 1891–92; Assistant Professor of Geology, Cornell University, 1892–96; Professor of Dynamic Geology and Physical Geography, same, since 1896. He is author of *Economic Geology of the United States*; *Elementary Geology*; *Elementary Physical Geography*; *First Book of Physical Geography*; and numerous articles in scientific and educational magazines. C. H. THURBER.

**Tax Laws**: Taxes, or the burdens or charges imposed by law upon persons and property for public purposes, are levied and collected by laws passed under the authority of the state for the support of the government and the meeting of the public needs. The power of passing laws for the purpose of levying taxes is inherent in all governments, and is limited only by the provisions embodied in the expressed constitution, which itself is revocable by the people of the state.

*Restrictions upon the Taxing Power in the U. S.*—In the U. S. the only direct limitation contained in the Constitution is that no tax or duty shall be laid on articles exported from another State. There are other provisions for the equitable and just distribution and collection of taxes—such as that capitation or direct taxes shall be paid in proportion to the Federal enumeration upon which representation in Congress is based; that duties, imposts, and excises shall be uniform throughout the U. S.; and that no preference shall be given by any regulation of commerce or revenue to the ports of any one State over those of another. These latter, however, are rules describing rather the mode in which taxes shall be regulated than limitations upon the tax power. Direct taxes are the only ones which require to be laid in proportion to the representation of States in Congress, all other taxes being assessable without apportionment; but all taxes must be levied in accordance with the rule of uniformity.

There are no direct limitations upon the power of the States of the U. S. to levy taxes except those which provide that no State may, without the consent of Congress, lay imposts or duties on imports or exports except such as may be necessary for the proper execution of their inspection laws.

The clause of the U. S. Constitution which vests the control of interstate commerce in the Federal Government in effect prohibits the several States from any exercise of the power of taxation which in effect regulates or restricts such commerce. A further restriction upon the taxing power of a State arises out of the provision of the Federal Constitution that no State shall pass any law impairing the obligation of a contract, so that, as a result of this, exemptions from taxation which are granted upon conditions that are accepted, and other stipulations with reference to taxation embodied in the charters of corporations which are contracts, can not be modified by subsequent legislation. This limitation, however, does not deprive the State of the right to a reasonable regulation of the use and operation of the rights and privileges which have become vested; nor is it a violation of the constitutional provision to change the method of taxation.

All taxes to be valid must be based upon notice given to the taxpayer, affording him a reasonable opportunity to be heard and dispute the propriety and justice of the tax levied upon him; and any statute which makes assessments without such notice, or attempts to validate void assessments without providing for such notice by reassessment or otherwise, is unconstitutional and void. There is no definite time or place when and where the taxpayer shall be entitled to be heard, except that they must be such as are reasonable under the circumstances; and it is sufficient if he is afforded an opportunity to be in an action brought for the collection of the tax.

Most of the States of the U. S. provide in their constitutions that taxes shall be equal and uniform, conforming to the construction of the clause of the Federal Constitution which forbids any State to deny any person within its jurisdiction the equal protection of the law. This restriction requires that all property of the same description shall be uniformly taxed, and that taxes shall be so levied as to give to all within the limits of the district in which the tax is levied equal benefits therefrom, and so that they shall bear with equal burden upon all of those upon whom the tax is levied. Approximate equality in taxation, however, being all that is obtainable, is construed to be in conformity with this rule. A State tax, therefore, must be imposed equally upon all parts of the State, and a county tax equally upon all parts of the county, etc. In order to secure equality and uniformity, property must be taxed according to its value, which must not be arbitrary or artificial, nor estimated by arbitrary or artificial rules.

*Delegation of Taxing Power.*—The power of taxation is entirely legislative; and if this power be in any part delegated or intrusted to a judicial or other body, the action of such body in imposing a tax is quasi-legislative. Executive officers have power to enforce tax laws, but they may not vary them by adding or taking away from the amount levied, or the nature of the property levied upon, or in any other way. The Legislature may regulate the method of imposition and collection of taxes, and may change them at any time before the taxes have been paid; and in the absence of constitutional restrictions, may pass retrospective legislation which will be valid provided it does not avoid the obligation of contracts or divest persons of their property without due process of law.

The power of levying taxes can not be delegated to the judiciary or to the executive or administrative branch of the Government, nor to individuals or corporations. The control of the details as to the levying and collection of the taxes, however, may be delegated, or the power to determine the existence of a fact or state of facts upon which the effect of law shall depend. The conferring of the power to tax upon counties and States and other municipalities to such an extent as may be necessary to the proper conduct of the local government is not a delegation of the power to tax, but the action of such municipality in levying a tax constitutes an exercise of the taxing power by the State itself.

*Relinquishment of the Right of Taxation.*—A State or municipal government may relinquish its right of taxation by an act constituting a contract based upon a sufficient consideration, and such relinquishment may be for a limited or unlimited period, and when such relinquishment has once been made, the revocation of it is void as against the provision of the Federal Constitution which prohibits legislation avoiding the obligation of a contract.

*Purpose of Taxation.*—All taxes must be imposed with the intention of raising revenue for public purposes. What constitutes a public purpose within the meaning of the law is a matter which must be judicially settled, the common purposes being construction and maintenance of highways and bridges intended for public accommodation; roads and highways and public improvements in the nature of highways; the construction of harbors, piers, breakwaters, etc.; the draining and reclaiming of swamps and overflowed lands; the manufacture of gas; the supply of water; the maintenance of a fire department; the protection of the public health; the regulation of market-houses; the maintenance of schools, poorhouses, hospitals, etc.

It has been held that taxes levied for private manufacturing enterprises, or to aid individuals in rebuilding districts destroyed by fire, or for the purpose of furnishing amusement to the public, are not for public purposes within the meaning of the law. A tax must also be levied and expended in such a way as to inure to the benefit of the district or locality taxed, although a tax is not rendered void by the fact that an indirect benefit may accrue to a locality other than the one upon which the tax is levied.

*The Levy and Assessment of Taxes.*—A tax may not be levied except within the jurisdiction of the State or Government imposing the tax, either actually or constructively. Land can be taxed only within the actual limits of the taxing State or Government, and a tax levied elsewhere is void and does not affect the liability of the owner upon the assessment rightly made. Personal property, as a general rule, is construed to be situated at the owner's domicile, and there to be taxable; but the State may, and often does, tax such property at the place where it is actually situated. The levying of a tax consists in the legislative act by which the tax is imposed; but the term is also used to denote the levying upon the property which is an incident of the collection of the tax. There should be a record of the levy of taxes, which should contain a record of every essential proceeding in a written and permanent form, such record being usually the only evidence to show that the tax was duly levied. It must show that the necessary statutory requirements have been complied with, and that the methods of levying and collecting the tax imposed by statute or legislation have been substantially followed. The absence, however, from the record of any fact or proceeding essential to the valid levying of a tax is not conclusive evidence that the tax was wrongly levied, but raises a presumption which must be disproved by further evidence.

The time and methods at which assessments for purposes of general taxation are required to be made are expressly prescribed by statute, and the requirements of the statute must be strictly followed. In some of the States provision is made for the correction of errors or irregularities by boards of equalization or review, usually consisting of county commissioners or supervisors. These boards can act only when specially authorized and within the strict limits of the authority conferred upon them. Their duties usually consist in adjusting and equalizing the valuation of property in the several tax districts, to the end of making an equitable apportionment of the burden of taxes upon each district. They ordinarily can increase or decrease the valuation of a district for this purpose, but, except when expressly authorized, can not change individual assessments or the valuation placed upon particular classes of property.

*Tax Liens.*—The lien of a tax upon property is wholly statutory, and its priority to other liens is determined entirely by the express provisions of the statutes, and does not arise by implication. A municipal government has no power to create a lien for its taxes unless expressly authorized to do so by the State Legislature; and a lien imposed in pursuance of authority so conferred has only such priority as may be provided for in the State law.

In the absence of statutory provision as to when a tax becomes a lien upon real estate, it is generally held that it becomes a lien at the time when a certain fixed sum is made payable as a tax against the property specified. A tax lien is generally discharged either by abandonment of its right on the part of the taxing power, by the statute of limitations, by the repeal of the statute providing for levying of the tax, or by payment or tender of the amount due to the proper officer. For a treatment of the subject of tax sales, municipal taxes, tax titles, taxation of corporations, etc., see MUNICIPAL ASSESSMENTS, TAX SALES, CORPORATIONS, FOREIGN CORPORATIONS, etc. See also Cooley's *Treatise on the Law of Taxation, including the Law of Local Assessments.*

F. STURGES ALLEN.

**Tax Title**: a title by which land is held by virtue of purchase at a tax sale. Such a title, if valid, is superior to all other titles and claims upon the land so purchased, and it may be acquired by the owner himself by his purchasing the land at the tax sale. Such titles are usually subject to grave uncertainty as to their validity, by reason of the fact that the sales must be made, and the title vested in the purchaser, in substantial compliance with the laws providing for tax sales, and the fact that these sales are usually administered by officers without special training fitting them for the conduct of such technical proceedings. See TAX LAWS. F. STURGES ALLEN.

**Taylor**, CHARLES FAYETTE: surgeon; b. in Williston, Me., Apr. 25, 1827; graduated at the medical department of the University of Vermont in 1856; made a specialty of orthopædic surgery; founded the New York Orthopædic Dispensary and Hospital in 1866, and was surgeon there until 1876; was appointed consulting orthopædic surgeon to St. Luke's Hospital in 1867. He invented apparatus for use in correcting deformities and for developing muscles by exercise, for which he received medals at the Vienna and Philadelphia International Exhibitions in 1873 and 1876. He was a corresponding member of the Vienna Royal Society of Physicians. He wrote many important medical papers and books, among the latter being *Theory and Practice of the Movement Cure* (Philadelphia, 1861); *Spinal Irritation, or Causes of Backache in American Women* (New York, 1864); *Mechanical Treatment of Angular Curvature of the Spine* (New York, 1864; German translation, Berlin, 1873); *Infantile Paralysis and its Attendant Deformities* (Philadelphia, 1867); *Mechanical Treatment of Disease of the Hip-joint* (New York and Berlin, 1873); and *Sensation and Pain* (New York, 1881). D. in Los Angeles, Cal., Jan. 25, 1899.

**Taylor**, HENRY CLAY: naval officer; b. in the District of Columbia, May 4, 1845; graduated at the Naval Academy; was commissioned ensign May 28, 1863, and was attached to the Shenandoah, of the North Atlantic blockading squadron. He was on special service in 1864 and 1865; was commissioned master Nov. 10, 1865; lieutenant Nov. 10, 1866; lieutenant-commander Mar. 12, 1868, serving in the meantime on the Iroquois, the Rhode Island, and the Susquehanna. He was stationed at the Naval Academy 1869–71; was executive officer of the Saranac, flag-ship of the Pacific squadron, until 1874, and was in command of the Coast Survey steamer Hassler for the next three years. He was then at the Hydrographic Office a year, was ordered to the navy-yard at Washington in 1879, and commanded the training-ship Saratoga 1881–84, receiving his commission as commander Dec. 16, 1879. He served on special duty in 1884 and 1885, was a member of the board of inspectors for the next two years, and was granted leave of absence in 1888. In 1890 he was put in command of the Alliance, of the Asiatic squadron, was granted leave of absence in 1891, and in 1893 was made president of the Naval War College. He was commissioned captain Apr. 16, 1894, and in 1896 was ordered to command the Indiana. He was engaged in the blockade of the Cuban ports during the war with Spain, and took part in the battle of July 3, 1898, off Santiago.

**Taylor**, JAMES MORFORD, LL. D.: educator; b. in Holmdel, N. J., Sept. 15, 1843; prepared for college at South Windham, Conn., and grammar school of Madison (now Colgate) University; A. B., Madison University, 1867, and A. M. 1869; LL. D., William Jewell College, 1891; studied theology at Hamilton Theological Seminary 1868–69; instructor in mathematics in Madison University 18€7–69; principal of academy and Professor of Mathematics, Madison University, 1869–73; Professor of Mathematics in Madison University since 1873. He is author of *Elements of Calculus* (1884); *College Algebra* (1889); *Academic Algebra* (1893); *Differential and Integral Calculus* (1898).

C. H. THURBER.

**Taylor**, SAMUEL COLERIDGE: musician; b. in London, England, Aug. 15, 1875. His father was a native African of Sierra Leone and his mother an Englishwoman. He began to study music when six years old, taking up the violin, and also becoming a chorister, first in St. George's church, and then in St. Mary Magdalene church, where he still sings alto. In 1890 he entered the Royal College of Music, and won a composition scholarship in 1893. After graduation he was appointed Professor of the Violin at the Corydon Conservatory of Music and conductor of the orchestra there. His compositions are already many and remarkable. They include a symphony in A minor; a nonet for piano, strings, and wind; a quintet for clarinet and strings; a ballade in A minor for orchestra; a ballade in D minor for violin and orchestra; a string quartet in D minor; a number of songs; an operetta, *Dream Lovers*; separate pieces for orchestra, piano, violin, and other instruments; a cantata, *Hiawatha's Wedding Feast*; and considerable church music. Mr. Taylor has the color, features, hair, and most of the physical characteristics of the Negro race, but has also remarkable mental development. D. E. HERVEY.

**Taylor**, Sir THOMAS WARDLAW, K. B. M. A.: lawyer and judge; b. in Auchtermuchty, in Fife, Scotland, Mar. 25, 1833; was educated privately and at Edinburgh University, subsequent to which he studied law and was called to the bar in Upper Canada in 1858; was made queen's counsel in 1881. He held the office of master in chancery 1872–83, of puisne judge of the court of queen's bench of Manitoba 1883–87, and he has been chief justice of Manitoba since 1887. He was appointed administrator of the government of the province of Manitoba in 1890, and again in 1893. He is best known for his researches in equity jurisprudence, and has published *The Chancery Statutes and Orders*; *Commentaries on Equity Jurisprudence* (1875); *Investigation of Titles to Estates in Fee Simple* (2d ed. 1873).

F. STURGES ALLEN.

**Telegraphy without Wires**: An illustration of telegraphy without wires, or "wireless telegraphy," is afforded by any method of signaling that does not require the use of a connecting wire; for example, signaling by means of flags, whistles, or search-lights. The use of the term is generally restricted, however, to cases in which *electrical* methods are employed. At least one method of telegraphing without wires was devised, and to some extent experimentally tested, as early as 1855; but no satisfactory results were obtained until more than thirty years later. In 1884 an extensive series of experiments on the subject was begun, under the direction of W. H. Preece, by the British postal authorities. These experiments, which are still in progress, led to the adoption of wireless telegraphy for temporary commercial service at several different points in the British Isles, and in one instance the system has been in regular use, over a distance of about 3 miles, for several years. Renewed interest in the subject has been aroused since the year 1895 by experiments upon wireless telegraphy by means of electric waves. This method has been successfully employed for distances as great as 100 miles, and is now frequently used in cases where the conditions are such as to make communication by ordinary methods impracticable. The three principal methods of telegraphing without wires are briefly described below.

*Methods Depending on Conduction by the Earth.*—Two terminals or electrodes are buried in the earth at the sending station, being placed at a considerable distance apart. A strong current, so arranged that it can be conveniently interrupted, is caused to flow through the earth from one terminal to the other. It is found that this current does not flow in the straight line joining the electrodes, but spreads out as shown in Fig. 1. In the diagram the electrodes are supposed to be at A and B; the arrows represent the direction of the current flowing between them. The presence of a current in the moist earth can be detected, even at a great distance from A B, by means of a second pair of electrodes, C D, between which is placed some sensitive indicator of current, such as a galvanometer or telephone. To send signals from A B to C D the current between A and B is "made" and "broken" in accordance with any convenient code, such as the Morse code used in ordinary telegraphy. Instead of burying the electrodes A and B in the ground they may be submerged in the water of a lake or of the sea; in this case, also, the current will distribute itself in the manner indicated in Fig. 1. The method has been employed in this form in communicating between an island and the mainland without the use of a submarine cable.

The distance to which signals can be sent in this way depends upon the distance between the electrodes, the character of the soil, and the strength of the current used. For the best results the distance between A and B, and also that between the receiving electrodes C and D, should be as great as possible—say several miles. This system of signaling is subject to considerable disturbance on account of variable earth-currents due to electric railways, telegraph circuits, etc., as well as earth-currents due to unexplained causes. For this reason it has never been extensively used.

*Methods Depending on Electro-magnetic Induction.*—In the case of two circuits not far apart the sudden starting or stopping of a current in one circuit develops an induced current in the other; in fact, an induced current will be developed by the mere change in intensity of a current in a neighboring circuit. (See ELECTRICITY.) The humming

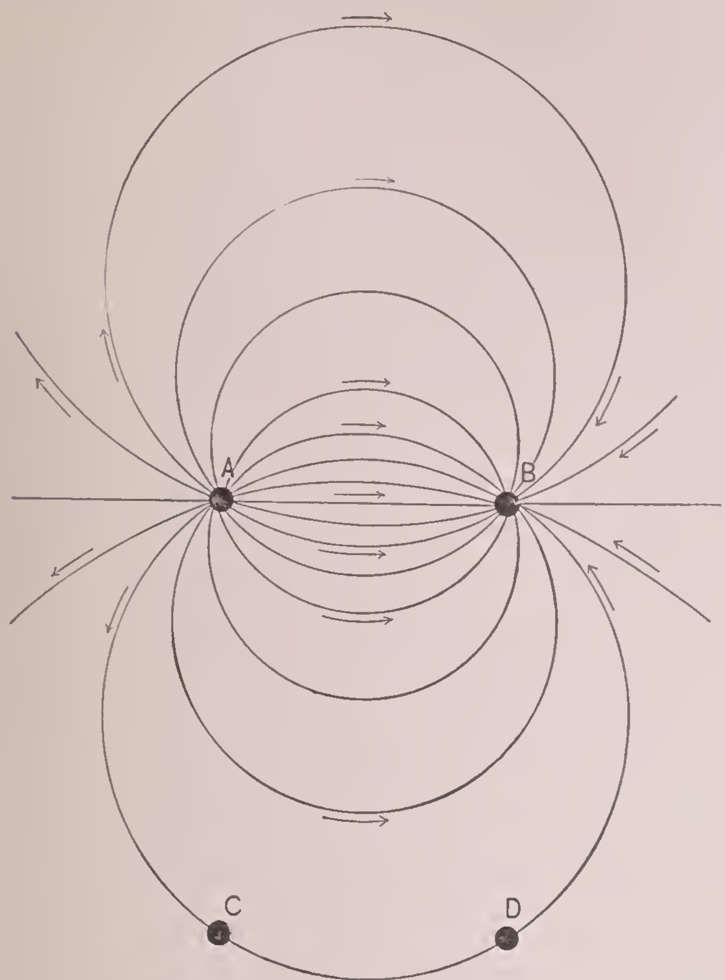

FIG. 1.

sound frequently heard in a telephone is usually due to induction from neighboring circuits, and special precautions are often necessary to prevent disturbance from this cause. All phenomena of this kind are, in a sense, illustrations of wireless telegraphy by means of electro-magnetic induction.

To utilize the phenomena of induction in practical signaling two complete circuits are required, one at the transmitting station and another at the receiving station. Signals are sent by making and breaking the current in the first circuit, and are received by any instrument that is sufficiently sensitive to indicate the induced currents produced in the second. In most cases a telephone is used for this purpose. The transmitting circuit generally consists of an overhead wire suspended at a considerable distance above the ground and having an earth return. The receiving circuit is similar to the transmitting circuit, and is placed parallel to it. Since the mutual inductive action of the two circuits is largely influenced by the area inclosed by each, the overhead wires are not only made long, but are also placed as high above the ground as circumstances will permit. In one instance, where this system of telegraphy was used in communicating between an island and the mainland, the wires were placed at the top of a bluff several hundred feet above the sea, while the return circuit was through the water.

The method above described has been used for commercial signaling in a large number of instances. It has been found especially useful as a means of obtaining temporary telegraphic communication at times when the ordinary connections were interrupted. Messages have been successfully transmitted in this way to distances slightly in excess of 10 miles. The system is in regular operation between Lavernock and the island of Flat Holm, near Bristol, England, the distance between the two stations being 3·3 miles. Attempts to signal by this method between England and Ireland have proved unsuccessful.

Inductive methods have frequently been used in signaling to and from a moving train. In this case the induction occurs between a telegraph line running parallel to the track and a wire stretched along the top of one of the cars. The principle of the method is the same as that explained above.

It is possible to increase the distance to which signals can be sent by giving suitable proportions to the sending and receiving circuits. Thus, when an alternating current is used, there is a certain relation between the self-induction and capacity of the receiving circuit which makes it respond most readily. When this condition is reached the two circuits are said to be in unison, or in "syntony." The extensive experiments that are in progress on this modification of the method are beyond the scope of this article.

*Methods Depending on the Use of Electric Waves.*—Telegraphy by means of electric waves is a more recent development than either of the two methods already mentioned, most of the experimental work on this subject having been done since the year 1895. In fact, electric waves have been known experimentally only since 1886, although their existence was predicted from theoretical considerations twenty-five years earlier. The discovery of these waves is due to Heinrich Hertz, who was also the first to investigate their properties and to determine their velocity. For this reason they are often referred to as Hertz waves. See HERTZIAN WAVES, in the Appendix.

To utilize electric waves in wireless telegraphy some form of apparatus is required at the sending station by which such waves may be developed in great intensity, while at the receiving station some instrument must be used which enables the presence of the waves to be detected. The apparatus used to develop the waves is called the "oscillator." It consists essentially of two insulated conductors, usually spherical in form, mounted side by side with a space of about half an inch or less between the adjacent surfaces. Sparks are caused to pass between the two by means of a Holtz machine or induction coil. The latter is usually the more convenient. If the sparks are truly disruptive—i. e. if they occur with great suddenness, and not as the result of a comparatively gradual breaking down of the intervening dielectric—the discharge will be *oscillatory.* (See ELECTRICITY.) To insure this condition the conductors are sometimes separated by an insulating oil instead of air; this has the additional advantage of preventing the surfaces from corroding. The violent surging back and forth of the charge on the two conductors gives rise to electrical disturbances in the surrounding ether which spread out in all directions. These disturbances constitute electric waves. Each spark gives rise to a succession of waves; in the forms of apparatus usually employed from four to ten waves are probably developed by each spark. The waves produced in this way travel with the same velocity as that of light; in fact, so far as is now known, they differ from waves of light in no respect except that of wave-length. The waves used for wireless telegraphy have a wave-length that is usually not less than 50 cm., and is in many cases as great as 200 meters.

Fig. 2 shows a diagram of a transmitter of the form above described. The two spheres $O_1$ $O_2$ form the oscillator. Connection is made with the secondary of an induction coil either directly or through the two air-gaps at $S_1$ $S_2$. A key (K) is placed in the primary circuit, and the coil is provided with some form of automatic interrupter (not shown in the figure). On pressing the key the coil is thrown into action, sparks pass between $O_1$ and $O_2$, and electric waves are sent out from the oscillator as long as the key is depressed. To send signals the key is operated in the same manner as in ordinary telegraphy.

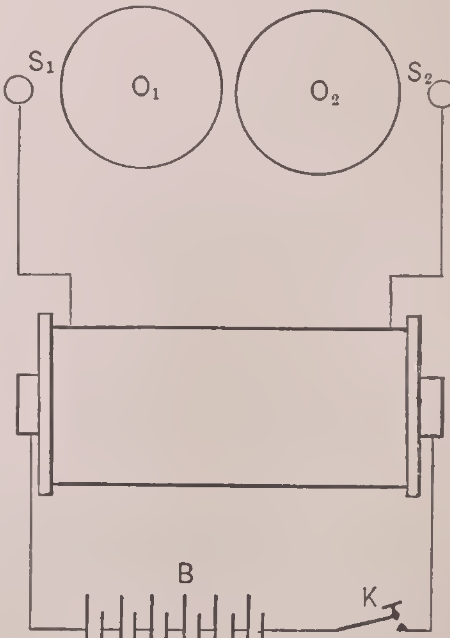

FIG. 2.

A simple form of instrument by which the electric waves may be detected at the receiving station is shown diagrammatically in Fig. 3. The essential feature of this instrument is the "coherer," C, which consists of a tube containing two terminals, $t_1$ and $t_2$, separated by metal filings. These filings lie loosely in the space between the two terminals, and on account of the succession of poor contacts between adjacent bits of metal the electrical resistance of the coherer is several thousand ohms. The coherer is connected in series with a battery, B, and an electric bell, S. Owing to the high resistance, the current developed under normal conditions is insufficient to operate the bell. The effect of electric waves falling upon such a coherer is to reduce its resistance to only a few ohms; this causes an increase in current, and the bell rings. Upon slightly jarring the tube the resistance returns to its original high value.

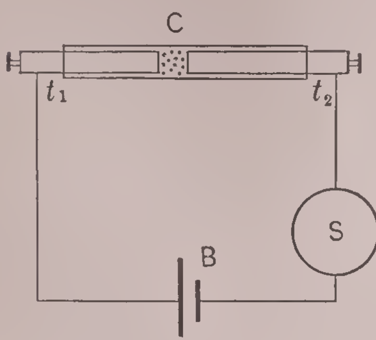

Fig. 3.

The exact manner in which the electric waves produce this effect is not known; but it is thought that they shake the filings into better contact, or perhaps cause little sparks to pass, which partly weld the filings together. This explanation of the effect, which is due to Lodge, has given rise to the name coherer. Filings of any metal may be used, but the metals differ widely in sensitiveness and certainty of action. In some cases mixtures of different metals have been used, and one experimenter has recommended that the filings be placed in a partial vacuum. A form of coherer that is often used has terminals of silver at a distance apart of about 1 mm. or less, the intervening space being loosely filled with nickel filings mixed with a trace of mercury. Opinion regarding the most satisfactory form of coherer is, however, still divided.

For distances exceeding a quarter of a mile greater sensitiveness is necessary than is attainable with the form of apparatus shown in Fig. 3. A very considerable gain is obtained by substituting for the electric bell a sensitive high-resistance relay, R (see Fig. 4). A small decrease in the resistance of the coherer, such as would be produced by waves of small intensity, is sufficient to cause the armature of the relay to move. This closes the circuit of a second battery, $B_2$, which operates the telegraph sounder, or Morse recorder, S. To restore the high resistance of the coherer and put it in condition to respond to the next signal some slight mechanical vibration is necessary. This may be obtained by an electrical vibrator operated by the same relay, R, or by some form of apparatus that will shake the coherer continuously. The jar produced by the sounder is often sufficient for this purpose.

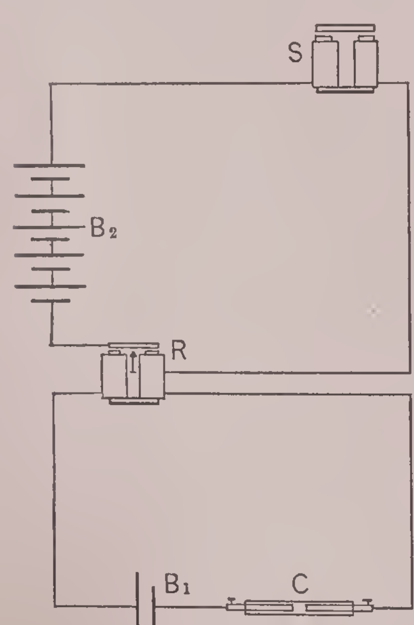

Fig. 4.

The sensitiveness may be still further increased by attaching a wire to one terminal of the coherer and carrying it as high as possible in the air, the other terminal being connected to the earth. This wire serves to collect the electric waves and carry the disturbance to the coherer. When signals are to be transmitted over great distances it is customary to connect one sphere of the oscillator to the earth also, and the other to an insulated wire extending high in the air. The length of this vertical wire is the chief factor in determining the wave-length of the electric waves developed. The vertical wires at the transmitting and receiving stations are usually made of the same length, and in many cases have been as high as 150 feet.

Telegraphy by means of electric waves is only to a slight extent affected by the presence of ordinary obstructions, such as buildings of stone or wood, lying between the two stations. In general, all substances that are not electrical conductors are "transparent" to these waves in the same sense that glass is transparent to light-waves. Metals, on the other hand, are opaque, and do not permit the waves to pass. The same is true, to less extent, with water and moist earth. A coherer on the interior of a completely closed metal inclosure will not be affected by electric waves developed on the outside. But a metal screen placed between the oscillator and the coherer is not sufficient to destroy the effect, since the great wave-length of the electric waves enables them to bend around an obstruction; in this respect they behave like waves of sound. This property of electric waves makes it possible to signal between points on opposite sides of a mountain, or between two points so far apart that the curvature of the earth makes it impossible to see one station from the other.

As already mentioned, the waves developed by the oscillator proceed from it in all directions. The signals sent by it can therefore be received by any coherer of sufficient sensitiveness in its neighborhood. In some instances this is evidently a disadvantage. Attempts have been made to remedy the difficulty by concentrating the electric waves and reflecting them in the desired direction by metallic mirrors, in much the same way that light-waves are concentrated in a searchlight. This has proved effective for distances of 2 or 3 miles, but at the present writing it has not been successful at greater distances. Another source of annoyance is due to the fact that the receiving instrument will respond to electric waves from any source within its range. The signals received from one transmitting station are therefore likely to be interfered with by those from another station in the same neighborhood. Attempts to remove this difficulty have not yet proved successful.

The discovery of the coherer is due to Branly, in France, and to Lodge, in England. The first extensive experiments on telegraphy by means of electric waves were undertaken by Guglielmo Marconi, and were in part carried on with the co-operation of the British postal authorities. Extended experiments have also been made in other countries, in some cases with Government aid; but the development of the subject is chiefly due to Marconi. Messages have been successfully transmitted for experimental purposes over distances of about 100 miles, and in a number of instances the system has been used practically for distances of 40 miles and less. Communication has been maintained, for example, between Alum Bay and Bournemouth, England (a distance of 18 miles), for two years, and across the British Channel between Folkestone and Boulogne (a distance of 32 miles) for a year. Wireless telegraphy is also in use between the Goodwin lightship and the South Foreland lighthouse (a distance of 12 miles) and has been found satisfactory even in the roughest weather. In 1899 the system was adopted by the British navy for communication between war-vessels; in the tests made during the naval manœuvres of that year messages were sent over distances of about 70 miles. It is for cases such as this, where communication by ordinary methods is difficult, that telegraphy without wires seems most promising.

Ernest Merritt.

**Telephone Law**: The laws governing the rights and duties of telephone companies and users and subscribers of public telephones are much the same as those applicable to telegraph companies. In a general sense, the term *telephone* includes all instruments or apparatus which transmit sounds beyond the limits within which they are ordinarily audible; but it is specifically and usually used to designate a device or mechanical contrivance for transmitting the sound of the human voice beyond the ordinary limits of audibility, especially by the use of electrical apparatus. The term *telegraph* has in a number of instances been construed to embrace within its meaning those instruments specifically called telephones; and in the absence of special conditions or provisions rendering such an application improper, or evidently without the intent of a statute, it would be held to apply to telephones as well as to what is commonly understood by the term telegraph. Thus in England the statute passed in 1869 regulating the transmission of telegraphic messages and telegrams, and placing it under the control of the Postmaster-General, has been held to apply to the transmission of messages by telephone, although the telephone was not invented in 1869, and was not contemplated in the act when passed.

Telephone companies when so conducted as to be open to the public in general are held to be public carriers in the same sense and to the same effect as telegraph companies, and a telephone company which receives the benefits of the right of eminent domain or other public privileges thereby assumes the character of a public carrier, and becomes obligated to permit the use of its line by the public in general under proper and reasonable regulations. Such a company is held to come within the conditions and description of a person or company engaged in a business affected with a public interest, and as such is subject to the regulation of the State. The statutes now generally prescribe that telephone companies shall provide service for all who apply, according to reasonable rules and regulations, for service as subscribers; but prior to such statutory provision it was held that such companies were bound to furnish to the public in general such facilities as were consistent with their rights and privileges under the patents or licenses under which they were doing business. The company may not discriminate against particular individuals or classes of individuals; and any contract or provision between a company and the owner of a patent used by it which stipulates that such discrimination shall be made is either wholly void or void as to such stipulation if the contract be separable in its nature.

A subscriber of a telephone company must conform to the reasonable rules and regulations of the company, and has no right to allow a telephone to be used for any other purpose than that for which his subscription is made or which may be reasonably incidental thereto. Thus the proprietor of a hotel may be enjoined from permitting his guests to use the hotel instrument for their private business, such as the calling of a carriage, a messenger, making of appointments, and the like.

It has been held that where a telephone company maintains a line with public stations operated by itself in different towns and cities it must maintain a reasonable messenger service for the purpose of notifying persons within a reasonable distance when they are wanted, and that it is liable for the negligence of its messengers, notwithstanding it may have a regulation to the contrary.

It is as yet undecided to what extent a conversation over the telephone shall be considered at law a conversation between persons in each other's presence. The decision of the question seems to depend upon the unmistakable identification of the voice of the person talking; and the legal recognition of such conversation has been carried in the State of New York to the extent of making an affidavit taken and sworn to over the telephone the basis for an attachment proceeding, although the law provides that such proceeding shall be based on an affidavit sworn to before a notary public or other qualified officer.

The maximum rates which a telephone company may charge may be fixed by legislative authority at a reasonable amount without violation of the constitution either of any State or of the U. S., and the control over rates is not taken away from the State authorities by the fact that the lines of the telephone company extend into the territory of another State; but the State can not exercise its authority over interstate messages or business in contravention of the Constitution of the U. S. See INTERSTATE COMMERCE.

On the subject of the inadmissibility of telephone messages as evidence, see vol. xxiv. of the *Weekly Law Bulletin*, p. 245; on the subject of telephone rates and discriminations, see INTERSTATE COMMERCE, and vol. xxiii. of the *Law Reports Annotated*, p. 177; see also vol. xxxv. of *American and English Corporation Cases*; Croswell's *Treatise on Law Relating to Electricity* (1895); *American Electrical Cases*; and Thompson's *Law of Electricity* (1891).

F. STURGES ALLEN.

**Tennessee Centennial and International Exposition**: an exposition held in Nashville, Tenn., May 1 to Oct. 30, 1897.

*Origin.*—A desire on the part of the citizens of Tennessee to celebrate the one hundredth anniversary of the admission of their State into the Federal Union by an exposition that would show to the world their patriotism, and at the same time promote their industrial, commercial, and educational progress, was suggested in 1881 at the time of the celebration of the centennial of the founding of Nashville. During the autumn and winter of 1893 the idea began to take shape, and at a convention called for that purpose on June 10, 1894, a preliminary organization was effected. Subscriptions were invited, and on July 8, 1895, the sum of $62,635 having been subscribed, and the city of Nashville having agreed to take $100,000 worth of stock, the preliminary officers resigned and a corporation of the stockholders was formed. Subsequently the citizens of Nashville and her two leading railways subscribed and paid in over $600,000, while in response to aid asked for of Congress, $130,000 was appropriated by that body—$30,000 for the erection of a building, and $100,000 for a complete exemplification of the workings of the national Government.

*Officers of the Fair.*—President, John W. Thomas; vice-presidents, V. L. Kirkman, W. A. Henderson, and John Overton, Jr.; secretary, Charles E. Currey; director-general, E. C. Lewis; director of affairs, W. L. Dudley; chief clerk, W. H. Bruce; commissioner-general, A. W. Wills; chairman of the finance committee, S. J. Keith; general counsel, S. A. Champion; auditor, Frank Goodman; treasurer, W. P. Tanner; and bookkeeper, C. T. Berry.

*Location.*—The site chosen for the exposition was the Old West Side Park, to which adjacent property was added, making a tract of 200 acres, and was a little more than 2 miles from the Public Square, and directly N. of Vanderbilt University. The grounds were made attractive with shade-trees, and thousands of evergreens, plants, shrubs, and blooming flowers were planted in the blue grass of the sward. Delightful drives and walks and the two lakes of Watauga and Katherine made the Centennial City, as it was called, a place of remarkable beauty.

*Buildings.*—There were perhaps a hundred structures of all kinds on the grounds, the largest of which, except the Fine Arts and History buildings, were constructed of heavy framework, the exterior being finished in staff, making them uniformly white. A brief description of the more important buildings is herewith given:

*Agriculture Building.*—This was 685 feet long by 175 feet wide, and was in the Renaissance style of architecture. It had a central dome rising to a height of 100 feet, while six minor domes balanced and lent an indescribable charm to the whole. The four entrances led under triumphal arches which were embellished with carving and surmounted by statuary. The domes were partly constructed of opaque glass, through which poured a flood of light on the exhibits.

*Auditorium.*—This was Colonial in design and Ionic in treatment. It had a square tower 140 feet high. The airy porticoes facing the points of the compass gave the building a shape resembling a short cross, except for the colonnades extending from the main entrance around in each direction to the end porticoes. Above the colonnades were pleasant balconies. Inside was the organ made by Messrs. Hook and Hastings, which was the largest organ ever brought South.

*Children's Building.*—This was built with money raised by the children of Tennessee. It was of a chaste design, and the interior was arranged to show the school system of the State. Only such exhibits were admitted as would amuse and instruct the young. A set of chimes in the tower was also procured with the fund raised by the children.

*Commerce Building.*—This was 591 feet long and 256 feet wide. The style of architecture was based on the Corinthian and Ionic orders of the Græco-Roman. The central pavilion was two stories in height, the second story forming a gallery on each side 141 by 160 feet, overlooking the nave, and reached by four broad stairways, one at each end of the four corners. Over the the central pavilion a dome rose to the height of 175 feet. Over the eastern portico was a bronze statue of Mercury of heroic mould, and the pediment beneath contained the seal of Tennessee.

*Educational Building.*—This was 144 feet long by 144 feet wide and 30 feet high, and was in the Renaissance style of architecture. The front elevation was uniform on the four sides, with an entrance from each. In addition to the exhibits of the educational institutions, this building also contained the articles pertaining to hygiene.

*Fine Arts Building.*—This was an exact reproduction of the Parthenon that stood on the Acropolis in Athens, in stone, brick, and iron. The sculptures on the pediments, metopes, and frieze were in imitation of the original, and were in moulded staff. Its fifty-eight fluted columns and every detail possible were true to the original in design and coloring. There was a large door at each end opening upon the double-columned porticoes, but no windows, light being obtained through the glass roof and incandescent lamps. The architect was Mr. William C. Smith.

*History Building.*—This was an adaptation of the Erechtheum that stood on the Acropolis near the Parthenon. Rooms on wings having the same projections and occupying the same area as the main porch in the original were used on the north and south sides of the building, giving it the form of a Greek cross. The building contained about 4,200 sq. feet, divided into five compartments. Aside from the exhibits of history and antiquities, there were displays by the Confederate Veterans, the Grand Army of the Republic, the Colonial Dames and the Daughters of the American Revolution, and a general miscellaneous exhibit. The architect was Mr. William C. Smith.

*Machinery Building.*—This was 375 feet long by 138 feet wide. The design of this structure was classic and was an adaptation of the Parthenon in part, and also of the Propylæum, the latter being used to suggest the main entrance and the former the side entrance. Utility and beauty were most harmoniously combined in the design for this building, and no steam was admitted, the boilers and engines being in a separate building some distance away.

*Minerals and Forestry Building.*—This was 526 feet long and 126 feet wide. It was of the Roman-Doric order of architecture, and had three main entrances, each marked by imposing porticoes, with six columns each, which gave the building a distinctive character. The columns guarding the entrances were crowned by sculptured gables in high relief and in beautifully appropriate designs. An annex, 162 feet long by 62 feet wide, was necessary to display the collected material. The total floor-space was 76,888 sq. feet.

*Negro Building.*—This was constructed with funds raised among the Negroes of the South, and had for its chief purpose to show exhibits of work done by Negroes in all walks of life, and illustrated the progress of that race in America from the old plantation days to the present.

*Transportation Building.*—This was 400 feet long and 125 feet wide. By the artistic grouping of the Muses and proportioning a very pleasing effect was obtained without the use of a single column. The sculpture and relief work illustrated the development of the art of carrying, from the old creaking cart to the lightning express. Railroad tracks ran through the building, and the doors at the north end were of sufficient size for the admission of engines and trains.

*U. S. Government Building.*—This was 350 feet long and 120 feet wide, and was in the form of a Greek cross, surmounted by a dome 50 feet high closely resembling that on the National Library in Washington. The display by the Government was designed to illustrate the internal operations of the various departments of the national service. It was designed in the supervising architect's office of the Treasury Department.

*Woman's Building.*—This was 160 feet long by 65 feet wide, and was modeled somewhat after the Hermitage, the home of Andrew Jackson. Eight massive columns held the roof above the portico, and higher still was an observatory surrounded by columns and highly ornamented, crowning the whole. Within the doors a rotunda extended through the two stories with a grand staircase leading up from the rear, passing a magnificent window of stained glass. The architect of this building was Mrs. Sara Ward-Conley.

*Other Buildings.*—These included special State buildings of Alabama, Georgia, Illinois, Kentucky, New York, and Texas; also of Mexico; and there were local buildings, as those of Cincinnati, Knoxville, and Memphis, the latter resembling the great Pyramid of Cheops. Nor should mention of the reproduction of the famous Rialto bridge of Venice, and the colossal statue of Pallas Athene, by Miss Enid Yandell, be omitted.

*Amusement Features.*—These were gathered in the northwestern portion of the grounds and were called Vanity Fair. The "Streets of Cairo," a Chinese village, and an "old plantation" were the ethnological shows. A cyclorama of the battle of Gettysburg was of historic interest; and a Colorado gold mine was attractive. A giant seesaw and the chutes were largely visited, while the palace of illusions and mirror maze, Night and Morning, Edison's mirage, and the phantom swing had many admirers. The wild animal arena was the menagerie feature. Besides the foregoing there were several vaudeville entertainments that were run in conjunction with restaurant privileges, notably the "Old Vienna," built to represent the walls of that city.

*Opening Exercises.*—These were conducted in the Auditorium and included an opening prayer by Bishop Thomas F. Gailor, followed by an address by President John W. Thomas, on behalf of the exposition, and then by addresses by Hon. Robert L. Taylor, Governor of Tennessee; Hon. D. L. Snodgrass, chief justice of the Supreme Court of Tennessee; Hon. John Thompson, Speaker of the Tennessee Senate; Hon. Morgan Fitzpatrick, Speaker of the Tennessee Legislature; Mayor McCarthy, of Nashville; and Major E. C. Lewis, director-general of the exposition. The machinery was then started by the touching of a button by President McKinley in the White House, and, amid the booming of cannon and other demonstrations, President Thomas pronounced the exposition open to the world. Several of the buildings were then opened with formal exercises.

*Exhibits and Awards.*—A jury of awards of 46 persons was selected, with Hon. Gardiner G. Hubbard as chairman, which examined 1,945 exhibits, and awarded 45 gold, 206 silver, and 338 bronze medals, and 179 certificates of merit, also 9 certificates of grateful recognition, and 1 certificate of honorable recognition.

*Attendance.*—The total attendance was 1,786,714 persons, of which 5,040 was prior to June 1, and 2,602 was after Nov. 1. The total paid attendance during the life of the exposition was 1,166,692. As in other expositions, each day was devoted to some special object, and of these the more important were June 11, McKinley and Ohio Day, with a total attendance of 25,212 persons, of which 20,792 were paid; June 23, Confederate Veterans' Day, with an attendance of 28,342, of which 24,407 were paid; June 24, Confederate Veterans' Day, with an attendance of 26,599, of which 22,657 were paid; Sept. 11, Nashville Day, with an attendance of 41,558, of which 38,963 were paid; Oct. 8, Nebraska Day (so called owing to the presence of William J. Bryan), with an attendance of 35,062, of which 30,829 were paid; Oct. 21, Director-General's Day, with an attendance of 33,449, of which 29,957 were paid; Oct. 23, Public Schools Day, with an attendance of 29,334, of which 25,926 were paid; and Oct. 28, Thomas Day, with an attendance of 98,579, of which 95,961 were paid.

*Expenses and Results.*—The total receipts were as follows: Subscriptions, $473,948.02; concessions, $124,757.50; admissions, $436,082.46; and receipts in connection with departments, $66,497.86; total, $1,101,285.84. The total disbursements were $1,101,246.40, leaving a balance in the bank on June 13, 1898, of $39.44. At that time it was estimated that the net value of the company's assets amounted to about $10,000, which was in excess of all liabilities, inclusive of about $6,000 of the Battle Abbey fund. The total amount spent upon the grounds and buildings, including sundry expenses, was $520,390.51.

The record of the exposition has been preserved in an *Official History of the Tennessee Centennial Exposition*, edited by Herman Justi (Nashville, 1898).

MARCUS BENJAMIN.

**Terry**, LUTHER: artist; b. in Enfield, Conn., July 18, 1813; after brief study under a portrait-painter in Hartford, went to Italy in 1838, studying for a year at the Accademia delle Belle Arti in Florence, and in 1839 went to Rome, where he afterward resided, at first devoting himself to copying from Raphael; was made an honorary member of the National Academy in 1846, like honor being conferred upon him by the academies of Philadelphia and Providence, R. I. His first important painting had for its subject Christ disputing with the doctors in the temple. Other of his works are *The Loves of the Angels*, from Byron's *Heaven and Earth*; *Columbus Before Ferdinand and Isabella*; *Jacob's Dream*; *Angel Announcing the Birth of Christ to the Shepherds*; *Toby and the Angel*; *Solomon's Choice*; and several subjects from Shakespeare.

**Thacher**, JOHN BOYD; author and collector: b. in Ballston, N. Y., Sept. 11, 1847; graduated at Williams College in 1869; served in the State Senate in 1884, and as mayor of Albany 1886–87 and 1896–97; represented New York at the Columbian Exposition 1893; has devoted much time to the collection of books, his library including many examples of the printing of the fifteenth century, one of his objects being to afford a means of identifying such early books as have no date or place of printing. A copy on vellum of the *Durandus* of 1459, the third dated book and the earliest dated book owned in the U. S., is in his collection, which also includes hundreds of autographs, and his library is rich in works relating to American history. He is the author of *The Continent of America: its Discovery and Baptism* (1896); *Charlecote, or the Trial of William Shakespeare* (1896); *Little Speeches* (1896); and *Cabotian Discovery* (1897).

**Thayer**, ELI: educator; b. in Mendon, Mass., June 11, 1819; d. in Worcester, Mass., Apr. 15, 1899. He was graduated at Brown University in 1845, and became principal of Worcester Academy. In 1848 he founded The Oread, an institute for young ladies, in Worcester. In 1853 he was an alderman of the city, and in 1853–54 a member of the Legislature. In the latter year he organized his Emigrant Aid

Company, his great plan for sending anti-slavery settlers into Kansas. Lawrence, Topeka, Manhattan, and Ossawatomie were settled under the auspices of this company. From 1856 till 1861 he was a representative in Congress, and in 1860 represented Oregon in the National Republican Convention, laboring for the nomination of Lincoln. He received patents for a hydraulic elevator, a sectional steam-boiler, and an automatic boiler-cleaner, and many other useful mechanical inventions. He published a volume of *Congressional Speeches* (1860); one of *Lectures* (1886); and *The History of the Kansas Crusade* (1889).

**Thayer**, William Makepeace: author; b. in Franklin, Mass., Feb. 23, 1820; graduated at Brown University: had charge of the orthodox Congregational church in Ashland, Mass., 1849–57, in the latter year relinquishing his pastorate and devoting himself to literature; was a member of the General Assembly in 1857 and 1863, and secretary of the Massachusetts Temperance Alliance 1860–76. He has chiefly written juvenile and religious books, and is credited with originating the conversational style. His publications include *The Poor Boy and Merchant Prince* (1858); *The Good Girl and True Woman* (1859); *The Bobbin Boy* (1859); a series of biographies (10 vols., 1859–63); *The Pioneer Boy* (1863); *Youth's History of the Rebellion* (1863–65); White House Series (1880–85); *Marvels of the New West* (1887); *From Log Cabin to the White House*; *Tact, Push, and Principle* (1880); *From Pioneer Home to the White House* (1882); and *From Tannery to the White House* (1885). He edited the *Home Monthly* and the *Mother's Assistant*. D. in Franklin, Mass., Apr. 7, 1898.

**Thomas**, M. Carey, Ph. D., LL. D.: educator; b. in Baltimore, Md., Jan. 2, 1857; A. B., Cornell University, 1877; studied at Johns Hopkins University 1877–78, University of Leipzig 1879–80; Ph. D., University of Zurich, 1883; LL. D., Western University of Pennsylvania, 1896; dean of the faculty of Bryn Mawr College and Professor of English 1885–91; president of Bryn Mawr College since 1894; elected trustee of Cornell University 1894. Author of numerous educational papers. C. H. Thurber.

**Thompson**, Albert: artist; b. in Woburn, Mass., Mar. 18, 1853; early studied painting, and traveled in Europe in 1872 and 1875: studied under masters in Paris 1880–81. Among his paintings, which are principally landscapes and cattle pieces, are *After the Shower*; *Clearing Up*; *More Wind than Rain*; *Changing Pasture*; and *An October Afternoon*. He is the author of *Principles of Perspective* (1878).

**Thompson**, Alfred Wordsworth: artist; b. in Baltimore, Md., May 27, 1840; studied art in Paris 1862–64, exhibiting at the Salon 1865, and returned to the U. S. in 1868, settling in New York city; became a member of the National Academy in 1875, and later a member of the Society of American Artists; has traveled extensively in Europe, Asia Minor, and Northern Africa. His paintings, which cover a wide range of subjects, include *Desolation*; *Lost in the Forest*; *Annapolis in 1776*; *Twilight in Corsica*; *Review at Philadelphia, 1777*; *The Market-Place in Biskra*; *The Hour of Prayer*; *Returning from a Boar-Hunt*; *Tangier*; *The Advance of the Enemy*; *Departure for the War, 1776*; *A Sabbath Day in Troublous Times*; and *The Schoolhouse on the Hill*.

**Thompson**, Hugh Miller, S. T. D.: clergyman; b. in County Londonderry, Ireland, June 5, 1830; early removed with his parents to the U. S. and settled in Ohio; received academical education in Cleveland, his theological course being taken at Nashotah House, Wis.; was ordered deacon in Nashotah in 1852, and priest in Portage in 1856, after which he had charge of Grace church in Madison; removed to Maysville, Ky., in 1853, remaining but one year; engaged in mission work in Portage and Baraboo, Wis., in 1854, and on his ordination to the priesthood became rector of St. John's church in Portage; engaged in mission work at Milwaukee in 1857, where he organized the Church of the Atonement; became rector of St. Matthew's, Kenosha, in 1858, and one year afterward removed to Galena, Ill., where he became rector of Grace church; was made Professor of Ecclesiastical History at Nashotah in 1860, and founded Kemper Hall, in the same year becoming editor-in-chief of the *American Churchman*, Chicago; became rector of St. James's, Chicago, in 1871, and in 1872 removed to New York city and took the rectorship of Christ church and the editorship of the *Church Journal and Gospel Messenger*; became rector of Trinity church, New Orleans, in 1875, remaining there until his consecration as Bishop of Mississippi in 1883, and four years later, on the death of Bishop Green, succeeded to his office; attended the third Pan-Anglican conference in London in 1888; was given the degree of S. T. D. by Hobart College in 1863. He is the author of *Unity and its Restoration* (1860); *Sin and its Penalty* (1862); *First Principles* (1868); *Absolution* (1872); *Is Romanism the Best Religion for the Republic?* (1873); *The Kingdom of God* (1873); *The World and the Logos* (1885); *The World and the Kingdom* (1888); and *The World and the Wrestlers*; lectures, sermons, and pamphlets.

**Thomson**, César: violinist; b. in Liége, Belgium, of Swedish parents, in 1857, and educated principally in the conservatory of that city, where he received the gold medal when eleven years old. After continued study under Wieniawski, Vieuxtemps, and other good masters, he made a concert tour in Italy and Spain, with phenomenal success. Then he traveled all over Europe and the U. S., making his appearance in New York on Oct. 30, 1894. He is master of the most extraordinary technic. He is also an enthusiastic yachtsman, and is a member of the Royal Sailing Navy of Belgium. D. E. Hervey.

**Thomson**, Elihu: electrician; b. in Manchester, England, March 29, 1853; educated in the public schools of Philadelphia; graduated Central High School in 1870. He was professor of chemistry and mechanics in Central High School from 1870 till 1880; and since that time he has been electrician for the Thomson-Houston and General Electric companies, who manufacture his inventions. Has obtained more than 450 patents. Invented electric welding, which bears his name, and many improvements in electric power and lighting. He was awarded the Grand Prix in Paris in 1889 for his inventions, and was decorated Chevalier and Officer of the Legion of Honor by the French Government for electrical research and inventions; Hon. A. M., Yale, and Ph. D., Tufts College. He is a member of many American and foreign scientific societies, and has contributed many papers to technical journals.

**Thorpe**, Rose (*Hartwick*): author; b. in Mishawaka, Ind., July 18, 1850; early removed to Litchfield, Mass., where she received a common-school education, and later settled in San Diego co., Cal. Among her more popular poems are *Curfew Must Not Ring To-Night*; *The Station-Agent's Story*; and *Remember the Alamo*. Her publications include *Fred's Dark Days* (1881); *The Yule Log* (1881); *The Fenton Family* (1884); *Nina Bruce* (1886); *The Chester Girls* (1887); *Temperance Poems* (1887); and *Ringing Ballads* (1887).

**Throop**, Montgomery Hunt: lawyer; b. in Auburn, N. Y., Jan. 26, 1827; took part of the course at Geneva (now Hobart) College, studied law, and was admitted to the bar in Utica; after an intermission of two years, spent in Michigan, continued the practice of law in Michigan with Roscoe Conkling for seven years; then removed to New York city; in 1870 was appointed a member of the commission which prepared the present (1899) Code of Civil Procedure of the State of New York; in 1880 he removed to Albany and devoted himself to the writing of legal treatises. Among his published works are *A Treatise of the Validity of Verbal Agreement as Affected by the Legislative Enactments in England and the United States, Commonly Called "Statute of Frauds"* (1876), and *The New Revision of the Statutes of New York*. F. Sturges Allen.

**Thurber**, Samuel, Ph. D.: educator; b. in Providence, R. I., Apr. 4, 1837; educated in the schools of Providence; A. M., Brown University, 1858; Ph. D., Brown University, 1891; principal classical department, Providence high school, 1858–65 (being absent one year in the army); principal of Hyde Park, Mass., high school for two and one-half years to 1872; principal of Syracuse, N. Y., high school 1872–78; principal of Worcester, Mass., high school 1878–80; master in Girls' High School, Boston, since 1880. He is author of several editions of English texts and a large number of addresses and articles, not yet collected in book form. C. H. Thurber.

**Thwing**, Charles Franklin, D. D.: clergyman; b. in New Sharon, Me., Nov. 9, 1853; graduated at Harvard in 1876 and at Andover Theological Seminary in 1879; was pastor of a Congregational church in Cambridge, Mass., until 1886, then taking charge of the Plymouth church in Minneapolis, Minn.; received the degree of D. D. from the Chicago Theological Seminary in 1888. He is associate editor of

*Bibliotheca Sacra*, and is the author of *American Colleges: their Students and Work* (1878); *Reading of Books: its Pleasures, Profits, and Perils* (1883); *The Family: an Historical and Social Study*, in connection with Carrie F. Butler-Thwing (1886); and *The College Woman* (1894).

**Tibesti**: a range of mountains in the Sahara, S. of Tripoli, that was known only by name until visited by Nachtigal in 1869. In its climate the region is somewhat allied to the Sudan, a slight rainfall differentiating it from the surrounding desert. Considerable grass grows and the water collects in the fissures of the rocks and in deep caverns, around which the inhabitants and their cattle live. The natives are Tibbus. They are rock-dwellers and troglodytes, living in caves or in spaces between the rocks, which they cover with roofs of palm or acacia branches. They are not confined to their mountain home, but range over a wide area of the Eastern Sahara. Their stronghold, however, is the mountains of Tibesti, where they raise hardy breeds of camels and asses, and have goats, sheep, and a few horses. Goat's milk, the berries of a few plants, and the fruit of the dûm-palm are staple articles of food, meat being eaten only rarely. The people are thought to number not more than 30,000 souls. Tibesti is included in the French sphere of influence.

**Tiffany**, Louis Comfort: artist; b. in New York city, Feb. 18, 1848; studied art at home and in Paris, and for five years traveled and sketched in Europe and Africa; became a member of the Water-color Society in 1870, and a member of the National Academy in 1880; is also a member of the Society of American Artists; has given special attention to decorative work, furnishing many designs for windows. Among his water-colors are *Meditation*; *A Shop in Switzerland*; *Old and New Mosques at Cairo*; *Lazy Life in the East*; *Algiers*; and *Cobblers at Borifarik*. His works in oil include *A Fruit-Vender Under the Sea-Wall at Nassau*; *Market-Day, Morlaix*; *Duane Street, New York*; and *Bow-Zarea, Algiers*.

**Timm**, Henry C.: pianist; one of the pioneers in the development of music in the U. S.; b. in Hamburg, Germany, July 11, 1811, and went to New York when twenty-two years old. He had received a fine musical education, and at once took a prominent place in New York musical life, taking part in a concert in Sept., 1835, in the Park theater. He was one of the founders of the New York Philharmonic Society in 1842, a director until 1848, and then its president until 1863, and from that date an honorary member until his death. In addition to being a fine pianist, he was organist, horn-player, trombone-player, composer, and conductor, both of opera and concerts. His influence was always exerted in favor of the best music. His last appearance in public was at a benefit concert in Steinway Hall, New York, conducted by Theodore Thomas, Nov. 21, 1885. D. in Hoboken, N. J., Sept. 4, 1892.

D. E. Hervey.

**Titchener**, Edward Bradford, A. M., Ph. D.: psychologist; b. in Chichester, England, Jan. 11, 1867; educated at Malvern College and Brasenose College, Oxford; B. A., Oxford, 1889; Ph. D., Leipzig, 1892; M. A., Oxford, 1894; Extension lecturer in biology, Oxford, 1892; Assistant Professor of Psychology, Cornell University, 1892–95; Sage Professor of Psychology, Cornell University, since 1895. He is author of *An Outline of Psychology* (1896); *A Primer of Psychology* (1898); and articles in *Mind*, *Brain*, *Philosophische Studien*, *Philosophical Review*, *American Journal of Psychology*, etc. He is one of the editors of *Mind*, and of the *American Journal of Psychology*.

C. H. Thurber.

**Tittmann**, Otto Hilgard: mathematician; b. in Belleville, Ill., Aug. 20, 1850; nephew of Julius E. and Eugene W. Hilgard; educated in St. Louis. In 1867 he entered the service of the U. S. Coast Survey as an aid, and has since been steadily advanced, until in 1889 he was made assistant superintendent of that service. In 1874 he served as first assistant astronomer on the transit of Venus expedition sent to Japan, and in 1893 he represented the U. S. at the international geodetic conference held in Berlin. For many years he was in charge of the office of weights and measures in the Coast Survey, and in 1890 visited the various bureaus of that character in Europe for the service. He is a member of various scientific societies, and is corresponding secretary of the American Meteorological Society and president of the Philosophical Society of Washington. His writings have been for the most part confined to the official reports of the service with which he is connected, and have been quite numerous.

Marcus Benjamin.

**Tobacco**: No one has yet discovered what are the properties of climate or soil that give peculiar excellence to the tobacco-leaf grown in certain regions. Tobacco grows well in all parts of Cuba, and the soil of the plantations is mostly composed of calcareous rocks; but the reason why the leaf grown along the southern slope of the Cordillera de las Organos in Pinar del Rio, in the west end of the island, is the best in the world is not known. The best tobacco of this famous Vuelta Abajo region is almost worth its weight in gold. Because of the excellence of its leaf, Cuba is the most famous tobacco-growing region, and many imagine that it is the chief center of tobacco production. The Cuban product, however, in the best of times, is very small in comparison with that of several other countries. The U. S. is one of the greatest tobacco-growing countries, and prepares over 220,000 tons of dried leaf every year, while India prepares about 150,000 tons, Russia 100,000, and Austria-Hungary 60,000. The normal tobacco crop of Cuba averages about 31,000 tons a year. The Philippines, whose tobacco is in high repute throughout the Orient, as Cuban tobacco is in the Occident, exported 119,977 tons of tobacco and 140,080,-000 cigars in 1894, the year before the internal troubles greatly reduced the export trade.

All countries make tobacco an important source of revenue, and in some lands, most conspicuously in France, Austria-Hungary, Italy, and Spain, the tobacco trade is a Government monopoly, and no one may engage in it unless he pays well for the privilege. In Spain one company pays to the Government a very large sum for the monopoly of manufacturing and selling tobacco. Every cigar-store is owned by this company. It has 11 manufactories in different parts of Spain, maintains nearly 19,000 places for the retailing of its product, and more than 50,000 families are supported by the money it disburses in wages. Egyptian cigarettes are made in Egypt, but the tobacco comes mostly from Turkey, the paper from Austria, Germany, or Italy, and most of the labor employed is Greek except for the common brands, which are consumed in Egypt and made by the natives. Tobacco-raising has been prohibited by law in Egypt since 1890, the Government preferring to derive income from duties on tobacco importations, and also desiring to maintain the reputation of Egyptian cigarettes, which seemed likely to suffer from the dishonest admixture of inferior native tobacco with the Turkish article.

C. C. Adams.

**Todd**, Charles Burr: author; b. in Redding, Conn., Jan. 9, 1849; was fitted for college, which he was prevented from entering by failure of sight; taught for some time, afterward devoting himself to literature; was appointed commissioner for erecting a monument on the winter quarters of Gen. Israel Putnam's division of Continentals in Redding, Conn. He is the author of *A General History of the Burr Family in America* (1878); *Life and Letters of Joel Barlow* (1886); and *The Story of the City of New York* (1888).

**Todd**, David Peck, Ph. D.: astronomer; b. in Lake Ridge, N. Y., Mar. 19, 1855; graduated at Amherst in 1875, and was soon afterward appointed chief assistant to the U. S. transit of Venus commission in Washington; reduced the observations of the transit, his result for the parallax of the sun being the first derived from the American photographs of the transit; observed the satellites of Jupiter during an entire revolution of the planet, his observations resulting in theoretical researches on the orbits of those bodies; published *A Continuation of De Damoiseau's Tables of the Satellites of Jupiter to the Year 1900* (1876), which tables are now used in the *American Ephemeris and Nautical Almanac*, the *Berliner Astronomisches Jahrbuch*, and elsewhere, and were extended by him back to 1665; in 1877 began to investigate the possibility of an extra-Neptunian planet; was sent to Texas in charge of the Government expedition to observe the total eclipse of the sun in 1878, on his return being appointed assistant to the editor of the *American Ephemeris*, holding that position until 1881, when he took the chair of Astronomy at Amherst and the directorship of the observatory there; was Professor of Astronomy and Higher Mathematics at Smith College 1881–87, and planned the construction of the new observatory; directed the observations of the transit of Venus at the Lick Observatory in 1882, and had charge of the expedition to Japan to observe the total eclipse of 1887, after which he organized an expedition to the summit of Fujiyama for meteorological observations. His writings consist principally of reports to the Government and contributions to the *Transactions* of societies. He received the degree of Ph. D. from Washington and Jefferson College in 1888.

**Tomlins**, William Laurence: conductor; b. in London, England, in 1844, and early developed a talent for music. He directed a performance of the *Messiah* when seventeen years old; went to New York in 1870, and filled several positions as organist, but soon went to Chicago to take charge of the Apollo Club, which he conducted for twenty-five years. He trained the choruses for the festivals there, especially for the Columbian Exhibition in 1893, and was a valuable assistant to Theodore Thomas. In 1898 he left Chicago, and has since been delivering lectures in various cities. D. E. Hervey.

**Torrens System** (of land registration): the name by which is commonly known the system of Government registration of titles to land under which the Government guarantees the title of the land to the registered owner. This system is sharply distinguished from the system of registration of deeds where the registration carries with it no guaranty of title, but simply serves either as a protection to third parties, by affording them notice of transfers, or incumbrances of real estate, or assistance to the owners of property in affording them a cheap and convenient method of ascertaining the title to their property. Under the guaranty system every deed of transfer, conveyance, or lien must be examined with respect to its validity as a condition of registration, while under the system of registration of deeds such examination is not necessary, except so far as it may be required to comply with certain requirements, such as being properly acknowledged and witnessed. See Registration of Titles. F. Sturges Allen.

**Townsend**, Thomas S.: compiler; b. in New York city, Aug. 27, 1829; received classical education, afterward engaging in mercantile business. He began in 1860 a chronological history of all important occurrences in connection with the civil war, consisting of clippings from newspapers, which work resulted in about 120 volumes containing 60,000 pages, and of which William Cullen Bryant said: "The age has given birth to few literary undertakings that will bear comparison with this work. The forty academicians who compiled the dictionary of the French language had a far less laborious task." The work is now in the library of Columbia University.

**Townsend**, William Kneeland: jurist; b. in New Haven, Conn., June 12, 1849; graduated at Yale College in 1871, and at the Yale Law School in 1874; Professor of Contracts in Yale Law School since 1881; in 1892 was appointed U. S. district court judge. He is author of the *Connecticut Civil Officer* and various municipal articles. Since his appointment as U. S. district judge he has decided many important patent cases.

**Tracy**, Roger Sherman: sanitarian; b. in Windsor, Vt., Dec. 9, 1841; graduated at Yale in 1862, taught for five years, and then took his medical degree at the College of Physicians and Surgeons of Columbia; was house physician at Bellevue Hospital in 1868, afterward becoming inspector of prisons and hospitals for the department of charities and corrections in New York city; became sanitary inspector in the health department in 1870, chief of the corps in 1887, and subsequently registrar of vital statistics. Besides contributing articles on sanitary science to various periodicals and to Buck's *Hygiene* (1879), he is the author of *The New Liber Primus* (1878); *A Handbook of Sanitary Information for Householders* (1884); and *Essentials of Anatomy, Physiology, and Hygiene* (1885).

**Trans-Mississippi and International Exposition**: an exposition held in Omaha, Neb., from June 1 to Oct. 31, 1898.

*Origin.*—At a meeting of the Trans-Mississippi Congress held in Omaha in Nov., 1895, a resolution was introduced by the Hon. William J. Bryan, saying that "We believe that an exposition of all the products, industries, and civilization of the States west of the Mississippi river, made at some central gateway where the world can behold the wonderful capabilities of these great wealth-producing States, would be of great value, not only to the trans-Mississippi States, but to all the home-seekers in the world." This was adopted, and after a thorough canvass of the matter the Trans-Mississippi and International Exposition was organized on Jan. 18, 1896, and articles of incorporation obtained. These required that the capital stock should be $1.000,000, issued in shares of $10 each, and that the life of the exposition should be from June 1 to Oct. 31, 1898. The following officers were chosen: President, Gurdon W. Wattles; vice-president, Jacob E. Markel; treasurer, Herman Kountze; and secretary, John A. Wakefield. To secure national aid, bills were introduced in both the House and the Senate asking for an appropriation of $250,000 to be available only after a like amount of the capital stock of the exposition had been obtained. A local canvass for subscriptions resulted in the securing of $330,000 by Nov., 1896, which amount was deemed sufficient to warrant the beginning of building operations. The failure of President Cleveland to sign the bill containing the Government appropriation, which had been cut down to $200,000, delayed work on the Government building until the passage of the bill by the extra session of Congress called by President McKinley. Local subscriptions had, however, increased until $420,000 had been promised, and the State of Nebraska and Douglas County each subscribed $100,000. Aid from various State Legislatures was received as follows: Illinois, $45,000; Iowa, $35,000; Montana, $15,000; Utah, $8,500; and New Mexico, $1,500. Among Eastern States the following sums were appropriated by their respective Legislatures: Georgia, $10,000; New York, $7,500; Massachusetts, $6,000; and Ohio, $3,000. The Kansas Legislature refused to appropriate money, but the people themselves made contributions equivalent to nearly $30,000, and the following amounts may be credited to the people of the respective States: Minnesota, $20,000; Montana, $15,000; Wisconsin, $12,000.

*Officers of the Fair.*—President, Gurdon W. Wattles; resident vice-president, Alvin Saunders; treasurer, Herman Kountze; secretary, John A. Wakefield. Executive committees: Chairman and manager of department of ways and means, Zachary T. Lindsley; manager of department of publicity, Edward Rosewater; manager of department of promotion, Gilbert M. Hitchcock; manager of department of buildings and grounds, Freeman P. Kirkendall; manager of department of exhibits, Edward E. Bruce; manager of department of concessions and privileges, Abram L. Reed; and manager of department of transportation, William N. Babcock. Later the departments of publicity and promotion were consolidated under the management of Edward Rosewater. The organization also included a vice-president from each of the trans-Mississippi States, appointed by their respective Governors.

*Location.*—The site chosen was the Kountze tract, lying across Twentieth Street and extending from Sherman Avenue to Twenty-fourth Street, on the north side of Omaha, within the city limits. It was 670 feet in width and about half a mile in length, and through the center extended a canal which was 150 feet wide at the east end, while at the west end it widened into a three-lobed lake 400 feet across. On the E., lying at right angles to the Kountze tract, was the Bluff tract of 60 acres stretching along the bluffs and overlooking the river-country beyond. In this were grouped the State buildings. The remainder of the grounds were N. of the Kountze tract, W. of Sherman Avenue, and included the old fair-grounds and the land beyond it, embracing in all about 80 acres. In this were the amusement features.

*Buildings.*—The principal structures on the grounds numbered about fifty. The larger buildings devoted to exhibition purposes were grouped along the sides of the lagoon with the Arch of States, the main entrance, on the S., the Government building on the W., the Administration arch facing the Arch of States on the N., and the Towers on the E. The general scheme of the architecture was the concept of Messrs. Walker & Kimball, of Boston and Omaha, who were the supervising architects of the exposition, while the landscape effects were under the direction of Mr. Rudolph Ulrich, of New York. Among the larger structures were the following:

*Administration Arch.*—This was 50 feet square and 150 feet high, and was Renaissance in style. On the front of the arch near the main cornice line were the seals of the State of Nebraska and of the city of Omaha, one on each side. Statuary of heroic size was used above the cornice to heighten the architectural effect. On each of the four pavilions were symbolic figures, and at the center of the south side, facing the lagoon, was a group symbolizing "Administration." On each side of the arch were covered colonnades connecting with the Manufactures building on the

E. and the Agricultural building on the W. It was designed by Messrs. Walker & Kimball.

*Agricultural Building.*—This was 400 feet long and 148 feet wide, with a floor-space of 84,260 sq. feet. The architecture followed was the Renaissance or classical style, and the building was decorated with ornaments modeled from agricultural products, such as festoons of corn and other cereals, including even common market-garden products. On each side of the semicircular niche forming the entrance were figures representing the "Sower" and "Digger" from Millet's paintings. Over the whole composition was a figure representing "Prosperity" supported by "Labor" and "Integrity." The architect was Mr. Cass Gilbert, of St. Paul, Minn.

*Arch of States.*—This was 50 feet wide, 25 feet deep, and 68 feet to the top of the parapet. It was in the form of a triumphal arch, the opening being 20 feet wide and 35 feet high to the keystone. The arch was flanked on each side by exedras which advanced in semicircles partially embracing the open space in front of it. This structure, which was one of the most conspicuous among the buildings, was decorated with a frieze composed of the arms in colors of the trans-Mississippi States, the whole being surmounted by sculptured figures, bearing the shield of the U. S. It was designed by Messrs. Walker & Kimball.

*Fine Arts Building.*—This was 246 feet long and 130 feet wide, with its longer side parallel to the lagoon. It consisted of two separate symmetrical domed buildings connected by an open court surmounted by colonnades. The structures were slightly raised from the avenue, and were entered by a flight of steps leading to the portico, whence access was had to either building, in which were the central domed rooms lighted from above and connected with smaller rooms for special exhibits, and by means of which the necessary hall-space was obtained. The basis of design of the building was the Corinthian order, and Messrs. Eames & Young, of St. Louis, Mo., were the architects.

*Horticultural Building.*—This was 300 feet long, 130 feet wide, and 160 feet high. The basis of design was the chaste Ionic, and the details were modeled from flowers, fruits, and foliage. On each side of a stately central entrance were mosque-like minarets, which were also reproduced on four sides, forming an octagon from which sprang the dome. Between the minarets were circular colonnades, surrounded by statuary emblematical of the seasons. Above the dome was an open observatory balcony from which could be obtained a grand view. At the ends of the wings were octagonal-roofed pavilions in harmony with and emphasizing the general form of design. It was designed by Charles F. Beindorf.

*Liberal Arts Building.*—This was 246 feet long and 130 feet deep, and was designed in the French Renaissance style of architecture. The exterior of the building had an appearance of two stories, the first of which was low in treatment, and had small windows cut into a plain wall-surface. The second story was ornamented by Corinthian columns set in pairs with windows between. At each corner of the building were ornamental pediments surmounted by octagonal bases on which were set groups of statuary each of which was composed of four heroic figures. Messrs. Fisher & Laurie, of Omaha, Neb., were the architects.

*Machinery and Electricity Building.*—The design of this structure was modern Renaissance, and the building was 304 feet long and 144 feet deep. In front of the building, flanking both sides of the main entrance, was an open portico 16 feet wide, extending along its entire front. The center entrance projected beyond the portico, thus forming a grand entrance-vestibule. A gallery 32 feet in width, extending around the four outer walls, was reached by staircases in the corners of the building. Groups of statuary symbolizing the principles and functions of machinery were placed on the building, and at each of the four corners were groups significant of the early supremacy of man over the untamed forces of nature. The architect was Mr. D. H. Perkins, of Chicago, Ill.

*Manufactures Building.*—This was 400 feet long and 152 feet wide. At the center and ends of the façade fronting the lagoon were pavilions 64 and 40 feet long, respectively. The height of the building to the top of the main cornice was 40 feet, and the height of the order 30 feet, resting on stylobate 10 feet high. The height of the center pavilion to the top of the crowning group of statuary was 85 feet. The center entrance, 24 feet wide and 34 feet high, was very rich in decoration. The interior decoration was confined to classic ornamentation and on the walls were paintings emblematic of manufactures. The architect was Mr. John J. Humphreys, of Denver, Col.

*Mines and Mining Building.*—This building was 304 feet long and 140 feet wide, and was in the Greek Ionic style of architecture. On the façade facing the lagoon was a circular dome 150 feet in circumference that formed a grand open vestibule, which served as an entrance to the building. The inner dome was ornamented with ribs and panels, while the outer one was formed by a series of steps rising in the shape of a cone to the apex. An outer row of detached dome columns with entablatures broken at the head of each, over which was a statue on a pedestal with a background formed by the stylobate of the dome, was an important feature. Flanking the central dome were Ionic colonnades which formed covered ways along the entire façade, stopping at the corner towers. The four corners of the building were marked by square towers surmounted by columned circular pavilions. The architect was Mr. S. S. Beman, of Chicago, Ill.

*Transportation Building.*—This was 432 feet long, 249 feet wide, and covered 3 acres of ground. It was of characteristic farm architecture of half timber and half plaster. Its entire surface was marked off into panels by a network of framing timber, posts, brackets, and braces. A recessed porch sheltered the east and west entrances, and a pleasant light pervaded all portions, coming through a skylight of a new material, which promises to displace glass for that purpose. Wide overhanging bracketed cornices gave the broad shadows so desirable for this style of architecture. The building was designed by Messrs. Walker & Kimball.

*U. S. Government Building.*—This building was arranged in three sections, that at the center having a frontage on the lake of 208 feet, and a height to the top of the balustrade over cornice of 58 feet, with a depth of 750 feet. The main entrance, which faced the center of the lagoon, was reached by a broad flight of steps and through a colonnade. Over the main building was a dome that towered above all other buildings and was capped with a heroic figure of "Liberty Enlightening the World." The side sections, which were separated from the central portion of the building by colonnades connecting with the adjacent buildings, had each a frontage of 148 feet, and were 100 feet deep. The building was designed by the supervising architect's office of the U. S. Treasury Department.

In addition to the foregoing there were the following minor buildings, the uses of which are indicated by their names: Apiary building, Auditorium, Boys and Girls' building, and the Dairy building. On the bluff tract were buildings erected by Georgia, Illinois, Iowa, Kansas, Minnesota, Montana, Nebraska, New York, and Wisconsin.

*Amusement Features.*—On the north side of the grounds, on two streets called North and East Midway, at right angles to each other, were the amusement features. These included a giant seesaw, a scenic railway, shooting the chutes, and a Union Pacific miniature train, together with an Afro-American village, a Chinese village, an English county fair, a Flemish village, a German village, an Irish village, a Japanese tea-garden, a Moorish village, streets of all nations, Streets of Cairo, and the usual Wild West show, a mammoth whale, an ostrich-farm, Hagenback's trained animals, a baby-incubator, cycloramas of Havana and the Maine, and of the fight between the Merrimac and the Monitor, as well as Night and Morning, the haunted swing, the mirror maze, lunette, and several vaudeville theaters. In addition to these, a conspicuous feature of the exposition was the congress of Indians, which consisted of more than 500 Indians, representatives of some 25 tribes, who had been brought from the various reservations, with their special forms of houses and household articles. Entertainments, including various dances and sham fights, were given by them at periodic intervals.

*Opening Exercises.*—The formal opening of the exposition occurred on June 1, when a civic procession 2 miles long marched to the Arch of States from the business center of Omaha under the grand marshalship of Major T. S. Clarkson. The exposition officials, State and county officers, and invited guests were conveyed in carriages. After entering the grounds the procession went to the wide space at the east end of the main court, where a temporary platform had been erected on which were distinguished guests, U. S. Marine Band, and the Exposition Chorus. "The Star-Spangled Banner" was sung by the chorus to the accompaniment of the band, and after an invocation by Rev. Samuel J.

Nichols, of St. Louis, addresses were delivered by President Wattles, Hon. John L. Webster, Hon. John N. Baldwin, and Gov. Silas A. Holcomb, after which a telephone message from President McKinley, who was in the reception parlors of the White House, was delivered to the audience, at the conclusion of which an electric button that set the machinery in motion was touched by President McKinley, and the exposition was declared open.

*Exhibits.*—There were 4,642 separate exhibits distributed among the various buildings, including a small number from foreign nations. These were on exhibition in a small building to the N. of the Administration Arch. In addition to the foregoing, 245 concessions and privilege contracts were made, from which a revenue of $306,365.45 was obtained.

*Attendance.*—The total number of persons visiting the exposition was 2,613,508, of which 1,778,250 paid and the remainder were free. The record of the admissions on the more important days was: June 1, opening day, 27,998; Sept. 22, Modern Woodman's Day, 52,725; Oct. 11, Government Day, 48,051; Oct. 12, President's Day, 98,845; Oct. 13, Army and Navy Day, 49,710; and Oct. 31, Omaha Day, 52,725. The largest single week was that of Oct. 7–15 (jubilee week), when the admissions amounted to 314,151, for which $116,320.10 was taken as gate receipts. The total gate receipts during the exposition were reported as follows: Preliminary period, $20,074.37; exposition period, $781,441.10; total, $801,575.47.

*Special Features.*—This exposition had its life characterized by a series of commemorative stamps that were issued by the Post-office Department in recognition of it. On each stamp was a picture illustrative of some event or scene on or west of the Mississippi, as follows: One-cent, "Marquette on the Mississippi"; two-cent, "Farming in the West"; four-cent, "Indian Hunting Buffalo"; five-cent, "Frémont on the Rocky Mountains"; eight-cent, "Troops Guarding Train"; ten-cent, "Hardships of Emigration"; fifty-cent, "Western Mining Prospector"; one-dollar, "Western Cattle in Storm"; and two-dollar, "Mississippi River Bridge." The usual commemorative medal issued by the exposition was struck under the direction of the U. S. Treasury Department, and the obverse showed a composite head from the photograph of 48 young women, native of the 24 Western States and Territories, thus idealizing the highest type of Western young womanhood; while on the reverse a group showed a typical American Indian mounted on a pony in the act of spearing a buffalo.

During the second week in October, the results of the war with Spain having foreshadowed peace, the exposition authorities decided to hold a peace jubilee, and invited the President, his cabinet, and other distinguished persons in official life to visit the exposition at that time. Beginning on Oct. 10, the following days were celebrated: Monday, Mayor's Day; Tuesday, Governor's Day; Wednesday, President's Day; Thursday, Army and Navy Day: Friday, Civil Government Day; and Saturday, Children's Day. On President's Day President McKinley visited the exposition, and addresses appropriate to the occasion were made on the plaza.

*Results.*—The total receipts of the exposition from all sources up to Dec. 1 were $1,924,077.69, of which amount the gate receipts were $801,575.47, and the receipts from concessions $306,365.45. At this time a payment of dividends amounting to 75 per cent. had been returned to those stockholders who had paid their subscriptions in full, leaving a surplus of $115,853.79, more than enough to cover the 25 per cent. still due. This result of an exposition paying entirely for itself was unique in the history of such enterprises. MARCUS BENJAMIN.

**Trent**, WILLIAM PETERFIELD, A. M.: author; b. in Richmond, Va., Nov. 10, 1862; studied at the University of Virginia, taking his degree of A. M. in 1884, and took history as a post-graduate course at Johns Hopkins; became Professor of English and History at the University of the South in 1888, and in 1894 accepted the post of dean of the academic department. He is the author of *English Culture in Virginia* (1889); *The Period of Constitution-making in the American Churches* (1889); *William Gilmore Simms*, in the American Men of Letters Series (1892); *Southern Statesmen of the Old Régime*, in Crowell's Library of Economics and Politics (1897); and was the first editor of the *Sewanee Review*.

**Tristram**, HENRY BAKER, D. D., LL. D.: b. in Eglingham, Northumberland, England, May 11, 1822; graduated B. A. at Oxford 1844; chaplain in Bermuda 1847–49; rector of Castle Eden, County Durham, England, 1849–60; master of Greatham Hospital and vicar of Greatham 1860–73; rural dean of Stockton 1872–76; of Chester-le-Street 1876–80; of Durham since 1880, and since 1873 canon of Durham. He declined the bishopric of Jerusalem 1879. He is a very eminent biblical naturalist and traveler in Bible lands. He has published *The Great Sahara* (London, 1860); *The Land of Israel: Journal of Travels with Reference to its Physical History* (1865; 4th ed. 1882); *The Natural History of the Bible* (1867; 5th ed. 1880); *Ornithology of Palestine* (1867); *The Daughters of Syria* (1869; 3d ed. 1874); *Scenes in the East* (1870); *The Seven Golden Candlesticks* (1875); *Bible Places, or Topography of the Holy Land* (1872; 13th 1,000, 1897); *The Land of Moab* (1873; 2d ed. 1874); *Pathways of Palestine* (1882, 2 vols.); *Fauna and Flora of Palestine* (1884); *Eastern Customs in Bible Lands* (1894); *Rambles in Japan* (1895). S. M. J.

**Trumbull**, GURDON: artist; b. in Stonington, Conn., May 5, 1841; studied art in Hartford and in New York city, giving special attention to the painting of fishes. Among his best-known pictures are *Over the Fall*; *A Plunge for Life*; and *A Critical Moment*. He has recently devoted himself to the study of ornithology, and is the author of *Names and Portraits of Birds which Interest Gunners, with Descriptions in Language Understanded of the People* (1888).

**Trust Companies**: This term is now applied to a modern form of banking organization, which in many respects resembles the national banks of the U. S. in the methods of doing business. The trust companies are incorporated under the specific provisions of State laws, and their business is managed under restrictions regarding the character of the investments which they may make, intended for the purpose of protecting the trust funds which they hold, and with these restrictions may also be combined the statutory guards which are imposed upon national banks to protect the depositors against dangerous or improper loans.

These companies have greatly increased in number during the last decade of the nineteenth century, and the foremost of them are powerful and very large moneyed institutions, most of which have been very successful in making money for stockholders. The great trust companies of the U. S. are in their most important features like the joint-stock banks of London, and, like them, they have a capital stock which is small as compared with the volume of business transacted.

Such companies are generally authorized to receive and hold moneys and property in trust and on deposit from courts of law or equity, executors, administrators, assignees, guardians, trustees, corporations, and individuals, and are also usually authorized to be appointed by probate courts as trustee under wills upon terms and conditions agreed upon or prescribed by statute. They are also usually made legal depositories of money paid into court by parties to legal proceedings or of money brought into court by reason of an order or judgment.

Another prominent feature of the business which they transact is that of acting as agents for the transfer of the stock or securities of railroads and other stock corporations, and as agents for the purpose of issuing, registering, or countersigning certificates of stock, bonds, and other evidences of debt; and as agents for the payment of dividends and interest of corporations, associations, and municipalities. They also usually undertake to act as agent or attorney according to agreement for the court in the management of invested property, the collection of dividends and interest, and the management of trust estates.

They differ from the national banks in that they customarily allow interest on deposits, usually on the average daily balances of some specified amount, such as $500, reserving the right, however, to change the rate of interest allowed on deposits.

It is customary for the articles of incorporation and the by-laws of such companies to prescribe the nature of the investments which the corporation shall have the power to make. The securities investments in which are allowed under these provisions are usually the duly authorized loans of the U. S. or any of the individual States which may be specified, as those within a certain region surrounding the State in which the corporation exists; the duly authorized loans of cities or towns of the State under the laws of which the company is incorporated; the stock of the national banks within that State; the first mortgage bonds of railroad companies which have earned and paid regular dividends for a given number of years next preceding the date of investment, as for two or five years; the bonds of any such railroad company as is unincumbered by mortgage, or the stock of such railroad companies as are incorporated under the laws of the State to which the company belongs, or it may be even under the laws of other States; mortgages on real estate, usually within the State to which the company belongs; the notes of domestic corporations, and the notes of individuals having a sufficient collateral security; the duly authorized loans of any of the counties, cities, and towns within certain specified districts, such as the State to which the corporation belongs or the surrounding States. It is also not unusual to provide that the corporation may make loans to the State or to a city or town situated therein under certain provisions, and in addition to these such companies are uniformly authorized to invest their capital and deposits on trust funds in all other securities in which savings-banks may then or thereafter be allowed to invest their funds, subject to the same provisions as those which regulate the investment of savings-bank funds.

Such corporations ordinarily receive deposits which may be drawn upon by checks in the same manner as the national and State banks, in which respect they are hardly to be distinguished from them, although their powers in this respect are usually more restricted than those of ordinary banking corporations. It is customary for them to distribute as deposits among national banks a large proportion of their funds on deposit or arising out of trusts, making such deposits upon condition that they shall be payable on demand and with interest. The general rules of law by which trust companies are governed are those governing other corporations. See CORPORATIONS and JOINT-STOCK COMPANIES. F. STURGES ALLEN.

**Tunis**: The condition of Tunis, which has been under a French protectorate for eighteen years, has vastly improved under the new *régime*. In 1880 it was as difficult and dangerous for a white man to travel in the regency as it is now in the far interior of Morocco; but to-day there is security for life and property throughout the country. Roads and railways have been constructed; the ruthless destruction of forests has been stopped; wells have been sunk, manufactures encouraged, and useful public works set on foot. The agricultural resources are numerous, but, in the opinion of Sir H. H. Johnston, the olive-tree promises to become the most important asset in the future. The export of halfa or esparto grass has recently diminished. The fisheries are destined to be a large source of wealth, and the live stock includes horses, donkeys, camels, oxen, sheep, and goats. It is believed that Tunis is certain to become a white man's country, such as Cape Colony. In the ten years ending in 1897 $25,862,000 was spent in public works; $6,562,000 on ports; $279,590 on lighthouses and buoys; $12,545,000 on railways; $2,316,000 on highways; $2,026,500 on public buildings; $482,500 on sewers; $250,000 on aqueducts, etc. Highways to the extent of 1,069 miles were constructed, and 303 miles of railways. European immigrants held 1,200,000 acres of land. Bizerta, which had a very fine natural harbor until it was shallowed by deposits of silt, is to be thoroughly dredged and strongly fortified. C. C. ADAMS.

**Turkey**: In 1899 an American firm started a direct steamship line between New York and Constantinople. The first vessel carried 15,000 bags of American flour and returned with a good share of freight from Constantinople, Smyrna, and Greece. If the line is a success it will open good markets for American goods in Turkey, Bulgaria, Roumania, and Southern Russia. In European Turkey manufacturing activity is now mostly confined to house and small industries. Even the few articles with which Turkey once commanded the markets, such as Morocco leather and some kinds of silk textiles and carpets, can no longer compete with foreign products. There are a few steam mills for the manufacture of silks and fezes in Constantinople and Salonica. The wool manufactures of Salonica and Monistir and the few cotton-factories of Salonica are also somewhat noteworthy. But, on the whole, Turkey is chiefly a market for Western manufactures. The heavy freight charges, due partly to transshipment at Liverpool and other ports, have almost kept American products out of the market. The total exports for the year ending Mar. 12, 1895, were $60,516,743, of which America received only $983,531; the total imports were $105,932,154, of which America sent $320,979. C. C. ADAMS.

**Turkey, History of**: The Turkish Government has been confronted with many domestic and foreign troubles. The finances are in a poor condition. Such storm-centers as Macedonia have been at times threatening. Insurrections have occurred in Arabia and among the Druses. In 1894 the gathering discontent among the Armenians culminated; massacres of Armenians were encouraged by the Turks; during the next two years there were riots in Constantinople and outbreaks in various places in Asiatic Turkey. These events excited much indignation in Europe and America, but, although many Armenian sufferers were relieved, nothing tangible was accomplished. In 1896 the Cretan question again became uppermost, and involved a war with Greece in 1897. (See GREECE.) Turkey gained a slight addition of territory, and increased her prestige. Her forces evacuated Greece and Crete in 1898. EDMUND K. ALDEN.

**Tutuila**: the easternmost of the three larger islands of the Samoan group. It is of volcanic origin, built up above the sea by basaltic rocks. The island is much smaller than Savaii and Upolu, farther W., but is not so mountainous. Pago Pago is the best harbor in the Samoan group. Tutuila came into the possession of the U. S. in Jan., 1900. (See SAMOA.)
