*Beginnings in the U. S.*—For the credit of introducing the modern Sunday-school into the U. S. there are many claimants. It would seem that in several places Sunday-schools which were started within a few years after Raikes's beginning in Gloucester were continued for a time and then given up without leaving immediate successors. Thus a Sunday-school was organized under the direction of Bishop Asbury at the house of Thomas Crenshaw, in Hanover co., Va., in 1786; yet little is known of it save its beginning. A minute in favor of organizing Sunday-schools was adopted by the Methodist Conference in Charleston, S. C., in Feb., 1790; yet no record is found of Sunday-schools organized. In Dec., 1790, a meeting was called in Philadelphia to consider the importance of this work, and early in Jan., 1791, the First-day or Sunday-school Society was formed for the purpose of securing religious instruction to poor children on Sunday. This society is still active, yet its schools, like those of Robert Raikes, had paid teachers during the earlier years of its operation. In 1791 there was started a Sunday-school in Boston; in 1793 one in New York by Katy Ferguson, a Negro; in 1794 one in Paterson, N. J.; in 1797 one in Pawtucket, R. I., by Samuel Slater; in 1800 one in Pittsburg, Pa. In 1803 a Sunday-school was gathered by Mr. and Mrs. Divie Bethune in New York, and subseqnently other schools were begun by them. Mrs. Bethune was a daughter of Mrs. Isabella Graham the philanthropist. Mr. Bethune had seen something of Raikes's work in England, and the New York school was in imitation of that. In the same year with this beginning in New York a Sunday-school was begun in Portsmouth, N. H., and the year following one in Baltimore, Md. In 1809 a systematic Sunday-school movement was organized in Pittsburg, Pa. The Rev. Robert May, from London, gave a new start to Sunday-schools in Philadelphia in 1811, which proved a beginning of permanent progress. A local union for Sunday-school work was organized in New York in 1816, another in Boston the same year, and another in Philadelphia in 1817. These societies became the nucleus of the American Sunday-school Union, a national society organized in 1824.

*Progress and Influence.*—The Sunday-school movement led to a new interest in popular education, and to new measures for the Christian evangelization of the home field and the foreign. J. R. Green, the historian, says: "The Sunday-schools established by Mr. Raikes . . . were the beginning of popular education." The system of penny postage, and the organization of the British and Foreign Bible Society, and of other benevolent societies, were an outgrowth of interest in this movement. Adam Smith said at the time: "No plan has promised to effect a change of manners, with equal ease and simplicity, since the days of the apostles." A century later John Bright, looking back on the record, said: "There is no field of labor, no field of Christian benevolence, which has yielded a greater harvest to our national interests and national character than the great institution of Sunday-schools."

In the U. S. the influence of the Sunday-school has been even more important than in Great Britain. When the Sunday-school was introduced as a practical power into the U. S., unbelief and error were already largely in the ascendant, and a flood of godless immigration was making the matter worse year by year. The new agency was by various changes adapted to the peculiar needs of the republic, and it became a means of instructing and influencing children and youth in the field of organized churches and of pioneer religious work in new communities.

*Present Status.*—The Sunday-school is a recognized department of the Church in the U. S. for the religious instruction of the young, and for systematic Bible study by young and old. It is also employed as a pioneer agency of evangelism in newer portions of both the older and the newer communities, as in the outlying districts of cities and villages, and on the borders of an advancing and extending population, beyond the limits of existing church organizations. Both as a denominational and as an undenominational agency it is of marked and growing prominence. Protestants and Roman Catholics alike recognize its importance, and it is in favor among the Jews as among Christians. Its management varies according to the ecclesiastical systems of which it has become a part, but its main features are alike throughout.

Buildings for the use of Sunday-schools are often arranged so that numerous rooms can be used separately, and yet all opened together into the sight of the superintendent's desk at a moment's notice. Sunday-school hymns and music are an important aid to social worship. An extensive literature, in the form of books and periodicals, has been created by and for the Sunday-school. Improved methods of teaching have been promoted by Sunday-school normal classes and teachers' institutes. Conventions and assemblies have extended the influence and uplifted the standard of Sunday-school instruction.

*International Lessons.*—In 1873 a plan of uniform Bible lessons was formally inaugurated, on the recommendation of a national convention of Sunday-school workers, and that plan was approved in Canada and England, and came to be known as the international system. Gradually this system overbore opposition, and was employed more and more generally in North America and throughout the world, until now from 6,000,000 to 8,000,000 are engaged each week in the study of the Bible according to its outline. This centering of interest on particular portions of the Bible has justified the issue of many special works as aids to intelligent study, and of the employment of the ablest scholarship and talent for critical and popular expositions. As a result, there is more of biblical study and of interest in biblical research than at any previous stage in the world's history. Criticisms of this international system and attempts at a better one have been incessant, but it has made progress steadily in public favor. A scheme of Bible lessons widely used in the U. S., and considered by many as an improvement upon the international lessons, is known as the Blakeslee or inductive system; and other schemes have their enthusiastic advocates.

The influence of the Sunday-school has been manifestly for good over the individual, the family, and the community; and schools, colleges, and churches have felt that influence, as widely and as steadily as the Sunday-school has made progress.

The following statistics of Sunday-schools in all nations were compiled for the third world's Sunday-school convention, in London, July 11–16, 1898:

| COUNTRY. | Sunday-schools. | Teachers. | Scholars. |
|---|---|---|---|
| EUROPE: | | | |
| England and Wales | 43,632 | 613,036 | 6,843,072 |
| Scotland | 6,338 | 63,939 | 713,360 |
| Ireland | 3,620 | 27,980 | 319,316 |
| Belgium | 83 | 403 | 4,616 |
| Austria | 208 | 533 | 7,340 |
| Denmark | 819 | 4,275 | 71,371 |
| Finland | 7,611 | 12,928 | 165,140 |
| France | 1,475 | 3,876 | 61,200 |
| Germany | 7,131 | 39,872 | 814,175 |
| Greece | 4 | 7 | 180 |
| Italy | 336 | 1,482 | 15,787 |
| Netherlands | 1,900 | 4,962 | 168,110 |
| Norway | 749 | 3,311 | 65,311 |
| Portugal | 18 | 70 | 1,419 |
| Russia | 83 | 785 | 15,679 |
| Spain | 48 | 220 | 4,275 |
| Sweden | 5,360 | 18,144 | 252,247 |
| Switzerland | 1,762 | 7,490 | 122,567 |
| European Turkey | 30 | 170 | 1,420 |
| ASIA: | | | |
| India, including Ceylon | 5,578 | 13,937 | 247,472 |
| Persia | 107 | 440 | 4,876 |
| Siam | 16 | 64 | 809 |
| China | 105 | 1,053 | 5,264 |
| Japan | 150 | 390 | 7,019 |
| Central Turkey | 516 | 2,450 | 25,833 |
| AFRICA | 4,246 | 8,455 | 161,394 |
| NORTH AMERICA: | | | |
| United States | 132,697 | 1,394,630 | 10,893,523 |
| Canada | 8,986 | 75,064 | 582,070 |
| Newfoundland and Labrador | 375 | 2,363 | 23,856 |
| West Indies | 2,306 | 10,769 | 111,335 |
| Central America and Mexico | 550 | 1,300 | 15,000 |
| SOUTH AMERICA | 350 | 3,000 | 150,000 |
| OCEANICA: | | | |
| Australasia | 7,458 | 54,670 | 595,031 |
| Fiji islands | 1,474 | 2,700 | 42,909 |
| Hawaiian islands | 230 | 1,413 | 15,840 |
| Other islands | 210 | 800 | 10,000 |
| The World | 246,658 | 2,378,921 | 22,540,392 |

**Sunderland**: town; in the county of Durham, England; at the mouth of the Wear; 12 miles S. E. of Newcastle-upon-Tyne and 13 miles N. E. of Durham (see map of England, ref. 4–H). The borough includes Sunderland proper and other townships on the south side of the Wear, and Monkwearmouth on the north side, the river being crossed by two iron bridges. Sunderland is a well-built modern town with broad streets. Among the principal buildings are the Renaissance town-hall, completed in 1890, and the museum, art gallery, etc. (1879). The harbor is formed by two piers, 1,850 and 650 feet long respectively. Two new piers 2,870 and 2,700 feet long, inclosing a harbor of 125 acres, are in process of construction (1895). Four docks, covering a total space of 49 acres, are capable of receiving the largest vessels. The shipments of coal and coke average upward of 4,000,000 tons; in 1892 1,332,546 tons were exported. Glass, earthenware, iron, lime, cement, and chemicals are also exported. The principal imports are iron ores, timber, chalk, and agricultural produce. The total tonnage entered and cleared in 1893, exclusive of that coastwise, was 1,979,733. Ship-building is largely carried on; in 1892 67 steamers, with a total tonnage of 174,940, were launched. Other industries are iron-works, bottle-works, chemical works, ropewalks, paper-mills, and breweries. In Monkwearmouth is one of the deepest collieries in the world (381 fathoms). Pop. of the municipal borough (1901) 146,823; of the parliamentary borough, returning two members (1891), 142,097.

**Sunderland**, JABEZ THOMAS, A. B., B. D., A. M.: clergyman and author; b. at Howarth, Yorkshire, England, Feb. 11, 1842; educated at Madison University, Hamilton, N.Y., University of Chicago, and Union Baptist Theological Seminary, Chicago; held pastorates in Milwaukee, Wis., Northfield, Mass., Chicago, Ill., and Ann Arbor, Mich.; published *A Rational Faith* (1878); *What is the Bible?* (1878); *The Liberal Christian Ministry* (1889); *Home Travel in Bible Lands* (1891); *The Bible, its Origin, Growth, and Character and Place among the Sacred Books of the World* (1893); and various minor works; established and became the editor of *The Unitarian*, a monthly, in 1886.

**Sunderland**, ROBERT SPENCER, Second Earl of: politician; b. in 1640; lived on the Continent during the time of the Commonwealth; returned to England at the restoration of Charles II.; was sent on embassies to Madrid, Paris, and Cologne, 1671–73, and became Secretary of State in 1679. He at first opposed and then supported the bill for the exclusion of the Duke of York, afterward James II., and was removed from office by Charles in 1681, but was reinstated in 1682, and exercised a controlling influence in the Government during the remainder of the reign. He was continued in office by James II., and is said to have become a Roman Catholic, but, being opposed to some of the radical measures of the court, was dismissed in 1688, and took refuge in Holland. He gained the favor of William, and in 1697 was made lord chamberlain, but retired from public life in 1697 with the reputation of having been the basest public man of his age. D. at his seat, Althorpe, Sept. 28, 1702.—CHARLES SPENCER, his son, the third earl, b. in 1674, professed liberal principles, and was returned to Parliament for Tiverton in 1695. His first wife, a daughter of the Duke of Newcastle, having died, he married in 1699 a daughter of the Duke of Marlborough, thereby strengthening his alliance with the dominant Whig party. He succeeded to the earldom in 1702; distinguished himself on a mission to Vienna, and from 1706 to 1710 was Secretary of State; was dismissed in 1710, declining a large pension offered him by the queen. Upon the accession of George I. in 1714, he was made Lord-Lieutenant of Ireland, in 1715 Lord Privy Seal, and in 1718 Prime Minister. He was apparently deeply involved in the South Sea Bubble, and though in an investigation by the House of Commons he was acquitted of personal corruption by a vote of 233 to 172, he was driven from office in 1721. D. Apr. 19, 1722.
F. M. COLBY.

**Sundew**: See DROSERA and INSECTIVOROUS PLANTS.

**Sun-dial**: See DIAL.

**Sun-dog**: See HALO.

**Sunfish**: a name given to different aquatic animals on account of their brilliant colors, shape, or habit of basking in the sun. (1) In the U. S. and Canada it is most frequently applied to species of fresh-water fishes belonging to the family *Centrarchidæ*, and chiefly to the genus *Lepomis*. These are readily recognized by the extension of the opercula backward into more or less enlarged or elongated membranous, highly colored, ear-like lobes, and the radial formula—viz., dorsal fin with ten spines and ten or eleven rays, and anal fin with three spines and nine or ten rays; the colors are always quite brilliant. The species are quite numerous. The best known in the Northern States are the (1) *Lepomis gibbosus vulgaris*; (2) *L. auritus*; and (3) *Lepomis pallidus*. The *L. gibbosus* is the common sunfish of New England and the Middle States, and is at once recognizable by the ear-flaps being black, tipped with scarlet, and by the orange spots of the sides. The *L. auritus* is equally readily distinguishable by the very long black but bluish-edged ear-flaps. The *L. pallidus* has squarish black ear-flaps. The first is the smallest, and the last two the largest, of the species mentioned. Wherever found, they are generally among the most common fishes. They are quite carnivorous and bold, and take a hook baited with the common earth-worm with avidity. Many of the species build curious nests. (2) On the seacoast, to some extent, but more especially in Great Britain, the name is given to species of *Orthagorisca* or *Mola*, fishes of an almost circular outline, with high anal and dorsal fins and an aborted tail. (3) In some parts of England the name is also applied to the basking shark (*Cetorhinus* or *Selache maximus*). (4) It is also frequently applied by sailors to the species of floating acalephs or jellyfishes.
Revised by F. A. LUCAS.

**Sunflower**: the *Helianthus annuus*; a coarse and tall annual plant of the family *Compositæ*. It is often seen in gardens, and is well known for its large and showy compound flowers. It is a native of the Great Plains of North America, where it grows in great abundance. In Europe the plant is raised for its seeds, which afford a good drying oil, nearly equal to that of linseed. The leaves are fed to cattle, the seeds to poultry, and the flowers yield good honey. The planting of sunflowers is reputed to be a preventive of miasmatic fevers. The pith is sometimes used instead of the true moxa. In tropical America the sunflower often attains a height of 20 feet and produces a flower of from 1 to 2 feet in diameter. In Southern Europe it is cultivated as a field-crop on account of its seed. See COMPOSITES for illustration.
Revised by CHARLES E. BESSEY.

**Sunflower Family**: another name for the COMPOSITES (*q. v.*).

**Sunga'ria**, or **Zunga'ria** (sometimes *Jungaria*): the country of the Sungars or Kalmucks; a geographical expression of no scientific value, loosely used to indicate the region that was once the center of the kingdom established early in the eighteenth century by the Sungars or Mongols of the left wing. It is a plateau of moderate elevation, bounded on the S. by an eastern extension of the T'ien-Shan or Celestial Mountains, has the Russian provinces of Semirechinsk and Semipalatinsk on the W. and N. W., and is separated on the N. E. from Kobdo in Mongolia by the Great Altai Mountains. It is intersected by minor chains which divide the region into several basins with a number of considerable lakes. It includes the valley of the Ili, and with Chinese Turkestan to the S. it forms what is called *Sin-kiang* (or -chiang), the "New Frontier" province of the Chinese empire. The population of Sungaria has been estimated at 2,000,000. Capital, Kulja.
R. L.

**Sunn Hemp**: the fiber of the *Crotalaria juncea*, a leguminous herb of Bengal, extensively cultivated in India both for its fiber and as a forage-plant for cows. The sunn hemp is exported extensively. It is inferior to true hemp, but better than jute, and is used for cables and canvas.

**Sun'nites**: all orthodox Mussulmans. They are so called as adherents of the *Sunna* or tradition, a collection of prophetic laws, which embrace (1) the remarks and counsels uttered by the Prophet; (2) his deeds and practices; and (3) his silence, it being considered that what the Prophet abstained from doing or saying fully indicates his opinion and hence the duty of his followers. The Sunnites are divided into four classes, the Hanefites, Malekites, Schafiyites, and Hannbelites. See MOHAMMEDANISM. E. A. G.

**Sunstroke, Insolation**, or **Coup de Soleil**: See THERMIC FEVER.

**Sun-worship**: commonly regarded as one of the characteristic features of the religion of ancient Persia. The Peruvians of old, who worshiped every aspect of nature, paid the chief honors to the sun. The Egyptians, the Greeks, the Italians of antiquity, and the Celtic and Teutonic races, the East Indians, and some African pagans, were, as some heathen races still are, sun-worshipers. In fact, sun-worship is one of the most widely diffused forms of nature-worship, the genial and fructifying warmth and brightness, the mysterious nature, and the constant course of the great luminary appealing powerfully to the religious feelings of the ruder peoples. See the article WORSHIP.

Revised by A. V. WILLIAMS JACKSON.

**Supereroga'tion, Works of** [*supererogation* is from Late Lat. *supereroga'tio*, deriv. of *supereroga're*, pay out in addition; Lat. *su'per*, over, above + *eroga're*, pay out, expend; *e*, out + *roga're*, ask]: in the Roman Catholic Church, good works performed by a Christian over and above his simple duty. These works, it is alleged, constitute a fund of merit which is applied to the relief of souls in purgatory. The definition is based on a distinction between what is commanded and what is only counseled—a distinction which is known only to Roman Catholic dogmatics.

**Superior**: city; port of entry; capital of Douglas co., Wis.; at the head of Lake Superior, on St. Louis, Superior, and Allouez Bays, and the Gt. North., N. Pac., Chi., St. P., Minn. and Om., St. P. and Duluth, Dul. and Winnipeg, and the Dul., S. Shore and Atl. railways; opposite Duluth, Minn. (for location, see map of Wisconsin, ref. 2–B). It has three perfect landlocked harbors, all connected, with total length of 13 miles and width of from 1 to 3 miles. The city is platted at right angles to the water front, with streets 80 feet wide, avenues 100 feet, and alleys 20 feet. The climate is crisp, dry, and healthful, with average temperature for twenty years 40°; average velocity of wind, 7 miles per hour; average number of fair days per annum, 260. The water-supply is from Lake Superior, and the sewerage system, planned when the city was laid out, is sufficient for a city of 1,500,000 people. There are 31 miles of paved streets, 89 miles of graded streets, 47 miles of sewers, 87 miles of sidewalks, 43 miles of water-mains, 15 miles of gas-mains, and 15 miles of double-track electric railway.

*Churches and Schools.*—Superior has 60 church organizations and 52 church edifices. There are 12 public schools, with 120 teachers and 7,017 pupils, 4 parochial schools, public library, and State normal school, and a business college. The public-school buildings cost $456,000.

*Finances and Banking.*—The assessed valuation in 1900 was $11,887,319; bonded debt, general, $363,598; special improvements, $745,737; school district bonds, $235,000. In 1900 there were 2 national banks with combined capital of $300,000, 3 State banks with capital of $250,000, 2 building and loan associations, local and serial, with 247 shareholders and 4,100 shares in force.

*Business Interests.*—The manufactures are chiefly flour, lumber, lath, shingles, iron, chairs, barrels, bags, coke, and woolen goods. There are 8 flour-mills, with a combined capacity of 23,000 barrels per day; 15 elevators with a storage capacity of 19,000,000 bush.; 8 coal-docks with a capacity of 6,000,000 tons, one of which is the largest in the world, with capacity of 4,000,000 tons, and one of solid steel in which all coal-handling is done in large steel tunnels beneath the ground; a bank of coking-ovens; an iron-ore dock; shipyards for the construction of steel steamers; 3 sawmills; the largest dry dock on the Great Lakes. The city has large repair-shops of the Great Northern Railway; 4 iron-working plants; windmill-factory; 2 cut-stone works; adamant-plaster factory; 2 breweries; extensive dredging plant; 3 wholesale-grocery houses; grass-twine plant, and many other industrial plants. The receipts by water are coal, oil, salt, cement, sugar, iron, and general merchandise; shipments, wheat, flour, lumber, copper ore, and wool. The port collector's official report for 1900 showed, arrivals and clearances, 3,419; tonnage, 5,139,240; coal receipts, 1,839,010 tons; grain shipped, 25,340,632 bush.; flour shipped, 3,286,888 barrels; lumber shipped, 60,288,000 feet; copper, iron ore, etc., shipped, 1,588,000 tons; and wheat in store on Jan. 1, 1901, 9,230,000 bush.

*Shipping Facilities.*—Besides those furnished by the railways, the city has exceptional facilities for receiving and shipping freight by water. The water front is divided into harbor districts, so that the city may make improvements in any one of them when needed and charge the cost to the property in the district. There are 10 miles of substantial wharfage, and the water front may be slipped so as to furnish 138 miles of wharfage. The U. S. Government has expended $1,850,000 and private parties about $600,000 in harbor improvements; and the city $3,200,000 and private corporations and parties $2,225,000 on docks.

*History.*—Superior was a station of the Hudson Bay Company, over 200 years ago; trading-post for Daniel Greysohlon du Lhut (Duluth) in 1680; and headquarters for Radisson and Grosseilliers in 1661. In 1853, when it was supposed the U. S. Congress would charter and subsidize the Northern Pac. Railroad from Lake Superior to the Pacific Ocean, and after the great land grant had been made by Congress to the State of Michigan to aid in constructing the first canal and locks around St. Mary's Falls, distinguished men preempted the land where Superior now stands for a town-site. The canal was completed and a land office and lighthouse established at Superior in 1855, and the town boomed. The Northern Pacific charter failed and the panic of 1857 paralyzed the city. In 1881 the Northern Pacific Railroad, for a gift of about half the town-site, built a branch to the water front and erected a dock. In 1883 Gen. John H. Hammond organized a company which acquired land W. of the original town-site, on St. Louis and Superior Bays, and in 1885 platted a new city. In laying out the town a right of way was provided for terminal tracks to reach every railway coming to the head of the lake, and connecting them with every dock and slip on the entire 90 miles of water front. More than 1,000 acres of land near the bay and on one side of the town, separated from all residence and business streets, was reserved exclusively for railway, switching, and storage yards. Thus every dock, mill, and wholesale house has equal facilities for receiving and shipping freight over all the railways at the head of the lake. The city comprises the parts locally known as East Superior, West Superior, South Superior, and Old Superior. Pop. (1890) 11,983; (1900) 31,091. JOHN M. MCCABE.

**Superior, Lake**: the largest of the Laurentian chain of lakes. It is also the largest fresh-water lake in the world, and the largest inland water-body except the Caspian Sea. Its area, as determined from the charts of the U. S. lake survey, is 30,829 sq. miles; another computation from the same data gave 31,200 sq. miles. The only possible rival to Lake Superior in size is Lake Victoria Nyanza, which is estimated to have an area of 27,000 sq. miles. The mean elevation of the surface of Lake Superior is 602 feet above the sea, and 20 feet above Lake Huron, into which it discharges through St. Mary's river. Its greatest measured depth is 1,008 feet; the bottom of the basin is therefore over 400 feet below sea-level. Its hydrographic basin, including the lake surface, has an area of about 85,000 sq. miles. The mean discharge through St. Mary's river is estimated at 86,000 cubic feet per second. In the deeper portions of the lake the temperature varies but little from 39° F., the temperature of water at its maximum density. Analyses have shown that the water at all depths is fresh.

The boundary between Canada and the U.S. passes through the lake, about one-third of the area of the lake belonging to the Dominion. The north shore is formed of crystalline rocks, and in places is bold and picturesque. The southern shore is mostly low and covered to a great extent with blown sand, glacial deposits, and fine, evenly laminated, pinkish clays, which were deposited from the lake during a former high-water stage, when it extended for many miles S. of its present boundaries. The rocks beneath those superficial deposits belong mainly to the Algonkian period, which includes the copper and iron bearing series, and to the Cambrian period, which includes the red sandstone, largely used for building in Marquette and other cities. The Pictured Rocks, about 100 miles W. of the outlet of the lake, are cliffs of sandstone, formed by the edges of nearly horizontal strata, and together with other bold features about the lake are remnants of an old topography which was fashioned by stream erosion and weathering previous to the Glacial period.

The land bordering Lake Superior is not well adapted for

agriculture, but rich deposits of copper and iron, and abundant forests of pine, together with fisheries and the facilities for transportation which the lake affords, have led to rapid developments. See also St. Lawrence River and Gulf.
Israel C. Russell.

**Supernatural**: See Miracles.

**Suphis** [Egypt. *Khufu*, the *Cheops* of Herodotus and the *Chemmis* of Diodorus]: name given by Manetho to the second king of the fourth Egyptian dynasty. Besides prosecuting the wars inaugurated by his predecessor, Snofru (see Soris), against the tribes of Sinai, he was engaged in gigantic building operations in Egypt. The largest pyramid at Gizeh (see Pyramids) was erected as his tomb, and three smaller pyramids near by were erected for relatives. The founding of the temple of Hathor at Dendereh is also ascribed to him. According to Manetho he reigned sixty-three years, but the Turin papyrus reduces the time to twenty-three or twenty-four years. Charles R. Gillett.

**Suppé**, soop'pā', Franz, von: opera-composer, whose baptismal name was Francesco Ezechiele Ermengildo Cavaliere Suppé Demelli; b. Apr. 18, 1820, on board ship near Spalato. He very early manifested musical talent, and at fifteen composed a mass which was sung at the Franciscan church at Zara. After study with the best masters he became conductor at the Josephstadt theater, Vienna, succeeded by other similar engagements. His first operatic work was *Sommernachtstraum*, founded on Shakspeare, in 1844. Then came a long list of operettas. In the U. S. he is best known by his *Fatinitza*, *Boccaccio*, and his overture *Poet and Peasant*. D. in Vienna, May 21, 1895.

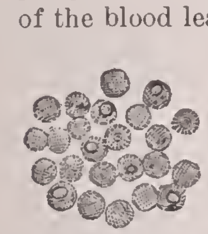
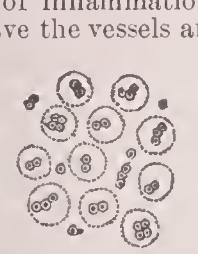
**Support of Land**: See the Appendix.

**Suppressio Veri**: See Fraud.

**Suppura'tion** [from Lat. *suppura'tio*, deriv. of *suppura're*, suppurate, form matter; *sub*, under, from under, (in compos.) up + *pus*, *pu'ris*, matter, pus]: a form of inflammation which goes on to the development of *pus* or matter. This is seen in abscesses, inflammations of the mucous membranes, and in granulating wounds. The product is a creamy yellow liquid composed of a fluid part, the *liquor puris*, and cellular elements, the *pus corpuscles*. The causes of suppuration have occasioned much study. Formerly a variety of traumatic, chemical, or other local injuries, together with certain general bodily conditions, were regarded as causes; but after the development of bacteriology attention was directed to micro-organisms as the active agents. Certain bacteria are now recognized as pus-producing or *pyogenetic*; but it is also admitted that suppuration may occur spontaneously or experimentally without the presence of bacteria. Injections of calomel, turpentine, and certain other substances, for example, are capable of exciting suppuration. In studying the process microscopically it is found that, as in other forms of inflammation, the white blood-corpuscles of the blood leave the vessels and accumulate in the tissues; at the same time a quantity of the fluid part of the blood exudes. Eventually the cellular exudate softens by degeneration, and yellowish pus results. At the same time the surrounding tissues produce a wall of young cells around the periphery of the suppurating focus, and thus an abscess with a retaining wall is formed. The older theory of the origin of pus-cells, viz., that they are altered tissue-cells, is thus seen to be abandoned. It is likely, of course, that some of the cells of a tissue are loosened and mingle with the pus, but the true pus-corpuscle itself is a white blood-corpuscle which has emerged from the blood-vessels and subsequently undergone more or less degeneration. When treated with acetic acid the protoplasm of the cells clears, and reveals a multiple nucleus, as shown in the accompanying illustration. The multinuclear character of the pus-cells is explained by the discovery that only these forms of white corpuscles have the property of readily escaping from the blood-vessels.



Pus corpuscles, as seen in healthy pus.



The same, after the addition of acetic acid.

Pus formed on the free surfaces, as in bronchitis, nasal catarrh, in granulating wounds, and the like, comes from the underlying blood-vessels, and filters through the superficial lining cells. Spreading suppuration is found in erysipelas, and certain other conditions in the submucous or subcutaneous tissues. The symptoms indicative of suppuration are those of inflammation—heat, redness, pain, and swelling; but the pain has often a peculiar throbbing character, and the swelling is found to be fluctuating or elastic. In addition, general fever of irregular type, sweats, or chills may be noted; and general infection of the blood (pyæmia and septicæmia) may occur.

The treatment of suppuration consists in abortive measures, and, these failing, in measures to promote "pointing," and in the evacuation of the abscess. Applications of cold are most useful for the first purpose; for the second heat, and especially poultices, is of value. After the development of fluctuation incision is called for. W. Pepper.

**Supremacy, Act of**: See Act.

**Sur**, or **Soor** (anc. *Tyros*): town; in the province of Syria, Asiatic Turkey; on an island in the Mediterranean, which Alexander the Great, when besieging Tyre, connected with the mainland by a broad dam. Sur has suffered very much from earthquakes, and its harbor has become so silted up as to be accessible for small vessels only. Pop. about 5,000.

**Surabaya**, soo-raa-bī'aa: town on the north coast of Java; capital of the Dutch province of Surabaya; opposite Madura, at the mouth of the Kediri (see map of East Indies, ref. 8–E). It has a good harbor, is strongly fortified, and contains barracks, magazines, hospitals, and other military establishments. It is a station on the railway from Surakarta to Probolingo, communicates regularly with Samarang, Batavia, and other places by steamboats, and carries on an important trade, exporting annually rice, coffee, cotton, sugar, tobacco, and cocoanuts. Its ship-building is also extensive. Pop. (1890) 107,878, of whom 6,523 (1894) are Europeans, the rest Javanese, Malays, and Chinese.
Revised by M. W. Harrington.

**Surakar'ta**: town of Java; capital of the Dutch residency of Surakarta; on the left bank of the Solo; connected with Samarang and Surabaya by railway (see map of East Indies, ref. 8–E). It contains a magnificent palace of the native emperor, who lives here as a pensioned rather than as a tributary prince; the Dutch fortress is opposite the emperor's palace. The trade is very large, especially in pepper, vanilla, and cacao. Pop. (1890) 91,368.

**Surat'**: town; in the presidency of Bombay, British India; on the Taptee, in lat. 21° 12′ N., lon. 72° 47′ E. (see map of S. India, ref. 2–C). It is 6 miles in circumference, and surrounded by walls surmounted by towers. It is said to have had 800,000 inhabitants at the end of the eighteenth century, but its manufactures died out, its trade is lost, and many of the Dutch, French, and Portuguese establishments are deserted. The place is most important from a military point of view. Pop. (1901) 118,364. M. W. H.

**Surette**, Thomas Whitney: See the Appendix.

**Surety**: See Guaranty and Suretyship.

**Suretyship** [viâ O. Fr. from Lat. *secu'ritas*, safety, security, (Late Lat.) security for a debt]: a term covering all cases of secondary liability of one person for the debt, default, or miscarriage of another, who is the primary obligor, whether the relationship results from express agreement or from implication. Guaranty (*q. v.*) and indorsement (see Bill of Exchange and Negotiable Instruments) are embraced by this definition. The word is used frequently in a specific sense to designate the relationship existing where the primary and secondary obligations are assumed in a single contract, as where one person signs a promissory note as maker and another adds his signature as surety. The distinction between suretyship in this sense and guaranty is stated clearly in a leading case as follows: "A contract of suretyship is a direct liability to the creditor for the act to be performed by the debtor, and a guaranty is a liability only for his ability to perform this act. From the nature of the former the undertaking is immediate and direct that the act shall be done, which if not done makes the surety responsible at once."

The creditor is under no legal obligation, as a rule, to disclose all the facts affecting the surety's risk. If, however, he makes any misrepresentation as to the subject-matter of the surety's undertaking, the latter will not be bound. The general principles governing the formation of this contract have been thus stated: "The surety is entitled to know the real nature of the transaction he guarantees and of the liability he is undertaking, and generally and naturally he looks to the creditor for information on this point, although he usually is acting at the debtor's request and as his friend, and so relies on him for collateral information as to general credit and the like. In that case the creditor's description of the transaction amounts to or is at least evidence of a representation that there is nothing further that might not naturally be expected to take place between the parties to a transaction such as described." Accordingly, it has been held that a bank can not enforce against the sureties a bond for the faithful and honest conduct of a teller who was known to the bank officers to have been dishonest unless such dishonesty was disclosed to the sureties before their execution of the bond. The failure to communicate such knowledge is declared to be fraudulent toward the sureties. Express contracts of suretyship are to be construed so as to give effect to the intention of the parties. The language is to be read in the light of the circumstances surrounding the execution of the instrument, and full effect is to be given to its meaning as thus ascertained. The surety's responsibility is not to be extended or enlarged by implication or construction, but is to be treated as *strictissimi juris*. It is also well established that any change in the contract made by the creditor and primary debtor without the surety's consent discharges the latter. Nor will the courts inquire whether the change operates to increase or diminish the surety's burden. He has a right to stand upon his own terms. An extension of the term of credit, however slight, pursuant to a binding agreement between the principals, must be assented to by the surety or he will be released.

Upon discharging his principal's obligation the surety is entitled to SUBROGATION (*q. v.*), to all the creditor's rights and securities. If there are two or more sureties either is entitled to CONTRIBUTION (*q. v.*) from the others.

FRANCIS M. BURDICK.

**Surface**: in mathematics, the locus of a point in space whose co-ordinates are connected by a single relation. It may also be generated by the movement of a straight or curved line. A surface forms the superficial configuration or boundary of a solid. It is said to be of the *n*th degree, when it is intersected by an arbitrary line in *n* points, real or imaginary. The surface of the first degree is a plane, and the surface of the second degree includes several varieties, treated under CONE, CYLINDER, HYPERBOLOID, PARABOLOID, SPHERE, and SPHEROID (*qq. v.*).

**Surf-bird**: a small wading bird (*Aphriza virgata*) of the American Pacific coasts, about 10 inches long, named from its habit of allowing the surf occasionally to dash over it as it seeks its prey on the rocky shores. Its flight is short and irregular. It is related to the oyster-catchers and the turnstones. F. A. L.

**Surf-duck**: a seacoast duck of America, the *Oidemia perspicillata*, known to gunners as the skunk-head coot. It belongs to the group called scoters in Great Britain and coots in the U. S. It is quite black, except a little patch of white on the head and another on the nape. F. A. L.

**Surgeon**, or **Surgeon-fish**: a fish of the family ACANTHURIDÆ (*q. v.*).

**Surgery** [M. Eng. *surgerie*, from O. Fr. *cirurgie* > Fr. *chirurgie* < Lat. *chirurgi'a* = Gr. χειρουργία, handicraft, skill, surgery, deriv. of χειρουργός, working by hand, handicraftsman, skilled workman, surgeon; χείρ, hand + ἔργον, work]: that branch of medical science which has for its object the treatment by manual operations of all lesions or malformations of the human body.

It is probable that in antiquity of origin surgery must take precedence of medicine, since attempts to assuage the pain or to remove the inconveniences of wounds or injuries resulting from external violence would be likely to be made before internal diseases were in any degree understood or supposed to be within the control of human means. Baron Percy has remarked that, while the internal diseases of mankind were still ascribed to the anger of the gods, and the smoke of expiatory sacrifices ascended from altars, surgeons had already become renowned by bold and salutary operations. He is inclined to attribute the origin of this art to the first occasion when some one, pierced by a foreign body, invoked the aid of a skillful comrade for its removal, remarking that in ancient times it was sufficient to extract adroitly darts or arrows, and to place on the wounded part some soothing balm, in order to be reckoned a benefactor of humanity entitled to divine honors (Homer, *Iliad*, lib. xi.). Students of Sanskrit literature, and those who have sought to decipher the inscriptions of Egyptian and Assyrian ruins, find some grounds for the belief that surgery was more advanced among those ancient peoples than is commonly supposed, pictures and *bassi-rilievi* having been found displaying surgical instruments and operations not unlike many in use in modern times. It is certain, at least, that the custom of embalming the dead, which implies some anatomical and surgical knowledge, was prevalent in very early times, and that among the Jews the operation of circumcision was practiced by divine command through many ages.

*Greek.*—The first definite traditions regarding surgery, and the first collected body of doctrine, came from the Greeks, who were, however, the pupils of the Asiatics and Egyptians, and Dujardin, in his erudite *History of Surgery*, has carefully traced the channels through which information was transmitted to a more gifted and brilliant nation. He would accept Plutarch's account, that Agenor, a Phœnician king, practiced surgery with distinction, dressing the wounded arm of a son of Priam, and devising the scarf or sling now so indispensable in many injuries of the upper extremities. Chiron, the Thessalian centaur, is more generally accredited the father of surgery in the fabulous ages of Grecian history. His reputation is eclipsed by that of Æsculapius, a son of Apollo, by some reckoned the pupil of Chiron, by others his contemporary and superior, believed to have been deified fifty years before the Trojan war, although skeptics have called his very existence in question. Jason, Theseus, and Hercules practiced surgery, and Epione, the wife of Æsculapius, as well as Medea, proved that women thus early not only shared with men the perils of war, but aided in repairing its ravages. A Thracian king, Orpheus, had such knowledge of the virtue of plants that he cured a woman bitten by a snake, whence arose the fable that he had rescued her from hell. The Greeks, prodigal in apotheosis, made many demigods partly because of their achievements in the healing art. Two sons of Æsculapius are named among the heroes of the *Iliad*. Menelaus, wounded by an arrow from Pandarus, and Philoctetes, struck by a poisoned javelin, are cured by the skillful Machaon; and Pausanias records that the Messenians, over whom he reigned, raised a temple to his honor. Podalirius, his brother, though much praised for his surgical skill in the Trojan war, has no important cures circumstantially ascribed to him, except that of the daughter of Damœtus, King of Caria, whom he bled from both arms when she was stunned by a fall, and, on her survival, married her, receiving the province of the Chersonese as a dowry. Hence the origin of phlebotomy is attributed to this surgeon. The surgical attainments of these sons of Æsculapius seem not to have extended further than the extraction of darts, the suppression of hæmorrhage by pressure or styptics, and the application of lenitive salves. Homer says that when the warriors at the Trojan siege sustained fractures of the bones, recourse was had, as when pestilence arose, to invocations to the gods.

For six centuries after the Trojan war there is little information of any advances in surgery. In common with other branches of knowledge, it was passing through that stage in which the intervention of supernatural powers is recognized rather than the scope of human possibilities. It was thus with the Asclepiadæ, or reputed descendants of Æsculapius, in the course of whose long monopoly, however, schools for the instruction in such surgical information as the professors possessed or were willing to impart were established about the temples, and those at Rhodes, Cnidos, and Cos became distinguished. Real achievements in surgery appear to have been known during this period, such as cutting for the stone and operating for cataract, although these advances were discredited by the priests, as suitable only for specialists of the baser sort.

*Hippocratic Surgery.*—It was not until Pythagoras brought the light of philosophy to bear upon the practice of the healing art that the way was paved toward raising its dignity in the direction of positive knowledge. The school that he founded at Crotona not only produced surgeons of distinction (among others, Damocedes, who, made captive by the Persians, treated Darius for a dislocated ankle and his Queen Atossa for a cancer of the breast), but also inspired the schools of Cnidos and Cos with the philosophic spirit, so that, a century later, there appeared in the latter that splendid genius Hippocrates. Born in the 80th Olympiad, about 460 years before the Christian era, this great man did much to free medicine from the absurdities with which superstition and ignorance had surrounded it, and through a long life gave a noble example of persevering industry, of philosophical research, and of lofty moral worth. His attention was more turned to medicine than to surgery, yet in the latter branch his practice was bold and decisive. He commended some operations that have only of late years been acknowledged to be legitimate surgical resources, such as tapping the chest for empyema, nephrotomy for calculus lodged in the kidney, and trephining the skull for persistent headache. He was familiar with cataplasms and venesection and cupping; with operations on ranula, nasal polypi, and ganglia; with the treatment of piles and fistulæ by ligature; with tapping in dropsies, advising even paracentesis in hydrocephalus; with all the surgical procedures known in his day except the operations for lithotomy and cataract, which seem to have been confined to specialists. He gave rules, for the most part rude and cruel, for the reduction and treatment of dislocations and fractures, and anticipated a multitude of the practices that have been vaunted by the moderns. For many generations after Hippocrates surgery made little progress. The religious prejudices that forbade the dissection of the human body precluded the acquirement of any definite knowledge of anatomy, and there was a barren interval of several centuries. Of the more immediate successors of Hippocrates, Diocles of Carystus was one of the most prominent in surgery. He devised sundry bandages, especially for wounds of the head, and improved the *beloulkon*, an instrument for extracting arrow-heads and darts, invented during the Peloponnesian war. Praxagoras of Cos is reported to have been a very bold surgeon, incising the fauces freely in cases of cynanche, and laying open the abdomen for the removal of intestinal obstructions.

*Alexandrian Period.*—The labors of Aristotle had some influence in promoting the healing art; but there was no advance of any practical importance until, on the dismemberment of the great empire of Macedonia, the chief center of learning was transferred to Alexandria, and the Egyptian school took its rise (B. C. 300). Herophilus of Chalcedon and Erasistratus were the most conspicuous leaders of the Egyptian school. The former was a pupil of Praxagoras. He was the first to direct attention to the radial pulse as an index of the varying conditions of health and disease. According to Falloppius, he held as an anatomist among the ancients the same place as Vesalius among the moderns. That he dissected human bodies is expressly asserted by Galen. Dr. Marx is satisfied that he discriminated nerves of motion from those of sensation; that he described the occipital depression now known as the torcular Herophili as the point at which the sinuses of the dura mater converge; distinguished the cerebrum from the cerebellum; and named the *calamus scriptorius* of the medulla oblongata, and the *duodenum*, and also carefully dissected the tunics of the eye and originated the term *retina*; and came near anticipating Aselli in the discovery of the lacteals, recognizing their relation with the mesenteric glands. Yet he fell into palpable mistakes, confounding the tendons and ligaments with nerves, and possibly the trachea with the aorta.

*Erasistratus*, a native of Chios, who had studied philosophy under Theophrastus, is also greatly distinguished as an anatomist, but his erroneous interpretation of the function of the arteries, overthrown by Galen, retarded the discovery of the circulation, reserved for the illustrious Harvey. Erasistratus is reported to have been a very bold surgeon, not hesitating to excise portions of the liver and of the spleen. The invention of a metallic catheter is ascribed to him. Xenophon of Cos, a pupil of Erasistratus, is said to have been among the first to restrain hæmorrhage from the limbs by tightly encircling the member with a ligature. Ammonius, surnamed *Lithotomus*, invented an instrument for crushing vesical concretions too large to be extracted through the ordinary incision—what would now be called a lithoclast—and hence is erroneously accredited with anticipating Civiale in the invention of the lithotrite, an instrument for crushing stone without a cutting operation.

*Celsus, Galen.*—From the time when the empire of the world was transferred to Rome until the reign of Augustus there appeared no surgical practitioner or writer of note until Aulus Cornelius Celsus, of whose numerous writings the eight books *De re Medica* are alone preserved. The last four books treat exclusively of surgery. He advises the amputation of limbs affected by gangrene. The method of lithotomy he describes is still regarded as of value in certain cases. He gives rules for the removal of cataract by depression, for forming an artificial pupil, and for the recognition and reduction of several varieties of hernia. The diagnosis and treatment of fractures and luxations he treats of judiciously and in detail. He is thought to have been the first to point out ruptures of the intracranial blood-vessels unattended by fracture. In the twenty-sixth chapter of his fifth book occurs the remarkable passage in which he advises that the bleeding from a wounded vessel, if it can not be otherwise restrained, shall be controlled by two ligatures, placed one above and the other below the bleeding point. He recommended the ligature also in varices and hæmorrhoids. It would be an endless labor, however, to particularize. Not only the value of his subject-matter, but the purity and elegance of his style, have made the work of Celsus classical and immortal. Aretæus of Cappadocia practiced in Rome in the latter part of the first century. His instructions on catheterism and on lithotomy are interesting; he opened hepatic abscesses and used the trephine for the cure of epilepsy. Heliodorus, the medical adviser of Trajan, was the author of some good observations on injuries of the head. Rufus of Ephesus is said to have been the first to tie successfully an artery for an aneurism at the bend of the elbow caused by venesection. He left a treatise on diseases of the bladder. No great surgical writer appeared from the time of Celsus to that of GALEN (*q. v.*), toward the close of the second century. He was a surgeon at Pergamus (A. D. 165), and afterward practiced his profession at Rome.

*Antyllus, Alexander of Tralles.*—After Galen, in the third century came Antyllus, who was a bold and successful surgeon. He recommended extraction for hard cataract, but cautiously, advising the operation only when the cataract was small. He also suggested arteriotomy in place of venesection in some cases, arguing that there was not risk of excessive bleeding, since the hæmorrhage might be controlled by cutting the vessel completely across. His name is associated with an operation for aneurism, revived by Syme of Edinburgh, and still occasionally employed, especially in cases of traumatic origin. Oribasius (326–403 A. D.) was the author of a valuable compilation of surgical knowledge, and alluded to the partial or bent fracture of the long bones of children (green-stick fracture)—an observation for which Malgaigne accredits Lanfranc, a surgeon of the thirteenth century. Aëtius (550 A. D.) was the first Greek medical man of prominence to embrace Christianity, and the bias of his religious ideas is clearly indicated in his writings. Alexander of Tralles (570 A. D.) appears to have been an independent thinker, and at the close of a long and useful career wrote from his own experience with such sound judgment that his work in twelve books is a valuable relic.

*Paulus Ægineta*, who was a professor at Alexandria about the time (640 A. D.) of its final subjugation by the Saracens, wrote a compendium of the healing art which is even more circumstantial than that of Celsus. The excellent translation by Adams, published by the Sydenham Society, has made the work familiar to English-speaking surgeons. In lithotomy he advised, after exploring by the rectum, an incision to the left of the raphe, or the modern lateral operation, instead of the median incision of Celsus. He discriminated aneurism by anastomosis, and performed ablation of the mamma, laryngotomy, and herniotomy in strangulation. He first treated of fractures of the patella. He was pre-eminent as an accoucheur, and is reputed to have devised the procedure of embryotomy. He was surnamed *Obstetricus*. He was the last of the Alexandrian school of any note.

*Arabian Surgery.*—In the seventh century, contemporaneously with the vast achievements and conquests of the followers of Mohammed, learning was gradually communicated to the Arabians, and for the next five centuries anything noteworthy in surgery must be looked for in this direction. Rhazes (852–932 A. D.) practiced and taught at Bagdad at the close of the ninth and beginning of the tenth century. He was the first to describe spina bifida. He cauterized the bites of rabid animals. He gave a better account of hernia than his predecessors. He seems to have had little confidence in ophthalmic surgery, for when he was old he had cataract, but could not be induced to submit to an operation. Haly Abbas lived at the end of the tenth century, and was a voluminous writer. In tapping for ascites he preferred to puncture in the linea alba, and he used caustics for the cure of hydrocele. Avicenna (980–1037 A. D.), educated in the schools of Bagdad, acquired an extraordinary distinction, but the most important to surgery among the Arabian celebrities is Albucasis (1110 A. D.). The edition of his *Chirurgia*, by Channing of Oxford, is still consulted, and contains the most complete view there is of the knowledge of surgery that then existed. He seems to have abused the actual cautery, and enthusiastically extols the surgical virtues of fire. He employed the cautery to suppress hæmorrhage, and styptics likewise, but also complete division of the vessel, and even the ligature. He was the first, apparently, to remark the occlusion of a divided artery by a coagulum. He practiced enterorrhaphy, and invented a probang for dislodging foreign bodies from the gullet, and an instrument for operating in lachrymal fistula. These and various other instruments he figures in his writings. After Albucasis arose two notabilities of the Saracenic school who were natives of Spain, yet wrote in the Arabic language. Avenzohar (1162 A. D.), a Jew, practiced at Seville in Andalusia, and his compendium entitled *Thaissyr*, though mainly a compilation, contains some original matter. He describes abscess of the mediastinum, and a case of suppuration of the kidney with discharge of 14 pints of pus. He treats judiciously of fracture involving the hip-joint, and of wounds of the blood-vessels. His pupil, Averroës (1198 A. D.), a native of Cordova, achieved a great reputation. A manuscript of 336 quarto pages, by an unknown author, was discovered in 1863 in the library of the University of Madrid, which gives an extended view of the Arabic treatment of wounds, including shot wounds by missiles of iron and stone. In a prize essay by Dr. Don Antonio, entitled *Memoria sobre el Origen y Vicisitudes de la Terapéutica que han usado los Cirujanos españoles en las Heridas de Arma de Fuego* (Madrid, 1863), it is claimed that the nature and treatment of shot wounds are judiciously discussed in this parchment, and that it dates from the closing part of the fourteenth century, or shortly after the introduction of gunpowder in warfare. Should the date and authenticity of this manuscript be established, it would be the earliest treatise on shot injuries extant. Neither Arnold of Villanova nor Guy of Chauliac mentions these injuries, and priority in adverting to them has commonly been ascribed to the German surgeon Heinrich von Pfolsprundt (1460 A. D.), whose manuscript, *Buch der Wundt-Artzney*, was printed in 1868 by Haeser and Middeldorpf.

*Mediæval.*—For several centuries there is among the successors of the Greeks and Romans no name in surgery to arrest attention by association with improvements either in theory or practice. The only attempts worthy of notice are in connection with the schools established at Salerno and Monte Casino, which maintained their prestige until the thirteenth century, when they were eclipsed by the rising reputation of the schools of Bologna and Paris. Most of the Italian surgeons of the thirteenth century whose names have left any trace in the history of the art appear to have derived their knowledge from one or the other of these schools. The first of these in date is Rogerius of Parma (about 1206). His *Chirurgia Magna* was long a text-book in Italy. He practiced enterorrhaphy, even in cases of complete division of the intestine, attempting to unite the divided surfaces by direct apposition over a cylinder of elder-wood. His disciple, Roland Capelluti, professed surgery at Bologna (1264), and composed a voluminous commentary on the work of his preceptor—whom he far surpasses in erudition—citing the Greek classics as well as the works of the Arabians. In a case of hernia of the lung he excised the protruding part, and the patient survived. Another disciple of Rogerius was Jamerius, who is described by Guy of Chauliac as a brutal and eccentric surgeon, but is placed by Peter of Argelata among celebrated operators of his time. Great obscurity envelops the history, and even the names, of the Four Masters, to whom are ascribed some important improvements in surgery, especially a method of suture of wounded intestines which still holds a place in the art. According to Devaux, they were four monks living at Paris in the time of Lanfranc (at the close of the thirteenth century), devoting themselves to good works. According to others, they were four teachers of surgery, who professed in four languages—Magister Salernus in Latin, M. Pontus in Greek, M. Abdallah in Arabic, and Rabbi Elimus in Hebrew. Weber and others believe that Rogerius, Jamerius, Theodoric, and William of Salicet are the four teachers referred to under the designation of the Four Masters. The little evidence extant gives most plausibility to the first of these conjectures. Manuscript copies of their voluminous work on surgery existed in the seventeenth century at Avignon and at Paris, and some fragments are said to be still preserved in the Bodleian Library at Oxford; but the work was never printed, and the opinions of these skillful masters are known only through citations in the works of their contemporaries. Hugo of Lucca (d. 1252) is regarded as the founder of the Bolognese school. He reduced a luxation at the hip of a year's standing in a man of twenty-five, and used alcoholic lotions largely as topical applications to wounds. After Hugo came Brunus of Longobucço, a professor at Padua (1262). He composed a *Chirurgia Magna*, and approved of dry dressings to wounds. Theodoric of Cervia, a pupil—and, according to Tiraboschi, a son—of Hugo of Lucca, expounded the views of his predecessors. He is accredited with having substituted soft and simple bandages and splints in fractures for the cruel appliances in vogue in his day. According to Guy of Chauliac, the Italian surgeons of this period may be classified in two schools. One, with Rogerius, Rolandus, Jamerius, and the Four Masters as its exponents, treated all wounds and ulcers by emollient fomentations and cataplasms; the other, in which Hugo, Brunus, and Theodoric were conspicuous, employed dry dressings or desiccating lotions. William of Salicet (b. at Piacenza in 1210) practiced in armies and at Cremona, Pavia, and Verona, and finally went to Bologna, and there (June 8, 1275) completed his work on surgery. He is the first Italian surgeon who treats at any length of the surgical affections of women. Gilbertus Anglicanus (1290) appears to be the first English writer on surgery. In 1271 Pitard founded the College of St. Côme at Paris, which was the origin of the Academy of Surgery that became so famous in later years. Pitard was a man of eminence in his day, and his observations on wounds of the head and on poisoned wounds are still remembered. Lanfranc, a Milanese and a pupil of William of Salicet, is generally regarded as the creator of surgery in France. He was the first to speak of the healing of wounds by "first intention." At this time flourished Master Jehan Ypermann (1295–1350), lately styled the father of Flemish surgery, whose manuscript treatise on the art was discovered and published as late as 1854 by the medical Society of Ghent. During the fourteenth century surgical science was dead in Italy. Rienzi states that Bartolomeo de Varignana dissected human bodies in 1290. Mondini de Lucci also publicly dissected at Bologna the cadavers of two women, braving the prejudices of his time, and published an anatomical work illustrated by wood engravings (1325).

*Fourteenth and Fifteenth Centuries.*—Early in the fourteenth century John of Gaddesden, after studying at Montpellier, practiced surgery with success at Oxford, and composed his *Rosa Anglica*. John of Ardern flourished in Newark about 1350, and subsequently removed to London. He compiled voluminously, but a treatise on *fistula in ano*, published in 1588 by John Reed, is the only one of his writings that was printed. Guy of Chauliac practiced in Avignon in the middle of the fourteenth century with renown. In his writings is found the first mention of the Cæsarean operation. Guy is esteemed a bolder surgeon than Lanfranc. Ackerman declares that his *Grande Chirurgie* embraces all of value written on surgery up to its epoch. Pre-eminence in surgical knowledge seems to have passed from Salernum to Bologna, and thence to Montpellier. The latter school, fostered by the neighboring papal court at Avignon, was enriched by manuscripts from both Spain and Italy. Guy described the use of weight-extension in fractures of the lower extremity (now commonly known as the "American method"), and treated indolent ulcers by binding on them a leaden plate. In the latter part of the fourteenth century the school of Montpellier rapidly declined. Both Italy and France were desolated by contending factions; the library of Guy was scattered. Balescon of Taranta, a Portuguese professor who succeeded to the chair of surgery, laments the loss of the works of Paulus, Rufus, and others. Balescon (or Valescus, as his name is sometimes Latinized) is said to have first advised the employment of mercurial ointment for the removal of lice and other parasitic vermin. Leonardo Bertapaglia (1429) is said to have practiced human dissections, and to have brought a certain luster upon the chair of surgery at Padua. He wrote on ulcers and wounds, and enumerates twenty-two kinds of punctured wounds by darts and arrows. He seems to have first described the tenaculum. Among other Italian surgeons who in some measure aided in the progress of surgery may be mentioned Guainerius, professor at Pavia, who wrote on diseases of the joints; his successor, Matthew of Gradi; and Bartolomeo Montagnana (1441), professor at Padua, who wrote on hernia, and first distinguished that variety of ventral hernia that protrudes through the linea alba. Arculanus also (1427) taught with credit at Verona and Ferrara, and devised several kinds of trusses and an instrument for extracting foreign bodies from the ear. He ligated the spermatic vein in varicocele, and wrote judiciously of ectropion. Marcellus Cumanus was a surgeon in the Venetian army in 1495 at the invasion of Charles VIII., and treated harquebuse wounds with boiling oil, regarding them as poisonous. Antonio Benivieni, a Florentine nobleman (1460), is probably the first writer treating systematically of morbid anatomy. He dissected two cases of coxalgia, an affection which J. L. Petit is sometimes supposed to have first described. Heinrich von Pfolsprundt, after participating in the great war in Poland in 1454, wrote his *Buch der Wundt-Artzney*, containing an early observation on shot wounds. He describes a rhinoplastic operation, anticipating Tagliacozzi by a century. In 1480 Colot, a French surgeon in favor with Louis XI. of France, performed lithotomy successfully on a condemned criminal; and this operation, previously abandoned to itinerant quacks, became a part of the legitimate practice of surgery. PARACELSUS (*q. v.*), noted in his time both as practitioner and author, was the introducer of many reforms.

*Sixteenth Century.*—With the revival of letters and of the natural sciences in the sixteenth century a new era dawned on surgery. Investigation of anatomy in the true spirit was undertaken by Vesalius (1513–64). Falloppius (1532–62) and Eustachius (1520–79) worthily succeeded this founder of modern anatomy. Fabricius of Acquapendente (1537–1619), a pupil of Falloppius, was the teacher of William Harvey (1578–1675), the immortal discoverer of the circulation of the blood. Gasparo Aselli (1581–1626) followed with the discovery of the lymphatic vessels. The way was thus paved for advances in surgery, which, illuminated by science, became a worthy pursuit for men of talent and education.

*Paré.*—Preceded by John di Vigo (1520), who still believed shot wounds poisonous, and by the Swiss surgeons Hans von Gersdorf (1520) and Felix Würtz (1576), who have left original observations of value, the latter being reputed the first surgeon who ventured to amputate in the thigh, appears Ambrose Paré, the founder of the modern French school, and reckoned the ablest of early army surgeons. If not the inventor, he was the restorer of the art of securing arteries by ligature after amputation—an advance which alone sufficed to secure for him immortality. Though originally a barber-surgeon, he became the counselor of four kings of France, and acquired such esteem that "his mere presence in a besieged town was enough to reanimate the garrison." His complete works were collected and published by his pupil, Guillemeau, in 1582, and have passed through many editions in many languages. Pigrai of Cremona succeeded Paré in his high dignities, and received great praise from his contemporaries. Morwitz accredits him with instituting ambulance-wagons, an advance in medico-military administration usually ascribed to Larrey in the nineteenth century. Guillemeau, besides editing Paré, distinguished himself in operative midwifery. In Italy at this period appeared several treatises on shot wounds. Maggius wrote *De Vulnerum Bombardorum et Sclopetorum Curatione* at Bologna in 1552. The work of Leonardo Botal on the cure of shot wounds (Lyons, 1560) is, after the writings of Paré, the most valued of the treatises on shot wounds of this period. Carcanus, of Milan (1573), and Berengarius, of Carpi (1550), published original but little-known treatises on injuries of the head. Marianus Sanctus, of Barletta, near Naples (1550), suggested improvements in lithotomy, and Tagliacozzi published in 1597 at Venice his treatise on plastic operations. The English surgeons of this period are not conspicuous. Thomas Gale, who served in 1544 with the army of Henry VIII. at Montreuil, published (1563) the *Institution of a Chirurgeon* and a treatise on gunshot wounds, which had the merit of denying the poisonous nature of such injuries. J. Hall (1561) also treated of shot wounds. John Woodall, who served in France in 1589, and was afterward surgeon-general of the East India Company's forces, published a *Military and Domestic Surgery.* William Clowes, a naval surgeon, wrote (1591) a *Proved Practice in Burnings by Gunpowder.* Peter Lowe, who served in France and Flanders, printed (1597) an *Army Surgery* that went through several editions. The work of Duchesne (*alias* Quercetanus) on shot wounds (1576) was translated into English. In Germany J. Schenckius, professor at Freiburg (1531–98), compiled a voluminous work of rare surgical cases, which remains a mine of interesting information.

*Seventeenth Century.*—In the seventeenth century the impulse given to the sciences by the diffusion of learning led to further improvements. Cæsar Magatus, professor at Ferrara, simplified the treatment of wounds. His work (*De Rara Medicatione Vulnerum*, Venice, 1616) is still consulted with advantage. Fabricius Hildanus, of Berne (1560–1634), by some styled the father of German surgery, was a man of great acquirements, but clung to old prejudices and amputated with red-hot knives. Richard Wiseman, surgeon to Charles II., has often been styled the true father of English surgery, but his *Severall Chirurgical Treatises* (1676) really contain no positive addition to the knowledge of the time. John Brown, another chirurgeon in ordinary to Charles II., a naval surgeon, published a *Discourse on Wounds, general and particular*, and a *Treatise of Gunshot Wounds*, in London in 1678—a work deduced from his practice in the navy in the Dutch war of 1665, in which he was severely wounded. Holland, restored to liberty in this century, furnished several good surgeons who promoted their art. Johann J. Rau, of Leyden, was probably the most successful lithotomist on record. Palfyn (1649–1730) was distinguished for devising a new plan for intestinal sutures. Roonhuysen (1663), by his operations for wry neck, may be regarded as the inventor of tenotomy. Peter Verduin, of Amsterdam, proposed (1693) an important modification in the flap method of amputating the leg. In France the tourniquet was first used in amputations by Morel at the siege of Besançon (1674). Frère Jacques improved the manual procedure of lithotomy, while Belloste (1696) deserves credit for denouncing the abuse of tents and complicated dressings then in vogue.

*Eighteenth Century.—France.*—In the eighteenth century we find great advances in surgery, and the French surgeons in the front rank. Jean Louis Petit (1674–1768) occupies a proud prominence among the early educated writers on the art. His treatise on diseases of the bones is classic; his work on general surgery is still consulted with profit. He devised the screw tourniquet, esteemed for a century an essential appliance in amputations. Le Dran (1685–1773), with less genius, was an original and excellent author. His copious writings abound in practical wisdom. Pierre J. Desault (1744–95) is one of the great names in surgery. He was the first who taught, systematically, surgical anatomy. His improvements in the treatment of fractures are illustrated in the everyday practice of the present time. He substituted straight amputating knives for the formidable sickle-shaped weapons previously employed. He improved the procedure for ligating arteries, and proposed the plan for the cure of aneurisms by distal ligature that bears the name of "Brasdor's method." Dominic Anel, of Toulouse (1678–1725), secured a permanent niche in the annals of surgery by first proposing the proximal ligature of the main trunk in aneurism. The institution of the Royal Academy of Surgery in Paris (1731) had great influence on the advancement of surgery not only in France, but throughout the world. Its *Mémoires*, composed of contributions from the most eminent men, constitute a rich mine of information which has been diligently worked by modern compilers, for the most part with scanty acknowledgment. Hévin may be regarded as the leading authority on wounds of the abdomen. Daviel, the oculist, Belloc, well known by his canula, Le Cat, the lithotomist, and Moreau, the founder of the practice of excision or resection of joints, are conspicuous among the specialists. Besides these academicians there were many French writers who hold an honorable place in surgical literature. Baron Percy, whose invaluable manual for the army surgeon was published in 1792, may be esteemed the foremost military surgeon between Paré and Larrey. The name of Xavier Bichat (1771–1802) closes this era in French surgery. This illustrious founder of general anatomy, the great genius who accomplished so much in his short space of life, commenced his career as a surgeon, and his earlier works are annotated editions of the teachings of his great preceptor, Desault.

*Great Britain.*—In Great Britain surgery attained great eminence in this century. William Cheselden (1668–1752), Samuel Sharpe (1700–65), Percival Pott (1713–88), W. Bromfeild (1712–92), Benjamin Bell (1749–1806), and the brilliant John Bell (1763–1820), all secured a permanent place in the literature of surgery, while the illustrious John Hunter (1728–93), a philosopher as well as an anatomist and surgeon, is justly ranked with the greatest minds that have graced the profession. Monro (1697–1767) is indissolubly associated with the birth and fame of the Edinburgh school. C. White, of Manchester (1770), rivaled the achievements of the Moreaus in France in excising the larger joints.

*Continent of Europe.*—In Italy, Scarpa (1747–1832), by his researches on hernia and aneurism, attained a high reputation. In Spain the name of Gimbernat is eminent.

Hendrik Callisen (1740–1824) was the most prominent surgeon of Denmark of his time. In Germany, Heister (1683–1758) wrote a system of surgery that was translated into many languages, and still enjoys a certain repute; and the encyclopædic Albert von Haller (1708–77) was Professor of Surgery at Göttingen.

*United States.*—Dr. William Shippen, of Philadelphia, in 1763 first delivered lectures on anatomy and surgery, and the first medical school in America (the University of Pennsylvania) was founded by Dr. Morgan in 1765. Dr. John Warren (1753–1815), Professor of Surgery in Harvard College, and James Tilton (1745–1822), a surgeon of the Revolutionary war and afterward surgeon-general of the army, were likewise eminent.

*Nineteenth Century.—Europe.*—At the beginning of the nineteenth century French surgeons were still in the foreground. Jean Dominique Larrey (1776–1842), the friend of Napoleon I., was an almost undisputed authority in military surgery in his time. Boyer (1757–1833) prepared a systematic treatise on surgery that was long a standard text-book. Delpech (1776–1832) taught surgery at Montpellier with nearly equal reputation. Dupuytren (1777–1835) may be regarded almost as the founder of a school. Many of the great French surgeons of the middle of the century were his pupils—Velpeau (1795–1867), Malgaigne (1806–65), Jobert (1799–1868), Vidal (1803–56), Nélaton (1807–73), and Goyrand of Aix; Roux (1780–1854) was Dupuytren's contemporary and rival. It would be endless to enumerate the eminent surgeons of the time. Lisfranc (1788–1847) acquired an unrivaled distinction in operative surgery. Cloquet (1790–1855) was renowned as a clinical teacher. Civiale (1794–1867) originated and Leroy (1798–1861) improved lithotrity. Bonnet of Lyons (1809–58) was among the first to treat in a scientific manner of diseases of the joints. Follin (1823–67), Guérin, and Sédillot, also were distinguished. In Germany the advance of surgery, if not as brilliant, was relatively as decided. Kern, of Vienna (1760–1829), Rust, of Berlin (1775–1840), von Walther, of Munich (1782–1842), Graefe, of Berlin (1787–1840), Konrad J. M. Langenbeck, of Göttingen (1776–1850), Dieffenbach, of Berlin (1795–1847), C. von Textor, of Würzburg (1782–1860), all aided the progress of surgery by their writings, and several of them made important improvements in the art. At the beginning of the century the Vienna school in ophthalmology was pre-eminent. G. J. Beer (1762–1821) was perhaps its most distinguished representative. The name of Albrecht von Graefe, of Berlin (1828–70), is indissolubly associated with the modern methods of treating glaucoma and cataract. The great illustrator of military surgery in Germany, the illustrious Louis Stromeyer (1804–76), the worthy successor of Paré and Larrey, was one of the founders of modern conservative surgery in cases of injury. Volkmann (1801–77) and Nussbaum (1829–90) stand high in the annals of German surgery. In Belgium, Seutin devised the method of treating fractures by starch bandages, which has led the way to the plaster treatment of the present time. In Italy, Assalini (1765–1840) and Porta acquired distinction. In Great Britain a succession of surgeons of the first merit rivaled their French contemporaries. The London school points with pride to Cline (1750–1827), to Abernethy (1764–1831), to Sir Astley Cooper (1768–1841), to Wardrop, Earle, Stanley, Travers, Hodgson, Lawrence, and Aston Key; to Sir Charles Bell; to the ophthalmic surgeons Tyrrell, Saunders, and Dalrymple; and to the illustrious Sir Benjamin C. Brodie (1783–1862). In Ireland, Colles, Carmichael, Jacob, Bellingham, and Tufnell are known by original researches, and Cusack, Crampton, R. W. Smith, and Maurice Collis earned high reputations. Scotland may boast of Liston, of Miller, of Syme, of Spence, and of Sir J. Y. Simpson, the obstetrician who recommended acupressure as a substitute for the ligature, and introduced chloroform as an anæsthetic. The annals of British surgery in the century are further advanced by two names that will always be remembered in the front rank of military surgeons—John Hennen (1770–1829) and G. J. Guthrie (1785–1856). Worthy contemporaries of Larrey, their works will ever be read with reverence by students of army surgery. The names of Fergusson, Callender, Savory, and many others, now deceased, add luster to the annals of British surgery, while Paget, Erichsen, Henry Thompson, Spencer Wells, Hutchinson, Holmes, Lister, and many more worthily sustain the reputation of their predecessors.

*United States.*—In the U. S. in the nineteenth century great advances have been made in practical surgery. A pupil of John Hunter, Philip Syng Physick (1768–1837), is often styled the father of American surgery. He left no work to record his vast experience, but his views were to some extent recorded by his nephew, John S. Dorsey (1783–1818), the author of the first systematic treatise on surgery published in America. John Collins Warren, of Boston (1778–1856), wrote a treatise on tumors, and was the first to perform (Oct. 16, 1846) an operation of importance on a patient anæsthetized by ether. Valentine Mott (1785–1865) acquired an immense fame by his daring operations on the arteries. According to Prof. Gross, "no surgeon, living or dead, ever tied so many vessels, or so successfully, for the cure of aneurism, the relief of injury, or the arrest of morbid growths." Benjamin Winslow Dudley (1785–1870), of Kentucky, had marvelous success as a lithotomist, and was noted for his dexterity in bandaging. Ephraim McDowell (1771–1830), of Kentucky, first performed ovariotomy (1809). William Gibson (1788–1868), of Philadelphia, was the first to tie the common iliac artery and to successfully perform the Cæsarean operation twice on the same subject. Nathan Smith (1762–1828), of New Haven, was a bold surgeon of indomitable industry and great versatility. Thomas D. Mütter (1811–59) was noted for his skill in the treatment of deformities. He bequeathed a valuable surgical museum to the Philadelphia College of Physicians, with a liberal endowment fund. George Hayward, of Boston (1791–1863), J. Rhea Barton (1796–1871) and George W. Norris (1808–75), of Philadelphia, and J. Mason Warren (1811–67), of Boston, were able hospital surgeons, whose contributions to the literature of the art are of permanent value. Other eminent names are those of Gross, Pancoast, and Agnew, of Philadelphia; of Van Buren, Hamilton, and Post, of New York; of Nathan R. Smith, of Baltimore, Eve, of Nashville, Hodgen, of St. Louis, and Bigelow, of Boston.

*Advances in the Art.*—The boundaries of nationality seem to be vanishing from the domain of surgery. With marvelously increased facilities of intercommunication, all advances are speedily known throughout the civilized world. At no former period, assuredly, was there greater scientific activity. One result of the emulative ardor with which surgery has been latterly cultivated is the prevalent tendency to pursue special branches of the art. Ophthalmology, invoking the aid of physical science, has been revolutionized, and in many other directions light has been thrown upon branches of surgery until lately enveloped in the deepest obscurity. The discoveries and improvements in surgery in the nineteenth century are not inferior to those of any preceding age. The practical use of anæsthetics, introduced in the shape of ether-inhalation by Morton in 1846, and by the use of chloroform by Simpson in 1847, constitutes an epoch-making advance in the art, while the employment of cocaine for securing local anæsthesia is a discovery of real though minor importance. The introduction of ovariotomy (1809) by McDowell, of lithotrity (1822) by Civiale, and of litholapaxy (1878) by Bigelow, are improvements of the first order. The extensions of reparative surgery to the relief of cleft palate, vesico-vaginal fistula, and a great variety of deformities, have been of much value. The employment of metallic sutures and ligatures (Levert, 1829), of immovable apparatus in the treatment of fractures (Seutin, 1842) and spinal affections (Sayre, 1877), and of manipulation in the reduction of luxations (W. W. Reid, 1855), are most important innovations. The bloodless method of Esmarch (1873) and the antiseptic method of Lister (1869) are of far-reaching application. The great advances made in the treatment of diseases of the joints, of blood-vessels and nerves, of the brain and spinal cord, eye, ear, larynx, thoracic and abdominal viscera, urethra, and rectum, and of outgrowths and tumors, are most creditable.

It would be impossible within the limits of this article even to enumerate, still less to describe, the many triumphs of the surgical art which have been won during the latter half of the nineteenth century, but a few of them may be briefly referred to. Beginning with the external integument, the introduction of *skin-grafting* has rendered it possible by the transplantation of small portions of cuticle, taken from the patient himself or borrowed from other individuals, to secure the healing of large ulcerated surfaces after burns or other injuries, which formerly would have been abandoned as totally incurable. The dread which the older surgeons felt in dealing with *nerves* has been replaced by a boldness which enables the modern operator to sew or splice nerves which have been accidently severed, thus restoring function and preventing loss of power, and on the other hand to relieve intractable neuralgia by nerve-stretching or nerve-section; and for this purpose surgeons have not hesitated to open the skull or vertebral column, so as to attack the diseased nerve directly at its origin from the base of the brain or spinal cord. Operations on the *blood-vessels* have become so much safer since the general adoption of aseptic methods that the surgeon now ties without fear the largest veins when they are accidentally wounded, thus preventing death from hæmorrhage, while the lessened risk attending the ligation of large arteries enables him to attack internal aneurisms which a few years since were not thought amenable to surgical interference. Aneurisms of the thoracic aorta and innominate artery are successfuly treated by simultaneous ligation of their principal branches; a subclavian aneurism has been successfully dissected out and removed bodily, as if it had been a solid tumor; and even abdominal aneurisms have been cured by firm pressure continued for many hours while the patient was kept in a state of anæsthesia, and in at least one instance by abdominal section and the introduction into the aneurismal sac of a coil of silver wire.

*Diseases of the Joints.*—In the treatment of these affections surgery has made marvelous progress. It is no longer thought needful, unless in exceptional cases, to amputate the thigh for scrofulous or tuberculous disease of the knee (white swelling); but the surgeon cuts out the offending articulation, preserving a useful limb, or in milder cases simply opens the joint and scrapes out the diseased tissue, or even effects a cure by the injection of iodoform and glycerin. Hip disease is no longer the opprobrium of surgery which it was; it is often curable in its milder forms by fixation and extension, followed by the use of judiciously planned orthopædic apparatus, and in its worst forms, osteotomy, or even excision, is successfully resorted to, and the patient is often restored to the duties of an active life with a limb somewhat shortened, but strong and enduring. Orthopædic surgeons deal with the distressing deformities due to rickets with a boldness which a few years since would have been thought almost criminally reckless. Knock-knees and bowlegs are straightened by cutting across the deformed bones with an osteotome or chisel, and the limbs are encased in plaster-of-Paris bandages with confidence that they will quickly and surely regain their firmness in their improved position. Relapsing or inveterate club-foot is successfully treated by boldly cutting through and separating all the contracted tissues, or even by cutting out the malshaped bones, thus making the foot both symmetrical and useful. Ununited fracture and false joint, after an arm or a leg is broken, are no longer dreaded as they were by our ancestors; the surgeon cuts boldly down upon the seat of injury, drills the bones, and joins them with a thick silver wire, or secures them with a silver splint directly applied to the fragments themselves and held in place by screws, and then closes the wound with the expectation that it will heal soundly over the inserted metal, which will supply the needed firmness to the broken bone and remain indefinitely, quietly buried in the surrounding tissues.

Surgery can no longer be considered as an equivalent term for external medicine, for the modern surgeon opens without hesitation all the great cavities of the body, explores with sight and touch the condition of the internal organs, and subjects them to such operative measures as may seem indicated. The *skull* is opened to permit the arrest of intracranial bleeding, the evacuation of intracranial abscesses, and the removal from the brain of tumors the exact site of which has been determined beforehand by the rules of cerebral localization. The *thorax* is cut into for the relief of empyema, or even morbid conditions of the lung itself, and after evacuation of the pleural contents reaccumulation is prevented by securing free drainage, cutting away, if necessary, considerable portions of the ribs in order to permit contraction and healing.

*Abdominal surgery* has perhaps made more striking progress than any other department of the art; hardly any organ of the abdominal cavity but is subjected to exploration, and, in cases otherwise incurable, to complete or partial extirpation. The surgeon cuts into a kidney, removes stones from its interior, stitches it into its proper place when it is dislocated, and when hopelessly disorganized removes it entirely from the body. The spleen is excised, as is the pancreas; wounds of the liver are sewed up or plugged to prevent hæmorrhage; stones are removed from the gall-bladder, or the latter is itself removed, or, if occlusion of the duct prevents the natural escape of bile into the intestine, an artificial passage is established into a neighboring portion of the bowel. Wounds of the stomach and bowel are closed by sutures, malignant tumors of these organs are boldly cut away, and the continuity of the alimentary canal is reestablished, sometimes after the removal of many inches or even several feet of intestine. Suppurative inflammation of the appendix vermiformis is now known to be the condition present in many of the cases formerly known as typhlitis, and is successfully dealt with by prompt excision of the diseased organ.

The triumphs of special surgery—ophthalmic, aural, laryngeal, vesico-urethral, and gynæcological—are no less brilliant than those which have been enumerated. The great success which attends surgical operations at present is to be attributed to a combination of causes, of which the discovery of anæsthesia and the introduction of aseptic and antiseptic methods of wound-treatment are the most prominent; but great importance is to be attached also to the general diffusion among practitioners of surgery of sound physiological, pathological, and therapeutic knowledge, thus enabling the surgeon not only to operate with facility and protect the wound from injury, but also judiciously to treat the patient after the operation and thus promote speedy and permanent recovery. See DENTISTRY, ORTHOPÆDIC SURGERY, etc. Revised by JOHN ASHHURST, Jr.

**Su′ricate** [from the Dutch (S. African) name. Cf. Fr. *surikate*], or **Zenick** [Anglicized form of native (S. African) name]: a carnivorous viverrid mammal of South Africa, the *Suricata zenik* or *S. tetradactyla.* It is about 12 inches long, with a tail a little more than half that length, and closely resembling the ichneumon; of a grayish-brown color, tinged with yellow, and with faint darker bands across the back. Its habits are nocturnal, it dwells in burrows, and is often domesticated, being very useful as a destroyer of vermin.

**Surinam′**: See GUIANA (*Dutch*).

**Surmullet**: See MULLET.

**Surname**: See NAME.

**Surplice** [from O. Fr. *surplis, surpeliz* < Late Lat. *superpellicium*; *super*, over + *pelli′cium*, a fur garment, pelisse]: a clerical garment worn in churches by priests and all clerics, and even by acolytes and choir-boys. It is considered to be a shortened style or a modification of the alb, and dates back to the twelfth century. It is worn by clergymen of the Church of England during the celebration of service, and at the performance of all ecclesiastical offices, as also by clergymen of the Danish, Norwegian, and Swedish churches, but by them only during the celebration of the Lord's Supper. The use of the surplice, however, was strongly objected to by the Calvinistic and Zwinglian Reformers on the Continent and by the Puritans in England, who regarded this vestment as a relic of popery and made it the subject of vehement denunciations. Both in the Church of England and in the Protestant Episcopal Church in the U. S. its use has become general, and all connection in the popular mind of the surplice with Romanizing tendencies has passed away. Revised by W. S. PERRY.

**Surrey**: inland county of England, bordering N. on the Thames, which separates it from Middlesex; area, 758 sq. miles. It is intersected from E. to W. by a range of low hills (its highest point, Botley Hill, being 880 feet), which slopes gently northward to the Thames, while to the S. the ground is more elevated and broken. In the northern part the soil is very fertile; in the southern it consists mostly of clay, chalk, and iron-sand; in the whole western part the land is heath. Wheat, hops, and vegetables are raised; hogs and poultry are extensively reared. Near London manufacturing industry is carried on. The county contains much wood, and the beauty of the scenery and the facility of communication with London have attracted many residents to Surrey, which is consequently studded with mansions and villas. Pop. (1901) 519,522.

**Surrey**, HENRY HOWARD, Earl of: soldier and poet; b. about 1516; was the eldest son of Thomas Howard, Duke of Norfolk; passed his youth at the court of Henry VIII., and was one of the most accomplished noblemen of the time. In 1544 he commanded the English forces in France; was made field-marshal, and subsequently governor of Boulogne. In Jan., 1546, he suffered a reverse at St.-Étienne, in consequence of which he was recalled and committed to the Tower, from which he was soon released, but in December was again arrested upon charge of treason for having quartered the royal arms upon his escutcheon with the design of securing for his family the honor of the regency. Upon his trial he proved conclusively that he had a right to bear these arms together with his own, but was notwithstanding condemned, and beheaded upon Tower Hill, Jan. 21, 1547. His works consist of sonnets, amatory poems, elegies, paraphrases of the Bible, and translations of the second and fourth books of the *Æneid*. They present the earliest instances of the use of blank verse in English poetry, and have been several times republished, the latest edition being G. F. Nott's (1871). Revised by F. M. Colby.

**Surrogate** [from Lat. *surroga'tus*, perf. partic. of *surroga're*, put in another's place, substitute; *sub*, under + *roga're*, ask]: one appointed as a substitute for another; and particularly an officer appointed to act in the place of a bishop, or of a judge, in matters relating to marriages and to probate jurisdiction. In England, since the abolition of the probate jurisdiction of ecclesiastical courts, and the establishment of a civil court of probate, the surrogate's principal function is dispensing licenses to marry without banns. He is prohibited by statute, unless "a qualified practitioner," from preparing for a fee any papers on which to found a grant of probate.

In some of the U. S. the term is employed to designate the officer upon whom probate jurisdiction is conferred. It is a survival from the colonial period, during which the governor of a colony was vested with full authority and jurisdiction over matters of probate, but exercised them through local delegates or appointees. The Supreme Court of Massachusetts declared in an early case that, before the Revolution, the judges of probate were considered as surrogates of the Governor and council, who derived from the royal charter the authority to prove wills and to grant administration. In New York the title of surrogate seems to have been first assumed by the Governor's delegate shortly after 1702. Later the Governor appointed a delegate in each county to act in his stead in probate affairs; and from that period to the present, with the exception of a few years, the county officer exercising probate jurisdiction has been known as surrogate. In New Jersey probate jurisdiction is vested in the orphan's court, of which the surrogate is a subordinate officer. In other States the courts exercising such jurisdiction bear various titles, such as probate courts, parish courts, county courts, or courts of the ordinary. As a rule, they are tribunals of limited jurisdiction, whose organization, procedure, and authority are prescribed by statutes, which should be carefully examined. It is generally declared that the surrogate, or corresponding officer, of the county in which the deceased had his legal residence at the time of his death shall have exclusive jurisdiction of administering his estate, although provision is made for granting letters of administration in foreign States, where such a course is necessary to the control of property in such States.

In some jurisdictions surrogates or probate courts have the power to appoint guardians for infants and imbeciles, to hear and determine disputes affecting estates before them for administration, to entertain and dispose of proceedings for the sale of real estate, and even to administer the estates of insolvent debtors. As a rule, these courts do not possess a general equity jurisdiction. In some States they are not allowed to exercise any equity powers, but in others it is held that where an estate is in settlement before a court of probate, and an equity arises between the persons interested in such estate, the court may exercise the fullest equity powers if necessary to do justice to all parties.

Francis M. Burdick.

**Surveying** [from Anglo-Fr. *surveer* : O. Fr. *surveoir* < Lat. *supervide're*, oversee, look over; *super*, over + *vide're*, see]: the art of measuring land for the purposes of determining areas, locating lines, and making maps. Surveying is supposed to have originated in Egypt, where property lines were annually obliterated by the inundation of the Nile, and its theory was then identical with geometry (Greek, γῆ, land + μέτρον, a measure), which still furnishes the most important part of the theoretical principles.

Plane surveying is confined to areas so small that the surface of the earth may be regarded as plane, the curvature being inappreciable. It is divided into land-surveying, whose object is the determination of property lines and areas of fields; topographical surveying, which produces maps showing the undulations of the surface, the forests, swamps, and waters; hydrographic surveying, which locates rocks, shoals, and all the features of bays and rivers; mining surveying, which locates the underground passages and shafts of mines; railway surveying, which establishes the best routes and grades for railway lines; and city surveying, which deals with streets, sewers, and water-supplies. Geological surveying notes the outcrops of rock formations, and lays them down on topographical maps, the field operations being usually of the nature of a rough reconnoissance.

Geodetic surveying extends over areas so large that it is necessary to take into account the curvature of the earth. For this branch of the subject, see the articles Coast and Geodetic Survey and Geodesy.

*Instruments.*—The Gunter's chain of 66 feet, the engineer's chain of 100 feet, and tape-lines of various lengths are used for measuring distances, and it would be possible by these alone to obtain all the results required in ordinary plane surveying. By the use of the compass and transit, however, for measuring angles, many distances can be computed from a few measured ones, and the work thus greatly expedited and economized. The compass determines the bearings of lines with respect to the magnetic meridian, while the transit measures angles on a graduated limb. The theodolite, of which an illustration is given in the article Hypsometry, is a form of the transit used in Great Britain. Leveling instruments and rods (see Levels and Leveling) are needed for determining elevations and differences of heights. In topographical work the plane-table and stadia-rods are used in connection with a triangulation, distances being measured by the spaces intercepted on the stadia-rods by wires in the telescope. See Stadia Measurement and Plane-table.

*Chain-surveying.*—A few elementary problems in the determination of distances and areas by means of linear measurements alone may here be noted, but others in great variety will be found in treatises on surveying. Instead of using a chain the distances may be approximately found by pacing, or by walking over the lines, and counting the steps, the length of a step being first ascertained by going over a distance which is accurately known.

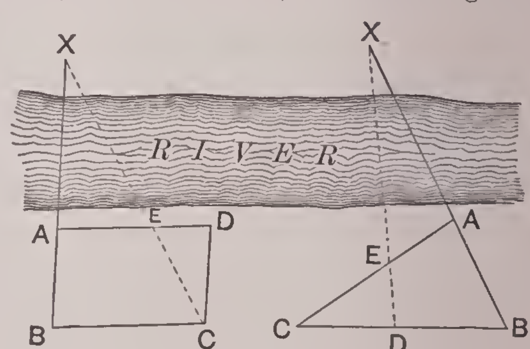


Fig. 1.

Two methods of finding the distance $AX$ across a river are shown in Fig. 1. By the first method a parallelogram, $ABCD$, is laid out, $AB$ being a prolongation of $XA$; then $E$ is marked on $AD$ at its intersection with $CX$. The distances $AB$, $AE$, $DE$ being measured, the distance $AX$ is computed by multiplying together $AB$ and $AE$, and dividing the product by $DE$. By the second method $XA$ is produced to $B$, and a stake, $C$, placed at any convenient point; then $D$ and $E$ are taken on $BC$ and $AC$, so that they are in line with $X$. The distances $AB$, $BD$, $DC$, $CE$, and $EA$ being measured, the distance $AX$ is equal to

$$\frac{AB \times AE \times CD}{BD \times CE - AE \times CD},$$

which will be somewhat simplified if $D$ be taken in the middle of $BC$.

A method of finding the length of an inaccessible line, $XY$, is shown in Fig. 2. A stake is first placed at any convenient point $A$, two stakes, $B$ and $C$, at points on $AX$ and $AY$, and a fourth stake, $D$, so as to make $ABDC$ a parallelogram. Then $E$ and $F$ are placed on $BD$ and $CD$ at their intersections with $CX$ and $BY$ respectively. The distances $AB$, $BD$, $DF$, and $EF$ being measured, the distance $XY$ is equal to

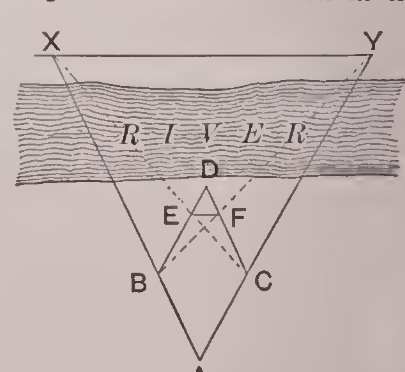

Fig. 2.

$$\frac{AB \times BD \times EF}{DE \times DF}.$$

The area of a field, as $ABCDE$ in Fig. 3, may be found by dividing it into triangles by either of the methods

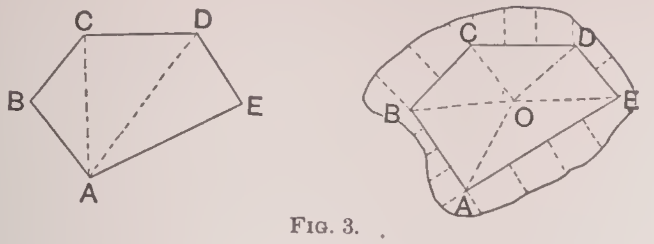

FIG. 3.

shown, measuring all the lines, and then computing the area of each triangle separately. To find the area of a triangle whose three sides are known, add the three sides together, and take half the sum; from the half sum subtract each side separately, multiply together the half sum and the three remainders, and the square root of the product will be the area.

A map of an island or irregular field, as in the second diagram of Fig. 3, may be made by staking out a polygonal area $ABCDE$, and measuring either its diagonals or the distances to a central point. Then perpendicular lines, called offsets, are set off from each side to the boundary and their lengths measured, thus giving all the data for mapping and computing the area.

*Compass-surveying.*—By means of the compass the angles or bearings which each line makes with the magnetic meridian are read, and thus a smaller number of linear measurements is required. For instance, in the case of Fig. 1, the line $AE$ may be measured, and the bearings of $AX$, $AE$, and $EX$ be read; then the angles $EAX$ and $AEX$ are known, and the distance $AX$ can be computed by the rules of trigonometry.

The area of a field is determined in compass-surveying by measuring the lengths and bearings of the sides. For example, for the case shown in Fig. 4, the field-notes would be as follows:

| LINE. | Bearing. | Distance. |
|---|---|---|
| $AB$........................... | N. 52° E. | 532 feet. |
| $BC$........................... | S. 29¼° E. | 204½ " |
| $CD$........................... | S. 31¼° W. | 389 " |
| $DA$........................... | N. 61° W. | 362 " |

From these data the distances $Ab$, $Ac$, $Ad$, called latitudes, and the distances $Bb$, $Cc$, $Dd$, called departures, are computed, and from these, in turn, the areas included between each line and its projection on the meridian $NS$. Then the area of the field is the sum of the areas $BbcC$ and $CcdD$, diminished by the sum of the areas $BbA$ and $DdA$.

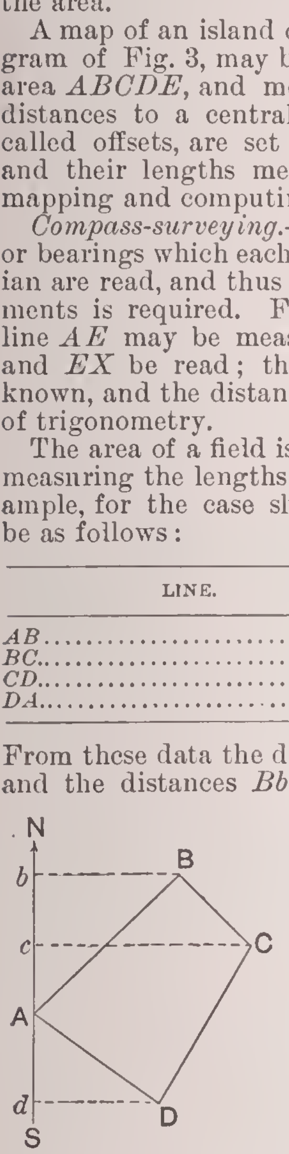

FIG. 4.

The method of balancing the latitudes and departures so as to eliminate errors of observations, and the computations of areas by means of double-meridian distances, given in most text-books on surveying, was perfected by David Rittenhouse (1732–96), and was formerly called the Pennsylvania method.

On account of oscillations in the forces of magnetism and of local attractions the compass is not an accurate instrument, and should be used only for rough reconnoissance or for farm surveys, where precision is not important. In all town or city work, as also in the surveying of railways and mines, the transit is generally employed for the direct measurement of angles.

*Topographical Surveying.*—A topographical survey of a region embracing more than a few square miles should be based on a triangulation which locates the positions in latitude and longitude of a number of stations. Then, starting from these stations, lines are run in various directions, and the location of roads, houses, streams, and other features, is made by offsets or by stadia sights. Levels are also run by which the contours or lines of equal elevations are determined, and thus a picture of the relief of the surface may be obtained. Rough topographical work, much of which is sketching, may be done for $5 per square mile, but good work will cost four or five times as much. Photography is an aid in this class of work, views being taken from different points which enable the contours of the surface to be sketched in the office. See also TOPOGRAPHY.

In the survey of a railway topographical work is done on each side of the line, and this is necessarily of a precise character so as to enable computations of excavation or comparative estimates of the cost of different locations.

*Public-land Surveys.*—The public lands consist of tracts of territory that belonged to the U. S. after the Revolution, together with all ceded by individual States soon after the formation of the Constitution, with the additions since made by treaty with Indians or by conquest. In 1802 Col. Mansfield, then surveyor of the Northwestern Territory, inaugurated a plan, which with slight alteration is still in use, for surveying and recording such portions as were offered for sale. Its general features are as follows: The entire public domain is first divided into parts called land districts, each of which is put in charge of a surveyor-general, who controls all the surveys in his particular district. In each district a meridian-line is run, extending through the entire district, and from some point of this meridian an E. and W. line is run, which also extends through the district. These lines are determined astronomically, and when located serve as axes to which the subdivisions of the district are referred. Parallel to the axes, and on each side of them, other lines are run 6 miles apart, dividing the whole territory into squares, each containing 36 sq. miles, and called townships. To take into account the obliquity of the meridians, suitable offsets are made in accordance with an established system. The townships lying between two consecutive meridians 6 miles apart constitute a range, and the ranges are numbered from the principal meridian, both E. and W. In each range the townships are numbered both N. and S. from the principal E. and W. line. Thus if a township lies 12 miles E. of the principal meridian and 18 miles N. of the principal E. and W. line, it is called township 3 N., range 2 E. Each township is divided by meridians and E. and W. lines into squares having (as near as may be) a mile on each side. These are called sections, and each contains approximately 640 acres. The sections of a township are numbered from the northeast corner, running along the northern tier of sections to No. 6, thence backward to section No. 12, which lies exactly S. of No. 1, and so on alternately, running from right to left and from left to right, to the southeasterly corner, which is No. 36. The four middle sections are numbered respectively 15, 16, 21, 22. In some of the Western States section No. 16 is set apart for school purposes.

LITERATURE.—Among the numerous text-books on surveying may be mentioned Bellows's and Hodgeman's *Manual of Land Surveying*, Gillespie's *Treatise on Surveying*, Johnson's *Theory and Practice of Surveying*; and on railway surveying, Searles's *Field Engineering* and Shunk's *Field Engineer*. A journal published by the German Association of Surveyors is *Zeitschrift für Vermessungswesen*, mainly devoted to precise methods. MANSFIELD MERRIMAN.

**Surveyors and Surveys**: See the Appendix.

**Surveys, Geological**: 1, systematic investigations of the character, arrangement, and distribution of the rock formations of a district; 2, state organizations or bureaus for the conduct of such investigations. In 1823 the Legislature of North Carolina provided for the geological survey of the State by Prof. Denison Olmsted, appropriating the sum of $250 a year for four years. In 1830 Massachusetts followed the example of North Carolina, making a somewhat larger appropriation, and placing Prof. Edward Hitchcock in charge of the work. Between 1830 and 1840 similar surveys were instituted in Tennessee, Virginia, Maryland, New Jersey, New York, Pennsylvania, Maine, Ohio, Michigan, Delaware, and Kentucky; and before 1895 all the States of the Union E. of the Great Plains, as well as California and Oregon on the Pacific coast, had made similar provision for the investigation of the rocks and minerals within their borders. Some States, after a few years of continuance, abandoned the work, or it was discontinued for a period. Others completed the investigations according to the original plan, and the results were communicated to the citizens in a series of final reports. Pennsylvania completed the survey first planned, and then after a lapse of years executed a second survey upon a more elaborate plan. New Jersey, Ohio, and Alabama maintain small permanent geological corps in the interest of the development of their mineral resources. New York, which early published systematic reports on the stratigraphy and structural geology of its territory, has since carried forward an elaborate study of its fossils, continuously maintaining therefor a small corps, and publishing a series of paleontologic monographs, which have been of the utmost service to the geological corps of other States.

The U. S. early established the custom of attaching geologists to parties sent out for the exploration of little-known portions of its territory. Expeditions having geological inquiry for their primary purpose were instituted under Featherstonehaugh in 1834, Owen in 1839, Burt and Hubbard in 1845, Owen in 1847, Jackson in 1847, and Foster and Whitney in 1848. The work under Owen and Foster and Whitney should perhaps be classed as surveying rather than reconnoissance. In 1867 Ferdinand V. Hayden, who had previously been connected with exploratory parties, was authorized to make a geological survey of Nebraska, and his work was afterward continued in other Territories. In the same year provision was made for the survey of a belt of country, including the 40th parallel, under the direction of Clarence King. In 1871 John W. Powell, who had previously explored the Colorado cañons under Government authority, was authorized to begin the geological survey of a tract bordering the river, and this work also was continued. In the same year explorations under the direction of Lieut. George M. Wheeler assumed the character of a topographical and geological survey, In 1879 the U. S. Geological Survey was created, being made to replace the Hayden, Powell, and Wheeler surveys. Two years later its field of operations, which had originally included only the Territories, was enlarged so as to comprise the entire republic, and its corps was gradually enlarged until it came to be the most important of all governmental organizations for the prosecution of geological investigation.

Great Britain was the first European country to establish a geological survey, De la Beche being placed in charge of the work in 1832. Austria and Spain followed her example in 1849, and works of this character are now in progress in nearly all the countries of Europe as well as in the British colonies. The first reports of the surveys of New Brunswick and Newfoundland were published in 1839, and the official survey of Canada, which is (1895) still in progress, was begun in 1842.

Geological surveying, or the work of a geological corps, consists primarily in the preparation of maps showing the horizontal distribution of the various formations, and of sections showing their vertical arrangement. The facts exhibited by maps and sections are called respectively the areal geology and structural geology. For their compilation it is necessary that the rocks be classified, and the study of the formations for the purpose of classification involves the determination of their position and other physical characters, and also the determination of the fossils they contain. In extensive geological surveys it has been found advantageous to differentiate the work, employing specialists for the chemical analysis of rocks, for their petrographic determination, and for the study of fossils. In regions not previously provided with topographic maps on which to delineate the outcrops of the formations, the geological corps has performed topographical as well as geological work, and in large organizations the topographical work also is performed by a special corps. In Great Britain and most of the countries of continental Europe topographical map-work was well advanced before geological mapping was begun, and the geological corps have no topographical divisions. In the U. S. the State surveys have, as a rule, executed little or no topographic work, but have made use of such maps, usually inaccurate, as happened to be available. The national survey prepares its own topographical base-maps, employing for that purpose a large corps of engineers.

G. K. GILBERT.

**Survival of the Fittest**: See EVOLUTION (*Struggle for Existence*).

**Survivorship**: (1) the state of outliving another. Whether A outlives B is, as a rule, an easily determined question of fact. If they are the victims of a common disaster, however, no evidence as to survivorship may be obtainable. In such a case the Roman law, and some modern codes founded upon it, establish presumptions for its determination, which are based upon the assumption that survivorship depends upon the comparative physical strength of the victims. For example, if a father and son perish, the father is presumed to survive, if the son is under puberty, while if the latter is above that age he is presumed to survive. (See 4 Burge, *Colonial and Foreign Laws*, ch. 1, § 1; Code Civil, Des Successions, §§ 720–722; Code of La., §§ 936–939; Code of Civ. Proc. of Cal., § 1963.) English law recognizes no artificial presumption on this subject. It will not balance "probabilities either that there was a survivor or who it was. We may guess, or imagine, or fancy, but the law of England requires evidence," and evidence which goes beyond that of the sexes, the relative ages and physical powers of the persons who are victims of a common disaster. In the absence of other evidence than the above, the fact of survivorship is deemed unascertainable, and property rights are disposed of as if death occurred at the same time. *Newell* vs. *Nichols*, 75 New York 78; *Ehle's Estate*, 73 Wis. 445.

(2) The devolution of rights or obligations upon the survivor by the death of a joint owner or a joint obligor. The survivorship of rights is often termed *jus accrescendi*, "because the right upon the death of one joint tenant accumulates and increases to the survivor." Such a doctrine was favored by the common law, for the reason that it tended to prevent a division of tenures, and to secure the continuance of the feudal system. It was not favored in equity, and was repudiated by mercantile law. Modern statutes have almost abolished it. This branch of the topic is discussed in the articles JOINT AND SEVERAL, JOINT OWNERSHIP, and PARTNERSHIP.

FRANCIS M. BURDICK.

**Sus**: See SUIDÆ.

**Susa** [= Lat. = Gr. τὰ Σοῦσα]: capital of the ancient kingdom of Elam, and afterward one of the residences of the kings of Persia; in lat. 32° N., lon. 48° E. It was taken by Asshurbanipal (668–626 B. C.), and, as appears from Ezra iv. 9, 10, some of its inhabitants were sent to live in Palestine. When Alexander took the city, 331 B. C., he found great treasures of gold. Susa is the scene of several interesting biblical narratives: (1) The vision of Daniel (viii. 2); (2) Nehemiah's office as cupbearer to the king (i. 2, ii. 1); (3) the feast of Xerxes (Esther i. 2). One of the buildings at the place is reverenced by the natives as the tomb of Jonah. The site, which is marked by ruins, was excavated for the Louvre by Marcel A. Dieulafoy, 1884–86, who was aided in the work by his wife. (Cf. Jane Dieulafoy, *La Perse, la Chaldée et la Susiane* (Paris, 1887); Jane Dieulafoy, *À Suse, Journal des Fouilles 1884–86* (Paris, 1888); Marcel A. Dieulafoy, *L'Acropole de Suse d'après les Fouilles executées en 1884, 1885, 1886*, etc. (Paris, 1890–92); B. T. A. Evetts, *New Light on the Bible and the Holy Land* (London, 1892, pp. 229–257).) The ruins are in the form of three large mounds. In one of these Dieulafoy excavated the palace which was built by Darius Hystaspes (521–485 B. C.), damaged by fire in the reign of Artaxerxes Longimanus (465–424), and restored by Artaxerxes Mnemon (405–362). The art treasures brought thence to the Louvre are most remarkable. Specially noteworthy are the capitals of the columns, the procession of the "immortals" (raised figures in enamel, of various colors, on the surface of the brick-work), and the figures of lions (also in enamel).

D. G. LYON.

**Susa**, or **Sous**: town of Northern Africa; 70 miles S. S. E. of Tunis; is surrounded with olive-groves, and has an extensive trade in oil and manufactures of woolen fabrics. Pop. estimated at 12,000, of whom 2,000 are Europeans and 2,000 Jews.

M. W. H.

**Susan'na, History of**: a short book, considered by the Roman Catholic Church to be canonical, and regarded as the thirteenth chapter of Daniel, but put among the Apocrypha in the English Bible. It relates the attempt on the virtue of Susanna, a beautiful Jewish matron, her false accusation, her final rescue from death, and the overthrow, by the judgment of young Daniel, of the wicked men who designed her ruin. It is probably a fiction of neo-Hebrew origin.

Revised by S. M. JACKSON.

**Susemihl**, soo'ze-meel, FRANZ: Greek scholar; b. at Laage, Mecklenburg-Schwerin, Germany, Dec. 10, 1826; studied in Leipzig and Berlin; private docent at Greifswald 1852; Professor of Classical Philology at the same university since 1856. His works chiefly relate to Plato and Aristotle. Among them are *Genetische Entwickelung der Platonischen Philosophie* (2 vols., 1860); Aristotle's *Poetics*, with translation and notes (2d ed. 1874); text editions of the *Politics* and *Nicomachean Ethics*. In 1891 he published his profoundly learned *Geschichte der griechischen Literatur in der Alexandrinerzeit* (2 vols.), the standard work on the subject.

ALFRED GUDEMAN.

**Suso**, or **Seuse**, HEINRICH (otherwise known as St. Amandus and Heinrich von Berg): mystic; b. at Ueberlingen, in the present grand duchy of Baden, 8 miles N. of Constance, Mar. 21, 1295. His father was a rough soldier of the name of von Berg, but after his mother's death in his eighteenth year he took her name, Süss or Süss. He studied first at Constance, then at Cologne; and became a Dominican monk at Constance 1308. He was greatly influenced by Eckart. At first his religious life was in the dark, and he led for several years a life of seclusion and the severest asceticism; but coming into the light, meeting as he believed with the Eternal Wisdom, he reveled in the newly found joy and peace and became then an itinerant preacher, and wrote several religious works of a mystical character, which made a deep impression, and of which the chief is *Buch von der ewigen Weisheit* (*Horologium Sapientiæ Æternæ*), which was partly translated into English at Douay, 1500. D. in the Dominican monastery at Ulm, Jan. 25, 1366. His collected works were translated into new High German by M. Diepenbrock (Regensburg, 1829; 4th ed. 1884); but his writings have not so much interest as those of the other German mystics—Eckart, Tauler, etc. F. H. S. Denifle has published selections in his *Das geistliche Leben* (Gratz, 1873; 2d ed. 1879; also his works, 1878, *seq.*). For Suso's biography, see his collected works, also his autobiography, *The Life of Blessed Henry Suso by himself*, translated from the German by T. F. Knox (London, 1865); also F. Bevan, *Trois Amis de Dieu* (Lausanne, 1890), and T. Jaeger (Basel, 1893). Revised by S. M. JACKSON.

**Suspension** (in music): See MUSIC.

**Suspension Bridge** (town): See NIAGARA FALLS (city).

**Suspension Bridges**: See BRIDGES.

**Susquehan'na**: borough; Susquehanna co., Pa.; on the Susquehanna river, and the N. Y., Lake Erie and W. Railroad; 22 miles S. E. of Binghamton, N. Y., 38 miles N. of Carbondale (for location, see map of Pennsylvania, ref. 2–I). It is a manufacturing place, with steam-heater factory, chemical works, and locomotive and railway-car shops, and contains a public library, 2 national banks with combined capital of $150,000, a private bank, and a daily, a tri-weekly, and a weekly paper. Pop. (1890) 3,872; (1900) 3,813.

**Susquehanna River**: a river formed by the union of its eastern and western branches at Northumberland, Pa. The eastern branch, the larger, rises in Otsego Lake, Otsego co., N. Y., at an elevation of about 1,300 feet. The western branch rises in Cambria co., Pa., and has a very tortuous and generally eastward course through a region abounding in timber and coal, but less celebrated for its fertility and beauty than the valley of the eastern branch, a portion of which, called the Wyoming valley, is renowned for the historic events of which it has been the scene, as well as for the mineral wealth which it contains. The main Susquehanna flows through a wide, open, exceedingly fertile, and very picturesque country of Devonian slates and limestones. It reaches the head of Chesapeake Bay at Port Deposit, Md. It is a wide and stately stream, but is shallow, and is nowhere navigable to any extent, save in the spring, when the freshets bring down great rafts of logs and lumber and some loaded boats. The length of the main stream is 150 miles, of the western branch 200 miles, of the eastern (or northern) branch 250 miles. The branches afford great water-power. Canals have been built along the main stream and both branches, but have been rendered useless to a great extent by railways. Revised by ISRAEL C. RUSSELL.

**Sussex**: county of England; S. of Surrey and bordering on the English Channel. Area, 1,458 sq. miles. It is intersected from E. to W. by a range of low hills, called the South Downs, consisting of chalk covered with fine turf and affording excellent pasturage, where the celebrated breed of sheep called the Southdowns is reared. To the N. of the range are extensive woods; to the S. the ground is wholly under tillage, and large crops of wheat, barley, beans, turnips, and hops are raised, and hogs, fowls, and rabbits are reared. Pop. (1901) 413,231.

**Susu**: See SOOSOO.

**Sut'cliffe**, MATTHEW, LL. D.: dignitary and author; b. in Devonshire about 1550; entered Trinity College, Cambridge; took holy orders, and became archdeacon of Taunton in 1586, dean of Exeter in 1588, and prebend of Wells in 1592. He founded a college at Chelsea, of which he was the first provost, the fellows of which were to devote themselves to writing the annals of their times and to combating popery and Pelagianism; but the institution fell into decay, became an asylum for invalid soldiers, and finally a part of Chelsea Hospital. He wrote many polemical works, chiefly against Bellarmine and Robert Parsons, among which are *A Treatise of Ecclesiastical Discipline* (London, 1590); *Disputatio de Presbyterio* (1591); *De Catholica et Orthodoxa Christi Ecclesia* (1592); *De Pontifice Romano, eiusque iniustissima in Ecclesia dominatione* (1599); *De Purgatorio* (1599); *De Vera Christi Ecclesia* (1600); *De Missa papistica* (1603); *The Unmasking of a Masse-monger*. D. in 1629. Revised by S. M. JACKSON.

**Sutech**: an Egyptian deity, usually regarded as the equivalent of SET (*q. v.*). He was adopted by the HYKSOS (*q. v.*), as their special divinity, and afterward, apparently, was transplanted to the East. It is somewhat doubtful whether the identification of Set and Sutech is justifiable in the earlier times, since as late as the eighteenth dynasty the name of Set appears as the principal part of the royal name of SETI (*q. v.*), which would scarcely have happened if the identification of Set with the foreign Sutech were then complete or generally recognized. At a later period both Set and Sutech are regarded as identical, and as foreign gods as well as gods of foreigners. CHARLES R. GILLETT.

**Sutherland**: a northern county of Scotland; bounded W. and N. by the Atlantic Ocean, E. by Caithness, and S. by the North Sea; area, 2,028 sq. miles, only 3 per cent. of which is under cultivation. The surface is elevated, mountainous, and rugged, especially toward the N. W., interspersed with large tracts of moorland or covered with extensive forests, where herds of red-deer roam wild. Rearing of cattle and sheep, and salmon and herring fishing are the principal occupations. Pop. (1901) 21,389. Chief town, Dornoch; pop. (1891) 514. Sutherlandshire sends one member to Parliament.

**Sut'lej** [Sanskr. *Satadru*, or the "hundred-channeled," the *Zaradros* of Ptolemy and *Sydrus* or *Hesidrus* of Pliny]: the most eastern and southern of the "five rivers" of the Punjaub, British India, and the one which receives the other four before it joins the Indus. It rises in Western Tibet, not far W. of the sources of the Brahmaputra and S. of those of the Indus proper, and takes a course first W., breaking through the Himalayas, thence S. W. to the Indus in lat. 29° N. The Tibetan valley of its upper course is highly picturesque and contains many hot springs. After passing the mountains it traverses the arid plains of Southern Punjaub, where its waters are much used for irrigation. It has no large southern affluents. On the N., the Bias enters at the turn in its course, and 50 miles from the Indus it is joined by the combined Jhilam, Chinab, and Ravi, from which junction to its mouth it is called the Punjaub. Its lower course is shifting. The annual floods occur in June, July, and August, and its volume of water is nearly equal to that of the Indus. Length about 970 miles, but the flow is intermittent from Rakas Tal, a lake 40 miles below its source. Boats of 40 tons burden ascend to Firozpur, 370 miles from the mouth. MARK W. HARRINGTON.

**Sū'tra**, in Pāli **Sutta** [Sanskr. *sūtra*, a thread or string; deriv. of √ *siv*, sew]: in Sanskrit literature, a short rule or aphorism, or a string of such aphorisms. Sūtras constitute an important part of Hindu literature, including all the ritual, grammatical, metrical, and philosophical works. They consist of brief sentences to be memorized, and were usually written separately on palm-leaves tied together by a string. One of the three "baskets" or "collections" of the Buddhist Tripitaka is composed of sūtras, which profess to be the very words of the Buddha. Each sūtra or string of aphorisms begins with the words, "Thus have I heard."

**Sutro**, ROSE and OTTILIE: See the Appendix.

**Sut'tee** [from Sanskr. *satī*, faithful wife, liter., femin. of *sant-* (pres. partic. of *as-*, be), being, existing, real, true, faithful]: the voluntary burning of a widow on the funeral pile of her husband, a practice formerly prevalent among Hindus in India. In the event of the husband dying in a distant land, the widow would place his sandals on her breast and cast herself alive into a fire. The practice is said to have been unknown to the primitive Aryans, but it is authorized by several passages in the *Puranas* (see Colebrooke's *Digest of Hindoo Law*), although the custom is not sanctioned by the laws of Manu. For some time the custom was permitted in India under British rule, and between the years 1815 and 1826 more than 7,000 cases of suttee were reported in the province of Bengal alone. In 1829 suttee was suppressed by the British Government in India, and in 1847 the prohibition was extended to all native states under the protection of the Government. T. P. HUGHES.

**Sutter**, John Augustus: pioneer; b. at Kadern, Baden, Feb. 15, 1803, of Swiss parentage; was educated at the military college at Berne; entered the French service as an officer of the Swiss guard and served, 1823–24, through the Spanish campaign; emigrated to the U. S. 1834; carried on a trade with Indians and trappers at Santa Fé; crossed the Rocky Mountains 1838; traded in a vessel along the Pacific coast; founded 1839 a settlement on the site of Sacramento; received a grant of land from the Mexican Government, and was appointed governor of the northern frontier country; encouraged the annexation of California to the U. S.; was a delegate to the convention to form a State constitution; and after the admission of California as a State was elected first alcalde of his district. In Feb., 1848, gold was discovered on his estate in Coloma, his lands were invaded by gold-diggers, and the claim he had filed for 33 sq. leagues was decided against him on appeal to the Supreme Court. Being reduced to poverty, he was pensioned by the State Legislature; in 1873 removed to Litiz, Lancaster co., Pa. D. in Washington, D. C., June 17, 1880.

**Sutter Creek**: town; Amador co., Cal.; on Sutter creek; 4 miles N. W. of Jackson, the county-seat, 45 miles E. S. E. of Sacramento (for location, see map of California, ref. 6–D). It is in a gold-mining and agricultural region, and has a weekly newspaper. Pop. (1880) 1,324; (1890) 1,351; not returned separately in 1900.

**Sutton**: village; Brome co., Quebec, Canada; on the Canadian Pacific Railway, near the U. S. boundary (for location, see map of Quebec, ref. 6–C). Near the village is Sutton Mountain, over 1,000 feet high, the slopes of which are covered with magnificent maple groves. It is the center of the maple-sugar export trade. Pop. of parish (1891), 3,362.

**Sutton**: town (incorporated in 1714); Worcester co., Mass.; on the N. Y., N. H. and Hart. Railroad; 9 miles S. of Worcester (for location of county, see map of Massachusetts, ref. 3–G). It contains the villages of Sutton, West Sutton, South Sutton, Manchaug, Wilkinsonville, Pleasant Valley, Woodbury, and Marbleville; has 5 churches, high school, 15 public schools, public library, and is principally engaged in agriculture and the manufacture of cotton goods. Pop. (1880) 3,105; (1890) 3,180; (1900) 3,328.

**Suture** [from Lat. *sutu'ra*, seam, deriv. of *su'ere*, *su'tum*, sew; Eng. *sew*]: in anatomy, the line of union of two bones between which there is no motion. Where motion is intended, the union is a joint or diarthrosis. The general term for an immovable joint is synarthrosis; this includes the suture (*sutura*), or linear articulation; the schindylesis, in which a thin lamina of bone is received between two laminæ of another bone; and the gomphosis, in which a long process is inserted into a socket. A serrated suture is one between bones whose edges have projections and indentations fitting into each other; a squamous suture is between bones whose edges overlap. In surgery, suture is either the uniting of the edges of a wound by means of stitches, or it is one such stitch. The most common materials for sutures are prepared catgut, silk, and silver wire.

**Suwa'row**, or **Suvo'roff**, Alexei Vasilievitch: soldier; b. in Moscow, Nov. 24, 1729; entered early the Russian army, and was made a colonel after the battle of Kunersdorf, 1759, and a general in 1783, after the campaign against the Lesghians on the Kuban. In the second Turkish war he defeated the Turks in several important battles, and in 1790 captured the fortress of Ismail. In 1794 he commanded in Poland, and took Praga Sept. 24, 1794, after which Catherine II. made him field-marshal. His most brilliant exploit was his Italian campaign in 1799. He had fallen into disgrace under Paul I., and had even been deprived of his rank, but on the demand of the Emperor of Austria he was, nevertheless, made commander-in-chief of the Russian army which was sent to Italy to co-operate with the Austrians against France. He defeated the French on the Trebbia and at Novi, and then crossed the Alps to join Korsakoff and the Austrians under Hotz. Both the generals had been defeated, however, and Suwarow was compelled to retreat. Shortly after the Russian-Austrian alliance was dissolved, and the Russian army withdrawn from the theater of war. He died a few days after his return to St. Petersburg, May 18, 1800. His *Autobiography*, written in French, was edited by Glinka in 2 vols. (Moscow, 1819). See biographies by Polevoi (1853) and Spalding (1890). F. M. Colby.

**Svarabhakti** [Sanskr., vowel-fragment; *svara-*, tone, vowel + *bhakti-*, division, deriv. of *bhaj-*, to allot, divide]: a technical term of Indian grammar (Prātiçākhyas) applied to a subsidiary vowel-sound inserted between *r* or *l* and a following consonant. This term has been adopted into modern grammar to denote the vowel appearing in the various familiar forms of anaptyxis with *r* or *l*; as in Lat. *familia* for **famlia*; *sæculum* for *sæclum*; O. H. Germ. *miluh* to *melchan*, to milk; Eng. *eləm* for *elm*. B. I. W.

**Sveaborg**: See Sweaborg.

**Svend**: See Sweyn.

**Sven Tröst**: pseudonym of Snoilsky (*q. v.*).

**Světlá**, Karolina (pseudonym of Johanna Mužáková, wife of Prof. Peter Mužák, of Prague): a Czech writer of novels of considerable fame; b. at Prague, Feb. 24, 1836. She published in 1858 her first novel, *Double Awakening*, in the Czech almanac *Máj*, and continued to enrich Bohemian literature with some fifty novels and tales. Her material is mostly drawn from the popular life and the modern society of her native country; her popular types, framed after French models, are very delicate and artistic. She also wrote many essays on education and literature, and memoirs which are widely read. Among her best novels are *Láska k básnikovi, román z časů novějšich* (Poet's Love, Novel of the Present Time, Prague, 1860); *Prnvi Ceška* (Prague, 1861; also published in the collection of novels *Slovanské besedy*); *Vesnicky roman* (The Village Romance, 1869); *Frantina* (1870); *Kriz a potoka* (The Cross near the Brook, 1871); *The Atheist* (1873). Karolina Světlá is, besides Eliška Krásnohorská (pseudonym for Henriette Pech), the author of the cycle of epic songs *To the Slavic South*, the foremost woman representative of modern Czech literature. Many of her novels have been translated into Russian, German, Polish, and French. Hermann Schoenfeld.

**Svir**: a river in the government of Olonetz, Russia. It issues from the southwestern extremity of Lake Onega, and enters, after a course of 130 miles, the eastern part of Lake Ladoga. It is navigable throughout its whole course, and forms part of the great system of rivers and canals which connects the Baltic with the Caspian and White Sea.

**Swa'bia**, or **Suabia** (Germ. *Schwaben*, Mod. Lat. *Sue'via*): a former territory of Southwestern Germany, corresponding nearly to the present Würtemberg and Baden, and bounded S. and W. by the Rhine, which separated it from Switzerland and France, and N. and E. by the Palatinate, Franconia, and Bavaria. Its original name was *Alemannia*, but when, in 496, the Alemanni were conquered by Clovis, the country received the name of Swabia after the Suevi, who inhabited large parts of it. In 1080 the Emperor Henry IV. made it a duchy, and bestowed it as an hereditary fief on Frederick of Hohenstaufen. Under this family Swabia prospered and became the seat of a flourishing civilization; but when the family became extinct with Conradin, who, as the head of the Ghibelline party, was executed at Naples in 1268, Swabia was broken up into many small dominions and free cities. From 1563 to 1806 Swabia was one of the ten circles into which the German empire was divided.

Revised by M. W. Harrington.

**Swain**, George Fillmore, B. S.: civil engineer and educator; b. in San Francisco, Cal., Mar. 2, 1857; graduated at the Massachusetts Institute of Technology in 1877, and then spent three years in study in Germany. Since 1883 he has been Professor of Civil Engineering in the Massachusetts Institute of Technology, and has also served as expert on the tenth census and as engineer of the railway commission of Massachusetts. He is the author of valuable articles in technical journals, of papers on the water-power of the U. S. in the *Reports of the Tenth Census*, and of discussions in the *Reports of the Massachusetts Railroad Commission*.

Mansfield Merriman.

**Swainson**, William: naturalist; b. in Liverpool, Oct. 8, 1789; served in the commissary department of the British army 1807–15; accompanied the German naturalist Köster in his travels in South America 1815, after which he settled in London, and began in 1820 the issue of his works on natural history. In 1841 he emigrated to New Zealand, where he was attorney-general, and subsequently published several works on the natural history and social and political condition of that colony and Tasmania. Among his works are *Zoölogical Illustrations* (1st series, with 318 colored plates, 1820–23; 2d series, with 136 plates, 1829–33); *Exotic Conchology* (1821–22; new ed. 1841); *The Naturalist's Guide for Collecting and Preserving all Subjects of Natural History and Botany, particularly Shells* (1840); 11 vols. on zoölogy, etc., in Lardner's *Cabinet Cyclopædia* (1834–40); *Birds of Western Africa* and *The Natural Arrangement and History of Fly-catchers* (in Jardine's *Naturalist's Library*, 1837–38); *Ornithological Drawings*, of birds from Brazil and Mexico (1834–41); *Observations on the Climate of New Zealand* (1840). He assisted Sir John Richardson in the ornithological portion of *Fauna Boreali-Americana*. Few of his day knew more about birds and no one excelled him as a delineator of them. D. in New Zealand in 1855.

**Swallow** [O. Eng. *swaleive*, *swealwe*: O. H. Germ. *swalawa* (> Mod. Germ. *schwalbe*): Icel. *svala*]: any bird belonging to the family *Hirundinidæ*, distinguished by the wide deep gape, allusion to which is evidently conveyed in the name. They have the neck rather short; the head full; the bill short, but comparatively broad and depressed; the gape very deep, and continued backward nearly as far as, or quite under, the eyes. There are no distinct rictal bristles; the wings are very long and pointed, and have only nine primaries, of which the second is generally longest, but the first is nearly or quite equal to it; the tail is forked or emarginated, and normally consists of twelve feathers; the legs are weak and small, the toes are long and slender, and with the normal number of joints; the claws curved and acute, but slender. The anatomical features demonstrate the close relationship of the family with the ordinary singing birds (such as the sparrows, thrushes, etc.), and the great differences from the swifts, which resemble them so much as formerly to have been generally united with them. There are over 125 species, and representatives are found in almost every land and every zone save the extreme polar regions. The several genera have been differentiated into two subfamilies—*Hirundininæ*, in which the outer edge of the wing is smooth-feathered, containing almost all of the species; and *Psalidoprocninæ*, in which it is serrated or armed with stiff recurved hooks, represented by the African genus *Psalidoprocne* and the American *Stelgidopteryx*. The species are among the most active and graceful of birds, and their circling and sweeping flight is well known to observers. They feed almost exclusively on insects, which they take on the wing. Their mode of nesting is various (for the nest of the barn-swallow, see NESTS OF BIRDS), the eggs five or six. The most common North American species are the purple martin (*Progne subis*); the cliff-swallow (*Petrochelidon lunifrons*); the barn-swallow (*Chelidon erythrogaster*); and the bank-swallow or sand-martin (*Cotyle riparia*). The so-called chimney-swallow is a swift. See SWIFT and MARTIN.

Revised by F. A. LUCAS.

**Swamp'scott**: town; Essex co., Mass.; on Massachusetts Bay, and the Boston and Maine Railroad; 2 miles N. E. of Lynn, and 13 miles N. E. of Boston (for location, see map of Massachusetts, ref. 1–I). It is a noted watering-place with an excellent beach and large accommodations for season and transient guests; contains the villages of Swampscott, Beach Bluff, Phillips Beach, and Mountain Park; and has a high school, 14 district schools, public library, 3 hotels, and 5 churches. In 1894 the assessed valuation was $5,000,000. Pop. (1880) 2,500; (1890) 3,198; (1900) 4,548.

**Swan** [O. Eng. *swan*: O. H. Germ. *swan* (> Mod. Germ. *schwan*): Icel. *svanr*]: any one of those swimming birds of the family *Anatidæ*, sub-family *Cygninæ*, which have a bill nearly equally broad throughout and as long as the head; the cere soft and extending to the eye; neck long and slender, consisting of twenty-two to twenty-six vertebræ; the front toes with a large web; the hind toe without a lobe; the tail short and rounded; the second and third wing-quills the longest. They are the largest species of the family, and among the largest of birds. Some authorities place all swans in one genus, *Cygnus*; others admit four genera, *Cygnus*, *Olor*, *Chenopis*, and *Sthenelus*. Omitting the Coscoroba swan (*Coscoroba coscoroba*), which probably belongs with the ducks, there are nine species, all but two inhabitants of the northern hemisphere. The exceptions are the black-necked swan (*Sthenelus melancorypha*) of Chili and the black swan (*Chenopis atrata*) of Australia. The North American swans, whistling swan (*Olor columbianus*) and trumpeter swan (*O. buccinator*), are fine birds, both white. The tame swans are of two European species—red-billed swan (*Cygnus olor*) and Polish swan (*C. immutabilis*). The former is found in a wild state throughout a great part of Europe, while comparatively little is known of the second species, some authors considering it to be a mere variety of the first. *Cygnus immutabilis* is so named from the fact that the young—or cygnets—are white, while those of other species are gray. Though once held in considerable esteem for the table, domestic swans are now bred merely for ornament. F. A. LUCAS.

**Swan**, JAMES: soldier and author; b. in Fifeshire, Scotland, in 1754; went to Massachusetts at an early age; was a clerk in Boston; published a *Dissuasion to Great Britain and the Colonies from the Slave Trade to Africa* (1772); became captain of artillery, secretary to the Massachusetts board of war, member of the Legislature in 1778, and afterward adjutant-general of the State. In 1787 he went to Paris; wrote *Causes qui sont opposées au Progrès du Commerce entre la France et les États-Unis de l'Amérique* (1790); acquired a large fortune; returned to the U. S. in 1795; returned to Europe in 1798; in 1815, upon the suit of a German with whom he had transactions, he was arrested and thrown into a prison in Paris, where he remained fifteen years. He also published *On the Fisheries* (1784); *Fisheries of Massachusetts* (1786); *National Arithmetick* (1786); and an *Address on Agriculture, Manufactures, and Commerce* (1817). D. in Paris, Mar. 18, 1831.

**Swan-p'an**: See ABACUS.

**Swan'sea** (Welsh, *Abertawe*): seaport in Glamorganshire, South Wales; at the mouth of the Tawe; 216 miles W. of London (see map of England, ref. 12–E). Owing to the rich coal-fields in the vicinity, and its position on the bay affording safe anchorage, Swansea has developed into one of the most important manufacturing towns in Great Britain. Nearly half the entire exports are tin-plates, the rest being coal, coke, iron, steel, zinc, copper, alkali, etc. The imports include copper, zinc, lead, silver, tin, iron, and their ores; also sulphur, grain, timber, etc. The total tonnage of vessels entered and cleared in 1893, exclusive of that coastwise, was 1,320,144. The parliamentary borough returns two members. Pop. of municipal borough (1901) 94,505.

**Swansea**: town (incorporated in 1668); Bristol co., Mass.; on Mt. Hope Bay, and the N. Y., N. H. and Hart. Railroad; 4 miles N. W. of Fall River (for location, see map of Massachusetts, ref. 5–I). It contains the villages of Swansea, North Swansea, South Swansea, Center Swansea, and Hortonville; has ten public schools, a public library, and a Protestant Episcopal church; and is principally engaged in agriculture and in bleaching and dyeing. Pop. (1880) 1,355; (1890) 1,456; (1900) 1,645.

**Swanton**: town; Franklin co., Vt.; on the Missisquoi river, near the north end of Lake Champlain, and on the Cent. Vt. and St. Johns and Lake Cham. railways; 9 miles N. of St. Albans, the county-seat (for location, see map of Vermont, ref. 2–B). It contains a union public school, a national bank with capital of $50,000, a weekly paper, quarries of white and variegated marble, and spring-bed and other factories. Pop. (1890) 3,231; (1900) 3,745; village 1,168.

**Swarga**, or **Svarga** [Sanskr.]: in Hindu mythology, the heaven over which Indra presides. It is the residence of beatified mortals and of the inferior gods, and is supposed to be situated on Mt. Meru. See INDRA and MERU.

**Swarthmore College**: a coeducational institution at Swarthmore, Delaware co., Pa., opened in 1869. It was founded by the Society of Friends belonging to the Yearly Meetings of Philadelphia, New York, and Baltimore, for the purpose of furnishing opportunities for higher education to its own members and to persons of other denominations. Women as well as men are members of its faculty and of the board of managers. It offers four courses of study—arts, letters, science, and engineering—for the completion of each of which a separate degree is given. In 1900 it had 28 instructors, 200 students, and 19,462 volumes in its library. The presidents have been Edward Parrish, Edward H. Magill, William Hyde Appleton, Charles De Garmo, and William W. Birdsall. Besides the main college building, in which are the dormitories, libraries, the biological laboratory and museum, and class-rooms for the departments of ancient and modern languages, mathematics, history, and economics, there is a spacious science building containing the chemical laboratory, the physical laboratory for teaching electrical engineering, the draughting-room, and shops of the engineering department. There is also an astronomical observatory and two gymnasiums, one for the young men and one for the young women. CHARLES DE GARMO.

**Swatow**: a port of China, opened to foreign trade by the treaty made at Tientsin in 1858. It is situated on the north or left bank of the river Han, about 5 miles within its mouth, in the province of Kwangtung but near the borders of Fuh-kien; lat. 23° 20′ 43″ N., lon. 116° 39′ E. (see map of China, ref. 8–J). It is the shipping-port of the city of Ch'ao-chow-foo, 35 miles inland, and of San-ho-pa, 40 miles farther up the Han. The site of the native town is but little raised above the level of the river, which is here about a mile wide. The southern bank, on which the foreign settlement is located, is bold, and lined with hills of an average height of 400 to 500 feet. The foreign community is small. The natives, who in both features and language resemble the people of Fuh-kien rather than those of Kwangtung, are noted for their turbulence and their hostility to foreigners. Their dialect, which is unintelligible to natives of Canton, approximates closely to that of Amoy. Sugar-making is the great industry of the neighborhood. The trade of Swatow, which is considerable, is mostly in the hands of natives, and is chiefly with Hongkong (180 miles distant), Shanghai, and Niuchwang. In 1893 917 vessels, with a tonnage of 883,695 tons, entered, and the same number cleared. The net foreign imports for that year amounted to 8,238,721 Haikwan or custom-house taels, and the net native imports to 9,512,749 taels. Of the foreign goods imported, 7,486,902 taels came from Hongkong, 383,617 taels from Cochin-China, Tonquin, and Annam, 96,975 taels from Russia, and 40,320 taels from the U. S. The chief imports were opium, value 2,888,740 taels; rice, 3,473,247 taels; bean-cake (used for manure in the sugar-plantations), 253,786 taels; raw cotton, cotton and woolen goods, metals, matches, and kerosene oil. The exports included tea (about 7,000 piculs), sugar (valued at 3,125,009 taels), grass-cloth, liquid indigo, prepared tobacco, joss-sticks, and joss-paper, and amounted to 6,445,682 taels, or about $676,966 U. S. gold. In the same year 93,095 native passengers left the port, but only 56,217 entered. More than half of the native emigration, for which the port is noted, is directed to the Straits Settlements. Pop. 22,500. R. LILLEY.

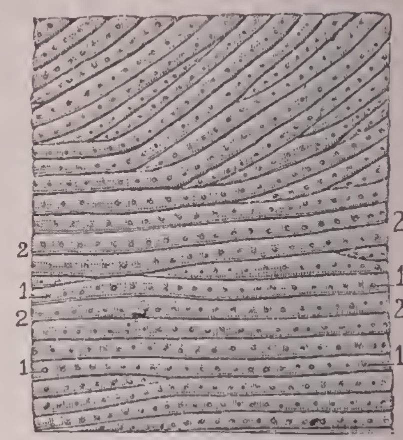
**Swayne**, JOHN WAGER: soldier and lawyer; son of Noah H. Swayne; b. at Columbus, O., Nov. 10, 1834; graduated at Yale College in 1856; studied law and practiced at Columbus; major of the Forty-third Ohio Volunteers 1861; became colonel; served through the Atlanta campaign; lost a leg at Salkahatchie, S. C.; breveted brigadier-general U. S. Vols. Feb. 5, 1865, promoted brigadier-general Mar. 8, 1865, and major-general June 20, 1865; mustered out of the volunteer service Sept. 1, 1867. He was a commissioner of the Freedmen's Bureau in Alabama, where he commanded the U. S. forces and administered the reconstruction acts; retired July 1, 1870. In 1880 he removed to New York.

**Swayne**, NOAH HAYNES, LL. D.: jurist; b. in Culpeper co., Va., Dec. 7, 1804; was clerk in an apothecary's shop in Alexandria; studied law; was admitted to the bar in 1823, and began practice at Coshocton, O.; in 1826–29 was prosecuting attorney of Coshocton County; in 1829 was elected to the State Legislature; removed to Columbus, O.; was U. S. district attorney 1831–41; was chosen judge of the court of common pleas in 1833, but declined the office; was again elected to the Legislature in 1836, and was prominent in organizing asylums and institutions for the deaf and dumb, the blind, and the insane; joined the Republican party on its formation; in 1861 was appointed a justice of the U. S. Supreme Court; resigned 1881. D. in New York, June 8, 1884.

**Swaziland**: See SOUTH AFRICAN REPUBLIC.

**Sweaborg**, or **Sveaborg**, svā'ă-borg: a fortress of Russia, on the northern coast of the Gulf of Finland (see map of Russia, ref. 5–C). The place was originally fortified by Sweden. When Finland became a province of Russia (1809), the latter made it a military and naval dépôt. The isle of Vargoe is the central or principal fortress; the isle of Great Oester-Svartoe the principal naval dépôt and dockyard. See HELSINGFORS. Revised by M. W. HARRINGTON.

**Sweat**, or **Perspiration** [*sweat* is deriv. of *sweat* (verb) < M. Eng. *sweten* < O. Eng. *swǣtan*, deriv. of *swāt*, sweat: O. H. Germ. *sweiz* (> Mod. Germ. *schweiss*): Icel. *sviti*; cf. Lat. *suda're*, to sweat: Gr. ἵδρως, sweat: Sanskr. *svid-*, to sweat]: the fluid exuded through the pores of the skin, consisting of water with numerous solids in solution. The amount of water excreted from the skin either in the form of the insensible perspiration, which maintains its softness and moisture, or in perceptible sweat, is but little less than the volume of the urine or the equivalent in water of the moisture exhaled from the lungs in breathing. It varies with the seasons and climate, sweat being most profuse in summer and the warmer regions. The action of the skin is complementary to that of the kidneys, chilling of the integument producing renal hyperæmia. The amount of solid excretory matter and carbonic acid gas eliminated by the skin is small, but can not be suppressed without danger to life. Experiments of closing the pores by a coating of varnish or tin-foil, both in man and lower animals, have induced alarming depression and death. Reversely, the artificial stimulation of the perspiration is a valuable channel for eliminating morbific matter in impaired health or disease. Bathing, friction, and clean clothing, by favoring activity of the sweat-glands and open pores, are means of preserving health. The sweat is secreted by the sudoriparous or sweat-glands, coiled tubular masses beneath the skin, with excretory tubules terminating on the surface. (See HISTOLOGY, *The Skin and its Appendages.*) The tube is about $\frac{1}{870}$th of an inch in diameter, the coils or glands vary from $\frac{1}{125}$th to $\frac{1}{25}$th or $\frac{1}{12}$th of an inch in diameter. The number of sweat-openings varies on different surfaces; thus, as enumerated by Krause, the palm of the hand (see figure) has 2,736 to the square inch, the back of the hand 1,490, sole of the foot 2,685, top of the foot 924, forehead 1,258, cheek 548. The number of sweat-glands in the body is estimated at 381,248, and the aggregate length of tubules as $2\frac{1}{3}$ miles. Revised by W. PEPPER.



Surface of the palm of the hand; a portion of the skin about half an inch square, magnified four diameters (*Sappey*): 1, 1, 1, 1, openings of the sweat-ducts; 2, 2, 2, 2, grooves between the papillæ of the skin.

**Sweating Sickness**: one of the prevalent and fatal epidemics which occurred during the fifteenth, sixteenth, and early part of the seventeenth centuries. It was also known as pestilent sweat and as the English ephemera, as the English people both at home and abroad were chiefly attacked. In Germany, Holland, Sweden, and Denmark it prevailed more mildly. It first appeared in England in 1485. It was of brief period, both in individual cases and in duration of single epidemics. Fully half of the population in infected towns had the disease, and the mortality was great, but where death did not result all danger was past in twenty-four or forty-eight hours, and epidemics rarely lasted a month. The other great English epidemics were in 1506, 1517, 1528, and 1551. In the last two the disease for the first time left English soil, appearing in various parts of Western Europe. After 1551 no further epidemics were met with till the beginning of the eighteenth century, since which numerous outbreaks of the disease, now generally known as *miliary fever*, have occurred. Miliary fever is of common occurrence to the present day, scarcely a year passing without an epidemic in some part of the world; but it is mild in character and very rarely spreads to any considerable distance. The attack consisted of a febrile and sweating period. It began with pains in the back, shoulders, and limbs, flushes of heat, oppression at the liver and stomach, pain in the head, delirium, palpitation, followed by heaviness and desire to sleep, which in fatal cases tended to become profound coma or stupor. Profuse sweating then set in, in favorable cases leading to speedy convalescence. Often there was an eruption in the skin, which afterward desquamated in cases which recovered. The patient was liable to one or many relapses. The disease spared the aged and young, attacking chiefly middle-aged, plethoric men of all classes and of every rank. Both in England and on the Continent the greater prevalence of this disease among Englishmen was attributed to their peculiarly gluttonous, excessive diet. By Hecker, Guy, and others the several epidemics of this disease are ascribed to preceding periods of atmospheric and telluric insalubrity, the influence of gathered armies, and to the absence of house and street drainage in the larger cities and towns. Its period of incubation, rapid progress, and speedy convalescence disconnect it from epidemics of the typhus class. The nature of sweating sickness has been the subject of much conjecture. Doubtless it is some special infection and not influenza, malaria, or rheumatism, as older writers were disposed to think. Probably various diseases have been described under this name. The treatment consists mainly in rest and tonics. WILLIAM PEPPER.

**Sweating System**: in popular usage, a term applied to the practice followed in certain trades of sub-contracting for a low class of work, which is done sometimes on the premises of the laborers, sometimes on the premises of the sub-contractor, and often amid unsanitary surroundings and with excessive hours of labor. This use of the term, however, is erroneous, for sub-contracting may be, and often is, practiced without the injurious results popularly associated with it. The system of sub-contracting obtains largely in iron and steel rolling, in which trades labor is as highly paid as in any others. The practice is coincident with but not inseparable from what is meant by sweating. An accurate definition of this term can not be given. The House of Lords' select committee in their report attempted several, but none is satisfactory. Indeed, the chairman, Lord Derby, said later: "We endeavored . . . for some years to ascertain what meaning attached to the word 'sweating,' and we never could find any." The reason is that, while the evils which the term sweating has been selected to describe undoubtedly exist, there can properly be no such thing as a sweating system. The so-called system is characterized by the absence of system, by the lack of those very features which denote the factory system or general industrial organization. Hence it must be regarded as an excrescence, an abnormal phase of industrial development, which when properly understood may be regulated, and, so far as environment is concerned, rectified. The term "sweating" is in this connection a term of reproach, and was first applied to tailors who took home work that their wives and children might assist them. Later, as Charles Booth pointed out, they found it profitable to do all their work at home. Then they began employing others, thus becoming sweaters instead of being sweated. Among boot-makers the "sweater" is known as the "chamber" or "garret" master. Among other trades it is the sub-contractor or middleman who has been thus nicknamed.

*Extent of the Practice.*—Sweating is an effect of the survival of domestic industry. Factory labor is not subject to it. One must not understand that it can exist only with domestic industry. Before the introduction of organization and protective legislation, factory employees were subject to most of the evils associated with sweating; while to-day, in much of the "house industry" of Germany, whether the workman is his own master or comes in direct relations with the employer-in-chief, there is no complaint. Sweating is common in certain trades—in Europe in tailoring, boot-making, furriery, needlework of all kinds, nail and chain making, and dock labor; in the U. S. the practice is almost exclusively confined to tailoring and other kinds of needlework, the preparation of feathers, the manufacture of cigars, artificial flowers, and fancy leather goods.

The tailoring trade is the employment in which sweating is chiefly practiced. To describe the process will be of most service. The wholesale clothier supplies the cloth, which in many cases also is cut and trimmed in his own workshops. The goods are then farmed out to contractors, for the most part Jews, to be made up and returned at a fixed price per garment. The contractor is generally the lessee of a small room, usually attached to his own lodgings in a tenement-house. In this room two or three "teams" of workers are employed—a machine-man, a baster, and a finisher constituting a "set." Wages are fixed on a piece basis. Where, for example, $7 is allowed for making up two dozen coats, $3 goes to the machine-man, $2.50 to the baster, and $1.50 to the finisher. The laborer must frequently work sixteen or eighteen hours in order to earn a nominal day's pay. The sweater works with his hirelings, overseeing them and often, doubtless, driving them to do their utmost. Sometimes his own margin of profit is so small that he is compelled to do this for protection against loss; but he is not always a pitiless taskmaster, and is besides on a footing of fair equality with his employees. Larger sweaters receive the cloth from wholesale clothiers, and cut and trim it in shops of their own, making up part of it on the premises and distributing the remainder among families working in their homes.

The essential features are as follows:

1. *Sub-contracting.*—The profits of the middleman are dependent upon the service he employs. Sub-contracting applied to unskilled or poorly skilled work makes competition painfully acute, and irresistibly reduces both contract and piece prices to the lowest possible minimum. Sub-contracting has developed particularly in the clothing business because the trade remains to a large extent a domestic industry, and can be pursued by women with other household occupations, because this method enables the wholesaler to save the cost of rent and superintendence, and to hold back his capital from investment in goods till the last moment, because it permits him to meet seasonal requirements by letting a large or small number of contracts as his exigencies demand, and because a very few dollars is all a middleman needs to start business. There is a tendency to do away with the middleman altogether, as is shown by large houses in London establishing workshops in the East End, and by New York dealers opening shops in outlying country districts, where rentals to home-workers will be less than in the tenements.

2. *Irregularity of Employment.*—This is common to all domestic industries. Large and well-organized establishments find it cheaper to run continuously than to stop during the dull seasons. No such condition exists in the sweated trades. Coupled with this is the evil of abnormally long hours of labor, which follow partly as a consequence of the above and partly because the small master works with his employees.

3. *Low Wages.*—These are due to several causes, among which are competition among sub-contractors, remuneration made to depend upon profits, the presence of a surplus of unskilled labor in cities, and the fact that much of the work can be performed by women who are only auxiliary supporters of the family. In certain cities of the U. S. there is the additional factor of an immense immigrant population, many of them Jews, and all having a relatively low standard of existence as well as endowed with patience and subserviency. It must be borne in mind that all persons working under the sweating system are not paid starvation wages. The skilled contingent commands fair remuneration. Because so much of the work is bad, and need only be so, is one reason why it is cheap. The proportion being large, the number of laborers in receipt of meager earnings is naturally also large. Failure to discern this fact has led to confused notions in reference to sweated trades. Low wages accompany inferior efficiency. The sweating system furnishes aggravated cases.

4. *Insanitary Conditions.*—These naturally result from using the dwelling as a workshop, particularly if lodgers are taken to make up the required "set." The evil is probably augmented in cities where this class of people live in tenement-houses.

What are the remedies, and how shall they be applied?

1. The most important is reorganization of the sweated trades. The main features of such reorganization are the development of large shops, substitution of superintendents remunerated by fixed salary for middlemen contracting by the job, and trades-union organization among workers. The second feature is especially important, and will probably come about as the first one grows. Large sweat-shops, which not uncommonly are severely condemned, are in reality not only better conducted than "gang-sweating" or "home-working," but are performing a useful step in the evolution of the industry from house to factory. Labor organization among unskilled and over-crowded occupations is a difficult matter, but the London dockers and the boot and shoe operatives in Massachusetts furnish evidence that it is feasible, and that much may be thereby accomplished.

2. Licensing by municipal authority, under stringent regulations as to cleanliness, use of sleeping apartments for work-rooms, employment of persons outside the family, and precautions against infectious diseases. Tagging tenement-made garments under penalty of a good-sized fine is also an effective provision.

3. Adequate inspection service for sweat-shops, large and small. Only in this way can health and morality be subserved.

There are no reliable statistics showing the extent to which sweating is practiced. The evils associated with the system are concomitants rather than products. Most of them are incident to lack of skill, physical inefficiency, moral weakness, and other factors which make for poverty.

E. R. L. Gould.

**Sweden** [deriv. of *Swede*: Fr. *Suède* (*Suédois*): Germ. *Schwede*. Cf. Swed. *Svear*: Icel. *Svīar*: O. Eng. *Swēon*, Swedes]: one of the confederated kingdoms of Sweden and Norway, occupying the eastern slope and southern end of the Scandinavian Peninsula, with Öland and Gothland islands (see map of Norway and Sweden). Area, including lakes, 172,876 sq. miles; pop. (1899) 5,097,402, or 29·5 per sq.

mile. The most of the boundary with Norway is formed by the watershed of the Kiölen Mountains, and that with Finland by the Torneå river and its branches.

*Topography.*—The coast is 4,740 miles long, of which 4,100 are on the Baltic and Gulf of Bothnia, the remainder on the Cattegat and Skager Rack. The fiords are few, and the adjoining seas generally shallow, with gentle slope. The coast is bordered by a narrow ribbon of islets called the *skärgård*, rocky and bare on the west coast, but green and fertile on the east. The Sound, 2½ miles wide at its narrowest part, separates Sweden from the nearest point of Denmark. The islands are most numerous about Stockholm.

The Baltic slope of the peninsula is gentler than the Atlantic one, and in Norrland (the northern part of Sweden) it descends in a series of terraces, giving its rivers alternately gentle courses, when they expand into lakes, and rapids, or cataracts. The southern part of Sweden or Gothland has a good development of rocky hills, and is separated from the central part, or Svealand (Sweden proper), by a broad low land filled with great lakes. The extreme south is ancient Skania, and is very fertile. Northern Gothland is relatively arid. Beyond Stockholm is Upland, the classic ground of Sweden, consecrated to ancient traditions. Dalecarlia, N. W. of Stockholm, and on the Norwegian frontier, is a beautiful and picturesque land with gay, hardy, and independent inhabitants; here Gustavus Vasa found the support necessary to overthrow the tyrannical Christian.

The highest mountains are in or near the Norwegian frontier, from 66° to 68° N. lat. The highest known is Kebnekaise, or Ivanstenen, in lat. 68° N.—more than 7,000 feet high. Sulitelma, 2° farther S., and long considered the highest mountain in Sweden, is 6,154 feet high. The culminating points of Norway are considerably higher. Sweden is not properly mountainous; it only descends a long and relatively gentle slope. Glaciers are very numerous in the north, covering a total area of 150 sq. miles. The largest are about Sarjektjokko (6,825 feet high, and between the two mountains above named), where on a surface of 460 sq. miles they cover 70. The glaciers are reported as growing.

*Rivers and Lakes.*—A score or more of rivers descend the slopes, form lakes in their course, have a length of 150 to 250 miles, and empty into the Bothnia or Baltic. The quantity of water they pour into the Bothnia keeps it almost fresh. The innumerable lakes occupy one-twelfth of the entire surface. They are generally small, but about thirty have an area of 40 sq. miles or more. The largest is the Wener, between Gothland and Svealand; area, 2,150 sq. miles; 144 feet above the sea; greatest depth, 295 feet. The second in size is Lake Wetter, a few miles S. E. of the preceding; area, 733 sq. miles; 290 feet above the sea; greatest depth, 410 feet. It is celebrated for the beauty of its shores, the clearness of its waters, its fogs, and its sudden storms. Lake Mälar, the third in size, and penetrating Stockholm, fiord-like in form, is only a few inches above the Baltic, and is divided into a series of levels but a few inches apart. It is said to have 1,200 islands.

*Climate.*—The climate is very mild for the latitude, and storms pass usually W. or S. The annual precipitation is from 10 to 40 inches, and is greatest on the southwest coast. It is said that the harvests are fifteen days later than in the eighteenth century.

*Geology and Mineral Products.*—Primitive crystalline and azoic rocks cover the most of the country, and the chief metalliferous beds are in the upper layers of these. Cambrian and Silurian rocks are not rare, and some Triassic and Cretaceous exposures are found. The Glacial period was an important one in Sweden, and has left traces everywhere. Mining is an important industry, and the production of iron is large. The chief districts are the Gellivara, within the Arctic Circle, and the Dannemora, in Upsala. In 1899 the chief mineral products were as follows: Pig iron, 489,231 tons, and bar iron, 335,706 tons; iron ore, 2,434,606 tons (1,400,801 exported in 1898); coal, 239,344 tons: gold, 234 lb.; silver, 5,047 lb.; lead, 3,540,396 lb.; copper, 394,196 lb. Zinc and manganese are also produced, and cobalt and nickel are found.

*Fauna and Flora.*—The fauna and flora must have migrated into Sweden after the Glacial period, and are more Finnish than German. The forests are very extensive, covering two-fifths of the area, and are characterized by spruces and birches to the north, pines and oaks in the center, and beeches in the south. The reindeer are nearly all domesticated, but the large pasturage area they require and their tendency to epizoötic diseases greatly limit their usefulness. The bear, wolf, lynx, and glutton are disappearing, while the fox and elk appear to be increasing, and the roe-deer is extending its range farther N. The swan is a common visitant of the lakes.

Food-fish are very abundant, and include, in fresh water, the salmon (by far the most important), the eel, pike, perch, and turbot; in salt water, the herring (by far the most important), flatfish, cod, mackerel, and sprats. The herring of the east coast are much smaller than those of the west.

*Products.*—The climate and soil are not very favorable for agriculture, but this is made up by the care given to the art. Only one-fifteenth of the area is cultivated; one part in ninety-two in Norrbotten, but one-third in Malmöhus. Barley and potatoes reach 68° N. lat.; rye passes N. of Haparanda, at the north end of Bothnia; wheat, formerly cultivated only S. of Stockholm, reaches the Dal river, 75 miles farther N. The farms are generally small, but they give occupation to about half of the population. The largest area is in oats, but the largest agricultural crop is potatoes. Horses are relatively numerous (one to every ten persons), due to the character of the roads. The stock generally is of poor native races, but the dairy industry is growing rapidly, as London is an accessible and profitable market.

*Divisions.*—The country is divided into twenty-four governments besides the city of Stockholm, as follows:

| GOVERNMENTS (LÄN). | Area, square miles. | Est. pop. Dec. 31, 1899. |
|---|---|---|
| Stockholm (the capital) | 13 | 302,462 |
| Stockholm (rural district) | 3,015 | 167,053 |
| Upsala | 2,051 | 123,774 |
| Södermanland | 2,631 | 166,363 |
| Oster Gothland | 4,267 | 277,553 |
| Jönköping | 4,447 | 201,572 |
| Kronoberg | 3,825 | 158,938 |
| Kalmar | 4,443 | 227,730 |
| Gothland | 1,219 | 52,586 |
| Blekinge | 1,164 | 145,563 |
| Christianstad | 2,486 | 219,407 |
| Malmöhuus | 1,866 | 404,306 |
| Halland | 1,900 | 141,954 |
| Goteborg and Bohus | 1,948 | 331,841 |
| Elfsborg | 4,938 | 278,589 |
| Skaraborg | 3,280 | 241,922 |
| Wermland | 7,435 | 254,175 |
| Orebro | 3,498 | 193,993 |
| Westmanland | 2,625 | 147,227 |
| Kopparberg | 11,522 | 214,861 |
| Gefleborg | 7,614 | 234,348 |
| Westernorrland | 9,837 | 229,011 |
| Jemtland | 19,712 | 110,492 |
| Westerbotten | 22,754 | 141,830 |
| Norrbotten | 40,870 | 129,852 |
| Lakes Wener, Wetter, Mälar, Hjelmar | 3,516 | ........ |
| Totals | 172,876 | 5,097,402 |

*Population.*—The population has shown for 150 years a considerable surplus of females (1,065 to 1,000 males); it has also shown a steady growth of nearly 1 per cent. per annum. The last is in spite of a considerable emigration to America, and is due to the high birth-rate, and not to immigration, which is very small. About 10 per cent. of the births are illegitimate, due not to immorality but to thrift and narrow circumstances; the parents usually marry later. The Finns number about 17,000; Lapps, 6,500; Jews, 3,000; other foreigners, 15,000. Aside from these, the Swedish type is pure and unmixed, and the ancient division into Göta (Goths) and Svea (Swedes) has about disappeared. The Lutheran is the state church, and other religions, though tolerated, are few. Education is compulsory, schools of all grades are numerous (including two ancient and highly esteemed universities, at Upsala and Lund respectively), and the percentage of illiteracy is evanescent. Serious crimes are relatively rare, but pauperism is large and increasing.

*Imports and Exports.*—The value of the annual imports is about $100,000,000, chiefly textiles, colonial wares, and coal; the annual exports are valued at $90,000,000, chiefly timber, animals and their products, and ores. Germany is the chief importer, Great Britain the chief buyer. The merchant navy consists of about 1,500 craft of over 100 tons burden, one-third steamers. Gothenburg is the most frequented port, Stockholm next, and 22,000 vessels visit Swedish ports annually.

*Railways.*—The railways have a length of 6,433 miles (1898), of which 2,283 miles belong to the state. The most noteworthy railway is that which connects Stockholm and Trondhjem in Norway, and the most northern railway in the world is the one which extends from the head of Bothnia northward to Gellivara and beyond, and is in process of construction to Ofoten Fiord, on the Norwegian Polar Sea.

*Government.*—Sweden has her own constitution, and governs herself, except for foreign affairs. Her system of government is the outgrowth of centuries of history, like that of Great Britain. The king is intrusted with the executive, and is aided by a council of state of ten ministers. Taxation and legislation (the latter subject to the king's veto) are intrusted to the two elective houses of a parliament, one of 150 unpaid members holding for nine years, the other 230 paid members holding for three years. The government of the twenty-four provinces is in the hands of prefects appointed by the king, but local affairs are administered by communal and municipal councils. The municipalities are limited to cities of over 25,000 inhabitants, and are at present Stockholm, Gothenburg, Malmö, Norrköping, and Gefle. The total revenue is about $27,000,000, collected chiefly from customs ($10,000,000), from land taxes and state property ($5,000,000), internal revenue (as stamps, spirit licenses, income tax), from the post-offices, and from the profits of the national (Riks) bank. One-third is expended on the army and navy; one-fortieth only on the royal household. The public debt is $85,000,000 (1899), contracted for state railways. The army is small, and the navy is intended only for coast defense. See ARMY and SHIPS OF WAR.

*History.*—The early mythical history of Sweden is dignified and attractive, and the gods of the Northmen displayed their chief activity in Svealand. The Goths, who played so important a part in the downfall of the Roman empire and the reconstruction of Europe, seem to have come from Gothland. Authentic history begins about 1,000 A. D., when Olaf became a Christian. The people did not accept Christianity for 150 years, and pagan ideas and customs lingered long after. The dissensions between Goths and Swedes were healed about 1300, and their amalgamation has continued since without serious interruption. The early history was terminated in 1389 by the battle of Axelwalde, when Queen Margaret of Denmark and Norway, a striking historical figure, took the Swedish king Albert prisoner, and the union of the three Scandinavian countries was confirmed in 1397 by the act called the Union of Calmar.

Sweden was very restive under the union, and tried repeatedly to break away, but without permanent success, until led by Gustavus Vasa (1523). With this king began the brilliant period of history which made Sweden one of the first powers of Europe, gave her extensive lands to the S. and E., and made her at one time the leader and defender of Protestantism. During this period appeared his grandson, Gustavus Adolphus, one of the most gallant figures in all history, and by far the greatest of Swedish kings, and the period ended with the resignation of his daughter Christina in 1654. Then follow 150 years of decline, during which Sweden was robbed both of her influence and her foreign possessions, until Gustavus IV. (1792–1809) proved so impotent and perverse that he was dethroned and his posterity repudiated.

Charles XIII. was then elected (1809–18), but was childless, and Marshal Bernadotte was invited to become crown prince. He accepted and founded the present line, under which Sweden's progress has been steady and secure. See SWEDEN, HISTORY OF, in the Appendix.

See article SWEDEN AND NORWAY; also NORWAY and DENMARK. See also Wood's *Sweden and Norway* (1882) and Löfström's *Swedish Statistics* for the World's Columbian Exposition (1893). MARK W. HARRINGTON.

**Sweden and Norway**: a federated kingdom occupying the Scandinavian Peninsula. The combined area is 297.321 sq. miles, and the population at the beginning of 1891 was 6,785,898; Sweden has nearly three-fifths of the area and three-fourths of the population. For details, see the articles NORWAY and SWEDEN. The federation was formed in 1814, and goes little further than allegiance to a common king and a common interest in foreign affairs. The king is Oscar II. of the house of Ponte Corvo founded by Bernadotte. The law of succession is the same in the two countries. The common affairs are decided upon by a council of state composed of Swedes and Norwegians. The federation is not without political friction, and is less satisfactory to Norwegians than to Swedes. MARK W. HARRINGTON.

**Swe′denborg**, EMANUEL: theologian; b. in Stockholm, Sweden, Jan. 29, 1688. His father, Jesper Swedberg, was Bishop of Skara in West Gothland, and was charged with the care of the Swedish churches in England and in the North American colonies. His family was ennobled by Queen Ulrica in 1719, and took the name of Swedenborg. He was educated at Upsala and then traveled widely through Europe. He attained to great eminence by his writings upon mathematics and mechanics, and later on the natural sciences and on finance. In 1716 he was made assessor of the board of mines by Charles XII. He assisted the king at the siege of Frederickshall in 1718 by transporting some vessels over 14 miles of land by machines he invented.

He had always been a thoroughly religious man, but for a few years before 1745 his diaries and note-books (which have been published to the extent of twelve or more 8vo vols.) show that he was changing the direction of his studies from the physical and natural to the psychical and spiritual. In that year, he tells us, he "was called to a new and holy office by the Lord himself, who manifested himself to him in person, and opened his sight to a view of the spiritual world, and granted him the privilege of conversing with spirits and angels." In 1747 he resigned his office of assessor, which he had held for thirty years, requesting that half of his salary might be continued to him. The king accepted his resignation, and granted him a pension for life equal to his full salary. He wrote to a friend: "My sole view in this resignation was, that I might devote myself to that new function to which the Lord had called me. On resigning my office a higher degree of rank was offered me, but this I declined, lest it should be the occasion of inspiring me with pride." From 1749 to 1756 he published the *Arcana Cœlestia* in eight 4to vols.; in 1758, *An Account of the Last Judgment and the Destruction of Babylon*; *On the White Horse mentioned in the Revelation*; *Heaven and Hell*; *On the Planets in our Solar System and in the Starry Heavens*, and *On the New Jerusalem and its Heavenly Doctrines*; in 1763, *The Doctrines of the New Jerusalem concerning our Lord*, same *Concerning the Sacred Scriptures*, same *Concerning Faith*, same *Concerning Life*, a *Continuation concerning the Last Judgment and the Destruction of Babylon*, and *Angelic Wisdom concerning the Divine Love and Wisdom*; in 1764, *Angelic Wisdom concerning the Divine Providence*; in 1766, *The Apocalypse Revealed*. He had written a much larger work, *The Apocalypse Explained* as far as the tenth verse of the nineteenth chapter, which he did not publish, nor, as far as is known, finish—it has been published since his death; in 1768, *The Delights of Wisdom concerning Conjugial Love*; in 1769, *A Brief Exposition of the Doctrine of the New Church*, and a small work entitled *The Intercourse between the Soul and the Body*, which is called in the English translation *A Treatise on Influx*. In 1771 he published his last work, *The True Christian Religion, containing the Universal Theology of the New Church*. He also left voluminous manuscripts, of which Dr. J. F. S. Tafel, professor and librarian in the University of Tübingen, published many. After the publication of the *True Christian Religion* he went to London, and while there, on Christmas Eve in 1771, he was struck with hemiplegia. After a few weeks he recovered his speech, and his faculties were clear to the last. His strength gradually declined, and he died Mar. 29, 1772.

He has never been charged with imposture, and they who think he was insane must rest that opinion on the fact that for more than twenty-five years, with brief intermissions, he claimed that he was in the spiritual world whenever he wished to be there, and published what would fill volumes of things there seen and heard. The best edition of his works is by R. L. Tafel (10 vols. fol., Stockholm, 1869–70); many are published in English translation by the New Church publishing societies (e. g. New York). See his *Life*, by B. Worcester (Boston, 1883). For an abstract of his doctrines, see NEW JERUSALEM, CHURCH OF THE.

Revised by S. M. JACKSON.

**Swedish Green**: See SCHEELE'S GREEN.

**Swedish Language**: genetically, a member of the Scandinavian division of the Teutonic group of languages. With Danish it forms the minor group East Norse, as distinguished from West Norse, made up of Icelandic and the modern popular dialects of Norway. Its present territory is the kingdom of Sweden, together with neighboring parts of Russian Finland and Esthonia. Chronologically, two main periods are recognized in the history of the language, viz., Old Swedish, from the end of the Viking age to the Reformation, in round numbers from 1050 to 1540; and Modern Swedish, from the Reformation to the present time.

The linguistic separation of the Scandinavian north falls within the Viking age (700–1050). Down to the year 1000, however, although local differences are visible even early in the period, the language is still, to all purposes, homogeneous, and only after the introduction of Christianity, at the middle of the eleventh century, do distinct dialects arise; namely, Swedish-Danish and Norwegian-Icelandic. The latter was not strictly differentiated until the beginning of the thirteenth century, the former not until its end. The material for the history of the earliest period of Swedish is contained in runic inscriptions, in all nearly 2,000, most of them from the eleventh and twelfth centuries. The oldest extant MS. is from the end of the thirteenth century (1281), after which time a native literature began to appear. The linguistic territory of Old Swedish comprised modern Sweden, with the exception of parts of the west which were Norwegian, and the southern provinces of Skaane, Halland, and Blekinge, which were Danish, besides, and to a greater extent than at present, coast regions of Finland, Esthonia, and Livland. The language of the period shows numerous local differences, but only in one case, the dialect of the island of Gothland, which is frequently described in contradistinction to Old Swedish as Old Gutnic, are they sharply defined. A common national language, a movement toward which is distinctly visible after 1350, gradually developed itself in the main out of the middle Swedish dialect of Södermanland.

Modern Swedish is the continuation, in direct descent, of the Old Swedish dialect of the midland provinces of Södermanland and Ostergöthland, which even in Old Swedish shows few local differences. Its beginning is coincident with the Reformation, and its first important literary monument is the translation of the Bible, the so-called Gustavus I. Bible of 1541. The language may be said to have assumed its present appearance early in the eighteenth century. The important external modifications from Old Swedish down were first the introduction of a multitude of Low German words into the vocabulary during the fourteenth and fifteenth centuries, principally as a consequence of commercial connection with the Hanseatic League. A Danish influence, the result of political conditions under the Danish sovereigns from the end of the fourteenth century to the beginning of the sixteenth, made itself widely felt, not only in the vocabulary by the introduction of Danish words, but in phonology and inflections. A second influx of German words came in with the Reformation. A reactionary tendency which looked toward the displacement of foreign elements and the rehabilitation of older words and forms has several times shown itself. This movement was directed at the beginning of Modern Swedish in the sixteenth century against Danicisms. In the latter half of the seventeenth century many words were introduced from Old Swedish and Old Icelandic, a process repeated in the nineteenth century by the further reinstatement of Old Swedish forms and the adoption of words from the spoken dialects.

Internally, the general tendency of the language from the fourteenth century down has been toward weaker phonetic conditions and simpler inflectional forms. At the beginning of the eighteenth century the Old Swedish system of inflections had to a great extent disappeared, and present conditions already prevailed. Some of the changes then observable date, however, from an earlier period. In the fifteenth century, for instance, falls the use of the ending *-s* for all genitives, and the displacement of the first plural of verbs by the third. In the sixteenth and seventeenth centuries all case-declension was lost in adjectives, and nominative, dative, and accusative in substantives were merged in a single form.

Swedish and Scandinavian language is distinctively characterized by the use of the suffixed definite article with substantives, and the formation of a passive voice of verbs by the addition of the reflexive pronoun, Swedish *-s*, to the corresponding active form. As an East Norse dialect it has, in common with Danish, as important characteristics the change of the diphthongs *ei*, *au*, and *ey* to the long vowels *e* and *ö*, respectively; the almost total absence of *u*-umlaut, and the passive form in *-s* (Icel. *-st*). In contradistinction, however, to Danish, which has throughout weakened the vowel of the inflectional ending to a voiceless *e*, Swedish has, in many instances, retained *a* and *o*; final *k*, *t*, *p* remain in Swedish after a vowel where they are weakened to *g*, *d*, *b* in Danish. Swedish has, in point of fact, on the whole much better preserved archaic phonetic conditions, although it has gone almost as far as Danish in the simplification of its grammar. As in Danish, but a single case-ending, genitive *-s*, occurs with substantives; neither the strong nor the weak adjective has inflection for case. Unlike Danish, where there is throughout no distinction of person in the verbal conjugation, Swedish has a distinctive form in the second person plural, and the threefold gender of substantives has been retained.

Swedish is still spoken in a number of dialects, some of which, like forms in Dalecarlia and the island of Gothland, notably deviate from the literary language. Generically, they may be arranged in a northern, middle, southern, and Gothland group. The northern or Norrland group includes, besides North Swedish proper, the dialects of Finland and Esthonia. The southern group is spoken in language territory once Danish, to which it is morphologically akin. Middle Swedish, out of which the literary language proceeded, shows the least dialectic differentiation, and now, as always, most nearly approximates the literary form.

For the pronunciation of Swedish, see Henry Sweet, *A Handbook of Phonetics* (Oxford, 1877). An exhaustive scientific treatment of the older language is contained in the chapter by Adolf Noreen, *Geschichte der nordischen Sprachen*, in Paul's *Grundriss der Germanischen Philologie* (vol. i., Strassburg, 1891); E. C. Otté, *A Simplified Grammar of the Swedish Language* (London, 1884). See also S. E. Rydquist, *Svenska språkets lagar* (4 vols., Stockholm, 1850–70), an historical grammar of the Swedish language, in Swedish. WILLIAM H. CARPENTER.

**Swedish Literature:** the literature of the Swedish people.

*Heathen Age.*—Although few fragments remain, it may be assumed that Sweden produced various literary works before the introduction of Christianity. The laws, which were given a written form in the following period, were composed much earlier, several runic inscriptions and figures, notably those of *Röksten* and *Ramsundsborg*, point to poetical works similar in character to the poetry of Iceland-Norway, and finally in the preface to *Þidreks saga af Bern* reference is made to the existence of a great body of lays in Denmark and Sweden.

*Mediæval Period.*—The influence of Christianity on the literature of Sweden made itself felt even later than on that of Denmark. Not until the middle of the thirteenth century did any Christian writings appear, but from that time great activity was displayed in the cloisters. The earliest theological writer of importance is Magister Matthias (d. about 1350), canon of Linköping and St. Birgitta's teacher, who is supposed to have made the first translation, or rather paraphrase, of a portion of the Old Testament (before 1340). During this century and the two following centuries other books, both of the Old and the New Testament, were put into Swedish. (See G. E. Klemming, *Svenska Medeltidens Bibelarbeten* 1848–55.) Matthias was also the author of commentaries on the Bible, originally written in Latin but afterward translated into Swedish. The only other religious prose work from this period that deserves special mention is *Heliga Birgittas Uppenbarelser* (The Revelations of St. Birgitta), "the first Swedish work that entered into the world's literature." (See BIRGITTA, SAINT.) It is full of warmth and originality and abounds in bold images. Of far greater importance is the influence exerted by Birgitta throughout the North, both on religion and literature. In the cloisters of her order a great mass of native writings was preserved and produced. The efforts of her followers were directed mainly toward translating continental mystical writings into Swedish. She encouraged the use of the Swedish language in the pulpit, and consequently a great mass of sermons, both in Danish and Swedish, must have been produced during this period, comparatively few of which, however, have been preserved. Of these only one, the Danish *Postille*, was printed before the Reformation. For specimens of Swedish sermons, see Klemming's *Svenska Medeltids-Postillor* (1879).

Swedish literature is remarkably rich, as compared with Danish, in legendary compositions. The most important collections are the so-called *Fornsvenskt Legendarium*, a translation of the *Legenda aurea* of Jacobus de Voragine, made shortly after the appearance of the original, but preserved in a MS. from 1350 (ed. by George Stephens, 1847–74), and *Vitæ Patrium*, in a MS. from 1385 (ed. by Klemming). Somewhat similar in character to these legends are the collections of miracles, of which a great number existed, both in Denmark and Sweden. Here may also be mentioned the narratives *Barlaam och Josaphat* and *Sju vise mästare* (The Seven Wise Men). These last two and many other mediæval prose works are contained in Klemming's *Prosadikter från Medeltiden* (1889).

Of secular prose literature the most important work is *Om Styrelse Kununga ok Höfdinga* (Concerning the Government of Kings and Princes; ed. with Latin translation and notes, Copenhagen, 1669), an adaptation in part of Egidius Romanus's *De Regimine principum*, written about the middle of the fourteenth century. See K. F. Söderwall, *Studier öfver Kununga-Styrelsen* (1880).

In historical writings Sweden must yield the palm to Denmark. The earliest prose history is the *Chronica Gothorum* (1470) of Ericus Olai (d. 1486), a dry annal written, like all the works of this class, in Latin, but later translated into Swedish. Of far greater interest are the rhymed chronicles, in which Sweden anticipated her sister kingdom of Denmark by a century. The oldest of these is the *Erikskrönika*, which treats of the strife between King Birger and his brothers Erik and Waldemar. It is undoubtedly the work of one who lived at the time the events described occurred. These close with the year 1320. Others are *Nya Krönika* and *Lilla Rimkrönika*, all written in Swedish. See Klemming's *Svenska Medeltidens Rimkrönikor* (1865–69).

In addition to the *Eufemia viser* (see DANISH LITERATURE), Swedish translations of a number of other romantic works exist from the Middle Ages. The first of these, following shortly after the *Eufemia viser*, is *Alexander*, made in 1380 under the direction of Bo Jonsson Grip from the Latin prose tale *Historia de Proeliis*. All have been edited by Klemming.

The principal original poetical production of this period in Swedish is found in the popular ballads (*Folkvisor*). It may be assumed that at least some of them were composed as early as the twelfth or thirteenth century in Denmark on Saxon models, and from there carried into Sweden. The later development of the ballads is practically the same in Sweden as in Denmark. The best collections of Swedish ballads are Geijer and Afzelius's *Svenska Folkvisor* (3 vols., 1814–16). Later edition by Bergström and Höjer (1880) and A. I. Arwidsson's *Svenska Fornsånger* (3 vols., 1834–42).

The oldest Swedish works in the vernacular are the provincial laws, which are derived in their original form from the heathen period, although they were not reduced to writing until much later. (See SCHLYTER.) The earliest of these and the oldest Swedish MS. in existence is the *Vestgötalag*, codified at the beginning of the thirteenth century, and preserved in a MS. from the end of that century. Besides the provincial there were also town laws, guild laws, and court laws.

*From the Reformation to 1640.*—Although the new doctrines were officially introduced into Sweden at the parliament of Vesterås (1527), they met with much opposition from all classes, and were not finally accepted by the people until 1593. Their influence upon the literature, however, was immediate and far-reaching. As in Denmark, this showed itself in the beginning chiefly in theology. In 1526 the New Testament was translated into Swedish by Laurentius Andreæ (1482–1552), the earliest leader in the movement, and in 1540–41 the whole Bible was given a native dress under the direction and largely by the actual labor of Laurentius Petri (1499–1573). Olaus Petri (1497–1552), a brother of Laurentius, rendered good service to the language as well as to religion by *Een liten postilla* (A Short Sermon) and *Den svenska messan* (The Swedish Mass, 1531), the foundation of the present Swedish Church service. He is the author of the first Swedish hymnal, *Någre Gudhelige Wisor, utdragne af den Heliga Skrift* (1530), which was followed by two other collections, partly original, partly translated from the German. His brother also composed a number of hymns; with these exceptions the period is extremely bare in religious poetry. A similar poverty is shown in secular poetry, the only works of any importance being the rhymed chronicles, of which may be mentioned the later redaction of *Lilla rimkrönika* (1520), Daniel Hansson Hund's (d. 1611) *Konung Erichs den XIV.'s Krönika, etc.*, and Karl IX.'s *Rimkrönika*. The separation from Denmark and the triumphs of Gustavus Vasa served to arouse the national enthusiasm, which found expression in numerous histories and chronicles, both in Latin and the vernacular. Olaus Petri's *Svenska krönika* is the first attempt to bring into discredit the claims of earlier writers for the antiquity of Swedish history. Although extremely uncritical, it may be regarded as the precursor of later historical methods. Its effects, however, were not immediately apparent, as Johannes Magnus (1488–1544) in his *Historia de omnibus Gothorum Sueonumque Regibus* (Rome, 1554) traces the royal line back to the Flood. The most prominent historian is Johan Messenius (1579 or 1581 to 1637), author of *Scandia illustrata* (14 vols.), written in Latin verse and prose. Minor historians are Peder Svart (d. 1562), Erik Tegel (d. 1636), Ægidius Girs (about 1580–1639), and Axel Oxenstjerna (d. 1654). The only prominent name in the first half of the seventeenth century is that of Johan Bure, or Bureus (1568–1652), the founder of the study of northern antiquities in Sweden. His influence upon the following period, especially through his connection with Stjernhjelm, was very great.

The only known specimen of dramatic literature in Sweden before the sixteenth century is a translation of the Latin *De uno peccatore, qui promeruit gratiam*. The earliest original school-drama preserved is *Tobiæ Comödia* (1550), attributed to Olaus Petri (ed. by Manderström, Stockholm, 1849). This was followed by a number of others, all in the vernacular, the subjects being taken from the Old Testament. The best of these is *Holofernis och Judiths Comödia*, by an unknown author. Gradually the original didactic element gives place to the æsthetic, the subjects being taken from profane history and from legends. A still further advance is marked by the treatment of national history. In this latter respect the Swedish drama is in strong contrast to the Danish, which with one exception shows no choice of national subjects until the middle of the eighteenth century. The earliest profane drama is *Een lustigh Comœdia vid namn Tisbe* (A Merry Comedy by the Name of Thisbe), probably by Magnus Olai Asteropherus (d. 1647), produced in 1610 (ed. by C. Eichhorn, Upsala, 1863). In this play the moralizing of the school drama is for the first time wholly absent. The most original dramatic author of the period is Johan Messenius. He planned to represent Swedish history in fifty plays, only six of which were completed. The first of these, *Disa* (1611), marks the beginning of the Swedish national drama. The national character of the plays is increased by the introduction of ballads, many of them original with the author, and the representation of peasant types (ed., with the exception of *Gustavus I.*, by H. Schück, Upsala, 1886–88; see also G. Ljunggren, *Johan Messenius som dramatisk författer*, Nord. Univ. Tidskr., 1862). Andreas Johannes Prytzz (1590–1655) wrote two religious-historical plays, *Olof Skottkonung* (1620) and *Comœdia om konung Gustaf I.* (1621), which display considerable satirical power. The school-dramas continued to be written and performed until the end of the seventeenth century.

*Period of Sovereignty* (*Stormakt*), *1640–1719.*—The political brilliancy of Sweden during the seventeenth century was reflected in education, literature, and science. Gustavus Adolphus was not only a great soldier and statesman, he was also a patron of letters and a writer of decided ability. Through his efforts elementary and high schools and gymnasiums were established, the University of Upsala was given new dignity and importance, and the intellectual formalism of the Reformation was replaced by a real culture. His example was nobly followed by his successors, Queen Christina, Charles XI., and Charles XII. The University of Lund was founded (1668), several scientific institutions were established, foreign scholars, among others Descartes and Hugo Grotius, were invited to Sweden, and many of the leading men of the country both encouraged learning and made contributions of their own. As a result of the newly acquired national pride, great interest was displayed in history, especially that of Sweden, but with the exception of Olof Rudbeck, the principal historical writers of this period were foreigners—Chemnitz, Puffendorf, and others. Attention was also directed toward the study of archæology, linguistics, and similar subjects. Olof Verelius (1618–82) translated many of the Icelandic sagas, and Johan Peringskiöld (1654–1720) translated the *Heimskringla*. The investigation of Sweden's legal system was begun in this period under the direction of Johan Stjernhöök (1596–1675), called the father of Swedish jurisprudence. Philosophy was almost wholly under the influence of Descartes, but Bishop Anders Rydelius (1671–1708), the first great Swedish philosopher, displays considerable originality. In anatomy and botany Rudbeck made many important discoveries. Urban Hjärne (1641–1724) did good service in attacking the superstitions of his time, especially the belief in witchcraft. The great mystic EMANUEL SWEDENBORG (*q. v.*) was in early life distinguished for his studies in mathematics and mineralogy. The most marked feature of the literary and scientific production of this period is originality.

The interval between 1640 and 1740 is often called the Stjernhjelm period, partly from the fact that Georg Stjernhjelm (1598–1672) was its greatest poet, but far more because the influences introduced by him continued to prevail long after his death. He has with sufficient accuracy been called the father of Swedish poetry; he might more properly be called the creator of modern Swedish literary expression, for it is due chiefly to his efforts that Swedish has become the most melodious of the Scandinavian tongues. It was not until after he had reached middle life that Stjernhjelm discovered his poetical genius in the long didactic poem *Herkules*. Filled with an enthusiasm for classic literature and his native tongue, he introduced his countrymen to the teachings of the Renaissance and showed them how this foreign element could be welded with the national language and character. He was the first in Sweden to make use of the hexameter, the alexandrine, the sonnet, the epigram, and the humorous lyric. The latter, in the hands of Bellman, was destined to become one of the distinguishing marks of modern Swedish poetry. His successors, while continuing his efforts to refine and expand the language, contributed but little of real poetic worth. Among them may be mentioned Samuel Columbus (1642–79), a pupil of Stjernhjelm, called the Swedish Flaccus from his *Odæ Suethiecæ*; Peter Lägerlöf (1648–99), author of a number of graceful songs and hymns; Johan Runius (1679–1713), whose collection of poems *Dudaim* was the most popular of his time; and Lasse Johansson (*circa* 1640–74), called from his pseudonym *Lucidor den olycklige*. By the side of this classical school appears a pseudo-romantic, largely influenced by the second Silesian school and by the later Italian poets, which sought to oppose the formalism of Stjernhjelm's successors. In spite of this, however, the poetry of its first prominent representative, Gustaf Rosenhane (1619–84), owes its value to the form rather than to the content. He resembles Stjernhjelm, furthermore, in his warm love of country and in his attempts to introduce new verse-forms, among others the French variety of the sonnet. Gunno Eurelius Dahlstjerna (1658–1709) was possessed of far greater originality, but his talents were hampered by their foreign influence. He also introduced a new verse form, the *ottava rima* with Alexandrines, exemplified in his principal poem *Kungaskald* (The King's Skald). The best hymnists of this period are Håkon Spegel (1645–1714), called the Wallin of the seventeenth century, and Jesper Svedberg (1653–1735). The most interesting prose work of that period is Rudbeck's *Atlantica*.

*Period of Freedom, 1719–72.*—In this period the activity of the preceding time was continued; a number of academies and learned societies were founded, the royal theater was opened, and scientific investigation was carried still further. Among the many scientists were the naturalist Karl von Linné (1707–78), the chemists Torbern Olof Bergman (1735–84) and Karl Vilhelm Schéele (1742–86), the physicist Anders Celsius (d. 1744), and the medical writer Nils Rosén von Rosenstein (1706–73), called the father of Swedish medical science. The most prominent linguist was Johan Ihre (1707–80).

The prevailing foreign influence during this period was the French. This was due to many causes, but its advance was hastened by the marriage of Louisa Ulrika, sister of Frederick the Great, to the Swedish king Adolphus Frederick III. The French influence made itself felt not only on the literature, but also on the whole culture of the period. The dominating figure is Olof von Dalin (1708–63), after whom the latter part of it, from 1740, is frequently named. In spite of his French prejudices Dalin rendered a real service to Swedish prose through the publication of *Den Svenska Argus* (1732–34), modeled on *The Spectator*, the first serious attempt at periodical literature in Sweden. His poetical productiveness was forced by the requirements of his position as court poet. Of Dalin's contemporaries may be mentioned Karl Gustaf Tessin (1695–1770), Anders Johan von Höpken (1712–89), both famous for their eloquence; Jakob Henrik Mörk (1714–63), author of the first Swedish novel, *Adalrik och Göthilda*; Jakob Wallenberg (1746–78), whose *Min son på galejan* (My Son on the Galley) is influenced by Swift and Holberg; Karl Gyllenborg (1679–1746), author of the first modern Swedish comedy; Fru Hedvig Charlotta Nordenflycht (1718–83), who received the title of the Swedish Sappho. Of special interest as illustrating the taste of this period is Gustaf Philip Creutz (1731–85), whose pastoral *Atis och Camilla* was for a long time the most popular Swedish poem. Belonging as much to the following period as to this is Karl Mikael Bellman (1740–95), the first great humorous poet of Sweden. In his treatment of subjects he stood entirely alone, and the moral undertone of his apparently reckless songs fell on deaf ears. His genius did not receive full recognition until after his death, when the frivolous spirit of the French school had given place to the earnestness of the romanticists. He is the only Swedish poet of the eighteenth century who enjoys general popularity.

*Gustavian Period, 1772–1809.*—The pseudo-classic style continued to be cultivated. The Swedish Academy, founded in 1786, was a French Academy in miniature, while the national theater, revived by the king, was as conventional as the Théâtre Français. Opposed to this French movement was a group of writers who sought to develop the national spirit. The leading spirit among the academicians was Johan Henrik Kellgren (1751–95), poet and critic, who deserves the title of the literary dictator of his time. His literary criticisms were published in *Stockholmsposten*, of which he was editor from 1788. After Kellgren's death his place was taken by Karl Gustaf af Leopold (1756–1829), who had the misfortune to outlive his time. He excelled in didactic poetry, his *Predikaren* (The Preacher) being his most popular effort in this direction. Among other poets of this group are Johan Gabriel Oxenstjerna (1750–1818), who translated *Paradise Lost*, and Anna Maria Lenngren (1755–1817), the foremost Swedish poetess. In opposition to the Academy and the principle it represents are Thorild, Bellman, Bengt Lidner (1757–93), a poet of feeling, and Karl August Ehrensvärd (1745–1800). The Finnish poet Frans Mikael Franzén (1772–1847) belongs in part to this period.

*1809–30.*—After the revolution of 1809 and the restoration of the freedom of the press, the revolt against the academic school took definite shape, and went to the furthest extreme of romanticism. The first leaders in the movement were the two young poets Per Daniel Atterbom (1790–1855) and Vilhelm Fredrik Palmblad (1788–1852), who in 1807 formed a literary society called Auroraförbundet, among the other members of which were Samuel Johan Hedborn (1783–1849), P. A. Sondén (d. 1837), and Karl Fredrik Dahlgren (1791–1844). The main principles of this society were those of the new romantic school in Germany. In philosophy they followed blindly the system of Schelling. Their literary discussions and original works were published in the periodicals *Polyfem* (Stockholm, 1809–12) and *Phosphorus* (Upsala, 1810–13), from the latter of which they were called Phosphorists. In spite of the many absurd features of their poetry and criticisms, the Phosphorists rendered a real service to Swedish literature by preparing the way for a sounder conception of the nature of poetry. Their faults are those of their German models. The discussion between the Academy and the Phosphorists was conducted with fierceness and brutality. The leading disputants were Per Adam Wallmark (d. 1858), the representative of the Academy, and the members of the Aurora Society already mentioned. The discussion continued until about 1825. In many respects it resembles the contemporary Baggesen-Oehlenschläger feud. (See DANISH LITERATURE.) In opposition to the Phosphorists, though also representing a romantic movement, are Göterna (The Goths), who sought inspiration in the culture of their Scandinavian ancestors. They differed from the Phosphorists, too, in avoiding a quarrel with the Academy. The representatives of the school formed a society in 1811 called Götiskaförbundet, with *Iduna* (1811–24) as its organ. Among the charter members were Jakob Adlerbeth (d. 1844), Erik Gustaf Geijer (1783–1847), and Leonard Fredrik Rääf (1786–1872). The most valuable service rendered by the society was in arousing public interest in early Scandinavian literature and culture, especially through the publication by Geijer and Arvid August Afzelius (1785–1871) of the first collection of Swedish ballads. The absurd side of the movement is displayed in the epics and tragedies of Per Henrik Ling (1776–1839). Standing apart, as its name implies, is still another school, Neutrer (Neutrals), who represented the principles of Goethe, Schiller, and Herder. Its organ was *Lycæum*, and its leading writers were Johan Olof Wallin (1779–1839), the greatest Swedish hymnist, Franzén, and Benjamin Höijer (1767–1812).

Esais Tegnér (1782–1846), the Swedish Oehlenschläger, is sometimes regarded as a Goth, sometimes as a Neutral. In reality he was neither. For the exquisite form of his prose and verse he is indebted to his academic training; in his love for the Northern past he resembles the Goths; in the catholicity of his genius he is a Neutral, in the best sense of the word. Of one thing only was he intolerant. His clear, logical mind could not endure the obscurity of the Phosphorists, and he opposed them fiercely as long as they continued to assert themselves as an independent school. Tegnér, more by the example of his writings than by the force of his arguments, succeeded in establishing modern Swedish poetry on a firm basis, and through his *Frithiofs Saga* his name was carried beyond the bounds of the North. The three lyric poets Erik Johan Stagnelius (1793–1823), Erik Sjöberg (Vitalis, 1794–1828), and Karl August Nicander (1799–1839), though at first influenced by the Phosphorists, occupied an independent position.

*Since 1830.*—The strife of literary parties having ceased, Swedish literature began a more peaceful development, which has been continuous. The most distinguished writers in the beginning were Karl Jonas Ludwig Almqvist (1793–1866), author of poems, plays, novels, and critical essays; the Finn Johan Ludvig Runeberg (1804–77), whose poetry is characterized by a healthy realism; Karl Vilhelm Böttiger (1807–78), poet, translator, and biographer; Bernhard Elis Malmström (1816–65), poet and critic. Of later writers may be mentioned the poets Karl Vilhelm August Strandberg (Talis Qualis, 1818–77), Gunnar Wennerberg (b. 1817), an imitator of Bellman, and Oskar Patrick Sturzenbecker (Orvar Odd, 1811–69), who was also a critic. Of the Swedish novelists of the nineteenth century the most popular is undoubtedly Fredrika Bremer (1801–65), at one time almost as much read in the U. S. as in Sweden. Other novelists are Magnus Jakob Crusenstolpe (1795–1865), Karl Anton Wetterbergh (Onkel Adam, b. 1804), Emilie Carlén (1807–92), Karl Fredrik Ridderstad (1807–86), Zacharias Topelius (b. 1818), and Maria Sofia Schwartz (1819–94). Of the newest authors may be mentioned Viktor Rydberg (b. 1829), the leading living Swedish prose-writer, Karl Johan Gustaf Snoilsky, the most original living Swedish poet, and Karl David af Wirsén (b. 1842), all academicians. The leading realist is August Strindberg (b. 1849), the Swedish Zola.

**Sweet**, HENRY: philologist; b. in 1845; graduated at Oxford in 1873. He has edited a number of Old English texts for the Early English Text Society: *King Alfred's West Saxon Version of Gregory's Pastoral Care* (1871–72); *King Alfred's Orosius* (1883); *The Epinal Glossary* (1883), etc.; has published *A History of English Sounds* (1874; 2d ed. 1888); *A Handbook of Phonetics* (1877); new *English Grammar, Spoken English*, etc.; an original and very ingenious system of shorthand, *Current Shorthand, Orthographic and Phonetic* (1892); and several readers and primers of Anglo-Saxon, Middle English, and Icelandic. He received honorary Ph. D. from Heidelberg. H. A. BEERS.

**Sweet**, JOHN EDSON: inventor, mechanic, and engineer; b. at Pompey, Onondaga co., N. Y., Oct. 21, 1832. After working at carpentry and joinery for a time, he practiced architecture until 1861, when he gave his attention to the designing of machinery. In 1873 he became the manager of the workshops of the mechanic arts department of Sibley College, Cornell University, and remained there until 1879. Meantime he had designed the "straight-line engine," and had built, with the aid of his pupils, in the Sibley College shops, the first engines of that type, which has as its characteristic features a straight-line frame, provisions for the reduction of engine-friction, and a simple and efficient governor. He has written for the technical journals, principally for *The American Machinist*. He is a past-president of the American Society of Mechanical Engineers.

R. H. THURSTON.

**Sweet Bay**: See BAY.

**Sweetbread**: the PANCREAS, or THYMUS GLAND (*qq. v.*) of an animal, used as food. The former is usually called stomach-sweetbread and the latter throat-sweetbread.

**Sweetbrier**: See EGLANTINE.

**Sweet-flag**: See ACORUS CALAMUS.

**Sweet-gale**: See GALE.

**Sweet-gum**: See GUM-TREE.

**Sweet Potato**: a trailing vine (*Ipomœa batatas*, formerly called *Batatas edulis*) of the morning-glory family, producing large thickened edible roots. The plant is widely cultivated for food in the tropics and the warmer portions of temperate countries. Its native country is unknown, but the evidence points strongly to an American origin. Its aboriginal American name was *batatas*, whence comes the word *potato*, later applied to the Irish or round potato (*Solanum tuberosum*). The sweet potato is a staple crop in the southern parts of the U. S., where it thrives in the sandy or loose soils. It is propagated by suckers or sprouts which spring from the tubers. It very rarely blossoms. There are many diseases of the sweet potato, for an account of which the reader should consult the bulletins of the New Jersey experiment station. Fitz's *Sweet Potato Culture* is the only general manual devoted to the plant in the U. S.

L. H. BAILEY.

**Sweet-sop**: the soft, sweet, and aromatic fruit of a small tree, the *Anona squamosa* of tropical America, cultivated not only in Brazil and the West Indies, but also in Hindustan and the East Indies. The fruit is greenish and resembles an artichoke in size, in form, and in its scaly covering. The pulp is soft, somewhat mealy, sweet, and luscious, though with a musky, aromatic odor and flavor. It is extensively used as an article of food, and it has proved the staff of life to the people of Hindustan in seasons of famine. Its seeds have an acrid, perhaps a poisonous, quality, shared by the leaves, which have also a disagreeable smell. In India it is called custard-apple, though the true custard-apple is *A. reticulata*. Revised by L. H. BAILEY.

**Sweet Springs** (formerly BROWNSVILLE): city; Saline co., Mo.; on the Blackwater river, and the Mo. Pac. Railway; 23 miles N. W. of Sedalia (for location, see map of Missouri, ref. 3–F). It is in an agricultural and stock-raising region, and has several sweet medicinal springs, 2 State banks, and a weekly newspaper. Pop. (1890) 1,137; (1900) 1,080.

**Swenson**, CARL AARON, Ph. D.: clergyman; b. at Sugar Grove, Pa., June 25, 1857; educated at Augustana College and Theological Seminary, Illinois; pastor of the Swedish Lutheran church at Lindsborg, Kan., since 1879, and founder (1881) and president of Bethany College at the same place. He was a member of the Kansas Legislature 1880–90, and has been editor of several Swedish journals. In 1885 he was elected English secretary, and in 1893 president of the General Council. H. E. J.

**Swete**, HENRY BARCLAY: See the Appendix.

**Sweyn**, swān, **Swegen**, or **Svend**: King of Denmark and father of Canute the Great; invaded England to avenge the massacre of the Danes by the English in 1002, and ravaged a great part of the country. In 1013 he made another invasion and this time reduced the Anglo-Saxon kingdom, forcing Ethelred to flee. He proclaimed himself king, but died (1014) before he had firmly established his power, leaving Canute as his successor. F. M. C.

**Swift**: a common name for the birds of the family *Micropodidæ* (or *Cypselidæ*), probably first bestowed on the European species from its rapid flight. In external appearance the swifts much resemble the swallows, but the bill is decidedly smaller, and the tarsi are not scaly, but simply covered with skin. The primaries are ten in number, the first and second being of equal length; the tail is variable in shape, deeply forked in some, almost square in others, but always composed of ten feathers. The first toe is directed more or less forward, and in the more typical swifts (*Cypselinæ*) the second, third, and fourth digits have but three joints each, owing to a fusion of the basal phalanges. Anatomically the swifts are very different from the swallows, and do not belong to the same order. There are about fifty species distributed over the greater portion of the globe; with the exception of the East Indian tree-swifts (*Macropteryx*), which are prettily clad, they are mostly of somber plumage. They are insect-eaters and pass the greater portion of their time on the wing, and some, like the chimney-swift or chimney-swallow (*Chætura pelagica*) of the U. S., even gather the materials for their nests in full flight. They build in caves, crevices of the rock, nooks of old buildings, hollow trees, or adapt themselves to civilization in chimneys, while an African swift suspends its nest to the fronds of a palm. The nests are gummed together with saliva, and the famous edible birds'-nests, built by the little swifts of the genus *Callocalia*, consist entirely of a peculiar salivary secretion. The eggs are white, two in number in many species, four or five in others, while the tree-swifts (*Macropteryx*) lay but one egg. One species of typical swift (*Micropus melanoleucus*) is found in the western parts of the U. S., while the common chimney-swift abounds in the Eastern States. The common species of Europe (*Micropus apus*) ranges from Great Britain to India, occurring also in Northern Africa. The swifts are usually divided into two subfamilies, according to the number of phalanges, but the tree-swifts (*Macropteryx*) are by their numerous peculiarities entitled to rank as a separate family (*Macroterygidæ*). In the western parts of the U. S. the name swift is applied to a small fox (*Vulpes velox*), and in the southern parts to a small lizard (*Sceloporus undulatus*). F. A. LUCAS.

**Swift**, JONATHAN: satirist and divine; b. in Dublin, Ireland, Nov. 30, 1667. He was the posthumous son of Jonathan Swift, an Irish official, and of his wife Abigail Erick, of Leicester. Of his birth in Dublin, the dean remarked in after-life, "I happened by a perfect accident to be born here, and thus I am a Teague, or an Irishman, or what people please," but his descent was purely English. He was kidnaped, as an infant, by his nurse, who carried him to Whitehaven, in Cumberland, where he remained nearly three years, when his mother took him away to Leicester. At the age of six he went to Kilkenny School, and on Apr. 24, 1682, entered Trinity College, Dublin. He was an idle scholar, often censured, and in 1688, on his twenty-first birthday, he quitted the university in disgrace. He went to his mother at Leicester, and was presently glad to accept the position of amanuensis in the family of his eminent kinsman, Sir William Temple, at Moor Park. There Swift remained, with two intermissions, until Temple's death in 1699. His health was bad, and after a surfeit of golden pippins in 1689, he began to suffer from the mysterious complaint of his lifetime, which, as is now conjectured, must have been a labyrinthine vertigo. In 1692 he received the degree of M. A. from Oxford, and to the same date belong his earliest existing compositions, his awkward and prosaic *Pindaric Odes*. In 1694 he left Temple and returned to Ireland; early in 1695 he took priests' orders and the small Ulster living of Kilroot. The solitude weighed upon him, and in the spring of 1696 he went back to Temple's service. In 1696 he began *A Tale of a Tub*, and in 1697 he wrote *The Battle of the Books*, which was first published in a joint volume in 1704, although prepared for the press in 1698. At the death of his patron Swift applied to William III., whose favorable attention he had attracted, but the petition failed to reach the king. He therefore was glad to accept the post of secretary to Lord Berkeley, but was dismissed in Dublin. In Feb., 1700, the living of Laracor, to which were presently appended two other small incumbencies and a prebend, secured for him a scanty competence. He was now invited by an old flame, Miss Waring, "Varina," to marry her, but he refused to do so in a strangely violent letter. He was more interested in "Stella," Sir William Temple's orphan ward, Esther Johnson; in 1701 she and her friend Mrs. Dingley came over to Ireland to be near Swift. When he was absent from Dublin, and his visits to England were frequent and lengthy, these ladies occupied his chambers. In 1701 Swift made his first appearance as an author, by the publication of the anonymous pamphlet *Contests and Dissensions in Athens and Rome*. This was successful, and the *Tale of a Tub* volume, in 1704, raised a storm of notoriety, but Swift took little part as yet in literary or political life. In 1708 he became suddenly a great power in the Whig party, and published a succession of vigorous and brilliant tracts. These, and other anonymous publications in prose and verse, were collected in a volume of *Miscellanies* in 1711, in which *Baucis and Philemon*, written in 1706, and the *City Shower* are to be found. Meanwhile Swift had risen to the highest level of London society. In 1705 Addison had addressed him as "the most agreeable companion, the truest friend, and the greatest genius of his age," and Swift was accepted on these terms by most of the leading wits and statesmen of the court of Anne. His influence on behalf of others was boundless, and most generously exercised, but he could secure no preferment for himself. A very clear light upon all his movements and his sentiments is presently thrown by the famous *Journal to Stella*, a correspondence kept up with Esther Johnson and Mrs. Dingley from Sept., 1710, to Apr., 1713. Of his profusion of political pamphlets poured out at this time, the best known is *The Conduct of the Allies*, which, published in Nov., 1711, went through four editions in one week. This gives, however, a very poor idea of Swift's importance in English politics during the administration of Harley. When he returned to London from a temporary retirement at Laracor in Sept., 1710, he was received by the Whigs with enthusiasm; but they had failed him before, and he repulsed their advances and rejected their "clumsy apologies." He threw in his lot with the Tories, and was received into the innermost councils of the new ministry. A satire, *Sid Hamet's Rod*, on the fallen Godolphin, enjoyed a prodigious success, and in Nov., 1710, Swift took the editorship of the Whig newspaper *The Examiner*, and made it the organ of the new Tory party. He proved himself a journalist of the very first order. His success culminated in the ministerial crisis of Dec., 1711, and he found himself one of the most powerful men in England. His health, indeed, began to trouble him, but throughout 1712 "Dr. Swift was the principal man of talk and business" in London. He was able to secure for his friends and *protégés* all the places and the favors they required; yet in the midst of his greatness his old ill luck assailed him, and in spite of his authority with the ministry he was refused the bishopric of Hereford. This was a blow to him, but he recovered from it; the death of Queen Anne in 1714 annihilated his hopes. As Arbuthnot said, Swift was "like a man knocked down," and in wrath and bewilderment he retired to Dublin. His fall was broken by his having been appointed in the previous summer to the deanery of St. Patrick's. His spirits languished in this enforced retirement, and his relations with Stella and with Vanessa (Miss Vanhomrigh) became closer and more mysterious. In 1716, so it has been alleged, Swift secretly married the former, and the latter died in 1723, in consequence of the furious resentment showed by Swift at her having endeavored to force the secret from Stella. Meanwhile Swift interested himself in the local politics of Ireland, and, having outlived the dislike which he originally inspired, became the most idolized of patriots. His political writing culminated in 1724 with the publication of the *Drapier's Letters*, in which he attacked the currency scheme for allowing a William Wood to supply Ireland with a copper coinage. The vogue of these *Letters* was so great, and the indignation they aroused in Ireland so vociferous, that the Government withdrew Wood's patent, and failed in an attempt to prosecute the author. Swift's popularity in Dublin knew no bounds, and when George II. came to the throne it was hoped by his English friends that the dean would recover his influence; but a visit to London in 1727 had no result, and Swift went back for good to "wretched Dublin in miserable Ireland." Two years later his foiled ambition made him describe himself to Bolingbroke as ready to "die here in a rage, like a poisoned rat in a hole." Meanwhile he had been more fortunately engaged in certain literary labors. As early as 1722, at least, he had received Pope's encouragement in the outline of a satire on society, which was to take the form of "very extraordinary voyages into very extraordinary nations," and to "manifest the most distinguishing marks of a philosopher, a politician, and a legislator." He brought the completed MS. of this work, the famous *Gulliver's Travels*, to England with him in 1726, and it appeared anonymously during the succeeding winter. With the exception of Defoe's *Robinson Crusoe*, which had been issued seven years earlier, no romance had been written in English which approached this wonderful book in originality or vigor. The first hint of the design has been traced to Pope's *Memoirs of Scriblerus*, while the hand of Arbuthnot has been detected in the speculations of the third part; it is plain that the whole scheme had been discussed in the brilliant coterie of men of letters with whom Swift loved to associate in London, and from whom he found exile so terribly irksome. It has been conjectured with probability that the voyage to the Country of the Houyhnhnms was written during the last illness of Stella, and that the mental anguish of the author gave ferocity to this appalling satire; but although, after the summer of 1726, Stella ceased to be capable of companionship, she lingered until Jan., 1728. Swift then hated Dublin more than ever; he described it as his "wretched, dirty dog-hole, and prison," and could give the deanery of St. Patrick's no higher praise than that it was "a place good enough to die in." He adopted of set purpose a contemptuous attitude toward literature and politics. Yet he continued to write some of the most highly finished and forcible of his compositions, especially in verse. Of the latter class are *The Journal of a Modern Lady*, which dates from 1728; *The Lady's Dressing-room* (1730); the admirable and extraordinary *Ode on the Death of Dr. Swift*, finished in 1731; *The Beast's Confession* (1732); and, best of all, the vigorous "rhapsody" *On Poetry* (1733). It is believed that about 1729 he wrote what has been called that "extraordinary passage of willfully inane chatter," *The Polite Conversation*, which was published by Mrs. Barber in 1738, soon after the vertigo, which had so long distracted him, combined with the distress of deafness and melancholy to cloud his reason. An excellent cousin, Mrs. Whiteway, finding him at the mercy of servants, came to take care of him, but he became hopelessly insane. From 1741 to 1743 Swift was a raving maniac, under restraint; he then sank into a sort of stupor, the vigor of his constitution long supporting his frame and lengthening the struggle. At last on Oct. 19, 1745, he died in Dublin. He was privately buried in St. Patrick's, and when his will, drawn up in 1740, was opened it was found that he had left his fortune to endow a lunatic asylum for Ireland, wishing to

> . . . show by one satiric touch
> No nation needed it so much.

The personal character of Swift deeply impressed the age, and innumerable anecdotes preserve the tradition of his wild humor, his tumultuous bursts of arrogance, his admirable perspicuity, and his curious inconsistencies of conduct and temper. His person was athletic and commanding, his eyes of the clearest blue, and all his life he was endeavoring by violent exercise to subdue his mysterious physical maladies. History has dwelt to excess on his ferocity, and has said too little about his prevailing charm of address, his occasional but exquisite outbursts of sympathy. In literature, although he scarcely produced anything that was not more or less of an occasional nature, his is the greatest figure between Dryden and Johnson. The earliest life of Swift was that published in 1751 by Lord Orrery. This book contained valuable documents, but was prejudiced and inaccurate, and it was supplemented by a very important volume of *Observations*, by Dr. Delany, in 1754. Hawksworth first collected the works in 1765. In 1785 Thomas Sheridan, the son of one of Swift's most intimate friends, published a life, although his personal knowledge of the dean had been very slight. Sir Walter Scott founded upon these and other materials his entertaining *Life of Swift* in 1814, and published a very full and excellent edition of the works, which he still further improved in 1824. John Foster published a fragment of a yet more minute biography in 1875, and among later writers on Swift, Leslie Stephen (1882) and Henry Craik have been the most competent. In 1883–84 a new issue of Sir Walter Scott's large edition of the works was published. EDMUND GOSSE.

**Swift**, LEWIS: astronomer; b. at Clarkson, N. Y., Feb. 29, 1820. He was first a business man, began studying astronomy in 1855, and constructed a telescope; gave special attention to comets, and discovered comets in 1862, 1869, 1874, etc. For these discoveries he received in 1882 the Lalande prize from the French Academy of Sciences. He also received three gold medals from the Imperial Academy of Sciences at Vienna. He removed to Rochester, N. Y., in 1872, and became director of the observatory there, specially fitted up for him by the citizens. In 1894 he removed his instruments to Echo Mountain, Cal., in order to get the advantage of the purer air of the Pacific coast. S. N.

**Swift**, WILLIAM HENRY: engineer; b. at Taunton, Mass., Nov. 6, 1800; was a cadet at the U. S. Military Academy from 1813 to 1819. He was assigned when a cadet to Maj. Long's Rocky Mountain expedition, with which he served until 1821, having meanwhile (1819) received his commission as second lieutenant of artillery; from 1821 to 1832 served on topographical duty in making surveys of military defenses of the Atlantic coast; of the Chesapeake and Ohio Canal; of the Florida Canal, and rivers and harbors of the Gulf of Mexico; in constructing a map of the post-offices and post-roads of the U. S.; and surveyed several railways. In 1832 was appointed brevet captain and assistant topographical engineer, and for ten years was employed as assistant in the U. S. coast survey upon the Atlantic coast, being in charge of river and harbor improvements from Maine to Connecticut 1837–42; from 1836 to 1840 was also resident and constructing engineer of the Massachusetts Western Railroad, from Worcester to the western boundary of Massachusetts, becoming captain topographical engineers, July, 1838; was assistant to the chief of topographical engineers 1843–49; was engaged 1847–49 in constructing the iron-pile lighthouse at Minot's Ledge, Massachusetts Bay, which was destroyed by a great gale in Apr., 1851. In 1849 he resigned from the army. D. in New York, Apr. 7, 1879.

**Swift**, ZEPHANIAH, LL. D.: jurist; b. at Wareham, Mass., in Feb., 1759; graduated at Yale College in 1778; studied law, and practiced at Windham, Conn.; was Representative in Congress 1793–97; appointed judge of the Supreme Court of Connecticut in 1801; was chief justice 1806–19; was several times elected to the State Legislature, a delegate to the Hartford convention, and a member of the commission to revise the laws of the State. He published an oration on *Domestic Slavery* (Hartford, 1791); *System of the Laws of Connecticut* (1795–96); *Digest of the Law of Evidence in Civil and Criminal Cases* and a *Treatise on Bills of Exchange and Promissory Notes* (Hartford, 1810); and *Digest of the Laws of Connecticut* (1822–23; new ed. 1848–53), which last work is the standard treatise on that subject, and is often called the Connecticut lawyer's Blackstone. D. at Warren, O., Sept. 27, 1823. Revised by F. STURGES ALLEN.

**Swimming** [O. Eng. *swimman*, swim: O. H. Germ. *swimman* (> Mod. Germ. *schwimmen*), float, swim: Icel. *svimma*]: the act of progressing in the water by means of strokes with the hands and feet. As the specific gravity of the human body is only slightly greater than that of water, swimming is easily learned, with or without an instructor. The density of salt water being greater than that of fresh, it is much easier to swim in it. Indeed, if the saturation is very great, as in the Dead Sea or the Great Salt Lake, the specific gravity is greater than that of the human body and a man can not sink in it.

A great variety of mechanical devices have been in use both to assist in acquiring the art and for making swimming safer, easier, or more rapid; but the presence in the water of a competent instructor to give the necessary support will give better results to the beginner than any attachment of floats or other supports which buoy the body too high in the water, and teach the swimmer to place his dependence on something other than his own floatage. One of the best methods in beginning is to wade out until breast-deep in the water, turn toward the shore, and throw a white pebble or any other object easily discernible a short distance before him and plunge after it. The resistance offered by the water to this effort will buoy him up, and the moment he has acquired sufficient confidence and command of his limbs to strike out regularly, he has learned to swim. The common forms of stroke are the broad, dog-paddle, and side, or Indian. The first two are much the more natural and easy to acquire. In the broad stroke after bringing the body nearly horizontal, the arms and legs are drawn slowly toward the body and then extended, alternately, with a quick and strong impulse. The hands should be kept flat and the fingers closed, the legs should be well apart at the beginning, and at the conclusion of the act of kicking brought together. In the tread the body is kept perpendicular and hands and feet beat downward. In the dog-paddle the body lies nearer horizontal, and hands and feet are moved rapidly and alternately with a paddling movement. The side-stroke is found represented in mosaics in Pompeii, and was popularized in England by Trudgeon. It is the stroke commonly used in racing, and consists, briefly, in turning the body on one side and reaching far ahead with the under hand while the other sweeps by the chest and belly.

Swimming races, especially in Great Britain, have become carefully regulated athletic events. Prior to 1869 there were few clubs to manage these contests, but on Jan. 7 of that year a swimming congress met at the German Gymnasium, King's Cross, London, where was formed an amalgamation called the Associated Metropolitan Swimming Clubs. The name was changed shortly after to the London Swimming Association, and again changed in 1874 to the Swimming Association of Great Britain. The Amateur Swimming Association of Great Britain was formed Mar. 3, 1886. It has a membership of over 300 clubs, and is the largest organization of the kind. New Zealand and New South Wales both have flourishing amateur swimming associations, the former being formed in 1890.

Both Oxford and Cambridge have clubs with intercollegiate and inter-'varsity matches, and official recognition of swimming as a subject of instruction was secured in the elementary board schools in England in 1891.

This art is not so general in the U. S. as in Great Britain, nor is club organization at all thorough.

**Swin'burne**, ALGERNON CHARLES: poet; b. in London, Apr. 5, 1837; son of Admiral Swinburne; received his education partly at Eton, partly in France, and in 1857 entered Baliol College, Oxford, where he remained only a short time. His life has been mainly spent in London. He has published *Rosamond* and *The Queen Mother*, two dramas (1861); *Atalanta in Calydon*, a tragedy constructed after the Greek model, in which he first manifested his peculiar powers (1864); *Chastelard, a Tragedy* (1865); *Poems and Ballads*, which were so severely criticised for their erotic character that the English publisher endeavored to suppress them, and which were put forth in New York under the title *Laus Veneris* (1866); *A Song of Italy* (1867); *Ode on the Proclamation of the French Republic* (1870); *Songs before Sunrise* (1871); *Bothwell* (1874), a dramatic sequel to *Chastelard*; *Essays and Studies* (1875); *Studies in Song* (1881); *A Century of Roundels* (1883); *Life of Victor Hugo* (1886); *Locrine, a Tragedy* (1887); *The Sisters*, a tragedy (1892), and other works. See ENGLISH LITERATURE.

Revised by H. A. BEERS.

**Swine**: any artiodactyl mammal of the family SUIDÆ (*q. v.*). The wild species of *Sus* are variously enumerated by zoölogists. Of these, the wild boar (*Sus scrofa*) of Europe, North Africa, and Asia Minor is the best known, and is generally regarded as the original of the common domestic forms. The validity of many of the other species, which are found mostly in the East Indies, is open to question, as they may be feral descendants of introduced domestic specimens. A small species (*Sus salvianus*) of Nepal, the Terai, and Bhutan has been separated generically as *Porcula*. The river-hogs of the genus *Potamochœrus*, the babirussa, and the wart-hogs are other swine. The chief seat of the world's swine-rearing industry is in the more northerly States of the Mississippi valley, where favoring conditions of soil and climate encourage the production in enormous quantities of Indian corn, which is chiefly relied on to feed the swine during both their growing and fattening periods. In the U. S. swine, when very young, are designated as pigs, when partly grown as shotes, and later as hogs. In Jan., 1895, the number of swine in the U. S., as given by the Department of Agriculture, was 44,165,716, worth $219,501,267; of these, Iowa alone had 5,516,485, or 50 per cent. more than the United Kingdom, which in its numbers does not vary widely from Missouri. In the U. S. the number doubled in seventeen years following 1876. Prior to 1850 swine had little uniformity except that they were white and slow in maturing; there were innumerable varying breeds, each a favorite in some county or section of a State, and those growing to the largest size were esteemed best, regardless of excessive offal or cost of production. At present nine-tenths of the hogs in the U. S. are black, with small markings of white on the face, feet, and tail, and sometimes elsewhere. These are of the Poland-China and Berkshire breed, or a mixture of the two; the next most prominent breed is the Chester White. Other breeds, equally distinct, but reared in limited numbers, are the Essex, black; Duroc-Jersey or Jersey, red, sandy, or reddish; Victoria and Suffolk or Small Yorkshire, white. The Essex and Yorkshires are from England, the Duroc-Jerseys are of uncertain origin, and the Victorias originated since 1860 in Indiana. The predominant breed, the Poland-China, originated in Butler and Warren cos., O., between 1838 and 1840 in the crossing of various families there known as Big China, Russia, Byfield, Bedford, and Irish Grazier, and the offspring was a large black and white spotted kind called by many names, from which a national convention of swine-breeders in 1872 selected that of Poland-China. These were crossed with imported Berkshires to give refinement and propensity to earlier fattening, and incidentally they acquired the Berkshire's black color and white markings. The Berkshire in its improved form originated (as did the Essex) in England—Italian and Spanish swine being crossed with the coarser native stock—between 1780 and 1800, but although first introduced into North America about 1830 it did not obtain general favor until 1870–80. Chester Whites are the result of mating some large white stock from Bedfordshire, England, with the white hogs common in Chester co., Pa., about 1818–30; the descendants being swine that gradually improved by selection, and have maintained their popularity in North America better than any other of their color. Hogs of a dark color are most largely reared because of a belief that they are hardier and less susceptible to affections of the skin incident to sudden changes of temperature and the muddy quarters, severe winds, and burning suns to which they are too often continuously subjected. Poland-Chinas, Berkshires, Chester Whites, and Duroc-Jerseys are classed as large breeds, weighing, when properly reared, from 300 to 450 lb. at twelve months, and from 500 to 600 and even more at eighteen months, and they have been bred to a degree of fineness in bone, smallness of offal, compactness of form, and early maturity which makes them well-nigh perfect. Essex, Victorias, and Suffolks or Small Yorkshires are termed small breeds, and, although of excellent quality, do not grow to such weights as others, and mature more quickly.

*Preparation of Hog Products.*—The two principal markets, slaughtering and packing points, for swine are Chicago, Ill., and Kansas City, Kan. There were marketed in the former city in 1894 7,483,228 head, and in the latter 2,547,077. Chicago packed in the year ending Mar. 1, 1895, 5,293,202, and Kansas City, 2,105,333; these numbers have been largely exceeded in some previous years when the supply was more plentiful. The average live weight of 16,003,645 hogs packed in the U. S. in the year ending Mar. 1, 1895, was 231·22 lb.; average weight of their lard, 33·31 lb.; and average cost alive, $4.67 per 100 lb. Careful calculation of the per capita rate of domestic consumption in recent years indicates 55 to 57 lb. of pork and about 8 lb. of lard. Next to cotton and wheat the swine interests furnish the largest values in exports from the U. S., which for the year ending June 30, 1894, were as follows:

| | |
|---|---|
| Bacon and hams | 503,628,148 lb. |
| Pork | 64,744,528 lb. |
| Lard | 447,566,867 lb. |
| Total | 1,015,939,543 lb. |
| Value | $93,433,582 |
| Average per pound | 9·19 cents. |

Counting on the customary basis of 175 lb. of product to equal one hog, the exported product for the year mentioned was equivalent to 5,805,369 hogs. Of the total exports for the twelve months indicated the United Kingdom purchased the following quantities:

| | |
|---|---|
| Bacon and hams | 408,979,637 lb. |
| Pork | 14,273,057 lb. |
| Lard | 149,691,959 lb. |
| Total | 572,944,653 lb. |

The British provinces of North America pack annually from 350,000 to 500,000 hogs, and import from the U. S. from 30,000,000 to 65,000,000 lb. of product. All other countries of the world produce from 40,000,000 to 45,000,000 swine, of which Russia has one-fourth, followed by Germany, Austria-Hungary, France, and Spain respectively, which have from 7,000,000 to 4,000,000 in the order named. They give but little attention to breed, quality, or pedigree. In the five years ending with 1840 the U. S. sold in Europe hog products to the value of $1,533,522 annually, or the equivalent of 92,154 hogs at $16.65 per head. Forty years later the

exports for a single year equaled 7,045,805 head, worth $104,660,065, or $14.85 per head. In 1860 hog product exports had increased 700 per cent., and in 1880 nearly 7,000 per cent. Since 1891 all swine products intended for export have been inspected at the point of slaughter as to healthfulness—and especially freedom from trichina—by veterinarians and microscopists appointed by and under supervision of the U. S. Department of Agriculture. The chief scourge among swine is a contagious fever little understood as to causes or treatment, popularly called cholera, which each year rages in various localities, destroying entire herds, including those supposed to be in the best condition, amounting to millions of dollars in value. Faulty sanitary and hygienic surroundings, and insufficient variety of food tending to an enfeebled constitution, are regarded as encouraging its development. Its incubation is from one to two weeks in cold weather and three or four days in warm; it is fatal in from one to six days, or ends in a tedious, uncertain, or unsatisfactory recovery. F. D. COBURN.

**Swing**, DAVID: clergyman; b. in Cincinnati, O., Aug. 23, 1830; graduated at Miami University, Oxford, O., 1852; studied theology; taught Greek and Latin, and became principal of the classical school of Miami University; became pastor of the Fourth Presbyterian church in Chicago 1866; was tried for heresy in 1874, and acquitted by the presbytery, but became an independent minister, and pastor of Central church, Chicago. He was an editor of *The Alliance*, and published *Club Essays* (1880) and other works. D. in Chicago, Oct. 3, 1894.

**Swinton**, JOHN: journalist; b. at Salton, Scotland, Dec. 12, 1830; brother of William Swinton. He emigrated to Canada and then to the U. S. in 1843; was educated at Williston Seminary, Massachusetts; removed to New York in 1857, where he was connected editorially with the *Times*, and afterward with *The Sun*. In 1883–87 he published *John Swinton's Paper*, a weekly journal in the interest of labor reform. He has written and lectured much on various aspects of the labor question, and has published among other pamphlets *New Issue: the Chinese-American Question* (New York, 1870); also *A Eulogy on Henry J. Raymond* (1870); *John Swinton's Travels* (1880); and *An Oration on John Brown* (1881.) H. A. BEERS.

**Swinton**, WILLIAM, A. M.: author; b. at Salton, Haddingtonshire, Scotland, Apr. 23, 1833; removed to the U. S. in 1843; studied at Knox College, Toronto, and at Amherst College; in 1853 taught in a female seminary at Greensboro, N. C., and subsequently in a private school in New York; during a considerable part of the civil war was the correspondent, mainly with the Army of the Potomac, of *The New York Times*; in 1866 received the degree of A. M. from Amherst College, and in 1869 was appointed Professor of Belles-Lettres in the University of California. In 1874 he resigned and went to Brooklyn, N. Y., where he prepared text-books. For these he was awarded a gold medal at the Paris Exposition of 1867. He published *Rambles among Words* (New York, 1859; London, 1861); *Campaigns of the Army of the Potomac* (1864; revised ed. 1886); *The Twelve Decisive Battles of the War* (1867); *The History of the New York Seventh Regiment during the War of the Rebellion* (Boston, 1870); *Word Analysis* (1872), and other works. D. in New York, Oct. 24, 1892.

**Swiss Guards**: bodies of mercenary Swiss troops employed as body-guards and for duty about courts. Swiss mercenaries have frequently been hired by foreign powers since the time of the Swiss struggle for independence, which brought the valor and hardihood of that people into notice. The term Swiss Guards, however, especially refers to the royal body-guard of the kings of France. This force, which was organized in 1616, showed remarkable courage and loyalty in the service of the Bourbons. In 1789 they were roughly handled by a mob, and Aug. 10, 1792, almost every man was killed in the heroic defense of the Tuileries. They numbered about 2,000. Their heroism is commemorated by Thorwaldsen's *Lion of Lucerne*, carved from the living rock in a cliff near one of the gates of Lucerne. Louis XVIII. reorganized the Swiss Guard in 1815. In the Revolution of 1830 they were defeated and dispersed. F. M. COLBY.

**Swiss Stone-pine**: See CEMBRA PINE.

**Swithin, Swithun**, or **Swithum**, SAINT: bishop and patron of Winchester; b. of noble parentage; became a monk in the Old Monastery in Winchester; later provost; private chaplain to Egbert, King of the West Saxons; his adviser and tutor to the king's son Ethelwolf, and later his adviser also; Bishop of Winchester 852. He was remarkable for piety and great activity in building churches. D. at Winchester, July 2, 862. "His body was buried, according to his order, in the churchyard, where his grave might be trodden on by passengers" (*Butler*). In 971 his relics were transferred to the church. On this translation "such a number of miraculous cures of all kinds were wrought as was never in the memory of man known to have been in any other place." One of his arms was "kept in the abbey of Peterborough." His day in the Roman calendar is July 2—his death-day—but in the English calendar July 15, the day of the translation of his relics, and it is commonly said in England that if it rains on St. Swithin's day it will rain for forty days thereafter, a saying which is supposed to have originated in the alleged fact that the translation of Swithin's remains was delayed by heavy rains. See John Earle, *Gloucester Fragments* (London, 1861) and Butler's *Lives of the Saints* under July 15. SAMUEL MACAULEY JACKSON.

**Switzerland**, or **Helvetic Confederation** [*Switzer-* is from Germ. *Schweizer*, a Swiss, deriv. of *Schweiz*, Switzerland; cf. Fr. *la Suisse*, Ital. *Svizzera*, Switzerland]: a confederated republic of twenty-two cantons, occupying the Alps; between Germany, Austria, Italy, and France; of oval form, 221 miles long E. and W., and 140 miles broad N. and S.; boundary irregular and only in part natural. Area, 15,976 sq. miles.

*Physical Features.*—It occupies the Central and Northern Alps; the Western are in France, the Southern in Italy, and the Eastern in Austria. The highest point is Mont Blanc (15,781 feet), at the angle of France, Italy, and Switzerland. The proper central mountain is Monte Rosa (15,217 feet), 45 miles E. on the Italian boundary. The hydrographic center (where arise the Ticino flowing through the Po to the Adriatic, the Rhône flowing to the Gulf of Lyons, the Rhine flowing to the North Sea, and the Inn flowing through the Danube to the Black Sea) is St. Gothard, 60 miles farther N. E. The chief range is the Pennine Alps, making the western part of the southern boundary; N. of it and nearly parallel is the range of the Bernese Alps with the Rhône valley between them, and containing peaks somewhat lower (Finsteraarhorn, 14,026 feet, and Jungfrau, 13,672 feet). To the E. the main ranges are in the Rhætic Alps with culminating point at Mt. Bernina (13,191) on the Italian frontier. (See ALPS.) The plain of Switzerland lies on the N. W., between the Jura Mountains and the Alps, and between Lake Geneva and Lake Constance; average elevation, 1,200 to 1,500 feet. Between it and the Bernese Alps is the higher plateau called the Bernese Oberland. The remainder of the inhabitable part of the republic consists of mountain valleys and lake margins, sometimes with small alluvial plains, but often narrow, wild, and inaccessible.

The chief river is the Rhine, which winds around the northern side of Switzerland and penetrates to St. Gothard from the E. With its tributaries it drains over 70 per cent. of the area and most of the lakes of the country; length in Switzerland, 216 miles. The Rhône leaves at the W., is 71 miles long in Swiss territory, and drains 16 per cent. of the area. The Inn leaves at the E., has 54 miles in the confederation, and drains 9 per cent. of the area; and the Po sends the Ticino 44 miles into Swiss territory and drains 5 per cent. A small part of the southeast is drained by the Adige.

Many beautiful lakes are situated in whole or part within Swiss territory. Some details as to the largest of these are tabulated below:

| NAME. | River basin. | Area in sq. miles. | Mean height of surface, feet. | Greatest depth known, feet. |
|---|---|---|---|---|
| Geneva | Rhône | 225 | 1,230 | 1,017 |
| Constance | Rhine | 208 | 1,306 | 410 |
| Neuchâtel | Aar, Rhine | 93 | 1,427 | 472 |
| Lago Maggiore | Ticino, Po | 83 | 646 | 1,230 |
| Lucerne | Reuss, Aar, Rhine | 44 | 1,434 | 853 |
| Zurich | Limmat, Aar, Rhine | 34 | 1,342 | 469 |
| Lugano | Tresa, Ticino, Po | 19 | 889 | 902 |
| Thun | Aar, Rhine | 18 | 1,837 | 712 |
| Bienne | Aar, Rhine | 16 | 1,424 | 256 |
| Zug | Reuss, Aar, Rhine | 15 | 1,368 | 1,321 |
| Brienz | Aar, Rhine | 12 | 1,857 | 856 |

The lake area of Switzerland is 520 sq. miles, but the area of glaciers (perpetual ice and snow) is 710 sq. miles. This is confined to eleven cantons and principally to four—viz., Valais (375 sq. miles), Grisons (139), Berne (111), and Uri

(44). The Swiss glaciers number 471, and of these 138 are of the first rank (having a length of $4\frac{3}{4}$ miles or more). The largest is the Aletsch, on the southern slope of the Jungfrau, 15 miles long and covering 42 sq. miles. The Pennine Alps alone have 140 or more glaciers, and the Rhône, just N., is fed by 263. The lowest point reached by a glacier in Switzerland is 3,225 feet, in 1818 by the Grindelwald on the northern slope of the Jungfrau. The line of perpetual snow varies between 9,023 feet and 9,259 feet. The Aletsch begins at 9,820 feet and descends to 5,000 feet. The Eastern Alps have many glaciers, but they are generally of the second rank. See GLACIERS.

*Geology.*—Notwithstanding the mountainous character of Switzerland its geology is simple. Eruptive rocks are few and belong to very early geologic times. The core of the Central Alps is made up of primitive, azoic, crystalline rocks, and these make the ridge of this roof of Europe. To them are applied a series of schistose Carboniferous rocks semi-crystalline in character. The Triassic is found only at the east and west ends of this ridge. The whole was raised out of the sea in Jurassic times (named from the Jura Mountains on the N. W. of Switzerland), and the Jurassic rocks are applied next outside the Carboniferous composing some of the secondary ranges. In them are found some of the most interesting fossils ever discovered. Next in succession from the azoic ridge are found well-developed layers of Cretaceous and then extensive Tertiary beds, especially the Miocene. The Glacial period and the more recent glaciers have left their traces and remains over all Switzerland, and the alluvial work of the present age has been and is still active in filling up lakes and making plains.

*Climate.*—The Swiss climate has been studied with special care, and presents features of great interest. There are four meteorological stations at heights from 6,290 to 8,215 feet, and the Mont Blanc station is just beyond the boundary. The southern slope is remarkably mild, but the northern part has a rigorous continental climate. The mean temperatures run from 35° F. to 55° in the inhabited portions, about equal to the range from Winnipeg to Cape Charles in North America. The decrease of temperature with each 1,000 feet of increased altitude is 3·2° on the northern slopes and 2·8° on the southern. The contrast of the seasons is greatest in the valleys, where winter temperatures of −25° F. sometimes occur. The precipitation is large (40 to 60 inches), and is greatest at an elevation of about 6,500 feet. The run-off is particularly large, and causes rapid and sometimes destructive accumulation of sediment and wash. The most noteworthy wind is the foehn, which, coming from southerly directions, descends on the leeward side so dry and warm that the snow disappears as if by magic, and the parching greatly increases the danger of fires.

Like the temperature, the population decreases with the height. There are no villages beyond 5,000 feet, except the little hamlet of Juf at 7,000 feet, the highest in Europe. On the Great St. Bernard the hospice is at 8,110 feet, and the Alpine Club has some retreats, the highest of which (on the Matterhorn) is at 12,800 feet. The inhabitants of the high valleys have larger bodies and feet than those below, and are more free from several maladies, notably phthisis. Pneumonia and pleurisy are more common and more dangerous than below, as are also asthma, scrofula, and rheumatism. In the deep, moist valleys, with little sunshine, goiter and cretinism occur in large ratio, but increasing attention to cleanliness and general comfort diminishes this.

*Natural Productions.*—Switzerland is not productive in metals. There are several mines of anthracite, lignite, ordinary coal and salt, and one of graphite. Quarries of building-stone are more numerous and important. The flora falls easily into five zones, defined by the elevation; the zone of the vine goes up to 2,000 feet; that of cereals to 3,000 feet, and includes most of the plain; that of the forests to 6,000 feet; the sub-Alpine to 8,000 feet; and the Alpine above 8,000 feet. The arable land is chiefly confined to the first two. The forests occupy 3,032 sq. miles of area, and include the oak, beech, and spruce. They are valuable not only for the ordinary uses of trees, but also to protect the lower levels from destructive overflows; forestry is carefully practiced. Peat exists in large quantities, and forms an important resource for fuel. The sub-Alpine zone is rich botanically; in the Alpine region a species of violet and the much-praised edelweiss reach the very margin of perpetual snow.

The fauna is not rich, and animals suitable for hunting are protected by stringent game-laws. Wolves and deer are very rare; a few bears still remain in the wilder recesses of Valois and the Grisons; the wild boar survives in the Jura; the chamois can be hunted only twenty days in the year, and is increasing in number; the fox is common. The best-known bird is the lammergeier. Fish are very abundant, and fish-culture is much practiced.

*Agriculture.*—Of the total area 72 per cent. is classed as productive, and of the productive part 36 per cent. is in grass and meadow, 29 in forests, 19 in fruit, and 16 in crops and gardens. There are about 300,000 peasant proprietors, representing 2,000,000 of the population. Rye, oats, and potatoes are the chief crops, but the importation of foods is large. Cheese and condensed milk are manufactured in large quantities for export. About 22,000,000 gal. of wine are produced annually. In 1896 there were 108,969 horses, 1,306,696 cattle, 271,901 sheep, 415,817 goats, and 566,974 swine; and in 1893 there were imported 10,198 horses, 65,199 cattle, 51,386 swine, and 92,461 sheep.

*Industry.*—The soil does not yield sufficient for the support of the population, and a large percentage finds employment in industries, generally small, occupying only the family. The larger ones subject to the factory law only are enumerated. Of these on Jan. 1, 1896, there were 4,933 devoted to the manufactures of textiles, leather, articles of food, chemical, metal, and wood products, paper and printing, pottery, glass, watches, etc. See SWITZERLAND in the Appendix.

Switzerland has over 1,400 hotels, employing 16,000 people, representing a capital of $64,000,000, and giving a gross annual income of $10,500,000.

*Population.*—The population from 1880 to 1888 increased at the annual rate of 0.4 per cent. In 1888 it was 2,917,514; and there were 1,041 females for every 1,000 males. The density of population was least in the Grisons (34 per sq. mile), Uri (41·5), and Valois (50·3); greatest in the canton of Geneva (977), of Basel (674), and of Zurich (506); all of the latter have cities of considerable size. German is spoken by the majority, and is hence the official language in sixteen cantons, French in five, and Italian in one. In the Grisons about 46 per cent. of the population use German, about 40 per cent. Romansh, and 14 per cent. Italian. Italian and Romansh are receding, French is growing in use, and German remains about stationary. The official French is full of Teutonisms. The birth-rate is high, and 4·5 per cent. of the births are illegitimate. The annual emigration amounts to about 3,000, and is decreasing; the emigrants are generally agriculturists and unmarried. They are chiefly from Bern, Zurich, St.-Gall, and Ticino, and nearly all go to the U. S. There is absolute freedom of conscience; about 60 per cent. of the population is Protestant, the remainder Roman Catholic. The Protestantism is Calvinistic in doctrine and Presbyterian in government. Education is compulsory, primary education is free, and the percentage of illiteracy nearly evanescent. There are 6,395 schools of all grades, with 13,877 teachers and 572,334 pupils; also five universities (at Basel, Zurich, Bern, Geneva, and Lausanne, the last since 1891), with 600 teachers and 25,000 pupils, of whom nearly a half are aliens. The principal towns (with the communal population for 1900) are Zurich (150,239); Basel, Basle, or Bâle (112,842); Geneva (104,044); Berne (63,994); Lausanne (55,973); Luzerne, or Lucerne (29,145); Neuchâtel (20,697); St. Gallen (36,344); and Chaux-de-Fonds (31,134).

*Commerce.*—The imports (including precious metals) for 1899 were valued at $248,321,795, and the exports at $167,073,709. The chief imports were foodstuffs, tobacco and spirits, silk, wools, cottons, and other textiles, metals, minerals, and chemical colors, bullions, and coin. The chief exports were textiles, timepieces, and colors. Wheat and flour are largely imported. The trade is chiefly with Switzerland's immediate neighbors, Germany first, but a considerable proportion of the exports goes to Great Britain and the U. S.

There were 2,347 miles of railway in operation in 1899, with a total cost of $235,000,000, and a gross income in 1892 of $25,219,419, and expenses of $14,910,504; also 5,707 miles of telegraph and 8,368 miles of telephone line. The number of post-offices was 1,505.

The unit of money is the franc of the same value (19·3 cents) as that of France. Swiss coin makes only about 5 per cent. of that circulated; the remainder is chiefly Italian and French. The *pfund* = 1·10 lb. avoirdupois; the *centner* = 100 pfund; the *arpent* of land = 8·9 acres.

*Cantons.*—Switzerland is composed of twenty-two cantons, although the splitting of each of three cantons into two demi-cantons makes the total number of federative units twenty-five. These, with the date of admission, area, and population for Dec. 1, 1900, are as follows:

| CANTON. | Date of admission. | Area in square miles. | Pop. Dec. 1, 1900. |
|---|---|---|---|
| Uri | 1291 | 415 | 19,701 |
| Schwytz | 1291 | 351 | 55,497 |
| Unterwalden | 1291 | .... | ...... |
| Upper | .... | 183 | 15,280 |
| Lower | .... | 112 | 13,088 |
| Lucerne | 1332 | 579 | 146,474 |
| Zurich | 1351 | 666 | 430,135 |
| Glarus | 1352 | 267 | 32,397 |
| Zug | 1352 | 92 | 25,045 |
| Bern | 1353 | 2,657 | 586,918 |
| Freiburg | 1481 | 644 | 127,719 |
| Soleure | 1481 | 302 | 100,838 |
| Basel | 1501 | .... | ...... |
| City | .... | 14 | 112,246 |
| Rural district | .... | 163 | 68,451 |
| Schaffhausen | 1501 | 114 | 41,523 |
| Appenzell | 1573 | .... | ...... |
| Outer Rhodes | .... | 101 | 55,284 |
| Inner Rhodes | .... | 61 | 13,480 |
| St.-Gall | 1803 | 779 | 230,066 |

| Thurgau | 1803 | 381 | 113,110 |
| Ticino | 1803 | 1,088 | 142,719 |
| Vaud | 1803 | 1,244 | 279,152 |
| Valais | 1815 | 2,027 | 114,980 |
| Neuchâtel | 1815 | 312 | 125,804 |
| Geneva | 1815 | 108 | 131,674 |
| Totals | .... | 15,976 | 3,312,551 |

*Administration.*—The constitution is thoroughly federal in character, with some novel features. (See LAW-MAKING, METHODS OF.) Supreme legislative and executive authority in federal matters rests in a federal assembly of two houses: a state council of forty-four members (two for each canton or one for each demi-canton) elected by the cantons, and a national council composed of 147 members—one for each 20,000 population, elected every three years by direct ballot. Each member receives $4 for each day when present, and 5 cents per kilometer for traveling expenses. Executive authority is deputed to a federal council of seven, elected by the assembly for three years, and its president and vice-president are the chief magistrates of the nation. There is a special tribunal for trial of cases between the confederation and cantons, or between cantons. The confederation can levy no direct taxes, and its chief source of revenue is the customs. The revenue for 1900 was $17,499,507, and the expenditures $19,832,262. The public debt (federal) in 1900 was $17,377,650, mostly at 3½ per cent., but there is state property worth $17,963,675. No standing army may be maintained within the confederation, and the individual cantons have certain independent rights in carrying on war. Fortifications have been constructed at St.-Gothard, are being constructed at St.-Maurice, and are in contemplation at Martigny.

Each element of the confederation (canton and demi-canton) is sovereign and independent in local affairs and in such others as are not limited by the federal constitution. The cantonal governments agree only in the absolute popular sovereignty, and differ much in organization and details. In a few smaller ones the public will is given by popular meetings without representative machinery. The *referendum* is most fully developed in Zurich, where all laws and even the chief matters of finance must be submitted to the popular vote. Communal government is well developed for local affairs. In 1890 the combined budgets of the cantons gave a revenue of $16,000,000, and an expenditure slightly greater. Several cantons have only indirect taxation—duties, stamps, etc.—while others tax income and property also. The cantonal debts are inconsiderable, and are covered by cantonal property. In many towns and parishes the octroi also exists.

HARRINGTON.

**Switzerland, History of:** Though many traces of the ancient race known as lake-dwellers remain in Switzerland (see LAKE-DWELLINGS), the Helvetii were the first inhabitants whose name has been transmitted to us by history. They were continually involved in war with Gauls, Germans, or Romans, and on one occasion even dared to attack Cæsar's army, but were beaten back to their native valleys, and from this time to the period of the Teutonic invasions enjoyed the protection of Rome. They served as a bulwark for Rome against the Germans, and their country became a Roman province. The time came, however, when the Romans had to withdraw their forces and make room for other invaders, the Ostrogoths, the Alemanni, the Burgundians, and the Franks. The western part was included in the Burgundian kingdom. The last of the Burgundian kings parted with his sovereignty in favor of the Emperor Conrad II. in the year 1032, so that the greater part of what is now Switzerland was placed under the immediate rule of the emperors. At the beginning of the twelfth century the emperor granted to the Dukes of Zähringen, as vassals, besides many other lands, the greater part of Western Switzerland and the Lesser Burgundy. At the death of the last Zähringen (1218) Switzerland was again put under the paramount authority of the emperor, who, however, conferred several parts thereof on other vassals. The Swiss were willing to submit themselves to the emperors as their paramount lords, but bore uneasily the rule of the imperial vassals. Following the example of the leagues of the nobles and of the free cities the three forest-cantons, Uri, Schwytz, and Unterwalden, formed in 1291 a league, known as the Old League of High Germany, which was the nucleus of the twenty-two cantons of the present confederation.

The house of Hapsburg, which had been instituted by the Duke of Zähringen protector of the Lands—for such the forest-cantons were called—attempted to increase its rights and domains; the Lands opposed, and tried in their turn to free themselves from the dominion of the house of Hapsburg. The Swiss war of independence is memorable for the bravery and vigor of the League. In the battle of Morgarten Pass (1315) Duke Leopold of Austria was utterly defeated, and for seventy years no serious attempt was made by the Dukes of Austria to force their rule upon the Swiss. In 1386 the Swiss gained another victory over the Austrians at Sempach, and this battle, which was soon followed by another victory for the Swiss at Näfels (1388), placed the growing power of the League on a firm footing. In the meanwhile new districts were added to the League, which after the accession of Bern in 1353 contained eight members. The period that succeeded the battle of Sempach was marked by the gradual destruction of the Austrian power over the members of the League, and in 1474 their independence of the house of Hapsburg was formally recognized. Another feature of this period was the undermining of the house of Savoy, which up to that time had almost as complete authority over the western part of the country as the house of Austria had over the central and eastern portions. In the fifteenth century another powerful foe appeared in the person of Charles the Bold of Burgundy, but the Swiss won victories at Grandson and Morat in 1476 and in 1477 under the walls of Nancy, where Charles was slain. By 1513 the number of the cantons was increased to thirteen. In the next few years Protestantism spread rapidly throughout the country, under the impulse given to it by the great Reformer Zwingli, and in 1531 war broke out between the Protestant and Roman Catholic cantons. In that year the Protestant canton of Zurich was defeated by the forest-cantons at Kappel, and Zwingli was killed. This reverse was in part offset by the spread of Protestantism in the west, where Geneva became the seat of Calvinism and where the Pays du Vaud, long subject to Savoy, was conquered in 1536 by the Protestant canton of Bern.

After each of the religious wars treaties of peace were made, but peace did not return. During the Thirty Years' war Switzerland remained neutral, and by the Treaty of Westphalia (1648) her independence of the German empire was formally recognized.

Up to the time of the death of Louis XIV. the greatest disorder existed in Switzerland, and this disturbed condition of things continued until the outbreak of the French Revolution, the principles of which gained ground easily in Switzerland. The number of malcontents increased, and the Swiss were to be seen in opposing armies. The canton of Bern, the largest of the states, fought valiantly to the last against the new ideas and the foreign republican armies, but without success. Switzerland was to be converted into a republic, "one and indivisible," according to the views of the French Directory. This was known as the Helvetic

Republic and lasted four years. To that form of government succeeded a sort of league based upon federal principles. Under this constitution Switzerland recovered an appearance of peace, but the mediator of that "mediation act" (Feb. 13, 1803) was a meddlesome neighbor and a despotic ruler. The mediation lasted ten years, and came to an end at the fall of the French empire. The European reaction against France took place, and Switzerland had to participate in it; her soil was invaded by the allies, as it had been so often and so long by the French armies. By the Congress of Vienna (1815) her independence and neutrality were acknowledged and guaranteed. The spirit of self-preservation and sense of dignity developed in Switzerland, and new efforts were made to give the country a stronger and more independent basis. Switzerland was led to it by new internal disturbances and external occurrences—notably the revolutions in France in 1830 and 1848. In the latter year a new constitution was adopted without foreign interference; this gave place on May 29, 1874, to that now in force.

F. M. Colby.

**Sword** [O. Eng. *sweord* : O. Sax. *swerd* : O. H. Germ. *swert* (> Mod. Germ. *schwert*): Icel. *sverð*]: a weapon of offense, consisting of a long blade and a handle large enough for the grasp of one hand or, rarely, of both hands. The characteristic of the weapon is that the blade is not mounted on a long handle or staff, while yet it is larger than the dagger or poniard.

*Sword* is the general term, and includes weapons as unlike one another as the cavalry saber and the slender triangular-bladed court sword worn by gentlemen at the close of the eighteenth century. It is, however, well to separate the saber in all its varieties from the sword proper.

*The saber* has one edge only and has a thick, broad back. Toward the point a few inches of the back may be sharpened, though this is uncommon. The edge invariably curves backward to meet the back in a sharp point, which is practically a triangular point; moreover, the whole blade usually curves backward, the back concave and the edge convex. Some cavalry sabers are straight. The cavalry and artillery sabers of the U. S. service are slightly curved, the curve being about one in twenty. The northern nations of Europe in the early Middle Ages used sabers as well as swords; that is, both their long and their short weapons of this kind often had but a single edge and a broad back. These weapons, really long and heavy knives, were called scramasaxes, and were probably the arms most constantly in use. The celebrated Japanese weapon is curved about as much as the U. S. saber, but is mounted very differently on its handle. The Eastern blade slopes backward from the handle at the very point of junction, but the Western one is set so that the blade slopes forward. The Japanese two-handed saber had a blade about 3 feet long; this, or a somewhat shorter weapon, formed the principal badge of the Samurai or military class, and was worn in the sash with a much shorter weapon of almost exactly the same general form. These Japanese sabers deserve their great reputation, as the blades are of extraordinary, perhaps unequaled, excellence. The scimiter of the Mohammedan nations is a light saber with the blade very much curved backward, the curve of a Persian scimiter of the eighteenth century and earlier being one in seven or one in eight. In these the blade is set almost exactly tangent to the straight line formed by the handle. Earlier scimiters seem to have had the blade made heavier and broader near the point than at the hilt, perhaps with the view of striking a heavier blow upon armor; but so little is known of the system of fencing or saber-practice in use among the Moslem nations that this is only offered as a suggestion. The drawing cut with the sword arm kept bent, which is supposed to be the favorite manner of attack, would not seem to require a heavy blade or one weighted toward the point. The steel of which the scimiter is made is or affects to be of the famous steel of Damascus, that is, of a steel wrought in such a way that the surface is covered with delicate waving lines in its substance. A weapon almost exactly like the Mohammedan scimiter was carried by officers of high rank in the French service during the first republic. Oriental blades and Oriental scimiters complete were worn indifferently in exchange with similar weapons of French make. English field-marshals are represented as late as 1885 carrying sabers of a like curvature. A modification of the saber used only in some parts of India has its sharpened edge concave and the back convex. One form of this, the deadly koukri of the Goorkhas, is weighted toward the point. The yataghan of the Mohammedan nations on the Mediterranean Sea, from the Danube to Morocco, has also its sharp edge concave; the form varies greatly. The cutlass is the saber shortened and roughly and cheaply mounted, as for sailors, both in the navy and in private service. The düsack or tesack is nearly the same weapon, and especially one forged in a single piece, the handle being a mere hole in a plate. This simple weapon was used in Germany in the later Middle Ages and down to the seventeenth century.

The ordinary hunting-knife, of which the famous American bowie-knife is one form, is a shortened saber; these weapons are to the saber what the European dagger of the Middle Ages is to the sword proper.

*Swords among Ancient Nations.*—The special weapon of the ancient Roman infantry was, at least after the beginning of the second century B. C., straight, double-edged, sharp-pointed, and much longer and heavier than had been in use in earlier times or at any time among the Greeks. Little is known of its exact character, as the steel blades have been destroyed by rust, but the general shape is known from such sculptured representations as are found on the columns of Trajan and Marcus Aurelius at Rome. The length of the blade may be put at from 20 to 24 inches. It was used mainly for thrusting, but we are not to imagine a legionary thrusting like a modern fencer with the hand high and the fingers uppermost; a more common way of "giving point" was certainly with the hand very low and the point higher, the thrust being upward. The bronze swords of the northern nations were often what is called leaf-shaped, that is, they were broad toward the point and narrowest at a distance of 3 or 4 inches from the handle, and symmetrical in shape, that is, both of the edges had the same elongated S-curve, but reversed, the two meeting at a sharp point. The sword of the Gauls at the time of the Roman conquest seems to have been sometimes of bronze, sometimes of steel; it was long, very heavy, and often retained the leaf-shape of earlier times. Among Eastern nations, whether ancient or modern, the most important weapon which can be called a sword is the Malayan creese. This has a blade about 18 inches long, sometimes shorter, sharp-pointed, and having on each side a waved edge, the undulations being very decided, one in five or one in six of their length. Another important peculiarity is the setting of the blade, often not at all in the prolongation of the handle, but at a decided angle with it, the angle varying in different weapons. These blades form a great contrast with the smooth, close-grained, highly finished Japanese blades. The Malayan steel is, as it were, a carrying further of the Damascus waved or watered steel: it is extremely rough and with depressions between the lines of the waving nearly like the graining of wood which has been exposed to the weather. The straight sword used by the Hamran Arabs in hunting as well as war seems to be of European origin, perhaps a lingering on of the knightly sword described below.

*In the Middle Ages.*—With the appearance of what is known as chivalry, after the firm establishment of the feudal system, the sword of the knight was broad-bladed and straight, symmetrical in shape. From the beginning to the end of the age of heavy armor and knighthood the peculiar weapon of the knight was the sword with a thin, flat blade and both edges alike. The well-known sword of Childeric, found in his tomb and now in the Louvre, could not have had a blade more than 18 inches long, judging by the sheath, which is in good preservation. The sword of the ninth century had a blade nearly or quite 3 feet in length. That of the twelfth century was often shorter. Some swords of the thirteenth century had a blade 45 inches long; but the sword of the knight, intended to be wielded by one hand, could hardly exceed this length, and when heavy armor was to be broken or wrenched apart a mace or a horseman's axe was used. The two-handed swords of the later Middle Ages may have been used on occasion by mounted knights; thus the famous bronze statue of King Arthur in the Church of St. Francis in Innsbruck, which dates from about 1520, is furnished with a sword whose grip has two distinct holds for the two hands; but the two-handed sword was essentially a weapon of foot-soldiers, having a blade 4 feet or more in length and a handle about 16 inches long, weighted at the butt to partly counterpoise the blade. It is probable that but little delicate sword-play was used during the Middle Ages. Each combatant struck hard and caught his enemy's blows on his shield or trusted to his armor.

*In Later Times.*—With the gradual disappearance of armor the gentlemen of Europe introduced swords which, though still heavy, were much lighter than those of the fourteenth century. The rapier was brought into use by the Spaniards and adopted by men of family toward the close of the sixteenth century, and was as long as the knightly sword of an earlier time, but much lighter. The broad, thin blade of the knight's sword gave place to a much narrower blade in which can be seen the beginning of the dueling sword of the seventeenth century. These, however, were the arms of the nobles and their imitators; the private soldier still carried a blade for cutting as well as thrusting, and this passed into the heavy broadsword of the seventeenth century, such as became famous in the hands of Cromwell's cuirassiers. A similar weapon, carried by the Scotch Highlanders under Montrose and Charles Edward Stuart, is often called claymore, but this is erroneous. The claymore proper was a huge two-handed sword, such as is described in Scott's romance *The Fair Maid of Perth.*

The rapier had always a straight, narrow blade, and when used for systematic and ordinary fighting, as in the duel, was generally accompanied by the dagger, which was held in the left hand and parried the adversary's thrusts. As the science of fencing was developed the dagger was given up and the sword became lighter and shorter. A duel under Louis XV. was fought with swords whose blades did not exceed 3 feet in length, and were sometimes two-edged and flat, sometimes three-cornered or bayonet-shaped.

One very curious form of the sword was the hunting-sword of the seventeenth century and later—a thin, two-edged blade curved about like a saber, one edge convex, one concave. Such blades were from 16 to 24 inches long.

In modern armies officers of certain ranks are supposed to wear a slender straight sword. Thus in the U. S. army in the civil war staff officers should have carried such weapons, but they generally preferred a saber.

As the sword has always been the weapon of ceremony and the typical badge of a soldier and commander of armies, so *swords of honor* and *sabers of honor* are often presented to successful officers. Moreover, swords of mere ceremony are carried before officials of high rank, or are held by them on certain occasions; thus among the regalia of Great Britain is the curtana, or pointless "Sword of Mercy," and the "Sword of Justice." Somewhat in a ceremonial way the *city-sword* or *walking-sword* of the eighteenth century was considered the distinctive badge of a gentleman.

*The Hilt.*—The sword-hilt consists of grip, guard, and pommel. The long tang forged with the blade, straight, tapering, and of square-edged section, passes through a hole in the guard, is covered by the grip, and is held fast at the end by the pommel, or else is held fast in the grip by pins or the like, while the pommel is put on separate. The grip is a mere enlarging and rounding of the tang, sometimes by laying plates of bone or wood against its sides, sometimes by means of a tube of wood or of shark-skin, or even metal. Wire is sometimes wound around the grip to allow of a firmer hold. The guard is the part that varies most. In Roman swords it was small, a mere plate sufficient to stop the edge of another sword which might slide along its own blade, but no more. The Japanese saber has but a small guard, approximately oval in shape, a flat plate of iron or bronze. The mediæval sword had a large and long cross-guard, each arm of it several inches long; those of the two-handed sword sometimes a foot across. The most elaborate of all sword-hilts is that of the sixteenth and seventeenth centuries, which was applied to broadswords and rapiers alike; this had a very elaborate protection for the fingers and knuckles, consisting of several curved bars or of a plate of steel. In connection with this was a complicated cross-guard; that is to say, a fine and carefully made sword of 1600 would have a long cross-guard, a secondary or upper guard 3 inches farther toward the point of the blade and composed of rings or flat plates or "shells" one on each side, and a "knuckle-bow" curving from where the cross-guard meets the grip to the pommel. Sometimes the guard took the form of a cup, with the open part toward the hand. Sometimes the basket-hilt was a bowl so solid and unpierced as to hold liquid. Modern sabers have generally a curved guard which protects the knuckles and sweeps around to meet the pommel, to which it is secured. This is a mere modification of the basket-hilt, as above described.

See Demmin, *Die Kriegswaffen* (Leipzig, 1886; trans. into French and English); Egerton Castle, *Schools and Masters of Fence* (London, 1885); Lacombe, *Les Armes et les Armures* (trans. by Boutelle, *Arms and Armour*, London, 1874); *La Collection Spitzer*, vol. vi. RUSSELL STURGIS.

**Swordfish**: any fish of the family *Xiphiidæ*, remarkable for having the upper jaw prolonged forward in the shape of a bony sword. The common swordfish (*Xiphias gladius*) ranges from the Atlantic coast of North America eastward to the Mediterranean. It is often from 10 to 16 feet long, has very fine scales, no ventral fins, a long broken dorsal fin, and a large and deeply forked caudal. It is a very rapid swimmer, and is said to assail the largest whales with its sword. It sometimes strikes ships with such force as to penetrate several thicknesses of plank, and the sword is frequently broken off and left *in situ*, but the fish which most often assaults vessels is a smaller species of the genus *Tetrapturus.* The swordfish is generally esteemed as food, and is taken by the harpoon, thus affording an exciting and dangerous sport, but is too scarce to be of much commercial value. The use of the sword is not clearly ascertained. In all probability the fish employs it in gaining its subsistence, but the precise method is not known. The food of the swordfish consists of cuttlefish, especially the squid, and of small fishes. See FISHERIES. Revised by F. A. LUCAS.

**Syagrius**, sī-ā'gri-ŭs: the last Roman ruler in Gaul; was a son of Egidius, from whom he inherited what is known as the kingdom of Syagrius, embracing the country around Soissons, between the Seine, the Marne, and the Oise. The Franks encroached upon his domains, and finally, under their chief Clovis, gained a decisive victory over him at Soissons in 486, thereby destroying the last remnant of Roman power in that region. Syagrius fled to Toulouse, but was afterward surrendered to Clovis, by whose command he was put to death. F. M. COLBY.

**Syb'aris** (in Gr. Σύβαρις): city of Magna Græcia, in Lucania; founded by Achæans and Trœzenians about 720 B. C.; 3 miles from the Tarentine Gulf, between the rivers Crathis and Sybaris, the modern Crati and Coscile. It rose rapidly to a great prosperity, founded other colonies—Posidonia, Laüs, and Scidrus—covered a space of 6 miles in circumference, and was notorious for the luxury and effeminacy of its inhabitants. In 510 B. C. Sybaris was completely destroyed by the Crotonians and never recovered, but in 443 B. C. the descendants of the conquered and exiled Sybarites founded the city of Thurii in the immediate neighborhood of the old site of Sybaris. Revised by J. R. S. STERRETT.

**Sybel**, HEINRICH, von: historian; b. at Düsseldorf, Prussia, Dec. 2, 1817; studied at Berlin and at Bonn; became Professor of History at Marburg in 1845, and director of the Royal Prussian Archives in 1875. He took an active part in politics, and was a member of the Hessian Legislature and of the Prussian Landtag. Among his writings are *Geschichte des ersten Kreuzzugs* (1841); *Die entstehung des deutschen Königthums* (1844); *Geschichte der Revolutionszeit* (1853–74; Eng. trans.); *Die deutsche Nation und das Kaiserreich* (1862); and *Die Begründung des deutschen Reichs durch Wilhelm I.* (1885–90; Eng. trans. 1891). D. at Marburg, Germany, Aug. 1, 1895. F. M. COLBY.

**Syc'amore** [(by analogy of *sycamine*) from O. Fr. *sycomore* < Lat. *syco'morus* = Gr. συκόμορος, mulberry-tree; σῦκον, fig + μόρον, black mulberry]: a tree (*Ficus sycomorus*, or *Sycomorus antiquorum*) which is a near relative of the fig. It is a widespreading, shady tree, much planted in the Levant for its shade. Its light, fragile wood is reputed to be indestructible. Its fruit is inferior in quality to that of the fig, but is abundant and palatable. In some parts of the U. S. the buttonwood or plane-tree is improperly called sycamore, and in Great Britain that name is applied to a maple (*Acer pseudoplatanus*). Revised by L. H. BAILEY.

**Sycamore**: city (founded in 1836); capital of Dekalb co., Ill.; on the Chi. and N. W. and the Chi. Gt. West. railways; 56 miles W. of Chicago (for location, see map of Illinois, ref. 2–E). It is in an agricultural, dairying, and stock-raising region; has manufactories of agricultural implements, flour, water-motors, insulated wire, brick, tile, varnish, furniture, carriages and wagons, and soap, works for preserving fruit and vegetables, and 2 creameries; also 11 churches, 3 graded public schools, a seminary for young ladies, high-pressure water-works, electric lights, a national bank (capital $50,000), a private bank, and a semi-weekly and a weekly paper. Pop. (1880) 3,028; (1890) 2,987; (1900) 3,653. EDITOR OF "TRUE REPUBLICAN."

**Syd'enham**, THOMAS: physician; b. at Winford Eagle, Dorsetshire, England, in 1624; educated at Oxford, and in 1648 became a fellow of All Souls' College, having meanwhile served as an officer in the parliamentarian army; studied medicine at the college of Montpellier. France; took his degree of M. D. at Cambridge, and established himself about 1660 as a physician in London, where he soon attained the foremost place. He abandoned the mere routine system of practice then prevalent, basing his own upon the theory that there is in nature a recuperative power which it is the province of the physician to aid. He was especially acute in observing and describing the symptoms of diseases, and carefully studied the relations between epidemics and the conditions of the atmosphere. Among the services which he rendered to medical practice were the treatment of intermittent fever by cinchona and the administration of cooling remedies in smallpox. His works, which are not numerous, were written in Latin, but have been frequently translated. Among them is *Methodus Curandi Febres* (1666; 3d ed., *Observationes Medicæ*, 1676). In 1843 was founded the Sydenham Society, for the purpose of printing important medical works in English and other languages. Its first issue was the complete works of Sydenham, in Latin (1846; English trans. by Dr. Greenhill, with a memoir by Dr. Latham, 1848). D. in London, Dec. 29, 1689.

**Sydney** [named after Thomas Townshend, first Viscount Sydney]: capital and chief port and railway center of New South Wales, Australia, and the oldest city of Australasia; on the southern side of Port Jackson, in lat. 33° 52′ S., lon. 151° 12′ E. (see map of Australia, ref. 7–J). The climate is temperate and generally healthful. The mean temperature is 62° F., ranging from a minimum of 35° to a maximum of 106°. The mean annual rainfall is 52 inches. Port Jackson is a long, slender inlet on the east coast, of irregular form, with numerous bays and coves, forming a magnificent harbor with a water front of more than 100 miles. The entrance is only a mile wide, but just inside is a bar with only 20 feet of water at low tide, increased by dredging to a few feet more. At the opposite end of the port enters George's river, navigable to Liverpool, a distance of 14 miles.

The city proper is about 4 miles from the heads, on a peninsula between Rushcutter Bay on the E., and Blackwattle Bay on the W. It has a water front of 8 miles, of which 6 are available for the use of commerce. The surface is undulating, with a maximum height of 230 feet. The streets are often crooked and steep, but this gives the city an old-fashioned appearance unique in Australia, and affords frequent and charming vistas over the waters of the bay and to the opposite shores. There are many public parks (3,800 acres), including the Domain (130 acres), extending to the water front, along the most densely populated and busiest part of the city, and Moore Park (500 acres), to the S. E. of the city. The suburbs are numerous and contain a large population. The more fashionable suburbs are toward the E., while the business portion is extending westward. The entire distance to Parramatta, about 15 miles, is practically suburban along the railway. The manufactories are more on the southern side, and population is rapidly extending toward Botany Bay, 6 miles to the S. There are also considerable suburbs on the north shore of the bay, which are connected with the city by steam-ferries and by rail.

The water-supply was first obtained from the small Tank stream flowing into Sydney Cove, along which the nucleus of the town was first formed. Later it was derived from a stream flowing into Botany Bay, brought to the city by a long tunnel. As this proves insufficient, a plan is under way to bring water from the Nepean river, taken at a point 63 miles distant and conducted to a large storage reservoir near Parramatta. The sewage is conducted to the water front, but as the size of the city renders this unsanitary, a large sewer is under construction to a headland on the ocean shore, where the sewage will be delivered into deep water and carried away by the current from the N.

The public and many private buildings are of fine style and good aspect, and are generally made of a fine sandstone found in the vicinity. The university is the most important edifice in Australia, the principal façade being 500 feet in length. Together with the affiliated colleges of St. Paul's and St. John's, it lies in a domain of 150 acres. With regard to its degrees it has the status of the English universities. The metropolitan cathedral of St. Andrew's and the Roman Catholic Cathedral of St. Mary are two of the finest structures in Australia. The royal branch mint at Sydney issues nearly £3,000,000 worth of coin annually, mostly gold, but with a little silver and bronze. The city is in the center of a large coal-basin, and the beds probably pass under the city itself. Coal is cheap and abundant, and the commercial advantages are great. The manufactures include all the products of the pastoral industry, and especially boot and shoe making, railway manufactures, carriage and wagon making, manufactures of glass, pottery, furniture, stoves, tobacco, etc., and distilling and brewing. In 1893 1,323 vessels cleared from Sydney, as compared with 1,593 from the other ports of the colony.

The city was founded in 1788 by Capt. Phillip as a penal station, and long remained a humble village. In 1861 it had 56,845 inhabitants, 93,685 with the suburbs. In 1891 the census gave the city and suburbs 383,386 inhabitants, which was 34 per cent. of that of the entire colony. At the end of 1895 it had, with suburbs, 1,415 miles of streets, and a population of 408,500.

MARK W. HARRINGTON.

**Sydney**: chief port of Cape Breton, Nova Scotia, and capital of Cape Breton County, formerly capital of the province of Cape Breton; on the east side of Sydney Harbor, lat. 46° 18′ N., lon. 60° 12′ W. (see map of Quebec, etc., ref. 1–D); station on the Intercolonial Railway, 275 miles N. E. of Halifax. The harbor is one of the best in the provinces, but it is ice-bound during the long winter. It is the principal port for the coal-mining district northeast, with which it is connected by rail. The harbor was originally the rendezvous of the Spanish fishing-fleet, and was then called Spanish Bay. Later it was a center for British military activity, and so remained until the Crimean war. France has, by treaty, coaling privileges here, and utilizes them to make this the station of her naval squadron on the North Atlantic. Regular connection is kept up with Newfoundland by steamer in summer. Pop. 4,000. MARK W. HARRINGTON.

**Sydney**: See SIDNEY.

**Syene**: See ASSOUAN.

**Sy'enite**: granular crystalline rock, consisting of alkali-feldspars (mostly orthoclase) with some lime-soda-feldspar, one or more ferromagnesian silicate: biotite, amphibole, or pyroxene; and little or no quartz, besides other minerals. According to the kinds of minerals accompanying the alkali-feldspars varieties are distinguished as quartz-syenite, augite-syenite, mica-syenite, hornblende-syenite (syenite proper), zircon-syenite, sodalite-syenite, etc. Its texture varies from coarse-granular to fine-granular, often exhibiting lath-shaped feldspars on the surface of fracture. Occasionally porphyritic, passing into syenite-porphyry and orthoclase-porphyry. With increasing quartz it grades into granite, and with more lime-soda-feldspar it grades into diorite. Varieties low in silica carry nephilite and sodalite, and grade into eleolite-(nephelite)syenite, which properly constitute a separate rock-group. (See ROCKS.) This variety is relatively high in soda and potash, which characterize the feldspars and feldspathic minerals, and enter into the ferromagnesian minerals, producing arfvedsonite, barkevikite, acmite, ægerite. This rock usually carries rare minerals, containing the rarer elements cerium, lanthanum, thorium, yttrium, etc.

The name syenite was first used by Pliny for the rock from Syene (Assouan) in Egypt. It was subsequently applied by Werner to the rock from the Plauensche Grund, near Dresden, from which it has grown into its present significance. It has been found that the rock from Syene is rich in quartz, and therefore a granite. Until recently the name syenite has been applied to hornblende-granite to distinguish it from mica-granite.

Syenite proper is much less common than granite, and has been identified in comparatively few localities in the U. S. outside of New Hampshire. Eleolite-syenite is somewhat better known, occurring in Arkansas, New Jersey, Maine, and Canada. It is known in Brazil, and especially in Norway, where numerous rare minerals associated with it have been described by Brögger. See GRANITE.

J. P. IDDINGS.

**Sykes**, GEORGE: soldier; b. at Dover, Del., Oct. 9, 1822; graduated at the U. S. Military Academy in 1842; served in the war with Mexico; was on frontier and garrison duty 1848–61; was in May, 1861, appointed major of the Fourteenth Infantry; commanded the regular troops in the battle of Bull Run; commanded as brigadier-general the regular infantry in the defenses of Washington during the winter of 1861–62, and in the Virginia Peninsular campaign of 1862 the division of regulars (Porter's corps) which so stubbornly maintained its position on the right at the battle of Gaines's Mill. He commanded this division at the second battle of Bull Run; also at Antietam, Fredericksburg, and

Chancellorsville, having been promoted major-general of volunteers Nov. 1862, and on the appointment of Gen. Meade to the command of the Army of the Potomac (June, 1863) Sykes succeeded to that of the Fifth Corps, which a week later was engaged at Gettysburg, and at the head of which he continued during the ensuing operations of the Army of the Potomac until Dec., 1863, when ordered to duty in the department of Kansas. He was breveted colonel for gallantry at Gaines's Mill; brigadier-general for Gettysburg, and major-general for gallant services. Mustered out of the volunteer service in Jan., 1866, he returned to duty with the Fifth Infantry, of which regiment he had been appointed lieutenant-colonel in Oct., 1863. In Jan., 1868, he became colonel of the Twentieth Infantry. D. at Fort Brown, Tex., Feb. 8, 1880.

**Sylla**: See SULLA.

**Syl'labus** [= Late Lat., from Gr. συλλαμβάνειν, συλλαβεῖν, take together; σύν, together + λαβεῖν, take]: a list of eighty propositions condemned by Pius IX. in his encyclicals, allocutions, and other official utterances. It is annexed to the bull "Quanta Cura," and was published by Cardinal Antonelli Dec. 8, 1864. The errors are grouped under ten heads, and concern pantheism, naturalism, and absolute rationalism; moderate rationalism; religious indifference and latitudinarianism; the ecclesiastical condemnation of socialism, communism, Bible societies, secret societies, and clerico-liberal unions in Italy; the rights of the Church; the rights of the state; natural and supernatural ethics; Christian marriage; the temporal power of the pope; and modern liberalism.

The document is purely negative in form, and states only the propositions to be rejected; but it is very well understood that the contradictory of the condemned propositions is to be held, and not the contrary. Failing to grasp this distinction many have given false and absurd interpretations to the syllabus. So understood, it is evident that the syllabus does not claim for the Church "supreme control over public education, science, and literature," but merely denies such control to the state (Proposition 45). Among Roman Catholic theologians the specific character and doctrinal value of the syllabus are still a matter of dispute. Some contend that it is infallible, but not *de fide*; others that it is also *de fide*; others that it is simply a list of errors drawn up for convenience of reference for bishops, theologians, etc., each proposition having only that specific kind of censure on it in the syllabus which was put upon it in the original document from which it was drawn. When in 1871 Dr. Schulte, professor at the University of Prague, contended that the syllabus is *de fide*, Dr. Fessler, Bishop of Pölten in Austria, wrote in refutation a work for which he received a letter of congratulation from Pope Pius. The Church has not decided that all the propositions in the syllabus are heretical (but only that they are to be rejected); therefore it does not follow that the contradictory propositions are all so many articles of faith. The Roman Catholic Church is accustomed to condemn some propositions as heretical, others as erroneous, others as rash, others as impious, others as dangerous, others as scandalous, others as offensive, others again as merely historically false. So, too, each proposition in the syllabus deserves some censure, but not necessarily the worst—viz., of heresy. Some propositions in the syllabus do not refer to doctrine at all, but only to matters of fact—viz., propositions 12, 23, 34, 38, 72. See Cardinal Hergenroether's *Catholic Church and Christian State*; Gladstone's *Vatican Decrees*, and the replies of Cardinals Newman and Manning; also Gladstone's rejoinder, entitled *Vaticanism*. The text of the syllabus is found in the *Acta et Decreta Concilii Vaticani*, Herder (Freiburg im Breisgau, 1871). JOHN J. KEANE.

**Syllogism**: See LOGIC.

**Sylvanite**: See TELLURIDES.

**Sylves'ter**: the name of two popes and an antipope. St. Sylvester I. (314–335) governed the Church during the reign of Constantine I. The basilicas of the Lateran, St. Peter, St. Paul, the Sessorian basilica, and many churches were completed under his pontificate. Much of the ancient Church legislation is referred to him. The original documents for his life are not extant. It is no longer maintained that he baptized Constantine, or that the latter's donation to Sylvester is genuine. Nevertheless he exercised much influence over the emperor, and received from him many gifts of land and church plate. (See Duchesne, *Liber Pontificalis*, i., pp. cix. 170, 187; Hergenroether, *Kirche und Staat*, p. 357.)—SYLVESTER II., whose true name was GERBERT, was born in Auvergne; studied in Spain under Bishop Hatto of Barcelona, and with the Arabs at Seville and Cordova; traveled in Italy; acquired a great reputation for learning, and was appointed by Otto II. teacher to his son, Otto III. While director of the school of Rheims, to which he attracted many students, he was elected archbishop of that diocese in 991 by a synod which deposed Archbishop Arnulf, but he was not confirmed by the pope, and had to give up his see to Arnulf. He then left Rheims, and repaired to Otto III., by whose aid he became Archbishop of Ravenna in 998, and in the following year pope. His knowledge of mathematics, astronomy, and physics led people to consider him a magician, and it was a popular rumor (see Doellinger's *Fables respecting the Popes in the Middle Ages*, Eng. trans., pp. 267–272) that he had sold his soul to Satan.—SYLVESTER III. was for three months the antipope of Benedict IX. and Gregory VI., and was deposed by the Synod of Sutri 1046.

Revised by J. J. KEANE.

**Sylvester**, JAMES JOSEPH, LL. D., D. C. L., F. R. S.: mathematician; b. in London, Sept. 3, 1814; studied at Cambridge, but could not take a degree on account of being a Jew; became Professor of Natural Philosophy at University College, London; went to the U. S. in 1841, and was in 1841–42 a professor in the University of Virginia. He soon returned to England, and in 1855 became Professor of Mathematics at the Military Academy at Woolwich. In 1876 he was invited to the chair of Mathematics in the Johns Hopkins University, where he remained until 1883. He then returned to England as Savilian Professor of Geometry at the University of Oxford. D. in London, Mar. 14, 1897. He wrote hundreds of memoirs in the *Transactions* of the Royal Society, *Proceedings* of the London Mathematical Society, *Crelle's Journal*, *Quarterly Journal of Mathematics*, *Comptes Rendus*, and many other journals, and in *The American Journal of Mathematics*, of which he was the founder. He enunciated a theory of versification in a volume, *Laws of Verse* (London, 1870), and invented several kinematic instruments. S. N.

**Sylvester**, JOSHUA: author; b. in England in 1563; became eminent as a linguist; was a member of the Company of Merchant Adventurers at Stade, Holland. D. at Middelburg, Holland, Sept. 28, 1618. He is best known as the translator into English of Du Bartas's *Divine Weekes and Workes* (1605; 7th ed. 1641). The original was by a French Huguenot nobleman; Sylvester's version had great popularity among the Puritans of Old and New England, and was one of the sources of inspiration to Milton when writing *Paradise Lost*. The quaint "conceited" style of Du Bartas was, if anything, exaggerated in the translation. In 1615 Sylvester published a singular anti-tobacco tract—*Tobacco Battered and the Pipes Shattered, etc.*—intended to please James I., who hated the weed. H. A. BEERS.

**Sylvicol'idæ**: an earlier name for the *Mniotiltidæ*. See WARBLER.

**Sylviculture**: See FORESTRY.

**Sylvi'idæ**: See WARBLER.

**Syl'vius**, JACOBUS (JACQUES DUBOIS): anatomist; b. at Louville, near Amiens, France, in 1478; studied medicine at the University of Paris, where he was appointed professor in 1550. He was the first to practice injection of the blood-vessels during their dissection; a fissure of the cerebrum is called the fissure of Sylvius. D. in Paris, Jan. 13, 1555. His *Opera Medica* were collected by René Moreau, and appeared at Geneva in 1630.

**Symbio'sis** [Gr. συμβίωσις, companionship; cf. συμβιωτής, partner; σύν, with + βίος, life]: a kind of COMMENSALISM (*q. v.*), in which the associated forms are intimately connected with and dependent upon each other. Thus the plants known as lichens are composed of symbiotic associations of algæ and fungi. The association of "yellow cells" (plants) in the *Radiolaria* (animals) is an example in the animal kingdom. J. S. K.

**Symbolic Logic**, or, better, **Algorithmic Logic**: a form of logic characterized by an artificial language composed of symbols with their laws of combination, and possessed of peculiar advantages in giving of actual relations representations which can be manipulated according to rules of operation and procedure, experimented upon to give new knowledge, according to organized processes.

Before George Boole logic always dealt with its materials directly and by intuitive perception, as did the old Greek geometry. What Descartes's analytic geometry did for the science of space, that Boole's algebra did for logic. His discoveries, startling as they appear, yet rest upon a principle well known to the modern mathematician. Though he had noteworthy forerunners, algorithmic logic, as a practical system, owes its creation wholly to his genius. He was, in a sense, the outcome of his time, the period when algebra was given a real plural. His discoveries in the algebra of linear substitutions are regarded as the foundation of the present vast theory of invariants. His *General Method in Analysis*, discovered in his researches on differential equations, reads like a prelude to his *Symbolic Logic*. His remarkable pamphlet, entitled *The Mathematical Analysis of Logic, being an Essay towards a Calculus of Deductive Reasoning*, by a curious coincidence made its appearance on the very same day as De Morgan's *Formal Logic*. In this he shows that by simply assuming 1 to signify what is, and 0 what is not, he can, without any further assumption, express the premises of a syllogism as two equations from which, by ordinary algebraic procedure, the conclusion can be deduced. This is a pregnant connecting of the concepts of being and nothing with a number system. Still more profound and unexpected is his developing a function of a general logical symbol by Maclaurin's theorem:

$$\phi(x) = \phi(0) + \phi'(0)x + \frac{\phi''(0)}{1.2}x^2 + \text{etc.}$$

Thus at a touch Boole changed a dead into a living science. Moreover, to the old synthetic logic he added a new analytic logic, namely, that the validity of the processes of an algebra does not depend upon the interpretation of the symbols which are employed, but solely upon the laws of their combination. Every system of interpretation which does not affect the formal operational laws is equally admissible, and so the same piece of symbolic algebra may, under one scheme of interpretation, represent the solution of a question on the properties of numbers, under another that of a geometric problem, under a third that of a problem of kinematics, under a fourth that of a new question in logic.

This principle, so fundamental that Boole assigns it as the definitive characteristic of a true calculus or algebra, may be illustrated as follows: If we define a sect as the piece of a straight between two definite points; if we indicate sects by the symbols $x$, $y$, $z$, etc.; if we define the product of two sects, $xy$, as the rectangle of those sects (not the *area* of the rectangle of the sects, but the *surface* of the rectangle determined by them); if we define the product of three sects, $xyz$, as the cuboid of those sects (not the *volume* of that cuboid), then all the theorems of Euclid's Book II. are rigorously demonstrated by the little equations usually appended to the propositions as mere numerical illustrations (e. g. in Playfair); and that, too, without any introduction of the idea of measurement or ratio. Moreover, each proposition may at once be generalized for space of three dimensions, and the mere algebraic statement of the generalization will contain its rigorous demonstration.

This general principle likewise explains why a professional mathematician in working out a way of accurately expressing by an algebra the operations and valid processes by which reasoning is ordinarily performed should make it as similar as possible to the ordinary algebra for number; not because thinking in its general character has any reference to number, but simply to get the benefit of as many as possible of the results and procedures produced by centuries of algebraic advance.

The aim of Boole's investigations was, in the first instance, confined to the expression of the antique logic, and to the forms of the Aristotelian arrangement, but he soon found that restrictions were thus introduced which were purely arbitrary and had no foundation in the nature of things. Feeling with the instinct of genius the high importance of his work, Boole applied his best powers to an elaboration, which appeared in 1854 under the title *An Investigation of the Laws of Thought on which are Founded the Mathematical Theories of Logic and Probabilities*, a work of which Herbert Spencer has said that it "constitutes a step far greater in originality and importance than any taken since Aristotle." The following is a summary of Boole's actual working method:

Convene to represent any class by a letter, as men by $a$ and good things by $b$. Combined in thought one acts as a selective adjective, and whichever this be the result is the same; so that $ba$, or "good men," gives us the same collection of individuals as $ab$, or "human good beings." Using the sign $=$ as meaning, in the most general way, identity, coexistence, or equality, we say $ab = ba$. "We are permitted, therefore, to employ the symbols $x$, $y$, $a$, $b$, etc., in the place of substantives, adjectives, and descriptive phrases, subject to the rule of interpretation that any expression in which several of these symbols are written together shall represent all the objects or individuals to which their several meanings are together applicable, and to the law that the order in which the symbols succeed each other is indifferent." Again, to form the aggregate conception of a group of objects consisting of partial groups, we use the conjunctions "and," "or." Convening that the classes so joined are quite distinct, so that no individual is added to himself, we see that these conjunctions hold precisely the same position *formally* as the sign $+$ in algebra, and are representable by that sign.

As the order of addition is indifferent, we have $x + y = y + x$. Again, to separate a part from a whole, we express in common language by the word "except," as "All men, except Asiatics."

This is our minus sign. As it is indifferent whether we express excepted cases first or last, we have $x - y = -y + x$.

But just as the algebra of quaternions differs in one fundamental law from the algebra of number, namely, in its multiplication being non-commutative, so that $ab$ does not equal $ba$, so Boole's algebra for logic differs in a law equally fundamental: in it $a^2 = a$; and from this comes the fact that, in it, every equation can be solved and every solution interpreted. Only two symbols of number obey this formal law. They are 0 and 1. Their interpretation for logic is *nothing* and *universe*, the two limits of class-extension. This law $x^2 = x$ it is which in Boole's algebra makes division indeterminate; but his genius overcomes this indefinitude by his expansion theorem. For example, from the proposition "All men are all the rational animals," $m = ra$, what can we get about animals? By developing, $a = \frac{m}{r} = f(m.r)$ $= f(1, 1)\, m.r + f(1, 0)\, m.r' + f(0, 1)\, m'r + f(0, 0)\, m'r'$. Hence all animals consist of all men and some irrational things ($r'$) not men ($m'$).

If we would use trial references to the premises the coefficients of the expansion are no longer needed, and by making these trial references mechanical we have from Boole's one theorem the interesting logical machines of Jevons and Marquand. In the latter, the premises being reduced to the form of the combinations to be excluded, as suggested by Boole, the operation of excluding these combinations is performed mechanically by the machine, and the conclusion exhibited. Boole's wonderful creation was so strange that it germinated slowly.

In 1864 Jevons began using $+$ to unite different terms into one aggregate, whether they be mutually exclusive or not. McColl and C. S. Pierce gave slightly varying algebras, adding a new sign to express *existence*. In 1877 Ernst Schröder, in his *Operationskreis des Logikkalkuls*, gave a beautiful simplification of the Boolian calculus, in which appears a duality like that of modern synthetic geometry. In 1879 Dr. Alexander Macfarlane published an algebra of logic which is particularly powerful for handling questions of probable inference and relationship.

Leslie Ellis, De Morgan, Joseph John Murphy, Alexander Macfarlane, and particularly C. S. Pierce, have developed a highly interesting symbolic logic of relatives. Prof. Peano, of Turin, is publishing a formulary containing the known propositions of the various subjects of mathematics, all written in a general symbolic language formed on the basis of algorithmic logic.

Finally, Dr. Ernst Schröder has collected in two encyclopædic volumes a systematic and critical account of all that makes the present status of algorithmic logic, including his own exceedingly important developments of many essential parts. In the first volume of this great work, *Vorlesungen über die Algebra der Logik (exakte Logik)* (first vol., Leipzig, 1890), the logical operations called identical multiplication and addition are shown to deserve these names, since all laws of addition and multiplication in general arithmetic which hold as general formulas, that is, without reference to the nature or individuality of the combined numbers, hold also for these logical operations; while the inverse operations may always be replaced by a simpler operation, *negation*, which appears as a common special case of each. The method of using the logical calculus is thus surprisingly simplified.

GEORGE BRUCE HALSTED.

**Symbols, Chemical**: See CHEMISTRY.

**Syme**, JAMES, M. D.: a noted Scottish surgeon; son of a Fifeshire lawyer; b. in Edinburgh, Scotland, Nov. 7, 1799; educated at Edinburgh University, and graduated in surgery therein 1821; was lecturer and Professor of Surgery at Edinburgh many years, and originated many improvements, including the resection of diseased joints in place of amputation, the process known as Syme's operation for amputation of the foot at the ankle-joint, and the removal of large tumors of the lower jaw by excision of the entire bone. He was the author of *The Excision of Diseased Joints* (1831) and *Principles of Surgery* (1832), both reprinted at Philadelphia (1866). D. in Edinburgh, June 26, 1870. See the *Memorial* by Dr. Robert Patterson (Edinburgh, 1874).

**Sym'machus** (Gr. Σύμμαχος): one of the three chief translators of the Old Testament into Greek who attempted to improve upon the LXX. Fragments of his translation have been preserved in that which remains of the *Hexapla* of Origen. According to Epiphanius (*De Mens. et Pond.* 16), he was a Samaritan living at the time of Severus (193–211). Eusebius (*Hist. Eccl.*, 6, 17) and Jerome (*Opp.*, ii., p. 894) say that he was an Ebionite. (Cf. also Nestle, *Theol. Stud. und Krit.*, 1879, p. 733.) Geiger (*Jüd. Zeitschr.*, i., p. 62) tried to prove that he was a Jew. He must have lived later than Irenæus, who in 180 A. D. (*Adv. Hær.*, 3, 24) does not mention him. Symmachus translated freely, and attempted to write a polished Greek. See also Field, *Hexapla*, i., chap. iii.; Bleek-Wellhausen, *Einleitung*, p. 582; F. Buhl, *Kanon des Alt. Test.* (Leipzig, 1891, § 54).

RICHARD GOTTHEIL.

**Symmachus**: pope (498–514); a Sardinian by birth; consecrated Nov. 22, 498, after the death of Anastasius II., but his election was contested, and Laurentius was on the same day made antipope. Symmachus was supported by Theodoric, King of Italy, and Laurentius by the Byzantine emperor. The contest lasted about seven years, but was decided in favor of Symmachus. Of more interest are the enactments of the synods which were held during his reign, and which contributed much to the systematic organization of the papal administration. Some seven councils were held (499–504) in which the election of the pope was regulated, the free disposition of Church goods forbidden to laymen and made more difficult even for the clergy, the principle proclaimed that the occupant of the Roman see could be judged by no inferior, etc. He was distinguished for his zeal in building and restoring churches, in redeeming captives, and aiding the needy. D. July 19, 514. See Duchesne, *Liber Pontificalis*, i., p. cxxxiii., 260. JOHN J. KEANE.

**Symmachus**, QUINTUS AURELIUS: author and orator; b. about 350 A. D.; educated in Gaul; held some of the highest civil offices in Rome in the latter part of the fourth century A. D. Of his works, the *Epistolarum Libri X.* are extant, and are of considerable historical interest; editions by Juretus (1580), Scioppius (1608), and Pareus (1651). Fragments of his speeches were discovered by Cardinal Mai, and published in *Scriptorum Veterum nova Collectio* (1815) and in Meyer, *Orat. Rom. Fragm.*, pp. 627–636. The best edition of all the works is by O. Seeck (Berlin, 1883); smaller edition by Kroll (Leipzig, 1893). Symmachus was one of the last champions of paganism, and a noble and pure character. D. about 405 A. D. Revised by M. WARREN.

**Symonds**, JOHN ADDINGTON: critic, biographer, and literary historian; b. at Bristol, England, Oct. 5, 1840; educated at Harrow School and Baliol College, Oxford, where he took the Newdigate prize; was elected a fellow of Magdalen in 1862. Ill health necessitated his residence for several years at Davos-Platz, Switzerland. Among his writings are *An Introduction to the Study of Dante* (1872); *Studies of the Greek Poets* (1873–76); *Sketches in Italy and Greece* (1874); an exhaustive work in seven volumes on *The Renaissance in Italy* (1875–86); *Sketches and Studies in Italy* (1879); *Essays* (1890); *In the Key of Blue* (1893); *Shakspere's Predecessors* (1884); *Walt Whitman* (1893); besides several volumes of verse, original and translated, lives of Shelley, Michelangelo, Ben Jonson, and Sir Philip Sidney, and a translation of the *Autobiography of Benvenuto Cellini* (1887). D. in Rome, Italy, Apr. 19, 1893. H. A. BEERS.

**Symons**, GEORGE JAMES, F. R. S.: meteorologist; b. in London, England, Aug. 6, 1838; educated by private tutors. From 1860 to 1864 he was assistant to Admiral Fitzroy in the British Meteorological Office. In 1860 he established the annual publication entitled *British Rainfall*, and in 1865 the monthly called *Symons's Meteorological Magazine*, both of which he still conducts (1895). He established a rainfall service of his own, and this now extends over the British islands. He was chairman of the Krakatoa committee of the Royal Society (1884), and editor of their *Report*. MARK W. HARRINGTON.

**Sympathy** [from Gr. συμπάθεια, community of feeling, deriv. of συμπαθής, affected by like feelings; σύν, together + πάθος, feeling]: the emotion aroused by any presentation which suggests suffering or pleasure.

1. It is aroused by states clearly pleasurable or painful. There is no occasion for sympathy with one who does not need it; that is, with one who is not in a state of positive feeling, good or bad. Further, the study of the first sympathies of children shows that they extend to things as well as to persons, and only gradually get narrowed down to objects which feel. Sympathy as an emotion is shown before the child makes any distinction between things that feel and those that do not. But whatever the object be, the emotion is called forth only by such happenings as have before excited the child's own feelings of pleasure or pain.

2. Some degree of interest is necessary to sympathy. The confirmation of this appears broadly in everyday experience. For example, a man reads in the morning paper that thousands of people perish in a Chinese flood, and the cup of coffee that follows it up is much more important to him than their bereaved families; but a single death in his own community makes him at once solicitous in reference to the deceased man's relatives. Yet mere exploring interest when it comes upon suffering always starts the sympathetic feelings.

3. A person's sympathy is in a rough way proportionate to the nearness of the individual's connection with himself. This, again, needs no detailed proof; if one's brother breaks his leg one feels more sympathy than if a casual comrade meets the same misfortune; and the difference is greater still if the latter be only an animal, as, for instance, a favorite horse.

4. Sympathy is aroused, not merely by real beings, but by any idea of suffering. It is not necessary that one believe in the object of one's sympathies. Pictures in memory win sympathy, imaginations in fiction arouse it, vague forebodings of misfortune to others excite it. Whenever there arises in consciousness an idea of a conscious creature—be he fact, memory, fancy, illusion, reality in any of its kinds, that is, be he a possibility in any form—his fortune as suffering or enjoying moves our sympathy. This is true in spite of our efforts—often successful as they are—to suppress sympathetic emotion by dwelling upon the unreality or ill desert of the subject of it. *Little Dorrit* will move some readers in spite of their sense that the character is fictitious. We all feel the stirrings of fellow-feeling for the condemned criminal, even though we be convinced of the justice of his sentence. In cases in which we do suppress the emotion it is by getting rid of the idea, turning the attention to something else, exciting some new interest, that we do it; not by depriving the subject in question, the idea of suffering, of its force to affect us.

In this definition several further considerations are involved. By the use of the word "suggestion" an important distinction is intended between the object on which sympathy terminates and that by which it is caused. A suggestion is a stimulating idea which is brought into consciousness from without, or comes by an association, in such a way that it does not belong in the course of my real life. A suggested pain, for example, is a pain which a person is led to think of, but which he is not really suffering. Suggested suffering, therefore, is the idea of pain as far as it differs in consciousness from the actual pain of the experience presented.

But the question arises: Does such a suggestion excite sympathy? Suppose a cruel father who punishes his child by pinching, the presentation of the father may suggest pain to the child; but this does not seem to be sympathy—it may be fear, or memory of pain. Yet, on looking closer and observing children, we find that if the father take the attitude which the pain before accompanied, real sympathy is excited. Let him pinch a piece of wood, paper, even his own finger, and the child a year old gives clear expression to its sympathetic emotion. The child does not need the notion of another person who suffers, nor even of another object that suffers; he only needs two things: first, a presentation which suggests vivid pain, and second, the absence of the coefficient of reality which his own suffering had. In other words, the emotion of sympathy does not *require* an object at all. It *acquires* an object, and then maintains itself by the emphasis of this object; but in the first place it attaches to any convenient presentation in close connection with its exciting cause.

*Kinds of Sympathetic Suggestion.*—We may sympathize, therefore, without sympathizing with anything, and at first this is the experience of the young child. But its sympathy gets an object, and so maintains and develops itself. The child inherits a susceptibility to a social response to others' actions, and also by *imitating* their expressions he learns how similar organic conditions feel.

*Altruistic Element in Sympathy.*—The much discussed question of egoism *versus* altruism in the sympathetic emotion may receive partial consideration here. If it be true that suggested suffering excites sympathy, and that it is only suggested suffering that excites it, namely, suffering not present as real suffering is, and for that reason attributed, when knowledge is sufficiently advanced, to some one else—then we must believe that sympathy is not entirely egoistic. Suggested suffering is at first neither egoistic nor altruistic, because neither the *ego* nor the *alter* exists in consciousness when sympathy at first arises. The reference of real pain to self, and of suggested pain to another, seem to be both late acquirements. But as it is true that the child gets his external objects clearly presented—especially his external personal objects—before he clearly presents himself, so sympathy must be a conscious emotional motive before self-seeking is.

*Varieties of Sympathetic Emotion.*—A large number of varieties or shades of emotion may be classed as sympathetic, i. e. kindness, benevolence, charitableness, etc. When felt toward an equal in character or station, we call it congratulation, fellow-feeling, fellow-suffering, companionship, common well or ill desert, solicitude, heartache; toward an inferior, compassion, pity, mercy; toward one much superior, it approaches *awe*, but differs from it in an unnamable way. J. Mark Baldwin.

**Sym'phony**, or **Sinfo'nia** [*symphony* is viâ O. Fr. and Lat., from Gr. συμφωνία, a chording, unison, symphony, deriv. of σύμφωνος, harmonious, chording; σύν, with + φωνή, sound, voice. *Sinfonia* = Ital. < Lat. *sympho'nia* = Gr.]: in music, an elaborate composition designed for performance by a full orchestra, and consisting of several distinct movements (usually four in number), each of which has its own individual character, as the *allegro*, *andante*, *adagio*, *minuet*, *scherzo*, etc., while the whole unite in forming one symmetrical and complete work of art. There appears to have been no important difference between the symphony and the overture until about the end of the eighteenth century. Revised by Dudley Buck.

**Sympho'sius**: a Latin writer of the fourth or fifth century, about whom nothing definite is known. A collection of 100 riddles, each in three hexameters, is extant under his name. See Baehren's *Poet. Lat. Minores*, vol. iv., pp. 364–385, and Corpet's *Énigmes de Symposius revues sur plusieurs manuscrits et traduites* (Paris, 1868). M. W.

**Sym'phyla** [Mod. Lat., from Gr. σύμφυλος, of the same stock; σύν, together + φυλή, tribe]: in entomology, the group containing the peculiar myriapod *Scolopendrella*. The name was given under the impression that it united the characters of the Myriapoda and Thysanura (*qq. v.*). *Scolopendrella* is really an aberrant diplopod, and has no other affinities. J. S. K.

**Symphytum**: See Comfrey.

**Sympiesom'eter** [Gr. συμπίεσις, compression (deriv. of συμπιέζειν; σύν, together + πιέζειν, press) + μέτρον, measure]: an instrument for indicating the amount and variations of atmospheric pressure, consisting of a vertical glass tube, terminated above by an oblong bulb, and bent upward at its lower extremity, where it expands into a cistern open at the top. The bulb and upper part of the tube contain hydrogen, the cistern and lower part of the tube colored oil of almond. As the pressure of the atmosphere varies, the inclosed hydrogen expands or contracts by proportional but large quantities, and the liquid consequently rises or falls in the tube through large spaces; the scale attached is corrected also for temperature, and its indications correspond to those of a mercurial barometer.

**Symplegades**, sim-pleg'ă-dēez, or **Cya'nean Rocks** (anc. Συμπληγάδες or Κυάνεαι): two small islands at the Black Sea mouth of the Bosphorus, on opposite sides of the strait; famous in mythology. When any living thing was passing between them they were supposed to come together immediately and then separate. Jason with the Argo by a stratagem eluded their collision, and they have since been immovable. That on the Asiatic side has disintegrated and almost entirely disappeared. That on the European side is about 550 feet long and 70 wide, consisting of three masses of volcanic rock. On its highest point is a marble pedestal with the inscription "Divo Cæsari Augusto." E. A. Grosvenor.

**Symptoms** [from Mod. Lat. *sympto'ma*, symptom, from Gr. σύμπτωμα, mischance, casualty, symptom, deriv. of συμπίπτειν, fall in with, meet with; σύν, with + πίπτειν (perf. πέπτωκα), fall]: in medical diagnosis and prognosis, the phenomena by which the physician judges of the nature and probable course of the disease he deals with. Symptoms are *objective*, that is, perceptible to the physician's senses, or *subjective*, perceptible only to the patient's senses, such as pain, deafness, etc. Each may be valuable, but the former are, as a rule, much more to be depended upon. These are by some writers called *physical signs*, as distinguished from *vital symptoms*, but these are sometimes objective, and practically all are classed as symptoms. Few symptoms are absolutely *pathognomonic*, or infallible signs of some one disease; but in general the import of symptoms can be learned only by the use of careful observation and patient and logical thought, guided by experience. In early times, when the knowledge of diseases was less advanced than at present, certain symptoms were regarded as diseases. Thus dropsy, asthma, diarrhœa, and the like have passed from their position as diseases to their proper station as mere symptoms of various and often quite dissimilar affections. It is still necessary to regard certain symptoms as diseases, particularly in the case of the nervous system, but advancing knowledge makes these fewer and fewer. William Pepper.

**Synæresis**: See Synizesis.

**Syn'agogue** [= Fr. < Lat. *synago'ga*, from Gr. συναγωγή, a bringing together, collecting, (in Septuagint and New Testament) assembly, synagogue; σύν, together + ἄγειν, lead. The Hebrew name was *Kenēseth* or *Bēth Hakkenēseth*; Aram. *Kenishtā*. Other Greek names are συναγώγιον, προσευχή, προσευκτήριον, σαββατεῖον]: a congregation or assembly of Jews met for the purposes of religious instruction and worship; also the building devoted to such purposes.

*Origin.*—It is impossible to fix with any accuracy the date at which the synagogue took its rise. Despite rabbinical traditions, its beginnings probably do not go beyond the Babylonian captivity. Far away from the national religious center, prayer became for the Jews a substitute for sacrifice, and a study of the traditional literature a religious exercise. Upon its return to Palestine the new community regarded the Law as an end in itself, and a knowledge of its contents of supreme importance (Josephus, *Contra Apion.*, ii., 17). The first synagogues were established for the reading and study of the Law, and Philo distinctly calls them διδασκαλεῖα (*Vita Mosis*, iii., 27). It is thought by some that Psalm lxxiv. 8 has reference to such assemblies. In the New Testament the synagogue is already a fixed institution (Matt. iv. 23, Luke iv. 15, etc.).

*Development.*—Side by side with the temple numerous synagogues were established in Jerusalem. Acts vi. 9 mentions those of the Libertines (freedmen), Cyrenians, Alexandrians, Cilicians, and Asiatics. They seem to have spread over the whole of Palestine. Ruins of synagogues have been found in Galilee, in Kasium, Kefr Birim, El-Jish, Meiron, Nabartein, Kedes, Tell-Hum, Keraze, and Irbik. Judging from the architectural remains, these belong to the time between the first and fourth centuries of our era. According to rabbinical law, ten men are sufficient to form a congregation. But also in the Diaspora, wherever the Jews went, they built synagogues (Philo, *De Septenario*, chap. vi). In Alexandria there were a number (Philo, *Legat. ad Caium*, § 20). Inscriptions found in Rome tell us of nine different synagogues in the city (Berliner, *Gesch. der Juden in Rom*, 1893, p. 62).

*Form and Constitution.*—According to express rabbinic law, the synagogue was always to be built on the highest point of the city, though there are traces of some which must have been built outside the limits of the city or village. Some services (as on fast-days) were held in the open market-place. The style of the early synagogues is largely

Græco-Roman. In Palestine they were built with the entrance (front) at the S. They were given into the charge of a body of elders who in Palestine—at least in the smaller places—were also the political heads of the community. In places of mixed population and in the Diaspora a special body (πρεσβύτεροι) was appointed for that purpose, the head of which was called γερουσιάρχος. To this body was also delegated the power of hurling the ban. For the reading of the service there were no stated functionaries, though throughout the Roman empire we find the ἀρχισυνάγωγος (*Rosh Hakkenēseth*), who watched in general over the service and selected the readers and preachers for each office. As collections for charity were regularly made, there were specially appointed almoners (*gabbāē tsedākāh*). The beadle (*Chazzan Hakkenēseth*, Ὑπηρέτης) had charge of the building.

*Service.*—The most important object in the synagogue was the Ark (*Tēbhāh*), which contained the scrolls of the law, wrapped in linen and deposited in boxes (θῆκαι). The readers and preachers officiated from a raised platform (βῆμα). On New Year's day and on fast-days horns were blown (*Shoferōth, Chatzōtzerōth*). The congregation was seated according to a certain order of precedence. The service, which was in Hebrew (though in the Diaspora Greek seems also to have been used), consisted originally of the recitation of the *Shema* (Deut. vi. 4–9, to which xi. 13–21, Numb. xv. 37–41 were added later); the reading of the Law (*Tōrāh*), which was done by at least seven men, in a three-year (later on in a yearly) cycle; a reading from the Prophets or Hagiographa (*Haftārāh*); and the priestly blessing. The portions from the Tōrāh and Haftārāh were also translated aloud into Aramæan by a specially appointed officer (*Meturgemān*). Gradually other prayers were added; the first and last three of the so-called *Eighteen Benedictions* have their origin in the times of the Mishnāh. Expositions of the weekly Tōrāh readings were given by any prominent teacher present (διδάσκειν ἐν ταῖς συναγωγαῖς, Matt. iv. 23), from which the Christian sermon and the Jewish MIDRASH (*q. v.*) were evolved. The one who was invited to act as reader was called "Messenger of the Congregation" (*Shelīach Tsibbūr*). Services were also held on Saturday afternoon, and on the mornings of Tuesday and Thursday, the chief market-days of the week. It will be seen how closely the organization of the early church followed that of the synagogue.

*Further Development.*—The building of new synagogues in the Roman empire, though technically illegal, was persistently carried on, and every community of Jews had one or more. During the Middle Ages the synagogue was used as a treasury and as a refuge-place from impending death (Stobbe, *Die Juden in Deutschland*, p. 168). The services grew in number. Minor local festivals were added; the old ones (the Day of Atonement excepted) being celebrated in all places outside of Palestine for two days instead of one. The ritual was developed by the addition of Psalms and of poetical compositions. (See JEWISH LITERATURE—*Characteristics of Hebrew Poetry.*) The best of the Jewish poets of Spain (1030–1230 A. D.) worked in the interests of the synagogue. Though the framework of the liturgy, the prayer *par excellence*, remained the same, each country, and almost each city, had its peculiar additions (*Minhag* = custom, rite). It is customary to distinguish two chief rites, the Spanish-Portuguese and the Polish-German; though there are special African, Arabian, Italian, Greek, Spanish, Provençal, German, etc., rituals. The old custom of preaching on every Sabbath gradually fell into disuse. It was relegated to the afternoon service or confined to festivals and special occasions. The rabbi became more of a teacher than a minister, so that by his side there grew up the Mōchīach and Maggīd, the moral preachers. The Chazzan developed into the reader and intoned the service. Women were rigidly separated from men. The reform movement in the Jewish Church, which began with Moses Mendelssohn, chiefly concerned the synagogue. His translation of the Pentateuch into literary German (1783) induced the desire for the translation of the prayers into the vernacular. These had grown to intolerable lengths; and, owing to the protracted misfortunes of the Jews, the whole service had become somewhat ungraceful and uncouth. With a view to remedying these evils, the Reform congregations in Berlin and England have modified the synagogue service to some degree, and have in a few synagogues introduced hymn-books in the vernacular, though nearly all the synagogues in Europe and a large number of orthodox and conservative ones in the U. S. still hold to the old ritual. In the U. S., where the congregational system has been carried to its furthest extent among the Jews, the advanced Reform synagogues have largely curtailed the ritual, have introduced many English prayers, have laid aside the hat and the praying-scarf (*Talīth*), have emphasized the importance of the sermon, and administer the rite of confirmation to both boys and girls, which was first introduced in Berlin in 1817. A number of these synagogues have also added to the Friday evening and Saturday morning services a short service and lecture on Sunday morning.

LITERATURE.—See especially Schürer, *Gesch. des Jüd. Volkes im Zeitalt. Jesu Christi*, ii., § 27 (Eng. trans. div. ii., vol ii.), where the older literature will be found. Cf. also Stapfer, *Palestine in the Time of Christ* (New York, 1885, p. 333); C. G. Montefiore, *The Hibbert Lectures* (1892, p. 388); Herzfeld, *Geschichte des Volkes Jisrael* (iii., pp. 129, 183); Zunz, *Die Gottesdienstlichen Vorträge der Juden* (2d ed. 1892); Zunz, *Die Ritus des synagogalen Gottesdienstes* (Berlin, 1859); Löw, *Der Synagogale Ritus* (*Mntschr. für Gesch. und Wissen. des Judenth.* (1884); Hamburger, *Real-Encyclopädie für Bibel und Talmud* (part ii., 1883, *s. v. Synagogue*); Holdheim, *Gesch. der Jüd. Reformgemeinde* (Berlin, 1857).

THE GREAT SYNAGOGUE (*Kenēseth Haggedhōlāh*) was an assemblage of 120 men which, according to Jewish tradition, Nehemiah brought together for the reorganization of religious worship and the maintaining of civil order. They are supposed to fill up the gap between the last of the prophets and the first of the rabbis. To this body are ascribed the reconstitution of public worship, the final collection of the canon of the Old Testament, and the introduction of certain prayers. Many other ordinances are referred to their initiative. Richard Simon (*Histoire Crit. du Vieux Test.*, i., chap. viii.) was the first to question the authenticity of this tradition. Abraham Kuenen's treatise on the subject seems to have removed all doubts that we have here simply a myth based upon the assembly of the people mentioned in Nehemiah viii.–x., which solemnly accepted the Law, and that there never existed a legal or religious body known as the Great Synagogue.

LITERATURE.—Kuenen, *Over de mannen der groote Synagoge* (*Verslag. en Meded. der Kon. Akademie*, Amsterdam, 1876; trans. by K. Budde in *Gesamm. Abhand. von A. RICHARD GOTTHEIL.

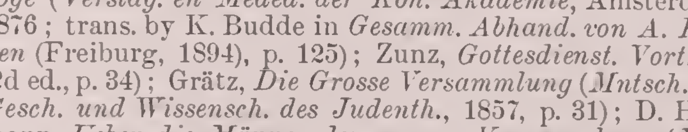
**Synap'ta** [from Gr. συναπτός, joined together, fastened]: a genus of HOLOTHURIANS (*q. v.*), embracing worm-like transparent forms noticeable for the anchor-like plates in the skin, which are favorite objects with microscopists.

**Synaptase**: See EMULSIN.

**Synchronograph**: See the Appendix.

**Syncopa'tion** [from Lat. *syn'cope* = Gr. συγκοπή, syncope (in med. and in gram.); σύν, together + κόπτειν, strike, cut]: in music, an arrangement of notes which often checks the rhythmical movement, disturbing the accent, and rendering emphatic that part of a bar or measure which would otherwise be unaccented. See *a*, *b*, and *c* in the example:



Syncopation of a simpler kind occurs when the last note of any bar and the first note of the bar succeeding are tied together by a "bind," and thus form in reality only one note. Formerly, instead of writing two notes separately with a bind, it was usual to write only one (equal to the sum of both), and place it directly across the bar-stroke.

Revised by DUDLEY BUCK.

**Syncope** [Gr. συγκοπή, deriv. of συγκόπτειν, chop up, squeeze together; σύν, together + κόπτειν, chop]: the shortening of a word by a syllable through the omission of a medial vowel or a medial vowel and one or more consonants. This is the strictest and proper meaning of the term, but it is sometimes loosely applied also to the omission of a medial consonant. Examples of syncope are *hemp* for O. Eng. *henep*, *mint* for O. Eng. *mynet*, *church* for O. Eng. *cyrice*, *p'lice* for *police*, *b'lieve* for *believe*, *s'pose* for *suppose*; Germ. *glauben* for **ge-lauben*, *gleise* for **ge-leise*. The omission of an initial vowel is called *aphaeresis*; of a final vowel, *apocope*. BENJ. IDE WHEELER.

**Syncope**: See FAINTING.

**Syn'cretism** (Gr. *συγκρητισμός*): said by Plutarch to have originated as the designation of a custom characteristic of the inhabitants of Crete, who forgot or overlooked all their internal dissensions as soon as a controversy occurred with any foreign country. In the sixteenth century the word was used to denote those attempts which were made by Pico de Mirandola, Bessarion, and others to reconcile the philosophy of Aristotle with that of Plato. But a still more extensive use for the name was found in the seventeenth century, it being applied to the views of George Calixtus and his followers, who hoped to heal the schism of the Christian Church by acknowledging the traditions of the first Christian centuries besides the Bible, and declaring the *Symbolum Apostolicum*, the common basis of the various Christian denominations, as sufficient for the definition of true Christianity. Revised by W. T. HARRIS.

**Syndicate**: See TRUSTS.

**Synec'doche** [= Lat. = Gr. *συνεκδοχή*, liter., an understanding of things together or of one thing with another; deriv. of *συνεκδέχεσθαι*; *σύν*, with, together + *ἐκδέχεσθαι*, understand, liter., take from; *ἐκ*, from + *δέχεσθαι*, receive, take]: a figure of speech which displaces an ordinary term by one which naturally suggests it, on account of the relation whole to part or part to whole, genus to species or species to genus; thus *city* for *people* of the city, *blade* for *sword*, *bald-head* for *bald-headed man*, *bird* for *fighting-cock*, *man* for *humankind*, etc. See METAPHOR and METONYMY. BENJ. IDE WHEELER.

**Syn'ergism** [deriv. of *synergy*, from Gr. *συνεργία*, a working with, assistance, deriv. of *συνεργεῖν*, work with, assist, deriv. of *σύνεργος*, working with or together; *σύν*, with, together + *ἔργον*, a work]: in theology, the view that God and man share in the work of regeneration, the human will responding to the Spirit of God. So Melanchthon taught, opposing the view of Luther as to the bondage of the will and its complete passivity in conversion. Flacius and his party charged Melanchthon with teaching that the human will had the initiative in conversion. This misunderstanding was repudiated by Melanchthon, who endeavored to make his meaning clearer by employing other phraseology. This difference of opinion in regard to the will led to vehement and long-continued controversies, and divided the Lutherans into the Flacians, or the orthodox, and the synergists. The former carried the day in the Formula of Concord (1577), but few modern Lutherans defend their view. See REGENERATION and CONCORD, FORMULA OF.
SAMUEL MACAULEY JACKSON.

**Syne'sius**: bishop, philosopher, and poet; b. in Cyrene, the civil metropolis of the Libyan Pentapolis about 375; studied philosophy in Alexandria under Hypatia, of whom he became an enthusiastic disciple; was sent at the head of a provincial embassy to the Emperor Arcadius at Constantinople in 397, and stayed there for three years, which time he describes as exceedingly painful; visited Athens in 402, but found himself greatly disappointed, and spent most of his time in rural retirement near the frontier of Cyrenaica, occupied with the study of philosophy and literary pursuits. In 410 he was elected Bishop of Ptolemais, the ecclesiastical metropolis of the province, but his relation to Christianity previous to his election is rather obscure, and it can not be made out with certainty whether he was baptized or not. He accepted the election with great reluctance. Many of the Christian doctrines he could not reconcile with the ideas of the Neo-Platonic philosophy which formed his innermost conviction. The date of his death was about 415 (Zeller). Of his works are extant several essays, among which are *De Insomniis*; several orations, among which that held before Arcadius (*De regno*); a number of hymns, often translated into modern European languages, and considered to be the finest specimens of mysticism in its highest flights; and letters of great interest. Collected edition, with Latin translation, by Petavius (Paris, 1612; 2d ed. 1640); critical editions by Krabinger of separate works. See H. N. Clausen, *De Synesio* (Copenhagen, 1831); C. Thilo, *Commentarii in Synesii Hymnos* (Halle, 1842–43); and Volkmann, *Synesius von Cyrene* (Berlin, 1869).
Revised by W. T. HARRIS.

**Syngnath'idæ** [Mod. Lat., named from *Syn'gnathus*, the pipe-fish, the typical genus; Gr. *σύν*, together + *γνάθος*, jaw]: a family of marine lophobranchiate fishes. The form is much elongated with little flesh, the body is almost covered with partially ossified plates, the head and snout are long and tubular, and the males have pouches in which the eggs of the female are hatched. They attain a length of 2 or 3 feet, live upon small marine animals and the eggs of other fishes, and have great affection for their young, which often return to the egg-pouch of the male parent for protection. Not all the pipe-fishes belong to this family, that name being often given also to the fishes forming the family *Fistularidæ*, also called pipe-mouths and flute-mouths.

**Synize'sis** [Gr. *συνίζησις*, deriv. of *συνίζειν*, sit down together, sink together; *σύν*, together + *ἵζειν*, to sit]: the blending of two vowels into one syllable. The term is generally used of vowel-contractions not indicated in the written form of language. Thus when in Homer the words *τεύχεα*, *ἡμέας* are scanned as disyllables without change of written form, the phenomenon is called synizesis, but when, as in Attic Greek, the written form presents *τεύχη*, *ἡμᾶς*, the change is called contraction, or synæresis, the opposite of diæresis. It is only in terms therefore of the written and not of the spoken language that synizesis differs from contraction. Contraction between vowels of different words is called *crasis*. BENJ. IDE WHEELER.

**Synod** [viâ Fr. from Lat. *synodus* = Gr. *σύνοδος*, a coming together, meeting, synod; *σύν*, together + *ὁδός*, way]: an ecclesiastical assembly or council. Synods may be local, diocesan, or œcumenical; for the last, see COUNCILS, ŒCUMENICAL. The supreme body of the Russian Church is the Holy Governing Synod. In the Presbyterian Church the synod is the ecclesiastical court, composed of lay and clerical representatives, which comes between the presbytery and the General Assembly. In the Northern Presbyterian Church it takes in, generally speaking, the presbyteries of only one State, and is composed of delegates chosen by these presbyteries. In the Reformed Church (Dutch and German) the highest court is called the General Synod, the next in rank the Particular Synod. The word synod is also used in the Lutheran Church, both on the Continent and in the U. S., for a church court composed of clerical and lay delegates. The synods in Reformation times in Germany were exclusively clerical; but the earliest in which the lay element, now an integral part, appeared was that held in Paris in 1559. S. M. J.

**Synodites**: See CŒNOBITES.

**Synod of Dort**: See DORT, SYNOD OF.

**Syn'onyms** [from Fr. *synonyme* < Lat. *synonymum* = Gr. *συνώνυμον*, synonym, liter., neut. of *συνώνυμος*, having the same name or meaning; *σύν*, together + *ὄνομα*, name]: words so nearly equivalent in meaning as to be in some of their uses interchangeable. In a thoroughly organized and digested language it is doubtful whether two words are ever perfect synonyms for all purposes. The superfluous material which tends to accumulate in a language, especially a literary language, through the formation of new derivatives, the widening and shifting of signification, and the introduction of loan-words (see DOUBLETS), is either applied by differentiation to the indication of special phases or shades of meaning or is discarded in the survival of the fittest. Conscious discrimination of the exact values of synonyms is often a most difficult task. Books which aid in this are: Smith, *Synonyms Discriminated* (4th ed. London, 1890); Crabbe, *English Synonyms Explained* (revised ed. 1891); Roget, *Thesaurus of English Words and Phrases* (n. e. London, 1883, a particularly useful book); Schmidt, *Synonymik der griech. Sprache* (5 vols., 1876–86, the best work of its kind); Döderlein, *Lateinische Synonymik* (6 vols., 1838); Shumway, *Handbook of Latin Synonyms* (based on the German of Meissner, 1884; this, as well as preceding, unsatisfactory); Trench, *Synonyms of the New Testament* (11th ed. London, 1890); Eberhard, *Synonym. Handwörterbuch der deutschen Sprache* (2d ed. 1888); Sanders, *Bausteine zu einem Wörterb. der sinnverw. Ausdrücke im Deutschen* (1890); Lafaye, *Dictionnaire de Synonymes Franç.* (1878, good); Tommaseo, *Dizionario dei Sinonimi della lingua Italiana* (1867). BENJ. IDE WHEELER.

**Syno'vial Membranes** [*synovial* is from Gr. σύν, with + Lat. *o'vum*, egg]: connective-tissue membranous structures which surround the closed cavities connected with the joints, or occur about certain tendons or between opposed movable surfaces; they resemble serous membranes in structure, but are distinguished from them by the viscid or glairy character of the synovial fluid or synovia with which they are lubricated, in contrast to the thin watery secretion bathing the serous surfaces. The synovial membranes consist entirely of connective tissue, between the closely felted bundles of which numerous branched or spindle cells are situated; the free inner surfaces of these membranes are invested with an imperfect layer of flattened cells, which, in places, closely suggest an endothelium, while, in other localities, thin plate-like elements are replaced by loosely grouped branching cells. There are three classes of synovial membranes in the human body: (1) The articular line the walls of the closed cavities of the joints, and secrete a fluid to lubricate the opposed cartilaginous surfaces of the articulating bones, over whose surfaces of contact, however, no part of the synovial membrane extends, as it fades away and terminates a short distance before reaching the articular facets. (2) Vaginal or sheath-like synovial membranes surround the tendons when passing through osseofibrous canals or grooves in the surface of bones, as is the case in the hand and foot. (3) Bursæ (Gr. βύρσα, a bag), little synovial sacs or cushions, are interposed between parts moving one upon the other with friction, as where a tendon glides over or presses directly upon a bony prominence. The synovial fluid consists of nearly 95 per cent. of water, rendered viscid by mucus, endothelioid cells, fat, albumen, and salts. The synovial membranes are frequently the seat of disease. Acute synovitis, acute inflammation, may attack any joint as the result of violent injury, exposure to cold, rheumatic taint, or less often from vitiated blood in the course of fevers and other diseases. The symptoms are local swelling, extreme tenderness upon touch or pressure, pain when moved, and often persistent agonizing pain caused by the distension of the sensitive inflamed cavity by a hypersecretion of fluid. Penetrating wounds of the large synovial cavities, whether gunshot, incised, or occurring in connection with fractures, are serious, often necessitating the loss of a limb. Chronic synovitis is often a product of tubercular or scrofulous hereditary taint with injury or over-use as the exciting cause. The destructive process often involves the ends of the bones and the ligaments, which are softened and disintegrated. Abscess, partial dislocations, and ankylosis, or stiff joint, are the chief misfortunes which result. The synovial bursæ often become swollen and prominent by hypersecretion, and also by injury and inflammation; such is the "weeping sinew" of the back of the wrist, which resembles a cystic tumor. Its contents must be evacuated and the membranous sac irritated or lacerated to obliterate it by adhesive inflammation. The occurrence of distended bursæ, and difficulty of cure in many cases, are due to their connection with the cavity of an adjacent joint. Revised by G. A. PIERSOL.

**Syntax** [Gr. σύνταξις, arrangement, organization, the organization of elements, as the elements of speech, into a larger whole; commonly used by the Greek grammarians in the stricter sense of the arrangement of words to form the sentence; σύν, together + τάσσειν, to arrange]: the science which treats of the sentence and its organization out of its constituent parts. In the following article it is not the purpose to consider the syntax of languages in general, but only that of the Indo-European languages, and that, too, only in so far as it admits of a comparative treatment. In the vast field of the literatures of the Indo-European peoples there appears only at two points the independent beginning of a grammatical science, as well as of a syntax, namely, in India on the one hand, and in Greece on the other. The Hindus failed to recognize syntax as a distinct department of grammar, but scattered their syntactical observations at various points in the body of their grammatical doctrine. It is possible even for one not versed in Sanskrit to gain some impression of this body of doctrine through Otto Böhtlingk's second edition of Pāṇini, in which the rules laid down by this prince of Indian grammarians are given in accurate German translation. (O. Böhtlingk, *Pāṇini's Grammatik*, Leipzig, 1887; cf. also Th. Benfey, *Geschichte der Sprachwissenschaft*, Munich, 1867, pp. 35 ff.) In order to gain a correct appreciation it must be remembered that from very early times Sanskrit, i. e. the language of the upper classes, which stood in contrast with the language of the people, was a subject of instruction. That is to say, a Hindu was shown by means of grammatical instruction what forms were to be used in polite speech, when he had a particular thing to say. Thus, for instance, he was taught that when he wished to report something that had occurred that day he was to use the aorist; when he wished to indicate the agent, which accompanies a verb, the nominative or the instrumental. Thus the Indian syntax takes its starting-point with that which one wishes to say, the necessity for the expression of ideas, whereas we in our modern discussions choose the external form as the starting-point. Though our procedure is unmistakably the more correct, we may nevertheless learn much from the Hindus, for they were accurate observers, good logicians, and insisted upon precise and clearly intelligible expression. The Hindus would never, for instance, be guilty of so absurd a rule as that familiar to the German schools—"Auf die Frage 'wem?' steht der Dativ," "the dative answers to the question to whom? or for whom?"—which in reality expresses nothing more than that a dative in the question is often matched by a dative in the answer. As the best contributions which the Hindus have furnished in this field may be regarded their doctrine concerning composition, a subject which we commonly discuss at the end of the inflexions, but which may fairly claim a place also in the syntax, and their theory of the cases which is set forth in Delbrück's *Comparative Syntax* (i., 172 ff.). The Indian method of regarding language was denied a permanent influence upon modern grammar, if for no other reason, because of the late period at which it became known, or at least became generally accessible. Concerning the grammatical system of the Greeks we have, besides numerous monographs, a compendious work by H. Steinthal, *Geschichte der Sprachwissenschaft bei den Griechen und Römern* (2d ed. Berlin, 1890). The first part embraces the theories of the Greek philosophers, in which was found the source equally of instruction and confusion for syntactical theory. The second source of the Greek grammatical system was the study of the Greek classics which reached its learned acme in the Alexandrian period. From the Greek grammatical system, resting upon these foundations, is derived the entire grammatical structure used by the modern world, as well as also the greater part of the syntactical concepts. (Cf. Introduction to *Comparative Syntax*, vol. i.) The term σύνταξις, *syntaxis*, was used very early, namely, in the *Techne* of Dionysius Thrax, written probably in the first century B. C., where the definition of a part of speech reads as follows: λέξις ἐστὶ μέρος ἐλάχιστον τοῦ κατὰ σύνταξιν λόγου, i. e. a λέξις is the smallest division, or the unit of the organized sentence. Syntax first appears as a special part of grammar in the well-known work of Apollonius Dyscolus (probably middle of second century A. D.). For a correct understanding of the work Περὶ συντάξεως, it is necessary to remember that there already existed definitions of the parts of speech, and that in single cases certain expressions had already been noted as grammatically correct or incorrect. Apollonius sought, however, to determine wherein the grammatical correctness or incorrectness inhered. It depends with him upon whether the *katallelia*, the correspondence of the forms, has been recognized or not; for instance, whether with a singular noun the singular or perchance the plural of a verb has been used, whether or not the case representing the correct idea has been used with the verb or not. He treats therefore of what is later brought together under the head of *agreement* and of *government*. This constitutes, however, only the central topic of his work; connected therewith are careful discussions concerning the character of various parts of speech, e. g. of the article. The later syntax adopted from him not only various definitions of fundamental grammatical concepts, but also the outlines of the doctrine concerning enallage and ellipsis. Through the Roman grammarians, particularly Priscian, his syntax (*constructio*) was handed down to the Middle Ages. Here it fell naturally into the hands of philosophy, where, until the beginning of the nineteenth century, it remained. In the introduction to the *Comparative Syntax* cited above it has been shown how one after another the scholastics, then Locke, Kant, Hegel, Herbart, exercised a determining influence upon the development of grammatical conceptions; but with the opening of the nineteenth century three currents of influence, all independent of philosophy, combined to reshape the methods of syntactical research, namely: (*a*) The more accurate study of the Greek and Latin texts, by which a purely empirical treatment of syntax became possible, as it, e. g., appears in the Greek grammar of Matthiæ (A. Matthiæ, *Ausführliche griechische Grammatik*, Leipzig, 1807); (*b*) the awakening impulse of Teutonic philology, connecting itself with the name of Jakob Grimm, who first taught how grammar, including syntax, can be treated historically; and (*c*) the science of comparative philology, which established for the study of syntax as well as of all linguistic phenomena a foundation reaching down into most primitive times.

The representatives of the comparative science of language occupied themselves first with the cases. Here it was at once observed that Sanskrit contains, besides the cases occurring in Latin, also the locative and the instrumental. This led directly to the conclusion that these cases, and perhaps still others. must have existed in primitive times. What now has become of these extra cases in the different languages, e. g. in Greek? The idea readily suggests itself that they had been absorbed into the other cases; for instance, the ablative into the genitive, the instrumental and locative into the dative. It is difficult to say who first gave expression to this conception, which is summarized under the term syncretism; it was certainly first developed in detail by Delbrück (B. Delbrück, *Abtativ, Localis, Instrumentalis*, Berlin, 1867). Here follows, besides a variety of monographs, the important work of Hübschmann (*Zur Casuslehre*, Munich, 1875), which contains not only a good history of the theory of the cases, but also adds a treatment of Iranian case-usage, to which Delbrück had given little or no attention. Then follows Gaedicke, *Der Accusativ im Veda*, (Breslau, 1880), a superb piece of work, full of ideas and covering a larger field than the title promises, a book which every syntactician is recommended to study. A first attempt in the study of the structure of the sentence was made by Ernst Windisch in an article on the origin of the relative pronoun (*Curtius' Studien*, ii., Leipzig, 1869). Even though the main idea, namely, that the relative was developed only in the separate languages, may perhaps be incorrect, yet the presentation of the pronominal usage in the different languages was important and suggestive. The syntax of the verb is the general subject of a series of works which appeared in the *Syntaktische Forschungen* (Halle, 1871–), published first by Delbrück and Windisch conjointly, later by Delbrück alone. In these the attempt is made to trace through the usage of the two languages compared the uniform fundamental idea of *will* for the subjunctive and of *wish* for the optative, in doing which it was necessary of course to construct a theory for the development of the different forms of the sentence. In this work the presentation of the actual existing facts of Vedic syntax was notably insufficient. This it has been the purpose of the *Attindische Syntax*, to be mentioned later, as far as possible to correct. In immediate connection with these first attempts there appeared in 1872 a work of Ludwig Lange, *Ueber den homerischen Gebrauch der Partikel* εἰ (*Abhandlungen der sächsischen Gesell. d. Wiss.*, 1872, vol. vi.), in which Delbrück's theories concerning the sentence-types were corrected and complemented, and an example given of statistical treatment of an individual phenomenon which has seldom been paralleled. A foundation for the study of tense is presented in the second volume of the *Syntaktische Forschungen*, *Die attindische Tempuslehre*, by B. Delbrück (Halle, 1876), in which was especially demonstrated that the Sanskrit has an aorist usage which, as may be shown, though not shown in this work, corresponds in substance with the Greek and the Slavic usage. In reference to the verb is to be added the work of Julius Jolly, *Geschichte des Infinitivs im Indogermanischen* (Munich, 1873). The infinitive is nothing more than a case introduced into the verb system.

Of prime importance for comparative syntax is the *Vergleichende Syntax der slavischen Sprachen*, by Franz Miklosich (Vienna, 1868–73). Though the theoretical outlines of this work are in many regards unsatisfactory, and the comparison of the different Slavic languages with each other and of the Slavic with other languages is not sufficiently true to historical method, yet all the defects of this excellent work are redeemed by the presentation of an inexhaustibly fresh body of language-material, from which all subsequent writers have drawn and continue to draw. In Miklosich's syntax the idea of the sentence scarcely claimed a proper place. Thus there is lacking, for instance, a chapter on the order of words. How much is to be observed, however, in this field has been illustrated in an article of A. Bergaigne, *Mém. de la soc. de linguistique* (vol. iii., Paris, 1875), and in the third volume of the *Syntaktische Forschungen*, *Die altindische Wortfolge aus dem Çatapathabrāhmaṇa* (Halle, 1878), which limits itself, however, to the Sanskrit. The fifth volume of the *Syntaktische Forschungen*, *Altindische Syntax*, by B. Delbrück (Halle, 1888), deals also with the Sanskrit, while the fourth volume contains sketches in Greek syntax.

All these works, and such others as might be added, contain only special discussions, and seldom venture upon the field of theoretical inquiry. A summarizing treatment is attempted in Delbrück's *Vergleichende Syntax* (part i., Strassburg, 1893; Engl. transl. *Comparative Syntax*), which forms the continuation of Brugmann's *Grundriss der vergleichenden Grammatik der indogermanischen Sprachen*. Theoretical discussions appear in an earlier work of Ludwig Lange, *Ziel und Methode der syntaktischen Forschung*, an address at the *Göttinger Philologenversammlung*, 1852; also in the *Principien der Sprachgeschichte*, by Hermann Paul (2d ed. Halle, 1886); and finally in the above-mentioned introduction to Delbrück's *Comparative Syntax*. What follows will be devoted to a brief statement of certain theoretical considerations.

I. *Limits and Classifications of Syntax.*—As regards the question how syntax is to be defined and limited in reference to other departments of grammar, complete agreement has not yet been reached, as indeed it has not been reached regarding the mutual provinces of the grammar and the lexicon; it is, for instance, still customary to discuss in the grammar certain things like the numerals, which properly belong only in the dictionary. This need not, however, be regarded as strange. In questions of this sort are involved not only difficult matters of principle, in reference to which the stubbornness of scholars is wont to assume monumental proportions, but also practical considerations and necessities. Every author desires to present a comprehensive treatment of his material, and every one who wishes to avoid discourtesy feels himself hampered by the traditional views and usages of his readers. Apparently all are now of the opinion that one thing belongs with certainty to syntax, namely, the doctrine concerning the organization of the word-forms into the sentence, i. e. the doctrine of the sentence in the narrower sense. An exception appears, however, it must be admitted, in F. Miklosich, who expresses himself as follows concerning the conception of syntax: "That department of grammar which undertakes to set forth the signification of the word-classes and word-forms is called syntax; syntax is accordingly divided into two parts, of which the one deals with the signification of the word-classes, the other with the signification of the word-forms." Under this limitation of the conception, however, the author himself is often involved in embarrassment. Thus the verbs without a subject, which we commonly call the impersonal verbs, he has been obliged, inasmuch as he does not recognize a doctrine of the sentence, to include in an appendix to the nominative. The order of words he has not discussed at all, though there is undoubtedly a traditional type of word-order in the Indo-European languages as well as in the Slavic. Miklosich was evidently led to this view by an exaggerated empiricism. He insisted on recognizing only the facts of tradition, and the union of word-forms into the sentence did not seem to him traditional, but a product in each several case of the free choice of the speaker. This view is, however, incorrect. As already indicated, certain types of word-connection and word-order are transmitted as psychological realities, and even one who declines to recognize psychological realities must yet allow that there is an objectively perceptible part of a sentence, namely, the sentence accent, which is in and by itself a matter of actual tradition. That we do not indicate this in writing is a matter of accident. It is in no way less real than the accent of individual words. Certainly one can not doubt that the interrogative sentence differs in the traditional accent from the declarative sentence, or that the differences between dialects express themselves with especial distinctness in the different accentuations of the sentence.

Besides the doctrine of the sentence in the narrower sense, we commonly include under syntax the doctrine of the parts of speech. Many scholars, to be sure, decline to admit this, and prefer to classify grammar under the heads doctrine of sounds, doctrine of forms, doctrine of signification, doctrine of sentence-structure. This is at bottom largely a matter of terminology. It is of slight importance whether a given part of the grammar is classed as the first part of syntax or by itself as the doctrine of signification. It is a fact of more importance that there is disagreement concerning what may be included under the chapter on the parts of speech. Under the noun are, e. g., involved the different kinds of substantives—concrete, abstract, simple, compounded, etc.—gender, number, case. The different kinds of nouns were discussed by Brugmann under the head of stem-formation, but not the subject of gender, and so it happens that in Delbrück's *Comparative Syntax*, which supplements Brugmann's *Grundriss*, there is no chapter on the different kinds of nouns. Similarly with other points. In general, however, it is agreed that the treatment of the parts of speech falls under the syntax, or constitutes an introduction thereto. How is it with other points, which less frequently claim discussion? Where, for instance, shall the sentence-accent be treated? It is related to the sentence as the word-accent to the word. This would seem to assign it to the phonology (doctrine of sound), or to the inflexion (doctrine of form). It is impossible, however, to separate it from the doctrine of word-order, with which it is most intimately connected, except as one is ready to sacrifice comprehensiveness and intelligibility to the demands of a rigid schematism. The writer consequently has deemed it correct to treat of the sentence-accent under the syntax, thus, e. g., in his *Altindische Syntax*, pp. 26 ff. As it is with the definition of the boundaries of syntax, so with the question of arrangement and classification. It is unavoidable that here also theoretical and practical considerations should often cross each other's track. It must above all things, however, be remembered that the demands of a reasonable systematization by no means require that a given subject should receive mention but once. It is essential, for example, to treat all the cases together, so that forms of usage which have mutually influenced each other may not be torn asunder. It is, however, on the other hand, necessary to mention certain cases where the relation of subject and predicate is under discussion, i. e. in the doctrine of the sentence proper. Under these circumstances it must be no cause of surprise when the selfsame author adopts now one and now the other arrangement.

2. *The Office of Syntax.*—The conception which one forms of the office of syntax will depend upon his views of the aims of linguistic science as a whole. There have been leading scholars, for instance, August Schleicher, who classed the science of language with the natural sciences, and who regarded it therefore as their office to identify laws within language after the analogy of physics or chemistry. Whether such a possibility may exist in the field of phonology can not be investigated here, certainly for syntax such a thing is out of the question. For this reason, indeed, Schleicher proposed to separate syntax, as far as consideration of function is concerned, from the other parts of grammar. Most philologists regard the science of language, however, as an historical discipline. In connection herewith, the older scholars, e. g. Franz Bopp, attempted to push their investigations to the beginnings of everything. They had confidence in their ability to discover the origin of the Indo-European languages, or at least of the grammatical forms. Inasmuch now as the understanding of the origin of the grammatical form would yield at the same time a knowledge of the primitive meaning, these investigations concerning the origin of inflexion would furnish at the same time a point of departure for historical syntax. The hopes and claims of present-day scholars have, however, assumed much more modest proportions. We are now, it may be believed, universally convinced that but little can be learned of the origin of inflexion, and that even this scanty knowledge is too uncertain to serve as a foundation for a structure of syntax. We now recognize the object and office of the science of language to lie in tracing out historically a specific body of linguistic development, whether through direct observation, or, as is the case in the comparative science of language, through combination. In this is involved, then, the assertion that syntax is an historical science. Its office may be in detail somewhat more accurately defined, when we have considered the question what is actually handed down within a language from one generation to another. Self-observation shows directly that this is not limited to a series of words and forms, but includes also a vast number of word-combinations of various sorts, certain connections between verb and noun, proposition and case, agreement between substantive and adjective, word-orders, etc., in short, a great number of types, whose real existence may be proven by the fact that the speech-sense immediately revolts when an expression is attempted which offends against a traditional type, e. g. if one should attempt to put the adjective after the noun. The observation of these types is the proper office of syntax. Within the limits of an Indo-European language it is to be observed how these types contract, widen, melt away, etc. It is, namely, to be observed which types are handed down from primitive times, and which are relatively recent products. In an examination of this sort it would, for instance, be found for Greek that the most of the uses of the finite verb are handed down from primitive times, but not so the uses of the infinitive, also not the use of the accusative with the infinitive, and so with the whole system of construction in the indirect discourse, which last is therefore a special product of the Greek. It is different with the noun, where the construction-types of the different cases have blended together, and in the course of time the dual has been lost.

In these very simple considerations is involved a conclusion which is in point of method of high importance. When it has been shown, for instance, that the aorist of the Greek was not developed within that language, but is a primitive structure with a primitive type of usage, it then becomes impossible through observation of the Greek alone to establish the fundamental value of the aorist; so, therefore, the whole body of fundamental values assigned on the basis of a single language becomes untrustworthy.

In accordance with what has been said, the task of a syntactician in the field of Indo-European grammar may be briefly summarized as follows: He is to collect with all possible completeness the instances of the type of usage to be discussed, seek to trace its historical development within the individual language, compare the use of the corresponding form in the cognate languages, and seek to determine in this way the Indo-European value of the form in question. This oldest value is the fundamental conception. This may be simple or complex. As to how a form came to this use one can never, or almost never, say anything with certainty. For syntactical terms, see especially VERB; also NOUN, PRONOUNS, GENDER, DECLENSION, GENITIVE, PREPOSITIONS, and INDO-EUROPEAN LANGUAGES. B. DELBRÜCK.

**Synthesis**: See CHEMISTRY.

**Synthesis, or Assimilation** [*synthesis* is from Gr. σύνθεσις, a putting together, combination; σύν, together + τιθέναι, place]: the fact of activity or unity in all mental operations. The principle of assimilation, made much of in recent discussions, clearly illustrates not only that an image may be so strong and habitual in consciousness as to assimilate new experiences to its form and color, but also that this assimilation or synthesis is the very mode and method of the mind's digestion of what it feeds upon. Consciousness constantly tends to neglect the unit, the *mal à propos*, the incongruous, and to show itself receptive to that which in any way conforms to its present stock. A child after learning to draw a full face—circle with spots for the two eyes, nose, and mouth, and projections on the sides for ears—will persist, when copying a face in profile, in drawing its circle, with two eyes and two ears, and fail to see its error, although only one ear is visible and no eyes. The external pattern is assimilated to the memory copy, or to the word or other symbol which comes to stand for it. The child has a motor reaction for imitating the latter; why should not that answer for the other as well? As everybody admits, in one way or another, such assimilation is at the bottom of recognition, and of illusions which are but mistaken recognitions.

It is commonly held that assimilation stands midway between absolute identity of presentations, on the one hand, and such difference of presentations, on the other hand, as is found in the relative independence of associated ideas (see ASSOCIATION OF IDEAS), such as, for example, the association "stable—horse." But this is not the true view of assimilation, for there is no such thing as absolute identity of presentation, or of mental content of any kind. Assimilation is always present. It is the necessary basis of the earliest association. For association is, on the organic side and at the start, only another statement for the consolidating of the different reactions which arise when the stimulations are multiple or not simple. These reactions are reduced to orderly habitual discharges—this is, association by assimilation, more or less adequate to give the sense of synthesis, or unity, or identity. Association has, accordingly, a motor foundation from the first. The elements hold together in memory because they are used together in action. And as the action becomes one, but yet complex, so the mental content tends to become one, but yet complex also.

This becomes more evident when we call to mind that the "objects" of the external world are very complex mental constructions. They are, for the most part, made by association. Objects have some very general aspects in common, such as color, resistance, odor, etc. But these bare qualities, taken alone, might go to constitute one object about as well as another; and really would constitute none. What kind of an object such or such a bare stimulus shall turn out to be—this is largely a matter of association and suggestion. Hence if the mind has to construct anyhow, in each case, and to depend largely upon memory of earlier instances for its material, then it falls back at once upon those habitual reactions by which groups of associated elements are reinstated together and as one content. These old groups thus usurp the new elements by assimilation, if it be within the range of organic possibility.

Generally, therefore, it may be said that assimilation is due to the tendency of a new sensory process to be drawn off into performed motor reactions; these preformed reactions in their turn tending to reinstate, by the principle of imitation, the old stimulations or memories which led to their preformation, with all the associations of these memories. These memories, therefore, tend to take the place or stand for the new stimulations which are being thus assimilated.

All perception is accordingly a case of assimilation. The motor contribution to each presented object is just beginning to be recognized in cases of disease called by the general term *apraxia*, i. e. loss of the sense of the use, function, utility, of objects. A knife is no longer recognized by these patients as a knife, because the patient does not know how to use it, or what its purpose is. The complex system of elements is still there to the eye, all together; the knife is a thing that looks, feels, etc., so and so. This is accomplished by the simple contiguous association of these elements, which has become hardened into nervous habit. But the central link by which the object is made complete, by which these different elements were originally reproduced together by being imitated together in a single act—this has fallen away. So the APPERCEPTION (*q. v.*), the synthesis which made the whole complex content a thing for recognition and for use, is gone in these cases. J. MARK BALDWIN.

**Syph′ilis** [Mod. Lat., from *Sy′philus*, name of a shepherd in the Latin poem of the Italian physician Fracastorius (1483–1553), *Syphilus, sive Morbus Gallicus*; (irregularly) Gr. σῦς, hog, swine + φίλος, loving]: a specific, chronic, contagious disease, peculiar to the human organism, and always more or less closely associated with the venereal act. It is always acquired through contact with a human being already suffering with the disease, or from some material which has been in contact with the discharges from a syphilitic individual. In the poem by Fracastorius *Syphilus* is afflicted with the disease by Apollo in punishment for paying divine homage to his king instead of to the god. Under various names the disease has been described in the earliest written history of every part of the globe. One Chinese account of it dates back to the writings of Hoan-Ti, B. C. 2637. In India its record appears in the Ajur Vedas of Sucrutas, A. D. 400. Hippocrates and later writers describe it as existing among the ancient Greeks. Celsus speaks of it among the Romans. The Abbé Brasseur de Bourbourg writes that numerous documents in the languages of the tribes of the valley of Anahuac have proved to him conclusively the existence of syphilis in America prior to the discovery of Columbus. Those who read the Old Testament attentively, particularly certain psalms of David, may find ample evidence of the existence of the disease among the nations and tribes of the Orient in biblical times. The existence of syphilis in very remote periods of the history of mankind is thus demonstrated; but the first well-authenticated record of its recognition in Europe dates from the year 1494, when a notorious outbreak occurred in the army of Charles VIII. of France, who was then besieging Naples. It was characterized by ulcers upon the genitals, pains in the bones, and eruptions upon the skin, and was known then as the morbus Gallicus or French disease. It spread to a fearful extent, and became a veritable terror in the land. Its cause was attributed to almost every imaginable influence except the right one. Later it was recognized as the result of venereal contact, and was then claimed to have been introduced into Europe by the followers of Columbus.

In the literature of those times, the disease was usually known in each country by the name of some other country, and was designated as the mal Anglais, morbus Gallicus, maladie de Naples, pox, lues venerea, etc. Later it was regarded as distinct from the contagious genital ulcers whose effects were simply local, and also from gonorrhœa, although so late as the time of John Hunter this distinction was not known to him, having been for a time lost sight of. The present accurate classification of venereal disease is in large measure due to Ricord, of Paris, who published extensively concerning the subject in 1831. Later, in 1852, his pupil, Bassereau, made clear the difference between the local ulcer i. e. "chancroid," the local lesion followed quickly by constitutional infection (see VENEREAL ULCER), syphilis, and the other local infection of mucous membranes known as gonorrhœa. Since this time and almost up to the present day a few writers have claimed, however, the unity of the poison producing the first two lesions. Others have stoutly maintained their duality or distinctness, and this view is now positively accepted by all writers of distinction.

*Effects of the Disease.*—The nature of syphilis and the manner in which the human system is infected by it are yet undetermined. Opinions concerning these subjects have been very numerous and variable. A number of investigators have at various times detected micro-organisms, some of these being bacteria, which they have thought to be the active agents in producing the disease, but research has shown that the presence of these micro-organisms does not account for the disease. The problem must be solved by different methods of investigation, yet higher powers of the microscope, or the introduction of some entirely new methods of studying the discharges.

When this poison of syphilis is inoculated upon a healthy surface, it shows no immediate signs of virulence, and healing of the wound takes place promptly, as if no such inoculation had occurred. Then ensues a period of complete rest, the so-called period of incubation, varying from ten to seventy days, when a thickening or induration of the integument or mucous membrane at the point of inoculation is noticeable. Soon a discharging lesion results, the discharge being extremely infectious. Inasmuch as this lesion is surrounded by a zone of tissue induration, i. e. cell proliferation, we have an ulcer or a papule, situated upon an indurated basis; and this is known as the chancre, or initial lesion of syphilis. Then occurs another period of apparent rest, the so-called secondary incubation, during which there is little or no consciousness on the part of the patient of the trouble brewing in his system, the local disease manifestation frequently healing with or even without the proper treatment. This secondary period continues for from four to six weeks, perhaps longer, when the lymphatic nodes in all parts of the body will be found enlarged and hardened, and there breaks out upon the surface of the body a rash or eruption, usually more or less resembling that of measles. This is seen most commonly upon the thorax and abdomen, from whence it may spread to all parts. This rash, usually known as syphilitic roseola, marks the second or constitutional stage of syphilis. Then, or within a short time, the patient begins to experience constitutional disturbances chiefly at night, including pains in the bones, increase of temperature and general discomfort, which is usually known as syphilitic fever. This stage is still further characterized by the tendency to engorgement and inflammation of those parts containing much lymphatic tissue, such as the tonsils, the pharynx, the soft palate, etc. If unchecked the eruption assumes more of a papular type, the papules varying in size from that of a pinhead to that of a split pea, occupying the upper part of the body usually, commonly symmetrically distributed, but not often ulcerating at this time. This is the papular or secondary eruption of syphilis, sometimes assuming rather the pustular type, or becoming pustular as the result of a depraved state of the system. The papules which occur upon the mucous membrane discharge a most infectious material, and are known as mucous patches. They may be found upon the membranes of the mouth, the inner surface of the nose, the eyelids, and about the genitals; while papules upon the skin wherever there is abundant secretion and moisture often assume the characteristics of mucous patches, and are spoken of as mucous tubercles. The secretions from both of these lesions being so highly inoculable constitute one of the most important dangers in dealing with the disease. Inoculation of a healthy person with syphilis frequently occurs through contact with the secretions of a mucous patch situated in the mouth, as in kissing, the only required condition being a crack, erosion, or simple eruption, like a cold-sore, on the part of the one who has not suffered previously from the disease. Numerous examples are recorded where the disease has been acquired from contact with a spoon, pencil, pipe, stick of candy, plug of tobacco, etc., which has been contaminated from such secretions. Chancres occur also in other parts of the body as the result of innocent contact on the part of persons who are totally ignorant, or at any rate unsuspicious. Syphilis thus acquired is known as syphilis insontium, or syphilis of the innocent. Fortunately, the syphilitic principle requires for its introduction and successful inoculation, in almost every instance, a pre-existing lesion of the skin or mucous membrane. But it has been transmitted through the instruments of the surgeon or dentist, by hypodermic syringe needles, and in other ways which are often difficult to trace. A specific inflammation of certain tissues of the eye, particularly of the iris, is a common occurrence in early constitutional syphilis, which is followed by more or less pain, often severe, by photophobia or fear of light, by irregularity of pupil, due to exudation and adhesion, etc. Later in the course of the disease the various structures of the eye may suffer seriously, and syphilitic affections of all the ocular tissues are known and carefully described.

Pains in the bones are often associated with the active or secondary period of syphilis. Sometimes these are of wandering character; again, they are localized. The periosteum, or covering membrane of the bone, is often thickened, as the result of which bony elevations, termed nodes, result. The nails and the hair also are frequently affected, the hair losing its luster and falling out, often in spots; at other times complete baldness results. The nails may become dry, lusterless, and brittle, with arrest of growth. The lymph nodes and lymphatic structures throughout the body suffer persistently during the active manifestations of the disease, and the former will be found enlarged in all of these cases. The lymph nodes in the neck are most easily investigated; and a chain of nodules of this kind may be felt on either side of the neck in distinct cases of syphilis. A small lymph node just above the inner condyle, known as the supracondyloid, is almost invariably involved in this disease, and seldom in any other affection, except in septic infection of the arm. The more active manifestations of syphilis covering the first and second stages extend over a period of rarely less than one, nor more than two, years, during which time all the secretions from all ulcerative lesions are inoculable, as well as even the blood. Its course is marked by the gradual invasion of the organism, and always in the line of the lymphatic distribution. Cases vary much, however, in degree, since in one the disease may be so slight that even the lymphatic enlargements are not easily recognized, and in another so severe that even death may be the result. The causes of these differences appear to depend upon degrees of virulence in the material inoculated, and upon the condition and antecedents of the patient. Syphilis may be transmitted to offspring through the influence of a syphilitic parent during the active period of the disease. From this stillbirths and arrests of development may result, and uterine and ovarian changes may depend upon antecedent syphilis for a long time subsequent to the termination of active syphilis. As a rule, however, syphilis is transmitted by hereditary taint only while lymphatic enlargements and involvements remain. A complete disappearance of the latter, with or without treatment, is the sign of immunity from danger of hereditary transmission.

Commonly the most serious manifestations of syphilis terminate with the arbitrary second stage, either as the result of treatment or by a natural evolution. All writers, however, recognize the existence of a so-called third, or "tertiary," stage, although no exact length of time can be named between it and the second. The tertiary is, in some instances, a gradual merging of the second stage; while in other instances it is separated from it by an interval of more or less perfect health, varying from a few months to a number of years. The products of tertiary lesions are seldom infectious. The lesions themselves are less symmetrically arranged also than are those of the second stage. They are characterized by infiltration or deposit of lymphatic elements in the various tissues of the body, which produce tumor formations, commonly known as gummata, or syphilomata. These tumors or new formations are of course composed of cellular aggregations, which, however, are quite prone to break down and ulcerate. Hence many of the tertiary lesions are of the ulcerative type. In the skin there are a variety of deposits, tending always to ulceration, by which eruptions of characteristic appearance are produced. The larger lesions of this character are usually discolored; the smaller are multiple, and are often widely disseminated. Very extensive ulceration sometimes results from lesions of this character. These are all more likely to occur in alcoholics, in the debilitated, and in the dissipated. The gummy tumors, or gummata, may form in or beneath the skin, or in any other part of the body; and they cause the organ affected to enlarge, presenting nearly all the appearances of ordinary tumors, assuming even malignant characteristics. They are, perhaps, most common in the skin, the liver, the bones, and the brain. In any one of these places they may break down with resulting abscesses or ulcerations.

*Treatment.*—The treatment of syphilis has been from the earliest times a subject of controversy, and is to-day a subject on which very great ignorance prevails, especially among the laity. There can be said, however, of this disease, that there is no other serious affection which involves the human body which can be so positively influenced for good as this: in other words, there is no other disease which in most respects it is so satisfactory to treat. It is necessary, however, to combat a great many popular superstitions regarding the disease, and to insist that the only certain and reliable remedies are mercury and iodine, which can be combined with various others often with good effect, whose action always needs watching, but without which little or nothing can be done. Certain mild forms of the disease, to be sure, will tend toward spontaneous recovery, and these may be aided by absolutely vegetable remedies, or by absence of treatment; but the more serious forms of the disease can not be successfully treated without the two remedies named above, and the public should be warned against men who advertise or profess to cure this disease without these measures; they are either ignorant or dishonest who make these claims. As the result of rash medication in years gone by, a legitimate dread of mercury was engendered, but now, under proper watching, no evil effects need be dreaded, and the manifestations of the remedy can be controlled with as much certainty as those of the disease, when using one against the other. It is possible that both of these elements—mercury and iodine—act by causing metamorphosis of tissue and influencing cell growth, perhaps also by introducing into the system some antidotal or antiseptic influence. There should be emphasized also the fact that syphilis is, so far as most cases are concerned, a curable disease, which offers an element of hope hitherto usually lacking. Too much pains can not, however, be taken to impress upon patients the fact that, in order to effect a cure, it is necessary to keep them continuously under the influence of these remedies for a period of time averaging about thirty months in duration. Less may answer in some cases; more may be required in others. This period of time, moreover, must begin with the last visible manifestation of the disease. Thus if a patient has been under ineffectual treatment already for three years, it will be necessary to begin then and to keep him for at least two years longer under treatment, watching its effects in such a way that neither the disease nor the remedies shall get the upper hand, but that the one shall be administered in just sufficient doses to counteract the effect of the other. Many patients treated in accordance with these principles have remained absolutely well, have married, and have propagated families in which there is not the slightest trace of any inherited affection. It is well, therefore, to maintain as publicly as possible that syphilis is, in proper hands, a curable disease, providing only that the right directions be insisted on and scrupulously followed. Syphilization, the proposed treatment of the disease by repeated inoculation of the purulent secretion of venereal sores, originated by Auzias of Turin in 1844, met with some favor in Italy and Sweden, but elsewhere was discredited, and since 1875 has fallen into disuse. ROSWELL PARK.

**Syphon**: See SIPHON.

**Syra**, or **Syros** (Gr. Σύρος): an island; one of the Cyclades; belonging to Greece. Area, 44 sq. miles (see map of Greece, ref. 17–L). Seldom mentioned in ancient times, it became important during the Greek revolution, when it served as a place of refuge for fugitives from the mainland and islands. Its favorable situation, good though diminutive harbor, and the enterprising spirit of its people have since rendered it the commercial center of the Ægean Sea. The island is rocky, mountainous, and generally sterile, but produces some grain, fruit, and wine, though insufficient to support its inhabitants. Hermoupolis, the capital, built of glaring white houses, presents a striking appearance as it rises amphitheatrically and almost precipitously from the water. It has dockyards, machine-shops, hospitals, good schools, and a college. Pop. (1890) 22,104.

E. A. GROSVENOR.

**Syr'acuse** [from Lat. *Syracu'sæ* = Gr. Συράκουσαι; Ital. *Siracusa*]: chief town of the province of Syracuse, Sicily; on the east coast of the island, in lat. 37° 0′ N., lon. 15° 20′ E. (see map of Italy, ref. 10–G). The modern town occupies the rocky islet Ortygia (1 mile in length, ½ mile in breadth), which serves as an irresistible breakwater to protect the large harbor on the W., across the mouth of which it lies. This harbor was formerly one of the finest in the world, and is even now the best, perhaps, in Sicily. Ortygia, though at some periods united to the main island by a viaduct or causeway, is now connected with it only by bridges. According to Thucydides, Ortygia was colonized by the Corinthians 734 B. C., though the Phœnicians had probably made an earlier settlement here. (See GELO, HIERO, DIONYSIUS THE ELDER, and DIONYSIUS THE YOUNGER.) When, however, after long and cruel wars, the Romans obtained possession of the rest of Sicily, Syracuse, together with some important places in its neighborhood, was left to Hieron II. (275 B. C.), who had become an ally of Rome. Under this king the city rose to its highest point of magnificence, and is said to have contained an immense population within its walls, then, according to some authorities, 22 miles in circumference; according to others, 14 miles. The grandeur of the edifices and the artistic wealth and refinement of Syracuse were altogether worthy its colossal size; but in the course of the Second Punic war, Hieronymus, the successor of Hieron, broke off the alliance with Rome and joined the Carthaginians—a step which proved the ruin of his kingdom. After a long and desperate resistance, in which the celebrated Archimedes exerted all the powers of his wonderful mechanical genius in the defense of his country, Syracuse fell into the hands of the Romans under Marcellus (212 B. C.), by whom it was barbarously sacked and an immense booty carried off to Rome. From this time Syracuse, as well as the rest of Sicily, was but a subjugated Roman province, unscrupulously oppressed and plundered by that power for its own aggrandizement. The town at the time of its capture consisted of four distinct quarters—or five, if Epipolæ be included, as it no doubt was by those ancient writers who describe it as a *pentapolis*. Epipolæ, however, seems to have served rather as a citadel and fortress to defend the town on the N. W., and was probably never thickly inhabited. The four quarters proper were: (1) Ortygia, or the islet; (2) Achradine, occupying the eastern coast of the main island, N. of Ortygia; (3) Tyche, W. of Achradine; (4) Neapolis, S. of Tyche. The most important remains of ancient Syracuse are found on the main island, though some objects of interest are still to be seen in the modern town. Pop. (1893) 25,200. See Serradifalco, *Antichità di Sicilia*; Gregorovius, *Wanderjahre in Italien, Siciliana* (1872); Cavallari, *Sicilia artistica ed archeologica* (1889); Lupus, *Die Stadt Syrakus im Alterthum* (1887). Revised by J. R. S. STERRETT.

**Syracuse**: city; capital of Onondaga co., N. Y.; on Onondaga Lake, the Erie Canal, and the Del., Lack., and W., the N. Y. Cent. and Hud. Riv., the Rome, Water., and Ogdens., and the W. Shore railways; 147½ miles W. by N. of Albany, and 150½ miles E. of Buffalo (for location, see map of New York, ref. 4–F). It is at the foot of the Onondaga valley, though the southern part is embraced by hills on either side opening to the right and left, thus broadening the valley where it joins the city. There are highlands to the N. E. also which, with those on the S., are populated. The length of the city proper from N. to S. is about 4 miles; from E. to W. about 3 miles. Salina Street is the principal thoroughfare. The streets mainly cross at right angles; most of those otherwise laid out followed early Indian trails and wagon-roads. They contain so many trees that the city resembles a forest when seen from the adjoining hills. There are about 250 miles of streets, 52 miles of street-railway, 24 public parks (of which Burnet Park, of 100 acres, situated on the highlands W. of the city, is the chief), and 6 public squares. The city has a new water system, with its source at Skaneateles Lake, and with 90 miles of mains; it cost $4,000,000. There are 34 newspapers (6 daily) and periodicals.

*Public Buildings.*—The U. S. Government building, the county court-house, and the city-hall, all built of limestone; the county clerk's and surrogate's offices; the First Presbyterian, St. Paul's, and St. Mary's churches; the Onondaga County and the Syracuse Savings-bank buildings; the Kirk building, the Granger block, the Bastable block, Dey's and McCarthy's buildings, and the Wieting block, are among the most imposing structures. The State Asylum for Feeble-minded Children and the buildings and grounds connected therewith are attractive and interesting to visitors. The Onondaga penitentiary and jail has room for about 300 prisoners, is situated within the city limits on elevated ground, and its inclosure embraces about 40 acres. The Onondaga County Orphan Asylum, St. Vincent de Paul Orphan Asylum, the House of Providence, House of the Good Shepherd (hospital), St. Joseph's Hospital, St. Ann's Maternity Hospital, Shelter for Fallen Women, Women's and Children's Hospital, Old Ladies' Home, German Hospital, Needlework Guild, Employment Society, Women's Union, Bureau of Labor and Charity, Women's Aid Society, Deaconesses' Home, and King's Daughters are the principal charitable institutions and organizations.

*Churches and Schools.*—There are 84 churches (with a total seating capacity of about 52,000), as follows: Presbyterian, 9; Baptist, 8; Methodist Episcopal, 20; Protestant Episcopal, 7; Roman Catholic, 11; Lutheran, 7; Congregational, 5; Evangelical, 4; Jewish, 7; Unitarian, Universalist, Reformed, Disciples, Independent, and Scientists, each 1. The Y. M. C. A. owns the large and commodious building it occupies, together with its music-hall and athletic rooms. The SYRACUSE UNIVERSITY (*q. v.*) leads the educational institutions. The public schools are 31 in number, including the High School, and all are built of brick. The enrollment is over 16,000; average attendance, over 12,000; annual cost of maintenance, over $303,400; number of teachers, 320. The City Library, now independent of the board of education, has about 26,000 volumes, and occupies a city building. Keble School, which, with several others, has an attendance of about 300 pupils, is the principal private school.

*Finance and Banking.*—The assessed valuation is: real estate, $44,827,180; personal, $3,838,205—total, $48,665,385; receipts and expenditures, about $1,000,000; bonded indebtedness, $5,056,500. There are 9 commercial banks, with an aggregate capital of $1,705,000 and surplus of $1,100,000; 2 savings-banks, with assets of $19,000,000 and surplus of $2,110,000; and 8 national savings and loan associations, with aggregate assets of about $3,500,000.

*Business Interests.*—The manufacturing interests are extensive and cover a wide range of products. Iron and steel are extensively worked in various forms. Salt is no longer an important factor. The State took possession of the salt-springs in 1797; since then 361,200,742 bush. of fine and coarse salt have been produced. The largest quantity made in any year was 9,053,874 bush. in 1862; the smallest, 25,474, in 1797. Competition at home and abroad, with a low tariff aiding the latter, has nearly ruined the industry. At one time the investments were valued at $14,000,000; now they are scarcely worth $500,000. There are in all 245 incorporated manufacturing companies, of which one, making soda-ash, is the principal. In 1890 over $17,000,000 capital was invested in 1,175 establishments; about 15,500 persons were employed, to whom nearly $7,500,000 was paid in wages; material costing over $12,000,000 was used in manufacturing; and the output of the manufactories had a value of over $25,500,000.

*History.*—Syracuse was settled in 1797, and was known first as Bogardus Corners; afterward as Milan, South Salina, Cossitt's Corners, Corinth, and in 1824 Syracuse. In 1826 the village was incorporated; in 1847 the rival villages of Syracuse and Salina were brought under a city incorporation. The Jesuits, in 1654, were the first to visit the locality then inhabited by Indians, a remnant of 425 of whom now occupy a reservation 6 miles S. of the city, and 6 miles square. Pop. (1880) 51,792; (1890) 88,143; (1900) 108,374.

DWIGHT H. BRUCE.

**Syracuse University**: a coeducational institution at Syracuse, N. Y.; founded in the year 1848, but located at Lima, N. Y., and known as Genesee College until 1871, when it was removed to Syracuse. The removal was determined by a great convention held in Syracuse in Feb., 1870. The most prominent citizens of the city aided in its new founding, and the city gave $100,000 as its contribution. The first chancellor, Alexander Winchell, LL. D., was inaugurated Feb. 13, 1873. He was succeeded in 1874 by E. O. Haven, D. D., LL. D., he by C. N. Sims, D. D., in 1880, and the present incumbent, James R. Day, S. T. D., entered upon his duties in Apr., 1894. The campus comprises 50 acres; the principal buildings are the Hall of Languages (1880), the Holden observatory, the John Crouse Memorial College, containing the college of fine arts, the library building, containing the famous library formerly the property of the historian Von Ranke, and the Y. M. C. A. hall and gymnasium. The athletic field is one of the finest in the State. The medical college building is near the center of the city. The college was removed from Geneva in 1881. A college of law was opened in 1895. The number of students has steadily increased. The roll for 1899–1900 showed 1,700. The faculty numbers 130. The institution has enjoyed a healthful growth and expansion in every department. The value of grounds and buildings is $2,185,700, and the endowment fund is $1,313,610, and the total income $132,611. The volumes (including pamphlets) in the library number 61,618. F. SMALLEY.

**Syr-Darya**, **Syr-Daria**, or **Sir-Daria**, seer-daar′yaa, (anc. *Iaxartes*, Arab. *Sihun*): the principal river of Russian Turkestan. It rises in the T'ien-Shan in a glacier at the height of 15,000 feet; flows first W. passing through mountain valleys, and through several unexplored gorges, receiving all its affluents; is largest opposite Khojend, where it passes out on the plains; gives off a few branches and many irrigation canals, and is decreased by evaporation, until it reaches the Aral Sea, where it is only a half or a third of the size it has at Khojend. It is frozen three or four months a year, is in flood in late spring and early summer, and is unsuitable for navigation because of its shallowness and changeable channel, and the lack along its banks of fuel. Length, 1,290 miles; area of basin, 120,000 sq. miles. Herodotus and Strabo describe it as a great river flowing into the Caspian, and the ancient bed between the Aral and Caspian can yet be traced. MARK W. HARRINGTON.

**Syr-Darya**: province of Russian Turkestan; on the middle and lower course of the Syr-Darya river, N. of the Thian-Shan, W. of Semirechensk, and S. of Akmolinsk. Area, 194,853 sq. miles. Pop. (1889) 1,214,300, mostly Kirghiz and Sarts, and 35,000 Russians, of whom 15,000 were military, 11,500 peasants, and 4,600 small merchants. In 1897 the population was 1,479,902. Russia made an especial effort to colonize this province, and in 1889 there were forty-seven colonies containing 16,000 persons. The country is chiefly steppes, deserts, and marshes, but contains some forests near the streams, and much of the land is very fertile when irrigated. Capital, Tashkend. M. W. H.

**Syren**, or **Sirene**: See ACOUSTICS (*Length of Sound-waves*).

**Syr′ia** [=Lat. = Gr. Συρία, deriv. of Σύρος, Σύριος, Syrian, a Syrian; etymologically an abbreviation of *Assyria*. See ASSYRIA. (Heb. *Arām*; Arab. *Esh-Shām*; Turk. *Suristan*)]: a vilayet of the Ottoman empire in Asia Minor; bounded N. by the vilayet of Aleppo, E. and S. by the Syrian and Arabian deserts, W. by the Mediterranean (see map of Turkey, ref. 7-H). In a less restricted sense, Syria comprises also the larger part of the vilayet of Aleppo, thus including the territory bounded N. by Asia Minor, from which it is separated by the Akma Dagh (Amanus Mountains), E. by the Euphrates, and S. by the Arabian Desert. Its length on the W. is coterminous with the eastern shore of the Mediterranean Sea. Its situation may be roughly indicated as between 37° and 31° N. lat. and 34° and 41° E. lon. It comprises the historical divisions of Syria proper, PHŒNICIA, CŒLE-SYRIA, and PALESTINE (*qq. v.*).

*Physical Features.*—Two systems of mountain ranges, LEBANON and ANTI-LIBANUS (*qq. v.*), connected with the Taurus Mountains, run parallel southward, inclosing a long valley of varying breadth and depth, Cœle-Syria, and losing themselves to the S. in the rocky plateaus of the Arabian Desert. The three chief rivers of Syria are the ORONTES and JORDAN (*qq. v.*) and the Leontes (Litany), none of them over 250 miles in length. There are also a score of still smaller rivers and many river-beds, filled by rushing torrents in spring but dry in summer. The valley of Cœle-Syria narrows in the south to a gorge through which the Jordan forces its way into the Lake of Merom (El Huleh). There it is on a level with the Mediterranean, but at the Lake of Gennesaret it is 650 feet and at the Dead Sea 1,300 below it. Here, as in many other regions, the country has a strongly marked volcanic aspect, and throughout Syria earthquakes are frequent. It is a peculiar fact that they occur usually in summer and very rarely in winter. One (1759) caused the death of more than 20,000 persons; another (1778) destroyed Aleppo; those of 1783, 1819, 1822, 1837, and 1872 were notable. Wherever the supply of water is sufficient the soil, generally of a light and sandy character, proves very productive. Most plants of temperate and tropical climates grow luxuriantly. Nevertheless, at certain seasons almost the entire country, and at all seasons a large part of it, presents a barren and desolate appearance. This is in great part due to climatic causes. Summer rains are rare. The climate is parching and the heat oppressive save in the elevated regions, the thermometer often indicating above 100° F. The scourge of the country is the locust. Above all, however, the misfortune of Syria has been its geographical position, rendering it the battle-field of races and religions.

*Natural Products—Flora and Fauna.*—The mountain-slopes are covered with pine, fir, and oak. Cedars are still found in Lebanon; laurel groves are frequent in the valleys; on the table-lands are dwarf-oaks which yield excellent gall-nuts. Extensive forests are rare. Farming tools and implements of all sorts, as well as the system of cultivation and handicraft, are of the simplest. The common cereals are wheat, rye, and barley; rice, dhurra, sesame, lentils, and beans are raised. Cotton, hemp, madder, indigo, melons, cucumbers, and artichokes are extensively cultivated. The tobacco along the coast is of excellent quality. Plantations of fig, orange, lemon, mulberry, peach, pomegranate, and almond, and the vineyards yield excellent returns. The coffee-plant has been introduced at Latakia, the sugar-cane at Beyrout, and Damascus is surrounded by orchards and gardens. All the domestic animals of Europe are found in Syria, as is also the camel. Asses, horses, horned cattle, goats with fine hair, sheep, both broad-tailed and of fine fleece, are numerous. The wild animals are jackals, hyænas, antelopes, the Syrian bear, wolves, and especially wild boar, deer, and wild buffalo. The silkworm is extensively reared. Mining is hardly carried on; but bitumen, coal, iron, salt, and sulphur are found.

*Population.*—There are no reliable statistics as to population. It is probably not far from 1,500,000, and is made up of heterogeneous races, peoples of Semitic origin predominating. Arabic is the generally spoken language. The old Syriac or Aramaic is heard only in certain localities. Along the coast Greek is generally understood, and French much employed by the higher classes. Tribal divisions are rather on the score of religion than origin or race. The country swarms with sects, Mussulman, Jewish, and Christian, equally zealous and intolerant. The Druses (90,000), Mutualis (30,000), Ismaïlis (6,000), Yezidjis (25,000), Nusairieh or Ansyrieh (80,000), Chaldeans or Nestorians (40,000), Syrians or Jacobites (10,000), and Maronites (482,000) are the more prominent or the best known. Though in general these peoples are quiet, hospitable, and kindly, yet outbreaks of fanaticism are frequent, not only on account of their detestation of each other's belief, but through the intrigues of foreign powers. Such were the massacres of 1841, 1845, and 1860. There is no question that the condition of the people has bettered in many respects since 1875. Education, though in a backward state, has made substantial progress. This improvement is due in large measure to the labors of the Roman Catholic and Protestant missionaries, and especially to the wide and active influence exerted by the Syrian Protestant College at Beyrout. The chief cities, with populations, are as follows: Damascus, 200,000; Aleppo, 120,000; Beyrout, 105,000; Jerusalem, 41,335; Homs, 35,000.

*History.*—The earliest known inhabitants of Syria were Semites of various branches, living in separate social organizations. Such were the Canaanites, Phœnicians, Aramæans, the latter of whom held Damascus and ruled to the Euphrates. Such, too, were the Hebrews. Practically all Syria, except Phœnicia, became subject to the Hebrew monarchy under David. When, on the death of Solomon, the Hebrew empire divided into the two kingdoms of Judah and Israel, an independent Aramæan monarchy under Rezin was set up at Damascus. Its kings conquered Northern and Central Syria. Tiglath Pileser, King of Assyria, subdued this state, capturing Damascus (740 B. C.), and likewise Israel (720 B. C.). Judah was conquered by Nebuchadnezzar, the King of Babylon, in 587 B. C. Syria passed from the Assyrians to the Babylonians, then to the Medes, then to the Persians, and after the battle of Issos (333 B. C.) to Alexander and the Greeks. During these transitions many non-Semitic elements were introduced into the populations. On the death of Alexander the Seleucidæ founded a Syrian empire which they ruled from 301 to 64 B. C. Antioch, built by Seleucus I.

(301–281 B. C.), was their capital. For centuries it was the largest and most brilliant city of the East, and was further influential through the civilization therein developed. The Syrian empire at the height of its prosperity rivaled in extent that of Alexander. Antiochus III., the Great (223-187 B. C.), was a most formidable enemy to Rome. Antiochus XIII. (69–65) was overthrown by Pompey, who made Syria a proconsular Roman province (64 B. C.). It continued part of the Roman and then of the Byzantine empire, but (635–638) was gradually conquered by the Mussulmans. Damascus was made the capital of Syria in 654; under the Ommiade dynasty of caliphs it continued the capital of the entire Mussulman empire (661–752). The Abasside caliphs, hating all that was associated with their Ommiade predecessors, degraded Syria to the rank of a province and removed the capital to the newly founded Bagdad. Distracted by rebellions and by frequent wars between the caliphs and the Byzantine empire, the condition of Syria was deplorable during the three subsequent centuries, till it fell under the humane sway of the Seljuk sultan Malek Shah (1073–93). Next the crusaders deluged the country, and the succeeding two centuries—from 1099, when the Christian kingdom of Jerusalem was set up, until 1291, when Acre, the last Christian stronghold in Syria, was retaken by the Mussulmans—formed the most disastrous and destructive period Syria has ever known. From that time, except during the invasions of Tamerlane and his successors, Syria was ruled by the Mameluke sultans of Egypt until 1516, when it was conquered by Sultan Selim I. From 1832 to 1841 it was governed by Ibrahim Pasha under the authority of his father, Mehemet Ali of Egypt. With the exception of this brief period it has, since the days of Sultan Selim, formed an integral part of the Ottoman empire.

EDWIN A. GROSVENOR.

**Syriac Language**: See ARAMAIC.

**Syriac Literature**: the literary productions of the Syriac Church. Its rise is lost in the first centuries of the Christian era. It is at its best from the fourth to the seventh centuries, when Arab dominion begins to impose its language upon Syria and Mesopotamia. From the tenth century on Syriac is only a literary tongue. Productiveness in that language dies out in the thirteenth century, just after a short period of revived glory. From the sixth century the split in the Eastern Church into Nestorians and Jacobites makes itself felt in the literature. It is probable that at one time there existed a heathen Syriac literature, but none of it has come down to us. The first writer in Syriac (Bardesanes, the last Gnostic) was a convert to Christianity. The translation into Syriac of the Bible (see PESHITO) and of Greek theological and secular works laid the foundation upon which later scholars built. Learning had found a home in the great schools of Mesopotamia—Edessa (destroyed by the Persians in 489), Nisibis, Māchōzē, Dōr-Kōnī, Jerablis, Mosul, etc. The literature is largely a theological one, and of importance because of the many translations it contains.

In these schools the study of the Bible was the chief interest. It was necessary to fix accurately the wording and the pronunciation of the more difficult expressions in both the Old and New Testament. This Masoretic work seems to have centered in certain convents—e. g. in the Jacobite one of Karkaftha, near Rās'ain, whence the best of such MSS. come (Martin, *La Massore chez les Syriens*, Paris, 1880). With this there went hand in hand the writing of commentaries upon the Bible, which were, of course, more theological than critical. The great Syrian Father Ephraem (d. 373) wrote commentaries upon both Testaments and upon the Diatessaron of Tatian. Among Nestorians were Hannānā (d. 607), a determined opponent to the exegesis of Theodore of Mopsuestia; Bābai the Elder (610); Elias of Merv; Isho'dad of Merv (852). The Jacobites have names of greater prominence—Jacob of Edessa (640–708); Daniel of Salaḥ (eighth century); Moses bar Kēphā (813–903); and Daniel bar Salibī (d. 1171), Bishop of Mar'ash. More like the Jewish Midrash and the pseudepigraphic literature are such compilations upon biblical history as the *Cave of Treasures* (ed. Bezold, 1883–88), *The Book of the Bee* (ed. Budge, Oxford, 1886). Of purely theological interest are the collections of church and monastic rules (*Canones*) which were formulated at various times—those of the Jacobite Church by Jacob of Edessa and Gregory Bar 'Ebhrāyā, those of the Nestorian by Abhdishō. The great schism in the Church has called forth a large polemical literature. One of the best apologies on the Nestorian side was written by Elias of Nisibis (b. 975), ed. by Horst, Colmar, 1886; while the Monophysites were defended by that elegant writer Philoxenus of Mabug (485). The homily was a favorite form of religious exhortation. A large number of such homilies have come down to us from Ephraem (ed. Lamy, 3 vols., Mechlin, 1882–86); Ibas (435); Jacob of Nisibis, called Afraates the Persian Sage (d. 338), trans. into German by Bert (Leipzig, 1888); Philoxenus (ed. Budge, 1893); and Jacob of Lerug (503), who is said to have composed as many as 760.

Poetry was also known in the service of the Church, though even historical, philosophical, and grammatical works were put into verse. Bardesanes (b. 154) is the first poet; he is followed by Ephraem, Balai (431), Cyrillōnā, Isaac of Antioch (d. 460), Narsai (489), and the Nestorians George of Mosul (d. 987), George Warda (1225), whose hymns are largely used in the Nestorian ritual, and Chamis bar Ḳardāhē of Arbel. Syriac poetry can not lay claim to great originality. Its system of meter is based upon two principles—the rhythmic sequence of accented or unaccented syllables, the one the arsis, the other the thesis of the verse, and the counting of the syllables. See Grimme, *Der Strophenbau in den Gedichten Ephr. des Syrers* (Freiburg, 1893).

Syriac literature is rich in historical works which throw much light upon the ecclesiastical and political history of the Christian Church in Mesopotamia. The *Didascalia* and *Constitutiones Apostolorum*, the legends of Abgar and the apostle Addai, and the Edessenian chronicle (Hallier, *Unters. über die Ed. Chronik*, 1892) are of prime importance (Duval, *Hist. d'Édesse*, 1892). The ancient martyrologies (re-edited by Bedjān, 4 vols., Paris, 1890–95) are full of interesting material, as are also the Nisibene hymns of Ephraem, the poems of Isaac of Antioch, and the historical romance dealing with the persecutions under Julian the Apostate (*Zeit. der Deutsch. Morgenl. Gesellschaft* 28, 263). Other historical works deal largely with the war between Rome and Persia. An anonymous Monophysite has turned the ecclesiastical history of Zacharias Rhetor of Mitylene (560) into Syriac, and united it with other works. Very full and accurate is the ecclesiastical history of John of Ephesus (b. 505) in three parts. Other writers are Simeon Barḳāyā (591); George, Bishop of the Arabs (686); Jacob of Edessa, who finished in 692 a continuation of the chronicle of Eusebius; Dionysius of Tel Mahrē (817); Thomas of Marga (832), author of a monastic history (ed. Budge, 1893); Elias bar Shināyā; Michael (1163), whose work exists in an Armenian translation, etc.

Translations were made from the Greek at a very early time—e. g. the *Recognitiones* of Clement; the *Apology of Aristides* (ed. Harris, Cambridge, 1891); the discourses of Titus of Bostra; the *Theophania* of Eusebius; the commentaries of Theodore of Mopsuestia; the *Geoponica* (ed. Lagarde, 1860); the *Physiologus*; the works of Homer; the collection of *Leges Seculares* (ed. Sachau, 1880); the fables of Æsop; the medieal works of Galen and Hippocrates. Many of these are useful for text-critical purposes; some have not been preserved in the original Greek. Among translators known by name are Ma'na (430), Moses of Aghel (550), Athanasius II. (684). A great many of the works of Aristotle were also translated, especially the *Organon* (Gottheil, *Hebraica*, ix., 166). Probus (about 450), George of the Arabs, Sergius of Rās'ain (about 540), Jacob of Edessa, and Honain (873) are the leaders in this work. From the Syriac they were translated into Arabic, and from Arabic into the languages of Europe. The old Sanskrit stories of Kalilag and Damnag, of Sindban, and the history of Alexander the Great were done into Syriac from the Pahlavī. The translations of Aristotle formed the natural starting-point for all philosophical study, but the Syrians hardly got beyond commentating and excerpting their Greek master. To the names already mentioned may be added those of Paul of Persia (575), Severus Sabocht (d. 631), Mār Abhā II. (740), Antonius Rhetor, Moses bar Kēphā (b. 813), Bazūdh, and Severus bar Shakko (d. 1241). See Renan, *De Phil. Peripat. apud Syros* (Paris, 1852).

The only non-theological science that was really cultivated was that of philology. Syriac lexicography had its beginning in the necessity of determining accurately the meaning of words in the Bible and of the many Greek expressions which had been taken over into the translation of other works. Collections of such explanations were made by Anānīshō, Honain, Bar Seroshwai (tenth century), but especially by Bar Ali (835) and Bar Bahlūl (963), where the definitions are in Syriac and Arabic. In grammar the starting-point was Aristotle and the Syriac translation of the Τεχνή of Dionysius Thrax (Gottheil, *Treatise on Syriac Grammar*, Berlin, 1887, p. 5; Merx, *Hist. artis grammaticæ apud Syros*, Leipzig, 1889). In later times the influence of the grammatical studies of the Arabs was also felt. The chief grammarians are Joseph Huzāyā, Jacob of Edessa, Elias of Tirhān (1028), Elias of Nisibis, Joseph bar Malkōn (1200), John bar Zo'bi (thirteenth century), and Severus bar Shakko. Other branches of science were hardly cultivated except for the writing of such compendia as the Hexaemera of Jacob of Edessa, Emanuel (963), Moses bar Kēphā (Gottheil, *Hebraica*, viii., 65; Hjelt, *Études sur l'Hex. de Jacques d'Édesse*, Helsingfors, 1892). Duval has published some interesting Syriac works on alchemy (Berthelot, *La Chimie au Moyen Âge*, ii., Paris, 1893).

This short account may be fitly closed with a reference to two lights which illuminated the last days of Syriac literature. Abhdīshō (d. 1318), the Nestorian, was the first to attempt a history of his national literature (*Catalogus Librorum*, in Assemani, *Bibl. Orient.*, iii., 1). In his *Paradise of Eden* he attempted to imitate the Makāmāt of Hariri (ed. Cardāhī, Beyrout, 1889). He also wrote a work on theology (*The Pearl*) and a collection of canons (Mai, *Script. Vett. Nova Coll.*, x.). Undoubtedly the most learned of all the Syriac writers was Gregory bar 'Ebhrāyā (Bar Hebræus; Abul Faraj), b. 1226; d. 1286. There is hardly a province of literary activity which he did not cultivate. He wrote the most comprehensive native grammar (ed. Martin, 1872), and the most useful native commentary upon the Peshitta (*Storehouse of Secrets*). That he had some acquaintance with physical sciences is shown in his *Lamp of the Sanctuary*, a compendium of all sciences; in his *Ascent of the Mind*, a treatise on astronomy and cosmography: and in his translation of Dioscorides's Περὶ ὕλης ἰατρικῆς, his commentaries on works of Galen, and in a medical work of his own. He wrote a work on ethics, on the life of an ascetic (*Book of the Dove*), and a commentary on the mystical *Book of Hierotheus*. His historical writings are very valuable. His *History of the World* has been re-edited by Bedjān (Paris, 1890); his church chronicle by Abeloos and Lamy (Louvain, 1872–77). He also made an Arabic recension of his *History of the World*. Bar Ebhrāyā was a poet of some prominence. A number of his poems have been edited by A. Scebābī (Rome, 1877). See Nöldeke, *Sketches from Eastern History* (London, 1892).

See W. Wright, *A Short History of Syriac Literature* (London, 1895). R. Graffin has begun the publication of a complete *Patrologia Syriaca*, the first volume of which contains *Aphraatis Sapientis Persæ Demonstrationes* (Paris, 1894). RICHARD GOTTHEIL.

**Syrian Rite**: See UNITED SYRIANS.

**Syrin'ga** [Mod. Lat., from Gr. σῦριγξ, σύριγγος, a shepherd's pipe, tube]: a genus of Old World shrubs of the family *Oleaceæ*, to which the lilacs belong. (See LILAC.) Popularly, the beautiful shrub *Philadelphus coronarius*, of the family *Saxifragaceæ*, and often seen in gardens, is called sweet syringa. It is a native of Japan; its cream-colored, fragrant flowers somewhat resemble orange-blossoms, whence another popular name of mock orange.

Revised by CHARLES E. BESSEY.

**Syringe** [from Gr. σῦριγξ, σύριγγος, tube-pipe, liter., shepherd's pipe]: an instrument identical in principle with the ordinary suction-pump. A vacuum is formed, either by means of a piston or a compressible chamber of India-rubber, fitted with suitable valves. Water or some other fluid then rushes in and fills the vacuum, and a second application of pressure causes a jet of the contained liquid to be thrown out. The syringe is of many forms, chiefly employed in surgery, in horticulture, etc.

**Syro-Chaldæans** and **Syro-Orientals**: See CHALDÆAN CHRISTIANS.

**Syros**: See SYRA.

**Syr'tis, Major** and **Minor** [Lat., Greater and Lesser Syrtis]: the ancient names of the two large inlets, or rather of the two opposite angles (E. and W.) of the great almost rectangular re-entrant in the southern coast of the Mediterranean, of which the margins are the coasts of Tunis and Tripoli. They are now called respectively the Gulf of Sidra and the Gulf of Cabes. They are shallow and dangerous to navigate on account of quicksands and the uncertainty of the tides.

Revised by J. R. S. STERRETT.

**Syrus**, PUBLILIUS: See PUBLILIUS SYRUS.

**Sysran'**: town; in the government of Simbirsk, Russia; on the Sysran, near its influx into the Volga (see map of Russia, ref. 8–G), and in the center of a very fertile district, from which it exports large quantities of grain. Pop. (1897) 32,377.

**Systole**: See HEART.

**Szabadka**, so-bod'kō (Germ. *Maria-Theresiopel*): town; in the county of Bacs, Southern Hungary; on Lake Palicz (see map of Austria-Hungary, ref. 7–H). It has manufactures of linens and leather, important cultivation of tobacco and breeding of cattle, and a brisk trade in horses, cattle, sheep, wool, and hides. It consists of the town proper and sixteen suburbs, and is rather indifferently built, though it contains several handsome buildings, such as the Church of St. Theresa, the beautiful Greek church, the town-house, the barracks, etc. Pop. (1890) 73,526.

Revised by M. W. HARRINGTON.

**Szalay**, so'loi, LASZLO: historian; b. at Buda, Hungary, Apr. 18, 1813; studied at the University of Pesth, and was admitted to the bar in 1833; devoted himself to history, jurisprudence, and politics; became editor of various leading reform papers, and published a collection of political essays in 1847, and of political biographies 1847–52; was the most prominent member of the commission for the revision of the Hungarian penal code, a work which earned great admiration outside Hungary; succeeded Kossuth as editor-in-chief of the *Pesti Hirlap* in 1844; was sent as ambassador in 1848 to the provisional government of Germany in Frankfort; resided subsequently in London and Switzerland, occupied with historical studies; returned to Hungary in 1861. D. at Salzburg, July 17, 1864. Among his works are a *History of Hungary* (6 vols., 1850–63); *Eszterházy Miklós* (2 vols., 1862–66); and *The Book of Statesmen*, a collection of political biographies. F. M. COLBY.

**Szarvas**, sor'vosh: town of Hungary, on the Körös; 80 miles S. E. of Budapest (see map of Austria-Hungary, ref. 7–I). It was formerly fortified, but its fortifications have fallen into decay, and it derives its importance mostly from its trade in grain and cattle. It suffered severely during the sieges of 1595 and 1685. The surrounding country is swampy and marshy, but famous for its extensive bee-culture. Pop. (1890) 24,399. Revised by M. W. HARRINGTON.

**Szatmar-Nemet**, sot-mor'nā-met': town of Hungary, on the Szamos; 68 miles by rail N. E. of Debreczin (see map of Austria-Hungary, ref. 6–I). It has a Roman Catholic cathedral, and has extensive manufactures of slibowiz, a kind of brandy distilled from plums. The town was formed by the union of Szatmar and Nemet in 1715. Pop. (1890) 21,218.

**Széchényi**, sā'tshān-yē, ISTVÁN, Count: Hungarian statesman: b. in Vienna, Sept. 21, 1792, of an old and celebrated Hungarian family; served in the Austrian wars with Napoleon, but retired from the army in 1825, and devoted himself wholly to the material and spiritual development of his native country. He took a prominent part in the foundation of the Hungarian Academy of Science, of the first Hungarian theater, of the conservatory of music in Pesth, etc., and in the erection of the great bridge across the Danube at Pesth, in the regulation of the course of the Danube through the Iron Gates, in the establishment of steam-navigation on the Danube and the Theiss, etc. In political matters he desired reform, not revolution. He held that the progress of Hungary could not be effected unless by the aristocracy and in alliance with Austria, and he consequently opposed Kossuth very strongly. Nevertheless, in 1848 he consented to be a member of the Batthyanyi-Kossuth ministry, but on the outbreak of the war with Austria he became insane, and was taken to the asylum at Döbling, near Vienna. Here he nearly recovered, but in Mar., 1860, the Austrian police, suspecting him of being the author of a political pamphlet which criticised the Government very severely, undertook a search of his rooms and papers, and this excited him so violently that he relapsed, and killed himself Apr. 8, 1860. He was the author of several spirited pamphlets.

Revised by F. M. COLBY.

**Sze-chuen**, or **Ssŭ-chuen**, se′chwăan′ [literally, four streams]: the largest province of China, bounded N. by Kansuh and Shensi, E. by Hupeh, S. by Kwei-chow and Yunnan, and W. by Tibet; area, 166,800 geographical square miles, or 220,000 statute square miles. The portion lying W. of the river Min (an important affluent of the Yang-tse, regarded by some as the upper course of the Yang-tse itself) is little known. It has an area of 120,000 sq. miles, is exceedingly mountainous, and forms part of the great mountain lands of Central Asia. With the exception of some small inclosures it is little populated, is almost uncultivated, and of inferior importance as regards the value of its products. Here are found several Tibetan and aboriginal tribes, such as the *Man-tse* (a people considered by the Chinese to be the remnants of the ancient occupants and rulers of the province), the *Si-fan*, who are divided into numerous tribes, each with its own chieftain, and the *Lolos*, who are practically independent, and from whose frequent raids the Chinese settlers suffer greatly.

The eastern portion, which may be regarded as Sze-chuen proper, has been described by Baron von Richthofen as a large triangular-shaped basin surrounded by mountains (mostly of Silurian and Devonian age), some of which rise above the snow-line, and all of which are difficult to cross. The basin he calls the Red Basin, from the accumulations of red clayey sandstones and sandy clays which are found in it. The summit lines within the basin are nearly at a level with one another, and would if connected represent an undulating plain, 3,000 to 4,000 feet above sea-level, but owing to the fact that the bed of the Yang-tse is 1,500 feet or more below the level of the plain, and that rocks of the Red Basin are soft and easily destructible, the rivers have eroded deep channels, and converted the entire basin into a hilly country. With the exception of the plain of Ching-tu, Sze-chuen contains no level ground worth speaking of.

Sze-chuen can be approached from the E. by only two routes: (1) by the Yang-tse, up whose gorges boats and junks (never exceeding 70 tons burden) are dragged slowly and at great expense and risk, and (2) by the "Great North Road" over the mountains from Si-ngan-foo. Communication within the province is everywhere difficult (except in the plain of Ching-tu), and is kept up chiefly by utilizing the affluents of the Yang-tse and their numerous branches. Several pack-roads, paved with flagstones, have been constructed, and steps cut in the rocks at very steep places. That which connects Ch'ung-K'ing with Ching-tu-foo is a good example. The sedan-chair is the commonest mode of conveyance used by travelers, while goods are transported by coolies. Beasts of burden are little used.

Coal is found in Sze-chuen, but is not mined extensively. The manufacture of iron from its ores is perhaps the most generally distributed industry of the province. Salt is extensively made from brine raised from wells ranging in depth from 700 to 3,000 feet, and evaporated in some places by coal, but in many by natural gas. Petroleum is plentiful, but is not utilized. The value of the salt produced annually is about $63,000,000. On this the province receives a tax of $3,150,000, while the province of Hupeh, which levies a tax of 18 cash a catty, takes $2,100,000. The other chief products of the province are silk, opium, insect wax (see PEH-LA), tobacco (which is of excellent quality, and is used by the natives in leaves rolled up in the shape of cigars), tea (only green and of inferior quality), and t'ung oil.

The inhabitants are, as a rule, gentle in character and refined in manners, and are both industrious and prosperous. All the great commerce of the province, however, is in the hands of men from Shensi and Kiangsi, and banking and pawnbroking are controlled by men from Shansi. The population is about 67,000,000. CH'UNG-K'ING (*q. v.*) is the only river-port opened to foreign residence and trade, but missionaries, both Protestant and Roman Catholic, are found in many places. The capital is CHING-TU (*q. v.*). See Baber's *Travels and Researches in Western China* (London, 1882); Hosie's *Three Years in Western China* (London and New York, 1890); and Little's *Through the Yang-tse Gorges* (London, 1887). R. LILLEY.

**Szegedin**, sech-ed-een′: city; in Hungary, at the junction of the Maros with the Theiss; 118 miles by rail S. E. of Budapést; connected by a bridge of boats with Neu-Szegedin on the opposite bank (see map of Austria-Hungary, ref. 7-H). The houses are generally only one story high, with thatched roofs; the streets are broad, but mostly unpaved, and sometimes are rivers of mud. The old Turkish castle in the center of the town is the sole reminder that Szegedin was once an important fortress. In 1879 the town, with the surrounding country, was submerged by inundation; almost half the houses were destroyed, and nearly 2,000 persons perished from drowning or exposure. Soda, soap, and cloth are manufactured on a large scale, and an active trade is carried on in corn, wine, tobacco, salt, and lumber. At its annual fairs vast exchanges of goods take place. The town is famous for its floating mills and river-boats. The Hungarians were defeated here by the Austrians (Aug. 3, 1849). Pop. (1890) 85,569. E. A. GROSVENOR.

**Sze-ma** (or **Ssŭ-ma**) **Kwang**: one of the most prominent statesmen and writers of China, and as a historian second only to Sze-ma Ts'ien; b. in 1009; d. 1086. He was remarkable for precocious intelligence, and a story is told that illustrates his presence of mind and resourcefulness even when a boy. A playmate, having fallen into one of the large earthenware vessels in which the Chinese keep tame fish, was on the point of drowning, when Kwang dashed a large stone against the jar and broke it, thus letting the water escape and saving the life of his companion. He was employed at an early age in Government office, and rose to high rank in the ministry. He is noted, first, for his strenuous and successful opposition to the reforms advocated by his contemporary Wang An-Shih, usually called "the Innovator"; and, second, for his great historical work, in 294 books, *The Comprehensive Mirror of History*, on which he spent the leisure of nineteen years. It covers the period from the beginning of the fourth century B. C. to 960 A. D. He was also the author of several dictionaries. R. L.

**Sze-ma** (or **Ssŭ-ma**) **Ts'ien**: author of the first general history of China; b. at Lung-mŭn, in what is now the province of Honan, about 163 B. C. He early devoted himself to study, and at twenty entered upon an extended course of travel throughout the empire. After this he held several minor offices under the Government until 110 B. C., when he succeeded his father, Sze-ma T'an, as grand recorder and astronomer, and shortly thereafter entered upon the task of completing the great historical work begun by his father. This was finished in 91 B. C., and received the name of *Shih-ki*, or *Historical Records*. It extends from the beginning of the reign of Hwang-ti (B. C. 2697) to 104 B. C. It has become the model for all Chinese historical works, and is divided into five parts: (1) Imperial Records; (2) Chronological Tables; (3) Treatise on Rites, Music, Chronology, Astrology, Sacrificial Service, Watercourses, Weights and Measures, etc.; (4) Genealogical History of the Princes and Grandees; and (5) Narratives, or biographies, and accounts of foreign countries and their affairs. About the year 98 B. C. Sze-ma incurred the displeasure of the emperor, and was thrown into prison because of his defense of Gen. Li Ling, who, having foolhardily advanced far into the territory of the Huns with a body of 5,000 foot-soldiers, had been overthrown, and then, afraid to face the wrath of the emperor, had surrendered. Sze-ma is also noted for reforming the calendar, and the chronology determined by him still obtains in China. He died in disgrace about 85 B. C. For a specimen of his writings, see Giles's *Gems of Chinese Literature* (London and Shanghai, 1884). R. L.

**Szumowska**, ANTOINETTE: See the Appendix.

# T

**T**: the twentieth letter of the English alphabet.

*Form.*—The form T is inherited viâ the Roman alphabet from the early Greek T or + X X. The form of the Semitic original was that of a cross, + or X. It occupied the last or twenty-second place in the original alphabet adopted by the Greeks from the Phœnicians.

*Name.*—The Semitic name of the letter was *taw*, i. e. mark, cross, whence the Greek *ταῦ*. The Latin phonetic name *te* passed through the French *té* into English as *te*, now pronounced like *tea*.

*Sound.*—It commonly denotes a voiceless dental (or alveolar) explosive formed by breaking a closure between the tongue-tip and the alveolar terrace back of the upper front teeth as in *tar*, or by effecting a check at the same point as in *rat*. Generally there is in the latter case an additional after-puff caused by again breaking the closure; thus in *act* the after-puff constitutes the only characterization of the sound. The same sound is denoted also by *th* in *Thames, Thomas, thyme, phthisis*, and by (*e*)*d* in preterites and participles, as *asked, rushed*. The letter *t* is silent in *hautboy, hasten, listen, often*, etc., *bustle, thistle*, etc., *chestnut, Christmas, mortgage, bankruptcy, waistcoat, Matthew*; in the combination *ti* before vowels it often has the value of *sh* (*š*), as in *initial, action*, etc., but in *-sti-* it has the value of *tsh* (*tš*), as in *question, Christian*. In the combination *th* it represents a spirant, either voiceless, as in *thin*, or voiced, as in *then*.

*Source.*—The sound represents in Teutonic words an Indo-European *d*; cf. *ten*: Lat. *decem*; *tooth*: Lat. *dens*; *two*: Lat. *duo*; *heart*: Lat. *cor, cordis*; or when following *s, h*, or *f*, an Indo-European *t*, as in *stand*: Lat. *stare*; *night*: Lat. *nox, noctis*; *eight*: Lat. *octo*. Between *s* and *r* it is excrescent, i. e. a special development of Teutonic; cf. *stream*, Indo-European root *sreu-*, *sister* from *swesr-*, Lat. *soror*. It is also an excrescent product of Mod. Eng. after final *-s*, e. g. in *betwixt* < M. Eng. *betwix*; *against* < M. Eng. *ageines*.

*Symbolism.*—T = Tuesday, ton, Tullius; Ta = tantalum; Te = tellurium; Th. = Thursday, thorium; Ti = titanium; Tl = thallium. BENJ. IDE WHEELER.

**Taaffe**, taa'fe, EDUARD, Count: Austrian statesman; b. in Prague, Feb. 24, 1833, of an Irish family; was educated with the Emperor Francis Joseph; entered the public service in 1857; became Austrian Minister of the Interior in 1867; Minister President in 1869 and again in 1879. He was much opposed to the anti-Semite agitation, and sought to form a middle party which should unite conflicting nationalities and creeds. In 1893 he alienated the conservatives, the German liberals, and the Poles by his electoral reform measure, and was forced to resign Oct. 29. D. at Elischau, Bohemia, Nov. 29, 1895. F. M. COLBY.

**Tabas'co**: a southeastern state of Mexico, bounded N. by the Gulf of Mexico, E. by Campeche, S. E. by Guatemala, S. by Chiapas, and W. by Vera Cruz. Area, 9,844 sq. miles. The southern portion only is mountainous, the rest consists of extensive plains and low rolling lands bordering the river Grijalva and its tributary, the Usumacinta, both of which are navigable. There are extensive swamps and lagoons near the coast, much of the surface is covered with matted forest, and the roads, even in the most settled portions, are execrable. The climate is warm and damp; there is no true dry season, but rains are most copious from July to October and in December and January. The soil nearly everywhere is very fertile; besides the common crops of maize, etc., cacao and sugar-cane are raised, the former for exportation and the latter principally for the manufacture of rum. There are no mines of importance. In general, Tabasco is one of the least progressive of the Mexican states. Pop. (1893) estimated, 111,820. Capital, San Juan Bautista. HERBERT H. SMITH.

**Tabasco River**: See GRIJALVA.

**Tabasheer'** [from Pers., Hind., and Arab. *tābāshīr*; cf. Sanskr. *tavakshīra*]: a white variety of opal obtained from the hollow stems of certain bamboos. It appears to be the product of an exudation of the siliceous sap of the plant into its internal cavity, caused by disease or injury of the plant. It is very light, brittle, porous, and has hygrometric properties. There are several varieties. The transparent kinds have a very low refractive power. The Hindus ascribe to it valuable medicinal virtues.

**Tabatin'ga**: a town of the state of Amazonas, Brazil; on the north side of the river Amazon, close to the frontier of Peru (see map of South America, ref. 3-C). It is the terminal port for the regular Brazilian steamboat lines, and the point of departure for small steamers which ply on the Peruvian rivers; there is a growing trade, especially in rubber. Ocean steamships have ascended to this point, nearly 2,000 miles. Pop. about 3,000. H. H. S.

**Tab'ernacle** [viâ O. Fr. from Lat. *taberna'culum*, tent, (in Late Lat.) tabernacle, dimin. of *taber'na*, shed, booth, shop, used as transl. of Heb. *mish'kān*, dwelling-place, tent, tabernacle, or, *'ōhel*, tent, tabernacle]: a tent erected, under minute divine directions (Exod. xxv.-xl.), by the Israelites at Mt. Sinai, and carried with them into the Holy Land. It was set up at Gilgal (Joshua iv. 19), then at Shiloh (Joshua xviii. 1), next at Nob (1 Sam. xxi. 1), then at Gibeon, where it is last mentioned (1 Chron. xxi. 29). It was designed as the place where God should especially manifest his presence to his people, and where they should offer to him their sacrificial worship, and was replaced by Solomon's temple which exactly doubled its dimensions. It was a rectangle 45 feet long and 15 broad and 15 high. Its two sides and western end—the eastern end was left open—were made of acacia boards placed on end in silver sockets, and bound together by rods overlaid with gold; and the frame was covered with (1) linen, on which was embroidery representing cherubim; (2) black goats'-hair cloth; (3) rams' skins dyed red; (4) seals' skins (or porpoise-skins). It consisted of two adjoining rooms, with an outer court surrounding both. The inner room, which was an exact cube, contained the ark of the covenant, with its contents; over this were the figures of two cherubim, and between them the Shekinah. The only access to this room, which was called "the holy place," or "the holy of holies," "the holiest of all," "the second tabernacle" (Heb. ix. 3, 7), was from the outer room, which was called "the holy place," also "the sanctuary," "the first tabernacle" (Heb. ix. 6), of the same width and height, but just twice the length. Between them hung a veil, or rather double curtain, which was passed only by the high priest, and by him only on one day of the year, the great day of atonement. In the outer room was the golden censer, the golden altar on which incense was burned every morning and evening, the table of shew-bread, on which were twelve loaves of bread, replaced each week, and the golden candlestick, the lamps of which were trimmed every morning and lighted every evening. Into this the high priest and the priests entered daily, in the course of their regular ministrations, but no others. The entrance was at the eastern end from the court in front. In the court the principal object was the large brazen altar, on which all burnt-offerings and the appointed parts of other sacrifices were burned. Between this and the sanctuary itself was placed the brazen laver for the ablutions of the priests. This court was entered not only by the priests and Levites, but by all Israelites—who must be ceremonially clean—who came to offer sacrifices. The entrance to this also was by a hanging of curtains gorgeously wrought in colors, supported on pillars, and was 20 cubits in width. The three entrances were thus in one line, all facing eastward. The dimensions of the court were 100 × 50 cubits; it was inclosed on all sides by pillars of brass 5 cubits high and 5 cubits apart, resting in sockets of brass; and on these were hung, by hooks of silver, curtains, one for each side, of "fine twined linen."

Revised by S. M. JACKSON.

**Tabernacles, Feast of**: the last of the three great annual festivals, at which all the males of Israel were required to present themselves at the sanctuary (Lev. xxiii. 33-43). It began on the 15th Tisri, the first month of the civil and seventh month of the ecclesiastical year, corresponding to the last part of September or first part of October, and continued seven days, with a supplementary eighth day. On the first and on the eighth day there were "holy convocations," when no servile work might be done, although the other activities of life were allowable. On the remaining days there was no legal restriction on labor, but from the manner of keeping the feast it must have been largely suspended. It was also called the "feast of ingathering" (Exod. xxiii. 16), and was pre-eminently a thanksgiving festival after harvest, and was far more joyously kept than any of the other feasts. It was distinguished by two peculiar observances—(1) the dwelling in booths, in memory of their wilderness wanderings. These booths were to be constructed of the branches of "goodly trees," and were not tents. According to Jewish tradition, the sides were built up of boards, and only the roof made of branches. The booths were placed on the roofs and in the courts of the houses, and in any unoccupied places in the streets. As little furniture as possible was to be placed in them, and it was not required that women and children should dwell in them, but only men. Tradition interpreted the word dwell to mean taking at least two meals a day in them. (2) The singular manner in which the sacrifices were arranged (Num. xxix. 13–38). There was offered daily a kid for a sin-offering, with two rams and fourteen lambs for a burnt-offering; but besides this there was a further burnt-offering of bullocks, thirteen on the first day, twelve on the second, and so on diminishing by one on each successive day, until only seven were offered on the seventh day. On the eighth day the sacrifices were a goat for a sin-offering, one bullock, one ram, and seven lambs for a burnt-offering. The Law required that at the feast of tabernacles in the sabbatical year the Law should be publicly read to the whole people, men, women, and children.

Two other customs arose at an early date: (1) One of the priests drew water in a golden pitcher from the Pool of Siloam, and brought it through the water-gate of the temple to the altar. As he entered, the trumpets sounded. Then, just before the offering of the sacrifices, the water was poured upon the altar, amid the joyous chanting of Ps. cxviii. on the part of the great concourse of people, in holiday attire and carrying *lulabs* or green branches tied together. So great was the joyousness of the occasion that it became a rabbinical proverb, "He has never seen joy who has not seen the joy of the pouring out of the water of Siloam." To this custom allusion is made in John vii. 37, 38. In the evening of the day of "holy convocation" the men and women assembled in the courts of the temple expressly to rejoice over the drawing of the water of Siloam in the morning, and gave themselves up to unrestrained hilarity. (2) On this occasion two great lights were set up in the court, each consisting of four lamps, the oil for which was supplied by the sons of the priests, and the wicks made of cast-off priestly garments. The light is said to have reached over nearly the whole city. The passage John viii. 12 is supposed to allude to this light. Revised by S. M. Jackson.

**Tabernæmonta'na**: See Cow-trees and Forbidden Fruit.

**Ta'bes Dorsa'lis**, or **Locomotor Ataxia** [*tabes dorsalis* is Lat., liter., a wasting away (*tabes*) in the back; *locomotor ataxia* is in-coördination of movements; Mod. Lat. *locomotor* (Lat. *locus*, place + *motor*, a mover) + Gr. ἀταξία, disorder (ἀ-, not + adjec. τακτός, deriv. of τάσσειν, arrange)]: a chronic affection of the posterior columns of the spinal cord, characterized by in-coördination, sensory and nutritive disturbances, and a loss of the light reflex of the pupil. It is a disease of middle life, and is much more frequent in men than women. While syphilis is the most frequent cause, sexual excess, overwork with exposure, and possibly even injury may produce it. Alcoholism alone exerts but little causative influence. The disease usually begins with attacks of violent, stabbing pains in the legs, coming on suddenly and lasting only for a moment, recurring for months before the onset of other symptoms, and usually diagnosed as rheumatic. On examination the knee jerks are found to be absent, and later the superficial reflexes also disappear. The pupils are small, and while still contracting on accommodation cease to do so when exposed to light. This condition is called the Argyle-Robertson pupil. Optic atrophy may be present. Later the characteristic gait due to in-coördination appears. The foot is raised too high, is thrown violently forward, and the entire sole touches the floor at once. Walking is made much more difficult by closure of the eyes, and on attempting to stand with the feet close together and the eyes shut the whole body sways sometimes so violently as to throw the patient to the floor (Romberg's symptom). The gait greatly resembles that of a drunken man. In-coördination is also present in the hands. On trying to touch the nose or ear with the finger, the eyes being closed, it goes wide of the mark. It is difficult for the patient to button or unbutton his clothes, and to pick up small objects without the aid of vision. There is no true palsy, but simply this inability to direct muscular effort, until late in the disease. Sensation is delayed, sometimes ten seconds elapsing between a touch and its recognition. The ability to localize sensation may be lost. There are spots of anæsthesia. The patient often feels as if walking on wool. Numbness and tingling occur in the hands and feet. Often a tight band is felt around the body. Attacks of violent pain in the stomach, with vomiting (gastric crises), are frequent. Laryngeal crises are characterized by noisy inspiration, dyspnœa, and cough. Infrequently there are crises in other organs. There is apt to be difficulty in micturition. Sexual power is entirely lost. Trophic changes occur. The most frequent are perforating ulcer of the foot, skin eruptions, changes in the larger joints characterized by erosion of the cartilages and effusion into the joint cavity, and brittleness of the bones rendering them peculiarly liable to fracture. The disease extends over many years. Death usually results from some intercurrent affection. While locomotor ataxia never causes disease of the mind, one form of insanity (general paralysis) occasionally begins with identical spinal symptoms. Fully developed locomotor ataxia is incurable, but treatment may benefit and for a time even stay the progress of its course. Pathologically tabes dorsalis is a sclerosis of the posterior columns of the spinal cord, with involvement of the posterior nerve-roots, the meninges, and sometimes a peripheral neuritis. William Pepper and C. W. Burr.

**Table-land**: See Plateau.

**Tables**: See Furniture.

**Taboo'**, or **Tabu** [from Polynesian (Marquesas islands), *tapu*, forbidden, (as noun) taboo]: a Polynesian interdict which makes persons, places, or things sacred, so that certain persons can not touch or come near them without becoming defiled and outlawed. The system of taboo penetrates the whole social life of most of the unchristianized Polynesian islands, and is a powerful agent in the hands of chiefs and priests in controlling the people.

**Tabor**, Mount [*Tabor* is from Heb. *Tābōr*, liter., lofty place (or perhaps stone quarry)]: an insulated mountain of Northern Palestine, in Galilee, 6 miles S. E. of Nazareth, rising 1,053 feet above the plain and 2,018 feet above the sea, and commanding a large and beautiful view of the surrounding country. It is often mentioned in the Old Testament, and was from the fourth century generally regarded as the scene of the transfiguration of Christ, although it is now known that at the time when that event took place its summit was occupied by a fortified town.

Revised by M. W. Harrington.

**Tabor College**: a coeducational institution at Tabor, Fremont co., Ia.; incorporated under the name of Tabor Literary Institute in 1854 and reincorporated under the name of Tabor College in July, 1866. It is an outgrowth of a colony of Congregationalists from Oberlin, O., who formed the settlement at Tabor in 1852. Many citizens of Tabor gave largely of their property to the institution at the opening of the college department. The first nineteen donors gave in cash and notes 60 per cent. of the assessed value of their property. An academy was opened in 1857, and a college department in 1866. Tabor College includes classical, scientific, and literary courses of study of four years each, also a preparatory academy, an English course of four years, a conservatory of music, and a department of fine arts. The entire number of students in 1900 was 178. Rev. William M. Brooks, D. D., was principal of the academy and first president of the college; he was succeeded in 1896 by the Rev. Richard C. Hughes. Tabor College has five buildings, 13 acres of land, a library of over 12,000 volumes, and a cabinet of 12,000 specimens. The property is valued at $160,000. The number of students from the first exceeds 3,000. The faculty consists of 8 professors and 5 instructors, besides a number of assistants. William M. Brooks.

**Ta'borites** [from *Tabor*, one of their strongholds, 65 miles S. of Prague]: the radical wing of the Hussites (*q. v.*) organized in 1420 under Ziska. They opposed the Calixtines or Utraquists, no less than the Romanists, and waged long defensive wars. They finally took the name of BOHEMIAN BRETHREN (*q. v.*).

**Tabriz**, or **Tabreez**, tāā-breez′: capital of the province of Azerbijan, Persia; 40 miles E. of Lake Urumeyah (see map of Persia and Arabia, ref. 1–F). It is in the midst of a fertile and well-cultivated plain, where there are many orchards and vineyards. The city itself is surrounded by gardens that are irrigated by the adjacent streams. It is poorly built, with crooked, narrow, and dirty streets and no important public edifices, except the remains of the Blue Mosque, a marvel of Eastern architecture and decorative art that was destroyed by the earthquake of 1780, and the ark citadel, containing the palace of the heir-apparent. Its bazaars are mean buildings, but extensive, and there are important manufactures of silk, arms, shawls, tobacco, and leather, and a large transit trade. Though a Persian tradition tells us that Tabriz was built by Zobeida, the wife of Harun-al-Rashid, the town was known in antiquity under the name of *Gazaca*, and was the capital of the Median province, Atropatene. Marco Polo visited it about 1293. It has suffered severely by fire, earthquake, and by the invasions of Turks. Pop. estimated at 180,000.

Revised by M. W. HARRINGTON.

**Tabu**: See TABOO.

**Tabula′ta**: a name formerly given certain corals, both recent and fossil, from the fact that the pits (calyces) in which the animals lived are divided by transverse partitions or tables. The group is an unnatural one, some of the forms belonging to the *Hydrozoa*, the others to the *Scyphozoa*.

**Tac′ahout**, or **Mahu**: a nutgall which grows on a tamarisk (*Tamariscus indicus*). It is valuable as a prolific source of gallic acid. Large quantities are exported from India and Barbary.

**Tac′amahac**: the resin of various trees (1) of *Fagara octandra*, a tree of Curaçoa and Venezuela; (2) of the buds of the balsam-poplar, which grows in the U. S. (*Populus balsamifera*); (3) of *Calophyllum calaba*, *C. inophyllum*, and *C. tacamahaca*, Old World tropical trees, producing East Indian tacamahac; (4) the Mexican COPAL (*q. v.*). These articles are sometimes used in medicine; all but the second are employed in varnishes, incense, etc.

Revised by CHARLES E. BESSEY.

**Taché**, tāā′shā′, Sir ÉTIENNE PASCHAL: statesman; b. at St. Thomas, Quebec, Canada, Sept. 5, 1795; d. there July 29, 1865. He served in the war of 1812; studied medicine and practiced as a physician till 1841, when he entered Parliament; was commissioner of public works 1848–49; Speaker of the Legislative Council 1856–57, and was knighted in 1858. He wrote *Du développement de la force physique chez l'homme* (Montreal, 1829) and *Réflexions sur l'organisation des volontaires* (Quebec, 1863).—His son, JOSEPH CHARLES, author, b. at Kamouraska, Quebec, Dec. 24, 1820, graduated as a physician in 1844; was a member of the Legislative Council 1847–57; represented Canada at the Paris Exposition in 1855; at that in London in 1867, and was British delegate from Canada at the international sanitary conference at Washington in 1881. He wrote *Esquisse sur le Canada* (Paris, 1855); *Tenure seigneuriale en Canada* (Quebec, 1854); *La pléiade rouge* (1854); *Trois légendes de mon pays*; *Forestiers et voyageurs*, and other works.—Another son, ALEXANDRE ANTOINE, Roman Catholic archbishop, b. at Rivière-du-Loup, Quebec, July 23, 1823, graduated at the College of St. Hyacinth; studied theology at the Seminary of Montreal, and became a monk of the Oblate order. He served as a missionary among the Indians of the Red River country; was ordained a priest in 1845; consecrated Bishop of Arath *in partibus* in 1850; Bishop of St. Boniface in 1863, and in 1871, when St. Boniface was erected into a metropolitan see, Bishop Taché was appointed the first archbishop. While attending the council of the Vatican at Rome in 1869, the Canadian Government begged him to return and use his influence with the Métis of Manitoba, who were in a state of insurrection. He returned at once, and, empowered by the British and Dominion Governments to offer full pardon to the rebellious Métis, helped materially to restore peace and allay disaffection. D. at Winnipeg, Manitoba, June 22, 1894. He was the author of *Vingt années de missions dans le nord-ouest de l'Amérique* (Montreal, 1866); *Esquisse sur le nord-ouest de l'Amérique* (1869), and other works.

NEIL MACDONALD.

**Tachycar′dia**: See HEART DISEASE.

**Tachyglos′sidæ** [Mod. Lat., named from *Tachyglos′sus*, the typical genus; Gr. ταχύς, swift + γλῶσσα, tongue]: a family of Australasian mammals of the order *Monotremata*, represented by the so-called hedgehogs, which must not be confounded with the hedgehogs of Europe. *Echidna*, a name often used, is preoccupied in zoölogy. The face and jaws are produced into a long and tubular snout, at the end of which is the small mouth; teeth are entirely wanting, but on the palate are robust horny spines, pointing backward; the tongue is subcylindrical, and very long, flexible, and protractile, and armed with numerous horny warts; the surface of the body and head above and on the sides is armed with long, stout, tapering, and pointed spines, intermingled with coarse hair, and below is clothed chiefly with simple coarse hair; the limbs are short and robust, each provided with five toes; the males are provided with horny spurs to the hind feet; the tail is rudimentary. The *Tachyglossus* attains a length of about 18 inches, but the *Zaglossus* of New Guinea is much larger. They feed chiefly on ants and other small insects, as is indicated by the small mouth and extensible tongue, but sometimes take in grass. The ants are chiefly sought for by digging, for which the animals are eminently adapted. "In soft alluvial soil or sand an echidna will disappear before the observer's eyes, apparently without any effort, gradually sinking out of sight." (*Krefft.*) Like their relatives, the duckbills, they develop eggs of large size, compared with those of other mammals; but, instead of "laying" two, as the duckbill does, the female matures a single one, which is carried about in a pouch formed by a fold of the skin, somewhat like the pouch, or "marsupium," of an opossum and other marsupials. As to the species, differences of opinion prevail. Until recently only one was generally recognized. There are two very distinct genera, (1) *Tachyglossus* or *Echidna*, and (2) *Zaglossus*, *Acanthoglossus*, or *Proechidna*. Of the former, three closely related modifications (species or subspecies) exist—one in Australia, one in Tasmania, and one in New Guinea, known respectively as *E. aculeata*, *E. setosa*, and *E. lawesi*; and of the latter, two in New Guinea, *P. bruijni* and *P. nigro-aculeata*.

Revised by F. A. LUCAS.

**Tachyg′raphy**: See STENOGRAPHY.

**Tachypet′idæ** [Mod. Lat., named from *Tachy′petes*, the typical genus; Gr. ταχύς, swift + πέτεσθαι, fly]: a family of birds represented by the frigate bird or man-of-war of mariners. The form is somewhat the same as that of pelicans, but the neck is shorter, and the anterior position of the legs imparts to the bird a peculiar appearance; the bill is longer than the head, rather slender, and contracted toward the middle, and nearly straight, but with the end strongly hooked; its sheath is composite or grooved, as in all the *Pygopodes*; the edges are entire; the wings are very long and pointed; the tail is also very long, is very deeply forked, and has twelve feathers; the legs are inserted unusually far forward, and are small; the tarsus being, proportionally, the smallest in the entire class of birds; the toes are slender, and the web between them deeply indented. The sternum is small and short, the coracoids long, the furcula ankylosed with the sternum and coracoid. The family belongs to the same group (*Steganopodes*) with the *Phæthontidæ* (tropic-birds), *Plotidæ* (snake-birds), *Phalacrocoracidæ* (cormorants), *Pelecanidæ* (pelicans), and *Sulidæ* (gannets). As to habits of species, see FRIGATE BIRD.

Revised by F. A. LUCAS.

**Tac′itus**, MARCUS CLAUDIUS: Roman emperor 275–276; b. at Interamna (Terni), in Umbria, about 200 A. D.; was noted as one of the oldest senators and one of the wealthiest citizens when the senate, on the death of Aurelian, elected him emperor. He was a man of upright and pure character and of literary tastes, claiming descent from the distinguished historian whose name he bore. It was his ambition to reinstate the senate in its former authority, improve the morals of the people, and check the confusion in public affairs. He waged a successful war with the Alani, but died soon afterward at Tarsus or Tyana, in Asia Minor. According to some authorities he was murdered by his soldiers.

F. M. COLBY.

**Tacitus**, PUBLIUS CORNELIUS: author; b. about 54 A. D. His birthplace is not known; in some MSS. and by Sulpicius Apollinaris he is called Gaius, but the prænomen Publius is established by a Greek inscription found at Mylasa, first published in 1890, which also proves that late in life he was proconsul of Asia. He married a daughter of C. Julius

Agricola in 77 A. D.; was prætor in 88; consul suffectus in 98, and probably survived Trajan, who died in 117. He had already acquired great reputation as an orator when Pliny entered public life. They became intimate friends. Of Pliny's letters, eleven are addressed to him, and it is apparent that his friendship was considered by Pliny as a distinction. As an author he was much appreciated by his contemporaries, as well as by the writers of the following century. The Emperor Tacitus claimed relationship to him, and ordered his works to be placed in all public libraries, and ten copies to be made every year at the public expense and deposited in the archives. During the latter part of the Roman epoch and during the Middle Ages he was not much read, and most of his works have been handed down only in a mutilated and corrupted form. The dialogue *De Oratoribus* is his earliest work; its authenticity has been denied by some scholars, but is generally accepted. The *Agricola*, a biography of his father-in-law, is an artistic masterpiece, and of special interest on account of the fact that Agricola spent so much of his time in Britain. The *Germania* or *De Situ ac populis Germaniæ* is an ethnographical-geographical work, of the greatest value for its description of early Germany. Some scholars look upon it as a political pamphlet or as serving a moral purpose. Of his *Historiæ*, written before the *Annales*, only the first four and a half books are extant, giving the history of the years 69–70 A. D. Of the *Annales*, beginning at the death of Augustus—hence the proper title *ab excessu divi Augusti*—and ending at the death of Nero, 14–68 A. D., only the first four books, part of the fifth, the sixth, and from the middle of the eleventh to the middle of the sixteenth, are extant. The style of these writings is very peculiar. To the common reader it is harsh and obscure, yet at the same time exceedingly powerful. Scholars who are familiar with the author generally admire not only the intellectual and moral, but also the literary character which these works show. Editions by Bekker (Leipzig, (1831), Orelli (Zurich, 1846 and 1848, and revised by other scholars 1859, and Berlin, 1877), Ritter (1848), and Halm (1884). Of the *Annales*, Nipperdey-Andresen (Berlin, 1892); *Germania*, Zernial (Berlin, 1890); *Agricola* and *Germania*, Hopkins (Boston, 1893); *Dialogus*, Andresen (Leipzig, 1891); A. Gudeman (Boston, 1894); *Histories*, Spooner (London, 1891); *Annales*, Furneaux (vol. i., 1884; vol. ii., 1892, Oxford). English translations by Gordon (1728–31), by Murphy (1793), and by Church and Brodribb (London, 1876–77). Revised by M. WARREN.

**Tacking**: a doctrine of English equity whereby a subsequent mortgagee or incumbrancer for value is allowed on discovering the existence of intervening incumbrances, of which he was ignorant when he advanced his money, to purchase the first mortgage and compel the intervening incumbrancers to pay off not only the first mortgage, but also his own incumbrance under penalty of losing the property by a foreclosure. This inequitable doctrine of English equity, by which a subsequent incumbrancer is enabled to "squeeze out" intervening incumbrancers, is an unjustifiable exception to the rule that as between conflicting but equal equities that which is prior in point of time prevails, and has found no acceptance in the U. S. WILLIAM A. KEENER.

**Tacking and Wearing**: the common methods of working a vessel from one tack to the other; they differ in that while in tacking the vessel turns toward, in wearing it turns from the wind. Square-rigged vessels when close-hauled lie within about six points of the wind; fore-and-aft rigged vessels lie a point or two higher; therefore, in tacking a ship turns through twelve and in wearing through twenty points of the compass. A vessel wears when, through high winds or heavy weather, or some other reason, tacking is impracticable. If in tacking a vessel comes up into the wind and lies there, it is said to be *in irons*; it may then by shifting the helm be made to fall off on the other tack when stern-board is gathered, otherwise it may be boxed off on the same tack. See BOX-HAULING. CHARLES BELKNAP.

**Tac'na**: the northernmost province (provisionally) of Chili, bordering on Peru, Bolivia, the Chilian province of Tarapacá, and the Pacific. Area, 8,686 sq. miles. The Andes on the E. separate it from Bolivia, and there is a coast range rising in parts to 3,000 feet. Most of the intermediate space is a rainless desert; but this is crossed by the valleys of several streams, and wherever they afford sufficient moisture the land is well fitted for cultivation. The streams are scanty and intermittent, and there is no good system of irrigation. Some of the valleys are insalubrious, and the climate everywhere is hot; earthquakes are frequent. Silver, copper, etc., occur, but are mined only on a small scale. A portion of the commerce of Bolivia passes through Tacna, but railways are rapidly drawing it into other channels. The scanty population (24,160 in 1895) is nearly all gathered at Tacna, the port of Arica, and two or three other points. Tacna is divided into the departments of Tacna and Arica. Formerly these were provinces of the Peruvian department of Moquegua. They were occupied by the Chilians, after several battles, in 1880. By one of the clauses of the treaty of peace between Chili and Peru, ratified Mar. 31, 1884, it was agreed that the former republic should hold Tacna and Arica for ten years; at the end of that time the people of the territory so held to decide, by a popular vote, which country they will belong to; the country so chosen to pay $10,000,000 to the other. This decision should have been made in Mar., 1894. Owing to the disturbed state of Peru, and to financial difficulties in both republics the question has been postponed, and is still (1897) unsettled. HERBERT H. SMITH.

**Tacna**: capital of the province of Tacna, Chili; in a fertile valley near the western base of the Andes; 48 miles by railway from its port, Arica (see map of South America, 6–C). The plain is irrigated from the little river Tacna. The town is well built, has a seminary, hospital, and small theater, and a fine public promenade. The water-supply is scanty and bad. Tacna has many foreign merchants, who control the trade with Bolivia across the Andes. Formerly this was very important, and it is still considerable. During the first year of the war of the Pacific (1879), Tacna was the principal post of the allied armies of Peru and Bolivia. Here, on May 27, 1880, they were defeated by the Chilians, under Gen. Baquedano, abandoning the town and, soon after, the province. Pop. (1895) 9,418. H. H. S.

**Taco'ma** [from the Indian name for Mt. Tacoma or Mt. Rainier]: city; seaport; capital of Pierce co., Wash.; on Commencement Bay, the Puyallup river, the N. Pac., the Tac., Lake Park and Columbia Riv., and the Tac. and Eastern railways; 25 miles N. E. of Olympia, and 41 miles S. of Seattle (see map of Washington, ref. 4–D). It is on the western shore of Commencement Bay, on the east side and near the southern extremity of Puget Sound. The Puyallup river empties into the bay within the city limits, and aids in making a fine natural harbor, and the shipping facilities and regulations are excellent.

*Plan and General Appearance.*—Most of the manufacturing and railway industries are in the eastern part, on or about the level tide-flats at the head of the bay. The business and residence portions are on a bluff 80 feet above the water, on ground rising gradually to 320 feet, to a level plateau, over which the city is spreading. The principal streets are 100 feet wide, and the others 80 feet. The surrounding waters, forests, and snow-capped mountains are of unusual grandeur, with the Olympic or Coast Range in the west and the Cascade Range in the east; Mt. Tacoma (by some called Mt. Rainier) rises to a height of over 14,526 feet. Wright Park, containing 40 acres, and Point Defiance Park, 662 acres, are the principal parks. The region immediately S. of the city, interspersed with numerous lakes, is a park land of much beauty. The city owns the water and electric-light plants, on which have been expended about $2,000,000; cable and electric street-car lines reach all sections of the city and several suburban resorts and other towns. There are about 120 miles of graded streets, and 60 miles of sewers. Notable buildings include the county court-house, city-hall, Tacoma hotel, the offices of the Northern Pacific Railroad, Tacoma theater, Union Club, Carnegie Library, and the Chamber of Commerce.

*Churches, Schools, and Charities.*—The church organizations are divided denominationally as follows: 15 Methodist Episcopal, 8 Presbyterian, 8 Lutheran, 7 Protestant Episcopal, 6 Congregational, 6 Baptist, 5 Roman Catholic, 2 Christian, 2 Christian Science, 2 Salvation Army, and 1 each Adventist, German Evangelical, United Presbyterian, Scandinavian Free Evangelical, Spiritualist, Jewish, and Universalist, besides the First Free Church of Universal Religion. The aggregate membership of the churches is about 10,000. The public schools embrace a high school, with a manual-training department, and grammar and primary schools, occupying twenty buildings (cost, with their sites, nearly $1,000,000); daily attendance of pupils, about 8,000; teachers employed, 145; annual cost of maintenance, over $245,000. There are 16 private schools, academies, and business colleges, the most prominent institutions being the Annie Wright Seminary (Episcopal) for girls, Whitworth College (Presbyterian), the Pacific University (Lutheran), the Puget Sound University (Methodist), Vashon College (non-sectarian), and the Roman Catholic parochial schools. The city and other public libraries, Carnegie Library, in course of erection (donation, $75,000), the Ferry Museum of Art, and kindred organizations add to the educational advantages. The charitable organizations and institutions are the Associated Charities, City and County Hospital, Fanny Paddock Memorial Hospital, St. Joseph's Hospital, Grand Army Relief, Children's Home, Seaman's Friend Society, and numerous charities connected with the churches and secret societies. The Washington State Asylum for the Insane is 8 miles S.

*Finance and Banking.*—The assessed valuation in 1900 was $22,549,000, and the bonded indebtedness Jan., 1900, $3,750,000. There are 7 banks—2 national, 3 State, 1 savings, 1 foreign branch (London) banks. A clearing-house was organized in 1889.

*Business Interests.*—In 1881 a cargo of wheat valued at $51,000 was shipped from Tacoma to Liverpool in an American bottom. Since then there has grown an ocean commerce which in 1900 aggregated $15,545,497 in exports to foreign countries, composed of wheat, flour, coal, lumber, canned salmon, and miscellaneous merchandise; and the imports—mostly from China and Japan—amounted to more than $12,000,000. The coastwise shipping to and from this harbor is extensive. About $12,000,000 is invested in manufacturing industries. The plants include car-shops (cost $1,500,000), in which about 800 men are regularly employed, and several sawmills with a capacity of 1,150,000 feet per day, employing about 2,000 men. Over 3,000 persons are employed in other works, such as box-factories, breweries, rolling-mills, foundries, machine-shops, shipyards, smelters, packing-houses, match-factories, furniture-factories, planing-mills, brickyards, wheat elevators, warehouses, flour-mills, and shingle-factories. The value of the wholesale and jobbing trade is about $18,000,000 per annum. Having a transpacific steamship line to the Orient, stopping at Yokohama and Hongkong, a clipper-ship line to South Africa, steamship connection with Alaska and Pacific coast ports, a steamship line to Manila and London viâ Suez Canal, also one to Vladivostock, and railway connections with all parts of the U. S., Tacoma is one of the most important shipping and distributing points on the Pacific coast.

*History.*—Tacoma City, now the first ward and popularly called Old Town, was laid out in 1868 by Gen. M. M. McCarver. On July 14, 1873, the Northern Pacific Railroad Company established its Pacific terminus on Commencement Bay, naming it New Tacoma; in 1880 the town became the county-seat; and in 1883 the two towns were consolidated as Tacoma. Pop. (1880) 720; (1890) 36,000; (1900) 37,714.

Revised by A. E. GRAFTON.

**Tacoma**, MOUNT: See RAINIER, MOUNT.

**Tacon'ic**, or **Taghkanic**: a range of mountains extending nearly N. and S. along the eastern boundary of New York, and uniting the Green Mountains of Western Massachusetts with the Highlands of the Hudson. Its highest peaks are Equinox Mountain in Vermont, 3,847 feet, and Greylock in Massachusetts, 3,305 feet.

**Taconic System**: in geology, a group of strata in Western Massachusetts and Vermont and Eastern New York, representing the Cambrian period. The system was named by Prof. Ebenezer Emmons in 1842, and further described and defined in subsequent papers. It was asserted by some of his contemporaries that these rocks are not pre-Potsdam, as claimed by him, but are the metamorphosed equivalents of formations of the New York system. The discussion of this question, known as the Taconic controversy, was animated and bitter, and its literature is voluminous. In later years it has been claimed by some geologists that Taconic should be substituted for Cambrian as the name of the first Paleozoic period, and this contention has been warmly sustained, though having little influence on usage. The question turns partly on the facts of history, and partly on the extent to which and manner in which the law of priority should be applied in questions of stratigraphic nomenclature. See CAMBRIAN PERIOD and GEOLOGY, and consult E. Emmons, *Geology of New York*, part ii. (1842); *The Taconic System* (1844); *American Geology* (1855); J. D. Dana, *A Brief History of Taconic Ideas* (*Am. Jour. Sci.*, 3d series, vol. xxxvi., 1888); *List of Papers on the Taconic System* (*Am. Jour. Sci.*, 3d series, vol. xix., 1880); J. Marcou, *On the Use of the Name Taconic* (*Proc. Boston Soc. Nat. Hist.*, vol. xxiii., 1887); N. H. Winchell, *Some Objections to the Term Taconic Considered* (*Am. Geol.*, vol. i., 1888); C. D. Walcott, *Taconic System of Emmons* (*Am. Jour. Sci.*, 3d series, vol. xxxv., 1888).

G. K. GILBERT.

**Tactics** [plur. of *tactic*, from Gr. *τακτικός*, pertaining to arrangement, especially to military arrangement, deriv. of *τακτός*, drawn up, deriv. of *τάσσειν*, arrange, draw up (troops). Cf. Gr. *ἡ τακτική* (sc. *τέχνη*, art), and *τὰ τακτικά*, tactics]: the art of drawing up military or naval forces in order of battle and of performing military or naval evolutions. It may be treated conveniently under two heads:

MILITARY TACTICS.—This is the art of so handling bodies of troops, large or small, as to utilize to the fullest extent the fighting, manœuvering, and resisting capacity of every individual, weapon, and resource of all arms of the service. When applied to the combined action of larger masses made up of different arms, on the field of battle, it is called grand tactics. When restricted to actions of small bodies or single arms it is called minor tactics. The two divisions run imperceptibly into each other.

*Minor tactics* include as one of their branches drill-regulations, or drill, formerly called in the U. S. by the general name of tactics. The object of drill is (1) to enable the commanding officer to place each and every soldier on the spot he is to occupy, in any desired formation, in the most rapid manner consistent with complete control of the men at all stages of the movement; (2) to enable the soldier to use his weapon in the most effective way in action, and to carry it with the least fatigue when marching; (3) to execute properly formations and movements of ceremony, such as parades, reviews, etc., which are necessary to preserve the pride of the soldier in his own appearance and that of his command. The accomplishment of these objects requires that drill-regulations should be devised with a view to simplicity and ease in learning, and fitness for handling troops, not only with full ranks, but also when their smallest subdivisions have been cut up and made of different sizes by the casualties of action. The field of minor tactics has been so extended as to embrace the subjects of information and security, including outposts, reconnoissance, and the handling of advance and rear guards; marches, instruction of the three arms in all that refers to the use of their weapons, and their employment upon the field of battle. In the latter respect sometimes it encroaches upon that of grand tactics.

The minor tactics of the different arms must conform to the changes and improvements in weapons. These require corresponding changes in formations, etc. The prime factor in these changes has been the weapon of the infantry; the vast improvements which have been made in cannon have also had their effect, but since these improvements are more in greater accuracy at the longer ranges than in destructiveness at close quarters, their influence upon tactical manœuvers has been of the same kind and concurrent with that produced by the increased range of the infantry weapon.

The most marked changes which result from the increased range and accuracy are forcing the enemy to deploy and open fire at much greater distance than formerly, enlarging very much the area covered by the effective fire of a battery, thus necessitating fewer changes in its position and giving a larger latitude in its selection. They also allow the artillery to open the combat at a distance from the enemy which can be traversed by him only with such losses and in such time that the artillery may safely march at the head of a column, open fire, and receive support before it is endangered by the approach of the enemy; and this advantage is gained without the loss of its effective fire at short range, which it may use in assisting the infantry in close action as formerly.

The correct tactical use of artillery requires the concentration of its fire upon properly selected targets, and the modern improvements have added largely to its efficiency by facilitating this; while the great distance at which a destructive fire can be poured upon a body of cavalry, by both artillery and infantry, has almost entirely changed the tactical use of mounted troops on the field of battle, narrowly limiting the opportunities for a successful charge upon infantry or artillery in position.

The changes made since the time of the Romans in the arms and equipments of the cavalryman, as distinguished from the dragoon or mounted infantryman, have reduced themselves almost entirely to the addition of the revolver and the abolition of body-armor. The first adds somewhat to his aggressive value, while the second is the direct result of the improvement in the infantry weapon. This alteration in equipment has, however, introduced no material change in the tactics of combat of bodies of men fighting mounted, the detailed regulations and instructions for which in the most modern treatises correspond in every respect with the methods used by the cavalry of the Romans. The most marked change in the organization and the tactics of modern cavalry is the conversion of all mounted troops into dragoons, armed with a rifle or carbine, and trained to fight on foot or mounted as necessity determines; or even in some cases into mounted infantry who use their horses for transportation only and fight altogether on foot. In recent operations cavalry has been used as a veil or screen, to cover the advance of the rest of the army, to a much greater extent than it was formerly, although cavalry has frequently been used in this way in times past; a notable instance being Napoleon's use of Murat in his advance upon Ulm in 1805. Scouting, reconnoissances, and map-making have become a most important part of the duties of cavalry, and instruction in the methods used in the field form an important part of the tactical instruction of the trooper and his officers.

The modern minor tactics of infantry, in order to fulfill the requirements laid down in the definition above given, are designed with a view to beginning an action with a dispersed skirmishing line, in which the front of each battalion or company is covered by its own men, who are re-enforced and strengthened by their own comrades and commanded by their own officers, thus avoiding the disorganization resulting from mingling different commands on the front line of battle. In attempting to accomplish this, great prominence is necessarily given to the advance of successive lines in open order, which, by short rushes and by taking advantage of all possible cover, may diminish as much as possible the losses caused by modern small-arms and machine-guns, and at the same time collect for the final charge a strong line of companies and battalions. It is not to be expected that any single method will be approved by all military men, but each of the great nations has a system which, under the constant supervision and study of its officers, is modified as new developments are made in weapons and new lessons learned from experience in war.

*Grand tactics* includes planning battles, perfecting the preliminary arrangements, conducting them during their progress, and securing the results of victory or avoiding the consequences of defeat. It is concerned generally with the action of the several arms in combination on or in the immediate vicinity of the battle-field; but it reaches out on the one hand into the domain of logistics and strategy in the movement of troops and the character of battle sought, and on the other into that of minor tactics in the handling and placing of the different arms upon the field. It is essentially the province of generals, and one in which they should have full and unrestricted command, as success or failure almost invariably results from the character of the position selected, the manner in which the troops are placed, and the instant at which the different bodies are brought into action. These questions can be decided only by the commander present on the field and as they arise.

Battles are usually preceded and followed by minor actions, classed as combats, skirmishes, etc., which are generally not intended to be decisive, but arise between detached parts of the main army, and which may cease without marked effect or may be continued and finally merge into the general battle. Battles are classed as offensive, defensive, and defensive-offensive, the latter name being applied to those actions in which the attack having exhausted its strength, the defense takes the offensive to gain the victory. In great battles the fighting is not carried on in the same manner at all points of the line. False attacks and demonstrations of the class known as "containing movements" are made at some parts of the line, while the strength of the attack is concentrated at another, thus "making one's self stronger than the enemy at the time and place of actual conflict," which is the guiding principle in all the operations of the art of war, and is the very soul of success in battles.

It is this principle which, by overshadowing all others, has led to the statement that "the rules of tactics are invariable and are the same now as they were in the time of Alexander." This is true only of grand tactics.

In open battle it is evident that the application of the above-given principle is most easily made by the offensive, which also generally develops the enthusiasm of the men and, in case of success, will usually render the result decisive. History shows that success has generally attended the aggressive leader when other things were equal; but when an army is weak in men, in training, or in morale, its leader can only seek to give it superior strength in actual conflict by fighting a defensive battle in a well-selected position made strong by fortifications, against which the enemy may exhaust his superior strength.

Much has been written, with very little profit, upon the orders of battle, with their relative advantages. These so-called orders result, as a rule, from the natural features of the ground in the first position and from the development of the strong attack when the battle opens. Necessarily, if the lines remain in contact when one assumes a "convex order," the other must take up a "concave order," and *vice versa*; while the great and manifest advantages which result from an oblique attack upon one wing, by which it is rolled back and beaten in detail, are obtained either by overlapping it or by throwing against it a preponderating force. Any attempt to take up a geometrical "oblique order" would, as a rule, be at once seen by the enemy, who would take measures to meet it. The same is true of the other orders. The use of the terms, however, when properly understood, may be convenient in the description of battles, if too much weight be not given to them.

The works upon tactics are very numerous; see especially Home's *Précis of Modern Tactics* (London, 1878); Boguslawski, *Tactical Deductions from the War of 1870–71* (London, 1872); Clery, *Minor Tactics* (London, 1883); Shaw, *Modern Tactics* (London, 1884); Mayne, *Fire Tactics* (London, 1888); Meckel, *Éléments de la Tactique* (Paris, 1887); Clausewitz, *On War* (London, 1873); Jomini, *Art of War* (Philadelphia, 1877); Mercur, *Elements of the Art of War* (New York, 1894); Derrecagaix, *Modern War* (Washington, 1888). See also FORTIFICATION, STRATEGY, and WAR.

JAMES MERCUR.

NAVAL TACTICS.—The subject may be divided into grand tactics, or the tactics of battles, and elementary tactics, or the tactics of instruction. The history of naval tactics can very properly be separated into three grand divisions. The first, which may be called the oar period, begins where tradition merges into authentic history, and ends about the time of the battle of Lepanto (1571), covering a period of about 2,000 years. The second, or sail period, may be said to be embraced between Lepanto and the battle of Lissa (1866), lasting only 295 years, since which time there has been only the steam period, which is yet in its infancy. The sail period having completely passed away, and the tactics under oars being based upon the same general principles as steam tactics, the latter alone will be described.

The key to any system of naval tactics is the line of battle. If, in the line of battle, the vessels are all in line—or, as it was called in the tactics under sail, "line abreast" and heading toward the enemy—we have the line of battle of the oar period, when war-galleys were armed at the bow with a spur (rostrum), and depended for success in battle on ramming and sinking the galleys of the enemy or grappling and boarding him. This formation gives us also the line of battle of modern fighting ships when their principal offensive power lies in their rams. If, however, the power of the ship lies in her broadside (artillery placed on the side of the ship), it is obvious that such ship must present her broadside to the enemy, in which case the line of battle must be the "line ahead," or, as it is now properly called, in "column." In addition to the above, there are certain "orders" in which it is convenient for a fleet or squadron to navigate the sea, to go in and out of port, to anchor and to get under way. To change from one of these orders to another, or to change from any given order of steaming to the order of battle, constitutes elementary tactics. The disposition of the fleet for actual contact with the enemy under various conditions constitutes grand tactics. It was in the tactics of battle that Nelson's genius was most conspicuous. The following definitions have been adopted with a view to securing uniformity of movement in tactical evolutions: The coefficient of speed is the ratio between the number of revolutions per minute of the engines of a given ship and those of the flag-ship, when the speed of both is the same; the coefficients of helm are the ratios between the angles of a given ship's helm and those of the flag-ship's helm when describing the same circle.

*Fleet Tactics under Steam.*—An assembly of twelve or more line-of-battle ships, or vessels of equal military value, is called a *fleet*, and is separated into three divisions of one,

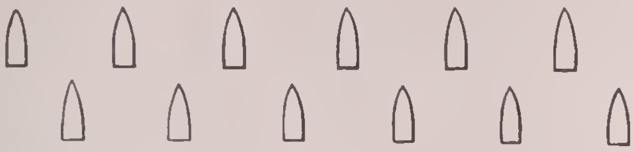

Fig. 1.

two, or three squadrons each, each squadron comprising not less than four vessels. The commander-in-chief commands the entire fleet; the second in command, the van division (or right when in line); the third, the rear division (or left when in line); and the fourth, the center.

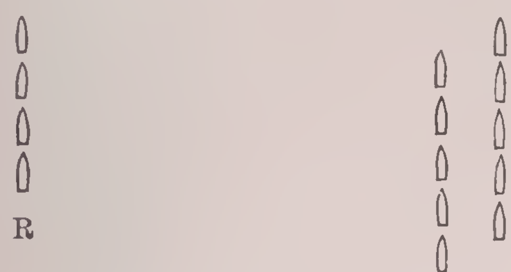

Fig. 2.

The line, the order of battle for line-of-battle ships, rams, and torpedo-vessels, is formed as in Fig. 1.

The column is the order of battle for vessels whose principal power is in their broadside batteries. (Fig. 2.)

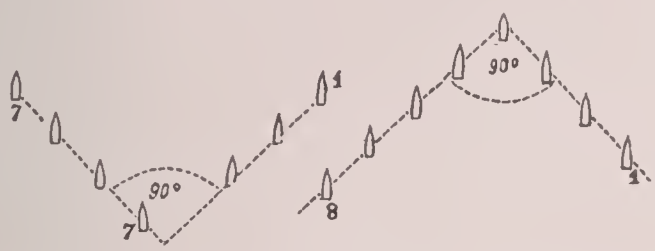

Fig. 3.

Double échelon orders are offensive (salient angle) and defensive (re-entrant angle) for vessels for all descriptions. (Fig. 3.)

Vessels are said to be in direct single échelon when, steering the same course, each bears from its next astern at an angle of 45° (four points) from the course; consequently the wings of a fleet in double échelon form a right angle. One vessel should always be designated by signal to act as guide, by which the movements of the other vessels are to be governed, and should wear a guide-flag at the main. When manœuvering, the vessel upon which a formation is made

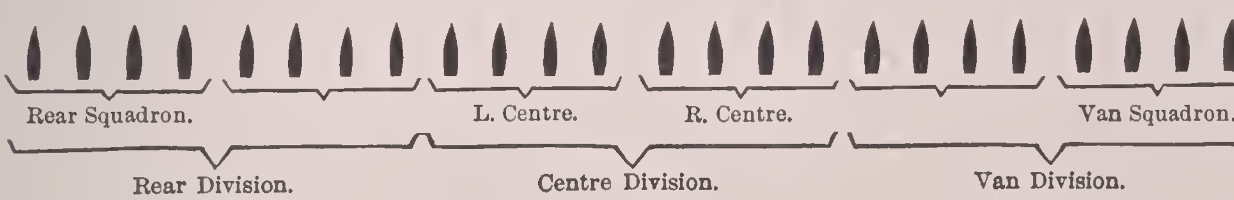

Fig. 4.

must necessarily be the guide. When the fleet is in line in natural order, the van squadron is on the right. (Fig. 4.) This was the line of battle formed by Callicratidas, the Spartan, at the battle of Arginusæ, his fleet being composed of 300 galleys. The fleet in column is in the natural order when the van squadron is leading.

Fig. 5 exhibits the fleet in column of squadrons, or of

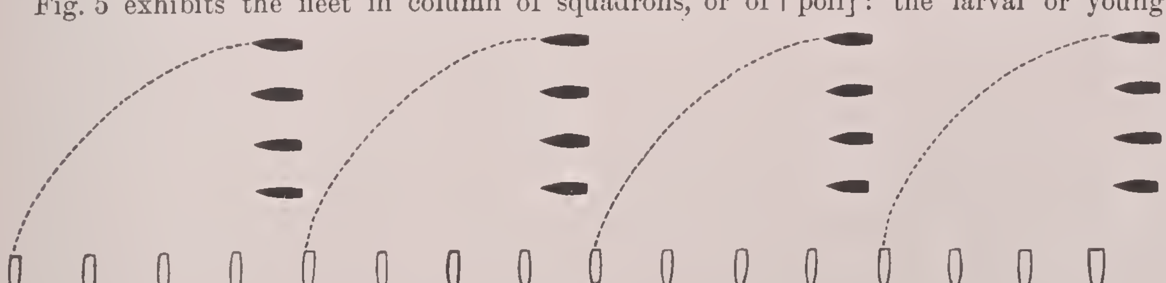

Fig. 5.

fours. Should Signal No. 319, By fours, left wheel, be made, each squadron on coming into line must find its place in the line without crowding or confusion. It was this evolution that was performed by Cnemus, commander of the Lacedæmonian fleet, in the battle in the Crisean Bay, when he engaged the force under Phormio, the skillful Athenian tactician, then guarding Naupactus, the modern Lepanto. These two illustrations show how closely the fleet tactics of the oar period resemble those of the steam period. The single line, as in Fig. 4, is easily shattered or doubled up. It should therefore be re-enforced as in Fig. 1.

Fig. 6.

As the single column may be broken and the rear ships cut off, it, too, should be re-enforced as in Fig. 2. In any case, there should be a reserve (R, Fig. 2), ready to succor any portion of the fleet that may need it.

A strong order of battle is the French *peloton* formation, for facility of manœuvering, affording mutual support, etc.

Fig. 7.

Three vessels act as a unit, and these *pelotons* may be formed in line (Fig. 6), in column (Fig. 7), or in échelon.

The simple orders are the line, column, and échelon; compound orders are those wherein the squadrons or divisions, considered as units, are ranged on one of the simple orders. See *Naval Tactics* (New York, 1859), by J. H. Ward, U. S. navy; *Fleet Tactics under Steam* (1863), by Com. F. A. Parker, U. S. navy; *Naval Warfare with Steam* (1832), by Sir Howard Douglas; *Tactique Navale*, and *Fleet Drill-book*, U. S. navy. S. B. Luce.

**Tacubaya**, tăă-kōō-baa'yăă: a town of the Federal District, Mexico, 3 miles S. W. of Mexico city (see map of Mexico, ref. 7–G). It is a fashionable suburb of the capital, and is associated with many episodes of the later history of the republic. The castle, military school, and observatory of Chapultepec (*q. v.*) are included in it. Pop. (1889) estimated, 12,000. H. H. S.

**Tacunga**: See Latacunga.

**Tadmor**, or **Thadmor**: See Palmyra.

**Tadousac'**: a summer resort in the united Chicoutimi and Saguenay Counties, Quebec, Canada; near the confluence of the Saguenay with the St. Lawrence, on a semicircular raised beach of sand (see map of Quebec, etc., ref. 2–E). Tadousac is the oldest village in Canada, having been a center of the fur-trade in early days. The Jesuits had a religious establishment here, of which only the traces of the foundation remain, and for a time it was the home of Father Marquette, the explorer of the Mississippi. It contains the oldest church edifice erected in Canada. From Tadousac to the Gulf the salmon and sea-trout fishing is unsurpassed. Pop. of district, 2,400. J. M. Harper.

**Tadpole** [Mod. Eng. *taddepol*; *tadde*, toad + *polle*, head, poll]: the larval or young stage of the frogs (*Ranidæ*), which is distinguished by the large head, compressed tapering tail, and (in the youngest stage) want of legs. The name is also applied to the corresponding stage in other amphibians and even to the larvæ of many ascidians, having a superficial resemblance to the tadpoles of frogs. See Batrachia, Frog, and Tunicata.

**Tael**, tāl [Portug., from Hindi *tola*, through Malay *tahil*, weight]: the name, in common use among foreigners in China and Hongkong, for the Chinese *liang* or ounce of fine silver, the monetary unit of reckoning there. It equals in weight $1\frac{1}{3}$ oz. avoirdupois. The haikwan tael is the standard recognized by the customs authorities. See China.

**Tænia**: See TAPEWORM.

**Tænioglos'sa** [from Gr. ταινία, ribbon + γλῶσσα, tongue]: a large group of molluscs. See MONOTOCARDIA.

**Taft**, ALPHONSO, LL. D.: jurist; b. at Townshend, Vt., Nov. 5, 1810; graduated at Yale, 1833, where he was afterward tutor and law student; was admitted to the bar 1838, and moved to Cincinnati, O., in 1840; judge of superior court of Cincinnati 1865–71; resigned and resumed practice of law; U. S. Secretary of War Mar. 8 to May 22, 1876; Attorney-General U. S. 1876–77; appointed envoy extraordinary and minister plenipotentiary of U. S. to Austria Apr. 26, 1882, and to Russia in 1884; resigned in Aug., 1885. D. at San Diego, Cal., May 21, 1891.

**Taft**, WILLIAM H.: See the Appendix.

**Taganrog'**: town; in the government of Ekaterinoslav, Russia; on the N. shore of the Sea of Azov, opposite and 18 miles W. of the mouth of the Don (see map of Russia, ref. 10–E). It was founded by Peter the Great, and was a favorite residence of Alexander I., who died here Dec. 1, 1825. Though its harbor is so shallow that ships must load half a mile from the shore, it carries on a large export trade in timber, hemp, copper, tar, wheat, and meat. Pop. (1897) 51,748. E. A. G.

**Taghkanic**: See TACONIC.

**Taglioni**, taa̤l-yo'nee: the name of a celebrated family of dancers and ballet-masters, of Italian origin, but principally connected with the royal theater of Berlin. The most illustrious member was MARIA TAGLIONI, b. in Stockholm, Apr. 23, 1804. She made her *début* in Vienna in 1822, danced subsequently in all the capitals of Europe, and created great enthusiasm, especially by her performance of the title-rôle in her father's ballet *La Sylphide*. She retired in 1847, and lived in Venice and at Lake Como. D. in Marseilles, Apr. 23, 1884.—Her brother, PAUL TAGLIONI, b. in Vienna, Jan. 12, 1808, was ballet-master in the royal theater of Berlin, and composed the ballets *Sardanapal*, *Satanella*, *Flick und Flock*, and others. D. in Berlin, Jan. 7, 1884.

**Ta'gus**: one of the principal rivers of Spain. It rises in the Sierra Albarracin, in lat. 40° 38′ N., lon. 1° 35′ W., flows mostly W. and S. W. through Spain and Portugal, and empties into the Atlantic at Lisbon, after a course of 566 miles. It is navigable 115 miles from its mouth.

**Tahiti**, taa̤-hee'tee, or **Otahei'te**: the largest of the SOCIETY ISLANDS (*q. v.*); in the Pacific Ocean, in lat. 17° 29′ S., lon. 149° 29′ W. It is high, reaching 7,336 feet at its highest point, but traversed by beautiful and fertile valleys, in which all tropical plants grow luxuriantly. It is 120 miles in circumference, with an area of 401 sq. miles, and had, in 1889, 9,603 inhabitants, who have been converted to Christianity. It is the principal island of the French establishments in Oceania, and contains Papiti, the capital of the colony. See Dora Hort, *Tahiti, the Garden of the Pacific* (1891). Revised by M. W. HARRINGTON.

**Tahlequah'**: town (founded in 1840); capital of the Cherokee Nation, Indian Territory; in the valley of the Illinois river; 26 miles E. of the Mo., Kan. and Tex. Railway, and 65 miles N. W. of Fort Smith, Ark. (for location, see map of Indian Territory, ref. 2–G). It is in an agricultural region, and contains national Cherokee schools, Female Seminary (building cost $100,000), Male Seminary (building cost $80,000), Capitol (cost $20,000), Baptist and Presbyterian mission schools, 2 school libraries, a private bank, and 4 weekly newspapers (2 printed in English and 2 in both English and Cherokee). Pop. (1900) 1,482.

EDITOR OF "TELEPHONE."

**Tahoe', Lake**: a lake partly in Nevada and partly in California, at an elevation of 6,225 feet in the Sierra Nevada. Its maximum length from N. to S. is 22½ miles and its greatest width 13 miles; area, 195 sq. miles; hydrographic basin, 500 sq. miles. Soundings by Prof. John Le Conte gave a depth of 1,506 feet, but it is thought that a more detailed survey will show a greater depth. Its waters are wonderfully clear, and are inhabited by excellent trout and other fishes. It is the source of Truckee river, which empties into Pyramid and Winnemucca Lakes. Surveys have been made with the view of drawing off its waters through a tunnel, for irrigation purposes. See *Physical Studies of Lake Tahoe*, by Prof. John Le Conte, in *Overland Monthly*, 1883 and 1884. ISRAEL C. RUSSELL.

**Tahpanhes** (Jer. xliii. 7–9), or **Tahpenes** (the *Tehaphnehes* of Ezek. xxx. 18, the Δάφναι of Herodotus, ii., 30, 107, and the Τάφνη, Τάφναι of the Septuagint): an Egyptian stronghold erected by Psammetichus I. as an eastern walled garrison for his Greek mercenaries, on the site of an earlier Ramesside town. It was to the E. what NAUCRATIS (*q. v.*) was to the W. of the Delta, and guarded the road to Asia. It was on the Roman road, 16 miles from Pelusium toward Memphis (*Itinerarium Antonini*, Wess. 162), on the Pelusiac branch of the Nile, at the present Tell Defenneh (30° 52′ N. lat., 32° 8′ E. of Greenwich). The main portion of the mound is known as the Palace of the Jew's Daughter (cf. Jer. xliii. 6–9), and its foundation deposits show that it was the work of PSAMMETICHUS I. (*q. v.*). A large elevated place before the fort has been identified with the "brick-work" in which Jeremiah hid large stones (Jer. xliii. 9) at the command of God. The site has furnished many Greek remains, but little that is Egyptian. In style the pottery of Tahpanhes was quite distinct from that of Naucratis, and shows attempts to imitate Egyptian bronze vases. This difference of style points to manufacture on the spot, not to importation from Greece. The date of the city is shown further by numerous impressions of the cartouch of Psammetichus I. on the seals of wine-jars. The overthrow of Hophra (Apries) by Amasis and the reduction of his eastern stronghold mark the existence of the place as from 665 to 564 B. C.

CHARLES R. GILLETT.

**Taillandier**, taa̤'yaan'di-ā', RENÉ GASPARD ERNEST, generally known under the name SAINT-RENÉ TAILLANDIER: educator and author; b. in Paris, Dec. 16, 1817; studied philosophy and literature in Paris and Heidelberg; was appointed Professor of Foreign Literatures at Strassburg in 1841, at Montpellier in 1843, at the Sorbonne in 1863, and became in 1870 secretary in the department of public education. He was elected to the Academy in 1873. Besides poems, he wrote *Scot Érigène* (1843); *Histoire de la jeune Allemagne* (1849); *Études sur la Révolution en Allemagne* (2 vols., 1853); *Michel Lermontoff* (1856); *Maurice de Saxe* (2 vols., 1865); *Tchèques et Magyars, Bohème et Hongrie* (1869); *La Serbie* (1871); *Dix ans de l'Histoire d'Allemagne* (1875); *Le roi Léopold et la reine Victoria* (2 vols., 1878). D. in Paris, Feb. 24, 1879. Revised by A. G. CANFIELD.

**Tailor**: the BLUEFISH (*q. v.*), *Pomatomus saltatrix*. The name is also applied (usually in the form tailor-herring) to the fall herring, *Clupea* (or *Pomolobus*) *mediocris*. It is probably applied to the bluefish on account of its sharp cutting teeth, but its applicability to the herring is not apparent.

**Tailor-bird** [so called from its habit of sewing together the tips of two or three leaves to make a nesting-place]: a small bird (*Sutoria sutoria*), a representative of the family *Lusciniidæ*; found in India and other eastern countries. It is about 5 inches long, with a slender and slightly decurved bill, short and rounded wings, and very long tail composed of narrow feathers; olive green above and white beneath, and brick-red on top of the head. For its nest, generally two leaves at the end of a bough are brought in contact, and sewed together by the bill, vegetable fibers being used as the threads; sometimes a large leaf is rolled together and sewed at its margins. Within the cavity thus formed are deposited soft downy or cotton-like vegetable substances, and the nest is then completed for the reception of the eggs, of which six to eight are laid. Revised by F. A. LUCAS.

**Tainan**, tī'naan': the name given to the treaty-port of Taiwan-foo in Formosa when, in 1885, it ceased to be the capital of the department and of the province of Taiwan. In 1896 it again became the capital. Pop. about 135,000. Tainan imports cotton and woolen goods, opium, metals, medicines, kerosene oil, ginseng, cuttlefish, rice, flour, gunny-bags, silk piece-goods, and matches; and exports sugar, camphor, hemp, lung-ngan pulp, and turmeric. In 1893 the net foreign imports amounted to 1,596,166 haikwan or custom-house taels (= $1,675,974), of which 92 per cent. came from Hongkong, while the net native imports amounted to 127,852 taels. The total exports amounted to 1,648,220 taels (= $1.730,631), including 480,529 piculs of sugar, valued at 1,272,757 taels, and 5,934 piculs of camphor. In the same year 70 steamers and 14 sailing vessels (aggregating 53,686 tons) entered port, and 69 steamers and 12 sailing vessels (aggregating 52,443 tons) cleared. R. L.

**Taine**, HIPPOLYTE ADOLPHE: philosopher and historian; b. at Vouziers, Ardennes, France, Apr. 21, 1828; was educated at the Collège Bourbon and the École Normale of Paris, and became a teacher, but soon gave it up because of the hostility of the authorities in consequence of his ideas. His *Essai sur Tite-Live* (1854) and *Les Philosophes français* *du XIX^e siècle* (1856) attracted much attention by their brilliancy and their sharp criticism of the current philosophy of Cousin's school. Strongly influenced by the study of the natural sciences, he sought to apply rigidly to the whole range of human achievements the laws of heredity and environment. He regarded all products of human activity as determined by three factors, environment (*milieu*), race, and moment. His works include *Voyage aux eaux des Pyrénées* (1855); *Essais de critique et d'histoire* (1857); *La Fontaine et ses fables* (1860); *Histoire de la littérature anglaise* (4 vols., 1864); *Nouveaux essais de critique et d'histoire* (1865); *Philosophie de l'art* (1865); *Philosophie de l'art en Italie* (1866); *Voyage en Italie* (2 vols., 1866); *Vie et opinions de Thomas Graindorge* (1867); *Philosophie de l'art dans les Pays-Bas* (1868); *De l'Intelligence* (2 vols., 1870); *Notes sur l'Angleterre* (1872); *Origines de la France contemporaine* (unfinished, 5 vols., 1876–90). In 1864 he became Professor of Æsthetics at the School of Fine Arts, Paris, and in 1878 a member of the Academy. D. in Paris, Mar. 5, 1893. See A. de Margerie, *H. Taine* (Paris, 1894); G. Monod, *Les Maîtres de l'histoire* (Paris, 1894). A. G. CANFIELD.

**Taiping** (or **Taeping**) **Rebellion**: a formidable insurrection which broke out in 1850 in South China, and had for its object the overthrow of the Manchu dynasty, which had ruled since 1643, and the establishment of a new purely native dynasty, to be styled the dynasty of "Great Peace." Hence the name Taipings applied by foreigners to the rebels, who, however, were by the Chinese called *Ch'ang-mao-tseh* or "long-haired rebels," from the fact that they had discarded the queue or outward expression of allegiance to the Manchus. (See CHINA.) The leader of the movement, a Hakka schoolmaster named Hung-Siu-Chuen, born in 1813, also included in his plans the establishment of a corrupt kind of Christianity elaborated by himself partly from a vision he had had in 1837 during a period of illness, and partly from an imperfect study of some Christian tracts and books he had obtained some years before. In this vision he thought he was taken to heaven, where, having been "washed" by an old woman, some venerable sages opened his body with a knife, took out his heart and other parts, and put new parts in their place, and a venerable man with a golden beard addressed him, saying: "All human beings in the world are produced and sustained by me; they eat my food and wear my clothing, but not one among them has a heart to venerate and remember me; they take my gifts and therewith worship demons; they rebel against me and arouse my anger," and giving Hung a sword he commanded him to "exterminate the demons." In his vision he also saw a man of middle age, whom he called his Elder Brother, and who instructed him how to act. After rereading the Christian tracts and books in Chinese which he had obtained, he concluded that the old man was God, the "Heavenly Father," that the middle-aged man was Christ, the "Heavenly Elder Brother," and that the demons were idols, and he became convinced that he had been appointed to restore the world to the worship of the true God. He at once began preaching his new doctrines, and thousands were converted. A "Church of God" was established, and so zealous were its members in demolishing temples and idols that they were soon brought into conflict both with their neighbors and with the authorities, and many fights ensued. In 1850 they broke out into open rebellion, Hung taking the name of the "Heavenly King." Early in 1852 they moved into Hunan, advanced down the Siang to the Yang-tse, down which they sailed, capturing every important city on its banks; made Nanking their capital, threatened Peking, and carried destruction and death over fifteen of the eighteen provinces of China. It has been estimated that 20,000,000 lives were sacrificed in this struggle. It was not till 1864, when Nanking was recaptured on July 19 by the Ever-Victorious army under "Chinese" Gordon, that the movement began to weaken; Hung himself had already taken poison, and his principal generals had fled. The remnant under Tsze Wang made a last stand at Chang-chow-fu in Fuh-kien, but were pressed so hard by the imperialists that they had to withdraw and disband. The imperial operations were directed by Tsŭng-kwoh-fan and Li Hung-Chang, but without the assistance rendered by the British and French at Shanghai and elsewhere, and by the native army drilled and officered by foreigners and led successively by Ward, Burgevine, Holland, Cooke, and Gordon, it is questionable if they would have succeeded in crushing the movement. See Wells Williams's *Middle Kingdom* (2 vols., New York, 1883). R. L.

**Taira**, tī'rää: a Japanese family descended from the Emperor Kwammu, and all-powerful in Japan during the eleventh century. This was a period of great corruption at court, and of misrule and insurrection in the provinces. The family was the first that rose to a leading place in the state by military prowess. Its chief representative was Kiyomori, who, after triumphing over the rival Minamoto party in 1159, was able to make and unmake emperors at will. When he died in 1181 only some infants of the rival clan had been spared, one of whom, however, YORITOMO (*q. v.*), was destined to restore the fortunes of his family and ruin the Taira dynasty. The incidents of these troublous times furnish to native art an inexhaustible store of themes for treatment. J. M. DIXON.

**Tait**, ARCHIBALD CAMPBELL, D. D., LL. D.: archbishop; b. in Edinburgh, Scotland, Dec. 22, 1811; educated at the University of Glasgow, and at Baliol College, Oxford; was one of the leading opponents of the Tractarians or Puseyites; took orders in the Church of England; was head master of Rugby School from 1842 to Apr., 1850, when he accepted the deanery of Carlisle; became Bishop of London Aug., 1856; originated in 1863 the successful scheme of raising a fund of £1,000,000 for supplying the deficiencies of church accommodation in London; became Archbishop of Canterbury in 1868. He was the author of *The Dangers and Safeguards of Modern Theology* (1861) and *The Word of God and the Ground of Faith* (1863), besides addresses, sermons, etc. D. in London, Dec. 3, 1882. See the *Life* by Davidson and Benham (2 vols., 1891).

**Tait**, ARTHUR FITZWILLIAM: See the Appendix.

**Tait**, JOHN ROBINSON: See the Appendix.

**Tait**, LAWSON, M. D., LL. D.: gynæcologist; b. in Edinburgh, Scotland, in 1845; studied arts and medicine in the University of Edinburgh 1859–66; settled in Birmingham, England, in 1870; passed examinations for licentiate in 1866, and in 1870 was made honorary fellow of the Royal College of Surgeons, Edinburgh; passed examinations for member in 1870, and for fellow in 1871, of the Royal College of Surgeons, England. He was one of the foremost surgeons in abdominal operations in Great Britain. His *Diseases of Women* has passed through several editions. D. June 13, 1899.

**Tait**, Sir MELBOURNE: See the Appendix.

**Tait**, PETER GUTHRIE: physicist and mathematician; b. at Dalkeith, Scotland, Apr. 28, 1831; educated at Edinburgh University and at St. Peter's College, Cambridge, where he graduated as senior wrangler in 1852; became Professor of Mathematics in Queen's College, Belfast, in 1854, and Professor of Natural Philosophy in Edinburgh University in 1860. He wrote a number of memoirs on the kinematical theory of gases, thermo-electricity, thermal conductivity, mirage, etc., and in pure mathematics on knots and quaternions. He was the author of *Dynamics of a Particle* (1856), written in conjunction with Steele, a work which has run through many editions; *Elementary Treatise on Quaternions* (1867); *Thermodynamics* (1868); *Recent Advances in Physical Science* (1876); and *Paradoxical Philosophy* (1878); and several text-books on physics. In conjunction with Lord Kelvin he wrote the *Treatise on Natural Philosophy*, and with Balfour Stewart *The Unseen Universe*. D. July 4, 1901. R. A. R.

**Taiwan**, tī'wään' (literally, terraced bay): the Chinese name of the large island lying off the coast of Fuh-kien, China, which is by foreigners called FORMOSA (*q. v.*). Until 1886, when it was made a separate province, it was a department of Fuh-kien, with a tao-tai or intendant of circuit at its head, and was divided into four *hien*, or districts, and five seaboard divisions called *ting*. Beginning at the S. and proceeding N., the hien are: *Fŭng-shan-hien*, *Taiwan-hien*, *Kia-yi-hien*, and *Changhwa-hien*. The ting are: *Taifang-ting*, comprising the seaboard of Fŭng-shan hien and Taiwan-hien; *Loo-kiang-ting*, the seaboard of the two remaining hien; *Tan-shui-* (or *Tamsui*) *ting*, the whole of the northernmost portion on the west side of the island; *Komalan-ting*, the whole eastern part of the island; and the *Pŭng-hoo-ting*, comprising the group of islands lying off the west coast, and known as the Pescadores. Twa-tu-tia, a few miles from Kilung, was the capital from 1885 to 1896. By the treaty concluded at Shimonoseki, Japan, early in 1895, China ceded Taiwan to Japan, and the Japanese took possession of it early in June, 1895, though opposed by the so-called republic which had been proclaimed there by the Chinese soldiers and residents some weeks earlier, with Tang, the ex-governor, as president. R. L.

**Taiwan-foo**: a walled city of Formosa and a treaty-port; situated on the west coast of the island, in about lat. 23° N. and lon. 129° E. (see map of China, ref. 8–K). Until 1885 it was the capital of the island. Since 1886 it has been called TAINAN (*q. v.*). In 1896 the Japanese again made it the capital of the island. It stands on a level plain of considerable extent, about 3 miles from the sea, from which canals run right up to the west gate, so that merchandise can be landed from ships in the roadstead alongside the godowns or storehouses in the western suburb, where most of the business is carried on. Kok-si-kon, the port of Taiwan-foo, 3 miles distant, is an open roadstead, in which ships anchor about 3 miles from shore. It is fairly well protected for vessels in the northeastern monsoon, but unsafe during the southwestern monsoon. For trade statistics, see TAINAN. Between this western suburb and the sea is the village of Anping, near which are found the ruins of the famous stronghold called Zelandia, built by the Dutch in 1624–30, when they established themselves on the island. It consisted of a single keep on a small hill, in the form of a bastioned fort, with another wall on the northern side at a distance of 100 yards. The walls were of great thickness and were built of small bricks, brought from Batavia for this special purpose. R. L.

**Tai-yuen**: a walled city of China, capital of the province of Shansi, but of no commercial importance (see map of China, ref. 4–I). It lies between two hills near the head of a fertile plain of considerable extent, about 3,000 feet above the level of the sea, and consists, like Peking, of an inner and an outer city, but has no extra-mural population. The outer city is surrounded by mud walls, pierced for three gates, but only two are opened. The inner city, or city proper, which is $2\frac{2}{3}$ miles long by $1\frac{2}{3}$ wide, has walls of moderate height pierced with eight gates surmounted by fine towers. The streets are 50 to 75 feet wide, and the people are well-behaved. Tai-yuen has a powder-mill and an arms-factory, and was anciently noted for its sword-blades and knives. Pop. about 200,000. R. L.

**Takashi'ma**: an island of Japan; about 8 miles from the entrance to Nagasaki harbor. It is only 250 acres in extent, and was, until a comparatively recent date, uninhabited. Coal-mining operations on a primitive scale were begun before the middle of the eighteenth century; in 1867 Scottish miners were employed, and now (1895) several thousand workmen turn out the largest output of any coal mine in Asia. At one time it was feared that the supply was near exhaustion, but later new veins were discovered and the output is undiminished. The mines extend for a considerable distance under the sea. J. M. DIXON.

**Takata**, taa-kaa'taa: a town in the province of Echigo, Western Japan; about 4 miles from the seacoast and 74 miles S. W. of Niigata (see map of Japan, ref. 5–D). Its port, Naoetsu, is the western terminus of the railway from Tokio to the west coast. It was formerly the castle-town of a daimio, Sakakibara, one of the four families entitled to supply a regent during the minority of a shogun. Cotton-weaving is extensively carried on, as also are leather-working and furriery. The Presbyterians of the U. S. have a mission here. Pop. 28,000. J. M. D.

**Takil'man Indians**: a stock of North American Indians, represented, so far as is known, by only one tribe, the Takĕlma. Their habitat was on the upper part of the Rogue river, Oregon (whence they are called Rogue River Indians), and their villages, numbering seventeen, extended along the south side of the river from the valley of Illinois creek to "Deep Rock," probably Rock Point, E. of Woodville, in Jackson County. It is probable that they were once the occupants of a territory larger than that just described, and that later there was an invasion by the Athapascan Indians, who established villages on all sides of them and imposed Athapascan names on Takilman villages, though they never succeeded in forcing the Takĕlma to abandon their own language. The present representatives of the tribe number about twenty-five, and are on the Siletz Reservation, Tillamook co., Ore. Apparently the Takilman Indians differed in no essential respect from their neighbors, except in their language. J. OWEN DORSEY.

**Takow**, taa'kow': a town on the west coast of Formosa; lat. 22° 38' N., lon. 130° 16' 30" E.; about 20 miles S. of Taiwan-foo (see map of China, ref. 8–K). It was thrown open to foreign residence and trade in 1864, but its trade has never been great. The custom-house returns are included in those of Taiwan-foo, now called TAINAN (*q. v.*).

**Taku**, taa'koo': a Chinese village, at the mouth of the Pei-ho, on the south bank; about 70 miles by water from Tientsin, but only 35 by land (see map of China, ref. 3–J). Here are the famous Taku forts, which, though deemed impregnable by the Chinese, were taken three times by the Anglo-French fleets in the campaigns of 1858–60, and again on June 17, 1900, by the fleets of the allied powers. (See CHINA.) See Oliphant's *Narrative of Lord Elgin's Visit to China in 1857–58–59*, and Swinhoe's *North China Campaign of 1860*.

**Talavera de la Reina**, taa-laa-vā'raa-dā-laa-rā-ee'naa: an old but well-built town in the province of Toledo, Spain; on the Tagus, 75 miles by rail S. W. of Madrid; in an exceedingly fertile plain, covered with vineyards and olive-groves (see map of Spain, ref. 16–E). It has manufactures of silk and earthenware. Here was fought a severe battle on July 28, 1809, between the French under Jourdan and Victor, and the allied Spaniards and British under Sir Arthur Wellesley (afterward Duke of Wellington), in which the latter were victorious. It was the birthplace (1536) of the historian Mariana. Pop. about 10,500.

**Talbot**, RICHARD: See TYRCONNEL.

**Talbot**, SILAS: naval officer; b. at Dighton, Bristol co., Mass., in 1751; at the beginning of the war of the Revolution was made captain in a Rhode Island regiment, and was present at the siege of Boston; in 1776 accompanied the army to New York, where he planned an attack by fire-ship on the British shipping, for which he received a commission as major and the thanks of Congress; was severely wounded in 1777 during an engagement with British vessels in Delaware river, and in 1778 he captured the British blockading schooner the Pigot, and was appointed captain in the navy Sept., 1779; fitted out the Pigot and captured several prizes, but in 1780 was made prisoner and sent to England; was exchanged in Dec., 1781; settled in New York, and in 1793–94 was in Congress; when the navy was reorganized in 1794 he superintended the construction of the frigate Constitution, which was his flag-ship during a cruise in the West Indies in 1799. D. in New York, June 30, 1813. See the *Life* by Henry T. Tuckerman (1850).

**Talbot**, WILLIAM HENRY FOX, LL. D.: photographer and antiquary; b. at Lacock Abbey, near Chippenham, England, Feb. 11, 1800; graduated at Cambridge 1821; sat for Chippenham as a Liberal in the first reformed Parliament 1832–34; pursued for some years from 1833 a series of experiments which resulted in Sept., 1840, in the discovery of the essential principle of the art of photography, and in 1841 of the calotype process; received in 1842 a medal from the Royal Society, and in later years devoted himself to antiquarian pursuits and philological studies, being one of the few scholars who have successfully deciphered the Assyrian cuneiform inscriptions. Among his works are *Hermes, or Classical and Antiquarian Researches* (vol. i., 1828; vol. ii., 1839); *Legendary Tales in Verse and Prose* (1830); *The Antiquity of the Book of Genesis illustrated by some New Arguments* (1839); *The Pencil of Nature, a Collection of Genuine Specimens of the New Art of Photography* (6 parts, 1844–46). D. at Lacock Abbey, Sept. 17, 1877.

**Talbotype**: same as calotype. See PHOTOGRAPHY.

**Talc** [from Fr. *talc*, from Arab. *'talaq*]: a magnesium silicate, usually somewhat hydrated, which sometimes makes up the mass of geological formations. Talc, when crystallized, is right rhombic. It belongs to the softest minerals, ranking with graphite in this respect, and is used as the lowest member, No. 1, of the scale of hardness. It is seldom found well crystallized, but usually in compact or in foliated masses, the foliation arising sometimes from the cleavage of the mineral, which is micaceous in its character. Its usual color is a light green, due to ferrous oxide associated with the magnesian base; but this color and this constituent are not essential, and it is found perfectly white, sometimes with a silvery luster. The massive varieties are called soapstone. (See STEATITE.) The average composition of the commoner varieties of talc is stated as $O_{16}Si_5Mg_6.2H_2O$; but there is an anhydrous talc, not separated from this species by Dana and other authorities, which, according to analyses of Genth, Senft, Lychnell, and Kersten, computes distinctly to the formula $O_{16}Si_6Mg_4$. Dana suggests that quartz may have been present as an impurity in these; but this would not account for the entire absence of water from many of the analyses; and, moreover, the density would be diminished by quartz, whereas one of Lychnell's anhydrous talcs gave the maximum density of all, 2·795.

The other extreme of the range of authoritative densities is a hydrous talc, a *rensselaerite* from Charleston Lake, Canada, for which Sterry Hunt gives the figure 2·644.

**Tal'ca**: a province of Chili; cut by the thirty-sixth parallel of south latitude; extending from the Pacific to the Argentine frontier. Area, 3,678 sq. miles. The Andes, including the quiescent volcanoes of Descabezado and Cerro Azul, occupy the eastern part; these and the lower Coast Range have forests resembling those of the southern provinces. The intermediate space consists of plains and rolling lands of great natural fertility, and improved by irrigation. The river Maule forms the southern boundary. The principal industries are wheat-raising and grazing. Pop. (census of 1895) 128,961. Talca, the capital, is in a fertile valley, watered by a branch of the Maule, on the railway from Chillan to Santiago, with a branch to the port of Constitucion (see map of South America, ref. 8-C). It is well built, has a seminary, hospital, etc., and is the center of a thriving trade. The climate is disagreeable, owing to the unusual extremes, for Chili, of heat and cold. Pop. (1885) 23,432; in 1895, 33,232. HERBERT H. SMITH.

**Talcott**, ANDREW: civil engineer and mathematician; b. at Glastonbury, Conn., Apr. 20, 1797; graduated at the U. S. Military Academy July 24, 1818, when appointed brevet second lieutenant in the Corps of Engineers. After a year's service on construction duty, he accompanied Gen. Henry Atkinson, as engineer, on the expedition to locate military posts on the upper Missouri and Yellowstone rivers, and on his return was assigned to the construction of the defenses of Hampton Roads, Va., Fort Delaware, etc., until 1835; from 1832 to 1836 was also engaged as astronomer for determining the boundary-line between Ohio and Michigan, and was in charge of the improvement of the Hudson river 1834-36; resigned from the army Sept. 21, 1836, to become division engineer on the Erie Railroad; in 1837 returned to duty in a civil capacity under the Government as superintendent of the improvement of the delta of the Mississippi river 1837-39; member of commission for exploration and survey of the northeastern boundary of the U. S. 1840-43; of joint army and navy board to visit the Portsmouth and Pensacola navy-yards and prepare plans for dry docks and other important works 1844-45; from 1848 to 1855 was chief engineer of the Richmond and Danville Railroad; of the Ohio and Mississippi Railroad 1856-57; of the railway from Vera Cruz, viâ the city of Mexico, to the Pacific Ocean, nearly completing the road from Vera Cruz to Mexico. He devised what is known as Talcott's method for determining territorial latitudes by the observation of stars near the zenith. D. at Richmond, Va., Apr. 22, 1883.

**Talent** [viâ O. Fr. from Lat. *talen'tum*, from Gr. *τάλαντον*, a certain weight, a certain weight of silver or gold, talent of money, liter., a balance. Cf. *τλῆναι*, bear, endure, Lat. *tollere*, lift, Sanskr. *tulā*, balance]: an ancient Greek weight containing 60 minæ, about 82 lb. avoirdupois. There was a Babylonian and an Æginetan talent, which were to the Attic as 5 to 3; the Eubœan talent was to the Attic nearly as 4 to 3; the Tyrian was equal to the Attic; the Cilician was half the Attic, etc. There was also a gold or Sicilian talent of about three-fourths of an ounce avoirdupois, called also the little talent. A talent in money was originally a talent's weight of silver or of gold, but the talent finally became a money of account. It was among all the Greeks the monetary unit. Its value varied with the kind of talent used and with the purchasing power of gold and silver. The Attic silver talent was smaller than the commercial talent, weighing 57 lb. of silver.

**Talfourd**, tal'ferd, Sir THOMAS NOON: statesman and author; b. at Doxey, near Stafford, England, Jan. 26, 1795; was the son of a wealthy brewer; studied at the Reading dissenting grammar school, under Dr. Valpy; was entered at the Middle Temple; studied law with Chitty, the celebrated pleader, and was called to the bar in 1821; practiced on the western circuit, acting at the same time as law reporter for the London *Times*; in 1835-41, and again in 1847-49, was a member of Parliament for Reading, and in 1849 was made a judge of the common pleas. In Parliament he was especially distinguished for his advocacy of the Custody of Infants Act and of the Copyright Act of 1842. He published many speeches and essays, some of which have been collected under the title *Critical and Miscellaneous Essays of Thomas Noon Talfourd* (1842). Among his works are *Poems on Various Subjects* (1811); *An Attempt to Estimate the Poetical Talent of the Present Age* (1815), one of the earliest public tributes to the genius of Wordsworth; *History of Greek Literature*, *History of Greece*, and *History of the Roman Republic*; several distinct volumes relating to his intimate friend Charles Lamb, subsequently put forth as one work, *Memoirs and Correspondence of Charles Lamb* (1837); *Final Memorials of Charles Lamb* (1848); four tragedies—*Ion* (1835), *The Athenian Captive* (1838), *Glencoe* (1840), and *The Castilian* (1854), the first two of which had a stage success; *Recollections of a First Visit to the Alps* (1842); *Vacation Rambles* (1844); and *Supplement to Vacation Rambles* (1846). D. at Stafford, Mar. 13, 1854.
Revised by H. A. BEERS.

**Taliesin**, tăl'i-sin: a Welsh bard, said to have flourished during the twelfth century, whose name has been handed down, together with that of the two Merlins, as the three principal Christian bards, Taliesin being styled *Pen Beirdd*, the chief of the bards. Many compositions ascribed to him are preserved in the *Archæology of Wales*.

**Talipes**: See CLUB-FOOT and ORTHOPÆDIC SURGERY.

**Tal'ipot** [from Hind. *tālpāt* < Sanskr. *tālapattra*, palm-leaf; *tāla*, palm-tree + *pattra-*, leaf]: a palm-tree, *Corypha umbraculifera*. It affords great leaves, which are used for covering houses, making umbrellas, and for making a substitute for writing-paper that is used extensively in the East, as well as for many other purposes. The pith affords a kind of sago. The tree grows in Malabar and Ceylon.

**Tallade'ga**: city; capital of Talladega co., Ala.; on the Birm. and Atl., the Louisv. and Nashv., and the South. railways; 23 miles E. of Birmingham, 30 miles S. W. of Anniston (for location, see map of Alabama, ref. 4-D). It is in an agricultural and mining region, and is noted for its educational and public institutions, which include the Talladega College for Negroes (Congregational, chartered in 1869), Isbell Female College for whites, Talladega Military Academy for whites, Alabama Institution for the Deaf (whites), Alabama Academy for the Blind (whites), Alabama Institution for the Colored Deaf, Dumb, and Blind, several public schools, and an Orphans' Home. The city has Baptist, Congregational, Methodist Episcopal, Presbyterian, and Protestant Episcopal churches, 2 national banks with combined capital of $100,000, cotton-factory, tannery, and 3 weekly newspapers. On the site of Talladega Gen. Jackson gained a victory over the Creek Indians in 1813. Pop. (1880) 1,233; (1890) 2,063; (1900) 2,661.
EDITOR OF "OUR MOUNTAIN HOME."

**Tallahas'see**: city; capital of the State of Florida and of Leon County; on the Carrabelle, Tall. and Ga. and the Fla. Cent. and Pen. railways; 21 miles N. of the Gulf of Mexico, 165 miles W. of Jacksonville (for location, see map of Florida, ref. 2-F). It is in an agricultural and fruit-growing region; contains 4 churches for white people and 6 for colored, separate public schools for white and colored children, West Florida Seminary, Normal College for Colored Teachers, 2 libraries (State, founded 1845; University, founded 1884), U. S. Government building, a national bank with capital of $50,000, a State bank with capital of $25,000, two private banks; a weekly and a daily newspaper; and has railway car-shops and machine and novelty wood works. Pop. (1880) 2,494; (1890) 2,934; (1895) 3,931.
EDITOR OF "TALLAHASSEEAN."

**Tallahatch'ie River**: a river which rises in Tippah co., Miss. After a devious course of more than 250 miles, in a generally S. S. W. direction, it unites with the Yallobusha to form the Yazoo. Throughout more than half its extent it is navigated by steamboats at all stages of water.

**Tallapoo'sa**: city; Haralson co., Ga.; on the Southern Railway; 3¼ miles from the Tallapoosa river, 63 miles W. of Atlanta; elevation, 1,200 feet above sea-level (for location, see map of Georgia, ref. 2-F). It is in an iron, timber, agricultural, and fruit-growing region, and contains six churches, free graded schools for white and colored pupils, a State bank with capital of $57,300, and a weekly newspaper. Adjacent to the city are about 3,000 acres devoted to grape-culture. The prosperity of the city dates from 1887, and is due to Northern capitalists. Pop. (1890) 1,699; (1900) 2,128. EDITOR OF "JOURNAL."

**Tallapoosa River**: a river which rises in Paulding co., Ga., and joins the Coosa to form the Alabama river. It is 250 miles long, and is navigable by steamboats some 40 miles.

**Talleyrand-Périgord**, Fr. pron. tăă'lă'raăn'pă'rēē'gōr', CHARLES MAURICE, Duc de, Prince of Benevento; statesman; b. in Paris, Feb. 13, 1754; was compelled by his family to renounce his right of primogeniture on account of his being lame, and was educated for the Church. He studied at St.-Sulpice, the Sorbonne, and at Rheims, and attracted much attention by his wit and other brilliant gifts. In 1775 he was ordained priest in spite of the notorious licentiousness of his life, in 1780 was chosen agent-general for the clergy, and in 1789 the king made him Bishop of Autun. Elected a deputy to the States-General, he was one of the first of the clergy who joined, and prompted his colleagues to join, the *tiers état*, and in intimate harmony with Mirabeau and Sieyès he took a prominent part in the debates of the Assembly. On Oct. 10, 1789, he proposed the confiscation of all Church property; July 14, 1790, he officiated at the grand national festival in the Champ de Mars, and consecrated the new colors of the national guard; Dec. 28, 1790, he took the oath to obey the constitution, and when the pope excommunicated him (May 1, 1791) he resigned his episcopal see. In the Representative Assembly his speeches on financial, educational, and other reforms exercised great influence. Nevertheless, a rumor was circulated that he was conspiring with the Duke of Orleans, and his friends saved him by procuring for him a diplomatic mission to London. While there his name was placed on the list of *émigrés*. He lived for some time in London and afterward in the U. S., but returned to Paris in 1796, and became Minister of Foreign Affairs in July, 1797, which office he held to Aug., 1807, with one short interruption. Recognizing the force of Napoleon's character, he gave him his support loyally in his struggle for power. He negotiated all the various treaties of peace of this epoch—the concordat with the pope, who relieved him from excommunication and secularized him; the confederacy of the Rhine, after which he was made Prince of Benevento, etc.; but he disapproved Napoleon's policy toward Great Britain, opposed his plans with respect to Spain, and when, after the Peace of Tilsit, an alliance was formed between France and Russia, he resigned his office and retired to his estates at Valençay. Before the Russian disaster he predicted the downfall of Napoleon, and entered into communication with the Bourbons; and during the last three years of Napoleon's career he was one of his most active and most dangerous enemies. He negotiated the first Peace of Paris, and represented France at the Congress of Vienna. Here he succeeded in dissolving the general feeling of concord with which the powers met, and produced a confusion of jealousy, mistrust, rivalry, and hatred which he understood how to use to the advantage of France. After the second restoration, however, he fell into disgrace, and during the reigns of Louis XVIII. and Charles X. took very little part in public life. In Sept., 1830, Louis Philippe sent him as ambassador to London, and he succeeded in establishing cordial and intimate relations between the courts of St. James and the Tuileries, and concluded the quadruple alliance between Great Britain, France, Spain, and Portugal Apr. 22, 1834. He returned to France shortly after. D. at Valençay, May 17, 1838. His *Mémoires* were intended by him to be published thirty years after his death, but in 1868 the publication was postponed for twenty-two years on the proposition of Napoleon III. They were published in 5 volumes 1889–91. For an account of his course at the Congress of Vienna, see *Correspondence between Talleyrand and Louis XVIII.* (1881); for estimates of his character, Lamartine, *Mémoires Politiques*; Blanc, *Histoire de Dix Ans*; Guizot's *Mémoires*; and Bastide, *Vie Religieuse et Politique de Talleyrand.* Revised by F. M. Colby.

**Tallien**, tăă'li-ăń', Jean Lambert: revolutionist; b. in Paris in 1769; became noted in 1792 as the editor of a Jacobin journal, *L'Ami du Citoyen*; was elected a member of the Convention; advocated the condemnation and immediate execution of Louis XVI., and attacked the Girondins with senseless fury. In 1793 he was sent to Bordeaux to exterminate the moderate party, but here he became acquainted with Madame de Fontenay, one of the most attractive women of that time, and this acquaintance suddenly changed him from an extreme radical to a decided moderate. He was immediately recalled, his name was erased from the lists of the Jacobin Club, Madame de Fontenay was thrown into prison, and his own life was endangered; but in this emergency he rallied the partisans of Danton and Hébert, and by his energy and coolness at the decisive moment the overthrow of Robespierre and the Terrorists was accomplished July 27, 1794. He then became one of the most conspicuous figures in the republic, and married Madame de Fontenay. He became a member of the Council of Five Hundred, but, trusted by neither monarchists nor republicans, was forced to withdraw. He went with Bonaparte to Egypt as a *savant*, but quarreled with Gen. Menou and was sent back to France in 1800. He was captured by a British cruiser and taken to London, where he was feasted and flattered by the Whig party as a hero. He returned to France in 1802, and died in Paris, Nov. 16, 1820. F. M. Colby.

**Tallis**, Thomas: organist; b. about 1520; was perhaps organist to Henry VIII., and certainly gentleman of the chapel to Edward VI., Mary, and Elizabeth, and organist to the last named; and has been styled the father of English cathedral music. In conjunction with his pupil, William Byrd, he issued *Cantiones quæ Sacræ vocantur*, etc. (1575), which are masterpieces, and were protected for twenty-one years by Elizabeth, this being the first patent of the kind granted by her. There are also extant his *Order of Daily Service* (ed. by Bishop, 1843, and by Rimbault, 1847), *Full Cathedral Service* (ed. by Rimbault, 1847), and *Order for Morning Prayer, with the Litany Noted* (new ed. 1854). It is said that for portions of his *Service* he was indebted to Peter Marbeck, organist of Windsor. D. Nov. 23, 1585. A complete list of his works is in Grove's *Dictionary of Music.*

**Tallmadge**, Benjamin, M. A.: soldier; b. at Setauket, N. Y., Feb. 25, 1754; graduated at Yale in 1773; principal of a high school at Wethersfield, Conn.; entered a Connecticut regiment at the outbreak of the war of the Revolution; rose to the rank of major; performed a brilliant exploit in crossing Long Island Sound, surprising and capturing 500 Tories at Lloyd's Neck, L. I., Sept. 5, 1779; planned and executed the capture of Fort George at Oyster Bay and the destruction of British forces on Long Island, May, 1780; was engaged in several prominent battles; was intrusted with the custody of Maj. André, and superintended his execution; was a member of Congress 1801–17. D. at Litchfield, Conn., Mar. 7, 1835. His *Memoirs* were published in 1859 by his son, Frederick A. Tallmadge.

**Tallmadge**, Frederick Augustus: lawyer; son of Benjamin Tallmadge; b. at Litchfield, Conn., Aug. 29, 1792; graduated at Yale College 1811; studied law under Judge Tapping Reeve at Litchfield, where he was admitted to the bar; began practice in New York 1814; soon became one of the most successful advocates, and filled many public posts, including those of member (1837–40) and president of the State Senate, judge of the Supreme Court of Errors, recorder of New York 1841–46 and 1848–51, member of Congress 1847–49, superintendent of the metropolitan police 1857, and clerk of the court of appeals 1862–65. He became best known for the energy he displayed while recorder in suppressing the Astor Place riot of May, 1849. D. in New York, Sept., 1869.

**Tallmadge**, James, LL. D.: lawyer; b. at Stamford, N. Y., Jan. 28, 1778; son of Col. James Tallmadge (1744–1821), an officer of the Revolution; graduated at Brown University 1798; studied law, which he practiced several years, but gave his chief attention to agriculture; was for some time private secretary to Gov. George Clinton; held a military command in New York during the war of 1812–15; was member of Congress 1817–19; introduced an amendment to the bill admitting Missouri excluding slavery from the region W. of the Mississippi; took a prominent part in the New York constitutional conventions of 1821 and 1846; sat in the Assembly 1824; was Lieutenant-Governor 1825–26. In 1836 introduced into Russia several American mechanical inventions, especially cotton-spinning machinery; was one of the founders of the University of the City of New York. D. in New York, Sept. 29, 1853.

**Tallow** [M. Eng. *taluh*: Low Germ. (hence Germ.) *talg*]: the hard fat of animals, more properly called suet. The term also includes those fats of a less degree of hardness, e. g. lard and grease, as distinguished from oils. The fats obtained from the rendering of animal fats of all kinds are technically known as tallow, and are chiefly used by the tallow-chandler for the production of soap and candles. The animal fats are hard in proportion as they contain more stearin and palmitin and less of olein. The quality of animal fats is much influenced by the mode of feeding and the quality of the food. The quality of tallow is also very dependent on its being rendered at a low temperature by steam, and the cleanliness of the operation, the character of the animals treated, etc.

Vegetable tallow is found in the seed of many plants. Chinese vegetable tallow is from the husk about the berries of *Stillingia sebifera*; the berries contain a liquid fat. The solid commercial product is white, sp. gr. 0·818, and melts at 99° F.; it is rich in palmitin. Bayberry tallow, from *Myrica cerifera*, also called myrtle-wax, is a pale-green, brittle, solid fat from the berries of the plant. It moulds in the fingers like wax when warm. It contains myristic acid in a free state, and also combined with glycerin, and a large quantity of palmitic acid, but no oleic or volatile acids (*Moore*). Other hard vegetable fats are found in nutmeg, palm oil, Japan wax, cocoa-butter, cocculus grains, and various species of *Bassia*, for a description of which see Gmelin, *Handbook*, xvi., 385–400. See also FATS and OILS. Revised by IRA REMSEN.

**Tallow-tree**: (1) of the southern parts of the U. S. and of China. see STILLINGIA; (2) the *Pentadesma butyracea* of West Africa, a guttiferous tree whose fruit yields a kind of yellowish tallow; (3) the piny dammar-tree of India, *Vateria indica*, a huge dipterocarpaceous tree, whose seeds on boiling yield an excellent white tallow.

**Talma**, taal'maa', FRANÇOIS JOSEPH: tragedian; b. in Paris, Jan. 15, 1763, the son of a dentist; was educated partly in London, partly in Paris in his father's profession, but was irresistibly drawn to the stage, and made his *début* in 1787 at the Comédie Française as Séïde in Voltaire's *Mahomet*. His *début* was successful, but he produced the first great impression by his performance of the title-rôle in Marie-Joseph Chenier's tragedy, *Charles IX.*, Nov. 4, 1789, from which date he rapidly rose in the estimation of the public until in the first decade of the nineteenth century he stood acknowledged by the whole world as the greatest tragedian of his time. He was a favorite with Napoleon, who liked to converse with him, and whom he accompanied to Erfurt in 1808, and to Dresden in 1813. The Bourbons also showed him great favor, and in his art he continued unrivaled and improving until his death Oct. 19, 1826, some of his last *rôles*, Sylla, Oreste, etc., being among his greatest creations. Before his time the tragic heroes, Brutus, Cæsar, Catiline, Nero, etc., always appeared on the stage in a sort of fancy costume, not very different from the costume of the age, and with high powdered peruke on the head. Talma was the first to discard the peruke and adopt a correct costume. He wrote *Réflexions sur Lekain et sur l'Art théâtral* (1815), and left an *Autobiography*, which was edited by Alexander Dumas in 4 vols. (1849–50).

**Talmage**, THOMAS DE WITT, D. D.: clergyman; b. near Bound Brook, N. J., Jan. 7, 1832; educated, without graduating, in the class of 1853, University of the City of New York, and at New Brunswick Theological Seminary; pastor of Reformed churches at Belleville, N. J., 1856–59; Syracuse, N. Y., 1859–62; Second, Philadelphia, Pa., 1862–69; Central Presbyterian (later known as the "Tabernacle"), Brooklyn, N. Y., 1869–94; began a popular Sunday afternoon service at the Academy of Music, New York, in 1895. During his pastorate in Brooklyn, the Schermerhorn Street church was opened as a Tabernacle lay college for training Christian workers, with Dr. Talmage as president; the Tabernacle was built in 1870, burned 1872; rebuilt 1874, burned 1889; rebuilt 1891, burned 1894; the membership last reported being 4,447. Dr. Talmage was co-pastor of the First Presbyterian church in Washington, D. C., 1895–99. Dr. Talmage edited *The Christian at Work*, New York, 1873–76; *The Advance*, Chicago, 1877–78; *Frank Leslie's Sunday Magazine*; and since 1890 *The Christian Herald*. His sermons appear every week in many hundred secular and religious papers, and are translated into many foreign languages. Besides frequent contributions to periodicals, he has published *The Almond Tree in Blossom* (Philadelphia, 1870); *Shots at Targets*; *Crumbs Swept Up* (1870); *Sermons* (4 vols., New York, 1872–75); *Abominations of Modern Society* (New York, 1872; 2d ed. 1876); *The Battle for Bread*; *One Thousand Gems: or Brilliant Passages and Anecdotes* (1873); *Old Wells Dug Out* (1874); *Around the Tea-table* (Philadelphia, 1874); *Orange Blossoms Frosted*: *Sports that Kill* (New York, 1875); *Every-day Religion* (1875); *Night Sides of City Life* (1878); *Mask Torn Off* (1879); *The Brooklyn Tabernacle: 104 Sermons* (1884); *The Marriage Ring* (1886); *Social Dynamite* (Chicago, 1887); *The Pathway of Life*; *From the Pyramids to the Acropolis* (Philadelphia, 1892); *Ready! Ay Ready!* (1892); and *From Manger to Throne* (New York, 1894). C. K. HOYT.

**Tal'mud** [from Neo-Heb. *talmūd*, instruction, deriv. of *lāmad*, learn; cf. Heb. *limmad*, teach, *talmīd*, disciple, scholar]: a work whose authority was long esteemed second only to that of the Bible, and according to whose precepts the whole Jewish people, with the exception of the Karaites and the Reformed Jews of the nineteenth century, have endeavored to order their religious life. In reality it is composed of two distinct works, which were compiled at different epochs—the Mishna and the Gemara. In the oldest terminology of the schools "Talmud" signified "a deducing," and designated the process of seeking in the sacred writings support for laws not expressly provided therein. On this account the Mishna which embodied these deductions was also known as Talmud. Later on, when learned disputations on the Mishna became more frequent, the name Talmud was employed to denote these more recent discussions in contradistinction to the Mishna proper. In later times they were called *Gemara* (the Aramaic equivalent of Talmud). It was only at a still later period, when the Mishna and the Gemara were no longer transcribed separately, that the name Talmud was applied to the whole great work consisting of both Mishna and Gemara.

(A) *Mishna*.—The name Mishna signifies simply repetition, teaching, doctrine. It was used to designate, first, each individual ordinance; secondly, a group of interconnected ordinances; lastly, and especially, the great compilation of ordinances now known by that name, the authorship of which is referred to Rabbi Jehudah Hannasi. In the Talmud of Palestine, however, each individual Mishna is called *Halāchā*.

(*a*) *The Structure and Arrangement of the Mishna*.—It consists of six divisions (*Sedhārīm*): 1. *Zerāīm*, laws relating to seeds and products of the fields; 2. *Mōēdh*, laws relating to the festival celebrations; 3. *Nāshīm*, laws relating to women; 4. *Nezīkīn*, civil and criminal laws; 5. *Kodāshīm*, laws relating to offerings and vows; 6. *Tehārōth*, laws relating to ritual cleanliness and uncleanliness. Each division is subdivided into *Massechtōth* (tracts), of which there are 63 (11, 12, 7, 10, 11, 12). The whole number of tracts is occasionally given as 61, the first three tracts of the fourth division being counted as one; or as 60 (*Shir Hashirim Rabba*, 6, 9), Makkoth being counted as the last part of Sanhedrin. Each tract is again subdivided into *Perākīm* (chapters), of which the total number is 523 (74, 88, 71, 73, 91, 126), and each chapter into paragraphs. The order and sequence of the Sedarim are fixed and undisputed. The same unanimity, however, does not exist in the sequence of tracts and chapters, a slight divergence having been noted between the Mishna, the Palestinian, and the Babylonian Talmuds.*

(*b*) *The Origin, Development, and Close of the Mishna*.—During the sojourn of the Jews in Babylon the assured hope of restoration to the promised land had led to a deeper study of the Law and to a firm resolve to put it into practice whenever that restoration should be accomplished. At the head of this restoration stood Ezra, "a ready scribe in the law of Moses" (Ezra vii. 6). Not only the forms of temple-worship, the many dietary laws, the laws of Levitical purity, but even the agricultural regulations and the whole judiciary code had to be included in the work of reconstruction. Jewish tradition ascribes the continuation of Ezra's work to the *Sōpherīm* (scribes) or the men of the Great Synagogue.† After these the Sanhedrin of Jerusalem became the chief tribunal. From its decisions there was and could be no appeal. Thus, in the course of several centuries, a vast stock of laws and usages had accumulated which the Tōrāh (five books of Moses) did not directly authorize, but which were transmitted orally from generation to generation, and which Jewish orthodoxy refers back to the time of Moses (Oral Law). Academies arose for the propagation of this stock of tradition, and efforts began to be made to found the traditional enactments upon a biblical basis and support. This tendency received its chief impetus at the time that Sadducean opinions began to manifest themselves, and the Pharisean doctors found it imperative to emphasize their belief in the necessary development of the Law to suit the changed conditions.

* Long after the close of the Talmud a number of smaller tracts, composed in the form of the Mishna, made their appearance. They are appended to the 4th Seder under the general title of Minor Tracts. Besides these, seven lesser tracts were edited by R. Kirchheim from an ancient manuscript (*Septem libri Talmudici parvi*, Frankfort-on-the-Main, 1851). These are all of Palestinian origin, of obscure authorship, and have never been regarded as authorities.

† Doubt has been cast upon the existence of this body. See A. Kuenen, *Over de Mannen der Groote Synogoge* (Amsterdam, 1876).

The suppression of the Sadducean Sanhedrin at the death of Alexander Jannai and the triumph of Pharisees at the recall of Simon ben Shetach must have given the first immediate impulse to a classification of the Oral Law. Such classification, with its anti-Sadducean tendency, was introduced in the exegesis of the Law (*Midrash*)—e. g. the method of procedure of the Sanhedrin in the exegesis of Deuteronomy. Hillel the Elder (B. C. 32) carried on this work. Installed as patriarch in Palestine, he became the head of a numerous and learned school. To him is attributed the general arrangement of the Oral Law in six divisions. It is very probable that every great teacher had his own compilation which he handed down orally to his immediate disciples. We hear especially of a Mishna of Rabbi Akiba (about 100 A. D.), the celebrated Talmudist and martyr; and the compilation of R. Meir (about 150 A. D.)—to whom are ascribed the majority of the anonymous canons in our Mishna—became the foundation of the Mishna as it now exists.*

R. Jehudah Hannasi, simply called "Rabbi" (about 160 A. D.), was the one who gave final form to the Mishna. He examined anew the vast accumulation of ordinances, abridged and amplified it where necessary, but preserved the teachings of the Fathers—in so far as they met with his approval—in exactly the form in which he had received them. Here and there a few additions were made by later teachers, but these are unimportant, and are generally to be found at the end of the tracts. Whether the division of the Sedarim into tracts was the work of Rabbi or of his predecessors it is impossible to decide. The tracts, however, were known to the doctors of the Gemara, and Frankel has conclusively shown (*Hodogetica*, p. 264) that the Babylonian Gemara was already familiar with the division of the tracts into chapters. The arrangement of the chapters, however, in their present order is said to have been the work of the later Saboræans. The period of time which includes the men who are mentioned as authors of canons in the Mishna extends over five centuries and a half—namely, from the last of the scribes to the death of Rabbi. In the post-Mishnic epoch the name *Tannāīm* (teachers) was applied to those who had advanced opinions of their own in the disputations of the academies.

(*c*) *Language of the Mishna.*—This, though essentially Hebrew, differs from the more ancient Hebrew in important particulars. The natural development is shown in new and modified meanings which have sprung up side by side with the old; in the invention of new terms; in formal changes by means of which biblical words have been adapted to express new modes of thought. The influence of the Aramaic, which in the second century B. C. had become the ordinary language of the people, shows itself in the many Aramaic words received bodily into the language of the Mishna, as well as in many grammatical forms and syntactical constructions. Besides this, the spread of Grecian culture in Palestine favored the introduction of many Greek terms, and also, indirectly, of some Latin ones. Many of them, however, passed through Syrian channels on their way to Palestine, and are thus more or less modified in form.

(*d*) *The Composition of the Mishna.*—That the Mishna was not cast in a single mould must be plain to every one who is acquainted with its contents, form, and language. In many places the Mishna simply lays down the Law, omitting to mention the conflict of opinion that existed in regard to it. Elsewhere even the slightest diversity of opinion is noted. Certain ordinances are twice and three times repeated. One and the same ordinance is sometimes supported by totally different arguments in the different places in which it occurs. All this points to the conclusion that a considerable number of minor compilations already existed in the days of Rabbi Jehudah which he adopted, arranged, and enlarged, and in this way the general arrangement can be yet recognized. The oldest layer of Mishnas, dating back to the time of Alexander Jannai (see above), busied itself with the temple service and the court of justice. The tone is a general one, and a certain rhythm is perceptible. Their tendency was anti-Sadducean. The second layer busied itself with more minute and individual affairs. As nothing was reduced to writing, the material was arranged (1) as far as possible in the same order as the laws occur in the Pentateuch, (2) according to the outward agreement in the form of expression or in subject-matter. There are also indications by means of which the author of some of the individual parts of the work of R. Jehudah can be discovered.

(*e*) *Reduction of the Mishna to Writing.*—It was a general principle with the men of the Talmud that the traditional law ought not to be committed to writing. Unity of development was threatened if each teacher were to fix in writing his own collection. There is, however, sufficient evidence to show that at an early time both Haggada (exegesis) and Halacha (law) were committed to writing. But concerning the exact time at which the Mishna was written down, great diversity of opinion prevails. Some hold that Rabbi Jehudah arranged the Mishna in his own mind and transmitted it by word of mouth to his disciples; that it was thus preserved with verbal accuracy down to the time when the academies sank in importance, and it was found necessary to fix the traditions in writing.

Some hold, with a greater show of reason, that Rabbi Jehudah himself wrote out the greater part of the Mishna in full.

(*f*) *Authenticity of the Mishna Text.*—The text of the Mishna has suffered much, as it has passed through the hands of many copyists and compositors. It exists at present in three recensions: one in the manuscripts and editions of the Mishna, another embodied in the Talmud of Babylon, and a third in the Talmud of Palestine. All these differ greatly, and the text which was before the ancient commentators differs from that of any of the three recensions mentioned. Frankel has shown (*Mebo*, p. 20) that even during the lifetime of R. Jehudah and soon after his death the great authorities of Palestine did not scruple to subject his work to revision. For this reason criticism of the Mishna text plays so important a part in the Gemara of Babylon and of Palestine.

(*g*) *Commentaries on the Mishna.*—Maimonides (twelfth century) heads the list with his commentary, written in Arabic, of which only parts have been printed (Edward Pocock, *Porta Mosis* (Oxford, 1655); J. Barth, *Maimonides Commentar zum Tractat Makkoth* (Leipzig, 1881); J. Derenbourg, *Commentaries de Maimonide*, etc. (Berlin, 1886–91); E. Weill, *Der Commentar des Maimonides zum Tractat Berachoth* (Berlin, 1891); J. Zivi, *Der Comment. des Maimonides zum Tractat Demai.* (Berlin, 1891); S. Bamberger, *Commentar zum Tractat Kilajim* (Frankfort, 1891). A Hebrew translation may be found in many editions of the Mishna and the Talmud. He was followed by R. Tanchum, of Jerusalem, who wrote a lexicon of the Mishna in Arabic (Neubauer, catalogue of Hebrew MS. cols., 534, 535). Of the many commentaries which have appeared since then, it is only necessary to mention those of Asher ben Yechiel (1327), Obadya of Bertinoro (end of fifteenth century), Yomtov Lipmann Heller (1579–1654), Jacob ben Samuel Chagis (seventeenth century), which are to be found in the different editions of the Mishna.

(*h*) *Translations of the Mishna.*—About the middle of the seventeenth century the desire to become acquainted with the contents of the Mishna was manifested also by Christian scholars. Translations of all or single portions of the Mishna began to appear in Latin, Spanish, Italian, French, English, and German. The most important are Guilielmus Surenhusius, *Mishna sive totius Hebræorum juris Systema* (Amsterdam, 1698–1703); *Mishnayott*, edited by J. M. Jost (vocalized text with German transl. in Hebrew letters), Berlin, 1832–34; J. J. Rabe, *Mischnah oder der Text des Talmuds* (Ansbach, 1760–63); E. Baneth, *Mischnaiott . . . nebst Deut. Uebersetz.* (Frankfort-on-the-Main, 1888); A. Sammter, *Mischnayott . . . mit . . . Deut. Uebers.* (Berlin, 1886); D. A. de Sola and M. J. Raphal, *Eighteen Treatises from the Mishna* (London, 1843); J. Barclay, *The Talmud* (London, 1878); *Yoma, or the Day of Atonement*, Palestine Exploration Fund, Quarterly Statement (1885); *Middoth, or the Measurements of the Temple, ibid* (1887). For an account of the numerous editions of the Mishna, see Fürst, *Bibliotheca Judaica*, ii., p. 40, i.; Benjacob, *Oṣar Hassepharim* (1880), pp. 399 ff.

(B) *The Gemara.*—The term *Gemara* is of Aramaic origin, and its signification is the same as that of Talmud—teaching. It is also used to designate the method of deduction current in the schools as well as *tradition* itself. Ordinarily it denotes the whole body of controversies and teachings which arose in the academies after the close of the Mishna, and which, being collected in writing, now form the second and major part of the Talmud. There are two Gemaras, the one elaborated in the academies of Babylon, the other having Palestine for its birthplace. The customary name

* Dr. Lewy, *Ueber einige Fragmente aus der Mischna des Abba Saul*, has endeavored to show that Abba Saul (about 100 A. D.) collected a Mishna which was used in the final redaction.

given to the latter, Gemara of Jerusalem, is erroneous, as no academy existed in Jerusalem after the destruction of the temple.

(*a*) *The Gemara in its Relation to the Mishna.*—The Gemara is in general a commentary to the Mishna, to the words of which it attaches its discussions, explaining terms and things wherever necessary, harmonizing discrepant statements, and endeavoring to refer anonymous decisions to their proper authors. Nor does the Gemara ever lose sight of extra-Mishnic compilations, but discusses to what extent these may be brought into agreement with the Mishna. Furthermore, it formulates new ordinances, and reports in full the controversies that took place in the academies in respect to all these and kindred subjects. For this reason the authorities who lived after the close of the Mishna are called *Amoraim* (expounders), in contradiction to the Mishnic authorities who are known as *Tannaim* (teachers). But the Gemara has also gathered the utterances which have dropped from the lips of great masters and the traditions which had been preserved of their life and actions. Thus it contains *legal enactments, homiletical exegesis of scripture, gnomes, maxims, proverbs, parables, tales*, and also *medical, mathematical*, and *astronomical* data.

The Talmud divides its component elements into two distinct classes. The one class includes the ritual and ceremonial, the civil and criminal laws, and also the chief heads of ethics (*Halacha*, way, custom, law; cf. *Acts* 9, 2, etc.). Everything not legal is embraced under the term *Haggada* (non-Halachic interpretation of Scripture). Haggadic utterances are considered as individual and without binding authority, though some have become so hallowed by tradition that even the Halacha employs them as the basis of some of its enactments. The Mishna is exclusively occupied with Halacha. A few Haggadic elements are found chiefly at the end of tracts, but they are undoubtedly later additions. A single Mishnic tract is devoted to Haggada (*Aboth*, Sayings of the Fathers), but its distinct anti-Sadducean tendency was the cause of its early redaction.

(*b*) *Ancient Elements in the Gemara.*—Shortly before and after the close of the Mishna various collections of ordinances and disputations were made, where Halacha was interspersed with more or less Haggada. A few of these (so-called Halachic Midrash) are still preserved, though expanded by later writers and corrupted in the course of time. They are the Tosephta, composed after the manner of the Mishna, but with discussions and explanations; the *Mechilta, Siphra*, and *Siphri*—all three arranged in the form of a running commentary on Exodus, Leviticus, and Deuteronomy. These, and perhaps others now lost, bore the general titles *Mathnitha* (collection of teachings), rarely *Bārāitōth* ("productions extraneous" to the Mishna). These *Bārāitōth* are often quoted in the Talmud for the purpose of throwing light upon obscure passages in the Mishna or with a view to determining their own value. But certainly they are in a state of sad confusion, as can be seen from many *Bārāitōth* which are quoted in Tosephta, Mechilta, etc., compared with their citation in the Gemara.

(*c*) *Scope of the Two Gemaras.*—The Gemara of Babylon does not cover more than 37 Mishnic tracts. (There are wanting in *Zeraim* 10, *Moed* 1, *Nezikin* 2, *Kodashim* 2, *Teharoth* 11.*) It will be seen that the tracts omitted deal mostly with matters which pertained specially to the land of Israel. The tracts of the fifth division, however, have received a commentary, because of the firm hope that a sacrifice would at some future day be introduced, and because the study of sacrificial laws was deemed equally meritorious with the performance of the sacrifice itself. It must not, however, be supposed that the omitted tracts were entirely neglected by the Amoraim of Babylon. They are frequently mentioned, and are often the subject of elaborate disputation.

The Gemara of Palestine extends over 39 tracts—i. e. over the first four books and over a part of the sixth. It is true that the text of the Palestinian Gemara is full of gaps, in view of which some scholars have thought that there was at one time a Palestinian Gemara to the whole Mishna. But the evidence is insufficient, and only makes it probable that a Gemara to the whole of Nidda in the sixth book (see *Tosaphot to Nidda*, 66 a) did exist at one time.

(*d*) *The Language of the Two Gemaras.*—Aramaic, which, as has been said, had become the language of the people, had branched off into Eastern and Western Aramaic. The Jews in Babylon had introduced into the Eastern Aramaic a number of Hebrew words and expressions, as the Jews in the Middle Ages have done in their Judæo-German dialect. In this Hebræo-Aramæan the Babylonian Talmud is written, but the want of good MSS. and the ignorance of copyists make it difficult to study its linguistic phenomena. The Palestinian Gemara is composed in the current Eastern Aramaic, of which there are other representatives in the Christian Palestinian dialect and in the Samaritan. The Palestinian Gemara has preserved more closely than the Babylonian the actual pronunciation of its day, in which letters belonging to the same order of speech interchange readily. It contains also a much larger quantity of Greek words than does the Babylonian.

(*e*) *The Form of Discussion in the Two Gemaras.*—In style and form both Gemaras exhibit the common attribute of pregnant brevity and succinctness. This is especially true in the terminology of the schools, where a single word often indicates whole sentences. As there are neither vowel-sounds nor interpunctuation, and as question and answer are stylistically closely interwoven, it needs the practiced eye of the scholar to discern where the one ends and the other begins. The Palestinian Gemara is still more economical. In *material* and *method* of discussion a difference is seen between the more ancient and the younger Amoraim of Babylon. The former aim at condensation, and restrict themselves to plain and simple exegesis and deduction. The younger Amoraim, particularly since the days of Abaya and Rabba (fourth century), argue rather for the sake of mental exercise. They raise artificial difficulties only for the purpose of unraveling them again; and this method obtained the ascendency in the schools against the older form and in practical cases of conflicting authority. The Gemara of Palestine refrained altogether from such attempts at unbridled dialectics. In its treatment of the Haggada, too, it is simpler and more rational; while the Babylonian Haggada is full of gross exaggerations; of demonology and of witchcraft, borrowed from the Zoroastrianism that surrounded it on all sides, though it is not wanting in noble moral principles and in deep sentiments.

(*f*) *The Teachers of the Two Gemaras.*—From the time of the older Amoraim (end of third century) to the middle of the fifth century seven generations of scholars are mentioned in the Babylonian and six in the Palestinian Talmud up to the first half of the fourth century. Until the disorders of war made it impossible, an unbroken bond of reciprocity had connected the schools of both countries. Young students from Babylon sought the Palestinian academies, and after years returned home with fresh materials. The reverse was sometimes the case. Thus at times we find Palestinian authorities cited in the Babylonian Gemara, and *vice versa*; but numerous inaccuracies and contradictions occur, the same ordinance being at times attributed to different Amoraim in the two Gemaras. This is often due to the corruption of the text and the similarity of names.

(*g*) *The Compilers of the Gemara and the Date of their Compilation.*—The rapid growth of the material on the one hand and the religious persecutions under the Sassanide kings Yesdigerd II. and Phiruz on the other necessitated the collecting and ordering of the discussions of the Amoraim in Babylon. Tradition and research places this toward the close of the fifth century, and ascribe its editing to R. Ashi (head of the school in Sura from 375–427 A. D.). But R. Ashi was by no means the first, last, or only one engaged in the work. Some of the tracts differ strikingly from others, and repetitions are very numerous. At an early date attempts were made by means of mnemotechnic signs to give assistance to the memory, and it is very possible that many of the tracts, or parts of them, had been previously arranged by earlier Amoraim. R. Ashi rearranged, corrected, and perhaps completed them. Nor was the redaction finished by R. Ashi; tradition expressly mentions R. Abhina, ii. (473–499 A. D.) as coeditor; and authorities are quoted in the Gemara who lived toward the end of the fifth century. The final redaction was made under the Saboraim (the followers of the Amoraim in the sixth century. But the work was never formally closed. It was never intended that there should be a canon of the Gemara. The assertion of Graetz that "further additions and extensions could no more be admitted" is a simple fiction. Not only have marginal notes crept into the text, but long passages of Halachic tendency and numberless Haggadas have been interpolated into the

* Schiller (*Encycl. Brit.*, xxiii., 36) says that the Gemara to *Shekahim* and the five smaller tracts are wrongly added to the Babylonian Gemara.

Gemara. Even passages from the famous commentary of R. Yitschaki have been incorporated in the text. Indeed, in the Middle Ages it was a mooted point whether R. Ashi himself wrote down any of the Gemara. It seems impossible to believe that R. Ashi could have orally arranged so voluminous a work (ten or eleven times as large as the Mishna); and there exists an authentic tradition that R. Ashi revised the Gemara in a second edition.

Of the authorship and date of completion of the Palestinian Gemara still less is known. By an ancient tradition its authorship is ascribed to R. Jochanan (end of second century). But that is impossible, as everywhere one meets with the names of Amoraim who flourished centuries after R. Jochanan. Perhaps the tradition merely indicates that R. Jochanan was the author of the Mishna recension found in the Palestinian Gemara. J. H. Weiss has endeavored to prove that R. Jose ii. (about the middle of the fourth century) laid the foundation upon which the Palestinian Talmud was built. In regard to the date of composition the same uncertainty exists. Isaac Alfassi asserts that the authors of the Babylonian Gemara were acquainted with that of Palestine. During the Middle Ages all deferred to his authority. Jost declares that it was edited hardly 100 years after the close of the Mishna. Rappoport and Chayoth (*Mebo*, p. 28 b) agree with Alfassi. Frankel refutes their arguments; but concedes that the close of the Palestinian preceded that of the Babylonian by several centuries. Wiesner assigns to its completion so late a period as that between 760–900. Steinschneider is correct in saying that it was not edited before the last third of the fourth century (as Diocletian, Ursicinus, and Julian are mentioned); and it probably received its final form at the time of the abolition of the patriarchate of Tiberias, in the last quarter of the fifth century.

(*h*) *Condition of the Text of the Gemaras.*—It is hardly to be expected that the text of the Babylonian Gemara, which has passed through the hands of so many copyists and compositors, should be very correct; but the disfigurement of the text as it stands is greater than in the case of any other work which has been handed down to us from ancient times. Three causes have occurred to bring about this result: (1) Unfortunately, the text of the Talmud was not treated with that care accorded to the biblical text. Incompetent men have inserted marginal notes in the text, have omitted whole sentences, and have confused names and things in general. Would-be critics have made uncalled-for changes in the text to suit their pleasures—an abuse already complained of by Hai Gaon. (2) Pious censors, who continued to pursue the literature of the Jews with a fanatical hatred almost to the present day, found a peculiar pleasure in venting their spite upon the Talmud. Ignorant and overzealous as most of them were, they not only expunged the few passages that refer to the founder of Christianity, but many others which they wrongly construed to be disguised attacks upon Christianity. Jewish editors themselves, in sheer self-defense, undertook to erase what a mournful experience had taught them was liable to give offense. (3) Good MSS. became very scarce, owing to the bigotry of mediæval popes. Acting upon the order of Louis IX., cartloads of the Talmud were burned in Paris 1242. Clement IV. (1265–68) sent to the Bishop of Tarragona a bull ordering that all copies of the Talmud should be handed over to the Franciscans and Dominicans, who were to burn whatever was anti-Christian. Gregory IX. in 1239 ordered the archbishops in France, Spain, and Portugal to confiscate all possible copies of the Talmud. Fortunately the passages which have been expunged or disfigured have been published separately.

Since the invention of printing not less than fifty complete editions of the Talmud have been published (see Rabbinovicz, *Dikduke Soferim*, p. 42), besides hundreds of single tracts. None of these, however, can be said to contain a philologically correct text. It is true that from the sixteenth century on attempts have been made to justify the text of the Gemara, notably by such scholars as Solomon Luria (1582), Samuel Kaidonover (1697), Isaac Berlin (1800), Elia of Wilna (1797), and Akiba Eger (1837). R. Rabbinovicz, in his *Variæ Lectiones*, 15 vols., Munich, 1868–86, has collected a large number of variants, especially from the celebrated Munich MS. But the first systematic attempt to formulate the requirements for such an edition was made by F. Lebrecht. In 1886 the Semitic section of the Seventh Oriental Congress publicly expressed its desire in this direction. M. Friedmann has accordingly attempted such a critical edition of *Sukkoth*, but hardly with success.

A trustworthy scientific text can be gotten only by (1) a comparison of all available MSS., (2) a comparison of parallel passages in both Gemaras, (3) a collection of all the citations in the older compendia,* in the commentaries,† and in the lexicon of R. Nathan ben Yechiel. A good beginning has been made in this direction by Max L. Margolis in his *Commentarius Isaacidis quatenus ad textum Talmudis investigandum adhiberi possit* (New York, 1891); *The Columbia College MS. of Meghilla* (New York, 1892).

The Palestinian Gemara has fared still worse. The corruption of its text is visible on every page. It has not suffered so much as the Babylonian from censorial interference and from the mistakes of copyists, for during a long period it remained unknown in the schools, and even after it had become known it was barely noticed, much less critically studied by scholars. But it has suffered from want of attention and pure ignorance of the Aramaic dialect in which it is written. Its unguarded condition has caused it to be largely interpolated, especially in its Haggadic portions. Wiesner has endeavored to show that such interpolations, evidently aimed against the reputation of the great bearers of Talmudic tradition, were at times the work of the Karaites, whose chief seat was in Palestine. Though this has been denied by Geiger, S. Adler has brought additional proof of this view in his *Kobeṣ al Yadh*. Only one complete MS. of the Palestinian Gemara exists in Leyden and one fragment in Oxford.

(*i*) *The Literature of the Talmud.*—For eighteen centuries Jewish thought has almost wholly moved within a sphere of which the Talmud was the center. The more the Jews were oppressed the more fruitful did their literary activity become. It kept the soul alive while the body was almost dead. An immense literature has grown out of and around the Talmud. A bare list of such would fill a bulky volume. (For the older literature, see Steinschneider, *Jew. Lit.*, London, 1857, and *Catal. Libr. Hebræor. in Bibl. Bodleiana*, Berlin, 1860. For the newer literature, Ben Jacob, *Oṣar Hassepharim*, Wilna, 1880, and the ordinary bibliographies.) They may be roughly referred to the following categories: (1) Epitomes (Halachoth). (2) Commentaries, primary and secondary. (3) Novellæ (extended disputations on Talmudic topics). (4) Digests, and commentaries on them. (5) Collections of commandments (containing the Talmudic ordinances in peculiar arrangement. (6) Ritual and legal questions and answers. (7) Religious discourses. (8) Polemic and apologetic works. (9) Lexica and works of reference. (10) Collection of Proverbs. (11) Historical and bibliographical works. (12) In modern times monographs and larger treatises of a scientific character. This great literature is written mainly in rabbinical Hebrew, but a number of works have appeared in Arabic, and latterly in almost every European language.

(*j*) *Some Auxiliaries to the Study of the Talmud.*—Very little has been done toward the grammatical treatment of the Talmudic texts; but see S. D. Luzzato, *Elementi Grammaticali del Caldeo Biblico e del Dialetto Talm. Babyl.*, Padua, 1865 (Germ. transl. by Krüger, Breslau, 1873; Eng. by J. S. Goldammer, New York, 1876); and the monographs G. Rülf, *Zur Lautlehre der Aram. Talmud. Dialekte* (Breslau, 1879); I. Rosenberg, *Das Aramäische Verbum im Babyl. Talmud.* (Marburg, 1888); M. G. Landau, *Geist und Sprache der Hebräer* (Prague, 1822); G. Dalman, *Gramm. d. galiläischen Aramäische* (Leipzig, 1894).

As to lexicons, the situation is more favorable. *The Aruch*, by Rabbi Nathan, of Rome, after having been enlarged by Benjamin Musaphia and M. J. Landau, has been re-edited according to the editio princeps and some MSS. in the monumental work of A. Kohut, *Plenus Aruch* (or *Aruch completum*; 8 vols., Vienna, 1878–92). Buxtorf's *Lex. Talmudicum* has been re-edited and enlarged (though not successfully) by B. Fischer (Leipzig, 1875). See also S. M. Bondi, *Or Esther* (Dessau, 1812); A Stein, *Talmudische Terminologie* (Prague, 1869). In modern languages should be mentioned J. Levi, *Chald. Wörterb. über die Targumim* (Leipzig, 1867); *Neuhebr. und Chald. Wörterb.* (Leipzig, 1876–89); M. Lattes, *Saggio di giunte e correzione al Lessico Talm.* (Turin, 1879); *Nuovo Saggio* (Rome, 1881); *Miscellanea Postuma*, fasc. i., ii. (Milan, 1884–85); M. Jastron, *A Dict. of the Targumim, the Talmud*, etc. (London and New York, 1886, *seq.*); J. Fürst, *Glossarium Græco-Hebræum*

* Such as the *Halakhot Gedholoth*, the *Sheeltoth of R. Achai Gaon*; the compendium of *Alfasi*; Jacob ibn Chahib's compendium of the Haggada *En Jacob*.

† Gershon ben Jehudah, Chananel, Nissim, Solomon ben Isaac (Rashi), the compilers of the Tosaphot or additions, Moses ben Maimon.

(Strassburg, 1891); Arsène Darmesteter, *Le Talmud* (in *Rev. Étud. Juives*, xix., p. ccclxxxi). As a general work of reference, J. Hamburger, *Real-encyclopädie für Bibel und Talmud* (Strelitz, 1883–86) may be consulted. See also a paper by T. Theodores, *The Talmud*, in *Owens College Magazine*, pp. 329–378; S. Schecter, *On the Study of the Talmud*, *Westminster Review* (1885); and especially the learned treatise of H. S. Strack, *Einleitung in den Thalmud* (Leipzig, 1887; 2d ed. 1894).

Much less has been done for the Palestinian Talmud; but see Zach. Frankel, *Introductio in Talmud Hierosolymitanum* (Breslau, 1870); M. Schlesinger, *Das Aram. Verbum im Jerusal. Talmud* (Berlin, 1889).

(*k*) *Translations of the Talmud.*—No work is so difficult to translate into a modern language as is the Talmud. Its condensed and peculiar style makes it unintelligible to one who can not make use of it in the original. The following attempts have been made, but they are all to be used with great caution: G. E. Edzard, *Tractatus Talmudici Avoda Sara* (Hamburg, 1705); B. Ugolini, *Thesaurus* (*Zebachim Menachoth, Tamid Sanhedrin*) (vol. xix., 1756; vol. xxv., 1762); Chiarini, *Berachoth* (Leipzig, 1831); Joh. J. Rabe, *Der Talmudische Tractat Berachoth* (Halle, 1777); E. M. Pinner, *Talmud Babli, Tractat Berachoth* (Berlin, 1842); F. C. Ewald, *Abodah Sarah* (Nuremberg, 1856); A. Sammter, *Tractat Baba Meşia* (Berlin, 1876); M. Rawicz, *Der Traktat Megilla* (Frankfort-on-the-Main, 1883); D. O. Straschun, *Der Traktat Taanit* (Halle, 1883); M. Rawicz, *Der Traktat Rosch ha-Schanah* (Frankfort-on-the-Main, 1886); Aug. Wuensche, *Der Babyl. Talmud in seinen Haggadischen Bestandtheilen* (2 vols., Leipzig, 1886–87); A. W. Streane, *A Translation of the Treatise Chagigah* (Cambridge, 1891); M. Rawicz, *Der Traktat Sanhedrin* (Frankfort, 1892); *Talmud in Maráthi*, transl. by Rámchandra Náráyan Neue (Bombay, 1884, *seq.*).

Of the Palestinian Talmud there is translation of seventeen tracts in B. Ugolini's *Thesaurus antiquitatum Sacrarum* (vols. xvii,–xxx., Venice, 1755–65); Moïse Schwab, *Le Talmud de Jérusalem traduit* (Paris, 1871, *seq.*; Eng. transl. of vol. i., London, 1885); M. Schwab, *Traité des Berakhoth* (Paris, 1871); J. J. Rabe, *Der Talm. Tractat Peah . . . aus der Hierasol. Gemara übersetzt* (Ansbach, 1781); Aug. Wuensche, *Der Jerus. Talmud in seinen Haggad. Bestandtheilen* (Zurich, 1880).

(*l*) *General Character and Importance of the Talmud.*—It is almost impossible to give in one paragraph an idea of what the Talmud is in its entire scope. From early times it has been customary to speak of the Ocean of the Talmud. The metaphor is well chosen to characterize a work so gigantic in proportions, so unique in the world's literature. It is a sea into which during many centuries have flowed the waters of Jewish life and Jewish thought. It swarms with a thousand varied forms of life. The Talmud is no dry handbook. It is an open encyclopædia of rabbinical Judaism, containing not only a digest of laws, enactments of ceremonial, moral, religious, and social character, but a record of the discussions themselves on each and all of these subjects; the history of the men who appear on its pages, their sayings and doings, and the record of the events which took place in the political life of the people during so eventful a period.

The Talmud has suffered much both from its worshipers and detractors. For the great mass of Jews it has been the one regulator of their every action, and has been held in as high esteem as the Bible. By its detractors it has been branded as "the product of a subtlety run mad." But a just and intelligent estimate of the great work finds hidden in its depths innumerable pearls and many priceless treasures, though at the same time much that is useless and the product of an over-developed casuistry, which the world and a large proportion of the Jews have now outlived. The Talmud is the mirror of its age, and the men of the Talmud, however exalted they may have been in intellect and character, were none the less the children of their age. The early Fathers of the Christian Church and the scholastics of the Middle Ages were imbued with the same spirit of casuistry; but neither class is regarded as authoritative in matters of belief and action, but as marking an epoch in the history of the Christian Church. Modern scientific inquiry will treat the Fathers and Scholastics of the Talmud as the Jewish representatives of a system matured in the past. It will find in the Talmud a source for the history of a great part of the Jewish mind, and will thus secure for the Talmud a place among the literary monuments of the world.

(*m*) *Science.*—The religion of Judaism, as represented in its Talmudic form, was a religion of life. It accompanied its adherent from the cradle to the grave. The Talmud, therefore, whose object it was to develop religion, to that extent had often to treat of questions of general science. The Haggada, too, offers scientific material in abundance. For the history of the different sciences there is much material buried in the discussions of the Talmud. The following branches are represented:

1. *Mathematics.*—Apart from scattered allusions, entire chapters of several tracts are devoted to mathematics for the purpose of fixing various religious observances. See the literature in Steinschneider, *Hammaskir* (1875); Mahler, *Ueber den Talmud als Quelle für das Studium der Geschichte der Mathem.* (*Jüd. Litt. Blatt*, xii. 1883).

2. *Medicine* is treated of in numerous places in the Talmud. No complete collection of all the passages has been made, but see S. Cohn, *De Medicina Talm.* (Breslau, 1846); J. Wunderbar, *Biblisch-Talmudische Medicin* (Riga and Leipzig, 1850); Alois Brecher, *Der Aderlass im Talmud* (in *Prager Medicin. Wochenschr.*, 1873); Joseph Bergel, *Die Medicin der Talmudisten* (Leipzig, 1885).

3. *Botany* is represented in the Talmud in the discussions on the agricultural laws, etc. The whole material has been definitely collected in the excellent work of Im. Low, *Aramäische Pflanzennamen* (Leipzig, 1881).

4. *Zoölogy.*—See L. Lewysohn, *Zoologie des Talmud* (Frankfort-on-the-Main, 1858); J. Bergel, *Studien über die Naturwissenschaftlichen Kentnisse der Talmudisten* (Leipzig, 1880).

5. *Astronomy.*—In addition to scattered notices on the subject, astronomy is especially discussed in the treatise *Rosh Hashanah* in regard to the fixing of the new moon. See S. Gobermann, *Sheerith Yaakob* (Vilna, 1884).

6. *Law.*—In this direction the Talmud offers vast material, which has given rise to numerous monographs, of which the principal are Frankel, *Der Gerichtl. Beweis nach mosaisch-talmudischem Rechte* (Berlin, 1846), *Zur Kenntniss des mosaisch-talmudischen Criminal- und Civilrechts* (Berlin, 1860), and *Grundlinien des mosaisch-talmudischen Eherechts* (Breslau, 1860); Mayer, *Die Rechte der Israeliten, Athener und Römer* (Leipzig); J. Wiesner, *Der Bann* (Leipzig, 1864), *Das mosaisch-talmudische Polizeirecht* (Leipzig, 1879); M. Mielziner, *The Jewish Law of Marriage and Divorce* (Cincinnati, 1884); J. J. M. Rabbinowitz, *Législation criminelle du Talmud* (Paris, 1876), *Législation civile du Thalmud* (5 vols., Paris, 1877–80); M. Bloch, *Das mosaisch-talmudische Erbrecht* (Leipzig, 1890).

7. *History.*—As the Talmud contains the product of the Jewish mind for 1,000 years, it is almost the only guide for the understanding of the development of Judaism from the close of the Bible to the close of the Babylonian Gemara. It also offers much archæological material which still awaits research. For a proper insight into the origin and beginnings of Christianity, the Talmud is an invaluable source. Much that is in the New Testament, its mode of exegesis, its allusions, and the conflict between the different sects of the time can be understood only in connection with the social and scholastic life (of which it was a part) as portrayed in the Talmuds. See Aug. Wuensche, *Neue Beiträge zur Erläuterung der Evangelien aus Talmud und Midrash* (Göttingen, 1878); M. H. Bennet, *The Mishna as Illustrating the Gospels* (Cambridge, 1884); Ferd. Weber, *Die Lehren des Talmuds* (Leipzig, 1888); E. Schürer, *A History of the Jewish People in the Time of Christ* (New York, 1891).*

8. *Geography.*—As may be expected, much geographical information, especially in regard to Palestine, Syria, and Babylonia, is contained in the Talmud. Zunz was the first to call attention to this. See *Gesammelte Schriften* (i., pp. 151–154); Berliner, *Beiträge zur Geographie und Ethnographie Babyloniens* (Berlin, 1883); A. Kohut, *Lakes of the Holy Land* (in *Jew. Quart. Rev.*, iv., p. 690, *seq.*).

9. *Pedagogics.*—Even before the destruction of the temple elementary and higher schools existed all over Palestine. The material on this subject has been collected by S. Marcus, *Zur Schulpädagogik des Talmud* (Berlin, 1866); J. Weisen, *Geschichte und Methodik d. Schulwesens im Talmud* (Strassburg, 1892).

10. *Ethics.*—From the description of the Talmud as given here, it will be seen how difficult it is to speak of the ethics of the Talmud as a whole. As there is no system of phi-

* For the influence of the Talmud on Mohammed, see Geiger, *Was hat Mohammed, etc.* (Bonn, 1833); Hirschfeld, *Beiträge zur Erklärung des Koran* (Leipzig, 1886).

losophy or of psychology, so there is no real system of ethics contained in the Talmud. We find there the individual opinions of different teachers, living at different times and under different circumstances. It is as wrong to make the whole Talmudic Judaism responsible for certain views as it is to foist upon the official Halacha the beautiful flights of individual teachers. The terrible accusations of Wagenseil, Eisenmenger, and Rohling (where they are not directly falsified), have magnified the one, while the panegyrics of Emanuel Deutsch and S. R. Hirsch have contributed little toward arriving at a just estimate; but, on the whole, it may be truthfully said that the general ethical level of both Halacha and Haggada is a high one, reaching in many of the leading spirits of the day to the full height of moral excellency of their time, and that where it does recede from this height it is due to political and social oppression, or to an excessive use of casuistical argumentation.

Non-Jewish scholars who were acquainted with its contents, such as Reuchlin, Buxtorf, Herder, F. Delitsch, and H. Strack, have even become its strenuous defenders; and it may indeed be said that it is due to the Talmud that the long centuries of heartrending persecutions which the Jews have had to suffer have been unable to break down their spirit or degrade their intellectual, moral, and emotional life. See Ad. Lowy, *Die Tugend und Sittenlehre des Talmud* (Vienna, 1890); S. Schaffer, *Das Recht und seine Stellung zur Moral* (Frankfort, 1889); Leopold Dukes, *Rabbinische Blumenlese* (Leipzig, 1844); and cf. A. Keunen, *Volksreligion und Weltreligion* (Berlin, 1883), p. 188. See BIBLE.
Revised by RICHARD GOTTHEIL.

**Tal'pidæ** [Mod. Lat., named from *Tal'pa*, the typical genus, from Lat. *tal'pa*, mole]: a family of insectivorous mammals embracing the moles and the desmans. The ears are rudimentary, and the eyes very small; the skull is nearly smooth, and the posterior ridges are obsolete; the foramen magnum is oblong, and inclined far forward below; there are no distinct postglenoid processes; the tympanic elements form auditory bullæ; the zygomatic arches are slender rods: the teeth are in number M. $\frac{3}{3}$, P. M. $\frac{3-5}{3-5}$, C. $\frac{1}{1}$, I. $\frac{2-3}{1-3} \times 2$, and also differ in development; in the upper jaw the true molars mostly (i. e. M. 1 and M. 2) have each four primary external and two primary and more elevated internal cusps, and an internal ledge bearing a cusp along its inner wall, but no secondary lower ledge behind the principal internal one; in the lower jaw the true molars have each two primary external cusps and three primary internal ones, connecting, and by their union circumscribing, triangular areas; the other teeth vary much in the several groups; the vertebræ are characteristic in that the cervicals have no hypapophyses, and the dorsal and lumbar no hyperapophyses; the sternum has a broad and keeled manubrium; the fore limbs are generally developed more than the posterior; the carpi are more or less enlarged, and have at least each an additional ossicle developed as an os intermedium: the scapulæ are long and narrow. (1) The *Talpinæ* include the moles, and have the body large and subcylindrical, the neck short, and the fore limbs short and very wide, and eminently adapted for digging; the skull is inflated at the pterygoid regions, and has no distinct pterygoid fossæ; the lower jaw is contracted under the ascending rami: the incisor teeth are in good number ($\frac{3}{3-2}$); the sternum has a very elongated manubrium; the clavicles are short and broad, the humeri broad, and enlarged at their angles; and the carpi have each an enlarged, sickle-shaped bone. (2) The *Myogalinæ* are in external appearance considerably like the shrews or long-snouted mice; the skull is not inflated at the pterygoid regions, and has distinct pterygoid fossæ; the lower jaw is extended below under the ascending rami; the incisor teeth are in reduced number ($\frac{2}{3}$ or $\frac{2}{1}$); the sternum has a manubrium of moderate size; the clavicles are elongated; the humeri subcylindrical; and the carpi have no sickle-shaped bones. The family is entirely confined to the northern hemisphere, and each great region is characterized by peculiar forms. Of the moles, the typical species (forming the group *Talpæ*, distinguishable by dental characters) are represented by the genera *Talpa* and *Scaptonyx* in Europe and Eastern Asia, and aberrant groups (*Condyluræ* and *Scalopes*) are exemplified by four genera in North America—viz., *Condylura*, *Scalops*, *Parascalops*, and *Scapanus*. Of the *Myogalinæ*, one genus (*Desman* or *Myogale*) is represented by species in certain parts of Europe (e. g. Pyrenees) and Asia; another (*Uropsilus*) is peculiar to Southern China or Tibet; a third (*Urotrichus*) has species in Japan; and a fourth (*Neurotrichus*) in America W. of the Rocky Mountains. See DESMAN and MOLE.
Revised by F. A. LUCAS.

**Taluses**: See PHYSIOGRAPHY.

**Talvi**: pseudonym for THERESE ALBERTINE LUISE ROBINSON (*q. v.*).

**Tama**: city; Tama co., Ia.; on the Chi. and N. W. and the Chi., Mil. and St. P. railways; 2 miles S. of Toledo, the county-seat, and 51 W. of Cedar Rapids (for location, see map of Iowa, ref. 5–I). It is in an agricultural region, and has a public park, 6 churches, public and parochial schools, water-works, electric-light and street-railway plants, a national bank with capital of $50,000, a private bank, and 2 weekly papers. The city has excellent water-power, and flour, saw, and paper mills, egg-case, cigar, and broom factories, and 3 machine-shops and factories. The reservation of the Sac and Fox Indians is in the township. Pop. (1880) 1,289; (1890) 1,741; (1900) 2,649.
EDITOR OF "HERALD."

**Tamagawa**: a river of Japan, flowing eastward into the Bay of Tokio, which it enters a few miles S. of that city. For over two centuries Tokio has received a supply of pure water from a canal cut from this river to the Yedogawa; and the water-works, with modern plant, obtain their supply from the same source. Cormorant-fishing is practiced at the Sekido ferry on this river. The finest cherry-blossoms found in the vicinity of Tokio occur at Koganei, on its banks. Hachioji, a silk-manufacturing center, is near the Tamagawa and about 25 miles from its mouth. J. M. D.

**Taman'dua** [= Portug., from the native name; said to be Tupi *taa*, ant + *munden*, trap]: a species of ant-eater (family *Myrmecophagidæ*), found in Brazil and other parts of northeastern South America, and distinguished by its arboreal habits and long prehensile tail. The hair is short; the color of the head, shoulders, fore limbs, hind limbs outside, and tail along the middle is white; a stripe from each side of the neck over the shoulder and remaining part black. The native name has been accepted as a generic term, and the species is now known as *Tamandua tetradactyla*.
Revised by F. A. LUCAS.

**Tama'qua**: borough (settled in 1799, incorporated in 1832); Schuylkill co., Pa.; on the Tamaqua or Little Schuylkill river, and the Cent. of N. J. and the Phila. and Read. railways: 17 miles E. N. E. of Pottsville, the county-seat, and 40 miles N. of Reading (for location, see map of Pennsylvania, ref. 5–H). It is in a coal-mining region, and contains a public high school, 24 graded public schools, 12 churches, gravity water-works, gas and electric lights, a national bank with capital of $100,000, a State bank with capital of $47,130, 3 foundries and machine-shops, 2 planing-mills, flour-mill, powder-mill, screen-works, and a semi-weekly and a weekly newspaper. Pop. (1880) 5,730; (1890) 6,054; (1900) 7,267.
EDITOR OF "COURIER."

**Tamarack**: See HACKMATACK.

**Tamarind** [from Arab. *tamarhindī*, liter., Indian date; *tamar*, date (cf. Heb. *tāmār*, palm-tree) + *Hindī*, Indian, deriv. of *Hind*, India]: a beautiful leguminous tree, the *Tamarindus indica*, from Southern Asia and Africa, now naturalized in most warm regions. The pods are filled with a pleasant sour pulp, which is preserved with sugar, and is used for making a drink for fever patients, etc. Tamarind-pulp contains citric, tartaric, and malic acids, potash, sugar, vegetable jelly, etc. As a salt of copper is a common adulteration, a piece of polished iron (as a knife) should be left in the pulp for about an hour, when, if copper be present, it will be deposited on the iron. Tamarind-pulp is refrigerant and gently laxative, and is employed in the diseases of children. The tree is sparingly grown in Southern Florida and along the north shore of the Gulf of Mexico. The wood is very hard and handsome.
Revised by L. H. BAILEY.

Tamarind (*Tamarindus indica*).

**Tamarisk Family** [*tamarisk* is from Lat. *tamaris'cus, ta'marix*; cf. Sanskr. *tamālaka*, a kind of tree]: the *Tamariscaceæ*, a small group of about forty-five species of dicotyledonous shrubs or trees, mostly of the temperate and warmer regions of the northern hemisphere, with regular, hermaphrodite flowers, having five sepals, five petals, five to many stamens, and a superior one-celled, many-ovuled, three to five carpellary ovary. The leaves are alternate and small, often scale-like. The most important genus is *Tamarix*, which includes about twenty species, several of which are cultivated for their pretty pink flowers and beautiful foliage—e. g. *T. articulata*, *T. dioica*, *T. parviflora*, *T. tetrandra*, and *T. gallica*, the common tamarisk, which has run into many varieties. An interesting relationship has been shown to exist between this family and the WILLOW FAMILY (*q. v.*), in which the flowers are simplified from the tamarisk type. CHARLES E. BESSEY.

Common tamarisk (*Tamarix gallica*).

**Tamatave**, taa-maa-taav': town and port on the east coast of Madagascar; lat. 18° 10' S., lon. 49° 28' E., 140 miles E. N. E. of Tananarivo, with which it is connected by telegraph (see map of Africa, ref. 8–H). It is on a sandbar between the port and the ocean, and is considered insalubrious. The port has deep water, but is ill protected and dangerous of access. Extensive improvements have been authorized by the Hova government. The trade is large, and the exports consist of cattle, swine, skins, rice, tobacco, copal, raw silks, mats, baskets, woods, especially the violet ebony wood. There are several important business houses. Pop. about 7,000, of which 3,000 are foreigners, including French, British, Hindus, natives of the U. S., and natives of the Mascarene islands. M. W. H.

**Tamaulipas**, taa-mow'lee-paas: a northeastern state of Mexico; bordering on Texas, the Gulf of Mexico, Vera Cruz, San Luis Potosí, Nuevo Leon, and Coahuila. Area, 29,339 sq. miles. Nearly all the surface consists of plains and low rolling lands with occasional hills, resembling the coast-belt of Southern Texas, and, like it, bordered by extensive lagoons and salt-marshes. The southwestern part alone is included in the Mexican plateau, which here rises to about 4,000 feet; this is bordered by low mountains of the eastern Sierra Madre, and their well-watered slopes are the finest and most thickly inhabited portions of the state. The climate of the plains is essentially tropical, and the coast region is hot and often insalubrious during the summer months; much of the land is too dry for tillage without irrigation. The mountain region has a temperate and healthful climate with abundant rains; portions of forest remain, principally on the higher slopes. Besides the Rio Grande, which forms the northern boundary, and the Pánuco on the S., the state has several considerable rivers. Agriculture and grazing are almost the only industries; but sugar, cotton, and hides are exported, and coffee-raising has come into prominence. There are no mines of importance, though silver, coal, petroleum, etc., are reported. Pop. (1893) estimated, 173,200. Capital, Ciudad Victoria. The principal ports are Tampico and Bagdad, the port of Matamoros. A strip, nominally 20 km. wide, along the northern frontier constitutes the *Zona Libre*, or Free Zone; this was established by the state in 1858, and has been extended by the general Government to the entire northern frontier of Mexico. Imports for use in the zone (except cattle) pay only 10 per cent. of the ordinary duties. The Mexican authorities claim that this arrangement is necessitated by the retail trade across the frontier; the U. S. customs officers, on the contrary, have frequently complained that it encourages smuggling. HERBERT H. SMITH.

**Tamboff'**: government of European Russia, in the southeastern part of the empire, on the Oka. Area, 25,710 sq. miles. Pop. (1897) 2,715,265. Here are large forests yielding fine timber and excellent pasturage. The grain crops are large, especially in the southern portions. Woolen fabrics, tallow, and spirits are largely manufactured.

**Tamboff**: capital of the government of Tamboff, European Russia; on the Zna; founded in 1636 (see map of Russia, ref. 8–E). It is well built, with low wooden houses that are surrounded by gardens. It has a college, an ecclesiastical seminary, a high school for ladies, a military academy, and several other educational institutions, and has an active trade in the products of the district. Pop. (1897) 48,134.
Revised by M. W. HARRINGTON.

**Tambora**: See SUMBAWA.

**Tambourine** [from Fr. *tambourin*, dimin. of *tambour*, drum (in O. Fr. *tabour*) from Arab. and Pers. *tambūr*, kind of lute or guitar, and Pers. *tabir*, drum]: a musical instrument resembling a drum, consisting of a wooden or metallic hoop over which a parchment is stretched, and furnished with a set of bells. It is held in one hand, and beaten with the knuckles or fingers of the other hand, or sometimes also with the elbow. It has been in use from time immemorial in the Basque provinces of Spain and in the retired regions of Italy, especially in the Abruzzi, and is well known from its employment by gypsies and wandering musicians, being a favorite instrument for accompanying their dances. It also figures prominently in the music of the Salvation Army.

**Tamerlane**: See TIMUR.

**Tamil Language**: See DRÁVIDIAN LANGUAGES.

**Tam'many Society**: a political society in New York, founded by an upholsterer named Mooney, May 12, 1789. It derived its name from a Delaware chieftain who for his reputed virtues was in the latter years of the Revolution facetiously chosen patron saint of the new republic. Organized ostensibly for charitable purposes, it nevertheless had a definite political character from the first, representing the dread of an aristocracy and the distrust of Hamilton's policy felt by the thoroughgoing Democrats of the time. Secret societies under the auspices of St. Tammany were organized in Philadelphia and other cities; but the institution soon fell into oblivion except in New York, where it was soon turned to account as a political lever, and it ultimately became the principal instrument of the managers of the Democratic party in New York, exerting a considerable influence also upon State politics, and to a less extent on national politics. The society was much discredited by the participation in its honors of WILLIAM M. TWEED (*q. v.*) and his accomplices in fraud, but it was reorganized, and to some extent reformed, after the Tweed prosecutions.

**Tammuz** [Heb., from Babylonian *Dumuzu*, *Duzu*]: a god of Babylonian origin, whose death the Israelitish women are said to have bewailed (Ezek. viii. 14). A similar lamentation has been found in the cuneiform literature. Tammuz represents the spring vegetation which comes to an end in the fourth month. For this reason the Babylonians named that month after the god; and with the other names of the months, the Jews took this one from the Babylonians. There is, no doubt, some connection between the cult of Tammuz and that of the Greek Adonis (*Ādhōn* = lord), which the old writers expressly connect with the Orient. The real home of the Adonis worship seems to have been Syria and Southern Asia Minor, though it appears as early as the seventh century B. C. in purely Greek countries. Whatever its origin may be, its later forms were undoubtedly influenced by the East. That sexual excesses were connected with the worship of Tammuz is evident from the phallus which still plays a part in the modern Persian festival of Husein, which Eerdman has shown to contain remnants of the old Tammuz worship. RICHARD GOTTHEIL.

**Tampa**: city; port of entry; capital of Hillsboro co., Fla.; at the head of Tampa Bay at mouth of the Hillsboro river; on the Fla. Cent. and Pen., the Savannah, Fla. and W., and the Silver Spr., Ocala and Gulf railways; 30 miles from the Gulf of Mexico (for location, see map of Florida, ref. 6–I). It has an excellent harbor, with 23 feet of water at the outer bar, mean tide, and has steamship connection with New York, New Orleans, Mobile, Havana, Puerto Cortez (Honduras), Key West, and other ports. There are 17 churches, 7 public and 8 private schools, 2 national banks with combined capital of $150,000, 3 daily and 6 weekly newspapers, electric-light and street-railway plants, and a spring-water supply with daily capacity of 3,000,000 gal.

The principal industry is the manufacture of cigars, which has 120 establishments, employs 4,000 persons, and turns out goods of an annual value of $6,000,000. In 1894 the internal revenue collections aggregated $185,000, and the custom-house collections $600,000. During the year 35,000 tons of phosphate were shipped to domestic ports and 105,-000 tons to foreign. The city has hotel property valued at $3,000,000. Tampa was made a port of entry in 1886, and has grown rapidly since. Pop. (1880) 720; (1890) 5,532; (1900) 15,839. EDITOR OF "TRIBUNE."

**Tampa Bay**: a body of water on the west coast of Florida, chiefly in Hillsboro County. Its upper portion is divided into two parts, called Old Tampa Bay and Hillsboro Bay. It is some 35 miles long and from 6 to 15 miles wide. A line of keys fences its entrance from storms, so that it constitutes a safe, spacious, accessible, and excellent harbor. The bay contains many small islands, and abounds in fish and turtle. On Egmont Key, at the entrance, is a brick lighthouse 86 feet high, lat. 27° 36′ N., lon. 82° 45′ 15″ W.

**Tampico**, taăm-pee'kō: town and port of the state of Tamaulipas, Mexico; a short distance above the mouth of the Pánuco river, which divides Tamaulipas from Vera Cruz; terminus of railways to Monterey and San Luis Potosí (see map of Mexico, ref. 6–H). The harbor, formed by the river, has been made good and safe by extensive improvements, including a breakwater and jetty, so that vessels drawing 24 feet of water may enter the harbor. The town is built on flat land surrounded by swamps; in the summer it is hot and unhealthful, but less so than Vera Cruz. The Pánuco and its branch, the Tamesí, are navigated for some distance by small steamers, and there is a canal to afford inland communication between Tampico and Tuxpan, Vera Cruz, through the lagoon of Tamiahua. Tampico was opened as a port in 1823, when the fort in Vera Cruz was still held by the Spaniards. During the frequent blockades of Vera Cruz it has been the most important gulf port of Mexico, and its trade is increasing. Pop. (1889) 11,680. HERBERT H. SMITH.

**Tamsui**, taam'sōō'ēē [literally, fresh water (town)]: a treaty-port of Formosa, on the north end of the island, in the hien or district called Changhwa; lat. 25° 10′ N., lon. 101° 26′ E. (see map of China, ref. 7–K). It lies between a double-peaked hill of about 1,700 feet, on the S. W., and the Tamsui range of mountains (2,800 feet), which extend far into the interior, and is distant about 13 miles from the large trading-town of Bangka. The anchorage is poor, and has at its mouth a bar covered with 10 feet of water at low tide. The water-supply of the town is remarkable for its excellence, being obtained from a mountain stream 8 miles inland from Bangka, and conducted to the city by a tunnel cut in the solid rock, and a wooden aqueduct 8 feet wide and 5 feet deep, supported on crutches 30 feet above the surface of the water of an affluent which it has to cross in its course. The village of Kien-pai and the towns of Bangka and Twa-tu-tia are supplied from the same sources. Tamsui (which includes Kilung, 29 miles to the E.) imports cotton and woolen goods, opium, metals, matches, kerosene oil, rice, beans, native cloth, joss-sticks, etc.; and exports, among other things, camphor, tea, and coal. In 1893 the foreign imports amounted to 2,137,805 haikwan or custom-house taels (= $2,244,695), and the native 947,417 taels; while the exports were valued at 5,197,652 taels. Pop. 100,000. R. LILLEY.

**Tan**: See FRECKLES.

**Tana**: See DEMBEA.

**Tanagers** [from Mod. Lat. *Tan'agra*, from Braz. *tangara*, a bird of the tanager kind]: the *Tanagridæ*, a family of passerine birds, having, as a rule, a thick, conical, triangular bill with the cutting edges not much inflected, and generally notched or toothed behind the tip; the angle of chin is not far forward; the nostrils are placed very high; the wings are moderate, angulated, have nine primaries, and the inner secondaries are not produced. They are closely related to the *Fringillidæ*, with which they should probably be united. The colors are in almost all the species quite brilliant. The group is peculiar to the New World, and is chiefly developed in the tropical regions. Over 300 species have been described, arranged under forty-three genera. One genus (*Piranga*) is represented in the U. S. by five species, the most conspicuous of which are the scarlet tanager (*Piranga erythromelas*) and summer redbird (*Piranga rubra*). The species feed upon grains as well as insects, etc. Revised by F. A. LUCAS.

**Tan'agra Figurines**: statuettes and groups of terra-cotta found since 1873 among the ruins of Tanagra in the modern province of Bœotia, Greece. The name is used loosely for statuettes and groups, fragments of which are found at other places, in Sicily, Southern Italy, Northern Egypt, as well as in Greece proper. In all the countries colonized or influenced by the ancient Greeks these figures were once as common as the painted vases which are so valuable to modern students, and Tanagra was only one, though an important one, of the many towns where keramic work was carried on. Thus outside the walls of Smyrna in Asia Minor are rubbish heaps from which have been brought hundreds of delicately finished heads in terra-cotta, the bodies being often left behind as unimportant. Many earthenware figures are found in tombs, but it does not follow that they were made, like the thin gold jewelry found in similar tombs, for interment with the body. It is far more likely that they were buried as the favorite works of art of the deceased, or in some cases as portraits of friends. It is the theory of some archæologists that the veiled female figures represent goddesses of the dead, as Persephone. Many of the statuettes are colored in an elaborate fashion, but this coloring is rarely fired so as to form true keramic painting; it is therefore very perishable. These painted statuettes generally bring the highest prices when offered for sale. As the laws of the Turkish empire and of Greece against the exportation of works of art have not long been enforced, and as these figures are small and easily concealed, thousands of them have been sold in Europe; and the greater number of these have passed into private hands. The museums of Europe and the U. S. have also fine examples.

The greater number of the figures discovered are standing, draped female figures from 6 to 9 inches high. These have been generally made in moulds, with the head alone showing signs of being finished by hand and much more carefully. The back of the figure, the drapery, etc., is generally much less carefully modeled than the front. Moulds have been found exactly corresponding to some of them. Groups of two or three figures are not uncommon, and some of these are curiously made like *appliques*, that is, with the back absolutely flat and blank, the whole group having one face only, as if a bas-relief of which the background had been cut away and removed.

Very few instances of the copying of important Greek statues are known among these terra-cottas, but these figures have given to the modern world a very important instance of what might be called *genre* sculpture among the ancients, fanciful, graceful, sometimes humorous, sometimes pathetic, and of a domestic sort. The theory cited above, that many of the pieces are religious in character, is not contrary to the evidently decorative and fanciful character of others. Many modern copies exist, sometimes made in the ancient moulds, and it has become difficult to distinguish the genuine ancient specimens. For treatises upon the subject, see A. S. Murray's *Handbook of Grecian Archæology*; the *Monuments Grecs*, a kind of periodical published in Paris; Rayet's *Art Antique*, which has splendid photographic plates; Kekulé's *Griechische Thonfiguren aus Tanagra* (Stuttgart, 1878); and many papers in the *Gazette des Beaux-Arts* and in other artistic and archæological periodicals. RUSSELL STURGIS.

**Tananarivo**: capital of Madagascar. See ANTANANARIVO.

**Tan'cred**: one of the most celebrated heroes of the first crusade; b. in Sicily in 1078, a son of Odo, a Norman baron, and Emma, the sister of Robert Guiscard; in 1096 raised an army in Apulia and Calabria, crossed over to Epirus, joined his cousin, Bohemund of Taranto, and distinguished himself greatly by his valor, sagacity, piety, and chivalric forbearance toward a defeated enemy during the campaigns in Asia Minor and Syria, but still more at the conquest of Jerusalem in 1099, and afterward in the battle of Askalon. He was made Prince of Tiberias, and governed with great wisdom not only his own principality but also that of Bohemund, who had been captured by the Saracens; but most of his time had been taken up in petty warfare, partly with Baldwin and the other Christian princes, partly with the Saracens. D. in Antioch, in 1112. His exploits have been narrated in prose and verse by Raoul de Caen in his *Les Gestes de Tancrède*. He also plays a conspicuous part in Tasso's *Gerusalemme Liberata*. See Delabarre, *Histoire de*

*Tancrède* (Paris, 1822), and Kugler, *Boemund und Tankred, Fürsten von Antiochien* (Tübingen, 1862).

**Tandy**, JAMES NAPPER: Irish agitator; b. in Dublin in 1740. He was the first secretary of the United Irishmen, a society said to have been formed to support HENRY GRATTAN (*q. v.*) in his effort to secure self-government for Ireland, but opposed by Grattan because of its rebellious schemes under the leadership of THEOBALD WOLFE TONE (*q. v.*). Tandy was active in local politics, being one of the Protestant leaders, and prominently engaged in the free-trade agitation. In 1792 he was ordered to be imprisoned for challenging the solicitor-general on the floor of the Irish House of Commons. Having been proclaimed, he brought an action against the viceroy and his privy councilors, but his suit was dismissed. In the spring of 1793, when he was about to be tried on a charge of distributing a seditious pamphlet, a far more serious charge of conspiracy was made against him, and he fled to the U. S., lived there five years, and then went to France, where he is said to have become a general of division. During the invasion of Ireland in 1798 Tandy landed at Rutland, Ireland, but failed and fled to Norway, and thence to Hamburg, where he was arrested and delivered to English authorities. He was tried and acquitted in Dublin on Feb. 12, 1800, but was held and tried in Lifford, County Donegal, for his treasonable landing, convicted, and sentenced to death. Again he escaped to France. He died in Bordeaux in 1803.

**Taney**, taw'nee, ROGER BROOKE, LL. D.: jurist; b. in Calvert co., Md., Mar. 17, 1777; graduated at Dickinson College in 1795; studied law, and was admitted to the bar in 1799, beginning practice in Calvert County, from which he was chosen a delegate to the General Assembly of Maryland; removed to Frederick, Md., in 1801, and in 1816 was elected to the State Senate. He originally belonged to the Federal party, and stoutly supported the policy of the Government in the war with Great Britain. In 1819, in his defense of a Methodist minister who had condemned slavery, he declared that slavery was a blot on the national character. In 1822 he removed to Baltimore, and in 1824 he became a supporter of Gen. Jackson, by whom in 1831 he was appointed U. S. Attorney-General, and in 1833 was nominated as Secretary of the Treasury in place of Mr. Duane, who had been dismissed in consequence of his disagreement with the President in the matter of the removal of the public deposits from the U. S. Bank; but the Senate, by a vote of 28 to 18, refused to confirm the nomination, although he had for nearly nine months exercised the functions of Secretary and had ordered the removal of the deposits. He was nominated by the President as the successor of Chief Justice Marshall, who died in 1835, and the administration having secured a majority in the Senate, the nomination was confirmed in Mar., 1836, he taking his seat upon the bench in the following January, and occupying it until his death. In the administration of this office he supported the supremacy of the U. S. Constitution, but far less broadly than Chief Justice Marshall had before him. Chief Justice Taney and a majority of the court decided, in the case of the city of New York against Miln, that an act of the Legislature of New York which required masters of vessels to report their passengers on arrival was a police measure merely, and did not interfere with the regulation of foreign commerce by Congress. In the case of Briscoe against the Bank of the Commonwealth of Kentucky the decision of the former Chief Justice Marshall was reversed, the new decision affirming the constitutionality of the act under which the bank was established. His judgment in a case connected with the Charles river bridge declared the right of legislatures to authorize bridges, railroads, and similar improvements regardless of contracts implied in former grants. Justice Joseph Story threatened to resign because of these decisions, and Chancellor James Kent declared that they destroyed his confidence in the Supreme Court as a guardian of the Constitution. In the case of disputed boundaries between Massachusetts and Rhode Island, in dissenting from the judgment of the court, Chief Justice Taney held that the Federal Supreme Court had no power to decide questions of political jurisdiction between States. His most noted act was his decision in the DRED SCOTT CASE (*q. v.*) in 1857. Another of his opinions which occasioned much public feeling was that rendered in 1861, in the case of John Merryman, who had been arrested in Baltimore by order of a Federal general for alleged treason. The chief justice issued a writ of *habeas corpus* to bring the prisoner before him; the officer in charge of Merryman refused to obey, on the ground that he had been empowered by President Lincoln to suspend the execution of the writ of *habeas corpus*; whereupon the chief justice wrote out a formal opinion to the effect that the President had no constitutional authority to suspend the writ, and that this could be done only by the legislative authority. D. in Washington, Oct. 12, 1864. A notice of his career is contained in Santvoord's *Sketches of the Lives and Judicial Services of the Chief-Justices of the United States* (1853), and a memoir, embodying an autobiography down to 1801, has been written by Prof. Samuel Tyler (1872). A bronze statue of him, ordered by the State of Maryland, was unveiled at Baltimore Dec. 10, 1872.

**Tanganyika**, taan-gaan-yee'kaa: a lake of Central Africa, S. of Lakes Albert and Victoria, between lat. 3° and 9° S. and between lon. 29° and 32° E.; about 400 miles in length from N. W. to S. E. It was first discovered by Burton and Speke in 1858, and afterward explored by Livingstone and Cameron. It has an elevation of 2,700 feet above the level of the sea, deep and clear water, and a very irregular form, its width varying from 10 to 50 miles. Area, 12,170 sq. miles. Its shores are generally rich in beautiful scenery, especially those of the northern part, which are set with mountains and hills covered with a luxuriant vegetation. The surrounding country is in many places densely peopled. The most important town is Ujiji, on the eastern shore.

The study of the fauna of Lake Tanganyika by Mr. J. E. S. Moore in 1896–97 suggested a striking theory as to the physical history of this part of Central Africa, and in 1899 Mr. Moore led an expedition to the lake to sound and dredge it, examine the surrounding region, and collect all data that may assist in solving the question he has raised. The genera of molluscs that occur in the African fresh waters have been found to be very constant over an immense area. The whole series in Lake Nyassa, for example, has also been recorded from Victoria Nyanza. But in Tanganyika he found a distinct fauna superadded to the normal African lake fauna. This strangely isolated group of organisms includes, besides the medusa and molluscs, two prawns, deep-water crabs, etc., which appear to be of marine instead of lacustrine origin. None of these animals can be directly associated with any living oceanic species, and the peculiar fauna, wherever it came from, must be old. It is inconceivable that delicate organisms like the medusa should have found their way up the lake's effluent as it now exists. The molluscs are almost exclusively deep-water forms. An anatomical examination of them shows that they possess the characters of several modern marine types. The supposition, therefore, is that the Tanganyika region must at one time have been in connection, either on the east, west, or north, with a deep arm of the sea. C. C. ADAMS.

**Tangent** [from Lat. *tan'gens*, pres. partic. of *tan'gere*, *tac'tum*, touch, whence Eng. *tact*, *tactile*, etc.]: a line touching a curve at some point of its length; this point is called the *point of contact*. The tangent to a curve at a point may be regarded as the limit of a secant through that point; for, suppose a secant to be drawn through the point of contact and at any other point of the curve; then let the second point be moved along the curve toward the first; the secant will continually approach the tangent, and when the second point falls on the first, the secant will become a tangent; if the motion of the second point is continued, the line will become a secant on the other side. From this explanation we infer that only one tangent can be drawn to a curve at a given point. An exception, however, occurs when two or more branches of the curve pass through the point. According to the theory of the infinitesimal calculus, a curve is to be regarded as a broken line whose sides are infinitesimal; the consecutive vertices of this polygonal line are called *consecutive points*, and the prolongation of any side is a *tangent*; a tangent to a curve is therefore a line passing through two consecutive points of the curve. The first point in the order of generation is the point of contact. For the trigonometrical tangent of an angle, see TRIGONOMETRY.

**Tan'ghin** [from Malagasy]: an ordeal poison formerly used in Madagascar, consisting of the powdered seed of the *Tanghinia venenifera*, an apocynaceous tree of that island. It killed by paralysis of the heart and respiration. It contains an active principle, *tanghinin*. A small portion was administered to the suspected person, whose only hope was in the emetic action which the drug sometimes exerted.

Revised by H. A. HARE.

**Tangier**, taan-jeer′ (Arab. *Tanja*, anc. *Tingis*): fortified port of Morocco, on the Straits of Gibraltar, 5 miles E. of Cape Spartel, on a shallow, semicircular bay open to the N. and N. E. (see map of Africa, ref. 1–B). Its trade is large and increasing. In 1892 935 vessels entered and 927 cleared; the value of the imports was $2,624,000 and the exports less than half as much. The chief imports are cotton goods and sugar; exports, beans, barley, and wool. Tangier is also of considerable political importance as the only place of residence permanently open for foreigners, whether representatives or private, and it is a favorite place of refuge for fugitives from justice. The winter climate is exceptionally fine, and is largely resorted to by those who are unable to stand the severer climate of Europe. Pop. about 30,000, one-third Jews, who transact most of the business. MARK W. HARRINGTON.

**Tangle**, or **Sea-tangle**: any one of several kinds of seaweeds, but especially *Laminaria digitata*. The young shoots are sometimes used as food and forage, and the plants are employed in the production of iodine. The stalks of the European sea-tangle are used in making uterine tents for surgeons' use, but those growing on the North American coast have been found unfit for this purpose.

**Tanhäuser**, taan′hoi-zer: minnesinger; probably a member of the noble family Tanhausen, in Bavaria. He was born in the early part of the thirteenth century; lived chiefly at the court of Vienna; participated in one of the crusades; probably joined King Konrad IV. (d. 1254), and disappears with the death of King Konradin (1268). He is one of the foremost representatives of the later minnesong, a poet of great talent, of delightful humor, and of a remarkable mastery of the metrical form. He led for a time a very gay life, and the sensuous character of many of his poems, as well as a penitential song which he composed later, may have been the cause of his becoming the hero of the Tanhäuser legend. According to this legend, Tanhäuser lived for some time with Venus in the Venusberg, but finally was smitten by conscience and begged Venus to allow him to depart. She refused, but owing to the help of the Holy Virgin Tanhäuser made his escape and went to Pope Urban (IV.) to obtain remission of his sins. The pope, however, answered that Tanhäuser's sins could as little be forgiven as the wand which he held in his hand could become green again. Tanhäuser, in his despair, went back to Venusberg and was received with great rejoicing. Three days after the pope's wand suddenly began to sprout, and messengers were sent to inform Tanhäuser of this divine miracle, but on account of his return to the Venusberg he was obliged to remain there till doomsday.

The Tanhäuser legend is doubtless one of the stories treating of the fatal union between a mortal youth and an elf which frequently occur in German, Danish, and English folk-songs, and which are founded on popular conceptions having their origin in old Germanic mythology. The reason why Venus, in this legend, takes the place of the elf may be found in the fact that the minnesinger Tanhäuser frequently addresses in his poems Minne (love) as Frau Venus. In the mentioning of Pope Urban may perhaps be seen a reminiscence of the historical fact that it was Pope Urban IV. (1261–64) who caused the final downfall and utter destruction of the glorious dynasty of the Hohenstaufen, with which Tanhäuser seems to have been closely allied. The story of the wand which began to sprout in spite of the words of the pope seems to express the popular view concerning the papal abuses in granting the remission of sins.

The best account of the Tanhäuser legend is contained in the famous *Tanhäuserlied*, one of the most popular folksongs of the sixteenth century, printed in Uhland's *Volkslieder*, No. 297. See also I. G. Th. Grässe, *Der Tannhäuser und Ewige Jude* (1861). In modern times the legend has been treated poetically by L. Tieck, H. Heine, Fr. von Sallet, E. Geibel, and by Richard Wagner in his famous opera. JULIUS GOEBEL.

**Tani**, KANJO, Count: soldier and statesman; b. in the province of Tosa, island of Shikoku, Japan, in 1837. He served on the imperialist side in the troubles of the restoration, and when the Satsuma rebellion broke out in 1877 was a major-general, in command of the garrison at Kumamoto. His brilliant defense of this stronghold against a powerful attacking force established his reputation. In 1883 he became Minister of Agriculture and Commerce, and soon after made a European tour. On his return he advocated various reforms in the administration, but as these were not adopted he resigned, and has since become leader of the opposition in the new house of peers. J. M. DIXON.

**Ta′nis** (Gr. Τάνις, Egypt. *Tā′* or *Tān*, Heb. *Zo′an*, Arabic *Ṣân*): an ancient Egyptian city in the Delta region, on the old Tanitic branch of the Nile (31° N. lat., 31° 55′ E. of Greenwich). It was the capital of the fourteenth nome of Lower Egypt, and a very populous and important city in certain periods of Egyptian history. In the Hebrew Scriptures it is said to have been founded seven years after Hebron in Palestine (Num. xiii. 22), and the miracles of Moses were said to have been performed in the "field of Zoan" (Ps. lxxviii. 12, 43). This designation corresponds with the native designation of the region, sekhet Tān, "the field of Tān." In the time of Isaiah and Ezekiel it was an important place. The site was explored by Napoleon's *savants*, by Mariette, and again by Flinders Petrie under the auspices of the Egypt Exploration Fund in 1883–84, The earliest monument found was a statue of Merira Pepi. of the seventh dynasty, but as it was the sole memorial of that ancient time it is supposed to have been transported thither at a later date. A red-granite colossal statue of Amenemha I., the first king of the twelfth dynasty, and others in black granite representing Usertasen I. and Amenemha II., of the same dynasty, are believed to be monuments of the earliest founders of the temple which constituted the central portion of the city. The last-named colossus shows a peculiarity, in that it is sculptured without the usual supporting pilaster in the rear. From the same dynasty came two sphinxes, one of which is in the Louvre. There were found also other pre-Hyksos sphinxes and statues dating from the thirteenth dynasty. From the following period, during which the place was beautified and fortified so that it became one of the Hyksos strongholds, the distinctive "Tanis sphinxes" were long supposed to have come. (See SPHINX.) They are cut from dark-gray granite, adorned with manes, short, thick beards, and shaggy breasts. They have been usurped by later native kings, who caused their own names to be inscribed over erasures, rendering an exact determination of their age impossible. In some cases the name of the Hyksos king Apepi still is visible on the right shoulder of the sphinxes. From the eighteenth dynasty there are no monuments at Tanis, but with Seti I. and Ramses II. of the nineteenth dynasty its real glory dates. The latter built the huge temple, utterly obliterating the plan of the buildings of the twelfth dynasty Pharaohs. This building was massive and extensive, and was approached by an avenue adorned with obelisks (fourteen have been found in broken condition), sphinxes, and huge statues. In a space of 150 feet were found eight obelisks, and between them were the statues mentioned above, while towering above them all was the colossal statue of Ramses II., which Petrie, judging according to the law of proportion when applied to the fragments that were found, declares must have been about 75 feet high, or, with the base and diadem, 92 feet, and must have weighed complete about 900 tons, "the largest statue ever executed." The ruins of the temple cover a space about 1,000 feet long and occupy a depression surrounded by ridges about 60 feet above the Nile. Tanis retained its importance under the native kings down to the thirtieth dynasty and under the Greeks and Romans. It appears also to have been an important seaport, and to have lost its pre-eminence to Alexandria through the silting up of the Tanitic branch of the Nile (now represented by the Mu'izz Canal) and also of Lake Menzaleh. In the Coptic period it had lost its importance completely and was scarcely known. At present Sañ is a squalid fishing-village, half a mile from the canal and at a considerable distance from Lake Menzaleh. See Petrie, *Tanis* (2 vols., London, 1885, 1888), and second and fifth *Memoirs* of the Egypt Exploration Fund. CHARLES R. GILLETT.

**Tanjore**, tăn-jōr′: city of Madras, British India: capital of a district of the same name, and railway junction; on the right bank of the south branch of the Cavery; lat. 10° 47′ N., lon. 79° 10′ E. (see map of S. India, ref 7–E). It is one of the great religious and literary centers of Tamil India, and is renowned for its artistic industries (silk rugs, jewelry, and copper *repoussé*) and for its great pagoda. The palace of the rajahs contains a very valuable collection of 18,000 Sanskrit manuscripts. Pop. (1901) 57,605. M. W. H.

**Tank-worm**: See GUINEA-WORM.

**Tan′nahill**, ROBERT: poet; b. at Paisley, Scotland, June 3, 1774; bred as a weaver, he worked at the loom all his life;

wrote occasionally for periodicals, and in 1807 published *The Soldier's Return, with other Poems and Songs, chiefly in the Scottish Dialect*, which rendered the poet famous. Several of these became popular favorites, and have remained so. When his publisher hesitated to issue a new and enlarged edition, he fell into a fit of despondency, burned all the new poems which he had written, and drowned himself in a pool near Paisley, May 17, 1810. A statue of the poet was erected in Paisley in 1883. Tannahill possessed much tenderness of sentiment and a delicate feeling for the effects of nature. An edition of his poems by D. Semple (1876) contains an exhaustive account of the poet's life and writings.

**Tanner**, THOMAS, D. D.: antiquary; b. at Market Lavington, Wiltshire, England, Jan. 25, 1674; was educated at Oxford, and was made fellow of All Souls in 1696; entered holy orders; became successively chaplain to the Bishop of Norwich, whose daughter was his wife, chancellor of Norwich, prebendary of Ely, rector of Thorpe, near Norwich, Archdeacon of Norwich (1710), canon of Christ church, Oxford (1723), and in 1732 Bishop of St. Asaph. His principal works, published posthumously, are *Notitia Monastica*, an account of the religious houses, colleges, hospitals, etc., founded in England and Wales before 1540 (1744), and *Bibliotheca Britannico-Hibernica*, an account of the writers who flourished in England, Scotland, and Ireland up to the beginning of the seventeenth century (1748). He edited Anthony Wood's *Athenæ Oxonienses* (2 vols. fol., 1721). He bequeathed his large collection of MSS. to the Bodleian Library. D. at Oxford, Dec. 14, 1735.

Revised by S. M. JACKSON.

**Tannhäuser**: same as TANHÄUSER (*q. v.*).

**Tannic Acid**, or **Tannin** [*tannic* is deriv. of *tan*, tanbark, deriv. of *tan* (verb) < O. Eng. *tannian*; cf. O. H. Germ. *tanna*, fir, oak > Mod. Germ. *tanne*, fir; *tannin* = Fr., deriv. of *tan*, tan]: any one of several astringent principles that are widely disseminated in the vegetable kingdom. The chief sources of these compounds are the barks of varieties of the oak and pine, sumach, gall and valonia nuts, kino, dividivi, and catechu; the bark and berries of many forest and fruit trees, such as the elm, the willow, the horse-chestnut, the plum, the pear. All of the forms of tannic acid were formerly supposed to be identical with the tannin contained in the gall-nut, the differences in chemical composition presented by them being accounted for by the presence of accidental impurities; but there is no doubt of the existence of several distinct acids with many properties in common.

The term "pathological tannins" has been applied to those obtained from diseased vegetable excrescences, such as the gall-nut; those which are contained in barks, etc., being designated as "physiological tannins. The latter only are adapted to the manufacture of leather. The most important and best-investigated form of tannin is that known as gallotannic acid. Other modifications are caffetannic, catechutannic, morintannic, quercitannic, and quinotannic acids, which, although very similar in many properties, possess different compositions.

Gallotannic acid occurs in the gall-nut, an excrescence produced by the puncture of a small hymenopterous insect upon the leaves and stalks of the species of oak *Quercus infectoria*, sometimes in a proportion as high as 60 per cent. of the mass. The tannin of the sumach, once considered identical with gallotannic acid, appears to be a distinct compound. Pure gallotannic acid, $C_{14}H_{10}O_9$, is an amorphous buff-colored solid, easily soluble in water; it also dissolves in aqueous alcohol, but only with great difficulty in pure ether. It has an intensely astringent taste, imparts a strong red color to litmus, enters into double decomposition with bases, and liberates carbonic acid from the carbonates. Of the gallotannates, the ferric salt is especially characteristic and important. It is obtained, upon adding a solution of the acid to a solution of a ferric salt, in the form of a violet-black precipitate. This reaction is exceedingly delicate. The basis of much of the ordinary writing-ink is ferric gallotannate. In common with most forms of tannin, gallotannic acid forms with gelatin an insoluble compound. The affinity of the acid for gelatin is so great that when a skin is immersed in its aqueous solution all the tannin is ultimately removed. This property of gallotannic acid is often utilized in its quantitative estimation in nut-galls, etc., a standardized solution of gelatin, with a small quantity of alum or ammonic chloride, being employed for this purpose. See LEATHER. Revised by IRA REMSEN.

**Tanning**: See LEATHER.

**Tañoan** (tăn'yō-ăn) or **Tanoan Indians**: a family of North American Pueblo Indians. In the middle of the sixteenth century they were widely scattered and divided into distinct geographic groups, and they were variously named by their Spanish discoverers and conquerors. For a long time they were regarded as representative, linguistically and otherwise, of four diverse stocks, but since 1878 they have all been designated as *Tanoan*.

*Tribes and Pueblos.*—As with other Pueblo Indians, they are chiefly named according to their pueblos or towns. In alphabetical order these are Hano (of the Tusayan group in Arizona), Isleta (New Mexico), Isleta (Texas, below El Paso), Jemez, Nambe, Pecos (a mere remnant, living since 1840 with their kinspeople at Jemez), Picuris, Pojoaque, Sandia, San Ildefonso, San Juan (de los Caballeros), Santa Clara, Senecú (in Northeastern Chihuahua, Mexico, below El Paso), Tangewiñge (a remnant sub-tribe sharing with the Keresans the pueblo of Santo Domingo), Taos, and Tesuque.

*Habitat.*—Notwithstanding the intrusion of the Keresan Cochitme and Kiwami tribes (which was comparatively recent at the time of the discovery), the Tanoans were the people *par excellence* of the Rio Grande del Norte, originally occupying, with but slight interruptions, its entire valley and some of its outlying tributaries from within 40 miles of the northern boundary of New Mexico to within 120 miles of Mexico itself, a stretch of country not less than 230 miles long by a varying width of from a few to nearly 100 miles at its several widest points. Throughout this region their pueblos were, in the sixteenth century, distributed from north southward in five groups—Taos, Tewa, Jemez, Tanos, and Piros—this geographic distribution agreeing almost wholly with that of the ethnic subdivisions of the family.

Of the Taos group were Taos (Te-wat-ha, the "Braba" of Castañeda and the "Tayberon" of later Spanish writers), situated about 45 miles due N. N. E. of Santa Fé, on an eastern tributary of the Rio Grande, and Picuris (Ping-'ul-tha or U-la-na, the Picuries of Oñate, 1584–85), 2 miles S. W. of Taos. Both occupy nearly the same positions as when discovered.

Of the Tewa group, San Juan (Jyu-o-tyu te-oj-ke) was situated on the western side of the Rio Grande, about 30 miles S. W. of Picuris. It was, with a companion town on the opposite side of the river, at Chamito, now in ruins, the Tunque Yunge of Castañeda, and from it probably the majority of the Tewas now of Hano in Tusayan fled in the latter part of the seventeenth century. The still inhabited Santa Clara (Ka-po), and San Ildefonso (Pho-ju-o-ge), on the east side of the river, respectively about 2 and 5 miles lower down than San Juan, belonged also to the Tewas. Their remaining towns are (as they were) Pojuaque (Pho-ju-añ-ge), Nambe (Na-im-be), and Tesuque or Tezuque (Te-tzo-ge), all quite near to each other and from 6 to 9 miles E. of the main Rio Grande valley, the last-named being only 9 miles N. of Santa Fé.

The Jemez (or Teguala tribe) now occupy but one pueblo, Jemez (Wa-la to-hu-a), 30 miles W. of the Rio Grande, on the Rio Jemez, but in the sixteenth century they existed in two branches. The western was distributed in twelve or thirteen towns, of which the main group was near the famous Hot Springs of San Diego. Here were the large ruins of Gwin-se-wa or old Jemez (at the Hot Springs themselves), and of A-mox-yum Kwa, Asht-ya-la-kwa, and four others on the heights lower down. Below these still were seven or eight goodly towns (the ruins of which can be still distinctly traced), from about where the modern Jemez stands to near the Keresan towns of Cia. The Pecos (Pa-e-kwi wa-la), or eastern branch of the Tequala, speaking the same dialect, were separated by a distance of 80 miles from their western kinsmen, with whom their few survivors now dwell. They occupied the famous ruin of Pecos (Tshi-kwit-ye, the Cicuiye of Coronado), on the Rio Pecos, some 40 miles E. of the Rio Grande and S. E. of Santa Fé. This pueblo was, at the time of the discovery, the largest and most populous in New Mexico. It is probable also that the ruins of Ku-wang wa-la (pueblo de las Ruedas) and Se-yu-pa we-la, near Fulton in the same section, were occupied by sub-tribes of these Pecos, who were the most eastern representatives (as the Taos are the most northern) of all the Pueblo peoples.

Properly, there were three groups of the Tano pueblos—the northern, or Galisteo; the southern, or Rio Grande; and the eastern, or Manzano. The northern Tanos (Tañ-ge-was) originally had two pueblos on the site of the present capital of New Mexico, and others in the same neighborhood; but when discovered their most northern town was Tzi-gu-ma, at Ciénega, 12 miles S. of Santa Fé, and a few miles S. E. of this was another important town at San Marcos, called Kwa-ka. About 12 miles farther S. (at Galisteo) was their principal pueblo of Tan-ge-wiñ-ge, and within a radius of 10 miles around the Galisteo basin the lesser pueblos of I-pe-re (at San Lázaro), Yam-p'ham-ba (San Cristóbal), and Hi-shi, or Pueblo Largo. Of these six towns the inhabitants were almost totally destroyed by the Comanches and Apaches soon after the sixteenth century, a few fugitives seeking shelter with the Santo Domingo Keres, where their descendants remain, keeping up, as do their Tewa kinsmen in the far away Hano of Tusayan, their original language and organization. On the northern spurs of the Sandia and Manzano Mountains were other pueblos of this tribe. In addition to these, but belonging more properly to the Rio Grande division of the Tanos, were six or seven pueblos W. and S. W. of the Salines, linking the northern or Tañ-ge-was to the more southern or Isleta series of Tano towns. Of the latter there were twelve or thirteen, situated along the Rio Grande from Bernalillo to below Isleta, including Na-f'hi-ap, near Bernalillo, and a town at Los Corrales (the ancestral homes, probably, of the present Sandias); and Pu-a-ray, the principal pueblo of the series, Hy-en tu-ay, and Bejui tu-way, near Las Lunas, which were the ancestral abodes of the modern Isletas. These eighteen or more populous pueblos constituted the famous province of Tiguex of Coronado.

Following the Isleta pueblos, there were at least ten or twelve settlements of the Piros distributed along both sides of the Rio Grande as far S. as San Marcial. The northernmost of these (abandoned for El Paso in 1680) was at Alamillo; another, called Pil-a-bo, and perhaps a third, occupied the site of Socorro. At San Antonio was the New Mexican Se-ne-kú, or Senecú, which was destroyed by Apaches in 1675. Fugitives from it fled to Socorro and to Chihuahua, near El Paso, where they established themselves with fugitives from other devastated towns in the pueblo of the same name there, still inhabited by their descendants. The last of the series, and the most southern example of the compact, many-celled pueblos, still occupied at the time of the discovery was Tre-na-quel, at San Marcial. S. of the Salines and some 40 miles E. of the Rio Grande series were, in the valley of Abo, the Piro towns of Abo and Ten Abo (El Pueblo de Los Siete Arroyos), and near the Mesa de los Jumanos, Tabira, or the famous Gran Quivira. All of these Piro towns, including three or four others in the immediate vicinity, were destroyed by Apaches between 1670 and 1680, those of the inhabitants who escaped fleeing to the lower Senecú and Isleta pueblos.

*General Characteristics.*—The Tanoans were everywhere the frontiersmen of the Pueblo country and peoples. On the N. and E. they were contiguous to the Great Plains, and thus to the Utes, Pawnees, Comanches, dog-using Apaches, and other buffalo-hunting or roving tribes. With these they were constantly either at war or on terms of very doubtful amity during frequent but brief trading-truces. Thus they became hardier and more warlike, and greater travelers, traders, and hunters, than any others of the Pueblo peoples. Their training as mountaineers, and their intermarriage for generations with wilder neighbors, especially with the Shoshonean Utes and Comanches, have had a marked influence on their physical development and appearance.

The typical Tanoans (of the north especially) are tall, broad-shouldered, lithe, but strong-limbed, resembling the plains Indians in these and many other respects, even more than they do the Pueblo Indians of other stocks. They are alert in movement and wit, their expression being keen, their features spare, clear-cut, and prominent. The women are shorter than the men, but taller than the average Pueblo woman, and less rotund as a rule. Their costume is much the same. Their dresses, although more ornate, are much shorter of skirt, both modifications being due largely to their greater stature, and to the more active life led by the Tanoan women. The men wear their hair as do the northern plains Indian, long, and plaited at the sides (with fur or bright-colored stuffs interbraided), instead of doing it up at the back in a club or queue, as do the Keresans. They also wear long leggings of buckskin in place of the short, wide trousers or long knitted stockings of the other Pueblos, and for a long time catskin and buffalo robes largely supplied the place of the striped or figured and woven serapes so characteristic of all the other Pueblos.

The wide distribution of the Tanoans was the result of their wandering proclivities; their permanent segregation in small but numerous communities and the compact many-storied and steeply terraced style of their pueblos being due to their constant warfare and defensive necessities. In supplying all pueblos with products of the buffalo-hunt the Tanoans formed small trading-parties, which sometimes penetrated as far S. and W. as the Pima country of Arizona and Northern Mexico. Even now their descendants are the greatest travelers and cleverest traders among existing Pueblos. Able to secure in this way all the products of the finer Pueblo arts, they depended more than the townspeople on both barter and the hunt, tilled the soil less extensively, and seldom resorted to irrigation.

Their tendency to sever themselves (in bands more or less numerous) from their own communities and to join those of other stocks is strongly characteristic, the Hano Tewas of Tusayan being the last of a series of such migrant settlements. While thus so much affected externally by natural and sociologic environment, the Tanoans have been remarkably tenacious of their language, organization, and customs, even the few survivors of the Galisteo towns adhering to these, after a residence with alien people for more than two centuries. This adhesion to native institutions was in part due to the similarity of culture everywhere traceable among the Pueblos; but with the Tanoans the division of each tribe into two main bodies—the clan-groups of winter and summer—was more distinct than with the other Pueblos, resulting sometimes in double (that is, northern and southern) divisions of their towns, as at Taos, and in the possession of at least two kivas in every pueblo. Within these groups, however, occurred the usual septenary subdivisions (see *Habitations* under PUEBLO INDIANS) and the clan-system, together with the totems of their tribes, was no less analogous to those of other Pueblos. The cult-lore of the Tanoans, while pueblo in principle, is very composite in make-up, their folk-tales being derived from, or modified by, that of all the numerous wilder peoples with whom they held intercourse. Naturally they had not advanced beyond simple animism and a resultantly extensive fetish worship, which included a kind of mortuary fetishism not characteristic originally of the other pueblos (exclusively, it may be, of the Tusayan Indians). Their dance-worship is more obviously animal dramaturgy than is that of the Zuñi Pueblos, and their sacred or sociologic games are more athletic than those of the farther pueblos. Their tendency to war kept them on only a slender footing of peace even with the other pueblos, but made them pre-eminent, and secured them leadership, in case of any general confederation or uprising of the Pueblos. The Rio Grande or Isleta (Tiguex) Tanoans were the first to oppose the Spaniards, murdering the earliest Franciscan missionaries to New Mexico. Moreover, it was a wizard chief of the Tanoans, the celebrated Popé, who incited, planned, and largely led the terrible Pueblo rebellion of 1680–96, which well-nigh resulted in the downfall of Spanish power N. of Mexico. Yet the position of the Tanoans on the frontiers, as heretofore defined, led to the speedy extermination of whole groups of their pueblos by the wilder tribes soon after the introduction of Spanish horses and firearms, which, by changing the nature of Indian warfare, rendered the Pueblo defensive method no longer adequate.

*History.*—There is evidence that the ancestral Tanoans were derived from the northwest—ruins of their pueblos being abundant in Colorado and Utah, and thence traceable southwardly into the cañon and mountain country W. N. W. of the present Taos ranges in the north of New Mexico. It seems probable that the Lower Taños and Jemez branches were the first to migrate, peopling the basin and tributary valleys of the great river below Santa Fé, from the north and west, while the Taos and Tewa branches of the same family descended directly from the west, and then spread gradually eastward and downward along the upper section of the same river to about their present stations thereon and on the higher tributaries.

Whatever the original language of the Tanoans may have been, it is now true that considerable numbers of words in their various dialects show Shoshonean association. Their long intercourse and constant intermarriages with Ute and Comanche branches of this great stock during centuries may account for this. If, nevertheless, the Tanoans should yet be proven to have been Shoshonean at an earlier stage of development, then the conversion to the pueblo mode of life and the aridian status of culture of the Shoshonean-Moqui or Tusayan Indians is, by comparison with theirs, a modern event. It is worth noting that the Jemez Tanoans are now largely Navajo, and that formerly they and their eastern kinsmen, the Pecos, were once so intermixed also with the Zuñis that much in their dialect—especially in the names of their pueblos and ruins—shows unmistakable relation to the Zuñi. this, however, more in a derivative than in an inherited way. The wide rangings of the Tanoans made them no less townspeople in the Pueblo sense, but far less sedentary than any of the other Pueblo peoples, and hence less conservative, more subject to admixture with and prone to adopt terms, etc., from outsiders.

*Population.*—The total population of the Tanoan Indians was in the sixteenth century much greater than at present. There are now only between 3,250 and 3,300 of them. Isleta, of New Mexico, is the most populous pueblo, its inhabitants numbering 1,059.

Bancroft, *Arizona and New Mexico* and *Native Races*; and W. W. H. Davis, *Spanish Conquest of New Mexico.* See also INDIANS OF NORTH AMERICA, PUEBLO INDIANS, KERESAN INDIANS, SHOSHONEAN INDIANS, and ZUÑIAN INDIANS. FRANK HAMILTON CUSHING.

**Tanrec**, or **Tenrec** [= Fr., from native (Malagasy) name]: any insectivorous mammal of the family *Centetidæ.* The species are confined to Madagascar, and some have a superficial resemblance to hedgehogs. The tailless *Centetes ecaudatus* attains a length of 6 inches, and has dorsal spines, lost in the adult. The species of *Orzoryctes* are mole-like, and burrow in the rice-fields, doing much damage.

**Tansil'lo**, LUIGI: poet; b. at Venosa, Italy, in 1510. He passed his life in Naples, where he long enjoyed the favor of the viceroy, Don Pedro de Toledo, after whose death, however, he lived poorly by a small office in the customs. D. at Teano, Dec. 1, 1568. His earlier poems are the *Due Pellegrini*, a pastoral; the *Vendemmiatore* (1532), in *ottava rima*, a work so licentious that it was placed upon the Index; and some amorous *Rime*, probably addressed to Maria of Aragon. To his later period belong certain spirited *Capitoli*, or epistles sent to influential friends; the *Balia*, exhorting mothers to nurse their own children; the *Podere* (1560), an idyl on the charms of country-life; and the *Lagrime di San Pietro*, a religious work written by way of atonement for the *Vendemmiatore.* See *Opere di Luigi Tansillo* (Venice, 1738); *Poesie di Luigi Tansillo* (London, 1782); *Capitoli giocosi e satirici*, ed. by S. Volpicella (Naples, 1870); *Poesie liriche edite ed inedite*, ed. by F. Fiorentino (Naples, 1882, with biography); *Il podere*, in *Poeti minori italiani* (Venice, 1786); *The Nurse, a Poem translated from the Italian of Luigi Tansillo*, by William Roscoe (3d ed. Dublin, 1800, with Italian text); *X. Sonetti inediti*, in *Aneddoti tansilliani e danteschi*, ed. by Francesco and Imbriani (Naples, 1883); Franc. Flamini, *Sulle poesie del Tansillo di genere vario* (Pisa, 1888). J. D. M. FORD.

**Tansy** [M. Eng. *tansaye*, from O. Fr. *tanaisie* < Late Lat. *athana'sia*, tansy, from Gr. ἀθανασία, immortality, deriv. of ἀθάνατος, immortal; ἀ-, un-, without + θάνατος, death; cf. *live-forever*, name of a plant]: the *Tanacetum vulgare*, a perennial plant of the family *Compositæ*, bearing doubly pinnatifid leaves and yellow flowers, blossoming from July to September. It was originally introduced into the U. S. from Europe, where it is indigenous. It is cultivated in gardens, but also grows in fields and along roadsides. It possesses a very strong, not unpleasant odor, and an acrid and aromatic taste, properties which are exhibited by its aqueous and alcoholic infusions. The leaves contain a peculiar volatile oil and an acid termed *tanacetic acid*, which is crystalline, forms salts with potassium and sodium, and precipitates solutions of calcium, zinc, silver, and mercury salts. The volatile oil of tansy has a specific gravity of 0·92; when distilled with potassium chromate and sulphuric acid, it yields a volatile crystalline substance isomeric with ordinary camphor; it possesses poisonous properties. Its seeds and leaves are employed, to a slight extent, as medicinal agents. Revised by L. H. BAILEY.

**Tan'talum** [Mod. Lat., named from the mythical *Tantalus* (see TANTALUS), because of the perplexity and difficulty encountered by its discoverer in isolating it]: one of the rarer elements, a metal discovered in 1802 by the Swedish chemist Ekeberg in two Swedish minerals, one of which was *tantalite*, composed mainly of tantalic oxide, $Ta_2O_5$, and ferrous oxide. For many years it was confounded with the COLUMBIUM (*q. v.*) of Hatchett. Tantalum is found also as tantalate of yttrium in the mineral *yttro-tantalite*; in the American, Bavarian, and Greenland *columbites*, with columbic acid; in Nordenskjöld's *hjelmite*; in *euxinite*, *æschynite*, etc. H. Rose obtained metallic tantalum as a black powder, of density 10·78. Its equivalent weight is accepted as 182 from determinations of Marignac. *Tantalic pentoxide* ($Ta_2O_5$), which forms tantalic acid by reacting with water, and tantalates by combining with bases, is an infusible white powder. Revised by IRA REMSEN.

**Tan'talus** (Gr. Τάνταλος): in Greek mythology, a very wealthy King of Phrygia, though some of the mythographers wrongly assign him to Argos, Corinth, or Paphlagonia. He was a son of Zeus and a nymph called Pluto (wealth)—though his lineage is variously given—and father of Pelops and Niobe. He was a favorite of the gods, who often invited him to their banquets, but their favor changed to hatred when Tantalus stole nectar and ambrosia from their table. In order to test the omniscience of the gods he slew his son Pelops, and served him up at a banquet to which he invited the Olympians. As a punishment for this crime he was cast down to Tartarus, where, tortured by hunger and thirst, he was made to stand in a lake, whose water receded whenever he tried to drink; rich fruit hung in clusters from trees above his head, but was withdrawn whenever he tried to pluck it. According to others his punishment consisted in eternal fear caused by a huge rock that was suspended over his head and threatened to fall and crush him. The myth is based on facts. The capital city of Tantalus was in the neighborhood of Smyrna, and its acropolis and what is called the tomb of Tantalus still exist. See Perrot and Chipiez, *History of Art in Phrygia*, etc. (London, 1892). J. R. S. STERRETT.

**Tantum Ergo** [Lat. (these words occurring in the hymn) *tantum* (*sacramentum*), so great (a sacrament) + *ergo*, therefore]: a popular eucharistic hymn, the fifth and sixth stanzas of the *Pange Lingua* (Proclaim, O Tongue!), a famous hymn by Thomas Aquinas. It is sung in Roman Catholic churches during eucharistic services, at the benediction.

**Taoism**, tow'izm [Chinese *tao*, road, way, or path; word, doctrine, reason, etc. + *ism*]: a philosophy and a religion found in China. Both are supposed to be based on the teachings of LAO-TSE (*q. v.*), a scholar and official of the sixth century B. C., who, disgusted with the general decay of manners and social order which characterized his times, became a recluse, and embodied his ideas of things in a little book entitled *T'ao-teh-king*, the "Classic of the Way and of Virtue"; but it is probable that he merely gave expression to ideas which had already found currency in his own and earlier times, while the religion called Taoism, if it ever had any connection with philosophic Taoism, has lost all trace of it. Just what philosophic Taoism is depends largely on the meaning of the word *tao.* Scholars are not agreed, and there is no word in English which can be used in all cases as a satisfactory equivalent. Moreover, Lao-tse's work is obscure in style and abounds in paradoxes, and the writings of Lieh-tse (about 500 B. C.), Chwang-tse (fourth century B. C.), and other later Taoists throw little light on the subject. Some Western scholars call it the "Doctrine of the Way," that is, of the ideal or eternal way of right conduct. Others describe it as "Rationalism," or the doctrine of Reason; while still others speak of it as "Naturalism."

Lao-tse's system seems to have been leveled more particularly against the artificial enactments, by which it was sought to remedy the licentiousness and the turbulence and unrest of his time. He wished people to cultivate "naturalness" or the simplicity and innocence of former days. It is only when *tao* (or nature) is missed that arbitrary standards are set up, that men become ambitious and violent, and squabble in their eagerness for gain and advantage. He who does not act contrary to his nature continues long. Lao-tse inculcated unselfishness under the figure of "emptiness" and humility under the simile of water, which, though good at benefiting all things, always seeks the lowest place—the place which all men dislike. Lastly, he taught that unkindness should be requited with kindness. CHU-HI (*q. v.*), the famous Chinese philosopher of the twelfth century, sums up Taoism as the doctrine of surrender to others. "Its leading doctrines," says Giles, "teach man, by a course of non-resistance and inaction, to bring his moral and physical natures into perfect harmony with their environment, the result being a complete victory over all obstacles to human happiness and even over death itself."

Taoism as a religion dates from the advent of Buddhism in China in the first Christian century, when the superstitions and fanciful notions about immortality (in the flesh) and genii, and alchemy, with its quest after the elixir of life and the herb of immortality, and geomancy, etc., became consolidated into one system and adopted Buddhist forms. It has its temples, monasteries, and idols; its "three pure ones" (in imitation of the Hindu Trimūrti and the Buddhist Triratna), of whom Lao-tse is one, its hell and its purgatory, and a hereditary pope, who enjoys large estates granted him by the government, whose recognition and patronage it now shares with Buddhism. Its moral system is embodied in such tracts as the *Kan Ying Pien*, or Book of Rewards and Punishments (translated by Dr. Legge in his *Texts of Taoism*).

For a fuller account of Taoism in both its forms, see Julien's translation of the *Tao-teh-king* (1822), and the translations in German by Plänckner and von Strauss (1824); Chalmers's *Speculations of the Old Philosopher Lau-tsze* (1868); Legge's *Religions of China* (London and New York, 1881) and his *Texts of Taoism*, in the Sacred Books of the East (2 vols., Oxford, 1891); Balfour's *Works of Chuang-tsze* (1881) and his *Taoist Texts, Ethical, Political and Speculative* (1884); also Giles's *Chuang Tzu, Mystic, Moralist, and Social Reformer* (London, 1890). R. LILLEY.

**Taos**: See TAÑOAN INDIANS.

**Tapajós**, tăă-pāă-zhōs': a river of Brazil; one of the principal southern tributaries of the Amazon; formed by the junction, in lat. 10° 24' 30" S., of two nearly equal branches, the Arinos and Juruena. Both of these rise on the plateau of Matto Grosso, near lat. 14° 30' S., and about 225 miles apart. The sources of the Arinos are close to those of the Paraguay, and it is said that both receive water from the same tracts of flooded land. The Arinos, Juruena and Tapajós are obstructed at intervals by rapids and low falls as far as lat. 4° 30' S.; below this the lower Tapajós is navigable, broadening into a lake-like expanse 12 miles across, but suddenly narrowing to less than a mile at its mouth in the Amazon. Length of the Tapajós and Arinos, nearly 1,100 miles. HERBERT H. SMITH.

**Tapestry** [from O. Fr. *tapisserie*, deriv. of *tapisser*, furnish with tapestry, deriv. of *tapis*, tapestry, carpet < Late Lat. *tape'tium* = Gr. ταπήτιον, dimin. of τάπης, τάπητος, tapestry, rug, carpet]: a fabric made by weaving or tying threads of worsted, silk, or other material into a warp of strong twine, which warp is not seen in the finished stuff. Tapestry is made entirely by hand and without those repetitions of the pattern which are characteristic of mechanical weaving. It also differs from all weaving in the usual sense in the fact that there is no shuttle thrown from side to side of the web. It has been rightly described as a mosaic of threads held in place only by the warp. In some modern languages the word for tapestry means also common worsted-work on canvas, and this is not inaccurate, for tapestry differs from worsted-work chiefly in its much greater solidity and in the immensely superior character of the designs executed in it. Both differ from embroidery, in that there is no background, as of cloth or leather, upon which the work is done, the whole fabric being made together.

Tapestry was anciently made on a frame which held the twine of the warp horizontal. As the work was always done from the wrong side, the workman could not see the right side, which was held downward and out of reach. An invention, perhaps of the Middle Ages, consisted in using a vertical frame. With this the workman can easily walk to the right side or face of his tapestry, judge of its progress, and compare it minutely with the cartoon or pattern made for him to follow. These two processes are called low warp (*de basse lisse*) and high warp (*de haute lisse*). The important tapestries since the fifteenth century are all high warp.

During the fifteenth and following centuries tapestry was made in Flanders, France, and Italy, and probably in other European countries. The most famous center of the industry was the town of Arras, France, and the name "arras" was often applied to tapestry of any make, as in Shakspeare's *Henry IV.*, Act II., Scene IV. Tapestry was the favorite decoration for walls of rooms and even for the lower part of the interiors of churches and chapels. It was hung from hooks and generally left free at the lower edge, so that a certain space might be left between it and the wall, in which a person might be concealed. The decoration of interior doorways and windows was made of but little account by the tapestry, which turned all corners and was arranged to meet across the door or to conceal the window at pleasure. This loose hanging of the tapestry is important to its best effect; those pieces which in modern times have been stretched tight and framed, as in the Gallery of Apollo in the Louvre, lose their charm and are mere imitations of paintings in an unfit material.

The famous factory of the Gobelins in Paris was established in 1630, the royal factory of Aubusson in 1665, and the royal factory of Beauvais is of the same epoch. These three factories have generally been maintained by the state; they are still so maintained, and their most important productions are not commonly sold.

The BAYEUX TAPESTRY (*q. v.*), so called, is a long and narrow piece of embroidery in worsted on linen, and is therefore not tapestry in any sense. It represents the preparations of William of Normandy for the invasion of England, and is undoubtedly a work of the epoch; it is on exhibition at the Public Library of Bayeux in Normandy, but is said to be decaying. For tapestry Brussels, see CARPETS.

BIBLIOGRAPHY.—The most important work on the subject is *Histoire Générale de la Tapisserie*, by Eugene Müntz (3 vols. fol., 1878–84). The same author has published a small volume, *La Tapisserie*, forming part of the Library of Instruction in the Fine Arts (Paris). What is known of the use of tapestry in ancient times is treated by de Ronchaud in *La Tapisserie dans l'Antiquité*, and the influence of tapestry on ancient art is discussed in Semper's book, *Der Stil in den Technischen und Tektonischen Künsten*. See also Viollet-le-Duc, *Dictionnaire de Mobilier*, art. *Tapis*.
RUSSELL STURGIS.

**Tapeworm**: any one of the *Cestodes*, a group of parasitic flatworms (Plathelminthes), the most striking feature of which is the complete absence of an alimentary canal. This is compensated for by the mode of life, as these animals live in the adult state fastened to the inner wall of the digestive tract of some animal, and being thus surrounded by partially digested food, absorb their nourishment through the body walls. In all there is an anterior end or head in which is the chief nervous center or brain, and which serves usually by means of suckers or hooks as the organ of fixation. Behind the head is the flat, elongate body, which is largely occupied by the organs of reproduction. In the simpler tapeworms, which occur in some of the lower animals, the body is undivided and there is but a pair, male and female, of reproductive openings. In the other forms the head, followed by an unsegmented portion or neck, is called a scolex and behind this occurs a series of joints or proglottids, each of which contains its own set of reproductive organs. These proglottids arise by division of the posterior part of the scolex, each new proglottid pushing the others backward, so that the one farthest removed from the head is necessarily the oldest. As the proglottids grow older they increase in size, and as they mature the sexual products they become free from the rest and are carried to the external world with the rejecta. New ones are continually formed from the scolex, and this is the reason why the head of the worm must be removed in order to stop the troubles caused by these parasites.

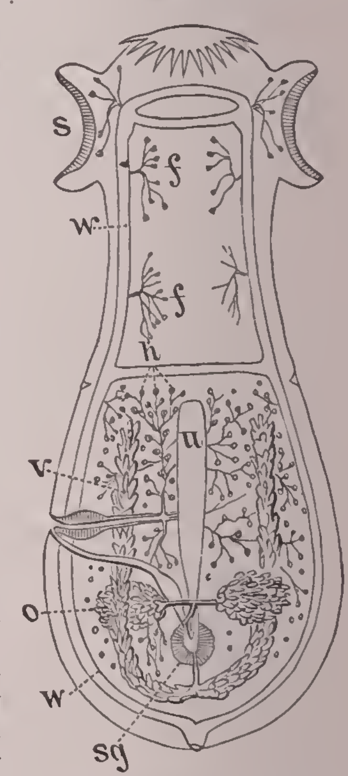

FIG. 1.—Diagram showing the structure of a tapeworm, with two joints or body segments, in the posterior of which the reproductive organs are developed. At the anterior end is a circle of hooks, behind which, at *s*, are two of the four suckers: *f*, flame cells; *h*, testis; *u*, uterus; *v*, vitellarium; *w*, excretory (water-vascular) tubes; *o*, ovary; *sg*, shell gland.

In many tapeworms the history is simple. The proglottids or their contained eggs are eaten by some animal, and in its intestine they develop directly into the parent form. In the case of those species which affect man the development is more complicated, and can best be followed by tracing the history of different forms.

The largest tapeworm occurring in man is known as

*Bothriocephalus latus*; it may consist of over 2,000 proglottids and have a length of 40 feet. The head is elongate and has two narrow pits or suckers on the side. Hooks are lacking. The genital openings are on the flat surface of the proglottids. The history is not completely known. From the eggs hatches an embryo which swims freely in the water, and apparently must enter some host not yet discovered. When this host is eaten by some fish (in Europe by the pike or burbot), the scolex is developed and bores through the intestinal walls, and entering the muscles secretes a thin wall (cyst) about itself. If this fish be eaten in an imperfectly cooked condition by man the scolex fastens itself to the intestinal wall and develops into the mature worm. *Bothriocephalus latus* is common as a human parasite in Switzerland, Northern Russia, and Sweden, but is rare in other parts of Europe. In America it is found only in natives of these countries.

Fig. 2.—Cysticercus stage of tapeworm.

Several species of *Tænia* infest man. These agree in having a spherical or pear-shaped head bearing four suckers and usually a circle of hooks to aid in fixation. The sexual openings are on the edges of the proglottids. These worms, like the last, have two hosts in the life-cycle, but differ from *Bothriocephalus* in the character of the larval stages and in that the intermediate host is usually a mammal. The larvæ have separate names. The cysticercoid is a scolex, the head of which has been inverted into the body as the finger of a glove can be turned into the hand. The cysticercus, or bladder-worm, differs in that the body into which the head is inverted becomes enormously swollen by fluids within. The cœnurus is a cysticercus with several invaginated heads, while the echinococcus has secondary *cœnuri* turned in from the wall of the original sac. In the future development of cysticerci or echinococci each head gives rise to a distinct worm.

*Tænia solium* is the most common tapeworm of man. The tip of the head is surrounded by a double circle of hooks, and the body, sometimes 10 feet in length, may consist of 800 to 900 proglottids. The ripe proglottids and eggs, cast out from the body, are eaten by pigs, and the embryos, hatching in the intestine, bore through into the muscles, where they develop into the cysticercoid stage. If pork infested with these bladder-worms ("measly pork") be eaten in an uncooked condition, the cysticerci are set free and, fastening themselves to the intestinal wall, develop into the adult worm. Sometimes man, by eating lettuce, etc., which has been watered by liquid manure, becomes the host of the bladder-worm stage.

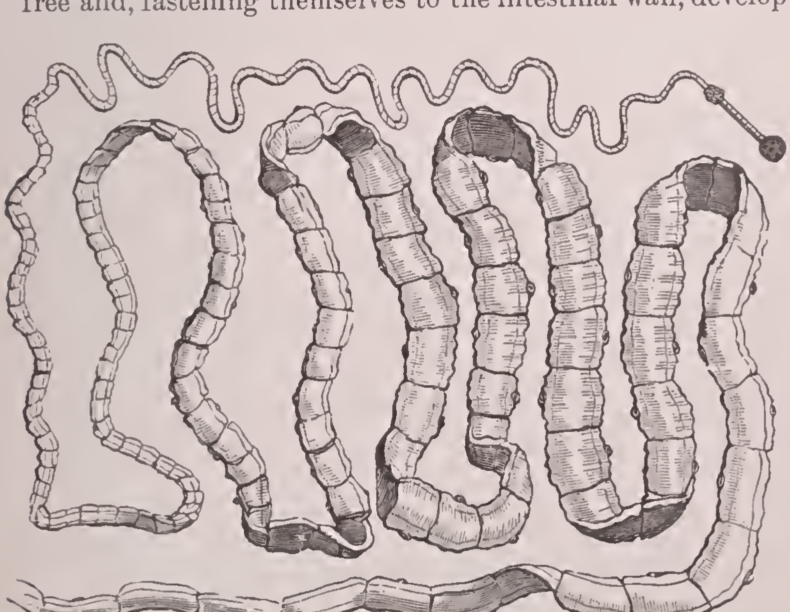

Fig. 3.—The common tapeworm of man (*Tænia solium*).

*Tænia saginata*, which is less common than *T. solium*, lacks the circle of hooks and reaches a length of 25 feet. Its history is much the same as that of *T. solium*, except that cattle instead of swine serve as the intermediate hosts. Other tapeworms are occasionally found in man, as *T. cucumerina* and the echinococcus stage of *T. echinococcus*, the adult of which lives in the intestine of the dog. Domestic and other animals are commonly infested with tapeworms, and the histories of many have been followed. The alternating hosts of a few may be of interest:

| Adult. | Encysted Form. |
|---|---|
| *Tænia serrata* of dog. | Cysticercus in rabbit. |
| *T. crassicollis* of cat. | Cysticercus in mouse. |
| *T. marginata* of dog. | Cysticercus in pigs and cows. |
| *T. cœnurus* of dog. | Cœnurus in sheep. |
| *T. echinococcus* of dog. | Echinococcus of man and domestic animals. |
| *T. cucumerina* of dog. | Cysticercoid in dog-louse. |

The presence of tapeworms in the human being is usually followed by uncomfortable symptoms, and a physician should be called. In domestic animals these parasites sometimes cause death. As infection in man almost always occurs by eating raw or improperly cooked meat, all danger may be avoided by partaking only of that which has been cooked through. The literature relating to the tapeworm is enormous. The most useful works are Cobbold's *Entozoa* (London, 1864) and Leuckart's *Die Parasiten des Menschen* (2d ed. Leipzig, 1879–89). J. S. Kingsley.

**Tapioca** [= Portug., from Braz. *tipioca*, manioc juice]: the starch of the manioc *Manihot utilissima* (*Janipha* or *Jatropha manihot*). It is prepared by pressing the washed and dried roots under water, when it is obtained in a mealy form, which is converted into a granular condition by drying over hot plates. Upon drying and pressing the pulp remaining in the water, cassava-bread is obtained. This, when pulverized, is known as manjok-flour. Tapioca is largely consumed as food. Revised by L. H. Bailey.

**Tapir** [from Braz. (Tupi) *tapy'ra*, tapir]: any one of the *Tapiridæ*, a family of perissodactyl mammals, related to the rhinoceroses and horses. The hind quarters project notably backward, the snout is produced into a short flexible proboscis with the nostrils at the end; the ears are erect and moderately developed; the neck abbreviated; the tail very short; the anterior feet have each four toes, the posterior three. The teeth are in almost full number—viz., M. $\frac{3}{3}$, P. M. $\frac{4}{3}$, C. $\frac{1}{1}$, I. $\frac{3}{3} \times 2 = 42$; all the molars, as well as premolars, 2, 3, 4, are nearly similar, squarish, and each with the anterior crest marginal, but with an anterior cingulum terminating in a cusp at the antero-exterior angle of the tooth; the hindermost molars (M. 3) have no posterior lobes; the outer incisors of the upper jaw are enlarged, and like canines; the true canines very small; the incisors of the under jaw uniform; the canines large. The skull has the nasal aperture very large, and encroaching far behind into the frontals and on each side of the nasal bones; the nasal bones, when fully developed, form together a somewhat heart-shaped figure, broad behind and tapering forward. The lower jaw has moderately deep rami, whose angles are convex and project considerably backward. The family is represented by five species, viz., (1) *Tapirus terrestris*, a species widely spread over South America in the lowlands, and extending from the Isthmus of Panama to Paraguay; (2) *Tapirus pinchaque*, confined to the Andes of South America, especially Ecuador and New Granada; (3) *Tapirus indicus*, an inhabitant of the Malaccan Peninsula, Sumatra, and Borneo; (4) *Elasmognathus bairdii*, a native of the Isthmus of Panama, and extending northward into Southern Mexico; and (5) *Elasmognathus dowii*, found in Nicaragua. In *Tapirus* the margins of the upper jaw are rolled inward, but in *Elasmognathus* they are spread out so as to firmly embrace the mesethmoid. All the species are denizens of deep forests, but near where water abounds, to which they frequently resort. They vary in size from that of a small ass to that of a moderate horse, the *Tapirus pinchaque* being the smallest, and the *Tapirus indicus* the largest. This animal is remarkable for its coloration, the fore parts and hind legs being black, the upper hinder portion of the body dirty white. The American species are dark brown. *Elasmognathus bairdii* is the largest American species. All the species (except possibly *E. dowii*) are striped or spotted in early youth, but soon assume the uniform or bicolored livery of full age. Although represented at present by species so singularly isolated as are the American and Malaccan species, in the Tertiary epoch the family was widely diffused, and animals belonging to it roamed over Europe and America far to the northward. The species, too, are the nearest relations of the Eocene *Lophiodontidæ*, which are among the oldest of known placental mammals. Revised by F. A. Lucas.

**Tappan**, ARTHUR: philanthropist; b. at Northampton, Mass., May 22, 1786; son of Benjamin Tappan (1748–1831), a Revolutionary patriot and merchant; became a merchant at Portland, Me., and at Montreal, Canada; established himself in New York as an importer of British dry-goods 1814; was one of the founders of the American Tract Society; endowed Lane Seminary at Cincinnati, a professorship at Auburn Theological Seminary, and erected Tappan Hall of Oberlin College, of which he was a founder; joined his brother Lewis in founding the New York *Journal of Commerce* (1828); was the first president of the American Anti-slavery Society, formed in Philadelphia Dec. 4, 1833, but withdrew from it in 1840 on account of the aggressive spirit manifested by many members toward the churches and the Union; was obliged to suspend payments in the great crisis of 1837, but ultimately met all his engagements; was nevertheless forced to go into bankruptcy in 1842, when he caused the whole of his personal property to be sold. D. at New Haven, Conn., July 23, 1865. See his *Life*, by Lewis Tappan (New York, 1871).

**Tappan**, HENRY PHILIP, D. D., LL. D.: educator and author; b. at Rhinebeck, N. Y., Apr. 23, 1805; graduated at Union College in 1825; studied theology at Princeton, and after having been a year associate pastor of a Dutch Reformed church in Schenectady became in 1828 pastor of a Congregational church in Pittsfield, Mass.; in 1832 became Professor of Moral Philosophy in the University of the City of New York; resigned in 1838, and opened a private school; in 1852 was elected chancellor of the University of Michigan; resigned in 1863. D. at Vevay, Switzerland, Nov. 15, 1881. He published *Review of Edwards's Inquiry into the Freedom of the Will* (1839); *The Doctrine of the Will determined by an Appeal to Consciousness* (1840); *The Doctrine of the Will applied to Moral Agency and Responsibility* (1841); *Elements of Logic* (1844; revised and enlarged 1858); *Treatise on University Education* (1851); and *A Step from the New World to the Old, and Back Again* (1852). Revised by G. P. FISHER.

**Tapping**, or **Paracentesis**: in surgery, the piercing of the walls of a cavity so as to draw off a dropsical or other collection of fluid. The abdomen, chest, scrotum, and even the head are tapped for the removal of such effusions. The trocar and canula answer for the performance of the operation in many simple cases. In some others the contained fluid has to be removed by an instrument acting as a pump or syringe. Tapping often affords great relief, and occasionally is of great service toward recovery, especially in pyothorax and hydrothorax. Revised by W. PEPPER.

**Tap′ti**: river of Bombay, British India; rising in the Satpura Mountains and flowing W. to the Gulf of Cambay, near Surat. It is paralleled by a railway and is not properly navigable, nor is it used to any extent for irrigation. Length, 457 miles; area of basin, 30,000 sq. miles. It is subject to occasional but severe floods. It curiously parallels the more important and more sacred Nerbudda river.

**Tar**: a word associated with pitch and used in a very indefinite manner, usually with a prefix. Tar is a name properly applied to a black, exceedingly viscous fluid distilled in a rude way in forests from the wood of various species of pine and spruce. The wood is placed in a pit and covered with turf in a manner resembling a charcoal pit. A part of the wood is burned to furnish heat to distill the remainder, and the tar is received into barrels. It is mainly used in preparing the hemp ropes used in the rigging of ships and in calking the sides and decks of ships. A different kind of tar is obtained as a residuum when the wood of deciduous trees is distilled for pyroligneous acid; this is called wood-tar. A similar material, known as coal-tar (also called gas-tar), is obtained as a residuum when bituminous coal is distilled for illuminating gas. A similar, but not identical, liquid called blast-furnace tar is obtained by condensing the vapors that escape from blast furnaces and coke-ovens. A material called bone-tar is obtained as a residuum from the distillation of bone oil or Dippel's oil. Candle-tar is a residuum from the stearin manufacture. The word pitch appears to have been applied at a very remote period to asphaltum and maltha or mineral tar. When different tars are distilled, as well as petroleums, various kinds of pitch are obtained. The pitch from the paraffin petroleums is called coke-pitch; that from wood-tar is the black pitch of commerce. Burgundy pitch is more properly a resin; it is obtained from the European fir, *Abies excelsa*. In Persia and Afghanistan goat and sheep dung are distilled, furnishing a material of a tarry or pitchy consistence that is applied to the goats or sheep to ward off disease. The oily distillate of tar is called oil of tar. See BITUMEN and COAL-TAR.

S. F. PECKHAM.

**Tara**: See TARO.

**Tarantass′** (Russian, *tarantasŭ*): a long Russian vehicle, drawn usually by three horses abreast. It has four wheels, and its boat-shaped body rests on two parallel wooden bars instead of on springs. The tarantass has a hood or cover, but generally no seats.

**Tar′antism**: an epidemic dancing mania, formerly prevalent in Apulia, and especially at Taranto, whence its name. It was popularly believed to be caused by the bite of the tarantula, and doubtless the fright attending the bite may have aggravated the nervous symptoms of the patient. The disease was essentially a form of emotional or hysterical excitation. (See DANCING MANIA and CHOREA.) Not only dancing, but catalepsy, was one of the symptoms. It was believed that the patients possessed an ardent passion for music and the dance and for bright and beautiful objects. The most successful cure was from hearing and dancing the music of the tarantella, the Sicilian national dance.

Revised by W. PEPPER.

**Taran′to** (Lat. *Taren′tum*; Gr. Τάρας, Τάραντος): town; in the province of Lecce, Italy; in lat. 40° 26′ N., lon. 17° 16′ E.; at the northern extremity of the large Gulf of Taranto, on an island connected with the mainland by two stone bridges (see map of Italy, ref. 7–H). Two low islands (anc. *Chœrades*), San Pietro and San Paolo, lie as a protection across the harbor, which is one of the finest in Italy. The main entrance is between Cape S. Vito and the island of S. Pietro, and admits shipping of the heaviest tonnage. The most important buildings are the Cathedral of San Cataldo, the church of the archbishop, and a castle erected by Charles V. The almost tropical vegetation is hardly less luxuriant now than when Horace wrote his *Ode*, 6, b. ii. Even the date-palm bears fruit here, though not in its perfection. The honey, the oil, and the fruits of the neighborhood have as great a reputation as ever, and the waters of the Gulf of Taranto are noted for their shell-fish, such as oysters and mussels, the gathering of which affords considerable employment to the people. The remains of the ancient town, the largest of all the cities of Magna Græcia (founded 708 B. C.), and once boasting of an army of 30,000 foot and 5,000 horse, besides a strong navy, are insignificant. Taranto is mentioned in mediæval history, and is especially remembered as the fief of Bohemond the Norman crusader. Pop. 25,246. Revised by M. W. HARRINGTON.

**Taran′tula** [= Mod. Lat., from Ital. *tarantola*, dimin. from *Taranto*, Tarentum]: a large lycosid spider (*Tarantula apuliæ*) of the warmer portions of Europe, fabled to cause by its bite the peculiar madness called tarantism. In America the term is given to any of the large mygalid spiders of the tropics.

**Tarapacá**: a northern province of Chile, between Antofagasta on the S. and Tacna on the N., extending from the Pacific to the Andes of Bolivia. Area, 19,300 sq. miles. A barren and desolate range of mountains runs parallel to the coast, rising to 6,000 feet in parts. Between this and the base of the Andes is a rainless desert, called Pampa de Tamarugal, 30 miles wide and 3,000 feet above sea-level. A few watercourses cross this waste in deep ravines, but generally do not reach the sea; they form the only habitable portions. The province owes its importance to its immense beds of Chile saltpeter; these extend also into Antofagasta, but always in the interior desert, and at least 20 miles from the coast. To reach them railways extend inland from Iquique, the capital and principal port, and from Pisagua; reducing-works have been built at various points. The exports of saltpeter and subsidiary products from Iquique and Pisagua exceed 30,000,000 pesos in annual value. There are some silver mines near Iquique. Tarapacá, formerly a coast department of Peru, was seized by Chile in 1880, and was definitely ceded to that country by the treaty of peace ratified in 1884. Pop. (1893) estimated, 48,638, nearly all engaged in the saltpeter-trade. HERBERT H. SMITH.

**Tarascon**, tāā′rāās′kōn′: town; in the department of Bouches-du-Rhône, France; on the left bank of the Rhône, 8 miles N. of Arles (see map of France, ref. 8–H). It has manufactures of woolen and silk fabrics, and the Arles sausages are made here. The Gothic church of St. Martha, built in 1187–97 and rebuilt in 1379–1449, and the castle finished in the fifteenth century by King René of Anjou are its most important buildings. The town celebrates the fête of La Tarasque, a monster subdued by St. Martha and described by Daudet in his works devoted to Tartarin. Pop. (1896) 9,023. Revised by M. W. HARRINGTON.

**Taraxacum**: See DANDELION.

**Tarbagatai'**: military frontier district of the Chinese empire and chain of mountains separating the former from the Russian province of Semipalatinsk. The district is a part of the ancient Sungaria, and is between Semipalatinsk and Kansuh. Area about 25,500 sq. miles, but the district is ill defined. Pop. about 64,000, consisting of Kalmucks, Kirghiz, and others, mostly nomadic. M. W. H.

**Tar'boro**: town; capital of Edgecombe co., N. C.; on the Tar river, and the Atlantic Coast Line railway system; 41 miles N. W. of Washington, 48 miles E. by N. of Raleigh, the State capital (for location, see map of North Carolina, ref. 2–I). It is in a cotton, corn, and peanut growing region, and contains 7 churches, a graded and 4 other schools, a State bank, with capital of $33,960, a weekly newspaper, and cotton and knitting factories and agricultural-implement works. Pop. (1880) 1,600; (1890) 1,924; (1900) 2,499.

EDITOR OF "SOUTHERNER."

**Tardigra'da** [Mod. Lat.; Lat. *tar'dus*, slow + *gra'di*, to step, walk]: a group of minute soft-bodied animals found in fresh water, damp moss, or sand. Popularly they are known as water-bears. Their four pairs of legs are short, thick, and armed each with a double claw. Through their transparent bodies the internal organization is readily studied under the microscope. The alimentary canal consists of a muscular pharynx near the mouth, a large sac-like stomach, and a short intestine or cloaca. Into this last division open the reproductive organs and a pair of small short tubes supposed to be comparable to the Malpighian tubules of insects. The nervous system consists of a supra-œsophageal and a sub-œsophageal ganglion connected by a circumoral commissure, and a chain of four ganglia, one for each pair of legs. The muscular system consists entirely of smooth muscle-fibers. The blood circulates freely through the body and is aërated through the skin, there being no special circulatory or respiratory organs. Where the animals belong in a system of nature is a matter of uncertainty. The presence of four pairs of legs has caused them to be considered as possibly primitive or degenerate *Arachnida*, but the absence of striated muscle-fibers and other peculiarities of structure seem to exclude them from the *Arthropoda* altogether. F. C. KENYON.

**Tarentum**: See TARANTO.

**Tarentum**: borough; Allegheny co., Pa.; on the Allegheny river, and the Alleg. Val. and the Penn. railways; 21 miles N. E. of Pittsburg (for location, see map of Pennsylvania, ref. 4–B). It is in an agricultural region, and has glass, paper, and other manufactories, a national bank with capital of $50,000, and two weekly newspapers. Pop. (1880) 1,245; (1890) 4,627; (1900) 5,472.

**Tares**: various leguminous plants, especially of the genus *Vicia*. Some of them are common weeds in the cultivated grounds of the U. S. and Europe. *V. sativa* is cultivated as a forage-plant and as a green manure. (See VETCH.) Its herbage is very nutritious. It is probable that the plant called tare in the English New Testament is either DARNEL or CHESS (*qq. v.*).

**Tar'gūm** [= Aram.-Heb., translation; cf. Assyrian *ragāmu*, to speak]: a name given by the Jews to the Aramæan translations and paraphrases of the Old Testament which became necessary when Hebrew was superseded by Aramæan as the spoken language of Palestine. The word occurs for the first time in Ezra iv. 7; but it is impossible to say when these translations were first made—unofficial ones probably at an early date. We hear of a Targūm to Job as early as the time of Gamaliel the elder, the teacher of Paul. But they were not committed to writing until a later date. Linguistically they belong to the Western Aramaic, and were made in Palestine, though they received their final form in Babylon. There seems to have been a disinclination to committing the Targūm to the Tōrāh and the Prophets to writing. In the official reading in the synagogue, the Tōrāh was translated verse by verse, as we find it in the best MSS. In the prophetical lessons, three verses could be read at a time. During the Middle Ages, the Targūm was cultivated especially by the Jews of Yemen, who have also translated into Aramæan certain portions of the prayer-book (*Mntschr. f. Wissen. d. Judenth.*, 39, p. 175).

The following Targūmīm are distinguished: A. To the Tōrāh: (*i.*) The first Jerusalem Targūm, which is fragmentary, and though probably the oldest, was not put into its present shape before the seventh century. (*ii.*) The second Jerusalem Targūm (or Pseudo-Jonathan), which is complete. (*iii.*) The Targūm Onkelos, which is supposed to mean "similar in character to the Greek translation of Aquila," but which Jewish tradition refers to one Onkelos the proselyte. It was called by the Babylonians "our Targūm," and is evidently a result of official pruning. It follows the Hebrew text very closely, and agrees with the LXX. in its philosophical and religious exegesis. By some its composition is placed in the second century A. D. (school of R. Akiba), by others in the first (Hausdorff, in *Mntschr. f. Wissen. d. Judenth.*, 38, p. 203). A Māsōrāh to this Targūm has been edited by A. Berliner (Leipzig, 1877). To parts of the Tōrāh there were also other Targūmīm (*Mntschr.*, 39, p. 97, *seq.*). B. To the Prophets there exist: (*i.*) Remnants of an old Jerusalem Targūm, which is, however, very largely intermixed with Midrash. (*ii.*) The official Targūm, which is said to be the work of Jonathan ben Uzziel, a pupil of Hillel; but it seems to have received its final form in Babylon under R. Joseph bar Chiyyāh (333 A. D.). Luzzatto supposes that the name "Jonathan" bears the same relation to the Greek translation of Theodotion as Onkelos does to Aguila. This translation is free and paraphrastic. For other Targūms to the Prophets, see Gottheil, *Journ. Amer. Orient. Soc.*, xiv., p. xlii. C. The Targūmīm to the Hagiographa were never official: some are literal translations, others largely interspersed with Midrash. There is no Targūm to Daniel, Ezra, Nehemiah; that to Proverbs shows a very decided connection with the Peshitta; that to the Psalms is later than the ninth century. There are three Targūmīm to Esther. There is also a Samaritan Targūm to the Tōrāh, but the date of its composition is unknown (ed. Petermann and Vollers, Berlin, 1876–85; cf. Nöldeke, *Deutsch. Zeit. d. Morgenl. Gesell.*, xxx., 343).

The text of the Targūmīm will be found in the Polyglotts. Onkelos has been re-edited by Berliner (Berlin, 1884); the Targūm to the Prophets and Hagiographa by Lagarde (*Prophetæ Chaldaice*, Leipzig, 1872; *Hagiographa Chaldaice*, Leipzig, 1873); cf. also Merx, *Chrestom. Targumica* (Berlin, 1888); Buhl, *Kanon und Text des Alten Testamentes* (Leipzig, 1891, §§ 59–67; Eng. ed., New York, 1893), where the full literature is given. RICHARD GOTTHEIL.

**Tarifa**, tāā-ree'fāā: town; in the province of Cadiz, Spain; on the Strait of Gibraltar. It is the southernmost town on the continent of Europe (see map of Spain, ref. 20–D). It is surrounded by old Moorish walls within which is an alcazar. There is a modern fort and a lighthouse 135 feet high. Its fisheries for tunnies and anchovies are very important, and its oranges are noted for their sweetness. Pop. (1887) 13,206.

**Tariffs** [viâ Fr. from Span. *tarifa*, price-list, rate-book, from Arab. *ta'rīf*, notification, information, inventory, deriv. of *'arafa*, know, inform, explain]: tables or lists of dues or duties, specifically of customs duties leviable on articles of import or export; by colloquial extension such duties themselves. Custom duties are as old as international trade, being a natural source of revenue as soon as commodities pass from country to country. In European countries they go back to the Middle Ages. Almost from the first they were instruments of industrial policy as well as means of securing revenue. How soon they began to be consciously used for the purpose of influencing industrial development is a matter of some dispute; but it is certain that duties having a distinctly protective purpose appear as early as the sixteenth century. In the mercantile system the use of import duties as one means of fostering certain kinds of industries, especially manufactures, reached perhaps its highest development. The most effective application of that system, and of high tariffs as part of it, was made by Colbert, in France, in the second half of the seventeenth century, more particularly in the tariffs of 1664 and 1667. Other countries adopted a similar policy, and in the eighteenth century every European country had an elaborate system of duties on imports and exports, prohibitions, bounties, premiums, designed to turn industry into particular channels. The other weapons of the mercantile policy—prohibitions, bounties, and so on—have in the main disappeared, but tariffs or import duties have continued to play an important part.

The first break in the general use of protective duties came late in the eighteenth century, by the commercial treaty of 1786 between Great Britain and France. These countries had carried on for a century and more a commercial warfare, which played a large part in causing the frequent military struggles. The treaty of 1786 provided for the reciprocal admission of goods at greatly reduced duties, and was due largely to the gradual permeation of the influence of Adam Smith and of the French physiocrats. It lasted, however, but a short time, being ended by the wars of the French Revolution. With the close of the Napoleonic wars in 1815 the tariff history of all European countries enters on a new stage. In Great Britain the influence of Adam Smith and his followers, all strong advocates of the principle of free trade, served to loosen the hold of the protective system. At the same time the industrial position of Great Britain, the need of plentiful and cheap raw materials for her growing manufactures and of food for her growing population, made it clearly to her interest to adopt a policy of freedom as to them. The first important steps were taken under the leadership of Huskisson in 1824, and consisted in a lowering of duties on manufactures and a lowering or abolition of them on raw materials. After Huskisson's death in 1829 there was a temporary lull, though some changes were made by Lord Althorp after 1832. In the decade 1830–40 the agitation against the corn-laws (duties on grain) became active, under the leadership of Cobden. The corn-laws had developed during the eighteenth century, and had been made more severe after the close of the Napoleonic wars. The Corn-law League attacked them, but at first without success. In 1842, when Peel resumed the task of moderating the protective system in general, the corn-laws were retained, though in modified form; but in 1846 they were finally abolished, under the pressure of a bad harvest and high price of food, combined with the potato famine in Ireland. With the downfall of the corn-laws the last prop of protection in Great Britain was gone. In the year of their repeal duties were further reduced; in 1853 still more; finally in 1860, at the time of the treaty with France (see below), the last vestige of protection disappeared. Since 1860 duties have been levied on a very few articles, like tea, coffee, cocoa, tobacco, spirits, wines; and where these articles are produced within the country (e. g. spirits), an internal tax is levied practically equal in amount to the duty on the imported articles.

France returned to the system of prohibitions during the revolutionary and Napoleonic wars. Largely as a measure of warfare against Great Britain, absolute prohibition of import was established in regard to most manufactured articles. The Revolution, however, had one important influence in the direction of freedom; for the intricate duties on the passage of goods from one province of France to another, which had previously existed, were swept away early in its course. When peace came in 1815 a system of prohibition even more rigid than that of the preceding century was maintained on imports of manufactures from abroad. The successive governments made some attempts at relaxation, but did not feel strong enough to alienate the manufacturing interest. Finally, in 1860, Napoleon III., influenced largely by a desire to gain the good will of England, abruptly put an end to the prohibitory *régime* by the famous commercial treaty with that country. The treaty, negotiated by the economists Cobden and Chevalier, provided for the admission of British goods into France at moderate duties, not usually exceeding 10 per cent. It had important consequences in all European countries, for similar treaties were concluded by France shortly after with the other leading countries, and by these with each other, with the result that a network of treaties was spread over the Continent, bringing everywhere a marked moderation of the duties. The treaty system, however, was never thoroughly popular in France, and did not endure. It had never been applied to agricultural articles, and the growing competition of the U. S. and other new countries caused a gradually increasing application of protection to them, by duties on grains and meat-products. The original treaty with Great Britain was terminated in 1881, and treaties with other countries in 1891–92. In 1892 the treaty system was finally abandoned, and a new tariff of distinctly protective duties was adopted, with a provision only for certain minimum duties to be granted to countries which should give reciprocal favors to France.

In Germany the seventeenth and eighteenth centuries had seen the application of highly complicated protective tariffs, similar to those of Great Britain and France. The most rigorous system was that of the Prussian kings, especially of Frederick the Great. After the close of the Napoleonic wars the liberal statesmen who had guided Prussia through the critical period of conflict reformed the tariff in 1818, substituting moderate and simple duties for the previous system of high and complicated rates. Other German states maintained for a while their own tariffs, but the number of petty states and their involved boundaries made the separate tariffs intolerable, especially as the French rule had for a while abolished them for large parts of Germany. Some smaller states joined in a customs union with Prussia; other states formed unions between themselves. Finally, by separate treaties, a general customs union, the Zollverein, was formed in 1834. The Zollverein treaties provided for complete free trade within Germany, and for moderate duties (those of the Prussian tariff of 1818) on foreign imports. The Zollverein treaties were renewed from term to term. In 1853 a treaty was made with Austria, not admitting that country to the Zollverein, but providing for reciprocal reductions of duty. In 1861 occurred a crisis in the Zollverein's history, Prussia being desirous of lower duties, while the southern states, influenced largely by political sympathy with Austria, wished a retention or increase of the existing rates. Prussia won the victory by boldly concluding an independent treaty with France in 1862, which was later adopted for the Zollverein, and provided for a marked moderation of the previous duties. After the formation of the German empire in 1870–71 the history of the Zollverein becomes the tariff history of Germany. In 1879 a distinct return to protection took place in the form of higher duties on manufactures and new duties on agricultural products. This change in policy was due partly to changed political conditions (Prince Bismarck having broken with the old liberal party), and partly to the agricultural depression resulting from the competition of the U. S. The duties on grain were further raised after 1879. In 1892 a change in policy was again made by commercial treaties with Austria-Hungary, Italy, and other countries, providing for reciprocal reductions of duties, and among others for lower duties on Hungarian grain and Italian wines. In 1894, after prolonged negotiations, a treaty on similar lines was concluded with Russia, admitting Russian barley and wheat into Germany at lower rates.

*Tariffs in the United States.* — The history of U. S. tariffs divides itself into four periods: the first running from the year 1789 to about 1816; the second, the period of the early protective movement, from 1816 to 1840; the third from 1840 to 1860; and the fourth and last covering the period since the civil war.

I. The first period is marked in general by the fact that tariff legislation occupied a subordinate place in public attention, and that the protective controversy can not be said to have fairly begun. It is true that one of the first acts passed by the first Congress in 1789 was the Tariff Act of that year; but the prompt attention given to the subject is easily explained from the imperative need of revenue for the new commonwealth. The act of 1789 was based partly upon the impost scheme which it had been attempted to adopt for the confederation in the years immediately preceding 1789, and partly on the existing legislation of some of the individual States. The impost scheme of the confederation had proposed a duty of 5 per cent. on imports in general, and other moderate revenue duties on tea, coffee, sugar, spirits, and similar articles. This scheme had never been carried out, because it had proved impossible to secure the necessary consent of every individual State. As to the tariff policy of the individual States, some, notably Massachusetts and Pennsylvania, had tariffs of a distinctly protectionist character, and some of the provisions in them were transferred bodily into the Tariff Act of 1789. Accordingly, that act contained two distinct sets of duties: First, duties for revenue only. These included *ad valorem* duties, varying from 5 to 15 per cent. (the 5-per-cent. rate being fixed on all commodities not otherwise specified, the higher rates put on some articles of luxury) and moderate specific duties on tea, coffee, sugar, and spirits. Second, there were certain specific duties on manufactures which were meant to give protection. It has sometimes been said that this act of 1789 marks the beginning of the protective policy in the U. S., while, on the other hand, the moderation of the duties has been emphasized as indicating that no such thing as protection was then contemplated. The fact is that the act had some undeniably protective features, but that these attracted little public attention.

These general remarks apply to the whole period from 1789 to 1816. After 1789 duties were raised from time to time, in each case for the purpose of securing more revenue. Thus the act of 1792 raised duties to provide means for increasing the army, after St. Clair's defeat in the Indian war. The act of 1797 was needed to provide for the payment of certain installments of the foreign debt then coming due. In 1800 duties were increased to pay interest on a loan authorized in view of a possible war with France. In 1804 an addition of 2½ per cent. to all duties, yielding the "Mediterranean fund" for carrying on the war with the Barbary powers, was made. In 1812 all duties were doubled, a futile attempt to secure an increase of revenue for carrying on the war of 1812. The main cause for all these changes was the need for revenue; but a few provisions were inserted which indicate a protective purpose. Thus in the act of 1804 specific duties were added on cordage, iron, and glassware, which were undoubtedly intended to be protective. It remains true, however, that throughout these years the protective system occupied a very small share of public attention.

II. In the second period (1816–42) of tariff history in the U. S. the protective principle was definitely applied. In 1807 came the embargo, followed by interruptions in foreign trade which lasted almost continuously till 1815. These interruptions, culminating in the war of 1812, checked and at times almost destroyed a profitable foreign commerce, and caused a sudden and rapid development of manufacturing industry within the U. S. The development of national feeling and patriotic pride which the war of 1812 brought about served to stimulate the desire to aid domestic industries. When the war of 1812 came to a close, and Congress proceeded in 1816 to remodel the tariff, a new spirit was felt. The Tariff Act of 1816 consequently raised duties generally. Specific duties were imposed upon crude iron, as well as upon manufactures of iron; the duties on cotton goods and woolen goods were made 25 per cent. While the act of 1816 was more distinctly protective in character than the acts of the earlier period, it was marked, like them, by a great degree of indifference on the part of the public. Not long after its passage, however, public feeling took a very different turn. In the latter part of 1818 a commercial crisis set in, partly in consequence of the collapse of excessive bank issues and partly in consequence of deeper causes. Imports and exports both fell sharply, and the shrinkage of foreign trade and the collapse of prices contributed to a sudden growth of strong desire for protection. For ten or fifteen years the feeling throughout the Northern States was unmistakably in favor of distinctly protective legislation. This feeling led in 1824 to the passage of the first Tariff Act for protection only. The act of 1824 was marked by an advance in duties on certain materials like hemp, wool, and iron, as well as by an advance on manufactures, such as cottons, woolens, cordage, and glassware. The increase of duties on raw materials caused this act to be resisted in Massachusetts; but in 1828, when a second protective act was passed, in which manufactures received a larger share of attention, Massachusetts and the New England States generally came into line among the advocates of protection. This act, the product of political intrigues, is known as the "act of abominations" from the fact that its authors, thinking to get rid of the tariff issue, loaded the measure with certain "abominations" to prevent the New England men from voting for it. The latter, however, accepted it with all its faults. In the act of 1832 the "abominations" of 1828 were removed, and the protective system was put in a more reasonable form. Hardly, however, had the protective movement reached its high-water mark in the act of 1832 than its disintegration began. The opposition of the South to the protective duties culminated in the nullification movement in South Carolina in the fall of 1832. By the so-called Compromise Act of 1833 concessions were made to the South providing for the gradual reduction of duties until finally on July 1, 1842, they should reach the 20-per-cent. level. As to the effects of the tariff legislation during this period, they are mingled with those of the many forces determining national prosperity. It may be fairly said, however, that there was at least some opportunity of securing advantage from the protective legislation of those days. The period was one of transition; the U. S., which had been almost exclusively an agricultural country in the earlier period, was developing into a country having a large manufacturing element. That development, which was certain to take place in any event sooner or later, may have been brought about more quickly and more easily in consequence of this protective legislation.

III. In the third period (1842–60) the tariff issue at first was a party question and had a good share of public attention; but it was soon crowded out of sight by the slavery question. In 1842 the Whigs, having come into power, proceeded to pass the Tariff Act of that year. It went into effect on Sept. 1; consequently the 20-per-cent. rate which the Compromise Act of 1833 had aimed at remained in force only two months, from July 1 to Sept. 1, 1842. The act of 1842 was a protectionist measure, passed by the Whigs after a long and bitter wrangle with President Tyler. It provided for high duties upon iron, cotton goods, woolen goods, paper, and glass, and on manufactures in general. It remained in effect only four years, being superseded in 1846 by the Democratic Tariff Act passed in that year. The act of 1846 was framed largely by Robert J. Walker, then Secretary of the Treasury. It arranged commodities in nine schedules, indicated by the letters A, B, C, D, E, F, G, H, I. The duties were respectively 100, 40, 30, 25, 20, 15, 10, and 5 per cent.; schedule I contained the articles admitted free of duty. Most articles with which the protective controversy is concerned—iron and metals in general, wool and woolens, manufactures of paper, glass, and wood—were put in schedule C, paying 30 per cent. duty. Cotton goods were in schedule D, and paid 25 per cent. The duty of 30 per cent. which was levied on most manufactures was really a moderate protective duty; and the fact that this act not what it is often said to be, a tariff for revenue only, is further indicated by the exemption from duty of tea and coffee. The act of 1846 remained in force for eleven years, and the system it established was continued to the time of the civil war. The changes made by the act of 1857 were of no importance in principle. In 1857 the revenue was redundant, and all parties were agreed upon effecting a reduction of duties. The rate in schedule A was lowered to 40 per cent., that in schedule B to 30 per cent., that in schedule C to 24 per cent., and so on. As to the effects of the legislation of this period, it is clear that the act of 1842 was not in force sufficiently long to give any indication as to its permanent effects upon the community. The whole period from 1842 to 1860 was one of prosperity, especially the latter part of it, the decade from 1850 to 1860. The commercial crisis of 1857, a simple result of over-speculation and over-investment, checked the advancing tide of prosperity for but a short time. This general prosperity has often been ascribed to the moderate tariff legislation of 1846, but it is difficult to trace any direct connection. Such events as the discoveries of gold in California, the opening up of the Mississippi valley by railways, the improvement of ocean transportation, and the general advance in the arts, were the chief causes affecting material prosperity, which probably would have continued at much the same rate whether tariff legislation had been more or less protective than it was. It is certain that notwithstanding the moderate duties of 1846–60 there was a growth of manufacturing industry nearly in proportion to the general growth of population and of wealth. The manufacture of cotton goods advanced steadily in the decade between 1850 and 1860, very nearly doubling its consumption of raw cotton. So far as woolen goods are concerned, there are no accurate figures, but most branches of the industry grew, especially after the Tariff Act of 1857 admitted wool practically free of duty. In iron the growth was less striking, but the production of pig iron increased from an average of about 600,000 tons at the beginning of the decade to one of about 750,000 tons at the close of the decade. In miscellaneous manufactures there was a steady advance. Whether or no manufacturing industries would have developed more quickly under the stimulus of higher duties, they did not cease to exist or cease to grow under a *régime* of moderate duties.

IV. The fourth period (from 1861 on) is ushered in by the Morrill Tariff Act of 1861. The crisis of 1857 had been followed by a decline in imports, and this, with the reduction of duties made by the act of 1857, had brought the revenue to a point dangerously low. At the same time the Republican party had secured, for the first time, control of the House of Representatives, and was desirous of increasing its hold in the manufacturing States, especially in Pennsylvania, by imposing protective duties. Accordingly, in the session of 1859–60, the Morrill Tariff Act was passed by the House. In the succeeding session of 1860–61 it was passed in the Senate, and became a law. It raised duties appreciably. The duty on pig iron was made $6 a ton; that on wool of the ordinary grade 3 cents a pound; cotton goods from 1 cent a yard upward; and so on with specific duties. The Morrill act of 1861 remained in effect a very short time. The war began in the spring of 1861. In every year of the war several acts for increasing duties were passed. The most important were the general Tariff Acts of 1862 and 1864. The Tariff Act of June 30, 1864, proved the most important of all, becoming the basis of a permanent tariff system. It was accompanied by a heavy internal tax act, and by an act giving wide authority to borrow, the three measures touching high-water mark in the revenue legislation of the war. The Tariff Act increased both revenue and protective duties. The need of revenue and the desire to offset the heavy taxes imposed on manufactures by the internal revenue acts were the main causes of its enactment. When the war closed the country consequently found itself with a tariff of very high duties. After that there was a twofold tendency. On the one hand, the revenue duties were steadily reduced; on the other hand, the protective duties in the main were retained, and in many cases were increased. Gradually and unexpectedly the high protective duties produced during the war became the permanent industrial policy of the country. The decade immediately after the war (1865–75) was one of uncertainty in regard to tariff legislation, as it was in regard to currency legislation. Some considerable advances in protective duties were made. The most important of these latter was the Wool and Woolens Act of 1867, making a considerable increase in duties on those articles. The duty upon wool of the kind chiefly used was raised from 6 to about 11 cents a pound. On woolen goods an elaborate system of compound duties, begun as early as 1861, was greatly enlarged and developed. A specific duty was imposed on woolen goods, the object of which was to compensate the U. S. manufacturer for the duty he had to pay on his raw wool. This specific duty was made 50 cents a pound by the act of 1867; over and above this a duty of 35 per cent. *ad valorem* was fixed. Another significant act was the Copper Act, passed in 1869 over President Johnson's veto. It raised the duties on copper considerably, on the copper ore as well as on pig copper, and so shut out a considerable importation of copper ore for smelting and refining in the U. S. The act was passed to aid the great copper mines of Lake Superior district, and helped them in securing control of the whole market. On the other hand, during this decade attempts were made to bring about a reduction of duties, in some cases with success. In 1870 an act was passed reducing considerably the revenue duties, and making some reductions in the protective duties. That on pig iron, for example, went down from $9 to $7 a ton. Some other duties, however, were increased by this same act, the most important of these being the duty on steel rails, which was changed from an *ad valorem* rate of 45 per cent. to a specific duty of $28 a ton. In 1872 a temporary reduction of 10 per cent. of the protective duties was made, but they were restored to the old rates in 1875. The complete repeal of the tea and coffee duties at the same time (1872) was of decisive importance. It settled for a long time the policy of using protection duties as the main sources of customs revenue. The next important step was the act of 1883, which made the first general revision after the civil war. In 1882 President Arthur appointed a tariff commission which framed a bill which became the basis of the tariff legislation of 1883. The bill prepared by the commission, however, was much changed in the course of its passage through the House and Senate, and the final result was a compromise and somewhat of a makeshift. Some protective duties were reduced. Thus the duty on pig iron went down from $7 to $6.72 a ton; on steel rails, from $28 to $17 a ton; on wool, from 11¼ to 10 cents a pound; on silk manufactures, from 60 to 50 per cent. In other directions, however, duties were increased. While the duties on the cheaper grades of woolen goods, of which importation had entirely ceased, were reduced, the duties on the finer grades were increased. Similarly on cotton goods, while the duties on cheap goods (never imported into the U. S.) were reduced, those on finer cottons, of which the importation was large, were raised. The next step came seven years later, in the Tariff Act of 1890, familiarly known as the McKinley Tariff Act. That act was the direct but unexpected result of the attack made on the protective system in President Cleveland's message to Congress in Dec., 1887. It is almost certain that if President Cleveland had not forced the tariff question to the front, the Republicans who passed the act of 1890 as a party measure would have been content to leave the tariff as it was settled in 1883. The important changes made by the Tariff Act of 1890 were the following: The duty on sugar was swept away, all raw sugar being admitted free. The sugar duty had been practically a revenue duty, nine-tenths of the sugar being imported and only one-tenth being made at home. The domestic sugar-producers, producing the one-tenth, were placated by being given, instead of the duty, a bounty of 2 cents a pound, the rate of the previous duty. This change was substantially similar to the remission of the duties on tea and coffee in 1872, and still further emphasized the policy of relying for customs revenue upon protective duties only. The duty upon raw wool was slightly increased, the rise on the important class being from 10 cents to 11 cents a pound. The change, slight in amount, served chiefly to emphasize the policy of making no concessions in the way of free admission of raw materials. On woolen goods there was a considerable advance. The compensating system was still retained, the specific duty continuing on all woolen goods. The *ad valorem* duty upon them was raised to 50 per cent. On cotton goods of the finer grades, on hosiery and stockings, on velvets and plushes of all sorts, particularly high duties were imposed. Among metals the duty upon pig iron was left unchanged; that upon steel rails was slightly reduced. The most important change was an increase in the duty upon tin plate. This article had never been produced in the U. S., while very large amounts were imported from England. The duty was raised to $2\frac{2}{10}$ cents per pound, equivalent to about 70 per cent. upon the value. This change perhaps more squarely presented the issue whether a new and distinct expansion of the protective system should be made; for the question here was not whether an industry already existing should be supported, but whether an entirely new industry should be established under the shelter of protective duties. The next stage in tariff legislation came with the Tariff Act of 1894, which reversed in part the policy of the act of 1890. As the Republicans had used the first opportunity to carry out their tariff policy after the election of 1888, so the Democrats used the first opportunity after their victory of 1892. The bill as passed by the House had provided for a considerable reduction of duties, and had made free use of *ad valorem* duties. The Senate, however, raised the duties somewhat, and restored many specific duties. After a long struggle between the two houses, the bill as amended in the Senate was passed, and became the Tariff Act of 1894. The most important change made by it was the free admission of raw wool, which marked a radical change in policy, toward the free admission of raw materials. With the free admission of wool came a complete change in the duties on woolen goods. The former system of compound duties was given up, and simple *ad valorem* duties of between 35 and 45 per cent. were imposed on woolens. Some other materials besides wool were admitted free, notably lumber, flax, hemp, and copper. Coal and iron ore were left subject to duties, though to reduced duties. On manufactures there was a general but not considerable lowering of the rates. Cottons, linens, and silks were subjected to less change. The rate on chinaware was lowered appreciably. On iron and steel manufactures most of the changes were of minor importance. A significant reduction was that on tin plate, to about half the rate imposed in 1890—1½ cents instead of $2\frac{2}{10}$ cents a pound. Sugar was again subjected to a duty, fixed at 40 per cent., mainly for revenue purposes, but largely in order to secure for the Tariff Act the votes of the Senators from the sugar-producing State of Louisiana. At the same time an additional duty was imposed on refined sugar, for the protection of the domestic refiners. The refining industry was monopolized by the so-called Sugar Trust; this was a direct contribution to monopoly profits, virtually the same as had been given by the act of 1890. On the whole, the tariff of 1894 made but one really important change—the free admission of wool. Beyond that it brought about mainly a slight moderation of the protective duties.

Considering now the effects of the protective system of this fourth period since the civil war, one is confronted by the same difficulties which presented themselves in considering the period of moderate duties that preceded the war. A dozen factors influenced the prosperity of the community, and among them it is impossible to disentangle the separate effects of the tariff. The community, upon the whole, prospered wonderfully. The arts advanced, however, at a rapid pace in the U. S. and abroad; new lands were taken into cultivation; new and rich mineral resources were discovered; the restless activity of the business man fairly transformed the industrial world. These factors counted for very much more than any tariff system, high or low, could have counted. So far as particular manufactures are concerned, there was in some directions very great growth, in other directions a less rapid growth. The iron industry has developed to an extraordinary extent. The total production of pig iron quadrupled between the close of the civil war and the year 1890; but the greatest part of this increase was due to the opening of new mines of iron ore and coal in the heart of the country, to the growth of population, and the great improvements in internal transportation. The cotton-manufacture advanced rapidly; but here again it is probable, that a great advance would have taken place without high duties. The woolen industry grew less fast, and it is questionable whether the duties on raw wool did not hamper it quite as much as those on woolen goods promoted it. The silk-manufacture was virtually created by the duties levied during the civil war and maintained thereafter, and in this instance there seems to have been, in part at least, a successful application of protection to young industries. In general, the effect of the protective duties in maintaining manufactures has been as much exaggerated as their effect on the prosperity of the community as a whole. The general trend of industrial development in the U. S., the high average of mechanical skill and inventiveness, the thickening of population, the possession of great stores of minerals—all would make the country a manufacturing one under any tariff conditions. The effect of duties may have been to make the growth of manufactures more rapid and somewhat more diversified than it would otherwise have been, but the main lines of development have not been greatly changed. See PROTECTION, FREE TRADE, and FINANCE.

F. W. TAUSSIG.

**Tarija**, taă-rec'khaă: the southeasternmost department of Bolivia; bounded W. and N. by Chuquisaca, E. by Brazil (separated by the river Paraguay), and S. by the Paraguayan Chaco and the Argentine Republic. The limits with Chuquisaca and Paraguay are arbitrary and unsettled; hence the area is unknown, but it is not less than 40,000 sq. miles. About one-third, in the western part, consists of mountainous lands and plateaus, on the eastern side of the Cordillera; the remainder is a plain, continuous with the Gran Chaco, and, like it, consisting of open lands and forests, interspersed with immense areas in the eastern part which are covered with water during several months of the year; this plain is crossed by the river Pilcomayo, and, except near the mountains, its only inhabitants are roving Indians. The civilized population is gathered in the mountain region, where much of the land is very fertile. Almost the only occupations are agriculture and grazing, the department being especially suitable for the latter. Pop. (1889) about 63,000, exclusive of wild Indians. Tarija, or San Bernardo de Tarija, the capital, is situated on a plain by a branch of the upper Vermejo. It has a considerable trade with the Argentine Republic, and resembles an Argentine rather than a Bolivian town. The climate is pleasant. Goiter is very prevalent in the vicinity. Pop. about 9,000.

HERBERT H. SMITH.

**Tar'kio**: village (founded in 1880); Atchison co., Mo.; on the Tarkio river, and a branch of the Kan. City, St. J. and Council B. Railway; 60 miles N. by W. of St. Joseph (for location, see map of Missouri, ref. 1–C). It is in an agricultural and stock-raising region; contains 7 churches, large public-school building, 3 hotels, water-works, electric lights, several manufactories, a national bank with capital of $50,000, a State bank, and a monthly and 2 weekly periodicals; and is the seat of Tarkio College (United Presbyterian, opened in 1884). Pop. (1890) 1,156; (1900) 1,901.

EDITOR OF "AVALANCHE."

**Tarleton**, taărl'tŭn, Sir BANASTRE: soldier; b. in Liverpool, England, Aug. 21, 1754, son of the mayor of the city; served under Howe and Clinton in the campaigns of 1777–78. He became lieutenant-colonel and commanded the British Legion, with which he served under Clinton and Cornwallis in the Carolinas, achieving a reputation for cruelty, so that "Tarleton's quarter" became a synonym for wholesale butchery. He took part in the battles of Camden and Guilford Court-house, and at the battle of the Cowpens, Jan. 17, 1781, was defeated by Col. Morgan. He served with Cornwallis during the remainder of the war, and was among those surrendered at Yorktown. Returning to England, he was promoted to the rank of colonel, and in 1790 was returned to Parliament for Liverpool, serving till 1806 and again in 1807–12. He was promoted to be lieutenant-general in 1817, having previously been appointed governor of Berwick and Holy Island, and was created a baronet and a G. C. B. in 1818. He published a *History of the Campaigns of 1780–81 in the Southern Provinces of North America* (London, 1787). D. in England, Jan. 23, 1833.

**Tar'ma**: a town of the department of Junin, Peru; in a beautiful valley formed by a sub-branch of the river Ucayali; 56 miles S. S. E. of Cerro de Pasco, and 9,800 feet above the sea. It was originally the Indian town of Tarama, was occupied by the Spaniards soon after the Conquest, and during the colonial period was noted for its rich silver mines; it was the capital of the *intendencia* of Tarma, now the department of Junin. It is the center of a fertile agricultural district; alfalfa is extensively cultivated. Owing to its salubrious climate the residents of the higher and exposed mining regions resort to it for rest and recuperation; with railway communication it would become one of the principal cities of Peru. In the vicinity are interesting ruins, some supposed to be pre-Incarial. Pop. about 9,000. H. H. S.

**Tarn**: department of Southwestern France; on both sides of the Tarn, an affluent of the Garonne. Area, 2,217 sq. miles. The ground is elevated, and the surface is mostly an undulating plain, except in the southeastern part, which is covered with spurs of the Cévennes. Forests of oak and beech are numerous, and large crops of wheat, wine, and hemp are raised. Coal and iron abound and are extensively worked. Many cattle and sheep are raised. Pop. (1896) 339,-827. Capital, Albi. Revised by M. W. HARRINGTON.

**Tarn-et-Garonne**, ā-gaă'rōn': department of Southwestern France; between the rivers Tarn and Garonne. Area, 1,436 sq. miles. The surface is an elevated and undulating plateau, traversed by several deep valleys along the rivers. The soil is very fertile, and the climate temperate and healthful. Agriculture is the chief occupation, and wheat and wine the principal products; manufactures include silk, paper, and soap, but are rather insignificant. Pop. (1896) 309,191. Capital, Montauban.

Revised by M. W. HARRINGTON.

**Tarno'pol**: town of Galicia, Austria-Hungary; on the Sered; 80 miles by rail E. S. E. of Lemberg (see map of Austria-Hungary, ref. 4–M). Formerly it was a fortress, and received valuable privileges from the kings of Poland. It is celebrated for its horses and horse-markets, which are the most frequented in the country. Pop. (1890) 26,217.

**Tarnow**, taar'nov: town of Galicia, Austria-Hungary; on the Dunajec; 50 miles by rail E. of Cracow (see map of Austria-Hungary, ref. 3–I). It has a fine cathedral and many good educational institutions. Pop. (1890) 27,574.

**Taro**, or **Tara** [= Polynesian]; an araceous plant; the root of *Alocasia macrorhiza*, of which many varieties are grown in the Pacific islands. The tops are used as a pot-herb, and the starchy root is one of the most important articles of food in Polynesia. In New Zealand the name is applied to *Pteris esculenta*, a fern whose roots afford an edible starch.

**Tarpeia**: See TARPEIAN ROCK.

**Tarpei'an Rock**: the southeastern portion of the Capitoline Hill at Rome. According to tradition, it took its name from Tarpeia, a vestal virgin, who during the reign of Romulus betrayed the Capitoline citadel to the attacking Sabines, having obtained from them the promise that they would give her what they wore upon their left arms, meaning certain gold ornaments. They kept their promise by crushing her beneath their shields. In later times it was customary to hurl condemned criminals from the Tarpeian Rock.

Revised by CHARLES H. HASKINS.

**Tarpon**: a large fish, *Megalops thrissoides*, of the family *Elopidæ*; closely related to the herrings, with which it is sometimes placed. The eye is large, whence the generic name, and so is the obliquely placed mouth. The dorsal fin is high, with a long filament behind, the tail deeply forked, the body covered with scales, some more than 2 inches wide.

The color is silvery below and on the sides, blue above. The tarpon reaches a length of 6 feet and a weight of 150 lb. It is found in the warm parts of the Atlantic and is common on parts of the Florida coast, where it has come much into vogue among anglers, since, in spite of its vast size, it can be taken with rod and line. furnishing rare sport from its vigorous leaps and fine fighting qualities. The tackle used is a 7½-foot to 8-foot heavy rod, multiplying reel, and 200 to 250 yards of linen line. F. A. LUCAS.

**Tarquin'ius**: the name of a Roman family of Greek origin, which, according to legend, played a very important part in the early history of the city of Rome, and two of whose members became kings. Demaratus emigrated from Corinth and settled at Tarquinii, a town of Etruria. His son, Lucumo, married Tanaquil, an ambitious and cunning woman, daughter of one of the most prominent Etruscan families, and she induced him to emigrate to Rome, where he soon acquired the rights of citizenship and assumed the name of (1) LUCIUS TARQUINIUS PRISCUS. His wealth and his wisdom made him one of the most prominent citizens. The king, Ancus Marcius, appointed him guardian of his children, and after the death of Ancus Marcius, in 616 B. C., the senate and people unanimously elected him king. He waged successful wars against the Sabines, Latins, and Etruscans, and extended the power of Rome. He built the Cloaca Maxima, laid out the Circus Maximus and the Forum, and began the Capitoline temple and the stone wall around the city. He instituted the Roman games and added 100 new members to the senate. He was murdered in 578 B. C., and succeeded by his son-in-law, Servius Tullius.—(2) His son, LUCIUS TARQUINIUS SUPERBUS, assassinated Servius Tullius in 534 B. C., and seized the crown. He abolished the reforms which Servius Tullius had introduced, and ruled arbitrarily and oppressively, whence his surname Superbus. The vacant places in the senate were not filled, the advice of this body was seldom asked, and he slighted the higher classes and sorely oppressed the lower by heavy taxes and forced labor. Finally, the rape of LUCRETIA (*q. v.*) became the occasion of a general outbreak. Tarquinius was deposed and the monarchical government abolished in Rome. He made three attempts to reconquer his power by the aid of the people of Tarquinii, Porsena, and the Latins, but in vain, and died in wretchedness at Cumæ in 495 B. C. For the elements of truth contained in these legends of the Tarquins, see ROME. Revised by CHARLES H. HASKINS.

**Tarr**, RALPH STOCKMAN: See the Appendix.

**Tar'ragon** [from Span. *taragona*, from Arab. *tarkhūn*]: an aromatic perennial composite herb (*Artemisia dracunculus*), a native of Northern Asia, but acclimated in European gardens, where, especially in France, it is cultivated for the sake of the young shoots, which are used in the dressing of salads and for the flavoring of vinegar with an infusion of its leaves, which have a taste resembling anise. Tarragon vinegar thus prepared is an article of commerce.

**Tarrago'na** (anc. *Tarraco*): capital of the province of Tarragona, Spain; at the mouth of the Francolí, in the Mediterranean, 60 miles W. of Barcelona (see map of Spain, ref. 14–J). It consists of an upper town, surrounded by walls, and a lower and modern town defended by two castles. Its harbor is accessible only for small vessels, yet it carries on a considerable trade in grain, wine, and oil; large quantities of fruits are annually exported. The imports and exports reach over 30,000,0000 pesetas annually. There are schools of design and navigation and an ecclesiastical seminary. The Gothic cathedral dates from 1120. The city was founded by the Phœnicians, and rose under the Romans to great importance. Pop. (1887) 27,225.

**Tar River**: a river which rises in Granville co., N. C., and after an indirect E. S. E. course falls into Pamlico Sound. Its wide estuary for some 40 miles is called Pamlico river. The Tar has a rapid current, is 180 miles long, and is navigable for steamboats 85 miles, to Tarboro.

**Tar'rytown**: village; Westchester co., N. Y.; on an expansion of the Hudson river known as the Tappan Sea, and on the N. Y. Cent. and Hud. River Railroad; 25 miles N. of New York (for location, see map of New York, ref. 8–J). It is one of the most attractive places for suburban residence on the Hudson; was the scene of the capture of Maj. André by Paulding, Williams, and Van Wart; and contains the Sunnyside home and the burial-place of Washington Irving, Sleepy Hollow, the Philipse manor house (erected in 1683), a Dutch church (erected prior to 1699), a monument to the Revolutionary soldiers of the manor (dedicated in 1894), 3 libraries, a national bank with capital of $100,000, a savings-bank with deposits of over $1,500,000, and 2 weekly papers. Pop. (1880) 3,025; (1890) 3,562; (1900) 4,770, including North Tarrytown, 9,011. EDITOR OF "ARGUS."

**Tar'shish** [from Heb. *Tar'shīsh*]: one of the most western trading-posts of the Phœnicians, probably Tartessus in Spain (on the Bætis, Guadalquivir), mentioned frequently in the Old Testament. It was probably founded by Tyrians (Is. xxiii. 1, 6, 10; Jer. x. 9). From this place the Phœnician merchantmen were generally called Tarshish ships, a name to which de Lacouperie (*Bab. and Orient. Record*, vii., 129) sees a reference in the Chinese *Tat'sin* traders. The author of 2 Chron. ix. 21; xx. 36, 37 identifies these ships with ships of Tarsus in Asia Minor, which W. F. Ainsworth, *A Personal Narrative of the Euphrates Expedition*, i., 138, considers to be right. Halévy (*Rev. des Études Juives*, xiii., 14) supposes that the island of Sardinia is meant; Le Page Renouf (*Proc. Soc. Bibl. Arch.*, xvi., 138), the mainland of Phœnicia; but both without sufficient reason. See Meyer, *Gesch. d. Alterth.*, i., § 281; Pietschmann, *Gesch. der Phönizier* (Berlin, 1889, p. 286). RICHARD GOTTHEIL.

**Tarsi'idæ** [from *Tarsius*—so named from the length of the tarsi—the representative genus]: a family of mammals of the order *Primates* and sub-order *Lemuroidea* or *Prosimiæ*, distinguished by the length of the tarsi and the dentition. The teeth are in number 34—viz., M. $\frac{3}{3}$, P. M. $\frac{3}{3}$, C. $\frac{1}{1}$, I. $\frac{2}{1} \times 2$; the true molars have numerous pointed cusps; the premolars are conical, and successively increase in size from the first to last; the canines are normally developed; the median upper incisors are longest. The skull has the orbits slightly closed behind; the fibulæ are partially ankylosed with the tibiæ; the hind feet have their second and third toes armed with claws, and the rest provided with flattened pointed nails. The bones of the tarsus are much elongated, whence the name of the group. Only one species is known, *Tarsius spectrum*, an inhabitant of the forests of Sumatra, Borneo, Celebes, and Banca, sometimes called malmang, specter lemur, and (adopted from the French) tarsier. Its size is about that of the common rat. It has very large eyes, and ears, long hind legs and tail, is nocturnal in habits, and feeds chiefly on insects and lizards. E. A. BIRGE.

**Tarsiped'idæ** [Mod. Lat., named from *Tar'sipes*, *Tarsipedis*, the typical genus; *tar'sus*, ankle + Lat. *pes*, *pe'dis*, foot]: a family of marsupial mammals. The general form and size of the animal are similar to those of a mouse; the snout is elongated; the tongue is very long, slender, and exsertile; the fore and hind limbs differ but little in length; the feet have each five toes; those of the front are rather small, slightly enlarged toward their tips, and provided with minute scale-like nails, "impressed, as it were, into the flesh, on the upper surface of the toe"; the inner hind toe is thumb-like, slender, and destitute of a nail, the second and third very short (joined together as usual in the sub-order), and armed with small nails which are directed upward almost at right angles to the toes, and the fourth and fifth larger (free), and furnished with scale-like nails; the tail is long and slender, scaly, like that of a rat, and sparsely hairy. The teeth are very small and simple, variable in number, and similar in shape. The stomach is small and simple, and has very thin walls; the intestine has no cæcum. The skull is very thin and almost papery; the lower jaw has very slender and almost straight rami, without distinct coronoid or angular processes, and with elongated foramina in their posterior halves. This type is one of the most extraordinary and exceptional of mammals. Only one species—the *Tarsipes rostratus*—is known, an inhabitant of Western Australia, and generally found from Swan river to King George's Sound, but is very rarely obtained. It is nocturnal in its habits, and in the night is very active. It will dart at passing flies and kindred insects with great celerity; having caught one, it holds the fly between its front paws, and proceeds leisurely to eat it. It is also very fond of honey, which it extracts from flowers by means of its long tongue. Revised by F. A. LUCAS.

**Tarsus**: See FOOT.

**Tarsus**: town; in Asia Minor, in the vilayet of Adana, on the Cydnus (*Tarsus Chaï*); the ancient metropolis of the Cilician confederation; then the capital of the Roman province of Cilicia, and for several centuries before and after Christ the most important city of Asia Minor as a seat of learning and center of commerce (see map of Turkey, ref.

6–G). Cleopatra, accompanied by Mark Antony, ascended the Cydnus to Tarsus in a gilded galley with purple sails and silver oars. Tarsus was the birthplace of Paul the apostle, and the burial-place of Julian the Apostate. The city has greatly declined. The greater part of its former site is covered with *débris*; but it possesses one colossal ruin, an enigma to antiquarians, as it resembles no known edifice, and as its object has never been determined. This consists of two solid masses of concrete masonry; the larger 115 feet long, 49 feet wide, and 23½ feet high; the smaller 56 feet long, 39 feet wide, and 23½ feet high; the two inclosed in a rectangular space, 380 feet long and 153 feet wide, by a solid wall 21 feet thick, and 23½ feet high. Tarsus is on the railway from Adana to Mersin, and at the junction of several highways. It carries on a considerable trade in cotton, sesame, wheat, maize, yellow wax, skins, carpets, tobacco, and raw materials. Pop. 30,000, which is reduced in summer to 7,000, the inhabitants being forced to leave on account of the poisonous exhalations of the Cydnus.

E. A. GROSVENOR.

**Tartar** [*tartar* (readapted to Lat.) is from O. Fr. *tartre* < Late Lat. *tar'tarum*; cf. Lat. *Tar'tarus* = Gr. Τάρταρος, the nether world, Tartarus, but the connection is not obvious]: any salt of tartaric acid, more especially the acid potassium tartrate or hydrogen-potassium tartrate. See ARGOL.

**Tartar, Cream of**: See CREAM OF TARTAR.

**Tartar Emetic** (*Antimonii et Potassii Tartras*): a double tartrate of potassium and basic antimony; its formula is $2K.(SbO).C_4H_4O_6.H_2O$. It is made by boiling acid potassium tartrate (cream of tartar) with antimony oxide in water. It forms in transparent crystals, which become white and opaque by exposure to the air, but in the shops it is generally kept in the form of powder. It dissolves in 20 parts of cold water, and in between 2 and 3 of boiling, but all aqueous solutions spontaneously decompose on keeping. It is insoluble in alcohol, but soluble in proof spirit or wine. If pure, a solution of tartar emetic yields no precipitate with barium chloride, nor, when diluted, with silver nitrate, nor does it turn blue with potassium ferrocyanide.

Tartar emetic has rather a nauseous, harsh metallic taste, and upon the animal system is a local irritant and a powerful constitutional poison. Applied to the skin, as in ointment, it causes burning pain, redness, and finally the eruption of a crop of painful pustules. Taken internally, small doses, as a small fraction of a grain, tend to reduce the force and frequency of the pulse and promote perspiration. Somewhat larger quantities cause nausea and vomiting, with relaxation of the bowels and of the muscular system, reduced action of the heart, and a general feeling of depression and weakness. Still larger doses cause an intensification of the above symptoms, with burning pain in the stomach, the induction of a choleraic state characterized by violent and prolonged nausea, vomiting, and serous purging, colic, cramps, great enfeeblement of the heart and general strength, and finally collapse and death. After death decided inflammation of the stomach and bowels is generally found. Sometimes, however, both this lesion and the irritative symptoms dependent upon it are absent even in fatal poisoning. Death does not often occur until several days after the poisoning. In cases of tartar-emetic poisoning, tannic or gallic acid, or some vegetable infusion containing the same, such as green tea, decoction of oak-bark, of cinchona, etc., should be administered, and free vomiting promoted. The inflammation and great cardiac and constitutional depression which the poison occasions must be treated on general medical principles. In medicine, tartar emetic has been much employed in minute doses to reduce the pulse and promote sweating in acute fevers. It is often made an ingredient of mixtures to relax the inflamed mucous membrane and promote free secretion in the early stages of bronchitis, and may also be employed as an emetic. Locally, it is sometimes used in ointment to produce pustulation for the purpose of persistent counter-irritation, but here, as in its other uses, less violent means are usually found sufficient.

Revised by H. A. HARE.

**Tartar'ic Acid** [*tartaric* is deriv. of TARTAR (*q. v.*)]: an acid ($H_2.C_4H_4O_6$) found in the free state in various plants and berries, or, by extension, any one of several isomeric acids. It forms salts called tartrates.

Of ordinary tartaric acid (dextrotartaric acid), the chief source is the grape, in which it occurs as the hydrogen-potassium tartrate (cream of tartar, $KHC_4H_4O_6$). It is prepared by dissolving crude tartar in boiling water, and slowly adding pulverized chalk as long as the mixture effervesces. Usually, 1 part of chalk is sufficient to decompose 4 parts of tartar. Insoluble calcium tartrate and soluble potassium tartrate are formed by this operation. Upon filtering, and adding the equivalent quantity of calcium chloride, all the tartaric acid is obtained as a precipitate of calcium tartrate. The two precipitates are then united, washed, and decomposed into insoluble calcium sulphate and free tartaric acid by 3 parts of sulphuric acid diluted with 7 of water for every 5 of the salt taken. The filtrate is evaporated in leaden pans, and allowed to crystallize. This acid can also be artificially produced by the oxidation of milk-sugar, glucose, starch, gum, etc., with nitric acid. It forms colorless transparent rhombic prisms, which become strongly electrical when gently heated. It is easily soluble in water and in alcohol; the aqueous solution becomes mouldy on standing, and is gradually converted into acetic acid. Dextrotartaric acid is distinguished from its isomers by the fact that in aqueous solution it exerts a strong right-handed rotation on polarized light. In its crystalline structure it bears an interesting relation to the isomeric lævotartaric acid. The crystals of the two acids resemble one another perfectly in form, excepting that ordinary tartaric acid presents hemihedral faces on the right of the crystal, which in lævotartaric acid are situated on the left or opposite side; so that the reflection of a crystal of the dextro-acid represents one of the lævo-acid. The dextrotartrates and lævotartrates exhibit the same difference in their crystalline form. In pyro-electrical relations also, crystals of dextrotartaric acid present properties opposite to those of the lævo-acid. Dextrotartaric acid precipitates solutions of the caustic alkaline earths; also solutions of lead, silver, and potassium salts. The precipitate with potassium compounds (cream of tartar) serves for the detection of the acid in the presence of other organic acids. Boiling tartaric acid reduces silver, gold, and platinum salts, and prevents the precipitation of the salts of copper and iron by the alkalies, the latter property being frequently utilized in chemical analysis. Dextrotartaric acid melts at 338° F.; at a higher temperature it is converted into several isomeric acids. By increased heat, pyruvic (or pyroracemic, $H_2.C_6H_6O_6$) and pyrotartaric, $H_2.C_5H_6O_4$, acids are produced. When heated with the alkalies it loses water, and the oxalate and acetate of the base are formed. By oxidation dextrotartaric acid is decomposed into carbonic and formic acids; when treated with reducing agents, either one or two atoms of hydrogen are eliminated, and malic or succinic acid is obtained. Tartaric acid forms acid, neutral, and double salts. Three varieties of the latter are well defined—those containing monatomic metals, such as Rochelle salts, $KNaC_4H_4O_6.4H_2O$, which is analogous to cream of tartar; those formed from monatomic and diatomic metals, in which the oxide of the latter is combined with the same proportion of acid as the monatomic element, such as potassium-ferrous tartrate, $K.FeO.C_4H_4O_6$; and those analogous to tartar emetic, such as silver-antimony tartrate, $Ag.SbO.C_4H_4O_6$. The only quadribasic tartrates as yet prepared are those of lead and zinc. When strongly heated, all tartrates are carbonized and emit the odor of burned sugar.

The isomeric *lævotartaric acid* is obtained upon neutralizing equal parts of racemic acid, one with soda, the other with ammonia, mixing the fluids, and allowing the double salt to crystallize; half of the crystals formed possess the hemihedral faces common to dextrotartrates, the remainder showing those characteristic of the lævo-salts. Upon mechanically separating the two varieties, dissolving them in water, adding plumbic nitrate, and decomposing the precipitates with sulphuric acid, solutions of the dextro-acids and lævo-acids are obtained. When equal amounts of the dextrotartaric and lævotartaric acids are mixed and evaporated, RACEMIC ACID (*q. v.*) is produced; in the same manner racemates are obtained from mixtures of dextrotartrates and lævotartrates. For the chemical theory, see STEREO-CHEMISTRY.

Tartaric acid is extensively used in dyeing and in preparing effervescing drinks and baking-powders. Some of the tartrates, such as tartar emetic, Rochelle salt, and the potassium-ferrous tartrate (*tartarus chalybeatus*), possess valuable medicinal properties.

Revised by IRA REMSEN.

**Tartars**, properly **Tatars** [from Pers. *Tātār*: cf. Chin. *Tah-tar*]: an ethnological name, used by some in a wider, by others in a narrower, and always in a somewhat vague, sense. The word *Tah-tar* was first applied to those Mongolian tribes who on their swift horses descended from the Altai plateaus into the Chinese lowlands, robbing and plun-

dering. When adopted by the Europeans, the word was changed into *Tar-tar*, with an allusion to the classical Tartarus, and was applied to all those tribes and races which Genghis Khan had brought under his sway and led into Europe, including not only Mongolian, but also Tungusian and Turkish races. The name is used in a restricted sense, especially by Russian writers, to designate certain populations speaking the Turkish language, and mostly of Turkish race, living in Siberia, the Caucasus, and Central and Eastern Russia. See Howorth's *History of the Mongols* (1876–80).
Revised by M. W. Harrington.

**Tar'tarus** (in Gr. Τάρταρος): a name used synonymously with *Hades* by the later Greek and Latin writers, but with Homer it means a separate place, as far below Hades as the heavens are above earth, into which Zeus had thrown the worst offenders against his authority. Later writers, however, sometimes make a distinction between Tartarus and the Elysian Fields as two divisions of Hades, the former occupied by the criminals, the latter simply inhabited by the dead. As a personification, Tartarus is represented as the son of Æther and Gæa (air and earth), and by his mother he was father to the Gigantes, Typhoeus and Echidna.
Revised by J. R. S. Sterrett.

**Tar'tary**: a geographical name of vague and variable application. In the Middle Ages the name denoted the whole central part of Eastern Europe and Asia, from the Dnieper to the Sea of Japan. Later, a division into European and Asiatic Tartary took place, and the name of European Tartary was soon confined to the territory now called Crimea, while that of Asiatic Tartary first signified the whole empire of Genghis Khan and his successors, then Turkestan alone, with the exclusion of Turfan, Mongolia, and Manchuria, and now only that part of Turkestan which does not belong either to Russia or to China.
Revised by M. W. Harrington.

**Tartrates**: See Tartaric Acid, Cream of Tartar, Tartar Emetic, Rochelle Salt, etc.

**Tarudant'**: southernmost city of Morocco and center of caravan trade; near the southern slope of the Atlas Mountains, 2 miles from the river Sus and 44 miles from the Atlantic. It is surrounded by walls, has several fine mosques and a citadel, but is otherwise poorly built. Its dye-works and manufactures of leather and copperware are important. Pop. probably 8,000 or 10,000, and decreasing.
Revised by M. W. Harrington.

**Taschereau**, taäsh'rō', Elzéar Alexandre: cardinal; b. at Ste. Marie de la Beauce, province of Quebec, Canada, Feb. 17, 1820; educated at the Seminary of Quebec and in Rome; was ordained a priest in 1842, and soon afterward appointed to the chair of Moral Philosophy in the Seminary of Quebec, which he filled for twelve years. In 1854 he was sent to Rome by the second provincial council of Quebec to present its decrees to the pope for ratification; in 1856 received the degree of canon law from the Roman seminary, and was appointed Professor of Canon Law in Laval University; in 1859 became a member of the council of public instruction in Lower Canada, and in 1860 superior of seminary and rector of Laval University. He was appointed vicar-general of the diocese of Quebec in 1862; administrator of the diocese in 1870; the same year attended the Œcumenical Council at Rome; was consecrated Archbishop of Quebec in 1871, and cardinal in 1886. Cardinal Taschereau was an earnest advocate of temperance. D. in Quebec, Apr. 12, 1898.

**Taschereau**, Henri Elzéar, LL. D.: jurist; b. at Ste. Marie de la Beauce, P. Q., Canada, Oct. 7, 1836; educated at the Seminary of Quebec, and admitted to the bar in 1857. He represented Beauce in the Canadian Assembly 1861–67; was appointed puisne judge of the Supreme Court of the Province of Quebec Jan. 12, 1871, and puisne judge of the Supreme Court of the Dominion Oct., 1878. In 1895 he became dean of the law faculty of Ottawa University. Author of *The Criminal Law for the Dominion of Canada* (2 vols.) and of *Code de Procédure civile du Bas Canada*.

**Taschereau**, Jules Antoine: journalist and author; b. at Tours, France, Dec. 19, 1801; became very early a frequent contributor to the Parisian press, and was one of the founders of the *National*; entered the civil service of the Government shortly after the Revolution of July, 1830, but soon returned to his journalistic activity; was one of the editors of *Historiettes de Tallemant des Réaux* (6 vols., 1833–34; 2d ed. 9 vols., 1854–60), and founded the *Revue rétrospective* (20 vols., 1833–37); received an appointment at the National Library in 1852, and became its director-general in 1858. D. in Paris, Nov. 11, 1874. He published editions of the works of Molière (1823–24), Boufflers (1827), the *Correspondance littéraire* of Grimm and Diderot (1829–31), etc.; superintended the publication of many volumes of the catalogue of the National Library (1855, *et seq.*); and wrote *Histoire de la Vie et des Écrits de Molière* (1825) and *Histoire de la Vie et des Ouvrages de Corneille* (1829), both several times reprinted.
Revised by A. G. Canfield.

**Tashkend'**: capital of Russian Turkestan and chief town of Syr-Darya; the most populous city in Central Asia; in a gently sloping, well-watered, fertile plain, covered with numerous fruit-trees, at the foot of the Alatau and Chatkal Mountains (see map of Asia, ref. 4–E). The city was formerly inclosed by a wall 7 miles long and pierced by nine gates, but this is now in a ruinous condition, and rich gardens irrigated by canals surround the city, which forms an oval whose greater axis lies in the direction W. to E., and which is bent inward to the S. In the hollow thus formed the Russian town, the so-called European town, is built. S. W. of the European and S. of the Asiatic city is the Russian citadel, with barracks and military stores, surrounded by a bastioned wall. A great caravanserai forms the center of the wholesale business district. The Asiatic city has narrow, crooked, and ill-paved streets. Tashkend is one of the oldest and largest cities of Central Asia, from old times the seat of an important agriculture and a brisk trade. Here the roads from Kashgar meet with those which lead S. from Samarkand, N. from Orenburg and Siberia, into Central Asia. The value of foreign goods exchanged in the city amounts to about $20,000,000 annually; the principal exports and imports are cotton fabrics, metal ware, and silk. The Arab geographers of the Middle Ages called the city *Shash*; from the sixteenth century to the eighteenth it was the capital of the Kirghiz Kosaks; in 1810 it was taken by the Khan of Khokan, and in 1867 it was occupied by the Russians. Pop. (1885) 121,410, of whom 75,000 are Sarts, and 20,000 Russians (in 1892), the remainder being Uzbegs, Kirghiz, Jews, and other Asiatics.
Revised by M. W. Harrington.

**Tashkurgan**: See Khulum.

**Tasman**, Abel Janszoon: explorer; b. at Hoorn, province of North Holland, about 1602; made voyages in the western Pacific and Indian Oceans in 1639–42, under authority of the governor-general of the Dutch East India Company, Van Diemen, who then sent him to circumnavigate the Australian continent; left Batavia Aug. 14, 1642; discovered Nov. 24 the island which he called Van Diemen's Land, but which is now called Tasmania; Dec. 13, the southern island of New Zealand; Jan. 21, the Friendly islands; Feb. 6, the Fiji islands; and returned to Batavia June 15, 1643. Of this voyage he published an account which was reprinted at Amsterdam in 1722 (new ed. by Swart, 1860). Jan. 29, 1644, he set out on a voyage along the coasts of New Guinea, and made important discoveries on the north and northwestern coasts of Australia. D. at Batavia in Oct., 1659.
Revised by M. W. Harrington.

**Tasma'nia**, formerly **Van Diemen's Land**: an island and British colony of Australasia; 150 miles S. of the colony of Victoria, Australia, from which it is separated by Bass Straits (see map of Australia). It is the smallest and most healthful for Europeans of the seven Australasian colonies; between the parallels 40° 33′ S. and 43° 39′ S. and meridians 144° 39′ E. and 148° 33′ E.; area, 26,216 sq. miles, about that of Greece and only a quarter of that of New Zealand. The discoverer, Abel Janszoon Tasman, named it after the governor of the Dutch Indies of the time—Van Diemen—but when the importation of convicts ceased, in 1853, it was renamed after the discoverer. The colony includes, with the island of Tasmania and the adjacent small islands, the Furneaux Archipelago, N. of the northeast angle and consisting of Flinders island (area, 800 sq. miles), Cape Barren island, and others smaller; also King's island, N. of the northwest point and about half way to Australia (area, 425 sq. miles). The main island is well watered, picturesque, and varied, with high mountains and fine valleys, rocky and often precipitous coasts, and numerous rivers, cascades, and fresh-water lakes. In contradistinction to Australia, it is sometimes called the Green Isle.

The coast is indented by many large and small bays, deep estuaries, and well-protected ports. The west coast is the boldest, and offers least protection to commerce.

The surface is rough and mountainous, and consists essentially of a central plateau, about 4,000 feet above sea-level, extending in places to the coast, especially at the W., which is rugged. Cradle Mountain in the west is 5,069 feet high; Frenchman's Cap, 4,760; Hugel Mountain, 4,700; and the celebrated Mt. Bischoff, 2,500. In the east the highest peak is Ben Lomond (5,020 feet); in the south Mt. Wellington (4,170 feet) dominates Hobart. The streams are numerous. The longest river is the Tamar (150 miles), which rises near the eastern coast—as the South Esk or Macquarie—and flows into Bass Straits through Port Dalrymple, near the middle of the north coast. The name Tamar is applied only to the estuary, which extends from the mouth southward about 60 miles to Launceston (the second port in point of importance in the colony), with about 20 feet of water. The next longest river is the Derwent (140 miles long), which rises in Lake St. Clair, at the foot of Mt. Hugel, and empties into Storm Bay on the south coast through a large estuary, on which is situated Hobart (formerly Hobart Town), the capital and principal port of the island. One of its branches rises in Great Lake in the center of the island—the largest of the lakes, having an area of 70 sq. miles—3,820 feet above sea-level. Nearly opposite the mouth of the Derwent are the strangely formed North and South Bruni islands, connected by a narrow isthmus, a characteristic form reproduced in several peninsulas and islands on the southeast coast.

*Climate.*—The latitude and insular character give Tasmania a temperate and genial climate. In the settled parts the extreme winter temperatures range only between 20° F. to 44° F., and in summer between 78° and 96°. The autumn is the pleasantest season, with a mean temperature of about 57°. The mean annual temperature for Hobart for fifty years is 55°. The hot winds of Australia are much tempered by the passage of Bass Straits, and are felt only in the northern parts of this colony. Land and sea breezes prevail in the warmest months. The rainfall is chiefly in winter, like Southern Chile and Oregon, and, also like them, the western coast is wet and the rainfall decreases rapidly eastward. A hundred inches or more may fall on the west coast, while more than a third of the area has an annual fall of only from 10 to 20 inches. At Hobart the average for a long series of years is 23 inches, with 143 rainy days a year. Zymotic diseases are relatively rare.

*Minerals.*—The strata generally are very much contorted and tangled, and the density of the scrub vegetation has greatly impeded their investigation. Metamorphic rocks are abundant, and quartz is so common a feature of the western cliffs as to reflect a white light on passing ships. The evidences of repeated volcanic action are numerous and unmistakable, but no volcanic cones are found. Palæozoic rocks abound, and are often thrown up into irregular ranges up to 5,000 feet or more in height. The Carboniferous strata are common, except on the western half. Tertiary rocks are not extensive, and the Pleistocene was marked by very great denuding forces. Raised beaches and moraines are not rare.

The character of the mineral products is indicated in the accompanying table. Gold was discovered in 1852, and is generally distributed in the river sands and in the quartz rock, but Tasmania has an unimportant position among the

| MINERALS. | TOTAL PRODUCT TO 1893. | | PRODUCT IN 1892. | |
|---|---|---|---|---|
| | Value. | Per cent. of Australasian product. | Value. | Per cent. of Australasian product. |
| Tin | £5,557,438 | 34·4 | £256,083 | 46·6 |
| Gold | 2,562,569 | 0·7 | 174,070 | 2·6 |
| Coal | 268,752 | 0·8 | 18,022 | 0·9 |
| Silver | 137,155 | 0·9 | 45,502 | 1·8 |
| Copper | 617 | .... | ........ | .... |
| Totals | £8,526,531 | 1·9 | £493,677 | 4·0 |

Australasian colonies as a producer of gold. The value of the export in 1899 was £205,936. As a producer of tin, however, she leads her sister colonies. It has hitherto been obtained almost exclusively from alluvial deposits, and is always in the form of cassiterite or tin oxide. The most celebrated mines are those of Mt. Bischoff in the northwest, near the head waters of the Arthur river, and these mines, with those of the Ringarooma district in the northeast, have yielded more than three-fourths of the tin product of the colony. Considerable areas of stream-tin are worked out, and attention is turning to the lodes, of which many well-known ones have remained untouched, as at Mt. Bischoff, Mt. Humskirk (on the coast S. W. of the preceding), and Ben Lomond in the northeast. The export in 1899 was valued at £281,947. Anthracite and bituminous coal are found, the latter in abundance; about 50,000 tons are produced annually. The silver-mining industry is developing rapidly, chiefly in the Mt. Zeehan and Mt. Dundas districts, which give almost the entire product. Silver of the value of £208,869 was exported in 1899, as against £79,353 in 1892. Copper is met with at Mt. Maurice and elsewhere, but not in paying quantities. Arsenic, bismuth, antimony, zinc, manganese, graphite, galena, and asbestos exist. Iron is present in large quantities and in all varieties of ore. Hobart free-stone is largely exported to the other colonies. A peculiar inflammable resinous mineral has been found in the Mersey district and named tasmanite.

*Fauna and Flora.*—The fauna is similar to that of Australia, but the TASMANIAN WOLF and TASMANIAN DEVIL (*qq. v.*) are peculiar to Tasmania. Several European food-fishes have been introduced. A less favorable immigrant is the rabbit, which has become a pest here as in Australia. The flora is similar to that of Victoria, but has many peculiar species. The celebrated blue gum, or *Eucalyptus globulus*, which has become a favorite immigrant in pestilential localities in America and Europe, flourishes best in the southern districts of Tasmania. Forests are abundant, and afford some woods of great value. The scrub is very thick and tangled. The evergreen forests are aromatic. There is a large timber-trade with the other colonies.

*Agriculture.*—The soil is generally good, and some of the lower plains and valleys are marvelously fertile. The higher plateau is especially suited to stock-raising. Only a little more than 1 per cent. of the area is under cultivation, and this percentage has increased very little for a generation. Of the cultivated land, 33 per cent. is in wheat, yielding 18 bush. to the acre, but the product is not sufficient for local consumption; 26 per cent. is in hay, yielding 1·2 tons per acre; 13 per cent. in oats (27 bush. to the acre); 9 per cent. in potatoes; 2 per cent. in barley; and 6 per cent. in orchards. For the last the climate and soil are especially suited. No maize is raised. Oats, potatoes, and hay are exported.

In 1900 the colony possessed 1,672,068 sheep, 160,204 horned cattle, 31,189 horses, and 74,451 swine. It is singularly well adapted to sheep-rearing, and its stud flocks are annually drawn on to improve the breed of sheep in the other colonies, but the industry is slowly decreasing. The wool clip was valued at £219,291. The dairy products are excellent, and are largely exported. The number of cattle and horses is increasing.

*Population.*—The aborigines were nearly allied to the native Australians, and in 1803 numbered about 5,000. Soon after arose the "Black war," in which they were nearly exterminated. In 1835 they were transported to Flinders island, where they died out rapidly. The last representative of pure blood died in 1876. In 1891 there remained 139 half-castes. In 1893 the population of the colony was 154,424, with a considerable surplus of males. The annual increase for thirty years was 1·63 per cent.—the least in the seven colonies. The conditions for longevity are favorable, and the percentage of those over 65 years of age is 5·55, which is very high. The density per square mile was nearly 6, and was 3·44 in 1861. In 1893 there were 848 marriages, 5,216 births (4 per cent. of them illegitimate), and 2,071 deaths, giving rates of 5·51, 33·92, and 13·47 respectively. Seventy-four per cent. of the inhabitants were born in the colony, and the surplus of immigration over emigration is small. The Chinese numbered 1,056 in 1891, and the number of other aliens was very small.

No state aid is given to religion. Half of the population are professed members of the Church of England, 18 per cent. are Roman Catholics, 12 per cent. Wesleyan and Methodist, 7 per cent. Presbyterians, 3 per cent. Congregationalist, 2 per cent. Baptists, and 84 persons were professed Hebrews. The percentage of Methodists and Baptists is increasing, that of the other sects decreasing.

The statutory school age is from 7 to 14, and school attendance is compulsory. In 1899 there were 309 public schools, with a total enrollment of 23,293, and 241 private schools, with 8,781 pupils. In 1891 over 20 per cent. of the population could not read or write, but this number is decreasing rapidly. In 1892 there were 357 insane and 732 paupers in asylums. Of the total population, 17,925 were engaged in agriculture and 987 in purely pastoral pursuits;

15.854 in industrial and 4,004 in mining pursuits. The public libraries numbered 40, with 65,787 volumes.

*Commerce.*—The first state railway was begun in 1868, and at the end of 1899 there were 547¼ miles of railways, of which 84 were in private hands. The principal line is 130 miles long, crossing the island N. and S. and connecting Hobart and Launceston. The state roads cost on the average £8,338 per mile, and in 1892 they gave a net profit of 3·76 per cent. on the cost. A cable joins Tasmania to Victoria, and within the colony there are (1899) 2,004½ miles of telegraph line, with 3,680 miles of wire, besides 815 miles of telephone wire. The total imports in 1899 were valued at £1,769,324; the exports for the same year amounted to £2,577,475. The chief imports were textiles, art and mechanical products, and foods and drinks. The trade is almost entirely with Great Britain or the other Australasian colonies. The registered shipping in 1899 was 44 steamers and 156 sailing vessels. In 1899 797 vessels entered and 755 cleared from Tasmanian ports.

*Administration.*—The constitution became operative in 1886. The Parliament consists of a Legislative Council of 18 elective members, holding office for six years, and of a House of Assembly of 36 members, elected for three years. All members of Parliament receive £50 per year, and have free passes on railways and franks in the post-office and on the telegraph lines. The governor is appointed by the British crown, and has a cabinet of advisers of six responsible ministers with salaries of £600 per annum. The public revenue is derived from taxation (58 per cent.), mostly customs: from railway, postal, telegraph, and other public services (32 per cent.); and from the rental and sale of public lands. In 1899 it was £943,970. The expenditure was £871,-453, devoted to special public works (35 per cent.), to interest due (36 per cent.), to hospitals and charities (6 per cent.), to law and protection (10 per cent.), to education (5 per cent.), and to general purposes (8 per cent.) The public debt at the end of 1899 was £8,395,639, chiefly at 4 per cent. The defense force consists of 1,854 volunteers. The Derwent and Tamar are fortified below the chief ports. The capital is Hobart: pop. (1891) 33,450; (1894) 35,073. The next largest town is Launceston; pop. (1894) 22,351. In 1891 there were no other towns with over 5,000 inhabitants.

*History.*—Tasmania was discovered by Tasman Nov. 24, 1642, and first circumnavigated by Bass and Flinders in 1798. The first settlement was made from Sydney in 1803, and in the following year a penal colony was established at Hobart. The first newspaper was printed in 1810. There were several conflicts with the natives, and by 1825 the prosperity of the colony was seriously endangered from the number of escaped convicts who had taken to the bush and become brigands. Up to this time the colony had been subject to New South Wales, but it was then made independent. A protest was made against the continuance of the importation of convicts, but this had to be repeated for nearly a generation before it was effective. Freedom of the press, trial by jury, and popular government were also gained only after long struggles. Although large numbers of criminals were transported to the colony from the beginning till 1853, the convict taint upon it was never so deep as on New South Wales.

MARK W. HARRINGTON.

**Tasmanian Devil** (so called from its fierce, untamable disposition): the *Dasyurus ursinus*, a carnivorous marsupial peculiar to Tasmania. It is about 20 inches long, exclusive of the tail, and dull black, with a white mark on the breast. The form is thickset, head large, teeth powerful. Before these animals were reduced in numbers they were very destructive to poultry and even to sheep. F. A. L.

**Tasmanian Wolf, Zebra Wolf**, or **Thylacine**: the *Thylacinus cynocephalus*, a marsupial of dog-like appearance, restricted to Tasmania. It is the largest of carnivorous marsupials, reaching a length of 4 feet. It has no marsupial bones, their place being taken by tendons. The color is grayish brown washed with yellowish, and there are about a dozen blackish cross-bars on the hind part of the back. It was abundant, but has been nearly exterminated, owing to the havoc it wrought among sheep. F. A. L.

**Tasse**, taas, JOSEPH: author; b. in Montreal, Canada, Oct. 23, 1848; educated at Bourget's College, Rigaud, P. Q. He edited *Le Canada*, Ottawa, 1867–68, *Minerve*, Montreal, 1869–72, and was a director of *La Revue Canadienne*, a monthly to which he contributed essays on literature, history, and political economy; since 1880 he has been the leading writer of that periodical. In 1873 he visited Europe and published an account of his tour. He represented Ottawa in Parliament 1878–87, and became a member of the Senate Feb. 9, 1891. He is author of *La Vallée de l'Outaouais* (1872); *Les Canadiens de l'Ouest* (2 vols., 1878); *Parallel of the Life of Sir John Macdonald and Lord Beaconsfield* (1879): *Political Recollections* (1891); and *Life and Speeches of Sir George E. Cartier* (1892). NEIL MACDONALD.

**Tassisudan'**: the summer capital of BHUTAN (*q. v.*); 15 miles W. of Punakha, the capital proper; on the Chin-Chu or Raidak, an affluent of the Brahmaputra (see map of N. India, ref. 6–J). It contains a palace for the two rajahs, of whom the dherma-rajah lives in a high tower, together with a beautiful idol, and the deb-rajah in a square edifice inclosing the tower. The palace is furthermore surrounded by rows of smithies, in which metallic idols are manufactured, and outside of these factories the town extends.

Revised by M. W. HARRINGTON.

**Tasso**, BERNARDO: poet; b. in Venice, of a noble family from Bergamo, in 1493; studied at Padua, then became secretary to Count Guido Rangone, in whose company he visited Paris (1528). He then entered the service of Renata, daughter of Louis XII. of France and wife of Prince Ercole d'Este. In 1532 he left Ferrara and entered the service of Ferrante Sanseverino, Prince of Salerno. In his company he visited Tunis (1535), Spain (1537 and 1539), France and Flanders (1544). As early as 1536 he married Porzia de' Rossi of Pistoja; and in 1544 he was allowed by his master to retire to Sorrento in order to give himself to literature. Here he labored on his long epic *L'Amadigi*, based on the *Amadis de Gaula*. In 1547, however, his master was ruined by participation in the uprising against the introduction of the Inquisition into Naples, and Tasso shared his fate. The latter's property was confiscated, and he came to actual want. His misery was increased by the loss of his wife in 1556. After living for a time at Rome (1554–56) the poet found refuge with Duke Guidobaldo of Urbino. In 1558, however, he went to Venice, where he was made chancellor of the Venetian Academy. Later he entered the service of Luigi d'Este, then that of Guglielmo Gonzaga, who made him *podesta* of Ostiglia. Here he died, Sept. 4, 1569. Besides the long epic *Amadigi*, we have from this poet the *Floridante*, a narrative poem finished by his son Torquato; and also shorter poems called *Amori*, *Egloghe pescatorie*, and *Odi*. In prose are the *Ragionamento della poesia*, and numerous highly interesting *Lettere*. The best edition of the *Amadigi* is that of Venice, 1581. See also Seghezzi, *Lettere di M. Bernardo Tasso* (2 vols., Comino, 1733); Serassi, *Delle Lettere di M. Bernardo Tasso*, vol. iii. (Padua, 1751); G. Campori, *Lettere inedite di B. Tasso* (with *Life*, Bologna, 1869); A. Portioli, *Lettere inedite di B. Tasso* (Mantua, 1871). A. R. MARSH.

**Tasso**, TORQUATO: poet; b. at Sorrento, Italy, Mar. 11, 1544; a son of Bernardo Tasso; educated first by the Jesuits at Naples, he continued his studies at Rome and Bergamo, then at the court of the Duke of Urbino in Pesaro, and at Venice, whither his father's fortunes had carried him; finally, in 1560, at his father's desire, he went to the University of Padua to study law. He felt himself more attracted, however, to literature and poetry. In 1562 he published a romantic epic, *Rinaldo*, in twelve cantos, and the applause with which it was received determined him to give up jurisprudence altogether and devote himself entirely to poetry. He repaired to Bologna, where he studied philosophy, frequented the select literary circles of the place, and took up again work on his great epic, *Gerusalemme Liberata*, which he had begun while still hardly more than a boy, moved by the advances of the Turks in Hungary and their frequent raids on parts of the coast of Italy, starting reminiscences of the great time of the crusades. In 1565 he entered the service of Cardinal Luigi d'Este, whom he accompanied to Paris and on other diplomatic missions, and who brought him into connection with his brother, Alfonso II., reigning Duke of Ferrara. In 1571, at which time he had finished the first eight songs of his epic, he left the cardinal, receiving in 1572 a kind of court appointment and a pension from Alfonso II., and settled at Ferrara, where he lived very happily for several years, enjoying the intimate friendship of the duke and his two sisters, Lucrezia and Eleonora. In the summer of 1573 he wrote for a court festivity his *Aminta*, a pastoral drama, the best of its kind (1st ed. Cremona, 1580); and in 1575 the *Gerusalemme Liberata* was completed. But in the meantime a peculiar melancholy had developed in his mind, and it sometimes burst into open lunacy. His relation to the ducal family had been disturbed, whether on account of a vehement passion for the Princess Eleonora or from some other cause is not known. He was greatly disturbed about his own spiritual condition, fearing that his opinions were unsound, and particularly that his poem was inconsistent with Christian faith and morals. He accordingly submitted the work to many supposed authorities, who treated it with pitiless pedantry, to the poet's great distress. The criticisms, rivalries, and intrigues which as a poet and a courtier he could not escape overwhelmed his imagination; he grew suspicious toward all, saw a secret enemy in everybody, and finally, after the duke had been compelled to restrain him in the effort to cure him, fled from the court in 1577. He sought refuge with his sister at Sorrento, and here his mind soon became calm and clear again. He now yearned for Ferrara, wrote to the duke, and, although the answer he received was very cool, he returned. But he had hardly arrived before the disease again seized his mind. Once more he fled, and once more he returned. His anxiety to re-establish the old relation to this family became more and more passionate as it became more and more evident to him that such a re-establishment was impossible. His manners, his denunciations, became finally so provoking that the duke confined him in a lunatic asylum in 1579. Here he remained seven years, while his great work was read not only in Italy, but all through Europe, and made his name one of the first of his age. At last, in 1586, at the request of Vincenzo Gonzaga, Prince of Mantua, the duke released him, and he now resided for a short time in Mantua, and then settled at Naples. He was poor, sick, and suffering, but his unquiet mind would not permit him to rest; for several years he moved restlessly from place to place, growing steadily worse both in mind and body. His fame, however, was growing continually greater. In 1594 Pope Clement VIII. invited him to come to Rome and be crowned on the capitol, but he died before the solemnity took place, Apr. 25, 1595, and lies buried in the Church of S. Onofrio in Rome. Besides the above-mentioned works he wrote *Torrismondo*, a tragedy, a number of beautiful lyrical poems, some dialogues and essays, some letters, etc. Mention must be made also of the second form of the *Gerusalemme Liberata*, the fruit of years of effort on Tasso's part to relieve the poem of the faults alleged by his self-chosen critics to exist in it. This was finished in 1593 and called *Gerusalemme Conquistata*. Compared with the first form it is a poor and heavy thing; and yet only the piratical printing of the *Liberata* by one Celio Malaspina (Venice, 1580) has preserved to the world one of the chief treasures of modern literature. A complete edition of the *Works* appeared in 33 volumes at Pisa (1821–32), but this is now superseded by the various partial editions of Guasti and Solerti: *Lettere*, ed. by C. Guasti (5 vols., Florence, 1852–55); *I Dialoghi*, ed. by Guasti (3 vols., Florence, 1858); *Prose diverse*, ed. by Guasti (2 vols., Florence, 1875); *Appendice alle Opere in prosa*, ed. by Solerti (Florence, 1892); *Opere minori in versi*, ed. by Solerti (7 vols., Bologna). Best edition of the *Gerus. Liber.* by S. Ferrari (Florence, 1890). See also G. J. Ferrazzi, *T. Tasso, studj biografici-critici-bibliografici* (Bassano, 1880); P. A. Serassi, *La Vita di T. Tasso* (3d ed., with notes by C. Guasti, 2 vols., Florence, 1858); A. Corradi, *Le infermità di T. Tasso* (in *Mem. dell' Istit. Lombardo*, vol. xiv., 1880); English translations of the *Gerusalemme Liberata*, by Edward Fairfax (London, 1600) and by J. K. James (2 vols., 1865). A. R. MARSH.

**Tasso'ni**, ALESSANDRO: poet and critic; b. at Modena, Italy, Sept. 28, 1565, of noble parents; spent some time at the Universities of Bologna and Ferrara, and was associated with the Accademia della Crusca from 1589. He was in Spain with Cardinal Ascanio Colonna in 1600; but after 1603 in Italy, in the service of Charles Emmanuel of Savoy and engaged upon diplomatic missions between Rome and Modena, Piedmont and Turin. D. at Modena, Apr. 25, 1635. His critical writings are the *Pensieri* (1608–20)—freely expressed views upon literary, scientific, and moral matters; the *Considerazioni sopra le Rime del Petrarca* (1602–09), directed against the literary abuses of the time, which were due to the Petrarchists and the Marinists; and the *Avvertimenti di Crescenzio Pepe* (1611). The political *Filippiche contro gli Spagnuoli* (1615) shows his hatred for the Spaniards. His best-known work is the *Secchia rapita* (1615–22), a mock-heroic poem which sings a war caused between the Modenese and the Bolognese, when the former carried off a bucket from the latter. It does not fall behind the *Lutrin* and the *Rape of the Lock*. Further may be mentioned the *Tenda Rossa*, several unedited political documents, the fragment of an epic, the *Oceano*, some satirical rhymes, and his *Letters*. See *La Secchia rapita, poema eroicomico, e Il primo canto dell' Oceano* (Turin, 1830); *Rime*, ed. by T. Casini (Bologna, 1880); *Life*, by A. Muratori, in the edition of the *Secchia Rapita* (Modena, 1744). Cf. G. Tiraboschi, *Biblioteca Modenese* (1784), v., 180 ff., and d'Ancona and Bacci, *Manuale della Letteratura Italiana*, iii., 356 ff. (Florence, 1893). J. D. M. FORD.

**Taste**: See SENSES and HISTOLOGY (*The Digestive Organs*).

**Tatar Bazardjik**: town; in Eastern Roumelia (Bulgaria); on the Maritza; 23 miles W. N. W. of Philippopolis (see map of Turkey, ref. 3–C); traversed by the railway which connects Vienna and Constantinople; maintains a large trade in wheat, lumber, coarse cloth (shaïak), ottar of rose, tobacco, tar, cheese, rice, butter, sheep, and skins. Pop. (1893) 16,343. E. A. G.

**Tatars**: See TARTARS.

**Tate**, NAHUM: poet; b. in Dublin, Ireland, in 1652; was educated at Trinity College; went to London, devoted himself to literature, and in 1692 succeeded Shadwell as poet-laureate; fell into pecuniary straits, and died in the precincts of the Mint, where debtors were privileged from arrest, Aug. 12, 1715. He assisted Dryden in the composition of *Absalom and Achitophel*, most of the second and poorer part being the work of Tate; perpetrated an alteration of Shakspeare's *King Lear*, which kept the stage for a long time in place of the original; as poet-laureate produced commonplace birthday odes and elegies; and put forth several works in prose and verse, among which are about half a score of dramatic pieces. He is chiefly known as a psalmodist, the versions of the Psalms executed by him and Nicholas Brady being long retained in the English *Book of Common Prayer*; these first appeared under the title *Essay of a New Version of the Psalms of David, consisting of the first Twenty, by N. Brady and N. Tate* (1695), which was followed by *The Book of Psalms, a New Version in Metre, fitted to the Tunes used in the Churches, by N. Tate and N. Brady* (1696), and *A Supplement of Church Hymns* (1700). Revised by H. A. BEERS.

**Tateno Gozo**: official and diplomatist; b. at Kokura, on the southern shore of the Straits of Shimonoseki, Japan, in 1841. Sent in 1869 to London in charge of students, he spent four years there, and acquired a thorough knowledge of the English language and of foreign life. From 1880 to 1890 he served with great acceptance as governor of Osaka, whence he was transferred to the legation at Washington, D. C., as minister plenipotentiary. He returned to Japan in the year 1894. J. M. DIXON.

**Tatham**, WILLIAM: soldier and author; b. at Hutton, England, in 1752; emigrated to Virginia in 1769, and entered a mercantile establishment on the James river; served as adjutant of militia against the Indians; during the Revolution was colonel in the Virginia cavalry, and in 1780, in connection with Col. John Todd, compiled the first trustworthy account of the Western territory. He studied law and was admitted in 1784; in 1786 established himself at Lumbarton, N. C., and in 1787 was elected to the Legislature of North Carolina. He twice visited England, and in 1801–1805 was superintendent of the London docks. Returning to Virginia in 1805, he was in his old age reduced to penury, and was appointed keeper of the military stores in the Richmond arsenal. He committed suicide at Richmond, Feb. 22, 1819. Among his publications are *Analysis of the State of Virginia* (Philadelphia, 1794); *Remarks on Inland Canals* (London, 1798); *Political Economy of Inland Navigation* (London, 1799); and *History and Practical Essays on the Culture and Commerce of Tobacco* (London, 1800).

**Tatia'nus**: Christian apologist; b. in Assyria about 110 A. D.; studied philosophy and rhetoric; went to Rome, and taught rhetoric there; enjoyed the friendship of Justin Martyr; was converted by him to Christianity about 152, and wrote in Greek one of the earliest apologies for Christianity against the pagan philosophers, *An Address to the Greeks* (ed. K. Otto, Jena, 1851; Eng. trans., *Ante-*

*Nicene Fathers*, ii., 65–82). After the death of Justin, about 167, Tatian returned to the East, and adopted very strange, heterodox ideas of the Gnostic variety, joining the Encratites. He died, perhaps at Edessa, about 180. His morality was asceticism. He forbade marriage, animal food, wine, etc., and used water in the celebration of the Eucharist. The *Diatessaron* of Tatian, in which the Gospels are so combined as to form a continuous narrative without repetitions, known from the fifth century as the form in which the Gospels were read in Syria, was probably made originally in Syriac. It was entirely unknown except in name and from quotations from it until a Latin translation of it, along with an Arabic version of it of Egyptian origin in the fourteenth century, was published by A. Ciasca in Rome, 1888. Eng. trans. from the Arabic by J. Hamlyn Hill, *Earliest Life of Christ* (Edinburgh, 1894). It proves the existence of four, and only four, Gospels about the middle of the second century. Revised by S. M. Jackson.

**Tatius**, Achilles: See Achilles Tatius.

**Tatnall**, Josiah: soldier; b. at Bonaventura, near Savannah, Ga., in 1762; went to England with his parents, who were loyalists, on the outbreak of the Revolutionary war, but ran away from home in 1780, and returning to Georgia in 1782 joined the army of Gen. Nathanael Greene; was made colonel of militia in 1793 and brigadier-general in 1800; took an active part in the military affairs of the State, and was elected to the Legislature; was U. S. Senator from Georgia 1796–99, and Governor of Georgia 1800. D. at Nassau, New Providence, June 6, 1803.

**Tatou-peba**: See Cachicama.

**Tatpurusha**: a technical term of the traditional Sanskrit grammar applying to substantive compounds, in which the prior member is an adjective, noun, or adverb modifying in meaning the second member, the whole being of the same part of speech as the latter member. They are also called determinative compounds. Such are *indradhanús-*, Indra's bow, *vedavíd*, Veda-knowing, *priyasakha-*, dear friend; or in English, *dining-room, weatherwise, wildcat*. Karmadhāraya (*q. v.*) applies to a subdivision of this class. See also Immutata. Benj. Ide Wheeler.

**Tattam**, Henry, LL. D., F. R. S.: Orientalist; b. in Ireland, Dec. 28, 1788; educated at Trinity College, Dublin, and at the Universities of Göttingen and Leyden; took orders in the Church of England; was archdeacon of Bedford 1844–66, and rector of Stanford Rivers, Essex, 1849–68, and was afterward a chaplain in ordinary to the Queen. D. at Stanford Rivers, Jan. 8, 1868. During his travels in the East, early in the century, he laid the foundation of an intimate knowledge of Oriental languages, concerning one of which, the Coptic, he became an authority. He discovered at the convent of Nitria, in the northwest desert of Egypt, and secured for the British Museum, a splendid collection of ancient Syriac MSS. Among these were the *Ecclesiastical History of John, Bishop of Ephesus* (Oxford, 1853), and the *Epistles of Ignatius* (1845), both edited in the Syriac text by Dr. William Cureton, and the former translated into English by Dr. R. Payne Smith (1860). He was the author of several works, including *Lexicon Ægyptiaco-Latinum ex veteribus Linguæ Ægyptiacæ Monumentis, etc.* (Oxford, 1835); *The Ancient Coptic Version of the Book of Job the Just, translated into English and edited* (1847); and *Prophetæ Majores in Dialecto Linguæ Ægyptiacæ* (Oxford, 2 vols., 1852). Revised by S. M. Jackson.

**Tattler**: a name applied without definite limits to numerous birds of the snipe family, usually to the larger species of sandpipers, such as the yellowlegs, *Totanus melanoleucus*.

**Tattooing** [deriv. of *tattoo*, from Fr. *tatouer*, tattoo, from Tahitian *tatu*, tattooing]: the practice of marking the skin with various indelible figures by means of slight punctures or incisions into which certain pigments are introduced. In the islands of the South Pacific the custom was originally almost universal, although now dying out through the influence of missionaries and civilization. Tattooing is also found among the Burmese, Laos, Japanese, and American Indians (see Indians of North America); in Japan, however, the practice has been forbidden by the Government, and is disappearing. With the races of darker color, such as Negroes, Malays, and the natives of Australia, a more prevalent method of ornamenting the skin is by means of simple scars. The tattooing of a few emblems on the arms or body is a common custom with white sailors and with the lower-class population of Europe. With the Polynesians and Japanese, however, the figures cover nearly the whole body, and largely take the place of clothing. A distinguishing peculiarity of the Maoris was the elaborate tattooing of the face; many of their heads are preserved in museums. The art of tattooing was brought to its highest and most artistic development in Japan; here the subjects chosen for representation include lions, dragons, birds, trees, flowers, historical incidents, beautiful women, etc. The best authorities on the subject are Lacassagne, *Les Tatouages* (Paris, 1881), and Joest, *Tättowiren, Narbenzeichnen, und Körperbemalen* (Berlin, 1887).

**Taubaté**, tow-bă̄a-tā': town of the state of São Paulo, Brazil; in the valley of the upper Parahyba, and on the railway from São Paulo to Rio de Janeiro; 81 miles E. N. E. of the former city (see map of South America, ref. 7–G). It is the center of one of the richest coffee-growing districts of Brazil. Pop. about 12,000; with the *municipio* (1889), 23,000.

**Tauchnitz**, towch'nits, Christian Bernhard, Baron von: publisher; nephew of Karl Christoph Tauchnitz; b. at Schleinitz, near Naumburg, Germany, Aug. 25, 1816; established a publishing-house at Leipzig in 1837, and became celebrated for his editions of Greek and Latin classics, Hebrew and Greek Bibles; best known to travelers and writers for his continental editions of British authors, which consists of 3,000 titles. He began this series in 1841, and adopted the principle of paying the authors for the republication of their works, although there was at that time no international copyright. He was made a baron 1860; became British consul-general in Saxony, 1872, and 1876 for the other Saxon principalities; called by the king to the house of peers of Saxony 1877. D. in Leipzig, Aug. 14, 1895.

**Tauchnitz**, Karl Christoph Traugott: publisher; b. at Grossbardau, near Grimma, Saxony, Oct. 29, 1761; learned printing at Leipzig; worked for some time in Unger's establishment in Berlin, and opened in 1796 a printing-house in Leipzig, to which were added in 1798 a bookstore, in 1800 a type-foundry, and in 1816 the first stereotype-foundry in Germany. From his establishment, which soon grew and became one of the largest of the kind in Germany, issued those celebrated editions of Greek and Latin authors which in correctness, convenience, and cheapness surpassed all other editions which had hitherto appeared. D. in Leipzig, Jan. 14, 1836.

**Tauism and Tauists**: See Taoism.

**Tauler**, tow'ler, Johannes, Doctor Illuminatus: mystic; b. at Strassburg about 1300; entered the order of the Dominicans about 1318, and came under the influence of Meister Eckart, theological professor of the monastic school. He further studied theology at the college of his order in Cologne 1327–31, and afterward in Paris. The scholastic method, however, of the theology of that time did not satisfy him; he felt himself drawn toward the mystical and speculative writers on religion and philosophy; and this tendency was still more strengthened within him, after his return from Strassburg, by his intercourse with Meister Eckart. Eckart's pantheism, however, as well as Suso's sentimentalism, remained foreign to him. His character was of a more practical turn, and it is the moral bearing of the religious ideas which forms the essence of all his writings. Banished with the Dominicans from Strassburg, in consequence of their determination to close their churches during the papal ban, he went to Basel (1339). There he was converted by the mysterious "Friend from Oberland," and his preaching became more spiritual. From 1346 he lived in Strassburg, and there died June 16, 1361. He enjoyed the reputation of being the greatest preacher of his time, and set a rare example of Christian courage, self-denial, and persistency during times of papal ban, of plague, and other hardships. His sermons were first collected in 1498 (Leipzig). A translation into new High German was given by Schlosser (Frankfort, 1826); better by J. Hamberger (Frankfort, 2d ed. 1872). See Karl Schmidt, *Johannes Tauler von Strassburg* (Hamburg, 1841); Miss Winkworth, *Life and Times of Tauler* (London, 1857), containing twenty-five of his sermons; American reprint, ed. by R. D. Hitchcock, New York, 1858. See also Denifle's *Das Buch von der geistlichen Armut* (Strassburg, 1877) and *Taulers Bekehrung* (1879); A. Jundt, *Les amis de Dieu au XIV$^e$ siècle* (Paris, 1879); F. Bevan, *Trois amis de Dieu* (1889). Revised by S. M. Jackson.

**Taunay**, tow-nā', Alfredo d'Escragnolle: author and politician; b. in Rio de Janeiro, Brazil, Feb. 22, 1843. His ancestors were French nobles, who fled to Portugal during the Revolution, and passed with the royal family to Brazil. After graduating with high honors at the Pedro II. College, he studied engineering in the Polytechnic and Military schools in Rio de Janeiro, having entered the army in 1861. In 1865–68 he was attached to the Engineer Corps of the Brazilian army which invaded Northern Paraguay from Matto Grosso. The history and sufferings of these campaigns were described by him in two works—*Scenas de viagem* (1868) and *La Retraite de Laguna* (1871; originally written in French); these at once placed him in the first rank among Brazilian authors. In 1869–70 he was attached to the army in Southern Paraguay, editing its records. After the war he took an active part (as a conservative) in politics, was elected to parliament, was president successively of Santa Catharina and Paraná, and in 1886 was chosen to the senate; in all these positions his efforts were especially directed to the promotion of immigration, and he urged his plans in an important series of publications. His other writings include essays, poems, comedies, criticism, etc., and a series of novels which are regarded as the best ever produced by a Brazilian author. Among these are *A mocidade de Trajano* and *Innocencia*, the latter translated into French and English. Taunay excels in descriptions and character-drawing, but is lacking in humor. Since the Revolution he has been a leader of the imperialist party, but has taken no part in the acts of rebellion. See Koseritz, *Alfredo d'Escragnolle Taunay* (Rio, 1886). HERBERT H. SMITH.

**Taunton**: town; in Somersetshire, England; on the Tone; 45 miles S. W. of Bristol (for location, see map of England, ref. 13–F). It is well built, and has manufactures of hosiery and silk, and trade in agricultural and dairy produce. Among its principal edifices are the Church of St. Mary Magdalen, St. James's church, the market-house, Taunton and Somerset Institution, the West of England College for Dissenters, and a castle built in the time of Henry I. Taunton returns one member to Parliament. Pop. (1891) 18,026.

**Taunton**: city; capital of Bristol co., Mass.; on the Taunton river, and the N. Y., N. H., and Hart. Railroad; 15 miles N. by E. of Fall River, 33 miles S. of Boston (for location, see map of Massachusetts, ref. 5–I). It was called Cohannet by the Indians; the first purchase of ground by the whites was in 1637; the town was incorporated in 1639, and had a city government in 1865. It is in an agricultural region, and is widely known for the extent and variety of its manufactures. In 1900 it had 313 manufacturing establishments, representing 67 industries. The invested capital aggregated $7,754,773. Over 6,000 persons were employed, to whom $3,104,023 was paid in wages. Materials valued at $4,771,096 were used in manufacturing, and goods were produced at an aggregate value of $9,834,584. The principal manufactures are cotton machinery, cotton cloth and yarn, cutlery, nails and tacks, copper, yellow metal, silver and britannia ware, oil-cloth, fire and building brick, stoves, printing-presses, shoe-buttons and eyelets, jewelry, and machinists' tools. The city has an extensive trade with the interior in coal and grain, and a considerable coasting trade. There are 22 churches; a high school, 64 graded and 17 ungraded public schools, and over 5,700 pupils; Bristol Academy (non-sectarian, chartered in 1792); a public library with 40,000 volumes; State Insane Hospital; Home for Aged Women; the Morton Memorial Hospital; exhibition grounds and buildings of the Bristol County Agricultural Society; headquarters of the Old Colony Historical Society; new court-house; 3 national banks with aggregate capital and surplus of $1,800,000, 3 co-operative banks with authorized capital of $1,000,000 each, 1 trust and loan company, and 2 savings-banks with aggregate deposits of over $7,000,000; and 3 daily, 2 weekly, and 3 monthly periodicals. The assessed valuation in 1900 was $20,000,000, and net city debt $419,482.97. Pop. (1880) 21,213; (1890) 25,448; (1900) 31,007.

**Taurida**, tow'rēe-dăă: government of Russia, bordering on the Dneiper, the Black Sea, and the Sea of Azof; area, 24,497 sq. miles. It consists of the peninsula of the CRIMEA (*q. v.*) and some extensive districts of the mainland. The northwestern part of the Crimea and the mainland are desert steppes interspersed with salt lakes; they are inhabited by Tartars, who feed large herds of cattle and sheep on the steppes and cultivate wheat and millet. Pop. of government (1897) 1,443,835. Revised by M. W. HARRINGTON.

**Taurus**, taw'rŭs [= Lat. = Gr., liter., bull, ox < Indo-Eur. **taruos* > O. Ir. *tarb*]: a brilliant constellation, which may be seen S. of the zenith during the evenings of December and January. It includes the remarkable groups of stars the Pleiades and Hyades, and the red star Aldebaran. Taurus is the second sign of the Zodiac. S. N.

**Taurus**: a range of mountains in Asia Minor, stretching E. to W. from the Euphrates to the Gulf of Adalia. By the Alma-Dagh it communicates with the Lebanon Mountains in Syria, and by one branch of the Anti-Taurus with the Caucasian Mountains. It rises in terraces from the Mediterranean to a height of 10,000 feet, and incloses between itself and Anti-Taurus an elevated plain, arid, dotted with salt lakes, and having the same character as the plateaus of Central Asia. Revised by M. W. HARRINGTON.

**Tausig**, tow'zich, CARL: pianist; b. near Warsaw, Poland, Nov. 4, 1841: pronounced by his teacher Liszt the best pianist the world ever heard. His octave playing was wonderful. After making many successful concert tours he settled in 1865 in Berlin, where he opened a school for piano instruction. D. in Leipzig, July 17, 1871. His compositions are all for the piano, and are masterpieces of execution. D. E. H.

**Taussig**, tow'sig, FRANK WILLIAM: political economist; b. in St. Louis, Mo., Dec. 28, 1859; A. B. 1879, Ph. D. 1883, LL. B. 1886, all from Harvard University; studied one year in Europe; has since been Professor of Political Economy in Harvard University; author of *Tariff History of the United States* (New York, 1888; 2d ed. 1892); *The Silver Situation in the United States* (1892); various contributions to scientific periodicals, chiefly to *The Quarterly Journal of Economics*. C. H. T.

**Tautog'** [from Amer. Ind. *tautauog* (given by Roger Williams, and said by him to mean sheep's heads), plur. of *taut*, the Indian name]: a fish (*Tautoga onitis*) of the family *Labridæ*, related to the wrasses of Europe, but the only member of its genus. It is a deep-bodied fish, with small smooth scales; the opercular bones scaleless; the teeth on the jaws conical and in two rows, and none behind developed as canines; dorsal spines numerous (seventeen), and only three anal spines; the adult is sometimes an almost uniform black, but generally more or less blotched, and in the young banded and otherwise decorated. It is common on the Atlantic coast of North America from Massachusetts to Carolina, and rarer farther northward and southward. Its average weight is about 2 lb., but it frequently weighs 10 lb. It makes its appearance in large numbers and in shallow waters on the New England and New York coasts between the months of April and November, and is most abundant in May and October. It spawns in May or June. When it first makes its appearance in shallow water, it refuses the hook, but soon takes it readily, and is one of the most frequently caught of the salt-water fishes. It prefers rocky places and slight currents. It keeps near the bottom, and preys upon crustaceans and molluscs. Revised by F. A. LUCAS.

**Tavernier**, tăă'vār'ni-ā', JEAN BAPTISTE, Baron d'Aubonne: traveler; b. in Paris in 1605; undertook while still very young extensive journeys in Europe, and made from 1631 to 1633 his first great journey to the East—from Constantinople to Persia, and thence by way of Aleppo to Rome. Subsequently, from 1638 to 1669, he made five more voyages to the East, through Asia Minor and Persia to Hindustan, and as far as Batavia. He possessed great skill in appraising precious stones, and by trading in jewelry he amassed a great fortune. He also promoted French commerce in the East Indies in various ways, and on his return from his last voyage Louis XIV., who bought many of his jewels, made him a baron. He lost a part of his fortune, however, and, being a Protestant, sought refuge in Switzerland after the revocation of the Edict of Nantes. On a seventh journey to the East he died in Moscow in July, 1689. A report of his first six voyages was edited by Chappuzeau (2 vols., 1676–77), and a third by La Chapelle (1679), under the title *Les Six Voyages de J.-B. Tavernier*. His descriptions are remarkable for their accuracy and for the light that they throw on the condition of Eastern commerce. An edition of his works was published in 1810 (7 vols.), and an abridged edition in 1882. See *Travels in India* (Eng. trans., 2 vols., 1890), and Joret, *Jean-Baptiste Tavernier*. F. M. COLBY.

**Tav'istock**: town; in Devonshire, England; on the Tavy; 11 miles N. of Plymouth (see map of England, ref. 14–D). There are only a few remains of a once splendid Benedictine abbey, founded in 961. Copper, lead, silver, and tin are found in the vicinity, and there is much trade in cattle and grain. Pop. (1891) 6,252.

**Tavoy′**: capital of Tavoy district, Tenasserim, Burma; in lat. 14° 7′ N., on the river Tavoy, 30 miles from its mouth (see map of S. India, ref. 5–M). It is a neat and handsome town, of a thoroughly Indian character, built of bamboo and on piles, half concealed by luxuriant orchards and fruit-gardens, and standing in the center of rich rice-fields. Salt and earthen pots are the chief manufactures. Pop. 13,370. M. W. H.

**Taysen**, tow′sen, HANS: Reformer; b. near Kjerteminde, island of Fünen, Denmark, 1494. In 1515 he entered a cloister, but the following year went abroad and studied at the University of Rostock, where he took the master's degree. After lecturing on theology at the University of Copenhagen for two years, he went abroad again, with the assistance of his cloister, and spent a year at Wittenberg, under the direct influence of Luther and Melanchthon. After a year he was suddenly called home, and returned filled with enthusiasm over the new teachings. In spite of entreaties, threats, and imprisonment, he continued to preach, even from his prison windows. In 1526 he was made chaplain to Frederick I., and permitted to preach in Viborg. Three years later he moved to Copenhagen, and became the leader of the Danish Reformation, *Omnium Lutheranorum in Dania antesignanus*. For some unknown reason he was not included in the first list of Danish Protestant bishops, but in 1542 he was appointed to the diocese of Ribe, where he remained till his death Nov. 11, 1561. Among his writings, which are inferior in form to those of Christiern Pedersen, are a translation of the Pentateuch (Magdeburg, 1535); *Postil* (Sermon, 1539), a collection of sermons for the whole year; and a translation of the whole Bible (before 1543). D. K. DODGE.

**Taw′as City**: incorporated village; capital of Iosco co., Mich.; on Tawas Bay, Lake Huron, at the mouth of the Tawas river, and on the Detroit and Mack. Railroad; 65 miles N. E. of Bay City (for location, see map of Michigan, ref. 5–J). It has a fine harbor, is in an agricultural region, and is principally engaged in the manufacture and shipment of lumber and salt. There are 6 churches, graded public school, a private bank, and 2 weekly newspapers. Pop. (1880) 712; (1890) 1,544; (1900) 1,228. EDITOR OF "HERALD."

**Tawing and Tanning**: See LEATHER.

**Taxa′ceæ** [Mod. Lat., from *Taxus*, the typical genus, from Lat. *taxus* = Gr. τάξος, yew-tree]: one of the two families of the order *Coniferæ*. See CONIFERS.

**Taxation** [viâ O. Fr. from Lat. *taxa′tio*, estimation, valuing, deriv. of *taxa′re*, handle, estimate, value, rate, deriv. of *tan′gere, tac′tum*, touch]: the system by which revenue is raised to meet the general expenses of a government, whether national or local. Taxes are to be distinguished (1) from forced contributions, which do not form part of a system, but which are an exceptional means of raising revenue in time of war or other emergency; (2) from fees like court charges or postage-stamps, which are contributions in connection with special services rendered in each case, and do not, properly speaking, form part of the general revenue.

An account of the principal taxes in use will be found in the article FINANCE. The object of the present article is to examine the grounds on which methods of taxation are criticised or justified.

In his *Wealth of Nations*, published in 1776, Adam Smith laid down four canons of taxation which are taken as the starting-point in this discussion. They were as follows: (1) The subjects of every state ought to contribute to the support of the government as nearly as possible in proportion to their respective abilities—that is, in proportion to the revenue which they respectively enjoy under the protection of the state. (2) The tax which each individual is bound to pay ought to be certain and not arbitrary. (3) Every tax ought to be levied at the time or in the manner in which it is most likely to be convenient for the contributor to pay it. (4) Every tax ought to be so contrived as both to take out and to keep out of the pockets of the people as little as possible over and above what it brings into the treasury of the state. As the French financier Colbert somewhat cynically puts it, taxation is the art of so plucking the goose as to secure the largest amount of feathers with the least amount of squealing.

Of these canons the second and third are obviously of minor importance, being rather of the nature of administrative directions as to the detail of collection than general criteria for judging a tax itself. The first and fourth are the important ones. Taxes must be equal and effective. Of course, if a tax meets both these requirements, it is a good one. But can both be applied side by side? In ancient times this was possible. There was one group of men who had considerable property and income which was in a form where it could be easily assessed. The property consisted chiefly of real estate. What little personal property there was consisted largely of visible and tangible objects, like plate or jewels, which the owners kept for display. A tax levied on these persons fell on those who could afford to pay it, and was one which could be collected at relatively little expense; a tax on any other body of persons was at once unjust and destructive. But even at the time when Smith wrote matters had begun to change from their ancient simplicity. The persons who had the most ability or revenue were not always in a position where the assessors could ascertain the exact measure of this ability. Personal property in invisible forms, like stocks and bonds, had begun to acquire increasing importance. The attempt to make everybody contribute equally by the old method resulted in burdening the honest and exempting the dishonest, and in making a tax system which was singularly ineffective—one whose burdens were out of proportion to the financial results. The tax legislator now has to decide the question whether he shall make equality *or* effectiveness his primary aim. This can be answered only by looking at the indirect effects of the taxes laid and studying what is known as the incidence of taxation. Suppose that a tax is laid which is equal, but not effective—for instance, one which taxes people on stocks and bonds in the same manner that it does on real estate—the result is that the honest people alone tell what they have, while the dishonest conceal it. This constitutes, first, a premium on dishonesty; second, a burden on the honest, for if half of the property of a given class escapes taxation, the other half has to pay double rates in order to yield a given amount of revenue; third, an increasing burden, because each year of successful evasion renders the public conscience more lax and reduces the honest to a smaller minority. No system of oaths has been devised which will meet this evil.

On the other hand, suppose a tax is laid which is effective but not equal—that is, which strikes a particular class of persons, but reaches all that it is aimed at. Assume, for instance, that houses were taxed at a different rate from other kinds of property. At first this would be an injustice to the owners of houses; but as time went on fewer houses would be built for rent, and the owners of those already existing could charge higher prices on account of the short supply, thus shifting part of the burden on to the occupiers. Then as rents were slightly raised the employers of labor would probably have to pay a little higher wages in order to induce workmen to live in the place in question—a thing which the employers would be enabled to do if the house tax had been sufficiently productive to diminish the amount of the total payments which business concerns would have to contribute to the municipal support. Each year as it passed would tend to shift the burden of this tax from the class which originally felt it to the shoulders of the community as a whole. The only cases where such shifting would not take place would be those where the class specially taxed was making such high profits that a diminution of these profits did not affect the supply of the goods or services which this class gave; and where profits were so large as this it would prove that such a class under previous systems of taxation had not been contributing a fair share to the expenses of the government. A tax law which aims to be equal, but which is ineffective, produces the worst kind of inequality, which tends to increase as time goes on. A tax law which aims to be effective, even in apparent disregard of equality, tends by a constant process of economic adjustment to be more and more equally distributed over the whole community. Effectiveness rather than equality should therefore be the primary object of the tax legislator. The other can be trusted to follow. Unfortunately this sequence is not well understood. In seeking to apply an illusory theory of equal treatment of all persons, law-makers really put double burdens on the honest. When the courts squarely face the fact that any tax is a discriminating tax, if a large part of those against whom it is directed can practically escape its burdens, we may hope for a real reform in these matters. A few rules can be given which tend to secure effectiveness of tax laws and to avoid discriminations against the honest.

(1) Taxes should be assessed on things rather than on persons—on the property itself rather than on its owners. (2) In conformity with this rule an income tax should be levied at the sources of the income rather than on the receivers of the income. Of course this complicates the possibility of levying compensatory or progressive income taxes, and may bear hard upon people with small incomes; but the evasions which result from a violation of this rule do far more harm than the hardships which result from conformity to it. (3) No deductions from the value of property should be made on account of debt. Mortgaged real estate, for instance, should be assessed at its full value. This at first sight seems very unjust, but is really the equitable arrangement. Under the present system, which allows deduction for debt, a large part of the money lent on real estate wholly escapes taxation. The present system puts burdens, first, on the holder of unmortgaged real estate, who has to pay a higher rate of tax because the valuation of the town where he lives is lower; second, on the widows and orphans, who pay a high tax rate on their investments, while other investors conceal the fact of their holdings. Its benefit to the holder of mortgaged real estate is largely illusory, because the existence of the present system keeps the rate of interest higher than would otherwise be the case. The only man who gets much benefit is the unscrupulous lender, who enjoys the high rate of interest and makes no tax return. (4) The same principle should be applied to corporations. The value of the corporate property is represented by the market value of its stock and debt. This debt can be reached by taxing the corporation either on its gross earnings, its net earnings, or its securities as a whole. It can not be reached by an attempt to tax it in the hands of the holders. (5) To secure an equitable land tax, real estate should be assessed on the basis of its price rather than of its productiveness; unimproved real estate should be assessed higher and improvements relatively lower than at present. The assessors to-day see that the man who holds unimproved real estate gets little income, and they let him off easily on account of his supposed inability to pay a high tax. The real effect of this is to take burdens off from the shoulders of a man who is waiting for the growth of the community to make him rich, and to put those burdens on the shoulders of those who are contributing to that growth. Whatever may be thought of Henry George's single-tax theory as a whole, there can be little question that a relatively higher assessment of ground rent, with corresponding relief for those who have made improvements, is a much-needed reform. (See SINGLE TAX.) (6) The objects of national, state, and local taxation should be separated as far as possible. If, as happens in so many of the U. S., the State taxes are partly made up of contributions from the towns on the basis of their grand lists, or assessed valuations, the local assessors are anxious to lessen the share of the State tax which their town must pay. This they can do by lowering the grand list and correspondingly raising the local tax rate. When once the assessors are interested in making an incorrect list, no board of equalization can overcome the evil.

There are certain important groups of taxes in which revenue is a subordinate consideration, and which therefore fall somewhat outside the scope of this article. High licenses constitute one group, protective tariffs another. The object of such taxes is to discourage certain forms of trade upon which they are levied, and they should obviously be judged on other grounds than those of equality or fiscal effectiveness.

There is no satisfactory general work on the economics of taxation. The leading American writers on the subject are David A. Wells, whose article on *Taxation* in *Lalor's Cyclopædia of Political Economy* goes into more detail than is compatible with the scope of this work, and includes a detailed bibliography, and E. R. A. Seligman, *Publications of the American Economic Association*, vol. vii., Nos. 2, 3, vol. ix., Nos. 1, 2, who has done excellent work, but not quite comprehensive enough for the general reader. Cossa, *Taxation, its Principles and Methods*, deals with European conditions rather than American. R. T. Ely's *Taxation in American States and Cities* contains some interesting matter, but must be used with caution. ARTHUR T. HADLEY.

**Tax'idermy** [from Gr. τάξις, arranging, arrangement (deriv. of τάσσειν, τάξαι, arrange) + δέρμα, a skin (deriv. of δέρειν, to skin)]: the art of preserving the skins of animals and replacing the flesh by some durable material, so as to represent life. In the matter of removing and replacing perishable parts it differs from embalming, which seeks to preserve the flesh itself. With the questionable exception of crustaceans, the art of the taxidermist is practically restricted to vertebrated animals, for invertebrates are usually dried or preserved in liquid, and while a large insect may be cleaned and mounted, such cleaning and mounting can hardly be called taxidermy.

Taxidermy is a comparatively modern art, for while it is said that Hanno brought back to Carthage skins, supposed to be those of gorillas, from the west coast of Africa, no attempt seems to have been made to mount them. The well-known quotation from *Romeo and Juliet*,

> And in his needy shop a tortoise hung,
> An alligator stuff'd, and other skins,
> Of ill-shaped fishes,

is one of the earliest references to stuffed animals. Still, from a work published in Paris in 1689, it is certain that as early as 1517 birds, including the cassowary, brought from Malaysia, were mounted in Amsterdam, and a stuffed rhinoceros is preserved in the Royal Museum of Vertebrates, Florence, which was prepared for the museum by Ulysses Aldrovandus in Bologna, sometime in the sixteenth century. It is very probable that taxidermy originated in the desire to preserve for exhibition the strange quadrupeds and brilliant-hued birds brought to Europe by the early navigators, and to this desire is due the genesis of the modern natural history museum. The establishment of museums naturally gave an impetus to taxidermy, but it was for a long time taxidermy of a decidedly inferior quality, and so far back as 1825 Waterton vigorously criticised the appearance of museum specimens. The demand for more art in taxidermy came mainly from private individuals desirous of preserving birds for their beauty, or mammals as trophies of the chase, and it was many years before the greater portion of museum work rose above the level of the positively bad. Perhaps the earliest institution to admit within its walls groups of animals mounted to show them with natural surroundings, or to illustrate their habits, was the University of Pisa, where, at the beginning of the nineteenth century, Prof. Paolo Savi mounted in a most artistic manner a number of groups of birds and mammals.

The British Museum was the first large institution formally to adopt groups of birds mounted with their natural surroundings as a part of its regular exhibition series, but in this it was only following in the lead of E. T. Booth, who had applied the idea to one entire museum, and had introduced into the Brighton Museum, England, a series of British birds thus mounted. At present the best work is demanded by public museums, and some noteworthy examples of taxidermy are to be found in the U. S. in the American Museum of Natural History, New York, and in the U. S. National Museum at Washington.

The general principles of taxidermy may be outlined as follows: The skin of the animal to be mounted must be carefully removed, cleaned, and poisoned, preferably with some preparation of arsenic, either in the shape of arsenical soap or in powder. In the case of most mammals the skin must be so tanned that the hair will not fall out, and that the skin may dry hard and stiff in order to retain the form given it. Wires or irons are placed in the legs to sustain the weight of the animal, and around these the original shape of the legs is carefully built up in tow, or tow and excelsior. On the care with which this is done depends much of the appearance of the finished work, and in the case of quadrupeds thinly clad with hair great pains are needed to bring out the muscles. The leg-irons are attached to a central wire, board, or body of excelsior, according to the size of the animal or method to be followed, and in birds and small mammals the neck and body are made together, and little remains to be done in the way of further filling. The easiest, but worst, method is after the skin has been drawn over the legs, and they have been attached to the body, to fill out the skin with tow or straw, working out the principal muscles from within. The best method, with quadrupeds of any size, is to build up over a wooden framework the entire shape of the body, including the neck, replacing the muscles by excelsior and tow, smearing this manikin over with clay to attain smoothness. The finer details about the eyes, lips, and nostrils are reproduced by placing a layer of clay beneath the skin, and working in the lines and other characters. Birds are preserved readily by the art of taxidermy; mammals are more difficult; the smooth, glossy skin of cetaceans defies the taxidermist, and can only be imitated by a carefully made cast, and the same is true of the large majority of reptiles and fishes, although with care many may be mounted. See Hornaday, *Taxidermy and Zoölogical Collecting* (New York, 1891), and Davie, *Methods in the Art of Taxidermy* (Columbus, 1894). F. A. LUCAS.

**Tax Laws**: See the Appendix.

**Taxonomy** [from Gr. τάξις, arrangement + νόμος, law]: that department of biological science which deals with the arrangement and classification of animals and plants.

**Tax Sales**: public official sales of land made in pursuance of law for the non-payment of taxes which have been laid upon them. Power to make such sales is entirely statutory, and is not derived from any rule of the common law, the right of a government to grant such power being a necessary attribute of its sovereignty. The power when granted is a naked power, and not one coupled with an interest, and the statutes giving it must be strictly construed.

In the U. S. tax sales are very common, and the laws governing them and the construction of those laws form a very important part of the jurisprudence of the various States. The statutes of the several States vary widely in their specific provisions as to the assessment of taxes, the manner of making tax sales and their effect, and the right of redemption accorded to interested parties. Certain general principles, however, have been established which apply to all, or nearly all, the statutes, and regulate the proceedings under them.

*Requisites to a Valid Sale.*—The land must be regularly listed and assessed, it must not be exempt, and the tax must remain undischarged at the time of the sale. Payment, or even tender by the owner, or by any other person whose interests would be prejudiced by the sale, destroys the right to sell. Such a sale is in a great measure an *ex parte* proceeding, and in order to render it valid every statutory requirement which regulates the prior proceedings, down to and including the sale, must be strictly complied with. This principle applies to all preliminary steps—the assessment and laying the tax, preparation of the assessment roll and its delivery to the proper officer for collection, etc.—as well as to the subsequent steps relating to default in payment of the tax and the proceedings thereupon preparatory to making the sale. This doctrine is fundamental in all the States, but in the methods and means by which this regularity shall be judicially determined there is considerable variation.

Due notice, usually by advertisement in a newspaper for a specified time, must be given of the property to be sold, and of the time and place of the sale, which must be held as advertised, must be public, and must be conducted by the officer authorized by statute in strict conformity with the provisions of the statutes.

The *amount of land* to be sold is variously regulated; in some States it is optional with the officer to sell the whole or a part, while in others the amount is limited to such as it is necessary to sell to realize enough to satisfy the taxes and charges, any violation of the provisions in this respect rendering the sale void. Each parcel of land which is separately assessed must be sold by itself, usually for cash to the person bidding the highest sum, which sum must not be less than the total amount of taxes and charges. After the sale, in most States, the officer is required to issue to the purchaser a certificate of sale which, upon the termination of the time limited by statute for redemption, entitles the purchaser to a deed of the land, executed by the proper officer on behalf of the State, and conveys or purports to convey the title to him; and the officer must make a return specifying the fact of notice, the time of sale, the property sold, the name of the purchaser, etc., and the making of this return is usually mandatory.

The *right of redemption* is usually allowed to the owner and parties interested during the period fixed by statute, during which time the possession of the owner is not disturbed. In most of the States it is provided that notice to redeem must be given to the owner, and that his right of redemption shall continue thereafter during the time required to elapse before the purchaser is entitled to a deed. The provisions as to who shall have the right to redeem are construed liberally, and usually any one possessing an interest in the land may exercise the right, but not a mere stranger. Payment or tender of the full amount required by statute by the owner, or other person entitled to redeem, constitutes an exercise of this right, and vests the title absolutely again in the owner or the redeemer, cutting off the right of the purchaser. The statutes regulating the right of redemption are liberally construed in favor of those having the right to redeem, but their provisions must be observed; and without statutory authority the courts can not entertain an action to redeem the land.

The *deed to the purchaser* upon the tax sale (to which he is entitled upon the expiration of the time of redemption, the land remaining unredeemed) must be substantially in the form required by statute; must recite enough of the previous proceedings to show at least authority to sell and to make the deed; must describe the property with sufficient certainty (if possible, following the description in the assessment roll); and its execution and delivery must be in accordance with such statutory provisions. There are some States in which every tax sale is required by statute to be founded upon an order of the court. At the common law a tax deed is not even *prima facie* evidence of the facts necessary to create valid title under the deed, but the burden of proof is upon the purchaser to show by independent proof compliance with all statutory requirements.

This rule has been variously modified by statute; in some States only to the extent of making the tax deed *prima facie* evidence that the proceedings on the sale itself were duly performed, still leaving the purchaser to prove compliance with the law as to all requisites thereto; in other States (the great majority) to the extent of making the deed *prima facie* of the regularity of all previous proceedings upon which the validity of the tax deed depends, making the production of the tax deed shift the burden of proof from the purchaser to the owner or redemptioner; in a few States, to the extent of making the deed conclusive evidence of the regularity of the sale and of certain proceedings prior thereto, such as the assessment of the tax, proper advertisement of the sale, etc., but not depriving the owner or redemptioner of the right to avoid the tax sale by proof of failure to comply with any vitally essential prerequisite. Adverse possession during the prescribed period, and under a claim of title by a tax deed valid on its face, is sufficient to vest the title by prescription where the title under the tax deed would be defective. This would not be so in a case of a claim of title under a certificate of sale. As to the case of possession under a claim of title by a tax deed void on its face the authorities are divided. In the case of a void or voidable tax title the purchaser at common law had no remedy; but relief is generally granted by statute, usually by providing that the purchaser may recover the purchase money, and subsequent taxes paid, with interest.

After execution and delivery of the tax deed the parties are remitted to the ordinary remedies open to them in cases of contested titles. Unless a purchaser under a tax sale can enter peaceably, he must bring an action in the nature of an ejectment in order to obtain possession. Generally the former owner may institute an action to set aside the sale and conveyance thereunder, for any material irregularity, illegality, or fraud; but the time limited for the beginning of such action is generally made much shorter than that prescribed by common law for contesting the title of land. This time begins to run in some States from the date of sale; in others, from the execution and delivery of the deed; and in still others, from the time when the purchaser takes possession. The nature of the estate acquired by the tax deed varies in the different States, in some being only the interest of the person to whom the land was assessed, or that of the real owner; in others, a new and original fee, unincumbered by previous liens, created in the purchaser, and going back no further than the tax sale. F. STURGES ALLEN.

**Tax Title**: See the Appendix.

**Tay**: a river of Scotland, flowing from Loch Tay, at an elevation of 355 feet above the level of the sea, to the German Ocean, which it enters through a large estuary, the Firth of Tay, from 1 to 3 miles broad. It is the largest river of Scotland, draining nearly the whole of Perthshire, and carrying to the German Ocean a greater mass of water than any other of the rivers of Great Britain. The Dochart, the principal feeder of Loch Tay, rises in Ben Lui, on the borders of Argyleshire and, flowing in a northeastern direction, is joined by the Lochy just before the united streams enter the lake. Loch Tay itself is a long and narrow sheet of water picturesquely situated in a basin scooped out of the bosom of the mountains, 355 feet above the level of the sea. After leaving it the Tay receives from the N. and the E. the Lyon, the Tummel, the Garry, and the Isla, and from the W. the Almond and the Earn. Its entire basin comprises an area of about 2,500 sq. miles. Its entire course is about 120 miles, and it is navigable for vessels of 500 tons burden up to Newburgh, 15 miles from its mouth. The tide flows up the river to about a mile above Perth, to which place it is navigable by vessels of 100 tons. The salmon-fisheries of the Tay and its tributaries are of considerable value. The Stormouthfield pounds for the propagation of salmon are 5 miles above Perth. On Dec. 28, 1879, the railway bridge across the Tay was blown down in a hurricane, but a new bridge, some distance to the W., was opened on June 20, 1887. See BRIDGES (*Failure of Bridges*).

Revised by M. W. HARRINGTON.

**Tayabas**, tāā-yaa'bāās: town of the Philippines, the capital of the district of Tayabas; on the southern shore of the island of Luzon, 60 miles S. E. of Manila (see map of East Indies, ref. 3–G); in an unhealthful region. It is a clean, well-built, and handsome town, carrying on a considerable trade. Pop. 20,000, most of whom are Chinese mestizoes.

**Taygetus**, tā-ij'i-tŭs: the loftiest mountain range of Peloponnesus, Greece, extending in an almost unbroken line for about 70 miles, from Leondari in Arcadia to Cape Matapan. Its height, ascertained by the French commission to be 7,902 feet, its unbroken length and majestic form, have been celebrated by both ancient and modern writers. It rises to its greatest height immediately above Sparta. Its principal summit was in ancient times called *Taletum*, now St. Elias. On the sides of Taygetus are forests of pine, which abounded formerly with wild animals. The districts around Taletum formed a celebrated hunting-ground. The southern part of Mt. Taygetus is rich in marble and iron. Near Croceæ there were quarries of green porphyry, which was extensively employed by the Romans. There was also another kind of marble, obtained from quarries more to the S., called by the Romans Tamorian marble.

**Tayler**, JOHN JAMES, D. D.: preacher, educator, and author; b. in Nottingham, England, in 1798; son of a Unitarian minister; educated at the dissenting college in York; graduated at the University of Glasgow 1818; studied theology; became minister of a Unitarian congregation in Manchester 1820; was secretary to the college in York from 1822 to 1840, when it was removed to Manchester; became at that time Professor of Ecclesiastical History, and subsequently of Doctrinal Theology; removed to London in 1853, along with the college, of which, under the name of Manchester New College, he became principal; was for some years pastor, together with Rev. James Martineau, of the Unitarian congregation in Little Portland Street. He was the author of *A Retrospect of the Religious Life of England* (1845); *Christian Aspects of Faith and Duty* (1851); *An Attempt to ascertain the Character of the Fourth Gospel* (1867); *A Catholic Christian Church the Want of our Time* (1867); *Christianity, What is it? and What has it done?* (1868); and other works on religious subjects, some of them posthumously published. D. at Hampstead, London, May 28, 1869. His *Life and Letters* (1872) were published by Rev. John Hamilton Thom. Revised by J. W. CHADWICK.

**Taylor**: town (founded in 1875); Williamson co., Tex.; on the International and Gt. N. and the Mo., Kan. and Tex. railways; 37 miles N. E. of Austin (for location, see map of Texas, ref. 6–E). It is in an agricultural, stock-raising, and fruit and vegetable growing region, and contains 12 churches, public-school buildings valued at $38,000, electric-light and street-railway plants, railway-shops, cotton-compress, 2 cottonseed-oil mills, 2 national banks with combined capital of $250,000, and 3 weekly newspapers. Pop. (1890) 2,584; (1900) 4,211. EDITOR OF "JOURNAL."

**Taylor**, ALFRED SWAINE, M. D., F. R. S.: physician and chemist; b. at Northfleet, Kent, England, in Dec., 1806; studied surgery; became Professor of Chemistry at Guy's Hospital, and first Professor of Medical Jurisprudence in the same institution. Author of *A Manual of Medical Jurisprudence* (1843); *Photogenic Drawing* (1840); *On Poisons in Relation to Medical Jurisprudence and Medicine* (1848); *On Poisoning by Strychnia* (1856); and (his most important work) *The Principles and Practice of Medical Jurisprudence* (1st ed. 1865); author with Dr. W. T. Brande of a standard *Manual of Chemistry*, and editor for many years of *The Medical Gazette*. D. May 27, 1880.

Revised by F. STURGES ALLEN.

**Taylor**, ANN and JANE: See TAYLOR, ISAAC.

**Taylor**, BAYARD: traveler and author; b. at Kennett Square, Pa., Jan. 11, 1825; in 1842 became apprentice to a printer; published his first volume, *Ximena and other Poems*, in 1844; in 1844–45 made a pedestrian tour in Europe, and after his return published *Views Afoot, or Europe seen with Knapsack and Staff* (1846); in 1847 became one of the editorial staff of *The New York Tribune*, with which he was connected while he lived, publishing in that journal originally the substance of most of his works of travel. In 1849 he visited California; in 1851 visited Egypt, Asia Minor, Syria, and Europe; in 1852–53 crossed India from Bombay to Calcutta, going thence to Hongkong and joining Perry's expedition to Japan, and made several other journeys. In 1862–63 he was secretary of legation, and for a while *chargé d'affaires* at St. Petersburg; in 1874 went to Egypt, and thence to the millennial celebration in Iceland. He resided at intervals several years in Germany, where he married, and from 1872 he was engaged upon a biography of Goethe and Schiller, which he left unfinished. Several of his works have been translated into German, French, and Russian. His books of travel are *El Dorado, or Adventures in the Path of Empire* (1850); *Journey to Central Africa* (1854); *The Lands of the Saracen* (1854); *Visit to India, China, and Japan* (1855); *Northern Travel—Summer and Winter Pictures of Sweden, Denmark, and Lapland* (1857); *Travels in Greece and Russia* (1859); *At Home and Abroad, a Sketch-book of Life, Scenery, and Men* (1859; 2d series, 1862); *Colorado, a Summer Trip* (1867); *Byways of Europe* (1869); and *Egypt and Iceland* (1874). He wrote four novels—*Hannah Thurston* (1863); *John Godfrey's Fortunes* (1864); *The Story of Kennett* (1866); and *Joseph and his Friend* (1870). He published the following volumes of poems: *Rhymes of Travel, Ballads, and other poems* (1848); *The American Legend*, delivered before the Phi Beta Kappa Society of Harvard University (1850); *Book of Romances, Lyrics, and Songs* (1851); *Poems and Ballads* (1854); *Poems of the Orient* (1855); *Poems of Home and Travel*, selected from his earlier productions (1855); *The Poet's Journal* (1862); *The Picture of St. John* (1866); *The Ballad of Abraham Lincoln* (1869); *The Masque of the Gods* (1872); *Lars, a Pastoral of Norway* (1873); *The Prophet, a Tragedy* (1874); *Home Pastorals and Lyrics* (1875); and a *Centennial Ode* (1876). He edited a *Hand-book of Literature and the Fine Arts*, in conjunction with George Ripley (1852); *Cyclopædia of Modern Travel* (1856); *Frithiof's Saga*, translated from the Swedish of Tegnér by W. L. Blackley (1867); Auerbach's *Villa on the Rhine* (1869); and the *Illustrated Library of Travel, Exploration, and Adventure* (1872, *seq.*); and translated into the original meters both parts of Goethe's *Faust* (1870–71), which is probably his most important literary work. Besides the foregoing he wrote largely in prose and verse for many periodicals; contributed notes on Loo-Choo and Japan to the *Narrative of Perry's Expedition*, and an introduction to R. H. Stoddard's *Life, Travels, and Books of Alexander von Humboldt*, and lectured extensively in nearly every part of the U. S. In 1876 he published *The Echo Club and other Literary Diversions*, and delivered the poem at the Centennial celebration of the anniversary of the Declaration of Independence, in Philadelphia, July 4. He was appointed U. S. minister to Germany in 1877; died in Berlin, Dec. 19, 1878. See his *Life and Letters* (2 vols., Boston, 1884). Revised by H. A. BEERS.

**Taylor**, BENJAMIN FRANKLIN: poet and journalist; b. at Lowville, N. Y., July 19, 1819; was educated at what is now Colgate University, Hamilton, N. Y., where his father, Stephen W. Taylor, was professor; became in 1840 literary editor of the Chicago *Evening Journal*, and during the civil war was its military correspondent with the armies in the West; afterward traveled and lectured. He published *January and June* (1853); *Pictures in Camp and Field* (1867); *The World on Wheels* (1873); *Old-time Pictures and Sheaves of Rhyme* (1874); *Songs of Yesterday* (1875); *The River of Time*; *Complete Poems* (1887); and other works. D. at Cleveland, O., Feb. 24, 1887. Revised by H. A. BEERS.

**Taylor**, BROOK: mathematician; b. at Edmonton, near London, Aug. 18, 1685; entered St. John's College, Cambridge, in 1701; distinguished himself in music, painting, and mathematics; in 1708 wrote a treatise on *The Center of Oscillation*, which was published in the *Philosophical transactions* for 1713; in 1712 was chosen a fellow of the Royal Society, of which he became secretary two years later; and in 1715 he had a controversial correspondence with Count Raymond de Montmort upon the philosophical theories of Malebranche. He published *Methodus Incrementorum*, etc. (1715), which contains the foundation of the calculus of finite differences and the first announcement of the famous "Taylor's theorem," the latter almost unnoticed by mathematicians until 1772, when Lagrange adopted it as the basis of the differential calculus. Among his other works were *New Principles of Linear Perspective* (1719), and *Contemplatio Philosophica*, with a memoir (1793). D. Dec. 29, 1731.

**Taylor**, Charles Fayette: See the Appendix.

**Taylor**, George: patriot; b. in Ireland in 1716; is said to have been the son of a clergyman and to have received a liberal education; emigrated to North America as a "redemptioner" in 1736; was bound to an iron manufacturer, by whom he was made a clerk, at Durham, Pa.; several years later married the widow of his employer and became proprietor of the works; established a large iron-mill on the Lehigh river, and acquired a considerable fortune. In 1764 he was elected to the colonial assembly, in 1770 became a judge of the county court, and in 1775 was elected to the provincial assembly, and was earnest in the advocacy of revolutionary measures. He was elected to fill a vacancy in the Continental Congress July 20, 1776, and so was not a member when the Declaration of Independence was passed, but was one of those who signed the document. He retired from Congress in Mar., 1777, and returned to his home in Pennsylvania. D. at Easton, Pa., Feb. 23, 1781.

**Taylor**, Sir Henry: dramatist; b. at Bishop Middleham, Durham, England, Oct. 18, 1800; entered in 1824 the Colonial Office in London, in which he continued until 1872, and was for many years one of the five senior clerks. He contributed to various periodicals, and published *Isaac Comnenus*, a drama (1827); *Philip van Artevelde*, a tragedy (1834); *The Statesman*, a series of essays (1836); *Edwin the Fair*, an historical drama (1842); *The Eve of Conquest, and other Poems* (1847); *Notes from Life*, a series of essays (1847); *Notes from Books*, containing essays on the poems of Wordsworth and Sir Aubrey de Vere (1849); *The Virgin Widow*, a comedy (1850); *St. Clement's Eve*, a play (1862); and *A Sicilian Summer, and other Poems* (1868). An edition of his plays and poems appeared in 3 vols. in 1863; another in 5 vols. in 1878; his *Autobiography* appeared in 1885 (2 vols.) and his *Correspondence* in 1888. His *Philip van Artevelde* is the best English historical tragedy since Otway's *Venice Preserved*. D. at Bournemouth, Mar. 28, 1886.

**Taylor**, Henry Clay: See the Appendix.

**Taylor**, Isaac (known as Taylor of Ongar): author; b. in London in 1759; was a successful engraver in London; removed to Lavenham, Suffolk, in 1786; was minister of an Independent congregation at Colchester 1796–1810, and of one at Ongar, Essex, from 1811 until his death. Besides sermons, he published, mainly for the young, a number of volumes including *Advice to the Teens*; *Beginnings of British Biography*; *Beginnings of European Biography*; *Biography of a Brown Loaf*; *Book of Martyrs for the Young*; *Bunyan explained to a Child*; *Character Essential to Success in Life*; *Child's Life of Christ*; *Mirabilia, or the Wonders of Nature and Art*; *Scenes in America, in Asia, in England, in Europe, in Foreign Lands*; *Scenes of Commerce*; *Scenes of British Wealth*; *Self-cultivation Recommended*, all separate works; and *Twelve Addresses to Youth, with Hymns*. Nearly all of his works have been frequently republished. He was the father of Ann Taylor (Mrs. Gilbert, of Nottingham, b. 1782, d. 1866; *Autobiography*, 1871), who with her sister, Jane (1783–1824; *Memoirs*, 1825), wrote *Hymns for Infant Minds* and *Original Poems*; of Jeffreys Taylor (1792–1853), author of a number of works, chiefly for the young; and of Isaac Taylor, LL. D. (*q. v.*). D. at Ongar, Dec. 11, 1829.—His elder brother, Charles Taylor (1756–1821), was the editor of *Calmet's Dictionary of the Holy Bible*. Revised by S. M. Jackson.

**Taylor**, Isaac, LL. D.: author; son of Isaac Taylor of Ongar; b. at Lavenham, Suffolk, England, Aug. 17, 1787; was educated as an artist, but began to study theology with the intention of becoming an Independent minister; became a member of the Established Church, turned his attention to the bar, and finally devoted himself to the study of mechanical inventions and to literary labor. Besides contributions to *The Eclectic Review* he published many books, including *Elements of Thought* (London, 1823); *History of the Transmission of Ancient Books to Modern Times* (1827); *The Process of Historical Proof Exemplified and Explained* (1828); *Natural History of Enthusiasm*, one of his best works (1829); *New Model of Christian Missions* (1829); *Saturday Evening* (1832); *Fanaticism*, a continuation of the *Natural History of Enthusiasm* (1834); *Spiritual Despotism* (1835); *Physical Theory of Another Life* (1836), which was the first work published under his own name and which greatly enhanced his reputation; *Ancient Christianity and the Doctrines of the Oxford Tracts for the Times* (1839; with supplement and indexes, 1844); *Loyola, and Jesuitism in its Rudiments* (1849); *Wesley and Methodism* (1851); *The Restoration of Belief* (1855); *The World of Mind* (1857); *Logic in Theology* (1859); *The Liturgy and the Dissenters* (1860); *The Spirit of Hebrew Poetry* (1861); and *Considerations on the Pentateuch*, a reply to the work of Bishop Colenso (1863). In 1836 he was a candidate for the chair of Logic and Metaphysics in the University of Edinburgh, but was unsuccessful. In 1862 a pension of £100 was bestowed upon him from the civil-service fund "in public acknowledgment of his eminent services to literature, especially in the departments of history and philosophy, during more than forty years." D. at Ongar, June 28, 1865. His LL. D. came from the University of the City of New York in 1862.—His son, Isaac Taylor, a clergyman of the Church of England, b. at Stanford Rivers, May 2, 1829, graduated B. A. at Cambridge 1853; became curate 1857; vicar of St. Matthias, Bethnal Green, London, 1865, of Holy Trinity, Twickenham, 1869; rector of Settrington, diocese of York, 1875; has been also a canon of York since 1885. He is honorary LL. D., Edinburgh, 1879, Litt. D., Cambridge, 1885, and is author of *Words and Places*, an explanation of the local names in Great Britain (London, 1865); *The Family Pen, Memorials, Biographical and Literary, of the Taylor Family of Ongar* (1867); *The Alphabet: an Account of the Origin and Development of Letters* (1883); *The Manx Runes* (1886); *The Origin of the Aryans* (1890); and other works. Revised by S. M. Jackson.

**Taylor**, Isidore Séverin Justin, Baron: traveler and author; b. in Brussels, Aug. 15, 1789; studied art at Paris; served for several years in the army; traveled extensively; was appointed in 1824 royal commissary of the Comédie Française, which he opened to the dramas of Victor Hugo and other romanticists; induced by his petitions the Legislative Assembly (1818–30) to vote the restoration of the mediæval monuments in France; was sent to Egypt to negotiate the transfer to France of the obelisk of Luxor, and was made a senator in 1869. He wrote *Voyages pittoresques et romantiques dans l'Ancienne France* (1820–54); *Voyages pittoresques en Espagne*, etc. (1826, *seq.*); *La Syrie, l'Égypte*, etc. (1837); *Voyages en Suisse, Italie, Angleterre*, etc. (1843). D. in Paris, Sept. 6, 1879. Revised by A. G. Canfield.

**Taylor**, James Hudson: clergyman, missionary; founder of the China Inland Mission; b. at Barnsley, Yorkshire, England, May 31, 1832; studied and practiced medicine and surgery in Hull; sent out by the Chinese Evangelization Society as its first representative 1853 and began duty in Shanghai; moved to Ningpo, and severed his relations with the society 1857; labored independently until 1860, when he returned to England in broken health; organized the China Inland Mission 1865, and returned to China himself 1866; has since been back and forth several times. He is the director of the China Inland Mission, which has had a remarkable career. Its missionaries come from different denominations and have no guaranteed salary, a number being of independent means. They adopt native dress and mode of life as far as practicable. The mission makes "no personal solicitation or collection of funds" and does not publish the names of its donors. See Miss M. Geraldine Guinness, *The Story of the China Inland Mission* (2 vols., 2d ed. London, 1893). Samuel Macauley Jackson.

**Taylor**, James Monroe, D. D., LL. D.: educator; b. in Brooklyn, N. Y., Aug. 5, 1848; educated at the University of Rochester and Rochester Theological Seminary; pastor in South Norwalk, Conn., 1873–82, Providence, R. I., 1882–86; elected president of Vassar College, Poughkeepsie, N. Y., 1886; author of a number of magazine articles and addresses, including *The Place of Preaching in the Plan of God* (1880); *The Catechumenate* (1875); *The Future of the Woman's College* (1890); *Neglect of the Student in Recent Educational Theory* (1893); and *Psychology* (1892).

**Taylor**, James Morford: See the Appendix.

**Taylor**, Jeremy, D. D.: theologian; b. in Aug., 1613, at Cambridge, England, where his father was a barber; in 1626 entered Caius College as a sizar; took his degree; gained the friendship of Bishop Laud, and in 1636 obtained a fellowship at Oxford, and in 1638 was presented to the rectory of Uppingham. In the civil wars he adhered to the cause of Charles I., who made him his chaplain, and in 1642 commanded that the degree of D. D. should be conferred upon him on account of his treatise, *Episcopacy asserted* *against the Acephali and Ærians New and Old*; but in that year his rectory was sequestered by Parliament and he was forced to take refuge in Wales, where he supported himself by teaching a school and wrote his noblest works; preached occasionally in London; was several times imprisoned for giving utterance to royalist sentiments; and in 1658 took up his residence in Ireland upon the invitation of the Earl of Conway. In 1660 he was one of the signers of the royalist declaration of Apr. 24 which paved the way for the restoration of Charles II. He had married for his second wife Joanna Bridges (who was said to be a natural daughter of Charles I.), and soon after the Restoration he was made Bishop of Down and Connor, to which the see of Dromore was added, and was also made vice-chancellor of the University of Dublin and a member of the Irish privy council. He labored earnestly, but with indifferent success, for the firm establishment of the English Church in Ireland. As a preacher and writer, he occupies a foremost rank in literature. Besides his *Sermons* his principal works are *Discourse on the Liberty of Prophesying*, setting forth the iniquity of persecution for differences in opinions, by some held to be the ablest of all his works (1647); *The Great Exemplar of Sanctity and Holy Life*, a life of Christ (1649); *The Rule and Exercise of Holy Living* (1650); *The Rule and Exercise of Holy Dying* (1651); *Ductor Dubitantium*, a work on casuistry. Many of his separate works have been frequently republished. His *Whole Works*, with a *Life* of the author and a critical examination of his writings by Bishop Heber, in 15 vols., appeared in 1820–22 (10 vols., rev. ed. 1807–54); his *Life* was also written by R. A. Willmott (1847). D. at Lisburn, Ireland, Aug. 13, 1667. See ENGLISH LITERATURE. Revised by S. M. JACKSON.

**Taylor**, JOHN: poet; b. in Gloucestershire, England, in Aug., 1580; was educated at a free school in Gloucester; went to London, where he was apprenticed to a waterman, and followed this occupation during the greater part of his life, whence he is styled "the water-poet." His productions in prose and verse, of which about 140 are known to collectors, have no literary value, but some interest in showing the manners and customs of the times. The following will serve to illustrate Taylor's eccentric titles: *Taylor's Revenge, or the Rimer, William Fennor, firkt, ferrited, and finely fetcht over the Coals* (1615); *The pennyles Pilgrimage, or the moneylesse Perambulation of John Taylor, alias the King's Majestie's Water-Poet, from London to Edenborough on Foot* (1618). In 1630 Taylor made a collection, in a single volume, of the sixty-three pieces which he had at that time put forth in brochures and broadsheets, which was in 1869 republished in facsimile by the Spencer Society. D. in London in 1654. Revised by H. A. BEERS.

**Taylor**, JOHN, LL. D.: Greek scholar; b. at Shrewsbury, 1703; was educated at Cambridge University; librarian to the university in 1732, advocate in Doctors' Commons in 1741, and chancellor of Lincoln in 1744. He subsequently entered holy orders; became rector of Lawford in 1751, archdeacon of Buckingham in 1753, and canon residentiary of St. Paul's in 1757. He published several orations and essays, but his principal works are an edition of the Greek text, with a Latin translation and notes, of *The Orations and Fragments of Lysias* (1739), his masterpiece, and some of the *Orations of Demosthenes, Æschines, Dinarchus, and Demades*. D. in 1766. See F. A. Wolf, *Analecta*, i., 550 ff. Revised by A. GUDEMAN.

**Taylor**, JOHN LOUIS: jurist; b. in London, Mar. 1, 1769; was taken to the U. S. by a brother in 1781; studied law, and settled at Fayetteville, N. C., from where he removed to Newbern, and later to Raleigh; was several times elected to the Legislature; became one of the judges of the superior court of the State in 1798, and was chief justice of the Supreme Court from 1810 until his death. He had much constructive ability, and in 1817 was made commissioner to revise the statutes of the State. A volume of his decisions, containing cases decided from 1799 to 1802, was published in 1802, and another volume, of cases from 1816 to 1818, appeared in 1818. He also published a *Charge to the Grand Jury of Edgecombe Superior Court, exhibiting a View of the Criminal Law of North Carolina* (1817). D. at Raleigh, Jan. 29, 1829. Revised by F. STURGES ALLEN.

**Taylor**, NATHANIEL WILLIAM, D. D.: theologian; b. at New Milford, Conn., June 23, 1786; graduated at Yale College in 1807; studied theology, and in 1812 became pastor of the First (Center) Congregational church in New Haven, where he rose to eminence as a preacher. In 1822 he was chosen Dwight Professor of Didactic Theology in Yale College, and occupied the chair until his death. In 1828 he delivered the *concio ad clerum* discourse at New Haven, which was the beginning of a theological controversy which spread through New England and beyond its limits. Dr. Taylor defended his modifications of Calvinism in the *Christian Spectator*. They were vehemently opposed by other divines in various discourses and periodicals. By his writings and through his pupils he produced a profound impression on theology in the Congregational and Presbyterian communions. After his death four volumes of his works, edited by Rev. Noah Porter, D. D., were published: *Practical Sermons*, preached while pastor of the Center church (1858); *Lectures on the Moral Government of God* (2 vols., 1859); and *Essays, Lectures, etc., upon Select Topics in Revealed Theology* (1859). D. in New Haven, Mar. 10, 1858. Revised by G. P. FISHER.

**Taylor**, PHILIP MEADOWS: soldier and author; b. in Liverpool, Sept. 25, 1808; went to Calcutta, where he held a mercantile post; in 1826 entered the army of the Nizam of Haiderabad, for whom he administered several large territories; about 1858 became administrator for the British Government of some districts in the Deccan; rose to the rank of colonel and was decorated with the order of the Star of India; was a learned archæologist; married a princess of Southern India. He was the author of *Confessions of a Thug* (3 vols., 1839; new ed. 1858); *Tippoo Sultaun, a Tale of the Mysore War* (3 vols., 1840); *Notices of Cromlechs, Cairns, and other Ancient Scytho-Druidical Remains in the Principality of Sorapur* (London, 1853); *Tara, a Mahratta Tale* (3 vols., 1863); *Ralph Darnell, a Tale* (3 vols., 1865); *The Student's Manual of the History of India, from the Earliest Period to the Present* (1870), and other works. D. in Menton, France, May 13, 1876. See his *Story of my Life* (1877; new ed. 1881).

**Taylor**, RICHARD: soldier; son of Zachary Taylor; b. in New Orleans, La., Jan. 27, 1826; graduated at Yale 1845; was a resident of Louisiana at the breaking out of the civil war, when he entered the Confederate army, and was made colonel of a Louisiana regiment, which fought under his command at the battle of Bull Run; was made brigadier-general in Oct., 1861; served under Stonewall Jackson in Virginia; became major-general; in 1863–64 commanded in the department W. of the Mississippi, especially against Gen. Banks in his unsuccessful Red river campaign; in Sept., 1864, was placed in command of the department of East Louisiana, with headquarters in Mobile; on May 8, 1865, surrendered to Gen. Canby, his force being the last which remained to the Confederacy. After the war he resided on his plantation in Louisiana. He published *Destruction and Reconstruction* (1879). D. in New York, Apr. 12, 1879.

**Taylor**, SAMUEL COLERIDGE: See the Appendix.

**Taylor**, THOMAS: author; styled the Platonist; b. in London, May 15, 1758; studied in St. Paul's School with the design of becoming a dissenting minister, but afterward entered a banking-house; devoted his spare moments to the study of Greek, mathematics, and chemistry; taught the languages and mathematics. His works comprise sixty-three volumes, of which twenty-three are large quartos: among them are treatises on arithmetic and geometry, on the Eleusinian and Bacchic mysteries; an edition, with large additions, of the *Greek Lexicon* of Hedericus; an essay on the *Rights of Brutes*, in ridicule of Paine's *Rights of Man*; a *History of the Restoration of the Platonic Theology*; and a volume of *Miscellanies in Prose and Verse*. His main labor was the translating of little-known Greek and Latin works. Besides the *Plato* and *Aristotle*, his translations include the remains of Apuleius, Celsus, Demophilus, Hierocles, Iamblichus, Julian, Maximus Tyrius, Ocellus Lucanus, Olympiodorus, Pausanius, Plotinus, Porphyry, Proclus, the *Orphic Hymns*, and the *Chaldæan Oracles*. His translation of Plato (1804) was printed at the cost of the Duke of Norfolk, who locked up nearly all copies in his house, where they remained until 1848. Of his translations of Aristotle (1806–12) only fifty complete copies were struck off, the expense being defrayed by W. Meredith, a retired tradesman, who gave Taylor an annuity of £100. D. in London, Nov. 1, 1835.

**Taylor**, Sir THOMAS WARDLAW: See the Appendix.

**Taylor**, TOM: dramatist; b. at Sunderland, Durham, in 1817; was educated at Glasgow University and Trinity College, Cambridge; appointed to the chair of English Literature in University College, London, which he held for two years; wrote for periodicals, especially for *Punch*, which he edited in 1874–80; studied law; was called to the bar in 1845; was made secretary to the board of health in 1854, and in 1858 secretary to the Local Government Act Office. He was art critic to the London *Times* and *Graphic*. He produced, either singly or in conjunction with others, more than 100 dramatic pieces, many of which have had a marked success; among them are *Still Waters Run Deep*; *The Unequal Match*; *The Overland Route*; *The Contested Election*; *Our American Cousin*; *The Ticket-of-Leave Man*; and *'Twixt Axe and Crown*. He also published *Life of B. R. Haydon* (1853); *Autobiographical Recollections of C. R. Leslie* (1860); translated from the French of Villemarque the *Ballads and Songs of Brittany* (1865); published *Life and Times of Sir Joshua Reynolds* (1865); and in conjunction with C. W. Franks prepared a *Catalogue of the Works of Sir Joshua Reynolds* (1869). D. at Wandsworth, July 12, 1880. Revised by H. A. BEERS.

**Taylor**, WILLIAM: author; b. in Norwich, England, in 1765. He was the first Englishman to introduce to English readers a knowledge of the literature of Germany, and is best known by his vigorous translation of Bürger's *Lenore*. He published a translation of Lessing's *Nathan the Wise* (1805); *English Synonyms Discriminated* (1813); and *Historic Survey of German Poetry*, with many translations (3 vols., 1828–30). His *Life and Writings*, containing correspondence with Robert Southey and original letters from Sir Walter Scott, was published by J. W. Robberds (2 vols., 8vo, 1843). D. at Norwich in Mar., 1836.

Revised by H. A. BEERS.

**Taylor**, WILLIAM, D. D.: bishop and author; b. in Rockbridge co., Va., May 2, 1821; educated at Lexington, Va.; entered the ministry of the Methodist Episcopal Church 1842; missionary to California in 1849; labored as an evangelist in all the English-speaking countries in the world; elected missionary bishop for Africa May, 1884; author of a number of works, including *Seven Years' Street Preaching in San Francisco*; *Address to Young America and a Word to the Old Folks*; *Pauline Methods of Missionary Work*; *Reconciliation, or How to be Saved*; *Infancy and Manhood of the Christian Life*; *Four Years' Campaign in India*; *Our South American Cousins*; *Ten Years' Self-supporting Missions in India*; *Letters to a Quaker Friend on Baptism*; and *The Election of Grace*. A. OSBORN.

**Taylor**, WILLIAM MACKERGO, D. D., LL. D.: clergyman and author; b. at Kilmarnock, Ayrshire, Scotland, Oct. 23, 1829: educated at Kilmarnock Academy; graduated M. A. at University of Glasgow 1849; studied theology at Divinity Hall of the United Presbyterian Church in Edinburgh; was licensed to preach by the presbytery of Kilmarnock Dec. 14, 1852; ordained pastor of the United Presbyterian congregation at Kilmaurs June 28, 1853; settled over the United Presbyterian church, Liverpool, England, Oct. 23, 1855; in 1871 was delegate from the United Presbyterian Church in Scotland to the General Assembly of the Presbyterian Church at Chicago; was called to the pastorate of the Broadway Tabernacle (Congregational) church in New York Nov. 22, 1871, and entered upon his labors there Mar. 10, 1872; retired in consequence of paralysis 1893. D. in New York, Feb. 8, 1895. In addition to many articles in *The Scottish Review* and many separate sermons, he published *Life Truths* (1862); *The Miracles Helps to Faith, not Hindrances* (1865); *The Lost Found, and the Wanderer Welcomed* (1870); *Memoirs and Remains of Rev. M. Dickie, Bristol* (1872); *David, King of Israel* (1874); *Elijah the Prophet* (1875); *The Ministry of the Word* (1876); *Peter the Apostle* (1877); *Limitations of Life, and other Sermons* (1879); *The Gospel Miracles* (1880); *Paul the Missionary* (1881); *Contrary Winds, and other Sermons* (1883); *John Knox* (1885); *Joseph, the Prime Minister*; *The Parables of Our Saviour* (1886); *The Miracles of Our Lord* (1890); and *The Scottish Pulpit from the Reformation* (1887).

Revised by G. P. FISHER.

**Taylor**, ZACHARY: twelfth President of the U. S.; b. in Orange co., Va., Sept. 24, 1784. His father, Richard Taylor (1744–1822), was colonel of a Virginia regiment in the war of the Revolution; removed to Kentucky in 1785: became a member of the convention which framed the constitution of Kentucky; served in both branches of the Legislature and was collector of the port at Louisville under Washington. Zachary remained on his father's plantation until 1808, in which year (May 3) he was appointed first lieutenant in the Seventh Infantry. Promoted to be captain in Nov., 1810, in the summer of 1812 he was in command of Fort Harrison, near the present site of Terre Haute, his successful defense of which (Sept. 4–5), with but a handful of men against a large force of Indians, was one of the first marked military achievements of the war of 1812; was breveted major, and in 1814 promoted to the full rank. In the peace organization of the army in 1815 he was retained as captain, but soon after resigned and settled near Louisville. In May, 1816, he re-entered the army as major of the Third Infantry, became lieutenant-colonel Eighth Infantry in 1819, and in 1832 attained the colonelcy of the First Infantry, of which he had been lieutenant-colonel since 1821. On different occasions he had been a member of a military board for organizing the militia of the Union, and to aid the Government with his knowledge in the organization of the Indian bureau, having for many years discharged the duties of Indian agent over large tracts of Western country. He served through the Black Hawk war (1832), and in 1837 was ordered to take command in Florida, then the scene of war with the Indians. By the battle of Okechobee, Dec. 25, 1837, the savages were decisively defeated and the war was virtually ended. For this Taylor was breveted brigadier-general and made commander-in-chief in Florida; was transferred to command of the army of the Southwest in 1840; subsequently was stationed on the Arkansas frontier at Forts Gibson, Smith, and Jesup. He proceeded, upon the annexation of Texas in 1845, with about 1,500 men, to Corpus Christi, where his force was increased to some 4,000. In Mar., 1846, he was ordered to advance to the banks of the Rio Grande, opposite Matamoros, where a camp was constructed, and established his dépôt of supplies at Point Isabel, 25 miles to the E. He was ordered by Gen. Ampudia to retire beyond the Nueces, to which he replied that under instructions of his Government he should maintain his position. Apprehending an attempt to cut him off from his base of supplies, he started for Point Isabel (May 1) with the main body of his troops. On May 3 the sound of heavy cannonading warned him of an attack on his camp, guarded only by a weak garrison, and he returned to its relief May 7. The battle of Palo Alto was fought next day, and that of Resaca de la Palma May 9; Matamoros was occupied without resistance May 18, where he remained until September. Taylor was breveted major-general May 28, and a month later (June 29, 1846) his full commission to that grade was issued. After re-enforcement, he advanced in September on Monterey, which capitulated after three days' resistance. Here he took up his winter quarters. The plan for the invasion of Mexico by way of Vera Cruz, with Gen. Scott in command, was now determined upon, and at the moment Taylor was about to resume active operations he received orders to send the larger part of his force (Worth and Quitman's divisions and most of Gen. Wool's volunteers) to re-enforce the army of Gen. Scott. Though subsequently re-enforced by raw recruits, yet after providing a garrison for Monterey and Saltillo he had but about 5,300 effective troops, of whom only 600 were regulars. In this weakened condition, however, he was destined to achieve his greatest victory. Relying upon the strength of Vera Cruz to resist the enemy for a long time, Santa Anna directed his entire army against Taylor to overwhelm him, and then return to oppose the advance of Scott's more formidable invasion. The battle of Buena Vista was fought Feb. 22–23, 1847. Taylor received the thanks of Congress and a gold medal, and "Old Rough and Ready," as he was called in the army, became a household word. He remained in possession of the Rio Grande valley until November, when he returned to the U. S. In the Whig convention which met at Philadelphia June 7, 1848, Taylor was nominated on the fourth ballot (June 8) as the candidate of the Whig party for President over Clay, Scott, and Webster. In November Taylor received a majority of the electoral votes and a popular vote of 1,360,752 against 1,219,962 for Cass and Butler, and 291,342 for Van Buren and Adams. Gen. Taylor was inaugurated President Mar. 4, 1849. Among the questions requiring the attention of the President was the organization of the large territories newly acquired by conquest and treaty, the question of the admission of California, the formation of new Territories, and the settlement of the boundary-line between Texas and New Mexico. The free and slave States being then equal in number, the struggle for supremacy on the part of the leaders in Congress was violent and bitter. California adopted in convention, in the summer of 1849, a constitution prohibiting slavery within its borders. Taylor advocated the immediate admission of

California with her constitution, and the postponement of the question as to the other Territories until they could hold conventions and decide for themselves whether slavery should exist within their borders. This policy ultimately prevailed through the "Compromise measures" of Henry Clay. On July 5 Taylor was taken ill with a bilious fever, which proved fatal, his death occurring July 9, 1850. Gen. Taylor's wife was Margaret (1790–1852), daughter of Walter Smith, a Maryland planter. One of his daughters married Col. William W. S. Bliss, his adjutant-general and chief of staff in Mexico, and private secretary during his presidency; after his death she became Mrs. Philip Pendleton Dandridge; another was married to Jefferson Davis.—His son, RICHARD TAYLOR (*q. v.*), was an officer in the Confederate army. The best *Life* of Taylor, written by Gen. O. O. Howard, appeared in 1892, being the second of the Great Commander Series. Revised by JAMES GRANT WILSON.

**Taylor, Mount**: an isolated mountain in New Mexico, 80 miles W. of Santa Fé. It was named San Mateo by the Spanish, but the name Taylor, afterward bestowed by American explorers in honor of President Taylor, is now generally used. It is an extinct volcano, composed chiefly of andesitic lava. Its altitude is 11,388 feet, and it rises over 3,000 feet above its immediate base, which is a plateau of lava 36 miles by 12. The Atlantic and Pacific Railroad winds about the southern base of the plateau. The geology of the mountain and its environs is described by C. E. Dutton in the sixth annual report of the U. S. Geological Survey. G. K. G.

**Taylor's Theorem**: in mathematics, a theorem first demonstrated by Dr. Brook Taylor, and published by him in his *Methodus Incrementorum* in 1715. The object of the theorem is to show how to develop a function of the sum of two variables into a series arranged according to the ascending powers of one with coefficients that are functions of the other. The formula for making the development may be written:

$$f(x+y) = u + \frac{du}{dx}y + \frac{d^2u}{dx^2}\frac{y^2}{1.2} + \frac{d^3u}{dx^3}\frac{y^3}{1.2.3} + \text{, etc.}$$

The first member of this formula denotes any function of the sum $x$ and $y$, and $u$ is what that function becomes when $y$ is made equal to 0. The formula is always applicable, but it sometimes happens that $u$ or one of its successive differential coefficients reduces to $\infty$ for a particular value of $x$. This is called the *failing case* of Taylor's theorem. It is more proper to say that the function fails to be developable in powers of $y$ for the value in question. If the series is infinite, it must satisfy a test of convergence, in order to represent accurately the function on the left-hand side.

**Taylorville**: city; capital of Christian co., Ill.; on the South Fork of the Sangamon river, and on the Balt. and O. S. W. and the Wabash railways; 25 miles S. E. of Springfield, 28 miles S. W. of Decatur (for location, see map of Illinois, ref. 7–E). It is in a coal-mining, grain and hay growing, and stock-raising region, and contains a high school (building cost $35,000), 2 ward schools, 7 churches, a national bank with capital of $75,000, 2 private banks, and a daily, a monthly, and 4 weekly periodicals. Pop. (1880) 2,237; (1890) 2,829; (1900) 4,248.

**Tchad**, or **Tsad**: a lake of Central Sudan. See CHAD.

**Tchernigov**: another spelling of CHERNIGOFF (*q. v.*).

**Tchernyshev'skiĭ**, NIKOLAĬ GAVRILOVICH: author; b. in Saratov, Russia, 1828; educated by ecclesiastical teachers and at the University of St. Petersburg, was for a time editor of a military journal and then of the *Sovremenik* (Contemporary, 1855–64), in which he published a number of able articles on literature, history, economics, and social questions, besides which he wrote a book on Lessing (1854), translated Mill and Adam Smith, and other authors. Finally he expressed such pronounced socialist views that he was arrested and sent to Siberia. It was while he was in prison that he composed his famous novel *Shto Delat* (What is to be Done? English translation with the title *A Vital Question*, 1886, and by Benjamin R. Tucker, *What 's to be Done?*, Boston, 1893), which as a literary work is full of impossible characters and unreadable, but was hailed as the gospel of the earlier generation of Nihilists, who saw in it their ideals of emancipated mankind. In 1883 Tchernyshevskiĭ was allowed to live in Astrakhan and occupy himself with the translation of foreign scientific works. He was pardoned in 1889, and died in Saratov, Oct. 29, 1889. His complete works were published at Vevey, Switzerland, 1868–70. A. C. COOLIDGE.

**Tchooktchees**, chook'chēez: a tribe inhabiting the northeastern corner of Siberia from the 160th meridian to Bering Strait. It consists of two divisions—one settled along the coast, and occupied in hunting the whale, the seal, and the walrus; and the other wandering across the bleak, barren plateaus with their herds of reindeer. The Tchooktchees, whose number is variously estimated at from 6,000 to 13,000, are a well-grown, vigorous people, hospitable and bold, but almost entirely destitute of civilization. They are dependents of the Russian Government. Ethnologically, they belong to the same family as the Eskimos of North America, and the Tchooktchee builds his house and his boat exactly like the Greenlander. See ESKIMAUAN INDIANS.

**Tea** [originally pronounced *tay*, the local pronunciation in Fuhkien, China, of *te*, a dialectal form of Chinese *ch'a*]: 1, the prepared leaves of a plant of the genus *Thea*, and specifically of the *Thea chinensis*; 2, the plant itself: and, 3, an infusion of the leaves of the tea-plant, in universal use as a beverage in China, Japan, and other Oriental countries, and widely used throughout Christendom. See the article FOOD.

By some authorities the tea-plant has been assigned to the genus *Camellia* as *C. thea* or *theifera*. Formerly, when it was erroneously supposed that black and green teas were derived from different plants, the attempt was made to distinguish between *Thea bohea* and *T. viridis*. Geographically and practically it is desirable to recognize as distinct sorts *T. assamica* (Assamese), *T. sinensis* (Chinese), and the intermediate hybrids which have resulted from the near cultivation of the two. It is probable that all tea owes its origin to Assam, a province of Burma ceded to Great Britain in 1826, and annexed to the Presidency of Bengal. There in the jungle bordering on the Brahmaputra were found a few years later thickets of indigenous tea-trees, often attaining a height of 30 feet. It has been claimed by some writers that indigenous tea exists in China and Japan; but it is probable that the plant was introduced into China from India 1,500 years ago, and into Japan from China not later than the ninth century. The Japanese declare that wild tea grows freely in the hills of Kiushiu, Shikoku, and the central part of the main island, although acknowledging that its leaf is inferior to that from the gardens which were established with imported seed. Tea was introduced into Europe by the Dutch about the beginning of the seventeenth century. It remained, however, for the East India Company to develop the great British trade in Chinese tea, of which it enjoyed the monopoly until 1834.

*The Tea-plant.*—Two extremes of growth and product are presented by the Assamese and Chinese plants. The Assamese in its natural condition, as originally found in the hot, moist, and still atmosphere of its native jungles, exhibits a most luxuriant growth, often developing into a small tree with a clean stem. Its leaves are of a bright green, not infrequently 9 inches long and 3 wide. It resents transplanting after the tap-root has attained any considerable size. It does not bear drought, cold, nor rough usage from high winds or otherwise. It requires rich soil, abundant moisture, good drainage, and a rather elevated temperature; and these conditions are difficult to fill beyond the region where it was found. Under suitable conditions of cultivation this variety produces twenty or more "flushes," i. e. successive crops of young leaf, during each picking season. The small young leaf is of a golden color and soft texture; it is better adapted for the manufacture of black tea. The tea made from the Assam leaf is strong, often pungent and rasping; it is half again as strong as the Chinese, hence the Assam leaf is frequently blended with the Chinese leaf by the trade.

The Chinese plant, whether indigenous in China or of Indian origin and altered by long exposure to a colder climate and otherwise less favorable conditions, is of bushy growth and of far less attractive appearance than its Assamese relative. It is tough and hardy, successfully enduring the severe winters of the higher latitudes of China and Japan or of the elevated gardens on the Himalayan slopes. It survives deficiencies in moisture, soil, and cultivation, but gratefully acknowledges care and enrichment with an improved growth and higher leaf qualities. Under ordinary agricultural conditions it annually produces only four or five flushes. The leaf is smaller, tougher, and darker. It yields when properly prepared a more delicate if weaker tea than the Assamese. It is usually made into green tea. See TEA-PLANT.

*The Hybrids.*—As the result of the introduction into India in 1835 of Chinese tea-plants and seeds and their cultivation in gardens adjacent to those of the Assamese variety, hybridization has so thoroughly taken place that there are in India very few gardens of pure stock. In the resultant hybrids are blended the qualities of the parents, although there is a frequent tendency to exhibit the marked characteristics of one. Many intermediate varieties have been described, but it is very difficult to maintain any one of them pure unless by distinct separation from other kinds or by propagation from cuttings.

*Conditions Favorable for Growth.*—Climatic and agricultural conditions improve or deteriorate the tea-plant. It quickly responds to favorable conditions in larger bush and leaf, more frequent and abundant flushes, tenderer leaf, and better tea. Neglect, drought, and cold gradually develop the opposite, while their extremes absolutely destroy the better grades. Thus while the tea-plant will often grow under disadvantageous conditions the produce may be scant and almost worthless. The plant does best in a moist, warm, equable climate; in a rich soil sufficiently friable for the penetration of its tap-root; in a situation protected from strong winds, freshets, or stagnant subsoil water. It is a strong feeder, and except when planted out in virgin soil should receive abundant manuring. Unfortunately the very conditions conducive to its best growth create the worst malarial disorders among Europeans and those from other temperate climates. "Fever and tea go together."

*Growth of the Plant.*—Cultivated tea is raised from seed. The plant produces small white flowers, which one year later become capsules containing from one to four seeds about half the size of the American chestnut. Neither well-plucked bushes nor the better varieties of the tea-plant afford much seed. The preferable plan is to pick the ripe seeds in the autumn before the opening of the capsules causes them to fall to the ground. The sooner thereafter the seed is planted out the better. The seeds do not bear transportation to a distance without serious loss of their germinating power. About one consignment in four reaches the U. S. in good order. They are apt to be mildewed or dried up, too often the result of careless packing or unaccountable mishaps in transportation. When received in prime order it is possible to germinate 50 per cent. of them. The seed is planted either in the future tea-garden or in nurseries whence the young trees are subsequently transplanted. Indian gardens usually contain from 2,000 to 3,000 plants to the acre, according to their habit of growth and the lay of the land. Where cultivators and draft animals are used, the number of plants to the acre should not exceed 1,500 to 2,500. In the U. S. and similar climates the seedlings require protection by shingles from the hot sun and by mulching from cold weather and drought. The plants are allowed to attain under favorable conditions two or three years' growth without interference; they are then subjected to severe pruning, which in temperate climates should be done when the trees are not in sap. The objects to be attained are to give the plants a form suitable for leaf-picking and to remove useless or objectionable branches, but particularly to induce an abnormal production of foliage.

*Leaf-picking.*—To obtain abundant young leaf, from which alone good tea is made, it is necessary to make two essential departures from the original mode of growth, viz., the thick shade of the jungle must be exchanged for the open, sunny garden, and the total amount of foliage must be reduced below the normal proportion. Nature will then make a supreme effort to re-establish the equilibrium, and will put forth a tender shoot from every leaf-bud, which in turn gives rise to countless others if unmolested. Yet in spite of sufficiently severe pruning to secure good picking, cultivated tea-plants occasionally attain great size, so that with a height of 4 feet and a stem 10 inches in diameter the circumference of the bush may exceed 40 feet. The tender leaves should be carefully plucked, so as to avoid making too serious inroads on the vitality of the plant or interfering with the speedy formation of another flush.

*Pekoe Tea.*—At the end of the young shoot is an undeveloped bud, which is of all the new foliage the tenderest and choicest. It is called the pekoe tip, or flowery pekoe when made into tea. Pekoe in Chinese means white hair or down, referring to the delicate fuzz on the very young foliage. Mandarin tea is prepared from it in China; the tips are slightly rolled and dried, and finally tied up with ribbons in tiny bunches, like cigars. Except as a curiosity one does not see this tea outside of China, as in that country it commands a very high price. The next leaves are called the orange pekoe and pekoe. They, with the tip, yield pekoe tea, especially esteemed for strength and flavor. When not fermented, but prepared as green tea from the half-opened leaves in April, it is known as young hyson, hyson being a corruption of the Chinese "yu tsien," meaning "before the rains." Most pekoe teas are sent to Great Britain and Russia.

*Souchong and Congou.*—Following the pekoe leaves the next two are called souchong (small kind), and whatever of young leaf may yet be present is termed congou, or the "well worked" (from Chinese kung-foo, "labor").

*Quality of Tea.*—In this order of enumeration, from the pekoe tip downward, the size of the leaf increases, but the quality falls off. The finer the picking, i. e. the more strictly it is confined to the bud and smaller leaves, the better is the quality, but the more expensive and curtailed is the crop. In China, at the time of the second picking, in the early summer, men, women, and children flock to the tea-gardens to pick leaf, as in other countries to pick hops or cotton. They practically strip the twigs of all the green leaf. The necessary result is a poor tea; and if the small quantity of fine leaf is sifted out from the mass, the balance is "tea," but decidedly trashy. The highest grades of Chinese teas are injured by subjecting them to the elevated temperature by which teas are rendered capable of enduring long sea voyages. They command high prices in China, and some of them can be bought only by the very rich. The lowest grades also find a home market, or are made up with some glutinous substance into bricks (brick-tea) for sale in the interior of Asia.

*Yield of Tea.*—The annual produce per plant may be stated at from 2 to 6 oz. of cured tea according to the climatic and cultural conditions, the richness of the soil or its fertilization, the variety of plant and the degree of picking. In India and Ceylon the yield per acre averages about 400 lb.; occasionally it amounts to 1,000 lb.

*Green and Black Teas.*—As before mentioned, green and black teas are not derived from distinct plants. It is possible to make either from the same leaf; but that from the Assamese plant is better adapted for the manufacture of black, and that from the Chinese for green; while some hybrids serve better for the former and others for the latter. The Chinese distinguish between green tea, as affording a greenish liquor, and red tea, as giving one of that color. They do not employ the term black tea, nor do they use any of the artificially colored bright-green teas so popular in the U. S. The great difference between the two most important classes of tea lies in this, that genuine green teas are the result of quickly drying the fresh leaf, whereas black teas are subjected to oxidation before being "fired," as the drying of the moist leaf over fire or in furnaces is called. The most important chemical difference between the simply dried tea-leaves (i. e. green) and the fermented (i. e. black) lies in the decidedly less amount of tannin in the latter. The multiplicity of brands of tea corresponds to the many varieties of the tea-plant, to differences in the mode of growth and manufacture which reflect racial characteristics, and finally to the taste of the consumer.

Some of the trade-names have geographical significance; others relate to the gardens where the tea was made or to the mode of manufacture; others to the quality; and finally many are accidental or unaccountable. The great bulk of the teas sent to the U. S. might be properly classified as "low-middling," with occasional consignments of superior grades and very rarely of fancy.

*Manufacture.*—The green leaf is tasteless and odorless; it contains almost 80 per cent. of water. To prepare it for receiving the rolling to which almost all tea-leaf is subjected, it is spread out thin and withered by exposure to light, heat, and air. Direct sunshine comprises all of these requirements, but it is apt to turn the leaf red. In the manufacture of green tea, where it is desirable to avoid any lengthy exposure of the fresh leaf to the air and light, withering is performed in iron vessels over a quick fire or the leaves are steamed on mats. Withered leaf is flaccid; it has the feel of an old kid glove; it does not crackle when held to the ear and compressed. When over-withered or after exposure to sunshine it becomes dark in color.

Rolling is necessary for breaking up the cellular tissues which contain the essential oil. The juice is expressed and coats the outside of the leaves and their fragments, whereby better cup-qualities are later obtained. Rolling is essential in the manufacture of black tea, as it masses the leaf in a state conducive to speedy oxidation. It is also desirable for giving form to the finished product. Well-withered leaf does not break into fragments under this operation; it retains its original shape. Rolling is performed by hand on tables or mats, or by the use of specially designed machinery. The finest finish is given by hand-rolling; machines perform the task more uniformly and cheaply. Under the pressure of rolling, juice exudes from the ball of leaf. In India it is carefully sopped up into the "roll," and the strength of the tea is thus retained. From much of the Chinese teas it has been expressed and lost.

For the manufacture of black tea, the fresh leaf is thinly spread out to wither. When sufficiently flaccid it is rolled, then the balls or mass of rolled leaf are broken up, spread out thinly, moistened, and are subjected to oxidation, whereby tea loses its raw smell and acquires a fine flavor. This constitutes the most critical operation in the whole process, there being no fixed rules to determine its length and intensity. Due allowance must be made for differences in leaf and in temperature. The effect of oxidation is chemical, the chief change being a loss in astringency, indueed by a diminution of the tannin; the tea also becomes darker in color. After the rolled leaf is broken it is fired in iron vessels over charcoal fires or in suitably constructed furnaces. The thoroughly dried and brittle tea should be packed while yet hot in metallic cases, and afterward hermetically sealed to exclude moisture.

In preparing green tea the essential points are that the fresh leaf should be taken into treatment with the least possible delay. It is sufficiently withered, usually by artificial heat, to admit of its being slightly rolled, then reheated. These steps are repeated several times, until the desired form has been put on the tea and it has lost a large part of its moisture. It is then subjected to long-continued drying over low fires, whereby a decidedly greenish hue is imparted to the finished tea. These are the fundamental rules for making tea. In different countries are practiced various departures or additional processes, such as screening and fanning.

*Tea-industry in China.*—The tea-plant is said to grow in all except the most northern provinces. Extremes of climate prevail in China as a whole, particularly in the interior, the temperature ranging from severe heat in midsummer to bitter cold in winter, with abundant ice and snow. There is reason to believe that in the principal tea-districts the frost is less intense and of shorter duration. The annual crop of tea has been estimated at from 400,000,000 to 2,000,000,000 lb.; in any case, it is immense, and is mostly consumed by the natives. Teas for exportation are raised chiefly in the central and southeastern provinces. In 1893 Chinese tea to the extent of nearly 250,000,000 lb., valued at 30,558,723 haikwan taels, was exported. Tea is China's most important export next after silk.

The Chinese cultivate the tea-plant in small gardens, or in outlying corners and on steep hill-sides where no other crop can be raised. The farmer often sells his crop on the bushes, as oranges are sold in Florida. Or if he picks the leaf, he sells it to the middlemen who in hordes invade the tea-districts at the time of leaf-picking. The tea that has not been mortgaged to the factors is sold at the large tea-hongs—brick buildings embracing with their courts an acre or two of land, and quite common in the Chinese towns. There it is prepared and packed for the market, or it is forwarded in an unfinished state to the great commercial centers on the coast. There are also very choice gardens, well manured and cultivated, whieh have a long-established reputation. They frequently belong to priests, and are tended by them and their acolytes.

*Japan.*—Tea-drinking in Japan began 692 A. D. Tea-seeds were brought from China in the eighth century, and gardens then established which are yet in existence. Although, as before mentioned, wild tea is found in Japan, the most celebrated gardens have been sown with seed imported from China. The chief tea-producing districts are in the Tokaido, in the region around Kioto, known as the Kinai, and in the islands of Shikoku and Kiushiu. The total production of the empire in 1891 was 59,000,000 lb., of which 41,000,000 were sent to the U. S. The climate of the Japanese tea-districts is moist, averaging 72 inches rainfall yearly on 165 days. The extremes of temperature are 93° and 20° F., with a yearly average of 55° F.

Japanese teas are almost wholly green. The leaf is not adapted for the manufacture of black tea. Steam-withering is practiced to reduce the raw flavor. The general finish is very elegant, but artificial coloring and facing are common features of the export trade. The choicest tea is that raised under protection from direct sunlight, as it contains 30 per cent. more theine than that grown in the open. The most esteemed brand is called *tencha* or flat tea, because it is not rolled; indeed, it is claimed that it is not touched by hand after being put on the steaming apparatus. It commands a high price in Japan. Such teas are finely ground shortly before use, and after stirring with warm (not boiling) water for a few minutes, the whole infusion is drank. They play an important part in the ceremonial tea-drinking—an institution dating back to the fifteenth century, and constituting a very curious feature of Japanese political history and social life.

*India and Ceylon.*—The climate of Assam has been already referred to under the conditions favorable to the growth of the tea-plant. It is steaming hot; its yearly average, nearly 75° F., with a maximum temperature of almost 100° and a minimum rarely below 50° F. The total yearly precipitation of moisture is from 90 to 100 inches. It is free from hot, dry winds. Fogs are quite prevalent there. The cutting down of the jungle and its transformation into a vast tea-garden has unquestionably altered the climate; nevertheless, Assam still affords the best tea-climate. That of the elevated gardens on the Himalayan slopes and in the Neilgherries is better suited for the Chinese plant and hybrids similar to it in ability to resist cold wintry weather and to dispense with excessive rainfall. Although situated in 7° lat., Ceylon enjoys, even at the intermediate levels, a comparatively temperate and equable climate; and naturally on the most elevated gardens (some being at 5,000 feet and more), it is quite mild. The thermometer at the intermediate levels rarely indicates 100 F., and above 2,000 feet elevation seldom over 90° F. At none of the meteorological stations in the districts does the thermometer fall below 32° F. in winter. The number of rainy days approximates 200, and the total yearly rainfall about 90 inches. At the higher stations the average temperature is about 15° F., and the rainfall 25 inches less than at the lower ones. The tea-plant continues to grow and produce leaf through the whole year on the lower estates. The development of the Ceylon tea-industry has occurred since about 1876. It is largely in consequence of the replanting in tea of the great coffee estates which were ruined by the leaf disease. Desultory experimentation in tea-planting had occurred before, but without material results.

The whole system of tea-production in the British Indies is on a large scale. Wealthy corporations or individuals cultivate hundreds or thousands of acres, employing great capital and immense numbers of laborers. The operations in the field are performed under the piece system and in a thoroughly systematic manner. In the factory, the simplification of processes and the substitution of machinery for manual labor have reduced the eost of manufacture, and resulted in the production of a more uniform and cleaner article.

The following statistics are from a paper on tea by A. G. Stanton (of Gow, Wilson & Stanton). The United Kingdom eonsumed in 1800 20,000,000 lb. of tea; in 1850, 51,000,000; in 1870, 118,000,000; and in 1894, 214,000,000. The annual consumption per head of population, and the displacement of Chinese and all other sorts by Indian and Ceylon teas in the United Kingdom, are shown by the following table:

| YEAR. | China, etc. | Indian. | Ceylon. | Quantity per head of population. |
|---|---|---|---|---|
| | per cent. | per cent. | per cent. | lb. |
| 1866 | 96 | 4 | .. | 3·42 |
| 1883 | 66 | 33 | 1 | 4·82 |
| 1894 | 12 | 55 | 33 | 5·53 |

*Java.*—Tea-seeds from Japan were planted in 1826, and shortly thereafter some gardens were established by the Dutch Government. They were not financially successful, and, consequently, the last of them were relinquished to private parties in 1860. The best localities for growing tea are at a height of 3,000 to 4,000 feet above sea-level, on the slopes of the mountains. Cold weather is not felt there and leaf-picking extends through the year. The plants are kept within small dimensions, being pruned down to 2 feet in height; they are planted in rows 4 by 2 feet apart. The tea is well made and highly esteemed for its fine flavor, but it is not strong. The crop for 1892 was 9,000,000 lb. It is chiefly sent to Holland, North Germany, and England. In regard to Java, parts of Ceylon, and similarly situated tea-districts where the tea-plant flushes through the whole year, it is believed that in vigor of growth and strength of tea they do not compare favorably with situations where the plant hibernates for a few months.

*United States.*—In other lands than those already described attempts have been made to establish the cultivation of tea. Some of these trials have resulted in failure, others are full of promise, but have not progressed far enough to warrant description here. In view, however, of the general interest which has been manifested in the experiments conducted in an intermittent manner since about 1850 to determine the feasibility of establishing the tea-industry in the U. S., and more recently by Charles U. Shepard, near Summerville, S. C., it may be proper to add a brief summary of the results thus far gained and the present outlook. It has been shown that ordinary hybrids, as also Chinese and Japanese plants, will thrive and produce exceptionally good teas, at least under the stimulus of high cultivation, in several of the Southern States. It is doubtful if the U. S. affords a suitable locality for the growth of the Assamese species. The main difficulties in the path of the tea-grower in the U. S. are the lack of a favorable climate and cheap labor. In regard to climate, at least in the Southeastern States, the variations of temperature are great, equaling those of the Chinese tea-districts, while the amount of rainfall during the picking season hardly meets the requirements for a successful crop. Thus at Charleston, S. C., the mean annual temperature is 66° F., with average extremes of 94° and 20½° F.; and the rainfall amounts to 57 inches per annum on 118 days. Climate materially affects the production. A dry spring retards luxuriant growth and the formation of early tender flushes. The tea-plant needs alternating gentle showers and warm sunshine. Violent storms of wind and rain cause considerable damage. Day labor costs at least five times as much as in the far East. The difference in the cost of leaf-picking amounts to five cents a pound of cured tea, and that is almost the cost of a pound of fair tea on some Oriental estates.

The Southern States, therefore, can not be regarded as ideal tea-districts. Indeed, it has been evident for some years that Asiatic competition precludes the successful raising of the cheaper classes of tea. Nevertheless, there is ground to believe that the better qualities may be profitably grown provided the yield of fine leaf can be made to equal the average of Asiatic gardens. Assuming that by high manuring and careful cultivation a yield of 400 lb. of cured leaf may be obtained from an acre containing 2,000 plants, the cost should not exceed 20 to 25 cents a pound, and 30 cents a pound is the price of similar Asiatic teas in "importers' bulk" at the chief ports of the U. S. Finally, it is very improbable that in the U. S. low-grade and sophisticated teas will always satisfy the wants of the public in general. With increasing wealth and intelligence tea-drinkers will demand and be willing to pay for the better qualities. There will be some who will want the best; that can be furnished only from gardens in the U. S., as it will not bear transportation to a distance.

*Adulterations of Tea.*—There can be no doubt that a great deal of the tea, especially green tea, imported into the U. S. would fall under the condemnation of the law of New York, by "being colored, or coated, or polished, whereby damage is concealed, or it is made to appear better than it really is, or of greater value." On the contrary, it should be regarded as very exceptional in any tea "if it contain any added poisonous ingredient, or any ingredient which may render such article injurious to the health of the person consuming it." The adulterants of tea have been carefully investigated, especially in the U. S., by J. P. Battershall (*Food Adulteration and its Detection*) and G. L. Spencer (*Foods and Food Adulterants*, U. S. Department of Agriculture, Division of Chemistry, Bulletin No. 13).

Tampering with tea has for its objects the improvement of its appearance, its increase in weight or bulk, or the heightening of some quality of flavor. The origin and method of imparting a bright green to tea, as practiced in China and Japan, more particularly for the benefit of tea-drinkers in the U. S., have been described as follows by S. Wells Williams (*The Middle Kingdom*):

"When green tea is intended for home consumption soon after it is made, the color is of little consequence; but when the hue influences the sale, then it is not to be overlooked by the manufacturer or broker. The first tea brought to Europe was from Fuhkien, and all black; but as the trade extended, probably some of the delicate hyson sorts were now and then seen at Canton, and their appearance in England and Holland appreciated as more and more was sent. It was found, however, to be difficult to maintain a uniform tint. Chinese ingenuity was equal to the call. The operation of giving green tea its color is a simple one. A quantity of Prussian blue is pulverized to a very fine powder, and kept ready at the last roasting. Pure gypsum is burned in the charcoal fire till it is soft and fit for easily triturating. Four parts are then thoroughly mixed with three parts of Prussian blue, making a light-blue powder. About five minutes before taking off the dried leaves this powder is sprinkled on them, and instantly the whole panful of 2 or 3 lb. is turned over by the workman's hands till a uniform color is obtained. His hands come out quite blue, but the compound gives the green leaves a brighter green hue. If foreigners preferred yellow teas no doubt they could be favored, for the Chinese are much perplexed to account for this strange predilection, as they never drink this colored or faced tea." The amount of Prussian blue used in coloring green tea is so infinitesimal that it would be necessary for a tea-drinker to consume at one sitting 1 lb. of such tea in order to take what was formerly regarded as one dose of it. The prevalent idea that green tea owes its color to copper is erroneous. Indigo, turmeric, plumbago, and iron sulphate are also used for imparting color. Lie-tea is a mixture of the dust of tea with old tea-leaves and occasionally the leaves of other plants, starch, gum, and mineral substances, worked down to a convenient mass, artificially colored, and usually made to imitate gunpowder tea. For facing or giving a gloss to teas, plumbago, soapstone, and similar materials are employed. Tannin is added for heightening the astringency, which with most tea-drinkers is synonymous with strength and high quality. Foreign substances, such as fragments of brick, sand, etc., up to a reasonable content, may be regarded as the result of carelessness; beyond that of fraudulent intent. Scented teas chiefly owe their fragrance to the odors of the rose, *Osmanthus* (*Olea*) *fragrans*, tuberose, and gardenia; the jasmine and azalea are also employed for this purpose. But scented teas can hardly fall into the category of adulterations. Spent leaves are rarely to be found in tea, except in small quantity; and the presence of the leaves of other plants has been seldom detected. The poorest teas are raised at such a modicum of expense that adulteration becomes remunerative only in response to the demands of the consumer, or at the hands of the middle men. "Tea," although unrecognizable in the cup, can be made almost to satisfy the buyer who wants something for nothing. The detection of adulterants lies in the application of the usual chemical tests, the determination under prescribed conditions of the matter extracted by hot water, and an examination of the leaves with the microscope.

CHARLES U. SHEPARD.

PHYSIOLOGICAL EFFECTS OF TEA.—The chief active ingredient of tea, upon which depends most of its influence upon the human body, is the alkaloid or active principle called theine, which is practically identical with caffeine derived from coffee, guaranine derived from guarana, and similar substances. It is stated on good authority that as a matter of fact most of the caffeine which is used in medicine is in reality theine derived from damaged teas which can not be used for the ordinary purposes, as this is a much cheaper source of supply than is coffee. In addition to theine tea-leaves contain some tannic acid, which gives them their somewhat bitter taste, and a small amount of volatile oil, upon which a "cup of tea" depends for its aroma. The percentage of theine in tea-leaves varies from ½ to 6 per cent., the tannic acid from 12 to 18 per cent., and the volatile oil equals about half of 1 per cent. In addition to these constituents there are numerous vegetable extractives, such as coloring-matter, albumen, gum, and slight traces of mineral substances.

When tea infusion, or in other words, a "cup of tea," is swallowed by the ordinary adult human being it produces a powerful stimulant influence which is chiefly exercised upon the nervous system, especially the brain and spinal cord. As a result of this, thought-processes are more rapidly and readily carried out and the reflexes are increased from the spinal stimulation, so that a mild condition of "nervousness" may develop. The heat which is also taken into the body in drinking tea acts as a powerful stimulant and aids very materially in the absorption of the drug by the stomach. If the tea is taken in over-dose the condition of cerebral and spinal excitation may be so great as to be quite annoying, the chief symptom, if the tea be taken in the evening, being often excessive wakefulness. Because of the stimulant influence of tea upon the human being it is employed very largely, and in many cases to excess, so that persons who are wont to pay little attention to their diet and habits of life frequently become addicted to its excessive use, resorting to it as a "whip" to overcome the apathetic condition arising from the nervous exhaustion from which they are suffering. While there is no doubt that tea is capable, by its stimulating influence, of removing temporary nervous depression, it should never be forgotten that its constant employment for this purpose is always followed sooner or later by physical bankruptcy, a condition which is seen most commonly in nervous women. Tea belongs to that class of substances, such as coffee, cocoa, tobacco, alcohol, and opium, which retard tissue waste, or, in other words, decrease nitrogenous break-down in the body, thereby conserving the tissues, and it is thought by some that human beings resort to these drugs as a result of an instinctive feeling that they are saving themselves to some extent from wear and tear.

A strong infusion of tea is valuable in two dangerous conditions as an antidote: (1) in opium-poisoning, for the purpose of stimulating the respiration and heart; and (2) in antimonial poisoning, for the same purpose, and also for the purpose of forming an insoluble tannate of antimony so slow in its action that acute poisoning will not ensue.

In preparing tea for drinking purposes care should be taken that perfectly pure water is employed which is devoid of either taste or smell, and which is neither too hard nor too soft. It should be poured upon the tea-leaves when actually boiling and the mixture allowed to steep for but a short time. Boiling tea-leaves for the purpose of making an infusion for drinking purposes should never be done, as this process extracts a large amount of organic matter from the leaf and dissipates the aroma, leaving in its stead an acrid, bitter taste. See CAFFEINE. H. A. HARE.

**Teachers' Institutes**: institutions, original in the U. S., for giving professional instruction to teachers already at work. The institute is usually held for a week during the school term at some central point in the county or commissioners' district, the teachers being required to attend and being paid as though they were teaching. The institutes are led by experienced conductors, and are substantially normal schools with a course of study of a week. Gatherings of this kind were held as early as 1834. In 1839 Henry Barnard assembled a number of teachers for this purpose at Hartford, but the first meeting that was called an institute was held in Tompkins co., N. Y., in 1843. The character and work of the institutes vary widely with different localities. See Boone, *Education in the United States* (1890).
C. H. THURBER.

**Teachers' Seminaries**: in Germany, Russia, Scandinavia, Denmark, and Finland, schools for the training of teachers. Such institutions all have the same general character, as described especially for German seminaries in the article *Normal Schools* under SCHOOLS.

**Tea Family**: the *Ternstrœmiaceæ*, a small group (310 species) of dicotyledonous trees and shrubs of warm and hot climates, with regular showy flowers, having usually five sepals, five petals, many stamens, and a superior three-celled to five-celled compound ovary, each cell containing from two to many ovules. The most important genus is CAMELLIA (*q. v.*), in which Bentham and Hooker include the TEA-PLANT (*q. v.*), *C. theifera*. Other botanists maintain *Thea* as a separate genus, and designate the tea-plant as *T. chinensis* or *T. sinensis*, while others still would include all the camellias in *Thea*. In the southern parts of the U. S. there are two species of GORDONIA (*q. v.*) and two of *Stuartia*, all shrubs with pretty flowers. CHARLES E. BESSEY.

**Teak** [from Malayalam *tekka*]: a forest-tree, *Tectona grandis*, of the family *Verbenaceæ*, of India and Farther India. It is the best timber known for ship-building. It is more durable than oak, more easily seasoned, equally strong, considerably lighter, and far more easily worked. It is used for making decks and planking, for the keel, timbers, and even masts and spars. Many all-teak ships are reported to be over 100 years old, and still seaworthy. The wood somewhat resembles mahogany. The flowers and leaves have medicinal qualities, and are used in dyeing. African teak, the wood of a euphorbiaceous tree, *Oldfieldia africana*, resembles true teak, but is much inferior to it.
Revised by L. H. BAILEY.

**Teal**: any one of several small ducks having a bill but little longer than the foot, rather narrow, and with small lamellæ. The wing bears a conspicuous mark, or speculum, of blue or metallic green. They are birds of rapid flight, partial to fresh water, and their flesh is excellent food. There are about twenty species scattered through the world, three occurring as regular residents within the U. S. These are the blue-winged teal (*Anas discors*), the green-winged teal (*A. carolinensis*), and the cinnamon teal (*A. cyanoptera*). The European green-winged teal (*A. crecca*) occurs as a straggler in the Eastern U. S. For the summer teal, see GARGANEY. F. A. LUCAS.

**Tea, Paraguay**: See MATE.

**Tea-plant**: a shrub with smooth evergreen leaves, bearing white flowers (an inch or more broad) in their axils, resembling those of a small camellia, belonging to the same family (*Ternstrœmiaceæ*), and in the opinion of many recent botanists to the same genus. A distinguishing character is that camellias have numerous unconnected stamens within the ring of outer ones, the united filaments of which form a short tube, cohering with the base of the petals, and falling with them; while in the tea-plants there are only five or six of these inner and separate stamens. In both the blossom is succeeded by a globular, thick-walled, woody capsule, internally divided into three or four cells, tardily splitting open; each cell ripening from one to four large and oily seeds, with a hard and smooth seed-coat. See TEA.

**Tear-gland**: See LACHRYMAL GLAND.

**Tears** [O. Eng. *tēar* : O. H. Germ. *zahar* ( > Mod. Germ. *zähre*) : Icel. *tār* : Goth. *tagr* < Teuton. **tahr-*, **tagr-* < Indo-Eur. **dakru* > Sanskr. *daçru* : Gr. δάκρυ : O. Lat. *dacruma* > Lat. *lacrima*]: the slightly saline watery secretion of the LACHRYMAL GLAND (*q. v.*). The ordinary function of this secretion is to assist in the work of moistening and lubricating the eyeball; but in the human species, at least, the exercise of certain strong emotions acts as a powerful stimulus upon this secretion. Pungent odors, as that from the onion, sometimes provoke a copious and even painful discharge of tears. To certain of the lower animals, as the crocodile and the hyæna, folk-lore ascribes the power of shedding voluntary tears for the deception of the beholder; and observers old and recent testify that certain species of deer and of the seal family express grief by the shedding of tears. Most of the lower animals do not secrete a noteworthy flow of tears except after injury of the eye or in some diseases of the gland or of some adjacent part.

**Teasel** [Mod. Eng. *tesel* < O. Eng. *tǣsel*, deriv. of *tǣsan*, pluck, tease (wool)]: the *Dipsacus fullonum*, a biennial plant of the south of Europe, naturalized to some extent in the U. S. It is cultivated in Europe, as in the U. S., on account of its burs or heads, covered with hooked bracts. These heads are fastened to a revolving cylinder, and are used by woolen manufacturers to raise a nap on cloth. No artificial contrivance has been found to equal the teasel for this purpose. "Male" and "female" teasels are merely varieties in size and stiffness, each adapted to the dressing of special cloths.

**Teasel Family**: the *Dipsaceæ*; a small group (150 species) of dicotyledonous herbs (rarely shrubs) of the Old World, with small flowers, having a small calyx, tubular corolla, stamens two to four inserted on the corolla, anthers free, and ovary inferior, one-celled and one-ovuled. They are closely related to the COMPOSITES (*q. v.*), from which they are separated mainly by their free anthers. The teasel and the ornamental species of *Scabiosa* are the most important plants of the family. CHARLES E. BESSEY.

**Têche** (tesh), **Bayou**: one of several small tide-water navigable channels in Southern Louisiana, which were once the main channels of large rivers. This bayou lies immediately W. of Grand Lake, and the Atchafalaya river basin and its high banks, formed by the overflows centuries ago, when it was a main river outlet, now form one of the most fertile and productive portions of the State of Louisiana. It produces large crops of sugar and cotton, these lands being above overflow. It is navigable to St. Martinsville, about 100 miles above its mouth, where it empties into the lower Atchafalaya, near Morgan City. Above St. Martinsville the Têche is only navigable for very small boats a portion of the year. What is now termed Bayou Têche was once the lower portion of the ancient channel of Red river, extending from the present Bayou Courtableau, E. of Opelousas, La., around and to the W. and S. of what is now the

Grand Lake basin—then probably an inland bay into which the Mississippi river discharged—to the Gulf of Mexico, but now, too, the lower Atchafalaya river, S. of Grand Lake. St. Martinsville, Pattersonville, Centerville, Franklin, and New Iberia are prominent towns on the Têche.

Revised by J. B. JOHNSON.

**Technical Schools** : See SCHOOLS.

**Technology** [from Gr. τέχνη, art + λόγος, discourse]: a general name for industrial science. Strictly, there is no such science, but all the sciences contribute much which is of the greatest value to the various industries; and technology is the teaching of those parts of science which are of direct industrial importance. See *Technical Schools* and *Trade Schools* under SCHOOLS.

**Teck** : small duchy situated in Suabia, and called so after the castle of Teck. It was held successively by several families during the Middle Ages, but in the fourteenth century passed into the possession of the Dukes of Würtemberg. In 1863 the King of Würtemberg conferred it on the children of Duke Alexander of Würtemberg by his marriage with the Countess Rhédey. Their son Francis (b. 1837), who became Duke of Teck by this arrangement, is the father of the Princess Victoria May, who married the Duke of York of the British royal house (July 6, 1893). F. M. COLBY.

**Tectibranchia'ta** [Mod. Lat.; Lat. *tec'tus*, perf. partic. of *te'gere*, cover + *bran'chiæ*, gills]: a group of opisthobranchiate molluscs in which the gills are covered by the mantle. See GASTEROPODA.

**Tecum'seh** : village (settled in 1824): Lenawee co., Mich.; on the Raisin river, and the Cin., Jack. and Mack. and the Lake Shore and Mich. S. railways; 13 miles N. E. of Adrian, and 33 S. E. of Jackson (for location, see map of Michigan, ref. 8–J). It is in an agricultural and fruit-growing region, has large manufacturing interests, and contains 6 churches, a central and 3 ward schools, a public library, 2 State banks with combined capital of $66,000, 3 flour-mills, 2 planing-mills, a paper-mill, brick and tile machine-works, 2 foundries, carriage-factory, table and furniture factory, and 2 weekly newspapers. Pop. (1880) 2,111; (1890) 2,310; (1900) 2,400. EDITOR OF "HERALD."

**Tecumseh** : city (founded in 1857); capital of Johnson co., Neb.; on the Big Nemaha river and the Burl. and Mo. River Railroad; 30 miles W. of Missouri river, and 50 miles S. E. of Lincoln (for location, see map of Nebraska, ref. 11–H). It contains 8 churches, 4 public-school buildings, high school, water-works, electric lights, a national bank with capital of $50,000, a State bank with capital of $50,000, and 3 weekly newspapers. Pop. (1880) 1,268; (1890) 1,654; (1900) 2,005. EDITOR OF "CHIEFTAIN."

**Tecumseh**, or **Tecumtha** : chief of the Shawnee Indians; b. near Springfield, O., about 1768; took part in the war with the Kentucky forces about 1791; was engaged in the battle of Mad river and in the attack on Fort Recovery, 1794; joined his brother, Elskwatawa (called The Prophet), about 1805 in the attempt to organize all the Western Indians in a confederacy against the whites; visited all the tribes on the upper lakes and in the Mississippi valley down to the Gulf of Mexico; collected a considerable force on the upper Wabash in the autumn of 1811, which, under command of the Prophet, attacked Gen. Harrison and was defeated at Tippecanoe Nov. 7, during Tecumseh's absence among the Southern tribes; went to Canada with a band of Shawnees in the following year on the outbreak of hostilities with Great Britain; was a useful ally to the British in the battles of Raisin river and of Maguaga, where he was wounded; was made a brigadier-general in the British service; was joint commander with Gen. Proctor at the siege of Fort Meigs, and protected the American prisoners from massacre; was wounded at the battle of Lake Erie, and commanded the right wing at the battle near the Moravian towns on the Thames. Having, it is said, a presentiment of his approaching death, he laid aside his sword and uniform, put on his hunting-costume, and plunged into the hottest of the fight, in which he was killed Oct. 5, 1813. It was asserted for many years that he fell by the hand of Col. Richard M. Johnson, afterward Vice-President of the U. S. (1837–41). See Drake, *Life of Tecumseh and his Brother the Prophet, with an Historical Sketch of the Shawnee Indians* (Cincinnati, 1841), and Eggleston, *Tecumseh and the Shawnee Prophet* (New York, 1878).

**Te De'um** [Lat., so called from the first words, *Te Deum (laudamus)*, Thee God (we praise), Eng. version, "We praise thee, O God"]: the most famous "non-biblical" hymn of the Western Church, dating from the fifth century. It was intended to be a daily morning hymn. Its authorship is unknown. It is first referred to by Cæsarius of Arles (502), who ordered it to form part of the regular morning service of his monks, and as he cites it only by the first three words it indicates that it was then well known. So it passed into the service books of the Western Church, and has always constituted a portion of the Morning Service (as one of its supplications, "Keep us *this day* without sin," implies) in the English and American church services between the first and second lessons for the morning, the rubric prescribing that it shall be "said or sung."

Besides the use in the Morning Service, this triumphal hymn is used, arranged to elaborate music, as a special service of thanksgiving. The sovereigns of England have been accustomed to go in state to the singing of the Te Deum after great victories, Handel's *Dettingen Te Deum* having been composed for one of these occasions. At the conclusion of coronations it has been used from time immemorial throughout Europe. When it is said in the ordinary Morning Service, its verses are antiphonally recited by minister and congregation, but it is very generally sung by choir and congregation. The music which has come down in connection with this hymn is probably pre-Gregorian. No hymn or form of words has been the subject of so many musical renderings by composers of all grades, of all ages, and of all nations. Among the elaborate works are those of Handel (just cited), Romberg, André, Lassen, and Wüllner. Revised by S. M. JACKSON.

**Teeth** [plur. of *tooth* < O. Eng. *tōð* (plur. *tēð*): O. H. Germ. *zand* (> Mod. Germ. *zahn*): Icel. *tönn*: Goth. *tunþus*; cf. Lith. *dantis*: Lat. *dens, dentis*: Gr. ὀδούς, ὀδόντος: Sanskr. *danta*]: certain hard bodies situated in the mouth or at the beginning of the alimentary canal. This definition, comprehensive and vague as it may appear, is as exact as the nature of the case permits. Under it would be included not only the teeth of mammals and other vertebrates, but also the hard bodies that stud the surface of the odontophore or lingual ribbon of molluscs, etc., although these parts are not at all homologous. The teeth of vertebrates, which alone are considered here, are exceedingly variable in development, as well as form and position, and their characteristics in the several classes may be briefly examined in order, while much information as to dentition will be found in the articles treating of the various families, etc.

The teeth of vertebrates, and particularly those of mammals, are closely related to the entire structure of the animal to which they belong, and as the teeth, owing to their hardness, often remain after other parts have wholly or largely disappeared, they are for these reasons of great importance to the palæontologist.

Following Tomes, the main features in the development of teeth are, briefly, as follows: "In all animals the tooth-germ consists primarily of two structures, and two only—the dentine-germ and the enamel-germ. The simplest tooth-germ never comprises anything more. When a capsule is developed it is derived partly from a secondary upgrowth of the tissue at the base of the dentine-germ, partly from an accidental condensation of the surrounding connective tissue. The existence of an enamel-organ is quite universal, and is in no way dependent upon the presence or absence of enamel upon the completed tooth, although the degree to which it is developed has distinct relation to the thickness of the future enamel. So far as researches go, a stellate reticulum, constituting a large bulk of the enamel-organ, is a structure confined to the Mammalia. The dentine-papilla is a dermal structure, the enamel-organ an epithelial or epidermic structure. As the enamel is formed by an actual conversion of the cells of the enamel-organ, this makes the dentine dermal and the enamel epidermic structures. In Teleostei the new enamel-germs are formed directly from the oral epithelium, and are new formations arising quite independently of any portion of the tooth-germs of the teeth which have preceded them. In mammals and reptiles, and in some, at all events, of the Batrachia, new tooth-germs are derived from portions of their predecessors. In all animals examined the phenomena are very uniform: a process dips in from the oral epithelium, often to a great depth; the end of the process becomes transformed into an enamel-organ coincidently with the formation of a dentine-papilla beneath it. The differences lie rather in such minor details as the extent to which a capsule is developed, and no such generalization as that the teeth of fish in their development represent only an earlier stage of the development of the teeth of Mammalia can be drawn."

The leptocardians or pharyngobranchiates are entirely destitute of teeth.

The marsipobranchiates have teeth developed on the tongue, and more or less from the surface of the oral disk; in the myxinoids a single tooth is present on the roof of the mouth; but in the petromyzonts numerous teeth exist in oblique rows on the disk.

The selachians or elasmobranchiates exhibit a very considerable diversity in their dentition, but the principal types are as follows: In sharks the teeth vary in shape from flat and broadly triangular, with serrate edges (*Carcharias*), to long, slender, and smooth (*Lamna*). They differ considerably in shape, according to their position in the jaw, and are arranged in several (six to eight) rows, although those of the front row only are in active use. The others form a reserve series, and move continually forward to replace the others, while new teeth are continually being developed at the back. The skates and rays have either numerous small, pointed teeth, arranged in alternating rows, but so thickly set as to form one mass (*Raja*), or they are flat, six-sided, and so disposed as to form a sort of pavement (*Myliobatis*). In either case new teeth are constantly forming at the back to replace the loss by wear in front.

The fishes are, more than any other class, distinguished by the diversity in development and position of the teeth, as well as form and mode of attachment.

As to position, they may be entirely absent from at least the mouth proper, or they may be present on almost all the bones—i. e. the intermaxillaries, the supramaxillaries, the vomer, the palatines, the pterygoids, the ento-pterygoids, and the tongue, as well as the pharyngeal bones, the branchial arches, and the beginning of the œsophagus. There may be also a considerable diversity in dentition within the limits of the same natural family, although, as a rule, the differences are inconsiderable: as examples among American fishes the cyprinoids and centrarchoids may be mentioned. All of the cyprinoids (carp and suckers) are totally devoid of teeth in the mouth, although they have them well developed on the pharyngeal bones. The centrarchoids (bass) offer considerable diversity: in *Pomotis* and *Lepomis* teeth are present only on the jaws and vomer, but in *Ambloplites* and *Chænobryttus* they exist not only on the jaws and vomer, but also on the palatine and pterygoid bones. A still more noticeable case of diversity is afforded by the family of clupeids, including the herrings, shad, etc.: in *Alosa* (the shad) the mouth is almost toothless, while in *Clupeoides* teeth are developed on the intermaxillaries and supramaxillaries (as crenulations), as well as on the dentaries, vomer, palatines, pterygoids, and tongue: between these there is almost every gradation. These variations in the clupeids are so generally unaccompanied by other modifications of structure that their systematic value is very slight. Nevertheless, in most cases there is a quite close concordance between the development of the teeth and other characters, so that, on the whole, the nature of the dentition may be tolerably well predicated from the associated characters. The most common combination, too, at least among the specialized acanthopterygian fishes, is expressed in the aggregation of teeth on the intermaxillaries, dentaries, vomer, and palatines. The *Percidæ*, *Serranidæ*, and *Scombridæ* (but not all their species) are examples of this class. Closely related types, however, have the teeth confined to the intermaxillaries and dentaries; such are, e. g., the typical *Pristipomatidæ* and *Sparidæ*. In *Stromateidæ* teeth are developed on plates at the entrance of the œsophagus.

In form there is great variety. The most common shape is an elongated but more or less curved cone, or some slight modification thereof. The most noteworthy examples of other types are the following: Extremely elongated, slender, and almost hair-like teeth are found in the chætodontids; incisors like those of mammals, superficially at least, are developed in the *Sargi* (sheepshead, etc.); molar-like teeth are present in the jaws of many *Sparidæ* and on the palate in *Anarrhicadidæ* (wolf-fishes); barbed or arrow-like teeth are exemplified in the *Trichiuridæ* and related forms; compressed, lancet-like teeth exist in the jaws of *Pomatomus* or *Temnodon* (the bluefish); slender spoon-like teeth are to be seen on the lips of the loricariids, a group of peculiar South American catfishes; squamiform, imbricated teeth cover the jaws in the *Scaridæ* (parrot-fishes); and broad incisorial teeth are confluent with the jaws in the diodons and tetrodons.

In their combinations and mode of attachment there is almost equal variety. In most fishes the teeth are very numerous, and grouped in many rows on the jaws as well as on the palate; in many they are a single row; often they are differentiated into two or more kinds—e. g. the foremost tooth or the hindmost ones, and sometimes (as in different labrids) both, may be developed as canines, while the others are small; often, too, the teeth of the anterior row are much larger than the others; again, as in the sparids, the teeth of the front of the jaws are conic or incisorial, and those of the sides molar. In fishes generally the teeth are immovably implanted in sockets in the jaws, but readily detached therefrom; in some (e. g. in *Salarias*, *Euchalarodus*, certain *Serranidæ*, etc.) they are more or less movable, while in loricariids they seem to be loosely attached to the lips; in the scarids they are imbricated on the jaws; and in the diodons and tetrodons they are inseparable from the jaws.

In the amphibians there is much less diversity than in the fishes, or even the selachians. In form they are mostly slender, conic, and pointed. In position they exhibit much greater diversities: in the *Gradientia* (salamanders and other tailed species) they are present on the jaws and palate under various combinations. In the *Salientia* they are less constantly present; in many (e. g. the frogs) they are suppressed in the lower jaw, and present only in the upper; in numerous others (e. g. the toads) they are absent from the upper as well as the lower jaw; in the frogs teeth are developed on the vomer, but in the toads are entirely wanting on the palate as on the jaws.

In the reptiles the varieties of dentition are quite numerous, but less so than in the fishes. In shape their teeth are usually more or less conical or rounded, but they may be somewhat notched or pectinated. It need only be added here that, according to Tomes, but contrary to the older authors, "the teeth, as far as known, consist of dentine, to which is very generally superadded an investment of enamel, partial or complete, but that cementum is only present in a few instances," the only forms having teeth covered with cementum being "those which have them implanted in more or less complete sockets or in a groove," as the crocodilians and ichthyosaurians. The teeth of reptiles are usually succeeded as they wear out by others which either grow up at their sides, as in serpents, or are pushed up from beneath, as in crocodiles and most lizards.

The birds of the present epoch are entirely destitute of true teeth, and the mandibles have generally more or less trenchant, unarmed linear edges, but sometimes they are armed with processes of bone simulating teeth, but in no other respect entitled to that name. In former epochs, however, there existed types actually provided with true teeth, having all the structural characteristics of those organs, and fitting in sockets in the jaws; these have been combined by Marsh under the general term *Odontornithes* (i. e. toothed birds).

In the mammals teeth are confined to the jaws—i. e. the intermaxillary, supramaxillary, and dentary bones—and are almost always developed, although in a few forms, representing several orders, they are entirely wanting. No teeth have been discovered in the Monotremes belonging to the family *Tachyglossidæ*, but in the *Ornithorhynchidæ* very young animals possess three minute, many-tuberculed teeth on either side of each jaw. A little later these are hidden under the large, horny, epidermal plates which serve as teeth in the adult, and ultimately the rudimentary teeth are absorbed, so that until recently the *Ornithorhynchidæ* were considered to be toothless. In the marsupials and placental mammals the teeth are homologous with each other, and developed in the same manner. The fully developed teeth are composed essentially of three substances: the dentine, the enamel, and the cement. The dentine is the chief component of the teeth, and is a dense, fine-grained, elastic substance, permeated by minute tubes; there is a familiar and well-marked example of dentine in ivory, but it varies much in appearance and hardness, although it always contains a considerable portion of animal matter. The enamel is generally more or less developed around the dentine on the crown of the tooth, or is present in the form of vertical plates as among ungulates. It is composed of extremely minute fibers standing outward over the dentine, and is the hardest of animal tissues. The enamel is developed around the teeth of most mammals, but to a varying extent, and is wanting chiefly in most of the representatives of the order *Bruta*. The cement is quite like bone in appearance and composition, and enters to a varying extent into the composition of the tooth. It is generally most developed around the roots, and least so on the crowns, although in ungulates it fills the valleys between the plates of enamel also. See the illustration in the article HISTOLOGY.

The teeth of mammals are always inserted in sockets in the jaws, surrounded by gums. They are severally divided into two portions—the exposed portion or crown, and the inserted portion, known as the fangs or roots. The difference is generally well defined, but in some forms, especially in certain rodents (*Arvicolinæ*), etc., there is no abrupt distinction between the inserted and exserted portions, and true roots are not developed.

In nearly all mammals there is a limit to the growth of a tooth, but the incisors of all rodents and all the teeth of some species, as well as the teeth of sloths, continue to grow upward throughout life, the pulp-cavity remaining open and new material being added at the base as it is worn away above.

The teeth of mammals not increasing in size, as do the other parts of the body, a provision must exist for the accommodation of their size and development to that of the animal. This is effected in part by the late development of some of the teeth, which do not appear until the animal has attained a large size; and, in part, as well, by the replacement of some of the teeth developed about the time of birth by subsequent ones of larger size. Those animals which have only one set of teeth are said to be monophyodont (μόνος, single + φύειν, to put forth + ὀδούς, tooth); those which have two sets of teeth, an early (deciduous) and a later (non-deciduous) set, are called in contrast diphyodont (δίς, twice + φύειν, to put forth + ὀδούς, tooth); these characters, however, are not co-ordinated with others, and mammals, therefore, can not be contrasted, as has been attempted, into natural sections distinguished by such characteristics. In the marsupials only four teeth (one in each jaw on each side) are succeeded by larger teeth, the teeth which correspond to the milk teeth of other mammals persisting during life, with the exception of the third premolar. The teeth of the second set are developed from diverticula of the sacs in which originated those of the first set. The edentates, so far as known, are mostly monophyodont, but the armadillos and aard-vark are diphyodont, a set of milk teeth existing for a longer or shorter time after birth, and being finally succeeded, sometimes not until near maturity, by a second permanent set. The sloths are not yet fully known, but there is reason to suppose that they may also prove to be diphyodont also. Among the Carnivores, in the Fissipedes, or terrestrial species, the diphyodont type is well exemplified, the milk teeth being rather large, and retained for quite a long period, until finally replaced by the permanent set; but in the Pinnipeds the milk teeth are extremely rudimentary, and replaced before birth by those of the permanent series. In the majority of the toothed whales the teeth are those of the first or milk dentition, which persist throughout life, but the porpoise (*Phocæna*) is partly diphyodont, although the majority of the teeth belong to the milk dentition. Fœtal whalebone whales have a single set of simple teeth which are absorbed before birth. In the rodents the great incisor teeth are permanent, and have no deciduous predecessors. In the case of those forms which have only three molars or less, as in the *Muridæ*, etc., these are permanent, being persistent milk teeth. In those forms, however, where the number of molars exceed three, the teeth in front of them are premolars, or teeth which have had deciduous predecessors.

Recent investigations have shown that the rudiments of teeth are present in many mammals previously classed as monophyodont, but that they fail to develop, and that diphyodont mammals possess germs of a third set, possibly of a fourth.

The rows of teeth in almost all species exhibit interruptions of varying extent. These interruptions (diastemas or diastemata) most frequently exist between the incisors and canines of the upper jaw for the reception of the canines of the lower, and in the lower jaw between the canines and molars for the reception of the canines of the upper jaw. When the canines are reduced in size, there is often a corresponding reduction in the extent of the diastemas; and in man, where the teeth are all nearly on the same level, the series in both jaws are perfectly uninterrupted; and in this respect man is distinguished from all the other living mammals, although approached by certain of the lemuroid species. The character is, however, not exclusive, and in certain extinct forms, notably those of the ruminant family of *Anoplotheriidæ*, there are also uninterrupted series of teeth in the two jaws. The diastemas, however, are by no means always co-ordinated with the development of the canine teeth, but very frequently result from the elongation of the jaws and the reduction of the anterior molar teeth, as in most of the ungulates and in all the rodents, in which latter the canines are never developed.

The teeth of mammals are, in respect to situation, function, or mode of replacement, divisible into four groups, incisors, canines, premolars, and molars. The incisors (Lat. *incidere*, to cut) are the teeth in the front of the jaws; those implanted in the premaxillaries above, and those immediately opposing them below. The canines (Lat. *caninus*, dog-like) are the usually prominent teeth just back of the incisors. The upper canine is the tooth situated immediately behind the suture dividing the premaxillary from the maxillary; the lower canine is that tooth which, when the jaws are closed, lies in front of the upper canine. Premolars are teeth back of the canines which have taken the place of those borne at or developed soon after birth, and molars are those back teeth which have had no deciduous predecessors. In some marsupials there may be as many as ten incisors, but in the placental mammals there are never more than six in either jaw. This is the normal number, but in some species there may be fewer, or even none. There are never more than four canines, one on either side of each jaw, and they may be entirely wanting. The number of premolars and molars is variable, particularly so in the lower groups; in the higher groups the typical number is four premolars and three molars. A complete typical dentition may therefore be said to comprise 44 teeth: incisors $\frac{3}{3}$, canines $\frac{1}{1}$, premolars $\frac{4}{4}$, molars $\frac{3}{3}$, a number shown by the hog, although uncommon among existing mammals. See Owen, *Odontography* (London, 1840–45) and *Comparative Anatomy and Physiology of Vertebrates* (London, 1866–68); C. S. Tomes, *Manual of Dental Anatomy, Human and Comparative* (London, 1882); and Wortman, *Comparative Anatomy of the Teeth of Vertebrates*, in *American System of Dentistry* (Philadelphia, 1886). See also DENTISTRY.

Revised by F. A. LUCAS.

**Teffé**, tef-fā', formerly **Ega** or **Egas**: a town of the state of Amazonas, Brazil; on a lake formed by the little river Teffé near its mouth, on the southern side of the Amazon; 1,215 miles by the river route from Pará. Originally a Jesuit mission, it is now the most important river-port above Manáos, exporting rubber, sarsaparilla, etc. Teffé, or Ega, as it is still commonly called in English books, is celebrated in science as the residence of Bates, Agassiz, and other distinguished naturalists. Pop. about 5,000. H. H. S.

**Tegnér**, teg-nār', ESAIAS: poet; b. at Kyrkerud, Wermland, Sweden, Nov. 13, 1782. His father, who was a poor parish priest, died early, but the son contrived to go to Lund in 1799, and in 1802 he graduated from the university with great honor; became docent in æsthetics, and in 1812 was promoted to the chair of Greek Literature. In 1818 he was elected a member of the Academy, and in 1824 he was made Bishop of Wexiö. In this position, for which he was but ill fitted by nature, he exercised a great and beneficial influence by his powerful eloquence and his energy in school matters. His talent was essentially lyrical, with a tendency toward the didactic. His first great poem, *Svea* (1811), although crowned by the Academy, was a protest against the conventionalism of the Academy, and had a decisive influence on the poetic development of the time. In *Nattvärdsbarnen* (The Children of the Lord's Supper, 1820), translated by Longfellow, he displayed his skill as a didactic poet, his model being taken from Goethe's *Hermann und Dorothea*. *Axel* (1820), influenced by Byron, though more popular than the preceding poem, is vastly inferior to it as a work of art, the poet's tendency to sentimentality and rhetoric appearing to excess. *Frithiof's Saga* (1825), which is his most celebrated work, and which has been translated into almost every European language and nineteen times into English, is a combination of ballads. In opposition to the French school, which with its pompous and pedantic or superficial and frivolous elegance predominated in the Swedish literature at the beginning of the nineteenth century, Tegnér unveiled the ideal of the romantic school, with its new relations between nature and art, and between art and religion. He avoided, however, the excesses of the Phosphorists (see SWEDISH LITERATURE), whose obscurity was repugnant to his clear, logical mind. During the latter years of his life he suffered from melancholia, which in 1840 assumed an acute form. D. at Wexiö, Nov. 2, 1846. His collected writings (*Samlade Skrifter*) were published at Stockholm (7 vols., 1847–51; additional, 3 vols., 1873–74). See Georg Brandes, *Eminent Authors of the Nineteenth Century* (R. B. Anderson's trans., New York, 1886). Revised by D. K. DODGE.

**Tegucigalpa**, tā-gōō-thēē-gaal'pāā: capital (since 1880) and largest city of Honduras; beautifully situated in a plain or basin surrounded by mountains, 3,250 feet above the sea; 60 miles from its port of Amapala on the Gulf of Fonseca (see map of Central America, ref. 4–H). It is in the most thickly populated region of the republic, is the center of a fertile agricultural district, and has mines of gold and silver, which were formerly much more important. The most conspicuous building is the cathedral; the president's palace and other public edifices are unpretentious, and most of the dwellings have but a single floor. The city has a university, library, ladies' seminary, etc. The climate is mild and salubrious. A railway to San Lorenzo on the Gulf of Fonseca is projected. Pop. about 15,000. Tegucigalpa is the capital of a department of the same name, having an area of 3,475 sq. miles and a population (1889) of 60,170. H. H. S.

**Teheran'**, or **Tehran**: capital of Persia; in lat. 35° 41′ N., lon. 51° 23′ E.; province of Irak-Ajmi, 70 miles S. of the Caspian Sea; in a sandy and stony plain at the southern foot of the Elburz Mountains, which rise here, in Mt. Demavend, 18,600 feet above the level of the sea (see map of Persia and Arabia, ref. 2–G). It was formerly surrounded by a mud wall 4 miles in circumference, 20 feet high, with 6 gates, but it has been extended beyond these limits. The streets for the most part are narrow, crooked, ill paved, and filthy, and the houses low and insignificant, generally built of mud, although there are some modern boulevards and houses in Western style. Some mosques, bazaars, and caravansaries are handsome structures, however, and the palace of the shah, forming a city by itself, adjoining the northern part of the wall, is vast and elegant. Teheran became the residence of the shah in 1796, and has increased considerably since that time. It has some manufactures of carpets, cotton and linen goods, shoes and hats, and carries on a brisk trade. Its population varies much from winter to summer, as the shah and all the wealthier citizens leave it early in spring on account of the intolerable heat and unhealthful atmosphere. Pop. estimated at 210,000. In the vicinity are the ruins of Rei, the *Rhages* of Scripture, the ancient capital of Parthia and the birthplace of Harun al Raschid.

Revised by M. W. HARRINGTON.

**Tehri'**: a small hill-state under British control in the Himalayas. See GARHWAL.

**Tehuacan**, tā-wāā-kāān', or **Tehuacan de los Granados**: a town of the state of Puebla, Mexico; in a dry but fertile valley, 31 miles, by a branch road, from Esperanza on the Mexican Railway; station on the Mexican Southern Railway on the line from Puebla to Oaxaca; 5,250 feet above the sea (see map of Mexico, ref. 7–H). Lying on the best route from the plateau to the Gulf of Tehuantepec, it is a place of considerable commercial importance. At the time of the Spanish conquest it was occupied by a powerful Nahuatl tribe. In the vicinity are ruins of pyramids and other structures, supposed to have been built by the Toltecs. Pop. about 12,000. HERBERT H. SMITH.

**Tehuantepec**, tā-wāān-tā-pek': town; state of Oaxaca, Mexico; on the Tehuantepec river, 13 miles from its mouth in the gulf of that name; station on the Tehuantepec Railway (see map of Mexico, ref. 9–I). It is of very ancient origin, was at one time the chief town of the Zapotec Indians, and later was occupied by a branch of that tribe which submitted to Alvarado in 1522. Pop. 8,000. H. H. S.

**Tehuantepec, Isthmus of**: a constriction of the American continent, in Southeastern Mexico, between the Bay of Campeche (Gulf of Mexico) on the N., and the Gulf of Tehuantepec, an arm of the Pacific, on the S. Its width, in the narrowest part, is 134 miles. The mountain chains, on reaching the isthmus, are suddenly depressed, with several passes below 700 feet. There have been many projects for a canal across this neck, and careful surveys, one by order of the U. S. Government, have been made with this end in view. Some of the reports are favorable, but the work would be enormously expensive. A railway from Coatzacoalcos on the N. to Salina Cruz on the S. now runs across the isthmus; it was constructed by the Mexican Government and was opened for traffic in 1894. (See also SHIP-RAILWAYS.) As long ago as 1847 the U. S. Government endeavored, without results, to procure a right of way over the same route. The great importance of communication through the isthmus may be seen from the accompanying illustration.

Map showing the relation of Tehuantepec to commerce.

Physically, the Isthmus of Tehuantepec separates Mexico from Central America, the land E. of it, with Yucatan, belonging rather with the latter than with the former region. HERBERT H. SMITH.

**Te'idæ** [Mod. Lat., named from *Te'ius*, the typical genus; cf. Braz. *teguexin*, name of one of the species]: a family of leptiglossate lizards distinguished by the single premaxillary bones and deeply bifid tongue covered with scale-like papillæ. The family is peculiar to America (especially the tropical portions). *Teius teguexin*, of Brazil, attains the length of 6 feet. When pursued and brought to bay it fights with its tail, with which it can inflict violent blows, as well as with its teeth. It is an indiscriminate feeder, taking small animals (mammals, frogs, and birds), and frequently robbing bees of their honey after driving them from their nests. Its flesh is esteemed, and is somewhat like that of a chicken.

**Teignmouth**, tin'mŭth: town; in Devonshire, England; at the mouth of the Teign in the English Channel; 12 miles S. of Exeter (see map of England, ref. 14–E). Teignmouth is a popular watering-place; has a promenade, a pier, baths, etc. Pop. (1891) 8,292.

**Teignmouth**, John Shore, First Baron: b. in Devonshire, England, Oct. 8, 1751; went to India as a cadet 1769; became Persian translator at Murshedabad 1773; accompanied Warren Hastings to England 1785; became a member of the supreme council at Calcutta 1786; took a prominent part in the formation of the revenue and judicial systems of India, especially the measure of zemindar proprietorship of the soil, which took effect under Lord Cornwallis's administration; was made a baronet 1792; was Governor-General of India from Aug., 1793–97; was an intimate friend of Sir William Jones, whom he succeeded as president of the Asiatic Society of Bengal Apr., 1794; was chief author of the code of laws for Bengal published in 1793; was created Baron Teignmouth at the expiration of his term of office 1797; returned shortly after to England; was the first president of the British and Foreign Bible Society 1804–34; became a member of the board of control and of the privy council Apr., 1807, and was a prominent member of the religio-philanthropic circle known as the Clapham Sect. D. in London, Feb. 14, 1834. He edited the *Works* of Sir William Jones (13 vols.), to which he prefixed a memoir; and his own *Life and Correspondence* (2 vols., 1842) was published by his son, the second baron.

**Teinds**: originally, the tenth part of the produce of lands appropriated by the law of Scotland to the support of the clergy. The earliest statute on the subject is that of David II., c. 42. Teinds were limited to the products of industry, and were drawn in kind; for example, the beneficiary went upon the land and carried off every tenth sheaf of wheat. After the Reformation teinds were not collected by the clergy, but belonged either to the crown, to lords of erection (called titulars), to the original founding patrons, or to grantees from the Church, although they were chargeable with the payment of stipends to the clergy of the established Church. At present teinds are a burden not on the fruits of land nor on the land itself, but on its rent or annual value to the extent of one-fifth thereof. This change has been beneficial to the land-owner, as most of the rentals were valued nearly two centuries ago at a rate not above one-thirtieth of their present worth. Provision has also been made for the redemption of teinds by the land-owner upon his paying a sum equal to nine years' purchase of their value if they belong to titulars, or to six years' purchase if they are in the hands of patrons. The management of teinds, including their collection, valuation, and sale, as well as the power of "assigning or modifying competent stipends to the parochial clergy out of the teinds of the parish and of uniting and disjoining parishes," is vested in the court of session as commissioners of teinds. See Erskine, *Principles of the Law of Scotland*, bk. 2, tit. 10; Bell, *Principles of the Law of Scotland*, §§ 837, 1146–1163. F. M. Burdick.

**Teisias**: See Stesichorus.

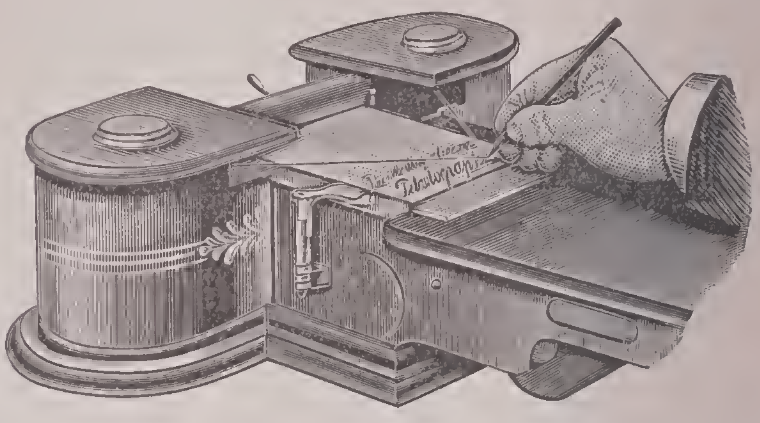
**Tejada, Lerdo de**: See Lerdo de Tejada y Correal.

**Tejuco**: See Diamantina.

**Teka'mah**: town; capital of Burt co., Neb.; on the Tekamah creek, and the Chi., St. P., Minn. and Omaha Railway; 5 miles from the Missouri river, and 42 miles N. of Omaha (for location, see map of Nebraska, ref. 9–H). It is in an agricultural, stock-raising, and fruit-growing region, and has 4 churches, a system of public schools whose diplomas admit to the State University, a national bank with capital of $50,000, a State bank with capital of $30,000, and 2 weekly papers. Pop. (1880) 776; (1890) 1,244; (1900) 1,597. Editor of "Burt County Herald."

**Tekirdagh**: See Rodosto.

**Telautograph** [from Gr. τῆλε, far + αὐτός, self + γράφειν, write]: the name given by Elisha Gray to an instrument invented by him by which autographic messages can be transmitted electrically. The mechanism consists of a transmitting and a receiving instrument, together with two conducting wires, and by its use handwriting, drawings, etc., are instantly reproduced at the receiving-point in facsimile. The message or drawing is produced with an ordinary lead pencil near the point of which two silk cords are fastened at right angles with each other. These cords connect with the mechanism of the transmitter, and, following the motion of the pencil, produce positive and negative electrical impulses through the action of a permanently magnetized steel gear-wheel, the teeth of which induce pulsations as they pass by an electro-magnet. The receiving mechanism at the terminus of the conducting wire is driven by an electric motor operated by a local battery. The pulsations, as they arrive, control an escapement-wheel driven by the motor which moves the writing lever in exact unison with the writing pencil of the transmitter. The movements of the pencil of the writer are reproduced by the shifting of a friction-wheel driven by two disks, one of which gives it an advance and the other a retrograde movement, dependent upon the wheel being brought into contact with one or the other of the two disks. The receiving pen is a capillary glass tube placed at the junction of two aluminum arms; it is supplied with ink from a reservoir through a small rubber tube in one of these



The telautograph (transmitting instrument).

arms. The pen passing over the paper leaves a facsimile of the sender's motions. The writing is made and reproduced on continuous strips of ordinary paper 5 inches in width. As each line is completed the movement of a lever advances the paper the proper distance for the beginning of a new line. The same operation brings the two instruments into unison in case of discrepancy in their movements. Satisfactory tests of the practical working of the telautograph have been made between Chicago and Cleveland, and London and Paris. Ralph W. Pope.

**Tel'edu**, or **Stinkard**: a small carnivorous mammal, *Mydaus meliceps*, of the family *Mustelidæ*, found in the mountainous parts of Java and Sumatra. It is said rarely if ever to descend much below the level of 7,000 feet above the sea. It secretes, like the skunks of America, an intolerably offensive fluid. It is rather nearer the badgers than the skunks in its structure and habits, as well as appearance. The teledu is blackish brown, with a broad white mark along its back and head. Its motions are slow. Its flesh is eaten by the natives. Revised by F. A. Lucas.

**Telegraph** [from Gr. τῆλε, far + γράφειν, write]: in general, any apparatus or process for conveying intelligence to a distance other than by voice or writing. The idea of speed is included, the telegraph being employed only to transmit intelligence more quickly than can be done by ordinary means. Sound, light, and electricity, owing to the rapidity with which they are propagated, form the most convenient agencies for telegraphing. For long distances light and electricity are immeasurably superior to sound.

The necessity of transmitting intelligence to a distance with rapidity and certainty was felt by the ancients, and many expedients were resorted to under different circumstances. These were usually simple, and exhibited little mechanical contrivance. The *semaphore* was the first really efficient telegraph. It was invented by Claude Chappé, and adopted by the French Government in 1794. It consisted of an upright post supporting a pivoted horizontal bar, which could be placed at various inclinations. This had two smaller arms pivoted to its extremities, and capable of being placed at various angles. By independent movements the apparatus was susceptible of ninety-eight distinct positions, and of thus exhibiting the same number of different signals, conventionally representing letters, numbers, words, or sentences. The speed of transmission under the most favorable circumstances was about three signals per minute. The semaphores were placed upon high towers, 4 or 5 miles apart. Much ingenuity was expended by Chappé and others in arranging a system of lights to enable the semaphore to be used at night, but with only partial success. In fogs and snowstorms this system was entirely useless. Before the introduction of the electric telegraph almost every country in Europe maintained lines of semaphores between its capital and the principal ports upon its seaboard. Perhaps the most important and costly undertaking of this kind was the great line constructed by Nicholas I. of Russia, from the Austrian frontier through Warsaw to St. Petersburg, which had 220 stations. The semaphores were erected upon the summits of substantial and lofty towers, and the whole work cost several millions of dollars.

Another system of ocular telegraphy consists of alternately exposing and cutting off a continuous beam of light directed from the sending to the receiving stations, the characters being formed on the same principle as those of the conventional telegraphic alphabet, shortly to be described, which consists in breaking a continuous line into sections of varying length. In 1861 Moses G. Farmer made a series of successful experiments with this method between Hull and Nantasket on the coast of Massachusetts, and it also appears to have been employed about the same time by the officers of the U. S. Coast Survey on Lake Superior, where, by means of equatorially mounted mirrors, telegraphic messages were exchanged between stations 90 miles apart with ease and rapidity. During the campaign of Gen. Miles against the Apaches in New Mexico and Arizona a system of thirteen stations was established, over which, during a period of four months, more than 1,800 messages, containing some 35,000 words, were sent. The savages were surprised and confounded by the way in which intelligence of their hostile movements became known hundreds of miles away. The French have established heliographic communication between the islands of Mauritius and Reunion in the Indian Ocean, the stations, which are on mountain-peaks, being no less than 133 miles apart. Even this has been surpassed by the U. S. Signal-corps, which has exchanged messages between Mt. Uncompahgre, Col., and Mt. Ellen, Utah, a distance of 183 miles. In 1862 this system was taken up by Capt. Colomb and Maj. Bolton and introduced into the British navy, electric and calcium lights being employed at night and a collapsing drum closing upon its central hoop by day. During the siege of Paris messages were often sent 20 or 30 miles from one elevated point to another by the use of a calcium light concentrated and directed by lenses. More recently it has been proposed to employ a similar alphabet of short and long sounds for signaling between vessels at sea.

*Telegraphing by Electricity.*—As soon as it became known that electricity could be conducted by wires to a distance, it began to be regarded as a possible means of conveying intelligence. The earliest suggestion of this kind seems to have been contained in a letter to *The Scots Magazine* dated Feb. 1, 1753, the authorship of which has never been satisfactorily determined. The writer proposed to employ insulated wires equal in number to the letters of the alphabet, the signals being given by means of frictional electricity. In 1774 Lesage, of Geneva, constructed the first electric telegraph, which was practically a realization of the above idea. It had twenty-four wires, each connected with a pith-ball electroscope, the signals being given by frictional electricity. From this time forward many ingenious attempts were made to employ frictional electricity for telegraphic purposes, most of which it is unnecessary to notice in detail. In 1816 Francis Ronalds constructed a telegraph, making use of frictional electricity and a single wire, and exhibited signals by the divergence of pith-balls combined with synchronously revolving dials. He fully appreciated the value of his idea, and strove to bring it before the British Government, but was informed that "telegraphs of any kind are now wholly unnecessary, and no other than the one now in use will be adopted." In 1828 Harrison Gray Dyar, of New York, invented a telegraph, the principle of which consisted in sending discharges of frictional electricity through a wire, which were to be recorded upon a sheet of moistened litmus-paper moving at a uniform rate. The relative intervals between the discharges were to indicate the letters of the alphabet. There is evidence that this invention was experimentally tried on Long Island the same year in which it was invented, but little is definitely known respecting the results. In 1820 Ampère suggested that the deflection of a needle by the galvanic current might be used for telegraphic purposes. In 1830 Baron Schilling constructed a telegraph having five vertical needles, and in 1835 he exhibited his invention, simplified to a single needle, at Bonn. This was shown by Moncke at Heidelberg in 1836 to W. Fothergill Cooke, who immediately set to work to devise and construct a telegraph for practical use, consisting of a pair of three-needle instruments, with keys and reciprocal system. He also invented the electro-mechanical alarm and the detector for discovering the position of faults in the lines. In Feb., 1837, he became associated with Wheatstone, and took out a patent with him the same year. In 1839 the first actual electric telegraph was constructed, extending from Paddington to Drayton, in England, a distance of 13 miles. It had six wires and five needles. The wires were wound with hemp and laid in a pipe on the surface of the ground. In 1839 Dr. W. O'Shaughnessy at Calcutta, India, built the first over-ground line of iron wire on bamboo poles. It was 21 miles long, and worked by Cooke's signal-needle instrument. Meanwhile in the U. S. Joseph Henry's experiments in electro-magnetism had demonstrated the feasibility of transmitting signals by a current of electricity through insulated wire.

Samuel F. B. Morse, of New York, during a voyage home from France in 1832, conceived the idea of making signs at a distance by means of a pencil moved by an electro-magnet and a single conducting circuit, the paper being moved under the pencil by clockwork. He constructed a working model of his invention in 1836, and exhibited it to several persons the same year, but not publicly until 1837. Several years were devoted by Morse and his associate Alfred Vail to improving the invention and endeavoring to interest the public in the project. It was not until 1844 that the first public line was completed between Washington and Baltimore (40 miles), and the first message transmitted May 27 of that year. Within a few years, however, lines were extended to the principal cities of the U. S. The Morse telegraph was introduced into Germany in 1847, whence it has spread all over the Eastern hemisphere, and may now be said to be the universal telegraph of the world. Gauss and Weber, of Göttingen, Germany, constructed a telegraph in 1833 consisting of a magnetic needle acted upon by magneto-electric currents. Their invention was taken up by Steinheil in 1836–37, and practically worked out to a high degree of perfection. The discovery that the earth may be employed as part of a telegraphic circuit was made by him. Steinheil's telegraph never went into extensive use, owing to the introduction of the Morse system in Germany.

The earliest experiment on record in submarine telegraphy was made by Dr. W. O'Shaughnessy at Calcutta in 1839. He laid a copper wire, insulated with a coating of cotton thread saturated with pitch and tar, across the river Hugli, and transmitted signals through it. In 1842 Morse made experiments with a cable between Castle Garden and Governor's island in New York, and obtained results that demonstrated the practicability of submarine telegraphy. In 1847 J. J. Craven, of Newark, N. J., insulated an iron wire with gutta-percha and placed it in the circuit of the New York and Washington telegraph line, submerging it in the waters of a small creek. The success of this experiment led to the laying of a gutta-percha cable between New York and Jersey City in 1848. In 1850 an experimental line was laid across the English Channel, followed in 1851 by a permanent cable, which is still in use. The success of this undertaking at once revived the suggestion of laying a cable across the Atlantic Ocean from Ireland to Newfoundland. In 1854 the attention of Cyrus W. Field, of New York, was directed to the subject, and mainly through his efforts a company was formed, principally of British capitalists, to undertake the enterprise. The first attempt was made in Aug., 1857, but it was unsuccessful, the cable parting 300 miles from shore. The following year the attempt was renewed, and the enterprise successfully completed Aug. 5, 1858. The electrical condition of the cable was faulty from the first, but signals and communications were exchanged with more or less facility until Sept. 1, when the cable failed altogether. During this time 366 messages, containing 3,942 words, were interchanged between Europe and America. Several attempts to raise and repair the cable were made without success, and this disastrous result discouraged further enterprise in the same direction for a number of years. The experience gained, however, was of the highest value, and the success of the Malta and Alexandria (1861), Persian Gulf (1864), and other deep-sea cables led to a renewal of the attempt to cross the Atlantic in 1865, which again resulted in the breaking of the cable after 1,186 miles had been paid out. The following year, however, a new cable was successfully submerged, being landed at Newfoundland in perfect working order July 27, 1866, and the great problem was thus at last definitely solved. In September following the lost cable of 1865 was picked up and completed. From that date such rapid progress has been made in the extension of telegraphic cables that no isolated system of telegraphs is to be found throughout the world.

All electric telegraphs may be said to consist of three parts: first, an apparatus for generating or producing the electric current; second, a conductor for conveying the electricity from one point to another as required; and, third, apparatus for transmitting and receiving the signals.

I. Sources of Electricity.—The electricity used in telegraphy may be derived either from the voltaic battery, the magneto-electric machine, or the thermo-electric battery. Of these, the voltaic battery has been the most commonly used, though latterly much has been done in developing the capacity of the dynamo-electric machine, which in most large stations has successfully replaced the voltaic system. The employment of the thermo-battery is very infrequent.

A. *Voltaic Batteries.*—Of these, the sulphate of copper battery, invented by Daniell in 1836, is the most generally employed. It is constructed in various forms, the most useful of which are (1) the gravity battery, invented by Fuller in 1853, which is almost exclusively used in the U. S., and (2) the trough battery, another form of the same, used in England. (3) The manganese battery, invented by Leclanché in 1867, is extensively used in France and England; (4) the nitric-acid battery of Grove; and (5) the chromic-acid battery, such as that of Bunsen is now but little used. (6) Storage batteries or accumulators are employed in many of the larger European stations and in some few instances in the U. S.

B. *Magneto-electric Machines.*—The earliest form of this apparatus was Pixii's, which is employed in Wheatstone's dial telegraph. Siemens's (1855), a much more efficient apparatus, is largely used in dial and other special telegraphs. In 1879 S. D. Field successfully applied the Siemens dynamo machine in the Western Union telegraph office in New York, with highly economical results, ten small dynamos replacing 35,000 cells of battery. Since that date the dynamo machine has been adopted in most of the larger stations.

C. *Thermo-electric Batteries.*—No permanently successful installation of this kind was made until the year 1895, when H. B. Cox's apparatus was introduced on the lines of the Commercial Cable Company in New York. The consumption of gas in the ordinary operations of the lines is 7 cubic feet an hour.

*Circuits.*—In applying electricity from any source to the production of telegraphic signals, it is generally done in one of three ways: (1) by completing the circuit of a battery or other generator, and giving signals by causing currents of determinate polarity to traverse a line normally free from electricity; or (2) by connecting the battery and line, so that a constant current will traverse the latter, the signal being given by interrupting this current; or (3) by arranging the battery and line as in the last case, and giving signals by reversing the polarity of the current instead of interrupting it.

II. Telegraphic Conductors.—Conductors are usually carried through the air, but when required may be placed under ground or under water. In either case they must be well insulated with non-conducting materials.

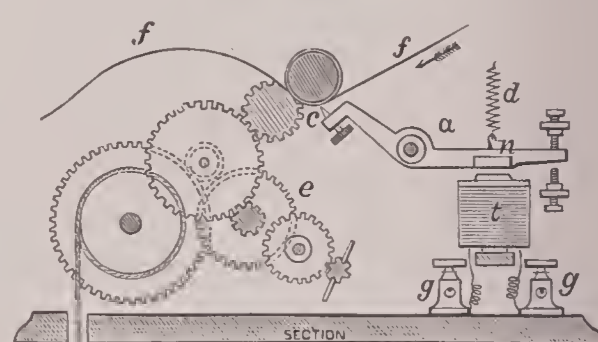
A. *Over-ground.*—Galvanized iron wire weighing from 320 to 740 lb. per mile and hard-drawn copper wire weighing from 166 to 209 lb. per mile are used in the U. S. The largest wire is used for the longest lines, and equivalent sizes are used in most of the European countries. The wires are supported on wooden poles placed along railways or highways from 8 to 10 rods apart. From 1 to 50 wires may be conveniently placed on one line of poles, the lowest being 20 feet from the ground. Iron poles are seldom used except in desert and tropical countries. The wires are attached to the poles by insulators of a bell or inverted cup shape, which are supported by brackets or cross-arms of wood or iron. In the U. S. insulators are usually of glass, in Europe and Asia of brown earthenware or white porcelain. In large cities the wires are frequently carried on standards fixed upon tall buildings.

B. *Under-ground.*—Wires are now laid under ground in the principal cities of Europe and also in New York and other large cities of the U. S. In London No. 13 copper wires, coated with gutta-percha to a diameter of $\frac{3}{16}$ths of an inch, are used. The required number of these are laid in a cable served with tarred tape. The cables are made in lengths of 400 yards, and drawn into iron pipes laid 2 or 3 feet below the surface of the ground. Boxes with trap-covers are placed every 400 yards for convenience in testing wires and drawing them in and out. The same system has been adopted in other cities of Great Britain, and also in New York. In Paris the cables are placed in the sewers. The plan of inclosing wires wrapped with fibrous material loosely within a metal tube filled with paraffin oil under pressure (Brooks's system) is much less expensive, and has been used to some extent. Paper insulation has also proved successful.

C. *Submarine.*—The early submarine lines were simply ordinary iron wires coated with gutta-percha to a diameter of half an inch. In the cable laid between Dover and Calais in 1851 four gutta-percha coated wires were wrapped with hemp and inclosed in a wire rope for protection. This general plan has been followed in all cables since constructed. The Atlantic cables are composed of a copper strand of seven wires, forming the conductor, surrounded by several distinct layers of gutta-percha and covered by a serving of jute; outside of this is a protecting armor of ten wires of homogeneous iron, each enveloped in fine strands of Manilla hemp. In shallow waters, where cables are exposed to injury from anchors, the armor is often made enormously thick and heavy, sometimes weighing as much as 20 tons a mile. The modern type of deep-sea cable weighs about 2 tons for each mile.

III. Telegraphic Apparatus.—The apparatus used in telegraphy may be conveniently divided into recording and non-recording. Of each of these there are several varieties, which will be described in order.

A. *Recording Telegraphs.*—These are of two classes, one recording arbitrary signs, and the other ordinary printed letters. (1) *Marking Telegraphs.*—(*a*) Morse's is by far the best known and the most extensively used of this class. Its characteristic feature is the *register*, which is constructed in many forms, but upon the general principle shown in the diagram. A horizontal lever is mounted upon a fulcrum, *a*, and armed at one end with a steel point, *c*, projecting upward and nearly touching a ribbon of paper, *f*, which is carried along at a uniform rate by a grooved roller just above it, the roller



The telegraphic register.

being impelled by a system of clockwork, *e*. The opposite end of the lever carries a soft iron armature, *n*, suspended just above the poles of an electro-magnet, *t*. The end of the wire helix surrounding this magnet terminates in binding-screws, *g g*, to which the conducting wires are attached. A current of electricity traversing the helix of the electro-magnet causes it to become powerfully magnetic, attracting the armature, *n*, to its poles, and thus pressing the steel point, *c*, against the paper ribbon moving above it upon the grooved roller. A continuous line will in this manner be embossed upon the paper as long as the armature remains attached to the poles of the magnet. When the current is interrupted, the magnetism disappears, and the spring, *d*, draws the marking-point away from the paper. Thus the length of the line embossed upon the paper corresponds to the greater or less length of time that the electric current is allowed to traverse the helix of the electro-magnet, *t*. This is governed by the transmitting instrument termed the key, which is simply a small horizontal lever with a finger-knob at one end and a spring beneath. The wire leading from the line is connected to this lever, and when the latter is depressed by the finger of the operator, it comes in contact with a metallic stud, known as the anvil, to which the battery wire is attached; thus the circuit is completed and the current permitted to flow into the line. When the latter is but a few miles long, the battery and key are connected directly by a wire with the electro-magnet of the register: but when the distance is greater, an instrument called the *relay* is employed. This consists of an electro-magnet with a lever mounted like that of a register, except that the marking-point is replaced by a contact-point, which opens and closes the circuit of a local battery, and this in turn operates the register. A considerable number of relays with their registers may be placed at as many different points upon the same line, and all operated simultaneously by a key at any point; and, in fact, this is the arrangement usually adopted in the U. S. The greatest length of line ordinarily worked in one circuit is about 500 miles, and the number of relays at different points varies from 2 to 30, and even 40. The line or main batteries are usually placed at the two ends of the route, though each station has of course its local battery of one or two cells. The alphabetical code, believed to have been devised by Vail, consists of arbitrary characters composed of combinations of short lines termed dots and longer ones termed dashes, separated by varying spaces. This alphabet, it will be seen, is capable of being written with facility by means of the key and register above described. The following is the alphabetical code used in the U. S., Canada, Mexico, and Central America:

THE AMERICAN TELEGRAPHIC ALPHABET.

The international alphabet is preferable, as it contains no spaced letters; these sometimes give rise to errors in reading communications. In Europe and Asia an improved register ealled the ink-writer is much used. A sharp-edged wheel is kept constantly revolving in a dish of colored fluid. The slightest pressure of this against the paper suffices to make a distinct mark, and thus the relay may be in most cases dispensed with, as a very feeble current is sufficient to make a perfect reeord. Electro-magnets intended for use in the main circuit, whether for relays or ink-writers, usually have helices composed of several thousand convolutions of very fine insulated wire, but for local circuits a small number of convolutions of coarse wire is sufficient. In order to transmit direct between points more than 500 or 600 miles apart, two or more circuits are coupled together by means of an automatic repeater, which was first accomplished by C. S. Bulkley in 1848. By this means each circuit operates the succeeding one upon the principle of the relay. In this way direct communication has been had between points several thousand miles apart.

(*b*) Bain's electro-chemical telegraph was invented in 1846, and extensively used in the U. S., Great Britain, and Germany from 1849 to 1860, but is now superseded by Morse's. The system of signs and the transmitting key are similar to those of Morse. The record is made by passing the current from the line over an iron style and thence directly through a moving strip or disk of paper. The paper is saturated with a mixture of 10 parts of saturated solution of potassium ferrocyanide, 2 parts each of nitric and hydrochloric acid, and 1 part of chlorinated lime. The electric current causes the solution to unite chemically with the iron of the style, forming Prussian blue. A very weak current suffices to give a distinct mark. No electro-magnet is required in this system except to operate an alarm.

(2) *Printing Telegraphs.*—The earliest conception of a telegraph which should record messages in printed Roman letters is due to Alfred Vail, of New Jersey (1837). The first model of such an instrument was made by Wheatstone (1841). (*a*) *House's Telegraph.*—This was the earliest practical printing instrument. It was first invented in 1844, introduced in 1847, and largely used in the U. S. until about 1860. It is simple in principle, though complicated in construction. The twenty-six letters of the alphabet, a period, and a blank are engraved on the edge of a type-wheel, upon the shaft of which is a scape-wheel of fourteen teeth. The type-wheel revolves by manual power, but is held in check by a double-acting anchor escapement. The latter vibrates by the alternate action of an axial electro-magnet and a retracting spring. When at rest, the blank space on the type-wheel is in front, the circuit being complete. If it is interrupted the scape-wheel advances half a tooth, presenting the letter *A*, and when restored it again advances, presenting *B*. If the circuit is opened fourteen times and closed fourteen times alternately, the type-wheel will make a complete revolution. It is obvious that any particular letter may be presented by breaking and closing the circuit the proper number of times. This is effected in practice by a metallic contact-wheel at the transmitting station. This wheel has fourteen teeth and fourteen equal spaces; its axis is connected to the line. A flat spring connected with the battery touches each tooth as it revolves and transmits the electric pulsations. The revolution of this contact-wheel is stopped at the proper place for each letter by a keyboard having twenty-eight keys. A cylinder fixed upon the axis of the contact-wheel carries twenty-eight pins arranged in a spiral, each pin turning with the cylinder underneath its own key. Each key is provided with a stop, which falls into the path of the pin and arrests the cylinder when the key is depressed. Thus when the cylinder is turned from one letter to another, just so many contacts and interruptions are given as will advance the type-wheel the same distance. The printing is effected at the receiving station by the action of an eccentric which is automatically released when the wheel pauses at any letter. It makes a single revolution, forcing the paper against the letter presented by the type-wheel, and then advances the paper, which is in the form of a continuous ribbon, so as to leave a clear space for the impression of the succeeding letter. Thus it will be seen that the instrument is operated wholly by manual power, the only office of the electric current being to secure a corresponding movement between the type-wheel of the receiving and the contact-wheel of the transmitting instrument. The apparatus requires a powerful electric current, and it seldom operates satisfactorily on a line more than 250 miles in length. (*b*) *Hughes's Telegraph.*—This was invented by D. E. Hughes in 1855, and has been extensively used in Europe since 1860. The essential principle of the apparatus is the synchronous movement of two constantly revolving shafts at two stations. This is effected by means of a governor consisting of a recoil escapement and a vibrating bar. The shaft at the transmitting station carries a revolving contact-maker, and the corresponding one at the receiving station a type-wheel similar to that of House. The contact-maker travels over a circle of twenty-eight pins which are connected with the same number of piano-keys. Each pin represents a letter, and is raised by the depression of the corresponding key when a letter is to be transmitted. The contact-maker, which travels round the circle of pins with a motion uniform with that of the type-wheel at the receiving station, comes in contact with the raised pin at the same instant that the corresponding type upon the type-wheel is passing the platen and closes the circuit. An electro-magnet at the receiving station releases a cam which throws the platen carrying the paper against the type as it is passing, thus printing the letter. Only one pulsation is thus required for the printing of each letter, and by the use of a peculiar form of electro-magnet a very weak current suffices to do the work. (*c*) The *combination instrument* is a modification of Hughes's. It retains the principle of synchronous mechanism at the sending and receiving stations, but it differs much in details. It has an electro-magnetic governor instead of a vibrating spring, and is more simple and durable in its construction than the Hughes apparatus. It was invented in 1859 by G. M. Phelps, and was formerly used on many of the principal lines in the eastern part of the U. S. (*d*) *Phelps's Electro-motor Telegraph.*—This apparatus was invented in 1869, and in 1875 was put in use by the Western Union Telegraph Company between Boston and Washington. The mechanism is driven by a small electric motor connected with a special battery. This is more convenient and economical than the manual power required by the House machine or the heavy weight and clockwork of the Hughes apparatus. The synchronous movements of the

transmitting mechanism at one station and the type-wheel at the other are maintained by means of a centrifugal governor attached to the motor, which instantly reduces the strength of the local current by which the latter is propelled whenever the speed of revolution tends to exceed the prescribed limit. The synchronous movement of the Hughes apparatus is retained, except that both the type-wheel and the revolving contact-maker are simultaneously arrested for a given integral portion of a revolution during the transmission and printing of each letter. An improved form of the automatic unison for bringing the two instruments into correspondence whenever transmission is suspended for a few moments (invented by Farmer, 1858) has also been applied to this instrument. (*e*) *Telegraphs for Financial and Commercial Reporting.*—The method of reporting the fluctuations of the prices of stocks, gold, merchandise, etc., by means of automatic-printing telegraph instruments placed in the offices of merchants, brokers, and other interested persons, and of which several hundred are often simultaneously operated by a single person located in the central exchange, originated in New York in 1867, and has since extended to the principal cities of the U. S. and of Europe. The instruments which have been principally used are those of Calahan, Pope, Edison, Phelps, Van Hoevenbergh, and Smith, though many others have aided in the perfection of the apparatus. The general principle is the step-by-step movement of the House apparatus, but two type-wheels are made use of—one for letters and the other for numerals and fractions—which print in parallel lines on the same strip of paper. By an ingenious device invented by Dujardin in 1867 the platen is automatically shifted from one type-wheel to the other by the operator at the central station according as he wishes to print letters or numerals. These instruments also have an automatic unison invented by Foote (1869). The printing is in most cases effected by a special electro-magnet. (*f*) *Printing Telegraphs for Private Use.*—These are constructed upon a plan similar to the instrument for commercial reporting, and thousands of them were used by manufacturers, merchants, and others from 1870 to 1878, after which they were practically superseded by the speaking telephone. The most successful were those of Gray, Chester, and Anders. Any intelligent person after a few minutes' instruction can print a communication at any distance, even in the absence of an attendant, by depressing the proper keys upon a lettered keyboard. The speed of transmission is from 10 to 30 words per minute, depending upon the instrument used and the skill of the operator.

B. *Non-recording Telegraphs.*—These may be divided into two classes—visual and acoustic. They give only evanescent signals, and are sometimes termed semaphores.

(1) *Visual Telegraphs.*—(*a*) *Cooke's Needle Instrument.*—This is simply an upright galvanometer needle surrounded by a coil of fine insulated wire, and is operated from the sending station by two keys, one of which sends a positive current, deflecting the needle to the right, and the other a negative current, deflecting it to the left. The alphabetical code is the same as the Morse, a deflection to the left signifying a dot, and to the right a dash. Owing to its simplicity and convenience this apparatus was almost universally used in Great Britain from 1840 until within a few years, since which time it has been superseded on all the important lines by the Morse system. It still retains its supremacy for railway use. (*b*) The dial instrument, invented by Wheatstone in 1840, is arranged on the same plan as a type-printer, but is much more simple, as an index-hand and dial carrying the alphabet replaces the somewhat complex type-wheel and printing apparatus. These are largely used for private and police telegraphs, and in Europe for railway purposes, as they are easily operated by unskilled persons. The best known are those of Wheatstone, Siemens, Anders, Bréguet, and Chester. The three first mentioned are operated by magneto-generators and require no battery. (*c*) The visual indicator, invented by C. H. Pond (1880), is a species of dial telegraph employed in connection with the fire-alarm system (see below), to exhibit the number of a signal-box simultaneously when an alarm is given.

(2) *Acoustic Telegraphs.*—Of these, the best known and most important is (*a*) the sounder, which is simply a Morse register stripped of all its parts except the electro-magnet, writing lever, and retracting spring. The operator interprets the sounds made by the motion of the lever up and down between its stops. This method was taken up by operators in the U. S. about 1848, and the sounder has now almost entirely superseded the recording apparatus in the U. S. and Canada, as experience proves that the speed of transmission is practically doubled, while, somewhat paradoxically, the proportion of errors is largely diminished. The same method is employed in India, and to an increasing extent in Great Britain and other parts of Europe. The operator reads from the instrument, and simultaneously copies the message. For military purposes the sounder, together with a manipulating key, is often reduced in size, so as to be contained in a pocket-case not larger than a tobacco-box and weighing but a few ounces, and yet forming a completely equipped Morse telegraph station, which may be connected with a line at any required point. (*b*) The fire-alarm telegraph, invented by W. F. Channing and M. G. Farmer, of Boston (1851), is a most ingenious and useful application of the telegraph, in use in the principal cities and towns in the U. S., and other countries. A series of locked signal-boxes are placed at convenient intervals throughout a city or town; each of these contains mechanism which, when wound up by simply pulling a hook, will instantly transmit through the connecting telegraph wires a determinate numerical signal representing that individual box and no other. The signal thus transmitted is instantly sounded, by means of mechanism controlled by electro-magnets in the circuit, upon the church and tower bells and upon large gongs placed in all the fire-engine houses. So effective is this system in practice that frequently in less than thirty seconds after the discovery of a fire a number of engines will be on their way to the spot. This invention has been the means of saving millions of dollars' worth of property and thousands of lives since its introduction. By a subsequent invention of W. B. Watkins (1871) the fire itself is made to transmit a numerical alarm-signal automatically. Thermostats are placed in the rooms of a building, which when heated above the normal temperature close a circuit and trip the clockwork of an automatic transmitter. The rest of the apparatus resembles Channing and Farmer's. (*c*) The district telegraph (1870) is another application of the above system. Signal-boxes are placed in the houses of persons desiring them, and connected telegraphically with a central station. By simply turning a crank at any hour of the day or night a messenger or policeman may be instantly summoned or a fire-alarm transmitted. Many thousands of these signal-boxes are in use in New York and other important cities of the U. S. (*d*) An application of the same principle is found in the municipal or police telegraph, one arrangement of which, for public use, employs a number of street stations, from any of which police assistance may be summoned by a citizen at a moment's notice. Another adaptation is an automatic attachment to safes, vaults, and other structures having valuable contents, so that in case the fastenings are tampered with by unauthorized persons a definite alarm is silently sent to a central station, at which officers are always on the alert.

IV. Special Methods of Telegraphy.—A. *The Automatic Process.*—At an early period in the history of telegraphy attempts were made to devise methods of transmission, by which means the capacity of each individual wire might be largely increased, and the evils which necessarily arise from a multiplication of wires in a great measure avoided. In 1846 Alexander Bain, of Scotland, patented an automatic telegraph, in which the messages, instead of being transmitted by a key or manipulator, were first prepared by punching out the telegraphic characters in a ribbon of paper, the dots and dashes being represented by perforations of different lengths. In order to transmit the prepared message the strip was caused to pass rapidly over a metallic roller driven by clockwork or otherwise, and a light spring or brush of metal, resting upon the paper over the roller, made contact with the latter through each of the perforations as they successively passed under it, and thus completed the electric circuit between the battery and the line. By this means several operators could be employed simultaneously in preparing messages, which could be run through the machine and recorded on chemical paper at the receiving station at a high rate of speed. The system was tried in Great Britain and the U. S. in 1849 and 1850, but no practical advantage over hand-labor resulted, perhaps largely owing to the fact that no convenient means of perforating the paper had been devised. In 1856 Dr. W. Siemens, of Berlin, invented a perforating-machine with three keys, by which the time required to prepare a dispatch was much lessened. He applied this method in conjunction with Morse's receiving apparatus on many Russian lines in 1853–55, but the automatic feature was soon abandoned. In 1856 J. P. Humaston, of Connecticut, invented a keyboard perforator which produced a complete character by the touch of a single key. The same year Siemens introduced the polarized relay, operated by alternate positive and negative currents. In 1858 Wheatstone, in England, modified Siemens's apparatus, and in its subsequently improved form it is largely used on the Government lines in Great Britain, especially for sending large quantities of press news in duplicate. The same system is used on a number of the more important lines in the U. S., and is probably destined to be still more extensively employed.

B. *The Autographic Process.*—In 1848 F. C. Bakewell, of London, patented a modification of Bain's automatic process by which a facsimile of the transmitted dispatch is produced at the receiving station. The original is written on tin-foil with insulating ink, and wrapped round a metallic cylinder rotated by clockwork at a uniform rate. A style rests upon the cylinder as it turns, and also receives a slight lateral motion by a screw as the cylinder revolves; it thus describes a spiral path, passing successively over the whole surface of the tin-foil on the cylinder. The battery-current passes through the style to the tin-foil, thence to the cylinder and over the line, but is necessarily interrupted when passing over the insulating lines of the writing. The cylinder at the receiving station is covered with Bain's chemical paper, and revolves synchronously with that of the transmitter. The iron style traces a continuous blue line on the paper, except when the current is interrupted by the style passing over the lines of writing upon the tin-foil. The chemical paper therefore appears covered with fine parallel blue lines, forming a ground-tint upon which a facsimile of the writing appears in white. This apparatus, though practically unsuccessful on account of the difficulty in maintaining sufficiently accurate synchronism, illustrates the principle of all its successors. Abbé Caselli, of Florence, in 1856 greatly improved this process by employing a pendulum to control the synchronous movements of the two corresponding instruments, and by so arranging his electrical connections that the facsimile appeared in blue on a white ground. In 1865 this process was put in actual service on some of the French and Russian telegraphs, and has given very good results. The more recent inventions of Lenoir and Meyer in France record in ink by means of electromagnets. W. E. Sawyer in 1874 invented several improvements in the autographic process, one of which consists in transferring the original message, written upon ordinary paper, to a metal plate for transmission. (See also TELAUTOGRAPH.) As the autographic process dispenses entirely with specially skilled labor, it is not unlikely that it may yet prove to be of considerable economic value.

C. *The Multiple Process.*—The idea of increasing the capacity of a line by transmitting two or more communications simultaneously appears to have been first suggested by Farmer, who in 1852 made a successful experiment on one of the municipal lines in Boston. He employed two rapidly revolving synchronous commutators, one at each end of the line, which served to bring the latter successively and simultaneously into connection with two or more short branches at each terminus, in each of which ordinary telegraphic instruments were inserted. Thus the current in the corresponding branches at each terminus, though apparently continuous, actually consisted of rapidly recurring pulsations. From the difficulty of maintaining synchronism, and other causes, nothing practical resulted from the experiment. In 1873 Meyer, of France, exhibited at Vienna an apparatus on this principle capable of transmitting four simultaneous communications. It has been employed in actual service between Lyons and Paris, and is said to have a capacity of 110 messages per hour. In 1853 Dr. W. Gintl, of Austria, invented a method of simultaneous transmission in opposite directions by connecting an auxiliary local circuit with the Morse key, which passed through a separate but opposing helix upon the instrument at the home station, and thus neutralized the effect of the current transmitted over the line upon the home instrument, while at the same time it was left free to respond to the increased current in the line due to the depression of the distant key. Practically it was found impossible to adjust the local current so as to perfectly compensate that of the main line. The following year Carl Frischen, of Hanover, substituted a branch of the main current for the local current of Gintl, and the method thus improved was used to a limited extent in Austria and Holland. In 1855 Stark, of Austria, proposed a method of simultaneous transmission in the same direction, and suggested that it might be combined with Frischen's plan, thus enabling four simultaneous dispatches to be sent over one wire. In 1858–59 Farmer made successful experiments with a modification of Frischen's method on several American lines. J. B. Stearns, of Massachusetts, revived Frischen's method in 1868, and in 1872 enormously improved it by adding a condenser to compensate the effects of induction in long lines. He introduced the improved method known as the "duplex" into general use, first in the U. S. and afterward in Europe. In 1874 Thomas A. Edison invented a new method of simultaneous transmission in the same direction, which has been combined with Stearns's method, forming a "quadruplex." Subsequent improvements by G. Smith and others have vastly increased the effectiveness of this method. It is in extensive use, and is regarded as an improvement of the highest value.

D. *Submarine or Cable Telegraphy.*—Owing to the embarrassment arising from electrostatic induction in long submarine cables, special arrangements have been devised by Lord Kelvin (better known as Sir William Thomson), C. F. Varley, and others without which it would scarcely be possible to transmit through them at a sufficient rate of speed to render them commercially valuable. The method employed on the Atlantic cables is a modification of Cooke's single-needle method, and is arranged as follows: Two keys, which when depressed transmit respectively positive and negative currents, are employed at the sending station in connection with a battery of a few elements only. The current of the battery does not pass directly into the cable, but into a condenser of considerable capacity composed of tin-foil plates interleaved with paraffined paper, the opposite side of which is attached to the cable, and the condenser transmits a wave of electricity through the cable. As there is no actual circuit from one terminus to the other, this arrangement serves to cut off the earth-currents, which would otherwise be troublesome. The receiving instrument employed is Thomson's reflecting galvanometer, the message being read by the right and left deflections of a spot of light upon a screen, which moves to and fro as in the ordinary needle telegraph. The recording or siphon galvanometer of the same inventor writes down the deflections by means of ink spurted from a fine glass siphon-tube attached to a coil suspended between powerful fixed magnets, and which swings to the right or left as the positive or negative pulsations pass through it. The record appears upon a ribbon of paper in the form of a straight line when no signal is passing, but with waves to the right or left when pulsations pass through the coil. Important improvements in this apparatus have been introduced by Charles Cuttriss. Mr. Stearns successfully applied his system of duplex telegraphy to the Valentia-Newfoundland cables in 1877–78, thereby doubling their carrying capacity. Dr. Muirhead about the same time effected the same result upon the Marseilles-Alexandria cable by a different system. All the important cables are now worked in this manner.

E. *Telegraphy without Wires.*—This idea was originally based on the principle of induction, and is nearly as old as the ordinary electric telegraph. Until the invention of the telephone, however, there was no practical instrument of sufficient sensibility to permit of tangible results. The only commercial application of the principle is the so-called "train telegraph," by which communication may be practically established with moving railway trains. The method of accomplishing this is the connection of the metallic roof of the car with the receiving apparatus therein, the principal feature of which is a magneto-telephone. An ordinary telegraph line alongside the track, but closer to it than usual, conveys the induced pulsations to and from the station. This system is entirely practicable, and was operated for some time on the Lehigh Valley Railroad. On Dec. 12, 1896, a young Italian electrician, Signor Marconi, exhibited through Mr. W. H. Preece, at Toynbee Hall, London, a system of telegraphy without wires depending upon electrostatic instead of electro-magnetic effects, in which electric (Hertzian) waves at the rate of 250,000,000 per second were utilized. Like light, these smaller waves are capable of being projected in one direction only, and consequently their power was not so enormously diminished in transmission to any distance. The apparatus was concealed in two boxes, one of which was placed in each end of the hall. The signal was made in one, and a bell immediately rung in the other. A previous experiment had been made on the top of the General Post-office, followed by another at Salisbury Plain, where signals were transmitted $1\frac{1}{4}$ miles. No complete description of the apparatus has been divulged, beyond the fact that a 10-inch induction coil was used with a Lodge originator and a parabolic reflector.

F. *Pneumatic Telegraph.*—This system has been employed for many years in Europe, and is extensively used in the U. S. Brass tubes $2\frac{1}{2}$ inches in diameter are laid in trenches under the streets. The messages are rolled up and placed in a cylindrical carrier of leather or felt about 8 inches in length, closed at the front, and provided with a flange loosely fitting the inside of the tube, while the rear end is left open. The carriers are driven in one direction by compressed air and in the other by an exhaust, both operated by a powerful air-pump at the central station. Packages of ten or twelve messages are sent a distance of half a mile in a few seconds. See PNEUMATIC TRANSMISSION.

The best authorities give the total length of telegraph line in all countries at the beginning of 1894 as 900,000 miles, of which 158,000 were submarine. The total mileage of wire was 2,632,000. Nearly all the submarine lines have been established by British companies.

The most extensive telegraphic system in the world is that of the Western Union Company of the U. S. In 1900 it had 192,705 miles of telegraph lines, 933,153 miles of wire, 22,900 offices, and transmitted 63,167,783 messages.

The number of messages transmitted in 1898–1900 in some of the principal countries of the world was as follows:

| | | | |
|---|---|---|---|
| Great Britain (1900) | 90,415,123 | India (1899) | 5,448,600 |
| Germany (1899) | 44,558,742 | Italy (1898) | 8,667,460 |
| Austria (1899) | 14,697,898 | Netherlands (1899) | 5,218,320 |
| Belgium (1899) | 12,550,871 | Norway (1899) | 2,236,229 |
| Denmark (1899) | 2,215,572 | Sweden (1898) | 2,451,708 |
| France (1898) | 43,963,811 | Japan (1900) | 14,763,777 |
| Switzerland (1899) | 3,970,098 | Russia (1898) | 19,217,238 |
| Hungary (1899) | 13,919,737 | Canada (1899) | 4,830,501 |

FRANKLIN L. and RALPH W. POPE.

**Telegraph Companies**, LAWS RELATING TO: The business of telegraph companies is so "affected with a public interest" that they may be authorized to take private property for their use, upon making due compensation (see EMINENT DOMAIN), and that the construction of their lines, as well as their rates and their treatment of customers, may be regulated by the state. It is now settled, contrary to the doctrine of a few early decisions, that these companies are not common carriers. Their legal status, however, is quite analogous to that of common carriers. Their employment is of a public nature, which subjects them to duties over and above those created by their contract obligations. For example, they must take all lawful messages that are offered, up to the limit of their facilities; they must transmit them, as a rule, in the order of reception; they must treat all customers impartially, even to the extent of furnishing facilities for rival companies. *Del., etc. Telephone Co.* vs. *State of Del. ex rel. Postal Telegraph Co.*, 50 *Fed. R.* 677.

*Regulations.*—They have the right to make reasonable rules and regulations touching their dealings with customers. All messages may be required to be plainly written; prepayment may be required, as well as a deposit for an answer; and the hours during which messages will be received and sent may be fixed. Whether the regulation that the company will not be responsible for the correctness of a message, unless it is repeated, is reasonable, and therefore binding on customers who assent to it, is a question upon which the courts are divided. In Great Britain, in New York, and in other States of the U. S. the regulation is approved. (*Kiley* vs. *W. U. Tel. Co.*, 109 N. Y. 231.) The weight of authority in the U. S., however, is against its validity. Two main reasons are assigned for this view: first, that a company can exempt itself from liability from errors only arising from causes beyond its control; second, if the repetition of the message is necessary to insure its accurate transmission, then the law devolves upon the company the duty of repeating it. (*W. U. Tel. Co.* vs. *Blanchard*, 68 Ga. 299; 45 *Am. R.* 480.) Some authorities enforce express contracts between customer and company that the latter shall be liable only for gross negligence or willful wrongdoing; but by most courts in the U. S. they are deemed against public policy, and void. *Gillis* vs. *W. U. Tel. Co.*, 61 Vt. 461.

*Liability.*—British courts hold that the duty of the company to transmit and deliver a message arises wholly out of the contract with the sender, and there is no duty toward the receiver. This view is not entertained to any extent by courts in the U. S. On the other hand, it is generally held that a receiver may recover against the company such damages as proximately result to him from its negligent default. (*Tel. Co.* vs. *Dryburg*, 35 Pa. St. 298.) This liability is rested in part upon the common-law duty incident to the exercise of a public calling, and in part upon the theory that the receiver may sue because he is a beneficiary under the contract between the sender and the company. It is held generally that the company will not be liable beyond the charge for sending the message, where it does not show on its face that it relates to a business transaction, or is in cipher. (Cf. *Baldwin* vs. *Tel. Co.*, 45 N. Y. 744, with *W. U. Tel. Co.* vs. *Hyer*, 22 Fla. 637.) The foregoing rules are applicable to telephone companies. F. M. BURDICK.

**Telegraphy without Wires**: See the Appendix.

**Telem'achus** (in Gr. Τηλέμαχος): in Greek mythology, son of Odysseus and Penelope. He was an infant when his father joined in the war against Troy. After the termination of the war, he sailed out, accompanied by Athene in the shape of Mentor, and visited Pylos, Sparta, and other places, where he expected to gather some information concerning the fate of his father; and on his return to Ithaca he found Odysseus living there in disguise with the swineherd Eumæus. A recognition took place, and he then aided Odysseus in slaying the suitors and clearing the house of its many burdensome guests, who ate up its wealth without bringing it any honor. His voyage forms the subject of Fénelon's celebrated epic *Télémaque*.

**Telemeter**: See STADIA MEASUREMENT.

**Teleoceph'ali** [Mod. Lat.; from Gr. τέλεος, complete + κεφαλή, head]: a group of fishes, recognized by some authors, containing most of the teleost or true bony fishes.

**Teleol'ogy** [from Gr. τέλος, τέλεος, end, purpose + λόγος, discourse, reason]: the doctrine which finds intelligent ends or purposes in the processes and forms of nature. The evidences of purpose in nature were recognized by the Greeks, especially by Aristotle, who distinguished the final or teleological cause of a thing—i. e. the purpose of its existence or activity—from the material and efficient causes of the same thing.

Teleology has been used to support the theistic theory of the world in each of the periods of modern speculation. The teleological argument for the existence of God is by many made the strongest argument—from the evidence of design in nature to the existence of an intelligent designer. The rise of modern evolutionary theory, using the principle of natural selection to account for single instances of adaptation found in nature, tended for a period to throw the theory of design into disrepute, the conception of mechanical law being substituted for that of purpose in the interpretation of nature. Undoubtedly the evolutionary conception does remove much of the force from the oft-cited instances of adaptation, such as of the eye to light, of the color of an animal to its environment, etc. But while this is true, the theory of teleology takes on, in view of it, a profounder and more inspiring form, as part of the broader idealistic philosophy of the world. The new construction of teleology exhibits two great contrasts to the old view as it was urged in the natural theology of such men as Butler and Paley.

1. We are now led to look for design in nature not in the planning of a particular instance of adaptation, for all such instances might have come about by the more mechanical operation of natural selection upon variations; but we are to look for it in the very conception of law—be it mechanical or be it mental. The principles of natural selection and probability when expressed in formulas are themselves consistent expressions of plan or mind in nature. For why should mechanical law, uniformity, conservation of motion—why should any steady *conception* be applicable to nature at all, if not because nature is in some sense the expression or embodiment of that steady conception or idea? So the presence of the idea which we ordinarily call *law* in nature is itself the best teleology, although the law be what is called mechanical, and subversive of the old theory of design.

2. Further, the old view of design made the designer and the design or plan both logically apart from nature. God, it held, imposed certain designs upon nature. This conception also goes under in the minds both of naturalists and of philosophers who accept current evolutionary doctrine. But again the resulting conception is more profound and inspiring. The idea of plan or law in nature yields what is known as the modern doctrine of immanence. Nature is law-abiding and progressive just because it is itself the manifestation and realization of intelligence. God is immanent in the world and in man; both the world and man in their law-abiding character show just the nature and reality of God. And the universe as a whole gives the movement of development which naturalists construe in its particular aspects in terms of law. This newer statement of teleology is found both in intellectual idealists, such as Caird and Green, and in the critical realists, as represented by Trendelenberg and Lotze.

Literature.—See the chapters on Descartes, Anselm, Kant, Butler, Hegel, in the *Histories of Philosophy*, by Erdmann, Fischer, Ueberweg; also the literature in the article God. Special books are Janet, *Final Causes* (New York, 1876); Lotze, *Metaphysic* (Oxford, 1884); Martineau, *Study of Religion* (London and New York, 1888).

J. Mark Baldwin.

**Teleos'tei** [from Gr. τέλεος, complete + ὀστέον, ὀστοῦν, bone]: a primary division of fishes embracing the great majority of living species, so called on account of the ossified condition of the skeleton, the cartilages being almost entirely replaced by bone. Among other characters which separate them from the other true fishes are the absence of a conus arteriosus in the heart, of a spiral valve in the intestine; the presence of a gill-cover (operculum), and usually the presence of true scales on the body, although the skin is sometimes naked, sometimes covered by bony plates. The subdivision of the group is yet in a most unsatisfactory condition, and the various species have probably descended from more than one ganoid ancestor. In general words, the sub-class can be divided into two groups. In the one, the *Physostomi*, the air-bladder, when present, is connected by a duct with the alimentary canal, and the ventral fins are never spined. In the *Physoclisti* the connection between air-bladder and alimentary canal becomes lost with growth, and the fins are usually spined. The *Teleostei* are further subdivided into more than a dozen orders, the names and characters of which must be sought in the article Ichthyology and in technical works, such as there cited.

J. S. Kingsley.

**Telep'athy** [from Gr. τῆλε, far + πάθος, feeling]: thought-transference, or the phenomenon of the reception by the mind of an impression not traceable to any of the ordinarily recognized channels of sense, and assumed to be due to an influence from the mind of another person, near or remote. Thus the sphere of telepathy is not the same as that of *clairvoyance*, in which it is assumed that the mind of the subject may receive an impression of *impersonal facts*, or things at a distance. The subject who receives the impression is called the percipient, the one from whom the influence emanates is usually called the agent, in accounts of experiments on this phenomenon.

In the earlier works on animal magnetism there are many reports concerning subjects who are said to have developed the faculty of obeying the unspoken will of their magnetizer, going to sleep and waking, moving, acting, and speaking in accordance with his silent commands. More recently there have been public exhibitors of "mind-reading," and their performances have been imitated in private circles by the so-called willing-game. In most of these feats the agent is required to think intently of some act while he lays his hands on some part of the so-called mind-reader's person. The mind-reader, either promptly or hesitatingly, will then usually perform the act. It is safe to assume that wherever such personal contact between the pair is allowed, the percipient is guided by the encouragment or checking which the agent's hands more or less unconsciously exert upon his at first tentative movements; so that muscle-reading, and not mind-reading, is the proper name for this phenomenon. There are, it is true, reports of success in the willing-game where no contact was allowed; but in the absence of authentic details, they can not be taken as evidence that telepathy exists. For the same reason the earlier mesmeric reports have doubtful evidential value. The operators took too few precautions against "suggesting" to the subjects by other channels than speech what their will might be. It is only within recent years that we have learned to measure the acuteness with which an entranced person with his mind concentrated upon his hypnotizer will divine the intentions of the latter by indications which he gives quite unconsciously by voice or movement, or even by the mere order of sequence of what he does. On these accounts, evidence in the strict sense for telepathy must be sought in a small number of experiments conducted by a few more careful observers since about 1880. These experiments, taken in the aggregate, appear to make it unreasonable to doubt any longer the fact that occasionally a telepathic relation between one mind and another may exist.

In a faultless experiment on thought-transference certain precautions must be observed. To avoid previous collusion between agent and percipient the agent should receive from a third party the idea to be transferred; and the latter should, when possible, select it by drawing lots or by some other appeal to chance. This is to exclude the possibility of himself and the percipient being led by number-habits, diagram-habits, or other parallel paths of inner association to a common result. The percipient should not be in the room when the idea is determined on; and when possible it should be chosen in silence, written down, and shown, if it need be shown beforehand, in written form. The percipient should, if possible, do his guessing in another room. In any case he should be blindfolded, and there should be no conversation with him during the performance, the signal that he must attend to his inner impressions being given by bell or other sound. Physical contact between agent and percipient must not occur, and if the percipient writes or draws his result the agent should not look on, since an unconscious commentary by changes in breathing, etc., might reveal to the percipient whether he was going right or wrong.

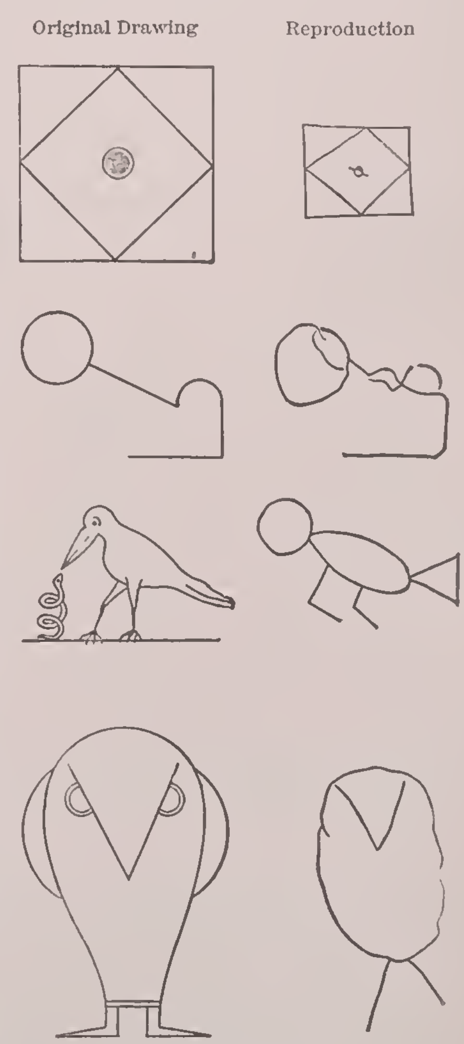

Fig. 1.

The *Proceedings* of the Society for Psychical Research contain some records of experiments made under approximately faultless conditions. In certain cases the ideas to be transferred were diagrams or drawings. A couple of examples will show the success reached when at its best. Fig. 1 is from a series made with Mr. Blackburn, agent, G. A. Smith, percipient, in which out of thirty-three trials without contact, though with percipient and agent in one room, there were twenty-five reproductions as good as those here given of a figure prepared and kept outside of the room. Fig. 2 gives the first six trials of a series reported by Malcolm Guthrie, of Liverpool, he being agent and a Miss E. percipient. The conditions seem almost faultless, if the account is accurate, though the figures are simpler than in the former series. In all, with various agents, Miss E. made 150 trials, the majority of which were successful entirely or in part. Sixteen specimens are printed in the report, all about as good as those in Fig. 2.

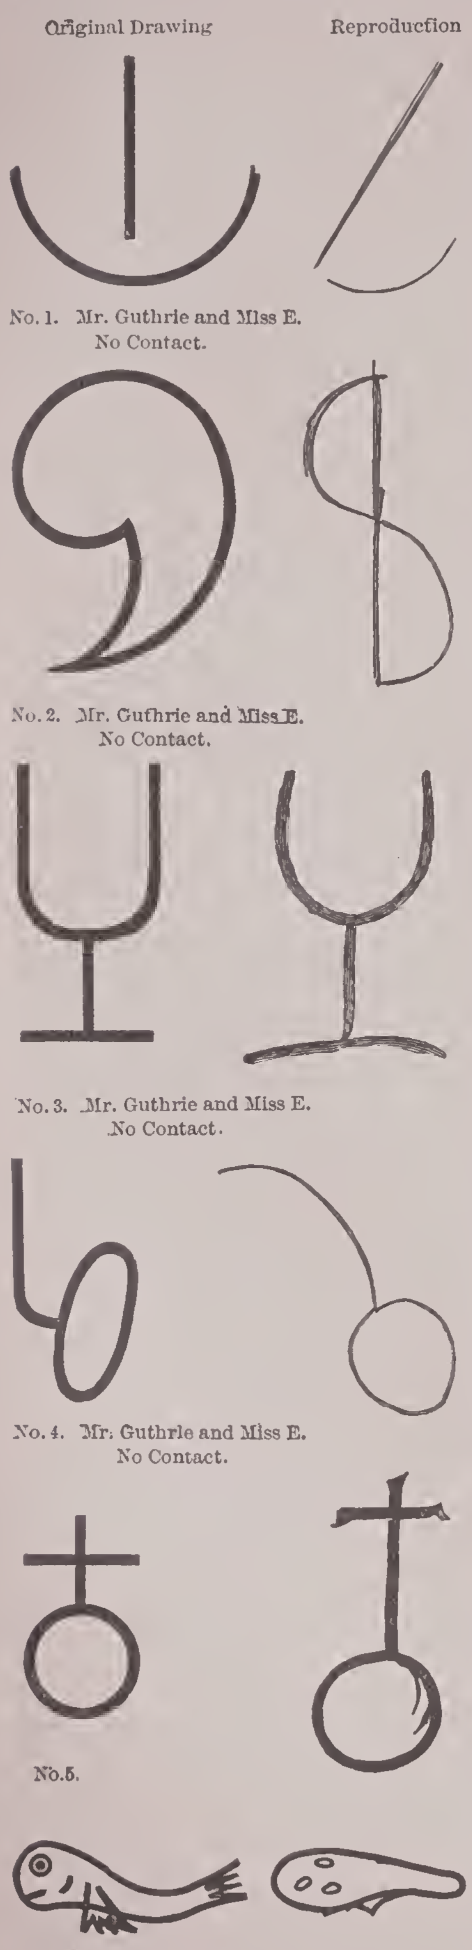

Fig. 2.

The same Miss E. and a Miss R. were subjected at Liverpool in 1883 to a series of experiments in transferring ideas and sensations of every order, the agents being Mr. Guthrie and others. Out of 713 trials there were but 252 cases in which the percipient either got no impression or described the object wrongly. In the remaining 461 cases the success was either complete or partial.

"Miss X." has published (*Proceedings* of Society for Psychical Research, vol. vi.) a long series of telepathic interchange of experiences over a long distance with "Miss D.," corroborated by independent entries in their respective diaries. Of 20 such entries 14 refer to a consciousness on the part of Miss D. that Miss X. was at that hour (the hours are quite irregular) playing a certain definite piece of music.

Miss Wingfield was the subject of a series of number-guessings, where out of 2,624 trials there were 275 successes instead of 29, which was the figure probable on the assumption of "chance." The numbers thought of were the 90 two-digital ones, from 10 to 99. They were drawn at random from a bowl and thought of by the percipient's sister. In a later series of 400 trials with this percipient the completely right guesses were 27 instead of the chance number 4; there were moreover, 21 guesses with the digits reversed, and 162 with a single digit in its right place.

Similar, though less extended and perhaps less conclusive, series of experiments at guessing ideas have been reported in the Society for Psychical Research *Proceedings* by various experimenters—Dessoir, Schmall and Mabire, W. J. Smith, von Schrenk-Notzing, and Barrett and Gurney. The observations last referred to were those first published. The subjects were two girls who, four years later when experiments were resumed, were found, when tested in each other's presence, to be cheating by a code of signals. Much has been made of the breakdown of this case. But very many of the earlier successes recorded of these children occurred when they were singly present, and often when only one experimenter knew the thing to be guessed. Collusion under such circumstances can not well be charged, although willingness to cheat rightly casts vague suspicion on all trials done with the percipient concerned, and shows the importance of making all tests under the conditions described as "faultless" a few lines back. Mr. Rawson finally, in vol. xi. of the *Proceedings*, gives a striking series of correct card and diagram guesses.

On telepathy in the hypnotic state there are recorded in the *Proceedings* experiments by Dr. B. Thaw and Prof. and Mrs. H. Sidgwick. The conditions in the latter set seem to have been, on the whole, very careful, though not quite faultless in the technical sense. The agent was the hypnotizer, G. A. Smith. The things to be impressed were usually the numbers (of two digits) on eighty-one lotto-counters, drawn by Prof. Sidgwick from a bag and handed to Mr. Smith to gaze at, while the hypnotized percipient awaited the impression. There were four percipients, with 644 trials made with agent and percipient in the same rooms, and 218 made with them in different rooms. In the former set 131 trials were successful, though the digits were named in reverse order in 14 of these 131 cases. In the latter set there were only 9 successes. The "probable" number of successes by chance would have been in the former set 8, in the latter at most 3. Later, with three of the same percipients and three new ones, Mr. Smith still being agent, Mrs. Sidgwick and Miss Johnson report 252 trials and 27 successes (chance number = 4), with agent and percipient in different rooms. Mr. Smith transferred "mental pictures" to five subjects, successfully in 31 out of 71 trials in one room, in 2 out of 55 in different rooms. The subjects of the mental pictures were such things as "a boy skating," "a baby in a perambulator with nurse," "a mouse in a trap," etc.

Prof. Richet has described (*Proceedings* of Society for Psychical Research, vol. v.) a series of successes in guessing drawings in the hypnotic state; but as he found that the same subjects succeeded 30 times out of 180 trials in guessing the drawing when it was inclosed in an envelope and unknown to any one present, it is doubtful whether telepathy or clairvoyance be the cause of the success. Control-experiments showed that "chance" could give as many as 3·5 per cent. of good successes at matching pictures made arbitrarily by different persons with others taken at random from a large collection previously prepared. Richet's hypnotic subjects gave, however, 10 per cent. of good successes in 200 trials, and he concludes the existence of an unknown power.

Thus, to count only systematically pursued experiments, some of which are not mentioned here, there are accounts from more than a dozen competent observers concerning about a score of subjects, all seeming to show a degree of success in guessing very much greater than that which chance would give. Different readers, however, will weigh the evidence differently, according to their prepossessions. Much of it is fragmentary, and in much one or other condition of "faultlessness" in experimenting is violated. The mass, however, is decidedly imposing; and if more and more of this solitary kind of evidence should accumulate, it would probably end by convincing the world.

Meanwhile there are other kinds of telepathy which, illogically perhaps, impress the believing imagination more than high percentages of success in guessing numbers can. Such are cases of the induction of sleep in hypnotic subjects by mental commands given at a distance. Pierre Janet, Richet, Gibert, Ochorowicz, Héricourt, Dufay, Danicx, Tolosa, Latour, and others are the relaters of these observations, of which the most important evidentially are those made on the celebrated somnambulic subject, Madame B., or "Léonie." Out of one series of 25 trials with this woman, there were 18 complete and 4 partial successes. Mr. Ochorowicz vouches for some of these, and gives also a long series in which silent commands were acted out by another hypnotic subject of his own, both he and she being, however, in the same room. The most convincing sort of evidence for thought-transference is given by the sittings of certain "test-mediums," of which the best worked-out case is that of Mrs. Piper, published in the Society for Psychical Research *Proceedings* for 1890–92–95. This lady shows a profuse intimacy, not so much with the actual passing thoughts of her sitters as with the whole reservoir of their memory or potential thinking; and as the larger covers the less, so the present writer, being as convinced of the reality of the phenomenon in her as he can be convinced of anything in the world, probably makes less exacting demands than he otherwise would on the sort of evidence given for minor grades of the power.

The authors of the word telepathy have used it as a theory whereby to explain "veridical hallucinations" such as would be the apparition of a person at a distance at the time of his death. The theory is that one who is dying or passing through some crisis is for some unknown reason peculiarly able to serve as "agent" and project an impression, and that the telepathic "impact" in such a case produces hallucination. Stated thus boldly the theory sounds most fanciful, but it rests on certain actual analogies. Thus a suggestion made to a suitable subject in the hypnotic trance that at a certain appointed time after his awakening he shall see the operator or other designated person enter the room, will post-hypnotically take effect and be followed at the appointed time by an exteriorized apparition of the person named. Moreover, strange as the fact may appear, there seems evidence, small in amount but good in quality, that one may, by exerting one's will to that effect, cause one's self to appear present to a person at a distance. As many as eight persons worthy of confidence have recently reported successes in this sort of experiment. The writer knows a ninth case, impossible to publish, but where the evidence (as far as taken) is good. Now the committee on the census of hallucinations of the Society for Psychical Research find that the "veridical" ones among them—those, namely, in which the apparition coincides with the death of the person who appears—are 440 times more numerous than they ought to be if they were the result of mere chance. For the particular data and logic by which this figure is obtained, see the report in vol. x. of the Society for Psychical Research *Proceedings*. Of course, if such a conclusion ever be accepted, and if the telepathic theory of such apparitions be credible, the probability that telepathy is the cause of success in the simpler number-guessing cases would be greatly re-enforced. The whole subject, so far as definite observation goes, is still in its earliest infancy.

Bibliography.—J. Ochorowicz, *De la Suggestion mentale* (Paris, 1887); *Proceedings of the Society for Psychical Research, passim*; F. Podmore, *Apparitions and Thought-transference* (1894). William James.

**Telephone** [from Gr. τῆλε, far + φωνή, sound, voice]: a term originally applied by Wheatstone in 1840 to the various forms of rod and string telephones (as they are now called) in which sound-vibrations are transmitted from one point to another by means of a rod or tightly stretched string connecting two elastic diaphragms of membrane, wood, or other suitable material, and of which the well-known lover's telegraph is a type; but while in strictness the word telephone still refers to the acoustic as well as the electric telephone, the latter, on account of its universal use, is the instrument to which the term is chiefly applied.

As early as 1854 a crude suggestion as to the possibility of transmitting speech electrically was made by Charles Bourseul in *L'Illustration* (Paris), and in 1861 at Frankfort, Germany, Philipp Reis exhibited and for the first time published an account of his extended experiments in the same direction. Reis endeavored to secure the transmission of speech by a circuit-breaking operation. For a transmitter he employed a membrane to which was fastened a flexible strip of metal connected with one terminal of a voltaic battery. In the instrument originally described the membrane was stretched over the smaller end of a conical speaking-tube bored in a cubical block of wood, whence this form of transmitter is known as the bored-block transmitter. Opposite the outer surface of the membrane was placed a stiff brass spring connected with the conducting line-wire which ran to the receiver. From the end of this spring, which was opposite the center of the membrane, a platinum point projected toward the metallic strip. The distance between this point and the strip was such that when the membrane was set into vibration by the voice of one speaking into the conical sound-tube, the metallic strip came into contact with the point on the forward motion of the membrane and broke contact with the point as the membrane retreated, thus making and breaking the battery-current once at each complete vibration of the membrane. The receiver employed consisted of a long helix of insulated wire wound about a knitting-needle, the whole being mounted upon a sounding-box. As was shown by Charles G. Page (1837), whenever the coils of an electromagnet are traversed by such an intermittent current there is a click produced at each make and break owing to the successive magnetization and demagnetization of the cores, and if the intermittences are sufficiently frequent the clicks will blend into a continuous musical sound, whose pitch is determined by the frequency of the breaks. Hence when the Reis receiver was connected in circuit with the transmitter and a battery, and the transmitter was operated as described, the alternate makes and breaks of the current produced by the intermittent contact between the metallic strip and point of the transmitter caused a sound to issue from the receiver. This sound would necessarily correspond in pitch with that uttered into the transmitter, since the pitch of a sound is determined wholly by the frequency or rate of vibration, which is necessarily the same for the knitting-needle of the receiver as for the membrane of the circuit-breaking transmitter which produces those intermittences of the current which excite the vibrations of the former. After the publication of his first paper Reis altered the shape of his transmitter, and caused to be manufactured and sold an instrument consisting of a hollow cubical box having a circular hole at the top which was closed by a membrane and furnished with a speaking-tube which entered the side of the box. To the membrane was fastened a flexible strip of metal. A light piece of sheet brass bent at right angles in a horizontal plane was loosely supported at its ends, while a pointed leg of platinum wire projecting from the angle rested upon the metallic strip over the center of the membrane. The circuit was completed through the strip and point. On speaking into the transmitter the angle-piece was tossed out of contact with the metal strip when the membrane diaphragm vibrated, thus producing an intermittent current. From its wide sale this transmitter, known as the cubical box transmitter, became more generally known than the earlier instrument.

Reis recognized the fact that much more than the reproduction of pitch at the receiver was necessary to reproduce speech. But he thought incorrectly that the amplitude of the vibrations of the receiver, upon which the loudness of the resulting sound depends, would be proportional to the amplitude of the vibration of the membrane of the transmitter, and that the reproduction of these two characteristics of the sound actuating the transmitter would be sufficient to reproduce that sound in its completeness.

Every sound possesses three characteristics, which determine and define it. They are pitch, which depends upon the frequency of the vibrations of the particles of the sounding body or those constituting the air-waves produced by it; loudness, which depends (other things being the same) upon the amplitude of vibration; and quality, which depends upon what is called the "form" of the vibration. Quality is that characteristic by means of which is recognized the particular kind of instrument producing the sound, as a piano, a violin, or the voice. It was proved by Helmholtz to depend upon the number, pitch, and relative loudness of the partial tones which constitute sound-vibrations, and which differ with different instruments. As these differ, the particular velocity with which the vibrating particle moves from instant to instant while executing its complete vibration will differ. See articles Acoustics and Voice.

If represented graphically according to the usual mode of illustrating such motions, the curves representing such different vibrations will have different forms to the eye, whence it has become customary to designate the corresponding differences in the vibrations thus represented by the term "form." And since the sound-waves possess a varying density from point to point corresponding to the varying velocity of their particles, they are also spoken of as having "form."

It follows from what has been said that no transmitter like that of Reis, which operates by breaking the circuit once at each full or complete vibration, can completely reproduce any sound, for it can not reproduce the quality. The receiver takes no cognizance of the mode of vibration of the transmitter between the breaks. The quality of the sound issuing from the receiver depends substantially upon the physical conditions of the circuit, and whatever may be the character of the particular instrument whose sound actuates the transmitter when operated as described, the sound issuing from the receiver will be the same.

A method by which the quality of sounds in general, including those of articulate speech, can be reproduced, together with an apparatus embodying this method, was invented by Alexander Graham Bell and first published in U. S. Patent No. 174,465, dated Mar. 7, 1876. The method consists in the production and utilization of electrical undulations similar in form to the vibrations of the air of the sound-waves. The electrical condition of the line particles and the vibration of the receiver are controlled, not intermittently, at the end of each complete vibration, but throughout the whole duration and extent of this vibration. To do this the transmitting instrument must produce in the line an electrical current which possesses a variation in strength from instant to instant, similar to the corresponding changes in the density of the air in the sound-waves which actuate the transmitter, in which case the electrical changes will copy the aërial vibrations, so to speak, and the varying electrical current will be represented graphically by substantially the same curve that represents the air-waves. Hence the electrical undulations are spoken of as being similar in form to the air-waves. By the action of this undulatory current upon a suitable receiver, it will reproduce at the receiving end of the line air-waves which are similar in form to the electrical variations, and hence to the sound-waves actuating the transmitter.

The original apparatus devised by Bell was a form of what is now called a "magneto-telephone." It will be sufficient to consider the improved instrument, which has chiefly been used in the U. S. The transmitter and receiver are alike, and are shown in Fig. 1. F F is a compound-bar magnet,

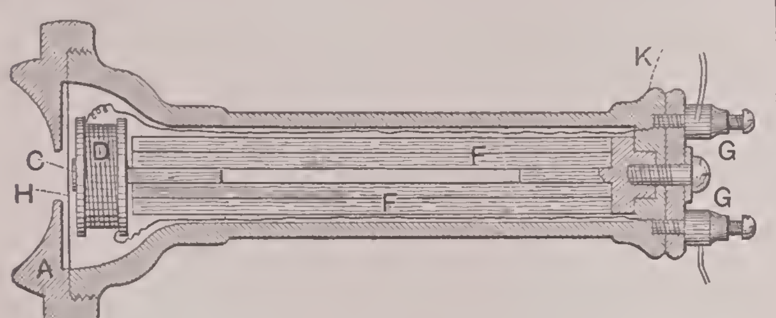

Fig. 1.

with a soft-iron pole-piece, C, around which is wound a coil of insulated wire, D, whose terminals run to the binding posts, G G. H is a circular diaphragm of thin ferrotype iron, held at its edge between the case of the instrument, K, and the mouth-piece, A. When used as a transmitter the instrument is put in circuit with a second one at the further end of the line, which serves as a receiver. The operation is as follows:

When the soft-iron diaphragm, H, is spoken to it takes up the motions of the particles of air and vibrates in accordance with these motions, and so moves toward and away from the magnetized pole-piece periodically with a velocity varying from instant to instant, according to the characteristic form of the air-waves.

In accordance with the well-known laws of electricity and magnetism, whenever the iron diaphragm approaches the pole of the magnet this will become stronger; an induced current of electricity will be generated in the coil, D, and will flow through the circuit. When the diaphragm recedes the pole will become weaker, and a current will be induced in the opposite direction. Moreover, the strength of the induced current will be proportional at each instant to the velocity with which the diaphragm is moving. (See Electricity.) Hence an undulatory current will be set up in the circuit which will be similar in form to the air-waves produced by the voice at the transmitter. This undulatory current flows through the coils, D, of the receiver, and increases or diminishes the strength of the pole of its magnet in a degree depending on the direction and strength of the current, that is, according to the direction and velocity of the motion of the diaphragm of the transmitter. Hence the magnet of the receiver will exert a varying pull upon the diaphragm, H, deflecting it more or less against the restoring force of its elasticity, and the vibrations thus impressed upon the diaphragm will be communicated to the air at the receiving station. Since these possess all the characteristics impressed upon the electrical current by the vibrations of the diaphragm of the transmitter, the receiver will give out a sound similar to that uttered into the transmitter.

*The Microphone.*—The magneto-telephone just described has been universally employed as a receiver. As a transmitter, however, it was soon superseded by a subsequently invented and more powerful apparatus, the microphone. It had been known for a long time that when an electric current passed from one conductor to another through a "loose contact"—that is, when the contact-surfaces or electrodes rested only very lightly upon one another—there was at the joint a resistance to the electrical flow, which was lessened when the pressure was increased. Early in 1877 Émile Berliner proposed to utilize this property in a telephone transmitter. A metal diaphragm rested firmly against a metallic point or ball. A battery current passed from the former into the latter and thence to a suitable telephone receiver. On speaking to the diaphragm the vibrations of this produced a variation of pressure between it and the metal point without ever breaking the circuit, thus producing electrical undulations. The law of variation of resistance with pressure is such that the electrical and acoustic undulations have a like form. Shortly afterward Thomas A. Edison invented an apparatus identical in principle, but employing soft carbon as the material of one of the electrodes instead of making both of them of metal. Still later (May, 1878), Prof. David E. Hughes devised and described another apparatus of the same character, employing hard carbon, and gave to it the name microphone. Carbon is so excellent a material for the purpose that in practice it has always been made to constitute either one or both of the electrodes of the microphone transmitter.

Many forms of microphone transmitter have been employed. The two described are the ones that have been principally used in the U. S.

The Blake transmitter, the best known of these, was invented by Francis Blake, and first introduced into public use late in 1878. Its construction is illustrated in Fig. 2.

D is a diaphragm of sheet-iron against which rests lightly a small platinum button, K, which is suspended by a light leaf-spring, A. Around a button of hard carbon, C, is spun a brass weight, W. A rather stiff spring, S, sustains W and C. A and S are insulated from each other at their upper ends. K and W are the hammer and anvil electrodes respectively of the microphone. A current from a battery, B, passes through the joint between the two electrodes. When the diaphragm enters into vibration under the action of the voice it pushes the hammer electrode, K, into more or less intimate contact with the anvil electrode, C. The inertia of C, weighted as it is by W, keeps the anvil electrode from jumping away from the hammer electrode, and the spring S holds the two electrodes in proper position as regards the diaphragm. The varying pressure between K and C causes a corresponding variation in the strength of the current to take place, so that when a magneto-receiver is put in circuit with the transmitter speech is reproduced.

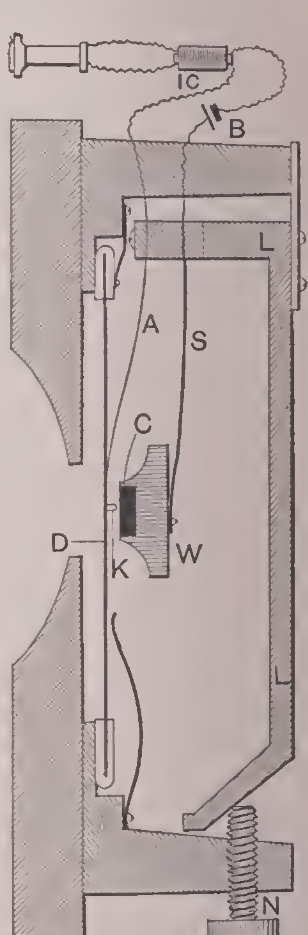

Fig. 2.

The proper normal pressure between the electrodes is secured by means of the bent lever, L, and adjusting screw, N.

Instead of placing the receiver in direct circuit with the battery and microphone, it is customary to cause the undulatory battery current to pass through the primary of an induction-coil in whose secondary, of much higher resistance, the receiving telephone is placed. This gives better electrical conditions for transmission over lines of considerable length. This arrangement is symbolically indicated at IC in the figure.

A very powerful form of microphonic transmitter, developed in the laboratory of the American Bell Telephone Company by A. C. White, is employed for long-distance transmission. Its construction is shown in Fig. 3. K K′ are

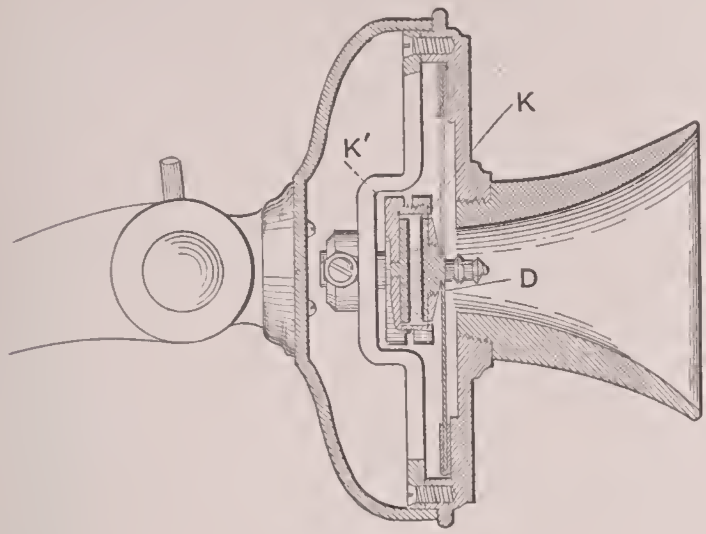

FIG. 3.

two polished buttons of hard carbon, the rear one of which is fastened solidly in a frame, while the forward one is riveted to the center of the metal diaphragm, D, and moves to and fro like a plunger when the diaphragm vibrates. The two carbon buttons are insulated from each other and form the opposite faces of a flat, cylindrical cell, which is closed at the front by a thin, flexible disk of mica concentric with the forward button and of greater diameter than this, so that the mica projects beyond the edge of the button. The disk is in front of the button, carried by the same piece that carries this and secured at its edges by an annular cap which holds it firmly while allowing perfect freedom of vibratory motion to the plunger and front button. The cell is filled partly full with coarse, granulated carbon powder. The current from a battery passes from the front button through the granulated carbon to the rear button. The buttons and the particles of carbon constitute the electrodes of the transmitter. An induction-coil is used, as with the Blake transmitter.

It is evident from what has been said regarding the microphone that microphonic action may be produced with a Reis transmitter by operating it so as to prevent any breaking of the circuit. When the Reis transmitter is coupled with a sufficiently sensitive receiver it is possible to transmit and reproduce speech by this operation. Whatever of quality has ever been transmitted by a Reis instrument was the result of this action, of which Reis was entirely ignorant.

The development of the art of telephony has necessitated the invention of a vast number of special contrivances for local and long-distance transmission. For long-distance transmission complete metallic circuits are employed rather than the grounded circuits usual in telegraphy, and such lines are also far more satisfactory for local business on account of their greater freedom from electrical disturbances.

Substantially all of the telephone business of the U. S. has been carried on by the licensees of the American Bell Telephone Company. Under the company's control there were on Jan. 1, 1900, 150,380 miles of long-distance ("extra-territorial") lines in use and 1,016,737 miles of local ("exchange") lines, of which 489,250 miles were underground. The total number of telephones in use was 1,580,101, the number of persons employed 25,741. The number of magneto-telephones in use Sept. 20, 1894, was 289,495, the number of Blake transmitters 218,782, and the number of long-distance transmitters 49,435. The number of telephone connections made at exchanges daily is 5,173,803, or more than 1,666,000,000 in a year. The longest telephone line in actual commercial use extends from Portland, Me., to Milwaukee viâ Boston, New York, and Chicago, a distance of 1,337 miles. The complete history and theory of the speaking telephone have been brought out very fully in the protracted litigation regarding it which has been carried on in the U. S. courts. The fullest accessible discussion of these topics will be found in vol. cxxvi., *United States Reports*. The laws relating to the duties of telephone companies are in general the same as those relating to telegraph companies. See TELEPHONE LAW, in the Appendix.

CHARLES R. CROSS.

**Telescope** [from Gr. τῆλε, far + σκοπεῖν, to view]: an optical instrument for increasing the apparent magnitude of distant objects, or the size of their images on the retina. The essential parts of the instrument are two in number: a mirror or combination of lenses for bringing the rays of light which emanate from each point of the distant object to a focus, thus forming an image of the object, and an ocular for viewing this image. A refracting telescope is one in which the rays of light are made to converge to the focus by a system of lenses; a reflecting telescope is one in which they are made to converge by being reflected from the surface of a slightly concave, polished reflector.

*The Refracting Telescope.*—If the light reflected or emitted by the object to be observed were all of one color and one degree of refrangibility, and if a lens could be made of any shape desired, then a single lens would suffice for the object-glass of a telescope. Practically, however, such a lens will not bring all the rays to one and the same focus. Since glass exerts a more powerful refraction on blue than on red rays, a lens brings the blue rays to a shorter focus than the red ones; hence the use of a single lens gives a row of foci, making distinct vision impossible. This effect is called chromatic aberration. Moreover, if the lens is spherical, the rays which pass near the circumference of the lens will come to a shorter focus than those which pass through the central portions. This makes a second defect, which is called spherical aberration.

*The Aplanatic Objective.*—In the modern aplanatic telescope these aberrations are in great part obviated by the combination of two lenses, a double convex lens of crown glass and a concave lens of flint glass, as shown in Fig. 1. For a statement of the principle by which chromatic aberration is thus obviated, see ACHROMATISM. The two lenses disperse the red and

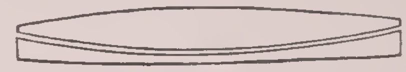

FIG. 1.

blue rays in opposite directions; that is to say, the crown lens, being convex converges the blue rays more than it does the red ones, while the flint glass, being concave, tends in an equal degree to diverge the blue rays away from the axis more than the red ones. On the other hand, the refracting power of the crown lens is stronger than that of the flint lens, so that the combined effect of the two is to bring the rays to a focus, while their opposite dispersions neutralize each other, and bring both blue and red rays to nearly the same focus. In addition, such curves may be given to the lenses that the spherical aberrations shall also annul each other, and thus all the rays be brought to one focus. It is this combination of achromatism with freedom from spherical aberration which gives perfection to the telescope.

The fact is, however, that no objective can be made of crown glass and flint glass which will bring all the rays absolutely to one focus. The reason of this is that the latter disperses the rays more and more in proportion to the former, as we pass toward the violet end of the spectrum. The result is that when the nearest approach to achromatism is gained, the extreme rays (blue and red) will come to a focus a little farther away from the objective than the intermediate rays, which are yellow or pale green. This defect is not serious in a small telescope, but becomes very serious in greater refractors. Makers of optical glass in Germany have devoted great attention to discovering kinds of glass which will not produce this secondary aberration. Partial success has been gained, but it is still questionable whether the new glasses possess the durability of the ordinary kinds and can be made of the requisite size for great telescopes.

*The Photographic Telescope.*—In consequence of the defect just described, a telescope which is best adapted for seeing will not be the best for taking photographs of heavenly bodies. The reason is that the best visual telescope brings the yellow rays to the shortest focus, and scatters the blue and violet rays farther along the axis. But the latter are those which have the best photographic effect. Consequently, in order to take the best photographs, the telescope must either have a weaker (less concave) flint lens or a stronger (more convex) crown lens than the ordinary visual telescope. In order that a telescope may be well adapted for both purposes some device must be employed to increase the effect of the crown lens, or diminish that of the flint lens. In the great Lick telescope a third lens is supplied, which is put over the objective when photographs are taken. One necessary effect of this method is to shorten the focus by several feet.

*The Reflecting Telescope.*—This instrument is so called because the rays from the star or other distant object are brought to a focus by a slightly concave, parabolic reflector, which may be either of polished metal or of glass. For the great telescopes of Herschel, Rosse, Lassell, De la Rue, and all others previously to 1857, the reflectors were made of a combination of tin and copper, called speculum metal, which would bear a high polish. It is now more common to grind a reflector of glass, which is then coated with a film of silver, about $\frac{1}{200000}$th of an inch thick, on the side toward the object. These latter must not be confounded with looking-glass mirrors, which are coated with tin-amalgam on the posterior side. Silvered-glass telescopes were invented by Steinheil, and reinvented in the same year by Foucault, whose admirable paper in the *Annales de l'Observatoire de Paris* (vol. v., 1859) is a model of what such memoirs should be. See Henry Draper's paper on this subject in the *Smithsonian Contributions to Science* (1864). Ever since the introduction of silvered glass, there has been a controversy as to its utility compared with speculum metal, but the balance has inclined finally to the former. A silvered speculum is permanent; for even though the silver coating be tarnished it may readily be repolished, or, if injured by dampness, be replaced without affecting the figure of the glass; it is many times lighter, and therefore demands less weight in the mounting, and is correspondingly more manageable; it is more reflecting, in the proportion of about 92 to 65, and in consequence a smaller aperture will give an equal brilliancy to objects, this being a great advantage in an unsteady atmosphere. Speculum metal is composed of copper and tin in the proportion of 32 to 14·911; it must be cast on a chill —that is, a slightly warmed iron surface; and that it must be annealed with the greatest care and for a long time.

*Grinding and Polishing.*—These operations do not differ much in the cases of metal and glass, except that the latter, being more rigid, will not take a permanent set if raised from its bearings, and, being lighter, can be more easily manipulated. The grinding and polishing of specula may be accomplished by machinery or by hand. When Hadley, Mudge, Edwards, Molyneux, Short, and others were making reflecting telescopes, the work was done altogether by hand, the tools being fixed on an optician's post, which allowed free motion all round the surface to be worked; but when the elder Herschel had advanced to the larger telescopes which he constructed, he found it desirable to use machinery. For many years the arrangement of this machinery was kept a profound secret until finally revealed by Sir John Herschel shortly before his death.

*Silvering of Glass.*—A large number of processes have been invented for coating glass with a thin and uniform film of silver. They all depend on reducing metallic silver from a solution of silver nitrate and ammonia, with perhaps the addition of potash. The reducing agent may be Rochelle salt, milk-sugar, inverted sugar, oil of cloves, aldehyde, etc. The best process is described in the *Monthly Notices* of the Royal Astronomical Society (Dec., 1875, vol. xxxvi., p. 76) by Martin, who made a 4-foot silvered-glass telescope for the Paris Observatory. The glass must be carefully cleaned with nitric acid, and afterward with potash and alcohol, and then placed face downward on a mixture of equal parts of the following four liquids: (1) A solution of 40 grammes of crystallized silver nitrate in a liter of distilled water; (2) a solution of 6 grammes of pure ammonium nitrate in 100 grammes of water; (3) a solution of 10 grammes of caustic potash (quite free from carbonate and chloride) in 100 grammes of water; (4) a solution of 25 grammes of sugar in 250 grammes of water, to which is added 3 grammes of tartaric acid, and the liquid is then boiled for about ten minutes to produce the inversion of the sugar. After the solution has cooled 50 cubic centimeters of alcohol are added to hinder any subsequent fermentation. The volume is made half a liter by dilution with water if the silvering is to be done in winter, or dilute still more if it is to be done in summer. The film of silver, if the potash is pure, may not need any polishing, and should in any case require only a few strokes of a buckskin pad slightly tinged with fine rouge.

The great difficulty with the reflecting telescope is that the speculum throws the rays back directly toward the object, so that the observer can not place his eye in front of the focus to see the object without obstructing the light which falls upon the mirror. This light must therefore be reflected backward or laterally by a second reflector. There are two ways of doing this; one, called the Newtonian, is shown in Fig. 2. A mirror, M, is placed at an angle of 45° between the focus and mirror, but nearer the former, in such a position as to throw the light through the opening

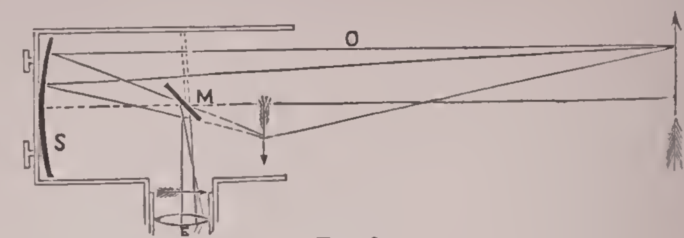

FIG. 2.

at the side of the telescope where the image is formed, and is viewed by an eye-piece of the usual construction. A more convenient form is that shown in Fig. 3, which is known as

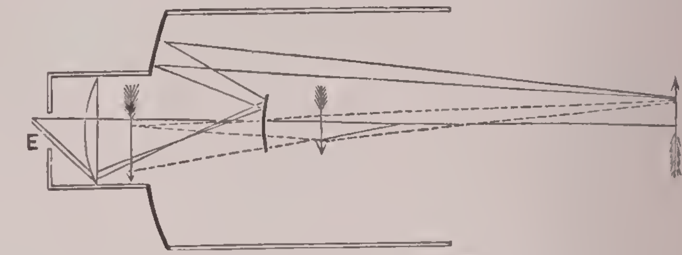

FIG. 3.—Cassegrainian telescope.

the Cassegrainian telescope. Here the light from the principal mirror meets a second slightly convex mirror placed between the principal mirror and the focus. From the second mirror it is thrown back through a central opening through the principal mirror, where the eye-piece is placed. This form is most convenient, because the observer looks directly up at the object.

In a modified form of the Cassegrainian telescope, called the brachi-telescope, which has been tried in Germany, the speculum is slightly inclined, so as to throw the rays to one side, admitting of the second reflector being so placed as not to prevent any of the light from falling on the speculum.

The reflecting telescope has the great advantage that chromatic aberration does not exist, because in all rays the angle of reflection is equal to that of incidence; while by making the mirror truly parabolic the spherical aberration can also be entirely obviated. It is therefore, in theory, the only perfect telescope. There is no limit to its possible size, and therefore no theoretical limit to its power. Unfortunately, the mechanical difficulties in its construction and use are so great that the astronomical work of the world is almost entirely done with refractors. The first difficulty is that if the mirror is more than a foot in diameter it is liable to bend under the influence of its own weight, and thus fail to bring the rays to one focus. By ingenious systems of supporting the mirror this defect can be partially cured, so that reflectors have been made of so great a diameter as 5 or even 6 feet. In the case of the celebrated telescope of Lord Rosse the diameter is 6 feet. Yet it does not appear that the contrivances for securing perfection of figure are entirely successful. Nothing has yet been seen or done with these great reflectors which can not be at least as well seen or done with much smaller refracting telescopes.

For the purposes of the amateur, small reflectors, say from 6 to 12 inches in diameter, can be made free from this difficulty, and are much cheaper than refractors of equal power. Another difficulty associated with them is the liability of the silver film to tarnish, especially near a city where gas is burned. Consequently the possessor of such an instrument must know how to resilver and repolish the mirror, directions for doing which are found in a preceding paragraph of this article, or must be near an expert who can do this.

*The Eye-piece, or Ocular.*—As essential as the object-glass or mirror of a telescope is a lens, or combination of lenses, for collecting the light from the image so as to form a second image on the retina of the observer's eye. In strictness, a single lens of short focus, such as is in common use for viewing minute objects, would suffice. But such a lens gives distinct vision only for a single point in the center of the field of view. Hence an astronomical eye-piece is made with two lenses. One of these, called the field-lens, is placed very near the focus of the objective; the other, called the eye-lens, is next the observer's eye. If the most distinct vision throughout the whole field is to be obtained, the best eye-piece is one of the Huyghenian form, shown in the article MICROSCOPE, Figs. 11 and 12. Here the field-lens is placed a little inside the focus, so that the image is formed between the two lenses. A further improvement on this form was made by Airy, who proposed a meniscus for the field-lens. The eye-pieces of this pattern are called negative. Since the image is formed in the eye-piece itself, a micrometer can not be used with a negative eye-piece. Hence, in ordinary astronomical observations, when measures are made by the micrometer, a form known as the Ramsden eye-piece is used. This consists of two plano-convex lenses, having the plane sides outward, as shown in Fig. 4. Every eye-piece must be fixed in a little sliding tube, so that the observer can push it in or out, and thus get it into such a position as to secure the sharpest vision. The more near-sighted an observer is, the further he must push an eye-piece in, to attain this object.

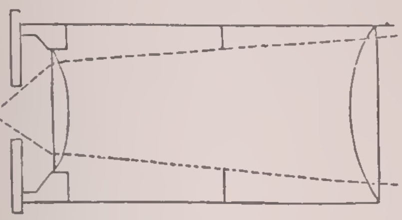

Fig. 4.

*Mounting of the Telescope.*—Owing to the diurnal motion of the earth, if a telescope is pointed at any object in the heavens, the latter will be seen to move across the field of view, and speedily disappear from sight. If a high power is used, it will be very difficult to point the telescope so as to find the object again. The telescope must therefore be mounted on axes, so as to admit of being continually moved. The arrangement for this purpose is called the mounting of the telescope. It varies with the size and with the needs of the observer. A small, cheap instrument, say of three inches in diameter, is usually mounted in the simplest way, so that the observer can himself turn it in any direction at pleasure. No exact observations are, however, possible with this sort of mounting. When the telescope is to follow a star closely, an equatorial mounting is used. In this form the principal axis of the instrument, around which it may be turned, is inclined to the horizon at an angle equal to the latitude of the place, and directed toward the north pole of the heavens. In other words, it is set exactly parallel to the axis of the earth. Thus as the earth turns in one direction, the observer has only to move his telescope around its axis in the other direction in order to keep it constantly pointed at a heavenly body. Attached to the principal axis is a secondary one, at right angles to it, by which the telescope may be pointed at any required distance from the pole. This is called the declination axis, while the principal one is called the polar axis. If the telescope is not very

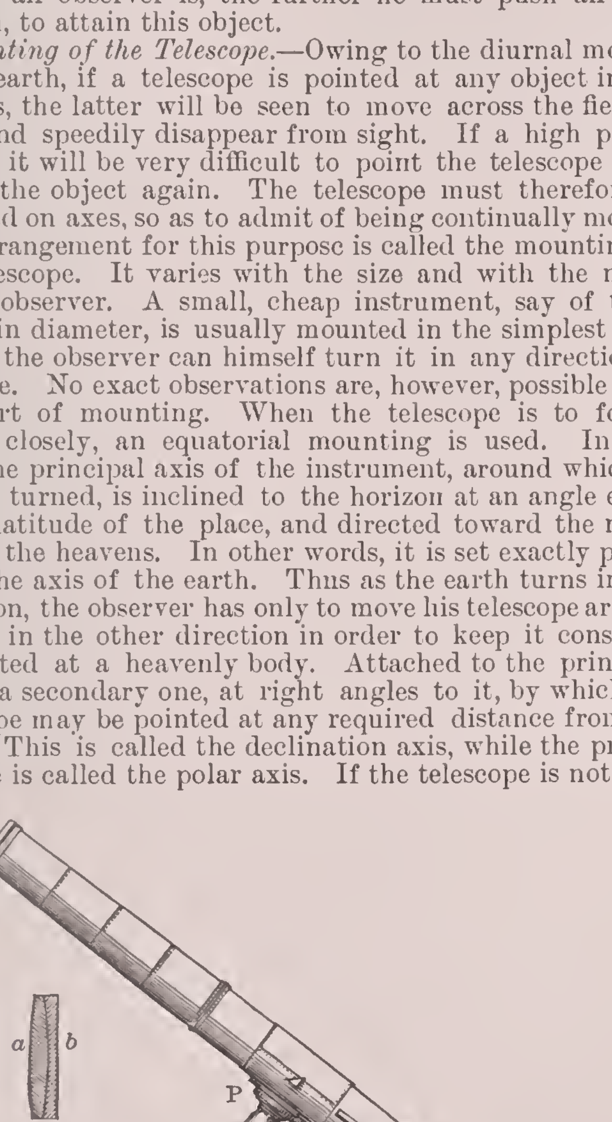

Fig. 5.—An equatorial telescope: A, section of object glass; *a*, crown lens; *b*, flint lens; PQ, polar axis; PD, declination axis; H, clockwork to turn telescope round the polar axis; F, finder; E, eye-piece.

large, it is frequently constructed so that the observer can move it around the polar axis by turning an endless screw. This would be very troublesome in a large instrument. A complete telescope must therefore be fitted with clock-work, so arranged as to make this motion automatically. Then, when the telescope is pointed at a star, clamped, and the clock-work set in motion, the star remains in whatever point of the field the observer may set it, just as if the earth were at rest.

*History of the Telescope.*—The question as to who was the first real inventor of the telescope is involved in some obscurity. What is certainly known is that telescopes were first made in Holland, about the year 1608, when Hans Lipperhey applied for a patent for such an instrument. It seems an attempt was made by the Dutch authorities to have the invention kept secret. The first telescopes were of course very imperfect instruments, the object-glass consisting only of a single small lens. It does not seem that the Dutch inventors attempted to apply the instrument to any important purpose. This was first done by Galileo in 1610, who, having heard of it, reasoned out the principles on which it ought to be constructed. Galilean telescopes consisted of an object-glass and a concave eye-piece, the latter being placed inside the focus. This form is still used in opera-glasses, but does not admit of a high power being obtained with distinctness. Galileo, however, was able with this imperfect instrument to see the phases of Venus and the satellites of Jupiter, making the discoveries which have made his name immortal.

The great difficulty encountered by the astronomers of the seventeenth century arose from the chromatic aberration of the telescope. It was found that this defect could be diminished by increasing the focal length, but then the instrument would soon become unmanageable. This led to the invention of the reflecting telescope, in which no such defect exists. The latter instrument underwent gradual improvement from the time of Newton to that of Herschel, a hundred years later, who brought it to great perfection. Meanwhile Chester More Hall, of England, about 1733, invented the combination of crown lenses and flint lenses already described, which would in great part correct not only the chromatic but also the spherical aberration. The invention was brought into practical use by Dollond, of London, whose telescopes acquired great celebrity during the latter half of the eighteenth century; but their size was only what is now considered the smallest. Up to 1800 it was thought almost impossible to make a good disk of flint glass of more than 4 or 5 inches in diameter. The difficulty was that the great density of the lead, which is a component of the flint glass, caused the lower part of the pot of glass to be denser than the upper part. By skill and attention glassmakers learned how to obviate this difficulty, so that early in the nineteenth century disks of 8 or 10 inches became common, and before the middle of the century they were carried to 15 inches. The difficulty then was on the part of the optician to grind lenses of this size so perfect in figure that they would bring all the rays to the same focus. The greatest artist in this respect during the first half of the century was Fraunhofer, of Germany. None of his immediate European successors was able to improve upon his work. The first person to do this was a comparatively obscure portrait-painter, Alvan Clark, of Cambridgeport, Mass. About 1846 he began to experiment in grinding lenses, and by 1853 had attained such success that a glass of nearly 8 inches diameter was purchased from him by Rev. W. R. Dawes, a member of the Royal Astronomical Society. This gentleman found that Mr. Clark's glass was superior to any that he had been able to obtain elsewhere; a conclusion which speedily established the reputation of the maker. He and his two sons continued to make larger and larger instruments, as orders were given, until his work culminated in the grinding of the 36-inch telescope of the Lick Observatory and that of his son, Alvan G., in the Yerkes telescope of Chicago, 40 inches in diameter.

So far it would seem that the refracting telescope has outstripped the reflector. The difficulties already mentioned are such that no great improvement has certainly been made in reflecting telescopes in recent times. Those of 4 and 5 feet diameter, made for or by A. A. Common, of England, may be taken as the latest and best result of art in this direction.

*Principal Telescopes of the World.*—The greatest refracting telescope ever made is that given by Charles T. Yerkes, of Chicago, to the university of that city. The diameter of the object-glass, made by Alvan Clark & Sons, is about 40 inches, and the focal length 64 feet. The mounting is by Warner & Swazey, of Cleveland, O. To give some idea of its dimensions, it may be stated that the movable part of the instrument, which turns on the polar axis, weighs about 12 tons, and the clock which turns the telescope weighs 1½ tons. It is to be mounted near Geneva Lake, Wis., so as to be away from the smoke of the city.

Next in size comes the great telescope of the Lick Observatory, California, which, under the terms on which the institution was founded, was to be supplied with the largest telescope in existence. It was completed in 1887. The object-glass was figured by Alvan Clark & Sons, and the mounting was done by Warner & Swazey.

Third in size are two practically equal telescopes of 30 inches diameter: that of the Russian Imperial Observatory, at Pulkowa, of which the object-glass is by Clark & Sons, and the mounting by the Repsolds, of Hamburg, and the telescope of the Nice Observatory, in France, of which the object-glass is by the Henry Brothers, of Paris, and the mounting by Gauthier, of the same city.

There are also two refracting telescopes of 26 inches aperture: one at the Naval Observatory in Washington, the other at the Leander McCormick Observatory, University of Virginia. Both were originally made by Alvan Clark & Sons, but the Washington telescope was remounted in 1893 by Warner & Swazey.

A telescope of 25 inches aperture was constructed in England by Messrs. Cook, for Mr. Newall, of Gateshead, in 1870; it was later given to the University of Cambridge.

The Vienna telescope is 27 inches in diameter, and was made by Sir Howard Grubb, of Dublin, in 1882. There are also at various observatories in the U. S. telescopes of considerable size, which are mentioned in the general list at the end of this article.

Bibliography.—For very full information about the use of a telescope by an amateur observer, see Chambers's *Astronomy*, 4th ed., vol. ii. (London, 1890). For a popular account, see Newcomb's *Popular Astronomy*. The mathematical theory of the formation of images by lenses is developed in the classic memoir of Gauss, *Dioptrische Untersuchungen* (*Werke*, vol. v.); in Pendlebury's *Lenses and Systems of Lenses* (London, 1884); and in Steinheil and Voit's *Angewandte Optik* (Leipzig, 1891). A brief but fairly complete history of the invention is found in Poggendorf's *Geschichte der Physik* (Leipzig, 1879) and a shorter one in Grant's *History of Physical Astronomy* (London, 1852). Discussions of recent improvements are found in great number in the volumes of *Monthly Notices of the Royal Astronomical Society*. The *Journal of Astrophysics*, published monthly at Chicago, and the *Observatory*, published at Greenwich, are also valuable for discussions of the latest proposed improvements.
S. Newcomb.

LIST OF THE PRINCIPAL TELESCOPES (BY PROF. J. K. REES).

*I. Refracting Telescopes with Object Glasses 13 Inches in Diameter and over.*

Photographic telescopes, employed in taking photographs for the purpose of making a catalogue of the stars to be measured on the plates, and in the construction of a photographic chart of the heavens (photographic lens 13 inches, with 11-inch visual refractor in each case), are mounted at the following observatories: Paris, Algiers, Bordeaux, Toulouse, San Fernando, the Vatican, La Plata, Rio de Janeiro, Santiago, Helsingfors, Potsdam, Catania, Greenwich, Oxford, the Cape of Good Hope, Melbourne, Sydney, and Tacubaya.

**Telesil'la** (Gr. Τελέσιλλα) **of Argos**: lyric poet and heroine, who flourished about 510 b. c. Her warlike deeds in the struggle of Argos against Sparta are probably mythical, and her poetry is represented by two lines in Bergk's *Poetæ Lyrici Græci* (vol. iii., p. 380, 4th ed.). B. L. G.

**Telford**, Thomas: engineer; b. at Westerkirk, Dumfriesshire, Scotland, Aug. 9, 1757; became a stone-mason, and studied architecture and drawing; went to London 1783, and was architect in the Portsmouth dockyard; in 1787 removed to Shrewsbury. His first great engineering work was the construction of the Ellesmere Canal, 103 miles long, which was begun in 1793 and completed in ten years. In 1803 he was intrusted with the construction of the CALEDONIAN CANAL (*q. v.*), connecting the Atlantic Ocean with the North Sea, the ascent and descent being accomplished by locks of a size surpassing any heretofore attempted; this was completed in 1823. Besides other works, as engineer to the commissioners of Highland roads and bridges, he built about 1,000 miles of road in Scotland, upon which are more than 1,200 bridges; he constructed eight canals in Great Britain, the Göta Canal in Sweden, and the beautiful suspension railway bridge over the Menai Strait. The Telford pavement was invented by him. The Institution of Civil Engineers was founded in 1818 mainly through his influence, and he was its first president. Before he left his native district he wrote several very creditable poems in the Scottish dialect; he contributed valuable papers to *The Edinburgh Encyclopædia*, and left *The Life of Thomas Telford, Civil Engineer, written by himself* (1838). D. at Westminster, Sept. 2, 1834. Revised by MANSFIELD MERRIMAN.

**Telford Pavement**: See ROADS.

**Tell**, WILLIAM: according to Swiss legends, a celebrated marksman with the bow, living as a hunter at Bürglen in the canton of Uri. He was a member of the conspiracy which was formed against Austria at Grütli Nov. 7, 1307, by Walter Fürst, of Uri, his father-in-law, Werner Stauffacher, of Schwytz, and Arnold von Melchthal, of Unterwalden, and which finally succeeded in freeing the country from the foreign yoke. At this time Gessler, the Austrian bailiff in Küssnacht, raised a cap on a pole in the market-place of Altorf and ordered all passers-by to bow to the cap in token of submission. Tell refused, and was condemned to death, but pardoned on condition that he should shoot an apple from the head of his son. He ventured the shot and succeeded, but Gessler noticed that he had put two arrows in his quiver, and asked why he had done so; and when Tell answered that if he had killed his son with the one he would have killed the bailiff with the other he was again put in chains and taken on board the bailiff's boat to be brought to Küssnacht. While crossing the lake the boat was overtaken by a fearful storm and Tell was unchained in order to steer it, but at a certain point, known as Tell's Leap, he jumped ashore, lay in ambush in a defile through which Gessler had to pass on his way to Küssnacht, and shot him; which deed became the occasion of a general rising in the cantons. Of this story about Gessler, Tell, Stauffacher, etc., the oldest Swiss chroniclers, Johannes, of Winterthur, Justinger, of Berne, and Hemmerlin, of Zurich, know nothing. The first mention of these names and incidents is made in the latter part of the fifteenth century by *Das weisse Buch*, and a complete narrative does not occur until the middle of the sixteenth century in the *Chronicon Helveticum*, by Ægidius Tschudi. The monuments erected in various places in honor of Tell are of a much later date. These circumstances early made the story of William Tell somewhat suspected, though as a general rule it was considered as real history; even Johannes von Müller accepted it. Later critics, however, have proved that the whole story is nothing but a legend common among the nations of the Aryan race, found with all its principal features in the Persian poet Farîd Uddîn Attâr, the Icelandic *Thidreksaga*, the Danish historian Saxo Grammaticus, the English popular song on William of Cloudesley, etc., and only modified to suit Swiss circumstances. It has been proved further, especially by Rochholz, that Gessler, too, is the product of imagination, and that a bailiff of that name did not exist at the time when Tell is said to have lived. The best poetic treatment of the Tell saga is that by Schiller in his famous drama *Wilhelm Tell*. Besides the account of the Tell legend in Tschudi, Schiller probably knew and used some of the old Tell plays popular in Switzerland. See Ideler, *Die Sage vom Schusse des Tells* (1836); Häusser, *Die Sage vom Tell* (1840); Hisely, *Recherches critiques sur l'Histoire de Guillaume Tell* (1843); Huber, *Die Waldstädte Uri, Schwyz und Unterwalden bis zur festen Begründung ihrer Eidgenossenschaft* (1861); Vischer, *Die Sage von der Befreiung der Waldstädte* (1867); Rochholz, *Tell und Gessler in Sage und Geschichte* (1877); and G. Röthe, *Die dramatischen Quellen des Schill. Tell*, in *Forsch. z. d. Philologie* (1894). Revised by JULIUS GOEBEL.

**Tell City**: city (settled by Swiss colonists in 1858); Perry co., Ind.; on the Ohio river, and the Louisv., Evansv. and St. L. Consolidated Railroad; 3 miles N. W. of Cannelton and 75 miles E. of Evansville (for location, see map of Indiana, ref. 11–D). It is in a coal-mining region; has Lutheran and English and German Methodist and Roman Catholic churches, a parochial and 2 public-school buildings, an incorporated bank with capital of $25,000, and 3 weekly newspapers; and flour, woolen, saw, and shingle mills, foundry and machine-shop, distilleries, breweries, and chair, furniture, and plow factories. Pop. (1880) 2,112; (1890) 2,094; (1900) 2,680. EDITOR OF "JOURNAL."

**Tell el-Amar'na**: a modern Arab village in Egypt, on the east side of the Nile, midway between ancient Thebes and Memphis, and 190 miles S. of Cairo (27° 30′ N. lat.). It is near the ancient site of the capital founded and built by Amenophis IV., or KHUNATEN (*q. v.*), the "heretic" king who attempted to supplant the cult of Amon of Thebes by that of Aten, being a form of solar monotheism. Abandoning Thebes, the previous royal residence, Khunaten chose the plain of el-Amarna. It is about 12 miles long by 5 broad. The city occupied its southwestern portion, and its site is indicated by low mounds which are about 5 by 2 miles in extent. These ruins show a systematic plan and are intersected by broad streets. The materials used in construction were mud bricks faced with plaster, except that stone was employed for altars, stelæ, and for pavements, doorsteps, and in other places exposed to hard usage. The king's palace was located on the side toward the river, and its painted pavements have been uncovered. The central and eastern portions were occupied by the temple of Aten, while the southern portion was devoted to the quarters of workmen and artisans. The designs are Egyptian in character, but bear a foreign appearance as though executed by foreign workmen. As is well known, the royal court of the time was under foreign influence, even if it was not itself of foreign stock. In the cliff back of the city are many tombs of adherents of the new form of the Egyptian religion.

In the winter of 1887–88 some 320 clay tablets, perfect or fragmentary, inscribed with cuneiform inscriptions, were found among the ruins of a building adjacent to the palace, and are now preserved in the museums of London, Berlin, and Gizeh. They were written in the Babylonian language and date from the fifteenth century B. C. Most of them are communications from various persons in the East, kings, governors, or agents, made to Amenophis III. and Amenophis IV., or Khunaten. They contain many well-known local names, such as Jerusalem, Lachish, Ascalon, Gezer, Joppa, Hazor, Accho, Sidon, Tyre, and Beirut. See Bezold and Budge, *The Tell el-Amarna Tablets in the British Museum* (London, 1892); Bezold, *Oriental Diplomacy* (London, 1893); Sayce, *Records of the Past*, 2d series, vols. ii., iii., v., vi.; *Higher Criticism and the Monuments* (London, 1893); Evetts, *New Light on the Bible and the Holy Land* (London, 1894); *Proceedings of the Society of Biblical Archæology*, x., 540–569 (Budge); x., 488–525, xi., 326–413 (Sayce); *Zeitschrift für Assyriologie*, iii., 372–406 (Lehman, *Aus dem Funde von Tell el-Amarna*); v., 137–165 (Zimmern, *Briefe aus dem Funde in el-Amarna*); vi., 245–63 (Zimmern, *Die Keilschriftbriefe aus Jerusalem*). See also Baedeker's *Upper Egypt*, p. 20 ff. CHARLES R. GILLETT.

**Tell el-Kebir'** [Arab. = the great mound]: a village in the province of Sharkiah in Lower Egypt; situated upon a canal of sweet water which flows from Suez to Zagazig. It lies slightly N. of Tell el-Mashkutah, the site of ancient Pithom. Tell el-Kebir was the scene of a fierce battle between British and Egyptian troops, which decided the fate of the rebellion instigated by Arabi Pasha. In this place, chosen by nature to be a fortress, Arabi had intrenched 50,000 men with 150 cannon and plenty of ammunition. Sir Garnet Wolseley, the British commander-in-chief, had, by a ruse, become possessed of the Suez Canal. On the march toward Cairo, Maj.-Gen. Graham had advanced as far as Kassassin, where he had been attacked by the Arabs. It was not until the night of Sept. 12, 1882, that Wolseley felt secure enough in order to move forward. On the morning of the 13th the British forces, to the number of 14,000, moved forward and took the fortifications raised at Tell el-Kebir at the point of the bayonet. Though the Egyptians fought bravely, their camp and 3,000 soldiers fell into the hands of the British. By continued prompt action Wolseley saved Cairo from a destruction which Arabi had prepared for it.

**Teller**, HENRY MOORE, LL. D.: U. S. Senator; b. at Granger, Allegany co., N. Y., May 23, 1830; educated at Alfred University, New York; studied law, and was admitted to the bar at Binghamton, N. Y., 1858; removed to Illinois in 1858, thence to Colorado in 1861; was elected U. S. Senator (Republican) on the admission of Colorado as a State in 1876; re-elected for 1877–83; chairman of special committee on election frauds, known as the Teller committee, 1877–78. He was U. S. Secretary of Interior from Apr. 6, 1882, to Mar. 4, 1885; re-elected U. S. Senator from Colorado in 1885, 1891, and 1897.

**Téllez**, tel'yāth, GABRIEL, Maestro Fray (better known by his *nom de guerre* of TIRSO DE MOLINA): dramatist; b. in Madrid, Spain, some time between 1570 and 1585. The details of his life are almost entirely unknown. He was educated at Alcalá de Henares, and later (perhaps when well advanced in life) took orders in the Church. He entered the order of Nuestra Señora de la Merced Calzada, and became a famous preacher; was made chronicler of his order; inspector of the convents in Old Castile; and Sept. 29, 1645, was elected prior of the monastery of Soria. D. in Soria about 1648. As a dramatist he belonged to the school of Lope de Vega, as he himself acknowledged. So prolific was he, however, that he is one of the chief figures of the golden age of the Spanish drama. He informs us that he had written 300 plays, but only fifty-nine are extant. Many of these are remarkable for the looseness of their situations and their language; and the Inquisition is known to have hunted down and destroyed his works on this account, wherever it could find them. Undoubtedly the most famous of his plays is *El Burlador de Sevilla*, in which, using a dramatic situation from Lope's *Dineros son Calidad* and a theme perhaps derived from real life, the poet first worked out the story of Don Juan Tenorio, so famous in European literature since. Another play, a most intricate comedy of intrigue, *Don Gil de las Calzas Verdes*, has held its place on the Spanish stage down to the present. A different side of Tirso's genius is shown in the grave and deeply religious play *El Condenado por desconfiado* (The Doubter Damned). Like all the Spanish dramatists of his time, he showed the greatest facility in turning from the gay to the serious; and several of his *Autos*, or religious dramas, are excellent in their kind. Besides plays, Tirso wrote two famous collections of stories after the fashion of the *Decameron*—the *Cigarrales de Toledo* (1st ed. 1621 or 1624)—giving the stories, verses, and plays supposed to have been recited to a wedding company at country-houses (*cigarrales*) near Toledo, and *Deleitar Aprovechando* (Pleasure with Profit, 1625), more moral, but never finished. The *Comedias* of Tirso de Molina, so far as published, first appeared in five parts, between 1627 and 1636. A selection of thirty-six of the best plays was edited by Hartzenbusch, 12 vols., 1839–42; 3d ed. 1 vol., 1885 (vol. v. of Rivadeneyra's *Biblioteca de Autores Españoles*). Tirso's *Novelas* are printed in vol. i. of Ochoa's *Tesoro de Novelistas españoles* (Paris, 1847). A. R. MARSH.

**Tellicher'ry**: town of Malabar, Madras, British India; picturesquely situated on the open sea in a beautiful, fertile, and well-cultivated district rich in spices, rice, and cocoanut-palms (see map of S. India, ref. 6–C). It has a good harbor and exports spices and sandal-wood. Pop. (1891) 27,196, of which number 10,000 are Mohammedans and 1,800 Christians. Revised by M. W. HARRINGTON.

**Tel'lurides** [deriv. of *tellurium*]: compounds of the element tellurium with other metals. They constitute chiefly the native mineral compounds of tellurium.

*Bismuth telluride* is the mineral tetradymite, which, as found in gold mines in Virginia and Georgia, has the composition, according to Genth, of pure bismuth telluride, $Bi_2Te_3$, while that from the Uncle Sam lode in Montana contains sulphur and has the composition $Bi_4Te_5S$. Other Montana tetradymites, from placer gold, were found by Genth to be free from sulphur. Genth discovered with these latter tetradymites, and also in Davidson co., N. C., a mineral montanite, a bismuth tellurate, $Bi_2O_3.TeO_3.2H_2O$. Tetradymite is a steel-gray mineral, in inflexible folia or laminæ like graphite, soft and marking paper like the latter, hexagonal in form. It may be distinguished from graphite by roasting in a glass tube open at both ends, when a white sublimate of tellurous oxide will appear, fusible to transparent, colorless droplets. It is also fusible and combustible before the blowpipe, tingeing the flame bluish green.

*Lead telluride* is altaite, a rare white metallic sectile mineral, sometimes in cubical crystals, like galena, the corresponding sulphide. It is PbTe. It is found in the Altai Mountains, and in the U. S. at the Red Cloud mine, Colorado, and at the King's Mountain gold mine in Gaston co., N. C.

*Silver telluride* is the rare mineral hessite, $Ag_2Te$. It is metallic, iron gray, and sectile, and in crystallization right rhombic. It usually contains some gold. It is found in the Altai Mountains, at several Hungarian localities, and at the Stanislaus mine in Calaveras co., Cal. Genth has also noted it in small quantity from the Red Cloud mine, Colorado.

*Gold and silver telluride* is the mineral petzite, found at Nagy-Ag in Transylvania, and also by Genth among the ores of the Red Cloud mine. Genth's analyses indicated 24 and 25 per cent. of gold in the composition of the Colorado petzite. It is scarcely to be distinguished without analysis from hessite in appearance or character. The auriferous mineral is somewhat lighter in color and more brittle. It is right rhombic, like hessite.

*Gold telluride* is sylvanite, which always contains some silver (12 to 13 per cent. at the Red Cloud mine), is monoclinic, steel gray or silver white, and varies in composition and density within wide limits, containing from 23 to 30 per cent. of gold. It is found at two Transylvanian localities in Europe, Nagy-Ag and Offenbanya, and it was unknown in the U. S. until the younger Silliman found it at the Red Cloud mine; but Dana gives also the Melones and Stanislaus mines in Calaveras co., Cal., as localities. Genth obtained gold telluride, calaverite, from the Stanislaus mine, having the composition $AuTe_4$, with about 41 per cent. of gold. Its color is bronze yellow, and its streak yellowish gray. It is brittle, and not crystalline. Revised by IRA REMSEN.

**Tellu'rium** [from Lat. *tel'lus*, *tellu'ris*, earth]: one of the elements of matter belonging to the same family as sulphur and selenium. It is one of the rarer elements, though it is found in a number of minerals. Von Reichenstein believed that he had found a new metal in 1782 while working with some gold ores. Not trusting his own work he sent specimens of the ores to Torbern Bergmann; but Bergmann would not venture a positive conclusion, and it was not until 1798 that Klaproth confirmed the discovery, and then he named the element tellurium. It has been since investigated mainly by Berzelius. Brauner has also contributed to the knowledge of its properties. The occurrence of the element is described in the article TELLURIDES (*q. v.*). It is found in a number of localities in North America, and if there were a demand for it no doubt it could be obtained in any desired quantity. The ores are treated with strong oxidizing agents, such as aqua regia, chlorine, etc., by which the tellurium is converted into tellurous acid, $H_2TeO_3$. By treating with sulphurous acid the acid is then reduced to the form of the element. Tellurium is silver white, very lustrous, and crystallizes very easily. It is brittle, does not conduct heat well, and conducts electricity very little. Under the influence of light the electrical conductivity is somewhat increased, though the increase is by no means as marked as in the case of selenium. When tellurium is strongly heated, it takes fire and burns with a strong flame which is blue with green edges, and gives off a thick white smoke of tellurium dioxide, $TeO_2$, which has a peculiar weak acid odor. It was formerly supposed that this vapor has the odor of rotten radishes, but this is wrong, as the latter odor is caused by the presence of a small quantity of selenium. Tellurium melts at about 500° C., and at a higher temperature it is converted into a golden yellow vapor. Its atomic weight is 125. Revised by IRA REMSEN.

**Telugu**: See DRAVIDIAN LANGUAGES.

**Temesvar**, tăm-esh-vaar': town; in Hungary; on the navigable Bega Canal, which joins the Theiss at Titel, 5 miles from the Danube (see map of Austria-Hungary, ref. 8–J). It is well built with broad, straight streets lined by handsome houses. Its cathedral and synagogue are splendid edifices, and it has fine monuments and educational institutions. The castle, erected by Huniadi in 1443, is now the arsenal. The town was held by the Ottomans from 1552 to 1716, when it was taken by Prince Eugene of Savoy. It was almost destroyed when besieged by the Hungarians from Apr. 25 to Aug. 9, 1849, but was delivered by Haynau. It manufactures leather, silk and cotton fabrics, and carries on an extensive transport trade in wheat and wine. Pop. (1890) 39,884. E. A. GROSVENOR.

**Temis'camingue Lake**: a body of water on the boundary between the provinces of Ontario and Quebec of the Dominion of Canada. It is 30 miles long and 15 broad, and is in lat. 47° 30′ N., lon. 80° W. Its waters flow into Ottawa river. Its basin is the seat of a French-Canadian colonization of several hundred families.

**Tem'minck**, CONRAD JACOB: naturalist; b. in Amsterdam, Holland, Mar. 31, 1778; entered the service of the Dutch East India Company, and became a student of natural history. His principal work was *Manuel d'Ornithologie* (1815; enlarged ed., 4 vols. 8vo, 1835–40). He was also author of *Nouveau Recueil de Planches coloriées d'Oiseaux* (folio, 1820–44), consisting of 600 plates. He became director of the Natural History Museum at Leyden in 1820. He wrote a number of important works respecting the East Indies; among others, *Coup d'œil général sur les possessions Neerlandaises dans l'Inde Archipélagique* (3 vols., Leyden, 1847–49). D. Jan. 30, 1858. Revised by F. A. LUCAS.

**Tem'pe** (in Gr. τὰ Τέμπη): a valley, or rather a gorge, in Northeastern Thessaly, Greece; 5 miles long, and in some places so narrow that between the high cliffs which rise almost perpendicularly on both sides there is space only for the river Peneus, which traverses the valley, and a carriage-road. In antiquity it was very celebrated for the beauty of its scenery. It was strongly fortified at several points, and ruins of these fortifications are still visible. It is now called Lykostomo. Revised by J. R. S. STERRETT.

**Temperament** [from Lat. *temperamen'tum*, a mixing in due proportion, temperament, disposition, deriv. of *temperare*, divide, proportion, mingle in due proportion]: in keyed instruments, such as the organ and piano, a certain adjustment or regulation of the sounds or intervals of the scale, with the view of removing an apparent imperfection, and fitting the scale for use in all keys without offense to the ear. The musical scale in use in keyed instruments is a compromise, or a scale in which most of the intervals are not mathematically correct, or true to the scale of nature as deduced from the MONOCHORD (*q. v.*), but are slightly modified by elevation or depression, a process absolutely necessary to meet the various exigencies of modern music. This modifying or nice adjustment of the sounds of the scale is the office of temperament; and in tuning an organ or piano the first thing done is the fixing of the temperament by adjusting with great care a single octave in the middle of the keyboard as a pattern from which all the other pipes or strings, above or below, are to be tuned by octaves, double octaves, etc.

It has been found that though the perfect octave seems to be divisible into six major tones, as C—D, D—E, E—F♯, F♯—G♯, A♭—B♭, and B♭—C, yet these, when added together, are really somewhat more than an octave. Again, though the octave seems divisible into three major thirds, as C—E, E—G♯, and A♭—C, yet by strict measurement these three thirds prove to be less than the octave in extent. This is illustrated in the following manner by E. J. Hopkins, of the Temple church, London, in his work on *The Organ*: "Supposing the perfect octave to be divided into 3,010 equal parts, the interval of a major tone would contain 511 of those parts. But if we multiply 511 by 6, we have 3,066, instead of 3,010, plus 56 parts; so that the octave contains less than 6 major tones by 56 parts. A major third also would contain 969 parts, which multiplied by 3 would make 2,907, instead of 3,010, minus 103 parts; the octave in this case containing 103 parts more than the three major thirds." To distribute or get rid of this excess or shortcoming resource can only be had to temperament—i. e. the modifying of several of the intervals by very slightly raising or lowering them, so as to extend or contract their whole sum to the exact limits of the octave. In the practice of tuning, this apparent irregularity or imperfection of the scale is usually treated as an overplus, which must be disposed of by some method which shall not so affect any interval of the scale as to make it offensive to the ear. Several modes of doing this have been devised, and these are commonly classed under the heads of equal and unequal temperament.

On an instrument unequally tempered the excess is unevenly distributed, so that some of the intervals will be perfectly smooth and agreeable, while others will be harsh. In old church organs this temperament was in general use. Music formerly was written in very few keys, and modulations were seldom carried into remote scales. It was customary, therefore, to make the keys that were in common use as perfect as possible, at the expense of the other keys, on which all the roughness of the temperament was concentrated. Under the requirements of modern music, with the whole circle of the keys in common use, this unequal temperament has become obsolete. In equal temperament the excess or deficiency above noted is distributed among all the keys, thereby rendering them all available for use, and enabling the composer to present harmonious combinations in the remotest keys without any disagreeable effect. There are, however, several shades or degrees of equal temperament, from the strictest uniformity to any amount of inequality which is still bearable. If all keys were made exactly alike, there would be an undesirable loss of their individual character, and no difference perceptible except in their degree of acuteness. To avoid this, some discrimination is commonly used in favor of certain popular keys, yet not to such an extent as sensibly to injure the effect of keys less favored. A difference is recognized at once between the major keys of D and A♭, even though the instrument in use is said to be equally tempered. In musical theory and in treatises on harmony a tempered interval does not differ by name from an untempered one. Thus the fifth C—G, though reduced by temperament, is still called and assumed to be a perfect fifth; and all terms indicating chords, combinations, and progressions remain unaffected by any influence from temperament. Revised by DUDLEY BUCK.

**Temperament**: the general temper or disposition of a person. The word is of popular origin, signifying the most general characteristics which distinguish one person from another. Such differences as those between phlegmatic and nervous individuals have a fairly evident basis in the popular use of the terms. Yet the doctrine of temperaments is very undeveloped. In the older physiology and medicine humors or bodily fluids were supposed to exist in varying quantities and varied mixtures in different persons; so among philosophers, Descartes and Priestley. Four temperaments were distinguished—the choleric, the sanguine, the phlegmatic, and the melancholic. Later writers, to whom the problem was one mainly of psychological interest, have classed the temperaments under much the same words, but with more adequate theoretical grounds. For example, Wundt arranges the temperaments under two great classes, each again having two divisions: first, as having a prevailing degree of quickness or sluggishness (i. e. fast and slow), and second, as being weak or strong. As follows:

| CLASS. | Strong. | Weak. |
|---|---|---|
| Fast | Choleric. | Sanguine. |
| Slow | Melancholic. | Phlegmatic. |

The grounds of explanation of such vaguely defined characteristics are about as vague in both medical and psychological literature. Two general suppositions underlie current explanations: The differences are considered either vaso-motor in their seat, due to differences in the blood-circulation, pressure, etc., or nervous, matters of hereditary variation on the side of sensibility. This latter explanation, vague as it is in respect to any definite determination of the actual basis of any of the so-called temperaments, is probably the line of inquiry which offers most promise for future research. An attempt has been made by Paulhan to distinguish the temperaments on the ground of individual peculiarities in the manner and facility of movement, giving such divisions as impulsive, inhibitive, reflective temperaments, etc. This has also a certain interest.

A distinction made by the pathologists in investigating speech-troubles seems to throw a little light upon this obscure subject. Men are distinguished as of various types, such as visuals, auditives, motors, etc., according as they depend mainly on one kind of sense-memories or another (those of sight, hearing, etc.) for the readiest speech. These distinctions probably apply also to other functions, and it is possible that in the future the criteria of mental "type" may be so defined as to cover broadly the phenomena now ascribed to temperament. This, combined with the investigation of nervous heredity, may be expected to clear up the topic somewhat. J. MARK BALDWIN.

**Temperance** [viâ O. Fr. from Lat. *temperan'tia*, moderation, sobriety, deriv. of *tem'perans*, pres. partic. of *tempera're*, mix in due proportion, temper, moderate]: moderation or abstinence respecting the use of intoxicating liquors. It is more common among the more educated and refined classes in the community than it was a century ago. At that time all classes indulged often to excess and without a thought of the impropriety of so doing. The disgusting stories of what happened without rebuke from public opinion in Europe or the U. S. are not myths. Some of the worst of these occurrences, which would not now be tolerated in any decent society, were then generally considered as mere practical jokes; but such facts could not long occur in any reasonable community without exciting decided opposition from the more thoughtful members of it. The evils arising therefrom were too patent. Hence arose temperance societies, so called—societies of men and women pledged to promote temperance in the use of intoxicating drinks, *not* total abstinence as now generally inculcated by their successors. After some years their efforts seemed weak and success impossible to the more earnest advocates. Hence have arisen various movements, all aiming to promote the same general object, the suppression of the liquor traffic and the disuse of alcohol in any form as a beverage. During the first half of the nineteenth century the so-called Washingtonian movement began in Baltimore. This for a season aroused the whole people and was the means of exciting a deep interest in the subject. It may be styled the confessional phase of the temperance movement. The pioneers and chief workers in it pleaded the cause of temperance by minutely detailing at public meetings their own erratic courses. Every drunkard became for the time being a most effective apostle, not only of temperance, but of total abstinence; but this movement did not last long, because (1) some of these apostles became backsliders, and (2) because after a time the community became nauseated with the revelations made by some of the speakers. Total abstinence was an essential article of faith for every Washingtonian. For him certainly that rule was supreme and admitted by all to be absolutely necessary. Following these have arisen societies, some of which declare that the taking of stimulants in any amount by any person is unnecessary and virtually a crime against society, a sin *per se*, while others acknowledge that many, perhaps a majority of, persons may indulge with personal safety, but urge that all should practice abstention as needful for the remainder, the strong assisting to bear the burdens of the weak and thus carrying out the Christian law of charity as taught by St. Paul. The doctrine that everybody should forego the use of all liquors because some became drunkards was a logical and practical one for the Washingtonians; but it was by no means an equally obvious conclusion when applied to the whole public, as the Prohibitionists for many years have been trying to do. The old temperance societies opposed this idea, but either failed of meeting it or were finally subdued by it. Licenses given by the state are by Prohibitionists deemed wrong in principle, as licensing a crime, or at least a great social evil which should be made the subject of legal restriction as well as gambling. Hence for years the questions of prohibition and license have been the watchwords of bitterly opposing partisans. It is proposed briefly to examine these two systems of promoting temperance.

Alcohol has been proved to be at times a remedy of immense value to man. In order to be thus valuable to mankind it must be used legitimately and under proper safeguards. On the contrary, if used on improper occasions or too frequently or too freely, it ruins man and injures society to its very depths. These two propositions are strictly, scientifically true. It would seem as if none but bigots of either of the contending parties could deny them. Hence it follows that we may properly and justly under the varying circumstances of life take one or the other position of favoring or of opposing either license or prohibition in our dealings practically with the question of temperance. It has been proved by correspondents living in various and widely separated portions of the earth's surface that a tendency to use stimulants exists among all people. From the savage to the most highly civilized race of men there is no one of them that has not this instinct; and with the instinct naturally arises the tendency to excess in the indulgence of it. The desire for this gratification appears, however, to vary much according to a cosmic law of heat and climate. The isothermal lines which limit the growth of the grape N. and S. of the equator seem to divide the northern and southern hemispheres into three tolerably well-marked zones —namely, (1) the tropical, (2) the temperate or grape-growing, and (3) the northern or colder. In the first drunkenness is almost unknown and it is deemed disgraceful, while lusts of other kinds, which are rare at the north, have full sway, unopposed by public opinion. In the second region milder drinks, such as native grape wines, mild beers, and ales, are used, perhaps in very large quantities, producing when drunkenness follows a milder and more jovial, less offensive, less destructive type of it than is observed in the more northern regions. In the third zone man drinks less in amount perhaps, but it is of a more potent fiery liquor. It makes him brutal and beastly, and frequently he becomes destructive of persons and of property. If this be so—and such seems to be the fact—it is plain that prohibition in the first zone would scarcely be thought of; in the second some moralists might suggest it, though it would not be likely to be adopted; in the third it would find its strongest advocates. Parties there would inevitably arise prepared to stop the whole traffic in liquor because of its vile influence on man; and the zeal of these parties would be just in proportion to the enormity of the evil sought to be eradicated. Surely any reasonable plan which proposes to prevent a man from degrading and making a tiger of himself in his intercourse with others should be sustained. Another great influence—viz., that of race, with its centuries of education of certain habits—should always be taken into consideration in judging of this question.

From these considerations it seems to many people that the state as a guardian of the public health is bound to use its great powers to restrain its citizens by actual prohibition from the use of every alcoholic stimulus or to allow the use of them under more or less restriction to all, provided that in so doing it does not interfere with the inherent right of the individual to use any food or drink he may prefer without injury to himself or others. In deciding these delicate questions the community may be divided into childhood and manhood. This is already done on the subject of voting and on many others. Only at certain ages does the male in the eyes of the law become a man and the female a woman. For the former of these classes—i. e. for all persons under the age of legal manhood—the prohibition of the use of liquors or a most restrictive license should be inaugurated and as far as possible thoroughly carried out. For the very young statute law would be rarely needed if the parental authority were duly exercised. The custom in some families, more common formerly than now, of allowing children to sip wine at their father's table is fraught with dangers of the most deadly kind for the future wellbeing of the man and of society; and it must be added that if the father sips his wine at table it will be very difficult to prevent the sons from doing the same when opportunity offers. Statute law should provide still further for the correct guidance of the youthful years of the future citizen, and the giving or selling of liquor to a minor should be prohibited under the severest penalties. When the state appreciates its high prerogative of contributing to the best education of every citizen, then the selling or giving of liquor to a minor will be deemed one of the most heinous of crimes. After the youth arrives at manhood or womanhood—viz., at the age at which even by statute law he or she has the fullest privileges in the choice of good or evil—we can not proceed in this arbitrary way. In consequence, however, of the inherent infirmity of human nature some will then be induced to drink inordinately and behave in a manner contrary not only to their own interests, but to the peace of the commonwealth. All such persons will need the watchful care of the state, and it must assume the parental relation or that of a stern judge, and if no punishment should be sufficient to restrain the drunkard, then the state should seclude him as an insane man in an inebriate asylum.

Again, it has been most justly urged that the state should not only prohibit the sale of liquor to an habitual drunkard, but that the dealer who for the sake of gain violates such a law should be held responsible, not only for that violation, but for all the damages the victim may commit while intoxicated; and, moreover, that the family of the latter, which is bereft of its natural guardian, should be allowed a weekly stipend from the vender during the illness or imprisonment of the father.

Finally, the state, for its own safety and on the sacred principle of *salus populi suprema lex*, should deprive the incorrigible drunkard of his civil rights, as the state treats the felon. Virtually the drunkard throws his recklessly away in the very act of becoming intoxicated. But shall we have prohibition or a limited license for the community at large? This question divides itself when applied to the practical customs of life. The system of open bars for the sale of the coarser liquors and the custom of treating, as practiced by the English-speaking race, and especially in the U. S., are unmitigated evils, and should be forthwith given up or should be crushed by state power. Although they would undoubtedly exist in secret places, it would nevertheless be the greatest boon to the community to have them, at least like the felons they make, obliged to keep out of sight. Should the same prompt measures be applied to the sellers of milder beers, ales, and wines? Undoubtedly these too should be under state and municipal surveillance. Moreover, some of the stronger beers or ales should be classed with the coarser liquors, as they steal away the senses almost as quickly and quite as powerfully as absinthe, whisky, or rum. Another question arises: Should the same rigid rule be applied to native light wines and beers which contain but a small quantity of alcohol and may therefore be used with comparative safety? The difficulty is that, as shown by practical experience, tavernkeepers, licensed to sell beer, will usually sell whisky also, surreptitiously. It is, moreover, argued that though beer and light wines may be indulged in more freely than stronger drinks, there is a danger that this use of milder liquors will lead to the use of grosser ones. It is probable that this is true in many cases, and doubtless it would be wrong to allow any one having tendencies to intoxication, either from hereditary descent or previous bad habits, to use even these milder liquors. With all such, total abstinence is absolutely essential; but it does not follow that this is necessary for all, and the only valid argument for total abstinence with those who are free from such tendencies must be the Scriptural one—that every man should be willing to curtail his own liberty lest his weaker brother be made to offend.

The final conclusion is this—viz., education and a cultivation of all the amenities of life should be promoted for the sake of temperance. In the school, and above all in the family, no opportunity should be lost of impressing on the tender consciences of the young the utter beastliness of drunkenness. A child should be taught to reverence the mind within him, and to shrink with horror from the thought of ever once depriving himself of its perfect control; and where public opinion will sustain such action the state may properly place liquor-saloons in the same category with gambling-houses, and rigidly suppress both. See PROHIBITION and ABSTINENCE, TOTAL.

Revised by JOHN ASHHURST, Jr.

**Temperature** [viâ O. Fr. from Lat. *temperatu'ra*, a mixing in due measure, proportion, temper, temperament, temperature, deriv. of *tempera're*, mix in due proportion, temper]: the condition of a body in relation to the molecular activity manifested as heat, which condition determines its interchange, either of radiation or absorption, with neighboring bodies. (See GAS and HEAT.) The addition of heat to a body communicates to it a higher temperature in all cases except when a change of form occurs, as from a liquid to a gaseous condition, or when there is chemical action. (See THERMO-CHEMISTRY.) Measurements of the temperature of a body by thermometers are not strict measurements from a scientific point of view, but rather comparisons with certain other effects depending on change of temperature in special bodies. (See THERMOMETER and THERMOMETRY.) In gases the temperature can be expressed in an absolute manner in terms of the kinetic energy of the molecules, if we suppose the rigorous truth of Boyle's and Gay-Lussac's laws; that is, in a perfect gas the temperature is proportional to the average kinetic energy per molecule. As this is not the case, only a part of the temperature can be so expressed in consequence of the existence of intermolecular actions. See THERMODYNAMICS. See also METEOROLOGY.

R. A. ROBERTS.

**Temperature of the Body**: The temperature of the human adult in a state of health averages from 98·4° to 98·6° F., the fractionally higher temperature existing in the warmer-blooded races, as those of Southern Europe, the lower average being found in northern nations and the Anglo-Saxon race. The fluctuations of temperature in health are exceedingly small—fractions of a degree, rarely more—dependent on physical activity or inactivity in sleep or wakefulness, or functional activity, as digestion. The extremities and surfaces may show a lowered temperature in winter, but the temperature taken by a thermometer in the mouth, rectum, armpit, or fold of the groin reveals a nearly uniform heat of the blood and internal organs. Animal heat is generated by the nutritive supply and assimilation with destructive tissue-waste. These processes lead to a certain production of heat; at the same time there is a constant dissipation of heat from the skin, through the lungs, and by the various other excretions. The regulation of the production and dissipation of heat is controlled by nervous centers situated in the basal portions of the brain. Any disturbance of these by conditions of the blood or circulation may therefore lead to disturbances of the temperature. As well-known examples "shock" or nervous depression causes reduced temperature, while excitement, pleasure, anger accelerate the circulation and elevate temperature. The temperature of children and infants is one to two degrees higher than that of adults. The temperature of aged persons is half a degree or more below the adult average. "Medical thermometry," the use of the thermometer to register and study temperature in disease, is a constant practice in medical work. De Haen (during the fever at Breslau a century and more ago), John Hunter, and Currie employed the thermometer, but the German school—and notably Wunderlich—has popularized its use by the profession within a comparatively recent period. The self-registering thermometer is employed, and the observations may therefore be taken by the nurse or attendant. In many diseases there is elevation of temperature. Where this is but a symptom in some distinct local disease the fever is regarded as but a symptom. On the other hand, there are diseases in which the fever is the most decided symptom. These have long been known as the fevers, or of late, from the present knowledge of their causation, as the infectious fevers. Among such are typhoid fever, malarial fever, and the like. In these there is usually a period of onset, a stage of continued symptoms, and a stage of decline. The temperature of the body varies greatly in different cases of the same fever or other disease and at different times. This may depend either upon the individual or upon the severity of the disease. As a rule, its range is from 101° to 105° F. When above the latter point the term *hyperpyrexia* is applied. Such may occur in various infectious diseases, and especially in pernicious malarial fever, in sunstroke, and in certain cases of rheumatism. In the last-named diseases, temperatures of 110° or 112° F. have not infrequently been noted where recovery ensued. Occasionally cases of elevation of the temperature to 118° or 120° or even more are recorded; but in many of these deception has been practiced. The reverse of fever, subnormal temperature, is also frequent. Moderate grades are noted in conditions of depression or shock. It reaches serious grades in collapse from injury or such diseases as cholera, in which debilitating discharges occur. The external temperature may here sink to 90° or even to 85° F. In practice the temperature is usually taken in the axilla or mouth, though the rectal temperature is less liable to accidental errors of observation. Revised by W. PEPPER.

**Temperature of the Earth**: See EARTH.

**Templar Knights**: See KNIGHTS TEMPLARS.

**Temple**: city (founded in 1882): Bell co., Tex.: on the Gulf, Col. and S. Fé and the Mo., Kan. and Tex. railways; 36 miles S. by W. of Waco, and 218 miles N. W. of Galveston (for location, see map of Texas, ref. 4-H). It is in an agricultural and stock-raising region, and has 7 churches, a graded public school, a private high school, 2 national banks with combined capital of $180,000, 5 weekly newspapers, 3 large cottonseed-oil mills, cotton-compresses, and agricultural-implement works. It is principally engaged in mercantile business. Pop. (1890) 4,047; (1900) 7,065.

EDITOR OF "TIMES."

**Temple**, FREDERICK, D. D.: Archbishop of Canterbury; b. in England, Nov. 30, 1821; educated in the grammar school at Tiverton; graduated at Oxford University 1842; became fellow of Baliol College; took orders in the Church of England 1846; was principal of the training-college at Kneller Hall, near Twickenham, 1848-55; one of the Government inspectors of schools 1855-58; master of Rugby School from 1858 to 1869; appointed by Lord Palmerston Bishop of Exeter 1869; appointed Bishop of London 1885, and Archbishop of Canterbury 1896. He was one of the authors of the famous *Essays and Reviews* (1860), and his confirmation to a bishopric was ineffectually opposed by the conservative party in the Church. He wrote three volumes of *Sermons preached in Rugby Chapel* (1861-71), and was Bampton lecturer at Oxford for 1884. Revised by C. H. THURBER.

**Temple**, HENRY JOHN: See PALMERSTON, VISCOUNT.

**Temple**, Sir RICHARD, D. C. L., LL. D.: statesman and author; b. in Worcestershire, England, in 1826; entered the India civil service in 1846; was knighted in 1867; was for several years lieutenant-governor and actual ruler of Bengal, in which capacity he did much to benefit the natives, especially during the famine of 1874; was governor of the Presidency of Bombay, and having returned to England in 1880 entered Parliament in 1885 as Conservative member for the southern division of Worcestershire; has been a member of the London school board since 1885. He is the author of *India in 1880*; *Men and Events of my Time in India* (1882); *Oriental Experience* (1883); *Cosmopolitan Essays* (1886); *Palestine Illustrated* (1888); and the memoir of *John Lawrence* in *English Men of Action*. F. M. COLBY.

**Temple**, RICHARD GRENVILLE, Earl: statesman; brother of George Grenville; b. in England, Sept. 26, 1711; entered Parliament for Buckingham 1734; was advanced in political life by the elder Pitt, and held the offices of Lord of the Admiralty 1756–57 and Lord Privy Seal 1757–61. D. at Stowe, Sept. 11, 1779. His correspondence, and that of his brother George, with Pitt, was edited as *The Grenville Papers* (4 vols., 1852–53), by W. J. Smith.

**Temple**, Sir WILLIAM: diplomatist and author; b. in London, England, in 1628; educated at Emmanuel College, Cambridge; traveled on the Continent 1647–54; married Dorothy Osborne 1654; was a member of the Irish convention 1660; a joint commissioner of the Irish Parliament to Charles II. 1662; was sent on a secret mission to the Bishop of Münster 1665; was made a baronet and minister resident at the court of Brussels 1666; visited Holland to urge the formation of a league against Louis XIV. 1667; negotiated the triple alliance between England, Holland, and Sweden, Jan., 1668; assisted in perfecting the Peace of Aix-la-Chapelle, and was commissioned ambassador to The Hague 1668; returned to England Sept., 1670; was dismissed from office June, 1671, in consequence of the change of policy which had already (1670) led to a secret treaty with France, but was again appointed to negotiate a peace with the States-General of Netherlands 1674; assisted at the Congress of Nymwegen 1675–79; devised for Charles II. the plan of his privy council of thirty members Apr., 1679, and himself became a member. He declined the secretaryship of state in the same year; served in Parliament as member for the University of Cambridge for a single session, but in 1680 his name was stricken from the roll of privy councilors and he lived in retirement at Sheen and at Moor Park during his later years, having as secretary and literary assistant Jonathan Swift; was visited and consulted by William III., but declined to return to political life. D. at Moor Park, Surrey, Jan. 27, 1699. Author of *Observations upon the United Provinces* (1672); *The Origin and Nature of Government*; *Essay upon Ancient and Modern Learning*; and other publications, collectively issued as his *Works* (2 vols., 1720), edited with a *Memoir* by Dr. Swift. His collected writings were republished in four volumes in 1814. See the *Memoirs* by T. P. Courtenay (1836) and the *Letters* of Dorothy Osborne, edited by E. A. Parry (1888).

**Temple, The**: See JERUSALEM.

**Templeton**: town; Worcester co., Mass.; on the Boston and Albany Railroad; 10 miles S. of Winchenden, 30 miles N. W. of Worcester (for location, see map of Massachusetts, ref. 2–F). It contains the villages of Baldwinsville, Otter River, and East Templeton; has 6 churches, high school, 14 schools, Boynton Public Library, a savings-bank, and a weekly newspaper; and is principally engaged in the manufacture of articles from asbestos, chairs, furniture, pails, and boxes. Pop. (1880) 2,789; (1890) 2,999; (1900) 3,489.

**Tem′poral Bones** [*temporal* is from Lat. *tempora′lis*, pertaining to the temples, deriv. of *tem′pora*, temples (of the head)]: a pair of irregular bones which in man constitute a portion of the sides and base of the skull. Each consists of (1) a squamous portion, perhaps a part of the expanded neural spine of the second cephalic vertebra; (2) a mastoid portion; and (3) a petrous portion. Some regard these last two as parts of the splanchno skeleton rather than of the vertebral skeleton, considering them as structurally parts of the auditory apparatus, although they are functionally, at least in part, identified with the rest of the temporal bones. Others regard the mastoid as belonging to the neural arch of the second vertebra. The zygomatic process reaches forward from the outer surface of the squamous portion, and joins the malar bone, forming the zygomatic arch; while attached to the petrous portion are a long styloid process and a nearly circular auditory process, the pleurapophyses, or ribs, of the third and second vertebræ of the skull. Attached to the mastoid portion is the mastoid (teat-shaped) process, which after puberty becomes hollowed into mastoid cells. Revised by W. PEPPER.

**Temporal Power**: See PAPAL STATES and ROMAN CATHOLIC CHURCH.

**Temudjin**: See GENGHIS KHAN.

**Tenacity of Metals**: See STRENGTH OF MATERIALS.

**Tenaille**: in fortification, a rampart in the main ditch, in front of the curtain, between two bastions. See FORTIFICATION.

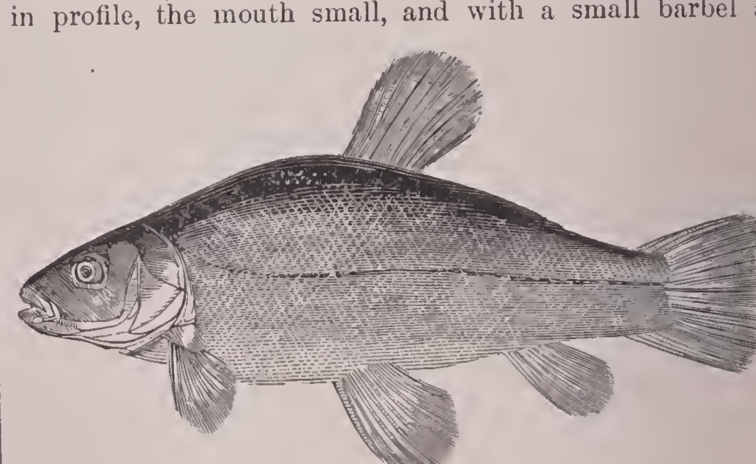
**Tenancy in Common**: See ESTATE, LANDLORD AND TENANT, and JOINT OWNERSHIP.

**Tenant for Years, at Will, and by Sufferance**: See ESTATE and LANDLORD AND TENANT.

**Tenas′serim**: a division of BURMA (*q. v.*), forming part of the British empire in India. It is a long narrow tract of country, in from 10° to 17° N. lat., between Siam and the Bay of Bengal. Area, 46,590 sq. miles. The principal river is the Tenasserim, which rises in about 15° N. lat., and empties into the sea by two mouths. Pop. (1891) 971,660. The principal town is MAULMAIN (*q. v.*).

**Ten Brink**, BERNHARD ÆGIDIUS KONRAD: See BRINK.

**Tench** [from O. Fr. *tenche* > Fr. *tanche* < Lat. *tin′ca*]: the *Tinca vulgaris*, a cyprinid fish, abundant in European streams and lakes, and the only member of its genus. It has a compressed, fusiform shape; the trunk covered with small scales, the lateral line little decurved, the head conic in profile, the mouth small, and with a small barbel at



The tench.

each corner, the dorsal above the pectorals, and short, the anal also short, and the caudal little emarginated; the pharyngeal teeth are compressed, club-shaped, and in one row, generally five on the left and four on the right side; the color is generally dark-greenish olive above and on the sides, lighter below; the fins dark brownish. It occasionally attains a length of nearly 3 feet and a weight of 12 lb., but does not often weigh more than 3 lb. It prefers rather deep and weedy, and apparently even foul water. It is very tenacious of life. The female spawns in the late spring. The fish is popularly supposed to possess healing properties. Its flesh is rather insipid. Revised by F. A. LUCAS.

**Tendai-Shiu** (in Chinese *T′ien-tai Tsung*): a Buddhist sect, whose doctrines were introduced from China into Japan in the year 805 A. D. by Dengio, the first abbot of Hiyeisan, Kioto. It divided later into three, the *Enriakuji*, the *Onjoji*, *Miidera* or *Jimon-Ha*, and the *Saikioji* or *Shinsei-Ha*. The name comes from the sacred mountain T′ien-tai in China, where Chisa first taught his doctrines. Recognizing the highest truths as incomprehensible, it makes spiritual enlightenment the result of contemplation and asceticism, which is confined to monks, who may impart their teaching by word of mouth to the laity. There is an exoteric teaching suitable for the vulgar, and another revelation of truth in itself. The deities worshiped formerly included many Shinto gods, who were regarded as Avatâras of Buddhist deities. Nirvâna is the final result of existence, a state of absolute unconditioned existence, in which the thinking substance while remaining individual is unaffected by feeling, thought, or passion. J. M. DIXON.

**Tender** [from Fr. *tendre* < Lat. *ten′dere*, stretch, extend]: in law, the attempt to perform a promise to do something or to pay something. The tender must be made by the promiser, or by one duly acting on his behalf, to the promisee or his duly authorized representative; it must be of the kind and must be made at the time and place stipulated in the contract or fixed by law, and it must be unconditional. If the law imposes upon the promisee the performance of some act as a condition of receiving the thing tendered, the fulfillment of such condition may be required by the tenderer. For example, the debtor upon tendering the amount due on a note or a mortgage may demand the surrender of the note or a satisfaction of the mortgage. (*Halpin* vs. *Phœnix Ins. Co.*, 118 N. Y. 165.) Defects in a tender may be waived by the promisee, and the waiver may be by express words or by conduct. The subject is regulated by statute in some States. The effect of a rejected tender to pay money is somewhat different from that of a rejected tender of goods. In the latter case the seller is discharged by his tender, "and may either maintain or defend successfully an action for the breach of the contract." According to the prevailing view in the U. S., the tender, although rejected, vests title to the goods in the purchaser. (2 Kent's *Commentaries*, 508.) Such is not the effect in England, unless the buyer has previously assented to the appropriation of the goods to the contract by the seller. (See SALE.) A tender of money in performance of a promise does not discharge the debt. It does, however, if kept good, stop interest and entitle the tenderer to costs, if he is subsequently sued upon the contract. It also discharges the lien of a mortgage or other security for the debt tendered. The money must be of a kind declared by law to be tenderable. In Great Britain gold coins of the realm are a legal tender to any amount, silver coins to the amount of 40 shillings, bronze coins to the amount of 1 shilling, and Bank of England notes for debts exceeding £5 are also tenderable. The U. S. Constitution (Art. I, § 10, cl. 1) provides that no State shall make anything but gold and silver a tender in payment of debts. The Federal Government has declared U. S. gold coins a legal tender to any extent, also silver dollars, except when otherwise expressly stipulated in the contract, also U. S. notes; while silver certificates are tenderable for customs, taxes, and public dues, and silver coins below the dollar are tenderable in sums not exceeding $10, and other minor coins for an amount not exceeding 25 cents. (U. S. R. S., §§ 3584–3590; ch. 20, Laws of 1878; ch. 12, Laws of 1879; *Legal Tender Cases*, 12 Wallace 457.) Silver coins are tenderable although worn smooth by wear, as are gold coins unless reduced one-half of 1 per cent. below standard weight. *Railroad* vs. *Morgan*, 52 N. J. L. 60, 558.

FRANCIS M. BURDICK.

**Tendon** [from Fr., deriv. of *tendre* < Lat. *ten'dere*, stretch, extend; cf. Gr. *τένων*, sinew, tendon, deriv. of *τείνειν*, stretch, extend]: in anatomy, the name of a white fibrous tissue connecting the end of a muscle with the bone which it is intended to move. It has sometimes the form of a cylindrical cord, sometimes of a broad ribbon, and in a few cases of a wide, thin sheet, but it is always inextensible and inelastic, and transfers at once the motion imparted by the contraction of the muscle to the bone into which it is inserted. See HISTOLOGY and ACHILLES' TENDON.

Revised by W. PEPPER.

**Teneb'rio** [Mod. Lat., from Lat. *teneb'rio*, one who loves darkness, trickster, deriv of *te'nebræ*, darkness]: a genus of beetles, one species of which (*T. molitor*) in the larval state is the well-known meal-worm, which feeds upon meal and other farinaceous substances. There are very few allied species in the eastern parts of the U. S. In California tenebrionid beetles "form the characteristic feature of the insect fauna."

**Ten'edos**: island belonging to Turkey; in the Ægean, 12 miles S. of the Strait of the Dardanelles and 4½ miles from the mainland; famous as the place where the Greek vessels were concealed during the stratagem of the wooden horse which resulted in the fall of Troy. On the E. it has a good harbor, sheltered from the west wind, but the east coast verifies Vergil—*statio malefida carinis.* During the Greek revolution Tenedos was the headquarters of the Ottoman fleet, which was destroyed here by Kanaris (Nov. 22, 1822). The island is famous for its wines and melons, and during the season abounds in red partridges and quail. Pop. of Tenedos, the capital, 6,000; of the island 15,000, almost exclusively Greeks, quiet and contented and less enterprising than most of their race.

E. A. GROSVENOR.

**Tenement** [viâ O. Fr. from Late Lat. *tenemen'tum*, holding, fief, deriv. of *tene're*, hold; cf. TENANT, etc.]: in law, any real property, corporeal or incorporeal, which was susceptible of tenure. Literally, the term signifies "that which is held," and the *holding* referred to is the feudal tenure of real property of and under a superior lord. In the familiar phrase employed by the common law to describe real property—"lands, tenements, and hereditaments"—the term tenement has the most extensive signification; for it comprehends not only lands proper, but everything in the nature of a right, interest, or estate in the lands of another; and it includes not only hereditaments, or estates of inheritance, but such interests also as are incapable of transmission by descent. For a fuller exposition, see articles on FEUDAL SYSTEM, LANDLORD AND TENANT, PROPERTY, and TENURE.

GEORGE W. KIRCHWEY.

**Tenement-houses** (originally *Tenant-houses*): dwellings sheltering under one roof several tenants, whose tenements, i. e. living-rooms, are independent of each other, but access to which is had by a common entrance. The number of tenants requisite to fixing their character as such varies with the legal definition of the term tenement-house. In New York it is a building "occupied by three or more families living independently and doing their cooking on the premises, or by more than two families on a floor, so living and cooking, and having a common right in the halls, stairways, yards, etc." (Ch. 84, Laws of 1887.) In Massachusetts the standard is "more than three families," while in some cities in the U. S. it is "two or more families having a common entrance." Of this latter kind are the small two-family houses common to factory towns in the U. S. which are often leased by the mill-owners to their employees. In England and in continental Europe the tenement-house may be a small two-story dwelling, originally built for and occupied by one family, or a barracks containing a hundred. In Scotland a "tenement" contains so many "houses" for tenants. There, as in England, the one-room apartment is common. In the U. S. it has never been so.

New York is pre-eminently the tenement city of the U. S. In 1893 1,332,773 persons out of an estimated population of 1,891,306 lived in 39,138 tenements (board of health census of 1893), but this included the better apartment-houses, which are legally tenements. Deducting one-fifth as inhabiting these, eight-fifteenths of the entire population lived in what are commonly called tenement-houses. The tenement of New York is generally from four to six stories high, of brick, on a lot 25 feet wide by 100, or less, deep, with air-shafts and more or less light on stairs and in hallways if built since 1880, when reform began in earnest, with none of these things if it antedates that period; stores on the ground floor, and two or four families on each of the floors above. Each family has a living-room with windows opening on street or yard, and usually two interior bedrooms, to which air and light are admitted only by the air-shaft or through the front room. In the old tenements the bedrooms are not lighted at all. They are ventilated only by windows cut through to the dark hall. Almost the first task the health department found to do after its organization was to order 40,000 such windows cut through tenement bedroom walls in one year. The four-families-on-a-floor tenement is styled the double-decker. "A five-story house of this character contains apartments for eighteen or twenty families, a population frequently amounting to 100 people, and sometimes increased by boarders and lodgers to 150 or more. The double-decker can not be well ventilated; it can not be well lighted. It is not safe in case of fire." *Report* of Tenement-house Committee, New York, 1894.

Bethnal Green, London, before its partial demolition by the authorities, presented a view of the Old World slum tenement: "An area of some 15 acres was covered with ancient two-story cottages facing on streets barely 18 feet wide and with the diminutive back-yards completely filled with outbuildings and workshops. Bethnal Green had been a thriving community of Huguenot weavers who had taken refuge in England from persecution in France, and had domiciled themselves in what was then a little village in the suburbs of London. But it had been swallowed up in the growth of the metropolis, and its tiny cottages had become packed with a slum population of the worst sort. The county council found five or six thousand people living in such a manner as to furnish an object-lesson." (Albert Shaw, *Municipal Government in Great Britain.*) In Glasgow "houses which were only intended to accommodate single families had been increased in height, and were found tenanted by separate families in every apartment, until they appeared to teem with inhabitants. . . . A worse state was disclosed by an inspection of some of the more recently erected houses for the working classes. Tenements of great height were reared on either side of narrow lanes with no back-yard space, and were divided from top to bottom into numberless small dwellings, all crowded with occupants." *Report* of Municipal Committee, 1859.

Tenements are as old as the race, wherever the crowding of population made building space scarce and dear. When there was no longer room to build houses beside each other, they were put on top of each other and so the tenement grew. The communal dwellings of the Pueblo Indians of the U. S. and Mexico are tenement barracks built so for the common defense. The same reason crowded the population of Old World cities within their walls. In the second century Juvenal drew in his satires (see the third) a scornful picture of the towering tenements of Rome—called *insulæ*, because of their being built with narrow alleys between—in which 500,000 of his fellow citizens lived, squeezed into single rooms (*cœnacula*), for which they paid rent that would have purchased cheerful and commodious cottages in provincial towns. The architect Vitruvius, who lived in the Augustan era, speaks of the crowding of the poor within their cramped quarters. The palaces of the wealthy Romans spread themselves over vast areas, leaving little room for the propertyless, and compelling recourse to the "common though inconvenient practice of raising the houses to a considerable height in the air. But the loftiness of these buildings, which often consisted of hasty work and insufficient material, was the cause of frequent and fatal accidents, and it was enacted by Augustus, as well as by Nero, that the height of private edifices within the walls of Rome should not exceed the measure of 70 feet from the ground." (Gibbon's *Rome*, ch. xxxi.) Modern cities have copied Nero's enactment for their own safety.

The development of the factory system with its changed industrial conditions, in the age of steam, caused the drift of population to the cities that has characterized the nineteenth century. Their sudden growth, for which no preparation had been made, caused an unprecedented packing of the population and a corresponding expansion of the tenement-house system. The result is shown in the case of New York. Its tenement-house system is entirely a growth of the century. The old dwellings, deserted by their wealthier inhabitants, were first turned into tenant-houses. Then rear houses were built in the yard, and great barracks without light or ventilation run up to shelter the crowds. Topographical conditions aided this development. The rivers shut in the population of workers, chiefly poor, who must live near their work. The greater the crowding grew, the higher the rent and the more pressing the need of crowding to pay it. New York in 1894 had a density of population of 143·2 to the acre, and stood in this respect at the head of the world's cities. Paris came next with a density of 125·2 to the acre, and Berlin third with 113·6. The Tenth Ward of New York had 626·26 to the acre, and one sanitary district of 32 acres in the Eleventh Ward averaged as high as 986·4 persons to the acre. The densest small section in Europe is given as that of Josefstadt, Prague, with 485·4 to the acre, but the Tenth Ward in New York alone is five times as large as Josefstadt. *Report* of the Tenement-house Committee, 1894.

*Evils of Tenement-house Crowding.*—Directly and indirectly, such crowding breeds bad social and moral conditions. "The more crowded a community, the greater, speaking generally, is the amount of abject want, of filth, of crime, of drunkenness, and other excesses, the more keen is competition, and the more feverish and exhausting the conditions of life." (Dr. Ogle, of the Registrar-General's office, England.) "Such conditions . . . interfere with the separateness and sacredness of home life, lead to the promiscuous mixing of all ages and sexes in a single room, . . . thus breaking down the barriers of modesty and conducing to the corruption of the young." (*Report* of the Tenement-house Committee, New York, 1894.) The death-rate rises in proportion to the crowding and the age of the tenements, except, usually, in quarters inhabited by Hebrews, whose general hardiness, great vitality, and habits of abstemiousness, enforced by the precepts of the Mosaic faith, counteract the deteriorating influences of the slum. Thus the Tenth Ward, in New York, while the most crowded, has of all the well-peopled wards of the city the lowest death-rate. Its rate in 1893, with an average density of 57·2 tenants to the house, was 17·14 per 1,000 of the living; while the general tenement-house death-rate of the entire city was 22·75, with an average number of 34 tenants in each house. But among the other elements of the population the oldest and most crowded houses, which were built before the era of sanitary reform, have the highest mortality. The rear tenements, generally the oldest, with the poorest tenants and the greatest swarms, are the worst. According to the New York health department's census of 1893 the death-rate for houses having rear tenements was 27·66, against 22·21 for the single tenements. The adult death-rate for the First (the oldest) Ward was for houses standing singly on the lot 29·03; where there were front and rear houses it was 61·97. The infant mortality for the same ward was respectively 109·58 and 204·54. In England, Dr. Tatham, of Salford, gave the following results in houses built on the "back-to-back" plan, now condemned as unfit to live in:

| | | General death-rate. |
|---|---|---|
| Regent Road Sub-district ......... | 1. No back-to-back houses ................ | 26·1 |
| | 2. Average of 18 per cent. of back-to-back houses .............................. | 29·1 |
| | 3. Average of 50 per cent, of back-to-back houses .............................. | 37·3 |

*Tenement-house Reform.*—These evils compelled recognition in the Old World about the middle of the nineteenth century, and measures were set on foot to better the condition of the tenants. They led, after twenty years of discussion, in Glasgow to the foundation in 1866 of the Improvement Trust, by which a wholesale destruction of old unsanitary tenement-house property was begun; 29 new streets were formed, 25 old ones widened and much improved, a new square and a park opened, all at a cost of about £2,000,000. The improvement in the condition of the people has been great. In 1871 30·4 per cent. lived in one-room tenements. In 1881 the proportion had fallen to 24·7 per cent., and in 1891 to 18 per cent. Great undertakings of the same character followed in Birmingham, in Liverpool, Huddersfield, and in London. Greenock, Sheffield, and Dublin struck the same path with much success. In many instances the city became landlord and engaged in the erection of municipal tenements. Under the Housing of the Working Classes Act (1890) great powers were given to local authorities in the matter of expropriation and acquisition of property that gave a impetus to this wholesome activity. London replaced its Bethnal Green slum and its narrow alleys with wide streets lined with model five-story tenements, from which the one-room family apartment was eliminated. In France, in Belgium, and throughout Europe the great cities engaged in the battle with their tenement slums. Napoleon III. made light in darkest Paris. In Naples and Rome immense public improvements have been instituted. Budapest has, from one of the filthiest capitals in Europe, become a model city. In the U. S. the cholera epidemic of 1866 gave the impetus to tenement-house reform, but it was not until 1885 that the first tenement-house committee was appointed. The second committee (1894) carried its work further. The sanitary condition of tenements has been greatly improved, and in New York their death-rate has been brought apparently even below that of the general death-rate of the city. In 1893 the registered tenement-house death-rate was 22·75, while that of the city as a whole was 23·52. (When, however, all deaths in institutions and all unknown dead that can not be referred back to the tenements are counted as belonging there, their showing is 25·77, and this is doubtless the more correct statement.) Light and air have been secured to the poor tenant, and steps taken to protect him from the danger of fire. The Tenement-house Committee in its report (1894) demanded the power of expropriation of unsanitary property. The Mulberry Bend tenement property, the worst in the city, has been acquired by the city. A park is to be opened on the site. Other cities in the U. S. in which the dangers due to the tenement-house system were impending are taking steps to prevent them. The 25-foot lot remains the chief obstacle to reform in New York.

*Model Tenements.*—In London Octavia Hill has shown that even old tenement property can be improved when proper attention is paid to it by the owner. Similar results have followed the efforts of Ellen Collins and others in New York. Philanthropists have erected model tenements in the effort to solve the problem of housing the poor, with excellent results. The general plan of these is that of a central court-yard, around which the buildings are grouped with two and three room flats, every room opening on the outer air. As a rule, they have yielded a fair return upon the investment where the management has been upon a business basis. The Peabody Fund tenements in London shelter about 20,000 tenants. Their death-rate, both adult and infant, averages below that of London as a whole. The Artisan's Block buildings house more than 100,000 tenants. There are some 600 "model" tenements in London, but not all of them are models, nor did philanthropy dictate the erection of all. In general, the barracks plan of these huge buildings is not accepted in England as the best.

In New York the model tenements of the Improved Dwellings Association, and in Brooklyn those erected by A. T. White upon substantially the London plan, have proved successful business enterprises, though the rate of rental of the poorer tenements has not been exceeded. If anything, rents have been cheapened. It was found by the Tenement-house Committee (1894) that the worst slum tenements yielded the biggest profits to the landlords, even as high as 25 per cent., while for the better class they ranged from 8 to 10 per cent. The model tenement has paid 5 per cent. and over to the owner.

The solution of the tenement-house question must come, apparently, through still greater crowding, which will compel the scattering of the population to the suburbs by some adequate system of rapid transit, as a measure of self-protection. Such a result has already followed in London, and has been greatly encouraged by the authorities. In its real essence the tenement-house question is in all the large cities of the world a question of transportation, and must be solved finally along that line.

LITERATURE.—*Old Glasgow*, by James B. Russell, medical health officer; *Report* of Parliamentary Commission on the Houses of the Working Classes (London, 1885); *Reports* of New York Board of Health (1869, 1891, and 1893); Dr. O. Du Mesnil, *L'Habitation du Pauvre* (Paris); Dr. Albert Palmberg, *Traité de l'Hygiéne publique*; *Reports* of the Tenement-house Commissions of 1884–85 and 1894 (New York); Albert Shaw, *Municipal Government in Great Britain* (New York); Charles Booth, *Life and Labour of the People* (London); Jacob A. Riis, *How the Other Half Lives* (New York). JACOB A. RIIS.

**Tenerani**, tā-nā-raa'nēe, PIETRO: sculptor; b. at Torano, near Carrara, Italy, Nov. 11, 1789; was a pupil of Canova, and also of Thorwaldsen, and worked under Desmarais in Rome. He resided almost wholly in that city, and had many public duties there connected with the museums and galleries. D. in Rome, Dec. 14, 1869. His principal works are a *Psyche with the Vase of Pandora*; a group of *Venus and Psyche*; a *Venus reclining, with Cupid drawing a Thorn from her Foot*; a *Piping Faun*; a *Crucifix*; a statue of *Bolivar* for Colombia; a bas-relief representing the *Deposition from the Cross*; the *Angel of the Last Judgment*, a statue of great power; busts of Thorwaldsen, of Pius IX. etc., and many other works for churches and cemeteries. Revised by RUSSELL STURGIS.

**Teneriffe'**: the largest of the Canary islands (see CANARIES); area, 780 sq. miles. The coasts are rocky and wild, and afford only one good harbor, that of Santa Cruz de Santiago. The interior is mountainous, and in the center is the mighty volcano of Pico de Teyde, 12,182 feet in height. The middle region is clad with beautiful forests of chestnut and oak, and the foot, as well as the hills and valleys around it, is covered with vineyards, olive and almond groves, wheat-fields, and orchards in which oranges and figs ripen to perfection. Prior to 1853 the average annual yield of wine was 25,000 pipes, but the grape disease appeared and the yield fell to 8,000 pipes. Land previously devoted to vineyards was given up to the cultivation of the cochineal insect, and it became the chief product. Pop. (1887) 108,081. Principal town, Santa Cruz de Santiago.

**Teniers**, ten'yėrs, Fr. pron. tā'nyār', DAVID: the elder; painter; b. at Antwerp in 1582. He lived in Rome for some time, where he studied under Elsheimer. He became a member of the Guild of St. Luke, in Antwerp, 1605. He taught his son painting, and their works are so similar in style as to be often mistaken the one for the other. D. in Antwerp, July 29, 1649. W. J. S.

**Teniers**, DAVID, the younger: painter; b. in Antwerp, Dec. 15, 1610. He studied under his father, but the influence of Rubens and Adrian Brouwer is recognizable in his work. In 1632 he was elected a member of the Guild of St. Luke, and in 1644 its president. His works were extremely popular, and he became wealthy and distinguished by honors. Archduke Leopold William, the governor of the Spanish Netherlands, appointed him to be his court painter and chamberlain. Teniers bought an estate at Perck, between Antwerp and Mechlin, whither people of distinction went to visit him; removed to Brussels in 1647; d. there Apr. 25, 1690, and was buried at Perck. He married twice. His first wife was the daughter of Jan Breughel. This artist is well represented in all European collections. He painted very rapidly, and produced hundreds of genre-pictures, also some landscapes. The father's signature seems to have been a T within a D, while the son wrote his name D. Teniers F. For further information, see *Teniers, David*, by C. de Brou; *D. Teniers*, by Arsène Houssaye; and P. Lacroix, *Le Cabinet de l'Amateur*, vol. ii., p. 481. W. J. STILLMAN.

**Tenimber Islands**: See TIMOR-LAUT.

**Ten Kate**, ten-kaa'te, JAN JACOB LODEWIJK: poet and theologian; b. at The Hague, Holland, Dec. 23, 1819. His youth was passed as clerk and bookkeeper in a mercantile establishment at The Hague, but he very early felt the influence of the romantic poetical movement, then in full swing in Holland. He was an enthusiastic admirer of Walter Scott, Macpherson's *Ossian*, Byron, and the Dutch poets Bilderdijk and Da Costa. He tried his own hand at verses, and in 1836 appeared his first volume, *Gedichten*. In 1837 he determined to give up trade and prepare himself for the Church. He studied at the University in Utrecht 1838–43, and passed his candidate's examination in May, 1844; and in Jan., 1845, he was called as pastor to the little fishing-village of Marcken. During these years, however, he had not neglected poetry. In 1837 he had published with a friend a translation of the *Odes* of Anacreon, the first of the long series of translations that have distinguished him among modern Dutch poets. In 1839 appeared *Bladeren en bloemen*, *Rozen*, *Nieuwe rozen*, and *Vertaalde poëzie*. In 1840 he published a translation of Byron's *Giaour*, and the poem *Ahasverus op den Grimsel*; in 1841, *Poëzy voor Hollands schoonen* and *Zangen des tijds*. In 1842 he became the leading spirit in a curious venture, a periodical wholly in verse, called *Braga*, devoted largely to satiric criticism of the literary tendencies of the time. In the same year appeared his poem *Thomas Chatterton*, and in 1846 the collection *Legenden en Mengelpoëzy*. In 1847 he was called to the church at Almkerk; in 1850 to Middelburg. Here he remained till 1860, when he was called to Amsterdam. There the remainder of his life has been passed. As has been indicated, the first productive years of Ten Kate were largely influenced by romanticism in its extreme form. After he had taken up the profession of clergyman, however, the influence of Bilderdijk became predominant with him, and the religious element in his thought grew much stronger. Through his later years his poetry has steadily held this religious coloring; and he has produced besides a number of treatises of a religious or philosophical character in prose. Among the poetical works in this manner are the didactic *Dood en leven* (1856); the poem on the creation of the world, *De Schepping* (1866; Eng. trans., *The Creation*, by Rev. D. van de Pelt, New York, 1888); *De Planeten* (1869); *De Jaargetijden* (1871); *Eunoë* (1874); *Godsdienstige poëzy* (1879); *Mozaiek* (1881); *Palmbladen en dichtbloemen* (1884); *Elck wat wils* (1887). Of great importance also are Ten Kate's translations into Dutch from other languages, many of which are among the best his country has produced. Among these are Tasso's *Gerusalemme Liberata* (1856); Tegnér's *Frithiof's Saga* (1861); Schiller's *Maria Stuart* (1866); La Fontaine's *Fables* (1868); Oehlenschläger's *Correggio* (1868); Dante's *Inferno* (1876); the first part of Goethe's *Faust* (1878); Milton's *Paradise Lost* (1880); Victor Hugo's *Lyric Poems* (1881); and strangely, but characteristically, the *Gospel Hymns* of Ira D. Sankey (1875). In these translations, as well as in his original verse, Ten Kate has shown very remarkable command of the Dutch language and imaginative powers of no mean order. A collected edition of his poems appeared in 8 vols. (Leyden, 1861–66; 2d ed. 1867). For his *Life* and a bibliography of his works see J. Ten Brink's *Geschiedenis der Noord-Nederlandsche Letteren in de XIXe Eeuw* (Amsterdam, 1888). A. R. MARSH.

**Tennant**, WILLIAM: poet and Oriental scholar; b. at Anstruther Easter, Fifeshire, Scotland, May 15, 1784; studied at the University of St. Andrews 1799–1801; was for some years clerk to his brother, a grain-dealer in Glasgow, and afterward in his native town; published *The Anster Concert* (1811), a poem in the Scottish dialect, and *Anster Fair, a Poem in Six Cantos* (1812), in *ottava rima*, both descriptive of rural Scottish life, which gradually acquired popularity; was parish schoolmaster of Dunino 1812–16, and at Lasswade 1816–19; acquired the Arabic, Syriac, and Persian languages; taught Oriental and classical languages in the

academy of Dollar, Clackmannanshire, 1819–34; became in 1834 Professor of Oriental Languages in St. Mary's College, St. Andrews. He was the author of several later poems and dramas which were not successful, of a *Syriac and Chaldee Grammar* (1840), a *Life of Allan Ramsay* (1808), and of numerous contributions to periodicals, including some translations from Oriental poets. D. near Dollar, Feb. 15, 1848.
Revised by H. A. BEERS.

**Tennent**, Sir JAMES EMERSON: author; b. in Belfast, Ireland, Apr. 7, 1804; son of William Emerson, a wealthy merchant; was educated at Trinity College, Dublin; traveled after graduation (1824–25) through Europe and the Levant, also in Greece; published *A Picture of Greece in 1825* (1826), *Letters from the Ægean or Grecian Islands* (2 vols., 1829), and a *History of Modern Greece* (2 vols., 1830); married (June, 1831) the only daughter of William Tennent, a wealthy banker of Belfast, whose name he assumed; was called to the bar at Lincoln's Inn in 1831; was chosen for Belfast to Parliament in 1832, and several times subsequently; was secretary to the Indian board 1841–45; published a work on *Belgium* (2 vols., 1841); procured the passage of an act establishing copyright in designs 1843; was civil secretary to the colonial government of Ceylon 1845–50; was one of the joint secretaries to the Board of Trade from 1852 to 1867, when he retired from office. D. in London, Mar. 6, 1869. He is best known as the author of *Ceylon, an Account of the Island, Physical, Historical, and Topographical* (2 vols., 1859); he also wrote *Christianity in Ceylon* (1850) and *Natural History of Ceylon* (1861).

**Tennessee′**: one of the U. S. of North America (South Central group); the third State admitted into the Union.

*Location and Area.*—It extends from the Appalachian Mountains on the E. to the Mississippi river on the W.; between lat. 35° and 36° 36′ N. and lon. 81° 37′ and 90° 28′ W.; is bounded N. by Kentucky and Virginia, E. by North Carolina, S. by Georgia, Alabama, and Mississippi, and W. by Arkansas and Missouri; extreme length from E. to W., 432 miles; breadth from N. to S., 109 miles; area, 42,050 sq. miles, of which 300 sq. miles are water surface.

Seal of Tennessee.

*Physical Features.*—The eastern third of the State is hilly and mountainous, the middle undulating, and the west comparatively low and level. Reckoned from the altitude of its river-beds, there is a gradual, but irregular, slope from an elevation of 1,264 feet on the E., to 200 feet on the W. There are eight natural divisions: (1) *The Unaka Range* on the eastern border, comprising numerous wooded mountain-ridges with outlying spurs and intervening coves of great fertility; also lofty peaks with treeless summits covered with luxuriant natural grasses and having the flora of Canada and the climate of New England; area about 2,000 sq. miles. (2) *The valley of East Tennessee*, a fluted region of parallel ridges and narrow valleys, extending diagonally from N. E. to S. W. through the eastern part of the State; elevation, 1,000 feet; area, 9,200 sq. miles. (3) Next on the W. the *Cumberland Table-land*, or level top of the Cumberland Mountains, which rise abruptly 1,000 feet above the valley of East Tennessee and 2,000 feet above the sea; surface shows low ridges and shallow valleys; much of it is covered with native grasses; summers are cool and climate healthful; area, 5,100 sq. miles. (4) *The Highland Rim* bounds the table-land on the W., and, extending on the N. and S., as far W. as the Tennessee valley, incloses the Central Basin; elevation, 1,000 feet; has numerous mineral springs and many summer resorts; area, 9,300 sq. miles. (5) *The Central Basin*, a depression of 5,450 sq. miles; resembles the bed of a drained lake with its main slope to the N. W.; greatest diameter from N. E. to S. W., 120 miles; breadth from 55 to 60 miles; altitude 550 feet, with variations of 200 to 300 feet. (6) *The western valley* of the Tennessee river embraces 1,200 sq. miles of river lowlands and subordinate valleys extending into the highlands; elevation above the sea, 360 feet; reaches across the State from N. to S., with a breadth of 10 to 12 miles. (7) Adjoining this is the *plateau slope* of West Tennessee, descending gently to the Mississippi; surface slightly undulating, but often showing abrupt hills and narrow valleys; streams sluggish; western border terminates abruptly with steep hills which overlook the Mississippi bottoms; average elevation about 500 feet; area, 8,850 sq. miles. (8) The alluvial *Mississippi bottoms* are low and level, with numerous swamps and many lakes, abounding in fish and wildfowl; elevation above the Gulf about 295 feet; area, 950 sq. miles. The Clinch, Powell's, and Holston rivers drain upper East Tennessee; the French Broad, Little Tennessee, and Hiwassee assist, lower down; and the Tennessee, formed by the union of the two forks of the HOLSTON (*q. v.*), carries all this water into Alabama, thence back north across Tennessee and Kentucky into the Ohio. The Cumberland pours into the Ohio the drainage of northern Middle Tennessee; the Duck, the Elk, and Caney Fork drain the rest of this section; and the Obion, Forked Deer, Big Hatchie, and Wolf carry most of the West Tennessee waters into the Mississippi. The principal rivers are the Mississippi, the Cumberland, and the Tennessee. The only lakes are found in the Mississippi bottoms, and are little more than expansions of small rivers. Reelfoot, between Lake and Obion Counties, is the most noted; it was largely produced by the earthquake of 1811–12.

*Geology and Mineral Resources.*—The geology presents a striking variety, ranging from the oldest metamorphic rocks of the Lower Silurian formation on the east border to the most recent alluvial deposits on the west. The natural divisions whose area is occupied almost wholly by the Lower Silurian are the Unaka Range, the valley of East Tennessee, and the Central Basin. The Cumberland Table-land and the Highland Rim are Carboniferous; the Western valley, Upper Silurian and Devonian; the plateau slope of West Tennessee, mainly Cretaceous and Tertiary; the Mississippi bottoms, Recent. All the important mountains are in the east end of the State, which rests upon the west slope of the Appalachian system. The Great Smoky Range is on the North Carolina border; extreme height, 6,660 feet; average, 5,000 feet. Parallel with this, through the valley of East Tennessee, extend Clinch Mountain (2,000 feet), Powell's Mountain, and numerous minor ridges. To the W. of these and parallel is the broad plateau of the Cumberland. The rest are unimportant.

The total value of mineral products in 1889 was $6,455,-283, coal and iron being most important. The coal-fields are coextensive with the Cumberland Table-land and form a part of the great system which extends from Pennsylvania to Alabama; area, 5,100 sq. miles; total output in 1899, 3,330,659 short tons. The coal is bituminous, makes a good coke (435,308 tons in 1899), and is adapted to smelting, manufacturing, domestic, and general purposes. There are three main iron-producing belts extending across the State: the eastern belt, along the Smoky Mountains; the Dyestone belt, parallel with the eastern base of the Cumberland Table-land, yielding hematite ore; and the western belt, 50 miles wide, on the dividing-line between Middle and West Tennessee. A fourth belt of minor importance coincides with the coal-fields. In 1899 there were produced 346,166 long tons of pig iron. In 1899 the output of iron ore was 632,-046 long tons. The marble-industry, confined mainly to East Tennessee, has experienced a rapid growth. The stone product in 1899 was valued: slate, $250; marble, $384,705; limestone, $208,097. Jefferson, Union, and Claiborne Counties, in the northeastern part of the State, produce large quantities of zinc ore. The copper mines of Polk County, in the southeast corner of the State, are very productive. One mine produces 150 tons of ore daily. In 1889 there were 3,057 tons of mineral paint produced. Blue Springs, in Bradley County, produces considerable lead. Gold is found in small quantities in Monroe County. Pyrite, manganese ores, alum, barite, salt, niter, gypsum, hydraulic rocks, building-stone, potter's clay, fire-clay, and epsomite abound. Overton and Dickson Counties produce petroleum, although in limited quantities.

*Soil and Productions.*—The soils of the State are as varied as its rocks. The greatest diversity is found in the east part, where only the best valleys and river-bottoms have high fertility. General farm products are here raised. The soil of the Cumberland Table-land is usually sandy, porous, and not very productive, though adapted to pasturage, the

growth of fruit, garden vegetables, and Irish potatoes. On the Highland Rim some sections have good fertility, but most of its area, called the Barrens, is flinty and little productive. Fruit and wild grass for pasturage are the main productions, excepting tobacco in the northern part. The rich limestone soils of the Central Basin make it the garden-spot of the State, and produce abundantly Indian corn, wheat, blue grass, and, in the south part, cotton. The soils of West Tennessee are sandy and mellow, but generally fertile. Cotton is produced abundantly in the south and general crops in the north. In the Mississippi bottoms is a black loam, the richest soil in the State; it produces cotton, Indian corn, and general crops in luxuriance.

The following summary of the census reports of 1880 and 1890 shows the extent of farm operations in the State:

| FARMS, ETC. | 1880. | 1890. | Per cent. |
|---|---|---|---|
| Total number of farms | 165,650 | 174,412 | * 5·3 |
| Number of acres in farms | 20,666,915 | 20,161,583 | † 2·4 |
| Value of farms, including buildings and fences | $206,749,837 | $242,700,540 | * 17·4 |

* Increase. † Decrease.

The following table shows the acreage, yield, and value of the principal crops in the calendar year 1900:

| CROPS. | Acreage. | Yield. | Value. |
|---|---|---|---|
| Corn | 2,849,894 | 56,997,880 bush. | $27,928,961 |
| Wheat | 1,181,423 | 11,696,088 " | 9,239,910 |
| Oats | 350,010 | 5,810,166 " | 2,033,558 |
| Rye | 11,297 | 124,267 " | 84,502 |
| Barley | 1,743 | 25,622 " | 15,886 |
| Buckwheat | 955 | 13,370 " | 7,888 |
| Tobacco (1896) | 53,351 | 35,211,660 lb. | 2,464,816 |
| Potatoes | 25,290 | 1,365,660 bush. | 792,083 |
| Hay | 223,880 | 313,432 tons | 3,698,498 |
| Totals | 4,697,843 | ................ | $46,266,102 |

The farm animals on Jan. 1, 1900, comprised 308,073 horses, value $13,251,442; 139,164 mules, value $6,664,988; 239,394 milch cows, value $5,781,365; 286,841 oxen and other cattle, value $5,390,598; 251,735 sheep, value $596,485; and about 2,000,000 swine, value $7,000,000; total head, 3,225,207; total value, $38,684,878.

*Climate.*—The average annual mean temperature is 59°. Though in summer and winter marked extremes are sometimes reached, yet these seasons are generally mild, and spring and autumn are delightfully temperate and pleasant. A limited amount of snow falls. Temperature and rainfall by months for twenty-three years (1871 to 1893, inclusive) are as follows:

| MONTHS. | Average mean temperature. | Average rainfall, in inches. | MONTHS. | Average mean temperature. | Average rainfall, in inches. |
|---|---|---|---|---|---|
| January | 39·0° | 5·53 | July | 79·0° | 3·95 |
| February | 43·7 | 5·49 | August | 77·0 | 3·78 |
| March | 48·7 | 5·48 | September | 70·3 | 3·35 |
| April | 59·7 | 5·15 | October | 59·7 | 2·79 |
| May | 68·0 | 4·03 | November | 48·3 | 4·28 |
| June | 76·0 | 4·49 | December | 41·7 | 3·88 |

The extremes for the above period in the three sections of the State are:

| SECTION. | Coldest month. | Average temperature. | Hottest month. | Average temperature. |
|---|---|---|---|---|
| West Tennessee | Jan., 1886. | 30° | July, 1878. | 84° |
| Middle Tennessee | Jan., 1886. | 29 | July, 1879. | 83 |
| East Tennessee | Jan., 1893. | 29 | July, 1878. | 80 |

A difference of elevation produces a difference of about 2° in the mean temperature of the extreme ends of the State.

*Divisions.*—The State has three distinctly recognized civil or political divisions: East Tennessee, Middle Tennessee, and West Tennessee. The first occupies the east end of the State to the middle of the Cumberland Table-land, and contains 34 counties; the second reaches to the west valley of the Tennessee river, and contains 41 counties; the third lies between the Tennessee and Mississippi rivers, and contains 21 counties. Much local feeling exists in these divisions as to the apportionment of State officers, the charitable institutions, etc. In many respects the divisions resemble different States.

* Reference for location of counties, see map of Tennessee.
† District. ‡ West, North, and South Knoxville included.

*Principal Cities and Towns, with Population in 1900.*—Memphis, 102,320; Nashville, 80,865; Knoxville, 32,637;

Chattanooga, 30,154; Jackson, 14,511; Clarksville, 9,431; Columbia, 6,052; Bristol, part in Tennessee, 5,271.

*Population and Races.*—In 1860, 1,109,801; 1870, 1,258,520; 1880, 1,542,359; 1890, 1,767,518 (natives, 1,747,489; foreign, 20,029; males, 891,585; females, 875,933; whites, 1,336,637; colored, 430,881, comprising 430,678 persons of African descent, 51 Chinese, 6 Japanese, and 146 civilized Indians); in 1900, 2,020,616.

*Industries and Business Interests.*—In 1900 the State debt was $17,023,600; value of taxable property, $340,359,148; State tax, $1,221,256; revenue (biennial period ending Dec. 19, 1900), $6,120,231.44. Sept. 5, 1900, there were 50 national banks with combined capital of $7,337,645, surplus and profits of $2,845,706.41, and deposits of $22,082,775; on June 30, 56 State banks, capital $2,806,315, surplus and profits $542,012, and deposits $7,303,710; and 7 stock savings-banks, capital $372,500, surplus and profits $192,931, and $2,015,472 in savings deposits from 19,687 depositors. The number of newspapers and periodicals in 1901 was 288. The census of 1890 reported the manufactures of cities only, the total of which for all industries was: Number of establishments reporting, 1,264; value of hired property, $4,346,153; direct investment, $29,713,423; miscellaneous expenses, $2,666,795; average number of persons employed, 23,094; total wages, $11,297,019; cost of materials used, $22,487,757; value of products, $43,071,586. There were 23 cotton-mills and 19 woolen-mills. The value of the annual product of flour is $10,000,000; lumber, $5,000,000; leather, $2,000,000. The manufacture of cottonseed-oil reaches about 3,000,000 gal. per annum, and the manufacture of distilled spirits 1,000,000 gal.

*Means of Communication.*—In 1900 there were 3,132 miles of railway; assessed valuation, $55,295,972.94. The most important roads are the Nashville, Chattanooga and St. Louis; the Louisville and Nashville; and the Southern. The number of electric railways in 1893 was 12; miles, 188; capital stock, $5,065,000. The rivers navigable for steamers are the Mississippi, 160 miles; the Tennessee, its whole course; the Cumberland, 304 miles; Clinch and Emery rivers, to Harriman; French Broad, 90 miles, to Leadvale; Hiwassee, 20 miles, to Charleston; Clinch, to Clinton; the Big Hatchie, Forked Deer, and other minor ones, to a limited extent. At high water many other streams float barges and rafts.

*Churches.*—The census of 1890 gave the following statistics concerning the principal religious bodies:

| DENOMINATIONS. | Organizations. | Churches and halls. | Members. | Value of church property. |
|---|---|---|---|---|
| Methodist Episcopal South | 1,367 | 1,317 | 121,398 | $1,994,382 |
| Baptist, Regular, South | 1,287 | 1,269 | 106,632 | 1,802,015 |
| Baptist, Regular, Colored | 575 | 581 | 54,252 | 525,573 |
| Methodist Episcopal | 609 | 603 | 42,873 | 665,460 |
| Disciples of Christ | 322 | 313 | 41,125 | 410,660 |
| Cumberland Presbyterian | 529 | 510 | 39,477 | 745,605 |
| African Methodist Episcopal | 144 | 236 | 23,718 | 461,305 |
| Methodist Episcopal, Colored | 206 | 205 | 18,968 | 258,120 |
| Roman Catholic | 60 | 60 | 17,950 | 434,200 |

*Schools.*—In 1891–92 the universities and colleges numbered 22; instructors, 404; students, 6,283; income, $368,304; value of grounds and buildings, $3,062,400. The most noted of these are the UNIVERSITY OF TENNESSEE (*q. v.*), at Knoxville; VANDERBILT UNIVERSITY (*q. v.*) and the University of Nashville (Peabody Normal College), at Nashville; the University of the South, at Sewanee; Cumberland University, at Lebanon; Southwestern Presbyterian University, at Clarksville; Southwestern Baptist University, at Jackson; and FISK UNIVERSITY (*q. v.*), at Nashville. The number of children of school age (six to twenty-one years) in 1899 was 760,162, of whom 499,845 were enrolled in the public schools, and 341,138 were in average daily attendance. There were 5,184 white primary district schools and 641 white secondary; 1,555 colored primary and 24 colored secondary; city schools, 156. The total number of public schools was 7,560; teachers, 9,214—average monthly salary, $29.03; the expenditures were $1,628,813. The number of schoolhouses was 7,076; value of school property, $3,935,671. In 1891 there were 978 private schools with an enrollment of 43,342 pupils.

*Libraries.*—According to a U. S. Government report on public libraries of 1,000 volumes and upward each in 1891, Tennessee had 53 libraries, containing 239,929 bound volumes and 39,595 pamphlets. The libraries were classified as follows: General, 11; school, 7; college, 25; college society, 6; law, 1; Y. M. C. A., 2; and society, 1.

*Charitable, Reformatory, and Penal Institutions.*—There is an insane asylum in each of the three divisions of the State, as follows: the Eastern, at Knoxville; the Central, at Nashville; the Western, at Bolivar. The disbursements for the insane in 1899–1900 were about $500,000. The School for the Deaf and Dumb is at Knoxville; the School for the Blind at Nashville; and the State also has at Nashville the Tennessee Industrial School, a reform school for both sexes. A home for Confederate soldiers was opened at the Hermitage (near Nashville) in 1892, with accommodations for 125 persons. Disabled and indigent Confederate soldiers who enlisted from the State receive pensions ranging from $8.33⅓ to $25.00 per month. The State penitentiary is at Nashville, but the convicts are worked by the lease (six years) system, and are scattered over the State, mainly in coal mines. There are poorhouses and jails in every county, and the most populous counties have workhouses.

*Political Organization.*—The State government has the usual legislative, executive, and judicial departments. The Legislature has two chambers, the House and the Senate. Its members are elected for two years and receive $4 a day during the session, which is limited to seventy-five days. At the head of the executive department is the Governor, elected for two years. He must have been a citizen of the State seven years and be thirty years old. In case of a vacancy the Speaker of the Senate succeeds him. Three State officers are elected by the Legislature, namely, a secretary of State (four years), comptroller (two years), and treasurer (two years). The Governor appoints, subject to confirmation by the Senate, a superintendent of public instruction, superintendent of prisons, commissioner of agriculture, statistics, and mines, etc. The judicial power is vested in a Supreme Court of five judges, elected for eight years, who sit in Jackson, Nashville, and Knoxville. There are also chancery or equity courts, circuit or law courts, and a court of chancery appeals. Some of the larger counties have separate criminal courts. Each county has a sheriff (two years), a trustee (two years), a register of deeds, and clerks of courts. Every civil district has two or more justices of the peace (six years), who, besides their individual jurisdiction, form the county court, a body of legislative and judicial powers. Each city has a mayor, a common council (some of one and some of two chambers), and the usual municipal officers. Suffrage is free to all males not convicted of infamous crime, who are citizens of the U. S. and have been one year in the State and six months in the county. A State law requires a modified form of the Australian ballot system in the large towns and counties. A State board of health has power to declare quarantine in times of epidemics.

*History.*—In 1541 the Spaniards under De Soto touched Tennessee where Memphis now stands, being the first European visitors. Here the French under La Salle, 141 years later, built a fort, and the Spaniards, in turn, afterward erected San Fernando. The country was claimed by the Spanish, the French, and the English. Charleville, coming up from Louisiana in 1714, built a trading-house near the present Nashville, and French and English struggled to secure the Indian trade. In 1748 Dr. Thomas Walker, with other Virginians, discovered the Cumberland Mountains, Gap, and river, which he named for the Duke of Cumberland. Fort London, the first Anglo-Saxon outpost in the great wilderness, was built by Andrew Lewis in 1756. It was taken by the Indians four years later. The tide of migration was from Virginia and the Carolinas. First came hunters, explorers (see BOONE, DANIEL), and traders, followed, in 1769, by immigrants who settled on the Watauga. In 1772 the first government, the Watauga Association, was formed. James Robertson settled on the Cumberland in 1779. The war of the Revolution found the settlements patriotic. Shelby and Sevier led 500 men into the Carolinas in 1780, where, under Campbell, they defeated the British Ferguson at King's Mountain. On his return the following year, Sevier made a conquest of the Cherokee Indians. After the Revolution North Carolina ceded the territory to the Federal Government and left the inhabitants without law or protection. Therefore, in 1784, the State of Franklin was formed, and, though the parent

State at once reversed her act of cession, lasted till 1788. The final cession, however, was made in 1790, and the "Territory South of the Ohio River" was formed, with William Blount as first governor. Knoxville was laid out in 1792, and the first territorial assembly met there in 1794. In 1796 the State was formed and admitted into the Union. The first two decades of the nineteenth century were characterized by rapid growth and contests with the Indians. The first bank (the Nashville) was chartered in 1807. Memphis was laid out in 1819. The State capital was Knoxville till 1811, except in 1807, when it was Kingston. Knoxville, Nashville, and Murfreesboro had the honor in turns till 1826, when Nashville became the permanent capital. Three Presidents of the U. S. have come from Tennessee: Andrew Jackson (1829–37); James K. Polk (1845–49); and Andrew Johnson (1865–69). The State was distinguished in the Mexican war (1845–47), Pillow, Haskall, Campbell, Trousdale, and Cheatham being prominent. In the civil war Tennessee at first hesitated, but on June 8, 1861, voted to join the Confederacy. The Federal Government soon regained the capital and a large part of the State, and President Lincoln appointed Andrew Johnson military governor. The contending forces fought successively the battles of Fort Henry, Fort Donelson, Pittsburg Landing (Shiloh), Stone River, Chickamauga, Lookout Mountain, Mission Ridge, Knoxville, Franklin, and Nashville. In Apr., 1865, the Legislature ratified the thirteenth amendment to the Federal Constitution, and on July 12, 1866, the fourteenth amendment. The usual reconstruction troubles succeeded the war. Prominent public leaders were William G. Brownlow, Andrew Johnson, and Horace Maynard, Republicans; and Isham G. Harris, John C. Brown, B. F. Cheatham, and others, Democrats. Following the war a large State debt accumulated, which has been greatly reduced.

**Tennessee Centennial and International Exposition**: See the Appendix.

**Tennessee River**: the chief affluent of the Ohio. It originates in the confluence of the Holston and the North Fork of the HOLSTON (*q. v.*), near Kingsport, Sullivan co., Tenn., flows S. W. to Chattanooga, thence W., and again S. W. Sweeping through Northern Alabama, it turns northward, traverses Tennessee and Kentucky, and joins the Ohio at Paducah, Ky. Its drainage-area is 41,000 sq. miles; total length to the head of the Holston, nearly 1,200 miles; below the confluence, 800 miles. It is navigable without obstruction 280 miles to Florence, Ala., at the foot of the Muscle Shoals. The shoals (20 miles long) are navigable about three weeks in the year during spring floods. Canals and locks now obviate this difficulty. Above this point the river is navigable throughout its course for the greater part of the year by light-draught steamers. There are 925 miles of naturally navigable waters above the shoals upon this river and its tributaries for six months in the year. Revised by I. C. RUSSELL.

**Tennessee, University of**: an institution at West Knoxville; chartered in 1794 as Blount College; name changed in 1807 to East Tennessee College; in 1840 to East Tennessee University; in 1879 to the University of Tennessee. It received the appropriations made by the U. S. Government in 1862, 1887, and 1890 for colleges of agricultural and mechanical arts in the several States. The university includes, besides the regular academic department, a department of law, a department of medicine, and a department of dentistry. In the academic department tuition is free to properly qualified students of both sexes from all States of the Union. Instruction is provided in military science. The university occupies twelve large brick and stone buildings situated on a beautiful campus of 40 acres. The elevation is over 1,100 feet above the sea. In 1888 a complete reorganization of the university was effected. In 1900 the number of instructors was 75; of students, 750. The library contains 16,000 volumes. The president is Charles W. Dabney, Jr. Revised by T. C. KARNS.

**Tenney**, SANBORN: naturalist; b. at Stoddard, N. H., Jan. 13, 1827; graduated at Amherst College 1853; afterward studied under Louis Agassiz at Cambridge; was lecturer on natural history in the Massachusetts Teachers' Institute 1856–65; was (1865–68) professor at Vassar College; became in 1868 professor at Williams College. Among his works are a text-book of *Geology* (1859); *Manual of Zoölogy* (1865); *Natural History of Animals*; and *Elements of Zoölogy*. D. at Buchanan, Mich., July 9, 1877.

**Tenniel**, ten-ni-eel', Sir JOHN: painter and illustrator; b. in London, England, in 1820; showed a decided taste for art in boyhood; pursued his studies in his own way, thus developing a very original style; was a successful competitor for painting pictures in fresco in Westminster Palace 1845; from 1851 to 1901, when he retired, he was one of the leading artists on the staff of *Punch*, for which he produced weekly most of the large full-page cartoons, and has illustrated many books, among which are *Æsop's Fables*, the *Ingoldsby Legends*, *Lalla Rookh*, and the celebrated books for children, *Alice's Adventures in Wonderland* and *Through the Looking-glass*, by Lewis Carroll (C. L. Dodgson). Revised by RUSSELL STURGIS.

**Tennis**: a game played with small, hard balls, formerly struck by the hand, perhaps always gloved; then by the hand covered with a special gauntlet, and finally by a bat or racket; but LAWN-TENNIS (*q. v.*) is a distinct game. In all its modifications tennis corresponds very closely with the French *jeu de paume*. Even in the elaborate game which developed in the seventeenth century, the resemblance between the French and English customs of playing and counting is marked, and the points of difference are few. Both in England and on the continent of Europe tennis was played by the populace out of doors, in a town moat, or wherever a blank wall could be had, and in like manner it was played by kings and their courtiers in large rooms especially built and prepared for it, and also out of doors. Toward the end of the seventeenth century it seems to have been thought improper for the populace to play tennis at all; it was the sport of those who had the privilege of leisure, as, indeed, none others could hope to excel in it. The antiquaries have discovered accounts of Henry VII. of England losing his balls at the game and losing money also, twelvepence at one time, and Henry VIII. was evidently an ardent player. Charles I., for all his gravity and dignity, both as prince royal and as king, played tennis a great deal. In literature allusions to the game are frequent. Pericles, Prince of Tyre, complains of being

> A man whom both the waters and the wind,
> In that vast tennis-court, have made the ball
> For them to play upon.

The "wild prince" Henry tells Poins that the tennis-court keeper knows more about the latter's wardrobe than anybody else because "it is a low ebb of linen with thee when thou keepest not racket there" (*2 Henry IV.*, ii., 2). To the same prince when king the Dauphin of France sends tennis-balls as a reproach for his idle frivolity (*Henry V.*, i., 2); but the king was not ashamed of tennis, for in his speech of defiance he goes into a discussion of the game which he means to play with the King of France, and revels in anticipation. The speech, some fifty lines long, is full of the language of tennis, not to be understood by those ignorant of the favorite game. In *Henry VIII.* (i., 3) Sir Thomas Lovell complains of the travelers who have so much faith "in tennis and tall stockings." Polonius, in *Hamlet* (ii., 1), giving advice to his servant, supposes "a falling-out at tennis." Benedick's whiskers are assumed, now that he is elegant and trim "for the love of Beatrice" (*Much Ado about Nothing*, iii., 2), to have stuffed tennis-balls.

In the 1894 edition of *Les Trois Mousquetaires*, with illustrations by Maurice Leloir, is a picture of Porthos in the *jeu de paume*, which shows a tennis-court as it may be thought to have been under Louis XIII. In the *Tableaux Historiques de la Révolution Francaise* (1791; reissued 1817) there is a contemporary picture of the famous *Jeu de Paume* at Versailles, in which was taken the oath of June 20, 1789, the *serment du jeu de paume*. It is very like a modern court.

A very large room, about three times as long as wide and 30 feet or more in height, is lighted with top light or at least with windows only at the top of the wall. Along one long side and both ends a wall about 7 feet high is built about 7 feet from the main wall, and a sloping, pent-house roof is carried from this wall back to the high wall. The gallery for spectators is high in the wall where there is no pent-house. What remains of unoccupied floor is divided into halves by what was originally a rope, afterward a net reaching to the floor. That half of the floor in which a player facing the net has the long pent-house on his left is the *service* side, the other is the *hazard* side. Behind the player on the service side is a long and large opening in the wall below the pent-house, and smaller openings are in other parts of it, as well as vertical break or step in the wall where there is no pent-house. The floor is marked with lines parallel to the net. The walls of the room are sometimes black to show the white balls the better, and it is stated that in India the British officers have their balls black so that they may keep the walls of the court white for coolness sake.

The game is played by striking the ball from the service side so as to bound from the upper wall or the pent-house on the hazard side, and by returning it from the hazard side. The ball must strike the floor within certain limits; it must be struck on the first bound; it must not strike the net, nor the roof, nor the high wall beyond a certain line. The player counts by sending a ball into any of the openings in the lower wall, and by striking the ball on its first bound in certain ways relatively to the cross-marks on the floor. Elaborate codes of laws are issued by tennis clubs, of which there are many in Great Britain and a few in the U. S. The not dissimilar game of racket is sometimes encouraged by the same association with tennis; thus in New York city the Racquet and Tennis Club has a court for each game, but nowhere does the game find many players, as it is superseded in popularity by other athletic sports, among which are lawn-tennis, cricket, and base-ball.

**Ten′nyson**, ALFRED, Baron Tennyson, D. C. L., F. R. S.: poet; b. at Somersby, Lincolnshire, England, Aug. 6, 1809; the fourth of twelve children (eight sons and four daughters) of George Clayton Tennyson, LL. D., rector of Somersby and other Lincolnshire parishes. Dr. Tennyson was the eldest son of George Tennyson (1750–1835), who belonged to the Lincolnshire gentry as owner of Bayons Manor and Usselby Hall, and was for several years a member of Parliament; he married (Aug. 6, 1805) Elizabeth, daughter of Stephen Fytche, Vicar of Louth. The poet's father (1778–1831) was a man of superior abilities and varied attainments. His mother (1781–1865) was a pious woman of many admirable qualities, being especially sensitive. From her he inherited his refined, shrinking nature. Alfred was a pupil of Louth Grammar School 1816–20. During the next eight years he was educated at home by his father and private teachers. The rector requiring only a moderate amount of intellectual work, he was out of doors much of the time, rambling in the woods and pastures about Somersby. He was solitary and reserved, moody and absent-minded, the mental habits of the boy foreshadowing the characteristics of the man. He was fond of reading and addicted to verse-writing at an early age. His literary career began in his youth, his boyish rhymes and those of his elder brother Charles being collected into a volume—*Poems by Two Brothers* (1827). In his nineteenth year he composed a labored narrative in blank verse, entitled *The Lover's Tale*, two parts of which were printed in 1833, but were immediately suppressed; in 1879 the entire poem was given to the world in a more finished dress, owing to the pirated republication of the fragment of 1833. In Oct., 1828, Tennyson entered Trinity College, Cambridge, leaving in 1831 without a degree. Here he formed friendships with Kemble, Milnes, Brookfield, Spedding, and other talented young men who afterward became famous as scholars and writers. He was fortunate in having the companionship of such choice spirits, but he owed most to one whose name is forever associated with his own—Arthur Henry Hallam, a son of the historian. This dearest of his friends, whom he calls more than brother, became the betrothed of his sister Emily. Together they traveled in the French Pyrenees in the summer of 1830. Hallam's sudden death (Sept. 15, 1833) in Vienna made an ineffaceable impression on Tennyson, and may be considered an important agency in shaping his character and poetical career. In producing the beautiful elegy known as *In Memoriam*, he conferred immortality upon his lost friend and won it for himself.

In 1829 young Tennyson won the chancellor's gold medal for the prize poem *Timbuctoo*. In 1830 appeared his first book—*Poems, chiefly Lyrical*, including a few pieces which are perennial favorites with lovers of Tennyson's poetry. His second book of *Poems*, published late in 1832 (dated 1833), was a more ambitious venture. There was nothing in it from the 1830 volume. It contained some of his loveliest lyrics, having the richness of melody and the indescribable witchery of style which constitute Tennyson's charm, yet it found but few admirers beyond the immediate circle of his acquaintances. Not many reviewers noticed it. Stung by the savage criticisms of Wilson and Lockhart, he set himself to the task of improving what he had written. Profiting by the advice of critics and the suggestions of friends, he subjected his verses to the most painstaking revision. He experimented with various styles and meters; thus he served his laborious apprenticeship as poetic artist. Ten years passed, then he issued his *Poems* (1842) in two volumes, comprising selections from his two earlier books and many new pieces. The singer, hitherto unrecognized, was greeted with universal praise. The new spirit of the age found an exponent in his verse, which reflected the unrest and hopefulness of a transitional era. This was the beginning of a series of triumphs and honors. In 1845 he was granted a pension of £200, in 1850 he was appointed poet-laureate to succeed Wordsworth, and in 1855 he received the honorary degree of D. C. L. from Oxford. After leaving college, Tennyson resided chiefly with his sisters and his widowed mother at Somersby, then at High Beech (1837–40), Tunbridge Wells and Boxley (1840–44), and Cheltenham. He roamed on foot through England and Wales, often visiting friends in London and elsewhere, and making occasional trips to Ireland and the Continent. His writings prove that he was a close observer of nature as well as a diligent student of books. More than Vergil, he was a "landscape-lover." The physical features of many of the places he visited are sketched by him with pictorial fidelity and vividness, though not with photographic accuracy. Hamerton called him the "prince of poet-landscapists." *The Princess*, in which he first essayed extended narrative in blank verse, was published in 1847; the six intercalary songs were inserted in the third edition (1850), and there were numerous additions and alterations in the fourth and fifth editions. In 1850, which is called his golden year, appeared anonymously the poem that is generally regarded as Tennyson's masterpiece, *In Memoriam*, a monumental work in process of growth during the seventeen years after Hallam's death. Canto lix. was inserted in the fourth edition (1851) and xxxix. about 1872. In 1855 *Maud and other Poems* was published. The volume contained two memorable patriotic lyrics previously printed—*Ode on the Death of the Duke of Wellington* (1852) and *The Charge of the Light Brigade* (1854). *Maud* was at first misjudged and underrated, but later won its way to a generous appreciation of its abundant merits. The appearance of *Idylls of the King* in 1859 can be described as a literary sensation. Tennyson's fame was now international, and his books sold by the hundreds of thousands. His next publication, *Enoch Arden* (1864), has been the most widely read of the laureate's writings in foreign lands, having been translated into Danish, German, Dutch, French, Bohemian, Italian, and Hungarian. Four more Arthurian romaunts were added in *The Holy Grail, and other Poems* (1869), two in 1872, and one in 1885. This series of tales, if not entitled to the name of epic, is certainly the greatest of his literary undertakings; the longest of his works, though not the most original. At threescore he showed no signs of failing powers. The last two decades of his life were exceptionally productive of works stamped with dignity of thought, felicitous expression, and musical versification. The list includes the dramas *Queen Mary* (1875); *Harold* (1876); *Becket* (1884); *The Cup* (1884): *The Falcon* (1884); and *The Foresters* (1892), several of which were put on the stage. There were also five volumes of minor poems—*Ballads, and other Poems* (1880); *Tiresias, and other Poems* (1885); *Locksley Hall Sixty Years After, etc.* (1886); *Demeter, and other Poems* (1889); and *The Death of Œnone, Akbar's Dream, and other Poems* (1892).

Tennyson is not a world poet, his appeal being more or less insular. He has been criticised for being a "chanter of the aristocratic idea," yet he was a poet of the common people as well as of lords and ladies. He drew his materials from many sources, finding subjects in the legends of antiquity, the mediæval world of romance, and the tangled skein of modern life. He was master of the technical resources of the poetic art, and possessed unrivaled power as a word-painter. But the domain of beauty was too narrow for him. Beyond any mere æsthetic influence that he exerted, he was a mighty force for good, his polished verse being the vehicle of ethical instruction and spiritual uplift. The personality and love of God, the divinity and mission of Christ, providence, free will, the immortality of the soul, the province of law, the ministry of sorrow in the development of character, the spheres and limits of faith and knowledge—these are some of the leading ideas or tenets of his theology and philosophy. His success is largely explained by the fact that he clothed in artistic form the higher thought and sentiment of his time, thus enriching the spiritual life of England and the world. Tennyson's career was unstained by excesses. He fulfilled Milton's condition; his life was a poem. He remained in the Anglican Church all his days, liberal but essentially orthodox in his creed. A friend of the Broad Church party, he contributed not a little to the growth of tolerance and the non-sectarian temper. In politics he was a moderate Conservative, an advocate of gradual reform in Church and state. He was a man of many-sided culture, keenly interested in astronomy, geology, botany, and other sciences. He was familiar with the discussions and speculations of physicists and metaphysicians. An idealist of the intuitional school, he was inclined to mysticism leavened with British sense.

Tennyson married (June 13, 1850) at Shiplake, Oxfordshire, Emily Sarah Sellwood, whom he had known and loved for many years (d. Aug. 10, 1896). She was the eldest daughter of Henry Sellwood, of Peasmore, in Berkshire, afterward a solicitor of Horncastle, Lincolnshire; her mother was a sister of Sir John Franklin, and her youngest sister the wife of Charles Tennyson Turner. A lady of high intelligence and gracious manner, she was in every way fitted to be the companion of her poet husband, who lovingly bore testimony to her loyalty and worth. Exalted as was the poet's ideal of woman as wife and mother, she seems to have met his exacting requirements almost perfectly. Their wedded life was harmonious and happy. They lived three years at Twickenham, where Hallam (the second Lord Tennyson) was born. In 1853 he bought the Farringford domain near Freshwater, Isle of Wight, where was born his second son Lionel. In 1867 he purchased a small estate on Blackdown, Sussex; in 1868 he built Aldworth, a fine Gothic mansion, which was his summer home for more than twenty years. He twice declined a baronetcy (1865 and 1868); was created a peer (Jan. 24, 1884) with the title Baron Tennyson of Aldworth and Freshwater. D. at Aldworth, Oct. 6, 1892; was buried in Westminster Abbey, Oct. 12. See Van Dyke's *Poetry of Tennyson*; Brooke's *Tennyson*; Waugh's *Alfred Lord Tennyson*; and Napier's *Homes and Haunts of Tennyson*. EUGENE PARSONS.

**Tennyson**, FREDERICK: poet; b. at Louth, Lincolnshire, England, June 5, 1807; second son of Dr. George Clayton Tennyson and a coheir of the Earls of Scarsdale; educated at Eton and Cambridge (entering Trinity College in 1827 and taking his degree in 1832), where he distinguished himself by writing Greek verse, winning the prize for a Sapphic ode, entitled *Egypt*, in 1828. He married an Italian lady, Maria Guiliotta (since deceased), lived in Italy many years, and since 1859 chiefly in Jersey, devoting his leisure to poetry and his favorite Hellenic studies. Author of three volumes of verse—*Days and Hours* (1854); *Isles of Greece: Sappho and Alcæus* (1890); *Daphne, and other Poems* (1891). D. Feb. 28, 1898. EUGENE PARSONS.

**Tennyson**, HALLAM, Lord Tennyson: author; eldest son of Alfred Tennyson; b. at Twickenham, England, Aug. 11, 1852; educated at Marlborough College and Trinity, Cambridge, also a student of the Inner Temple. He edited a volume (1880) of sonnets by his uncle, CHARLES TENNYSON TURNER (*q. v.*), for which he furnished a memoir of the author; issued a juvenile work, *Jack and the Beanstalk* (1886), illustrated by Randolph Caldecott; translated the old Saxon song of Brunanburh, which appeared in *The Contemporary Review* (Nov., 1876), and was later versified by his father. He has written a *Life* of the late poet-laureate. He was appointed Governor of South Australia in 1899. E. P.

**Tennyson**, LIONEL: author; second son of Alfred Tennyson; b. at Freshwater, Isle of Wight, Mar. 16, 1854; educated at Eton and at Trinity College, Cambridge; married (Feb. 28, 1878) Eleanor Mary Bertha, the accomplished daughter of Frederick Locker-Lampson; was connected with the India Office several years, and prepared a masterly report on *The Moral and Material Condition of India* for 1881–82. A profound student of dramatic poetry, he contributed valuable articles to the *Cornhill*, the *Nineteenth Century*, and other periodicals. D. on board the Chusan, near Aden, Apr. 20, 1886. EUGENE PARSONS.

**Tenochtitlan'**: See MEXICO (city) and MEXICAN ANTIQUITIES.

**Tenor**: the highest kind of adult male voice. The average compass of a true tenor is from C in the bass staff to A in the treble. Special cases may occasionally be found which can produce two or three tones higher. In written music the treble clef is usually employed for the part to be sung by this voice, although the tones produced are an octave lower in actual pitch. D. B.

**Tenos**: island in the Ægean Sea; one of the Cyclades, belonging to Greece. It is mountainous, but springs abound, and it is well cultivated. It has a good harbor, Porto Panormo, on the N. E. Wine, raw silk, and marble, especially vert antique, are exported. The Tenians took a memorable part in the battle of Salamis (479 B. C.), fiercely resisted the Ottomans, by whom they were conquered, and fought heroically in the Greek revolution (1821–27). Their cathedral of the Holy Virgin, the Evangelistria, is one of the finest edifices of modern Greece. Area, 79 sq. miles. Pop. 21,000, nearly half of whom are Roman Catholics. E. A. G.

**Tenpins**: See BOWLS AND BOWLING.

**Tenrec**: See TANREC.

**Tensas** or **Tensaw River**, or **Bayou Tensas**: a stream which rises in Carroll parish, La., and after a devious southerly course of 250 miles joins the Washita at Trinity, La. It is navigable 150 miles during good stages of water.

**Tensaw River**: a bayou of Alabama, which leaves Alabama river before its junction with the Tombigbee, and pursues a course parallel with that of Mobile river. Its waters flow into Mobile Bay.

**Tense**: See VERB.

**Tenshi**: See MIKADO.

**Tension of Electricity**: See ELECTRICITY, ELECTRIC DISCHARGE, and VOLT.

**Tension of Vapors**: See VAPORS.

**Tent** [from O. Fr. *tente* < Lat. *ten'tum*, neut. perf. partic. of *ten'dere*, stretch]: a pavilion or portable lodge made of skins, strong cloth, or canvas, sustained by one or more poles, and used as a shelter from the weather, especially by soldiers in camp. The material used as a covering is usually stretched by means of cords secured to tent-pegs. Such portable shelters, or tents of some sort, have been used as homes by nomadic tribes from the earliest ages. The patriarchs were dwellers in tents, and the poorer classes in Persia, China, and other Eastern countries still live in tents formed of frames of wood covered with thick cloth, felt, or matting. Tents have become indispensable to the equipment of armies. The Greeks encamped in tents at the siege of Troy, and the soldiers under Hannibal had tents of skins or canvas. Modern military tents are made of canvas, generally of cotton duck, on account of its being more impervious to water and cheaper than linen or hemp, though the latter are sometimes used. Different forms of tents for military purposes have been employed in the armies of the U. S. and of Europe. Prior to the civil war the Sibley tent, which is a conical tent, supported by a central pole resting on an iron tripod, and capable of sheltering fifteen infantry soldiers or thirteen mounted men, was used in the U. S. army. One of its advantages was that it could be warmed by an open fire or small stove, and afforded ample ventilation, having a circular opening at the apex partially covered by a movable piece of canvas so arranged as to be shifted according to the direction of the wind. It resembled a Sioux lodge, the chief difference being that it was constructed of canvas and supported by the central pole and tripod, while the Indian lodge was made of rudely tanned buffalo skins stretched on several long wooden poles. The tents used in the U. S. military service include the hospital tent, which is of cotton duck $28\frac{1}{2}$ inches wide, clear of all imperfection, and weighing 12 oz. to the linear yard, and has the following dimensions when pitched: Height, 11 feet; length of ridge, 14 feet; width, 14 ft. 6 in.; height of wall, 4 ft. 6 in.; wall eaves, 3 inches in width; height of door, 8 ft. 9 in.; width of door, 18 inches at bottom and 10 inches at top; and from top of ridge to wall, 9 ft. 10 in. Such tents are made to open at both ends, so that several may be placed together and form a continuous ward. Each tent holds from six to eight beds. The wall tent for officers is of similar material, and has the following dimensions: Height, 8 ft. 6 in.; length of ridge, 9 feet; width, 8 ft. $11\frac{1}{2}$ in.; height of wall, 3 ft. 9 in.; wall eaves, 2 inches wide; height of door, 6 ft. 8 in.; width of door, 12 inches at bottom, 4 inches at top; and from top of ridge to wall, 6 ft. 6 in.; and is furnished with a fly. The conical wall tent for enlisted men has the body of the tent of standard 12-oz. cotton duck, and the sod-cloth of standard 8-oz. cotton duck $28\frac{1}{2}$ inches wide, with eave-lines of six-thread manilla line (large), and foot-lines of nine-thread manilla line. Its roof is in the form of a frustum of a cone, 16 ft. 5 in. in diameter at the base, 18 inches in diameter at the top. Its wall is 3 feet high; the height to top of roof, 10 feet; eaves 2 inches wide, and tabling at bottom, $2\frac{1}{2}$ inches wide. From the top to the eave it measures 10 ft. $1\frac{1}{4}$ in. The shelter tent, which is a modification of the French *tente d'abri*, consists of two pieces of cotton duck; each half is 65 inches long on the ridge and 61 inches wide when finished. The center seam overlaps 1 inch. They are made of cotton duck 33 inches wide, to weigh from $7\frac{1}{2}$ to 8 oz. to the linear yard, and be free from imperfections, arranged to button together and stretch over a ridge supported by poles. In active service each soldier carries half a tent, which may serve as a cloak on the march, as a covering at night, and when the two pieces are joined forms a tent for both men. Besides military tents, there are special forms of tents made for emigrants, lumbermen, gypsies, surveyors; and prospecting parties, as in railway construction, have tents devised for their wants. There are pleasure tents of many forms, as those used for camping out, for lawns (square and oblong), for children, for screens, as the surf tents used on beaches. Besides large circus tents, which are of heavy twilled duck and special construction, there are boarding tents, stable tents, and house tents; also special tents for agricultural and other fairs, with varieties for the sale of refreshments and exhibition of side-shows, also photographers' tents, illusion tents, etc. The chief market for the duck in the U. S. is in Baltimore, and the centers of the tent-industry are in New York, St. Louis, Chicago, Cincinnati, and St. Paul. There is a large local demand in the U. S. for the many kinds of tents mentioned, and a small export trade dependent upon special causes; thus in 1894 and 1895 the demand was largely from Japan.

MARCUS BENJAMIN.

**Tentaculif'era**: a group of protozoans. See *Suctoria*, under INFUSORIA.

**Tenterden**, Lord, CHARLES ABBOTT: judge; b. at Canterbury, England, Oct. 17, 1762, his father being a barber; entered Oxford University in 1781; took degree of B. A. in 1785; acted as private tutor to the son of a judge, who persuaded him to take up the law; entered the Middle Temple 1787, practiced as a special pleader from 1789 to 1796, and then was admitted to the bar; became a judge in the court of common pleas in 1816, and lord chief justice of the king's bench in 1818. In 1827 he was raised to the peerage as Lord Tenterden. D. in 1832. He combined with an unusually quick mind extraordinary perseverance and application, and was recognized as the ablest lawyer of his time; but he was not called upon to decide any great constitutional questions. He published in 1802 a *Treatise on the Law relative to Merchant Ships and Seamen*, which has passed through more than a dozen editions and is a standard yet.

F. STURGES ALLEN.

**Ten Thousand, Retreat of the**: the homeward march of about 10,000 Greek mercenaries from Cunaxa, a town 60 miles N. of Babylon. At Cunaxa their leader, Cyrus the Younger, was killed in battle against his brother Artaxerxes II. (401 B. C.). Thereupon their Persian allies dispersed and the Greeks were left in a most critical position. Their only possible line of escape was by the upper Tigris through the country of the Kardouchi (the modern Kurds), and across the highlands of Armenia to some Greek city on the Black Sea. At the river Zapatas their five principal generals were assassinated by the Persian satrap Tissaphernes. Thereupon Xenophon, then a private soldier, was elected a general, and became practically commander-in-chief. After a winter's march of over 700 miles in an enemy's country, during which they endured terrible hardship and suffering, they reached Trapesus (Trebizond). Finally they arrived at Chrysopolis, opposite Byzantium (400 B. C.). Their successful escape revealed the weakness of the Persian empire, and encouraged Alexander to undertake its subjugation. In the *Anabasis* Xenophon describes this retreat, and gives the most vivid picture extant of Greek discipline and military methods.

E. A. GROSVENOR.

**Tennes**: See MEDIÆ.

**Tenuiros'tres** [Mod. Lat.; Lat. *te'nuis*, slender + *rostrum*, beak, bill]: a group (tribe or family) of birds, including forms whose only common characters consisted in the possession of a slender bill, and feet with three toes directed forward and one backward. According to Cuvier, it included the Linnæan genera *Sitta*, *Certhia*, *Trochilus*, and *Upupa*. The group was a very heterogeneous one, and has not been retained in the ornithological system.

**Tenure**: the manner in which real property is held or owned. As has been explained in the articles on LANDLORD AND TENANT and PROPERTY (*qq. v.*), the common law of England and the U. S. denied to real property the capacity of absolute ownership. The exigencies of the feudal system, which required the complete dependence of the man upon his lord and of the lord upon the king, substituted for the notion of absolute ownership of lands—such as was recognized in the case of goods and chattels—the conception of "estates" in land, the land being deemed to be held of and in subordination to the lord of the man and of the land. These estates were qualified interests, resting upon a recognition of a superior right vested in the person of whom the land was "held," and dependent for their continuance upon the due performance of the terms and conditions of such "holding." It is true that the early English law recognized an "allodial" or absolute ownership of lands, as well as of chattels, but this form of proprietorship did not long survive the Norman Conquest.

The feudal system was primarily a military and political organization of society, its system of land tenure being only an incident, though doubtless at first a necessary incident, of that social organization. As the article on the FEUDAL SYSTEM (*q. v.*) shows, these primary features of the system dominated and controlled its development on the continent of Europe, while its system of land tenure continued to be a thing apart. In England, on the other hand, where the feudal system in the generation following the Norman Conquest had an unparalleled expansion, its military and political features soon disappeared, while its system of land tenure entered into and completely transformed the property rights and the property law of the kingdom. From that time on the law of real property in England was the feudal law, and the allodial ownership of an earlier day disappeared so completely that its very existence was denied. It became a maxim of English law that the king is the ultimate and absolute owner of all the lands in the kingdom, and that all of his land-owning subjects are only his tenants. "Every acre of English soil and every proprietary right therein have been brought within the compass of a single formula, which may be expressed thus: *Z tenet terram illam de . . . domino Rege*. The king himself holds land which is in every sense his own; no one else has any proprietary right in it; but if we leave out of account these royal demesnes, then it is true that every acre of land is held of the king. The person whom we might be inclined to call its owner, the person who has the right to use and abuse the land, to cultivate it or leave it uncultivated, to keep all others off it, holds the land of the king either immediately or mediately" (*Pollock and Maitland*). He who held directly or immediately of the king was said to hold in chief (*in capite*); but the tenant *in capite* is not usually the person who deals with the land as owner. The latter is usually one to whom the tenant in chief has directly, or through still other links in the feudal chain, transmitted the power of dealing with the land. In other words, D, who is seized of the land in fee simple, holds of C, who in his turn holds of B, who holds of A, who holds *in capite* of the king. In this feudal order D is said to hold the land *in demesne*, while A, B, and C are *mesne lords*, being lords with respect to those standing below them, but tenants with respect to those standing above them.

There is another side to this relation of lord and tenant which has been developed out of the feudal relation of lord and man. The chief end of the transaction above described is not to confer lands on A, or B, or C, or D, but to secure to the king the services of A, to A the services of B, and so on. It is to secure these services that the land is granted, and it is only by the due performance of these services that it can be retained. The term "tenure" involves the obligation of service on the part of the tenant quite as much as it does the right of the tenant to hold the land for which the service is due. So important is this fact of service that the principal classification of tenures is by the service to be performed. A tenant may hold his lands in fee simple, fee tail, or for life, but his tenure is by "knight service," or by the service of "free alms," or by the service of "serjeanty," or by the service of "socage."

Classification of Tenures.—Land tenures under the feudal *régime* fell into two classes—(*a*) the free tenures and (*b*) such as were not free.

*The Free Tenures.*—1. *Knight's Service.*—This form of tenure, known also as military tenure, or tenure *in chivalry*, was the most important, as it was for many years the most numerous, class of tenures at common law. It was created by "homage," a solemn act by which the tenant acknowledged his lord as him of whom he held his land and to whom he was bound to render service, and from which, on the other hand, arose the duty on the part of the lord of protecting his tenant. This tenure was, as its various designations indicate, based upon the performance by the tenant of military service in the army of the king. Most of the tenants *in capite* held by this tenure, but wherever it existed, whether the holding was immediately of the king or of some *mesne* lord, the military service was still due directly to the king. Doubtless the practice of that feudal society conformed for a time to the theory upon which this form of tenure was based and the tenants in chivalry paid their service in person by actual military duty, but it was not long before tenure by knight's service stood for an irregular series of money payments, while the king, with his share of these payments (*scutage*, shield-money), recruited his army wherever he could. The "incidental" payments to the lord, however, were by far the most burdensome feature of military tenure, and, under the name of rights of *marriage*, *wardship*, *aids*, and *reliefs*, became the most characteristic and oppressive features of the feudal system in England. They continued until the abolition of military tenures by statute in the year 1660 (12 Car. II., cap. 24, *Stat. of Military Tenures*).

2. *Serjeanty.*—Closely allied to the tenures based on military service were those where the tenant held his land by the duty of performing some personal and ofttimes domestic or menial service to his lord. This form of service covered a wide range, from the "grand serjeanties" of the king's marshal, chancellor, or justiciar, to the "petty serjeanty" of the freeman who supplied his lord with arrows or knives for the chase.

3. *Frankalmoign.*—Most of the lands held by ecclesiastics or by the Church (and the quantity of land so held was, even at the beginning of the thirteenth century, very large) were held by this tenure of "free alms." The service implied was spiritual—to sing masses, to distribute money among the poor, etc.—and the land was, as between the donor and the tenant in frankalmoign, held free from any services or dues of a secular nature. Of course, if the land thus given was held by the donor of the king, or of some *mesne* lord by a tenure of secular service, the land would go even into the hands of the Church burdened with this external (*forinsec*) service; for it was a marked characteristic of all the feudal tenures that the services on which they were based were directly imposed upon the land, and could thus be exacted even of those tenants of the land who did not personally "owe" them.

4. *Socage.*—This was the great residual tenure of the feudal era, and comprehended all freehold lands not held by military, or "domestic," or spiritual service. The landowner who bought his land outright for a valuable consideration, the freehold tenant who held by the service of paying a perpetual rent in money, or produce, or labor, the secular tenant to whom the land was given as a free gift—all these held by the tenure of "free and common socage." Homage was not essential to the creation of this tenure, though doubtless it often arose by the performance of that solemn act. But the oath of fealty was indispensable, and often constituted the sole "service" of the tenant in socage. The principal characteristic of this tenure was the certainty, or definiteness, of the service required as compared with those exacted under the other feudal tenures, and its freedom from the most burdensome of the so-called feudal "*incidents*"—wardship and marriage—rendered it a popular and highly desirable form of tenure. The first socage tenants were doubtless primitive allodial proprietors, some of the more obscure of whom succeeded in escaping the general confiscation of lands after the Conquest by coming under the protection of the local lords and admitting their paramount title to their lands. At first the number of persons in socage must have been very small, but it must also have grown very rapidly as the advantages of this form of tenure became apparent and unoccupied lands were, more and more, granted out for agricultural uses. By the statute of Charles II., heretofore referred to, all freehold tenures were turned into free and common socage, and this has continued to be the well-nigh universal form of land-holding in England. The so-called "burgage" tenure was merely a form of socage which obtained in certain boroughs. The tenures of Borough English and Gavelkind (*qq. v.*) were only local variations of socage tenure.

*Non-free Tenure.*—In addition to the lands held by the king or other territorial lords in demesne and those parceled out by them to be held of them by the free tenures above described, there were other lands granted by them for longer or shorter periods—to be held, perhaps, at the will of the lord, perhaps for the life of the tenant, sometimes even by the tenant and his heirs forever—upon the service and condition of agricultural or other labor to be performed by the tenant at the lord's will. The terms of this tenure—known as "villeinage"—were, for the most part, regulated by the custom of the "manor," or estate, of which the villein tenement formed a part, and the rights of the villein tenant were protected by the court of the manor, but there is no doubt that the quasi-servile character of this tenure was due to the fact that the terms of the tenancy and the enforcement of the tenant's rights were originally largely dependent on the will of the lord. Although it was the unfree man, the villein, who gave his name to this form of land-holding, there was nothing to prevent a freeman, even one who already held lands in the same manor by knight's service or in socage, from being the holder of a villein tenement.

In the course of time this villein tenure lost its arbitrary and indefinite character. The custom of the manor acquired binding force and became enforceable in the king's courts even against the lord of the manor. The condition of labor to be performed by the tenant was commuted into rent, and the copy of the "roll" or record of the lord's court, in which was recorded his accession to the estate, became his muniment of title. He was now a "copyhold" tenant and was said to hold "by copy of court roll." Copyhold tenure still prevails to a considerable extent in England, and presents in the main the same characteristics as it did after the transformation above described. However much it may resemble the prevailing form of freehold tenure—as respects duration of interest, time of enjoyment, mode of descent, etc.—it is nevertheless sharply discriminated from the latter. Land held by copyhold tenure is always parcel of and included in a manor. The lord of the manor has the freehold, the copyholder holds "at the will of the lord according to the custom of the manor." The evidence of the nature and extent of his rights is to be looked for, primarily, in the court rolls of the manor. He has the free right of alienation, but he can alienate only by surrendering the land to the lord who then admits the purchaser.

*Feudal Incidents.*—Occasional reference has been made to the incidental burdens of the feudal relation. As has been pointed out above, these incidents of feudal tenure were, from the very beginnings of the system in England, a grievous burden, and in the course of time, when there was nothing else to distinguish such tenures from one another and from allodial ownership, the legalized exactions of the feudal lords served to keep the old distinctions alive. For more than a hundred years before the abolition of these burdens by the Statute of Military Tenures, they had been the distinctive badge of feudalism as well as the principal cause of complaint against the feudal system of property. The usual incidents of tenure were the following: (*a*) *Relief*: a fine paid to the lord of the fee by the heir upon the death of a tenant of an estate of inheritance. Although the law recognized the right of the heir to succeed to his ancestor's estate, he could enter only at the price of a relief. The amount to be paid was originally indefinite, but in Glarvill's time the relief for a knight's fee is fixed by law at 100*s.*; for socage land it is one year's rent; as to baronies and serjeanties, there is no settled rule; the heir must make the best bargain he can. (*b*) *Aids*: regular or irregular exactions made by the lord to enable him to meet his own pressing necessities. They were regularly and lawfully claimed for the purpose of ransoming the lord from the enemy, for knighting his eldest son, and for marrying off his eldest daughter; but they were sometimes more doubtfully demanded for the purpose of paying the lord's debts, or his relief to his superior lord, etc. It was anciently provided that the aid should be "reasonable," and the amount to be exacted was as early as the year 1275 fixed by statute. (*c*) *Wardship and Marriage*: the right of the lord of a minor tenant, who held by knight's service or military serjeanty, to the custody or wardship both of the land and tenant during the minority of the latter, as well as to dispose of the infant tenant in marriage. These rights were during the latter part of the feudal *régime* the principal source of revenue to the king and the other territorial lords. The lord was entitled to all the rents and profits of the tenement for his own use during the continuance of the wardship (though he was expected to support the heir until the latter came of age), and he might "sell" the young heir, whether boy or girl, in marriage. As has been said before, the lord had in general no rights of wardship or marriage over the heir to socage lands. (*d*) *Escheat*: the lord's right to resume an estate in fee upon failure of the estate. Nothing is more significant of the reality and permanence of the lord's rights in the lands held of him than this notion of the escheating or reverting of the estate to him. Though he has parted with the land in fee, his feudal lordship is a real right of property, which persists through all the changes in title which the land in question may undergo, and which may at any time become once more a full ownership of it. See ESCHEAT.

TENURE IN THE UNITED STATES.—The more burdensome forms of feudal tenure, i. e. the military tenures, never gained a foothold on the American side of the Atlantic. Although these tenures were still in force in England when the earliest colonial charters were granted, these charters invariably provided for socage tenure. The usual provision was that the land should be holden of the king "in free and common socage, by fealty only, for all services, and not *in capite* or by knight's service." Tenure in this form, the lordship of the State being substituted for that of the king, and all feudal incidents being abolished, survives in New Jersey, Pennsylvania, South Carolina, Georgia, and several other States. In New York and most of the remaining States "all feudal tenures, with all their incidents," have been abolished even in name, and all lands are declared by statute "to be allodial, so that, subject only to the liability to escheat, the entire and absolute property is vested in the owners." This is the language of the New York statute (1 Rev. Stat. 717, sec. 3) now embodied in the constitution of the State (Revision of 1894), which has been substantially followed in many other States.

In addition to the *Commentaries* of Blackstone, Kent, and Stephen, the reader is recommended to consult the following modern authorities: Digby's *History of the Law of Real Property*; Leake's *Digest of the Law of Property in Land*; Williams on *Real Property*; Fowler's *History of the Law of Real Property in New York*; and especially Pollock and Maitland's admirable *History of English Law*.

GEORGE W. KIRCHWEY.

**Teocalli**, tā-ō-kaal-lee' [Nahuatl, *teotl*, a god + *calli*, house]: a temple or place of sacrifice of the ancient Mexicans; the name is especially applied to those of Aztec origin. Commonly they were low truncated pyramids, with small buildings on the summit, and an open space where the sacrifices, with their attendant ceremonies, could be carried on in view of the people below. Some of them were very large. The great teocalli of Mexico occupied a space 375 feet long and 300 broad; it was 80 feet high, and the terraced edges were so arranged that it was necessary to pass five times around the whole structure in ascending. On the top were several small buildings, and the sacrificial stone, which is still preserved in the national museum. This pyramid was completed in 1486, and during the first Spanish occupancy of Mexico it was the scene of several fierce battles. After the conquest it was torn down, and its site is now occupied by the cathedral. Remains of true pyramidal teocallis are found in various parts of Southern Mexico. The name has been incorrectly applied to structures of a similar form—for example, the great pyramid or mound of Cholula—which are older than the Aztec period, and, presumably, were not built for religious purposes. HERBERT H. SMITH.

**Te'os** (in Gr. ἡ Τέως): one of the most prominent of the Ionian cities in Asia Minor; situated in Lydia, 25 miles S. W. of Smyrna, between the promontories of Coryceum and Myonnesus, and N. of the island of Samos. It had two good harbors, and carried on a considerable trade. In its vicinity was produced a celebrated wine, and its most prominent public building was a splendid temple of Dionysus. After the Persian conquest most of the inhabitants emigrated to Abdera in Thrace. Teos continued, nevertheless, to be a city of some importance until the time of the Romans, when it gradually fell into decay. Ruins of it, of its walls, theater, and temple, are visible near the present village of *Sighajik*. Anacreon and Hecatæus were born in Teos. Revised by J. R. S. STERRETT.

**Tepic**, tā-peek': a territory of Mexico, separated in 1889 from the northwestern part of Jalisco; surrounded by Sinaloa, Durango, Jalisco, and the Pacific. Area, 11,275 sq. miles. It corresponds in part to the region long called Nayarit, a mountainous tract W. of Zacatecas, included in the Sierra Madre; to this has been added a strip of lower coast-land, including San Blas, which is the principal port. A large proportion of the inhabitants are Indians, who maintain a quasi-independence. The Nayarits number at least 30,000. They are an intelligent race of agriculturists and bold warriors. In their mountain fastnesses they long resisted the Spaniards, and were only conquered after a war of twenty years, in 1722. Subsequently they received missionaries, and were nominally subject to the Government at Mexico, though really obeying their own chiefs. In 1872 they rebelled under one of these chiefs, Manuel Losada, but were subdued after a bloody war. Pop. of the territory (census of 1895) 148,776. Tepic, the capital and principal town, is on a plateau, 18 miles from the Bay of San Blas, and on the railway from Mexico to that port; 2,900 feet above sea-level (see map of Mexico, ref. 6–E). The situation is a fine one, commanding a view of the Pacific, and the climate is very salubrious. The town has manufactures of cotton-cloths, cigars, etc. Pop. about 25,000. H. H. SMITH.

**Teplitz** [derived from Slav. *teplice*, i. e. warm bath; spelled in old documents *Toplic*, from which *Töplitz* till the present time]: one of the most famous watering-places in Europe and a district town of Bohemia, near its northwestern frontier (see map of Austria-Hungary, ref. 2–D). It is beautifully situated in the Biela valley, which separates the Saxon Erzgebirge from the Bohemian Mittelgebirge, is a station of the Aussig-Teplitz and the Dux-Bodenbach railways, and has, with Schönau, 17,526 inhabitants (1890). The castle of Prince Clary, with its fine park and the shady promenades, as well as the numerous arrangements for the comfort and pleasure of the 7,000 to 8,000 people who visit Teplitz annually, make it a delightful abode. It has twelve alkalo-saline springs of 90° to 117° F., whose waters are very effective in cases of rheumatism, gout, paralysis, and gunshot wounds. There is an Austrian military bathing-house in Schönau, and a Prussian and a Saxon bathing-house in Teplitz, which was especially frequented by wounded soldiers of the three wars of 1864, 1866, and 1870–71, so that Teplitz is rightfully called the warriors' bath. The first discovery of Teplitz's thermal springs is said to have been made in 762. The place is historically memorable for the triple alliance concluded there Sept. 9, 1813, between the monarchs of Russia, Austria, and Prussia against Napoleon, and for later conventions of the monarchs. Teplitz in Bohemia must not be confused with other spas of the same name: Teplitz near Trentshin on the Waag, Hungary, with the famous Trentshin sulphur springs, Teplitz or the Warasdin bath (133° F.), and Krapina-Teplitz (35° R.), in Croatia, Teplitz in Carinthia, and Teplitz in Moravia. *Bibl. Gerold* (Vienna, 1886); Delhaes and Baumeister, *Der Badeort Teplitz-Schönau* (Prague, 1886); Hallwich, *Teplitz, eine deutsch-böhmische Stadtgeschichte* (Leipzig, 1886).

HERMANN SCHOENFELD.

**Tequenda'ma**: a waterfall in Colombia. See BOGOTÁ.

**Teramo**, tā'rāā-mō: town; in the province of Teramo, Southern Italy; about 35 miles S. of Fermo (see map of

Italy, ref. 5-E); beautifully situated on an elevated plain between two streams, somewhat above the site of the old *Interamna*, of which the modern name is a corruption. It is an industrious and thriving place, having pottery, household furniture, hat, and licorice factories. Pop. 8,650.

**Ter'aphim** [= Heb. (*terāphīm*), plur. of *terāph*, perhaps meaning "givers of prosperity"]: images or figures, probably used by the ancient Hebrews either as objects of household worship or as religious symbols of some kind. Nothing satisfactory is known of their character, origin, or use. They were found in Jacob's and David's houses as apparently household gods (Gen. xxxi. 30, 32-35; 1 Sam. xix. 13-16); Josiah attempted their suppression (2 Kings xxiii. 24); Hosea (iii. 4) speaks of them as in familiar use.

Revised by S. M. Jackson.

**Tera'shima Munenori**: statesman and diplomatist; b. in the province of Satsuma, Japan, in 1832. Sent as a youth to study medicine in Tokio, he acquired a thorough knowledge of Dutch, and later of English, which brought him into prominence during the negotiations with foreign powers that followed the visit of Commodore Perry to Japan in 1853. Terashima was attached to the embassy that visited the U. S. in 1861, spent two years in England (1865-67), whither he returned in 1872 as minister. Next year he resigned this position, and later became Minister for Foreign Affairs. For two years he served as minister at Washington. When the orders of nobility were created in 1884 he received the title of count. D. June 6, 1893. J. M. Dixon.

**Teratogeny**: See Pathology, Vegetable.

**Teratol'ogy** [from Gr. τέρας, τέρατος, monster, prodigy + λόγος, discourse, reason]: that branch of biological science which treats of monstrous growths in either plants or animals; for example, in botany, of the growth of "double" flowers, flattened or distorted stems, etc. For these, see *Teratogeny* in the article Pathology, Vegetable. Primitive anomalies or congenital malformations in animals, such as have been developed during intra-uterine life, belong to the province of teratology, while acquired deformities, such as have arisen after the birth of the fœtus, are embraced in the field of medical and surgical pathology.

*History.*—All that can be found in any of the ancient authors who have attempted to discourse upon the subject is of very little scientific value. While remarkable malformations among the lower animals were regarded as monsters portending dire calamities, human monstrosities were considered as evidences of divine anger or as the direct result of demoniacal influence, and hence looked upon with apprehension and dread, being interpreted by the augurs of the times as prodigies entailed upon parents as punishments, and frequently as wonders of bad omen to the public, foreshadowing some general calamity. The general belief that monsters had a satanic origin gave rise to the practice of destroying them, either by drowning, strangling, or casting them into the flames, with the hope of thus diminishing or entirely exterminating the progeny of the devil. It was not until the early part of the eighteenth century that painstaking observations of the anatomical structure of monsters were fairly instituted in place of the mere superficial examination and description of the external configuration which had previously constituted the ultimate limit of physical inquiry on this subject.

*Causes of Malformation.*—This inquiry has given rise to much fruitless speculation, but the superstitions and absurd explanations of a former age have chiefly vanished in consequence of the light which modern embryological investigations have shed upon the subject. Certainly, nothing can be more irrational than an attempt to explain the anomalies of organization which occur in man by maternal mental emotions, when corresponding malformations occur among the lower animals, viviparous or oviparous, and also in plants —developments which apparently result from defective or excessive formative power. Such flimsy explanations would certainly fail to account for the fact that deep-seated organs, the existence of which is unknown to the pregnant woman, are frequently malformed, as in congenital malformations of the heart, kidneys, intestinal canal, the abnormal distribution of blood-vessels, etc. External mechanical influences, such as blows, falls, etc., may by shock or by affecting the general health of the mother have power to disturb the normal development of the fœtus in utero. Experiments by Dareste and others in teratogenesis by agitation of the egg and by the establishment of other abnormal conditions, such as the diminution of oxygenation, have demonstrated this possibility beyond a doubt. Original malformation of the germ has been reckoned among the causes of anomalous development. This view of the embryogenesis of at least some of the primitive anomalies receives force from the fact that repetition of the same kind of malformation by the same parents has been observed in a number of cases. It may be ascribed to the mother when the malformation is repeated, and to the father where his children by different wives are malformed in the same manner. An additional evidence of original defect in the germ is the hereditary transmission of certain deformities through several generations, examples of which in an excessive number of digits, hare-lip, hypospadias, and other structural vices, are not very infrequent. Otto maintains that many malformations may be ascribed to diseases of the fœtus, while Vrolik contends that very few are attributable to this cause. Chronic inflammation of the brain may produce dropsy of the ventricles, and thus acrania; the different forms of hydrencephalocele and an arrest in the development of the limbs may occur *in utero* by constriction of amnionic bands, the result of amnionic inflammation. The chief cause of malformation is impeded or retarded development of the fœtus, from whatever cause. Retardation or arrest of development may be confined to one part or extended to others, as seen where several malformations coexist. Wolff, Tiedemann, and J. F. Meckel have elaborated the theory that "most malformations represent certain stages of the development of the embryo and of its organs, at which stages formation has stopped short, or from which ulterior development has ceased to follow the normal type." The deviations from the normal type of a species are never so great as to destroy all semblance to it. There is a limit beyond which abnormalities never pass. In reaching her ultimate anomalies nature observes the law of propriety (*lex proprietatis*, Fleischmann), and makes her approach through a series of transitional gradations. Dissimilar parts and organs are never found fused or united together, nor transpositions of viscera beyond the limits of their natural locality; as, e. g., the brain in the abdomen, or intestinal tube in the cranial cavity.

The following facts have been observed in relation to monsters: That they occur in definite number, the relation being about 1 to 3,000 births; that in the greater part of malformations the sex is female; that certain species of animals are more liable to produce certain forms of monsters than others; the constancy of form in monsters, even among animals of diverse classes (cyclopia, acrania, and double monsters occur in birds, possessing the identical characters as in mammals); and, lastly, the greater predisposition to monstrosity among certain animals, being greater in mammals than in birds and among domestic than wild animals.

Under the head of *Hemiterata* (partial monstrosities) are grouped: I. Anomalies of volume either of stature, as dwarfs or giants, or of volume, *sensu stricto*, affecting regions, systems, or organs. II. Anomalies of form, as of the head. III. Anomalies of color, either deficiency, excess, or alterations, as of the color of the iris. IV. Anomalies of structure, exhibited in the cartilaginous conditions of bones or anomalous ossification. V. Anomalies of disposition: (*a*) by displacement as in clubfoot; (*b*) by change of connection, as in teeth out of line; (*c*) in continuity, as in the union of lips or of digits; (*d*) by closure, as in complete transverse vaginal septum; (*e*) by disjunction, as in persistence of the foramen ovale, or in hare-lip. VI. Anomalies of number and existence, as in defect or excess of digits. Heterotaxis or displacement of organs includes splanchnic and general inversion. There are two divisions of hermaphrodites: true hermaphrodites and pseudo-hermaphrodites, the latter with bisexual external genitals but unisexual reproductive glands.

Monsters proper fall into two classes, single and composite. The former are divided into autositic and omphalositic. I. The autositic include (*a*) ectromelus, with limbs imperfectly developed or differing in size, and symelus, with joined limbs; (*b*) celosoma, in which there is eventration; (*c*) exencephalus, with hydrencephalocele or encephalocele, pseudencephalus, with defective development of brain and cranium, and anencephalus, with brain and cranium absent; (*d*) cyclocephalus, with imperfectly differentiated eyes, and otocephalus, in which the ears are joined under the upper jaw-bones. II. The omphalositic include cases of an imperfectly developed fœtus in twin pregnancy, in the extremest examples reduced to a shapeless mass of flesh. Composite monsters are double autositic or double parasitic.

*Compound monsters* include all cases in which more than belongs to a single being is developed; in its lower degrees the mere addition of an extra finger or toe, and in the highest complete duplication by the union of two well-formed fœtuses. That the genesis of double monsters is not a mere freak of nature, but the result of obedience to laws as invariable as those which govern normal development, will be seen by the following general considerations: (1) *The Law of Unity of Sex.*—Out of over 500 cases of human double monsters, as also of innumerable cases in the lower order of animals, in no instance has this law been violated. The account of a double monster of both sexes, given by a clergyman of Giessen, is very properly rejected by Virchow and all teratologists. The individuals of a double fœtus will always be found to have the same sex, either both males or both females. It is also a fact that in the vast majority of cases they have been found to be females, whether human or animal. (2) *The Law of Homologous Union.*—The union of the two fœtuses of a compound monster obeys the law of homologous union as uniformly as in the union of the two lateral halves of a single fœtus in normal embryogenesis. In other words, there is an equal balancing of parts and organs in each individual. The same muscle of one fœtus unites with the same muscle of the other; bone to bone; the same nerve or blood-vessel to the corresponding parts; and so on until all the parts and organs which are situated adjacent to each other are fused, heart to heart, stomach to stomach, etc. In cases of apparent exception to this law—such as a fœtus by inclusion or of a parasitic monster—it has been found that the union was homologous in the early embryonic periods, but that the growth of one fœtus being arrested or retarded, this blighted one was overlapped and included by its fellow. (3) *The Law of Right and Left Symmetry.*—On examination of the structure and relative position of the internal organs of a double fœtus there will be found a transposition of the viscera of each individual in order to dispose them symmetrically in relation to the common median axis of the compound body. If the double fœtus has two hearts, they will be right and left in position, and their apices will converge toward the line of fusion of the two bodies. This will be found true also of the livers and spleens and of the stomachs. The universality of this law is less positively proven than the two previously stated.

Several theories have been suggested to explain the production of double monsters: (1) The theory of maternal impressions has already been shown to be untenable. (2) The theory that they result from the fecundation of a double egg—i. e. of two distinct yelks inclosed in one capsule—has been proved by repeated experiments to be incorrect. (Prof. Panum, of Kiel, with eighty double eggs of the domestic fowl.) The product of hatching such eggs is twins, separate and of the same or of opposite sexes. (3) A more plausible hypothesis claimed that all double monsters were originally twin conceptions, but that the membranes separating them being absent, imperfect, or absorbed, the two bodies were brought into close contact with each other, and coalesced by reason either of some inflammatory action or of the strong formative power existing at that period of uterine life. This theory fails to explain the law of unity of sex, homologous union, and right and left symmetry. Twins often differ in sex, and one-third of twins are contained in one amniotic sac, the very condition claimed to be most favorable to fusion, and yet in these cases the twins are usually of opposite sexes. Should union occur under these conditions, they would be joined in the most accidental and heterogeneous manner. (4) It has been demonstrated by early embryos in the eggs of birds, and by observations under the microscope of the transparent eggs of fish, that a double monster is the product of a single ovum, whose vitelline membrane develops two primitive traces—i. e. two neural axes—instead of one. In some cases the primitive traces were not entirely separated nor precisely equal in size, while in other cases the neural axis was only partially bifid. The various degrees and the extent to which the primitive trace is cleft, from the slightest amount of duplicity to complete duplication, account satisfactorily for all the forms of duplex development. Thus it is seen that the compound monster proceeds from a single germ, single sexuality, and being governed by identical germinal laws, homologous and symmetrical development and fusion must result. The degree of duplicity and the extent of fusion depend upon the proximity or remoteness of the primitive traces and the relative inclination of their axes. (5) The theory which at present has the strongest support from teratologists is that so strongly supported by Ahlfeld, namely, the fission or splitting of the germinal area. This has been actually observed in the fowl. The cephalic extremity has been observed to divide into two parts, resulting in a two-headed chick, with the duplicity confined entirely to the cephalic extremity. Two authentic cases of triple-headed monsters are recorded, one human and one of a lamb. Their embryogenesis is readily explained by a double splitting of the primitive trace, whereby the cephalic extremity of the neural axis becomes trifid. Limited space forbids going into a detailed account of the numerous forms of double monsters which have occurred, even in the human subject. For particulars, see the essays of George Jackson Fisher on *Diploteratology* in the *Transactions* of the Medical Society of the State of New York for 1865, 1866, 1867, and 1868. The student of teratology will seek the works of Isidore Geoffroy Saint-Hilaire, Otto, Vrolik, Förster, Braune, Ahlfeld, Hirst and Piersol, and many others.

Revised by BARTON COOKE HIRST.

**Ter′bium**: the name given by Mosander to a substance associated with erbium and yttrium in the mineral gadolinite, and supposed by him to be a new element; but the experiments of other careful analysts have failed to discover such a metal, and its existence is consequently a matter of doubt. See ERBIUM and YTTRIUM.

**Terborch**, or **Terburg**, ter′boorkh, GERARD: painter; b. at Zwolle, Holland, about 1617. He first learned drawing of his father, and in 1632 was studying in Amsterdam, but it is not known under what master. Soon after he went to Haarlem and became a pupil of the elder Pieter Molyn. He also was much influenced in his work by Frans and Dirk Hals. In 1635 he matriculated in the Guild of St. Luke at Haarlem and visited England the same year, also Germany, Italy, and France. He remained for some time in Amsterdam, where he studied and learned much from the works of Rembrandt. In 1646 he was in Münster painting the congress then sitting there. His picture the *Ratification of the Treaty of Peace of Münster* is in the National Gallery of London, with the celebrated *Guitar Lesson.* He followed the Spanish plenipotentiary to this congress to Spain, where he became known to Velasquez and studied his work. In 1650 he was again in his native country, and in 1654 he married and settled at Deventer. He became burgomaster of this place, and lived there to the end of his life, which he spent in following his art. D. at Deventer, Dec. 8, 1681. His pictures are in most of the great European galleries. For further information, see *Descriptive Catalogue of the Pictures of the National Gallery* (1889); *The First Painters of Holland*, by Lord R. Gower; C. Lemcke in Dohme, *Kunst und Künstler*, vol. ii., part 1 (1875). W. J. STILLMAN.

**Terceira**, ter-sā′rā̆a: one of the Azores islands (see AZORES); area, 163 sq. miles. The coasts are steep, wild, and, with the exception of a few strongly fortified places which afford good harbors, inaccessible. The interior is much broken up by volcanic agencies, but the soil, mostly consisting of decomposed lava and tufa, is exceedingly fertile, and wine, oranges, and timber are largely exported. Pop. 45,000. Capital, Angra.

**Ter′ebinth, Tiel-tree**, or **Turpentine-tree** [*terebinth* is viâ O. Fr. from Lat. *terebin′thus* = Gr. τερέβινθος, terebinth, turpentine. See TURPENTINE]: the *Pistacia terebinthus*, of the *Anacardiaceæ*. It is some 30 or 40 feet high, and grows in the Levant. It produces the valuable Chian turpentine. The terebinth-tree is noted for its extreme longevity. It was a terebinth in whose branches Absalom was caught (2 Sam. xviii.).

**Terebratu′lidæ** [Mod. Lat.; named from *Terebra′tula*, the typical genus, dimin. of Lat. *terebra′tus*, perf. partic. of *terebra′re*, bore]: a family of BRACHIOPODA (*q. v.*) or lamp-shells. A few species still live in the seas, but the fossil allies are numerous. The shell is pear-shaped in outline, and is anchored by means of a fleshy peduncle which passes through the beak of one of the valves.

**Teredin′idæ** [Mod. Lat., named from *Tere′do*, the typical genus, from Lat. *tere′do, tere′dinis* = Gr. τερηδών, a worm that gnaws wood or clothes, etc., deriv. of τείρειν: Lat. *terere*, rub, grind]: a family of conchiferous or lamellibranchiate molluscs, notable as destructive of timber used as piles, etc., in the ocean. The so-called ship-worms are its chief representatives. The several forms are in nowise related to worms, and the only feature common between the two is the elongation of the body and the tube which they form; they have the true molluscan organization, and the elongation is simply due to the excessive protraction backward of the siphonal tubes and the reduction of the body. The portion of the animal which is covered with shell is comparatively very small and almost globular, and the siphonal

The ship-worm.

portion is in proportion extremely long and worm-like; the siphons are united for the greater part of their length, but free toward their ends, and there armed with two peculiar elongated shelly appendages called styles or siphonal palettes; the mantle is well developed, its lobes united except at the pedal opening, reflected behind over the valves of the shell, and developed above into lobe-like expansions, which are also reflected over the hinges of the shell, and serve to keep the valves in place; the gills are large, and extend far into the siphonal portion; the mouth is provided with palpi, the foot is subcylindrical and sucker-like, with a foliaceous margin, moderately protractile, and well supplied with nerves; the shell is composed of two equal valves of peculiar form; these valves are not united at the hinge, but are only kept in place by the reflections of the mantle above referred to, and are thus susceptible of much independent interaction. The animal forms a long burrow lined with shelly material, in which it conceals itself. Such are the principal characters which distinguish this type. The family has quite a number of representatives, most of which bore in wood, but a few live in the bottom of the water, and the tubes they form in that case serve to protect them from the inflow of mud into their burrows. The members of the several subordinate groups and species are essentially similar, but differ much in details as to form and sculpture of their shells, and still more in modifications of the siphonal palettes. Not far from forty species have been recognized by recent naturalists, most of which belong to *Teredo*. Representatives of the family are found in the seas of almost every country. Great ravages have been committed by species of the genus *Teredo*—especially *Teredo navalis*—and government commissions of inquiry have been instituted to investigate the natural history of the animals with a view to staying their destructive work. The literature concerning the subject is therefore very voluminous. The most noteworthy reports are those made during the years 1860–65 by a commission authorized by the Government of the Netherlands. An account of the American forms is given by A. E. Verrill in *Report of the United States Fish Commission* (1871–72), p. 384. The burrow seems to be made by the foot, not by the shell. It is very small at the surface of the wood, but becomes a quarter of an inch in diameter and as much as 10 inches long. It may penetrate the wood in any direction, but usually runs with the grain, avoiding knots and the burrows of other teredos. The wood is often completely honeycombed with the burrows, and the largest piles may be destroyed in the course of two or three years. The wood thus excavated is not eaten, but the animal feeds on infusoria, etc., obtained from the water. The young are produced in May, and later. They are active free-swimming at first, but later attach themselves to solid objects. The young teredo, when it first settles on the pile, is not larger than the head of a pin. The only remedies are those which prevent the teredo from gaining entrance to the wood, such as sheathing for vessels, painting with coal-tar, etc. Impregnating the timber with creosote and similar means is less effective. Revised by E. A. Birge.

**Teredo**: See Teredinidæ.

**Terence** (*Publius Terentius Afer*): writer of comedy; b. at Carthage, although the date usually given, 185 B. C., is doubtful. He became the slave of a senator, Terentius Lucanus, but on account of talent early evinced he received a careful education, was manumitted, and lived, after the performance of his first comedy, *Andria*, in 166 B. C., in intimate friendship with some of the best men in Rome, such as the younger Scipio and Lælius. He died 159 B. C., on his return from Greece, where he had spent about a year. A daughter survived him. The reports of his death differ very much, some asserting that he was drowned, others that he died in Arcadia. His six comedies are extant—namely, *Andria*, *Hecyra*, *Heauton-timorumenos*, *Eunuchus*, *Phormio*, and *Adelphœ*. They belong to the so-called *fabula palliata*—that is, they represent Greek characters, Greek customs, and Greek life; and they all are borrowed from Greek originals by Menander, Apollodorus, or Diphilus, two Greek comedies being often compounded into one by the Latin author. By the Roman public at large they were not received with any great applause; when the *Hecyra* was first played, people left the theater to see the acrobats; but their purity of language, elegance of diction, and refinement of humor and sentiment—merits which the rivals of Terence ascribed to the co-operation of Scipio and Lælius—made them great favorites with cultivated Romans and subjects of much imitation after the revival of letters in the Middle Ages. Among late editions are those by Parry (London, 1857), Wagner (London, 1869), both with notes, Umpfenbach, critical (Berlin, 1870), and Dziatzko (Leipzig, 1884). There are translations into English by Patrick (1745), Colman (1765; reprinted 1841), and Riley (1853). Annotated editions of separate plays: *Andria* and *Adelphœ*, by Spengel (Berlin, 1888 and 1879); *Phormio* and *Adelphœ*, by Dziatzko (1885 and 1881); *Andria* and *Heauton-timorumenos*, West (New York, 1888); *Hecyra*, Thomas (Paris, 1887). Revised by M. Warren.

**Terentia′nus Maurus**: a Latin writer of the end of the second century A. D., from Mauritania. His treatise in 2,981 verses, *De litteris, syllabis, metris*, addressed to his son Bassinus and stepson Novatus, is still extant. The exposition of meters is especially valuable. The work was edited by Lachmann (Berlin, 1836), and by Keil, *Grammatici Lat.*, vol. vi., pp. 313–413. M. W.

**Teren′tius Scaurus**, Quintus: a celebrated Latin grammarian who flourished under Hadrian, wrote commentaries to Horace, the *Æneid* of Vergil, and Plautus, and grammatical treatises. Excerpts from his *De Orthographia* are printed in Keil's *Grammatici Lat.*, vol. vii. M. W.

**Tereus**: See Philomele.

**Tergouw**: See Gouda.

**Terhune′**, Mary Virginia (*Hawes*): author; known by her pseudonym, *Marion Harland*; b. in Amelia co., Va., about 1835; in 1856 married Rev. Edward P. Terhune, a clergyman in Virginia, who in 1859 became pastor of a Dutch Reformed church in Newark, N. J., and afterward of Dutch Reformed and Congregational churches in Brooklyn, N. Y. In 1888 she became editor of *The Home-maker* magazine. She has published a number of novels, including *The Hidden Path* (1855); *Marion* (1860); *Judith* (1883); *His Great Self* (1892); and several books on domestic housewifery, such as *Common Sense in the Household* (1871). H. A. Beers.

**Terlizzi**, tār-lēet′sē: town; in the province of Bari delle Puglie, Italy; in a fertile plain about 7 miles from the Adriatic, and very near the town of Barletta (see map of Italy, ref. 6–G). Grain, wine, oil, and fruits are exported to some extent. Pop. 20,440.

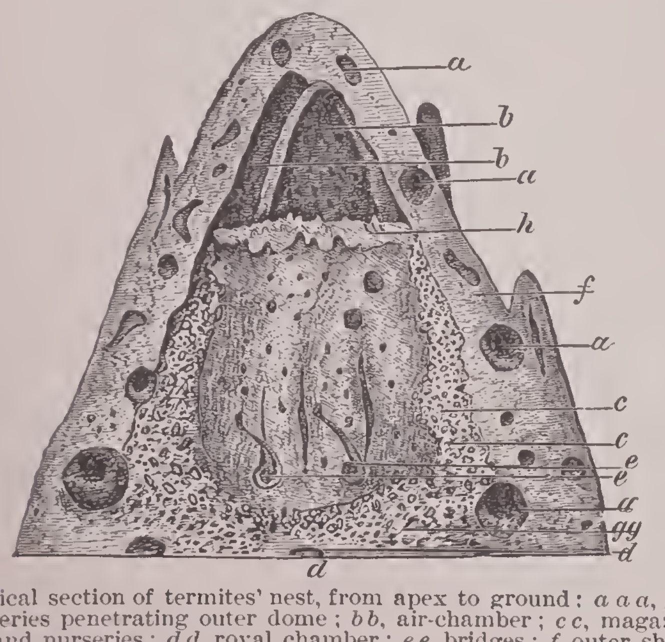
**Termini Imerese**, tār′mē-nē-ee-mā-rā′sā (anc. *Thermæ Himerenses*): town; in the province of Palermo, Sicily; 23 miles E. S. E. of Palermo. It is on a hill on the left bank and near the mouth of the river Termini, which, as well as the town, derives its name from the warm springs in and near this place. The exports are chiefly grain, fruits, sulphur, macaroni, fish, etc. It was under the walls of the ancient *Himera* that Gelon obtained his great victory over the Carthaginians (480 B. C.), and when, seventy years after, the Punic armies destroyed the city, the refugees made the new settlement of *Thermæ Himerenses*, which was a flourishing town in the time of Augustus. Fragments of the ancient ruins are still visible. Pop. 22,730.

**Terminos** (tār′mē-nōs), **Laguna de**: a lagoon on the coast of Campeche, Mexico; separated from the Bay of Campeche (Gulf of Mexico) on the N. by reefs and low islands; these are partly rocky, and between them there are three passages. The lagoon has an area of about 2,600 sq. miles, and over half of it admits vessels of deep draught. It receives a number of small rivers, and several bayous and navigable channels open into it; through some of these, on the W., there is communication with the river Usumacinta. The shores are low and swampy, but abound in cabinet woods and dye-woods, for which the lagoon has long been frequented. At the beginning of the eighteenth century it was a resort of buccaneers. Contemplated improvements would make it one of the best harbors on the Mexican coast. Herbert H. Smith.

**Termites**, tėr′mīts [usually derived from Late Lat. *ter′mes, ter′mitis*, wood-worm; another view is that the name of the principal genus, *Termes*, was given because the book-louse (*Atropos*) was formerly included in it, and this animal was confused with the death-watch (*Anobium*), which insect was supposed to forebode early death; Gr. τέρμα, end]: insects (also called white ants, from the fact that like the ants they are social) which were formerly assigned to the *Neuroptera*, but are now considered as distinct under the name *Isoptera*. The termites form large colonies, and in each colony the individuals are differentiated into different classes or castes, each being fitted by structure for its duties in the colony. Only the king and queen are winged, and these have two pairs of long, narrow, leathery wings, which are similar in structure and are carried flat upon the back when not in use. The mouth-parts are efficient biting organs, and there is an incomplete metamorphosis. The wingless forms are grouped into small-headed workers and soldiers with enormous heads. The king and queen are the sexual members of the colony. At certain seasons of the year they swarm from the nest, take a marriage flight, and then lose the wings, and under favorable circumstances found a new colony. Before egg-laying the abdomen of the female becomes enormously distended with eggs. (For illustrations of termites, see ENTOMOLOGY.) The workers wait upon the royal pair, feed the young, and, besides, do all the excavating for the colony, store away the food, etc. The soldiers are far less numerous, and, as the name indicates, they are the fighters of the colony. Besides their warlike duties, in some species they act as overseers of the workers.

The great home of the termites is in the tropics, but they also extend into colder climates, one species being found in New England. These northern forms do little damage, although one year they seriously threatened libraries in Cambridge. In the tropics, however, they are a formidable pest. The reader is referred to the oft-quoted account of Smeathman, which though published in 1781 still remains the most accurate and detailed description of the habits of these animals.

The termites are dark-loving forms, and the workers and soldiers are blind. They are rarely seen, since they are miners and spend their whole lives in the tunnels which they excavate. When they wish to attack a piece of timber they build a covered approach of earth and saliva, and then when the wood is reached their tunnels run through it in



Vertical section of termites' nest, from apex to ground: *a a a*, galleries penetrating outer dome; *b b*, air-chamber; *c c*, magazine and nurseries; *d d*, royal chamber; *e e*, bridges; *f*, outer shell; *g g*, congeries of royal ante-chambers.

every direction, until at last only the thinnest shell remains, ready to crumble at the slightest touch. In this way they build their mortar approaches up the trunks of the largest trees in order to reach dead branches. They do great good in the tropical forests by removing all dead timber, but when they attack human habitations the results are serious, and the more so since the ravages give no external sign. They will completely riddle every bit of timber in a house, and have even been known to enter a table through its legs and leave nothing but the outside, ready to collapse upon the slightest strain.

The species found in the U. S. lives in decaying wood, but some of the tropical species build conical nests surmounted by numerous pinnacles, and in some cases these nests are 10 to 15 feet in height and 40 to 50 in circumference. They are made of clay solidly packed together and cemented by the saliva of the animal, while in the interior are passages and storerooms for food, nurseries for the young, quarters for the workers and soldiers, and always near the center of the base is the royal chamber where the queen is kept.

See Smeathman, in *Philosophical Transactions*, vol. xvii. (1781); Hagen, monograph in *Linnea Entomologica*, vols. x.–xii.; Fritz Müller, in *American Naturalist*, vol. xxiv., p. 1118 (1890). J. S. KINGSLEY.

**Tern**: any small gull of the sub-family *Sterninæ*, popularly known as sea-swallows. They are characterized by their slender build, remarkably long, pointed wings, rather long, sharp beak, small feet, and, usually, deeply forked tail. They range in size from 2 feet in length down to 9 inches. The general style of plumage is white, with a pearly mantle, and top of head black, but there are exceptions to this, the sooty tern and noddy being almost black. Terns are found over the greater part of the world, and, while typical sea-birds, often occur on bodies of fresh water, especially during the breeding season. They nest on the ground, lay from one to four eggs, feed on fishes and small crustaceans, or even, as in some of the smaller species, on insects. There are some sixty species, about one-fourth of which occur in the U. S., one of the most familiar being the *Sterna hirundo*, a species common to Europe and North America. This bird is 15 inches long, 30 in spread of wing, and the tail is well forked. For the sooty tern see EGG-BIRD. F. A. LUCAS.

**Ternate**: See MOLUCCAS.

**Ternaux-Compans**, tãr′nō′kōṅ′paaṅ′, HENRI: bibliographer; b. in Paris, France, in 1807. He was secretary of the French embassies at Madrid and Lisbon, and *chargé d'affaires* at Rio de Janeiro; resigned and devoted himself to the collection and study of early documents relating to America, traveling extensively in Spain and America for this purpose. For a short time he was a member of the French Assembly. In 1836 he published *Bibliothèque Américaine, ou catalogue des ouvrages relatifs à l'Amérique depuis sa découverte en 1493 jusqu'à l'an 1700.* French translations of a selected series of documents and rare books from his magnificent library were published as *Voyages, relations et mémoires pour servir à l'histoire de la découverte de l'Amérique* (two series, 20 vols., 1836–40), generally known as the Ternaux-Compans collection. This set, which is of great value, is enriched by notes. Subsequently he issued smaller collections or single works of the same character, an historical and bibliographical essay on Guiana, etc. D. in Paris, Dec., 1864. HERBERT H. SMITH.

**Terni**, tãr′nee (anc. *Interamna Umbrica*): town; in the province of Perugia, Italy; near the banks of the Nera, about 10 miles S. S. W. of Spoleto and 55 N. N. E. of Rome (see map of Italy, ref. 5–E). It is chiefly interesting from the antiquities, and remains of a very ancient wall with square towers are to be seen. One of the five gates is called *Tre Monumenti*, from the monuments of the historian Tacitus and of the Emperors Tacitus and Florian, all of whom were born here. The streets open upon a very large square near the center of the town. The cathedral, dating from the seventeenth century, contains many early monuments and inscriptions, but the basilica of San Valentino is still more ancient. The Church of San Salvadore is built on the ruins of a temple of the sun—that of Sant' Alò over a temple of Cybele. The episcopal palace stands, in part, on the site of an amphitheater of the time of Tiberius, which, judging from the foundations, was capable of holding 10,000 spectators. Pop. about 9,420.

Revised by M. W. HARRINGTON.

**Ternstrœmia′ceæ**: See TEA FAMILY.

**Teror**, tā-rōr′: a beautiful town in attractive surroundings on Grand Canary, one of the Canary islands, which has some warm mineral springs, resorted to on account of their curative effects. Pop. 5,800 (in the commune). M. W. H.

**Terpan′der** (Gr. Τέρπανδρος): musician and lyric poet; b. at Antissa, island of Lesbos, in the first half of the seventh century B. C.; settled in Sparta, where, in 676 B. C., he gained the prize in the first musical contest instituted at the feast of Apollo Carneius. He is generally considered the founder of Greek music, as he increased the number of the strings of the lyre from four to seven; was the first to set poetry to music, both his own verses and those of Homer;

established the first regular school of music, and made music a part of education. See Flach, *Geschichte der griechischen Lyrik* (vol. i.). Revised by B. L. GILDERSLEEVE.

**Terpsichore**, térp-sik'ŏ-rē [= Lat. = Gr. Τερψιχόρη, liter., fem. of τερψίχορος, delighting in dancing; τέρπειν, τέρψαι, enjoy + χορός, dance, dancing]: one of the nine Muses. She presided over song and choral dancing, and was represented with lyre and plectrum in her hands, and a wreath of flowers on her head. See MUSES.

**Terrace**: a limited plain, natural or artificial, from which the surface descends on one side and ascends on the other. Artificial terraces are often constructed for the purpose of utilizing the sides of hills, and the steep slopes separating them are protected from the attack of rain by masonry or turf. They have also an extensive use in connection with agriculture, especially in Southern Europe. Gentle slopes, which in the natural condition are covered and protected by vegetation, are sometimes worn into gullies and steep ridges when cultivation exposes them to the action of rain. To prevent this, the land is graded in terraces whose flat surfaces give the rain-water rills no power to erode, and the steep bluffs between the terraces are guarded by turf or a facing of stone. Natural terraces are of various kinds, the most abundant being *terraces of differential degradation*. Where a hill or mountain or the side of a valley is composed of level strata which differ among themselves in texture, these differences usually find expression in the topography. Frost and other agencies that break up rocks act more rapidly on weak rocks, such as shales, than on strong rocks, and reduce them to earth which is washed away by rain. Often a weak rock is in this way eaten back until the strong rock above it is deprived of support and falls away in blocks. By such processes the hillside is carved into a series of terraces separated by bluffs or cliffs. *Stream terraces* are next in abundance. When the volume and grade of a stream are so adjusted to the load of detritus it carries forward that it neither wears down nor builds up its bottom, the stream wears its banks, making a flood-plain, and this gradually becomes broader. If the stream is overloaded, part of the load is deposited and the flood-plain grows higher as well as broader. If then the land is lifted, or the flow of water is increased, or the load is diminished, the stream cuts its channel deeper and ceases to spread over the flood-plain, which then constitutes a terrace on each side of the stream. A repetition of this process produces a series of terraces rising like steps on the valley side, and such series are to be seen in many valleys of the U. S. *Shore terraces* are of several types. Those most frequently seen are carved out by the waves where the sea attacks the land. They are overlooked by cliffs and are usually submerged at high tide. On parts of a coast where drifting sand or shingle accumulates, beach being added to beach, a rather uneven terrace is produced, and this is bounded seaward by a submerged declivity. The deltas accumulated at river mouths are fan-shaped terraces with steep outer slopes. While these features are in process of formation they are partly concealed by the water, but if the region is afterward uplifted their character as terraces becomes conspicuous. *A moraine terrace* is formed where a stream of water flows between a glacier and the side of its valley. The earth and stones of the lateral moraine, together with other material brought by the stream, are built by the running water into a plain; and afterward, when the glacier has disappeared, this plain constitutes a terrace on the valley side. The glaciated districts of the U. S. afford numerous examples. *Fault terraces* are comparatively rare. They are formed where a system of faults traverse a plain, letting it down in steps, and their production is accompanied by earthquakes. American examples occur in the Great Basin, especially at the foot of the Wasatch range. Rain and frost, the great agents of land sculpture, attack and gradually destroy the terraces marking the former activity of streams, glaciers, waves, and the forces of the inner earth, but they perpetually restore the terraces of differential degradation, and it is for this reason that the latter are most abundant. See GEOLOGY, and consult *Lake Bonneville*, Monograph I., U. S. Geological Survey.

G. K. GILBERT.

**Terrace Epoch**: See CHAMPLAIN EPOCH.

**Terra-cotta** [= Ital. < Lat. *terra cocta*, liter., baked earth; *terra*, earth + *cocta*, femin. sing. of perf. partic. of *coquere*, cook, bake]: baked clay, that is to say, pottery. (See *Earthenware, Unglazed*, under POTTERY AND PORCELAIN.) In the language of decorative art the term is used for an object made of baked clay, as a terra-cotta, a collection of terra-cottas; and in this sense it means always an object made of coarse brown or yellow earthenware, and usually unglazed. Greek terra-cottas known to us are TANAGRA FIGURINES (*q. v.*), or figures from Smyrna or Sicily or Tarentum, or antefixes or cymas or anthemions from temples, as from Olympia or Akragas. Greek painted vases are sometimes called terra-cotta vases, but less often, because these are often of soft material. Etruscan terra-cottas are often burial-urns adorned with bas-reliefs of battle-scenes, and having on their covers reclining figures of the dead. Some of these are large, in cases where the body was not burned, and the figures are of life size. Etruscan temples were adorned with pediment figures of terra-cotta, painted in bright colors, and it is established that early Roman architecture depended much upon terra-cotta ornaments. (See ROMAN ARCHÆOLOGY.) None of these is known to exist, but suggestions of what they were like are to be found in the collection of terra-cottas from Pompeii, in the Naples Museum. Terra-cotta figures from China, and more especially from Japan, have been brought to Europe and America, of all degrees of size and importance, from small round boxes made in the semblance of draped figures of men to statuettes and groups of half life size. Many of these are of extraordinary vigor and decorative value, and some even reach a high degree of merit as works of sculpture. Among such figures in baked clay the name *terra-cotta* would not commonly be given to those of light yellow ware, like Satsuma or Kioto figures, nor to those of porcelain; but rather to those of brown clay, sometimes wholly unglazed, sometimes having a thin and fine dark-brown glaze, sometimes wholly or partly glazed with colored and even porcelanous glazes. Such figures often have the flesh left in the brown ware, and the dress and hair put in the glaze, and are then very effective. The Italian Renaissance was very rich in terra-cotta statuary, busts, and bas-reliefs. The museums of Florence, Paris, Berlin, and London have many splendid specimens of this ware. Busts by Donatello, Verrocchio, and other men of their times are among the most interesting and valuable pieces of European sculpture of modern times. The noble enameled terra-cottas of the Renaissance are partly described under ROBBIA, Luca della (*q. v.*); but, besides the work of the Della Robbia family, colored enamels applied to terra-cottas of life size were used by Begarelli, by Mazzoni, and others. Since the sixteenth century terra-cotta has been used for fine and decorative art fitfully and at intervals, as one artist or another took a fancy to it. Thus Clodion (1745–1814) made many small groups of bacchantes and nymphs of great merit in a certain graceful and fantastic way, in reddish-brown terra-cotta, with no glaze whatever. The contemporary French school of sculpture often produces large works in unglazed terra-cotta, especially portrait-busts. In decorative building Italian, Gothic, and Renaissance architecture made a great use of terra-cotta, especially in Lombardy, where good stone was not very accessible. In modern times columns, archivolts, cornices, etc., are made of it, and whole fronts are built of brick and terra-cotta in combination. The taste for it is growing. RUSSELL STURGIS.

**Terra de Fuego**: a corruption of Portuguese *Terra de Fogo*. The Spanish name is TIERRA DEL FUEGO (*q. v.*).

**Terra di Lavoro**: See CASERTA.

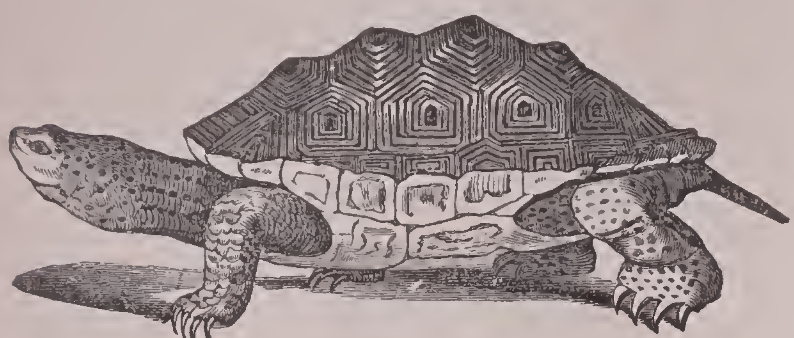
**Terra di Otranto**: See LECCE.

**Terra Firma** [Lat., firm or solid earth]: a term sometimes used to designate the Spanish main or the northwestern portion of South America; also that part of the Italian mainland which formerly acknowledged Venice as mistress. The term designates continental regions as opposed to islands, although also used colloquially to denote land as opposed to water.

**Terra Japon'ica** [Lat., Japanese earth]: an old pharmaceutical designation of CATECHU (*q. v.*), which was formerly regarded as an earthy mineral.

**Terrano'va**: town; in the province of Caltanisetta, Sicily; on the south coast of the island, near the mouth of the Terranova: 60 miles W. of Syracuse (see map of Italy, ref. 10–F). This town occupies the site of an ancient city (probably *Gela*), as is proved by the remains of a Doric temple and by the many old sepulchers found in the neighborhood, whose contents have enriched the museum of Palermo. Pop. 16,440. Revised by M. W. HARRINGTON.

**Ter'rapin** [probably Amer. Ind.]: any one of various small fresh-water turtles of the family *Emydidæ*. The name has no exact scientific meaning, but in the U. S. is usually applied to the salt-water terrapin (*Malaclemmys palustris*), more familiarly known as the diamond-back. This species, held in high estimation for the delicacy of its flesh, is an inhabitant of the salt-water marshes from New York to Texas. It has a large head, covered with a soft naked skin



The salt-water terrapin.

(whence the name *Malaclemmys*), and the alveolar surface of the upper jaw is broad and divided in front by only a slight groove; the neck is short and thick; the shell oval, moderately convex, slightly keeled, and the scales marked with concentric, generally impressed, lines; the skin is gray, spotted, and otherwise marked with black. It rarely much exceeds 8 inches in length, and is generally less than that. It is the most esteemed for the table of any species of the family, and is caught in large numbers for the markets of Baltimore, Philadelphia, New York, and other cities. It commands a price of from $15 to $100 a dozen, according to size, season, and demand. It is active in the water, swimming well, and on land runs with considerable speed. See TORTOISE and TURTLE-FISHERY. Revised by F. A. LUCAS.

**Terrebonne**, tãr'bon': town of Terrebonne County, Quebec; on the north shore of the navigable river Jésus; 16 miles by land N. of Montreal (see map of Quebec, ref. 5–B). It is the seat of Masson College (Roman Catholic), a large and prosperous institution. It has a fine water-power, utilized in a number of manufactories. Its stone-quarries are valuable. Pop. 1,460.

**Terre Haute**, tãr-hōt': city (founded in 1816): capital of Vigo co., Ind.; on the Wabash river, and the Vandalia Line, the Cleve., Cinn., Chi. and St. L., the Chi. and E. Ill., and the Evans. and T. H. railways; 73 miles W. of Indianapolis (see map of Indiana, ref. 7–B). It is on a rolling prairie between the Wabash and a low range of wooded bluffs; has broad streets, paved with macadam, brick, or asphaltum, with brick, limestone, and artificial stone walks; and contains three parks, Union Station, Collett, with 30 acres of grove and lawn; and a driving-park and fair-grounds of 90 acres, with a noted racing-track. The city is surrounded by coal-fields, and has 5 productive oil-wells, 2 artesian wells, supplying sulphur water, 21 miles of electric railway in the city and 11 miles of interurban electric lines, and a garbage crematory. The notable buildings include the county court-house (cost $475,000), U. S. Government building ($150,000), union station ($100,000), State normal school ($250,000), opera-house ($65,000), and St. Benedict's church ($150,000)—the finest in the State. There are 47 churches, viz.: Methodist Episcopal, 13; Baptist, 9; Roman Catholic, 4; Presbyterian, 3; Protestant Episcopal, 3; Congregational, 2; Christian, 3; German Evangelical, 2; Lutheran, 2; United Brethren, 2; and Church of Christ, Jewish, German Reformed, and Salvation Army, 1 each. The public-school system supports a high school and 20 district schools, having 189 teachers and 6,678 pupils, and costing annually over $145,500. Connected with the system is a free public library with over 18,000 volumes. There are also 5 Roman Catholic parochial schools with 23 teachers and nearly 573 pupils, and 1 German Lutheran school with 1 teacher and 48 pupils. The most noted educational institution is the Rose Polytechnic Institute, an advanced school of engineering and chemistry, founded by the late Chauncey Rose, and opened in 1883. It is admirably equipped for its work, and has a productive endowment of $600,000 and an annual income of $47,000. The State normal school has an annual allowance by the State of $65,000, a library of 35,000 volumes, and an average attendance of 800. St. Mary's in the Woods is a Roman Catholic seminary for girls. The charitable institutions include the Rose Ladies' Aid Society for the relief of the poor and the care of a home for old ladies (endowment $90,000), St. Anthony's Hospital, conducted by Sisters of St. Francis (cost $160,000, chiefly gift of H. Hulman, Sr.), Union Hospital (Protestant, endowment $20,000), Rose Dispensary (endowment $90,000), Rose Orphan Home (cost $130,000, endowment $200,000), and St. Ann's Orphan Asylum.

In 1900–01 the city had receipts, $425,067.91; disbursements, $333,014.43; net debt, $365,000; and total assessed valuation, $20,414,090. There are 3 national banks with combined capital and surplus of $1,057,000, savings-bank with deposits of $841,397, a loan and trust company with capital and surplus of $235,000, and a private bank. The city has large manufacturing establishments, including 3 glass-factories, 1 railroad shop, 1 railway-car works, 1 match-factory, 3 rolling-mills, 2 breweries, 4 box-factories, 4 flour and hominy mills, 2 coffee and spice mills, 2 grain-elevators, 1 paving-brick factory, 7 foundries and structural-iron shops, 1 electrical fixture company, 2 carriage-manufactories, 3 boiler-works, 1 candy-factory, 1 casket company, 2 rectifiers and compounding houses, 2 cooperage-factories, 1 gunstock-factory, 1 heading-factory, 5 overall and workingmen's clothing-factories, 1 cracker-factory, 4 distilleries with combined capacities 25,283 bushels of corn daily. The Majestic, largest in the world, capacity 8,533 bushels; 1 shovel and tool works, many wood-working establishments. There are 4 daily, 4 weekly, and 5 monthly newspapers. Pop. (1890) 30,217; (1900) 36,673.

**Terrell**: city; Kaufman co., Tex.; on the Tex. and Pac. and the Tex. Midland railways; 31 miles E. of Dallas (see map of Texas, ref. 2–I). It contains a large high school, a school for colored children, railway-shops, cottonseed-oil mill, creamery, compress, flour-mill, iron-works, a national bank, capital $75,000, a private bank, and two weekly newspapers. Pop. (1890) 2,988; (1900) 6,330.

**Terrestrial Magnetism**: See MAGNETISM, TERRESTRIAL.

**Terrier** [from O. Fr. *terrier* in *chien terrier*, terrier dog; *chien*, dog + *terrier* < Late Lat. *terra'rius*, of the ground, deriv. of *ter'ra* > O. Fr. *terre*, earth, ground; cf. O. Fr. *terrier*, little mound of earth, burrow of a fox or rabbit]: any one of a large number of breeds of small dogs distinguished for vivacity and courage. Among the best known are the English or black-and-tan terrier; the bull-terrier, a miniature bulldog in courage, and often in shape; the fox-terrier, formerly used to unearth foxes; the Scotch or rough-haired terriers, including the Skye, the Dandie Dinmont, and other strains; and the toy-terriers, crosses with some of the small lapdogs. Most of the various breeds of terrier are especially trained to the killing of rats and other vermin. See DOGS. Revised by F. A. LUCAS.

Skye terrier.

**Territory**: a term technically applied in the U. S. and in some Spanish-American republics to certain portions of the public lands which are under the direct control of the national legislature. In the U. S. Territories are organized by congressional enactment. The governor and the administrative and judicial officers are appointed by the President, but a territorial legislature is intrusted with limited powers, subject to the approval of Congress. When a Territory attains a population sufficient to entitle it to one Representative in Congress, it has usually been given permission by a special act to form a State constitution, and then admitted into the Union with rights equal to those of the other States. The rights of Congress over the Territories and respecting their admission as States are based on Art. IV., Sec. 3, of the Constitution. With the exception of Texas, California, West Virginia, and the original thirteen colonies, all the States of the Union have passed through the territorial form of government. At present (1901) there are four organized Territories: Arizona, New Mexico, Oklahoma, and Hawaii. Alaska and Indian Territory also rank in the U. S. as Territories, although they have no organized territorial form of government.

**Terrorite**: See EXPLOSIVES.

**Terry**, Alfred Howe: soldier; b. at Hartford, Conn., Nov. 10, 1827; educated at schools in New Haven and at the law school of Yale College; entered upon the practice of law in 1849, and was clerk of the Superior and Supreme Courts of Connecticut 1854–60. For some years prior to the civil war he had been an active member of the State militia, and since 1854 in command of the Second Connecticut Militia, which regiment was mustered into the service of the U. S. in response to the call for three months' troops, and, with Terry still in command, was engaged in the first battle of Bull Run. Returning at the expiration of the three months, Terry then organized the Seventh Connecticut Volunteers, of which regiment he was appointed colonel Sept., 1861, and which he commanded in the expeditionary corps of Gen. Thomas W. Sherman at the capture of Port Royal, S. C.; was placed in command of Fort Pulaski upon its capture. Promoted to be brigadier-general of volunteers in Apr., 1862, he served in the operations about Charleston, in making a successful demonstration up Stono river during the descent on Morris island, and in the siege operations at Forts Wagner and Sumter. In the Virginia campaign of 1864 he commanded a division in the Army of the James, and was engaged at Drury's Bluff, Bermuda Hundred, and siege of Petersburg, being in command of the corps May–July, 1864. Upon the failure of the first attempt to capture Fort Fisher (*q. v.*), Terry was selected in Jan., 1865, to command the new expedition, which successfully carried that work by assault Jan. 15. For his services on this occasion he was promoted to be a major-general of volunteers and made a brigadier-general in the regular army. In the capture of Wilmington he rendered efficient aid, and in Mar., 1865, was placed in command of the Tenth Corps, which he held during the subsequent operations in North Carolina. In June, 1865, he was placed in command of the department of Virginia; commanded the department of the South 1869–72, and afterward the department of Dakota. He became major-general in the regular army Mar., 1886, and took command of the division of Missouri; retired Apr. 5, 1888. D. at New Haven, Dec. 16, 1890.

Revised by James Mercur.

**Terry**, Ellen Alice: actress; b. at Coventry, England, Feb. 27, 1848; made her first appearance on the stage in 1856 at the Princess's theater, London, under the management of Mrs. Charles Kean, playing Puck, Prince Arthur, etc., and became in 1878 a member of the company of the Lyceum theater under the management of Henry Irving, playing Ophelia, Desdemona, Portia, Juliet, and other characters. Her three sisters—Kate, Florence, and Marion—and her daughter are successful actresses. She visited the U. S. six times in company with Irving, and her acting was much admired for its winning charm, its gracious dignity, and its emotional intensity. Her Portia especially entirely accords with the spirit and poetry of Shakspeare's play.

**Terry**, Luther: See the Appendix.

**Terry**, Milton Spenser, A. M., S. T. D.: minister and educator; b. at Coeymans, Albany co., N. Y., Feb. 22, 1840; educated at Charlotteville Seminary, Troy University, and Yale Theological Seminary; pastor in the Methodist Episcopal Church eighteen years, presiding elder four years; since 1884 has been Professor of Old Testament Exegesis in Garrett Biblical Institute, Evanston, Ill. He has published *Commentary on Judges, Ruth, and Samuel* (1873); *Commentary on Kings, Chronicles, Ezra, Nehemiah, and Esther* (1875); *Biblical Hermeneutics* (1883; rev. ed. 1890); *Commentary on Genesis and Exodus* (1889); *Sibylline Oracles*, translated from the Greek (1890); *The Song of Songs* (1893); *The Prophecies of Daniel Expounded* (1893); and *Rambles in the Old World* (1894). A. Osborn.

**Terschel'ling**: the third of the chain of islands which lie in the North Sea along the northeastern coast of Holland; comprises an area of 45 sq. miles, and consists of low and rich meadow-land protected by downs and dikes against the sea. The inhabitants form a commune numbering about 3,730, and are engaged in ship-building, fishing, and pilotage.

Revised by M. W. Harrington.

**Tertian Fever**: See Fever and Chill.

**Ter'tiaries** [from Eccles. Lat. *tertia'rius*, belonging to the third degree or order < Lat. *tertia'rius*, containing a third part, deriv. of *ter'tius*, third: Eng. *third*]: in some Roman Catholic religious orders, those members who from marriage or secular occupations are not received into the highest membership of the order, but nevertheless take simple vows. The members of the Third Order of St. Francis are the most celebrated class of Tertiarics. They have long, in fact, constituted a separate order in the Church and have a general of their own. The Third Order embraces congregations of both men and women. Other orders have houses of Tertiaries, who are not to be confounded with the lay brethren and sisters of the orders. Revised by J. J. Keane.

**Tertiary Era**: a division of geologic time co-ordinate with the Primary era, and Secondary era, which it follows, and the Quaternary era, which it precedes. In the later and widely adopted classification based on life, the Cenozoic Era (*q. v.*) is made to include the Tertiary and Quaternary. Tertiary time is divided by European geologists into four periods—Eocene, Oligocene, Miocene, and Pliocene. In the chronologic system adopted for the atlas of the U. S. Geological Survey these are represented by two periods named Eocene and Neocene. For accounts of the periods, see the articles under their several names. The flora of this era is treated in the article Plants, Fossil. See also Quaternary Era. G. K. Gilbert.

**Tertre, du**: See Dutertre.

**Tertull'ian** (*Quintus Septimius Florens Tertullianus*): the most eminent Latin ecclesiastical writer of the early Church; b. at Carthage about 160. The son of a Roman military official, he was liberally educated, and became one of the ablest lawyers of the day and professor of rhetoric in his native city. The hollowness of contemporary paganism, the purity of the Christian life, and the courage of the martyrs co-operated to make him a Christian. From his conversion he experienced a profound change of heart, and was soon as noted for the rigidity of his ethical views and conduct as he was formerly for his looseness of life. In fact his severity in this regard led him to break with the regular Church authorities by his excessive insistence on the tenets of Montanism and his want of pity on the fallen. He is said to have founded a sect of Tertullianists which lingered on until the fifth century. He is famous for many works apologetical, doctrinal, and ethico-practical. Among them are the *Apologeticum*, a gem of Christian wit, logic, and erudition; the *De præscriptionibus hæreticorum*, valuable as an evidence of the ecclesiastical mind of his time; the *Adversus Marcionem*, in five books; and works on patience, on chastity, on monogamy, on idolatry, on theaters, etc. He is laconic, pointed, sarcastic, sententious in his utterances. His language is often compressed and obscure, so loaded is it with thought and reference. He created much of the technical ecclesiastical phraseology of the Latin Church. He lived and taught at Rome for some time, and his personal differences with the Roman clergy may have had something to do with his sharp expressions concerning the Roman mildness in treating those who fell away from Christian virtue or faith, but his works contain many expressions and principles that show the theoretical headship and real influence of the Roman Church. D. about 240. See Tillemont, *Mémoires pour servir à l'histoire ecclésiastique*; Freppel, *Tertullien* (Paris, 1864); Cruttwell, *A Literary History of Early Christianity* (London, 1893); the patrologies of Fessler-Jungmann and of Alzog. The best edition of Tertullian is that of Oehler (3 vols., Leipzig, 1851–54).

John J. Keane.

**Terwagne**, Anne Josèphe: See Thérsigne de Méricourt.

**Tesla**, Nikola: electrician; b. at Smiljan, Croatia, Austria-Hungary, in 1857; graduated at the Polytechnic School, Gratz; engaged in electrical work in France; went to the U. S. and was associated with Edison; became electrician of the Tesla Electric Light Company and established the Tesla laboratory in New York for independent electrical research. He has received honorary degrees from Columbia and Yale and the order of St. Sava from the King of Servia, as well as that of the Eagle from Montenegro, and has been vice-president of the American Institute of Electrical Engineers. He is the inventor of the modern principle of the rotating magnetic field embodied in the apparatus used in the transmission of power from Niagara Falls, of new forms of dynamos, transformers, motors, induction coils, condensers, arc and incandescent lamps, and of the oscillator, combining steam-engine and dynamo, etc. His researches in electrical oscillation have opened a new field for scientific investigation. See *The Inventions, Researches, and Writings of Nikola Tesla*, by T. C. Martin (New York, 1894).

**Tessin**: See Ticino.

**Tessin′**, Karl Gustaf: statesman and writer; b. in Sweden, 1695. He filled various important political positions, but he is best remembered as a patron of letters and an orator of force and elegance. While tutor to the crown prince, afterward Gustaf III., he wrote his famous *En gammal mans bref till en ung prins* (An Old Man's Letters to a Young Prince). D. 1770. D. K. D.

**Testament** (Lat. *testamentum*): See Will.

**Testamentary Guardian**: See Guardian.

**Testaments, Old and New**: See Bible.

**Testi**, Fulvio: poet; b. at Ferrara, Italy, Aug. 23, 1597, the son of a pharmacist. Trained at Bologna and Ferrara, he spent his life in the service of the court of Modena; attacked the Spaniards in some early verses, and excited their suspicions; later sought to gain their favor, when ambassador to Madrid (1635–38); was arrested Jan., 1646, for intriguing with French officials, and died in prison at Modena, Aug. 28, 1646. His verse consists chiefly of the *Rime* (1611); a tragedy, *Isola d'Alcina* (1626); the fragments of another drama and two epics; and most pro ably the poem in octaves called the *Pianto d'Italia*. J. D. M. Ford.

**Testicle**: See Histology.

**Testimony** [from Lat. *testimo'nium*, deriv. of *tes'tis*, a witness]: in law, the oral statement of facts made under oath by witnesses upon the trial of a civil or criminal action, or upon the hearing of any other judicial proceeding, as contradistinguished from the evidence furnished by written instruments, or by any other mere physical facts or appearances which can be exhibited to the court or jury. "Evidence" is the generic term, while "testimony" is specific. (See Evidence.) At the common law the witnesses in a legal action must be produced before the jury, unless they are without the kingdom or state, in which case their examination is taken in writing by means of a commission sent to the foreign country. In the English equity, admiralty, probate, and ecclesiastical proceedings the testimony was always taken by deposition and read on the trial. The modern radical changes in procedure have altered most of these ancient rules. Even the testimony in legal actions, both in the U. S. and in England, may now be written if the parties agree to that method; while by the practice of some States and of the U. S. tribunals it may always be in the form of a deposition if the witness lives at a fixed distance from the court or in certain cases in a county other than that in which the trial is held. One important exception to this relaxation is made necessary by the national and State constitutions. In all criminal trials the prisoner must be confronted by the witnesses against him, so that the testimony for the prosecution must be produced and delivered orally before the jury. Generally, wherever the reformed procedure prevails, the testimony in equitable suits is given in the same manner and is governed by the same rules as that in legal actions. In the U. S. courts, however, and in a few States which still retain a separate administration of equity the original form of deposition continues to be used. The reformed English procedure allows the parties a free selection between the written and the oral modes. In respect to the compelling the attendance of witnesses, the administration of the oath or of the affirmation, the examination and cross-examination, and the rules as to the competency of witnesses, see Subpœna, Oath, and Trial.
Revised by George W. Kirchwey.

**Test Oath**: the oath required by the Corporation and the Test Acts (13 Car. II., st. 2, c. 1, a. d. 1661, and 25 Car. II., c. 2, a. d. 1672) to be taken by nearly all civil and military officers. Blackstone describes these statutes as "two bulwarks erected in order the better to secure the Established Church against perils from nonconformists of all denominations, infidels, Turks, Jews, heretics, papists, and sectaries." They made the holding of public office conditional upon the incumbent's taking the oaths of allegiance and supremacy, and subscribing a declaration against transubstantiation and receiving the sacrament of the Lord's Supper according to the usage of the Church of England. After various modifications the statutes were substantially repealed in 1828 (9 Geo. IV., c. 17). During the civil war in the U. S. and after its close, test oaths were imposed by Federal and State legislation. (See U. S. R. S., § 1756, repealed by ch. 46, Laws 1884.) Their validity was soon called in question, and in the famous cases of *Cummings* vs. *Missouri* and *ex parte Garland* (4 Wallace 277 and 333) the U. S. Supreme Court held that any law requiring these oaths to be taken as a condition of holding certain offices and trusts or of pursuing one's ordinary and regular vocation, and thus operating to deprive persons of vested rights, was unconstitutional, as imposing a punishment for an act which was not punishable when it was committed, and hence within the prohibition against *ex post facto* laws; or as inflicting punishment without a judicial trial, and hence under the ban against bills of attainder. Francis M. Burdick.

**Testudina′ta** [Mod. Lat., neut. plur. of Lat. *testudina'tus*, from *testu'do*, tortoise]: an order of reptiles including the turtles, distinguished by having the body protected by a bony case. This is formed above by the ribs and vertebræ, to which are added other expanded bony plates, the whole constituting the carapace; below by a series of bony plates, usually nine, forming the plastron; other bones, called marginals or peripheralia, are usually developed about the edge of the carapace, and in the adults of many species all these bones are immovably connected with one another. The lower jaw, as in other reptiles, is formed of several pieces, but its halves are largely and firmly united at the symphysis by the coalesced dentaries. The jaws are toothless and, like those of a bird, encased in horny sheaths. The dorsal vertebræ are few in number, and immovably connected with one another and with the ribs. The feet have five digits each, and are variously modified for walking and swimming. There is no true sternum, the plastron consisting in part of bones corresponding to the clavicles and interclavicle of other animals, and in part of dermal bones. In most *Testudinata* the carapace is covered with regularly arranged horny plates, which may be quite thin, as in some tortoises (*Testudo*), or thick and overlapping, as in the hawk's-bill turtle. In the trunk-turtle (*Dermochelys*) and the fresh-water *Trionychidæ* the carapace is covered with a thin skin. The heart has two auricles and an imperfectly divided ventricle, and some venous blood enters into the circulation. The digestive apparatus is well developed, although the distinction between gullet and stomach is slight. In the marine turtles, which feed on seaweed, the gullet is armed with long, sharp, backwardly directed papillæ; in other turtles the gullet usually shows longitudinal folds. Including fossil forms the *Testudinata* are divided into four groups: (1) *Amphichelydia*, containing extinct species distinguished among other characters by the separation of the dentary bones. (2) *Pleurodira*, in which the neck is bent sidewise, not in a vertical plane, and the head in consequence can not be drawn within the shell; the pelvis is ankylosed to the carapace and plastron; marginal bones are present. This group contains a small number of tropical species. (3) *Cryptodira*, in which the neck can be bent in a vertical plane, and the neck in most can be drawn within the shell; marginal bones are present. The large majority of turtles belong to this division. (4) *Trionychia*, containing forms in which marginal bones are usually absent, or when present they form an imperfect series and are not connected with the ribs. This group comprises the so-called soft-shelled fresh-water turtles, which have a considerable portion of the outer and posterior part of the carapace cartilaginous and slightly flexible. A fifth group (*Athecæ*) is used by some systematists for the reception of the trunk-turtle (*Dermochelys*) and some fossil forms, in which the carapace consists of numerous small segments and is not united with the vertebræ and ribs. Geological members of the order *Testudinata* are found from the Upper Trias onward. Geographically they are found throughout the tropical and temperate portions of the world, their northernmost limits being about 50° in North America and 54° in Europe. See article *Tortoise* in *Encyclopædia Britannica*, 9th ed.; also Baur *On the Classification of the Testudinata*, *American Naturalist* (June, 1890). See Green Turtle, Hawk's-bill Turtle, Leather-turtle, Lyre-turtle, Tortoise, and Trionychidæ. F. A. Lucas.

**Testudin′idæ** [Mod. Lat., named from *Testu'do*, the typical genus, from Lat. *testu'do*, tortoise]: a family of tortoises (*Testudinata*) distinguished by their club-shaped feet and their special adaptation for terrestrial life. (See Tortoise.) The North American species are *Gopherus polyphemus*, *G. agassizii*, and *G. berlandieri*. The species are long-lived and very tenacious of life, and can live for a long time without food; they subsist upon herbage (grass, vegetables, and roots), and travel, in some cases at least, periodically to watercourses to drink. In temperate climates they hibernate in burrows through the winter.

**Tetá**: See Othoes.

**Tet'anus** [Mod. Lat., from Lat. *te'tanus* = Gr. τέτανος, spasm, tetanus, liter., stretching, tension, deriv. of τείνειν, stretch]: a dangerous spasmodic disease characterized by paroxysms of tonic muscular contraction, succeeding each other with varying frequency for days or weeks. The spasms usually appear first in the muscles of mastication, producing the condition popularly known as "lock-jaw," then involve the large muscles of the trunk, then those of the extremities and those concerned in respiration. In a paroxysm the patient's face is livid or purple, his respiration suspended, his whole body rigid and usually arched backward, owing to the greater power of the muscles of the back. Such a spasm lasts several seconds, and may cause death by arrest of respiration. Fever of varying intensity is present, and extreme exhaustion follows the paroxysms. Death is the more common issue in acute cases, occurring in two or five days. Occasionally, tetanus of less intense type becomes chronic, lasting weeks. Tetanus is universally recognized as an infectious disease due to the bacillus of Nicolaier, which was discovered in 1885. This micro-organism gains access to the system through wounds which are infected with earth or dust. The earth of almost any garden contains them. Jagged wounds, and especially such as involve or injure nerves, are particularly liable to cause the disease. It may begin soon after the injury or not for a long time. Tetanus is more common in hot than in cold climates. As in other infectious diseases the symptoms are largely the result of the action of certain toxines, the products of the bacillus. Tetanus has been successfully treated by chloral hydrate, opium, chloroform, and by timely removal or separation of the nerves which are irritated by the wound. The modern treatment consists in the injection of antitoxines obtained from the blood of animals rendered immune from the disease. This treatment has been highly satisfactory in some cases.

Revised by W. PEPPER.

**Tête de Pont**, tāt'de-pōn̄ [Fr., head of a bridge, bridgehead]: in fortification, a fieldwork, generally open at the gorge, resting its flanks on the banks of a river in order to cover one or more bridges. In spite of their small compass, such works are often of great strength. See FORTIFICATION.

**Tetrabranchia'ta** [Mod. Lat., from Gr. τετρα-, four + βράγχια, gills]: that group of cephalopod Mollusca which includes those forms with two pairs of gills. See CEPHALOPODA, NAUTILIDÆ, and MOLLUSCA.

**Tetrachord**: See HEXACHORD.

**Tetracoral'lia** [Mod. Lat.; from Gr. τετρα-, four + κοράλλιον, coral]: a group of fossil corals, characterized by having the septa arranged in fours. They are simple or colonial, free or fixed. The group is confined to the Paleozoic age, and attained its maximum in the Silurian. About 400 species are known.

**Tetradecap'oda** [Mod. Lat.; Gr. τετρα-, four + δέκα, ten + πούς, ποδός, foot]: a group of malacostracous crustacea, embracing forms the typical members of which have fourteen (seven pairs) feet fitted for locomotion. They have a small head, seven free thoracic body-rings, while more or fewer of the seven abdominal segments are coalesced. The eyes are never on stalks. The group is often known as EDRIOPHTHALMA (*q. v.*) (sessile-eyed) or *Arthrostraca*, in allusion to the jointed thorax. (See MALACOSTRACA.) The group may be divided into four orders: ISOPODA (*q. v.*), AMPHIPODA (*q. v.*), *Læmodipoda*, and *Entoniscidæ*. In the *Læmodipoda*, embracing a few marine forms and including the whale-lice (*Cyamus*) and *Caprella*, the abdomen is greatly reduced, several of the thoracic feet may be lost, while one pair is transferred to the head. The *Entoniscidæ*, with isopodan affinities, are greatly reduced by parasitism, the female being frequently so degenerate that no crustacean relationships are recognizable in the adult. J. S. KINGSLEY.

**Tetradymite**: See TELLURIDES.

**Tetragram'maton** [Mod. Lat., from Gr. τετραγράμματον, a word of four letters; τετρα-, four + γράμμα, letter]: the word of four letters, i. e. the Hebrew YHWH, the holy name of the Deity which the Jews considered "secret" or "inexpressible" (*shēm hammephōrāsh*). Cf. *Zeit. Deutsch. Morgenländ. Gesell.*, xxxv., 162; xxxvi., 410; xxxix., 543. It was written in Hebrew letters in MSS. of the LXX., and then read as Greek ΠΙΠΙ (*Zeit. Deutsch. Morgenl. Gesell.*, xxxii., 465). The real pronunciation, which was given but once—on the Day of Atonement by the high priest—has been lost. In its place the word Adonai (my Lord) was used, and the vowels of that word placed under the consonants YHWH. Since 1520 Christian scholars have wrongly combined the consonants of the one with the vowels of the other, and produced a new word, *Jehovah*. The correct pronunciation is probably *Yahwē*; cf., Ἰάω of the Ophites, Valentinians, Abraxas Gems, and magical papyri; Ἰαουέ of Clemens, Ἰαβέ of Epiphanius and the Samaritans (Theodoret). The word means either "the one who exists" (Ex. iii. 14; Hosea i. 9), or "the one who calls into being" (Clericus, Lagarde, *Bildung der Nomina*, p. 137). For other meanings, see Wellhausen, *Skizzen*, iii., 175; Stade, *Geschichte*, i., 429; Schultze, *Alttest. Theologie*, 4th ed., p. 508; Baudissin, *Studien zur Semit. Religionsgeschichte*, i., 181; *Zeit. Alttest. Wissen.* (1882–83). RICHARD GOTTHEIL.

**Tetrahe'dron** [from Gr. τετρα-, four + ἕδρα, seat, base]; a solid having four bounding planes, four solid angles, and six edges. If regular, its sides are equilateral triangles.

**Tetral'ogy** [Gr. τετραλογία, a quaternion of discourses or dialogues]: the technical name given to a combination of three tragedies (trilogy) and a satyr-drama. The word is also applied to the Platonic dialogues, as grouped in sets of four. B. L. G.

**Tetrameter**: See METRES.

**Tetraon'idæ** [Mod. Lat., named from *Te'trao*, the typical genus; from Lat. *te'trao*, *tetrao'nis* = Gr. τετράων, heath-cock, moor-fowl]: a family of birds comprising the grouse, partridges, quails, etc. The general aspect of the birds is familiar in connection with the kinds just indicated; the bill varies considerably in size, being in some robust and in others rather weak; it is broad at the base, and thence compressed, and the culmen is always arched to the tip, which is obtusely hooked and decurved over the lower mandible; the nostrils are basal and lateral, in some (e. g. *Tetraoninæ*) concealed by feathers, in others partly covered by a hard scale; the wings are short, rounded, and concave; the tail diversiform, but generally short and depressed; the tarsi strong, variously clothed; the toes moderate, the three anterior free, the posterior elevated; the claws stout and adapted for scratching. With these are associated certain osteological characters, contrasting with those exhibited by the nearly allied *Phasianidæ*. (Huxley, *Proc. Zoöl. Soc. London*, 1868, p. 301.) These characters are best expressed in the grouse. As here defined, the family embraces the sub-families *Tetraoninæ*, *Ortyginæ* or *Odontophorinæ*, *Perdicinæ*, *Rollulinæ*, and *Caccabininæ* (in part). The *Turnicinæ* have been isolated by Huxley not only as a distinct family, but as a peculiar super-family or sub-order, under the name *Turnicimorphæ*. By some authorities the family is held to contain only the grouse proper, the partridges and quail being placed in a separate family, *Perdicidæ*, but there seems to be no good reason for this separation. See GROUSE, PARTRIDGE, QUAIL, RUFFED GROUSE, etc.

Revised by F. A. LUCAS.

**Tetrapol'itan Confession** [*Tetrapolitan* (with *t* by analogy of Gr. πολίτης, Eng. *political*, etc.) is from Gr. τετράπολις (sc. χώρα, district, country), a region having four cities, liter., fem. adj., having four cities; τετρα-, four + πόλις, city]: the "confession of the four cities" of Constance, Strassburg, Memmingen, and Lindau. It consists of twenty-three articles and is the oldest confession of the Reformed Church in Germany. It was drawn up by Bucer during the session of the Diet of Augsburg (1530), and presented to the emperor in the name of the four cities, but not read before the diet, nor did it ever receive wider sanction than in the four cities. See Schaff, *Creeds*, i., 526–529. S. M. J.

**Te'trarch** [from Lat. *tetrar'ches* = Gr. τετράρχης, τέτραρχος; τετρα-, four + ἄρχειν, be first, lead, rule]: a name which strictly designated, originally, the viceroy or monarch of the fourth part of a country (Thessaly, etc.), but subsequently became a title bestowed, especially under the Romans, upon the minor tributary princes of the East.

**Tetrodon'tidæ** [Mod. Lat., named from *Te'trodon*, the typical genus; Gr. τετρα-, four + ὀδούς, ὀδόντος, tooth]: a family of plectognath fishes distinguished by the development of the jaw into four tooth-like margins. The form is normally more or less oblong, but the abdomen is capable of much distension, and thus the true form is often disguised; the skin, especially on the belly, is mostly covered with larger or smaller dermal ossifications or spines; the head is oblong and covered with skin, so that the opercular and other bones are concealed; the mouth terminal or subterminal, and with the cleft mostly transverse; the intermaxillary and supramaxillary bones are confluent, but those of the opposite sides are divided by a suture, as is also the dentary bone of the lower jaw; the teeth are represented by the trenchant edges of the jaws and are otherwise wanting; the branchial apertures are narrow slits in front of the pectoral fins; the branchiostegal rays are entirely inclosed within the integuments; the dorsal is chiefly composed of articulated and branched rays, and is generally short and far behind; the anal is like the dorsal, and obliquely opposite, but rather farther behind; the pectorals are narrow and high up; the ventrals are wanting. With these characters are co-ordinated certain osteological features which confirm the isolation of this group as a peculiar family. It is, however, nearly related to the family *Diodontidæ*, which has generally been combined with it. Between sixty and seventy species are known. Representatives of the family are found in all tropical and warm temperate seas. Several are natives of the seacoast of the U. S., two (*Tetrodon lævigatus* and *Chilichthys turgidus*) extending to the eastern coast, and one (*Tetrodon politus*) occurring along the Californian coast. These species are called by the fishermen and others puffers, swell-fish, blowers, etc. The puffing is due to the development of a largely dilatable air-sac, which closely adheres to the peritoneum, and has a valvular communication with the œsophagus, through which the air is received. The species are of no economical importance; indeed some are poisonous. Revised by F. A. LUCAS.

**Tetuan**, tet-oo-aan': town of Morocco; in lat. 35° 34′ N., lon. 5° 18′ W., near the mouth of the river Martil; in an exceedingly fertile and well-cultivated region, especially celebrated for its oranges (see map of Africa, ref. 1–B). The town is fortified and well built, and has several fine mosques and an active trade in woolen and silk stuffs, leather, and fruit. Pop. 20,000 to 25,000, one-quarter Jews. M. W. H.

**Tetzel**, or **Tezel**, tet'sel, JOHANN [*Tetzel* is a diminutive of *Tietze*, his father's name]: seller of indulgences; son of a goldsmith; b. in Leipzig about 1455; studied theology and philosophy at the university of his native city; in 1489 entered the Dominican monastery of St. Paul in Leipzig, and soon became noted as a very impressive popular preacher. In 1502 he was appointed to preach an indulgence in Zwickau and its vicinity, and he was so successful—that is, he made so much money for the papal treasury—that he was steadily employed in the sale of indulgences for fifteen years. His territory was enlarged and his authority increased. It is said that he sold indulgences without requiring previous confession, and that he led an immoral life. At Innspruck in 1512 he was sentenced as an adulterer to be sewn in a sack and thrown into the river, but that sentence was commuted to imprisonment for life, and after being confined for some time at Leipzig he was set free. Roman Catholic writers deny that he sold indulgences without repentance, or indulgences for sins not yet committed: but their argument rests solely on the words of the papal commission, which are vague, and prove nothing with respect to the practice of the man as it had been reported by eye-witnesses. Leo X., having determined to grant a universal indulgence, made Tetzel inquisitor, and commissioned him to preach the indulgence throughout Germany. Tetzel appeared in his highest glory, journeying from town to town and levying his contributions, as has been described by contemporary writers; but when from Brandenburg he approached the Saxon frontier in the middle of 1517, he was unexpectedly met by Luther's theses, nailed to the church-door in Wittenberg Oct. 31. He burned Luther's theses at Jüterbogk, and wrote some theses himself, which the students burned at Wittenberg, while he defended them in a disputation at Frankfort-on-the-Oder, whereby he became a doctor of divinity. This illusion did not last long; and when, in 1518, Karl von Militiz, the papal ambassador, arrived at Leipzig, he not only suspended Tetzel, but spoke so harshly to him that the poor man fell sick of fright and humiliation, and died July 14, 1519. His *Life* has been written by the Protestants F. G. Hofmann (Leipzig, 1844) and F. Körner (Frankenburg, 1880), and by the Roman Catholics V. Gröne (Münster, 1853; 2d ed., Soest, 1860) and K. W. Hermann (Frankfort-on-the-Main, 1882). Cf. J. B. Röhm, *Zur Tetzel Legende* (Hildesheim, 1890). Revised by S. M. JACKSON.

**Teu'cer** (in Gr. Τεῦκρος): (1) the first King of Troy, in honor of whom the Trojans are sometimes called Teucri; but the legends differ with respect to whether he was a native of Troy, giving his daughter, Arisbe, in marriage to Dardanus of Samothrace, or whether he immigrated, together with Scamander, into Troas from Crete. (2) Son of Telamon, King of Salamis, and Hesione of Troy. He accompanied his step-brother, Ajax, to Troy, and was the best archer among the Greeks; but when the Greeks returned after the capture of Troy, Telamon would not receive Teucer in Salamis, because he had not avenged Ajax, and he then sailed to Cyprus, which he received from Belus, King of Sidon, and where he founded the town of Salamis. Revised by J. R. S. STERRETT.

**Teuffel**, toif'fel, WILHELM SIGISMUND: classical scholar; b. at Ludwigsburg, Würtemberg, Germany, Sept. 27, 1820; studied ancient languages in Tübingen, where he became privat docent in 1844; professor extraordinary in 1849; ordinary professor in 1857. D. at Tübingen, Mar. 8, 1878. His most famous work is his *Geschichte der römischen Litteratur* (2 vols., 5th ed., by L. Schwabe, Leipzig, 1890; trans. into English by Warr), the most exhaustive survey of the subject, and absolutely indispensable to every serious student. He is also the author of excellent editions of Aristophanes's *Clouds* and of Æschylus's *Persæ*, and wrote a commentary to the second book of the *Satires* of Horace. His admirable and highly instructive essays on ancient life and thought are collected in his *Studien und Characteristiken* (2d ed., Leipzig, 1889). See S. Teuffel, *W. S. Teuffel* (1889) and Bursian, *Biographische Jahrbücher*, i., 1878, pp. 2 ff. ALFRED GUDEMAN.

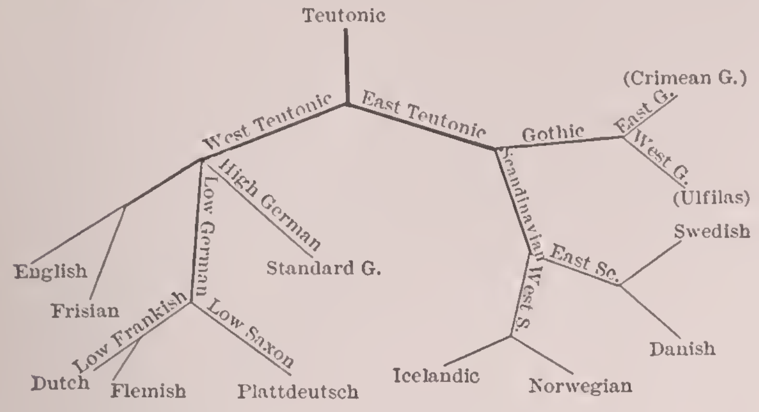
**Teuthid'idæ** [from *Teuthis*, the typical genus]: a family of acanthopterygian fishes, characterized by the peculiar structure of the fins. The body is oblong and compressed, scales small, lateral line continuous. There is a single row of cutting teeth in either jaw, no teeth on the palate. The dorsal fin has thirteen spinous and seven soft rays, the anal seven and nine, a formula common to all the species. Ventral fins thoracic with an outer and inner spine, between which are three soft rays. There are about thirty species, none over 15 inches in length, found in the Indian and Pacific Oceans. F. A. LUCAS.

**Teuton'ic Knights**: a military ecclesiastical order, founded in 1190 by some North German merchants, who had been moved by the sufferings of the crusaders at the siege of Acre. It soon found a patron in Frederick, Duke of Swabia, and secured charters from the emperor and the pope entitling it to all the privileges possessed by the two great rival orders of the Knights Templar and Knights of St. John. The members of the order were required to be Germans of noble birth, but priests and half-brothers, not noble, were admitted. In the early times they took vows of chastity and poverty. In 1230 they entered upon a crusade against the Prussians, and after a century of hard fighting established their rule over Prussia, when they fixed their headquarters at Marienburg. In the meanwhile they had served in the crusades of St. Louis 1248–50, founded Königsberg in 1255, and attacked the heathen Lithuanians in 1283. They were for many years involved in wars with Poland; held at times East and West Prussia, Esthonia, Pomerania, and other neighboring countries. In 1466 they surrendered West Prussia to Poland, and recognized the latter's feudal ownership for East Prussia, when Königsberg became their capital. In 1525 their grand-master, Albert of Brandenburg, converted Prussia into a secular hereditary dukedom, and in 1527 the seat of the order was transferred to Mergentheim in Swabia. In 1561 they lost all their Livonian possessions. In 1805 the Emperor of Austria became grand-master of the order. In 1809 Napoleon declared the order abolished, and gave its lands to various German sovereigns. In 1840 the Austrian emperor reorganized the Teutonic Knights, and in 1865 the order was still further reorganized. F. M. COLBY.

**Teutonic Languages**: a branch of the Indo-European family of languages. For the relationship of Teutonic to the other branches, see article INDO-EUROPEAN LANGUAGES. The term Germanic is also used, especially in Germany, where it is supplanting the older term *Deutsch*. The members of this group may be enumerated and compared with the aid of the following diagram. Each language has been treated in a separate article, under Gothic, Icelandic, German, Dutch, etc.

*Teutonic* is general and theoretical, and represents the one prehistoric language spoken by the Teutonic stock in Central Europe, between the Baltic and the Black Sea. The first divergence in general Teutonic was between East and West Teutonic, first fully treated by Zimmer in *Z'tschrift für d. Altertum*, xix., p. 393, *seq.* See also Kluge in Paul's *Grun-*

*driss der german. Philol.*, i., p. 362, *seq.*, and Sievers in *Encyclopædia Britannica* under *Gothic Language*. East Teutonic is divided into Gothic (see GOTHIC LANGUAGE) and the SCANDINAVIAN LANGUAGES (*q. v.*), but the differences between



the two are more striking than their similarities, and they may as well be kept distinct. See Brugmann's *Grundriss*, i., p. 11, and Noreen in Paul's *Grundriss*, p. 419, *seq.*; also Emerson's *History of the English Language*, chap. ii., and Brandt's *German Grammar*, § 479. The West Teutonic division stands out as more distinct and compact. Applying GRIMM'S LAW (*q. v.*) in its second shifting we get three subdivisions: 1. High German (see GERMAN LANGUAGE), which shifted most of all. 2. LOW GERMAN (*q. v.*), which shifted *th* to *d*. 3. English (see ENGLISH LANGUAGE), which, like Gothic and Scandinavian, shifted only once. The Frisian language stands between English and Low German. Some of its modern dialects have preserved *th*, some shifted it to *d*, and even to *t*. English writers like to place English in the Low German group, but this is hardly justifiable. It is true that when Angles, Saxon, Jutes, and Frisians left the Continent for Britain, their dialects were, roughly speaking, identical with Old Low Saxon, Old Low Frankish, Old Frisian; but the general term Low German should be limited to the non-High German continental dialects, including Modern Dutch, Flemish, Plattdeutsch, and perhaps Frisian, all of which shifted *th* to *d*. The main common characteristics of the Teutonic languages, which constitute at the same time the reason for grouping them together, are as follows: 1. The shifting of consonants according to GRIMM'S LAW and VERNER'S LAW (*qq. v.*). 2. The ACCENT (*q. v.*). In the Indo-European and for a while still in the Teutonic period the accent was "free." Then it became limited to the stem-syllable, which is always the first one in simple words and in "nominal" compounds. In genuine (inseparable) compound verbs it is the second syllable. Cf. Lat. *a'mo—ama'mus, a'mor—amo'ris* with Germ. *ich stand, wir standen, stand'haft, Stand'haftigkeit, verste'hen*; Germ. *Ur'laub—erlau'ben, Bei'schlaf—beschla'fen.* 3. The "strong" and "weak" conjugations. By ABLAUT (*q. v.*) which is not peculiar to the group, however, a regular and full system of verb-inflection called strong has developed; e. g. Eng. *write, wrote, written*; O. H. Germ. *helfan, half—hulfum, giholfan.* The so-called weak conjugation is quite characteristic. It employs a suffix *d* (*t*), of still doubtful origin, to express the simple past tense; e. g. Gothic *nasyan—nasida*; Eng. *love—loved*; Germ. *hausen—hauste.* 4. The double adjective declension: (*a*) The strong, identical with the strong substantive declension, although endings from the pronominal inflection have been mixed with it; (*b*) the weak, whose endings are identical with the weak or *n*-declension of substantives. Mod. H. Germ. has well preserved this twofold inflection and the syntax of the same, e. g. *guter Mann, gutem Manne*; *der gute Mann, dem guten Manne*; *Gutes, das Gute.* There are other minor characteristics of the group, but too technical to enumerate and enlarge upon here.

H. C. G. BRANDT.

**Teutonic** (or **Germanic**) **Mythology**: the body of myths belonging to the Teutonic or Germanic nations; also the system of gods, minor deities, and spirits which these myths commemorate.

*History of the Science.*—The discovery of the *Eddas* (see EDDA) in the sixteenth century dates the beginning of this science, which moved chiefly on lines of interpretation—and that in the main Euhemeristic—until Jacob Grimm (*Deutsche Mythologie*, 1835) put it upon a foundation of philological, historical, and comparative criticism. His main success was in the exhaustive material which he gathered, and in his wonderful, if often misguided, power of combination. Moreover, he not only avoided interpretation, but also insisted that Scandinavian sources are not to be regarded as the foundation, but simply as part of the material, of Teutonic mythology. Then came the great enthusiasm for comparative mythology, with Max Müller and Kuhn as leaders. This has been succeeded by a caution bordering on skepticism in regard to the validity of such processes; but it is interesting to note that rationalists were abroad a century ago, declaring (Adelung, Rühs, and others) that Christian and classical material—that is, mere loans and repetition—lay at the foundation of Norse myth. This view, with concessions to Teutonic and comparative mythology, and put forth with great philological insight, method, and ability, has been revived of late by certain Scandinavian scholars, such as Jessen, and notably by Sophus Bugge, who has succeeded in throwing grave suspicion upon the exclusively heathen character of such myths as the sacrifice of Odin, the death of Balder, and the descriptions of Valhalla. Müllenhoff, who had insisted on the critical methods of Lachmann as check to the more generous combination of J. Grimm, Grundtvig, and others, nevertheless took up the challenge of Bugge and made a manful defense of the essentially heathen character of Scandinavian mythology (*Deutsche Alterthumskunde*, v. i.). Whatever the merits of this particular controversy the vigorous methods of Müllenhoff in the general science deserve all praise. His friend and scholar Mannhardt, who began investigation as an enthusiastic follower of Kuhn, soon developed independent powers of criticism, insisted upon the artistic or poetical element which is sure to master higher forms of myth, abandoned (see his *Mythologische Forschungen*, with valuable introductions by Müllenhoff and Scherer, Strassburg, 1884) much of the old material, and emphasized the importance of traditional rites and superstitions among the peasants. With Mannhardt, as with others, anthropology has exercised a salutary power. Finally, we may mention the tendency of modern critics to exalt the importance of religious rites in general as a far more stable affair than the myth. Extreme in this regard is J. Lippert (*Die Religionen der europäischen Kulturvölker*, 1881), a disciple of Herbert Spencer; according to Lippert myths are mere tales and fancies, accretions upon the religious instinct, and subordinate in every way to ceremonial religion. This is exaggeration; but it is safe to say that while the old problems of Teutonic mythology are still unsolved, a more temperate and reasonable spirit prevails, the material is better understood, and a sounder critical method is accepted on every side.

*Sources.*—Aside from Scandinavian myths (see SCANDINAVIAN MYTHOLOGY), plentiful indeed, but not to be used in their present shape as outright material for the reconstruction of a Teutonic Olympus, the sources are meager and baffling. The line between genuine myth and poetic fancy or allegory is not easy to determine; while the test of a definite cult and a definite locality can be applied successfully to few of the myths which we possess. Names of persons and places—Thor was a favorite for this purpose in Scandinavia—from heathen times are trustworthy, particularly when the name is compounded so as to indicate some phase of worship; and with these sources are to be ranged runic and other inscriptions of ancient date, genealogies, like those of the Anglo-Saxon kings, which go back to such gods as Woden, and even the so-called "kennings" or metaphors of scaldic poetry. Ornaments and other relics from heathen tombs are often incorruptible witnesses to heathen worship. Important, but not always clear, is the evidence of classical writers contemporary with our heathendom; such are Cæsar (*Commentaries on the Gallic War*, vi., 21), Tacitus (*Germania* and parts of the *Annals* and *History*), and Plutarch. With the conversion come the Christian chroniclers—Jordanes, for example—and the lives of saints, particularly of men like Boniface, who were foremost in missionary labor; here too belong renunciations of heathen gods drawn up for the Germanic convert. Critical powers of a high order are needed in the use of such sources as the half-heathen epic (*Beowulf*) and the complicated heroic legend; but poetic fancy is not so rife and contamination not so prevalent in the charms and incantations which more or less clearly show heathen origin. These are a part of religion, as is evident from their purpose and the manner of using them; but popular stories, legends, ballads, and the like, are of little value, having no stay in religious rites and floating easily from one race or community to another.

*Lower Mythology.*—Turning to the actual material we note that the worship of spirits, survival from heathen belief, is found in all Teutonic races, and carries with it a host of stories which belong in part to primitive myth. One example out of many which prove an older worship of the dead is the myth of the Wild Huntsman and his troop of spirits sweeping through a stormy sky. Such a storm is often called *Allerseelenwind*; and the direct cult of these spirits is known still in folk-lore, even adapting itself to Christian purposes in the feast of All Souls. Offerings to the dead, ceremonies at a tomb, give sanction to degenerate myths of this sort, still told by the people, but hopelessly tangled with other elements, native and foreign. Here too belong stories of spirits in guise of bird or beast, or in a form at once human and superhuman—the lore of ghosts. In the popular tales (see BEAST-FABLES) myth is inextricably woven with narrative pure and simple, and migration, especially from the East, may be assumed at every turn; but an exception must be made of charms and incantations, for here we have the sure test of a cult, of ceremonial rites, together with the credentials of immemorial tradition. A charm is often introduced by an epic exordium, setting forth a case similar to the one about to be treated and holding in many cases its shred of myth. Such is the famous Merseburg charm which tells of Phol and Wodan; such is a long incantation in Anglo-Saxon, meant to cure sudden attacks of rheumatism and telling how "mighty women" riding about the air send their spears at the unwary mortal (translated in Gummere's *Germanic Origins*, p. 373). These supernatural women, degenerating into modern witches, or the weird sisters of Macbeth, are of course related to the Norns and the Valkyries of Norse myth, and to those women whom the Germans of Tacitus worshiped as divine.

*Nature-myths.*—Myths of the dead, ghost-lore in general, may be referred to the analogy worked out by primitive man between the world of spirits and the world of his inner consciousness, particularly in dreams. But the world without was as insistent as that within, and there is no good reason for postponing the myths of nature to the late stage assigned them by some modern scholars. Storm and lightning were probably referred to the agency of gigantic spirits, not necessarily ancestral; a vague personality, logical result of what Mr. Tylor calls primitive "animism," was behind the roar of the tempest. Minor phases of natural power, moreover, had their cult and myth; tree-worship and water-worship are cases in point, and exist in manifold survival to this day. Worship of such elemental powers was partly conciliatory and grateful, partly of the banning order, and the myths connected with them have these dualistic types. The forces of nature had higher powers and larger utterance than the serviceable or annoying spirits of the home. The Corn Demon, the good or bad genius of the fields, belonged in this list (see Mannhardt, *Antike Wald- und Feldkulte*); and so, in yet more vague conception, did the giants (see JOTUN), of whom Scandinavia preserved so many myths.

*Gods and Goddesses.*—Through the border-land of demons, dragons, and giants we pass to what E. H. Meyer has called the Pantheon, as opposed to the Pandemonium, of Germanic myth. Here is the higher mythology, where the poet has wrought material, often brutal and always clumsy, into shapes of beauty and majesty. Some of the gods are merely demons or giants promoted, like Loke, god of fire or possibly of lightning; but many of them are far more venerable in origin. They are called *god* (perhaps "he who is invoked") or *ans* (probably "helper"; Anglo-Saxon *Os-* in words such as Oscar), and, as opposed to giants, are the friends of man. They were worshiped in rude temples, despite the denial of Tacitus, and in sacred groves, with dance, song, and sacrifice. Comparative mythology assures the parallel of an old Teutonic god, probably "the bright one," Tiwaz (Scand. Týr), with Sanskrit Dyâus, Greek Zeus, Latin Ju-piter, god of the shining heaven. Originally supreme god, he became the Teutonic Mars (giving the name to Tuesday, *dies Martis*); a few traces of his worship are found, notably an inscription in England. His supremacy was overthrown by Wodan (Ang.-Sax. Woden; Scand. Odin), the god of wind and storm, "Mercurius" in Roman interpretation (hence Wednesday), and then a divinity representing conquest and new arts of life. Wodan became of course monarch of all Teutonic gods; myths about him abound in Scandinavian sources, and traces of his worship are found in all Teutonic nations. Identification of English Woden and the outlaw Robin Hood, however, is made without good reason. (See Child, *Ballads*, 2d ed., iii., p. 47.) The cult of Wodan seems finally to have penetrated peasant life, and is proved by folk-lore; but for Scandinavia at least there is no doubt that Thor (Ang.-Sax. Thunor) was once the favorite; ample material is given by Henry Petersen, *Om Nordboernes Gudedyrkelse og Gudetro i Hedenold*, especially page 46, *seq.* Thor, the thunder-god (Thursday, *dies Jovis*), may have been meant by Cæsar when he ascribes to the Germans a god "Vulcan." There are many myths about this friend of man and sworn foe to the giants, and the converted Scandinavians parted from him unwillingly enough. Occasionally an old god is worshiped under a new name, and Tiwaz probably lives again as the Freyr of Norse myth, a god of fertility, peace, and commerce; his sister Freyja is probably no other than the Nerthus, *terra mater*, mentioned by Tacitus (*Germ.*, 40) as worshiped by Germans along the North Sea with rites that are described in valuable detail. Freyr, moreover, is closely related to, probably identical with, Ing, the father and god of the Tacitean Ingvæones, who dwelt about the Elbe mouth, and later sent conquerors to Britain. Ing is mentioned in the Anglo-Saxon Rune-Lay. Besides Freyja should be mentioned Frigg (Scand. form; Ang.-Sax. Frig), wife of Odin, goddess of love and fecundity; later she appears in folk-lore in humble guise and under many names, such as Holda in Germany.

*Interpretation.*—Occasionally, as has been shown, the meaning of a myth and the origin of a deity are evident enough; such is the case with Wodan and his hunt, with Tiwaz, and others. But the mania for interpretation of myths—whether sun, storm, or a beautiful allegory of human life be the solution—lapsed at one time into a mere guessing-match, and was baffled by nothing. Simrock, in his *Mythologie*, gives after each myth a *hæc fabula docet*, often ingenious to absurdity. Jacob Grimm held himself aloof from all this; and with modern times, as criticism finds more and more difficulty in the mere sifting and valuation of material, and recognizes how many strands are interwoven, what different stages of culture are to be reckoned with, and how hard it is to approach the origins of a myth, interpretation, even with the aid of comparative mythology, has lost much of its ardor. One thing is certain: while myths may yet be traced to personified natural forces, often with convincing proof, the hunt after allegories and fine-spun meanings, such as mars the effect of so able a book as Uhland's *Mythus von Thor*, is now abandoned.

BIBLIOGRAPHY.—Besides the works already named, one should consult J. Grimm, *Deutsche Mythologie*, especially his preface to the second edition (1844; reprinted in fourth edition); Müller, *Geschichte und System der altdeutschen Religion* (1844), despite its age still a useful book; K. Maurer, *Bekehrung des norwegischen Stammes zum Christenthum* (1855, *seq.*); Wuttke, *Der deutsche Volksglaube der Gegenwart* (1869); H. Pfannenschmid, *Germanische Erntefeste* (1878), an excellent book; Tylor, *Primitive Culture*; Kemble, *The Saxons in England*; E. H. Meyer, *Völuspa* and *Germanische Mythologie* (1891); Mogk, *Mythologie*, in Paul's *Grundriss der Germanischen Philologie*.

FRANCIS B. GUMMERE.

**Teutons** [from Lat. *Teu'toni*, *Teu'tones*, from a Teutonic word represented by Goth. *þiuda* : O. H. Germ. *diot* : O. Eng. *þēod*, people; cf. Eng. *Dutch*, from Dutch *Duitsch* : Germ. *Deutsch*. German < O. H. Germ. *diutisk*, popular, national, deriv. of *diot*, people]: the members of the Teutonic branch of the Aryan family.

(1) *The Peoples embraced under the Name.*—Much uncertainty is manifested in the extent of the application. The Greek and Latin authors seem to have used the word to designate only a certain portion of the great race then inhabiting the lands N. of the Alps and E. of the Rhine—viz., that portion with which they first became acquainted—that portion which undertook, in company with the Cimbri, to invade the Roman empire about 113 B. C., and whose original abode had been probably the western coast of Schleswig-Holstein and the territory about the mouth of the Elbe. It was then that Rome first became aware of the existence of a people of untamed might dwelling N. of the Alps, and distinct from the Celtic tribes; and it is quite natural that the Romans, in their ignorance of the extent of the race, should have taken the word which this tribe used, in common with all the other tribes, to designate itself, and have applied it in a Latinized form in particular to this one, and then, upon becoming acquainted with the larger extent of the race, have adopted, as they did, another word, the Belgic-Celtic

word *Germani*, for the name of the entire race. Some of the Latin authors—as Martial and Claudian—used the adjective *Teutonicus* as of like meaning with *Germanicus*, and after the beginning of the tenth century the Latin "Teutonicus" displaces, even in German authorship, the indigenous "Theotiscus" as the comprehensive race-adjective, while in modern times the Latin names, though still used, have been turned wholly about in the extent of their application, the race being designated by the term Teuton, and that portion of the pure or nearly pure stock inhabiting the European continent by the term *German*. In this broadest sense must be included under the name Teuton, in first degree, the Germans of the Continent—viz., the inhabitants of the German empire, of Austria proper, of the northern and northeastern cantons of Switzerland, and of Holland, and the Scandinavians of the two northern peninsulas; in the second degree, the English, the inhabitants of Lower Scotland, and the inhabitants of the U. S.; while in the ethnological composition of almost every truly European nation—that is, every nation W. of Russia proper and Turkey—the Teutonic component enters in a greater or less degree. At the close of the fifth century, when the great movement known in European history as the migration of the peoples ended, the Teutons were the ruling race from Carthage to the Vistula: the Vandals in Africa from Carthage to Gibraltar; the Visigoths from Gibraltar to the banks of the Loire; the Suevi occupying about the present Portugal; Burgundians from the upper course of the Loire to the center of the present Switzerland; the Ostrogoths from the last-mentioned boundary to that of the present Turkish empire on the E., and from the Mediterranean Sea on the S. to the Danube on the N.; the Franks from the lower Loire to Thuringia; Saxon conquerors upon the English coasts; Saxons, Frisii, Thuringians, Marcomanni, Bavarians, and Longobardi still upon the original German soil, the latter moving down a little later (last half of the sixth century) into Italy, and occupying the plain of the upper Po, while the Scandinavic branch not only occupied the two northern peninsulas, but reached round the entire eastern and southeastern shore of the Baltic and far inland. In the far-off lands of Africa, Hispania, Southwestern Gaul, and Middle and Southern Italy the Teutonic element disappeared almost entirely in the amalgamation with the great mass of the Romanic population; while, on the other hand, the inhabitants of Northern and Northeastern France, of Belgium, of Northern Italy, and of Russia's Baltic provinces manifest still most strongly the ethnological characteristics of the Teutons.

(2) *Characteristics of the Teuton.*—(*a*) *Physical.*—Besides the usual Caucasian peculiarities of the "oval head; the lines of eye and mouth dividing the whole face into three nearly equal parts; the large eyes with their axis at right angles with the line of the nose; the 90° facial angle; the full beard, covering to the ears; the white complexion, and the tall, straight, and well-proportioned stature"—which the Teuton possesses in common with all Europeans, he is further somewhat distinguished from these by a larger frame, a whiter and more florid complexion, a bluer eye, and a lighter shade of hair. (*b*) *Mental.*—The distinction between the Teutonic and the Romanic nature is even more manifest in the mental than in the physical constitution. The Græco-Roman world meditated the connection between the ancient civilization and the modern. Its geographical position and historical connections with the Oriental world preserved in the Greek and the Roman the inheritance of the Oriental traits, which the differences of climate and soil, of geography and topography, have indeed modified but not destroyed. The prevailing temperament of the Romanic peoples is still a mixture of the sanguine and the melancholic, the latter element predominating, while fancy and imagination, vacillation, and mysticism, are among the chief traits in their intellectual, moral, and religious character. On the other hand, the Teuton, with more of the phlegm and the choler in his temperament, evinces the deeper insight, the more constant purpose, and the greater *éclaircissement.*

(3) *Institutions.*—These differences of mental constitution are most clearly seen in the fundamental institutions which they have produced. The Roman imperium and the Roman Church may be taken as the great historical products of the Roman spirit. In both of these the sum and substance of all authority is viewed, imaginatively and mystically, as inherent in an office, and all law as proceeding out of it, from above, down, over, and independent of the governed. On the other hand, individual liberty and personal worth were the fundamental principles of the old Teutonic life and polity. In the old assemblies of the village, the hundred, and the tribe it was the will of the freeman which was the authority of law. While in Rome the central power was the strongest, and there existed no local power worth the name, save as an imperial agency, among the Teutons, again, the local power was always the strongest, and centralization always opposed, defied, and overthrown. When Marbodius, the Marcomannic duke, and even the brave Arminius, to whom the German tribes were indebted for the expulsion of the Roman legions from their soil, attempted to retain in time of peace the centralized authority which they had exercised as leaders in war, the one was obliged to flee to Rome in order to save his life, while the other fell a victim to his fatal ambition. Thus is seen enkindled at the very first contact of the Teutonic with the Romanic world the irrepressible conflict between freedom and authority which has shaken Europe from that day to this. Then it was Teutonic liberty against the Roman imperium; in the Middle Ages, after contact and connection with the Roman world had given the Germans kings and emperors, it was the emperor against the pope; in the transition period from the mediæval age to the new time it was German Protestantism against Roman Catholicism; and to-day it is Teutonic science against the syllabus and the Vatican. The Teutonic spirit has given to the modern civilization its freedom of thought and conscience, its estimation of man above institutions, its science, its Protestantism, its doctrine of popular sovereignty, its local self-government, and its national development. It can therefore be truly said to be the spirit of the modern civilization.

J. W. BURGESS.

**Tewfik** (tef-fēēk') **Pasha**, MOHAMMED: Khedive of Egypt; b. Nov. 15, 1852, the eldest son of Ismaïl Pasha. He was educated in Egypt, and declared heir-apparent in 1866 when the Porte granted the right of primogeniture to the Egyptian reigning family. He married Emineh Hamen, and never had any other wives. In 1879 Ismaïl appointed him president of the ministry, which position he resigned after a few weeks. On June 26, 1879, Ismaïl was compelled to abdicate by the British and French Governments, and Tewfik was proclaimed khedive. But he ruled only in name, the dual control having placed the state virtually in the power of the two foreign governments. The result of this was the formation of a national party, with Arabi Pasha at the head. Though he was Minister of War, he quarreled with Tewfik. Great Britain, acting in the interest of the Egyptian bondholders, intervened, and issued an ultimatum July 9, 1882. Alexandria was bombarded on July 11. The insurrection was forcibly put down, and a sort of constitutional monarchy established. On Jan. 18, 1883, a British financial adviser was given a seat in the council. During the Mahdi troubles in 1884 Tewfik was compelled, against his better judgment, to give up the Sudan. He was greatly interested in public works and public instruction. D. at Helwān Palace, Jan. 7, 1892.

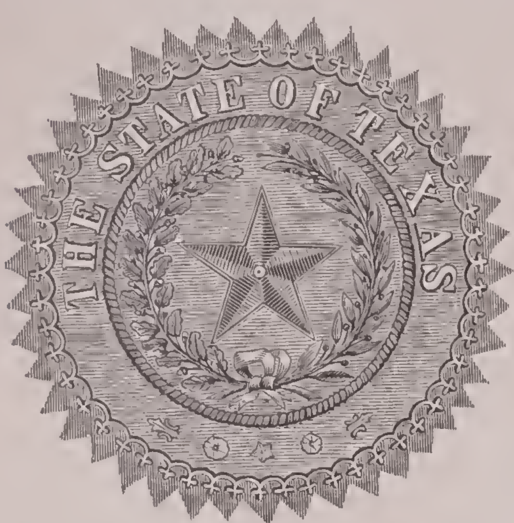
RICHARD GOTTHEIL.

**Tewksbury**: town (incorporated in 1734); Middlesex co., Mass.; between the Merrimack and Concord rivers; on the Boston and Maine Railroad; 5 miles S. E. of Lowell, and 22 miles N. W. of Boston (for location of county, see map of Massachusetts, ref. 2–H). It contains the villages of Wigginville, Gillmanville, Phœnix, and North Tewksbury; has a high school, twelve schools, public library, and the State almshouse; and is principally engaged in agriculture and the manufacture of cotton-machinery. Pop. (1880) 2,179; (1890) 2,515; (1900) 3,683.

**Texarkan'a**: twin city; one part, the capital of Miller co., Ark., the other part in Bowie co., Tex.; separated by the boundary-line between the two States; on the St. L., Iron Mt. and S., the St. L. S. W., the Texark. and Ft. Smith, and the Tex. and Pac. railways; 45 miles S. W. of Little Rock, and 58 miles N. N. E. of Jefferson (for location, see map of Arkansas, ref. 5–B, and of Texas, ref. 2–K). The city is a unit practically, though each part is legally a separate municipality. It is in a pine-lumber region; ships large quantities of cotton; has electric lights, cotton-compresses, machine and boiler works, cottonseed-oil mill, ice-factories, and car-works; and contains 3 national banks with combined capital of $275,000, and 2 daily and 2 weekly newspapers. Pop. (1890), part in Arkansas, 3,528; part in Texas, 2,852; (1900), part in Arkansas, 4,914; part in Texas, 5,256.

**Texas**: one of the U. S. of North America (South Central group); the fifteenth in order of admission into the Union; popularly known as the "Lone Star State."

*Location and Area.*—It is the most westerly of the States bordering on the Gulf of Mexico; is the largest State in the Union: lies between lat. 25° 51′ and 36° 30′ N., lon. 93° 27′ and 106° 43′ W.; bounded N. E. and E. by Oklahoma, Indian Territory, Arkansas, and Louisiana, S. E. by the Gulf of Mexico, S. W. by Mexico, and N. W. by New Mexico; with a rectangular projection, known as the Panhandle, included between Oklahoma on the N. and E., and New Mexico on the W.; area estimated at 268,242 sq. miles, including Greer County on its N. E. boundary, which is also claimed by the U. S. Government.



Seal of Texas.

*Physical Features.*—In its geology and topography Texas is composed of areas marked by typical aspects. The northeastern part belongs to the forest-belt extending across the Southern States, the northwestern to an extensive plain reaching downward through several States from the N., and the southwestern, beyond the Pecos river, to the Rocky Mountain system. The surface of the State, omitting the Trans-Pecos region, consists of a series of benches, approximately parallel to the Gulf coast, rising gently toward the N. W. and culminating in the great plateau of the Llano Estacado. Several of these benches are narrowed considerably near their middle portions. The Trans-Pecos country is covered with scattered mountain peaks and ranges having great basins between. The principal benches named in order from the S. E. are the Coast Prairie, the Lignitic Belt, the Black Waxy Prairie, the Grand Prairie, and the Central Denuded Region. Beyond the last lies the Llano Estacado. The Coast Prairie has a width varying from 50 to 100 miles, and the southeast edge, with its long, easy slope, extends a considerable distance out under the waters of the Gulf. The Lignitic Belt has an undulating surface, and is made up of plains, from some of which great basins have been carved out by rivers. The surface of the Black Waxy Prairie rolls gently, and is marked by numerous small hollows or depressions known as hog-wallows. This prairie is about 140 miles wide along Red river, about 85 on the Rio Grande, and only about 10 where the Colorado intersects it. The Grand Prairie is a great plateau, the southwestern part of which is a bed of hard limestone. Its southeast edge is marked by an escarpment reaching from the Colorado river to the Rio Grande, and known as the Balcones. Many springs, remarkable for volume of water and for beauty, burst out along the base of this escarpment. The Central Denuded Region is a basin having a maximum width of about 180 miles. It extends S. into the State for more than three-fourths of the distance across and separates the Grand Prairie from the Llano Estacado. The Grand Prairie, however, sweeps around the southern end of the basin and reaches the Llano Estacado in that quarter. The latter is a vast table-land, sloping gently to the S. E. In Burnet and Llano Counties there is an area of older rocks, notably Archæan, near the junction of the Grand Prairie and the Central Denuded Region. The coast has a line of long narrow islands extending along its front at a distance of 10 to 20 miles from the mainland. From Galveston northeastward these islands sink into shoals. The principal bays are those of Galveston, Matagorda, Espiritu Santo, Aransas, Corpus Christi, and Alazan. While there are districts in North and Central Texas mountainous in geological formation, the only elevations deserving the name of mountains by their altitude are in the Trans-Pecos country. The rivers all have an approximately parallel S. E. direction, except the Canadian and the Red. The former flows N. E. across the Panhandle, and the latter nearly E. along a large part of the northern boundary of the State. The principal remaining rivers named in order toward the S. W. are the Sabine, Neches, Trinity, Brazos, Colorado, Guadalupe, Nueces, and Rio Grande, with its tributary the Pecos. The Canadian, the Red, the Pecos, and the Rio Grande originate beyond the State, and their sources are included in a comparatively small district of upper New Mexico and lower Colorado.

*Soil and Productions.*—The Coast Prairie has a fertile soil of sandy loam with a red or yellow clay subsoil. The alluvial deposits of its river-bottoms are composed largely of materials brought down from the Cretaceous and Permian beds through which the rivers flow in their upper course, and are exceedingly rich. In the Lignitic Belt the pine uplands have a gray sandy soil, usually not very fertile, but the lowlands are better. The Black Waxy Prairie, though somewhat difficult of tillage, is one of the finest agricultural areas of the world. The northeastern half of the Grand Prairie is covered with a chocolate soil of great productive capacity. The southwestern half has a rougher surface, and the soil is shallow, the parts fit for cultivation being mainly the valleys. The Llano Estacado is deeply covered with a brown loam suited especially for wheat and fruit. The mineral resources of Texas are great, but as yet little developed. Salt is obtained from numerous lakes along the Rio Grande border and from salines in East Texas. Extensive beds of rock-salt exist in Van Zandt and Mitchell Counties. In East Texas lignite has been found throughout a large district. In the central and western parts are beds of bituminous coal. The workable area of the Central beds is estimated at 2,300 sq. miles. Sulphur, celestite, strontianite, asphaltum, gypsum, and kaolin are found in various quarters. There are large deposits of iron ore in East Texas, in the Trans-Pecos region, and in the districts adjacent to the town of Llano. Copper ore exists in the last two localities, and also in Northwestern Texas. Lead occurs in the Central Mineral Region and the Trans-Pecos district, and in the latter zinc as well. Gold and silver are found in both these sections. There are, however, few mines of any sort in the parts mentioned as mineral-bearing. There are numerous quarries of good building-limestone in the State, and several of sandstone. Among the most durable and costly varieties of stone are the granites, marbles, and serpentines of Burnet and Llano Counties and the Trans-Pecos region. The principal forests are in East Texas, and the prevailing growth is pine. In the western part of the forest region oak, hickory, and ash are common. In the river-bottoms of the southeast cypress is found in abundance, and in the northeast bois d'arc. Running from Red river S. are two belts of post-oak and blackjacks about 40 miles apart, the eastern being known as the Lower Cross Timbers and the western as the Upper Cross Timbers. They reach about 150 miles into the State, and mark respectively the eastern and the western edges of the Grand Prairie. Toward the S. W. the forests disappear and are replaced by cedar brakes, stretches of mesquite, and similar growths. Along the Rio Grande border are dense thickets of chaparral, mimosa, and various kinds of acacias. The southern part of the district W. from the Black Waxy Prairie is covered with nutritious grasses. Texas ranks first among the cotton-growing States. It produces also large crops of maize, wheat, and oats. Near Alvin in the Coast Prairie, around Tyler, and in the western parts fine fruit is grown.

The animals of Texas, like the vegetables, change in type in passing from the N. and E. toward Mexico. In the forests and along the streams of the eastern part are the red deer, beaver, squirrel, gopher, and badger, with an occasional brown bear, and panther. On the plains and in the more rugged districts of the west are antelopes, black-tailed deer, and big-horn sheep. Only one herd of buffalo is left in the State, and this is in a large pasture in the Panhandle. In different quarters are lobo-wolves and coyotes, red and gray foxes, skunks, wild cats and civet cats. The prairie districts abound in prairie-dogs and Texas hares. Among the birds of the State are wild geese and ducks, which are found mainly in the eastern portions and on the coast; while farther west the plover, curlew, snipe, and Mexican canary prevail. The quail, wild turkey, crow, hawk, owl, and mocking-bird are widely distributed. The commonest

reptiles are the alligator, horned toad, and snakes of various kinds, the only dangerous ones being the copperhead and rattlesnake. Two hundred and thirty species of fishes have been distinguished, most of them in the rivers of the Coast Prairie. The finest is the black bass. Among the invertebrates are the lobster, shrimp, crab, centipede, and tarantula, while along the coast are found oysters and clams in great abundance.

The following summary from the census reports of 1880 and 1890 shows the extent of farm operations in the State:

| FARMS, ETC. | 1880. | 1890. | Per cent.* |
|---|---|---|---|
| Total number of farms | 174,184 | 228,126 | 31·0 |
| Total acreage of farms | 36,292,219 | 51,406,937 | 41·6 |
| Value of farms, including buildings and fences | $170,468,886 | $399,971,289 | 134·6 |

* Increase.

The following table shows the acreage, yield, and value of the principal crops in the calendar year 1900:

| CROPS. | Acreage. | Yield. | Value. |
|---|---|---|---|
| Corn | 4,553,495 | 81,962,910 bush. | $38,522,568 |
| Wheat | 1,271,517 | 23,395,913 " | 14,973,384 |
| Oats | 744,164 | 28,278,232 " | 8,483,470 |
| Rye | 3,917 | 64,630 " | 43,302 |
| Barley | 2,049 | 50,405 " | 36,292 |
| Potatoes | 14,789 | 916,918 " | 806,888 |
| Hay | 304,933 | 548,879 tons. | 3,732,377 |
| Totals | 6,894,864 | ................ | $66,598,281 |

The cotton production in 1899–1900 was 2,438,555 bales. On Jan. 1, 1900, the farm animals comprised 1,125,645 horses, value $23,507,407; 260,562 mules, value $9,166,041; 693,794 milch cows, value $17,518,298; 4,352,541 oxen and other cattle, value $77,736,384; 2,416,721 sheep, value $4,634,063; and about 3,000,000 swine, value $10,000,000; total head 11,849,263; total value $142,562,193.

*Climate.*—In the northeastern and eastern part there is a fair amount of humidity, but the southwestern and western are too arid for successful agriculture without irrigation. The most marked features of the climate are the Gulf breeze, which blows from the southeast during the warm season, and is quite strong 200 to 300 miles from the coast, and the norther, a cold wind which comes with great velocity and little warning and causes sudden and considerable falls in temperature. The following tables, compiled from U. S. Signal Service observations, show the mean annual and monthly temperature and rainfall of six stations, two in the eastern, two in the central, and two in the western parts:

TEMPERATURE.

* Reference for location of counties, see map of Texas.
† Formed since census of 1890. ‡ Encinal annexed in 1899.

*Principal Cities and Towns, with Population for 1900.*—San Antonio, 53,321; Houston, 44.633; Dallas, 42,638; Galveston, 37,789; Fort Worth, 26,688; Austin, 22,258; Waco, 20,686; El Paso, 15,906; Laredo, 13,429; Denison, 11,807; Sherman, 10,243; Beaumont, 9,427; Paris, 9,358; Corsicana, 9,313; Palestine, 8,297; Tyler, 8,069; Gainesville, 7,874; Marshall, 7,855; Cleburne, 7,493; Temple, 7,065; Greenville, 6.860; Terrell, 6,330; Brownsville, 6,305; Brenham, 5,968; Hillsboro, 5,346; Texarkana, 5.256; Bonham, 5,042.

*Population and Races.*—In 1850, 212,582; 1860, 604,215; 1870, 818,579; 1880, 1,591,749; 1890, 2,235,523 (native, 2,082,567; foreign, 152,956; males, 1,172,553; females, 1,062,970; white, 1,741,190; colored, 494,333, of whom 492,837 were persons of African descent, 727 Chinese, 3 Japanese, and 766 civilized Indians).

*Industries and Business Interests.*—Texas is pre-eminently an agricultural and cattle-raising State, but is rapidly developing manufacturing interests. In 1890 there were reported in the census 5,268 manufacturing establishments, with $46,815,181 capital, employing 39,475 persons, paying $18,586,338 for wages and $36.152,308 for materials, and turning out articles valued at $70,433,551.

*Commerce.*—The foreign trade in the fiscal year 1899–1900, through the customs districts of Brazos de Santiago, Corpus Christi, Galveston, El Paso, and Saluria, aggregated, imports, $5,606,351; exports, $105,985,258.

*Finance.*—In 1898 the State had a bonded debt of $3,992,030, of which $3,254,040 are held by special funds, and $737,990 by individuals. The assessed valuation in 1900 was $946,320.258. The balance of the treasury Sept. 1, 1899, was $1,092,807.94; receipts for fiscal year ending Aug. 31, 1900, $2.859,967.60; disbursements, $2,733,781.60; balance Sept. 1, 1900, $1,159,587.54.

*Banking.*—Sept. 5, 1900, there were 223 national banks, with a combined capital of $19,618,920, surplus and profits of $9,029,138.13, and deposits of $49,749,908.63; on June 30, 41 private banks, capital $1,235,450, surplus and profits $319,179, and deposits $2,276,604; and 2 stock savings-banks, capital $135,000, surplus and profits $148,888, and $584,424 in savings deposits from 2,980 depositors.

*Post-offices and Periodicals.*—On Jan. 1, 1901, there were 3.102 post-offices, of which 164 were presidential (7 first-class, 27 second-class, 130 third-class) and 2,938 fourth-class. Of these, 1,153 were money-order offices and 4 money-order stations. The newspapers and periodicals (1901) comprised 71 daily, 14 semi-weekly, 646 weekly, 1 bi-weekly, 14 semi-monthly, 68 monthly, and 1 quarterly publications; total, 815.

*Means of Communication.*—The total mileage of main railway track in Texas, June 30, 1899, was 9,778·02. The total earnings for the year were $41,102,587.14. The following shows the extent of direct track and the value of property in the State of some of the most important systems, reported Dec. 3, 1894:

| NAME OF CORPORATION. | Mileage. | Total value. |
|---|---|---|
| Austin and Northwestern | 105·96 | $1,753,694 22 |
| Fort Worth and Denver City | 454·13 | 5,771,582 42 |
| Galveston, Harrisburg, and San Antonio | 919·06 | 16,142,297 45 |
| Gulf, Western Texas, and Pacific | 109·67 | 1,318,081 80 |
| Houston and Texas Central | 452·60 | 9,588,903 28 |
| Missouri, Kansas, and Texas of Texas | 837·91 | 13,437,440 80 |
| New York, Texas, and Mexican | 91·52 | 1,093,459 16 |
| Sabine and East Texas | 102·03 | 896,565 73 |
| St. Louis and Southwestern of Texas | 551·78 | 8,862,293 18 |
| San Antonio and Aransas Pass | 687·67 | 8,677,698 37 |
| Texas Central | 175·95 | 2,348,666 47 |
| Texas and Pacific | 1,039·33 | 17,730,689 31 |
| Tyler Southeastern | 88·60 | 914,746 98 |

*Churches.*—The census of 1890 gave the following statistics of the principal religious bodies:

| DENOMINATIONS. | Organizations. | Churches and halls. | Members. | Value of church property. |
|---|---|---|---|---|
| Methodist Episcopal South | 1,701 | 1,632 | 139,347 | $1,647,866 |
| Baptist, Regular, South | 2,318 | 2,302 | 129,734 | 1,384,035 |
| Baptist, Regular, Colored | 1,468 | 1,472 | 111,874 | 667,786 |
| Roman Catholic | 263 | 258 | 105,138 | 1,018,800 |
| Disciples of Christ | 536 | 390 | 41,859 | 467,900 |
| Methodist Episcopal | 407 | 390 | 27,453 | 592,835 |
| Cumberland Presbyterian | 476 | 411 | 22,297 | 436,108 |
| Colored Methodist Episcopal | 222 | 219 | 14,895 | 147,075 |
| Presbyterian in the U. S. | 242 | 216 | 10,774 | 627,806 |
| Lutheran, General Council | 42 | 43 | 7,140 | 128,740 |
| Protestant Episcopal | 139 | 118 | 7,097 | 624,900 |
| African Methodist Episcopal Zion | 47 | 47 | 6,927 | 26,450 |
| African Methodist Episcopal | 138 | 208 | 23,392 | 233,340 |
| Methodist Protestant | 158 | 155 | 5,536 | 16,700 |

*Schools.*—The system of public instruction includes the common schools, the high schools of the cities and towns, the Sam Houston Normal Institute for whites at Huntsville, the Prairie View State Normal School for colored students near Hempstead, the Agricultural and Mechanical College at Bryan, and the State University, which has the departments of literature, science, arts, and law at Austin, and that of medicine at Galveston. In 1899 the total scholastic population of the State was 706,050; and the total expenditure for public instruction in 1898–99 was $4.476.457. One hundred and eighty-eight cities and towns are organized as independent school districts. These may levy special taxes for the support of schools up to 5 mills per $1 for taxable property. Rural districts are allowed to levy 2 mills. The city and town districts levy varying amounts, but many of them go to the limit. Reports for 1898–99 show 10,667 public schools, with 14,989 teachers and 552,503 pupils enrolled, with a daily attendance of 370,055.

*Libraries.*—According to a U. S. Government report on public libraries of 1,000 volumes and upward each in 1891, Texas had 27 libraries, which contained 86,603 bound volumes and 8,401 pamphlets. The libraries were classified as follows: General, 5; school, 5; college, 12; college society, 1; law, 1; and garrison, 3.

*Charitable, Reformatory, and Penal Institutions.*—These comprise a State Asylum for the Blind, State Deaf and Dumb Asylum, Deaf, Dumb, and Blind Institute for Colored Youth, and State Lunatic Asylum, all in or near Austin; North Texas Hospital for the Insane, at Terrell; Southwestern Insane Asylum, near San Antonio; State Orphan Asylum, at Corsicana; State House of Correction and Reformatory, near Gatesville; and State penitentiaries at Huntsville and Rusk. The plan on which the work of the institutes for the blind and the deaf and dumb is based is, first, to educate their inmates as far as the conditions will allow; second, to train them to become self-supporting. The reformatory receives convicts under sixteen years of age, sentenced for not more than five years. Most of the convicts in the penitentiaries are employed in different kinds of manufacturing within the walls, but about one-third are kept at labor under contract, part on railways and part on State and private farms.

*Political Organization.*—The ordinary tenure fixed by the Constitution for officials of the legislative and executive departments is two years. Most of the heads of departments are elected. The judiciary consists of a Supreme Court, a criminal court of appeals, five civil courts of appeals—one for each of five districts into which the State is divided—and the usual district, county, and justice courts. The first two have final jurisdiction respectively of civil and of criminal cases. The judgments of the civil courts of appeals may be reviewed by the Supreme Court under constitutional conditions. There are three judges for each court, and they are elected one for each court every two years, the tenure being six years. Every male citizen twenty-one years of age, who has been one year a resident of the State and six months of the county where he seeks to vote, has the right of suffrage, with the exception of idiots and lunatics, paupers, persons convicted of felony, and soldiers, marines, and seamen in the service of the U. S.

*History.*—It is believed that the coast of Texas was reached in 1528 by Cabeza de Vaca, but the first European settlement within the limits of what is now the State was planted by René Robert Cavelier (see LA SALLE) in Feb., 1685, on the Lavaca river, and was named Fort St. Louis. Previous to this the country had been occupied only by scattered Indian tribes. In 1689 the Viceroy of Mexico sent a small force against the new colony, but the Indians had already stamped it out. In 1691 Don Domingo Teran, governor of Coahuila and Texas, planted several settlements in the latter province, but none survived long. In 1714 Crozat, to whom Louis XIV. had granted Louisiana, sent Huchereau Saint-Denis through Texas to the Rio Grande, mainly to ascertain the possibility of establishing trade with the province. This roused the Spaniards to an effort to secure possession of Texas. In 1715 they established a number of missions in the province, among them that of San Antonio de Valero, which was afterward moved to the famous mission-house known as the Alamo. From this time the hold of Spain on Texas was secure as against France, though the latter continued to assert its claims. In 1729 the Spanish Government tried the policy of colonizing the country instead of holding it by means of missions and military posts, but the attempt failed. In 1730 the Indians began war upon both Spanish and French settlers with the intention of expelling them, but did not succeed in weakening the hold of either. In 1735 the French planted a settlement on the west bank of Red river, and the Spaniards protested; but an official investigation made in Mexico tended to show that the settlement was on French territory. In 1762 France ceded Louisiana to Spain, and in 1800 Spain retroceded it to France. The establishment of the independence of the U. S. was followed by a controversy as to the boundaries between it and the Spanish territory, and the sale of Louisiana to the U. S. in 1803 made it necessary to define the eastern boundary of Mexico. Spain strengthened her forces in Texas, and in 1806 a conflict between the Spanish troops and those of the U. S. in the country E. of the Sabine river was prevented only by an agreement between the opposing generals to recognize the strip between the Sabine and the Arroyo Hondo, a little farther E., as neutral ground. In 1819 the Sabine was agreed on as the eastern limit of Mexico. During 1821–34 Southeastern Texas, except the part adjacent to the Mexican border, was settled by colonists from the U. S. The most important colony was that brought in by Stephen F. Austin. It was located on the lower course of the Colorado and of the Brazos. The Anglo-Americans soon became so numerous in Texas as to excite the jealousy of the Mexicans. The province had been joined to Coahuila, and the whole was governed unsatisfactorily to the colonists. In 1830 further immigration from the U. S. was prohibited by the Mexican congress. In 1833 the Texans sought to obtain a separate state government, but SANTA ANNA (*q. v.*) would not consent. In 1835 Texas revolted. A provisional government was organized, and a war followed, which was ended by the rout of the Mexican army at San Jacinto Apr. 21, 1836. On Mar. 2, 1836, Texas declared its independence, and on. Sept. 2 it adopted a republican constitution. At the same election Sam Houston was chosen president, and an almost unanimous vote was cast in favor of annexation to the U. S. The measure was then checked by President Van Buren's declining the proposition, and it failed again in 1844 because the anti-slavery sentiment and the fact that annexation meant war with Mexico prevented confirmation by the Senate. In 1845, under President Polk, who had been elected on a platform favoring annexation, Texas was annexed, not by treaty, but by a joint resolution of Congress. War with Mexico followed. The treaty of Guadalupe Hidalgo in 1848 established the Texas claim to the strip between the Nueces and the Rio Grande, previously claimed by both Texas and Mexico. In 1861 Texas seceded from the Union and joined the Confederate States. From June, 1865, to Mar., 1867, the State was under a provisional government, and from the latter date to Sept., 1869, under military administration. After this it was restored to its place in the Union.

GOVERNORS OF TEXAS.

*Provisional Governor before the Declaration of Independence of Mexican control.*

Henry Smith, Nov. 12, 1835–Mar. 18, 1836.

*Presidents under the Republic.*

David G. Burnet, Mar. 18, 1836–Oct. 22, 1836.
Sam Houston, Oct. 22, 1836–Dec., 1838.
Mirabeau B. Lamar, Dec., 1838–Dec., 1840.
David G. Burnet (acting), Dec., 1840–Dec., 1841.
Sam Houston, Dec., 1841–Dec., 1844.
Anson Jones, Dec., 1844–Feb. 19, 1846.

*Governors of the State.*

GEORGE P. GARRISON.

**Texas, University of**: a coeducational institution comprising departments in Austin, Galveston, and Bryan. The constitution of the republic of Texas made it the duty of the congress of the republic to provide by law a general system of education as soon as circumstances permitted. The congress of 1839 provided for the selection of a site for a university, and when Austin was located as the capital of the State, 40 acres of land, in the center of which the university buildings stand, was designated for the seat of the university. This action of the republic was followed by a grant of 50 leagues (221,400 acres) of land for the "establishment and endowment of two colleges or universities"; and in 1858 the State appropriated to the university $100,000 in U. S. bonds then in the State treasury, confirmed to it the 50 leagues grant of the republic, and further appropriated for its endowment every tenth section of the lands set apart to encourage the construction of railways in Texas. This endowment, which would have amounted to some 3,200,000 acres, was diverted to the free schools by the convention of 1876, which substituted therefor but 1,000,000 acres of far less valuable lands to the university. In 1883 partial restitution was made by the Legislature granting another million acres. The main sources of maintenance are from interest on bonds in which were invested the proceeds of the sale of the 50 leagues, with such appropriations as the Legislature can be induced to make. The bonds amount to $575,840, the interest on which and on land-notes of the university and a few thousand dollars from tuition fees aggregate an annual available fund of from $50,000 to $60,000, which it is proposed to ask the Legislature to supplement with a small tax sufficient to support the institution without the necessity of specific appropriations. The main university establishment, embracing the academic and law departments, was located at Austin in accordance with a vote of the people of the State in 1881, and was opened by the admission of students Sept., 15, 1883, when rooms were provided for the purpose in the temporary Capitol and used till the university building was finished and occupied Jan. 1, 1884. The medical department, which was located at Galveston, also by a vote of the people at the election in 1881, was formally opened in Oct., 1891. The Agricultural and Mechanical College at Bryan, which had been in operation many years before the university was organized, and which, under the Federal grant of 1862 for establishing agricultural colleges in the several States, was a beneficiary, independently of the university, of an endowment from the general Government, was made a branch of the university by the State convention of 1876 in order that it might also have the benefit of appropriations from the university fund. The university has three fine buildings on its grounds at Austin—the main building, costing $135,000; the chemical laboratory, $25,000; and Brackenridge Hall, which is a gift from George W. Brackenridge, of San Antonio, one of the university regents, built at a cost of $17,000 and used for a mess-hall. The medical department at Galveston embraces the Medical College, which cost about $125,000, and the John Sealy Hospital, valued at $70,000, the latter having been originally willed to the city by John Sealy, a citizen of that place, and transferred to the university. All departments of the university so far established are liberally equipped. In Jan., 1900, the number of academic and law students was about 400. Including with these 180 in the medical department at Galveston and those in the Agricultural and Mechanical College at Bryan there were over 900 students. The academic department has over 100 women students. J. J. LANE.

**Texcoco**, or **Tezcuco**, tāth-koo′kō: a town of the republic and state of Mexico; near the eastern side of Texcoco Lake, opposite to and 17 miles E. from Mexico city (see map of Mexico, ref. 7–H). It is celebrated in history. According to the Indian accounts it was founded or occupied about the year 1120 by a tribe of Chichimecs, who called it Acolhuacan or Tenayucan. It became one of the three confederated pueblos of the lake valley, and for a time was the most powerful, subsequently yielding the first place to Tenochtitlan, or Mexico. The inhabitants, called Acolhuas or Texcoeans, claimed a pre-eminence of culture and of purity in the use of the Nahuatl language. The chronicles of their chiefs or kings are preserved by Ixtlilxochitl and others. The last Acolhuan chief became an ally of Cortés in 1520, and at Texcoco the vessels were fitted out which played such an important part in the reduction of Mexico. The modern town is surrounded by farms and gardens. Near it are ruins, supposed to be remains of a country-house of Netzahualcoyotl, with a fountain incorrectly called the Bath of Montezuma. Pop. (1889), with the commune, 15,856. See MEXICAN ANTIQUITIES. H. H. S.

**Texcoco**, or **Tezcuco**, **Lake of**: the largest of the cluster of lakes in the valley of Mexico between Mexico and Texcoco. It is about 12 miles long by 7 miles wide, less than 2 feet deep, and much polluted by the city sewage. Formerly it was larger and deeper, surrounding the capital, which was approached by causeways. There are no true fish, but the axolotl (*Siredon*) is common in it. H. H. S.

**Texel**: the first and largest of the chain of islands which stretches along the northeastern coast of Holland. It contains about 35,000 acres of rich meadow-land.

**Texier**, tes′i-ā′, CHARLES FÉLIX MARIE: archæologist; b. at Versailles, France, Aug. 29, 1802; studied first architecture in the School of Fine Arts in Paris; devoted himself afterward to archæology; undertook under the support of the Government extensive explorations in the East between 1833 and 1843, and after his return was made inspector-general of public buildings in France and Algeria. The results of his explorations he communicated in his two magnificently illustrated works—*Description de l'Arménie, de la Perse et de la Mésopotamie* (2 vols. fol., Paris, 1842–45), and *Description de l'Asie mineure* (4 vols., 1839, *seq.*)—which were put into English by R. P. Pullan. These books have been much criticised for their lack of accuracy, as many plates are alleged to have been drawn and engraved chiefly from unwarranted conclusions of the explorer, and to have been proved inexact by later investigation. D. in Paris, July 1, 1871. Revised by RUSSELL STURGIS.

**Textile-designing**: the originating and producing of designs for textile fabrics. All large mills, making goods which require the combination of colors or weaves to produce patterns, employ a designer of such patterns. A textile design should contain not only the drawings of the figure to be produced, but also a careful arrangement of the calculations and estimates for the work in the different branches of the manufacture. Many of the calculations and explanations, which must be a part of the complete design for a fabric complex in its production, may, however, be dropped from the design for a simple fabric. Besides giving the arrangement of warp and filling, as to colors, and the disposition of warp on the different harness, the textile design should include all the items in the following form, even for the simplest fabric:

| | |
|---|---|
| Name of fabric, | Style number, |
| Number of ends in warp, | Number of picks to the inch, |
| Reed, | Width in loom, |
| Size of warp yarn, | Size of filling yarn, |
| Loom texture, | Finished texture, |
| Loom weight, | Finished weight, |
| Production of the loom a day, | Finished width, |
| Stock, | Weave. |

It is also often necessary to give the amount of each different color of yarn to the yard or in a given number of yards of the fabric in hand.

It will thus be seen that designing is one of the most important of the branches of textile manufacturing. Any mistake in the design may cause much trouble in the mill, if not a loss to the manufacturer. If a fabric is not started properly in the designing-room, the processes through which it passes before being ready for the market will not produce it a perfect fabric. It is not necessary to send a complete design to each department in the mill; only instructions respecting the processes in the department; but this work should be carefully compared by the designer with his record before being sent to the departments. To produce a textile design intelligently a knowledge of manufacturing is required. The designer must become thoroughly conversant with the loom and what can be accomplished by its use, that he may be competent to produce and understand any weave which could be made. The various raw materials must be studied and the methods used to grade the yarns made from them, according to size. To produce a perfect fabric he must study the effect each process in the manufacture has on the raw materials, and, in his conception of the fabric, go over all the processes and then make his design. Only experience, practical mill-work, will show the designer what the construction must be.

*Weaves.*—A knowledge of this division of the textile designs, while more theoretical, is not less important than the practical knowledge of raw materials, yarns, and processes of manufacture. Weaving is the interlacing of two systems of threads, technically known as "warp and filling"; the threads in the length of the fabric are known as the warp, while those with which it interlaces are called the filling; yet very few persons realize the endless varieties of ways, i. e. weaves, which may be employed in the interlacing.

As in the study of color it is found that all the many shades and tints point to three primary colors, so in the study of weaves there are found three primary weaves known to designers as the plain, twill, and satin. It does not follow that every weave resembles either one or all of these primary weaves; yet in innumerable cases the weave is derived directly from one of the three weaves, or is a combination of them.

*Plain Weaves.*—The three primary weaves are illustrated in Fig. 1. The plain weave is shown by the plan A, called a draft, written out on a section of squared design-paper. The warp and filling as interlaced are represented by B. It will be seen that in the weave the movement of every other warp-thread is alike, as shown by the crosses which are used in the draft to represent the raising of the warp-thread at the passing through of the shuttle. To be able to understand the drafts even for the plain weave, the reader will find it necessary to possess a knowledge of the process of weaving. The warp after being wound upon the warp-beam is drawn through the heddles of the different harness. Of these harness there must be as many as there are different movements required for these warp-threads, as shown by the weave. The filling is interlaced with the warp by the shuttle, containing the bobbin of filling, being passed through the shed, formed by the warp being separated into two parts, some of the harness being raised, the others lowered. For description of shed, harness, etc., see LOOM.

Looking for a moment at A in Fig. 1, there will be seen only two movements to the warp-threads. Threads 1, 3, 5, 7, and continuing odd threads, are working alike, and could in consequence be put upon one harness. Threads 2, 4, 6, 8, etc., would be placed on a second harness, as they work alike, and differently from 1, 3, 5, and 7. Thus only two harness are required for this the plain weave, which is the most simple that could be made, the position of the warp-threads changing for each successive pick or shot of the shuttle. Warp-threads 1, 3, 5, etc., are raised on the first pick in the draft A, while their mates are lowered, forming a shed. For

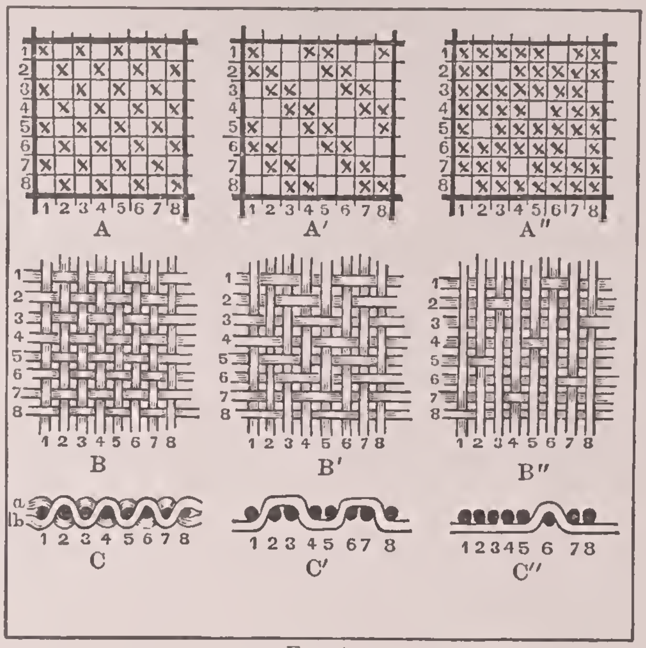

Fig. 1.

the second pick the position of every thread is reversed. The continued changing of position and the passing of the filling through the shed at each change forms the fabric as seen in B, Fig. 1. A sectional view of the plain fabric cut through the warp is given in Fig. 1, C, the warp being represented by the solid black, the filling by *a* and *b*.

*Twills.*—The second primary weave, the twill, could be defined as a weave having the picks alike, except that each pick in turn is stepped one square, that is, one thread to the right or left of the one preceding it, and has at least one float of more than one thread. Beginning at the left and stepping each succeeding pick to the right one thread and toward the bottom would produce a left twill (see A′, Fig. 1); while beginning at the right and stepping to the left toward the bottom would form a right twill. Any twill may be easily written out if one pick is given by starting in the upper left-hand corner of a piece of squared paper, using the crosses when the threads are raised. If the pick given was "the first thread raised the second lowered," and continuing the same, technically "one up and one down," or $\frac{1}{1}$, each pick alike but stepping to right or left, the weave written out would be the plain weave. The twill requires a float of more than one thread and the three-harness twill is the simplest, designated $\frac{1}{2}$ or $\frac{2}{1}$. The first pick of the $\frac{1}{2}$ twill beginning at the left gives *a*, Fig. 2; the next pick must step one space to the right (or left), and is *b*, Fig. 2; the third pick is *c*, Fig. 2; each pick being shown by two repeats of the weave. On this basis all twills may be written out. A′, B′, and C′ in Fig. 1 illustrate the $\frac{2}{2}$ twill weave. This is the four-harness or cassimere twill; with the exception of the plain, it is the most common weave which is used.

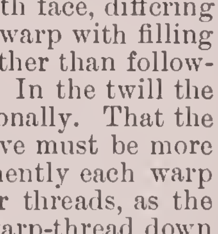

Fig. 2.

*Satin Weaves.*—The satin or satine is a weave extensively used, producing a fabric with a very smooth face, differing from the twill in that the intersections of warp with filling threads are distributed over the surface rather than following closely as in the stepping of the twill. In the twill the fabric presents a rib or wale, running diagonally. That the intersections may not be adjacent the weave must be more than four threads to a repeat, and consequently each warp and filling thread must float at least four threads, as the smooth face is obtained by stitching the warp-thread down for one pick in a repeat, if it is a warp-face, or if a filling-face the warp is carried to the back, and only brought to the face for one pick in each repeat. The simplest satin weave possible, then, is the five-harness, Fig. 3, which is used to illustrate the construction of all satins. A rule to construct any perfect satin weave is to take two numbers, the sum of which is the number of harness to be used, neither of the numbers to be one, or to be contained an even number of times by the number of harness; select one of the numbers as a counter, and begin in the lower left-hand corner of the squared-design paper, having marked off a square with as many sections as there are harness to be used. In the construction of the five-harness satin, A, Fig. 3, take the numbers 2 and 3; selecting 2 as a counter, mark the intersection of warp and filling threads No. 1 as the stitching of the first filling thread; counting off 2 to the right from this intersection gives the warp-thread to which the second pick is stitched. The continued counting off of two threads gives the weave A, Fig. 3. Should the fabric in hand require a warp-face the draft would be written as B, Fig. 3; C, Fig. 3, would be the draft for the filling-face. The eight-harness satin warp-face is given in Fig. 1, A″, B″, C″, and if compared with the plain and twill weaves in the same illustration will further show the construction of the weave and its differences from the other primary weaves.

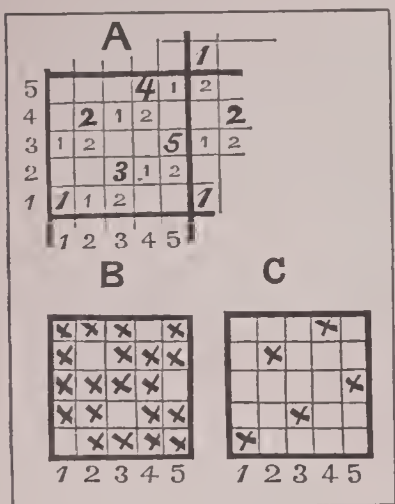

Fig. 3.

*Drawing-in Drafts.*—The object of these drafts is to designate the position of the different warp-threads in each repeat of the pattern, showing which of the harness each shall be placed on. There are various names given to the different forms of drafts, each self-explanatory, as straight draws, skip-draws or cross-draws, point-draws, section-arrangement draws. An examination of Fig. 4 will help the reader to understand the process of drafting for the drawing-in. A represents the weave, B the straight-draw on twelve-harness, and C the reduction of the number of harness to six by the cross-draw, that is, by drawing in all those warp-threads which work alike on one harness; D is the draft showing the harness-movements when reduced to six. The vertical lines marked *v* in C designate how the warp-threads shall be drawn through the reed.

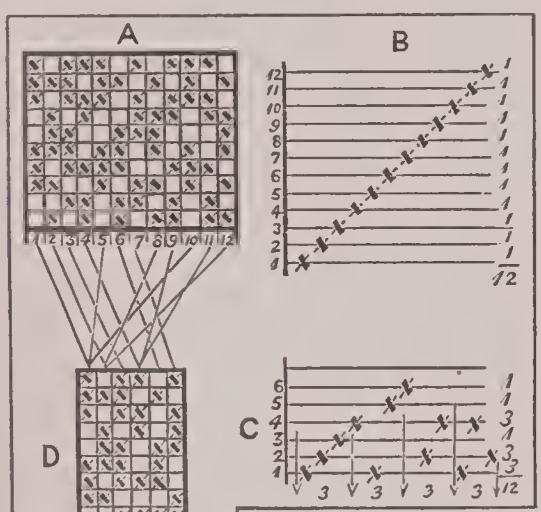

Fig. 4.

*Texture.*—This is the number of threads to the inch in a fabric; the warp-texture means the number of warp-threads, while the texture of the fabrics is the texture of both warp and filling, as 50 × 50, 48 × 48, 40 × 32. In writing out weaves for fabrics of uneven textures it is advisable to use a squared paper which is divided into sections to the square inch in the proportion of the warp and the filling threads.

*Figure-designs.*—Upholstery and carpet-designing and many kinds of silk-designing demand more artistic ability than skill in manufacture so far as the designer is concerned, and the field is so great that explanations of the various systems can not find place here.

LITERATURE.—For books covering not only what has been given in this article, but far more that could not be given, as designing for double-cloth, gauze, and all Jacquard work, the reader will find very valuable Ashton and Ashenhurst on *Design*; Posselt's *Technology of Textile Design* and *Jacquard Machine*; Posselt's *Structure of Fibres, Yarns, and Fabrics* (among the best); Chevreul, Barlow, and Beaumont on *Color*; and a book which is itself a cyclopædia of textile terms, Spitzli's *Manual* (5th ed. 1881). LOUIS CLARK.

**Textile Fabrics**: fabrics made by weaving threads in a loom. (See LOOM and WEAVING.) The threads usually employed are those made by spinning from vegetable fiber, such as that of hemp, flax, cotton, and many plants with fibrous leaves, especially common in tropical countries: of animal fiber, such as wool of sheep, the hair of many varieties of goat, the llama, the camel, the horse, and other beasts: and of the threads spun by the silkworm. A few exceptional fabrics have been woven from *byssus*, or the silky filaments attached to the bivalve shell *pinna flabellum*, the thread of the spider, and other materials capable of being reduced to slender and somewhat pliant strips; thus glass has been spun into threads, and these have been woven into a texture having much beauty of color and luster; the unopened leaves of some plants are woven into hammocks and into the well-known "Panama" hats; and a weaving together of leather thongs has been used as a defensive garment in warfare. Wire, as of silver and silver gilt, has been woven into cloth with other materials, as linen and silk, for ornament, and gilded paper cut into slender strips is used for the same purpose. Feathers also have been woven into fabrics, perhaps only for decorative purposes, a good example being the fabrics of brilliant-colored feathers made by the people of some islands in the Pacific.

As textile fabrics have in all ages been made ornamental, so decorative effect has been sought not only by the color and the luster of the threads composing it, but also by the arrangement of the loom and the passing of the threads so as to produce surfaces of a character very different from that of simply woven stuff like ordinary cotton cloth. Thus a stuff can be woven of silk and cotton, or of silk and wool, in such a way that the whole surface of one side shall be of silk. In like manner a fabric of silk of two colors can be so woven that each surface shall be of one of those colors. Again, the threads can be so interwoven that considerable masses of the thread running in one direction shall be brought to the surface without being visibly broken by threads crossing them. These threads lying closely parallel display whatever natural gloss they have. Again, the threads running in one direction can be thrown up in loops, more or less long, and these loops can either be left to produce by themselves a peculiar surface or, as is more usual, they can be cut or shaved so as to produce the well-known surface of velvet, velveteen, and fustian. Patterns on the surface varied from the background both in the color of the threads and in the direction in which they lie, and patterns also of velvet surface or of uncut velvet or loops, as above mentioned, are also available by way of ornament. Greater thickness, warmth, the power of shedding water from the surface, and similar useful qualities can be got by the same means as are employed for decoration. Hence the varieties of textile fabric are indefinitely numerous, for these different devices are combined together in many different ways. Textile fabrics are colored for decorative purposes, sometimes by dyeing the thread before it is woven into the web. The simplest instance of this is gingham, in which all the threads are colored and the pattern is got by arranging the differently colored threads in stripes and plaids. Glass-cloths and tea-toweling are made in this way. Textiles are often colored after being manufactured, or "in the piece." (See DYEING.) The effect of dyeing is sometimes modified for decorative purposes by gathering up small parts of the surface and tying them tightly. These parts, when the stuff is plunged in the dye, do not absorb the color with any readiness, and undyed spots are left. In some Eastern stuffs, both silk and cotton, undyed figures of definite shape are relieved upon the dyed ground. It is probable that those are produced by painting or printing the surface beforehand with some substance which repels the dye. A somewhat similar effect is produced in European goods, as thin silks, by printing in color the larger part of the surface, leaving spots of the uncolored material. Textile fabrics are ornamented also by the application of color directly to their surface, either by hand-painting, which is unusual, or by printing from engraved blocks. All the great variety of figured calicoes are produced in this way, and thin silks also are printed in patterns. But this manner of decorating, as well as EMBROIDERY (*q. v.*), is separate from the question of textile fabrics, as fabrics are made complete before being decorated in either of these ways.

*Simply woven goods* are those in which one thread of the weft or woof passes across the width of the web, passing alternately above and below the threads of the warp, one at a time. Examples are common linen and cotton goods, such as are used for undergarments, bed-sheets, and the like. Such goods are known by different names often taken from the uses they are put to and often from the place of their original manufacture. Linen cloth or linen is the common name for cloth made from flax. Linen sheeting and linen shirting are so called because of the more common use in modern times of cotton cloth for these purposes. Cambric or linen-cambric is a fine and close-woven material for pocket-handkerchiefs, and at different epochs, according to fashion, for different articles of dress; batiste is a still finer cambric; crash, canvas, duck, and sail-cloth are all stouter cloths, made originally of linen or hemp, although now more commonly of cotton, the names sometimes being used with the prefix, as cotton-duck. Other cotton goods of plain weave, besides cotton-cambric, etc., are the cloth which is called in Great Britain *calico* and in the U. S. more commonly *muslin*, except when printed in colors, and muslin proper, a cloth which is either the fine hand-woven stuff of India or its European imitation. Woolen cloths and those of silk and wool or cotton and wool are also frequently of simple weave. Such are many blankets, the stuff called challis, which is usually printed in colors, the dress material formerly called mousseline de laine and now known by other names, and many light materials, the trade-names of which differ so widely from year to year, as fashions change and manufacturers try to recommend their goods, that it is useless to name them. The patterns in simply woven stuffs must be either plain stripes, or stripes which when crossing each other form plaids, or "polka spots," or other plain figures. A very slight change in the weave allows of a much richer ornamentation. Thus, when the threads are slightly bunched together, so that three parallel threads of the woof which have been separately alternating with those of the web are gathered into one strand and alternate with another similar strand made up of three threads of the warp, there is produced a square of coarser weave, giving a decided pattern to the surface. In like manner, especially in silk-weaving, threads are bunched together for the whole fabric, producing what is sometimes called "basket weave." If the strands are pretty large, thirty-two to an inch or larger, and if several colors are employed in the same web, an appearance of considerable richness may be got by mere crossing lines. In like manner an appearance of silky softness is got by bunching the threads lying in one direction, and holding these together by fine strong threads the other way, as in some silk blankets; but this weave has little strength.

When, however, anything elaborate is proposed, some less simple weave is employed. The one which comes nearest to plain weaving is that where, while the warp is continuous, the threads of the weft stop and return upon themselves, so that each figure of the pattern is of one color and is separated by a complete break in the stuff from the next figure. This is used in some beautiful Chinese silks, where the most elaborate flowers are woven into the uniform thickness of the web, without other separation from the background than this of the breaking off of the weft threads. In the flowers each color is separated from the other colors, as can be seen along the lines of division which run lengthwise of the stuff. A similar texture exists in the thin and hard-finished Eastern rugs without nap, and showing the same pattern on both sides, which rugs are called "Persian cloths" by the dealers. A twill or a twilled fabric is merely one in which a thread of the woof is carried over and then under several threads of the warp at one time. This produces in the simple forms a kind of diagonal striping characteristic of the stuffs ordinarily called twill. Scotch tartan plaids, the beautifully soft India shawls called Rampoor Chuddahs, most linen diaper, tweeds and cheviots and serges, are examples of twilled fabrics. Satin is nothing more than a twill, the threads which lie side by side and form the surface being very soft, with a silky luster. Twilled fabrics are much stronger than those simply woven, and it is much easier in these to produce elaborate patterns on the surface, whether in different colors or by the mere arranging of the threads so as to catch the light. Linen damask, for instance, such as is used for table-cloths, has commonly a pattern, the principal threads of which lie in one direction, while those of the background lie in the contrary direction. It is common to have the pattern finished with a satin-like gloss on the right side; on the reverse side, then, the background will have this gloss and the pattern will be without it, for the two sides of this stuff are the counterparts of each other. Another variety of weaving is that which produces ribbed materials, the ribs running across the fabric. In these the woof is merely a series of bunches or strands of fine threads, or else single stout cords, which lie nearly straight in the fabric, while the warp passes over them, up and down, leaving the ribs showing their rounded surfaces. Such materials are called reps, corded silk, and gros-grain. Sometimes the ribs come in pairs, or ribs of different sizes are alternated. *Crape* is the general name of material made of threads twisted in reverse directions, so that the surface of the stuff is very much crimped and blistered. Ordinary silk crape, a thin and gauzy textile, is dyed black and used for mourning garments in Europe, but is printed in bright colors in the East. *Canton crape* is a thicker and softer silk textile. *Crépon* is a similar fabric made of woolen or other thread much heavier than crape.

Perhaps the most important variety of weave is that which produces goods having a pile, such as velvet, velveteen, and fustian, also corduroy, which is merely velveteen or fustian in lengthwise ribs. In these materials a part of the woof is brought to the surface and forms fine, small loops, which loops cover the whole surface, at least of those parts which are to have the velvet finish. When these loops are not cut in any way the stuff, if of fine silk material, is what is called *uncut velvet*. Much the more common way of finishing the stuff is to cut the loops so that their threads form a uniform surface like the fur of some small animal. The threads standing up in this way are called the pile. Ordinary velvet has a uniform surface, usually of one color, and the name is confined to silk material of considerable value. Velveteen has a similar surface, and is of several kinds: first, a mixture of silk and cotton; second, the material anciently called fustian and made entirely of cotton; third, a material in which the pile is of woolen; but the names change with changing fashions. A material called *velours*, made of linen with a short pile, is also used for furniture-coverings. In goods having a pile the surface is generally uniform, although it may be broken by patterns in color; but a material is also produced in which only a part of the surface has the raised loops, whether cut or uncut, the rest being solid and seeming depressed below the velvety surface. There is, for instance, a Chinese stuff of great beauty in which large parts of the surface are covered or nearly covered with thin strips of gilded paper or silver gilt wire, having upon this an elaborate pattern of flowers, birds, and dragons in velvet pile. There is also a velvet which has the pile of different length or height in different parts, so that a pattern in long or high pile is relieved upon a shorter pile. This is called *pile upon pile* velvet. A greater elaborateness may be reached by having the general surface smooth, with a pattern in short velvet pile relieved and picked out by parts of longer pile. In the sixteenth century a splendid fabric was made which has been reproduced since 1880 in Venice and perhaps elsewhere. In this the ground is more or less satin-like in gloss and finish, and upon this ground a pattern is raised which is partly in uncut velvet with the loops arranged in strongly marked ridges and partly in cut velvet in still higher relief, the pattern being also in three or four different colors.

For another important class of textiles, see CARPETS.

Textile fabrics are of peculiar interest to the student of decorative art, because of the endless variety of effect which may be produced by combining the different methods of weaving, and because of the beauty of the results. In all ages weaving has been one of the first industrial arts which man on emerging from savagery has used for his humblest needs, and which he has then tried to make ornamental; the only exception being the practice of those peoples who have at hand natural substances which replace textiles, such as *tappa* and similar easily prepared materials in the Pacific islands. Elaborate machinery has not been necessary. The most splendid fabrics known, and the most delicate, have been produced on hand-looms of a rudeness hard to imagine—portable frames set up under a tree, as in India, or under a tent, as with the weavers of some of the most beautiful rugs ever made. In fact, the introduction of labor-saving and complicated machinery has been a direct and very positive injury to the textile industry considered as an ornamental art. None of the productions of the power-loom can interest the lover of beautiful fabrics. The making of such beautiful fabrics in the primitive way stops as soon as the machine-made product comes to compete with them, and, although manufacturers sometimes try to imitate the ancient hand-woven stuffs, the imitations have very little of the beauty of the originals. The fine art of weaving belongs to the past and to the few Oriental peoples who still preserve for a little while some of their traditions. Public museums exist in which there are large collections of ancient stuffs, from the fragments of Egyptian and Peruvian mummy-wrappers to the gold-woven kincabs of India and brocades of Japan. The history of textiles is to be studied also in the representations of stuffs of which no fragments remain, as in the sculptures and paintings of Egypt and the art of sculptures in Assyria. The textile art and pottery should be studied together as the most important records of mechanical civilization. R. STURGIS.

**Thacher**, JOHN BOYD: See the Appendix.

**Thack'eray**, ANNE ISABELLA: author. See RITCHIE.

**Thackeray**, WILLIAM MAKEPEACE: novelist; b. in Calcutta, India, July 18, 1811; son of Richmond Thackeray, secretary to the Calcutta board of revenue, and descended from an ancient Yorkshire family. He was sent to England in 1816; was educated at the Charterhouse School, London, and at Trinity College, Cambridge (1829–30), where he was a contemporary of John M. Kemble and the brothers Tennyson, but left without taking a degree. At Cambridge he edited *The Snob*, a weekly undergraduate paper, in which he printed a parody on Alfred Tennyson's prize poem *Timbuctoo*. He then traveled and studied on the Continent, especially in Italy, with a view to becoming a painter; spent a season (1830–31) in Weimar, enjoying free access to the ducal courts and becoming intimate with the aged Goethe and his brilliant circle. In 1831 he took up his residence in the Temple and began to read law; but in 1832 he went to Paris, in which city he continued to be as much at home as in London for the next ten years of his life. He had inherited a fortune of about £20,000, which he lost in an Indian bank and in journalistic speculations, and by 1837 he began to devote himself seriously to literature. He became a correspondent of *The Times*; wrote humorous papers for *The New Monthly Magazine*, for *Fraser*, and for *Punch* over a variety of signatures, such as Michael Angelo Titmarsh and The Fat Contributor; published collections of his magazine articles with original illustrations, as *The Paris Sketchbook, by Mr. Titmarsh* (1840); *Comic Tales and Sketches* (1841), including the *Yellowplush Papers*; *The Irish Sketchbook* (1843); visited the East in 1845, and published as the result *Notes of a Journey from Cornhill to Grand Cairo* (1846); was first recognized as a literary celebrity upon the publication of his novel *Vanity Fair*, in monthly numbers (Jan., 1847, to July, 1848). He was called to the bar May 26, 1848, but never practiced; availed himself of his recently acquired popularity to issue several small volumes made up from earlier articles, *Our Street* (1847); *The Book of Snobs* (1848); *Dr. Birch and his Young Friends* (1848); and *The History of Samuel Titmarsh and the Great Hoggarty Diamond* (1848); brought out in monthly parts (Nov., 1848, to Oct., 1850) his second novel, *The History of Pendennis*, which confirmed his already high reputation, and made him in popular estimation a rival of Dickens for the first place in modern English fiction; lectured with brilliant success on the *English Humorists of the Eighteenth Century* in London 1851, and in the U. S. 1852; published *The History of Henry Esmond* (1852), *The Newcomes* (1853–55), and *The Virginians* (1857–59), completing the series of his five really great novels; lectured in the U. S. 1855–56, and afterward in England, on *The Four Georges*; presented himself unsuccessfully as a Liberal candidate for the representation of the city of Oxford in Parliament 1857; founded *The Cornhill Magazine* (1859), in which he published his two latest novels, *Lovel the Widower* (1860–61) and *The Adventures of Philip* (1861–62), both admitted to be inferior to his earlier productions, and a series of articles collected as *Roundabout Papers* (1862), and resigned his editorship Apr. 11, 1862. D. in Kensington Palace Gardens, London, Dec. 24, 1863. A marble bust by Marochetti has been erected to his memory in Westminster Abbey. A great part of his life was saddened by the insanity of his wife, who survived till Jan. 11, 1894. Thackeray has been variously described as a realist and a caricaturist, a cynic and a sentimentalist. Beginning with burlesque, satirical character sketches, and all manner of humorous skits and broadly comical drolleries, he gradually widened his field and refined his method until in his great novels he was able to draw a picture of English life, and especially of the life of town, society, and the upper classes, which, while brilliant as satire, included the tragic as well as the comic elements, and in truth to nature was superior to the work of his great rival and counterpart, Charles Dickens. He left an unfinished novel, *Denis Duval*, printed in 1867. Collected editions of his early writings appeared in the U. S. under the title *Miscellanies in Prose and Verse* (4 vols., 1855–57), and rival editions of his complete works are published in Boston, New York, and Philadelphia. A collection of his fugitive articles was issued by James T. Fields as *Early and Late Papers* (Boston, 1867). *The Orphan of Pimlico, and other Sketches, Fragments, and Drawings* (1875) was edited by his daughter. A volume of his inimitable caricatures and marginalia collected under the title of *Thackerayana* was published in 1876. James Hannay, Theodore Taylor, and William B. Reed have published valuable biographical monographs on his life. See also *Thackeray, the Humorist and the Man of Letters*, by J. C. Hotten (1864); *Anecdote Biography of Thackeray*, by Richard H. Stoddard (1874); *Life of Thackeray*, by Anthony Trollope (1879); and *Life of Thackeray*, by Herman Merivale and Frank T. Marzials (1891).

Revised by H. A. BEERS.

**Thadmor**, or **Tadmor**: See PALMYRA.

**Tha'is** (in Gr. Θαΐς): an Athenian courtesan, as celebrated for her wit as for her beauty. She accompanied Alexander the Great on his expedition into Asia, and is said to have instigated him, during a festival at Persepolis, to set fire to the palace of the Persian kings in revenge for the calamities which Xerxes had brought on her native city. After the death of Alexander she entered into a connection with Ptolemy, son of Lagus, King of Egypt, who is said to have married her, and to whom she bore two sons and a daughter. Revised by J. R. S. STERRETT.

**Thalamenceph'alon**: See BRAIN.

**Thalberg**, SIGISMOND: pianist; b. in Geneva, Switzerland, Jan. 7, 1812. He was a natural son of Prince Dietrichstein and the Baroness Wetzlar, who superintended his early education. By the time he was fourteen years of age he was a remarkable pianist. He made many concert tours all over Europe and through the U. S. with the greatest success. He married in 1843 in Paris the daughter of Lablache, the singer, and his daughter, Zare Thalberg, became an opera-singer. Thalberg's compositions are all for the piano. D. in Naples, Apr. 26, 1871. D. E. HERVEY.

**Thaler**, taa'ler [= Germ. : Eng. *dollar*. See DOLLAR]: a coin and money of account in several European countries. The German *Thaler* of silver, till 1871 the monetary unit for Northern Germany, is worth \$0·729. The former Norwegian specie *daler* was equal to \$1·106. Denmark has a gold ten-daler piece worth \$5·532. Since 1873 the monetary unit for Denmark, Norway, and Sweden is the *krona*, two of which form a rigs-daler, equal to \$0·553.

**Tha'les** (Gr. Θαλῆς): the earliest of the Greek philosophers, and with justice called the father of philosophy; b. at Miletus about 640 B. C.; d. about 550. He was of Phœnician descent, and his father's name appears to have been Examyos (perhaps *Samuel*; see *Acta Societat. Philolog. Lipsiensis*, vol. iv., p. 328, *seq.*; but cf. Diels, *Arch. für Gesch. der Philos.*, ii, 165–70). He was the founder of the so-called Ionic or Hylogoic School of Thought, and was also one of the Seven Sages, a practical man, an astronomer, and a mathematician. He was the first man in the Western world who, setting aside the popular mythological or theological explanation of the universe, looked for its first principle in an abstraction of the reason. Philosophical language being then uninvented, he defined his abstract, universal ground of things as *water*, being led to this perhaps by observing that all nourishment contained moisture. (See Aristotle, *Metaph. A*, 3.) He may be said to have been the discoverer of Material Cause, although of course he made no distinction between matter and form, or between being and becoming. Still less had he any notion of efficient or final cause, although, having observed the action of the loadstone, he affirmed (according to Aristotle, *De An.*, i., 5) that all things were full of gods (θεοί). Thales left no writings, and even in Aristotle's time considerable doubt prevailed regarding his opinions. The chief sources of knowledge respecting him are Aristotle and Diogenes Laertius. (Cf. Byk, *Die Vorsokratische Philos. der Griechen*, vol. i., pp. 25–34.) He taught geometry, and studied astronomy. He is said by Herodotus (i., 74) to have predicted an eclipse of the sun, which happened, according to Ottmanns, in B. C. 609; according to Airy (*Philosophical Transactions*, vol. cxliii., p. 179), in 585.

THOMAS DAVIDSON.

**Thali'a** [= Lat. = Gr. Θάλεια, liter., fem. adj., luxuriant, blooming, deriv. of θάλλειν, abound, be luxuriant, bloom]: in Greek mythology, one of the nine MUSES (*q. v.*). She presided over comedy, idyllic and bucolic poetry, and her attributes are the ivy crown, the comic mask, and the shepherd's staff. J. R. S. S.

**Thal'lium** [Mod. Lat., from Gr. θαλλός, green shoot, deriv. of θάλλειν, be luxuriant, flourish, bloom. So called from its green line in the spectrum]: one of the rarer elements, a metal, discovered in 1861 almost simultaneously by Lamy in France and Crookes in England, working independently of each other, by means of the spectroscope. It is found as a small constituent of some iron and copper pyrites in both native and artificial sulphur, in blende and calamine, in lepidolite, in mother-liquors of salt-works at Nauheim, etc. The most productive source of thallium has been from the condensed fume found in the flues of furnaces in which thalliferous pyrites is burned for the manufacture of sulphuric acid. Thallium is nearly as white as silver, with a high luster. It is a very soft metal, easily scratched by the nail, and even softer than lead. It marks paper like lead. Like the latter it is almost or quite destitute of elasticity, and acquires none by hammering or rolling. It is nevertheless crystalline in its internal structure, and gives, when bent, a "cry" almost equal to that of tin. It fuses at about 555° F., expanding considerably. It may be welded perfectly at the ordinary temperature by pressure, like the soft alkali metals. Its spectrum is the simplest one known, and becomes no more complex at intense temperatures in flames, but in sparks from an induction-coil, between thallium-points, five more lines come out, and the photographic spectrum is by no means simple. Thallium has not been recognized in the sun. It is strongly diamagnetic, nearly as much so as bismuth, and conducts electricity about like tin and lead. At a red heat it volatilizes in the air, giving brown oxidized vapor, and boils at a heat below whiteness. Hydrogen passed over the highly heated metal carries it along in vapor, and such hydrogen, even when cool, retains enough thallium to burn with a bright-green flame. Thallium burns brilliantly in oxygen. It is attacked with some difficulty by dilute sulphuric acid, but scarcely at all by hydrochloric acid; by nitric acid with violence. Its salts are highly poisonous, and some of them are sensitive to light, like silver salts, and might be used in photography, though not sensitive enough to possess any advantages. It forms a hard, brittle, white alloy with copper; with lead, a malleable alloy; it combines with platinum very readily, with evolution of great heat; and with tin forms a malleable compound. Mercury readily amalgamates it, forming a crystalline mass.

Revised by IRA REMSEN.

**Thallome**, or **Thallus** [Mod. Lat., from Gr. θαλλός, young shoot or branch]: in botany, a plant-body in which stem and leaf have not been differentiated, as in many of the algæ, some liverworts, the prothallia of ferns, etc. It is often a flat mass, sometimes with a thickened midrib of firmer tissues. Its margins may become lobed and its midrib more distinct, thus passing easily into the leaf-bearing stem. The thallus is thus the homologue of the leafy shoot, and may be regarded as the primitive condition from which it sprang. See MORPHOLOGY, VEGETABLE. CHARLES E. BESSEY.

**Thal'lophytes**, or **Thalloph'yta** [from Gr. θαλλός, young shoot + φυτόν, a plant]: a general term applied in botany to the plants below the MOSSWORTS (*q. v.*), and including those described in the articles on PROTOPHYTES, PHYCOPHYTES, and CARPOPHYTES (*qq. v.*). Originally the group of the thallophytes was made co-ordinate with the cormophytes ("stemmed plants"), the two including the whole vegetable kingdom, but in recent years it has been made the lowest of the four branches, anthophytes (flowering plants), pteridophytes (fernworts), bryophytes (mossworts), thallophytes (thallus-plants). While the term is a convenient one to use it does not represent a natural group of plants, but rather an aggregation of groups. See PLANTS, FOSSIL.

CHARLES E. BESSEY.

**Thames**, temz [anc. *Tamesis*, appar. from *Thame* + *Isis*, names of the two rivers uniting to form the Thames]: the principal river of England. It rises on the southeast side of the Cotswold Hills near Cirencester, at an elevation of 376 feet above the level of the sea, and flows in an eastern direction to the North Sea, passing Oxford, Reading, Henley, Windsor, Eton, and Richmond on its way to London. It is called the Isis up to its junction with the Thame. The tide ascends as far as Teddington, between Eton and Richmond, and from this point up to Oxford there are thirty-three locks. At London Bridge its width is 290 yards; at Woolwich, 490 yards; at Gravesend, 800 yards; 3 miles below Gravesend it expands into a large estuary, 6 miles broad at its mouth, at the Nore Light. Its entire course is about 250 miles, and it is navigable for vessels of 1,400 tons burden up to Blackwall, 6 miles below London Bridge, and barges may ascend as far as 200 miles from the mouth. It owes its importance as a waterway to its tidal estuary and to the fact that it has no delta. Its principal affluents are the Coln, Leach, Windrush, Cherwell, Thame, Colne, Lea, and Roding on the left bank, and on the right the Kennet, Loddon, Darent, Mole, and Medway. The area of its basin is 6,100 sq. miles. Above London the scenery is interesting, and the river is studded with numerous islands. Through a vast system of canals it communicates with the southern and western coasts.

**Thames**: a river of the province of Ontario, Canada. It flows in a southwest course for 160 miles, and then enters Lake St. Clair. The towns of London, Chatham, and Oxford are on this river. It is navigable by vessels of 8 or 10 feet draught to Chatham, 18 miles, but there is a troublesome bar at its mouth.

**Thames**: a river in Connecticut, formed at Norwich by the junction of Yantic, Shetucket, and Quinebaug rivers. It is a navigable tidal channel 14 miles long, and reaches Long Island Sound at New London.

**Thane**, or **Thegn** [M. Eng. *thein* < O. Eng. *þegen*, soldier, attendant, minister, nobleman: O. H. Germ. *degan*, boy, follower, warrior; cf. Gr. τέκνον, child]: in English history, the title among the Anglo-Saxons and early Normans of certain military tenants and freeholders in the king's service. They were originally the servants of the king, and as the royal power increased they became a new nobility, supplanting the older nobility of birth, the nobility of the earls. Very early in the history of the Anglo-Saxons in Britain thanehood was fully established. As a nobility of office it made it possible for the simple freeman to rise to noble rank. The churl who owned five hides of land or had taken three sea-voyages was eligible to thanehood. After the Norman conquest the thanes were gradually merged in the barons, and the principle of personal service to the king gave place to that of the tenure of land from the king as the basis of nobility. In Scotland the thanes were a class of non-military tenants of the crown, and the title was in use till the end of the fifteenth century.

F. M. COLBY.

**Than'et**, OCTAVE (pseudonym of ALICE FRENCH): writer; b. at Andover, Mass., about 1860. She was educated at the academy in her native place, and early removed to Davenport, Ia., where she has since chiefly resided. Her short stories contributed to the *Atlantic*, the *Century*, and other monthlies attracted much attention, and were collected into a volume entitled *Knitters in the Sun* (New York, 1884). She has also published *Expiation*, a novel (1890); *Otto the Knight and other Trans-Mississippi Stories* (1891); *We All* (1891); *Stories of a Western Town* (1893); and *An Adventure in Photography* (1893). M. B.

**Thanet, Isle of**: the northeastern extremity of the county of Kent, England, separated from the mainland by the river Stour and the Nethergong rivulet. Area, 26,180 acres. The surface is level and the soil fertile, though light. Pop. (1891) 57,821. It contains the watering-places Ramsgate, Margate, Westgate, and Broadstairs.

**Thanksgiving Day**: an annual religious festival in the U. S., celebrated in New England from the first settlement by the Pilgrims. It originated in 1621, when Gov. Bradford of the Plymouth colony appointed a day for public praise and prayer after the first harvest, and the practice was observed by the other New England colonies and during the Revolution was introduced in several of the Middle States. Since then it has extended to nearly all the States, and has become a national institution since 1863. The day, which is usually the fourth Thursday of November, is designated by a proclamation signed by the Governor or the President. F. M. COLBY.

**Tha'sos**: island; in the Ægean Sea; 5 miles S. of the mainland; since 1462 belonging to Turkey. Area, 85 sq. miles. The island has gold mines not worked since antiquity; is the most fertile and least visited by foreigners of all the Greek islands; and in dress and customs its inhabitants have been the least affected by modern innovations. The painter Polygnotus was a Thasian. Ruins of ancient and mediæval monuments abound. Pop. 4,500, all Greeks, simple, unambitious, and prosperous, living in nine villages.

E. A. GROSVENOR.

**Thatcher**, HENRY KNOX: rear-admiral U. S. navy; b. at Thomaston, Me., May 26, 1806; entered the navy as a midshipman Mar. 4, 1823, and in 1855 attained the rank of commodore. During the civil war he commanded the first division of Porter's fleet in both the Fort Fisher fights, and the West Gulf squadron during the bombardment of Fort Alexis and Spanish Fort in Apr., 1865, just prior to their being stormed and carried by the Union army, their surrender being immediately followed by that of Mobile. After the war he commanded the Gulf Squadron and the Pacific Squadron; was promoted rear-admiral in 1866, and retired in 1868. D. in Boston, Mass., Apr. 5, 1880.

**Thaumatrope**: See STROBOSCOPE.

**Thaumaturgus, St. Gregory**: See GREGORY THAUMATURGUS.

**Thaxter**, CELIA (*Laighton*): poet; b. at Portsmouth, N. H., June 29, 1836. She was a daughter of Thomas B. Laighton, an editor and politician who, disappointed in his political aspirations, became keeper of the White Island light, on the Isles of Shoals, and her writings, both prose and verse, were largely inspired by the sea. She was married in 1851 to Levi L. Thaxter, of Watertown, Mass. Among her books are *Among the Isles of Shoals* (1873); *Poems* (1874); *Driftweed* (1878); *The Cruise of the Mystery and other Poems* (1886); and *An Island Garden* (1894). D. on the island of Appledore, Isles of Shoals, Aug. 26, 1894. H. A. B.

**Thayer**, ABBOTT HANDERSON: portrait, figure, and flower painter; b. in Boston, Mass., Aug. 12, 1849; pupil of Gérôme and Lehmann in Paris; third-class medal, Paris Exposition, 1889; Temple silver medal, Pennsylvania Academy, Philadelphia, 1891; member Society American Artists 1879. His portraits are notable for expression and character and his studies of roses for beautiful color. His most important work is *Virgin Enthroned*, owned by J. M. Sears, Boston. Studio in New York. W. A. C.

**Thayer**, ALEXANDER WHEELOCK: music critic, biographer, and historian; b. at South Natick, Mass., Oct. 22, 1817; graduated at Harvard in 1843, and at the law school 1848; in 1849 went to Europe and began collecting materials for a *Life of Beethoven*. He made frequent visits to Europe, and after 1862 remained there, being U. S. consul in Trieste during 1859–82. His great work was left incomplete. Three volumes have been published, vol. i. (1770–92) in 1866, vol. ii. (1792–1806) in 1872, and vol. iii. (1807–16) in 1879, and the concluding volume was nearly completed at the time of his death, in Trieste, July 15, 1897. It was written in English and translated into German by Herman Deiters, of Bonn, and published in Berlin. It has not appeared in English.

**Thayer**, ELI: See the Appendix.

**Thayer**, EUGENE: organist and composer; b. in Mendon, Mass., Dec. 11, 1838; settled in Boston, where he remained for nearly twenty years; in 1862 was one of the performers at the opening of the great organ in Music Hall, Boston; visited Europe in 1865 and 1866 for additional study; gave the first free organ recital in the U. S. in Boston, Apr. 10, 1869; in 1881 removed to New York to be organist of the Fifth Avenue Presbyterian church; received the degree Mus. Doc. from Oxford; composed much organ and vocal music, including a mass in E flat and a festival cantata. D. at Burlington, Vt., June 27, 1888. D. E. HERVEY.

**Thayer**, JOHN MILTON: lawyer, soldier, and governor; b. at Bellingham, Mass., Jan. 24, 1820; graduated at Brown University; studied law and came to the bar; went to Nebraska, where he became brigadier-general of militia and member of the Territorial Legislature; he was colonel of the First Nebraska regiment, and commanded it at Shiloh; was appointed brigadier-general of volunteers for services at Fort Donelson and Shiloh; Senator from Nebraska 1867–71; was Governor of Wyoming 1875–78, and of Nebraska 1887–91. He was the department commander of the Grand Army of the Republic in Nebraska in 1886.

**Thayer**, JOSEPH HENRY, D. D.: biblical scholar; b. in Boston, Mass., Nov. 7, 1828; graduated at Harvard in 1850, and at Andover Theological Seminary in 1857; preached for the Evangelical Congregational church in Quincy, Mass., one year; was settled over the Crombie Street church in Salem, Mass., Dec. 29, 1859; was chaplain of the Fortieth Massachusetts Volunteers nine months from Sept., 1862; relinquished his pastorate in Feb., 1864, to become Associate Professor of Sacred Literature in Andover Theological Seminary, which place he resigned in 1882, removing to Cambridge, where, in 1884, he was chosen Professor of New Testament Criticism in the Divinity School, and became *emeritus* in 1901. Secretary of the New Testament Company of the American Committee for the Revision of the English Bible. Besides occasional sermons, review articles, and contributions to the *Journal of Biblical Literature*, the American edition of Smith's *Bible Dictionary*, Hastings's *Dictionary of the Bible*, etc., he has published a biographical sketch of Ezra Abbot (1884), whose *Critical Essays* he edited (1888), and *Notes on Scrivener's Plain Introduction*, etc. (1885), *The Change of Attitude toward the Bible* (1891), *Books and their Use* (1893), a translation of the 7th German ed. of Winer's *New Testament Grammar* (1869), and a translation of Alex. Buttmann's *New Testament Grammar* (1873). He has also published *A Greek-English Lexicon of the New Testament* (1886), a monument of great labor and erudition. He edited an edition of Sophocles's *Greek Lexicon* (1888).

**Thayer**, SYLVANUS, LL. D.: soldier; b. at Braintree, Mass., June 9, 1785; graduated at Dartmouth College 1807, and at the U. S. Military Academy 1808. After service in the defenses of the eastern coast and of New York harbor, he was called to the field in 1812, and was chief engineer on the Niagara frontier; of the right division of the Northern army on the Lake Champlain line of operations in 1813; and in the defense of Norfolk, Va., in 1814, receiving the brevet of major Feb. 20, 1815. In 1815 he was sent to Europe to examine military works and schools and to witness the operations of the allied armies before Paris. From 1819 to 1833 he was superintendent of the Military Academy, during which time that institution was organized upon its present basis. (See MILITARY ACADEMIES.) On being relieved from the superintendency July 1, 1833, he was charged with the construction of the fortifications of Boston harbor, upon which, in union with his duties as president of the board of engineers for permanent fortifications, he was engaged during the remainder of his active service. During parts of 1857 and 1858 he commanded the Corps of Engineers, and was chief engineer of the U. S.; declined to transfer his headquarters to Washington, and on his own application was placed on leave of absence; was retired with the rank of colonel July 1, 1863. He gave $70,000 to found the Thayer School of Civil Engineering at Dartmouth College, $10,000 for a public library in Braintree, and bequeathed about $300,000 in trust for an academy in Braintree. He published *Papers on Practical Engineering* (1844). D. at South Braintree, Sept. 7, 1872. His body was reinterred in 1877 at West Point, where a statue was raised in his honor.

**Thayer**, WILLIAM MAKEPEACE: See the Appendix.

**Theater** [viâ O. Fr. from Lat. *thea'trum* = Gr. θέατρον, place for seeing shows, theater, deriv. of θεᾶσθαι, view, behold, deriv. of θέα, view, sight]: specifically, any structure erected for dramatic or operatic performances, the present form being a modification of the model first established by the Greeks more than 500 years before the Christian era.

*The Greek Theater.*—In the very earliest days the Athenian dramas were performed upon temporary wooden scaffoldings, prototypes of the booths of mediæval times, which were put up for the festivals of Dionysus and then taken down and laid aside for future use. It was upon such a scaffolding that the first acted drama of Æschylus was produced, and the collapse of the structure during the performance, an accident regarded as an evil omen, suggested the construction of a more durable edifice.

The first stone theater was begun soon afterward on the southeastern slope of the Acropolis, and it is a noteworthy fact that the plans were drawn with such skill and foresight, such exact appreciation of acoustic and spectacular requirements, that none of the architects of succeeding generations was able to suggest any important improvement upon them. In all the ruins of theaters extant in Greece, Asia Minor, and Sicily, the same general arrangement and proportions are observable. Here it may be noted that all Greek theaters were built either upon eminences or on the side of a hill, and that in every case the spectators occupied the upper or northwestern and the stage the lower or southeastern part of the structure. As the performances occurred at comparatively long intervals, and were originally in the nature of religious festivals, it was necessary to provide accommodation for great crowds, and it is probable that some of the largest theaters were capable of holding as many as 70,000 or 80,000 people. The acoustic qualities of the auditorium were thus the last to receive attention, and the actors, to reach the ears of so vast a multitude, were compelled to adopt a slow method of elocution, and to use mechanical devices in their masks in order to increase the volume of the voice.

Originally, the most important part of the Greek theater was the orchestra (ὀρχήστρα), the central space devoted to the movements of the chorus, out of which the drama ultimately grew. This space was exactly circular, except that a narrow segment of it was occupied by the stage. It was a little lower than the lowest row of seats or benches surrounding it, and was boarded over. In the center of it, equidistant from the rear of the stage and from all other points of its circumference, stood the altar of Dionysus (θυμέλη), which was square, made of wood, and elevated on a platform approached by steps. It was used for various purposes in different plays, sometimes as an altar, sometimes as a monument, etc. Occasionally it was occupied by the flute-player, or the leader of the chorus, which generally was grouped between it and the stage. Around the orchestra the seats were ranged in rows forming three-fourths of the circumferences of a series of concentric circles arranged like stairs. When the theater was on the side of a hill these seats were hewn out of the rock. In other cases they were supported by elaborate sub-structures. The ascending series of these concentric circles was interrupted by one or more broad level spaces, or circular aisles (called by the Greeks διαζώματα, or κατατομαί, and by the Romans *præcinctiones*), in which spectators were allowed to stand if there were no seats for them elsewhere. The benches themselves were intersected at frequent and regular intervals by flights of steps running from one aisle to another, but not in unbroken straight lines, by which the spectators could ascend or descend at will. These steps divided the benches into blocks or wedges, known in Greece as κερκίδες and in Rome as *cunei*. The approaches to the seats were mainly through underground passages to the lower benches, but in some cases there were galleries and stairways communicating with the upper rows. All the space devoted to the spectators, the *theatrum* proper, was often denominated the κοῖλον, or in Latin the *cavea*, or pit, in allusion to its being an excavation. Behind and above the highest row of seats there was a covered portico which is supposed to have had some relation to the acoustics of the structure, but with this exception the audience was unprotected by any sort of roof, although at a later period awnings were introduced.

*The Stage.*—The stage, as has been mentioned, occupied a small segment of the orchestra circle, and in height was level probaby with the top of the altar. At each end it was connected with the orchestra by a flight of steps by which the chorus ascended when required to take part in the action of the play. The back of the stage was inclosed by a wall called the scene (σκηνή, *scena*), having two extensions, or wings, entitled side-scenes (παρασκήνιον, *parascena*). The stage itself was called the προσκήνιον (*proscenium*), and the front part of it nearest the orchestra, where the actors generally took their places, was known as the λογεῖον (*logeum*), and in the Roman theater the *pulpitum*. The *scena* represented a suitable background for the play, and, before the performance, was covered by a curtain (παραπέτασμα, αὐλαία, *aulæum* and *siparium*), which was let down, not rolled up as with us. As to the description and quantity of the scenery employed, the information is rather meager, but it is known that there were different scenes for different plays, and that they were susceptible of change or modification. In the great tragedies the scene consisted of the front of a palace, with a door in the center, and two projecting wings, also with doors. The center door was known as the royal entrance, and was used by the πρωταγονιστής or leading man. The wings were often supposed to represent the abodes of guests or strangers. Frequently the palace possessed an upper story, from which actors described what was supposed to be going on at a distance. There is little doubt that elaborate scenery was in use before the days of Sophocles, and it certainly was needed in the plays of Euripides. Woods and hills were represented in the satiric drama, and private dwellings and the houses of slaves in comedies. There was also a certain amount of machinery, including one device for bringing a god down from the sky or up from the infernal regions.

*Actors and Audience.*—There is some dispute among the authorities as to whether or not women were admitted to the theater in the earlier days of the drama, but the probability is that they were permitted to witness tragedies but not comedies. Later on all restrictions as to sex were removed, although the coarseness of the dialogue in comic plays became worse and worse as the drama degenerated. This, perhaps, was one reason why all female characters were taken by youths. Another, possibly, was the fact that a bad actor was occasionally subject to the penalty of corporal punishment. In the modern sense of the word, the old Greek stage-performers were not actors at all. To add to their stature they wore high-heeled boots (*cothurnus*); they were padded so extravagantly that free movement was not to be thought of; their faces were hidden behind masks of various material, and they chanted their lines through some sort of metal contrivance which had an effect akin to that of a speaking-trumpet. The performances, which always included a series of plays, often lasted from sunrise until sunset. The places of honor were in the lowest rows of benches, where the magistrates and military and social magnates and illustrious strangers sat. Above them were the senators, then the *ephebi*, then the general public. The best seats cost the highest price, the average rate of admission being about 2 obols, or 6 cents. Pericles passed a law which conferred the right of free admission upon the poor. The expenses of the representations were defrayed by wealthy citizens and by state subvention.

*The Roman Theater.*—From the ruins of some of the most ancient Roman theaters, like those at Tusculum and Fæsulæ, which were excavated out of the sides of hills, it is quite plain that the Romans borrowed their theatrical ideas in the first place from the Greeks, but it was a long time before a stone theater was erected in Rome itself, owing to a notion that anything so elaborate and costly was not in accord with the simplicity of the republic. Dramatic representations were popular at an early period, but the theaters used were wooden structures put up for temporary use, and then taken down. It was in buildings of this kind that the comedies of Plautus and Terence received their first interpretations. During the later days of the republic wooden theaters of vast size and elaborate ornamentation were built in Rome, but Pompey was the first man who dared to depart from precedent and construct a magnificent stone theater near the Campus Martius. The plan of this as of all other important Roman theaters differed from the Greek model, chiefly in the fact that the rows of benches around the orchestra formed only a semicircle, and that the orchestra itself was a semicircle, of which the diameter was the front of the stage. In the Roman orchestra there was no altar, and no provision for any chorus, the orchestral space being set aside for distinguished persons. The fourteen lowest rows of benches were appropriated to the Equites. Pompey's theater was a copy of that at Mytilene, and had a capacity of 40,000. The Romans erected more theaters upon level ground than the Greeks did, their use of the arch and of concrete cheapening the cost of sub-structure. It may be noted that although there was no religious idea in the Roman theater, Pompey, to escape a charge of impiety, put a statue of Venus Victrix at the top of the cavea. The best-known remains of ancient theaters are at Rome, Nîmes, Ephesus, Miletus, Cnidus, Tauromenium, and Syracuse.

*The Modern Theater.*—The exact process of the evolution of the modern theater from the early structures erected in England and on the Continent in the sixteenth and seventeenth centuries can not now be traced, but the whole history of the stage, as we know it, dates from the days of the old miracle-plays or mysteries, which were performed by itinerant performers in churches, in temporary booths, or in the court-yards of inns. In the last-mentioned case the stage was erected in the center of the yard, with its back toward the door, which afforded means of ingress and egress to the actors. The galleries of the inn served as boxes for the more distinguished spectators, while the common folk stood on the ground. Sometimes the stage was roofed, in which case the ends of it were appropriated to the use of such fashionable folk as might be present. . This arrangement suggested the models of the earliest London theaters, which were practically inclosed yards, octagonal or nearly circular in shape and roofless, except over the stage, which continued to give shelter to the fashionable theater-goers until Voltaire in France set the example of driving them into the boxes. At the rear of the stage was a raised platform, surmounted by a balcony, from which a movable curtain depended. This corresponded to the door in the inn-yard, and no other provision for scenery or decoration appears to have been made. The green-room, or "tireynge-house," was on one side of the stage, and the roof of it was often surrendered to the audience. The first playhouse in London was the theater erected by James Burbage in 1576–77, and the next the Curtain theater, in Shoreditch (so named from a plot of ground called the Curten). Burbage built the Globe, of Shakspearean fame, in 1598, and in the same decade Henslowe opened the Rose and the Swan. Among other contemporary houses were the Blackfriars, the Red Bull, the Hope, the Whitefriars, and the more famous Fortune of Edward Alleyn, which lasted from 1600 to 1819.

Meanwhile (about 1550) Palladio had begun building theaters in Italy, modeled largely upon the old classic rules, in which the stage was provided with a solid structure, with doors and balconies made to do duty for all kinds of scenery. This example, a little later, was followed in France in the Palais Royal, founded by Richelieu in 1639, where the tragedies of Corneille were first performed. The invention of movable scenery, by Bibbiena, and of the drop-curtain, is ascribed to the latter half of the century. Thereafter the development of theatrical architecture and literature proceeded apace, and a gradual combination of the mediæval and classical ideas resulted in the prototype of the luxurious theater of the present era, with its boxes (intended originally for the persons who otherwise would have sat upon the stage), its orchestral stalls, which gradually have usurped the place of the old pit (the floor of the inn-yard), and its rows of semicircular galleries, which represent the benches of the ancient Greeks.

*The Modern Stage.*—The theater, properly so called, has changed but little in essentials (except the addition of a roof) since the Greeks devised it 2,000 years and more ago, but as it now is the stage is a modern creation. The word stage is generally applied only to that part of it visible to the spectators through the proscenium arch, and inclosed by the scenery. The spaces on either side are known technically as the wings, and these originally contained all the scenery (flats), which was pushed forward as required, running in grooves. Nowadays there is a space above the stage as high again as the proscenium arch, which is known as the flies, while below the stage there is an excavation of almost equal capacity, which is called the dock. This latter is divided into several floors, in which there is storage-room for scenery and much complicated machinery for raising and lowering it at will, through trenches cut in the stage, and also for working the traps through which demons, harlequins, etc., appear and disappear. Scenery therefore can be manipulated in three ways, from above, below, or the sides, while set pieces (such as castles, cottages, reversible exteriors, etc.) are constructed upon collapsible frames, which can be moved upon wheels in any direction and packed away with wonderful celerity. The double stage (of which the first example was constructed in the Madison Square theater of New York) was an invention of Steele Mackaye, and is extremely useful when a succession of elaborate interiors is to be presented, but it occupies much space, and has other disadvantages which have prevented its general adoption.

*Scenery, Lighting, etc.*—The recent advance in the art of stage illusion has been very great. In the mere painting it would be difficult to improve much upon the work of such artists as Watteau and Boucher in France, Raphael in Italy, and Clarkson Stanfield, Beverley, and Telbin in England, but the new mechanism accomplishes marvels. Thunder is counterfeited by iron balls or sheets of tin. The introduction of electricity has made real lightning possible in storms, and the noise of rain and wind is simulated wonderfully by the use of a cogged cylinder revolving against tightly stretched cloth. Formerly lightning was simulated by flashes of lycopodium, and the noise of rain by parched peas in a metal cylinder. Wagner, at Bayreuth, first used steam for the production of magical and other effects, and water is most faithfully represented by huge mirrors in which sylvan scenery is reflected. Until 1720 dip-candles were used for footlights. Then the French substituted moulded candles, which in time were replaced by lamps with Argand burners. Gas followed in 1822 and now yields to electricity.

*Stage Directions.*—For purposes of directions to actors, scene-shifters, etc., the stage is divided into five lateral strips, which, beginning from the left-hand side as the spectator faces it, are denominated the "prompt-side" (from the position of the prompter, who no longer occupies a box in the very center of the footlights, except in opera and in Continental theaters), "prompt-center," "center," "opposite prompt-center," "opposite prompt-side." These titles are abbreviated into "P.-S.," "P.-C.," "C.," "O. P.-C.," and "O. P.-S." The various entrances for actors in the wings, counting from the front of the stage, are called the first, second, and third entrances, left or right, as the case may be. Doors in the rear of the stage are described as center and left or right center (back), according to position. The position of the dressing-rooms for the performers depends largely upon the amount of space available. In the older theaters these chambers were often little better than underground cells, stowed away in all sorts of dark and unwholesome recesses, but in the best modern houses the quarters of the actors are well lighted, well ventilated, and moderately comfortable. Special conveniences, of course, are provided for "star" performers.

The danger from fire in a well-equipped modern theater is inconsiderable. It is possible, indeed, to build and furnish a theater wholly with incombustible materials, and to exclude all fire from the structure. The dynamos for lighting, and the furnaces for heating and supplying power, can be placed in a separate building. All scenery, ropes, draperies, and woodwork (of which little is needed in these days of light steel manufactures) can be rendered fire-proof by the aid of various cheap chemicals. The use of gas, once a source of continual danger, is on the point of being discontinued altogether. The largest theaters in Europe are La Scala in Milan and the San Carlo in Naples, each of which can hold nearly 5,000 persons. The opera-house in Vienna and the Grand Opéra in Paris are perhaps the most notable houses architecturally. The first theater in the U. S. was opened in Williamsburg, Va., in 1752, the second in Nassau Street, New York, in 1753.

LITERATURE.—An immense body of literature is at the disposal of students of the ancient and modern theater. Some of the best authorities on the early English stage are Wilkinson's *Londina illustrata* (1819); Collier's *History of Dramatic Poetry* (1879); Halliwell-Phillips's *Life of Shakespeare* (1883); Malone's *History of the Stage* (1790; republished by Boswell in 1821); the publications of the New Shakespeare Society, and a series of articles on early London theaters by F. F. Ordish in *The Antiquary*, vols. xi., xii., xiv. (1885–86). Other writers on the general topic are Coleridge, Hazlitt, Leigh Hunt, Charles Lamb, Edward Dowden, Dr. Doran, and Walter Thornbury. Of the continental authorities may be mentioned Donnet's *Théâtres de Paris* (1821); Salomon's *Construction des Théâtres* (Paris, 1871); Coutant's *Principaux Théâtres Modernes* (Paris, 1870); Moynet's *L'Envers du Théâtre* (Paris, 1874); Pougin's *Dictionnaire du Théâtre* (Paris, 1885). The student of the ancient theater may consult Dr. Smith's *Dictionary of Antiquities*, Prof. Becker's *Charicles*, and the works of Schlegel, Böttiger, Böckh, Schneider, Geppert, and others in the long list of German commentators.

J. RANKEN TOWSE.

**Theaters, Law of**: Unlicensed or improperly conducted playhouses are nuisances. In Great Britain the license is granted by letters-patent from the crown, or by the lord chamberlain (to whom all new plays must be submitted also), or by justices of the peace, or by the county council. In the U. S. the authority to license, regulate, and tax theaters is commonly delegated to the municipalities. The English courts seem disposed to give to the term "theatrical entertainments" a broader meaning than is attached to it by U. S. decisions. (Cf. *Shelley* vs. *Bethell*, 12 Q. B. D., and *Queen* vs. *Tucker*, 2 Q. B. D. 417, with *Harris* vs. *Com.*, 81 Va. 240, and *Re Theatrical Licenses*, 3 Pa. Dist. R. 191, A. D. 1894.) The proprietor of a theater is not engaged in a business "affected with a public interest." He may therefore fix his own prices, and he may refuse admission to whomsoever he pleases, unless a statute imposes the duty of providing like accommodation for all persons without regard to race or color. (*People* vs. *King*, 110 N. Y. 418.) If he sell tickets for an entertainment he must provide seats for the purchasers or refund the money. The purchaser, however, has no right to take a seat not called for by his ticket, and if he does he may be lawfully ejected. Moreover, as a ticket is at most a personal license to enter the theater, it may be revoked at any time, whereupon the holder is bound to leave the house, although he is entitled to damages for breach of the contract for admission. (*Purcell* vs. *Daly*, 19 Abb. N. Cas. (N. Y.) 301.) Auditors have the right to express their honest likes or dislikes of the play or the players or the management, by applause, by hisses, or by other demonstrations which do not tend to excite terror or to break the peace. If two or more, however, go to the theater with the preconcerted design to howl down an actor or to damn a play, their demonstrations in carrying out such designs are unlawful, and their conduct amounts to actionable conspiracy. (*Gregory* vs. *Brunswick*, 1 C. and K. 24.) See Hamlyn, *Manual of Theatrical Law* (London, 1891); Wandell, *Law of the Theatre* (Albany, 1891).

FRANCIS M. BURDICK.

**The'atines** [named from the Bishop of Theate, afterward Pope Paul IV.]: a Roman Catholic order of regular clerks and nuns, founded in 1524 by the Bishop of Theate and several of his friends. They spread into various countries, opposed Protestantism, and labored for the reform of the clergy and the extension of the Oriental missions. They are now found chiefly in Italy. Revised by J. J. KEANE.

**The'baïs**, or the **Thebaïd** [Gr. Θηβαΐς, the region of Thebes]: the district of Upper Egypt, extending from Siut (Asyut, Lycopolis, about 27° 20′ N. lat.) to Syene at the first Nile cataract (24° N. lat.), which with the HEPTANOMIS (*q. v.*) constituted the "land of Upper Egypt" in the ancient texts. It probably was equivalent to the Hebrew Pathros, and it was originally of like extent with the Coptic and Arabic grand division of Upper Egypt. The Romans subdivided the Delta region into four parts, created the Heptanomis, and at one time divided the Thebaïs into two portions.

CHARLES R. GILLETT.

**Thebes**, theebz [Gr. Θῆβαι, and later Διόσπολις; Lat. *Thebæ, Diospolis Magna*; Egypt. *Pa-Amon*, dwelling of Amon-Zeus, *Uast, Nu-Amon, Nu*, city of Amon, or city *par excellence*; Heb. *No-Amon*]: a city of Egypt on both sides of the Nile (at about 25° 50′ N. lat.). After the desertion of Memphis by the princes of the seventh to the tenth Egyptian dynasties, due possibly to a foreign invasion similar to that of the Hyksos at a later period, Thebes became the capital of Egypt, and so continued during the middle and new kingdoms. (See EGYPT, ANCIENT). The city proper was on the east side of the Nile, and is now represented by the ruins of several temples, those of KARNAK (*q. v.*) and LUXOR (*q. v.*) being the chief. The west side of the river was occupied by the Theban necropolis and various temples, most of which were memnonia dedicated to the manes of their founders. The temples, beginning toward the N., were those of GURNAH (*q. v.*), Dêr el-Bahri, built by Hatasu, the Ramesseum (built by Ramses II.), Dêr el-Medîneh (founded by Ptolemy IV. and continued down to the time of Augustus, dedicated to Hathor), and MEDÎNET HABU (*q. v.*). There was also formerly a temple of Amenhotep III. (the MEMNON (*q. v.*) of the Greeks) adjacent to the Colossi of Memnon, but it has almost entirely disappeared. Another temple, built by Thothmes III., just N. of the Ramesseum has also disappeared. The cemeteries in the same region are those of Drah Abu'l Neggah (eleventh and twelfth dynasties), just W. of Gurnah, Asasif and Abd el-Gurnah, respectively E. and S. of Dêr el-Bahri, and Gurnai Murraï, N. of Medînet Habu. Besides these there were also the Tombs of the Kings, in a valley W. of Dêr el-Bahri, and the Tombs of the Queens, W. of Medînet Habu. It was in the hills W. of Dêr el-Bahri that the mummies of the Pharaohs of the seventeenth to the twentieth dynasties were discovered in 1881. See HER-HOR.

The hills bordering on the strip of land fertilized by the Nile at Thebes recede farther from the river than elsewhere, but they are more distant on the E. than on the W. The Libyan hills are honeycombed with tombs. The residence portion of Thebes was to the E. of the temple of Karnak, though it is estimated that about a quarter of the total population, consisting of priests and artisans whose employments were of a funerary character, dwelt in the necropolis on the W.

The foundation of the city goes back probably to the Old Kingdom, though at that time it was of insignificant size. Its prominence dates from the eleventh and twelfth dynasties, when more extensive building operations were begun. During the Hyksos period it was the seat of native princes tributary to the invaders, and it so continued till the seventeenth dynasty, when a revolt occurred, occasioned by religious demands made upon Seqen-Ra, King of Thebes, by Apepi the Hyksos ruler. War was waged during several reigns, till at last the Egyptian armies were victorious. Thebes became the national capital again and Amon-Ra, the tutelary deity of Thebes, became the supreme god in the Egyptian pantheon. The kings of the eighteenth and nineteenth dynasties, especially THOTHMES III. and RAMSES II. (*qq. v.*), were exceedingly active in building at Thebes, and the history of the city is largely a history of these dynasties. During the reign of Amenophis IV., the "heretic king" (see KHUNATEN), the capital was temporarily removed to TELL EL-AMARNA (*q. v.*), but the power of the priests of Amon was too great for the innovator, and the old *régime* was speedily restored. After the close of the twentieth dynasty the seat of government was removed to the Delta and Thebes gradually lost its power, though it was twice the source of insurrections, which were subdued only by the aid of the Romans. (See PTOLEMY.) Its final destruction as a political power occurred in 85 B. C.

The sanctity of Thebes, the "On of the South" as contrasted with On-Heliopolis at the apex of the Delta, arose from the fact that it was reputed to have been the birthplace of Osiris, but it was inferior to Abydos (see MEMNONIUM), the burial-place of Osiris, and Heliopolis, the city of the Sun, in the religious estimation of the people. Its wealth and power were due to the spoils of war taken thither by the warlike Pharaohs of the eighteenth and nineteenth dynasties. The epithet "hundred-gated" applied by the Greeks to Thebes had reference to the multitude of pylons which marked the entrances to its numerous temples. The origin of the Greek name is uncertain, though several conjectures have been ventured. CHARLES R. GILLETT.

**Thebes**: the capital city of Bœotia; founded by Cadmus in a fertile, well-watered, and undulating plain. The city was very prominent in mythical times, for many of the most important and most extensive myths were located there. (See CADMUS, HARMONIA, SEMELE, INO, AMPHITRYON, ALCMENE, AMPHION, NIOBE, and ŒDIPUS.) Its walls and their seven gates were built by Amphion, and were taken but twice, once in mythical times by the EPIGONI (*q. v.*) of the Seven and then by Alexander the Great. In historical times Thebes was the leading city of Bœotia and was usually hostile to Athens, but she never fought with success or rose to first-rate importance until after the battle of Leuctra, when she assumed the hegemony of Greece, though she maintained it only during the lifetime of Epaminondas. She was unfortunate in her wars with Philip of Macedon, who placed a garrison within her citadel. On the death of Philip she expelled this garrison, but was punished severely therefor by Alexander, who razed the city, sparing only the temples and the house of Pindar, and sold the inhabitants into slavery, with the exception of the descendants of Pindar and those who had opposed the rebellion. PHRYNE (*q. v.*) offered to rebuild the walls of Thebes, but her offer was declined. The city was rebuilt by Cassander with the help of the Athenians, but it did not prosper. The modern town has about 5,000 inhabitants. It was virtually destroyed by an earthquake in 1893. An excellent topographical account of Thebes is by Fabricius, *Theben*, etc. (Freiburg, Baden, 1890). J. R. S. STERRETT.

**The Brill**: See BRIEL.

**Thecla**, SAINT: according to the famous story, a virgin of Antioch, enthusiastically attached to the apostle Paul, by whom she was converted to Christianity and strict celibacy. She maintained her faith in Christ amid persecutions, public and private, and was miraculously delivered from assaults upon her virtue. *The Acts of Paul and Thecla* is a widely circulated Christian romance of the second or third century, designed to exalt celibacy and to emphasize the comfort the doctrine of the resurrection gave. It is probable, however, that the tale has an historical basis. See the chapter upon it in W. M. Ramsay's *The Church in the Roman Empire* (London and New York, 1893). S. M. J.

**Thecoso'mata** [Mod. Lat., from Gr. θήκη, case + σῶμα, σώματος, body]: a subdivision of the pteropod *Mollusca* (see PTEROPODA) in which a shell is present.

**Theft**: See LARCENY.

**Thegn**: See THANE.

**The'ine**: the alkaloid of tea and coffee; its formula is $C_8H_{10}N_4O_2.H_2O$. See CAFFEINE and TEA, PHYSIOLOGICAL EFFECTS OF.

**Theiner**, tī'ner, AUGUSTIN: historian, critic, and polemical writer; b. at Breslau, Prussian Silesia, Apr. 11, 1804; studied theology, philosophy, and jurisprudence at the university of his native city; obtained the degree of *doctor juris* at the University of Halle for his *Commentatio de Romanorum Pontificum Epistolarum Decretalium Collectionibus antiquis* (1829); traveled with the support of the Prussian Government to Vienna, Paris, and London; settled in 1831 in Rome, and was in 1851 appointed keeper of the secret archives of the Vatican, from which office he was removed in Aug., 1870, accused by the Jesuits of having during the Council of the Vatican furnished the bishops of the opposition with the documents necessary to combat the dogma of infallibility. D. at Cività Vecchia, Italy, Aug. 10, 1874. He originally held liberal views of the relation between the papal see and the Roman Catholic Church; he assisted his brother, Johann Anton, in the publication of *Die Einführung der* *erzwungenen Ehelosigkeit bei den christlichen Geistlichen und ihre Folgen* (2 vols., Altenburg, 1828; n. e. Barmen, 1893), a book which was first upon the index; but during his residence in Rome he attached himself more and more closely to the Ultramontane party, and developed an astonishing literary activity in its service. Besides a number of minor essays and pamphlets, he wrote *Geschichte der geistlichen Bildungsanstalten* (Mentz, 1835); *Disquisitiones in præcipuas Canonum et Decretalium Collectiones* (Rome, 1836); *Versuche und Bemühungen des Heiligen Stuhls in den letzten drei Jahrhunderten, die durch Ketzerei und Schisma von ihm getrennten Völker des Nordens wiederum mit der Kirche zu vereinen; nach geheimen Staatspapieren* (Augsburg, 1837); *Die neuesten Zustände der katholischen Kirche beider Ritus in Polen und Russland seit Katharina II.* (1841); *Geschichte der Zurückkehr der regierenden Häuser zu Braunschweig und Sachsen in den Schoss der katholischen Kirche* (Einsiedeln, 1843); *Die Staatskirche Russlands im Jahre 1839* (1844); *Le cinque Piaghe della S. Chiesa* (1849); *Zustände der katholischen Kirche in Schlesien von 1740–58* (2 vols., Regensburg, 1852); *Geschichte des Pontificats Clemens XIV.* (2 vols., Paris, 1852); *La Souveraineté temporelle du Saint-Siège* (1861), etc. His principal works are his new edition and continuation of Baronius's *Annales Ecclesiastici*, and his publications of documents relating to the history of the Church among various nations—*Documents inédits retatifs aux affaires religieuses de la France 1750–1800* (2 vols., 1858); *Vetera Monumenta Hungariam sacram illustrantia* (2 vols., 1859); *Monuments historiques relatifs aux règnes d'Alexis Michaélowitsch, Théodore III. et Pierre le Grand de Russie* (1859); *Vetera Monumenta Poloniæ Gentiumque Finitimarum Historiam illustrantia* (4 vols., 1860–64); *Codex diplomaticus Dominii temporalis Sanctæ Sedis* (3 vols., 1862); *Vetera Monumenta Slavorum meridionalium Historiam illustrantia* (1863); *Vetera Monumenta Hibernorum et Scotorum Historiam illustrantia* (1864); and *Acta genuina ss. oecumenici concilii Tridentini* (2 vols., 1874).—His elder brother, JOHANN ANTON THEINER, b. at Breslau, Dec. 15, 1799, became Professor of Scriptural Exegesis in 1824 in Breslau; became a pastor in 1830; resigned his office in 1845, and joined the German Catholics; lived as a private teacher in Breslau, and was appointed secretary of the library of the university in 1855. He wrote, besides the above-mentioned work on celibacy, *Die reformatorischen Bestrebungen in der katholischen Kirche* (Altenburg, 1845); *Das Seligkeitsdogma der römisch-katholischen Kirche* (Breslau, 1847); *Enthüllungen über Lehren und Leben der katholischen Geistlichkeit* (Leipzig, 1862). D. at Breslau, May 15, 1860. Revised by S. M. JACKSON.

**The′ism** [from Gr. Θεός, God]: in the widest acceptation of the term, the doctrine of a Divine Being. As such it may be deistic or pantheistic or polytheistic, while atheism and agnosticism are its opposing terms. More narrowly considered, theism is synonymous with monotheism, and in this sense it may be deistic or pantheistic. Lord Shaftesbury used indifferently the terms theism and deism. John Fiske in his *Outlines of Cosmic Philosophy* and elsewhere develops a "Cosmic Theism" which is essentially pantheistic. He is not singular in this, and a pantheistic theism may be said to be the general result of modern scientific and philosophic thought. In later usage theism has been, as with Frances Power Cobbe, a term indicating a belief in God not derived from supernatural revelation and not specifically Christian. While the derivative force of the words theist and deist is precisely the same, the only difference being that in one case we have a Greek and in the other a Latin root, they have been used very generally for some time past as differentiating terms. Deism has designated the historical movement in theology which is described in the article DEISTS. From that movement the theism of the nineteenth century has differed, as less mechanical and more spiritual. The god of deism was a god outside the world, a mechanical creator, apart from the world, and leaving it to go alone, or governing it by natural laws. The god of theism has been a principle of life and order, never ceasing from his operations, his laws not delegated forces, but the constant habits of his activity. On the physical side theism has allied itself naturally with the doctrine of evolution. During the transcendental period in the U. S. deism was contemned as resting on the argument from design, while theism was glorified as the doctrine of conscience and direct intuition. There has been much confusion, however, in the use of these terms, Kant using them in a manner directly opposite to that of the New England transcendentalists. By deism he indicated the exclusive belief in a transcendental theology; by theism the belief in natural theology as a possible, if not the only, way to God. Prof. Robert Flint's *Theism* is a classic treatment of the matter, and another is Martineau's *Study of Religion*. See NATURAL THEOLOGY. JOHN W. CHADWICK.

**Theiss**, tīs: a river of Hungary; formed by the junction of the Black and White Theiss, both of which rise in the Carpathian Mountains; flows with a winding southern course to the Danube, which it joins 22 miles E. of Peterwardein. Its entire length is 828 miles, for the greatest part of which it is navigable even for large vessels. After entering the Hungarian plain its breadth is from 400 to 800 feet, its shores are low and marshy, and its current is sluggish. It is rich in fish, especially sturgeon.

Revised by M. W. HARRINGTON.

**The′mis** [= Lat. = Gr. Θέμις, personification of θέμις, custom, divine sanction, law, right, deriv. of τιθέναι, θεῖναι, put, set]: a daughter of Uranus and Gæa, and the second wife of Zeus, by whom she became the mother of the Horæ and the Mœræ. She is the personification of law and order as established by custom and equity. She presides over the assemblies of men, and sees to it that their deliberations make for order and justice. She is also a goddess of prophecy, and declares to mankind the decrees of Zeus. She presided over the oracle at Delphi before Apollo became the mouthpiece of Zeus at that place. She was worshiped at many places in Greece. As represented in art her features resemble those of Athene, but she carries a cornucopia and a pair of scales, to typify the blessings that result from law and order.

J. R. S. STERRETT.

**Themis′tius** (in Gr. Θεμίστιος) **of Paphlagonia**: Greek philosopher and orator; flourished in the second half of the fourth century A. D. As a teacher of philosophy and oratory he had a long and successful career at the Byzantine court, being especially honored by the Emperor Theodosius. Though he shows great tolerance in religious matters, his spirit and his style are steeped in the thought and language of the great pagan authors. His extant works consist of orations, edited by W. Dindorf, 1832, and paraphrases of Aristotle, which maintained their popularity through the Middle Ages, edited by L. Spengel (1866). B. L. G.

**Themistocles**, the-mis′tō-klēez (Gr. Θεμιστοκλῆς): general and statesman; b. at Athens about 514 B. C.; the son of Neocles and a Carian or Thracian woman; became the political leader of Athens after the expulsion of Aristides by ostracism in 483. He was impetuous and shrewd; sagacious in his judgment of actual circumstances and their probable consequences; swift in arriving at a resolution; inexhaustible in devices for the realization of his plans; possessed of a most impressive eloquence; energetic, cunning, and unscrupulous. His actions show a blending of rank ambition and lofty statesmanship; of egotism sometimes even sordid, and an elevation of mind truly noble, which becomes the more inexplicable the better known his ways and means become. Nevertheless, in a most decisive crisis he was the saviour of Athens and of Greece. After the battle of Marathon (490) people generally believed that the Persian war was ended. Themistocles, however, felt that a still heavier storm was coming, and he understood that a strong fleet would be the most effective means of victory, and the only safe means of rescue in case of defeat. Thus the development of the Athenian navy became the goal of his policy. He induced his countrymen to spend the income of the silver mines of Laurium, which had hitherto been distributed among the citizens, in the organization of a powerful fleet. He secured the passage of a law that twenty triremes should be built every year. When the armament of Xerxes was heard of, and Greece became alarmed, he procured an oracle from Delphi saying that Athens should defend herself by wooden walls—that is, by her fleet; and when, finally, the pass of Thermopylæ was forced, when the battle off Artemisium, in which he consented to fight under the Spartan commander, though the number of the Athenian ships was the greatest, had proved ineffective, and the Persian hosts streamed down over Bœotia and Attica, he persuaded the Athenians to leave their city to the protection of its tutelary deities, to bring their women and children in safety to the island of Salamis, and to go on board the fleet. In the Bay of Salamis the entire Greek fleet lay assembled; but various opinions prevailed in the council—whether to give battle here or at the isthmus, whether to give battle at all, or to separate, etc. It was Themistocles who held the fleet together by declaring that if the Greeks now separated the Athenians would leave Greece for ever, take their women and children, and set sail for Italy—a plan as sound as grand, and one which he no doubt was able to carry out. It was also he who finally compelled the Greeks to give battle by entering into negotiations with the Persian commander and hastening the approach of the Persian fleet. The Greeks were surrounded without knowing it, escape was impossible; fight had become a necessity. During the night Themistocles rowed from the Athenian division of the fleet to the Spartan, from the Spartan to the Corinthian, etc., busy to the last. In Salamis the women and children of Athens watched in prayer; on the opposite coast of the mainland carpenters were raising a throne from which Xerxes would look at the battle. In the morning (Sept. 20, 480) the Persian fleet stood up the narrow sound; the battle began, and it terminated in a most glorious victory for the Greeks. Themistocles was now the first man, not only in Athens but in Greece; when visiting Sparta, he was presented with the best chariot the nation possessed, and accompanied to the borders of Tegea by a guard of 300 horsemen—honors unheard of hitherto. To his native city he did one more great service. When, after the battle of Salamis, the Athenians began to rebuild their city, Sparta, through jealousy, dissuaded them from rebuilding the fortifications, and even threatened them with an armed interference. Themistocles hastened to Sparta, bribed the ephori, deluded the assembly of the elders by lies and dissimulations, deceived the whole community, and kept the question floating and undecided until it became superfluous, the walls not only of Athens, but also of Piræus, having reached a sufficient height to be defended with effect. Then he returned home, loaded with the hatred of all Spartans. Soon after this event he disappeared from public life. The last part of his history, that which follows the rebuilding of Athens, is as obscure and confused as the first, that which precedes the expulsion of Aristides. He was accused of treasonable connections with the Persians, but acquitted; then ostracised in 471, exiled to Argos, and again accused of treason by the Spartans; an order to arrest him was issued, and he fled from Argos to Corcyra, Thrace, Ephesus, and arrived finally at Susa, the residence of the Persian king, in a covered carriage, such as was generally used to convey women to the royal harem. At the Persian court there was a party, headed by the widow of Xerxes, which demanded his execution immediately; but Themistocles understood how to impress the reigning monarch, Artaxerxes, so favorably that he was not only left unmolested, but received rich dotations and acquired considerable influence. Deeply implicated in the Persian plans for the subjugation of Greece, he died suddenly at Magnesia in Asia Minor in 449 B. C.

Revised by J. R. S. STERRETT.

**Thenard's Blue**: See BLUE and COBALT.

**The'obald**, LEWIS: author; b. at Sittingbourne, Kent, England, about 1690; educated at Isleworth, and became a lawyer, but devoted himself chiefly to literature; published *Electra, a Tragedy* (1714); *A Critical Discourse on Homer's Iliad* (1714); *A Translation of the First Book of the Odyssey* (1716); *The Censor*, a periodical (1717); *Memoirs of Sir Walter Raleigh* (1719); *The Double Falsehood* (1720), a play which he attributed to Shakspeare; and some twenty other plays, none of which had much success or are now remembered. He is chiefly known as a Shakspearean editor, having published *Shakespear Restored, or Specimens of Blunders committed and unamended in Pope's Edition of this Poet* (1726), which brought upon him the wrath of Pope, and procured him the post of hero of the first edition of the *Dunciad* (1729). In 1733 he issued an edition of Shakspeare (7 vols.) which completely superseded that of Pope. His emendations were few, executed with great care, and are acknowledged to possess great merit, having been reproduced without acknowledgment by many subsequent editors. D. in Sept., 1744. Revised by H. A. BEERS.

**Theobroma**: See CACAO and THEOBROMINE.

**Theobro'mine** [deriv. of Mod. Lat. *theobro'ma*; Gr. θεός, god + βρῶμα, food]: an organic base present in cacao-beans, and therefore in chocolate; formula $C_7H_8N_4O_2$. It is prepared by treating the beans with warm water, adding neutral plumbic acetate to the strained solution, conducting a current of hydrogen sulphide through the filtrate from the lead precipitate, evaporating the second filtrate, and crystallizing from alcohol. It may be further purified by heating between two watch-glasses, when it is obtained as a dazzling white sublimate. Theobromine is a colorless crystalline powder, but sparingly soluble in boiling water, and still less so in alcohol and in ether. It has a bitter taste, and gives crystalline salts with several of the acids.

**Theocracy**: See RELIGION, COMPARATIVE.

**Theoc'ritus** (in Gr. Θεόκριτος): earliest and chiefest of bucolic poets; commonly set down as a native of Syracuse, though Cos also has claims on him. He flourished in the first half of the third century B. C., at the court of Ptolemy Philadelphus in Alexandria, and the court of Hiero II. in Syracuse, but the chronological order of his poems in honor of those potentates is much disputed, so that it is not certain how his career is to be distributed. Nor is anything known as to the time and manner of his death, though it has been inferred from a line of Ovid, *Ibis*, 549, that his end was the halter. We have under the name of Theocritus thirty-one poems, besides a number of epigrams. Of these poems, commonly called idyls (Gr. εἰδύλλια), ten are strictly bucolic, three are imitations of the mimes of SOPHRON (*q. v.*), the rest vary in sphere and poetic value, and a few are spurious, or at all events fall below the poet's art and tone. Theocritus occupies a unique position in literature. No one has so blended in his verse the artistic and the popular, and all who have attempted to emulate him have failed to reproduce his wonderful charm. His language is Syracusan Doric, and yet it is not the peasant language pure and simple. It has notes that have been learned from the predecessors of Theocritus, from Epicharmus and Sophron; and his Æolic poems, among the most attractive of all, are clearly artificial. His peasants are peasants, his shepherds smell of the sheepcote, his reapers of the harvest-field, his fishermen of fins and scales; their jests are as broad as the sky under which they live, and yet we can not but suspect allusion here and allegory there. His measures, as a rule, are epic, and belong to the recitative order, and yet the arrangement in strophes mimics song and the dialogue gives dramatic character, so that the three great forms of poetic composition are all present in his works. He is a conscious artist to the minutest points of workmanship; he is the child of a period when the scholar held the poet bound; and yet through all the limitations and artificialities of the period and the province there breathes an intimate love of nature that makes Theocritus a poet for all time, as he is the last true poet of the Greek tongue. Noteworthy editions are by Ahrens, 2 vols. (1855), by Meineke, 3d ed. (1856), by Wordsworth (1872), by Fritzsche-Hiller with German notes (1881). There is a *Lexicon Theocriteum*, by Rumpel (1879). For the bibliography, see Cipollini, *Gli Idilli di Teocrito* (1887). Of the translations into English the most interesting are the verse rendering by Calverley (1869) and the prose version by Andrew Lang (1880), with an introductory essay, *Theocritus and his Age*.

B. L. GILDERSLEEVE.

**Theodec'tes** (in Gr. Θεοδέκτης) **of Phase'lis**, in Lycia: pupil of Plato and Isocrates; distinguished alike as tragic poet and orator. The scant fragments of his tragedies which are collected in Nauck's *Fragmenta Tragicorum Græcorum* (2d ed., pp. 801–807) hardly bear out his reputation, which was doubtless enhanced by his versatility. B. L. G.

**Theod'olite** [probably for *the alidade*; Arab. *al 'idāda*, rule]: an instrument used by surveyors for measuring horizontal and vertical angles, similar to an engineer's transit in all respects, except that the telescope is not usually reversible. See HYPSOMETRY.

**Theodo'ra**: Byzantine empress; b. about 508, either at Cyprus or more probably at Constantinople; the daughter of Acacius, master of bears to the Green Faction. By the death of her father her mother was left destitute with three daughters, Comito, Theodora, and Anastasia, none of whom was over seven years of age. The three successively appeared on the stage as pantomimic dancers, an occupation held in general contempt. In the *Anecdota*, attributed to PROCOPIUS (*q. v.*), scandalous stories are narrated of Theodora's youth, which it is impossible to verify or wholly refute. In 525, when she married the consul Justinian, she was, if the commonly accepted date of her birth be correct, but seventeen years old; hence some of the charges against her can not possibly be true. Justinian had obtained from his uncle Justin I. abrogation of the law which forbade marriage between a senator and a woman of servile origin or who had appeared on the stage. In 527 Justinian succeeded to the throne. He required public functionaries to swear allegiance to Theodora as well as to himself, caused her effigy to appear on the coins with his own, and cited both their names in public decrees as joint rulers. During twenty-three years of married life she showed herself his worthy consort. Her courage and judicious counsels prevented his deposition at the revolt of the Nika in 532, and in all questions of administration she took a notable share. No female sovereign manifested larger interest in the unfortunate and destitute of her own sex or strove more earnestly to alleviate their condition. It has been supposed that thus she sought to atone for the possible faults of her own youth. She retained her ascendency over the mind of Justinian to the last. Her only child by him was a daughter. Theodora was of small stature, pale, delicate, vivacious, graceful rather than beautiful, had expressive eyes, and was fascinating in manner. She died of cancer in 548 at Pythia, near Broussa, whither she had gone for the baths. EDWIN A. GROSVENOR.

**Theodore**, King of Abyssinia: See ABYSSINIA.

**Theodore of Mopsues'tia**, also called, from his place of birth and early life, THEODORE OF ANTIOCH, and whose epithet among the Nestorians is "The Interpreter": bishop and exegete; b. in Antioch about 350. His parents were wealthy and gave him every advantage, but under the urging of John Chrysostom, his life-long friend, he entered an ascetic brotherhood which Chrysostom had established. Shortly afterward he repented of the step and left the brotherhood, as he desired to marry. To him Chrysostom then addressed two eloquent and affectionate letters which bear the title *An Exhortation to Theodore after his Fall*, and which had the desired effect of determining him to renounce his matrimonial intentions and saving him for the Church. He was not yet twenty years of age when his "fall" and recovery occurred. He continued his studies and was ordained priest in Antioch 383. Somewhat later he removed to Tarsus. He essayed authorship with brilliant success and in 392 became Bishop of Mopsuestia, the modern Messis, 40 miles W. from Tarsus, where he died 428. He is the most prominent representative of the "middle" Antiochian school of Bible interpreters. He commented on nearly the whole Bible in the grammatical and historical manner of the Antiochian school, and in constant protest against the allegorizers. He also appeared as a controversialist and as a practical theologian. Much of his writings has been lost—particularly to be regretted are his letters, which were so highly admired that they were called the Book of Pearls. His fame in the West is due to his alleged heresy. Dying in the odor of sanctity and passionately defended, it was soon afterward openly said and was proved that he was the virtual author of Nestorianism. The Council of Ephesus in 431 condemned his "creed"—although his name was not mentioned—and the Council of Constantinople in 553 anathematized him, by request of the Emperor Justinian. So the West wanted to learn who the man was about whom the East was so much excited, and a Latin translation of portions of his works was the result. Curiously enough his commentary on Paul's Epistles was circulated under the name of Ambrose. It was highly popular, and the heretic of the East "supplied the Middle Ages [in the West] with an accepted interpretation of an important part of Holy Scripture." Much of this Latin translation was first published in 1880–82 in Cambridge. See Migne's *Patrologia Græca*, lxvi., for a general collection of the remains. Cf. H. Kihn, *Theodor von Mopsuestia u. Junilius Africanus* (Freiburg im Breisgau, 1880). SAMUEL MACAULEY JACKSON.

**Theod'oret**: bishop and author; b. about A. D. 393 at Antioch, Syria, the only son of rich and influential parents; received a good education under religious influences; at twenty-three, his parents being dead, distributed all his property and retired to a monastery at Nicerte, 75 miles from Antioch; in 423 became Bishop of Cyrus or Cyrrhus, the modern Koros, on a branch of the river Aphreen, in the district of Syria called Cyrestica, which is a fertile plain lying between Alma Dagh and the Euphrates. D. probably in 457. In the discharge of his diocesan duties he was eminently successful, bringing back by his eloquence and power of persuasion numbers of heretics to the Catholic Church. At last, however, he himself was accused of heresy. He had a strong sympathy for Nestorius, and in 449 he was even deposed from his see by the synod of Ephesus, though he was reinstated by the synod of Chalcedon in 451. Of his works, comprising a history of heresies, a dialogue against Eutychianism, commentaries, etc., the *History of the Church from 325 to 429* is the most important. The best edition of his works, which comprise commentaries on Paul's Epistles and large parts of the Old Testament, discourses, controversial works, histories, and letters, appeared in Halle, 1769–74, in five volumes, edited by Schulze and Nösselt, reprinted by Migne, in *Patrologia Græca*, lxxx.–lxxxiv. (Paris, 1860); English translation by Bloomfield Jackson of the *Ecclesiastical History, Dialogues, and Letters*, in *The Nicene and Post-Nicene Fathers*, 2d series, iii. (New York, 1892); Gaisford's translation of the history is in Bohn's Ecclesiastical Series. Revised by S. M. JACKSON.

**Theod'oric** [a Teutonic name; cf. Goth. *þiuda*, people, and *reiks*, king]: founder of the Ostrogothic kingdom of Italy; b. about 454, the son of Theudemir, who with his two brothers ruled over the Ostrogoths in Pannonia under the authority of the East Roman emperor; was educated at the Byzantine court, whither he was sent as a hostage at eight years of age, and where he spent about eleven years. In 474 he succeeded his father as king of his nation, and for some time was a true ally of Zeno, the Eastern emperor, but, dissensions soon arising, Theodoric invaded the Roman provinces of Macedonia and Epirus, and for several years harassed the empire by marauding expeditions. At last, in 488, he and the emperor agreed upon a plan for the employment of the Ostrogoths in Italy against Odoacer. Late in the fall the whole nation, numbering over 200,000, of whom 40,000 were soldiers, broke up its settlements, and advanced slowly into Italy, defeating the Gepidæ on the way. Odoacer was defeated in three battles—at the Isonzo, near Aquileia, Aug. 28, 489; at Verona, Sept. 30, 489; and on the Adda, Aug. 11, 490. He then shut himself up in Ravenna, was besieged there for over two years, and was finally assassinated Mar. 15, 493, at a banquet shortly after he had surrendered himself. After his victories Theodoric naturally considered the soil of Italy as belonging to himself, and a part of it, one-third, it is said he partitioned out among his warriors, thus covering Italy with a network of Gothic military colonies. In other respects he retained the administrative machinery of the empire, and he understood how to work it. He governed Goths and Romans as if they were one people, and, though himself an Arian, refrained from persecuting the Catholics till the last two years of his reign. Under him the country enjoyed peace and prosperity to a greater degree than fell to its lot for several centuries. In commerce and industry, in science and art, damages were repaired, and new undertakings started. Cassiodorus, Boethius, Symmachus, and other literary men of eminence lived at his court in Verona as his intimate friends. In his foreign policy he was also wise and successful, and among the German tribes he became a hero (*Dietrich von Bern*), around whose name legends grew thick during the Middle Ages. The last days of his life were embittered by a controversy with the emperor and the pope over the persecution of the Arians, and stained by deeds of violence and cruelty. He alienated the minds of his Roman subjects by the judicial murder of Boethius and Symmachus, and he angered the Catholics by his treatment of Pope John I., who died in prison. He died at Ravenna, Aug. 30, 526, just after he had issued an edict giving over the Catholic churches of Italy to the Arians. See Hodgkin, *Theodoric the Goth* (1891). F. M. COLBY.

**Theodosia**, or **Feodosia**: See KAFFA.

**Theodo'sius**: an eminent Roman general from whom a line of emperors descended. Sent to Britain by Valentinian I. in 367 A. D., he drove out the Picts and Scots, strengthened the military positions on the frontiers, and restored security and order in the country. After his return he was for some time stationed on the upper Danube, where he defeated the Alemanni. In 372 he took command in Africa, and succeeded, after an obstinate struggle, in putting down a revolt led by the Moorish chieftain Firmus. Theodosius was executed in 376 by order of Valens.—His son, THEODOSIUS I., THE GREAT, Roman emperor from 379 to 395, was born in Spain, probably at Cauca, in Galicia, about the year 346, and educated in his father's camp. He early received an independent command in Mœsia, and distinguished himself by victories over the Sarmatians, but after the execution of his father, in 376, he retired from public life, and returned to his native place. After the defeat and death of Valens in the battle of Adrianople (in 378), Gratian recalled him to the court, made him commander-in-chief against the Goths, and declared him Augustus (Jan. 19, 379), placing Egypt, Asia, Thrace, Macedonia, and Dacia under his scepter. Theodosius pursued a skillful policy in his campaigns against the Goths, and a peace was concluded by which they received lands within the empire and became allies of Rome. In 383 Gratian was defeated and killed by Maximus at Lyons, and Theodosius acknowledged the usurper as Emperor of Britain, Spain, and Gaul, but secured Africa, Italy, and Illyricum for Gratian's brother, Valentinian II. In 387, however, Maximus broke from Gaul into Italy, and the weak Valentinian II. and his mother Justina, who was the true regent of the empire, fled for safety to Theodosius. Theodosius became so infatuated with Valentinian's beautiful sister, Galla, that he promised to restore him to the throne in order to obtain her hand. Maximus was defeated and put to death in 388, and Valentinian II. was reinstated as Emperor of the West, but in 392 was killed by Arbogastes, who, not venturing to assume the purple himself, raised the rhetorician Eugenius to the throne. Theodosius hesitated long before he entered on a new war, but in 394 he marched against Eugenius and Arbogastes, and defeated them at Aquileia, thereby uniting the whole Roman empire under his scepter. He died shortly after, however (Jan. 17, 395), at Milan, leaving the empire to his sons Arcadius and Honorius. Theodosius was a zealous upholder of orthodox Christianity, and took active measures for the suppression of pagan rites and heretical opinions. His obedience to the Church was exemplified in his submission to the penance imposed by Ambrose after the cruel massacre of Thessalonica (390).—His grandson, THEODOSIUS II. (408–450), b. in 401, succeeded his father, Arcadius, as emperor in the East. He was a weak ruler, controlled largely by his sister, Pulcheria, and his wife, Eudocia. He is chiefly known for the Theodosian code, a collection of the imperial constitutions issued since the time of Constantine. Revised by CHARLES H. HASKINS.

**Theog'nis of Megara**, in Greece: elegiac poet who flourished in the latter half of the sixth century B. C., and lived to see the on-coming of the Persian war. His life fell in a period of feuds and factions; the oligarchical party to which he belonged was overborne by the democracy, and Theognis, stripped of his estate, suffered the pangs of poverty and exile. In the verses that have been preserved under his name, 1,389 in number, we have the creed of a Doric oligarch set forth for the instruction of a young favorite who belonged to the same order. The fragments vary in length, and as the sententious character of the poetry of Theognis lends itself readily to interpolations, his genuine work is largely mixed with passages from other poets, such as Solon, Mimnermus, Tyrtæus, and Evenus. But for all these foreign ingredients the character of the poet and the bitterness of his spirit are manifest enough, and the remains of Theognis are of prime importance in enabling us to understand the state of parties and the problems of society in the Greece of the sixth century. Ed. by Welcker (1826), by Ziegler (2d ed. 1880), by Sitzler (1880), and by Bergk, *Poetæ Lyrici Græci*, vol. ii., pp. 177–236 (4th ed.). Translated by Frere (1842)—see Frere's *Works*, vol. iii., ed. of 1874—with a clever but hopeless attempt to work all the disparate fragments into a mosaic of the poet's life and character. For more recent studies, see Sittl, *Geschichte der griechischen Literatur*, vol. i., p. 261, foll. B. L. GILDERSLEEVE.

**Theological Schools**: See SCHOOLS.

**Theology** [from Gr. Θεός, God + λόγος, discourse, reason]: literally, discourse concerning God. The term has come down to us from the Greek philosophers, who used it in the sense of "account of the gods." Plato so used it in speaking of what Homer and Hesiod in their poems have said of the gods, though he also employs the word mythology, which by common consent has been adopted by Christian writers as the more appropriate term. The word theology seems to have first come distinctly into Christian use during the great controversies in the fourth century respecting the divinity of Christ and his relation to the Godhead, the term then meaning sometimes the doctrine of the divine nature of Christ as distinguished from his human nature (οἰκονομία), and sometimes the doctrine of the Trinity. Theodoret in the fifth century appears to have been the first to use the term in the sense of "doctrine of God." He proposes and discusses the question, Why did not Moses preface his account of the creation with (θεολογία) the doctrine of God—i. e. with some explicit teaching respecting the nature and attributes of God? It was not until the twelfth century that theology assumed something like the comprehensiveness of its modern meaning. Abelard having prepared a compend of his lectures on some of the most prominent doctrines of faith, entitled it "Christian Theology" (*Christiana Theologia*). From the time of Abelard the term rapidly widened in meaning till it came to include all that is now comprehended under it. Theology now denotes not merely the doctrine of God, or theology proper, but also the doctrine of the world in its relations to God, or cosmology; the doctrine of man in his relations to God, or anthropology; the doctrine of the salvation of man through the person and work of Christ, or soteriology; the doctrine of the final states of all men, or eschatology; and the doctrine of the Church, its constitution and government, or ecclesiology. Theology may therefore be defined as the science which treats of God and the universe in all their known relations to each other. It has sometimes been defined as "the science of the supernatural," and very commonly as "the science of religion." These definitions, however, are vague and inexact; both, with any definiteness of meaning, would necessarily include much that does not properly belong to theology, and omit still more that does. The last named, "the science of religion," from its apparent simplicity and comprehensiveness has gained great popular currency, which has also been promoted by indefinite notions as to the nature of both religion and theology.

Religion exists as an inward state of feeling—a sense of duty toward a Being or beings regarded as divine and supreme—and also as an outward expression of that feeling in acts of worship and service. The science of religion, therefore, should analyze and classify the religions of the world—both the religious convictions and feelings of men, and the forms of worship and service in which these convictions and feelings find their natural expression. Theology, on the other hand, deals exclusively with the facts, whether of consciousness or of revelation, from which religion, both subjective and objective, proceeds, and, educing the truths and principles which the facts embody, it formulates and groups them into the doctrines which constitute theology.

The right of theology to be called a science, which in late years has been warmly disputed, can be determined only by answering the following questions: first, Can the facts with which it has to do be proved to be indubitably real, and what are they supposed to be? and second, Can the methods which it adopts in dealing with its facts be shown to be in accordance with the acknowledged laws of mind? In its broad sense as a science it must gather its facts from the wide fields of nature, consciousness, and the sacred Scriptures. In a narrower and commoner sense of the term its facts, according to one class of theologians, are to be found only in the sacred Scriptures, and are strictly historical; according to another class, even in the narrower sense of the term, the facts of the moral consciousness should not be overlooked; this latter class holding that the ultimate and decisive appeal must ever be to the Scriptures, yet maintaining that the facts of the moral consciousness when properly scrutinized will be found to be explanatory, supplemental, and corroborative of those of the Scriptures. As to the facts, so far as they are historical they are amenable to the bar of criticism, like the facts of any other history, and must vindicate their trustworthiness by precisely the same kind of evidence; and so far as they are from the moral consciousness, they are open to inspection, and may be subjected to the same kind of analyses and tests as any other facts of mind. As to methods, there is the same liability to error in theology as in any other science; but out of various possible methods in dealing with the phenomena of nature, some one is of course admitted to be scientific, and that one, with such insignificant modification as may be necessary to fit it to its service, must be equally scientific in dealing with the phenomena of revelation; so that, if a science of astronomy, and still more if a science of ethics, be possible there may also be a science of theology. Science differs from mere knowledge in the degree of its certitude and exactness. It would be difficult to show that the essential principles of theology are less certain or less capable of exact statement than those of any other science. Science also differs from mere knowledge in the extent to which its material is classified and organized. The facts of theology can be classified and organized, and precisely to the extent in which this is accomplished can theology be called a science. The chief ground for denial of the right of theology to be called a science is found in its liability to resort to theory when facts are wanting, and to hypothesis in the absence of evidence. Its danger of becoming in this way unscientific is, however, no greater than that of most other sciences. The facts of revelation on which the science of theology rests presuppose and imply those fundamental facts of being which it is the office of metaphysical philosophy to interpret: of these facts some kind of explanation is to every enlightened mind a necessity. The theologian must have his explanation, and it is to him the source of his greatest danger of becoming unscientific. His metaphysic is perpetually suggesting to him its method of rounding his theology into the completeness of a system. To what is strictly scientific in his theology he is continually tempted to add what is purely theoretic. It is because theology has been so encumbered by what is purely theoretic—by theories of the Trinity, theories of sin, and theories of the divine providence, of the atonement, of regeneration, etc.—that its right to be entitled a science has been disputed; but to any one who looks impartially at the materials with which theology builds, and at the inductive method which it may justly adopt, its right to be called a science would seem to be as clear as that of any other species of knowledge.

Theology has been divided into two kinds, which have been designated according to the supposed sources of their materials. Thus we have Natural Theology (*q. v.*) and revealed theology. By the first is meant that knowledge of God, his existence, attributes, and government of the world, which may be gathered from nature—i. e. from the external world and from the mental and moral constitution of man; and by the second is meant that knowledge of God and the universe, and of their mutual relations, which may be gathered from the Bible alone, or at least that knowledge alone which the Bible sanctions. It may be doubted, however, if the line of separation between the two is so clearly marked as is commonly supposed. The Bible assumes and incorporates into itself no small portion of what must be regarded as fundamental in natural theology, and few, if any, of the sources of natural theology have failed to be irradiated by the light of revelation. It is now well-nigh impossible to distinguish between what is taught by nature and what by revelation.

Revealed theology has been distributed into a variety of species, each of which has received its designation either from its special aim or from its special method of treatment. Thus, to particularize, we have systematic theology, the aim of which is to reduce all revealed truths to a series of statements that together shall constitute an organized whole; dogmatic, which aims pre-eminently to state what is authoritatively taught, whether by the Scriptures, the councils, or the creeds; philosophical, in which the formal statements of truth are more or less directly determined either by the postulates or by the conclusions of some special system of philosophy; metaphysical, in which the aim is to substantiate the teachings of the Bible by an appeal to those primitive cognitions and primary beliefs which the Bible always assumes; speculative, in which theory predominates over Scripture and all other authority; rational, which gives to human reason the highest authority in determining what is theological truth; biblical, which, indifferent alike to philosophy and dogma, and, making system but a secondary consideration, aims simply to state the teachings of the Bible; doctrinal, which contents itself with simply formulating its statements of truth with a view to their being understood and accepted; and practical, which, on the other hand, seeks so to shape its statements of truth as to secure conformity of life with what is stated; polemical, which is quite as intent on overthrowing the positions of other systems as in defending its own; and historical, which traces doctrines through the controversies amid which they were enunciated, and under the influence of which they were formulated. Moral theology is a designation which has among Protestants fallen into general disuse, but once denoted a discussion of moral law and human duty as laid down in the Ten Commandments and the Sermon on the Mount, and covered ground which is occupied by moral philosophy or Christian ethics. The term theology, unaccompanied by an epithet, commonly denotes a completed series of the classified doctrines of Christianity. Doctrines are formal statements of Christian truth, and scientific theology consists of the whole circle of doctrines arranged according to some determinate plan.

Theology as a science has had a clearly marked history—a history covering special controversies under which specific doctrines took form, and those broader and less violent discussions in which all doctrines, under the influence of metaphysical philosophies, were adjusted into the various systems which, taken together, constitute the science as a whole. This history, beginning with the time immediately succeeding that of the apostles, naturally divides itself into three great periods, the first extending to A. D. 730, the second from 730 to 1517, and the third from 1517 to our own time.

During the first period, theology was in its formative state. The hints given by Scripture in the formula of baptism (Matt. xxviii. 19) and the apostolic benedictions (2 Cor. xiii. 14), in the grouping of the facts of sin and salvation about the two persons, Adam and Christ (Rom. v. 12–19), in the poetical summary of the truths of redemption quoted by Paul (1 Tim. iii. 16), seem first to have suggested the possibility of combining these facts and truths into a system. Ignatius (d. 115) gives the first distinct statement of the faith drawn up in a series of propositions, and his systematizing formed the basis of all later efforts. No complete treatise of theology, however, was written during this first period. The nearest approach to one was by Isidore, of Seville, who died in 636. He wrote what he styled Three Books of Sentences (*Tres Libri Sententiarum*), but it was, as its title indicated, a mere collection of extracts from the Church Fathers. The period, however, was not unproductive of results. It gave to the Church universal that admirable digest of Christian faith called the Apostles' Creed. Among the churches of the East were elaborated the great doctrines of the Trinity and of the person of Christ, which were formulated in the creeds adopted by the Council of Nice in 325, of Constantinople in 381, of Ephesus in 431, and of Chalcedon in 451. Within the same period also—that is, during the first quarter of the fifth century—the equally important doctrines of anthropology (specifically of the fall of Adam and its effects on the human race) were discussed, chiefly among the churches of the West under the leadership of Augustine and Pelagius. Augustine maintained that all men sinned in Adam; that by his fall all were physically and morally corrupted (original sin), and incapacitated to will or to do aught but evil; that all there is of good in any one is by sovereign grace in fulfillment of a predestinating purpose. Pelagius, on the other hand, maintained that Adam alone was injured by the fall; that every one of his descendants begins life with a nature as pure as his was, and with a will as free to choose good as evil; that grace simply assists natural power, and is bestowed on those who by right use of natural power deserve it. Augustinism was adopted as the orthodox doctrine of the Church by the Council of Ephesus in 431. Semi-Pelagianism denied the positions of Augustine and softened the statements of Pelagius. Wiggers in his history of the three views says aptly that "Pelagianism makes man to be morally *well*; Semi-Pelagianism makes him to be morally *sick*; Augustinism makes him to be morally *dead*."

The second period (from 730 to 1517) produced three great writers on theology—viz., John of Damascus, Peter the Lombard, and Thomas Aquinas. John (d. 754) wrote what he styled An Accurate Summary of the Orthodox Faith (Ἔκδοσις ἀκριβὴς τῆς ὀρθοδόξου Πίστεως, or *De Orthodoxa Fide*). He is the only writer of note on systematic theology which the Greek Church has ever produced. He drew his materials from the earlier Fathers, and chiefly from the three great Cappadocian teachers, Gregory Nazianzen, Gregory of Nyssa, and Basil the Great. He was the first to apply the formulas of Aristotle to theological investigation, and thus to introduce the dialectic or scholastic method. His views of the moral state and ability of man, like those of all the Greek Fathers, are much less rigid than those of Augustine. His work is chiefly of value to one who would understand the history of the doctrine of the person of Christ. Peter the Lombard (d. 1164) compiled from the Latin Fathers, chiefly from Augustine and Gregory the Great, what he styled Four Books of Sentences (*Quatuor Libri Sententiarum*). His method is formal and dialectic, but he shows great acuteness and skill in his aim at reconciling the opposing views of the authors whom he quotes—an aim the opposite of that of Abelard (d. 1142), who had sought in his "Yes and No" (*Sic et Non*) to array the Fathers against one another. The work of Peter became the great authority in the Roman Church, the ablest theologians for a long time contenting themselves with simply commenting on it. The greatest of mediæval theologians, however, perhaps one of the ablest of any age, was Thomas Aquinas (d. 1274). He wrote, according to the fashion of his time, elaborate commentaries on the *Sentences* of the Lombard, to which he also gave the alternative title of Sum of Theology (*Summa Theologiæ*). He is pre-eminently scholastic in method, but transparent in thought and exhaustive in treatment. The Lombard simply recognized the rising controversy between the Realists and the Nominalists; Aquinas was a pronounced and earnest Realist. He was also more Augustinian in his anthropology than Lombard, and, setting aside the mythical theory of the atonement, which Lombard had accepted from the Fathers, and which made the death of Christ to have been a ransom paid to Satan, he maintained, and established for all time since, the Anselmic theory, that the death of Christ was a satisfaction for sin to the justice of God. The mythical theory had prevailed until the beginning of the twelfth century, when Anselm, Archbishop of Canterbury (d. 1109), elaborated the theory which bears his name, and the final acceptance of which made as distinctly, though less violently, an epoch in the progress of theological science as had been made more than seven centuries before by the adoption of the Augustinian views of human nature. The *Summa* of Aquinas is one of the highest authorities in the Roman Catholic Church.

The third great period, from 1517 to the present, has been more fruitful of treatises on scientific theology, and has contributed more to its progress than all the Christian centuries preceding. Until the sixteenth century only two great doctrines or groups of doctrines—viz., of God, including the Trinity, Christology, etc., and of man, including sin, free will, sovereign grace, etc.—had been comprehensively discussed. The Reformation under Luther turned on controversies over the doctrines of soteriology, or of the divine method of making the work of Christ available for men. The Roman Church, under guidance of mediæval theologians, had come to make the process of salvation to be a mere external work (an *opus operatum*) wrought by the efficacy of the sacraments. Luther maintained that it could be wrought only through a personal faith (a *fides justificans*). In prosecution of the controversy the Reformers, cutting loose from scholastic theology, entered at once on the study of the Bible and the Christian truth for themselves. The first Protestant treatise on scientific theology, the *Common Places* (*Loci Communes*) of Melanchthon, had its origin in a course of lectures on the Epistle to the Romans, the chief object of which was to collate and expound such passages of the Epistle as bore directly on the question in dispute. Out of the biblical studies of the Reformers, German, Swiss, and French alike, grew those statements of soteriological doctrines now found in all systems of Protestant theology.

From the middle of the sixteenth century theology presents itself under three clearly defined types—the Lutheran, the Reformed (the Calvinistic), and the Roman Catholic. At the beginning of Protestantism the Lutherans and the Calvinists were essentially one in doctrine. Both adopted the Augustinian views of sin and grace, and both held firmly to the Nicene and Chalcedon creeds. Luther was himself pre-eminently Augustinian, and even wrote a book (*De Servo Arbitrio*) to prove that the will of man is enslaved; and Melanchthon, when he wrote the first edition of his *Loci*, as well as the Augsburg Confession (*Confessio Augustana*) and the apology for it (*Apologia Confessionis*), was no less Augustinian. Luther, however, propounded and defended a doctrine of the real presence of the body and blood in the Lord's Supper under the title of consubstantiation; and Melanchthon, gradually swerving from the Augustinian views of sin and irresistible grace (monergism), maintained the existence of a co-operative power of the human will in regeneration (synergism), and favored the Reformed view of the Supper rather than the Lutheran; the Reformed, under the lead of Calvin, adhered to Augustine's views of human nature, and maintained that in the Supper the Lord is present, not in the bread and wine, but in the heart of the communicant through partaking of the consecrated elements; the differences between the Lutheran and Reformed, slight at first, rapidly widened into complete separation. The historical progress of dogmatic theology may be traced under the three above-mentioned types—the Roman, the Lutheran, and the Reformed or Calvinistic.

*The Roman.*—The Roman Catholic Church, in which theological studies had fallen into neglect, was roused into immediate activity by the outbreak of the Reformation; but in the canons of the Council of Trent (1545–93) it reaffirmed the theology of its mediæval writers, particularly of Aquinas, and authorized the preparation of the Roman Catechism (*Catechismus Romanus*), which popularizes and reiterates the decrees of the council. Its great writers, such as Bellarmine and Petavius, contented themselves with acting on the defensive, simply reaffirming the dogmas of the Church and the interpretations which priestly authority had put upon them. There has been no dearth of modern theological treatises in the Roman Church, but the most able and complete of them all is that of Cardinal Perrone (*Praelectiones Theologicæ*), which first appeared in 1835, and of which very many editions have been since published. It is specially able in its presentation of the Roman theory of the Church and its sacraments. Moehler's *Symbolism* skillfully states and minimizes the points of difference between Roman Catholicism and Protestantism; while Hurter's *Compendium Theologiæ Dogmaticæ* is a recent and extended exposition of the Roman doctrine.

*The Lutheran.*—The *Loci* of Melanchthon, first published in 1521, became at once the great Lutheran authority, and was the first in a series of learned and able treatises. It was clear in thought, admirable in style, and entirely free in language and method from scholasticism. Sixty editions in Latin and a large number (estimated at more than twenty) of translations into German were published during its author's lifetime. The later editions were so changed from the earlier as to make it almost another work. Theologians immediately succeeding Melanchthon contented themselves with writing commentaries on the *Loci*; but during the 200 years following his death (1561) the Lutheran Church abounded in great writers on theology, many of whom were noted for their learning as well as for their extraordinary grasp and acuteness of intellect. Among others may be mentioned Chemnitz, Gerhard, Calixtus, Calovius, and Quenstedt. Of these authors, some sided in their anthropology with Luther, but the majority with Melanchthon, while almost unanimously they went with Luther in his views of the sacrament of the Supper. The simultaneous appearance, however, of Rationalism and Pietism about the middle of the eighteenth century interrupted the sluggish flow of Lutheran theology, few or no treatises of any special value for a half a century or more from that date having made their appearance. The Rationalists were too intent on their work of destruction to construct a scientific theology; and the Pietists, regarding religion as much more a matter of the heart than of the intellect, were indifferent to doctrinal discussions. The only strictly rationalist treatise on systematic theology worthy of note was that of Wegscheider (*Institutiones Theologiæ Christianæ Dogmaticæ*); the Pietists produced no dogmatic treatise; but Pietism and Rationalism have, one or the other, largely determined the methods and conclusions of subsequent treatises. The union of the Lutheran and the Reformed Churches in Germany, since 1817, has rendered increasingly indistinct the line of separation between the two theologies, and for this reason the later developments of Lutheran doctrine will be mentioned in connection with the Reformed theology after the time of Schleiermacher.

*The Reformed* (*Calvinist*).—At the head of all the Reformed theologians, and, in the estimation of some, of all Protestant as well, stands John Calvin. He was eleven years old when Melanchthon published the first edition of his *Loci*, and was but twenty-seven when he published the first edition of his own *Institutes of Theology* (*Christianæ Religionis Institutio*). Few if any writers on theology have surpassed him in transparency of thought, in depth or breadth of view, in strength of grasp, or in logical force and consistency. The Reformed theology has gained wide currency among different nations. Its adherents had so multiplied and organized themselves into Churches under Calvinistic creeds among different nations as to admit, with varying degrees of accuracy, of national designations. Thus we have the Swiss-French or Genevan Church, founded by Calvin (he published at Geneva the revised edition of his *Catechism*, 1541: the *Creeds*, *Consensus Tigurinus*, 1549; *Consensus Genevensis*, 1552; and the revised and standard edition of his *Institutes*, 1559); the Anglican, which through Cranmer and Ridley expressed itself in the Thirty-nine Articles, 1552; the German Reformed Church, which crystallized around the Heidelberg Catechism, 1562; the Dutch (Netherlands), which culminated in the Synod of Dort, 1618, and afterward signalized itself by the origin of the federal theory or covenant system, 1648; the Anglo-Scotch, which proclaimed itself in the Westminster Confession and Catechism, 1646–48: and, finally, we have the American type of theology, which, having begun under the Westminster Symbols (the Congregationalists adopting them 1648, and the Presbyterians 1729, while the Dutch brought with them the Heidelberg Catechism, and the Episcopalians the Thirty-nine Articles), now presents itself under new and ever-increasing variations.

Calvinistic theology, unlike the Lutheran, has been subject to many modifications, and has subdivided itself into a variety of schools. Some of these modifications have had their origin in reactions against extremes of view or of method, and others have resulted from the influence of special schools of speculative philosophy, to which the Reformed theology has always been much more sensitive than the Lutheran. Thus near the middle of the seventeenth century the Calvinist writers of the Netherlands had become excessively scholastic and formal. In opposition to their method, Cocceius (in German *Koch*, and English *Cook*) conceived the federal method or the system of covenants—a covenant of works between God and man, and a covenant of grace between God and Christ—a method which he regarded as founded on the historical order of the Scriptures. Francis Burman at Utrecht and Herman Witsius at Leyden adopted the federal theory. The Cartesian philosophy, just then engaging the attention of Europe, was accepted by the Federalists, who adopted it so far as it taught the capacity of the unaided reason of man to know God and his character; the Scholastics assailed it. Voetius and Van Mastricht (who styled it the gangrene of theology) being specially bitter in their denunciations. While the Netherlands were agitated with controversies about scholasticism, federalism, and Cartesianism, the Calvinists of France were equally moved by disputes over the two distinctively Calvinistic doctrines of predestination and imputation. The professors at Saumur persisted in modifications of the current statements of both these doctrines. Amyraldus (Amyraut) rejected absolute predestination, but propounded in its stead a predestination conditioned by a hypothetic or ideal universalism. Associated with Amyraut at Saumur was Placæus (La Place), who denied the doctrine of immediate imputation—i. e. the notion of a direct imputation of Adam's guilt to his innocent descendants—and affirmed the doctrine of mediate imputation—i. e. the imputation of Adam's guilt to his descendants as made guilty by an inherited evil nature. The views of both Amyraut and Placeus were opposed by Rivetus in France, by Francis Turretin at Geneva, and by J. H. Heidegger at Zurich. Against them, Heidegger was apppointed by the Swiss to draw up a symbolical book, the *Consensus Helveticus*, which was much discussed, but could never be lifted into a position of authority. Turretin, a sympathizing friend of Heidegger, in his important treatise on theology (*Institutio Theologiæ Elencticæ*) adopted the covenant theory of Cocceius and affirmed immediate imputation and absolute predestination. Again, during the first half of the eighteenth century the philosophy of Leibnitz having been adopted and adjusted to theological inquiries by Wolff, some of the Swiss theologians followed the Wolffian method. Wolff had maintained, and attempted to show by a most elaborate treatise, that the truths of natural theology were capable of demonstration, and that revealed theology, resting on natural, could thus be made to stand on a basis of science and certainty. But Wolff had also resolved all theological truths, whether of revealed or of natural religion, into mere abstract principles and definitions; and the theologians who constructed their systems after his method, while making a great show of logic, reduced theology to a mere system of formal and arid propositions. Notably of this class were Daniel Wyttenbach and J. F. Stapfer, of Berne. Schleiermacher, under the double influence of a pantheistic philosophy and of the Moravian teaching of his youth, gave to the German Reformed theology, during the first quarter of the nineteenth century, a tendency and a modification which continue. He mediated, however, between the Lutheran and the Reformed systems, thus influencing to some extent the methods and results of both. Schleiermacher based his system of theology upon the inner certainties of Christian feeling, and his writings constituted a transition from the rationalism of the preceding century to the more scriptural and evangelical faith represented by Neander and Tholuck, Twesten and Nitzsch, Müller and Dorner, Ebrard and Lange, Thomasius and Philippi, Luthardt and Kahnis. Two new forms of rationalism, however, have appeared in Germany, the one based upon the philosophy of Hegel, and numbering among its adherents Strauss and Baur, Biedermann, Lipsius, and Pfleiderer; the other based upon the philosophy of Kant, and advocated by Ritschl and his followers, Harnack, Hermann, and Kaftan; the former emphasizing the ideal Christ, the latter emphasizing the historical Christ, but neither of the two fully recognizing the living Christ present in every believer. The Swiss Reformed Church has produced an able conservative theologian in the person of Gretillat, of Montauban.

*Theologies in Antagonism with the Reformed.—Socinianism.*—At a very early period in the history of Protestant theology there was opposition to the doctrine of the Trinity. This opposition culminated in the person of Servetus, and he was put to death by burning. The opponents of trinitarianism gathered in Transylvania, and finally, organized by Faustus Socinus (d. 1604), became known as Socinians. Socinus wrote a brief treatise on theology, and a catechism which comprehended only the points in dispute between him and the trinitarians. The views of the Socinians are found in the *Racovian Catechism* and in the *Bibliotheca Fratrum Polonorum*. Socinianism has been represented by the Unitarians Samuel Clarke and James Martineau in England, and William Ellery Channing and James Freeman Clarke in the U. S. Unitarianism, however, has at no time produced a systematic theology. For a more extended account, see SOCINIANS AND SOCINIANISM.

*Arminianism.*—In reaction against the rigid high Calvinism of the Netherlands, Arminius denied the doctrine of absolute predestination, and propounded in its stead the doctrine of a predestination founded on the foreknowledge of God. Violent controversies ensued; the followers and successors of Arminius addressed a remonstrance to the state authorities; the Synod of Dort was convened, and the Remonstrants were excluded from the Reformed Church. Episcopius and Limborch elaborated the Arminian theology into a self-consistent system, while Hugo Grotius constructed the governmental theory of the atonement. The Methodists, who have inherited the theology of the Arminians, have for their systematic theologians in England Watson and Pope, in the U. S. Raymond, Foster, and Miley. English Methodists hold in general to the modified Arminianism of John Wesley, and regard man's ability to co-operate with God to be a matter of grace, while Arminius regarded the bestowal of this ability to be a matter of justice, man without it not being accountable. American Methodists, in general, hold more closely to original Arminianism, and maintain the almost unlimited self-determining power of the human will. See also ARMINIUS AND ARMINIANISM.

The Anglican Church and the Protestant Episcopal Church of the U. S. have taken little or no interest in the cultivation of systematic or scientific theology, in large part because, until recently, specifically theological schools have been lacking in England, and because questions of missions and of ritual have absorbed attention in the U. S. Pearson on *The Creed* and the popular expositions of the Thirty-nine Articles by Bishop Burnet, and more recently by Browne, Bishop of Winchester, are not in any proper sense scientific treatises on theology, although they are common English text-books. The "judicious" Hooker is still the greatest theological writer of the English Church, although his work is only on *Ecclesiastical Polity*. Yet there are signs of awakening interest in theology. Litton's *Compendium of Dogmatic Theology* and Moule's *Outlines of Christian Doctrine* show a tendency to return from the usual Arminianism of the Anglican Church to the old Augustinism; while Kedney's *Christian Doctrine* is a recent American work in which the speculative element is prominent.

The Baptists have been represented in theology by John Bunyan's *Gospel Truths Opened*, John Gill's *Body of Practical Divinity*, and Andrew Fuller's *Letters on Systematic Divinity*. It is in the U. S., however, that the Baptists have shown greatest activity both in theology and in missions. Within a few years have been published Ezekiel G. Robinson's *Christian Theology*, Augustus H. Strong's *Systematic Theology*, Alvah Hovey's *Manual of Theology and Ethics*, James P. Boyce's *Systematic Theology*, E. H. Johnson's *Outlines of Systematic Theology*, Ebenezer Dodge's *Christian Theology*, and W. N. Clarke's *Christian Theology*. The ablest exposition of the views of the Quakers is Robert Barclay's *Apology for the True Christian Divinity*.

*American theology* in general, aside from the writers already mentioned, has run in two lines: 1. The Reformed system of Jonathan Edwards, modified successively by Joseph Bellamy, Samuel Hopkins, Timothy Dwight, Nathaniel Emmons, Leonard Woods, Charles G. Finney, and Nathaniel W. Taylor. Jonathan Edwards, one of the greatest of metaphysicians and theologians, thought too little of nature, and tended to a thoroughgoing idealism. He regarded the chief good as happiness—a form of sensibility. Virtue was voluntary choice of this good. Hence union with Adam in acts and exercises was sufficient. This God's will made identity of being with Adam. There naturally followed the exercise-system of Hopkins and Emmons, on the one hand, and Bellamy's and Dwight's denial of any imputation of Adam's sin or of inborn depravity, on the other—which last denial was also made by many other New England theologians who rejected the exercise-scheme, as, for example, Strong, Tyler, Smalley, Burton, Woods, and Park. Dr. Nathaniel W. Taylor added a more distinctly Arminian element, the power of contrary choice—and with this tenet of the New Haven theology, Charles G. Finney, of Oberlin, substantially agreed. Thus from certain principles admitted by Edwards, who held in the main to an Old School theology, the New School theology has been gradually developed. Calvinism, as thus modified, is often called the New England theology. Through Horace Bushnell, and the influence of Andover professors who, in their turn, have followed the German Dorner, the New England or New School theology has developed a tendency to the doctrine of probation after death for those who have had no opportunity in this life to accept Christ; and, as thus modified, the New School theology is often called the New Theology. 2. The older Calvinism, represented by Charles Hodge the father, and A. A. Hodge the son, together with Robert J. Breckinridge, Samuel J. Baird, and William G. T. Shedd. All these, though with minor differences, hold to views of human depravity and divine grace more nearly conformed to the doctrine of Augustine and Calvin, and they are for this reason distinguished from the New School theologians and their followers by the popular title of Old School. Old School theology has for its characteristic tenet the guilt of inborn depravity; but among those who hold this view, some are federalists and creationists, and justify God's condemnation of all men upon the ground that Adam represented his posterity. Such are the Princeton theologians generally, including Charles Hodge, Archibald A. Hodge, and the brothers Alexander. Among those who hold to the Old School doctrine of the guilt of inborn depravity, however, there are others who are traducianists, and who explain the imputation of Adam's sin to his posterity upon the ground of the natural union between him and them. Baird's *Elohim Revealed* and Shedd's essay on *Original Sin* (Sin a Nature and that Nature Guilt) represent this realistic conception of the relation of the race to its first father. R. J. Breckinridge, Robert L. Dabney, and James H. Thornwell assert the fact of inherent corruption and guilt, but refuse to assign any rationale for it, though they tend to realism. Henry B. Smith holds guardedly to the theory of mediate imputation: but while ranked with the Old School he may be regarded as mediating between the Old School and the New. As a learned, acute, and philosophical theologian, he deserves to be placed next to Jonathan Edwards.

*Relation of Theology to Metaphysical and Physical Science.*—The rise and progress of systems of theology have always been coincident with the rise and progress of systems of philosophy. Mediæval theology is intelligible only by understanding the realistic or nominalistic philosophies of its authors; and the modern systems of Protestant theology can be fully understood only by understanding the systems of philosophy which underlie them. It is remarkable that while the great theological writers anterior to the sixteenth century, who are appealed to as common authorities by Roman and Protestant writers alike, were philosophical realists, the chief theological systems of the Protestant Churches rest either upon avowed and unadulterated nominalism or upon nominalism in the disguised form of conceptualism; but with the traditional influence of metaphysical systems the natural sciences have in our day been rapidly coming into collision. It is the office of these sciences to ascertain what is really knowable of the processes of nature, and to reduce this knowledge to exact forms of statement. In fulfillment of this office, these sciences, in their manifold departments, are not only rendering an invaluable service to the science of mind, by bringing metaphysicians to observe its actual phenomena rather than to build on definitions of its processes, but are doing a work of equal value to theology, by requiring theologians to deal with law, government, sin, righteousness, character, heredity, and other fundamental truths, not as mere names or conceptions, but as the most real of realities. Both in Europe and in the U. S. the most recent theology has been greatly influenced by the monistic tendencies of modern science, in some instances to the denial of the freedom of man and of the transcendence of God, in other cases with a strenuous affirmation of these ethical postulates. The so-called higher criticism has applied the principles of historical development to the Old Testament, with the result in some cases of denying any specifically divine element, but in general with the only result of inducing a somewhat broader view of divine inspiration as possibly consistent with error in matters not affecting the moral or religious teaching of the Scriptures. The theology of the future, which is to stand the test of criticism and control the consciences of men, must, like the teachings of the New Testament, rest on a basis of reality, and find in the consciousness of mankind an unequivocal testimony to its truth.

LITERATURE.—Petavius, *Opus de Theologicis Dogmatibus*; Bellarmine, *Disputationes de Controversiis Fidei*; Möhler, *Symbolism*; Gass, *Geschichte der protestantischen Dogmatik*; Polenz, *Geschichte des Calvinismus*; Heppe, *Dogmatik des deutschen Protestantismus*; Hase, *Hutterus Redivivus*; Schweizer, *Die Glaubenslehre der evangelischen Reform-Kirche.* The church histories of Neander, Gieseler, Hase, and Guericke; Neander, *Christliche Dogmengeschichte* (History of Christian Dogmas, translated by J. E. Ryland); Hagenbach, *History of Doctrines* (the translation revised and enlarged by H. B. Smith); Winer, *Comparative Darstellung des Lehrbegriffs der verschiedenen christlichen Kirchenparteien*; Schneckenburger, *Vergleichende Darstellung des Lutherischen und reformirten Lehrbegriffs*; Schaff, *Creeds of Christendom*; Dorner, *History of Protestant Theology*; and the *History of Theology* in Gretillat's *Théologie Systématique.* Dictionaries of theology, which give definitions of theological terms and articles upon theologians and their systems, exist in different languages. Of them the best are known as Herzog's *Real-Encyklopädie*, the great thesaurus of Protestant learning (2d ed. Leipzig, 1877–88, 18 vols.); Wetzer and Welte's *Kirchenlexicon*, the great thesaurus of Roman Catholic learning (2d ed. Freiburg im Breisgau, 1882, *seq.*); McClintock and Strong, *Cyclopædia of Sacred Literature* (New York, 1867–81, 10 vols., with 2 supplementary vols. and supplements 1887, *seq.*); less extensive is the *Schaff-Herzog Encyclopedia* (New York, 3 vols., 1884; rev. ed. 1887); in one volume are W. F. Hook's *Church Dictionary* (London, 1842; 14th ed. 1887); J. H. Blunt's *Dictionary of Theology* (1870); W. E. Addis and T. Arnold's [Roman] *Catholic Dictionary* (London and New York, 1883; 4th ed. 1893). See also ANTHROPOLOGY, ATONEMENT, CALVINISM, CHURCH HISTORY, FUTURE STATE, GERMAN THEOLOGY, and GOD. Revised by AUGUSTUS H. STRONG.

**Theopaschites**: the Greek name for PATRIPASSIANS (*q. v.*).

**Theoph'ilus**: Bishop of Antioch (171–185); probably of heathen parentage; famous for his *Apologia ad Autolycum*, an elaborate apology for Christianity. He is the first Christian writer to mention a Trinity in the Divine Nature (*Apol.*, ii., 15). A commentary on the Gospels is ascribed to him, but probably inaccurately. The *Apology* was best edited by Otto (Jena, 1861), and has been translated in the *Ante-Nicene Fathers*, ii., 89–121. S. M. J.

**Theophilus**: Byzantine emperor (829–842). A brave and skillful soldier, he waged generally successful wars in Sicily and against the Saracens, and led his armies in person as far as the Euphrates. He enforced justice, rewarded merit, and his reign was glorious. The iconoclastic controversy which had convulsed the empire over a hundred years was terminated at his death. E. A. G.

**Theophras'tus** (Gr. Θεόφραστος) **of Eresus**, in Lesbos: Greek philosopher; became the head of the Peripatetic School after the death of its founder, ARISTOTLE (*q. v.*), and presided over its fortunes, which prospered under his guidance for thirty-five years (322–287 B. C.). This prosperity was due to the character and ability of the head of the school, who enjoyed the highest esteem both at home and abroad. His lectures had the same themes and the same titles as those of his great predecessor. Especially attractive were his discourses on ethical topics, in which he showed the indulgent temper of a man of the world; and in the province of science he eclipsed the botanical work of Aristotle. His treatises on *Practical Botany* (περὶ φυτῶν ἱστορίας) in nine books and *Theoretical Botany* (περὶ φυτῶν αἰτιῶν) in six books are still extant, besides fragments of works on mineralogy (περὶ λίθων), on the senses, and on metaphysics. But the work by which he is best known is his treatise called *Characters* (χαρακτῆρες). These sketches of character by Theophrastus, who was a friend of MENANDER (*q. v.*), are taken not from real life, but from the mimic life of the stage, and are of great importance for the study of the New Comedy. The book has enjoyed unbounded popularity, and has been imitated scores of times. Especially famous are La Bruyère's companion pieces in French, and George Eliot's *Theophrastus Such.*

Unfortunately only the vicious and ludicrous characters have been preserved, and the book has come down to us in a condition which shows serious interference with the original form. There is an edition of all the works by J. G. Schneider (Leipzig, 1818); a critical edition by Wimmer (Leipzig, 1862); of the *Characters* by Casaubon (Leyden, 1592), and one by Jebb (1870). B. L. GILDERSLEEVE.

**Theoph'ylact** (surnamed SIMOCATTA): author; b. at Locri, of Egyptian descent; went to Constantinople in 610 A. D., held various offices during the reign of Heraclius, and died there about 629. His extant works comprise *Historiæ Mauricii Tiberii Imperatoris Libri VIII.* (first edited with a Latin translation in 1604, latest ed. by Immanuel Bekker, Bonn, 1834), which gives a minute account of the Emperor Maurice's wars from 582 to 602; eighty-five letters divided into *morales. rusticæ et amatoriæ* (Venice, 1499); and *Questiones Physicæ*, edited by J. F. Boissonade (Paris, 1835).
Revised by S. M. JACKSON.

**Theophylact**: archbishop; b. at Euripus, on the island of Eubœa: seems to have gone early to Constantinople, where he obtained great reputation for learning, and was appointed teacher to Constantinus Porphyrogenitus. In 1078 he was make Archbishop of Achrida, in Bulgaria, and took up his residence at Achrida, where he died after 1107. He was a prolific writer, and his collected works were published in a splendid edition by Maria de Rubeis (4 vols. fol., Venet., 1754–63, reprinted in Migne's *Patrologia Græca*, lxiii., lxiv.). His commentaries are really catenas derived mostly from Chrysostom and not original, but they are remarkably well done, and may be consulted with advantage. This remark applies especially to his commentary on the four Gospels, which was translated into Latin by Œcolampadius (Basel, 1524). SAMUEL MACAULEY JACKSON.

**Theopom'pus** (Gr. Θεόπομπος) **of Chios**: Greek historian; b. about 380 B. C.; was banished from his native island in early life and took refuge in Athens, where he became a pupil of Isocrates, who said of him that he needed the bit as his fellow-pupil Ephorus needed the spur. Theopompus had great success as a composer of show speeches, especially with his panegyric on Mausolus, King of Caria, but, like EPHORUS (*q. v.*), he is known chiefly as an historian. In his *History of Greece* (Ἑλληνικά), twelve books, he took up the thread of narrative where Thucydides dropped it, and told the story of Greece from 410 to 394, the date of the battle of Cnidus. In his *History of Philip* (Φιλιππικά), fifty-eight books, he made the reign of Philip of Macedon the center. Besides these works an epitome of Herodotus in two books was attributed to him, and Anaximenes the rhetorician forged under his name a famous invective, *Three-headed* (Τρικάρανος), in which Athens, Sparta, and Thebes were represented as the triple monster that had ruled and ruined Greece. Of all his work nothing is left save extracts and fragments; but an epitome of the Latin translation of his *Philippica* by Trogus Pompeius survives in the work of Justin. He was a vigorous writer, but first and foremost a rhetorician rather than an historian, and he may be set down as a bitter partisan and a propagator of scandalous stories, which later gossips were only too glad to repeat. Fragments in Müller's *Fragmenta Historicorum Græcorum*, vol. i., pp. 278–333.
B. L. GILDERSLEEVE.

**Theos'ophy** [from Gr. θεοσοφία, knowledge of divine things, deriv. of θεόσοφος, wise about God; Θεός, God + σοφός, wise]: a name which, as specifying a religious philosophy, was originated by Ammonius Saccas in the third century of our era. The body of ethical, philosophic, and scientific doctrines to which that title applies is, however, as old as humanity itself, and contains everything that is true in all other and later systems. Esoterically preserved and transmitted in its entirety by adepts and initiates, from time immemorial, their messengers—known to the world as "great teachers" and "saviours"—have, at periodic intervals determined by cyclic law, exoterically taught as much of it as could safely be given out and which any considerable portion of our race could at such times receive and assimilate.

Theosophy teaches a knowledge of the laws governing the evolution of the universe. It is not based upon assumed divine revelation, but upon consciousness. It sees no unsolvable mystery anywhere, throws the words coincidence and chance out of its vocabulary, and affirms the omnipresence and omnipotence of law and perfect justice. Theosophy postulates an Eternal Principle, unknowable except in its manifestations, which is in and is all things, and which, periodically and eternally, manifests itself and recedes from manifestation—evolution and involution. Its opposite poles in the manifested universe are spirit and matter, which are coexistent and inseparable. In manifesting itself the spirit-matter differentiates on seven planes, which are of progressive density down to that within our sensuous perception, the substance in all being the same, but differing in the proportions of its two compound elements. Through all thrill ceaselessly vibrations which are the inexhaustible impulse from the First Cause. These vibrations are distinct, each from all the others, and each always the same in mode upon every plane, but differing in rate according to the rarity or density of the substance of the plane. By means of these vibrations are brought about all forces—phenomena in nature, specialized differentiations and effects of creation, preservation, and mutation—in the world of forms as well as upon the ethereal planes. Thus every atom of the universe is infused with spirit, which is life in one of its phases of manifestation, and endowed with qualities of consciousness and intelligence—likewise phases of the spirit—in conformity to the requirements of its differentiation. On the lowest material plane, which is that of humanity, the spirit focalizes itself in all human beings who permit it to do so. Its rejection is the cause of ignorance, from which flow all sin, suffering, and sorrow; by its conscious acceptance man becomes partaker of the Divine Wisdom, "one with the gods," entering into possession of an ever-increasing power of consciousness, and attains oneness with the Absolute. This is the ultimate destiny of all beings; hence Theosophy affirms the perfectibility of the race and rejects the concept of innate unregenerable wickedness. From the theosophic point of view the world is compounded of the Egos or individual spirits, for whom it emanates from the Divine Will; and its evolution is due to the impulse imparted by its spiritual element, that force manifesting itself from the beginning in the primary conditions of life—far below the sentient stage—and having in the evolvement of higher forms, including man, the guidance and direction of intelligent, perfected beings from other and older evolutions. Hence man is deemed a conscious spirit, the flower of evolution; while below him, in the lower kingdoms, are other less-advanced classes of egos, all, however, on the way of ascent to the human stage, which they will eventually reach when man has gone on still higher. The perfecting of self-consciousness is the object of evolution. By this man is enabled to reach more exalted stages of existence. And his conditioned mortal life is for the purpose of affording him experience by which that self-consciousness may be developed and cognition of the spirit attained.

Man is a spirit and requires vehicles with which to come in touch with all the planes of nature included in evolution, and it is these vehicles that make of him an intricate, composite being, liable to error, but at the same time able to rise above all delusions. He is in miniature the universe, for he is, as spirit, manifesting himself to himself by means of seven differentiations. Therefore he is characterized in Theosophy as a septenate or sevenfold being. His immortal being comprises a trinity, spirit (*Atman*), the spiritual soul or discernment (*Buddhi*), and mind (*Manas*). This triad requires as vehicles or instruments through which to operate and gain cognition in matter four lower mortal principles. These are: The animal passions and desires, unintelligent and productive of ignorance through delusion (*Kama*); the life-energy (*Jiva*); the astral body (*Linga Sarira*), which is the connecting link between the ethereal principles and the corporeality; and, finally, the physical body (*Sthula Sarira*). The principle designated as *Jiva* is a special differentiation for the energizing of the human being from the great *pranic* ocean of the life-principle, which is one of the distinctive vibrations already spoken of, and a phase of manifestation of the spirit. It does not cease when the collective entity called man dies, but simply continues its vibrations in the myriad of lives that make up the cells of the body without animating them in harmonious aggregate action. The *Linga Sarira* belongs to the astral plane of matter, which, being next above that of our tangible world in refinement of its substance, is just beyond our normal sensuous perception. As the physical body is at death reabsorbed into the material elements whence it was drawn, so the astral body is eventually dissipated in and absorbed by the substance of its plane; but its permanence is much greater than that of the gross body. During life it is from the earliest moment until the last the model upon which are moulded the physical molecules of which the body is composed, and through it the life-principle is enabled to animate the aggregate mass as a collective entity. These lower four principles or sheaths are the transitory, perishable part of man—not himself, but in every sense the instruments he uses—given up at the hour of death and rebuilt at every new birth. The trinity is the real man, the thinker, the individuality that passes from house to house, gaining experience at each rebirth, while it suffers and enjoys according to its deeds. In each successive earth-life he is known to others as a new personality, but in the whole stretch of eternity he is one individual, conscious of an identity not dependent on name, form, or recollections of personalities. This doctrine of reincarnation is the very base of Theosophy, for it explains life and nature as no other hypothesis can; and it is an essential to the scheme of evolution, for without such re-embodiment on the plane of experiences and atonements there could be no evolution of the human soul. The Ego returning to mortal life only goes into the family which either completely answers to its whole nature, gives an opportunity for its evolutionary progress, or is connected with it by reason of events in past incarnations and causes mutually created. Inseparable from the doctrine of reincarnation is that of *Karma*, or justice, sometimes called the "ethical law of causation." Mere entry into life is no fit foundation for just reward or punishment, which must be the deserts for prior conduct. But such consequent awards determine entry into life, and with unerring equity establish the sequence of good and evil happenings in requital of the past. Effect is always in cause, and thus the body, brain, and intellectual faculties furnished by reincarnation being products of one's own deserving, become the field from which must be gleaned the harvest planted by acts in the past. The law of Karma applies in physical nature as well as in ethics to solar systems, planets, races, nations, families, and individuals. With reincarnation the doctrine of Karma explains the misery and suffering of the world, and no room is left to accuse nature of injustice. The misery of any nation or race is the direct result of the thoughts and acts of the Egos who make up the race or nation. If they did wickedly in the past, they must suffer the inevitable consequences. To this end they must go on incarnating and reincarnating until the effects they caused have been exhausted. Though the nation thus suffering chastisement should for a time disappear, the Egos belonging to it could not leave the world, but would reappear as the founders of some new nation in which they would continue to receive their karmic due.

With reference to *post-mortem* conditions, Theosophy teaches two states of existence somewhat analogous to the Christian "purgatory" and "heaven." The first, immediately subsequent to earth-life, is *Kama-loka*, where the immortal triad takes leave of the lower principles remaining after separation from the body. Thence the Ego passes into *Devachan*. The former is, as its name indicates, a place —the astral plane penetrating and surrounding the earth— the latter a state of being, or rather of consciousness. In Kama-loka all the hidden passions and desires are let loose, and enough mentality is retained to make them tortures. When the astral body in which they cohere is disintegrated, as it is in time, they remain a sort of entity in the *Kama-Rupa*, a form of still less materiality than the *Linga Sarira*. Eventually this too is said to fade out, leaving only their essence, the *Skandhas*, fateful germs of karmic consequence, which, when the Ego emerges from the devachanic state, are by the law of attraction drawn to the new being in which it incarnates. Owing to the law of cohesion between the principles, which prevents their separation before a given time, the untimely dead must pass in Kama-loka a period almost equal to the length life would have been but for the sudden termination. Losing the body has not killed them. They still consciously exist in the astral body, and in the case of very wicked and forceful persons—some executed criminals, for instance—may be even more harmful on the astral plane than they were in life. Prolonged kama-lokic existence is no injustice to the victims of accident, since death, like everything else, is a karmic consequence. Finally, it may be said of Kama-loka that it is the last conscious state of the thoroughly evil human souls bereft of the spiritual tie and doomed to annihilation (*Avitchī*). Having in life centered the consciousness in the *kamic* principle, preserved intellect and rejected the spirit, leading persistent lives of evil for its own sake, they are the only damned beings we know. Pure souls speedily pass from Kama-loka to the devachanic state. It is a period of rest; a real existence, no more illusionary than earth-life, where the essence of the thoughts of life that were as high as character permitted expands and is garnered by the soul and mind. When the force of these thoughts is fully exhausted the soul is once more drawn back to earth, to that environment which will best promote its further evolution.

No new ethics are presented by Theosophy, as it is held that right ethics are forever the same. But in the doctrines of Theosophy are to be found the philosophical and reasonable basis of ethics and the natural enforcement of them in practice. The present worldwide interest in Theosophy dates from 1875, when Helena P. Blavatsky, a messenger of the adepts, appeared in New York, initiated the theosophic movement, and, with Henry S. Olcott, William Q. Judge, and several other persons, formed the Theosophical Society. Other revivals of the ancient doctrine, occurring in the last quarter of each century during several hundred years past, are matters of historic record; but, as their times were not propitious, they amounted to little in their effect upon humanity at large compared with the importance this one has attained. The Theosophical Society, though its members generally, no doubt, subscribe to theosophic doctrine, is not dogmatic, but admits to membership all who can conscientiously accept its three avowed objects: 1. "To form the nucleus of a Universal Brotherhood of Humanity without any distinctions whatever. 2. To promote the study of ancient and modern religions, philosophies, and sciences. 3. To investigate unexplained laws of nature and the psychical powers of man." Starting with a membership of fifteen persons in 1875, it has spread all over the globe, until now it has hundreds of branches scattered through all the civilized and even the semi-civilized countries, and counts its members by thousands. Beyond its organization in importance, however, is the wonderful influence of theosophic teachings in coloring the literature, thought, ethics, and even scientific progress and religious expression of the world. The size of the society gives but a very imperfect idea of the extent of its work.

The best books conveying instruction in detail concerning theosophic doctrine—but a meager skeleton of which has been offered in the foregoing—are the following: H. P. Blavatsky, *The Secret Doctrine* (1888); *Isis Unveiled* (1877); *The Key to Theosophy* (1889); William Q. Judge, *The Ocean of Theosophy* (1893); A. P. Sinnett, *Esoteric Buddhism* (1883); *Five Years of Theosophy*, selections from *The Theosophist* (1885); Rama Prasad, *Nature's Finer Forces* (1890); *Patanjali* (Judge's version) *Yoga Aphorisms* (1889). A score of theosophic magazines are issued in half as many languages. The leading one of the Theosophical Society in America is *The Path*, published in New York. WILLIAM Q. JUDGE.

**Thera**: See SANTORIN.

**Theramenes**, the-răm'ē-nēez (in Gr. Θηραμένης): an Athenian politician whose name figures in all political transactions during the last years of the Peloponnesian war, now on the side of the demagogues, now on the side of the oligarchs, and always in the character of a traitor. After the battle of Arginusæ (406 B. C.), in which he held a subordinate command in the right wing of the Athenian fleet, he was ordered to return to the scene of action and save as many as possible of the disabled galleys and their crews. A heavy storm set in, which made the execution of the order impracticable, and a great number of Athenian citizens were drowned. In order to escape the odium of this incident, Theramenes speedily repaired to Athens and accused the commanders-in-chief of having taken no measures in the case. In 404 B. C. he was sent first to Lysander, who besieged Athens, and afterward to Sparta, to negotiate a peace, but he postponed the final conclusion of a treaty until the Athenians were reduced to such a degree that they were compelled to accept any conditions whatever. After the peace he was elected one of the thirty tyrants, but as he opposed the violent measures of that body, he became suspected by Critias, was accused by him as an enemy of the state, and finally forced to drink poison. He was a man of eloquence, and, according to Diodorus, a disciple of Socrates.

Revised by J. R. S. STERRETT.

**Therapeu'tæ** [= Lat. = Gr. Θεραπευταί, liter., servants, deriv. of θεραπεύειν, minister to, serve, deriv. of θεράπων, attendant, servant]: a sect of Jewish contemplative ascetics, kindred to, though distinct from, the Essenes. Their chief seat was on Lake Mareotis, the body of water immediately S. of Alexandria, in Egypt. They were of both sexes, strictly observed the Sabbath and other Jewish festivals, were ardent students of the Mosaic law, and claimed to have secret religious knowledge. Philo describes them in his treatise *On a Contemplative Life, or on the Virtues of Suppliants* (Yonge's Eng. trans. of Philo, Bohn's Series, iv., 1–20). Philo is the only writer to mention them—a fact which has led some to deny their existence and to attribute to a Christian forger of the fourth century the mention of them by Philo. See the exhaustive treatise by Fred. C. Conybeare, *Philo about the Contemplative Life* (Oxford, 1895). SAMUEL MACAULEY JACKSON.

**Therapic Acid**: See COD-LIVER OIL.

**Theresa**, tā-rā'sā̆ă, or **Teresa de Jesus**, SAINT: b. at Avila, Spain, Mar. 28, 1515, her full name being TERESA SANCHEZ DE CEPEDA; entered (Nov. 2, 1536) the Carmelite monastery at Avila, and in 1562 founded a reformed branch of Carmelite nuns. She made a prolonged study of theology and wrote several mystical and ascetic treatises, which are accounted among the Spanish classics, and obtained her a great reputation. Among them are *Discurso ó Relacion de su Vida* (1562), an autobiography giving an account of her interior conflicts and visions; *El Camino de la Perfeccion* (1563); *El Libro de las Fundaciones; El Castillo interior, ó las Moradas* (1577), a mystic description of the heavenly life; and *Santos Conceptos de Amor de Dios.* D. at Alba, Oct. 4, 1582. She was canonized by Gregory XV. in 1621. Revised by J. J. KEANE.

**Theresi'na**: capital of the state of Piauhy, Brazil; on the right bank of the Parnahyba river, 220 miles above its mouth in the Atlantic (see map of South America, ref. 4–G). It was founded in 1852, the capital being removed from Oeiras. The town is regularly laid out, but has no buildings of note and the trade is inconsiderable. The climate is somewhat insalubrious, though less so than that of Parnahyba. Pop. about 8,000. H. H. S.

**Theresiopel**, or **Maria-Theresiopel**: See SZABADKA.

**Theresop'olis**: town of the state of Rio de Janeiro, Brazil; in a high valley of the Organ Mountains; 38 miles by railway from Nictheroy on the Bay of Rio (see map of South America, ref. 7–G). It was originally a German colony, named in honor of the Empress Theresa. On account of its delightful climate and magnificent mountain scenery it is a favorite summer resort, and no place near the capital better merits a visit of the tourist. In 1892 it was selected as the state capital, but subsequently this was changed to Petropolis. Pop. 6,000. H. H. S.

**Thereza Christina Maria**: Empress of Brazil; b. in Naples, Mar. 14, 1822. She was a daughter of Francis I., King of the Sicilies, by his marriage with Maria Isabella, Infanta of Spain. In 1843 she married Pedro II., Emperor of Brazil. Her unassuming goodness caused her to be generally beloved. The Brazilian revolution and the abdication of the emperor were the probable causes of her death at Oporto, Portugal, Dec. 28, 1889. Of her children only one, Isabel of Bragança, survives. See PEDRO II. H. H. S.

**Thermæ** [Lat., warm springs, warm baths = Gr. θέρμαι, warm springs]: essentially, structures of the Roman imperial epoch consisting in general of large establishments in which baths of all sorts were provided, including large tanks for swimming, together with grounds for running, ball-play, etc., halls for similar exercises, porticoes for promenade and conversation, lecture-rooms, libraries, and probably rooms for eating and festivity. Public baths existed before the time of Augustus in Rome and in other cities, but the earliest thermæ erected was that of Marcus Agrippa. For the architecture of these structures, see ARCHITECTURE. The service of these gigantic places of resort was performed by slaves in great numbers, and carried on by means of underground passages elaborately planned and systematized. Some of the underground structures of the baths of Diocletian in Rome have been explored, but it is probable that much remains to be known of them. Admission to the thermæ was by means of a small fee, but at times the generosity of the emperor or some public man opened some one thermæ gratuitously for a time. The regulations about the hours of opening and closing, the separation of the sexes, the charge for admission and other details of management were frequently varied, and many edicts concerning them are on record. There also remains much that is unknown in the matter of the arrangement of the buildings and the use of different parts; nor is it certain whether the admission fee was payable for the use of the buildings, the porticoes, etc., or for bathing only. See ROMAN ARCHÆOLOGY. RUSSELL STURGIS.

**Thermal Springs** [*thermal* is from Gr. θερμός, hot]: in general, springs which have a mean annual temperature higher than that of the region in which they are found. Many springs which maintain an even temperature throughout the year appear warm in winter and cold in summer, owing to changes in the temperature of the air.

In most instances the designation thermal is restricted to springs where the temperature stands from 10° to 15° F. above that of the surrounding atmosphere. All observations lead to the opinion that the cause of these high temperatures must be found in the heated rocks below the surface. It does not follow that the waters themselves are necessarily derived from any deep-seated source. On the contrary, the waters of hot springs are mainly meteoric waters that have penetrated downward a sufficient distance to attain increased temperature by contact with heated rocks. In other words, the higher temperature is due to internal heat which is known to increase with depth.

Nearly all thermal springs are found either in regions of orographic disturbance, where the rocks have undergone great displacement through faulting and folding, or else in regions that have been subjected to volcanic eruptions. As lavas have been forced to the surface along lines of least resistance, it not infrequently happens that profound disturbance of strata and volcanic eruptions occur together in the same locality. All regions where hot springs are on a grand scale appear to have been at one time or another centers of eruptive energy. This has been shown to be the case in so many instances that thermal activity and volcanic manifestations may be regarded as closely associated phenomena. In areas of eruptive rocks where the pouring out of lavas long since ceased, the occurrence of thermal springs is looked upon as evidence of the dying out of volcanic energy. Such heated waters testify to the slow cooling of underground lavas through long periods of time. In many localities eruptions have not taken place since Tertiary time, yet connected with them are boiling springs still active and discharging vast quantities of water. The amount of internal heat dissipated by this continuous action of hot springs and steam-vents must be very great.

*Distribution of Thermal Springs.*—Thermal springs occur in all parts of the world, and not one of the great continental divisions is without them. Many of the larger islands of the world have hot springs, which are usually recognized even by primitive inhabitants as possessing curative properties for many forms of human ailment. In Europe hot springs are numbered by thousands; in France alone over 900 have been described, mostly in the Auvergne, a region of extinct volcanoes. In England, where all volcanic action ceased before the historic period, two hot springs have been noted for centuries. The spring at Bath is known to have remained nearly in its present condition ever since the occupation of England by the Romans. It maintains a temperature of 120° F., and according to the best estimates discharges daily 180,000 gal. of water carrying mineral matter in solution. At Buxton the temperature stands at 82° F. Hot springs extend along the Cordillera from the southern end of South America, through Central America, Mexico, the U. S., and well up into British Columbia. They are distributed over the Appalachians—North Carolina and Virginia being noted for hot springs. In Virginia they are connected with the anticlinal axes and displacements in sedimentary strata. The regions where thermal activity is displayed on the grandest scale, with the most extensive outflows of hot water, are Iceland, New Zealand, and the Yellowstone National Park. Within the restricted area of the Yellowstone Park there are between 3,500 and 4,000 hot springs, without counting innumerable steam-vents and fumaroles. The cauldron of Excelsior geyser discharges 4,400 gal. of boiling water a minute. Geysers are intermittent hot springs. See YELLOWSTONE PARK.

Notwithstanding the wide distribution of thermal springs, there are extensive areas in which none exist. They are wanting in the Mississippi valley and over the Great Plains, and none are known along the coastal plain of the South Atlantic States. Over large areas in Russia they appear to be absent. Their absence in these localities is accounted for by the fact that the sedimentary rocks lie nearly horizontal and show little disturbance. Hot waters fail to reach the surface, and if any exist they flow off underground. Proximity to the seacoast and elevation above sea-level apparently exercise no influence upon the distribution of thermal waters. In the elevated portions of the Andes, notably in Chili and on the high plateau of Tibet, hot waters flowing from fissures in the rocks have been recorded by scientific travelers at elevations from 10,000 to 16,000 feet above sea-level. In the Yellowstone Park they are found over 8,000 feet above the ocean.

*Temperature.*—At the surface the temperature of thermal springs varies from a few degrees above that of the air, up to the boiling-point. As a large number of springs are situated less than 1,000 feet above sea-level, many of the boiling waters show a temperature but a little below 212° F. On higher plateaus and elevated mountain regions the boiling-point is reached at much lower temperature. In the geyser basins of the Yellowstone Park water boils at 198° F. Careful observations made by lowering self-registering thermometers into hot pools and geyser-vents gave some clew to increased underground heat. In the Upper Geyser Basin, at only 70 feet below the surface, the thermometer recorded 253° F., a rise in temperature due to the pressure of a superincumbent column of water.

*Solvent Power.*—In general, the solvent power of thermal waters may be said to increase with temperature. Pressure also increases the power of hot waters to take up mineral matter in solution. Many of the relatively cool springs may have acquired their mineral contents at lower depths and consequently higher temperatures. Thermal waters which hold alkaline carbonates in solution have greatly augmented their solvent power for other mineral substances, notably silica, a common ingredient of boiling water in volcanic regions. The mineral ingredients of thermal springs are varied and embrace all substances found in what are usually designated natural mineral waters. Owing to their great solvent power nearly all thermal waters may be considered as mineral waters. In general, any classification of mineral waters based upon chemical composition would apply equally well to thermal waters. ARNOLD HAGUE.

**Thermic Fever**, or **Sunstroke**: fever due to excessive heat, but most commonly due to exposure to the direct heat of the sun; indirect solar heat or artificial heat may have the same effect. There is another form of disease which results from excessive heat quite distinct in its characteristics from thermic fever in that the temperature of the body is depressed. This is generally called *heat exhaustion.* In its mildest form it is represented by the weakness of feeble persons subjected to heat while under exertion. In severe cases there is profound depression, pallor, and in the most severe forms collapse and unconsciousness. The temperature of the body is lowered sometimes to 95° F. Thermic fever, on the other hand, is characterized by high fever, the thermometer in severe cases registering as much as 112° and 115° F. The onset of the symptoms is usually abrupt, though vague distress or weakness may precede their development. The patient rapidly sinks into unconsciousness, is extremely restless, even delirious or maniacal, the surface of the body is red and covered with sweat, the eyes are suffused with blood, and vomiting and purging are frequently present. Unless the patient is promptly treated death ensues from paralysis of the controlling mechanism of respiration and circulation in the brain. The causes of heat exhaustion and thermic fever have been the subject of much speculation, but it is now recognized that the important factor is the immediate effect of heat upon the nervous centers at the base of the brain. Whatever lowers the vitality and resisting power of the system, such as ill health or fatigue, contributes to the development of these diseases, but the immediate cause is the heat itself.

The treatment is different in the two forms. In heat exhaustion the temperature of the body must be promptly elevated by the use of external heat, and stimulants, such as digitalis, atropine, and strychnine, are demanded imperatively. In the case of thermic fever, on the other hand, reduction of the excessive fever is the first requisite. For this purpose cold bathing, effusions of ice-water over the chest and body, or rubbing with ice must be resorted to, and should not be delayed a moment beyond necessity. Antipyrine is a remedy useful for the reduction of fever, but is not in the least comparable with cold water. Where the circulation is failing digitalis should be given hypodermatically; and, on the other hand, in cases of great excitement of the circulation, venesection is used with advantage.

After recovery from sunstroke or heat exhaustion there is often an abnormal susceptibility to the effects of heat, and meningitis or other diseases may follow in consequence of the attack or of the greater susceptibility resulting from the attack. WILLIAM PEPPER.

**Thermidor**, Fr. pron. tār'mēē'dōr' [= Fr. from Gr. θερμός, hot]: the eleventh month of the French republican calendar. It began on July 19 and ended with Aug. 18.

**Thermo-æsthesiometer**: See RECORDING APPARATUS, PSYCHOLOGICAL, in the Appendix.

**Thermo-chemistry** [from Gr. θέρμη, heat + Eng. *chemistry*]: that branch of chemistry which deals with the investigation of the evolution and absorption of heat in chemical reactions. Whenever a chemical change takes place there is either an evolution or absorption of heat, and a complete study of the change necessarily involves an estimation of the quantity of heat evolved or absorbed. In 1840 Hess, of St. Petersburg, announced the fundamental law of constant heat summation, according to which the amount of heat developed in a reaction is the same no matter what the intermediate stages may be. Another fundamental law is this: The amount of heat required to decompose a compound into its constituents is the same as the amount evolved in its formation. An immense number of determinations have been made, particularly by Julius Thomsen, of Copenhagen, and by M. Berthelot, of Paris, and the laws referred to have been shown to hold good. While work of this kind is of undoubted value, it has had a comparatively slight effect upon the advance of chemical science. See CHEMISTRY. IRA REMSEN.

**Thermody'namics** [from Gr. θέρμη, heat + δύναμις, power]: the science which deals with physical phenomena involving either the development of heat or the transformation of heat into other forms of energy. The development of the science has been most rapid since the middle of the nineteenth century, and its applications, which were at first confined to the problems of mass mechanics, now extend to such fields as electro-chemistry, thermo-electricity, and the various branches of physical chemistry. The following may be cited as examples of cases where the principles of thermodynamics are involved: The expansion of bodies when heated; the development of heat by compression; the transformation of heat into mechanical energy in the steam-engine and other heat-engines; the dissociation of gases and of substances in solution; the flow of gases; fusion and evaporation; the influence of temperature changes upon the electromotive force of a voltaic cell. The fundamental principles of the science are usually stated in the form of the two laws of thermodynamics which are explained below.

*First Law.*—The first law, although capable of expression in a variety of forms, is at bottom only a statement of the principle of the conservation of energy as applied to cases where heat is transformed or developed. Heat being a form of energy may be measured in ordinary mechanical units. (See ENERGY.) Thus 1 British thermal unit is developed by the expenditure of 778 foot-pounds of energy, or 1 minor calorie $= 4{\cdot}197 \times 10^7$ ergs. Similarly, when one calorie of heat is transformed, $4{\cdot}197 \times 10^7$ ergs are obtained in some other form of energy. The first law merely states that heat is a form of energy capable of transformation, and that the mechanical equivalent of heat is constant. The first law is often put into the following form: If a quantity of heat $dQ$ is imparted to a body, this energy is expended (1) in increasing the internal energy of the body by raising its temperature or changing its state; (2) by causing the body to expand and so do external work. If $dU$ represents the change in the internal energy and $dW$ the work done against external forces during expansion, then the law of energy requires that

$$dQ = dU + dW, \qquad (1)$$

where $dQ$ is supposed to be measured in mechanical units. If $p$ and $v$ represent the pressure and volume of the body, we have $dW = pdv$, and the equation may be written in the more usual form

$$dQ = dU + pdv. \qquad (2)$$

Many thermodynamic problems may be solved by a direct application of the energy relations expressed by the first law. Among such may be cited those problems of hydromechanics and PNEUMATICS (*q. v.*), which involve heat transformations as well as ordinary mechanical considerations.

The pressure, volume, and absolute temperature of a perfect gas are found to be related by the equation

$$pv = RT, \qquad (3)$$

in which $R$ is a constant depending upon the chemical constitution of the gas, $v$ refers to the volume of unit mass, and $T$ is the absolute temperature. The fixed gases obey this law with great accuracy, while the relation is also approximately satisfied in the case of most vapors, provided they are at a temperature not too near the boiling-point of their liquid.

If a gas is allowed to expand or contract under such conditions that the temperature is maintained constant, we have

$$pv = RT = \text{const.} \tag{4}$$

In this case the expansion is *isothermal*. The first law makes possible the computation of the amount of heat which must be supplied to the gas during expansion in order to keep the temperature the same. We have from (2)

$$dQ = dU + pdv.$$

For a gas $dU = c_v dT$, $c_v$ being the specific heat for constant volume,

$$\therefore\ dQ = c_v dT + pdv.$$

In the case of isothermal expansion, however, $T$ is constant, i. e. $dT = 0$. Therefore $dQ = pdv$, and if the gas expands from $v_1$ to $v_2$ we have $\left(\text{remembering that } p = \frac{RT}{v}\right)$

$$Q = \int dQ = \int_{v_1}^{v_2} pdv = \int_{v_1}^{v_2} RT\frac{dv}{v} = RT \log_e \frac{v_2}{v_1}. \tag{5}$$

The expression $\int_{v_1}^{v_2} pdv$ represents the work done by the gas in overcoming the external pressure. Equation (5) states therefore that energy equivalent to the work done must be supplied in the form of heat.

When no heat is supplied to the gas during expansion its behavior is different. Work is then done at the expense of the internal energy of the gas, and the temperature falls. Under these circumstances the expansion is *adiabatic.* The condition that no heat is lost or gained during expansion leads to the equation

$$dQ = 0 = dU + pdv = c_v dT + pdv.$$

This is equivalent to

$$c_v dT + RT\frac{dv}{v} = 0. \tag{6}$$

If the gas expands from $v_1$ to $v_2$, the corresponding temperatures being $T_1$ and $T_2$, we therefore have

$$c_v \log_e \frac{T_1}{T_2} = R \log_e \frac{v_2}{v_1}. \tag{7}$$

The constant $R$ is equal to the difference (expressed in mechanical units) between the two specific heats of the gas; that is to say, $R = c_p - c_v$ where $c_p$ is the specific heat at constant pressure. The relation between volume and temperature during the process of adiabatic expansion may therefore be put in the form

$$\frac{T_1}{T_2}\left(\frac{v_1}{v_2}\right)^{\gamma - 1} = 1, \tag{8}$$

or, making use of the relation given in (4),

$$p_2 = p_1\left(\frac{v_1}{v_2}\right)^{\gamma}, \tag{9}$$

where $\gamma$ represents the ratio $\frac{c_p}{c_v}$.

As an example of the application of these equations we may consider the case of the adiabatic expansion of air. The numerical value of $\gamma$ has been found by experiment to be 1·405 for air as well as for other gases in which the molecule is supposed to consist of two atoms. If expansion continues until the air occupies three times its original volume, we have from (8)

$$\frac{T_2}{T_1} = (\tfrac{1}{3})^{0 \cdot 405}.$$

Assuming that the air was originally at the ordinary atmospheric temperature, say 20° C., its absolute temperature was $T_1 = 273° + 20° = 293°$. The temperature $T_2$ after expansion is therefore

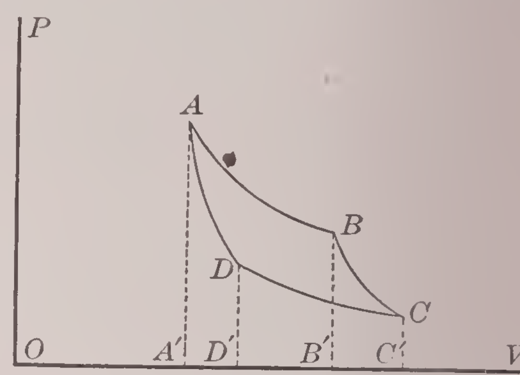
$$T_2 = 294(\tfrac{1}{3})^{0 \cdot 405} = 148° \text{ (absolute)},$$

or − 25° C. The air is therefore cooled by expansion from 20° C. (68° F.) to − 25° C. (− 13° F.). In cases where power is transmitted by compressed air the expansion is often approximately adiabatic, and the cooling effect is a source of some trouble. See Pneumatic Transmission.

For other cases in which the first law may be directly applied (e. g. the flow of gases through pipes, velocity of sound in gases, etc.), the reader is referred to treatises on hydromechanics.

*Second Law.*—While mechanical energy can be completely transformed into heat, the transformation of all the heat in a body into other forms of energy is in no case possible. In general only a small fraction is capable of such transformation. The second law of thermodynamics affords a means of determining the *availability* of heat. The fundamental principle upon which it rests is the experimental fact that heat can not of itself pass from a colder to a warmer body. The consequences of this principle are more far-reaching than is at first apparent. The following example will afford an illustration of its application:

*Carnot's Cycle.*—A perfect gas may be utilized as a working fluid in transforming heat into mechanical energy in the following cyclic process: Let the initial pressure and volume of the gas be represented by the co-ordinates $AA'$ and $OA'$ of the point $A$ in the diagram. The gas is allowed to expand isothermally until its pressure has been reduced to $BB'$ and its volume has increased to $OB'$.



During expansion the gas may be made to do work by driving a piston, while an amount of heat, $Q_1$, must be supplied from a "source" in order to keep the temperature constant. When the condition represented by the point $B$ has been reached, the source of heat is removed, and the gas allowed to expand adiabatically to $C$. If the absolute temperature was originally $T_1$, it will have fallen between $B$ and $C$ to some lower temperature, $T_2$. Let the gas now be compressed isothermally at this temperature to $D$. During this process the heat $Q_2$ developed by compression must be removed by a "refrigerator." The gas is finally compressed adiabatically to the original condition $A$, when its temperature will be $T_1$ as before.

During the complete cycle the heat $Q_1$ has been given to the gas, while the quantity $Q_2$ has been taken from it. The difference $Q_1 - Q_2$ represents the amount of heat that has been transformed into mechanical energy. It may be mentioned in passing that the graphical representation here used affords an excellent means of following the various steps in such a process. Thus the area $ABB'A'$, being equal to $\int_A^B pdv$, represents the work done during the first expansion. Similarly the areas $BCC'B'$, $CDD'C'$, and $DAA'D'$ represent the amounts of work done, either *upon* the piston or *by* the piston, during the corresponding expansions or compressions. The area of the figure $ABCD$ is a measure of the net work done by the gas in the course of the complete cycle. Graphical methods similar to this are frequently employed in thermodynamic problems.

A consideration of the laws of perfect gases shows that under these circumstances

$$\frac{Q_1}{T_1} - \frac{Q_2}{T_2} = 0, \text{ or } \frac{Q_1 - Q_2}{Q_1} = \frac{T_1 - T_2}{T_1}.$$

The expression $\frac{Q_1 - Q_2}{Q_1}$ is the ratio of the work utilized in driving the piston to the total heat energy supplied, i. e. the efficiency of the engine.

Such a process is a reversible one. For if the expansions and compressions are made to occur in the reverse direction, a quantity of work, $Q_1 - Q_2$, will be done *by* the piston and will result in taking the heat $Q_2$ from the refrigerator and giving up $Q_1$ to the source. It is clear that no heat-engine working between the temperatures $T_1$ and $T_2$ can be more efficient than one that is reversible. For if this were possible, such an engine might be employed to drive a reversible engine, using the same source and refrigerator, backward, and there would result a continual transfer of heat from the refrigerator to the source, i. e. from a colder to a warmer body. But this is contrary to universal experience.

The greatest possible efficiency which can be obtained in any heat transformation is thus determined by the range of temperatures that can be used, and does not depend upon the working substance. For example, if heat is supplied at

200° C. while the temperature of the refrigerator is 100° C., the highest possible efficiency is given by the expression

$$\frac{T_1 - T_2}{T_1} \text{ or } \frac{100}{200 + 273} = 21{\cdot}1 \text{ per cent.}$$

If steam is used as the working fluid this case would correspond to that of an engine receiving steam at a pressure of about 200 lb. and exhausting at atmospheric pressure. The efficiency practically attainable would of course be much less than that computed for the ideal case. In the case of any reversible cycle of operations in which the quantities $Q_1$ $Q_2$, . . . etc., of heat are supplied at temperatures $T_1$, $T_2$, etc., it is found (remembering that $Q$ is sometimes negative) that

$$\frac{Q_1}{T_1} + \frac{Q_2}{T_2} + \ldots = 0. \qquad (10)$$

By a reversible cycle is meant any series of operations which finally bring the whole system back into its original condition, and which can be performed in the opposite direction with all quantities reversed. If the temperature changes are continuous, equation (10) may be written

$$\int \frac{dQ}{T} = 0 \qquad (11)$$

for a reversible cycle. Considerations which can not be discussed here show that $\frac{dQ}{T}$ is a complete differential, i. e. the differential of some quantity whose value is completely determined by the physical condition of a body, and independent of the manner by which the body was brought into that condition. This quantity is called the *entropy* of the body, and may be denoted by $S\left[\frac{dQ}{T} = dS\right]$. The entropy of a perfect gas may, for example, be found as follows: From (1)

$$dQ = dU + pdv,$$

but $dU = c_v dT$, and since for a perfect gas $pv = RT$, we have $pdv = RT\frac{dv}{v}$,

$$\therefore\ dS = \frac{dQ}{T} = C_v\frac{dT}{T} + R\frac{dv}{v} \qquad (12)$$

$$S = c_v \log_e T + R \log_e v + \text{const.} \qquad (13)$$

In other cases the determination of $S$ presents greater difficulties. But the principle stated below may often be applied without a knowledge of the actual numerical value of $S$.

By using the conception of entropy, the second law of thermodynamics may be stated in a very useful form as follows: In the case of any reversible process the *total* entropy remains constant; if the process is not reversible, the entropy of the system must increase. In estimating the total entropy, all bodies whose condition is in any manner altered during the process in question must be considered. As examples of non-reversible processes may be mentioned the development of heat by friction, or the expansion of a gas without overcoming outside pressure.

In accordance with the second law, as stated above, the entropy of a system can never diminish. When the physical conditions of a system are such that its entropy is a maximum, the system must therefore be in equilibrium. It is this condition that enables the solubility of a salt, the dissociation of a vapor, the vapor tension of liquids or solutions, etc., to be determined by the application of the second law; for these are all cases of physical and chemical equilibrium. In the case of evaporation, for example, the development of vapor at the surface of a liquid continues until a certain definite vapor pressure, whose value depends upon the temperature, has been reached. The vapor is then saturated, and there is no tendency either for further evaporation or for condensation. Under these circumstances the liquid and its vapor are in equilibrium with one another. The conditions necessary for such equilibrium may be investigated by remembering that the entropy of the system must be at a maximum. Various laws in regard to the dependence of vapor tension upon temperature, substances in solution, etc., have been developed in this manner.

The application of thermodynamics has been greatly extended during the last few years, and it seems probable that this science will be a most valuable aid in the further development of physics and chemistry. ERNEST MERRITT.

**Thermo-electricity**: the direct production of electric currents by means of heat. The process was discovered by Seebeck about 1821 or 1822 (Pogg. *Ann.*, vi., 1826). Strictly, the phenomenon consists in the generation of electromotive force at the unequally heated junctions of two substances which are in some way dissimilar. Thus if a circuit be formed of an iron and a copper wire, and if the temperature of one junction be raised above that of the other, a current will flow across the warmer junction from copper to iron. The heated junction is the seat of an electromotive force of such direction that the iron is at a higher potential than the copper. A current, therefore, flows around through the circuit from the warmer iron across the cooler junction back to the warmer copper. For thermo-electric series, see *Electricity from Heat* under ELECTRICITY.

The electromotive force of a thermal element is small, and depends not only upon the temperature difference of the two contacts, but upon the absolute values of their temperatures. Every combination of two metals has what is called a neutral temperature. At this temperature the electromotive forces at the two junctions are equal and in opposite directions; hence there is no current. Thus for silver and iron the neutral temperature is 223·5° C.; for copper and iron it is 274·5° C. When the mean temperature of the two junctions is above the neutral temperature, the current is reversed. There is no current when $t_1$ equals $t_2$ and when $\frac{1}{2}(t_1 + t_2)$ equals the neutral temperature.

With most pairs of metals, if differences of temperature be plotted as abscissas and electromotive forces as ordinates, a parabola will be obtained with its axis vertical. (See *Electricity from Heat*, under ELECTRICITY.) Therefore, from the properties of the parabola,

$$E - e = b\,(T - t)^2, \qquad (1)$$

where $E$ and $T$ are the electromotive force and temperature corresponding to the vertex of the parabola, and $b$ is a constant. In a few cases the parabola becomes a straight line, and in others the curve consists of portions of parabolas with their axes parallel and their vertices turned alternately in opposite directions.

This relation between electromotive force and temperature led Lord Kelvin and P. G. Tait to adopt an elegant method of constructing a thermo-electric diagram. The differential coefficient of $e$ with respect to $t$ is, from equation (1),

$$\frac{de}{dt} = 2b(T - t). \qquad (2)$$

Now $\frac{de}{dt}$, or the rate of change of the electromotive force with temperature, is the *thermo-electric power*, and, if this be taken as an ordinate, (2) is the equation of a straight line. If, then, this line for some standard metal be made to coincide with the axis of temperature, the lines obtained from observations on circuits of other metals with it will, in general, be straight lines also; and taken together they will

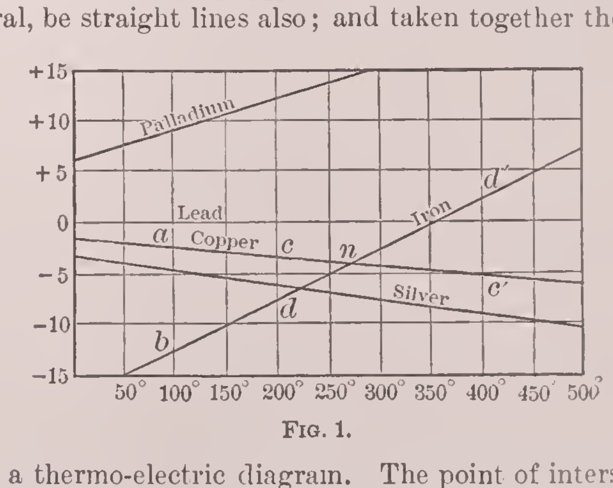


FIG. 1.

form a thermo-electric diagram. The point of intersection of any pair of lines corresponds with the temperature of maximum electromotive force for this pair of metals. Thus the copper-iron lines cross at 274·5°. This is therefore the temperature at which the thermo-electric power of this pair becomes zero. It is also the point, therefore, corresponding to the neutral temperature for this pair. At a mean temperature a little below 274·5° a small difference of temperature between the two junctions causes a current to flow across the warmer one from copper to iron; if the mean temperature is above 274·5°, the current flows across the warmer junction from iron to copper. This phenomenon is known as *thermo-electric inversion*. Fig. 1 is the thermo-electric diagram for several metals compared with lead.

From the manner in which this diagram is constructed it follows that, if the cooler junction of a copper-iron couple be at 100° and the warmer at 200°, the electromotive force in the circuit will be represented by the area *a b c d*; but if the warmer junction be at 400°, the electromotive force will be numerically equal to the difference of the areas *a b n* and *c′ d′ n*. The intersections of some of these lines, palladium-copper, for example, lie beyond the limits of Tait's experimental diagram. The palladium-copper lines, if produced, would intersect at − 170° C. Dewar and Fleming have found, by means of the low temperature obtained with liquid oxygen, that thermo-electric inversion for this couple occurs at about − 170° C.

In 1834 Peltier discovered the phenomenon converse to the production of electromotive force by the application of heat. If a bismuth-antimony junction, for example, be heated, a current flows across from bismuth to antimony, or bismuth is positive to antimony. Peltier discovered that if a current be sent across such a junction from B to A, Fig. 2, where B is bismuth and A antimony, the junction is cooled; but if it goes from A to B, the junction is heated. The long arrow in the figure shows the direction in which the current is sent through from an outside source; the arrows at *a* and *b* show the direction of the electromotive force at the junctions. At *a* this electromotive force is in the same direction as the current; hence at this point work is done on the current, and the heat of the junction is converted into the energy of a current. At *b* the electromotive force is negative, and the current does work on the junction and heats it. This accords with the general principle that the current gives up energy wherever it encounters a back electromotive force. This generation of heat is entirely distinct from that due to the resistance of a conductor, since the heat due to the Peltier effect is proportional to the first power of the current, while that due to ohmic resistance varies as the square of the current. Moreover, the former is a reversible phenomenon, while the latter is not.

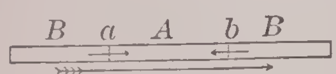

Fig. 2.

In order to explain the fact of electric inversion in such couples as copper and iron, Lord Kelvin assumed that the Peltier effect becomes zero at the neutral temperature. No heat is then absorbed or developed at a junction at this temperature, while heat is generated at the other junction, since the current there meets a counter-electromotive force. There is, therefore, no thermal energy at the junctions which can be converted into electrical energy; but since there is no other possible source of the energy of the current, Lord Kelvin was led to predict that heat is absorbed at parts of the circuit other than the junctions. This prediction he subsequently verified. In copper heat is absorbed when the current passes from cold parts to hot parts; in iron it is absorbed when the current passes from hot parts to cold parts.

Consider a metallic bar, A B C, Fig. 3, which is heated at the middle, B, and cooled at the ends, A and C. Then the distribution of heat may be represented by the curve *a b c*. But if a current be passed from A to C, then, in metals like copper, the curve of the distribution of heat becomes somewhat like *a′ b c′*. Since a current in copper absorbs heat as a liquid does in flowing from the cold parts to the hot parts of a tube, electricity is sometimes said to have *specific heat*. It is positive in metals like copper and negative in metals like iron.

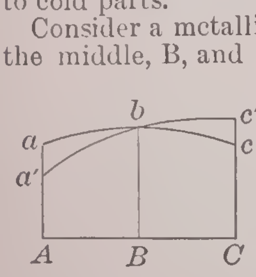

Fig. 3.

Thermal electromotive forces have their origin also at the contacts of solids with liquids and of liquids with liquids.

The thermo-electric power of Zn–$ZnSO_4$ is 0·00076 for a mean temperature of 18·5° C.; that of Cu–$CuSO_4$ is 0·00069 for about the same temperature. Since the liquid is positive to the metal in both cases, and there is no appreciable electromotive force at the contact of the two, the temperature coefficient of the electromotive force of a Daniell cell, which is composed of zinc in zinc sulphate and copper in copper sulphate, is the difference of the above two thermo-electric powers, or 0·00007. This conclusion is verified by experiment. Similar results with other cells show that the temperature coefficient in general is determined by the superposition of the several electromotive forces at the contacts of the dissimilar substances in the cell.

Henry S. Carhart.

**Thermom′eter**: any instrument for the measurement of temperature. The effect generally used for the purpose is the relative expansion of a liquid or a gas. The distortion of solids by heat is also sometimes used. In the earliest thermometer (Galileo, 1592, and Debbel, 1621) a glass bulb containing air was used, a bead of liquid in the stem separating the contained gas from the outer atmosphere. The movement of this bead along an arbitrary scale indicated the change of temperature. In the eighteenth century liquid thermometers came into use, among others the mercury-thermometer, which, in the hands of Fahrenheit (1714), of Réaumur (1730), and of Celsius (1742), reached a considerable degree of perfection. The scales of these three makers are related to each other as shown in the following formula and graphically in Fig. 1:

$$n°\ C. = \tfrac{4}{5}\ n°\ R. = \tfrac{9}{5}\ n°\ F. + 32°\ F.$$

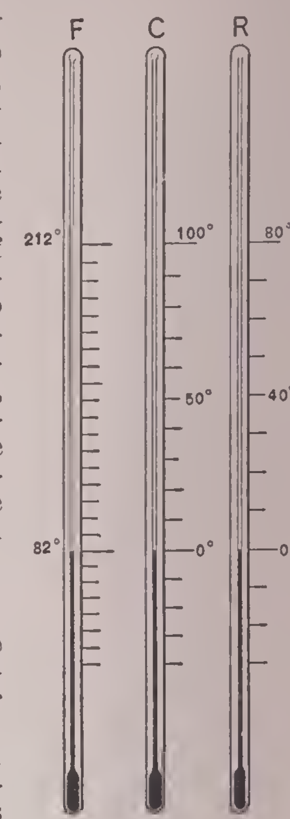

Fig. 1.

The only other scale which need be mentioned is the absolute scale, sometimes used in scientific work, for which see Thermometry.

All thermometers are based upon the same principle of scale-making—viz., the selection of two fixed points which are capable of accurate experimental determination and the division of the intervening portion of the bore into equal parts called degrees. Parts of the tube lying above and below the fixed points are divided into degrees of the same size. The fixed points used in the construction of all ordinary thermometers are the temperatures of melting ice and of the steam within a vessel of boiling water when the pressure is 76 cm. of mercury. The scale of Fahrenheit appears to have been arranged with reference to the uses of the physician, the attempt having been to make 100° correspond with the temperature of the human body; but it is always fixed by the use of the two points already mentioned.

*The form of the mercury-thermometer*, which is the result of nearly 200 years of experience, is briefly as follows: (1) An elongated bulb containing pure mercury (B, Fig. 2), with walls of glass as thin as is compatible with safety, and a diameter somewhat less than that of the stem (S), in order to admit of its passage without pressure through any hole which snugly fits the tube of the thermometer. (2) An elongated stem of glass with a capillary bore, sometimes flattened to show the height of the mercury, but in the better forms cylindrical. The stem is sometimes of clear glass, sometimes of glass with a strip of milk-glass at the back. In all thermometers for scientific purposes it carries the scale, etched upon the glass. The bore should terminate above in a small bulb (*b*), which serves to receive any mercury which may be driven to the upper end of the bore. This minor bulb is also useful in the calibration of the thermometer.

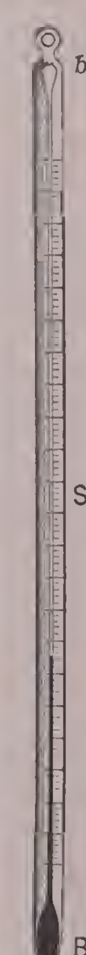

Fig. 2.

*Establishment of the Fixed Points.*—To find the melting-point of a thermometer, after the same has been filled with mercury, exclude the air by boiling the mercury within the bulb, seal the tube, and insert the bulb in broken ice, as shown in Fig. 3; then, after a sufficient interval (about twenty minutes to thirty minutes) has elapsed, mark on the stem the position of the mercury; this gives the melting-point of ice. To find the boiling-point, the apparatus shown in Fig. 4 is used. It consists of a bath in which the thermometer bulb and a portion of the stem are surrounded by steam at the proper pressure. After adequate exposure, the height of the mercury is again noted.

*The scale of the mercury-thermometer* is based upon the assumption that equal movements of the mercury along the stem indicate equal differences of temperature. As is pointed out in the article on Thermometry (*q. v.*), this assumption fails of strict fulfillment from two distinct causes.

The first of these is the irregularity of the bore, a source of error, which can be overcome by calibration and by making the divisions with equal cubic contents of bore, instead of making them of linear equality. The other difficulty arises from the fact that glass expands with increasing rapidity as the temperature rises, so that the relative coefficient of expansion of the liquid with which the bulb is filled, even though that liquid possesses a perfectly constant coefficient, will vary with the temperature. This source of error, although it may be neglected in many of the uses to which the mercury-thermometer is put, is so serious in its bearings upon experiments of precision as to have led to the abandonment of that instrument as a primary standard in favor of the air-thermometer.

FIG. 3.

*Shifting of the Zero-point.*—A very troublesome error of the mercury-thermometer is the gradual rise of the zero-point with age. This effect, which often amounts in the aggregate to more than a degree of the centigrade thermometer, is due to the continued contraction of the glass of the bulb after fusion. This change, which is rapid at first, continues, although with diminishing intensity, for a very long time. It has been traced for at least twenty years. A similar shrinkage, through much smaller range, follows every subsequent heating of the thermometer; so that an instrument which, after the determination of its zero, is placed in boiling water suffers a shifting of the zero from which it recovers only after a long time.

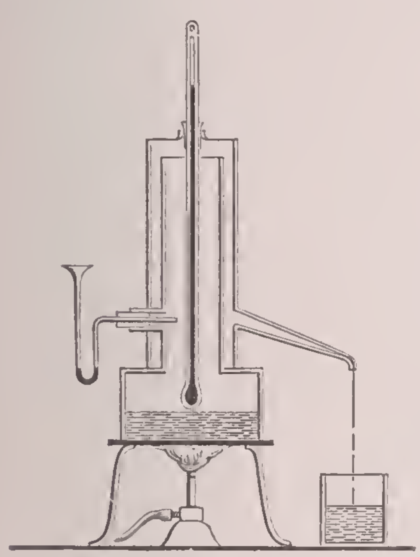

FIG. 4.

*Air-thermometers*, on account of their comparative freedom from the influence of the variations in the coefficient of expansion of the bulb, have been universally adopted as standards of comparison. They depend upon the laws of Charles and Mariotte (see PNEUMATICS), which express the well-established fact that the volume of a gas is directly proportional to the absolute temperature, with a constant coefficient of ·003668, and inversely proportional to the pressure.

The essential parts of the air-thermometer are the bulb (B, Fig. 5) and the manometer (M), by means of which the pressure may be regulated and measured. The usual procedure consists in holding the air within the bulb at constant volume, the mercury within the manometer tube being brought always to the same level ($n$). The temperature of the air within the bulb is computed from the pressure necessary to give it the volume in question.

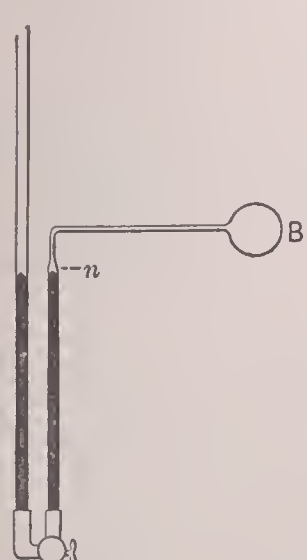

FIG. 5.

At very high temperatures this process has to be abandoned for fear of distending the bulb and changing its volume permanently. For such experiments the pressure is maintained constant and the volume is allowed to vary. In the measurement of temperatures above 400°, porcelain is substituted for glass on account of its greater refrangibility. Fig. 6 shows the form of bulb used by Barus in the calibration of thermo-elements for the measurement of high temperatures. It is of porcelain, with a neck 40 cm. long and only 0·1 cm. of internal diameter. A re-entrant tube is introduced for the purpose of admitting the junction to be calibrated to a position near the center of the bulb.

*Special Forms of Thermometers.*—The thermometers described in the preceding paragraphs are standard forms. These are modified to adapt the instrument to special purposes, and sometimes new principles are introduced.

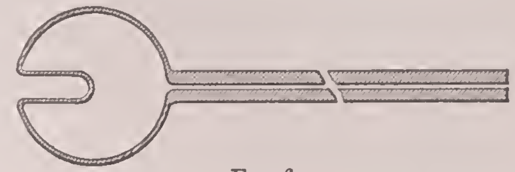

FIG. 6.

Among the numerous special forms of mercury-thermometers it is possible to mention here only one or two of the best known. One such is the clinical thermometer, in which the stem is shortened between the zero and the range with which one has to do in determining the temperature of the human body, by means of a small subsidiary bulb, as shown in Fig. 7. Other well-known special forms are the various maximum and minimum thermometers, of which one of the most widely used (Rutherford's) is shown in Fig. 8. The maximum recording device consists simply of a steel marker, which is pushed along the wide bore in front of the mercury column, and is left by the latter when it recedes. The minimum is recorded by means of an alcohol-thermometer containing a minute dumb-bell-shaped marker of glass, which fits the tube loosely, so that when the thermometer rises the liquid flows past. Upon the return the surface film catches the marker, which is thus compelled to follow the receding column to its lowest point.

FIG. 7.

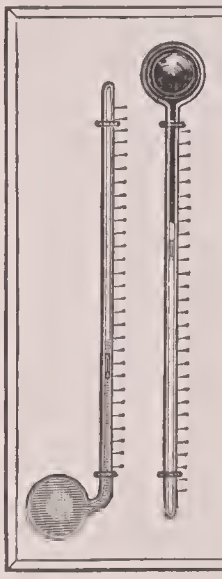

FIG. 8.

Where it is desired to indicate temperatures in such a way that the scale may be easily read from a distance, distortion thermometers are sometimes used. They are analogous to the aneroid barometer in principle, the same multiplying devices being used to carry a hand along a circular scale. Fig. 9 shows a familiar form. It consists of a strip of copper and one of steel fastened side by side and bent so as to form nearly a complete ring. The copper is on the inside. Difference in the coefficients of expansion of the two metals distorts the double piece which is fastened at one end, and the slight movement of the free end is magnified by the simple device shown in the figure. The spiral spring secures a prompt return of the pointer. See CENTIGRADE THERMOMETER.

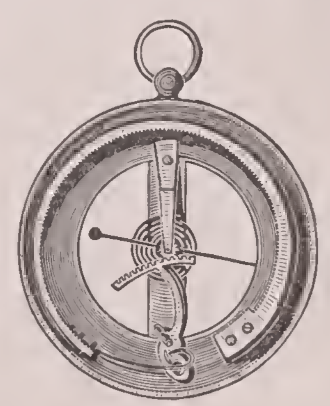

FIG. 9.

E. L. NICHOLS.

**Thermom′etry** [deriv. of *thermometer*; Gr. θέρμη, heat + μέτρον, measure]: the process of measuring temperature. The phenomena which are commonly utilized in thermometry are the change in length or volume under the action of heat, distortion of form from the same cause, the electromotive force due to difference of temperature between the junctions of a thermo-element or thermopile, and the change of electrical resistance which occurs in a metal when the same is subjected to variations of temperature.

*Expansion thermometers*, on account of their simplicity, are the most widely used. They are also the earliest, Galileo having made air-thermometers with arbitrary scales in 1592. A nearly ideal substance for thermometry at ordinary temperatures is mercury. That liquid possesses a very low freezing-point (— 39·4° C.) and a higher boiling-point than any other available liquid (357° C.). It has a sufficiently large coefficient of expansion (0·000181), as compared with glass (0·000025), to afford ample sensitiveness; it is opaque and an excellent conductor of heat. These properties have led to the adoption of mercury for all excepting a few special purposes, in spite of the fact that it does not possess the one essential characteristic of a perfect thermometric medium, viz., an absolutely constant coefficient of expansion. Only the permanent gases possess such a coefficient, and these, while they are likely always to be used for purposes of reference and comparison, are ill adapted in almost every other respect for the purposes of practical thermometry. Since, moreover, the performance of any liquid or gas thermometer depends not only upon the coefficient of the contents but also upon that of the bulb itself, the accuracy of the instrument is limited by the lack of uniformity in the expansion of glass. The error due to variations in the coefficient of the bulb are less important in the case of air thermometers, where the gas expands 140 to 150 times as fast as glass, than with mercury, where the ratio is only about 7 : 1. That mercury is a sufficiently good material to use in bulbs of ordinary glass is seen on comparing its coefficient at different ranges with that of the latter substance. See Table I. :

TABLE I.—COEFFICIENTS OF EXPANSION OF MERCURY AND OF GLASS.

| MERCURY (ACCORDING TO LEONARDT). | | ORDINARY GLASS (ACCORDING TO RECKNAGEL). | |
|---|---|---|---|
| Range of temp. | Mean coeff. (cubic). | Range of temp. | Mean coeff. (linear). |
| 0° to 100° | 0·00018092 | 0° to 10° | 0·00000851 |
| 100 " 200 | 0·00018094 | 0 " 50 | 0·00000882 |
| 200 " 300 | 0·00018129 | 0 " 100 | 0·00000920 |
| | | 0 " 150 | 0·00000959 |
| | | 0 " 200 | 0·00000997 |

Happily glass is an artificial mixture, and its properties are to a great extent within the control of the manufacturer. Under the guidance of Abbe, of Jena, and other investigators, it has been found possible to adapt glass, by varying its composition, to the varying needs of the optician, and also to reduce the changes in its coefficient of expansion. How marked the improvement is may be seen from Table II., in which are indicated the errors of two mercury-thermometers, the zero-points and boiling-points of which are correct and the bores of which between those points are divided into 100 parts of equal volume. One of these is a thermometer of Thuringian glass of the composition used in 1830–40, the other is a modern thermometer of the Jena normal glass. Both are compared with the hydrogen thermometers :

TABLE II.

| TEMPERATURES. | CORRECTION OF A THERMOMETER OF | |
|---|---|---|
| Hydrogen thermometer. | Thuringian glass. | Jena normal glass. |
| 0° | 0·000° | 0·000° |
| 10 | −0·086 | −0·056 |
| 20 | −0·149 | −0·091 |
| 30 | −0·191 | −0·109 |
| 40 | −0·213 | −0·111 |
| 50 | −0·206 | −0·103 |
| 60 | −0·201 | −0·086 |
| 70 | −0·171 | −0·071 |
| 80 | −0·127 | −0·041 |
| 90 | −0·069 | −0·018 |
| 100 | 0·000 | 0·000 |

*Thermometric Scales.*—Many proposals have been made to establish thermometric scales based upon some absolute system, thermodynamic or other. In practice, however, it is found convenient to adopt an arbitrary scale with two points fixed ; these fixed points being that of melting ice and of the saturated vapor above water which boils at a pressure of 76 cm. The familiar scale of Fahrenheit has this interval divided into 180 parts [+ 32° to + 212°], that of Réaumur into 80 parts [0° to + 80°], while the scale of Celsius, the "centigrade" scale of science, contains 100 divisions. The ratio of the three is therefore

$$1\ F. = \tfrac{5}{9}\ C. = \tfrac{4}{9}\ R.$$

To consider the case of the centigrade scale only, it is evident that the 100 equal divisions between melting and boiling might be—

(1) Linearly equal divisions,
(2) Divisions of equal content of bore,
(3) True degrees of the centigrade scale.

In a thermometer of truly cylindrical bore, filled with a thermometric substance with uniform coefficient, and having a bulb which likewise expands uniformly, the three methods of dividing the stem would be identical. Actual thermometers, however, do not possess truly cylindrical bores. Calibration of the same by means of a detached thread of mercury shows in general a conical form, more or less irregular. The character of the bore can be shown graphically by means of a curve in which ordinates are reciprocals of the lengths of the thread and abscissas are distances of the middle of the thread from the zero-point of the thermometer. Fig. 1 is such a curve, platted from measurements upon an unusually good thermometer. It is evident that a scale made by dividing the bore between the melting and boiling points into 100 parts linearly equal will be inaccurate. All fine thermometers have the bore calibrated for the purpose of determining the lengths of divisions, embracing everywhere equal cubic contents of bore. Such a scale is subject only to errors arising from variations in the coefficient of apparent expansion of the mercury. The size of this error, which depends upon the character of the glass, is given in Table II. For the work of the highest precision, in which the errors of expansion can not be neglected, a direct comparison is made with the air-thermometer. For other errors of the mercury thermometer and for details of its construction, etc., see THERMOMETER.

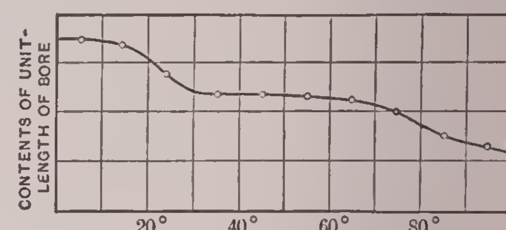

FIG. 1.

The so-called *absolute scale of temperature* is based upon the following consideration : Given a thermometer containing a perfect gas. Suppose the form of the thermometer to be cylindrical (Fig. 2). If this cylinder be placed in ice and in steam and the two fixed points noted, it will be found that the interval contains $\frac{100}{273}$ of the contents of the tube. If now the tube be graduated in centigrade degrees (all of equal length) and the graduation be carried downward past the zero, the 273d division below zero will coincide with the bottom of the tube. From this −273° is called *the absolute zero.* It is a point lying considerably below the experimental range, which at present extends only to the temperature of oxygen boiling under reduced pressure, or to about − 200° C. See, further, the article ZERO.

The use of the expansion of solids in thermometry is chiefly confined to the measurement of high temperatures or pyrometry (see PYROMETER), the coefficient being too small to afford sufficient delicacy at ordinary temperatures, but the distortion of properly constructed composite solids consisting of two or more solids with different coefficients is used with excellent results. Such instruments, for a description of which see THERMOMETER, are adapted for indicating temperature changes rather than for precise measurement. They bear much the same relation to the mercury-thermometer that aneroid barometers do to the standard mercury-barometer.

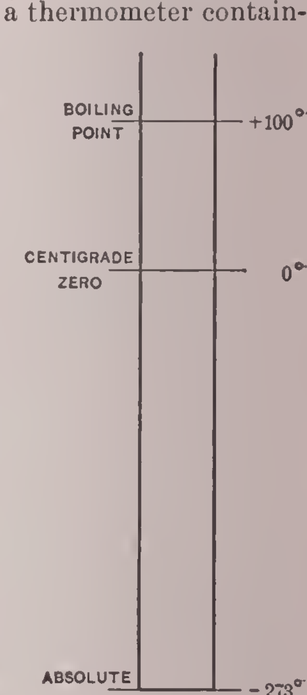

FIG. 2.

It may be seen from the foregoing that the standard process in thermometry is that in which the expansion of a gas is used. The manipulation of the air-thermometer, whether by the method of constant pressure or of constant volume, is, however, so complicated a matter that that instrument is used only for purposes of reference and calibration.

*Electrical thermometry,* as indicated in ELECTRICITY (*q. v.*), consists in the utilization of the electromotive force of a thermo-element for the determination of differences of temperature or of the change in resistance in a wire for the same purpose. These two methods are incomparably the most sensitive of known processes for the detection of minute differences, and it is in the measurement of the almost infinitesimal heat quantities with which the student of radiant energy has to deal that they have chiefly been employed.

Both methods, however, furnish likewise the most trustworthy means of extending accurate and quantitative measurements to very low and to very high temperatures. Throughout both these extreme ranges, which lie beyond that of the mercury-thermometer, a properly calibrated thermo-element or resistance-coil affords quite as manageable a substitute for the air-thermometer as the mercury-thermometer does between 0° and 100°. For temperatures of 0° to —200° C. the most serviceable apparatus consists either of a coil of pure copper wire or of a thermo-element of platinum — platinum-iridium. Where the coil is used resistances are measured either with the Wheatstone bridge, of which the other three arms are known and are maintained at constant temperature, or by fall of potential. In the latter method, which has certain advantages, the arrangement of the apparatus is that shown in Fig. 3, in which diagram B is a battery in closed circuit with the temperature coil, R, and compensated comparison-coil, C. The sensitive galvanometer, G, can be placed in shunt with R or C at will, and it is the ratio of the deflections thus obtained which measures the temperature of R. The change in the resistance of copper with the temperature, which amounts to ·40 to ·42 for 100°, is ample for the purposes of such measurements, and determinations of the coefficient for a wide range have shown a degree of constancy in that factor which leaves little to be desired. Thus Kennelly and Fessenden found for a copper wire a mean coefficient 0·004065 between 27·8° and 255·26°, with no deviation from that value comparable with the errors of observation. The researches of Dewar and Fleming led to a precisely similar result for the range of temperatures —200° C. . . . +100° C. The specimen of copper with which they performed their experiments gave a higher temperature coefficient (0·00424), but the coefficient was found to be nearly constant throughout the entire range covered by their investigations. Fig. 4 shows the resistance curve for copper, the observations being made at the temperatures of boiling oxygen, boiling ethylene, ice, and steam. It appears as the result of the study of that metal, therefore, that while different specimens of copper possess different coefficients, it is quite safe to assume that the coefficient remains unchanged between —200° C. and +250° C. Since the coefficient is readily determined at ordinary temperatures, say between 0° and 100°, copper is one of the most satisfactory of materials for the electric determination of temperature.

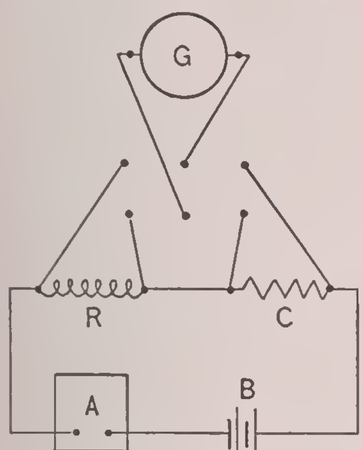

Fig. 3.

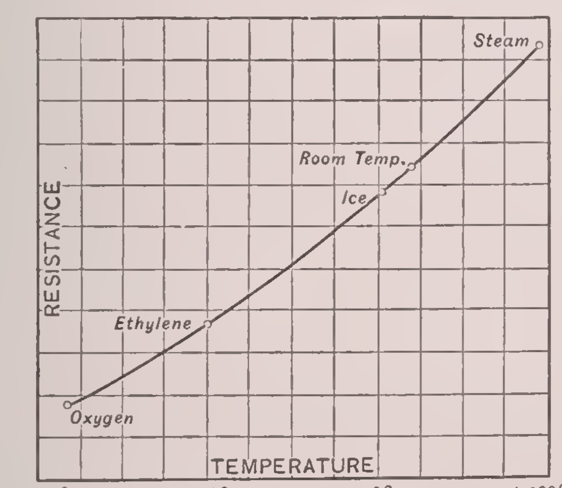

Fig. 4.

Comparisons of thermo-elements with the hydrogen-thermometer have been made, extending downward to the very lowest temperatures that can be produced by artificial means. By these experiments it appears that the electromotive force of a couple, consisting of pure platinum and of an alloy of platinum with iridium (10 per cent.), one junction of which is cooled, is very strictly proportional to the difference of temperature. This is the combination to be selected when the circumstances make it better to use a thermo-element. The difficulty of obtaining platinum of sufficient purity, however, makes it desirable to use the method of the resistance coil whenever practicable.

For the electrical measurement of very high temperatures the same two methods are used. Since, however, the only metals which are sufficiently refractory to admit of their employment are platinum and the metals of the platinum group, the choice of materials is confined to them and their alloys. Barus has shown that the thermo-couple already described (platinum and an alloy of platinum and iridium), when the metals are of the utmost purity, gives an electromotive force very nearly proportional to the temperature almost up to the melting-point of platinum. Fig. 5 shows his curve of calibration up to 1,600°. The performance of thermo-elements in which commercial platinum is used is, however, altogether untrustworthy. Attempts have been made by Siemens, Matthiesen, Benoit, and others to utilize the change of electrical resistance of platinum for the measurement of high temperatures, but the results are most unsatisfactory. See Pyrometer.

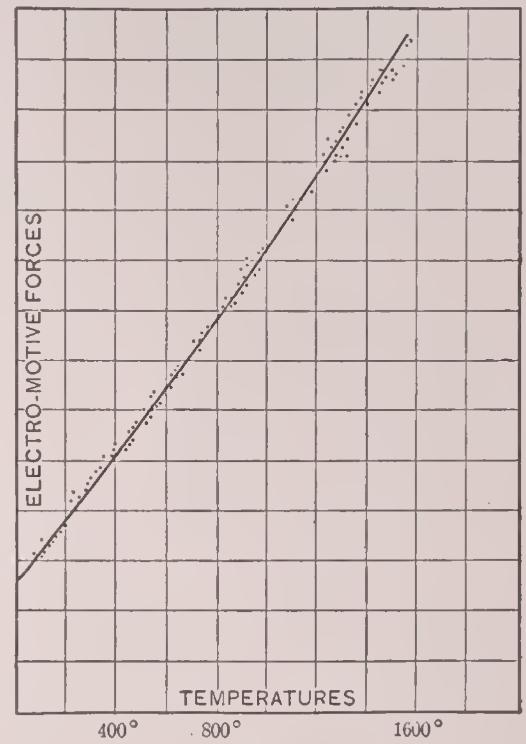

Fig. 5.

When the thermo-electric couple is to be used for the measurement of temperature through whatever range, the arrangement of apparatus shown in Fig. 6 is an advantageous one. It is based upon the same principle as the method given above for the use of the resistance coil—viz., the comparison of the electromotive force to be determined with one constant and known. The thermo-element, *c*, V, has the junction, *c*, packed in melting ice, while V is exposed to the temperature to be measured. It is in circuit with a suitable galvanometer, *G*, through the switch, *S*. The points *a* and *b* in any circuit have a constant difference of potential. The galvanometer may be brought into shunt around *a* and *b* at will by means of *S*. The ratio of the deflections due to differences of potential between *a* and *b* and between *c* and V affords a measure of the difference of temperature between junctions of the latter couple. The points *a* and *b* may be the terminals of a standard cell, the junctions of a thermo-element maintained in ice and boiling water, or two points upon a closed metallic circuit through which a constant current is flowing.

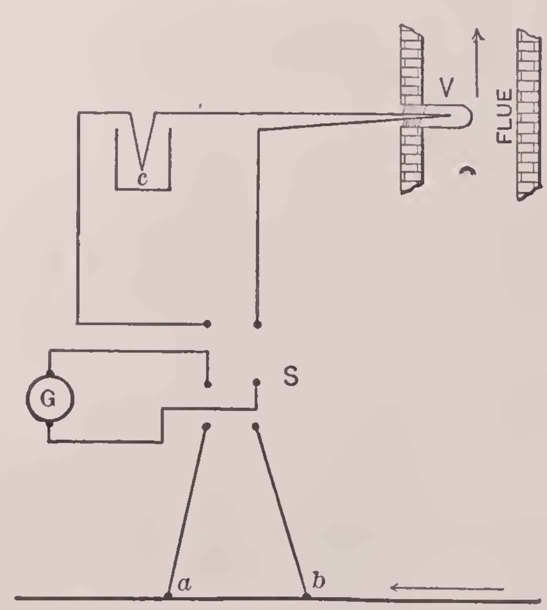

Fig. 6.

It should be noted that none of these electrical methods affords any direct or absolute measurement of temperature. They all depend upon calibration of the apparatus, that is to say, directly or indirectly, like all other thermometric processes, upon comparison with the air-thermometer. See, further, Guillaume, *Thermométrie de Précision*; Barus, *Measurement of High Temperatures*; Preston, *Heat*; Larden, *Heat*; and the chapters on thermometry in the treatises of Jamin, Wüllner, Müller-Pouillet, Violle, and Winkelmann.
E. L. NICHOLS.

**Ther'mopile**: an instrument for the production of electric currents by means of the added electromotive forces of a series of thermo-elements. The action of a thermopile depends upon a principle which is elucidated in ELECTRICITY (*q. v.*). Whenever a closed circuit consists of more than one metal, and there is a difference of temperature between the junctions or points of transition from one metal to another, a current will flow through the circuit as if generated by a difference of potential between the hot and the cold junction. By having several hot and several cold junctions in a circuit it is possible, by a proper arrangement, to sum up the differences of potential thus produced. Such a device is a thermopile. Thermopiles are of two classes: (1) for the study of radiation or of minute differences of temperatures; (2) for the production of considerable current.

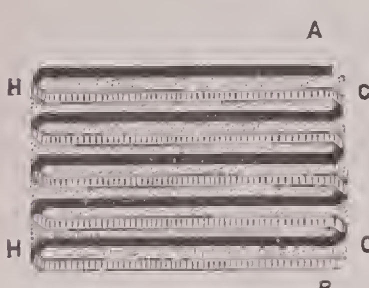

FIG. 1.

In the first class large electromotive forces are desired. These are obtained by selecting metals situated at as great a distance from one another in the thermo-electric series as possible. Bismuth and antimony form the couple usually chosen. These metals are worked into tiny slabs, and soldered together alternately with intervening strips of insulating material, as shown in Fig. 1. In such a series of thermo-elements, alternate junctions of which at H H, for example, can be heated while the other set lying between C C remain cool, a difference of potential equal to the sum of those generated in all the single elements will be found to exist between the terminals A and B. Such an arrangement constitutes a linear thermopile, and a number of these are frequently gathered together into a cubical block, as shown in Fig. 2.

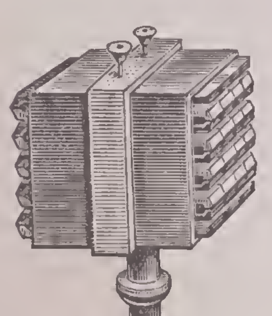

FIG. 2.

This was the form of pile used by Melloni in his famous researches upon radiant heat. The cubical pile was incased in a metal tube with flaring ends, by means of which, when desired, rays from a source of radiation could be gathered upon one face of the pile. Fig. 3 shows the cubical pile of Melloni, mounted in the customary manner. One face is furnished with the funnel-shaped tube which is closed in the illustration. The other face is exposed to the radiation from a Leslie cube.

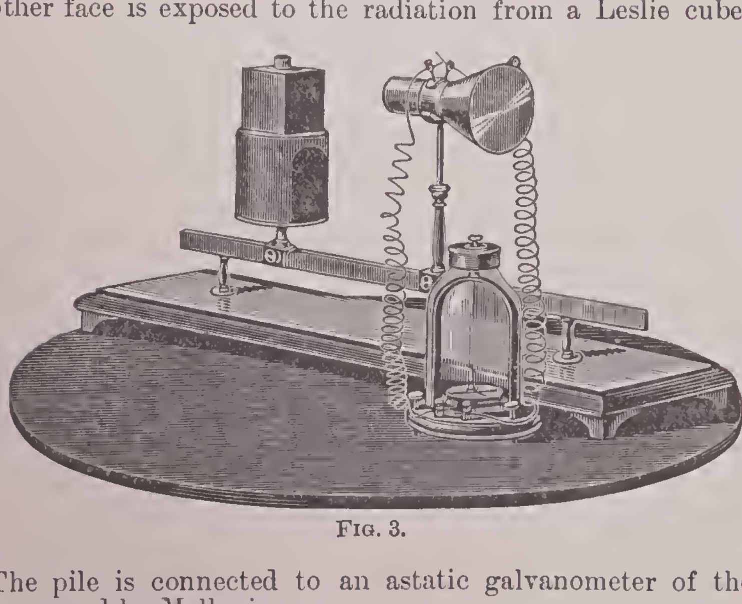

FIG. 3.

The pile is connected to an astatic galvanometer of the type used by Melloni.

The requirements to be met in the construction of a thermopile of the second class are entirely different from those of an instrument of the kind just described. The materials must be capable of withstanding a high temperature, and the electrical resistance must be low. Instead of antimony and bismuth, two more refractory metals are therefore selected, generally iron and German silver. These are connected in couples so as to form a flat ring, with the junctions to be heated within and the cold junctions outside, as shown in Fig. 4. A number of such layers, one above another, all connected in series and forming a hollow cylinder, constitutes the pile or battery. A burner of the Bunsen type placed beneath the axis of the cylinder heats the inner junctions.

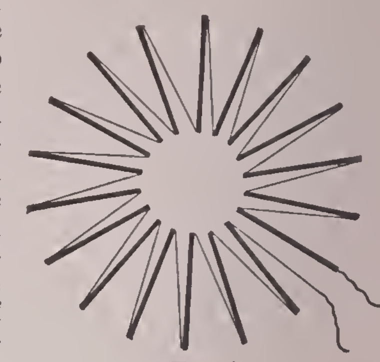

FIG. 4.

With such thermo-batteries very considerable currents may be generated in circuits of low resistance—sufficient, for example, to perform electrolysis or to drive small motors. It has been shown, however, that this method of converting heat energy into electrical energy is of necessity a wasteful one, and that the thermopile considered as a thermal engine must always be of very low efficiency. E. L. NICHOLS.

**Thermop'ylæ** [= Lat. = Gr. Θερμοπύλαι, liter., Hot Gates; θερμός, hot + πύλαι, gates]: a narrow defile between Mt. Œta and the Maliac Gulf, leading from Thessaly into Locris. It was the only way by which an enemy could enter from Northern Greece into Hellas, and became celebrated as the scene of the heroic death of Leonidas and his 300 Spartans in their attempt to prevent the Persian hordes from passing through the defile. The locality is no longer a pass, as it has been widened by natural causes into a swampy plain.
Revised by J. R. S. STERRETT.

**Thêroigne de Méricourt**, tā'rwaăñ-de-mā'rē'koor', assumed name of ANNE JOSÈPHE TERWAGNE: revolutionist; b. at Marcourt, Luxemburg, Aug. 13, 1762; was educated in a convent, but went in 1789 to Paris, where she lived as a courtesan. On the outbreak of the Revolution she acquired influence over the mob, was conspicuous at the fall of the Bastile, and from her fiery speeches and boldness became known as the Amazon of the Revolution. Driven from Paris by an order for her arrest, she fell into the hands of the Austrians at Liège, and was imprisoned in Vienna for nearly a year. Restored to liberty, she returned to Paris, and became still more popular; but her fidelity to the Girondists angered the partisans of the Mountain, whose violence she strove to check. On May 13, 1793, she was seized by a rabble of infuriated women in the garden of the Tuileries, stripped naked, and whipped. This drove her mad, and she spent the rest of her life in La Salpêtrière, where she died June 9, 1817. See Fuss, *Théroigne de Méricourt* (1854).
F. M. COLBY.

**Theromor'pha**, or **Theromora** [*theromorpha* is from Gr. θηρίον, mammal + μορφή, form]: a group (order) of fossil reptiles which combines in a remarkable way the characters of both Batrachia and monotreme mammals. It appears in Carboniferous time and dies out in the Triassic. These fossils are found in America, Europe, and South Africa.

**Thesau'rus**: See LEXICOGRAPHY and DICTIONARY.

**The'seus** (Gr. Θησεύς): in Grecian mythology, the national hero of Attica and the founder of the city of Athens; a son of Ægeus and Æthra. He was married first to Antiope, the queen of the Amazons, and afterward to Phædra. He took part in the campaign of the Argonauts, in the Calydonian hunt, in the battle with the Centaurs, etc., but his most famous exploit was the slaying of the Minotaur. Attica was bound to send annually a tribute of youths to Crete to be sacrificed to this monster. In order to put an end to this misery, Theseus repaired to Crete and won the affection of Ariadne, the daughter of King Minos, who provided him with a clew to the labyrinth and a sword to kill Minotaur; he slew the monster and carried off ARIADNE (*q. v.*), whom he afterward left on Naxos. During a revolution in Athens he fled to Scyros, where he perished by the treachery of King Lycomedes, but in 469 B. C. Cimon conquered Scyros and brought his bones back to Athens, where they were interred in the celebrated temple of Theseus. By the sculptors Theseus was sometimes represented as resembling Hercules, with a lion's skin and a club, though of a lighter and fleeter form and of a more elevated expression; sometimes as resembling Hermes, with chlamys (a short cloak) and petasos (a cap). Revised by J. R. S. STERRETT.

**Thesiger**: See CHELMSFORD, FREDERICK AUGUSTUS THESIGER.

**Thesis**: See ARSIS AND THESES.

**Thes'pis**: a native of Icaria in Attica and a contemporary of Pisistratus; became the inventor of the Greek tragedy by introducing between the dithyrambic chorals at the festival of Dionysus an interlocutor, or manner of actor, who now in monologues, now in dialogues with the leaders of the chorus, narrated, or gave a mimetic representation of, the incidents to which the songs referred. Nothing of his writings, if he wrote anything, has come down to us, but he seems to have been a serious person, and the curious picture of Thespis strolling about from place to place and entertaining people with shows from his wagon is due to Horace (*Ars Poetica*, 276), whose perspective of the history of literature is very faulty. Revised by B. L. GILDERSLEEVE.

**Thessalo'nians, First and Second Epistle of St. Paul to the**: See PAULINE EPISTLES.

**Thessalonica**: See SALONICA.

**Thes'saly**, or **Thessa'lia** [= Lat. = Gr. Θεσσαλία, Θετταλία]: a large division of ancient Greece, bounded E. by the Ægean Sea, N. by Macedonia, and W. by Epirus. The surface is a plain, inclosed on all sides by mountains—Pelion and Ossa on the E., Olympus and the Cambunian Mountains on the N., Pindus on the W., and Othrys on the S. The soil is very fertile, and the land was in ancient times famous for its wheat and its fine breed of horses. The inhabitants were Æolians, but very early the Epirotes invaded and conquered the country, and made the inhabitants their slaves. The government was oligarchical, but very often disturbed by internal wars, which was the reason why Thessalia never exercised any influence on the affairs of Greece. It was conquered by Philip of Macedon, and passed from Macedonia into the hands of the Romans. After long subjection to Turkey, Thessaly was added to the kingdom of Greece in 1881 through the recommendation of the powers after the Russo-Turkish war. It consists of the nomarchies of Arta, Trikalla, and Larissa; total area, 5,073 sq. miles. Pop. (1896) 397,459. See the articles on GREECE.

**The'tis** (in Gr. Θέτις): in Greek mythology, a daughter of Nereus and Doris. She lived with her sisters, the Nereides, in the depths of the sea, and was a gentle and kindly goddess, ever ready to assist gods in trouble. So she cared for Dionysus when he was fleeing before King Lycomedes, for Hephæstus when he had been hurled from heaven by Zeus, and she called Briareus to the assistance of Zeus when he was endangered by the machinations of Hera, Athene, and Poseidon. Both Zeus and Poseidon sued for her hand, but Themis foretold that she was destined to bear a son greater than his father. For this reason she was forced, to her great sorrow, to marry Peleus, a mortal man, but king of the Myrmidons in Thessaly. The gods attended the wedding in a body and brought gifts. Eris, enraged because she had not been bidden to the marriage, threw the apple inscribed "To the Fairest" among the wedding guests, and therefore to this wedding may be traced the origin of the Trojan war. Thetis was prevented by Peleus from fully carrying out her plan to make her only son Achilles immortal. In anger thereat she abandoned Peleus and returned to her home in the sea, but she ever followed the fortunes of her son with passionate sympathy. J. R. S. STERRETT.

**Theuriet**, tö'ree'ā', ANDRÉ: poet and novelist; b. at Marly-le-Roi, France, Oct. 8, 1833; studied law in Paris, and received his licentiate in 1857; soon entered the office of the ministry of finances, and at the same time began his literary work with the verses *In Memoriam* (1857). Subsequent poems are *Le chemin des bois* (1867); *Les paysans de l'Argonne, 1792* (1871); *Le bleu et le noir* (1873); *Les nids* (1879); *Le livre de la payse* (1882); *Nos oiseaux* (1886); *La ronde des saisons el des mois* (1891). His novels are numerous, beginning with the *Nouvelles intimes* (1870) and *Mlle. Guignon* (1874), and comprising among the latest the *Charme dangereaux* (1891); *Jeunes et vieilles barbes* (1892); and the *Chanoinesse* (1893). Dramatic productions are *Jean-Marie* (1871); *La maison des deux Barbeaux* (1885); *Raymonde* (1887), the two latter being drawn from his like-named novels. He has also contributed to various periodicals, and, as an art-critic, written *Jules Baslien-Lepage, l'homme et l'arliste* (1885). J. D. M. FORD.

**Thian-Shan**: another spelling of TIEN- (or T'IEN-) SHAN (*q. v.*).

**Thibaudeau**, tēē'bō'dō', ANTOIN CLAIRE: statesman and historian; b. at Poitiers, France, Mar. 23, 1765, where he subsequently practiced as an advocate; was elected a deputy to the Convention in 1792; voted for the execution of the king without appeal to the people, but fell out, nevertheless, with the Terrorists; was chosen president of the Council of Five Hundred in 1796; became a member of the council of state under the consulate and empire, and was made a count in 1803, but was banished from France by the ordinance of July 26, 1815, and lived in Prague, engaged in mercantile business, till 1830, when he returned to France; was made a senator by Napoleon in 1852. D. Mar. 8, 1854. Among other works, he wrote *Mémoires sur la Convention el le Direcloire* (2 vols., 1824); *Hisloire générale de Napoléon Bonaparte* (1827–28); *Mémoires sur le Consulal el l'Empire* (10 vols., 1835); and *Ma biographie; mes mémoires* (published after his death, 1875).

**Thibaut**, or **Thiband**, tēē'bō': King of Navarre; b. at Troyes in 1201; a posthumous son of Count Thibaut of Champagne, and Blanche, daughter of King Sancho the Wise of Navarre; was educated at the court of Philip Augustus; took an active part in the political entanglements after the death of Louis VIII.; became King of Navarre in 1234; made an utterly unsuccessful crusade in 1239; persecuted the Albigenses in his territories, which in other respects he governed well. D. at Pamplona, July 10, 1253. Among the *trouvères* he occupies a high rank; sixty-six poems by him were published in 1742 by Lévesque de la Ravallière, and eighty-one are found in Tarbé's *Collection des Poètes champenois* (1851). See Delban, *Vie de Thibaul* (1850).

**Thibaut**, ANTON FRIEDRICH JUSTUS: jurist; b. at Hameln, Hanover, of French descent, Jan. 4, 1774; studied law at Kiel, and in 1798 was appointed Professor of Civil Law, teaching there until called to Jena in 1803; in 1806 he was made Professor of Civil Law in the University of Heidelberg, and remained there till his death, having some political offices conferred upon him without his seeking. He was a man of striking personality, and, in addition to his great legal attainments, was a finished scholar and student of music. D. at Heidelberg, Mar. 29, 1840. His works have left a deep impress on German jurisprudence, the most important of them being *Theorie der logischen Auslegung des römischen Rechts* (1799); *Ueber Besitz und Verjährung* (1802); and *Syslem des Pandeklenrechls* (1803), besides numerous essays, and a book dealing with music. F. STURGES ALLEN.

**Thibet**: another spelling of TIBET (*q. v.*).

**Thibodeaux**, tib'ō-dō': town; capital of Lafourche parish, La.; on the Bayou Lafourche and the S. Pac. Railroad; 3 miles N. of Terre Bonne, and 55 W. by S. of New Orleans (for location, see map of Louisiana, ref. 11–F). It is in an agricultural and a rice and sugar-cane growing region; contains Thibodeaux College (Roman Catholic, chartered in 1859), Mt. Carmel convent, a State bank with a capital of $25,000, and two weekly newspapers; and has a number of important mechanical industries. Pop. (1880) 1,515; (1890) 2,078; (1900) 3,253.

**Thick-knee**: any bird of the genus *Œdicnemus*, family *Charadriidæ* or plovers. The thick-knees are distinguished by the moderately long and straight bill (a little longer than the head), which is compressed and wedge-shaped at the terminal half, the linear open nostrils, some distance from the base of the bill, and the elongated tarsi (three or four times as long as the middle toe) covered with hexagonal scales. One species (*Œ. superciliaris*) is a native of Peru; all the others are peculiar to the Old World. They are migratory, and resort to the temperate regions to rear their young. They frequent mostly open inland plains. The common European species is *Œdicnemus crepilans*, which attains a length of about 17 inches. Revised by F. A. LUCAS.

**Thierry**, ti-ā'ree', JACQUES NICOLAS AUGUSTIN: a brilliant historian of the "picturesque" school; b. at Blois, France, May 10, 1795; educated at the college of his native town and the normal school of Paris; attached himself in 1814 with great enthusiasm to Saint-Simon, whom he assisted in his literary labors; became in 1817 a contributor to *Le Censeur européen*, edited by Comte, and afterward to the *Courrier français*, in which he first published in 1820 his remarkable *Lettres sur l'Histoire de la France*, but concentrated himself more and more on the study of history, especially that of France and England, and published in 1825 his *Histoire de la Conquête de l'Angleterre par les Normands* (4 vols., 1860), which attracted great attention, and has been often republished, and translated twice into English (1825 and 1847). In 1826 he became nearly blind, and could continue his studies only by the aid of secretaries and of his friends, among whom were Armand Carrel and Fauriel, above all of his wife, Julie de Quérangal, known from several spirited essays in the *Revue des Deux Mondes*; they were married in 1831, but she died in 1844. Subsequently he lived mostly in his brother's house, and died in Paris, May 22, 1856. He became a member of the Academy in 1830. To the latter period of his life belong *Dix Ans d'Études historiques* (1834), a collection of minor essays, and *Récits des Temps mérovingiens* (1840), both translated into English. By Guizot he was appointed to edit one part of the *Collection des Monuments inédits de l'Histoire de France*—namely, the *Recueil des Monuments inédits de l'Histoire du Tiers État* (3 vols., 1849–56), which led him to write his *Essai sur l'Histoire de la Formation et des Progrès du Tiers État* (1853; translated into English by Francis B. Wells, 1855). His *Œuvres complètes* were collected in 10 vols. (1856–60).—His brother, AMÉDÉE SIMON DOMINIQUE THIERRY, D. C. L., b. at Blois, Aug. 2, 1797, was appointed Professor of History in Besançon in 1828, prefect of the department of Haute-Saône in 1830, member of the council of state in 1838, senator in 1860. D. in Paris, Mar. 27, 1873. His writings, advocating the same principles as those of his brother, but less brilliant in execution, comprise *Histoire des Gaulois jusqu'à la Domination romaine* (3 vols., 1828); *Histoire de la Gaule sous l'Administration romaine* (3 vols., 1840–47); *Histoire d'Attila* (2 vols., 1856); *Récits de l'Histoire romaine* (1860); *Tableau de l'Empire romain* (1862); *Saint Jérôme* (2 vols., 1867); *Saint Chrysostome* (1872).

Revised by A. G. CANFIELD.

**Thiers**, ti-ār': town; in the department of Puy-de-Dôme, France; on the Durolle; 23 miles E. N. E. of Clermont by rail (see map of France, ref. 6–G). It contains the Church of Le Moutier, portions of which date back to the seventh and eighth centuries. Among its manufactures are paper, including stamps and playing-cards, candles, and, most important of all, the making of cutlery. Pop. (1891) 11,993.

**Thiers**, LOUIS ADOLPHE: statesman and author; b. in Marseilles, France, Apr. 16, 1797; studied law at Aix; was admitted to the bar in 1818, and began to practice as an advocate, but was drawn by his ambition as well as by his talents to politics and literature, and removed in 1821 to Paris. Here he became a contributor to the *Constitutionnel*, and his articles attracted wide attention. In the meanwhile he made the acquaintance of Laffitte, and became prominent in liberal circles. In 1823 he began to publish his *Histoire de la Révolution française*, finished in 1827 in 10 vols., and this book at once made his name popular throughout France. In 1830 he founded the *National* in connection with Mignet and Armand Carrel, drew up the protest against the *ordonnances* of July 26, and took an active part in the revolution which effected the change of dynasty in France. He was elected a member of the Chamber of Deputies, held office in the ministry of Finance, and in 1832 became Minister of the Interior. For the next four years he virtually directed the policy of the cabinet, though he was not made Prime Minister till 1836. He withdrew altogether from the Government in August of that year on account of the king's opposition to his plan of an armed intervention in the affairs of Spain. On Mar. 1, 1840, he was again made Prime Minister. In the controversy between Mehemet Ali and the Porte, France supported the former, in the hope of reviving Napoleon's policy in the East, and gaining the supremacy in Egypt and Syria, while Russia, Great Britain, Austria, and Prussia were bent on maintaining the integrity of the Ottoman empire. Thiers assumed a menacing attitude, and for a time it seemed as if France might go to war on behalf of her ally, but the king refused to countenance extreme measures, and Thiers resigned Oct. 21, 1840. He retired from public life for several years; visited England, Spain, Italy, and Germany, making preparations for his great work, *Histoire du Consulat et de l'Empire* (20 vols., 1845–62); but in the last years of the reign of Louis Philippe he resumed his work in the Chamber of Deputies, and made vehement opposition to the government of Guizot, especially to its foreign policy. In the banquets which preceded the revolution of Feb., 1848, he took no part, but the popularity which he had partly lost during his own administration he fully regained when he came into opposition. As a member of the Constituent and Legislative Assemblies he accepted the republic, but advocated very restrictive measures. He voted for the presidency of Louis Napoleon, and fought a duel with a fellow deputy named Bixio, who had criticised him for his vote. Nevertheless, when the empire began to develop from the policy of the president, Thiers immediately went into opposition, and on Dec. 2, 1851, he was arrested, and shortly after banished from France. He returned, however, in August, but lived in retirement until 1863, when he was elected a member of the Representative Assembly by Paris. His criticism of the policy of the emperor, the Italian and Mexican wars, the rebuilding of Paris, etc., was often very severel though generally not very effective; he was almost the only member of the Assembly who opposed and condemned the declaration of war against Prussia, but after the downfall of the empire he developed an astonishing energy to save his country from utter ruin. On Sept. 17, 1870, he started on a tour to London, St. Petersburg, Vienna, and Florence in order to procure foreign intervention, and on his return in the last days of October he opened negotiations with Bismarck concerning an armistice. After the capitulation of Paris and the conclusion of the armistice, he was elected a member of the National Assembly by twenty-six departments, Feb. 8, 1871, and on Feb. 17 the Assembly chose him chief of the executive. On Aug. 31 his term of office was fixed at three years, and he received the title of "president of the republic." He was very successful in negotiating the peace; he saved Belfort and one milliard for France. He was still more successful in procuring the means of fulfilling the conditions of peace; the payment of the indemnification and the liberation of French soil from German occupation were effected in a surprisingly short time. The insurrection of the Commune was promptly put down, but his attempt at consolidating the "conservative republic" by legislative enactment failed, and on May 24, 1873, he resigned. He continued a member of the Assembly, and in 1876 was elected senator for Belfort. D. at St.-Germain, Sept. 3, 1877. Among his other works are *Histoire de Law* (1826; Eng. trans., New York, 1859); *De la Propriété* (1848); *L'Homme et la Matière* (1875).

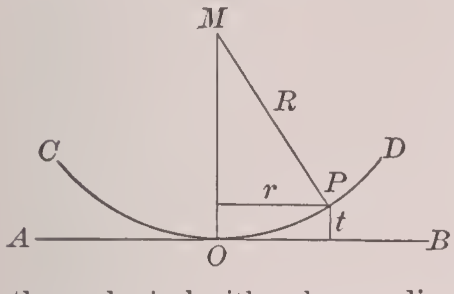
**Thiersch**, teersh, FRIEDRICH WILHELM: classical scholar and educator; b. at Kirchscheidungen, in Prussian Saxony, June 17, 1784; studied theology and philology at Leipzig and Göttingen; privat docent in the latter university in 1809; professor of the Lyceum at Munich, and on the transference of the University of Landshut to the Bavarian capital in 1812 was called to the chair of Ancient Languages, which he held with great distinction till his death in Munich, Feb. 25, 1860. Thiersch has the credit of reviving classical studies in Bavaria by his masterly reorganization of the entire school system of the state. He founded the Philological Institute (*Acta Philologorum Monacensium*, 4 vols.), published a once highly esteemed *Greek Grammar*, and numerous works on archæological and pedagogical subjects, among which may be mentioned *Ueber gelehrte Schulen* (3 vols.); *Ueber den gegenwärtigen Stand des öffentlichen Unterrichts in Deutschland, Holland, Frankreich und Belgien* (3 vols., 1838); *Ueber die Epochen der bildenden Kunst unter den Griechen* (2 vols., 2d ed. 1820). See his *Life and Works*, written by his son Heinrich (2 vols., Leipzig, 1867).

A. GUDEMAN.

**Thinocor'idæ** [Mod. Lat., named from *Thino'corus*, the typical genus; Gr. θίς, θινός, heap of sand, sandy shore or bottom + κόρυς, the crested lark]: a family of birds of uncertain affinities peculiar to South America. The general aspect is somewhat quail-like; the bill rather short, somewhat slender, broad at the base, and compressed forward, and with the upper mandible slightly decurved over the lower; nostrils basal and lateral, and partly curved by a horny membrane; wings long and pointed; tail moderate and produced straight backward; tarsi stout or moderate, and with the investing scales more or less small; toes four, the three anterior moderately long and free, the posterior small and elevated. The family name was proposed (by Prince Bonaparte in 1850) and has been adopted (by Kaup, Gray, etc.) for a group of birds confined to the temperate and colder regions of South America. They are generally supposed to be most nearly related to the sheathbills (*Chionididæ*), but this remains to be verified. They go about generally in pairs or small coveys. Their flight somewhat resembles that of grouse. Open plains seem to be their chief resorts. Eight species are known, belonging to the genera *Thinocorus* and *Attagen*.

Revised by F. A. LUCAS.

**Thin Plates, Colors of**: the colors produced by interference of light at the surfaces of thin layers of media differing in density. When light falls upon a soap-bubble, or a thin floating film of oil, iridescent hues are seen, which owe their existence to interference of light reflected from the upper and lower surfaces of the film. The same is observed when a thin crevice is produced in a transparent body like ice or glass. The film of soap-solution, or oil, or air, is optically a plate whose thickness determines the tint observed.



These phenomena were first studied by Newton, who investigated a film of air between two surfaces of glass, one of which was plane and the other spherical with a long radius of curvature. Let $AB$ be the plane surface, touched at $O$ by the curved surface $COD$, whose radius of curvature, $OM$ or $PM$, is $R$. Let $t$ be the thickness of the film at any point, $P$, whose distance from a perpendicular at $O$ is $r$. Then by geometry

$$r^2 = (2R - t)t = 2Rt - t^2.$$

Since $t^2$ is exceedingly small in comparison with $R$, the formula may be written simply

$$r^2 = 2Rt. \qquad (1)$$

Now suppose yellow light to be incident vertically from above at $P$. Some of it is transmitted through the film to the lower surface, and there reflected to join what is directly reflected at $P$. The difference of path of the two portions is obviously $2t$. If this retardation be such that the two portions become united with a difference of phase of a half wave-length, or any odd number of half wave-lengths, the resulting interference produces extinction (see INTERFERENCE); but if this difference be a whole wave-length, or any even number of half wave-lengths, they conjoin to produce brightness. This is true for all points where the thickness of the air-film is $t$, and these form a circle around $O$ as center with radius $r$.

It can be shown that when light is reflected at the boundary between two media of different density, if the reflection occur in the less dense medium there is change of phase, which has the same effect as if there were a retardation of half a wave-length. This occurs in the film of air at its lower surface. At the center, $O$, where the glass-surfaces are in optical contact, there is hence a black spot due to interference. Around this is a succession of alternately bright and dark rings, according as the interference is with an even or odd number of half wave-lengths of retardation, including that due to change of phase. If the symbol $\lambda$ be used for wave-length, the successive values of $2t$ for the dark points will be 0, $\lambda$, $2\lambda$, $3\lambda$. $4\lambda$, etc., while for the bright points they will be $\frac{1}{2}\lambda$, $\frac{3}{2}\lambda$, $\frac{5}{2}\lambda$, etc. Substituting these values of $2t$ in the fundamental equation, $r^2 = 2tR$, we have the means of calculating the wave-length of light, since $R$ is known and $r$ may be measured easily. If blue light be employed instead of yellow light, the diameter of any given ring is found to be smaller. The wave-length for blue is hence less than for yellow. If white light be employed there will be a succession of rainbow-rings with the full succession of colors, each tint being due to the extinction of its complementary tint; but these spectra become wider and overlap each other with increasing distance from the center, becoming mixed, so that only a few remain visible. If these Newton's rings are viewed by transmitted rather than reflected light, as there is no change of phase by transmission, the central spot is bright. The presence of the film causes interference as before, but the ratio of reflected to transmitted light is small, so that the rings are wanting in clearness of definition. If the incident light be oblique instead of perpendicular to the surface of the film the rings are larger, and the formula is a little less simple than that just deduced. W. LE CONTE STEVENS.

**Thionville**, ti-ōn̄'vēel' (Germ. *Diedenhofen*, anc. *Theodonis Villa*): town of the present German province of Alsace-Lorraine; on the Moselle, 19 miles N. of Metz, and in the midst of a broad level plain (see map of German Empire, ref. 6–B). It is a walled city of the old school of fortification, ranking under that system as a third-class fortress. After the investment of Metz by the Germans in 1870, Thionville proved of annoyance to the besieging force, and after two days' bombardment capitulated Nov. 24, 1870, with large stores of supplies. Although many buildings were destroyed, the defences were left almost intact. Pop. (1890) 8,928.

**Third Estate**: See ESTATES, THE THREE; and FRANCE, HISTORY OF.

**Third Orders**: See TERTIARIES.

**Thirion**, tēe'rēe'ōn̄', EUGÈNE ROMAIN: historical painter; b. in Paris, May 19, 1839; pupil of Picot, Fromentin, and Cabanel; medals, Salons, 1866, 1868, and 1869: second-class medal, Paris Exposition, 1878; Legion of Honor 1872. His *Moses* (1885) is in the Luxembourg Gallery. Works in the museums in Bordeaux, Perpignan, Tours, and Lisieux; frescoes in La Trinité, Paris. Studio in Paris. W. A. C.

**Thirl'wall**, CONNOP, D. D.: historian; b. at Stepney, London, England, Jan. 11, 1797; displayed such extraordinary precocity that at the age of eleven years his father, who was a clergyman, printed a volume of his compositions under the title *Primitiæ, or Essays and Poems on Various Subjects*, etc. (1809); entered Trinity College, Cambridge, 1814, and in 1815 took the Craven and Bell scholarships; took the senior chancellor's classical medal and graduated in 1818; became fellow and tutor of Trinity College; studied law, and was called to the bar at Lincoln's Inn 1825; published a translation of Schleiermacher's *Critical Essay on the Gospel of St. Luke* (1825); took orders in the Church of England 1828; became rector of Kirby Underdale, Yorkshire; associated with Rev. Julius Charles Hare in translating Niebuhr's *History of Rome* (2 vols., 1828); and as one of the editors of the Cambridge *Philological Museum* was for several years examiner for the classical tripos at Cambridge, and classical examiner in the University of London; wrote for Lardner's *Cabinet Cyclopædia* a popular *History of Greece* (8 vols., 1835–40), afterward revised and enlarged in a library edition (8 vols., 1845–52); and became Bishop of St. Davids 1840, which post he resigned May, 1874. D. at Bath, July 27, 1875. He was chairman of the Old Testament company on Bible revision. He published a number of sermons, charges, letters, addresses, and essays, which, with other writings, were issued under the title *Literary and Theological Remains* (3 vols., 1876–77), edited by Canon J. J. S. Perowne. His *Letters* were published in 1881 (2 vols.), and his *Letters to a Friend*, edited by Dean Stanley, in 1882. Revised by S. M. JACKSON.

**Thirst** [O. Eng. *þyrst*, *þurst* : O. H. Germ. (> Germ.) *durst* : Icel. *þorsti* : Goth. *þaúrstei*, thirst, deriv. of *þaúrsus*, dry, withered, deriv. of *gaþíarsan*, wither; cf. Lat. *torre're*, parch : Gr. τέρσεσθαι, become dry : Sanskr. *tṛṣ*, thirst]: a sensation normally caused by the need of water in the animal system, and consequently relieved by drinking. The great thirst of cholera is also caused by a deficiency of water. But thirst also accompanies febrile excitement. This is only temporarily relieved by drinking, and unless contra-indicated by the symptoms small lumps of ice will usually relieve the thirst, and reduce the excessive heat with efficiency and without danger. The use of too much salt is another familiar cause, the explanation being in this case the excessive salinity of the blood. The great thirst of diabetes is similarly induced. Revised by W. PEPPER.

**Thirty-nine Articles of Religion**: doctrinal formulas of the Reformation period. When the Reformation was fairly introduced into England under Edward VI. (1547–53), Archbishop Cranmer at first entertained the noble but premature project of framing an evangelical catholic creed in which all the Reformed Churches could agree in opposition to the Church of Rome, then holding the Council of Trent, and invited the surviving continental Reformers, Melanchthon, Calvin, and Bullinger, to London for the purpose. Failing in this scheme, he framed, with the aid of his fellow Reformers, Ridley and Latimer, the royal chaplains, and the foreign divines, Bucer, Peter Martyr, and John à Lasco, whom he had drawn to England, the *Forty-two Articles of Religion* for the English Reformed Church. After passing through several revisions they were completed in Nov., 1552, and published in June, 1553, by royal authority and with the approval of convocation. The reestablishment of the papacy under the short but bloody reign of Mary (1553–58) set them aside, together with the Edwardian Book of Common Prayer. Under Elizabeth (1558–1603) the Articles were revised and permanently restored. They were reduced to thirty-nine, and brought into that shape and form which they have ever retained since in the Church of England. The Latin edition was prepared under the supervision of Archbishop Parker, with the aid of Bishop Cox, of Ely (one of the Marian exiles), and Bishop Guest, of Rochester, and approved by convocation 1562. The English edition, which is of equal authority, though slightly differing from the Latin, was adopted by convocation in 1571, and issued under the editorial care of Bishop Jewel, of Salisbury, 1571. They were made binding on all ministers and teachers of religion and students in the universities, but subscription was not always enforced with equal rigor, and they were bitterly complained of by Nonconformists, who had scrupulous objections to the political articles. The Act of Uniformity under Charles II. imposed greater stringency than ever; but the Toleration Act of William and Mary gave some relief by exempting dissenting ministers from subscribing Articles XXXIV. to XXXVI. and a portion of Article XXVII. Subsequent attempts to relax or abolish subscription resulted at last in the University Tests Act of 1871, which exempts all students and graduates in the Universities of Oxford, Cambridge, and Durham, except divinity students and the holders of offices with clerical functions, from subscription, and throws these institutions open to persons of all religious denominations.

The Thirty-nine Articles cover nearly all the heads of the Christian faith, especially those which at the time of their framing were under dispute with the Roman Catholics. They affirm the old orthodox doctrines of the Trinity and incarnation, the Augustinian views on free will, total depravity, divine grace, faith, good works, election, and the Protestant doctrines on the Church, purgatory, and the sacraments of baptism and the Lord's Supper. They are borrowed in part from Lutheran standards—namely, the Augsburg Confession of Melanchthon (1530) and the Würtemberg Confession of Brentius (1552), but on the sacraments, especially the much-disputed doctrine of the real presence in the Eucharist, they follow the Swiss Reformers, Bullinger and Calvin. In the political sections they are purely English, and teach the Erastian doctrine of the spiritual as well as temporal supremacy of the sovereign as the supreme governor of the Church of England. They have therefore an eclectic and comprehensive character, which distinguishes the Anglican Church from the Lutheran and the strictly Calvinistic churches of the Continent and Scotland, and from the dissenting denominations of England. They have often been interpreted and misinterpreted in the interest of particular schools and parties, while all claim them as favoring themselves. They must be understood in their plain grammatical sense; and when this is doubtful, the Prayer-book, the two books of Homilies, the Catechism, and the private writings of the English Reformers and the Elizabethan divines must be called to aid. The doctrinal decisions in the Gorham (1848–50), Bennet (1870–72), and other controversies favor great latitude in their interpretation.

The Protestant Episcopal Church in the U. S., after effecting an independent organization and episcopate in consequence of the American Revolution, formally adopted the Thirty-nine Articles of the mother Church at the General Convention held in Trenton, N. J., Sept. 12, 1801, but with sundry alterations and omissions in the political articles (Art. XXI. and XXXVII.), which the separation of Church and state made necessary. The only doctrinal difference is the omission of all allusion to the Athanasian Creed (Art. VIII.), which is also excluded from the American editions of the Prayer-book. The Twenty-five Articles of the Methodist Episcopal Church and the Thirty-five of the Reformed Episcopal Church are based upon the Thirty-nine Articles.

LITERATURE.—C. Hardwick, *History of the Articles of Religion* (Cambridge, 1851; 3d ed. 1876); Thomas Rogers, *Exposition of the Thirty-nine Articles* (London, 1579; new ed. Cambridge, 1854); G. Burnet, *History of the English Reformation* (many eds.) and *Exposition of the Thirty-nine Articles* (Oxford, 1845 and other eds.); Laurence, *Bampton Lectures* for 1834 (Oxford, 3d ed. 1838); E. H. Browne, *Exposition of the Thirty-nine Articles* (London, 1850; ed. by J. Williams, 1887, the best book); A. P. Forbes, *An Explanation of the Thirty-nine Articles* (1867; 3d ed. 1887); Schaff, *Creeds* (vols. i., p. 292, and iii., pp. 485–522).

Revised by S. M. JACKSON.

THE THIRTY-NINE ARTICLES as revised by the Protestant Episcopal Church in the U. S. are as follows:

ART. I. *Of Faith in the Holy Trinity.*—There is but one living and true God, everlasting, without body, parts, or passions; of infinite power, wisdom, and goodness; the Maker and Preserver of all things both visible and invisible. And in unity of this Godhead there be three Persons of one substance, power, and eternity—the Father, the Son, and the Holy Ghost.

ART. II. *Of the Word or Son of God, which was made very Man.*—The Son, which is the Word of the Father, begotten from everlasting of the Father, the very and eternal God, and of one substance with the Father, took man's nature in the womb of the blessed Virgin, of her substance; so that two whole and perfect natures, that is to say, the Godhead and manhood, were joined together in one person, never to be divided, whereof is one Christ, very God, and very man; who truly suffered, was crucified, dead, and buried, to reconcile his Father to us, and to be a sacrifice, not only for original guilt, but also for actual sins of men.

ART. III. *Of the going down of Christ into Hell.*—As Christ died for us, and was buried; so also is it to be believed, that he went down into hell.

ART. IV. *Of the Resurrection of Christ.*—Christ did truly rise again from death, and took again his body, with flesh, bones, and all things appertaining to the perfection of man's nature; wherewith he ascended into heaven, and there sitteth, until he return to judge all men at the last day.

ART. V. *Of the Holy Ghost.*—The Holy Ghost, proceeding from the Father and the Son, is of one substance, majesty, and glory, with the Father and the Son, very and eternal God.

ART. VI. *Of the Sufficiency of the Holy Scriptures for Salvation.*—Holy Scripture containeth all things necessary to salvation; so that whatsoever is not read therein, nor may be proved thereby, is not to be required of any man that it should be believed as an article of the faith, or be thought requisite or necessary to salvation. In the name of the holy Scripture we do understand those canonical books of the Old and New Testament, of whose authority was never any doubt in the Church. *Of the Names and Number of the Canonical Books.*—Genesis, Exodus, Leviticus, Numbers, Deuteronomy, Joshua, Judges, Ruth, The First Book of Samuel, The Second Book of Samuel, The First Book of Kings, The Second Book of Kings, The First Book of Chronicles, The Second Book of Chronicles, The First Book of Esdras, The Second Book of Esdras, the Book of Esther, The Book of Job, The Psalms, The Proverbs, Ecclesiastes or Preacher, Cantica or Songs of Solomon, Four Prophets the greater, Twelve Prophets the less. And the other books (as *Hierome* saith) the Church doth read for example of life and instruction of manners; but yet doth it not apply them to establish any doctrine; such are these following: The Third Book of Esdras, The Fourth Book of Esdras, The Book of Tobias, The Book of Judith, The rest of the Book of Esther, The Book of Wisdom, Jesus the Son of Sirach, Baruch the Prophet, The Song of the Three Children, The Story of Susanna, Of Bel and the Dragon, The Prayer of Manasses, The First Book of Maccabees, The Second Book of Maccabees. All the books of the New Testament, as they are commonly received, we do receive, and account them canonical.

ART. VII. *Of the Old Testament.*—The Old Testament is not contrary to the New; for both in the Old and New Testament everlasting life is offered to mankind by Christ, who is the only Mediator between God and man, being both God and man. Wherefore they are not to be heard, which feign that the old fathers did look only for transitory promises. Although the law given from God by Moses, as touching ceremonies and rites, do not bind Christian men, nor the civil precepts thereof ought of necessity to be received in any commonwealth; yet notwithstanding, no Christian man whatsoever is free from the obedience of the Commandments which are called moral.

ART. VIII. *Of the Creeds.*—The *Nicene* Creed, and that which is commonly called the *Apostles'* Creed, ought thoroughly to be received and believed; for they may be proved by most certain warrants of holy Scripture.

ART. IX. *Of Original or Birth-sin.*—Original sin standeth not in the following of *Adam* (as the *Pelagians* do vainly talk); but it is the fault and corruption of the nature of every man, that naturally is engendered of the offspring of *Adam*; whereby man is very far gone from original righteousness, and is of his own nature inclined to evil, so that the flesh lusteth always contrary to the Spirit; and therefore in every person born into this world it deserveth God's wrath and damnation. And this infection of nature doth remain, yea, in them that are regenerated; whereby the lust of the flesh, called in Greek φρόνημα σαρκός (which some do expound the wisdom, some sensuality, some the affection, some the desire, of the flesh), is not subject to the Law of God. And although there is no condemnation for them that believe and are baptized; yet the Apostle doth confess, that concupiscence and lust hath of itself the nature of sin.

ART. X. *Of Free Will.*—The condition of man after the fall of *Adam* is such that he can not turn and prepare himself, by his own natural strength and good works, to faith, and calling upon God. Wherefore we have no power to do good works pleasant and acceptable to God, without the grace of God by Christ preventing us, that we may have a good will, and working with us, when we have that good will.

ART. XI. *Of the Justification of Man.*—We are accounted righteous before God, only for the merit of our Lord and Saviour Jesus Christ by faith, and not for our own works or deservings. Wherefore, that we are justified by faith only, is a most wholesome doctrine, and very full of comfort, as more largely is expressed in the Homily of Justification.

ART. XII. *Of Good Works.*—Albeit that good works, which are the fruits of faith, and follow after justification, can not put away our sins, and endure the severity of God's judgment; yet are they pleasing and acceptable to God in Christ, and do spring out necessarily of a true and lively faith; insomuch that by them a lively faith may be as evidently known as a tree discerned by the fruit.

ART. XIII. *Of Works before Justification.*—Works done before the grace of Christ, and the inspiration of his Spirit, are not pleasant to God, forasmuch as they spring not of faith in Jesus Christ; neither do they make men meet to receive grace, or (as the school-authors say) deserve grace of congruity: yea rather, for that they are not done as God hath willed and commanded them to be done, we doubt not but they have the nature of sin.

ART. XIV. *Of Works of Supererogation*—Voluntary works besides, over and above, God's commandments, which they call works of supererogation, can not be taught without arrogancy and impiety: for by them men do declare, that they do not only render unto God as much as they are bound to do, but that they do more for his sake, than of bounden duty is required: whereas Christ saith plainly, When ye have done all that are commanded to you, say, We are unprofitable servants.

ART. XV. *Of Christ alone without Sin.*—Christ in the truth of our nature was made like unto us in all things, sin only except, from which he was clearly void, both in his flesh, and in his spirit. He came to be the Lamb without spot, who, by sacrifice of himself once made, should take away the sins of the world; and sin (as Saint *John* saith) was not in him. But all we the rest, although baptized, and born again in Christ, yet offend in many things; and if we say we have no sin, we deceive ourselves, and the truth is not in us.

ART. XVI. *Of Sin after Baptism.*—Not every deadly sin willingly committed after baptism is sin against the Holy Ghost, and unpardonable. Wherefore the grant of repentance is not to be denied to such as fall into sin after baptism. After we have received the Holy Ghost, we may depart from grace given, and fall into sin, and by the grace of God we may arise again, and amend our lives. And therefore they are to be condemned, which say, they can no more sin as long as they live here, or deny the place of forgiveness to such as truly repent.

ART. XVII. *Of Predestination and Election.*—Predestination to life is the everlasting purpose of God, whereby (before the foundations of the world were laid) he hath constantly decreed by his counsel secret to us, to deliver from curse and damnation those whom he hath chosen in Christ out of mankind, and to bring them by Christ to everlasting salvation, as vessels made to honor. Wherefore, they which be endued with so excellent a benefit of God, be called according to God's purpose by his Spirit working in due season: they through grace obey the calling: they be justified freely: they be made sons of God by adoption: they be made like the image of his only-begotten Son Jesus Christ: they walk religiously in good works, and at length, by God's mercy, they attain to everlasting felicity.

As the godly consideration of predestination, and our election in Christ, is full of sweet, pleasant, and unspeakable comfort to godly persons, and such as feel in themselves the working of the Spirit of Christ, mortifying the works of the flesh, and their earthly members, and drawing up their mind to high and heavenly things, as well because it doth greatly establish and confirm their faith of eternal salvation to be enjoyed through Christ, as because it doth fervently kindle their love towards God: So, for curious and carnal persons, lacking the Spirit of Christ, to have continually before their eyes the sentence of God's predestination, is a most dangerous downfall, whereby the devil dost thrust them either into desperation, or into wretchedness of most unclean living, no less perilous than desperation.

Furthermore, we must receive God's promises in such wise, as they be generally set forth to us in holy Scripture: and, in our doings, that will of God is to be followed, which we have expressly declared unto us in the Word of God.

ART. XVIII. *Of obtaining Eternal Salvation only by the Name of Christ.*—They also are to be had accursed that presume to say, That every man shall be saved by the law or sect which he professeth, so that he be diligent to frame his life according to that law, and the light of nature. For holy Scripture doth set out unto us only the name of Jesus Christ, whereby men must be saved.

ART. XIX. *Of the Church.*—The visible Church of Christ is a congregation of faithful men, in the which the pure Word of God is preached, and the sacraments be duly ministered according to Christ's ordinance, in all those things that of necessity are requisite to the same.

As the Church of *Jerusalem*, *Alexandria*, and *Antioch*, have erred; so also the Church of *Rome* hath erred, not only in their living and manner of ceremonies, but also in matters of faith.

ART. XX. *Of the Authority of the Church.*—The Church hath power to decree rites or ceremonies, and authority in controversies of faith: and yet it is not lawful for the Church to ordain anything that is contrary to God's Word written, neither may it so expound one place of Scripture, that it be repugnant to another. Wherefore, although the Church be a witness and a keeper of Holy Writ, yet, as it ought not to decree anything against the same, so besides the same ought it not to enforce anything to be believed for necessity of salvation.

ART. XXI. *Of the Authority of General Councils.*—[This article (which is given at foot *) was omitted, because it is partly of a local and civil nature, and because the remaining parts are provided for in other articles.]

ART. XXII. *Of Purgatory.*—The Romish doctrine concerning purgatory, pardons, worshiping and adoration, as well of images as of relics, and also invocation of saints, is a fond thing, vainly invented, and grounded upon no warranty of Scripture, but rather repugnant to the Word of God.

ART. XXIII. *Of Ministering in the Congregation.*—It is not lawful for any man to take upon him the office of public preaching, or ministering the sacraments in the congregation, before he be lawfully called, and sent to execute the same. And those we ought to judge lawfully called and sent, which be chosen and called to this work by men who have public authority given unto them in the congregation, to call and send ministers into the Lord's vineyard.

ART. XXIV. *Of Speaking in the Congregation in such a Tongue as the People understandeth.*—It is a thing plainly repugnant to the Word of God, and the custom of the primitive Church, to have public prayer in the church, or to minister the sacraments, in a tongue not understanded of the people.

ART. XXV. *Of the Sacraments.*—Sacraments ordained of Christ be not only badges or tokens of Christian men's profession, but rather they be certain sure witnesses, and effectual signs of grace, and God's good will toward us, by the which he doth work invisibly in us, and doth not only quicken, but also strengthen and confirm our faith in him.

There are two sacraments ordained of Christ our Lord in the Gospel, that is to say, baptism and the supper of the Lord.

Those five commonly called sacraments, that is to say, confirmation, penance, orders, matrimony, and extreme unction, are not to be counted for sacraments of the Gospel, being such as have grown partly of the corrupt following of the Apostles, partly are states of life allowed in the Scrip-

* XXI. *Of the Authority of General Councils.*—General councils may not be gathered together without the commandment and will of princes; and when they be gathered together (forasmuch as they be an assembly of men, whereof all be not governed with the Spirit and Word of God), they may err, and sometimes have erred, even in things pertaining unto God. Wherefore things ordained by them as necessary to salvation have neither strength nor authority, unless it may be declared that they be taken out of holy Scripture.

tures; but yet have not like nature of sacraments with baptism, and the Lord's Supper, for that they have not any visible sign or ceremony ordained of God.

The sacraments were not ordained of Christ to be gazed upon, or to be carried about, but that we should duly use them. And in such only as worthily receive the same, they have a wholesome effect or operation; but they that receive them unworthily, purchase to themselves damnation, as Saint *Paul* saith.

ART. XXVI. *Of the Unworthiness of the Ministers, which hinders not the Effect of the Sacraments.*—Although in the visible Church the evil be ever mingled with the good, and sometimes the evil have chief authority in the administration of the Word and sacraments, yet forasmuch as they do not the same in their own name, but in Christ's, and do minister by his commission and authority, we may use their ministry, both in hearing the Word of God, and in receiving the sacraments. Neither is the effect of Christ's ordinance taken away by their wickedness, nor the grace of God's gifts diminished from such as by faith, and rightly, do receive the sacraments ministered unto them; which be effectual, because of Christ's institution and promise, although they be ministered by evil men.

Nevertheless, it appertaineth to the discipline of the Church that inquiry be made of evil ministers, and that they be accused by those that have knowledge of their offenses; and finally, being found guilty, by just judgment be deposed.

ART. XXVII. *Of Baptism.*—Baptism is not only a sign of profession, and mark of difference, whereby Christian men are discerned from others that be not christened, but it is also a sign of regeneration or new-birth, whereby, as by an instrument, they that receive baptism rightly are grafted into the Church; the promises of the forgiveness of sin, and of our adoption to be the sons of God by the Holy Ghost, are visibly signed and sealed; faith is confirmed, and grace increased by virtue of prayer unto God.

The baptism of young children is in anywise to be retained in the Church, as most agreeable with the institution of Christ.

ART. XXVIII. *Of the Lord's Supper.*—The supper of the Lord is not only a sign of the love that Christians ought to have among themselves one to another; but rather it is a sacrament of our redemption by Christ's death; insomuch that to such as rightly, worthily, and with faith, receive the same, the bread which we break is a partaking of the body of Christ; and likewise the cup of blessing is a partaking of the blood of Christ.

Transubstantiation (or the change of the substance of bread and wine) in the supper of the Lord, can not be proved by holy Writ; but is repugnant to the plain words of Scripture, overthroweth the nature of a sacrament, and hath given occasion to many superstitions.

The body of Christ is given, taken, and eaten, in the Supper, only after an heavenly and spiritual manner. And the mean whereby the body of Christ is received and eaten in the Supper is faith.

The sacrament of the Lord's Supper was not by Christ's ordinance reserved, carried about, lifted up, or worshiped.

ART. XXIX. *Of the Wicked, which eat not the Body of Christ in the Use of the Lord's Supper.*—The wicked, and such as be void of a lively faith, although they do carnally and visibly press with their teeth (as Saint *Augustine* saith) the sacrament of the body and blood of Christ; yet in nowise are they partakers of Christ; but rather, to their condemnation, do eat and drink the sign or sacrament of so great a thing.

ART. XXX. *Of both Kinds.*—The cup of the Lord is not to be denied to the lay people; for both the parts of the Lord's sacrament, by Christ's ordinance and commandment, ought to be administered to all Christian men alike.

ART. XXXI. *Of the One Oblation of Christ finished upon the Cross.*—The offering of Christ once made is that perfect redemption, propitiation, and satisfaction, for all the sins of the whole world, both original and actual; and there is none other satisfaction for sin, but that alone. Wherefore the sacrifices of masses, in the which it was commonly said, that the priest did offer Christ for the quick and the dead, to have remission of pain or guilt, were blasphemous fables, and dangerous deceits.

ART. XXXII. *Of the Marriage of Priests.*—Bishops, priests, and deacons are not commanded by God's law, either to vow the estate of single life, or to abstain from marriage: therefore it is lawful for them, as for all other Christian men, to marry at their own discretion, as they shall judge the same to serve better to godliness.

ART. XXXIII. *Of Excommunicate Persons, how they are to be avoided.*—That person which by open denunciation of the Church is rightly cut off from the unity of the Church, and excommunicated, ought to be taken of the whole multitude of the faithful, as an heathen and publican, until he be openly reconciled by penance and received into the Church by a judge that hath authority thereunto.

ART. XXXIV. *Of the Traditions of the Church.*—It is not necessary that traditions and ceremonies be in all places one, or utterly like; for at all times they have been divers, and may be changed according to the diversity of countries, times, and men's manners, so that nothing be ordained against God's Word. Whosoever, through his private judgment, willingly and purposely, doth openly break the traditions and ceremonies of the Church, which be not repugnant to the Word of God, and be ordained and approved by common authority, ought to be rebuked openly (that others may fear to do the like), as he that offendeth against the common order of the Church, and hurteth the authority of the magistrate, and woundeth the consciences of the weak brethren.

Every particular or national church hath authority to ordain, change, and abolish ceremonies or rites of the Church ordained only by man's authority, so that all things be done to edifying.

ART. XXXV. *Of the Homilies.*—The Second Book of Homilies, the several titles whereof we have joined under this article, doth contain a godly and wholesome doctrine, and necessary for these times, as doth the former Book of Homilies, which were set forth in the time of *Edward the Sixth*; and therefore we judge them to be read in churches by the ministers, diligently, and distinctly, that they may be understanded of the people.

*Of the Names of the Homilies.*—1. Of the right use of the church. 2. Against peril of idolatry. 3. Of repairing and keeping clean of churches. 4. Of good works: first of fasting. 5. Against gluttony and drunkenness. 6. Against excess of apparel. 7. Of prayer. 8. Of the place and time of prayer. 9. That common prayers and sacraments ought to be ministered in a known tongue. 10. Of the reverend estimation of God's Word. 11. Of alms-doing. 12. Of the nativity of Christ. 13. Of the passion of Christ. 14. Of the resurrection of Christ. 15. Of the worthy receiving of the sacrament of the body and blood of Christ. 16. Of the gifts of the Holy Ghost. 17. For the rogation-days. 18. Of the state of matrimony. 19. Of repentance. 20. Against idleness. 21. Against rebellion.

[This article is received in this Church, so far as it declares the Books of Homilies to be an explication of Christian doctrine, and instructive in piety and morals. But all references to the constitution and laws of England are considered as inapplicable to the circumstances of this Church; which also suspends the order for the reading of said homilies in churches, until a revision of them may be conveniently made, for the clearing of them, as well from obsolete words and phrases, as from the local references.]

ART. XXXVI. *Of Consecration of Bishops and Ministers.*—The Book of Consecration of Bishops, and Ordering of Priests and Deacons, as set forth by the General Convention of this Church in 1792, doth contain all things necessary to such consecration and ordering; neither hath it any thing that, of itself, is superstitious and ungodly. And, therefore, whosoever are consecrated or ordered according to said form, we decree all such to be rightly, orderly, and lawfully consecrated and ordered.

ART. XXXVII. *Of the Power of the Civil Magistrates.*—The power of the civil magistrate extendeth to all men, as well clergy as laity, in all things temporal; but hath no authority in things purely spiritual. And we hold it to be the duty of all men who are professors of the Gospel, to pay respectful obedience to the civil authority, regularly and legitimately constituted.

ART. XXXVIII. *Of Christian Men's Goods, which are not common.*—The riches and goods of Christians are not common, as touching the right, title, and possession of the same; as certain Anabaptists do falsely boast. Notwithstanding, every man ought, of such things as he possesseth, liberally to give alms to the poor, according to his ability.

ART. XXXIX. *Of a Christian Man's Oath.*—As we confess that vain and rash swearing is forbidden Christian men by our Lord Jesus Christ, and *James* his Apostle, so we judge, that Christian religion doth not prohibit, but that a man may swear when the magistrate requireth, in a cause of faith and charity, so it be done according to the prophet's teaching, in justice, judgment, and truth.

**Thirty Tyrants**: a body of thirty magistrates in Athens (404–403 B. C.). They were appointed from the aristocratic party by the Spartans, victorious in the Peloponnesian war. The tyrants were guilty of the most cruel and shameless acts, and after one year were expelled by Thrasybulus.

**Thirty Years' War**: the name given to a succession of wars (1618–48) begun as a struggle between Roman Catholics and Protestants, carried on as an attempt to establish the authority of the German emperor over the religious interests of Germany, and concluded as a struggle of the house of Austria to maintain its imperial power over domestic and foreign affairs.

*Causes of the War.*—By the Treaty of Augsburg (1555), which temporarily brought the strifes of the Reformation to an end, each of the German states was permitted to determine the nature of its national religion. All subjects were permitted to remove from states in which their religion was forbidden to states in which it was officially sanctioned. But the inconveniences imposed on dissent by these provisions made disagreements inevitable. Protestantism continued in Catholic states and Catholicity continued where it was under governmental prohibition. Protestantism throve, especially in Bohemia and Austria; but under Rudolf II. (1576–1612) a strong reaction, largely under the influence of the Jesuits, set in. In 1608 the Evangelical Union and in 1609 the Catholic League were formed to protect their respective interests. The Emperor Matthias (1612–19) gave certain guarantees of liberty, but in 1617 Ferdinand of Styria, who had been educated by the Jesuits, was crowned King of Bohemia. Persecutions at once began. Protestant churches were closed in Braunau and pulled down in Klostergrab. The Protestant estates met in Prague Mar. 5, 1618, and petitioned the Emperor Matthias, who sent messengers to declare their meeting illegal and to defend his own acts. The reply of the emperor was borne by Slawata and Martinitz, and received in the assembly-room of the castle. At the end of the altercation which ensued Slawata and Martinitz, with their secretary, Fabricius, were hurled from the castle window about 70 feet from the ground. The fact that all escaped with only slight injuries tended to increase the faith of the Catholics in the divine protection of their cause. Protestants and Catholics alike in all parts of Southern Germany took up arms.

*The Bohemian War* (1618–20).—After the events just described the concessions made to Protestants in Bohemia were withdrawn, and an insurrection followed. Frederick V., the Elector Palatine and a Protestant, was chosen King of Bohemia in 1619. Count Thurn repeatedly defeated the Catholic forces, but Frederick V. was a courtier rather than a soldier, and his motley army was totally routed by the army of Maximilian of Bavaria at Weissemberg Nov. 8, 1620. The same autumn and winter the Lower Palatinate was ravaged by an army of Spaniards under Spinola. The Protestants, utterly defeated in Bohemia, were given over to persecution.

*War in the Palatinate* (1621–23).—Count Mansfeld and Duke Christian of Brunswick at the head of the Protestant forces showed great skill and energy in opposition to the Catholic armies on the Rhine. They ravaged the territories of the Catholic League, and everywhere retaliated with energy for the tyranny shown by Ferdinand II. in his dealings with the Protestants. Both sides fought with desperation. The imperial commander TILLY (*q. v.*) defeated the Margrave of Baden at Wimpfen (May 6, 1622); also Christian of Brunswick at Höchst (June 30, 1622) and at Stadtlohn (Aug. 6, 1623). These victories might have ended the war but for two reasons. The Protestant princes in the north were beginning to be aroused, and Mansfeld and Christian, though dismissed by Frederick (July, 1623), refused to lay down their arms or leave the field. They fought desperately on their own account in Alsace, in Lorraine, in Holland, and in Saxony, supporting their armies as they went, and everywhere leaving desolation.

*The Danish-Saxon War* (1624–29).—The Danish king Christian IV. resented injuries inflicted on him by the emperor, and, supported by a British subsidy, joined the Protestant cause in 1624. With the forces of Mansfeld and Christian of Brunswick, he marched into Lower Saxony. Meantime the Emperor Ferdinand had called for the help of WALLENSTEIN (*q. v.*), who, with the army of Leaguers under Tilly, now marched to the north. The Danes were routed in 1626 by Tilly at Lutter and Mansfeld by Wallenstein at Dessau. The hopes of the Protestants would have perished but for the fact that Mansfeld, after an apparently overwhelming defeat, gathered together forces enough to conduct a victorious raid or campaign through Silesia, Moravia, and Hungary. Meanwhile, however, the forces of Wallenstein and Tilly overran North Germany and Denmark, and compelled Christian IV. to sign a treaty of peace at Lubeck May 12, 1629.

*The Swedish-German War* (1630–36).—In 1629 Ferdinand issued the famous Edict of Restitution, according to which all estates that had been secularized since 1552 were ordered to be restored to the Catholic Church. The edict, unpopular with many Catholics, gave the greatest offense to the Protestants. Not content with this, Ferdinand fomented a revolt of the Poles against Sweden, thus intensifying the deep indignation that was already at the point of war. On July 4, 1630, GUSTAVUS ADOLPHUS (*q. v.*) landed with a Swedish army at Usedom, drove the imperialists out of Mecklenburg and Pomerania, and formed alliances with Hesse, Saxe-Weimar, Magdeburg, Brandenburg, and Saxony. Tilly advanced against the new alliance, and stormed and sacked Magdeburg May 20, 1631, after a desperate siege. The city was given up to plunder, and the slaughter of the inhabitants became memorable. On Sept. 17, 1631, the armies met at Breitenfeld, near Leipzig, and the army of Tilly was nearly annihilated. Gustavus now advanced to the W., to the S., and to the E., traversing the Rhine and ascending the valley of the Main, defeating his enemy on the Lech Apr. 15, 1632, where Tilly was slain, and entering Munich May 17, after having established organizers and supporters in every important city along his route. The brilliancy of this march startled Europe and laid the basis for a new Evangelical Union, with Sweden at the head. Ferdinand saw that the case was desperate, and thereupon recalled Wallenstein, whom he had previously disgraced, giving him practically unreserved powers. Wallenstein rapidly collected an army, overran Bohemia, and marched N. into Saxony. Gustavus was obliged to follow. In the desperate battle of Lützen (Nov. 16, 1632) Wallenstein was defeated, but the cause of the Protestants, while overthrowing the enemy, suffered an irreparable loss in the death of Gustavus Adolphus at the moment of victory. The Swedes, under Oxenstierna, preserved their advantages until at Nördlingen, Sept. 6, 1634, the Protestants, under Bernard of Weimar, were totally defeated. The cause of the emperor was thus reinstated, and Saxony signed a treaty of peace at Prague May 30, 1635.

*The French-Swedish War* (1636–48).—RICHELIEU (*q. v.*), having broken the political power of the Huguenots and of the nobles in France, was now ready to advance to the third great object of his policy—the defeat of the ambitions of Austria. To secure the hearty alliance of France, Oxenstierna yielded to Richelieu the direction of the war. The contest then became political rather than religious. While France united with Sweden, Denmark and Saxony united with the Emperor Ferdinand. Another set of generals then came into prominence. The Swedes under Banér held Northern Germany, and, after penetrating Silesia and Bohemia, defeated the Austrians and Saxons in a great battle at Wittstock in 1636. The same army under Torstensson and Königsmark gained further victories at Breitenfeld (1642) and Jankau (1645). Meantime Turenne and Condé devastated the regions of the Rhine, and, by repeated victories, drove back the imperial forces from the Palatinate and from Bavaria. These successes prepared the way for an invasion of Austria, which was about to take place when, after many preliminaries, the terrible struggle was brought to an end by the Peace of WESTPHALIA (*q. v.*) Oct. 24, 1648. As the fruit of this most terrible of modern wars, Protestantism was saved, but at a cost which it is difficult even to estimate. The population was greatly decreased; intellectually and morally the people suffered a great decline. Germany was disintegrated, and the material losses were such that a complete recovery had hardly taken place at the end of two centuries.

AUTHORITIES.—Gardiner, *Thirty Years' War* (1874); Ward, *The House of Austria in the Thirty Years' War*; Schiller, *Geschichte des Dreissigjährigen Kriegs* (Leipzig, 1793); Gindely, *Geschichte des Dreissigjährigen Kriegs* (4 vols., Prague, 1869–80; Eng. transl. *History of the Thirty Years' War*, by Ten Brook); also by the same author, *Illustrierte Geschichte des Dreissigjährigen Kriegs* (2d ed. 3 vols., Leipzig, 1884).

C. K. ADAMS.

**Thistle** [O. Eng. *þistel* : O. H. Germ. *distil* > Mod. Germ. *distel*]: any one of many stout spinous herbs of the family *Compositæ* and of the genera *Cnicus, Carduus, Centaurea, Onopordon.* A few have medicinal qualities, and some have fine flowers. The roots and leaves of some species were once eaten as food. The creeping thistle, commonly but er-

Creeping or Canada thistle.

roneously called the Canada thistle (*Cnicus*—or *Carduus*—*arvensis*), is a noxious weed of European origin, now naturalized extensively in America. It is a perennial, with many long, running underground stems which come to the surface and give rise to new plants. When these creeping stems are cut or broken each part produces a new plant. The plants tend to be diœcious, hence many produce no seeds.
Revised by CHARLES E. BESSEY.

**Thistle-bird**: a name given to the American goldfinch (*Spinus tristis*), often designated the YELLOW-BIRD (*q. v.*).

**Thoburn**, JAMES MILLS, A. M., D. D.: bishop; b. at St. Clairsville, O., Mar. 7, 1836; educated at Allegheny College, Meadville, Pa.; joined the Pittsburg Conference of the Methodist Episcopal Church 1858; has been engaged in missions in India since 1859; was elected missionary bishop for India and Malaysia in 1888. He has published *Missionary Addresses*; *My Missionary Apprenticeship* (New York, 1884); *India and Malaysia* (1892); *Light in the East* (1894); and *The Deaconess and her Vocation.* A. OSBORN.

**Tholuck**, tō'look, FRIEDRICH AUGUST GOTTTREU: theologian and author; b. at Breslau, Germany, Mar. 30, 1799; studied theology and Oriental languages at the Universities of Breslau and Berlin; visited England in 1825, and Rome in 1828; was appointed Professor Extraordinary of Theology at Berlin in 1824, and removed to Halle in 1826 as ordinary professor. He found the university given up to rationalism, but under his influence it largely regained its reputation for piety. His works, most of which have been often reprinted in Germany and translated into English both in England and America, were published at Gotha in a collected edition in 11 vols., 1863–72, and treat of Oriental subjects—*Sufismus, sive Theosophia Persarum pantheistica* (1821); *Blütensammlung aus der morgenländischen Mystik* (1825); *Speculativ Trinitätslehre des spätern Orients* (1826); exegetical—*The Epistle to the Romans* (1824; twice translated into English); *The Gospel of John* (1827; translated into English by Kaufmann, 1836); *The Sermon on the Mount* (1833; translated into English by R. L. Brown, Edinburgh, 1860), etc.; historical—*Vorgeschichte des Rationalismus* (4 vols., 1853–62); *Geschichte des Rationalismus* (1865, etc.); ethical and dogmatical—*Wahre Weihe des Zweiflers* (1824; translated into English by Ryland under the title of *Guido and Julius, the Doctrine of Sin and the Propitiator*); *Stunden der Andacht* (2 vols., 1840; Eng. trans., *Hours of Christian Devotion*, 1875). He was one of the most fruitful and influential German theologians and authors during the second and third quarters of the nineteenth century, and better known in England and the U. S. than any other. He was original, brilliant, suggestive, eloquent, and full of poetry, wit, and humor. He can not be classified with any school. He was influenced by Pietism and Moravianism, by Schleiermacher and Neander, and even by Hegel. His elastic mind was ever open to new light. He was particularly admired as a preacher. He lives in the lives he inspired and guided, not in the books he wrote. D. at Halle, Prussia, June 10, 1877. See his *Life*, by L. Witte (2 vols., Bielefeld, 1884–86).
Revised by S. M. JACKSON.

**Thom**, JOHN HAMILTON: preacher and author; b. probably in Scotland about 1810; became a distinguished minister of the Unitarian Church, and was many years pastor of the congregation worshiping in Renshaw chapel, Liverpool; author of *St. Paul's Epistles to the Corinthians* (London, 1851; Boston, 1852); *The Revelation of God and Man in the Son of God and the Son of Man* (1859); a *Memoir of Rev. John James Tayler* (1872), and other works; editor of *The Life of the Rev. Joseph Blanco White, written by himself, with Portions of his Correspondence* (3 vols., 1845); a book in which Dr. Liddon finds the beginnings of the Latitudinarian movement in the English Church. In 1839 he was associated with Dr. James Martineau and the Rev. Henry Giles in a course of controversial sermons delivered at Liverpool which attracted wide attention at the time, and are still a landmark of exceptional importance in the history of Unitarian thought. D. Aug. 2, 1894.
Revised by J. W. CHADWICK.

**Thoma**, RICHARD: surgeon; b. at Bonndorf, in the Black Forest, Germany, Dec. 11, 1847; studied in the Universities of Berlin and Heidelberg, graduating M. D. at the latter in 1872; settled in Heidelberg and devoted himself to the study of pathological anatomy; was elected, in 1877, extraordinary professor of that science in the university. Subsequently he accepted the chair of General and Anatomical Pathology in the University of Dorpat. He has written several monographs on pathological topics. S. T. A.

**Thomas**, or **Did'ymus**, SAINT [*Thomas* = Lat. = Gr. Θωμᾶς, from Heb. *Tᵉōm*, liter., twin; *Didymus* = Lat. = Gr. Δίδυμος, liter., twin]: one of the twelve apostles, of whose personal character and history nothing is known except by two or three allusions in the Gospel of John. The most important of these is his refusal to believe in the resurrection of Jesus until convinced by tangible proof. Two apocryphal works are ascribed to him—a "Gospel" and "Acts" (best ed. by Bonnet, Leipzig, 1883). He was represented by later so-called "tradition" as having preached in Ethiopia, Egypt, Parthia, or India, and in the latter country the CHRISTIANS OF ST. THOMAS (*q. v.*), found by the Portuguese on the Malabar coast in the sixteenth century, claimed to originate from his preaching. This, however, is probably due to a confusion with a Nestorian or Manichæan missionary. Great efforts have been made by several Spanish, Mexican, and South American theologians to make it appear that the apostle evangelized America, and traces of his presence are pointed out in sacred caves and other sites from Paraguay to Mexico, in which latter country he has been formally identified by several native antiquarians with the Aztec divinity Quetzalcoatl. Revised by S. M. JACKSON.

**Thomas**, ARTHUR GORING: opera composer; b. at Ratten, Sussex, England, Nov. 21, 1851; did not study music seriously until he became of age. In 1875 he went to Paris and studied two years, then returned to England and entered the Royal Academy, remaining there three years and twice gaining the annual prize for composition. His first opera, *The Light of the Harem*, performed by students, led to his receiving a commission from Carl Rosa, for whose company he composed his opera *Esmeralda*, produced Mar. 26, 1883, and a second opera, *Nadeschda*, was performed by the same company Apr. 16, 1885. He composed also *The Sun Worshippers*, a cantata for the Norwich festival of 1881, an orchestral *Suite de Ballet*, several smaller orchestral pieces, some church music, and many songs. D. in London, Mar. 21, 1892. D. E. HERVEY.

**Thomas**, CHARLES LOUIS AMBROISE: musician; b. at Metz, then in France, Aug. 5, 1811; entered the Paris Conservatory in 1828; took many prizes, including the Prix de Rome in 1832; has been a prolific composer of cantatas and operas, and considerable chamber music, piano pieces, and songs; also a *Requiem Mass* and other sacred music; was appointed Professor of Composition in the Conservatory in 1852, and succeeded Auber as director July 6, 1871; elected member of the French Institute in 1851; made a grand officer of the Legion of Honor, Jan., 1881. His principal operatic works are *Le Caïd* (1849); *Le Songe d'une Nuit d'Été* (1850); *Raymond* (1851); *Psyche* (1857); *Mignon* (1866); *Hamlet* (1868); and *Françoise de Rimini* (1882). D. Feb. 12, 1896.

**Thomas**, CYRUS, Ph. D.: ethnologist and entomologist; b. at Kingsport, Tenn., July 27, 1825; removed to Jackson co., Ill., in 1849, and in 1851 was elected county clerk, being at the same time admitted to the bar. After practicing law at Murphysboro for several years he entered the ministry of the Evangelical Lutheran Church in 1864. From 1869 to 1874 he was naturalist on the U. S. Geological Survey under Prof. F. V. Hayden, and from 1874 to 1877 Professor of Natural Sciences in the Southern Illinois Normal University, becoming also State entomologist of Illinois in 1875. He was a member of the U. S. entomological commission to investigate the destruction caused by grasshoppers in the West 1877–82, and then became ethnologist in the U. S. Bureau of Ethnology, in charge of mound explorations. He has studied the Maya hieroglyphs as written in the codices and on the Central American inscriptions, and claims to have discovered the signification and phonetic rendering of a sufficient number of characters to form a key by which to determine the others. His most important works are *Acrididæ of North America* (Washington, 1873); *The Noxious and Beneficial Insects of Illinois* (5 vols., 1876–80); *Study of the Manuscript Troano* (2 vols., 1878–80); *Notes on Certain Maya and Mexican Manuscripts* (1884); *Aids to the Study of the Maya Codices*; *Cherokees in pre-Columbian Times*; *The Shawnees in pre-Columbian Times*; *Catalogue of Prehistoric Works East of the Rocky Mountains*; *Mound Exploration of the Bureau of Ethnology*; and bulletins relating to the mounds.

**Thomas**, Edith Matilda: poet; b. at Chatham, O., Aug. 12, 1854. She was educated at the Normal School at Geneva, O.; removed to New York in 1888. Her poems deal mainly with aspects of nature, and are very subtle in feeling and delicate in expression. Her published volumes include *A New Year's Masque* (1885); *The Round Year* (1886); *Lyrics and Sonnets* (1887); *Babes of the Year* (1888); and *The Inverted Torch* (1890). H. A. B.

**Thomas**, George Henry: soldier; b. in Southampton co., Va., July 31, 1816; graduated at the U. S. Military Academy in 1840; served in Florida against the Seminoles and in the Mexican war; was instructor at the Military Academy 1851–54, and in 1855 was appointed major of the Second Cavalry, with which he served continuously for the next five years. On the outbreak of the civil war Thomas, notwithstanding his sympathies and associations with the South, at once gave his adherence to the Union. Promoted to be brigadier-general of volunteers in Aug., 1861, and transferred to the department of the Cumberland, he was for a time engaged in mustering and organizing the First Brigade; was given command of the First Division (Army of the Ohio) in Nov., 1861, and fought in the battle of Mill Springs (Jan. 19–20, 1862), which was the most important victory yet gained in the West and brought Thomas into general notice. He was promoted major-general of volunteers Apr. 2, 1862, and rendered valuable service in the West and South. In the battle of Murfreesboro (*q. v.*) he commanded the center, and at Chickamauga (*q. v.*), Sept. 19–20, 1863, he commanded the left wing where the great struggle took place for the repossession of Chattanooga, out of which the enemy had been manœuvered. The record of Thomas's wonderful resistance for upward of five hours against the concentrated efforts of the enemy after the Federal right was routed forms one of the most remarkable events in the history of the war. He was given command of the Army of the Cumberland, and on Oct. 27 he was commissioned brigadier-general in the regular army. On Sept. 27, 1864, Thomas was detached from the main army in Georgia, and placed in chief command in Tennessee, with large discretionary powers, as it was a matter of doubt what were the real intentions of the Confederate general Hood, who was moving northward in the hope of causing Sherman's withdrawal from Georgia. After a period of intense anxiety in Washington over what seemed an unnecessary delay, Thomas checked Hood's advance at Nashville, pursued him beyond the Tennessee, and destroyed his army. (See Nashville, Battle of.) The appointment of major-general in the regular army was (Dec. 15, 1864) bestowed upon him, and Congress tendered him a vote of thanks. During the remaining months of the war he contributed materially to the overthrow of the Confederacy by organizing raiding expeditions (resulting in the capture of Jefferson Davis in May, 1865) and by timely aid to other departments. He commanded the military division of the Tennessee (1865–66); the department of the Tennessee (1866–67); the third military district (Georgia, Florida, and Alabama), and the department of the Cumberland (1867–69). From May 15, 1869, he commanded the military division of the Pacific, with headquarters at San Francisco, where his death occurred Mar. 28, 1870.

**Thomas**, George Housman: illustrator and engraver; b. in London, England, Dec. 7, 1824; served an apprenticeship to a wood-engraver; practiced that art in Paris, giving his chief attention to the illustration of books, in which he gained such popularity that his services were engaged to go to the U. S. to illustrate a newspaper; resided at New York 1846–47; furnished designs for a number of bank-notes; returned to England on account of ill health; became one of the principal draughtsmen for *The Illustrated London News.* His best pictures were *The Queen giving the Medals to the Crimean Heroes* and *The Queen and Prince Albert at Aldershott.* His illustrations to Thomson's *Seasons* (1858) and to *Uncle Tom's Cabin* were much admired. D. at Boulogne, France, July 21, 1868.

**Thomas**, Isaiah, LL. D.: printer and editor; b. in Boston, Mass., Jan. 19, 1749; lost his father in childhood; was apprenticed when six years of age to a printer, with whom he remained eleven years; began business at Newburyport 1767; removed to Boston; aided his former employer in establishing in 1770 *The Massachusetts Spy*; became its sole editor and was connected with it until 1801; became obnoxious to the British authorities on account of the support given by his paper to the movements preparatory to the Revolution; transferred his printing-office to Worcester 1774; published a long series of reprints of popular English works, displaying good judgment in their selection, also Bibles and hymn-books; engaged in book-publishing and in printing *The Farmer's Museum*, at Walpole, N. H.; established an additional bookstore and publishing-house in Boston in 1788, under the firm name of Thomas & Andrews; issued *The Massachusetts Magazine* (8 vols., 1789–96); conducted for twenty-six years (1775–1801) the celebrated *New England Almanac*; was author of a carefully prepared *History of Printing in America* (2 vols., Worcester, 1810). He was founder and first president (1812) of the American Antiquarian Society; endowed it, erected a building for its use, and gave it a valuable library. D. at Worcester, Apr. 4, 1831. See the *Memoir* by his grandson, Benjamin F. Thomas (Boston, 1874).

**Thomas**, Jesse Burgess, D. D.: clergyman; b. at Edwardsville, Ill., July 29, 1832, graduated from Kenyon College, Gambier, O., in 1850; began a course of theological study at Rochester Theological Seminary in 1852, but relinquished it in consequence of ill health; studied law, and was admitted to the Illinois bar 1855, and engaged in mercantile pursuits in Chicago for some years. In 1862 he entered the ministry in the Baptist Church as pastor of a church in Waukegan, Ill.; in 1864 was called to the Pierrepont Street Baptist church, Brooklyn, N. Y.; accepted a call to San Francisco in 1867; returned to Chicago as pastor of Michigan Avenue Baptist church in 1871; was pastor of the consolidated First and Pierrepont Street Baptist churches, Brooklyn, N. Y., 1874–77; became professor in Newton Theological Institution, Mass., 1887. Published *The Old Bible and the New Science* (New York, 1877) and *Significance of the Historic Element in Scripture* (Philadelphia, 1883). Revised by W. H. Whitsitt.

**Thomas**, John, M. D.: physician and soldier; b. at Marshfield, Mass., in 1725; became an eminent physician in his native town and at Kingston; was surgeon to a regiment sent to Annapolis, N. S., 1746, and on the medical staff of Gov. Shirley's regiment 1747, but exchanged that post for the rank of lieutenant; attained the grade of colonel 1759; commanded a regiment under Amherst at Crown Point 1760, and took part in the capture of Montreal the same year; enrolled himself at an early date among the Sons of Liberty; was a delegate in 1774–75 to the Massachusetts provincial congress, by which he was appointed brigadier-general Feb. 9, 1775; received the same rank from the Continental Congress June 22, and was promoted to be major-general Mar. 6, 1776; was in charge of the fortification of Dorchester Heights Mar. 4, 1776, which led to the speedy evacuation of Boston by the British; succeeded at Montgomery's death to the command of the remains of the army then besieging Quebec, where he arrived May 1, found the smallpox prevalent in camp, the forces reduced to less than 1,000 effective men, and was consequently forced to raise the siege and retreat, but was attacked by the epidemic near the river Sorel, and died at Chambly, June 2, 1776.

**Thomas**, John: architect and sculptor; b. at Chalford, England, in 1813; served an apprenticeship to a stonecutter; taught himself to paint sign-boards and engrave door-plates in order to earn a few shillings out of working hours; engaged in business with his brother; was an architect at Birmingham, and later at Leamington; executed a great number of commissions for architectural and decorative sculpture, and ultimately undertook with great success the execution of works of sculpture of the highest class, among which were *Musidora, Boadicea, Lady Godiva, Una and the Lion*, and several portrait-statues, including a colossal memorial of Shakspeare, and a famous majolica fountain exhibited at the International Exhibition of 1862. He was also the architect of the seats of several noblemen. D. at Maida Hill, London, Apr. 9, 1862.

**Thomas**, John J., A. M.: agriculturist; b. near Aurora, Cayuga co., N. Y., Jan. 8, 1810; became, like his father, a distinguished writer on agriculture and pomology; was assistant editor of *The Genesee Farmer* 1834–39, horticultural editor of *The Albany Cultivator* 1841–53, assistant editor of the same and of *The Country Gentleman* for many years from 1853; contributed to the *Transactions* of the New York State Agricultural Society 1841–47 and to *The Farm* (New York, 1858); conducted *The Illustrated Annual Register of Rural Affairs* (Albany, 1857–65), and was author of *The Fruit Culturist* (1846), which in later editions, under the name of *The American Fruit Culturist*, is one of the chief American pomological works; and *Farm Implements, and the Principles of their Construction and Use* (New York, 1859). D. Feb. 22, 1895. Revised by L. H. Bailey.

**Thomas**, Joseph, M. D., LL. D.: lexicographer; brother of John J. Thomas; b. in Cayuga co., N. Y., Sept. 23, 1811; educated at the Rensselaer Polytechnic Institute, Troy, N. Y., at Yale College, and in medicine at Philadelphia; resided in India 1857–58, engaged in the study of Oriental languages; spent some months in Egypt with a similar object; and became Professor of Latin and Greek at Haverford College, Pennsylvania. He was coeditor with Thomas Baldwin of a *Pronouncing Gazetteer* (Philadelphia, 1845), which in a revised edition was entitled *A Complete Pronouncing Gazetteer and Geographical Dictionary of the World* (1855; revised 1861, 1866, 1880); and of *A New and Complete Gazetteer of the United States* (1854); published *A First Book of Etymology* (1851–52); a volume of *Travels in Egypt and Palestine* (1853); *A Comprehensive Medical Dictionary* (1864); and *Universal Pronouncing Dictionary of Biography and Mythology* (1870–71); contributed geographical and biographical pronouncing vocabularies to Webster's dictionaries, and published an edition of Oswald's *Etymological Dictionary.* D. in Philadelphia, Pa., Dec. 24, 1891.

**Thomas**, Lorenzo: soldier; b. at Newcastle, Del., Oct. 26, 1804; graduated at the U. S. Military Academy in 1823; served in the Fourth Infantry in Florida until 1831, and again in the Florida war of 1836–37; on quartermaster duty at Washington 1837–38. Upon the organization of the adjutant-general's department he was commissioned major and assistant adjutant-general, and served as chief of staff of the army in Florida 1839–40; at Washington, D. C., 1840–46; served in the war with Mexico as chief of staff to Maj.-Gen. William O. Butler, both while in command of a division of volunteers and after his succession to the command of the army. In 1852 he became lieutenant-colonel, and served as chief of staff to Lieut.-Gen. Scott from Mar., 1853, to Mar. 7, 1861, when he was promoted to be colonel, and placed in charge of the adjutant-general's office at Washington; became brigadier-general and adjutant-general of the army Aug. 3, 1861, but from 1863 was employed on special duty in organizing colored troops, inspection tours, etc., until Feb., 1869, when he was retired from active service. At the time of President Johnson's controversy with Congress he appointed Gen. Thomas (Feb. 21, 1868) Secretary of War *ad interim*, but Secretary Stanton refused to vacate. D. in Washington, D. C., Mar. 2, 1875.

**Thomas**, Mary F. (*Myers*), M. D.: philanthropist; b. in Maryland, Oct. 28, 1816; daughter of Samuel Myers, a Quaker associated with Benjamin Lundy in the first anti-slavery meeting held in Washington, D. C.; married Owen Thomas in 1839; studied medicine, and graduated from Penn Medical College in Philadelphia, Pa., in 1854; was assistant physician in hospitals during the civil war; city physician and physician for the Home for Friendless Women in Richmond, Ind.; admitted to membership in the Indiana State Medical Society in 1876; was an earnest advocate of temperance for more than fifty years; in 1851 helped to organize the first woman's rights society in Indiana, and held responsible offices in connection with the movement, State and national. D. in Richmond, Aug. 19, 1888. Susan B. Anthony.

**Thomas**, M. Carey: See the Appendix.

**Thomas**, Philip Francis: lawyer; b. at Easton, Talbot co., Md., Sept. 12, 1810; educated at Dickinson College; admitted to the bar 1831; elected to the State constitutional convention 1836; a member of the Legislature 1838 and 1843–45; member of Congress 1839–41; subsequently judge of the land-office court of the Eastern Shore of Maryland; Governor of Maryland 1848–51; comptroller of State treasury 1851–53; U. S. commissioner of patents 1860; Secretary of the Treasury from Dec., 1860, to Jan. 11, 1861; was elected U. S. Senator Mar., 1867, but not admitted to a seat, on the ground of disloyalty; was elected a Representative in Congress 1874, 1876, and 1878, and in 1880 declined a renomination. D. in Baltimore, Oct. 2, 1890.

**Thomas**, Theodore: orchestral conductor; b. at Esens, Hanover, Germany, Oct. 11, 1835; received his first musical instruction from his father, a violinist, and made a successful public appearance at the age of six; removed with his parents to New York in 1845, and played the violin in concerts and orchestras; in 1851 made a concert tour as solo violinist. In 1855 he started a series of chamber-music concerts with William Mason, George Matzka, Joseph Mosenthal, Ferd. Bergner, and Carl Bergmann, which continued till 1869. In 1864 he began his first series of symphony concerts with an orchestra which he conducted until 1888, giving nightly summer concerts in New York and making tours through the U. S. during the winter months. From 1878 to 1881 he was director of the Cincinnati College of Music. In the season of 1877–78 he was conductor of the New York Philharmonic Society, and in 1879 he was elected to this position for the second time, and held it continuously till 1890, when he went to Chicago. He has conducted the Cincinnati biennial festivals since their start in 1873. He was conductor of the Brooklyn Philharmonic Society in 1862, 1866 to 1870, and 1873 to 1890, when the society disbanded on his removal to Chicago. He was also conductor of the Mendelssohn Union, the New York Chorus Society (four years), and the great New York festival in the Seventh Regiment armory in 1882. He was conductor of the American Opera Company in 1885–87. In 1892 he was appointed musical director of the World's Columbian Exposition in Chicago. D. E. Hervey.

**Thomas**, Theodore Gaillard, A. M., M. D., LL. D.: gynæcologist; b. on Edisto island, S. C., Nov. 21, 1832; graduated M. D. at the Medical College of South Carolina in 1852, and removed to New York city during the same year; served at Bellevue Hospital; elected Professor of Obstetrics and Diseases of Women in the College of Physicians and Surgeons, New York, 1862; visiting physician to Roosevelt and Bellevue Hospitals; surgeon to the Woman's Hospital in the State of New York; president of the medical board of the Nursery and Child's Hospital; president of the American Gynæcological Society 1879; honorary fellow of the Obstetrical Society of London; corresponding fellow of the Obstetrical Society of Berlin, etc.; has contributed largely to current medical literature. His chief work is *Diseases of Women* (Philadelphia, 1868), which has been translated into several languages. Revised by S. T. Armstrong.

**Thomas à Kempis**: See Kempis, Thomas à.

**Thomas Aquinas**: See Aquinas, St. Thomas.

**Thomas, Christians of St.**: See Christians of St. Thomas.

**Thoma'sius**, Christian: jurist and theologian; son of Jacob Thomasius, a distinguished teacher and author; b. at Leipzig, Jan. 1, 1655. After studying at Frankfort-on-the-Oder and traveling in Holland, he became Professor of Law at Leipzig in 1681. Among the innovations of which he was author was the introduction of the German instead of the Latin language as a medium of university instruction, and the editing of a literary review which criticised with caustic wit and scholastic methods the proposition of the so-called territorial as a substitute for the heretofore current episcopal scheme of Church government. The foe of all that was purely speculative, his efforts in the sphere of the practical extended so far as to depreciate classical learning. In the Pietistic controversy he sided with Spener and his school in the criticism of the defects of dead orthodoxy, but unlike them, while believing in revealed religion, he offered no definite faith as a substitute for the errors he exposed.

Regarding "superstition more dangerous than unbelief or atheism," Tholuck pronounces him "the personified spirit of illuminism." As a jurist, his efforts against prosecutions for witchcraft and the use of torture in obtaining evidence are worthy of enduring memory. Fleeing from Leipzig to escape arrest, he became one of the founders of the University of Halle and Professor of Law there in 1694. D. at Halle, Sept. 23, 1728. See the *Biography*, by H. Luden (1805); article by Tholuck in Herzog's *Real-encyclopädie*; and Hagenbach's *Kirchengeschichte*, v., 455–467.

H. E. JACOBS.

**Thomasius**, GOTTFRIED, D. D.: theologian; descendant of Christian Thomasius; b. at Egenhausen, Bavaria, July 26, 1802; studied at Erlangen, Halle, and Berlin; pastor in several places in Bavaria, finally at Nuremberg 1829–42; Professor of Dogmatics at Erlangen from 1842 until his death Jan. 24, 1875. He was a representative of the confessional reaction of the nineteenth century in Lutheranism. His great work on dogmatics from the christological standpoint, *Christi Person u. Werk*, 3 vols. (1st ed. 1852–61; 2d 1856–63; 3d 1886), is a philosophical treatment of the Lutheran system, influenced to some extent by the school of Schleiermacher, and departs from the stricter Lutheran position, mainly on the doctrine of the *Kenosis*, which he ascribes to the divine nature. His *Dogmengeschichte* (2 vols., 1874, 1876; 2d ed. 1890) is also a work of importance, especially valuable for its treatment of the development of doctrine in the Lutheran Church. His strictly confessional but irenic character is indicated by his words: "The name 'Lutheran,' in my opinion, should not be used as though it referred to something alongside of or beyond what is catholic and evangelical; but we are rather convinced that in what is properly Lutheran we possess what is truly catholic, and what forms the true mean between the confessional extremes."

HENRY E. JACOBS.

**Thomas of London**: same as THOMAS A' BECKET. See BECKET, THOMAS A'.

**Thomas the Rhymer**: See RHYMER, THOMAS THE.

**Thomaston**: town; Litchfield co., Conn.; on the Naugatuck river and the N. Y., N. H. and Hart. Railroad; 8 miles S. E. of Litchfield, and 10 miles N. of Waterbury (for location, see map of Connecticut, ref. 9–F). It is principally engaged in the manufacture of clocks, cutlery, and brass goods, and contains the Laura Andrews Free Library, a national bank with capital of $50,000, a savings-bank, and a weekly newspaper. It was incorporated in 1875, and in 1894 had an assessed valuation of $1,500,000. Pop. (1880) 3,225; (1890) 3,278; (1900) 3,300.

**Thomaston**: town; capital of Upson co., Ga.; on the Cent. of Ga. and the Macon and Birmingham railways; 16 miles S. W. of Barnesville, and 75 miles S. of Atlanta (for location, see map of Georgia, ref. 4–G). It is in an agricultural region, is principally engaged in the manufacture of carriages, shoes, and furniture, is an important cotton and stock market, and contains five churches, the R. E. Lee Institute, a State bank (capital $25,000), and a weekly paper. Pop. (1890) 1,181; (1900) 1,714. EDITOR OF "TIMES."

**Thomaston**: town (incorporated in 1777); Knox co., Me.; on the St. George's river and the Maine Cent. Railroad; 4 miles W. of Rockland, the county-seat, and 12 miles N. of the Atlantic Ocean (for location, see map of Maine, ref. 9–D). It contains 6 churches, high school, 11 grammar, intermediate, and primary schools, library, the Maine State prison, 2 national banks with combined capital of $210,000, a savings-bank, and a weekly and 2 monthly periodicals. The town is connected with Rockland by electric railway, and is noted for its ship-building interests and lime manufactories. Pop. (1890) 3,009; (1900) 2,688. EDITOR OF "HERALD."

**Thomasville**: town; capital of Thomas co., Ga.; on the Sav., Fla. and West. Railway; 36 miles E. of Bainbridge, and 58 miles E. of Albany (for location, see map of Georgia, ref. 7–G). It is in a cotton and a wool growing region; is the seat of the South Georgia Agricultural and Mechanical College (a branch of the State University); and contains the Young Female College, a public library, 3 State banks with combined capital of $361,000, a national bank with capital of $100,000, a branch savings and trust company, large cigar-factories, and a daily and 2 weekly newspapers. Large quantities of fruit and melons are raised in the vicinity. Pop. (1880) 2,555; (1890) 5,514; (1900) 5,322.

EDITOR OF "TIMES-ENTERPRISE."

**Thomists**: See AQUINAS, ST. THOMAS.

**Thompson**: town (set off from Killingly and incorporated in 1785); Windham co., Conn.; on the N. Y. and New Eng. Railroad (for location, see map of Connecticut, ref. 6–L). It is watered by the French and Quinebaug rivers; contains the villages of Thompson, East Thompson, West Thompson, Grosvenor Dale, North Grosvenor Dale, Mechanicsville, Wilsonville, New Boston, and Quinebaug; and is principally engaged in agriculture and the manufacture of cotton and woolen goods. Pop. (1890) 5,580; (1900) 6,442.

**Thompson**, ALBERT: See the Appendix.

**Thompson**, ALFRED WORDSWORTH: See the Appendix.

**Thompson**, AUGUSTUS CHARLES, D. D.: clergyman and author; b. at Goshen, Conn., Apr. 30, 1812; educated at Yale College, but did not graduate; studied theology at East Windsor Seminary and at the University of Berlin; became pastor of the Eliot Congregational church, Roxbury, Mass., July, 1842; accompanied Rev. Rufus Anderson on his visit to the American missions in India 1854–55; author of *The Mercy Seat* (1863); *Moravian Missions* (1882); *Future Probation and Foreign Missions* (1886); and of many other writings.

**Thompson**, BENJAMIN: See RUMFORD, BENJAMIN THOMPSON, COUNT.

**Thompson**, DANIEL GREENLEAF: lawyer and writer; b. at Montpelier, Vt., Feb. 9, 1850; educated at Montpelier and at Amherst College; began the practice of law in New York in 1872. His principal works are *System of Psychology* (2 vols., London, 1884); *The Problem of Evil* (1886); *Social Progress* (1889); *Philosophy of Fiction in Literature* (1892). D. July 10, 1897. J. M. B.

**Thompson**, DANIEL PIERCE: author; b. at Charlestown, Mass., Oct. 1, 1793; removed to Berlin, Vt., in childhood; taught district schools 1815–16; graduated at Middlebury College 1820; was for some time a private tutor in Virginia, where he studied law and was admitted to the bar; settled at Montpelier, Vt., 1824; became register of probate; was clerk of the Legislature 1830–33; compiled the laws of Vermont 1824–34 (Montpelier, 1835); was county judge of probate 1837–40; clerk of the county 1843–45; afterward clerk of the Supreme Court and secretary of State 1853–55; author of several novels, chiefly illustrative of Vermont life and of Revolutionary history, among which were *The Green Mountain Boys* (Montpelier, 1840; republished in Boston and London); *Lucy Hosmer* (1848); *The Rangers* (1851); *Gaut Garley* (1857); and published a *History of Montpelier* (1860). D. at Montpelier, June 6, 1868.

**Thompson**, EDWARD MAUNDE: librarian and author; b. in Jamaica, May 4, 1840; was educated at Rugby School; appointed assistant in the British Museum in 1861; became keeper of the MSS. in 1878 and principal librarian and secretary in 1888. He has edited a number of mediæval Latin chronicles for the Camden and other societies; also *Diary of Richard Cocks in Japan* (for the Hakluyt Society, 1883); with Prof. R. C. Jebb, the facsimile of the Laurentian Sophocles (for the Hellenic Society, 1885); and has written a *Handbook of Greek and Latin Palæography* (International Scientific Series, 1893).

**Thompson**, ELIZABETH (by marriage *Lady Butler*): painter; b. at Lausanne, Switzerland, about 1850; acquired celebrity from her painting of *The Roll Call*, exhibited at the Royal Academy, London, 1874, highly admired by the Prince of Wales, and purchased by the Queen; visited Italy 1875; painted *The Twenty-eighth Regiment at Quatre Bras* and other military pictures, including *The Battle of Balaklava* (1876), *Inkerman* (1877), and *The Camel Corps* (1894). In 1877, she married Capt. (afterward Maj.-Gen.) Sir William Francis Butler. Revised by RUSSELL STURGIS.

**Thompson**, HENRY: author; b. in England in 1797; graduated at Cambridge, 1822; took orders in the Church of England; was for some years curate of Wrington, Somerset, and became in 1853 vicar of Chard, in the same county; author of a *Life of Hannah More* (1838); *A History of Roman Literature*; and a part of the *History of Greek Literature*, in the *Encyclopædia Metropolitana*, to which work he was a large contributor; also several religious works; translated Schiller's *Maid of Orleans and William Tell* (1845), and *Original Ballads by Living Authors* (1850); wrote for the *Lyra Messianica* and its companion volume; edited *The Complete Works of Horace, from the Text of Orellius* (1853), and *The Complete Works of Virgil, from the Text of Heyne and Wagner* (1854); contributed to a work on *Occult Sciences* (1855). D. at Chard, Dec., 1878.

Revised by H. A. BEERS.

**Thompson.** Sir HENRY, F. R. C. S.: surgeon; b. at Framlingham, Suffolk, England, Aug. 6, 1820; studied medicine at University College Hospital, London, graduating M. B. in 1851; was appointed assistant surgeon there in 1853, surgeon in 1863, Professor of Clinical Surgery in 1866, and consulting surgeon in 1874. In 1852 he gained the Jacksonian prize of the Royal College of Surgeons for his essay on *The Pathology and Treatment of Stricture of the Urethra*, and again in 1860 for his essay on *The Healthy and Morbid Anatomy of the Prostate Gland*. He was appointed surgeon extraordinary to King Leopold I. of Belgium in 1863, and to Leopold II. in 1866; made an officer of the Order of Leopold in 1864, and promoted commander in 1876. For the success of an operation on King Leopold I. he was knighted in 1867. He is a member of numerous British and foreign medical societies, and an enthusiastic advocate of cremation, and the popularity of that method of disposal of the dead in Great Britain is largely due to his efforts. He is an artist of no mean ability, and his paintings have been exhibited at the Royal Academy and the Paris Salon. Among his published works are *Practical Lithotomy and Lithotrity* (1863); *Clinical Lectures on Diseases of the Urinary Organs* (1868); *Modern Cremation* (1890); and the novels *Charley Kingston's Aunt* and *All But*, which appeared under the pseudonym of *Pen Oliver*. S. T. ARMSTRONG.

**Thompson,** HENRY DENMAN: actor; b. at Girard, Pa., Oct. 15, 1833; removed in 1847 with his parents to Swanzey, N. H., where he lived for a number of years. It was here that he studied the characters which many years after he introduced in his plays of *Joshua Whitcomb* and *The Old Homestead*. He made his first appearance on the professional stage at Lowell, Mass., in 1863 in *The French Spy*. He played on the variety stage and as an Irish comedian. He first introduced *Joshua Whitcomb* in 1875, which was worked up from a variety sketch. His greatest success was in *The Old Homestead*, which ran continuously for four years until 1891, and had many long runs.

**Thompson,** HUGH MILLER: See the Appendix.

**Thompson,** JACOB: member of Congress and cabinet officer; b. in Caswell co., N. C., May 15, 1810; graduated at the University of North Carolina 1831; was admitted to the bar in 1834; settled in the Chickasaw country, Mississippi, in 1835; was a Democratic member of Congress 1839–51; chairman of the committee on Indian affairs; opposed the Compromises of 1850; Secretary of the Interior under President Buchanan from Mar., 1857, to Jan. 7, 1861, when he resigned in consequence of the order to re-enforce Fort Sumter being given without the knowledge of the Cabinet; Governor of Mississippi 1862–64, and subsequently aide to Gen. Beauregard and inspector-general for the department of Mississippi. D. at Memphis, Tenn., Mar. 24, 1885.

**Thompson,** Sir JOHN SPARROW DAVID: statesman; b. at Halifax, Nova Scotia, Nov. 10, 1844; educated at the Free Church Academy there; admitted to the bar in 1865. He was a member of the House of Assembly of Nova Scotia 1877–82; Attorney-General of the province 1878–82; Premier and Attorney-General of the same from May 25, 1882, until July 25, 1882, when appointed a judge of the Supreme Court of Nova Scotia; resigned Sept. 25, 1885 to become Minister of Justice and Attorney-General of Canada, and was elected to the Parliament of Canada in 1885, 1887, and 1891. He was appointed Premier of Canada in Nov., 1892, upon the resignation of Sir John C. Abbott. He was a member of the senate of the University of Halifax; counsel on behalf of the U. S. Government at the fishery commission held under the Washington treaty which met at Halifax in 1877; assisted the British representatives on the fishery commission at Washington in 1887, and was knighted for his services in 1888. Sir John was one of the British representatives in the Bering Sea arbitration proceedings between the Governments of Great Britain and the U. S. which met at Paris in 1893, and became a member of the Queen's Privy Council in 1894. D. at Windsor, England, Dec. 12, 1894. NEIL MACDONALD.

**Thompson,** JOSEPH PARRISH, D. D., LL. D.: clergyman and author; b. in Philadelphia, Pa., Aug. 7, 1819; graduated at Yale College 1838; studied theology at Andover and at New Haven; became pastor of the Chapel Street Congregational church, New Haven, Nov., 1840; was minister of the Broadway Tabernacle, New York, 1845–71; was one of the founders of *The New Englander*, a quarterly theological organ of the Congregational denomination, and of the New York *Independent*; was a manager of the American Congregational Union and of the Home Missionary Society; originated in 1852 the plan of the Albany Congregationalist convention; visited Egypt, Palestine, and other Oriental countries 1852–53; afterward devoted much research to Oriental subjects, especially Egyptology. In 1872 he became a resident of Berlin, Germany, and was an active member of its literary and scientific societies, frequently delivering addresses and contributing papers to their publications. These were published under the title *American Comments on European Questions* (New York, 1884). Among many other works were *Lectures to Young Men* (1846); *Egypt, Past and Present* (1856); *Memoir of Rev. David T. Stoddard* (1858); *Christianity and Emancipation* (1863); *Man in Genesis and Geology* (1869); *Theology of Christ from his own Words* (1870); *Church and State in the United States* (1874); *Life of Christ* (1875); *The Workman: his False Friends and his True Friends* (1879). D. in Berlin, Sept. 20, 1879. Revised by GEORGE P. FISHER.

**Thompson,** LAUNT: sculptor; b. at Abbeyleix, Queen's County, Ireland, Feb. 8, 1833; removed to Albany, N. Y., 1847; began the study of medicine; afterward was pupil and assistant of Erastus D. Palmer, the sculptor, nine years; developed a remarkable talent for medallion portraits; settled in New York 1858, and became an Academician in 1862; member and vice-president of the National Academy of Design in 1874. Among his works are busts of Edwin Booth as Hamlet, Bryant, and Gen. Dix; a colossal statue of Napoleon; an equestrian statue of Gen. Burnside, in Providence, R. I.; and the statues of Winfield Scott, at the Soldiers' Home, Washington, D. C., and of Abraham Pierson at Yale College. The honorary degree of M. A. was conferred upon him by Yale in 1874. D. at Middletown, N. Y., Sept. 26, 1894.

**Thompson,** MAURICE: author; b. at Fairfield, Ind., Sept. 9, 1844. His childhood was passed partly in Kentucky and Georgia, and he served in the Confederate army during the civil war. He subsequently returned to Indiana and engaged alternately in civil engineering and in the practice of law at Crawfordsville. In 1885–89 he was State geologist of Indiana. Among his published writings are *Hoosier Mosaics* (1875); *The Witchery of Archery* (1878); *A Tallahassee Girl* (1882); *His Second Campaign* (1882); *Songs of Fair Weather* (1883); *At Love's Extremes* (1885); *By-ways and Bird Notes* (1885); *Sylvan Secrets* (1887); *The Story of Louisiana* (1888); *A Fortnight of Folly* (1888); *Ethics of Literary Art* (1893); and *Alice of Old Vincennes* (1901). D. Feb. 15, 1901.

**Thompson,** MORTIMER: humorist; b. at Riga, N. Y., Sept. 2, 1832; studied for a time at University of Michigan, but left before graduating; was for some time connected with a traveling theatrical company; became about 1852 a clerk in New York; wrote some humorous letters for the Detroit *Advertiser* which procured him employment on the New York press, and subsequently became a popular lecturer, and published several humorous volumes which had a wide circulation under the pen-name of *Q. K. Philander Doesticks, P. B.* Among his books were *Doesticks—What he Says* (1855); *Plu-ri-bus-tah*, a travesty of Longfellow's *Hiawatha* (1856); *History and Records of the Elephant Club* (1857); and *Nothing to Say* (1857). D. in New York, June 25, 1875. Revised by H. A. BEERS.

**Thompson,** RICHARD WIGGINTON: jurist and Congressman; b. in Culpeper co., Va., June 9, 1809; received a classical education; was a clerk in a store in Louisville, Ky.; afterward a school-teacher in Lawrence co., Ind., but studied law at the same time, and was admitted to the bar in 1834 and began to practice at Bedford, Ind. In the same year he was elected to the State Legislature of Indiana, and reelected in 1835. In 1836 he became a State Senator; in 1841 was chosen to Congress, and again in 1844 and 1847. He declined various appointments, including that of minister to Austria, but took active part in politics; was a delegate to the Republican conventions of 1860, 1864, 1868, and 1876; in 1867–69 was judge of the eighteenth circuit of Indiana; was Secretary of the Navy 1877–81, and then became chairman of the American committee of the Panama Canal Company; author of *The Papacy and the Civil Power* (New York, 1876); *History of the Tariff* (Chicago, 1888); *Footprints of the Jesuits* (1894); and *Personal Recollections of Sixteen Presidents* (1894).

**Thompson,** ROBERT ANCHOR; clergyman and author; b. at Durham, England, in 1821; educated at Durham School and as an engineer student of Durham University; graduated at Cambridge, 1844; was for some years connected with the astronomical observatory at Durham, and published a volume of his observations in 1849; took orders in the Church of England; became curate of Louth and (1854) of Binbrook, Lincolnshire, and in 1858 was chosen master of the hospital of St. Mary the Virgin at Newcastle-upon-Tyne; author of a volume of *Sermons* (London, 1853); of *Christian Theism, the Testimony of Reason and Revelation to the Existence and Character of the Supreme Being* (London, 2 vols., 1855; n. e. 1863), which gained the first Burnett premium (£1,800) among 208 competitors; *An Essay on the Principles of Natural Theology* (1857); *Christ the Light of the World* (1859); *The Oxford Declaration* (1864); and *Thomas Becket* (1889).

Revised by S. M. Jackson.

**Thompson**, Robert Ellis, S. T. D.: professor and editor; b. near Lurgan, Ireland, Apr. 5, 1844; educated in the University of Pennsylvania and the Reformed Presbyterian Seminary, Philadelphia, Pa.; ordained by the Reformed Church in 1873; entered the Presbyterian Church with his presbytery in 1882; instructor in the University of Pennsylvania 1868–70; professor 1870–92; and since 1894 president of the Central High School of Philadelphia. Dr. Thompson was editor of *The American Presbyterian* 1866–70; of *The Penn Monthly* 1870–80; of *The American* 1880–91; and since 1891 has been assistant editor of *The Sunday-school Times.* He was lecturer on protective tariffs in Harvard 1884–85; in Yale 1886–88; Stone lecturer in Princeton 1891. His publications are *Social Science and National Economy* (Philadelphia, 1874); third edition under the title *Elements of Political Economy* (Philadelphia, 1882); *Hard Times and what to Learn from them* (Philadelphia, 1877); *Protection to Home Industry*, Harvard lectures (New York, 1886); *Relief of Local and State Taxation through Distribution of National Surplus* (Philadelphia, 1883); *De Civitate Dei: the Divine Order of Human Society* (Philadelphia, 1891); and he has edited *Duffield's Latin Hymn-writers and their Hymns* (New York, 1890); *The American Supplement to the Encyclopædia Britannica* (vol. i., Philadelphia, 1883; vol. ii., 1884); *Life of George H. Stuart, written by Himself* (Philadelphia, 1889); *The National Hymn-book of the American Church* (Philadelphia, 1892); *A History of the Presbyterian Churches in the United States* (New York, 1895); and *A First Book in Political Economy for the Use of Schools and High Schools* (Boston, 1895). C. K. Hoyt.

**Thompson**, Silvanus Phillips: physicist and electrical engineer; b. at York, England, June 19, 1851; educated at the Royal School of Mines; in 1878 received the degree of D. Sc.; in 1879 became Professor of Experimental Physics in University College, Bristol, whence he was subsequently called to take charge of the department of electrical engineering in the Finsbury Technical College, London. He is the author of numerous memoirs; also of a volume entitled *Elementary Lessons in Electricity and Magnetism* (1881); of a voluminous treatise on *Dynamo-electric Machinery* (1885; 4th ed. 1890); and of special treatises on the arc-lamp, the electro-magnet, etc. E. L. Nichols.

**Thompson**, Smith, LL. D.: jurist; b. at Stanford, N. Y., Jan. 17, 1768; graduated at Princeton College 1788, and was admitted to the bar 1792, having been a student under Chancellor Kent at Poughkeepsie; practiced first in Troy, later in Poughkeepsie, and then in New York city. He was elected to the Legislature in 1800; was associate justice of the Supreme Court 1802–14; chief justice 1814–18; Secretary of the Navy under Monroe; justice of the Supreme Court of the U. S. (1823) till his death at Poughkeepsie, N. Y., Dec. 18, 1843. He left no permanent writings outside of his written decisions. F. Sturges Allen.

**Thompson**, Thomas Perronet: political reformer; b. at Hull, England, Mar. 15, 1783; graduated at Cambridge in 1802; entered the navy as a midshipman in 1803, and the army as second lieutenant in 1806; governor of Sierra Leone in 1808, but was so active in his hostility to the slave-trade that he was recalled in 1810. He accompanied Sir William Keir Grant as Arabic interpreter in his expedition up the Persian Gulf 1819, and assisted in negotiating a treaty with the Arab tribes by which the slave-trade was declared piracy. He was one of the founders of *The Westminster Review* (1824), and the author of pamphlets and articles on a great variety of subjects. His *Catechism of the Corn Laws* (1827) was one of the ablest of the attacks on the protective system. In the field of mathematics he published a *Theory of Parallels* (1844) and *Geometry without Axioms*; and in musical acoustics his *Theory of Just Intonation* (1850) was a valuable contribution. He became member of Parliament for Hull in 1835, and afterward sat for Bradford. D. Oct. 6, 1869.

**Thompson**, William Hepworth, D. D.: master of Trinity College, Cambridge; b. at York, England, Mar. 27, 1810; educated at Trinity College, Cambridge, where he became a scholar 1830, fellow 1834, assistant tutor 1837, and tutor 1844; elected Regius Professor of Greek in Cambridge University 1853; in the same year became a canon of Ely; on the death of Dr. Whewell in 1866 was chosen master of Trinity College; edited William Archer Butler's *Lectures on Ancient Philosophy*, also two of Plato's *Dialogues*, with criticisms; was author of papers read before learned societies and of published addresses and sermons. D. at Cambridge, Oct. 1, 1886.

**Thompson**, Zadock: naturalist; b. at Bridgewater, Vt., May 23, 1796; graduated at the University of Vermont in 1823; was tutor there 1825; published a *Gazetteer of Vermont* (Montpelier, 1824), an *Arithmetic* (1825), and a *History of the State of Vermont* (Burlington, 1833); edited the *Iris* (1828) and *The Green Mountain Repository* (1832); removed to Hatley, Canada East, 1833; was engaged as a teacher there and at Sherbrooke; published a *Geography of Canada*; studied theology, and took deacons' orders in the Protestant Episcopal Church 1835; returned to Burlington, Vt., 1837; became a professor in the Vermont Episcopal Institute; published his chief work, *The History of Vermont, Natural, Civil, and Statistical* (1841–43; appendix 1853); issued a *Guide to Lake George, Lake Champlain, Montreal, and Quebec* (1845) and *The Geography and Geology of Vermont* (1848); State geologist 1845–48; Professor of Chemistry and Natural History in the University of Vermont 1851–53; visited England as Vermont commissioner to the exhibition held in London in 1851, and published a *Journal* of his trip (1851); appointed State surveyor 1853. D. at Burlington, Jan. 19, 1856. He had issued an *Almanac* as early as 1819, made for thirty-four years the astronomical calculations for *Walton's Register*, and for some years those for *The Vermont Register*. A brief biography was published by Isaac F. Redfield (1856).

**Thompsonville**: village: Hartford co., Conn.; on the Connecticut river, and the N. Y., N. H. and Hartford Railroad; 18 miles N. of Hartford (for location, see map of Connecticut, ref. 7–H). It contains 5 churches, several schools on the consolidated system, a high school with library, a private bank, a trust company, and 2 weekly newspapers, and is known for its manufacture of carpets. Pop. (1880) 3,794; (1890) 4,673; not returned separately in 1900.

**Thoms**, William John, F. S. A.: antiquary and bibliographer; b. at Westminster, England, Nov. 16, 1803; was for some years a clerk in the office of the secretary of Chelsea Hospital; was long a clerk to the House of Lords; from 1863 to 1882 was deputy librarian to the House of Lords; was for many years one of the most active members of the Society of Antiquaries; was secretary of the Camden Society 1838–73; and was the founder of *Notes and Queries*, and its editor until 1872. Among his publications are *A Collection of Early Prose Romances* (London, 3 vols., 1828; enlarged ed. 1858); *Anecdotes and Traditions illustrative of Early English History and Literature, from MS. Sources* (1838–39); a translation of Worsaae's *Primeval Antiquities of Denmark* (1849); *Choice Notes from Notes and Queries* (2 vols., 1859); and *Human Longevity* (1873). D. in London, Aug. 15, 1885.

**Thomsen**, Christen Jürgensen: archæologist; b. in Copenhagen, Denmark, Dec. 29, 1788. In 1816 he became director of the newly established Museum of Northern Antiquities in Copenhagen, which he arranged in a masterly manner, and with which he was connected until his death, May 21, 1865. In his *Ledetraad til nordisk Oldkyndighed* (Guide to Northern Antiquities, 1836) he indicated the triple division of the prehistoric age, and prepared the way for the modern scientific study of the subject. D. K. D.

**Thomson**, Andrew, D. D.: clergyman and author; b. at Sanquhar, Dumfriesshire, Scotland, July 11, 1779; studied theology at the University of Edinburgh, and was appointed minister of Spronston, Roxburghshire, in 1802, of the East church of Perth in 1808, of the New Gray Friars' church, Edinburgh, in 1810, and of St. George's church, Edinburgh, in 1814. D. in Edinburgh, Feb. 9, 1831. He was a man of great energy and considerable eloquence, and is remembered for his attack upon the British and Foreign Bible Society for circulating the Apocrypha. He published numerous volumes of sermons. A posthumous volume of these contains his memoirs (Edinburgh, 1831; Boston, 1832).

**Thomson**, Anthony Todd, M. D., F. L. S.: physician and author; b. in Edinburgh, Scotland, Jan. 7, 1778: son of the British postmaster-general of Georgia; graduated in medicine at Edinburgh University 1799; became a physician in London in 1800; was a voluminous writer in periodicals on medical and literary subjects; edited *The Medical Repository*; became Professor of Materia Medica in London University, and of Medical Jurisprudence 1832, holding both posts until his death at Ealing, near London, July 3, 1849. Among his works were *The London Dispensatory* (1811) and *Elements of Materia Medica and Therapeutics* (2 vols., 1832–33). He edited Dr. Thomas Bateman's *Practical Synopsis of Cutaneous Diseases* (7th ed. 1829), to which he added an illustrative *Atlas of Delineations* (1829); Eusèbe Salverte's *Philosophy of Magic, Prodigies, and Apparent Miracles* (2 vols., 1846; New York, 1847); and James Thomson's *Seasons* (1847). Revised by S. T. Armstrong.

**Thomson**, César: See the Appendix.

**Thomson**, Charles, LL. D.: patriot; b. at Maghera, Derry, Ireland, Nov. 29, 1729; landed in 1741 at Newcastle, Del., with three brothers, his father having died on the voyage; educated in an academy at Thunder Hill, Md.; became a teacher in the Friends' Academy at Newcastle; removed to Philadelphia, where he became an efficient teacher; was concerned in negotiations with the Iroquois Indians and Delawares, who named him "Truthteller"; was secretary of the first Continental Congress; filled the same post to the successive Congresses until 1789; was chosen to inform Washington at Mt. Vernon of his election to the presidency; resided during his later years at Lower Merion, Montgomery co., Pa., where he died Aug. 16, 1824. He was the author of *An Inquiry into the Causes of the Alienation of the Delaware and Shawanese Indians* (London, 1759); of a valuable translation of the whole Bible, the Old Testament portion being from the Septuagint (4 vols., Philadelphia, 1808); and of *A Synopsis of the Four Evangelists, in their own Words* (Philadelphia, 1815).

**Thomson**, Sir Charles Wyville: b. at Bonsyde, Scotland, Mar. 5, 1830; educated at Merchiston Castle School and University of Edinburgh. Appointed lecturer on natural history in the University of Aberdeen in 1850, Professor of Natural History in Queen's College, Cork, in 1853, and in 1854 to the chair of Mineralogy and Geology in Queen's College, Belfast, where he also had charge of the Natural History Museum. In 1860 the charge of instruction in botany and zoölogy was given to him, and in the same year he received the degree of LL. D. Here he remained until 1870, when he was appointed to the chair of Natural History in the University of Edinburgh, a position which he held until, on account of ill health, he resigned in 1879. D. in Edinburgh, Mar. 10, 1882. His early work was in the line of botany, but that for which he will longest be remembered is the exploration of the deep seas. After conducting several smaller dredging expeditions (those of the Lightning, 1868, and Porcupine, 1869, being most prominent) and demonstrating that life existed at the greatest depths yet reached by the dredge, he was appointed to the scientific charge of the well-known expedition of the Challenger, which sailed on its voyage of circumnavigation Dec. 21, 1872, returning to England May 24, 1876. (See Challenger Expedition.) After his return he reassumed the duties of his chair and at the same time labored on the collections of the voyage, publishing in 1877 two volumes of preliminary results relating to the Atlantic and in 1880 the general introduction to the zoölogical series of reports of the voyage. Among his numerous other publications may be mentioned his *Depths of the Sea* (1873).

J. S. Kingsley.

**Thomson**, Edward, D. D., LL. D.: bishop; b. at Portsea, near Portsmouth, England, Oct. 12, 1810. His parents removed to the U. S. in 1819, and settled at Wooster, O. He received a good classical education; graduated in medicine at the University of Pennsylvania 1829; began practice as a physician at Wooster, but, experiencing a change in his religious views, became in 1833 a minister of the Methodist Episcopal Church; preached at Detroit, Mich., 1836; was principal of the Methodist Seminary at Norwalk, O., 1837–44; editor of *The Ladies' Repository* at Cincinnati 1844–46; first president of the Ohio Wesleyan University at Delaware, O., 1846–60; editor of *The Christian Advocate* from 1860 to 1864, when he was chosen a bishop. He was author of *Educational Essays* (1856); *Moral and Religious Essays* (1856); *Biographical Sketches* (1856); *Letters from Europe* (1856); and *Letters from India, China, and Turkey* (2 vols., 1870). D. at Wheeling, W. Va., Mar. 22, 1870.

**Thomson**, Elihu: See the Appendix.

**Thomson**, James: poet; b. at Ednam, Roxburghshire, Scotland, Sept. 11, 1700; studied for six years at the University of Edinburgh, with the design of entering the Church, but, abandoning this intention, went to London in 1724, where he was for several months tutor in a nobleman's family. In 1726 appeared his poem *Winter*, which speedily became popular; *Summer* followed in 1727, *Spring* in 1728, and *Autumn* in 1730, completing *The Seasons*. In the interval he had published a *Poem Sacred to the Memory of Sir Isaac Newton* (1727), and written *Sophonisba*, a tragedy, acted in 1729. He then traveled for two years as tutor to the son of Lord Chancellor Talbot, by whom he was rewarded with the post of secretary of briefs, and wrote a poem on *Liberty* (5 parts, 1735–36), which met with a very unfavorable reception, and was subsequently considerably abridged. The Lord Chancellor dying in 1737, the secretaryship was lost by Thomson, but he received from the Prince of Wales a pension of £100, and some years later was rendered independent by the appointment of surveyor-general of the Leeward islands, which, after paying the deputy who performed all the duties, brought him £300 a year. His works, besides those already mentioned, are *Agamemnon*, a tragedy (1738); *Edward and Eleanora*, a drama (1739); *Alfred*, a masque, which contains the song *Rule Britannia* (1740); *Tancred and Sigismunda*, a successful tragedy (1745); *The Castle of Indolence* (1748), a poem in the Spenserian stanza, upon which he had labored many years, and which is his best work, though far less popular than *The Seasons*; and *Coriolanus*, a tragedy, not produced until after his death. D. at Kew Lane, near Richmond, Aug. 27, 1748.

Revised by H. A. Beers.

**Thomson**, James: engineer and physicist; brother of Lord Kelvin (see Thomson, Sir William); b. in Belfast, Ireland, Feb. 16, 1822. The brothers, James and William, received their early education from their father, Dr. James Thomson the mathematician, who was one of the most remarkable teachers of his time. In 1832 the family removed to Glasgow, where the father had been appointed professor of mathematics, and Thomson continued his studies in the university classes. At the age of seventeen, he took the degree of M. A. in the University of Glasgow, with honors in mathematics and natural philosophy. He then decided to become an engineer, but serious ill health, which lasted for many years, prevented him from carrying out his plans in full. He continued to interest himself in engineering problems, however, and perfected a number of inventions in the domain of hydraulics and pneumatics. Thomson's mind was essentially philosophical and mathematical, and it turned continually even in the midst of his technical activity to questions of pure science. In 1849 he read before the Royal Society of Edinburgh a paper of the highest importance, entitled *Theoretical Considerations on the Effect of Pressure in Lowering the Freezing-point of Water*. His conclusions, subsequently verified experimentally by his brother, William Thomson, afforded the solution to the great problem of the movements of glacier ice, and threw much light upon plasticity, regelation, and various other phenomena. The discussion of these matters, which had attracted the attention of Forbes, Faraday, Tyndall, and others, lasted for many years. It resulted in the recognition of the correctness of the principles laid down by James Thomson. Among his contributions to pure and applied science may be mentioned papers *On the Continuity of the Liquid and Gaseous States of Matter*; *On the Flow of Waters in Rivers and Open Channels*; and *On the Grand Currents of Atmospheric Circulation* (Bakerian lecture for 1892). In 1853 Thomson was appointed Professor of Civil Engineering and Surveying in Queen's College, Belfast, a chair which he held for twenty years. He then became the successor of Rankine as Professor of Engineering in the University of Glasgow, in which institution his brother William occupied the chair of Physics. In 1889 he was forced by partial blindness to resign his professorship, but his activity and interest in science continued to the end of his life. D. in Glasgow, May 8, 1892.

E. L. Nichols.

**Thomson**, JAMES (*B. V.*) poet; b. in Port Glasgow, Scotland, Nov. 24, 1834; brought up in the Caledonian Orphan Asylum; entered the British army as regimental schoolmaster, where he made the acquaintance of Charles Bradlaugh, then a private soldier, who in 1860 established *The National Reformer*, to which Thomson became a contributor. While stationed in Ireland he became engaged to a young girl whose sudden death cast a gloom over his life. Discharged from the army, Thomson devoted himself to literature, writing chiefly for English radical periodicals and journals. He was for a time connected with *Cope's Tobacco Plant.* His first work was published in *Tait's Edinburgh Magazine* under the pseudonym *Crepusculus.* In 1863 he published in *The National Reformer* the powerful verses *To our Ladies of Death*, and in 1874 his chief and best-known work, *The City of Dreadful Night*, republished with other poems in book-form in 1880. In 1872 he went to the U. S. as agent of the shareholders in what he ascertained to be a fraudulent silver mine; in the following year he received a commission from *The New York World* to go to Spain as its special correspondent with the Carlists. About this time he adopted the pseudonym *Bysshe Vanolis*—afterward shortened to the initials "B. V."—Bysshe being the commonly used Christian name of Shelley, Thomson's favorite writer, and Vanolis an anagram of Novalis, the pseudonym of F. von Hardenberg. He was a prolific writer. In later years the fits of depression and insomnia to which Thomson was subject led him to seek refuge from his misery in opiates and alcohol. D. in University College Hospital, London, June 3, 1882. *A Voice from the Nile*, with memoir by Bertram Dobell, was published in 1884; *Shelley* in 1885. See *Life*, by Salt (1889). A. GROWOLL.

**Thomson**, JOHN: clergyman and painter; brother of Thomas Thomson, antiquary; b. at Dailly, Ayrshire, Scotland, Sept. 1, 1778; studied theology in Edinburgh; became minister of Dailly, succeeding his father, in 1800, and of Duddingston, near Edinburgh, in 1805. He had begun the pursuit of art before entering the Church, and at Duddingston applied himself assiduously to study, becoming one of the great landscape-painters of Scotland, and in 1830 being elected a member of the Royal Scottish Academy. He also contributed papers on optics to the early issues of *The Edinburgh Review.* D. at Duddingston, Oct. 27, 1840.

**Thomson**, JOSEPH JOHN: physicist; b. in Manchester, England, Dec. 18, 1856; educated at Owens College, Manchester, and at Trinity College, Cambridge. Since 1884 he has been Professor of Experimental Physics in Cambridge University. In addition to many scientific papers, Thomson is the author of volumes on *Vortex Motion* (1883) and on the *Application of Dynamics and Physics to Chemistry* (1888); also of an important treatise entitled *Notes on Recent Researches in Electricity and Magnetism*; the last-named work was written as a sequel to Maxwell's *Treatise on Electricity and Magnetism*, which Thomson edited with copious notes and comments in 1893. E. L. NICHOLS.

**Thomson**, KATHARINE (*Byerly*): biographer; b. at Etruria, Staffordshire, England, in 1800; married Dr. ANTHONY T. THOMSON (*q. v.*); wrote several novels and many works of biography and anecdotical literature. The later volumes appeared under the pseudonyms of *Grace* and *Philip Wharton*, her son John Cockburn Thomson having aided her. D. at Dover, Dec. 17, 1862. Among her works were *Memoirs of Sir Walter Raleigh* (1830); *Memoirs of the Jacobites of 1715 and 1745* (3 vols., 1845–46); *Recollections of Literary Characters and Celebrated Places* (2 vols., 1854); and *Wits and Beaux of Society* (2 vols., 1860).
Revised by H. A. BEERS.

**Thomson**, THOMAS: antiquary; b. at Dailly, Ayrshire, Scotland, in 1768; educated at the University of Glasgow; became an advocate 1793, deputy clerk registrar of Scotland 1806; principal clerk of session 1828, and president of the Bannatyne Club 1832; was one of the founders of *The Edinburgh Review*, and occasionally acted as its editor; was esteemed the most learned antiquary in Scotland, and as such is frequently referred to in the writings of Sir Walter Scott. He edited for the Bannatyne Club some of the works of Sir Thomas Hope, John Lesley, Sir George Mackenzie, Sir James Melville, Lady Griselda Murray, Sir James Turner, and other old Scottish writers, and superintended for the Maitland Club and the record commission other reprints of the same character. D. at Shrubhill, between Edinburgh and Leith, Oct. 2, 1852. *A Memoir* (1855) was prepared for the Bannatyne Club by Cosmo Innes.

**Thomson**, THOMAS, M. D.: chemist; b. at Crieff, Perthshire, Scotland, Apr. 12, 1773; educated at Stirling and at the University of St. Andrews; succeeded his brother, James Thomson (1768–1855), as editor of the third edition of the *Encyclopædia Britannica*, Nov., 1796–1800; graduated in medicine in Edinburgh 1799; was for some years after 1802 the scientific editor of James Mill's *Literary Journal*; was the first to introduce the use of symbols in chemistry in articles for the *Supplement* to the *Encyclopædia*, written 1798–99, and serving also as the basis of his *System of Chemistry* (4 vols., 1802); first announced to the world Dr. Dalton's atomic theory, which had been privately communicated to him in 1804, in the third edition of the same work (5 vols., 1807); was for many years a lecturer on chemistry, and conducted a laboratory for students; edited in London the *Annals of Philosophy* (1813–22); became in 1818 Professor of Chemistry in the University of Edinburgh. D. at Kilmun, Argyleshire, July 2, 1852. Among his works were *The Elements of Chemistry* (1810): *The History of the Royal Society of London* (1812); *Travels in Sweden and Lapland* (1813); *An Attempt to establish the First Principles of Chemistry by Experiment* (2 vols., 1825); *An Outline of the Sciences of Heat and Electricity* (1830); *The History of Chemistry* (2 vols., 1830); *Outlines of Mineralogy, Geology, and Mineral Analysis* (2 vols., 1836); and a recast of his earlier work on chemistry in three separate treatises—*The Chemistry of Inorganic Bodies* (2 vols., 1831); *Chemistry of Organic Bodies, Vegetables* (1838); and *The Chemistry of Animal Bodies* (1842).—His son THOMAS, b. in Glasgow, Dec. 4, 1817, was an assistant surgeon in the Bengal army, superintendent of the East India Company's botanic gardens in Calcutta, and author of *Western Himalaya and Thibet, the Narrative of a Journey through the Mountains of Northern India* (1852). D. in London, Apr. 18, 1878. Revised by IRA REMSEN.

**Thomson**, WILLIAM, D. D., F. R. S.: archbishop; b. at Whitehaven, Cumberland, England, Feb. 11, 1819; educated at Shrewsbury School; was successively scholar, fellow, tutor, and provost of Queen's College, Oxford, where he graduated 1840; was ordained deacon 1842 and priest 1843; was incumbent of the parishes of Guildford and Cuddesden; was appointed select preacher at Oxford 1848, and again 1856; preached the Bampton lectures on *The Atoning Work of Christ, viewed in Relation to some Current Theories* (1853); became rector of All Souls', Marylebone, London, 1855; contributed to the *Oxford Essays* (1855) and to *Sermons at Westminster Abbey for the Working Classes* (1858); was preacher of Lincoln's Inn 1858–61; was appointed chaplain to the Queen 1859, Bishop of Gloucester and Bristol Dec., 1861, and enthroned Archbishop of York Feb. 24, 1863; took an active part as a member of convocation in promoting ecclesiastical reform and church extension; labored for educational reform in Oxford University; was a member of the Royal, Geographical, and Photographic societies; president of the Palestine Exploration Fund; examiner in logic and mental science to the Society of Arts, and in divinity at Oxford; one of the lords of the privy council, governor of the Charter-house and of King's College, London. D. at York, Dec. 25, 1890. As an author he is best known by his *An Outline of the Necessary Laws of Thought* (1842; 9th ed. 1868), a text-book in several British and American universities. Revised by S. M. JACKSON.

**Thomson**, Sir WILLIAM (Lord Kelvin): physicist, mathematician, engineer, and inventor; b. in Belfast, Ireland, June, 1824; educated at the Universities of Glasgow and Cambridge. At the age of twenty-two years he was appointed Professor of Natural Philosophy in the University of Glasgow, and still (1895) holds the chair. During the half century of his career as a teacher of physics he has published a very large number of papers touching nearly every important theme with which the physicist has to deal. His earlier papers upon the theories of electricity and magnetism were gathered together in 1872 in an important volume entitled *Reprints of Papers on Electrostatics and Magnetism.* More complete collections have since been made (1882–90) under the titles *Mathematical and Physical Papers* (3 vols.) and *Popular Lectures and Addresses* (3 vols.). Two long and important articles published in the ninth edition of the *Encyclopædia Britannica* have also been reprinted under the titles *On Heat* and *On Elasticity.* In 1867 Thomson, in collaboration with Prof. Tait, of Edinburgh, issued the first volume of *A Treatise on Natural Philosophy* (2d ed. in two parts, 1879). This treatise, in which the effort was made to base a complete and exhaustive theoretical analysis upon the doctrine of energy, was never carried beyond the division of mechanics, but it contains much upon that subject that is of the highest scientific value. From 1846 to 1853 Thomson was editor of the *Cambridge and Dublin Mathematical Journal*; for many years also he has been the chief of the board of editors which conducts *The Philosophical Magazine*. He was president of the British Association for the Advancement of Science (1871), of the Royal Society of London (1891). and of other societies. In 1872 he was made a fellow of St. Peter's College, Cambridge. Aside from his labors in pure science, Thomson has been active as an engineer and inventor. It was in great part due to his skill in solving the many intricate problems involved in submarine telegraphy that transoceanic signaling became a practical success; and it was in recognition of that fact that he was knighted in 1866. Of his numerous inventions, many of which were made to meet the demands of the manufacture and operation of submarine cables, the best known are his quadrant and portable electrometers, compensated compasses for iron ships, various types of mirror galvanometer, the siphon recorder, a machine for the analysis of tidal curves, and a large number of commercial instruments for the measurement of electrical currents and potential differences. His services as savant and engineer received high official recognition by his elevation to the peerage in 1892 with the title of Lord Kelvin. Jan., 1897, elected honorary member of the Russian Academy of Science. E. L. NICHOLS.

**Thomson**, WILLIAM MCCLURE, D. D.: missionary and author; b. at Springfield (now Spring Dale), O., Dec. 31, 1806; graduated at Miami University 1826; spent one year in Princeton Seminary; was missionary in Jerusalem 1832–33; in Beyrout 1833–76; and in 1877 returned to the U. S. He published *The Land and the Book, Biblical Illustrations drawn from the Manners and Customs, the Scenes and the Sceneries of the Holy Land* (2 vols., New York, 1859; London, 1860; new ed. 3 vols., 1880, 1882, 1885). D. in Denver, Col., Apr. 8, 1894. Revised by S. M. JACKSON.

**Thor** [from Icel. *þōrr*, for **þonrr*: O. Eng. *þunor*, Thor, thunder]: in Scandinavian mythology, the son of Odin and Jord. He ranked next to Odin, but was far more popular, as is evidenced by the many myths and names by which he is known. He was the protector of Midgard and of human industries against nature's destructive forces personified by the giants, with whom he was in constant conflict. Thunder and lightning were caused by his riding in the clouds in his car drawn by two goats. His weapon of protection was his hammer Mjolner. He had steel gloves and a belt, Megingjarder, which doubled his strength. His home was Thrudvang and his hall was called Bilskirner. His wife was Sif. Just as the Christians put a cross on gravestones, so the Scandinavian heathens put the sign of Thor's hammer (a cross) on their rune-stones. Thursday is named after Thor. See SCANDINAVIAN MYTHOLOGY. RASMUS B. ANDERSON.

**Thorac'ic Duct** [*thoracic* is deriv. of *thorax*, from Gr. *θώραξ*, breastplate, cuirass]: the principal lymphatic vessel in the human body. It runs upward on the left side of the spinal column from the receptaculum chyli, and terminates near the junction of the left internal jugular and the left subclavian veins. It discharges into the blood-current the chyle and most of the lymph of the body. It is often represented in the lower animals by a congeries of lymphatic vessels. Birds have two thoracic ducts, one on each side. Its outlet is provided with valves which prevent the ingress of blood, and the duct has other valves which allow the contents to pass upward, but not downward.

**Thoracos'traca** [Mod. Lat.; Gr. *θώραξ*, breastplate + *ὄστρακον*, shell]: a name sometimes employed for those Crustacea (*Decapoda*, *Stomapoda*, *Schizopoda*) in which the anterior part of the body (cephalothorax) is covered with a carapace, and the eyes (except in *Cumacea*) are on movable stalks. See MALACOSTRACA.

**Thorax**: See CHEST.

**Thoreau**, thō'rō, HENRY DAVID: author; b. at Concord, Mass., July 17, 1817; was the son of John Thoreau, of Concord, and Cynthia Dunbar, and the grandson of John Thoreau, of Boston. His grandfather was a prosperous merchant of Boston, who removed to Concord in 1800, and died there; his father was originally a merchant, but in middle life took up the business of pencil-making, at Concord, which he and his children carried on for half a century. Henry, his second son and third child, learned this art while fitting for college in his native town, and practiced it occasionally, with its allied art, the preparation of finely ground graphite, for electrotyping, until a year before his death. He graduated at Harvard College in 1837, and for five or six years taught school or was a private tutor in Concord and on Staten Island, N. Y. He was an inmate of Ralph Waldo Emerson's family from Apr., 1841, to May, 1843, and again from Sept., 1847, to Oct., 1848; and in the interval of these residences with Emerson was in his cabin by Walden Pond, from July, 1845, to Sept., 1847. After 1849 he lived with his parents and his sister Sophia at Concord until his death May 6, 1862. He had been in college a close student of Greek, reading most of the common authors, and also much of the earlier English literature, with which he became very familiar. He read much and easily in Latin and French, and formed his own style on classic and French models, taking great pains with everything he wrote. He kept a journal from 1837 to his last illness, and made up his essays and books mainly from its many volumes, which were interspersed with verse, as are his two early works, the *Week on the Concord and Merrimack Rivers* (edited at Walden in 1846–47 and published in 1849), and *Walden* (written partly while living by the pond, but edited later, and published in 1854). These were the only volumes he published; but many essays and a few poems were printed by him in magazines, which have since his death been collected and published in volumes. Four volumes have also been selected from his journals by his literary executor, Harrison Blake, and two more are in preparation. An imperfect collection of his letters and poems was edited by Emerson in 1865, and a fuller volume of letters by F. B. Sanborn (*Familiar Letters of Henry Thoreau*) in 1894. No complete collection of his poems has been made, but Henry S. Salt, his English biographer, is editing a fuller selection than has yet appeared; several of them, including translations from the Greek poets, are found in his *Miscellanies*, the last of a ten-volume edition of his works, published with a general index (1893–94). Although often stated, it is not true that Thoreau never voted or attended church, paid no taxes, and never used a gun. He lived simply, but seldom alone, always supported himself by the work of his hands or otherwise, was a good land-surveyor, naturalist, and mechanic, a good citizen, a valued friend, and devoted to the comfort of his family. He never married, partly from an early disappointment in love. but was intimate with admirable women and the children of his friends, and was beloved by them, as by most of those who really knew him. He was original and sometimes eccentric, but never misanthropic or morose. His intellectual and moral elevation is plainly seen in his writings, which have steadily gained in favor since his death. He is buried in Concord, near the graves of Emerson, Alcott, Hawthorne, and Wasson, his congenial friends. See his *Life* (1882), by Franklin B. Sanborn, in the American Men of Letters Series, and a biography, *The Poet Naturalist* (1873), by Ellery Channing. F. B. SANBORN.

**Thores'by**, RALPH, F. R. S.: antiquary; b. in Leeds, England, Aug. 16, 1658; educated at Leeds School; resided some years at Rotterdam, qualifying himself for the mercantile business, which he afterward successfully conducted, devoting, however, much of his time to antiquarian pursuits. D. in 1725. Author of *Ducatus Leodiensis, or the Topography of Leeds* (London, folio, 1715), of which a new edition was brought out by Dr. T. D. Whitaker (1816); *Museum Thoresbianum, or a Collection of Antiquities in the possession of Ralph Thoresby*, and *Vicaria Leodiensis, or the History of the Church of Leeds* (1724): all which are highly appreciated by topographers. He contributed to Gibson's edition of Camden's *Britannia*, Collins's *Peerage*, Calamy's *Memoirs of Divines*, and other works, and wrote much in the *Philosophical Transactions*. His *Diary* (2 vols., 1830) and *Correspondence* (2 vols., 1832) were edited by Rev. Joseph Hunter.

**Thoresen**, tor'e-sen, ANNA MAGDALENA (*Kragh*): novelist; b. at Fredericia, Denmark, June 3, 1819. The scenes of her novels and tales are laid almost exclusively in Norway, where she married in 1844 a country parson. The best of these are *Fortællinger* (Tales, 1863); *Signes Historie* (Signe's History, 1864; translated into English 1865); *Solen i Siljedalen* (The Sun in the Silje Dale, 1868); *Billeder fra Vestkysten af Norge* (Pictures from the West Coast of Norway, 1872); *Herluf Nordal, en Fortælling fra det forrige Aarhundrede* (Herluf Nordal, a Tale from the Last Century, 1879), and *Mindre Fortællinger* (Short Tales, 1891). She is also the author of several dramas. D. K. DODGE.

**Thorild**, tor'ild, THOMAS: critic; b. at Svarteborg, Sweden, 1759. After studying at Lund, he moved to Stockholm, where he remained, with the exception of a short time spent at Upsala and in England, until 1793, when he was exiled for giving expression to advanced political views. He was afterward appointed to a professorship in the Swedish University at Greifswald. He was one of the earliest of the revolutionary writers in Sweden, and his polemics with Kellgren and Leopold are of immense importance. Hanselli published his *Samlade Skrifter* (2 vols., Stockholm, 1873–74). D. at Greifswald in 1808. D. K. DODGE.

**Tho'rium**, also **Thori'num**: one of the rare metals, discovered by Berzelius in 1828 in a Norwegian mineral which he called thorite, from the Scandinavian god Thor. Thorite is a thorium silicate, with the composition $ThSiO_4.2H_2O$. Thorium is a gray metallic powder, which burns with great brilliancy to snow-white infusible thoria, $ThO_2$. Water does not act upon it, and nitric and sulphuric acids with difficulty, though hydrochloric acid attacks and dissolves it powerfully. This is the statement of Berzelius, but Chydenius states that it is easily soluble in nitric and difficultly in hydrochloric acid. Thorium occurs also in other minerals besides thorite, as orangite, as columbate in some pyrochlores, as phosphate in monazite, and according to Chydenius in euxenite, as columbate and tantalate. Its atomic weight is 232·6. Revised by IRA REMSEN.

**Thorn**, or **Thorn-bush**: See CRATÆGUS.

**Thorn**, torn: town of Prussia; province of West Prussia; on the Vistula, 31 miles by rail E. S. E. of Bromberg (see map of German Empire, ref. 3–I). It was made a fortress of the first rank in 1878 by Prussia; has manufactures of cloth, linen, soap, tobacco, and gingerbread, and carries on an active trade in grain and timber. Copernicus was born here, and a bronze statue of him stands in the market-place. Pop. (1890) 27,018. Revised by M. W. HARRINGTON.

**Thorn**, FRANK MANLY: lawyer and U. S. official; b. at North Collins, N. Y., Dec. 7, 1836; educated in common schools and at Fredonia Academy; studied law; clerk of the surrogate's court in Erie County 1857–60; practiced law and did journalistic work until 1871; member county board of supervisors during 1871–80; chief clerk in the bureau of internal revenue in Washington, D. C.; 1885; superintendent U. S. COAST AND GEODETIC SURVEY (*q. v.*) from July, 1885, to July 1, 1889.

**Thorn-apple**: See DATURA.

**Thornback** [i. e. back with prickles or thorns]: the name given in parts of Great Britain to the *Raia clavata*. This is a short-snouted ray, whose dorsal surface, especially about the snout and interorbital space, is covered with small spines, and along the middle of the back and tail with a row of large spines, resembling somewhat the thorns of a rosebush; the male has further still larger thorns on the sides of the head and pectoral fins, and the female has numerous spines, each arising from a large roundish base. It is very abundant along parts of the British coast, and is the most esteemed as a table-fish of any member of the genus. It comes into shallow water in spring and summer, and is then taken in the greatest numbers. Revised by E. A. BIRGE.

**Thornbury**, GEORGE WALTER: author; b. in London, England, in 1828; became contributor to periodicals at the age of seventeen; was connected with *The Athenæum* 1851; studied art and occasionally practiced painting, but devoted himself to literature and produced some twenty-five volumes. D. in London, June 11, 1876. Among his works are *Shakespeare's England, or Sketches of our Social History during the Reign of Elizabeth* (2 vols., 1856); *Songs of the Cavaliers and Roundheads* (1857); *Life in Spain* (2 vols., 1859); *Turkish Life and Character* (2 vols., 1860); *British Artists from Hogarth to Turner* (2 vols., 1860); *Life of J. M. W. Turner, R. A.* (2 vols., 1861); *Haunted London* (1865); *Two Centuries of Song* (1866); *Old and New London* (2 vols., 1873–74); and *Historical and Legendary Ballads and Songs* (1876). Revised by H. A. BEERS.

**Thornton**, Sir EDWARD, D. C. L., LL. D.: diplomatist; b. in London, July 17, 1817, son of Hon. Edward Thornton, British minister in Portugal; was educated at Cambridge; entered the diplomatic service in 1842 as *attaché* at Turin; successively held important places in the legations in Mexico and several South American states; was envoy to Brazil 1865–67; envoy to the U. S. 1867–81; a member of the joint high commission on the Alabama claims 1871; appointed privy councilor 1871; and arbitrator of the Mexican and U. S. claims commission 1873. He was appointed British ambassador to Russia 1881, and to Turkey in 1884; retired in 1887.

**Thornton**, MATTHEW: signer of the Declaration of Independence; b. in Ireland in 1714. His parents emigrated to New England, living at Wiscasset, Me., and removing thence to Worcester, Mass. He received a classical education and studied medicine; accompanied Pepperell's expedition against Louisburg as a surgeon 1745; became a physician at Londonderry, N. H., and a colonel of militia; was president of the convention which in 1775 assumed the government of New Hampshire; took his seat as a delegate to the Continental Congress Nov. 4, 1776; signed the Declaration of Independence, though he was not a member at the time of its adoption. In 1779 he removed to Exeter, and shortly thereafter relinquished his practice and settled on a farm at Merrimack. He was afterward chief justice of Hillsboro County, judge of the New Hampshire Supreme Court, and member of both branches of the Legislature and of the council (1785). D. at Newburyport, Mass., June 24, 1803.

**Thornton**, Sir WILLIAM: soldier; b. in England about 1775; entered the British army as ensign 1796; became major 1806; was appointed military secretary and aide-de-camp to the Governor-General of Canada Aug., 1807; returned to England 1811; took part in the Peninsular war and Wellington's campaign in Southern France 1813–14; was sent to the U. S. and commanded the light brigade and advance of Gen. Ross's expedition up the Chesapeake May, 1814; was severely wounded and made prisoner at Bladensburg; was exchanged for Commodore Barney; commanded the advance of the British army sent against New Orleans in October, and the detached corps which operated on the right bank of the Mississippi in the battle of New Orleans, Jan. 8, 1815, when he was again severely wounded. He reached the rank of lieutenant-general in 1838. D. near Hanwell, England, Apr. 6, 1840.

**Thornton**, WILLIAM THOMAS: publicist and miscellaneous author; b. at Burnham, Buckinghamshire, England, Feb. 14, 1813; son of Thomas Thornton, president of the Levant Company's establishment in Constantinople; educated in the Moravian settlement at Oekbrook, near Derby; was secretary to the British consul-general at Constantinople 1830–35; was a clerk in the India House, London, 1836–56, when he was placed in charge of the public works department of that office, and in 1858 became secretary for public works in the India Office, a post which he held till his death. He was the author of *Over-population and its Remedy* (1845); *A Plea for Peasant Proprietors* (1848; 2d ed. 1873); *Zohrab and other Poems* (1854); *Modern Manichæism, and other Poems* (1856); *Old-fashioned Ethics and Common-sense Metaphysics*; *On Labor, its Rightful Dues and Wrongful Claims, its Actual Present and Possible Future* (2d ed. 1869); and a verse translation of the *Odes of Horace* (1878). D. June 17, 1880. Revised by H. A. BEERS.

**Thorntown**: town; Boone co., Ind.; on the Rock river, and the Cleve., Cin., Chi. and St. L. Railway; 26 miles S. E. of Lafayette, 38 miles N. W. of Indianapolis (for location, see map of Indiana, ref. 6–D). It is in an agricultural region, and contains a high school, a State bank (capital $25,000), and a weekly paper. Pop. (1890) 1,530; (1900) 1,511.

**Thornwell**, JAMES HENLEY, D. D., LL. D.: clergyman and educator; b. in Marlborough district, S. C., Dec. 9, 1812; graduated at South Carolina College, Columbia, S. C., 1831; studied and taught till the summer of 1834, when he spent some weeks at Harvard College, Cambridge, Mass.; was settled over a Presbyterian church in Lancaster, S. C., June 12, 1835; took the professorship of Logic and Belles-lettres in South Carolina College in Jan., 1838; resigned to take the pastorate of the Presbyterian church in Columbia in 1840; in 1841 returned to the college as chaplain and Professor of Sacred Literature and the Evidences of Christianity; from July to Dec., 1851, was pastor of the Glebe Street church in Charleston; returned again to the college, to become its president, in Jan., 1852; in 1855 accepted the professorship of Didactic and Polemic Theology in the Theological Seminary at Columbia. D. at Charlotte, N. C., Aug. 1, 1862. He was a man of rare critical acumen, of great personal magnetism, and the acknowledged theologian of the Southern Presbyterian church. He published several sermons and addresses; his *Collected Writings* were edited by Rev. J. B. Adger and J. L. Girardeau (4 vols., Richmond, Va., 1871–73), and his *Life and Letters* by Rev. Benjamin M. Palmer (1875). Revised by S. M. JACKSON.

**Thornycroft**, JOHN ISAAC, F. R. S.: engineer and naval architect; b. in Rome, Italy, Feb. 1, 1843; studied practical engineering at an early age, and in 1863 designed the Ariel, which may be regarded as the forerunner of modern torpedo-boats; went through the engineering course at Glasgow University, and studied ship-building at Govan on the Clyde. He then became a builder of torpedo-boats at Chiswick, and has constructed a number of such boats for the British and other governments. Among his inventions may be mentioned the turbine propeller for use in shallow-draught vessels. Mr. Thornycroft is the vice-president of the Institute of Naval Architects of Great Britain.

**Thornycroft**, Walter Hamo, R. A.: sculptor; b. in London, Mar. 9, 1850; was educated at University College School, London; in 1869 began to study at the schools of the Royal Academy, and exhibited first in 1871. In 1880 he made a success with a statue of Artemis, now in Eaton Hall, near Chester. Among his more important works are *Teucer* (1881), in the South Kensington Museum; *The Sower* (1886); *The Mower* (1894); *Science* (1891); a bust of S. T. Coleridge, in Westminster Abbey (1885); an equestrian statue of Edward I (1885); and the national memorial to Gen. Gordon in Trafalgar Square.

**Thorold**: town of Welland County, Ontario, Canada; 7 miles S. of Lake Ontario, on the Welland Canal (see map of Ontario, ref. 5–E). It is a station on the railway from St. Catharines to Port Colborne. Pop. 2,275. M. W. H.

**Thorold**, Anthony Wilson, D. D.: bishop; b. at Hougham, Lincolnshire, England, June 13, 1825; educated at Queen's College, Oxford, and graduated in 1847; was rector of St. Giles-in-the-Fields, London, 1857–68, minister of Curzon chapel, Mayfair, 1868, vicar of St. Pancras 1869, and canon residentiary of York in 1874. He was appointed Bishop of Rochester in 1877, and Bishop of Winchester in 1891. His *Presence of Christ* went through over twenty editions. D. in Farnham Castle, Surrey, July 25, 1895.

**Thorough-bass**: in music, the mode or art of expressing chords by means of figures placed over or under a given bass. These figures indicate the harmony through all the other parts, and hence the name. Thorough-bass may be considered as the first department in the study of harmony. The term is sometimes taken in a larger sense, as equivalent to musical science. See Figured Bass and Harmony.

**Thoroughwort**: See Eupatorium.

**Thorpe**, Benjamin: Anglo-Saxon scholar and author; b. in England in 1782; devoted himself at an early age to the study of the Anglo-Saxon and Scandinavian languages and literatures; made a complete translation of the *Edda* (unpublished); received a pension from the British Government. D. at Chiswick, July 19, 1870. Among his numerous works were a translation of Rask's *Grammar of the Anglo-Saxon Tongue* (Copenhagen, 1830; new ed. 1865); Cædmon's *Metrical Paraphrase of Parts of the Holy Scriptures, in Anglo-Saxon, with an English Translation, Notes, and a Verbal Index* (1832); *The Anglo-Saxon Version of the Story of Apollonius of Tyre, upon which is founded the Play of Pericles, with a Translation and Glossary* (1834); *Analecta Anglo-Saxonica, a Selection in Prose and Verse from Anglo-Saxon Authors of Various Ages, with a Glossary* (Oxford, 1834; 3d ed. 1868); *Libri Psalmorum Versio Antiqua Latina, cum Paraphrasi Anglo-Saxonica, etc.* (1835); *Ancient Laws and Institutes of England, enacted under the Anglo-Saxon Kings from Ethelbert to Canut, with an English Translation of the Saxon* (London, folio, 1840); *The Holy Gospels in Anglo-Saxon, edited from the Original MS.* (Oxford, 1842; new ed. 1848; New York, 1846); *Codex Exoniensis, a Collection of Anglo-Saxon Poetry, etc., with English Translation and Notes* (1842); *The Homilies of the Anglo-Saxon Church, etc., with an English Version* (2 vols., 1843–46); *The History of England under the Anglo-Saxon Kings, translated from the German of Dr. J. M. Lappenberg, with Additions and Corrections by the Author and Translator* (2 vols., 1845; new ed. 1857); *Florentii Wigorniensis Chronicon* (2 vols., 1848–49); *Northern Mythology, etc., compiled from Original and other Sources* (3 vols., 1851; new ed. 1863); *Yule-Tide Stories, a Collection of Scandinavian Tales and Traditions* (1853); *Pauli's Life of Alfred the Great* (1854); *The Anglo-Saxon Poems of Beowulf, with a Literal Translation, Notes, and Glossary* (Oxford, 1855); *Lappenberg's History of England under the Norman Kings* (1857); *The Anglo-Saxon Chronicle, according to the several Original Authorities* (London, 2 vols., 1861); *Diplomatarium Anglicum Ævi Saxonici, a Collection of English Charters, etc.* (1865).

**Thorpe**, John: architect; b. in England about 1540; was the chief designer in what is known as the Elizabethan style of domestic architecture, having built Kirby House in Northamptonshire (1570); Burleigh, Holdenby, Audley End, and Ampthill; Longford Castle in Wiltshire, in the form of a triangle; Liveden Hall in Northamptonshire; Slaugham Place in Sussex; the Strand front of Somerset House (1607), and many other edifices. A valuable collection of his drawings exists in the Soane Museum, and offers the most complete example known of the methods of work of an architect and building surveyor of the sixteenth century. The particulars of his life and date of his death are unknown.

**Thorpe**, Rose (*Hartwick*): See the Appendix.

**Thorpe**, Thomas Bangs: journalist and artist; b. at Westfield, Mass., Mar. 1, 1815; educated at the Wesleyan University, Middletown, Conn.; studied art; resided in New Orleans, La., from 1836 to 1853; edited a Whig paper there several years; raised volunteers for the Mexican war; was the writer of the first newspaper correspondence narrating military events on the frontier; published *Our Army on the Rio Grande* (1846) and *Our Army at Monterey* (1847); was an active political speaker in the campaign of 1848; became known by the pseudonym of *Tom Owen, the Bee-hunter*, as the writer of a series of tales of Western life, including *Mysteries of the Backwoods* (1846); *The Hive of the Bee-hunter* (1854); and *Scenes in Arkansaw* (1858); and became in 1859 editor and proprietor of *The Spirit of the Times*; published *Lynde Weiss, an Autobiography* (1854); *A Voice to America* (1855), and other works; and wrote a series of biographical sketches of American artists. His best-known painting is *Niagara as it is*. He was city surveyor of New Orleans during the administration of Gen. Butler (1862–63), and later became connected with the U. S. custom-house in New York city, where he died Sept. 20, 1878.

Revised by H. A. Beers.

**Thorpe**, Thomas Edward, Ph. D., F. R. S.: chemist; b. at Harpurhey, near Manchester, England, Dec. 8, 1845; was educated at Owens College, Manchester, and the Universities of Heidelberg and Bonn; was appointed to the chair of Chemistry in Anderson's College, Glasgow, in 1870, and to similar positions in the Yorkshire College in Leeds (1874) and the Royal College of Science, South Kensington (1885). He has contributed a large number of papers on chemistry to the *Philosophical Transactions, The Journal of the Chemical Society*, the *Reports of the British Association, Nature*, and other scientific journals. He edited *Coal: its History and Uses*, and is the author of a *Dictionary of Applied Chemistry*, 3 vols.; *Inorganic Chemistry*, 2 vols.; *Qualitative Analysis*; *Quantitative Analysis*; *Chemical Problems*; and *Essays in Historical Chemistry*.

**Thorpe**, William: reformer; b. in England about 1350; received a good education; became a priest; preached the doctrines of Wiclif for twenty years from 1386; was imprisoned in Saltwood Castle, Kent, as a Lollard, 1407, and examined before Archbishop Arundel, then Lord Chancellor, July 3 of that year. He wrote an account of his *Examination*, which was widely circulated, and was condemned by an assembly of the clergy so late as 1530. The subsequent history of Thorpe is unknown. His *Examination*, which may be found in Foxe's *Book of Martyrs* and in Dr. Christopher Wordsworth's *Ecclesiastical Biographies*, is elegantly written, and is of great value as a picture of English society and manners in the time of Chaucer and Gower, and especially as a trustworthy summary of Lollard doctrines.

Revised by S. M. Jackson.

**Thorwaldsen**, tor'wa̋ald-sen, Albert (Bertel): sculptor; b. at sea, Nov. 19, 1770. His father, Gottschalk Thorwaldsen, a native of Iceland, then on his way to Copenhagen, was a wood-carver and poor. Bertel's schooling was short and unprofitable until he was sent to the free school of the Academy of Arts at Copenhagen. There, at the age of seventeen, a bas-relief of Cupid reposing gained the silver medal; at twenty a sketch of *Heliodorus driven from the Temple* gained the small gold medal; two years later he obtained the grand prize, which entitled him to receive the royal pension, available for five years, beginning in 1796. In Mar., 1797, he arrived in Rome. His model of *Jason*, which Canova praised, attracted the admiration of an English connoisseur, Thomas Hope, who gave the artist a commission to execute it in marble. This was the beginning of a great career. The *Adonis*, begun in 1808, was not finished until 1832. It is the only one of Thorwaldsen's statues which was entirely carved by his own hands. It is a triumphant answer to the charge brought against Thorwaldsen in his lifetime, that he could not work in marble. "Not work in marble!" he said. "Tie my hands behind my back, and I will hew out a statue with my teeth!" The bas-relief, *The Triumphal Entry of Alexander into Babylon*, celebrated Napoleon's entry into Rome in 1812. The familiar bas-reliefs *Night* and *Morning* were modeled in 1815. The *Venus Victrix* (1813–16) and the *Mercury* (1818) are, with the *Adonis* just mentioned, his most perfect works. In 1819 Thorwaldsen returned to Copenhagen, and was received with great demonstrations. The well-known groups of *Christ and the Twelve Apostles* and *John the Baptist preaching* were completed in 1838 for the Church of Notre Dame at Copenhagen. Another visit in that year to Copenhagen, where he meant to live for the rest of his life, was cut short by the uncongenial climate. In 1841 he went back to Italy, stayed a year, then returned to Copenhagen, intending to remain for a short time only, but died suddenly of heart disease Mar. 24, 1844. The chief part of his fortune was left as a perpetual endowment for the museum at Copenhagen, which is raised around his grave, and contains only his works. (See COPENHAGEN.) The best and most accessible works on Thorwaldsen are J. M. Thiele, *Thorwaldsens Biographie* (4 vols., Copenhagen, 1851–56; Am. ed., translated by Prof. Paul C. Sinding, New York, 1869); *Thorwaldsen, sa Vie et son Œuvre*, by Eugène Plon, with two etchings and thirty-five wood-cuts (Paris, 1867; Am. ed. Boston, 1874, with the wood-cuts of the Paris ed.). Thorwaldsen's works are very numerous—205 as mentioned by Thiele—and of them, his colossal lion carved out of solid rock near Lucerne, Switzerland, commemorating the Swiss guards who fell while defending the Tuileries in 1792, and his bas-reliefs of *Night* and *Morning*, executed at a single sitting, are the best known. He may be considered as the chief of those modern sculptors who have tried to follow a purely classical tradition.

**Thoth** [Egypt. *Tehuti*, the measurer]: an Egyptian lunar deity, god of wisdom, whom the Greeks identified with Hermes. He was the god of HERMOPOLIS MAGNA (*q. v.*), the son of Ptah and Mut (other parents are also assigned), and husband of Māt, goddess of truth (also of Nephthys). He is represented as an ibis-headed man, and occasionally he is shown surmounted with a crescent moon and the sun-disk. He was regarded as the adviser and scribe of the gods, as the inventor of writing and of numbers, and as the measurer of time. He was believed to have been the author of the most sacred books, prayers, and laws (Diodorus, i., 94, 75), and the *Book of the Dead* is ascribed to him. Hence he was the tutelary deity of scribes, and because of his knowledge of magic, one of the chief reliances of physicians, he was also their special god. He was regarded as the guardian, companion, and advocate of the dead, whom he accompanied to the "Hall of Double Justice," where he superintended the weighing of the heart of the deceased against the symbol of truth, and noted the result. To him the ibis and the cynocephalus ape were sacred, as were also the first month of the year and the sixth hour of the day. Few temples were reared to him, but in the eighteenth dynasty he was apparently held in special honor, as is shown by the fact that his name appears in that of Thothmes, "son of Thoth." See also HERMES TRISMEGISTUS. CHARLES R. GILLETT.

**Thothmes, Tahutmes, Tutmes** [*Tahuti-mes*, son of Thoth]: the name of four kings (the fourth, fifth, sixth, and eighth) of the eighteenth Egyptian dynasty. During the reign of the first king Egypt regained most of the ground, as regards both art and national power, which had been lost through the Hyksos invasion and domination. With the expulsion of these "shepherd kings" Egypt entered upon an era of foreign conquest which reached its furthest limits under Thothmes III. The booty which was brought back from various expeditions served to enrich both rulers and soldiers, and its evidences are seen in numerous buildings and temples in all parts of Egypt, but particularly at Thebes, the national capital. It was a period of renaissance and prosperity, and in matters of foreign trade and intercourse it marks an epoch in Egyptian history.

Following in the footsteps of Ahmes (the Amosis of Manetho), THOTHMES I. made conquest of Ethiopia and established rule there after the pattern of Egypt. At the head of this government was a "prince of Cush" who was also frequently the heir-apparent to the Egyptian throne. To the eastward he pushed as far as the Euphrates, where he set up two stelæ as the boundaries of his dominions. At home he was active in building, especially at Thebes, but most of his edifices have been obscured by the remodeling of his successors or destroyed by time. His reign covered only nine years, and he left as his successors his son Thothmes II., his daughter HATASU (*q. v.*), and also Thothmes III., a son by a concubine. After death he received divine honors.—THOTHMES II. reigned only a brief time, as coregent with Hatasu; and we know only of unimportant expeditions against the nomads of the deserts that bordered Egypt on the E., and Nubia on both sides. He contributed to the architectural splendors of Thebes, but his name was erased from his monuments by his sister, who survived him.—THOTHMES III. was perhaps the greatest warrior produced by Egypt. After twenty-one years of joint reign with Hatasu, he became sole king, and he at once entered upon his warlike career. His efforts were directed toward the entire subjugation of Western Asia, and during the first twenty years of his sole reign there are records of fourteen campaigns to the East. He subdued Palestine, Syria, and a portion of Mesopotamia, together with the region between the Euphrates and the Mediterranean. He took Megiddo, Tyre, Kadesh on the Orontes, Carchemish, and a large number of other places, whose names he inscribed on the walls of the temple of Karnak. It is supposed that his dominion extended to the border of Asia Minor, and from Cyprus also he received tribute. At home he built on an extensive scale in various parts of Egypt from the Delta to the second cataract of the Nile. Thebes naturally received most of his attention, and there he labored principally in extending the temple of Karnak, which he adorned with inscriptions that give a very complete record of his reign. Evidence of an intense hatred of his early coregent, Hatasu, is seen in the fact that he industriously erased her name wherever it was possible. He was succeeded by Amenhotep II., whom he had previously associated with himself in the government. His reign covered about fifty-three years in all, of which for about thirty-one he was sole king. Dr. Mahler, of Vienna, using astronomical data, has calculated that his reign extended from Mar. 20, 1503, till Feb. 14, 1449 B. C. —THOTHMES IV. was the son of Amenhotep II., mentioned above. His reign covered only seven years, during which he claimed to have waged war in Ethiopia, Syria, and Phœnicia. But the pompous style of the narratives of these exploits throws doubt upon their historical trustworthiness. Early in his reign he cleared the great sphinx of Gîzeh of the sand which had buried it, and erected between the paws a tablet 13 feet high. (See SPHINX.) He was followed by Amenhotep III. and his son Khunaten, and after them the kingdom became much weakened, till its power was again restored by Seti I. and Ramses II., the mighty kings of the nineteenth dynasty. CHARLES R. GILLETT.

**Thott**, tōt, BIRGITTE: scholar; b. in Denmark, 1610; the most learned woman and one of the greatest scholars of her time. Her chief work is a translation of Seneca (Sorö, 1658), which won admiration by its correctness and elegance. She also translated Epictetus and Cebes. In the preface to the Seneca she makes a strong plea for the intellectual rights of her sex. D. 1662. D. K. D.

**Thou**, too, JACQUES AUGUSTE, de: historian; b. in Paris, Oct. 8, 1553; studied law at Orleans and afterward at Valence, under Cujas; traveled in Italy, Germany, and Holland; and was made councilor to the Parliament in 1578, councilor of state in 1588, vice-president of the Parliament and keeper of the royal library in 1593. Henry III. and Henry IV. showed him great confidence, and employed him in many difficult diplomatic and political negotiations; but under the regency of Marie de Médicis he felt himself to be slighted and retired from public life. He was a member of the Politique party, a strong opponent of the League, and a supporter of the policy of toleration toward Protestants, being one of the promoters of the Edict of Nantes. D. May 7, 1617. His great work, *Historia mei Temporis*, comprising the period from 1546 to 1607, written in Latin, and divided into 138 books, was published in part in 1604 and succeeding years; but the last part did not appear till 1620, when it was issued by his friends, Dupuy and Rigault, the latter of whom added a continuation or conclusion based on the papers of the author; complete edition in seven folio volumes (London, 1733); French translation in sixteen volumes 4to (1734). Though the author betrays his sympathy with the Politiques, the work is in general impartial, and is one of the chief authorities for the period. He also wrote some Latin poems and an autobiography, edited by Masson (1838). See John Collinson, *Life of Thuanus, with some Account of his Writings* (London, 1807). F. M. COLBY.

**Thought**: the mental processes of comparing, judging, and reasoning. The term thought is used to mark off those mental states in which there is a breaking loose from particular objects and the manipulation of general notions, concepts, signs, or terms. It involves Apperception (*q. v.*), the relating function, primarily, but after it comes to work upon the more abstract material used in arguments, reasonings, inferrings, and the like. In its nature, however, thought can not be held to differ from the lower exercises of mind seen in perception. The distinction is largely one of range and reach in the use of material. The lower animals seem to come only to a very small degree of thought.

Psychologists distinguish certain stages in the process of thought, having mainly in view the degree of generality of the object to which the mind is directed. These stages may be given a further word under the names which they hold in popular language, i. e. conception, judgment, reasoning.

*Conception.*—In conception, the object which the mind is thinking about is a "general idea," concept, or notion. It is a mental state which is equivalent in thought to more than one object in the external world. When, for example, a man speaks of the "place of the *horse* in the animal kingdom," he is using a concept, "horse." The psychological point at issue is the way the mind comes to have a state which thus stands not for any particular object—no one single horse—but for any of the objects which go in a class, large or small. General ideas are generally distinguished as "abstract," i. e. when they designate a quality of objects, such as "green," "sweet," etc., independently of the kinds of objects to which this quality may apply; and concrete, or "general," in a narrow sense, i. e. when they refer to the objects themselves, as to number, distribution, etc., independently of the qualities which they possess, as, for example, the case given, "horse." The way that the concept arises on the basis of the perception of the particular objects which come first in mental growth is called "abstraction" and "generalization" in these two cases respectively.

*Judgment.*—This term is usually applied to the mental procedure of asserting anything, as, for example, "Socrates is mortal," "It rains." The theory of judgments when they are thrown into statements called "propositions" belongs to the ordinary or Aristotelian theory of Logic (*q. v.*). The action of the mind in getting and using its judgments, however, belongs to psychology. The theory most current on the psychological side looks upon judgment as just the mind's own consciousness of the progress it is making with its conceptions. For example, the judgment "horses eat grass" is looked upon by the newer theory as the mind's expression to itself of the fact that the new quality or attribute of eating in a particular way has to be added, in future cases when horses are thought of, to the concept which stands for this class of animals. There seems to be nothing added to the concept by the mere fact of judgment—that is, nothing additional to what is already there in the altered concept. But connected with this very growth of the concept there arises as a necessary part of the function itself the recognition by consciousness of the addition being made to its content, and this recognition of and assent to its own process constitute judgment. Consequently, the older school of psychologists who thought that judgment represented an entirely new function or faculty are no longer considered authorities; yet the newer school, represented by Brentano, Sigwart, Lotze (especially the first named), are disposed to think that the predication of existence is always carried by the exercise of judgment, and that that is a new mental movement, since in conception the notion may or may not have the attribute of existence attached to it. The view of Brentano is probably correct, as far as it finds in judgment the attribution of existence; but this attribution of existence is a fact of emotion, which becomes explicit at a certain stage in the development of conception, and then gives the form of conscious recognition or assertion which we call judgment.

*Reasoning.*—It is the process of reasoning which is usually suggested by the word thought; and reasoning is, when psychologically considered, the most explicit form of the growth of conception, and with it of the direct assertion found in judgment. The detailed treatment of reasoning belongs to Logic (*q. v.*); and it only remains to say in this connection that reasoning is again only a further stage in the growth of conception. In every piece of reasoning, in every argument, what we really have is an attempt to broaden our conception of the subject reasoned about by adding to it certain new elements. We do this by discovering relations between concepts formerly held apart; and the successful union of such conceptions in one is what we call the "conclusion" of the argument. So here again the old psychology is wrong in thinking that reasoning is a distinct faculty. It is only the general apperceptive or synthetic function of consciousness, as it works on more general and detached elements of perception and conception. The reason, therefore, that animals do not show more reasoning power than they do is probably simply that they are not developed far enough, either in consciousness or in the brain complexity that accompanies consciousness, to do much of the synthesis which thought embodies.

Literature.—See the references given under Logic; also the *Psychologies* of Brentano, James, Höffding, and Baldwin.

J. Mark Baldwin.

**Thought-transference**: See Telepathy.

**Thousand and One Nights**: See Arabian Nights.

**Thousand Islands**: a group of about 1800 islands situated in the St. Lawrence river, near the outlet of Lake Ontario; famed for the beauty of their scenery, and annually visited by large numbers of tourists. Many have been chosen as sites for summer cottages. An expansion of the river, caused by the numerous islands obstructing it, is known as the Lake of the Thousand Islands. A belt of crystalline rock termed Laurentian gneiss, which unites the Adirondack hills of New York with a vastly larger area of a similar geological character in Canada, is crossed by the St. Lawrence, and owing to the unevenness of the surface of the rock and inequalities in the depth of the glacial deposits spread over it, many islands were formed when the region became partially submerged.

Israel C. Russell.

**Thrace** (in Gr. Θράκη): in earliest times the entire and wholly indefinite region of country N. of Mt. Olympus, but later on the boundaries were in general these: On the N. the Danube, on the E. the Black Sea, on the S. the Hellespont and Thracian Sea, on the W. the Strymon. The Thracians belonged to the Indo-European family, and in earliest times had attained a relatively high standard of culture, as is indicated by the religious myths that originated in or were connected with Thrace, though they failed to keep pace with their southern neighbors. Little is known concerning the history of the country. The people were very warlike, living mainly by plunder and robbery, and were notorious for their drunkenness. The Greeks planted many colonies along the coast of Thrace, but the Thracians never exercised any great influence upon political affairs in Greece. They were conquered by Philip and Alexander, and from the Macedonians the country passed into the hands of the Romans, though it was not fully subdued until 26 b. c.

J. R. S. Sterrett.

**Thrale**, Hester Lynch Salusbury: See Piozzi.

**Thrasher**: a name applied in parts of the U. S. to the species of *Turdidæ* or thrush-like birds belonging to the genera *Oroscoptes* and *Harporhynchus*. *Oroscoptes* has the wings and tail of nearly equal length, the tail nearly even, and a slightly notched moderate bill. *Harporhynchus* has the wings decidedly shorter than the tail, the tail long and graduated, and the bill not notched and diversiform, but generally quite elongated and decurved. The color is rather plain, generally brownish or ash above, whitish or spotted on the breast. The species include the sage-thrasher or mountain-mocker (*O. montanus*), the brown thrasher (*H. rufus*), Cape St. Lucas thrasher (*H. cinereus*), gray curve-bill thrasher (*H. curvirostris*), California thrasher (*H. redivivus*, and red-vented thrasher (*H. crissalis*).

Revised by E. A. Birge.

**Thrashing**: See Threshing Machinery.

**Thrasybu'lus** (in Gr. Θρασύβουλος): son of Lycus of the deme Steiria, one of the leaders of the democratic party in Athens during the latter part of the Peloponnesian war. He was one of the associates of Thrasyllus at Samos, and was prominent in the attempt against the four hundred. He then fought under Alcibiades in the Hellespont and elsewhere, and as trierarch took part in the battle of the Arginusæ, being one of those ordered to pick up the shipwrecked sailors. He was banished by the Thirty Tyrants and took up his residence in Thebes, where he planned his successful attempt to redeem Athens from the rule of the Thirty. From the fortress of Phyle as his base of operations he seized Munychia, the stronghold of the Piræus, and finally succeeded in overthrowing the Thirty and in reestablishing a democratic form of government in Athens (403 b. c.). He served as general in Bœotia and at Corinth, but without distinction (394 B. C.). In 391 B. C. he commanded the Athenian fleet, and succeeded in restoring the Athenian prestige in the Hellespont, but was charged not only with embezzlement, but with treason as well. When his fleet was visiting Pamphylia his soldiers angered the people of Aspendus by acts of violence, and Thrasybulus himself was killed in his tent during the night. His death probably saved him from execution at Athens, a fate which overtook Ergocles, his fellow general. J. R. S. STERRETT.

**Threadworm**: any nematode worm. See NEMATHELMINTHES.

**Threats**: expressions of intention to inflict injury on another. At common law they are criminal offenses when directed against persons under the protection of a court, or when made against the life, reputation, or property of another for the purpose of extorting money from him, provided they are of a nature calculated to overcome a firm and prudent man. (*King* vs. *Southerton*, 6 East. 126.) This subject became a matter of legislative regulation at an early day, and is governed wholly by statutes in each jurisdiction. Threats for the purpose of intimidating a public officer, or of preventing a person from exercising his lawful calling, or threats to publish a libel, or threats in a letter sent or delivered for the purpose of extorting money or annoying persons, are generally declared misdemeanors by these statutes. Threats which unlawfully interfere with one's business are actionable as a tort. In an early English case the owner of a stone-quarry was allowed to recover damages against a party who by threats of bodily harm and of lawsuits frightened away plaintiff's workmen and customers. (*Garret* vs. *Taylor*, Croke, James. 567, A. D. 1620.) Threats may also interfere with one's personal freedom to such an extent as to amount to FALSE IMPRISONMENT (*q. v.*). See BOYCOTTING and CONSPIRACY. FRANCIS M. BURDICK.

**Three Bodies, Problem of**: the problem of determining the motion of three mutually gravitating particles. The discovery of the law of universal gravitation by Newton reduced the question of the motion of the planets to one of almost pure mathematics. Newton himself was able to show, by a rigorous but intricate geometrical demonstration, that if two bodies like the sun and a planet attract each other with a force inversely as the square of their mutual distance they will each describe a conic section around their common center of gravity. The planet being very small relatively to the sun, this common center of gravity would be very near the center of the sun, and the planet might therefore be said to describe a conic section around the sun. It was thus shown that, considering only the attraction of the sun upon the planets, each planet would revolve in an ellipse having the sun in one of its foci, which was Kepler's first law of planetary motion. But since each planet is attracted by all the other planets, as well as by the sun, this motion in an ellipse does not represent the mathematical truth, but only an approximation to the real motion. Hence mathematicians were led to propound the problem more general than that solved by Newton: *Three bodies being projected in space with any velocity and in any direction whatever, and then left to their mutual attraction, to find the motion of each of them during all time.* The general and complete solution of this problem was found to be beyond the power of mathematical analysis, for the reason that the curves described by the several bodies would be so irregular, subject to such constant variation, and changing so greatly according to the masses of the bodies, that it would be impossible to express them by any mathematical formula. It was, however, possible to find certain general laws to which the motion would be subject. The center of gravity of the three bodies would always move in a straight line with a uniform velocity. Certain relations were found to subsist between the masses of the bodies, their distance apart, and their velocities, and certain great principles established relating to the secular changes as well as to the real permanence and stability of the solar system. See LAGRANGE.

All this, however, did not suffice to determine completely the motion of any one body. In consequence of the impossibility of the general solution, the efforts of mathematicians have generally been directed, not to the general problem, but to two special cases of it which occur in the solar system. The first of these cases is that of the motion of two planets around the sun, in which the masses of the bodies are very small compared with that of the sun, while their motion takes place in nearly circular orbits. The deviations of each planet from the average ellipse in which it would move if not attracted by the other, then admit of being determined with any required degree of accuracy, though not with mathematical rigor. The actual problem of planetary motion is, however, not simply that of three bodies, or two planets, but of nine bodies, there being eight large planets. But the solution of the problem of any number of planets involves no greater mathematical difficulties than are encountered in the case of two, though the labor of the numerical solution is immensely greater. The other special case is that of the motion of the moon around the earth, under the influence of the attraction of the sun as well as of that of the earth. This is a more complicated case than that of planetary motion, because while the moon revolves round the earth both the earth and moon revolve together around the sun. But by the researches of Hansen and Delaunay this difficult problem of the moon's motion has been solved with nearly the same degree of accuracy as that of planetary motion.

The efforts of several generations of mathematicians since the middle of the eighteenth century have resulted in the general problems of planetary and lunar motion being rendered comparatively simple from a purely mathematical point of view. But the problem of actually calculating the formulas necessary to determine the motion of any one planet is one of immense labor, the increased accuracy demanded by modern astronomy having more than made up for the greater simplicity of the methods now used. The difficulty involved is indicated by the fact that the algebraic formulas by which Delaunay represents the position of the moon occupy 120 4to pages. S. NEWCOMB.

**Three-chapter Controversy**: an episode in the great Monophysite controversy. In order to win over the Monophysites the Emperor Justinian issued in 544 an edict condemning the so-called Three Chapters—the person and writings of Theodore of Mopsuestia, the writings of Theodoret against Cyril and in defense of Nestorius, and the letter of Ibas of Edessa to the Persian Maris. Though this condemnation involved a condemnation of the Council of Chalcedon (451), which had expressly affirmed the orthodoxy of Theodoret and Ibas, the Greek Church accepted the edict, as did also Pope Vigilius (540–555), while the whole Western Church rejected it and excommunicated the pope. Revised by S. M. JACKSON.

**Three Estates**: See ESTATES, THE THREE.

**Three Rivers** (Fr. *Trois Rivières*): city, port of entry, and *chef-lieu* of St. Maurice County, Quebec, Canada; on the northern bank of the St. Lawrence where it is joined by its tributary the St. Maurice (see map of Quebec, ref. 4–C). The Canadian Pacific Railway connects the city with Montreal, 95 miles distant, and with Quebec, 77 miles distant. There is also a branch of the Grand Trunk terminating here by means of a ferry from the other side of the river. The river steamboats make this a place of call during summer. The town is one of the oldest in Canada, having been settled in 1634. It is an ecclesiastical center, with its cathedral, bishop's palace, college, and convents. The old original parish church still stands. The city owes its growth to the development of the lumber-trade of the St. Maurice and its tributaries. The St. Maurice iron-works are 10 miles distant, and connected with the city by rail. The manufactures of Three Rivers are lumber, boots and shoes, and iron ware. The cathedral, with its massive spire, surrounded as it is by many handsome edifices, gives the city an imposing appearance as it is approached by rail. Some of the streets have an untidy appearance, while the system of water-supply and drainage needs improvement. The city sends one member to the House of Commons at Ottawa, and one to the House of Assembly at Quebec. There are 2 weekly newspapers, 3 branch banks, 3 Protestant churches, and several well-equipped schools. Three Rivers was in origin the fort or central station of the three great tributaries of the St. Lawrence; hence, perhaps, the name, though it is generally thought to have been given on account of the two dividing islands at the mouth of the St. Maurice. Pop. (1881) 7,998; (1891) 8,334. J. M. HARPER.

**Three Rivers**: village; St. Joseph co., Mich.; at the junction of the St. Joseph, Portage, and Rocky rivers; on the Lake Sh. and Mich. S. and the Mich. Cent. railways; 8 miles N. of Constantine, and 25 miles S. of Kalamazoo (for location, see map of Michigan, ref. 8–H). It has excellent water-power for manufacturing; is in a lumber region, and contains 2 flour-mills, several saw and planing mills, foundries, agricultural-implement works, paper mill, peppermint-oil works, 2 national banks with combined capital of $114,000, a State bank with capital of $30,000, a free public library, and 3 weekly newspapers. Pop. (1880) 2,525; (1890) 3,131; (1900) 3,550. EDITOR OF "HERALD."

**Thresher**: See FOX SHARK.

**Threshing Machinery**: machinery for the separation of grain from the straw.

*Primitive Methods of Threshing.*—There are two methods of threshing without machinery—one by blows which beat out the grain, the other by a kind of trituration which breaks its hold on the straw. The former appears to have been developed from the latter. The earliest method of threshing was doubtless that of treading the grain to and fro by horses or oxen—a method in common use on the small farms in the U. S. and elsewhere, especially for buckwheat, and notably for clover. Another ancient method still in use in the Orient, but probably nowhere else, is that of drawing a sled back and forth over the unthreshed straw. The primitive method of beating out the grain was by means of a flail, an implement comprising a staff wielded by the thresher, and having at one end a swingle shorter, thicker, and heavier than the staff, to which it is connected by a flexible thong. The flail is uniformly used even now where only small quantities of grain are to be threshed. The best flails have staves made of ash and swingles of hickory; the staff in each case being provided with a wooden bow swiveled at its upper end in order that the swingle may be free to swing around the line of the staff, the swingle being attached to the bow by a looped thong made preferably of eel-skin, which best resists the great and continual strain and friction brought upon it. In threshing grain with straight straw, such as oats, wheat, barley, etc., the sheaves are laid in double rows with their heads turned inward and slightly overlapping. The thresher first threshes down the middle, beating out the heads. The bands upon the sheaves are then broken, and the whole is uniformly again threshed over. It is then turned or inverted and flailed again. If the weather is damp, the straw is tougher and holds the grain more firmly; and in such cases the straw is shaken up with a pitchfork once or more as may be required, and repeatedly gone over with the flail. With buckwheat, in which the sheaves or stooks are of conical form, the stooks are placed upright, and the whole mass is beaten down upon the floor by first striking upon the tops of the stooks, the straw being turned and shaken up as often as may be required, and repeatedly threshed until the grain is completely separated. Clover, beans, peas, etc., are flung promiscuously on the threshing-floor and turned and beaten until the threshing is complete. These last, however, are readily threshed by horses trampling upon them, an attendant turning the straw at one part of the floor while the horses are trampling at another.

*Early Forms of Threshing Machinery.*—From the very earliest times until a very recent period, the methods just described were the only ones by which grain was separated from the straw, unless the rude method sometimes used by warlike Celtic tribes of burning the straw and gathering the parched grain left behind be excepted; also that other method in which may be detected the faintest suggestion of the principle of modern inventions—the hurdles made of planks or wide beams, stuck over with flints or hard pegs to rub the grain ears between them; for it is only necessary to curve one of these planks to the arc of a circle, and bend the other to a complete cylinder revolving within the concave, to have an imperfect representation of the two essential parts of a modern threshing-machine. It is to such beginnings that the principles of improved machinery may be frequently traced; and the modern threshing-machine finds its inception in the pegged hurdles of the ancient Romans, just as the harvester had its beginning in the comb-like reaping-blade mounted on wheels mentioned by Pliny as in use among the Gauls. The first threshing-machine that could in any sense be considered a practical success, and which was the prototype of those that led to the displacement of the hand-flail, was that invented by Michael Menzies, of East Lothian, in Scotland, who used a number of flails attached to a revolving shaft driven by a water-wheel. This machine succeeded in threshing very rapidly, but the high velocity required soon broke and destroyed the flails, and the mechanical resources of that time were not equal to the task of constructing an apparatus on this principle which would successfully stand the wear and tear of actual use. Afterward, in the year 1758, another Scotchman, Michael Sterling, in Perthshire, constructed another thresher, which appears to have been merely an experiment. This had a vertical shaft with radial arms working within a cylinder, the shaft being turned by a water-wheel. The sheaves were thrown in at the top of the cylinder and were beaten by the radial arms. This appears to have been of little utility, and was followed twenty years later by another machine, in which a number of rollers were arranged around an indented drum, the drum being revolved and the rollers rubbing out the grain. This was manifestly impracticable, as were also several modifications. At a later date another Scotchman, Andrew Meikle, devised a machine in which rollers and drums were retained, but in which beating was substituted for rubbing. The first machine of this kind was made in 1786, and appears to have been the earliest threshing-machine that was practically adapted to extended and successful use. In this, scutches were attached to the drum, and arranged to strike the grain from the straw. At first this invention was adapted merely to detach the grain from the straw, and threw grain, chaff, and straw in a heap together. But early in the introduction of these machines screens were added, and the grain, separated from the straw, was passed to a winnower. This was really a most notable invention, and the threshing of grain by a machine turned by horse-power or steam-power, which had been before at most an experiment, became an accomplished fact. This machine, as well as those that followed it, was expensive. A large one with suitable rakes and fanners for separating straw from the grain and chaff, and the grain from the chaff, cost £150 sterling at that time, when the purchasing power of money was at least three times what it is now. But such machines enabled one man to do the work of six, and secured 5 per cent. more of winnowed grain from a given weight of straw than was possible with hand-threshing. And as has been said: "If 5 per cent. is added to the national produce, it is as great a gain to the public as if the national territories were increased one-seventh." Notwithstanding the comparative excellence of these early British machines, they have been much changed, and the steam threshing-machines exhibited at the annual agricultural shows in Great Britain are triumphs of mechanical engineering.

*Threshing-machines in the U. S.*—In North America threshing-machines were early invented, but for the reason that most of the farms were newly cleared from the wilderness, divided into small fields, and almost necessitating hand-labor in all departments of agriculture, it is only since about 1840 that this class of machinery has been brought to any perfection. Among those earlier invented, the plan of rotary beaters or flails attached to a revolving shaft was the subject of much experiment. But a revolving cylinder provided with radial teeth or spikes, and working with a concave or section of a cylinder provided with similar but inwardly projecting teeth, comprised the beating mechanism which was first found uniformly successful, and which continues in use. The changes and improvements have related for the most part to the mode of giving motion to this cylinder and to accessories for securing safety and convenience in the operation of the machine. Those which first came into common and satisfactory use had the cylinder actuated by intermediate gearing from a vertical driving-shaft, from the upper end of which extended radial arms. To the outer end of these arms was attached a whippletree, on which draught was exerted by a single horse. The four horses walked in a circular path, and thus gave rotary movement to the vertical driving-shaft and rapid rotation to the cylinder. The sheaves, unbound, were fed with the heads first into the space between the cylinder and its concave. In some of the first of these machines shaking screens were so applied as to sift the grain and chaff from the straw, the latter being carried and deposited by itself, while the former passed to the hopper of a fanning-mill, which cleaned or separated the grain from the chaff, while a graduated system of sieves separated the small seeds, pigeon-weed, devil's-gut, etc. Many attempts were made to supersede this clumsy mode of driving the cylinder by an inclined endless belt constructed with transverse wooden lags, and driven after the manner of a treadwheel by horses. This plan has been adopted with success for small dog-power machines for churning. Many experiments were made to apply the same principle in various forms to the heavier work of driving a thresher. The first attempts of this kind were made at a foundry in the village of Fly Creek, N. Y. A resident of that place had succeeded in making a horse-power on the plan just mentioned, which theoretically appeared to be perfect, but with which no steadiness of motion could be given to the cylinder. When the sheaves were not passing to the machine the apparatus ran too fast for the horses; when the sheaves were applied the apparatus choked. This was about 1830–35; the apparatus was laid aside, but shortly after a projector from the State of Maine came to the same foundry and had constructed a far ruder apparatus, which on trial gave a perfectly satisfactory motion to the cylinder. The constructor of the first-named device was not long in discovering that this was due to a balance-wheel placed on the main shaft of the horse-power. He added this useful appliance to the shaft of the previous machine, and from this was developed the Badger railroad horse-power, which for many years held its own as the most efficient power for driving threshing-machines. It is difficult to explain the construction of this apparatus without elaborate diagrams. It consisted, in brief, of a framework carrying at each side two endless cast-iron tracks situate in vertical planes. The endless belt was composed of two systems of iron links arranged around the two tracks, and connected by the transverse lags or wooden bars which composed the traveling floor of the apparatus. Each link carried a broad-faced wheel resting upon the upper part of the adjacent endless track. The endless belt thus constructed and arranged was of course in an inclined position, the weight of the horse walking thereon as upon a treadmill giving a motion to the endless belt, the wheels of which traveled upon and around the endless tracks, from which operation the designation "railroad" was derived. A large broad-faced wheel constituted at once the balance-wheel to give steadiness of motion and the driving-wheel from which, by means of a belt, power was transmitted to the threshing-cylinder. At a later date the construction was much simplified, and what are now termed railroad horse-powers differ materially in construction from the first representatives of the class. In the use of this class of machinery much difficulty was at first experienced from the breaking or slipping of the driving-belt, which by relieving the horse-power from the resistance of the thresher was liable to throw the horses back out of the machine, with consequent injury and loss. This was remedied by an ingenious application of a lever arranged in such relation to the belt that the breaking of the belt lets fall the lever, and this in its turn actuates a brake that, coming in contact with the driving-wheel, stops the motion of the endless platform.

The ordinary threshing-machine in use in the Eastern States comprises either a portable steam-engine or a railroad horse-power for two or three horses, and a thresher composed essentially of the toothed cylinder acting in conjunction with the toothed concave. An endless shaker formed with transverse wires and operated like an endless belt conveys the straw some distance in the rear of the thresher, a vibrating motion given to the belt shaking out the chaff and grain, these latter being passed to a fanning-mill which separates the chaff, small seeds, etc., from the winnowed grain. These machines are commonly owned by some enterprising farmer, who, aside from the threshing of his own farm, journeys from farm to farm by appointment, and threshes either for a stated price per bushel or for a percentage of the grain itself, commonly one-tenth. The large farms of the West and the immense quantities of grain produced have called into existence far more elaborate apparatus, in which, however, the principle of operation is substantially unchanged. A thresher in use for a number of years in the Western States may be taken as a type of the improved threshing-machine in use in the Prairie States. In this the threshing-cylinder "is made of skeleton form, having cast-iron heads, and the central annular brace of the same material; wrought-iron bars are arranged on these parts, and form the circumferential parts of the cylinder, being held in position by the external wrought-iron rings. The bars carry the teeth, the shanks of which pass through holes in the bars, and are held by nuts firmly screwed upon their inner ends; the uniformity in shape and size of the teeth arises from their being made by machinery properly shaped in dies under a drop-hammer. The concave is of cast iron, with slots in it which allow the grain to pass through to separate from the straw at the earliest possible stage of the threshing operation. The straw as it leaves the cylinder is flung back, the grain being then shaken out by a vibrating shaker and its separation completed by an air-blast from a revolving fan."

In the Pacific States the peculiar dryness of the atmosphere greatly facilitates not only the threshing but the reaping of grain; the standing grain, instead of crinkling down when ripe, as is the case in the Eastern States, stands straight for many weeks; and this without the shaking out of the kernels incident to ripe grain in other portions of the country. It is, however, dry enough to thresh immediately; the threshers are driven by portable steam-engines, and the threshing is carried on in the open field. During recent years much attention has been given to straw-burning furnaces for steam-boilers of threshing-machines in the open field. By these the straw is used in generating the power which drives the thresher, and a comparatively waste product is made to cheapen the expense of the work. Straw-burning furnaces have been used in Hungary during a long period, and for many years the straw of the rice-fields in the Southern U. S. has been utilized in the same manner. A Californian apparatus for cutting, threshing, and winnowing grain in the field, devised many years ago, is constructed as follows: A large grain-frame is supported on two heavy driving-wheels, and has two lighter ones in front arranged as guiding-wheels. Projecting from the side of this frame is a platform like that of an ordinary reaper, but about 12 feet long. This runs at such height that the reciprocating sickle at the front will cut off the heads from the standing grain; the heads fall on an endless apron running longitudinally upon the platform, and are carried by this to a hopper that conducts them to a threshing-cylinder having a fanning-mill and straw-separator arranged behind it. The threshed and winnowed grain is thrown out from the fan-mill through a spout at the side directly into the mouth of a sack suspended under the spout. An attendant riding upon the platform ties the sacks when full, and throws them off upon the ground to be collected at leisure. The driving parts receive their motion from the large or driving wheel by means of suitable bands and gearing. This apparatus was designed to be drawn by ten horses, the management of which would constitute the greatest difficulty in the operation of the apparatus. Something similar to this has been projected in Australia, where the peculiarities of the climate permit the immediate threshing of the grain as soon as cut. The plan is not more audacious than that experimentally carried into effect about 1850 in Devonshire, England, of connecting a threshing and winnowing apparatus with a run of mill-stones, so that the grain was stripped from the straw, separated from the chaff, ground, and bolted at one continuous operation.

JAMES A. WHITNEY.

**Thrift**: the *Armeria elongata*, a European seaside and mountain plant, found also on British American shores, and often grown in gardens as an edging for flower borders. It has diuretic powers. *A. latifolia* is a fine ornamental plant from Portugal. They are of the family *Plumbaginaceæ*.

**Thring**, EDWARD, A. M.: educator; b. in England, Nov. 21, 1821; studied at Eton; graduated at Cambridge 1847; took orders and served as curate for a time, always wishing to teach; went to Uppingham, Rutland, as head master Sept. 10, 1853, where he had a career as one of the most famous of English schoolmasters. D. Oct. 22, 1887. He published four volumes of school sermons, *Thoughts on Life Science* (1869); *Education and School*; *Theory and Practice of Teaching* (3d ed. 1886), besides poems and addresses. See Skrine, *A Memory of Edward Thring* (1889); Rawnsley, *Edward Thring, Teacher and Poet* (1889). C. H. THURBER.

**Thrips**: See *Physopoda*, under ENTOMOLOGY.

**Throat Diseases**: Although the specialty of the study and treatment of throat diseases is designated laryngology, it includes diseases of the posterior nares, the fauces, pharynx, and larynx. Exceptionally, some of these diseases may be suspected or even diagnosticated from symptoms only, as laryngitis from hoarseness, stridor, or aphonia; chronic tonsilitis from muffled voice and habitual snoring; elongated uvula and papular pharynx from habitual spasmodic pharyngeal cough. But physical exploration, the direct examination of the oral cavity and the passages to the posterior nares and larynx, is essential both to diagnosis and to correct treatment. Simple examination—the depression of the tongue by a spoon or tongue spatula—will suffice in many cases, exhibiting the tonsils, soft palate, uvula, posterior wall of the pharynx, and the top of the epiglottis. To discover the root of the tongue, the entire epiglottis, the true and false vocal cords, the chink of the glottis, and even the upper rings of the trachea and division of the bronchi, the laryngoscopic mirror must be employed. Laryngoscopy may be performed by the use of either bright sunlight or a concentration of artificial light.

Specialists employ lamps with condensing lenses; with such methods of illumination the examination is conducted in a dark room. A good light, whether the sun's rays or artificial, is reflected, by a concave mirror held by the physician or worn upon a head-band, into the patient's opened mouth. The patient's tongue being drawn forward and gently held, a small circular or oval laryngeal mirror is introduced. There are several sizes of mirrors, varying from one-quarter to one inch in diameter; they are attached to delicate handles at an angle, so that when passed to the back of the throat they catch the rays thrown into the mouth by the concave mirror, and reflect them downward, illuminating the larynx. The parts thus rendered luminous present a distinct picture in the small laryngeal mirror above them; and this is seen by the observer.

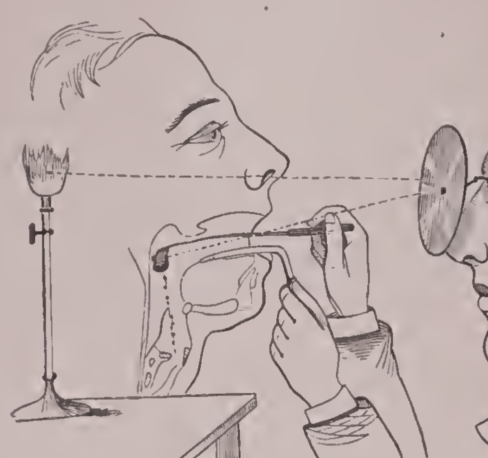

FIG. 1.

The laryngoscopic examination is easily accomplished after a brief period of practice. More difficult is the exploration of the upper pharynx and the posterior nares, termed *rhinoscopy*. The uvula has to be drawn forward, and the reflecting laryngeal mirror passed well back and turned upward. When correctly held, a distinct image of the septum between the nostrils, and of the extensive corrugated surfaces of the naso-pharyngeal spaces, is transmitted to the eye (Fig. 3). Patients are easily trained to permit the presence of the throat mirror, and even to explore their own throats. The movements of the vocal cords are displayed best in uttering the sound *a* (*eh*).

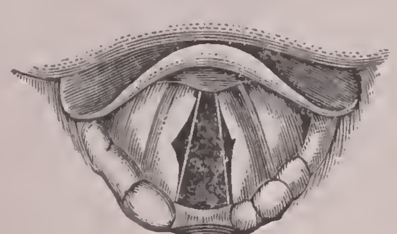

FIG. 2.—Healthy larynx.

All of these several connecting parts of the throat are richly supplied with blood-vessels and lined by a mucous membrane, secreting mucus. They are therefore liable to hypersecretion of mucus, or catarrh, which may be acute, subacute, or chronic; to active and passive congestions, inducing redness, heat, and swelling; to active inflammations, with formation of submucous abscess, erosion of the epithelial covering of the mucous membrane, or ulceration and sloughing of its deeper layers. Such destruction of soft tissue may induce necrosis of the underlying hard structures, the nasal and laryngeal cartilages. Inflammation may terminate in an exudation of membranous character, as those of croup and diphtheria. Repeated congestions and inflammations tend to engorge and hypertrophy the structures of the mucous membrane and glandular bodies embedded in it. The papillæ of the back of the throat and of the columns of the fauces are very often thus enlarged. The surface is seen to be studded with prominent ovoid papules or tubercles, a condition often known as clergyman's sore throat, and technically as papular pharyngitis. Polypoid growths of variable size develop in the nares, pharynx, and on and around the vocal cords—products of papular growth and of granulation.

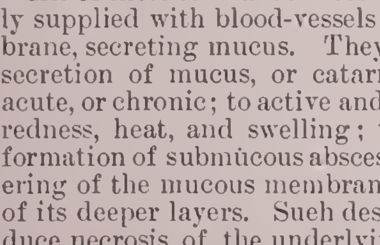

FIG. 3.

A most alarming and critical condition is acute œdema of the larynx. This is an acute inflammatory disease attended with great swelling, by œdema, of the submucous tissue. The distended, swollen structures overlap the opening of the glottis and occupy the ventricles of the larynx, preventing inspiration and threatening immediate death by suffocation. The laryngoscopic mirror definitely locates the seat of these dropsical sacs, and is the sure guide to efficient scarification and evacuation of their contained fluid.

The vocal cords may be affected by spasms, producing hoarseness, aphonia, and labored respiration, in which case the mirror detects the unusual approximation and irregular action of the cords, and excludes the presence of more serious organic disease. One of the vocal cords may be found paralyzed, inactive, and relaxed, while the other remains normal. Such paralysis of a cord may be due to inflammation or abnormal growth, or may depend upon lesions of the nerves in the neck, or again, coexisting with paralysis of half of the body, depend on a lesion of the brain. Ulceration or inflammation may so seriously damage the vocal cords that cicatricial or scar-like tissues are formed, tending to contract and harden; in time the chink of the glottis becomes contracted and narrow—termed stenosis of the larynx. The aperture being no longer adequate for the ingress or egress of air, gradual suffocation must ensue unless surgical relief is afforded. Extensive destruction of the vocal cords often occurs from syphilis and epithelial cancer.

The more accurate diagnosis of throat diseases, and intelligent study and classification by aid of laryngoscopy, have led to corresponding progress in treatment. Applications are no longer applied at random by probangs, uncertain of the condition that exists and of the parts which are reached. Remedies are applied with accuracy by various methods, with definite regard for the indications of each case. Astringents—as tannin, iron, and silver—are employed to contract blood-vessels, lessen congestions, and relaxations of surfaces. Caustics are sometimes used, local applications are made to heal ulcers, and inflammation is checked by warm solutions and vapors, or in other cases by cold gargles or sprays. Anodynes are given to allay pain, either by the stomach or locally. Electricity is applicable directly to the paralyzed vocal cord. The knife is constantly of service in treating throat diseases, for the excision of the tonsils and uvula, opening abscesses, the scarification of œdema of the glottis, and for the operations of tracheotomy and laryngo-tracheotomy, whenever, by inflammation, tumors, croupous or diphtheritic membrane, or whatsoever obstruction, the larynx is closed to the passage of air and death is imminent by suffocation. Of recent years the operation of intubation has been introduced. This consists in the insertion of a metallic tube directly into the larynx from the pharynx. In this way the larynx is kept open and suffocation prevented. See CATARRH, DIPHTHERIA, MOUTH, DISEASES OF THE; QUINSY, and TONGUE.

Revised by W. PEPPER.

**Thrombosis**: See HEART DISEASE.

**Throm'bus** [Mod. Lat., from Gr. θρόμβος, lump, clot of blood]: in pathology, a clot of blood within the blood-vessels or heart. Inflammations of the lining membrane of the vessels, altered states of the blood, and slowing of the current of blood are the principal factors which contribute to the formation of clots. Their appearance varies according as they are formed rapidly or slowly. Thus in the heart the clots which so frequently result from slowing of the current of blood have a yellow or white appearance, from the fact that the heavy red corpuscles are carried along by even a sluggish current, whereas the lighter white corpuscles cling to the walls and enter into the formation of the thrombus. If the current is alternately slow and rapid, stratified or laminated clots result; and if the stream is suddenly and completely checked, a red clot results. Thrombi in the vessels or heart tend to undergo softening or disintegration, and particles may thus be swept to distant parts of the circulation. On the other hand, under favorable conditions, and particularly in those in small vessels, thrombi become organized, and thus obliterate the lumen of the blood-vessel where they occur. This is the most important feature of thrombosis, for in this manner severed blood-vessels are obstructed and hæmorrhage permanently arrested. W. P.

**Thrush** [M. Eng. *þrusche* < O. Eng. *þrysce*: O. H. Germ. *drosca* < Teuton. **þrus-ka*; cf. *throstle* < O. Eng. *þrostle*: Germ. *drossel* < Teuton. **þrustala*: Lat. *turde'la* < Indo-Eur. **trzdela*]: any one of various birds of the family TURDIDÆ (*q. v.*), a group of Oscines, which stands at, or near, the head of the class of birds, and includes many of the best songsters. They are birds of moderate size, well typified by the wood-thrush (*Turdus mustelinus*) of the eastern parts of the U. S., a delightful songster and a near relative of Wilson's thrush

(*T. fuscescens*) and the gray-cheeked thrush (*T. aliciæ*). These birds resemble one another quite closely, being more or less olive brown above and white below, with blackish spots. The European song-thrush (*Turdus musicus*) is much like the wood-thrush on a larger scale. The common robin (*Merula migratoria*) of the U. S. is a thrush, and so is its relative, the blackbird of Europe (*M. merula*). For the golden-crowned thrush, see OVENBIRD. F. A. L.

**Thrush**: See MOUTH, DISEASES OF THE (*Stomatitis hyphomycetica*).

**Thrush**: an abscess in the sensitive frog of the horse's foot. Cleanliness and the paring away of loose pieces of the frog are useful toward a cure. Carbolic-acid lotions or occasional sprinkling with calomel are also beneficial.

**Thucydides**, thyu-sid'i-dēez [= Lat. = Gr. Θουκυδίδης]: Greek historian; son of Olorus and Hegesipyle, of the Attic deme Halimus. He belonged on one side of the house to an old aristocratic Athenian family, on the other to a line of Thracian princes. The year of his birth is uncertain, not much earlier than 470 B. C., nor later than 454. He received an education that matched his lineage and his wealth; and the influences of Anaxagoras the philosopher and Antiphon the orator have been traced in his thought and in his style. The story that he heard Herodotus read his history at Athens is destitute of warrant, but not destitute of probability. At the outbreak of the Peloponnesian war Thucydides had reached what he calls the age of discernment, and in 423 commanded a detachment of Athenian forces, which was to operate on the Thracian coast, the region in which he had large possessions. Having failed to relieve Amphipolis, he was condemned to death for high treason, and forced to withdraw from Athenian territory; nor did he receive formal permission to return until the end of twenty years, an interval which he spent partly on his estate in Thrace, partly in visits to the scene of hostilities, notably to Italy, Sicily, and Macedon. The time and manner of his death are alike uncertain. One account has it that he was assassinated—cut off untimely, as was his history; and his silence as to the eruption of Etna in 396 makes it probable that he did not long survive the end of the fifth century.

The history of Thucydides, which covers twenty-one years of the Peloponnesian war, has come down to us in eight books, of which the eighth, in which the characteristic speeches are lacking, has not received the last hand of the author. This division into eight books is not the author's division, and we read of other distributions, one into nine, one into thirteen books. A noteworthy break takes place at v., 26, which marks the opening of a second part. But the whole matter of the composition of the work of Thucydides is disputed, some holding that the history was conceived and executed as a whole, others that the piecemeal composition has only been partially effaced by later revision.

Thucydides is universally considered the first and greatest critical historian of antiquity, and claims for himself the credit of an exactness which is possible only to conscientious research as distinguished from hearsay report. His theme, as announced in the outset, is the war and its causes. It is a theme of which he has personal knowledge, and he sticks to it closely, indulging in few episodes, and excluding the sidelights of literature and art. His narrative is rigidly annalistic, year by year, summer by summer, winter by winter, to the detriment of effective grouping, and to the disgust of the rhetorical historians of a later day. Thucydides brought to his task rare qualifications. He was a man of affairs and a soldier, and knew the springs of action even if he could not always work them. His vision was clear of superstitious glamour, his deity was "the strong god, the chance central of circumstance." His aim was the truth, and this praise, though of late years eagerly disputed, can hardly be denied him. He saw and described the men of his time and the movements of his time as they were. His portraits of character abide not merely because of his artistic power, but because of their truth to life. His exhibit of the political forces at work commends itself the more because of the impartiality of the form. He does not tell us what was thought, he bids us listen to the voices of the time, and the statesmen and the captains of the period are made to give abundant expression to the motives of the war. No less than one-fifth of the history is taken up with the speeches in which the thought of the times is dramatized. His narrative shows great variety, sometimes breathlessly rapid, sometimes lingering on each picturesque detail; now a line-engraving, now a painting full of color. The story of the Sicilian expedition is the most elaborate specimen of his art, the retreat of the Athenians from before Syracuse one of the most famous descriptions in all literature. His style is confessedly a hard style, and not undesignedly so. Those who attribute the difficulties of Thucydides to the crude state of Attic prose forget that he could be as simple as the simplest. The fact is that the harshnesses to which all manner of crabbed rhetorical names have been given are of the essence of his genius, are of the essence of his time. Thucydides mirrors more or less consciously in his style a period of conflict and distraction.

EDITIONS.—I. Bekker (4 vols., 1821), also text ed.; Poppo (11 vols., 1821–40), also a smaller ed. revised by Stahl; Goeller (2 vols., 1826, 1836); Didot (3 vols., 2d ed. 1868); Thomas Arnold (3 vols., 8th ed. 1874); S. T. Bloomfield (2 vols., 1842–43); K. W. Krüger (2 vols., 1846–47, and often since); Classen (8 vols., 1862–76, and often repeated); new ed. by Steup in progress 1893; American translation and revision by Fowler, C. D. Morris, C. F. Smith, in progress: by Boehme-Widmann (5th ed. 1882). Noteworthy text editions by Stahl (2 vols., 1873–74) and van Herwerden (5 parts, 1877–83). To these may be added editions of single books and selections by Bigg, Croiset, Dougan, Frost, Goodhart, Graves, Holden, Lamberton, Marchant, F. Müller, Rutherford, Schoene, Shilleto, Simcox, Sitzler, Tucker. Translated into English by Hobbes, Bloomfield (3 vols., 1829), Dale in the Bohn Library, Crawley (1876), B. Jowett with introductions, notes, etc., a monumental work in two volumes (1881). There is an important translation of the speeches by Wilkins (3d ed. 1881), and an admirable essay on the same subject by R. C. Jebb in Abbott's *Hellenica* (1880). See also Bétant, *Lexicon Thucydideum* (2 vols., 1843–47), and von Essen's remarkably complete *Index Thucydideus* (1887). B. L. GILDERSLEEVE.

**Thugs** [from Hind. *thag*, deceiver, robber]: members of a religious fraternity of robbers and murderers which flourished in India from the fourteenth till the nineteenth century. They were worshipers of Kālī (see HINDUISM), by whom they believed themselves to be commanded to murder and rob. Therefore they were utterly unconscious of wrongdoing, considering themselves priests of the goddess carrying out a pious work, for which they were rewarded with the booty gained on their expeditions. They never committed a murder without solemn preparatory rites, prominent among which were the sacrifice of sugar and the consecration of the pickaxe, symbolizing the tooth of Kālī.

The origin of the sect is obscure. The earliest mention of thugs is in the *History of Firoz Shāh*, written by Ziā-ud-dīn Barnī about 1356. It is there related that in 1290 a thousand thugs were captured in Delhi on the information of one of the brotherhood and transported to the island of Lakhnautī. Many of the methods of the fraternity are detailed by the Frenchman Thévenot in relating his travels through India in the years 1665–67. Thuggee (as the system is called) grew rapidly, owing to the extraordinary precautions of its members, and the want of national union among the tribes of India. Thugs were thoroughly organized, and had a special language (Ramasī) and secret signs by which they could recognize each other anywhere. By paying a share of their gains, they even received the support, at least in secret, of many of the native princes.

They went about in bands of from ten to two hundred. Each man was allotted a special duty. There were the leader, the pick-bearer, entrappers, scouts, stranglers, and grave-diggers. It was the business of the entrappers to discover rich travelers, and, representing their band to be merchants or pilgrims, to offer to go with them for mutual protection against robbers or for the sake of each other's society. Having started on the journey, scouts and grave-diggers were sent out ahead to find a favorable spot and prepare a place for the burial of the bodies of those who were to be murdered. Often it would be many days before the opportunity arrived, especially since the omens had to be auspicious. Meanwhile the members of the band mixed on the most friendly terms with their victims—ate and slept with them, and worshiped together at the wayside shrines. When the chosen spot was reached each thug was at his post, and on a given signal from the leader the victims were strangled with the handkerchief (*romāl*). All witnesses were put to death. The bodies of the dead were buried, sometimes being mutilated to hasten decomposition, or fastened down with stakes. The booty was divided among the band, a considerable amount being reserved for their tutelar goddess. Those who did not know their real trade are said to have taken the leaders of these bands to be the ablest, most estimable, and amiable members of native society, and often even the families of the thugs were kept in utter ignorance of their true profession. Several unsuccessful attempts were made by the British Government to stamp out this pest, until, in 1826, owing chiefly to the efforts of Lord William Bentinck and Capt. (afterward Sir) William Sleeman, the movement was started which within a few years utterly broke the power of the sect. This result was reached chiefly by admitting many of the fraternity as king's evidence.

See Sleeman's *Ramaseeana* (Calcutta, 1836); Hutton's *Popular Account of the Thugs and Dacoits* (London, 1857); and Meadows-Taylor's *Confessions of a Thug* (London, 1839; new ed. 1879).

**Thule**, thyu'lee: the name which Pytheas (at the time of Alexander the Great) gave to a land which he discovered after sailing six days in a northerly direction from the Orkney islands. Later, the Romans used the name as a general signification for the northernmost parts of the habitable earth —*ultima Thule*. What island Pytheas meant is unknown.

**Thumbscrew**, or **Thumbkin**: an instrument of judicial torture formerly used in various parts of Europe, but particularly in Scotland. The thumb was compressed by a screw. Its last official use was in the trial and on the person of Principal Carstairs in 1682, after the Rye House Plot.

**Thümen**, tü'men, FELIX, von, Baron: botanist; b. in Dresden, Germany, Feb. 6, 1839. He is known in botany for his many papers on the fungi, published mainly in *Hedwigia*, *Flora*, *Grevillea*, besides other journals, and the proceedings of learned societies between the years 1873 and 1891. He published four series of *exsiccati*, viz.: *Die Pilze des Weinstocks*, 25 species (1877); *Herbarium Mycologicum Œconomicum*, 1,300 species (1872–79); *Fungi Austriaci Exsiccati*, 1,300 species (1871–75); *Mycotheca Universalis*, 2,300 species (1875–84). D. at Schönau near Teplitz, Bohemia, Oct. 13, 1892. CHARLES E. BESSEY.

**Thunberg**, toon'bārch, CARL PETER: botanist; b. at Jönköping, Sweden, Nov. 11, 1743; studied at Upsala under Linnæus; resided at the Cape of Good Hope 1772–75, and in Japan 1775–78; returned in 1779 to Sweden; succeeded Linnæus in 1781 as Professor of Botany at the University of Upsala. His principal works are *Flora Japonica* (1784); *Prodromus Plantarum Capensium* (1794–1800); *Icones Plantarum Japonicarum* (1794–1805); *Flora Capensis* (1807–13); and *Resa uti Europa, Africa och Asia* (4 vols., 1788–93). D. near Upsala, Aug. 8, 1828. C. E. B.

**Thunder**: a rumbling or crashing noise heard after vivid flashes of lightning. Intense electrical discharges in the atmosphere, whether from cloud to cloud, from cloud to earth, or from cloud to cloud and then to earth, are followed after an appreciable interval by the sound which, on a small scale, is represented by the snap and crackle of an artificial electric discharge. The origin of the sound is in the violent sudden increase in volume of the air along the path of discharge. The exceedingly high temperature, sufficient to make the air-column incandescent, causes tremendously rapid expansion and motion of the air. P. G. Tait shows that "such a sound-wave must at first be of the nature of a bore or breaker. But as such a state of motion is unstable after proceeding a moderate distance, the sound becomes analogous to other loud but less violent sounds, such as those of the discharge of guns." Calculations have been made showing that if a cannon-ball could have imparted to it a velocity of 100,000 meters per second we should hear something like the rumble of thunder instead of a whistling noise. Inasmuch as lightning flashes are of very variable dimensions, and as cloud-masses are also variable, and the air itself is of different density and purity at different times, all manner of sounds are produced, from the sharp crash to the prolonged rumble. As the sound-waves may be variously reflected, the original thunder-peal may be reenforced, and, on the contrary, it may even happen that because of interference a sound which if free would have been loud may be deadened. The column of air thus suddenly heated and producing sound-waves may be several miles in length, though recent estimates make the length of the average flash of lightning considerably below this. The beginning of the thunder may be ordinarily taken to determine the nearest point of "break-down" (or lightning) in the air and the duration of the thunder the length of the flash. Thunder may be heard from a great distance, but not so far as some artificial noises have been heard. J. J. Symons has run to earth a number of so-called thunder-bolts, and concludes that the belief in the fall of material substances during thunder-storms is merely the survival of the belief in mythical bolts of irate Jupiter. Belemnites frequently preserved as thunder-bolts are really fossils. Sometimes aërolites and meteorites fall during thunder-showers, but there is no necessary relation between them. Fulgurites or lightning-tubes are found where heavy lightning penetrates into a bed of sand containing silex. The sand for a depth of several feet is fused into a glassy tube. Many of these have been dug out in good preservation, and good specimens are to be seen in museums. A. MCADIE.

**Thunder-storm**: a small short-lived local storm named from the intense electric phenomena which usually accompany it, but which are probably rather a result than a cause. These storms favor warm latitudes, the warm season, and the warm hours of the day. They are often accompanied by a peculiar form of cumulus-cloud called thunder-head, and many are preceded by a short rush of wind outward, accompanied by a slight but sharp rise in the barometer, and followed by cooler weather, a change of wind, and higher pressure. Others seem to have a well-developed but small system of cyclonic winds. The rain which accompanies them is usually intense and the first drops are very large. It sometimes passes into hail. Thunder-storms differ much in intensity, and under this name are probably included phenomena of very different character. The classification is imperfect, but the best is the genetic one, according to which we have: (1) *Stationary* solitary thunder-storms, when in favorable topography a cumulus-cloud on a hot afternoon grows black below and begins to move only after the rain from it has begun. This type is the commonest in the tropics, where it gives most of the rainfall, occurs most frequently in hilly and mountainous regions in the temperate zone, may be very intense among mountains, especially in the arid regions, but shows no relations to "highs" and "lows." (2) *Sporadic* thunder-storms when over a large area, covering perhaps a middle-sized State, a storm crops up here and there, especially in the warmer hours, travels eastward for a few hours, and then disappears. The critical area is a few hundred miles S. E., S., or S. W. of a "low," forms in the morning, becomes best developed in the afternoon, and disappears at night to reform the next day, if favorable, as far in advance of the preceding day as the "low" has traveled in the interval. This is a common condition in midsummer in the U. S., and the individual storms are dependent on topography. (3) *Deploying* thunder-storms, those which travel in a rank in a straight or curved line, sometimes radiating from a point and covering a fan-shaped area. These are always a few hundred miles S. E. or S. of a "low," are generally more intense and longer lived than the preceding, and are independent of the lesser elements of topography. They are common in the U. S. and Europe, and may pass into hail-storms, thunder-squalls, or tornadoes. (4) Winter thunder-storms, the only ones that belong to the cold season. They are isolated, generally intense, often destructive, longer lived, and are rare in the U. S. They are essentially northern, nocturnal, and oceanic. MARK W. HARRINGTON.

**Thun** (toon), **Lake of**: a body of water in the canton of Berne, Switzerland, at an elevation of 1,837 feet above the level of the sea; 10 miles long and 2 miles broad. On its eastern shore stands Interlaken, and beyond its northwestern shore—on the Aar, about a mile from its exit from the lake—the town of Thun. Both these towns are visited every summer by a great number of tourists. Steamers ply on the lake.

**Thurber**, CHARLES HERBERT, A. M.: educator; b. at Owego, N. Y., Mar. 24, 1864; graduated at Cornell University in 1886; registrar of Cornell University 1886–88; taught in the Haverford College grammar school 1888–90; traveled and studied in France and Germany 1887, 1889, and 1890–91; during 1890-91 was also a special agent of the U. S. Bureau of Education; instructor in French, Cornell University, from 1891 to 1893, when he became principal of Colgate Academy and Professor of Pedagogy in Colgate University, Hamilton, N. Y. In 1895 he was appointed Associate Professor of Pedagogy in the University of Chicago, and Dean of the Morgan Park Academy. He has been editor of *The School Review* since 1893, is author of numerous magazine articles, and of *The Higher Schools of Prussia and the School Conference of 1890* (in *Report* of the U. S. Commissioner of Education, 1889–90), and edited Gherardi del Testa's *L'Oro e l'Orpello* (Boston, 1893).

**Thurber**, George, A. M., M. D.: botanist; b. in Providence, R. I., Sept. 2, 1821; educated in the Union Classical and Engineering School in Providence; botanist to the U. S. Mexican boundary commission 1850, the collections resulting in *Plantæ Novæ Thurberianæ*, by Dr. Gray; lecturer on botany in the New York College of Pharmacy 1856–57; Professor of Botany and Horticulture in the Michigan Agricultural College 1859–63; editor of *The American Agriculturist* 1863–90. He revised Darlington's *Agricultural Botany*, bringing it out under the title of *American Weeds and Useful Plants* (1859); wrote the botanical articles for Appletons' *American Cyclopædia* (1876–80); besides many papers in scientific journals and the proceedings of societies. D. at Passaic, N. J., Apr. 2, 1890.

**Thurber**, Samuel: See the Appendix.

**Thurgau**, toor'gow: canton of Switzerland; bordering N. on the Rhine and the Lake of Constance. Area, 381 sq. miles. The surface is undulating, but not mountainous, except in the southernmost districts. The soil is very fertile and agriculture is the main industry pursued; several cotton and linen spinning and weaving factories are in operation. Pop. (1888) 104,678, of whom 70·7 per cent. are Protestants. Capital, Frauenfeld.

**Thu'rible**, or **Censer** [*thurible* is from Lat. *thuri'bulum*, censer, deriv. of *thus* (or *tus*), *thu'ris*, incense; *censer* is shortened from *incenser*, viâ O. Fr. from Late Lat. *incensarium*, deriv. of *incen'sum*, incense, deriv. of *incen'dere*, *incen'sum*, kindle, burn]: a vessel of silver suspended by four short chains, used in the services of certain churches. It is charged with burning charcoal, upon which incense is placed. The thurible is borne by an acolyte called the thurifer. See Censer.

**Thüringerwald**, tü'ring-er-vaalt [Germ., Thuringian Forest]: a picturesque mountain range in Central Germany, extending along the right bank of the Werra, from the influx of the Hörsel, for about 60 miles, and joining the Franconian Forest in Northern Bavaria. Its highest point is Schneekopf, 3,460 feet high. It is covered with pine forests, and consists mostly of granite, porphyry, and slate, interspersed with rich veins of iron ore. It forms the southern boundary of Thuringia (*q. v.*).

Revised by M. W. Harrington.

**Thurin'gia** (Germ. *Thüringen*): the general name for that region of Central Germany which lies between the Hartz and the Thuringian Forest, the Saale, and the Werra, and which comprises parts of the Prussian province of Saxony and the Saxon duchies. The name originated from the Thuringii, who settled here, but since the fifteenth century it has had no definite political signification.

**Thurles**, thĕrlz: town; in the county of Tipperary, Munster, Ireland; on the Suir; 46 miles E. of Limerick (see map of Ireland, ref. 11–E). It has a Roman Catholic college, an establishment of Christian Brothers, two convents, a handsome cathedral, and carries on an active general trade. Pop. about 4,850.

**Thurlow**, Edward B.: lawyer and politician; b. at Bracon-Ash, Norfolk, England, in 1732; entered Cambridge University, but was compelled to withdraw for an act of discourtesy; entered the Inner Temple, and was called to the bar in 1754; established a reputation for ability and determination. He entered politics, and after some vacillation sided with the Tory party, holding numerous offices, becoming Lord Chancellor in 1778, and taking his seat in the House of Lords as Baron Thurlow of Ashfield. He was averse to constitutional and economic reforms, and opposed violently the interests of the American colonies, as well as any attempt at suppression of the slave-trade. He lent only an insincere support to his party from 1788 to 1792, and in the last-mentioned year he was at the instance of Pitt (one of whose measures he had captiously but violently opposed) dismissed from the office of Lord Chancellor, which he had again taken in 1783 when Pitt took office. Having been a few days before made Baron Thurlow of Thurlow, he retired to private life, and died at Brighton, Sept. 14, 1806, without again acquiring any decided influence in politics.

F. Sturges Allen.

**Thurman**, Allen Granbery: lawyer; b. at Lynchburg, Va., Nov. 13, 1813; removed to Ohio in 1819; received an academic education; studied law, and was admitted to the bar in 1835; was elected to Congress in 1844; elected judge of the Supreme Court of Ohio in 1851; was chief justice from 1854 to 1856; unsuccessful Democratic candidate for Governor of Ohio in 1867; succeeded Benjamin F. Wade in the U. S. Senate Mar. 4, 1869, and served till Mar. 3, 1881; was prominent among the candidates for the Democratic nomination for President in 1876, and in 1888 was defeated as Democratic candidate for Vice-President of the U. S. D. in Columbus, O., Dec. 12, 1895.

**Thurneysen**, toor'nī-sen, Eduard Rudolph: comparative philologist; b. at Basel, Switzerland, Mar. 14, 1857; studied at the Universities of Basel, Leipzig, and Berlin; privat docent, and later assistant Professor of Romanic Philology, at Jena 1882–87; since 1887 Professor of Comparative Philology at Freiburg im Breisgau. His unusually complete command of the scientific detail of three provinces of Indo-European philology, namely, Romanic philology, Italic philology, and Celtic, coupled with a quick, fine insight into the historical mechanism of language, assigns him a prominent and fairly unique place among the authorities in the field of Italo-Celtic philology. He is the author of *Ueber Herkunft und Bildung der lateinischen Verba auf -io* (1879); *Das Verbum être und die französ. Conjugation* (1882); *Keltoromanisches* (1884); *Der Saturnier und sein Verhältniss zum späteren römischen Volksverse* (1885); *Mittelirische Verslehren*, in Windisch's *Irische Texte*, iii. (1891); also articles in *Kuhn's Zeitschrift* and the *Revue Celtique*.

Benj. Ide Wheeler.

**Thurn und Taxis**, toorn'oont-taaks'is: the name of a noble family of the German empire, famous for its former possession of a monopoly of the postal service. It is descended from the della Torre (whence the name Thurn, a German translation of Torre), one of whom took the name de Tassis (Taxis) from the castle of Tasso. In 1516 Franz von Thurn established the first post between Vienna and Brussels, and in 1595 his descendant became postmaster-general of the empire, securing for himself and his heirs the right of carrying the mail throughout the imperial dominions. A century later the princely rank became hereditary in the family, but the postal privileges were gradually curtailed by the different governments, which granted extensive territories in compensation. The family has hereditary possessions in Austria, Bavaria, Belgium, Würtemberg, and Prussia. The last of these states arranged with the family for the abolition of the monopoly in 1867.

F. M. Colby.

**Thursby**, Emma: concert-singer; b. in Brooklyn, N. Y., Nov. 17, 1857; studied under local teachers and in 1873 at Milan under Lamperti, and finally in New York under Madame Rudersdorff; made a tour of the U. S. and Canada in 1875; first appeared in England May 22, 1878, at a Philharmonic Society concert; in 1879 sang in Paris; and in 1880–81 made an extended concert tour through Europe, everywhere with great success. Her voice is a rich and high soprano, ranging to E flat in alt.

D. E. H.

**Thursday** [M. Eng. *Thursdei*, *þorsday* (by anal. of Icel. *þōrsdagr*), for earlier *Thunres dæi* < O. Eng. *þunres dæg*, Thunder's (or Thor's) day. See Thor]: the fifth day of the week. The later Roman pagans adopted the week of seven days and named the fifth day *Jovis dies*, Jove's day; the name Thursday originated as a translation of this.

**Thurston**, Robert Henry, LL. D., Dr. Eng.: mechanical engineer, inventor, educator, and author; b. in Providence, R. I., Oct. 25, 1839. During childhood and youth he spent much time in the workshops of his father's establishment, then devoted especially to the building of steam-engines. He graduated at Brown University in 1859 with the degree of Bachelor of Philosophy, and immediately entered the works of his father's firm, spending some time as a designing engineer. In 1861 he joined the Engineer Corps of the U. S. navy, serving in Dupont's and Dahlgren's fleets throughout the war; was made engineer-in-charge of the Chippewa in 1863 when a second assistant engineer, and was later transferred to the Dictator iron-clad, and commissioned first assistant in 1864. He served as a Professor of Natural Philosophy in the U. S. Naval Academy from Jan. 1, 1866, to June, 1871, when he became Professor of Engineering at Stevens Institute of Technology, resigning in 1885 to assume the directorship of the Sibley College of Mechanical Engineering in Cornell University, where he still (1895) remains. Under his administration this college has grown in size and efficiency, and now has over 500 students and an equipment valued at nearly half a million dollars. He has been employed on many Government commissions, as the U. S. scientific commission to the Vienna International Exhibition (1873); to Paris (1889); the U. S. commission to investigate the causes of boiler explosions (1875); U. S. commission to test iron, steel, and other metals (1875–88); U. S. commission on safe and bank-vault construction (1891); U. S. board to report on best construction of iron-clad Puritan, etc. He is a member of a number of American and European societies, has been first president of the American Society of Mechanical Engineers, and three times vice-president of the American Association for the Advancement of Science. He has designed engines, boilers, and many kinds of machinery, and has written many treatises, among which are his *Manual of the Steam Engine* (2 vols., 1890–91); *Manual of Steam Boilers* (1890); *Engine and Boiler Trials* (1890); *History of the Steam-engine* (1878); *Materials of Engineering* (3 vols., 1882–86). He has published over 250 papers, mainly on professional subjects. He translated Carnot's *Reflexions sur la Puissance motrice du Feu*, the basis of the modern science of thermodynamics, and edited the reports of the U. S. scientific commission to the Vienna International Exhibition of 1873 (4 vols. 8vo, 1874–75), his own report constituting the third volume. He has invented magnesium-burning lamps, army and navy signal apparatus, various forms of testing-machines for iron and other metals and to ascertain the quality of lubricants, some improvements on the steam-engine, and scientific and engineering apparatus. He has performed much work in scientific research and in the investigation of engineering problems; his determination of the useful qualities of the alloys of copper and tin, of copper and zinc, and the ternary alloys of the three metals; his studies of boiler-explosions; his examination with his own apparatus of the laws of friction and of lubrication, as published in his *Friction and Lost Work*; his investigations of the laws of variation of engine-wastes of heat and power; and his studies in commercial economy of steam-engines, are among the best known. He organized in 1872–73 the first laboratory for research in applied sciences of engineering in the U. S. When organizing Sibley College he made this a separate and prominent department.

**Thwing**, Charles Franklin: See the Appendix.

**Thyatira**: See Ak-Hissar.

**Thy'ine Wood** [*thyine* is from Gr. θύϊνος, deriv. of θύειν, sacrifice]: a kind of wood mentioned in the Bible; probably the arar or sandarach wood, the wood of *Callitris quadrivalvis*, a large tree of Barbary. This tree affords the resin called gum sandarach, and its timber is considered imperishable by the Turks, who floor their mosques with its planks.

**Thylacine**: See Tasmanian Wolf and Thylacinidæ.

**Thylacin'idæ**, or **Dasyu'ridæ** [*Thylacinidæ* is Mod. Lat., named from Gr. *Thyla'cinus*, the typical genus, from Gr. θῦλαξ, θύλακος, sack, pouch (perh. with similation in the last syllable of Gr. κύων, κυνός, dog); *Dasyuridæ* is Mod. Lat., named from *Dasyu'rus*, another genus; Gr. δασύς, shaggy + οὐρά, tail]: a family of mammals of the order *Marsupialia* and sub-order *Dasyuromorpha*, including the chief carnivorous mammals of Australasia. The form varies in the several genera, the larger species much resembling a dog externally, others an opossum, and the small species simulating a mouse in appearance, although anatomically they differ but little from each other. The snout is like that of a dog or acutely pointed; the ears moderate or large; the tail is generally more or less long, and the feet have separate toes, four or five in number. The teeth are well developed, and simulate those of the placental carnivores (dogs, etc.), and are in considerable number; there is no such distinction between molars and premolars as in placental carnivores, only the last premolars having deciduous predecessors; the premolars are compressed, conical; the canines generally well developed and typical in form, and the incisors cylindroid and curved, and moderate or rather large. The skull superficially has much resemblance to that of a dog, but is of course radically different, and exhibits the typical marsupial modifications of the mammalian skeleton, and the small size of the cerebral cavity is indicated externally by the absence of inflation; the palate has a pair of large longitudinal vacuities between the true molar teeth of the respective sides. The stomach is simple, and there is no intestinal cæcum. The family is peculiar to the Australasian region, and its representatives there take the place in the economy of nature held by the placental carnivores and insectivores in other parts of the world. The species are numerous. See Tasmanian Devil and Tasmanian Wolf. Revised by F. A. Lucas.

**Thyme** [from O. Fr. *thym* < Lat. *thy'mum* = Gr. θύμον, thyme; cf. θύειν, to sacrifice, and θύος, incense]: any one of certain labiate half-shrubby plants of the genus *Thymus*. None is indigenous to America. Two kinds are cultivated in gardens, the common, *T. vulgaris*, and the lemon-scented, a variety of *T. serpyllum* or wild thyme. Both afford good bee-pasture. The leaves are used for flavoring soups and forcemeats; the volatile oil is sold for oil of origanum, which it closely resembles. Revised by L. H. Bailey.

**Thyme, Oil of**: a volatile oil obtained by the distillation of the common thyme (*Thymus vulgaris*) with water. It usually is brownish red and has a thickish consistency, although when freshly prepared it is nearly colorless and is mobile. It possesses a pleasant pungent odor and an aromatic taste, has a specific gravity of about 0·9, and is but slightly soluble in water, although it dissolves in alcohol and in ether. Oil of thyme contains two hydrocarbons, a terpene ($C_{10}H_{16}$) and cymene ($C_{10}H_{14}$), and a phenol, Thymol (*q. v.*). These compounds are separated by submitting the oil to fractional distillation. When oil of thyme is distilled with a mixture of 8 parts of chlorinated lime and 24 parts of water, chloroform is formed. Revised by Ira Remsen.

**Thym'ol**, also called **Thymyl'ic Hydrate**, **Thymylic Alcohol**, and **Thymylic Acid** [*thymol* is deriv. of *thyme*]: a homologue of phenol and an isomer of cymylic alcohol; formula, $C_{10}H_{14}O$. It is obtained from the oil of thyme (see Thyme, Oil of), of which it is the oxygenated camphor or stearoptene, by distillation. Thymol forms crystalline rhomboidal plates that have a weak odor and a peppery taste. It fuses at about 111° F. to a colorless liquid which has a boiling-point of 446° F., and dissolves with difficulty in water, but easily in alcohol and in ether. By the action of chlorine, bromine, and nitric acid upon thymol, series of derivatives are formed.

**Thy'mus Gland** [*thymus* is Mod. Lat., from Gr. θύμος, a warty excrescence (so called from its resemblance to a bunch of thyme—θύμος), the thymus gland in the chest of young animals]: a ductless gland, with no known function, located in the neck below the thyroid gland, and in the chest beneath the sternum, in the mediastinal space, as low as the fourth costal cartilage. It develops at the third month of fœtal life, weighs ½ oz. at birth, and grows until the second year, attaining a length of 2 inches. Thereafter it atrophies, and at the fourteenth or sixteenth year is obliterated, or its site marked only by a few fibers and a small deposition of fat. It has abundant blood-vessels, nerves, and lymphatics, but endless research has failed to disclose positively its use in either the fœtal state or during childhood, though many investigators are of the opinion that the gland is connected with manufacture of blood in fœtal life. The thymus of calves and lambs is called sweetbread, or neck-sweetbread. Revised by W. Pepper.

**Thy'roid Gland** [*thyroid*, more properly *thyreoid*, from Gr. θυρεοειδής, shield-shaped; θυρεός, a large oblong shield (deriv. of θύρα, door) + εἶδος, appearance, form]: a glandular structure consisting of two lateral lobes, with a connecting band or isthmus, situated on the anterior surface of the neck and attached to the sides of the larynx. The gland moves with the larynx in respiration and deglutition. The isthmus bridges across from the lower or basic portion of the lobules, and covers in its transit the front of the second and third tracheal rings. By this relation and its great vascularity it has an important surgical relation to the operation of tracheotomy. It has an external fibrous coat, which gives off numerous internal partitions and bands, so that the gland consists of communicating cavities like a sponge. The thyroid gland is ductless, and its functions are obscure. Very probably it aids in the manufacture of blood in fœtal life, and after birth it would seem to have certain functions connected with the animal chemistry. Its removal or disease occasions peculiar metamorphosis of the subcutaneous tissues, known as myxœdema. The thyroid gland is the seat of goiter. Revised by W. Pepper.

**Thysanop'tera** [from Gr. θύσανος, fringe + πτερόν, wing]: a synonym of the group *Physopoda*, given in allusion to the fringe of hairs on the wings. See Entomology.

**Thysanu'ra** [Mod. Lat.; from Gr. θύσανος, fringe + οὐρά, tail]: minute wingless insects of considerable interest, since they retain some primitive hexapodan features. (See Entomology.) Thus among the *Cinura*, *Campodea* shows the three portions of the thorax distinctly, while on the ventral surface of the abdomen are sac-like organs comparable to coxal sacs and on the first abdominal segment a pair of bud-like legs, thus indicating a former polypodal condition.

Respiration is carried on by tracheæ and by these ventral sacs, or, where tracheæ and sacs are wanting, as in *Isostoma*, through the skin. In the *Collembola*, which with the *Cinura* composes the order, the end of the abdomen is furnished with a pair of stylets. These are bent under the body with the tip of the abdomen, and held by a pair of processes on the first abdominal segment. The apparatus serves as a spring, and has given rise to the popular name of springtails. In the *Cinura* the terminal processes may be developed into a pair of forceps, as in *Iapyx*, or be very long or filamentous—as is usually the case. In some forms there may be as many as seven of these filaments. The body is in some forms covered with many delicately marked scales of much interest to amateur microscopists. The *Thysanura* are found everywhere, in moist earth, under stones, logs, in cellars—wherever, in fact, decaying vegetation occurs. One species is found on the snow of the Alps; other forms are even found on floating objects at sea or near shore on seaweeds. One form, popularly known as the silver-fish (*Lepisma*), occurs in old libraries, where it often does considerable damage by eating the paste of the binding of books. It also devours the sizing of the paper, destroying thus the printed matter. See Lubbock, *Monograph of the Collembola and Thysanura*; A. S. Packard, *Synopsis of the Thysanura of Essex County*; T. J. Oudemanns, *Beiträge zur Kenntniss der Thysanuren und Collembola.* F. C. Kenyon.

**Ti** [ = native (Polynesian) name]: a liliaceous tree-like plant of the genus *Cordyline*, found in the Pacific islands and in parts of Asia. Its leaves afford roofing for houses, food for cattle, and fiber for cloth. The sap yields sugar and a stimulating drink, while the roots, when baked, afford a valuable supply of food.

**Tia'ra** [ = Gr. τιάρα, a Persian head-dress]: the papal crown, consisting of a cap of cloth of gold, encircled by three golden coronets, and surmounted by a mound and cross of gold. It is considered symbolical of the pope's temporal authority.

**Tiahuana'co**: See Incan Antiquities.

**Tiber** [from Lat. *Tiberis*, Tiber; Ital. *Tevere*]: river of Italy, passing through Rome, the largest stream of the peninsula proper; rises in Mt. Fumaiolo, Tuscany, at an elevation of 3,830 feet, flows in a southerly direction, and empties into the Mediterranean 22 miles below Rome; length, 260 miles; area of basin, 6,225 sq. miles; breadth at Rome, 250 feet. The principal affluent is the Nera, which descends from the Sibylline Mountains, and enters on the left about 100 miles from the mouth; above it and on the same side enters the Clitunno (*Clitumnus*), praised by the Latin poets, and below the Anio. On the right the most important affluent is the Chiana, which is connected by canal with the Arno. The Tiber is navigable for small steamers to the mouth of the Nera, and for larger ones to Rome. The river delivers at the mouth on the average 10,250 cubic feet of water a second, but in the highest floods this may amount to 60,000 cubic feet, and in lowest water is only 5,650 cubic feet. The floods of the Tiber have been formidable from the foundation of Rome, not only for their height, but for their suddenness and for the large amount of sediment carried. The Romans called the river *flavus* because of the yellow clay it carries. This has gradually extended the delta of the Tiber until the ancient port Ostia is now 4 miles inland and the port of Trajan is a marsh. The growth at the southern or principal mouth for the last 800 years has been 10 feet a year. At the northern mouth it is about a third as much. The branches to the two mouths embrace the ancient Sacred Isle, dedicated to Venus, now marshy and very unhealthful. Between Rome and the sea the Tiber is practically an estuary, and the navigation of this was apparently easier in ancient times than now.

Mark W. Harrington.

**Tiberias, Lake of**: See Gennesaret, Lake of.

**Tibe'rius** (full name *Tiberius Claudius Nero Cæsar*): Roman emperor 14–37 A. D.; b. Nov. 16, 42 B. C.; a son of Tiberius Claudius Nero and Livia Drusilla. In 38 B. C. Livia was divorced from Claudius and married to Augustus, who thus became the step-father of Tiberius. Tiberius was large and strong of body, with handsome features, a man of simple habits and reserved manners, not altogether without literary taste, and with a decided aptitude for military affairs. He commanded successively in Cantabria, Armenia, Rhætia, Dalmatia, and Germany, and finished the wars promptly and with honor. From Germany, where he commanded after the death of his brother Drusus, he returned in 7 B. C. to Rome, celebrated his second triumph, was chosen consul for the second time, and was the following year invested with the *potestas tribunitia* for five years. His relations with Augustus soon became strained. He had divorced his wife Vipsania Agrippina at the emperor's command and married Julia, the dissolute daughter of Augustus; and, disgusted by Julia's conduct, he withdrew to Rhodes, where he spent seven years in exile. By his mother's exertions he was recalled to the court in 2 A. D., and in 4, all the male heirs of Augustus having died, he was adopted by the emperor and appointed his successor. The next ten years he spent mostly in wars on the northern frontier, and on the death of Augustus in 14 he succeeded to the throne. Except in the transfer of elections from the people to the senate, Tiberius made no noteworthy change in the system of government instituted by Augustus. As an administrator he showed an earnest desire to correct abuses and to secure the welfare of all parts of the empire. The northern and eastern frontiers were strengthened, strict discipline was enforced in the army, and considerable improvement was made in the government of the provinces, where Tiberius was always popular. Drusus, the son and heir of Tiberius, was poisoned in 23 by his wife at the instigation of Sejanus, the pretorian prefect, who divorced his own wife to marry the murderess. Sejanus also induced Tiberius to banish the widow and sons of his brother Germanicus, the remaining heirs, and aspired to succeed to the throne himself. Always sensitive and distrustful, Tiberius was now morbidly suspicious and apprehensive, and in 26 retired to the island of Capri, intrusting the government to Sejanus, whose rule was almost absolute. Finally, however, in 31, he suspected Sejanus, and gave orders to have him executed. Tiberius, however, remained at Capri, placing the management of affairs in the hands of Macro, Sejanus's successor as pretorian prefect. During all his later years the class of private informers (*delatores*) was encouraged, and condemnations for treason became more and more common. The last six years of his rule seem to have been a real reign of terror. Tiberius died at Misenum, Mar. 16, 37. The common view which represents Tiberius as a monster of vice and cruelty rests chiefly upon the authority of the historian Tacitus, a bitter critic of the imperial system. Recently there has been a growing tendency among scholars to question this estimate of Tiberius, or at least to limit it to the closing years of his life, when as "an old man of seventy, broken in body and spirit, betrayed, disappointed, morbidly brooding in solitude upon his wretchedness," he may have allowed the bad elements in his character to gain control.

C. H. Haskins.

**Tibesti**, tee-bes-tee' (the Arab name; the native name is *Tou*): country of the Sahara, about Mt. Tarso, between the parallels 18° and 22° N. and the meridians 15° and 18° E. Area about 60,000 sq. miles, occupied by Tibbus, numbering 12,000 according to the estimates of the traveler Nachtigal. It is a mountainous country, bare, infertile, and arid, but favored with summer rains. The population is tribal and nomadic, depending chiefly on the domestic animals, consisting of camels, asses, goats, and sheep. The flora is poor, but the fauna includes the dog-faced baboon, the hyæna, jackal, fox, gazelle, antelope, and many birds and insects. The ostrich was formerly common, but has nearly disappeared. See Tibesti in the Appendix.

**Tibet** (called by the natives Bod or Bodyul, and Bhot and Bhotiya in India): the high and massive table-land, buttressed on the N. by the Kuen-lun or Kulkun and Altyn Tagh ranges, which mark a sudden descent to the deserts of Eastern Turkestan and Gobi, and on the S. by the Himalayan range and the northern portion of British India (see map of China, ref. 5-C). It is one of the least-known countries of the world. Its area (651,500 sq. miles) can only be vaguely estimated, vast portions are as yet unexplored, and present geographical knowledge is based solely on the Jesuit survey (1708–18), and on the route surveys of a score or so of European travelers and trained Indian observers.

*Physical Features, Productions, Fauna, etc.*—The dip and drainage of the Tibetan plateau is generally eastward, so the highest part of this vast lacustrine plateau is the western, where it adjoins the British feudatory state of Kashmir. Here its mean level is from 16,000 to 17,000 feet above sea-level, and in the southwest angle thereof there spring three great rivers, the Sutlej, Indus, and Sanpur, which burst through the Himalayan chain at different points on their way to the Arabian Sea and Bay of Bengal, The last of these three rivers flows through Great or Southern Tibet in a generally easterly direction for nearly 1,000 miles before it turns abruptly southward, and, piercing the Himalayas, emerges into British territory, where it assumes the name of Brahmaputra. A large belt of country N. of and parallel to the valley of the Brahmaputra is drained by another river which connects a chain of lakes and flows away to the E. It is believed to be the upper course of the Salwen, but the view is contested by some authorities, and the determination of this point, as well as of the precise sources of the Salwen, is an interesting geographical problem that awaits solution. In Northern and Eastern Tibet, again, lie the sources of the Mekong or Cambodia river and those of the great Yang-tse-kiang and Hwang-ho of China. The lower courses of the Sanpur or Brahmaputra and Salwen drain the most populous part of Tibet; most of the remainder of the country, being too bleak and unproductive to support life, is either totally uninhabited or else tenanted by bands of nomad Turk and Mongol tribes; the Tangla plateau, however, N. of Lhasa, and no doubt other parts of the country, affords luxurious pasture to antelopes and other game.

An interesting analogy between the Andes and the Himalayas was perceived by Warren Hastings, India's first governor-general, and has been elaborated by C. R. Markham, C. B., president of the Royal Geographical Society (1895), in his work *Bogle and Manning*. Both the mountain masses of the Old and New World consist of three parallel chains; in both great rivers rise in the inner chain and force their way through the other two, while smaller rivers rise in the central cordillera and after lateral courses force their way through the outer chain. In both Peru and Tibet the staple product is wool, conveyed through numerous passes by the llamas and sheep used as beasts of burden.

The chief mineral products of Tibet are gold, silver, salt, and borax; the metals first named are fairly plentiful, but the jealousy of the lamas against foreign intrusion prevents any systematic working and export thereof, though gold mines exist at Thok-Jalung (32° 24′ 26″ N. and 81° 37′ 38″ E. of Greenwich) and in the northwest of the country.

Among the principal domesticated animals are sheep, horses, yaks, and mastiffs, while the wild fauna comprise bears, antelopes, musk-deer, and wild asses, and on the extreme northern confines of the table-land wild camels are occasionally found.

*Climate.*—The climate, as might be inferred from the excessive altitude, is of Arctic rigor, and only the hardier cereals can be raised in the valleys, though in the E., where the streams enter upon a lower level, the vegetation becomes rather more assimilated to that of the contiguous quasi-tropical regions of Assam, Bhutan, and Western China.

*Inhabitants.*—The inhabitants of Tibet, about five and a half to six millions in number, belong to the great Mongolian family, and are described by the Abbé Huc (whose *Souvenirs*, dating from 1852, furnishes still a most graphic and intelligible picture of Tibetan life) as a people with small, contracted black eyes, thin beard, high cheek-bones, flat noses, wide mouths, and thin lips. The skins of the upper classes are as white as those of the Europeans, but the ordinary complexion is tawny. They are of middle height and combine agility and suppleness with force and vigor. They are said to be brave in war, though the inferiority of their weapons and ignorance of the art of war placed them at an enormous disadvantage in the Sikkim war with Great Britain, the last hostilities in which they were engaged.

*Literature and Religion.*—The literature is vast, including all the Buddhist canon of scripture, translated from the Sanskrit, the *Tripitaka*, or three baskets of precepts and other works, one list of which has been given by Csoma de Körös, the Hungarian scholar. The art of printing by means of engraved wooden blocks has been known to the Tibetans for many centuries. Traces of the old religion called *Bon* or *Pon* still linger in the eastern province of Kam. It appears to have been a worship of the powers of nature. Buddhism seems to have reached Tibet about the beginning of the seventh century, from both China and India. (See Lamaism.) The history of its development is full of interest, and at present the numerous hierarchy of Tibet plays the foremost part in national politics, besides supplying the educational requirements of the country, so far as any provision may be said to be made for the same.

*Political Divisions and Government.*—Politically, Tibet is divided into four great provinces called Kam, U, Tsang, and Ari. The first named is in the E., and adjoins the Chinese province of Szechuen; Ari is the mountainous region W. of the Mariam-la Pass, including Ladak; while U and Tsang or Utsang form Central or Great Tibet, and practically coincide with the basin of the Brahmaputra river. Here are found the capital or sacred city of Lhasa and other important towns, besides the greater monasteries.

Tibet is politically subject to China, but the enormous distance and difficulties of communication have naturally made the country more or less independent of the suzerain power. The visible sign of Celestial supremacy is the presence of the two Chinese *ambans* or residents, with their military guard, at the capital. Appointments to the first offices in the state are bestowed by the emperor, and in all measures of consequence reference is made to the court of Peking, but the internal government of the country is intrusted entirely to natives, the executive administration being in the hands of a regent and four ministers or councilors called *kahlons*. The governors of forts and provinces are appointed by these, and the revenue is collected by officers sent annually from Lhasa. The Dalai lama on attaining full age has in times past been invested with supreme authority by the Emperor of China, but for some years all the grand lamas have died in infancy, a circumstance that sheds a significant light on the methods resorted to by those who wish to keep the power in their own hands. The position of the grand lamas has been thus very similar to that of the popes of Rome, and the analogy is still more observable in the tenets and rites of the Roman Catholic and Tibetan religions, between which there is a striking similarity; this is probably due to the early Capuchin missionaries who settled in Lhasa having introduced a knowledge of Catholic observances. The *gylongs* (monks) and *annis* (nuns) are found in huge monasteries presided over by abbots and scattered all over the kingdom, and indirectly possess much influence; the actual executive authority is, however, vested in *jongpons*, or district officers, under the supervision of the provincial governors.

*Trade and Commerce.*—Lhasa, the capital, is the great central mart, and thither traders repair from China with silks, carpets, and hardware; from Mongolia come leather, saddlery, sheep, and horses; from Kam come perfumes; from Szechuen, tea; from Tawang, Bhutan, and Sikkim, rice and tobacco; from Nepal, broadcloth, silk, indigo, coral, pearls, sugar, spices, and Indian manufactures, while the latter, with saffron, also enter by way of Kashmir and Ladak. The merchants come in December and leave in March, before the rivers become flooded, having provided themselves with silver and gold, salt, wool, woolen manufactures, furs, drugs, and musk. By the Nepal and Ladak routes Tibet exports large quantities of yaks' tails, borax, gold, silver, and ponies. The great and inexhaustible staple of the country is wool, a remarkably fine quality of which can be largely produced on its vast plains and mountain-slopes. But for this trade it is essential that intercourse with India should be thrown open and all the passes through the Himalayas made free to traffic, the live stock, which constitute the chief beasts of burden, requiring a large area of pasturage for their support. Warren Hastings made wise and strenuous efforts to establish regular commercial intercourse between the two countries, but through neglect his policy was not continued; the passes to the S. were sealed up, and it was not until after repeated efforts to remove the restrictions that a treaty between China and Great Britain was negotiated in 1893, providing for the establishment of a trade mart at Yatung in the Chumbi valley. This arrangement was practically forced upon the Tibetans after their invasion of British Sikkim had been forcibly repulsed. But the military victory was not followed up, the Tibetans were not much impressed, and the latest information is that the treaty, in consequence of the lama jealousy of foreigners, has practically become a dead letter. The importance, however, of finding a Tibetan market for Indian tea makes it unlikely that the British will submit to be thus rebuffed; tea is a prime necessary of life in Tibet, and its eventual introduction into the country and the complete opening up of the land to Western civilization and trade can be only a matter of time.
